

THE  
TROPICAL  
AGRICULTURIST

ES. 2,016.

"Step after step the ladder is ascended."—George Herbert, *Jacula Pudentum*.  
"Agriculture is the most healthful, most useful and most noble employment of man."—WASHINGTON.

---

THE  
TROPICAL AGRICULTURIST:

(ESTABLISHED 1881.)

A MONTHLY RECORD OF INFORMATION FOR PLANTERS

OF

TEA, CACAO, COFFEE, PALMS, RUBBER, CINCHONA, SUGAR,  
RAMIE, COTTON, TOBACCO, SPICES, CAMPHOR, RICE,

AND OTHER PRODUCTS SUITED FOR CULTIVATION IN THE TROPICS:

Circulating in India, Ceylon, Burma, Straits, Java, Sumatra, Borneo, Northern Australia,  
Queensland, Fiji, Mauritius, Natal, West Indies, South and Central America,  
California, Southern States, and throughout Great Britain:

---

EDITED BY

J. FERGUSON,

of the "CEYLON OBSERVER," "CEYLON HANDBOOK AND DIRECTORY," &c.

---

"It is both the duty and interest of every owner and cultivator of the soil to study the best means of rendering that soil subservient to his own and the general wants of the community; and he, who introduces, beneficially, a new and useful *Seed, Plant or Shrub* into his district, is a blessing and an honour to his country."—SIR J. SINCLAIR.

# THEORETICAL AERONAUTICS

A MONTHLY JOURNAL OF SCIENCE AND ART

EDITED BY  
SIR HENRY COPELAND, F.R.S.  
AND  
SIR GEORGE CAMPBELL, F.R.S.  
LONDON: THE SCIENTIFIC PRESS, LTD., 1909

12 SEP 1909

VOL. XXIII

NUMBER 10

1909

## TO OUR READERS.

---

In closing the Eighteenth Volume of the "**Tropical Agriculturist**," we would as usual direct attention to the large amount of useful information afforded and to the great variety of topics treated in the several numbers. From month to month, we have endeavoured to embody in these pages the latest results of practical experience and scientific teaching in all that concerns tropical agriculture; and our ambition has been to make our periodical not only indispensable to the planter, but of service to business men and capitalists, never forgetting that agriculture trenches upon every department of human knowledge, besides being the basis of personal and communal wealth.

While directing our attention chiefly to the products prominently mentioned on our title-page, we have always taken care to notice minor industries likely to fit in with sub-tropical conditions; and our readers have an ample guarantee in the index pages before them, that, in the future, no pains will be spared to bring together all available information both from the West and East, the same being examined in the light of the teachings of common sense as well as of prolonged tropical experience in this, the leading Crown and Planting Colony of the British Empire.

Special attention has, during the past year, been given to the introduction and extension of an industry in rubber-yielding trees (more especially in the planting of Para and *Castilloa* trees), and much literature on the subject will be found throughout our pages; also on cacao in Central America and the West Indies as well as in Ceylon; coffee and allied products in Brazil, Mexico, Costa Rica, East Java, Nyassaland, British Central Africa; Liberian coffee in Sumatra, Java, the Straits Settlements; and to other new developments in coffee, coconuts and tobacco planting, &c., in the Malayan Peninsula, Sumatra and North Borneo, as well as in this Island.

The Tea-planting Industry has sprung into so much importance in India (South as well as North) and Ceylon, as also in Java, that a considerable amount of space is naturally given to this great staple; and we think it will be admitted by impartial judges that the *Tropical Agriculturist* should be filed, for the convenience of planters, in every Tea Factory in this Island, in India and in Java.

A full and accurate Index affords the means of ready reference to every subject treated in this, the Eighteenth volume, which we now place in our subscribers' hands, in the full confidence that it will be received with an amount of approval, at least equal to that which has been so kindly extended to its predecessors.

To show how fully other Products besides Tea are treated in this volume, we may mention the number of entries under several headings as follows:—Coffee (including Liberian) 66; Cacao 31; Indiarubber 42; Coconuts and other Palms 25; and Miscellaneous Products nearly 1,000. In the 18 Volumes, the references to Rubber, Coffee and Cacao number many thousands, as also to Coconuts and other Palms.

We are convinced that no more suitable or useful addition can be made to a Planting Company's Library or gift to a tropical planter or agriculturist, whether he be about to enter on his career, or with many years of experience behind him, than the eighteen volumes of our periodical which we have now made available. They are full of information bearing on every department and relating to nearly every product within the scope of sub-tropical industries.

In conclusion, we have to tender our thanks to readers and contributors, and our wish that all friends may continue to write instructively and to read with approval; for then indeed, must the "**Tropical Agriculturist**" continue to do well.

J. FERGUSON.

COLOMBO, CEYLON; 1ST JULY, 1899.

The first part of the year was spent in the  
 study of the history of the country and  
 the progress of the various branches of  
 science. The second part was devoted to  
 the study of the natural history of the  
 country, and the progress of the various  
 branches of science. The third part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The fourth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The fifth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The sixth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The seventh part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The eighth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The ninth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science. The tenth part was  
 devoted to the study of the history of the  
 country, and the progress of the various  
 branches of science.

### RESEARCHES IN PRUNING FRUIT TREES.\*

EVERY practitioner who has to do with the pruning of fruit trees, if he has studied the subject, knows how various are the views of the different cultivators who have written concerning it, many of them being diametrically op-

posed to each other, so that the less-experienced reader is apt to be greatly puzzled as to the course he should take. These differing opinions have their rise in the fact that the practices of the older cultivators are constantly being repeated without further proof. In recent years Herr Koopmann has published his researches and observations, extending over many years in a very excellent work, entitled *Grund Lehren des Obstbaumschnittes*; or, *Principles of Pruning Fruit-trees*.

This work can be most warmly recommended to the notice of all pomologists, but as it is one that requires careful study, we can only notice here a few striking observations on subjects of every-day practice in gardens.

It is a rule of general acceptance that the hard cutting-back of a young tree results in the strengthening of the shoots, although some pomologists believe that hard-cutting weakens the tree, and consequently has the opposite effect.

Koopmann, in order to put these contradictory views to the test, carried out experiments on a row of equally-developed trees, as to the comparative lengthening and thickening of the shoots after pruning. He found that 1-year-old grafts reached their greatest length when they were not cut-back, which agrees with the view of Gaucher, that by the rearing of standard trees, they should not be cut-back. The thickening of the stem, and the production of wood is, however, not so great if the lateral shoots be not shortened. When the year's growth is re-

latively of sufficient strength, stems intended for standard trees should not be cut back; but when this is not the case, then cutting back must be performed. These experiments showed that the stem development was greatest when seven-tenths were cut off, leaving but three-tenths. By harder cutting back than this, the resultant shoot was shorter. Taking into consideration, however, the entire production of wood, it was found that the removal of two-thirds of the length resulted in the greatest possible strengthening of a tree. This agrees with the fact that the lateral shoots should be also cut back two-thirds of their length.

Experiments were made on pinching the summer shoots of fruit-trees, and it was found that every shoot that was pinched suffered a weakening of one-tenth as compared with the lengthening of a natural or unpinched shoot. The earliest is the most suitable time to pinch, or when the shoots are about 4 inches long, and only the terminal bud should be taken. If more than this be removed, the lower buds push out strongly, and the object of the pinching is defeated.

It is an important point in the management of pinched trees, that, only in the second year does a permanent weakening occur if the pinched parts are pruned, and the small lateral shoots shortened back, then the shoots remain permanently weak. On the contrary, if the pruning is performed on parts of a tree below the pinched shoots, the results and purposes of the pinching are frustrated.

We are also enlightened as to the results of Ringing. The breadth of a ring should on no account exceed 4 to 6 millimetres, this being the most suitable because the excised space gets covered in the first season; whereas narrower rings allow the bark to unite too quickly, and broader ones prevent an union taking place. A suitable time for ringing a tree is just previous to its flowering.

Especially deserving of notice are the effects of ringing on the growth of the roots; ringing forming a hindrance to the descent of the sap, the roots being thereby decidedly weakened. Beyond this we find that ringing not only weakens the branch on which it is performed, but likewise the branches below the ringed part break water. Ringing should not be carried out on all the branches of a tree at one time, but at the utmost on the half of them, and on naturally weak-growing trees it should be omitted.

Koopmann struck a note of warning in reference to scraping and slitting the bark, not to carry these operations too deeply into the innermost tissues of the bark, recommending slitting to be carried out over the basal enlargement of the branch as far as the stem; and he points out its importance in cases of canker caused by frost or sun-burning. He advised the cutting of parallel lines, beginning above

\* The subject-matter of this article was contained in a lecture given by Herr W. Lauche, at a meeting of the K. K. Gartenbau Gesellschaft of Vienna, March 15, 1897.

the injured parts, deep down to the wood, and ending in sound tissue below them, this being the only method by which healthy new bark can be made to extend over an injured surface.

In order to make the so called notching of a branch or shoot of good effect, the notch must be cut down through the bark to the wood at a point just above a dormant bud; which then leads to the strengthening of the growths below that point, whereas if the notch be made under the bud it weakens them. Koopmann discovered that notching can be used in different methods with diverse effects on various kinds of fruits.

Important are his observations on pruning newly-planted trees. The very common practice of cutting the shoots hard back, i.e., to three or four buds, was always productive of unfavorable results, but a cutting back to one-half the length was satisfactory, and good results were sometimes obtained in the absence of all pruning, but only by such trees as possess a very compact habit of growth. And concerning the much-discussed subject of the season when to plant, Koopmann has much to say. He found that planting during winter, in the early autumn, and as early as possible in the spring, gave the best results; and the worst when the planting was performed in late autumn, and in winter just previous to the occurrence of hard frost.

In Germany, where the winters are, as a rule of great severity, with bright sunny days, protection against frost by means of mulches, and against sunshine, have to be used for autumn and winter-planted trees. Koopmann deprecates the planting of fruit trees in the autumn after a wet summer and autumn, the wood being in an immature condition; and he only recommends the planting of Apricots and Peaches at that season if the summer has been a warm one.—*Gardeners' Chronicle*.

## INDIAN AND CEYLON TEA.

### ANNUAL REVIEW.

38, Mincing Lane, June 8th, 1898.

The publication in London of statistics relating to the trade of the twelve months ending May 31st brings an opportunity of reviewing the main features of the season now concluded, of recording results of general or particular interest, and of surveying the position and prospects.

The season opened under favourable conditions and with a hopeful outlook. In the background stood the record of many prosperous years; accumulated experience and knowledge, placing planters in a position of great advantage; and the signs that our produce was making headway in all the chief markets. In the foreground stood the hopes raised by the remarkable increase in the use of tea at home during recent years; by the abundant capital attracted to the Home Trade; and by the evidence that in none of the business centres of the world large stocks were in existence.

The outcome of the season, however has not been fully equal to its early promise—and it is necessary to search for explanation of a result disappointing to many, though not entirely unexpected by those who a year ago took note of possible contingencies.

Turning, in the first place, to PRODUCTION:—as regards INDIA, owing to circumstances which may be considered exceptional, over large areas conditions prevailed which prevented planters from making tea sufficiently good to maintain its value. Taken as a whole, Assam kept up its high reputation—some Estates yielding tea of exceptional quality—but results were not so uniformly good as usual, and gardens north of the Brahmapootra have generally suffered from adverse climatic influences. Cachar and Sylhet, on the other hand, temporarily lost ground in respect of quality and value of produce, largely attributable to the effect of the earthquake, which was followed by widespread malarial sickness, rendering it difficult to maintain work at the highest point of efficiency—apart from the disturbance of factories, machinery, roads

and waterways. Estates in the Dooars appear to have been less affected; they have given full crops of average quality, if somewhat short of the excellent tea once produced in this district. In Darjeeling with a few exceptions results have been disappointing, notwithstanding the increased appreciation of its tea. Up to the date of the earthquake the gardens were doing well, but subsequently a general reverse was experienced, and although a fair yield was secured, the latter portion of the crop lacked the right flavour, greatly to the detriment of value. By some this was attributed to rapid flushing after excessive rainfall; by others to disturbance of soil during the earthquake which affected the bushes. The crops from Southern India—slowly growing in volume—have not been of sufficiently good quality to hold their own in competition with other growths, but if Managers will pay more attention to the details of cultivation and manufacture, there seems no reason why good tea should not be made there: if good it will find a ready market here. The season was not a favourable one for Estates in the Kangra Valley, but there is a demand for their tea abroad, and buyers will pay a fair price for such as have flavour.

As regards CEYLON:—Production increased, but at a slower rate than hitherto. Upon the whole the crop has maintained its ground in respect of quality, and although it has contained but few of the specially fine sorts originally made, tea of uniformly good make and flavour has been sent from estates situated on the higher levels, possessed of character so distinct from other produce as to make a market for itself. The position of properties which have not given "distinctive teas" and cannot work as cheaply as estates in the low countries seems less assured, and it will be well for their proprietors to make improvement of quality their first aim, in face of the tendency for values to decline for ordinary teas lacking special characteristics, wherever produced.

All growers in India and Ceylon have suffered from the high rate of exchange, which has raised the cost of production without bringing any compensation in the form of higher values in London. An inflated rupee may check further extensions, but the effect of this, in retarding increase in production, will not be felt for years. Some have also suffered heavy loss on rice, owing to the famine. These several drawbacks to a successful season, however, would not have been so much felt if the market had not been checked and buyers discouraged by the signs that Home Consumption was not expanding as it used to do. Useful as our growing foreign trade is, it is still inadequate to do more than stiffen the price of particular kinds, the value of the crop as a whole, remaining dependent (1) upon the requirements of the United Kingdom; (2) upon its quality.

The Board of Trade Returns show that in 1891 Home Consumption increased 8½ million lb. in 1892, 4½ millions; in 1893, 1 million; in 1894, 6½ millions; in 1895, 7½ millions; in 1896, 6 millions, and in 1897, only 3½ millions;—making a total of 37½ millions in 7 years, i.e., from 194 millions in 1890 to 231½ millions in 1897. By contrast with such progress, the increase of only 1½ million lb. during the 10 months ending 31st March was most discouraging;—that the figures at the moment look better is due to recent heavy duty payments in advance.

When writing a year ago, we pointed out some of the causes contributory to the large expansion in the past, and remarked that as they had "been for some time in operation in London and other great centres, if not in the country, it would be unsafe to reckon upon Home Consumption expanding in the future as substantially as it has done for the past two years." We also showed that the margin for increased use of our own teas at home had become narrow, owing to the extent to which China tea had already been pushed out of consumption. The figures are as follows:—

Of the total used in 1891-2 1893-4. 1895-6. 1896-7 1897-8					
British-grown tea	was	79%	86½%	88½%	90%
China and other	..	21	13½	11½	10
kinds were	..	21	13½	11½	10
					½

Apart from these reasons, have any other causes operated to cheek expansion, and if so, are they permanent in their effect, or merely temporary?

The principal beverages competing with Tea are Coffee and Cocoa. The quantity of Coffee and Chicory taken for home use in 1897 was 37 million lbs., compared with 37½ millions in 1896. The quantity of raw Cocoa taken was 27¾ million lbs. in 1897, compared with 24½ million lbs. in 1896, and the increase has continued since 1st January, which means that several million pounds weight of Cocoa and its compounds have been pushed into consumption, with the aid of lavish advertisement, mainly at the expense of tea. Opinions differ as to its future as a popular beverage. It lacks some of the properties which have made tea almost a necessary of life to the masses, and the price of the pure Cocosas retailed is nearly double that of tea. An indirect reason for the comparatively short Deliveries of tea last year may be the serious loss of income to the working classes incidental to the labour troubles. Renewed activity in the industries of the Midlands and North should beneficially affect a commodity of which wage-earners are the principal consumers.

Much attention has rightly been paid to fostering trade with other countries. The figures at fact show progress, but not sufficiently rapid to keep pace with the prospective increase in production. Our trade with America, indeed, continues small in view of the energy and capital devoted to the work of introducing our teas there, where we have to encounter the efforts of Japan to fill the opening left by the smaller receipts from China. We regard Russia as a more hopeful market, for the Russian buyers appreciate the best Indian and Ceylon teas and will pay a good price for them, whereas in other outside markets, whether Australian, American, or Central Asian, the demand is chiefly for the cheaper kinds and depends much upon the lowness of quotations. Business with Russia would be helped by the shipment of the fine sorts they like in larger lines, which prove to be most attractive.

The probability, then, seems to be that in the coming year the total supply may be somewhat heavier than the United Kingdom requires, and the surplus a little larger, perhaps, than the other markets will absorb. Under these circumstances it will be prudent to modify the policy, which has lately prevailed in some districts, of making the heaviest crop possible, irrespective of quality. So long as there was a fair margin of profit, this policy was successful; but with higher cost of production and reduced selling value it ceases to be so. Prices have fallen here for such kinds partly because London has become the destination of tea, from all parts, too common to find acceptance elsewhere; and partly from a reason to which we referred a year ago, viz., that the principal vendors who make tea a speciality have mainly built up and are maintaining their trade by selling *better tea* than the average individual retailer—not by pushing the sale of inferior tea at *lower prices*. The proof that this is the case exists in the fact that for many years the finest qualities have met with the strongest competition, and in the evidence that those who have bought them are among the most successful traders of the day.

The profitable nature of the Distributor's business is a factor of importance, and an element of strength not to be overlooked, as it ensures a buying-power commensurate with the large dimensions of the trade. The confidence with which wealthy buyers handle crops, however, depends largely upon their quality—not merely upon the statistical position—and there can be little doubt that the market has suffered more from the *inferiority* of the last Indian crop than from larger importations.

It is estomary to assume that China tea has been ousted from British and Colonial markets, and need not be deemed a serious rival. Indian and Ceylon teas, however, have made their way; 1, by their superior character and value, accentuated by the deterioration in the quality of China Congou; 2, by the help of their low cost of production. It must not be taken for granted that the Chinese are incapable of reforming

their methods and making good tea once more, in order to save a valuable trade now in danger of being lost; and it must not be forgotten that dear Rupees with cheap silver place British growers at a serious disadvantage compared with those in the Far East. There seems no occasion to fear competition at home from the produce of Java or Japan, but the Japanese will compete strongly with us to keep their trade with the United States and Canada, approaching an annual value of nearly £1,000,000.

Surveying the position as a whole, therefore, we conclude that the wisest policy for growers both in India and Ceylon will be, to pay the closest attention to improvement of quality; to cheek the tendency to pack and send forward to any part of the world tea so common as to lower the reputation of their produce; and to be slow in extending plantations upon soil which has not proved its capacity of yielding good tea. The industry is so thoroughly established and sound, that with ordinary prudence and normal climatic conditions, successful results may reasonably be anticipated for well-managed properties not overweighted with unduly high capital.

STATISTICS.

Showing the development of the INDIAN TEA TRADE during the past three Seasons, ending 31st May:—

Exported from	1895-96.	1896-97.	1897-98.
Calcutta			
To the United Kingdom	121,165,000	132,600,000	133,800,000

WM. JAS. & HY. THOMPSON *Brokers.*

#### IN THE LAND OF GINGER.—JAMAICA.

IN THE LAND OF GINGER, JAMAICA," is the title of a pamphlet from the pen of Mr. J. B. Kilmer, of New Brunswick, N. J., a reprint from the "American Journal of Pharmacy." Mr. Kilmer's investigations into the methods employed in planting and preparing ginger for the market, have been personally conducted on the plantations of the small settlers in the ginger producing districts of Jamaica, and are entertaining and instructive. We produce extracts from the pamphlet for the benefit of those of our readers who are engaged, or who are desirous of engaging in the cultivation of this important minor product.

The books state that "Zingiber officinale. Roscoe (Amomum zingiber,) is a native of Asia, and that it has been introduced into most tropical countries, and is now found in the West Indies, South America, tropical western Africa, and Queensland in Australia." But the vial handed over the drugstore counter, even though it may contain a weak decoction of pepper, will invariably be labeled "Jamaica Ginger." In these notes we shall, therefore, study this plant as seen in its popular habitat, thus keeping in

sympathy with the West India planter, to whom the only known spot where ginger grows is in his sun-lit garden.

One of the essential requirements for the growth of this plant is sunshine—Old Sol is here young, bright and active.

Another requisite for growth—moisture—is also here in plenty. In some portions, 281 inches, or 23 feet, is recorded as an annual down pour. In the "ginger district," 88 inches, or over 7 feet, has been the mean annual rainfall for the last twenty years. (In a report made by one of my correspondents in this district, October, 1897, 47 inches or nearly 4 feet, of rainfall were recorded in sixteen days.) While ginger grows at suitable elevations all over the island, it is mainly produced in the central western portion, along the borders of the parishes of Westmoreland, St. Elizabeth, Manchester, Clarendon, Trelawny, St. James. The underlying soil of this district consists of white and yellow limestone, with trappean formation: this is covered in some of the nooks or valleys with a pulverent mould or loam deposit several feet in depth. The plant grows luxuriantly in such soil, but apparently will not thrive in marshy soil, nor where there is present more than 10 to 20 per cent. of clay or 30 per cent. of sand. The government returns for the whole island give only about 250 acres of land devoted to ginger. This amount of acreage would not yield the crop harvested. But the real cultivation is not in acres, many cultivators having beds varying from six feet square up to the size of a building lot. A few cultivate from one to six acres. Large lots are very rare. For the most part, it is put in the ground in any convenient spot, alongside pineapples, yams, cocoa, cassava or other plants, often in the midst of a dense growth of bush or weeds. In the statistics of this fertile island this article does not figure in pounds, shillings and pence as largely as do some of its other products. Economically speaking, however, ginger is one of its most important articles of commerce. In my judgment, from 25,000 to 50,000 of its people are more or less dependent upon the ginger crop for such ready money as is essential to maintain their existence. The ginger planter divides ginger into "blue" and "yellow" from the color of the rhizome. These are also known as, respectively, "turmeric" and "flint." I was unable to see any botanical difference in the plant producing the two different coloured root-stalks, and many intelligent planters were unable to distinguish the kinds without first examining the root. If anything, it seemed to me that the blue was a degenerate species. The root of the blue is hard and fibrous, yields a much less proportion of powder, is less pungent, and therefore less valuable commercially. There is also a division into "plant" and "ratoon" ginger. Plant ginger is ginger that is planted each season; ratoon ginger is really a product of laziness. It is a return crop, secured by leaving part of the "hand" containing a bud in the ground when the crop is harvested. Ratoon ginger is much smaller in size of hands than the planted, and loses each year in flavour, each successive crop being less and less in amount.

#### Ginger Planting

Ginger is planted in March and April. The planting process consists in burying the divided fingers, each division containing an "eye" or embryo, in trenches or holes a few inches below the surface and about a foot apart, similar to the process of planting potatoes. The small grower simply digs a hole in a convenient spot. The thrifty planter first burns over his plot, to destroy weeds and insects, then ploughs and lays the plot out into beds and trenches. The growing plant needs plenty of sun, and the weeds and bushes must be kept down. This latter is a perplexing problem, unless the weeds have

\* I found some shippers in Jamaica ports who were exporting the undried "blue" ginger to supply the demand for green ginger as used in pickling and preserving.

been destroyed before the ginger has been planted. If the weeds are pulled or the ground disturbed while the plant is growing, water is apt to settle round the root, and this rots them. The red-like ginger plant, with its leafy stems, grows sometimes to a height of five feet; its cone-topped flowering stems reach from 6 to 12 inches, and, in a well-cleaned field, make a pretty show when in their September bloom. On wet soil and during very rainy seasons the root is subject to what is termed "black rotten." This is a rotting induced by warm, soggy soil. The root swells in spots, fills with water, turns black, and emits an offensive odor. In this condition it is attacked by insects and worms, which has given rise to the belief among the planters that the rotting is caused by a so-called ginger worm. (It is possibly a fungus disease.)

Growing ginger must be well watered. Irrigation is practised to a limited extent, but in most of the parishes this is unnecessary, as the rainfall is abundant. Fertilization, though highly important, is rarely attempted, partly owing to the small profit, but largely owing to the customs of the country. The most that is ever done is to plough in the weeds and cover the ground with banana trash. Rarely will the planter ever gather up the manure from his live stock and throw it on the ginger-bed. There are no stables used in Jamaica, therefore no such thing as a compost heap. Sea weeds and watering the beds with sea water have been tried, experimentally with good results; but no matter how large-sized roots or how fine a quality would be yielded, the average planter would not take the trouble to work his ground in a scientific manner. An all important feature is the rapid impoverishment of the soil that follows the ginger culture. One planter told me that only ferns would grow on the soil after exhaustion by this crop. There is thus a constant demand for virgin soil to secure the best-paying crops. This is attained by sending valuable timber up in smoke, as one authority tersely expressed it. "Dried-up streams, general barrenness in fact a wilderness marks the progress of ginger culture."

The situation is clearly summed up by Mr. Winfawcett, Director of Public Gardens for Jamaica, from whose report to the Honorable Colonial Secretary I quote: "The soil which produces the very highest quality ginger, realizing, perhaps, £10 per cwt. in the London Markets, is the very deep black soil of virgin forest. To grow ginger under this condition involves the destruction of large areas of forest. Magnificent trees, six feet in diameter, may be seen in some districts lying rotting on the ground, while the ginger cultivators have gone further to the centre of the island, abandoning the wood lands already cut down. The plan adopted in clearing a forest is for a cultivator to invite ten or twelve of his friends to a 'cutting match.' He provides food and drink, and the laborious work of felling tree is carried on merrily and without much expense. Afterwards, fire is put and the place is burnt over. This burning is considered very important, as much so as the virgin soil.

"Probably its importance is due principally to the deposit of potash and other mineral matters contained in the ashes, but the fire will also sweeten the ground, correcting sourness; and moreover, it destroys insect pests. Some cultivators will only grow ginger in freshly cleared woodland, and next year they move on to a new clearing; but although in this way they get very fine ginger, it is at the expense of forest land which would require a heavy outlay and perhaps a term of 100 years to restore. Albert Town was not long ago a great centre for the cultivation, but I was told there that growers had already got as far as 11 miles further inland.

"Ginger can be, and is, grown in many places year after year on the same ground. An intelligent cultivator at Borbridge stated that he knew of ginger growing for forty years in the same patch. Sanford Town is in a German colony, and one of the original colonists, Somers, an active old man of eighty years

of age, has been cultivating ginger and arrowroot there since his youth. He and the other colonists have been in the habit of planting a small patch one year, leaving it to ratoon as long as it was profitable, then throwing it up or growing other plants until, after a term of years, they again plant the same patch with ginger. This is an irregular rotation of crops; 'plant ginger,' the product of planting, is of better quality than the ratoons, and the ratoons in each succeeding year are inferior. When the ground is too poor to grow 'white ginger,' the blue ginger' the inferior variety, can be grown. "More depends upon the curing of ginger, considering the crop as a livelihood, than soil. I believe that the badly-cured ginger brought sometimes to the market is due to wet weather, rather than to want of care." "The export of ginger is, on the whole, on the increase, but if this is accompanied by the gradual destruction of woods and forests, it is not a subject of congratulation." An examination of the exhausted soil revealed the fact that it was deficient in organic matter, lime, phosphoric acid and soda. Attempts made, at my suggestion, to supply these deficiencies by the use of market fertilizers of various kinds were not productive of any favourable results. Stable manure alone resulted in a failure, as likewise did the use of a bat guano found on the island. The use of a marl, especially when mixed with stable manure, was a partial success.

The Jamaica Agricultural Society, in 1895, began a series of practical experiments which are still in progress. Their first results gathered in February, 1897, were somewhat affected by a drought in the previous November. Upon a limited area of worn-out land, which in check experiment gave no return, they secured a crop which would be equivalent to over 2,500 pounds of cured per acre, and the product was of extraordinary size and quality. The fertilizer aiding in bringing this result was a mixture of marl with a compound fertilizer made up of about 10 per cent. each of soluble phosphates ammonia and potash salts. These results were very encouraging and the Society has extended them by securing larger plots, giving aid to planters in the way of furnishing fertilizer, etc., returns from which will be gathered in the spring of 1898.

The solution of the problem of reclaiming land exhausted by the ginger and other crops, and the prevention of the further wasteful destruction of valuable soil, is in Ginger Land one of great moment. There is in this fair Island thousands upon thousands of acres of abandoned land, lying within easy reach of roads and ports; much of it has been abandoned because the soil has been exhausted by ginger or coffee. If by suitable tillage and manures it can be reclaimed, great benefits to the inhabitants will follow.

Ginger, as we know it, is the root-stalk of the plant. The root proper or root fibres are about ½ inch long, not very numerous, dying off as the rhizome advances and leaving a slight scar. As regularly shaped hands, with more or less straight fingers, command the higher price in markets, experiments were made to secure a regular shaped growth. Owing to the peculiarities of the native planter, instructions were not closely followed and the results were unsatisfactory. The fact was developed that a sprout starts from the parent eye, and from this stem intern, lateral shoots or branches develop in pairs. These side branches again develop in pairs, these pairs generally alternating on opposite sides. It was found that if the soil was well worked and pulverized before planting the growth was straighter than when planted in hard soil. Some difference was noted also in the condition of the parent plant; if this was well developed and vigorous the resultant root-stalk was of a better type than where the parent was small, heavily and crooked. The Botanical Department is now experimenting with selected plants.

#### Gathering the Ginger Crop.

Ratoon ginger is gathered from March to December, but planted ginger is not ready for digging until December or January, and from then until March

is the "ginger season." Ginger is known to be ready for harvest when the stalk withers. This begins shortly after the bloom departs. The rhizomes are twisted out of the ground with a fork. In this operation, every bruise or injury to the hands is detrimental to the market value. There is quite a knack in doing this, and it takes long practice to become expert. The hands are thrown in heaps, the fibrous roots are broken off, and the soil and adherent matter removed. This must be done quickly after removal from the earth, for, should the ginger be dried with the soil and roots still adhering, the product would not be white, and, if it lies in heaps before drying, it will mould. The custom is to throw it immediately into a dish of water; it is then ready for the mcoating or peeling operation; this is done by hand. A planter who has any quantity of it on hand, will make a "peeling match" by gathering his own numerous family, and whatever help his neighbors can afford. The ginger season thus becomes a time of merry-making.

#### *Peeling Ginger.*

Ginger-peeling is an art, and there are many expert peelers in Jamaica. The ginger knife is simply a narrow-edged blade riveted to a handle. In large operations an expert peels between the fingers of the hands, less experienced hands peeling the other portions. Examination of a transverse section of ginger will show the importance of the operation. There is an outer striated skin under which there are numerous oil cells, the oil cells being most numerous at the bud points. The oil contained in these cells, in specimens fresh from the ground, is almost colorless, very pungent, and exceedingly aromatic. It becomes yellow very quickly on exposure to the air, and, even upon drying without removing the epidermis, its delicate aroma is found to be fleeting. On drying the ginger the contents of these cells appear as a yellow, pithy mass. (It has been stated that this coloring matter is identical with that of Curcuma.) As this cork layer is the seat of the greatest amount of oil and resin cells, it will readily be seen that the deeper the peeling so much the more of these substances will be carried away with the epidermis, and more cells opened from which these principles may exude.\*

As fast as peeled, the roots are thrown into water and washed. The purer the water and the more freely it is used, the whiter will be the product. Generally a very little water washes a great deal of ginger. The hands are peeled during the day, and allowed to remain in the water over night. This water acquires a slimy feeling and if concentrated, becomes mucilaginous and acquires a warm and aromatic taste. The natives claim that this process sucks out the "fire and poison" from very hot ginger. I placed some pieces in a stream of running water for twelve hours, and succeeded in making them several shades lighter in color. This sample proved to be less pungent to the taste, and it is quite possible the force of the water carried away some portion of the aromatic principles. A few planters use lime juice in the wash water. This gives a whiter root, having some solvent action on the coloring matter, but, as the lime juice contains saccharine and pectose matter, it prevents drying, and mildew follows. In another experiment I supplied the natives with citric acid, vinegar and acetic acid. They all worked fairly well, citric acid being the best whitening agent, but it was reported that the process was expensive and troublesome. It is generally stated that ginger is deprived of its coat by being plunged into boiling water before being scraped. This practice is not used to any extent in Jamaica. Its effect is to swell the starch and mucorin-like gums. I found that after keeping the freshly

peeled root-stalks in boiling water for an hour they were considerably swollen and the stream was filled with the aroma of the ginger. Under this treatment the coating comes off easily; but, if the action of the boiling water is prolonged, the starch and fibre are acted upon, the product dries hard and the color is darkened. In fact, what is known as "black-ginger" of the market is the result of this process. Ginger is found in the market coated with calcereous matter, such as carbonate of lime, etc., this is said to be to fill a demand for "white ginger." Such a proceeding is apparently unknown among the planters. Well-cured ginger has a decided white coating and that is all they know about it.

It has been stated that it is a common practice to bleach ginger with the fumes of chlorine or sulphurous acid. It may be done in the other parts of the world, but no instance of it is known in Jamaica.\* I tried chlorine gas as a bleaching agent, but at best the product was of a dirty yellow color. By using the fumes of burning sulphur, the whole being partially enclosed in glass, the heat of the sun aiding in the experiment, the ginger was whitened and mildew prevented. I found on trial that it might be of service to place the ginger in a weak solution of chloride of lime before drying; this would aid in bleaching and prevent mould.

#### *Curing Ginger.*

After washing, the process of drying follows: The tropical sun is the drying agent in all cases. Large operators have what is called a "Barbecue." This is a piece of ground several feet square, leveled off and laid with stone and the whole coated with cement. It is placed so as to receive the greatest amount of sunshine. The small planter uses what is called a "Mat," consisting of sticks driven into the ground, sawbuck fashion, and across these sticks are laid boards, palm, banana or other large leaves; oftener than otherwise, the place for drying is a few palm leaves spread upon the ground.

Careful handlers put their ginger out as the sun rises, and turn it over at midday, taking it in at sundown. Rainy or cloudy weather invites mildew. It requires 6 to 8 days for the root to become thoroughly dry. I made several tests to ascertain the loss in weight by drying in the sun, and found the average to be nearly 70 per cent.

Ginger dried in the sun for the market examined for moisture gave the following results: Six samples well dried specimens, showed a further loss when dried at 100° C. as follows: 7-2, 8-5, 8-9, 9-5, 10, 11, 12 per cent. Several poorly-dried specimens, some of which were damp and mouldy, gave from 15 to 25 per cent. moisture when dried at 100° C. During the progress of my attention to this subject, several attempts were made to utilize artificial heat in drying ginger. Such a course would, in some respects, be a very desirable one.

In a portion of the island given almost entirely to the cultivation of this product, a few years ago a wet season prevailed. It was impossible to dry the crop in the sun; as a consequence there was a loss of the crop, followed by a considerable distress among the planters.

During my observations an attempt was first made to dry without removal of the skin coat. This, if successful, would have meant the saving of considerable labor. The product was quite dark, the flavor not as good as that of the sun-dried. By removing a part of the coat the drying was hastened. Dr. A. G. McCarty, a practicing physician and owner of a plantation, at my suggestion, placed in operation an American fruit evaporator. It was necessary to use wood as a source of heat, and, partly owing to the high temperature and partly from the ignorance of the operator, the product so far has been rather poor in quality, the color many shades darker, much of the aroma was lost, and a smoky, burned flavor acquired. Other planters are trying the process on this year's crop.

\* The Jamaica Agricultural Society has advertised in the United States and England the desirability of a machine or apparatus to be used in removing the coating from ginger; experiments along the line are now being made.

\* Bleaching by chemicals and coating with powders are market processes unknown to the planters.

A curious incident resulted during these experiments. The natives, through prejudice against innovations, boycotted the drying apparatus, and refused to furnish supplies at any price. Experiments were made with calcium chloride as a drying agent. The result did not equal samples produced by the native method of drying in the sun. Attempts made to dry the ginger after first slicing, as might be expected, resulted in great loss of flavor and pungency. My conclusions were that, when well conducted, the native method of careful peeling and curing in the sun would produce a handsomer and a better product than any process yet suggested.

These observations were not undertaken with a view of making any complete analysis, and it was found that a macroscopic examination by expert judges was far more reliable than any assay that could be made with limited facilities present in the ginger fields. A few such examination were made as follows:

*Ethereal Extract.*—Exhaustion of the ginger with either in a Soxhlet extraction apparatus. The resultant extract, after evaporation of the ether, was dried over sulphuric acid to remove moisture. From this extract the volatile oil was calculated by the loss on drying the ethereal extract at 110° C. for three hours. The only results from this process that seemed to be of value were that the finer grades, when carefully dried, contained a higher percentage of volatile oil.

Ginger dried without removing the peel gave somewhat higher results as to volatile oils than the peeled. The loss of this constituent was greater in a product dried by artificial heat than when dried by sun. The amount of volatile oil found by aforesaid process was, lowest, 1 per cent.; highest, 3.20 per cent. The results as to ethereal extract, exclusive of volatile oil or from alcoholic extract from the ether-exhausted residue, seemed to be of little value, the different specimens giving such greatly changing amounts as to afford no guide.

In these Experiments some observations were made that were interesting though of no particular value. In the extracts from ratoon ginger there was evidently a more fiery taste and less flavor than in the planted ginger. This was also true in regard to the extracts from the blue and yellow varieties, the yellow having a much finer odor and taste. Upon the addition of water to these extracts in sufficient amounts to precipitate the dissolved resins, it was observed that in the case of the well-cured specimens of plant ginger a delightful aroma was imparted to the water, a true ginger flavor, without fire or pungency. But in extracts from old ratoon ginger, from mildewed specimens spoiled in drying, this aroma was greatly changed, becoming musty and weak, the taste in some instances being decidedly better. Ninety-five per cent. alcohol was found to give better results as to flavor of extract than that of lower strength.

The ruling price in Kingston and Montego Bay for the heap is a penny-half-penny (about three cents). Heaps purchased by me varied according to quality, but the average weight was from one-fourth to one-half pound.

The buyers of ginger for shipping are expert and accurate. They grade, sort and price with a quick eye and ready touch gained by years of practice. The highest grades are large-sized hands of light and uniform color, free from evidence of mildew. This grade is brittle and cracks easily, but broken pieces depreciate the value. Buyers also require the hands and fingers to be firm and full, without wrinkles or spots. They generally assort into four or five grades, that which is shriveled and small being the lowest. The dark varieties form another, the heavy, tough and flinty a third. These four are finally assorted by placing hands which are small but of good texture and color as one grade. The larger-sized, well-bleached hands into the highest grade.

The ratoon ginger sorts generally bring the lowest price, as they are small, soft and soggy, and lack flavor. Ginger gathered green shrivels much in

drying and is less aromatic and pungent than when fully matured. Ginger that has mildewed is spotted, and the mildew starts a decomposition that affects the flavor. Ginger put in bags or laid away before being thoroughly dried will mould and acquire a musty odor and flavor, which it is impossible to remove.

The largest sized hands are carefully selected by buyers and shipped to special markets, usually to England. I noticed hands weighing as much as eight ounces; many of them weighing from four ounces upward.

Ginger is packed in barrels for shipment.

#### *Economics.*

The amount of Ginger exported from this Island during the last ten years is shown in the following table\* :—1887, 1,121,827 lb.; 1888, 1,141,877 lb.; 1889, 1,002,653 lb.; 1890, (½ year), 554,93 lb.; 1891, 1,219,197 lb.; 1892, 1,822,531 lb.; 1883, 1,526,884 lb.; 1884, 1,672,384 lb.; 1885, 1,736,460 and 1896, 1,960,609 lb.

The yield and profit of the ginger crop depend somewhat upon the nature of the soil. In favourable seasons rainfall, sunshine, planting care and curing, are also factors. An average yield can be estimated at from 1,000 to 1,500 pounds dried ginger per acre. In exceptional cases, 2,000 pounds have been gathered. There are planters in Jamaica who plant ginger here and there in patches, and gathering as little as a hundred pounds in a year. Ginger is well adapted to the small planter, and admirably suited to the peasantry of Jamaica, who, by slow evolution, are passing from serfdom to manhood and independence.

The Botanical Department, through its crops of agricultural instructors, is now going among the people and showing them exactly what may be done in the way of improving their methods of cultivation. The Jamaica Agricultural Society is conducting practical and extensive demonstrations to show the use and value of fertilizers. These have already an important bearing upon this crop. Information recently to hand states that the crop which will be gathered in the coming season (Spring, 1898) will probably be the largest ever grown upon this Island. This is due to the improvements in cultivation, together with an abundant rainfall. Unfortunately for the ginger planter, a largely increased production will tend to lower prices.

I am aware of the fact that these notes will add but little to the already recorded observations upon ginger. It may be questioned whether such a common article of materia medica merits any extended research. We should, however, realize that any drug that holds a name and place in medicine is of sufficient importance to merit our best efforts.

Our knowledge of the changes which take place in crude drugs, due to the methods of preparation, is very meagre. Karl Dieterich (*Berichte der Deutschen Pharm. Gesellschaft, 1896. p. 335.*) says:

“Thus it is that I am convinced that the study and development of this branch of pharmacy will yield far more than theoretical results and that the analysis of fresh and dried drugs at different stages will be of great practical advantage in directing the proper manipulations to be employed in producing uniform and superior products.” My convictions are strong that the study of drugs should begin in their habitat and extend to the bedsides of the patient. That it is important to know every change that may take place in their cultivation and collection as well as those incident to their preparation for administration, this seems to be sufficient warrant for these observations taken in the

\* Figures obtained from the office of the Collector-General of Jamaica show that more than one-half of the crop is shipped direct to the United States, ports.

The amount of ginger imported into the United States from all parts of the world, from the years 1890 to 1894, was as follows:—1890, 2,328,825 lb.; 1891, 2,697,989 lb.; 1892, 1,431,295 lb.; 1893, 2,927,942 lb.

Land of Ginger—Jamaica.\*—*Journal of the America Agricultural Society.*

### ORANGE CULTIVATION IN MEXICO.

It is generally supposed that the Spaniards introduced several varieties of fruit trees into Mexico, among them perhaps the sweet orange, but the traveller in that country, after seeing the numerous forests of wild oranges inclined to the theory that the ancients knew of this fruit, and that perhaps it was cultivated before the time of Cortez. However, works treating on the history of old or ancient Mexico do not describe oranges; yet it is to be presumed that the existing wild stock, found generally in obscure and inaccessible regions of the tropics, was placed there originally by the hand of man, and nature spread it widely, but gradually changed it from a sweet to a sour or bitter orange. The United States Consul-General in the city of Mexico says that the Mexican orange comes under the family *Aurantiacea*, genus *citrus*. Although fifty varieties are known to exist, there are but three kinds of oranges found in the markets of the country, classified as follows:—The sweet orange, "naranja dulce;" the Chinese orange "naranja de China;" and the sour orange, "naranja de agria." The "naranja de China" is a small fruit, a little over two inches in diameter, spherical, slightly depressed at the apex, deep yellow in colour, thin, with minute oil cells, and very delicious; its tree is somewhat dwarfish, having small leaves, one inch to one inch and-a-half long, and resembling those of the myrtle. The sour orange has a roughish rind, rather thick, acrid, bitter pulp, and is generally large in size; its tree is large, having a hard wood, and in many places develops a trunk of great dimensions; the leaves are of a brilliant, agreeable green colour, aromatic, lanceolated, and with a broadly-winged petiole. The sweet orange could be greatly improved and much could be accomplished with it by careful selection in its propagation—for instance, selecting shoots, cuttings, or seeds from trees, or budding, or grafting with sound stock from California and Florida. There are few countries that possess the natural advantages which subtropical and tropical Mexico enjoys, and hardly any are gifted with the immense proportion of territory comprising two-thirds of the Republic, suitable for orange culture. The greatest producing and most important districts, having easy means of transportation, are La Barca, Ocotlan, and Guadalupe, in the state of Jalisco; Yauatepec, Morelos, Linares and Montemorelos, Nurvo Leon; Rio Verde and San Antonio, San Luis Potosi, Guaymas and Hermosillo, Sonora; Julia, Tamaulipas, and Coatepec and Cordoba, Veracruz. In Montemorelos and Linares, during the last three years, more than 50,000 trees have been planted with several hundred grafted and budded with California and Florida stock. The Mexican people relish the fruit, and especially on the occasion of the holidays—All Saints' Day and the Posadas—vast quantities of it are brought into the principal cities for home consumption. Mexico city alone consumes annually more than 300 car-loads of sweet, Chinese, and sour oranges, while Puebla consumes 70, and Guadalupe 30 car-loads. As regards the by-products of the Mexican orange, the leaves (*hojar*) are used for the tea of the Indians and of the poor, and in large cities where they are sold in the streets and in the markets in small bunches for one half penny each, are consumed in large quantities. They are considered the best remedy for insomnia and restlessness, and are highly commended for children. A wine is manu-

\* In preparing this paper, valuable assistance has been rendered the writer by those whose names are mentioned therein. In addition, he feels indebted to His Excellency, Sir A. Blake, Governor of Jamaica; to the Hon. Q. O. Eckford, ex-United States Consul; to Geo. A. Donet, Esq., Secretary of the Jamaica Agricultural Society; to L. Frazer, of Montego Bay, and many others.

factured from the refuse oranges, purchased at about one shilling a hundred in Cuantla, Morelos, and Guadalupe, which retails at two shillings a bottle. There are other valuable products which could be obtained, such as the distilled water of the blossoms, used for toilet purposes, worth about 19s. a gallon; citric acid from the pulp of the sour oranges; oil from the leaves and rind; and the essential oils from the blossoms, leaves, and unripe fruit. Mexican growers propagate the orange from seed, but it can be reproduced more advantageously by budding, grafting, layering, and from cuttings. The fruit appears in the latter case, in from four to five years. Budding and grafting have to be practised on grown trees. Propagation by cuttings can be effected from both immature and mature growth. In propagating by seed, a well ventilated place, yet free from cold winds, is selected; the soil must be deep and susceptible of being irrigated. For this process, good vigorous large seeds must be chosen from healthy fruits and best plants. In May the seed beds are made and in June the seeds, which have previously been kept in earth, are sown 4 inches apart by 8 inches between the rows. The rows can be run with the length of each seed bed, thereby producing 427 seedlings to the seed bed. Having soaked the seeds from 12 to 20 hours in lukewarm water, previous to sowing them the plants should come up in fifteen to twenty days. If the rainy season, has not set in, and on dry days during that season, the seed beds are sprinkled every two days, but when the plant has made its appearance a generous application of water is necessary every day, the amount being decreased as the plant grows. In May the ground is ploughed, cleared of all weeds, and fertilised with cheap manure, having plenty of nitrogenous matter. After the land has been well worked, ditches are run at a distance of about 13 feet apart, and then cross ditches of the same distance. At the intersection of these ditches hole 2 feet deep are made for the reception of the young trees; this will give 245 trees to the acre, which can be decreased on a very rich soil, making the distance 16 feet apart. Great care is taken in transferring the young plants that they are not in any way injured either in leaf or root. A ring (*cajete*) is hoed round each tree, wide enough to admit manure, and in connection with the ditches referred to above, for irrigation purposes. If it does not rain all day following the transplanting, the plants are irrigated, and afterwards so often as they require it. Two or three days after, if the earth around the plant has settled loose soil mixed with leaf mould or manure is used to make up the loss. When the trees are mature, dead and ill-shaped branches are removed with the pruning saw, the wound being trimmed with a knife and then tarred over. Wax can be substituted for the tar if the former is not obtainable, and this is done to prevent decay entering into the heart of the tree. Maturity of crop varies very much in Mexico. In Campeachy, Chiapas, Oaxaca, Guerrero, Atlixo (Puebla) and Yauatepec (Morelos) the fruit ripens as early as July, and the season lasts until December 1, while in Cordoba and Coatepec (Veracruz), in Michoacan and Jalisco until September, Rio Verde and Montemorelos following, and the Sonora crop comes in last, about November 10. The yield in Mexico varies very much—soil, climate, proper irrigation, pruning, and cultivation being important factors in determining the extent of the crops. In Atlixo, Yauatepec, and Tacambaro the trees average 860 oranges each, but in Atotonilco, Montemorelos, and Hermosillo, the average yield is from 1,700 to 2,200 oranges a year. With the advantages of climate and soil the tree in Mexico should yield from 5,000 to 8,000 oranges. The tree is not generally subject to any pest, nor is it affected by any disease.—*Indian Agriculturist.*

JAVA SHIPPING MEN intend, says the "Liverpool Journal of Commerce," to try and benefit by the war owing to the extra demand for quinine and the check to the trade in Cuban and Philippine sugars.

### “THE THIRTY COMMITTEE” AND EXTENSION OF TEA SALES.

The “Thirty Committee” being one of the most important organizations in existence for pushing the sale of Ceylon tea in foreign markets, its proceedings are always of special interest. In another column we give the minutes of the last meeting at which Mr. Mackenzie, our Commissioner, was present and received a unanimous and surely well deserved vote of thanks for his labours on behalf of Ceylon tea throughout the great North American continent. Not a dissentient voice was raised,—not a word suggesting an amended or new policy,—and therefore, Mr. Mackenzie has completely justified the confidence reposed in him as Ceylon’s representative in America where he has had to cope with some of the smartest business men in “creation,” and so it must be all the more encouraging for him to know that the Committee, and specially the planting community, have so unanimously declared their confidence in him. We are certain that all this confidence will lead to no effort being spared on his part to gain fresh ground and we sincerely trust that the methods devised may continue to be even more successful than they have been in the past. Financial matters of course occupied a good deal of the attention of the Committee and it is only right that members should be in possession of all details as to the state of the fund and how it is expended whether in America, Russia, Germany, or elsewhere. Much has been heard about the impotence of manufacturing green tea for the American market. The Committee have carefully considered the subject, and their resolution to consider applications for assistance from those prepared to experiment in making these teas for export to America, while certainly cautious, holds out an inducement which may result in much good. A sum of £500 has been voted for the purpose of pushing our staple product amongst the green tea drinkers in Canada and Mr. Mackenzie will no doubt see the sum fairly apportioned. The business before the meeting was varied enough, and embracing from South Africa to Norway and from France to Russia, which only comes second to North America in importance. The more attention that is directed to Russia, its import duty, customs of transit, &c., the better. But for a moment, most interest is concentrated on Austro-Hungary, and that is dealt with separately.

### THE THIRTY COMMITTEE.

Minutes of proceedings of a meeting of the “Thirty Committee” held at Kandy, on Friday, the 20th day of May, 1898, at half-past 7 o’clock (7-30 a.m.) in the morning.

Present;—Messrs. F. G. A. Lane, (Chairman); A. Philip, (Secretary); Wm. Mackenzie, (Representative in America); Hon. J. N. Campbell, M.L.C.; Messrs. James E. P. Ryan, W. Henry Figg, A. E. Wright, R. A. Galton, E. Turner, J. B. Coles, A. J. Denison, J. H. Starey, J. A. Burmester, George Greig, Hugh B. Roberts, Gordon Pyper, H. V. Masefield, A. A. Bowie, Joseph Fraser and A. Melville White.

The notice calling the meeting was read. The minutes of proceedings of a meeting of the Thirty Committee held at Kandy, on Saturday, the 12th March, were submitted for confirmation.

Resolved:—“That they be and they hereby are confirmed.”

Read letter from Government acknowledging receipt of copy of the minutes of proceedings of a meeting of the Thirty Committee held at Kandy, on the 16th of February, 1898.

### STATEMENTS OF ACCOUNTS.

Resolved:—“That members of the Thirty Committee be furnished with a detailed statement of the names of those to whom payments have been made in America, for purposes of advertising with the amounts paid to each in 1897; also with a report and statement of account of the whole fund for the same year.”

With reference to the last paragraph, it was pointed out that a 100 copies of the report of the Thirty Committee, with statement of account for the whole fund for the year 1897, had been printed and duly circulated and that there remained only about six copies available in pamphlet form for issue to any members who might wish for another copy, but that the report, minutes of proceedings and statements of accounts for the year 1897, would also be included in the usual way with the proceedings of the Planters’ Association in the annual volume.

### FINANCES.

Submitted letters from the Treasurer of the Colony.

Submitted letters from the Manager, National Bank of India, Ltd.

Submitted sketch memo of the position of the fund as at 29th May, 1898.

Resolved:—“That the Bank be asked to furnish quarterly a transcript of Mr. William Mackenzie, No. 2 account for the information of the Committee; (2) that the sanction of the Governor in Executive Council be obtained to the transfer of any available balances in the Ceylon Tea (New Markets) Fund, from time to time into fixed deposits with the Bank for short periods with a view to earning interest on such temporary balances.

### GOVERNOR IN EXECUTIVE COUNCIL.

Read letter from Government intimating that the Governor has been pleased with the advice of the Executive Council to sanction the proposal to send 500 lb. of Ceylon tea to Norway for free distribution, in terms of resolution passed by the Committee and forwarded to Government by letter, dated the 2nd March. Read letter from Government intimating that the Governor has been pleased with the advice of the Executive Council, to sanction the expenditure of a £1,000 in advertising Ceylon Tea in Russia, in terms of resolution passed by the Committee and forwarded to Government by letter, dated the 2nd March. Read letter from Government intimating that the Governor has been pleased with the advice of the Executive Council to sanction the expenditure of £200 sterling in advertising

### CEYLON TEA IN SOUTH AFRICA.

Read letter from Government intimating that the Governor has been pleased with the advice of the Executive Council, to sanction the expenditure proposed to be incurred by the Committee in advertising Ceylon Tea in Germany, in terms of resolution forwarded to Government by letter dated the 17th March.

### REPRESENTATIVE IN AMERICA.

Mr. Wm. Mackenzie (representative in America) who was present, gave a long and interesting sketch of the position, and of the progress made

in his work of pushing and advertising Ceylon Tea in America. Resolved:—“That copies of Mr. Mackenzie's accounts, without names being given, be furnished to all members of the ‘Thirty Committee’; (2) that copies of Mr. Wm. Mackenzie's letters be circulated to members of the ‘Thirty Committee’ as far as practicable before the regular meetings; (3) that sketch memos similar to those submitted for the past few months, showing position of the Fund be laid on the table at each meeting; (4) that the Secretary be and he hereby is authorised and empowered to make the necessary arrangements for such special services under the general approval of all necessary expenditure incurred in and about the carrying out of the provisions of Ordinance No. 4 of 1894, in terms of letter from Government, dated 13th June 1895; (5) that the Thirty Committee desire to express to Mr. Wm. Mackenzie its great appreciation of the good work done by him in pushing Ceylon Tea into the American Market, and its approval of his methods, which have been so eminently successful in the past. The Committee now records its unanimous confidence in him, its hearty thanks and trusts he will continue to carry on the work and gain fresh ground.

#### GREEN TEAS.

Discussed the question of the manufacture of Green Teas for America. Resolved:—“That the Committee would consider applications for assistance from those prepared to experiment in making Green Teas for export to America.”

#### CEYLON TEA IN WESTERN CANADA AND THE PACIFIC SLOPE OF THE UNITED STATES, AS FAR EAST, AS SALT LAKE, AND DENVER, &C.

Read letter from Messrs. Rowbotham & Co. supporting an application on behalf of Mr. J. E. Chipman for advertising Ceylon Tea in the above-mentioned country. Resolved:—“That Messrs. Rowbotham & Co. be informed that their application on behalf of J. C. Chipman will be considered at next meeting before which a member of Committee has been asked to obtain full information as to the extent and nature of Mr. Chipman's business.”

Read letter from Mr. C. W. Horsfall enclosing a letter from Rev. T. S. Smith, making an application for samples of Ceylon Tea for distribution in New Zealand, etc. Resolved:—“That it be suggested to Mr. Horsfall that he should inform Rev. Mr. Smith, that he might renew his application to Mr. Wm. Mackenzie at his New York address as already given.”

#### CEYLON TEA IN RUSSIA.

Read letters from Government acknowledging receipt of a letter in triplicate to the Secretary of State for the Colonies, on the subject of duties levied by the Russian Government on tea, and stating that His Excellency the Governor will have much pleasure in complying with the request made relative to the import duty on tea in Russia.

Read letter to the Secretary of State for the Colonies above referred to.

Read letter from Mr. J. M. Maitland, Kirwan. Resolved:—“That pending further advices from Mr. Christie, the Committee are not disposed to make any appointment.”

Read letter from Messrs. Rodewald & Heath, while thanking the Committee for their suggestion that they should apply for samples of Ceylon Tea for free distribution in Russia, regretting that they shall not be able to take advantage of the proposal as they do not think

the sale of Ceylon tea in Russia would be likely to be increased by this means.

Read letter from Messrs. Peek Brothers & Winch, Limited, acknowledging the receipt of the resolution of the Committee, regarding the grant to them as passed by the Committee at a meeting held on 1st February.

Read letter from Messrs. Crossfield, Lampard & Co., Colombo, in regard to the grant made to them, and enquiring when payment would be made. Resolved:—“That Messrs. Crossfield, Lampard & Co. be informed in reply that on production of vouchers for the whole £3,000 sterling, or any considerable part, the Committee would be prepared to pay one third subject, to the conditions contained in the correspondence on the basis of which the grant was promised.”

Read letter from Mr. Arthur Lampard to Mr. Lane.

Read letter from Mr. John Ferguson to Mr. Lane with enclosure

#### CEYLON TEA IN GERMANY.

Read letters from Messrs. Murdoch & Bramwell in regard to the grant of 5,900 lb of Ceylon tea, made to Mr. John Hagenbeck for free distribution in Germany, in terms of the resolution of the Committee passed at a meeting on the 12th March and enclosing invoices and specimen labels and intimating that the teas had been packed and would leave per “City of Calcutta” on through Bill of Lading for Hamburg. Resolved:—“That payment be made.”

Read letter from Messrs. C. H. and A. Bohringer, Colombo, acknowledging cheque for R750 and noting with pleasure the Committee, further grant of £50 sterling for advertising Ceylon Tea in Germany on the same terms as previously.

#### CEYLON TEA IN NORWAY.

Read letter from Mr. A. G. Seton regarding Messrs. A. Ktieboleget G. Maren & Co., Stockholm. Read letter from Messrs. A. Ktieboleget G. Maren & Co., Stockholm, defending themselves against the strictures passed on them by Mr. R. V. Webster.

Resolved:—“That consideration of the papers be deferred.”

Read letter from Mr. C. Palliser acknowledging receipt of 250 lbs. Ceylon tea granted by the Committee and stating that he had distributed the tea, to his Agents in Bergen, Stavenger, and Christiania and requesting payment of the duty thereon amounting to £13 17s 7½d sterling. Resolved:—“That the claim be paid.”

Read letter from the Ceylon Company, Limited, regarding the shipment of tea granted to Mr. Floor, Burgundy.

#### CEYLON TEA IN AUSTRIA HUNGARY AND OTHER COUNTRIES.

Read letter from the Imperial and Royal Austro Hungarian Consul, stating that he had received from the Lord High Steward of the Imperial and Royal Household, through the Minister of Foreign Affairs, information that his Imperial and Royal Apostolic Majesty has been graciously pleased to note with satisfaction the intention of your Committee to offer to His Imperial and Royal Majesty, a presentation of Ceylon tea, on the occasion of the Jubilee of His reign.

Read letter from Messrs. Bosanquet & Co., enclosing account for the presentation tea and stating that it had been shipped while a letter of advice had also been sent to the British Ambassador Sir Horace Rumbold in Vienna. Resolved:—“That the invoice be paid.”

Read letter from the Anglo Colonial Import Association Budapest, intimating that the samples of Ceylon Tea for free distribution had arrived, and claiming payment of freight and duty which they state amounts to about £100 sterling. Resolved:—“That the attention of Messrs. Cooper, Cooper & Co. Ltd., London, who made the application on behalf of the Anglo Colonial Import Association, Budapest, Hungary, be drawn to the allegations made by Mr. R. V. Webster, which appeared in the Ceylon newspapers and that they be requested to give a detailed explanation to the Committee regarding the advertisement referred to.”

Read letter from Messrs. Cooper, Cooper & Co. Ltd., advising that they would draw for £200 sterling for Belgium and £40 sterling for Sweden by next mail.

CEYLON TEA IN CANADA.

Resolved:—“That a sum of £500 sterling be devoted to push Ceylon tea amongst the Green tea drinkers in Canada, and that the grant be handed to Mr. Wm. MacKenzie, to apportion as he considers best; (2) that the sanction of the Governor in Executive Council be obtained to this appropriation.”

UNIVERSAL INTERNATIONAL EXHIBITION TO BE HELD IN PARIS, IN THE YEAR 1900.

Read letter from Government intimating that no official information has yet been received in regard to the Paris Exhibition, but that it is observed from the newspapers that a Royal Commission has been issued instructions will doubtless soon follow. Until the Regulations which are said to be on a new principle are issued, it cannot be stated what space the Ceylon is likely to require.

INDIAN TEA ASSOCIATION, CALCUTTA.

Read letter from the Indian Tea Association, Calcutta, asking for information regarding the levy, the proceeds of which are devoted in Ceylon to the exploitation of foreign markets as the Indian Tea Association's attention is now being prominently directed to the best means of raising a permanent annual fund to aid in the expansion of the trade in British-grown tea. Intimated that the desired information had been supplied.

RECEIPT ON ACCOUNT OF TEA FUND.

Submitted letter from the Treasurer of the Colony, No. 766, on the subject of a receipt furnished. Resolved:—“That the request made be complied with.”

TEA SALES IN COLOMBO.

Read letter from the Secretary, Ceylon Association in London enclosing copy of a letter received from Mr. A. Lampard in regard to tea sales in Colombo. Resolved:—“That the matter be placed on the agenda for next meeting.”

The Thirty Committee then adjourned.

A PHILIP,

Secretary to the Thirty Committee.

TROUT CULTURE IN CEYLON.—We direct attention to the extremely satisfactory account of his stewardship which Mr. Burrows furnishes in our correspondence column as Hon. Secretary of the Ceylon Fishing Club. That 11,788 trout fry should have been successfully distributed among so great a variety of our upland streams must be cause of gratification to all who take an interest in trout acclimatisation, apart from the enthusiastic anglers in our midst.

“FOUR IMPORTANT CEYLON TEA COMPANIES.”

[Mr. Wilson's “Investors' Review,” strange to say, has been comparing the same four Companies we dealt with the other day.—ED. T.A.]

Ceylon tea companies, as a rule, are small, but in the past week four of the large ones issued their reports. Each company complains of a lower price obtained for its tea, and naturally the higher exchange and enhanced cost of rice, through the Indian famine, adversely affected profits. It might be well to explain that the cost of rice, affects the companies from the fact that they are bound to supply their coolies at a fixed price, and in times of high prices the companies have to pay a good deal more for the grain than the amount received back from the coolies. The exchange for the year 1897 averaged just about 1d. per rupee higher than in 1896, which meant an increased working charge of about ¼d. per lb., while the higher price of rice represented nearly another ¼d. per lb. So the companies had their charges increased by ½d. per lb., in addition to which a lower price was obtained for their tea. The increase in acreage, too, was very moderate, as the following table sets forth:—

Ceylon Tea Plantations	Mature area. 1896.	Mature area. 1897.	Crop. 1896. lb.	Crop. 1897. lb.	Price per lb. 1896. d	Price per lb. 1897. d
	7,998	8,067	3,763,167	4,000,516	8½	7½
Eastern Prod. & Estates Nuwara Eliya	9,490	9,565	3,715,000	3,635,000	7½	7 1-16th
Standard	1,734*	2,302*	565,692	699,223	9½	9½
	1,519	1,680	602,773	749,630	9½	9½

\* Part of this worked for only some months in year.

The Eastern Produce Company actually obtained a smaller crop, but the Nuwara Eliya had an output exceeding the estimates. In its case, however, the increase is in a great measure due to the fact that it is a new company, and in 1896 it evidently did not gather the full crop upon its acreage. The Standard Company included another estate it had purchased, but even then the yield per acre is higher while the Ceylon Tea Plantations had merely an ordinary increase. Under these circumstances the profits of the companies working under normal conditions were bound to be lower, and the following table gives the amount and the manner in which it was divided:—

Ceylon Tea Plantation	Net Profits.		Put to Reserve, &c.		Dividend.	
	1896. £	1897. £	1896. £	1897. £	1896. Per cent	1897. Per cent
	48,896	43,713	18,892	11,600	15	15
Eastern Produce and Estates	48,212	40,660	23,219	14,963	6½	7
Nuwara Eliya	9,910	13,584	953	1,023	6	6
Standard	10,991	10,920	2,500	2,000	15	15

The increased profit of the Nuwara Eliya was mostly due to its working the greater part of its estates for the whole year, but it must have done relatively better than the other three companies. Yet the margin set aside for reserve before paying the dividend compares badly with them. The fact that the older concerns have been so prudent in the past mainly accounts for their good exhibit at the present time. In spite of the decline in profit, the Eastern Produce is able to pay a higher dividend (this, however, only represents £1500), and sets aside nearly 40 per cent. of its profits to reserve and depreciation, and the two others pay the same dividend, the Standard setting aside nearly 20 per cent., and the Ceylon Tea Plantations 25 per cent. of their profits to reserves. Beside these statements, the

deduction of £1,023 by the Nuwara Eliya or about 7 per cent. of the profits, is poor especially when it is remembered that £381 of the sum is represented by the writing off of the balance of preliminary expenses. Yet this company, of the quartette, needed most in the way of accumulation from revenue, for taking the generally accepted formula, its capital cost works out at £89 per mature acre, as against about £30 per mature acre for the Eastern Produce and Standard Companies, and £21 per acre for the Ceylon Tea Plantations. Of course, we know that an acre of the Nuwara Eliya must be more valuable than an acre of the other three, for on an average it obtained last year 578 lb. of tea per acre, worth 9½d per lb. Accordingly, in working out the formula we have treated every acre of immature Nuwara Eliya tea as being worth £10 an acre, as against £20 per acre for the immature tea of the other Companies. Even allowing for these circumstances, we must assume that the company is highly capitalised, and it would have been more prudent to have paid less in dividend and studied reserves to a greater extent. It is, however, a high-grade company, and so far has not worked the whole of its properties for a year. Of course, the shares of the Eastern Produce, Ceylon Tea Plantations, and Standard Companies stand at higher premiums in the market than those of the Nuwara Eliya, but even when this is taken into account the latter company compares badly. Treating debenture and loan capital as being worth par, the market valuation per mature acre works out as follows:—

	Market valuation.	Deduction for reserves and immature acreage.	Mature acre-age.	Market value per acre.	Profit per acre
	£	£	£	£	£
Ceylon Tea Plantations ..	581,654	109,951	8,067	58 5½	
Eastern Prod. & Estates ..	485,000	96,258	9,565	41 5½	
Nuwara Eliya ..	250,000	25,517	2,302	97 8½	
Standard ..	136,100	20,055	1,680	69 7	

Yet if we take the present price of £11 per £10 share for Nuwara Eliya, £27 per £10 share for Ceylon Tea Plantations, £63 per £5 share for Eastern Produce, and £14 per £6 share for Standard, we find the yield to an investor works out at about 5½ per cent in each case. It is not, perhaps, a high return for an industry subject to fluctuations of exceeding severity, but then the three older companies have never paid dividends up to the hilt, and last year their profits were reduced from every cause. Rice will certainly not be so dear this year, and in other respects these older concerns ought to be better fitted to meet the future than the weedy productions of the last few years. We are glad to learn that the increased cost of working last year has proved a blessing in disguise to prudently worked concerns, as the putting out of heavy extensions has been brought to a standstill. Many of the new companies were to do this upon borrowed money, but the money has not been forthcoming, and so the extensions have had to be postponed. A year or two back, when Sir John Muir, the Buchanans, and others of that enterprising *genus* were launching their ill-balanced productions, the older concerns were very much in the state of mind assigned to Wellington at Waterloo by French writers when they say, he prayed "for night or Blucher." In the tea-growing industry "night and Blucher" have come together in the shape of a high exchange and low prices, and the consequence is that crudely formed and wasteful schemes are feeling the pinch severely. It is yet too early to estimate the mischief such have given rise to, but of one thing we may be certain, the bad results achieved by a number of them will effectually prevent more capital being put into this industry for some time to come.

## THE STATISTICAL AND MARKET POSITION OF TEA.

It is certainly a striking fact at this time of low tea prices, that, statistically, the position of our staple was never better in the London market. Both as regards rate of consumption—deliveries—and the quantity now in stock, no Ceylon planter could wish for more favourable figures. They are almost unprecedentedly good. They are, moreover, backed up by short shipments and a falling-off in estimates from this side with evidence that these experiences are likely to be strongly accentuated in the approaching months, if not during the rest of the year. And yet in the face of these facts, prices continue almost at their lowest! How is this fact to be accounted for? There must be some unusual if not mysterious factor, qualifying the situation, and in the absence of any other explanation, we cannot but fall back on the control which the big tea-buying and distributing houses are said to exercise over the Mincing Lane market. It is also said that a temporary cause affecting the price of tea has been the great run upon cocoa and especially vi-cocoa; but it is now recognised that this was a mere passing "boom" and that there is not likely to be any special rise in the consumption of cocoa of a permanent character. If then the prices in the tea market do not shortly improve, we can only be shut up to the conclusion that the big tea buyers are too many even for the very strong statistical position. In such a case, we should hail the advent of a new firm like Gilbey's taking up tea, as it is rumoured to be doing in return for Lipton's going in for wines; for, it is evident that the more numerous the big distributors, the less likely they are to arrive at a common understanding and the greater the chance of healthy competition. We can find no encouragement for the suggestion that a Planters' Direct Tea Supply Association should be started; but obviously if there is no improvement, an experiment of this kind will be forced on the producers.

## THE PADDY WEEVIL PEST.

We are indebted to Mr. Vanderpoorten for a practical suggestion as to fighting the very serious attack of weevils on the paddy of the North-Western and Western Provinces. In the case of Indian corn and wheat in America naphthaline is used, the smell of which is sufficient to keep away weevils without doing any harm to the corn. Mr. Vanderpoorten would recommend the use of a series of pieces of bamboo say each 5 feet long to correspond with the usual depth of heaps of paddy. Along the sides of these bamboos gimlet holes should be bored—up even to an inch in diameter. Pinches of naphthaline should then be put inside the bamboos which should be wrapped in a piece of clean cloth to prevent the rice getting into the bamboos. The naphthaline is so volatile that when the bamboos were stuck into the heaps of paddy, say at 5 feet apart, the smell would very speedily permeate the heap and drive away the weevils, or prevent paddy as yet free, from being attacked. Mr. Vanderpoorten has already sent some naphthaline to the Kurunegata district to be experimented with, and it would be well if the Government Agents and Headmen and all intelligent natives

in the districts affected, at once gave a trial to this very simple and yet effective remedy. The cost is very little; a rupee's worth of naphthaline going a very long way indeed towards saving a large store of paddy.

### AGRICULTURE AND TROPICULTURE AT ZANZIBAR.

ONE of the most practical and interesting Reports on a small scale it has been our privilege to peruse for some time is that which has reached us from Mr. R. N. Lyne, Director of Agriculture, Zanzibar for 1897. We have marked copious extracts for our *Tropical Agriculturist*, while all we can do here is to mention the new products which are reported on with the results of careful experiments. These are Cacao, Kola, Para and Ceara Rubbers, Vanilla, Coffee, Chillies, Papaya, Castor-seed, and especially Cloves which is the staple crop of Zanzibar. The Clove crops of Pemba and Zanzibar fluctuate a good deal from 537,845 in 1895, to 361,869 in 1896 and 332,521 "frasilas" (35lb. each) in 1897. Dry weather is chiefly to blame for short crops. Labour seems good and plentiful:—

LABOUR.—No labour difficulties have arisen at Dunga in consequence of the abolition of the legal status. Women received R6 per month, including food money, and men R8 and R9. Twelve months ago the wages were R10 and R11, and they are still at this figure in the town; yet in spite of this disparagement the labourers show no inclination to desert the shamba for the town. A few Indian and Chinese labourers have been given work at Dunga but have not been a success as they frequently get fever when cultivating the soil. They also require higher wages than the natives though they work shorter hours.

Live stock, implements, manures and soils form the closing chapter of Mr. Lyne's admirable Report.

### PRODUCE AND PLANTING.

TEA AND THE CURRENCY COMMITTEE.—As regards the Committee on Indian Currency, to which, reference is made elsewhere, the tea industry has been practically left out in the cold. It is true Sir John Muir is on the committee, but he may be said to represent the commercial side of the industry. It is the actual producer of Indian produce who needs representation. What about Mr. Christie? Immediately on the announcement that the Secretary of State for India had agreed to the appointment of such a committee the Ceylon Planters' Association put in a claim to independent representation on the committee, and submitted to the home Government the name of Mr. Thomas North Christie as that of a suitable representative of the interests of the colony. Planters may to some extent be satisfied if Mr. Christie is called as a witness before the committee. But, it is urged, "the producing interests of Ceylon are of sufficient importance to secure Ceylon a seat on the committee." The incident may perhaps suggest to Lord George Hamilton and, what is more important, to the committee itself, that interest in the Indian currency question is not restricted to India. The views of the Indian Tea Association, London, are shown in the following letter from Mr. E. Tye, the secretary, forwarded for publication in the *Times*: "The Secretary of State, in his despatch of April 7, 1893, wrote as follows: 'I propose therefore, to refer the whole matter to a committee consisting of gentlemen whose knowledge and experience, whether administrative, financial, or commercial, entitles their

judgment to the greatest weight, and who may be expected to give an impartial and unbiassed opinion upon the question which will be submitted to them.' The result has been the appointment of a committee, who are all men of mark and weight, but I am desired to point out that there is not a single representative with Indian experience of such great producing industries as tea, coffee, indigo, and other important agricultural products, or of such manufactures as jute and cotton. The interests of Indian producers and Indian manufacturers are not necessarily opposed to those of Indian houses of commerce and finance. But in the present case financial and commercial authorities, however able and impartial, are not likely to look at this question of currency and exchange through the eyes of the Indian producer or the Indian manufacturer. What my association and the producers, both of India and Ceylon, ask is that some members should be added to the committee to represent the views and interests of producers and of manufacturers in India and Ceylon, considered independently of those either of financiers or commercial middlemen. In other words some members are required on the committee who will see that the question of currency and exchange are carefully considered from the point of view of producers and manufacturers in those countries. While official, financial, and commercial views are fully represented on the committee, there is not a single member with Indian experience who exclusively represents the views of producers and manufacturers in India. The association therefore asks that two members be added to the committee to represent the great producing and manufacturing industries in India and Ceylon, such as tea, coffee, indigo, jute, cotton, and other agricultural produce."

THE GREEN TEA TRADE.—As evidence of the intensity of the trade struggle in Asia between Great Britain and Russia a correspondent of the *Morning Post* points out that another attempt is to be made to put an end to the trade in Chinese green tea carried on between Bombay and the Central Asian possessions of Russia. The business, still fairly large, is entirely in the hands of British subjects, Peshawur merchants in Bokhara, who act as agents and consignees for certain Indian firms. The Muscovite dealers have long looked with envious eyes on this branch of business, and have made many endeavours in late years to tempt the Hindoos to abandon their Indian connections and ally themselves with the Russian traders. About fifteen months ago a delegate from Sumarkand came to Bokhara and actually offered to advance to the Peshawur merchants as much money as they might require for their purchases without any interest if they would cease to order their green teas through the Bombay houses they represented, and procure their supplies instead direct from certain Russian firms already established in China. In addition to the tempting offer of an advance of money, it was represented to the Peshawur dealers that by obtaining their green teas from the Russian firms named, and allowing the Russians to forward them direct from the Chinese port of shipment to Batoum, and thence to Bokhara, they would save at least two to three annas—from 1½ to 13-16 of a penny—on each pound, and would thus be in a position to sell cheaper locally and make a better profit than they now do. But though the Russian authorities joined in the representations made them, the Peshawur dealers declined to abandon their clients. The result was that every hindrance possible has since been put in their way by the Customs and other officials. A Muscovite combination of firms arranged for the importation direct of from fifteen thousand to twenty thousand chests of green tea from the Russian bourses in China, and sold them locally in competition with the Indian traders at such low prices as to make the business unremunerative to the Bombay shippers.—*H. and C. Mail*, May 6.

## MEXICAN COFFEE.

[Some one—we think an ex-Ceylon Planter—has sent us a copy of the *Mexican Herald* of April 14th with the following letter, making his own notes which we append.—ED. T.A.]

## EFFUSION OF POSSIBLY A DISAPPOINTED PLANTER.

To the Editor of the *St. Louis Globe-Democrat*

St. Louis, Mo., April 7.—The cultivation of coffee in Mexico continues to attract the attention of speculative promoters and unwary St. Louis capitalists. The beautiful white blossoms of the coffee plant, I do believe, would actually turn yellow, and its bright red cherries blush still more scarlet, had the tree the sense of hearing and could listen to all the barefaced lies absolutely ignorant writers are telling us about its capabilities. Men really who have done little more than see a coffee tree are from time to time being quoted as high authorities, and, still more surprising, their theoretical methods substantially indorsed.\*

Coffee culture in Mexico, on an average, may, perhaps, be a fair investment, if care be taken, but at the present prices of coffee, and the certainty almost of it for some years remaining at a low ebb, there is no room for either theory or experiment. Every detail and important attention that a coffee tree needs must be practically understood before it is safe to embark in an expensive enterprise of such a nature.

Not the least of the many important features that should be most carefully investigated in starting a coffee plantation is locality. Under this heading I fear that great errors of judgment have been made that will cause considerable disappointment, if not ultimately dismay.

It is only a matter of time. Coffee comes into bearing at the end of the second year, and in four years give a full crop, if the planting has been from the start carried out correctly. Some of our companies have, I think, been fully four years in existence. Are they declaring dividends, or piling up the agony and adding insult to injury by fictitious values of their mismanaged properties and wild forest land?

Coffee planting was, I think, at its zenith in Ceylon in the year 1870, and Ceylon had then 185,000 acres of coffee in cultivation, which produced a crop of 885,728 cwt. of clean coffee. This was, I am almost positive, the largest crop Ceylon ever produced. How much was it per acre? How much per tree? A simple enough question; let those interested work it out and base their calculations accordingly. It must also be borne in mind that Mexico will never produce a coffee that will in the markets of the world command the price of No. 1 Ceylon plantation.†

In 1880 Ceylon had an area of 311,000 acres of coffee in bearing and exported a crop of only 649,000 cwt. An immense increase of acreage, accounted for by the famous young districts of Dimbala, Dikoya and Maskeliya coming into bearing, but the decrease in crop is almost appalling. It has been calculated that not more than ten per cent of the planters in Ceylon (and they were men of education and intelligence) ever bettered themselves by investing in the coffee enterprise. Of the rest, many lost their health or their lives in the struggle. Fearful of offending Ceylon planters I apologize for calling them

men, not gentlemen. I simply do so because they did not wear silk hats and kid gloves.

It has been said that many a good British sovereign (pound sterling) lies buried on the Kandian hillsides, just perhaps as in after years many a good American dollar will lie buried in Mexico.\* Ceylon is an island, 267 by 149 miles, with an area of 15,809,280 acres all told, and to prove how precarious a matter location is I may mention that only about 400,000 acres of this area was considered fit for the cultivation of coffee, the balance being absolutely useless for coffee, the bean in fact almost refusing to even germinate in the extreme north of the island.

It may be said that the writer is an alarmist or, speaking metaphorically, has "got an axe to grind." Such is not the case; Ceylon coffee culture has become history, and my remarks can be verified by perhaps one of the greatest living authorities on coffee culture, viz., Mr. Wm. McKenzie, Ceylon Government Commissioner, and Planters' Representative, 138 Front Street, New York. PRO BONO PUBLICO.

## INDIAN PATENTS.

Applications for the under specified inventions have been made.

No. 120.—Samuel Cleland Davidson, of Belfast, for improvements in apparatus for drying tea leaf or other substances.

No. 144.—John McDonnell, of Ceylon, for improvements in tea rolling machines.

No. 153.—Samuel Cleland Davidson, of Belfast, for improvements in apparatus for drying tea, coffee, cocoa, grain or other substances.—*Indian and Eastern Engineer.*

## THE MATE TEA COMPANY.

In the Court of Appeal on Tuesday before the Master of the Rolls and Lords Justice Rigby and Collins, Major Coglan appealed from an order of Mr. Justice Barnes dismissing an action which he had brought against Arthur and Hamilton Cumberland, in respect of the purchase of the business of the Mate Tea Company. The action was to have an agreement of the 14th August for the purchase of the business and a subsequent mortgage set aside and cancelled, and for the repayment of a sum of £1,000 which had been paid to the defendants. The business, that of the manufacture and sale of Mate Tea, which was stated to have stimulating properties similar to coca and kola, was advertised for sale by the defendants and the plaintiff entered into negotiations for its purchase. The plaintiff, it was admitted, had had no business experience, but he contended that the defendants had misrepresented the extent and profits of the business. His Lordships in the Court below, came to the conclusion that no substantial misrepresentations had been made, but that the falling off in the volume of business was due to the inexperience and want of care and forethought of the plaintiff.—Mr. Terrell q.c., on behalf of the appellant, agreed that everything being taken into account, there was such a misrepresentation on the part of the defendants as would entitle the plaintiff to have the purchase annulled.—After hearing Counsel on the other side, their Lordships reserved judgment.—*Grocers' Journal*, May 7.

\* This is quite true.—Cor.

† Not correct to wit present prices.—Cor.

\* Not so Ceylon planters come here.—Cor.

† He is certainly not a practical planter.—Cor

## LOW-PRICED TEA.

The people of the United Kingdom are among the greatest tea-drinkers on the continent of Europe, consuming five pounds per capita, against one and one-half pounds per capita consumed in the United States. The tea trade, therefore, means more to the grocers of the United Kingdom than those here, and yet interest in the article is quite as great in this country as abroad. Cheap tea and competition have diminished the profit on the article, and not tended to increase the consumption. Some very pertinent comments on the tea trade are made by the *Grocers' Gazette*, of London, Eng., as follows:—"The extraordinarily low range that tea generally has now got down to make those who look ahead wonder what is going to be the end of it all. It is wise to educate the public to lower and lower-priced tea. Who reaps the benefit? We venture to say nobody. It cannot be argued that because a tea costs the household 1s per pound, instead of 1s 3d per pound, more cups will be drunk, or more spoonfuls put in the pot. No; all we are doing at present is (to use vulgarism) 'queering everybody's pitch.' Tea is now what may almost be called a disreputably low range of price, and the morale or tone of the trade is certainly not improving. Cutting is the ruin every decent business; it always has been and always will be. That forcing low-priced tea on the public will not appreciably increase consumption can be seen in the falling-off—or, if not exactly falling-off, at any rate the standstill—in deliveries for months past; from which it would almost appear that tea drinking has, for the time being, at any rate reached its limit. We cannot but think that some of the tricks and ruses adopted to sell tea are a discredit to a time-honored business, and are undoubtedly tending to lower the prestige of the trade. A good tea at a fair price is all that any reasonable person wants. Cutting prices cannot tend to a healthy state of things. They spoil the trade, benefit nobody, and are decidedly detrimental to sound business.—*American Grocer*, April 20.

## PLANTERS' ASSOCIATION OF CEYLON.

We have received the following for publication:—

## NEW PRODUCTS: RHEA FIBRE.

Kandy, May 26.

SIR,—I enclose for publication copy of a letter received from the Rhea Fibre Treatment Company, Limited, London, with reference to that portion of the Annual Report under the above heading and asking what price per ton or the Ribbons would be considered adequate to pay for the cultivation of Rhea in Ceylon,—I am, Sir, Yours faithfully,  
A. PHILIP,  
Secretary to the Planters' Association of Ceylon.

Piccadilly Mansions, 17, Shaftesbury Avenue, W.  
London, April 15.

The Secretary, of the Planters' Association of Ceylon, India.

DEAR SIR,—Our attention has been drawn to the Supplement to the "Times of Ceylon" of Feb. 18th, 1898, which contains a reprint of the Forty-fourth Annual report of the Planters' Association of Ceylon, for the year ending the 17th February 1898.

In this report, under the heading of "New Products Forest Reserves, Rhea Fibre," occurs the following passage:—

"Your Committee having received an offer from a London Company for the treatment of Rhea Fibre of £10 a ton for the Ribbons, felt bound to state in reply that the price offered was inadequate to pay for its cultivation in Ceylon and that the difference between the price offered for the Ribbons and the value of the prepared article appeared to be out of proportion."

May we ask you what price per ton for the Ribbons your committee consider would be adequate to pay for its cultivation in Ceylon, as for the first few years, and with the desire to assist in the promotion of the cultivation, we would not object to pay a slightly higher price than the above-mentioned £10 per ton, although we are advised by Planters and others competent of forming a reliable opinion that the plantations once established, and assuming only four cuttings a year, the price we have offered, viz., £10 a ton would leave a considerable margin of profit to the cultivator.

We send you under separate cover a copy of "The Rochdale Observer"\* of April 2nd, 1898, in which you will find an account of the New Plant for Degumming, which has just been erected at our Spinning Mill at Castleton, near Rochdale, and it may interest you to know that Captain Whitley was present at the trial and has promised us to write out to Ceylon, giving his impressions as to the future of the Rhea Industry with our Gomees Process, which we believe are of an extremely satisfactory character.—Yours faithfully,  
Sgd. ERNEST A. COLLIN,

Secretary and Manager.

## THE GUATEMALA COFFEE DISEASE.

[It is curious that our coffee planting friends in Guatemala and Hawaii should not understand that the disease in the coffee of the former is nothing more or less than the dread fungus *hemileia vastatrix* which wrought havoc all through our Ceylon coffee. We see a different name given to it in Washington; but from the description we should take it to be our old enemy.—ED. T.A.]

Frequent reference has been made in our exchanges to a new and very dangerous disease which has attacked the coffee plantations of Guatemala and other parts of Central America and the West Indies. In last year's volume of the Planters' Monthly (page 230, May, 1897), will be found a letter referring to this disease from Mr. W. J. Forsyth,† who visited these islands some ten years ago, and wrote a full report for the government regarding coffee planting in Hawaii. His last year's letter did not furnish a full description of the Guatemala disease, but it contained the opinion of the government entomologist at Washington that it was what is called *Stilbum Flavidum*, a disease that is well known in Costa Rica, Jamaica and Venezuela, for which he could suggest no remedy. Owing to this disease, Mr. Forsyth was compelled to abandon his plantation in Guatemala, and went to Mexico, where no disease to the coffee has yet appeared. His letter referred to above should be read by those engaged in coffee culture.

In the *Advertiser* of a recent date, Mr. Marsden, Commissioner of Agriculture and Forestry, publishes a communication, in which a more detailed account of this dangerous disease is given, from information received from Washington. We insert the whole of his article, and would caution coffee planters to be on their guard and note its first appearance, should it by any means reach these islands. If introduced by the seeds, the seat of the disease will probably be found located in the roots, and every plant found diseased with it should be dug up by the roots and burned, root and branch, as a surest remedy, till something better is found.

I would respectfully call the attention of coffee planters to a fungus disease that is seriously affecting the coffee plantations in Guatemala. The following account of this disease has been sent to this bureau from Washington: "It is a vegetable fungus which

\* Not received.

† Published in the *Ceylon Observer and Tropical Agriculturist*.

is destroying the coffee culture of Guatemala, so that the whole industry in that country is to be given up, unless a remedy is found. So far no antidote has been found for this fungus, nor any means by which it can be kept in check. It not only attacks coffee trees, but other plants as well. It is first seen as a little brown spot, about the size of a pea, on the leaf. There may be a number of such spots on a single leaf. In the centre of each spot is a little orange red growth, about the size of a dot, which under the microscope looks like a little ball on a stem. The action of this fungus on the coffee tree is to cause the leaves to shrivel up and fall off, so that the tree is entirely denuded of its foliage, the growing berries also dry up and fall off. This fungus clings to seed coffee and may be transported to other countries receiving such seed."

It would be a wise plan for our coffee planters to refrain from importing seed coffee from any foreign country and any seed coffee for which orders have previously been sent, should be disinfected as soon as possible after being landed on the wharf. This can best be done by immersing the bags containing the coffee in strong lime water, made by putting a large bucket of unslacked lime into 50 gallons of water. After the lime is slacked it should be well stirred up, and the bage of coffee should be immersed in the mixture for at least ten minutes. This method will effectually destroy any fungus spores that may be adhering to the bags or seed. There seems to have been a great and general desire on the part of the coffee planters to obtain coffee seed from Guatemala and other countries. There is no doubt but that the trees grown from Guatemala seed have borne crops much earlier than trees grown from Hawaiian seed; but it is by no means certain that the superiority of the Guatemala trees is maintained as the trees become older. As a general rule, trees that bear at an early age, soon lose their vigour and are short lived. We would like to hear from Mr. J. M. Horner on this subject. He was perhaps the first planter to grow the Guatemala trees.—J. MARSDEN, Commissioner of Agriculture and Forestry.

#### MINOR PRODUCTS.

London, May 6.

Oil, Citronella.—The price of this oil is almost nominal at 1s 1½d in drums and 1s 2d in cases on the spot, whilst for arrival it is quoted at 1s 0½d to 1s 0¾d c.i.f.

Amsterdam, May 5, 5.20 p.m.—At the cinchona-auctions held here today 7,086 packages of bark were offered, of which 5,526 packages sold at an average unit for the manufacturing-bark of 5.20c per half-kilo (or slightly under 1d per unit), against 4.25c paid at the auctions on March 31. The American and English manufacturers bought 4,361 kilos., the Auerbach factory 945 kilos, the Bruswick factory 4,036 kilos, the Mannheim and Amsterdam factories 7,088 kilos, the Frankfurt and Stuttgart factories 1,795 kilos, and various other buyers 4,885 kilos. The prices realised for manufacturing-bark ranged from 7½c to 58c per half-kilo, and for druggists' bark from 12½c to 115½c. The tone of the auctions was quiet.

Camphor.—There appear to be indications of an advance in prices of refined camphor in the not very remote future, and German sublimers have raised the price of tablets slightly, taking 1s 2½d for bells as the basis.

Camphor (Crude).—A quiet and dull market, with easier quotations. There are sellers of Chinese for arrival at 82s 6d, and Japanese at 88s per cwt., c.i.f. terms. The arrivals of Japanese camphor at Hong Kong since March 19 amount to 1,071 cases; sales 750 cases; and stock, 7,200. The total exports to the Continent from January 1 were 4,291 cases; to the United Kingdom, nil.

Cocoa-butter.—Lower. At the London sales on Tuesday, 80 tons Cadbury's brand sold at 10d down to 9½d, closing at 9½d per lb. These figures mark a decline of ½d to ¾d per lb. At Amsterdam on the same day, 60,000 kilos, Van Houten's make, sold at 49½c to 52c, an average of 51.11c (10½d.), and other brand at substantially the same rate.—*Chemist and Druggist.*

#### RHEA.

[BY AN OLD PLANTER.]

Given, then, a supply of roots or cuttings, the next question is the selection of ground to put your rhea out in; and this must be of the very best. It is no use people thinking there is a valuable adjunct in rhea, that it will do to fill up any vacant corner, and thus increase revenue! Rhea demands the very finest of soils, and to this we attribute the slow development that has taken place in its cultivation. A heavy loam with strong dampish subsoil is the *beau ideal* of what rhea requires. Possibly the present peat hills that have been planted with tea will one day be converted into rhea fields, for in such low, damp-lying lands, from 12 to 14 cuttings can be made in one year. Rhea abhors water, so that our readers must not run away with the idea that it will grow in rich land that is liable to be submerged. A few hours under water will kill it, though it is one of the hardiest of plants in other respects, for it will grow on mountain sides, 1,000 to 1,500 feet above sea level. When we say, grow, we mean it, we don't mean flourish and yield a paying crop.

Having then got a good low peat flat, well drained, and quite dry, the planting out of cuttings or roots should be begun. Regarding this there is greater diversity of opinion, more especially as to the distance apart to plant. Some argue 12 inches; some two feet, and so on. Our own experience is that 12 inches is the most economical, as less weeding is necessary. The time is short before rhea takes possession of the ground, but this it does in real earnest, when the ground is covered, so to speak. As soon as the ground is covered, and the stems attain their full height, which takes place during the first year of its existence, it will be seen if the plants are too close, and if so, they can be thinned out, and put into a new extension. The above method, we recommend as giving a quicker return than with two feet planting. The only cultivation that will be found necessary will be a few hand weedings, just for the first month or two, until the rhea has got a good hold, when it will not only be more than able to keep its own position, but will kill out anything else in its neighbourhood, so that the initial outlay is practically the only cost in raising this valuable weed, except of course the cost of cutting the ribbons later on. At the present time, when all products are daily going down in price and narrowing the margin of profit, we strongly recommend this new opening to our planting friends, as, instead of cheapening the product, we feel certain that for some years, at any rate, the price would be enhanced, as it is simply the want of supplies that is hampering our manufacturers, and there are a hundred and one uses to which rhea can be applied, as yet untouched, on account of the want of the raw material. Jute machinery requires but little altering to work the fibre up into fabrics, but the supply at present visible is not enough to guarantee even this small expense.—*The Planter*, May 14.

CEYLON COFFEE IN MINCING LANE.—At a time when coffee can be bought at Brazil shipping ports for from 18s to 22s per cwt., it is cheering to notice in the very scanty sale list elsewhere that Middleton (Dimbula) coffee has been selling up to 107s and Bogawana (Dikoya) to 104s 6d to 111s 6d. Oh, that there were some hundreds of thousands of cwt. of such coffee now going from Ceylon!

## RUBBER AND ITS PROSPECTS IN CEYLON.

We have delayed too long offering a correction on our last statement that Para rubber trees may be safely planted amongst tea on lowcountry plantations at *fifty feet apart*. The correction we have to offer is not, as might be supposed from recent discussion, a prohibition of such planting altogether; but an assurance that Para trees may be planted without doing the least harm at the rate of 50 to the acre. To get this number per acre, the planting would have to be 30 feet by 30 and men in whose judgment and experience we have the utmost confidence, assure us that no field of tea will suffer from being so dealt with. Indeed one authority says that in some tea fields, he would not hesitate to plant 20 by 20 feet or 100 Rubber trees to the acre. So much for planting in connection with tea, apart from what can be done on boundaries and in separate small clearings should the reserves permit.

But now on the general question of Rubber cultivation and the prospects of a profitable return, we have to face a considerable divergence of opinion. One of the shrewdest of planting critics in expressing his doubts, referred to the rush into "Ceara" Rubber some years ago and asked, what came of it? Well, it so happens that we have just been made acquainted with a fact which seems to show that the planters of Ceara rubber even were far too hasty in giving up their experiments. For it turns out that where the tree has been allowed to grow as in some parts of the Dumbara Valley, 1 lb. of good Rubber per cooly for each day's work is now readily collected. This, as an adjunct to the staple cultivation whether tea or cacao, is not to be despised and it has the obvious advantage that the harvesting can be done within certain limits, according to the convenience and labour supply of the planter.

But now as to Para Rubber, which is undoubtedly, the preferable kind to plant in the lowcountry of Ceylon, indeed up to 500 feet altitude, or perhaps 1,000 in certain districts, there are sufficient data to show that given good seed, careful planting and suitable soil, six years should mark the term of waiting before returns can be got. In the 6th year, no doubt, the quantity gathered per tree would be limited; but experience in the Kalutara district shews that from this date, a steady increase may be expected year by year up to a period, so far practically undefined. There are not many Para trees growing in the island altogether that are above six years old, so that we may really be said to be only entering on the period when harvesting and financial experience is to be reaped. But the indications are decidedly in favour of Para Rubber Cultivation turning out a stable and profitable industry, and more especially do we recommend it as a help and alternative to the lowcountry tea planter. Men who want to go in for "a big thing" in planting Rubber, are perhaps right in trying the Straits Settlements; but for our part, we do not see why suitable lots of land, if not for any extensive, at least for safe experiments should not be picked up between the Kelani Valley and Kalutara, in the neighbourhood of Ratnapura for instance, or in some of the damper korales of the Western Province.

Strangely enough there are numerous enemies to be found in connection with Para Rubber, both of

the seed and young plants, and the destruction by porcupine, cattle, &c., in some cases is past belief. No doubt in the case of an appreciable clearing it would pay to fence properly and to set systematic traps for porcupine and wild pig; but all this is only an old story in the Ceylon planter's experience of new products. In the Kelani Valley, cattle trespass is found to be a great drawback to Rubber cultivation. We are glad to learn that an experimental clearing in the far distant Moneragalla division of Uva, is doing well. So far, of course, the older trees on private estates as in the Botanical Gardens, are more profitable as seed-bearers than as Rubber-yielders, and this for some time to come will prevent anything like an appreciable export of Rubber. As to the area cultivated so far, we are not yet in a position to say from our estate returns, and indeed the best reckoning must be from the quantity of seed sold. Mr. Willis's reckoning is 750 acres and probably our Directory, which gave 634 acres in last edition, will shew the equivalent of about 1,000 acres of Para Rubber planted out altogether at this time in the island.

## BANANA DRYING APPARATUS.

In transmitting a summary of the exports from Bluefields, Nicaragua, Consular Agent M. J. Clancy reports a shipment of evaporated bananas to the United States, and says:—"The men engaged in the experiment here have no practical knowledge of the business of drying the fruit. If firms in the United States engaged in the manufacture of machinery and appliances adapted to the evaporation of fruits would experiment until they perfected machinery to evaporate bananas, hundreds of such machines would be immediately sold, and the demand would increase. At present there are millions of bananas yearly thrown into the river or allowed to rot on the ground, because they are too small or too ripe for shipment." I may say, in addition that if the demand for evaporated bananas should become general, the industry would embrace every banana district of Central and South America, Jamaica, Cuba, the West Indies, Haiti, and other tropical and semi-tropical belts, and the sale of the machinery therefore would be enormous.—*United States Consul-General at San Juan del Norte.*

## THE COFFEE PLANTERS' MANUAL.

We have received a copy of the new (4th) edition of Coffee Planters' Manual, by J. Ferguson (*Ceylon Observer and Tropical Agriculturist.*) The book is well-known to coffee planters and in its 300 pp. will be found references to every imaginable subject connected with coffee—except how to raise the price. There are notes on Liberian Coffee in the Malay Peninsula, and in Serdang, from a well-known ex-Ceylon man. Altogether the book is quite a *vade mecum* for the coffee planter.—*S. F. Press.*

RHEA FIBRE AND THE PRICE FOR "RIBBONS" IN CEYLON.—We fear there are not sufficient data available as yet to show at what price "ribbons" off Ramie stems, can be profitably supplied at, or shipped from Colombo. Mr. Manley-Power has an appreciable acreage under this new product; but he has only now begun to harvest his crops systematically and keep a careful record of the results. In six months he should be able to say at what price per ton it would pay to supply "ribbons."

## COCONUT PROPERTY AND CULTIVATION IN THE NORTH.

We are indebted to an intelligent proprietor of coconut estates in Jaffna for the following comment on our remark that R200 per acre seemed a low price to pay for coconut palms in bearing, and also for information as to extension of cultivation by natives. Our correspondent writes:—"Several natives are clearing and planting yearly small portions of land which will in time develop into fair properties. At present they can only be called native gardens. I notice your remark on the prices supposed to have been paid for estates here lately. R200 an acre is considered a very good figure here, and a large advance on old prices, considering that coconuts are rather at a disadvantage in the Northern Province. The almost yearly recurrence of eight months' dry weather, leaving only four for cultivation, is a great drawback. Then the existing facilities for transport are uncertain and difficult. With them we can take no advantage of the favourable fluctuations of the market." The last drawback should be relieved by the railway if only coconut produce can afford railway transport for so great a distance as to Colombo or Kandy? Were the line a cheap narrow one—or a tramway—over so great an expanse of flat country, it could afford to carry produce at rates far below what must be charged on a broad-gauge line.

## THE "VINE" EXPERIMENT AT THE SCHOOL OF AGRICULTURE.

In answer to an enquiry in connection with our "agricultural review," we regret to have the following report:—"The vine-growing experiment under M] Zanetti's care was very promising while it lasted and it is a pity that Government could not see its way to continue the license for more than twelve months. Signor Zanetti who brought over the plants from Anstralia offered to demonstrate vine growing at the School on certain terms, which at the end of a year he wished altered so as to make it worth his while to continue the trial for another year; but Government not accepting his terms he decided to sell all his plants (about 1,000) which are now to be found no doubt in various parts of the island. It is satisfactory to know that the vines were not taken out of Ceylon and that some are in the hands of Mr. Ievers at Jaffna and others in the hands of Mr. E. Elliott at Tangalle."

## PRESERVATION OF GRAIN FROM WEEVILS.

Here is information on this important subject from the *Agricultural Magazine* for December last:—

(NOTE BY PROF. CHURCH.)

The only cheap and perfect application of the prevention of the attack of weevil upon corn and grains consists in the employment of bisulphide of carbon. The quantity required, provided for the grain is kept in closed vessels, is very minute—not more than 1½ lb. to each ton of grain—so that 8d is the cost of preserving a ton of wheat. The bisulphide leaves no disagreeable taste or smell behind, and the quality of the grain remains unimpaired. When bags are used instead of the iron cylinders specially prepared

for use in the bisulphide process, the protective influence of this chemical soon ceases, and a fresh application of the bisulphide must be made. In either case the liquid is applied as follows. A ball of tow is tied to a stick of such a length that it can just be plunged into the middle of the vessel containing the grain. The tow receives the charge of bisulphide like a sponge and is then at once plunged into the sack or cylinder and left there, the mouth being closed tightly. When necessary the stick may be withdrawn and the charge (1 oz. bisulphide to 100 lb. grain) renewed.

(Note by F. W. Cabaniss, Assistant Director of Agriculture, Burma, on the Prevention and Destruction of Black Weevil.)

I have been trying for several years a number of experiments, with the object of finding a cheap and simple method of preventing the ravages of this weevil. I think that I have found it in the use of naphthalene powder. My method of using the powder is here given for the benefit of the grain dealers of Burma. It is best to place the naphthalene powder at the bottom of the bin or hulk of grain. To accomplish this take a bamboo, about 1½ inches in diameter and long enough to reach from the top to the bottom of the bulk of grain. Punch the joints out of the bamboo, so as to be able to pass a stick through from one end of the bamboo to the other. Have the stick made to fit the cavity in the bamboo. Pass the bamboo, with the stick in it, down through the hulk of grain from the top to the bottom. Withdraw the stick, and drop into the top of the bamboo about half a teaspoon of naphthalene powder. The bamboo can then be drawn out, as the naphthalene is safe at the bottom of the bulk of grain. If the bulks are large this should be done once to every 10 feet square of the bulk. Repeat the application every 15 or 20 days as the powder evaporates.

The weevil that can leave the grain will do so, and those that cannot leave are killed by the odour of the naphthalene. I do not believe that naphthalene thus used can cause any injury whatever to grain. For seed purposes the germinating powers appear not to be affected in the least. For marketable grain the colour is not affected, and the odour will leave in a short time if fresh naphthalene is not applied to it. The quantity of powder used is infinitely small in proportion to the quantity of grain, and the powder is entirely destroyed by evaporation, so that for food purposes the effect is nil.

Naphthalene powder can be procured at the Medical Halls in Rangoon at R2-80 per ounce, and a few ounces of it will be sufficient for one season for any grain dealer in Burma.

[There are two species of weevil (*Curculionidae*) belonging to the division *Rhynchophora* which attack stored wheat and other grain. One is *Calandra* (*Sitophilus*) *Granaria* and the other *Calandra* (*Sitophilus*) *Oryzae*. The former is found principally in Europe, America and Canada. The latter which requires a high temperature is chiefly confined to India and other hot climates.]

## BURMA: AREA UNDER, AND TRAFFIC IN RICE.

At a time when the question of a rice supply from Burma to Ceylon is under discussion, it may be well to quote the following information from Dr. Watt's standard work on "Economic Products of India":—

The Agricultural Statistics of British India, published by the Imperial Government, show that the province of Burma had 5,673,542 acres under rice during the year 1888-89. Of this area, 4,067,606 acres were under cultivation in Lower Burma and 1,605,936 in Upper Burma. The following figure show the principal rice-growing districts of the two sections of the province: Upper Burma, Yezing (250,000 acres); Mimu (176,880 acres); Shweb

(172,858 acres); Katha (166,400 acres); Pakokku (142,025 acres); Kyaukse (136,355 acres); and Sagaing (115,000 acres). Lower Burma, Pegu (678,200 acres); Bassein (406,003 acres); Akyab (451,418 acres). Hanthawaddy (403,983 acres); Thongwa (391,194 acres); Henzada (297,199 acres); Tharrawaddy (290,661 acres); Amherst (286,872 acres); and Promc (250,210 acres). For the other districts, in Upper Burma, the statistics fluctuate between 84,000 and 1,838 and, in Lower Burma, between 134,201 and 1,249 acres.

It is commonly stated that 1,600 lb of paddy per acre is the average yield in Burma. That quantity, by deducting twenty-five per cent as loss of weight in husking, would show the yield to be fifteen maunds of clean rice. Expressing that yield to the acreage returned, the total production may be said to have been for the year (1888-89) as follows:—

	Maunds of Rice.	Total Production.
Lower Burma ..	6,10,14,090	8,51,03,130 maunds
Upper Do. ..	2,40,89,010	or 3,039,397 tons.

The transfrontier trade to and from Upper Burma is not published, but the available statistics show the land traffic to and from the lower province, the transactions with Upper Burma being viewed as between a foreign country. These may be briefly reviewed:—Imports of rice and paddy 13,961 owt and exports 2,738,723 cwt, thus showing a net export of 38,00,663 maunds. The average exports to Upper Burma during the past nine years have been 20,92,188 maunds. But viewing the transactions between Upper and Lower Burma only, the net export from the latter to the former province was 38,11,262 maunds. That amount has, therefore, to be added to the estimated production of the upper province. The figure thus obtained would have given to the population of Upper Burma a daily consumption of 1½ seers per head. But as the amount thus shown is, judging from the similar results obtained for other provinces of India, exceptionally high, it may be pointed out that there are four possible errors:—The population accepted is a mere estimate and may be considerably below the mark; there were in Burma during that period a large army of soldiers and camp followers which materially increased the rice-consuming population; no allowance has been made for the exports beyond the frontier of Upper Burma; and the figure of yield (fifteen maunds of rice to the acre) is that worked out for the lower province and may be too high for the mountainous tracts of Upper Burma.

But in addition to its exports to Upper Burma, the Lower province has an extensive trade by sea to the provinces of India and to foreign countries. Besides Upper Burma, it has also a small land traffic with Siam and Karennee. The following balance sheet of the rice traffic of Lower Burma may, therefore, be given for the official year ending 31st March 1889:—

Destination.	Exports.		Imports.		Net Exports.
	Maunds.	Maunds.	Maunds.	Maunds.	
Foreign Countries ..	1,99,52,090	310	1,99,51,780		
Indian Ports ..	5,35,498	1,05,482	4,30,016		
Land Traffic ..	38,34,212	20,749	38,13,463		
Total..	2,43,21,800	1,26,541	2,41,95,259		

These figures have been purposely made to exclude from consideration the transactions to and from ports within the province, and thus to exhibit the net exports from Lower Burma. Owing to the disturbances in Upper Burma the exports to that province, during 1887 and 1888, were abnormally high, and the comparison with those of the succeeding year, therefore, showed an apparent, though not real, falling off, since the total exports were, during these years, adjusted by the temporary decline and again restoration of the foreign trade. A slight confusion is also occasioned through the fact that the financial year ends (31st March) in the middle of the rice season. An average of the transactions carried out during a period of years would, however, admit of the correction of this cause of confusion. To allow the above

balance sheet to be compared with other published statements, it may, for example, be said that the average gross exports (under the three headings shown in the table) for the past nine official years ending 31st March 1890, have been 3,95,10,308 maunds or, say, 1,411,082 tons, and the average net export of any period of years would appear never to have exceeded 40 million maunds.

It need scarce be here added that paddy and rice have in these figures of Burma trade (as in those of the provinces of India) been taken conjointly. The error thereby admitted into the calculations is, perhaps, more serious in the case of Burma than in any of the provinces of India, since the coast-wise exports are in nearly equal quantities of paddy and rice. But even this fact is greatly minimised by the immensely greater quantity of rice exported to foreign countries. If we accept the balance sheet as fairly correct, the net export deducted from the estimated production would leave the amount which in the year in question was available for local consumption. That quantity expressed to head of population (viz., 3,736,771) would be about one seer per day.

### QUININE TO CONTINUE CHEAP:

#### PROSPECTS OF THE JAVA MANUFACTURES.

The anomalous condition of the quinine-market has been slightly relieved. We have no previous occasions called attention to the influence which Java quinine may have upon the supply of Java bark, the European quinine-manufacturers' mainstay; but, so far, the information in regard to the quinine-works in Java has been too general for definite conclusions, while the supply of bark has increased rather than diminished. We now have more specific information before us, and, in presenting it, we, for clearness sake, review the conditions which prevailed before Java undertook the manufacture of quinine. We shall take it from the Amsterdam point of view, since the market there dominates the supply. It will be remembered that when Amsterdam reached that position, cheap bark and quinine became inevitable, and continued sales from the large London stocks threw greater quantities of bark on the market than the quinine-works required, very little was bought on speculation, and a decline in the prices naturally followed. The margin between the price of quinine and that of bark, which, in 1888, was 7s. (11s 8d), gradually fell until in 1892 it was only 4s., and at one of the auctions in that year it came down even to 3s. (5s). With a margin of from 5s. to 6d. the manufacturers were still able to work with a good profit, but the downward tendency caused much dissatisfaction, and, to remedy matters, the most important quinine-manufacturers combined to depress the price of bark. Growers are naturally inclined to sell their output quickly, as very few of them are backed up by sufficient capital to allow their stocks to lie idle and increase; so the combination had it all their own way until recently, when some Java planters resolved to turn their bark into quinine, which they reckoned would give them as good profits as bark, and better if they embarrassed European quinine-manufacturers. Three factories have been established in Java, the most important being the Bandoeng quinine-works, which have been working for over twelve months, although it is only within the past two months that their quinine has come into the market. The company which owns the works is well supplied with capital, otherwise it could not have met the difficulties which have repeatedly been placed in its way, which difficulties extended even to the fitting of the factory and its superintendence. These difficulties have been overcome, and when we consider that the works have already done in the production of quinine it would be unreasonable to exclude

the supposition that with extended experience they will produce an article which is as merchantable as any. Moreover, Mr. John Smit Sibniga, the director of the Langen-Ardjo plantations, to whose "manifesto" we alluded in our issue of February 12 (page 288), has successfully carried out his combination amongst the planters, who have contracted with the Bandoeng works to supply a certain proportion of their output to the Bandoeng works, against payment on a sliding-scale, varying with the prices obtained from the manufactured product; they also agree not to supply any bark to other quinine-manufacturers without the consent of the Bandoeng works. The latter have secured the orders from the Netherlands-Indian Government, and the remainder of the manufactured quinine is sold for collective account by a wealthy firm in Samarang.

The following, according to a writer in the *Pharmaceutisch Weekblad*, is the method of manufacture adopted in the factory:—

At present only sulphate of quinine is produced, but the intention is to extend the scope of the works soon, and to add the manufacture of hydrochloride of quinine, &c. Ledgeriana is the only bark used, and the different parcels are mixed in such manner that the contents are always approximately 5 per cent. The bark is then ground to a fine powder, and mixed with about 50 per cent. of slaked lime and a sufficient quantity of water to give it a consistency which allows it to be transported in baskets to a vertical tank containing a certain quantity of mineral oil. This oil, of a sp. gr. of 0.92 and a boiling point of 130 dg. C., dissolves the alkaloid in a proportion of about  $\frac{2}{3}$  to 1 per cent. The tank is heated by means of a coil, through which steam is passed for about half an hour. When steam is shut off, the mixture separates readily into two layers, of which the upper—i.e., the oil, which now holds the alkaloids in solution—is drawn off; the remainder is again heated, in order to separate any oil that might have been left. The oil is then pumped into another reservoir, and warmed with a quantity of 1 per cent sulphuric acid, which removes the alkaloid. The acid solution of the sulphates is then drawn off, again heated, and almost, but not quite, neutralised with either ammonia or soda. As soon as it is sufficiently concentrated, it is run into shallow dishes holding about 5 to 6 gals., and there left to cool, by which means the crude sulphate of quinine crystallises out. This crude product then passes through a centrifuge, and the residue is washed, and afterwards purified by treatment with charcoal and re-crystallise. It is then dried and packed for export.

So far, we understand, the company is satisfied with the results of the sales of its product in Europe, and regular shipments have been arranged for. The producers are apparently content to sell their product at less than secondhand prices of German quinine, and it has been eagerly bought here for manufacturing-purposes, so that its future is practically assured. Their principal danger is that of being squeezed out by the European manufactures, but the latter do not appear to have given any indication of moving in that direction, perhaps because of their failure to move the Java people otherwise. In any case, dear quinine appears to be a remote possibility.

### THE IMPORTS OF COCOA.

By the courtesy of the Chancellor of the Exchequer we have been favoured with the exact figures of the duty paid on the imports into this country of raw and manufactured cocoa, as referred to in his Budget speech. The particular feature of that speech which interested us was the statement that the imports of "manufactured" cocoa were three times as great in the last financial year as they were two years ago. This was rather unexpected. We thought it was the home-prepared cocoa which was growing in favour. The following are the exact figures recorded at the Statistical Office of the Customs House;—

Net Duty received on Cocoa, Raw and Prepared, in the two financial years 1895-96 and 1897-98.

	1895-96	1897-98
	£	£
Cocoa, raw .. ..	103,503	116,454
.. prepared .. ..	21,032	66,213
Total .. ..	124,535	182,647

The duty on raw cocoa being 1d per lb. and that on manufactured cocoa 2d per lb., it appears from this statement that while our imports of raw cocoa had increased by 3,103,440 lb. those of cocoa manufactured abroad had increased by 5,421,720 lb. a notable and not very easily explainable fact.—*Chemist and Druggist.*

### FIGHTING PESTS WITH PARASITES.

The greatest single industry of California is fruit-growing, says the *Sydney Mail*, and the importance of this industry has led to the study of every method which would increase its profits or lessen its expenses. In this studies that of economic entomology has taken a foremost place, for the most obdurate and expensive enemy the orchardist has to combat is the myrial insect pests that attack him at every point and lessen his profits on all sides.

The result of years of careful study and continuous fighting with sprays and washes and gases is what may be called the California method—that of fighting insects with insects—a sort of homœopathic remedy of like curing like. Wherever insect pests have become destructive, efforts to find and introduce their natural parasites have been made, and usually with good results. Artificial methods are resorted to as a temporary expedient until better means could be had.

Throughout all Nature there exists a perfect system of checks and counter checks, and otherwise redundant life is kept down and the balance preserved. It is this fact that the Californians endeavour to take advantage of. The worst pests that are known there are all imported varieties. They were brought into her borders when California, ambitious to become the garden of the Union, imported all varieties of plants from every part of the world. In very many cases they were destructive varieties of insects without their natural parasites. Removed from their natural enemies these pests increased with wonderful rapidity and became a threatening danger.

One of the worst of these was the now well-known cottony-cushion scale (*Icerya purchasi*), which at one time threatened the total destruction of the orange orchards of the State. All artificial methods of combating this pest were unavailing. At last it was suggested that, in as much as the scale had been brought from Australia, where it was native and not a pest, there must be some natural parasite which kept it in check. Upon this suggestion action was taken, and the now famous *Vedalia cardinalis* was introduced. The result of the labours of this one little parasite is that California will this year ship 12,000 carloads of oranges, whereas she would have had none had it not been for its labours, for the shipments at one time fell to 600 cars, and scores of orchards were being cut down and burned.

The wonderful success of this importation of parasitic friends led to the further study of parasitism in insects, which was aided by the State, and large importations of parasitic insects have been made, with varying but usually good results. In some cases parasites have been introduced with the scales themselves, and in these cases the spread of the pest has not been rapid. In other cases natural parasites have adopted themselves to new conditions, and attacked the imported insects. There are now very few scale insects in California which do not have some parasites. There are sections, however, in which the parasites have not got a foothold, and the pests increase rapidly, while in some cases the scale increases beyond the power of the parasite to keep it in check. But, as a rule, the effort to introduce and

propagate beneficial insects has met with marked success. While artificial methods of fighting pests have still to be resorted to for some varieties and in some sections, these have been and are still being lessened, much to the benefit of the fruit-grower, by taking advantage of Nature's methods of keeping them in check.

—◆—

### CEYLON PLANTERS IN MEXICO: AND THEIR WORK ALL ROUND THE TROPICAL WORLD.

"What about your coffee venture in Mexico?" we asked a recent visitor to the island who was one of the prominent supporters of the Syndicate that sent Agents to inspect and report on Mexican coffee properties. "Abandoned—collapsed," was the reply: "the fall in the price of coffee put an effectual stop to any idea of buying land or estates at high rates in Mexico." Very fortunate indeed, it was, that the great fall in price occurred just in time to prevent the investment. With Brazil coffee, suitable for the American market, purchaseable at from 18s to 22s per cwt.; with the Dunmont Company's £10 shares, so highly thought of when brought out by Messrs. Buchanan, Rutherford, Talbot and others down to £2½; with "good coffee" selling retail in the United States at 4d per lb., we cannot see where the margin of profit can exist for Mexican coffee planters who look chiefly to the great Republic for a market for their staple. This being so, we cannot attach much practical importance under present circumstances to the information sent us by Mr. W. Laing Malcolmson. As regards coffee this is chiefly given in an extract from the *Mexican Herald* where a planter relates how it only cost him 18,000 Mexican dollars (not much more than £2,000 sterling with silver depreciated) to bring his 500 acres of coffee into full bearing at 5 years old. Five years' expenditure not exceeding £4 or even £5 per acre is a little beyond belief, even if the cost of land and buildings is excluded; unless, indeed, it means that weeds and coffee were pretty well allowed to grow up together, with a cutting down of the former once-a-year or so. Further the clear income specified of 21,000 dollars a year—on a total investment of 20,000—must be considerably affected by the drop in coffee and altogether we should like to have the experience of a resident Ceylon man—Mr. Darley or Mr. Forsyth for choice—above his own name for this year 1898, before paying much attention to news about "Coffee in Mexico." We should like to know too from Mr. Forsyth how long he allows for the fungus disease—which, not long ago, he described to us pretty well as *hemuleia vastatrix* and as rampant in Guatemala,—to cross over into Mexico, and indeed to penetrate to the great South American coffee-growing region?

It would have been more interesting to us at this time to learn from Mr. Malcolmson as to the working and results of other products—cacao, fibre, tobacco. Mexico is the home of cacao, the seeds of which were used as current coin in the days of the Emperor Montezuma who also drank chocolate flavoured with vanilla from a golden cup when first visited by Cortez. Information regarding Mexican cacao groves or "walks" from ex-Ceylon planters, as to growth varieties, mode of culture and cropping and especially as to the prevalence

of any pest, fungus or otherwise, on pod or tree, would have been of special interest. Let Mr. Laing Malcolmson try his pen in this direction if he wants to interest a considerable number of readers in Ceylon. Meantime his present chatty letter will receive attention chiefly for its interesting references to "personalities." We all like to hear of old friends in distant lands. "Where is Mr. Pineo now?" we asked the American Tea Commissioner the other day; but he could not tell; and here he turns up unexpectedly in Mexico, while the list altogether of ex-Ceylon planters visiting that land is a considerable one. The missions of Messrs. Naftel, Clark, Fort, Stopford-Sackville and perhaps P. F. Hadow we had heard of; while our old correspondent Mr. W. J. Forsyth has wandered so freely between California and Brazil, that he must know as much of Mexico and Central America as any trained practical planter in existence. Then there are Mr. Malcolmson and his partners Messrs. Darley and Evans as permanent settlers in Mexico. May they be prosperous! It is very pleasant to note in the photographs sent us (which can be seen at our office) that Mr. Darley especially, is looking so stalwart and well. He does credit to the old Colony (and to the Knuckles district) as a Ceylon planter, although he does not do much more than overtop the wonderful two-and-a-half year old (from seed) coffee bush alongside of which he is standing. The other little picture of Messrs. Hadow and Darley on foot and Mr. Naftel and the Comprador on mule-back upcountry taken for a casual meeting at one of our might be bazaars. Both photographs are very interesting and we are obliged to our correspondent for his letter and enclosures and hope to hear from him again; but until prices improve, it is little use anticipating the arrival of "planter-capitalists" from Ceylon to go into "coffee."

Altogether what an illustration does this little chapter afford us of the wonderful way in which Ceylon planters have spread themselves round the whole tropical world! Not simply are they to be found in every British tropical dependency that can be named, but also in nearly every foreign tropical State, and everywhere we find their judgment and experience as practical planters deferred to. The old proverb about the ubiquitous Scot, may well be altered so far as the tropics are concerned, into "the Ceylon planter"; for, go where you may, he is sure to crop up. At this moment he is showing the Brazilians how to "pulp" and prepare coffee after the proper plantation fashion; he is teaching the Dutch tobacco planters of Sumatra how to grow tea; and he is developing East Java with the old staple. What he has done in North Borneo and the Straits needs no exposition; while he will shortly be taking in hand New Guinea, to which we are about to despatch one or two intelligent Sinhalese to supervise the planting of coconuts. Time would fail us to relate how the Ceylon planter has pioneered "coffee" in several divisions of Northern Queensland; shewn the Guatemalan President how a cinchona nursery and plantation may be formed; or to indicate what he has done and is doing in Nyassaland, East Africa, and even in growing Vanilla on the lonely Seychelles; while a Ceylon planter first shewed Mr. Shephard in South Carolina how to cultivate and prepare his tea; and his fellows are now doing the same service for the tea pioneers in Natal, Costa Rica,

Mexico, Florida, California, Jamaica, Trinidad, Dominica, Fiji, the New Hebrides, West Africa and San Domingo have all seen the Ceylon planter and to nearly every land we have named, the Ceylon "*Tropical Agriculturist*" finds its way, in following our wanderers, or in being spoken by residents who have heard of it through their visitors.

Verily Ceylon has proved a Training School for Planters to serve the whole Tropical World\*; and if we speak at this time of our Planting Districts being overcrowded with "creepers" (pupils), let us not forget that their training over, if they are men of the right stamp, and have put their heart and mind into their work, the tropical

—world is all before them, where to choose.  
Their place of work, and Providence their guide.

\* We are accustomed to say that Ceylon is the best field and school in the world for the training of the tropical planter. This saying is based, not simply on the interested opinion of our very good selves, but on the observation of scientific gentlemen connected with Kew, or other botanical, agricultural, and chemical institutions, who have visited us; of travellers who have been able to compare plantation work in different colonies; and on the evidence of intelligence, skill, and experience in the development of our local enterpriser. A young man properly graduating as a planter in Ceylon is bound to acquire much practical knowledge respecting the best treatment of the plant and soil on which he is engaged; in regard to the proper management of coloured labour—and nowhere are labourers treated more kindly—including the learning to speak the coolies language colloquially; he is expected to understand not only the mysteries of seed nurseries, of planting, draining and road-making; but to be able to design and superintend buildings, whether in wattle and daub for coolie lines, or in brick and stone for his own bungalow and factory, and the more he is, or becomes, of a practical engineer, land surveyor, and even physician for his coolies, the better. To know something of chemistry and geology, of soil constituents and manurial applications, is no drawback, but the reverse, to such colonists. Many of our planters, after they have learned the nature of their work, are anxious to experiment—backed by the expert in Mincing Lane, the machinist, or the analytical chemist, or by all three, in the hope of turning out a better, or better prepared product, of securing a more abundant crop, without injury to the plants, or waste of soil; or of economising in their field or factory work, in freight or other expenses, by some mechanical contrivance or improvement. For such improvements there is still plenty of scope in connection with nearly every department of tropical agriculture. Supported by the local press—and Ceylon produces an organ, the monthly *Tropical Agriculturist*, unique among English periodicals, and which finds its way to the Agricultural Department in Washington, whilst it is highly valued all over India, in Australia, East and South Africa, Central and South America, in fact, all round the tropics)—there is a constant interchange of ideas, experiments, and criticism in our island. Therefore it is no wonder that, to have earned the reputation of being a reliable, experienced planter in Ceylon should pretty well be a passport to respect if not profitable employment, in any part of the tropical world. In this region the Ceylon trained planter, like the Scotchman, who is never so much at home as when he is abroad, promises to become ubiquitous. The first great exodus took place after the collapse of our coffee when some three hundred planters gradually left Ceylon, and began cultivation in the jungles of Perak and Johore, of the Straits Settlements, in North Borneo or "New Ceylon," in the tobacco fields of Deli, Sumatra; in the sugar-growing regions of Northern Queensland; while I found some of them in 1884 in the vineyards and fruit orchards of California, and orange-growing in Florida. Others went

### CEYLON TEA IN AMERICA.

We direct attention to the full and business-like letter of our Tea Commissioner published on another page. It is well deserving of careful consideration by all who are inclined to criticize the course pursued by Mr. Mackenzie and the Thirty Committee across the Atlantic. The Commissioner is satirical and rightly so about some of the applications made to him for money to push or advertise Ceylon teas:—

The sacristan said nothing to indicate a doubt,  
But he put his hand up to his nose and spread his fingers out.

In some cases, at least, the Commissioner holds that private pockets would benefit, rather than the Ceylon planters if he made grants. What he is prepared to do is to add a third more of Ceylon money to the *bona fide* advertising fund of any Firm taking up Ceylon teas; and that, we think, is a safe and wise principle to act on. Finally, we may notice some of the accusations brought against Mr. Mackenzie by a contemporary or in his columns. Our Commissioner was accused of making no annual Report and sending in no accounts. He has never failed to send in both every year. Further he was accused of only writing casually and that to one and another member of Committee. It so happens that the Commissioner never wrote to a member of Committee; but always to the Chairman and that he has never failed writing once-a-week, save when travelling or at sea. Then again as to Green Teas he was accused of making a new departure not approved of by Mr. Bleehynden—whereas the suggestion has the latter's full approval; but with this we deal elsewhere. Altogether whatever criticism may be offered in Colombo, it is quite evident from the recent meeting of the Thirty Committee, that the Commissioner has the full confidence of his Planting Constituents.

CEYLON CACAO.—The Mincing Lane sale of "Cocoa" recorded elsewhere does not seem to have been very satisfactory, so many of the lots are marked "out." Still we notice several sales at from 70s to 75s per cwt.

to try coffee on the Blue mountains of Jamaica, to revive cacao planting in Grenada, to open coffee and cinchona plantations for the President of Guatemala, and to supervise coffee investments in Brazil. Farther, two ex-Ceylon planters of experience have lately returned from a Trans-Andean Expedition in Peru, where they explored and selected large areas of fine land for tropical products, these areas lying along the tributaries of the Amazon, and being taken up for the Peruvian Corporation of London; while another gentleman, Mr. J. L. Shand, closely connected with Ceylon, has just been reporting on cultivation in Johore and North Borneo. New Guinea and Madagascar have been explored by Ceylon planters, and among the pioneers in the hill-country of East, or rather Central Africa, at this moment are men trained in our island. An illustration of what is thought of such training in other lands came under my notice the other day. One of our planters was travelling through a West Indian island. The director of the local Botanic Gardens, greatly interested in his cacao field, and seeking the opinion of his Ceylon visitor on the different kinds he had growing together, was reminded by the latter of one result in the probability of his different plants *hybridising*. "Ah!" said the director, "that word alone teaches me a lesson as to your training; such a suggestion I have never heard from any West Indian planter."—From Mr. J. Ferguson's Lecture before the London Chamber of Commerce, July 25, 1892.

## TEA MACHINERY FOR CHINA.

MR. DAVIDSON OF THE SIROCCO WORKS  
INTERVIEWED.

Mr. S. C. Davidson has been interviewed on the subject of tea machinery for China, the following dialogue occurred:—

“You have recently, I believe, received an order for large consignments of your machinery for China?”

“Yes; for firms in Shanghai and Foochow and another in the neighbourhood of Hankow. I expect others shortly.”

“Then you have not been in the habit of sending your machinery there, as you do to India?”

“Oh, no! You see the Chinese are so conservative that up to the present it has been utterly impossible to get them to consider the advantages of the new methods of tea preparation. Hitherto my machinery has gone mainly to the Indian, Ceylon and Java tea estates, where it has saved enormously in labour and produced a better article. Natal also is a tea-growing colony now, and uses my machinery, as well as Fiji, and several places in the West Indies.”

“And yet the Chinese retained——”

“Yes, the Chinese still retained their old and antiquated hand labour, with the result that they have been left far behind.”

“Their trade has fallen off in proportion as that of India has increased?”

“Exactly. From an export to the United Kingdom of, roughly speaking, 120,000,000 lb. in the zenith of their prosperity to 20,000,000 lb., which is about their annual exported quantity now.”

“Then they have begun to see the error of their ways, as manifested by the orders you have received from China?”

“Well, it is the influence of British and Russian enterprise. But for it, I suppose they would continue their old, painfully slow, and in many respects objectionable methods of manufacture.”

“It does seem surprising that it should be left to outsiders, so to speak, to teach the Chinaman what he ought to do with his own tea?”

“It is nevertheless a fact. Then again, these orders are not from English or Russian firms in their individual capacity, but from syndicates in which Chinamen are associated with the foreigners.”

“I should have thought the foreigner would rather do without a native as a partner?”

“So they would. But you see no foreigner can own a square yard of soil in China outside the Treaty ports. There must be a native along with him, and to him it must (at least nominally) belong.”

“Under such difficulties as you have narrated, the English and Russian traders deserve great credit for their enterprise.”

“Assuredly,” said Mr. Davidson, “and in my opinion there are vast possibilities before us in China in the near future.”—*Ulster Echo*.

---

 PLANTING NOTES.

**PADDY AND WEEVILS.**—We are reminded that the subject of preserving grain against weevils has been fully discussed in the “Agricultural Magazine,” in which a number of articles have appeared at intervals. But no better or simpler remedy than naphthaline has yet been suggested we believe.

**BANANAS.**—Eleven thousand bunches of Queensland bananas were recently condemned in Sydney owing to the presence of the fruit fly.

**“RAW RICE.”**—The Colombo merchant, who writes elsewhere on this subject today, is very likely right in his surmise that in the majority of cases our estate coolies would make little if any objection to the Burma rice. We can recall a time when any rice save that from Southern India, was regarded with suspicion.

**QUININE AND LOCAL MANUFACTURE.**—Some interesting information respecting quinine and especially the influence which the Java manufactures is having on the market, will be found on page 19. The Java planters have now no fewer than three local factories of their own, and the result is they save all the middle profits and are therefore able to go on making the cultivation pay. Had the Ceylon—and especially the Uva—planters only got a local Quinine Factory some years ago, as we strongly advocated, the cultivation of Cinchona might have been profitably continued in certain districts up to the present day.

**RHEA FIBRE.**—That cultivators are not for the present to have a rival in Rhea fibre production in Natal may be inferred from the following extract from the Report of the Curator of the Natal Botanic Gardens:—

I may say that I have little hope of this plant Rhea or Ramie being a success commercially in the colony, as in some other countries three or even four crops may be reaped in the season; in Natal I think that two are as many as we could fairly expect to get, which would place us at a considerable disadvantage in competing with more favourably situated places, where heavier crops could be got, and where labour is more plentiful and cheaper.

“THE AGRICULTURAL GAZETTE” of New South Wales, for April, 1898, has the following contents:—Some Food Plants of the Aborigines. J. H. Maiden; Botanical Notes; The Weed of New South Wales, No. J. H. Maiden; Sheep's Burnet. J. H. Maiden; Notes on the Constitution of Wheat Glutena F. B. Guthrie; Potato Culture—Result of Experiments at Ontario Agricultural College, Canada; Vegetable Galls. W. W. Froggatt; Ramie, Rhea or China-grass. H. V. Jackson; Appliances Necessary in Fruit-packing Houses, Orange Grading, Raisin Dipping. W. T. Allen; The Propagation of Plants. J. L. Leopold; Bees, How to Manage Them, IV. Albert Gale; Report on Parasites of Stock. N. A. Cobb; Bee Calendar. Albert Gale; Orchard Notes for May. W. J. Allen; Practical Vegetable and Flower Growing for May. W. S. Campbell; General Notes; Replies to Correspondents; Manure List for 1898, F. B. Guthrie and E. H. Gurney; List of Agricultural Societies' Shows; Label for Specimens.

**TEA PLANTERS** in general, and those whose lot is cast in rainless districts in particular, might, says a Calcutta contemporary, do worse than the planters in the Doloi River Valley. Recently a visitor to the South Sylhet Tea district noted a rather ingenious method of irrigating tea bushes on one tea estate. All the small streams had been dammed up, and the water made to flow back among the bushes by the drains, natural and artificial. The different appearance of these bushes on the flats compared with those on the tillals was very marked. This garden, he opines, will score heavily in its outturn by this simple and inexpensive irrigation scheme. It was the oft-told tale of necessity being the mother of invention. Compared with last year the rainfall in the Doloi Valley is two inches as against nine inches. Possibly this wrinkle may be worth something to tea planter similarly circumstanced.

**RUBBER PLANTING IN THE STRAITS.**—That a Ceylon man should decide, as Mr. Gordon Brown has done, to go all the way to the Straits to plant up 1,000 acres with Para rubber shows what advantages the Government of the Protected Malay States are deriving from their liberal treatment of the land question. It cannot be asserted for instance that there is not abundance of land in Ceylon quite as suitable as any in the Malay Peninsula for the cultivation of para rubber, but owing to the difficulty of securing it, and the high price probably demanded for it, an enterprising planter leaves the island and embarks elsewhere. It seems to us that this sort of thing ought to be prevented, if possible. Why should not Government, even now at the eleventh hour, turn round and say that they will alienate no more land from the Crown by outright sale except in certain specified cases? If this were done and a yearly rent exacted instead, it is not possible, that with greater facilities for acquiring land opening it, greater encouragement would be given to the extension of new cultivations? We call attention to the information kindly supplied by Mr. Gordon Brown in another column.

**THE REPORT OF THE MADRAS BOARD OF REVENUE** on the prospects of an iron industry in Salem, is of so hopeful a character, writes the *Madras Mail*, that it should not fail to attract attention from those interested in the iron trade. The question has been very carefully considered—from the manufacturing expert's point of view by Mr. Jeremiah Head and Major Mahon, and from the fuel expert's point of view by Messrs. Popert and Brazier; while the whole matter has been summed up by the Board of Revenue in the proceedings published. The conclusion arrived at by the Board is, briefly, that it would be possible to deliver ten thousand tons of Salem pig-iron annually in London at £3-11-6 per ton, while the value per ton of Swedish pig-iron delivered at a British port varies from £4-1 to £5-0-9. Furthermore, it is shown that the Salem product would compete on favourable terms with hematite iron imported into India, the average cost of the latter at Madras being £3-3-6, while the average cost of the former would be only £2-16-6.

**GREEN TEAS FOR AMERICA.**—Those who object to the suggestion of the Tea Commissioner—see his letter elsewhere—that an attempt should be made to capture the “green tea trade” of the United States from the Japanese, alleged that success is impossible and the business not one appertaining to the Ceylon planter. Now these critics forget what the Ceylon tea planter has already done. He has driven out the inferior China teas in the mother country and created a taste for a very different and far better tea right through the land. Moreover the same process with even a greater difference is going on in North America with our British-grown or “English breakfast teas” as the Americans call them. Why then should Ceylon and Indian “green teas” not oust the 40 millions lb. of Japanese it only sufficient care is taken? We learn that Mr. Blechynden who was at first opposed to the recommendation, is now most heartily with Mr. Mackenzie in this matter and that samples of green tea he submitted from an Assam factory to large American buyers, received their express approval. This being the case, we strongly advise the Ceylon tea planter, where favourably placed for the manufacture of green teas, to go on at once and conquer this new and profitable market.—We must quote in an early issue, some instructions as to the making of “green teas” for local guidance.

**VANILLA.**—We alluded the other day to the well-known facts that the American market takes almost the whole of the Mexican beans produced and that these are of distinctly superior character. We have in this article the appearance of each of the beans met with in commerce described—Maican, Bourbon, Seychelles, and so on. The character of the Tahiti bean is only referred to in connection with vanillon, a description of bean from Guadeloupe, which was offered at auction five weeks ago. We note that the writer of this article says that the odour of vanillon is “that of heliotropæ, even surpassing that of the Tahiti vanilla.” We should be inclined to emphasise the fact that the odour of vanillon is totally distinct from that of the ordinary vanilla bean, even the Tahiti description. The consumption of vanilla in the United States is enormous. The highest point it reached in the last 13 years was in 1893, when nearly 250,000 lb. were imported into the country. Bourbon beans are improving in appearance, Mexican deteriorating. The introduction of vanillin has not interfered so much as would have been expected in the old field enjoyed by vanilla, but has helped to extend the use of this flavour; 100,000 ozs. of vanillin were used in the United States in 1897. —*British and Colonial Druggist*, April 8.

**OLIVE OIL FOR ENTERIC FEVER.**—In continuation of what has appeared, from time to time, on the above subject, in the local press, the following from an Indian contemporary will be of interest:—

“Medico” writes to and upcountry paper:—“I notice with great interest, in your issue of the 16th instant, your reference to the treatment of enteric fever with olive oil now being carried out at the Station Hospital at Meerut. In the *Lancet* of November 27, 1897, page 1883, there is an article on the value of olive oil in the treatment of typhoid fever by Dr. Owen Paget of Fermantle, Western Australia, and on reading this I was so struck with the excellent results obtained, that I determined to try it on the first occasion which came under my notice, but as yet have had no opportunity I think that medical officers who have opportunities, as so many have now, of trying any new treatment, would do well to study the article in question. Dr. Paget in his article says:—‘It has been my lot to attend a large number of patients suffering from typhoid fever (well over 100) who were placed under the most disadvantageous circumstances, many of them unable to obtain any form of fresh milk, yet my percentage of death is nil, and this is the more remarkable seeing that among patients removed to the hospital where they are properly attended to and receive suitable nourishment, the percentage was high as 20 in 1896 and 11 in 1897, with better accommodation.’ He continues:—‘Now this success I attribute very largely to the use of olive oil in this disease.’ He gives the method of administration in his article, simple in the extreme. Typhoid fever is so common in India and its death-rate so high in spite of all the latest methods of treatment being adopted, that I think from the remarkable results recorded in the article in question, the simple treatment advocated might, with advantage be tried in cases in all hospitals and its results recorded. I ask you to kindly give publicity to this letter in order that medical officers who wish to try the above method of treatment may know where to find it fully explained.” The *Times of India* says:—“It may interest Surgeon-Major Rennie, who is making encouraging experiments at Meerut to establish the curative effect of olive oil in enteric fever, to know that the oil in question is in many parts of Spanish America considered the only remedy of much use in yellow fever. The usual practice is to make a patient drink half a pint of olive oil—not always an easy thing to do—and then send for a doctor, who, if he is well advised, repeats the dose. The remedy, real or supposed, is well known to the captains of merchant vessels trading with Havana, the Brazils and Pernambuco. They prescribe it for sailors under their charge who may be attacked,

## SCIENTIFIC MANURING :

MR. JOHN HUGHES—MR. A. BAUR—AND  
THE LATEST CONTINENTAL AUTHORITY.

Before directing our readers' attention to the following communication from Mr. John Hughes—who always writes after an instructive fashion—we would explain that the passage Mr. Hughes condenses in the editorial of *Observer* of April 6th which he quotes, was expressly given by us as a quotation from the writings of one of the most distinguished Agricultural Chemists of the present day. Moreover our attention was called to this deliverance by Mr. A. Baur—who sends us another letter on nitrogen in the manuring of tea—and for whom Mr. Hughes has commendation to offer towards the end of the following communication. We are now enabled to give the information Mr. Hughes desiderates as to the identity of the Agricultural Chemist. He is Monsr. M. P. P. Deherain, member of the Institute of Science, Paris, whose work on "Science and Agriculture" was published in Paris (Rueff & Co., 103 Boulevard St. Germain) in 1897, and is entitled "Micro-organisms or Bacteria in the Earth"\* and from this volume we quoted. With this preliminary explanation, let us hear what Mr. Hughes has to say:—

"A leading article in the *Overland Observer* of April 6th under the heading of 'Science and Manuring' is naturally calculated to attract considerable attention not only in Ceylon, but also in India and China and wherever tea is cultivated. In this article the following paragraph has no doubt attracted special notice and well deserved hostile criticism:—'We proclaim, not as a prophecy but with certitude; the reign of the nitrogenous manures is finished and that of the Bacterias commences.' Who the author of so definite a statement may be does not appear; but it may safely be stated without fear of contradiction by those well informed that the reign of nitrogenous manures is very far from being over; and this fact may be illustrated by the enormous quantities of guano, nitrate of soda and sulphate of ammonia that are annually applied both directly, and as important ingredients in mixed manures wherever artificial or chemically prepared fertilisers are applied.

"It is somewhat surprising that such a statement as that contained in the above paragraph should have been published in a paper which has always been so justly regarded as the medium of a forwarding planters sound practical advice.

"Let me quote the opinion of the late Agricultural Chemist to the Royal Agricultural Society of England when reporting upon some analyses of Australian soils sent to the writer by the Agent-General for Queensland:—'As regards the relative rapidity with which the fertilising matters are removed by growing crops and natural drainage, nitrogen is the first which goes, and in relatively larger proportions than any of the essential mineral plant constituents, and hence there is the greatest necessity to make ample provision for the restoration of nitrogenous food which is constantly being eliminated from the land by the growing crops, and to a very large extent in the drainage (see Voelcker's analyses of drainage water from experimental plots at Rothamsted).' This statement is just as correct now as when it was written upwards of 23 years since Nitrogenous manures must, however, be used with moderation especially if they are employed in a form readily soluble in water such as nitrate

of soda, nitrate of potash, sulphate of ammonia or even as guano. This caution is specially important to bear in mind in tropical or semi-tropical climates with a heavy rainfall like that associated with Ceylon. It is for these reasons that the writer in recommending fertilisers for tea, coffee and cacao has found it desirable to treat each estate or groups of estates according to their special requirements as indicated by previous analyses of selected samples of soil. Where the nitrogen naturally present in the soil is comparatively large, the percentage of nitrogen in the manure recommended was naturally comparatively small and the proportions of phosphates and potash salts were comparatively large; When, however, as in most Ceylon estates the figures for nitrogen are low, and in cases where the original rich humus of the surface soil has been washed away, it is reasonable, and indeed requisite to raise the percentage of nitrogen. Also at higher altitudes much more nitrogen is required than in low altitudes. In fact as I have already stated if manuring is to be carried on with due regard to science it is necessary to treat each locality according to local circumstances of soil, situation and season. A recent writer, Mr. A. Baur has correctly pointed out that it does not seem reasonable to apply nitrogen in a readily soluble form while phosphates are supplied in a form only slowly soluble. In a properly compounded manure for tea a certain proportion of all the necessary elements of plant food should be supplied in a form at once available and the remainder of these constituents in forms and conditions of different and less soluble character. It is only by careful attention to these and other points that manures can be economically applied, and it would be very impracticable as well as decidedly unscientific to prescribe any definite formula for a tea manure without regard to the composition of the soil, the altitude of the estate, the situation as regard exposure to wind, and the average rainfall experienced.

JOHN HUGHES, F.I.C.,  
*Agricultural Analyst.*"

"79, Mark Lane, London, E.C."

No doubt Mr. Hughes will refer to Mr. Deherain's book and will, in due season, give his opinion of it. He may also have something to say about the present letter of Mr. Baur who tells us that average tea soils have enough nitrogen (and to spare) year by year, for 1,600 lb. of made tea per acre—20 lb. of nitrogen being equal to 400 lb. of made tea. He further indicates how this may be increased by stirring the soil; and also by our tropical rains which are notoriously rich in nitrogen. Now it seems to us that each practical planter may well settle the question at issue for himself. Surely he can afford to set aside a few acres for an experiment while going on treating the rest of his estate as usual? Let him hole a couple of acres as for manuring, but put nothing in—filling in the holes after the usual interval and repeating this operation year after year for three years. Another two acres let him treat as directed by Mr. Baur; and a third in the old and most approved fashion with castor-cake and bones. Let him keep a note of the cost and returns in each case for the three years and he will then have an object lesson more valuable to him for his estate, than can be offered by all the manure sellers or Agricultural Chemists in the world. He should take care that the six—or even three—acres of the estate selected, should be as near as he can decide, a fair average of the property.

\* M. Deherain is in charge of the best-known agricultural Experimental Station in France.

## TEA AND TOBACCO.

Tea and Tobacco have been brought into unwonted antagonism by the removal of the duty from the latter article in this year's Budget. It was contended in the House on the night of Monday, the 9th of May, that the tax on tea ought to have been withdrawn instead, seeing that a greater number of the community are concerned with its purchase. Ladies drank tea, said Mr. Edmond Robertson, the Member for Dundee, whereas they did not touch tobacco. Subdued mirth in the Ladies' Gallery followed this remark, and Sir William Harcourt rose to affirm that it was contrary to his "own personal observation." The practice is, we know, extremely common in ladies' clubs in the West End and among the higher classes in the country, especially in Ireland; but to those who know anything about the sale of tobacco, it is an established fact that hardly any smokers of small means refrain from indulging in the fragrant weed through lack of cash. They merely smoke inferior tobacco, and often a greater quantity of it, owing to its mildness. Whereas a reduction in the cost of tea would involve a vast increase in its sale. Poor people are repelled by the inferior qualities of cheap tea far more than in tobacco. Moreover, in the stimulating beverage, there is a power for genuine refreshment; while smoking gives us only a sensuous pleasure with, at best, but a soothing effect on the nerves. The removal of the tobacco duty is a move in favour of the upper classes, amongst whom the fashion of abstaining from tea is prevalent just now, whilst expensive cigars with them remain always in demand.

In the House of Commons, on the Budget Resolutions coming up, as already stated, Mr. Edmond Robertson, Member for Dundee, expressed regret that the surplus had not been applied to a reduction of the tea duty instead of the duty on tobacco. Sir Wm. Harcourt supported and pointed out that tea had become almost exclusively a British product. A reduction of the tea duty would therefore benefit a larger number of people than the reduction of the duty on tobacco, whilst at the same time, it would be of service to the British tea-grower. The Government, however, carried its Resolutions. A reduction of the Tea Duty is bound to come next year if there be no war.

---

 THE CACAO DISEASE: MR. CARRUTHERS' CAMPAIGN.

We learn that Mr. Carruthers is working hard now at cures and preventives and that he has a lot of experiments in hand. He is at present travelling about and has already visited some 17 estates, all of which except one, have disease in varying proportions. Mr. Carruthers hopes that his final report may be able to lay down methods of getting rid of the canker which will be quite effectual; but of course the wet season, N.-E. monsoon in the Matala district, is the time that will test the efficacy of any cure and he is not likely to stay for that. Mr. Carruthers' engagement is till August 13th only. Mr. Carruthers is now with Major Pain at Wattegama for a few days to look at the estates in that district and then he goes on to the Katugastota district and then to Rambukkana, and also perhaps to Monaragala in Uva.

## THE SCOTTISH CEYLON TEA COMPANY.

We direct attention to our special report of the proceedings at this Company's meeting. There is a good deal given there that does not appear in the official report or in the London papers. One item of interest is that the Chairman, Mr. Forbes, is likely to be able to impress the producers' view about the Indian Currency on a member of the Committee who has not studied the subject. The other is the little discussion over the reading by our old friend Mr. Geo. Todd of Mr. A. L. Cross's letter—given in full—objecting to the reduction in dividend. We have a similar complaint from a home correspondent who writes:—

"You would be surprised perhaps to see the Scottish Ceylon Tea Company are only going to pay 10 per cent against the usual 15 per cent. I think this was a mistake as I gather from the Report 12 per cent might have been paid and a small balance still carried forward. With a reserve of £7,000, there was no occasion it appears to me to be so very cautious. It will lead to the depreciations of the shares I fear."

It is clear, however, that the city business men present at the meeting, fully approved of the course taken by the Directors. We hope the good old "Scottish Company" will return next year to its usual rate of dividend.

---

 MR. ROGIVUE AND THE THIRTY COMMITTEE.

The following correspondence has been forwarded to us for publication by Mr. A. Philip, the Secretary of the Thirty Committee.

Kandy, March 2.

M. Rogivue, Esq., Mroseika, House Leberieff, Moscow.

CEYLON TEA IN RUSSIA.

DEAR SIR,—Your letter of the 5-17th December, 1897, having been duly submitted to the "Thirty Committee" and published, I now annex for your information and guidance, copy of a Resolution passed by "Thirty Committee" after personal conference with Mr. T N Christie on his return here from Russia—I am, Dear Sir, Yours faithfully,

A. PHILIP,  
Secretary to the "Thirty Committee."

RESOLUTION REFERRED TO.

"That having heard Mr. T N Christie's views regarding Mr. Rogivue's work in Russia the Committee desires to convey to Mr. Rogivue their thanks for his past services in pushing Ceylon Tea in Russia, and to intimate on the understanding that his business is carried on on similar lines, the Committee would wish to continue their patronage and support."

Moscow, Mroseika, House Leberieff, 17-19th April 1898.

M. Rogivue, Ceylon Tea and Coffee, to A Philip, Esq., Secretary to the "Thirty Committee," Kandy, Ceylon.

DEAR SIR,—I have duly received your esteemed favour of the 2nd March and was very pleased to hear of the resolution passed by your committee in February expressing their satisfaction with my efforts to push the sale of Ceylon Teas, in Russia, as reported by Mr. Christie, and indicating their willingness to continue to support me.

My plan of business has not been changed, and I shall, as hitherto, carry it on similar lines, and continue to sell and push the sale of "Ceylon"

Tea in this country. This being understood, I now write to ask if the committee will kindly subscribe a sum to assist with the advertising of the Teas. My scheme of advertising must necessarily be governed by the sum which the committee agree to devote to this purpose, but with sufficient funds I should be inclined to cover as much ground as possible by means of Newspapers, Magazines and Illustrated papers. To do this thoroughly well would involve a very heavy expenditure, say nearly Rs 50,000 as it would mean 3,200 advertisements in 80 newspapers during 40 weeks of the year,—September to May—and sundry extra insertions from time to time during that period and the Nijna-Nowgorod's fair, but of course the advertising can be very effectively done on a smaller scale according to the funds allowed.

Mr. Christie, I think, is averse to private firms' names appearing on the Committee's advertisements, but this can be met by my own advertisement appearing on the same page immediately below that of the Committee.

Another way which I can recommend is by "Placards" at Railway stations.

I have another inexpensive and effective scheme for advertising by means of "Post-Cards" with views of Ceylon and tea estates, etc., upon them; these can be got up here very cheaply, and if the Committee will permit me to stamp them with my name and address, I would be glad to pay a share of the expense.

I can go more fully into details when I get the views of the Committee and have a general idea of the amount they are prepared to spend to help on this work.

The progress made by Ceylon tea in this country, during the last year, is undoubtedly noticeable. A number of whole-sale Tea merchants are selling it pure and many, (K. and S. Popoff amongst them, who once said that they would never touch Ceylon Tea) are now advertising a special brand-mixture of "China-Ceylon," this being an evident proof that the fancy to the taste for "Ceylon" is gaining more and more ground amongst the public and that the demand is on the increase.

Last year, I have myself imported 320,000 lb. Ceylon Tea, all sold in packets of 1/1, 1/2, 1/4, 1/8, 1/16, and 1/32nd of a pound, and during the past three months of this year, I have already passed orders for over 2,000 chests all "Ceylon," of which 800 chests direct to Colombo.

Another evidence of the increase is, I think, the fact that Moscow, Odessa, St. Petersburg, and other places, are now constantly visited by representatives of London Tea Houses who, one after the other, appears on these markets seeking for Agents capable of placing for them Ceylon Tea.

No doubt that a good, steady and substantial advertisement would still help and push forward the consumption

Awaiting on this subject the favour of your reply.—I am, Dear Sir, Yours faithfully,

Signed M. ROUVIEU.

### PRODUCE AND PLANTING.

THE OUTLOOK FOR TEA IN CHINA.—Consular reports from China on the subject of the tea trade differ in regard to tea prospects. While some of them point to renewed efforts and hopes on the part of the Celestials in regard to their tea trade, others are not at all sanguine about the prospect of rehabilitating it. Amongst the latter is the report of Mr. Carles, the British Consul at Foochow, who

says the export of tea from Foochow in 1897 was nearly sixteen million pounds below that of 1896. At present the cultivation of tea is scarcely remunerative. In the Kien Ning and Yen Ping prefectures rice is said to be taking its place. In the Foochow neighbourhood the sweet potato receives more attention, and in remote tea districts the Consul hears of curing-houses being offered for sale to missionaries. But Oolong, Seu-moo, Souchong, and Pan-yong teas retain and in some cases improve their position. The competition for Oologs, some Souchongs, and flowery Pekoes is still very keen, nothing like them being produced in India. Mr. Carles cannot see how China can regain her position in the tea trade, the importance of which to the country is far greater than might be imagined. The consumption of tea in China is restricted even in the provinces, which produce it to a small class. Even in Fuhkien, outside the literary class and merchants, the majority of the people use tea dust of different grades and in provinces where tea is not grown other leaves take its place. In England 6 lb. per head of the entire population is the average consumption. In the Foochow province it is probably nearly 3 lb. per head, even among the small fraction of the population who are tea drinkers. Some of the old faults of Foochow teas appears to have been eradicated; but none of the new methods of preparing teas appears to have proved a complete success, from which we are to infer that the dirty methods affected by the Celestial still prevail. This of itself would be enough to drive Englishmen from the Chinese to the Indian article could they but realise the difference between the two modes. One sensible and direct step towards the resuscitation of Chinese tea is being taken by the local government—the *likin* charges have been reduced. But even this reform has not been induced by any real desire for the amelioration of the trade. The provincial government has reduced the charges because it was apprehensive that, if it made no concession, tea would be brought down to the coast under transit passes, the proceeds of which would not go to it, but to the central government.

CHINA TEA IN AMERICA.—The American importation of Chinese tea in the year ending June 1897, amounted to 56,932,000 lb., valued at £1,467,000. This represents about half the total import of tea into the United States for that year; the balance was contributed by Japan (45,000,000 lb.), the United Kingdom (6,000,000 lb.), and East India (2,000,000 lb.) The total consumption of China tea by the United States in 1896 was larger than the British consumption by about 1,800,000 lb., but fell short of the Russian consumption (inclusive of Asiatic Russia) by over 14,000,000 lb.—*H. and C. Mail*, May 13.

### AN OPENING FOR INDIAN FRUIT. EFFECT OF THE SPANISH-AMERICAN WAR.

(From *Indian Gardening*.)

Advices from England state that the Spanish-American war is calculated to completely paralyse the fruit trade between Spain and Great Britain. It is pointed out that one of the first results of the war will be the destruction of this industry. It is well known that England draws a very large proportion of her supply of fruit, not only from Spain, but from the Spanish colonies as well. The Seville orange, from which marmalade is chiefly made, comes from Spain mainly, not to mention grapes and some other fruits. As long as hostilities continue between Spain and the United States, the supply of Spanish fruits for the London market will be very scarce. Of course, the home country can draw upon Florida and the Australian colonies; but from the Australian papers we gather that the fruit supply this year has been practically destroyed by blight; while the authorities in Sydney are reported to be condemning as unfit for human consumption large quantities of Tasmanian apples and Queensland bananas.

Melbourne imports large quantities of lemons and oranges from Northern Australia; but it is stated that something like 80 per cent of the supply is condemned as being affected with scale; indeed, it is averred that oranges completely covered with this disease are found among the consignments coming from that source. It so happens that Northern Australia grows very much the same kinds of fruit as India, such as guava, mango, loquat, &c.; in Victoria there are large areas planted with fruit trees; and the Australian fruit trade has grown very large during recent years.

It seems to us that India's opportunity has come at last, and if she does not seize it now, and make the most of it, she ought for ever to hold her peace. Two important sources of England's fruit supply are practically closed, as we have pointed out more than once. India produces fruit of several kinds and of good quality. Her oranges and bananas are far and away superior to anything that can be raised in any other country in the world. The Allahabad guava will compare favourably with the produce of any other country; moreover, the fruit is in great abundance, and after leaving a large margin for home consumption, there would be more than enough for export, and we have no doubt that this fruit would be much appreciated at home. Take our liches and mangoes: we do not believe that any other country could produce them of the same quality and in the same variety. Why should not some enterprising firm set about the establishment of an export trade in fruit from India for the London market? We have shown that were shipping companies to afford special facilities for the export of Indian fruit, by providing refrigerating chambers, such as are to be found in most of the liners plying between the Australian Colonies and Britain, they would, we believe, have no reason to complain of want of cargo. Last week we quoted an interesting article from the *Australasian* on a new process for the preservation of fruit for export. It is such a simple one that it could easily be adopted in this country. The fact is that Englishmen in this country are so much occupied in trying to make large fortunes out of such products as indigo and jute, that they have never troubled themselves about the possibilities of an extensive fruit trade, which, we consider, would pay much better than either jute or indigo; and would, moreover, give an impetus to a new industry.—*Pioneer*, May 24.

#### EXCHANGE AND THE TEA TRADE.

(To the Editor of the *Economist*.)

SIR,—Lord Farrer, in his letter of the 25th ult., no longer holds to his position that an increase in the exports of tea from Ceylon in 1897, proves that the industry is not now suffering from the 1s 4d rupee. But with some object, not disclosed, he returns to the charge with a comparative statement of the imports of tea into the United Kingdom from India, Ceylon, and China, from 1884 to 1896. These teas, it will be observed, must have all been plucked from bushes planted in or before 1893, up to which year, as Lord Farrer kindly reminds us, all three countries had a silver currency. The figures tell a marvellous tale of the results that have been achieved by Indian labour, directed by British energy and supported by British capital, in fair and open competition, a tale of which Indian and Ceylon planters may well be proud; but they give us no information at all as to the course of trade when India and Ceylon have to work with rupees

fixed at 1s 4d, China having still a silver standard in which the value of the rupee is 3d to 10d.

Fortunately, owing to the kindness of the secretary of the London Chamber of Commerce, I am able to give some figures that bear on the point. Java has a gold standard. In the days when the rupee was worth 2s she used easily to hold her own with Ceylon in coffee. About the same time as Ceylon she began to plant tea. How has she fared? The following list of her exports (in lb. 600's omitted) for the years 1885 to 1896, as compared with those from Ceylon, will show us:—

	From Java	From Ceylon.
1896	9,569	108,141
1895	10,147	97,950
1894	8,734	84,592
1893	8,792	84,388
1892	9,157	71,154
1891	5,880	68,274
1890	7,002	46,992
1889	7,627	34,048
1888	7,479	24,381
1887	7,029	13,801
1886	7,303	8,111
1885	7,029	4,412

During these years the gold price of Ceylon tea fell from 1s 3½d to 8½d, the gold price of the rupee varied from 18½d to 13¾d. Java made a better start than Ceylon, when the gold prices of both tea and the rupee were high, but has since been able to make little progress.

But the Ceylon tea-grower has been making profits "at the expense of those whom he employs," by paying his "coolies in depreciated rupees," say both Lord Farrer and your correspondent "East India Merchant." This, I venture to think, is one of those "currency delusions" that Lord Farrer deprecates. First, from the point of view of the planter, it is clear that he has nothing wherewith to pay his coolie but his tea, and the rupee, having even at its lowest had an increased purchasing power in respect of tea, the wage bill has been a heavier charge on the produce at the lower rates of exchange. Secondly, from the point of view of the coolie, his fixed daily wage (it has for fifty years past varied little from one-third of a rupee) has bought him as much rice, provided at a fixed rupee rate, as much cotton cloth, curry, stuffs, &c., when the rupee had fallen to 1s 1½d, as when it was 2s. He has been able to live as well and to put by as many rupees wherewith to return home to India as ever. He is a man free to come and go as he will, and his contentment with his lot is proved by the fact that rarely during the recent wonderful expansion of tea cultivation has the supply of labour fallen short of the constantly increasing demand.

So, then, though there has been a steady and prolonged depreciation of silver in respect of gold, there had been up to 1893 no depreciation of that metal either to the disadvantage of the coolie or to the undue advantage of the employer. In a word, silver had up to that date shown itself, so far as Ceylon was concerned, a fairly stable standard of value in respect both of commodities and of the "services of man."

This has been all changed by the closing of the Indian Mints and the forcing of the rupee to 1s. 4d. The rupee price of tea has experienced a heavy fall, the silver price a corresponding rise.

The real vital question that lies behind these currency changes, this diminishing of "the number of counters" out of which Lord Farrer and the Indian Government seek to make profit, is the effect on the comparative cost of labour in the competing producing countries.

In Ceylon the daily wage, which in 1894 and 1895 was equal to 4½d, has been raised today by the action of the Indian Government to 5½d. Similarly, the wage of the Chinaman, as measured in gold, will have fallen in proportion as silver has fallen, and there is not the least reason to suppose that in either country the currency changes will lead to a change in the nominal wages.

Now as to the future of the trade, Lord Farrer has shown by his table that the United Kingdom already takes nearly all its supplies from India and Ceylon, and cannot absorb any large additional quantity. The "East India Merchant" has told us how far at least three or four years to come both India and Ceylon will export largely increased weights. This excess of tea must go to other markets where at present China and Japan hold the field. In the process of expelling China tea from the United Kingdom the gold price of the Ceylon leaf fell from 1s 3½d to 7½d; how can we possibly expect that, under the circumstances created for us by the Indian Government, there will not be, in the struggle for such markets as those of Russia and North America, a still further fall in the gold price?

I am no prophet, as Lord Farrer suggests, but I am an English manufacturer, and I know too well by experience the inevitable curtailment of profits consequent on a fixed wages bill and constantly falling prices, not to see in these the threatening of disaster.

Lord Farrer throws light on my statement that within the last few months tea seeds have for the first time become unsaleable in Ceylon, by showing that so recently as some unnamed date in 1897 (probably, I think March 31st) tea seeds were being imported from India. The figures given seem to add weight to my statement, as showing how quickly the effect of the 1s 4d rupee, established so lately as January last, has made itself felt. On this point I may quote the following extract from the "Ceylon Times" of April 4th, which has reached me since the date of my last letter:—"No bidders for tea seed! Such is the report which reaches us as to the result of a sale of Horagalla seed which was held by Messrs. Forbes and Walker today. We do not think there is much likelihood of any further demand for tea seed yet awhile."

I am glad that Lord Farrer has not attempted to minimise the significance of this sudden cessation of planting in Ceylon.

I now turn to the letter of "East India Merchant." When next he quotes with a view to criticism, even though he quotes but three words, I would recommend him to read carefully the sentence from which the words are taken, so as to make sure of its meaning. He attributes to me not only that which I did not say, but the very reverse of that which I did say. I did not say there was no increase in the land planted with tea in Ceylon later than 1894. I did say that tea seed had become unsaleable for the first time within the last few months.

I made no error. The "East India Merchant" makes many. The Ceylon Directory gives as the area planted with tea, old and new, in 1890, not 250,000 but 220,000 acres. The years 1890 to 1894 are four not three. The yearly average acreage planted in those years was 17,000, not 13,000. There are not, nor are there likely to be, 375,000 acres planted with tea in Ceylon. The latest estimate of the total acreage planted is 315,000 with a probable eventual extension to 350,000. The yearly average acreage planted in the last three years was probably about 10,000, not 29,000. "East India Merchant," when next he rushes into print with figures about Ceylon, had better come to me to have them verified before publication.

He is so far right, however, in that in each year a substantial addition has been made to the planted area; but he omits to notice that in the years subsequent to the closing of the Mints the gold price of the rupee touched its lowest point, its average values being 13.53d in 1894, 13.37d in 1885, 14.11d in 1896, and even in 1897 only 15.37d. The 1s 4d rupee was not established till January last.—Yours faithfully,

WM. MARTIN LEAKE, Secretary.

Ceylon Association in London, 61 and 62 Gracechurch street, E.C., May 4th, 1898.

Since writing the above, I have read the letter of the Indian Government giving its new currency proposals, as reported in *The Times*. A high official lately said something about "luacy." I will not retaliate, but, like Lord Farrer, I will ask a question. What is to be said of gentlemen, however eminent,

who, complaining of the burden of their gold, debt and expressly stating that in payment thereof "the real remittance must be made in exported produce," propose as a remedy to borrow more gold, and to melt rupees, unfruitful operations both, and yet give not one word of heed to the effect of these operations on the quantity and gold value of the all-important produce?  
W. M. L.

TO THE EDITOR OF THE "ECONOMIST."

SIR,—I have read, with interest and respect, Lord Farrer's views on exchange as a factor in the trader's calculation. May I be allowed to put the following case?

Lord Farrer and I are merchants in India, competing for a foreign order for the shipment of Indian produce. The other conditions of our competition being equal, let us suppose that I can command a lower exchange for my bills than he is able to do. Which of us would make the cheaper tender? Would he secure the order, or should I?

Lord Farrer says:—"Of all the mischievous delusions prevalent in the mercantile world there is perhaps none more mischievous than the notion that a nation can, by depreciating its standard of value, increase its power of production, of exportation, and of competition with other nations."

But the Indian contention is not that we wish to depreciate our standard of value, nor that we expect benefit therefrom *per se*. What we say is, we cannot afford to artificially enhance our standard of value so long as our trade rivals who have a similar standard allow it to rest at a natural level and lower than ours. I scarcely suppose Lord Farrer intends to dispute this. But if he does, I venture to think that he will not find himself in agreement with any practical trader.—I am, sir, your obedient servant,  
May 4th, 1898. H. F. B.

#### CEYLON TEA: HOW TO FIGHT THE BIG DISTRIBUTING HOUSES.

It is well to remember how Ceylon tea first came into notice in the United Kingdom. The prejudice against it in Mincing Lane was very great: it is always so at first with reference to any new departure in an established trade. Samples or shipments of any product identified with certain regions, coming from a previously untried country, are viewed with suspicion and brokers and buyers were far from favourable to Ceylon tea at the outset. The distributing Houses and middlemen would have nothing to do with it. How then was a demand created? It is not too much to say that a thousand or more Ceylon planters did this effectually by sending sample chests or half-chests to their relatives—parents, cousins, aunts—all over the Kingdom, and instructing them how to make and enjoy this new tea, and then to insist on getting no other but Ceylon tea from their grocers. That speedily created a demand which had to be supplied, so that for some years the shipments from Colombo were not equal to the requirements of Mincing Lane. To hasten the distribution, moreover, a considerable number of retired coffee planters or other colonists became agents for certain tea estates and supplied the local village grocers, or families, taking a chest or half-chest at a time. All this speedily created a revolution in the tea trade: "Chinas" were everywhere decried in households that had become accustomed to the superior flavoured "Ceylons" and Indian teas also greatly profited by the change in public taste originally started by the action of a thousand or more planters out in Ceylon.

Now the problem before us at the present time is whether some action cannot be taken to meet

and overcome the present crisis similar to that effected a dozen or fifteen years ago. The trouble is now that, while Ceylon and Indian teas command the United Kingdom and the people are willing to pay a fair price for a good tea, their taste is being gradually spoiled by very inferior mixtures, while, on the various grades sold, the enormous profit goes nearly all into the pockets of middlemen, and the producers see only a fraction which, year by year, is growing less. How is this to be met and remedied? The first thought and answer is, - by the formation of a powerful Syndicate of planters and their friends to establish a "Direct Supply Tea Association" and compete with the big tea distributing Houses on their own ground. This, we are assured, has been thought of by Ceylon men settled in the Metropolis with the command of capital and experience in business; but after full consideration, they have shrunk back from an enterprise which they declare would be attended with immense difficulty and risk and might eventuate, through failure, in doing more harm than good to the producer. This is a first decision and we do not accept it as final, if the evil complained of continues as bad as at present. But, there is a simpler, preliminary mode of proceeding open to the Ceylon planter and his friends at this time which ought to be tried. It is well known that teas, advertised as the finest and retailed as high as 2s and more per lb. by the big Houses, are bought in the Lane at not more than 8d per lb. We can imagine what the medium teas must be like if these are the finest sold in this way, and how the public taste is being gradually lowered. Now, it is suggested that the 1,600 planters now in Ceylon should once more send home good or superior samples, half-chests or chests, to their relatives and friends with instructions that they are to demand and require of their grocers, a better class of tea, a tea up to the sample produced which can be got for such and such a price. In many cases where there is opportunity, leisure, and inclination, this may, of course, lead to a little "direct trading," and every little helps. But, in any case, the simultaneous demand all over the United Kingdom for a better class of tea than that now sold at 1s 6d and 2s, and the demonstration to grocers that a far superior tea can be laid down in his store, with an ample profit to himself, for that money, could not fail to work a change; to cause a fluttering at headquarters among distributing Houses and a re-arrangement and improvement in their grades of tea sold—all of which must tend, to some extent, to benefit the producer by giving a better price for his tea. It depends on the planters themselves then for the crusade to begin.

### COFFEE PROSPECTS IN BRAZIL.

The following has been received from the British Consulate at Santos Brazil in reply to a communication sent by the Singapore Chamber of Commerce asking for information. The letter is being circulated to all members of the Chamber:—

1. Actual prices in Brazilian currency are still remunerative for the smaller part of production in the State of San Paulo. The greater part, say about 2-3rds, however, depend on heavy interests on mortgages and excessive expenses, the more so, as during the times of high coffee—prices and prosperity—the majority of these estates were bought and laid out to culture at double and triple of

actual value. Should currency rise and prices in the consuming quarters not follow accordingly on account of the pressure of the extraordinary large stocks, a great portion of the culture would be voted to miscry, principally in the more distant coffee growing districts, where the expensive cost of transport and higher railway-tariffs interfere seriously with the result.

2. The cultivation is not dependent to any appreciable extent on European Capital and only a small number of Estates or Plantations are worked under European management.

3. There are no prospects of cheaper labour than that furnished by the Italian immigrants. Several attempts have been made with other immigrants (Siberian, Russian) but failed completely. Japanese labour is not being employed, although there appear periodically strong endeavours to attract the Japanese Immigration. Under the actual critical circumstances and the heavy crisis the country is undergoing, there is no probability of any propaganda for other immigration than Italian proving successful.

4. As stated under item 1 many estates would have to be abandoned, if actual critical conditions were to last and bring about lower prices. Even with actual value of coffee production is most probably to be curtailed by the fact of many planters not being able to give their plantations sufficient care as to cleaning the ground and eventually manuring.

5. The reason of foreign capital not having been invested in Brazilian estates to a more considerable extent was in first place the slavery up to 1888 and since then political uncertainty and the everlasting republican troubles.

### THE PRUNING OF TEA.

#### SOME SUGGESTIONS FOR AN IMPROVED SYSTEM.

(By a Planter in India of Twenty-four Years' Experience.)

After a long experience I venture to give some of my ideas about pruning. I want to show that *cutting down* is a serious mistake and to propose a system by which this cruel operation can be stopped entirely. If any one will take the trouble to examine a bush which is about to be sacrificed, he will see by marks and signs that the great stems are of various ages. Some of the branches will show the scar of a previous cutting low down near the ground, other branches will be found with a clean stem almost level with the top of the bush, and the marks of the annual prunings will be found at intervals on all the stems. This will prove that some of the branches grew up from the ground or out of the old branches after the last cutting down. The theory which I have evolved from this fact is that branches should be eradicated only when they cease to yield well, and that the bush will constantly renew itself with fresh vigorous branches.

I have for many years been working patiently to bring the garden in my charge into good growth, and I have succeeded, and I am confident that I can now keep my hushes at a constant level and in full vigorous growth, without "cutting down" a single bush, and in course of time I expect to get all the bushes to be one height, and of equal bearing surface. During the last four years I have succeeded in getting the height and surface more uniform, but when I began I had bushes of all sizes; the biggest are three feet up to the pruning point, and I refuse to cut down even these which are rather too high.

At each pruning I cut off the new wood close to the last pruning on any hush over two feet in height, leaving only about one inch of new wood; on the lower hushes I leave from four to eight inches of new wood so that in course of time the smaller hushes will reach the height of the best. In course of time I shall reduce the height of the bushes which are too high. Any new wood found growing from low down

is cut at about two feet from the ground and one or two of the tallest branches are cut out, the weakest being selected for sacrifice. I am not sure that three feet is too high, because I find bushes of this height have new wood as thick as one's thumb, and by the end of the season they have grown to about 4½ feet which is well within reach of the pluckers. If my system can be adopted, the result after eight or ten years would be that each bush would be composed of straight clean branches without a break, to the height of two feet, and above that there would be visible the scars of each successive pruning. And then year by year the weakest of these would be cut down as low as possible, and replaced by new wood from below.

I have been applying this system thoroughly only for four years, and I notice that most of the bushes have one to three of these fine clean stems; and the older branches show good growth owing to judicious topping off of weaker parts. And when I find that an old branch has sent out good new wood from low down, and the top has ceased to give strong new growth, I cut off the piece above the new wood. Only four years have shown such a vast improvement that I am now confident of being able to renew each bush in course of time.

I recognise that there is a short cut to this result, *i.e.* to cut down and re-grow the bushes, but I should have to sacrifice a great deal of tea, and I consider it wiser to sacrifice the appearance of the bushes to keep up yield of tea, than to sacrifice the yield to get good bushes. "Cutting down" is a short cut, and as usual with short cuts it proves to be the longest way round. The object of cutting down is eventually to increase the yield, and no sooner has this object been attained than it becomes necessary to resort to it. But I hold that by a system of constantly cutting out *only* those branches which show weakness, the bushes can be kept at one constant level and surface, and will give the same yield from year to year without any limit of time. It is also reasonable to think that branches quite clean from the ground to the pruning point will have a freer flow of sap than those which have been cut and hacked at yearly intervals. One must have at least two feet growth to give a large surface to a bush, and if you can get the sap to flow *straight* up to this *necessary* height the result must be increased yield. It is necessary to clean out the bushes now and then and I think that intervals of two years are quite sufficient. Thus one half of a garden would be cleaned out thoroughly, all whippy and oversized wood cut off, and the other half of the garden should be light pruned, and all the *inside* growth left alone, and only the surface growth should be cut off.

This light pruned part would begin to yield first, and would give a considerable amount of leaf before the other part can be plucked. The *surface* only of each bush should be plucked, so that any new shoots which grow from inside are not touched until they appear on the surface. These will give new straight wood to prune on at the end of the year. At first I had to do my pruning with two lots of coolies; the ordinary lot simply pruned the bush leaving the required amount of new growth.

After them came the knowing lot who selected hard wood to be cut out. My work was to examine this cut out hard wood to see that no vigorous parts were cut away. If I found a knot with decent wood on it say about ¼ inch diameter I explained to the man that I had lost the yield of that piece of wood for a whole year, and that I wanted only weak wood to be cut off. This required a great deal of attention. Now I make the men collect what they cut off and heap up the bits at intervals and I examine those heaps. But even the ordinary coolies are getting to know what I want, and as only half the garden has to be pruned with discretion there is not much fear of serious over pruning. The rest of the garden is only "cut over," not quite straight, but with a view to giving as regular a surface as possible. I like to see the bushes "round," it gives more surface, and the side branches can be of the

same length as the centre ones. I have seen a piece of old tea yielding well which had never been cut down,—it averaged about 3 feet to the pruning point; and regarding the fear that a bush will get too high this can be obviated by not leaving too much growth at each pruning. If you start pruning a new shoot at 2 feet, and leave only one inch each year, this shoot will only be 3 feet in height in 12 years; and supposing that by that time it shows signs of getting weak you can cut it out entirely, and its place will be taken by other shoots which have grown up in the interval.

With a new extension, and this system of pruning I imagine that the greatest yield would be attained over the course of any given number of years. No branch should be cut below 2 feet, and I really think that with a good class of plant 3 feet would be the best height. A bush of this sort would not grow much harsh-wood inside. Failing a ready made garden which has not been hacked and hewed, it is possible with patience and discretion to get the place round gradually. Rather than cut down a gnarled bush, I would leave it unpruned for two years; it has not sufficient energy to grow fine new wood in one year, but at the end of two years some of the growth would be found of a decent size. With a little humouring this bush will begin to send out good wood from lower down, and it will in time regain vigour and youth, whereas one or two "cuttings down" will leave it an old wreck with only a few twigs to show that it is alive. I think that as a rule tea is "cut down" not because it has fallen off in yield, but from the fear that it will soon begin to yield less, and that the bushes will get too high. I would earnestly recommend to any one who contemplates the renewal of a plot of tea by cutting down to give it a year or two more of full growth, thinning out some of the worst branches, keeping a careful record of the yield as compared with past seasons. This advice would apply especially to any manager taking charge of a new garden, which, (according to his opinion) has been ruined by past bad pruning, or overplucking. As long as a branch can give new wood as thick as one's little finger there is no fear of its power of yielding well; then why should thousands of such branches be cut down? And consider the loss of plucking surface. As an illustration, take a compass and draw concentric semicircles on a straight line, have one of 1 inch radius, another of 2 inches, another of 3, and another of 4. This last semicircle of 4 feet represents the bush which has to be cut down, and the intermediate lines will show the gradual increase to the original surface, and I am quite convinced that the greatest possible surface (*i.e.*, all the bushes touching) can be maintained by simply cutting out weak branches, and pruning any new growth at the level of the surface of the bush.

I must admit that I have never seen a whole garden pruned on this system from the very beginning so that I must also admit that the universal practice is opposed to my theory, and it is always rash to suggest that the universal practice is wrong. However I venture to do so because I have worked hard at the problem for six years on an old and much hacked estate, and at the end of this time, of which only four years have been fully given to the idea, I can see a very great improvement in the appearance of the bushes, and I have also the *proof* of the benefit to the bushes, because I make *more* tea of very much better quality than my predecessors made in former times.

If any one has had experience that this system is not the best, I should like to hear from him. I imagine that this system would give best results in Ceylon, the bushes being pruned every second year; one quarter of the estate cleaned out and pruned thoroughly, one quarter pruned lightly, and one-half not touched at all. The two years of growth gives the new wood time to be well matured before it is cut, and any wood that has not grown to a standard size can be shaved off close to the branch it started from.

This pruning at intervals of two and three years is customary in Ceylon, I have little doubt that it would

be best for India also, but the annual pruning has become so firmly fixed that I do not dare to suggest any departure, I can only say that I tried the plan on a patch of Manipuri indigenous, and it gave 14 maunds of tea per acre, against a yield of 12 maunds from the rest of the plot which was pruned as usual.

That was long ago, and I had not sufficient courage or power to continue the experiment on a large scale. I have nothing to say to those who are in charge of estates on good soil and yielding more leaf than their labour forces can handle, but there are many properties which might be saved by patient and careful fostering of the bushes, and by refraining from the established custom of cutting down. The planter has an instinctive horror of a "knot" and to get rid of the knot, he gets rid of the bush. There is also an idea that the tea plant has not the power to propel the sap to a distance beyond 2 feet or so. Naturally, when the old stem is interrupted at intervals of a few inches, and is also tapped by small side growth, the sap does not show great vigour; but a stem which rises clear from the ground up to the yielding part and having no small branches to divide the sap will show great strength and give a good crop of strong well-grown leaf. Whether straight or gnarled the life of a branch comes to an end sooner, or later, but it is folly to cut it out before it has given signs of weakness. One should have a standard gauge of wood below which the branch should come out, and each branch should be left as long as it grows good of the standard girth. On some soils planted with indigenous,  $\frac{1}{2}$  inch diameter might be taken as a gauge; on other soils with hybrid plant  $\frac{3}{4}$  inch might be the limit.

My principles now are not to sacrifice one inch of yielding surface area, and to increase the surface year by year by adding about four inches growth at each pruning to the smaller bushes; to carefully cut away poor wood so as to give more sap to the branches which are yielding well.

Beyond this, at present I have not sufficient labour to take all the leaf that is grown, so that manuring or anything of the sort is not advisable. Having mentioned the word manure, I cannot refrain from repeating what I said once before that manuring should be adopted, *not* to improve the bushes, but as a separate means of utilizing capital to good profit. In course of time, I expect that manuring will become general, and that it will be found an excellent source of revenue. You will pour money on the roots of the plants, and take it off the tops with an increase of about 10 per cent. With very ordinary care, one thousand rupees applied as manure to a given plot of land annually should give a return of eleven hundred rupees, that is to say, 10 per cent. At this rate a big company would find it more profitable to spend Rs50,000 getting a return of Rs55,000 per annum, than in spending an equivalent sum in extending its area of plant.

With pruning on the system detailed above, and liberal manuring every year, the yield of a whole estate should not stop short of 1,600 lb. of tea per acre. And this would be better in every way than having an estate of double the area yielding 800 lb. per acre.

### PLANTING NOTES.

**PRUNING OF TEA.**—We publish a paper elsewhere under this heading, from the pen of an experienced Indian Tea Planter, propounding improvements according to a system which he has found to give good results on the plantation under his charge. We would invite the opinions of practical Ceylon men to the letter of "1874"; for an interchange of experience in this way between this island and Northern India cannot fail to be mutually beneficial.

**CACAO PLANTING IN SAMOA.**—We have an interesting letter from a British resident in Samoa, who has begun planting cacao and who by the *Tropical Agriculturist*, which he and his neighbours prize much, has been induced to send to Ceylon for "more information" which we are glad to supply. Cacao planting can never become of much importance in Samoa: to meet a local demand seems the ambition of our correspondent.

**FACTS ABOUT TEA, BY DR. GORDON-STABLES, C.M., R.N.**—The Mazawatte Tea Company, Ltd. have issued a tastefully designed booklet, printed in green and gold, which is written by Dr. Gordon-Stables, of caravan fame, and illustrated profusely by Ambrose Dudley. The evils of drinking cheap and common teas, which are now a matter of every-day discussion, are here dealt with in a thorough and most interesting manner. The Doctor proves, by his own experience and observation, both as a doctor and consumer of the cup that cheers, that it is not a question of the "evils of tea drinking," but the evils of drinking "bad teas," which are to be feared and avoided. Copies of the book, which will well repay the few minutes required for its perusal, can be had on application from the Company.

**"KEW BULLETIN."**—No. 132, December, 1897, has just been issued. Its contents are of unusual interest, comprising extracts from letters of Dr. Henry from Yunnan, in which he urges the despatch of a botanist to Szechwan and the neighbourhood. The flora is very rich, extremely interesting, and contains many plants which would be suitable for introduction here. Perhaps the Royal Horticultural Society, having fallen on better days, might be induced to assist, and renew its old glories. The introduction of *Ficus elastica* into Egypt promises to be a matter of importance as a source of rubber. The great demand for the timber of white Willow—for cricket-bats!—will give rise to much thought on the part of practical men, as well as of philosophers! The fate of the pelican is detailed, but the conduct of the gamekeeper was so abominable, that it is to be hoped he will be deprived of his gun forthwith. *Gardeners' Chronicle*, May 14.

**TEA FOR RUSSIA.**—The Secretary to "Venesta, Limited" sends us copy of a letter he has addressed to Mr. A. Philip, Secretary, Planters' Association, Kandy, as follows:—

"We understand that one of the obstacles to the introduction of Ceylon tea into Russia, is the very high duty. We therefore wrote Mr. Luther, who, as Director of our Factory at Revel, is not only a resident in that country, but a Russian subject as well to learn if tea packed in Venesta cases could not be got through at a lower Customs Tariff, on account of the packages being of Russian manufacture. Mr. Luther writes us, that he will take the matter in hand, and try to get a reduction, not only in the Duty, but in the Railway Freight as well, if we will advise him when the next shipment of tea packed in Venesta cases is made to any Russian Port. You no doubt notice in Mr. Christie's report, that tea imported in Russian bottoms, is taken from St. Petersburg to Moscow at a reduced railway freight, the economy being something like 20-25%. We believe that the Russian Volunteer Fleet generally carries this cargo from Ceylon, and we would suggest that the next lot that is going by that opportunity, might be packed entirely in Venesta cases so as to afford an occasion for making this experiment.

"It would also facilitate matters, if, just before shipment, you could give us a description of the cargo, and tell us what the marks are, so as to have everything in readiness before the goods arrive."

## Correspondence.

To the Editor.

COFFEE IN MEXICO BY AN EX-  
CEYLON PLANTER;  
ALSO TOBACCO—RUBBER—CACAO.

Mexico, 15th April 1898.

SIR,—Under a separate cover I send you a copy of the "Mexican Herald" and as the article referring to coffee growing in Mexico may reach you and appear in your paper, I think some explanation is necessary. The writer is evidently one of the many Americans who come here and have been disappointed as they think all they have to do is to stick in a coffee plant into the ground and allow it to take care of itself. Coffee here in Mexico with experienced attention, as in the old days of Ceylon, will beat the world, both for production and quality, and the present prices or high grade coffee attest this. For production, I have seen on estates lately visited by me, coffee trees which produced last year from trees only five to six years old, 60 lb. of cherry or equal to 15 lb. of clean coffee.

On an adjoining property to this and under the management of Mr. E. O. Darley an old Ceylon planter, I send you the photograph of a coffee tree, two and half years from the seed with Mr. Darley standing beside it, which was topped at 4½ feet, which has a crop upon it equal to 2 lb. of clean coffee. This will therefore, show what coffee will do under proper treatment in Mexico.

The property I write from is jointly owned by Mr. Darley and Mr. Evans and myself. We propose this year placing a considerable area under coffee and look to our getting a crop of tobacco which we intend planting between the rows (and which last year we successfully experimented with) for one season only. That will pay us at least for our expense in opening up and planting our land.

Tobacco cultivation in Mexico, is one of the finest paying investments in this or any other country. Whilst Rubber planting also pays handsomely. Mexican cocoa is known all over the world and commands the highest price, Messrs. Menier & Co. of Paris securing nearly all the crop grown in Mexico.

Since I turned my attention to Mexico, some two years ago, I have been the means of drawing the attention of some well-known Ceylon men to the country, these include Mr. John Clark, of Wategode; Mr. J. Fort of Eltofts, Bogawantalawa; whilst I enclose you the photographs of Messrs. P. F. Hadow and C. O. Naftel taken on this property. These four gentlemen have all been in this country. Mr. Sackville has lately paid a visit to Mexico in the interest of a Syndicate in London, headed I understand by Mr. James Sinclair of Dimbula. I may mention that outside of Mr. E. O. Darley being in Mexico there are also at the present time Mr. R. E. Pineo and Wm. Forsyth late of Lindula both of whom are looking out for investments, in this country. I may also state that Mr. Wickham paid a visit to Mexico some few weeks ago, so it will be seen some considerable attention is being taken by Ceylon men in Mexico.

I consider this country offers unusual inducement to planters of experience. Land is of

the best and cheap. Whilst labour is moderately plentiful. Although if extensive areas are placed under tropical products labour will require to be drawn from Japan. There are already some Japanese labourers in Mexico and they work most satisfactorily, their rate of wages being for men 1s per day, women 6d to 9d. and boys and girls less.

I shall be glad to hear from any Ceylon planters who should think of turning their attention to this country.

W.M. LAING MALCOLMSON,

Late of Campion Estate, Bogawantalawa.

We quote the essential part as follows:—

## COFFEE IN MEXICO.

(From the *Mexican*.)

All the coast States of Mexico south of the 25 deg. are suitable for coffee culture, and the finest plantations are found about Vera Cruz on the east coast, the States of Colima and the Michoacan on the west coast, and the Isthmus of Tehnantepec.

One of the most successful coffee growers in the republic gives his experience in its culture as follows:—

"When I came to Mexico, ten years ago, I had \$20,000 in gold which, by the way, is as small a sum as anyone should ever undertake the business with. Most of the failures in the coffee business, and they are many, are due to the fact that the parties have insufficient means to wait from five to seven years before realizing anything from the crop. I had had some experience in coffee-growing in the Hawaiian Islands, previous to coming to Mexico, and learned some very dear lessons there, having planted my trees at too low an elevation, and lost the entire plantation from the rust which prevails at an altitude of from 1,000 to 2,000 feet above sea level, where most of the plantations located in former days.

"I selected 500 acres of land in the State of Vera Cruz, among the primeval forest, at an elevation of 3,000 feet, paying \$12.50 in Mexican silver per acre. The land was a rich loam, rather rocky, and cost me \$8 per acre to clear. Thus, you see, the first outlay, was about \$10,250. I left trees at a distance of about twenty-five feet, as they were large, and I calculated that one tree would shade three or four coffee plants. All of the land was on a side hill, where drainage would be good, thus preventing too much dampness about the roots of the plants. I selected young plants from a nursery, paying about \$800 for sufficient plants for my 500 acres of ground. Of course, the cost was much higher than ten years ago than now. The distance at which to set trees is a mooted question, some claiming that they may be set as close as three and one-half feet, others say that the proper distance is eight to ten feet. In India and Ceylon the average distance is six feet, with the trees topped at about four feet. In Guatemala they are set at about nine feet and the trees allowed to attain their natural height of about twenty feet. Each planter has his own opinion, but from my experience, I am convinced that ten feet is the proper distance in this State, where the conditions are somewhat different from the west coast or the Isthmus of Tehnantepec I set my trees in holes eighteen inches deep by eighteen inches square, carefully removing all stones and roots from the surrounding soil. The holes were left open for about three weeks, and the plants placed in them just at the beginning of the rainy season.

"When the trees attained the age of eighteen months, I had them topped to a height of four feet, which caused them to throw out more vigorous branches, and from these sprang "suckers," most of which I had removed. It requires a good deal of experience to understand the principles of successful pruning, that is, to remove all superfluous wood and leave such branches as will produce the best crop. In the work of pruning comes one of the greatest ob-

stacles to be met with in coffee culture in Mexico. The ordinary peon laborer will cut and slash the tree indiscriminately if not carefully watched, and they sometimes totally ruin the next year's crop. The work of weeding and keeping the soil free from grasses which grow so luxuriantly in this climate, is very arduous and expensive.

"The total cost of bringing my 500 acres of coffee trees to maturity, that is, the fifth year after planting was about \$18,000 in Mexican silver, which sum included my living expenses and the buildings erected on my plantation. The first crop that I gathered averaged half a pound per tree, which I sold for 16 cents a pound, gold. The fourth year the production was one and one-quarter pounds, and the fifth year showed a trifle over two pounds per tree, which has been the average production for the past five years. I have never lost a crop, and my trees are all healthy and the plantation is in the best possible condition. The life of a coffee tree is about thirty years. In the twenty-fifth year about one-half of the trees should be taken up and the ground replanted to young trees. This, of course, cuts the planter's income down to one-half for the ensuing five years, but insures the original income for the next twenty years thereafter. My income for the past five years from my 500 acres of trees has averaged \$40,000, Mexican silver, from which, deducting the cost of curing the crop and care of the land, about \$19,000, leaves me a clear income of \$21,000, which I consider a good investment for my \$20,000 Mexican silver. There are many men in Mexico who have enormous incomes from their coffee plantations, and all the old plantations are making money. On the Isthmus of Tehuantepec, which is the ideal coffee-growing country of Mexico, personally know dozens of men whose incomes range from \$10,000 to \$60,000 per year. It is only the inexperienced growers and those who began without sufficient capital and with no knowledge of the language or labor conditions who are crying about there being no profit in the business."

With the exception of maize, coffee forms the most remunerative of Mexico's agricultural products. During the past year Mexico sold to the United States 32,387,823 pounds of coffee, worth in gold \$4,880,895, as compared with but 18,959,467 pounds, worth \$3,179,578 in gold in the corresponding period of the previous year. Thus, the average value of Mexican coffee during 1895 was 16.77 cents a pound, and 15.06 in 1897.

### THE TEA PLANTING INDUSTRY AND ECONOMY.

April 29.

SIR,—A worm will turn when trodden on unmercifully, but it is something out of the common to find a planter rounding on the big-wigs of Colombo and London. Having a fellow-feeling for "An Unfortunate Shareholder" in the *Observer* of the 28th inst., and thinking that it is about time some one should resent the one-sidedness of this economical wave which has been sweeping over Ceylon for some time past I feel constrained to give that unfortunate my moral support if nothing else.

I have no wish to single out any one particular concern, but I was surprised to see that Hugh (said to be of The Rock) having got the sow by the right ear, allowed himself to be ground to pieces like so much rotten old red sandstone. It does seem strange there should be such exceeding great extravagance in local and London charges as also in palatial new factories in face of what we are told is something little short of a crisis unless it pays the wire pullers or some one to have it so.

I am not the only one who has felt inclined to ask the local Press if they were subsidised by the Company Mergers of London and Colombo;

for all along it has been the happy-go-lucky days of 20 per cent arc over, and now you planters have got to work just as if we'd been playing the fool for years, and the 20 per cent had carried us off!

A lucky gambler in the tea world takes a run out to Ceylon to escape the winter as he's got a liver. The tip spells profit as well as pleasure to him, but it's rough on the planter.

Peter Dick promptly got the sack and Sandy Simple gets the supervision of the Cook of the North Estate, some 500 acres, on the handsome addition of R50 per mensem to his salary and a conductor as resident manager.

It's only half-a-dozen miles away, however, so Sandy can easily visit his outlying charge as well as his factory, at least twice a day and give special care and attention to his manufacture, with the view of improving his prices which some cracked old musical instrument in the shape of a Chairman of Directors in London will assure his shareholders is very probable; but is it right of the local Press to applaud pranks of this sort and call it true and far-seeing economy?

When coffee went to the wall what a rumpus there was over return commissions and such like little swindles, and I am much mistaken if when the tea pot begins to boil over, we don't have a high old dhoby's day once again.

Do you know if our local Brokers get the one per cent which their memos so regularly show? I'd like to know this and lots of other things, but enough for the present.—Yours faithfully,  
A FOOL PLANTER.

### MANURING OF TEA.

May 2.

SIR,—A perusal of Mr. Baur's letter suggests a doubt whether the writer has any practical knowledge of manuring in Ceylon, or of the conditions that obtain in the planting districts.

While it would be a pity if any really valuable theories were lost to the planting community, it would equally be a matter of regret if any considerable section were led astray by Mr. Baur's somewhat specious arguments.

In the face of the experiments conducted by eminent scientists on the Continent, no one would be prepared to deny that micro-organisms increase the natural sources of nitrogen; but consider what are the actual ascertained facts disclosed by Mr. Baur and upon which he builds his whole theory of manuring:

Experiments carried on at a "French Agricultural Station" demonstrated that in a temperate climate the quantity of soluble nitrate was least in winter and most in autumn; but these facts are of little value to us in Ceylon where the climatic conditions are altogether different.

Even assuming that Mr. Baur is right in answering in the negative his own question that "the production of nitrates in our soils during the year is inferior to that at home," does it necessarily follow that the nitrates formed remain in our soil?

As one of the functions of the micro-organism, we are informed, is to convert atmospheric nitrogen, its habitat must be on the surface and the nitrates it produces beside it. What then becomes of the micro-organism when a heavy shower of rain falls and washes away the surface soil? It is much to be feared that this useful little creature and all his works are deposited in the nearest drain!

But most people will not be disposed to waste much sympathy on micro-organisms, until actual

experiments in Ceylon prove that they exist in sufficient numbers to be beneficial to the soil. At present we have no knowledge on this point, and Mr. Baur's arguments are based on an airy theory that may, or may not, be ultimately substantiated.—I am sir, your obedient servant,  
EX-PLANTER.

### MEALY BUG.

Colombo, May 2.

DEAR SIR,—During a recent holiday trip to Kandy, I noticed with much alarm that lantana between Kadugannawa and Kandy was in places badly attacked with mealy bug and was being killed. On enquiry I learnt that the same thing is noticeable further north as well. Knowing with what rapidity fungoid and insect pests spread from uncultivated into cultivated lands, I was surprised to find that so far no notice whatever has been taken of this pest. What with low prices, the numerous enemies of the tea plant, and the yet undiscovered enemy of cacao, one would think the upcountry planter had enough to contend with. How is it he sits with folded hands, and takes no steps to ward off a great and possible danger? Should not the Planters' Association take the matter up, and ask Government to legislate for clearing and burning of all waste bug-infected lands? Prevention is better than cure.—Yours truly,  
B.

### MR. HUGHES AND MR. BAMBER'S VISIT.

Analytical Laboratory, 79, Mark Lane, London E.C., May 20.

GENTLEMEN,—Mr. M. Kelway Bamber, whose name must be well-known by Tea Planters, on account of his excellent book on the "Growth and Manufacture of Tea," called upon me this week prior to his departure today per P. and O. "Victoria" for India via Colombo and Calcutta.

I understand he has to keep an important appointment in Calcutta, so will probably not remain long in Ceylon on his outward voyage; though if necessary could arrange to make a stay on his homeward voyage.

He appears to me to have given much attention to the manufacture of tea, and I feel sure could give planters considerable information, especially in regard to the final operations, such as the temperature and length of time best adapted to firing.

As regards myself, I am very busy in connection with Ceylon, much more so than I have ever been before. I have also samples of coffee soil from Central Africa sent me at the suggestion of the Director of the Botanic Gardens at Kew. I have also samples of Ceylon tea now being exhaustively analysed with a view of ascertaining if possible how far differences in market value are due to differences of soil and situation or to differences in the manufacture.

It is very interesting to me to see that *last* planters are recognising the advantage of making a careful inquiry into these important points, and I need hardly add that every effort on my part will be made to assist in the improvement of the cultivation and manufacture of Ceylon tea.—Believe me, yours faithfully,  
JOHN HUGHES.

### TEA IN AMERICA.

#### LETTER FROM MR. MACKENZIE.

Kandy, May 27.

SIR,—I enclose a letter from Mr. William Mackenzie, which he has sent to the Chairman for

publication, as it will interest all.—I am, sir, yours faithfully,  
A. PHILIP,  
Secretary to the Thirty Committee.

New York, February 1893.

To the Chairman of the Committee of Thirty,

DEAR SIR,—I have not yet heard who has been elected, but I trust you are well posted in the history of this mission, and have been taking an interest in the matter hitherto. If not, names I may mention, and references to different methods and schemes, will be obscure to you.

You are doubtless aware that the method I suggested to the Committee three years ago was to assist strong firms who were putting their own energy and capital into the business. I advised having little or nothing to do with the many who founded claims on such fanciful reasons as that they had been in Ceylon, or had friends there; that they have been engaged under Sir J. Grinlinton; that they were the first who introduced Ceylon tea into America (wonderful what a number of the *very first* I met)? I enquired into the position and standing of many of those, and found they were generally failures who had tried many things, but had not succeeded with any. The Committee agreed with me that the Fund was not a Benevolent Society, or a Pension Fund, and that "BARNACLES" should have no place on it.

When I first went to America in a position to work, in August 1895 (my previous visit was to enquire and report), I found American Houses averse to handling our tea. They had much capital invested in establishments in China and Japan, they had a good business in the teas the people were in the habit of drinking; and they saw no reason for doing pioneer or missionary work, on behalf of an article whose introduction could only be at the expense of their existing business.

I was thus thrown back on the few strong English Houses who were endeavouring to push Ceylon teas in the States and Canada. In addition to these, I tried a few small traders as a lever to move the larger American dealers. But one by one, these "went under"—not having the requisite capital or ability.

In Canada I found one firm pushing our teas energetically, and advertising Ceylons as superior to all others. Several rivals of this firm on whom I called, vowed vengeance on them, and expressed their intention of breaking them, as they objected to their disturbing the business in Chinas and Japans. For a year, I paid a small proportion of this firm's advertising. Finding then that their trade had made great progress, and that their rivals instead of crushing them, were all themselves advertising Ceylon teas I withdrew all support from this Canadian work. This firm's brand is now the chief of 19 Ceylon packets, being advertised in hundreds of papers in Canada.

But even in Canada there is still a consumption of about 11 million lb. of Japan teas yearly, chiefly among the French Canadians, and of poor cheap congeneric in the thinly-peopled Eastern settlements. It would perhaps be good policy to spend some money in endeavouring to persuade those people to try our Teas.

I need not here repeat what I have so frequently written, as to how the efforts of the English Houses, coupled with the very extensive Advertising we have been doing, gradually weakened the conservatism of several of the Ameri-

can importers, until we now number many such among allies. These firms employ many travellers who call on the grocers, and supply them with stocks of Tea, Coffee, etc. Instead of urging the grocers not to hold our Teas as was the case two or three years ago, these travellers now show them samples of Ceylons, and insist on leaving a case of packets, put up by their American employers, for exhibition on the shop counters. I am safe I think in saying, that there are eight to ten thousand shops in the large towns between New York and Chicago, where Ceylon and Indian teas are sold, and that three or four thousand of them have the words "Ceylon Tea" in large white letters on their window. The word "Ceylon" must be read many times a day by all who frequent the marketing quarters of Chicago, Buffalo, Pittsburgh, Detroit, Rochester, Clevedon, Boston, New York, Brooklyn, Philadelphia, etc.

In the West too, beyond Chicago,—Tetley, Lipton, and some Chicago houses, are gradually pushing our Teas in Kansas City, Cincinnati, St. Louis, Denver, St. Paul etc. etc. In all these cities, advertising and demonstrations are being done.

Two Indian Houses have helped Ceylon very materially by holding stocks, circulating samples, etc. I think it a pity that the strong Colombo Firms have not seen their way to help us more than they have done. Several have made efforts more or less successful, but in a spasmodic way. Grants have been asked for, but the Committee does not make grants, although always glad to make grants-in-aid. I do not think it falls within my province to give a bonus to any firm in America, merely because a Colombo firm recommends it—on the ground of the shipment of a few thousand lb. of Tea. The American or Colombo firms must show that they are themselves spending money in advertising or pushing our Teas. So far Mr. Webster alone has satisfied the conditions on which grants-in-aid are made.

Figures frequently published have shown the progress hitherto made. What is to be our position this year I cannot tell. During my recent visit to Chicago, Pittsburg and other towns, frequent complaints were made of the difficulty of selling our teas with coffee down to 4d per lb., and the opinion generally held seemed to be, that we could not do as well in 1898 as we did in 1897. In any case we must persevere for another year, as if we stop now, the United States' dealers would certainly relapse to a great extent to China Tea, as the difference in exchange gives that country so great an advantage. In Canada our position is more secure.

But we must not forget that as in England and Australia, so in America, there are only a few millions lb. more of China BLACK Tea to be displaced. Against such tea our progress has been comparatively easy. But the vast bulk of the tea used in America is green or unfermented tea.

To convert Americans from unfermented to fermented tea would be a long and costly process. The present generation of planters would pay the piper, without seeing much of the benefit, whether or not Ceylon men care to make the tea, the Americans drink, is for them to say. I can but repeat what I previously said, that a few million lb. taken off the London market would greatly relieve the tension there.

I have no new suggestions to make. If [we] are to go on I would advise continuing to help and stimulate those who are using their own energy and capital in the work; at the same time keeping up our general advertising in the magazines and daily papers,—the circulating as hitherto of cards, leaflets, etc., and of demonstrations at all good Food Shows, Bazaars, and Social Entertainments.

Yours truly,  
WM. MACKENZIE.

FURTHER LETTER FROM MR. MACKENZIE.

Kandy, May 30th.

SIR,—At Mr. Lane's request I enclose a further letter he has received from Mr. William Mackenzie.—I am, sir, Your obedient servant,

A. PHILIP,  
Secretary to the Thirty Committee.

Colombo, May 26th, 1898

Dear Lanc,—In a letter which appeared a few days ago it was said, I sent no annual report. I have done so each year. That I write *occasionally* to some official of the Planters' Association. I have written almost weekly to the Chairman of the Thirty Committee. I have been accused of giving no information, as to recipients of subsidies.

My accounts shew names in every case. Besides everything, save stamps and wires, is paid by cheques and the account does not stand in my name, and is always open to the Chairman. The Bank will at any time furnish a copy. There is *no* secret service money in our work.

In a leader in yesterday's "Times" we are told we should not attempt to make "greens" because we cannot make them similar to Japans. Our "blacks" are not similar to Chinas, yet we are displacing them, notwithstanding difference in exchange, just because of the dissimilarity! Again Mr. Biechyden is diametrically opposed to me in this matter. He *tears*, but, is now very enthusiastic over the success of some green samples from India. Of several firms to whom those samples were shown, *five offered to take the whole crop.*

Of course the firms able to exploit the Pacific slope rops up. But I have not yet heard of their offer to "put up" some of their own money, I have had several offers to do it from men who were convinced they were in a better position than any other to undertake the work, but who always to meet the test of their own CAPITAL as well as ENERGY. All wished go on the old principle of "*your* money and *our* brains."—  
Yours truly, (Signed) W. MACKENZIE.

#### LIBERIAN COFFEE STILL PROSPEROUS IN SERDANG, SUMATRA.

SIR,—In your issue of 6th inst., you throw me a sort of challenge as to Tea r. Coffee on the East Coast of Sumatra. You say, "How does Mr. Mackenzie, explain Mr. Baker and his Dutch Superiors abandoning Liberian Coffee for Tea?" My reply is short. I don't attempt to explain it, because I know nothing of the estate or the circumstances. Further: my little confidences to you have all been from, and of, Serdang; and Serdang only. Mr. Baker's estate is in Deli or Langkat.

However, as you've got me on the war-path, let me repeat my conviction that Serdang, acre for acre, will be one of the finest Liberian Coffee producing districts in the East. I hope shortly to give you some account of the progress made in the district during the last three years. Mean-

time note the following. About six months ago, I met a planter from the native States over here on a visit. He reluctantly admitted that the coffee in the Peninsula was *not better* than what he had seen here. Secondly: a friend of mine visited Selangor a few weeks ago and returned fully convinced that his property was on the right side of the water. He is a Serdang proprietor. Thirdly: a Selangor resident, not a planter, was through the length and breadth of this district a few days ago; and he said without fear, favour or intimidation, that the coffee here struck him as looking finer than that in Selangor. The soil here *must* be richer than that across the narrow, though deep, strip of water that divides Smtatra from the Malay Peninsula: and to anybody who reads Wallace's *Malay Archipelago* or *Island Life*, the explanation is as clear as mud in a wine-glass. Wherever one goes the richness of the soil strikes one, and I can't help recalling a saying of old John Scott, who died near Nuwara Eliya a few years ago. I asked him about something or other growing in a certain kind of soil. His idea of its productive powers was summed up in his emphatic answer. "Graw, mon, graw?" he roared, "stick yer pipe into the groon' an' it'll graw terbacker!" So it is here.

The *Singapore Free Press* of 13th inst. quotes Liberian coffee at \$17.50 per pikul—the quotation having been \$17—for many weeks. I have all along held that prices will recover in the course of time, South America having cut her own throat by over-production. She has tried the same game before; but this time she has gone parous near the jugular. Who will give us reliable figures of S. America's cost of production? Surely she cannot stand against the cheap labour of the East?

A gentleman largely interested in coffee in the Malay Peninsula writes as follows:—After referring to "retrenchment" tactics—"Personally I am inclined to think the present a good time for capital to be invested, feeling confident that in a couple of years' time there will be a change for the better, for the simple reason that the low prices will induce a larger consumption. It is a question whether Brazil can afford to go on at these prices."

Them's my sentiments to a T: or should I not rather say, to a Coffee?

W. TURING MACKENZIE.

Daisydale, Lohopakam, O. K. Sumatra,  
24th May, 1898.

P.S.—I should mention that my last-named correspondent is not "on the sell.—W. T. Mk.

### MANURING OF TEA vs. CHEAP PRODUCTION.

DEAR SIR,—In my previous letters I have drawn attention to the natural sources of nitrogen due to micro-organisms in fixing and converting the atmospheric nitrogen and in reducing the organic nitrogen already present in the soil into nitrates, the form in which nitrogen is taken up by plants. I have pointed out the conditions under which the formation of nitrates is going on, conditions that are rendered specially favorable by our climate: an even and warm temperature and a good and well distributed rainfall. I have further pointed out how the formation of these nitrates can be increased artificially by loosening the soil, in bringing it in contact with the oxygen of the air and by making it more retentive for water. The conclusion drawn therefrom was that only small quantities of nitrogenous manures were needed for our tea crops.

I would now approach the subject afresh and state that where those climatic conditions are fairly fulfilled I see no reason why any nitrogenous manures should be needed at all. To support my theory it is necessary that I should place before the reader the researches which of late years have been made at home with a view of ascertaining the composition of drainage waters *v.c.* water that had filtered through the soil. As

previously mentioned, the nitrates have a deplorable habit: contrary to what takes place with the other elements of fertility like phosphoric acid and potash, the nitrates are incapable of being fixed or retained in the soil. The loss of nitrates in a soil covered with vegetation is very small but in a soil, devoid of vegetation they are carried off with the water that filters through it. Therefore in analysing the composition of the drainage water it is easy to calculate the amount of nitrates formed in a given soil. The experiments to which I refer had been carried out on a French Agricultural station under the direction of one of the most eminent agricultural chemists of the day, and were undertaken with soils of totally different character and which had not been previously manured. The average quantity of nitrates found in these drainage waters amounted to the following figures, viz:—

In winter	about 11 lb.	of nitrogen per acre.
In spring	" 16 lb.	" "
In Summer	" 24 lb.	" "
In autumn	" 37 lb.	" "
	—	
Total per year	" 88 lb.	" "

From this it will be seen that the formation of nitrates is smallest during winter; it is a little better in spring, when with the warmer temperature the conditions for micro-organisms become more favourable; it increases considerably during summer, but owing to the comparative dryness of the soil, it reaches the maximum only in autumn. At this period the soil which had been heated during summer now also contains a fair amount of moisture, and thus the conditions for the micro-organisms are all the most favorable. Other experiments had been carried out which show the influence of the aeration of the soil on the formation of the nitrates by micro-organisms. Before the analysis of the drainage waters was begun, the soil had been turned and brought thoroughly in contact with the air and afterwards was left to itself. During the first year the nitrates collected in these drainage waters amounted to about 195 lb. of nitrogen per acre, during the second year to 71 lb. of nitrogen per acre, and during the third year to 65 lb. of nitrogen per acre. Thus the utility of loosening the soil is clearly demonstrated.

But to return to the first series of experiments it will be interesting to draw some practical conclusions therefrom. The average quantity of nitrogen removed by a crop of cereals or potatoes at home is about 50 lb. of nitrogen per acre. This it will be seen could be amply met by the natural production of nitrates during the course of a year. If such or better crops cannot be grown as a rule without the aid of nitrogenous manures, it is owing to the fact that the bulk of those nitrates are produced at a time when they cannot be taken advantage of by the growing crop. In July and August most of the crops have already ceased to assimilate nitrogen, and it is owing to the insufficiency of the nitrates produced in the spring and early summer that the application of nitrogenous manures has to be resorted to at home.

How are we now placed with regard to our staple produce? We are not tied down to particular seasons for our crop and the plants can therefore take advantage of whatever nitrates are produced in the soil during the year. Is it likely that the production of nitrates in our soils during the year is inferior to that at home? To suppose it, we would have to assume that our vegetation is poorer than at home. Let us therefore examine what those 88 lb. of nitrogen produced naturally in the soil mean to our tea crop per year. We know that 400 lb. of tea take up 20 lb. of nitrogen; therefore we can multiply this crop by four before we see those natural sources of nitrogen exhausted by our crops. Now I do not mean to imply that all the nitrates produced in the soil are pure gain for the plants; but at any rate I believe I have demonstrated the fact that there is enough nitrogen for the most ample crops and that if they are denied to us it is not for want of nitrogenous food for

plants, but is due to the insufficiency of some other element or elements of fertility and those which from experience we know to be almost always deficient are phosphoric acid and potash.

The planter has recognised the necessity of keeping his soil clear from weeds in order to render the conditions under which the micro-organisms perform their function more favorably, but is it not equally important that he should make sure that the fruit of the labour of those micro-organisms—the nitrates—be not lost to the plant through the deficiency of the other necessary plantfood constituents?

We owe the theory of the micro-organisms to Pasteur; it is still within my memory when the discovery of the nitrifying organisms by Winogradsky was made at Zurich; the fixation of the atmospheric nitrogen through micro-organisms by Bertholet is of still later discovery; but it is practically only during the last few years and due to experiments some of which have already been cited by such eminent agricultural chemists as P. P. Deherain, that an entirely new light has been thrown on subjects which formerly escaped a satisfactory explanation, and that thus a better knowledge of the conditions of inducing soil fertility was brought about.—Yours faithfully,

A. BAUR,

The Ceylon Manure Works.

### SCOTTISH CEYLON TEA COMPANY, (LIMITED.)

(Specially Reported for the "Tropical Agriculturist".)

Mr. H. L. FORBES presided on May 12th at the ninth annual ordinary meeting of shareholders in this Company, held at 16, Philpot Lane, London, the offices of Messrs. Lyall, Anderson & Co., agents and secretaries.

The CHAIRMAN said:—The nett profits for the year amounted to £4,429 5s 8d, and adding to this the balance brought forward from the preceding year's accounts, £1,252 7s 3d, we have £5,681 12s 11d to dispose of. Last September, you will remember, we paid an interim dividend of 5 per cent, which absorbed the sum of £2,051, and £630 has been paid on the preference shares; and we propose to pay now a final dividend of 5 per cent on the ordinary shares, which will leave us with a balance of £951 12s 11d to carry forward to the current year's accounts. As you have been told in the report, the directors much regret that, owing to the high level of exchange during the past year and the depressed state of the Ceylon tea market, and of the tea market generally, the results of our 1897 working compare unfavourably with those of previous years. The average rate of exchange was 1s 3 13/32d per rupee, against 1s 2 15/16d per rupee, for 1896. We realized an average price of 7·956d per lb, against 8·860d in 1896, but you will be glad to know that we were above the Ceylon average as regards price in the London market, which, according to Messrs. Wilson, Smith & Co.'s report, was rather over 7 3/4d per lb. Owing to the unfavourable weather at the close of the year our total crop fell short of expectations, the out-turn being 708,533 lb. against 721,200 lb. for 1896—some 12,000 lb. less—the average yield being 415 lb. to each acre in bearing. In addition to this we manufactured about 296,500 lbs. of tea for other proprietors, making a total output from our factories of 914,997 lb. of made tea. Mr. Kerr, our manager, reports that all the estates under his charge are in a thoroughly satisfactory state. I shall have to ask you, gentlemen, to pass a vote of thanks to our staff in Ceylon

for the admirable manner in which they have looked after the Company's interests (hear, hear.) Mr. Craib, who has charge on one of our estates, is over here, and I regret that he is unavoidably absent today from our meeting. His estate has done best during the year, though that, too, shows a falling-off in comparison with 1896. I have had a long interview with Mr. Craib about the estate's present results and its previous prosperity, and he merely says: "It will come again" (hear, hear.) And I believe it will come very shortly. The high exchange and the fall in the market price together account for a very large sum. Other factors not here mentioned must be also considered. The question of the rice I have not put in, for I do not believe that the rise in the cost of rice is anything but a very small matter. One year we make a little money out of it; another year we make less. But I don't think it makes an appreciable difference to the dividends. The cost of our production during the last year has been rather higher than before. One of the reasons has been that labour was so scarce at the beginning of the year that wages went higher, and the cost of production was necessarily greater. Comparing 1897 with the previous year we spent about £900 on manure and its application to the estates. Out of this we have so far received no result, and we have the prospect of seeing a return for that expenditure in the future. I may point out that it has been charged, not to capital account but to ordinary expenses. Another thing that increased the cost of production was that though labour was scarce we did not get the full value out of the labour we employed that we used to get. My experience of the past seven years is that the coolie is scarce to find, dear to pay, and hard to work (laughter.) He has rather deteriorated, I am afraid, and has perhaps been rather spoilt. We do not get the same day's work for the day's pay that we used to get in any day. I should not like to say that the superintendents are to blame—not our own, at any rate—but in some parts of the island they have grown a bit loose, perhaps. The rises in the exchange may prove to be a blessing in disguise, for they may help to stop the too rapid extension of the tea industry in Ceylon. As to the cure of the present exchange trouble—well, we should be glad to cure it but I don't know how to go about it; in fact, nobody knows anything about it (laughter.) A Departmental Committee has been appointed by the Government, but nobody as yet knows what the remedies are to be. Undoubtedly the causes of the trouble include the closing of the mints in India and the raising of the value of the rupee to the fictitious value of 1s 4d. We are all endeavouring to assist the market—this Company as well as others—and I believe that all the private owners of estates are also doing whatever they can. In Ceylon we have a self-imposed tax for the pushing of Ceylon teas into new markets, and our Indian brothers are working with us in this direction, and I hope our united efforts will do much to still more widely spread our tea over the world than it is distributed at present (hear, hear.) Of course, the present wars and rumours of wars do not help us, but we have to hope for a speedy termination of the present conflict. We will not say much about rice. All that needs to be said is that the famine in India is over, and that we hope it will be a very long time before we get another one. As to the cost of production, we

shall all do everything that we can to keep down the cost. We must really try to work up the coolie to the point of giving a day's work for a day's pay, and we must also see that his pay does not get too high. I hope all the Ceylon Companies will exert themselves to reduce expenditure, while at the same time taking care not to interfere with efficiency. Labour is now, I believe, more plentiful in Ceylon; if exchange keeps as high as it has been and the prices on the London market continue to rule law, there is a fear that labour may become too plentiful, for there are many estates that cannot keep on much longer under the present condition of things. In the past year our Company has had to increase its expenses, but we shall now try to keep them down. The directors of this Company propose that nothing shall be written off this year for depreciation. Our capital outlay, as you will see in the report, has been very small, and we do not think it is necessary to write anything off. Our reserve is, we consider, a very fair percentage on the capital for the present, and so we do not propose to add anything to our reserve fund this year. Now as to our prospects. Mr. Kerr has sent us his estimates, which are, as usual, very carefully prepared, and he tells us that he considers them to be very safe estimates indeed. To make them still safer we have gone into the figures very fully on this side, and have cut them down considerably. We have reckoned that tea will be at the prices it fetched last year, and have taken exchange at 1s 4d; and working out our figures on their basis, and putting down that the crops to be harvested, according to our estimates,—will be harvested—and I may say that Mr. Kerr is always safe in this respect—our prospects are considerably safer for this year than they were in the past year. Tea, from all I can hear from men who ought to know, has reached its bottom price in London (hear, hear). You will, I think, consider that our Company is in a very safe position, and the best proof of this is that after passing through a very bad year we are still able to pay 10 per cent; and this, I should say, ought to give confidence to the public (applause).

Mr. TODD:—A shareholder, Mr. A. L. Cross, who is unable to be present today, has written me a letter which I should like to read to this meeting, Mr. Chairman, as it may be expressing the views of other shareholders.

The CHAIRMAN:—Certainly, we shall be very glad to hear it.

Mr. TODD:—Mr. Cross writes:—"I think the Directors of the Company might easily have maintained the dividend at 15 per cent for 1897. It would only have necessitated taking some £400 from reserve, and as the object of this sort of fund should be to enable Companies to equalise dividends it could have done no harm, as next year the amount might probably have been replaced, and if there was then no improvement in the situation in Ceylon from the action of the Indian Government they (the directors) would have been able to come before the shareholders with a better case for lowering the dividend; whereas this drop of 5 per cent—it appears to me, wholly unnecessary—will be sure to cause the shares to drop and to be injured in the eyes of the public. In any case, they could surely have given us 13 per cent and then have carried forward a balance of £131 to next year. Why reduce the dividend so suddenly with a considerable reserve, and keep back £951 from the

shareholders? I certainly would have pointed these things out had I been able to attend the meeting." Mr. Todd added: "I thought perhaps the Chairman might have anticipated the feeling which I think is well put in the letter, and which I dare say is in the minds of many of the shareholders."

The CHAIRMAN:—I do not know that I have any reply to that, except to say that I am myself the chief sufferer. (Laughter.) What is carried forward is, surely, not a loss to the shareholders. It remains with them, and they may be very glad to have it next year. (Hear, hear.)

Mr. G. G. ANDERSON:—I should have thought that taking money from reserve would have had the effect of depreciating the value of the shares more. (Hear, hear.)

Mr. TODD:—I hardly think that. The reserve fund is undoubtedly large, is it not?

The CHAIRMAN:—I don't think it is large enough, and I should like to add another £1,000 to it. (Hear, hear.) The larger our reserve fund the greater the value of the shares, I think.

Mr. TODD:—For my own part I do not, of course, move to amend what is being done. But perhaps we might have had 12 per cent.

Mr. G. W. PAINE:—I think the directors are doing quite right in paying the smaller dividend and thus taking the bull by the horns. I quite agree with their policy. Perhaps the writer of that letter is not a shareholder in other Companies, or he would have known that this course has been followed in the case of most of them. (Hear, hear.)

The CHAIRMAN:—I value Mr. Cross's opinion: I know him well. But, of course, we stick to our report, because we think it is best for everyone concerned.

Mr. R. W. FORBES (Director):—It is always a pity to touch the reserve fund if we can but pay a fair dividend without it. Best let the reserve fund stand. But if unfortunately next year the same condition of things prevails the directors may, of course, have to consider the suggestion.

Mr. TODD:—The fear is that it will bring down the value of the shares.

The CHAIRMAN:—That is Mr. Cross's idea, I see, but I think that to do as he says would show, not strength, but weakness.

Mr. DODDS:—I would rather have had 8 per cent. I prefer to add to the reserve and pay a smaller dividend. (Laughter.)

Mr. R. W. FORBES:—That was really one point that the directors did consider. At any rate, we thought it a pity to break up the reserve fund.

The CHAIRMAN:—Mr. Cross thinks we ought to have paid more; Mr. Dodds thinks we ought to have paid less; Mr. Paine thinks we have done quite right. (Laughter.) I will now formally move: "That the report and accounts as now submitted be adopted, and that a final dividend of 5 per cent be paid, free of income tax, on and after this date."

Mr. R. W. FORBES seconded the motion, and it was carried unanimously.

Mr. G. G. ANDERSON:—I have pleasure in proposing that Mr. R. W. FORBES be re-elected a director of the Company. Mr. Forbes has been a director since the inauguration of the Company, and that I think is sufficient inducement to us to re-elect him. The Company's past record has been exceptionally good, and the future record, I hope, will be well worthy of it (hear, hear.)

Mr. DONALD ANDREW seconded the motion, which was carried.

Mr. R. W. FORBES :—I am very much obliged for your vote of confidence. I hope I shall keep up to all that Mr. Anderson says.

Mr. TODD, moved :—“That Mr. J. B. Laurie be re-elected auditor for the ensuing year,” remarking that Mr. Laurie had done the work very well in the past.

This was seconded by Mr. G. W. PAINE, and carried.

The CHAIRMAN :—I have now to move that a vote of thanks be given to the Ceylon and London staffs. I have very great pleasure in proposing this. Your staff in Ceylon, I am sure, are quite as dissatisfied with the short-comings in the result of their endeavours to carry on the past year's working of the Company successfully as we are. But they will continue to do their very best. As to the London staff, the same can be said, only with them the disappointment came all the sooner for they had the accounts sooner (laughter.) But they have shown the most praiseworthy activity in doing their best to keep your teas up to the full price in the market. If any of the brokers were here they would be able to say how our staff in London has gone at them to keep prices up (hear, hear.) Perhaps that is why none of the brokers are here today, (laughter.)

Mr. DODDS :—I second, that. It has struck me that there has been a great deal of thoroughness in carrying on the Ceylon tea industry. We owe our best thanks to all those who carry on the industry, those in Ceylon and in London as well (hear, hear.) I say this because I noticed in the *Investors' Review* of May 6 an anonymous article which rather criticised the action of those responsible for the working of Tea Companies. Still, I do not think an anonymous article like that can have much influence with the public. To me it is a great satisfaction to have such gentlemen on the staff and on the directorate as we have in this Company, and as are to be found in so many others of the Ceylon tea Companies (hear, hear.)

The proposition was carried unanimously.

Mr. G. W. PAINE :—I have to propose, “That our best thanks be given to Mr. H. L. Forbes, the chairman, and his brother directors, for their able conduct of the Company's business.” I ought to thank Mr. Forbes personally for his practical remarks as to the cause of the diminution of this Company's dividend. It is really the same as in other Companies. The rise in exchange and the fall in markets are, I think, the only substantial causes of the reduction. There seems little chance of reducing exchange prices at present. As to the Committee appointed by the Government, do you think there is sufficient representation of Ceylon tea Companies on the committee.

The CHAIRMAN :—I don't.

Mr. PAINE :—Can we not move or get our association to move to get some one on the Committee who would represent us directly? It would be a good thing (hear, hear).

Mr. G. G. ANDERSON :—Lord George Hamilton said in the House that the reference to the Committee had been completed, and that the Constitution of the Committee could not be altered. The name of Sir John Muir was mentioned as that of one who was largely interested in the Indian and Ceylon tea industry.

The CHAIRMAN :—Ceylon proposed Mr. Christie, as you know, of course. One gentleman is on the Committee who met me the other day and

confessed he knew little about the question, and said he would be glad to have some views on the subject (a laugh). I said I would be only too happy to let him have our views (hear, hear), and I shall certainly take the opportunity in the interests of this Company and of Ceylon Companies generally to do everything I can to send information and views to this gentleman. He seemed to be very anxious to get any information and to have the expression of Ceylon views generally—and Indian as well, of course—and I'll take care he has all I can give him (hear, hear).

Mr. TODD :—Perhaps you can give evidence. I second Mr. Paine's proposition.

The proposition was carried, and the Chairman briefly replied.

Mr. DODDS :—You said, sir, that the coolies were “bought and sold.” (laughter.) I hope you don't mean that literally (laughter.) I should not like any misunderstanding on coast advances to get spread about through what may be reported of our meeting in the papers.

The CHAIRMAN having explained the coast advance system, amid much laughter, the proceedings closed.

## PRODUCE AND PLANTING.

**DIVIDENDS.**—When two ably administered Indian tea companies fail to maintain the same high rate of dividend as in previous years, it is evidence that tea planters have had more than ordinary difficulties to contend with of late. The Assam Company has been paying 20 per cent dividends since 1894, but for 1897 the rate is only 17½ per cent. The outturn of the Hanzhie Tea Association has proved 202,909 lb. less than the estimate and 142,816 lb. short of the 1896 total. The prices realised were somewhat more favourable, but this was, of course, more than counterbalanced by the shortfall.

**LOW EXCHANGE IN CHINA.**—Although the export trade of China, as a whole, has benefited by low exchange there was no apparent effect on the tea trade during 1897. In spite of a further falling off in the shipments of tea, the value of the exports for 1897 exceeded that of 1896 by over 32 million taels. The year 1895 held the record with the value of Hk. Tls. 143,293,211, but 1897 has beaten this easily and stands at Hk. Tls. 163,501,358, which nearly doubles the figures for 1887, although at that time the tables included the exports from Formosa. The increase is not due to an exceptional demand for a particular article, and almost every item, except tea, has shared in the expansion.

**THE TEA TRADE OF NINGPO.**—We gather from the consular report that the total trade of the port of Ningpo for 1897 fell off to the extent of £206,376. Practically the whole of the decrease occurred under the head of exports. It is accounted for by the opening of Hangchow as a treaty port, and the consequent complete diversion of Fuchow teas and the partial diversion of Pinguey teas.—*H. and C. Mail*, May 20.

PROFESSOR DEWAR caused a good deal of amusement at the Royal Institution of Friday night, last week, by producing a milk can, which he had filled with liquid air, and pouring the fluid out, just as one would the more familiar substance milk. A few years ago, he said, liquid air could only be obtained by the pint, now a gallon of it could be produced with the greatest ease, owing to the improvements in the apparatus for its manufacture. Professor Dewar remarked that many industrial and commercial uses for liquid air had been found, and as production was cheapened further applications its would be sought for.—*British and Colonial Druggist*, April 8.

PLANTATION PROPERTY AND VARIED PRODUCTS IN CEYLON:  
ENCOURAGEMENT TO YOUNG PLANTERS.

There is much truth in one remark made in the record of Rajawella estate which we published as the introduction to our June number. It is to the effect that no owner should ever despair about plantation property in Ceylon. Even when threatened with abandonment on account of the failure of a particular product, *nil desperandum* should be his motto. If his be a fair average estate with no exceptional drawbacks, he may comfortably adopt Mr. Micawber's philosophy and feel sure "something will turn up." Such is the moral read from the history of ups and downs on the Rajawella estate in the valley of Dumbara. But there are far more striking vicissitudes in the history of old coffee estates than experienced in Dumbara where the rich soil has always given an advantage in trying one product after another. In the early "eighties" the most miserable man in Ceylon was said to be he who "owned a coffee estate" and who could not get rid of it and its mortgage burdens. And yet those who considered themselves fortunate enough to get clear by transferring their property for, comparatively, "a mere song," were no doubt ten years later, envying their aforesaid "miserable" neighbours who having had, perforce, to worry along, found their land advance amazingly in value in the "tea era." Now again, we have a check—a swing of the pendulum. So it has ever been in "the planting history" of Ceylon. Every ten or eleven years, (as if in correspondence, with the sun-spot cycles), there has come round a term of depression, sometimes serious and prolonged; at other times less severe and temporary. Let us hope that to the latter belongs the present check to the Tea Enterprise.

But our subject today is the consideration of certain products which ought to be more and more tried in certain suitable districts as supplementary to tea. In connection with the review of our great industries for our "Handbook and Directory," we have been applying to certain representative planters, Visiting Agents and Managers, for their experience and opinions of alternative products and a good deal of valuable information has been the result. We have already dealt with "Para Rubber," which, by many, is considered the most important of coming products, but which is limited by an altitude of 500 feet, for clearings, as only under exceptional circumstances should planting be tried up to 1,000 or 1,200 feet above sea-level. It is therefore a low-country product. Still it is satisfactory to know that apart from the extensive plantings in Kalutara and other maritime districts, in Kelani Valley and especially in Kurunegala, not a little has been done in Matale and Dumbara and still more in divisions of Uva. An interesting and successful experiment is that found on one of the Monaragala estates, from which no doubt neighbouring planters will take courage. On Balanogoda clearings a great deal of Para Rubber has been put in and we hope it will succeed in spite of the elevation in some instances, being above that recommended. It is well to remember that experiments, a good many years ago, were not confined to one or two estates or even one or two districts, and although unnoticed, because in most cases the trees have been utilised for seed only, our district returns for Directory seem to shew that there is the equivalent of over 1,000

acres covered with rubber on private plantations, apart from the plantings of the Forest Department and the Botanic Gardens; but then this includes clearings or plantings of the now discarded Ceara Rubber which, in Dumbara, is proving by no means an unprofitable tree. With the Manila trade disorganised, something ought to be done in "Fibres" and we see the New Zealand flax trade is likely to revive and extend. This same New Zealand flax (*Phormium tenax*) grows well in Uva, and a clearing might not come amiss; but at present the more valuable "Ramie" claims attention; and while the low-country again would seem to be favourite, there is no reason why it should not be tried higher up—only it wants good soil. We regard to find a consensus of opinion and experience unfavourable to any revival of coffee, even of the Liberian variety in Ceylon. The extremely plucky and interesting experiment with 129 acres of Liberian in the Kelani Valley cannot be pronounced a success; the trees which blossom and get the same set as well as carry crop till it ripens, are few and far between and leaf disease is often rampant; so that the proprietors have had to protect themselves by planting tea (3 by 3½ ft.) between the coffee. So, from Matale and elsewhere, we have unfavourable accounts of Liberian coffee: when planted with cacao, the latter is almost invariably the successful product. Here is one report from a practical quarter:—

"We tried Liberian coffee with cacao—planted at the same time. A rich piece of soil with situation and everything favourable but no good. It is now 3 to 4 years old, and is nearly killed out every now and then by leaf disease and green bug."

On the other hand it is cheering to have such good accounts of our old staple this year from most of the divisions of Uva: crops up to 5,000 or 6,000 bushels on individual estates, are spoken of, if the season continues favourable; and it is hard to say whether if the lady-bird experiment in Coorg and Mysore prove successful, the same might not save and perpetuate coffee in Uva, where even now there are some 7,500 to 8,000 acres out of 12,000 acres of *Coffea Arabica* remaining in the island. One of the oldest bits of coffee in Ceylon must be that on "the rocky field" of Asgeria between Vicarton Gorge in Matale West—which we visited in 1869 with Abercromby Swan and Charles Forbes. It is planted up with cacao; but continues to give occasional good crops. The interesting experiment begun in Dumbara some years ago of planting coffee for catch "crops" with cacao is still, we find, continued. Coorg seed was used on Kondesalle estate as supposed to be disease-proof—a vain delusion—but good crops were got for a few years, till in the fourth year or so, the Cacao began to overpower the Coffee and the crop from the latter became a straggling one and rapidly fell off. Here is a report from Dumbara on the subject, of some interest:—

"Re coffee planted in 1892 from Coorg seed the coffee is not doing much now as the cacao which was planted along with it has taken up all the ground. Suckers were left on the trees some two or three years ago, and the lateral branches began to die back owing to cacao. They are now very healthy, but of course don't give much crop as the shade is too dense for it. Nothing is now done to the trees, and they are left to grow like native coffee. It gave last year only about ¼ cwt per acre. The coffee, as you know, was only planted as "catch" crop. In 1894-95 another field was planted with coffee, cacao and coconuts. Cacao and coconuts are doing well. The coffee looks very

healthy, but only gave a little over 1 cwt per acre last year. In June and July 1897 another clearing was planted in coffee and coconuts (cacao now being planted in it.) The young coffee trees are doing very well and have now a small crop on them." As to Cacao—of which there are now over 21,000 acres in Ceylon, an increase of 3,000 acres in 2½ years—the reports are generally favourable; and if only Mr. Carruthers is enabled to show the planter how to deal with its present enemies in certain districts, the industry should rapidly increase in importance. Even as it is, where care is taken to plant the stronger variety on good soil, there is not much to fear. Here is an encouraging Matale report:—

"Cacao is doing very well. First clearings all common rod are now four to five years old, fine growth and no signs of disease so far. Subsequent clearings all Foresteria and very little else being planted now and anywhere. The disease is said not to flourish west of the north road, but no dependence can be placed in this. Grub moved round about in much the same way in the old days." This, it will be observed, refers to Matale; but we have equally good reports from the other end of the country, say Monaragala, where cacao fields are quite healthy and bearing well. Cacao in the lower divisions and cardamoms on the higher slopes of the Monaragala range seem to prosper; while, as already mentioned, Para rubber is not behind. Here is how one shrewd proprietor and Inspector of Estates sums up the situation:—

"Accepting cacao as a success and well worth growing, I think Para Rubber is the coming new product, but it should not be planted much above 500 feet and unless one has sufficient command of seed to open a considerable tract it should be confined to existing estates where it can be introduced economically."

We have already quoted the opinion of another Visiting Agent with exceptional experience of Rubber to the effect that 50 trees per acre of Para rubber among tea can do no harm; while in some situations (with good soil and plenty of rain) he would go up to 100 trees with confidence. There is an increasing tendency among European managers—for Companies especially—to plant coconut palms in cacao, coffee and even in some tea clearings in certain districts. Dambara, Kurunegala, Kelani Valley and Kalutara are the favourite districts, but there is also a good deal done in this way in Matale, and in districts around Kandy; and managers are generally satisfied with the growth so far. Raminie is being tried in Dambara and the soil should be very suitable; but a rainfall of 60 to 70 inches is scarcely enough.

Of other and minor products, we should like to see a little more done with "Kola" of which so far only patches have been tried, but with success, in Matale. A great deal more ought certainly to be done in Pepper and we cannot understand why experiments are not freely made in Kegalla and Kelani Valley, seeing the large crops that used to be collected there for the Dutch, over a hundred years ago. A Matale experiment interests us very much: pepper is there grown in one case on shade trees of a cacao field, and the spice now both bears and sells well. The example ought to be freely followed. Then what about Vanilla? "I believe"—writes one shrewd colonist—"there is money in vanilla round Kandy and Matale." A good deal is being done in Dambara where a report tells us:—

"Vanilla is being extended as much as we can and is promising, but so far we have only a few

acres. This plant and the curing require a great deal of care and the cultivation can hardly be undertaken on a large scale."

That is true; and yet why not a vanilla garden in Ceylon on the scale followed in poor little Seychelles? At any rate, let young planters of the right stamp, on the look-out for new industries, take heart. There is a choice before them and several of the products mentioned are decidedly promising. As striking out a new line altogether we must quote two more opinions or recommendations from experienced and successful colonists for the benefit of younger men. Here is one in the shape of an enquiry:—

"Don't you think that the very great demand for castor cake in Ceylon with the fact that the castor plant grows so well, should make the growing of the latter a paying concern?"

While the other remarks that it would, he believes, pay well to "plant timber trees (Casuarina) for fuel on waste land accessible to Colombo, &c." This reminds us that in the "sixties," an Uva planting proprietor made a good thing by planting casuarinas in the neighbourhood of Madras and afterwards selling the clearing for fuel purposes. But for further information in regard to "minor" as well as "staple" products at this time in Ceylon, we must refer to our Review in the forthcoming "Handbook and Directory."

## PLANTING AND SPORT IN SOUTHERN INDIA.

COFFEE—CINCHONA—SOIL.  
(By an ex-Ceylon Planter.)

The buildings in this quarter of the empire seem to be of a very primitive nature, the bungalows, lines, etc., are not like the neat (as a rule) and comfortable erections one finds on estates in old Ceylon. I cannot say anything as yet about the coffee here, only having viewed it in distance, but I hope soon to see and go over several estates only a few miles from here. It certainly looks well, and I believe is very good, the elevation here is rather too high for coffee, my bungalow being some 6,200 feet, and the land running up to close on 7,000 feet; at the same time I came across a few hundred coffee trees which had been planted by some previous superintendent, and looking exceedingly well. These were one mass of tangled bushes, but finding some Ceylon coolies who had been on an estate up Nuwalapitiya way, I immediately had the trees hauled out with the result that there is now a good spike coming out on them, they had a blossom out and set well previous to this, which looks as if the elevation was not out of the way. I looked closely for our old enemy leaf-disease, also for green bug, but could find neither, and at this I was glad. I noticed the coffee leaves were much smaller than these in Ceylon, being long and narrow, stems of trees were of very fair size, and altogether I am inclined to think coffee would grow and pay well even at this high elevation. I mean to ask leave to try an experimental patch of a few acres, and hope I shall be allowed to do so. Soil over in this district is something to look at, I have never seen anything to equal or touch it in Ceylon during all my long stay there, I am inclined to pronounce it almost too good. There is no old tea about just at this particular part of the district, the oldest being only two years old, growth is very backward compared to two years' old Ceylon tea; but one would naturally expect this to be the case at such an elevation, from 5,700 up to quite 7,000 feet.

With regard to wild game, &c., about here, I am told it is very plentiful, elephant, tiger (one of these and a cub have been taking a daily ramble through my cinchona fields along the roads of late, about 100 yards below my bungalow, and by the size of the foot prints it must be a monster.) Sambur

these in the hills away above the estates are also there in great numbers, the little red deer as we call it in Ceylon, and what they call here jungle sheep, are about in numbers, the roads, through a 300 acre field of officialis cinchona being thickly marked with them. Jungle fowl and quail are also about, and altogether anyone fond of shooting would have a very good time of it, elephants alone being preserved, there being no end of a row if one is shot by anyone, licences being refused to anyone applying for them. I had almost forgot about the bison, they are about in herds on the hill tops and slopes, a fine bull having been shot a few miles from here by the British Resident, and another caught not long ago on this estate in a pit, which had been dug for it. It was to have been sent to some Zoo, but he broke out one night and got clear away, much to superintendent's disappointment.

I had almost forgotten to mention cinchona. As I said there are over 300 acres here, and on the next estate a big lot of it also, all officialis and hybrid, and looking very healthy, although I have noticed canker on individual trees, but nothing evidently to alarm any one. If prices would only rise I dare say a large amount of bark would be harvested, but at present (although I note the price of bark is going up) it is hardly worth one's while to bother with it. We are all busy preparing tea clearings for the S.W. monsoon which we expect will be on us very soon now, we have had almost daily afternoon rains nearly all this month, but evidently N.E. rains. At present the weather is very mild even at this high elevation, and most enjoyable.

"KLONDYKE."

#### EXCHANGE AND THE TEA TRADE.

To the Editor of the *Economist*.

SIR,—The Secretary of the Ceylon Association in London has, in your last issue, favoured your readers with another letter, on which I would make a few remarks.

In my former letter I showed that, in the three years subsequent to 1894, the fresh tea planting in Ceylon was more than double what it was in the three years subsequent to 1891 (erroneously printed 1890, no doubt my fault), and that the area of land under tea in Ceylon is now 375,000 acres. Mr. Leake says I am wrong, that "there are not, nor are there likely to be, 375,000 acres planted with tea in Ceylon. The latest estimate of the total acreage planted is 315,000, with a probable eventual extension to 350,000." The following, however, is an extract from "Kelly's Merchants', &c., Directory of 1898," which is also borne out by the other particulars in my hands:—"There are now (October, 1897) 375,000 acres in Ceylon planted with tea, and it is proved that some parts of the country are capable of producing a greater yield of leaf per acre than any other country in the world." So that the Ceylon Association in London is not up to date in so simple a matter as the area now planted they are wrong to the extent of 60,000 acres.

Driven by Lord Farrer from holding out the tea trade of China as a bright example of the advantages of a falling currency, Mr. Leake has now turned to Java as a shooting example of the disadvantages of a steady currency. He says, quite correctly, that tea in Java has only increased (wonderful that it has increased!) from 7 million lb. in 1885 to 9 million lb. in 1896, whereas Ceylon, which only exported 4 millions in 1885, exported in 1896 108 millions. He writes as if the contrast were due to the respective currencies. But the increase in Ceylon is not due to the currency but to the coffee blight, which left so much excellent land to be replaced by tea. Java had no coffee blight. On the

contrary, whereas in 1883 the exports of coffee were 515,000 piculs, last year they came to 767,361 piculs. How strange that the Ceylon Association in London seem never to have heard of the coffee blight!

The Ceylon Association do not deny that they would like to pay their coolies in depreciated rupees. But they write as if this were good for them, and that they enjoy it. "From the point of view of the coolie, his fixed daily wage (which has for fifty years past varied little from one-third of a rupee) has brought him as much rice, provided at a fixed rupee rate, as much cotton cloth, curry, stuffs, &c., when the rupee had fallen to 1s 1½d as when it was 2s." An article in the *Economist* of September 3, 1892, analysing the figures in the latest Blue Book on prices and wages in India, brings out that "they show a fall of more than 40 per cent. in the purchasing power of the rupee during the last 20 years." This agrees with the fact that the price of coolie rice in Calcutta, which, in 1872, was about 2 annas per mannd, is now about 4 annas. So much as to his food. As to his clothing, brought from Lancashire, it is plain that at 1s 4d exchange it needs now 3 rupees to do the work of 2 rupees at 2s. Until the wages of the coolies, therefore, adjust themselves to the new Mint ratio a wrong is being done to them, of which they are not aware.

Mr. Leake's letters, however, are extremely valuable, as showing the state of mind and style of reasoning of those who believe in falling currencies, who would wreck and ruin the whole currency of the Indian empire to enable them temporarily to pay their workers less; and that although the Indian labourer is cheaper and more effective, more docile, industrious, and thrifty than the clumsier and higher paid Malay and Chinese, or than the idolent negro or the weak mixed breeds of South America.—Yours truly,

May 10th, 1898.

EAST INDIA MERCHANT.

TO THE EDITOR OF THE "ECONOMIST."

SIR,—Let me assure Mr. Leake that I do hold to my position, notwithstanding all that he says. I am not going to encumber your pages with a discussion of his irrelevant facts or of his curious "theories." I suppose I must not call them "prophecies." But I would ask him one question. If it is true, as he says, that "the daily wage of the Indian labourer, which in 1894 and 1895 was equal to 4½d; has been raised to-day by the action of the Indian Government to 5½d," by how much was that daily wage diminished by the fall in the value of the rupee which took place before the closing of the Indian mints? The rupee, which stood at 2s or 1s 11d before the great fall in silver, had fallen more or less irregularly until the closing of the Indian mints, when it stood at from 1s 2d to 1s 3d; since then it has, with some variations, which brought it down nearly to 12d in January, 1895, risen to nearly 1s 4d. Again, I ask, if the rise of the rupee from 1s 2d or 1s 3d to 1s 4d, which has been consequent on the closing of the Indian mints, has raised the wages of the Indian labourer by one-fifth or one-sixth of its previous amount, by how much must the fall in the rupee from 2s to 1s 2d, which preceded the closing of the Indian mints, have reduced his wages?

I need not say that I do not indorse Mr. Leake's figures; I only point out what is their necessary consequence.

FARRER.

Abinger Hall, May 10th, 1898.

## CEYLON AND THE INDIAN CURRENCY.

TO THE EDITOR OF THE "ECONOMIST."

SIR,—On my return to England may I be permitted to offer a few remarks on the letters that have appeared on the Indian currency question, arising from my letter from Ceylon of March 1st? Lord Farrer has endeavoured to prove that the Ceylon tea industry has not been adversely affected by the restricted currency. Mr. Leake, who has been the guardian of planting interests in London for the last twenty-six years, has set him right in that matter; but both Mr. Leake and Lord Farrer appear to shirk the true gist of my letter, which is that we Ceylon and Indian producers are expected, without a currency, to compete with the barbarian with one. It can hardly be denied that we have a common right with all other subjects of the Empire to a currency that shall be a true measure of our commodities. We had this in silver previous to the closing of the Mints, and now that the Government has attained its object of forcing the rupee up to a level which will enable it to transfer from silver to gold, we expect it either to do this or to give us back our silver currency. Any middle course only continues the evil, as the rupee can only be maintained over the natural gold value of silver by keeping up a currency famine. Since my letter was written the Home Government has intimated its intention of developing a gold standard, and with that promise definitely before us we can now consider what this will mean to the producer. From Mr. Leake's letters of the 7th inst. it appears that he regards this as likely to continue the same bounty on the produce of silver-using countries as against ourselves. I do not, and in the contention I trust I shall have the support of Lord Farrer and other economists. It is argued by the planters, in a memorial which they have addressed to the Colonial Office, that commodities will not re-adjust themselves to a gold currency in Ceylon, and the commodities specially instanced for the purpose of the argument are the coolie wage and the price of rice. It is said that the coolie wage has remained constant at three days' labour to the rupee for the last thirty years, and that the price of rice in Ceylon has not risen commensurately with the fall in the gold value of silver, and from this it is inferred that if a gold currency is substituted for a silver one, neither the labour wage nor the price of rice will fall when measured in gold. In other words, the planters claim that their principal commodities—cost of rice and labour wage—are excluded from the operation of a great natural law.

There must, of course, be a fallacy underlying such an argument, and the fallacy is this. It is quite true that the labour wage has remained the same for the past 30 years, but that wage represents to the Tamil family today at least 40 per cent more in volume than it did 30 years ago. The Ceylon planting industry then was coffee, which only gave three months' full employment to the coolie in the year. At the end of the crop a great part of the labour force was paid off, to return to distant homes in India; the women that remained were worked half-time, and the children not at all.

Tea gives full employment to the Tamil family all the year round, and the women and children—the least useful labourers in coffee—are those most in request in tea. The volume of wage earnable has increased fully 40 per cent, or quite the equivalent of the fall in the gold value of silver.

In other ways the condition of the coolie has been ameliorated by the opening of the Southern Indian Railway, by which route he can be carried from a Ceylon estate to his home in 36 hours, where formerly he had a weary tramp of many hundred miles on foot. In other words, the re-measurement of the labour wage in the currency has been rendered unnecessary (and therefore has not been given visible effect to) only because other compensating circumstances have more than made good the difference to the coolie. Similarly in rice; it will be contended that the actual price of rice in Ceylon (excluding famine considerations) is only some 15 per cent higher than 20 years ago, while the fall in the gold value of silver has been 40 per cent. Here again it is overlooked that cheap freights and railways have enabled rice to be laid down in Ceylon at a price 25 per cent cheaper than could be done 20 years ago, and that the price paid to the rice grower in India is fully 40 per cent higher than it was when the rupee was at par. Of these two commodities—rice and the coolie wage—one has re-measured itself as far as it could in the currency, the other—coolie wage—has re-adjusted itself to the currency in other ways. Why, then, is not the same re-adjustment to continue with a gold currency?

I will not trespass on your space by detailing the many advantages to Ceylon that will result from a gold currency, for these will be fully dealt with by the Commission, but I would point out that when these results have been attained Ceylon will have little to fear in its competition with silver-using countries, on which much stress is laid in the planters' memorial. Our Chinese competitors will be unsupported by cheap capital as in Ceylon, and rice, the food of the Chinese coolie, must rise in price as the gold countries purchase it. The quality of Chinese labour must also deteriorate in proportion as it is ill-paid and ill-fed.

I have ventured to suggest the transition from a silver to a gold currency at the rate of 1s 3d per rupee, not only because it appears a just rate, but also because it will fit in exactly with the token coins of England and India if represented by a gold coin, the equivalent of 12s 6d in England, and R10 in India. The present stock of rupees is not more than sufficient for token requirements, and it must be remembered that the burden of currency work in the East will always fall on the token coins, *e.g.*, in monthly payments for labour; the individual wage—after deducting food supplies—but seldom reaches R10. This fact disposes of the idea that the demand for gold for circulation in India will ever in any way compare with the like demand for it in England, where the labour wage is so much higher and food is not made part of the terms of payment.

The proposal of the Government to withdraw rupees from circulation will simply create a difficulty for itself and send a thrill of horror throughout the East. What is wanted is to re-supply the depleted currency of the last five years with gold, minted in India, and statisticians are not worth much if they cannot ascertain what this depletion amounts to, and what further addition to the currency is necessary to move the increased volume of produce stimulated by the fall in silver.—Yours truly,

HARCOURT SKRINE.

New University Club,  
St. James's Street, May 9th, 1898.

THE CEYLON AND ORIENTAL  
ESTATES CO.

It is very evident now that Mr. Ford, operating with Messrs. Cooper & Cooper, will carry out the arrangement shadowed forth at the last meeting of the shareholders in the above Company. We learn on good authority that the deposit of £3,000 has been paid to the Directors and this will be absolutely forfeited should Mr. Ford fail to form the new Company with sufficient subscribed capital to carry out the purchase by 31st July next.

So far, no ordinary dividend has been paid by the C. & O. Company for 1897 and we learn the accounts were not audited when the mail left owing to the pending sale with Mr. Ford. If the Company takes over, they have to pay a dividend of 7 per cent for 1897 to the old shareholders and 6 per cent interest for the current year until the assets are fully paid for in cash. On the other hand if the shareholders elect to go on in Mr. Ford's new Company they are to have on ordinary shares a bonus of 14 per cent. and on Preference of 12 per cent.

Amalgamated with Messrs. Cooper & Cooper, it seems to us the new Company ought to be a powerful one; and it should to some extent form a Direct Supply Association if it chose to sell its own teas direct to retailers and consumers? The Manager of the C. & O. Company's estates in Ceylon is Mr. A. J. Denison, the Colombo Agents being the Eastern Produce and Estates Co., Ltd. The following is a list of the estates belonging to the Company, so far as our Directory shows:—

District.	Total area.	Culti- vated.	Other Tea. Pro- ducts	
Bogahawatte	Dimbula .	618	541	0
Denegama	Balangoda..	449	320	0
Keenekelle	Badulla ..	1,517	782	566
LeVallon	Nilambe ..	2,095	1,218	1,218
Moralioya	Kelani Val- ley ..	453	335	335
Oodewelle	Hantane ..	1,181	817	817
Peacock Hill	Pussellawa.	388	300	300
Pathragala	Kurunegala	725	406	100

PLANTED AREA UNDER TEA IN CEYLON ;  
AND THE CURRENCY AND EXCHANGE DIS-  
CUSSION.

It would certainly be wrong—that is premature—to say in October 1897 that three were 375,000 acres covered with tea in Ceylon. But the figures were as certainly not a misprint for 315,000—as some London friends suppose—for that would have been far more erroneous the other way. We probably wrote 355,000 in our rough draft of statistical corrections for Kelly's Directory and in the copy sent home, the blunder must have been made. But we cannot understand how Mr. Leake and other London friends connected with Ceylon should not have recalled the fact that both 1896 and 1897 were years of exceptional activity in planting tea both in new plantations and in reserves attached to existing estates. The check to such extensions only took

effect in reality early this year, with the realization that the rise in exchange was not to be temporary, and the low prices were likely to continue for some time.

Now the latest complete return of the planting districts showed 305,000 acres covered with tea in October, 1895, and surely Mr. Leake has heard of the extraordinary activity in planting which has prevailed since then? Why in the one district of Balangoda, mainly through the Companies represented by Messrs. Finlay, Muir & Co., nearly 5,000 acres will have been added to the tea area since October 1895? An addition of the same extent has been made to the Kalutara district, and no less than double or 10,000 acres additional to the Kelani Valley district in the 2½ years—so that we have here 20,000 acres added for three districts alone! We are not quite prepared to give the exact figures for the whole country—although a few more days will bring them out—but we may say that the total addition to our tea area, including native tea gardens, is certain to bring the figures much nearer to 375,000 than to 355,000 acres. Still, the activity represented belongs to 1896 and 1897, rather than 1893, although there are doubtless included, clearings which having been felled in December-January last have to be planted during the present South-west monsoon. What is the lesson to be derived from the largely-increased area under tea in Ceylon? Why, surely, that a halt should be cried both in Northern and Southern India as regards further tea extensions, in the face of such figures; while, it is no less true that the continuance of the Ceylon industry on its present large scale depends a great deal on the course adopted in reference to the Indian Currency. Indeed, though we have had no actual returns of "abandonment" made to us for Directory purposes, it is none the less a fact, we believe, that the cultivation of certain poor tea fields has already ceased, and that this unfortunate experience may extend is, we fear, quite possible, should the rupee, be artificially maintained at 1s 4d and no special improvement take place in Mining Lane prices.

BRAZILIAN COFFEE.

Coffee-Planting in Brazil has for many years completely overshadowed all the other branches of industry and agriculture in that vast country, and no check seems probable in the near future to the constant increase of the already enormous trade. Last year the exports from Rio consisted almost exclusively of coffee, the supply of which exceeded in quantity that of any previous season, having far surpassed all calculated expectations. The entries at Rio and Santos totalled 10,032,300 bags, an increase over 1896 of 2,701,584 bags, and the shipments from the two ports were 9,687,317 bags. The average value was about 36s. per bag. The unprecedented supply, greatly in excess of the consumption, caused prices to drop to a point hitherto unknown in the history of the article, type No. 7, in November, having been sold in Rio at about 6s. 6d. for 32 lb. In the same month, 1896, the lowest quotation for this quality was 10s. 2d. for 32 lb. The large increase in production is the inevitable result of the very high prices which ruled from 1887 to 1896. These prices gave an average profit to the planter estimated at 150 per cent., and naturally stimulated planting to an enormous degree. As it requires several years to bring the coffee plant to a bearing and paying stage, the effect of the enormous extension of plantations has only been seriously felt in the past two years; but whilst it takes some years for the coffee-tree to bear, it continues to bear for many years, and therefore the low prices and depressed condition

of the coffee interest is likely to continue for some time. An interesting feature of the transactions of the year is the increase of foreign capital which has been invested in Brazilian coffee plantations. It is reported that extensive properties in the States of Santo Paulo and Minas Geraes have been acquired by European syndicates chiefly English; and it is also said that a company has been organised at Antwerp, which will have a branch at Santos for the purpose of buying coffee of the planters direct, and selling it by retail in Europe for account of the said planters. The receipts of Rio this year up to May 1, were 3,836,600 bags, against 3,156,000 for the first four months of 1897.—*Grocers' Journal*, May 21.

#### TIMBER AND BOXES FOR TEA.

It seems somewhat of an anomaly that about half of the tea crop of Assam is shipped in packages imported from Japan, Burma, Norway and Great Britain, and it points to a serious error in the conduct of the vast forest territory of Assam that such a state of things should exist. Japanese shooks of all those mentioned above, can be landed probably most economically, but the class of timber used, although very nice to look at, is somewhat brittle and fragile; yet there is no doubt that it is properly seasoned, which is not the case with country-made boxes; and nowadays when there is such a glut of tea in the market, the condition of the packages on arrival can no longer be ignored, and planters will have to look to this and endeavour to copy the Chinese trade. It has often been a marvel to us how the Indian packages have gone on from year to year, exhibiting the same rough exterior, and that no attempt has been made to furbish up the appearance a bit. Were any of our large manufacturers of tinned provisions to neglect this for a moment, their trade would at once suffer. We by no means suggest that "the outside of the platter should be cleansed at the expense of the inside," but we would advocate an attempt being made to put the teas into more attractive cases. The old China package would not have been much to look at, without its outside covering of paper with the old quaint Chinese characters that were engraved on it, in addition to other designs. What would a tin of Lipton's Marmalade look like without the touch of paint and showy label, and yet that is what the common Indian package is as compared with its Chinese rival. Is it not a matter that might well be enquired into, and an endeavour made to encourage a trade in?—*Indian Planters' Gazette*.

#### IMPROVED PRUNING OF TEA.

Our Indian tea-planting correspondent who signs "1874"—as the year from which his experience dates—has startled our local community by his exposition of an improved system of Pruning and Manuring, which he says, ought to raise the yield of average estates to 1,600 lb. an acre. "*Credat Judæus*" seems the more common local commentary on this sanguine estimate; but today a representative Ceylon planter treats the matter more seriously and although still dubious of results, expresses himself as "willing to try." Meantime, clearly Ceylon planters would like to hear a little more of "1874's" experiments and experience—although no doubt time must be allowed for both. As regards the merits of Ceylon and Indian estates, we doubt if there is any-

thing even in the richest part of Northern India to touch the record of the 100 acre-field of Mariawatte which has given an average yield for 14 years of 1,137 lb. of made tea per acre, the whole plantation of 467 acres averaging 926 lb. per acre last year. Nor is this a solitary case in Ceylon; for figures were given lately for a Matale or Ukuwella estate indicating quite as good results for a certain number of years. We doubt if at the end of 14 years, "1874" could shew as good a record as Mariawatte; and yet the Managers of the latter are, no doubt, quite ready to consider a system which would add 25 to 30 per cent to their already large yields, provided it does not tend to injure their bushes in the long run. Of course Mariawatte is regularly manured.

#### COFFEE IN EAST JAVA.

We are much indebted to the correspondent who sends us for inspection the set of photographs referred to in the following notes:—

Reading your recent publications of papers from Mexico about the coffee these lead me to think you will be interested to see the amateur photos I send herewith of the coffee at Glen Falloch Estate in East Java. The most striking perhaps is that of a coffee tree with two men near it. This tree was planted in January 9th 1895, the photo having been taken in February 1898. The oldest coffee in any of the photos dates from July 1894 but all those marked B division are a year younger.

The photographs are very interesting in showing us the vegetation and glimpses of mountain and river scenery as well as of the growth of coffee in East Java. The special picture of Glen Falloch coffee bushes three years old shows a wonderfully luxuriant growth, the bushes topping both the planters shown and indicating a great wealth of leaf, wood and berries—remining us of Dumbera in its richest coffee days.

#### PLANTING NOTES.

LADY BIRDS.—The publication of the correspondence respecting the proposal made in the interests of the coffee planters of Ceylon, in reference to the introduction from our Southern colonies of lady birds, has been delayed by circumstances beyond our control. The letters published show that the matter is one of more than passing interest, and it is to be hoped that the Planters' Association will not dally with the question, but will take such steps as will ensure to the coffee proprietors and planters of Ceylon the same advantages that are evidently going to be gained by Southern India.

THE EXPORT OF INDIA-RUBBER FROM INDIA has steadily fallen year by year since 1892, as the following figures compiled for our "Hand-book" will shew:—

Year.	Exports to U.K.	Total cwt.
1892-3	.. cwt. 4,712	9,972
3-4	.. " "	9,616
4-5	.. " 6,695	9,270
5-6	.. " 5,833	7,154
6-7	.. " 8,941	6,213
1897-8	.. " 3,017	5,565

A fall of 40 per cent in six years is a serious matter and affords additional reason for cultivating rubber in Ceylon. The supplies of rubber from indigenous or wild trees cannot well increase—but must rather tend to decrease shortly—from Africa as from South America.

“LADY-BIRD” BEETLES AND COFFEE.

We are asked by Mr. A. Philip, the Secretary of the Planters' Association of Ceylon, to publish the following correspondence:—  
Eton, Pandaluoya, 25th February, 1898.

From E. E. Green, Hony. Government Entomologist.  
To Alex. Philip, Esq., Secretary, Planters' Association of Ceylon, Kandy.

Dear Sir,—I note that the coffee planters of South India, pecuniarily assisted by the Madras Government, have commissioned Mr. Newport to collect and bring over from Australia, a consignment of “Lady-bird” beetles to check the ravages of scale insects upon coffee. I would strongly urge the corporation of Ceylon planters and proprietors (such as are still interested in the cultivation of coffee), in the scheme. The United Planters' Association of Southern India, and the Madras Government, should be approached with a view to the engaging of Mr. Newport's services on behalf of Ceylon also. A small contribution towards the cost of the work would doubtless be sufficient.

As Mr. Newport was appointed in January, any action proposed should be undertaken at once.—I am, Sir, yours faithfully,  
E. ERNEST GREEN.

1st March 1898.

From the Director, Royal Botanic Gardens, Peradeniya.

To the Secretary, Ceylon Planters' Association.

Sir,—I have the honour to enclose herewith papers received from the Government of Madras giving an account of the manner in which it is proposed to obtain a supply of lady-bird beetles for the benefit of the coffee planters of South India.

2. I enclose also a letter from Mr. E. E. Green upon this subject, and should be obliged if you could inform me whether there would be any likelihood of Ceylon coffee planters adopting the suggestion in paragraph 2 of this letter.

3. If any use is to be made of Mr. Newport's mission, action should be taken at once.—I am, Sir, Your obedient Servant,  
JOHN C. WILLIS,  
Director R. B. G.

Eton, Pandaluoya, 25th Feb., 1898.

To the Director, Royal Botanic Gardens, Peradeniya.

Dear Sir,—I have the honour to return copies of proceedings of Madras Government, relating to the appointment of Mr. Newport to collect and bring over to India, a consignment of “Lady-bird” beetles from Australia, to check the spread of scale insects upon coffee.

2. I have noted this action of the United Planters' Association of Southern India with the greatest pleasure. I would strongly urge that Ceylon planters still interested in the cultivation of coffee, should, with the assistance of the Government, join in the scheme, and—by permission of the Indian Planters' Association and the Madras Government—engage Mr. Newport to bring a supply of the beetles for the use of Ceylon planters also.—I am, Sir, Your obedient Servant,  
E. ERNEST GREEN,  
Hony. Govt. Entomologist.

Fort St. George, 2nd Feb. 1898.  
PROCEEDINGS.

Stating that the Government is unable to render the planters any substantial help in obtaining the services of a competent Entomologist or an Agricultural Chemist, but that arrangements will be made with the Government of Queensland for the shipment of a consignment of “Lady-birds.”

Approving the proposal of the United Planters' Association to send Mr. Newport to Australia to collect and bring over to this country a consignment of “Lady-birds” and stating that the Government is prepared to meet a moiety of the cost.

EXTRACTS FROM MINUTES OF PROCEEDINGS.

Government of Madras, Revenue Department, 17th January 1898.

READ—again the G.O., No. 1040, Revenue, dated 11th December 1897.

ABSTRACT.—Stating that the Government is unable to render the planters any substantial help in obtaining the services of a competent Entomologist or an Agricultural Chemist, but that arrangements will be made with the Government of Queensland for the shipment of a consignment of lady birds.

READ—again the following G.O., R. No. 2316, Revenue, dated 14th December 1897:—

Read—the following letter from the Hon'ble Mr. H P Hodgson, Craigmores Estate, Kullakambay, Nilgiris, to the Secretary to Government, Revenue Department, dated 23th November 1897:—

As I had no reply to my letter, dated the 21st September, regarding the introduction of lady birds, I have the honour to ask if anything further has been decided in the matter.

We are anxious not to lose another season, as the reports of the spreading of scale pests are constantly coming in. We should like to despatch our Agent to Australia at an early date, as March and April are good months for collecting the lady birds.

I should like to know if Government would approve of our sending Mr. Newport, and if they will supply him with letters of introduction to the Government of Victoria.

Considerable sums have been already subscribed by several planting associations towards this object, and as Government were good enough to promise us some pecuniary support, to the extent to say half the expenses incurred in importing the lady birds, I should be glad to know if I can apply for the money when our subscription list are complete.

READ—also the following letter from the Hon'ble Mr. H. P. Hodgson, Craigmores Estate, Kallakambay, Nilgiris, to the Secretary to Government, Revenue Department, dated 10th January 1898:—

I have the honour to address to you at the request of the Chairman of the United Planters' Association, with a view to ascertain if Government would approve of our sending Mr. Newport to Australia at once to collect and bring over a consignment of lady birds and to arrange for future consignments being sent over to us.

The rapid and continue I spread of the scale insects, both on the Paluis and in the Nilgiri district, is causing us the gravest apprehension, and we feel that something ought to be done at once to arrest it. Fields of coffee effected by the pest are threatened with extinction, and if they are to be saved something must be done immediately to relieve them.

Mr. Newport is an intelligent man, and has given the subject considerable study, and is in our opinion well fitted to perform the duty we propose to send him on; if he starts at once he will be in time to make collections of lady birds this season, otherwise another year will be lost before it can be done, and the consequences of such delay may be serious.

We trust therefore that Government will approve our proposal to send him at once. Subscriptions amounting, so far, to say Rs.100, have been already collected by the United Planters' Association of Southern India for the purpose of sending him to Australia, and presume I may rely upon the promise contained in G.O., No. 634, Press, dated the 27th July 1897, that Government will contribute half the cost of importing the lady birds.

Letters of introduction from the Government of Madras will be of the greatest assistance to Mr. Newport, and I have the honour to ask that such letters may be provided, and I will send the names of the persons to whom introductions would be required should Government approve of the suggestion.

Finally I would urge the importance of something being done as soon as possible, and trust to receive the support and assistance of Government in carrying out this experiment, which I have every reason to believe will be attended with success.

[Copy of minutes follow stating maximum the contribution of the Madras Government will be Rs. 2,000.]

READ—the following letter from the Hon'ble Mr. H. P. HODGSON, Caignmore Es'tate, Nilgiris, to the Secretary to Government, Revenue Department, dated Kullakunhay, No.—, September 1897:—

In accordance with the request contained in paragraph 3 of G.O., No. 634, Revenue, dated the 27th July 1897, asking me to ascertain what was the result of Mr. Newport's attempt to introduce lady birds, I have the honour to enclose a letter from that gentleman which shows that he failed in getting any of the insects sent to him either from Honolulu or Australia, and he is of opinion, in which I quite concur, that, without the assistance of Government, the attempts of private individuals in this direction are not likely to succeed.

The subject of the scale pests, and the introductions of their natural enemies, was discussed at the annual meeting of the United Planters' Association of South-India, held at Bangalore last month, and I beg to enclose for information a copy of "Planting Opinion" in which the proceedings on this subject appear in pages 503 to 506.

It will be noticed that the ravages of green bug, and the increase and rapid spreading of the insect threaten the Lower Pulney coffee estates with extinction, and from my own experience in this district with black bug I can speak to the danger being in no way exaggerated.

That whatever is to be done must be done quickly is therefore of paramount importance, and it is with this fact before me that I would beg Government to reconsider the decision contained in paragraph 1 of the G.O., No. 634, in which it is considered "unsafe to apply for or introduce lady birds from Australia except under the professional advice and supervision of an expert."

I can quite understand that Government would agree with the opinion of Mr. Marsden "that the work of searching for and introducing the natural enemies of insect pests should be entrusted only to a skilled entomologist," lest "injury instead of benefit might arise." The principle is a thoroughly sound one as applied to the introduction of unknown insects and in searching for new varieties.

I would submit, however, for consideration that the two species of lady birds which I asked Government to assist us in introducing at once, are neither new or unknown, but have been working beneficially for some time past in Honolulu, their history and habits being well-known.

The objection on the score of a possible danger would not apply to the introduction of these species, and I would earnestly urge that Government give us their assistance in procuring them from Australia without delay.

The urgency of the case is so strongly felt that subscriptions are already being raised with a view to sending over to Australia at once and anticipating the assistance and support of Government in the matter.

Should Government, on reconsideration after perusal of the papers sent and the reasons herein set forth, decide on the early introduction of the two varieties named in my letter dated the 23rd June 1897, Mr. Newport would be willing to go to Australia to collect and bring them over, supposing such a course be approved and the planters will defray half the cost of the experiment.

[Confirmatory letter from Mr. Howard Newport is appended.]

READ—the following letter from DENZIL IBBETSON, Esq., C.S.I., Secretary to the Government of India, Department of Revenue and Agriculture, to the Secretary to the Government of Madras, Revenue Department dated Simla, the 18th September 1897, No. 1428/39—3:—

In reply to your letter, No. 635, dated the 27th July last, in which you enquire whether the services of the

Imperial Entomologist can be spared, to conduct investigations in connection with the importation into the Madras Presidency of lady birds and other natural enemies of the insect pests which now infest Indian plantations, I am directed to state that there is at present no Imperial Entomologist at the disposal of the Government of India, and that the question of entertaining one is awaiting the proposals of the Government of Madras on the subject referred to in this department's letter, No. 2146/1—11, dated the 5th August 1897, regarding the appointment of a Botanist for that Presidency.

2. I am, however, to observe that, should such a specialist be appointed, the field for inquiry will be so vast that his first duty will be to enquire into the diseases of the main staples of India that are grown by those who are too poor or too ignorant to help themselves in the matter. Thus, while any assistance that can be given without detriment to the wider work will be afforded, the Government of India are of opinion that the cost of investigations connected with such products as tea, coffee, indigo and the like, which are cultivated by persons possessed of both capital and intelligence, must, in the main, be borne by those interested in them.

3. Indeed, under no circumstances would it be possible to depute such a specialist upon a roving commission outside India for an indefinite period. If, therefore, the scheme under consideration is to be carried out, an independent expert must be engaged for the purpose.

4. I am to add that a copy of the present correspondence will be forwarded to the Trustees of the Indian Museum who will be asked to place any information which they may possess on the subject at the disposal of the Government of Madras, and to inform them whether they are in any way able to assist in the matter.

#### PLANTING NOTES.

**THE FRUIT AND FLOWER SHOW.**—We are extremely glad to learn of the success which has attended the fruit and flower show, which was held at the School of Agriculture on Wednesday and Thursday. The result must be extremely gratifying to the promoters who worked so very hard on behalf of the exhibition and we sincerely trust that the effect will be such as to cause an effort to be made to hold a regular annual show.

**TEA PLANTING EXTENSION.**—The following keen criticism and sensible advice are given in the latest *Pioneer* to hand, by its Calcutta commercial correspondent:—

In face of the bad results tea gardens are showing, and especially with the possibility of fresh currency legislation which would affect them still more injuriously, few companies have the temerity even to hint at such a thing as further extension at present. The Phoenix Tea Company of Cachar Limited is one of these few however. The accounts for the past year show a loss of Rs. 7,742 which was only met by the sale of the Darrigh at grant of the company, which realised Rs. 27,500. There is a balance of Rs. 15,364 at the debit of profit and loss account, no dividend has been paid for at least eight years past, and yet on the "strong opinion" of the superintendent the agents now propose to consider way and means for a further extension, which it is estimated will cost Rs. 1,73,000. Unfortunately for the shareholders there is an uncalled capital of Rs. 15 a share, which is equal to Rs. 90,000, and this is referred to in the report as part of the "ways and means." If the shareholders consult their own interests, I should think the best thing they can do is to emphatically protest against good money being thrown away after bad in this manner. The present is clearly no time for tea garden extension especially in the case of a garden that has given no return to its shareholders for eight years.

COFFEE PESTS AND LADY BIRD BEETLES.

With less than 15,000 acres of coffee—including Liberian as well as Arabian varieties—now on the Ceylon plantations, Mr. E. E. Green and the Planters' Association will agree with us that our interest in the "Lady-Bird" experiment is limited, as compared with that of the Madras Presidency where, including Mysore, 290,000 acres of coffee are still reported. We would by no means discourage Ceylon sharing in the experiment. Quite the reverse. We think it would be the greatest pity in the world if some of the "lady-birds" were not got to be tried in Pundalnoya under Mr. Green's direct care, as well as in Haputale, Badulla and other Uva districts. But at the same time, our outlay should be proportioned to our position as a coffee-growing country and our Madras neighbours will, from the above, be able to judge that our share should be in proportion say to that contributed by Travancore which has close on 5,000 acres coffee, while Coorg has over 100,000 acres, and Mysore close on 170,000 acres. We think the fair way would be for the Ceylon proprietors owning coffee, as per Directory, to raise a certain sum; for this to be supplemented by the Planters' Association as a grant-in-aid; and then for the Ceylon Government to grant an amount equal to the aggregate of the other two. Altogether if Ceylon gave R2,000—R1,000 from the Government and R1,000 from the P.A. funds and special contributions from Uva—we think it would do well. Of course, it may be argued that our interest is greater than the 15,000 acres; because if the lady birds proved a success, coffee might once again be planted. But with the present great depression in the coffee market we scarcely think there is encouragement in this direction. Nevertheless, we should feel very great regret if Ceylon took no share in the Lady-bird Experiment of the Madras coffee planters. We feel sure that His Excellency the Governor, with his usual enlightened progressive spirit, has only to have the matter put fairly before him, in order to sanction a moiety of whatever grant it may be proposed to make on behalf of Ceylon Coffee.—It must be remembered that the Government represents native coffee gardens besides the plantations with 15,000 acres

INDIAN AND CEYLON CURRENCY AND EXCHANGE.

One of the very sanest dissertations we have yet read on this subject is contained in a pamphlet written by "H. F. B." entitled "The Indian Finance Difficulty: a Solution" and published by Effingham Wilson, Royal Exchange. "H. F. B." whoever he may be, is a thoroughly sound financier and knowing a gold standard to be impracticable for India, he boldly shows—writing be it remembered some time before Sir Robert Giffen—that the true solution of the difficulty is only to be found in the re-opening of the mints and a return to an honest silver currency. The gloomy picture of the state of India previous to closing the mints drawn by Lord George Hamilton is well met by "H. F. B." when he states:—

To me the situation of the country at that time seemed quite otherwise. The revenue had been rapidly increasing. Debt was amply covered. The loss by exchange (as stated by the Government) was to a great extent fictitious, and where real had been easily met. Loss to the Government officials had been compen-

sated. The flow of capital to India had not been checked. Local enterprise was active. Trade was flourishing. The fluctuations of Exchange were not especially embarrassing. The purchasing power of the rupee in India had not diminished. Whence, then came the supposed necessity for the closure of the Mints?

The position of the country was perfectly sound, but the Government required money for its ever-increasing home and military expenditure. To obtain this, two alternatives presented themselves—to increase the Customs duties or to tamper with the currency. They chose the line of least (political) resistance: they tampered with the currency.

What has been the result of that action? On the general question of success or failure, perhaps the most conclusive answer would be, the appointment of the present Committee. But I will tabulate some of the results:—the internal trade sapped of its life-blood; the external trade thrown out of balance; the opium revenue half lost; the flow of English capital reversed; local enterprise checked; monetary crises rendered annual; ordinary banking accommodation unobtainable; fluctuations of exchange more violent.

Nor has the Government's object been attained. For although there has been an occasional spasmodic clutch of the one-and-fourpenny rupee, this has been reached, not by the closure of the Mints, but by the suspension of Council drawings and increase of sterling debt; in other words, by augmenting the evil it sought to cure.

"H. F. B." then proceeds to illustrate the trade effects by various statistics and incidentally he has a passage of special interest to Ceylon readers:—

It seems to me that Mr. Leake has every reason for anxiety as to the future of his Ceylon tea trade. Fortunately for Ceylon and India they, so far, possess great advantages. They have superior quality, more concentrated and better cultivation, and honest manufacture. But who can say that, in the coming development of China, European methods may not be applied to tea enterprise there, if so, does any tea trader feel confident that—other things being thus equalised—he would be able to compete with his rival shipper in China at the present difference of sterling exchange, which is, I make out, about 6d. per rupee in favour of China.

The same argument applies to our Indian cotton yarn trade with China, which is now under serious check. Who can say whether, under this immense incumbrance of exchange, we may not only have to cease our export to China, but even suffer competition from a reversal of the trade current by imports of Shanghai yarn into India.

The indigo planters and other growers of produce in India also complain that they are suffering from the artificial rupee; but no doubt this point will be amply elucidated by the present Commission. It is unnecessary to demonstrate it to any practical trader.

There is only one way in which India can meet her liabilities—namely, out of the produce of her soil and manufactures—so that the first duty of the State should be to foster the Export trade. The majority of mercantile opinion in India recognised this, and the Mints were closed against emphatic protest.

He then shows the effect of the present policy on the balance of trade:—

Here is the analysis of the *Manchester Guardian* of 28th April:—

EXCESS OF EXPORTS, EXCLUSIVE OF TREASURE.		
1895-6	.. ..	R316,669,050
1896-7	.. ..	195,740,640
1897-8	.. ..	178,401,940

These are the official trade returns from April to January of the financial years quoted, and upon which that excellent authority comments as follows:—

"We showed recently that, at the end of the first eight months of the current fiscal year, the decline in the merchandise balance in favour of India since 1894-5 was nearly 40 per cent., and the decline in the net balance, including treasure, close upon 70

per cent. At the end of the ten months the position had become worse, the percentages of decline being about 44 per cent. and 71 1/4 per cent. respectively. Sir James Westland and Lord George Hamilton may not unreasonably be invited to give some attention to these impressive figures."

Next he comes to remedies :—

If, as is I think generally allowed, the artificial rupee has been inimical to India's prosperity; if the Mints ought to be re-opened, and exchange allowed to fall to its natural level; how, it will be asked, is the Government to meet the then increased rupee cost of its home remittances? I fear it may seem presumptuous to say so, but in this I do not see, and have never seen, any difficulty. The obvious course is surely that which is resorted to by all civilised Governments when in need—namely, to increase the Customs duties. I will now endeavour to show that this is perfectly feasible.

The Indian Finance Minister has budgeted for £16,000,000 Council Bill drawings for current year, at an exchange of 1s. 3 3/4d. per rupee. On this basis he estimates for a surplus of R8,914,000. Let us now suppose that the Mints were open, and exchange 4d. per rupee below Budget estimate—that is to say, 11 3/4d. instead of 1s 3 3/4d. per rupee—the extra rupee cost of the £16,000,000 home remittances would then be R87,826,321. How, then, to provide for this extra cost? Here is a rough estimate of ways and means :—

Extra cost of Home Remittances ..	R87,826,320
Do Compensation to the Services (?) .. .. .	2,500,000
	<hr/>
	R90,326,320
Less Amount budgeted for continuation of the Frontier War now ended ..	R14,815,000
	<hr/>
Net extra Revenue required ..	R75,511,320

PROVISION

Increase of Import Duties to 10 per cent.	R45,905,000
Duty on imported Yarns at 7 1/2 per cent.	1,881,525
Increase of Excise Duties on Indian Cotton Goods to 10 per cent. ..	
Excise Duty on Indian Yarn at 7 1/2 per cent.	7,031,250
Recovery of Opium Revenue ..	15,000,000
Seignorage on resumed Coining of Silver (as per last return) ..	1,604,000
Import Duty on Gold at 5 per cent. ..	2,225,000

R75,960,775

Thus leaving the Budget surplus untouched. If it be argued that my estimate of an 11 3/4d. exchange with open Mints may prove too high, I would reply that the foregoing suggestions of ways and means do not exhaust the possible provision.

And we cannot help quoting his defence of the proposed increase in taxation :—

INCREASE OF IMPORT DUTIES.—The objection taken to this will probably be upon the following grounds :—

1. Its divergence from our modern fiscal principles.
2. Its oppression upon an already overtaxed people.
3. Its injury to home manufacturing interests.

None of these objections can, in my opinion, be made good. (1.) In reply to academical objection on this ground, I would first of all point out that nearly one-half of the revenue of the United Kingdom is derived from Customs and Excise duties. Tea is taxed to the amount of about 40 per cent. of its value and tobacco to the amount of about 200 per cent. In India considerably less than one-fourth of the revenue is so raised.

When the import duties on cotton goods and yarn were remitted in 1873 and subsequent years, the sacrifice of revenue was commented upon as follows by that pre-eminent free-trader, Mr. Gladstone :—

"With regard to the remission of import duties, there seems to me to be something distinctly repugnant in the way it has been done in the time of India's distress and difficulty. . . . The Govern-

ment says he cannot see that financial difficulty can in any way be pleaded as a reason against what he calls fiscal reform. If that be a true principle of government, it has been discovered for the first time by the present Viceroy. There has not been a Free Trade Government in this or any country which has not fully admitted that the state of the revenue is an essential element in the consideration of the application even of the best principles free trade." I will call in one other authority to my aid, that of a distinguished Indian administrator, whom I am glad to see upon the present Committee. In 1886 Sir Charles Crosthwaite thus wrote in *The Times*:—"The [silver] question is purely one of taxation. The general effect upon the country is good, but the equilibrium of the Budget is upset. If no other remedy can be found, the re-imposition of the duties and taxes remitted in 1882 will probably be effective." If any Indian precedent be required it is afforded by the legislation of the post-Murphy period, when the Import duties were raised to 10 per cent. The financial urgency is greater now.

(2.) If an increase of import duties were to constitute a proportionate burden, or any burden at all, to the people of India, I would be the last to propose it. I think, however, I can show that, combined with a restoration of the currency to its natural condition, the effect would be not to increase the burden, but to lighten it. Upon this, in fact, my argument stands or falls. To ascertain this we must go back to the period prior to the closing of the Mints, and see what was the condition of the Indian ryot then, for that is the condition to which he would be restored by the re-opening of the Mints.

From this it will be seen that whilst then (as compared with fifteen years previously) paying 20 per cent. less for his imported necessities, the Indian ryot was obtaining 30 per cent. more for his produce. It is obvious, therefore, that he could well have afforded to pay the higher Import duties necessary to produce an equilibrium in the Budget; that such duties would have imposed upon him no undue burden, but would have merely taken from him a moderate and equitable portion of his increased earnings.

Finally, "H.F.B." feels sure that to save Indian Agriculture from further check, nothing will be efficacious save the re-opening of the Mints :—

The temporary stimulus now being given to the export of certain articles by war, and grain scarcity, will postpone, but cannot avert, the evil day. With sterling exchange in China at the equivalent of about 10d. per rupee, and in the South American Republics at about 1s. to 6 3/4d. per rupee, it is impossible to suppose that India (with a 1s. 4d. rupee) can compete in the export to gold standard countries of those articles which can be laid down by her rivals at such immense differences of cost in the selling markets. To re-open the Mints, and thus place India, as an exporting country, on equal terms with its rivals seems therefore not merely an advantage but a necessity for the Indian ryot, by which he would be recouped threefold for his contribution, in higher Import duties, to the necessities of the Government.

A duty on Imports is the least objectionable form of taxation in India, and, even on a larger scale than I have estimated, would be unnoticed and unknown to the bulk of the population. Moreover, it has the special advantage of bringing under contribution the Independent Native States, with a population of about 70 millions, whose pockets are otherwise so difficult to reach.

(3.) That home manufacturing interests would be injured by the measures I have proposed is, in my belief, a complete delusion. On the contrary, of all those who would be thereby affected none would probably benefit more than the Lancashire manufacturers. During the whole period of falling exchange, down to the closure of the Mints, it was a particularly noticeable feature that the Import trade on cotton goods increased *pari passu* with the Export trade. With the currency restored to its natural condition, the Indian consumer would be much better

able to buy his clothing at the then necessarily enhanced cost than he is now. Any measure designed to improve the condition of the Indian agriculturist ought to meet with the hearty support of Lancashire.

Upon the other items of my estimate it seems scarcely necessary to comment. An Excise duty on Indian-made cotton goods is already a recognised necessity. A similar, although rather smaller, duty on Indian spun yarns seems also equitable. The other items speak for themselves.

"H.F.B." is quite aware that the re-opening of the Indian Mints will have to be accomplished gradually, and without sudden convulsion to trade. This he thinks might be best effected by preliminary coining to a sufficient extent on Government account. As to keeping up silver, he thinks it possible that China may ere long have a silver currency of her own with open mints. As for the various schemes to keep up the rupee and introduce gold, "H.F.B." considers that these schemes resemble the attempt to produce sunshine out of cucumbers, which has never yet been accomplished!

THE OLDEST INDIA-RUBBER PLANTATION IN THE WORLD.

For the following translation of a Dutch Report on a Java Rubber plantation, we are indebted to *The Indian Forester* for May. Its contents are specially interesting to Ceylon planters at this time:—

The oldest Caoutchouc plantation in the world is perhaps one existing in the west of Java, in the province of Kranong. A former proprietor of the Pamanockan Tjassan Estate which is the biggest private property in Java, containing 540,000 Dutch acres, had most of his land under coffee until 1872. Finding the cultivation of this plant was no longer lucrative, he planted some of the land up with *Ficus elastica*. The coffee plantations had already been more or less cleared of forest growth, so that the planting of *Ficus elastica* cost less than thirty shillings per acre. The soil of these coffee gardens had become useless for other agricultural purposes; and had not *Ficus elastica* (Karet) been planted in time, would only have become covered with poor forest growth. The trees were planted 8½ yards apart, or 72 trees to the acre. The area planted was 72½ acres, containing 5,200 stems. The trees were first tapped when the plantation was 14 years old, and the yield for that and the six following years was:—

Year.	lb.	Average-oz per stem.	Value. £.
1886 ..	5,512	17	600
1887 ..	4,954	15	540
1888 ..	1,514	4	165
1890 ..	3,307	10	*360
1891 ..	6,113	18	387
1892 ..	5,992	18	256
1895 ..	3,197	10	411
Total ..	30,589	Average per year per stem 6 oz.	2,719

72½ acres thus, it is said, yielded in 7 years a surplus of £2,719, or per acre per annum £5-8-0. The yield was 71 lb. per acre per annum during this period. During the 23 years from the establishment of the plantation in 1872 till 1875 the net yield per acre per annum amounted to £1-12-10. A. H. BERRHOUT, late Consr. of Java Forests.

Wageningen, Holland, 6th Jan., 1898.

\* This note is taken from a report of the Netherland Indian Commercial Bank, in which the money results are called "net income," presumably after deducting the original cost of the planting operations.—*Translator*,

We cannot regard the above as a favourable yield from trees 14 years old: closer planting would probably give a better return per acre. It is noteworthy that the harvest fell off rather than increased during the 7 years recorded above. Far better and earlier returns can be got from Para rubber trees in Ceylon.

HOW TO PLANT THE NUTS OF THE COCO-PALM.

A question has been raised in far Fiji as to the best mode of planting coconuts. Hitherto the recognised mode has been by laying the nuts on their side or with the eye upwards: but an ex-Ceylon planter Mr. Griffiths(?) has turned up in Fiji who declares that the proper way is with the eye down and that the tree comes into bearing in half the time if the nuts are put in that way! We never heard of this practice and should like to know what Messrs W. H. Wright and W. Jardine have to say to it? We suspect they will agree with the experienced and shrewd coconut planter who writes:—

I always prefer laying the coconut on its side in the nursery, horizontally; and should say it is the best method for any district. The water in the nut keeps the eye moist, and facilitates the development of the germ; while if it is placed vertically, eye up, the eye dries and the germ may be sooner scorched in droughty weather. Besides, the nut may have to be planted out, too, erect, and then the base to resist wind &c. is less. Eye down is a system I never heard of, and to which there are obvious objections. The shoot has an unnatural twist, is more liable to submersion (and rot) in wet weather, and to attacks of rats, white ants and porcupines from immediate contact with the soil. I don't believe in it. I am quite content with the proportions of plants obtained by the horizontal system which further follows nature. The dropped nut lies on its side.

EXCHANGE AND TEA.

We direct attention to Mr. Leake's latest letter from the *Economist* given on page 54. While thanking our old friend for his cordial praise of our work as statist, we regret that he did not observe that our "Handbook and Directory" of 1896-7 was, so far as the Agricultural Review, which he quotes is concerned, only a reproduction of the edition of 1895-6. In other words, the passage he quotes:—"310,000 rising eventually to 350,000 acres" of tea for Ceylon was written in September 1895 and he will find it on page 168 of the 1895-6 edition. Our present statistical review of the situation will show that including native gardens and the clearings to be planted during this monsoon season, there are not fewer—probably more—than 370,000 acres of tea in Ceylon.

Mr. Leake is, however, quite right in his reply to the "East India Merchant" about Java and its coffee crops. Java suffered severely from coffee leaf disease and its crops tumbled down very seriously, although latterly there has been a revival due partly to the planting of the Liberian variety.

We need scarcely say how strongly we approve of the latter part of Mr. Leake's letter and appreciate his cogent demonstrations of the erroneous character of the arguments used by its opponents in *The Economist*.

## INDIAN vs. CEYLON TEA.

Reuter's Agent in Colombo writes:—"Replying to our query as to why Indian tea average is above Ceylon, our Head Office has obtained the following from some of the leading London brokers:—

"Messrs. Lloyd and Carter state that the average quality of Indian tea is better, and besides which more common tea is sent from Ceylon, and add, if it was plucked finer doubtless it would make a difference.—Messrs. Lloyd Matheson & Co. say that it is simply a question of supply and demand, Indian tea being naturally stronger than Ceylon, and therefore more suitable for mixing with the weaker kinds, for that reason commands a higher price.—Messrs. Stenning Inskipp & Co. say that the Indian tea has been of better quality and that the low-country teas sent from Ceylon have comprised many of a very poor quality, also adding that Ceylon tea is possibly not plucked fine enough and although they say perhaps the system of manufacture may have somewhat to do with it, yet of course the soil &c. are of great importance."

[There is nothing novel to our planters in the above information, although it is courteous of Reuter to collect the various opinions. Ceylon, as we all know, produces some of the finest and some of the poorest teas sent into the London market; and unfortunately rubbish is sometimes shipped that ought never to leave the island, if indeed it should not be burnt. —ED. T.A.]

### MAINTENANCE OF FERTILITY IN TEA SOILS.

(By M. KELWAY BAMBER, F.C.S.)

The question of manuring tea and restoring or conserving the normal fertility of original soils, both in India and Ceylon, is becoming more and more important as the available land for planting either diminishes in extent or increases in cost, and the supply of labour becomes more difficult to obtain, and the time must come when the planter's closest attention will have to be turned in that direction. There are no doubt many tea estates on which the soil is of practically inexhaustible fertility, and the tea plant on such areas will continue to give a good outturn so long as it remains in a healthy condition. But outturn is not everything, the quality of the leaf being of equal importance in determining the value of the tea, and it is more than probable that the quality in certain particulars would tend to diminish, even though quantity was maintained. This fact has, indeed, been noticed in many instances, and the reason for the deterioration can readily be understood when the complex nature and the many constituents of tea are considered. It must be remembered that tea differs from most crops in the fact that after the leaf is plucked or harvested, it has to undergo a process of manufacture entailing certain chemical changes or reaction between some of its constituents *inter se*, and others, involving the action of the oxygen of the air. Now it can be readily seen that a deficiency in the leaf of one or more of the constituents which undergo this chemical change must affect the finished product either by a loss of strength, colour, flavour, or any of the other characteristics which go to make up a tea of good quality. Such a deficiency may easily occur if a single one of its essential constituents is taken from the soil by prolonged plucking without being replaced artificially, and although the soil substance (mineral or organic) in question may be essential for the production of the particular compound in the leaf, its absence may be only of

minor importance in its effect upon the formation of the leaves or shoots as a whole, and consequently on the total outturn.

There are, however, many estates where the soils are of less depth, and more open and non-retentive in character, and it is these which will first demand attention if fertility is to be maintained. It is not sufficiently recognised that partial sterility of a soil may be produced by other means than merely removing the crop without replacing the constituents withdrawn, and this especially in a tropical climate, where the conditions of chemical and bacterial activity are at a maximum, and the rainfall also is unusually excessive. Under these agencies soil matter, whether mineral or organic, is more readily broken down and rendered soluble; in which state it is readily carried away by a heavy and continuous fall of rain, unless the soil has the property of absorbing and retaining the matter in solution, a peculiarity most wanting in open sandy soils, mainly owing to the absence of clayey and humus matter, which are the chief absorbents. This feature of sandy soils will have to be borne in mind, if waste of expensive and valuable material is to be prevented, and the application of concentrated easily soluble manures must be performed with due care. One of the most important factors to be considered relating to the manuring of tea, either in India or Ceylon is the cost of carriage from the source to the estate. As a general rule manures of any great value are not obtained locally, although in some districts where certain oil seeds form a staple crop, oilcakes are to be had of considerable feeding or manurial value. Cattle manure is also produced in quantity on some estates, but it is doubtful whether its direct application to tea is an unmixed blessing, as it is more than probable a fertile source of introducing certain diseases, fungoid or otherwise, to the tea plant, especially when the cattle producing it are obtaining the bulk of their fodder from the jungle, from which most, if not all, tea diseases have originated. The general absence of local manure, therefore, makes importation essential, and are as distances in those countries and freight charges are not particularly low, it is necessary to avoid as far as possible the carriage of large quantities of inert or useless material and at the same time only to apply those constituents, in which the particular soil in question is deficient, or otherwise stands in need.

We give Mr. Kelway-Bamber a hearty welcome to Ceylon where his name is widely known among the tea planters through the great circulation of his book on "The Chemistry and Agriculture of Tea" which has taken place through the agency of the *Observer* Office.

### TRADE IN THE OLD WORLD.

"The Early Commerce of Babylon with India." B James Kennedy, M.R.A.S. (London: Luzac and Co.)

The study of the history of commerce is a subject of the greatest interest and importance, for it was the merchant trader who was the first missionary of culture, and who established in the great centres of the human race, in past ages, exchanges not only of material, but of intellectual wealth. The history of civilisation is inseparably associated with trade intercourse between the various nations of antiquity, and a study of the subject proves beyond doubt the fact that peace has her victories as well as war. The establishment of a trade reciprocity with a distant land, which resulted in the exchange of commodities, the introduction of a common system of writing, and a mutual medium of monetary exchange, which could only be effected by the trader, was a victory far more extensive and lasting in its benefit to humanity than the conquest of a capital and the deportation of thousands of captives.

The wonderful discovery of recent years in such seats of early culture as Egypt and Chaldea and Arabia have restored to us a vast amount of material with which we can construct the early chapters of commercial history, and in this carefully-written pamphlet the author affords a most concise *resumé* of the facts now ascertained. The quest on of the period when trade intercourse was established between India, the Far East, and Babylon, is a subject which has attracted many scholars. Lassen Harren formerly studied the subject from the Indian side, while De Lacouperie and Hewitt have availed themselves of recent discoveries in Western Asia.

The author deals first with the early trade of the Egyptians, Babylonians and Arabs, and shows that it could not embrace India; he also treats most exhaustively of the overland trade in the ninth century of the Christian era, which shows by the discoveries of the representation of the elephant, of Indian apes, a rhinoceros, and Bactrian camels, found on Assyrian sculptures, that there was a trade over the Hindu Kush and by the Bayazid Pass, in North-East Armenia. Whether this represents a trade intercourse of any lengthy duration is doubtful, and it must be borne in mind that all traces of Western Asiatic influence in India are most clearly Babylonian, and not Assyrian, and must be assigned to the period of the New Babylonian Empire, that is, subsequent to B.C. 700. The third section of the work deals with gradual growth of a trade not only with India, but also China, from the shores of the Persian Gulf, the foundation of which was due to the large naval flotilla established on the Persian Gulf in B.C. 695. This fleet was built for the Assyrian King by Phœnicians working on the Upper Euphrates, and manned by Tyrians, Sidonians, and Cypriote Greeks. It successfully broke up the pirate nests on the east shores of the Persian Gulf, and returned to the mouth of the two rivers, but afterwards not a mention of its existence is found in the inscriptions, while as it was quite new it is hardly likely to have been destroyed. In B.C. 675-670, a coinage was introduced into China by traders from Lang-ya in the Far West, who settled on the Gulf of Kiaotchou, in the South Shantung Peninsula. The currency took the form of bronze knives, but of a standard exactly uniform with the Babylonian. Later, in B.C. 613-590, Tehwang, King of Tsu, issued two sizes of small bean-shaped coins again on the Babylonian tariff, and inscribed them with their weights. At that period the Babylonians were in the habit of using small pieces of silver, but payment was still by weight. In the time of Darius, earliest date B.C. 521, the silver shekel was punched for "giving and receiving," and later a device was embossed on them. Thus in B.C. 521 we have a contract which says a payment of "half a maneh of pure silver (ingot), and half a maneh fifty shekels by one shekel piece stamped." These do not appear to have been a State coinage, but issued by private firms, and several kinds are specified, and one mint, which marked its coins with a "bird's-tail plant," seems to have been regarded as spurious. In the main then they resembled the non-Hellenic coinage, punched on one side and not inscribed, but appear to have been as far as possible of uniform weight.

We have seen how shortly prior to this stamped silver tokens corresponding to the Chaldean maneh standard were coined in China, and Mr. Kennedy points out that in just such a system of private minting we have the origin

of the Indian *puranas*. They could not have borrowed them from the Arabs, and in their rude and uninscribed form they resemble the pre-Hellenic and not the Greek coinage, which was afterwards copied.

In dealing with the commodities imported, the author, like all former writers, has to deal with "peacocks" of Solomon, and the sandal wood, and his remarks are of great value, as showing that if the usual identifications of the Hebrew Tuki with Tamil Toge holds good, the passage must be late. The LXX. know nothing of either. On this trade the recent discoveries in Arabia and South Chaldea throw great light. Ophir has been generally regarded as Abhira at the mouth of the Indus, but Hommel and Glaser's discoveries seem rather to point to the Apir of the Chaldean inscriptions, which was the east shore of the Persian Gulf. Here as early as B.C. 800 were settled a powerful tribe, who were certainly mariners. Here the land would be, as in Genesis (x. 29.) opposite to the Arabian trading stations. It is, moreover, the very district near the Karun from which the converted fleet of the Assyrians would start. This may then have become the depot of Indian trade when it commenced. The author now quotes the Indian folk tale known as the *Bavern* or *Baviln-Iataka*, compiled about B.C. 400, but probably much older, which describes how certain traders brought first a crow and then a peacock to Baviln in their ships and sold them for a fabulous price. This would seem certainly to fall in with the evidence we have referred to, and would show that a depot for Indian trade was in existence on the east shore of the Persian Gulf shortly after B.C. 700. With regard to gold there is no difficulty, as alluvial gold is found on both sides of the Persian Gulf. Rice was known under its Tamil name, *arisi*, the Greek *oruz*a, in the time of Sophocles, and the peacock to Aristophanes. It would seem that Mr. Kennedy has made out a strong case, and added a new and important chapter to the history of commerce.

One word, in conclusion, must be said as to overland trade with India and Central Asia—it existed much earlier than the author suggests. The number of jade axes found in Babylonia is considerable, and all of them in buildings of the "Tower builders" of Ur and Nippur, which would point to a connection with Central Asia; and the jade axe found by Dr. Peters was found in the centre of the Tower of Ur-Gur. Bactrian lapis-lazuli was found as early as B.C. 1500. The Bakk tribes, or the so-called "hundred families," left their home on the western side of the Tigris about B.C. 3000-2500, and made their way to the north-east, entering China about B.C. 2300. They took with them a great legacy of culture, and it seems very doubtful if the route suddenly became closed. However, the subject is a wide one, and each day brings to light fresh discoveries as to the nature and extent of this old-world trade.—*Daily Chronicle*, May 17.

## THE FLORIDA VELVET BEAN.

[TO THE EDITOR OF THE "SPECTATOR."]

SIR,—I send you herewith a sample of the new Florida product,—the wonderful velvet bean. Up to two years ago it was grown here in a limited way, mainly as a trellis shade, but afterward it became recognised as invaluable for all kinds of stock as a forage, and a phenomenal fertiliser for orange and

other fruit trees, and for the soil as well, until it is now grown in large quantities. There is nothing yet discovered that is, all in all, so valuable a crop as this for farmers to raise. It being an air plant, it will do well in most any kind of soil, in any of the States, north or south, that will grow corn, and no fertilising is necessary. The forage—the foliage and vine—coming from this bean is a marvel and a wonder. Planting in rows 4 feet apart will produce a solid mass of vine and foliage, up to your waist in height, covering the ground completely, and yielding leaf, vine, and fruit, aggregating four to five tons to the acre, and of dry beans twenty to thirty bushels. Besides the vine being a valuable fertiliser, forage, mulch, and shade, the question will be asked, "Is it also prolific in fruit?" The answer is "Yes, emphatically so." From the hill the vines run out in all directions like the water-melon, 10 ft. to 20 ft. It commences to fruit at the hill in clusters like the raisin-grape thence along the entire length of the vines at intervals of 10 in to 20 in. pods in clusters of from two to twenty appear. Therefore the fruitage must be immense. For twenty years this bean has had a home in Florida, and has been known among the people as "the climber." In good rich soil it will climb 50 ft. to 60 ft., blooming and fruiting all the way up,—a most beautiful and lovely sight to look upon. To drill an acre will take sixteen quarts of seed; to plant an acre in rows 4 ft. apart each way, about twelve quarts. In good soil this acre will produce four to five tons of green forage, and fifteen to seventeen hundred pounds of beans. I speak from practical knowledge, as I have recently harvested nineteen acres of as fine a crop as ever grew.

Plant seed in spring the same time as you do corn, and cultivate and treat in same way, until vine begins to fill the row, then lay by for the season. When bean is ripe in the fall pick it, then turn mass of dry leaf and vine under for fertiliser, and from this your soil is immensely benefited. It is a good idea to drill or plant corn right in with bean seed as a partial support to vine, to keep pods off the ground. You can turn stock into bean field if you wish, or cut vines up at hill and carry out to stock, latter being advisable. If planted in orange grove or orchard, keep 5 ft or more away from trees, as vine is a rampant grower and climber, and will cause you bother. Experience has shown that it is better to drill than to plant in hills, as by drilling you get a better stand on the ground, and that is important. The beans ground up, hulls and all, make a fine fertiliser of pine-apples, orange, and other fruit trees, as well as for all vegetable growth. Stock of all kinds like it, as well as the green forage early in the season, and all do specially well on it. Every living thing on the farm will eat the green forage and dry bean with greediness. The dry bean is also fit for table use. The question is often asked if this newcomer—the Florida velvet bean—will do well in any other section of our country except Florida. I answer by saying there is no earthly reason why it will not, as it is not tropical, and will do well wherever corn will grow. After having made a thorough test of it, I have come to the conclusion that, as a fertiliser, forage feed, mulch shade, a prolific bearer of fruit, an up-builder of the soil, this bean has no rival. As a porch and trellis-shade, with its beautiful dark-green foliage, and its long, pendant, down-hanging purple bloom, it is truly lovely. The analysis of this bean shows:—Nitrogen, 54 per cent.; crude protein, 19; fat, 6; fibre, 8; moisture, 12. Any further information your readers may want, if they will send stamp, I will cheerfully reply.—I am, Sir, &c.,

Captain E. A. WILSON.

Orlando, Florida.

P.S.—If you desire to say, for the benefit and information of your many readers, that this seed may be obtained in your city of John Shaw and Sons, 5 Great Maze Pond, Borough, you are at liberty to do so.

## CEYLON TEAS SELLING AT 2½d. PER LB.

### CAN THE RUBBISH BE IDENTIFIED?

[Well may an old Ceylon planter in London ask 'What Estate' in reference to the following:—]

Tea-drinkers will be surprised to learn that in Mincing-lane the Ceylon leaves from which their favourite beverage is brewed has been sold at the fabulously low sum of 2½d per lb. This is probably a record price for tea, and it has caused a great deal of indignation among the planters in the island of the "spicy breezes," who declare that the stuff thus sold can be little better than rubbish, and is calculated to bring the products of Ceylon, and India generally, into disrepute. It would be interesting to know how much per pound the public were asked to pay for the article, or how much a cup they gave for the water in which it had been steeped for a certain time—*Daily Telegraph*, May 21.

## EXCHANGE AND TEA.

TO THE EDITOR OF THE ECONOMIST.

SIR,—If your correspondent "East India Merchant" will refer to page 168 of "Ferguson's Ceylon Directory, 1896-7," the latest issue of the work, he will find given as a "rough estimate of the entire area cultivated" in tea in Ceylon 310,000 acres, with a "probable eventual extension to" 350,000 acres. In another part of the book 315,000 acres are mentioned as possibly the acreage. I have inquired from Messrs. Kelly & Co., whence they got their figures of 375,000 acres: it came, as might have been foretold, from Mr. Ferguson, the sole first-hand authority on this matter, and I can hardly doubt that there has been some misreading of 375,000 for 315,000 acres. To anyone who knows Ceylon the statement put forward that 90,000 acres of tea had been planted in the last three years needed no contradiction.

Now, as to Java, "East India Merchant" says, "Java had no coffee blight." If he will refer to Ferguson's Directory, 1893, he will read at p. 174, "The coffee fungus (*Hemileia vastatrix*), which has wrought so much injury in Ceylon, India, and Java, reducing their coffee crops so grievously by from 50 to (in the case of Ceylon) over 90 per cent., has only been casually reported from the Far West..... Already alternate crops, a very poor one followed by a better, which became the rule in Ceylon and Java in the fungus era, have become to operate in Brazil." "East India Merchant" further gives us the exports of coffee from Java in 1883 as 515,000 piculs. This seems to have been the total figure for that year from Java and its dependencies. He does not mention that in 1883 the exports amounted to 1,767,000 piculs (see Ferguson's Directory, 1893, p. 175), the difference between the two years being a greater weight of coffee than ever was exported in one year from Ceylon.

The rest of "East India Merchant's" letter teems with mistakes of the same kind, but it is not my duty to correct them.

I wish, however, to say a few words in the charge that he brings against tea growers of paying "their coolies in depreciated rupees." The charge is a false one. If the fact that the Tamil coolies have themselves of their own free will flocked to Ceylon in constantly increasing numbers as the gold price of the rupee has fallen be not considered a sufficient proof of this, abundant corroborative evidence is to be found in the index numbers, which show beyond question that up to 1893 the silver rupee has lost none of its purchasing powers of all the necessities of life. On this point the Calcutta index numbers, shown in the Review of the Trade of India, 1896-97, I under-

stand, agree closely with the Index numbers, issued here by Mr. Sauerbeck. Let us assume, however, that "a wrong is being done to" the coolies, a wrong "of which they are not aware," who is it that is profiting by the wrong? Who is the receiver of these stolen goods? Certainly not the tea grower, for he has to sell more tea to get his hard earned rupee. No! the real criminal is the tea drinker with a fixed gold salary or pension, the British working man with his living wage fixed in gold, these are the people who have gone off with the spoil in the form of that cheap and good beyond experience. I can only hardly believe that they are as thankless for benefits received as "East India Merchant's" would make out.

And this brings me to the economic adjustment, the fall in the cost of labour, to which Mr. Harcourt Skrine looks forward under a gold standard. How does recent experience bear on this? The rupee, as we have seen has for years been an absolutely stable measure of the value of Eastern labour, up to 1893 it had been a fairly stable measure of value of all the chief commodities, yet we have had the daily pay of the English working man rising steadily from about R2 to nearly R4. This gold pay has, if anything, increased. This change (for it is a change) has been going on for a quarter of a century, and we still wait for any symptom of the economic adjustment.

I come now to Lord Farrer's latest question. To those who have read my last letter with any care, it can hardly present any difficulty. It is within my own personal experience that the rupee has been as high as 2s 2d at the time of the cotton famine, and as low almost as 1s some three years back. The coolie's daily wage has been at its highest nearly 9d, at its lowest a little above 4d. This is all matter of history; but in what sense it is to be considered, as Lord Farrer states the "necessary consequence" of "the action of the Indian Government" in forcibly driving the rupee to 1s 4d, I can hardly say. The position thus taken up by his Lordship seems to bear a strong family resemblance to that other position to which, he assures me, he holds that big crops from land planted before the closing of the Indian mints are good evidence as to the effects on the trade of the 1s 4d rupee established in January last.

If Lord Farrer means seriously to argue that the effects on the trade of a change in the gold value of the rupee by reason of a forced contraction of the currency will be similar in all respects to the effects of a change due solely to the fall in the gold value of the silver in the coin, I can only say that I differ from him, and that the argument seems so superficial as to be hardly worthy of so high an authority.

I have done with my merchant's "nonsense." The impression left on my mind by this correspondence is this: From those who approach these currency questions, attributing to either one standard or the other a special fixity, who cannot think of values indifferently and with equal ease in silver or in gold, it is hopeless to look for a right judgment. As well might one have sought from Galileo's Inquisitors, with their firm faith in the fixity of the earth, a right solution of the motions of the heavenly bodies.—Yours faithfully,

WM. MARTIN LEAKE, Secretary.

Ceylon Association in London,  
61 and 62, Gracechurch-street, May 18th, 1898.

#### EXCHANGE AND CURRENCY.

We feel it an honour that Lord Farrer should send direct to the *Ceylon Observer*, his views in reference to the effect on the ryots and coolies of what he calls "a depreciated currency." His lordship's letter in another column will be read with interest and attention. We may clear the ground in the first place, we think, by pointing out that, however we may differ about the effect of a silver currency, Lord Farrer is, like ourselves, a staunch monomet-

allist. From all his past writings, we infer that he could have nothing to do with putting any bimetallic theory into practice. We are, therefore, shut up to the belief that failing an honest and reliable "gold standard," Lord Farrer would vote for silver—in other words, an "honest" rupee—currency for India and Ceylon. Of course Lord Farrer may differ from Sir Robert Giffen (who has sent another able explanatory letter to the London *Times* which we reproduce elsewhere) as to the feasibility of introducing a gold standard at this time into India. His lordship, for aught we know, may favour the "Lindsay" or some other scheme for supplying a gold currency without incurring the full responsibility usually attached to the substitution of a gold for a silver standard. But we cannot suppose that Lord Farrer favours the practice of the Indian authorities in establishing an "artificial" rupee and depleting the country of its currency to an extent that has seriously hampered trade and prejudiced not only the producers but all classes of the community? For the present we take it that Lord Farrer favours "gold" instead of "silver"; but that failing gold—as impracticable which, following Sir Robert Giffen, we believe it to be,—he would not oppose the re-establishment of the old silver currency to which India has been so long accustomed, rather than any bimetallic or paper compromise?

Having thus indicated, as we trust correctly, how far we see, eye to eye, we now proceed to deal with Lord Farrer's objections to a "depreciated," or as we prefer to call it, an "honest" silver currency in India and Ceylon. In the first place we think Lord Farrer would alter his view if he paid a visit himself to India and Ceylon and studied the subject in one or two of the great native, or planting, producing centres. The millions of Indian ryots know and care nothing about "exchange" or the complications of the British Government in reference to its sterling loans and remittances. But they do prize their "rupee" currency and self-contained as their districts so largely are, we feel sure that no one could ever make them believe otherwise than that the more rupees they got for their marketable produce, the better off they were in every material respect. As a matter of fact, it is generally acknowledged that never were the Indian ryots so prosperous as previous to the closing of the mints in 1893. The same thing applies to our Indian coolies in Ceylon. Ignorant as these Tamils are, they are wonderfully shrewd wherever their own or their employers' monetary interests are concerned. During the latter half of the fifty years' reign of "coffee" in Ceylon, it was quite interesting to learn how the coolies on the plantations talked among themselves of the prospect of a good crop, and spread the news to their homes in Southern India, to encourage friends and relatives to come over to share in the benefits to them of the rich harvest of work which a full crop meant. Now the same thing is true in the "tea" era as regards the prosperity of the employer and the coolie being largely identical—the more rupees the former gets for the tea leaf crop, the more he can afford to spend through Ramasamy, on better cultivation, on extra work, on plucking a full return of crop that is in profitable demand, and the more liberal he can afford to be in respect of the issue of rice which is often supplied at a rate below cost price. But when rupees are scarce, and the planters' profit

dwindles to vanishing point, it stands to reason that less onlay on cultivation, short work all round, and a keen scrutiny as to the issue and "loss" on rice, becomes the rule. It is, in fact, difficult to apply the hard and fast rules of political economy to the cooly system—patriarchal and with "a give and take" aspect as it is found in the Planting Industry of Ceylon. But let Lord Farrer understand that unlike Assam and Northern India generally, here there are no "indentured" cooly labourers, all come and go between Ceylon and Southern India and take service in companies of relatives or village friends and acquaintances under the guidance of headmen of their own choosing and are free to leave after a month's notice or it wages remain unpaid beyond a certain date. Anglo-Indian officials in the Madras Presidency have repeatedly borne testimony to the great benefit conferred on their people and districts by the Ceylon Planting Enterprise. But this may be considered a little beside the mark, although our main contention is that the coolies themselves if questioned would be the first to say 'the more rupees our masters get for their crops, the more earnings we likely to make, and certainly the more rupees we handle, the better off we are.' So also, will say the Sinhalese and Tamil owners in Ceylon of coconuts, cinnamon, citronella, plumbago and other exportable goods. Not all the political economists in the world can persuade the Ceylonese "ryots," if we may apply the term, out of the opinion that the more rupees they handle in return for their saleable produce, the better off they are. "Europe-goods" are, in the main, luxuries rather than necessities to the vast mass of producers in India and Ceylon. Their staple food is produced in the country and give them an abundant rupee currency, and we can assure Lord Farrer, they will be not only contented but able to rejoice in renewed prosperity. They will not care how much the Indian import duties may be raised to meet the requirement of the "Raja's" exchange necessities, even if they find their luxuries in fine or gaudy cloths, ornaments, umbrellas, &c. &c., costing them a little more. If there could be a plebiscite of the people of India and Ceylon, there is not the least doubt that 999 out of every 1,000 would vote for the currency that would make the rupee plentiful in the country, no matter what the foreign or exchange value of the said rupee might be.

#### PRODUCE AND PLANTING.

**NEW SEASON'S CHINA TEAS.**—Commenting on the character and extent of the new tea crops in the "Flowery Land" for 1898-99 the *Grocer* says: "Most parties agree in stating that, so far as is at present known, the entire crop promises to be larger than in 1897-8, which is satisfactory, as in previous years there has been a heavy falling off in the production of China tea. This is proved by the fact that in 1897-98 the total crop did not yield more than about 582,000 half-chests, as contrasted with 640,000 half-chests in 1896-97, and 811,000 half-chests in 1895-96. It is, however, too plain that if the new crops of China tea do turn out well the full benefit to be derived from this fact will not be enjoyed by the British consumers, but rather by the foreigners who prefer that kind of tea to any other. Thus it is that, whilst the agents acting for English firms are simply looking on there, the Russian buyers at Hankow are actively securing all the best supplies as they arrive, and a good business is being done on their account, whereas last year they operated very cautiously at the outset. As evidence of the diminished rate of consumption of China tea in this country, it may be mentioned that the deliveries for home use during the

first four months of 1898 have been only 5,127,950 lb. against 6,190,180 lb. in the same period of 1897, and 6,535,300 in 1896. Singularly enough, the quantity of China tea exported from the United Kingdom in the four months ended April 30 last comprised 5,812,940 lb. or 684,950 lb. more than the amount consumed in these isles; but the foregoing total of 5,812,940 lb. was lighter than those pertaining to 1897 and 1896, when in the four months 6,038,366 lb. and 6,149,922 lb. respectively of China tea were shipped hence to foreign parts. The exports of all other kinds of tea together (Indian, Ceylon, &c.) to date did not embrace above 6,466,520 lb. in comparison with 5,583,710 lb. and 4,048,150 lb. in the two preceding years, showing that China tea, in this respect at least, takes the lead with shippers to the Continent and elsewhere.

**THE OUTLOOK.**—The new season opens with a London stock of old Congou, one of the smallest that has ever been seen, it having been at the end of last month only 6,778,650 lb. as opposed to 8,101,750 lb in 1897, and 13,691,350 lb in 1896; and with this deficiency in the available supply on hand, there is a corresponding poorness in the assortment on offer. Such being the statistical position of China tea, there is some reason to hope that, when the coming arrivals of new Monings and Kaisows appear on the market here, they will meet with a better reception, both from the dealers and exporters, than they did last year, and so impart a healthier tone to the trade all round. A similar feeling of hopefulness was expressed in May, 1897, when there was a good deal of talk about "machine-made" tea as a novelty in Chinese manufacture, and of the possibility of its taking the place of Indian and Ceylon, where delicacy of flavour, united with a little pungency, was an essential condition with the purchaser. Yet it was not the success anticipated, and the chief manufacturers at Poochow suffered losses of 3d to 4d per lb on the red leaf teas sent to London. The truth is the home trade did not take very kindly to them, not liking to try the experiment of them in their usual blends, for fear they should not exactly please the tastes of their customers; and, worse than all, exporters would hardly look at the teas turned out under the new process. But, notwithstanding these reverses, the makers of these teas have no intention of giving up their enterprise, from a conviction that they are an undoubted improvement on the old style, as the teas are much admired by some tasters and drinkers for being thick, strong, and full of delicate aroma—a flavour which is greatly esteemed by consumers of a more fastidious class. When more widely known and appreciated, it is possible that China teas produced from the machine will find their way more freely into consumption.

**THE COFFEE TRADE IN AMERICA.**—East India coffee is not popular in America, and for this reason Sumatra coffee and Mocha coffee are worth more than is warranted by their intrinsic value. Coffee dealers say that fine Central American or other mild growth costing 8d to 10d per lb will roast better and make a more satisfactory beverage than East India coffee costing 1s to 1s 3d per lb. The market ranges from 3d to 1s 3d per lb for the raw bean. The roasted bean retails anywhere from 4½d to 1s 10d per lb. The result is the greatest variation in retail cost, and a chance for the shrewd buyer to make use of the prejudice of consumers for Java, or Java and Mocha blended, to sell them some other sort for these favourite growths. Indian tea has been popularised in America at a considerable cost, but it would not, we fear, pay to try a similar experiment with Indian coffee.—*H. and C Mail*, May 27.

A BRAZILIAN COFFEE-PLANTING EXPERT delivered a lecture, this month, at Amsterdam, on coffee-growing in Brazil, and dwelt upon the fact that Brazil furnished nearly sixty per cent. of the world's coffee output.—*Indian Planters' Gazette*, June 4.

## COLOMBO HORTICULTURAL SHOW.

## THE SHOW AND ITS LESSONS.

The utility of Exhibitions of produce is a well-worn subject; and we certainly cannot take blame to ourselves for having failed to press it on the attention of the public and the Government. While we do not pretend that our efforts and the efforts of those who think with us, on behalf of Agricultural Shows have altogether failed, we yet consider that a great deal, a very great deal, remains to be done. Colombo was, for a long time, the only centre of population in which Agri-Horticultural Shows—with the most elastic interpretation of the poly-syllabic description—were held; and although the stranger wondered at the connection of the interesting animals, pottery, baskets, jewels and all manner of curios that were exhibited, with agriculture and horticulture, visitors, whether foreign or indigenous, were greatly interested in, if not always instructed by, the variety and richness of the display. Perhaps no Government Agent was ever more eager in organizing and promoting Agri-Horticultural Shows than Sir Charles Peter Layard—himself an enthusiastic horticulturist, lover of animals and collector of curios; and it may not be amiss to inform the modern official that the then veteran Nestor of the Civil Service, found time and opportunity to organize these Shows when the burden of the undivided Western Province (including Sabaragamuwa) was on his shoulders, when Kalutara and Negombo had no resident Assistant Agents, and even when the Colombo Municipality was under his direct charge. After his retirement, the recurrence of Shows was more fitful; and the last that was organized, after a very long interval, was in 1891, shortly after Mr. A. R. Dawson had assumed the administration of the Province. That Show was a great success, both for extent and variety; but the provoking delay that occurred in the distribution of medals after they were awarded—was it not more than a year?—left a very bad impression on the minds of Exhibitors. Possibly, it was the memory of that disappointment which rendered the Agent of the Province unwilling to promote another Show during the years that intervened; and probably the same reason operated to make the organizers of the Fruit and Flower Show just concluded, attempt a revival only on a modest scale. Whatever the original intention, however, the gradual growth of the venture was a most pleasing feature; while the consummation was not only far beyond the original conception, but, we feel sure, was also greatly in advance of the general expectation. And for this, the highest praise is due to the Sub-Committee of management, and especially to Sir F. R. Saunders, whose large experience, local knowledge and well-known tact singled him out as the best possible chairman and to Messrs. W. E. Davidson and C. Drieberg, whose enthusiasm imposed on them an amount of work which must have taxed their energies to the utmost, but to which they showed themselves quite equal. Nor must we omit in our commendations and congratulations for the splendid success of the Show, the two ladies,—Miss Ellis and Miss Taylor,—who more than justified the new departure of having the fair sex represented on the Executive Committee of a Colombo Show.

Now, the very success of the Fruit and Flower Show just concluded, supplies a rebuke to those—we do not name names: let those whom the cap fits wear it!—who have allowed years to elapse without an Exhibition in Colombo. We referred at the outset to the success which has attended the efforts of our advocacy of Shows; but this success has been secured outside the capital. While Assistant Agents have vied with each other in promoting Shows, and Kegalla, Matale, Matara, and especially Nuwara Eliya have entered the lists, to the reproach of capitals of Provinces, and even somnolent Kandy has roused itself to a Show or two,—Colombo has lagged behind. The metropolis has in fact of late years set the rest of the Island a bad example, which has almost nullified the service it rendered in originally pointing the way in the organization of Shows. We need not labour to prove that Agricultural Shows, if they are to serve their primary and most obvious object of promoting agriculture by healthy competition, must occur at regular intervals, annually by preference, so that exhibitors under the stimulus of success and the disappointment of defeat, may put forth their best efforts to excel. Competition at irregular intervals chills enthusiasm, and tends to make one forget the lessons both of success and failure; while spasmodic Shows further mean generally the denial of sufficient time to prepare for the competition. It is impossible, with only three or four months' notice, to specially grow most of the fruits, vegetables, flowers and general products for which prizes are offered; and mere chance exhibits, even if they win a prize, scarcely teach the needed lesson. We do not dispute, or under-rate, the social aspects of friendly competition and the advantages attendant on the gathering, under one roof, of men and women of different nationalities, in preparation, in exhibition, in judging, and in enjoyment of the profusion and beauty of the treasures which our beautiful Island yields; but the primary object in view is not social, but economical, industrial and educational. We trust therefore, that Sir Frederick Saunders will call together the influential Committee under whose auspices the Show was inaugurated and decide at once on the revival of the Agri-Horticultural Society, or on the formation of a kindred Society for the holding of a Fruit and Flower Show annually in Colombo.

Let this, then, be the first lesson of the Show, namely, that Shows should be held once a year in Colombo. Hitherto, we fancy, one of the chief obstacles to an annual Show has been the cost, a large share of which, in the shape of buildings and decorations, had to be borne by Mudaliyars and other chief Headmen. We are by no means favourable to the exaction of such services from Headmen because they render them uncomplainingly. They are not all wealthy; the official salary of none of them is specially generous; and it is not right to place obligations on Headmen which either involve them in serious expense, or tempt them to place those under their influence under contribution. They may cheerfully enough assist in decorations, &c. on a great public occasion; but Shows, we maintain, once properly organised, can be run so as to pay their way, or at most to call for a subscription of a guinea or so a year from Colombo and upcountry residents who will gladly give what is needed. In this view, the idea of holding the Show in the School of

Agriculture was a happy one; and we trust it may be possible to continue them annually in the same place—*annexes* being provided, if necessary.

The second lesson is, we think, that June is not always the best month for a Show. Let experience decide between May, June and July for the best specimens of fruits and flowers.

The third lesson is that the programme be drawn up and published for the next Show immediately; and in future whenever a Show is concluded; or at the very least in the present case six months before the date fixed. This will enable real and healthy competition, by the selection of seed, the application of manures, &c.

The fourth lesson is that, as regards some articles at least, competition be restricted to the *bona fide* producer, whether the *goiya* growing his own vegetables and fruits, or the estate cultivating its special products. It would not be difficult to get together a most interesting collection of fruits from the Municipal market; but to award a silver medal to the most skilful in picking up the fruits of other men's labours is not the proper way to encourage the agriculturist and the horticulturist.

Then, it may be a question whether competition, in some articles, such as coconuts, should not be confined to the Province, and to the *bona fide* products of one estate. In our last Thursday's issue, we noted Mr. Wright's failure to secure a medal for his splendid coconuts. Had the prize been offered for the best commercial specimens, he would probably have been the winner; but the Judges had before them two beautiful collections which, for variety, could hardly be excelled, while they included nuts of undoubted high commercial value. We are assured the Judges did not overlook Mr. Wright's exhibit; but awarded it a special certificate of merit, pointedly commending the exceptional thinness of husk, and the relation which the nut bore to the unhusked fruit. Still, the competition between the produce of one estate, and that of perhaps a dozen from different parts of the island, was not in our opinion, quite fair.

#### LANTANA AND ITS INSECT (COCCUS) ENEMY.

We direct attention to the letter of Mr. Shelton Agar. Travelling by rail the other day between Nawalapitiya and Gampola, we failed to observe any difference in the lantana; but we suppose it requires closer observation and is worse on the Kandy side? We certainly think not a day should be lost in asking the Director of the Botanic Gardens with the Hon. Entomologist to examine and report on the pest. A coccus or bug is quite within the purview of Mr. E. E. Green who will no doubt be able to tell us all about the Lantana enemy. We should think if the Chairman, P.A., communicated with His Excellency's Private Secretary, that the needful order would at once be given, in a matter so clearly *pro bono publico*.

#### COCONUT PLANTING AND CATTLE FEEDING IN FIJI.

The following information arising out of the enquiry how to plant coconuts, is of interest:—

"The enclosed from an old friend of mine in Fiji, who has one of the largest and best coco-

nut estates in the group, will I am sure interest you and you may be able to answer his questions. I am not well up enough in coconut planting to tell him whether Mr. Griffiths (by the bye do you know the gentleman and is he an authority on nuts?) is right in saying that coconuts should be planted with the eyes in the ground, but if by doing so they bear 12 months earlier than they would if planted any other way of course it's a great thing to know. I have generally seen them planted on their sides either flat or slanting, but I cannot remember them being planted as Mr. G says they should be. My friend's plantation has a large sea frontage and of a gradual slope back. Fine volcanic soil and parts of it full of scoria. Most of the estate is laid out in paddocks with stone walls and Mr. — has a large and fine herd of cattle always on the place. As soon as his stock is three years or so old and fat, he sells them to the butchers. The price a good many years ago was £8 to £10 a head, but now £4 10s to £5 for beasts above 450 to 550 lb. is the price. The biggest butchers there have a cold storage room and get meat from the other Colonies at cheap rates, which has had something to do in reducing price of cattle. Besides this, a great many coconut planters, who could afford to buy cattle have gone in for breeding and the butchers themselves have leased several places to run and fatten stock on, so decent, fat cattle are generally readily procurable. The stock all originally came from Australia or New Zealand and thrive well in Fiji, where the climate is good and there are no leeches or ticks. The cattle just roam about and no shelter is provided. Bulls for keeping up and improving the breed are being constantly imported. Sheep thrive fairly well in the drier parts of the group."

The Fiji estate referred to with 2,000 acres more or less, planted with coconut palms is a big concern.—We cannot recall any Mr. Griffiths as a coconut planter or authority in Ceylon.

PLANTING IN VENEZUELA.—In the report of the British Consul at Caracas it is stated that agriculture, the principal source of the riches of this Republic, has hitherto received little or no attention except that which was required to gather the crops. The coffee estates number about 33,000, and those of cocoa 5,000. These two products, coffee and cocoa, were most cultivated because they commanded good prices during the last fifteen years, but as the prices received in 1897 hardly cover the cost of production, the serious attention of agriculturists has been aroused, and they are beginning to see that if they do not turn to some other products which have greater demand and better prices, or if they do not by improved methods increase the production and lower the expenses, their fate is sealed. Numerous agricultural clubs have been founded, and are endeavouring to arouse the planters to a sense of the benefits that would accrue to them by the application of scientific methods in manuring, irrigating, &c., and in the use of improved machinery in all the processes of preparing the produce for the market. Lately, a Superior Board of Agriculture has been formed, with the President of the Republic at its head, and its object is to study and report on agricultural teaching, technical and practical, on agricultural institution immigration, &c., and, in fact, on everything relating to the cultivation of the soil. Beneficial results are expected through this institution.—*H. & C. Mail*, June 3.

Gow, Wilson & Stanton's Report.

Teas marked thus \* are New Seasons.

TEA REGULATION IN AMERICA.

A modification of the tea regulations has been promulgated at the Treasury Department. Notice is given to collectors and other customs officers that whenever Japan teas shall be imported hereafter, so made up as to imitate the green teas of China, examiners shall compare such teas with the pan-fired standards for Japan teas. Should such teas be made up so as to imitate Congous, they will be compared with the North China standards for Congous.—*American Grocer.*

TEA PLANTING EXTENSION.—The *Pioneer* quotes our words of warning in reference to further tea extensions, based on the unexpectedly wide area already planted in Ceylon,—namely that a halt should be cried in both Northern and Southern India to further tea clearings.

June 11,

ANNATTO SEED.—Good bright East Indian was limited at 5½d per lb.

KOLA-NUTS.—Cheaper. Fair West India sold at 2½d per lb. Good washed ditto was limited at 3d.

LEMONGRASS OIL.—A large parcel was sold without reserve at 3d to 3¼d per oz, or 25 per cent below market value.

VANILLA.—In small supply. Madagascar sold at 17s 6d for 7 inches to 7½ inches; slightly crystallised, 6¼ to 7½ inches, 18s; 6 inches to 6½ inches 17s; foxy, 6 inches to 7 inches 11s to 14s. Only a few Seychelles sold; 7 inches 19s 6d per lb.—*Chemist and Druggist.*

COFFEE IN B. C. AFRICA.

(From *B. C. Africa Gazette.*)

Mr. D. Morris, the Assistant Director of the Royal Gardens, Kew, in a recent letter says:—"It is evident that planters must adopt some means for manuring their coffee trees if they are to keep them in a suitable condition for yielding crops. Apparently the soil is not rich enough without some manurial treatment. Also, during the dry season, the roots of the trees should be covered with grass or trash, to keep them cool and moist."

Messrs. Gardiner & Co. have issued their circular in regard to the 1897 crop and the prices obtained:—"We are sorry to have to report no market increase in the 1897 crop over that of 1896. The quality, taking the crop as a whole, was not so good as last year, and was distinctly inferior to that of 1895. There appears to us to be a large increase of defective and light berry. Heated reds and stinkers were again present in some parcels, more especially in those parcels showing light berry. Some parcels showed a considerable quantity of chipped and bruised berry. On this account we recommend most careful pulping. A few parcels were overdried, and consequently rather foxy; on the other hand, some parcels were magnificent, and we are of opinion the finest ever put on the market."

It is now more important than ever for planters to do everything in their power to turn out a good even coloury sample in order to maintain the position which we are happy to report the highest grade of Nyassaland coffee has established for itself amongst the high grade coloury coffees sold on the London market.

In our opinion, the greatest difficulties to be overcome by Nyassaland planters are in connection with defective and light berries which are now so prevalent, and which, to a somewhat large extent, detract from the values obtained by the different planters in British Central Africa for their crop. We have great hopes that, with the introduction of shade which is now being so extensively planted the above defects will be eradicated.

CEYLON TEA IN GERMANY.—Mr. Chas. Böhringer, who some years ago established a house at Colombo for the purpose of buying cinchona-bark, is now in Stuttgart, where he has opened several shops for the sale of Ceylon tea only. Mr Böhringer anticipates a strong demand for this kind of tea in Southern Germany.—*Chemist and Druggist.*

QUARANTINE FOR PLANTS.—Alluding to the steps taken to prevent the intrusion of the San Jose Scale, our contemporary, *Mechanics' Monthly*, has the following wise remarks:—"But the truth is, the Scale does not need looking after—not by law, for the Scale will travel in spite of all law and its useless expenditures. Cultivators should be encouraged to look for and destroy the Scale. It is as sensible to make laws that there should be quarantines against weeds as against insects. Like love, they laugh at lock-smiths."

## COFFEE-GROWING IN QUEENSLAND.

I am sometimes asked, "Will Coffee pay in Queensland?" By this, of course, is meant not whether coffee is profitable as an article of trade, but whether it, as a field-crop, will pay the cultivator we would advise all those who are in doubt about the matter to visit the State Nursery, and see for themselves the crops on the trees here.

Mr. Dansy, Manager of the Mackay Coffee Co.'s Estate, says he has not seen a better crop in Ceylon. Most people say coffee must be grown in a scientific manner, and for some this word science seems to have a fearful significance, but at the nursery they may see a crop grown on non-scientific principles [?]. At the outset I planted on scientific lines. Starting at the surface of the ground, it was considered necessary to maintain a clear height of stem of 6 or 8 inches without any branches. The single stem was to be continued, and no suckers were to be allowed to grow.

Under this system I soon found that all the plants would require staking. This was all very well for a few months, but when the branches began to grow, I saw that the stakes were not strong enough, and they had therefore to be replaced; then, when the usual wet season, with its gales of wind swept over the place, neither stakes nor stems could resist their violence, and the greater part of the plants were laid flat. I very soon came to the conclusion that the local conditions rendered this method useless. No more pruning, and no more destruction of suckers took place, the single stem soon thickened, the branches began to rest on the ground and formed the necessary support for the trees. Some books recommend manuring; and the scientific method recommended consists of digging a hole or two round the roots, in which the manure is placed. Now the consequence of this is that the roots cut off in digging receive no benefit, and those at a distance from the holes would have to travel if they wanted to share in the good things supplied in the shape of manure.

My method was to spread the manure over the surface of the ground within a radius of some three feet from the stem, and then lightly prick it in with a digging-fork. The result of this was, that as soon as the rain fell, the plants showed dark green foliage in abundance.

It is just possible that when the coffee-expert visits this nursery he may order all these bushes to be dug up, and I would therefore advise anyone who has been lamenting his ignorance of coffee-growing, to come here, and after what he has seen, he will, perhaps, have an easier mind.

The other day I had a visit from an intending coffee-grower, who, no doubt, was impressed with fears for his success, after reading a mass of books on the subject. When he had seen several of the bushes, he expressed the opinion that growing coffee by book was not the way to succeed. There is, however a danger, of going to extremes on the other side; but it is plain that hard-and-fast rules must give way to circumstances.

Science has done much in the past, and will do much in the future, for agriculture. All I want to impress upon would-be coffee-growers is, not to let science be the bugbear to frighten you out of the field. If you want to grow coffee, and you possess average common sense, put that common sense to work. If you have not got a farm, then look out for one—a piece of good land, well sheltered from the wind if possible. Having selected your farm, "look over the hedge" and watch the man who is succeeding in the industry. Take his advice, and follow it, as far as your own particular environments will allow. You are then not likely to fail. If a crop of coffee-berries can be grown such as may be seen here, where the soil is by no means specially congenial to the growth of the plant, and where the land is exposed to the fury of the gales that sweep over the place, it shows there is not so much mystery about the matter as is supposed. For land such as that at this nursery I believe manuring to be an absolute necessity.

I notice that some trees bear better than others. Some trees are absolutely barren, although I believe I have none here. In Ceylon these trees are called "males," but such nomenclature does not speak well for the botanical knowledge of those who so designate them. The coffee-tree is not dioecious, it is a hermaphrodite. Perhaps the expression merely means a barren tree; but whatever they may be it would be better to dig them out and plant others in their places. To avoid the risk of raising non-bearing plants, as far as possible seeds would be selected, when it can be done, from the bushes bearing the greatest crop of berries.

The trees here having strong stems and being well-rooted, the branches, as soon as the present crop is gathered, will be thinned, out, thus complying with the common sense and scientific instructions as to letting in light and air.

There are many people who, even if they have the necessary capital and knowledge, are physically unfit for the laborious work of growing coffee. While the price remains at its present figure, coffee-growing will pay better than cane growing at the present price of sugar; and where there is a family of children, the pickers are ready at hand. I feel sure that a good future is in store for the coffee-growing industry, and it is just those farmers who have 20, 50, or 100 acres of cane who can go in for coffee-growing successfully, as they have money coming in to tide them over the three years during which they have to wait for a crop.

D. BUCHANAN.

*Gardeners' Chronicle*, May 28.

## SNIPE SHOOTING IN CEYLON.

At the turn of the year the thoughts of shooters at home are greatly occupied by snipe, and it is the same in Ceylon. It is from December that snipe-shooting begins to be at its best, it improves up to the end of January, remains stationary throughout February and March, and is out altogether by the end of April.

It has often been said that snipe, like oysters, are in season in all months which have an R in them; and this is true in Ceylon, although very little is done with them in September and October, and it is seldom before the middle of November that they show really good sport.

What excitement there is among all Europeans throughout the colony as soon as it is known that the "long-bills" are in! The junior subaltern and civil servant, and the Colombo merchant who has for the past six months stuck hard at his office rupee-collecting, are all alike bitten with mania to take their guns out to the paddy fields. Different, indeed, are the conditions under which snipe are shot in the tropics from what they are in Great Britain. No crisp rushy marshes, sparkling with frost in the keen morning air, nor snow bound moorlands, where occasional soft boggy spots afford an almost certain "find" for the birds, but usually long ranges of green paddy fields, or perhaps the borders of some remote-lying tank, where you flounder through the black mud under a burning sun, until the perspiration pours from you. Nevertheless, very pleasant are the memories of bygone days in pursuit of the sport, and such days can be reckoned by me in many hundreds. There was the getting up at 4 a.m., if the ground to be shot over was several miles away, and the early meal (by coconut oil lamp) of "hoopers" (rice cakes), eggs, and coffee. Then the native "tat" was brought round, saddled, the horsekeeper, with gun and cartridges, having been sent on in advance an hour earlier, and after the spurs had been buckled on the shooting boots—for a native pony often needs

these stimulants—the brisk ride to the scene of action which was reached near about dawn.

Very likely at this time of year (January) the fields are enveloped in mist, making it difficult to see to shoot at a greater distance than thirty yards, and impossible to follow the flight of a wounded bird to see where he falls. But after a little the sun gains power, and, with the departing mists, all the beauty of the tropical morning begins. The crops of grain and the surrounding jungles look so fresh and cool, and bird life is present everywhere. The fields are alive with cranes, kingfishers, mangobirds, and doves of different sorts—the little grey dove and the beautiful bronzewing being the most common. But far more attractive to the sportsman's eye are the snipe, which, with their exciting "skeep, skeep," are rising and pitching again in all directions.

There is no doubt that Ceylon snipe are, as a rule, easier to hit than English ones; but in the early mornings in the mudfields, where there is very little cover, they rise wild and go away with a dash equal to anything ever seen with the home birds. As the morning advances and the sun gets hotter, they become lazier and seek cover, and the great thing is to get them into young paddy not more than 2ft. high. The paddy-beds are divided by small ridges or bunds; and you have to walk along these, and often get a most precarious foothold which, of course, handicaps you heavily, but otherwise the shooting is perfect. The birds lie well, and fly, albeit swiftly, steadily—their brown forms showing grandly against the green background of paddy; and, granted decent walking ground, you ought then to make the heaviest part of your bag. Generally, at the end of a range of fields, there is a more or less large bit of untilled ground called a *deniya*. This kind of place often abounds in little pools fringed with highflags and rushes, and is very treacherous walking (it is quite easy to sink in up to your middle if not careful), but it is splendid holding ground for snipe, and must somehow or other be thoroughly shot out. If it cannot be all walked, the plan is to drive it; and this, to my mind, is the prettiest form of snipe shooting, and the one at which the best bags are often obtained.

There is no difficulty about getting beaters; one is pestered by Sinhalese boys following to see the sport from the moment shooting begins (that is to say, in populous parts; it does not apply to wild parts of Ceylon, where you are quite undisturbed), and they are only too glad to be allowed to flounder about in the swamp and scare up the birds. It can be generally ascertained in which direction the snipe mostly break away, and posting yourself well forward, they give most beautiful shots of every variety, though chiefly rocketers; and to see their little twinkling wings collapse and the birds come down dead from high overhead is very satisfactory.

In the course of a day's shooting one often comes across painted snipe; beautifully plumaged birds without doubt, and attractive to novices, but experienced snipe-shooters vote them worthless, as having no good qualities to recommend them either for sporting or gastronomic purposes.

Jack snipe are so rare that they may be said to be practically unknown in Ceylon. It happened, however, to a friend and myself to shoot three one morning many years ago on the lake shore at Jaffna, the extreme north of the island. They were veritable jacks,

and we were very much surprized, as neither of us had, in our experience of the colony, ever come across one before. Two of the birds were stuffed and sent to Capt. Legge, R.A., the well-known ornithologist, who has referred to them in his work on the birds of Ceylon. Curiously enough, some years after this, I heard of another jack being shot in exactly the same place; but, to the best of my belief, no other has been met with in any part of Ceylon.

The bags of snipe in Ceylon are not equal to those made in India. An account of some heavy bags of snipe near Calcutta was given in the *Field* in the early part of 1897—one shooter had since the beginning of the year several times exceeded 100 couple to his own gun. This is far greater than anything in Ceylon. The largest bag, to my knowledge, was made some twenty-five years ago for a bet, and 110 couple were bagged by one gun. Referees were appointed to see that all was fair, and the bet was paid, so there can be no doubt that this bag was actually made; but it stands alone, and cannot be taken as a fair example of Ceylon snipe sport. Fifty couple have often been bagged, and this is a grand bag for one gun. Anything over twenty couple may, nowadays, when guns and shooters are yearly increasing in numbers, be considered an excellent day's sport.—*Court Journal*.

[Capt. Walker, the veteran member of the Forest Department, considers Mr. Rice's 103 brace shot on the favourite ground in the Trincomalee district to be the largest bag ever made in Ceylon; but then several guns were used by him. To make 40 to 50 brace, with only one gun, and that a muzzle-loader as Capt. Walker has done, ought to be considered very good. Next to the Trincomalee resort, the neighbourhood of Horoborewewa tank in Uva used to have the greatest reputation for big bags among Ceylon snipe shooters.]

#### CEYLON, INDIA AND RUSSIA.

For some unexplained reason, or perhaps for no good reason at all, mercantile enterprise in India has greatly neglected the very promising market for Indian produce which seems to exist at Odessa. Such goods as tea, coffee, jute are quick to make their way in new markets if properly pushed, but though the more alert merchants of Ceylon export large quantities of tea to the Black Sea, Indian tea exporters have so far left this market unexploited. Freight for Indian produce by the Volunteer Fleet steamers, which run to Odessa from the Far East, rule very low, and the shipowners, we are told, are keen to do more business. Volunteer Fleet steamers call at Colombo regularly, and at ordinary times—that is to say when there is no plague in India to raise quarantine difficulties—at Coconada also. It certainly seems a pity to see steamers which are capable of carrying thousands of tons of Indian goods to Russia, sail to Odessa with perhaps only a few hundred tons of tea or coffee from Ceylon, and a little castor-oil seed from Coconada. There is a large jute factory at Odessa, and most of its jute is supplied from India, though a small quantity of the best sorts is sent from Resht in Persia. In this direction, as in many others, there appears to be an opening for Indian merchants. Mr. J. H. Frontmann is the largest dealer at Odessa in Ceylon and Indian teas, and a British subject, and he may be addressed by anyone in India desiring to make further inquiries.—*Indian Agriculturist*.

## PLANTING NOTES.

"COLONIA; THE COLONIAL COLLEGE MAGAZINE."—Spring Session, April, 1898. Contents:—Our Students' Column:—Communications from Africa, Australasia, Canada, West Indies and California; "Emigration: a Plea for State Aid" The British South African Police; New Caledonia; Poet's Corner: A Hint on Manuring; Laboratory Notes; Weather Report—January to April, 1898; Estate, Farm and Building Notes; In Memoriam; The Athletic Club Report; Old Students' Directory (revised); Notice to Correspondents.

PLANTING IN NEW CALEDONIA.—SUGAR is grown but to a very limited extent, there being, in fact, but one planter. Tapioca is another product, and one which is stated to pay well, the quality being first class. Tea is being tried by one or two in an experimental form, but it is doubtful whether it will be found to answer on a large scale on account of labour and deficient rainfall. The latter difficulty could be overcome by irrigation, but the question of labour is more serious and would, I think, prevent competition with India, Ceylon, and other tea-growing countries where labour is both cheap and plentiful. Coconuts are, of course, most prolific, and all the tropical and semi-tropical fruits, such as bananas, oranges, lemons, citrons, mangroves, guavas and a host of others grow in profusion.—*Colonia College Magazine.*

A SIGN OF THE TIMES: THE JAPANESE IN FORMOSA.—A few months ago we had an accomplished English visitor here looking round some of our planting districts and making many enquiries in the interests of Japanese administration in Formosa. This island is sure to be developed year by year now and as a sign of the times or rather of the future in that island, we may mention that a recent mail has brought us an order from the Japanese Government for a complete set (17 volumes) of *The Tropical Agriculturist*. The last enquiry of the kind was in the interests of the King of Belgium for the Agricultural Library of his Congo State; and so the tropical world of foreigners in the Far East and West equally with British tropical dependencies, look to Ceylon for guidance and instruction. Unfortunately the earlier volumes are getting scarce and to reprint them (as Mr. T. Christy suggests) would be a heavy undertaking. Those of our subscribers who have preserved their sets of the T.A. may yet find they have a special value.

CEYLON RAINFALL RETURN FOR 1897.—The Return of Rainfall in Ceylon during 1897 and the Means during different periods, prepared by the Survey Department, was issued as a Supplement to a recent *Gazette*. We are giving the same (together with the P. W. D. Rainfall Return for last year) with our Meteorological Summary, in the "Ceylon Handbook and Directory," where they can be readily referred to. Meantime we may remark that the highest total rainfall for last year, registered by the Survey Department, was 201.90 inches on Sembawatte, Nawalapitiya, spread over 218 days, the means during 14 5-6 years being 217.32 inches. This was closely followed by Digalla, Awissawella, with 195.86 inches on 173 days, and 179.83 inches means during 11½ years; while the lowest total quantity was 33.68 inches falling on 76 days at Puntalam, the means during 27 11-12 years being 46.08. The quantity registered in any 24 hours ranged from 2.60 inches (on Nov. 13-14) at Puntalam to 10.29 inches (on June 17-18) at Horkele, Chilaw. Nothing therefore approaching the exceptional Nedunkeni fall, came within the purview of any of the Survey Office observers.

COFFEE-GROWING IN QUEENSLAND.—Some interesting information on this subject will be found on page 60. It is surprising that our contemporary of the useful *Tropical Cultivator* published at Mackay, Queensland, does not tell us more about coffee. Can he not institute an enquiry and compile a list of all the Queensland coffee gardens in existence with their acreage for publication in his columns, and also, if possible, a return of crops in the aggregate or per acre?

CEARA RUBBER IN ZANZIBAR.—The following paragraph from the *Zanzibar Gazette* is of interest to us at present:—

It may be interesting to note that a thousand Ceara Rubber trees are now being planted out at Dunga, on the adjacent coral. The soil is only a few inches deep but what there is of it is of the very best quality. By digging holes one and a half to two feet deep with heavy crowbars and filling in with the rich black surface mould plenty of room is afforded for the short tap root of the tree to strike down. There is a good deal of soil of sorts, chiefly of a red sandy character, mixed up with the coral underneath. It is not by any means all solid rock. The Ceara rubber trees are being placed 17 feet apart which gives 151 trees to the acre. They stand transplanting extremely well and in most cases renew their growth the day after being put out. Then who planted Ceara freely in Ceylon some years ago should look after their trees. A yield of a lb. of rubber a day per cooly, from trees in Dunbara, is not to be despised.

PADDY AND WEEVILS.—Our Negombo correspondent sent us a packet of paddy affected by weevils which we forwarded to Mr. M. Cochran who kindly reports as follows:—"With regard to the sample of injured paddy received from you on Saturday, there is no doubt the grain is very badly weevil-eaten; a great proportion of the sample consisting of empty husks, the weevil holes and the weevils themselves being in evidence. A few days ago in the *Observer*, you published the manner of using the only two agents which I am aware are used as weevil-destroyers. It would be interesting to know if the weevils are noticed on the grain in the field, or if they only come in the granaries. Bisulphide of carbon has, as far as I know, been the favourite remedy; but naphthaline was also mentioned in the article I refer to as very effective. These agents could only act as preventives as well as destructive agents in the granaries, and not if the weevils commence their destructive work in the field."

UNHEALTHY OOTACAMUND.—The talk up here (says the *Madras Times*) is all about the unhealthiness of Ootacamund. The following are some of the patients:—Sir Frederick Price, Miss Davies, Miss Simpson, Miss Pryce and Mr. Geddes, 4th Pioneers, all of typhoid fever; Mr. Irwin, rheumatic fever; Lady Souter, malarial fever. Sir Frederick Price is not improving as might be wished. It appears, indeed, that he has had a relapse. The Misses Davies, Simpson and Pryce are all improving, and the last two are on their fair way to recovery. Mr. Geddes, of the 4th Pioneers, is the latest addition to typhoid fever, while Mr. Irwin is seriously ill of a malady which he caught through exposure during the race week when he was drenched; and Lady Souter is also ill, having caught malaria while on her coffee estate up here. There are other cases of typhoid in the place among the Natives and Mahomedans. The Sisters of the Church and a large number from that institution have been ill. Miss Elwes, who took the contagion from this institution, and who went to Coonoor, is, I learn, doing well.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo, June 28th, 1898

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST,"*

The following pages include the Contents of the *Agricultural Magazine* for June :—

Vol. X.]

JULY, 1898.

[No. 1.

## SEASON REPORTS.

**ESTERN Province.**—Paddy. Sowing for Yala almost completed: early sown paddy looking promising. Destruction of stored paddy by weevil reported from various places. Rainfall abundant. Health of cattle good, except for some outbreaks of foot and mouth disease.

**Central Province.**—Paddy. Yala cultivation still going on in most parts, but reaping in Nuwara Eliya district where the results are very satisfactory. There is a want of rain in Matale and Kandy districts. The weevil pest is reported to be doing damage in most districts, but the use of naphthaline is being adopted. Health of cattle generally good.

**Northern Province.**—Paddy. Fields being prepared for ensuing cultivation. Rainfall at Jaffna, '28; Mannar, 1.78. Murrain still prevails in the province, though not widespread.

**Southern Province.**—Paddy. Yala cultivation still going on, prospect middling in Galle, good in Matara district. More rain wanted.

**Eastern Province.**—Paddy. Prospects of Pinmari crop good: harvest approaching. Tobacco crop has been harvested and cared with good results. Rainfall at Trincomalee, '85 in.

**North-Western Province.**—Paddy. Crops progressing fairly, except in Demala Hatpattu where rain is wanted badly. Rainfall at Puttlam 6.14 in. Cattle murrain in the Chilaw district where the weevil is also reported.

**North-Central Province.**—Paddy. Maha crop being threshed; some field being sown for Yala. Rainfall at Anuradhapura 6.45 in. Health of cattle good.

**Province of Sabaragamuwa.**—Paddy. Yala crops in Ratnapura district satisfactory, but there is suffering from drought. In Kegalle district sowing for Yala is in progress. Naphthaline is being used against the paddy weevil.

Greatest amount of rainfall in any 24 hours on the 19th, 1.15 inches.

Mean rainfall for the month .19 in.

Recorded by A. H. AHAMAT.

## OCCASIONAL NOTES.

The Agricultural Journal of Cape Colony, quoting an article by Mr. E. T. Hoole, on Rinderpest in Ceylon, which appeared in the March number of the Agricultural Magazine, says: "This disease has been more or less prevalent in Ceylon from the remotest times. Though it is more general at times when there are special outbreaks, yet

there is we believe never a clean bill of health for the whole Island. It has been said that the disease is less fatal than in former times, but the following extract from the Colombo Agricultural Magazine shows it quite bad enough."

A Mr. Griffiths, described as an old Ceylon planter has been recommending the planting of Coconuts upside down in Fiji. The idea is certainly novel, and as our experience has been that the planting of the nuts upright instead of sideways (as some advocate) is the most satisfactory, we are hardly prepared to endorse Mr. Griffiths' recommendation, nor are we inclined to think there is any good grounds for it, though it is averred that trees thus raised come into bearing a year sooner than under ordinary conditions of planting!

The statements of accounts of the late Fruit and Flower Exhibition show that it was worked as successfully from a financial point of view as in other respects. The total receipts from subscriptions, sale of tickets, &c. were R2,143-73, and the expenditure was R1,915-54, so that a balance remains of R228-19 to the credit of the Show Committee. This is certainly a very satisfactory state of affairs, and should give further encouragement towards making the Show an annual event.

The credit of making the Show a success is in a great measure due to Mrs. Ellis, Miss Taylor and Mrs. Davidson who rendered invaluable assistance to the gentlemen on the working committee. Of these latter we would specially mention Sir Frederick Saunders, Messrs. W. B. Davidson (Mayor of Colombo), W. Noek, H. MacMillan (both of the Royal Botanic Gardens), C. H. Pate, and W. Ebert. Messrs. L. Van Dort and H. de Meil also rendered great help in the office, while the masters and students of the School of Agriculture worked like men.

A young bull and a heifer were procured by the Manager of the Government Dairy for the French Consul in Colombo for shipment to Hongkong. We understand that they are required for breeding experiments by Dr. Jersin of plague fame.

Mr. Alfred Driehberg, an old boy of the School of Agriculture, is at present working under Mr. E. Elliott, on the Walave Estate, Amblantotte, near Tangalle, where some interesting experiments in paddy cultivation are being carried out.

We have had enquiries about the flowering and seeding of *Pisonia* (the lettuce tree) so commonly grown in Colombo gardens, particularly on the sea side. On referring to many growers of the tree where it is found of the greatest age, we were told that none of them had seen the seeds, or even the blossom. Some two years ago we saw a tree in flower in a Colpetty garden, and Mr. F. Lewis, to whom we mentioned the fact, said that it was the second time he had heard of any one who had seen the tree blossom, he himself, with his large experience, not being so fortunate. Curiously enough, Ferguson in his "Timber Trees in Ceylon," referring to *Pisonia oleracea* says "flowers freely and bears staminal

flowers only." Trimen in his "Ceylon Flora" referring to the tree as *P. Morindifolia*, says the male tree has the leaves much darker green, and is therefore not much grown. It rarely flowers here."

Mr. Jas. Morrison, Superintendent of Farms in the Bombay Presidency, who rendered such valuable service in the selection of a herd for the Ceylon Government Dairy, was a visiting to the Island some weeks ago. He is much interested in our indigenous cattle, and we have promised to send him photographs and measurements to accompany a descriptive account of Eastern breeds.

Regarding *Thespesia populnea* (the native "Suriya" or English "tulip tree") at one time so common as a roadside tree in town, we find Dr. Trimen in his "Flora" saying: "It ripens its seed only in the dry region." We have, however, had more than one experience of old trees in the neighbourhood of Colombo seeding profusely and found the ground under the trees thickly covered with seedlings.

#### THE "DEMONSTRATIONS" AT THE FRUIT AND FLOWER SHOW.

One of the features of the late Show was what was designated the practical demonstrations held on the occasion. These consisted of the processes of budding and grafting, cream-separating, &c. We hope to see at future Shows a development of this excellent idea.

The demonstration in budding and grafting was on the first day carried out by Mr. Macmillan, the Curator of the Royal Botanic Gardens, Peradeniya, and, on the second day, by a Sinhalese assistant of the Botanical Staff. This was a commendable arrangement, as on the first day the majority of visitors were of the English-speaking classes, while on the second the Sinhalese predominated. Many were the enquirers who wished to be informed as regards a process which to the ordinary horticulturist is a mysterious operation not to be attempted by him. This particular demonstration proved, for one thing the advantage that may be expected to result from a combination of the botanical and agricultural interests, and the benefit that is to be looked for by utilising the talent of experts available in the Colony for educational ends—though an educational establishment such as the School of Agriculture. As regards this latter consideration it is a matter for regret that, under existing conditions, the "talent" should be hid within the circumscribed area of Botanical Gardens, while the opportunity offered by making the school a medium for utilizing expert knowledge to its full advantage should be neglected. It will be a good day both for the school as well as the agricultural and horticultural classes in Ceylon when Messrs. Willis, Noek and Macmillan become associated with the curriculum of the School of Agriculture. The cream-separating demonstration as conducted by the Manager of the Government Dairy was a decided revelation to many hundreds who visited the Show, and it must have suggested many possibilities. In this connection we might refer to the advantage derived both by the fa-

seeing speculator in town and the village cattle-keepers in the Bombay Presidency. The latter residing in remote rural districts is unable to find a market for the milk got from his cows, while he finds it impossible to send his produce to town owing to the peculiarly perishable nature of milk in the tropics. The former, while looking to his own interests, comes to the rescue of the villagers by investing in one or more cream separators which he sets up at one or more rural centres to which milk is readily brought for sale, as readily purchased and worked out as cream. The cream, which may be said to be less perishable than milk, and indeed is improved for butter-making purposes by keeping, is carried into town and there converted into butter. We are inclined to think that such an industry as is here indicated can, with the same mutual advantage, be carried on in Ceylon where a good deal of the milk, milk of cows and buffaloes are allowed to run to waste in remote villages.

Bee-keeping on rational principles as demonstrated by Mr. Charles Andree was another very suggestive side-show which must have struck many as indicating a possibility of a commendable by-industry, not without remuneration considering its inexpensive character, particularly suitable for the women in a husbandman's family. Mr. Andree proved to satisfaction in carrying on his demonstration amid an assembly of over 2,000 persons, his dictum that "if you do not hurt the bees they will not hurt you." Gentle treatment and an improved hive—costing but a few rupees—would seem to be all the necessary conditions for the production of a pure article of diet—admitted by all authorities to be amongst the most wholesome food products—for home consumption or disposal. Bee honey, as has to be accepted in Ceylon, is an objectionable substance if it is not in many cases a noxious compound, it would be out of place to describe its origin here,—and the popularizing of apiculture as a home industry to find occupation for the husbandman's family during their many hours of leisure, between seasons of paddy cultivation, should have a more beneficial and far-reaching influence in the villages than at first appears.

Among other exhibits to be seen in the same department of the Show were various insecticides and the means of using them. These should have proved of interest to many who probably had never seen or heard of Paris green or London purple or naphthaline (specially recommended against the paddy weevil), nor were aware that there were convenient and cheap spraying machines that would enable to use certain insecticides most effectually.

We are inclined to include another exhibit in the class to which we are referring, we mean Mr. George Warr's excellent show case illustrating the various and numerous uses to which the fibre of the rhea or ramie plant—now grown in many parts of the Island—can be put. There were many who considered this exhibit among the most striking objects in the Show. There are a number of capitalists who are ready to grow ramie extensively if they were only satisfied that the decorticating and degumming processes can be satisfactorily got over, and, if Mr. Warr saw his way to bring over an efficient machine

for decortication, and also to show growers how they should set about the after-treatment of the fibre, he would be conferring a boon on the local planting community.

#### THE COLOMBO FRUIT AND FLOWER SHOW, 1898.

It is admitted on all hands that the Show which was held on the 9th and 10th of June was a great success, that is to say, fruits and flowers as well as the additional classes of vegetables, poultry, dairy produce and miscellaneous products were all well represented. Considering the fact that such Shows are held only at long intervals, and that they are as a rule hastily got up, it must have been a pleasant surprise to the promoters of the Show to find that their efforts gave such general satisfaction. But as has been pointed out in the local press the benefits derivable from Agricultural Shows cannot be expected to be of a permanent character, unless Shows are held frequently, at least annually, on dates which should be notified 6 months or even one year before. If, as is reported, it is intended before dissolving the present Committee of Management to appoint a Standing Committee for the promotion of annual shows an important step in advance will have been taken. Such a body from gaining experience in conducting recurring Shows may after a few years be expected to become experts in the management of these exhibitions on the most economical as well as utilitarian principle lines. To adopt the model of European Shows has not been found the very best plan, and the endeavour to make local agricultural exhibitions sufficiently comprehensive to fully represent the various departments of agriculture has generally ended disastrously. The better plan appears to be to give prominence to one or two of such departments, while at the same time some recognition is given to agricultural operations in general. For instance, fruits at one time, vegetables at other, poultry and cattle on a third occasion, might form the principal class at a Show just as the chief features at the late Show were flowers and fruits. Exhibitors, themselves, have also to learn the real object of Agricultural Shows. There are many who are under the impression that odd and curious specimens are the most acceptable kinds of exhibits, and good normal specimens are of only secondary importance. They have yet to grasp the fact, that quality as well as size as regards fruits and vegetables are to be reckoned in judging of the merits of exhibits. It is very necessary that the number of specimens of any one exhibit should be limited by the Committee, so that all exhibitors will be showing under the same conditions. If it is thought advisable to call for large collections of different varieties of any one product, there should also be an opportunity for competition as regards the best commercial specimens of that product. All these points will no doubt receive full consideration on future occasions, with the result that the best results will be achieved. The advantage of annually recurring Shows should be seen in the uniform quality of cultivation that will have to be kept up to meet the requirements of healthy competition, while many competitors will find new and important facts

brought to their knowledge as regards details of successful cultivation from their own experience in the choice of seed, manures, &c., or from the experience of others with whom they have competed in healthy rivalry.

### THE PADDY WEEVIL.

A great deal has been written in the public press about the damage that has been done by the weevil attacking stored paddy, but no reliable information has yet reached us of the extent of the damage, nor, so far as we are aware has any investigation been carried out in the affected areas, regarding the special causes that may have favoured the widespread ravages of the pest, which has long been known to attack badly-stored paddy. It has been said that the last harvest was gathered at a season when the weather was wet, and that, in many cases, there was no alternative but to store the paddy in a comparatively damp condition. If this be so, it is sufficient reason to account for the more or less general (as regards certain districts) prevalence of the pest. A damp condition of grain is well known to favour attack by the weevil, and it is a matter of surprise that cultivators should with their past experience as regards seed-paddy have neglected to take the first opportunity of thoroughly drying their grain when dry weather prevailed after the wet harvest. If the circumstances are such as we have indicated, the present outbreak should read a valuable lesson to cultivators, viz., that they must not shirk the extra trouble and expense of properly drying their grain a second, and even a third time where necessary, if they would not lose 50 or 60 per cent more of their paddy.

Another point, which has been referred to in the bulletin issued by Messrs. Willis & Green, and that should receive careful attention, is that granaries, or whatever form the receptacles for paddy take, should be thoroughly cleaned out against the storing of new grain.

We are aware that special precautions are often taken with seed paddy to preserve it from insect attack; and we would advise cultivators to look upon the expenditure of a comparatively trifling sum in adopting preventative measures against the attack by insects on all stored paddy, as a regular item in the cost of cultivation.

Naphthaline has been generally recommended as the most suitable and efficient preventative medium, and the objection that it is too expensive to be generally used by cultivators is a trivial one. It is merely a choice between the cost of a small quantity of the preservative medium, and the loss of half and more than half of a paddy crop.

We would strongly urge upon Government the necessity for having naphthaline available at every dispensary in the rural districts, and obtainable at cost price by those who may ask for it. This would greatly facilitate matters for the paddy cultivator, who, as we know him, will never dream of procuring the insecticide from town. Indeed, we can hardly expect the villager to accomplish the task of writing as well as of procuring a money order, before he can get possession of a few ounces of naphthaline. Muda-

liyors and minor headmen might also well be made use of to bring relief to the helpless paddy growers.

### SEED PADDY.

We have more than once urged that the question of seed paddy which so materially affects the welfare of native agriculture should occupy the attention of those who have, or are supposed to have the best interests of paddy cultivators at heart. Now and again we hear a story of how paddy seed brought over to a particular locality from some other part of the Island, has produced results in the crop which have far surpassed the precious fields. "Change of seed" is always recognised a desirable practice, but with us it is the exception. Without a department to facilitate exchange of seed and the systematic introduction of new and improved varieties of paddy from abroad, we should greatly desire to see an Association founded through the help of the wealthy and influential landowners for taking up among other questions that of seed paddy. Some time ago a quantity of one of the best varieties of Bengal paddy was imported by the Superintendent of the School of Agriculture and distributed among those who showed an interest in the matter of improved paddy. Among others, Mr. E. Elliott, of Wallawe Estate, Amblantotte, grew the seed experimentally, and as reported in our last issue, the result was most satisfactory. Mr. Elliott, got back as he puts it "forty-five fold," and from the sample sent to us we can endorse his opinion that the rice is "beautiful," not merely in appearance but as an article of diet, possessing, when boiled, all the best qualities of consistency, flavour and digestibility that can be wished for in rice.

Here is an instance of how much good can be done by systematic attention to the question of seed paddy, which must eventually result in the production of large crops of the best varieties by paddy cultivators, who are now, and have been so long, left to shift for themselves as best they can. The Australian Colonies can teach us many lessons in promoting the best interests of our Island by judiciously aiding the agriculturist through measures which, indeed, it is the duty of every good Government to adopt.

The average yield of paddy in the Island is a reproach to the capabilities of our soil and the traditions of the Island as a rice-producing country.

There have been no leaders among paddy cultivators (Mr. Elliott, be it said to his credit, is proving himself one) as there have been in tea and cocoa and coconut cultivation, to show the way to the more backward; and considering the close connection there exists between the rice supply and the labour question, not to say the general prosperity of the Colony, the improvement of paddy cultivation is a subject which cannot be too fully threshed out by the powers that be.

What we should have liked to see in connection with this first (so far as we know) serious attack by weevil, is a few agents—preferably students of the School of Agriculture—despatched to the scene of the ravages by the pest, supplied with a stock of the insecticide recommended, and with

instructions to demonstrate the method in which the stuff is to be employed. Such a measure would have done an incalculable amount of good which no amount of reports or verbal instructions will effect.

The question of aid to the agriculturist which has so fully been worked out in Colonies such as Queensland and South Africa is still practically unopened in Ceylon.

The spasmodic attempts to help the paddy grower will never secure any permanent benefit to him or bring any good to the country. A properly organized system of safeguarding native agricultural interests is what is wanted, and if this be provided there is bound to be a striking improvement in the condition of the rural cultivator which is so much to be desired.

#### INOCULATION FOR RINDERPEST.

The following letter by the Colonial Veterinary Surgeon on the above subject is hereunder published for the information of our readers:—

In reply to numerous inquiries on the above subject, I have the honour to state that cattle can be salted very readily by an injection of glycerinated bile followed by a judicious injection of virulent blood at regulated short intervals. The difficulty is to define the exact dates on which to apply and repeat the blood injection, and this difficulty is by no means easy to surmount as the strength and length of immunity conferred on different animals by the same bile vary very much, hence the unequal results obtained by the first and subsequent injections of virulent blood in different herds and on different animals in the same herd.

In our experience with glycerinated bile followed by blood, in a great majority of the herds as treated the loss after the first injection of 0·1 c.c. virulent blood on the third day was comparatively small, and in some herds none died, while in a very few herds the losses were somewhat heavy. It was after the second and third inoculation with blood that the losses varied so much, and in some herds were very heavy. The cause of this was in my opinion due to the length of time that was allowed to lapse—14 to 17 days—between the first and second doses of virulent blood, because in the case of those animals which did not react to the first injection of blood the immunity had completely passed off before the second dose was applied.

It is a well-recognised fact that the immunity conferred by bile does not pass off gradually but suddenly. Animals which resist effectually a large dose of virulent blood at one time may in a very short time afterwards develop acute rinderpest from the same dose repeated. It has to be borne in mind in justification of the practice that was followed that at the commencement of the bile inoculations all the experts held the opinion that an injection of virulent blood after bile—whether glycerinated or pure—strengthened and extended the immunity conferred by the bile, whether it produced any fevered reaction or not. Painful experience in the field, however, has clearly demonstrated that this was a grave scientific error which led to somewhat serious results in practice, more especially in individual

herds, in which the bile immunity must have been unusually weak and evanescent. Keeping these experiences in mind I would recommend when using glycerinated bile to increase the dose from 20 c.c. as formerly recommended to 30 c.c. for full-sized cattle, others 20 c.c. to 15 c.c. according to size. This will ensure a safe immunity against the first dose of 0·1 c.c. of virulent blood to be injected on the 10th day following, then repeat the blood injection every six days until all the animals have given a decided fever reaction. I may mention that animals have been salted and highly fortified by this method in large numbers. The next consideration is the virulent blood itself. There can be very little doubt that other diseases besides rinderpest can be conveyed to a healthy animal by the injection of blood drawn from a beast affected with rinderpest, Redwater is one. This may not be of much consequence in an area where the cattle are salted against that disease. At any rate, great care should be exercised to obtain virulent blood from cattle which are not liable to suffer from any other blood disease such as redwater or lung-sickness. Another consideration is to see that the blood is used perfectly fresh and free from any septic germs; the instruments also and all vessels used should be boiled for at least fifteen minutes before being used.

I have, etc.,

D. HUTCHEON,

Col. Vet. Surgeon.

Cape Town, May 4th, 1898.

#### THE PRESERVATION OF EGGS.

In Germany systematic experiments have recently been made for the purpose of ascertaining the most rational method of preserving eggs. Twenty methods were selected for these experiments. In the first days of July 400 fresh eggs were prepared according to the methods (20 eggs for each method) to be opened for use at the end of the month of February. Of course a most essential point for the success of preservation is that only really fresh eggs be employed. When after eight months of preservation the eggs were opened for use, the twenty different methods employed gave the following results:—

1. Eggs placed in salt water were all bad, not rotten but unseatable, the salt having penetrated into the eggs.
2. Eggs wrapped in paper, 80 per cent bad.
3. Eggs preserved in a solution of salicylic acid and glycerine, 80 per cent bad.
4. Eggs rubbed with salt, 70 per cent bad.
5. Eggs preserved in bran, 70 per cent bad.
6. Eggs provided with a cover of paraffin, 70 per cent bad.
7. Eggs varnished with a solution of glycerine and salicylic acid, 70 per cent bad.
8. Eggs put in boiling water for 12 to 15 seconds, 50 per cent bad.
9. Eggs treated with a solution of alum, 50 per cent bad.
10. Eggs put in a solution of salicylic acid, 50 per cent bad.
11. Eggs varnished with water glass (was-serglas), 40 per cent bad.

12. Eggs varnished with collodion, 40 per cent bad.
13. Eggs covered with lac, 40 per cent bad.
14. Eggs varnished with sward, 20 per cent bad.
15. Eggs preserved in woodashes, 20 per cent bad.
16. Eggs treated with basic acid and water glass, 20 per cent bad.
17. Eggs treated with manganate of potash, 20 per cent bad.
18. Eggs varnished with vaseline, all good.
19. Eggs preserved in lime water, all good.
20. Eggs preserved in a solution of waterglass, all good.

It thus appears that the last three processes are to be considered the best. The preservation in a solution of waterglass is however said to be preferable to the other two, as varnishing with vaseline takes so much time, and the treatment with lime water sometimes communicates a disagreeable odour and taste. There is one drawback with waterglass, that is that the eggs burst easily in boiling water; but it is said that this may be avoided by cautiously piercing the egg with a strong needle. For ordinary household purposes vaseline would seem to be the most handy and convenient medium of preservation.

#### AGRICULTURE IN ZANZIBAR.

We have been favoured with a copy of the annual report of the Agricultural Department, Zanzibar, by the Director of Agriculture, Mr. R. N. Lyne.

The report is arranged into five parts: Part I. New Products; Part II. Local Products; Part III. Live Stock; Part IV. Implements; Part V. Manures, Soils, Labour, Weather of 1897, and publications received.

Under the head of new products is mentioned Cocoon, of which it is said that great difficulty has been experienced in obtaining seeds and plants. A consignment of 3,000 seeds which went from Ceylon arrived in Zanzibar "in a completely perished condition," while of 72 plants received from London in Wardian cases only 34 survived. It would appear that there are only two old trees in the Island, but we can hardly endorse the conclusion arrived at in the report that "their presence is sufficient evidence that cocoa will thrive on these islands."

Under the same head we read that Para Rubber shows every indication of doing well. "If para rubber, the most valuable of all varieties will pay to grow at all—a point that has nowhere yet been decided—it ought to pay to grow here." The Director thinks that Ceara rubber might be found suitable for the coral wastes which cover about  $\frac{2}{3}$  of the Island, though he is not satisfied that the yield of juice from trees he has tapped is good enough.

Kola is recommended as germinating freely, growing well, and easily prepared for the market. We read that "The trees may be put down 20 feet apart, and come into bearing in 4 or 5 years. Prices in London rule from 4d. to 6d. per lb. If each tree yields 50 lbs. per annum—a moderate estimate as

trees have been known to yield up to 150 lbs. of nuts each—the gross returns, both per tree and per acre would be much larger than those now obtained from clove plantations, which do not average more than 15 lbs. of produce per tree, worth 2½d."

Kola in 1890 was worth 2s. 9d., but the price has steadily gone down owing to the increased shipments from the West Indies. Among other new products are mentioned vanilla, the rubber, vine, coffee, candlenut, annatto, eucalyptus, camphor, safflower, olives and sarsaparilla. The cultivation of the last four mentioned has been discontinued as unsuccessful. Referring to castor oil under the head of local products, the Director says "The oil is worth about £36 per ton in London, which compared well with coconut oil at £23."

The following report by Messrs. Thomas Christy & Co. of Lime Street is of some local interest:—"In reply to your query regarding Papaw we may tell you that we import the dry juice of this plant in large quantities. We believe this way of drying it is to place the juice upon slabs of glass or earthenware, so that it has a smooth surface to dry upon. This is exposed till it is thoroughly dry and the film then flakes off. . . . The price we could pay for the dry juice would be about 5s. to 8s. 6d. per lb. . . . We understand that the juice is taken from all parts of the plant, principally from the stem or trunk of the tree; if you take it from the fruit you will have to be careful to make your incisions in the latter just before the fruit is ripe. You need only make scratches as the juice is found between the skin and the pulp. None is obtainable from the fruit proper. We hardly think it worth your while to take any trouble with this part of the plant. Out of many fruits you will only be able to obtain but a few ounces, whereas, from the trunk of the tree and other parts of the plant, you can obtain several pounds."

Under the head of "Stock" we read: If there is any tropical country where a cattle-breeding industry might be started with a good prospect of success it is Zanzibar. . . . The islands are not subject to serious droughts or ravaging storms: there is good communication both with Southern and Northern parts; communication which owing to competition is sure to improve; lastly our insular position would, with proper precautions, always be an effective barrier against contagious epidemics.

As regards agricultural labour we are told that women receive R6 per month, including food money, and men R8 and R9. Twelve months ago the wages were R10 and R11, and they are still at this figure in the town.

The rainfall for the year 1897 was 67·03 in. as compared with the previous five years' average of 55·29 in.

#### A REPORT ON "ORTHEZIA INSIGNIS."

The severity of the ravages of *Icerya purchasi*, the coccid insect commonly known in this country as "Australian Bug" and "Dorthesia," should tend to interest all fruit growers and gardeners in the discovery of an allied insect in the suburbs of Cape Town. This new pest is a true *Dorthesia*, or

more properly an "*Orthezia*"—for such is the proper rendering of this generic name; specifically it is *Orthezia insignis*. We will speak of it by its generic name.

*Orthezia* has its mouth parts formed for piercing and sucking, and obtains its nourishment by imbibition of plant sap as do all the numerous species of scale insects. The young are very small. They would hardly be discerned on a plant were it not for the presence of snow-white plates of waxy matter which occur on the back and sides, and which contrast strongly with the darker background of the body. The plates on the back are narrow and are arranged in two rows, one on either side of the middle; those on the sides are broad and prominent and are in a single series as seen from above. There is a single plate in each series to each segment or joint of the body, but as the plates develop they become more or less united.

The adult female insect measures about  $\frac{1}{8}$  inch in length and is not much narrower. It resembles the young insect in appearance, but bears in addition to the white plates on the back and sides, a somewhat cylindrical sac of the same substance projecting from the abdomen. In fully matured females the sac is from three to four times the length of the body proper, thus making the complete insect measure up to  $\frac{1}{4}$  inch in length. The width of the sac is about the same as the width of the body. Its upper surface is fluted and is partially covered in front by the projecting plates for the converging sides of the body. The sac is for the reception of the eggs as they pass from the body of the mother, and here they are retained in a mass of cotton-like substance until they hatch. The young escape through an opening at the end or the upper surface.

The appearance of the mature female as a whole suggests a miniature extremely slim Australian bug; but any gardener having seen both the insects would never mistake the one for the other. And while the ovisac of the Australian bug is soft to touch, that of *Orthezia* is comparatively firm; and the colour of the insect itself, instead of being reddish, as in the case of the former insect, is dark green.

The young insects are quite lively when they emerge from the ovisac and scatter quickly over the stem and under side of the leaves of the food plant. As they grow older they become somewhat sluggish; but they always retain their power of locomotion, and even the heavily egg-laden female may often be seen moving slowly and sedately along with her ovisac highly elevated. The appearance of the insect at such times is almost ludicrous.

From 125 to 200 eggs are laid, and there are three, perhaps four, generations in the course of a year. The females greatly outnumber the males; in fact, it is probable that several generations may be passed without any of the male sex being developed. We have seen no males on any of the plants thus far found infested in the Colony. As in other coccids, the male is totally unlike the female in appearance; it is a tiny, two-winged, flying insect without mouth-parts and therefore short-lived, but with well-developed legs, antennæ and eyes. A characteristic brush of long, slender, fragile, white, thread-like bodies (filaments) projects from near the end of the abdomen.

**OCCURRENCE ABROAD.**—Northern South America is supposed to be the native home of this insect. It also occurs, perhaps as a native, in Mexico and some of the West Indies. In 1887 it was discovered in greenhouses in England, and three years later it was reported as a very troublesome pest by American florists in the vicinity of New York. From England it was accidentally introduced into Ceylon, or at least it was supposed that the plants from England carried it to Ceylon, and it was reported in 1895 to be becoming a destructive pest in the vicinity of where it was introduced.

How and when it got to the Cape is yet unknown to us. It was first discovered a few weeks ago on some coleus plants exhibited at the Western Agricultural Show. The plants were traced at once to the grounds from which they came, and it was there found that a large number of plants of the same kind were much infested. On learning that the insect was new to the country and one liable to prove a dangerous pest, the owner at once promised to have all the infested plants destroyed, and to keep a sharp look-out for the insect in the future. But he was unable to say more concerning the insect than that it did not attract his attention till within the last year. He has imported no plants in recent years to which suspicion can be attached, and the pest is not present at the only place from which he has obtained cuttings of coleus.

The various floral establishments about town have since been visited, but no trace of the insect has been found at any one of them. There is a possibility that we have discovered the insect in time to secure its extermination, but the chances are that infested plants have been distributed from the place where we found it, and it seems probable that the plants at this place became infested from some source within the Colony.

It may be well to note that there are specimens of the insect in the South African Museum marked "Durban, Natal." There is no date on the labels, but it is supposed that the specimens has not yet been traced, and though it is most likely that they are taken from a house plant from which the insect did not escape, there is also the possibility that the insect has become established in some part of Natal, and that it is from that source that the insect was introduced into the Colony.

*Orthezia* appears to be most partial to coleus, and it is only on this plant that it has been found near Cape Town. But the number of plants which the insect attacks in other countries is a long one and includes many of our common garden plants, as well as a number found growing wild in the bush. Next to coleus, lantana is most attacked; its destructiveness to this plant disproves the inference somewhat naturally drawn that the insect is one which can only flourish on soft succulent growth. Citrus fruit trees are included among its food plants, and relative to its occurrence on these plants, we quote the following from a personal letter written to us three years ago by Prof T. D. A. Cockerell, the authority in America on the group of insects to which this one belongs:—"Mr. Hart sends it (*Orthezia*) badly infesting lime trees in Trinidad,

In Mexico Prof. Townsend lately found it bad on oranges and limes. They will have to take care they don't get it in Florida, Louisiana and California on their Citrus trees."

In American greenhouses we have known the insect to badly infest plants belonging to the following families: Verbenaceæ, Labiatae, Acanthaceæ, Convolvulaceæ, and Composite, and have been known to spread to Certicææ, Lythraceæ, Geraniaceæ, Malvaceæ, Onagraceæ, Boraginaceæ, Apocynaceæ, Amaranthaceæ, and Solanaceæ.

E. E. Geen states that it is "most accommodating in its tastes" in Ceylon, but prefers plants belonging to the Acantiaceæ, Rubiaceæ, and Verbenaceæ, he found it on Coffee, which is a member of the second of these families. In Mexico and Trinidad as mentioned above, it attacks Citrus fruits, member of the Aurantiaceæ. This list of technical names is uninteresting to the general reader, we know, but it will serve to impress one that the insect is, as Mr. Geen aptly expresses it, "accommodating in its tastes."

There is no telling how important a pest *Orthezia* may turn out to be. We know of no place where it is a plague such as the Australian Bug was with us a few years ago, but the Australian Bug has had "its day," and it may well be that "the day" for *Orthezia* is yet to come. It should be remembered that the Australian Bug was known at the Cape in 1873, now a quarter of a century ago; it did not become a pest of importance at once but spread with ever increasing rapidity for twenty years before the climax was reached. Nowhere was it a pest of importance in 1873, but a dozen years later it threatened annihilation to orange growing in several parts of the world. The *Orthezia* has not more than reached the stage where the Australian Bug was in 1873. It has been known to science only ten years. But it has already spread to remote countries and given evidences of great destructiveness. What may it do in the next decade? Give it a score of years and it may be as widespread and destructive as the now prevalent Red Scale.

While the *Orthezia* does not deposit as many eggs as the Australian Bug, it probably has the advantage of one more brood in the course of the year—together circumstances which would ensure as rapid increase as in the case of the "Bug," while at the same time tending to render the destructive attentions of predatory lady-birds less eradivative. It may be well to remark here that as yet we know nothing of the natural enemies of the *Orthezia*. The Australian Bug spread rapidly through the country. The *Orthezia* is adapted for an equally rapid dissemination, for the insect possesses even greater power of locomotion and is just as easily transported with nursery

stock. No other scale insect that we know of is so free moving, and although, if left entirely to its own locomotive powers, its spread would be slow, this spread would probably be much more rapid than that of any other scale insect under similar circumstances.

Happily the insect is one not difficult of detection on plants; and gardeners and fruit growers who heed the oft-given advice to thoroughly examine and clean all plants brought on to their premises, are not likely to become sufferers by it if their gardens are at all separated from their neighbours'.

AN ARGUMENT FOR NURSERY LEGISLATION.—The discovery of the *Orthezia* was a mere accident. If infested plants had not been exhibited at the Show, several years might have elapsed before attention was drawn to the pest. It *may* now occur elsewhere in the Colony and has already become thoroughly established for aught we know. The notorious San Jose Scale was disseminated from several most reputable American nurseries for four or five years before the discovery of the identity of the insect was made; then many thousands of trees had become so seriously affected that they soon succumbed, and many hundreds of orchards had become breeding grounds for this most destructive of the armoured scale insects in states where even the name of the insect was previously unknown. Many of these states have since secured nursery inspection laws, the necessity for which had been learned by this bitter experience.

Nurseries in this country have played the most important part in the distribution of destructive scale insects; and this recognized fact was the *raison d'être* for the bill introduced in the last session of Parliament calling for the regular inspection of our nurseries and the quarantine of infested stock. Such a measure would preclude the possibility of a pest like the present one remaining undiscovered. But as matters stand, not only must we remain at a loss what nurseries, if any, are disseminating the *Orthezia*, but we are even powerless to demand the destruction of the insect at such places as we may discover it. Happily the florist on whose grounds we have found it, is willing to destroy the infected plants although he has a perfect legal right to sell them. Our nursery inspection bill failed to become law last session, and it behoves fruit growers of the country to come forward and demand its adoption.

In conclusion of this article it is almost needless to say that we are most anxious to learn from the readers of the Journal the occurrence of this insect anywhere in South Africa. If it is anywhere found we would earnestly request that specimens be at once despatched to this office.

Govt. Entomologist,

# \* The TROPICAL AGRICULTURIST \*

## ◇ MONTHLY. ◇

Vol. XVIII.]

COLOMBO, AUGUST 1st, 1898.

[No. 2.

[The following paper on Tea production has a good deal of interesting matter in it and of course a deal that doesn't in any way apply to Ceylon; but I think it might well go into your *Tropical Agriculturist* because of its criticism of London charges, and other items of general interest.—*Practical Ceylon Planter.*]

### THE PRODUCTION OF TEA, CHEAPENING THE COST.

(A PAPER READ BY THE SECRETARY BEFORE THE KANGRA TEA ASSOCIATION.)

THE keynote of the current condition of the Indian tea industry is struck in the following passage excerpted from the commercial article of an Indian daily newspaper:—

“The first tea sale of the season was held on the 20th

of May, and the result was far from satisfactory to planters. I am told that not one invoice will cover the cost to the grower.”

The tea industry of India is entering on a crisis due chiefly to the artificial rate up to which exchange has been rigged by Government. Had there been no interference with the Indian currency, our industry would probably at this moment have been in a highly flourishing instead of a critical condition. As matters stand it is simply being ruined by what is in practice an overwhelming export duty compared to which the *likin* of China is merely a mild fee. Moreover, her unfettered freedom of exchange is enabling China to keep up competition with us in the tea market, for she gets the full silver value of her produce, which India does not. Time was, as members of this Association are aware, when we reckoned our profits at so many pence per pound of tea, and four pence or five pence was a result obtained by several. But now it has come to pass that we estimate our gains (if there are any) by farthings, and five farthings a pound is probably the utmost limit of our profit. Under these completely

changed conditions, and facing a market which only makes about 1½d. difference between our Broken Pekoes and our Souchongs, and gives us just one-third the price for our tea that it did twenty years ago, it is scarcely to be wondered at if planters despair of improving prices. The average value of Kangra Valley tea sold on the public market during the past two seasons has been about 7½d. per lb.

The problem, therefore, for us to solve is how to make tea pay a profit. It can only be done by reducing the cost of production, for I take it that after many years of fruitless effort we are persuaded it is beyond our power to appreciably improve the general standard of our teas.

Accepting then 7½d. as the marked value of the article we produce (and devoutly praying that it may be maintained), to find room for a margin of profit, we must investigate our cost of production, the factors in which are as follows:—

1. Plantation expenditure.
2. Agency and Garden Stores.
3. Interest on advances.
4. The rate of Exchange.
5. Road and rail freight to seaport.
6. Shipping charges and steamer freight.
7. London Dock and Warehouse charges.
8. Sales charges, brokerage and commission.
9. Trade taxes.

1 and 2 plantation Expenditure, Agency and Garden Stores.—These are matters which individuals must deal with for themselves, and we can only start on the assumption—perfectly justified in most instances—that the utmost care and economy have brought down expenditure under these two heads to the lowest level compatible with the proper upkeep of plantations. As a basis to work on we may take this expenditure at 4d. per lb. at the plantation and ½d. per lb. for Agency and Garden Stores—an estimate based on actuals.

3. Interest on Advances.—Twelve per cent. is the lowest current rate of interest. This is of course a usurious rate. The bank rate in London (unusually high at the moment) is 4 per cent. A substantial industry like tea should be able to borrow at 6 per cent. That it cannot do so is due to the dearthness of money, occasioned by the currency policy of the Government of India. Nearly all tea gardens want financial assistance: the extent of their necessity may be assessed at one quarter of their annual working expenses. At 12 per cent. interest their advances will probably cost them '06d. on each pound of tea produced, which is '03d. more than they ought to pay. Of course this is a matter in which the planter is helpless. But he should not suffer in silence. On the contrary, he ought to raise his voice and join loudly in the chorus of protest which all commercial India is sending up against the proposed contraction of the currency of the country which must tend to increase the dearthness of money.

## LOSSES BY EXCHANGE.

4. The Rate of exchange.—Here, again the planter individually is utterly helpless. The currency policy of the Government has raised exchange from 1-1 in 1894-95 to 1-4 in 1898. Three years ago an eight-penny tea yielded the planter nearly ten annas; to-day it only yields him eight. The loss, after adjustments, is at least  $1\frac{1}{2}$  annas per lb., in short, a handsome profit whistled away on the wind. At this critical moment when Government is seeking to make this adverse rate of exchange permanent, and before it is too late, the planting body ought to rouse itself from its normal apathy and do something. Every tea Association in India, every tea planter, every tea agency house, and every tea shareholder should clamour against the proposed Government currency policy that threatens to wreck the tea industry and may bring ruin in the near future to many engaged in it. *Laisser faire* folk will try and make believe that in the end prices adjust themselves to exchange, and that all will come right. They will tell you that exchange governs prices and if silver gets dearer so will tea. But in the last three years we have seen a rise of 3d. in currency silver and a fall of  $1\frac{1}{2}$ d. in tea, both gradually developed during the same period. Low exchange is killing the industry, whose cry should be heard loud in the land calling for an open mint and a shilling rupee. If planters can only get a quarter of this ideal, they will save themselves from a fall from which many will never rise again. Agitation, prolonged, persistent, is the only way to reach the dull year of Government. What was the Ilbert Bill in its practical bearing on the welfare of the bulk of the planting community compared to this bulging of exchange that is going on? The Indian planters shouted themselves hoarse over a sentiment. Here is a substance, and their protest against it, to be consistent, should be far more fervid and strenuous.

5. Road and Rail Freight to the Seaport.—I do not think the Association can do much more than it has done to minimise these charges. The reductions they have obtained for their members this year are very considerable. In 1897 it cost '67 of a penny to get a pound of tea from the factory to the seaport: this year it is only costing us '53. A railway to Palampur would probably reduce this to '40d., and the Association's efforts to obtain a Railway, if successful, will greatly benefit the industry. On a crop of 144,000 lb. the above figures work out.

Road and Rail freight in	1897	£	402
do	1898	"	315
Probable cost with the railway to district		"	240

6. Steamer freight and shipping Charges.—These are quite beyond the control of planters. Had the Mutual Line of steamers been in existence, the industry might have been enjoying more favourable freights now. But this would not have affected us in Kaugra, where we ship chiefly by Bombay and Karachi. Freights this year have gone up 40 per cent., showing an increase in the cost of carrying one pound of tea of from '45d. to '63 of a penny. Shipping charges work out '09 at Karachi and Calcutta and '11 at Bombay, where dock dues are very heavy. I think we should do well, when freights drop, to try and enter into a contract rate for one, two or three years. Last year a contract rate for only half the season worked advantageously for us.

7. London Dock and Warehouse Charges.—In these there is a great scope for saving, though the effort would probably result in a battle royal between the tea industry and the bonded warehouse keepers who hold it in their clutches. Prior to 1888 the wharfingers allowed a discount of 20 per cent. on their fixed rates, and sometimes even more to secure business. They made the great dock strike an excuse to enter into a combination and reduce discounts to 10 per cent., at which rate they stand at present. In the process they incidentally reduced the discount on rent, which was certainly not affected by the dock strike. The present dock and warehouse charges on a 100 lb. chest of tea weighing gross 140 lb., works out '50 of a penny per pound; with a

reversion to the 20 per cent. rate of discount, charges would be reduced to '45 of a penny per pound. The tea industry now is in a far more indigent state than the wharfingers were in 1888 when they increased their rates. Their charges are very high—no less than 4'2½ for a 100 lb. chest. Learning a lesson from them, the tea industry should combine, and endeavour to get a reduction in their charges, and this, I venture to think is a matter worthy of the attention of the Indian Tea Association.

Reverting again to the charge for rent, the wharfingers do what they call "commute it" to 12 weeks. This means a fixed charge of 9d. on each chest of 100 lb. But it sometimes happens that long before the 12 weeks are up the chests have been taken away, and the planter is consequently made to pay rent when no rent ought to be charged.

This is another matter the Indian Tea Association might take up. Let us be charged actual and not commuted rent. Let us have value for our money, which at present it is my firm and fixed belief we are not having.

## BULKING AND TARING.

I now turn to another matter which intimately affects every Indian planter. I allude to the charges for London bulking and taring our teas. There is a sliding scale, but for the purposes of this paper I take a chest containing 100 lb. nett and grossing 140 lb.

An immense sum comparatively speaking, can be saved by factory bulking and taring. It can be accomplished by any planter willing to devote a decent amount of trouble to save his proprietors unnecessary expense, and I take it all planters worthy the name, are willing to do that. There are, I admit, considerable difficulties can be overcome as I shall proceed to show.

The London Customs regulations require that the tares in a break shall not vary more than 2 lb. Thus, for instance, an invoice may consist of three breaks of, say.

20 chests Broken Pekoe net 120 lb. gross	158	&	159
30 " Pekoe " 160 " "	139	&	140
50 " Pekoe Souchong, " 90 " "	127	&	128

If any of these breaks gross any other weight than those given (as examples) the whole 20, 30, or 50 chests are turned out, and the entire parcel tared at the London Warehouse, and I need scarcely say charged for.

Now every planter who saws his own planks and makes up his own chests knows the enormous difficulty, with the wretched and often *kutch* jungle timber that we have available, of getting a given number of empty chests to weigh the same. They dry off when the hot teas are poured into them: they absorb moisture and consequently extra weight in a few hours on a wet day; they apparently increase or decrease in weight in a most irrational way. In short they set a manager tearing his hair as well as taring his boxes. I may mention as an instance in my own experience that chests made from fire planks, cut and dried for six months, have varied from 21 lb. to 36 lb. each. Wherefore I submit that a margin of 2 lb. on the average tares of a break is not sufficient for practical purposes. If that margin were increased to 3 lb. the difficulty of factory taring would be greatly reduced; if it were increased to 4 lb. every planter could easily factory tare his own breaks.

I cannot see what harm the Customs in London would suffer if they raised the margin of permissible variation in tares from 2 lb. to 4 lb. Planters are not such fools or rogues as to put more into their chests than they stencil on the outside. All that the Customs want is to ensure a correct net weight of tea; and if a variation of tares up to 4 lb. were permitted, I fail to see how this would materially interfere with the essential point aimed at. Nor have I ever been able to fathom the philosophy which deters the Customs from weighing net, instead of weighing gross and then deducting the tare. A few nails or snips or lead tumbled into the tea, may deduct from the tare and increase the net, and

perhaps in the aggregate add appreciably to the duty on tea. If so there is more in the philosophy of the Customs than I dream of. But I maintain that the process of weighing net for duty is more sensible, more exact, and more expeditious. But since gross and tare the Customs will have, let us endeavour to get them to allow us a reasonable margin of 3 lb. or, if possible, 4 lb. in the variation of the tares. This is a matter which I think the Indian Tea Association ought to take up. It is a matter which will enable the Indian Tea Industry to save many thousands of pounds sterling annually, as I will show in black and white. Take my illustrative crop of 144,000 lb. Pack it in 100 lb. chests, and send it to London. Now here is what you will save by bulking and taring at the factory, if you can succeed on getting a tare that will come within the Customs Regulations.

London bulking and taring charges on a crop of 144,000 sent to market in 1,440 chests of 100 lb. each, and weighing gross over 129 each.

Bulking at 5d, per chest less 10 per cent. ...	£27-0-0
Taring at 1/3 do do ...	£81-0-0

Total expense if bulked and tared in London £108-0-0

But, if bulked and tared at Factory, only 10 per cent. of the chests will be tared in London for purposes of Customs' check, leaving 144 chests at 1/3 per chest less 10 per cent. to be charged, say ... 8-2-0

Leaving a clear saving of .. £99-18-0 or in round figures £100.

My factory taring costs me  $\frac{1}{4}$  anna, or one farthing a chest, which is the extra allowance I make my carpenters for even weights in their work. They are allowed to make chests from 28 lb. to 33 lb. each, and these are stacked separately according to their weight. On 90 per cent of my chests sent to market I can save exactly 1-5 $\frac{1}{2}$  each, and so can every planter who tries. It is nearly 2 $\frac{1}{2}$  per cent. on the average price I get for my tea. At present it gives me a great deal of trouble to achieve this, but if the margin of permissible difference in tares were raised from 2 lb. to 4 lb. or even 3 lb., then it would give me practically no trouble at all, to save £100 a year out of hand.

With regard to factory bulking this is a most simple and satisfactory operation. My bulking bin cost me Rs. 80. It is made of galvanised iron sheets, bolted together, and holds 4,000 lb. to 5,000 lb. of tea. The bottom is on a slight slope to let the tea run out easily. The top is fed from two superimposed shoots whose mouths deliver at the same point. The tea naturally falls conically and scatters. When full a slide on the lower side of the sloping floor is drawn and the tea runs out, almost of its own accord, on to a surface of zinc-lined flooring. Here two coolies rake it over and over to the end where the packers receive it. In practice the tea is twice bulked, once vertically and then horizontally. The process costs me about four annas for 4,000 lb.: for the same work the London wharfinger would charge me fifteen shillings. I steucil all my boxes

“Chests numbered—to—bulked at Factory, and guaranteed even quality throughout.”

I had not a single complaint last season, except for three chests country damaged, which would of course have been damaged whether factory bulked or not.

EXCESSIVE CHARGES.

One final word about factory bulking and taring. Brokers and wharfingers are dead against it: the former from trade sympathy I imagine; the latter for obvious reasons, for, as I have shown, it is calculated to decrease their revenue from £108-0-0 to £8-0-0. I imagine the wharfingers make the greater part of their profits out of London bulking and tar-

ing. Fancy a charge of 1s. 6d. for bulking and taring 100 lb. of tea sold for 4l. per lb.! Why, it is 4 $\frac{1}{2}$  per cent. on the value! The wharfingers are getting this rate of payment for thousands of chests every week, and the work done in return could not be worse performed.

I have endured much tribulation through my insistence on bulking my teas at factory. “We would point out to you,” write my brokers pathetically, “that not any of your teas have been bulked in London this season. Had this parcel been bulked at the London warehouse the damage would have been discovered before the tea was sold!” A plain dig against factory bulking and its evils! But the “damage” was country damage, which had not the remotest connection with the factory bulking of my teas. It cost me £1-10-8 to make good; and my factory bulking saved me over £30.

Listen to the plaint of the wharfingers:—“From our experience certain teas, even if bulked at the factory, show a variation when landed, and we know the brokers find it necessary to bulk these teas for the purposes of sale, and in some sale catalogues they are marked “Bulked in London” in order that the sale may not be prejudiced!”

To which I felt inclined to reply: “From my experience I do not feel inclined to follow your purely disinterested and kindly advice, because I find by bulking at factory that I have to pay you £30 less than I should if I did not do so.”

If teas require re-bulking in London it is because they were not properly bulked or properly fired at factory. A properly bulked and fired tea will of course turn out as even in London as when it left the factory.

8. Sale Charges, Brokerage and Commission.—I find that on my crop of 144,000 lb. brokerage cost me £43-15-8 or '07d. per pound of tea, and sale charges (lotting and advertising) £10-8-8 or '02 per pound of tea. Both I should hold to be perfectly reasonable and good value for money, if it were not for the expense of discounting the prompt, to which I shall refer later on.

Commission cost me, at 1 $\frac{1}{2}$  per cent. on account sales, £64-7-8, or nearly '11 per lb. of tea. If my agent had taken the same trouble as I have myself to analyse the warehouse charges and shown me how to avoid unnecessary expense I would not have grndged him a commission which is, I think, at least  $\frac{1}{2}$  per cent. in excess of the value of the work he performs. It was not until I extracted from him the detailed warehouse accounts for the year that I saw what I had saved by bulking and inefficient factory taring, and how much more I could save, and how to save it. In the present state of the tea industry I consider 1 $\frac{1}{2}$  per cent. selling commission too much. The whole of the detail and checking of the selling work can be done by any London clerk at a pound a week salary, and for an invoice of 10,000 lb. done in about twenty minutes applied work. The skilled part of the business is done by the broker. The agent merely asks—“What's your valuation?” The broker says “Seven pence.” The agent rejoins, “Sell at seven pence,” and the job is done. The best agent in England cannot get you a farthing more for your teas than the market values it at. All he has to do is to sign the warrants and check the accounts presented to him, and take the money. He is the best paid man in the industry for the purely mechanical work he does, and 1 per cent is ample remuneration for him. His accounts are no more intricate than the brokers, and he is not required to bring the same skilled technical knowledge to the planters' assistance. He is merely a necessary conduit for the planters' money to reach them, and the planter should now insist on his commission being reduced to 1 per cent. Any larger commission is behind the requirement of the times.

AN UNNECESSARY LEVY.

9. Trade Taxes.—I now come to the last factor in the cost of production. There are two species of

trade taxes; one is draft and the other the discounting of the prompt.

Draft, as every planter knows, is a free pound of tea given away with every chest weighing over 28 lb. gross to compensate the buyer for the turn of the scale in weighing off to retail. What can be more ludicrously incongruous than the present system in force? A box containing 20 lb. net and weighing 27½ lb. gross, gives no draft, yet there are twenty turns of the scale at least. A box containing 25 lb. net is taxed 4 per cent. by the 1 lb. draft. On the other hand, a chest containing 150 lb. of fine dust is only taxed 2-3rds per cent. by this trade allowance. This, of course, is simply inverting the ratio of necessity. In my crop of 144,000 the amount deducted for draft was 1,626 lb., which, at 7½ per lb. cost me £19-2-4. But suppose my plantation had been up on the Range, and to enable my coolies to carry my teas to the cart road I had been compelled to pack in 40 lb. half-chests. Then I should have been mulct 3,600 lb., valued at £108-15-0.

This again is, I think a matter which the Indian Tea Association should take up. Half a pound of tea extra is ample to compensate for the turn of the scale in weighing off 100 lb. If more is required it is the retailer, not the planter, who should suffer for what can only be laxity of work. Heaven alone knows it is the retailer and not the planter who makes the profits. Supposing the scale of ½ per cent. draft to have been in force last year I should have been cut on my 144,000 lb. only £23 instead of £49.

The last point I have discuss is discounting the prompt. A broker sells your tea, and payment is due three months after date of sale. Well, that is a trade custom, and the planter agrees to give the credit. But here comes in the hardship. Whether he wants it or not, whether he objects or not, the broker can compel the planter to accept payment less 5 per cent. per annum discount, at any moment after the sale. If the bank rate is 2 per cent. as it often is, there is a clear profit of 3 per cent. to the buyer, and I have sometimes suspected to the broker, on this ability to compel the seller to accept a diminished price for his tea. I kicked against it once, but I was told it was the "custom." This custom cost me last year on my crop of 144,000 lb. the sum of £38-19-2. I had no choice, but to accept money I did not want, to pay 5 per cent. per annum for accepting it, and then to deposit it at my bankers, either at no interest, or at 2 per cent. If I contracted to leave it with them for three months certain. Another hardship that runs in double harness with discounting the prompt is warehouse rent. I will quote actual figures. Early in September 1 sold 8,360 lb. tea for £343-10-5 as per account sales. On the 10th my brokers paid me £100. A week later they paid another £200, and on the last of October the balance of £39-16-7. I lost by discounting the prompt £3-13-10. That was bad enough I have reason in this particular case to suspect that they paid me up so sharp because the buyer paid them, and that the buyer paid up so sharp because he wanted the teas out of the warehouse.

To return to discounting: the prompt against the desire of the seller. As I have said it cost me last year £38-19-2. It added 74 per cent. to brokerage and sale charges; wherefore I called them moderate, with a reservation as to this point. Brokerage and sale charges alone cost me '09 of a penny per lb. on my tea, but when prompt is added the cost works out '16 of a penny per pound, or considerably more than agency; and this is too much. Agent, broker, and prompt discount got the odd farthing and more of my 7½d. tea. It was payment in excess of the work they did for me.

I think this is another point that the Indian Tea Association might take up. If sellers want their prompts discounted, well and good; let it be done, and let them pay for the convenience. But if they do not want them discounted, then they should not be compelled to accept a diminished payment for the goods they have sold especially when the rate

of diminution is 5 per cent., while the Bank rate is often only 2 per cent.

#### SURPLUS PAYMENTS.

That some of the points to which I have attempted to draw intelligent attention are important the following figures will show. Taking the amount of Indian tea put through the London warehouses at 144,000,000 lb. per annum, and valuing it at 8d. per lb., I believe it will be found that:—

1. The decrease in discount from 20 per cent. to 10 per cent. established in 1883 costs the tea industry on warehouse "management" £15,000 a year.

2. That the decrease in discount on warehouse rent, which was contemporaneously introduced without a shadow of justification, costs £5,000 a year.

3. That planters are charged rent, over and above that due for storage to the extent of about £20,000 annually

4. That London bulking, which can be easily avoided, costs the industry £30,000 a year.

5. That 90 per cent. of the London taring charges, which could be easily avoided if the margin of variation of tares was raised from 2 lb. to 4 lb. or if the teas were weighed net, costs the industry £75,000 and damages their tea into the bargain.

6. That if the draft to the buyer was equalised and reduced to ½ per cent. it would probably save the tea industry about £25,000 a year. Nearly two million pounds are given away annually as draft!

7. That if brokers and buyers choose to enforce their legal trade rights they could charge the tea industry about £60,000 a year for discounting the prompt: that if prompt was reduced to 30 days instead of 90 days, or if sellers were allowed to discount it or not as they, and not the buyers chose, it would probably save the industry £20,000 a year.

8. That if by a general combination of tea growers the rate of selling commission was reduced from 1½ to 1 per cent. it would save the industry £25,000 a year.

Here we have what I venture to think is a not unreasonable or impracticable set of proposals to curtail the expenses of the industry by considerably over £200,000 a year.

Taking 400 lb. per acre as the average outturn and £32 per acre as the average capital, I estimate the capital invested in Indian tea plantations at £12,000,000. The above saving, if effected, would produce nearly 2 per cent. extra profit on that capital.

I have not included the question of steam freights and exchange, both of which might be influenced by combination among planters. Taking the present rate of exchange at 1s. 4d. every reduction of 1d. will give planters an extra half anna per lb. for their teas; and, on the figures of capital and outturn per acre given, every half anna gained means an extra profit of over 2 per cent.

The time has now come for planters to take a personal interest in these charges levied in London, which are in most cases hidden from them by a system of quoting "totals" of bills instead of supplying details, and letting those who pay figure out what and why they are required to pay. In a matter of this sort planters naturally look to the Indian Tea Association to take the lead. Of course, in that body there must be many interests that are touched by the suggestions I have made. But the tea industry is in too desperate a condition for anyone who wishes it well to stand upon ceremony.

I conclude by appending a table showing (A) what I might have had to pay for producing and selling my crop of 144,000 lb. on the London market; (B) what I hope to get off with this year, and (C) what I consider is an ideal minimum to aim at.

TABLE.

VALUE OF CROP, 144,000 lbs. @ 7½ £4,350.

Detail.	Scale			Remarks on Scale C.
	A.	B.	C.	
Plantation Expenditure ..	4·00	4·00	4·00	
Agency and Stores ..	·75	·75	·75	
Interest ..	·06	·05	·03	Reduced to 6 per cent.
Road and Rail Freight ..	·67	·55	·40	Railway to District.
London Whouse Management ..	·20	·20	·18	Extra discount of 10 per cent.
Do. Rent ..	·03	·08	·04	Actual Rent only charged.
Do. Bulking ..	·05	Nil	Nil	Avoided.
Do. Taring ..	·16	·02	·02	Simplified by margin of variation in tares increased to 4 lbs.
Selling Commission ..	·11	·11	·07	Reduced to 1 per cent.
Brokerage and Sale Charges ..	·09	·09	·09	
Discounting the Prompt ..	·07	·07	Nil	Made optional to seller.
Draft to buyer ..	·09	·09	·05	Reduced to ½ per cent.
Total cost of production ..	6·33	6·02	5·63	
Profit on Scale A.	£544			
" " B.	£738			
" " C.	£934			

From these profits steamer freight has to be deducted: it is too fluctuating to include in the tables.

It will be seen that the proposed economies in (1) London Dock and Warehouse charges, (2) sales, charges, brokerage and commissions, and (3) Trade taxes, would reduce them from ·85 of a penny per pound of tea to ·45 of a penny, or a saving of 4/10ths of a penny per pound.

I have not touched exchange in the tables. But if the protest of all producing and exporting India can help to stay the hand of government, and secure a ls. 3d instead of a ls. 4d. rate of exchange, it would increase the profit by nearly another half penny per lb.

The details and decimal figures I have given may appear confusing and even trivial. They are only a few hundredths of a penny saved here and there, or so it appears on the surface. But in those days of desperate struggle for existence by the tea industry it is the hundredths of the penny that go to make the meagre margin of profit. To adapt an old proverb to the exigencies of the case: "Look after the decimals, and the dividends will look after themselves.—*Planter*."

## NEW PRODUCTS IN ZANZIBAR IN 1897.

**Cacao.**—Great difficulty has been experienced in obtaining seeds and plants of Cacao. Early in the year 3000 seeds arrived from Ceylon in a completely perished condition. In June 72 plants were received from London in Wardian cases but only 34 survived. A few pods from Seychelles did well.

**Kola.**—Kola germinates freely and grows well. The seed is cheap and easily procured, while the produce requires little preparation for the market, being merely placed in the sun to dry. Hence, if it can be grown at a profit, Kola is more likely to find favour with the Arabs than Cocoa, the beans of which have to undergo fermentation before being ready for market. Kola trees may be planted 20 feet apart;

they come into bearing in 4 or 5 years. Prices in London rule from 4d. to 6d. per lb. If each tree yields 50 lb. per annum—a moderate estimate as trees have been known to yield up to 150 lb. of nuts each—the gross returns, both per tree and per acre, would be much larger than those now obtained from cloves plantations, which do not average more than 15 lb. of produce per tree, worth 2½d. per lb. Large quantities of Kolas have been shipped from the West Indies, which has had the effect of reducing the price considerably. Thus in 1890 Kolas were worth 2/9 per lb. in 1894 1/3 per lb.; while now they are worth, as above stated, less than 6d. The nuts are made into Kola wine, Kolatina and Kola paste, a preparation similar to cocoa paste. Chocolates are also adulterated with Kola.

**Vanilla.**—A small plantation of Vanilla has been made at Dunga and preparations are in course for extending the cultivation of this vine. Of the 600 cuttings planted, 427 survived and are growing fairly well. Many were found going rotten at the bottom, from being planted too deeply, and had to be taken up and replanted. The vines have been planted singly between three live supports, placed in a small circle. The Mbono (Castor oil—*Curcas purgans*) and Frangipani make good live supports and throw out rapid shade. Six feet has been allowed between each little bed of vanilla. Water is conveyed from the well to the plantation—a distance of 300 yards—through bamboo pipes. Much care is required both in the planting and cultivation of this vine, and some skill in fertilizing the flowers and in harvesting and preparing the fruit for market. For these reasons it is doubtful if the industry will take root here among the Arabs. A small plantation of Vanilla has been made at Tundaa.

**Para Rubber.**—Para Rubber shows every indication of doing well here. Though the proportion of seed which germinated in the nursery appears small (174 out of 983) much of the seed was old and worthless when sown, and not expected to grow. Those that came up grew rapidly and, with the exception of three, have all been transplanted. One hundred and fifty were taken to Pemba and planted 25 feet apart in one of the sandy swampy valleys of Tundaa. Seven out of the 150 (5%) died, but the others came away well. Sixteen have been planted out in the rich alluvial valley that divides the Dunga bank from the coral, but some of these have failed. There is a Para rubber tree, 50 feet high and 6 feet in circumference, growing at Mbweni on a dry sandy ridge. It was planted by Sir John Kirk and in September last was observed to be flowering. The presence of this tree growing so well in an uncongenial locality, justifies I think, the assumption that if Para Rubber—the most valuable of all varieties—will pay to grow at all—a point that has nowhere yet been decided—it ought to pay to grow here.

**Ceara Rubber.**—The Ceara Rubber is just coming up and looks extremely healthy. It has been grown principally from trees growing about the island. The Ceara Rubber trees don't appear to yield much juice. I tapped one growing at Mbweni and got little or nothing from it though it must have been five or six years old. It was afterwards found that wrong methods had been adopted, though at the same time it was quite clear that there was little milk in the tree. This variety of Rubber is said to thrive on very barren as well as rich soils, and if this is the case, it ought to do well on the coral wastes of Zanzibar, which cover about 3/5 of the total area of the island.

**Coffee.**—About 60 young Arabian coffee trees are growing in the Nursery from seed obtained from Nyassaland. They look well and will be planted out, though they can hardly be expected to prosper in Zanzibar as the elevation is too low. Liberian coffee was sown late in the year and has not yet germinated. Attempts have been made to procure seed of the Maragojipe coffee, Brazilian variety, but none has yet been received.

*Anatto*.—Anatto grows well here but the market is too depressed to encourage cultivation. Seedlings are being raised at Dunga for vanilla shade.

*Camphor, Safflower, Olives, Sarsaparilla*.—Camphor, Safflower, Olives and Sarsaparilla have proved unsuccessful, and their cultivation will be discontinued.

*Bois Immortelle (Cocoa Shade trees)*.—The Bois immortelle trees have grown very freely.

*Eucalyptus*.—Small success has attended the efforts to grow gum trees.

*Cloves*.—Some experiments have been made with a view to ascertaining whether it were possible to produce a sample of cloves here equal to the best Penang and Amboyna. The experiments leave little doubt that this can be accomplished. An examination of the table (see next page) shows that the buds should be picked when the stems are pink. If the stems (calyx tubes) are allowed to get red the flowers are very apt to open during the process of drying, and the little round heads (imbricated petals) will drop off, to the detriment of the sample. This is what happened in sample No. 2. On the other hand if the stems are green—too young—the dried cloves will be shrivelled. Pink bold heads make the best samples. Arabs probably know this; they also know that selecting the buds in the proper stage of ripeness involves more labour in the picking than they can afford at present. Cloves grow on the trees in bunches and each bunch will generally contain from six to ten buds in different stages of ripeness. The labourers pluck the whole bunch when most of the cloves on it appear to be ready; a much more rapid process than picking singly would be. Whether it is possible to apply a speedy and inexpensive method of sorting afterwards is a question for further experiment.

A firm of Engineers (Messrs. Rainforth and Sons, Lincoln, England) have at my request, been endeavouring to separate the good cloves by means of a screening machine and report as under:—

"We have made several lengthy experiments . . . but were unsuccessful in making a separation. We submitted the sample to Messrs. Gray Dawes and Co. and they said the chillies were very slightly improved, and the cloves actually damaged. Their opinion is that it will be impossible to get a machine to do the work and we must confess we are of the same opinion."

Mr. Hugh Garden of Messrs. Gray Dawes & Co. also wrote as follows:—

"They (Messrs. Rainforth and Sons) have sent me samples of chillies which are rather improved, but as so many stalks still adhere it would not appreciably effect the value. The cloves on the other hand are distinctly damaged; the dry bright head has been removed and the cloves which previously passed as fair would now be one eighth under."

#### TOTAL YIELDS.

	Pemba "	210,950	332,521
Average	Zanzibar "	119,249	
8 years.	Pemba "	291,496	410,745

The quality of the cloves depends also, though to a less extent, upon the drying as well as upon the picking. The experiments at Dunga seem to show that the cloves should be submitted to a high temperature and dried rapidly. I believe that most Arabs overdry their cloves. They expose them to the sun till they become black and dried up, and much of the oil evaporated. The stem of a properly dried clove should be tough and should yield slightly to the strain before breaking. I think that an effective system of drying cloves under glass could be introduced here with little expense. Some authorities are of opinion that, if all the Zanzibar and Pemba cloves were placed upon the market in the best possible condition, the price would not be in-

creased beyond what it is likely to reach under prevailing conditions; low prices being due to over production. The recent abolition of the legal status of slavery will, it is acknowledged, withdraw a lot of labour from the Arab shambas, and the yearly yield of cloves suffer in consequence. Concurrent improvement in the quality of the product should therefore, if it can be accomplished, tend to lessen the effect of a declining crop. The short crop of 1897-98 is probably due to dry weather quite as much as to scarcity of labour. I noticed in October that comparatively few cloves remained upon the trees in the Pemba plantations, and in this respect Pemba compared very favourably with Zanzibar, where a considerable proportion of the cloves were left unpicked. Dr. Charlesworth reports that the rainfall for the second half of the year was only 18.51 inches compared with the previous five years' average of 24.32. This difference practically amounts to a drought, and is quite enough to explain any eccentricity in the output of cloves.

*Chillies*.—About three acres of coral waste have been cleared of scrub and planted in chillies. The dry weather has hindered the growth of the plants, so that we have as yet no results to report.

*Castor Seeds*.—An enquiry was made in London as to the market condition of Castor seeds, and samples of both the large and small varieties of Castor Seeds were, in May, sent home to Messrs. Gray Dawes and Co. to be reported upon. On May 8th Mr. Hugh Garden wrote as under:—

"From their appearance I did not think they were equal to Madras coast seeds which are very full of oil; but I have had them reported on both in Marseilles and London. In Marseilles our agent writes that both samples are very clean sound seed and they make very little difference in value between the large and the small. In London they state that most crushers give the preference to the large beans although both are of good quality; the difference in favour of the large being about 2s. 6d. per ton. I have made a rough calculation and make to-day's price c. i. f. London or Marseilles about £9.10.0 per ton, without allowing for any excessive admixture of non oleaginous seed. In London they charge shippers with anything over 3% and in Marseilles 4%. To-day's prices however are very high, owing to scarcity, and I have known the seed fully £3 per ton under the above price."

Castor oil trees, though they grow wild in Zanzibar, don't appear to yield much weight of seed. We make a point of collecting the seed from all the trees round about Dunga, but as yet we have got only quite an insignificant quantity together. The oil is worth about £35 a ton in London which compares well with coconut oil at £23.

*Papaya*.—Enquiries have also been made in London regarding Papaya and the following communication from Mr. Hugh Garden was received in April:—

"I have received the following information from one of the first authorities:—The dried price of Papaw fruit is a powerful digestive agent and differs from Pepsin in begin active in neutral and alkaline solutions. The Papain of commerce is prepared from it by solution of the crude juice in water, and precipitation by alcohol. Only small quantities of the crude concentrated juice have hitherto reached this country, and therefore the price at which it has been sold has only been a nominal value. So far as my observation goes, and the matter has been the subject of considerable experiment by my son, the substance is not likely to come into extensive use, and I should think that the import would hardly be worth consideration by you."

Messrs. Thomas Christy and Co., of 25 Lime Street were good enough to send out a sample of the dried juice with the following:—

"In reply to your query regarding Papaw we may tell you that we import the dry juice of this plant in large quantities. We believe the way of drying it is to place the juice upon slabs of glass or earthenware so that it has a smooth surface to dry upon. This is exposed till it is thoroughly dry and the

film then flakes off. . . . The price we could pay for the dry juice would be about 5s. to 7s. 6d. per lb. . . . We understand that the juice is taken from all parts of the plant, principally from the stem or trunk of the tree; if you take it from the fruit you will have to be careful to make your incisions in the latter just before the fruit is ripe. You need only make scratches as the juice is found between the skin and the pulp. Juice is obtainable from the fruit proper. We hardly think it worth your while to take any trouble with this part of the plant. Out of many fruits you will only be able to obtain but a few ounces, whereas, from the trunk of the tree and other parts of the plant, you can obtain several pounds."

I regret having as yet been unable to make any experiments with papaya juice. The report from Messrs. Christy is sufficient encouragement to do so, especially as the tree grows here most freely, though entirely neglected.—*Dunga Zanzibar.*

#### A SEYCHELLES PLANTER ON THE PROSPECTS OF VANILLA IN ZANZIBAR.

(i) We lately had an opportunity of discussing the prospects of Vanilla here with a Planter from Seychelles who has 25 acres under cultivation, and has been successfully engaged in this industry alone for 13 years. In Seychelles Vanilla grows very much as castor oil and cassava grow here, that is to say almost wild. The soil where the cultivation is carried on is gravelly, which allows of a most perfect natural drainage. Sticky soils and stagnant water are most harmful. Our sandy soils, especially on the hill sides, should be equally good, probably the coral country as well; while the low flats and swamps where the water accumulates during the rains should be avoided. The hill tops would be probably too dry. It is in the rainfall where we are deficient. In Seychelles they have 100 inches as against our 60 inches. Our rainfall, though falling short in quantity, is fairly well distributed as a rule, and it is always possible to supplement by watering. But watering, besides being expensive, is at best but an imperfect substitute for rain. In this respect therefore, Seychelles has an advantage over us which we can never hope to overcome.

Bad years sometimes occur in Seychelles through failure of the dry season. They count upon 9 wet and 3 dry months, but if, as it sometimes happens, rain continues to fall during the three usually dry months the Vanilla will continue to grow, and there will be no period of rest to enable it to produce flowers and seed pods. They have a way of inducing the vine to throw out buds by nipping back the pendulous growing end, when the sap of the pendulous end will be partly absorbed by renewed growth lower down, and flowers will appear upon it. But this does not make up for nature's shortcomings. We can always rely upon a dry time about the months of September and October which is in our favour though it does not make up for our deficiency in rainfall which is a permanent and perennial limitation. It was our visitor's opinion that Seychelles has a more forcing climate, and is thus better adapted to the growth of Vanilla, than Zanzibar, though this by no means implies that it would not thrive here. We are in all respects better off than Bagamoyo where the industry has taken firm root and flourishes.

We received some useful impressions as to the methods of the Seychelles Planters. They prefer to plant cuttings 6 or 12 feet in length if they can get them; in fact they cannot be too long. A short cutting of 3 feet may take a year longer to crop than one of 6 feet. Vines are never in any case allowed to crop the first year, as this weakens them. Roots of Vanilla seek the surface. For this reason it must not be planted more than an inch deep, a mere scratch being made in the soil to receive it. If planted too deeply the roots may not have sufficient strength to reach the top and the cutting will

then rot at the bottom. These superficial roots are very liable to be scorched by the sun and must therefore be kept well covered with grass or leaves to the depth of about 6 inches. This will also prevent the soil from becoming too dry; but on the other hand if the soil is kept in too sappy a condition rot will set in, especially with young cuttings. Hence the necessity of constant attention.

Hitherto it has been thought that Vanilla is subject to but one disease, but Mr.———(we regret not being permitted to publish his name), who has made a special study of the subject, declared that his investigations have led him to detect many different diseases of a fungoid nature. The roots are the chief point of attack, whence disease may spread to other parts of the plant. Next to the roots the growing tips and pods are the most vulnerable. Roots begin to rot, and leaves to bleach and wither. To as far as possible check the spread of disease, creepers should be planted at least 9 feet apart and all diseased plants uprooted and burnt as soon as the effects of the fungus are visible. As a safe precaution cut off and remove from the plantation all withered leaves and unhealthy parts.—*Shamba.*

#### NEW METHOD OF DRYING VANILLA PODS.

In the *Kew Bulletin* (1898, p. 224) a note appeared giving a brief account of a method of drying vanilla pods by means of chloride of lime in course of trial at the French island of Reunion. Fuller particulars are now to hand in a report from Her Majesty's Consul, addressed to the Marquess of Salisbury (F. O. No. 1965, Annual Series, 1897):—

*Explanatory Notes as to the Drying of Vanilla by Chloride of Calcium.*

The object aimed at in the treatment of vanilla, is to endow it with keeping properties, and at the same time to develop the perfume which has not yet come into being at the moment of cropping.

Pods of the best quality should be perfectly smooth, and without excrescences or holes. The longer the pods, and the more perfumed they are, without acidity, the more valuable is the vanilla.

The success of the treatment of vanilla depends upon the care bestowed upon it, and especially upon the state of maturity of the pods.

If the vanilla is picked too green, its treatment will be difficult and its keeping qualities doubtful, the pods will be thin and poor after drying, whilst the perfume will not be properly brought out, and what there is will be lacking in quality.

If plucked when too ripe, the treatment will be easy, it will be of good size and highly perfumed, but it will split and thus lose much of its commercial value.

On a well-ventilated and properly exposed plantation the pods are ripe when the lower part begins to turn yellowish.

The treatment by chloride of calcium,  $\text{CaCl}_2$ , as indeed do all the other methods of treatment, consists of several operations;—

1. Stoppage of vegetation.
2. First drying and colouring.
3. Drying.
4. Watching,

1. The process of drying in a stove by means of hot water is the one resorted to. On the day of the cropping, or the next day at latest, the pods are put to dry by heat in tin cases of the following dimensions;—0.220 millimetres by 0.220 metres by 0.350 metres. Old petroleum oil tins are generally used for the purpose. The size may be slightly altered, but the width and breadth of the box should not be too large, as the vanilla in the centre should be subjected to the same heat as that which is nearest to the sides of the box. Otherwise the treatment of the pods in the centre would not be assimilated to that of those at the sides, and the resultant colouring would be lightly different.

These boxes are fitted with lids closing on the outside of the box. They are lined with wool carefully arranged along the bottom and up the sides, and a little over the top of the sides.

The vanilla pods are placed on end close enough to secure pressure without damage by rubbing; a horizontal layer is placed on top of these, the wollen covering is folded over all and the lid put on.

The boxes thus arranged are put into the halves of wine barrels and hot water emptied in to the barrels up to the lid of the boxes, care being taken that no water gets into the boxes. In order to prevent the sudden cooling of the hot water, the barrel is covered with a piece of sacking. It is left thus covered during one night.

2. Next morning the pods are withdrawn and exposed in the air for some time to dry; then for two or three days they are kept under wollen coverings in full sunlight.

For this operation low wooden boxes are used, a single layer of pods being placed in the bottom and covered with a wollen cloth. The boxes are placed in sunlight on trestles to prevent contact with the more or less moist earth. After this operation the colouring of all the pods will be uniform if the drying by hot water has been properly done. Now is the moment to proceed to the drying operation.

3. The old methods of preparation, drying in the open air upon screens in an airy situation, or in hot-air stoves, in which the heat is constantly renewed, result in a loss of perfume and at the same time require a large amount of hand labour. These drawbacks are avoided by drying in closed vessels by means of chloride of calcium,  $\text{CaCl}_2$ .

This operation is carried on in boxes of galvanised iron with a hinged door and closing on an india-rubber edging to ensure airtightness. A drawing of the form and dimensions of the box as used by the Credit Foncier Colonial is given below;—

Each box has eleven drawers or trays; the bottom and the sixth drawer are for the vessels containing chloride of calcium, the others are for holding the vanilla; in the former are placed 13 kilos. of chloride of calcium, and in the latter 45 kilos. of vanilla.

The vanilla is laid upon wooden hurdle-shaped frames resting upon little brackets rivetted into the sides of the box. The tray can thus be drawn out in order to arrange the vanilla properly. Several layers are placed on each tray.

The trays should not be made of resinous or strong-smelling woods, as vanilla absorbs and retains odours it comes in contact with; the hurdling is made of split rattans.

The vessels containing chloride of calcium should be double bottomed, the inner one being perforated to allow of the escape of the liquid chloride of calcium. Each time the case is opened the chloride vessels should be looked to, and the chloride renewed or added to as necessary. When the trays are filled with vanilla, and the chloride vessels are in their places, the door is closed and should fit perfectly into the doorjamb. To be quite sure that the boxes are hermetically closed all rivets in the box should be soldered beforehand.

Every two or three days the vanilla is carefully examined, and any pods showing moisture are taken out and put aside to be sunned and prepared by themselves in a special box, where they are all collected.

In from 25 to 30 days the vanilla will have reached the required degree of dryness. Practice will show the exact moment when they should be withdrawn.

Vanilla insufficiently dry will not keep and breeds small worms; vanilla over-dried keeps well, but it is not supple, it is called "broken" (brisee) and has less commercial value.

4. After leaving the box, the vanilla is placed for several days on small frames in a covered and well-ventilated, place then it is removed and shut up in tin boxes, each holding from 15 to 20 kilos. of vanilla.

There it remains for several weeks, being examined every two or three days and any showing traces of mildew is carefully wiped.

When it is thought that the vanilla has reached perfection (rendue a point) and its perfume well developed, the cleaning of the vanilla is taken in hand in order to remove the dust and the germs of mildew which may adhere to it. Vanilla which is not subjected to this process is dull in colour and does not keep well.

25 to 30 litres of water at about 60° Cent. (140° Fahr.) are emptied into a perfectly clean receptacle and 15 to 20 kilos. of vanilla are thrown into it and vigorously stirred up in the water by hand.

The pods are withdrawn, lightly wiped and put to dry in the shade. In a few days when the pods are dry, they are sorted and classed according to length and quality, and made up in bundles. All these operations must be conducted with the greatest care. The bundles are placed in tin boxes with covers. Each box contains only vanilla of the same length and quality, and holds from 4 to 5 kilos. each.

Vanilla should never be sent away immediately after dealing with it. It must be watched for at least a month to be quite sure that it will keep during a sea voyage.

During the time it is being watched the boxes should be examined twice a week, and every pod showing the least trace of moisture should be withdrawn.

The mildewed pods are worked up by various processes and sold as quite inferior vanilla.—*Kew Bulletin*.

## PLANTING NOTES.

A METHOD OF TRAPPING ANTS.—We read in one of Mr. Harmsworth's little magazines the other day of a ready means of catching ants. It is to take a large sponge and sprinkle it well with moist or pounded loaf sugar, and set in the vicinity of the ant's nest. These little troublesome creatures eat sugar with avidity, and soon swarm all over and in the interstices of the sponge. When this is noticed throw the sponge into boiling water and let it remain for a few minutes. Then wash out the dead ants, sprinkle the sponge with sugar, and lay it as before. If this be preserved in for a few days every ant will be destroyed.—*Gardeners' Chronicle*.

HOW TO MEASURE AN ACRE.—Farmers would often be glad to know the area of oddly-shaped fields without having recourse to a surveyor. The following may prove of some use:—

5 yards wide by 933 yards long	contains one acre
10 " " " 434 " " " "	" " "
40 " " " 121 " " " "	" " "
70 " " " 69½ " " " "	" " "
80 " " " 60½ " " " "	" " "
60 " " " 726 " " " "	" " "
110 " " " 397 " " " "	" " "
130 " " " 363 " " " "	" " "
220 " " " 181½ " " " "	" " "
440 " " " 93 " " " "	" " "

—*Journal of the Jamaica Agricultural Society*.

ASHANTI PRODUCE.—The last-issued number of the *Kew Bulletin* contains some particulars of the botany of Ashanti which Surgeon-Captain H. A. Cammina gathered during the 1895 expedition, who brought home with him 200 specimens, which have been classified at Kew. He mentions in his report amongst the plants cultivated in the country are pipews, castor oil and chillies, ginger plants grew eighteen inches high in three weeks; palm oil and coconut oil can be produced on a good scale; kola-nuts are obtained and the plant is plentiful; and there is plenty of rubber to be had. The report concludes with a list of the plants of which the surgeon brought specimens home, and one is almost inclined to hope from this that some good may come out of Ashanti yet.—*Chemist and Druggist*, July 9.

## COFFEE AND "LADYBIRD" BEETLES.

Mr. H. Kirby's cheery letter about the bright prospects before our old staple this year in Ceylon, ought to prompt the P. A. Committee to immediate action in respect of the "Lady-bird" mission. Or, seeing that the Haputale P.A. very nearly represents *one-third* of all the coffee acreage left in the island, why should its Committee not meet and give the first impulse to a movement for raising funds to enable Ceylon to benefit at the earliest possible day in the South-Indian "Lady-bird" importation from Queensland?

## LADY-BIRDS AND COFFEE.

We call attention to the letter addressed by Mr. Philip to Mr. E. E. Green on this subject. Surely the decision of certain Uva planters to do nothing at this time towards getting the benefit of lady-bird beetles, is not well-advised? Mr. Kirby spoke of a levy of 20 cents an acre on coffee; but say that it was only 10 cents and the collection was confined to 12,000 acres (as it would be difficult to levy on small gardens and acreages); yet, in our opinion the resulting R1,200 with a similar amount from Government, or R2,400 in all, should suffice to enable Ceylon coffee planters to share in the importation of the anti-bug beetles now expected for the benefit of Mysore, Coorg, &c. We trust that neither Mr. Green nor Mr. Kirby will let the matter rest where it is now. With our old staple promising so well this year, it will be a great shame if nothing is done to try and get rid of its chief enemy when so good an opportunity offers.

## COLOMBO HORTICULTURAL SHOW.

## STRAY THOUGHTS ABOUT THE COLOMBO FRUIT AND FLOWER SHOW.\*

(By One who was Present.)

The impetus which has of late been given to Horticultural Shows in Ceylon is undoubtedly an indication of progress in the right way. Colombo and Nuwara Eliya seem now imbued with a spirit of emulation, vying with each other as to which will be the more regular and successful with Shows of this kind, leaving benighted Kandy with all her floral advantages, to boast only of an annual barbarous procession of Perahera. The last Flower Show held in Kandy was, if I remember rightly, in 1883, and since then the paradisaical town has evidently been enjoying a blissful state of lethargy. The success of the Colombo Show just past is a renewed proof of the interest and wholesome spirit of competition that such Exhibitions are capable of arousing in all lovers of flowers and in all classes of people. That the competition, however, in certain departments was particularly slack is no criterion of what might be the case if Shows were held more regularly and at shorter intervals. An Agricultural or Horticultural Exhibition held only once in every decade can hardly serve the utilitarian purposes for which its promoters strive so eagerly and a lapse of more than a year is certain to neutralize whatever good may have resulted from it, making the undertaking of a succeeding Show always as much of a tentative nature as the preceding one. But it is in the wind just now, I hear, that before the present energetic Committee disperses an Agri-Horticultural Society is to be organised.

To return to the Colombo Fruit and Flower Show, there were several features and object lessons which must have well repaid a visit from those whose attention was not absorbed in studies of fashion and other diversions. In the classes for native products, coconuts, jak-fruits, and mangoes may be said to have been the most striking both in point of size and in number, the last-named especially being more remarkable for size and variety than for eating qualities. The display of tropical edible fruits was very disappointing, with the single exception of pineapples, among which were some very fine exhibits, notably the lot from the Royal Botanical Gardens, which was not for competition. Some fruits shown in this class could not possibly be called "edible," if indeed they were not poisonous, for instance, the "Kiri gedi." The same remark could well be applied to articles included under the head of yams, the show of which was surprisingly poor. As for nfangosteens, the most delicious of fruits and "the only fruit which the Queen has never tasted," they looked tempting to any one acquainted with their delicacy, but from some strange cause most of them displayed signs of disease, which was readily noticed on trying to cut open the fruit, the rind being very hard and corky and the inside quite unfit for eating.

## THE EXHIBITS OF COCONUTS

were all good though some were ridiculously large in number, some exhibitors showing over 300. But it must be said that this was not so much the fault of exhibitors, as of those who omitted to put reasonable restrictions on the number to be exhibited. This oversight must have involved some difficulty in the matter of judging, not only in this class but in several others. The selection of coconuts staged by the veteran coconut planter, Mr. W. H. Wright, was in every way excellent, and that it did not include more than were necessary of each variety was an additional recommendation. Yet with these merits it failed to draw the well-deserved medal.

## IN THE CLASS OF MISCELLANEOUS EXHIBITS,

there were several objects of special interest, among which may be mentioned Mr. Wright's handsome specimen of a fruit-climber (*monstera deliciosa*) bearing fruit, which as the name implies is said to surpass most other fruits in sweetness of flavour. A monster clump of Mysore cardamoms quite 15 feet in height, shown by Mr. Westland of Matale was also of interest, as showing the height, the plant attains when well-grown. Here also were specimens of rubber "bleached" by a new process discovered by Mr. Parkin of the Botanic Gardens, Peradeniya. But whatever may be said of the exhibits generally, it must be admitted that the arrangements reflected great credit on

## THE MANAGING COMMITTEE

and no small share of which is due in particular to Mrs. Ellis and Mrs. Davidson.

The "lady correspondent" in the *Observer* of the 10th instant makes some opportune observations, and the suggestion that Begonias should claim the attention of the country to a special degree sounds very nice and lady-like. But the lady correspondent in question does not seem to take into account that all plants thrive only within a certain range of temperature; otherwise why would Nuwara Eliya not compete against Colombo for coconuts, and Colombo against upcountry for English vegetables?

## TEA—LANTANA—CREEPERS AND MOSQUITOES.

(By a Cynic.)

Tea planting like all other Tropical farming gives those interested the "jumps." We are exercised one day by advice in local papers and brokers' lists to go in for fine and careful plucking. The next day we read that the Chairman

\* Written, we may mention, before our editorial on page 57.—Ed. T.A.

of a Ceylon-London Tea Company congratulated the shareholders on having secured as their adviser in Ceylon a gentleman notorious (I don't use this in a bad sense) for his large out-put per acre of poor-priced tea! The fact is that Directors of poor paying Companies are at their wits' ends to prolong their existence\* in the face of low tea prices and high exchange. There is a crumb of comfort in the fact that our Ceylon tea per last London circular May 27th 1898 is averaging 7½d against 7¼d in the same week 1897.

What has come over our LANTANA? You see large tracts of Lantana dying off or blackened in Dumbara, Kadugannawa, etc. Rumour has it that an imported bug is responsible for this and that we shall have no lantana in Ceylon in two or three years' time. If the bug then finds its way on tea, what a treat the tea farmer has in store for himself!

A young CREEPER when he arrives in the island finds CEYLON MOSQUITOES and fleas quite willing to feast on his new blood. It appears that new insect pests have no enemies to attack them for some time after their arrival, hence the rate they multiply at. I would rather be a *new bug* than a *creeper*.

#### "CEYLON" COFFEE IN CONGO FREE STATE.

MR. VANDER POORTEN RESPONSIBLE FOR ITS  
INTRODUCTION.

(From the *B. C. Africa Gazette*, April 9.)

At Uesso experiments have been made on a modest scale both with the Liberian bush, and with what is described by the "Mouvement Geographique" as indigenous coffee. The former appears to have been a failure but the latter is said to have afforded the most gratifying results. A specimen of this so called indigenous coffee was transmitted to Belgium with a view to obtaining the opinion of experts upon origin and capabilities, and the following report has been issued by the Vice-President of the Chamber of Commerce and his colleagues. "After a minute analysis we have come to the conclusion that this coffee must have originated in Ceylon. Our decision on this point is to a certain extent confirmed by the fact that, in 1893-94 M. de Porter, formerly Belgian Consul in Ceylon, came to Africa and began to plant, in a tentative fashion, upon the Congo plateau. It is more than probable that he introduced in this way what is known as Ceylon coffee. The specimens submitted to us though rather smaller than the Ceylon berry resemble it closely in colour and form. Their flavour is decidedly superior and rivals that of our choicest varieties. The gathering of the coffee must have been effected at precisely the right moment, for it has retained to perfection its tender bluish green colour and silvery outer skin. The preparation and transport must also have been carried out in the most careful manner, the specimens being entirely free from bruises and containing no black or withered bean. We should advise the authorities of the Free State to propagate this variety as widely as possible and to institute experiments with it in every part of the country under their jurisdiction. We have no doubts as to its favourable reception by consumers, nor can it fail to be highly remunerative, being nearly double the value of the varieties known as Liberian, African Mocha, and San Thomé of which our export has hitherto consisted, and which are, for the most part weak and of doubtful flavour."

Experiments are also being made in the cultivation of nutmeg, pepper, and of a species of vanilla peculiar to the Congo from which an excellent cream has been extracted.

\* That explains the story current about a circular, letter from one London Chairman to his Superintendent, presenting alternatives:—"Put 'tappence-a lb. on your tea, or expect the 'sack'!"—ED. T.A.

#### THE BUG ON LANTANA:

#### A SERIOUS MATTER, UNLESS DEALT WITH PROMPTLY.

We received recently a branch of bug-affected lantana from Mr. S. Agar, which we at once re-despatched to Mr. E. E. Green, Panduloya, the best authority in the island on any question of Entomology. Mr. Green had, however, no occasion to see this specimen as the appended letter which crossed ours will show. The pest, indeed, is not a new one, having been fully described three years ago. It will be observed on consideration of Mr. Green's facts and opinions that the matter is now a serious one, calling for immediate action on the part of private individuals as well as of the Government. Mr. Green writes:—

"June 15.—Referring to your note and Mr. Shelton Agar's letter in *Observer* of June 14th, it may interest you to learn that the Bug on Lantana is our old friend (or rather enemy), the *Orthozia insignis*, about which you printed a paper in 1895 (*T. A.* vol. iv., p. 437), republished as a pamphlet under the title "An Important Insect Enemy." In this paper, written when the insect first appeared in Peradeniya Gardens, I prophesied extension of the pest over the island by means of lantana, which is one of its favorite foods. My report was considered in some quarters to be of an unnecessarily alarmist character. The pest has now spread throughout a radius of at least 20 miles around Kandy, and it will be almost impossible to prevent its further progress. In the high jungles, it will find an equally favourable stronghold in the various species of *Strobilanthus* ("nilu"). Besides proving an eyesore on waste land, the pest is an intolerable scourge in the flower garden, attacking numbers of ornamental foliage plants, and it is most difficult to eradicate where once established. I am sorry to say that I have already found it attacking tea plants in the immediate neighbourhood of infected lantana bushes. In the case in question the lantana bush was destroyed, the affected tea heavily pruned, and the prunings burned, which has prevented the spread of the disease in this quarter. Unlike most scale insects, the *orthozia* attacks and prefers the young shoots of the plant. On the tea plants, it was found crowded upon the 'flush.' It is moreover a very active insect, and wanders freely from one plant to another.

"There is no doubt that this pest was introduced into the Botanical Gardens on imported plants,—whether from Kew or some other country remains an open question. This is only one of the many lessons that should turn our attention to the importance of establishing a system for the proper inspection and disinfection of all imported plants and fruit. All our most serious insect pests are imported ones. Situated as we are in Ceylon, with but a single port of entry, a little outlay in the establishment of a quarantine station might prevent enormous loss from the ravages of introduced pests."

In the first place must we not all as a community—and especially the leading planters around Kandy, Gampola and Matale—take blame for not attending to Mr. Green's warning in 1895? No doubt it may be said that the Government and its Gardens Staff should have led the way; but their inaction is probably explained by the illness and death of Dr. Trimen, while his successor may never have had the description of this pestiferous importation, brought specially to his notice. We quite recall Mr. Green's paper and the resulting pamphlet, copies of which are still available. Fortunately it is not too late to fight this "bug" with some prospect of success if the contest is gone into with heartiness and unanimity. According to Mr. Green, the bug is

confined so far to a twenty-mile circuit of Kandy and is there found on lantana chiefly if not alone? (Have any other planters seen it on their tea in the way described by Mr. Green?) We call then on every estate proprietor and manager,—within the prescribed circuit especially—to cut down and burn the lantana in his immediate neighbourhood if only for his own protection; and we call on Government to issue orders through its Agents to every Headman in the districts concerned, that wherever lantana is affected, they are to cut down and burn the same. We quote the instructions given in Mr. Green's pamphlet—which by-the-way includes figures in illustration of the bug and twigs affected—as to the best mode of procedure. Bad as a visitation of these minute and active little insects can be, it is very different from a well-developed fungus, like *hemiteia vastatrix*, the spores of which were blown about everywhere by the wind in millions. Still, without being in the least alarmist, the occasion is one to be "up and doing," and we think the Planters' Association and Chamber of Commerce should call on the Government to lose no time in taking effective action.

It will be observed that Mr. Green further indicates the necessity for following the example of other Colonies—frightened by the Ceylon coffee pest—in establishing an inspection (if not quarantine) of all plants and seeds imported. This is certainly proved by the case of the present pest to be most necessary: for we see that Dr. Trimen referred to the insect in 1893, but spoke of it as mainly a "garden pest" and made light of it then. Mr. Green's warning in 1895 was specially distinct and outspoken; but it passed by unheeded. Let there be no mistake and no procrastination now, on the part of either the Planting public or the Government.

A new importance too must henceforth be given to the question of importing "lady-bird beetles" of the species known as the deadly enemy of the coccus or bug tribe. The interest in this importation will now extend to our tea, as well coffee, planters and to the Government itself in a special degree. Meantime we give a few extracts bearing on the subject from Mr. Green's pamphlet:—

#### AN IMPORTANT INSECT ENEMY:

AND THE NEED FOR PLANTERS TO GUARD AGAINST ITS SPREAD.

By E. E. GREEN, ETON, PUNDALUOYA.

In Dr. Trimen's annual report on the Botanical Gardens for 1893, mention was made of the occurrence in the Peradeniya Gardens of a serious insect-pest which was most destructive to the ornamental shrubs there. As this pest has been increasing very rapidly and has already spread beyond the limits of the Gardens, it is important that general attention should be drawn to it. Within the Peradeniya Gardens efforts are being made to keep it in check, but it has appeared on lantana in the neighbourhood, and there is no knowing where it will stop. It has fortunately as yet shown no taste for either of our two most important products—tea and cacao. Coffee, however, does not share this immunity, for trees of Liberian coffee have been observed to be infested with the insect, and we have no reason to suppose that the Arabian species will be less liable to attack.

Dr. Trimen is of opinion that this is mainly a garden pest, and does not except that it will spread to estates. It is to be hoped that this prediction will prove correct; but it would be unwise to ignore the fact that, if unchecked, the pest might spread enormously and might possibly develop a taste for

other plants; as was the case with the "Fluted Scale" (*Icerya purchasi*) which, at first practically confined to acacia and orange trees, finally became almost omnivorous. "Forewarned is forearmed"; and, though it would be most imprudent to create a scare, it is still most advisable to point out a possible danger.

As mentioned above, the insect has obtained a foothold upon lantana. Should it once become widely and firmly established, it will be extremely difficult to deal with, and wherever lantana flourishes there will be a stronghold of the pest. Though most accommodating in its tastes this bug at present shows a preference for plants belonging to the natural orders Acanthaceæ, Rubiaceæ (which includes coffee and cinchona), and Verbenaceæ (of which lantana is a member). To the first of these orders belong our numerous species of "Nelu" (*Strobilanthes*) which might form another possible breeding-ground as extensive and even more impregnable than the lantana scrub.<sup>1</sup>

The insect is known to Entomologists by the name of *Orthezia insignis*, Douglas, being first described by Mr. J. W. Douglas from specimens found in Kew Gardens, where it is now said to be doing an enormous amount of damage in the plant-houses. It has more recently been figured and described by Mr. Buckton under the name of *Orthezia naerea*, ("Indian Museum Notes," Vol. III., No. 3, p. 103). The specimens submitted to Mr. Buckton were unfortunately damaged in transit; his figures are consequently not very satisfactory. Comparison with specimens from Kew proves the two insects to be specifically identical.

Originating as it does in the Peradeniya Botanical Gardens, there is little doubt but that we owe the introduction of this pest to plants received from Kew. Its native country has not been determined.

Like so many our insect enemies, this is one of the "scale-bugs" (*Coccidæ*), but is more active than many of the better known members of that family.

The accompanying figures (on our frontispiece) will be of assistance in the recognition of the enemy:—

(Then follow descriptions.)

#### REMEDIES.

Determined efforts should be made to stamp out the pest upon its first appearance in any locality. Infected plants should be treated *on the spot*, regardless of expense and, if necessary, with complete sacrifice of the plant. Too great stress cannot be laid upon the importance of "Treatment upon the spot" in all cases of serious insect-pests. The pruning of affected plants and subsequent carriage of the cuttings to some spot where they might be burnt or buried would only serve to sow the pest broadcast along the route of transport. However much a fixture the adult insect may seem to be, as in the case of many of the scale bugs, it must be remembered that the young are very minute, very active, and usually very numerous. Should a colony of the insects be discovered upon any plant, a good-sized hole might be dug beside it, in which a fire of dry brushwood and grass could be lighted. The plant should then be cut down or pruned to bare poles, the prunings thrown directly on to fire, and all dead leaves and rubbish from below the plant swept into the hole. The hole should afterwards be filled with earth to prevent the escape of any possible survivors. In places where the pest has established itself on lantana or other waste land, such patches should be fired. On cultivated land such extreme measures will usually be impracticable. In this case repeated and thorough spraying with insecticides will be the only available course.

[Details of emulsion, etc., followed.]

Mr. Green winds up with the following important paragraph:—

"Mr. Albert Koehle, the celebrated discoverer of the Australian beetle (*Vedalia carminalis*) which cleared the Californian fruit orchards of the dreaded 'Fluted Scale' is now on a visit to Ceylon. He has seen this *Orthezia* at work in the Peradeniya Gardens, and has made the acquaintance of the

'Green-bug' that killed out our coffee. He asserts that there are Australian beetles that would assuredly destroy these two pests. It is hoped that a consignment of these beetles will shortly be procured, and that they will soon become established in Ceylon."

Mr. Green then appends to his pamphlet, as related very much by Mr. Kœbele and substantiated by other authorities,—“the Story of the Fluted-Scale (*Teerya purchasi*) in California and its Eradication through the introduction of a Pedaceous Australian Beetle.” It is a thousand pities, in the interests of coffee as well as of all our planting operations that when Mr. Kœbele was in Ceylon in 1895, the Government did not engage his services to go to Queensland to bring over a consignment of the celebrated “Vedalia”; but it is not too late to secure such consignment either through the South Indian Agent, or independently on our own account. Whatever may be done in destroying the lantana and fighting the bug by fire, burial or kerosine emulsions in the first place, there can be little doubt that the most effective means of keeping in check, if not of clearing off “*Orthezia insignis*” as well as our old friends of the black, white and green bugs—described in Neitner’s “*Enemies of the Coffee Tree*—will be to import the Vedalia or Lady-bird beetles. “To this complexion we must come at last” and the sooner the better.

#### INDIA RUBBER IN FRENCH CONGO.

The “*Mouvement Geographique*” of January 30th, speaking of the manufacture of rubber in the French Congo, says:—“The rubber is sold in balls weighing either 120 grammes or about 6 grammes. The larger balls contain a superior quality of rubber, which is obtained by treating the latex with fresh lime-juice. The smaller balls are prepared with lime-juice which has already been used. The natives add a certain proportion of marine salt which serves to facilitate the precipitation of the rubber. The commercial article is obtained from a species of liana called by the Bakala ‘Djomial’ (Landolphia?) This is the only liana capable of producing rubber of a fine quality, though many others, notably the ‘Akounya’ and the ‘Aboundje’ yield this material; the first named forming a soft rubber devoid of elasticity and strength, while the second gives a substance which, when dried, is possessed of considerable firmness. These three are the only varieties of liana exploited by the natives.”—*B. C. African Gazette*, April 9.

#### CEYLON TEA IN CHINA.

The following note is from the *Westminster Budget*. English residents at Shanghai sending to Ceylon and India for their tea is, no doubt, not entirely imaginary; and “the Tschang-Tschilung” is excellent;—

The Chinese Mandarins, in order to save themselves pain, appear to be at present hiding their heads in the sand as the ostriches are popularly supposed to do. One of them, however, has determined to make the best of the position, and he sees no reason why, if the foreigner cannot be turned out of China, he should not be made of some service. The refusal of the authorities to allow the introduction of modern machinery and modern methods of cultivation into the tea plantations has gone far to ruin the once extensive trade in tea that China carried on with Europe. English residents at Shanghai have, it is said, found it cheaper to send to Ceylon and India for their tea than to buy from the Chinese planter at their very door. But the Tschang-Tschilung, Governor of the great provinces of Hunan and

Ngpeh, decided to overthrow the old prejudices that prevented the employment of modern methods of cultivation, and there is no reason why the Celestial Empire should not again become one of the great tea-growing districts of the world. It is another proof that

“*Ill blows the wind that profits nobody.*”  
—*N. C. Herald*, May 30.

#### PALM KERNELS: A NEW INDUSTRY.

The crushing of seeds and nuts for the oil which they contain and the preparation of feeding stuffs from the residue is, so far as England is concerned, a comparatively new industry. And one of the most important phases of this business is that which centres round the products of the oil palm, and plays such a considerable part in the trade between the West Coast of Africa and Liverpool. This palm—a beautiful tree of the umbrella pattern—flowers about September or October, and the fruit ripens about four or five months afterwards, the main crop being gathered from February to May. The fruit is gathered by natives, who ascend the trees by means of ropes—sailor fashion—and detach the masses of nut clusters, or “hands” as they are called, with a small axe or cutlass. The nuts are then heaped on the ground, covered with palm leaves, and left for a week in the hot and more or less moist atmosphere to ferment. During this process the nuts become loose in their sockets, and are removed by hand and placed in baskets. The next process aims at the separation of the nut proper from the seed vessel, or pericarp. First, huge earthenware pots are taken, with a capacity of about 12 or 14 gallons, and in these are placed about half a hundred weight of nuts. Water is added and the pot placed over a slow wood fire. After two hours’ boiling the seed vessel is sufficiently soft to be squeezable by the fingers. The nuts are then placed in the bottom of a canoe drawn up on the river-bank, and the natives tread out the nuts from the encircling pericarp with their bare feet. Three men will thus tread out 250 lbs. in an hour. Water is then poured into the canoe to a depth of 3 to 4 inches, and the nuts treated to the final separating process by being rocked, stirred, and shaken. By this means the kernels with the hard shells containing them become detached from their pericarp, and after drying in the sun are cracked between stones so as to separate the “palm kernels” of commerce from the hard shell enclosing them. But the water in the canoe has become covered with a yellowish oily scum. This is carefully collected in calabashes, and the pericarp fibre is squeezed and washed, and finally pressed in a mortar to extract the remaining particles of oil, and being of no further commercial value, is thrown aside to be used as fuel. Thus, the West African negroes supply us from the oil palm with two valuable articles of commerce—palm oil and palm kernels. The processes employed are wasteful, no doubt, and the absence of means of communication, save by the rivers and creeks implies that many thousands of tons precious produce are annually allowed to rot. This waste, however, is gradually being reduced, and with the advent of much required railways, our supplies of West African tropical produce must be increased indefinitely. The bulk of the palm kernels—or rather that section of them shipped to England—find their way to Liverpool, and it certainly did not reflect creditably upon the enterprise of the merchants of the Mersey port that the major portion of such imports also figured in the exports or transshipments from Liverpool to Continental ports.—*Syren*.

THE POPLAR is an excellent conductor of electricity; they prove, when planted near houses, excellent defences against lightning, owing to their height, and their influence upon the electric fluid. [The same may be said of the coconut palm.—*Ed. T.A.*]

## ARTIFICIAL INDIA RUBBER.

## WHAT NEXT?

One of the most recent important events in the history of chemistry was the discovery by an English professor that a substance corresponding in every respect to India rubber may be produced from oil of turpentine. Dr. W. A. Tilden, Professor of Chemistry in Mason College, Birmingham, began a series of experiments with a liquid hydro-carbon substance, known to chemists as isoprene, which was primarily discovered and named by Greville Williams, a well known English chemist, some years ago, as a product of the destructive distillation of India rubber. In 1884, says the *New York Sun*, Dr. Tilden discovered that an identical substance was among the more volatile compounds obtained by the action of moderate heat upon oil of turpentine and other vegetable oils, such as rape-seed oil, linseed oil and castor oil.

Isoprene is a very volatile liquid, boiling at a temperature of about 56 degrees Fahrenheit. Chemical analysis shows it to be composed of carbon and hydrogen in the proportions of five to eight. In the course of his experiments Dr. Tilden found that when isoprene is brought into contact with strong acids, such as aqueous hydrochloric acid for example, it is converted into a tough elastic solid, which is, to all appearances, true India rubber. Specimens of isoprene were made from several vegetable oils in the course of Dr. Tilden's work on those compounds. He preserved several of them and stowed the bottles containing them away upon an unused shelf in his laboratory. After some months had elapsed he was surprised at finding the contents of the bottles containing the substance derived from the turpentine entirely changed in appearance. In place of a limpid, colourless liquid, the bottles contained a dense syrup, in which were floating several large masses of a solid yellowish colour; upon examination this turned out to be India rubber. This is the first instance on record of the spontaneous change of

## ISOPRENE INTO INDIA RUBBER.

According to the Doctor's hypothesis, this spontaneous change can only be accounted for by supposing that a small quantity of acetic or formic acid had been produced by the oxidizing action of the air, and that the presence of this compound had been the means of transforming the rest. Upon inserting the ordinary chemical test paper, the liquid was found to be slightly acid. It yielded a small portion of unchanged isoprene. The artificial India rubber found floating in the liquid, upon analysis showed all the constituents of natural rubber. Like the latter, it consisted of two substances, one of which was more soluble in benzine or in carbon bisulphide than the other. A solution of the artificial rubber in benzine left, on evaporation, a residue which agreed in all characteristics with the residuum of the best Para rubber similarly dissolved and evaporated. The artificial rubber was found to unite with natural rubber in the same way as two pieces of ordinary pure rubber, forming a tough, elastic compound. Although the discovery is very interesting from a chemical point of view, it has not as yet any commercial importance. It is from such beginnings as these, however, that cheap chemical substitutes for many natural products have been developed. Few persons outside of those directly connected with

## RUBBER INDUSTRIES

realized the vast quantities imported yearly into this country. Last year there were brought into United States ports, as shown by the reports of the customs officers, no less than 34,348,000 pounds of India rubber. The industry has been steadily progressive since the invention of machinery for manufacturing it into the various articles of everyday use. The wonderful growth of the India rubber interests in this country will be seen from the statistics compiled in the tenth census. In 1870 there were imported 5,122,000 pounds at an average rate of \$1 per pound in 1880 the imports were 17,835,000 pounds at an average price of 85 cents per pound, in 1890 31,949,000 pounds were imported at an average price of 75 cents

per pound. The present price of India rubber varies from 75 cents per pound for fine Para rubber to 45 cents per pound for the cheapest grade. It will be seen that, notwithstanding the increase in importations, the price of the raw material remains at a comparatively high figure. Many experiments have been made to find a substance possessing the same properties as India rubber, but which could be produced at a cheaper rate. Many of the compositions which have been invented have been well adapted for use for certain purposes, and have been used to adulterate the pure rubber, but no substance has been produced which could even approach India rubber in several of its important characteristics. There has never been a substance yet recommended as a substitute for rubber which possessed the extraordinary elasticity which makes it indispensable in the manufacture of so many articles of common use. Great hopes were at one time placed in a product prepared from linseed oil. It was found that a material could be produced from it which would, to a certain extent, equal India rubber compositions in elasticity and toughness. It was argued that linseed oil varnish, when correctly prepared, should be clear and dry in a few hours into a transparent, glossy mass of great tenacity. By changing the mode of preparing linseed oil varnish, in so far as to boil the oil until it became a very thick fluid and spun threads, when it was taken from the boiler, a mass was obtained which, in drying, assumed a character resembling that of glue. Resin was added to the mass while hot, in a quantity depending upon the product designed to be made, and requiring a greater or less degree of elasticity. Many other recipes have been advocated at different times to make a product resembling caoutchouc out of linseed oil in combination with other substances, but all have failed to give satisfaction, save as an adulterant to pure rubber.

Among the best compounds in use in

## RUBBER FACTORIES

at present is one made by boiling linseed oil to the consistency of thick glue. Unbleached shellac and a small quantity of lampblack is then stirred in; The mass is boiled and stirred until thoroughly mixed. It is then placed in flat vessels exposed to the air to congeal. When still warm the blocks formed in the flat vessels are passed between rollers to mix it as closely as possible. This compound was asserted by its inventor to be a perfect substitute for caoutchouc. It was also stated that it could be vulcanized. This was found to be an error, however. The compound, upon the addition of from 15 to 25 per cent of pure rubber, may be vulcanized and used as a substitute for vulcanized rubber. Compounds of coal tar, asphalt, &c, with caoutchouc have been frequently tested, but they can only be used for very inferior goods.

The needs for a

## SUBSTITUTE FOR GUTTA PERCHA

is even more acute than for artificial India rubber. A compound used in its stead for many purposes is known as French gutta percha. This possesses nearly all the properties of gutta percha. It may be frequently used for the same purposes and has the advantage of not cracking when exposed to the air. Its inventor claimed that it was a perfect substitute for India rubber and gutta percha, fully as elastic and tough, and not susceptible to injury from great pressure or high temperature. The composition of this ambitious substance is as follows:—One part, by weight, by equal parts of wood tar oil and coal tar oil, or of the latter alone is heated for several hours at a temperature of from 252 to 270 degrees Fahrenheit, with two parts, by weight, of hemp oil, until the mass can be drawn into thread. Then one-half part, by weight of linseed oil, thickened by boiling, is added. To each 100 parts of the compound, one-twentieth to one-tenth part of ozokerite and the same quantity of spermaceti are added. The entire mixture is then again heated to 252 degrees Fahrenheit and one-fifteenth to one-twelfth part of sulphur is added. The substance thus obtained, upon cooling is worked up in a similar manner to natural India rubber. It has not been successfully used, however, without the

addition of a quantity of pure rubber to give it the requisite elasticity. A substitute for gutta percha is obtained by boiling the bark of the birch tree, especially the outer part, in water, over an open fire. This produces a black fluid mass, which quickly becomes solid and compact upon exposure to air. Each gutta percha and India rubber factory has a formula of its own for making up substances as nearly identical with the natural product as possible, which are used to adulterate the rubber and gutta percha used in the factory. No one has as yet, however, succeeded in discovering a perfect substitute for either rubber or gutta percha. The history of chemistry contains many instances where natural products have been supplanted by artificial compounds possessing the same properties and characteristics. One of the most notable of these is the substance known as alizarine, the colouring matter extracted from the madder root. This, like India rubber, is a hydrocarbon. Prior to 1869 all calico-printing was done with the colouring matter derived from the madder root, and its cultivation was a leading industry in the eastern and southern portions of Europe. In 1869 alizarine was successfully produced from the refuse coal tar of gas works and the calico-printing business was revolutionized. The essence of vanilla, made from the vanilla bean, and used as a flavouring extract, has been supplanted by the substance christened vanilla by chemists, which possesses the same characteristics and is made from sawdust. Isoprene, from which Dr. Tilden produced India rubber, is comparatively a new product, as derived from oil of turpentine. It yet remains to be seen whether rubber can be synthetically produced certainly and cheaply. The results of further experiments will be awaited with interest, as the production of artificial rubber at moderate cost would be an event of enormous importance.—*Scientific American.*

#### CEYLON TEA IN AMERICA AND RUSSIA.

If there is to be any contest on the question raised by a Colombo merchant a few days ago in our columns, we feel that it should be fought out in the "Committee of Thirty"; but meantime the following deliverance on the other side of the case, by a leading planter, is worthy of careful consideration in Colombo, and while our Commissioner is at work in America he must, of course, have unanimous and cordial support to secure the fullest measure of success:—

"I know Mr. Wm. Mackenzie's letters, and utterances, have left a soreness in Colombo, but to my mind there never was a more opportune moment than now for pushing, with increased energy and vigour, our campaign in America, we have still 70,000,000 lb. of green tea drinkers to win over, and now that our teas have already commanded attention, and those most opposed to us, are compelled to hold them, because they cannot resist the demand from their customers, it would be madness in my opinion to slacken one jot of our energy; for, every pound of tea taken off the London market is a gain, and helps to maintain prices, and if Mackenzie was withdrawn, and the work left to go casually on, without anyone to check or watch how the grants-in-aid were applied, we should soon have a falling off in exports to America, and where would then be our London market? The 11½ million pounds of British-grown tea taken in America last year, was the saving of Ceylon, for without that additional market, our prices would have been fully ½d lower, which to many estates would have meant a loss on production.

"I quite concur with you that more should be done in Russia, and I believe the 'Thirty Committee' are only awaiting letters from Mr. Christie, who is to look out some reliable man, (vide

published Report of Thirty Committee meeting on 16th Feb. 1898) to whom can be entrusted the advertising in all the large and important towns. This will help all interested in tea, and I hope be a means to increase direct orders from Colombo. With regard to publication of accounts I see from Report of Thirty Committee meeting of 20th May that members are to have a full and detailed statement for the past year. Names cannot be given to the public, as you can easily realize, great jealousies would arise if one man who was getting a grant-in-aid from the Fund, learnt that another (perhaps in the same town) was getting more, and we must protect our Commissioner, and trust him. I contend we must not stop our efforts in America, financially or otherwise, until we have so securely got hold of the tea-drinking public, that they will not go back to China or Japan teas, which in my opinion they would do, if left alone now, or at the end of this year. The Committee will require every cent of the Cess when they really launch into Russia and the Continent, and I consider it would be a very short-sighted policy to attempt to reduce it. We must remember that in Mackenzie we have a very independent man, he has no need to work, but I believe has gone heart and soul into this American business for the love of the old Colony."

#### COFFEE IN COSTA RICA.

A Maskeliya planter writes:—"The following extract from a private letter from Mr. R. P. Macfarlane formerly of Cannavarella, may interest some of your readers. He (R. P. M.) is now enjoying good health." We are very glad to have good news of this esteemed Uva proprietor and to learn about Costa Rica as follows:—"The coffee I saw in Costa Rica beats anything I ever saw in Ceylon. They have no leaf disease, and the soil is very rich and deep. Ramasamy would revel in it, as there are few stones, and it is very soft. However the drawbacks are scant and dear labour and awful roads; they drive laden carts over roads we would have thought a good many times about before attempting to ride over. It is a lovely country with vegetation ahead of Ceylon. I never saw such a display of orchids in my life. Everything appears to grow well there; but being a Spanish Republic makes it a very different place from a British Colony."

"DAIRY FARMING FOR TEA PLANTERS," is the title of a long article in the Indian *Planters' Gazette* of course written with reference to the circumstances of Assam; but we quote the conclusion:—

Apart from the suggestions of prosecuting the industry of dairy farming in conjunction or as an adjunct to general factory work, there is the important matter of manure. The manure from cattle well nourished on substantial food will be more valuable than from those fed upon the scant herbage afforded by their usual grazing grounds; thus, a further incentive is given to planters and all connected with the tea districts, to accord support and encouragement to dairy farming; 10,000 head of cattle would yield about 200 tons of manure daily; thus the success of the gardens may be said to be secured. Many people have an objection to buffalo milk and butter, but it is seldom the latter can be distinguished from the product of the common cow. All things considered, we are of opinion that a dairy establishment set up, say, at Brahminbarrie or some other equally eligible site on the Assam-Bengal Railway, offers as promising an investment as anything in the agricultural line we know of.

## COCONUT AND TOBACCO PLANTING IN TRINCOMALEE DISTRICT:

### EARLY PIONEERS.

*From a Correspondent.)*

In this district the only European efforts have been by the late Capt. Maloney of Uganda fame and Lieut. Kirkpatrick, situated by Upaar in Kottiar Bay and by Mr. Lushington at Nilavelly. Why other speculators don't turn their attention towards Trincomalee seems strange. There are good lands available in Kottiar pattu and considering that water transit costs far less than land carriage, these lands must surely be attractive. Those lying by the mouth of the Kottiar river towards Foul Point and the islands in "Kattaiarichchan aar and off Foul Point inwards by the South sea shore, are admirably suited for coconut culture.

Lands lying beyond the village of Kottiar between the angle where the "Mahawili Ganga" branches off to the east coast and to Kottiar Bay and such others as are irrigable under the catchment of "Allai" and minor irrigation tanks in the pattu are specially adapted for tobacco cultivation. These are all now jungle lands and not noticed because attention is only given to the spots lying towards Nilavelly.

The European capitalist will find tobacco culture a most paying concern, at present the native cultivators speculate un-borrowed money which enriches the lender, but leaves the planter at the end as poor as when he began the undertaking. I am told that this season's tobacco now safely piled, will not be sold off till by the end of July or August.

There are fine Crown land by the Hot wells hillock from whence there are many streamlets of water quite enough to irrigate a large area for a good farm or garden. The climate is humid, soil excellent and elevation fitting, so it seems strange that speculation is not met in this direction. Hot wells is the only site where the Kittul palm flourishes in this Province. I am informed that Pepper culture was in days gone by successfully carried on; but why abandoned I cannot just now gather.

Cotton seems once to have been tried as some vast acreage of jungle land bears testimony from their designation as "Parathie pullavol" or cotton plantation. All along the Trinco-Anuradhapura road there are vast tracts of estate lands.

Captain Colomb, a French Naval officer who quitted France during the Revolution, and settled with his family at Trincomalee, seems to be the pioneer European planter towards the Anuradhapura side of Trincomalee. Remains of clearings made by him called "Franscara thotum" are yet to be seen and he was I am told the only European who brought labourers from Mosambique whose descendants are now the Caffre settlers of "Palanttu" a village skirting the Inner Harbour. Remains of the Caffre dwellings are yet to be traced at "Thattaiyak" which was the Captain's nearest clearing.—17th June.

### PLANTING NOTES.

**THE INDIAN TEA ASSOCIATION.**—Could not the Secretary of this body in Calcutta manage to have the Minutes of Proceedings at its Meetings, published within a week in the press, in place of being delayed for a month or so? Even we in Ceylon take enough interest in these proceedings, to prompt this request.

**TEA PRUNING.**—An experienced planter criticising "1874's" proposals, says:—

"Some of the writer's suggestions have been carried out by me for some years and now I do not approve of them, or have found different treatment more successful."

Our friend promises us a letter on the subject, a little later.

**LEGEND OF THE TEA PLANT.**—Dhrama, the ascetic priest, was the son of a king of India. He went into China and for the space of nine years he remained in contemplation in a temple. Later he went to Japan, and he died on Mount Katavka. He imposed upon himself, as the first rule of his life, privation from sleep. One day, indignant at falling asleep, he cut off his eyelids and threw them away as miserable sinners. From the spot where the eyelids had fallen sprang up a bush which is the tea plant, affording the perfumed beverage which chases away sleep.—"Vick's Magazine."

**JAVA QUININE.**—We have no desire to supersatiate those who read this report with facts about the Java quinine-factories; still, we cannot overlook the circumstance that Mr Consul Davids, in his report to the Foreign Office (No. 2,095, 1½d), mentions the matter, stating that the planters have seen that the policy of sending their bark to Europe was "a mistaken one, and a number of them are now affording the local manufactory good support, and are giving it a considerable share of their bark for manipulation, so that the enterprise is confidently expected to be a success." There is nothing in this quotation which we have not already reported, but it has the distinction, if any, of coming from a British Blue Book.—*Chemist and Druggist.*

**EXHIBITION IN WESTERN AUSTRALIA.**—We had a call today from Mr. E. T. Scammell who is on his way to England by the ss. "Stuttgart" to act as Commissioner for the Westralian Exhibition to be held in March next. Mr. Scammell, whom we had met on previous visits, enquired what chance there was of Ceylon taking a part. We replied that the first step should be an official invitation from the Westralian Government to that of Ceylon and that then we saw no reason why Ceylon should not send an interesting if limited set of exhibits to the Show of its nearest Australian neighbour,—a Colony which through the Coolgardie gold discoveries, has advanced so wonderfully since we visited Perth and the surrounding country in 1875. We think that exhibits of our staple products ought certainly to be sent to the Westralian Exhibition and specially of our staple tea.

**THE PEARL FISHERIES: INTERESTING BUT DOLEFUL.**—An oyster-bed would be a risky thing for anybody to speculate in, seeing that oysters have a disappointing habit at times of suddenly deserting a bank. We are not thinking of oysters for eating purposes, such as the small store of humble molluscs at Ennore, but of the great oyster-beds connected with the pearl-fisheries down Ceylon. Captain Donnan, the authoritative reporter on the pearl banks of Ceylon, has just returned from a serious inspection. As the result Capt. Donnan "regrets having to report that no oysters were found on any of these banks." To read of oysters disappearing by the 155 million is an insight into what an oyster bed is like; but it is a regrettable thing that what is a considerable industry in Ceylon should be in a bad way. Pearls for the next few years are not likely to be cheap—so far at least as the Ceylon production is concerned.—*Madras Times.*

INDIAN LABOUR FOR EASTERN COLONIES.—We see (says *Indian Engineering*) that the district of Tanjore furnishes nearly all the free emigration from the South of India to the Straits Settlements, where the demand for the "Kling" coolie is an ever increasing quantity. Ceylon, on the other hand draws its requirements from the districts of Madura and Tinnevely. It is noteworthy that the "Carungee" coolie never looks to either of these Colonies as a field for employment. His special preserve appears to be Burma, but it would appear from the returns that that monopoly will be short-lived, as the "Tamil" from the South bids fair to outrun him ere long.

CINCHONA LOOKING-UP.—Is it not time for Ceylon planters who have patches or scattered trees, or even stumps with suckers, of cinchona on their estates, to look them up and down, with a view to cultivation and possible harvesting of bark, root and otherwise? There need not be a rush at least in shipments; for bark is an article that can be kept any length of time without much damage, until the market favours shipment. A Ceylon planter who went over to one of the divisions of Travancore lately, was astonished to find 30 acres of officinalis cinchona on the estate placed under his care. Lucky proprietor with 300 acres of possibly mature cinchona, at a time when the price is undoubtedly looking-up!

"THE QUEENSLAND AGRICULTURAL JOURNAL." Vol. II. Part 5. The following are the contents for May 1898:—Co-operation Again; Agriculture—Co-operative Flour Mills; Queensland Agricultural College: The Cockatoo Farmer; Those Summer Crops; Onion Growing on the North Coast; Jerusalem Artichokes and Crocuses; Old Bones and How to Utilise Them; Brussels Sprouts; Four Year's Farming in New South Wales; Liability of Nurserymen; The Hot-water Treatment of Seed Wheat; Yield of Wheat in Australasia; Wheat Harvest, 1897-98; Pumpkins; The Economic Feeding of Working Horses; Dairying; Horse-breeding—Cross-breeding; Poultry; The Orchard; Viticulture; Botany; Economic Botany; Popular Botany; Horticulture; Tropical Industries—Cultivation of Tobacco; Ramie Fibre (Rhea); The Divi-divi; The World's Cane Sugar Industry; Chemistry Entomology; Tick Fever; Forestry—Some Timber Trees of Queensland. No. 2; Trees—Their Benefits to Man; Artesian Wells, &c., &c.

THE CALCUTTA TEA AUCTION yesterday (June 10)—says the *Pioneer* correspondent—passed with more spirit, but there is no doubt that there would have been a better demand from home but for the absurdly high estimate of outturn which was telegraphed home by the India Tea Association. A revised estimate will not be prepared till August I believe and meanwhile the Committee of the Association for some reason or other appear to think it unnecessary to wire the true state of affairs to the London dealers. Cachar and Sylhet are much behind last season in outturn and will not now be able to catch up to last year's figures. Assam and Darjeeling are (although to a less extent) also behind the yield of season 1897. There has not been a single transaction in tea shares and this is not to be wondered at. What is wanted in Calcutta is a Planters' Association, and I hear there is every probability of subscriptions to the present Association being discontinued by some of the gardens. The Ceylon Planters' Association are to be congratulated on the energy with which they have taken up the currency question. The Indian Tea Association, on the other hand, have done practically nothing in the matter although I did hear that one of the members, was at length preparing a letter to be sent to the Currency Committee.

WHO IS M. GUNERATNE?—The following appears in the *Investors' Guardian* of May 23:—

Guneratne, Ltd. (57,399).—Registered May 18. h, with capital £1,000, in £1 shares, to adopt an agreement with M. Guneratne, and to sell and deal in Guneratne's Curry Powder in the United Kingdom. Table A mainly applies. Registered by E. Goddard & Aldridge, 6 Old Serjeants' Inn, E.C.

LIBERIAN COFFEE IN SUMATRA.—We have had further assurances and evidence given as to the success of coffee in the Serdang division of Sumatra. Whatever may be the case in the solitary instance in another district, where tea had to be substituted, there can be no question that in Serdang, as Mr. Turing Mackenzie has consistently reported, the growth and prospects are most satisfactory.

ARTIFICIAL SUBSTITUTES FOR INDIA-RUBBER AND GUTTA-PERCHA form the not very comfortable theme discussed in an article in our *Tropical Agriculturist* from the *Scientific American*. Fortunately, there is nothing beyond the experimental stage as yet and we know how long "artificial quinine" has been incubating with the probability that the artificial, if ever attained, would be dearer than the natural product.

POOR COFFEE!—says the *American Grocer*, May 11th:—"The total supply of coffee for the year ending June 30th, 1898, is estimated as follows:—

	Bags.
Visible supply, July 1, 1897	.. 3,975,380

The above shows that there is no chance for a "bull" campaign in coffee to succeed, and that if the law of supply and demand asserts itself, there must be a reaction from present prices."

THE BUGGED LANTANA AND SENDING SPECIMENS BY POST.—We have received a well-merited "censure" and warning from Mr. E. E. Green which we must make public for the benefit of all and sundry. It will be remembered that we received a lantana-bugged branch from Mr. Shelton Agar which we sent on to Mr. Green in paper cover as it came to hand. Mr. Green rightly declares that this is just one easy way of spreading the bug, and that it got into his tea through specimens sent in the same way by some one when he was in England. The warning for all and sundry is that *specimens of this pest and of all similar pests should only be sent by post or transmitted from one district to another in tin, or otherwise hermetically closed*. We ought to have remembered this fact; because in 1884 when by special request from the Academy of Sciences of California we carried thither specially choice specimens of the coffee fungus (*Hemiteia vastatrix*) kindly provided for us by Mr. Gordon Pyper of Hantane, we had them enclosed in one tin inside the other and Professor Barkness was equally careful in opening and handling, not to give the chance of the spores escaping abroad! Let our readers then be on their guard how they send specimens of any insect or fungus pest by post save in tightly fitting tin cases.—We are glad to learn that the Planters' Association is likely to call the attention of Government at once to the pest, and to ask for a Report (no doubt from Messrs. Willis and Green) as to the best mode of getting rid of it,

## CORNERING WHEAT: AND HIGH PRICES.

Corners generally do not commend themselves to ordinary folk, though some superior persons, who are too fond of expressions like "rant" and "cant," and consider betting and gambling natural and legitimate incidents of horse-racing and other forms of sport, may consider everything fair in trade and in war. Specially objectionable is the cornering of food stuffs, so that men—generally very rich already—may grow richer on the absolute necessities of others. Very few, we fancy, will sympathise with the promoters of the wheat "corner" in America, of the collapse of which we have learnt by wire, even if they are not among those who lose heavily by what we cannot, but consider an immoral exhibition of cuteness. The worst of it is that the fall in prices is sure to injure so many more than the greedy adventurers, and to some extent unhinge legitimate trade; but if producers obtain, for some time to come less than a fair market price for their corn, they may have already been, to some extent, compensated by the prices that prevailed under artificial conditions. At the same time consumers must greatly rejoice at the heavy decline in prices which has immediately followed the collapse of the "corner." It would be a mistake, however, to suppose that the sharp rise in the price of bread in England—and, we fancy, the experience has been the same in most European countries—is due to the outbreak of hostilities between Spain and the United States, though the war has possibly tended somewhat to aggravate the situation. We find in a London weekly a very sober and thoughtful consideration of the chief cause of the rise in the price of bread which, happily, has led to no disturbance in the United Kingdom, though in some quarters almost a panic had arisen, from a recollection of the troubles which had to be overcome through dear bread not so very far back, and from the knowledge of what was going on in parts of the Continent, notably in Italy. Our home contemporary points out that the upward tendency in the price of wheat had begun since last harvest, before war was declared or considered to be inevitable. The explanation is that last harvest was deficient in Europe (including Russia), in India, and in Australia; and, in the opinion of the best authorities, the world's crop of wheat for 1897 was fully 30,000,000 quarters below the average; and that unfortunately meant a good deal below actual requirements. It is only in good years, when the outturn is above the average, that reserves can be stored; and when these begin to dwindle, prices naturally go up. This result was anticipated at the beginning of this year, and even at the end of last year: and although America was able to furnish the United Kingdom with all it wanted, it became a question, two or three months ago, whether she could send enough to Europe to meet requirements till the new crops from India began to arrive. It is calculated that France alone required to import 20 million quarters; and of that she was able to secure only 5 millions during the first four months of the year. Her home supplies being exhausted, France began buying abroad; and the result of nearly all the cargoes available going thither, was the further lowering of British stocks, and the rise in prices, but this began

before there was any alarm of war. When war was declared, it proved "a nervous shock acting on a feeble constitution," and the sudden jump in prices was out of proportion to the real need. There was thus no cause for undue anxiety, much less for alarm, in the situation in England, with heavy shipments coming steadily from North and South America and the expectation of the new crops from elsewhere, due this month and the next. But the food supply of the United Kingdom is always a matter of concern, seeing how large a proportion has to come from outside; and very opportunely are two considerations pressed on public attention.

The first safeguard suggested is the establishment of national granaries, which would render possible the storage of something more than provision for a month or two which is now the limit of the stocks known in Great Britain. There are difficulties in the way of carrying out this suggestion, one of the most obvious being that the preservation of grain for long periods is by no means an easy task. The other and chief safeguard, however, must remain the naval supremacy of Great Britain. Under most conceivable conditions, there need be no apprehension of actual famine from shortage of the world's crop. The highest bidder will always command grain, and Great Britain is better able to pay the highest price than perhaps any other country. It then becomes a question of transport; and that can be secured only with the full command of the sea. Naval supremacy means something more for Great Britain than commercial supremacy. It means insurance against famine, and even the very existence of the Mother Country and Empire. It is held to be pretty certain that there will be no permanent reversion to low prices for wheat for some time to come; as it takes more than a year for granaries, exhausted by short crops, to be filled, while current consumption is being met from good harvests. But scarcity and high prices have done this great service. They have made more clear than ever that there should be no relaxation in ship-building, that the naval supremacy of England must be maintained at all costs. Not only has the policy of the Government been abundantly justified, but its hands cannot fail to be strengthened by the experiences through which the country has recently gone.

## PRODUCE AND PLANTING.

A CHEERFUL STATE OF THINGS.—The feeling of sympathy with West Indian sugar planters ruined by foreign bounties should be extended to tea planters in the East. In India and Ceylon the tea industry is suffering not from the action of foreign governments, but by reason of the financial policy adopted by the Indian Government with the sanction and approval of the Government at home. The effect on tea is illustrated by the speech of the chairman at the Lungla meeting, a report of which appears elsewhere. He referred to the serious effect on the industry of the high quotation of the rupee, and mentioned that, so far as his company was concerned, every rise of one penny in the exchange meant a loss of £2,000. Seeing that since 1895 there has been an advance of 2½, this means that, as compared with three years ago, there is a loss equivalent to £5,000 per annum, which is certainly very considerable in view of the fact that the ordinary capital amounts to £100,000. He also pointed out that to the industry as a whole this appreciation of the exchange has meant a shortage of income of no less than £1,000,000. Then again, as regards the lower price of tea, he mentioned that every fall of one penny meant to his company a loss of £8,000.

**TEA PLANTERS AND THE CURRENCY.**—The following letter appears in *The Times* from Mr. Granville L. Acworth, late Chairman, United Planters' Association of South India:—"May 1, in behalf not merely of the European planter of India and Ceylon, but also of the millions of producers of the great Indian Empire who are unable to make their voices heard, support the proposal of Mr. Ernest Tye, that two members to represent the huge producing interest of India and Ceylon be added to the Indian Currency Committee? I do not think the public have adequately grasped what the proposals of the Indian Government in regard to the fixing of the rupee at 1s 4d mean to the producer. Taking silver at its present price of 264 per ounce it means that an export duty of some fifty per cent (50 per cent) is placed on all Indian products coming into competition with those of other silver-using countries; or to put it in other words, countries with a silver currency competing in India have a bonus of fifty per cent (50 per cent) placed on their goods by the Indian Government. Tea, coffee, cotton, jute, hides, seeds &c., will all suffer under this crushing tax, and, so far as the European planter is concerned, it simply spells ruin. We positively cannot on these terms compete with China, Brazil, Costa Rica, and the Central States of America. The end for us must surely come, as surely as it has to the sugar industry in the West Indies, for it must never be forgotten that it was bounty-fed beet and not fair competition that extinguished sugar planting in the West Indies.

**JAPANESE TEA PLANTING PROSPECTS.**—The tightness of money in Japan is said to be seriously embarrassing the tea trade there, and the rise in wages and in the prices of general commodities in recent years has likewise been severely felt by the planters. It is again stated that a considerable decrease in the production of tea in Japan will be a feature of the present year. We have previously pointed out that Japan teas are suffering in reputation in foreign markets as a result of careless and inferior methods of preparation, and attention is being called to this fact as a serious matter affecting the future of Japanese trade and finance, tea being a very important item in the exports of the country. The question is considered to be the more deserving of attention as Ceylon tea is now said to be steadily taking the place of Japan tea in many directions. The Central Tea Guild of Japan is taking the matter up, and is urging the producers in Japan to improve their methods. The Guild is also establishing tea inspection offices in Yokohama and Kobe, with the object of preventing the exportation of inferior tea.

**COFFEE IN JAVA.**—The decline in coffee prices, encouraged as it is by the great fall in the Brazil exchange, appears to be having a very adverse influence on coffee-planting interests in Java. A stage of depression there, it is stated, has now been reached which justifies fears of the worst. It is reported that many estates there are to be "shut down." The position is said to be most unsatisfactory in Cotie—Dutch East Borneo—where the suitability of the soil and climate to the cultivation of Liberian coffee led planters to open up estates very eagerly. Prices, especially for the Liberian description, have, however, fallen so low, and coffee growing in Brazil has been so extended, that all hopes of financial success in Cotie have now, it is stated, been abandoned. Only a year ago nineteen concessions for coffee planting in Cotie were applied for, but the outlook is at present so discouraging that all these applications will be allowed to fall through. Many coffee estates in Java also are reported to be in difficulties, and four are mentioned, valued in 1896 at 1,400,000 guilders, which are now in the hands of mortgagees, who intend to sell them by auction. It is added that the estates have, as a rule, been worked on so unsatisfactory a system that no provision has been made for bad years such as are now being experienced, planting companies having trusted to a continuance of the brilliant results at first attained.—*H. & C. Mail*, June 3.

## LADY BIRD BEETLES FROM AUSTRALIA :

### MR. NEWPORT'S MISSION.

We call attention to the important correspondence on the above subject given elsewhere. It will be observed that both the Director of Kew Gardens (Mr. Thibetson Dyer) and Mr. W. F. H. Blandford (a leading Entomological authority) deprecate the mission undertaken by Mr. Newport—who is supposed not to be a scientist,—and point out certain risks that may be incurred. At the same time, the success of Mr. Koebel's mission on behalf of California is acknowledged, and it will be observed that Mr. Koebel's authority is mentioned with respect, as also incidentally that of our own Mr. Green—though the latter wrongly (?) gets credit for work done by the late Mr. Nietner we think. We know how Mr. Koebel advocated, to Mr. Green, the getting over of certain lady-bird beetles which he was confident would work beneficially in the case of Ceylon. Under any circumstances Mr. E. E. Green's authority as a competent Entomologist is fully acknowledged and whatever the Ceylon Government and Planters may do under his advice, cannot be wrong. Could he not be persuaded to undertake a mission in person on behalf of Ceylon, that is if he thinks an enemy to *Orthesia insignis* as well as to "green bug" could be safely introduced.—It will be curious now to see what the United Planters' Association will do: perhaps it may turn out that Mr. Newport is a qualified Entomologist after all. It will be observed that the sum raised for his Mission is only £5,000 all told—half from the planters concerned and half from the Madras Government.

## THE LADY BIRDS AND COFFEE IN SOUTH INDIA :

### ADVERSE OPINION ON MR. NEWPORT'S MISSION.

(From a Correspondent.)

The Madras Government has communicated copies of correspondence received from the Secretary of State for India on the subject of the deputation of Mr. Newport to India for the purpose of obtaining lady birds. The following is the correspondence referred to in proceedings of the Madras Government:—

Read the following despatch from the Right Hon'ble the Secretary of State for India, Revenue No. 4 dated 28th April 1898:—I forward herewith a copy of a letter received from the Director of the Royal Gardens, Kew, and of its enclosure from Professor Blandford, offering some precautionary observations which may be useful on the subject of Mr. Newport's deputation to Australia for the purpose of obtaining a consignment of certain species of lady birds. I am aware of the circumstances in which Mr. Newport was selected for this duty in the absence of a skilled entomologist.

Enclosures: Letter from the Director of the Royal Gardens, Kew, dated 17th March, 1898.

1. I have before me the proceedings of the Government of Madras G.O. 351, 18th May, 1897, and G.O. 28th, 17th January, 1898, of which I have received copies through the Secretary of State in Council.

2. It appears from these that coffee in the Madras Presidency is affected with scale bugs and other insects. To remedy this state of things it has been decided by the Madras Government to pay Rs 2,000, a moiety of the expenses of the delegation of Mr. Newport to Australia, to collect and carry to India, a consignment of lady birds.

3. The principle of dealing with scale bugs by introducing their appropriate enemy has been worked out by American entomologists and is undoubtedly sound. But as pointed out in the papers there are 1,700 known kinds of lady birds and for the most part each of these will only feed on one kind of scale insect. The method therefore will obviously not work unless the appropriate enemy is set to work on its destined prey.

4. As it appeared to me doubtful if this point had been adequately considered by the Government of Madras, I obtained the opinion of Mr. W. F. H. Blanford, one of the Secretaries of the Entomological Society. This I enclose.

5. I may be permitted to observe that it appears to me improbable that any attempt to utilise these refined entomological expedients will lead to anything except waste of money and perhaps as Mr. Blanford points out worse mischief unless carried out by a competent expert.

LETTER FROM MR. W. F. H. BLANFORD, TO THE  
DIRECTOR OF THE ROYAL GARDENS, KEW. DATED  
15TH MARCH, 1898.

With respect to the support which the Government of Madras is giving to the United Planters' Association of Southern India, in order to send Mr. Newport to Australia, for the collection of ladybirds it is clear that the Government and the planters are relying on the success of the Hawaiian and American experiments in the same direction.

I have looked up as much information as I can find of what has been done in this direction, and it appears that certain Australian ladybirds (of the genera *Chilocorus*, *Orcus* and *Cryptolaenus*) have been found to attack and feed on species of *Lecanium* Insect Life, IV., 164-165.

Although the official papers are silent on the point, it may be inferred that the destructive coffee-scale of Southern India is *Lecanium viride* first described by Mr. Green from Ceylon. It is therefore quite within the bounds of possibility that Mr. Newport may provide a return for the Rs.5,000, by bringing back lady-birds that really will be useful in India.

At the same time, though not necessarily foredoomed to failure the experiment is being carried out on quite unscientific lines.

No study appears to have been made of the Indian parasites of *Lecanium* viride. Whatever the native home of this scale may be, it is presumably not Australian, as was *Icerya purchasi*; there are plenty of Indian Lady-birds, which perhaps already accomplish all the destruction that imported kinds could do.

The success of the "Vedalia experiment" has given rise to a sort of delusion that one must inevitably turn to Australia for coccidiphagous insects; and it is worth pointing out that *Icerya aegyptiacum*, Dongl., which has been introduced into India, was found in 1894 to be attacked in the compound of the Indian museum, Calcutta, by an indigenous species of *Vedalia* *V. fanida roseipennis*. In this case the introduction of the Australian *V. cardinalis* would have been utterly unnecessary.

In considering the chance of success of such experiments it is well not to lose sight of considerations thus expressed by Riley in a paper which lays down authoritatively the principles of such economic methods (Insect Life, 130 et seq.) There is very little to be hoped for in the miscellaneous introduction of predaceous or parasitic insects for the suppression of a phytophage which they do not suppress in their native home or in the country from which they are brought. All other things being equal, we should expect the species beneficial in Australia to be less so when brought to this country (America) a deduction which brings out still more clearly the exceptional nature of the case of *Vedalia* and *Icerya*.

Whatever good result the present experiment may have, must depend on Mr. Newport's capacity for carrying it out, and as the Planters' Association has vainly asked for the services of a skilled Entomologist, he must be presumed not to be one.

To study and collect suitable predaceous species from among the various Australian Coccinellidae

appears to me to be no easy task even for an expert, and to be probably beyond the powers of a non-entomologist.

The selection of the species is only an initial difficulty; possibly injurious forms must be eliminated, a point on which Mr. Koeble, who introduced *Icerya* into America, was specially cautioned. The examples collected must be brought back alive, and sufficient investigations of their life history &c., made to enable this to be done. Moreover they must be fed during the voyage on Australian scale-insects, unless Mr. Newport exports with him a supply of shrubs infested with *Laccanum Viride* on which to test and subsequently to rear the lady-birds. In either case there is a risk that unskilled management might introduce an Australian scale into India, or vice-versa, which would be a most lamentable outcome of an ill-considered experiment.

Order thereon. Misc. No. 2,294 dated 26th May, 1898.

Copies of the Correspondence received with the Right Hon'ble the Secretary of State's despatch read above will be communicated to the United Planters' Association of Southern India.

## INSECTS INJURIOUS TO STORED PADDY.

CIRCULAR FROM MESSRS. GREEN AND WILLIS.

Much alarm has recently been caused among paddy cultivators by the appearance in the granaries of large numbers of destructive insects, the most familiar of which is the paddy weevil. Much damage has been done by these insects; e.g., we have found in one sample of grain from the Kurunegala District 35½ per cent of empty grains, and in one from the Salpiti korale 75 per cent. The samples were probably taken from the bottom of the bins, where the damage is greatest; but even when allowance is made for this, the injury is still very serious, and if unchecked, the pest will affect the whole mass. Samples of both the "maha" and "yala" crops from the same district have been examined: the latter which has been longer in store shows a much larger proportion of damaged grain. The insects are always found in greatest abundance at the bottom of the bins; the reason for this is possibly that the bins have not been carefully cleaned before the grain was put into them. In America, where the grain weevil is also prevalent, the injury is found to begin at the top.

A careful examination was made of a particular sample from Kurunegala with a view to ascertain the kinds of insects present and their relative numbers. The result showed that 47 per cent or nearly half, consisted of small Hymenopterous parasites, belonging to the family *Chalcididae*, which had presumably been preying upon and destroying the insects actually injurious to the grain. The remaining portion consisted of small beetles of three distinct kinds, in the following proportions:—

(1) <i>Scolytid</i> beetles, species undetermined	64
(2) Rice weevils ( <i>Calandra oryzae</i> )	.. 32
(3) <i>Tenebrio</i> sp.	.. 4

Judging from the numbers represented, by far the greater portion of the damage seems to have been effected by the *Scolytid* beetles. This particular family of beetles usually attacks wood, but some few species are known to tunnel into hard seeds. There as so far been no record of their attacking food grains. All stages of the insects, from the larva upwards, have been actually obtained inside grains of rice in the samples examined on this occasion.

Next in importance is the common rice weevil, *Calandra oryzae*, a well known enemy to stored grain. This insect is always present to a small extent, but in the present season, owing to some unrecognized cause, there has been a very considerable increase in its numbers.

The third kind of beetle, *Tenebrio*, occurs in such small numbers as to be practically unimportant.

In other samples of grain examined, and in granaries near Kandy, we have also found large numbers of a small *Teneid* moth, the larva and pupa of

which have been found inside the injured grains. Although the cultivators say that this moth is always present in the granaries, and do not attach much importance to it, there is no doubt that they do a certain proportion of the damage. All these insects can be driven out of the grain, or actually killed by the same method of treatment. The recognized treatment in America, where most attention has been paid to the subject, is by means of the bisulphide or carbon, evaporated in open dishes on the surface of the grain. The vapour formed, being heavier than air, sinks through the mass of grain and destroys the insects. It is impracticable to use this remedy in Ceylon, on account of its extremely poisonous nature, and also because its importation is dangerous, by reason of its great inflammability.

A simpler and very satisfactory method is the use of ordinary naphthalene powder, which can be used both to drive out the insect already present and to prevent others coming in. It is cheap, and there is no danger in its use. It may even be swallowed in quantity without injurious effects. Fears have been expressed that the germinating powers of the seed paddy may be destroyed or injured by its use, but it has been tried in Burmah without any ill result, and there seems no reason to suppose that its use can in any way affect the germination.

Considering the fact that the beetles are chiefly at the bottom of the bins, the best results will be obtained by applying the naphthalene at this level. This can be done by the following method, devised by Mr. F. W. Cabaniss, Assistant Director of Agriculture, Burmah (see the "Agricultural Magazine," Colombo, December, 1897):—

"Take a bamboo about 1½ in. in diameter and long enough to reach from the top to the bottom of the bulk of grain. Pouch the joints out of the bamboo, so as to be able to pass a stick through the bamboo, from one end to the other. Have the stick made to fit the cavity in the bamboo. Pass the bamboo, with the stick in it, down through the bulk of grain from the top to the bottom. Withdraw the stick and drop into the top of the bamboo about half a teaspoon of naphthalene powder. The bamboo can then be drawn out as the naphthalene is safe at the bottom of the bulk of grain. If the bulks are large this should be done once to every 10 ft. square of the bulk. Repeat the application every fifteen or twenty days as the powder evaporates.

"The weevils that can leave the grain will do so, and those that cannot leave are killed by the odour of the naphthalene. I do not believe that naphthalene thus used can cause any injury whatever to grain. For seed purposes the germinating powers appear not to be affected in the least. For marketable grain the colour is not affected, and the odour will leave in a short time if fresh naphthalene is not applied to it. The quantity of powder used is infinitely small in proportion to the quantity of grain, and the powder is entirely destroyed by evaporation, so that for food purposes the effect is nil."

This method has already been tried by several Sinhalese proprietors, with satisfactory results. In one case that we examined 6 oz. of naphthalene had thus been applied to a bin containing 530 bushels of paddy; this had apparently driven away all the beetles, though only ten days before they had been present in very large numbers. All smell of naphthalene had disappeared from the paddy by this time. This was chiefly due to the fact that the bin was open above to the roof, so that air could freely enter from outside. To produce the best results the bin should be as closely fitting as possible. This will prevent the too rapid evaporation of the naphthalene, and will also help to keep out insects.

In cases where the grain is stored in wickerwork baskets, or other receptacles which admit the air freely, it will be advisable to render these more airtight before applying the naphthalene. This may be done by plastering them with cowdung on the outside.

Spreading the affected grain out in the sun in thin layers will also have a very useful effect, by killing off the grubs of the beetles before they arrive at

maturity; it will also tend to drive away the mature beetles and weevils. The same treatment will entirely free any grain from the disagreeable smell of naphthalene, if such should be found hanging about it when required for use.

What has been said above applies chiefly to cases where the grain is already affected by the pest; the experience of the ravages of these insects should, however, make cultivators and dealers more careful in future to take preventive measures against the repetition of this trouble. A few recommendations on this point will now be given.

Tightly fitting granaries are strongly recommended so as to leave as few apertures as possible for the entry of injurious insects; a closely fitting building is also more convenient when remedial measures have to be applied. Seed grain might with advantage be kept in zinc-lined bins, such as are at present used in tea factories.

All refuse grain should be carefully destroyed and the granaries kept as clean as possible; the bins should be carefully cleaned out before the new grain is placed in them, and any remains of the previous crop should be stored separately. The addition of a small quantity of naphthalene powder to the bottom of the bin before the grain is put in is strongly recommended. The grain should be well dried before storing; any heating or fermentation is well-known to be a productive source of weevil.

The presence of such large numbers of the parasitic *Hymenoptera* is a very hopeful sign, and points to the probability that the sudden increase of the pest has been met by a corresponding increase in the numbers of these natural enemies, which should speedily afford a check to any further extension of the injury.

E. ERNEST GREEN,  
Honorary Government Entomologist.  
JOHN C. WILLIS,  
Director, Royal Botanic Gardens.

## RUBBER.

There are four different species of rubber-producing plants growing in the station. The most common species are the native rubbers (*Landolphia ovarianensis* and *L. florida*). These abound on the Gambia, but owing to the ruthless manner in which the trees are tapped, it is feared they will soon disappear.

*Hevea brasiliensis* (Para rubber).—A few plants of this are at the station, but they do not appear to be growing very well, owing to the long dry season.

*Castilloa elastica* (Central American rubber).—Several plants were brought out by me as already mentioned from Kew. They are now growing well, and are about two feet high. These plants are said to grow well in a deep warm soil, composed of loam and sandy clay; a dry or rainy climate seems equally suitable, but a high and equal temperature, which does not sink below 60° F. at any time is essential.

*Manihot Glaziovii* yields the rubber known in commerce by the name of Ceara rubber. This plant grows well in the Colony. The only difficulty up to the present has been to procure the rubber from the tree. The sample of rubber collected from a tree growing at the station is free from impurity, but, though small, it is quite large enough to show that the method of collecting I have practised is the correct one and the one which should be impressed on the local rubber collectors. The plant is very hardy, and will grow almost anywhere. Its healthy appearance in this Colony shows that it may prove of great value.—*Kew Bulletin*.

COCONUT AND TOBACCO PLANTING IN THE TRINCOMALEE DISTRICT forms the subject of a communication elsewhere from a resident who gives a good deal of information about the lands available. We fear the Trincomalee district is, like Jaffna, too dry for coconuts; but alluvial land on the banks of the rivers or near backwaters ought to be well suited for the palm and certainly water-carriage is an attraction.

### "A GREAT WORLD OF COMMERCE"

Waiting to be opened up, is the description given by the *Scotsman*, June 1 in reviewing Consul Bourne's Report on the valley of the Yang-tze which he ascended for the first time. We quote as follows:—

As a site for commerce and manufacturing industries the Lower Yang-tzi Valley is described as being "as perfect as can anywhere be found;" coal and iron are within easy reach; the climate is temperate; and behind and around it is a magnificent system of water-ways. But, besides the li-kin barriers, commerce seeking its way to the interior of China has to overcome the obstruction of the hundred miles of rapids that break the course of the Blue River. We have now the treaty right to send steamers up the stream to Chung king, the commercial capital of Ssu-chuan; and in point of fact the experiment of navigating the gorges in a steamer has been successfully made since Mr. Bourne's report was written. His own voyage, however, was made by the old-fashioned method of tracking—"most inhuman work," he calls it. By this Via Dolorosa, the Mission reached a new and wonderful world—the "Red Basin" of Ssu-chuan, some 100,000 square miles in extent, and supporting between forty and fifty millions of souls. The country is wonderfully rich and well-cultivated. And yet its trade, in comparison to its resources, is quite insignificant; it has not yet found an outlet for its wealth. The travellers passed on to Cheng-tu, the capital—a place of nearly half-a-million of inhabitants:—

A few words will describe the country traversed—the same for hundreds of miles—an endless succession of hills of soft red sandstone washed into rounded shapes by the streams that have eaten below, and flow at least in winter, through hard grey sandstone, with water of limpid clearness. The hills are terraced from top to bottom, and enough water is lying on most terraces to cover and fertilise the earth. It is astonishing how the Chinese contrive to retain water at great heights without any appliances—labour, ceaseless and minute, is the secret. Here and there are white farm-houses, with black gables and beams, and graves surrounded by cypress—of a variety resembling the trees of a toy Noah's Ark—and temples embosomed in pines.

Cheng-tu was distinguished from the average Chinese city by "the great display of articles of Chinese luxury; gorgeous silk brocades, delicate pongees, and silver-ware—all products of local art—musk from Thibet, and scents. The officials and literati assume a very grand air; they ride gaily caparisoned steed, or are carried about at great speed in sedans, with poles bent up in the middle, so as to put the rider above the heads of the pedestrians, and with large retinues. Then there is the link with Central Asia, evidenced by the Thibetans in the streets, and the authority of the Viceroy, who resides here, over that curious country; and the historical interest of the place with its memorials in the palace and tomb of Lui Pei, the great Emperor who ruled Western China from this place in the 3rd century of our era." Such is Ssu-Chuan—a great world of commerce, waiting to be opened up; a country "drained by a splendid system of rivers, making water communication easy;" with a soil, "cultivated in the most careful manner and producing ample food in average years for the teeming population;" and with a climate remarkably mild for the latitude, in which Europeans enjoy good health. Yet, strange to say, "there is not at

present a single Western merchant engaged in the cotton goods import trade in the whole of the Yang-tzi Valley, except in Shanghai; English capital has been withdrawn from Hankow, and has never been invested in the new ports like Chung-king."

### INDIAN PATENTS.

Applications for the under specified inventions have been made:—

No. 179.—William Jackson, of Aberdeen, for improvements in machines or apparatus for packing tea or other analogous products into chests or boxes.

No. 194.—Samuel Cleland Davidson, of Belfast, for improvements in apparatus for drying tea or tobacco leaves, coffee, fruits, cloths and other substances, and for the baking of tobacco stems and other substances.—*Indian and Eastern Engineer.*

### OUVAH COFFEE COMPANY, LTD.

CROP 1896-7.

The coffee crop as estimated in last year's Report proved to be a very short one, and it will be seen that the actual weight sold in London amounted to 405 cwt 1 qr 22 lb.

The proceeds amounted to £1,846 9s 10d, giving an average of 91s 1d per cwt, against an average of 92s 2d obtained for the previous crop. Coffee sold in Ceylon realized £41 16s 7d.

The tea crop was estimated at 650,000 lb, and the actual weight sold from the company's own estates was 695,600 lb being a yield of 457 lb per acre of the 1,524 acres plucked, and of this area 279 acres were only in partial bearing. In addition, 135,936 lb of tea manufactured from leaf bought from neighbouring estates were sold.

The value of the tea sold in London was £28,075 9s 1d, at an average of 8'08d per lb, as compared with 9'15d for the previous season. Tea sold in Ceylon realized £10 7s 6d.

Cocoa, weighing 100 cwt 1 qr 10 lb, realized £276 7s 4d, the average selling price being 55s 1d per cwt, against 46s 11d for the former year's crop. Cocoa sold in Ceylon thus realized £16 11s 8d.

It will be seen that the total value of all produce sold amounted to £30,270 2s.

The total expenditure for the year in Ceylon and London amounted to £26,039 19s 11d, and deducting this from the value of the produce, a profit is shown on the season's working of £4,230 2s 1d. To this has to be added the sum of £166 5s 9d, brought forward from last account, giving a total of £4,396 7s 10d at the credit of Profit and Loss Account.

An Interim dividend of 2 per cent on the capital of the Company was paid on the 9th November last, which absorbed £2,000 of the above-named sum, and the Directors now recommend that £2,000 be applied to the payment of a further dividend of 2 per cent, making 4 per cent for the year and that the balance of £396 7s 10d be carried forward to next account.

The coffee crop sufficed to cover the expenditure incurred in maintaining the area still under that cultivation, and it is hoped that the coffee will continue to do this until it is replaced by tea.

The favourable anticipations formed regarding the tea producing capabilities of our estates, and the rupee cost of production have been fully realized. The shrinkage in profits is due to the fall in the market price of tea, and to the rise in the value of the rupee.

The cost of extensions, and the maintenance of young tea not yet yielding crop, necessarily continues to be a heavy charge on the profits earned by the bearing area.

Since the date of last Report a further 133 acres of Tea have been planted, bringing the total area under that cultivation up to 2,111 acres as de-

tailed below. Further plantings will be limited to replacing Coffee with Tea, as the former has to be abandoned.

The Tea crop for 1897-98 is estimated at 722,350 lb. of made Tea. So far pluckings have been good, and the estimate of crop is considered safe.

Mr. L. Famin, a Member of the Board, retires on this occasion, and being eligible, offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths & Co., the Auditors, also offer themselves for re-election.

By order, J. ALEC ROBERTS, Secretary.

4th June 1898.

## SPRING VALLEY COMPANY, LTD.

DIRECTORS.—Messrs. Alfred Brown (Managing Director), Leon Famin, P. C. Oswald, Norman Stewart.

The following annual accounts are now presented to shareholders, viz.—Profit and Loss Account for Crop 1896-7. Balance Sheet made up to 31st March, 1898.

## CROP 1896-7.

As anticipated in last year's report, a very small crop of coffee was secured for the above season, and it will be seen that the actual weight sold in London amounted to 268 cwt. 1 qr. 4lb. This crop, inclusive of clean and refuse coffee sold in Ceylon, realised £1,182 9s 7d, the average selling price being 87s 10d, as compared with 90s 2d per cwt. obtained for crop 1895-6.

The crop of tea amounted to 352,700 lb, the estimate in last report being 311,000 lb, and this, together with 87,086 lb, bought from neighbouring estates and manufactured at Spring Valley, sold for £15,392 14s 0d, or an average of 8 4/10d per lb, the average selling price last year being 9 0/8d per lb.

The yield from the 811 acres of tea in bearing was 440 lb. per acre, a good return when it is remembered that the tea is all planted in old coffee land and that the best portions of the estate have yet to come into bearing.

The total proceeds from the sale of produce amounted to £16,585 3s 7d. The total expenditure in Ceylon and London, including outlay on planting 159 acres tea and maintaining a large area of young tea not yet yielding crop, amounted to £16,049 1s 8d, the result being a profit on the year's working of £536 1s 11d. To this has to be added the sum of £154 9s 5d brought forward from last year, making a balance at the credit of profit and loss of £691 1s 4d.

The Directors regret that owing to the heavy outlay necessitated by the extension of our tea area they are unable to recommend the payment of a dividend. Expenditure incurred in this connection during the next and following years will be charged against the new preference capital created and now available for the purpose, and profit earned by the bearing area will thus be set free for the payment of dividends.

The Tea Industry in Ceylon and India is suffering from a decline in the value of tea, and from the artificial value that has been placed upon the rupee by the action of the Indian Government in closing the mints to the coinage of silver. It is, however, believed, that the natural advantages possessed by Spring Valley place it in a favourable position to compete successfully in the profitable cultivation of tea.

Every effort is now being made to plant up our remaining area, and to complete the necessary factory accommodation as rapidly as possible.

Since the date of last report, 186 acres of unproductive coffee land have been planted up in tea, and 111 acres of steep and precipitous land have been planted as a fuel reserve. The acreage now stands as follows:—

## TEA.

Over 5 years old .. .. .	611	acres
Planted November/December .. .. .	1893	228 "
" .. .. .	1894	179 "
" .. .. .	1895	145 "
" .. .. .	1896	159 "
" .. .. .	1897	186 "
Area under Tea .. .. .	1,708	"
Area under Coffee .. .. .	115	"
Area under Fuel .. .. .	167	"
Forest Patna and Waste .. .. .	264	"

Total Area .. 2,253 acres

Mr. L. Famin, a member of the Board, retires on this occasion, and being eligible, offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths & Co., the Auditors; also offer themselves for re-election.

4th June, 1898.

## DUTY ON TEA ENTERING RUSSIA.

It will be remembered that Mr. T. N. Christie expressed a strong opinion about the differential duties levied on tea entering Russia from different directions and, we believe, that a representation is being made through the British Embassy to get the duty on teas by the overland route equalised with the duty levied on teas via Odessa or from the West. We had occasion to ask the Russian Consul in Colombo a question as to the new duties proposed for teas received via the Siberian rivers, and in courteously replying Capt. de Frisch touches on the general question in a way so interesting to Ceylon planters that we make no apology for quoting his letter:—

Colombo, June 27, 1898.—In reply to your inquiry I am sorry to say that I have no Customs Tariff, but as far as I remember the same duty is levied for tea whichever way it enters Russia, whether by sea or by land, and all the informations given by Mr. Christie is, in my opinion, wrong. The duty for tea is everywhere the same, viz. 11 1/4d per lb. Brick tea entering via Kiachta and Yenisei in Siberia and for Siberia, comes under a different heading, but this can scarcely be called tea for it is a mixture of tea and lard and only used by the different Mongolian tribes in Siberia; also there is a reduction for tea of any kind for use in Siberia, I believe. But should such teas enter into Russia—proper, an additional duty, making it equal to that imported via Odessa, is levied on the Ural frontier. Brick tea as prepared in Ceylon, that is to say compressed black tea, as used for the troops in Russia, naturally comes under the same heading as ordinary tea. I hope you will see from this, that there is no preference shown to any nation or country where tea is grown, and that all those stories concerning the differential duty were founded on mistakes.

This leads us to see that the new duties quoted by the St. Petersburg Correspondent of the London Times telegraphing on June 3rd, must be for brick (tea and lard) sorts. Here is the paragraph:—

A Special Commission discussed the subject here several months ago with Mascovite, Siberian, and English representatives. The result, as now determined upon, is that the following imports by sea via Siberian rivers are to be free of duty:—Machinery

for Siberian gold works, salt, coal, agricultural machinery and parts of machines, to an unlimited extent; machines for equipping Siberian mills and workshops, fishing nets and twine for the same, certain chemicals—but only in quantities actually required by works in Siberia—tin, lead and olive oil in the quantities required in each separate business for preparing fish conserves; and sacks to the extent necessary for the actual export of grain. Duties 4 $\frac{1}{2}$  roubles per pood on Ob and 4 roubles on Yenisei will be charged on brick tea, so that a Kiakhta tea merchant who pays only 2 $\frac{1}{2}$  roubles, will be protected and the overland trade preserved from ruin.

The Minister has made the above exemptions for the present year, and hopes to have them prolonged for the next five years. All machinery for gold mining in Siberia is further more made free of duty on all the frontiers of the Empire. Duties are likewise repealed or reduced for five years from September 1st next on agricultural machinery. Steam ploughs, various kinds of threshing machines, reapers, sorters, harrows, &c., will be free of duty, while duties on other special kinds will be reduced from 1 rouble 20 kopeks to 50 kopeks per pood. Finally, duties on nearly all chemical manures and remedies against diseases of trees and vines are abolished.

We work out 4 to 4 $\frac{1}{2}$  roubles (rouble = 3-1 $\frac{1}{2}$ d) per pood (36lb. English) to mean 4d to 5d per lb. and therefore this can only refer to the common brick tea as Capt. de Frisch points out, and which apparently enters via Kiakhta for 2 $\frac{1}{2}$  roubles per pood, or 2 $\frac{1}{4}$ d per English lb.!

THE DISTRIBUTION OF CEYLON TEA: ROOM FOR A COMPANY; AND "J. L. S." READY TO PROMOTE ONE, IF DULY SUPPORTED FROM CEYLON.

We direct the special attention of Ceylon planters to the following letter from one whose initials, as well as his special claim to treat of tea distribution, will at once be recognised. We feel sure that great interest will be felt in the "new departure" J.L.S. has already begun to promote; and if he makes arrangements to enable planters out here to give their support and take shares in his Distributing Company, we cannot help thinking, that support would at once be forthcoming. Should he not also get some of the big estate proprietors at home—such men as H.K.R., W. McK., G.S.D., A.L.C., H.L.F. and others—to take an interest and shew that they recognised the importance of the movement and the sound business basis on which it stands? "J.L.S.'s" letter is as follows:—

24, Rood Lane, 11th June, E.C.

Two or three letters and editorial remarks in your columns lately have pointed at a way in which every planter in Ceylon might do something to raise the prices of Ceylon tea and that is by bringing his force to bear on the domestic and social circle, which, be it large or small, every one can do something to influence.

Many of the Companies, firms and individuals to whom you are good enough to give a gratuitous advertisement as "supporters of the Ceylon Tea Industry" have done much to foster the taste for good Ceylon tea and have as a rule, tried and in many cases very successfully to show that the lowest priced article is not necessarily the cheapest; that the best tea the world produces cannot be retained at 1s 7d per pound, and by giving good tea and good value for money, have supplied the wants of those who are still ready to pay 2s a pound or upwards for their tea.

The enormous profits which can be made by retailing tea are a dream of the past; retail prices have so come down that it is only by dealing

on a large scale that a tea-selling business can be profitably conducted and most of the "supporters of the Ceylon Tea Industry" could tell how much more business they could do without any increase of rent or wages, and how crippled they are by heavy expenditure owing to the smallness of their transactions.

Now if we could capitalize all these Companies at a fair price, which would show 19 per cent profit over a series of years and if we could secure the co-operation of all whose interest it is to keep up the quality and the price of good Ceylon tea, giving them the opportunity of sharing in the profit which their good-will created, the result would be very beneficial to Ceylon.

Place a LONDON COMPANY in a position to retort a million pound, of tea at 2s per pound or more (and there are still many people prepared to pay those prices if they get what suits them) and the result would be far-reaching, it would not only affect the million pounds bought and sold, but it would tell on every pound of Ceylon tea sold in Mincing Lane and if it had as I believe it would have, the effect of creating a taste for better tea and there is strong evidence that this has already set in, the benefit to growers might be very great.

I may mention that before my attention was drawn to the suggestions in your columns, I had been working this matter up and have arranged for the amalgamation of several concerns on the basis I have mentioned, each seller of a business to the new Company retaining for a period of years, at least half his purchase price in shares to ensure the continuity of good-will.

Give us the good-will from Ceylon planters which will dispose of a million pounds of good Ceylon tea at the prices indicated which means that the proprietors, managers and assistants of each estate should enable us to sell say six chests of Ceylon tea per annum and I will guarantee good dividends and what is of more importance to all of us an effect on Mincing Lane prices.

J. L. S.

P. S.—The time is specially favorable for bringing out a Company of this sort: there is clear evidence of a revolt among all classes of tea-drinkers against the cheap and nasty, and the recent reduction in parcel post rates has led largely to the 10 lb. canister, the favourite form of purchasing tea by very many, being sent direct from London to all parts of the country.

USEFUL HINTS TO CACAO PLANTERS.

With reference to Mr. de Sanctis' letter and our advice to cacao planters to make "observations," Mr. Carruthers is good enough to write:—

"When I first came out to Wariapolla early in December I marked some 80 young leaves—only just out of the bud. After 15 weeks not one of these leaves was still on the tree. Of course the production of leaf and its duration is modified by the season of the year and the conditions passed through; but this may give a notion of the time the leaves stay on the trees. I have been amused in my visits to find some planters when I asked them, estimate the duration of the leaf at from 3 months to 4 years! The more observations taken the better. The plan I used was to make with a small pencil point protector, a hole in each leaf and make a note of the date."

Mr. Carruthers is at present working at Peradeniya laboratory; but has still to visit Rambankana and Monaragala, so that if he is to finish by the middle of August, he has his work cut out for him.

## BRITISH TEA TABLE.

## A DIRECTORS' GOLD MINE.

We fully expected that some of the shareholders at the meeting of this company would have drawn attention to the extraordinary scale of liberality on which the directors are paid for their services. The accounts just passed only cover nine months' work, and this is how the board are treated. It should be stated, to begin with, that there are three ordinary directors and one managing director. First of all we see in the profit and loss account the item of £1,375 for "directors' fees." On the other side the gross profits are shown, "after deducting rents, wages, managing director's salary and commission," and other expenses. We may perhaps assume, therefore, that the £1,375 is appropriated by the three other directors, and for nine months' attendance at board meetings it is not to be sneered at. But the remuneration does not end there. When we come to the balance sheet, these gentlemen have another turn. The balance of profit and loss is reduced by an item of £1,096, put down as "directors' percentage." That makes £2,471 altogether, without counting the managing directors' "salary and commission," which we believe amounts to over £2,000. Taking at that figure, here is the distribution amongst those interested as the result of nine months' trading:—

Directors take... ..	...4,471
Preference shareholders	...3,891
Ordinary shareholders...	...8,125
Carried forward	.. 1,508

This is not the sort of appropriation that we should approve of if we held ordinary shares in this company. The managing director, Mr John Pearce, is of course an expert who can command a high salary; but the other three directors, Sir Edward Sullivan, Bart., Mr. J. P. Hurst, and Colonel Sir H. H. Oldham have no special knowledge of the light refreshment business, and the fees paid to them are absurdly high. Again, the office salaries and expenses (excluding rent) come to £1,900 for the months, an amount which a shareholder might properly grumble at. It appears to us that the people who found the money for this undertaking do not get the share of the profits which they might reasonably expect.—*Investors' Guardian*, June 4.

## BRITISH NORTH BORNEO COMPANY.

The trade returns of British North Borneo for the past year have more than a local interest just now, when the merits and demerits of Chartered companies as colonisers are being so fiercely discussed. It is useful to ascertain what one of these much-maligned corporations can do when unhampered by international political and territorial complications. The British North Borneo Company cannot compare with either the British South Africa or the Royal Niger Company in its capacity for embroiling us in disputes with foreign powers, but it is doing a considerable work in colonisation and trade development. The statement issued by the Custom Office shows that, notwithstanding the troubles in the interior, the trade of the country has continued to increase during 1897. The gross totals of imports and exports for the last two years, and also for 1887, compare as follows:—

	1887.	1896.	1897.
Imports ..	\$958,642	\$1,882,188	\$1,887,498
Exports ..	535,267	2,420,234	2,942,293

Totals \$1,493,909 \$4,302,422 \$4,829,791

Tobacco heads the list of principal exports at 1,686,173 dols., cutch taking second place with 232,460 dols.; the other principal exports were: sago and sago flour 145,670 dols., rattans 127,332 dols., treasure 120,510 dols., timber 117,916 dols., gutta percha 93,639 dols., india-rubber 43,513 dols., and "birds' nests" 57,141 dols. With the exception of rattans 1897 showed a considerably larger trade than in 1896 in all the articles enumerated above, the increase being especi-

ally noticeable in tobacco, cutch, and gutta percha. The principal imports were rice, grain flour 463,357 dols., treasure 257,543 dols., cloth 254,905 dols., provisions 96,345 dols., spirits and wines, 87,447 dols., machinery 85,469 dols., opium 89,853 dols., tobacco 72,152 dols., and oils exclusive of kerosine, 57,079 dols. Machinery, rice, and grain and spirits show the largest increases, whilst, on the other hand, there have been considerable fallings-off, in the quantity of cloth, fruit and vegetables, treasure and ironware imported. During 1897, also, no "railway material" was received, against 27,000 dols. worth in 1896 allowing for this, and the decrease noted under the heading "treasure," the general import trade really increased by 68,250 dols. Alas! the shareholders in the British North Borneo Company have reason to feel satisfied with the progress which is being made in the territory under their control.—*The Investors' Guardian*

## TEA INDIAN PLANTERS COMBINE.

It has often been said, remarks the *Englishman*, that tea planters are incapable of combining to effect a common object, however much in their favour such object may be; but the Buxa-Duars tea planters have effectively combined and have unanimously resolved to effect substantial reductions in sirdars' commissions and coolie labour from the 1st of January next. This, of course, means a great saving in garden expenditure, and at a time too when the tea trade, is in anything but a prosperous condition. This reduction, we understand, will not in any way affect labour prospects. The sirdars, who now draw two pice commission per working day for each coolie, will, in future, only receive one pice, and, in order to make up for the loss in commission, they will have to double their musters. The example set by the Buxa-Duars planters is being followed by the Alipur-Duars sub-district planters.

## PLANTING NOTES.

GREVILLEAS IN TEA.—We are able to add to Mr. Fraser's testimony from Abbotsford that of Mr. Cantlay, Manager of Mt. Vernon, which is a property very freely dotted over with grevilleas of a mature size for some years back. Mr. Cantlay has always been a firm believer in grevilleas benefitting the tea bush and he considers that the product is also benefitted rather than injured. There is this satisfactory evidence in his case, namely that Mr. Vernon gets better prices for its tea than adjacent estates of equal natural advantages in regard to soil; but which are not dotted over with timber trees, grevilleas or otherwise.

"TEA PLANTING" is the subject of a long contribution to the *Pioneer* by "Sirocco." That he is nothing if not original may be judged from the following specimen:—

At present the range of dividends is from 50 per cent to nil; in a few years the range will be from 20 to 2; later on it will be 10 to 5—and there it will stay. There will be no concerns which don't pay at all, and there will be none which pay fabulous profits. It is hardly necessary to trace the cause of this "steadying," because it is simply the human desire to participate in good things, and the demand for shares precludes any private monopolies. More than 20 years ago I heard a man say that tea would not be steady until the prices came down to an average of 6d per pound, and at that time a rupee average was not considered out of the way, and a rupee was worth two shillings. That this saying was true can be seen by the course of events, and the nearer we come to 6d the better prospects for tea.

TEA (CEYLON QUALITY IMPROVED  
OF RECENT YEARS).FURTHER EVIDENCE IN FAVOUR OF DIRECT  
DEALINGS.*(By a retired Rangalla Planter.)*

I never take up a Ceylon paper, now-a-days without reading several paragraphs from brokers in the Lane, and other agents for the sale of tea, complaining about the inferior quality of your staple as compared with former years. Then advice is given to the planters, by all and sundry, to pluck finer, cure better and ship more carefully; but still, although all this advice has been taken in some cases, the results, so far as the price is concerned, do not improve, in fact everything connected with tea goes down except the commissions paid to agents and brokers,—they keep up all right. It is not for me, a non-specialist on the subject of tea, to suggest any alteration in the present line of mercantile procedure; but just, as a happy thought, I would advise that a rule be brought into operation that no commission is, in future, to be paid to brokers on sales effected under ninepence a lb. I have as good opportunities of tasting Ceylon teas of various brands as most ordinary residents in the British Isles, and, I must confess that, so far from the quality having depreciated, it has improved, in every case, during the past few years, and it would be a very strange thing if all the high grade teas were sent to this remote corner of Scotland, and all the badly cured, coarsely picked and inferior quality brands were reserved for London drinkers. I always pay 1s 4d a lb. for my tea, and I prefer it to the 2s 6d Assam tea which I occasionally meet with, and compared with China tea—well I can't compare the two, because I never drink China tea. Ceylon planters need not fret, therefore, over the ghastly tales of the London broker; these are all told for the purpose of excusing themselves for getting such bad prices; what the planters are requiring to do is to try and get their work done without the assistance of a middleman at all, as one can always get a better price by a direct sale than through a broker. I write this feelingly as I find that I can always get a better price for my wool by selling direct to the mill than through a broker, and a better price for cattle and sheep sold at home than by sending them to an auction mart. In a late *Observer* there appeared a paragraph about "atrocious tea" and an illustration was given of a stem, about as large as the pen-holder with which I am writing. No doubt that sample was bad enough to justify the brokers' ontery, and, if it went forward, must have been productive of an outburst of advice from the distinguished member of the Lane into whose hands it had been placed for sale. It reminded me,—and no doubt your erst-while correspondent, "Aberdonensis," would be reminded also,—of the celebrated post and rail brand of China tea which was so commonly in use, at one time, in the back blocks of Australia, the larger stems of which, after being infused as tea, were kept in reserve, as Christmas logs, in districts where firewood was scarce!

## CHINA TEAS—"NEW METHOD."

We are indebted to the planting proprietor who sends us a copy of a London circular of 9th June on China teas, and writes:—"You may not have seen the enclosed which evidently refers to the new (modern) methods of making Tea being introduced into China. Even with the very favourable exchange, I should think, these prices would hardly pay." We quote as follows:—

New-make Congous.—The first New season's ex "Victoria," were offered on the 25th April, viz., 518 boxes medium to good medium Macao leaf, which sold from 5½d to 9d per lb.—the succeeding import of 703 boxes ranging from about 5d to 8d—subsequent small imports, including New Method manufacture, experiencing a less ready sale the last fortnight or three weeks, especially New Style—the closing range for New Macao leaf, fair common, being 4½d fair to good medium 5d to 7d, and 95 mats, each four 5-lb. boxes, 7d per lb.

"New Method" Teas.—Auction sales show following results:—

		Per lb.
54	hf-ch Pekoe Congou .. at	5½
55	" Pekoe Souchong .. "	4¾
83	" " " .. "	4½d and 5d
16	" Broken leaf Pekoe Congou .. "	3½d and 5½d
11	" " Pekoe .. "	6½d
16	" " " .. "	3½d and 6d
34	" Orange Pekoe .. "	6½d and 6¾d
16	" " " .. "	5¾d
38	" Golden " .. "	6d
21	" Specially prepared Broken Orange Pekoe .. "	2½d
94	" Specially prepared New Season's Panyong .. "	5d
121	" Choicest hand-made Saryune .. "	6d
10	" Keemun Broken Pekoe .. "	4¾d
8	" Siftings .. "	2½d

577 half-chests, which sold at easy rates considering the scarcity of medium to good medium Congous.

## TEA PLANTING IN ASSAM.

(BY SIROCCO).

I have been a long time "in Tea" and have had little dreams about writing a book on "Tea. I know the orthodox beginning of a book. You get hold of the Tea Cyclopædia and you start from the beginning of tea, and copy out how Major So-and-So first discovered tea in Assam, &c., &c. I have a way, when I get a new book to read, of opening it somewhere about the middle, and going on as long as interest lasts, and if this lands me at the end, I begin that book and read up to the starting place; and so I will begin my book on "Tea" about the middle, and see if I can keep up the interest. The readers of the *Pioneer* are those who have invested, mean to invest, may possibly invest, or take no interest whatever in tea—not even in the drinking of it. I should like to take the *seriatim*.

If you *have* invested in tea the great question is—will it continue to pay? The answer is simple. Tea will continue to pay large percentages until it comes down to a steady and certain 5 per cent. At present the range of dividends is from 50 per cent to *nil*; in a few years the range will be from 20 to 2; later on it will be 10 to 5—and there it will stay. There will be no concerns which don't pay at all, and there will be none which pay fabulous profits. It is hardly necessary to trace the cause of this "steadying," because it is simply the human desire to participate in good things and the demand for shares precludes any private monopolies. More than 20 years ago I heard a man say that tea would not

be steady until the price came down to an average of 6d per pound, and at that time a rupee average was not considered out of the way, and a rupee was worth two shillings. That this saying was true can be seen by the course of events, and the nearer we come to 6d. the better prospects for tea. "Tea" in those days was "planting;" now it is a regular and well founded industry, and a recognised basis for forming companies and dealing in shares. At the present moment there is great faith in those concerns which pay steadily. One company which pays steadily 20 per cent for three years consecutively sells its R100 shares at R375, which means that the purchasers are willing to take a return of R5-9-8 per cent, so that they can have little doubt of the stability of that concern. But should it happen that this concern ultimately pays 10 per cent, then the present purchasers of shares will have to be content to get R2-12-6 per cent, and this is not brilliant. Of course it all depends on whether one invests for a permanent income, or with a view to taking advantage of a rise in the price of shares.

For those who want a permanent, or at least a long investment the question comes, "How long will tea pay 20 per cent? We can see that very many people are anxious such monstrous profits; they rush in and open new estates, they struggle for the already insufficient supply of labour; they increase the amount and decrease the price of tea, they are content to get 5 per cent and hope for 10, and this struggle will go on incessantly until a certain 5 per cent is assured. This settling down will not take very long now, because we have almost reached our limit in the way of economy and labour-saving devices, and the output of tea swells rather more rapidly than the markets expand. It is almost a certainty that there will be another boom or two, exchange may go down again, and duties may be taken off in several or all the countries with which we deal. Both of these may give tea another spurt, which will show large dividends from some of the best companies.

#### THE IMPROVEMENT IN MACHINERY,

and every year shows very great advance in this direction, will be one of our greatest factors of safety. It is very important to keep one level quality and character in the tea made, so that the buyers may be fairly sure that they can get what they want and at the time they want it. This result is now attainable by those estates which use the best machinery. This equalising of the quality and character of tea will enable the buyers to make up bigger lots and they will also be able to keep the prices steady. We are gradually eliminating the influence of weather on manufacture. Formerly one of the greatest hindrances to making good tea was the difficulty of "withering." Withering is the process by which the leaf is made ready to be rolled. When the leaf is fresh from the bush it is crisp and any pressure breaks it. If the leaf is placed on a tray for several (from 12 to 48) hours it get *withered* and it can then stand severe pressure in all direction without breaking. In wet weather the leaf will not wither properly, and so when there is a long spell of rain the tea made is distinctly bad. We are now getting machines which will wither the leaf in all weathers. Withering by the help of heat is feasible, but it is admitted that the best quality of tea is made from leaf withered in cool dry air, but it is also a fact that withering effected by hot air is better than insufficient withering, and consequently less bad tea will be placed on the market. I am still

looking at tea from the investor's point of view, and I have mentioned one process called withering, because it was probably the greatest cause of uncertainty, and of pie-bald profits (white one year and black the next), and the greatest desire of the investor is to have steadiness.

I noted above the probable benefit to tea from THE REMISSION OF "DUTIES" and there can be very little doubt that those countries which have the heaviest "duties" will lessen them out of self-interest. Good tea at low prices is sure of favour in all countries from pole to pole. It has paid England to lower the duty to four pence and other countries will find this out. With a heavy duty it is only possible to supply the very worst kind of tea, and even then the price is prohibitive, so that the consumption cannot increase rapidly. People prefer chicory to bad tea at five shillings a pound, but they will certainly give up the stuff which ought to be called "coughy" when they can get good tea at one shilling a pound. There is a great argument against the benefits of free tea, that it has not made much way in America; and the answer is that America has as yet had very little *good cheap* tea. They have had a lot of indifferent cheap tea which could not be disposed of in England, but even this has been found better than the stuff obtained from China. In course of time we planters will be able to turn out great bulks of really good tea; it will cost us no more because we improve our appliances for manufacture; so that the surplus which we dump into other countries will be good, honest tea, and it make its way on its own merits. Then each remission of duty will enable it to spread further and further until (as in England) it becomes the national drink. These causes of steadiness (better and more even quality) will increase the consumption of tea in England itself to a very great extent. Altogether our outlook is hopeful and tea should remain a safe investment for those who form companies and start new ventures. But for those who buy at high figures because of the present inflated returns, the prospect is hardly so attractive. Looking up and down

#### THE LIST OF TEA COMPANIES

I see one of which the closing quotations are four and a half times the price of the shares. The last profit was 12½ per cent, therefore the closing purchasers reckon on a dividend of R2½ per cent. The dividends for two previous years had been more than double. The capital of this company is R500 per acre. Another company shows 155 as closing quotations and 15 per cent profit, so the purchaser got R9-10-11 per cent, and its capital is R325 per acre. I confess myself a perfect novice as regards investment in tea. I know that people jump at large returns, but I always fancied that when a return of only 5 per cent is required there is usually also a demand that the investment shall be steady, and I hardly think that tea has proved itself steady up to now. It is perhaps hard to understand why concerns which pay about 10 to 5 per cent now should remain at that figure while others which now pay from 20 to 50 will (as I stated before) come down to from 10 to 5, but one cause may be that the prices of tea will get more equal. There are roughly three kinds of tea in demand. The lowest is bought in large quantities and brought up to a certain level of quality by mixing in a little of the highest priced tea. This highest tea is in demand, because the lowest requires

to be brought up a peg or two. The medium tea passes into consumption on its own merits. In course of time the lowest grade, which is also the bulk, will improve (from causes explained above), and there will be less necessity to purchase very high priced teas of extraordinary strength to raise the quality of the bulk. This will chiefly affect Assam which makes teas for the dealers with which to leaven the tea from Cachar, Sylhet, Dooars, etc. Some estates score by making a very large yield per acre of tea at low prices; this class of tea will probably go out of demand and the yield per acre will have to be reduced.

#### THE EXPENSIVE QUALITY OF TEA-PLANTING

may be seen from the run of large profits during recent years in spite of the fall in prices. The market falls step by step and the dividends rise, and if tea could remain a sort of private property affair it would continue to give increasing dividends, but the outside world will not allow any section of mankind to become too prosperous. We have risen to the eminence which attracts public attention and so we shall be rushed with new ventures until 5 per cent is to be gained only by the greatest care, fullest knowledge and backed by large capital.

Beside improvements in machinery, which save labour and make tea manufacture less uncertain, we are tackling the labour problem. We are about to organise a central recruiting agency which will undoubtedly help to make labour cheaper because any sort of combined effort must be better than catch-who-catch-can game that has been played since tea planting assumed large proportions. But all these things only enable us to keep pace with the falling price of tea. It is like the ship and the wind; as the breeze fails, one sail after another is brought out, and when all the regular rig is displayed one sees (from pictures) that odds and ends of sticks are put out at the side with cloth on them, and last of all the men whistle for the wind. It will probably be a long time before we have to whistle, but we are coming to the regular trade wind, and our progress will be steady and safe.

There is always a certain amount of risk to any planter who details the scenes behind the *purdah*, and the planters are right in going for anyone, tooth and nail, who accuses the industry in general for faults of individuals. I don't intend to make any disclosure, but there is much of interest to be said about.

#### HOW WE GET OUR WORK DONE.

Our work people number about half a million. As a rule they come from far-off countries, and they very seldom go back home again. Some coolies stay ten to twenty years in one garden. "Garden" is the technical term for "tea estate." These are the cream of labour. Some coolies work for periods of five to two years on one garden and move on as soon as the term of contract is finished: these are in search of a "Klondyke" and they never find it. Some coolies get knocked up in their first term of contract, they are asked to "move on," and they wander off and come to various ends. The Chief Commissioner of Assam is now very urgent that some means should be found to support these waifs and strays. A certain amount of opprobrium is cast on the tea industry because it has not up to now established refuges for those who have served it and failed. It would be a most admirable thing if tea would separate itself from the rest of the hard-hearted world and have its own poor-house and

alms houses: if it would take the lead—(not given by any other industry) and from its vast wealth return a little to those who fail. I have not heard that the coal mines, the railway, the post offices, the docks, the mills, in fact any other industry or occupation is accused of stony hard-heartedness, because it refuses to employ people who have worked for them and cannot work any more. The fact that tea labour is imported make this question of vagrants and failure more palpable. Those who cannot work are found wandering about, begging, suffering, lying about on roads and giving piteous tales to kind enquirers. When a man loafs in his own country, even with small children, he manages somehow to fix on to some particular village and leads the life of a dog, but this is so common as to be at present beyond the reach of society. So that we would probably all be quite content if vagrant tea garden failures could be returned to their own homes. It is a question of expense, and I feel quite sure that if the expense of

#### RE-PATRIATING COOLIES

could be lessened it would become a law. The expense of returning a cooly from Assam is about R18 and this could be divided by four. The garden, the carrying companies, the Government and the association. All these corporations benefit largely by the "coolie." Government takes stamps and land rents and duties on liquor and income-tax from the planters. The garden takes good sound work and dividends ranging between 50 per cent and nothing. The steamers, &c. make lakhs of rupees by carrying, and the association is supposed to be the general *ma-bap*. Another source of revenue for the repatriating scheme may be found in those who made such a noise about destitute coolies a short time ago. The idea noted takes count only of the humane feelings of the tea industry, and of society in general. The virtuous civilian or soldier or sailor, will say, "Just fancy those planter chaps, they get coolies from far away, and when they bust them up, they kick them out to starve." It certainly is a blot, but it is shared by others. I have no doubt that tea will take the lead in this matter and give a good example to other sections of the industrial army.

If you could only go a step further and consult the "bust-up" labourer, he might elect to be given one more chance. If we could have "general hospitals" in each district, a certain proportion would return to work, but this is asking too much. The cost of keeping and curing sick coolies would be fully R5 per mensem and the average chance should be about two months' duration. That makes R10, the doctor's fee would be fully R2 per coolie per month and all this added to the R18 for re-patriation would fall too heavily on the four or five subscribers to the scheme.

I think that in practice the proportion of cures would be fairly large and those cured could be sold to the planters. Thus supposing a coolie to get fit for work in a month or two he could be sold to the planters for R10, R15, R20 (according to the price of labour), these sales would go a long way to pay for the keep of the hospitals. I have purposely used the word *sold*, and *sale*, because this is the accepted term for transactions in transferring labour from the districts to the plantations. The planters *buy* coolies and the Arkatties sell them. If you take money for effecting emigration you sell coolies. And so (of course) if the hospitals take money for the rescued coolies they will have to *sell* them. In course of time

this word *sell* will not be applied to coolie transactions. At present, being a short and forcible word, it comes handy if you are in any way displeased with coolie emigration. So far I am not aware that any one has attempted to disparage the term, but it might be well to do so.

I have wandered from the main point, which is to get at some form of

#### COOLIE ASSURANCE

without charging the whole amount to the planters, and I forgot to suggest that the coolie himself should be taxed. Let us consider the taxes which he gets free of by becoming a tea coolie. At home he is taxed for chowkidars, for land, for and by the police, for village poojas and customs, for leave to cut wood and grass, and when he flourishes in the tea gardens he is exempt from all but the liquor tax. The coolie is the direct cause of much wealth, a part of this should be put aside by *all* who benefit, to form a fund for supporting and re-patriating the failures. — *Pioneer*, June 19.

#### COFFEE NOTES.

A London telegram of the 13th June says the Coffee market at Havre has become much firmer owing to advices of frosts in the State of Sao Paulo, notwithstanding the circumstance that Van Leekwyck, of Antwerp, has declared that frosts will considerably increase the present crop and also the next.

The *New York Journal of Commerce* of April 20 says, in its Washington telegram regarding the proposed new war taxes:—

“There has been some opposition to the proposed duty of three cents per pound upon coffee, and several members have expressed a desire to find some other article which would yield an equal revenue with equal facility. These efforts have not been successful, and the duty on coffee will probably be imposed.”

—It is a curious fact that the protectionists of the United States are ready and willing to impose any kind of a tax, no matter how uncertain or unjust it may be, rather than levy import duties on coffee. No other article would yield so large a revenue, at so slight an expense as coffee, but as it cuts into the theory of protection it must not be levied. It shows how narrow and selfish are the views of a class which is living upon organized monopolies and maintaining them by false theories of their value to the public.—*Rio paper*.

#### THE USES OF FLOUR IN CHINA.

Although rice is generally regarded by the Chinese as the staff of life, a large quantity of wheat has been used from the most ancient times, and in the earliest classifications, wheat is mentioned as one of the five grains. In the northern provinces, where rice is not grown, and can only be purchased by the well-to-do, wheat is the most common cereal, but it is of very poor quality. The wheat is ground by a very primitive process. The mill consists of two large stones which are turned by the aid of a blindfolded mule. The flour is coarse and dark, chiefly used in the form of vermicelli, and when steamed, makes a good substitute for rice, and when mixed with a little broth, flavoured with a dash of soy, it forms a very savoury dish. To use the Chinese term, they are the “suspended” and the “dropped;” the former is the true vermi-

cell, the manufacture of which is a common sight in many northern villages, where strings of the paste, fastened at the ends of two light sticks, are suspended before the doors of the cottages even in the main streets.

#### THE CHOPPED VERMICELLI

is made by rolling out the dough and cutting it into thin strips with a knife fastened to the board like a straw chopper. The United States Consul-General at Shanghai says that wheat flour is also used for making rolls which are lightened with leaven, and these are cooked by steaming, as are the many varieties of patties containing minced meat, molasses, or a kind of jam. The steamer consists of sieves, fitting tightly one upon another, which are covered and placed over the kettle in which the meat or other food is being cooked. The ordinary Chinese, whether in city or village, takes his breakfast at the tea-house or restaurant. It consists almost entirely of these meat rolls or patties; the latter are dipped in vinegar, soy, or a solution of red pepper when eaten. Sometimes the steamed rolls, after they have grown old, are made palatable by being toasted on a grill over a charcoal fire. Another popular dish is dough nut fried in oil. Baking is almost entirely unknown, but there is a cake of the size and shape of an ox rib which is baked by being struck on the inside of a jar shaped furnace on which there is a hot charcoal fire. These cakes are sometimes circular, but in every case they are covered with the seeds of the sesame which add very much to the flavour. Another variety is a large round cake cooked on a griddle, and which is divided into quarters when offered for sale. The Mohammedan Chinese make a similar cake, of which they are very fond, without using any pork fat. For the better quality of native pastry and confectionery, rice flour is used, but at the treaty ports and the cities to which foreign influence has extended many forms of sweet cake and biscuit are made of American flour.—*Journal of the Society of Arts*.

#### A HINT ON MANURING.

All plants are composed of thirteen or fourteen simple bodies, but it is only necessary for the farmer to concern himself about the restitution of three or possibly four of them to his soil. These elements are nitrogen, phosphorus, potash and lime. The three former of these are the chief ingredients of plant food, and should any one of them be deficient in the soil, it is absolutely necessary that it should be supplied, otherwise the remaining elements are inert and useless, and a good crop cannot possibly be expected. Some may say—“that is all very well, but as we farmers are not chemists, and time is too valuable to spend in experiment we would ask—is there not some way to diagnose the conditions of plant growth, so that we may know what elements of plant food are wanting in the soil, as well as those which predominate?” It is true that farmers are not usually chemists, but they can more easily find out the deficiencies of their soil than any chemist can. The chemistry of the field is more beneficial to the farmer than that of the laboratory. A soil analysis gives only what the soil contains at the moment of examination, and not the quantity in which these constituents may be available to the plant in assimilable form during the period of growth.

While there are elements, besides those particularised above, essential to vegetable growth in our soils, it is needless for the tiller of the soil to concern himself in the least degree about them, as every soil contains a supply sufficient to last practically for ever. Sometimes it may happen that a soil may contain plenty of nitrogen, phosphoric acid

and potash, but one of them may be combined in an insoluble form and therefore is no more of use to the plants than if it were absent. In such cases it would be better to use some means for

#### RELEASING THE INERT ELEMENT,

rather than apply it in a more soluble combination. Therein exists a large part of the value of lime. It causes a re-arrangement of the matter already in the soil, and puts plant food into an available form. A growing plant can find in the soil food material of which a chemist with all his manipulations could hardly find any trace. To illustrate what I mean, suppose I add uniformly to an acre of land, deficient in potash, one cwt of kainit. Is it likely that a chemist, analysing a fair sample of this soil, could find any appreciable difference in the amount of potash, and in that of an adjoining acre of the same soil to which none had been applied? This one cwt would hardly give him a trace of difference, and yet even this small quantity would be shown distinctly in the growth of a crop planted on the land.

No good agricultural chemist places much reliance now-a-days upon chemical analysis of soils. Any intelligent farmer can find by experiment, better than any chemist can tell him, what particular element is lacking in the soil, by trying different elements in combination separately, and comparing the results. In many soils phosphorus is a substance which is frequently deficient; this is applied as superphosphate of basic slag. Nitrogen, in any of its compounds, is hard to keep in any soil, but we may assume that it abounds in a soil full of humus or decayed vegetable matter, though in some of these, such as peaty soils, in an inert state. On such soils heavy applications of lime will usually render it available. While Nitrogen is one of the most important elements, one of the hardest to keep, and the most costly to buy in an artificial form, we know now that it is comparatively easy to keep up a supply in our soils by the growth of

#### LEGUMINOUS CROPS,

in a rotation, aided in their development by a liberal supply of the cheap combinations of potash and phosphorus, and by the occasional use of lime in connection therewith. If any soil has lost part of its original fertility, it is safe to assume that phosphorus is largely what it has lost, since all our cultivated grains and the bony structure of all our domestic animals take large quantities from the soil. In soils which are the result of the decomposition of granite or felspathic rocks, as are many of our clays, it is safe to assume that they are not particularly deficient in potash, though it may often, or even generally exist in such a form that heavy applications of lime may be needed to render it available. On a sandstone formation, and indeed on most of our light soils, potash is generally deficient.

There is no one subject in agriculture which demands at the present day more care, continued and widely extended, than the practice of manuring. A soil cannot be cultivated properly until it has been subjected to such examination as will tell us, as nearly as any examination can, what is necessary to render it fertile. The theory of scientific agriculture is based upon a complete knowledge of soils, plants, animals and manures, and it is evident that until these elements are thoroughly understood, no attempts at improvement, or plans for increased production, can possibly be successful.

C. G. FREER-THONGER, M.R.A.C., F.C.S.

—*Colonial College Magazine.*

LOGWOOD was exported from Jamaica in 1896 to the amount of 84,000 tons, which I have previously stated was valued at £300,000, or 20 per cent of the export of that island. Now we can grow better logwood and can get higher prices than Jamaica can, as I have more than once proved by consignments from our Queen's Park trees, and yet it is apparently despised.—*Mr. Hart of Trinidad.*

#### INDIAN AND CEYLON TEA COMPANIES.

The *Scotsman*, of June 6th, has an article on the prospects of Indian and Ceylon Tea. It remarks how that eighteen months ago when the promotion of Indian and Ceylon Tea Companies was being pursued with considerable activity they pointed out that the business was being overdone and that the enterprise bore the appearance of being forced to an excessive extent. Since then things have taken an unfavourable turn. They may mend, but at the moment the outlook is not altogether encouraging, and one had only to study the speeches of the chairmen of the various Companies to see that for a time progress has been arrested. One of the great drawbacks was the rise in the exchange of the rupee, by which it is estimated that the advance of which has taken place is equivalent to an extra charge of 30 per cent in the cost of production, and to the entire tea-growing industry of India and Ceylon a loss of about a million sterling per annum. There were other industries in India similarly prejudiced by this and there was considerable dissatisfaction that these were not represented on the Currency Committee. If every trade were represented on the Committee it would become unwieldy, and its work seriously hampered. As it is now composed there is no reason to doubt that it will perform its functions more effectively and thoroughly than if every class concerned in the problem had been given a voice in the final decision. The article then refers to other disadvantages, against which the tea planters have to contend. The famine had meant an increase in the cost of rice, the staple food of the coolies, while a lower price had been obtained for tea, which together meant that the Companies were to the bad to the extent of 1d per pound on the season's output. That famine and earthquake with an adverse state of exchange, with a deteriorated market, will again overtake the Companies simultaneously was improbable, but on the other hand it would be a mistake to think it would be all plain sailing in the future. The time had arrived for putting a check on the industry. In many cases Indian and Ceylon Tea Companies have either wholly or in part abandoned their plans for extension. Nine out of fourteen Companies have been compelled to pay smaller dividends than in the previous year, while one which distributed 10 per cent for 1896-7 has been able to pay nothing for 1897-8. Not a single one has increased its dividend, but it could not be said compared with other industries, investors have done badly. The production of tea in Ceylon and India has increased enormously during the last few years. Competition with China, Japan and Java would be felt because of the high exchange with which India and Ceylon were handicapped. The one thing producers must keep in view was that the market is threatened with a glut of Indian and Ceylon tea and production will have to be curtailed if prices are to be maintained. As to the question of exchange and increase in the cost of production, that is a matter to which the business has to adjust itself.

No. 27. —Ustilago Maydis, D. C.; Oranges (the Bitter and the Sweet) and variation from seed; Cacao: An estimation of the characters of three varieties of Cacao; The Agricultural Exhibition.

### MR. THOS. CHRISTY, COFFEE, CURRENCY AND T.A.

I found Mr. Thos. Christy, the new products expert, and stopped a few minutes questioning him on different products. His bluff unconventional manner was not exactly an aid to conversation, but I gained several bits of information. Amongst these the most startling was this, that the owners of larger

#### COFFEE ESTATES IN BRAZIL

have been ordering coffee seed from Ceylon that they may sell it to their smaller rivals. They hope by this means that the disease may be introduced into the little estates of the country and that these will thereby be crushed out of existence. I suggested that the coffee-disease (due to the fungus) had pretty well died out by this time in Ceylon. Mr. Christy was of a different opinion, but admitted it was very possible the disease might not flourish along with the plants grown from diseased seed in the new soil. He believes very much in the coffee of Central America, Nicaragua, the beverage made from this transatlantic bean being of a rich deep colour, a fine flavour, and with a powerful aroma.

He invited me to visit his hot-houses at Wallington where specimens of this most important rubber-plant *Landolphia*, in which he does a good deal of trade with Germany, may be seen in various stages of growth. The *Tropical Agriculturist* was, in his opinion, the paper for tropical products, and the value of its information for all engaged in their cultivation both recently and in the further past, hardly calculable. Its circulation, he said, ought to be vastly increased. Tropical planters would be more alive to the advantage of taking it, he thought, if the first numbers were gradually reprinted up to within the last few years. Recent subscribers would be more than ready than to make up their sets, and new or possible subscribers seeing reprints of the early numbers, if sent at first as specimens, would be tempted to get the invaluable information abounding in every number up to date. These may sound strong words, but the importance of the project was emphatically and repeatedly impressed on me during my talk with Mr. Christy.

From there I went to

#### THE COLONIAL OFFICE

and after a short time was shown in to a well-known official. He was somewhat busy, but gave me a few minutes' conversation. With regard to the

#### CURRENCY

all I could get from him was that he fully realised how strongly the Ceylon Planters individually and collectively in their Association felt in the matter of special representation on the Committee. The Committee, however, had been called together to attend to the wants of India, whose financial outlook was undeniably far more serious than that of Ceylon, from the very magnitude of its affairs, combined with wide agricultural misfortune and a costly Frontier war. Seeing, nevertheless, that Ceylon and neighbouring Colonial Settlements are affected by any reform of the Currency in India, the India Office agreed to hear special evidence on the subject in connection with the island. Moreover two members of the Committee, besides Sir Alfred Dent, were, said Mr. —, interested in Ceylon. The Colonial Office was expected to attend to everyone's interest and act accordingly, but

Ceylon planters forgot that its power in regard to a matter which really concerned the Secretary for India was somewhat limited.

To finish with the Currency Question for the present I will here mention the opinion Mr. Lawrence holds. He said that Ceylon ought to have a Mint of its own, and coin its own silver. Ceylon was a comparatively prosperous Colony compared with India, and to keep the island perpetually involved in any financial depression on the mainland was like keeping a clever boy at school back and trying to push a dunce forward, or more accurately I should say, keeping an advanced student handicapped by a whole form of backward ones.

#### BRAZILIAN

importation of

#### CEYLON COFFEE SEED

Mr. Hughes, from his analytical knowledge of the disease, thought it less than probable that it would flourish under new conditions as the importers would wish.—From Fenchurch Street I walked across to Billiter Square buildings and saw Mr. Stretch of Messrs. Darley and Butler. In the course of a brief chat with him he expressed the opinion that Ceylon planters were needlessly alarming themselves concerning the work of

#### THE CURRENCY COMMITTEE;

it was, he thought, most unlikely that the result of their decision would be to raise and fix the value of the rupee.—R. H. F.

#### PLANTING NOTES.

CEYLON PLANTERS IN SOUTH WYNAAD.—Tea-opening here is going on apace. Over 1,000 acres will be planted this monsoon; and of this, over 600 acres will be put down by Ceylon planters on their own estates, whilst 80 per cent. of the balance will be planted by Ceylon men who are in charge of Companies' estates. Messrs. Robinson, Day and Wright are planting from 100 to 200 acres each. In spite of exchange and the fall in prices, the estimates for next year's clearings amount to between 1,500 and 2,000 acres. The latter figure will probably be passed, as I hear that one big Ceylon Company and two or three private individuals are coming over to buy estates in time to plant up next year's clearings. Three large *pucca* factories are being erected, and all the best machinery is being put in. Labour is very plentiful just now, and, being 30 per cent. cheaper than Ceylon labour, we still have a nice margin of profit.—Cor.

A SIGN OF THE TIMES: THE OPENING OF CHINA.—The following appears in the *Investors' Guardian* of May 28:—

British and Chinese Corporation, Limited (57,491).—Registered May 24th, with capital £250,000, in £100 share to adopt agreements with the Hong Kong and Shanghai Banking Corporation and Jardine, Matheson & Co., and to carry on in China or elsewhere the business of contractors for public works, railway, tramway, dock, and harbour proprietors, miners, metallurgists, builders, shipowners, carriers, etc. The subscriptions are:—

### THE LONDON QUARTERLY CINNAMON SALES.

The news brought by a recent mail from London confirms and explains the intelligence received by wire three weeks ago, of a slight fall in the price of Cinnamon at the last quarterly sales, held on the 6th inst., on account of the Whitsuntide holidays, instead of as usual at the end of May. It is the first check that has been experienced in the gradual rise of the Island spice, year after year, since the turn-set in after a very long period of depression; but the circumstances under which the present drop has occurred do not give cause for much anxiety. Spain has long been known to be, if not exactly our best customer for Cinnamon, at any rate the consumer of the best qualities of Cinnamon; and it is believed that one at least of our best known brands is altogether appropriated for Spanish needs. That brand has seldom, if ever, been purchased except by the Firm<sup>s</sup> which have dealings with Spanish houses; and hence the uniformly high price which Golnapokuna Cinnamon, apart from its intrinsic merits, has always commanded. It is not surprising that the demand from Spain—chiefly, it is said, for use in confectionery and chocolate and for the preparation of incense—has slackened during the past few months; but when peace has been restored, as we devoutly hope it soon may be, the demand is certain to revive, if not from Spain, from other countries which will take up its trade and forms of luxury.

But as against the undoubted fact that the fall in prices has not been very serious, must be placed the smallness of the offerings. Had the quantity catalogued not been exceptionally small for the second sale in the year—only 959 bales, against 1,956 in February (which was a heavier quantity than usual) and 1,675 bales at the corresponding auction last year—the drop would probably have been greater. Without, however, speculating on what might have been, we may find comfort in the fact that the drop was principally in "Superior" brands which had, at the February Sales, fetched prices which recalled old times. Those brands are well able to bear the fall of 1d to 2d per lb.; while the marks which constitute the bulk of our exports maintained their prices, or receded but slightly. Another hopeful factor is that the quantity of unworked Cinnamons which found buyers was more than two-thirds of the quantity disposed of, and that the prices they fetched do not compare unfavourably with the rates which ruled last February. Indeed, we note in Firsts an advance of 1d. Let us hope that when the parcels which arrived too late for the sale come to the hammer next August, there will be a revival of demand for the Spanish market, and that Superior and Fine sorts will recover lost ground.

The incidents of this Cinnamon sale show how the interests of others than belligerents are affected by War; but the inconvenience and loss sustained by outsiders are, of course, not to be compared with those which must fall on the trade and the industries of the countries engaged in warfare.

### COFFEE-SEED GOING FROM CEYLON TO BRAZIL.

We can scarcely credit the story related to "R. H. F." by our old friend, Mr. Christy of Lime St.,—see page 102 and yet he gave it as seriously as it was afterwards received by Mr. John Hughes, to the effect that coffee seed was being imported into Brazil from Ceylon by parties who wished to introduce *hemileia vastatrix*! We have never before, heard a whisper of such a thing; and what makes it most improbable is that we fully believe our fungus (H. V.) to exist on the South American continent, and even in some parts of Brazil already; while, in districts where it is not known, they have other enemies to contend with. District after district has been opened and partly abandoned with coffee in Brazil; and yet its coffee crops have gone on increasing because of the unlimited reserves of rich virgin land and because the railways have kept up their extension with that Coffee.

### MR. J. L. SHAND ON TEA DISTRIBUTION.

We cannot see wherein the mystery lies in "J.L.S."s letter which our contemporary conjures up. We have been loudly calling for some means of getting all the friends of Ceylon throughout the United Kingdom to make sure of drinking a pure and good Ceylon tea and thereby, to some extent, forcing the hands of the big dealers and influencing the Mincing Lane markets. "J.L.S." shows us one means by which this can be done. No one dreamt of a continuous direct supply of tea from the estates. That is impossible business; but it is not impossible to recommend our friends to deal with a house that sells, pure good Ceylon tea at a moderate profit; and moreover (as we hinted to "J.L.S.") why not turn the business into a Limited Company and make shares available to those in Ceylon who would then more than ever be ready to do their best to secure business in their own direct interest. As "J.L.S." said such a Company buying over a million lb. of good Ceylon tea in Mincing Lane, would have a certain effect on prices, and, of course, so much more effect as the million was doubled and trebled and business extended.

### OUR TEA EXPORTS.

It will be seen that the Chamber's return gives very close on 59 million lb. of tea as exported up to the 28th June.—an increase of only 720,000 lb. over the same period last year. Judging by the precedent of the past three seasons in which the first half of the year shows the larger shipments, the indication at present is that our total exports for 1898 are not likely to exceed 118,000,000 lb., and certainly 120 million lb. may be regarded as a liberal anticipation—(of which 100 to 102 million lb. may go to the United Kingdom); but the P.A. Estimate is 126 million lb. It ought at once to be reduced.

Cacao shows a large increase, also Plumbago, Coconut Oil and Copra; but Coffee a woeful falling off again this season.

EUCALYPTUS GLOBULUS is in flower in the garden at Huntley, Bishops Teignton, as we learn from the gardener, Mr. Best. We lately saw two young trees of this species at Buckland, near Dover. One was suffering if not dead, the other was as well as could be expected in the locality. —*Gardeners' Chronicle*, June 4.

## PRODUCE AND PLANTING.

**TEA IN BOND.**—Tea planters know something about the treatment of their tea at the bonded warehouses. The general public are not so well acquainted with the *modus operandi*, and a writer in the *Daily Mail* tries to enlighten them. He begins by pointing out that, "of course, London does not consume all the tea imported. The 200,000 odd retailers in the United Kingdom obtain their supplies from the metropolis, and there are besides 36,000,000 lb. required by tea drinkers abroad. All the tea sent to England is landed at the docks, and sent under lock and key to bonded warehouses, the largest of which, situated near Liverpool Street Station, stands on five acres of ground. Other goods, &c., to the value of £3,000,000 are housed in this six-storied barrack-like building, but tea occupies the bulk of the 610,000-square feet of space, which is not surprising, considering that there are seldom less than 100,000 packages in stock, and that the incomings and outgoings average 10,000 packages a week. To finish with statistics, let it be added that there is enough tea at this bonded store to supply every one of the 5,000,000 inhabitants of the metropolis with 12 lb of tea each.

**WAREHOUSE METHODS.**—"It would be impossible in the limits of this article to describe the routine of a bonded tea warehouse," says the writer. "Speaking generally, it may be said that the packages on arrival are hoisted with lightning celerity from the yards below and stacked in piles called beds, damaged cases being repaired by coopers with a rapidity and dexterity quite wonderful to behold; but not more surprising, perhaps, than the speed shown in sorting the packages with due regard to quality, marks, weights, etc. One of the busiest spots is the scales. Innumerable trucks are rushed to this spot at full speed. One overseer will call the shipping mark; the entering clerk will shout some response. Stentorian accents will proclaim the description of tea, and the person for whom the information is intended will yell something in reply. In fact the noise here is so great that had not the individual who notifies the weights a very penetrating voice he would not be heard at all. The only silent figures in this Babel are the Government officer, who is there to see that Her Majesty gets a full 4d on every pound of tea that comes in, and a workman whose duty it is to stencil the date on every box as it goes by. The emptying of the chests, which is necessary to ascertain the tare, frequently reveals dead rats and other foreign substances, mostly introduced, it is feared, to replace tea which has been abstracted. There is one individual in a bonded tea warehouse whose presence to the community is a boon and a blessing. Since the Sale of Food and Druggs Act of 1875, which empowered a public officer to select a sample of tea for analysis, adulteration has virtually become extinct. Prussian blue, turmeric, aloes, liquorice, and ash leaves are now things of the past. Indian tea being, notwithstanding its splendid properties, a little variable in quality and make has to undergo, in order to secure uniformity, a process known as "hulking." It is quite a common thing in this warehouse to see gangs of men armed with shovels mixing mountains of tea of 20,000 lb. or more. Brokers are allowed to take away samples providing they tender in exchange an equivalent in weight. Blending is an interesting operation, but one quite impossible to describe. The object of blending is to legitimately increase the profits of the trade, and at the same time tickle the palate of the public. Its mysteries are so intricate and profound that only the 'tea mind' can tackle them. The 'tea nose' is even more exclusive than the 'tea mind.' Place before this appendage half a dozen samples, and it will nose you their merits to a nicety. In the tea world, brains of course rank high, but it is questionable whether noses are not more marketable. As evidencing the care taken by the officials to prevent the revenue being defrauded, the sweepings are carefully collected, and when a sufficient stock has been accumulated are taken in barges and emptied into the Thames near the Nore. The bonded tea warehouse packs the tea sent abroad in wrappers

and canisters, furnished by merchants. Many of these labels are remarkable for the elegance of the pictorial display."

**IMPORTS OF TEA AND COFFEE IN MAY.**—The trade returns show that among dutiable articles coffee increased by £106,000, while tea, from Ceylon mostly, fell off by about £100,000.—*H. and C. Mail.*

## PLANTING NOTES.

**BURMAH RICE.**—A Colombo Estate Agent who ought to know, thinks well of the prospect of Ceylon planters being able to utilise Burmah rice for their coolies and at a cheaper rate than rice from Calcutta. It appears that Burmah will have about two million tons of rice available for export this year. Our total requirements for Ceylon are under 300,000 tons.

**INDIARUBBER.**—The market is again firmer with sales in Para spot at 3s. 11½d. to 3s. 11½d., and Bolivian at 4s. per lb. closing buyers, report Messrs. Henry Kwer & Co. on the 20th ult. In mediums at the sales on the 13th, the quantity offered was only partly sold at extreme rates. 96 bags Mozambique offered, and 50 sold—good green hall at 2s. 11½d. to 3s., red rather heated 2s. 0½d., good read 3s. 2d., mixed Lamm 2s. 11½d. to 2s. 11½d. 108 bags Borneo offered, and 30 sold—fine 2s. 2½d., good 2s. 1d. to 2s. 1½d., fair 2s., and pickings 1s. 4½d. to 1s. 5½d. per lb. 326 bags Penang offered and 23 sold—fine 2s. 10½., good 2s. 7d., and low pickings 1s. per lb.—*British Trade Journal.*

**CEARA RUBBER.**—The article on this subject in the last number of the *Kew Bulletin*, (to be reprinted in full in the *Tropical Agriculturist*) will be read with much interest by tropical planters, says the *Gardeners' Chronicle*, as the tree Manihot Glaziouvi is easily propagated by seeds or by cuttings is, very hardy, a fast grower, not subject to insect or fungus attack, and thrives on poor soil. It produces rubber of good quality, for which there is a large demand, and it is, therefore, recommended that the tree be planted over large areas in a dry climate and on poor stony soil.

**THE GREVILLEA QUESTION.**—In my letter, I merely expressed my opinion to the effect that Grevilleas were not injurious to tea, which is about all an ordinary unscientific planter may do, and my object in doing this was with the view of preventing a stranger like Mr. Kelway Bamber, authority though he be, running away with the idea that we generally supposed Grevilleas were at the bottom of all our troubles. I admit I have proved nothing further than that an estate with a plethora of trees (mainly gums, the planting of which throughout the tea, even I won't attempt to defend) can hold its own fairly well in the London saleroom. Is the originator of this crusade against one of our most ornamental and useful trees, an unfledged creeper or a buyer of Grevillea plants? Is he aware that one of the principal reasons given for the coffee-leaf disease was our flying in the face of all the laws of nature, by confining our attention solely to the one product, coffee, for miles and miles on end? Is it not a fact that when the heathen Chinese lays himself out to produce a pound of tea worth for weight in silver, he artificially shades his bushes, and the result is a thing that Queens and Emperors dream of? In the face of all this, would it not be very foolish of us to revert to the naked, ugly-looking landscapes of old, even if our trees were not all of them beneficial to our tea bushes which, most men of any experience whatever, consider Grevilleas are. Comparison with my neighbours would only end in confusion. Most of them have sufficient sense nowadays to grow Grevilleas or other shelter trees. Some of them get better prices, some worse, which again proves nothing.—**JOHN FRASER**, Abbotsford, Nanuoya, June 28th.

A COFFEE EXPERT FOR QUEENSLAND.

CEYLON MEN AT A DISCOUNT.

In the face of the wine and the tobacco industries having had their wants looked after, it is not unreasonable that the coffee growers should seize upon recent opportunities to urge their claims. The growing of coffee has not yet attained that importance which it should perhaps have reached, but neither has tobacco. Just what has hindered the one has kept back the other—want of expert knowledge. Both of these industries have great possibilities before them, and should on that account be duly encouraged. The new Minister of Agriculture (Mr. J V Chataway) in his late speech to his constituents at Mackay, in speaking on this subject, as good as made a direct promise to appoint a coffee expert, and even went so far as to say that a man had been found. Let us hope the choice may not fall on some of the broken-down gentlemen planters from Ceylon we wot of. A few years unsuccessful struggle at the business in Ceylon, or elsewhere, is not a sufficient recommendation for appointment to teach the struggling but determined coffee planters of Queensland.—*Australian Tropical Cultivist.*

PALMS AND TOBACCO IN MULLAITTIVU.

IN MULLAITTIVU DISTRICT.

**COCONUTS.**—In the Vavuniya District it is estimated that there are between 7,000 and 8,000 coconut trees. The yield—only five nuts per tree—would seem to show either that the soil is not suited for them or that they are not cultivated with proper care.

In the Mullaittivu District there are said to be about 89,000 trees, yielding an average of 50 nuts per tree. Nearly all of them are growing in the maritime pattus, where the soil is well adapted to them. The nuts fetch on an average Rs 50 per 100.

**PALMIRAH.**—In the Vavuniya District it is estimated that between 49,000 and 50,000 palmirah trees grow. They yield on an average only 10 nuts per tree.

In the Mullaittivu District about 110,000 trees are said to be growing. They yield 200 nuts per tree. As in the case of coconuts, it is in the maritime pattus that they thrive.

**TOBACCO.**—In the Vavuniya District 88½ acres were cultivated, as against 159½ acres in 1896, and are said to have yielded 1,255,100 leaves, or 14,142 leaves per acre. The yield in the previous year was estimated at 11,196 leaves per acre. The decrease in acreage planted was due to land suitable for tobacco cultivation being flooded at the end of 1896.—*Mr. Fox's Administration Report for 1897.*

TOBACCO IN JAFFNA.

As pointed out by Mr. Ievers in his Administration Report for 1896, the cultivation of tobacco constitutes one of the most important industries of the Province, and were it possible to encourage the growth and manufacture of a superior article of commerce the greatest boon possible would be conferred on the industrious agriculturists of the North. So far, however, no experiment of this character has succeeded, though European capital and energy have been freely expended in various parts of the Island under the guidance of experts

in the endeavour to produce tobacco saleable in a foreign market.

I fear that it must be admitted that the soil of the Island will not produce anything better than the coarse product now grown. The cultivation during 1897 extended over a very large area, but owing to unseasonable weather the crops were not equal in quantity or quality to those obtained in the previous year. The following is a comparative statement showing the exports of the last two years, to which must be added a very large quantity sent by road to Anuradhapura and Matale, of which no reliable returns can be obtained. The exports for 1896 were the largest on record:—

RETURN SHOWING EXPORTS OF TOBACCO BEYOND SEA AND COASTWISE.

	Beyond Sea.	Coastwise.	Total.
	Quantity.	Quantity.	Quantity.
	Cwt.	Cwt.	Cwt.
1896 ..	61,879	29,592	91,471
1897 ...	44,914	39,857	75,772

—*Mr. Fisher's Administration Report for 1897.*

COCONUT CULTIVATION AT PUTTALAM.

It is extraordinary how coconut cultivation has taken on in the Puttalam district. Thousands of acres of lands have been within the last few years cleared and the cultivation is rapidly extending. In the fresh clearings, plantations are cultivated and a very large quantity sent down to Colombo in padda boats. Puttalam is one of the busiest towns in the island. The district contributes a very large proportion of the income of the island, but it cannot be said to be well treated. Bullock coaches always full ply between Chilaw and Puttalam, a distance of thirty-two miles and a whole day is taken up by the journey. There is no proper jetty for loading and unloading goods and everything is done in a most primitive style. Salt as everybody knows is the stable export from Puttalam and yields a handsome revenue. After a lapse of three years salt is again being manufactured and the salt pans are being prepared to receive the sea water. The people in the district seem to be all well off and no beggars of any description are seen anywhere. The coach service between Negombo and Chilaw is abominable. The horses are of the worst possible description and the coaches themselves are bad. It is time some improvement is made. The boat service is fair, but as the boats start from Grandpass the public in town find it inconvenient to go all that distance.—*Cor.*

PLANTING REPORT FROM S. INDIA.

NORTH TRAVANCORE NOTES.

June 26th 1898.

The S. W. Monsoon burst here on the 5th instant, coming on very mildly at first, but every day increasing in force, and violence, and lasting for fully a fortnight, since when the weather has moderated. The strong winds, along with the rains, have done considerable damage; blowing down a number of jungle trees across roads and blocking them up for a time. I hear of as much as nine inches of rain having fallen in the twenty-four hours, but more down towards Munnar; farther to the N. E. the rains were not so heavy. We had more

squally weather with driving showers, and very cold winds; the poor coolies had a bad time of it, and during the fortnight very little work was done on the estates, it being simply cruel to ask the cooly to go out to work, besides, the roads being pretty well blocked by fallen trees. Tavalams were unable to get along to bring the necessary weekly supply of rice &c., so Ramasamy and Meenatchy had to go to fetch the necessary weekly supplies themselves.

#### THE DEER

and other inhabitants of the dense jungles must have had a pretty lively time of it too; evidently, numbers (to judge by foot-prints in the clearings) have been frightened from the jungle by more falling trees, and branches torn off and tossed about their ears. Elephants were to be heard trumpeting all day and night long; they evidently having got a fright as well. Now, however, the weather has changed very much for the better; today being the best day (to say nothing of its being Sunday) we had since the burst, and we only hope we have seen the worst of it.

CLEARING WORK from what I understand is pretty well advanced, and should the monsoon prove a good one, a lot of tea will be planted out during the next few months.

I had an opportunity lately of

#### VISITING SOME COFFEE ESTATES

up in this quarter, the first I have seen since my arrival in the district. The first field we entered was a nice sheet of coffee, and judging by the look of it, I should say it was between four and five years old, smallish trees, but they had a very fine crop set on them, just as much, I should say as they can comfortably carry, and in fact I should expect to see a good many of the trees looking shuck towards end of crop, the small berries were looking remarkably healthy, as also the trees themselves, I scamed the trees all along the road-sides for our old enemies green bug and leaf disease, and was very pleased I could not find a bug, nor a spot, of the disease, long may they keep away, and let the old "King" get up his head again. The next estate we came too had evidently had a good crop the previous year, as there was not much crop on the trees, but a profusion of fine healthy wood, and it ought to do well next season. There are some particularly fine coffee fields in the neighbourhood which I hope to have an opportunity of seeing later on, and for which I hope I shall have a good word to say. They certainly look remarkably fine in the distance, and I have no doubt they will prove as good as they look, its to be hoped so at any rate.

I am rather surprised your invaluable *Tropical Agricultural* is not better known over this way. It is a periodical which I think ought to be in every bungalow, for the instruction, information and guidance, of each, and every superintendent, and manager of an estate. Again I think it is a sort of publication which ought to be supplied free gratis by every Company, or private Proprietor, to their Superintendents, managers &c., for I am sure the gain would be theirs, and the cost next to nil. Oh for a *Ferguson's Directory* as well, it would be like the Pickwick pen a "boon and a blessing" to us, but we cannot yet everything in a day. Meantime

#### ROADS AND TELEPHONES

seen to be the great rage, the former especially are much required, for what they call roads here, are most execrable, to say nothing of their being

positively dangerous; if I could only think of a word which would define them better I would substitute it for "dangerous." However this will do, and you can imagine the rest, but once the road; work on hand just now is finished, things will be much better. What we want is a light railway transport of all goods including rice &c. is our great drawback at present, and I must say it is no child's play. However "Nil Desperandum" must be our motto, so let us stick to it. Strange, we have not had a single clap of thunder with the S. W. Monsoon, but I noted we had plenty of it during the last dying kicks of the N. East Monsoon. Is this usual in Ceylon? Thunder seems to be the dis-connecting link here between the two—more anon. KLONDYKE.

#### INDIAN CURRENCY:

EXTRACTS FROM LETTER BY MR H  
DUNNING MACLEOD.  
THE TRUE PRINCIPLES OF CURRENCY.

The Summary of the Principles declared by (reliable) writers may be stated thus:—(1) That if good full-weighted coin and clipped and degraded coin of the same metal, or base coin, be allowed to circulate together, the good, full-weighted coin disappears from circulation and the degraded and base coin alone remains current. (2) That it is not possible for gold and silver coins issued in unlimited quantities to remain together in circulation at a fixed legal ratio between the coins differing from the market ratio of the metals. (3) That the coin which is underrated invariably disappears from circulation, and the coin which is overrated alone remains current. (4) There cannot be two measures of value in the same system of coinage, however, large any more than there can be two measures of length, weight, or capacity in the same country. These principles may be summed up thus: "The worst form of currency in circulation regulates the value of the whole currency, and drives all other forms of currency out of circulation." (5) When the legal ratio of the coins remains fixed, and the market ratio of either metal rises above or falls below the legal ratio of the coins the metals alternately displace each other from circulation, and that one alone which is overrated remains current, and the one which is underrated disappears from circulation.

These laws have been observed to be TRUE IN ALL AGES AND COUNTRIES, and are as firmly established as the law of gravitation. When it was proved by experience that it was impossible to adapt the legal ratio of the coins to the varying market of the metals, and that they alternately displaced each other from circulation according as the market value of one metal or the other rose above or fell below the legal ratio of the coins, Sir William Petty, one of the most scientific men of the age, demonstrated that the true principle was that one metal should be selected as the standard, and that coins of other metals should only be used as subsidiary to the standard. This principle was advocated at great length by Locke in 1694 and by Harris in 1750 was, thoroughly explained by Lord Liverpool in 1805, and was fully considered by the Governor-General of India in Council in 1806, and adopted by them. It was upon these principles that the great recoinage in this country was founded in 1816, and they have now been recognised as true, and adopted by every Government in the world, with only a very few exceptions.

When the market value of a metal in bullion exceeds its legal ratio in coin it is said to be at a premium, and every tyro in finance knows that whenever either

#### METAL GOES TO A PREMIUM

it at once disappears from circulation by one or all of three methods: either (1) by being hoarded away, or (2)

by being melted down into bullion, or (3) by being exported to foreign countries. Thus, suppose that the legal ratio between silver and gold was 15 to 1 while the market value was 18 to 1, then silver in coin would be worth 15 while in bullion it would only be worth 18. The inevitable consequence would be that it would either be hoarded away, or it would be melted down into bullion, or it would be exported to foreign countries, where it would pass at its market value; and no one would bring silver to be coined, because then 18 oz. of silver would be reduced in value to 15 oz. Now let us apply these considerations to the coinage of India.

I must, however, begin by dispelling two very

#### PREVALENT ERRORS

(1) that India has nothing but a silver coinage from time immemorial, and that it is not possible to change the inveterate habits of a people; and (2) that India is too poor a country to have a gold coinage. Both these assertions are erroneous.

In the first place, it is certain that gold was the original measure of value throughout all India. India produces large quantities of gold, but no silver. Nevertheless, from pre-historic times vast quantities of silver have been introduced into Northern India to purchase gold. The ratio of gold to silver was 1 to 13 in Persia; but it was 1 to 8 in India. The Phœnicians, before the times of authentic history, brought vast quantities of silver from Tartessus and exchanged it for the gold dust of the Lower Indus, which Sir Alexander Cunningham, the highest authority on the subject, holds to be Ophir.

Sir Alexander thinks that silver was coined in India as early as 1000 B.C. But the gold was not coined; it was kept in dust and tied up in little bags, which passed current as money. But as silver was first coined it was considered as the standard, and the gold dust passed at its market value. Darius exacted as tribute from the satrapy of the Punjab 360 talents of gold dust, which he coined into Darius. The other 19 satrapies paid their tribute in silver.

We have no certain information when gold was first coined in India; but though gold and silver were equally current in Northern India, there was never any fixed legal ratio between them. Every petty prince issued his own coinage. The Mahomedans adopted the silver coinage as they found it existing; but their conquests never extended to Southern India, and gold was the standard in Southern India until 1818, when the East India Company for the first time forced the silver rupee as the standard in Southern India. These historical facts refute the two errors I have mentioned above—that silver had been from time immemorial the standard of India and that India is too poor a country for a gold standard.

The Government of India took no action on its weighty and important minute of 1806 till 1818, when it issued

#### A NEW COINAGE OF GOLD AND SILVER

and for the first time introduced the silver rupee as legal tender in Southern India, where gold alone had hitherto been the standard. In 1835 the Government gave up the attempt to maintain bimetallicism as hopeless. They then coined gold and silver rupees of equal weight and fineness. The new silver rupee was declared the sole legal tender throughout India; but the gold rupees were allowed to pass current and be received at the public treasuries at their market value in silver.

This state of affairs continued till 1852. The great gold discoveries in 1848 and subsequent years seemed likely to cause a serious fall in the value of gold. Holland, in a fit of panic, demonetised gold, which she repented of afterwards and retraced her step. Lord Dalhousie took the same panic, and in the last week of 1852 he suddenly issued a notification that after January, 1st 1853, no gold coin of any sort would be received at the public treasuries. By this unfortunate action gold was totally demonetised throughout India. By this astounding *coup de finance*, utterly without precedent in the history of the world, it was estimated that £120,000,000 of

gold coin at once disappeared from circulation and was hoarded away, and this has been the origin of all our present monetary troubles in India, and for forty-five years we have been repenting at leisure.

#### THE DEMONETISATION OF GOLD

by Lord Dalhousie was soon felt to be a disastrous error, and a strong feeling grew up in favour of its restoration. Some minor movements were made, but in 1864 a most powerful and unanimous effort was made throughout India to procure the restoration of the gold currency. By this time the gold sovereign had acquired an immense circulation throughout the whole of India. The Chambers of Commerce of Bengal, Bombay, and Madras, and the Bombay Association unanimously pointed out the immense inconveniences and losses by having only a silver currency, which was no longer adequate for the wants of commerce. From time immemorial, until within the last few years, India had an extensive gold currency, and the superior convenience of it was fully appreciated by the natives. The gold coins in circulation commanded a considerable premium in the market, and the natives made an attempt to supply the deficiency by circulating gold bars bearing the stamps of the Bombay banks. The restoration of a gold currency would be most popularly received, both from ancient associations and present convenience. The exclusion of gold from the currency of India could not be justified, or considered as otherwise than barbarous, irrational, and unnatural. These views were supported by a large number of high officials and bankers from all parts of India, and they were unanimous that the gold sovereign should be made the standard unit, as the people were already well accustomed to its use. A great number of collectors in Southern India reported that large quantities of sovereigns were in circulation in their district, and the natives complained bitterly of the losses and inconvenience they suffered from their not being received at the public treasuries.

This is a very slight epitome of the immense mass of evidence collected from all parts of India of the unanimous desire of the people to have the sovereign made the standard unit. Some persons, indeed, pretend that it is an impossible chimera to restore a gold currency to India. But what can persons sitting in their studies in England know about the matter if they will not read the unanimous opinion of the people of India themselves which was published as a parliamentary paper in February, 1865? In consequence of this powerful movement and the vast body of evidence it had collected, the Government of India, on July 14, 1864, addressed a despatch to the Home Government, requesting it to authorise it to declare that British and Australian sovereigns and half-sovereigns should be made legal tender throughout the British dominions in India at the fixed rate of 10 rupees for the sovereign.

Sir Charles Wood (the Secretary of State for India) instantly quashed this fatuous proposal, which was

#### PURE BIMETALLISM,

and showed that two metals could not circulate together at a fixed legal ratio in unlimited quantities different from the market value of the metals, instancing the recent case of France, where a small change in the market ratio of gold and silver had sufficed to displace the whole silver currency of France and to substitute gold for it. But it appears that neither Sir Charles Wood nor the Indian Government had any knowledge of the minute of the Indian Government in 1806. Sir Charles Wood, however, proposed that sovereigns might be received and paid out of the Indian treasuries at R10; but this plan equally failed, because at that time sovereigns passed at R10 and several annas. Thus both the plan of the Indian Government and that of Sir Charles Wood failed because they were both tainted with bimetallicism, which has ruined every system of coinage it ever touched, and thus the golden opportunity passed away, never to return, when, by adopting a system of coinage similar to the British, the sovereign might have been made the standard unit, with a subsidiary currency of silver at R10 to the sovereign, by restricting the issue of silver.

As silver continued to fall in value, the Bengal Chamber of Commerce in 1876 addressed a memorial to the Government of Lord Lytton

TO SUSPEND THE COINAGE OF SILVER;

but the Government replied that it would be impossible to suspend the coinage of silver without at the same time opening the mints to the free coinage of gold as unlimited legal tender. The Indian Government being then prohibited from attempting to reintroduce pure bimetalism into India, addressed several memorials to the Home Government to aid in bringing about an international agreement to fix the ratio between gold and silver, and several fatuous international conferences were held to see if anything could be done; but they all ended in smoke, as they were bound to do. For every sound economist knows that it is just as chimerical to secure a fixed ratio between gold and silver by international agreement as for any single State to do so. It would be just as rational to appoint an international conference to square the circle or to discover perpetual motion. Both of these are known impossibilities. In economics it is equally a known impossibility to fix by law a ratio between any two quantities which are produced without limitation. At least, in 1893, when the value of silver continued to fall, and it was expected that the United States would repeal the Bland and Sherman laws, the Indian Government found itself on the verge of bankruptcy. It then closed the mints to the free coinage of silver, and declared its intention to restore the gold currency. But just five years have passed away, and it has never yet taken a single step to carry its purpose into effect, and of course it has found itself surrounded with constantly-increasing difficulties. The whole of this unhappy India business for thirty years is an everlasting stigma on the British economic and financial statesmanship of the nineteenth century. —*Financial News*, May 28.

PLANTING COFFEE IN BRAZIL:  
DUMONT COFFEE COMPANY, LIMITED,  
MR. P. R. BUCHANAN GIVES A FULL  
EXPLANATION.

The second annual general meeting of the Dumont Coffee Company, Limited, was held Thursday, at Winchester House, Old Broad-street, E.C., under the presidency of Mr. P. R. Buchanan (chairman of the company).

The Chairman, in moving the adoption of the report and accounts, said that the result which was disclosed in the accounts showed the company had made a profit for the year of £54,425, as against some £93,000 in the year 1896. The sole cause of this diminution of profit was the continued and persistent fall in the price of coffee. There was no other reason that the directors were able to give. It undoubtedly was a most unfortunate thing that this company had had to commence its career with the very worst year that had been known in the coffee trade for the past forty years; but such was the case, and they could only accept it and work for better results in the future. There were those who had suggested reasons other than he had mentioned for the board's inability to recommend a dividend. These suggestions however unjustifiable they might be, he felt bound to bring before the meeting. They were, first, that the vendors got a great deal too much profit that was that the company paid far too high a price—for the properties; and, in the second place, that the commission given to the promoter was excessive in the extreme. In regard to the first point, the directors knew nothing of what profits the vendors made. What they did know was that those gentlemen had owned for some time previously the estates which they sold to the company; they had worked them, added to them, and improved them. They offered them for sale to the company, and had made a profit on the sale. In doing so they did nothing they had

not a perfect right to do. The directors made full investigation, and, being satisfied at that time that the price asked was not an unreasonable one, they concluded the bargain, and, so far as they had been able to judge, the statements made at the time had in no way been discredited. The estates were as good as ever, and as good as they had been stated to be, and if the price of coffee had been maintained at what it was when the company made the purchase the profits would have been quite as good as was anticipated, or even better. That being so, it was not fair to turn round on the vendors and accuse them of having taken anything in an undue or improper manner. It was a truism which was scarcely worth repeating to say that if they had known that coffee was going to take this tremendous drop they would not have given the price they did for the properties. On the other hand, if coffee had taken a rise they would all have been very pleased at having a good investment. With regard to the other suggestion, that the company could not pay a dividend today because the commission paid to the promoter was excessive, under ordinary circumstances if he were satisfied, as he had already shown he was, the price given for the properties at the time of their sale was reasonable, he should hold that for them as a company to go behind that and to claim the right to ascertain what the vendors chose to do with the money the company paid them was not in order. But the circumstances were a little different; for the promoter in this instance happened to be their chairman. He claimed the right to take advantage of the present opportunity for settling this question once for all. There had never been any secret as to what the terms of the promotion were. As a matter of fact all the gentlemen who were invited to join the board, all who were invited by him to do any underwriting for the company, and all, in fact, who had anything to do with the formation, were not only informed by him exactly the terms that were given, but they also had placed in their hands every document of every kind connected with the whole transfer of the company. What he undertook to do was to have the properties thoroughly inspected, and the whole of the statements of the vendors investigated. He placed his services for nearly a year at their disposal in both Brazil and England. He advanced all the money necessary for those investigations, entirely at his own risk, and for what might he called the preliminary expenses, amounting, as they did, to several thousands of pounds. He agreed, on being satisfied, to take all steps to bring out the company, and to get underwritten on behalf of the vendors any amount of capital they required underwritten for the purpose of carrying through this transaction: That was what he carried through. He received for this in cash a little less than the actual amount of cash that he was out of pocket, viz., £7,000 in payment of £7,200 that he had disbursed in cash, and besides that he received a commission of slightly over 2½ per cent upon the whole transaction, that commission being payable in shares. He ventured to say there were very few gentlemen in the City of London who would have rendered such services and undertaken such duties on similar terms. If the shareholders were not satisfied that he had made out a good case for himself he was glad to think he was one of the directors retiring at that meeting, and they could have an opportunity of showing their opinion with regard to him pretty forcibly a little later on.

Reverting to the heavy fall in the price of coffee, the Chairman said it had dropped about 2½s a hundredweight during the past year, which meant a difference of £270,000 to the Company in the year. Their estates were in a very much better condition than they had ever been previously and, instead of producing coffee which, as in 1896, sold at 5s. per hundredweight under the average price of Santos coffee, they had produced coffee which had realised nearly 5s. per hundredweight over the average price, and great credit was due to the management for that very satisfactory result. There was a large expenditure on capital account, amounting alto-

gether to about £35,000; some £10,000 of this was on extensions, £20,000 on machinery, buildings, &c., and £5,000 on the railway. They had opened up during the year some 877 acres of young coffee. This was a much larger area than they had contemplated, and, indeed, under present circumstances they would far rather have postponed making any extension, but in this matter they were a little tied upon labour questions, and no doubt that these extensions would come in very usefully in the course of time. In the meantime, so far as labour would permit, they had given instructions that extension should be rigorously curtailed. As to the capital expenditure during the coming year, the estimate sent to them was that it would possibly amount to some £12,000, of which £7,000 had been already incurred. With regard to the management, they had every cause to be satisfied with the work done, and he was very glad to say they had been able to secure the services as second in command, of Mr. Hammond, who had had considerable experience in Brazil not only in coffee growing, but in business matters generally. As to labour they had a good and full force on the estates, and had added to it considerably. The directors felt that the great hope of the company was to be able to produce a quality of coffee superior to that generally known as Santos coffee, and all the exports they had consulted had been fully satisfied that all that was necessary was certain mechanical alterations in the treatment of the coffee. The general character of Brazilian coffee was poor, and the great fall from which they were now suffering was caused by the fact that there had been a very great oversupply of this particular class of coffee. Other grades—medium, fine, and good qualities—had not fallen in the extraordinary manner in which Brazilian coffee had, and therefore the aim of the directors was to keep Dumont coffee out of the rut of the Brazilian, so that it might be of a superior grade, equal, as they felt it should be, to any Central American high-class coffee. During the past year they had been making every preparation they could for the treatment of the 1898 crop, and in that respect they had been very fortunate in securing the services of Mr. Michie, of Ceylon, who was a very capable engineer, and was in every way the right man for this work. The point was—with all these improvements would they be able to earn a dividend for the ordinary shareholders, for they looked upon the debenture holders and preference holders as perfectly safe. The directors stated in their report that they hoped that the improvements they were making would even this year enable them to earn a dividend; but of course it depended not only upon the improvement in quality, but also upon their getting a fair quantity. Since the report, however, they had received telegrams from their managing director in which he informed them that the coffee crop would be very short of the estimate, though the quality was considered to be good. This, of course, rather altered the position from that existing at the time the directors issued their report, and he was not inclined to confirm the hope held out there in. It was early, of course, to judge, but he felt he must advise patience. In the calculations the directors had made they had never taken into consideration the possibility of a rise in the coffee market. Of course they could not predict what the state of the market would be, but if the Brazilian crop was going to be short to the extent of some 20 per cent to 25 per cent, as they were advised, of the previous year's crop, it was clear there must be a very considerable rise in the market, and that would mean to them a very great deal. Owing to the low prices ruling in the past year, the consumption was very materially affected, and he was told by authorities who should know that during the current year the deliveries up to date had been at the rate of an increase of 4,000,000 bags per annum, and if that continued the market for coffee would undoubtedly very soon be in a far more healthy position than at the present time. He could only promise that the board would continue to do its best in the shareholders' interests. It might be satisfactory to them to know that the board held one-

fourth of the ordinary capital of the ordinary, and, personally, not only was he a buyer of company shares last year, but since then he had trebled his holding. That would show that he had full confidence in the goodness of his investment.

Mr. H. K. Rutherford seconded the motion. Mr. Stratten Binolis said he visited the company's estates because he and his friends were largely interested in them. He was very pleased with all that had been and was being done by the staff, and by Mr. Michie. Improved methods were being adopted in the gathering of the crop, and the coffee trees themselves seemed to be in a perfectly healthy state.

The resolution was carried unanimously. Mr. Rutherford moved the re-election of Mr. Buchanan as director, which was seconded by Mr. G. A. Talbot, and carried unanimously.

Mr. C. A. Carlisle was also unanimously re-elected a director, on the motion of the Hon. H. A. Lawrence, seconded by Major F. B. McCrear.

Messrs. Jackson, Pixley & Co. were reappointed auditors, and the proceedings closed with a vote of thanks to the chairman and directors.—*H. and C. Mail*, June 17th.

### CEARA RUBBER.

"Kew Bulletin" for January-February, lately received, gives the first place to a resumé of the experiments made in various Countries with Ceara Rubber and winds up with the following Summary:—

The result of experience so far gained in the experimental cultivation of the Ceara rubber plant may be summarised as follows:—

1—The plant is readily propagated both from seeds and cuttings. Seeds are abundantly produced in almost every part of the world where the plant has been introduced. They may be gathered from plants when only three to five years old. There is therefore the great advantage that a large area could be planted within a comparatively short period. Sowing the seeds in the position where they are to grow permanently is universally adopted in Brazil. It is possible, if adopted elsewhere, this plan would greatly reduce the cost of establishing plantations.

2—The Ceara rubber plant is very hardy, a fast grower, free from insect and fungoid attacks, requires little or no attention when once established and thrives in poor, dry and rocky soils unsuited to almost any other crop. It is evident, however, that the yield of a few trees cannot be remunerative and only large areas can hope to make the industry a paying one.

3—It produces a good class of rubber, second only when well prepared to the best Para rubber. For this there is a steady and continuous demand. The yield per tree is apparently small, but a return is obtained earlier than from any other rubber plant. With thick planting and judicious thinning as the trees grow up, it may be possible to increase the yield hitherto recorded; while with skilful treatment the permanent trees may be tapped twice yearly and last in a productive state for 15 to 20 years.

4—In spite therefore of the apparent want of success which so far has attended experiments with Ceara rubber plants in Ceylon and other countries, the increasing importance of rubber as an article in large demand in all civilized countries at good prices, suggests a reconsideration of the merits of this interesting plant. In many of our colonies possessing a dry climate and a poor stony soil, it is possible that large areas could be profitably occupied with Ceara rubber trees so grown as to provide annual crops for tapping. We feel very strongly that more might be done in Ceylon with Ceara Rubber, and that cultivation was not persevered with, ten years ago, because of the "boom" in tea. But now in dry districts not suitable for Para, the Ceara kind might well be planted.

## TEA CULTURE IN ASSAM.

An upcountry planter asked us the other day to say in what relation the various divisions of the great tea country of Assam stood to each other. His immediate object was to show that when a report came affecting crops in Cachar or Sylhet, that meant but a limited division of Assam. That is quite true. Assam altogether is made up of 10 divisions and while Cachar includes the largest number (191) of tea gardens, Sibsaghur has the largest area under crop, 70,000 acres or 7,000 acres less than Dimbula and Dikoya together. Sylhet comes a good second with 70,200 acres. Altogether Assam includes 822 gardens with an area of 310,550 acres of mature and immature plants, the total crop last year being 107,266,334 lb. As to the yield per acre, the average ran from 474 lb. from Sylhet to 132 for Kamrup. As regards total crop, Cachar gave a little over 22 million lb.; Sylhet over 26; Lakhimpur nearly 19; Darrang over 11; Nowgong over 4; Kamrup  $\frac{3}{4}$ ; Goapara and Khasi and Jantai Hills under 150,000 lb.

## PICKINGS.

Says the *Chemist and Druggist*:—"A thirty pound case of the concrete JUICE OF THE PAPAWE, shipped from Ceylon, was included in the drug sales recently; it consisted of small, irregular masses of a light-brown colour, having an odour somewhat resembling Para rubber. Papaw juice is obtained by scarification from the unripe fruits and is generally employed medicinally in countries where the tree is found. The active principle—papain—is readily precipitated by the action of alcohol; it is used in the treatment of dyspepsia, diphtheria, and as an anthelmintic, and is also recommended for eczema. The lot in question was sold at five shillings per pound, 'subject to approval.'—It is hardly correct to say that the juice is used medicinally in countries where the tree is found; at any rate this is not the case as regards Ceylon. It would be interesting to know who are the shippers of papaw juice from Ceylon at present. It is advised (by Mr. Christy we believe) that the papaw juice for papain should be taken not from the fruit but the tree itself. This would leave the fruit undamaged and allow it to ripen properly.

The following is an advertisement, writ large, taken from an Australian exchange:—"SUN-LIGHT COCONUT OIL CAKES. For cows, calves, working horses, pigs and poultry. It is the richest food known. Coconut oil cake is used on every up-to-date farm in England, Denmark and Germany. It prolongs the milking period of cows, enriches the milk, and increases the quantity. It increases the feeding power of grass, hay ensilage, lucerne, oats, maize, bran, &c. Enables more stock to be kept in a given area and returns to the land a rich manure. Pamphlets etc. on application. Its effects are marvellous—just give it a trial. Manufactured by Lever Bros., Ltd., 63, Pitt Street, Sydney." Coconut planters in Ceylon should feel thankful to Lever Bros. for this advertisement.

Advocates of the LACTOMETER should read the following:—"A gallon of water at 60° F. weighs 10 lb.; a gallon of average milk 10.25 lb.; and a gallon of cream 10.15 lb. Skim milk weighs about 10.36 lb. to the gallon, so that water is

lighter than either milk or cream. This was the chief reason of the failure of the lactometer as a testing instrument. Fat being the highest constituents of milk, a low specific gravity would indicate rich milk, but as water was also lighter than milk, the addition of water produced the same results.

To treat SEED GRAIN for planting, it is recommended that each bag of seed should be heaped on a cloth on the ground and a preparation consisting of a milk dishfull of lime and three gallons of boiling water, added. Stir the seed quickly with a shovel. Take care that the water is in a boiling state. If it is melted it is said to be superior to treatment with bluestone. It carries earlier germination and an earlier harvest, while preventing smut and improving the yield.

## WEEVIL AMONG STORED GRAIN

is from the "Farm and Dairy" (Sydney):—

There is probably more grain stored in N.-S. Wales at present than at the corresponding period of any other season in its history. And it is equally probable that less is known about storing grain in this colony than in any other of the large wheat producing countries. The weevil became domesticated at about the time that Cain—or was it Abel—first planted wheat and offered up some of his stored grain as a sacrifice in the off season when he wasn't busy ploughing. Perhaps it was because his wheat was weevily that it didn't find so much favour as his brother's merinos and shorthorn calves. Later on the weevil did much damage to the wheat that Joseph cornered in Egypt and we have it from authentic records writ on Papyrus in hieroglyphics found in the Pyramids that in revenge for the bad treatment that he received in his youth from his brethren, Joseph gave them weevily grain later on out of his sack and much of it they couldn't eat. It was about that time that the weevil, finding that it wasn't safe to fly out of doors and catch one of the seven plagues, forgot the use of its wings and ever since it has been able to fly about as far as a Muscovy duck. Joseph tried all manner of means of extirpation but failed, and if the drought hadn't broken up about that time Pharaoh would have had to lynch him, on the top of Cleopatra's needle. We have since then learnt somewhat about weevil. The floor, walls and ceilings of all grain sheds should be smooth and so leave no lurking place for weevils or their eggs and when the shed is empty all the corners should be played on with a steam hose. Close all doors and windows and evaporate 1 lb. of bisulphide to every thousand cubic feet of space and the weevils will feel very sick indeed and express a keen desire to go and rest with their ancestors.

## AUCTION SALE TEAS IN NEW YORK.

## THE LARGEST PUBLIC OFFERING EVER MADE.

A correspondent writes:—New York, June 3.—Possibly the enclosed, from yesterday's *Journal of Commerce*, will interest you. Strikes me that prices are extraordinarily low:—

The largest offering of teas ever sold by auction in the United States was disposed of yesterday in this manner by the Montgomery Auction and Commission Company in this city. The sale lasted from 12 o'clock noon to 4 p.m., and attracted one of the largest gatherings of buyers ever seen at an auction sale; two auctioneers were required. A noteworthy feature of this sale is that it was the first public offering under the new tea regulations, which, it will be remembered, provide for a higher standard of importations than what existed a short time ago.

The total amount offered was 32,654 packages, consisting of 9,394 half-chests Moyune, including the

Lee Yeh Hing, Emperor and many other fancy chops; 1,982 half-chests and boxes Pinsuey; 925 half-chests Japan; 960 half-chests Japan, basket-fired and sundries, including all grades; 282 half-chests Japan dust; 3,673 packages Congou, every grade and kind; 780 packages India, Java and Ceylon Pekoe, well selected stock; 3,303 half-chests and boxes Amoy, well selected invoices; 11,350 half-chests and boxes Formosa, including "White Bear," "Black Bear" and "Swan" chops.

A large contingent of city and out-of-town buyers were noticed on the floor, but very many were represented by brokers, so it is impossible to give the actual number of purchasers at the sale.

The lots sold at the following prices:

Moyune—346 packages hyson at 22 a 11½c per pound, 6,135 packages young hyson at 31½ a 11½c per pound, 907 packages of imperial at 21½ a 12½c per pound, 2,016 packages gunpowder at 26 a 15½c per pound.

Pingsuey—294 packages imperial at 16 a 14½c per pound, 1,688 packages gunpowder at 24½ a 14½c per pound.

Japan—925 packages of pan fired at 18 a 14½c per pound, 810 packages basket fired at 16 a 14½c per pound, 150 packages sun-dried at 14½ a 14c per pound, 282 packages siftings at 9½ a 8½c per pound.

Congous—3,673 packages at 13½ a 9½c per pound, 780 packages India and Ceylon at 18½ a 11½c per pound.

Oolong—3,303 packages Amoy at 13 a 11½c per pound, 11,350 packages of Formosa at 41 a 16c per pound.

Naturally, the unusual offering of 32,664 packages has had the effect of depressing the market for some time, and it has been expected that prices would be in buyers' favour. However, the sale, considered in its totality, has resulted in a large quantity of teas being marketed without a disastrous fluctuation, although, as expected all kinds and grades of teas declined from what they have been when the market was stimulated with the prospect of a duty on tea. In country greens, all extras sold at a decline of fully 2 cents per pound against last market, low grades declining only about 1 cent per pound. Pingsueys showed a well sustained market, all grades selling at firm prices. Japans declined about 1 cent per pound for all grades, including basket fired and sun dried. Congous probably suffered the most of any other teas in the sale, low grade teas declining fully 1½ cents per pound from a week ago. Indias and Ceylons were very heavy and but little support was given to them, with the result that desirable teas sold as low as 12 cents. The offering of Amoy was very attractive, and the prices declined about 1 cent per pound in comparison with the last sale. Formosas showed quite a sharp decline for teas selling from 20 to 25 cents, while low grades declined to 16½ cents to 17 cents.

## HOW TO UTILISE CHILLIES AND PAPAWE.

In response to inquiries made by various persons as to how certain products should be treated when it was desired to prepare them for domestic use, Mr. H. V. Jackson has furnished the following information:—

**HOW TO MAKE USE OF CHILLIES.**—Capsicum-Chillies are a variety of shrubs or subshrubs, natives of tropical countries; *Capsicum annuum* the common chilli, *C. baccatum*, the bird pepper of Chili, and *C. grossum*, the bell pepper, being the most generally in use, whether for pickles or ripened and ground as cayenne pepper. Some of the varieties are exceedingly ornamental, and in most cases the smallest pods have the hottest flavour.

**TO MAKE CHILLI VINEGAR.**—Take say fifty chillies to 1 pint of vinegar, mash the chillies, then place them in a close jar or wide bottle, adding the vinegar, then cover tightly; at the end of four weeks uncover, strain and bottle.

**TO MAKE CHILLI SAUCE.**—Take one dozen large tomatoes, two large onions, and four green chillies; peel the tomatoes and onions, and chop them up fine, also chop the green chillies fine. Keep them all separate until chopped, then mix and stir all together, adding two tablespoons of salt, two table-spoons of sugar, one tablespoon of cinnamon, and three teacups of vinegar. Boil the whole steadily and slowly about an hour and a half, stirring well all the time, and then bottle.

**TO PICKLE CHILLIES.**—Take large green capsicums and slit them sufficiently to remove the seeds, then make a brine of salt and water of sufficient density to float an egg. Place the chillies in this when the brine is cold and let them remain for twenty-four hours, then make a fresh brine, drain the chillies, and put them in it for another twenty-four hours, drain again, rinsing in cold water, then place in wide-mouthed stone or glass jar. Now take vinegar and water in the proportion of 1 quart vinegar and 1 quart water to every thirty chillies. Heat to boiling point and pour it over the peppers in the jar; leave it stand till cold, then drain off this vinegar and water and throw away. Heat fresh vinegar now without water and pour over peppers boiling hot. Cover the jar tightly and set in a cool place.

**WHAT CAN BE DONE WITH THE PAPAWE FRUIT.**—*Carica papaya*, Papaw.—A native of South America, now commonly cultivated in most tropical countries. Fruit of an orange colour when ripe, shaped like a melon, the inner flesh being yellowish, like that of rock melon. The fruit and leaves are reputed to possess the remarkable property of rendering the toughest meat tender. According to Vanguelin they contain *fibrine*, a substance at one time supposed to be confined to the animal kingdom. The *Chemist and Druggist*, 23 August 1897, says:—"A 30-lb case of the concrete juice of the papaw, shipped from Ceylon, was included in the drug sales recently; it consisted of small irregular masses of a light-brown colour, having an odour somewhat resembling Parsnip. Papaw juice is obtained by saccharification of the unripe fruits, and is generally employed medicinally in countries where the tree is found. The active principle—papain—is readily precipitated by the action of alcohol; it is used in the treatment of dyspepsia, diphtheria, and as an anthelmintic, and is also recommended for eczema. The lot in question was sold at five shillings per lb, subject to approval." The fruit is used in making chutney, and it also will make excellent jam, for which peel off the outer skin and cut up the flesh in small pieces, such as you would a jam melon. Put half an ounce of green ginger with every pound of fruit, three-quarter of a pound of sugar to every pound of fruit. Mix the sugar through the fruit and allow to stand all night, then boil about an hour. For jam-making take the fruit just turning yellow and not fully ripe. In the West Indies the ripe fruit is made into sauce, or preserved in sugar, and the unripe fruit is pickled, or boiled and eaten like turnips. The flowers give forth a very powerful aroma, and scent is manufactured from them in the South American States.—*New South Wales Agricultural Gazette*.

## PLANTING NOTES.

**VINES vs. COFFEE.**—In the hope of making up the loss Brazil has sustained through the fall in the value of coffee, Dr. Barrets, a well-known agriculturist, has long been urging the cultivation of the grape, 600 varieties of which from all parts of the world he has been experimenting with upon his own estate in the San Paolo province. At a recent exhibition he had on view 300 varieties, and in most cases the products were superior to those of the parent country, both with respect to table fruit and that more suitable to the wine-press. Dr. Barrets evidently believes it better to get a new seed than to try flogging one lacking in quality.—*Planting Opinion*.

**LADY BIRD BEETLES FOR SOUTHERN INDIA.**—We regret to learn that the first batch of lady-bird beetles obtained in behalf of the United Planters' Association of India from Australia has proved a failure. Not a single insect had thawed out alive.

**WEEVILS IN PADDY.**—It will be observed that in the useful circular just issued by Messrs. Willis and Green (see page 91) principal remedy recommended is fresh naphthalene, already so much pressed on the notice of our Sinhalese rice cultivators, and whose virtues is, we believe now well-known to them.

**COFFEE IN JAVA.**—People in the East of Java are pulling long faces at the bad price of coffee and the short crop. An estate at Blitar which last year produced 1,400 pikuls now produces a couple of hundred. Some estates have sold at 42½ to 47½ guilders per pikul, and one hears of plans to bring all under the hammer. A good way not to meet the famine years stoutly, says the *Sourabaya Courant*.—*S. F. Press*, June 27.

**JAPANESE TEA.**—A large company has been formed in Japan for the purpose of introducing Japanese tea into Russia, depots for its sale are to be opened in Moscow, Warsaw and Odessa. Japanese officials are also visiting in order to find other openings for their goods. Russia, on the other hand, is going to run a special line of steamers from the Black Sea ports to Yokohama, carrying petroleum to Japan and bringing back raw iron and camphor.—*Pioneer*, July 2.

**LADY-BIRD BEETLES AND BUG.**—We direct attention to Mr. E. E. Green's very instructive letter elsewhere which, we think, is a satisfactory answer to Mr. Blanford's objections to the Indian Coffee Planters' Mission through Mr. Newport. We were wrong in supposing green-bug had dated back to Nietner's time: to Mr. Green belongs the honour of describing it. We earnestly trust that an attempt will be made to get the proper lady-bird enemy of the new lantana bug "*Orthesia insignis*."

**TEA CULTIVATION.**—Manuring and Pruning are freely discussed by correspondents elsewhere: as regards the former there is nothing like each planter experimenting for himself. "Experimental plots" are far better guides than chemical analyses. As regards improved Tea Pruning, "J" gives some very good advice, and no wonder; for there are few more competent managers than he, in the island. In our *Overland Supplement* will be found more about grevilleas from another old planter, Mr. J. Fraser; and references to our tea exports.

**THE LANTANA BUG.**—Although we published Mr. E. E. Green's full letter and warning on Friday last, our evening contemporary waits till he receives the same news in an extract on Monday, before he votes "urgency." Mr. Willis in sending on Mr. Green's statement respecting the bug to our contemporary, adds:—

You will see that this is a rather serious statement, and it is very hard to say what is best to be done. One thing may be recommended to planters—that they should destroy at once any lantana on which they see *Orthesia*. In this neighbourhood the result of the bug as far as the lantana is concerned, is to cause it to give place to the newer invader, the *Tithonia* or so-called sun-flower, which bids fair to replace lantana all over the island. We trust that an immediate campaign against bugged lantana may be commenced and that Government will do its full share.

**SIR WILLIAM AND SIR JOSEPH HOOKER.**—In acknowledging the presentation by the Linnean Society of a special medal as previously reported by us, Sir Joseph Hooker thus gracefully alluded to the part that his father had taken in launching him in his career and supporting him in it:—"It remains, Sir, to thank you cordially for coupling my father's name with my own in this award; but for which indeed, I could not have accepted it without a protest. I inherited from him my love of knowledge for its own sake, but this would have availed me little were it not for the guiding hand of one who had himself attained scientific eminence; who, by example, precept and encouragement, kept me to the paths which I should follow; launched me in the fields of exploration and research, liberally aided me during his lifetime, and paved for me the way to the position he so long held at Kew with so great credit to himself, and benefit specially to our Indian and Colonial possessions."—*Gardeners' Chronicle*.

**THE COMING "CORNER" IN TEA** is the heading of an article in the *Indian Planters' Gazette* of June 4, from which we quote:—On the 21st April we pointed to the possibility of the London Tea Market getting into the hands of the large dealers, and suggested co-operation among all British Indian growers to check the operation of these people. Since then matters seem to have intensified. Although the average price (according to the last mail) in London had fallen only to 7d, the miserable results of the sales at Calcutta tend to show that influences are at work to still further depress the market. It would thus seem to be evident that the situation must be grappled with in the promptest manner. Those concerns with good reserve funds can always resort to the extreme measure of abstaining from manufacture *in toto*, or restricting their operations to very fine plucking; but those carrying on from hand-to-mouth must apparently go to the wall. At all events a very serious loss on the season's operations must result, and all must gird up their loins for a struggle that will be long and severe; but if loyal and united action is immediately taken, we believe the corner men can be beaten. \* \* \* The stoppage or restriction of supplies might force the big men to act more generously, and we suggest that fine plucking should be the order of the day until such time as the reduction of stocks indicated the prudence of more copious cropping. Weekly meetings of the agents here could be held, and each could compare his visible supply with what was held in the London warehouses, wiring the different Managers how to act in the matter of plucking. A well-digested scheme of this kind would go far to regulate the markets. Stocks ought never to be allowed to accumulate in the manner they have heretofore been permitted to. We can pretty accurately judge now of the weekly demand for deliveries, and provide for the winter requirements; for should the depletion justify it, the large yielding months of August and September would make good any deficiency that might become apparent towards the end of summer. This is of course, restriction under another guise, but it is better to keep our reserves on the bushes, than boxed up in bond. Once tea is made it must be held or sold, and we can draw upon our plants at discretion. We believe that improved prices would result when it became known in London that this determination had been universally come to; the tactics of the ring would be rudely shaken, if not shattered altogether. But co-operation on strictly loyal principles is imperative.

## OUR EXPORTS FOR THE FIRST HALF OF 1898:

### THE WIDE DISTRIBUTION OF CEYLON TEAS.

It will have been seen from the statistics elsewhere that even more interesting than the satisfactory development of some of our staple products, has been the change in the destination of some of our more prominent exports. The diversion of trade from one country or from one centre, to another, is of more than academic interest, whether as evidence of the appreciation of our wares by new customers, or of the desire of old consumers to deal directly with the producing country. In either case, the producer must derive some benefit from increased competition, or from the removal of at least one middleman and his appropriations. It is in this view we welcome the growth in the Exports of Tea to Germany, to America, Africa, "China" (which means the Pacific Coast of America), and to "Singapore" (as a distributing port) which has nearly doubled its orders; to Australia which is our best customer after the mother-country, and which has already taken nearly a million lb. more than last year—we are, of course, speaking only of the first half of the year—and especially to Russia which, as we saw in our last article, claimed 1,198,555 lb. up to 28th June last, against only 176,257 lb. for the corresponding period of 1897! Most of these countries, especially America and Russia, receive considerable quantities of our tea through London and the Continent, so that the figures before us do not represent anything like all our trade with those countries; but the direct trade is full of hope; and we regard with special satisfaction the opening of direct communication with Russia. She is a great country, her population is immense, and the people are great tea-drinkers. Much as the Thirty Committee, and their predecessors in pushing the Tea trade into likely markets, have done through Mr. Rogivue and other agencies in making our Teas known in Russia, we feel sure that what they have accomplished will be as nothing compared with what may be achieved through direct means and from the presence of Russian buyers in our midst. They know their countrymen and their wants; their countrymen will be naturally more ready to deal with them than with strangers; and altogether we look very hopefully, to the expansion of this branch of our Export trade. We shall deal separately with the question of the tea duty as it affects the Russian trade.

Curiously enough, Tea is the only one of our numerous Exports which is sent direct to all the nineteen countries which find a place in our Export tables. Coconut Oil comes next with a list of eleven countries, to which it finds its way direct—though this year, so far, the number is reduced to ten, without any shipments to Italy; while Cinnamon, Plumbago and Coir Yarn are claimed by ten countries. The other Exports are sent to less than half the countries on the list—Ebony finding an outlet in the United Kingdom alone, and Coir Rope in India and Singapore. With apologies to old King Coffee for the omission, we are bound to say that he is still sought in eleven countries; but of these Sweden and Singapore have taken only one cwt. each! Again, while the United Kingdom has taken away more or less—generally more!—of all our

products, save rope, Malta and Maeritius have been content with Tea alone, Turkey with Tea and cardamoms, and Sweden with Coffee, Tea and Plumbago. But Russia, although she too has put in a bid for only three products, has claimed full quantities of each—standing third on the list for Tea, first for Copra, and fourth for Coconuts with 60,000 against her name. Altogether, Russia is showing herself a customer whose friendship must be specially cultivated.

We must add a few lines on some of the products to which we were unable to make special reference in our previous article. Of these Plumbago is the most considerable and shows a gratifying increase, with a total of 200,922 cwt., on the Exports of previous years. For the whole of last year the Exports were 357,257 cwt. and topped the four previous years. Should we send away as much during the current half year as during the past, 1898 will show the largest quantity of Plumbago ever exported in any year save 1889 when 475,516 cwt. were sent away. America, which was our largest customer in 1896, and the second in order last year, claims first place again with 79,527 cwt. against 62,182 by the United Kingdom, and 37,137 by Germany. Coir, in its various forms of Rope Yarn and Fibre seldom shews any remarkable growth or fluctuation; but this year in both Rope and Fibre, we are well-ahead of the three previous years, while in Yarn there has been a corresponding drop. Palmyra fibre shows an increase after two years' falling-off; but that is scarcely matter for congratulation, as young trees are reported to be seriously injured in collecting the fibre. Citronella Oil continues to develop; and Cinnamon Oil too, shews an advance this year; but it is noteworthy that Germany has so far made no demand for this Oil: while as regards Cinnamon, in both Quills and Chips she heads the list, distancing even the United Kingdom for the first time.

### THE BOGAWANTALAWA DISTRICT TEA COMPANY, LTD.

Directors.—Henry Bois, Esq., Charles Fetherstonhaugh, Esq., John Geoffrey Fort, Esq., Alfred Tabor, Esq.

Agents in Colombo.—Messrs. J. M. Robertson & Co. Agents and Secretaries.—Messrs. Robertson, Bois & Co.

REPORT.—To be presented at the first ordinary annual general meeting of the Company, to be held at the office of the Company on Monday, 27th June, 1898, at 12 o'clock noon.

The Directors have the pleasure to submit the balance sheet and accounts of the Company for the year ending 31st March, 1898, duly audited. The higher rate of exchange and fall in the Tea Market reduced the profits of the estates as compared with the years prior to the formation of the Company. The expenditure compares favourably with the estimates, and the crops have somewhat exceeded the quantity expected at the beginning of the season. In accordance with the prospectus, the factory on Bogawana is being enlarged so as to take in the leaf from the adjacent Bridwell estate. These alterations will shortly be completed, and the sum expected thereon to the 31st March, 1898, amounting to £1,331 6s 10d, has been charged to capital account. The total yield was 994,413 lb. tea, plucked off 2,041 acres, of which 141 acres are only in partial bearing, being at the rate of 487 lb. per acre all round, costing free on board Colombo 26½ cents, or 4.22d per lb. The gross average price of the 985,330 lb. sold in London was 8.20d per lb. The crops for the current season

are estimated at 1,011,570 lb. tea. The gross average rate at which drafts were negotiated was 1s 3-9-16d per rupee. A rise or fall of 1d in the rate of exchange is approximately equivalent to 1 per cent on the ordinary capital of the Company.

The Profit for the year inclusive of interest, and after providing for General Expenses &c., amounted to £12,997 13s 5d

Interest in the Mortgage Debentures has been paid *less* Income Tax £406 0s 0d

Dividends on the 6 per cent Preference Shares for the 12 months were paid on the 1st October 1897, and 13th April 1898, *less* Tax £5,394 0s 0d

An interim Dividend of 2½ per cent on the Ordinary Shares was paid, *less* Tax, on the 21st January 1898 £2,416 13s 4d

It is proposed:—

To pay a Final Dividend of 3½ per cent on the Ordinary Shares, making 6 per cent for the year, which will require, *less* Tax £3,383 6s 8d

To write off the whole of the Preliminary expenses £438 19s 1d

And to carry forward to next year (out of which Income Tax has to be paid) the Balance of £958 14s 4d

£12,997 13s 5d

	Knuckles	...	207,356		6.61		
			594,066		6.60		

The Dooars gardens have not done so well as in 1896, but the results for the Ceylon gardens are encouraging.

Prospects for 1898.—The gardens are in a good state of cultivation, advices to date are satisfactory, and the Directors look forward with some confidence to the results of the current year.

Profits.—The profit for the year amounts to £32,617 4s 8d, from which £2,576 3s 0d has to be deducted for commission to Managers. Adding the balance of £429 19s 10d, brought forward from last year, there remains the sum of £30,471 1s 6d available

for distribution. The Preference dividend will absorb £10,950, and the Board recommend a dividend of 9 per cent on the Ordinary Shares. After providing for the remuneration of Directors, the balance of £143 3s 9d will be carried forward.

WYNAAD PLANTING NOTES: HYBRID COFFEE.

Coffee crop prospects are exceedingly favourable, much more so than has been the rule during the past few years, as both March and April blossoms set well. Extensions of tea are being carried on vigorously, despite the lamentable fall in the Tea Market. Estates which in the early quarter of 1896 secured an all round average of 10d per lb. for their produce, have of late sold their breaks for little more than half that price, and unless we get a very high average of made tea per acre, it is difficult to understand how 6d per lb. with exchange at 1s 4d can pay. Both tea and coffee estates are looking exceeding well, and it is a notable fact that one of the bumper coffee crops expected is from a property opened 36 years ago. Increased attention is now being devoted to hybrid Librician-Arabica coffee, and amongst those who are in a position to form an unbiased judgment on the subject, the opinion is rapidly gaining ground that this new variety, and not tea, will prove the salvation of the country. Already rumour is rife that an offer of a rupee per bean, the production of an original hybrid Liberian-Arabica, has been declined, and assuming that a Mysore seer measure will hold 1,500 of such beans, and that this original hybrid has, since it came into full bearing, averaged a yield of nearly six seers of such coffee annually, the value of such a tree, while the supply of good seed is so far below the probable demand, furnishes an appreciable addition, prospectively, to the fortunate owner's income. The result of the deliberations of the Currency Commission in England is awaited with much anxiety by Planters' for with the high ruling rate of exchange, and the decline in prices in both coffee and tea markets, it will be a problem for even the most affluent proprietors to show a profitable margin in the working of their estates, confronted as they all are by alternate good and indifferent coffee crops.—*M. Mail*, July 5.

SELANGOR PLANTERS' ASSOCIATION.

Minutes of a General Meeting held in the Victoria Hotel, Kuala Lumpur, on Saturday, 18th June, 1898, at 11 a.m. Present:—Messrs. E V Carey (Chairman), C Meikle, A Walker, A B Lake (Members of Committee), Hardy Inniss, E B Skinner, H M Darby, J D Toynbee, A D Douglas, R C Tollemache, W Meikle, G Watson, Logan Tod, F A Hurth, J G Glassford, C G Glassford, H Hüttenbach, F Callaway, N Dalrymple, Brooke and Tom Gibson (Hon. Secretary.)

Read letter from Secretary to Government, forwarding copy of a letter from the Colonial Secretary, Singapore, to the Singapore Chamber of Commerce, on the subject of the proposed alteration in the currency of the Straits Settlements, and asking for the views of the Association on the subject for the information of Government. The Chairman said you only had to look upon the fatal effects of fixity of rupee exchange in India and Ceylon on the planting interests, to see that a fixed dollar would affect us prejudicially here if its silver value continued to depreciate.

Mr. W. MEIKLE agreed with the Chairman that a dollar fixed at 2s was not desirable. Mr. Huttenbach said that although there might be some in the room like himself who in the general interest would like to see a fixed dollar, still, as such might lead to

serious complications, he thought it better to leave the currency question as it now is. After some general discussion the Chairman proposed and Mr. W. Meikle seconded the following resolution, which was carried unanimously—viz.:—"That in the opinion of this Association any action having for its object fixity of exchange is undesirable in the interests of the planting community."

Read letter from Secretary to Government inviting the Assistance of the Association to effect the acceptance on the part of Estate Managers in Selangor of the views expressed by the Government of India to the effect that coolies should not be denied sustenance in cases of malingering, but that the proper remedy for contumacious refusal to work is punishment as provided by law. Resolved that the Hon. Secretary inform the Government that it is the custom on Estates to make advances of money and food to coolies who may be without means of subsistence and are in consequence disposed to malingering.

Read letter from Messrs. Barlow & Co., in reply to certain queries made by the Association in reference to the proposed Curing Mill at Klang, intimating that they will keep the queries before them, but with the immediate future so gloomy they think it wiser to break off negotiations for the present.

#### COCONUT TREES PRESERVATION ENACTMENT, 1898.

The CHAIRMAN said that now with coffee at such ruinously low figure, planters had to look to other products to make up for the loss, and it behoved Government to give us all the assistance in its power such as the stringent enforcement of the Enactment in question. This had been done in Province Wellesley and Singapore with good effect, and should be done here, where a great deal of capital was being invested in the coconut industry.

The Chairman read a letter from Mr. F. A. Toynbee offering to assist the Association in pushing of our coffee by the sale of packets, and in the opinion of the meeting the offer was well worthy of consideration. Tom GIBSON, Hon. Secretary, S.P.A.

Klang, 20th June, 1898.

#### TEA BROKING IN CALCUTTA.

We are in receipt of the business circular of Mr. Louis Campbell Baines from 3, Mangoe Lane, Calcutta, 29th June and we quote as follows:—

I have this day established myself in business at the above address under the style of Baines & Co. as Tea, Indigo, and General Produce Brokers, assisted by the staff of the late firm of Messrs. William Moran & Co. I have authorised Messrs. Bertram Stansbury and George Henry Louis Mackenzie to sign my firm, and beg to call your attention to our respective signatures at foot. The late partners in Messrs. William Moran & Co., to whom I have been an assistant for the past eighteen years, share with me the hope that all their friends and constituents will extend to me the same support, as was afforded to them, and every endeavour will be made by me, and the staff, to ensure the efficient conduct of all business entrusted to my firm.

EXTRACTION OF RUBBER.—We read that at the Trinidad Agricultural Exhibition—the Botanical Department exhibited a new form of machine for the extraction of rubber, Mr. Hart directing the operations which were carried out on the spot. The rubber in the space of two minutes is separated from the latex, or milk of the Castilloa tree, and is then put to dry. In the space of three hours, sheets or slabs of fine clear marketable rubber is produced, free from the usual amount of proteid and albuminoid matters which are usually found in rubber produced by the ordinary process. Some 22,000 people visited the Exhibition, which was a great success.

#### DIRECT PRODUCE SUPPLY ASSOCIATION.

We have now received some further information about the proposal brought under the notice of our readers by our well-known correspondent "J.L.S." We have been placed in possession of a Circular which has been addressed to several who have tea businesses and which, we learn, has been very favourably received: so much so that the project is certain now to go on and the larger it can be made and the more it embraces, the better for all interested. Some friends of the proposal at home think the promoters should start in competition with the huge cheap, tea-supplying concerns and cut them out; but to enter into competition with such Houses would only still further lower the price to the consumer and consequently to the producer. If it is decided to raise the price of tea it can only be done by getting people to pay more for it, and the scheme now proposed will—to all appearances, and "J.L.S." is especially confident—have the effect of arresting the steady fall, and possibly in raising the price. Those who have already built up connections for the distribution and sale of Ceylon tea or other produce, can capitalize them according to the information given in the Circular; and those who can build up connections and have not already done so can work as commission agents at ten per cent clear profit upon all business introduced. Working as a commission agent, it seems, will only mean sending home a list of names to whom circulars and price lists may be forwarded. This ready-made machinery will save part of the enormous expenditure on advertizing and employing travellers which otherwise would have to be paid. The promoters are anxious to lose not a moment in putting the project through, so if any of their friends in Ceylon think of joining they should write at once. The new Company is likely to have agents in all the large towns to take orders, but not lock up large stocks of tea in the country, supplying as far as possible direct from London. We now reproduce the preliminary Circular referred to above:—

This Company is formed to take over and amalgamate several going concerns, which have made the supplying of Ceylon tea their special object, and also of coffee, cocoa, pepper, curry powder and other articles of common use, which they procure direct from the place of production and can thus offer to the public on exceptionally favourable terms. The going concerns which are now being taken over are all purchased at a price which shows 10 per cent nett profit for the last three years, and it is estimated that the economies in working expenses which will result from the amalgamation will considerably increase this return. In addition to which the introduction of many new shareholders largely interested in the cultivation of tea in Ceylon will, it is confidently expected, afford a cheap and valuable advertizing medium which will very largely increase the business and consequently the dividends of the Company. The supporters of these businesses are composed chiefly of those who can appreciate a good article and are prepared to pay a fair price for it, who realise that the lowest priced article does not necessarily offer the best value, and who are aware that "the finest tea the world produces" cannot be retailed at prices below what it realises in Mincing Lane; and while the object of this Company will be to supply tea at prices which will suit the wants of all, special attention will be given to placing the very best tea at reasonable prices within the reach of everyone. No promotion money will be paid, and, to ensure continuity of goodwill, the vendors to the Company will in no case take less than half the purchase money in shares. The extra capital which

is being raised will enable the Company to purchase such other firms as may from time to time offer, and to provide for the extension of business which is expected.—15th June, 1898.

We do not know how far planters in Ceylon are ready to act on the above. Possibly many may be inclined rather to wait for the Prospectus which we understand is to follow very speedily and to then offer to take shares or otherwise extend support by furnishing a list of possible or certain customers. The experiment seems to us to be well-deserving of planting support and we trust in the interests of all concerned, it will prove a success.

#### COFFEE LEAF DISEASE AND MANURING.

The Queensland *Agricultural Gazette* for April contains a long contribution on coffee leaf disease by Mr. Philip MacMahon, Curator, Botanic Gardens. The references to Ceylon are naturally frequent in this unfortunate connection, and the diagrams are "after Rev. R. Abbey." Speaking of the abatement of the disease in our Island, the writer says "it is not due to applications of fungicides, which on such a scale would be out of the question, but to improved cultivation and to the fact that the fungus in its turn does not now find the same growth conditions that it formerly did. . . . Formerly it was not the custom to manure coffee; it did quite well without it. But for years the crop, a highly special one, was being taken off the land, and no equivalent returned. Wherever this practice is adopted the result will inevitably be failure of the land to produce that crop, and a condition of the plant favourable to the reception of the first wandering fungus spore of a suitable species which floats that way. Manuring is now largely practised in Ceylon, and the custom is increasing."

Mr. MacMahon should know that our coffee area has gone down in 18 years from 230,000 to 12,000 acres, and that even what is left is not free from disease; and let him further digest this one absolute fact that the fungus *hemileia vastatrix* first left its jungle habitat and fixed on coffee in one of our youngest coffee districts, Madulsima, where the fields were on virgin soil and not long enough in existence to have given many crops. The fungus, in fact, revelled in our youngest and most vigorous coffee fields. Again, manuring with the highest possible cultivation was very general in Ceylon before the fungus appeared, and yet manured coffee suffered equally with unmanured. Of course, coffee in good heart from cultivation, or being in its prime on good soil, was able to carry and mature its crop, in spite of the fungus, better than poor neglected coffee. But the fungus spared nothing in the shape of coffee.

#### THE IMPORT OF BURMAH RICE. MESSRS. JACKSON AND SHATTOCK'S REPORT ON BURMAH RICE.

The following Report has been made by Mr. Jackson, the present Acting Collector of Customs, and Mr. E. M. Shattock, of Messrs. Lee Hedges and Company, in reference to their recent visit to Rangoon. The Report has also been submitted to the Chamber of Commerce:—

TO THE HON. THE COLONIAL SECRETARY.

Colombo, 18th June 1898.

SIR,—We have the honour to submit our Report on the Commission issued to us to make enquiry into the conditions of the Burma rice trade, with

special reference to the supplying of Ceylon with a rice suitable to the needs of her coolly population.

(2.) We reached Rangoon on the 27th May and remained there a fortnight, during which time we interviewed all the principal firms of rice exporters.

(3.) The rice trade is in the hands of three classes:—

(a) The producer, the Burma villager, who sells his crop at the threshing floor to

(b) The broker, a Chetty, or other trader, and very frequently the owner of the boats in which the paddy is transported to the market at Rangoon.

(c) The miller, who buys from the broker, to whom he makes advances in order, it is presumed, to ensure a due supply of paddy, but, as the broker has no time limit and contracts to deliver at the market rate at time of delivery, the benefit which the miller derives from the advance is problematic, though it is easy enough to see that the broker can utilise it most profitably, and not infrequently to the disadvantage of the miller from whom he receives it. The reason for this somewhat extraordinary state of affairs appears to be in the extremely acute rivalry between leading milling firms.

(4.) As to the capabilities of the Burma market it suffices to state that it is estimated that there will be this year a surplus of one million nine hundred and thirty thousand tons of cargo rice available for export. The total requirements of Ceylon average about eight million bushels equivalent to two hundred and thirty thousand tons of rice, or about twelve per cent of Burma's estimated surplus for this year. The rice is shipped from ports Rangoon, Akyab, Bassein and Moulmein; Rangoon exporting more than half, and the other three ports dividing the balance in about equal proportions.

(5.) All paddy is milled raw and the opinion is unanimous that, for "parboiling" paddy and then milling, an entirely different type of milling machinery is necessary, as well as "dryers" on a very large scale.

(6.) Of the milling firms, two alone, Messrs. Steel Brothers, and Messrs. Gillanders, Arbuthnot & Co. gave the question of "parboiling" anything like serious consideration, while a third, Messrs. Zaletski, Boch and Company also asked us for estimates of cost of the necessary machinery and spoke of sending their engineer to inspect the Tanjore mills.

The chief difficulty in preparation of rice in this way on a large scale, is the drying of the parboiled paddy before milling. No desiccators exist in Rangoon and the rains at present render "sun drying" out of the question. Messrs. Steel Brothers are ready to make a sample of parboiled rice and try our market with it during the next dry season (January to June.)

Messrs. Gillanders, Arbuthnot & Co., are comparatively a new firm in the rice trade, they have space available for putting up new machinery, have not worked into the trade grooves of other firms, and are by no means averse from putting up the requisite machinery, provided the Chamber of Commerce, from whom they would like to hear fully and authoritatively on the subject, can shew them that it is worth their while to embark in this new enterprise, by giving them a guarantee that the rice specially milled for this market will be duly purchased. It, therefore, rests with the

Chamber to push this matter to a successful conclusion. As "enquirers" we had no power to give orders or to bind the rice buyers of Colombo in any way; it is however now open to them if they think it worth their while to come to terms with this firm.

(8) The other millers, though averse from milling other than raw rice, are all prepared to mill, in the raw, samples as near to our Indian rices as practicable. "Kallundai" and "Karai" are the rices that can most nearly approximate to them, and we have brought with us, for distribution amongst merchants and planters, certain samples of rice that may be found to satisfy the tastes of our coolies.

9. In our opinion before any other step is taken a full and patient trial should be given to these qualities of rice. We base these considerations on the following grounds:—

(a). The rice is immediately available, whereas parboiled rice cannot be at any rate for months to come, owing to the absence of the necessary machinery.

(b). We shall have at once, all the millers competing for our market and get the benefit of an exceedingly keen competition.

(c). Rice of a similar grade was largely exported to Chittagong and Bengal during the late famine, with a result that a steady trade has since developed between Rangoon and Chittagong, hitherto a stronghold of the "parboiled" trade. It is stated that the Assam planters are now very largely using a raw rice for their coolies, who have apparently quite overcome their former prejudices.

(d). Medical opinion in Rangoon is unanimous that the raw rice is thoroughly wholesome

In jails and hospitals alike, not only Tamils, but Sikhs and Punjabis, who have probably never eaten rice in their lives, are at once put on a rice diet, and the medical officers in charge assure us that they have never known ill-effects to follow from using the raw rice.

(e). There are in Rangoon very large number of Tamil coolies of the same class as our estates labourers, who all live upon raw rice, on account of its cheapness.

10. Paddy is sold in Rangoon by the 100 baskets, each basket holding a bushel—the price varies from R85 to 150 and even higher. The average purchasing price this season, according to the information given us by one of the large milling firms, amounted to R94 per 100 baskets, and this is probably above the ordinary, the brokers having combined to keep up the price of paddy in the market.

11. With the existing competition between millers, if it were contemplated to import paddy into Ceylon, it would be necessary to keep a man in Rangoon to make the purchases. From Akyab, however, during the paddy season from January to April it is practicable to import paddy through the Akyab Milling Company, at rates which we are informed are nearly always R10 to R15 per 100 bushels below those of Rangoon.

At the commencement of the 1899 season, samples with prices will be forwarded by the Akyab Milling Company.

12. Freight on rice averages about R10, and on paddy R11, per ton of twenty cwts.

We are, etc.,

(Signed) E. M. SHATTOCK,

W. H. JACKSON,

Commissioners to Rangoon.

## MINOR PRODUCTS REPORT.

London, June 17.

LEMON OIL.—The London market is quiet, and at least 4s 3d must be paid for reliable oil. An advance is looked for in Messina if orders go forward there to any notable amount, as the stocks are said to be low.

LEMONGRASS OIL.—Dearer. We reported last week the sale of a parcel at 3½d per oz "without reserve." This was unexpectedly cheap and had the effect of depressing the market, but holders are now firm and want 4½d per oz on the spot, and 4½d for August-September. Advices from India to hold the oil at these figures have helped to strengthen the position of the article.

CITRONELLA OIL.—Quiet, with a little spot business doing at 1s 1½d for tins or drums.

CINNAMON OIL.—Higher grade oil has been in distinctly better demand since the publication of the Pharmacopoeia. The new standard requires a 50 per cent content of aldehydes, and consequently better oil has a higher market value. For stuff answering the B.P. test 1s 6d is being obtained.

TAMARINDS.—Barbadoes kind sold at auction this week at 13s.

TURPENTINE.—American spot, 23s.—*British and Colonial Druggist.*

## HYBRID COFFEE IN SOUTH INDIA.

As the subject of Liberian-Arabian hybrid coffee has for some time past engaged a good deal of attention in South India and in Ceylon, a few particulars will probably prove of interest, more especially in view of the decline in prices of tea in India and Ceylon, and the prospect within the next two or three years of the abandonment of unprofitable tea lands. A recent issue of the *Kew Bulletin* refers to the subject as follows:—

Hybrid Coffee in Mysore. What are regarded as hybrid coffee plants, the result of cross fertilisation between the Liberian and Arabian kinds, are being cultivated in some Districts in Mysore. The most recent information regarding them is that contained in a Report on the Manjerabad Forests, presented last year to the Government of Mysore by Mr. J. Cameron, F.L.S., Superintendent of the Lal Bagh Gardens, Bangalore. It is evident that coffee planters in the District believe the plants to be true hybrids. No specimens, however, which would substantiate the fact, have been received in this country. It is therefore impossible to express an authoritative opinion on the subject."

Mr. Cameron has already pronounced these to be true hybrids, and his report contains a description of their origin, which briefly summarised, indicates that some seed yielded by Liberian trees which had been planted in or near Arabian, had developed one or two plants of a new type, combining many of the best peculiarities of both varieties, two of the most important points being immunity from leaf disease, and productive powers of a high order. Mr. Cameron, by the way, contributed some interesting articles to *Planting Opinion* early in the present year on "Fertilisation of the Coffee Flower," from which the following is an excerpt bearing on the question of hybrids:—

"Coffee Arabica or Arabian coffee, of which there are several well defined varieties, known by such names as 'Chick,' 'Coorg,' 'Nalknad,' has been almost exclusively cultivated in this country from the time the industry was started, and it is only within recent years that one or two new varieties and species have been introduced and cultivated on estates. This fact will explain the absence of hybrids over such an extensive area, there being no material to make hybrids from. Yet, within the past few years, some hybrids have made their appearance, shortly following the introduction of Liberian coffee, a distinctly new species. And barring the fact that the two distinct species have been placed in juxtaposition to each other the hybrids

are the work of nature. But in the instances referred to, man must get the credit of having materially helped Nature by providing a new species for the latter to work upon."

An important factor which has tended to minimise the chances of cross-fertilisation between Liberian and Arabian coffee, notwithstanding that many lakhs of the former variety have been planted out in the coffee districts during the past decade, is found in the fact that whereas Liberian coffee blossom opens out within 6½ days of the first good shower, it fades and drops off within 36 hours; whereas the Arabian variety requires 9 to 10 days to reach the former stage, and unless displaced by rain usually retains its position on the branches from 48 to 60 hours.

The first hybrid Liberian-Arabian discovered in Wynaad, about which reliable details are forthcoming, was observed amongst some plants grown from seed at stake (raised from Liberian seed) in 1890. This original hybrid tree is now nearly 8 years old. It has never shown the slightest signs of leaf disease, although surrounded by Liberian and Arabian, both of which varieties have been severely attacked by the blight year after year. The rapid growth of this original tree has been phenomenal, though it is on ordinary bamboo land, at an elevation of about 2,800 feet above sea level, and with an annual rainfall of about 85 inches. The following figures furnish the crop yielded by this tree:—

1893 at 2½ years old	½ seer sound parchment
1894 " 3½ "	3 seers do
1895 " 4½ "	8 " do
1896 " 5½ "	4½ " do

or nearly 16 seers within the four years, so that omitting the "virgin crop," the yield was 5½ seers parchment per annum average.

So far experience shows that these Liberian-Arabian hybrids should be planted 8 feet apart, which would give about 660 trees per acre, and assuming that each tree yielded only 4 seers parchment annually, equal 1.7 of an imperial bushel the return works out to about 94½ bushels per acre, or approximately to a ton an acre all round. An encouraging feature connected with the plants raised from the seed of this original hybrid is that they have hitherto been found immune from leaf disease, although now over 4 years old, while their productiveness promises to equal that of the parent tree. It is believed that high, light shade is necessary to protect hybrid coffee, this advantage insuring *inter alia*, less risk of injury from bover. One or two noticeable peculiarities with hybrids are that the spike on this variety is always much more forward in the spring than that of either Liberian or Arabian. Moreover, the spike opens in either 7 or 8 days. The crop requires nearly 12 months to mature, and the bean is shorter and bulkier than Liberian, though of course larger than ordinary Arabian coffee. The best original hybrids hitherto observed have all been raised from seed gathered off pure Liberian, while the ensuing generation has also been found fairly true to type, notwithstanding the absence of protective arrangements to guard against cross fertilisation during the flowering season.

The following is the history of another hybrid tree, which is, if possible, more encouraging than the instance already quoted. In 1892 a two-leaved seedling, rooted in a basket raised from the seed gathered off a pure Liberian, was planted in semi-abandoned Arabian coffee, opened in 1862, together with Liberian seedlings. About a year later, this seedling presented such marked peculiarities that it attracted attention, its foliage differing from the surrounding Liberian plants, while it far outstripped the latter in growth. This land has a South aspect, elevation 3,400 feet above sea-level, and an annual rainfall of about 140 inches, and so far this hybrid, which in foliage, etc., closely resembles the original hybrid tree first described, bids fair to equal the latter in all essential points.

It is as yet premature to judge whether hybrids grown from the seed of hybrid plants that have been raised from the produce of the original hybrid tree, will retain all the distinctive peculiarities of the latter; but as the efficient protection of the blossom

from external influence is believed to insure the reproduction of the same strain exactly, the reasonable inference follows that it is merely a question of time, careful selection, both of the seed and plants, to effect the gradual introduction of the Liberian-Arabian variety all over the coffee districts. We understand that Messrs. Parry & Co. have already initiated the opening of an hybrid coffee estate in their Vellera Mulla Forest. Messrs. Arbuthnot & Co., are also planting the same species in their South Wynaad properties while an offer of a rupee per bean from an original hybrid tree, for the ensuing 3 years, has been declined by the fortunate owner. Should, therefore, the favourable anticipations now held of Liberian-Arabian hybrids be realised, coffee planters have a fair prospect of profitable returns, year by year in South India, and as coffee paid well in Ceylon prior to the inroads of leaf disease, suitable lands in that Island may also eventually be turned into paying coffee estates.—*M. Mail.*

### PLANTING NOTES.

**HYBRID COFFEE IN SOUTHERN INDIA.**—We draw attention to an interesting deliverance on this subject from the *Madras Mail*, referred to in our *Tropical Agriculturist*, which points to the possibility of a hybrid coffee between the Liberian and Arabian varieties capable of withstanding disease and yielding better crops than either of the parents, being found permanently prolific. It is too soon, however, to make sure of success. In his first Report (for 1896) Mr. Willis referred to the great expectations aroused by a similar hybrid in Java. It would be interesting to know what Dr. Treub has to say about this Java hybrid?

**MANGOSTEENS FROM THE WEST INDIES.**—Plants of this well-known and delicious tropical fruit have been widely distributed from Kew to the West Indies. The Mangosteen is a native of the Molucca Islands, and is cultivated in the Straits Settlement, Java, and in one or two localities in India and Ceylon. The fruit is regularly shipped from Singapore to the Calcutta market. The first West Indian fruits were produced at the Botanic Gardens, Trinidad, in 1875. In September 1891, the Governor of that island forwarded some West India Mangosteens for presentation to her Majesty the Queen. The Mangosteen fruited for the first time in the Jamaica Botanic Gardens in 1886 ("Kew Bulletin," 1895, page 79). Last year a box was received at Kew from Mr. J. H. Hart, F.L.S., of Trinidad, containing nine fruits of Mangosteen, which were perhaps the first to reach this country in a condition to allow their merits to be appreciated. Each fruit was separately packed in a compartment with pine wool. Owing to the firm consistency of the outer wall of the fruit it appears to travel well. The fruits were distributed to the Secretary of State for the Colonies and others. The reports received were uniformly favourable. One fruit was sent to Mr. George Munro, one of the leading fruit merchants in Covent Garden, to obtain an opinion as to prospects of shipments of Mangosteens to this country. Mr. Munro reported:—"Yours to hand. I cut open the fruit and showed it to some of my best customers, and they think with me that, if they came in good condition, and not too many at first, a business could be worked up in them. At any rate I should like to try some, and if sent, will do all I can to get a trade for them. They appear to be a fruit that would carry well."—*Kew Bulletin.*"

CEYLON TEA IN RUSSIA AND THE  
RUSSIANS AS A TEA-DRINKING  
PEOPLE:

RUSSIAN TEA CONSUMPTION 43 PER CENT. ABOVE  
MR. T. N. CHRISTIE'S FIGURES;

THE NEED OF A REFORMED TARIFF;

LETTER TO M. DE WITTE, FINANCE MINISTER;

PROPAGANDA FOR TEA-DRINKING HOUSES  
IN RUSSIA.

"After all there is nothing which would affect the prospects of our tea industry so beneficially as the liberal opening of the Russian market to Ceylon teas. The Russians are a great tea-drinking people like ourselves, only they are prevented by a prohibitory customs tariff from obtaining a sufficiency of the beverage they all delight in." This opinion of a home resident with extensive proprietary interests in Ceylon, is one which is now largely shared both here and in the United Kingdom. Indeed, more and more do we find attention directed to Russia as the great hope of the tea producer and every mail increases the interest felt in the various attempts made to foster a taste for our teas and to place the trade generally on a sound basis. Mutual trade interests and identity of certain social customs, ought to draw differing nationalities rapidly together, and we sincerely trust that the better the Russian people learn to appreciate Ceylon and Indian teas, and the greater the trade in the same becomes, the more will a tie be created between large bodies of British and Russian subjects with which politicians will have to reckon when they think of disturbing good relations between the two countries.

We owe a good deal of fresh information about Russia and its tea trade to Mr. T. N. Christie in the Report which he made to the Planters' Association in February last, including detailed statistics such as had not previously seen the light. But strange to say our first task today will be to shew that so far as we can see, Mr. Christie understated the present consumption of tea in Russia by a very large figure. No doubt Mr. Christie got his figures from the best available authorities in Russia; but we must remember the enormous extent of Empire from the White, Baltic and Black Seas eastward to the Pacific; from the Arctic Ocean to the borders of Thibet and Western China. It will be remembered that Mr. Christie gave the total annual consumption of tea in Russia in 1896 at "about 52 million lb. of leaf teas and 40 million lb. of brick and slab teas" per annum and this is about the figure usually accepted by our leading London authorities. But we can see no escape from this being a very serious underestimate to the extent of over 43 per cent; and we think our information when it is considered, will be accepted as reliable. It is based on a Report of the "Tea" section Sub-Committee of Shanghai dated 21st January 1897 which was signed by the following:—

Alex. Campbell, of Alex. Campbell & Co., Chairman; J. F. Rodewald, of Rodewald & Heath; J. W. Harding, of Turnbull, Howie & Co.; R. S. Freeman, of Barlow & Co.; E. Davis of Wisner & Co., Members.

These names will, we have no doubt, carry weight. We are not going to deal with their Re-

port (already freely noticed in our columns many months ago), but with some of the valuable statistics appended to that Report. The fullest possible details are appended from 1871 onwards and one strange fact brought out is that the total volume of the China Tea Trade has not decreased since that year, if we take into account the brick tea trade via Kiachta, and also an overland trade in leaf teas. The grand total of China exports in 1871 was 236 million lb.; in 1896 it was 238,800,000 lb. In the interval there was a falling-off of over 100 million lb. to the United Kingdom; but there was an increase of no less than 105 million lb. in the export to Russia! Here is the comparison afforded to us:—

*Export of Tea from China to Russia:*

1871.—Congou and Green Tea—via Odessa 1,984,000 lb. Northern Ports 2,293,333 lb. Leaf Tea via Fancheng† 12,149,600 lb. Brick Tea mainly via Kiachta 11,172,000 lb. Total 27,598,933 lb.

1896.—Congou and Green Tea—via Odessa \*23,285,333 lb. Northern Ports 21,893,733 lb. Leaf Tea via Fancheng† 10,439,600 lb. Brick Tea mainly via Kiachta †76,949,200 lb. Total 132,567,866 lb.

\* Including 631,733 lb. green tea (Hysons) shipped to Batonn.

† Leaf tea via the Han River and Fancheng does not come under the cognisance of the Foreign Customs; the statistics are given in a supplementary form.

‡ Including 2,717,733 lb. via Odessa.

We may be told that the brick tea does not count; but Mr. Christie included 'brick and slab' tea in his figures and when it is carefully included by a Committee of Shanghai merchants in their tea tables of exports, we do not think its importance can be denied, and in any case it is well to have the fullest and most reliable figures for Russian tea consumption before us. To the total of 132½ million lb. exported direct from China, must be added the re-exports from London (perhaps 7 million lb.) to get a proper appreciation of how far the people of Russians have progressed as a tea-drinking people. The census of January 1897 gave the population of the Russian Empire at about 129½ millions of people and so we see the consumption of tea at 140 million lb. (in place of Mr. Christie's 92 million lb.) is equal to 1·08 lb. per head.

And now we come to a very practical as well as interesting question, namely, if so much as 140 million lb. of tea of all kinds is consumed with the present adverse Russian tariff, to what would that consumption reach if gradual reductions were made as in the case of Britain during the past sixty years? For, curiously enough,—leaving brick tea and its exceptional tariff out of view—the present normal tea duty in Russia is the same as prevailed in the United Kingdom when Queen Victoria came to the throne! In 1837, 24 millions of the British people drank 30 million lb. of tea paying 2s 1d duty on the same; in 1897, Britons numbering 40 millions drank 231 million lb. of tea very much because the duty had been reduced step by step to 4d. The reform which Mr. Christie thought it his business to take up after visiting Russia is the equalisation of the duty and the removal of certain differential disadvantages that British teas introduced via Odessa, and from the West, seem to lie under. It is the opinion of the Russian Consul just retiring from Colombo, that some mistake has been made and that only brick tea is treated more advantageously than the rest. Be this as it may the action of the Planters' Association at Mr. Christie's instance through the

British Embassy can do no harm and may very likely do good, either in removing an existing injustice to our teas, or in attracting attention to the new trade with Ceylon springing up and perhaps interesting certain Russian authorities in the same. We are now very pleased to have Russian merchants in Colombo, buying our teas and shipping them direct to Odessa, and it is of course to their interests as well as to ours, that the Tariff Law of Russia should be impartially administered.

But what struck us, personally, in considering the question how to Promote the Consumption of Tea in Russia was the great pity that the enlightened Russian Minister now at the head of its Finances, should not copy the example of Britain and of the greatest English Finance Minister who has just gone (Mr. Gladstone), in starting a Reform of the Tariff and Reduction of the Duty. That would be a matter of much greater importance to Ceylon planters than even the abolition of differential levies if such exist. Nowhere else in the world does so high a tea duty now exist as in Russia, and nowhere else have we a people more eager to drink tea. Full of this thought we drafted a letter on the subject to the Russian Minister of Finance; we showed a rough copy of this letter to Mr. Christie before he left and it had his approval; it was sent to be read before the Thirty Committee for any comment that might be afforded, but secured none, although the Chairman of the Planters' Association gave it his cordial approval in a private letter; and we had further the advantage of learning from the Private Secretary to His Excellency the Governor that the letter had better be sent on direct to the Minister to whom it was addressed. After this, it was delayed for a reference about statistics and some other reasons; but went forward in French to M. de Witte a few weeks back and must by this time be in his hands. It runs as follows:—

Ministre des Finances à Monsieur le Ministre Son Excellence le Sec. d'Etat Cons. pr. S. J. de Witte, St. Petersburg, Russia,

Office of the *Ceylon Observer*,  
Colombo, Ceylon, June 1898.

Your Excellency,—

I would very respectfully beg to draw Your Excellency's attention to the following account of the treatment of tea under the British Customs Tariff:—

In the year 1837—when Queen Victoria came to the throne—the Customs Duty on Tea imported into the United Kingdom of Great Britain and Ireland, was two-shillings-and-one-penny per pound avoirdupois; the total consumption for that year was 30,625,206 lb. (or less than 1½ lb. per head of population per annum) and the total of revenue collected from the duty was £3,190,125.

Not much change took place until Mr. Gladstone became Chancellor of the Exchequer (Minister of Finance); and then between 1852 and 1865 a series of financial reforms, due to his initiation, took place, and we find the Customs Duty at one-shilling-and-ten-pence per pound in 1854; at one-shilling-and-five-pence in 1858; at one shilling in 1863; and then it was reduced to six-pence per pound, to take effect from 1st June 1865.

The result of this policy was not only a largely increased consumption of tea; but eventually, an increase as well of the revenue derived from the duty,

The progress in Consumption and Revenue may be indicated as follows:—

Year.	Total consumption. lb.	Per head per annum.		Revenue. £.
		lb.	s. d.	
1837 ..	30,625,206	1½	2 1	3,190,125
1867 ..	111,061,160	3½	0 6	2,776,529
1879 ..	160,432,000	4½	0 6	4,010,800
1887 ..	183,635,885	5	0 6	4,590,897

The next reduction was on 1st May 1890,\* when the Tea Duty was reduced from six-pence to four-pence per lb., and the result is thus shown for last year:—

Year.	Total consumption. lb.	Per head per annum.		Revenue. £.
		lb.	s. d.	
1897 ..	231,399,778	5½	6 0 4	3,556,662

or £666,537 more of revenue than when the Customs duty was two-shillings-and-one-penny per pound in 1837; while the total consumption of tea is now twice as great, and per head of population, is four times more.

I would wish respectfully to point out, to Your Excellency, that the Russian people, like the English, are noted as tea drinkers, and that no more wholesome or refreshing beverage can be used by any people. It is a drink that makes for peace and contentment as well as health. This is evidenced in the case of the population of the Australian Colonies who are the greatest drinkers of tea in the world averaging over seven-and-a-half pounds per head, in their tea consumption, per annum; while they (the Australians) are among the healthiest of people, noted for their activity and athletic powers, capable of defeating the choicest English players in their own favourite field game of cricket.

All this shows that the policy of gradually reducing the tariff on tea ought to benefit the Russian people, while by no means causing any loss to the Imperial Revenue; but rather, eventually, benefiting it. There are some countries indeed—like the United States of America—that consider it advisable to have no Customs levy on tea (except in time of war); and Belgium has just led the way among the Powers of Continental Europe in abolishing the duty on tea. But in the case of Russia, a reduction of duty to the equivalent of one shilling per pound could not fail to be beneficial, and still more a few years later if there were a further reduction to the equivalent of six-pence per lb.—so making this very wholesome and refreshing beverage (tea) accessible to many more millions of the Russian people than it can be at present.

\* CONSUMPTION OF TEA IN UNITED KINGDOM.

1887 ..	..	..	185,620,800 lb.
1890 ..	..	..	194,008,492 "
1891 ..	..	..	202,456,837 "
1892 ..	..	..	207,126,825 "
1893 ..	..	..	208,047,385 "
1894 ..	..	..	214,341,044 "
1895 ..	..	..	221,800,137 "
1896 ..	..	..	227,785,500 "
1897 ..	..	..	231,399,778 "

[Total value of tea consumed last year about £10,400,000.]

In conclusion, I would venture to draw attention to the appended list of the Customs duties imposed by different nations of the world,\* and

I have the honour to be, Your Excellency's most obedient, humble servant,

J. FERGUSON, *Editor*,

[Thirty-seven years resident in Ceylon and the Compiler of Books about Tropical Produce and Culture.]

We were greatly encouraged in sending on the above by the Russian Consul, Capt. de Frisch, who after reading the French original for the Minister, was good enough to write to us:—

"I have read your letter to our Minister of Finance and my opinion is, that he will take great interest in your communication. He is a very go-ahead man and has done already a lot to improve the revenue in Russia and possibly the contents of your communication may be new to him and may have the result desired by you and the Ceylon tea planters. Over-leaf the proper address of M. de Witte."

But while arranging for the despatch of this letter, further encouragement as to the future of tea in Russia, was afforded by a friend of the Chairman of the Planters' Association who called his attention from Bombay to a palper in "Harper's Magazine" with some interesting references to M. De Witte's interest in a "Spirit Monopoly" and also apparently in the encouragement of Temperance workers and the establishment of Tea-drinking rooms to win the people away from intemperance. It is well known that drunkenness is the worst failing of the Russian peasant and of the lower classes generally in the country. We reprint in full all of the paper in "Harper" for June that bears on our topic. It will be observed that the Temperance Committees which establish tea shops in the villages to counteract drunkenness are as much under official patronage as is the Spirit Monopoly. Indeed M. De Witte is apparently aiming at the Gothenburg system, and we see that Mr. Stead in the latest *Review of Reviews* advocates the United Kingdom Alliance sending out a Commissioner to Russia to investigate the working of the new system. It is just possible therefore that the lessons offered from England and Australia as to tea-drinking may arrive at an opportune moment. In any case "tea" is evidently a subject much in the thoughts of M. de Witte. One would like to know how the Russian Temperance Committees get their tea and whether it would be possible to supply them direct from Ceylon. Meantime, let us hope that M. de Witte may take the letter sent on to him in good part, giving it some consideration, so that in due season it may bear fruit. From England the suggestion has reached us that a similar letter ought to be sent to the Ministers of Finance in Austria and Germany. But the tea duty in Germany is only 6d; in Austria it is 9d per lb; and in France 9d to 11½d. A more useful idea would be to print the letter in English, French and German as a leaflet for distribution with Ceylon tea on the Continent in order to help to form a sound, liberal opinion and a movement for a reform of the tea tariffs generally on the Continent of Europe, little Belgium having led the way by abolishing its tea duty altogether.

## "THE RUSSIAN PEOPLE AT HOME"

BY JULIAN RALPH.

HOW THE SPIRITS MONOPOLY AND TEA TEMPERANCE SOCIETIES AFFECT THE PEOPLE.

(From Harper's Magazine for June 1898.)

The utter hopelessness of the condition of the great black mass of peasants which underlies the light embroidery of the uniformed class in Russia makes it the drunkenest peasantry in Europe. The fact that Russia is mainly a huge farm brings to that mass a winter of idleness. The shortness of the daylight over the great northern half of the empire in winter tends greatly to increase the drinking habits of the muzhik. Corn brandy, or whiskey, as we would say, is the staple intoxicant. It is a colorless liquid, as transparent as gin, but with the almost sparkling clearness of distilled water—fire would be a better word for this sparkle, because vodka is a liquid which starts a train of fire at the palate and blazes its way through one's body to one's boots. Sodden drunkenness is what I saw most of. The peculiar, hilarious, noisy, exuberant intoxication of the whiskey drunkard which I had expected to see continually, fell under my observation only two or three times in all my journeyings.

Among the many important activities of M. Witte, the Finance Minister, none is more extraordinary than his effort to make the vodka trade a government monopoly. The scheme is attractively subtitled; one to counteract the evil effects of the original dram-shops. It aims to provide a purer grade of whiskey to the masses, and to break the power of the dram-shops which have been so managed in the past as to make the pawn-shops as well as public-houses—even to the degree that it was possible for a muzhik to lose there not only his superfluities and his tools, but even his right to a share of village land—even his profit on his own labor. It was in 1895 that M. Witte began the building of the government monopoly scheme by introducing it in the provinces of Samara, Ufa, Perm and Orenburg. Eighteen months later, in July 1896, it was extended to Bessarabia, Volhynia, Ekaterinoslav, Kiev, Podolia, Poltava, the Taurida, the Black Sea, and Kherson provinces.

In these places the excise on vodka is abolished, and the government has established central liquor-depots in each province, from which supplies are distributed in sealed bottles and vessels to retail shops set up by the government in the towns and country districts. The little local distilleries, once so numerous and prosperous, are closed, and the drink is supplied to the state (by distilleries operated under government control) in quantities and at prices fixed by the government. It is the law of South Carolina carried out consistently from the root—the purchase of the grain and its distillation—instead of being begun in the middle, as by Governor Tillman. For the public convenience, let us say (of course, not to increase the sale of the liquor), licenses are issued to tavern and restaurant keepers and grocers to sell the government liquor, the licensees being selected for trustworthiness and good repute, and they having to sign an agreement that their licenses are revokable at the government's pleasure. In connection with the scheme, Temperance Committees are formed in each province under the leadership of the Governor, and in the principal towns under the Marshal of Nobility, to prevent drunkenness and establish attractive tea-shops, to wean the people from their taste for liquor—tea, by-the-way, being the commodity which it is said the government means next to monopolize.

Wines, beer, and all other intoxicating beverages, as well as the government's vodka, may be sold by licensees under the same terms as the licenses for vodka-selling are given out.

The government's official announcements, after two years of experimenting with the new law, are to the effect that it is working very satisfactorily. M. Witte made a tour of ten provinces in eastern and southern Russia where it is in

\* Here was appended the list of Tea Tariffs compiled for the "Ceylon Directory."

operation, and was confirmed in his plan to extend the scheme all over Russia. It is declared that the better qualities of the liquor and the decrease of drunkenness have produced a reform whose good is already apparent. The unofficial newspapers of the empire do not altogether share this admiring and hopeful view of the new system. They declare that the government got a profit of fifty per cent on the capital invested in the new enterprise, and argue that this came out of increased excise rates, so that it is clear that there is the opposite of reform in the drinking habits of the people. Where the new system has been longer in operation it is asserted that the Temperance Committees have failed to appropriate sufficient money to make the tea-shops attractive, and they are a failure. A serious loss to the unfortunate small farmer has come from the closing of the local distilleries—abandoned because of the advantages secured by the large ones under government control. The little distilleries afforded convenient markets for the sale of farm products, and produced a waste that was utilized to feed cattle and enrich the land. A considerable decline in cattle-breeding has followed the new system, and very small agricultural communities have suffered other losses which to them are very severe.

The muzhik is still being bled by the liquor-sellers. Even the Government admits that under the new system the licensees, though obliged to sell vodka cheaper than under the old plan, still manage to get more from him than the former price of the liquor by charging for the use of the glasses, corkscrews, and whatever the poor peasants need in connection with this liquor, and by exacting high prices for the relishes sold at the bars. These evils, being understood, are to be dealt with by law.

The muzhik, who possesses self or popular Government in its purest and simplest form in the management of his village—which is all the world to him—has always shown remarkable skill and moderation in the use of this right. He has seen his own and his village rights shorn and invaded from time to time in ways and to an extent which must have seemed monstrous: but then, as always, he has proved himself the patient, amiable, simple, and docile creature that he is. He believed, for instance, from the beginnings of his nationality that, though he was a chattel of the nobles, yet the land was his irrevocably. But when serfdom was abolished the land was partitioned, and the villagers got only a portion, which is now seen to be generally less than is actually necessary for the support of the inhabitants whose numbers have greatly increased. New abuses have crept in, owing to the muzhik's simplicity, his lack of ambition, and the vices of drink, gaming, laziness, and aboriginal disregard for the morrow, so that the nihilist writers declare his present state as a freeman is worse and more hopeless one than his former serfdom. And the calmest men—even in official life—admit that condition of agriculture is desparately bad. With characteristic rebound into despondency that is a Slav trait, the journals which have recovered from their jubilation over the proposed reform of the drinking habits of the people now declare that there is no hope for reform by the Government, and that the muzhik can only be turned from drunkenness by multiplying the primary schools and spreading education among the masses.

Of course this is true, and it is the hostility of the Government to the spread of enlightenment by schooling, by travel, and by the introduction and multiplication of serious literature, that renders impossible a valuation of Russia's future based upon European comparisons. For myself, I cannot foresee the consequence of a long continuation of present Russian methods in Europe, because I cannot begin by conceiving their durability; and yet the Russians tell me that these must be maintained, that the self-interest of those who govern Russia demands the maintenance of present conditions, that with enlightenment must come rebellion, unrest, reforms in the direction of a constitutional

government—and with this latter alone must come the breaking up of this huge feudal landlord's estate.

His government of his villages suggests the capacity the Russian peasant possesses, sadly rude and undeveloped as it is. His "artels" prove that this capacity is strong enough for him to govern himself, which we are taught is a mightier thing than the taking of a city. They show that he can make himself industrious, honest, thrifty, far-sighted, responsible, nearly everything, in fact, that he is not—until such combination gives him the chance to redeem himself.

#### PLANTING NOTES.

AGRICULTURAL STATIONS.—According to some statistics given in the *Botanical Gazette* there are in the United States fifty-one State Experiment-stations, Connecticut and New York having two each. On the whole, there are about 50 trained botanists scattered over the land, acting either as botanists, or as entomologists, bacteriologists, mycologists, &c. Up to recently we had none, but the County Councils have in many cases accomplished that, the necessity for which we so often pointed out.

THE PADDY WEEVIL.—The attention is drawn of our paddy-growing friends to the correspondence published by the Government Agent for the Western Province on damaged paddy. In connection with that report Mr. E. Green, the Government Entomologist recounts some interesting experiments, which he has made by placing insects among sound grains of paddy and he says he was surprised to find them after several days remained untouched. It seems to be the opinion of the Mudaliyars in the Western Province that weevil is disappearing, and that it is less frequently found in places free from damp. Commenting on these facts Mr. Willis, of the Peradeniya Gardens, thinks that the pest will disappear until such time as the people again become careless as to drying their grain after a damp season, before storage.

CLOVES.—The clove question which was exciting the London market three months ago was still being discussed in Zanzibar when the last mail left. The *Shamba* reprints a *C. & D.* editorial on the subject, and adds: "Another view on the clove question"—viz., its own—and it is a good view on the whole. The opening sentences of the *Shamba's* article are soothing; there is no need for excitement, says the writer, there have been short crops of cloves before now, and there will be again. It is difficult—nay, almost impossible—to say what next season's crop of cloves will be, because travellers rarely visit the clove districts, and native reports are not in the least to be relied upon. Still the *Shamba's* inquiries have resulted in the discovery that the new crop promises favourably. Many Arabs say that the rains have made the trees throw out buds even more freely than last year, and that looks well. Then our contemporary proceeds to indulge in speculations as to what the Arabs will do if there happens to be a big crop. Some of them are hopelessly involved with Indian money-lenders, and all have to conform to the new slave regulations, which give these persons an extra day per week, so that they only work four days now; so that "if the coming season should produce a 500,000 frasila crop only 400,000 frasilas would be gathered," but "there are a multitude of small holders who can be relied upon to pick all they can find. Many of the plantations in Pemba are in the hands of small Indian traders, who employ the Wa-pemba to gather in the crop on the co-operative system of one-third to the labourer and two-thirds to the owner, or, in the case of short years, half and half. There are no cloves left on the trees where this system prevails."—*Chemist and Druggist*, June 25.

**SKILFUL ADULTERATION.**—In his quarterly report to the Cheshire County Council, the public analyst states that the samples examined by him included a sample of coffee which was found to contain an excess of sugar. This, he said, was probably due to a practice of roasting coffee with a certain proportion of sugar, which would increase the weight of coffee from 5 to 10 per cent. This admixture was so skilfully done that each berry was coated with the sugar, and anyone buying such coffee in the berry would think he was obtaining it pure. Some might say that it was an innocent adulteration, but it was, at the same time, a most profitable one, for the sugar, which was not much more than one penny a pound, was sold at the rate of one shilling or more.—*British and Colonial Druggist*, June 10.

“**CEYLON TEA-BOX WOODS**”; AND “**MICA**.”—Mr. Frederick Lewis, F.L.S., of our Forests Department, contributes a paper under this heading to the “*Journal of the Society of Arts*” of June 17. There is not much that is new to local readers; but the paper will be useful for reference as reproduced in our *Tropical Agriculturist*, seeing it gives a full list of all the local timbers in use for tea-boxes. From the introduction the following is of general interest:—

Some notion of the volume of wood required yearly may be arrived at from the fact that, assuming all the tea exported from the island to be packed in 100 lb. chests, the total number of chests for one year's export alone would be over a million, or, roughly speaking, upwards of 18,000,000 superficial feet of planking.

In the same number of the *Journal* there is a brief but very instructive paper on “*Mica Mining in the District of Nellore*” by Robert W. Thompson, A.M.I.C.E., M.S.A., which we must also give in our monthly, where it can be studied by those interested in mica mines in Ceylon.

**CEYLON'S PERSEVERANCE.**—No one can read Mr. W. Mackenzie's letter of February from New York, which we reproduced in our last issue—says the *Indian Planters' Gazette*—without acknowledging that the Tea Planters' Committee of the island have secured the services of a man possessing not only energy, but also sound commercial views. The Indian Tea Association will do well to bestir themselves in the matter of providing additional travellers to push our teas, especially among that class of French Canadians to which the letter commented on refers. It is not in the American market alone that Ceylon has displayed more energy than India, but both in Southern Russia and Holland the Islanders are pushing the trade with success, and, in fact, all along the line are leading the way. As has been pointed out, the discovery of gold in the Arctic Circle will give an impetus to farming in British Columbia and the far west of the Dominion, the returns showing that an influx of emigration from Europe has set in with the summer, so that a vast field is opening for driving a lucrative business among a class more than any other that is partial to the “cup that cheers.” What is required in the above and similar places is the taking of packet teas to each homestead, persistently forcing it into notice, and the establishment of central depots whence the pedlars and bagmen could replenish their stock to keep up the supply. That all this means money we fully admit, and it is the duty of those who have constituted themselves the guardians of an industry that may truly be described as gigantic, to grapple with.

## PRODUCE AND PLANTING.

**THE BATTLE OF THE TEAS.**—We notice that Mr. Mackenzie, the representative of the Ceylon tea industry in the United States, suggests that an effort should be made to capture the green tea trade from the Japanese. This tension in the London market has to be relieved somehow, and that fact must be recognised. It is not always pleasant to have to look facts squarely in the face, but the necessity for straining every nerve in the direction of finding new outlets for tea is paramount. A go-as-you-please policy will not do. Every opportunity must be taken advantage of, and every possible encouragement offered to those who have the work in hand.

**A PROMISING MARKET.**—That there is work to be done is certain. Here is a case of a new market for tea being thrust upon us. According to the consular report on Sicily, just issued by the Foreign Office, a taste for tea is increasing among the upper classes in Palermo, and with a little judicious education the demand would rapidly grow. At present tea can be obtained at only one or two places, and that of a very inferior quality, while the price is very high, being about 8 lire, or 6s per lb. The duty on tea is about 1s per lb if in bulk, and the cases are included in this rate. Taking everything into consideration, the Consul is of opinion that high-class Ceylon and Indian teas could be sold at a fair profit at from 3 lire 50c to 4 lire 50c per lb. During the past year the total amount of the commodity imported was, according to the Customs returns, only 1,000lb, so that Palermo and in fact, the whole island, is yearning for more tea.

**GOOD BUSINESS.**—The tea planter is subject to vicissitudes of climate and exchange which do not trouble the tea dealer. This latter business when properly organised and managed is clearly a very lucrative one. From the report of Messrs. Brooke, Boud, and Co., we find that the net profit for the year ending last month amounted to £23,128 which with the amount brought forward, totals £36,861. The company spent £8,623 in additional freehold warehouse premises during the year. A dividend of 15 per cent is declared, £5,000 is carried to reserve, £10,000 is written off goodwill and £4,170 is carried forward. Thus in six years the reserve has been built up to £32,000 and goodwill has been written down by £64,000. The share capital of the company is £150,000.—*H. and C. Mail*, June 24.

## INDIAN AND CEYLON TEA IN FRANCE.

To the Editor of the *H. and C. Mail*.

SIR,—Your leaderette regarding the allusion by the British Consul at Bordeaux, to the increasing use of tea in France, and your remark that a *little pushing* was required has an appropriate suggestiveness at the present moment, when the necessity for opening up new channels of consumption is so urgent. It may interest your readers to know in this connection, that the money spent some years ago on the “*Palais indien*” scheme in Paris was by no means altogether wasted, though the scheme at the time, was dropped in an altogether unjustifiable way for want of funds and the necessary persistence. Mr. W. de Peyster who was connected latterly with the *Palais indien* business has since done and is now doing a satisfactory and increasing business—chiefly in Ceylon Teas—at No. 14 rue de Rome, Paris (near the Western railway terminus). His resources however, are small, and it is of course, impossible for him “off his own bat,” to push the trade rapidly or on a large scale. I believe however, that any aid which could be afforded to him by the Indian or Ceylon Association in the way of subventions for advertising purposes, etc., would be amply repaid in the long run. He would, I am sure, himself willingly furnish information or the undersigned would be glad to speak for him, if applied to.—Yours faithfully,

Geo. SETON,  
120, Bishopsgate St., E.C.

June 19, 1898.

P.S.—Mr. de Peyster is a Frenchman, who has had business experience also in the United States and speaks English frequently.

AN AGRICULTURAL CHEMIST FOR  
THE CEYLON TEA INDUSTRY:  
£1,000 A YEAR SALARY IF GOVERN-  
MENT APPROVE.

We direct special attention to the official correspondence received from the Secretary of the Planters' Association regarding the doings of the Thirty Committee with reference particularly to the appointment of an agricultural chemist. There are several items of general importance, but the most important we believe to be that of the agricultural chemist, and that the selection of Mr. Kelway Bamber to act in this capacity would give universal satisfaction.

CACAO: THE FUTURE OF CULTIVATION  
IN CEYLON—BAD ROADS—GOOD TEA.

When passing through the Wattedgama cacao the other day it was not difficult to see the impress of the teaching of our cacao expert, "Moisture and heat," Mr. Carruthers maintains, are the favourite conditions for the growth of all fungi, and that they get in Ceylon to perfection especially where the shade is at all dense. "Thin out your shade" is the order which has resulted from this deliverance, and as one travels up from the Wattedgama station it is clearly evident that the axe and the woodman have been about: Letting the sun in, is, as if you put salt on the tail of the fungus, and it wants the source of energy evidently to cope with the reproductive powers of fungi, for, given the favourable conditions, it spreads beyond calculation.

It is becoming clear that the future of cacao in Ceylon may be safe enough if the cultivation be intelligently pursued. The artist's advice to mix your colours with brains, will apply to the cacao planters now that the cacao pest has got a hold, for it is brains that will be wanted. Too much shade will be the death of him, as the fungus will rage and rampage; too little will let in the *helopeltis*, and that sucking bug will produce results as hard to bear. The conditions of cultivation are changing, and it is only by patient care, the watchful eye, the regular inspection, knife in hand to cut out the first appearance of the pest, that this plague will be stayed. Cacao has ever been responsive to attentive treatment; but the old hunting for borers and the squirting of kerosene into the eye of the "poochie" generally, which was formerly undertaken in an intermittent way, has now to give place to an orderly campaign. The fungus will have to be watched as keenly as weeds are watched, and a gang will have to go round the estate monthly anyhow to examine each tree, and where necessary apply the knife. What will they be called? We have weeders, pruners, pluckers, drainers, and so on; but what can be added to fungus or fungi that will make a decent word? In Tamil it is easy enough. "Kokalathie-al" will cover a lot, but the English cognomen has yet to be discovered. Mr. Carruthers has it that the cacao culture of the future will be more like orchard cultivation than the rough and ready system which obtained in the past. Each cacao tree will have its own individuality, be regularly examined, and treated

accordingly. We are evidently not going to have a panacea for the pest, to treat by the million and be done with it. All the more call for the brains. It will be interesting to watch what will be the effect of the thinning of the shade. That it will not wholly stop the progress of the fungus is likely enough, for on cacao trees that are away from shade, and have been grown in the open, there have been deaths from the pest. The late Dr. Trimen made many cacao planters "sit up" when he condemned shade, and got it cut out in many places to the sad detriment of the cacao growing below, and we will have to wait and see what the thinning out will result in before swearing by it. Meanwhile the cacao round and about Wattedgama was looking vigorous and hopeful with a fine blossom out, and the promise of more to come.

It is queer how the cacao pest resembles "the pestilence that walketh in darkness," and why it should be so virulent in one part of a district and absent altogether from another. You hear of a place here and there "smitten hip and thigh" for no obvious reason, while others have wholly escaped, and the lesson for the cacao planter is to be very watchful. In the days of our ignorance when whitewash, tar, kerosine oil and other things were applied to the stricken tree, on the principle that *something* had to be done, we were only half-hearted. We might stumble on a discovery and *we might not*. But now that a system of mitigation—for since the fungus is in, it will be impossible to hunt out and exterminate—has been recommended, and has where tried been successful so far, there is a heart of hope about, and though the cacao planter's difficulties have very much increased he can expect to overcome them with brains and care. Mr. Carruthers gave a fine object lesson on the need of observation, when to a man who pointed out how tar had done good, the expert made a cut with his knife and revealed below the tar the fungus in full vigour? "That's how it is," said our expert, "tar may do good; but it prevents you from seeing what is going on underneath"! What was wanted was to kill the disease and to plaster it with tar seemed as if that would "cook its goose," but fungi like the Heathen Chinee have "ways that are dark" as the knife of our expert certainly revealed. The late Dr. Thwaites used to have a fine contempt for the planter as an observer. He cannot scientifically observe, he used to maintain, he never was trained to it; and although it is a humbling confession to make, still it must be allowed. However put him on the track of any thing that can be hunted down, and that is capable of being exterminated, and he will give it a warm and a merry time.

By the way into what a dreadful condition has the road to Panwila and beyond been allowed to get? As you drive over it, you are banged and tossed about as the trap gets out of one hole into another. Driving is now-a-days on Ceylon roads more fatiguing than walking, and a couple of hours' run on roads like these, leaves you sore all over an aching at special points over and above. We used to have roads which were a credit and things to be proud of, but now-a-days all this is changed. Who is the officer in charge? He ought certainly to be promoted.

Tea about looked very vigorous, and the returns for June are considerably ahead of what were expected. This is doubtless the result of the enforced inactivity of the months of drought and a mildness of the S.-W. monsoon.

### CEYLON TEA IN AMERICA—AND THE INDIA CURRENCY QUESTION.

June 21st.—I have been to see Mr. Wm. Mackenzie, Ceylon Tea Commissioner for North America, at the Ceylon Association rooms this morning. I found him looking extremely well after the voyage home. He said he had very little information to give regarding the immediate prospects of tea in America, having unburdened himself to the Committee shortly before leaving the island. The only comparatively new point was the 5d duty on tea which the American Government had imposed as a War Tax. The injury that this will do to the trade in tea is somewhat serious, and for the present its sale will be considerably hampered. Of course America had to create some extra tax to provide revenue for the war which is proving far more costly than the nation had anticipated, £80,000,000 having been spent already. But a duty of half the amount, say 2½d, on coffee would have produced, in the ordinary course of affairs, more than three times the revenue that will accrue from the ordinary tea-duty. For coffee is far more of a national drink in America than its later rival. For every 9 lb. of coffee consumed by the Yankee, the corresponding quantity of tea does not exceed 1½ lb. The only cause for this apparent shortsightedness in American finance must be found in the powerful influence exercised by the large coffee firms in the States, such as the American Sugar Trust and Arbuckle & Co. They practically rule the market and may be said also to control any fiscal measures that may be proposed in Congress. It is doubtless their wire-pulling that has kept the coffee untaxed at a time when the immense revenue that a small impost would produce would have proved a welcome addition to the resources of the American War Department. As it is, the very price of coffee, at wholesale rates, *viz.*, 4d per lb., is alone less than the duty now imposed on tea. Mr. Mackenzie had however heard this morning from one of Sir John Muir's men that an agitation had been started in America to obtain either a remission of the present tea-tax, or else a similar treatment for coffee. It would be a bolder stroke than one feels justified in expecting (provided the influence of the big coffee firms is really as great as Mr. Mackenzie believes) if the American Government were to equalize the circumstances of

#### TEA AND COFFEE

by making a tax of 2½d on each. They can hardly, in the case of pressing war-needs, remove the recent imposition, and it is only too probable that tea will have to endure its hardship and make the best of it without hope of change for some time. The tax, taking the tea imports at 90,000,000 lb. is expected to yield rather more than 1½ million sterling; but, as Mr. Mackenzie remarked, the higher prices consequent upon the new duty will reduce the quantity of tea-drinking. Here lies the chief hope of the even-handed justice that those interested in tea would desire. The American Government if they find the tea revenue to be below their estimates may be brought to see the superior importance of coffee to them as a revenue-producing product and act accordingly with decision and audacity, in spite of the long arm of the millionaire kings of the bean. With reference to Sir John Muir's doings in the American tea market Mr. Mackenzie informed me that it was an error to suppose that that gentleman

was favouring India at the expense of Ceylon. He had received a considerable number of orders for Ceylon tea, and was serving the interests of both without partiality.

Mr. Mackenzie also told me that the Tea Commissioner for Russia, Mr. Rogivue, is in town just now, so I will interview him in a few days if he has leisure.

Mr. Leake came in for a few minutes before I left and he had written another letter to *The Times* yesterday on the Currency questions, proving from the words of Lord George Hamilton, Sir James Westland and Sir Henry Fowler, that the Indian Government had already gained, not lost, by the depreciation of the rupee and that the additional Indian Loan proposed would be an additional to the prosperity it had enjoyed through its borrowings. He was of opinion also that the re-opening of the Mint was bound to come eventually. As I was going, Mr. T. N. Christie turned up. He had come to meet a gentleman with a view to discussing the Currency question. I said I had hoped to see him before now, but had not found time. He had, however, been away in Scotland till yesterday, having had a bad attack of fever and been in the doctor's hands for days past; but today he seemed fairly well.

R. H. F.

### TICKS IN CEYLON AND AUSTRALIA.

The *Queenlander* of June 18th mentions that—"Ticks have now been received by the Stock Department from India, Ceylon, Batavia, Argentine and the Continent of Europe, which are identical with the true cattle ticks of Queensland, and, with the exception of Natal and Argentine, the ticks have no evil effect one way or another on the cattle."

The specimens from Ceylon referred to are no doubt those sent by the Colonial Veterinary Surgeon. The request for the specimens from Queensland, with specimens of the Australian tick and bottles containing the preserving solution for Ceylon ticks, came to the Superintendent of the School of Agriculture through Mr. J. G. Drieberg, D.E., Anuradhapura. The matter having been referred to Mr. Sturgess, that officer undertook to forward the required information. It appears that a tick found on goats which was sent from Ceylon is new to Queensland.

The *Queenlander* who mentions that "Mr. T. J. Kingsbury, of Town Hall Chambers, has brought before the notice of the Department of Agriculture an oil made from the Margosa tree of India (*Azadirachta indica*), which is said to be very effective in destroying ticks on cattle. The oil is used in Ceylon for nearly all cattle diseases, and is mentioned by Mr. J. Affleck Robertson, who has had thirty years' experience of cattle in Ceylon." The most common remedy, we may add, against ticks, and moreover a satisfactory one, is a mixture of salt and coconut oil.

RUBBER FROM CORN OIL.—This is the heading which the *Financial News* puts, with an exclamatory sign attached, to cover a statement that some Chicago chemists have provided a substitute for rubber by vulcanising the oil of corn. The South American rubber tree is going to be eclipsed by this discovery.—*British and Colonial Druggist*, June 10.

## THE AMERICAN DUTY ON TEA.

Under the lead of Senator Tillman, of South Carolina, the United States Senate, by vote of 39 to 32, agreed to an amendment to the war revenue bill placing a duty of 10 cents per pound on tea after July 1st, 1898. This means an addition of \$9,000,000 to \$10,000,000 to the revenue without imposing any appreciable tax upon the consumer. If coffee is taxed 3 cents per pound, as it ought to be, another \$18,000,000 would be added to the revenue. Unfortunately, legislators who privately have conceded the equity of a duty on tea and coffee, have lacked the courage of their convictions, simply because they are imbued with the idea—as several senators have expressed it—"that it would be bad politics." And yet these astute politicians, gray with experience, have witnessed successive revolutions, completely changing the political character of the Administration and Congress; while today there is not in either branch of Congress one who can predict with certainty the result of next fall's elections. It seems as if Senators and Representatives can not or will not learn the force of the political axioms enunciated by the late President R. B. Hayes, that "He serves his party best who serves his country best," and ex-President Cleveland's, that "Public office is a public trust." A duty on tea and coffee is partly, and sometimes wholly, borne by the producer. The cost of both articles is unusually low and much below the average of previous years. Tea is selling today at wholesale at one-fifth the price it commanded during the civil war period. Three cent duty on coffee added to the cost at wholesale, would still leave its price far below the average cost of coffee from 1881 to 1896. Every pound of tea makes at least 150 cups of beverage, so that a duty of 10 cents, amounts to 1 cent or less for every fifteen cups. Three cents per pound on coffee is equivalent to a tax of half a mill per cup. Next to the duty on sugar, no tax could be levied that is so equally distributed as one on tea and coffee. We trust that the Conference Committee will insert in the bill a duty on coffee, and thus give all of the people a chance to share in the cost of a war, which is ostensibly waged in the interest of liberty and humanity.—*American Grocer*, June 8.

## TEA IN NEW MARKETS.

## MEETING OF THE THIRTY COMMITTEE.

Minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Saturday, the 9th day of July, 1898, at half past seven o'clock (7-30 a.m.) in the morning.

*Present.*—Messrs. F G A Lane (Chairman), A Philip (Secretary), Hugh B Roberts, R S Duff Tyler, H V Masfield, George Greig, E M Shattock, W Henry Figg, Edgar Turner, J B Coles, Hon. J N Campbell, Messrs. W D Gibbon, Gordon Ppyer, and A J Denison.

The notice calling the meeting was read.

The minutes of the proceedings of a meeting of the "Thirty Committee" held at Kandy, on Friday, the 20th May, were submitted for confirmation.

Resolved that they be and they are hereby confirmed.

Read letter from the Secretary, Indian Tea Association, Calcutta, acknowledging with many thanks letter and copies of the Book of Proceedings of the Planters' Association for the years ending 17th February 1896, and 1897 with the last report of the Committee of Thirty and stating that the information asked for had been fully supplied by these reports.

Read letter from Mr. A. E. Wright on the subject of advertising Ceylon Tea in Russia and

drawing attention to the following Resolution viz: "That all shippers of 'Green Teas' to America be given a grant of say 19 cents per pound out of cess funds on presentation of copy of shipping documents and sample of Tea shipped."

Resolved that Mr. Wright be referred to the following resolution passed at last meeting of the "Thirty Committee" as follows: "That the Committee would consider applications for assistance from those prepared to experiment in making green teas for export to America;" and that Mr. Wright be further informed that under the resolution above mentioned, the Committee would be prepared to deal with any application from him or any other shipper of "Green Teas," (2) that Mr. Wright's remarks regarding Ceylon Tea in Russia be considered when the subject comes up."

Read letter from Mr. Hugh B. Roberts requesting that a list of the members of the "Thirty Committee" and their attendance during the past and present year be laid on the table of the Committee.

Submitted the lists as requested which were circulated among the members present.

## STATEMENTS OF ACCOUNTS.

Read letters from the Secretary, Ceylon Chamber of Commerce and the reply sent.

Read letters from Mr. John Guthrie reporting that he had examined the books of the "Thirty Committee" and found the balance sheet to the 31st December 1898, quite in order. Further stating that he found that the books have been kept in a thorough business-like manner.

Submitted "summary of receipts and expenditure of the Ceylon Tea (New Market) Fund—as per abstracts for each year—from 1894 to 31st December 1897, referred to above as audited and found correct.

Resolved that a copy of the said audited account from 1894 to December, 1897, be published in the newspapers.

Submitted abstract of the Ceylon Tea (New Market) Fund account from 1st January to 30th June, 1898, for the inspection of the Committee.

Submitted ledger balances as at 30th June, 1898.

Submitted memos showing the proceeds of the levy from 1st January to 30th June, 1897, from 1st July to 31st December, 1897; 1st January to 30th June, 1898.

Submitted sketch memo. of position of the fund as at 9th July, 1898.

Read letter from Chairman "Thirty Committee" to the Secretary, "Thirty Committee" and his reply.

## MINUTES OF PROCEEDINGS.

Read letter from Government acknowledging receipt of copy of the Minutes of Proceedings of a Meeting of the "Thirty Committee" held at Kandy, on the 12th March, 1898, and which were confirmed at a meeting held at Kandy on the 20th May, 1898.

## FINANCES.

Submitted letters from the Treasurer of the Colony.

Read letters from the National Bank of India, Limited.

## GOVERNOR IN EXECUTIVE COUNCIL.

Read letter from Government stating that there is no objection to the transfer of any available balances in the Ceylon Tea (New Market) Fund from time to time into fixed deposit with the Bank, at

same time offering the Committee the alternative of making their own arrangements for the deposit—which however should be in the name of the Treasurer—or of receiving from Government 4 per cent., on the minimum daily balance for the month.

Resolved that the proposal of Government be accepted, viz., to receive from Government 4 per cent. on the minimum daily balance, on the understanding that the funds are available at any time required: (2) that Hon. Mr. J. N. Campbell and Mr. W. H. Figg be asked to see the Hon'ble the Colonial Secretary with a view to a satisfactory arrangement.

Read letter from Government notifying that the Governor has been pleased with the advice of the Executive Council to sanction the expenditure of the sum of five hundred pounds sterling in advertising Ceylon tea in Canada.

#### CEYLON TEA FOR THE AMERICAN ARMY.

Submitted correspondence that had passed on the subject of a proposal to make a present of a thousand chests of Ceylon and Indian Tea to the American Army and which had been published in the newspapers; also read letter from the Secretary Ceylon Association in London acknowledging receipt of cablegrams and stating that having communicated the fact that permission could not be given for the present to the American Army to the Indian Association, he had learned that the Indian Association also had rejected the proposal.

#### REPRESENTATIVE IN AMERICA.

Submitted circular letter marked private and confidential to the members of the "Thirty Committee" transmitting accounts called for in regard to the work in America, also letters received from Mr. Mackenzie to the Chairman and Memorandum to the Secretary regarding remittance.

Read letter from Mr. C. W. Horsfall.

#### CEYLON TEA IN CANADA.

Read letter from Messrs. Gordon Frazer and Co., asking for small samples for free distribution, also some pamphlets for advertising purposes.

Resolved that Messrs. Gordon Frazer & Co. be referred to Mr. William Mackenzie.

Read letters from Messrs. Rowbotham and Co., transmitting letters from Mr. J. E. Chipman making application for the appointment of Ceylon Tea Commissioner for Western Canada and on the subject of aid in advertising generally.

Read the Chairman's reply.

#### CEYLON TEA IN RUSSIA.

Read letter from Government stating that a despatch has been received from the Secretary of State intimating that a copy of the letter on the subject of the duties levied on tea by the Russian Government has been forwarded to the Secretary of State for Foreign Affairs.

Read letter from Mr. Rogivue on the subject of advertising Ceylon Tea in Russia.

Resolved that a copy of Mr. Rogivue's letter be sent to Mr. T. N. Christie, and that he be asked whether co-operation with Mr. Rogivue would be advisable in the matter of advertisements, post-cards, railway placards, etc., as indicated in Mr. Rogivue's letter and that if this meets with Mr. Christie's approval the Committee would ask Mr. Christie to arrange with Mr. Rogivue for the carrying out of his proposals; (2) that Mr. Rogivue's letter be acknowledged and that a copy of the above resolution be forwarded to him; (3) that a copy of the resolution be also forwarded to Mr. A. E. Wright for his information with reference to his suggestion.

Submitted letter from Messrs. Crosfield, Lampard & Co.

#### CEYLON TEA IN GERMANY.

Read letter from Messrs. Murdoch & Bramwell acknowledging receipt of R3,002-31 and reporting on Mr. Hagenbeck's exhibition at Berlin.

#### CEYLON TEA ON THE CONTINENT OF EUROPE.

Read correspondence with Mr. R. V. Webster on the subject of the following resolution passed by the "Thirty Committee" at a meeting on the 16th of January, 1897, viz.:—"That Mr. Webster be informed that a sum of £500 has been granted for his use on the Continent of Europe in pushing and advertising Ceylon Tea; (2) that the Chairman's letter to Mr. Webster dated the 7th January, 1897, be on the same hereby is confirmed; (3) that Mr. Webster be requested to furnish the Committee with progress reports, and statements of accounts showing how the sum voted is applied."

Resolved that the Committee deprecates the great delay that has taken place in Mr. Webster's rendering of his complete report with accounts and submitting necessary vouchers as promised, and trusts to receive them at the date now named.

#### CEYLON TEA IN NORWAY.

Read letter from the Ceylon Tea Company, Limited, advising having shipped the Ceylon tea granted to Mr. Floor for free distribution in Norway with accompanying invoice; read also letter from Mr. Floor stating that steps had been taken to fulfil the conditions intimated having forwarded to Mr. Cecil Palliser a draft for £13 17s 7d in payment of his claims for duty.

Intimated having paid Messrs. Cooper, Cooper & Co., Limited, draft for £40.

#### CEYLON TEA IN BELGIUM AND HOLLAND.

Intimated having paid Messrs. Cooper, Cooper & Co., Limited, draft for £200 sterling.

Read letter from Messrs. Murdoch & Bramwell asking for a grant of 250 lb Ceylon tea for free distribution in Belgium and Holland on the understanding that they also send 250 lb. of Ceylon tea for free distribution there.

Resolved that 250 lb. of Ceylon Tea be granted to Messrs. Murdoch & Bramwell for free distribution in Belgium and Holland and that a report with accounts be rendered to the "Thirty Committee."

Resolved (2) that the sanction of the Governor in Executive Council be obtained to this appropriation.

#### CEYLON TEA IN AUSTRIA AND HUNGARY.

Submitted correspondence and cablegrams with reference to the presentation to His Imperial and Royal Majesty the Emperor of Austria on the occasion of the Jubilee of His Reign.

#### CEYLON TEA IN NEW ZEALAND.

Submitted letter from Mr. George T. K. Mackenzie on the subject of Ceylon packed teas.

#### SECRETARIAT.

Resolved that the salary of the Secretary be increased by R2,000 per annum from 1st January, 1898, on the footing of the accounts submitted as audited as at 31st December, 1897.

#### AGRICULTURAL CHEMIST.

Considered the following report received from the Committee of the Planters' Association with the intimation that the report had been adopted and had been ordered to be forwarded to the "Thirty Committee" for approval and action thereunder. The Sub-Committee in conference

with representatives of the Chamber of Commerce and Managers of Companies unanimously recommend that the "Thirty Committee" should approach Government for sanction to the necessary disbursements at the rate of a thousand pounds sterling per annum in securing the services of an analytical Agricultural Chemist for the purpose of investigating Ceylon Tea and in finding out all information as to various chemical changes which occur in the process of Tea Cultivation and Manufacture with an analysis of soils, the Sub-Committee being of opinion that this step is of paramount importance at this critical time in order to safeguard the position Ceylon Tea has held in the past and to ascertain how strength and flavour can be maintained.

Resolved that the recommendation of the Committee of the Planters' Association be adopted by the "Thirty Committee"; (2) that the sanction of the Governor in Executive Council be obtained to this appropriation; (3) that a Sub-Committee consisting of Messrs. W. H. Figg, E. M. Shattock, W. D. Gibbon, E. Turner, John H. Starey, H. V. Masfield, George Greig, Hon. Mr. J. N. Campbell, Messrs. F. G. A. Lane, and A. Philip, to make the necessary arrangements.

#### TEA SALES IN COLOMBO.

Read letter from Secretary Ceylon Association in London transmitting copy of a letter received from Mr. A. Lampard in regard to tea sales in Colombo.

Resolved that the letter be sent to the newspapers for publication.

The "Thirty Committee" then adjourned.

A. PHILIP,

Secretary to the "Thirty Committee."

#### PLANTING NOTES.

**THE IMPERIAL TEA DUTY.**—A well-known tea planter, who has been looking into the matter, expresses a doubt as to the wisdom of touching the tea duty. He writes:—"I question the necessity of agitating for a reduction of duty on tea in England as being in any way advantageous to the producer. The price per lb. in England is well within the purchasing power of the labourers, and if the duty is entirely removed, it lets every body in to sell tea without any hold on them as to purity, &c."

**THE BOGAWANTALAWA DISTRICT TEA COMPANY'S FIRST REPORT** (which we give in our daily and *T. A.*), is an interesting one, and shews a splendid margin between the cost of its million (nearly) lb. of tea f.o.b. Colombo, namely 26½ cents or 4.22 per lb., and the gross average price in London 8.20d per lb. Nevertheless, in view of Mortgage and Preference liabilities, the ordinary shareholders only get 6 per cent. The Company owns 2,533 acres, 1,901 of tea in bearing, 140 partial, and 144 not in bearing.

**THE LANTANA BUG.**—We are glad to learn from Mr. Green, what we did not understand before, that in his opinion the tea plant is not a really congenial food-plant for *orthesia insignis*. It is more likely to prove troublesome on coffee if it got a hold. But so long as boundaries are kept clear and clean and lantana cut down and burnt or kept back from cultivated fields, the risk of mischief is greatly diminished. So far, there is no authentic case of the bug touching tea, save what came under Mr. Green's own notice.

**A RECORD IN COFFEE!**—Messrs. I. A. Rucker & Bencraft report of our old staple on June 33rd:—

Spot coffees have seldom been more irregular in price, and a considerable and rapid fall has taken place, which may be assessed at 1s to 4s per cwt. At this decline there is far more disposition to deal on the part of buyers, and several of the large importers are not in the market at anything like the full decline. The fact that contracts are passing at 37s for some good ordinary coffees is a record, 38s to 39s being the lowest price ever known before for a generation, and it is not so very long ago that these descriptions were bought in quantity at 80s, as being a cheap and attractive price.

**AN ENTERPRISING SEEDSMAN.**—An Australian exchange writes:—"Messrs. J. P. Williams & Brothers of Heneratgoda offer to supply plants of *artocarpus incisa* (breadfruit) by the Wardian care of 50 plants for the sum of £10. One cannot help comparing what it must have cost the British Government to send Bligh twice to the South Sea Islands and back to the West Indies, 109 years ago—probably returning with not more than 500 plants after an absence of years—with the facilities of the present day, when we are able to send a telegram to Ceylon and have the same description of plants packed in fine wardian cases, and all to cost probably one-hundredth part of the sum spent in the 'Bonny' affair."

**MINOR PRODUCTS IN TRINIDAD.**—Mr. Hart summed up his lecture in a way that conveys lessons to Ceylon:—

1st.—I have shown that it is idle to expect Minor Industries to be introduced, as it were by word of command.

2nd.—I hope to have convinced you of the urgent need for educating the people in the principles of agriculture and practical husbandry.

3rd.—I hope I have convinced you that tradition must be conquered, that people must be taught new methods, and that a crop that is worth growing at all is worth growing well, and that small profits must not be despised.

4th.—I hope I have shown you that there are no greater obstacles here, than have already been met and overcome elsewhere, and that the Minor may be made a Major, with a full commission as a Field Officer, if only the culture of the field is properly watched and controlled. For evidence of this, I recommend you to peruse the table of Jamaica exports which I have prepared for your inspection.

**TEA PLANTING PROSPECTS.**—The *Economist*, in lately noticing a total fall in value of certain selected Indian and Ceylon sterling Tea Companies, in the year ending May last, amounting to £737,963 or the equivalent of 10½ per cent, offered the following remarks:—

Current quotations still show on the average a considerable premium on the nominal value of the capital paid up, as the dividends, in spite of the reduction, give a fair return on the investment. It remains to be seen whether even the present rates of distribution can be maintained in future years. The companies may fairly hope for an improvement in the climatic conditions, but most of the other difficulties have still to be contented with. The currency question remains to be settled, and fears have been expressed that its adjustment may open the way for renewed competition from Chinese tea-growers. To that anticipation, however, probably not much weight need be attached. It seems improbable, however, that the industry can for a considerable period to come, be worked on the same highly-profitable basis as formerly, since no improvement in prices is likely to occur until the demand overtakes the supply; and while there is a check to the introduction of capital for the opening up of new estates, the existing companies are in many cases extending areas, as they can by such means largely increase their production at a comparatively small increase in working costs.

## Correspondence

To the Editor.

## THE PRUNING OF TEA: IN INDIA AND CEYLON.

DEAR SIR,—The Indian planter, who in your columns has offered suggestions for an improved system of pruning, has evidently a different condition of things to deal with than obtains generally in Ceylon. With his applied system of pruning and liberal manuring he holds an estate should not fall short of 1,600 lb. an acre.\* Who in Ceylon is sufficient for these things, and where is the estate here to be found that can hope to touch such a magnificent record? I have heard of estates brought up to 800 lb. after a series of successive manurings, and each was thought to be doing well at that, and as a top shot, 1,200 lb. may have been attained; but these Indian yields take poor Ceylon wholly to the fair, and we can but comfort ourselves that if we cannot duplicate them we can at least stand by and admire.

That the planters in Ceylon know a lot is admitted at least by themselves, and they are as ready to impart their information, as they are to pick up a wrinkle anywhere. Our thanks are due therefore to the Indian man, who has so fully explained a system which he says he has tried, and proved to be worthy of following.

On the face of it the system reads well, and to be able to save a field from the drastic action of "cutting down" should commend it for a trial anyhow. Thus regularity of surface and steadiness of yield are two conditions much to be desired, and when to this is added that the tea obtained from the trees is better than could be expected from bushes recovering from a severe dose of the knife, it would seem as if your Indian correspondent was on the track of a good thing, and that Ceylon might benefit from his thoughtful work.

That the new system will need careful watching goes without saying, but what does not need that more or less? The experts who are to remove the hard work; will soon take a pride in their work for the Tamil cooly has the faculty of all good workers that of knowing when they stand well with their employer and rising to it. Of course "the proof of the pudding is the eating of it," and to know what this new system is worth, will take sometime. Meanwhile, the writer of the article assures us that *he* is satisfied with what he has seen it do, and as the whole paper has a decidedly modest ring about it, and is full enough to enable any one to follow out the line indicated, it is more than likely that the system will get a trial and later on there will be improvements on this improved system. If the result be better grown trees, better tea, and a bigger yield, the new system will have more than established a footing for itself. Certainly in these days of short crops, and unattained estimates, to read of a simple system for increasing output is cheering. But perhaps the improved system is not proof against drought!

WILLING TO TRY.

## COFFEE AND THE "LADY-BIRD" QUESTION.

Hiralouva Estate, Haldummulla, June 13.

DEAR SIR,—I am glad to see the interest you are taking in the "Lady Bird" question, as I

consider it more important to the island generally, than it seems to be supposed at present, and if successful would enable many of us to resume coffee growing with satisfactory results.

There is not much coffee left here, but what there is, I have never seen in better heart, and with a good show of spike on it. Its improved appearance this year, is I think due to much more favourable weather (for coffee) than we have had for some few years. And with bug kept in check by "Lady Birds" I should be glad to increase the acreage under coffee, especially as "Ceylon plantation" always seems to sell well. I do not know what funds are required for the scheme. But if coffee planters were agreeable we could easily raise K3,000 by a levy of 20 cts. per acre in the 15,000 acres coffee left. And I daresay many tea planters would be glad to assist with the hope of being able to plant portions of their estates with coffee, and grow it successfully.

Government would I should think be glad to give a similar amount to what was collected by planters, through the P.A.—Your faithfully,

H. H. KIRBY.

## THE BUG ON LANTANA.

Fairland, June 13.

SIR,—My attention was drawn to the "Bug" that attacks the "Lantana" some six months ago. Since then, it appears to have spread very considerably in the "Central Province." It will be an "eye-sore" very soon, as the pretty green, soon turns to an ugly black; and the "Lantana" looks withered.

The question of importance, however, is not one of appearance but one for very serious consideration, as to whether this "Lantana" pest may or may not attack our tea bushes?

The Government should be approached on this subject, by our "Planters' Association," and opinions obtained from qualified experts.

Some of your readers may remember the first appearance of the "coffee" pest, and how efforts were made to "stamp it out," only when it had gained a firm footing in Ceylon; if there is danger of this "Lantana" bug coming on to our tea bushes, then let us with the help of Government, fight it and try and stamp it out at once.

SHELTON AGAR.

## "LANTANA" BUG AND COFFEE LEAF DISEASE.

Heneratgoda, June 15.

SIR,—Referring to Mr. Shelton Agar's letter I have to say that many people told me that coffee leaf disease was introduced by disease which affected Lantana plant. I think there is reason to believe the story as is plague from rats. There is no disease in the lowcountry Lantana as yet to be seen. Coffee leaf disease also first appeared up-country and gradually came to lowcountry. Mr. Shelton Agar's letter deserves immediate attention of the Planting Community as well as Government.—Yours faithfully,

J. P. WILLIAM.

[Coffee leaf disease was first seen in Madulima district and Dr. Thwaites traced the fungus to an insignificant jungle plant in Uva. It had nothing to do with Lantana.—ED. T.A.]

## "THE LADY BIRD."

SIR,—The "Lady Bird" is a very common insect of Ceylon. It is found on pumpkin vines

\* As a maximum.—ED. T.A.

during the hot season, in most part of the island.  
E. J. THWAITES.

Rosewood, Nuwara Eliya.

[Not the particular "lady birds," we think, which feed on the coccus bug,—the *Vedalia*; or Mr. Green would be sure to have heard of them.  
Ed.—T.A.]

### AGRI-HORTICULTURAL SHOW.

June 16.

DEAR SIR,—I am glad to see the good advice in your columns about the Show. If the suggestions therein are carried out there is no doubt a really good Show will be held every year, which will be most useful in improving Agriculture and Horticulture. The rubbish wants to be sorted out and the good and improved things brought forward. This is impossible when a Show is only held once in six or seven years.  
—Yours, &c.,  
PRACTICAL.

### AN ANALYTICAL CHEMIST FOR THE TEA PLANTATIONS.

DEAR SIR,—Why should not you revive at this time the suggestion that the services of an Analytical Chemist might be paid out of the Cess Fund money? A very useful appropriation it would be, in my opinion.—Truly yours,  
A PAYER OF CESS.

[A very useful suggestion: of course the sanction of Government would have to be got to this vote from the Cess Fund, but we would expect it to be readily given.—Ed. T.A.]

### THE PLANTING OF COCONUTS:

THE OPINIONS OF TWO OF OUR OLDEST PLANTERS WHO NEVER HEARD OF THE MODE INSISTED ON BY "MR. GRIFFITHS" WHO IS REGARDED AS A "HOAX" THOUGH IN FIJI HE POSES AS AN EX-CYLON COCONUT PLANTER.

Kurnnegala, June 15.

DEAR SIR,—*Re* planting coconuts with the eyes downwards,—I have no knowledge of, and never before heard of such a method. In the white-ant-warming soil, of Ceylon I doubt if 10 per cent of the nuts would be allowed to grow; white ants would attack the nuts at once and the eyes be destroyed. To guard against white ants, nuts in a nursery are never entirely covered with soil, an inch or two of the upper part of the nut containing the eyes is always left uncovered and care taken to keep off the white ants from encroaching. I always sow my nurseries with the nuts standing upright and get from 80 to 90 per cent of plants. Ample water should be allowed to nurseries in the dry weather: one copious watering every five or six days. In my nurseries the paths are an inch or two higher than the surface of the beds and thus water is retained. When the beds are raised and the paths six inches below the surface of the beds (as is the general practice) most of the water runs to waste and the outer rows of nuts do not grow with the same vigor as those in the centre. That trees raised from nuts planted with the eyes downwards should come into bearing in half the time that plants raised in the ordinary way do, seems to me absurd, and the whole story sounds very like a hoax.

W. J.

No. II.

Mirigama, June 15.

DEAR MR. EDITOR,—I have received your memo about planting coconuts with the eyes downwards. I must confess that this is quite new to me. I have little faith in this mode of planting. I have this day put twelve nuts in my nursery eyes downwards, twelve slanting, and twelve eyes upwards. I shall let you know the result of the trial afterwards.

The following is an extract from the *Ceylon Observer* of the 26th June 1893 when I gave some hints to those about to open land under coconuts:—"Let the nuts be close to each other in a slanting position; shade them from the sun, and water during dry weather. The nuts will germinate within four months from date of putting down, and if at the end of five months there are any which show no signs of growth, reject them, for they will never make healthy trees.

"When the seedlings are from two to two-and-half inches high transplant them at intervals of 18 to 20 inches in to another nursery where they will have more sun; ashes applied lightly after transplanting will help the growth of the plants greatly. The plants when twelve months old will be big enough to put out into your clearing, and sufficiently strong to withstand the attacks of white ants, one of the most formidable of the enemies of a young coconut plant. On removing the plants from the nursery carrying them by the branches must be strictly forbidden, as want of care in this respect is very likely to result in injury to the 'ebbage.'

"May being a wet month is the best time in the year for planting."—Yours truly,  
W. H. W.

### CEYLON TEA IN THE UNITED STATES AND THE NEW TEA DUTY.

Toronto, June 17.

DEAR SIR,—You will, no doubt, have heard before this of the imposition of 10c per lb. duty on tea entering the United States and it might be interesting to your readers to get the opinion of an interested person on the spot as to the probable effect it will have on Ceylon Teas.

As many of your readers are aware, we, the "Salada" Ceylon Tea Company, have opened branches of our business and have been pushing Ceylon Teas in the following cities in the United States:—Boston, Buffalo, Cleveland, Detroit, Pittsburg, Toledo, Rochester, etc. In many of these places we have our own warehouses and staff; in others we have given the agency for our teas to wholesale tea firms, but are doing the advertising ourselves. Of course, any change made by the Government is an annoyance to the trade, but we really believe that this imposition of a duty will redound, in the end, to the benefit of Ceylon and Indian teas, increasing their sale. We make some impression on coffee drinkers, winning not a few over to tea, but our main gain has been from the drinkers of China and Japan teas. This duty will hurt these trashy teas far more than it will ours. A person is not very likely to import a low grade China or Japan tea—even one that will pass the standard—pay the duty on it and perhaps "be hung up with it." And we believe that the effect of the duty will be to limit the importations of these teas. This is evidently recognized by the Japanese Government as they have made representations, through their Ambassador, to the authorities at Washington, pointing out that this was aimed chiefly at their products.

We might say that the Campaign is going on most satisfactorily at all points in the United States. But it is slow and laborious, as we have found it in Canada in times gone-by. Yet there is a constant gain there, as there was here, and we have every reason to feel sanguine that in a few years, Ceylon Teas will be as popular in the United States as today they are in Canada.

Some time ago, in writing to your Commissioner, Mr. McKenzie, I predicted that at some date within a period of 25 years there will be more Ceylon tea consumed on this Continent than there is today in all England.

With kind regards, I remain yours, truly,  
P. C. LARKIN.

#### EFFECTS OF GREVILLEAS ON TEA.

Abbotsford, Nannoya, June 20.

DEAR SIR,—As this subject keeps cropping up periodically in the local press and as such an eminent authority on tea as Mr. Kelway Bamber appears to think that grevilleas planted throughout the tea may be detrimental to the product, both as regards strength and flavor I venture (as an investigation of the question is desired) to give my opinion and experience though they may be practically of no value whatever.

Abbotsford, as is well-known is about the best wooded estate in Ceylon. Its trees consist of all sorts of gums, grevilleas, wattles, &c., and as they were mostly planted in the days of coffee, the tea has had to contend against them from its infancy. That they have injuriously affected the growth of the tea is undoubted, but I very much question their having injured its quality in any way and I base my belief as to this on results.

The net prices realised for the teas from this estate during the past three years are as follows:

1895	..	..	9-19d per lb.
1896	..	..	8-99d "
1897	..	..	8-29d "

The drop is not nice to look at, but it is not more than may be accounted for by the drop in the market and as the yield has considerably increased during this time, although the youngest tea is 12 years old and a pretty large proportion ranges from 20 to 25 years'. I look on it with a certain amount of philosophical equanimity and cannot think that the gums or grevilleas have misbehaved themselves in any way.—Yours truly,  
JOHN FRASER.

#### LADY-BIRD BEETLE AND BUG.

Eton, Pundaluoya, 24th June, 1898.

DEAR SIR,—There are one or two points in the "Lady-bird" correspondence, (see page 90,) that call for comment.

The Director of the Royal Gardens, Kew, remarks that for the most part each kind of lady-bird will feed only on one kind of scale insect. This is fortunately not altogether the case. Several kinds are very general feeders upon not only different species, but different genera of scale insects. Mr. C. P. Lounsbury—Government Entomologist at the Cape—informs me that one of their local lady birds (*Eoichomus nigromaculatus*) is an all-round feeder—including Aphides and Psyllidæ as well as Coccidæ. Other kinds will often prey promiscuously upon closely allied species. The beetles that feed upon the various species of *Lecanium* in one country would most probably attack allied species in another country. Those that prey upon the *Dia-*

*spidine* (*Aspidiotus*, *Chionaspis*, *Diaspis*, &c.), are very wide feeders within that group.

Mr. Newport, though possibly not a trained Entomologist, will no doubt receive assistance and advice from the several Government Entomologists in Australia.

Mr. Blanford remarks that "there are plenty of Indian lady-birds which perhaps already accomplish all the destruction that imported kinds could do." There certainly are—both in India and Ceylon—several kinds of lady-birds that attack the "green-bug" (*Lecanium viride*). But, being themselves indigenous species, they are hampered and kept in check by their own long-standing natural enemies.

It is a well established fact that imported insects, (beneficial as well as injurious), if they find an ample supply of congenial food, will increase much more rapidly than they did in their own country where they were subject to their own natural enemies. It is this that constitutes the special danger from imported insect pests and the corresponding advantage from the importation of beneficial insects.

The natural home of *Lecanium viride* has never been definitely determined. I have always been of opinion that it was introduced with Liberian coffee. It is a comparatively recent pest (long after Nietner's time). In its original home it may attract little attention, being doubtless kept in check by the balance of nature. It is when taken away from its home and placed amidst an unlimited supply of congenial food that it is enabled to increase without check.

Mr. Blanford quotes the fact that an Indian species of *Vedalia* (*V. fumida roseipennis*) was found to attack an imported scale insect, *Icerya aegyptiaca*, and argues that "in this case the introduction of the Australian *Vedalia* "cardinalis" would have been utterly unnecessary." I do not agree with Mr. Blanford on this point—for the reasons stated above—viz., that the Indian *Vedalia*, being an indigenous species, would be unlikely to multiply rapidly enough to cope with an introduced pest.

With reference to the last paragraph of Mr. Blanford's letter, I would point out that it is not absolutely necessary that the beetles should be fed during the voyage. Some of Mr. Koebele's most successful consignments were imported in a dormant condition on ice. When the insects are imported in an active condition, together with a supply of food, I quite agree with Mr. Blanford that the utmost caution is necessary to prevent the accidental introduction of further injurious insects. On this account, importations should not be turned directly into the field, but kept for a time in carefully constructed breeding cages. All diseased specimens, and any suspicious insects of other kinds that may appear in the breeding cages, should be at once destroyed, and only healthy examples liberated.—Yours truly,

E. ERNEST GREEN,

Hony. Government Entomologist.

#### MICRO ORGANISMS IN SOILS.

DEAR SIR,—“Ex-Planter” according to his letter which appeared in your issue of the 2nd instant has apparently no sympathy with micro-organisms. This may be more due to coneratism than to any special knowledge of the subject. But let me tell him that though he does not know the theory of their existence he will one day have to accept their practice and then I am afraid “Ex-Planter”'s criticising powers will be lost to us. The day we shall

all have to make close personal acquaintance with these micro-organisms will be the day of our dissolution; for the very micro-organisms which convert the organic nitrogen in the soil are those which will reduce our mortal remains. If it were not for them, the dead plant (to use a popular expression) would not rot and the dead body would not decompose. Our earth would be full of corpses—vegetable as well as animal—and for that very reason life would become impossible. Is "Ex-Planter" still prepared to argue that these micro-organisms are less at work under our climatic conditions than under those of Europe?

But there is yet another class of micro-organisms whose function as explained has been found to be the fixation of the atmospheric nitrogen. According to "Ex-Planter" one would imagine that these micro-organisms sit on the surface of the earth and with open mouths swallow whatever nitrogen they can get hold of. Let me however tell him that the process is not quite as simple as all that. Whilst the first-mentioned class of micro-organisms—those converting the organic form of nitrogen—can only perform their functions when in contact with the oxygen (of the air,) the last mentioned micro-organisms—those fixing the atmospheric nitrogen—can on the contrary only perform their function when cut off from contact with the air. They have, as it is, to be surrounded by the ordinary bacteria and only after the latter have deprived the air of its oxygen can the former fix the nitrogen.

I have explained that in a soil devoid of vegetation the nitrates are unavoidably carried off with the water that filters through it, but even in a soil covered with vegetation there is a constant though very much minimized loss of nitrates going on. These nitrates, in the course of their voyage, are carried into the sea and only very little is returned as organic nitrogen in the shape of fish, sea-weeds, &c. By far the largest portion of these nitrates is turned into ammonia (sea water contains about 0004 ammonia; and from there finds its way back into the atmosphere. The disproportion between the losses and gains of nitrogen (as shown also by the Rothamsted experiments) would thus be so great that our soils would, with every year, diminish in fertility and would have become sterile long ago.—Yet we see no change in nature as time goes on; our plants assume their ordinary growth year after year; and we have no fear that this state of things will cease. What then makes good this deficiency? We know today, as a scientifically established fact that it is due to this special kind of micro-organisms fixing the atmospheric nitrogen. It is owing to their work that the continuance and perpetuity of vegetable life is assured. Matter does not create itself, nor does it lose itself, it only changes its form. Present today as an organic combination, tomorrow it falls a prey to micro-organisms, resulting in a nitrate to assist the building up of a new form. But this nitrate may through ill-luck get dissolved in water, then carried off into the sea to form ammonia whence to find its way back into the atmosphere where after awhile it will be fixed by micro-organisms only to start its career afresh.

Travelling educates people and when Ex-Planter will himself have accomplished this great voyage he will no doubt learn to feel the power and usefulness of these micro-organisms. And if perchance he should one day find himself back in the scene of his former labours—not as a Planter this time however but as a modest nitrate; let him be careful not to tumble into a drain and again desert the field as his *nom-de-plume* admits he has done during his present career.—Yours faithfully,

A. BAUR,

The Ceylon Manure Works.

#### EX-PLANTER'S REPLY TO MR. BAUR.

14th June, 1898.

DEAR SIR,—M. Baur's reply will convince no one that he has a practical knowledge of manuring.

It may be conveniently divided into two parts. The beginning and end are devoted to purely personal remarks, which, if not impertinent, are certainly not pertinent to the matter under discussion; and the middle is taken up with a description of ordinary phenomena familiarised to the average man through the medium of elementary text books. To this is added a re-hash of certain portions of works on manuring, which presumably form the staple of M. Baur's extensive scientific library.

I really cannot pretend to follow M. Baur in his gruesome incursion into the realms of dissection and putrefaction.

M. Baur has adopted a method much in favor with a certain class of controversialists, and has by implication attributed opinions to me which there is no evidence to show that I hold. He has fathered dummies upon me to give himself the pleasure of bowling them over!

It was nowhere stated in my letter that there were fewer micro-organisms here than in Europe. What I questioned was whether on the hill-sides, that are a feature of the majority of Ceylon estates, the nitrates formed would not be frequently washed away by excessive rain.

It is not unreasonable to assume as I did that experiments conducted on level land in a temperate climate are of no great value in dealing with steep land subjected to a tropical rainfall.

Although it has not occurred to him to admit it, M. Baur must be well aware that experiments have shown micro-organisms to be far more abundant on the surface and immediately below than at a depth of a foot or more. Indeed I believe that at quite moderate depths, it is possible to find soil that is absolutely germ free.

Even if M. Baur proved by cultivation in gelatine the medium usually employed, the existence of large numbers of micro-organisms in our soil under normal conditions, nothing much would be gained. For, according to his own showing, micro-organisms have always been at work maintaining the fertility of the soil, and we can conceive no reason why they should not so continue doing till the end of time. But has their action rendered the application of nitrogenous manure unnecessary either in Europe or Ceylon? I trust not. Is it not a fact well within the knowledge of most planters that the results from Castor Cake—a manure whose value is almost entirely nitrogenous—have been universally most favorable? Why should this be, if sufficiency of nitrates already exists in the soil? Again why does M. Baur himself recommend nitrogenous manures, and why does he offer Castor Cake for sale, if there is already an excess of nitrates present in the soil?

The fact is that the sooner M. Baur recognises that his self-proclaimed omniscience on the subject of manuring is not acknowledged, the better it will be for himself and the general public, upon whom he inflicts his dogmatic deliverances.

On reflection I think, perhaps I have treated M. Baur too seriously.—Yours, etc., EX-PLANTER.

#### MANURING OF TEA, AND NITROGEN.

DEAR SIR,—It was not my intention to reply to "Ex-Planter's" letter, but as I find that some wrong impressions have been created it may be as well to shortly review his letter.

I have brought forward this nitrogen question in rather a prominent fashion, and I make no excuse for having done so, as I consider the same as one of the greatest importance to our planting interests. I may also state that I am quite prepared to argue the subject further, and to adduce unmistakable practical evidence in support of what I have written, though for the present I must confine my remarks to the points raised by this correspondent.

I have said that there was nothing to show or indeed to make us suppose that the natural formation of nitrates going on in our soils was less than in Europe, and the only thing this correspondent has been able to urge there against is that on steep land and with a tropical rainfall part of the nitrates may get washed away. How does this compare with my own statement, viz., I do not mean to imply that all the nitrates formed in the soil are pure gain for the plants. Admitting, however, for argument's sake that half of the nitrates formed are washed away—which I think is rather a large concession to make—there would still remain say 44lb. of nitrogen per acre, capable of producing 800 lb. of tea. Does his argument then take anything away from my contention that under certain conditions the natural supply of nitrates—which we can besides augment artificially by loosening the soil—is sufficient to produce ample crops?

Your correspondent has tried to make out an inconsistency between my theory and the fact of my offering for sale nitrogenous manures; but is this not rather proof that I am not personally prejudiced on this nitrogen question and that my writings have had their main object in an attempt to benefit and assist the planting industry?

"Ex-Planter" points to the results that have been obtained by the application of nitrogenous manures. Have I disputed or minimized these facts, though I have plenty of letters to show that the application of nitrogenous manures has not always proved an unmixed blessing. But is this application of nitrogenous manures the cheapest way to produce our crops? That is the real question at stake. It is easy enough to produce large crops, if the question of cost has not to be considered, but my letters, as their headings denote, bore on the subject of cheap production, a fact seemingly overlooked by this correspondent, but which will by-and-by be fully appreciated by those going in for practical trials and supplying those fertilising ingredients, which are actually deficient in soils.

Let us for one moment consider the meaning of the manurial percentages recommended by Mr. John Hughes for up-country estates. The application of 4 cwt. of a mixture containing 4 per cent nitrogen, 9 per cent phosphoric acid, and 13½ per cent of potash, is equal to 16 lb. nitrogen, 36 lb. phosphoric acid, and 54 lb. potash. The phosphoric acid, as the dominant manurial ingredient, is therefore sufficient to produce over 4,000 lb. of tea per acre (400 lb. tea to every 3 lb. phosphoric acid), but the nitrogen would hardly suffice for 400 lb. of tea, and reliance is therefore placed upon the natural sources of nitrogen to make up the deficiency. Practically this in no way differs from what I maintain? Mr. John Hughes has given it as his opinion that 4 per cent nitrogen in a manurial mixture should prove sufficient for most Ceylon tea estates and I dare say that Mr. Bamber's recommendations will hardly be much at variance with those of his colleague.

Should "Ex-Planter" care to give us the benefit of his further criticisms, let him throw off his non-de-plume and write over his own name.—Yours faithfully,  
A. BAUR.

#### MANURING TEA: THE "NITROGEN" QUESTION AGAIN.

June 30.

Sir,—If "wrong impressions have been created" by my letter of the 14th inst., it was unkind of M. Baur, in the interests of the planters for whom he professes such concern, not to have endeavoured to

remove them sooner, and when he did make the attempt not to do so more thoroughly. I cannot see that he has tried to disprove any one of my assertions. If there is anything fresh in his last letter, I hope, he will forgive me for not being able to seize upon it. For my own part I am not inclined to trespass on the patience of the editor and his readers by carrying this correspondence much further, unless some obviously useful purpose can be served. But there are one or two points in M. Baur's last letter, which I trust, I may be allowed space to comment upon.

In the first place, what is the "Nitrogen Question" which he takes credit to himself for having "brought forward" in "a prominent fashion"? Apparently the fact that nitrification is the result of micro-organic action and not, as was at one time supposed, a purely chemical process. But this discovery was made more than 20 years ago, and M. Baur pays the planters and merchants of Ceylon a poor compliment in taking for granted that they are so hopelessly behind the times. But say that all Ceylon, save M. Baur, lay enveloped until lately in black ignorance on this point, does M. Baur imagine that the eminent chemists who have from time to time, recommended suitable tea fertilisers for India and Ceylon producers, are unaware of the important part played by the micro-organism? It is refreshing to witness such a delightful display of naive vanity and unreflecting fervour at the end of the nineteenth century! A fire with all the zeal of a recent convert M. Baur is impelled to shout aloud his good news from the housetops! M. Baur states that "under certain conditions" the natural supply of nitrates is sufficient. But has he the least idea what these "certain conditions" are? Could he, for instance visit an estate and say whether it was blessed with such happy "certain conditions"? If he cannot, of what practical value is this loosely-worded paragraph? Is M. Baur prepared to state definitely that the application of nitrogen in Ceylon has been excessive in the past, or that it is altogether unnecessary in some cases or in all cases? Why, if half the natural supply of nitrates is capable of producing 800 lb. of tea, does Mr. Hughes recommend the addition of nitrogen sufficient for another 400 lb. of tea per acre? Presumably, even from M. Baur's point of view, because in Mr. Hughes' opinion, all the nitrate present in the soil is not readily available as plant food.

If M. Baur's offering nitrogenous manures for sale when he believes them to be unnecessary, is proof of anything, it is surely rather of a disregard for the pockets of his clients than of his impeccable and unprejudiced attitude in the matter.

Nothing is easier than to insinuate that some vague system of manuring recommended, but not very particularly described by M. Baur, is cheaper than all others, but nothing would be more difficult to prove. There is not space for a long letter containing elaborate calculations in the correspondence column of a paper and M. Baur probably relies on his assertion passing unchallenged. But such ex-parte statements have no weight, and are in some degree their own refutation.

If M. Baur had more experience of planting matters, he would know that no one interested in the industry can afford for one moment to "overlook" the "subject of cheap production." It goes without saying that it is a subject constantly in our thoughts.

Should any one wish to read a short but clear exposition of the functions of the various micro-organisms engaged in building up the soil, I would suggest their perusing Dr. Aikman's article entitled "The Microbe in Agriculture" in the June number of the "Nineteenth Century." I see no reason why I should abandon the *non-de-plume* which I adopted for the express purpose of eliminating the personal element, as far as possible from the discussion. I have nothing to gain by advertising my name. I do not pose as an authority. M. Baur lays down the law publicly, and I take it that anyone in the crowd has a right to answer him.—Your obedient servant,

EX-PLANTER.

BY ORDER OF THE COMMITTEE.

C. Lombo, 29th July, 1898.

PLANTING NOTES.

PLANTING IN DUMBARA 34 YEARS AGO.—Mr. Edward Mortimer—one of the oldest planters left at work in Ceylon writes:—"I was much interested in reading your account of 'old Raja.' I raised the tea in nursery and planted out the plants you refer to, as supplies amongst the coffee about the year 1864. The tea bushes were about 1½ foot high on my handing over charge to my successor. I was sorry he spoilt the leaf and did not turn out a better sample of tea, but I suppose he was not at fault. (In those days we were all young hands and how very few know in Ceylon the process of manufacturing tea.) The tea seed was from Assam and it grew up to be lovely plants and made a fine show in the nursery."

COFFEE IN TRANSVAAL.—They are going ahead with coffee-planting in the Transvaal. The Cape Times says:—"It appears that the entire Eastern part of the Transvaal, from Spelonken in the north to Vryheid in the south, contains tracts of ground particularly suitable for the cultivation of coffee. The coffee plant must be sheltered and the chain of mountains from north to south through the eastern half of the Transvaal affords that shelter. The equatorial current from the Indian Ocean and the other ocean currents blowing in a southerly direction through the Mozambique Channel have a beneficial influence upon the cultivation. Right up, in the north in Servaa's country, many farmers grow their own coffee. One farm in the Lydenburg district in Water-vallei, on the slopes of Spitzkop and the Secoenie's Mountains coffee has been cultivated with success. Coffee from the district exhibited in the Vryheid Show in 1896 was judged to be of excellent quality. The plant appears to grow best in a loose, sandy soil of a reddish colour. It must be sheltered against wind and frost. Twenty-five years ago a farmer named Gysbert van Rooyen, grew not only his own coffee, but his sugar.

## "BARREN SOILS."

**I**n an article on the sources of plant food, and particularly of nitrogen, written by us for the Magazine some years ago, we drew attention to the fact of many plants which are characteristic of almost purely silicious soils, thriving with apparently no adequate supply of nitrogenous food, and went on to indicate the likely sources of such plant food in the case of these plants.

In his Report on the Agriculture of Zanzibar for last year, the Director, referring to "Soils" remarks that the soils over the cultivated portions of the Island are of a very light sandy character. A sample of this kind of soil was sent to Dr. Voelcker, the Consulting Chemist to the Royal Agricultural Society of England, who reported on it as follows:—

	Dried at 212° F.
* Organic matter and loss on heating	... 3.83
Oxide of iron	... 2.28
Alumina	... 5.34
Lime	... .23
Magnesia	... .33
Potash	... .15
Soda	... .07
Phosphoric acid	... .05
Sulphuric acid	... .02
Insoluble silicates and sand	... 87.00

100.00

\* Containing nitrogen 0.09.

"The Soil is one of a light loamy to sandy nature. Judging its composition by the foregoing analytical figures, it will be seen it is one of a miserably poor character, and has every evidence of being a thoroughly exhausted Soil, so that apart from the objection you mention, as existing in the pan of hard sand, there is so little fertility in the Soil that I am not surprised to hear that the cloves grown on it are unproductive.

"The Soil has in the first place a deficiency of vegetable matter and is very poor in Nitrogen. Next there is very little Lime present, only a small portion of Potash, while in Phosphoric acid in particular there is a most marked deficiency. In brief, in all the constituents which are needed to make a Soil fertile, this one is exceptionally deficient, and the Soil is clearly quite impoverished. It seems to me, indeed, a question whether such a soil would bear the cost of any large outlay in manuring of an artificial nature. The existence of the 'pan' of which you speak must be always detrimental and, unless this can be broken up by cultivation, it would be waste to spend much in manures upon it. Moreover, what the Soil needs, rather than artificial manuring, is the liberal application of bulky materials, such as cattle manure; leaf and similar refuse of a vegetable nature; wood ashes; anything in short which will give the Soil better texture and more substance."

On the Director pointing out that the Soil in question produced, as a rule, vegetation of a luxuriant character, and suggested that this might be accounted for by the abundant and

well-balanced supply of sun and rain, Dr. Voelker replied:—

"I note with interest what you say with regard to crop production under favourable climatic conditions, although a soil may be intrinsically poor. I was much struck by the same fact when a few years ago in India, and it is very evident that these conditions must have a most marked influence in enabling crops to provide themselves with food. There can be no doubt I think that under such conditions, what food supplies there are in the soil become more quickly available than where we have such a climate and physical conditions of soil to deal with as are met with in England."

These observations of Dr. Voelker are very interesting and bear out our own remarks, which have appeared in the pages of the Magazine, with reference to the "Cinnamon sands" of Ceylon and the characteristic—and comparatively luxuriant—vegetation found on them. Considering the nature of these soils, which do not even possess the slight loamy character which the Zanzibar soils are said to have, it cannot be doubted, as Dr. Voelker remarks, that our tropical conditions are peculiarly favourable to the availability of plant food, a circumstance which would place analyses of tropical soils in a different light from that in which analyses of soils generally, and particularly in the case of soils in temperate climes are read. Indeed, it would appear that we must attach a distinct signification to the analyses of "tropical soils," owing to the important part played by sun and rain in the tropics, and any ordinary comparison between soils in the tropics and in temperate climes cannot be considered a fair one. We have had visitors to the school enquiring in their innocence what was the "white stuff" we strewed over our soil in the areas lately reclaimed from cinnamon jungle, so misleading is the appearance of the surface soil, particularly during the dry months, when it is so blanched as to resemble a sheet of snow. And yet we find Cinnamon, Dawata (*Carallia integerrima*), Dan (*Eugenia Jambolana*) and *E. Cary ophylla*, Cashew (*Anacardium occidentale*) and other forms of vegetation undoubtedly flourishing in this barren waste. There is, however, one point to be noted in the growth found on the Cinnamon sand, and that is, that the vegetation is of a deep-rooted character, while natural surface growth is very sparse and generally found loosely rooted in parts where some organic matter has found a lodgement. So that although the character of the top soil is such as to make one wonder that the land carries any form of vegetation, the sub-soil in which the deeper roots ramify is apparently of a better character, and with the aid of sun and rain, and particularly, as we are inclined to think, of the supply of nitrogen compounds (for the formation of which we have specially favourable conditions in the tropics) brought down by the rain, is able to sustain the vitality of the trees found growing on cinnamon sand.

In an interesting article on the Barren Soils of Ceylon in the *Tropical Agriculturist* of September, 1890, the Editor considers the possibility of improving their fertility.

Greatest amount of rainfall in any 24 hours on the 3rd instant, 4.38 inches.

Mean rainfall for the month '43.

Recorded by D. L. DIAS.

OCCASIONAL NOTES.

We are indebted to Mr. J. Ferguson for a handsome map on rollers, representing the planting districts of the Island and showing the areas under different forms of cultivation. This up-to-date map will form a valuable addition to the School of Agriculture reading-room.

At the request of a correspondent we publish some notes on the cultivation of the Castor Oil plant, for which we are indebted to Dr. Nicholls.

We are glad to announce that there is a prospect of Annual Agricultural Shows being held. We have always been advocates of such Shows, and we note with pleasure the passing of the following resolutions at the final meeting of the Committee of the late Fruit and Flower Show, held on the 9th of July:—(1) That the members present do form themselves into a Standing Committee for the purpose of reviving the Agri-Horticultural Society of Colombo, with the object of holding annual fruit and flower shows, and from time to time larger agri-horticultural shows, at which all products of the Island might be suitably represented. (2) That an invitation be sent to all the members of the late Agri-Horticultural Society, and of the Committee of the late Fruit and Flower Show asking them to join the Society—paying an annual subscription of Rs5.00 from 1899—and requesting them to attend a meeting to be held at the School of Agriculture on Saturday, the 6th of August next, at 7-30 a.m., for the purpose of electing a permanent Committee, a President, and other office-bearers, and to make rules."

Those who have Ceara rubber (*Mainhot Glaziovii*) growing in their gardens should be careful that cattle do not get at the leaves, as we have seen fatal effects resulting from a cow and calf eating the foliage. Another plant we often see

growing as a weed in gardens is the *Datura* which, as is well known, is also poisonous to stock.

We understand that it is intended in future not to sell the Government Dairy calves, as usual, by public auction in Colombo, but to offer them for sale at provincial towns situated in the remoter districts. We doubt if this plan will work successfully, for as far as the Government Dairy is concerned it will be a disadvantage. In Colombo the highest values are naturally realized for stock, so that the Dairy as a commercial concern will not gain anything by taking the risks of conveying its cattle to great distances and exposing them for sale in places where it is not to be expected that there will be very keen competition. According to present arrangements the sales are held in Colombo at seasons when most people of any standing in the provinces are in the capital, while those who are unable to be present can always depute the auctioneer or some other agent to make purchases for them as is commonly done. It is not to be expected either that the smaller native cattle owners will purchase Sind calves and keep them for a couple of years to be afterwards used for breeding purposes. Take Kurunegala, for instance, where it is intended to hold the first sale. The best known stock owners in this district have found it convenient to make their purchases in Colombo. The new arrangement proposed would, we suppose, be welcomed by these gentlemen who would get their Sind stock brought to their very doors and made available to them at prices that with no doubt be lower than what they have hitherto paid.

As we said before, it is the more wealthy cattle owners who will purchase Dairy cattle, and they can, however far away they may be, arrange to purchase their cattle in Colombo; indeed, Sind animals are now found in Negombo, Chilaw, Henaratgoda, Kurunegala, Veyangoda, Matale, Lindula, Ohiya, as well as in the Southern Province.

The solution of the problem under present conditions in Ceylon is for Government to purchase the calves from the Dairy whenever an auction sale is held, and supply them to the Agents of Provinces to be used for the benefit of the locality, or Government might authorize the Revenue Officers to purchase one or more bulls, each to be kept for the use of the poorer cattle owner in the provinces. By this plan the Dairy as a commercial concern will not suffer, and the proper parties will be benefitted by having some means of improving their stock provided for them.

Referring to an advertisement to supply bread-fruit plants from Ceylon, the *Queensland Agricultural Journal* says: "So it would seem that the bread-fruit has found its way to the west of us, and is being turned into capital," as though its introduction is something comparatively new, when indeed the tree is one of the commonest found in gardens and has been long naturalized in the Island.

Specimens of the common cattle tick of Ceylon have been sent to Queensland, and it has been found that the parasite is identical with the Australian tick which causes so much trouble there. A tick

found on Ceylon goats is said to be new to Australia. The usual treatment for ticks is applying a solution of coconut oil and salt (unrefined salt being generally used) and washing the cattle afterwards.

We have seen an excellent sample of plantain flour made by the head clerk of the Anuradhapura Kachcheri. As the fruit grows well in the N-C. Province and means of transport is difficult, it would be a good thing if the flour could be manufactured so as to make it a paying business. Specimens of the flour have been sent to England, America and the Continent for information as to the market for the product, with reference to which we shall have more to say in a future issue.

#### MILKING EXPERIMENTS.

Much diversity of opinion exists amongst experts as to the intervals that should elapse between milkings to secure the richest results. It is asserted, too, that the hours at which cows are milked exercise an influence not only on the quantity, but on the quality of the milk—its richness in fat. Some recent experiments made in France show that the longer the interval between the milkings the more the fat in the milk diminishes. When a cow is milked three times a day, the milk of the morning is always less rich in fatty matters than that of the midday and evening milkings. This upsets the idea which many possess that the longer the interval the richer the milk; in fact, it is quite the reverse. The result of milking trials almost invariably indicate that the butter fat ratio is greater in evening milk than it is in the morning supply; and there is always a longer interval between the evening and the morning operation than between the morning and evening. It seems, also, that the more equal the intervals the better it is. A German breeder has ascertained that with two milkings per day 33 lbs. of milk were required to make 1 lb. of butter, but that when the milk was taken from the cow in three operations, extending equally over the day, a similar quantity of butter could be made from 28½ lbs. of milk. The difference is found to be less striking, however, with newly-calved cows than those which have been in profit for a more or less longer period. It is, therefore, advisable to replace the two milkings by three if the best quality milk is required. Of course, it will be necessary to see that the animals have plenty of good and suitable food if they are expected to yield more and better milk. There is another advantage in frequent milking; it gives ease to the cows, more especially when they are naturally heavy milkers; and further, it tends to develop the dairy propensities in young cattle, and predisposes their offspring to a greater secretion of milk and becoming higher class dairy stock.

#### GREEN RUBBER.

From the *Tropenpflanzer* (Organ des Kolonial-wirtschaftlichen Komitees, Berlin) we take the following note on "Green Rubber":—Much has already been written on the extraction of gutta-

percha from the leaves of the tree by the Rigoles method, and only lately this invention was represented in a very bad light by many publications, whilst previously optimistic opinions prevailed on the other side. Who is right, time must show. But meanwhile the fact remains that the product by this method is placed on the market in quantity and offered to the manufacturers. In the United States shipments made some months ago were favourably received.

In Europe, the well-known firm of H. P. Moorhouse, Paris, undertook the sale of green gutta-percha. This firm reports:—Green gutta-percha is the extract of the leaves of the *Isandra*, a tree which hitherto has yielded the rubber of commerce by tapping or by felling. The product has the advantage:—1. Of guaranteeing a constant equal quality to the purchaser. 2. The work of cleaning, which increases the price from 15 to 20 per cent, is entirely done away with. In addition, the material combines the same properties of ordinary rubber with an exceedingly great solidity and elasticity, which must necessarily tend to strengthen and extend the use of the material.

The green colour, which results from the chlorophyll contained in the leaves, can easily be altered or done away with by ordinary chemical process. As it is very plastic and yet very solid, the green rubber can be bent and twisted at will, without breaking. It can be rolled into very thin plates; it gives the most exact and delicate impressions, and withstands the action of water as well as that of the sharpest acids. Even after it has been used and broken up, it still represents a value of about 25 per cent. of the cost price.

The French Telegraph Directory, in order to obtain an authoritative opinion on the product, has employed the new rubber for the repair of deep-sea cables, and experiments made with the most sensitive apparatus have established the fact that, as far as capacity and insulation are concerned, the rubber extracted from the leaves gave better results than were obtained with other first-class rubber. The green rubber works up either when pure or mixed, as in the case of the ordinary crude material, with the only difference that, on account of its purity and homogeneity, exceeding care has to be taken in working it, and this has to be done at a somewhat higher temperature—100 degrees to 120 degrees Réaumur (257° F.)

#### WHITE-ANTS AS AGRICULTURAL PESTS.

The extermination of white-ants as plant pests is still an unsolved problem, the statement frequently made that the ants only attack plants after they have been killed by or are very nearly dead from other causes is as proved by the experiments referred to below, unwarranted, we and have always taken the opportunity, from our own experience, of contradicting the statement. We have heard of bi-chloride of mercury (corrosive sublimate) being used with success against the pest, while we have ourselves employed Paris Green with satisfactory results. Both these remedies are of course used in the form of solutions and employed against the pest when not closely associated with plants. It is a question whether the insecticides referred to can be made of sufficient strength to destroy

the pest when found on young plants, and at the same time not to injure the plants themselves. In the *Indian Agricultural Ledger*, No. 18, of Entomological Series No. 7 appears the following note from the Settlement Officer, Balaghat, to the Commissioner of Agriculture, Central Provinces:—

White-ants are specially fond of young mango trees. In some villages repeated efforts to make a mango grove have failed on account of the roots of the young trees being attacked by white-ants. I once doubted this fact and was disposed to believe that in those villages the people were unusually negligent in watering the saplings, and that first the trees died of thirst and then the white-ants devoured the dead wood, as is their ordinary practice. A scientific forester had told me that white-ants attacked only dead wood, and hence my scepticism as to the statements of the villagers; but I am now convinced that the saplings in many cases die of white-ants and not of other causes, that the attacks of the white-ants on the roots are the cause and not the effect of the trees drying up.

The cause that led me to this perception of the truth is that I have attempted to raise a row of half a dozen mango trees close behind my bungalow, and I have had a number of the saplings die, they being in most cases attacked by white-ants. I have dug up three of the trees in different stages of the white ant disease. One of the plants was almost dead, and it would have been difficult to prove that the white-ants were not scavengers, removing useless dry wood. Another tree was half-dend, and the theory that exonerates the white-ant from the charge of devouring living timber could only be maintained by crediting the termite with a marvellously accurate prophetic instinct that told the scavenger which of the trees were already doomed to die and might be removed as useless, for the tree was not yet dead but only likely to die shortly. In the third case the tree still looked quite green, save for a suspicion of unhealthiness about some of its leaves, and on digging it up I found that its roots had been eaten through in places by white-ants, and that a detachment of the voracious termites was actually pushing its way up the heart of the sapling, eating its path through perfectly good, juicy wood. The sight of a channel about  $\frac{1}{4}$ th of an inch wide thus eaten out up the very centre of a sapling appeared to me to be conclusive proof that the mango tree was dying from the attacks of white-ants pure and simple, and that the theory I had heard put forth in the name of science by a Forest Officer was untenable. That theory appears to me to confuse two cases: (1) that in which white-ants attack young trees a few feet high, eating out the heart of the tree, full of sap though it is, and doing their work of destruction unseen below the surface, and (2), that in which white-ants ascend the *outside* of a tree in search presumably, of dead branches on top. The attacks of the first of the above kinds are not confined to young trees. I have found fields of *tur* in which a number of the plants have withered owing to the roots being eaten by white-ants, and in grain-fields also I have had similar damage pointed out to me.

If, then, it be considered as proved that white-ants do considerable damage to horticulture by attacking the roots of living trees, the question of finding some preventative against their ravages

becomes one of practical importance. I have made enquiries as to remedies against the attacks of termites, and found that the popular preventatives are numerous and not usually efficacious.

The cultivator starts with the belief that the white-ants have a delicate sense of taste or smell; and exercise their ingenuity in inventing nauseous mixtures with which to water the suffering plant. Water in which fish has been allowed to decompose is believed to be almost as strong in efficacy as in stench. Solutions of salt or tobacco are about the most popular remedies. The *al* dye I have heard of in this connection, but it is not thus used locally. The burying of *gur* in a hole near the tree in the hope that black ants will be attracted thereby and will incidentally eat up the white-ant colony, has been put forward by villagers. I have also been told to utilize the fact that bears are greedy eaters of white-ants, and to soak a bear skin in water and put the termites to flight by applying the resulting liquor highly impregnated with the smell or taste of their enemies' skin.

None of these proposals are believed in very much by the people. I have myself tried a decoction of salt and tobacco with some effect, but the young trees are not thriving on the diet any more than the white-ant is. The question of finding a cheap and efficacious remedy is, I submit, worth an enquiry over a larger area than I have been able to arrange for.

#### THE TRINIDAD GOVERNMENT DAIRY FARM.

The Report on this Establishment which is always interesting to us from the fact that it was the Trinidad Farm which suggested the establishment of the local Government Dairy, is as usual a satisfactory one. The manager, Mr. Meaden, states at the outset that the demand for milk from the various institutions has steadily increased during the past three years and has been well fulfilled. The produce for the year was 131,285 quarts: an average of 360 quarts was issued daily, and 55 cows were milked. This is certainly a satisfactory record. The losses by death during the year under review (1897) were, an imported Red Poll Bull, a shorthorn bull, two other bulls, 7 calves and 3 cows, making a loss—somewhat larger than usual we are told—of 14 animals in all.

The Manager considers that the eating of earth by young calves—a common experience in all dairies—is probably due to an insufficiency of saline matter, but though the animals have salt now placed before them each evening in an open trough, Mr. Meaden is not able to say that this is a preventative.

As an instance of the influence of the sire, it is mentioned that a  $\frac{3}{4}$ -bred zebu heifer with well-developed hump and ample horns produced a hornless calf to the polled bull. Mr. Meaden states that a start has been made in the special treatment of the herd to cultivate the milking qualities of cows or heifers under different conditions of feeding, shelter, &c., a departure that may well be followed in our own dairy, where we should also like to see some trials in crossing with approved European breeds and our Sind stock carried out.

Mr. Meaden points out that all English stock should be introduced to a tropical Colony such as Trinidad as early as possible. Experience has shown that pure-bred European animals do not thrive satisfactorily in Colombo, but half-bred animals from up-country have, when mated with Indian cattle produced excellent milkers and regular breeders. We should like to see a country-bred shorthorn or Jersey bull introduced among the Sind cows for a short period as a trial, or an arrangement by which a number of heifers could be made to visit a good pure bred bull upcountry. The progeny of the half-English sire that was kept two years ago were, as a rule, unsatisfactory animals; no doubt from the fact of the bull being rather too old for breeding purposes.

Regarding di-horning we read: "All the heifer calves born during the year have been dishorned, the process adopted being almost painless. The button was scraped, but it assumed an inflamed appearance, and then was rubbed with stick caustic potash. The operation was generally effectual the first time. The immense horns of our cows are a nuisance and a source of danger to the cows themselves, as they frequently inflict injury on each other; besides, dishorning makes them more docile, a fact that must weigh a great deal in managing part-bred zebu cattle. The red poll was introduced with a view to bringing down the horns by a natural process, but this would take years to effect. The artificial process is immediate in its results."

Another method of treatment for dishorning is by making cross incisions in the button and inserting a small piece of stick caustic potash. The stock constituting the dairy herd in Trinidad are as indicated a cross breed between English and zebu cattle (the humped cattle of India, but of what particular breed or from what part of the Indian Empire we have not been able to gather). Some weeks ago a good deal of surprise was evinced at the announcement that native Sinhalese cattle were wanted for Trinidad. The inference naturally was that the stock were required in connection with the dairy operations, and that possibly a mistake was made in asking for Sinhalese cattle instead of those of the Sind breed (kept in the Ceylon dairy) whose reputation as dairy stock might have reached the West Indies. But a letter to the Editor of the *Ceylon Observer* from the Manager of the Trinidad Stock Farm explained the misconception, for the Sinhalese stock were wanted as being small and cheap draught animals suited to the requirements of the peasants. An enquiry for these animals for draught purposes in connection with Municipal work came some time ago from Mauritius, so that there is a likelihood of these hardy little creatures being found as colonists in other lands in the near future.

#### THE VALUE OF ASHES AND CHARCOAL.

Ashes are now largely used in connection with the cultivation of coconuts, and the good results attending its use are well known to most coconut planters, but Mr. R. Harding, Curator, Botanic Gardens, Toowoomba, proves so well the value of

both ashes and charcoal in an article contributed by him to an Australian exchange, that we quote it for the benefit of those who are inclined to look with contempt on these simple fertilizers:—

Long observation and study, together with the intimate practical experience acquired over a long term of years of close association with plants introduced into this colony will probably give some weight to the remarks here made on ashes and charcoal, as I have found them the most natural, and in all respects the most economical, manures that can be applied to all plants, especially when they are so near at hand, but yet are allowed to go to waste. These, when used as fertilisers, not infrequently produce a greater increase of crop than their chemical composition promised; and this is all the more remarkable because the opposite is usually the case with fertilisers. The ashes contain all the mineral parts of the wood, and, as not much nitrogen is required, the ashes alone are sufficient. Suppose we were to burn an apple-tree, what is left? Ashes certainly; and as 50 lb. of these ashes contain 4 lb. of potash, this must have been the substance most largely taken from the soil by the tree. Apparently the potash in the ashes increases the production of available plant food in the soil by inducing or stimulating chemical action. This potash is a constituent of every plant, although some plants require a great deal more than others. The power of the potash in ashes to liberate nitrogen from humus is well known, and this action in making available the nitrogen in the soil is strikingly shown when land recently cleared of timber is put into crop. Wherever a heap of logs or brush has been burned, the vegetation is rank and luxuriant.

In the raising of trees and shrubs, my seed beds consist of ashes and charcoal, except a small amount of good soil on top for the seeds to germinate in and for absorbing the water, as it would be impossible to get the water to enter the ashes; and I notice that immediately the young roots get a firm hold of the ashes they make tremendous growth, and also find that the application of these ashes to the soil improves its capillarity, and therefore gives to the plants more moisture, increases the woody growth, and in all pot plants it gives the greatest satisfaction.

In a ton of ashes there should be about 140 lb. of potash in a form most readily available by the roots of plants, besides sufficient phosphoric acid and a small quantity of nitrogen, and the inorganic matter in the ash of a plant gives strength to the plants and enables them to give large produce. But some soils have sufficient potash only in a dormant state; then a little lime will make it active. For instance, recently a lucerne crop on Talgai Station became less each year, and at last it was nearly covered with weeds. In the dry weather the manager decided to burn these off previous to ploughing. After this was done (the burning), rain set in, and in one week after the fire the crop showed signs of being as good as it was in the first or second season after sowing. I think the ashes did that, because if we were to burn 2 tons of clover hay we would have a large quantity of ashes, and this is what it contains:—Potash, 52 lb.; soda, 7 lb.; magnesia, 35 lb.; lime, 111 lb.; phosphoric acid, 20 lb.; silica, 10 lb.; and common salt, 3 lb.

To show that the ashes are also good for the orchard, we will take the orange-tree as an example. A ton of oranges removes from the soil 100 lb. of mineral matter, and 30 lb. of this is potash. We will say that an average crop of full-grown trees will be about 10 tons per acre, and we have thus a removal from the soil of about 1,000 lb. of mineral matter per acre per annum by an orange crop. This may go on for ten years, and not a single particle of these ingredients is returned except what Nature returns by an occasional crop of weeds; and still many wonder why their orchards become exhausted. But how many take into account the necessity for their growth? And as the largest proportion of the residue of the orange-tree is phosphate of lime, the value of ashes to this tree cannot be over-estimated.

All kinds of fruit abound in potash, more especially in their seeds, and lack of potash in available form for use is probably one reason why fruit does not perfect itself as it used to do.

In growing grapes in Europe, they use no fertilisers excepting potash made by burning clippings from vine and twigs cut in the pruning of trees, and it was part of my duty, when a boy, to assist in doing this. In France this is done extensively. It is probably true that a dressing of unleached ashes applied in the spring will make the fruit ripen earlier and attain higher colour and perfection. It may be a lack of potash that causes fruit at midsummer to remain several days without change. This is particularly noticeable in grapes when the vines have set more fruit than they can perfect. In such cases mildew often sets in, and the fruit never matures. Potash aids not only in perfecting the seed, but in that mysterious process which changes the acid astringent green fruit to the wholesome lusciousness that the same fruit attains when ripe. Whatever of sweetness the fruit has, it receives through the leaves, but cannot do so unless there is soluble potash to be taken up by the roots from the soil. The lime in the ashes tends to make the plant food already in the soil available, and is essential to plant growth, also for decomposing vegetable matter in the soil.

With the ashes there is always a certain amount of charcoal; therefore what the ashes are deficient in, the charcoal provides. Charcoal which is frequently used as a manure, does not act as such by changing into carbonic acid. Its effects are solely owing to the property which it has of retaining large quantities of various gases in its pores. Fresh burnt charcoal will absorb ammonia to ninety times its own volume. It also absorbs hydrochloric acid, sulphuric acid, hydrogen, carbonic acid, oxygen, nitrogen. Ammonia, from its being the great source from which plants derive nitrogen, is one of the most important components of manure, and this ammonia is a colourless gas with a pungent smell, such as we meet with on opening the stable-doors, also when cleaning the manure from the pig-styes. Charcoal forms a valuable auxiliary to all manures, and when applied to the soil alone has great fertilising properties, and it also renders the soil to which it is applied in any considerable quantity lighter and more friable.

In using charcoal, I make a large quantity of strong liquid manure, and into this is put the dry charcoal. When well soaked, it is taken out and

dried. It can then be used as required. In re-potting plants I simply put a little of this in the bottoms of the pots, and as soon as the roots reach it, the effects can be immediately seen. Being in a dry state, there is no smell while using the charcoal. I also use this in a powder to the soil to darken and enrich the flowers of dahlias, petunias, roses and other flowers, and the foliage of all is improved by the use of this, combined with wood ashes.

I think it would be advisable for every one to preserve all the ashes they possibly can in a dry condition and distribute them over the roots of the trees in the orchard and also in the garden. If the soil has been roughly dug, the ashes may be scattered on the surface each day they are collected. It would not be amiss to utilize the ashes in this direction all the year round, since the trees will be benefitted thereby. They do their work slowly but surely, and this I have proved by experience.

#### NATURAL INCUBATION AND THE DEVELOPMENT OF THE CHICK.

This is a subject which is little understood even by those who make a business of poultry-keeping, and we therefore take over for the benefit of our readers, an extract dealing with the subject from an article on Incubators and Incubation contributed by Mr. J. McCue to the last number of N.S.W. *Agricultural Gazette*:—

All hens at one time possessed the natural desire to incubate, but a long course of selection by poultry breeders has eradicated it in some breeds, *i.e.*, Hamburgs, Leghorns, &c., which now rarely have a desire to incubate. A hen, if left to itself, will prepare a shallow nest for her eggs, let her be a sitter or non-sitter. The non-sitter will go on laying, but will seldom show the maternal propensities by sitting on her eggs. The sitter, after preparing her nest, will at some time during the laying period settle down to incubate her eggs.

When a hen is broody the plexus of the organ of incubation is developed. This consists of a number of arteries ramifying beneath the integument of the abdomen, which form by their union a rich network of vessels which becomes truly extraordinary during hatching. Through these arteries the warm blood is brought to the surface of the abdomen, nearest the eggs, bringing the temperature of the eggs nearly to that of the fowl.

After the hen has become properly broody and prepared herself she sits on the eggs, more or less constantly for twenty-one days, turning and moving the eggs from time to time about in the nest, to assist the development of the chick and for her own comfort. The number of times that a hen leaves her nest depends on the weather, if and she is fed or is compelled to find her own food. If the weather is hot she leaves the nest more often, dusts and cools herself more often; if the weather be very warm during the last three or four days of the hatch many chicks will be found dead in the shell. Just before the chick breaks the shell the eggs sweat; after the chick comes into the world it at first sweats profusely—is very sensitive to

cold at this time, and nestles close under the mother for warmth.

As most poultry-breeders know, all fertilised eggs have the germ of life when laid, and it remains in a kind of dormant state if the temperature is not allowed to reach 70 or 80 degrees. Dr. W. H. Ransom, who has investigated with great care, says: "That the unfertilised ovum or egg continues, for a time, to undergo changes similar to those which the fertilised egg undergoes; but that these changes, becoming languid and incomplete, are finally arrested by decomposition."

The yolk of an egg is enclosed with a thin skin called the *vitelline membrane*, *viz.*, a transparent and flimsy membrane. On the upper surface of the yolk, and immediately under this membrane, will be found a little semi-opaque spot; this is the germ-spot or *blastoderm*. During the passage of the egg along the oviduct of the fowl, it is in a temperature of 105 to 110 degrees, and the germ undergoes important changes during its passage down the oviduct.

From the germ of every egg a narrow passage runs to a small chamber in the centre of the yolk. As the yolk matures, the ovisac becomes thinner, especially around its greatest diameter. Around this diameter, when the yolk is almost matured, a belt—*stigma*—appears. Then fecundation takes place, the sac ruptures at the stigma, and the fertilised yolk, covered with a thin substance, is received by the funnel-shaped opening of the oviduct, or egg passage. On its way through this passage, the yolk becomes enveloped in a white fluid—albumen. This is secreted by the mucous membrane of the oviduct, and is added layer by layer as the egg passes on.

The albumen of the egg forms the chief nourishment of the chick, being absorbed very fast by the little embryo; it also gives room to the fast-growing animal. Albumen, being a bad conductor of heat and cold, guards the germ-life in the hatching eggs against chills, which may occur when a hen leaves her nest for food, &c. It also preserves the yolk and germ from sudden shocks or injury. Besides the ordinary albumen, there are two cords, or strings, of a slightly fibrous albumen found; these strings, called the *chalazæ*, are spiral-shaped and fastened to the yolk—one at the air-bubble end, the other to the small end of the egg. These two cords act as balance-weights to the yolk, keeping the germ uppermost, where it can best receive the heat to incubate it.

After an egg has been incubated for a short time, the germ-spot enlarges by the development of small vessels, which spread until they almost cover the yolk. From the germ-spot a flask-shaped tube proceeds to the centre of the yolk. During the growth of the embryo, many chemical and physical changes happen; blood-vessels appear about the third day in the membrane that lines the shell, and this being porous, admits the air necessary to aerate the blood. The air-bubble at the larger end of the egg becomes larger by the evaporation of the water from the albumen through the pores, and the consequent influx of air to take its place.

The chick, until nearly developed, is encased in a thin skin, or membrane, which is broken by the beak of the chick on the nineteenth day. The chick begins to use its lungs for the first time by using the air in the much enlarged air-bubble. At

this time the chick occupies the smallest space in the egg, the air-bubble taking up about one-third of the egg-space. When the air-bubble is broken, the chick commences its struggles to leave the shell, and in its efforts gradually works itself up to top of the egg till it fills the whole space. This gives it more room, and liberty to move around. After the chick begins to use its lungs, it can be heard (if the egg is held close to the air) "puffing" and struggling for several minutes. The chipping of the shell is done by the beak, which has a small, hard, horny tip on it. Owing to the position of the head and beak, this horny tip comes in direct contact with the shell. The "chip" at the first is a small star-like fracture; after this the chick works itself round in the shell, at the same time cutting off the upper portion of the egg. After the chick escapes from the egg he rests for some time, to gain strength and prepare himself to be able to follow his parent.

Chicks vary considerably in the time they take to free themselves from the egg. Much depends on the moisture in the egg, strength of chick, and thickness of the shell. Three to twelve hours is about the usual time taken. Just before the chick leaves the shell it should have absorbed into the abdomen all the unused yolk, which is its natural food for twenty-four or thirty hours. If chicks leave the shell before the whole of the yolk is properly absorbed, they will, in nine cases out of ten, die.

Many things cause chicks to die in the shell. Some die from want of stamina or constitution, often hereditary or brought on by impure air. Of course some chicks die in the shell through over-exercion in trying to extricate themselves from the egg. The chick, just before leaving the shell, draws its head from under its wing—where it had been folded,—stretches out its neck, and rests after its labours, then a few more struggles, and it leaves the egg.

The chick comes out of the egg covered with wet downy feathers; these feathers possess innumerable minute branchlets, enclosed in delicate tubes. As the chick dries the tubes split, the branchlets open out and spread by their own elasticity, covering the little chick with its first coat of soft down:

#### THE USES OF WOOD.

(Continued from page 108, Vol. IX.)

14. Distillation of wood furnishes charcoal to the smithy or furnace, vinegar to the table, alcohol to the artisan, creosote to the wood preserver, gas for fuel and light, tar for roof boards, and pyroligneous oxalic, acetic, and other acids, as well as acetone, paraffin, naphthalin, etc. to the manufacturing chemist, and, by a slight variation of the process, lampblack to the printer and painter.

Wood also differs from the metals in several other respects. It is not fusible, it cannot be cast; hence, to duplicate a form in wood requires the same amount of effort as did the original. Changed into pulp, and still more into cellulose, this drawback is largely overcome. Wood cannot be welded, though, as stated before, this is more than compensated by gluing; nevertheless, an end-to-end.

junction of the kind produced in iron cannot be effected.

Wood cannot be rolled; it must be cut into shape; but owing to its softness and cleavability this requires incomparably less effort and equipment than the rolling of metals.

Wood is hygroscopic; it contains water under all ordinary conditions, and the amount so contained varies with external conditions and with it the dimension of the piece. Though an advantage in a barrel or tube, by making it more secure against leakage, this peculiarity of wood is nevertheless a drawback not belonging to the metals, but corresponding to the drawback in the use of metals occasioned by their annoying expansion and contraction due to change of temperature. Wood decays, iron and steel oxidize or rust. Both are serious drawbacks to the use of these materials, but since decay depends on living organisms, whose multiplication is sometimes extremely rapid, at other times almost imperceptible, varying with the conditions of the wood (moisture, temperature, etc.), the decay of woods is generally more damaging than the oxidation of metals. Under water wood lasts longer than steel or iron.

#### WHEREIN THE WOODS DIFFER.

The properties which directly or indirectly lead the artisan to prefer a particular kind of wood for a special purpose may be grouped into—

- (1.) Mechanical properties, such as strength, toughness, stiffness, etc.
- (2.) Physical, such as weight and behaviour during and after seasoning.
- (3.) Chemical, such as colour, durability, and value as fuel.
- (4.) Structural, such as texture, beauty of pattern, and length of fibre.
- (5.) Biological, such as size, form and abundance.

#### MECHANICAL PROPERTIES.

Of these several groups, the mechanical properties naturally take precedence, and of these again toughness and stiffness are unquestionably the most important, so that even the most general classification of woods into "hard woods" and "not hard woods" (for this latter class, though by implication the conifers, has so far no name in this country) depends not at all on hardness as the word might suggest, but on toughness, the tough woods being the hard woods, the others the conifers. Since toughness is a combination of strength in several directions, the various forms of strength should be first considered separately.

When in use, wood usually breaks in bending, as in the case of an axe or fork handle, or else in shearing or splitting as seen in planks and boards, whether on the sidewalk or in the wagon body. Wood fails much more rarely in compression, though much exposed to this form of strain, and still less frequently in tension, since in this direction its resistance is enormous, and can, in ordinary articles, never be brought to fair trial.

Fundamentally, all strength of wood depends on four different forms of resistance, namely, the resistance to tension or lengthwise, separation of the fibre, resistance to compression lengthwise, resistance to compression sidewise, or to

collapse of fibre, and lateral adhesion of the fibres.

Where a stick of wood is tested, more of these forms of resistance can be isolated and tested separately, and in every kind of failure two or more are represented.

Since the strength of the fibres in adhesion is very much less than in tension and compression, adhesion enters into nearly every test as an important factor. Thus, if a piece of wood consisting of several fibres is tested in tension, the fibre would probably not break at all, but be merely pulled out, the failure, as far as they are concerned, being due to lack of adhesion and not to a lack of tensile strength. Every tension test presents numerous cases of this kind, the broken fibres presenting no even fracture, but being splintered and drawn out, especially if the wood is good.

In the same way when a piece of wood is compressed lengthwise, some fibres badly situated with regard to the action of the load collapse, or else crush into their neighbours, and immediately a breach develops into which fibre after fibre falls, the breach spreading from this point; and the whole mass of fibres, now no longer adhering in this plane, behave as a great number of separate fine strands—they "buckle," and the piece fails.

Bending is a compound test of compression on the upper (concave) side of the beam, and tension on the lower (convex), and numerically stands between these two, that is to say, if a stick breaks in bending, whether it break first on the upper side (in compression) or on the lower side (in tension), the bending strength, as commonly stated, is neither equal to the compression strength nor to the tension strength, but lies between the two. Here, as in the case cited, adhesion forms one of the factors, since at failure part of the rupture consists in a separation of fibres.

Shearing along the fibre is simply a test in adhesion, where the force acts in a line parallel to the fibre, and the values in shearing wherever tested agree with those of test in "transverse tension," as the test of adhesion may be termed.

#### THE CASTOR OIL PLANT.

This plant, known botanically as *Ricinus Communis*, is supposed to be native to India, though some authorities make it of African origin. It is now extensively cultivated in India, the southern States of America, and even the warmer parts of Europe. It stands wide ranges of climate, and in the tropics grows from sea-level to a height of 5,000 feet. In temperate climates (where it grows in the summer) it is an annual, but in the tropics it becomes a small perennial tree.

The best soil is a rich well-drained sandy or clayey loam; light loose sandy, and wet heavy soils are not suitable. The plant is said to improve the fertility of soils on which it is grown, but this is a mistaken idea as the seeds contain much nitrogen, potash and phosphoric acid, and thus heavy crops would remove considerable quantities of these substances from the soil. The plant has many roots which penetrate deeply, and, therefore, by their decay they would open channels for the penetration of the atmosphere,

and thus increase the valuable constituents of and add organic matter to the land, thereby temporarily increasing the available quantity of plant food, and so the error of imagining that the plant enriches the soil may be explained in this way.

Plants are propagated by seeds which are sown in the fields. The land is cleared and prepared in the usual way; deep tillage and subsequent harrowing being necessary to render the soil open and free, so that the roots can penetrate easily. Before sowing, hot water should be poured over the seeds, and they may, with advantage, be left to soak in the water for twenty-four hours. Then the seeds are planted at distances of six feet by six, or eight feet by eight, in good rich land. The best time for sowing is just before the rainy season commences. Four seeds should be planted in each hole, at the distance of six inches from each other; and, when the plants are from six to ten inches high, all but the strongest seedling should be pulled up. The seeds will usually germinate in about ten days, and the plant will grow rapidly, and commence to bear in four months from the time of sowing. The ground will have to be kept clear of weeds, and the plants may with advantage be moulded up occasionally. As the object of the planter is to produce trees with many fruit-bearing branches, it will be necessary to nip back the main stem when it is making too rapid growth, otherwise long lanky stems with few flowering spikes will result. The castor oil plant has few enemies, for most insects shun it; and for this reason it has been recommended in cases of insect blights on other plants, that castor oil bushes should be planted at intervals in the affected fields. In older plants, however, the bark of the stem becomes attacked with various insects, such as the scale blight, *Coccus*, and the mite, *Acarus*. Should these pests appear to injure the trees, they may be killed by applying lime wash or kerosine oil emulsion to the affected stems with a brush.

There are two principal kinds of castor oil seeds cultivated—the large and the small varieties. The large seeds yield from 25 to 30 per cent. of oil, but the oil is of an inferior quality, and it is used only for lighting and lubricating purposes. The small seeds give from 38 to 40 per cent. oil, which is of a finer quality, and this variety is the one from which the medicinal cold-drawn oil is obtained. The plants commence to bear at the fourth month, and the crops will become larger as the trees increase in size. In India, sometimes a yield of 15 lb. of seed is obtained from single trees; and in the United States it is reckoned that from fifteen to twenty-five bushels are got from an acre of land under castor seed cultivation. There is a ready sale for the cleaned seed in the American and European markets. In the United States, the seeds are sold by the bushel of 46 lb., and the produce may be shipped in bags or in barrels.

In harvesting, the spikes are gathered as soon as the capsules commence to turn brown; for, if they were left on the trees to ripen thoroughly, the crops would be lost as the capsules burst open suddenly with some force and scatter the seed to wide distances. The spikes, when cut off, are

carried to the drying house, or they may be exposed to the sun on barbecues. During the day the spikes are turned over with a rake once or twice, so as to allow the lower layers to receive the rays of the sun. In from three to four days all the capsules will have burst, and then the seeds may be cleaned from the husks and foreign matter by winnowing. Should rain come on whilst the spikes are exposed out of doors, they should be raked into heaps, and covered up with tarpaulins or boards. As the seeds "pop" to some distance it is usual to confine the drying-place by a board fence four or five feet high; but, if a clear space of twelve feet can be left outside the drying layer of capsules, this fence may be dispensed with. The spikes should be spread in a thin layer of not more than six inches in depth, for the thinner the layer the quicker will be the drying. The cold-drawn oil is made in Europe and the United States by several rather complicated processes requiring the aid of expensive machinery and skilled labour; but there is always a ready sale in the great northern markets for crude oil which is sometimes refined, and sometimes sold without further preparation for lubricating purposes. In India, the crude oil which is exported in large quantities is made in the following manner:—The seeds are broken between rollers set so that the outer hard covering is cracked off. The whitish kernels are then separated, placed in hempen cloths, and submitted to heavy pressure in powerful screw hydraulic presses. The oil which runs out is then boiled with water to separate the mucilage and albumen. The clean oil is finally drawn off, strained through flannel and put into tins, barrels, hogsheads and *dubbers* for exportation. A *dubber* is a globular leather barrel or bottle used by the natives of India to hold oils and such like.

A common oil is made in the West Indies, where the castor oil plant can scarcely be said to be cultivated, and is practically a weed—on a small scale in a simple way. The seeds are first stacked in an earthenware pan over the fire and then pounded in a mortar; the husks are sometimes removed and sometimes left, but their separation produces a better oil. The broken seeds are then tied in a linen bag and boiled with water in a large pot, and the oil is skimmed off as it rises to the surface. It is then strained and may be bleached by exposing it to the sun in clear glass bottles. In this way the seeds will yield at least a fourth by their weight of oil.

#### GENERAL ITEMS.

In an article on "Dehorning" contributed by Mr. P. R. Gordon to the *Queensland Agricultural Gazette*, the writer says:—But the most satisfactory and least painful process of dehorning is by the use of caustic potash on very young calves, the younger the better. Mr. J. C. Thompson, the late Principal of Hawkesbury Agricultural College, practised this mode of destroying the growth of the horns, and reported it as most successful. If the young horn has not made its appearance above the skin, it should be felt for by the fingers. The surrounding surface should be saturated with a little oil or grease to prevent injury from the caustic soda. With a portion

of a sponge or a piece of rag firmly tied on the end of a small stick, the "button" should be rubbed with the caustic soda, which will effectually stop further growth, and the animal grows up a "poley," a curly lock of hair taking the place of the horn. Complaints have been made as to the failure of this process as tried in this colony, but the failure must have been due to the caustic soda having been exposed to the air. It should be borne in mind that when caustic soda is exposed to the atmosphere, it loses its power as an aesccharotic, and therefore the air must be carefully excluded from it.

The experiments of Mr. H. A. Tardent of the Westbrook Experimental Farm] have been particularly successful as regards tomatoes, some of his specimens (of the crimson cushion variety) turning the scale at 20 oz. and measuring 15½ inches in circumference. The variety known as the new Peach is said to be the favourite. It is said that a handful of kainit spread round tomatoes when they have been planted out, keeps off the destructive cut worm.

The following comes from an American paper, and we give it for what it is worth:—"John Russell, of Seattle, Washington, is said to have discovered a process for preserving milk that will stagger the condensed milk people. Some samples have been kept for a year, and the milk has proved as fresh as when 'put up.' It is not condensed, nor is it preserved by the use of any additional preservative. It is, however, subjected to a process known only to the discoverer. Milk and cream are both prepared in the same way, and have the same taste, appearance, and properties of the fresh article. Samples have been submitted to Dr. Spencer the well-known bacteriologist, who is reported as having enthusiastically endorsed the milk as being pure and healthful. A factory has been erected, and the preserved milk is now being used in San Francisco, California. The possibilities of the discovery are described as being enormous; and while it may injure the business of the milkman near the large cities, it will be of the greatest benefit to the more remote dairies and the consumers. At Point Reyes, where the parent factory is located, farmers are offered 25 per cent. more for their milk than they could make by turning it into butter. The new process takes milk out of the list of perishable articles, and it is said that so cheap is the process that it can be practically sold at the same price as fresh milk. A family can get a dozen bottles, or a hundred for that matter, and keep them on hand ready to use at any time. It is expected that grocers will keep it on hand also, just as they do canned tomatoes or corn, as it can be handled just as safely and easily.

Mr. Geo. Warr, who is interesting himself in the cultivation of ramie fibre has contributed an interesting series of articles on the subject, bringing up all the latest and most reliable information with reference to the fibre in review. We understand that Mr. Warr intends republishing his account in pamphlet form, and we have no doubt it will be a valuable brochure which just at this time will be welcomed by local agriculturists.

*(Third Series.)*

FRANCIS RICHARD SABONADIÈRE, J.P.,

AND

WM. AUGUSTUS SABONADIÈRE, J.P.,

PLANTERS AND MERCHANTS :—1839—1891 ; AND 1845—1896.

THE BROTHERS SABONADIÈRE deserve to be put in the very forefront of the Pioneer Planters of Ceylon. Both began their career in the island at an unprecedentedly early age—as lads of only 16 years ; both (but especially

Frank) were among the very earliest batch of planters ; both earned general esteem by industrious, persevering and honourable careers ; and both clung to coffee as long as the industry had any return to make in Ceylon ; while, in Jamaica, William died, as he had begun life, a coffee planter. We had, personally, no idea until we began to utilise the dates and notes, kindly placed at our disposal by surviving relatives, that the planting careers of the Messrs. Sabonadière, offered such uniquely interesting lessons of self-dependence, perseverance and sterling character from the very beginning—and this beginning, dating from an age when lads are usually sent to a Public School, in place of being shipped off to try their fortune in a new and, then, almost unknown colony like Ceylon. We believe Robert Boyd Tytler was of the same age

when he left home for Jamaica, to learn the West Indian mode of cultivating coffee, before coming to Ceylon ; and it is interesting that there is this link of age between Pioneers who formed the advance-guard of so many Ceylon Planters, furnished by the North-Eastern Counties of Scotland and the Channel Islands. How the former came to be connected with Ceylon has often been explained. The influx from the Channel Islands began through the connection of the Bird (or Byrde) family, or rather of Colonel Byrde with residents in the islands, and this will come out very clearly as we proceed with our account of the Messrs. Sabonadière. Certainly, no Pioneers connected with Ceylon had a better right to induce a flow of young planters than the Messrs. Byrde, seeing that to them belongs the honour of forming the very first coffee plantation in Ceylon.

But to return to the subjects of our notice. We may be permitted first of all to say that the Sabonadières were a Huguenot family originally from Nîmes, in the South of France, where there are still residents—as a relative found out some years ago—spelling the name as Sabonadier without the final “e,” but who belong to the Roman Catholic

Church, and whose relationship to the descendants of the Huguenot branch is probably too distant to trace. Curiously enough, we may mention that the family (Durands) of the mother of the Messrs. Sabonadière, as also that of the wife (Portals) of Mr. Wm. Sabonadière, were of Huguenot descent. The father of the subjects of our paper was the Rev. C. C. A. M. L. J. A. Sabonadière, ordained of the Church of England, and a Pasteur in the Reformed Church of France, resident in the town of Meaux in the Department of Seine & Marne.\* His wife was Sophia, daughter of the Very Reverend Dean Durand of Peter Port, Guernsey. Here, in Meaux, were born Francis Richard Sabonadière, on 8th Feb. 1823 and (six years later almost to a day) William Augustus Sabonadière on 9th February 1829. Soon after the latter year, their father was transferred to Paris, and there Francis was educated at the Lycée, until his father's further transference to St. Quentin, where the latter died in 1838. Their mother then returned with her family to her old home, Guernsey, and her elder son, F. R., a lad of 15 at the time, could hardly speak a word of English. A notable physical defect in F. R. Sabonadière (big powerful frame as he eventually developed) was the absence of the right eye, and many in Ceylon, during his lifelong residence, thought this had occurred through some sporting accident. But it really dates from his early childhood, when during an attack of measles (at the age of 4) a nurse wrongly treated the inflammation of the eyes in poulticing, and this proved fatal to the right one. The incident is worth recording as showing under what disadvantages school work, and still more a Colonial and Planting life was begun. Mrs. Sabonadière, unable to make further provision for her son, bethought of her relative Capt. Bird (afterwards Colonel H. C. Byrde) in Ceylon, and it was to his care, young F. R. Sabonadière was consigned in 1839; and under whom he began his planting career, a lad of 16 years, on Black Forest Estate, Pussellawa, the property at the time of Capt. Cobbe, of the Ceylon Rifle Regiment. The salary allowed to the "sinna durai" (Assistant Superintendent) of that day was not more than a good native

or Eurasian tea-maker now receives; but on this, F. R. Sabonadière managed to live without incurring debt, by denying himself any stimulant or tobacco.

We usually date the beginning of the regular Coffee Planting Enterprise in Ceylon from 1837, so that Mr. F. R. Sabonadière was here almost from the outset by arriving in 1839. This arrival then was interesting from another cause; for he saw the first crop of coffee—and a very remarkable one—taken from the earliest clearing on Black Forest. The estate got this name from the Pussellawa jungle being all peculiarly heavy and of dark foliage and this being the first estate opened in the district. It was begun on a small scale in 1836, as an experiment in planting coffee at a comparatively high elevation—that is above 3,000 feet—for the only estates previously opened—namely Gangarouwa, Wariagalla, Konda salla and Rajawella—were from 1,500 to 1,700 feet above the sea. The unopened district of Pussellawa must have presented a grand expanse of forest and patana in 1836, and even so three years afterwards when young Sabonadière arrived. The experiment of Colonel Byrde (or as he was then Lieut. Bird)—at first was only over 8 acres, but from this in three years was gathered the heaviest crop of coffee per acre perhaps ever harvested in Ceylon, and F. R. Sabonadière must have helped to gather it in. The return was 167 cwt. or nearly 21 cwt. (105 bushels) per acre. This result was due to the land being grubbed up, and all the roots and stumps of trees being burnt and the ashes spread over the surface; but this work was found far too expensive to be continued. The success of Black Forest clearing, however, soon caused a rush into Pussellawa; but, indeed, the larger and finer blocks had been taken up in 1836, owing not only to the fine forest and soil of the district; but to the fact that the main road from Kandy to Nuwara Eliya ran through its midst. We have in our possession a sketch in red pencil made for us by Mr. F. R. Sabonadière of the various blocks and the dates of most of them being taken up. The first on the road (nearest Gampola) though not the earliest taken up is Old Kaloogalla (C. R. Buller); next Melfort (Brook); Black Forest (Bird); Delta on the right 1836 Archdeacon Glenie with Glenloch and Whyddon behind all making 2,290 acres; on the left of the road Rothschild (Major Murray, 1836—we take it that the name was given by the Messrs. Worms when they purchased this block of the black forest of Pussellawa three or four years later at £5 an acre); further on the road we have Helbodde bought in 1836 by Col. Macpherson 2,200 acres; Karagastalawa, Capt. Fisher; Tavalamtenne

\* From a memorandum in the late Mr. F. R. Sabonadière's writing the following private family reminiscence is transcribed:—"My grandfather John Scipio Sabonadière married Louisa Barbauld (a sister of the well-known authoress) at the Parish Church of St. James, Westminster, on 7th April 1789, and had issue Adelaide Henrietta born 1st January 1790 and my father Carey Charles Alfred Mary Louisa Jean Antoine, born 25th January 1791 in the Parish of St. Luke's, Chelsea, and baptised in the Church of the said Parish 25th February 1791, also John Richemont born 25th March 1792, baptised in St. Luke's, Chelsea, and died at Caen June 13th 1809.

Darley; Wavendon, Tattersall and Lang; Ramboda, Smith; Bluefields and Rangboda, Col. Fraser; Pallagolla, Kelson and Garstin; Kandegalle, E. R. Bower. Some of these ownerships must date from well on in the "forties"; for next to Colonel Fraser, we find entered Bird and Sabonadière 1845. Then away to the East of Delta, beyond the Attabage-oya, Mr. Sabonadière pencilled in a block belonging to "Rev. Owen Glenie"; Pooprassie, a large block bought by Gray & Co., Bombay, and which included Torrington, 1840-41" (we take it, however, the name Torrington was applied after the arrival of Governor Lord Torrington in 1847); "Hannagalla, Geddes; Galloway-Knowe, "Miller, the Bombay Dentist," both dating from 1843-t. "Beyond this, MacCulloch's Land, now the Le Vallon Group." Farther South, there ran "Newmarket and Stellenberg originally Kandalawewa, the two Arnands, representing an English house in Paris;" "Kandelaweva, Alston; Poodjagodde, Fisher; Eyrie, W. Keir; Balleywan, Lyon Fraser and Sheriff." We cannot resist reprinting the contents of this sketch of the district properties as they were from 53 to 60 years ago, first, because it is in Mr. Sabonadière's own pencilling; secondly, because of the many old names recalled; but chiefly because it indicates the early development of what was long regarded as the Premier Coffee-planting Division of Ceylon and with whose fortune the names of the Messrs. Sabonadière were so long and so creditably connected.

To return to the career of the young planter-pioneer: five years of steady hard work followed, and then Mr. F. R. Sabonadière went home; and at the age of 21 married Miss Emily Murray, daughter of General Murray. On his return to the island in 1844, he took charge of Wahagapitiya estate, Pussellawa, and here he continued, until, in 1852, he was appointed to the management of Delta estate. In the interval, Mr. Sabonadière lost his wife who died of consumption at Jaffna, whither she had been removed to try and check the fell disease. Soon after entering on the management of Delta, Mr. Sabonadière built the fine large residence which has ever since marked the property. This, at first, he shared with Mr. Straube, the then Agent of Baron Delmar, proprietor of the estate; but the latter soon after retired leaving Mr. F. R. Sabonadière in full charge.

It is time now that we said something of the start in life of the younger brother. Only nine years old when his mother returned to Guernsey, William was sent to a private school, and afterwards to Elizabeth College. Just six years younger than Frank, he started for Ceylon (no doubt en-

couraged by the success of his elder brother) exactly at the same age and arrived in 1845 a lad of sixteen to begin a planting career. Our local information went to show that the first employment of Mr. W. A. Sabonadière was under the Messrs. Rudd on Bowlana estate, Hewaheta; but we have in our possession the last letter he wrote to us from Jamaica in 1893, in which he alludes to the start of his planting career in Ceylon, 51 years before as on "Imbulpitiya and Wahagapitiya in July 1845." The latter meant that he got some of his first lessons and start under his elder brother as was natural. Probably he went to Bowlana when qualified to take charge and continued some years in Hewaheta, until called to the management of Glenloch, Pussellawa and Ramboda where, in Choisy, he and his brother acquired proprietary interests. There is in fact only the usual planting routine of opening and managing estates to record up till 1858-9, when Mr. Wm. Sabonadière returned home, and met Miss Sarah Portal his future wife, with whose family he passed a summer in Guernsey; they were married in 1860 and returned to Ceylon to reside on Glenloch which Mr. Wm. Sabonadière continued to manage, while developing Choisy. More than one trip home occurred in the "sixties" and he was in England in 1869, when he got the appointment of Manager of Delta in succession to his brother. He returned at once with his wife and two children and continued in charge till 1875.

In the early "sixties," the district of Pussellawa may be described as flourishing exceedingly. Our first visit was in 1865 on our way to Nuwara Eliya and we had for our companion through the district old Geo. Sheriff of Helbolde on his way to visit John Lewis Gordon on Wavendon who had not been very well. Full of reminiscences, Mr. Sheriff pointed out to us the different properties, so well known by name: Melfort so well cared for by the "Rev. John" (Martin) lately passed away. Rothschild with its hedges of roses, so long the property of the Messrs. Worms who always cultivated highly, as indeed did their successors, the Ceylon Company, Limited, under the guidance of Mr. Wm. Rollo. Delta Store stood out as if commanding the whole district, and Mr. F. R. Sabonadière was clearly recognised as not only the most experienced, but the leading planter in the countryside. A more delightful residential district there could not be than Pussellawa, with its healthy climate, average temperature of 65 degrees, its wide outlook of country and beautiful and varied scenery; abundance of pasturage for cattle, good roads—Delta alone having some 15 miles of cartroad and 20 miles of good bridle-paths within its bounds, affording delightful and

extensive rides with fine scenery. Such was the home and scene of labours for 17 years of Mr. F. R. Sabonadière and afterwards for 6 years of Mr. W. A. Sabonadière—one of the largest and for many years) most prosperous coffee plantations, Ceylon, or even the world, has ever seen.

Meantime, Mr. F. R. Sabonadière married a second time on August 19th, 1854, Miss Mary (Minnie) Layard—sister of Sir C. P. Layard, so long Government Agent of the Western Province—and they continued to reside on Delta till her death which occurred on January 4th, 1864, leaving two daughters, Sophia who was married to Mr. Alex. Crabbe, merchant, Gracechurch Street, and died in 1895; and Emily Antoinette, now Mrs. A. M. Hurst. After 23 years; uninterrupted residence in Pussellawa (15 of which were on Delta), Mr. F. R. Sabonadière took a trip home in 1867 and in 1869 retired from Delta (in favour of his brother) to begin a mercantile life in Colombo as the head of the new firm of Sabonadière & Co.; having for his partner Mr. John Northmore, both being joined later by Mr. Wm. Bowden Smith.

As a Planting Proprietary and Agency House, Messrs. Sabonadière & Co. (having secured the support of Mr. G. S. Duff, Messrs. Crabbe & Co., and other home proprietors) quickly took a leading position—indeed in our Directory for 1883 they stood at the top of our Agency list—having the produce of some 28,564 cultivated acres from 113 estates to attend to. All was prosperous in the “seventies” and until the gradual decay of coffee through the fungus *hemileia vastatrix*, and then a struggle set in for the partners (as for nearly all Ceylon) which culminated in the failure of the old Oriental Bank, and Sabonadière & Co. closed on 4th September 1884. It was at once succeeded by Messrs. Cumberbatch & Co., Mr. Cumberbatch having been a trusted assistant in the old house, and in due season (March 1885). Mr. F. R. Sabonadière in due time, became a partner in the new firm and watched the transition from coffee to tea, while cinchona, in many cases, affording the means to enable the new product to be started. Mr. Sabonadière could never be idle, even in his old age, and he was always chatty and cheerful; but his life-work was drawing to a close and the end came on 18th July, 1891. All that was mortal of Francis Richard Sabonadière was next day committed to the grave in the General Cemetery, Colombo, amid a large assemblage of all races and classes, many of whom felt they had lost a true friend; while all realized that the island was poorer through the death of as honorable, true hearted and upright a colonist as ever helped to develop its prosperity. No one in the long list of Ceylon planters and

merchants was ever more deservedly loved and respected than the subject of our memoir whose whole life practically was given to Ceylon since he arrived a lad of 16 and never left it till he died in his 68th

#### DEATH OF MR. F. R. SABONADIÈRE.

(From the “Ceylon Observer,” 20th July 1891.)

Another of the ancient landmarks is gone. Mr. F. R. Sabonadière died on Saturday night, and last evening his remains were interred in the General Cemetery in the presence of a large number of those who knew and respected him when living, as an honest man and an amiable gentleman. As the manager of the great Delta coffee property of Baron Delmar, in Pussellawa, in “the forties” and “fifties,” and subsequently as estate proprietor and head of a mercantile firm, Mr. Sabonadière has been for a period in excess of half a century connected with the planting enterprise in Ceylon. The collapse of coffee brought misfortune to him as to so many others, and amidst trying physical suffering the closing years of his life were devoted to the task of enabling him to say “I owe no man anything.” In his death European society in Ceylon has lost one of its most worthy members, while his departure will be mourned by the community generally. Much sympathy is due to his family, especially to Miss Sabonadière, who was deeply attached to one whose death leaves her an orphan. The deceased gentleman was connected by marriage with the Layard family, having married a sister of Sir Charles Peter Layard. His brother, Mr. William Sabonadière, author of a standard work on coffee cultivation, will, in far-off Jamaica, receive with grief the news that the elder brother whom he esteemed so much and loved so well has been taken away while he is left to fight the battle of life. On that battle-field but few remain of the generation, who were connected with the early days of coffee, who experienced its vicissitudes, and lived to see it finally superseded by tea as the staple product of Ceylon.

#### THE FUNERAL.

The funeral took place last evening, the procession leaving Nethercourt at 5-30 p. m., the first carriage being occupied by Miss Layard and Mr. and Mrs. Bowden Smith. At the cemetery the funeral service was conducted by the Archdeacon. The pall-bearers were the Hon. F. R. Sannjers, Dr. Kynsey and Messrs. Henry Bois, Stanforth Green, P. C. Oswald, and F. J. de Saram. There was a large and representative gathering at the funeral.

On the 18th July, 1891, at Nethercourt, Colombo, FRANCIS RICHARD SABONADIÈRE, aged 68.

We must now return to Mr. William Sabonadière who after six years' management of Delta, determined to retire to the old country in 1875, selling out of his properties, Choisy in Ramboda and Cobo in Bululla. Before this, however, we should notice the preparation by Mr. Sabonadière and the publication of “The Coffee Planter of Ceylon” at the time by far the best and most practical book published on the subject. It first appeared in 1866 and was characteristically dedicated as follows:—

Dedicated to

F. R. SABONADIÈRE, ESQ.,  
OF DELTA, PUSSILAWA, CEYLON,  
BY HIS AFFECTIONATE BROTHER,  
THE AUTHOR.

The Preface we quote as follows:—

PREFACE.

As planters, like doctors, often disagree, it may be thought presumption on my part to come forward with a work on the subject of Coffee-planting, as at present practised in Ceylon; yet I think that my twenty years' experience in the districts of Passellawa, Hewahette, and Rambodde justify me in the desire to employ usefully the leisure time at my disposal for the benefit of beginners, in writing a work which may hereafter be useful as a book of reference.

I trust I need not say that I have no wish, neither do I pretend, to teach men who are as old and experienced planters as myself; for had I not felt confident, before I commenced this book, that a *modern* work or manual for young coffee-planters was required (the want of which has often been deplored), I would not have undertaken the task.

I have appended numerous extracts from Laborie's work, which, though written many years since, is still in some respects excellent of its kind, though not fully equal to present requirements—so much that is new having been learnt since Laborie wrote.

I have also availed myself of various letters, published either by the Planters' Association or in the local papers, all of which I gratefully acknowledge. They will, I am certain, add to the value of my book, as affording corroborative professional authority. I also acknowledge, with thanks, much statistical information derived from Ferguson's 'Ceylon Directory,' 1864—5, a compilation very useful to anyone who has interests in that island.

In conclusion, I trust my fellow-planters will excuse the many deficiencies that may be found in my work, and rely upon their kind and friendly criticism.

WILLIAM SABONADIÈRE.

GUERNSEY, February, 1866.

There was a new edition published in 1870.

In selling out of coffee estates before the crash overtook coffee, Mr. Wm. Sabonadière may have been deemed fortunate; but on settling in London he went into partnership with Mr. David Smith (afterwards Mayor of Brighton and a well-known Cinnamon and Coconut estate proprietor in Ceylon), the firm being Runciman and Smith, and so maintained business relations with coffee proprietors in Ceylon. In this way he suffered, like many more merchants, when the ravages of leaf-disease ruined the coffee properties of constituents. But for some years after 1875 prosperity ruled and Mr. Sabonadière lived in Delta House, Worcester Park, Surrey, the lower garden gate of which was immortalized by Millais in his picture of the "Black Brunswicker." Finally, Mr. Sabonadière retired from the firm and from mercantile life in 1882, and, although now in his 54th year, began to cast about for a new field of labour and enterprise. Tea at that time had begun to attract attention in Ceylon as a substitute for coffee; but at his age, Mr. Sabonadière did not think it well to take up with a new product. He received good accounts of coffee in Jamaica where the fungus disease was unknown, and at the beginning of 1884 he went out to Jamaica and took up the Arntully coffee plantation on the Blue Mountains, finding, however, that labour and means of transport and other conveniences

were very different and more trying than in Ceylon. Mrs. Sabonadière and his only daughter, Miss Mary Sabonadière, accompanied him; but the former died in December 1885. Still Mr. Sabonadière, cheered by his daughter's society, stuck with marvellous tenacity for more than another decade to the by no means encouraging work to which he had thus put his hands. Of his varying fortunes and of his experience of coffee and other products and life generally in Jamaica, the readers of the *Ceylon Observer* and the *Tropical Agriculturist* learned a great deal from his series of graphic letters sent to us at intervals between 1885 and 1896. He was cheered at times by good crop prospects and still more by the success of his only son, Mr. Alfred Sabonadière, who won his way into the Indian Civil Service to the great satisfaction of both the old Ceylon Colonists (father and uncle) who well knew the possibilities for good and notable work and the advantages offered by the finest Service in the world.

At length, early in 1896, Mr. Sabonadière began to feel the time had come when he should wind up in Jamaica and retire finally to the mother country. In May, his daughter left for England to be with her brother invalided home from India; and it was arranged that he (the father) should follow in a couple of months. In our last letter, already alluded to, Mr. Sabonadière dating from "Arntully, Cedar Valley P. O., Jamaica, 17th May," intimated that he would "be leaving Jamaica for good on or about 21st July," and he gave us his London address for papers, etc., and promised to write occasionally after he had settled down, though he added, "my notes may not be so amusing as Jack Tyndall's." Alas, it was not to be! He wound up his letter in the following interesting fashion:—

"Crops on the Blue Mountain estate are this year a bumper, and I am pleased to chronicle that Arntully is no exception to the rule. The coffee I planted since I came out is in full bearing and commencing to tel favourably.

"The estate should increase in value, as we have a cart road near by, which will soon be further advanced, and pass close above the Works. It has also been proved that with cheap and easy transport it would pay to send Arntully oranges to the New York market, now that poor Florida has been proved too risky by reason of the terrible cold "snaps" and "blizzards" it occasionally experiences. It is time I went home for good. I am 67, and it is 51 years since I commenced work at Imbulpitiya and Wahagapitiya in July 1845. I feel the laborious work of a Coffee Planter's life getting a little beyond my diminishing powers. I shall be glad to hear from you on my arrival in England.

Believe me, yours most truly,

W. A. SABONADIÈRE.

The big crop on Arntully and difficulties with unseasonable weather in July, prevented Mr. Sabonadière getting away on 21st July as originally planned, or again by the first mail in August,

But everything was arranged for his departure by 1st September, and all business arrangements settled, Mr. Stephens of Radnor estate having taken charge on the 26th August, the very day on which Mr. Sabonadière fell ill. The doctor was sent for next day, but did not think the case at all serious and left his patient much better on Friday morning the 28th. Dr. Castle, however, did not think Mr. Sabonadière, weakened by a diarrhœtic attack, would be able to take the long ride down to Gordontown *en route* to Kingston, and he therefore arranged that a buggy should be sent to Moy Hall (quite close to Arntully) to drive into Kingston on Sunday by a new and easier road lately opened. On Friday evening, the Dr. returned to Arntully and seemed to have thought all was going on well; but at 10 P.M. a great change came on, through failure of the heart's action, and Mr. Sabonadière passed away soon after midnight, very peacefully. He was in his 68th year, almost exactly the same age as his brother at his death. The illness was therefore a short one and there was little or no suffering. Even in his latter Ceylon days, Mr. Wm. Sabonadière used to be careful about his heart which was pronounced weak. Overwork and excitement towards the end of his stay in Jamaica, no doubt was the reason of what seemed a slight, but yet proved a fatal, attack. Few if any Planting Colonists in the East or West had so ruled their lives as to be readier for the great change than Mr. W. A. Sabonadière. He was known in Ceylon as a truly humble-minded sincere Christian man, and both brothers left a high example to succeeding generations of younger planters. The remains of Mr. W. A. Sabonadière were laid beside those of his wife at Woburn Lawn close to the East End of the Church which had been enlarged some few years previously, chiefly through his personal efforts.

We cannot do better than close our notice of the Messrs. Sabonadière, than by quoting our letter, Sept. 11th, 1896, to the *Ceylon Observer* from London where the news of Mr. Wm. Sabonadière's death reached us. We do so at the risk of some repetition. He wrote as follows:—

London, Sept. 11th.

I was indeed sorry to see the death of  
MR. WM. SABONADIÈRE

announced in the *London Times* two days ago, and as occurring "very suddenly on the eve of his embarkation for England." I had been under the impression that he was already safely settled at Norwood, to enjoy rest and calm after much hard work and buffetings both in the Far East and West. Mr. Sabonadière was a pattern planter in Ceylon for some 30 years and he wrote the most elaborate, in some respects the best, treatise, ever penned on "coffee planting," and dedicated it with the loyalty that ever distinguished him, to his elder brother "Frank" who preceded him

as Manager of Delta, when it was perhaps the largest and most prosperous coffee plantation in Ceylon. While the esteemed brother left planting to give his name and experience to the large Agency House which as "Sabonadière & Co." flourished as long as coffee held out, William—more fortunate so far—gathered together all the capital he could out of his Ceylon investments and cleared out before the crash came. So far, we have said, he was "fortunate"; but query, if it had not been better had he stuck to his first love and passing through our days of trial and depression had merged with some more of the old hands on the sunny side of prosperity in "tea." For, as matters turned out, Mr. W. Sabonadière, with the best intentions, but in an evil hour for himself, left his retirement in England to invest in a hill coffee garden in Jamaica, and there he struggled on under disadvantages—as regards labour and transport especially—which would not at all have tried him, had he returned or even sent out his capital again to Ceylon. Having, however, made the choice at a time that none of us could say it was an unwise one, he stuck to his post like the plucky, industrious planter he was. Everything that intelligence and hard work could ensure, we may be sure, was done; but in his "sixties," he could not work in the field under a tropical sun—albeit on the hills—as he could have done during his third, fourth or even fifth decade, and it must have been both trying and depressing to the old Ceylon coffee planter—accustomed to cheap and superabundant coolies—to work with the labour available in Jamaica. But we need not pursue the story: much of it is familiar to our readers through the racy little letters which the late Mr. Sabonadière was accustomed to send the *Observer* and *Tropical Agriculturist* from the Far West. We have his very latest letter before us as we write. It is dated "Arntully, Cedar Valley, Jamaica, May 11th", and in the beautifully clear neat "hand" of the veteran (of 67 years), it tells us that he was to leave Jamaica "for good about 21st July" and so giving his new address at Norwood where he hoped to hear from us. Mr. Sabonadière went on to report a bumper coffee crop on the Blue Mountain, including his own place, Arntully, from which, too, he thought it would now pay with a road close by, to send away oranges to be shipped to the United States. The coffee he had planted he was leaving "in full bearing"—no doubt hoping to reap the return in the old country, well earned by one who began his planting career 51 years ago (when only 16 years of age) at Imbulpitija and Walagapitiya in July 1845. No wonder though he added:—"I feel the laborious work of a Coffee Planter's life getting a little beyond my diminishing powers." I fear that illness and possibly worry accounted for the delay of six weeks beyond the date fixed for his departure as above—and this delay as it turned out, proved fatal:—

"After life's fitful fever

He sleeps well."

A good man in the highest sense, Wm. Sabonadière ever was—a truly sincere humble Christian; a model of an intelligent, industrious planter; of an upright, straightforward man of business; a good friend and no man's enemy:—

"Peace to the memory  
Of a man of worth"

if ever there was one among the Planting community of Ceylon or Jamaica. Our condolence is due to relatives—especially to the daughter, and to the son (in whom he rightly felt pride) for the distinguished place he had won for himself in the Indian Civil Service.

The name of

SABONADIÈRE

will always hold a leading place in the Planting and Mercantile annals of the first of Crown Colonies, and both brothers—Messrs. F. R. & W. A. Sabonadière—may be fearlessly held up as examples to young men of the present and succeeding generations.

## THE QUALITY OF CEYLON TEA.

A very interesting discussion has taken place through Mr. C. H. Bagot's condemnation of our contemporary for alleging that the quality of Ceylon tea has deteriorated. Mr. Bagot holds to the contrary and he is supported by Mr. Metcalfe of Dunsinane, Pundaluoya, and by Mr. H. B. Roberts of Bogawanalawa (all three letters reproduced below,) both of whom maintain that the teas from old tea in their districts have improved, and that the fault for lower prices is with the market, not with the quality of the produce sent forward. This is a most important question; and its practical bearing on the mission just entrusted to Mr. Kelway-Bamber will at once be seen. Our contemporary attempts to turn the tables by pointing to the fall in the Ceylon, as compared with the Assam, averages during the past three years. But this is obviously unfair; for Ceylon includes a far larger proportion of lowcountry coarse common leaf than is the case in Assam. There is no division in Assam to be exactly compared with our lowcountry districts of the Western and Sabaragamuwa Provinces. It must be remembered that while the average for all Ceylon in 1897 was as low as 7½d., the average for our highest group of districts was as high as 9½d. A great deal of information bearing on this subject is embodied in the many letters we received in answer to our circular on the "Planting, Pruning and Preparation of Tea." For instance, "B," writing from a high district, told us very tersely that (as regards good quality tea and good prices),—

Preparation in the Factory is most important and I scarcely know of a building which has *always* sufficient withering space and machinery. and he gave his own case with its splendid results:—

Factory has accommodation for ½ million lb.

1895 318,000 lb. sold for 1s 0½d

1896 340,000 " " " 1s 1¼d

No change in system of plucking.

"B" also said that so far as he knew manuring and pruning had not much to do with quality; but he significantly added as a special cause for poor quality:—

Starvation wages paid to Superintendents and the mistaken idea that any one can make tea.

We may be pardoned for taking the following valuable testimony from the letter of Mr. Bagot—who, we know, has made "tea manufacture" a special study during the past twenty years or so. He writes:—

"I see samples of teas from many estates in different districts, and as far as I can judge this year's quality shows much improvement; this is due to finer plucking, drier season, and smaller crop to deal with."

The first question then to be asked of a grumbling proprietor who says the quality of his tea is declining, is, Have you provided withering space and machinery in proportion to your increased crops?—and (2) have you a good Manager with qualified Factory Assistant, both adequately remunerated? This is, perhaps, enough for the present.

## TWO REASONS WHY OUR TEAS HAVE LOST QUALITY.

Sir,—Now that Mr. Kelway Bamber is in Ceylon, perhaps it might be as well to enquire from a person

of his scientific knowledge if there is any reason to suppose that the quality of Ceylon Tea is in any way effected by the increased age of the plant. I have for some years past watched with interest what might be regarded as the phenomenal rise and fall of prices of teas sold by certain estates, and except where fine plucking has been resorted to, I have remarked that up to a certain point these places got considerably over the market price, and then after a time, they tottered on the edge of the weekly average of sales, and finally got a shade below it or on a level with it.

My theory is this, in explanation of the above, that up to a certain point the tea plant is nourished by the superior "top-soil," after which, as the plant is a deep feeder, the roots get into a poorer and poorer stratum of soil as it gets older, and so is unable to draw from a richer combination of elements—if I may use this phrase. Not only is this so, but it may in a way be borne out by what we may call district averages, when we know certain districts have not got the same soil as those of higher altitude, and less denudation.

My theory is also supported by the results of sales from estates in which the prevailing soil is sandy, or say, made up of quartz.

Those estates not only always get a low price, but from the first never had a good one, for the simple reason that they started in sand and so must continue.

It is undoubtedly true that a great deal can be done by careful manufacture; but if the plant has not got the "flavor" to start with, no amount of manufacture will put it there.

I am also inclined to believe from certain observations that I have followed, that we are by no means at an end of our knowledge of what Planters call "fermentation." If that part of the process was strictly mechanical, it might be contended that it had its limits; but such is not the case. The "fermentation" begins, where the "mechanical" leaves off, and it is from its chemical standpoint that this process should be examined. Indeed I would go further in venturing to suggest not only a chemical standpoint, but a bacteriological standpoint.

If it was in our power to control the action going on within the bruised cells of the leaf, we might, to some extent say we could make all our samples of tea alike; but this the Planter has never been able to do, and it is held probable that he may find the greatest scope for change in the art of manufacture.

I trust I may be excused for taking up so much of your space, Sir, but as we have a learned authority in the country, perhaps he may be pleased to express his views on the two points that I have ventured to put forward.

4th August 1898.

F. L. S.

## CEYLON TEA HAS NOT DETERIORATED

## EVIDENCE FROM NUWARA ELIYA.

SIR,—It is not only Ceylon tea which is suffering from low price, but teas from every other country are affected in the same way, and yet neither you nor anyone else can seriously affirm that the quality of teas *everywhere* has deteriorated.

For our own teas, I maintain that *to-day* we are making universally far better quality than we ever have done previously, notwithstanding what Colombo exports and tea tasters tell us to the contrary, not one of whom, I believe, would back his opinion as to the value he puts on samples, unless he knows the mark.

When coffee dropped from 120s. per cwt. to 60s, was fault found with the cultivation of the berry, or manipulation of the bean? Take cinchona, cocoa, cinnamon, or any other product.

That some estates once got better prices than they are at present getting is easily explained.

Formerly there was competition for these marks, whereas now buyers have a larger selection of tea of the *same quality* to choose from, thus entirely doing away with competition.

The Tea market is in a *rotten* condition, which is to be regretted, but that neither chemical nor bacteriological investigations, still less "crying stinking fish" will improve it is the humble opinion of yours faithfully.

CHAS. H. BAGOT.

St. Leonards, Nuwara Eliya, Aug. 7th, 1898.

### I.

SIR,—I am glad to see Mr. C. H. Bagot has protested against the harm done by your frequent references to the alleged falling-off in quality of our teas. That your remarks have done harm, I have proof in the shape of letters from friends in England who are interested in Ceylon estates, asking my opinion as to the question raised in your paper, of the altered character of Ceylon teas. I replied that there must be differences in the quality of tea made under varying climatic influences; as with the vintage, so with tea, one season's crop differs from another; that the teas manufactured this year were well made in the factory, and of better quality than last year's, as comparison with 1897 teas fully proved.

The absence of competition on the market owing to the altered conditions of the tea-trade at home, the statement that "the finest tea the world produces" can be bought at a figure that, to anyone who thinks, carries contradiction on the face of it, the over-supply of one type of tea; these are some of the reasons for the fall in price.

I beg to differ from you as to the "whole tea-trade" opinion on Ceylon teas. I have valuations and reports of sales before me which contain the following remarks: "These teas are the best we have seen from— for some time, but we do not value them higher owing to the depressed condition of the market." Again—"we regret not to have obtained more for the Pekoe, the market is over-supplied with this grade, the tea is fully up to invoice ex s. s. ———, sold early in May at 2½d. per lb. higher."

If you would cease your unjustifiable comments on the character of Ceylon teas, and do all in your power to advocate their consumption in new countries, you would further the interests of the planting enterprise.—I am, sir, your obedient servant,

W. P. METCALFE.

Dunsinane, August 10th, 1898.

### II.

SIR,—I quite agree with all Mr. Bagot says on this subject. The teas on most estates have improved with the age of the bushes, showing more strength, and still have fine flavour. Thin flavoured teas made from young tea, *which used to sell so well* do not command any price in the present market. They are *too thin*.

Could we go back to the market we had five years ago, *even with our increased yield per acre* the teas would fetch as high prices as then.

It is the market, not the tea, that is at fault.—Yours faithfully,

HUGH B. ROBERTS.

Eltofts, Bogawantalawa, August 9th.

### CEYLON WOODS FOR TEA PACKAGES.

SIR.—The publication recently of Mr. Lewis's paper on Ceylon woods leads me to offer a few remarks on the fitness of some of those woods for tea-packages. At the present time, when there is so much talk about the special attention we must give to our teas with the view of introducing them to new markets, planters should not overlook the subject of packages, for that subject is almost as important as the subject of the tea itself. I am nearly certain that at least two-thirds of the tea that comes down from up-country is packed in native wood cases which are totally unfit for shipment; in fact many firms have told me in my travels that they cannot take Ceylon teas;—they are afraid to indent for them, not knowing what cases they will be in. Mind, I am not condemning the country chest as a whole. Several local woods are useful and serviceable; but care should be taken in their selection. The following are native

woods suitable for tea chests:—Hal, Bombie, Mango Arada, Diatalia, and Ombie. Tea should never be packed in Kattuimbul, Tell-kakuna, or Bulu chests. If planters would pay more attention to the packages their teas are shipped in, many firms now selling Chinas and Japans could be induced to handle our product. Going on board a steamer loading tea in our harbour, numbers of chests are to be seen with lead and often the tea exposed to view. When weevils and dry rot have had time to work their havoc on Kattuimbul, Tell-kakuna, and Bulu chests, what condition will the tea be in when it arrives at the store of a purchaser in a distant land?

One day while in San Francisco I saw a cart load of Ceylon tea going down the street, leaving a trail of tea as it went. My friend, who happened to be one of the largest importers of tea in America, remarked:—"there goes your Ceylon tea, and still your planters wonder why our merchants are not ready to receive your goods with open arms, and condemn teas from China and Japan in their neat, light, packages, which seldom give any trouble through breakages." I strongly urge on planters the necessity of paying more attention than they have hitherto done to this vital matter.—Yours truly,

R. V. WEBSTER.

### PLANTING NOTES.

TEA PRUNING AND PLUCKING.—There is clearly a great deal to be learned in this connection; but allowance must be made for the differing conditions of different districts. Thus from Uva, in the midst of drought, we learn of 1 lb. of leaf a day per cooly coming in, which certainly will not pay on a price not above the average. A critic of this, in an old district on the Kandy-side, thinks the "pruning" is to blame and tells us:—"Why I get 20 lb. of leaf a head, and I attribute it to going over my tea once a year with light pruning." Another equally experienced planter, but in a much higher district (4,500 ft. as compared with 2,000?) says: "Your 20 lb. plucker will injure his tea in the long run—my average is 12 lb. and I think it a good one: this season I have got 14 lb. which I think quite as much as should be plucked by any cooly in a day." Now all we have to say is that our "20 lb." friend is the last man in the world to injure his tea and he knows a good deal about it too; but 'who will decide when doctors disagree?'

COFFEE AND PEPPER IN SOUTHERN INDIA.—We have delayed publishing Mr. R. Tatham's letter until we could, as usual, give his tabular statement which is the really valuable portion of the information. Both will now be found as a *Supplement*. It will be seen that, for the first time we think, Mr. Tatham attempts to distinguish between 'Native' and 'Plantation' coffee and he makes out that as much as 81,658 cwt. of Native coffee was exported. But we thought from a recent discussion in the press that all the 'native' coffee grown in India was scarcely enough for local consumption if the whole continent were considered? Again, if the plantations of Mysore, Coorg, &c., only gave 121,517 cwt., what will that make per acre? We fear very little, judging by the figures in our Directory. Still the total export of 203,000 cwt. is not so bad, considering the times. The maximum export of coffee reached by India was 507,296 cwt. in 1871-72; but since then there has been a steady decline though never the collapse which has occurred in Ceylon.—The export of Pepper from India last year was short and the price high; what a chance for Ceylon to do something with this "new-old product"!

TEA AND COFFEE IN INDIA;  
LATEST RETURNS OF AREA UNDER  
CULTIVATION;  
TEA IN INDIA COVERS 100,000 ACRES  
MORE THAN IN CEYLON.

Just as we are closing our work for the present edition of the "Ceylon Hand-book and Directory" we receive (as Editor of the *Tropical Agriculturist*) the latest volume of "Agricultural Statistics in British India for the years 1892-3 to 1895-7." It is one series of tabulated returns covering well-nigh 400 pages and of course—with an almost universal collection of revenue from cultivated land,—the figures for the different crops are far more reliable than anything of the kind in the Ceylon Blue-books; though they cannot approach our still more accurate record for the tea, cacao, coffee, cardamoms, cinchona, rubber, &c. plantation statistics of this Colony. To give an idea of the enormous areas with which the Indian Director-General of Statistics has to deal, we give a few of the results, leaving out odd figures. First, there is the total net area of territory by professional survey, deducting feudatory and tributary States and areas for which no returns exist, and we get 537 millions of acres! Under forests, 64 millions; not available for cultivation 15½ millions; culturable waste 95 millions; fallow land 47 millions; area from which crops were taken 177½ millions; area irrigated 29 millions acres. Next we have the different crops: Rice covers 63½ millions acres; wheat over 16 millions; and the total under food-grains was no less than 160 millions acres! Under oil-seeds 10½ millions; cotton 9½; jute 2½; other fibres 601,000 acres; sugar 2½ millions; indigo 1½ million; tobacco 1 million; fodder crops 2 million; opium 691,000 acres; Coffee 147,158 acres; Tea 423,732 acres.

It is with reference to Coffee and Tea that we wish to offer remarks and corrections on the official statistics just published. In the case of coffee there is not much to correct, because the volume before us credits Mysore as an independent State with nearly as much coffee as all "India," but ignores Travancore. Adding in for the last the figures compiled for our own Hand-book, we get the following:—

Coffee cultivated in "India" =	147,158 acres
" " " Mysore "	145,550 "
" " " Travancore "	4,283 "
<b>Total ..</b>	<b>296,991 "</b>

But inasmuch as we feel sure the official return is too high for the Wynnaad and Nilgiris districts, we are inclined to reduce the figures and estimate to 290,000 acres as the approximate area now under coffee in all India against not more than 18,000 acres in Ceylon for plantations, Liberian and native gardens. Much of the area in India must be bearing very little; for the total export in 1897-8 was only 225,000 cwt. It is surmised, however, that there is a far larger local consumption of coffee in India than has hitherto been credited. We are inclined to put it down at 150,000 cwt.; but even then we should not get an average yield over all the coffee area of 1½ cwt. per acre.

Turning to TEA, the Director-General in Calcutta has evidently failed to get returns from Travancore which, with the large area being opened up by Sir John Muir's Companies in North Travancore, has now become quite an important tea-growing division. Our returns indicate no less than 23,000 acres in tea in Travancore, more than half of which is young or immature. Altogether we arrive at a total extent for tea throughout the opposite Continent, of 433,751 acres or 45,000 in advance of the Director-General's return. Here is how we make up our returns. In ASSAM:—Cachar 61,190; Sylhet 70,200; Sibsaghar 70,644; Lakhimpur 55,530; Darrong 33,934; Nowgong 12,659; Kaurup 5,873; Goalpore 40; and Khasi, etc. 30—total 310,550 acres planted—but divided as follows:—

	In Bearing.	Young.
	Acres.	Acres.
Assam .. .. .	233,213	47,337
Bengal (Darjeeling, Chittagong etc.) ..	93,000	14,000
Kannou, Dacca Dan, etc. ...	8,000	
Kangra Valley .. .. .	10,000	
Burma .. .. .	1,200	
Bombay Presidency .. .. .		1
Nilgiris, Wynnaad, etc. ..	1,000	5,000
Travancore .. .. .	10,000	13,000
<b>Total for India ..</b>	<b>333,414</b>	<b>70,337</b>
All Ceylon .. .. .	273,000	93,000
<b>Grand total = ..</b>	<b>617,414</b>	<b>172,337</b>

	Acres.
Total of Tea planted in India = ..	433,751
Do. do. do. Ceylon .. .. .	371,000
<b>Grand total, acres ..</b>	<b>804,751</b>
	lb.
1898—Estimated crop—India ..	153,000,000
Do. do. do. Ceylon .. .. .	120,000,000
<b>Total .. .. .</b>	<b>273,000,000</b>
Allowing local consumption ..	6,000,000
<b>For Export .. .. .</b>	<b>272,000,000</b>

Say 233 million lb. to United Kingdom and 31 million lb. to other countries. In our calculations of area for Ceylon, we include 7,000 acres in native tea gardens—2,000 young and 5,000 acres in bearing. We take between 4 and 5 years as the limit between young and mature tea. Let it be further noted that the Assam tea planters have a reserve of land not yet planted equal to nearly 700,000 acres; while the reserve in private hands on Ceylon plantations equals 367,000 acres, of which 12,000 acres may be fit for planting.

In round figures we may now say that in all India, there are 470,000 acres planted with tea; and in Ceylon 370,000 acres; so that our big neighbour is only 100,000 acres in advance of us. The time has, however, come for suspending further planting operations until it is seen what is to become of the additional crop (say 50 million lb. at least) which the young tea is capable of producing. If crops aggregating 272 million lb. can with difficulty be disposed of at a profitable rate, how, within the next four years or so, can 50 millions more lb. be taken off? That is the problem; and one that can only be solved with the aid of Russia and the United States. May these countries respond by demands increasing by leaps and bounds, year by year.

DR. MORRIS, C.M.G., AND MR. JOHN  
HUGHES ON THE WEST INDIES.  
INDIAN CURRENCY, AND CEYLON  
TEA.

With Dr. Morris at Kew this afternoon (15th June) I had a long conversation. Explaining the reasons for the

WEST INDIAN COMMISSION

to inquire into the disastrous condition of the sugar trade, Dr. Morris stated that French Colonies send home their sugar to any French port where it receives a bounty of £5 per ton; thence it is sent over to the English market and sold at the cost price of £10 per ton. English Colonies receive no bounty and therefore have practically to sell against Frenchmen at less than cost price. A rich mother-country, owing to her stubborn, and yet far from blameworthy, principles of free trade, thus allows a bounty-fed foreign supply of sugar to oust from the English market that sent home by its own colonies. Dr. Morris did not approve of the creation of a bounty system of our own, seeing that it tended to weaken the independence of planters and led them to rely less upon their own resources. He would advocate very strongly, nevertheless, that some assistance should be given in the West Indies to those Colonies, which have been ruined by the free-trade principles at home, in the shape of loans at a moderate rate of interest to help them put their estates in order and renew their machinery. Even after this has been done, it seems to me that French sugar will still hold the field in England, unless its quality is inferior to that of the English and the charges for freight considerably greater. The only resource of the West Indian planters would seem to be to confine their supplies to and develop those markets nearest to them namely the American and Canadian. It will be interesting to see what assistance Mr. Chamberlain will eventually propose should be given, for he has already agreed that something shall be done for the West Indian sugar estates.

With regard to

THE CURRENCY

Dr. Morris admired the wholly justifiable energy with which the Ceylon Association had acted in view of non-representation on the Indian Committee. But, he said, it would be unwise on the part of Ceylon planters to offer any opposition to the Indian Government when once it had decided on the step which to it seemed necessary—and this was evidently the fixing of the value of the rupee at 1s 4d. If the whole question were looked at from a wider point of view, the importance of Ceylon was small compared with that of the dollar-using Colonies. The "almighty" coin which rarely fluctuated much from 4s 2d in America, was there worth only 2s 3d. Nevertheless the injury that would result to Ceylon planters from the measure they fear, coupled with the recent fall in the prices of tea (now happily less marked), would undoubtedly add to their difficulties.

[It is what may shortly occur through British agencies, in the Yang-tse-kiang Valley in developing properly grown and prepared teas, with the dollar at 2s 3d or less, that brings a cloud over the prospect of the Indian and Ceylon tea planters

and makes them anxious about the Currency settlement.—ED. T.A.]

Mr. Hughes said the other day that it would be a point of interest to discover whether the

DETERIORATION IN TEA

of late (of which he felt assured) was due to careless manufacture, or the affection of the tea-bush by decay, or exhaustion of the soil. On this question Dr. Morris's views were as follows:—The tea plant was too hardy to be quickly affected by any deterioration in the soil. The latter was always a slow process, and seeing how short a time the industry had been established in the island it could even if ascertained for a fact, which it is not, hardly account for the reported loss of quality in the manufactured tea. It was more probable that, as usual with all products that come to be manufactured on a large scale, less careful attention had been given to each of the various processes involved in the work of the factory and the field. Competition, in the shape of Companies, was largely answerable for the depreciation in the quality of the manufacture. Dr. Morris recalled how in the days of hand-made teas, when tea was 3s 6d per lb., he used to receive 2lb. packets from Mr. James Taylor of Lolecondra, and sent them to various people such as Mr. Thiselton Dyer, Sir Joseph Hooker and Professor Huxley. It usually led to their writing for more of the article, and in the case of Sir Joseph Hooker to the throwing up of China teas through preference for the Ceylon. But in these days unless the pristine excellence of teas exported from Ceylon were restored, their advance in the home markets would be a slow and tedious business. If the planters would strive rather to improve the product than accelerate its production, the outlook for the tea industry was by no mean disappointing. Visitors to Ceylon were struck with the vitality of the work going on and the hopeful look of the estates. Only the other day Dr. Morris had had a visit from Mr. Freeman-Mitford, C.B., late M.P. for South Warwickshire, and of Batsford Park, Gloucestershire. While on a trip to Ceylon recently, this gentleman gained so high an opinion of the prosperity of plantations he visited in Dikoya that, before he left the island, he had invested in a share of an estate at Hatton. Dr. Morris invited me to visit Kew again before I sail, and he would then show me round many things of interest.

R. H. F.

CARDAMOM CULTIVATION IN CEYLON—is well-known to be very prosperous, where it does succeed, although a good many fields in unsuitable districts have had to be given up. But can any cardamom planter beat this return courteously sent to us for our Handbook by a well-known Ceylon V.A. :—a field of about 80 acres 4 to 5 years old last season gave 480 lb. dry cardamoms per acre. At a gross return of 4s per lb. or £96 per acre, this ought to pay well! One-hundred-and-fifty-years ago, the Dutch had to get most of their cardamoms from the Hanwella and Matara districts—is the cultivation quite given up there by the natives? Altogether we now get 5,153 acres planted with cardamoms on plantations, chiefly in the Medemahanuwara, Raugalla and Matale East districts with less in Nitre Cave, Knuckles, Keleokkka, Hewahette, Kurunegala and Badulla. Our last export of 510,000 lb. should be added to as young fields come into bearing.

COFFEE AND RUBBER IN MEXICO.

A recent mail brought us from America a very handsome volume on the above subject, accompanied by the following note from the author, Mr. M. Romero—"Washington, June 11.—I have the pleasure of sending to you by this mail, at the request of Mr. Hawthorne Hill, editor of the 'India Rubber World,' of New York, a copy of the book I have just published in New York entitled 'Coffee and India Rubber in Mexico,' which contains two papers that I wrote several years ago on the culture in Mexico of both staples, which may be of some interest to you. In my paper on 'Coffee Culture' I make frequent reference to its culture in Ceylon." The full title of the work is "Coffee and India Rubber Culture in Mexico preceded by Geographical and Statistical notes on Mexico, by Metras Romero—G. P. Putnam's Sons, New York and London, 1898." We cannot more tersely or exactly explain how Mr. Romero came to write this book or how he gained the necessary experience than by quoting the first portion of his introduction as follows:—

When, after serving five years, from 1833 to 1871 as Secretary of the Treasury in Mexico under President Juarez's administration, I was obliged to resign, my health being so greatly broken down as to make it impossible for me to continue discharging the duties of that responsible, and at the time, very difficult office, feeling that if I remained in the City of Mexico, I could not regain my health as I would be subject to continual mental excitement, I made up my mind to live in the country and occupy my time in agricultural pursuits. Before deciding what branch of agriculture I should follow, I made a tour of inspection to the most favored regions of Mexico and found that india rubber and coffee raising seemed to be the most promising and profitable undertakings. The place which I thought best adapted to both of these products was the district of Soconusco, one of the counties of the State of Chiapas, in southeaster Mexico, bordering on Guatemala, and I concluded to settle there and apply myself to coffee and india-rubber culture.

In the meanwhile, coffee raising had attained considerable development in Guatemala, the Guatemalan coffee being very highly esteemed in foreign markets, and I determined to make a tour of inspection in Guatemala and examine the principal coffee plantations, in order to learn what was the best way to make a plantation and keep it productive. I, of course, tried, during this time, to collect all the information I possibly could about these two branches of agricultural industry.

Finally I undertook to make a coffee plantation in the high lands of Soconusco—located from four to five thousand feet above the level of the sea—as, in my opinion, a temperate zone is the proper one for that tree; and another for india-rubber in the lower lands of the district, which are warm, damp and marshy. I acquired some experience by these experiments and I made a study of the subject, not only in coffee plantations in Mexico and Guatemala, but in other countries where I understood coffee raising was also very prosperous, like the Island of Ceylon, in the East Indies, and Brazil which is now and has been for many years, the largest producer of coffee in the world.

Mr. Romero eventually visited every coffee district of Mexico, so that he ought to write with a full knowledge of his subject. The first edition of his book—a small manual—came out 25 years ago and it ran afterwards through several editions. When the price of coffee began to rise rapidly in 1890, great attention began to be given to Mexico with its grand advantage of proximity to the United States, the greatest coffee consuming country in the world. Mr.

Romero mentions that the maximum price obtained was 35 cents in silver; but that the price fell rapidly in 1897 until 12 cents was reached and yet even that proved remunerative. Still we think the Ceylon planters who recently visited Mexico did quite right to hold off purchasing coffee property there until they saw what the course of the market was likely to be. The total production of coffee for Mexico in 1896 is given as follows:—

	lb.
Cordoba produces ..	10,000,000
Huatusco and Coatepec..	10,000,000
Oaxaca ..	6,000,000
Tabasco ..	5,000,000
Chiapas..	3,000,000
Other Districts ..	26,000,000

60,000,000 lb.

Or nearly 536,000 cwt. The only chance of maintaining the remunerativeness of the industry we should say, must lie, in introducing the Ceylon system of careful pickings of ripe cherries only, pulping, drying, separating, &c., in fact that careful "preparation" which gave "plantation Ceylon" so high a reputation.

But the strange fact is that the recent Ceylon visitors to Mexico did not pay a little more attention to "Rubber," the coming product and one so much in demand at handsome prices. Here is what Mr. Romero has to say with a quotation from a Report by the British Minister:—

*India-Rubber.*—The lowlands of Mexico, especially those adjoining the Pacific Ocean which have a very warm and moist climate, are very well adapted for the india-rubber tree, which attains a large size and yields a considerable amount of india-rubber. We used to have whole forests of them, which fact shows that they were in their proper conditions of soil and climate, as they could outgrow the rank vegetation of the tropics, and prevent the growth of most of the other large trees in the forests; but india-rubber gatherers have destroyed most of them, and I imagine that there is a comparatively small number left.

I have always thought that the production of india rubber would before long cease to be sufficient to supply the demand, and that, therefore, the value of that article would increase with the lapse of time. Now it is to be expected that the enormous expansion during the last few years of the cycle-tire, electrical motor-car, cab, and kindred industries will lead to the bestowal of increased attention on the world's rubber supply, which is so intimately associated with the existence of these industries.

Thinking that a plantation of india-rubber trees would be very remunerative, I devoted considerable attention to that subject, and in 1872 started one of 100,000 trees in a place admirably located for the purpose, bordering on the Pacific Ocean and between two large rivers, in the same district of Soconusco. In an article published in 1872, under the title "India-Rubber Culture in Mexico," I compiled all the information on the subject that I could obtain, supplementing it with the experience that I had acquired. Unfortunately, for reasons of a political nature, I had to abandon that plantation, and when the trees that I had planted grew large enough to yield rubber, they were tapped by the natives and entirely destroyed, but my work gave me an experience which I considered of great value.

The india-rubber trees that grow in Mexico are not the *Hevea guianensis* that grows in Brazil, but the *Castilloa elastica*, and if we have any of the *Hevea guianensis* I have not seen them.

Enough has been written lately on rubber cultivation to show that the profits, in Mexico at least, would be very great; indeed, 300 per cent. on the capital invested is a possible return, after five years, from cultivating *Castilloa elastica* in that Republic. This is a return which provides plenty of margin for

contingencies. Rubber-growing is no longer in the experimental stage, as witness the plantation of La Esmeralda, in Oaxaca, to which further reference is made below. Cultivated india-rubber plantations are few, for the reason that, in some degree like the coffee plant, the india-rubber tree requires a long period of continuous cultivation before making any return to the cultivator. Mexico affords excellent opportunities for the development of this admittedly profitable industry. On this point the authority of Sir Henry Nevil Dering, the British Minister to Mexico, who, in a recent report to the Foreign Office on the cultivation of india-rubber, says:—"The regions most favorable for the growth of this important, yet rarely cultivated, india rubber tree are the plains of Poehulla, Oaxaca, and also along the banks of the Oopalita River where the tree is found in astonishing numbers. Few are the plantations of india-rubber trees existing in the Republic of Mexico. The principal one is La Esmeralda, in Juquila, Oaxaca, which has over 200,000 trees eight years old." According to the same report the total expense for five years' cultivation of a "rubber plantation of 100,000 trees will not exceed \$25,000 in silver and the yield of 100,000 tree at the first year's harvest will bring the planter \$120,000, besides the product obtained from the corn, vanilla beans, cacao, and bananas raised, from side planting. The net profit on the investment, after deducting the entire cost of the land and all expenses up to the first year of harvesting, will be \$95,000, and each of the succeeding harvests, for twenty-five or thirty years, will bring a steady income of over \$100,000." This is 400 per cent. per annum net profit on the investment. These calculations are based upon the production of a five year old tree, but the report adds that "this product will be gradually increased every year for the next four or five years."

Leaving aside the wonderful estimate of profits—and neither Sir Henry Dering nor Mr. Komor gives much practical information as to labour to back it up,—we would observe that the favourite rubber is that so well spoken of by Mr. Hart in Trinidad (as quoted by us the other day) and which for several years received a good deal of attention from Dr. Trimen in his annual Reports, although the growth and yield of milk did not answer his expectations. Possibly the situation was not favourable to either. We should like to know if any trees of this kind (Panama rubber) have been tried in the Kalutara or Ratnapura districts and with what results. Here we must close for the present.

## PROGRESS IN THE FAR WEST.

### TOBAGO--THE FINEST OF WEST INDIAN ISLES.

The beautiful little island of Tobago is to be the scene of some agricultural life and enterprise at last. A gentleman of ample means, ability and enthusiasm, having one day, last autumn, come across the little book "In Tropical Lands," was struck with the idea of selecting an interesting winter resort in the Tropics, and after consultation with the writer, left in November last for the West Indies. Visiting Barbados, Dominica, Antigua, St. Thomas, St. Kitts, etc., he spent a month in Trinidad and another month in Tobago. This, he thinks, the finest little island in the West Indies: splendid soil, rich vegetation, abundance of clear sparkling water and pretty scenery—little changed since the day of Robinson Crusoe. Here my friend has invested in 1,600 acres of excellent land eminently suited for, and intended for, cacao, coconuts, nutmegs, rubber, etc. He was not much enamoured with Port of Spain, but greatly enjoyed a ride through the mountain gorges, where Sir Arthur Gordon took his friend

(Chas. Kingsley; purchased two fine cacao estates in Trinidad, the steamy climate of which exactly suits the cacao though the reverse of invigorating for the European. There will soon be openings in that quarter for some of your spare "dorays." The great advantage of the West Indian islands over Mexico or Peru is the stable Government and ———! I do not like Brazil for the same reason. Nothing will thrive through a Spanish extraction and the old proverb holds good:—"Pump out of a Spaniard every particle of good and the remainder will make a pretty fair Portuguese." No, no: stick to the old flag under which there is still ample room, and as regards the Crown Colonies, at least, some feeling of safety and justice. O. C.

## CEYLON PLANTERS' ASSOCIATION.

*Extracts from Minutes of Proceedings of a Meeting held at Kandy, on Friday, the 8th day of July, 1898*

### OFFICIAL ESTIMATE OF TEA CROP FOR 1898.

Discussed the Official Estimate of the Tea crop for 1898 as compared with actual shipments as at date. Resolved:—"That as the first half year has shown no increase over the Tea yield to end of June 1897, the Committee is of opinion that the estimated increase of 10,000,000 (ten million) lb. of Tea for 1898 will not be secured."

### CACAO DISEASE AND THE SERVICES OF A CRYPTOGAMIST.

Read letters from Government in reference to remittance of the equivalent of £ 50 stig.

### LADYBIRD BEETLES.

Read letters from the Director, Royal Botanic Gardens, Peradeniya, and from Mr. E. Ernest Green the latter stating that in his opinion the introduction of various kinds of foreign "Ladybird beetles" would prove beneficial not only to coffee or tea but, to all cultivated plants in Ceylon, each of which has one or more species of feed insect or aphid that must more or less affect its productive power; further mentioning that he had been promised a consignment of living Ladybird beetles from the Cape, where they have several species likely to be useful in Ceylon. Resolved:—"That a grant of R200 be voted to Mr. E. E. Green towards his expenses in bringing a consignment of 'Ladybird beetles' from the Cape."

Read letter from the Secretary United Planters' Association of Southern India.

### LANTANA BUG.

Read letter from the Director, Royal Botanic Gardens, Peradeniya stating that in regard to the Lantana insect it has been common about Kandy for years and that the Director now does not see any chance of exterminating it; adding that the area affected by it is too large and it is too omnivorous in its appetites. The Director further mentions that the only feasible thing is he thinks for planters to keep it off the tea by burning back the Lantana and other weeds upon the boundaries of estates. If the insect is once allowed to live on tea for a generation or two, the progeny may acquire the taste for this plant and thus become a most dangerous enemy; at present the insect prefers other plants and seems to have but little relish for tea. In this connection the chief danger is likely to arise from the insect getting upon abandoned tea estates and planters who have any such land in the neighbourhood should keep careful watch upon it for the appearance of this or other pests. Resolved:—"That Government be asked to appoint an entomologist who could devote the whole of his time to investigation of the many important problems in connection with insect pests the Committee being of opinion that the time has come when in the agricultural interests of the island Government should at once take preventive measures which can only be done by a scientist in the early stages: such entomologist would work out the life history and habits of obscure insect pests which are at present not thoroughly understood."

## AGRICULTURAL CHEMIST.

Submitting the following report received from the sub-committee appointed to consider the advisability of securing the services of an Agricultural Chemist with instructions to confer with representatives of the Chamber of Commerce and Managers of Companies, viz.: "The sub-committee in conference with representatives of the Chamber of Commerce and Managers of Companies unanimously recommend that the Thirty Committee should approach Government for sanction to the necessary disbursements at the rate of a thousand pounds stg. per annum in securing the services of an analytical Agricultural Chemist for the purpose of investigating Ceylon Tea and in finding out all information as to various chemical changes which occur in the process of Tea cultivation and manufacture with an analysis of soils the sub-committee being of opinion that this step is of paramount importance at this critical time in order to safeguard the position Ceylon Tea has held in the past and to ascertain how strength and flavour can be maintained." Resolved:—That the report be adopted and that it be forwarded to the Thirty Committee for approval and action thereunder.

Read letter from Mr. A. Baur, and submitted the chairman's memorandum on the subject appended.

## MEMORANDUM REGARDING THE ANNEXED COPY OF MINUTE AND RESOLUTION PASSED BY THE COMMITTEE OF THE PLANTERS' ASSOCIATION ON THE SUBJECT OF AN AGRICULTURAL CHEMIST.

With regard to the resolution I proposed relative to the appointment of a Sub-Committee of the Planters' Association and Chamber of Commerce to consider the question of securing the services of an Analytical Agricultural Chemist.—I would suggest that a Guarantee Fund should be started of R20 per Estate, which would raise a sufficient capital sum to pay a really good Scientist, who would (say for six to nine months) devote his entire time to finding out all information as to the various chemical changes which occur in the process of tea cultivation and manufacture. I would suggest his first finding out the special chemical advantages which exist on those Estates which are known to command high prices in the London or Colombo Markets, and when once he has fully ascertained what particular chemical constituents exist on these Estates, he will then be able to compare with analyses of the teas and soils of those Estates, which only command medium and low prices.

My contention is that Estates in the same districts, equally found in Factory and Machinery, shew such divergence in price, that it is self-evident, that a great deficiency exists in some very essential chemical ingredient, which only a Scientist can find out—and at this present critical position of Tea cultivation it is very important that an Agricultural Chemist should be secured, who must go thoroughly into the matter and help in maintaining the position Ceylon Tea has held in the past, by endeavouring to find how strength and flavour can be maintained.

The Guarantee Fund would thus be utilized in paying for the Agricultural Chemist during the early stages of his investigations, and after he was in a position to explain the difficulties which exist, his services would then be available to those who wish individual Estates visited, and analyses taken. A table of fees would then have to be arranged for by the Sub-Committee, which would be paid by the Estates visited by the Scientist. F. G. A. LANE, Kandy, 31st May, 1898.

Minute and Resolution referred to.

The question of an Agricultural Chemist was introduced by the Chairman.

Resolved:—That a Sub-Committee be appointed to consider the advisability of securing the services of an Agricultural Chemist with instructions to confer with representatives of the Chamber of Commerce, and Managers of Companies, and that the following members be requested to serve.—The Hon. Mr. J. N. Campbell, Messrs. John H. Starey, H. V. Masfield, T. C. Huxley George Greig, the Chairman, Planters' Association, the Secretary, Planters' Association,

## THE EADELLA ESTATES CO., LD.

The annual ordinary general meeting of the Shareholders of the Eadella Estates Co., Ltd., was held recently at Kandy, when report of the Directors (Messrs. W. D. Gibbon, A. Melville White and Frank M. Laurie) for the year ending 30th June and the statement of accounts were submitted and passed.

## REPORT.

TEA.—The estates have yielded 73,924 lb. made tea against an estimate of 110,000 lb. There has been leaf purchased 11,893 lb., and the average price of the tea sold has been 39.48 cents per lb.

COCOA.—129 cwt. 0 qr. 18½ lb. were secured against an estimate of 150 cwt.

COFFEE.—37 bushels of Liberian parchment coffee was obtained against an estimate of 100 bushels.

The balance of profit and loss account is R6,768.18. The new branch road involved a heavy contribution which was not included in the original estimate. When completed, as expected in the first months time this road will be of very great advantage to the estates, besides relieving the labour force from all heavy transport and making the carriage between factory and railway stations much easier and cheaper.

COCONUT NURSERIES are very fine and are ample to supply both clearings and to plant up some of Lesmoir estate.

TEA NURSERIES for supplies are also successful.

The cocoa clearings are beginning to bear and may be expected to yield a little crop in 1898-99. They are reported upon as being perfectly healthy and without any appearance of disease at all, and promise to be very shortly a most valuable addition to the Company's property.

ADVANCES.—It has been necessary to increase the amount. The Visiting Agent reports the question of labour at the root of all the difficulties upon these estates, and now that this is on a better footing and pruning can be effected at proper period there is every season to expect a much increased yield of tea in the coming season.

## Area.

221	Tea approximate
98	Cocoa and coffee approximate
102	Cocoa and coconuts
	50 a. 4 years old and 52 a. 3 years old
151	Forest

Total 572 acres.

THE DIRECTORATE.—Mr. W. D. Gibbon was re-elected a Director.

AUDITOR.—Mr. John Guthrie was re-elected Auditor for the Company.

THE IMPORT DUTY on quinine and its salts in Portugal is now 8,000 reis (about 36s) per kilo. (2.1-5th lb) —*British and Colonial Druggist*, July 1.

LADY-BIRD BEETLES.—In the face of what he has told us of the lantern bug attacking his own tea and the difficulty attending its destruction, we are surprised at the modest and moderate tone of Mr. E. E. Green's latest communication to the Planters' Association in regard to the introduction of Lady-bird beetles. The introduction to our mind should be regarded as "urgent." Perhaps though, this may arise from there being a doubt as to whether *Orthzia in ignis* would be dealt with by the Lady-bird beetles? Even if there be such a doubt, we should say the case is one for immediate action. It is absurd to talk of the expense—at most a very few thousand rupees—when the interests at stake are considered. We shall be much disappointed if the P.A. leaders do not decide to share in Mr. Newton's mission or to start an independent one, looking to Government for a moiety of the required outlay.

### RULES FOR PLANTING PADI IN THE MATANG DISTRICT.

No. 361.—The clearing of all fields to be commenced not later than the 20th June. Nurseries to be commenced not later than the 4th July, and completed by the 14th July. The planting of *padi* to be commenced not later than the 24th August, and completed by the 30th September. It shall be lawful for the District Magistrate to alter, at any time, the dates on which any of the above operations shall take place if, owing to drought and other causes, it is found expedient to do so, due notice being published in the *Government Gazette* and given to planters and all others concerned of such alteration being made.

Any person who shall commit a breach of any of these rules shall be liable, on conviction before a Magistrate or Penghulu, to a fine not exceeding \$5, and in case of a continuing offence to a fine not exceeding \$1 for each day during which such offence is continued.

13th June, 1898.

### THE CINCHONA COMBINE.

The three cinchona bark auctions in Holland, which were to be an experimenting ground for an attempt by importers of the bark at a combination, are now things of the past, and yet the association which promoted these attempts has had little or nothing to say as to the success or non-success of its plans. Our market reports have, of course, shown the main fact that the effort to maintain cinchona bark at the unit ruling at the time the project was started has failed, and we have also thought it was only fair to place considerations before our readers which to an extent excused the failure of the importers. No official explanation has, however, been given in Amsterdam, but in Java a criticism of the circumstances surrounding these three auctions has appeared from Mr. E A Van Winning, one of the Java growers of cinchona bark. This gentleman, writing from Bandoeng, deals very fully with the case. He recognises that the attempt to keep up prices has failed, but, as is to be expected, he does not put this down to any fault of the cultivators. Indeed, he surprises one by insinuating that there was much more real combination amongst the growers in Java than there was amongst the importers in Amsterdam. The principal growers, he says, had made some kind of working arrangement which was frustrated by the action of their agents, the importers. In Amsterdam the whole thing became a comedy, and he lays a great deal of the blame for what has happened on those who were not loyal in helping the combination and on speculators.—*B. & C. Druggist*, June 17.

### PLANTING IN NEGRI SEMBILAN STRAITS.

(From Report on Land Department, Coast District, 1897.)

ESTATES.—Early in the year the Port Dickson Coffee Company completed the planting of the 700 acres previously cleared by them. Mr. Robert Engler obtained a concession of 640 acres of land for planting coconuts adjacent to the 300 acres already planted up by him at Pasir Puteh, and has already begun operations. A small coconut plantation was begun by Mr. C. Malcolm Cumming on the Lukut Road, the land selected being deserted kampong land, grown up in lalang and blukar. The owners of tapioca estates are year by year planting less and less, and in my opinion, it will be a blessing to the district when this form of cultivation ceases altogether. To judge from the customs returns, the cultivation of gambier and pepper is on the increase, 39,290 pikuls of the former having been exported during the year. The largest of the gambier and pepper estates is owned by a Chinese firm in Canton, which is represented by Loh Cheng Keng, and is situated between

the Lukut and Sepang Rivers. It would be tedious in a report of this kind to go into detail with regard to the way in which these estates are managed and worked, and also superfluous, as I am led to believe a report on the working of them will shortly emanate from another quarter. When the Sengkaug Gambier and Pepper Concession fell in, about 6,000 acres of it was applied for by the executors of the original owner, Toh Eng Siew. The survey is now complete and I am led to believe that the amount alienate will reach nearer 8,000 than 6,000 acres.

### MR. W. MACKENZIE AND TEA: AN INTERESTING LETTER.

Kandy, July 12.

SIR,—I enclose copy of a letter received by Mr. Lane from Mr. Mackenzie, together with the newspaper cutting referred to.

I am, sir, yours faithfully,  
A. PHILIP,

Secretary to the "Thirty Committee."

London, June 24.

Dear Lane,—I arrived home this day last week.

Thanks for your letter of the 31st inst. The China blacks we have been displacing, were quite 2d nearer 1/4d cheaper than our black tea. Japans are at present dearer than our teas in America. By the new tea law Japan inferior tea is excluded and the average price has gone up considerably. I enclose a cutting from the "Canadian Grocer," of 10th June, which, while it shows Japans were being quoted at 1/4 to 1s 5/4d, speaks of the very poor quality of Ceylons! See bright flavory pekoes are practically unobtainable in Ceylon.

This week's mail has brought me depressing reports of the result to tea of a duty of 5d per lb. while coffee, already so absurdly cheaper, gets off free. I have heard today, that a strong agitation was being got up to have both articles treated equally, but with what success remains to be seen. I am arranging for the effort we are to make in Canada. I am glad to say a strong Colombo and London firm are contemplating action in Canada. I had an interview with them today.

I can learn nothing of the "Nirvana" Company here, although they are described as of Colombo, London, New York and Vancouver. I have written to New York and Canada about them.

Rogivue is in London, I hope to meet him. Large quantities of Ceylons have been bought for him recently.

I was given a sample yesterday of a very rubbishy Ceylon Tea, which was sent here to be matched. It is reported too poor to be matched here. Yet the Committee has helped the men introducing this rubbish to a new country. I am not allowed to disclose the name. Since such tea is made, it is well it should find a market elsewhere than in London.—Yours faithfully,

(Signed) WM. MACKENZIE.

(Extract referred to from the *Canadian Grocer*, June 10th.

The one or two wholesale houses which brought on Japan teas by the first steamer are quoting 28c. to 35c. (14d. to 17 1/2d) per lb. There have been a good many transactions in Ceylon teas of low and medium grades during the past week, and there has been a little doing in Indian growths, but other descriptions are neglected. The Ceylon teas arriving this week are not showing nearly as good quality as those which arrived a month ago, and advices from Colombo and London say that fine teas are becoming scarce. Bright, flavory pekoes are practically unobtainable in Ceylon. A few China green teas were shipped to the United States this week, while some teas of the same description, which had been rejected by the tea inspectors in the United States, are being offered this week in Toronto.

## DAMAGED PADDY.

The following has been handed to us for publication :—

To the Director, Royal Botanic Gardens.

SIR,—I have the honour to return the enclosures, relating to samples of injured paddy from Batali in the Hapitigam Korale.

2 I have carefully examined the samples submitted. In addition to the insects noticed in previous samples, I now find a considerably larger beetle, apparently allied to the genus, *Tenebrio*: also large numbers of the larvae of another grain beetle—*Tenebrides Mauritanicus*—a species that is found in stored grain all over the world. While itself feeding upon the grain it is partly carnivorous and will attack and destroy the grubs of other grain-feeding insects. The presence of a few small earwigs was probably accidental.

3. With a view to testing the relative amount of injury caused by the several species of beetles occurring in damaged paddy, I have confined living examples of the insects in separate boxes, and supplied them with sound uninjured grains of paddy. I have been considerably surprised to find that after several days (in one instance eight days) the grain has been absolutely untouched. In one instance only a discoloured and defective grain had been perforated. *It would appear therefore that well developed and properly dried grain are impervious to attack.*

4. A question therefore arises as to the real cause of the excessive injury to stored grain and the sudden increase in grain-feeding insects noticeable in Ceylon at this time. It should be ascertained if any difference in the quality of the grain was noticeable at the time of harvest, whether a larger amount of defective grains were present; whether there had been any disease (fungal or otherwise) in the growing paddy; or whether any circumstances occurred at the time of harvesting to prevent the proper drying of the grain before it was stored.—I am, etc.,

(Signed.) E. ERNEST GREEN,  
Hon. Government Entomologist.

Eton, Pundaluoaya, June 21, 1898.

The Director of the Royal Botanic Gardens reports as follows on the above:—

The insects appear to be beetles and earwigs. There appear to be more insects than in the previous samples, but the naphthalene treatment is equally efficacious with all.

I would call attention to paragraphs 3 and 4 of the report, which seem to indicate that the pest is largely due to bad drying of the grain before storage. Would it be possible to find out through the headmen, if any of the causes suggested in para 4 by Mr. Green have been at work?

(Signed) J. C. WILLIS, Director, Royal Botanic Gardens.

The Kachcheri, Colombo, July 1.  
WEEVILS.

Sir,—I have the honour to inform you that, from reports received from the Mudaliyars, it appears that the weevils are largely decreasing. The drying of the paddy in the sun and mixing it with certain leaves seems to be effective.

2. Some of the Mudaliyars attribute the disease to the fact that there were heavy rains at harvest time, and that the paddy was not properly dried. It has now been noticed that paddy stocked in houses or near fire places has not been attacked, and it seems probable that the existence of the

animals is due to the dampness of the paddy when stocked.—I am, etc.

F. R. ELLIS, Government Agent, W. P.

J. S. DRIEBERG, Office Assistant.

The Hon. the Colonial Secretary.

Mr. Willis reports on the above :—

This confirms the statement made by Mr. Green in Report referred to. I think the weevil will probably soon die out, but appear in numbers again at some future season, when people have once more become careless about drying.—I am, etc.

(Signed) JOHN C. WILLIS, Director R.B.G.

Peradeniya, July 8th 1898.

## THE DIRECTOR OF THE JAVA BOTANICAL GARDENS IN CEYLON.

### HIS IMPRESSIONS.

We briefly referred, the other day, to the visit of a distinguished scientist to our shores in the person of Dr. Treub, the Director of the Botanical Gardens of Java. Dr. Treub arrived in Ceylon, on the 23rd of June, and since then has been visiting several places of interest in Ceylon, accompanied by his curator, Mr. Wignam. He has come in his official capacity, but the doctor's visit has no special aims, he informed the reporter of a contemporary that beyond collecting information of interest to himself. The first place he visited in Ceylon was the Peradeniya Gardens, and then he went on to Hakgala-Badulla, and Anuradhapura, to all of which places he was accompanied by Mr. Willis, our Director. Dr. Treub also went on to Galle, whence he returned and then went to Heneratgoda to inspect the gardens there. Questioned first as to

### THE PERADENIYA GARDENS

the doctor said that what struck him most in connection with it was its extremely fine situation. It was the best situated Botanical Garden he knew of, what made it so being the beautiful river that skirted the gardens, which with such an advantage

### HAD NO EQUAL.

What they had in Java was only a mountain stream, and nothing like the Mahaweli Ganga of Peradeniya. The gardens besides had excellent slopes and the general scenery was very striking, while the place, he thought, was very well laid out indeed. As to the botanical specimens in the gardens, he was much struck with them, and particularly with the giant bamboos. The rubber trees near the entrance he considered very fine specimens indeed; while the banyan trees were also striking. Dr. Treub spent some time in Peradeniya collecting information, and he is loud in his praise of Mr. Willis for his unremitting attention and hospitality.

### HAKGALA PRAISED.

From the Peradeniya gardens, Dr. Treub went on to Hakgala, and when asked what he thought of the garden there, he started with the exclamation "Oh!" and said he never saw anything like it in the tropics. In fact he never saw such a grand garden in Europe; and he was much struck with the splendid display of European flowers. They were excellent specimens, and the garden was well laid out and apparently well cared for. The advantage was that it was near Nuwara Eliya, which gave many people an opportunity of visiting it. In Java, they had mountain gardens at an altitude of 5,000 feet; but they were isolated and were seldom visited. Dr. Treub also spoke very well of the orchard at Hakgala, and specially mentioned the luxurious growth of the papaya fruit. In regard to

### THE GARDENS AT BADULLA AND ANURADHAPURA

Dr. Treub, of course, had not much to say, but he considered them very profitable things, and thought they should be kept up, though he did not think much of the soil at Anuradhapura, as he thought it too sandy. In speaking of his visit to Badulla and Anuradhapura, the doctor, referring to the scenery generally, enthusiastically praised it.

THE REMARKABLE EXTENT OF OUR TEA AREA.

He was struck with the splendid foliage wherever he went, and the stretches of tea between Peradeniya and Bidulla were magnificent. He never saw a more extensive area of tea, and he thought it remarkable. The flush, as far as he was able to see, was splendid and he thought tea ought to thrive well always in the mountain districts of Ceylon, and in this connection he particularly mentioned Scrubs estate in Nuwara Eliya.

A VISIT TO THE MUSEUM.

Dr. Treub though going to Galle, only visited the Southern capital to see the place, and he did not visit Mataara, where, as most of our readers are aware, there is a thriving Botanical Garden of some interest. The doctor paid a visit to the Museum where he was taken round by Mr. Italy. Dr. Treub thinks Colombo must congratulate itself on the valuable collection at its museum. The specimens were remarkably well-kept for a tropical country, and as he knew the difficulty there was himself he must confess that the collection at the Museum was in very good condition indeed. Dr. Treub also went round the Library, and he was much interested in the books to be found there.

DR. TREUB'S NEXT ANNUAL REPORT.

At Heneratgoda gardens the Doctor was met by Mr. Willis, and he returned to Colombo in time to catch the German Lloyd steamer on his way to Java through Singapore. This is Dr. Treub's first visit to Ceylon, and he said he would carry back very favourable impressions of Ceylon and the hospitality meted out to him here. His notes on his visit will probably appear in his next annual report in the same way as he referred to his visit last year to Singapore and Penang.

CACAO—AN ESTIMATION OF THE CHARACTERS OF THREE VARIETIES.

Wishing to ascertain for ourselves whether there was any essential difference in the character of various samples of cacao when worked up or manufactured for consumption, I obtained three samples through the kindness of the well known firm of Messrs. Gordon, Grant & Co. of Port-of-Spain, our chief town. These samples were accurately weighed to 10 lb each, and were then roasted and ground and the fat extracted by an ordinary press. The percentage of fat is not so large as might have been taken, but as in each case the means used was identical, the results are directly comparable as to the relative proportion shown in the tables of results. The character of each cacao is exhibited most distinctly by the colour and flavour of the dry powder, and by the colour, character and flavour of the fat extracted. The cacao powder, cocoatina cocoa or essence, which we produced, is an article which can be used in the same manner as ordinary cacao powder of the larger manufacturers, and is of course a perfectly pure article. The value of the powder can be estimated if we allow a certain per cent for process of manufacture. Our own experience is too limited to fix this with accuracy, but it may be for our present purpose taken as twenty per cent.

The cacao powder produced is seen to average some 55 per cent of the total weight of cacao operated upon, and therefore we have a saleable article at a loss of 45 per cent of the original weight. Now the value of cacao at the time of the operation was averaged at 14 cents per lb, and therefore the cost of the powder not allowing for value, of fat, and sale of waste—and not admitting cost of manufacture, is more than double the cost of raw material—or some 30 cents per lb. When, however, some 15 per cent or 20 per cent fat is sold at 1s 3d per lb and the husk at lower value, it will greatly reduce the cost of manufacture, and it can be clearly seen that *Pure Cacao Powder* can be produced at reasonable rates, leaving a good margin of profit, and also that the admixture of starch and sugar is not in any

way required, either for the purpose of making it palatable or as an improvement to the keeping qualities of the article. The public should therefore put down adulteration by demanding nothing but a pure cacao powder, which is in every way a palatable and nourishing beverage. One of the facts to be noted is, that the mild flavoured and light colored Venezuelan cacao is rated at the same value as ordinary Trinidad, although it is evident it produces a cacao powder in every respect superior to "Ordinary" Trinidad cacao.

The following are the tables of results of our late experiment:—

NO. 1.—VENEZUELAN FINE CLAYED CACAO, VALUED AT 14C. PER LB.—MESSRS. G. G. & CO.

1	Weight received from G. G. & Co.	10 00	lb
2	Weight when roasted and cleaned	7 55	..
3	Weight of Husk	1 63	..
4	Weight dry Cacao after fat was removed	5 50	..
5	Weight of Fat extracted from 7 55 lb	1 23	..
6	Loss during roasting and cleaning	77	lb
7	Loss during grinding and expression of fat	82	lb
8	Total loss of manufacture	1 59	..
	Loss roasting, cleaning and extracting fat and husk	32 7	Per cent
	Dry Powder	55 0	..
	*Fat	12 3	..

Notes.—The loss is larger than it would be with larger quantities.

Comparing samples Nos. 2 and 3, it is seen that clay is to be estimated at about 1½ per cent.

NO. 2.—TRINIDAD "FINE ESTATES" VALUED 14½C. PER LB.—MESSRS. G. G. & CO.

1	Weight received from G. G. & Co.	10 00	lb

—Trinidad Royal Botanic Gardens Bulletin.

\* Fat should be slightly more, owing to absorption during extraction of first samples, possibly 13 per cent.

## THE IMPERIAL TEA DUTY.

From the letters and hints, which reach us from planters in different parts of the country, there is evidently a good deal of difference of opinion on the subject of abolishing the duty of 4d a lb. on tea entering the United Kingdom. The argument is used in some quarters that good sound tea is now sold, notwithstanding the duty, at a price well within the means of the British labouring-classes; and this is clinched by the further argument that the abolition of the duty would tell all in favour of the lower grade teas. The fear indeed is, that with no duty to pay, inferior Chinas would be rushed in and by their extreme cheapness tend to deprave the taste and destroy the market, among a certain proportion of the people, for good and sound teas. The answer to this is that a people once won over from China to Ceylon and Indian teas, are never likely to go back; and that among the lower classes in the United Kingdom there is often a keen appreciation of good tea and a determined intolerance of anything cheap and nasty—"fusionless" as many old wives describe tasteless infusions. There is much truth in all this, and much encouragement to hope for an increased consumption of Ceylon and Indian teas, were the duty reduced, if not removed altogether. Nevertheless, there is no denying the fact that at this moment, even with the barrier of a four-penny duty, there are shippers enterprising, or reckless enough, to send to England from Ceylon (and we suppose from India) teas which are described as "rubbishy" and a libel on the good name of the country whence they are exported. Now, again, with this object-lesson before us,—asks a planter who is all for the maintenance of the duty,—what may we fairly expect if there is no duty? And he goes on to insist that one result will be a large increase in the shipment from Calcutta and Colombo of the very cheapest and in many cases of "rubbishy" teas, to the great detriment of legitimate trade and of good well-made teas. There is always a residue of the British people, he thinks, who cannot resist the attraction of great cheapness and the evil will spread among the rising generation around them. So that, the typical Ceylon proprietor of whom we speak, would vote for the maintenance of the present imperial tea duty, as a protection against a greatly increased export of cheap and even rubbishy teas. Now this is a "planting" view of the case which never strikes the reformer in love with the policy of "a free breakfast table" or rather on the principles of free and unrestricted trade the latter would welcome the increased influx of all sorts of tea: "people will soon find out what they like and want, and that they ought to have, however cheap or even rubbishy in some persons estimation." There are also among the great tea-traders and Mincing Lane authorities those who welcome any change that brings a larger volume of trade; although, we presume the leading brokers in the India and Ceylon tea trade would hesitate to approve of any step that affected the consumption of the better class of teas. Probably, the carefully weighed opinions of such experts on the questions which we have summarized and formulated in the foregoing remarks would be of more value, and carry greater authority, than any other utterances available.

For ourselves, we have long been inclined to advocate a medium course on the ground at once of prudence, expediency and feasibility. We do not believe for one moment that the total abolition of the tea duty will be sanctioned or voted by the present House of Commons. In this time of war, and rumours of war, there are stronger reasons than usual for resisting such a proposal. The Chancellor of the Exchequer has shown that each penny of the tea duty means very nearly a million pounds sterling in revenue. Even if all were "peace" with no warlike cloud on the horizon, to sweep away in one year four millions sterling of revenue, would be well nigh impossible. Sir Michael Hicks-Beach shewed that in his last budget, the surplus would not permit of the 2d reduction in the tea duty which Sir Wm. Harcourt preferred to the amelioration of tobacco levies, and the latter on learning the fact, at once withdrew his opposition. It is difficult to surmise whether the current fiscal year's surplus will be equal to, or greater than the last; but to our mind, the wise course to advocate is one of gradual reduction of the duty, and so the nearer we get to total "abolition," the better able shall we be to judge of the effect as regards the export of, and market for, cheap and rubbishy teas. It may be argued that "abolition" ought to be memorialised for, even if the petitioners would be content with a reduction of the duty by one-half. We scarcely think so, and for this reason. There must be a large number of men on both sides in the House of Commons who would absolutely refuse to support a movement for "abolition"; but who might well be won over to support a movement for gradual reduction, and by their aid in speaking here and there during the recess, it could be made clear to the Chancellor of Exchequer that "something must be done." If the Ceylon and Indian planters with their friends at home press for a reduction of the duty to two-pence, they would, we think, meet with far wider parliamentary and general support, and they might well hope that if Sir Michael Hicks-Beach did not see his way to sacrifice two millions sterling of revenue in 1899, he might, at the least, consent to spread the loss over two or three years—reducing the tea-duty to 3d from May 1899 and to 2d from May 1900 or 1901. By this means the effect of a policy leading to abolition could be fairly and fully judged by the tea planters and their friends.

## RANGOON RICE FOR CEYLON.

Mr. Owen De Rin, who was interviewed by one of our representatives recently stated that Rangoon rice had been imported by Messrs. Lee, Hedges & Co., and distributed through the Chamber of Commerce, to several merchants in Colombo, who had sent it out to various estates in small lots of from five to fifteen bags, where it had been issued to the coolies. The superintendents had not had time yet to make any definite report, but it appeared that the coolies do not show any dislike to it, neither do they take to it readily. The rice appears to be sound, and considering the great difference in price between it and the Calcutta article it was in quality satisfactory. It would be an inducement for the coolies to take it if they had to actually pay for it: and if only the planters could reason with the coolies and induce them to accept it. The quantity sent, however, was not large enough to give a fair

trial, and they should have further supplies so that each estate could have a run of it for a fortnight at least.

My own impression is, continued Mr. de Run, that the Calcutta rice will revert to satisfactory prices in the first week in August, and will be able to compete with Rangoon rice. The shipping difficulties are over and the plague restrictions are not so stringent. The reason why the prices are firm in Calcutta is because a large percentage of paddy in the dealers' hands is not turned into rice, until they are satisfied that the incoming crop will be a good one. The latest reports received by local dealers show that the crop will be a good one, and therefore this old paddy, with a large percentage of the new, will be turned into the market.

In another column we publish a very interesting Report by Mr. Jackson, Acting Collector of Customs, Colombo, and Mr. E M Shattock, of Messrs Lee Hedges and Company on their recent visit to Rangoon to make enquiries into the conditions of the Burma rice trade with special reference to the supplying of Ceylon with a rice suitable to the needs of her coolly population. There was recently a boom among the Colombo Chetties in broken rice from Burma, but the coolies refused to purchase it and planters would not take it at a gift. The schemes put forward in the Report under reference seem to be thoroughly practical and business-like and there is probably a great future for Burma rice in Ceylon.—*M. Mail.*

MINOR PRODUCTS REPORT.

CARDAMOMS.—Offered, 434 cases. Sold 346. The following rates were obtained:—Ceylon-Mysore, fine bold 3s 9d to 3s 11d; fine medium bold 3s 3d to 3s 4d; fine medium 3s; fine small 2s 3d to 2s 5d; good medium bold 2s 9d; good medium 2s 5d; good small 2s 1d; brownish and splits 1s 11d to 2s 1d; seeds 2s (low) 2s 9d. Ceylon—Malabar, fine bold 2s 9d; fair small to medium, 2s 3d. Native, lean long 2s 9d.

KOLA NUTS.—Offered, 19 packages. Sold, 19. An unusual clearance was made from the catalogues in the case of this article; bold West Indian and Ceylon nuts each fetched 2½d, and fair washed nuts offered without reserve 3d.—*British and Colonial Druggist*, June 24.

CINCHONA.—The monthly auctions were held on Tuesday, when only a small quantity of bark was offered. A fairly animated tone prevailed throughout, and the bulk of bark offered was sold at fully previous London sales' prices, and rather better than at the last Amsterdam auctions. The unit averaged ¾d to 1d per lb. The ten catalogues comprised 2,724 packages (against 4,145 in May), which were divided as follows:—

	Packages.	Packages.
East Indian cinchona ..	1,898	of which 1,766 were sold
South American cinchona (Calisaya) ..	349	do 152 do
Java cinchona ..	226	do 213 do
Ceylon cinchona ..	224	do 189 do
American Cinchona ..	27	do 27 do
	2,724	2,347

CEYLON.—Ledgeriana, natural stem chips, 2½d; branch, 3½d; renewed stem chips 4½d; and root, 5d per lb. Succirubra, poor to fair stem chips and shavings, 1½d to 2½d; ditto, renewed, 2d to 2½d.

COCOA-BUTTER.—The next cocoa-butter auctions will be held at Amsterdam on July 5th, and will consist of 60 tons Van Houten's and 10 tons Helm brand. On the same date 40 tons Cadbury's brand will be offered in London.

COCAINE.—The official quotations for muriate are 9s 5d and 9s 6d, but a small amount of business has been passing at a few pence less per oz.

CITRONELLA OIL.—Business has been done this week at 12 1-16thd per lb. c.i.f., for October shipment.

COCA-LEAVES.—Ceylons sold at 7½d per lb for good bright pale. Truxillos were offered and bought in at 6d per lb. Privately Huanoco leaves are 10d per lb, c.i.f.

CROTON SEEDS.—In better supply, and slightly cheaper for second quality, which sold at 65s to 71s for medium sizes, slightly dull; 85s to 87s 6d was refused for fine bright, and from 90s to 95s per cwt. is wanted.

LEMONGRASS OIL.—Quiet. An attempt on the part of speculators to "bull" the market had no effect upon it, and there is plenty oil available in London at 4d to 4½d per oz. on the spot, while there are sellers forward at 3½d, and buyers at 3½d. In auction a parcel was offered "without reserve," and sold at 3½d per oz. Another lot was bought in at 5d.

VANILLA.—Easier. Only Mauritius sold. They were mostly good beaus, well-frosted or chocolate, and the following were the rates realised:—5½ to 6 inch, 17s to 17s 6d; 6½ to 7 inch 19s, 18s 6d, 16s, 20s 6d; 7½ to 8 inch 20s; 7 to 7½ inch 17s. Small brownish beans: 3½ to 5 inch 16s; 4½ to 5 inch 13s 6d, 13s; 4 to 5 inch 13s; 5 to 5½ inch 15s; 5½ to 6 inch 15s 6d; 6 to 6½ inch 14s 15s; 8 to 8½ inch 16s 6d; slightly mouldy 5s 6d. The exports from Tahiti in 1897 were 75,740 lb (£35,408) against 59,134 lb (£16,957) in 1896 and 50,628 lb (£7,209) in 1895. In 1897 the value of the vanilla sent to the United States was £20,236; Great Britain £2,249; New Zealand £6,281; and France £6,642. In January 1897, vanilla at Tahiti, was worth £1 per kilo, and it gradually rose in value to £1 16s per kilo. In April, after which it gradually declined to 16s.—*Chemist and Druggist*, June 25.

TEA SEED.

A writer on "Tea Seed, its Varieties and Capabilities," discusses the subject of how many different kinds exist at present. He states that "there are two varieties of Manipuri that exist in what is known as the small black one, and the yellow one." Hundreds of maunds of this seed have passed through my hands, but I have never noticed that there existed the two varieties named. We all live and learn. I should like to know if any of my brother planters have noticed that Manipuri seed is of two kinds, black and yellow. Jacobson in his "Handbook for the Cultivation and Manufacture of tea in Java" writes:—"A change in the plant takes place, by changing the seeds in different lands. A difference in the colour of the fruit becomes also perceptible." I have consulted several works on tea but can find no other allusion to differences in colour of seed. Bad seeds, those which have kernels and are merely shells, are of a sickly yellow colour, but I doubt if good, sound seeds vary in colour. Dr. Watt distinguishes different varieties of tea by the number of veins in the leaf but we want to know more. A small pamphlet before me gives the following information:—"There are several varieties of the tea-plant, each of which is called after the country in which it is found growing wild or to which it is indigenous. The principal of these being the following, viz:—The China variety is a small bush, growing under favourable circumstances to 8ft. or 10ft. in height. The Assam variety is a free growing shrub, growing to 20ft. or 25ft. in its wild state. The Cachar variety is a very strong growing plant, and is found wild in the jungles as a tree from 40ft. to 50ft. in height. The Manipur variety also grows as a tree, but is not so strong growing as the Cachar variety, and has more lanceolate shaped leaves. There are numerous hybrids between these, the best yielding of which, are found to be the hybrids between the indigenous Indian varieties and the China plants." Such is the meagre information supplied. The chapter on tea seed has yet to be written, for none of our present works on tea exhibit any really definite knowledge of the subject.—*The Planter.*

PRODUCE AND PLANTING.

A LARGE ORDER.—The *Ceylon Observer* modestly puts forward a suggestion for improving the position of the Ceylon tea industry. This is to be done by bringing about the humiliation of the great tea distribution houses who have failed to do justice to Ceylon tea, and the establishment of a system of direct trading. As this savours somewhat of a large order, it is as well we should quote our Ceylon contemporary on the subject. (Quotations follow.)

A DANGEROUS MOVE.—We do not wish to damp the ardour of the writer of the above. Ceylon planters we know are, enterprising enough for anything, and if 1,600 planters were to supply their friends with samples of superior tea the effect might be electrical. It is well to point out, however, in justice to the distributing firms, that they, or at least some of them, have spent large sums in advertising and pushing tea. It is quite true that in the first instance they were apathetic on the subject of Indian and Ceylon tea, and so long as China held the field they were content to ignore British-grown tea, leaving planters to do the pioneer work, and when the public began to recognise the merits of Indian and Ceylon tea the dealers, wholesale and retail, took advantage of the new departure. All this true. It cannot be denied, however, that when once the public taste for tea had been tickled in the right direction, the dealers helped things along very considerably. If the work of popularising these teas had been left to direct supply associations the work of supplanting China would have made but slow progress. Farmers and fruit growers have tried the direct supply system, but the consumer is a queer customer, and it takes him a very long time to think out new methods. The large tea dealers or distributing firms may be all that the *Observer* thinks they are and more, but they too have the bug bear—keen competition—to contend with, and although large profits are made by successful tea-dealing, an extensive knowledge of the business is required. These terrible distributing houses may be great sinners, but they have their uses, and we think that were the advice of the *Ceylon Observer* followed some regret would also follow in its wake.—*H. and C. Mail*, July 1.

RICE GROWING IN THE TRINCOMALEE DISTRICT.

Having had the opportunity of visiting the village grounds of Tampalagamattu, and spending a few days in the vast rice growing plains there, I trust some notes on the mode of cultivating paddy in that part of the

TRINCOMALEE DISTRICT

will be of interest. To begin with—the measures of capacity in vogue as regards buying and selling paddy, are as follows:—120 *nalies* make 1 *amonam*; 1 *amonam* equals 10½ bushels. The size of the “*nalies*” or baskets vary in different “*pattus*” or divisions. “*Pinnari*” is the only cultivation carried on under the catchment area of the “*Kanthalai*” tank, and the fields are not manured.

The cultivation of paddy is pursued as follows:—The seeds are steeped in water and left covered, to germinate, as they do in four days’ time, then washed in water and spread under shelter, and on the sixth day to the fifteenth day they are scattered in the different beds or pans prepared. This commences in the beginning of April and the grown crop is reaped in four months’ time. The method followed is in this manner:—After letting in water for about two weeks, the fields are trampled by buffaloes in February and March, and the dams are banked and then, after one or two weeks, retrampled, and any mending or patching work is done to the embankments—the pans are afterwards trodden over by foot so that whatever tufts of grass or any vegetable matter lying on the surface may be pressed into the earth and buried. The surface of the beds are then made even and smooth to be perfectly level. This process is done by foot in ankle deep water, and afterwards

a small supply of water is let into each bed for a week or two, to imbue sourness, or tart, or taint the soil and keep it moist (to idiomatically express it as explained in Tamil) and then the fields are sown. In beds of poor soil, fresh water is let in two or three days after the seeds are scattered for growth, and in rich soil five or six days after; but drained off. This process is repeated two or three times or days. In eight days’ time the paddy will have sprouted and then a little water should be caught in to rot or destroy the grass and herbage.

The following descriptions of paddy are usually sown:—“*Ottavaleu*,” “*Sempa*,” “*Sellakadha*,” and “*Pern nelli*.” The first two shoots into ears in 80 or 90 days, and can be reaped in four months’ time, and the others in lesser time by 15 days or so. The following show the income of a field eight acres in extent, which is equal to twelve “*chundus*.”—Calculated 9 *amonams* Land share 6 baskets equals ¾ *amonams* for a *chundu*.

Do	3	”	Seed paddy 2 <i>amonams</i> with interest at ½ per one.
Do	4	”	Buffalo hire, 1 <i>amonam</i> each pair.
Do	6	”	Consumption paddy, with interest at ½ per one.
Do	3	”	(say)
Expenses incurred, for advances in money			Chargeable against cultivation and are repaid in paddy taken over at Rs per <i>amonam</i> , however much more in value the market rate of paddy may be.
Wages of hired sower			
Wages of bird drivers			
Watcher			
Vatti Vidhan			
Repairing fence			

25 *amonams* at R10 per *amonam* amounts to R250, equal to R750 in one year.

It requires two cultivators and four pairs of buffaloes to cultivate such an area. Consumption paddy is estimated at two *amonams* for each cultivator. You and your readers can just imagine what the income is, without failure or damage or insect destruction.

PLANTING NOTES.

CACAO ANALYSES.—Mr. Cochran has now sent in his Report on this subject to the Planters’ Association: it will be looked for with interest in due course.

JAVA CINCHONA.—The cinchona of Java, which produces about two-thirds of the world’s supply, has for years been regularly shipped to Holland, where it has been sold at public auction. The large quinine manufactories, mostly situated in Germany, who supply themselves with the raw material in the Dutch market, have, however, during the last five or six years combined to keep prices at such a low level as to render the cinchona cultivation unprofitable, notwithstanding the fact that large dividends have been derived from these manufactories, part of which should rightly have found their way into planters’ pockets. In order to counterbalance the influence of this ring of quinine manufacturers it was decided to establish a manufactory in Java. This quinine manufactory has since been erected at Bandoeng, in the Preangar Regencies, and delivered last year its first product, which is said to be of first-rate quality, and in all respects equal to the best European brands. Some large shipments of the Bandoeng manufactory’s product have, towards the end of 1897, been made to London, and smaller ones to various other parts of the world, and much will depend upon the result of these ventures. The crop of cinchona for 1897 was 7,991,502 lb. from private, and 597,224 lb. from Government lands, against 9,440,855 lb. and 631,177 lb. respectively in 1896.—*H. & C. Mail*. [There are now three quinine factories in Java we believe.—ED, T.A.]

AN AGRICULTURAL-SCIENTIFIC DEPARTMENT.—A planter writes:—"I quite agree with your editorial; but if the Colony can throw away £2,500,000, why not an extra lac? The whole Administration wants over-hauling, and the sooner the better."

SCIENTISTS AND EXPERTS are all very well in their way, says a correspondent of the *Calcutta Planter*; they can, undoubtedly, afford us great assistance, but the real backbone of the industry is the *practical* planter. Without his co-operation and assistance little hope can be entertained of the tea enterprise making much headway.

"THE INDIAN FORESTER."—Edited by J. S. Gamble, M.A., F.L.S., Conservator of Forests, and Director of the Forest Schools, Dehra Dûn. Contents. No. 6— for June 1898:—Original Articles and Translations; Correspondence; Official Papers and Intelligence—How rubber trees are grown in Assam, by D. P. Copeland.—[We give this in *Tropical Agriculturist*.—Ed. C.O.] Reviews; Shikar and Travel; Timber and Produce Trade; Extracts from Official Gazettes.

CEYLON TEA IN AMERICA.—Mr. J. C. Larkin, of the far-famed Salada, Ceylon Tea Company of America, is indeed a sanguine individual; but, although we cannot go all the way with him in his predictions, still it is very cheering to get so hopeful a letter as he sends us in regard to Ceylon Tea Prospects on the North American continent. It is noteworthy, too, that he regards the new American Tea duty as distinctly telling in favour of Ceylon and other high-grade teas—another warning, perhaps, that the absence of a duty favours cheap inferior teas?

PORTO RICO is an extremely rich little island—not quite so big as Jamaica, 3530 square miles or 200 miles less than the aggregate of our Western and Sabaragamuwa provinces, though with less population. Hills rise to 3,600 feet: it is extremely well watered, 1,300 streams being enumerated and that it should grow and ship 500,000 cwt. of coffee; 100,000 tons of sugar; large quantities of tobacco, &c., is marvellous for its population of 800,000 with their own food to grow. But there are nearly 300 miles of railway made or under construction. Under American auspices, Porto Rico will at once spring into a new and splendid development and Jamaica may suffer from its rivalry.

CASTILLOA, OR CENTRAL AMERICA rubber, —said Mr. Hart of Trinidad in his lecture on Minor Products—is worth today from 1s 6d to 3s 7d per pound. We have trees in the Garden which will give a yield of from four to six pounds per tree per annum. Two gentlemen, who were lately here, declared on trial that our trees not only produced a fine quality of rubber, but that the yield at one bleeding was greater than any they had previously seen, and the milk itself gave a return of twenty-five per cent. of the best transparent rubber, and His Excellency the Governor has been told on good authority that rubber is a gold mine to Trinidad, if we can only work it. Returning to rubber, a Castilloa forest, if it existed today, would be a valuable property. A single tree of eight years is capable of giving at one tapping six to eight ounces of rubber, and such a tree can be tapped many times a year without injury, the number of times varying in accordance with the season. This means that an acre of 200 trees would give a gross return of some £90 per annum, while the expenditure for upkeep is much less than for any other crop generally grown.

"THE CEYLON HANDBOOK AND DIRECTORY FOR 1898-9."—In answer to numerous enquiries, we may mention that the compilation of this work is now completed; the printing should be finished within a week; and the binder begin to supply volumes a week later on. Copies will be issued according to the registered list of subscribers.

A HINT TO THE "THIRTY COMMITTEE."—In view of what Mr. J. R. W. Pigott—as an old Ceylon planter—has been able to do in making Ceylon tea known in Sicily—he got a supply regularly direct from Abbotsford estate—would it not be a good plan for the "Thirty Committee" to send a gift in the form of a sample chest of Ceylon Tea to each on a selected list of British Consuls all over the world? The recipients would be certain to take it as a complimentary bit of attention; and in return would be sure to make the tea known to their friends and probably refer to it in their Reports.

THE CEYLON AND ORIENTAL COMPANY AND COOPER, COOPER & CO.—We call attention to the full report of the extraordinary general meeting of the shareholders in Cooper, Cooper & Co. elsewhere, where much information of interest was given respecting the terms of amalgamation and the starting of a new Company with a capital of £500,000. So long as they induce increased rivalry in the tea market, the more new Companies of this kind the better. In this case, however, it will be seen the promoters talk of supplying consumers direct after the fashion of "butter and eggs from our own farm"! And also of shipping from Colombo direct to foreign markets. It will be seen that Pallakelle and other estates are likely to be included in the new Company.

GROWING TEA IN SOUTH CAROLINA AND THE WAR-TAX.—Our friend Mr. Charles U. Shepard, of the Pinehurst tea plantations, Summerville, South Carolina, is well satisfied with the war-duty on tea. He writes to us under date June 7th in the following complimentary way:—

"Thanks to the information which the highly prized *Tropical Agriculturist* affords and to the probable duty on tea in the U. S., the Pinehurst tea experiments are going to prove a success in spite of cheap oriental labor and the jeers of my friends."

That Mr. Shepard should feel indebted to the Ceylon monthly is only natural, tea being so entirely our staple of late years. It appears, however, that Mr. Shepard has taken an active part in inducing the U.S. Government to tax tea, using the following arguments in a letter to the Secretary of Agriculture:—

1st. As a source of revenue; 2nd. As inducing an improvement in the quality of commercial tea; 3rd. As an encouragement to the establishment of a tea-industry in the United States.

And then he explains about his Pinehurst experiment, adding in a subsequent letter:—

As you have expressed an interest in the "Pinehurst" work as a means of employing poor children who have otherwise no lucrative employment, I would beg to add to my letter of yesterday that nineteen coloured pupils from the "Pinehurst School" picked today from five or six acres 190 pounds of green leaf, for which they shall receive \$5, or more than 25 cents each. Some of the better workers have earned over 40 cents. This lot of leaf will make over 45 pounds of cured tea, at an outlay of about 14 cents for leaf-picking, children's lunch and supervision. As it costs about 2 cents in the Orient, the difference between us is about 12 cents. The same fields in the height of the season should afford me 50 per cent more.

**GRAPE GROWING.**—An interesting experiment is being made in Brazil, with a view of making up the loss sustained by the fall in the value of coffee. This is the cultivation of the grape. An exhibition was held last month at Rio de Janeiro, at which specimens of about 300 varieties were on view, including grapes for table and wine making.—From "The Journal of the Jamaica Agricultural Society" for June.

**CURING GOAT SKIN.**—To cure a goat's skin, trim it on the flesh side with a sharp knife, and then well brush with a solution of 2½ lb. of alum and 1 lb. of common salt in 1 gal. of warm water; the skin should be treated two or three times with this solution on successive days. Now sprinkle bran all over the skin, brush out, and nail the skin to a board and dry it. As a preservative against insects; the flesh side may be treated with a mixture of arsenic and black prep'd previous to drying.—From *Work* for July.

**THE PROFITS FROM CARDAMOMS.**—A planter writes:—"The figures in your Saturday's issue, of a yield of 480 lb. per acre over 80 acres of cardamoms, are, surely, phenomenal, and must make the mouths of planters water. At 4s a lb., that would represent £7,680 for the year—or, say, nett £7,000! Deducting this acreage and yield from the 5,153 acres under the product and the 592,830 lb. cardamoms exported last year, we have an average of only 97 lb. per acre. Is not that too low? Though even with that, if an average of 4s can be obtained, the spice must be regarded as one of our most paying products."

**THE THREATENED TEA CRISIS.**—At the meeting of the Jokai (Assam) Tea Company on June 24th Surgeon-General A. C. C. De Renzy, C.B. (chairman of the company) in the course of his address said:—

The figures given in the report showed how grievously the rise in exchange was effecting the cost of production in India, but that was not the end of the matter. The establishment of a gold standard in India would have the effect of lowering the price of tea in this market by raising the value of gold, and as it would confer a bounty of 30 per cent on China, they could hardly expect to be able to continue the struggle with that country for the supply of foreign markets, in which for the last few years, they had been finding so large an outlet for their surplus produce. If China were to continue under its present corrupt and impotent Government they might be able to continue the struggle. But how long would that Government live? Was it not almost certain that that country would shortly be opened to European enterprise, capital, and skill, and that they must look forward to planters of foreign nationality, as well as Englishmen, engaging in the tea industry in China? Favoured by a bounty of 30 per cent China grown tea would surely be able to retain its position in the foreign market, from which they had been lately so rapidly displacing it. It was greatly to be regretted that the Indian tea industry was not represented on the Commission which was now examining the currency proposals of the Indian Government. The question, in his opinion, vitally affected the safety of the Indian tea industry, and a common standard of value between India and the other countries where tea could be produced commercially was essential to its existence for any long period. Such a bounty as it was proposed to confer on China would as certainly destroy the Indian and Ceylon tea industries as the bestroot sugar bounties had destroyed the West Indian sugar industry. In conclusion, he stated that instructions had been sent to the company's superintendents to reduce expenses to the lowest possible point. The directors had also decided to stop all extensions, except such as might be calculated to reduce the cost of production on those gardens which were too small to give profitable occupation to a first-class manager. As regarded buildings, they would do the best they could with the old ones, only completing the permanent ones under construction.

**THE FUTURE OF CEYLON.**—A correspondent, writing as a merchant and owner of tea property in Ceylon, calls attention to the adverse effects on the prosperity of the island of the closing of the Indian mints. Ceylon since 1872 has had a rupee currency, but it is quite independent of India in its financial relations, and is in no way interested in the Indian debt. Yet, whenever a scarcity of money occurs in India it seriously affects Ceylon, as the Indian banks which have agencies in the Colony are instructed to remit rupees to Bombay or Calcutta, as the case may be, sometimes even selling high-class securities to obtain cash. The result is that it is difficult, and sometimes even impossible, to borrow at 15 or as much as 20 per cent. The Ceylon Government has a note issue based upon a reserve of 5 millions of rupees, about half of which is in silver in the Government vaults. Our correspondent asks whether it is not possible to use this silver in times of great pressure in the Colony for the relief of trade. And he goes on to ask how India is to compete with China if she is to have a gold standard, supposing China continues the silver standard and is opened up by means of railways. All the European nations are now interesting themselves in China. Is it not likely that China will soon become an exporter of wheat, indigo, and jute, as she has long been of tea? And if she does, with European capital and European skill to develop her resources, what is to become of India and Ceylon? The question is undoubtedly very serious, and we would commend it to the careful attention of the Committee that is now considering the Indian Government's currency proposals.—*Statist*, June 25.

**WANTED: AN AGRICULTURAL (SCIENTIFIC) DEPARTMENT.**—A well-known planter puts the question to us—"Has not the time arrived for a public agitation for a Government Scientific Department? What with weevil, cacao disease, lantana bug, etc. and the colony dependent on 'agriculture?' Surely there should be a department to look after the various interests involved." We most heartily agree. We have been pressing for reforms in this direction for a quarters of a century back. *Never was there a more pressing need than now; but then never was there a more unfavourable time for asking for a new Department!* With R2,500,000 of our revenue to be appropriated for a non-paying Railway (in utter defiance of the "Will-it-pay" test), where is the chance of getting money voted for the permanent establishment of Scientific and Agricultural investigators so much needed in the country? It will even, perhaps, come to be asked if we can afford the boon of imperial Penny Postage, although the disgrace and discredit of refusing to join in this great reform will, we hope, deter obstruction or delay. With Ceylon leading, the Straits must follow and also India we are told.—At the same time how extraordinary that a Colony so entirely dependent on its agriculture should be far behind Dependencies like British Guiana, not nearly so important, in its provision for the scientific investigation of agricultural pests. The fact is that every Civil Servant Cadet for Ceylon should go through an agricultural course after the pattern of the Civil Servants sent out to Java; and then their interest in the needs of cultivators and planters, would speedily secure the appointment of Specialists. The way, in which the local Agricultural School is allowed to drag on, is simply a disgrace to the present Ceylon Administration.

TEA DUTY AGAIN.—“The proprietor of a small totum making good teas” asks us in a private letter to state editorially whether in the matter of the abolition of the home duty on tea, the interests of Colombo merchants and of up-country planters are identical. He adds that in his opinion, a merchant cares only for more business and commissions with no special interest in the quality of the produce shipped; whereas the planter would wish to see cheap and nasty teas discouraged even if business were restricted.—There is, of course, some truth in this; but a “Proprietor” should also be fair in recalling the fact that the large majority of Colombo mercantile houses are as closely identified with the Planting Industry of the island as the planters themselves. Many firms in view of their long list of responsible agencies are, we believe, ready to put the interests of their constituents before their own—that is if the latter could be shewn to be different; many houses again own plantations; and altogether we do not think it can be fairly said there is a diversity of interests, although it is true that in a matter primarily affecting producers, the vote of the latter should carry most weight. But “Proprietor” and any others opposed to total abolition—if that is the reason of the above enquiry—can “possess their souls in patience” and take this consolation, namely, that there is not the remotest possibility of £3,800,000 sterling of imperial revenue being sacrificed in one year: one million or two millions may be managed, but that is the most a Chancellor of the Exchequer can look for in a surplus now-a-days.

MR. M. KELWAY BAMBER IN CEYLON.—Mr. Bamber returned to Colombo last evening with Mr. John Roger, who is sailing for England on Thursday. While up-country they did not go further than Kotmale and the Hatton districts, Mr. Bamber preferring to wait until the Planters' Association have decided on the question of appointing a scientific analyst. He will defer his visit to Calcutta for the present, but was unfortunate in not being able to prevent his chemical apparatus from going there. It was shipped from London by P. and O. steamer with instructions that it might be wanted in Colombo; and he subsequently wrote for it to be put out here on arrival. He could not get down to Colombo to meet the steamer, however, three days ago the ss. “Sunda” carried the apparatus away for Calcutta. It will probably be three weeks before it can be got back to Ceylon, and although there is much that Mr. Bamber can do in the meantime, the circumstance is annoying. He is not bound to time as regards his return to England. Mr. Bamber has already received instructions to visit several estates to make investigations and analyses, and should Government approve of the expenditure of the necessary amount of the Thirty Committee funds, he will no doubt receive the official appointment already referred to, and will be able to commence work without further delay. The idea, we believe, is that for the special retaining fee Mr. Bamber should devote special attention to twelve typical estates at different elevations, and in different localities, making exhaustive experiments and accumulating data of all kinds. At present nothing of this sort exists, and the opinions of hardly two planters are alike as to the various causes which effect quality and price. There can be no doubt that methodical investigation and their scientific classification will be eminently useful.—Local “Times.”

PALMYRAH FIBRE.—The industry in this product is now dying out. Less demand in the Colombo market has limited the purchase of the fibre, which is now bought at 7 to 10 cents a pound. A Colombo trader has been carrying on his trade for some time past at a godown on the 1st Cross street, Jaffna. He proposes to wind up his business, for want of encouragement, by the end of this month. It is no doubt a matter for rejoicing, that the injury to our palmyrah trees once so mercilessly committed, has to be abandoned. The craze for the fibre was then so alarming, that a continuance of the same demand, it was feared, would have caused a wholesale destruction of the trees, and starvation to the people, a large majority of whom look to the palmyrah palm for their subsistence during several months of the year.—Jaffna “Morning Star,” July 14.

CEARA RUBBER.—Near to the carriage drive is a tree of Ceara rubber, *Manihot Glaziovii*, easily recognized by its papery bark like that of the common birch. Some years ago this tree was largely planted in Ceylon for rubber, but although it grew very well indeed, the yield of rubber was not sufficiently large, and the market price was too small, to render the cultivation profitable. The rubber is obtained by scraping off the outer bark and making numerous small incisions in the stem. From these there flows a milky juice, which hardens into rubber. This species is a native of the Province of Ceara in Brazil, where a large part of the world's supply of rubber is obtained from the wild trees of *Manihot Glaziovii*. With the rise in the price of rubber and the improved methods of cultivation and tapping, &c., that are being perfected, it is possible that the cultivation of this species may again become an important industry in Ceylon, though perhaps rather in native than in European hand.—Mr. Willis' Circular in the Badulla Gardens.

THE REPORT OF THE ROYAL BOTANIC GARDEN, Calcutta, for the year 1897-98 is not a very elaborate affair. From the order of Government thereon we quote as follows:—

Plants of an economic value received especial attention. In the cold weather Dr. Prain commenced the study of the various kinds of pulses and other leguminous crops cultivated in Bengal, but as the subject is a large one, it could not be brought to completion in one season. The results of a series of experiments on the cultivation of rhea-seed were inconclusive, but they tended to show that seed derived from plants grown in Lower Bengal is very often infertile. At the request of the Reporter on Economic Products to the Government of India, certain of the varieties of cotton were experimentally cultivated, and the same officer supplied a number of tubers, bulbs, and seeds of plants of economic interest to be cultivated and determined, after they had flowered and fruited. In this way, Dr. Prain reports, the sources of a considerable number of economic products, the origin of which was unknown or doubtful, have been definitely ascertained, and this branch of study is about to be developed. The chief work of the year was the completion of an account of the *Orchids of Sikkim* by Sir George King and Mr. Pantling. This constitutes one of the finest contributions to systematic and regional botany that has recently appeared. Some valuable papers on botanical subjects were also published by Sir George King and Dr. Prain, the contributions of the latter officer including a “Note on the mustards in Bengal,” to which reference was made in the Resolution on last year's report. Sir George King, the Superintendent of the Garden, was compelled by ill-health to retire at the end of February last. He had been in charge of the Garden since July 1871, and his brilliant services have been acknowledged by Government in a separate Resolution. The Lieutenant-Governor desires also to thank Sir George King's successor, Surgeon-Major Prain, for his efficient management of the departments under his care, and for the interesting report submitted by him,

**THE FLORIDA VELVET BEAN.**—"I was induced to plant about two acres of them [velvet beans] last spring upon thin land. The beans grew nicely, and made a large amount of forage. As they were recommended as good food—both vines and beans for stock, and also regarded by some as edible table food—we cooked and ate a lot as green shelled beans. Quite a number were made sick, some before leaving the table, others later—even to twelve hours afterwards. Two who were not affected, and doubting that the beans were the cause of the trouble experienced by others, ate some cold the next day, which 'fetched 'em.' Some were seriously affected, but all recovered after two or three days. Symptoms were nausea, purging of the bowels, headache, and violent action of the heart. Afterwards, some were fed to chickens, both cooked and raw; some of the chickens died, and the beans were found, on examination, to be still undigested. Horses refuse to eat the ripe beans in the pods, and, in view of our experience, we do not care to urge them by grinding and mixing with other food. Will not our experiment station test and analyse them for poison, and tell us what is its extent, and how to overcome it?"—*The Daily Pepper*.

**TEA AND AUSTRALIAN TREES.**—We think it is generally acknowledged that Abbotsford is among the estates in the island, most fully supplied, with introduced timber, as well as ornamental trees. The *penchant* of the late Mr. A. M. Ferguson was, it is possible, to give a trial to every tree he could hear of in India, Australia or elsewhere that might be useful or interesting to grow on the hills of Ceylon. He and his son backed up by their experienced Manager, Mr. Fraser, have certainly succeeded in giving Abbotsford a leading place in the island, so far as introduced trees go. Among these the Australian eucalypti and Queensland grevilleas occupy a prominent place and being dotted through the estate from the very beginning of tea, no one is better qualified perhaps than the Abbotsford Manager to give an answer to the question said to be started by Mr. Kelway-Bamber.—Do grevilleas on estates affect the quality of the tea? Hitherto there has been unanimity in the opinion that grevillea leaves dropping on the soil did good to the teaplant; and now as regards the quality of the product, if due consideration be given to his long observation and experience, we think the letter we publish today from Mr. John Fraser should be deemed re-assuring. We have no doubt Mr. Kelway-Bamber will be much interested in reading it.

**TAHITI : EXPORTS OF VANILLA.**—In a report on the trade of Tahiti for 1897 our Consul says that vanilla, which had been rapidly increasing in value during the early months of the year, suddenly dropped to half the price previously obtained, and the Chilian and Peruvian silver dollar—the currency in which most of the trade of the island is conducted—fell to the comparative value of 1s 9d sterling. Accordingly, their expectations not having been realised, importers found themselves at the end of the year with abnormal stocks on hand and in bond, and with by no means promising out-look for the ensuing 12 months. Our Consul goes on to say that the greater care exercised in the cultivation of vanilla during 1897, stimulated, doubtless, by the continued demand and high prices ruling at the end of the year preceding, led to an increase in the export of this article of 16,606 lb, valued at £19,351. Starting in January at about £1 per kilo, it gradually rose in value until £1 16s per kilo, was reached in April, when its price declined to 16s, with little prospect of an immediate improvement in that figure. During 1897 75,740 lb of the value of £35,498, were exported, against 59,134 lb. of the value of £16,057, in 1896.—*British and Colonial Druggist*, July 1.

**THE "JOURNAL OF THE JAMAICA AGRICULTURAL SOCIETY,"** for June 1898 has the following contents:—Illustration of Dexter Cow "Red Rose," Frontispiece; Board of Management; Special and Annual General Meeting; How to Work an Incubator; Vegetable Growing; Notes from Apiary; War on the Banana; Sheep Breeding; Bad Results from the Cross-Bred Rams; Poultry Notes; Hoeing Tobacco; Grape Growing in France; Methods of Planting Irish Potatoes; Odds and Ends; War! Its Effect on the Fruit Trade; The Right Way to Set Fruit Trees; The Orange; Cheese; Recipes; The Agricultural Outlook; Questions and Answers, Prices of Meat, Vegetable, &c.

**THE NATURE OF FUNGUS DISEASES.**—Mr. W. C. Sturgis contributes to the Twenty-first Annual Report of the Connecticut Agricultural Station (New Haven, Conn.), a valuable list of the publications relating to plant diseases, issued by the U.S. Department of Agriculture and the several experiment station during the ten years, 1887-1897, inclusive. The list will be so valuable that we may express the hope that it may be circulated separately. The author has adopted popular names where they are misleading, and has endeavoured to systematise them thus, black-rot, rust, leaf-blight, leaf-spot, stem-rot, mildew, leaf-scab.—*Gardeners' Chronicle*, July 2.

**VERA CRUZ:—EXPORTS OF VANILLA AND CACAO.**—In a Foreign Office report on the trade of Vera Cruz for 1897 our Consul says that there has been a considerable decrease in the exports of vanilla. The curing of it is very difficult, and cultivators generally sell their crops to professional curiers. In 1896-97 the exports amounted to 16 tons, of the value of £47,316, against, in 1895-96, 56 tons, of the value of £101,524. The exports of cacao have been insignificant, and our Consul says that it is even imported into the country, although it produces abundantly on the coast. In the States of Tobacco and Chiapas cacao gives four crops a year. The principal harvest is from March to April, though harvesting continues all the year round. The price is very variable, being from 18 to 33 dollars Mexican per 60 lb. Cacao could be advantageously cultivated both for home consumption and for export.—*British and Colonial Druggist*, July 1.

**THE BOTANIC GARDEN, BADULLA.**—The area of the Garden being only eleven acres, it is impossible to grow more than one or two specimens of each kind of plant, and trials on a commercial scale must necessarily be made elsewhere in the neighbourhood. The function of the Garden is to grow as many kinds of useful plants as possible with a view to determining their suitability to the climate of Uva, and, should they prove thus suitable, to supply seeds or cuttings in small quantity to residents who may be desirous of giving them further trial. The Garden was opened in 1886 on some old paddy land near the racecourse; a driving road passes through it, and there are several foot-paths. Badulla stands on the eastern side of the main mountain mass of the Islands, at an elevation of 2,220 ft. It depends for its rainfall more on the north-east than the south-west monsoon, and has a distinctly drier climate than that of the western side of the hills. The mean annual temperature is about 73.9. The average rainfall is given in the following table:—

January,	9.91 in.,	February,	3.75 in.,
March,	4.24 in.,	April,	8.46 in.,
May,	5.57 in.,	June,	2.96 in.,
July,	1.54 in.,	August,	3.61 in.,
September,	2.95 in.,	October,	10.11 in.,
November,	12.21 in.,	December,	14.61 in.,
Total,	79.92 in.,	falling on	106 days.—

*Mr. Willis's Circular.*

## A FORTUNE IN VANILLA?

No wonder though our friend Mr. Hamilton Traill of Victoria expressed himself well satisfied with his Vanilla property in Seychelles when the Administrator Mr. Cockburn Stewart—who will be remembered by old residents as Private Secretary to Sir Hercules Robinson and for a time, to Sir William Gregory—reports an "estate" there (none are of large extent) as yielding £5,000 worth of vanilla. He further adds that "some of the Seychelles vanilla sent home last year was pronounced by experts to be the finest ever seen in the London market." Mr. Chamberlain sends the letter and samples to Kew, and Mr. Thistleton-Dyer gets an expert's opinion as follows:—

Report by Mr. A. C. Meyjes, of the *Chemist and Druggist*, on a sample of vanilla grown in Seychelles, and received through the Colonial Office, December 7, 1897:—"The pod you have sent is an unusually fine and long one. Vanilla of this character would probably realise about 26s or 27s per lb. gross in the London market at the present time. From that figure must be deducted certain trade allowances brokerage, &c. amounting altogether to about 10 per cent. But your friends should be careful to tie the vanilla together in bundles containing pods all of the same length, or at least not varying more than  $\frac{1}{2}$ -inch, because the pods are paid by length as well as by appearance. And further, I am afraid that the prices of vanilla are on the decline. They have been unusually high this year, and after Christmas the trade demand is apt to drop. Moreover, vanilla-growing must have been a very profitable business during the past few seasons and the usual result, viz., over-production is sure to follow. Strange to say, vanillin (the coal-tar product) has never been so cheap as now. The consumption of vanilla pods, however, is increasing every year and likely to continue to do so for a long time."

Then the pursuit looks very attractive when described by the Administrator in his Annual Report:—

"The Mexican system of allowing the vines to grow under trees nearly wild is almost universally adopted at present, and is a decided improvement on the old system of training the vine on artificial supports. Nothing pays better than vanilla. Its production costs the planter R3 per pound, and as prices vary from R8 to R16 the pound, a net profit of from R5 to R13 is the result. This year the average price was R15 the pound. The yield may be taken to be 200 lb. an acre. Taking, therefore, an average of R10, an acre of vanilla should produce R2,000. Most of the land in Seychelles is in the hands of private owners, and it is difficult to estimate its cost, but it may be taken that land can be bought at from R100 to R200 the acre. It has been stated that landowners are reluctant to part with their land, but not much difficulty need be apprehended on this score provided that purchasers are prepared to pay ready money. There is some land belonging to the Government well adapted for vanilla cultivation which can be leased for periods varying from nine to 21 years. Seychelles is, unfortunately, almost a terra incognita, but there is little doubt that if the scores of young Englishmen who leave the Mother Country year after year for other lands knew of it, they would give the preference to an English colony which offers advantages not to be met with elsewhere for the investment of small capital, say £1,000."

But there is the prospect of further extensions of planting in the Seychelles (only these islands are out-of-the-way) and the possibility of over-production: for Mr. Stewart further tells us in his Annual Report for 1896:—

"The vanilla crop of last year is the largest that has ever been grown in Seychelles—63,000 lb. The prices

ruling during the year on the London and Paris Markets have also been most favourable, and the value of the crop has been declared at R936,000."

"The large output of vanilla has given a fresh impetus to its cultivation and a very large quantity has been planted during the past year. When the country is opened up by means of roads, as will shortly be the case, many acres of vanilla land will no doubt be taken up which at present are uncultivated, owing to the difficulty of transport. In one district alone, the Mare aux Cochons, to which a new road will be opened, there are about 5,000 acres of virgin soil well suited to vanilla. The cultivation of vanilla only dates back to about 20 years ago, and is only now beginning to be thoroughly understood."

Still, there ought to be room in Ceylon—in Dumbura, around Kandy or in the low-country and even near to Colombo—for producing some of the precious pods. Mr. W. H. Wright of Mirigama is indisputably the oldest cultivator of vanilla in Ceylon and he has always been very successful. His experience and that of some other cultivators will be found recorded in our planting review in the forthcoming "Hand-book and Directory" and we really think there is room for several thousand pounds sterling worth of vanilla pods being added to our Ceylon exports without disturbing the European markets: We are glad to learn that Mr. Wright has recently had a demand for vanilla cuttings.

## PROGRESS OF CEYLON TEA:

## ADVICE TO PLANTERS.

An absent proprietor, writing to us by last mail, offers the following remarks for local consideration, and we think they deserve to be thought over:—

"With regard to tea matters I am hopeful that the Currency Commission will do us some good. Meantime, we should do all we can to improve matters ourselves. We should keep down expenditure on the estates as low as possible. The superintendents should give increased attention to the plucking and the factory, in order to improve the quality of tea. By combination, coast advances may be greatly reduced and crimping may be stopped.

"We should pluck a little finer and keep down the output of tea to something like 100 million lb. I think Mr. Mackenzie's advice, to make a certain proportion of our crop *green tea* for the American market, is excellent, as it will take so much tea off the London market. Planters should not send home so much inferior tea,—Dust, fanings, etc., fetching 2d to 3d per lb. It should be sold locally. If we were to act on these lines, we would soon again be paying 10 to 15 per cent dividends."

PAPER FLOORS.—Paper floors are enjoying a steadily increasing popularity, which is readily explained by the many advantages they possess over wooden flooring. An important advantage consists in the absence of joints, whereby accumulations of dust, vermin and fungi dangerous to health are done away with. The new paper floors are bad conductors of heat and sound, and, in spite of their hardness, have a linoleum-like soft feel to the foot. Their cost is considerably lower than that of floors made of hard wood. The paper mass receives a small addition of cement as binder, and is shipped in bags, in powder form. The mass is stirred into a stiff paste, spread out on the floor, pressed down by means of rollers, and painted with oakwood, nutwood or mahogany colour, after drying.—*Scientific American*.

### THE BOMBAY TEA ASSOCIATION, LIMITED.

This Company has just been formed with a capital of R1,00,000, divided into 1,000 shares of R100 each. In the prospectus it is stated that the annual production of Ceylon and Indian tea is about fifteen crores of lb., but the consumption in India is very small, only forty lakhs with a population of twenty-eight crores, whereas with a population of about four crores in Great Britain, the annual consumption is fourteen crores, so there is a great future for introducing tea among the masses in India. Hundreds of tea Companies and Agents in Calcutta it is said realize a good profit and pay handsome dividends. Tea merchants, agents and owners of tea estates are flourishing and making large fortunes, but it is surprising that such a well-known commercial city like Bombay has not a single tea Company, and people have no idea of the large and extensive tea industry and profits accruing therefrom. There is a vast field for such a Company in Bombay to extend sales of Indian teas in Indian and foreign markets. It is not generally known that teas from different districts in India vary in strength, quality, and flavor; some draw strong liquor, but less flavor; some have high flavor, but draw very thin light liquor; some teas are of very fine leaf, whilst others are coarse; some have tips and flowers, and others have none. Different varieties of choice teas can be prepared, by importing teas from different districts in India, such as Darjeeling, Kangra, Kumaon, Assam, Dehra Dhoon and the Nilgherries, &c., and blending them. It is necessary to open a factory where different varieties of teas can be sorted, blended and seasoned scientifically, so as not only to give good strength and flavour, but to secure perfect tea of uniform quality, and also to remove the injurious properties of teas, such as tannin and to give a stimulating as well as a nourishing drink. All these require practical knowledge and care, and it is a secret art to blend and season teas to perfection, to suit the tastes of different nations. These teas may have to be refined and packed into cheap wooden, lead and tin boxes, as well as in superior class fancy boxes, also in a variety of tin foil and lead packets of different sizes, in such a way as to suit the climate of different countries. It is also advisable to open agencies in India, and export teas to Europe, America, Australia, South Africa, and such Mahomedan countries as Persia, Asia Minor, and other markets, where Indian teas are appreciated and largely consumed. To carry out, amongst others, the above objects, the Bombay Tea Association, Limited, has been formed and registered as a Joint-Stock Company, and to start this Association on a firm and profitable footing, and to ensure success in this enterprise, it is arranged to purchase the good-will and stock of the well-known and oldest firm of Messrs. Morton, Maju & Company who have done so much for the tea industry, and were the first to introduce Indian tea into the Bombay Presidency. The business of this Association will be conducted under the immediate supervision of the experienced and enterprising proprietor of this firm, who is a well-known expert in teas. If there is a good opportunity, tea estates will be purchased which will considerably add to the profits of the company. The company will also have the power to deal in coffee, sugar, &c., and other profitable articles.

The payment of a dividend at the rate of 6 per cent at least for the first three years is guaran-

teed, and the shareholders will have the further advantage of a right to purchase from the company any of the articles in which the company shall deal at 10 per cent less than the fixed prices therefor.

### PLANTING IN STRAITS SETTLEMENTS.

(From Report on Tampin District, 1897.)

Padi planting was begun simultaneously, for probably, the first time, in obedience to the regulations issued early in the year, and, I believe, that there has never before been such a large area under padi nor, for some years, so good a promise of a fine harvest. It is impossible to speak too highly of the good derived from the issue of a few simple rules.

Tapioca planting was, during the first five or six months of the year, in a very depressed state owing to low prices, wet weather, and the bad state of the Malacca country roads; with the advent of dry weather and a slight rise in the market, however, the export quickly increased and large quantities of tapioca were taken out of Negri Sembilan during the latter part of the year. Tapioca ruins the soil, and is, nearly always, replaced by *alang* of which there are now large expanses in this district. Could fires in the small scrub and *alang* be prevented, there is no doubt that in many places the jungle would grow again and gradually kill the *alang*, but these constant fires mean death to the young trees, whilst the *alang* seems to thrive all the better after burning.

About 1,000 pikals of jungle produce were exported during the year, and the sum of \$1,436.73 was collected as duty thereon. Four thousand pigs reared on or near the tapioca estates were also exported, bringing in duty of \$1 per head.

Steady progress was made on the coffee estates owned by Europeans, and a considerable amount of new land was cleared. No coffee was exported, none of the estates being yet in bearing.

**CASTILLOA RUBBER.**—Read the following letter from Mr. T. J. Ferguson, Calicut, dated 5th January 1898, about *Castilloa* rubber:—"I am anxious to propagate plants of *Castilloa elastica* Central American rubber from cuttings as my trees seldom or ever seed and I have never been able to save any seed from these trees while the Heveas, Para Rubber, seeds freely. When these Rubbers were first introduced here I undertook to experiment on the best plan of propagating the plants rapidly from cuttings, but I failed. The late Mr. Lawson, at the request of Government, came here to look into this matter and to advise me on the subject and my opinion being that we could not propagate by cuttings except by having a propagating house with bottom heat: but this Mr. Lawson, stated was unnecessary: he spent several days with me here and planted many hundreds of cuttings of the *Castilloa* in small pots in much the same manner as I had previously done. I took the greatest personal care of the cuttings but all died, not one cutting had formed a callus, and an expenditure of R784 and much valuable time were lost, as Government would not sanction my building, a small propagating house with hot-bed to start the cuttings. If you can give me any suggestion or information in this connection I will be greatly obliged. In the case of planting cuttings, here, it appears to me the sap is drawn up and no callus is formed. I find this with *Roses* and many other plants, but I think the use of bottom heat would overcome this difficulty? If so what would be the best form of applying bottom heat here or in Wynaad for propagating purposes? a stove or a hot bed? and with a suitable propagating house and a trained man to attend to it, could the work be carried on at all seasons of the year? Mr. Ferguson has been asked to send some cuttings of *Castilloa elastica*—they will be tried in the gardens here and the results communicated to him.—*Agri-Horticulturist Society, Madras.*

RAMIE FIBRE :  
IMPORTANT PROGRESS.

The company of which Mr. Bluntschli is managing director has its chief office in Zurich, and its plantations in Sumatra. It commenced a careful series of experiments in 1894 in relation to ramie growing in Sumatra. These experiments were carried on systematically, according to intelligent methods, and had for their object to ascertain clearly :—(a) The best kinds of soil suitable for the growth of ramie ; (b) The questions of irrigation, shade, manuring, etc. ; (c) The number of roots that can be planted practically per acre—the number of effective cuttings obtainable per year—the average number of available stems per root per cutting—the average weight per 100 stems available for decortication—and the percentage of dry fibre obtainable ; (d) The best method of decortivating the stems or extracting there from the fibre and the most advantageous condition in which to send the fibre to market. Simultaneously extensive inquiries were made in Europe concerning the prospects of trade in the fibre, both as regards the quantity saleable and the price obtainable. During the experiments various methods of mechanical and hand decortication were tried, including the importation of Chinese labourers.

The company purchased through Mr. Bluntschli, a Faure decortivating machine, and having thoroughly tried it on their plantation, they were convinced that it satisfied their requirements and had solved the question of successful decortication. All these experiments and enquiries were considered terminated early in 1897, and the valuable data thus obtained, which indicated that a large profit could be realised by growing ramie on an extensive scale under favourable conditions, led to the decision to proceed energetically with the extensive production of fibre. Ample capital has been subscribed by leading manufacturers in Germany and Switzerland, and all the circumstances seem very favourable to a successful issue of the undertaking.

The company possesses upwards of 12,000 acres of land suitable for the growth of ramie. Five hundred acres are now under cultivation, an additional five hundred will be planted between now and next year, and further acreage will be planted as required. The figures relating to: the outlay of capital required for all purposes; the cost of planting; the cost of cutting, decortivating and bailing the fibre; bringing it to market; the general working expenses, have been very carefully worked out on the basis of actual experience, and show that clean, dry fibre, free from wood and skin, and freed from a large percentage of its natural gum, if sold at £20 a ton c.i.f. European port, will leave a profit sufficient to pay large dividends on the capital employed.

The question of the sale of the fibre is also in a favourable position. The two largest spinners of ramie on the Continent have entered into contracts with the new company to buy yearly 600 tons of the ramie fibre grown on their plantation in Sumatra and decortivated by the Faure machines, at a price very favourable to the buyers and very profitable to the growers. There will be no difficulty in selling the balance of the production to European and American spinners, because the fibre can be produced as cheaply as flax, and it is very much superior in every respect, viz., length, strength, ductility, lustre, etc.—*British Trade Journal*, May 1st, 1898.

THE TEA INDUSTRY.

That 1897 was a bad year for the tea planters of India and Ceylon is a fact only too well-known by everyone interested in the industry. The same tale, with little variation and very few exceptions, has been told by the chairmen of the various companies which have lately held their annual meetings. The chief causes for the set-back are the rise in the exchange, the high price of rice—the chief food of the coolie—and a shortage in the crops. The earthquake which occurred about this time last year also caused considerable loss to many companies, both in revenue and capital, while in other estates there was an unusual amount of sick-

ness. These weighty factors, sufficient in themselves to severely depress the industry, were unfortunately supplemented here, at home, by an all-round lower price for tea. The better to illustrate the position of the industry, compared with that of the previous year, we give below the net profits, etc., for 1896 and 1897, of the twelve largest Indian and eight largest Ceylon companies which have as yet published their accounts. The figures compare as follows:—

Name	Capital 1896-7. £	1896		1897.	
		Price per lb. d.	Net profit. £	Price per lb. d.	Net profit. £
INDIAN :					
Assam	187,160	12-45	43,294	11-91	31,288
Cachar and Doorga	153,000	7-00§	10,426	6-25§	9,921
Darjeeling	135,420	12-18	9,601	10-25	5,565
Do Consol	120,000	10-75	5,031	10-22	3,534
Doorga	225,000	8-26	29,954	7-75	24,486
Doom-Dooma	167,000*	11-75	31,352	11-40	18,568†
East India and Ceylon	170,000*	7-70	12,656	6-75	7,134†
Empire India, etc.	430,500	9-56	30,046	9-20	30,041
Jhazie	83,500	10-33	9,521	10-50	4,387
Jokai	300,000*	10-79	29,786	10-52	28,695†
Lungla	200,000	7-59	12,718	7-71	7,608
Majuli	99,970	10-31	4,976	9-75	3,571
Total	2,238,050		229,341		174,721‡
CEYLON :					
Alliance	50,000*	8-23	4,909	7-84	3,876†
Ceylon Land.	47,950*	8-25	12,125	7-87	10,386†
Do Plantations	248,460	8-14	48,986	7-85	42,199
Eastern Province	299,888	7-33	39,163	7-06	32,992
Imperial Estates	30,000	8-36	3,993	8-17	3,689
Leuka Plantations	164,700	8-15	10,708	7-53	8,281
Onvab	100,000	9-15	5,015	8-08	4,200
Sunnygama	55,000*	6-75	6,213	7-16	3,982‡
Total	1,053,993		131,202		109,574

It will be seen that in every one of the above twenty companies the profit for 1897 was less than that for the previous year. The Empire of India and Ceylon

\* These capitals were increased during 1897-8 by the following amounts:—Doom-Dooma, £7,500 ; East India and Ceylon, £15,000 ; Jokai, £50,000 ; Alliance, £15,000 ; Ceylon Land and Produce, £5,200 ; and Sunnygama, £10,000, so that

† The 1897 profits were made on an aggregate capitals larger by £102,700 than that appearing in the table, viz. :—Indian companies £2,330,550 ; Ceylon companies, £1,086,193.

‡ Loss of £5,340 on rice debited to reserve, not to revenue.

§ Sold in Calcutta.

shows best, the reduction in this case being only £5. The Cachar and Dooars gave £505 less, the Imperial Estates £340 less and the Ouva £785 less; all the others have decreased more than £1,000. The falling-off in the profit of the Jokai is shown above as £1,161, but this figure is arrived at by debiting a loss of £5,340 on rice to reserve, instead of to revenue, as in the other companies. In only one case (the Eastern Produce and Estates) has the dividend on the ordinary shares been increased (from 6½ per cent. to 7 per cent.); the rate of 1896 is maintained in six of the companies; the reduction in the remaining thirteen ranges from 1 per cent. (Darjeeling) to 5 per cent. (Majuli.) The additional ½ per cent. in the case of the Eastern Produce and Estates, despite a falling-off in the net profit, was owing to only £7,500 of debentures being redeemed out of revenue, as against £12,500 in the previous year. The teas of three of the companies, two Indian and one Ceylon, realised a higher price per lb. in 1897 than in 1896; Jhanzie .17 per lb., Lungla .12 per lb., and Sunnygama .31 per lb.

Taken collectively the figures tabled above give the following comparisons:—In the case of the twelve Indian companies the profits of 1897 were 23.81 per cent. less than those of 1896. The aggregate net profits of 1896 represented an average of 10.15 per cent. on the share capital employed; those of 1897 give just under 7½ per cent. Ceylon companies have had fewer difficulties to contend with than Indian, and, consequently, they show considerably better. The net profits of 1897 were 16.48 per cent. less than those of 1896. The aggregate profits of 1896 gave an average of 12.42 per cent. on the share capital concerned; those for 1897, 10.09 per cent.—*Investors' Guardian*, June 25.

#### NUTMEG TREES COMING INTO BEARING IN THE LOWCOUNTRY OF CEYLON IN FIVE YEARS.

Nutmegs form another minor product with which a great deal more, we are convinced, might be done in Ceylon and we dare say the news we are going to report of trees coming into bearing in a lowcountry district in *five* years will cause a rush after this handsome and profitable tree. Hitherto, 10 to 15 years have been given as the term required to come into bearing. In the West Indies—Grenada especially, now called "the island of spices" of the West—nutmegs are freely cultivated with cacao and Liberian coffee. There used to be very fine trees in Nilambe, 25 acres of nutmegs having been planted by Sir John Wilson, K.C.B., General Commanding 1831-1838; and there are very fine trees in front of Ratnapura resthouse from seed put in by Charles Shand in the "forties"; also we believe there is a nice grove of nutmegs on Roseneath and Mr. Dewar should tell us about the crops and how utilised? Clearly if nutmegs can be got to bear in Kurunegala and perhaps Kegalla (Kelani Valley) and other lowcountry districts in five years, there ought to be a great deal more planted. The late Dr. Trimmen was a firm believer in nutmegs and cloves paying well; but Zanzibar too often swamps the European market with cloves. So far, Ceylon exports from 4,000 to 7,000 lb. of nutmegs a year.

#### GAME PROTECTION.

The last issue of the *Ceylon Forester* has a paper dealing with this subject and criticising certain views put forward by Mr. Wace, in which the belief is expressed that as "The forests in Ceylon are reserved, it is the policy of Government to hand them all over to the

control of the Conservator of Forests, if such is the case as we have reason to believe, the appointment of Forest Guards by the Government Agents, over whom the Conservator would have no control is certainly to be deprecated; in fact, we should simply be reverting to that system of dual control which has caused endless trouble in the past."

Our proposal would be to put the money available in the hands of the Conservator of Forests (both Mr. Brown and Mr. Fisher who is acting for him are well-known as keen sportsmen), and let them spend the money available in consultation with the President and Secretary of the Game Protection Society. In this way the Society would know in what way their money was being spent, and it would lead to homogeneous work throughout the island. If the money was placed at the disposal of the different Government Agents, our opinion is that there would not be a similarity of policy, and this is very desirable if game protection is to be thoroughly carried out. Another important point we would desire to impress on the Secretary of the Game Protection Society is the necessity of framing rules under the Forest Ordinance, giving Forest Officers power to seize any one found shooting game. In the close season both forest officers and surveyors are more constantly employed in the jungles than any other Government officers, and they would most certainly be able to do more to protect game than any others. At present they have no power to arrest, even when they catch an offender redhanded in the act of killing a deer in the close season. We are also inclined to join issue with Mr. Wace on his instructions to Mr. Hopkins to only allow two stags and one hind to be killed on each license, as Mr. Davidson said at the meeting the limit is a small one, sportsmen going all the way from upcountry to places like Hambantota, have to go to very considerable expense, and would expect to be allowed to shoot more than three deer; it is, besides, very hard on forest and other officers, who spend their lives in the lowcountry, to be only allowed three deer in the year."

The article then refers to the question of close season and proceeds:—

"At present what is the use of the close season. We maintain that the only result of it, is to prevent a few Europeans from shooting deer, while the native still shoots indiscriminately, and that such is the case will be admitted we are convinced by the vast majority of Europeans who live in the dry lowcountry, and who being mostly officials are compelled to travel about on duty all over their provinces and districts as the case may be.

"Let the Game Protection Society move for the abolition of the close season for deer, and ask for the proclamation of sanctuaries. In these sanctuaries, no one should be allowed to go with a gun or rifle, unless he has a special license, for which a large fee should be demanded, a clause being put in, especially prohibiting the shooting of does or their young, and a penalty clause being inserted entailing the confiscation of the license and gun if the conditions of the license are infringed, and the possibility of a criminal action as well. Should this be done, we have little doubt that does in young would soon learn that these sanctuaries were safe places to breed in, and would resort to them in large numbers with every prospect of bringing up their young in safety."

It is contended that if the villagers had at one time the right of hunting in Crown forests, that right has terminated, and the editor of the *Forester* fails to see why the Government Agent of any province cannot act under the Forest Ordinance and proclaim any forest not a reserved or village sanctuary.

Another important step in the better protection of game will undoubtedly be achieved if it is said if Government can be induced to compel traders in deer to take out a license for removal.

Finally our contemporary says:—A small annual tax on guns would yield a fair revenue. There

are, we believe, something over 200,000 gms in the island, and a yearly tax of R1 per gun would enable the Government to go a good deal further in protecting game, and at the same time to obtain revenue from a tax which would not entail any hardship on the people who have to pay, while it would enable Government to know in whose possession most of the guns are, and a 10% commission to the headmen for collecting this tax would doubtless induce them to take some trouble in collecting it.

#### “GOOD BUSINESS.”

(To the Editor of the *H. and C. Mail*, July 1st.)

Sir,—In your issue of June 24th, you comment on the report of Brooke, Bond & Co., Limited, under the heading as above, “Good Business.” Allow me as a looker on, to point out that the report of the same Company for the previous year showed “Better business still,” inasmuch as the Company then earned a total of £48,001 17s 6d, out of which sum they redeemed debentures at a cost of £10,558, leaving a nett disposable profit of £37,443 17s 6d. This, I would point out, is very different to the results of this year’s operations, as no debentures have been redeemed, and it would thus appear, as the profits are stated at £32,000, that there is a falling away of about £16,000. Wholesale tea blenders like this Company who, by the way, carry on extensive retail business at Leeds, Bradford, and Manchester, have no insect pests such as ‘red spider,’ ‘green fly,’ and blight to contend with, but are subject to excessive competition, low prices, etc.; for example “true tea” at tenpence retail. It is possible for any dealer to sell “true” that is clean, pure Indian and Ceylon tea at such a price and maintain profits?—I am, sir, yours, etc. S.  
London, June 27th, 1898.

#### RUSSIAN TEA.

It is always interesting to note what may be the beginnings of a big industry. Last year the first crop of tea that has ever been grown in Russia was secured by Mr. Popoff, a Russian tea merchant. On March 14th he was received in audience by the Czar, and he gave him a sample of the new crop. As tea is largely consumed in Russia, and cost just twice as much as it does in England, it is possible that there is as great an opening for the tea planters as there was for the vine-grower in that country.—*Westminster Budget*, July 1.

MICA IN QUEBEC.—In a paper on “Mining in Quebec,” read before the Federated Canadian Mining Institute, it was stated that several prospects for mica were made in the Gatineau district, but that they were of small importance. In the vicinity of Perkins mill, in Templeton, three important companies have worked regularly, and taken out a large quantity of mica, well adapted for electric purposes, of which a good part has been sold in Canada and in the United States. It is very difficult to give exact figures regarding this mineral, on account of the numerous qualities and sizes, representing as many different prices, but according to the best information it is estimated that about 200 short tons of thumb-trimmed mica have been taken out, 90 men being employed. The demand has diminished, on account of the high duty in the United States, and only the best grade of electrical mica is wanted. No mine of white mica was worked last summer.—*The Electrical Engineer*.

#### A RECORD SALE IN “RED TEA LEAF” AND THE HISTORY THEREOF.

A planter writes:—“You are a steady denouncer of the shipper of ‘rubbishy teas,’ and in that I agree with you. Yet I have humbly to confess that I have been in the London market with rubbish, and come out in a way that has surprised me. My ‘flutter’ was forced upon me, for I had shipped good Broken Pekoe, and while it was in Colombo—presumably between the store and the wharf—some of the chests were tampered with, emptied of their contents, and a vile sample of red leaf and dirt was substituted. I was not the only sufferer; other marks were treated in the same way, and the thing was done so neatly that it was only by very careful examination that it externally became evident that the chests had been opened. The lead inside was cut, and left unsoldered. A sample of the ‘muck’ was forwarded to me from London, and instructions asked for: Would they sell it, or what? I naturally grumbled a good deal, for I made sure that the loss would have been less had the chests been walked off with for good, but to be filled up with a kind of no quality tea, and on which I would have to pay the usual shipping charges, etc., was like adding insult to injury. What to do with it? That was a question, and I expected to see my estate mark with a sale of Broken Mixed at 1½d or 2d a lb. and to read again a burst of indignation from various quarters, on the iniquitous cut-throat policy of shipping rubbish and ‘spoiling the face’ of Ceylon teas. So I replied to my London friends, that I left the problem with them; they could sell it or abandon it if they liked, but they were to take no course that would land me in any extra expenses, and there I left it. Fancy my astonishment to get by the mail just in, a memo of sale for this unique thing in teas—and 4½d landed! I am sorry I threw away the samples which were sent me, for I am sure the all-seeing editorial eye if it had seen them would have admitted that here was (and at the price) something it had never seen before. Four-pence-farthing for such stuff is surely a thing only to be dreamt of!! Who could be the buyers of this undrinkable stuff and how could it be utilized?”

“P.S.—I find that my tea maker has kept back a sample of the ‘Broken mixed’ which I told him to throw out. So I send it for inspection.”

Messrs. Somerville & Co. have been good enough to report on the sample sent us as follows:—“Brownish flaky mixed dusty; liquor very common. London value 2d; Colombo equivalent at exchange 1s 4½d=6 cents.” This increases the mystery of the London Sale at 4½d? We trust this will not be taken as an encouragement to go in for the shipment of “rubbishy tea” worth 1½d to 2d in the hope of “landing” 4d to 4½d!—a trade which undoubtedly the full abolition of the tea duty would be apt to foster. There is, however, no chance of getting rid of this duty save by gradual steps—the first probably being a reduction from 4d to 3d; then another year from 3d to 2d; and then, after an interval, total abolition.

## THE AGRICULTURAL MAGAZINE.

The following are the contents of the July number to hand :—

I.—Ourselves; II.—Season Reports; III.—Rainfall taken at the School of Agriculture during the month; IV.—Occasional Notes; V.—The Demonstrations at the Fruit and Flower show; VI.—The Colombo Fruit and Flower Show, 1898; VII.—The Paddy Weevil; VIII.—Seed Paddy; IX.—Inoculation for Rinderpest; X.—The Preservation of Eggs; XI.—Agriculture in Zanzibar; XII.—A Report on "Orthezia insignis"; XIII.—The Utilisation of Town Refuse; XIV.—General Items.

As will be seen from the above table there is a good deal of interesting reading, both of a local and general character.

The present issue, which begins a new volume, furnishes an index to the IXth volume, July 1897 to June 1898. We wish the Magazine all success in the future.

## MINOR PRODUCTS REPORTS.

**JAVA QUININE.**—On the 12th instant 26 cases, totaling 306 klogrammes (10,710 ounces) of quinine sulphate from the Bandoeng factory will be put up for auction in Amsterdam.

**THE BULGARIAN ROSE-CROP** will yield 60,000 T. oz of otto. A Kezanlik correspondent does not think the price will rise.

**CINNAMON.**—Ceylon chip fetched at this week's auctions 4½d 16 bags being sold. Quils are firm, but quiet at 1s 0½d for firsts 10½d for second, 9½d for thirds, and 8½d for fourths.

**COCA LEAVES.**—Rather firmer and scarcer, though little business is passing: good green Truxillo leaves have sc 1 at 8d.

**CARDAMOMS.**—There have been a fair enquiry, but actual business has been small, though prices are steady. Mysore splits have fetched 2s, and good medium bold at 2s 11d.

**EUCALYPTUS OIL.**—Ceylon Coconut oil 24s to 24s 6d in pipes, and Cochin 29s on the spot. Fine Lagos Palm oil is lower on the week at 23s per cwt.

**LEMONGRASS OIL.**—Little business doing; but if anything the oil is firmer, at 4½d per oz on the spot, and 3½d to 3¾d, c.i.f. or new oil.

**QUININE.**—Dealer in second hand, and manufacturers are firm, without inclination to sell other than small lots for consumption. As a matter of fact, makers' stocks are low, and they appear to be supplying as they make. The general opinion is that the recent reduction in price by manufacturers was not justified by the condition of the hark market, and that it is fear of Java competition which keeps the price low. In that connection we may note that at Amsterdam, on Tuesday July 12th, there will be offered 26 cases, each containing twelve 1-kilo. tins of the Bandoeng sulphate of quinine. The total amounts to nearly 11,000 oz.

**OLIVE OIL IN CALIFORNIA.**—A great increase has lately been made in the olive acreage of Southern California. Reports say that there is more than enough olive oil product to supply the Pacific Coast, and unless an Eastern demand can be created ruin stares the olive growers in the face. A single packing company in Angeles, which has just completed its season's work, has manufactured 3,000 gals. of olive oil and pickled 1,000 barrels of olives.

**ROYAL GARDENS, KEW BULLETIN** of Miscellaneous Information, June, 1898.—Contents:—Tea Blights, Fungi Exotici, I. Miscellaneous Notes:—Mr. H. B. Lloyd—Mr. H. Holley—Botanical Magazine—Hooker's Icones Plantarum—Rosa Gigantea—Totem Pole from British Columbia—Kola in the Lagos Hinterland—Gutta Percha—The Toonu or Tunu—Brunfelsia Calycina—Praguay Tea—Malingering in Egypt—A Chinese Prescription.

## PLANTING IN PERAK.

COFFEE, COCONUTS, RUBBER, SUGAR, RAMIE, PEPPER, RICE

(From Annual Administration Report for 1897.)

It is not generally realized how large is the area of land held by Europeans and Chinese in Perak, and I have appended to this report a special return shewing the number and area of estates exceeding 100 acres, from which it will be seen that the number of estates is 75, comprising a total area of 68,138 acres. The total area of agricultural land alienated in Perak amounts to 230,691 acres. During the time I have been in acting charge of the State I have visited every district, and have been specially struck by the extent and excellent management of the sugar estates in Krian, and of the coffee and coconut plantations in Kuala Kangsar, Larut, Matang, Kinta and Lower Perak. The planting of coconuts and Para rubber is being rapidly extended, and experiments are being made with ramie, a new fibre somewhat difficult of treatment. The high price of pepper is very encouraging to the few planters of this agricultural product in Perak. The Malay cultivator is mainly depended on his rice crops, and the rice harvest partially failed in every district during the year under review. The chief district in which swamp padi is grown at present are Krian and Kuala Kangsar, but the area is being extended throughout the State, and, if opened up by means of roads and drains, there is no reason why the extent of land under rice cultivation in Lower Perak should not soon equal or exceed that of either of the districts named above. I hope that a rice mill will soon be established in Krian, as it would be of great assistance to the local cultivators. Large tracts of good planting land are still available, and there is every reason for confidence in the planting future of the State. At Kuala Kangsar there is a Government garden, planted chiefly with limes, coconuts, nutmegs and other fruit trees, from which good crops have been obtained, and about 35,000 Para rubber seeds have been supplied to intending planters. A scheme for establishing a Federal experimental garden is now under consideration.

The prices of Liberian coffee were much lower at the end than at the beginning of the year, and I fear that planters must have suffered severely. The check to this promising industry is much to be regretted, but I hope that it is merely temporary and that the ability and energy of European planters in the Federated Malay States will successfully cope with the bad times through which they are now passing, as their fellow planters have done, on former occasions, in Ceylon and elsewhere. It is probable that the conditions of soil, climate and labour prevailing in these States compare favourably with those of other countries in which Liberian coffee is grown, and no one visiting the estates can fail to be impressed by the excellence of the crops. Possibly, however, improved methods of curing, sorting and packing the beans can be devised, and more general advertisement may enable Malayan coffee to command higher quotations in the European market.

## ROYAL BOTANIC GARDENS, CEYLON.

INSTRUCTIONS FOR COLLECTING AND SENDING SPECIMENS OF PLANTS AND INSECTS FOR REPORT.

I.—DIRECTIONS FOR PACKING AND TRANSMITTING INSECT PEST FOR REPORT.—Packets, said to contain "Insects for Report," are frequently received by the Government Entomologist with the contents quite unrecognizable. The chief consideration is that the specimens should reach their destination in as fresh a condition as possible. As a general rule this can be best ensured by putting them into a close-fitting tin box. In this way leaves, and the insects feeding upon them, can be kept quite fresh for several days, or even a week. *But do not spoil the effect by punching air-holes in the lid of the box.* Insects do not require much air, and the supply that enclosed with them will in all cases be ample for their needs. The

free admission of air will only result in the drying up of the leaves and the possible escape of the insects; or the specimens may be injured by the edges of the tin where the holes have been punched. If the objects consist of blighted leaves it is particularly important that they should arrive in perfectly fresh condition. When withered and dried up, many leaves, particularly those of the tea plant, become quite black, and any peculiar spots or characteristic markings are obliterated or rendered indistinct. Leaves and shoots of plants will keep fresh a longer time if gathered early in the morning.

For small parcels an ordinary tea sample box will answer the purpose as well as anything. For larger specimens, or a larger supply of them, an empty tobacco box or small biscuit tin will be found useful. If it should be necessary to send large pieces of stems or branches that cannot be conveniently packed in a tin box, they should be nailed up in a close case in such a manner as to prevent the possible escape of any of the insects or the spread of the disease.

An ample supply of the material should always be sent and this should include examples in as many different stages as can be found. It is not always possible to identify the insects locally; in such cases a duplicate set of specimens has to be forwarded to some specialist in Europe, whose large collections and good zoological libraries are available for reference. It is also intended to make up a collection of Economist Insects for exhibition in the Museum of the Peradeniya Gardens. It is therefore particularly requested that ample material of any insect pests, as they occur, may be sent in.

Care must be taken that the specimens shall not rattle about loosely within the package during transit, which would result in their being bruised or otherwise injured. This can be prevented by including a sufficient number of leaves and twigs to support them. The opposite extreme—the overcrowding and consequent crushing of the contents—should be equally avoided.

Cardboard boxes or empty match boxes are not recommended, as leaves and young shoots soon become dried up in them; but if they should be used a separate label should be attached for the stamps and to bear the brunt of the postmark. Packages sometimes arrive completely crushed for want of this precaution.

It should be remembered that a broken package, or one that permits the escape of any of the contents, is a source of considerable danger. A most serious pest or disease may be widely distributed by this means.

Careful notes should be made and sent with each parcel, giving—

- (1) Locality and elevation at which the pest occurs;
- (2) Date of first appearance and particulars of progress;
- (3) Nature and extent of the injury.

To prevent any possible confusion between packets arriving by the same post, the name and address of the sender should be written on a corner of the label. In conclusion, stress should be laid upon the following important points:—

- (1) Send the specimens in as fresh a condition as possible.
- (2) Do not make holes in the boxes for ventilation.
- (3) Send an ample supply of material.
- (4) Do not risk the spread of a perhaps dangerous pest by sending an insecure package.
- (5) Send full and precise particulars of the disease.

E. ERNEST GREEN,

Honorary Government Entomologist.

2.—SENDING PLANTS FOR IDENTIFICATION.—It is very difficult to recognize many of the specimens of plants sent for identification, as the most important parts—the flower and fruit—are omitted. The specimen should always include, if possible, flowers, fruits (ripe, or nearly so by preference), and a branch with both

young and old leaves in the case of a tree or shrub, or the whole plant in the case of a herb. A small portion of the surface bark is also useful in the case of trees. If the journey is longer than twelve hours, and always by preference, the specimens should be sent in a tin box, tightly closed, and the name of the sender should be written outside. In the case of plants found growing wild in Ceylon, notes should be sent of the locality in which they were found and of any other points of interest. If the plants are from abroad, the country from which they came should be mentioned if known, as the labour of identification is lightened if this is known.

3.—SENDING FUNGUS PESTS FOR REPORT.—Specimens of plants with fungus pests upon them should be most carefully packed in tin boxes or tea lead to keep them fresh, and to prevent the disease being spread by means of the packages. They should be despatched as soon as gathered, and if the journey be long other samples may be sent in alcohol (dilute whisky or arrack will do). Full notes should be sent of the time of appearance of the disease, its ravages, what parts it attacks, the causes to which its appearance is supposed to be due, the results of any preventive or curative measures tried, and so on. If the pest attack the leaf or bud, send fresh specimens showing as many stages as possible, with the necessary explanatory notes; also send a few healthy specimens of the same variety of plant from the same neighbourhood if possible. If it attack the stem, cut out diseased pieces in as many stages as possible, to whatever depth the fungus penetrates, and send also some healthy pieces.

JOHN C. WILLIS,

Director, Royal Botanic Gardens.

#### SCARCE TROPICAL PRODUCTS.

There is little likelihood that at the price ruling this year for Tonka beans, or Touquin beans as they are incorrectly called, snuffmakers will run the risk of a £300 penalty and forfeiture of the snuff by using an illegal quantity of the bean for scenting purposes. The limit fixed by law is three per cent. Last year the price of this Tonka or Tonga bean was 4s per pound; this year it is 8s, or more than twice the price of ordinary snuff. The crop is only gathered once in three years, and as the tree bearing the fruit grows to a great height, and as each fruit contains only one seed or bean, it is a troublesome one to save, but at the present price is a very profitable one. Those engaged in it have, I am told, cleared cent per cent on last year's crop, which was put on the market a week ago. Another tropical product, has reached the highest price known to the trade. I refer to indiarubber, the demand for which appears to be as great as ever despite the paragraphs about overstocking and depression in the Midland cycle trade which have been appearing in the London papers lately. As to whether the Birmingham cycle manufacturers have been obliged to discharge their hands in thousands because dealers are overstocked and are trying to clear at a sacrifice, I have no trustworthy information—my own experience of the past week is that machines are as dear now as at any time during the past five years—but I can say that although since Monday last buyers have been offering 4s 1d per lb.—an extraordinary price—for Para, rubber sellers decline to trade until they obtain another halfpenny, and practically no business has been done in the best rubber.—*Glasgow Herald.*

PLANTING IN SERDANG, SUMATRA.—Mr. Vanderpoorten writes:—"I called on my return, but missed you. When in Serdang, Mr. Mackenzie wrote that he was anxious to meet me. So was I, but luck willed it otherwise. It is a grand country; it may well be called the stoneless land; there is not even gravel for the roads and the ballast for the railway has to be brought from Penang. No part of Ceylon comes anywhere near it and Serdang is not the most favoured district."

UGANDA: CURATOR OF THE NEW  
BOTANICAL GARDENS.

LONDON, July 8.

Mr. Alex. Whyte, having been appointed Curator of the Botanical Gardens, Uganda, as was mentioned in my last letter, left London on Wednesday per s.s. "Shannon" to take up his work. Before he left, I was fortunate enough to meet him, and learn from himself some details of this fresh work he has taken up.

"I had some expectation of being sent to Rhodesia," Mr. Whyte told me, "where a department of Agriculture has been talked of for some time, but when Mr. Rhodes was home the other day it was decided to postpone that project in the meantime, though it's what they want out there. With their own food grown in the Colony, a good part of their difficulties would disappear. However as I say, the scheme is put off, for the present and so I immediately closed with this other offer."

"I didn't know," said J, "that they were so far advanced in Uganda as to have Botanic Gardens. I thought the railway was about as much as they had managed in that part of the world."

Mr. Whyte laughed. "To tell you the truth," said he, "the Gardens so far exist only in imagination. I am going out to make them."

"Make them! You'll have your work cut out, then for you."

"Well, yes, I suppose so; but then you know I am used to pioneering, and I don't anticipate much trouble once I get started. I sail by the 'Shannon' as far as Aden, and then leaving her make for Mombasa, after which I go on up the country to my destination. Altogether I shall have a march of about five hundred and fifty miles. The entire distance is seven hundred, but on the first part I shall have the benefit of the railway. I am taking out all the implements, seeds, and other things with me that I require to make a start."

"That will give you a lot of baggage, I should say."

"A large quantity. Two hundred loads I reckon at least which will all have to be taken by native carriers of course. However I am allowing myself three months for the march."

"So long as that?"

"One can't travel very rapidly in Africa you see at any time and besides I have instructions to examine and report on the country as I go along, with a view to the opening up of other public seed gardens. I shall also be making new collections of plants. To the botanist, Africa is an intensely interesting place. There are any amount of flora and fauna there new to Europeans, as no doubt you know. From British Central Africa, I brought back upwards of three hundred new specimens."

"Do many of these exotic plants survive their transportation to a colder climate?" I enquired.

"Yes. Many of them do very well. Of course they must be looked after. But for instance on my last African visit, I was fortunate enough to find a new variety of the

WIDDINGTONIA,

that is a description of cedar first discovered by Widdington and called after his name. It is

an extremely rare plant, but some of the seeds of the variety I brought home have done very well. I had the honor of presenting six plants to the Queen, which are to be grown in the open at Osborne. I believe they will flourish in the Isle of Wight, where the climate is extremely mild. Some have been grown up in Inverness, though they can't get them to do in Kew, by-the-bye. Another couple I sent to the Marquis of Salisbury. The species I brought home is called the 'Widdringtonia Whytei' or 'Whyte's Cedar' and was found in Nyassaland."

"Then you have a name child, Mr. Whyte."

"Oh not one only. Over ninety different specimens are called after me, and if I live to have another good spell of the tropics, I daresay I shall add to their number when I come back."

"What sort of tropical industries do you suppose Uganda will be favourable for, Mr. Whyte?" I enquired.

"Not tea. The climate is not suitable for that, but coffee. I should say Uganda would be a grand place for coffee, and all products that grow under similar conditions. However I'll be better able to tell you that, when I have been there a little time."

"And big game. I suppose you'll have something of that?"

"I had a letter last week from a friend who has just gone out, and he tells me that in the march up, nineteen elephants were shot among the party of eight Europeans. That wasn't a bad bag eh?"

"And lions?"

"There are lions galore, but of course it does not follow that I shall fall in with any. Deer too abound in that part of Africa. There will be plenty of shooting, no fear of that." "You are a silver medalist, Mr. Whyte, aren't you?"

"Yes, of the Royal Zoological Society. Would you like to see the medal? I am just on my way to leave it at the Bank, for I prize it too highly to carry it into Africa. There are only six other people living who hold a similar one to mine" he added with pardonable pride as he opened the velvet case and showed the large solid disk covered with engraved figures of elephants, giraffes and such like awesome creatures on the one side, and with representations of tropical birds on the other. I observed it was a handsome heirloom.

"Yes, but I have another which, at the present time at least, would perhaps be considered of quite as much interest, though it has of course no connection with African exploration. See here," continued Mr. Whyte drawing out his watch, and showing me the inscription on the back, "this gold watch as you see was presented to my father by Mr. Gladstone's father on his death-bed. Sir John Gladstone was one of the principal heritors in my father's parish in Scotland, and when he was dying he gave the minister his watch as a remembrance of him. For the sake of his son, that great man, William Gladstone, my father's son prizes it, as well as for other reasons."

"You won't take that into Africa either, I daresay," I remarked as I shook hands.

"Not likely. Well good-bye. I'm glad enough to get away from all this." Mr. Whyte concluded pointing to the men and women hurrying along,—for we stood in the street now—"I'm spoiled for civilized life now, but when I come back in two years time, I'll be able to tell you something again. I've always a good side to Ceylon,"

## THE AMERICAN DUTY ON TEA.

*(Omaha Bee.)*

As to the expediency of the duty, it has been questioned on the ground that it will impose a considerable tax upon American consumers, but on the other hand, it has been urged that it will give them a better quality of tea. But at all events, the duty is one which can be easily collected and which will yield a considerable revenue, and in the present exigency this is what is needed.

*(Providence R. I., Journal.)*

We now have one more honest tax, entirely unconnected with any unfair attempt to "protect" a favoured class of home producers at the expense of their fellow-citizens. It is distinctly a free-trade tax—the only kind of tax that ever ought to be levied by a well-established country on imported goods. That Congress has been forced to resort to this method of raising revenue at a time when an increase of national income has become imperatively necessary, is a rather striking proof of the comparative worthlessness of the "protective" taxes as revenue producers; and it is perhaps not too much to hope that, having once started on a more rational taxation plan, our national legislators will hereafter extend it as occasion arises, gradually abandoning the less satisfactory and less equitable plan that has been applied for many years at the wholly unnecessary cost of many millions of dollars to their constituents. To collect import duties on non-competing products only is an essential part of a wise and effective tax system; and if the Spanish war teaches us that great truth it may, for that reason alone, be worth all its costs.—*American Grocer*, June 29.

## AN AMERICAN VIEW OF INDIA AND CEYLON TEA.

Twenty-three years ago Ceylon exported 282 pounds of tea; last season, 116,000,000 pounds. At present Ceylon and India can be counted upon to furnish the world 240,000,000 pounds or more of tea for the season of 1898-99. This vast quantity displaces an equal amount of China and Japan tea, which displacement has been going on for 23 years, and has been most marked in the United Kingdom. In England the average price of India and Ceylon teas for eight months ranged from 6½d to 9½d, or from 13 to 20 cents American currency. The average for Assams was 10½d, or 20½ cents. These low prices are likely to continue until there is a heavy shrinkage in the world's total production.

The future in this country is regarded as very promising for Ceylon and India tea. The fashion of blending and selling in bulk has been growing, and also the demand for blended packet teas, and this has increased the demand for India and Ceylon for blending purposes. It is to be regretted that so few American consumers have acquired the habit of drinking high grade tea, the flavor of which is incomparably better than the low grades. The majority of tea drinkers seem satisfied if they have a warm and palatable drink. Their indifference to the niceties of flavor and the art of brewing robs them of much of the pleasure of the cup, for the highest grades of China, Japan, India and Ceylon tea afford the greatest delight to a sensitive palate. If tea planting is to be profitable, we believe it must come through greater attention to quality and less regard for quantity on the part of growers all over the world.—*American Grocer*, June 29.

ROYAL BOTANIC GARDENS.—Three more of Mr. Willis's useful Circulars have come to hand:—No. V, The Botanic Garden, Badulla (a brief Guide to the Garden); No. VI, Insects Injurious to Stored Paddy (by Mr. Green and Mr. Willis); and No. VII, Instructions for collecting and sending specimens of Plants and Insects for Report (also by Messrs. Green and Willis).

THE INDIAN TEA ASSOCIATION,  
LONDON.

The following is an abstract of the Proceedings of a Meeting of the Committee held on Tuesday, July 5. Present:—Mr. D Cruickshank, chairman; Messrs. A Bryans, J R Boyle, G W Christison, R Lyell, J N Stuart, R G Shaw, J Stewart, A G Stanton, W H Verner, and C W Wallace.

It was noted that two meetings of the Special Sub Committee on Currency appointed at the last meeting had been held under the presidency of Mr. D Cruickshank, and that a letter dated the 24th ult. had been addressed by the secretary to the Right Hon. Sir Henry Fowler, M.P., expressing the views of the Association on the proposals of the Government of India and tendering the evidence of Mr. D Cruickshank, Mr. R B Major, Mr. J N Stuart, and Mr. W H Verner.

INDIAN TEA FUND.—It was noted that the subscriptions promised to the new levy were reported by the secretary of the Indian Tea Association, Calcutta, on June 16 to amount to Rs9,913 12s 6p.

It was noted that Mr. R. Blechynden left New York on the 2nd inst for London.

ESTIMATES OF CROP.—It was resolved that with a view to ensure greater accuracy in estimating the amount of the crop, the Indian Tea Association, Calcutta, should be asked to procure special estimates from managers to be submitted by the end of June and published immediately afterwards, and that no estimate be published before that time.

PROPOSED CENTRAL RECRUITING AGENCY.—A letter dated the 1st inst. from Mr. J. Stewart was read, and it was decided to ask Mr. H. C. Begg if he would be good enough to reply to the questions put by Mr. Stewart, and that his answer be submitted to the committee.

INLAND STEAMER AGREEMENT.—A telegram from Calcutta as follows, "Steamer agreement companies intimated expiration agreement rates June 13. Speedy settlement desirable," was read, and it was resolved that the agents of the two steamer companies be asked whether they were prepared to consider and settle the terms for a new agreement on this side, or if the matter must be settled in Calcutta, and in case the question is to be considered here that Messrs. Hyell, Boyle, and Wallace be appointed a sub-committee to meet the representatives of the steamer companies.

Copies of the report of Government on "Tea Culture in Assam for 1897," and copy of a letter from the secretary, Bengal Chamber of Commerce, to the secretary of the Indian Currency Committee, dated June 16, 1898, were laid upon the table.

It was noted that the Calcutta Customs daily entries for the second half of June were 5,040,000 lb, making the total from April 1 to June 30 11,497,000, against 9,948,000 lb in 1897.

ANNUAL REPORT.—Draft of the annual report was read, revised, and ordered to be printed. The date of the annual meeting was fixed for Tuesday, the 26th inst., at 11 a.m.—ERNEST TYE, Secretary.—*H. and C. Mail*, July 8.

MR. KELWAY-BAMBER looks wonderfully fresh and vigorous, considering his seven years of scientific work in India. He came out to Ceylon this time on a special mission for private proprietors; but is free to stay on—after perhaps a week's visit to Calcutta—should the proposal formulated by the P.A. Committee to Government be accepted, as, of course, it ought. Mr. Kelway-Bamber's book showed that as a scientist, he is specially qualified to help the tea planter and moreover that his whole heart is in his work. We sincerely trust he may be engaged for several years to work for the benefit of Ceylon planters.—His full name and designation are:—Mr. M. Kelway-Bamber, M.R.A.C., M.R.A.S., ENG., F.C.S., Analytical and Consulting Chemist.

## THE INDIA CURRENCY COMMITTEE:

## MR. T. N. CHRISTIE'S MEMORANDUM.

Being much more interested in Ceylon than in India, I should premise my statement by explaining the relevancy of Ceylon evidence to the present enquiry. Although the Indian Government in their recent Despatch (3rd March, 1898) claim for their Currency policy Imperial importance and Imperial aid, and so open the question to the consideration of other than purely Indian views, there is not on the part of Ceylon any expectation that its interests could in the very least be allowed to interfere with those of India. The attitude of the Colony in this matter is, that its 1893 Currency Commission (of which I was a member) cleared up issues and elicited facts which had not previously—nor have they subsequently—been investigated by any authoritative body, and that Ceylon affords a most valuable object lesson to those who desire to see what the effect of currency changes has been, and is likely to be, on the real prosperity of the people in a producing country. There is practically no difference between Ceylon and India in this particular; the prosperity of the people in both countries depends on the remunerativeness of their agriculture, and the ability of each country to meet its home (English) charges for debt, &c., entirely hinges on a favourable balance of trade being maintained. It is true, however, that in the matter of sterling payments, the position of the Government of India is not such an easy one as that of the Government of Ceylon, and that the anxieties of the former have not been shared by the latter owing to its relatively smaller gold obligations.

In the investigation by the Committee of the probable effects of the proposed changes upon the internal trade of India, the issue of most far-reaching importance is whether on the whole a high or a low rate of exchange is beneficial, and the findings as regards Ceylon, after most careful investigation, was:—

“Our opinion is that up to the present time a bullion silver currency, coupled with a falling rate of exchange, has been for the benefit of the greatest number—in other words, the sum of the advantages has preponderated over the sum of the disadvantages, and, as far as we can see, the action of the Government of India is not advantageous to the general interests of Ceylon, provided—

“(a) That the re-adjustment of all local salaries, wages, and prices to the altered value of the rupee could be deferred for an indefinitely long time;

“(b) That the future rise in the general revenue would be sufficient to keep pace with the increase in the obligations of the Government consequent on the altered value of silver, such rise being secured either by the revenue naturally rising *pari passu* with the increased demands on it, or by additional contributions from the producing interests specially favoured by a bullion silver currency and low exchange.

“With reference to the possible re-adjustment of local wages and prices measured in silver, while we find that there is in Ceylon a slight tendency towards increasing wages, and a more general tendency towards increasing prices (after taking duly into account local exceptions and certain prices which have decreased), such increase bears no actual proportion to the progressive decline in the gold price of silver, and it can hardly be attributed thereto.

“It is our opinion that the date of such a general adjustment of wages and prices is uncertain: that it will probably be remote, and that it may be postponed for an indefinite period of time.”

This, be it remembered, was during a period when India, Ceylon, the Straits, China, Japan, &c., were all sharing the fall, but when, as at present, the

high rate of exchange <sup>is</sup> an artificial one, and partial only to India, Ceylon and Mauritius, the crushing disadvantage to these countries where they now, or may hereafter, come in competition with silver-using countries, cannot be lightly thought of, and claims the most careful consideration. There is one rather convincing example of the benefit which a silver currency is to an industry competing against gold currency rivals, and that is the sugar production in Province Wellesley. It is the only one of England's sugar Colonies which is prosperous and not on the verge of ruin—it is the only one with a bullion silver currency.

I would most especially direct the attention of the Committee to the necessity of their examining the only attempt (so far as I know) of the Government of India to rebut the producer's belief that low exchange benefits him. It is contained in the letter of the Government to the Darjeeling Planters' Association, dated 12th October 1892, and on that document the Government of India evidently still rely, for it is referred to in their despatch of 17th March last. The entirely erroneous premises on which the reasoning in that document is founded, were exposed by the Ceylon Currency Commission, (quotation).

Even had the position of India's trade been as was (wrongly) assumed, the reasoning would still be unsound, for it takes no heed of the benefit which accrues by a producer exporting more and spending the full amount of his increased income on imports. Further, the reasoning that any benefit derived by anyone from a mere currency change can only be at the expense of another member of the same community, would, if true, apply equally to the benefit which the Government of India expected to get by their currency manoeuvre. And still further, the argument that the gain is not permanent and is counterbalanced by a tendency to overproduction and consequent re-action would apply with equal force to a rise in market prices, and would condemn as illusory the benefits which the credulous producer has hitherto imagined he derived from many of the devices of mankind to cheapen production and land and sea transport. Additional profit of course means additional production, and that, in its turn, means lower prices, but it is the action of an all-round law and not one singular to exchange benefits.

The value of Ceylon as an object lesson in this matter is that it presents, in a compact and reliable form, an index of the results of high and low, natural and artificial, exchanges, undisturbed by war, famine or plague. The prosperity of all classes in Ceylon steadily advanced with falling exchange, and with the artificial rise and scarcity of currency came a great check; the margin of profit has most seriously gone down, in some cases disappeared, and the Bank rate has stood for months at 12 to 15 per cent. The price of tea, its staple product, has gone down, and verified the prediction of the 1893 Currency Commission:

“The effect of this exchange premium in China's favour would therefore be manifested less by any remarkable increase in the export of China tea or displacement of Ceylon tea, than by a prolonged reduction in the price of tea to a figure which was so low as to prevent Chinese growers, even with a premium of say 1½d or 2d per lb. in their favour, exporting with profit.”

Had Ceylon been competing during the last few years on even currency terms with China and Japan, it would undoubtedly have displaced the teas of these rival countries to the extent of a good many millions of lb. in the American, Russian and other markets, and, as a consequence, the English market would have been relieved of the over supply which has depressed it. Up to the time when the artificial value of the rupee

rose considerably above the lowest point which it had reached when a bullion coin, and the scarcity of Currency became acute, every index of a people's prosperity unmistakably showed the advancing welfare of all classes in the Colony: since then the taru has taken place, prosperity has waned, and Europeans and natives alike feel the baneful effects of the present Currency position. I draw precisely the same deduction from the Indian statistics—they showed a steady and great increase in the prosperity of the people, in their purchasing power and in their accumulating capital. The later figures tell a different tale, but, distorted as they must have been by the influences of plague and famine, it is impossible to attribute the decline solely to the state of the Currency, although it must have been a potent adverse factor. Not only do the statistics relating more particularly to the people tell of the steady advance under low exchange, but the facts and figures connected with the Government's finances bear witness to the same conclusion. In spite of the great decline in the opium revenue, and the much increased rupee charge for sterling payments, the Finance Minister in his last statement was able to show that during the 20 years (1878-1898) the revenue had exceeded the ordinary expenditure by Rs. 50,988,294 and he declared "The record of 20 years finance which I have displayed in the above figures is a better one than can be shown by almost any country in the world but the United Kingdom. The prosperity of the people was reflected in the expansion of Revenue, for there has practically been no increase in the rates of taxation except those imposed after 1886 to make up for the remissions of 1882. It is evident, too, from the above statement that the embarrassments of the Government of India, due to low Exchange had been greatly exaggerated. In this connection, it may be well to draw attention to the erroneous way in which the Government of India's loss by exchange is commonly thought and talked of. The par value of a remittance is taken, and the difference between it and the rupee sum actually required is "loss by exchange," or the rupee cost of India's sterling remittances in a given year is contrasted with the rupee cost in a subsequent year and the difference is "increased loss by exchange." India has of course often increased its debt, and with increased debt, apart from exchange, larger payments have to be made. I notice that the permanent debt in England which was £73,000,000 in 1886, has gone up to £113,000,000 in 1896, and the difference has been raised at an average probably under 1/4 per rupee. The gain on capital on such portions of the debt is quite equal to the proportionate loss on the annual interest, and enabled a smaller loan to construct a given railway or irrigation work. I notice that Sir J. WESTLAND quotes the extra exchange loss on the railway debt as it stood in 1878 at only Rs 1,000,000.

Stability of exchange has had very great importance attached to it, and the Secretary of State for India said lately.

"If we could ever establish a gold standard in India, fixing the stable exchange of the rupee at 16l., subject only to the fluctuations of trade the advantage to India would be enormous. At the present moment the great industries of tea, and indigo, and jute, are carried on to a large extent by borrowed money, and in India money can only be borrowed at from 6 to 10 per cent. On the other hand, if you can secure anything like a stable exchange, you would have all the hoarded capital in

this country waiting for employment, ready to be used in developing the resources of India."

But I submit there is in this utterance a great mis-apprehension of what is the real magnet that attracts capital. It is the reasonable prospect of profit which causes the flow of capital, and stability of exchange *per se* comes as a very minor factor. For instance, we have perfect stability of exchange with the West Indies, but no British capital—other than the Government does—is going there; nor has the stable exchange with Australia, Newfoundland, or Fiji, sent British capital to these countries for some time past; on the other hand the unstable exchange with Ceylon has not in the least checked the flow of capital to it. After examining witnesses of all classes, the Ceylon Currency Commission reported:

"The evidence we have is conclusive that that fall has not prevented the introduction of all necessary English capital, and it is stated that there is more capital offering for investment on reasonable terms than has ever been the case before. There is no practical or legal difficulty in securing the repayment of sterling loans in sterling value, and the loans of English capital almost entirely made to Europeans, are so secured (see appendix D 13). Native borrowers and lenders deal entirely in rupees, and have been in this respect unaffected by the fluctuations of exchange."

Stable exchange, if other things remained equal, is an encouragement to the free movement of capital, but it is not a condition that is worth achieving at the cost of restricted currency and diminished prosperity. It would be a convenience to many, and tend to assure profit to those financial houses—private firms and public companies—who can borrow money at low rates in England and lend it at high rates in the East. The increase of local capital, to which the mints were so favourable, and the maintenance of whatever exchange conditions are found to be best for the producers, would seem preferable to driving the people to borrow from foreign lenders. It must always be remembered that many of those whose voices are heard loudest in expatiating on the advantages of a stable exchange, care, in reality, nothing for stable exchange *per se*; but regard it solely as a hopeful means towards securing their end, which is an artificial rate very much above the natural rate. Similarly, with those who, like myself, oppose it, it is not the abstract stable rate which is opposed, but the knowledge that behind it comes what at present would probably be a 50 or 60 per cent artificial appreciation, and the possibility that this crushing handicap on Indian and Ceylon products in competition with those of the far East might be further increased. On the merits of the scheme, as a sound or unsound currency proposal, now before the Committee, I can only offer a mere amateur opinion, but it seems to be a reversal of the usually accepted duties of a Government to its people in currency matters; and a denial of a sufficiency for local trade requirements of the only legal tender, in order that it may acquire an outside scarcity value, is a sad come-down from the stand-point of the Indian Government as disclosed in a state paper bearing date, October, 1876 in which it was laid down that to evade the consequences of lower exchange by raising the value of the standard unit of value, would be "an especially vicious form of class taxation," and "an expedient quite inadmissible."

The present scheme is apparently that of Sir David Barbour, as laid down in his minute of

21st June, 1895; but it omits one essential of the scheme then propounded, viz. that "they (the rupees) must be convertible into gold coins either without payment of premium or on payment of a trifling premium whenever any person wishes for gold coins in exchange for silver coins." If an effective gold standard can be introduced into an Empire like that of India in such a simple manner as is now suggested at almost no cost at all, it is strange that other countries, Russia for instance, should have required many millions to achieve the same end.

If achieved in India in the manner now suggested, the real cost would I believe soon be apparent in the strangulation of trade and diminution, if not extinction, of the favourable balance. I do not question that, as the Indian Government states, "redundancy is a relative term," but I submit that the standard should be the needs of the people, and not that necessary to give a coin a scarcity value in foreign eyes.

So far as the needs of commerce and the people go, there is far from being a redundancy even at present, before the destruction of the currency medium has commenced.

It is much more easy to criticise than to suggest, and I am unable to propose any alternative scheme which I consider satisfactory. The least unsatisfactory plan would be, I think, to re-open the mints with a rather heavy seignorage and the imposition of an import duty on silver to about the same amount per rupee. If the whole of the artificial value be placed on the seignorage the temptations to illicit coining will remain very great, and, on the other hand, if it were all placed in an import duty, the value of silver in the country would be raised too much, and probably for some time to come there would be little outside silver imported, and consequently the revenue to Government would be small.

The unqualified re-opening of the mints is what one would like to be able to recommend, but although strongly opposed to their closure, I consider that a sudden drop in the rupee to bullion value, even allowing that silver would at once rise somewhat, would be too revolutionary, and it would leave the Government in a position of anxiety as regards their sterling payments. I may say, however, that I would prefer to see the mints re-opened without qualifications, and bear the cyclonic disturbance which would result, rather than continue the present wholly intolerable position.

THOS. NORTH CHRISTIE.

18th June, 1898.

**TEA PROSPECTS IN INDIA.**—The following is from the Calcutta correspondent of the *Pioneer* (July 19th):—

In tea shares there has been a strong demand for Central Cachars at 59 and 60. Dehing at 44 and Singell at 80 and 81. The prices obtained at Friday's tea auction were again very satisfactory and high prices were paid for quality. Prices in most cases were overlast year's rates in spite of the adverse exchange, which makes fully  $1\frac{1}{2}$  annas difference. The falling-off in outturn of Cachar and Sylhet gardens is becoming serious, as the gardens do not seem to be making up leeway. The reduction in outturn in this direction helps the other districts considerably and there ought to be a stronger market for tea when London fully realises the extent of the deficiency in crops. A very encouraging feature is the active demand for Bombay and the Persian Gulf—two markets which have just opened to Indian teas but which promise to take off a very large part of what London calls the surplus outturn.

### THE MAYFIELD (DIMBULA) TEA COMPANY OF CEYLON, LIMITED.

The following is from the report of the directors, submitted at the first annual ordinary general meeting:—

The yield of tea from the three estates during the period covered by the report was 417,323 lb. of which 338,268 lb were sold in London, and 19,055 in Colombo, at an average of 6'924 gross for the combined sales. The yield of cardamoms was satisfactory, and a small quantity of cinchona was also produced and sold. During the season a small extension of six acres of tea was made, the total area now under that product being 1,159 acres. To provide for some further planting out a supply of high-class Indian tea seed, Jetinga Valley, was purchased, sufficient for about 30 acres extension, and this will be planted up during the next three months, as well as an additional clearing of 25 acres cardamoms. The estates have lately been visited by the chairman, who went over each most carefully, and reported on the prospects as being highly satisfactory, although some extraneous outlay will be necessary to bring Chalmers into the same condition as the others. In the transfer of the estates to the company a large amount of labour was lost, and the crop consequently suffered, but as that is now remedied and full supply is working, a very much increased yield is estimated for the current season. After taking over the gardens certain improvements were found to be necessary, and this was represented to the vendor, who agreed to bear a portion of the cost, to the extent shown in the revenue account. The profit and loss account, after providing for general expenses and writing off one-third of the preliminary expenses, shows a gain of £2,215 14s 2d out of which £1,204 13s 1d has already been paid as dividend on the preference shares up to December 31, 1897. Out of the balance £,011 1s 1d, the directors recommend the payment of a dividend on the ordinary shares at the rate of 5 percent. per annum, to be calculated from the date of the payment of the final call, which will absorb £965 7s 5d, and that the balance of £45 13s 8d be carried forward to next account. The company's along with all other tea estates have suffered severely financially during the past year from the higher rate of exchange, high price of rice and the fall in the price of tea, a combination your directors could not avoid. The estimate for this year is 435,000 lb of tea, 5,000 lb cardamoms.—*H. and C. Mail*, July 8.

### TEA AND CACAO ESTATES COMPANY, LD.

COOPER, COOPER & JOHNSON, LIMITED.

Share capital ... .. £340,000  
(Incorporated under the Companies Acts, 1862 to 1893.)

Being an Amalgamation of Cooper, Cooper & Co. Limited, Johnson, Dodds & Co. (Manchester and London), the Ceylon and Oriental Estates, Co. Limited, the Pallikelle Ceylon Estates, Limited, and other valuable Estates in Ceylon.

Divided into 170,000 six per cent preference shares and 170,000 ordinary shares of £1 each. The preference shares rank in priority to the ordinary shares, both as regards dividends and the repayment of capital. Of the above shares, 20,000 preference shares, and 50,000 ordinary shares are reserved for allotment in part payment of purchase money. Subscribers are now invited for the balance of the preference and Ordinary shares, viz., 150,000 preference shares & 120,000 ordinary shares, and for £250,000 45 per cent First Mortgage Debenture Stock.

TRUSTEES FOR THE DEBENTURE STOCK HOLDERS.

William Howard, 21 Lombard Street, E.C. Thomas Chandler, 7, Angel Court, Trogmorton Street, E.C.

DIRECTORS.

Matthew P. Evans, 39, Lime Street, E.C., Director of the London Commercial Sale Rooms, Limited. Connt Max Hollender, 97, Westbourne Terrace, London, W. Charles Brook Dobson, 72, West Cromwell Road, S. W., Director of the Wenlock Brewery Company, Limited. Alfred A. Clark, Director of Wilkinson, Heywood, & Clark, Limited, of London, Bombay, Hong Kong, and

Melbourne. Hamilton A. Hancock, Director of the Ceylon and Oriental Estates Company, Limited, John Young, 71 and 73, Tooley Street, S.E., Managing Director of Cooper Cooper and Company, Limited. William Johnson (Johnson, Dodds & Co.), 29, Mincing Lane, E.C., Director of the Pallikelle Ceylon Estates, Limited. Clive Harding Meares, 71 and 73, Tooley Street, S.E., Managing Director of Cooper, Cooper & Co., Limited.

PROSPECTUS.

This Company is formed for the purpose of acquiring as going concerns the well-known business and assets of Cooper Cooper & Co., Limited, the Manchester and London business of Messrs Johnson, Dodds & Co., the Ceylon and Oriental Estates Company, Limited, the Pallikelle Ceylon Estates, Limited, and other producing estates in Ceylon, whereby it is believed that one of the most important amalgamations of cocoa and tea producing and distributing business will be effected:

(a) The business of Messrs. Cooper Cooper and Co. was founded in the year 1866, and was converted into a limited liability company in October 1895. As wholesale and retail dealers in tea, coffee and cocoa this concern enjoys a high reputation, and has over 100,000 customers at its various establishments in London, Belfast, Dublin, Glasgow, New York, Brussels, and the chief Continental cities.

(b) Messrs. Johnson, Dodds & Co have recently established at Manchester and London a wholesale Tea distributing business, and have at the present time a large number of accounts on their books, they have also a general grocery business at Newcastle-on-Tyne, which will not be acquired by the Company, but they will purchase the Tea required in connection with such business from the gardens acquired by the Company. Messrs. Johnson, Dodds & Co. take the whole of their purchase consideration in shares of the Company, and guarantee that the profits from that branch of the Company's business shall, during the next three years, amount to at least 5,000 p er annum.

(c) The Ceylon and Oriental Estates Company, Limited, was formed in the year 1892 to acquire numerous valuable plantations and estates in Ceylon. The Company has been very successful, substantial dividends having been paid, and for some time past the shares have been regarded as a safe and profitable investment.

(d) The Pallikelle Ceylon Estates, Limited, was formed in June, 1896, and own some of the most valuable Cocoa estates in the Island. The first year's operations were sufficient to allow of a dividend of 12 per cent. on the Ordinary Shares, and the latest reports show a large increase of profits.

(e) This Company acquires, in addition to the foregoing, ten privately owned estates in Ceylon, which are being worked at a profit by their respective owners, and which will add an additional source of strength to the present amalgamation.

The estates above mentioned represent a total approximate acreage of 19,670 acres, of which 10,580 acres are already under cultivation—6,860 acres being in Tea, 3,543 Cocoa, and 177 Coffee and Crotons.

	Tea.	Cocoa.
	lb.	lb.
The output of Estates for the season 1896-7 was	1,985,680	590,128
For 1897-8 the output was	2,046,502	604,240
The estimate of crops for 1898-9 is	2,210,000	708,960

The directors reserve to themselves the right to eliminate any of the privately owned estates, should they deem it advisable, on the grounds of defective title, delay in transfer, or otherwise, in which case the purchase price and proportionately the Debenture Stock issue would be reduced, or other estates substituted. They think it right, however, to state that they do not anticipate any such occurrence, but have taken the precaution referred to in the interests of the company.

The various businesses, estates, &c., will be taken over from the dates mentioned in the several contracts. Further particulars of the estates, will be found on the sheet accompanying this prospectus.

ADVANTAGES OF THE AMALGAMATION.—The directors do not think it necessary to point out at any length the various advantages that are practically assured by the combination of interests, as they must be apparent to investors and the public generally. Considerable economy will be effected in connection with the cost of administration, whilst the combination of production and distribution, by diminishing the intermediate charges, must ensure increased profits. The company acquires the various businesses and estates as going concerns, the existing arrangements as to management so far as requisite, being continued, whilst it will be noted that the Board is composed of practical men, mostly intimately associated with the trade, who will have a considerable financial interest in the concern.

VALUATIONS.—Mr. E. H. Hancock (of the firm of Messrs. Hancock Brothers & Co., 28, Mincing Lane, E.C.), who has recently returned from Ceylon, has valued the estates, including factories, machinery, growing crops, &c., whilst Messrs. Izard, French, & Izard, of Gracechurch Street, E.C., have valued the premises, fixtures, horses, vans, &c., of Cooper, Cooper & Co., Limited, and Messrs. Johnson, Dodds & Co. The foregoing valuations are set out in full in the sheet accompanying the Prospectus, and amount exclusive of goodwill, to

£414,500 0 0
To this must be added the stock-in-trade, cash balances at the Bankers, and the guaranteed book debts of Cooper Cooper & Co., Limited, and Messrs. Johnson, Dodds & Co., amounting to
73,227 8 7
Further working capital to be provided by this issue
20,000 0 0

Making a total value, exclusive of goodwill, of

CERTIFICATE OF PROFITS.—Messrs. Arthur Goddard & Co., Chartered Accountants, of St. George's House, Eastcheap, E.C., have furnished the Directors with a detailed certificate as to the profits of the various businesses to be taken over.

This certificate is set out in full on the sheet accompanying the Prospectus, and shows the annual net profits to be

£42,699 7 11
With a probable further annual profit in connection with one of the businesses of
1,500 0 0
Making in all
£44,199 7 11

Taking, however, the profits at £42,699 7s. 11d. only, it will be seen that after paying interest on the Debenture Stock (£12,500 per annum) and the dividend on the Preference Shares (£10,200 per annum) there would remain

£19,999 7 11

Which is sufficient to pay 10 per cent. on the Ordinary Shares, leaving a balance of over £3,000 for administration expenses, &c. The Managing Directors have expressed the greatest confidence as to an increase in future profits of the distributing businesses; whilst the estimate of the 1898-9 crops shows a considerable increase on the output of the preceding season.

WORKING CAPITAL.—With the additional £20,000 cash provided by this issue, the Company will have, besides the growing crops, liquid assets available as working capital, amounting to about £120,000, which is ample for all present requirements and developments.

PURCHASE PRICE.—The Vendor, who has contracted to purchase the various properties, and is reselling at a profit, has fixed the purchase price of the various properties and assets, including the goodwill, at £570,000, payable as to £70,000 by the allotment to him or his nominees of 20,000 fully paid-up Preference shares, and 50,000 ordinary shares of the Company; and as to the balance, in cash, shares, or debenture stock, at the option of the directors of the Company. The Vendor pays all expenses in connection with this issue up to and including the first general allotment of shares.

CONTRACTS.—The following contracts have been entered into, namely:—(1) dated 29th April, 1898, between the Ceylon and Oriental Estates Company, Limited, and Theodore Jermyn Ford; (2) dated 14th March, 1898, between the Pallikelle Ceylon Estates, Limited, and Marshall Harcourt Paine; (3) dated 18th May, 1898, between Marshall Harcourt Paine and T. J. Ford; (4) dated 18th May, 1898, between George Vanderspar and T. J. Ford; (5) dated 28th May, 1898, between William Johnson and William Henry Dodds and T. J. Ford; (6) dated 1st June, 1898, between Alexander Charles Pirie, Martin Lindsay Hadden, Martin Henry Pirie and T. J. Ford; (7) dated 3rd June, 1898, made between Cooper Cooper and Co., Limited, and T. J. Ford; (8) dated June 27th, 1898, between The Right Honourable Frederick Augustus Baron Chelmsford, G.C.B., Charles Montagu Buckworth, Charles George Inglis and T. J. Ford; (9) dated June 1st, 1898, between Clive Harding Meares and T. J. Ford; (10) dated 8th July, 1898, between T. J. Ford (the Vendor) and the Company.

London, 9th July, 1898.

VALUATIONS.

28, Mincing Lane, London, June 8th, 1898.

To the Directors of Cooper, Cooper & Johnson, Limited, Gentlemen.—Having lately returned from Ceylon from visiting Tea and Cacao properties, and having visited most of the Estates to be acquired by your Company, and being well acquainted with the working of the others, I have carefully considered the acreages under cultivation on the various Estates (as more particularly set forth in the Schedule annexed) and considering the elevation, quantity and quality of crops and other points, I value the properties including forest land, factories, machinery, bungalows, buildings &c., at Three Hundred and Ninety-one Thousand Five Hundred Pounds sterling (£391,500).—Yours faithfully.

E. H. HANCOCK, Sworn Broker, City of London.

TEA BLIGHTS.

(“Kew Bulletin” for June.)

The field of nature is one of incessant struggle. Every plant has to hold its own in the face of foes bent continuously and relentlessly on its destruction. If it succeeds it is only because its defensive resources are on the average superior to the attacks made upon it. The final result is one of equilibrium, in which foe and victim each manage to survive. This is arrived at through the interaction of conditions usually difficult to trace, but brought into adjustment after a long period of struggle.

When man appears on the scene and for his own purposes destroys the adjustment, the struggle begins anew with increased severity. He grows some one plant in wide stretches after clearing the ground of its competitors. But in so doing he relaxes the restraint of all its foes and often gives them a chance they have never possessed before.

Plants and their parasites have to live in nature as best they may. The host can do without the parasite, but the parasite cannot do without the host. A plant may exist alone in a forest and the parasite which kills it will find its own fate sealed if it cannot transfer its attacks to a neighbouring individual. The straits to which a parasite in consequence is put to continue its existence, and the varied means by which this is effected, form one of the most fascinating subjects of biological study. But the net result is that under natural conditions the parasite is kept in check.

When any crop is grown on a large scale it is obvious that the conditions are changed. A parasite having by accident fastened on an individual plant in a plantation and done its fatal work, can then extend, usually with little difficulty, to contiguous plants. Under such circumstances the spread of a fungoid disease can only be compared to a conflagration, which beginning on a small scale may increase to disastrous dimensions. Such troubles are part of the price which man has to pay for disturbing the order of nature. The only way to treat them is to endeavour either to restore the natural checks which man has abolished, or, as this can from the circumstances of the case rarely be done, to substitute artificial ones in their place. And as a matter of practice, an attentive study of the habits of the parasite, this can generally be effected and the injury it inflicts circumvented.

The difficulties which best tea-culture in Assam are only an illustration of these general principles. But the Government of India does not possess any trained mycologist in its service, and no one was available for the study of the “Blight” which affect Indian tea-culture, but Dr. Watt, its Reporter on Economic Products. When a similar investigation was needed for the poppy crop, it was entrusted to a gardening member of the staff of the Royal Botanic Garden, Calcutta. Dr. Watt, was obliged to have recourse to Kew for the technical investigation of the most serious maladies with which the tea-planters have to contend. The following report has been drawn up, from material transmitted by Dr. Watt, by Mr. Masse, a Principal Assistant in the Herbarium of the Royal Gardens.

GREY BLIGHT.

(*Pestalozzia Guepinii*, Desmaz.)

The amount of injury caused to the tea plantations by this fungus is estimated by Dr. Watt as follows:—“I regard the ‘Grey Blight’ as very alarming, a disease that if not checked may easily reduce the productiveness of gardens by fifty per cent. It might, in fact, convert Assam from the prosperous province the planters have made it, to one of extreme distress.”

An examination of the fungus sent from Assam on leaves of the tea plant, showed it to be identical with the parasite common on leaves of cultivated species of *Camellia* in Europe. The fungus first appears under the form of small grey spots, more or less circular in shape; these spots gradually increase in size and not infrequently run into each other, forming large, irre-

gular blotches which often eventually cover the greater portion of the surface of the leaf. During increase in size, the spots are often bordered by a narrow dark line. The grey or sometimes white colour of the spots is equally evident on both surfaces of the leaf, and is due to the disappearance of the chlorophyll, and the subsequent death of the cells composing the tissue of the leaf. The mycelium of the fungus is very delicate, rarely exceeding  $2\mu$  in diameter, hayline, and sparingly transversely septate; it at first occupies the intercellular spaces and runs between the cells, which eventually become separated from each other by a dense web of mycelium. Finally the mycelium enters the cells and vessels in considerable quantity, causing the death of the invaded patches, the unattacked portion of the leaf remaining quite unchanged. When the leaf tissue of the diseased patches is quite dead and brittle the mycelium of the fungus becomes aggregated in numerous dense tufts just beneath the cuticle, more especially on the upper surface of the leaf. On the tips of these aggregations of slender, erect hyphae, or conidiophores, which spring from a basal pseudoparenchymatous stroma, the conidia are borne. As these clusters of conidia increase in size they raise the cuticle of the leaf into a series of minute warts, until finally the tension is too great, and the cuticle ruptures, usually in a triangular slit through which the mature conidia protrude and soon become free on the surface of the leaf, from which they are removed by wind or rain. Such of those as happen to alight on the moist surface of the leaf of a suitable host-plant, germinate at once, enter the tissues of the leaf, and form a new centre of disease, which in course of time produces conidia. By this rapid method of conidia-formation and distribution, it can be readily understood how possible and certain it is for the disease to spread rapidly when once introduced into a tea garden.

The conidia are produced at the apex of slender hyphae or conidiophores, and are very beautiful objects when seen under the microscope, being narrowly elliptic with somewhat pointed ends, and usually three-septate; the two end cells are colourless, while the two median cells are olive-brown, the terminal colourless cell being surmounted by four very slender, colourless, spine-like processes longer than the conidium itself. The above-described is the typical and most abundant form of conidium; variations occur in the number of septa, which range from two to four; the hair-like appendages also vary from one to four, or are sometimes entirely absent.

The life-history of the fungus was ascertained from a series of cultures; living conidia being obtained from the fungus growing on "Camellias" cultivated at Kew.

Conidia germinated freely within eighteen hours in hanging-drop cultures in ordinary tap water. The median dark-coloured cells of the conidia are alone capable of germination, each cell as a rule producing a single germ-tube; in rare instances two germ-tubes spring from a cell, one of which remains rudimentary. On sterilised bread a dense white superficial mycelium soon appears, on the surface of which very minute dark points, consisting of groups of conidia are visible about the third day. Five days after sowing, the conidia are mature and capable of germination, but bread does not appear to be a very suitable medium for the cultivation of this fungus, the characteristic terminal, filamentous appendages of the conidia being almost constantly below the number normally present, and in certain tufts entirely absent. The spineless condition of conidium agrees exactly with the fungus described by Cooke as "*Hendersonia theicola*," parasitic on living tea leaves from Cachar, which is in reality nothing more than an abnormal form of "*Pestalozzia Guepini*," and has also been observed on "*Camellia*" leaves at Kew. Examples of these abnormal spineless conidia, sown on plum-juice gelatine, gave origin to perfectly normal conidia within a week, in fact only normal conidia were produced on the last mentioned nutrient solution, whether normal or exceptional conidia (in so far as the number of apical

spines were concerned) were sown. It is quite an easy matter to inoculate living uninjured "*Camellia*" leaves by placing conidia on the damp under surface of the leaf, and keeping it moist for two or three days. No result was obtained when the conidia were placed on the upper surface of the leaf.

*Pestalozzia Guepini* is not known to possess any other form of fruit or mode of reproduction than the condition described above.

The disease under consideration is by no means new; specimen of tea leaves attacked by the "*Pestalozzia*," now in the Kew Herbarium, are accompanied by the following note: "Tea leaves (blighted). Cachar, 1872 growth, A. H. Blechynden." A second lot of tea leaves, suffering from the same disease, is accompanied by a note as follows: "Leaves from a tea tree recovering from 'red spider.' Sp just beginning to run through them. This tree like many thousands has not given any leaf for three months. T. B. Curtis. Received from Mr Blechynden, Calcutta, by T. B. C., October, 1878."

The fungus occurs as a parasite on leaves of plants belonging to the following genera:—"*Camellia*," "*Rhododendron*," "*Citrus*," "*Magnolia*," "*Alphitonia*," "*Niphobolus*," and "*Lagerstrœmia*."

Owing to its wide distribution at the present day, the original home of the fungus is difficult to determine with certainty, but the amount of evidence at hand suggests an Eastern origin. In India it occurs on "*Camellia*" and "*Rhododendron*"; in Europe it is by no means uncommon, but always on introduced plants belonging to the two above-named genera. In the United States it occurs on introduced species of "*Camellia*" and "*Citrus*," from which it may possibly have passed on to the native "*Magnolia*." On the other hand, it occurs on indigenous plants (*Niphobolus*) in New Zealand, and on "*Alphitonia*" in Queensland.

**PREVENTIVE MEASURES.**—If the diseased leaves were collected with the amount of care and intelligence exercised in collecting sound leaves, and burned at once after being collected, the disease would soon be stamped out, as the mycelium of the fungus is not perennial in the tea plant; consequently infection, and a recurrence of the parasite, depends entirely on inoculation by the numerous conidia or reproductive bodies of the fungus present on deceased leaves. Remembering the very different kinds of plants on which the fungus is known to be parasitic, it is very probable that it also occurs on wild plants growing in the vicinity of the tea gardens; if such proves to be the case, all such plants should be removed if practicable, as the conidia of fungi are carried considerable distances by wind, birds, and insects, and no amount of attention in the way of removing the parasite from the tea plants would avail, if the supply of conidia requisite for inoculating the tea plants were formed on other plants growing in the neighbourhood.

The name of the fungus, together with the synonymy, is as follows:—*Pestalozzia Guepini*, "Desmaz.," *Ann. Sci. Nat.*, Ser. 2, XIII., 182, tab. 4, figs. 1-3 (1840). *Syn.* "*Pestalozzia inquinans*," Karst., *Hedw.*, 1891, p. 301. "*Pestalozzia Camelliae*," Passer., *Rev. Myc.*, 1887, p. 146. "*Corynecum Camelliae*," Masee, *Grev.*, XX., 3 (1891). "*Hendersonia theicola*," Cooke in *Sacc. Syll.*, IV., No. 2,334 (1884).

### BLISTER BLIGHT.

("Exobasidium vexans," Masee).

The amount of injury caused by this parasite, along with an interesting account of its general appearance and mode of life, will be gathered from the following account by Dr. Watt:—"One of the very worst blights on tea is known to the planters as "Blister Blight." At first it seemed to me as if this might prove a species of blister mite (*Phytoptus*), but I am now disposed to regard it as a fungus, and possibly a species of "*Exoascus*" or "*Taphrina*. In tube No. 257 I have sent specimens of the disease in

All stages, from young leaves showing translucent spots, to pieces of leaves showing well-formed circular blisters, also the further stages of the blisters appearing hairy (under the lens), and others turned quite black. The history of the disease is somewhat striking. It invariably appears on tea that has not been pruned in the autumn. About April it extends to the pruned tea, which has by then come into leaf. At first it looks like a minute pink spot, which, on being viewed through the leaf, is seen to be surrounded by a pale margin. This widens, and the upper surface of the leaf at this point becomes depressed into a circular pit that appears shining and moist. The under surface looks like a wart of a white, woolly appearance. These warts, as they enlarge, unite together and invade the shoots until the whole of the affected parts shrivel up. The woolly surface of the warts thus seems to be covered with white filaments, but I could never detect these as bearing spores. Shortly after this the leaves and shoots turn quite black, and fall to the ground. At this stage the tea plantation looks as if it had been burned. I have seen hundreds of acres completely ruined in this manner. But in two months or so, new shoots appear, and the blight is not seen again, as a rule, till next spring, and even then spasmodically, and where unpruned tea exists. It was very bad in the spring of 1895, and in 1897 I could not discover a bush with this blight in the very gardens where, at the time of my first visit, all operations had been completely stopped by it."

The view entertained by Dr. Watt as to the fungus nature of the parasite proved to be correct, microscopic examination showing it to be an undescribed species of "Exobasidium," possessing features of interest from the mycological standpoint, more especially in the production of a dense layer of conidia which covers the surface subsequently occupied by the hymenium. The earliest indication of the disease is the appearance of translucent spots in the leaf, due to the disappearance of the chlorophyll and starch grains; this is followed by a rapid increase in the number of cells constituting the spongy parenchyma of the leaf and situated within the area occupied by the mycelium of the fungus. The conspicuous blisters present on leaves that have been attacked for some time, are caused by the secondary increase in the number of leaf-cells over a limited area of the surface being resisted by the healthy unyielding tissues of the leaf; hence the abnormal growth, stimulated by the action of the parasite, assumes the form of a blister, being concave on the upper, and convex on the under surface of the leaf. When the points of infection are numerous on a leaf, the originally distinct blisters grow into each other during their development. The mycelium is very slender, not exceeding  $2\mu$  in thickness, sparingly transversely septate, and tinged with yellow when seen in the mass. It runs between the cells, which finally become much distorted and separated from each other. After becoming concentrated in clusters between the epidermal cells of the convex surface of the blister, on the under surface of the leaf, the mycelium ruptures the cuticle and appears on the surface of the blister under the form of minute, densely crowded clusters of hyphae. When the growth of the parasite is very vigorous the hymenium is not infrequently formed on both surfaces of the blister. Some of these hyphae run out into long, sterile filaments, giving a minutely downy or velvety appearance to the blister, when seen under a lens; the greater majority of the hyphae, however, remain short, and produce a single conidium at the apex. The conidia are hyaline, or with a tinge of yellow when seen in the mass, elliptic with somewhat pointed ends 1-septate, slightly constricted at the septum, straight, or sometimes very slightly curved, measuring  $14-16 \times 5-6\mu$ . It is not unusual to find conidia germinating *in situ*, each cell of the conidium producing one slender germ-tube. Mixed with the conidiophores are numerous basidia, but these are not sufficiently crowded and compact to form a typical hymenium, the surface of the tuft constantly remaining loose in

texture, resembling the face of a brush rather than a waxy, compact surface. The basidia are subcylindric, and so far as observed, constantly produce two slender spine like sterigmata, although the presence of four daughter nuclei in some preparations of basidia stained with iodine green, would seem to suggest the probability of four sterigmata being found in some instances. The spores are hyaline, continuous, glabrous ovate-oblong, often slightly inequilateral,  $5 \times 3\mu$ . When old, the tufts of hyphae appear to contract a little, thus becoming more isolated and distant from each other, and giving the hymenium a cracked appearance.

The branches do not appear to be disfigured to the same extent as the leaves by the parasite.

**PREVENTIVE MEASURES.**—Remembering the statement by Dr. Watt, that the disease "invariably appears on tea that has not been pruned in the autumn," it seems almost superfluous to suggest that autumn pruning should be carried on, unless there is some very strong reason for not doing so. The removal of diseased portions before the spores are mature would go far towards preventing a recurrence of the disease. Such infected parts should be burned, and not allowed to remain on the ground. Spraying would not, in all probability, be permissible, otherwise a solution of potassium sulphide (one ounce to three gallons of water) would prevent to a great extent the spread of the disease, if applied at the time when it first appears. All known species of "Exobasidium" are parasites, forming blisters or galls on the leaves and branches of the host plant: the flowers and fruits are sometimes also attacked. Species belonging to the following genera are known to serve as host plants:—"Rhododendron, Vaccinium, Andromeda, Cassandra, Arctostaphylos, Ledum, Saxifraga, Laurus, Symplocos, Arrhenatherum, and Bromus." The above list of genera belonging to widely separated orders of plants, suggests the possibility of some ally of the tea plant also serving as a host for the "blister blight," and if such exist in the forest adjoining the tea plantations, there is but little hope of eradicating the disease until such nurse-plants are removed from the vicinity.

The following is a diagnosis of the species:—

*Exobasidium vexans*, "Massee." "Hymenophora" innata, effusa, forma varia, vulgo orbicularia vel oblonga, in foliis infestatis bullas supra concavas infra convexas 4-12 mm. diam. interdum confluentes formantia. "Hymenium" leve, siccitate rimosum, initio pallidum, dein etate albo-pruinosum. "Basidia" cylindracea  $30-35 \times 5-6$  d, 2-sterigmatifera; sterigmata aculeata,  $3 \times 0.5\mu$ . "Spores" ovato-oblongae, continuae, hyalinae, glabrae, saepe inequilaterales,  $5 \times 3\mu$ . Conidia fusiformia, hyalina, 1-septata, ad septum leviter constricta,  $14-16 \times 5-6\mu$ .

On living leaves and branches of "Camellia Tbea," Assam.

Fig. 6. Leaf of tea plant, with blisters formed by blister blight ("Exobasidium vexans"); nat. size. Fig. 7. Section through a blister;  $\times 100$ . Fig. 8. Portion of hymenium of same, showing numerous conidia, a, and basidia, b, bearing two spores each;  $\times 400$ . Fig. 9. Free spores;  $\times 400$ . Fig. 10. Conidia;  $\times 400$ .

### THREAD BLIGHT.

("Stilbium nanum," Massee).

This very remarkable fungus, while agreeing technically with the genus "Stilbium" in the structure of the conidiophore, differs very materially in the presence of an elaborately branched, sterile stroma composed of densely interwoven, slender, sparsely septate, vaguely branched hyphae,  $2-3\mu$  in diameter, combined to form a thin, white membrane, which is inseparable from the bark or leaf on which it grows. This sterile felted mycelium often forms white patches several inches in length on the bark of living branches, and then breaks up into irregularly-branched slender strands, many of which are

not thicker than thread, hence the planter's name "thread blight." The delicate white strands of mycelium run along the surface of the bark to the tips of the young shoots, branching and anastomosing irregularly; thence they not infrequently pass on to the leaves, where they form a yet more delicate, irregularly branched pattern. Microscopic examination of a deceased branch shows that the slender mycelium is at first most abundant in the cambium zone, and extends to the young wood, the vessels of which soon become choked with a dense web of mycelium. A slight browning of the tissues indicates the progress of the mycelium. This internal mycelium passes through the substance of the bark, and gives origin to the superficial strands of mycelium described above. The branches are eventually killed owing to the destruction of the cambium zone and choking of the vessels of the wood by mycelium. So far as can be observed from an examination of the ample supply of material forwarded by Dr. Watt, the fruit of the fungus is only produced after the branch on which it occurs is dead, when it appears on the surface of the bark under the form of miniature pins about half a line high, and of a pale yellow colour. These fruits generally occur in large numbers, giving to the branch a minutely velvety or hairy appearance as seen with the naked eye.

In the absence of living material it is impossible to state definitely in what manner the fungus first gains access to the interior of the living plant; but the general habit suggests the idea of its being a root-fungus, first attacking the slender rootlets, and afterwards extending into the above-ground portions of the plant. If mycelium is found in quantity on the thicker root-branches and about the base of the trunk, the above supposition would doubtless be correct, and would imply the presence of strands of mycelium in the soil; such strands probably traversing the soil and extending from one plant to another, as is known to be the case in other root-parasites, as "*Dematophora Nectatrix*" and "*Rosellinia radiciperda*." The fungus described above is in all probability only the conidial phase of some higher form, which, as is usually the case, only forms its fruit on thoroughly decayed portions of the host plant.

**PREVENTIVE MEASURES.**—If examination, as indicated above, shows the fungus to be a root-parasite, a trench should be made round the base of the stem, as deep as practicable without injuring the roots, and filled with lime, or failing this, with wood ashes. Deep narrow trenches should be made enclosing batches of diseased trees, for the purpose of checking the spread of underground mycelium from diseased to healthy trees. Under any circumstances branches killed by the disease should be collected and burned, otherwise the conidia formed on such branches will be carried by wind and other agencies, and infect healthy plants. Care should be taken to ascertain whether fungus is present on wild plants growing in the vicinity of the plantations, as no amount of care exercised on the tea plants to prevent the disease will avail if the fungus is present on other plants that grow near at hand.

The following diagnosis will enable the fungus to be recognized by a mycologist:—

*Stilbum nanum*, "Massee" (sp. nov.).

"*Conidiophora*" minutissima, vix 0.5 mm. alta, gregaria, flavida. "*Stipites*" æquales, tenues. "*Capitula*" globosa vel obovata. "*Conidia*" numerosissima, minuta, hyalina, continua, elliptica, mucoprimis obvoluta, 5 × 2.5µ.

On living branches and leaves of "*Camellia Thea*." Assam.

Fig. 11, Branch of tea plant attacked by "thread blight" ("*Stilbum nanum*"), showing the white sterile mycelium running over the bark, also the fruit of the fungus; nat. size. Fig. 12, Fruit of the same; × 100. Fig. 13, Section through a head of fruit, showing the conidia borne at the tips of the hyphae which form the head; × 400.

## PLANTING NOTES.

SINGAPORE which has been taking so much of our coconut oil this year is to have an Oil Mill on a big scale of its own. A former member of Messrs. Volkart's firm here, is getting the Mill erected at Singapore and it is expected to be in working order by the end of the year.

**NORTH BORNEO.**—We (*L. & C. Express*) are pleased to note that the directors of the British North Borneo Company are again able to recommend a dividend of 1 per cent. It is true the shareholders have had to wait a long time for any return upon their capital, but the fact that for two years in succession the directors have been able to pay even a small dividend shews that a better financial position is being gradually brought about, and that the time is arriving when those who have for so long put their faith in North Borneo may look for substantial results. The company has a magnificent territory, and the shareholders, we think, may rest content that it is being administered under the present management upon a thoroughly sound and statesmanlike basis. Much, of course, remains to be accomplished yet, for it is impossible to transform such a country all at once, but in pursuing a cautious policy the directors are without doubt acting wisely. A 1 per cent dividend is not handsome, but it is better than nothing at all, and must be taken by the shareholders as an earnest of better things to come.

**THE MAURITIUS CHAMBER OF AGRICULTURE.**—A series of 20 resolutions in answer to Mr. Chamberlain's refusal of the £500,000 loan have been adopted. We quote a few:—

That the Chamber regrets to see that the Secretary of State considers that part of the money raised under the Hurricane Loan Ordinance of 1892 has been lent for purposes for which it was not intended.

That the Chamber submits that, if the law has been misinterpreted, which it is not ready to concede neither the Planters of the Colony nor the Loan Commission, which was purely an advising board, can be held responsible for it, nor can the Commission be reproached with having overlooked the instructions of the Secretary of State, contained in a despatch which only reached Mauritius when nearly all the applications made by the Planters for loans had been disposed of.

That the Chamber firmly hopes that, on reconsidering the matter, the Secretary of State will admit that the appeal made for the aid of the credit of the Imperial Government is justified by the circumstances of the Colony.

That though the Colony may not be at its last extremity, yet it is a fact that the Sugar industry of Mauritius is in imminent danger of extinction because the sale price of its produce does not cover the costs of production.

That our sugar, which is unprotected, cannot compete on foreign markets with bounty fed beet sugars or home grown sugars.

That we have thus been driven from the English and the Australian markets and we are gradually losing the Indian markets.

That, to be beneficial, the aid of the Government must be given in time before the position becomes worse.

That unless the production of the island is increased by a larger extraction of the sugar contained in the cane, the Colony will ultimately become a burden on the Imperial Government.

That the best proof that we are declining is that our public revenue is now insufficient to meet our public expenditure.

That with improved methods and machinery the cost price of sugar may be reduced so as to render competition possible.

## Correspondence

To the Editor.

## THE CHERRY TREE AT NUWARA ELIYA.

St. Denis, Island of Reunion, May 30, 1898.

SIR,—I hope you will excuse the liberty I take in asking you some botanical questions, to which I hope you will deign to grant a reply. It is concerning the Cherry Tree of Europe (*Prunus Cerasus* and *Prunus Avium*). Professor W. Detmer (University of Jena) asserts, in a treatise of Vegetable Physiology that this tree, introduced from Europe into Ceylon by English colonists, at first lost its leaves once only every year, as it does in temperate climates at the end of the autumn. Then, gradually, the tree became an evergreen never completely losing all its leaves. Is this correct?

I should be keenly anxious to know the answers to the few questions which I venture to put to you on the opposite page. If you could fill them in and send the half sheet to me, I should owe you a thousand thanks.

Not only do these points interest me, but they have been asked for by a French horticulturist.—I am, &c.,

EDMOND BORDAGE,

Director of Museum, St. Denis.

[We thought the quickest way of answering Mr. Bordage's questions would be to refer to Mr. Nock of Hakgalla Gardens and publish the result in the answers given below. Mr. Nock tells us that he has had to answer similar questions from scientists more than once of late.—ED. T.A.]

## Questions and Answers

1. Has the European cherry tree introduced into Ceylon become an evergreen?—No. It loses its leaves at the end of every year and for a short time is quite bare.

2. Does it flower abundantly in Ceylon?—It flowers abundantly in the locality of Nuwara Eliya. [6,200 feet above sea-level; average temperature 57.7 degrees. Ed. T.A.]

3. Does it bear fruit there?—It sets but little fruit, and that generally falls off before the stoning stage. Occasionally I have seen fruit colouring, but never saw one quite ripe.

4. Is it sometimes reproduced from seed or kernel in Ceylon?—Never, to my knowledge, by seeds, but plentifully by cuttings and suckers.

5. Is it exclusively reproduced from cuttings or from grafting?—Yes, from cuttings and suckers, not grafting.

## TEA PRUNING IN CEYLON: CRITICISM BY A SUCCESSFUL PLANTER ON "1874" S TEA-PRUNING LETTER.

SIR,—Nothing is said in this very interesting letter of elevation, soil, jat or cost; so I will merely say that with us, at some 4,000 feet, I have found the greatest success with good jat tea (which is naturally a one-stem tree) instead of encouraging the straight stems, in the way the writer describes, in removing them all and keeping the tree perfectly clear of them in pruning, and afterwards as much as possible in plucking. On such tea I look upon them as simply and purely gourmandizers. The rest of the treatment in pruning, I quite agree with, and that each branch be treated on its own merits, and not merely left up to the one level. Also that the

"frame" of the tree should as a rule always be preserved. In Ceylon I think most planters adopt the up-pruning system as far as possible and few go down very low except for reasons given in a letter signed "Andi Alteram Partem" in "Times of Ceylon" with which I entirely agree. To leave such tea as "1874" suggests, would be very liberal treatment; but few would allow it with present unfavourable exchange and comparatively low prices, and I am not at all sure that where tea has been badly planted at first and has all else against it, that even this would be as successful as cutting down, manuring and re-training in the right way—but it should never be cut down again lower than the 2 feet when once up to that.

Instead of always cutting up the one inch when pruning (above the 2 feet) I have found that occasionally one can cut down between the previous cuts and then go up again the one inch; or it can be 2 inch cutting for 2 or 3 prunings and then down 1½ or even 3 inches, and let up again. This keeps the tree low and does not necessitate the cutting down to 2 feet at all even after the 1 foot, or "12 upward cuts."

Of course in Ceylon at this elevation we let our tea run from 2 to 3 years between prunings and at a higher elevation even much longer.

In place of "surface pruning" advocated by "1874" I have found that cutting down (some 3 inches or so below level) the high branches only, and heavy banging, or plucking down to fish leaf and then letting it up again, answer best, and it does not stop plucking altogether, though it may reduce the average for a time.

There is no doubt about the importance of getting all the tea to one height and I have been trying to do this for years, but have found the most successful plan is to leave the smaller trees up to height of the larger ones when tipping by stick measurement and not when pruning. The wood produced is superior. These trees too ought to be treated lightly for a time or left to grow up if they show any distress from plucking. In any case, however, it will take years to train all the trees to the one size; for though one may get height it is not so easy to get bulk. Supplying also has a lot to say in keeping up a regular cover of tea, and can, as I have proved, be successfully done under proper conditions.

With this treatment, and manuring such tea as requires to be kept up to the general standard, I can get large yields (for Ceylon at this elevation) and good prices and realize a good profit per acre; but when it comes to doubling 800 lb. per acre all round even with the best possible cultivation, I must either doubt the possibility of any such thing, or we are altogether out of the running in Ceylon as far as I know anything about it! J.

## GOURDS, LOCAL PRODUCTIONS.

SIR,—In Ceylon the cultivation of gourds is very much neglected, it is entirely in the hands of natives and they seem to be quite satisfied with the few varieties they have, viz. *Lagenaria vulgaris* and *Cucurbita Moschata*; the *Dhya* and *Rata Labu* of the Sinhalese. Yet the number of these fruit taken on board of steamers and ships is something enormous—there must therefore be a brisk trade in these and it is a pity that its cultivation is not taken up on a large scale. On looking over Sutton's or Carter's monthly catalogues, the most attractive and luscious pictures of fruit are the different varieties of gourds and melons. Is this not a subject worthy of our School of Agriculture?

Whilst on this subject it strikes one forcibly that with our favourable climate, rainfall, and other advantageous resources, why we should so entirely depend upon Southern India for our chillies, onions and saffron? This is a point on which the public would very much like to have the opinion and advice of the intelligent principal of our Agricultural School.

Many years ago we also depended upon India for our ginger, but all our wants in that direction now, is met with locally, for the Sinhalese have now taken to planting it largely and they supply the market. C.

#### FLOWERING OF THE GIANT ORCHID.

July 12.

DEAR SIR,—It may interest some of your readers to know that the largest orchid known (*Grammatophyllum Speciosum*) may now be seen in flower in these gardens, this being, so far as is known, the first time it has been induced to bloom in Ceylon. That this Malayan plant, which was introduced into Ceylon probably about 1850, merits the title of "Queen of Orchids" will be conceded from the dimensions of the Peradeniya specimen above referred to: viz:—Length of stems or pseudo-bulbs (24 in number) 5 to 10 ft., the sheathing leaves being about 2 ft. long and closely arranged in two rows on the stem; height of flowering-scapes (six) at present 5 to 6 ft.; thus the height from base of mound containing the plant to top of inflorescence is about 10 ft.; circumference of the plant approximately 40 ft. Of individual flowers, nearly 500 can now be counted (not including the smaller in bud), each measuring  $5\frac{1}{2}$  to 6 inches across.

The period of flowering promises to be prolonged for a few weeks yet, though the expansion of the first flower occurred a month ago. It is hoped, now this interesting plant has got into flowering trim, it will blossom annually in future.—Yours faithfully,

H. F. MACMILLAN.

Curator, Royal Botanic Gardens, Peradeniya.

#### THE FOUR-PENNY DUTY ON TEA.

4,500 feet, July 15.

SIR,—No getting over this argument, I think. If, with the barrier of a four-penny duty, "rubbishy" teas are now sent from Colombo to London, paying Freight and CHARGES ( $1\frac{1}{2}d$ ?) and DUTY  $4d$  a lb.,—how much more would the same process go on and increase, if there were no Duty at all? I for one, say to my brethren who are abolitionists,

BEWARE!

#### COFFEE IN QUEENSLAND, &C.

Department of Agriculture, Brisbane, June 22nd, 1898.

DEAR SIR,—I quite forget whether I wrote to thank you for the back numbers of the *Agriculturist*. Should I have failed to do so, I beg that you will now accept my thanks for acceding to my request so promptly.

I now write to ask if you can give me any further information on the trade in *coffee husk refuse* between Colombo and the Persian Gulf Ports, to which you alluded in the early part of the year. I have promised to get further statistics on the trade, and I hope that you will be able to furnish me with same. I shall be always happy to reciprocate with any information in my power concerning matters agricultural in Queensland.

I am publishing a series of articles on coffee in Queensland by Mr. Dausey, who is manager of the Mackay Coffee Company in Northern Queensland.

He seems to have mastered the work of coffee-planting here where the conditions of climate, soil and seasons are different to those in Ceylon. We have great hope of this industry for Queensland. No disease has as yet appeared and heavy crops have been obtained on small plots—up to 7 lb. of clean coffee per tree (6 years old) and  $3\frac{1}{2}$  lb. from 3 years old trees. A fair price also is obtained locally (9s per lb) I am afraid however, that when we come to big plantations, picking will be a source of trouble as far as labour is concerned.

You will find in the next number of the *Journal* (August 1) a capital paper on coffee-growing on a small scale on the coast of Queensland by a farmer who read his paper at the late Agricultural Conference at Rockhampton. It is worth reading. Wishing you all success with your work.—Yours very truly,

A. H. BOYD.

[The papers referred to will be read by us with interest: Coffee growers on a limited scale in Northern Queensland have the grand advantage of a local market, and if Federation prevails, this market, free of every border duty, will extend all over the Continent, if not to Tasmania and perhaps eventually to New Zealand.—We can give no further information about a trade in coffee husks, save that it is reported to prevail largely in Arabia where, in some parts, a decoction from the husks only is drunk, the beans (Mocha coffee) being all exported.—ED. T.A.]

#### CULTURE OF VANILLA.

SIR,—The report of the vanilla crop in the Seychelles is very interesting. The mode adopted of allowing the vines to grow wild on trees is good, as the trees afford the required shade and moisture; but it has its disadvantages, as it is difficult to fructify the flowers, when the vines go up too high and on their branches, unless the natural operators (bees) can be depended upon to do what is necessary. In Ceylon there are so many other flowers that yield larger quantities of honey, that the flowers of the vanilla are quite neglected by bees and artificial means have to be devised to fructify them.

Many years ago I purchased a few cuttings of vanilla for a few pence from the Botanical Gardens at Peradeniya and planted them in a garden at Colombo; the vines were allowed to go up some mango trees growing thick and affording good shade; they grew up luxuriantly and formed a regular network. One morning, my friend, Mr. Wright, the veteran planter, who was then a resident in Colombo, called on me, accompanied by a young European gentleman, and asked if I would part with the vines and at what price? I left it to them, they paid me one shilling for every two knots, a little more than a foot in length. The vines were pulled down and measured and a cheque was written out in my favour for R561. The cuttings were taken and planted on an estate in the Galle district and I afterwards learned with regret that the venture proved a total failure.

That vanilla requires both light and shade is proved from the fact that I grew one on a Cochin goraka (*Garcinia Xanthochymus*) tree, every alternate branch being removed to admit light, very successfully and this yielded a fair crop of beans. The difficulty I had to contend with in the preparation of the bean was that they split at the ends: this had to be avoided by tying them up with thread. C.A.C.

#### VANILLA CULTIVATION.

Bentota, July 23.

DEAR SIR,—I note with much interest the extension in vanilla cultivation, which is at present taking place. The Seychelles' report certainly presented a very roseate account of the industry. As you rightly remark, there seems no reason

why Ceylon should not put a few thousand pounds' worth on the London market.

Intending cultivators should bear in mind that, while the actual growing of the plant and the fertilising of the flowers are quite simple, the proper "curing" of the fruit is by no means simple or easy; in fact, it is a very ticklish operation, especially in our climate, which seems to favour the development of "mouldiness" on the surface of the "cured" fruits. Vanilla tainted by mould fetches quite nominal prices—3s or so per lb. Much care is required also to bring out the aroma to its fullest extent, and to so conduct the "sweating" stage as to produce the "frosted" appearance, which is taken, to a great extent as the criterion of quality. Vanilla has undergone a serious drop in prices within the last year. Last July the finest long-frosted beans fetched some 32s per lb.; while the same quality beans now bring from 19s to 22s per lb. Other grades have dropped proportionately. Vanilla cultivation could be easily overdone, as there is but a certain limited demand for the spice.—I am, dear sir, yours truly,  
ORCHID.

July 26.

DEAR SIR,—Your correspondent "C.A.C." records the total failure of the planting of over 100 vanilla cuttings on an estate in the Southern Province. The cause of failure, or at least one good reason for it, was evidently the small size of the cuttings planted. To be successful, these should be at least four joints in length; five leaved cuttings are even better. They should be planted with two eyes below the surface and the third just level with it, the soil being well mixed with dead leaves and litter. An essential to good growth is permanent moisture without damp, that is to say, without stagnation; good drainage is necessary. The vines grow well up many soft-wooded trees such as the indigenous *Erythrina* (*E. indica*) and the writer has seen plants growing, with a profusion of fine pods on them, over old stone walls of dismantled buildings and even over moderate sized rocky boulders, of course under shade. When grown-up trees the vines should be turned down over the lowest branch and led down to the ground to root again; in this way the flowers are all within easy reach for artificial fertilisation.

The pods, if gathered before they are ripe, will always split just as cardamom capsules do: they should be gathered as soon as they begin to turn yellowish at the tips.—Yours faithfully,  
B.

#### GAME PRESERVATION.

July 25.

DEAR SIR,—The article you quote from the "Ceylon Forester" (see page 173) raises an important point. If the close season, as is suggested, is abolished and sanctuaries for game are established, who is going to look after them? They would have to be very numerous, if not very large, so as to be close together, or a large proportion of game would have no refuge in the breeding season. Would the headmen be sufficient to protect them?

The value of the proposal is considerably reduced in the very next sentence, in which it is suggested that special licenses, with large fees, might be issued for shooting within these sanctuaries, penalties being inflicted for shooting does or young!

The question of gun licenses is dealt with in an airy way, but owners of guns used merely for protection of property would naturally object to be taxed at the same rate as sportsmen. If the Game Association is in want of funds to

pay for watchers and informers, it should agitate for a license on the manufacture of guns in the island: the number produced locally is not small.  
—Yours faithfully,  
MAXIMS.

#### THE SALE OF RUBBISH AS TEA.

July 25.

DEAR SIR,—You have on many occasions called attention to the numerous instances in which villainous trash has been sold as Ceylon tea, but we seem to be no nearer a solution of the difficulty of suppressing this malpractice. A correspondent suggested in your columns some six months ago, that the names of all local buyers of teas below 12 cts., should be published with the weekly sale lists. Why not?

The Commissioner who is spending large sums of money in pushing the sale of Ceylon tea in America, lately called attention to a consignment of tea valued at 2½d, but stated that he was not at liberty to disclose the estate's name! Again, why not? If the tea had been worth two shillings instead of two-pence, American dictionaries would have been ransacked for terms to proclaim its virtues: the Commissioner's false modesty will prove expensive to the Ceylon tea enterprise.

Can we do nothing in Ceylon to check the shipping of worthless teas? Have our Colombo tea-testers no fixed limits to separate tea from rubbish? At last week's sale over 21,000 lb of dried tea leaves in some form or other were sold at 12 cts per lb., and over 24,000 lb at still lower prices. If all this was fit for human consumption, the producers are being robbed: if not, the Public Analyst should interfere and order its destruction.—Yours faithfully,  
DUST-BIN.

#### THE FLORIDA VELVET BEAN.

July, 27.

DEAR SIR,—I should be greatly obliged if you or any of your agricultural readers could tell me whether the much-talked-of velvet Bean of Florida has yet been grown in Ceylon. From all accounts it is a plant deserving of cultivation, in at least all sub-tropical countries, being wonderfully productive as a forage plant, handsome as an ornamental climber, and the bean useful as a table vegetable. Its nutritive properties have apparently not attracted attention until within the last two years, and now it seems to be booming in America, Australia, and Southern Europe. Stock of all kind feed greedily upon it—the foliage, vines, and beans; and belonging to the pea family, its merits as a soil fertiliser are said to be very prominent.

—Yours faithfully,

INQUIRER.

Colombo, July 29.

DEAR SIR,—If your correspondent "Inquirer" is a man who wishes to try the Florida Velvet Bean, let him have the enclosed seeds of it which I brought with me from Melbourne. B.

[Our correspondent, we feel sure, will do full justice to the seeds which we send on to him.  
—ED. T.A.]

#### "FIRE EXTINGUISHER": A CORRECTION WANTED.

DEAR SIR,—In the T.A. for May is given a 'recipe' (taken from the "Diocesan Gazette")

for a fire extinguisher. The ingredients are given as common salt and sal ammoniac (nitrate of soda). As sal ammoniac is not nitrate of soda but ammonium chloride, one is unable to make out whether sal ammoniac or nitrate of soda is the second ingredient. As the correct recipe will be a useful one, and as mixed chemicals are not always safe, it would be an advantage to have the point cleared up.—Yours, &c. C. D.

#### HIGHEST RAINFALL IN 24 HOURS.

27th July, 1898.

DEAR SIR,—The following correspondence on the above subject is interesting now that Ceylon is competing with Queensland and India for the highest record rainfall in 24 hours.—Yours truly,

C. D.

A REMARKABLE RAINFALL.—I send a few particulars of the recent remarkable rainfall at Crohamhurst, situated on the western slope of Mont Blanc, a peak on a spur of the D'Aguilar Range, an offset from the Blackall Ranges, South Eastern Queensland. The whole of this district is watered by the Stanley river, a tributary of the Brisbane river, and hence the values given below were prominent factors in producing the terrible floods from which we have suffered. I may mention that the observer at Crohamhurst is Mr. Inigo Owen Jones, one of my specially trained assistants, and that implicit reliance can be placed on his figures. The following are the more remarkable falls of the flood period at Crohamhurst:—For 24 hours ending 9 a.m. February 1, 10'775 inches; ditto February 2, 20'056 inches; ditto February 3, 35'714 inches; ditto February 4, 10'760 inches. The gauge is a standard of the "eight inch" pattern, standing one foot above the ground at an altitude of about 1,400 feet above mean sea level. The approximate latitude and longitude of Crohamhurst are 26° 50'S. 159° 55'E. The gauge was emptied every three hours, night and day, on the occasion of the greatest fall. I think meteorologists will agree that for a 24 hours fall we have beaten the world's record. Clement L. Wragge, Government Meteorologist of Queensland. (Late of Ben Nevis). Brisbane, March 22.  
—*Nature*, May 4, 1898.

THE GREATEST RAINFALL IN TWENTY-FOUR HOURS.—In *Nature*, May 4, Mr. Clement Wragge, of Brisbane, confidently asserts that Queensland has beaten the world's record in the extraordinary amount recorded on February 3, viz., 35'7 inches. I am sorry to have to take away such an unenviable palm from Queensland, by recalling a fact well-known to every Indian Meteorologist that the highest record extent belongs to Chirapunji, in the Khasia hills, where on June 14, 1876, 40'8 inches were recorded in the twenty-four hours. Not only so, but on the 12th 30 inches fell, and in the four days, from the 12th, to the 15th inclusive, as much as 102 inches. Of course the effects were not so disastrous in this case, as indeed such a state of things is little removed from the normal at China in the early part of June, but I have a very clear recollection of it as I was at Chirapunji on the 12th and 13th, and not far from it on the memorable 14th. The conditions which have occurred in Queensland and the North Islands of New Zealand during the last six months have been a remarkable example of persistent abnormalities, and though the total number of rational causes may still be wanting to explain everything, one or two were evidently in operation when I was there from October to January, and I am confident that from the empirical law of persistency, coupled with a few rational inferences, a forecast of impending floods could have been made and can be made for the future, much in the same way as the general character of the monsoon can be foretold in India.—(*Nature*, May 13 1893.)

With regard to the statement made by Mr. E. Douglas Archibald in our issue of May 25th, that the highest rainfall in twenty-four hours was 40'8 inches, registered at Chirapunji, in the Khasia hills, a correspondent writes to the *Ceylon Observer* as follows:—"If the *Indian Planters' Gazette* of 28th Jan. 1893 is correct, the following paragraph establishes a still higher record. On page 59 one reads: 'On Dehra Doon correspondent writes on January 21st 1893, "Last night we had 48 inches of rain, and all the hills are covered with snow. It is still raining." For this to have any scientific value, however, it must be known who were the observers, and by what means the rainfall was gauged.—*Nature*, July 27th, 1893

HIGHEST RAINFALL IN TWENTY FOUR HOURS.—With reference to the paragraph quoted in your notes of this week's "*Nature*" from the *Indian Planters' Gazette* of Jan. 28th 1893, the most elementary knowledge of Indian meteorology would suffice to show that the remarkable figure, 48 inches, supposed to represent the fall of a single night in January at Dehra Doon, is simply a misprint for 4.8. The entire rainfall of the winter season in no part of India exceeds one-half this amount, and I have no hesitation in declaring such a figure as 48 inches in twenty four hours to be absolutely without precedent, and in my opinion, so extraordinary at such a season, that, if it really were 48, it would require us to regard all existing Indian meteorological data with suspicion. Thirty inches in twenty four hours has often been recorded at Chirapunji in June and July. Can any one show a single instance of even 20 inches in twenty-four hours at Dehra Doon? Moreover, the whole annual supply at Dehra Doon is only 75 inches, while that of Chirapunji is 600 inches.  
E. DOUGLAS ARCHIBALD.

#### CEYLON TEA IN GERMANY: AN URGENT APPEAL.

Gammadna, July, 30.

DEAR SIR,—It seems an age since I lifted my pen to open my mind to you, but having just returned from a very enjoyable trip of nine days, I cannot let the impressions received from my journeying be altogether lost. I shall not at present attempt to describe individual estates, factories or the hospitalities I met with in Badulla, Udapussellawa and Dolosbage, but rush to the subjects I feel most deeply concern the great industry we are all so heartily endeavouring to keep afloat.

I was greatly pleased to see, that so many papers had given favourable notices of the Planters' Association Commemoration present to the Emperor of Austria, and think that now is a fitting opportunity for the Thirty Committee, to show their appreciation of the notices, by sending each of the Editors of those papers a 50 lb. box of the best household tea the country can produce. In sending these presents the Committee might also advocate the reduction of the import duty on tea in Austria pointing out some of the advantages the reduction of the duty would bring to the people individually, and to the great increase of revenue their country would receive. Comparing England's consumption of tea under the high rate of duty with that of the present day.

The Ceylon Government should also approach the German Government on behalf of the great industry which is so often spoken of and truly considered the backbone of this country. Without the tea planting industry, Ceylon would be in a very bad way. It is therefore to my mind the duty of the Government to help that industry in every possible legitimate way it can, and there is no way more likely to be productive of good

results, than this of His Excellency, (either with or without his Legislative Council) at once appealing to the Emperor of Germany on the matter of redaction of the duty on teas into that great country. It is needless to point out in a letter to the press the vast benefits a country like Germany would derive from the greatly increased importation of good pure sound teas, at prices within the means of the poorest inhabitant.

At present our teas are said to be beyond their means owing to the prohibitive duty, and the difficulty in obtaining it. Tea in Germany is still an article found in few but chemist's shops, I believe, not that the Germans who knows its good properties wish it to be so, but that so few of the people who know good tea can afford to pay the price charged for it. In a country like Germany this ought not to be and our Thirty Committee might, and ought to do far more towards spreading a knowledge of our teas there, than they are doing. Why should they wait for agents to come forward and ask aid?

Are there no more men of the Rogivue type to be found to pioneer Ceylon tea throughout Germany? Cannot the Thirty Committee advertise for men thoroughly qualified to do the work in Germany as Rogivue has done in Russia? Or must we all wait in the hopeful expectation of such persons presenting themselves? I appeal to you Mr. Editor to stir up the planters and the Government to do more for the country's great industry and not to go on in the old track we have quietly been following in the vain hope of times improving. My letter is already too long or I should urge the latest reports from London in proof of the great need there is for immediate action.—Your faithfully,

JAMES WESTLAND.

[The duty in Austria is 9d; in Germany 6d per lb.—ED. T.A.]

### GREEN TEA.

SIR,—I am very glad to see that Mr. Mackenzie has at last spoken plainly about the advisability of making Green Tea for America. He has hinted it all along, but now that times are so very hard he has had the courage to advocate it openly.

You will not grudge me the pleasure of saying "I told you so." You will see by my letters in 1894 that I said a good deal about making green tea for America. I was looking ahead. To do any real good we must all look ahead.

In 1894 our prices were not low enough to encourage any change in our programme but now the time has come when something *must* be done. If we had only had a few men in 1894 who were looking ahead, we might by this time have had a large market for green tea. It is all right now, and we shall begin, and we shall succeed because we have the material ready in the shape of good leaf, and we shall very soon find out how to acquire the *lost art* of making green tea as good as any that comes from China. I believe that in course of time we shall destroy the taste for green tea because it is unfermented and injurious. The Americans will first demand unfermented tea, gradually they will take (and like) very lightly fermented teas; later on they will ask for fully fermented (or oxydized) tea. The change will not be noticeable from year to year, but we shall succeed by *humouring* the taste of the consumers, and we shall be able to follow their taste as it gradually changes from flavoured dish water to the liquor of our noble fermented teas.

The Americans are absolutely blind to the merits of our teas. But you don't restore sight to weak eyes by showing an electric light in front of them. You shade the weak eyes with green shades, and remove them gradually, and increase the light little by little.

That is what we are now going to do to the American "tea eye." But now that we intend to imitate the character of China tea, it will be the vastest mistake if we do not also imitate their methods of dealing in tea. I presume that we shall (until taught by severe experience) as is now our custom send off small breaks of 20 chests, and that each garden will send teas differing from the rest, so that no dealer can know what will become of his venture, and whether he can *ever* get the same tea again if the venture proves profitable.

We *must* send large "chops" of tea and we *must* be prepared to repeat them as often as required.

One hundred estates from different districts should send, each, a contribution of 500 lb. of green tea each month to a common bulking house, and risk getting much or little for the tea.

This bulk of 50,000 lb. should be forced on the American market month by month. Let them have the lot at 2d per pound as an advertisement and then let it take its chance in their market.

Whatever we are, let us be "*big*." The spirit of the day requires big things. Big estates, big factories, no peddling in small plots of land, and tiny breaks of tea. The Americans require big things, irrespective of quality.

We don't want to upset the system of tea dealing; we want only to replace the China tea with British tea. So we must copy as closely as possible the ways and customs of the China trade even to the shape and appearance of our boxes, to the size and quality of the breaks, to the giving of the usual trade credits, &c., &c. And all this can be attempted by a Syndicate of Tea Estates. The syndicated estates would steal a march on China by taking the place of both grower and merchant. Looking at recent tea sales from Sylhet, Cachar, Ceylon, &c., it is not rash to say that the same leaf which sold at 4 to 5 annas as black tea would have got the same (and possibly more) price if it had been made into unfermented tea and sent to America. 1874.

### WHITE ANTS AND THE TEA-BUSH.

Veyangoda, August 3rd, 1898.

DEAR SIR,—Will you please give your opinion on the point involved in the following discussion? *A* maintains that white ants attack a perfectly healthy living tea-bush.

*B* denies this and holds that the white ant only attacks the tea-bush when the bush is unhealthy—suffering in some mysterious way from fungus growth or poebies, etc.

In a word *B*'s argument is that the white ant finishes the deadly work commenced by some other enemy of the bush.—Yours faithfully,

WHIST.

[This is a revival of a controversy which frequently occupied our columns in "days of old." Undoubtedly, the weight of opinion is that white ants cannot touch a living healthy plant of any kind, and we do not see why a tea-bush—regarded as exceptionally hardy—should be an exception. But we must confess that in days gone by, evidence was afforded of appar-

ently vigorous plants (not tea) being occasionally overcome, especially in the lowcountry; and therefore we should not like to be positive. Since writing the above, we have referred to the "T. A."—what a blessing to every estate manager if he had a set within reach!—and in the very first volume we take up, on reference to the index, we find the following letter showing that in North India at least, white ants are a recognised enemy of Tea:—

WHITE ANTS IN TEA.

To the Editor of "The Planter."

SIR,—In reply to "Chunder" I am pleased to inform him that when I was an assistant in one of the largest concerns in Cachar we used kerosine and kerosine oil against this pest, in proportion of about 10 to 1, with very fair success, the bushes thus treated not being attacked again for several years, in no case a gain in the same year.

Before applying the remedy, the branches and trunk of the affected bushes were well scraped, and the roots opened to about 12 inches round the stem with a forked hoe. The branches were then washed with a piece of cloth soaked in the fluid and an ounce or two sprinkled round the roots, after a day or two fresh manure was applied and covered up again with soil. This work has to be done immediately after pruning.

CACHAR.

—ED. T. A.]

PLANTING NOTES.

THE AMERICAN TEA TAX.—Habit is so strong with most people—says the *American Grocer*—that a 10 cent duty on a favorite article of drink will not prove a barrier to its use.

CUTTA PERCHA.—The series of Cantor lectures on Gutta Percha delivered before the Society of Arts by Dr. Eugene Obach in November and December last has now been published in a separate volume with numerous illustrations. It forms an exhaustive summary of all that pertains to the gutta percha industry and contains numerous appendices with analytical and statistical tables. The assistance afforded by Kew is fully acknowledged.—*Royal Gardens Kew Bulletin*.

TEA BLIGHTS.—We reproduce verbatim from the "Kew Bulletin" for June, the full account given of certain fungoid enemies of tea in Assam—popularly known as Grey, Blister and Thread Blights—together with recommendations as to preventive measures. Although we have not heard of these blights troubling Ceylon planters, the latter ought to be prepared and should therefore carefully study the descriptions, and the proposed remedies.

RUBBER AND THE T. A.—A Burmah resident writing to a friend who was able to lend him our monthly, says:—"Many thanks for the *Tropical Agriculturist*, which I return herewith. I have just copied out the article containing the two Government Reports on Para rubber, and have written to the Director at Peradeniya for a copy of the Circular he quotes giving data for a profit and loss calculation on working a rubber farm. Para is a good journal—I am going to take it in regularly. I had no idea Para rubber cultivation was taken up so extensively in Ceylon. Curious to note how much at variance the two reports are as regards planting. Ceylon puts down the success of the trees he reports on to wide intervals—the Straits man insists on the value of close planting."—It is all too soon yet to dogmatize in either direction: further experience is wanted before settling a good many points connected with Rubber planting, culture and especially the tapping and harvesting.

PLANTING IN SERDANG, SUMATRA.—Mr. Vander Poorten gives (on another page) a glowing account of the richness of the Serdang district of Sumatra. He had heard a good deal about it; but the half was not told him. He compares the fertile soil to that which he saw in the little island of Fernando Po where cacao groves yield 20 cwt. per acre. He also sends a very fine photograph representing young Liberian coffee with Malays picking crop, certainly much finer trees than we have ever seen in Ceylon at same age.

COPRA TRADE FROM THE PHILIPPINES STOPPED: COCONUT OIL SHOULD RISE IN PRICE?—The following information of interest to all coconut producers (for export) in Ceylon is from a New York trade journal of May 30th:—

It seems not unlikely that the warlike conditions prevailing at the Philippines may have a material effect upon the supply of coconut oil should they be long continued. It is not generally known that the exportation of copra constitutes a very important element in the commerce of the islands. Formerly coconut oil was made quite largely in different parts of the territory, as it doubtless still is for domestic consumption, but efforts to export the surplus product proved unsuccessful, by reason of the lack of containers in which could be transported to the coast without too great expense of carriage or excessive waste. This led to the production of copra as an industry which has existed for about 15 years, with steadily increasing importance. The exports of copra from the Philippines annually for the past three or four years, have ranged from 40,000 to 50,000 tons. Of this amount the statistics we have indicate that about 90 per cent. went to Europe, more than half going to France, and the remainder being divided about equally between England and Spain, the latter country being the small receiver. Just what percentage of oil the average crop of copra will yield, we have no means of ascertaining, but the undried coconut meat is estimated to contain 50 per cent. of fat which, it is obvious, must constitute a still larger percentage of the copra, as the meat would lose nothing but water in the process of drying. We may therefore assume the supply of coconut oil derived from the Philippines as about 25,000 tons, or about two-thirds of the entire exportation from Ceylon and Cochín. Of the Indian oil it must be remembered, not more than 12,000 tons go to Europe and America, hence the importance of the Philippine supplies to these countries is very great. To be sure, none of the copra comes here, but it supplies European markets, which compete with our own for coconut oil, and these, it deprived of the material by means of which they are now able to obtain oil made by their local pressers, must fall back upon the Cochín and Ceylon oils. The present advancing tendency in all of the soap fats has not left so much of a margin between coconut oil and the other greases as to greatly encourage the substitution of the latter, although at a price they would, of course, very largely supplant the oil. But on its merits with the supply even measurably diminished, coconut oils are in a position which is very favorable to holders, and points to a further advance in cost.

We had no idea the copra exports from the Philippines were so large as 40,000 to 50,000 tons, a maximum of 1 million cwt per annum. Our New York contemporary is however too high when he thinks the copra would produce half its weight in oil. Our reckoning is 500 coconuts to a cwt. of oil and 170 to 180 to a cwt of copra. The maximum copra export from the Philippines would therefore not be equal to more than 18,000 tons or 360,000 cwt of coconut oil, close on an average year's export from Ceylon? This quantity lost to the markets of the world for a time, should certainly make a difference.

**TEA IN NATAL.**—In an article entitled "The Imperial Heritage"—(in which by-the-way the Crown Colonies, included Ceylon, are passed over in three lines)—there is a brief summary of the position of tea in Natal. The writer of the article is Mr. Ernest E. Williams, the author of "Made in Germany" and he says:—

Natal also means entering the world's market as a tea planter. Already some 2,500 acres have been planted, and the estimated return on the proportion of them bearing was, for the year 1894-5, 800,000 lb. This industry should have a good future. The tea planters at present under way appear to be thriving, and the industry is particularly well worth the attention of men whose capital is not large.

**FORMOSA CAMPHOR.**—The fall in the price of camphor this week gives point to two consular reports, which have been published since our last issue, regarding the trade of Formosa. In one of these, from Tainan, it is reported that the danger of camphor-distillation increased during the past year owing to continued brigandage, which the Japanese authorities appear not to have been able to overcome or minimise in the least. The net result is that several of the merchants who have provided the capital for camphor-distillation have lost it all, and in view of that there is no disposition to invest more in the same direction. The exports from Tainan since the trade commenced in South Formosa are as follows:—1892, 4,315 piculs; 1893, 6,691; 1894, 12,157; 1895, 10,145; 1896, 8,001 (value £44,888); 1897, £3,057 (value £12,525). The present out-look is far from bright. The Consul in North Formosa states that at present no British firm in North Formosa seems to interest itself in this important product, the handling of which is in the hands of German and Chinese merchants, acting probably in combination. The value of the camphor exported decreased from £194,221 in 1896 to £121,938 in 1897.—*Chemist and Druggist*, July 16.

**PARAGUAY TEA.**—Notes on the botany of the tea plants yielding Paraguay tea or Maté were published in the *Kew Bulletin* (1892 pp. 132-137). In the following year it was noted (*K. B.* 1893, p. 367) that seeds of what was believed to be true *Ilex paraguayensis* had been received through the kindness of Senor Glaziou, Director de Passeio publico, Rio de Janeiro. After retaining a few the others were distributed to various Botanical Institutions in the Colonies. Unfortunately none of the seeds sown at Kew germinated. The following interesting information respecting the tea made from the leaves, so largely used in South America is taken from a report issued by the Foreign Office (No. 1,963, 1897):—"Yerba-mate, or Paraguayan tea, is the most valuable article of export. There are two classes sold, but it is only in the manner of preparation that they differ. The kind known as 'Mborovire' is merely dried over a furnace, and then beaten into small pieces with sticks. The 'Molida' goes through the same process, but it is afterwards ground in a mill. The export duty on the former was increased in 1895 from 30 c. paper to 10 c. gold, and on the latter from 25 c. paper to 9 c. gold per 10 kilos. The revenue derived from this source in 1895 amounted to 471,668 dol. (16,845l.). The yerba forests, called yerbales, were formerly the property of the State, but most of them have been sold, and are now in the hands of a few capitalists and companies. The Industrial Paraguaya Company which owns about half of the yerbales known to exist in the country, exports annually about 400,000 arrobas (4,512 tons). The total quantity of yerba exported during the past year is estimated at about 9,024 tons, and the average price per arroba (25 lb.) was 11 dol. 50 c. paper (7s 8s)." Paraguay tea is now advertised for sale in this country and appears to be in moderate demand; possibly, as a curiosity more than as a regular article of food.—*Royal Gardens Kew Bulletin* for June 1898.

"TEA PLANTING BY SIROCCO."—This paper by an Indian Tea Planter as given by the *Pioneer*, may now be read in full in our *Tropical Agriculturist*. It contains some novel and amusing passages; but it is sad to learn how discharged coolies are neglected in Assam, and how a scheme for their "re-patriation" is required. We are certainly better off in our coolie dealings in Ceylon, both for cooly and employer.

**VANILLA CULTIVATION EXTENDING.**—We are glad to learn with reference to our recent notice, from the Mirigama veteran, Mr. W. H. Wright, that he continues to have numerous applications for Vanilla cuttings. He writes:—"I have already sold 12,000 cuttings 18 inches long at R15 per 1,000 cuttings, and I think I have still 8,000 cuttings, but of these 4,000 are already booked and the balance will soon be gone. To give you an idea of the quantity of Vanilla which I have sold 12,000 cuttings 18 inches long each will make in all 18,000 running feet. I have sold cheaply and chiefly to Kelani Valley and Kandy planters." We would also direct attention to correspondence on page 188 *et seq.*

"THE FUTURE OF COFFEE IN NORTHERN INDIA AND BURMAH."—Such is the title of a "communicated article to the *J. P. Gazette* which opens out as follows:—

With the persistent high exchange and low prices prevailing in tea, added to the immediate intention of the United States to add a 10 cent per pound duty on tea, it behoves the firms interested in tea to supplement it as soon as possible with a second known staple, coffee; just as a similar step was found necessary when, by mismanagement alone, Ceylon coffee planters turned the grand old fruit tree coffee into a simple evergreen bush, which *actually ceased to bear*.

The writer "O.P.Q." makes out that he discovered in the "seventies" how Ceylon coffee could be restored to its pristine vigour and leaf disease got rid of. There is no need for further comment. Our advice to any one thinking of following "O.P.Q.'s" advice must be like *Punch's* to those about to marry—"Don't." We have no belief in coffee flourishing North of 15° to 18° N. latitude in India.

**THE "LANTANA BUG" IN SOUTH AFRICA.**—Mr. E. E. Green writes:—"The enclosed may be of interest, as showing that we are not the only sufferers from the 'Lantana Bug' (*Orthesia insignis*). The insect has recently attracted considerable attention at the Cape as a garden pest. It seems to be particularly fond of the ornamental foliage plant (*Coleus*)—a trait which is equally noticeable with the pest here. I have had many *Coleus* plants killed out in my own garden." Mr. Green encloses a brief paper by the Government Entomologist, Cape Colony, showing that the bug is prevalent in Natal and has been known there for the past 15 years. Some think it is a native of Natal and altogether there is less fear of its proving a destructive pest from the experience gained in that Colony. This leads us again to mention that a full Report on this bug, by the same Entomologist Mr. Lounsbury, is reproduced in the local "Agricultural Magazine" (included in July *T.A.*) from which a good deal of information can be gained.—Since writing this, Mr. Willis's latest letter on the subject has come to hand and will be read with interest in another column. Clearly *Orthesia insignis* flourishes in Ceylon as it never did in Natal and it ought to be fought, in our opinion, by Government as well as by private individuals,

MR. ALEX. WHYTE—remembered in Ceylon by old Kandy residents, must be quite a veteran now—not under 55 to 60 years, we should think—yet here he is starting off to Africa to begin Botanical Gardens at Uganda! He writes:—“Leaving for Uganda via Aden per ss. ‘Shannon’ on 6th July. Good-bye and best wishes. It will be interesting work in a very interesting country, and I trust, I shall be able to stand another spell of the tropics and be of much use in developing the resources of the country. My destination is Mengo, but I shall have to report on likely stations on the way up.”—Our London Correspondent gives results of an interview with Mr. Whyte.

PERADENIYA GARDENS.—On another page will be found a very instructive account by “W.H.W.” of a recent visit to the Gardens with which he was so closely connected in years gone by and in which he has always taken a deep interest. The immediate object of the veteran’s visit was the flowering of the giant orchid; but he does not confine his description to it, nor to other special flowers, but gives us a general survey of the Gardens which he considers much improved under the present régime. Coming from so experienced, and practical an observer as “W.H.W.” this may be accepted as a compliment of some value, especially by the Curator who is in immediate charge of the Gardens.

EUROPEANS AND COCONUT CULTIVATION IN THE EASTERN PROVINCE.—We recently stated that a large block of forest land in the Eastern Province had been sold to Mr. Jemmett Brown, but it was not stated at the time that the land—in extent some 1,400 acres—was purchased by him on behalf of others for coconut cultivation. The land is situated in Tirukovil and Komari, in the Batticaloa district, and skirts the seashore. The land between the lots sold and the road, are also, we hear, available for purchase. On the 13th instant Mr. Brown purchased another 175 acres at Mandur, which, it is said, he will clear of timber for sale to the Steamboat Company and others. We are also told that more land for coconut cultivation has been applied for at Pottuvil by Europeans, so that there promises to be a large extension of the area under this product in that part of the world, and, as the new proprietors are Europeans, the ultimate benefit to the surrounding district cannot fail to be great.—Local “Times.” [The Tirukovil Division of the Eastern Province will make quite a show in our Coconut Estates Directory.—ED. T.A.]

COOPER, COOPER & JOHNSON, LIMITED.—On page 181 we reproduce in full the prospectus of this Company with the list of estates taken over in Ceylon. These are more numerous and extensive than we had anticipated, including not only the plantations of the Ceylon and Oriental Company and Pallekely Company; but also the well-known Rajawellas belonging to the Messrs. Pirie and Hadden; Mr. Beachcroft’s two Dumbara places; the Kalutara and Kelani Valley properties of Lord Chelmsford and Messrs. Inglis and Buckworth; and Patirajah belonging to the heirs of A. T. Broadhurst. Altogether the new Company are to hold 19,670 acres in Ceylon, of which 13,580 acres are in cultivation (6,860 in tea; 3,543 in cacao and 177 in coffee and crotons) with 9,090 acres of forest, chena and grass. The Company will therefore take a first-class position as proprietors with almost exactly the same cultivated acreage as the Ceylon Plantations Co., Ltd.—Only the latter has tea and coconuts; the new Company tea and cacao.

COFFEE GROWING IN GUATEMALA.—From the Consular report on the trade of Guatemala we gather that at the present time the cultivation of coffee absorbs the attention of almost all the landowners, for until the past year the high price at which Guatemala coffee was quoted abroad stimulated the planting of many large coffee plantations. The principal districts of the coffee-growing industry are found in the departments of Quetzaltenango, San Marcos, Chimaltenango, Santa Rosa, Retalhuleu, Zacapa, and Alta Verapaz. The conditions essential for the growth of coffee are, in this latitude, an altitude of from 2,600 feet to 4,500 feet above the sea level, a considerable depth of vegetable soil, and a clay subsoil. Lands of this description are found in almost every department of the Republic. The coffee tree is easily cultivated. The young trees are planted in little pits about fifty centims. deep, and at a distance of 1½ metres from each other. Every three months the plantation needs thinning out, and the first harvest is obtained the third or fourth year after planting the trees. The cost of a coffee plantation and the profits which it yields are not easy to state accurately, and are estimated very differently by different persons. There has not been much change in the cost of raising coffee or its yield in the last twenty years.

THE IMPORTANCE OF BACTERIOLOGY, both at home and in the tropics, is every day—says the London *Times* of July 11th—receiving fresh illustrations; and the latest of these comes to us from German East Africa, where, as was mentioned by our Berlin Correspondent on Saturday, Professor Koch has discovered a new and previously unsuspected plague bacillus, among a race of people who live almost entirely upon bananas, and whose diet may, he thinks, have something to do with their proneness to the disease. At all events, he has shown its character by isolating its bacillus, and it has pursued its usual course by first producing an extraordinary mortality among rats, and next by attacking hum in beings. The tendency of recent investigation seems to be to show that certain disease producing bacilli may be indigenous to certain localities, like other special forms of vegetable life, and that they may be transplanted to new soils along the ordinary lines of human intercourse. It would seem probable, therefore, that the soil must be congenial if the imported bacillus is to thrive; and it can hardly be doubted that the condition most congenial to the plague bacillus is supplied by the presence of large quantities of decomposing animal and vegetable matter. If this be so, Dr. Koch is probably justified in his anticipation that plague cannot survive the spread of civilization, and that within a measurable time it may be expected to disappear. In the meanwhile he confirms the accounts which we have already published of the excellent results that have been obtained from inoculations for the production of artificial immunity, and he also points out the dangers which, until civilization has done its work, most occasionally follow from the passage of caravans, and, still more, of railway trains. Sir John Simon told us, many years ago, that a time might come when the current infections of India would be current also in Europe, as a result of the increased activity of mankind and of the increased rapidity of travelling. It is comforting to reflect that the conditions which produce the evil may be expected also to provide the remedy; and it may be hoped that the step now taken by the Colonial Office will shortly furnish our tropical dependencies with medical officers who will enter upon their duties not only prepared to grapple with the diseases which they will be called upon to encounter, but also to unravel their nature and the sources from which they spring, and so to render important service in preventing them.

**CACAO CULTIVATION: MR. COCHRAN'S ANALYSES AND REPORT.**

To the Editor of the "Ceylon Observer."

Kandy, 29th July 1898.

SIR,—I enclose for publication copy of Mr. M. Cochran's report to the Planters' Association of his agricultural analysis of the cacao tree.—I am, sir, yours faithfully,  
A. PHILIP.

Secretary to the Planters' Association of Ceylon.

City Analyst's Office, Colombo, 9th July, 1898.

The Secretary, Ceylon Planters' Association, Kandy.

SIR,—I have now the pleasure to hand you the results of my agricultural analysis of the Cacao tree, samples of which were sent to me by Mr. H. de Sanctis of Pathragalla Estate on behalf of the Planters' Association.

At the request of Mr. de Sanctis, I have added to the analyses some deductions therefrom with reference to the manuring of the Cacao tree, suggesting proportions in which fertilisers may be advantageously applied. These, planters will be able to modify according to the special conditions of their estates as regards shade trees, in the direction indicated by the Chemical and Botanical authorities of British Guiana, *i. e.*, reducing nitrogenous manure and increasing the amounts of Potash and Phosphates, as the development of the shade trees may render advisable.

I trust this investigation may be of some service to members of the Association. I am, sir, your obedient servant, M. COCHRAN, *City Analyst.*

**ANALYST'S REPORT.**

**AGRICULTURAL ANALYSIS OF THE THEOBROMA CACAO TREE.—VARIETY "FORESTERO."**

City Analyst's Office, Colombo, 9th July, 1898.

The following analysis shows the composition of the Cacao tree, only so far as is required to assist the agriculturist in the cultivation of the tree. The tree analysed was grown on Pathragalla estate, near Potuhera, and the samples were forwarded to me by Mr. H. de Sanctis, who made what may be termed the physical analysis of the tree on the estate. As some of my calculations are based upon the data supplied by Mr. de Sanctis, I shall quote from his letter of 28th April, advising me of the despatch of the samples. He wrote as follows: "I am sending you by rail to-day two bags containing:—

- "6 lbs. Stem and primary branch ... (one analysis)
  - "6 " Leaf and twigs ... (one " )
  - "6 " Roots, large and small ... (one " )
  - "6 " Pod-husk ... (one " )
  - "3 " Merchantable unsized Cocoa (one " )
- "for analysis, (five in all.)

"The proportions are as follows:—

- "Stem and primary branches ... .. 68½ lbs.
- "Smaller branches ... .. 18 "
- "Leaves ... .. 27 "
- "Roots, large and small ... .. 17½ "

131 lbs.

"Proportion of root is probably not quite correct, as some of the smaller roots must have remained in the ground. For each 100 lbs. dry seeds packed, 126 lb. of dry Cacao pods are thrown away."

Mr. de Sanctis, likewise, weighed the parts after being dried in the sun in the condition in which the samples were despatched. By the time, however, that I was able to put the samples in hand, the stem, primary branch and roots had lost very considerably in weight by further dryage.

Representative portions of the samples were thoroughly desiccated at 212° F. of temperature, and all the subsequent calculations expresses in terms of the perfectly dry matter.

The physical analysis of the tree, in terms of dry matter, was as follows:—

	lbs.	per cent.
Root ... ..	6.011	13.2
Stem and primary branch ...	22.854	50.2
Leaves and smaller branches	16.663	36.6
	45.528	100.0

The following is the agricultural-chemical analysis of the different parts of the tree in the dry states:—

TABLE A.  
Agricultural-Chemical Analysis of the different parts of the Cacao-tree, in the Dry State.

	Root per cent.	Stem and primary branch per cent.	Leaves & smaller branches per cent.	Seeds per cent.	Pod-husks per cent.
*Organic Matter	91.036	91.91	86.523	96.514	89.9
†Ash	8.914	5.09	13.477	3.486	10.1
	100.000	100.00	100.000	100.000	100.0
*Containing Nitrogen	.640	.554	1.458	2.307	1.401
†Containing Sand & Silica	.720	.029	3.813	0.82	.245
Lime	2.040	1.492	3.453	.237	.876
Magnesia	.787	.504	.746	.585	.699
Potash	2.468	1.489	2.581	1.275	4.991
Phosphoric Acid	.263	.216	.449	1.074	.447
Other constituents	2.631	1.360	2.435	.233	2.842

The percentage of ash in each case was the percentage of residue obtained by incinerating the substance, after deducting the proportion of unburned Carbon, but without recarbonating any of the alkali earth that may have been rendered caustic by the heat of incineration. In the next table I give the percentage composition of the ash as thus defined.

TABLE B.  
Percentage Composition of the Ash of the different parts of the Cacao-tree.

	Root.	Stem and primary branch.	Leaves & smaller branches.	Seeds.	Pod-husks.
Silica and Sand	8.07	.562	28.29	2.85	2.43
Lime	22.89	29.317	25.62	6.80	8.67
Magnesia	8.83	9.910	5.54	16.77	6.92
Potash	27.68	29.257	19.15	36.56	49.41
Phosphoric Acid	3.01	4.237	3.33	30.80	4.43
Other Constituents	29.52	26.717	18.07	6.72	23.14

The ash of all parts of the tree is particularly rich in Potash; while, in the case of the pod-husks, practically one-half of the ash is Potash. The ash of the pod-husks is thus about as rich in Potash as is the Salt Sulphate of Potash imported for manurial purposes.

When compared with the wood ashes produced on Estates from jungle woods, the ashes of all parts of the Cacao tree are relatively rich in Phosphoric acid, while, in the ash of the Cacao seeds, there is nearly one third more Phosphoric acid than there is in bone meal. My results, as regards the Phosphoric acid in the ash of the seeds, are, moreover, lower than those obtained by some other analysts for different varieties of Cacao seeds. I may state that I did not make a selection of the best seeds, but took the flatter ones, as well as those that were filled out, for the analysis.

Of the "other constituents" referred to in the analysis, the chief one is Carbonic acid. Small quantities of Chlorine and Sulphuric acid also occurred in all the samples. The presence of Oxide of iron was also detected in all the samples. In the leaves and pods the presence of Oxide of Manganese was distinctly evident. From the presence of Chlorine the presence of Sodium in small proportion may also be inferred in all the samples.

From the data in the foregoing tables may be calculated, first, the amount of the more important plant food ingredients, from the agriculturist's point of view which go to build up a cacao tree of four and a half years old; and, second, the amounts of the same constituents required for a crop of seeds and pods.

Estimate of the amount of the more important plant-food ingredients in a cacao tree of four and a half years old:—

TABLE C.

	Stem & Root,		Leaves & smaller branches.	Total.
	lb.	lb.	lb.	lb.
Nitrogen	... 0385	1266	2424	4075
Lime	... 1226	3410	5754	10390
Magnesia	... 0473	1152	1243	2868
Potash	... 1484	3403	4301	9188
Phosphoric acid	... 0161	0494	0748	1403

As the trees were planted 12 feet by 12 feet apart, by multiplying the results in the last table by 302, the amounts of plant food required for an acre of such trees is obtained. Estimate of the amount of the more important plant-food ingredients in 302 trees, planted on one acre:—

TABLE D.

	Root.	Stem & primary branch.	Leaves & smaller branches.	Total
	lbs.	lbs.	lbs.	lbs.
Nitrogen	... 11627	38233	73205	123065
Lime	... 37025	102982	173771	313778
Magnesia	... 14285	34790	37539	86614
Potash	... 44816	102771	129890	277477
Phosphoric acid	... 4862	14919	22590	42371

In building up the tree, lime is thus the dominant ingredient, amongst those of which the agriculturist has to take account; then come, in order, Potash, Nitrogen, Magnesia, and Phosphoric acid.

In like manner may be calculated the amounts of the more important plant-food ingredients assimilated by a year's crop of seeds and pods. The Cacao planter looks for a crop of from 2½ to 3 cwts. of cured Cacao beans. For this estimate I shall take a year's crop at 1 lb. perfectly dry Cacao beans per tree, and 1.26 lb. dry pods, or 302 lbs. beans per acre, and 380 lbs. pods per acre.

Estimate of the amounts of the more important plant-food constituents in a crop of 302 lbs. dry Cacao beans, and 380 lbs. dry Cacao pods grown upon one acre:—

TABLE E.

	Seeds.	Pods.	Total.
	lb	lb	lb
Nitrogen	... 6.97	5.32	12.29
Lime	... .72	3.33	4.05
Magnesia	... 1.77	2.66	4.43
Potash	... 3.85	18.97	22.82
Phosphoric acid	... 3.24	1.70	4.94

The total amounts of the five ingredients of plant-food in the tree, and in the fruit respectively, may now be set side by side for comparison. In the case of the former, I do not take into account that the leafage is renewed from two to three times each year, as appears from some observations made by Mr. J. B. Carruthers. The leaves are returned to the soil, and I understand from cacao planters that there is very little absolute loss of leaf to the estate by wind and wash.

Comparison of the amount of the more important elements of plant-food in 302 Cacao trees, 4½ years old, and in one year's crop of fruit (seeds and pods.)

TABLE F.

	Tree.	Fruit.	Total.
	lb.	lb.	lb.
Nitrogen	... 123.07	12.29	135.36
Lime	... 313.78	4.05	317.83
Magnesia	... 86.61	4.43	91.04
Potash	... 277.48	22.82	300.30
Phosphoric acid	... 42.37	4.94	47.31

There is, still, one more interesting estimate and comparison to make. An estimate of the amount of plant-food removed from the soil by the annual increment to the substance of the tree will enable a comparison to be made with the amount of plant-food removed by crop as per table E, and the two amounts added together will give an approximation to the amount of plant-food removed from the soil annually.

In the estimate of the annual increment to the tree, I have no data of an exact nature; indeed, the increment will not be the same for any two years; but for this calculation I shall assume that a four and a half year old tree may double its weight by an additional 5 years of growth. If, then, the weight given in column No. 1 of table F be divided by 5, the quotients will be an approximation to the average amounts of plant-food removed per annum during the next five years, in building up 302 Cacao trees.

In the following table.

No. 1 is an estimate of the amounts of plant-food removed from an acre of soil, by the annual increment to the trees only.

No. 2 is an estimate of the amounts of plant-foods removed from one acre annually, both by the increment to the trees, and by a crop of Cacao seeds only. The pods are supposed to have been returned to the soil.

No. 3 is an estimate of the amounts of plant-food removed from one acre annually by the increment to the trees, and by a crop of Cacao seeds and pods.

TABLE G.

	No. 1	No. 2	No. 3
	lb. per acre.	lb. per acre.	lb. per acre.
Nitrogen	... 24.61	31.58	36.90
Lime	... 62.76	63.48	66.81
Magnesia	... 17.32	19.09	21.75
Potash	... 55.50	59.35	78.32
Phosphoric acid	... 8.47	11.71	13.41

In the case in which the pod-busks are burned, and the ashes only returned to the soil, the total Nitrogen removed annually from the soil by tree and crop will be as in No. 3, the other items as in No. 2.

The Cacao tree is usually cultivated under shade trees, which act as Nitrogen collectors, and which, of course, store up a certain amount of plant-food in their tissues, which is, therefore, removed from the soil. Both the shade trees and the Cacao trees require after a time to be pruned. The application of the above calculations to the manuring of the Cacao tree can, therefore, only be on general lines, subject to modification by experience, and to increased knowledge of the wants of the shade trees.

MANURING.

In the West Indies, the good Cacao soils appear, from published analyses, to be markedly richer than Ceylon soils in respect of Lime and Magnesia. In respect of Potash, the average is also higher than in Ceylon; but in respect of Nitrogen and Phosphoric acid, the soils of the West Indies have no superiority. It is regarded as essential to a good Cacao soil that it should be well drained. The dampness, due to an undrained condition of the soil, or to overshadowing or overcrowding, is regarded in the West Indies as conducive to a diseased condition of the pods.

The Cacao tree, we have seen, has a very good proportion of Phosphoric acid, distributed through the tree with a concentration of it in the seed. Any deficiency in this constituent in the soil will, therefore, affect more especially the fruit-bearing power of the tree. We have seen, further, that all parts of the Cacao tree are rich in Potash, with concentration in pods and seeds, that Lime is the predomi-

nant constituent in root, stem, branch and leaves and that Magnesia is distributed in considerable proportion through all parts with concentration in the seed. A soil, therefore, deficient in Potash, Lime or Magnesia is likely to produce sickly trees, and such are usually less able to resist attacks of parasitic blights, even if a sickly condition does not induce an attack.

The Botanical department of British Guiana in the "Proceedings of the Agricultural Society" make recommendations for the manuring of Cacao, based more especially on the unavoidable loss of plant-food in the beans and pulp of the Cacao. The crop of cured Cal-barillo is taken at 250 lb. and of Forastero at 150 lb. per acre; while the Cacao grown in Guadeloupe is assured to give a return of 450 lb. per acre. I quote as follows:—"The unavoidable loss in this Colony, as compared with that in Venezuela, given by Marcao, and with that in Guadeloupe, reported by Boname, is as follows in lb. per acre per annum:—

	Demerara.	Venezuela.	Guadeloupe.	
	Calabacillo.	Forestero.	Varieties not stated.	
Nitrogen	... 11.30	7.26	8.7	7.3
Phosphoric Anhydride	5.32	4.19	4.5	2.8
Potash	.. 6.31	3.20	3.7	4.3
Lime	... .65	.47	1.4	.4
Magnesia	... 2.69	1.95	1.0	1.4

"There is a general concordance in these results, showing the low amounts of constituents necessarily removed from the soil by the production of a crop of Cacao.

"In the absence of direct experiments on the manuring of Cacao, we have formed our opinion that, when Erythrinae are used as shade trees, manuring should be directed largely towards the upkeep of the potash and phosphates necessary to enable the shade trees to do their part as Nitrogen collectors; and that, when no shade trees are used, the mineral manuring ought to be more largely supplemented by Nitrogen. Thus, the following mixture or mixtures of other material, yielding the same proportions of Nitrogen, Potash, and Phosphates per acre, might be advisedly tried in Cacao plantations.

	Erythrinae used for shade.	Not shaded.
	1 cwt.	2 cwt.
Nitrate of Soda	...	...
Superphosphate of lime 36 per cent Soluble	$\frac{3}{4}$ "	$\frac{1}{2}$ "
Potash Sulphate	1 "	$\frac{1}{2}$ "

"The materials should be well mixed and applied in quantity, according to the number of trees planted per acre around each tree, at a distance of about two to three feet from the stem." Whether the foregoing are intended as annual or biennial application is not stated.

In the above recipe, if Nitrate of Potash, which would supply both the Nitrogen and the Potash, were substituted for Nitrate of Soda and Sulphate of Potash, the equivalent would be approximately:—

	Shaded.	Not shaded.
Nitrate of Potash	... 140 lb.	280 lb.
Superphosphate of Lime 36 per cent soluble	... 84	56

In the case of Phosphoric acid supplied in less soluble forms than Superphosphate, the quantity would have to be much greater, I should say not less than, double. While the unavoidable loss of Nitrogen, Potash, and Phosphates in the beans and pulp is small, yet, when the amounts of these constituents which are required for the annual increment to the tree are also regarded as so much plant-food removed from the soil, it puts a different complexion on the matter.

If a calculation of the manures required for cacao cultivation be based on table G, and the ashes only of the pod-barks be supposed to be returned to the soil, the following data may be taken as a guide in preparing suitable mixtures. For one manu-

ring, the effects of which last for two years, the whole of the Nitrogen in column 3 may be returned to the soil, say about 37 lbs. This would be a sisting nature to the extent of one half of the Nitrogen required for two years; and, if the Cacao is grown under good shade trees, which act as Nitrogen collectors, the amount of Nitrogen may be greatly reduced.

The quantity of Potash would be deduced from column No. 2 of table G, and, say 60 lb. might be allowed, thus assisting nature, in this case, also, to the extent of one half of the requirements for two years.

In the case of Phosphoric acid, the tabular number is 11.71, say 12 lb. When a seed crop is to be raised, it is advisable to be liberal with the Phosphoric acid, so as to enrich the soil with it. If added in the soluble state, not less than 30 lb. equal to 181 lb. Superphosphate, would probably be a sufficient quantity; and using less soluble materials, such as thomas Phosphate powder or bone meal, 60 to 76 lb. would not be too much.

The following would be an example of a manure-mixture, using soluble materials:—

	Per acre.
Superphosphate of Lime 36 % soluble	... 182 lbs.
Sulphate of Potash 50 % Potash	... 120 "
Nitrate of Soda	... 287 "
or (Sulphate of Ammonia	... 186 "

With good shade trees to act as Nitrogen-collectors, the Nitrogenous manure might be reduced by as much as a half, and this item, whether as Nitrate of Soda or Sulphate of Ammonia, being in such a very soluble form, might, with advantage, in any case, be halved and applied annually instead of biennially, or the whole receipt might be halved and applied annually.

The following would be a few typical examples of mixtures in which the Phosphates are in less soluble forms than Superphosphate:—

	Per acre.
Bone meal	... 300 lbs.
Sulphate of Potash	... 120 "
Castor Cake	... 400 "

With good shade trees the Castor Cake might be reduced to 100 lbs.

	Per acre.
Thomas Phosphate Powder	... 360 lbs.
Sulphate of Potash	... 120 "
Castor Cake	... 570 "

With good shade trees the last item might be reduced as low as 285 lbs.

	Per acre.
Thomas Phosphate Powder	... 360 lbs.
Sulphate of Potash	... 120 "
Blood meal	... 300 "

With good shade of trees the last item might be reduced as low as 150 lbs.

	Per acre.
Fish Manure	... 500 lbs.
Bone meal	... 200 "
Sulphate of potash	... 120 "

With good shade trees the fish manure might be reduced as low as 200 lbs., adding 50 lbs. to the bone meal.

The foregoing will suffice as examples respectively of the more soluble and of the more slowly available manures; while the following might be taken as an example of a judicious mixture of the above per biennial application:—

	Per acre.
Nitrate of Soda	... 119 lb.
or (Sulphate of Ammonia	... 93 lb)
Blood meal	... 100 lb
or (Castor Cake	... 200 lb)
Superphosphate of Lime 36 % soluble	
Phosphate	... 91 lb
Bone meal	... 150 lb
Sulphate of Potash	... 120 lb

It will be observed that, in the manure mixtures, no special account has been taken of Magnesia. In all the common Phosphatic manures, Lime is supplied in considerably larger proportion than the Phosphoric acid; but, in most manures other than the cruder Stassfurt salts, Magnesia is present in very small proportion. In Thomas' Phosphate powder, however, 5 or 6 per cent may be looked for, which in 360 lb. represents half of the Magnesia required by the Cacao tree for two years. In

\* For a perusal of this I am indebted to Mr. John Ferguson of the *Ceylon Observer*.

soil, shown by analysis to be deficient in Magnesia, this substance may be supplied as Sulphate of Magnesia, as Sulphate of Potash-Magnesia, or as dolomitic Lime or limestone. I would not desire to lay too much stress on the propriety of using Magnesia in manure. Many agriculturists consider it unnecessary, taking it for granted that soils can always supply all the Magnesia that is required for crops; but when the analysis of a Cacao soil shows the Lime and Magnesia to be very low, the following considerations would justify the Cacao planter in giving the soil a dressing of Lime or ground lime-stone, containing a fair amount of Magnesia. In the published analysis of good Cacao soils in the West Indies, the amount of Lime ranges from 356 to 493 per cent, and of Magnesia from 217 to 3367 per cent. I cannot give the corresponding figures for Ceylon Cacao soils, but our up-country soils generally have Lime ranging from about 05 to about 75 per cent, and Magnesia from about 02 to about 55 per cent. The Cacao tree makes a much greater demand on the Lime of the soil than on the Magnesia; but, on the other hand, the seed of the Cacao, like most seeds, makes a considerably greater demand on the Magnesia of the soil than on the Lime of the soil. Both of these substances, Lime and Magnesia, have, moreover, a value in the soil beyond their plant-food value. In the case of Lime, this is so well known as not to require further reference here.

As an example of good effect attributed to Magnesia, M. Dajardin states that Magnesia forms a very important constituent in all soils, in which the French vine resists the attack of *Phylloxera vastatrix*, and according to Dr. A. B. Griffiths, the American vine flourishes best on those soils containing a high percentage of Magnesia. The Magnesia in the ash of the Styrian Vine, according to an old analysis, is 6.55 per cent; while in the ash of the Cacao tree, the proportion of Magnesia is decidedly higher than this.

As a source of Potash, I have no objection to Sulphate in preference to the Muriate, as, in the absence of much direct experience on the subject, the Sulphate is the safer salt to use.

Chlorides, however, have been said not to derange the Cacao tree, in which case the Muriate, as the cheaper salt, may be used instead of the Sulphate.

M. COCHRAN, M. A., E. C. S.;  
City Analyst.

## SERDANG\* AND THE LIBERIAN COFFEE ENTERPRISE.

(By a Ceylon Planting Visitor.)

The description of the soil and rainfall sent to me some time back by the managing partner of one of the plantations there, had given me a high idea of the country; but the reality I found far beyond anything told me.

The plantations I visited are situated at about 55 miles from Belawan, the shipping place, 40 of which are covered by rail to Lobocq Pakam and the extension of it is being considered and will soon impose itself.

I must not forget, however, to mention *Keboen coffee*, the first plantation I saw on the main road at about 7 miles from the rail and where the oldest trees exist. These I did not see, but a field of eight years old, bordering the cart road was very luxuriant: topped at 8 ft. they were touching at 10 ft., without vacancies, under the shade of young cotton trees (*kapok*), which I would not recommend. Some young *Arabica* did not seem so promising owing, I think, to the too retentive flat drained land.

On Begerpang, the largest plantation of Serdang, with 300,000 trees planted within the 2½ last years, the growth is all what can be desired; for

even on the St. Paul's river (Monrovia), in the best cultivated gardens, I have not seen better. It is bearing heavily from after the 2nd year (which does not seem to injure the trees later on).

In other plantations I have seen fields of trees up to four years which all came up to the highest standard.

*Henileia Vastatrix* is not unknown, but does not affect the trees in any way, on which it is but sparse.

GREEN BUG also is there but only on trees from one to two and half-years old. It then seems to cease reproduction.\*

The distance adopted is 10 by 10 which is fully necessary and I am convinced that the returns at four years will be from 10 to 12 cwt. per acre (about 3 lb. per tree).

A few cacao trees raised from seed obtained from Peradeniya (a forester variety) planted on the edge of a ridge and measured for had given an average of 40 pots at 3½ years.

The altitude of the Serdang plantations is about 300 ft. and the rainfall averages 100 inches well-distributed through the year. There is a heavy dew at night, clothes in the bungalow felt damp in the morning. The temperature is the same as in Ceylon at the same elevation, but the nights are cooler. Cyclones are unknown. There is less fever than in the Ceylon lowcountry and living is cheap and comfortable.

The lay of land is generally undulating at such a gradient that roads have seldom to be diverted from the straight line, *high forest* covers the main part of it, with much good timber, and *ideng* (illuck grass) those parts which have been cultivated by the natives and being burned yearly, forest growth is prevented.

THE SOIL in the forest is a thick layer of humus covering a silicious brown loam of great depth. Thousands of square miles are in the same condition between the sea and the dividing range on the N.-E. coast. I have seen nowhere in Ceylon anything to compare to that part of Sumatra as to general conditions required for lowcountry products, and Dutch and German planters have assured me that the S.E. part (Palembang) and the Padang west coast is even more fertile.

Deli and Serdang might well be called the stoneless country; the ballast for the railway has to be imported from Penang and there is no gravel for the roads. The land in Sumatra is leased for 75 years. In Serdang the Sultan requires at present 8\$ per bouw (1¼ acres) and a yearly rent of 1\$; besides the Government survey costs 1, 10 gulden per bouw.

THE JAVANESE LABOUR is unlimited and the cost is cheaper in the end than our decayed Tamil labor. It is indentured for three years. A premium of 30 gulden (1 gulden = 1s 8 1/3d) free passage 10 G. advance 30 G. Monthly wages, men 6\$ (1\$ = 1s 11 1/2d) women 3\$: work 6 to 11-3 a.m. and 1 to 6 p.m. Only two free days per month, periods of sickness deducted, no kanganyas, mandares or overseers appointed by the manager. No crimping nor bolting possible by good regulations.

THE FELLING AND CLEARING is generally done by Battacks, the aborigines of the country, and

\* This would be in favor of my theory that another mysterious (*root*) disease was in Ceylon in conjunction with these two and was the main cause of the destruction of the coffee. A root disease also affected the cacao for several years (1831-91) and was the reason of the abandonment of one-third of the acreage then in cultivation.

\* A Dutch-protected State of N.-W. Sumatra,

cost 10\$ per acre. They also contract for the *buildings*, such as sheds and lines at a more moderate cost than in Ceylon.

A certain amount of Tamils (called Klings there) are also employed, more specially as cartmen.

The Malays have many privileges and only few of them care to serve as house servants. They have their own lands that they cultivate, but nowhere have I seen a wet paddy field. They have groves of nutmeg trees; but the produce is all consumed in the country for no export is reported, so are the coconuts and the arecanuts, the former being sold at \$5 per 1,000. Nearly all the rice is imported from Singapore, or Penang being raw rice from Siam and Burma.

The Chinese work on the tobacco estates where their more skilled labour is more remunerated or have holdings of their own, particularly in the tobacco country where they produce large quantities of sweet potatoes, manioca, beans and vegetables. They do nearly all the trade of supplies, none being given to the coolies by the managers of plantations. Nearly all the artisans belong to that race.

The universal language is Malay.

The interior of Sumatra is practically unknown. Exploration requires the special permission of the Resident on account of the danger. It is inhabited by the Battaks, a warlike race of good physique. They have no racial connection with the Malays, who came over from the Straits some centuries ago and repulsed them. Their features have much affinity with those of the Tamils, but of a paler hue, probably due to the more cloudy sky. They have their own writing and make their own weapons; but, nevertheless, are cannibals. One of them working on the plantations admitted in my presence having eaten human flesh. They cultivate dry paddy and other grains, sweet potatoes, manioca, tobacco, etc. They are very jealous of their females. I was told that they were not fetiches but could obtain no details as to their religions.

### PRODUCE AND PLANTING.

**TEA BLIGHT.**—A report appears in the "Bulletin of Kew Gardens," on the subject of the diseases and parasites which attack the tea plant in Assam. It is by Mr. Masee, who deals with these maladies. The first is the "grey blight." It is a disease that, if not checked, may easily reduce the productiveness of gardens by 50 per cent. It might, in fact, convert Assam from the prosperous province the planters have made it to one of extreme distress. Mr. Masee states that this fungus is identical with the parasite common on leaves of cultivated species of camellia in Europe. He believes that if the diseased leaves were collected and burned at once the disease would soon be stamped out, as the mycelium of the fungus is not perennial in the tea plant. One of the very worst blights on tea is the second malady known as "blister blight," another kind of fungus. The earliest indication of the disease is the appearance of translucent spots in the leaf, due to the disappearance of the chlorophyll and starch grains. In his advice to the tea planters Mr. Masee says that the removal of diseased portions before the spores are mature would go far towards preventing a recurrence of the disease. The third malady is "thread blight." Delicate white strands of mycelium run along the surface of the bark to the tips of the young shoots, branching irregularly: thence they not infrequently pass on to the leaves, where they form a yet more delicate, irregularly branched pattern. Microscopic examination of the diseased branch shows that the slender mycelium extends to the young wood, the vessels of which soon become choked with a dense

web of it. Mr. Masee, however, is confident that even the spread of this disease can be checked by proper precautions. The best remedy, he thinks, is to make a trench round the base of the stem and fill it with lime or wood ashes.

**A SUGGESTED NEW SOURCE OF PROFIT.**—Planters cannot complain of a lack of counsellors in view of a continuance of bad times. The *Indian Planters' Gazette* advises tea planters to turn their attention to—in conjunction with or as an adjunct to general factory work—dairy farming.

**THIRTY YEARS AGO.**—The task to be performed on behalf of the Celestial Empire if the tea of the United Kingdom is to be recaptured will be a tall one. The Indian and Ceylon position is a strong one, and the victory over China tea is complete, while the consumption of tea has increased enormously during the last thirty years. In 1868 the total consumption of tea in the United Kingdom was 107,085,000 lb., giving an average of 3.52 lb. per head of the population. Of this 93 per cent. was Chinese tea and 7 per cent. Indian. Since that date the consumption has increased to 227,785,509 lb., an average of 5.73 lb. per head of the population. But at the present moment 11 per cent. only of the entire consumption is Chinese, whilst India supplies 51 and Ceylon 35 per cent.—*H. and C. Mail*, July 8.

### A VISIT TO THE PERADENIYA GARDENS.

I was induced by Mr. M—'s letter in the *Observer* of the 12th instant to pay one of my periodical visits to the Royal Botanical Gardens, Peradeniya, rather earlier than usual, but that did not in any way detract from the interest the old place always affords to me. The Giant Orchid, which is here now displaying for the first time in the history of Ceylon, tall and gracious tusses of flowers, is itself worth a visit by all who are interested in this most beautiful and wonderful class of plants. It is certainly entitled to be called

#### THE "QUEEN OF ORCHIDS"

as the proportions of both foliage and flowers are at once pre-eminent among its kind. But it is the size of the monster orchid that is remarkable, rather than the attractiveness of the flowers, and people who expect to find it bearing huge masses of cattlegale flowers will be somewhat disappointed on seeing it. There are however very many interesting and unique plants to be seen both in the immediate neighbourhood of the giant orchid and elsewhere. Efforts are being made to get together in the Ornamental Lake an interesting and useful collection of

#### WATER PLANTS,

among which are shortly to be planted several plants of the giant water-lily (*Victoria Regia*) which are now being carefully nursed in a tank with other aquatics. This very handsome plant with huge tray-like leaves which are sometimes 25 to 30 feet in circumference and 8 to 9 feet in diameter, has been found within the last 2 or 3 years to succeed at Peradeniya with careful treatment. The general appearance of the garden struck me as having greatly enhanced in beauty within the last few years. What have only recently been uncared-for quarters, are now made to assume an appearance that is more in keeping with the best kept parts. Of course it is impossible for a large botanical establishment like this to be properly judged by a person who is otherwise than a botanist, so that these few lines do not pretend to touch on the scientific character of the Department; but that the Peradeniya Gardens combine the functions of a botanic garden and the features of a magnificent Public Park to a degree not elsewhere equalled in the world, is a well known and undeniable fact. This is to a great extent due to the naturally favourable position of the Garden, the large river almost surrounding it, and the beautiful undulating character of the land. Yet notwithstanding this, the greatest drawback the Curator particularly deplores is

#### THE MEAGRE SUPPLY OF WATER.

the river being too much below the level of the Garden to be availed of by ordinary means. This is a de-

sideratum that must be seriously felt, especially when the labour force is not over strong, and any extensive improvement must obviously be thus considerably retarded. A long and intimate acquaintance with these Gardens, however, enabled me to notice evidences of indomitable energy and ambition possessed by those at present in charge of them.

The work of beautifying and utilising the grounds by thinning out ungaily and common trees and by the judicious replanting of only useful and handsome kinds, goes on apace with important though limited agricultural experiments, to which numerous plots are now being devoted. The extensive lawns never seemed to me finer than they are at present; and fresh aeres are now gradually having their rough surfaces cleared and made even. A new avenue of Royal Palms has just been planted in a position with a commanding aspect. Rare and beautiful plants are being gradually planted along frequented drives, and some of the latter also are now undergoing a great improvement in being made wider where necessary.

Additional flower borders planted with the newest varieties of cannas have just been completed, and their design is in good taste. The nurseries too are well worth a visit, being full of young stock of every description, but with economic plants predominating.

W. H. W.

## THE TEA, COFFEE, &C., TRADE.

TO THE EDITOR, "PIONEER."

SIR,—*Apròpos* of your recent articles on the Indian tea industry, it may be of interest, to give some figures (taken from the latest, the 1895, edition of Dr. Paul Langhans' *Kleiner Handelsatlas*; Gotha, Justus Perthes), showing the annual importation per head of population, in kilogrammes, of tea, coffee, sugar and tobacco by the principal nations of the world. The figures are very instructive, those for sugar, more especially, as they show what a boon to our country, upon the whole, is the free entry of sugar, as affecting manufactures in which sugar is largely used, and its domestic consumption.

ALDOBRAND OLDENEUCK.

## MINOR PRODUCTS REPORT.

**COCA LEAVES.**—Offered, 13 packages; sold 5. Some Truxillo leaves, offered without reserve, were disposed of at 4d, a low price considering the quality,

part of the leaves being of fair green colour, though the rest were faded; nice pale brownish green Ceylon leaves fetched 7d.

**KOLA NUTS.**—Offered, 79 packages. Sold 0. Nothing was sold, pale brown medium nuts being bought in at 4d, and ordinary dark small at 3d.

**NUMEGS.**—West Indian kind fetched at auction from 1s 11d for 6's to 11d; for 30's for ordinary to good nut.

**CITRONELLA OIL.**—Quiet. The spot value is 1s 1d for drums, and 1s 1½d for tins. The last business for arrival was done at 1s 0¼d c.i.f., but now there are no sellers under 1s 0¼d, whilst there are buyers at 1s.

**LEMONGRASS OIL.**—Quiet, and lower since the end of last week. For arrival it is now offered at 3¼d c.i.f. —*British and Colonial Druggist*, July 8.

**LEMON OIL.**—Tending dearer. For oil of guaranteed citral content, 4s 6d, per lb f.o.b. Messina, is wanted, and holders are not disposed to part with it at that, as they expect higher rates. Fair quality may be had at 4s per lb, c.i.f. terms.

**COCOA LEAVES.**—The exports from Java during April amounted to 65 bales, and from July 1st 1879 to April 30th 1898, the total exports were 948 bales. In 1894 only 12 bales were exported, in the following year 901, and four more in 1895-96, but in 1896-97 the exports fell to 825 bales. Fine bright Ceylons sold at 7d per lb and Huanoeco (put up without reserve) realised 4d. The later was partly broken, but of fair colour.

**CROTON SEEDS** are still high, 70s per cwt being refused for a fair medium seed.

**KOLA NUTS.**—Very flat, the demand having lately gone off considerably. Sales of West Indian have been made privately at 1½d to 2d per lb.

**VANILLA.**—The following are some of the prices obtained:—For Mauritius fine 4½ to 5 inches, 15s 6d to 16s fair frosty. From 6 to 7 inches part frosty, 14s 6d to 16s. Fine frosted 8 to 8½ inches 22s-6d. Short sizes 12s to 14s. For Madagascar we noted the following: 4½ to 5½ inches 13s; 6 to 7 inches 15.—*Chemist and Druggist*, July 9.

## INDIAN TEA ASSOCIATION.

### DUTY—TEAS FOR THIBET—CROP ESTIMATES.

The following is an abstract of proceedings of a meeting of the General Committee, held on 6th June 1898:—

The General Committee noted the London Secretary's remarks with reference to the Budget Statement and the duty on tea, and regretted that the Chancellor of the Exchequer, although admitting that the tax on tea was oppressively heavy in relation to its prime cost, and that India supplies more than half the consumption of the United Kingdom, could not see his way to reduce this tax. His argument was that the Government at home should "settle their system of taxation rather with regard to the necessities and advantage of those who have to bear the taxation than anybody else." This was recognised to be right in principle, if it were strictly adhered to, as taxes had been imposed upon India against the wishes of Indian taxpayers and purely in the interests of English industries, it was thought that this principle need not have been so strictly adhered to in the case of the tea industry.

The London Secretary suggested as a possible outlet for Indian tea that the Bengal Chamber of Commerce might be able to move the Government of India to obtain an "open door" for our teas on the Frontier of Thibet. The General Committee noted this suggestion, but considered that at present the difficulties appeared to be insuperable.

A number of letters were read by the Chairman on the subject of Tea Crop Estimates. After a full discussion, in which the proposition was made that a revised estimate should be made up, now, or at

latest early in August, it was decided that the Secretary should write to the London Secretary to ask his Committee whether they desired the estimate to be continued under the present system, and to point out that these early estimates had been kept up at the request of the London Association. It was further decided that it was undesirable to make up fresh estimates now, anticipating those published in September, and the Secretary was instructed to advise the firms whose letters were now under discussion to this effect.—*Indian Planters' Gazette*, July 2.

### PLANTING NOTES

**NEW GUINEA.**—There can be now no doubt that Sir Hugh Nelson had known all about the New Guinea syndicate affair long ago, (says the *Sydney Mail*, July 9) and he appears to have at least failed to adequately impress upon the other Australian Premiers. He says he mentioned it to Mr. Reid and Sir George Turner, but the latter has no recollection of it, and Mr. Reid did not consider it at a discussable stage then, while both deny that it was brought up at the Premiers' conference. Mr. Chamberlain explained last week that Sir William McGregor considered that unless encouragement was given to such a company as the New Guinea Land Syndicate there was no apparent prospect of early development of the agricultural resources of the protectorate, and the Queensland Government were responsible for the agreement with the syndicate. It is not only the undue concealment that Australians object to in this matter, but the conditions, some of which were certainly objectionable. If there was to be such a syndicate there should have been equality of opportunity. There was no need to go to English company promoters. Australians should have at least been permitted to know that such chances were open.

**COCONUT PLANTERS AND THE PLAGUE.**—The *Bombay Gazette* writes:—Amongst the numerous classes who fled from Bombay in large numbers when the first epidemic of plague was at its height eighteen months ago, were the Bhandaris whose hereditary occupation is the tapping of coconut trees for the extraction of toddy. The number of persons thus employed in the town and island is about ten thousand, and their operations are carried on at the head of about double that number of trees. When the large majority of these sure-footed climbers left the city, they were in such hurry that they did not stop to pay the dues receivable from them as licensed Bhandaris; many of the trees remained untapped, and distilling operations were greatly interrupted. As other work-people had fled besides the Bhandaris this did not lead to any marked restriction of supply available for the reduced number of toddy-drinkers left behind. But there is one class of the community to whom the disappearance of the Bhandaris has been a serious matter. The fazandars or owners of the coconut plantations are liable, under Section 21 of the Abkari Act of 1878, to make good to Government the amounts due from defaulting toddy-drawers, and the Collector of Bombay has served them with notices requiring them to do so. They are thus brought face to face with a heavy burden, and as the Commissioner of Abkari has rejected the appeal preferred against the order of the Collector they have resolved to petition the Governor-in-Council. His Excellency is to be asked to direct withdrawal of the order compelling the owners to pay the sums due by reason of the disappearance of the Bhandaris, especially as their absence was caused not by any act of the fazandars but by fear of the plague.—*Pioneer*.

**JAVA QUININE.**—The result of the auction which we announced in our issue of July 1st, and at which 26 cases of Java quinine from the Bandoeng factory were to be put up in Amsterdam, has been that only one case was sold at 15 florins per kilo (8½d per ounce), while the rest were bought in at 15½ florins.—*British and Colonial Druggist*, July 15.

**TEA-DRINKING IN ASSAM.**—It is quite refreshing to hear that the natives of Upper and Northern India, especially Mahomedans, are taking to drinking tea in large quantity in the cold weather:—

Those who know India—native India—have noticed of recent years a remarkable change coming over the habits, at least as regards eating and drinking, of vast masses of the population, except the orthodox Hindus of Bengal and Southern India. It is a common fallacy to suppose that English rule and English civilisation has made no impression on the multitude. Nothing could be further from the truth. Everywhere may be seen a breaking loose from old ties and traditions, an upheaval of creeds, and relaxation of the rules of custom and caste. With especial reference to the matter in hand, there do not seem to be any reliable statistics available as to the consumption of tea among natives, but personal observers have noted that it is steadily increasing, the Mohomedan community especially growing year by year more partial to the beverage. About 7,000,000 lb. of China and Ceylon tea are annually imported into India. It would appear that the consumption is, as might be expected, larger in the cold weather than in the hot. In Upper and Northern India the mornings are bitterly cold in the winter, and those who have to be abroad early generally if they can afford it fortify themselves with a dish of tea. In Calcutta itself the Mohomedans are supplied by a large number of tea shops located in every part of the town. Twenty years ago, we have reason to believe, there was not a single one. In the cold weather here men may be seen parading the streets every evening with large cans supplying tea to passers-by at the rate of only a pice a cup, and they do a thriving business. Quite a little trade has sprung up in the capital in the sale of once-used tea-leaves. But, of course, this is not the chief source whence natives obtain their tea. It comes chiefly from China and Ceylon as noted above. Here then is a chance for planters. The demand is bound to grow enormously, and steps should be taken to learn the methods which now obtain among native merchants for distribution. Planters, however, must not be above selling their dust in small quantities to retail dealers. Indeed there is no reason why pound packets should not be sold by gardens out of Assam direct to the consumer. The attempt, we know, has been made, but it should be persevered in.

In Central Asia, Afghanistan, Russian and Chinese Turkestan, and Tibet are to be found, one might almost say, the most profitable markets in the world. In these regions everybody drinks large quantities of tea. So far Chinese brick-tea enjoys an absolute monopoly, not that it is better than Indian tea, but because it is the only sort procurable. For many years Chinese growers jealously guarded the secret of the manufacture of tea in bricks, but recent travellers have published full particulars of their methods. The tea, it appears, is gathered in June and July after the opening of the summer rains. After being rolled by hand into large balls, it is put away till it ferments. When in this state the tea is put into wooden moulds and slowly dried over a charcoal fire till baked into a solid mass in the form of a brick. In the countries west of Ilassa the best quality of brick-tea is sold at a rate averaging about four shillings and six-pence per pound. When absolutely pure the tea is really drinkable, but generally speaking it is so mixed with mud, twigs, and rice-water as to be absolutely abhorrent to Europeans. One traveller has shortly described it as "all brick and no tea."

**AMSTERDAM BARK AND QUININE MARKET.**—Our Amsterdam representative wires us this afternoon that the result of the bark auctions in Amsterdam today was an advance in the unit of 10 Dutch cents per half kilo the average unit working out today at 4.20 about 7.9d per lb) against 4.10 at the last auctions. The lowest price for *Manufacturers' bark* was 7½ cents., and the highest 33 cents, and the lowest for *Druggists' bark* was 1 cent and the highest 60½ cents. The tone of the market was firmer. Out of 6,350 packages offered 6,113 sold.—*B. and C. Druggist*, July 15.

**THE FLORIDA VELVET BEANS,** you so kindly sent me, for trial, look almost the same as our Vandurumá. The description given in the *T. A.* comes so very near it. But the Vandurumá of Ceylon, is not much relished for human consumption as the consumer is often put into a sort of giddiness, just after it is taken. I shall report on Florida beans later on.—*Sinhalese Planter*.

**FLORIDA AND LIMA BEANS.**—A well-known planter writes:—

"I shall be very glad if you can spare me a few Florida Velvet Beans to try: and I promise to do the best I can for them, and to report results. I have tried the famous 'Lima' Bean here with some success; but the crop seems only seasonal, and I shall not have any more for a few months. It is a very fine bean, and I shall be glad to send you a dish when the next supply comes on."

From the *Gardeners' Chronicle* of July 16, we quote:—

**THE FLORIDA VELVET BEAN.**—We had occasion to refer to this in a preceding number. We now have to make mention of an article with an illustration in the *Queensland Agricultural Journal* for May last. The plant is named as *Mucuna pruriens* var. *utilis*, and it is thought it may prove a valuable fodder plant in warm climates, and useful for green manuring.

**COMPRESSING FLOUR: A NEW INDUSTRY FOR INDIA.**—We find the following interesting statement in the *Friend of India*:—

"Considerable interest is being taken in the system of compressing flour in England. It is now found to be quite feasible to make blocks sufficiently hard and coherent to bear the handling necessary for packing, etc. Compressed flour occupies two-fifths the space of the loose flour, or one half the space required for flour stored in the ordinary manner in sacks. The quality of the flour when compressed is not injured in any way." The foregoing quotation, which is taken from an Irish agricultural journal—the *Irish Homestead*—ought to be a sufficient hint to Indian milling companies. There are now flour mills at work in Calcutta, the Punjab, and elsewhere, producing as fine flour as any English or American mill could turn out. The whole of the present output of these mills is, we believe, consumed locally. The important question is whether the output might not be increased for the sake of establishing an export trade, or whether it would not be profitable to start further mills of the same character. Hitherto the main objection to sending Indian flour instead of Indian wheat to England has been the transport difficulty. Wheat is obviously less delicate as a traveller than fine flour, and therefore suffers less by the trying journey through the steaming atmosphere of the Indian Ocean and the Red Sea. But if it be possible to compress flour as above described, there seems to be no reason why it should not travel as well as wheat. If so, India can retain for herself that portion of the milling industry which she now gives to Great Britain. It is along these lines, as we have often before urged, that Indian industries should be developed. Wherever a trade in raw materials is established, the object of manufacturers should be to convert that manufactured, or partially manufactured, products. The wheat trade should, if possible, be converted into a flour trade, just as the trade in raw jute has been.

**THE BIG TEA DISTRIBUTING FIRMS**—do not enjoy the criticism which our columns for some back have contained; but there is no getting over the harm done by fixing their prices too low and so shutting out best quality teas.

**ULU LANGAT, STRAITS SETTLEMENTS,** for June 1898.—The durian-crop, now ripening, will not be a large one, though there is promise of a better crop than was experienced at the end of last year.—*Selangor Government Gazette*.

**CEYLON TEA IN RUSSIA.**—Writes a tea estate proprietor:—"You of the *Observer* certainly have done well for the Ceylon Tea interest, by directly interesting the Russian Finance Minister in the subject of reducing the heavy duty on tea, and in the information you elicited from the late Russian Consul Capt. de Frisch as to the tea customs duty in Russia, I heartily trust that we may see some good come of this and a growing trade between Colombo and Odessa."

**TEA IN SICILY.**—This is how our old friend Mr. J. R. W. Pigott (formerly of Matale) reports on the prospect in Sicily, where he has been Consul:—

A taste for tea is increasing among the upper classes in Palermo, and with a little judicious education the demand would rapidly grow. At present tea can be obtained at only one or two places, and that of a very inferior quality, while the price is very high, being about 8 lire, or 6s per lb. The duty on tea is about 1s per lb. if in bulk, and the cases are included in this rate. Taking everything into consideration, the Consul is of opinion that high-class Ceylon and Indian teas could be sold at a fair profit at from 3 lire 50c to 4 lire 50c per lb. During the past year the total amount of the commodity imported was, according to the Customs returns, only 1,000 lb., so that Palermo, and, in fact, the whole islands, present virgin soil for the propagandists of the cup that cheers and does not inebriate.

**A CURE FOR TYPHOID FEVER.**—"A Planter writes to *Indian Gardening*:—I desire to record the virtues of the Eucalyptus oil in typhoid fevers. The remedy is well known in Australia; and Mr. Maiden, F. L. S., and Curator of the Technological Museum, New South Wales, in his works on the useful plants native to Australia and Tasmania in the chapter on oils, records that a Doctor Kesteven, in two hundred and twenty cases, treated in eighteen months for typhoid fever had only four deaths; his success was due to the use of Eucalyptus oil. It is a pity that India cannot show the like results. For instance, they have had some fatal cases of typhoid fever in Ootacamund quite lately, and though the Blue Gum abounds and the oil is common, we do not hear of its use as a cure; if given with olive oil it is said to produce astonishing results, more especially if the diet is confined to milk and plantains. Some thirty years ago a lady treated her son suffering from typhoid fever to a milk and plantain diet, and he recovered; this was before the virtues of Blue Gum oil were known. As an antiseptic in the treatment of sores and wounds, it is unrivalled, being three times more powerful in the destruction of bacteria than carbolic acid. It is mentioned that an Australian native suffering from a fearful wound over the intestines, to which a person treated in the ordinary manner would have succumbed, was cured by a poultice of Eucalyptus leaves applied by his *gin*. In influenza the inhalation of steamed Eucalyptus leaves has cured many; the remedy is also very useful in attacks of bronchitis. In intermittent malarial fevers the oil has been found useful in doses of five drops every three hours.

CACAO ANALYSES AND MANURING.

There can be no question of the great value to the Cacao cultivator of the Report furnished to the Planters' Association by Mr. Cochran, on the suggestion of Mr. de Sanctis of the Kurungala district. The several analyses and the recommendations as to manuring are very clearly put, so that the cacao planter should make no mistake over the practical advice offered. Of course, properly speaking, each district, if not each estate, should have its own soil analyses; but Mr. Cochran gives enough of information to shew in what directions manuring experiments can safely and profitably be made, even without further analyses. A special vote of thanks should be passed to Mr. Cochran for this Report.—See page 195 for full report.

THE ANGLO-CEYLON AND GENERAL ESTATES COMPANY.

The Report given on page 204 appears to be a very satisfactory document so far as Ceylon is concerned, but specially unsatisfactory as regards Mauritius. It is the old experience of the Ceylon Company, Limited, over again. We suppose the reason that there is no dividend is entirely due to the losses in Mauritius; for the Ceylon estates, under the general management of the Hon. J. N. Campbell, did better last year than in 1896 in respect of crops both of tea and cacao, and the average prices in both cases were distinctly better. It is very disheartening under these circumstances to find no margin for dividend. However, let us do Mauritius justice, apart from a less sugar crop for which it is responsible, there was the plague in Bombay ruining the best market for its sugars, which it could not help. There is hope, therefore, for better times, especially if the Currency Committee respect the producing interests, and honest silver, in India, Ceylon and Mauritius. In Ceylon the Company owns 12 tea estates and two cacao and coconut estates; in Selangor one coffee estate with 490 acres under coffee, and 711 reserve; in Mauritius two fully owned sugar estates and four others in which the Company is interested. We confess we should like to see the Mauritius properties handed over to another Company to work, and that Ceylon interests stood on their own basis.

CRAIGHEAD TEA COMPANY, LIMITED.

Registered July 1, by Allen and Son, 17, Carlisle-street, Soho-square, W., with a capital of £50,000 in £10 shares (1,650 six per cent cumulative preference). Object to acquire, by purchase or otherwise, certain lands, buildings, and other property in Ceylon or elsewhere or any interest therein, and in particular the Craighead and Cholankander Estates, Dolosbage District, Central Province of Ceylon, with a view to the above objects, to adopt and carry into effect an agreement expressed to be made between G Alston, E Hamilton, and E B Hay of the first part and this company of the other part, and generally to carry on in all or any of their respective branches the businesses of timber growers, timber merchants, tea, coffee, and cocoa merchants with the necessary plant, machinery, apparatus which may be considered necessary or useful for the said businesses, or any of them; as coal and coke merchants, brick and tile manufacturers, carriers by land and sea of goods, passengers, live stock, munitions of war, &c.; to acquire and turn to account any patents, patent rights and inventions; to acquire and turn to account any real or personal property; to establish and maintain telephone and telegraph systems, &c.; to acquire any mines, mining, water, and other rights, grants, leases, claims, concessions, options of purchase, metalliferous land, alluvial ground, mineral deposits, &c.; and to carry on the business of a mining, smelting, and trading company in all its branches; and, further, to acquire any lands and estates, and to develop, deal with, and turn to account the same; also to carry on the business of an electric light and power company in all its branches. The signatories are:—

The first directors—of whom there shall be not less than two nor more than five—are G Alston, R H Wallace, and C M Robertson. Qualification, £500. Remuneration, £250 per annum, divisible. Registered office: 12, Fenchurch-street, E.C.—*Financial News*, July 12.

CEYLON ESTATES INVESTMENT COMPANY, LIMITED.

The fourteenth general meeting of Ceylon Estates Investment Association, Limited, was held in the office of the secretaries, Messrs. Brown, Fleming, and Murray, 163, West George-street, Glasgow. Mr. Robert King presided.

The directors, in their report, stated that owing to unfavourable weather the crop of tea harvested was 17,973 lb. below that of last year. The lower prices and the higher rate of exchange have also prejudicially affected the result. The balance at the credit of profit and loss account, including £359 8s 9d brought forward from last year, is £1,389 1s 6d. From this the directors have already paid on January 1st, 1898, an interim dividend at the rate of 5 per cent per annum, free of tax, amounting to £775, leaving a balance of £614 1s 6d, which the directors propose should be applied in payment of a dividend for the half-year of 2½ per cent per annum, free of tax, £389 10s, making 3¾ per cent. for the year, and that the balance of £226 11s. 6d. be carried forward to next year. Depreciation at the rate of 10 per cent. has, as usual, been written off tea machinery and factories. During the year there has been expended on the factories and machinery the sum of £903 2s 8d.

The CHAIRMAN said the directors regretted that they had to submit a disappointing report. The crop had been very nearly 18,000 lb less than in the previous year. This falling off was due to the unfavourable weather. The smallness of the crop was a matter of considerable disappointment to the directors, especially as the estimate for the year was 5,000 lb. in excess of that of the previous year. Although the small crop was the principal cause of the disappointment, the result had also be prejudicially

WANTED: FIBRE TO MAKE UP FOR MANILA HEMP.—There is a great want of hemp in England just now as "R.H.F." shows on the authority of Mr. T. Christy; but, alas! Ceylon is not ready to supply the deficiency, although the island in several districts is most favourable to the growth of fibre plants.

affected by the lower prices obtained for the teas and by the higher rate of exchange. In 1896 the average price of Ceylon tea was 8'25, while in 1897 it was 7'79, showing a difference of about 4d per lb. The rise in the exchange value had caused an increase in the cost of working the estates of £424 2s 8d.—The report was adopted, and Mr. Robert King and Rev. Dr. Grant, Dundee, were reappointed directors.—*The Grocers' Journal*, July 9.

### THE DIMBULLA VALLEY (CEYLON) TEA CO., LTD.

**DIRECTORS** :—James Sinclair, Chairman and Managing Director; Wm. Forbes Laurie, Keith F. Arbuthnot, Aneas R. McDonell and C. J. Rowe.

**DIRECTORS' REPORT**.—To be submitted to the shareholders at the second annual ordinary general meeting, to be held at the office of the Company on Tuesday, the 19th day of July at 12 o'clock noon.

The directors beg to submit the general balance sheet and profit and loss account for the year ending 31st March last.

The net amount at credit of profit and loss account, bringing forward £375 6s 2d from last account, after providing for general expenses, for depreciation, and for directors' fees, and after writing off the whole of the preliminary expenses, is £11,693 9s 9d.

Dividends aggregating 6 per cent, less Income Tax, have been paid for 1897 on the Preference shares. These dividends amounted to .. ..	£	s.	d.
Interim dividends aggregating 5 per cent, less Income Tax, have been paid, and amount to .. ..	3,440	2	0
It is proposed to pay a final dividend of 2 per cent on the ordinary shares (making 7 per cent in all). This will absorb .. ..	5,733	5	0
Leaving to be carried forward to next year a balance of .. ..	2,293	6	0
	226	16	9
	<hr/>		
	£11,693	9	9

The Company has during the past year had to contend with serious mistakes in local management, resulting in a very heavy shortage of crop beyond what may have been due to unfavourable weather. It has also had to face a depressed tea market and a rate of exchange which averaged 1s 3½d as against 1s 2 9-10d for the previous year. Your Managing Director, Mr. Sinclair, thought it advisable to visit the Company's estates himself in January last. It was then too late to regain the large shortage, or to alter the system of working, but the results during the last two months of the financial year have been proportionately far more satisfactory than those for the previous ten months.

Mr. Sinclair reports that the estates are in excellent order, and he is of opinion that the insufficient plucking of last year will ensure to the benefit of the present year. Already 30,000 lb more tea have been secured during the first three months of this year than were made during the corresponding quarter of 1897. So much of it as has yet come to hand show that the teas keep up their high quality. Mr. Forbes Laurie, another of your directors, also visited the Company's estate in January. His opinions and conclusions are in agreement with those of Mr. Sinclair. The directors recommend a final dividend on the ordinary shares of 2 per cent, making up the total dividend for the year to 7 per cent.

The total tea crop for the year was 833,874 lb. As the Company was in possession of Langdale estate during the whole of the year, the total crop should have exceeded 900,000 lb. The gross average price realised was 8'95d per lb., as against 9'22d per lb. for 1896-97.

The Company's property consists of the following, viz.:—

	Total Area, Acres.	Tea, Acres.	Forest, Waste, &c. Acres.	Elevation above Sea Level
Elgin ..	448	379	69	4,600
Lippakelle ..	206	197	9	4,400
Tillicoultry ..	401	380	21	4,300
Mausa Ella ..	550	468	82	4,800
Belgravia ..	305	270	35	4,200
Bearwell ..	233	229	4	4,200
Langdale ..	303	291	12	4,300
	<hr/>			
	2,446	2,214	232	

The issue of 1,267 preference shares and 1,133 ordinary shares was promptly taken up by shareholders in the Company.

A mortgage debt for £5,000, which fell due on December 31st last, has been paid off, which will result in a saving of revenue to the Company.

Mr. Keith F. Arbuthnot retires in accordance with the articles of Association, and offers himself for re-election. Messrs. Singleton, Fabian & Co., the Auditors to the Company, retire, and, being eligible, offer themselves for re-election.—By order of the Board, BENTHAM F. WHITE, Secretary.

9th July 1898.

### THE ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED.

Report of the Board of Directors to be presented to the stockholders at the twelfth annual ordinary general meeting, to be held at 20, Eastcheap, London, E.C., on Thursday, July 21st, 1898, at noon:—

The Directors herewith submit to the Stockholders their Report, together with the accounts of the 12th year of the working of the Company. The net profit, as shown in the audited accounts annexed hereto, amounts, after payment of the Debenture Interest, to £9,629 8s 11d.

In Mauritius, the year under review, the Directors regret to state, had been throughout unfavourable. A prolonged drought seriously affected the canes over a large part of the island, and particularly those on the Beau Sejour and Mon Songe Estates, in which the Company has an important interest, and a hurricane was experienced in the month of November last which did some damage, not only to the canes, but also to the buildings. The combination of these unfavourable conditions resulted in a great diminution of the crops, 8,916 tons of sugar only having been made from the estates as against 11,960 tons in the previous year. Further, owing to the prevalence of plague in Bombay (the principal market for the Company's sugars), hardly any demand existed for sugar for a long period, and consequently low prices ruled for Mauritius sugar throughout the year. Considerable stringency existed also, and still exists, in the Money Market in Port Louis, and rates for accommodation advanced to 15 per cent. per annum and upwards for ordinary commercial business.

A considerable sum is shown for cash in hand at the close of the financial year: part of this consisted of proceeds of Ceylon land sales, and the remainder included the necessary provision for financing the Mauritius Estates until the new crop is available. The circumstances being as described, the Directors, while feeling that the Company is fortunate in having escaped actual loss in Mauritius, regret that they are unable to recommend the distribution of a dividend. With the consent of the Trustees for the Debenture Holders, the Estate of Knda Oya in Ceylon was sold as from June 1st, 1897.

Owing, however, to the extensions made in recent years, the total acreage of Tea in bearing on the Company's Estates in the course of the current year

will be about as large as at any previous time, notwithstanding the sale of Havilland, which was previously reported, and of Knda Oya. A statement of the present acreages of the Ceylon and Mauritius Estates is given in the Schedule annexed hereto.

The Tea Crop in Ceylon amounted to 1,584,236 lb. (which includes 26,425 lb. from bought leaf), as against 1,743,824 lb. in the previous year. The reduced amount was due to the lessened acreage under Tea consequent on the Sale of the Estates above-mentioned. The gross average price was 8.17 pence per lb. in London as against 7.95 pence in the previous year.

The Cocoa Crop was 2,100 cwt. as against 1,346 cwt., and the price averaged 71/ per cwt. as against 60/8d per cwt. in the previous year.

The net profits from the Ceylon properties were slightly better than those of the preceding year, notwithstanding the high prices of rice, the higher rate of exchange and the general fall in the average price of Ceylon Tea.

The result of the working of the Estates in Ceylon and Mauritius respectively are given in the Profit and Loss Account, calculated at the average rate of exchange of 1/9 $\frac{1}{2}$  as against 1/2 $\frac{3}{4}$  in the year 1896-97.

In accordance with the resolution passed at the last General Meeting of the Company, Mr. S. C. Macaskie was, on the 27th July last, elected to a seat on the Board of Directors.

Mr. Norman William Grieve, under the provision of the Articles of Association, retires from the Board, and being eligible, offers himself for re-election.

The Auditors, Messrs. Welton Jones & Co., also retire from office, and have expressed their readiness to act if re-elected.

By order of the Board, HENRY GREY, Secretary.  
July 5th, 1898.

### THE FLORIDA VELVET BEAN.

We have a number of correspondents acknowledging Mr. Brown's gift through us, of seed; promising to do all the justice they can and to report the result. Mr. Nock of Hakgala, writes:—

"I am extremely obliged to you for twenty 'Florida velvet beans,' which shall have my best attention. I have sown ten, sent six to Badulla Gardens and four to Mr. A. J. Kellow. So they will be tried in three different kinds of soil and elevation. I got three seeds a few days ago from Dr. Drummond of Talawakele; so if they all grow I shall have 13 plants to work on. I am afraid we shall be too wet here for it at the end of the year; but if it grows at the rate Capt. Wilson says it does, it must have a strong constitution and may push through our wet season. I hope I shall have seeds at the beginning of the year 1899, and so try it in our dry season. It will have a job to beat Lucerne, I have just cut my *ninth* crop of this, this year."

We quote as follows from the letter of an American to London seedsmen:—

"Up to two years ago this bean was grown in Florida in a limited way, mainly as a trellis shade, but afterwards it became recognised as invaluable for all kinds of stock as a forage, and a phenomenal fertiliser for orange and other fruit trees, and for the soil as well, until it is now grown in large quantities. There is nothing yet discovered that is, all in all, so valuable a crop as this for farmers to raise. It being an air plant, it will do well in almost any kind of soil, in any of the States, north or south, that will grow corn, and no fertilising is necessary. The forage—the foliage and vine—coming from this bean is a marvel and a wonder. Planting in rows 4 ft. apart will produce a solid mass of vine and foliage up to your waist in height, covering the ground completely, and yielding leaf, vine, and fruit, aggregating four to five tons to the acre, and of dry beans twenty to thirty bushels. Besides the vine being a valuable fertiliser, forage, mulch, and shade, the question will be asked, 'Is it also prolific in fruit?' The answer is 'Yes emphatically so.' From the hill the vines run out in all directions like the water-melon, 10ft. to

20ft. It commences to fruit at the hill in clusters like the raisin-grape, thence along the entire length of the vines at intervals of 10 in. to 20 in. pods in clusters of from two to twenty appear. Therefore the fruitage must be immense. For twenty years this bean has had a home in Florida, and has been known among the people as "the climber." In good rich soil it will climb 50ft. to 60ft., blooming and fruiting all the way up,—a most beautiful and lovely sight to look upon. To drill an acre will take 16 quarts of seed; to plant an acre in rows 4 feet apart each way, about 12 quarts. In good soil this acre will produce four to five tons of green forage, and fifteen to seventeen hundred pounds of beans. I speak from practical knowledge, as I have recently harvested 19 acres of as fine a crop as ever grew.

"Plant seed in spring the same time as you do corn, and cultivate and treat in same way, until vine begins to fill the row, then lay by for the season. When bean is ripe in the fall pick it, then turn mass of dry leaf and vine under the fertiliser, and from this your soil is immensely benefited. It is a good idea to drill or plant corn right in with bean seed as a partial support to vine, to keep pods off the ground. You can turn stock into bean field if you wish, or cut vines up at hill and carry out to stock, latter being advisable. If planted in orange grove or orchard, keep 5 ft. or more away from trees, as vine is a rampant grower and climber, and will cause you bother. Experience has shown that it is better to drill than to plant in hills, as by drilling you get a better stand on the ground, and that is important. The beans ground up, hulls and all, make a fine fertiliser for pineapples, orange and other fruit trees, as well as for all vegetable growth. Stock of all kinds like it, as well as the green forage early in the season, all do specially well on it. Every living thing on the farm will eat the green forage and dry bean with greediness. The dry bean is also fit for table use. The question is often asked if this newcomer—the Florida velvet bean—will do well in any other section of our country except Florida. I answer by saying there is no earthly reason why it will not, as it is not tropical, and will do well wherever corn will grow. After making a thorough test of it, I have come to the conclusion that, as a fertiliser, forage feed, mulch, shade a prolific bearer of fruit, an up-builder of the soil, this bean has no rival. As a porch and trellis shade, with its beautiful dark green foliage, and its long, pendant, down-hanging purple bloom, it is truly lovely. The analysis of this bean shows:—Nitrogen, 54 per cent; crude protein, 19; fat, 6; fibre, 9; moisture, 12."

### COCONUT PLANTING N.-W. PROVINCE: MARITIME.

MARAWILA, July 27.—We were passing through a season of comparative drought which was broken on the 25th inst. by a fall of 71 inches of rain. The whole of that day was drizzly and moonish. What aggravated the dry weather was the dry, scorching wind usual in July-August. Farther north, the drought is said to be more severe. I have heard of streams, wells and tanks drying up and making the water supply of estates a matter of much difficulty and anxiety.

Hardly had I despatched my last communication announcing that I had not heard of the canal being impassable anywhere, before I had ocular evidence of the grounding of boats. The water in the centre of the canal ran down to barely two feet, and heavily laden boats were grounded and had to wait till a rising tide floated them. It is interesting to notice how the tides affect the level of the canal. Boatmen know exactly the time of the day when the tide rises, and if it is sufficiently high to float their boats, they go on their journey; otherwise, they wait till the tides are affected by the lunar phases. The sides of the canal are being trimmed and it looks quite trim and spruce.

The price of coconuts and copra has gone down.

## NILGIRI PLANTERS' ASSOCIATION.

The bi-weekly meeting of the Nilgiri Planters' Association that was held on July 30, was very poorly attended, for besides the Honorary Secretary and the Chairman (Mr. W. L. Edmestone) only two members were present, *viz.*, Messrs Groves and Cockburn.

## LADY BIRD.

The Collector, Mr. Allan Butterworth, attended, and Mr. Newport was present to explain matters connected with the consignment of lady birds that perished in transit.

The Association resolved to express their sympathy with Mr. Newport, whom they exonerated from all blame, resolving to refer the question of further experiments in the same direction to the United Planters' Association, which will consider it at its forthcoming meeting at Bangalore.

## AGRICULTURAL CHEMIST.

The Association resolved not to join in the proposed scheme of the Mysore Government to get a man for the Planters of Mysore, whose services should also be available for the whole of Southern India. Another circumstance referred to was the importation of an Agricultural Chemist by Messrs. Stanes and Co., at Coimbatore. This gentleman, however, had preceded his apparatus. Messrs. Stanes and Co. promise that as soon as the latter arrives he will be able to undertake the analysis of soils and chemical investigations for the public at charges to be notified later on. The sense of the meeting was in favour of an essentially *Planters' Chemist*, and it accordingly resolved to refer this subject also to the consideration and discretion of the U.P.A. at Bangalore.

Satisfaction was recorded with the proceedings of the Director of Cinchona Plantations in Ootacamund in respect to what Government is doing in the purchase of bark and manufacture of quinine.

## TEA.

The Chairman, at the conclusion of the meeting, made allusion to his experience as an exporter of tea with the P. & O. Agents at Bombay; owing, he said, to a chest of tea put on board that was mildewed and damaged belonging to someone else, the agent refused to receive a shipment from himself and others. He considered this a most high-handed proceeding on the Company's officers, and stated that he would lay the matter before the U.P.A. at its next meeting. Meantime he hoped this Association would give him their good-will.

ABOLITION OF THE IMPERIAL  
TEA DUTY.

At the half-yearly meeting of the Colombo Chamber of Commerce, on July 22nd,

Mr. STANLEY BOIS moved his motion that it was desirable that action should be taken with a view to secure the abolition of Import Duty on Tea in the United Kingdom. Just before he began his remarks on the subject fully two-thirds of those present left the room they having been chiefly concerned in the foregoing business, and Mr. Bois began by saying that in rising to support his motion he did not think he need detain the other members long. It would be fresh in the memory of them all that in the Budget presented on the 21st April last by Sir Michael Hicks-Beach he disclosed a satisfactory statement of Imperial Revenue, showing a surplus of three and a half millions of which £75,000 was due to the increased returns from tea and he also showed an increase to the revenue which had been derived

from tobacco. Subsequently, when the Budget proposals were being considered in Committee Sir William Harcourt urged that as nearly nine-tenths of the tea consumed in England was grown in India and Ceylon, and was therefore nearly all British-grown, there is good reason for a diminution of the duty on this article to the extent of two-pence—in other words he asked that half the existing duty should be taken off. It was evident from this that the question of the reduction and the entire abolition of the tea duty was well within the range of practical politics, and, assuming that the next Budget showed a corresponding buoyant state of the Revenue the matter would no doubt come up for consideration again, and if the duty was taken off tea it would be another move in the direction of the free breakfast table they had heard so much about. In support of this Mr. Bois quoted some interesting figures that were given in the *Observer* some days ago, as follows:—

"In the year 1837—when Queen Victoria came to the throne—the Customs Duty on tea imported into the United Kingdom of Great Britain and Ireland, was two shillings-and-one-penny per pound avoirdupois; the total consumption for that year was 30,625,206 lb. (or less than 1½ lb. per head of the population per annum) and the total of revenue collected from the duty was £3,190,125 and then between 1852 and 1865 we find the Customs Duty at one-shilling-and-ten-pence per pound in 1854; at one-shilling-and-five-pence in 1858; at one shilling in 1863; and then it was reduced to six-pence per pound, to take effect from 1st June 1865.

The progress in Consumption and Revenue may be indicated as follows:—

Year.	Total consumption. lb.	Per head per annum.		Duty per lb.		Revenue. £
		lb.	s.	d.	£	
1837 ..	30,625,206	1½	2	1		3,190,125
1867 ..	111,061,160	3½	0	6		2,776,529
1879 ..	160,432,000	4½	0	6		4,010,800
1887 ..	183,635,885	5	0	6		4,590,897

The next reduction was on 1st May 1890 when the Tea Duty was reduced from six-pence to four-pence per lb., and the result is thus shown for last year:—

Year.	Total consumption. lb.	Per head per annum.		Duty per lb.		Revenue. £
		lb.	s.	d.	£	
1897 ..	231,399,778	5½	6	0	4	3,856,662'

It was evident, he argued, that these periodical reductions of the tea duty had in all instances had the effect of stimulating consumption and, therefore, he thought they could not do better than press it on these grounds alone for the abolition, or at all events the reduction meanwhile of the duty on tea as affecting their staple. But it had been urged in some quarters that this reduction in the price of tea to the consumer might stimulate the consumption of low grade China tea, which would displace a corresponding quantity of Ceylon and Indian tea. That was, of course, a matter of opinion, and he would like to hear what anyone

had to say on the subject, but he did not think any of the figures before them would lead them to suppose that that would be the case, and he thought moreover from all independent accounts that they had before them that the tea trade of China was on its last legs, Great Britain and the Continent were beginning to acquire a taste for India and Ceylon teas, and he did not think this movement was likely to be damaged by a reduction of the duty—a reduction in which they would have an advantage as well as China. Under these circumstances he begged to propose—“That in the opinion of this Chamber it is desirable that action should be taken with a view to secure the abolition of Import Duty on tea in the United Kingdom.”

Mr. CUMBERBATCH seconded the resolution.

Mr. MACKWOOD thought that it was very desirable that the Chamber should approach the Secretary of State with the view of inducing him to use his influence in order to get—he did not think it likely they should secure abolition—but in order to get probably a reduction of the duty. He thought that with the present claims on the revenue, due to political troubles, it was impossible to expect abolition, but a reduction might be agreed to. On the other hand, strictly, it seemed to him, the request should come more from the people at home who were the drinkers of the tea as they were the people likely to benefit most by the change. He did not think that they in Ceylon could expect to benefit very much. The figures quoted by Mr. Bois included figures which represented the displacement of China tea to a very large percentage. He had not had time to work out those figures, but they did not show merely an increase of consumption, but were largely due to the displacement of China tea. They must remember that in the battle they had been fighting with China they had been fighting with that duty before them and it was another matter how far the altered conditions of abolition, might affect the fight. As regarded China being on its last legs—it did not sound very sympathetic, but from their point of view one would be glad to think this was so; but he (the speaker) had friends in China, and he understood from them that they did not intend to sit and take their chance with their hands folded. They intended to do their best to resuscitate their trade and, among other things, they in Ceylon had been accustomed to speak of China tea as being cultivated from the China bush, but they would have to meet in future with tea manufactured from the same description of tea-seed, that they had been using in Ceylon. They were getting the same sort of seed that we had planted, and he did not suppose the climatic conditions were very different in China from what they were here, and it was an unknown question as to what China would do with these conditions; but one thing he was quite certain of was this, that they should bear in mind that if there was any public agitation of the tea enterprise in Ceylon brought to bear upon the authorities in England, after January or February next it would leave such a state of uncertainty in the tea trade as would have a disastrous effect on prices, and they would probably have a serious crisis to go through even if their expectation in regard to extension of consumption held good. Nothing was said last year about the increase there had been, in the revenue got from tea, and it came as a surprise this year when the Chancellor of the Exchequer said:—“Will you have a reduction off tea or tobacco?” And there was no public agitation for the free breakfast table last year. The real hope he had in the change was that

they might gain a great advantage over the countries that produced cocoa and coffee if they could induce people by giving them cheapened tea to drink tea by preference. He was not opposing the motion, but simply putting forward these views to help on the discussion. (Applause).

The Hon. Mr. MITCHELL said that when at home last year he talked over this matter with several people and found a great difference of opinion. He drew attention, however, to the fact that in Australia the average number of lb. of tea consumed per head was  $7\frac{1}{2}$  lb. and thought there was some reason for thinking that reduction might raise the English average from its present point— $5\frac{3}{4}$  lb.

Mr. MACINDOE thought this was rather a serious matter for the Chamber to discuss as it was at present with so many members away. He advocated the matter being sent to a Committee, and he would bring that suggestion forward as an amendment.

Mr. HORSEFALL seconded.

The CHAIRMAN said, before he put the amendment he would not detain them by saying much, but he thought it a pity they should defer it.

Mr. RENTON:—We have not a quorum.

The CHAIRMAN said that though they had not so many members as when they came in that was really the fault of the members who retired. They had had a week's notice of this resolution and if they took such little interest in the question that they did not remain to discuss it, it rested with the members who remained to give their opinion as to whether they were in favour of the resolution or the amendment. He, as in duty bound, should put the amendment first, and that was to the effect that the matter should be deferred. Personally he was not inclined to take that view. He suggested the Standing Committee might put themselves in communication with the Planters' Association, and, if they saw fit, there might be a general meeting to see how far they agreed. The mere fact of their asking the Chamber to take action did not mean that they were going to apply at once to the Secretary of State. There would be, he could guarantee, no hasty action in the matter. He would put the amendment.

Mr. HORSEFALL wished to make his position clear. When he seconded the amendment he did so on the understanding that the matter was to be taken up at once. If there was going to be any delay and the matter stood a chance of being shelved for six months he desired to withdraw his seconding.

The CHAIRMAN (To Mr. Macindoe): Will anyone else second your amendment.

Mr. RENTON: I second it.

The CHAIRMAN then put the amendment and it was lost by 10 votes to 7.

Mr. HORSEFALL said he would like to propose another amendment.

The CHAIRMAN: You are too late. The resolution must now be put.

He then put the resolution, and it was carried by 9 votes to 8.

CEYLON TEA IN GERMANY.—Mr. Westland writes:—“The more I think of the great field there is before us, the more I feel assured that we ought to have far more success in Germany than in America, and I hope to see and learn of a large share of the funds of the ‘Thirty Committee’ being wisely diverted into this new channel.”

## SUGAR IN MAURITIUS AND TEA AND CACAO IN CEYLON.

ANGLO-CEYLON AND GENERAL ESTATES  
COMPANY, LIMITED.

The twelfth annual ordinary General meeting of the Anglo-Ceylon and General Estates Company, Limited, was held yesterday at the offices, 20, East cheap, E.C., Mr. Alec W. Crichton (managing director) presiding.

The Secretary (Mr. Henry Greay) having read the notice convening the meeting

The CHAIRMAN said: I must explain that I have been asked to take the chair at this meeting in the absence of Mr. Quintin Hogg. He has gone, as perhaps some of you have already been informed, to the East on a tour, principally to visit our estates. He is first going to the Straits and to Ceylon, and when he has finished his inspection there he will go on to Mauritius, where he will arrive in September—that is, shortly after the beginning of the crop. I believe that this latter visit of his—to Mauritius, I mean—will be a matter of particular satisfaction to you, because his long acquaintance with sugar machinery and manufacture and with the economical management and the capital values of sugar estates make him an excellent judge of their position, and you will be glad to hear his views at the next meeting, and to have the benefit of his knowledge of the actual present state of affairs which he will gather during his visit, which can thus hardly fail to be of advantage to the Company. He will arrive in Mauritius at a time rather critical in the history of the Colony, when they have just passed through one of the very worst years on record, and when we feel, as I know that he does, that we should act with great caution, and strengthen the resources of the company so as to be able to meet all contingencies. You will have seen from a paragraph in our report the series of misfortunes which we have had to encounter in the course of the year  
IN MAURITIUS.

First there was the very severe drought, and as an example of the effects of that I will take the estate of Beau Sejour, a large and important property, which was lately cited, at a public meeting held in Port Louis, as one of the best-managed estates in the island. The drought there was so severe that they failed to harvest half a crop, and that realised very indifferent prices. If we compare the position of this estate at the close of our financial year in March, 1897, with its position at the close of this financial year in March, 1898, you will find that by March, 1897, we had received 36,000 bags of sugar from it, of which 27,000 bags were actually delivered and in the hands of purchasers who had paid us over R3,23,000 for them, whereas by March, 1898, we had received only 17,000 bags of sugar, and 8,000 bags were in the hands of purchasers, and we had only been paid R92,000. If you will consider those figures—R3,23,000 against R92,000—you will see the enormous difference, especially to us who have to finance the estate, and who have to provide, in the interest of this company, that the machinery and cultivation should be thoroughly well kept up.

In addition to the difficulties presented by the small crop, and therefore the small income, and the expenditure—because that, of course, must always go on—there was hardly any demand for sugar in Bombay, our principal market, owing to the prevalence of the plague there, and there arose, and not unnaturally, a financial crisis in Port Louis of great severity, which lasted for a long time, when the rates of money lent for ordinary commercial business rose to 15 per cent., and even over that rate, and they are very high now. Hence you will see that what has been suggested to us by several shareholders—that we should call in the mortgages on those estates in which we are interested—was absolutely inevitable. Far from that, we had ourselves, in order to continue the liquidation of the Highlands Estate, to pay off the mortgage there. But

you will say, as, in fact, it has been said, "Notwithstanding all these complaints of yours, by looking at the balance-sheet we see that you had a very substantial sum of ready cash in hand, which at the end of March amounted to over £30,000." That was so, but a great part of that consisted of moneys arising from sales of land in Ceylon belonging to the debenture-holders, which were not available for the purposes of finance in Mauritius, or for the distribution of dividends. As for the remainder of the £30,000, if you will consider the course of our business in Mauritius you will remember that March is five or six months from the time when we can expect any money to come in from the sales of the new crop, and it is in March that we have to make provisions, especially in times of financial difficulty such as this, for cash for the purpose of carrying on our estate, and this, in fact, does not represent the whole amount necessary. I think that under those circumstances you will see that the paragraphs in our report are clearly justified. It is as unpleasant to us as it can possibly be to you that we should have to recommend you not to divide these profits at present, and not to declare a dividend; but it is our plain duty to do so, having regard to the circumstances which I have referred to, and also to the somewhat uncertain future of cane sugar. The principal element of uncertainty in that respect is the question of whether the continental bounties, which cause such an over-production of beet sugar, and a glut in the market here, and sometimes in Bombay, shall be allowed to continue. It is admitted that one word from this country would be sufficient to procure their abolition; but if that is to be a determined or decisive word, who knows whether it will ever be pronounced. Other countries are making considerable sacrifices for their colonies and for the future of their trade, but it is impossible to say what we are going to do in that respect. One thing is certain, that if we had made up our minds long ago to preserve the freedom of our trade in our own markets—for all—for the producers as well as consumers—against those bounties by means of which any trade whatever can be attacked and ruined, we should not have been in our present difficulty, and if we fail to seize the opportunity now of discrediting these bounties we may have to fight them under circumstances which may be much more dangerous to ourselves and our trade. These Mauritius properties are good ones in their present condition, and capable of giving us good returns, provided we have natural, and not unnatural, competition to contend with. Before I leave the subject of Mauritius I should direct your attention to an item in the balance sheet, "Mauritius Sugar Estates, including lands under realisation," which has increased to £101,114 in the present balance-sheet.

After what I have said you will doubtless wish for an explanation; and it is very simple. In the 1897 balance-sheet the item of

### MAURITIUS SUGAR ESTATES

contained nothing in respect of our interests in the Highlands property. That was then represented and considered, as it was, a debt from the estate, and was included in the sundry accounts receivable; but a large amount of the Highlands lands has now been sold under registered contracts, the terms of which are for payment to us of the purchase money spread over five years by yearly instalments, and under the advice of our auditor we have taken the amount of the registered sales, and placed it under the head of Mauritius Sugar Estates, including lands under realisation; because we either recover the moneys from the purchasers or we recover the lands themselves as unpaid vendors. I may mention that in most cases the first instalment has actually been paid. Proceeding with the list of estates, the next one I will refer to is the Selangor Estate, the cultivation of which estate is being duly proceeded with. We have a most excellent report as to the lie and capabilities of the land. We have planted it not only with coffee, but with coconuts and indiarubber, and the coconuts and indiarubber particularly are likely to become very valuable products, and it is

reported to us on every hand that the estate will constitute a very remunerative asset. I may mention that

IN SELANGOR

we are not troubled with the Indian rupee but we have the advantage of a coinage more in accordance with the natural price of silver. With regard to the upkeep of the estate the general profits of the company will not be burdened, because we shall keep it up out of the sales of land in Mauritius which would not be applicable in any case to the payment of a dividend. With regard to the sales you will see from our report that we have sold our tea during the year at an average price of a little under 8½d., as against an average price of something under 8d. last year, and an average market price for the year under consideration of 7¾d., and our profit rose from £15,800 to about £16,700 in Ceylon. In fact, there are two circumstances which I think will afford you satisfaction with regard

TO CEYLON.

In the first place, whereas most people have been coming of the plaining low price they have obtained for their tea, and the high rates for rice and the high exchange, and that consequently the profits had declined, we have been enabled to increase our profit; and, secondly, that whereas, as is within your knowledge, we have in the course of the past two years sold estates in Ceylon of a total acreage of 800 acres of tea in bearing, we have now—that is, in the current year—as large an acreage of tea in bearing as ever. This is owing to the policy that we have pursued during the past few years of extending the cultivation of tea rapidly on the better estates, and of getting rid of those that were less remunerative. There can be no doubt, for instance, that the extensions of tea on the estate of Delmar, though rapidly made, have been thoroughly well done, and that as they increase in productiveness, as they naturally will do, the estate will become very much more valuable. You will see, also, that at Looecondra we have 1,200 acres of tea planted, of which over 1,000 is actually in bearing. On two of the estates we have planted since 1893 a considerable acreage of coconuts, and although those trees are somewhat slow in coming into bearing, yet the expense of keeping them up after they are first planted is quite trifling and every year they will increase in value.

With regard to the expenditure, I have not gone into the figures of the cost of sugar per ton in Mauritius, as usual, because, as I have just explained, the year has been so very exceptional in Mauritius that no general rule could be deduced, and nothing was to be said usefully on that point, although I shall be happy to discuss the question with any gentlemen who will come here to see the figures in regard to our estates. The expenditure in Mauritius generally has been reduced from £69,000 to a little over £66,000. Every effort has been made to keep down the expenditure, and the same thing may be said with regard to Ceylon, where you will see that there is a slight decline; but in both these cases you must remember the effect of the high rate of exchange which prevailed during this year, and through which it may easily be that an expenditure which was really less than in the previous year when measured in rupees, will appear greater if measured in pounds sterling. As a great many shareholders appear, from their communications with us, not to understand the operation of the exchange, perhaps I might usefully say a few words on the subject to those of you who are not acquainted with it, in order to show how it works and why it is so important to us. All Indian and Ceylon producers who send home their produce to England receive, of course, gold for it as the result of their operations, and out of that gold they have to pay for the rupees which are necessary for keeping up their East Indian estate, and when the rupees are dear the expenses of the estate are higher than they are when the rupees are cheap. That seems very elementary, but the application of it is striking. Suppose you have a group of estates costing £30,000 to keep up with the rupee at 1s it will cost £45,000 to keep them up with the rupee at 1s 6d and £60,000 with the rupee at 2s; and, if under the former cir-

cumstances, with the rupee at 1s the profits were £15,000 a year, then, roughly speaking, of course there would be no profits with the rupee at 1s 6d. Now, the higher rate of exchange which now prevails is not due to any natural causes. Silver is as cheap as it ever was. It is due to the contrivance of the Indian Government. That Government wishes to pay off its debts in a manner advantageous to itself, and for that purpose. It has put in practice a plan for raising the price of its rupees in comparison to gold in order that it may pay off a greater proportion of its gold debts with them. It has closed the mints, and thus made the rupees scarcer and dearer. Now, that is a new plan of tampering with the coinage—if I may use the phrase, without offence, with regard to persons who are, of course, only acting up to the best of their lights; but the principle—that, I mean, of trying to get the coinage taken for a much higher value than that of the metal of which it is composed—is a very old principle indeed, and I believe has never been found advantageous to the trade of the countries which have employed it. In this case the Indian Government, of course, has raised the gold value rupee; but other people have to pay for that, and one of those persons is

THE CEYLON PRODUCER,

who ought properly, to have nothing to do with the difficulties of the Indian Government; and you must remember that the welfare of Ceylon is almost entirely dependent upon the welfare of the tea producer. A commission has been appointed to consider this question, and I presume that some regard will be had to the interests of the producer, because, otherwise, if the conditions are made too adverse, large branches of trade will be affected, and there can be no question that the trade of India has flourished under a low exchange. I have kept you for a long time I fear, on this subject; but it is really of great importance to us and to our profits and that is my excuse for doing so. I think I need only say, in conclusion, that we have done our best in a year of difficulties to promote the welfare of the company, and to procure for it brighter prospects. While the profits of other Ceylon companies have been shrinking we have increased ours, and in Mauritius, amidst great difficulties, we have avoided actual loss, and in both cases I think that our thanks are due to the managers. With regard to Mauritius, we are continuing the scales of land there, and I hope that gradually we may be able to accumulate a fund which will materially lessen the burden of the debenture debt. I will now ask Mr. Rutherford to address a few words to you on the subject of Ceylon. (Applause)

MR. RUTHERFORD: As the chairman has asked me to say a few words relative to your business in Ceylon, I have great pleasure in doing so, more especially as there are a great number here who have no intimate knowledge of tea cultivation and management. There may be a few who do know intimately about it, so that in any remarks that I may make I will only touch upon the fundamental part which may interest both classes of shareholders. Well, it will be within your recollection that about four years ago, when I was elected on the board of this company I went to Ceylon and paid a visit to all the company's estates, and I found then that the management was not as it ought to be, and I made very drastic changes in the management. I am happy to state that after four years of that management I would not undo a single thing that I did when I went to Ceylon and made that change. (Hear, hear.) With regard to the management, there are many companies in Ceylon that have better estates than we have; but I make bold to say that there is not a company—and I have a knowledge of a good few—that is better managed than the Anglo-Ceylon and General Estates Company. (Applause.) You have in the Hon. Mr. Campbell, perhaps, without exaggeration, the best man that you could have, or that could be got in Ceylon. As a proof of that, and of the view the planters take of him, they have elected him to be the chairman of the Planters' Association, and they have lately elected him to be their Member in the Legislative Council. That shows clearly that the planters themselves look upon him as their leading

man. We know, of course, intimately, what he has done for us. You have only to read his annual reports on our various estates to see in every line the care, trouble, and anxiety that this company gives him out there; so that you may rest assured that your interests are cared for not only by Mr. Campbell but the whole of the staff, who, I believe, are well selected, and are doing all they can in the interests of the company. I think that is satisfactory on that point. With regard to what has happened in four years, I may say that in 1894 you had something like 5,000 acres under tea cultivation, and when I was out there I drafted a scheme for the further extension of the tea on the estates and the development of the forest and other lands. Practically that programme has been carried out, and we are now at about the end of those extensions. Although we have sold nearly 1,000 acres of tea land, at the present moment we hold as large a quantity of tea land in bearing as we held in 1894, and we have 1,600 acres not in bearing; so that altogether we have 1,500 acres more than we had in 1894. But not only that. We have added in that time, I think, 280 ACRES OF CACAO, ABOUT 80 ACRES OF CARDAMOMS, AND 1,000 ACRES OF COCONUTS.

That is a great work to do in that short time, and it is a great work to do without a large sum to do it with. You have not felt it further than not getting a dividend this year. I value those extensions at between £70,000 and £90,000, and you have been quite unaware during these four years that that has been done.

The profit of 1894 was £12,700, while this year it has amounted to £16,700, practically over the same acreage of tea. Since, as has been mentioned, we have sold 1,000 acres. Well, I think that when you consider that this year which we have just passed was the very worst year that Ceylon has ever experienced in the tea enterprise, you cannot but say that we have done extremely well. (Applause.) And we should have done a great deal better if the conditions of 1894 had obtained in 1897-98. We would have made nearly £12,000 profit with the exchange ruling then and the price of tea ruling then. These are matters, however, over which we have no control; but as to those matters over which we have control—good cultivation and good management—I say we have done extremely well. If that is the true position of affairs, although you may not feel inclined to give any credit to this board for it, still, I hope you will give full credit to the management in Ceylon for what they have done. (Applause.) Now, those who do not know about our estates say: "It is all very well talking like that; I see that other estates are making 400 lb. or 500 lb. tea an acre, whereas we only get 340 lb. tea per acre." In answer to that, I may say that we cannot control a yield. The estates we have to manage were not of our selection; they were handed down to us. They are some very excellent estates and some very indifferent estates, and you cannot increase the yield more than the nature of the soil and climate will permit, except by further manuring. There was a certain amount of manuring done in 1894, but I say the funds of the company would not allow us to expend a large sum in manuring, and I thought it better to stop manuring and extend the tea cultivation. Now that has been done we will revert to manuring. We have 700 acres to manure, and the yield will increase; but we could not face that expenditure previously, and I think it was better that we do not attempt nay manuring, because in the four years we have been able to get the benefit of all the various experiments made by others, and we shall be able to arrive at a better system than was in vogue four years ago. That, I think, explains the question of yield; and now I will say a few words with regard to the future. I will not say what we are going to get next year, or the year after, or any year, as I cannot predict what the exchange will be or the price of tea will be. But I think it will be a great satisfaction to you to take away the following, namely, that if the present conditions as to the price of tea and exchange, if those two conditions prevail, and if the whole of our tea is in bearing, and we get the like amount of cocoa from our estates, which have

done exceedingly well this year the Ceylon portion of the company ought to pay 10 per cent on the capital value of the estates as they stand in the books, that is to say, ought to pay £23,000 or £24,000. That is, I think, a very fair prospect, and it is a prospect we cannot grumble at. You must remember that these were not selected estates, or they might yield 20 per cent or 30 per cent, but under the conditions in which this company was formed I think if we do that we shall do extremely well.—*H. and C. Mail*, July 22.

**EUCALYPTUS PILULARIS, Sm.**—We think we have heard of this tree upcountry. It is the "Blackbutt" of Queensland and is thus described:—

The Blackbutt is a very large tree, generally growing straight and tall, and attaining a general height of from 60 to 150 feet, with a circumference varying from 8 to 15 feet or more. On good soils it attains a height of as much as 200 feet, with a diameter of as much as 15 feet. It attains perhaps the biggest bulk of any tree in Australia.

And of its uses we are told:—

It is close and very straight in the grain. It is much used for house carpentry (especially as flooring-boards), in shipbuilding (decking and planking), for wharves, piles, bridges, and culverts, and any purpose where strength and durability are required. It is extensively used for fencing purposes, splitting into posts, rails, and even palings very easily. It is also used for telegraph poles and ships' masts, and to some extent for railway sleepers. It is useful for wheelwright's work, and is one of the best timbers for woodpaving. It also furnishes one of the best of charcoals.

Its liability to gum-veins has prejudiced the timber of the Blackbutt in public favour. When free from them, it is second in point of durability, hardness, and strength only to Ironbark. From observations of the timber of this tree, I think the veins exist only in the butt portion of each tree (that part covered with the rough bark), and are found chiefly in old trees. Except when thoroughly dry, it furnishes but an indifferent fuel. In seasoning it shrinks a good deal, but warps very little. Fencing posts have been known to last for fifteen and twenty years, and rails for a much longer period. It is very liable to the attack of white ants; indeed, many trees are hollow, or "pipey," and infested with these insects. Trees growing on dry open ridges furnish the best timber.

The bark, though inferior to stringybark, is useful for roofing and flooring bush buildings. When exposed, however, it does not last long, but when under cover it hardens and lasts a long time.

The tree yields a kind of a ruby colour, quite transparent, and entirely soluble in spirit or water. It contains about 64.00 per cent. of kino-tannic acid.

The Blackbutt is a tree of very rapid growth, and the leaves of the young saplings are opposite, sessile, and of a lanceolate shape. It commences to flower at from about five years of age. A ship's most 60 feet in length and 14 inches square has been obtained from a tree twenty-one years of age. It attains the biggest bulk of any tree in Australia, and in the sister colony (New South Wales) there are some giant specimens of this tree. The following are three of the largest:—

1. The "Bulli Big Tree," situated on the Bulli Mountains, a little below the "Elbow," forty-two miles south of Sydney, said to be the largest tree in New South Wales. Girth, from buttress to buttress, at ground 57 feet 6 inches girth at 3 feet above the ground, 45 feet; girth at 6 feet above the ground, 40 feet; estimated height, 90 feet (the head is broken off). Measured March, 1891, by J. H. Maiden, Consulting Botanist, Sydney.
2. A tree in the Illawarra district. Girth, 45 feet; height about 300 feet. Measured by Messrs. Camara and Kirton.
3. A tree at Gosford. Girth, 25 feet at 6ft. from the ground; height, 156 feet.

## BETTER PRICES FOR TEA WITH INCREASED PLUCKING.

DIMBULA VALLEY (CEYLON) TEA COMPANY, LIMITED.

The second ordinary general meeting of the shareholders of the Dimbula Valley (Ceylon) Tea Company, Limited, was held on Tuesday at the offices of the company, 16, Philpot Lane, E.C. Mr. James Sinclair (chairman and managing director) presided.

The SECRETARY (Mr. Bertram F. White) read the notice convening the meeting.

The CHAIRMAN said: Gentlemen,—The report and balance-sheet for the year just passed, having been in your hands for some time, may be taken as read. (Hear, hear.) But in moving their adoption I should like to tell you a little more than a report usually discloses. You will be all the more anxious to have this in the face of the reduction of our dividend. Looking at the class of properties you own, and the quality of tea they will always produce, 7 per cent is not a bad return, yet I am bound to confess the result of the year's working has been a great disappointment to your directors. If I could have stood here today and only echoed that the complaint of most tea companies—viz., that the poor result was allowing to high exchange and the cost of rice—I could have done so with a certain amount of complacency. No doubt we were handicapped to some extent by high exchange. If exchange had been all, whilst you might have seen a sum carried forward some £800 less than if exchange had ruled as during our first year, your dividend need not have been reduced. If our crop had been gathered and produced at what it should, the loss by exchange (some £800) would not have brought our dividend down. Gentlemen, almost every tyro knows what it should cost in any given district to put a pound of tea free on board ship in Colombo. About that there is no mystery, but when I tell you that the Dimbula Valley tea cost 34 cents per lb it will be apparent that it can only be attributed to mismanagement on the other side. For the previous year, when our staff of European supervision and labourers was not thoroughly organised, and when in the nature of things, work must have been more costly, it cost but 29 cent. That was under different management, however. The Dimbula Valley teas should run to, at the outside, not over 28 cents per pound, free on board ship. But gentlemen, this was not our only loss. Our crop should have been nearer a million pounds than \$33,000. Most of this loss was caused by under-plucking, for it was perfectly apparent on my visit to the estates in February that the bushes had been underplucked. Langdale estate, which we purchased last year, was a disappointment as regards prices realised for the tea. Prior to our acquiring this estate, the teas had been sold locally, and were bought entirely for the Russian market, realising a high average, but when we shipped to London we could not get over 6½d per pound. Attempts on the estate to improve prices by varying the style of manufacture proved abortive until my visit last February, when certain changes were made, and the teas are now selling at prices satisfactory for the season of the year. To these causes, gentlemen, more than to loss by exchange, or even low prices (only ½d below the previous year), is to be attributed the falling-off in dividend. Of course, it is but temporary, and with the management now engaged we shall soon return to our original dividend. Gentlemen, I am quite sure if we are to have a hard time in Ceylon in regard to tea that the Ceylon planter will rise to the occasion. I can remember very well in the old days when we thought that coffee could not be produced under £10 per acre, and to our surprise a few years after, when we were compelled to do so, we found that we could place our coffee in Colombo at £5 an acre. I have no doubt, although not to such a large extent, some reduction can be made in the cost of the production of tea. In London, so far as expenses go, the company is on the most favourable terms. When it was formed we were

careful to keep our hands perfectly free. We are bound to no agents in any shape or form on this side or in Ceylon hence we can command the easiest terms. That I think, is a matter the shareholders may be congratulated upon. Well, gentlemen, besides visiting Ceylon three times at practically no expense to the company, I have this year, in view of the losses we have sustained, waived my managing director's fee, and my colleagues their remuneration as far as commission on profits go. We do not mean to make this a precedent and we have only done so because we feel satisfied that not only will there be no need for us to do it again, but that one day in the not far distant future you will reimburse us. You will observe that all preliminary expenses have now been paid, and that a mortgage for £5,000 which fell due January 1st last has been paid off. This mortgage carried interest at 6 per cent, and to this extent the company has been relieved. You will notice that over £5,000 has been spent on capital account, some explanation of which you will expect. The whole of this outlay has been made to enable us to produce our teas at the minimum of cost, so that if Ceylon is to have a pinch for a period, we shall be in the best position for taking the last cent of value possible out of our green leaf at the lowest possible cost. One of the most serious questions for many districts in Ceylon is that of fuel. Well, by removing factories to centres where there is a plentiful supply of water for power by which steam power is superseded, the question of fuel has been with us reduced to infinitesimal proportions. For our seven estates we have now but three factories, all worked with water power. Another very important point, namely, that of superintendents, has been put on a proper footing, for I know nothing that handicaps profit-making more than continual changes of European supervision. This can only be obviated by making each charge large enough to justify good salaries, and so be in a position to retain good men when you have proved them to be so. Our estates were happily so situated that we have been able to combine four of the smaller gardens into two charges under two superintendents, instead of under four as formerly. These combinations, besides the advantages named, tend towards greater economy all round. With a further outlay of some £500, to complete Belgravia factory we shall have three of the most substantial factories in Ceylon, equipped with the very best machinery and competent to turn out 1½ millions of tea, a quantity which I hope in the not very remote future I may be able to tell you we have secured. Our crop this year should run well over 1,000,000 unless we have a return to the somewhat untoward weather which prevailed this year up to May 15th. We are, however, already for the first quarter 30,000 lb. ahead of last year at same time and our prices so far are somewhat better; hence I think I am safe in predicting a better result altogether. I do not think I have anything more to add, and I now beg to move the adoption of the report and accounts.

Mr. ENEAS R. McDONNELL seconded the motion.

Mr. W. F. LAURIE said he had visited some of the company's estates with the chairman, and he found them in perfect order as regarded all general workmanship and maintenance, and that the prospects for the coming year were exceedingly good, certainly more promising than they had been before. He agreed with all the chairman had stated with reference to the position of the different estates.

## PRODUCE AND PLANTING.

NATAL TEA.—Mr. Hulet, who is the pioneer of tea-planting in Natal, does not intend to confine the supply to South Africa apparently. There is a London office at 31, Great St. Helens, for the supply of Hulet's Anti-Dyspeptic Natal tea in packets. It is probable that the Natal Government will further protect tea by increasing the duty to 6d per lb. and in the case the Natal tea enterprise will receive an impetus.

## BIG TEA FIRMS AND THE TRADE IN LONDON.

Healthy competition cannot be expected if there should be anything like an understanding not to oppose each other's interests, among a certain number of the leading buyers; and this is the conclusion now forced on business and tea men in Ceylon. A letter from a "Colombo merchant now at home," to our evening contemporary, has an intimate bearing on this question. He says:—

The reasons advanced do not altogether, however, account for the serious decline in prices which has been taking place during the last few years, and whilst the rise in exchange, inferior quality and increase in production (particularly in India) is undoubtedly responsible to a large extent for having brought too many Ceylon estates into the bad way they are at present in, yet these reasons do not altogether, I venture to think, fully account for it, and since I have been in London some other reasons have been apparent to me. One of the most noticeable causes is the contraction of the trade. By this I mean that the large distributing firms have by sheer weight of capital and by cutting prices to the lowest possible level driven a very large number of their smaller competitors out of the field altogether, and so reduced competition in the public sale-room. This coupled with the instructions given by a large number of merchants to whom tea is consigned for sale to the selling brokers "to sell" at valuations (which may or may not mean the value of the article!), means on a bad market simply ruinous results. This auction business appears to me to be the curse of the tea trade from a producer's point of view, and if tea could be sold privately as was the case in the old China tea trade days results would not be so disastrous. Alas! however, I fear that this is no longer possible, as the weight of Indian and Ceylon tea to be dealt with is too great, and merchants will not combine, whilst buyers will. Another important reason not to be lost sight of is that the export trade, once held by London, is now being done directly from Colombo,—witness the large shipments direct from Colombo to America and Russia. One comfort to the Ceylon producer must be that his produce is more readily saleable in foreign markets than Indian tea is, and that, by judiciously supporting the Colombo market, a great deal may yet be done to renew the prosperity of the industry. Prices realized in Colombo during the past twelve months have, undoubtedly, on an average, been much above London rates; unfortunately for the industry, however, a very large acreage has passed into the hands of London Companies so much mixed up with the selling brokers, that it is much to be feared that the interests of shareholders will not be altogether considered, as, indeed, the living of both agents and brokers depend upon their commissions, so that no movement will be made in the direction of selling in Colombo, without considerable pressure is brought to bear by the shareholders themselves. There is a feeling in city circles that the Commission now sitting will not accomplish much in our interests. It is certainly most unfair that we should have to bear, in addition to our own burdens, those of India, too.

### CINCHONA IN INDIA.

The Resolution of the Government of Bengal sums up the contents of Sir George King's Annual Report on the Government Cinchona Plantation and Factory in Bengal for the year 1896-97. The number of trees uprooted at the plantations for their bark was 1,064,200, against 453,000 uprooted in 1895-96. The result of the year's operations was that the total number of cinchona trees in the plantation at the close of the year (excluding the nursery stock, which amounted to 79,000) was 2,683,451,

all being of the quinine-producing sort, with the exception of 185,000 trees of the red bark for the manufacture of cinchona febrifuge. The policy steadily observed for several years past has been to reduce the number of the trees which yield the febrifuge, and to plant out only the quinine-producing varieties. The crop of the year amounted to 629,222 lb. of dry bark, of which 251,468 lb. were obtained from the trees uprooted in the Government plantations in Sikkim, and 377,754 lb. were collected from the trees in the plantation purchased at Nimbong. The bulk of the bark was of the quinine-producing sort, and with the exception of 1,642 lb. supplied to a medical depot and sold to the public, the whole crop was, as usual, made over to the Cinchona Factory for disposal. Besides the bark obtained by cropping, 122,571 lb. were purchased from private plantations in Sikkim and Travancore. The output of the factory, which was strengthened by a new turbine, was 10,672 lb. of sulphate of quinine, and 3,452 lb. of cinchona febrifuge, against 9,004 lb. and 3,124 lb. respectively, in 1895-96, the total increase being 1,996. The stock of quinine in hand at the close of the year was 4,548 lb. and of febrifuge, 1,205 lb. The revenue derived from the sale of sulphate of quinine, cinchona febrifuge, cinchona bark, and other products of the plantation, amounted to R171,779, against R189,530 in the previous year. The expenditure on the plantation amounted to R82,143, against R79,865 in the previous year. The amount spent on account of the factory rose from R62,982 to R79,867, which included the price paid for the bark purchased from private plantations, and the cost of a new turbine. The net profit on the working of the plantations amounted to R9,767, against R4,598 in the previous year. The result is satisfactory. The amount of quinine delivered to the Jail Department, for conversion into pice-packets for sale to the public through the Postal Department, was 3,330 lb. or only 130 lb. more than the quantity supplied in 1895-96. It appears that the smallness of the increase was due to the inability of the Printing Department to supply to the Jail Department, in sufficient quantity, the envelopes in which the quinine is wrapped up. Measures have since been taken to remedy this defect. At the same time, all restrictions on the supply of quinine, either in pice-packets or in bulk, to other Governments and Administrations, referred to in the last year's Resolution, have been withdrawn, and Dr. King has been instructed to comply with any demands he may receive. The Lieutenant-Governor desires to thank Dr. King and also Mr. Gammie, the Deputy Superintendent for the Cinchona Plantations, who has since retired from service, for their efficient management of the Department during the year.

### INDIAN TEA ASSOCIATION, LONDON.

#### ANNUAL REPORT.

The following is from the annual report of the Association:—

The general committee have the pleasure to submit their report for the eighteenth year of the operations of the Indian Tea Association in London.

#### NEW MARKETS.

Mr. Blechynden's work in America continued to receive the attention of the committee during the whole of the year. The two Commissioners—Mr. Blechynden for India, and Mr. Mackenzie for Ceylon—have continued to work together satisfactorily with no inconsiderable measure of success in making British grown teas known to the American consumers. The

various modes of advertisements have been detailed in previous reports, and these were combined with subsidies to persons and firms who interested themselves strongly in the movement. It may be safely said that facilities for obtaining British-grown teas are now offered in nearly every important district in New York, Brooklyn, Boston, &c. The number of firms dealing with Indian tea has largely increased, and of these firms nine out of every ten, store our teas and offer them for sale to consumers. Efforts are being made in many quarters to take advantage of the trade in green tea, which is the predominant tea in the United States, by mixing with it a proportion of Indian and Ceylon growths, and in this direction an increasing consumption is looked for. In response to the appeal made in Calcutta, subscriptions amounting to R102,039 were received in 1897, as compared with R103,674 in 1896, and R92,575 in 1895, and in addition the sum of £200 was subscribed in London. The planters of Southern India contributed liberally. The committee issued on February 15 an interim report on the operations in America, a copy of which will be found in the appendix, together with Mr. Blechynden's report to date. As will be seen from the interim report, the committee in view of the increased crops expected yearly both from India and Ceylon, recommended a fresh levy to enable them to continue their special work in America. This recommendation has been supported by the General Committee of the Indian Tea Association, Calcutta, and it is hoped that subscriptions will not fall short of those of last year. The imposition of a duty of 10 cents per pound as a war tax is unfortunately likely to curtail considerably the consumption of tea in the States, as it will add appreciably to its cost and tend to make coffee the more popular beverage. It is hoped, however, that the tax will be only a temporary one. Our advertisements now point out, that owing to the strength and purity of our teas, buyers will not feel the tax so much as those who drink the weaker Japan and China tea. In view of the increased production expected from the large area of new extensions to come into bearing, the Committee recognise the importance of giving attention to other markets beside that of America, especially to that of Russia, and will at the first opportunity, appropriate a portion of the funds at their disposal towards that object.

#### INDIAN TEA CROP.

The first estimate of the crop for last year was 156½ millions. The actual crop gathered was only 148 millions, climatic conditions having been unfavourable for yield and quality. The actual quantity shipped to the United Kingdom was 134 millions. For the current season the total crop is estimated at 153¾ millions of which 140¼ millions will, it is estimated, be available for the United Kingdom. Unseasonable weather, however, in Cachar and Sylhet, experienced since the above estimates were framed, will considerably reduce the crop. Travancore is not included in the above estimate, and about 3 million lb. may be expected from that district, making a gross total of 161¾ million lb.—*H. and C. Mail*, July 22.

#### MANAGING AGENTS' SHORTER CATECHISM.

##### THE DISTORTED VIEWS OF A MUCH-MANAGED MANAGER.

(Contributed.)

What are Managing Agents?

We are the middlemen between the Board of Directors in London and the Managers of the Tea Estate.

What is a Board of Directors?

A small body of kindly disposed elderly gentlemen, who, knowing nothing about the working of tea estates, and believing all planters are unbusiness-like and unreliable, wisely leave the control of the gardens to us.

What is a Tea Estate?

In the eyes of Government Tea Estates are farms started by wealthy philanthropists for the redistribution of population and the comfort and happiness of the labouring classes; in the eyes of the Directors they are tea plantations where planters will persist, in spite of instructions to the contrary, in growing more Pekoe than Orange Pekoe bushes; but we look upon them as forming a most reliable and lucrative source of income.

What is a Manager?

He is a planter appointed by the Board to work and look after the gardens, but whose whole time is much better employed in supplying us with information and statistics.

What is the chief aim of Managing Agents?

Our chief aim, after taking care of Dowb, is to impress the Board with the enormous amount of skillful supervising we bring to bear on the Manager?

How is this best accomplished?

By constantly inventing new forms of elaborate statistics to be supplied by the Manager, which, republished and sent home in neat typewritten columns, causes the Board to feel how fortunate the company is to possess such able and zealous Agents.

What is the great secret of successful management by an Agent?

It is to keep the Manager well under control.

Is this easily done?

Yes, it is very simple.

Can you give an example?

Yes, if a Manager in the middle of the season wires us: "150 Cacharees offering, can I employ?" we do not wire back "yes" or "no."

What do you reply in such a case?

We reply thus: "Estimated expenditure must not be exceeded, but cultivation and efficiency of garden must be maintained."

What is the result of this?

The result of this is, that if the Manager employs the Cacharees, we send him a set of statistics to show he is exceeding his estimate; while if he does not employ the Cacharees, we send him another set of statistics to show the cultivation is falling off.

Is it desirable that Managing Agents should understand the working of a Tea Estate?

No; it is most undesirable.

Why?

Because such knowledge would seriously hamper the freedom of our criticising.

Without such knowledge can the Managing Agents with confidence instruct a Manager as to how he is to work his garden?

Yes, certainly; we do so with the greatest confidence.

Do such instructions given at the beginning of a season ever produce a disastrous failure at the end of it?

Yes, frequently.

What do Managing Agents then?

We express to the Board our great disappointment in the Manager; and recommend, reluctantly, that in the interest of the company he be dismissed.

What effect has this system on the Managers?

The effect is distinctly good, for we have every reason to believe that the Manager frequently rises up (from his statistics) and calls us Blessed!

What is a Shareholder?

He is a man of no importance.—*Indian Planters' Gazette*, July 23.

SANITATION IN ASSAM.—The death-rate on tea gardens in Assam of 6.82 per 1,000 from cholera is serious. Fever also claimed a terrible amount of victims. Deaths in Cachar increased from 3,691 to 12,974; and in Sylhet from 33,850 to 66,550—as the *Englishman* truly remarks: "With cholera, fever, and a destructive earthquake, Assam passed through what appropriately may be called 'a record year of tribulation.'"

## NUTMEG CULTURE NEAR KANDY.

Mr. J. L. DEWAR has replied to our enquiry regarding nutmegs as follows:—"I don't think that there is a fortune in nutmegs, unless perhaps the culture were tackled on a big scale.

"Here, there is perhaps a quarter to one-third of an acre planted, but a considerable proportions are male trees. A well-cared-for nutmeg grove would have had only a few males; but as you have to wait till the tree flowers before the sex can be determined, people who are only playing with the product, dislike the rooting out and re-planting process. Once the nutmeg tree is up, the cost of cultivation is almost *nil*. The shade becomes so dense, that a run over once in six months would fulfil all that was wanted in the way of weeding. The trees are very subject to parasites, which if not regularly seen to—a cleaning out twice a year—spread with considerable rapidity and ruin the trees; but except that, a nutmeg estate would cost little besides superintendence, gathering and drying. It does not do to have them growing where there is much wind, not that the tree suffers to speak of, but the crop is so heavy that in the swaying it snaps off, long before it is ripe.

"From my experience, about 750 lb. of nutmegs—the weight includes the shell—and 120 lb of mace, might be got from an acre, and as the price of nutmegs is locally from 20 to 30 cents a lb.—and at times a little more—and mace about R1 per lb., this would work out, taking the nutmegs at 25 cents, and the mace at R1 a lb. = R307.50 an acre for the gross earnings. There is this to be remembered before jumping to the conclusion that here is a promising minor product, that the trees here are old and well-grown, and besides this there is the well-known deception of basing a calculation on the output of a small patch. We can all remember the kind of calculations which were indulged in when cinchona was the vogue. That cinchona tree gave so much, there are so many trees to the acre, which at that rate works out a goodly sum, add the selling price and what a handsome return—a fortune in fact! But all the same it was not there. Still all said and done, granted a sheltered piece of good land, it would seem as if there was a possibility of 'striking' it. Beside the nutmeg grower on a big scale would ship to London, which might pay better than the local market; but of that I have no experience.

"If the culture be taken up, no doubt the best will be done for it. In the old days of the East India Company, when, among other things dabbled in, there was shipped home, nutmegs and mace, the Court of Directors turned their attention to these spices; and the result of their deliberations was, that an order was issued, directing that for the future, they were to grow less nutmegs and more mace! Ceylon when it tackles a new product in earnest, generally 'gives it fits' and everybody connected with it; and although to follow the instructions of the Court of Directors may be beyond the Ceylon planter even at his best, I have no doubt that both mace and nutmegs could be piled in to the amazement of the world. It would be wise perhaps if nutmeg culture is to become a favourite, that too many should not rush in all at once, for not only is the market for spices a limited one, and the tree can easily be grown in many parts of the East; but even if we did manage to take first place in the Orient, what about the American variety—the wooden one?"

We do not think there is much chance of a rush after a tree that at least takes five years to bear and from that up to ten years, according to the soil, climate, &c. The best situations for nutmegs are said to be about Avisawella and in the Kurunegala district.

## PLUMBAGO: A FORTUNE IN CEYLON'S ONE MINERAL OF COMMERCIAL IMPORTANCE.

We can recall the day when plumbago was R100 per ton and when R140 was considered a handsome figure. A year ago the price stood at R350 and today it is R700 per ton! Plumbago is in fact more valuable per lb. than a great deal of tea. The foregoing price works out to over 31 cents per lb. for plumbago, and so the fortunate owners of "pits"—including our old friend Mr. W. A. Fernando, Messrs. N. D. P. De Silva & Co. and others—must be making large fortunes. The great demand, too, is not a temporary one, merely caused by the War—though that has given an impetus—but is connected with the activity in Electrical Engineering and electric business generally; and so far as we can judge "plumbago" and "rubber" are going to be two articles for which there will be a full market demand for many years to come.

We can now judge how far-seeing Mr. Tottenham was in bringing out his Mining friend, Capt. Tregay, when he did. The Plumbago Mine on Monerakande is now, we learn, turning out 5 tons of the valuable mineral every week. Our exhortation today is to tea-planters in suitable districts, such as, Kalutara Kurunegala, Kegalla and in some divisions even in the Central Province, if they have labour to spare, to go in for a little "Plumbago" prospecting. There may be a "fortune" in it—or at any rate a very profitable return. But we more especially write today, in order to appeal to His Excellency the Governor to do all he can to get the Indian Government to lend us a Geologist, or failing that, to telegraph to England for a competent Scientist who will aid us at this crisis in deciding which are likely to be lands with plumbago deposits. America and Europe are clamouring for "more plumbago." Ceylon is one of the very few countries in the world with a large reserve—how extensive no one as yet knows; and, if Governor Ridgeway makes the most of his opportunity, no one can say how important may be the results:—

There is a tide in the affairs of States  
Which taken at the flood, leads on to fortune!

## PLANTING NOTES.

"THE QUEENSLAND AGRICULTURAL JOURNAL."—Vol. III. Part 1, for July has the following contents:—Agricultural and Pastoral Conference; Agriculture—Liquid Manure, R R Harding; The Food of Horses; Dairying; Horse-Breeding—Cross-breeding, "Arab"; Viticulture—Maladies of Vine, E H Hainsford; Treatment for Anthracnose; Tropical Industries—Sugarcane from Childers; Preparation of Meat Extracts; Forestry—Some Timber Trees of Queensland, No. 4, J W Fawcett; General Notes; List of Agricultural, Horticultural and Pastoral Associations in Queensland; The Markets—Average Prices for May; Enoggera Sales; Farm and Garden Notes for July; Orchard Notes for July; Cultural Notes for Tropical Queensland; Public Announcements.

**CEYLON TEA IN AMERICA AND IN MINCING LANE.**—The P. A. correspondence published on another page is chiefly remarkable for the buoyant spirit displayed by Mr. Larkin as to the future of our teas in North America. He feels certain that the day is not far distant when the people of the States will drink more tea than the population of England! In other words, 500,000,000 lb of tea will be required for North America alone when Mr. Larkin's prophecy comes true! Mr. Mackenzie informs us that the Indian Tea Committee in London favour British prepared "green" tea being tried in America. He also gives us very clear evidence of the system adopted by big buying houses in the Lane in order to keep down prices of tea. What can be done to check such powerful combinations?

**THE RUBBER INDUSTRY OF PARA**—In his report on the trade of the Consular district of Para for the year 1897, Mr. Consul Churchill gives some particulars of the rubber industry, which is the principal one of the province of Grao-Para. There are numerous varieties of elastic gum produced in all tropical countries of the world which are chemically allied, but which are obtained from many varieties of several orders of plants, and are used for different purposes in commerce. These gums are commonly divided into two classes—indiarubber and guttapercha, the chief commercial difference being that indiarubber is elastic whereas guttapercha becomes hard and inelastic when kept in a cool temperature. For this reason guttapercha is used for the insulation of submarine cables. The world's production of rubber in 1896 reached 31,541 tons, towards which South America (mainly the Para district) contributed 19,261 tons. Last year the exports from this particular part amounted to 22,216 tons. Rubber, it appears was first introduced into Europe from South America in 1736, but its virtues were not generally appreciated until the close of the eighteenth century, when it was first employed in the manufacture of waterproofs. The localities where rubber trees thrive the best are on islands and low ground near rivers where the banks are periodically inundated. Ground that is above water at all times or that has no drainage is not suitable to the tree.

**USEFUL ORIGINAL WORK** is being done since July 1896, at the Technological Museum, New South Wales, by R. T. Baker, F.L.S., who besides a great deal of original botanical work has discussed the presence of a true manna on an Australian grass (jointly with Mr. H. G. Smith, F.C.S.) (As Mannite is worth 5s per lb. we have here a pharmaceutical product new for the Austrian Continent, and obtained from what was previously supposed to be an objectionable fungus). He has had a note on a new variety of *Acacia decurrens*, Willd. (On two new species of *Acacia* from N. S. W.) (One species was found to yield in quantity a good gum arabic worth 16s to 20s per cwt.) On the Cinnamomums of N. S. W., with a chemical research on oliverian oil. (Apart from the botanical discovery, it is shown that in the bark alone there is a valuable oil to be obtained and in good quantity). On the essential oil of *Eucalyptus piperita*, Sm. and the occurrence therein of a solid camphor or stearoptene. (In the finding of this new camphor they add another product for the consideration of the commercial world.) On *Eucalyptus punctata*, DC. especially in regard to its essential oil (Jointly with Mr. H. G. Smith, F.C.S.) (The economic side of this species is very fully treated and its oil is shown to be superior in quality and equal in quantity to that of *Eucalyptus globulus*). Organic chemistry—By H. G. Smith, F.C.S. On the constituents of the sap of the Silky oak, (*Gravillea robusta*), R. Br. and the presence of butyric acid therein.

**COFFEE PLANTING IN THE MALAY PENINSULA** is just now on the verge of a grave crisis. Latest accounts from the Straits through the Singapore *Free Press* tell of the annual report of the Malay Peninsula Coffee Company showing a deficit of £1,975 on last year's working, due to bad weather and the fall in prices.—*Friend of India*, July 28.

**KEW BULLETIN.**—The June number contains articles on Tea Blights, and an account of various fungi injurious to Tea in India, drawn up by Mr. Masee; who also contributes descriptions of various exotic fungi. "Miscellaneous notes" justify their title. The acquisition of a Totem Pole made from the wood *Thuya plicata*—gigantea, is very interesting.—*Gardeners' Chronicle*, July 23.

**IMPROVED PRUNING OF TEA AND HEAVY CROPS.**—Our correspondent "1874" complains that we interpreted his previous letter wrongly; and that he meant a maximum, not an average, crop of 1,600 lb of made tea per acre as the result of improved pruning. There is certainly reason for criticising the practice of "cutting-down" and a Dumbula planter the other day condemned it unsparingly.

**THE AGRICULTURAL SOCIETY OF INDIA.**—The report of this Society for the past year shows that the organization is now in a much healthier and more active state than it has been for many years. The finances of the Society are however we regret to note, not in a satisfactory state, the year closing with a deficit of over R2,000. The work of the past year was interesting and varied. Large additions of plants, rare, beautiful, and of economic value were made during the year, while a new glass house—believed to be the finest structure of the kind in India—and a very fine specimen house, were among the new additions. Another important addition is the aermotator, presented by the Maharaja of Hutwa, which is now in full working order. It is acknowledged to be a most valuable aid for irrigation purposes.

**RINDERPEST** exists in Colombo and Government Veterinary Surgeon Sturges recommends the following measures for suppression and the treatment of affected animals:—

I. On the earliest indication of illness an animal should at once be isolated.

II. Tacks soaked in Carbolic acid and water ( $\frac{1}{2}$  tea cupful of acid to a bucketful of water) should be hung up in the sheds and about the yard, for purposes of disinfection.

III. Waste food, litter and dung from the sick animals should be burned.

IV. *Treatment*: I have found the following prescription answer well and I strongly recommend it,—in the present outbreak most of the cases treated in this way from the earliest indication of illness are recovering:—Quinine 1 to 2 drams, according to size of animal; arrack  $\frac{1}{4}$  bottle, rice congee  $\frac{1}{4}$  botl's, mixed together and given every morning or morning and evening in bad cases.

The eyes and nostrils when gummed up with the discharged should be cleaned with a weak solution of permanganate of potash in water, (or Jeyes fluid and water).

Good nutritious food in the way of congee, and soft grass should be given until the animal regains its appetite.

For the last day and a half I have heard of no fresh cases.

Cattle owners will greatly assist in suppression by at once reporting cases. I may add for their guidance that one of the earliest symptoms I have observed during the present outbreak is that the belly becomes puffed up accompanied by a little pain; followed in about 12 hours by diarrhoea.

BY ORDER OF THE COMMITTEE.

C lombo, 2nd Sept., 1898.

## PLANTING NOTES.

THE FAMOUS VINE at Hampton Court Palace, which is now 130 years old, is bearing 1,200 bunches of grapes. The fruit is beginning to ripen, (August 12th) and will shortly be sent for use on Her Majesty's table, says a home contemporary.

COFFEE AND CARDAMOMS.—Writes a Matale planter:—"What a grand coffee year this would have been, had we been growing it as in by-gone days. These long spells of dry weather would have ripened the wood for the big blossom in September on the Uva side. Should this weather continue the cardamom crop will be very short this year, and some of us trust to the cardamoms paying for the loss on the tea."

DR. MORRIS, M.A., C.M.G.,—has been promoted to a very important and responsible post—as may be seen from paragraphs on our third and seventh pages—and it may be said that the future prosperity of the West Indies is intimately bound up with the "Agricultural and Botanical Department" which Dr. Morris is to establish and direct. There could not possibly be a better officer for the post. The planters of Ceylon know something of the energy, ability and varied knowledge of Dr. Morris; and since he left us, his experience has been greatly increased, not only through his position at Kew, but also in the West Indies itself, to which—apart from his Botanical Directorship in Jamaica—he has had more than one special mission. His compilation respecting the products, conditions, resources, &c., of the different British Dependencies in the Western Tropics, as the outcome of his connection with the recent Commission, is one of the most practical and useful little works we have ever come across—a most complete agricultural guide for each of the Colonies concerned. We wish Dr. Morris all success and prosperity in his new position.—The question will be asked who is to succeed Dr. Morris at Kew, and it may have some interest for Ceylon should Mr. Thistleton Dyer recommend Mr. Willis for the post. We hope not, for the sake of Ceylon; but stranger things have happened.

COLOMBO PRICE CURRENT.

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."*

The following pages include the Contents of the *Agricultural Magazine* for August:—

Vol. X.]

SEPTEMBER, 1898.

[No. 3.

## SEASON REPORTS FOR JULY.

**ESTERN Province.**—Paddy. Yala crops in ear. Preparation for Maha cultivation has commenced in some places. Rainfall ample. Prospects of crops good in the Colombo and Negombo districts,

but not so in the Kalutara districts.

**Central Province.**—Paddy. Yala cultivation in progress. Rainfall in Matale, 5·36 in. Crop prospects good. Health of cattle good.

**Northern Province.**—Paddy. Threshing of Kalapokam and preparation of fields in progress. Rainfall in Jaffna, nil. Health of cattle good, but want of pasture felt.

**Southern Province.**—Paddy. Crops being reaped, prospects fair. Rainfall in Galle, 8·24 in., in Hambantota weather very dry and cattle suffered for want of grass and water.

**Eastern Province.**—Paddy. Pinmari crop harvested. No rain, excessive heat and tanks dry in Batticaloa. No cattle disease reported:

**North-Western Province.**—Paddy. Crops suffering for want of rain which was practically absent during the month. Health of cattle fair, though some cattle plague still prevails.

**Province of Uva.**—Paddy: Maha crops reaped, yield not very good. The weevil has done much damage to stored grain. Cattle murrain still prevails.

**Province of Sabaragamuwa.** Paddy. Crop prospects good, except where drought is felt. Rainfall at Ruanwella, 14·12 in. Cattle murrain prevailing.

**North-Central Province.**—Paddy. Crops in various stages, but the want of irrigation water is felt in many parts. Rainfall at Anuradhapura 1·04 in.

Greatest amount of rainfall in any 24 hours on the 9th instant, 1·48 inches.

Mean rainfall for the month '19 inches.

Recorded by D. L. DIAS.

## SELECTION AND CHANGE OF SEED.

In his final report on Indian Soils, Dr. Leather refers to Dr. Voelcker's remark that the Indian cultivator is very ignorant in regard to selection and change of seed, and says how desirable it is that the ryot should be helped by introducing to him new varieties of crop and new crops altogether,

In this view, says Dr. Leather, I entirely agree with him. Whilst in England and America, he continues, there is no branch of agriculture more energetically pushed than that for the provision of both good seed and new varieties; in India there is, for all practical purposes, no such agency. If, he says, there were a body of educated agriculturists, such as one sees in Europe and America, who could form Agricultural Societies, then a few principal stations could do something by working in conjunction with such bodies.

Now that an Agricultural Society has been established in Ceylon, we would respectfully suggest to the members the desirability of taking up this question of seed supply, and making some attempt to work on the lines suggested by such eminent authorities on Agriculture as Dr. Voelcker and Dr. Leather. With an influential body of men such as form the Colombo Agri-Horticultural Society, ready and willing, we take it, to work for the cause of agricultural improvement by holding Shows and in other ways, it would be a wise policy on the part of Government to allow a grant to the Society for the special object of supplying native cultivators with good seed and with new varieties. We have before now fully discussed the advantage of change of seed and selection of seed, and the possibilities of greatly improving the condition of the paddy cultivator by these means, and we therefore need not go over the same ground. But we would again urge upon the Government and the new Agricultural Society the desirability of co-operating in "energetically pushing" this most important but much neglected branch of agriculture.

#### OCCASIONAL NOTES.

The following gentlemen have been appointed a Committee by His Excellency the Governor to report on the area required for the representation of Ceylon Products at the Paris Exhibition of 1900, as well as on the character and extent of the representation to be made:—The Hon. Sir F. R. Saunders, K.C.M.G.; the Mayor of Colombo; the Chairman of the Chamber of Commerce; the Chairman of the Planters' Association; the Director of the Colombo Museum; the Director of the Royal Botanic Gardens; and the Superintendent of the School of Agriculture.

There is a probability of a steady demand springing up for the oil from the Kekuna tree (*Aleurites triloba*) through the specimens sent from Ceylon to the Imperial Institute. Already large orders have been received which it is difficult, just at present, to meet.

Rinderpest has been prevailing in Colombo during the months of July and August, and though the disease has in a great measure been checked now, we hear of its appearance in the districts outside Colombo. The Government Dairy cattle have so far remained intact as a result no doubt of the stringent preventative measures adopted by the authorities.

The following statement gives the rainfall recorded at the School of Agriculture during each

month in 1897:—

January	...	...	...	3.51
February	...	...	...	2.80
March	...	...	...	2.35

November	...	...	...	10.56
December	...	...	...	8.41

The total rainfall for the year was thus 89.58 inches. The greatest amount of rainfall fell on Thursday, the 15th May, and measured 4.70 inches.

We have to thank Mr. J. P. Williams, the well-known seedsman of Henaragoda, for a parcel of 28 varieties of vegetable seeds from America for trial and report, and also for seeds of the Florida Velvet bean.

His Excellency the Governor has been pleased to become patron of the Colombo Agri-Horticultural Society, and H.E. the Lieut.-Governor has consented to be President. The following form the Committee elected at a meeting held on the 6th August:—The Hon. the Government Agent, Western Province (Chairman), Sir F. R. Saunders, the Hons. J. N. Campbell, H. L. Wendt, Abdul Rahiman, and Giles F. Walker, Mr. Ellis, Sir Harry Dias, Messrs. C. E. H. Symons, J. C. Willis, P. Coomaraswamy, J. C. Huxley, F. C. Loos, the Mayor of Colombo, Mr. Davidson, Messrs. J. Ferguson, James Pieris, H. VanCuylenberg, W. Nock, H. A. Perera, G. H. Perera, Jacob de Mel, W. A. de Silva, P. D. Siebel, T. Kurunaratne, J. Clovis de Silva, G. W. Sturgess, Dr. Vandort, Mahawalatenne R.M., and C. Driberg, (Hon. Secretary).

We would draw attention to the important points brought forward in the article on "The Relation of Water to Soil Fertility," which is based on an exhaustive paper by Edmond Gain, Professor of Agricultural Physiology and Chemistry, University of Nancy, France, on the Physiological Role of Water in Plants.

#### SERUM INOCULATION AGAINST RINDERPEST IN INDIA.

It is to be hoped now that the initiative has been taken in India that Ceylon will follow suit in utilizing the means at the disposal of veterinary officers to minimize the ravages of Rinderpest by the method of inoculation introduced by Dr. Koch.

The last number of the *Indian Agriculturist* refers to the trials made with Koch's serum as very encouraging, and goes on to say that in North Behar where a herd was inoculated, none of the animals subsequently developed the disease which was raging amongst the village cattle around. The operation of inoculation is said to be so simple, and inexpensive, that, with the increasing number of trained veterinary students, there would seem to be reason to hope that the time is approaching when it can be employed upon a

sufficiently large scale to check an epidemic in any particular area. It is hoped that the Bacteriological Laboratory under Dr. Lingard will ultimately be able to manufacture the serum in any quantity.

We would suggest that the veterinary scholar now undergoing his course of training in Bombay should be instructed by Government to thoroughly acquaint himself with the details of serum inoculation, so that on his return to the Colony he may be in a position to operate on local stock and make a beginning in stamping out a disease which at present is admitted to be amenable to no curative treatment that English veterinary science is able to bring to bear upon it.

#### REPORT ON THE GOVERNMENT DAIRY FARM, 1897.

At the beginning of 1897 the dairy stock consisted of 127 head, made up as follows: 65 cows, 58 calves, 2 stud bulls, and 2 draught bulls. In January a batch of 25 cows was imported from Sind (brought over by the Colonial Veterinary Surgeon) at a cost of R2,999. Three other half-bred Durham cows were purchased for R400, while two extra draught bulls were also added. In February and June 22 cows, 18 calves, and 2 stud bulls were sold by public auction and realized, after paying all incidental charges, R1,047.85. The cows were such as could not have been profitably retained any longer, the calves were male animals that would have served no useful purpose in the dairy, while the stud bulls, which had been in use for over three years, had to be disposed off to prevent in-and-in breeding among the stock. These latter were replaced by younger animals bred on the farm.

Some of the heifers born in the dairy were transferred to the herd of milch cows.

For the twelve months there were 5 deaths among the cows and ten among the calves. The cows were nearly all old and debilitated animals, while the calves succumbed to ordinary calf ailments. There was thus a total absence of any form of epizootic disease. In December, however, there were apprehensions of an outbreak of cattle plague, which arose from the fact that a number of animals became feverish, 4 calves dying rather suddenly, while colour was lent to our suspicions by the fact that rinderpest was prevailing in more than one part of the Island. Precautionary measures were at once adopted, but the fears that had been entertained fortunately proved to be unfounded.

There were 40 calves born during the year, at the end of which the dairy herd was constituted as follows: 71 cows, 62 calves, 3 stud bulls, and 4 draught bulls, and numbered in all 140 head.

In the latter part of the year the supply of milk was a good deal short of what was demanded from the hospitals, owing to the increase of the demand as well as the running down of some of the milkers. Of necessity a part of the supply to the hospitals had to be supplemented with milk purchased from outside. As the price paid for dairy milk is only 18 cents per bottle (26 oz.), it was found extremely difficult to get pure milk for that value, the market rate for pure dairy milk ranging from 22 to 25 cents. Much trouble arose

owing to the inferior quality of the purchased milk, and it is to be hoped that in future the dairy will be so stocked as to obviate the necessity of milk being purchased in the open market. Of the 137,156 pints of milk supplied 34,195 pints had to be purchased from outside. The quantity produced in the dairy was thus about 102,961 pints, or 12,870 gallons. The largest quantity supplied in any month was 12,710 pints in July, and the smallest, 9,586 pints, in February.

A new wing, 52 ft. by 42 ft., has been added to the dairy building, principally for the accommodation of the growing heifers, which are an exceptionally fine lot. The new structure cost R300.

The quarantine shed, which is a thatched building, had to be repaired, and this cost another R134.05.

It is to be hoped that from next year the Medical Department will see its way to give 20 cents for a bottle of dairy milk instead of 18 cents hitherto allowed. The enhanced price would be nearer the intrinsic value of the milk, and also meet the complaint of other dairy keepers that the Government dairy is underselling them and interfering with private enterprise.

The Model Farm revenue has steadily increased during the year under review. The income, after deducting all expenses connected with the farm, was R4,004.30. From this a further sum of R1,350, payable to the Government Agent of the Western Province as rent, must be deducted, when a clear profit is left of R2,655.30. Adding to this a sum of R121 per annum paid by the Colombo Golf Club (R10 per mensem for the use of the farm bungalow and 25 cents per mensem peppercorn rent for the use of the grounds), the total revenue for 1897 will be found to be R2,778.30.

Since the month of June no dairy cattle were kept on the Model Farm, as it was found convenient and more economical to have all the cattle in one centre, while the acquisition of the Havelock Racecourse as a grazing ground met the difficulty as regards pasture.

At the end of the year, on the application of the Mayor of Colombo, a block of about 3 acres of land lying at the back of the infectious diseases hospital was given over to the Health Department of the Colombo Municipality as a site for the erection of an incinerator.

The grass farm attached to the dairy was worked departmentally during the year, and this resulted in an increased revenue. In 1896 the net profits from this source was R776; in 1897, in spite of purchases of carts and bulls for working the lands, the net income was R1,414.65. To give some details the value of grass taken off the land was R3,331.02, the value of carts and bulls was R192, and the expenses were R1,724.37, and the net profit R1,414.65.

The Havelock Racecourse has proved an economical investment, though as much as R60 per mensem is paid to the Ceylon Turf Club for the right of grazing dairy cattle. As I stated in my previous report, it is particularly valuable as an exercising ground for the stock.

C. DRIEBERG, B.A., F.H.A.S.,  
Superintendent.

THE FLORIDA VELVET BEAN.

We have to thank Mr. J. Ferguson for a few seeds of this much-talked-of plant. Agricultural Journals have of late contained frequent references to it, and seedsmen have not been behind-hand in issuing circulars about the bean. It is said that when planted 4 feet apart in rows it may be expected to yield a crop of leaf, vine and fruit aggregating 4 to 5 tons to the acre, and of dry beans 20 to 30 bushels. Stock of all kinds are said to like the green forage including pods and do

\* The total amount voted and advanced by Government was Rs. 1,039-12.

specially well on it. The beans ground up make an excellent fertilizer for fruit trees, but are also fit for table use. The vine is however specially recommended as a renovator of the soil when turned in as green manures.

Prof. Person, Chemist of the Florida Station, gives the following analysis of the bean: ash, 2.29; albuminoids, 21.36; fat, 7.14; fibre, 8.46; carbohydrates, 60.75.

The Florida bean is said to be specially adapted to sandy soils as has been repeatedly tested in Florida. Plots in which the bean has been grown and the vines allowed to wither on the land are described as being covered with a mulch fully 4 inches deep, leaving the soil on their decay of a rich alluvial character. One writer graphically describes his experience of the velvet bean as "the boss for making humus, and gathering the most expensive of fertilizers—ammonia. I would advise every one to shade their land from the hot sun and provide a fertilizer and humus for future use by planting their beans wherever possible." It is pointed out in the *Queensland Agricultural Journal* that the velvet beans has been wrongly named *Dolichos multiflorus*, and that Mr. P. M. Bailey identifies it as *Mucuna pruriens* var. *utilis*, a variety of Cowitch. Other names for it are "Pea banana," "field pea," "Banana stock pea."

#### COCONUT OIL CAKE.

To judge from the pamphlet issued by Lever Bros. of Sunlight Soap fame, the refuse cake in the extraction of coconut oil for making Sunlight Soap is bearing an exceedingly popular food for dairy stock. There are of course many kinds of oil cakes of which linseed, groundnut, gingelly, coconut, and kekuna are used as cattle food. In Ceylon the two best known are gingelly and coconut oil cake or "poonac" as they are generally called. The former is a by-product in the manufacture of gingelly (sesamum) oil, and is of far higher value than coconut poonac as a food for milch cows. In fact it is the exception to use coconut poonac for milking stock, though it is the common food for working bulls. Horses, too, are never fed on coconut cake in Ceylon, the usual diet being crushed paddy (rice in the husk) and gram (the legumes of *Cicer arietinum*). The recognised foods for dairy stock are gingelly poonac and crushed cotton seed, which are often supplemented with bran and sometimes with "black gram" (*Phaseolus mungo*, var. *radiatus*), a very rich milch-producing food. A full daily diet for a good milker might thus be made up of 5 lbs. gingelly poonac, 2 lbs. cotton seed, 2 lbs. bran and 1 lb. black gram. Both the cotton seed and gram, which have to be used in moderation, and mixed with poonac and bran, are considered to "improve the quality" of milk, while again rice "conjee" or gruel is sometimes given to "increase the quantity" as it is said.

Coconut cake or poonac is generally classified as "chekku" and "mill" poonac, the former being the product of the Native oil mill worked by cattle, and containing a larger percentage of oil than the latter, which is the by-product from machine-made oil, and is considered to be considerably inferior to the other as cattle food.

For pigs, poonac is considered to be an excellent food for fattening purposes.

Though coconut cake is looked down on locally as food for milch cows, we are glad to see that it is very popular abroad, as this fact should go to still further ensure the stability of what is always considered one of the safest agricultural enterprises in the Island, viz., coconut cultivation.

#### THE ANALYSIS OF SOIL AS A GUIDE TO ITS FERTILITY.

BY BERNARD DYER, D.S.C., F.L.C., LONDON.

The request that I should contribute this paper is no doubt due to the fact that, in 1894, I had the honour of contributing to the "Transactions of the Chemical Society, a paper of some considerable dimensions, "On the Analytical Determination of probably available Mineral Plant-Food in Soils," which paper embodied the results of some years' work on the subject, and involved an attempt to approach it on somewhat new lines. The work then recorded has been extended since its publication; but although some reference will be made to newly-obtained and hitherto unpublished results, it is nevertheless difficult to render the present article much more than a popular summary of the more extensive paper to which reference has been made.

It is exactly five and twenty years ago that I began to analyse soils, under the guidance of the late Dr. Augustus Voelcker, whose pupil I was privileged to be. The late Dr. Voelcker's name is not specially connected with any brilliant scientific discovery, but it is a name that will last in the history of agricultural chemistry for the many essentially practical investigations with which it is associated. He did not introduce agricultural chemistry into England, but he came from Germany to Edinburgh, as assistant to the late Professor Johnston, at a time when the value of agricultural chemistry appealed to comparatively few farmers; and it is not too much to say, without loss of respect to the memory of Johnston, or even of Liebig, whose lectures, translated by Playfair, had already attracted attention, that it was Voelcker who acted as the chief pioneer of agricultural chemistry in the United Kingdom, dealing as he did, one after another, with so many interesting problems of agriculture, and always in so practical a fashion, that the atmosphere of the laboratory never seemed with him to vitiate that of the open country. One of the subjects I well recollect on which he was never satisfied, although dogmatic scientific orthodoxy claimed to have said its last word thereon, was that of the world's maintenance of its stock of vegetable nitrogen. It was impossible to gainsay the negative experiments of Boussingault and of Lawes and Gilbert as to the non-assimilability of atmospheric nitrogen by certain plants under certain conditions. Too many chemists held these experiments as a general and complete demonstration of the non-assimilability of atmospheric nitrogen; and no little effort was made to adopt the theory of the non-assimilability of atmospheric nitrogen to the existing facts of soil condition and productiveness. Whenever

one approached this nitrogen question conversationally, Voelcker's brow assumed the knotted expression well-known to his friends, and a short discourse would ensue, ending always in the reiteration that there was something or other which we had not yet taken into account, and without which the balance was incomplete; and among the lasting regrets of his sons, his old pupils, and other survivors among his chemical friends, is the fact that he did not live to learn the discoveries of Hellriegel and Wilfarth on the mode of nitrogen assimilation by the leguminous family of plants, in which discoveries he would have keenly delighted.

During my pupilage with him a large proportion of my time was devoted, under his direction, to the analysis of soils, an operation then much more in vogue than it now is; and a constant lament poured into my youthful ear was that of the limited utility of the analysis which we were called upon to make. Under some circumstances an analysis of soil—as then and as now ordinarily conducted—viz., by determining the constituents soluble in strong mineral acids—was useful enough, as, for example, in showing that a soil required liming, in showing the presence of imperfectly oxidised iron, and, inferentially, the existence of imperfect drainage; or as indicating a deficiency of phosphoric acid, of potash, or of nitrogen, so great as to obviously remove the soil from the category of ordinary land, and to proclaim a glaringly unusual degree of poverty. But under most circumstances it was unsatisfactory. In an excellent paper, "On the Influence of Chemical Discoveries on the Progress of English Agriculture," published in 1878, Dr. Voelcker wrote:—

"At one time both farmers and chemists thought analysis would solve all the difficulties which practical men meet in cultivating soils of low fertility, the occupier of which experiences much disappointment by his frequent failure to raise remunerative crops upon them.

"Further experience, however, has proved that in many cases mere numerical analytical results are not calculated to assist the farmer in improving his land, or to inform him of the cause of non-success in growing certain crops—why, for instance, he cannot grow clover on some soils. There are many apparently similar soils—that is to say, soils in which analysis shows like quantities of the same constituents—such as potash, soda, lime, magnesia, phosphoric, sulphuric, and silicic acids—and in which, notwithstanding, the same kind of manure produced a good result in one case and an unfavourable one in another. This plainly shows that the analysis of soils, as usually performed by chemists, does not afford in all cases a sufficient guide to an estimate of their agricultural capabilities, nor to point out the kind of manure which is particularly well adapted for the special crops intended to be grown. Even the detailed analysis of a soil usually gives only the proportions of its different constituents, and generally without reference to the states of combination in which they exist in the soil; and it is altogether silent on the property possessed by all soils in a higher or lower degree, of effecting striking and important changes in the manures which are incorporated with the land. Analyses of soils, therefore, it must be

confessed, are often disappointing in their practical bearings."

During the time that I worked at my bench in Dr. Voelcker's laboratory, some years before this, he had not only frequently talked in the same strain, but had urged that any one wishing to make a useful contribution to the chemistry of agriculture could best do it by devoting himself to devising some more subtle and more satisfactory means of chemically gauging the plant-food in a soil than was afforded by the ordinary process of determining the total percentages of phosphates, potash, and the like, without reference to the degree of assimilability they might happen to possess. As he often pointed out, a soil containing only 1 per cent of phosphoric acid is poor rather than rich in that constituent, as average soils go, yet such a soil, measured over an acre to a depth of from 6 to 9 inches, would contain 1 ton of phosphoric acid, which is about as much as would be contained in 7 or 8 tons of ordinary superphosphate. And yet on such a soil experience shows that a few hundredweights of superphosphate, applied at the proper time, make all the difference between a good and a bad turnip crop.

Hermann Von Liebig (son of Justus Von Liebig) had then recently published a paper in which he gave the results of some attempts to distinguish between total and available potash in certain of the Rothamsted wheat-soils. He extracted the potash with "dilute acetic acid" (the use of which was also tried by E. Peters) and also with "dilute nitric acid," but the strengths of acid used are not recorded. Although the scope of the investigation was not sufficiently complete to render the details of much practical value, the results, nevertheless, afforded indications that the enquiry might have proved of considerable interest had it been systematically worked out.

Some preliminary work on the subject was actually started in Dr. Voelcker's laboratory and under his advice, about the year 1875, beginning with the determination of the water-solubility of the constituents of a given soil, the next step in view being the determination of the carbonic-acid solubility; but circumstances took me away from his laboratory before any substantial progress was made in the matter, and it was not for some years that I again began to work at it, although the subject gradually attracted the attention of many chemists, some of whose successive contributions to it I have mentioned in the paper which appeared in the Chemical Society's Journal, and these I may be allowed still more briefly to refer to here.

(To be continued.)

#### INTERESTING REPORT ON INOCULATION AGAINST RINDERPEST.

Since writing about Serum inoculation in India, we have been favoured with a copy of the Report on Prof. Koch's method of immunising cattle against rinderpest, issued by the Government of India, and embodying reports by Dr. Lingard, Imperial Bacteriologist to the Government, of India Veterinary Lieut. Baldrey, Assistant Principal

Bombay Veterinary College; Veterinary Capt. Hagers, Principal, Ajmere Veterinary School; Veterinary Capt. Pease, Principal, Veterinary College, Lahore; Veterinary Capt. Raymond, Superintendent, Civil Medical Department, Bengal; and Veterinary Capt. Evans, Superintendent, Civil Medical Department, Burma.

We are specially interested in Veterinary Capt. Raymond's experiments which point to great possibilities, and make the following short extracts from that officer's report for the benefit of our readers:—

"On the 25th June a bullock belonging to the Chitpore Municipality was admitted at Belgatchia suffering from cattle plague and died.

From this animal two calves were inoculated and proved to be immune, and as the outbreak was sporadic, my material came to an end. But from the bile obtained from the bullock I inoculated four calves, four bulls and three bullocks. The dose was 10 c. cm. each.

The result went to prove that the operation was perfectly harmless. The animals had a slight swelling at the seat of inoculation, but this showed no sign of any kind of disease and fed and worked as usual.

On the 15th of August I received an urgent telegram from Muzaffarpur. Upon my arrival I found Mr. G. R. Toomey of the Kanti Indigo Concern, who, whilst driving me to his place, told me that cattle plague had been raging on the estate since the 3rd August, and that he had lost 86 head of cattle. I ascertained that some 400 or 500 head of cattle had died in the neighbouring villages. Mr. Toomey had heard that I was desirous of experimenting with rinderpest, and in the most public-spirited manner expressed his willingness to assist me, undeterred by some hostile criticisms of the method which it was my duty to send him.

It should therefore be noted that Mr. Toomey is the pioneer in India in what may possibly become a very important public benefit.

Having decided upon inoculation, the next thing was to procure suitable materials. It was obviously out of the question to kill any of the cattle owing to the religious opinions of the people. On the other hand, observations upon cases that had succumbed were often unsuitable in cases that had died in the usual way. Unless the bile can be removed at once, it is nearly always useless:

Hence there was an element of uncertainty over the work which it was desirable to remove. There is fortunately no prejudice against killing buffaloes. I therefore recommended Mr. Toomey to procure some buffaloes. I there obtained a typical case of cattle plague wherewith to infect the buffaloes. This case (Buffalo A.) showed all the symptoms in a marked degree and soon died.

Buffalo No. 1, besides receiving materials from Bullock A., was also treated with material from a young calf that had died without showing all the typical symptoms of cattle plague. Four other buffaloes (Nos. 2, 3, 4 and 5) were also treated with material from Bullock A.

Having prepared the way for further work, I returned to Calcutta to my other duties, leaving my assistant to report by wire when the temperatures of the buffaloes were rising. I returned to Kanti, and on the 3rd September Buffalo No. 1 was shot,

The bile was extracted and placed in ice. On completion of the post-mortem examination, I examined the bile under the microscope, moreover the colour and odour were satisfactory. In the afternoon I injected 10 c. cm. of the bile into each of 12 head of cattle, which were then branded  $\begin{matrix} K \\ T \end{matrix}$  1-12. On the 5th September, Buffaloes Nos. 2 and 3 were shot. Bile was extracted from both animals, found to be good, and placed in ice. The bile from Buffalo No. 2 was used the same afternoon to inject 23 head of cattle which were branded  $\begin{matrix} K \\ I \end{matrix}$  1-28.

On the 6th September I injected 32 head of cattle with bile from Buffalo No. 3, which had been kept in ice. This batch was branded  $\begin{matrix} K \\ T \end{matrix}$  1-32.

On the morning of the 7th September, Buffalo No. 4 was shot. I extracted the bile which was good, and placed it in ice. In the afternoon, I injected 21 head of cattle, which were branded  $\begin{matrix} K \\ T \end{matrix}$  1-21.

On the 9th September, Buffalo No. 5 was shot. From this animal I obtained a quantity of bile but on the remaining cattle of the herd I only inoculated 14, because some were too wild to catch and others were cows in calf. This batch was branded L K 1-14.

From the same animal I secured a quantity of virulent blood for testing experiments. This was placed in ice. Some of the blood and the remainder of the bile was also placed in ice and taken to Belgatchia.

I wish here to mention that Mr. Toomey told me that cattle plague had not been known on the estate nor in the neighbourhood for at least eight years and probably more. Mr. Toomey breeds his own cattle. This points to the probability that none of the animals on the estate had been rendered immune against cattle plague by suffering from a previous attack.

It was found impracticable to take the temperature of the 108 cattle that had been treated with bile, but they were all repeatedly inspected by Mr. Toomey, his assistant, my assistant and myself, and I was surprised to see how little swelling was to be seen; only in two cases did it interfere with the gait of the animals. Constitutionally none of the animals appear to suffer in the slightest degree.

Professor Koch states that the bile injection confers immunity not later than the tenth day.

In order to test the immunity of the animals after the bile treatment 6 bullocks were selected simply because they were blind or lame.

(a) Bullocks  $\begin{matrix} K \\ I \end{matrix}$  2 and 10 each received subcutaneously 20 c. cm. of virulent blood from Buffalo No. 5 on the 10th September, that is to say, seven days after the bile inoculations.

(b) Bullock  $\begin{matrix} K \\ T \end{matrix}$  15 received subcutaneously 10 c. cm. of virulent blood from Buffalo No. 5 on the 12th September, that is to say, after seven days after bile inoculation.

(c) Bullock  $\begin{matrix} K \\ T \end{matrix}$  16 received 20 c. cm. at the same time under the same circumstances.

(d)  $\begin{matrix} K \\ T \end{matrix}$  1 received 10 c. cm. of virulent blood from a case of Belgatchia on the 16th September,

that is, eleven days after inoculation with bile;

(e) L K 2 received 20 c. cm. of the same blood on the same date and under the same conditions. All these animals proved to be immune.

The dose of virulent blood used in these test cases is said by Koch to be respectively 5,000 and 10,000 times greater than a fatal dose.

The experiments above recorded go to show that Professor Koch's preventive treatment with bile promises to be successful in Bengal. The exact amount of success can only be determined by future experiment.

Here again Mr. G. R. Toomey has rendered great assistance by permitting the inoculated bullocks to be branded, so that each animal might be identified later.

I have performed another experiment to ascertain if by any chance bile in this province would confer immunity quicker than in other climates. For this purpose I injected calves with 10 c. cm. of bile and five days later tested them with virulent blood from Buffalo No. 5. They have all reacted in temperature, three developed genuine rinderpest, and one died.

Experiments are proceeding."

#### THE RELATION OF WATER TO SOIL FERTILITY.

It is evident that as regards fertilizers there is an opportunity for selection with reference to special conditions which will greatly influence the profit from their use.

Declaux has said that "the meteorology of a region influences the vegetation more than the geology," and under different climatic conditions it is to be expected that fertilizers will give different results, so that the results of fertilizer experiments in one place cannot be expected to be the same in another.

The life of a plant is in effect the resultant of a number of physical conditions acting in conjunction. For example, the action of water will not be the same during a hot and a cold season nor in a moderately cold temperature and a tropical region. The exact knowledge of the influence of water on the phenomena of vegetation, therefore, requires a comparative study of this influence as affected by such factors as temperature, light, fertility of soil, &c.

The fertilizing substances are partially absorbed and retained by the soil and partially dissolved. It is known that drainage water carries off only a small portion of potash, the quantity thus removed being least in well manured soil. The potash is retained not only by the humus but also by the clay colloids. With an excess of water in the soil the solvent action is largely increased as shown by the experiments of Gasparin and Berthelot and Andre. While the soil, therefore, may contain large quantities of soluble potash, it is retained with such energy that enormous quantities of water are necessary to dissolve it. The solubility of the potash is greatly increased if some sulphate such as gypsum is added to the soil. Way has shown that the quantity of ammonia absorbed by a soil

is nearly constant when the solutions present have the same concentration, but that the force with which the soil absorbs alkalies varies with the concentration of the solution. Brustlein has shown that soils are not able to remove alkali completely from its solution in water. These solutions circulate to a considerable extent in the soils without undergoing decomposition. This explains how water brings to the plant the chemicals needed in very great dilution. Potash and ammonia are easily retained as carbonates by the soil, but less readily in the form of sulphates.

When a solution of acid phosphate of lime comes in contact with sand, a portion of the phosphate is rapidly absorbed; but absorption is not complete for at least twenty-five days. Still it is believed that there is little serious loss of phosphates by drainage following a heavy rain even in sandy soils, while with lime and clay soils the absorption is naturally more rapid and complete.

The influence of the water of the soil upon the micro-organisms which play a part in the fertility of the soil remains to be mentioned. The experiments of Berthelot show that the nitrogen of the air is fixed through bacteria in non-sterilised soil; and Hellriegel and Wilfarth, Breal, Schlössing, and Laurent have shown that the bacteroids in the root tubercles of leguminous plants are able to fix free nitrogen.

It is known that the phenomena of nitrification takes place in three steps—formation of ammonia, nitrites and nitrates—under the influence of bacteria, yeasts, algae and the ferments of Winogradsky. *Bacillus Mycoides* is aerobic, and able to produce ammonia in the presence of organic nitrogen, but it becomes a denitrifier and anaerobic when there exists in the soil rapidly reducible substances, such as nitrates.

These investigations show that the lower organisms play an important rôle in the fertility of the soil. Water in varying quantity has an influence on the biology of all these organisms. Schlössing and Müntz have shown that nitrification requires a certain amount of moisture, and the writer's investigations have shown that the vitality of *Rhizolium leguminosarum* is influenced by the water content of the soil. For each soil there is an optimum humidity. Too great dryness checks or entirely prevents the formation of tubercles. Excessive moisture produces an analogous effect though less marked. The writer has shown that the formation of the tubercles begins soon after the development of the plants, and it is therefore of the highest importance to furnish the young leguminous plant with sufficient water.

As regards the variations in ammonia formation with varying proportions of water, it would appear *a priori* that the results should be analogous to those cited in the case of nitrates.

We think the time has arrived to study with greater care the absolute value of the different optima which are recognized in biology. It is well known that there are optima of temperature, of light, of plant-food, and of humidity with which to realise the best possible growth of the plant, but only in rare instances have the values of these optima been definitely fixed. It has been considered sufficient if we knew the optimum temperature for germination of our cultivated plants.

## INOCULATION OF PLANTS AGAINST DISEASE.

The June number of the *Queensland Agricultural Journal* contains an interesting contribution from the pen of Mr. Henry Tryon, the Entomologist, on Preventive Treatment in Plant Diseases. The writer first refers to Hybridisation as a means of warding off plant diseases, and cites as examples of the successful employment of this method, the production of a rust-resisting wheat and phylloxera-proof vines. Success has even been attained in preventing "chlorosis" and "mildew" in grapes, and a kind of leaf disease in the strawberry by hybridisation, and Dr. Von Tubeuf, the eminent German authority on Plant Pathology, has stated that he considers the method as available in preventing many diseases in cultivated plants generally. Mr. Tryon considers that it might be possible to keep off the woolly aphid or American blight from apples, the fruit maggot fly from plums, and "black spot" from pears and apples by the same means.

As regards inoculation against plant diseases, we shall quote Mr. Tryon's remarks *in extenso* :—

With regard to this procedure little beyond general considerations can be adduced in support of its employment as a means for preventing the occurrence of disease in plants.

Many maladies that they exhibit present this feature—viz., their active agents, whether germs or other bodies, are restricted in the first instance to the vessels or to the tissues with which these are immediately in connection. As instances of this may be mentioned the gumming disease of sugar cane caused by a microbe, *Bacillus vasculorum*, Cobb, in the vessels thereof; and the new and most destructive disease of the potato, discovered by the writer and found to be occasioned by the presence of *Bacillus vasculorum-solani*, Tryon, similarly related to it; and the same obtains in other diseases with regard to the tissues.

Again, it is possible to introduce small dosages of chemicals or other reagents into the vessels and tissues of plants without prejudicially affecting the vigour and health of the latter. As an instance of this may be mentioned the *Hydrangea*, the flowers of which are pink or blue, in correspondence with the plentiful or comparatively paucal occurrence of available iron in the soil in which it is grown. Moreover, it has been found that when vines have been sprayed with Bordeaux mixture their leaves absorb into their tissues an appreciable amount of copper from the copper sulphate that this fungicide contains. Again, a permeability of plant vessels and tissues to bodies of various kinds, as well as the general translation of these when once introduced, is shown by well-known physiological experiments.

Chemicals or other reagents may therefore be brought into contact with the germs or other bodies originating disease, and either destroy them or counteract or inhibit their action. Thus an Italian investigator, Pichi, has alleged that experimental evidence is forthcoming to prove that the absorption by the foliage of the vine of copper sulphate is preventive of the occurrence of mildew occasioned by the growth of the parasitic fungus, *Peronospora viticola*, in the tissue. A. N. Berlese, however, in commenting on this finding by P. Pichi, alleges that in using a solution of copper

sulphate as weak as that mentioned by the latter there would be no deposit of copper sulphate in the tissue, and therefore no such action manifested as that implied. It may, however, be pointed out that this objection would appear to lack soundness, for, as has been subsequently demonstrated by Dr. Meade Bolton, pieces of metal that are absolutely pure, and not only such as are commercial and marked chemically pure, will, when placed in pure cultivations of different micro-organisms, notwithstanding they are practically insoluble in the media of these cultivations, inhibit or prevent the growth of these organisms in a very marked manner; and in the absence of any suggested explanation of this phenomenon it may be presumed that a germicidal action by infinitesimal quantities is being displayed.

The introduction of metallic salts into the tissue of plants, moreover, forms the special feature in a treatment employed in France, with—in some instances—marked success, in obviating the previously mentioned vine disease chlorosis, and known as "Badigeonnage Rassicquier." This treatment consists in applying to all the fresh surfaces exposed by the pruning scissors or "secateur" a strong solution of sulphate of iron, at a time when there is free movement of the sap (*i.e.*, in October, in France). The absorption (states Rassicquier) in this case takes place rapidly; and, after some days have elapsed on cutting a "courson" or a "bras de souche," it is easy to detect traces of sulphate of iron by following up the tissue of the plant. In fact, according to L. Degrully, this solution can be observed to penetrate into the body of the branch from 10-12 centimetres below the point of insertion of the shoot through which the solution has entered. The benefit following the adoption of this process of inoculation has been fully dealt with by the last-mentioned authority, and would appear to be very pronounced.

From the foregoing statements it would seem likely also that there may, after all, be some grounds for concluding that the observed freedom from disease, said in some instances to follow the act of driving metallic nails into the wood of fruit trees, may stand in the relation of cause and effect.

With regard to other forms of inoculation for preventing disease in plants it may be remarked that, though those maladies that might be attributable to the presence and action of bacteria have been little studied, "there are (to quote Dr. Erwin F. Smith) in all probability as many bacterial diseases of plants as of animals." Moreover, with regard to the bacteria that produce maladies in plants, it may be further affirmed that they are closely related, both biologically and morphologically, to bacteria that produce maladies in animals. Again, in the course of their growth they both may produce acids, alkalis, enzymes, or other bodies. Thus, whereas in the case of animals immunity may be secured by inoculating into their systems products derived in the course of their development from pathogenetic bacteria, so also the same may happen when similar inoculation is performed on plants, and this seems especially probable since it has been demonstrated that the disease itself, with its casual agents, can be communicated to them by this procedure.

As to the employment of any method of inoculation related to that which consists in the use of serum, as in dealing with animal diseases occasioned by micro-organisms, it may be stated that, although Dr. Russell has concluded from experimental evidence that "vegetable cell juices, aside from their acid reaction, are entirely powerless against bacteria, and do not possess any germicidal properties like the blood serum of animals," the experiments that he conducted were "too limited in number to afford any basis for a general conclusion"; and there are grounds for concluding that "it is not improbable that a great variety of bactericidal and protective substances occur in plants," just as there are bodies contained in them, such as "the various essential oils and other vegetable products—*e.g.*, thymol, salicylic acid, benzoic acid, tannin, quinine, oil of peppermint, &c., that are known to "exert a powerful restraining influence on bacterial growth."

Again, there are organisms that are met with in the tissues of plants in a condition referred to by German writers under von Beneden's term "Mutualismus" that exert, as far as has been observed, no apparent influence upon either the vigour or development of their hosts, or if otherwise only after a comparatively long period has elapsed, although it has been suggested that the advantages of this "Mutualismus" may be only distinctly manifested when the plant is in need of a large amount of nitrogenous matter—for instance, during the ripening of the fruit. These may yet prove to be destroyers of the true parasitic organisms occurring in plants, and therefore competent to prevent the maladies that these originate in them; and if so, seeing that plants previously free from their presence may be artificially infected by them, as shown by Janse and other investigators, they may be available for inoculation having for its end the prevention of disease.

#### GENERAL ITEMS.

There are two simple ways of ascertaining the height of trees. The first is well-known and depends on the shadows thrown, thus requiring the aid of the sun. The shadow of a stick fixed in the ground is to the length of the stick as the shadow thrown by the tree is to the height of the tree. The calculation is easily made according to ordinary rule of three. Another simple way is given in the *Journal of Horticulture*. Take three laths and nail them in the shape of a triangle, so that a right angle may be formed by two laths of equal length. Now let the triangle stand with one equal side along the ground and the other parallel with the tree to be measured. Next move the triangle into such a position that, as far as can be judged by the eye, the line opposite the right angle, if continued upwards will strike the top of the tree. It will then be seen, by the help of a diagram, that the height of the tree will be the same as the length of the line measured from the foot of the tree to the farther end of the lathe laid on the ground that is to the end away from the right angle.

An experienced cultivator of tobacco states that the best fertilizer for the crop is crushed cotton seed and cotton seed meal. The latter to give the plants a quick start, the former by its slow action to feed the plants at a later period and sustain them during the important crisis of leaf formation. About 80 to 100 bushels of crushed seed, and 500 to 800 lbs. of the meal should be applied per acre.

Mr. E. Cowley writing to the *Queensland Agricultural Gazette* says, referring to *Ceara* rubber, "the idea published in Ceylon that seeds planted in fresh horse-dung will germinate rapidly" has on trial been quite exploded. Only six out of 100 seeds thus planted germinated after a long period, though every care was taken. Reference is also made to the 'fallacy' that the seeds take twelve months to germinate, and it is stated that seed obtained for Messrs. Christy, London; germinated within two months in the open ground without any preparation of seed. The writer draws attention to the fact that half-ripened wood grows readily though older wood will not grow at all except in isolated instances. The younger wood if freshly planted is said to grow to a height of 20 feet and bear flowers and fruit within 12 months. He believes that if rubber growing is to be established in Queensland, *Ceara* will yield the best results.

In the Straits rubber is got from the following trees:—*Dichopsis gutta*, *D. polyantha*, *D. pustulata*, and *D. Maingayi*; also from *Payena leerii*. In Java, *Palagnium borneensis* and *P. gutta* are among the rubber-producing trees. A species of rubber plant peculiar to Colombia, and which grows at an elevation of 6,000 to 8,000 ft. has been named *Sapium biglandulosum* by the Kew authorities. *Ficus rigo* is a rubber tree of British New Guinea, said to be hardy and a fast grower, coming into "bearing" in about 4 years.

Prof. Raulin of the University of Lyons has demonstrated that the chemical nature of the soil influences the seed of plants grown upon it, and this difference may be felt for many generations. In this way some of the widely-different results of experiments may be explained.

Gaston Bounier of the University of Paris has proved that in the process of acclimatization certain secondary characters are developed which are often retained by the plant in its struggle to adapt itself to its surroundings, this being seen in the convergence of morphological types under the influence of cold, due either to latitude or altitude, and the analogous structure of plants upon mountain tops and polar regions.

Vesque has established the fact that inherited characteristics have little to do with the adaptation of plants to drought, and that there is no genus, however small, all the species of which are adapted in the same degree to a given physical environment.

## “PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

*(Third Series.)*

### CAPT. JOHN KEITH JOLLY,

FIRST CHAIRMAN OF THE PLANTERS' ASSOCIATION OF CEYLON;  
PROPRIETARY PLANTER, 1843—1865.

We regret being unable to present a portrait of CAPTAIN JOLLY, one of our earliest and most esteemed Planting Pioneers and the first Chairman of the Planters' Association. In view of his holding

the latter position Captain Jolly would have appeared as one of the earliest in our list, were it not for the absence of a portrait. Application was duly made to surviving relatives for such photograph or other portrait as would enable us to reproduce a colotype print; but Lady Kynsey, the only surviving daughter (Capt. Jolly had no son) could not help us, and we quote as follows from the courteous answer received:—“Fain would I send you one, but Captain Jolly was unfortunately never photographed; and the only miniature we have of him is in such youth that it would convey nothing of himself to the very few who now remember him and could not interest others: so that, as I feel on the subject, it would be better to have no portrait than one of so distant a date. So will you be so kind as to put in a word that no worthy picture of him was to be had or I, his daughter, would most gladly have supplied it.” We must,

therefore, content ourselves with a brief biographical notice of the veteran Captain and Planter, based mainly on notes kindly placed at our service by his nephew, Mr. Stewart Jolly—himself one of our early, but still surviving, and much-esteemed planters.

We find then that CAPTAIN JOHN KEITH JOLLY was the son of Stewart Jolly, Justice of the Peace and Deputy-Lieutenant of the Shires of Stirling and Dumbarton, by his wife Catherine Douglas. He was born in 1807 and at an early age entered the Maritime Service of the Hon. East India Company. In it he remained till the Company's Charter was withdrawn and the Eastern ports thrown open to free trade. So his service came to an end and with other officers he was pensioned off. He commuted his pension, married, and in 1843 decided to settle and plant coffee in Ceylon. He had before that been offered the command of an “opium clipper” by Messrs. Jardine, Matheson & Co. of China, which would have brought him an almost certain and speedy fortune; but we are glad to learn that, for conscientious reasons, he felt bound to decline the offer. So in 1843, Captain Jolly and his wife arrived in Ceylon and settled at Katugastota near Kandy. Mrs. Jolly was sister of Mrs. Swan, wife of Mr. James

Swan of Morankanda, a leading Colombo merchant and sometime member of the Legislative Council, and of Doveton Greentree, Lieutenant in the Ceylon Rifles. Her father, who was a pensioned member of the Hon. East India Company's Civil Service, bought Katngastota House, and it only passed out of the family about 1866. Captain Jolly successively bought the lands which became the estates of *Farieland*, opened by Archibald Millie\* ; *Vicarton*, *The Borders* and *The Glen*, opened by the well-known and worthy Mr. Abercrombie Swan (so long known as "B. W."—"Back Woodsman" of the *Observer*); *Atherton* opened by that most admirable of managers Mr. W. B. Lamont—still we are happy to think to the fore; and *The Burn* opened by Jack Sutherland, afterwards of the Public Works Department and of Pussellawa where he owned Karagastalawa. When he first arrived in Ceylon Captain Jolly was asked by Lady Oliphant if he, like all those who were going into coffee, expected to make a rapid fortune? He said, "No", but that he hoped by industry and perseverance to achieve a modest independence in perhaps twenty years. As coffee estates *Farieland* (above Kandy) and the three *Matale* estates—*Vicarton*, *The Borders* and *The Glen*—paid very fairly well; but by *Atherton* in *Ambagamuwa* and *The Burn* in *Yakdessa*, through the almost never-ceasing rain preventing the ripening of crops and encouraging the growth of weeds, some £20,000 were lost. In 1853 Captain Jolly joined the firm of Messrs. George Wall & Co. which, after some years' existence in Kandy, in that year set up what grew to be an influential mercantile house in Colombo; and in this firm he remained a partner—latterly only a sleeping one—till he died in 1865. From that date, as a coincidence, the prosperity of the firm, we have heard, began to decline. But the fact was that a time of depression generally set in during 1866, beginning from "Black Friday" when Messrs. Overend, Gurney & Co. collapsed in London. Captain Jolly's partnership in the estates with friends at home, who were unknown in Ceylon, was broken up about 1860 and so, selling out of the other properties, he was left sole owner of *Farieland* only. On that model and delightfully situated plantation he had in 1847 built a bungalow at a cost of some £2,000 and there, as soon as the work was finished, he took up his residence finally, quitting Katugastota. We believe Captain Jolly was, if not *the* first, among the very earliest to keep coffee estates free from weeds by constant weeding; and Mr. Louis Byrde,

a good judge, on visiting *Farieland* in 1855, deela that although the soil was by no means rich indeed over a great part comparatively poor, yet the estate and vigorous coffee were a perfect triumph of good management.

Of Capt. Jolly's life as a public man there is not much to be said, though he worked faithfully and well both in the Planters' Association and as Member of the Legislative Council. He was, as we have said, the first Chairman of the Association—1854-55—and gave general satisfaction by his upright, straightforward guidance in the public questions of the day dealt with. The two great rivals in the Association at its commencement were R. B. Tytler and Geo. Wall: the latter did most work, and indeed drew up the "constitution" &c., but Tytler with his *bonhomie* and wide liberal views was far more popular among his brother planters. It shows how much esteemed and liked was Capt. Jolly, when both leaders and rivals readily agreed to sink all differences and to serve under him as first Chairman. The first Secretary was the redoubtable "Sandy Brown" who was indefatigable and in love with his work, so that he became almost as indispensable to the Association as Mr. Alexander Philip has proved since he took Mr. Brown's place in 1876. (Of course the work has increased ten-fold since the early days.) On Capt. Jolly's retirement after two years' service, Mr. Tytler took his place, but for a few months only, as he was leaving for home, and then Mr. Wall succeeded. Meantime, Capt. Jolly was not idle; and so long as health permitted, he ever continued loyal and assiduous in attendance at Committee and General Meetings of the Association. No European Colonist, too, was more respected and trusted by the natives—whether we take the Kandyan aristocracy with whom he came in contact,\* the minor headmen

\* Mr. A. Millie was a brother of the better-known Mr. P. D. Millie who still survives. The former left *Farieland* in 1848 to take charge of *Patampahal* estate in *Hunagiriya*, but returned home a year later to his native *Kirkaldy*.

\* THE REBELLION IN 1848.—Mr. S. Jolly supplies the following interesting note:—"I well remember I was 'out' one day as a special Constable—the day when Sir Emerson Tennent made a speech to the people from the steps of the Pavilion, (and "Goompane could make no reply"!)" Another day I saw the anointed King (Denis the bandyman)—a fair man with blue eyes—brought in a prisoner from *Matale*. George Elphinstone Dalrymple (Logie's uncle) and I, who were at the time living at *Katugastota*, went to the ferry to await his arrival in charge of our friend "Twig" Wilkinon, Lieut. of the 15th Regt., and a small escort of men. I heard the *volley* when he was shot, after trial by court-martial. One evening my uncle, Capt. Jolly, and I rode down to *Kandy*. We met Lord Torrington also on horseback in front of the O.B.C. house. He stopped and talked to us. Parsons the Fiscal passed on horseback. Lord Torrington called him to stop and said to him:—"Be sure you hang that Buddhist priest in his uniform tomorrow morning." I think the doing of that and recording it in a despatch had much to do with Lord Torrington's recall. Whereas if he had said and written *nothing at all*, the man would have been hanged in his yellow robe all the same. He had nothing else to wear!"

and villagers, or the Tamil coolies on his own estates—than was Capt. Jolly. His chief aim in public life was ever the public good—to do all he could for the progress of the Colony, for the good of the land and of the people of Ceylon and the Indian immigrants whose labour did so much to develop the hill country. Capt. Jolly was the soul of honour, ever generous and kindhearted, and one who knew him well, declares he cannot recall a single action in his Ceylon career which the worthy proprietor of Farieland had to recall with regret. No doubt Capt. Jolly himself, if he saw such testimony, would, in modest sincerity, deprecate it as exaggerated; but of how few of us Colonists of the present day—God help us!—can we expect neighbours and onlookers to say “He never did anything he had to recall with regret.”

Capt. Jolly's solid judgment and prescience were illustrated in the fact that his forecast in answer to Lady Oliphant was as nearly as possible realized. In about twenty years, he had from his work and investments in coffee (though some turned out heavy losses) realized the competency he had aimed at. No great fortune as some people would count it, but enough to satisfy the ambition of a worthy man. Capt. Jolly, however, did not live long to enjoy the *otium cum dignitate*.

We have already mentioned the large sum Capt. Jolly had spent on his bungalow, and the extremely careful cultivation he directed in his home estate, making it one of the most comfortable and delightful residential properties in the island. Within a few miles of Kandy which it overlooked, from the grassy hills rising above the property, extensive and varied views were obtained over the Kandyan country, especially from the summit of the celebrated Mattana-patana (Mutton-Button) hill.\*

Capt. and Mrs. Jolly clung to their delightful Farieland home which had been brightened for some years by the presence of their two daughters, soon, however, to leave them—the one to become Mrs. Steele, the wife of the Poet-Magistrate of Kandy (who retired from the Service eventually as Assistant Agent, Hambantota), and the other to marry the then young bright Military Assistant Surgeon, Dr. William Raymond Kynsey (afterwards to return to Ceylon as P.C.M.O., and to retire

as Sir Wm. Kynsey, Kt., C.M.G.\*). Through a painful and lingering illness, Capt. Jolly was most devotedly nursed, and being brought for a change to the seaside at Mount Lavinia, the veteran East Indiaman and Colonist expired there on the 27th day of February, 1865, at the comparatively early age of 53 years. In the following year, his widow passed peacefully away at Farieland, and the poor and natives of all degrees, about Kandy, knew they had lost true friends.

(From “Overland Ceylon Observer,” March 3, 1865.)

On the 27th February, at Mount Lavinia, John Keith Jolly, Esq., of Farieland Estate, aged 53 years.

It becomes our sad duty to record the death of Captain John Keith Jolly which occurred on Monday, the 27th February. The deceased was well known as one of our earliest and most enterprising Planters, and at one time filled, with much credit to himself, the post of Chairman of the Planters' Association and representative of the Planters in the Legislative Council. One by one, the links connecting the present with the commencement of our great coffee enterprise, are dropping off.

#### THE HOME OF “PARA” (HEVEA) RUBBER.

Condensed from a recent report on the trade of the consular district of Pará, Brazil, by Mr. Consul W. A. Churchill, to the British foreign office.

The *Hevea* tree is not conspicuous, and resembles many other forest trees. People have travelled for thousands of miles through the rubber region and have lived for years in the centers of the industry without even noticing it. The newcomer invariably expects to see the familiar glossy dark-green leaves of the *Ficus*, and is disappointed with the insignificant appearance of the *Hevea*. In appearance it is more like the English ash than anything else. It grows to a height of upwards of 60 feet. The blossoming season is in August, and the fruit ripens in December and January. The seeds should be planted as soon as possible after ripening, as they speedily lose their vitality.

The localities where rubber-trees thrive the best are on islands and low grounds near rivers where the banks are periodically inundated. Ground that is above water at all times or that has no drainage is not suitable to the tree. A peculiarity of this rubber-tree is that it will not grow satisfactorily on cleared and open ground. It requires the shade of other trees, and still air, from the time that its growth begins until it becomes an adult tree. Without these conditions the supply of milk is very much affected. In fact, the tree has been known to die soon after the clearing of ground around it.

No cultivation worth mentioning has been attempted in the Amazon region. It is considered useless to invest capital in cultivation so long as the Amazonian forest shows no signs of exhaustion. The *Hevea* requires about fifteen years to mature—that is too long for the ordinary investor to wait. The most competent authorities maintain that the

\* MUTTON-BUTTON (the hill above Kandy). In 1848 Loku Banda (then Inspector of Police, Kandy, and the brother of Tikiri Banda, the famous rebel, and of James Alex. Dunuwilla) told Mr. S. Jolly that the proper name of this hill is “Motta” (the Tamil word for bald) and “patana” (the Sinhalese word for a natural grassland)—Motta-patana. We believe he was right: nothing could be more apt or truly descriptive. It is exactly like a bald crown surrounded by a fringe of hair (jungle).

\* Though Sir William and Lady Kynsey have left Ceylon, there is still a family tie through the presence of Mr. and Mrs. Buckworth (Dimbula)—Mrs. Buckworth (nee Miss Kynsey) being a grand-daughter of Capt. Jolly.

Supply is inexhaustible, because the *Hevea* is continually being reproduced by nature. Certainly some areas become exhausted when overworked, but when left alone for some time they recover. The district of Cameté, on the river Tocantins, gave an excellent quality of rubber, for which there was a special quotation in foreign markets. This district, however, is now exhausted, because, for about forty years, thousands of men have tapped its trees. All newcomers flocked to Cameté to make their fortunes.

But there are many districts that have not been tapped. The area that is known to produce Pará rubber amounts to at least 1,000,000 square miles. Further exploration will no doubt show that this area is underestimated. The richest zones as at present known are along the banks of all the southern tributaries of the river Amazon, and on the islands in the main stream and near Pará. The most prolific part is on the river Aquiry or Acré, one of the tributaries of the river Purús. Here a hundred trees yield as much as one ton of rubber per annum.

The northern tributaries of the Amazon do not produce much rubber. Of these, the river Negro produces the most, but the quality is soft. The river Branco yields very little rubber, and the upper part runs through pasture lands and high ground which is not suitable for good rubber. Some of the other northern tributaries have not been explored, and may yet reveal large stores of rubber. The *Hevea* is known to exist on the banks of Japurá, but that district has not yet been opened up.

It was at one time imagined that the excellence of Pará rubber was greatly due to the kind of fuel (palm-nuts) used in curing it. The palms that furnish this fuel were accordingly transplanted to Africa with a view of making "Pará rubber" there—the experiment, however, has not succeeded. The reason why these nuts are selected is because they emit a continuous dense smoke, and are more portable than other fuel obtainable. However, when none of the palms are present, bark and twigs of other trees are used as fuel.

When the accumulation of rubber is sufficient—usually the collection of three or four days—the collector lights a fire in his hut, places an inverted funnel over the fire, and ladles a thin coat of milk over a paddle and holds it over the smoke to coagulate; the process is repeated until a large cake has been formed. To release the paddle from the cake it is necessary to make a slit on one side. The paddle mold makes a cake of uniform and even shape. The paddle is in general use in the state of Pará; in other districts a spit is placed on two upright forked sticks, and given a rotary motion. By this means the rubber is cured with greater ease, but paddle-smoked rubber is preferred, as it is drier and more carefully cured. Attempts to introduce improved curing apparatus have not been received with popular favor, because the primitive process possesses the advantages of being simple and inexpensive. The process of curing rubber is very injurious to the eyes. Many cases of total blindness result from it.

An expert collector gathers 7 pounds of rubber in a day on the lower Amazon, but three times this amount is collected on the upper Amazon, in the rich parts. The collecting season on the lower Amazon begins when the waters have subsided—about July—and ends in January or February. The collectors employed are principally Brazilians, immigrants from Ceará and other neighbouring states and from Portugal, together with half castes. The pure South American Indian is of very little use as a laborer. Nor are the West Indian negroes suitable for the Amazonian rubber estates, as they cannot stand the malarial climate.

The insufficient amount of labor is one of the most serious difficulties in the rubber industry. It is not of much use to own rich rubber estates if the owner cannot obtain sufficient laborers to collect the rubber for him. The exploitation of rubber

forests is entirely in the hands of the Brazilians and Portuguese. Foreigners to the country have on several occasions attempted to engage in the same enterprise, but without success. It was tried some years ago on a large scale by an American syndicate, but the experiment failed.—*India Rubber World*.

## MICA MINING IN THE DISTRICT OF NELLORE, INDIA.

By ROBERT W. THOMPSON.

A. M. I. C. E. M. S. A.

Nellore is one of the maritime districts of the Madras Presidency. It is bounded on the North by the district of Kistna, on the south by the districts of Chingleput and North Arcot, on the east by the Bay of Bengal, and on the west by the district of Cuddapah, from which it is separated by the Eastern Ghats—a range of hills from 2,000 to 3,000 feet in height, running roughly parallel to the coast from fifty to sixty miles inland. The length of the district is about 150 miles, and the area about 10,000 square miles. The Great Northern Road from Madras to Calcutta passes through the district south to north keeping at an average distance of ten miles from the sea. Various other roads branch east and west from this trunk to populous and important villages. The chief town is Nellore, on the Pennar river, 110 miles from Madras by the Great Northern road; the next in importance are Ongole, 132 miles from Madras and Gudur, 85 miles from Madras, both of which are also on the Great Northern road. Venkatagiri and Calastary are also important places, both being in the south-west of the district. There is railway communication with Madras, but the route is circuitous, and a break of gauge occurs at a place called RENNIGUNTA where passengers transfer from the Madras railway, broad gauge, to the South Indian Railway, narrow gauge, the journey taking over sixteen hours; but the new Bezvade-Madras State Railway, which will probably be opened for traffic this year will give direct broad-gauge communication between Madras and Nellore, the journey taking not more than six hours. The district is salubrious and populous, the population being approximately 200,000. There is not sufficient employment for the lower, or cooly, class of the people, so that labour is plentiful and cheap, a man's wages (reduced to English money being from 3d. to 4d. a day, and a woman's or boy's from 2d. to 3d.—nothing more. The district is interested by numerous streams having their origin in the Eastern Ghats, and one river—the pennar—which, rising in the tableland of Mysore, flows through the district of Cuddapah (receiving there the waters of the Chittravutty, the Paupugni, and the Cheyair) and then through a rift in the Eastern Ghats past the town of Nellore into the Bay of Bengal, after a course of 355 miles.

East of the Great Northern road, and for a few miles to the west of it, the country is generally low and flat and the soil alluvial, and rice is largely cultivated upon it; to the west of this the ground begins to rise and becomes undulating and rocky, and is only fit for the cultivation of dry grains in some parts, the rest being barren or covered with jungle. The geological formation of this portion may be described as being generally a bed of metamorphic rock on which is superimposed a layer of laterite, which is a soft argillaceous stone of a reddish-brown colour, and of aqueous formation. The metamorphic rocks are represented by gneiss, mica schist, hornblends schist, and quartzite; these, though forming the bed rock of this part of the district, very often crop out about the surface and stand exposed. Instances of igneous rock are also met with in trap, felspar, and granite, the former occurring in dykes, and the two latter as isolated intrusions through the bed of metamorphic rock. This is the general aspect of the district: but laterite is occasionally met with in places nearer to the sea than above indicated, and alluvial land farther inland; this is

naturally the case along the valleys through which streams flow.

Mica exists in the western parts of the district where the land begins to rise to the ghats. The surface indication of it is the outcrop of quartz and felspar, with which minerals it is usually associated, being sometimes integrated with them so as to form a coarsegrained granite, or else occurring in large separate masses. It is not unusual to find distinct masses of mica, of quartz, and of felspar, lying contiguous to each other; the idea which they convey being that Nature intended manufacturing granite on the spot, but after collecting the necessary materials had changed her mind about it. But the surface indication, above mentioned, is not always present: in some cases mica occurs in isolated blocks. There are mica mines in operation at Inikurti, Utukur, Chaganam, Sydapuram, and Khandali, all lying from W.S.W. to S.S.W. of the town of Nellore, at from twenty to thirty miles distance. Indications of mica are met with further north, but no mines have yet been started: the industry is in fact in its infancy, the first mine, the one at Utukur, having only been started in 1888. The mineral it found near the surface, and those hitherto engaged upon the getting of it not being professional miners, but mere diggers, the only method of working yet adopted has been that of quarrying—no subterranean mining has yet been attempted. The mica occurs in masses of from 100 to 200 cubic feet; these masses have been found from near the surface to a depth of 70 feet, the method employed for detaching the stuff being blasting with gunpowder or dynamite.

The cutting and sorting of the mica after it is won from the quarry is a very important part of the industry: the value depends not only on the sizes of the sheets, but also upon their freedom from flaws and their clearness and transparency. Slabs of clear mica have been obtained of a superficial area exceeding two square feet; such pieces are however rare. But pieces of no more than 4 square inches find a ready market. All clear mica is cut into rectangular pieces of certain sizes. The clippings, or waste, have hitherto been thrown aside as useless; but inquiries have recently been made for this waste also, as the mineral is said to be useful as a lubricant when powdered. Some of the mines recently started have had their whole output bespoken by firms in Madras. New uses are continually being found for the mineral. A patent has recently been taken out in India for a composition, in which it is the principal ingredient, for the covering of boilers, steam-pipes, and the like, as it is a capital non-conductor of heat. A cartridge has also been recently invented in which, instead of paper or metal for the wrapping, mica is used, the advantages of the material for this purpose being manifold.

It is not easy to ascertain the actual cost of getting the material, the mine owners being naturally reticent on the subject; and, in fact, the cost must vary in different mines according to the quantity and quality of the mica obtained, and the depth at which it is found. That it is a very paying industry is clear from the eagerness with which both Europeans and natives are taking up land for mining.

From statistics obtained from the Sea Customs Department, it appears that during the first half of the year 1895 the quantity of mica exported from the port of Madras was 66,815 lbs., which increased to 71,030 lbs. in the second half, and to 89,330 lbs. in the first half of 1896. During last year (1896), no less than 30 mining leases were taken out for 64 acres of land, for a total assessment of 3,192 rupees. The industry has hitherto been worked by men of small means, who have each taken up from one to two acres of land to operate upon. But recently some firms in Madras have been applying for large blocks of land for the purpose. In consequence of these applications Government have been reconsidering the question of their attitude towards the industry. Hitherto the rule has been a charge of a rupee an acre for the right of prospecting, and an annual rent of 50 rupees an acre for land taken up on lease for

mining upon. But the term "prospecting" has not been clearly defined, nor have any maximum or minimum limits been laid down as to the sizes of blocks which may be taken up or the distances which must separate rival blocks. In consequence of this difficulties have arisen at times. Government have hitherto taken no interest in the outturn of the mines or the status of the lessees; they are inclined now to take an interest in both; they desire to encourage firms or companies to take up large blocks of lands say of about half a square mile in area and while reducing the ground-rent to charge a royalty of 5 per cent. *ad valorem* on the outturn. The idea is that such firms or companies, by introducing improved methods of mining, would get better results than have yet been achieved and so earn a higher profit, in which profit Government desire to participate. The difficulty of accurately valuing the mica obtained is to be gotten over by ultimately accepting a broker's certificate as to what it realised on sale in London, or wherever it was disposed of; Government in the first instance exacting a royalty calculated upon the highest price it is likely to realise. A deposit of 500 rupees is to be made with each application for a lease of land or a license to prospect. The new rules have not yet been promulgated, but it is believed that the above is a pretty accurate forecast of what is coming. These rules will, of course, apply only to mining on Government land. Where it is desired to mine on land belonging to private parties, an arrangement must be come to with the owners. The Rajah of Venkatagiri owns much mica bearing land in the district; his rates, at present, are a rupee an acre for prospecting and an annual rent of 50 rupees an acre for mining.

It must not be supposed that all who have gone in for mica mining have been successful; there have been failures as well as successes; but the successes have so far outnumbered the failures that, as has already been said, there is a considerable boom in the industry just now—as booms in India go. The failures have generally been due to ignorance, men have started mining where there was no mica. In some cases failures have been due to want of capital and spirit. One of the most successful mines in the district was abandoned by the original owner as unprofitable.

Besides mica, the district contains iron, copper, gypsum, kaolin, and garnets. The iron ore is of good quality and is worked by the natives to a small extent for supplying local wants. The copper ore was worked formerly, but the ore procurable near the surface being exhausted, the industry has been abandoned. It is not known to what extent these minerals exist. Gypsum, kaolin and garnets are found, but are not worked. The kaolin, which is disintegrated felspar, is white, and appears to be of good quality. The garnets hitherto found have been poor.—*Journal of the Society of Arts.*

## HOW RUBBER TREES (FICUS ELASTICA) ARE GROWN IN ASSAM:

By D. P. COPELAND, DEPUTY CONSERVATOR  
OF FORESTS, DARRANG DIVISION.

**FICUS ELASTICA.**—1 The India rubber fig or Outchonc tree is indigenous in Assam where it is found a dominant tree in the evergreen forests. It requires an exceedingly damp atmosphere, and the best natural rubber trees are met with in the forests at the foot of the hills, or on the hills themselves up to an elevation of 2,500 feet.

**NATURAL GERMINATION.**—2 In its natural state, the rubber starts from seed dropped by birds in the forks of other trees, often 20 or 30 feet or even more from the ground, where it germinates, and the young plant remains an epiphyte for years until its aerial roots touch the ground; as soon as this takes place, the little epiphyte changes rapidly into a vigorous tree, throwing out numerous aerial roots which gradually envelope the tree on which it first began life and often kill it out.

Having started life so high up, it soon throws out branches which overtop the surrounding trees, and the numerous aerial roots, which fall from these and establish connection with the ground, in a few years enable it to dominate the forest growth around it.

**SEED.**—3. The seed of this tree is contained in fig-shaped fruit, about 75 seeds being found in one good sound fig. The fruit first begins to form on the trees in March and ripens from May onward to December. On some trees the whole crop ripens and falls off by June, but, as a rule, the rubber tree has fruit on it from April right up to December, the figs forming, ripening and falling off, the whole of the rains.

After collection the figs have to be carefully dried and mixed with pounded charcoal, which preserves the seed for several months.

**SEED BEDS.**—4. In the Charduar rubber plantation nursery, for a seed bed 40' x 3½', two to three seers of pulverized rubber seed, 10 seers ash and 20 seers of vegetable loam or good soil, is well mixed in a half cask and spread evenly over the bed, and then lightly stamped down and watered. Such a bed should yield, with good germination, 2,000 seedlings and should be sufficient for putting out 100 acres of rubber planted 70' x 35'. The beds must be well-raised and drained, the soil being prepared in the same way as for vegetable or flower seed. If sown in boxes, these should be put under the eaves of a house; if in beds, light removable shades must be put up to keep off the direct rays of the sun. The shades should be removed during rainy or cloudy weather and at night. Light sandy loam is most suitable for seed beds; if the soil is stiff, charcoal dust should be mixed with it to make it porous and prevent caking. The bed or boxes must never be allowed to get dry.

**SOILING.**—5. This should be done exactly in the same way as for vegetable or flower seed which requires transplanting after germination. The figs are broken between the hand. As the seed is very minute, the particles of the fruit are left with the seed and sown with it, no attempt being made to clean or separate the pulverized figs. In order to distribute these minute seeds evenly over the seed beds, or boxes, a certain quantity of ash and soil is mixed with them.

**GERMINATION.**—6. Germination takes place from the end of April to the end of the rains. Seed sown between October and January, requires daily watering and screening from the sun, and will not germinate before the end of April or the beginning of May, but seed sown any time during the rains will germinate in a few days (from five days to a fortnight). It follows that the best time for sowing seed is during the rains—that is from June to September.

The embryo appears on the germination of the seed as a seedling having a pair of opposite cotyledons with an entire margin destitute of incisions or appendage of any kind, with the exception of the notched or emarginate apex, oval in general outline, green in colour and of a glassy smoothness. The second pair of leaves shows a tendency to the alternate arrangement on the stem but appears at the same time. Their shape and venation are very different from those of the primary leaves for they have a central midrib and a distinctly coarsely-crenated margin. The third pair of leaves do not appear simultaneously, and are distinctly alternate, with a marked reddish colour: after this the plant is easily recognized.

**PRICKING OUT.**—7. When the seedlings are one to two inches high in the seed beds or boxes, they should be transplanted into nursery beds, and put out in lines about a foot from each other. The nursery beds should be well-raised and drained, but the soil need not be so carefully prepared as for the seed beds. Here the plants are kept till the following rains, when they are dug up and taken to stockaded nurseries in the forest, and put out 5 x 5' on raised well-drained beds, where they remain for

two years till they are required for planting operations.

**PLANTING OPERATIONS.**—8. Almost every animal will eat the young seedlings; it is, therefore, impossible to plant out small seedlings in the forest, owing to the destruction by the wild elephants and game, unless each individual plant is carefully fenced in. As this is too costly, and the rubber after it is 1—2 feet in height is very hardy and can be transplanted with ordinary care, at any time of the year (the best time in Assam is between May and July), the seedlings are kept in stockaded nurseries in the forest where planting operations are to take place, and remain there till they are 10 or 12 feet high, that is, about three years after germination. When they are dug out and the roots are cut back 18 inches right around the plant and planted on the mounds in the forests.

**PLANTING OPERATIONS.**—9. In artificial planting it is found that the rubber grows best on mounds. Lines are cut through the forest 20 feet wide and 70 feet apart from centre to centre; in these lines 15 feet stakes are put up 35 feet apart. Round each stake a mound is thrown up four feet high. The base of the mound is about ten feet in diameter and they taper to four feet on the top; on this mound the rubber tree is planted, care being taken that the roots are carefully spread out before they are covered up with earth. To prevent animals pulling the plants and wind blowing them down, they are tied to the stakes.

**CUTTINGS.**—10. The rubber tree can readily be propagated from the cuttings, if only perfectly ripe young branches or shoots are used, but the tree raised from cuttings does not appear to throw out aerial roots, and, as the future yield of the tree probably depends on its aerial root system, it is questionable whether trees raised from cuttings ought to be used except where required only as shade givers, such as in an avenue. In the Charduar rubber plantation, propagation by cuttings was given up very early, that is about 1876, the plantation having been commenced in 1873.

The best time to take cuttings is May and June. **GENERAL.**—11. The rubber grows equally well on high land or low land, in forest land or grass land, so long as it is planted on a mound and its roots are not exposed to the sun. It is a surface feeder, but, as soon as its roots appear above ground, they must be covered with fresh earth until such time as the tree has formed a sufficient leaf canopy to protect itself.—(Assam Forest Report 1896-97).—*Indian Forester.*

## PLANTING IN SELANGOR: LIBERIAN COFFEE—COFFEE CURING— RAMIE—RUBBER—COCO. NUTS—PADI.

The year 1897 was not a prosperous period for the European owners of coffee estates. The price of Liberian coffee, which stood at \$31.50 a pikul in January, 1897, declined so low as \$22.50 a pikul, rendering it almost impossible for those planters with estates in bearing to put their produce upon the market except at a loss. Notwithstanding this adverse outlook, however, the estate owners have continued to extend their clearings, and the area under cultivation was very considerably increased during the year. There is now coffee in Selangor of all ages up to fifteen years old under the management of European planters. The appearance of the plants, of whatever growth, is almost uniformly flourishing, whether on the low lands of the coast districts or the more elevated situations in the inland divisions. Many additional acres come into bearing every year, the amount of produce increases in proportion, and nothing but a more favourable market appears to be now wanting to ensure a fortunate future for the estates of Selangor.

Allusion was made in the last Annual Report to the existence of a small coffee curing establishment

at Klang. I am glad to say that this factory is now about to be supplemented by a store and curing establishment of large dimensions now in course of erection by Mr. W. W. Bailey, on his estate of Lowlands, near Klang. Constructed under the superintendence of this most experienced planter there can be no doubt that this building will be replete with all the necessary plant, and Mr. Bailey will, in all probability, be able to render assistance in curing to his planting neighbours as well as to provide for the requirements of his own produce.

The decline in market rates has exercised a very visible effect upon the condition of the Malay coffee gardens. The natives, naturally, never anticipated that the value of the produce would drop to its present figure, and now that it has done so, and shows no immediate sign of a return to former quotations, they are generally convinced that the trees are not worth looking after, and have withdrawn much of the little attention which they previously paid to the growing plants. Their gardens, for the most part, present a neglected and uncared for appearance. The cultivation of coffee is not an industry which is well suited to Malays, because the trees require careful handling throughout the time of their growth, and the Malay understands planting, but does not realise what cultivation means. He likes to put something in the ground and then to sit down and watch it grow, until it is time to gather the fruit, leaving the cultivation to nature. He therefore succeeds with coconuts, betelnuts and plantains, and it may be that he will be well advised to leave coffee alone.

I again desire to express to the Selangor Planters' Association the sense of this Government of the valuable work done by their body in 1897. It is, in my opinion, a matter of much import that all matters affecting the planting interest should be freely ventilated and suitably and concisely represented to the Government. This is precisely what has been done by the Association, whose continued effects on behalf of all that affects the agricultural development of the State will always be warmly seconded and fully appreciated by the officers of the administration.

The attention of planters has been directed to other products besides Liberian coffee—ramie grass, rubber, and coconuts, having each received notice. I am not aware that the cultivation of ramie has yet assumed a practical form, but experiments are being made with Para rubber (*Hevea Braziliensis*), which appears to be the species best adapted for cultivation in this part of the world, and exceptionally favourable terms for the acquisition of land for this purpose were sanctioned during the year.

Coconut cultivation has received much stimulus from the establishment of the Oil Company's Factory at Kuala Selangor, under the management of Mr. H. C. Holmes. The natives on the coast, attracted by the creation of an assured market, are seriously interesting themselves in this form of cultivation, and the demand for seed coconuts became so great as to cause a noticeable rise in their value. Mr. E. V. Carey is now negotiating with Government for a large area of land at Kuala Langat, which it is proposed shall be utilised for the same purpose by an English company.

The cultivation of wet padi has never yet been undertaken on any important scale in Selangor, and there is no doubt that rice is not being grown to the extent which it should be. There is plenty of land on the coast which is suitable for that purpose and for very little else, but it requires draining in some cases and irrigation in others, and the people are not generally prepared to make the attempt unless assisted by Government in the undertaking of the preliminary works, and afterwards directed and encouraged by the personal influence of an officer interested in the task. It is therefore satisfactory to record that Mr. A. Hale, the newly appointed District Officer of Kuala Selangor, is devoting himself enthusiastically to the development of this industry. With the small amount of money at his disposal last year he succeeded in getting the

people of Jeram to open up and plant the land lying between Bukit Panjang and the Klang Road, and the work will be much extended with the additional resources available in the current year. I visited the land and found the people hopeful and industrious, and their work thoroughly well done. I am glad to hear, since, that they have been favoured with a good harvest. The abnormally high price of padi which prevailed during the year caused an unusually large amount to be planted last season. The harvest is reported to have been generally excellent, and the circumstances of the people are improved in proportion.—From Mr. Belfield's Administration Report for 1897.

## NEW AND OLD PRODUCTS IN ZANZIBAR.

*Cocoa*.—Great difficulty has been experienced in obtaining seeds and plants of Cocoa. Early in the year 3000 seeds arrived from Ceylon in a completely perished condition. In June, 72 plants were received from London in Wardian cases but only 34 survived. A few pods from Seychelles did well.

*Kola*.—Kola germinates freely and grows well. The seed is cheap and easily procured, while the produce requires little preparation for the market, being merely placed in the sun to dry. Hence, if it can be grown at a profit, Kola is more likely to find favour with the Arabs than Cocoa, the beans of which have to undergo fermentation before being ready for market. Kola trees may be planted 20 feet apart; they come into bearing in 4 or 5 years. Price in London rule from 4d. to 6d. per lb. If each tree yields 50 lb. per annum—a moderate estimate as trees have been known to yield up to 150 lb. of nuts each—the gross returns, both per tree and per acre, would be much larger than those now obtained from clove plantations, which do not average more than 15 lb. of produce per tree, worth 2½d. per lb.

*Vanilla*.—A small plantation of Vanilla has been made at Dunga and preparations are in course for extending the cultivation of this vine. Of the 600 cutting, planted, 427 survived and are growing fairly well. Many were found going rotten at the bottom, from being planted too deeply, and had to be taken up and replanted. The vines have been planted singly between three live supports, placed in a small circle. The Mbono (Castor oil—*Curcas purgans*) and Frangipani make good live supports and throw out rapid shade. Six feet has been allowed between each little bed of vanilla. Water is conveyed from the well to the plantation—a distance of 300 yards—through bamboo pipes. Much care is required both in the planting and cultivation of this vine, and some skill in fertilizing the flowers and in harvesting and preparing the fruit for market. For these reasons it is doubtful if the industry will take root here among the Arabs. A small plantations of Vanilla has been made at Tundaa.

*Para Rubber*.—Para Rubber shows every indication of doing well here. Though the proportion of seed which germinated in the nursery appears small (174 out of 938) much of the seed was old and worthless when sown, and not excepted to grow. Those that came up grew rapidly and, with the exception of three, have all been transplanted. One hundred and fifty were taken to Pemba and planted 25 feet apart in one of the sandy swampy valleys of Tundaa. Seven out of the 150 (5%) died, but the others came away well. Sixteen have been planted out in the rich alluvial valley that divides the Dunga bank from the coral, but some of these have failed. There is a Para rubber tree, 50 feet high and 6 feet in circumference, growing at Mbweni on a dry sandy ridge. It was planted by Sir John Kirk and in September last was observed to be flowering. The presence of this tree growing so well in an uncongenial locality, justifies I think, the assumption that if Para Rubber—the most valuable of all varieties—will pay to grow at all—a point that has no where yet been decided—it ought to pay to grow here.

*Ceara Rubber*.—The Ceara Rubber is just coming up and looks extremely healthy. It has been grown

principally from trees growing about the island. The Ceara Rubber trees dont appear to yield much uice. I tapped one growing at Mbweni and got little or nothing from it though it must have been five or six years old. It was afterwards found that wrong methods had been adopted, though at the same time it was quite clear that there was little milk in the tree. This variety of Rubber is said to thrive on very barren as well as rich soils, and if this is the case, it ought to do well on the coral wastes of Zanzibar, which cover about 3/5 of the total area of the island.

*Landolphia Kirkii*.—In October I went to Pemba and investigated the local Rubber vine (*Landolphia Kirkii*) and reported thereon.

*Coffee*.—About 60 young Arabian coffee trees are growing in the Nursery from seed obtained from Nyassaland. They look well and will be planted out, though they can hardly be expected to prosper in Zanzibar as the elevation is too low. Liberian coffee was sown late in the year and has not yet germinated. Attempts have been made to procure seed of the Maragojipe coffee, Brazilian variety, but none has yet been received.

*Anatto*.—Anatto grows well here but the market is too depressed to encourage cultivation. Seedlings are being raised at Dunga for vanilla shade.

*Camphor, Safflower, Olives, Sarsaparilla*.—Camphor, Safflower, Olives and Sarsaparilla have proved unsuccessful, and their cultivation will be discontinued.

#### LOCAL PRODUCTS.

*Cloves*.—Some experiments have been made with a view to ascertaining whether it were possible to produce a sample of cloves here equal to the best Penang and Amboyna. The experiments leave little doubt that this can be accomplished. On the other hand if the stems are green—too young—the dried cloves will be shrivelled. Pink bold heads make the best samples.

The quality of the cloves depends also, though to a less extent, upon the drying as well as upon the picking. The experiments at Dunga seem to show that the cloves should be submitted to a high temperature and dried rapidly. I believe that most Arabs overdry their cloves. They expose them to the sun till they become black and dried up and much of the oil evaporated. The stem of a properly dried clove should be tough and should yield slightly to the strain before breaking. I think that an effective system of drying cloves under glass could be introduced here with little expense. Some authorities are of opinion that, if all the Zanzibar and Pemba cloves were placed upon the market in the best possible condition, the price would not be increased beyond what it is likely to reach under prevailing conditions; low prices being due to over-production. The recent abolition of the legal status of slavery will, it is acknowledge, withdraw a lot of labour from the Arab shambas and the yearly yield of cloves suffer in consequence. Conquerent improvement in the quality of the product should therefore, if it can be accomplished, tend to lessen the effect of a declining crop. The short crop of 1897-98 is probably due to dry weather quite as much as to scarcity of labour. I noticed in October that comparatively few cloves remained upon the trees in the Pemba plantations, and in this respect Pemba compared very favourable with Zanzibar, where a considerable proportion of the cloves were left unpicked. Dr Charlesworth reports that the rainfall for the second half of the year was only 18.51 inches compared with the previous five years' average of 24.32. This difference practically amounts to a drought and is quite enough to explain any eccentricity in the output of cloves.

*Chillies*.—About three acres of coral waste have been cleared of scrub and planted in chillies. The dry weather has hindered the growth of the plants, so that we have as yet no results to report.

*Castor Seeds*.—An enquiry was made in London as to the market condition of Castor seeds, and samples of both the large and small varieties of Castor Seeds were, in May, sent home to Messrs. Gray Dawes and

Co. to be reported upon. On May 8th Mr. Hugh Garden wrote as under:—"From their appearance I did not think they were equal to Madras coast seeds which are very full of oil, but I have had them reported on both in Marseilles and London. In Marseilles our agent writes that both samples are very clean sound seed, and they make very little difference in value between the large and the small. In London they state that most crushers give the preference to the large beans although both are of good quality; the difference in favour of the large being about 2s. 6d. per ton. I have made a rough calculation and make to-day's price c.i.f. London or Marseilles about £9.10.0 per ton, without allowing for any excessive admixture of none oleaginous seed. In London they charge shippers with anything over 3% and in Marseilles 4%. To-day's prices however are very high, owing to scarcity, and I have known the seed fully £3 per ton under the above price." Castor oil trees, though they grow wild in Zanzibar, dont appear to yield much weight of seed. We make a point of collecting the seed from all the trees round about Dunga, but as yet we have got only quite an insignificant quantity together. The oil is worth about £36 a ton in London which compares well with cocoanut oil at £23.

*Papaya*.—Enquiries have also been made in London regarding Pepsin and the following communication from Mr. Hugh Garden was received in April:—"I have received the following information from one of the first authorities:—The dried price of Papaw fruit is a powerful digestive agent and differs from Pepsin in being active in neutral and alkaline solutions. The Papain of commerce is prepared from it by solution of the crude juice in water, and precipitation by alcohol. Only small quantities of the crude concentrated juices have hitherto reached this country, and therefore the price at which it has been sold has only been a nominal value. So far as my observation goes, and the matter has been the subject of considerable experiment by my son the substance is not likely to come into extensive use, and I should think that the import would hardly be worth consideration by you." Messrs. Thomas Christy and Co., of 25 Line Street were good enough to send out a sample of the dried juice with the following:—"In reply to your query regarding Papaw we may tell you that we import the dry juice of this plant in large quantities. We believe the way of drying it is to place the juice upon slabs of glass or earthenware so that it has a smooth surface to dry upon. This is exposed till it is thoroughly dry and the film then flakes off. . . . The price we could pay for the dry juice would be about 5s. to 7s. 6d. per lb. . . . We understand that the juice is taken from all parts of the plant, principally from the stem or trunk of the tree; if you take it from the fruit you will have to be careful to make your incisions in the latter just before the fruit is ripe. You need only make scratches as the juice is found between the skin and the pulp. None is obtainable from the fruit proper. We hardly think it worth your while to take any trouble with this part of the plant. Out of many fruits you will only be able to obtain but a few ounces, whereas, from the trunk of the tree and other parts of the plant, you can obtain several pound."

A CRISIS IN THE INDIAN TEA INDUSTRY.—"Any one at all conversant with the subject says the *Planter's Gazette*—knows that the Indian Tea Industry is at the present moment passing through the most critical stage of its existence"; and elsewhere our contemporary adds:—"It is useless dallying with the subject, and the sooner proprietors realise that they are manufacturing an article un-saleable under present conditions in increasing quantities, the better. To our mind the apathy of shareholders is inexplicable. Producers all over the world have shown a determination to get rid of the middlemen, and why should the British tea-grower foster them?"

FOREST CONSERVANCY IN CEYLON.

Mr. F. C. Fisher supplies the Report for 1897. He disarms criticism in his first sentence by stating that he wishes it to be understood that his Report is merely a *resumé* of the reports sent in by the Assistant Conservators of each Province. There is nothing novel or original, therefore, in the pages before us. Mr. Fisher gives the total Revenue of the Department at ... R488,956  
Expenditure ... R465,383

Balance to the good ... R23,573

So that, at least, the Forest Department pays its way. We have then details of the work done under "Area and Boundaries" (reserve forests); "Surveys and Working Plans"; "Protection and Improvement"; "Yield and Working"; "Financial Results" (already summarized) and "General Remarks." The only chapter that contains information of general interest is "Protection and Improvement" which covers nearly five pages. But the arrangement is so bad that it is not easy to pick out what is of importance. Chena cultivation seems generally dying out save in the Uva and Eastern Provinces. "Forest fires" are reported to do damage in the same two provinces. The branches of the Assistants' work that are of most interest to planters and others, are given under the headings of "natural" and "artificial" reproduction. In regard to the former we learn:—

WESTERN PROVINCE.—Mendora seeded freely in Barawa forest.

CENTRAL PROVINCE.—In Nuwara Eliya District the Forester reports that keena flowered very plentifully all over the district, the flowering on the Kandapola side being a month later than on the Nuwara Eliya side of the Pedro Range. Sapu (*Michelia nilagirica*) and mihiriya (*Gordonia zeylanica*) flowered freely all through the year, but there were no signs of reproduction from the year's fruit. The red flowered mihiriya (*Gordonia speciosa*) blossomed towards the end of the year in the Pandalu-oya forests. Madol, damba, and kududawla reproduced freely. In the Nanuova clearings different species of *Myrtacea* with mihiriya are reproducing themselves well. In the Hatton District, den, damba, and kududawla seeded freely, and natural reproduction has taken place in the Kotagala forest, the seedlings being favourable. In Nawalapitiya District the following species have flowered, seeded, and germinated freely in forests:—*Homalium zeylanicum* (livan) flowered and seeded fairly. *Vateria acuminata* (hal) flowered and seeded well, and *Filicium decipiens* (pehimbiya), pepilis (*Aporosa latifolia*), damba (*Eugenia operculata*), hora (*Dipterocarpus zeylanicus*) flowered and seeded heavily. Wal sapu (*Michelia alauca*) and porawamara (*Caulium didymum*) have flowered and seeded copiously.

MAZALE DISTRICT.—Halmilla, satinwood, wewarana, palu, pihimbiya, and hulanhik have seeded and germinated favourably where improvement fellings were made, and in the forests where fellings have been carried out numerous seedlings are springing up. In fact, where light is let into the forest seedlings at once appear in a most remarkable manner. Satinwood did not as a rule seed well this year, and ebony does not appear to have seeded at all.

NORTHERN PROVINCE.—Most of the species flowered freely, there having been no drought. In some cases seedlings were abundant.

EASTERN PROVINCE.—The weather was on the whole very favourable for the seeding of the forest trees and growth of seedlings, as the rainfall was well distributed throughout the year, and there were no long

periods of drought. Ebony fruited well in the Bintenna, Koralai, and Porativu forests, but as usual the seedling crops are reported to have been bad. Satinwood seeded largely as usual. In forests containing this tree every open spot almost had seedlings. Halmilla seeded well in the Panawa and Naaukadu pattus, palai seeded abundantly. The stunted palai trees in the coast forests were as usual stripped of their branches by people collecting the edible fruit. Milla is reported to have seeded only moderately and the germination to have been bad, Ranai seeded freely in the south part of the Province, and even better in the Koralai pattu. Kumbuk, Jampalai, margosa, and naval all seeded well.

NORTH-WESTERN PROVINCE.—Satin, halmilla, palu, kumbuk, milla, mi, and hora are the principal species that seeded abundantly during the year. It has not been a good year for seedlings excepting in the case of satin, lunumidella and hora.

NORTH-CENTRAL PROVINCE.—The year has been a good one for seedlings, but a great part of the blossom this year was partially a failure, having been damaged by heavy rains.

PROVINCE OF UVA.—Owing to the unusual wet weather the seed and seedling crops were only partially successful.

Then as regards the "plantations" formed by the Department, everything connected with "rubber" is of interest:—

WESTERN PROVINCE.—During the year 75 acres of land were surveyed opposite the rubber plantation at Midellana for the purpose of extension. Care was taken to select land well above the high water mark left by last year's exceptional floods. The land was cleared of forest and the firewood sold on the spot, but unfortunately, owing to an unfavourable seed crop, both at Henaratgoda Government Gardens as well as at the Forest Department plantations at Edangoda in Sabaragamuwa, sufficient seed was not procurable to plant up the land opened. A small nursery was made with all the available seed, but it cannot be denied that by this circumstance a whole season has been lost, and the work will have to be done over again in 1898. The great difficulty of obtaining seed will for some time prevent our extending rubber on any large scale, even assuming that suitable land is available, but in this last particular it is very doubtful that any large connected area can be found in Western Province.

The Midellana plantation of rubber has been carefully looked after, and some of the vacancies supplied. It is too early yet to report as to the prospects of this plantation, which has already had to contend against many drawbacks.

PROVINCE OF SABARAGAMUWA.—No further addition was made to the rubber plantations at Edangoda or at Yattipowa during the year. The crop of seed from there (and the majority came from Edangoda) amounted to 11,500 seeds, and was sent to the Western Province for the plantation at Midellana in the Pasduu Korale. This crop was very much below the Assistant Conservator's estimate, and the deficiency was due to the loss of much seed through gales of wind that destroy the young fruit. Obviously no seed was available for sale. If the public are to be supplied with rubber seed the existing plantations will have to be added to, but it is difficult to find any large block of suitable soil. No tapping of the rubber trees at Edangoda was attempted in 1897, the oldest plantation being only eight years old.

As to other plantations here are the reports:—

The jakwood plantation at the Model Farm at Kalutara has been kept cleared and free from weeds. The jak plants are already from 6 to 8 feet high and look healthy and regular, giving a promise of future success. A few lunumidella plants were put in, and at long distances apart, by the sides of roads and drains. They are progressing, but their growth is slow.

The 3½-acre plot selected for calamander and planted with ingasaman for shade has not proved a success

The plants have for some reason, contrary to all experience, assumed a semi-creeping habit, necessitating interplanting of the whole again in 1898 with jak, which will supersede the ingasaman. The Assistant Government Agent at Kalntara is desirous that more of the Model Farm may be planted up with jakwood in view of the success of the existing plantations.

The teak garden at Hanwella had a number of thin and weakly poles cut out in order to secure greater freedom of growth for the remaining trees—a work that the plantation was much in need of. The teak plantation at Kotadeniya was not weeded again this year, but should be next.

The Mugarungapola and Pohannornwa plantations appear to be considerably improved by the weeding they had in 1896, but it is to be regretted that sickly plants were not thinned out in 1897. The domba has self-sown itself freely, and young plants are looking healthy.

**CENTRAL PROVINCE.**—No addition was made to existing plantations during the year. The acreage of plantations is as follows, viz., Galboda 337, Kotagala 14, Nann-oya 118, and Nuwara Eliya 36; total 545 acres. At Galboda the 377 acres have been kept up by rooting out scrublantana, mana grass, and weeds. A few plants were also put in bare places and seed at stake dibbled in. The total cost for these works was Rs 1,700-55, averaging Rs 4-51 per acre. This sum has been disbursed as follows:—

**BLACKWATER.**—This clearing is still very poor, and very little improvement can be seen except the new clearing of 9 acres planted in 1894, which is coming on well. The *Acacia melanoxylon* and jak continue to die out where the soil is poorest and gravelly. The *Eucalyptus* and *Grevilleas* are the only species growing fairly well, and that only in sheltered places. The seeds which were dibbled in last year, and which came up well, have died off on account of drought. Out of the whole 69 acres in this clearing only about 12 acres can be said to be of any use. This clearing should be left to take care of itself, except that the few acres of what is good should be kept clear of weeds.

**DEKINDA Nos. 1 and 2.**—Leaf canopy has formed well in several places on these two clearings, and the general appearance of the two blocks of 60 acres may be considered promising.

**MAPAKANDA.**—This clearing of 192 acres though looking bare in many places has been thoroughly stocked with plants. Last year 2,096 plants were supplied. The indigenous plants, though slow growers, have sprung up considerably more than the previous year, and a great improvement in the general appearance of this clearing is observable.

**PENHROS.**—This clearing of 56 acres is fairly wooded, particularly the portion below the railway line.

**KOTAGALA.**—The plantation in Kotagala forest, Hattott District, has shown improvement in the growth of the *Eucalyptus robusta* plants, and the trees have attained considerable dimensions.

The new clearing of 4 acres planted with *Grevilleas* last year was damaged by wild animals. In consequence of this some replanting will have to be done during the next rainy season, as there are a good many vacancies on the clearing to be supplied.

**NUWARA ELIYA.**—The plantation in Galway's land was slightly thinned out during the early part of the year. The Forests reports a great deal of damage was done by the high winds, necessitating the lopping of broken branches and the coppicing of damaged trees. The plantations on the whole are doing well, with the exception of some of the blue gum clearings at Conical Hill. Wherever *Acacia* has been planted in places exposed to incursions of elephants and pigs, it has been severely browsed down. In one or two clearings, such as the one near Mahagasotta tea estate, where a thorny undergrowth has been allowed to spring up round the plants, they have shown the benefits of this protection and grow well and healthily. Of all the exotic species planted, the red gum (*E. robusta*) shows itself the one which has best adapted itself to the soil and climate. The plantations at Nannoya were cleared of weeds and undergrowth

during the year. Beyond this, the present system of working the Nannoya compartment, which is really an improvement felling, no improvement fellings were carried out. It is interesting to note in connection with this system how rapidly the leaf canopy has assumed the previous natural condition.

**EASTERN PROVINCE.**—No additions were made to the teak plantations, but in the latter part of the year 46 acres of grass land were planted up with gallnuts obtained from the Province of Ceylon for the purposes of experimental re-forestation.

**NORTH WESTERN PROVINCE. SUNDAPOLA PLANTATION.**—This plantation has made very considerable progress during the year, and the growth of nearly all the species is most marked. This improvement is due to more attention having been paid to weeding and thinnings. The Conservator of Forests again this year brought the forestry class to this plantation, and the students did a great deal of work in thinnings and marking trees to be felled, &c. This plantation was planted in the north-east monsoon of 1890, and the following are the mean girth increments for seven years:—Teak 12-02, jak 14-40, na 3-87, mahogany 14-04, satin 6-61, and kumbuk 13-62. The expenditure for the year was Rs 474-35, and the receipts from date, of thinnings, fagrots, and firewood, Rs 500. The expenditure since the beginning has been Rs 832-16 and the receipts Rs 6,214-59.

**KUMBALPOLA PLANTATION.**—No work was carried out at this plantation beyond keeping the place clear at a cost of Rs 90 for the year. The trees have made some considerable progress. The mean annual increment for seven years of 59 teak is 13-08, 50 jak 18-14, and 30 halmilla 6-73.

**PUTTALAM TEAK PLANTATION.**—Pruning and coppicing were the chief operations carried out during the year. 270 posts were sold to the Telegraph Department during the year. The receipts for the year are Rs 1,162 and the expenditure Rs 249. Teak and satin show the following increment for the year:—Teak 1-47, satin 3-7.

**NORTH-CENTRAL PROVINCE.**—No plantations were carried on in 1897.

**PROVINCE OF UVA. JUDGE'S HILL PLANTATION.**—Thinning operations, which were commenced in this plantation at the latter end of 1896, were continued. All the suppressed and inferior trees were taken out and the stools carefully coppiced with satisfactory results. *Grevilleas* are doing fairly well, especially in the hollows. But they do not stand coppicing as well as the sapu, the stool shoots being weedy-looking as compared with those of the latter.

**ELLADALUWA PLANTATION.**—The 13-acre field of this plantation, too, was gone over during the year, but the thinnings were only slight, but notwithstanding they have had a beneficial effect. The 28-acre field planted in 1892 is coming on well in parts, but there are still many vacancies, owing chiefly to the damage done by buffaloes at night.

**MEDIHVA.**—The broad-leaved mahogany is not doing at all well here, it would seem that the soil and probably the climate is not suitable to it.

**MORATOTA.**—In November and December, 1895, twelve acres were planted up. In the hollows the growth has been good and canopy has been formed. But the soil on about a quarter of this field is poor, as shown by the stunted appearance of the plants.

**BANDARAWELA.**—This plantation has proved a failure. The soil is so extremely bad that it will be many years before the trees will form cover. It was this year supplied with seeds of forest trees.

**HAPUTALE PLANTATION.**—This has certainly proved a grand success, and it is rather a pity it has not been further extended. Adjoining it there is a large piece of forest land, from which all valuable timber has been removed, and it now seems desirable to make a complete clearance of the remaining unprofitable jungle growth and substitute for it a continuation of the existing plantation. The experimental coppice was not continued this year, as it was thought advisable to make sure of the success of previous experiments. The growth of the stool shoots has been extremely satisfactory, and this work

should be again taken in hand next year, as it is doubtful whether better results would be obtained by waiting longer. The measurements of stool shoots appear elsewhere, the average height being 19 ft. 6 in. and the average girth 3 ft. from the ground 7'26, in. The total expenditure on this plantation amounted to R169'94 for the year. The quarry situated in this plantation was handed over to the Public Works Department by order of Government.

**OHIVA PLANTATION.**—The damage caused to this plantation this year by the wind was very great. Large numbers of trees in every field were either broken or destroyed entirely, especially so in the field opposite the railway station, where numbers of plants were broken down and others, especially *Grevilleas*, were almost twisted out of the ground. The total number of trees that had to be coppiced owing to the damage were 2,748 *Eucalyptus robusta*, 276 *Grevilleas*, 125 *A. Melanoryton* and *Toona*.

Some of our planting friends have been accustomed to smile over the "plantation" efforts of the Forest Department; what have they to say to the above? We suppose Mr. Fisher has done the best he could with his material; but surely an Acting Conservator with liberty to travel about could have inspected the plantations and given the Government and public his own general impressions of the same, in criticism or corroboration of the Assistants more immediately responsible?

#### PLANTAIN MEAL OR FLOUR.

From the Government Agent, Anuradhapura, to the Hon. the Colonial Secretary.  
No. 199/74.

Anuradhapura Kachocheri, July 11th, 1898.

Sir,—In forwarding a sample of Plantain meal or flour prepared by my head clerk, Mr. Stonter, I have the honour to request that you will be good enough to obtain the opinion of an expert as to whether the flour as prepared will keep for any time, and whether it is fit for food, and how it should be packed for transport to Colombo or beyond the island.

Plantains grow well in this Province, and I am anxious to know whether it would be as well to encourage the making of this flour or meal.—I am, &c.,

(Signed) E. M. BYRDE,  
Government Agent.

(Signed) T. R. E. LOFFUS, Office Assistant.

#### Copy of Report referred to.

No. 333.

Since W. H. Stanley drew attention to banana meal as an article of diet, a good deal has been done to bring the fruit into convenient form for export. A Committee to inquire into this matter was some years ago appointed in Jamaica, with the Director of the Botanic Gardens as Chairman. I have not seen any report on the result of the inquiry, but have written for information to Jamaica and also to Trinidad. In a report on the Trinidad Experimental Farm reference is made to plantain meal. A sample sent from there to London was quoted at 6d per lb. The same report states that a 15-lb. bunch of plain plantains yielded 3 lb. of flour. Dr. Watt (Economic Reporter to the Indian Government) mentions that the fresh core should yield 40 per cent meal, and that an acre of average quantity will produce 1 ton. In Australia it has been found practicable to prepare dried bananas and ship on board at a cost of 3d per lb., the fruit fetching 6d per lb. in London.

All authorities agree that as a flour it is an excellent food, and more nutritious than any of the ordinary starch flours in the market. If properly dried it will keep well for a long time. It is the opinion of some, however, that the dried fruit will keep better than the flour, and will probably find a better sale than the latter. As labour would be saved by simple drying, further information on this point

is desirable. Dried fruit could be packed in boxes like figs, but the flour will need to be put into sealed tins for transport.

I have already given over one sample to be sent to America for an opinion as regards price and market, and another sample will go to London. I shall be glad if a similar quantity to that sent could be forwarded to me, as well as a specimen of the dried fruit. In sending these may I ask to be supplied with some figures; e.g., what weight of fresh fruit (say without stalk) will produce 1 lb. of flour; the cost of producing 1 lb. and delivering it in Colombo (valuation being placed on the fruit according to local market rates); and the approximate quantity of flour that might be expected to be produced (if the industry was taken up in the district) per month.—I am, &c., (Signed) C. DREBERG,  
School of Agriculture, Superintendent.

July 27, 1898.

#### VANILLA AND PEPPER.

We have received some well-grown and well-prepared pods as a sample of his Vanilla from Mr. Vanderpoorten, who has been for many years paying attention to this product: his first shipment having been made eleven years ago. Mr. Vanderpoorten enquires if the present sample can be valued locally; we fear not. Few, if any of our merchants have experience of Vanilla and the market in London and Europe generally is rather uncertain and changeable. But we should say the sample is nearly as fine as the Seychelles Vanilla which some time ago was selling at 20s per lb. and upwards. Still, it would not do to count on such a return for any quantity. If there is any deficiency in Mr. Vanderpoorten's pods, it is the absence of the slight, frosted covering or appearance of the pods, to which some attach importance in the present day. Those interested in the culture will note that Mr. Vanderpoorten advertises Vanilla cuttings for sale, and these ought to be specially reliable as being from properly-matured vines and supplied of a full length. It is encouraging to hear of the increased attention given to Vanilla: a Hangwella correspondent says there is a demand for cuttings in his neighbourhood.

We would next ask, what about Pepper?—a product that deserves very general attention all through the Kegalla and adjacent districts, including that of Kalutara. In the Area Palm, Rubber, Nutmegs, Pepper and Vanilla, planters (Europeans and natives) have a choice of minor products to add to their tea or coconut gardens.

#### GUATEMALA AND COFFEE.

Guatemala is the largest of the independent States of Central America; and, sitting astride of the continent in a narrow part, it has a sea-board both on the Atlantic and on the Pacific. Beyond this, owing to the altitude above sea-level to which the interior of the Republic rises, it enjoys a remarkable variety of climate and productions, with the result, as we are informed in the excellent report on the trade and finance of Guatemala during 1897, prepared by Mr. Consal Trayner, that its agricultural capabilities are "equal to any in the world," and that "every kind of crop, from those of the tropical coast regions to those of the cold highlands, the latter having a climate corresponding with that of Northern Europe in summer, may be raised." Still Guatemala is lacking in many conditions essential to an Earthly Paradise; It knows not political stability; it is poor and in debt, and of the plagues that vex it the incredible laziness of its labouring population is not the least. Of the 195 miles of line between the capital and Puerto Barrios, on the Atlantic coast, only 131 miles have

been constructed, although the works were begun in 1881. The remaining sections are the most costly and difficult from the engineering point of view; and Guatemala has no money to spare for railway construction. Public opinion and official inclination appear to be in favour of resigning the work to foreign capitalists, who have the money and energy in which Guatemala finds itself sadly lacking. Foreign capital rather hangs back, and not without reason. Considering, however, the extent to which British commerce is interested in the trade of the Republic, it is to be hoped that the money may be found; for, says Mr. Trayner, "the country is practically waiting for this road to be completed for its full development, and its commerce and prosperity will undoubtedly increase immensely when it is in working order under good and independent management."

There were other reasons, besides revolution and the "hopeless condition" of the Guatemalan railway projects, why, in 1897, money was scarce and credit hard to obtain—why banks were shaky, and the national revenues fell off by over two million silver dollars. The staple product—indeed, "the sole source of wealth which the country possesses"—is

COFFEE; and while the export of coffee last year was larger than usual, there was a still more marked drop in prices, so that while Guatemala gave to its customers 150,000 quintals more coffee than in 1896, it drew about four millions of gold dollars less from the transaction. This, it must be admitted, was bad business. Whether an improvement will be made by the lowering of the export dues which the Guatemalan Government makes on its coffee from 3 dollars 65 cents to one dollar silver per quintal, it will be for a future report to say coffee growers in the Republic have had another evil to contend against—the incursion of a destructive bug, known as the "chinche"—a kind of "coffee phylloxera," which attacks not the roots, but the branches and other overground parts of the plants. To check this plague an attempt was made to introduce the Australian "lady-bug," which has the great merit of devoting itself to the extermination of the destroying "chinche." But the "lady-bug" is costly and difficult to obtain; and the Guatemalan planter has been fain to put up with a native bug—the "tortolitas;" and this, it seems is "fairly efficacious," in chawing up the intrusive "chinches," which are further being blasted by a convenient fungus. Between revolutions, floods, bugs and suspended banks and railways, Guatemala cannot be said to have been in a very hopeful state commercially. But business, having reached the lowest ebb, has begun to improve; and all classes in the Republic have lately become more hopeful. The labour question is perhaps the most deep-seated and stubborn of the causes that tell against Guatemalan prosperity. There are three classes of farm-workers or "mozos" in the Republic; and all begin by getting in debt to their employer. The first class, according to Mr. Trayner, work well until the debt is paid, and then get another advance; the second keep jogging on in a state of chronic indebtedness, rendering the white tolerably faithful service, until they die in debt. The third class is an "interesting and very numerous one, composed of those who ask advances as long as they can get them, and when they know that they can get nothing more, desert with what money they have and anything more can beg or steal." The Guatemalan "mozo" is admirable as an actor, if not as a worker; he may labour well and obediently for a week, and then "he begins to play his part; either he or his wife turns ill, and he is unable to work, but must needs buy broth." The game may be carried on for five or six months; and then one fine day the "mozo" disappears; nine-five per cent. of these rogues "simply evaporate, and turn up at the opposite end of the country, and there find another victim;" and against the evil the unfortunate agriculturist and capitalist has no resource.—*Scotsman*.

#### PLANTING IN NORTH FORMOSA.

CAMPHOR.—With regard to camphor at present no British firm in North Formosa seems to interest itself in this important product, the handling

of which is in the hands of German and Chinese merchants, acting probably in combination. There is a slight decrease in the quantity exported and a large decrease in value from £194,221 in 1896 to £121,938 in 1897.

TEA.—There was a short export in Formosa oolongs amounting to 17,857,433 lb., as against 19,286,231 lb. in 1890. The value, however, was £654,583 in 1897, as against £592,326 in 1896.

To prevent the adulteration of Formosa oolongs by mixture with old local leaf or China teas, foreign merchants co-operated with the Chinese Tea Guild under the auspices of the Japanese authorities. A committee, consisting of three foreign and four Chinese merchants, was appointed to deal with the questions of adulteration of tea, having the power to impose fines and confiscate adulterated teas. It is doubtful whether decisions given by that committee may not yet become the subject of litigation. The inland tax on tea collected last year amounted to some £40,000.

The export of hemp and other fibre becomes noticeable this year, amounting to some £7,000. The special ports each exported a lesser or greater quantity. The authorities are taking great interest in the development of this product.

For many years Tawatutia, the centre of the tea trade and the distributing centre of North Formosa, has been the home of the foreign merchants, who have quite forsaken the port Tam-sui, called Hobe in former times. Their right to reside and trade in that town seems never to have been questioned by the Chinese Government, though the latter would never allow foreigners to lease lands in their own names. A most satisfactory arrangement, however, was made with the Japanese Government whereby lands and buildings acquired previous to the end of April, 1897, and hitherto held in Chinese compradores' names, could respectively be leased perpetually and owned absolutely by foreign merchants within the limits of "mixed residence" which were made to include the whole of Tawatutia and several large vacant spaces. It was a pity that British merchants did not avail themselves more largely of the opportunity of acquiring land at that moment, for leases made after May 8th could not be made for a longer term than twenty-five years. The British merchant in Formosa is rather a pessimist in his views as to the future of the island, but if high prices for land and exorbitant rents are a guide the owners of property in Tawatutia should have every reason to congratulate themselves.

That the natives of the cities have never enjoyed so much prosperity as at present, and that commercially they have benefited much by the altered circumstances of the island, are facts that cannot be denied.

The want of road and rail communication is perhaps the most serious obstacle to expansion of trade, and what is of greater importance, the pacification of outlying districts. It is most regrettable that the projected railway between north and south is no nearer a commencement than it was a year ago. It is indispensable for the Government to undertake its construction; a private company like the "Formosa Railway Company" formed in Japan, and having no support in the island is bound to be a failure. Roads leave the capital in every direction, but the method of construction makes them unsuitable for permanent traffic.—*L. & C. Express*, July 22.

FIBRE SPECIMENS.

The Principal of the School of Agriculture writes:—"I am sending some fibre specimens for you to see:—

1. Ramie ribbons extracted by Mr. Warr from sticks supplied by me and grown on the premises. The growth I did not consider by any means good, and that is to be expected considering the nature of our soil. The following figures will be useful:—

100 fresh stalks with leaves were taken and found to weigh 40 lb.

The same without leaves weighed 27 lb.

Average height of stalks, 5 ft.

Weight of stalks without fibre, 20 lb.

Weight of dry ribbons—2 lb., i.e., 5 per cent of the sticks with leaves.

Mr. Warr reports 'quality of fibre fair, growth medium.'

2. Fibre extracted at the School from leaves of Sisal hemp, a few plants of which, supplied by Dr. Trimen, are growing here.

3. Fibre of Niyanda (*Sauseviera Zeylanica*) extracted by Mr. Warr.

4. Fibre of *Sansevieria Cylindrica*, extracted at the School. The plants were supplied by Dr. Trimen as one of the best of the *Sansevieras* for fibre. I send specimens of leaves also."

The collection is a very interesting one and may be seen at our office by anyone who wishes, and we must send it round the Fort after the mail leaves.

PLANTING NOTES.

ICED TEA.—There is no more refreshing summer beverage than iced-cold tea served with lemon. One pound of tea will make from five to fifteen gallons of beverage, as to the sort used. What better advertisement for a store than to serve on a hot day iced-cold tea? It would tend to increase the popularity of the store and the sales of the tea, cracker, and fruit sections. Make the experiment.—*American Grocer*, July 6.

CHINA TEA IN AMOY.—According to some particulars given by our Consul at Amoy, once an important tea growing and exporting district in China, the competition of Indian and Ceylon teas is very far from being, as is sometimes supposed, the chief cause of the decline and ruin of the tea-growing industry says the *Financial News* of July 12th. Its extinction is due to the ruinous system of taxation. Mr. Gardner tells of the sad sight to be seen in the district, of tea-gardens run to waste and of once comfortable homesteads of prosperous teagrowers fallen into ruins—a sight which rouses, in addition to sympathy for the sufferings of the natives, a not illegitimate feeling of annoyance, for our own sakes, that our hoped-for customers should be thus prevented from purchasing our wares. Of reform in taxation—the only thing which could have saved the industry—there is no indication, the only idea the authorities seem to have been to increase the stringency with which the likin is collected. Mr. Gardner appends a report by Mr. Frank Cass on the Amoy tea season of 1897-98, in which it is shown that the crop for the season was only 7,000 half-chests, compared with 26,000 half-chests, in the previous season and with 178,000 half-chests twenty years ago. Mr. Cass caustically adds that natives and foreigners alike, whose trade likin and duty have ruined, have the consolation of knowing that for those to whose ignorance and rapacity the present state of affairs is due there is now no trade left for them to blackmail,

BOTANIC GARDENS AND DOMAINS, N.S. WALES.—Mr. J. H. Maiden's Report for 1897 is an elaborate document, for he has a very varied and extensive charge in all its departments. Our old friend Mr. Charles Moore after forty-eight years' service retired from the Sydney Directorship in 1895 and we are glad to gather that he is still in good health, his successor expressing the hope that there remains to Mr. Moore "a long period of leisure after his exceptional services to the Colony." Mr. Maiden is evidently a well-qualified successor and we congratulate him on the exhaustive Report just published

THE HAWAII ISLANDS being annexed, there is sure to be a rapid development of coffee culture there, through the influence of American capitalists. The American Consul-General at Honolulu has issued a very full Report on the subject, an early copy of which has been sent to us and from this we gather that out of 76,000 acres of land well fitted for coffee, not more than 10,000 have been taken up, or 4,000 acres planted, the highest elevation being 2,300 feet. The largest plantation so far opened is one of 200 acres belonging to a Company, with the bushes planted 8 by 8 feet. The labourers (Japanese) are paid 15 dollars a month. Some Japanese get 16 and Chinese labourers get 16 to 17 dollars a month.

ESSENTIAL OILS.—The adulteration of essential oils has been for a long time one of the most lamentable practices in commercial circles, extending as it does from the time that the oil leaves the natural source to the point at which it reaches the wholesale drug trade; after which we think we may safely say there is little to fear of such practice being followed. The most trustworthy British firms in the drug trade have set their face strongly against this evil, and we are glad to see that the Essential Oil Importers and Exporters, Limited, of 62, 63, and 66, Basinghall Street, London, E.C., are doing all they can to assist dealers in essential oils by laying it down as a first principle to sell best articles only, and undertaking to hand customers a warranty that all essential oils delivered by them are pure.—*British and Colonial Druggist*, July 22.

CONSUMPTION OF COFFEE.—The following table taken from the *Economist*, and quoted in the *Board of Trade Journal*, shows the annual consumption of coffee for the last five years in the United States and the principal countries of Europe:—

	Europe	U.S.A.
	Tons.	Tons.
1893	271,498	248,117
1894	272,191	258,822
1895	277,400	260,850
1896	291,150	267,630
1897	305,150	318,170

As will be seen from the above, the consumption of coffee in the United States in 1897 exceeded that of the whole of Europe. The European countries which consumed the most coffee are Germany (136,390 tons) and France (77,310 tons). The United Kingdom consumed only 1,420 tons, and Italy 12,500 tons.—*Journal of the Society of Arts*, July 8. [Other authorities show the total consumption for Europe to be over 400,000 tons; North America 340,000 tons.—ED. T.A.]

## PLANTING IN S. INDIA.

The following are extracts from the U.P.S.I. Report:—

**GOVERNMENT CINCHONA BARK.**—Representations made to Government have been so far successful that tenders for the supply of bark were called for during the year by the Director of the Government Cinchona Plantation. In reply to your Secretary's enquiry as to the result, the Director wrote:—"It was estimated that about 100,000 lb of crown bark would be required, and the enquiry for tenders resulted in 246,018 lb being offered to Government, at the unit rate ruling in the London market. The total amount purchased during the official year 1897-98 was 108,934 lb. and payment was made at the unit rate ruling in the London market at the time of purchase, based on the actual outturn of Sulphate of Quinine after the bark had been worked up in the Nedivattam factory. The percentage of Sulphate of Quinine in the barks ranged from 3.2 to 6.40, the average for the whole quantity purchased being 3.95, and the amount paid for the 108,934 lb of bark being Rs23,999.65, or an average of annas 3-6-29 per lb." He observed that the system of purchasing bark to supplement the yield on the plantations had so far been a success from the Government's point of view, and as there was a considerable saving effected in freight and Home charges, by the opening of a market at Nedivattam it was presumed that the planters whose bark was accepted had benefited.

**SCIENTIFIC INVESTIGATION.**—There was no strong feeling in favour of the employment of an Agricultural Chemist, and a month ago the proposition put forward last year appeared to have fallen through. The Government of Mysore then submitted a suggestion that gave fresh life to that proposal. A circular issued on the 23rd July gave details, and the matter was also brought to the notice of the Governments of India, Madras, Travancore, and Cochin, whose replies are awaited. The Mysore suggestion comes up for consideration at the present meeting.

**SCALE PESTS.**—Mr. Newport proceeded to Australia in quest of ladybirds for the extermination of certain scale pests on coffee. His report giving full details is laid on the table, and the accounts are also before you.

**CHEMICAL MANURES.**—Owing to the active personal interest the Madras Government took in this matter, it has been decided that the Import Duties levied on certain chemical manures be abolished. The Government of India has now under consideration what manures, in addition to Nitrate of Soda shall be allowed to enter the country duty free.

## CHILLIES.

It is estimated about 100 tons of dried chillies are annually received in this country from the West Indies and the East and West Coast of Africa. The price at which they are sold appears to be liable to considerable fluctuation. In May 1898, "50 bags dull Zanzibar sold without reserve at 29s to 29s 6d; while 58 bags good Japan sold at 39s to 41s per cwt." A sample of capsicums grown at St. Lucia in the West Indies, dull and uneven in colour, were valued (in February last), in limited demand, at 20s per cwt. What is evidently required is an article bright in colour even in quality, and possessing great pungency.—*Kew Bulletin*.

## PLANTING NOTES.

**WHITE ANTS AND TEA.**—We attract attention to the very useful letter (page 250) on this subject from the Hon. Government Entomologist, Mr. E. E. Green. It settles the dispute between A and B very satisfactorily, since both are shown to be right!

"THE AGRICULTURAL MAGAZINE," COLOMBO, for August 1898, has the following contents:—"Barren Soils"; Rainfall taken at the School of Agriculture during the Month of June, 1898; Occasional Notes; Milking Experiments; Green Rubber; White-Ants as Agricultural Pests; The Trinidad Government Dairy Farm; The Value of Ashes and Charcoal; Natural Incubation and the Development of the Chick; the Uses of Wood; The Castor Oil Plant; General Items.

"THE JOURNAL OF THE JAMAICA AGRICULTURAL SOCIETY."—Illustration of Hackney Mare "Vivandiere," Frontispiece; Board of Management; Annual Report; Corn Preservation; A Cup of Coffee; Jamaica Hay; Hints before Starting; Bee-Keeping; Poultry Notes; Wheat Crops of the World; Sheep Breeding; Condensed Milk; The Kerry Breed; A Trip to the Ginger District; Notes from the Apiary; A New Way to Tell a Good Cow; Tobacco; An Experiment with Irish Potatoes; Odds and Ends Cuba's Extremity; Ladies' Corner; The Agricultural Outlook; Questions and Answers; Prices of Meat, Vegetables, &c.

**PLANTING IN SUMATRA.**—The annual report of the company for working the Pamanoeakan and Tjiassam lands refers to the bad coffee crop, but, on the other hand, to better results obtained with rice and cinchona. Plans for the establishment of a tea undertaking on the lands are being considered by an able expert. Concerning petroleum nothing can be said as yet, as a further exploration is necessary. The Djati wood working is regularly continued. Of rice 58,581 piculs were received, against 59,059 in 1896. The account closes with a credit balance of \$262,245 against \$196,661 in 1896. The total proceeds of the coffee crop was \$415,347, and the cost of production \$413,299, and further \$177,065 was spent to begin and maintain cultivations. The crop of cinchona was 130,382 kilos and afforded a profit of \$103,267, against \$12,002 in 1896. The profit and loss account opens with a deficit of \$1,225,541, and closes again with a debit of \$54,273, so that the total loss sustained from 1887 to 1897 amounts to \$1,279,815.—*L. & C. Express*, July 22.

**THE FLORIDA VELVET BEAN.**—This vegetable has been very much lauded as a valuable food and fodder crop,—says *Indian Gardening*, August 4. The *Gardeners' Chronicle*, we see, has identified it as *Mucuna pruriens* var. *utilis*. We had a suspicion that, like the much-lauded Soy Bean, we had its counterpart in India, and our suspicions are confirmed. We have here the *Mucuna nivea*, a very common Indian vegetable, known to the Natives under the name of *Kamach*. The following description of it by Dr. Roxburgh (vide Firminger's *Manual of Gardening for India*, 4th edition, p. 156) is quite correct. He says: "By removing the exterior velvet skin of the large fleshy tender pods, they are, when dressed, a most excellent vegetable for the table, and the full-grown beans are scarcely inferior to the large garden beans of Europe." We have in India many valuable food and fodder plants, the properties of which are either not known or not appreciated, until some one discovers the product in some other country, and raves about its value. Then we in this country wake up to the fact that we have had it with us all along! Our *Mucuna nivea* is probably identical with the *Mucuna pruriens* var. *utilis* of Florida.

"THE INDIAN FORESTER."—Edited by J. S. Gamble, M.A., F.L.S., Conservator of Forests, and Director of the Forest School, Dehra Dun, for July has the following contents:—Original Articles and Translations.—The Belgian Forest Exhibition and the Forest Service; Equilibrium between the crown and the roots of trees, by F. Gleadow. Correspondence.—Income Tax in England. Official Papers and Intelligence.—Estimate of Forest Revenue and Expenditure for 1888-99; Report on some Indian Gums. Reviews.—Forest Administration Report of the North-Western Provinces for 1896-97; Forest Administration Report for Berar for 1896-97. Shikar and Travel.—A Day on the Beas, by 'X'; On the Choice of Rifles for the use of Forest Officers, by 'O. C.' Extracts, Notes and Queries; Timber and Produce Trade; Extracts from Official Gazettes.

WANTED A GEOLOGIST.—It may be supposed that our oft-repeated call for a Geological Survey of the island is of recent date. But we first put it forward in 1884, and the late Mr. A. M. Ferguson in his paper on Plumbago for the Royal Asiatic Society in 1885, distinctly pressed the matter on public and official attention. Here is one passage from his paper:—

To set this and other like questions at rest, I submit that this Society would do well to use its influence with Government to induce them to borrow an officer, if his services could be spared, from the Geological Survey Staff of the Government of India, to examine and report, once for all and with authority, on the Geology and Mineralogy of our island.

A COMPLIMENT TO PLANTERS.—Mr. J. D. Rees in his "Nineteenth Century" paper on "Among the Elephants" in Travancore has the following:—

How much better the planter often knows the native than the honourable member who makes speeches in the Legislative Council, and how untrue it is to represent him as an oppressor! I who have known innumerable instances of kind treatment will here mention two, because they are amusing. An old woman and a young boy were treated by their employer's wife for months for a serious complaint, and finally completely recovered their health. They were then desired to resume work, when both plaintively asked whether it was really possible that the sahib and his wife, after treating them like their own children for so long, could intend them to work like coolies again! On another occasion an old woman asked her employer for 10 rupees, which she had vowed as an offering at the shrine of a neighbouring goddess whose festival was just then being celebrated. The next day she was seen picking weeds as usual, and when her master said, 'Why! I thought you were going to make your offering,' she said, 'I made it over to another cooly who was going.' But, asked the master, 'How do you know he will give it to the goddess?' 'Oh!' said she, 'I don't. All I know is, I vowed 10 rupees, and I paid 10 rupees; and if the goddess cannot look after the money herself, what can be expected from a poor old woman like me?' Of the hundreds of millions of India the vast majority are more like the cooly than the smart lawyers, who pretend to represent them and their feelings in the Legislative Councils. The honourable gentlemen represent a microscopical minority, and see far less of the masses than the European, who, as a planter, a sportsman, or an official of the older school, mixes with the people, talks to them in their own languages, and recognises the stage of development which they have actually reached, and their real capacity for the absorption of the benefits of highly elaborate and scientific administration. Indeed, the busy lawyer of the towns sees nothing of the people. I venture to say so last year during the Budget debate in the Viceroy's Council, and though taken to task by Indian friends whose opinions I respect and value. I will repeat the statement. The voice of the people does not thus penetrate into the Council Chamber.

CEYLON TEA IN AMERICA.—More correspondence from our indefatigable Commissioner; and he is hopeful of making a push with green teas and so relieving pressure by a few million lb. He also shows how Messrs. Finlay, Muir & Co. are making way with their "Monsoon tea"—all pure Ceylon—in Canada. But very hard is the intelligence he gives us of the trouble caused by the new duty and of an American tea house repudiating an order given by them, in what strikes us as a dishonourable way. Along with the letter we have received several specimens of attractive advertisements and a long list of the newspapers in which it was intended to advertise during July and August:

PLUMBAGO—now R7.0 per ton in Colombo—was, in 1858, valued at R80 per ton. Even in 1873 the price fell from R200 a ton to a few years before to R90, at which price there was no profit in digging. The highest price ever paid up to 1885 for the best Plumbago in the home market was £48 per ton. In the palmy days of "the plumbago mines" of the North of England, the blacklead obtained from them was valued at 30s per lb. or over £3,400 per ton! Ceylon plumbago is now frequently mixed with Cumberland blacklead in pencil-making.—Mr. Jacob de Mel drew £2,000 a year profit for eleven years from a Kurunegala plumbago mine.—As a general rule, plumbago shows itself not far from the surface, although the superior qualities are got deep down. These are but a few (out of a host of interesting) facts culled from the late Mr. A. M. Ferguson's Monograph on our one mineral of commercial importance.

MR. ALEXANDER WHITE has been appointed by the Secretary of State for Foreign Affairs, Curator of the Botanic Garden Uganda, about to be established "for the better examination and development of the agricultural resources of the Protectorate." Mr. Whyte had previously started a similar enterprise in British Central Africa, in which he was from 1891-7 Head of the Scientific Department. An interesting report of his work is given in the *Kew Bulletin* for 1895 (pp. 186-191). He made an important collection in North Nyasaland, a country which had never been previously explored botanically. A portion of the novelties was described in the *Kew Bulletin* for last year (pp. 243-300) and a further one is published in the present number.—*Kew Bulletin for July*.

RUBBER.—The Governor (de Brien) and the Fijian authorities under the stimulus of Kew are endeavouring to get the natives to revive rubber collecting from different rubber-producing trees in the forest; but so far the samples sent home are not very satisfactory. Here is the most promising:—

With the above was enclosed a sample of rubber from a tree known as "Baka" (*Ficus Obliqua*, Forest f.). According to Mr. Joske, this "yields quantities of rubber." Further, "it is used by the natives of the interior as birdlime with which at certain seasons of the year they catch wild pigeons; it is very easily procured. Incisions are made in the bark and underneath are placed bamboos which receive the sap as it pours out. It is coagulated by the means of heat.... the natives say they could get immense quantities of this without much trouble. Were it discovered that the rubber was of commercial value, it would prove an immense boon to the natives of these islands." although the specimens of "Baka" rubber received at Kew had not been sufficiently coagulated it was regarded by Messrs. Hecht, Levis and Kahn as suitable for mixing purposes, and its value today was placed at 1s to 1s 3d per pound.

## PLANTING IN JAMAICA.

(From Report Jamaica Agricultural Society.)

**EXPERIMENTAL FARMS.**—These Farms, devoted to the cultivation of Coffee, Kola, Cocoa, Nutmeg, and many other minor products, continue in operation, and notwithstanding the protracted drought and other adverse circumstances, the crops give evidence of good promise. While this Society cannot, at this stage, regard these Farms as remunerative or even self-supporting ventures, there is good reason for the belief, that their primary purpose of affording object lessons to the neighbouring peasantry is being fulfilled, noticeable improvements having taken place in the adjacent holdings, due, to a certain extent, to the more enlightened methods of tillage employed on these farms.

**APICULTURE.**—The interesting and remunerative nature of this occupation brings it daily into wider popularity. The flora of our island holds out excellent inducements to our people to engage in bee culture, and this fact is being brought to their notice through the medium of the Journal. Already in the parishes, notably in Manchester, Clarendon, St. Catherine, and St. Ann's, apiaries have been established with satisfactory results. Crude ideas have given place to the latest scientific knowledge on the subject. The Society has been approached on the question of employing a competent apiarist to deliver lectures on bee culture to the peasantry, and circumstances point to the development of a very important industry to the colony.

**RAMIE FIBRE.**—The Society has interested itself in the question of Ramie cultivation in Jamaica. A machine for the decortication of the Ramie Fibre, known as the "McDonald Boyle" Process, which appeared to fulfil the requisite conditions, was exhibited by Mr. L. Bernstein in Kingston, and was reported upon favourably by a committee appointed by the Society to inspect it. Efforts are being made to establish a company for the cultivation of this plant in the island, on an extensive scale, samples of the fibre having been pronounced by experts in England of excellent quality.

**RUBBER WITH.**—In view of the remunerative prices of Rubber in the American markets and the fact of a quantity of rubber producing plants growing wild in the colony, a committee has been appointed for prosecuting enquiries into the possibility of developing rubber industry, and a grant of £20 has been made for experimental purposes by the Society. Small samples of Jamaica Rubber have been submitted to the American market and are said to be of a desirable quality and investigations are being made in Jamaica concerning this product, by parties interested in the rubber trade.

**GINGER EXPERIMENTS.**—This product has received considerable attention at the hands of the Society during the past year. In the Christiana district, Mr. R. J. Miller, on behalf of the Society has very energetically carried out experiments on exhausted ginger lands, with manures, with gratifying results, and ginger cultivation in this fertile district is being widely extended on improved methods, due, in no little measure, to the active operations of the Christiana Branch Society. Similar experiments have been conducted at Mannings Hill, in St. Andrew, and at Lamb's River in Westmoreland, by the respective Branch Societies, and in these excellent ginger-producing districts, there is a growing belief that the industry, conducted on proper lines, is likely to prove very remunerative. The primitive, tedious and costly process of peeling ginger prompted the Society to address communications to the editor of "Invention," England, and the editor of the "Scientific American," pointing out the advantage that might accrue to the inventor of a machine for this purpose. In response to enquiries from Canada and the Straits, samples of unpeeled and peeled ginger have been forwarded, but so far no machine has yet been devised.

**TOBACCO.**—Of all the industries which this Society is striving to encourage, perhaps, none deserves, at

this juncture, to be brought into greater prominence than tobacco. With the Cuban product no longer in the market, the opportunities of Jamaica are most hopeful, and the Society, recognizing this fact, has distributed large quantities of seed for experiments, in districts where favourable conditions for its cultivation are apparent.

**ANALYSIS OF SOILS AND MANURES.**—The Society has lost no opportunity in urging upon cultivators, the use of fertilizers for their crops. Satisfactory experiments have been carried out on coffee lands, orange groves, ginger plots and other cultivations, and there is reason to believe that the valuable properties of these chemical preparations, are being extensively recognized and in this connection, the Board has pleasure in reporting that after a somewhat protracted delay the hope of securing the appointment of an Agricultural Chemist is likely to be realized.

## RAMIE FIBRE IN JAVA.

An experiment is reported in the Java and Straits papers with a new machine called the "Faure" for the preparation of ramie. It was conducted on Tjitrap Estate near Buitenzorg by Mr. du Perron the manager, and it is confidently said to have been a complete success. Mr. Bennett, Chief of the Engineering firm of Taylor and Lawson in Batavia, is credited with the praise for this triumph, for he introduced the machine into Java.

The machine was driven by a Pelton wheel of 35 h.p. The results summarised are:—2 coolies in 10 minutes can work 25 cattie of stem. This yields 1½ cattie wet fibre from cultivated ramie. Parcels of ramie were shown:—

(a)—Rough ramie fibre from the machine, afterwards worked in water and dried in the sun.  
(b)—Ramie soaked after washing for some hours in a lye (merang water) bath of 1c strength.  
(c)—Ramie after a lye bath of 1½c (d)—Ramie after a lye bath of 2c.

It appears plainly from experiment that the fibre lost strength from the lye bath but as the manufacturer does not require fibre treated with lye, seeing that this hinders the further handling (treasing) of it, the preparer need not bother about this chemical process.

The Faure machine answers entirely to what is required of it—the ramie fibre is prepared out of the stalk.

## BAHMEEN FISHING IN CEYLON.

K. G. D. B. writes to the (London) *Field* as follows from Slave Island:—In hopes that this may catch the eye of Colonel Osborn, who writes on the above and on nair fishing in "the Rod in India," I would venture to ask him if his remarks apply equally to Ceylon? At page 211 he says that thick water and evening fishing are suitable for nair fishing. Here in Ceylon I have observed large fish in the estuary of the Kelani river, but directly the monsoon burst these fish cease to frequent the river. I had a try or two of them, but the fishermen assured me it was useless after the burst of the monsoon. Can Colonel Osborn, or any other gentleman who has had experience of this fishing, kindly inform me whether any is to be had during the monsoon, and in what localities? Native fishermen here do not help one much, and look with contempt on a rod and line. Should the fish be spun for, or will it do to troll only; and is it of any use fishing until the nair are seen to be on the feed?

TEA AND COFFEE IN THE  
NILGIRIS DISTRICT.

A CEYLON PLANTER INVESTING IN TEA  
AND CINCHONA PROPERTY AT  
6,500 FEET.

SPLENDID COFFEE AT 3,000 FEET.

MR. T. C. ANDERSON of Maskeliya has just returned after a prolonged tour of inspection through the Nilgiris, where he was on a preliminary visit some months ago. The result of the present trip is that Mr. Anderson has purchased from, or through, Messrs. Arbutnot & Co., the Glen Morgan Tea and Cinchona property of 400 acres at an elevation of 6,500 feet on the Nilgiris. The tea is Assam Hybrid and promises well, although hitherto neglected—according to Ceylon notions—while the preparation with a hand roller and no proper Factory, has been a farce. In fact, though there have been tea gardens for many years in the Nilgiris District, tea "preparation" is in its infancy. A sample of the leaf prepared by Mr. Anderson with primitive appliances, has been valued very highly for flavour and liquor by Messrs. Somerville & Co. That Messrs. Arbutnot & Co. have not lost faith in Nilgiris tea—though, for some (perhaps family) reasons, they had to sell Glen Morgan—is shown by their now arranging to open 1,000 acres in tea adjoining Mr. Anderson. We have no doubt the advent of Ceylon-trained planters will work a change; for, though labour is fairly abundant, the coolies do not understand plucking, pruning and other work as done in Ceylon. They simply would not believe that coolies in Ceylon could get through so many trees a day, and as for Factory work, they know little or nothing about it. Mr. Anderson's Superintendent—Mr. G. B. Triugham, late of Deltota—greatly admires the Nilgiris tea, and when a proper Factory is equipped and some Ceylon coolies got to show the way, he has no doubt of fine tea being turned out.

Besides tea, Mr. Anderson includes in his purchase nearly 100,000 well-grown cinchona trees, most of them ready for barking whenever the market suits, and samples sent home lately realized up to 7d a lb. We have not learned the price paid for the property by Mr. Anderson; but evidently he is well-satisfied with his bargain, though no doubt he will have a good deal of factory and other outlay at the commencement.

Coming down from Glen Morgan to Pykara, Mr. Anderson passed through a renovated coffee property which astonished him: 200 acres of our old staple (at about 3,000 feet elevation) were laden with a splendid crop, the bushes all looking healthy and vigorous, with little or no signs of *hemiteia vastatrix*. The renovation consisted of liberal manuring and irrigation and *planting with shade trees*. There can be no doubt of the good effect of shade; for, where not available, the disease takes hold. Several descriptions of trees—dadap, 'potatoe' trees, &c.—are used for shade and all seem to do well. Is it too late for some of the owners of coffee fields in Uva to try the effect of a quick-growing shade tree?

Mr. Anderson is delighted with the climate and scenery of the Nilgiris at the present time, though the season has been an unhealthy one, owing to an outbreak of typhoid, due to bad water. The dwarf nilloo (*strobilanthes*) is in flower on the rolling patenas around Utacamund, and the flowers give a lavender-coloured tinge to the downs and the general outlook. Game being preserved, the number of deer and other

animals encountered in travelling is very large. When the railway is open to Coonor, the journey from Ceylon will be shortened. For the present, Mr. Anderson left Ooty on 15th August, landed at Colombo within 48 hours, via Tuticorin.

TEA, AND COOLIES, AND PREPARATION  
ON THE NILGIRIS:—IN CORRECTION.

Colombo, Aug. 17, 1898.

DEAR MR. EDITOR,—Just a line to explain that my remarks about the Nilgiri Coolies knowing nothing of tea manufacture, referred only to Glen Morgan. There are several Ceylon planters over there and some estates turn out very fair teas—see the London reports. In your remarks, it reads as if planters and coolies on the Nilgiris generally knew little of manufacture. I spoke only of the one estate "Glen Morgan."—Yours truly,

T. C. ANDERSON,

[We stand corrected and give prominence to Mr. Anderson's letter.—ED. T.A.]

THE INDIAN TEA ASSOCIATION  
(LONDON.)

ANNUAL MEETING.

The eighteenth annual meeting was held at the offices, St. Mary's Chambers, 14, St. Mary Axe, on Tuesday last. Mr. W. H. Verner the senior vice chairman, was called upon to preside.

The Secretary (Mr. Ernest Tye) read the notice convening the meeting.

REPORT AND ACCOUNTS.

The Chairman moved the adoption of the report and accounts, and observed that one or two matters mentioned therein were in an inchoate state, not having been finally dealt with, and notably the very important question of Indian Currency Exchange. They must await, before they could put forward any very definite views as to that, the result of the examination now being made into the matter by the Currency Committee. The question of inland river freights was also still under consideration. This was a matter of very great importance to the Assam tea industry, and it was hoped that the very able sub-committee which had been appointed would be able to meet the representatives of the shipping companies so as to get the matter placed on a satisfactory basis for tea planters. He might mention that he had been approached privately, not as a member of this Association, to consider the possibility of forming some new river shipping agency in the interest of Assam tea planters, but he and others who considered the subject with him thought that existing agencies were sufficient, as there was no reason to suppose that the steamship companies would not be very glad to meet the planters half-way. It was hoped, therefore, that the committee would be able to make satisfactory arrangements. The one great thing which the report brought home to every one of them was the necessity for new markets. Day by day it was being brought home to them that they must not sit still. They must try to extend their markets not only across the water, but also on this side of the water. Operations were being commenced by private enterprise with a view to extending markets, but hitherto the great and powerful connection of Sir John Muir and Messrs. Finlay and Company had been the only producers who had been also engaged in pushing their teas as ordinary merchants in foreign countries. For that, he thought, the tea interest was very much indebted to them. Of course they were proceeding on a business basis and seeking to make a profit, and were not doing it simply for benevolent reasons, but that made their chances of success all the greater. With regard to the Association itself, he had had the privilege of being connected with it for ten years, and though the Association had not done all that it might have done,

nor all that it was hoped it would have done, it had still been of some use, and he thought that by degrees it would gain a larger and greater importance in the eyes of the public. The feeling of those who had conducted the work of the Association for years past was that it was time almost for some of them to stand by, and to allow new and younger blood to come in with fresher ideas.

Mr. J. N. Stuart seconded the resolution, and speaking with regard to the Currency Committee, &c., said that unfortunately the committee was unable to take any evidence from the Indian representatives this month, but the Indian representatives hoped that they might be heard in October. The point that he had endeavoured to put forward in the memorandum he had sent in to the committee was that they could not expect to get any great benefit from a low exchange, but that unless they were put on a footing with other silver-using countries such as China, they would be severely handicapped in opening out foreign markets. A low exchange would of course have the effect of reducing the cost of tea to themselves, but on the other hand it would have the effect of opening out new tea to a still greater extent than had already been done, and that would be a very serious matter to the existing tea gardens. A letter in the *Calcutta Englishman* of July 7 pointed that there were only two ways of meeting the difficulties before tea growers arising from the large supplies of tea—one by the curtailing of supplies, and the other by the opening out of new markets. As regarded the curtailing of supplies, all connected with Indian tea were not likely to agree to reduce their output and to stop extensions. He noticed from the report of two large companies that during the years 1897-98 they had put out or had contemplated putting out over 10,000 acres of tea, and if people would keep on extending to this enormous extent the markets could not hope for any relief. As regarded the opening out of new markets there were certain suggestions made in the latter of the *Calcutta Englishman* which would no doubt be considered by all connected with the tea trade. One of them was as to the consumption in India itself, a very important fact being that 7,000,000 lb. of China and Ceylon tea are imported into India and consumed there. There were no doubt many present who had endeavoured to dispose off—tea among the natives of India, and the great difficulty they had always met with was how to sell it to them cheap enough, for although the natives were very glad to drink tea if it was given to them, they did not like to have to buy it. Within the last year or two (as the article pointed out), although the individual quantities of tea sold were small, the aggregate consumption had been increasing. A good many of the members of the Association once invested in the Indian Tea Supply Company, which had a capital of one lac of rupees. That company went on losing money every year, but had 35,000 rupees still to lose in its mission for the disposal of Indian tea to the natives, and if they could replace the 7,000,000 lb. of tea imported from China and Ceylon by Indian tea, that would be some help. With regard to Russia, they would, perhaps, have noticed in Messrs. Gow, Wilson, and Stanton's circular that the direct exports from Colombo to Russia had increased from 178,000 lb. last year to 1,198,000 lb. during the first six months of the present year. This was an increase which they would do well to follow up if they could see their way. Another suggestion was that Tibet might be opened out. In that country brick tea was used, and the *Calcutta Englishman* quoted the opinion of one traveller to the effect that it was nearly all brick and very little tea; still, the consumption would help the trade in disposing of some of their lowest quantities, if the country could be opened out. Five or six years ago, when he was in Calcutta, he was consulted by the Government with reference to a treaty which was then being made with China for the opening out of Tibet, and it was finally agreed that for five years the Government of India would not press

for the import of Indian tea into Tibet, but that at the end of that time they should be free to send tea into that country. The attention of the Calcutta Association should be called to the fact that that time had now about arrived. They wanted, of course, also to open markets in other parts of the world, for while Ceylon exported 20 per cent. of her produce to foreign countries, India only exported 10 per cent. If they could establish the "open door" with surrounding countries and press forward extensions as successfully as was being done by the mission which was now being directed to America, they might by degrees carry through that very important part of their work, which consisted in opening out of new markets.

#### THE USE OF METAL CHESTS.

Mr. Leckie asked if the Association had got any further with the steamship owners in the matter of the metal chests.

The Chairman said they had heard nothing more about it, but the Association was quite prepared to maintain the rights of any members of the Association to use the metal chests.

The Secretary; that the Association had protested against the assumed right of the shipowners to decline to pay ullage on metal chests, and the shipowners had never replied to the protest.

Mr. Leckie: How do we stand in the matter of ullage?

The Chairman said they were waiting until a specific case came up before taking action.

Mr. Leckie said that when he saw Mr. Westray some time back, that gentleman explained that the difficulty with the shipowners was that they were afraid that there were a great many claims held back, and that if they met any claims their position would be very much prejudiced in the future.

The Chairman said he understood that the shipowners were finding that the use of metal chests did not increase their liabilities at all. The Association had told the shipowners that they could not accept their view, and they were now waiting until the question was further raised.

Mr. Leckie said that his own claims were trifling, amounting to only 301 lb. on 1,093,582 lb. Therefore, so far as he was concerned, as he had told Mr. Westray, the pretension put forward by the shipowners was a monstrous one. The position of the Association should be positively defined.

Mr. Wallace said that if Mr. Leckie would send in his claim to the committee of the Association they would go into it.

#### CROP ESTIMATES.—THE OPENING OUT OF THE RUSSIAN MARKET.

Mr. Seton called attention to the report of crop estimates, which he believed was occupying the attention of a good many members of the Association both here and on the other side, and asked the Chairman to state what were the ideas of the committee with regard to the future. There was an idea that the original estimate which was wired home was rather a useless thing, and it had been suggested that it would be a good thing if the Association in Calcutta were to revise the estimates received from the managers and communicate a reliable estimate to the Association here somewhere about the month of August. With regard to the opening out of new markets in Russia, it was stated in the report that the committee proposed to devote a certain proportion of their surplus funds to that purpose. For a great many years he had ventured to urge that this Association should devote more of its large funds to the development of Russia, which he regarded as an equally important market with America, if not more so.

The Chairman said that with regard to the estimates of the crops it had been resolved that, with a view to ensuring greater accuracy, the Indian Tea Association should arrange to procure special estimates from managers, to be submitted by the end of June, and published immediately afterwards, and that no estimate should be published before that time

With regard to Russia, what was stated in the report was that "the committee recognized the importance of giving attention to other markets besides that of America—especially to that of Russia—and will, at the first opportunity appropriate a portion of the funds at their disposal towards that object." Personally he very much agreed with what had fallen from Mr. Seton, and that the sooner they made a beginning—however small—in Russia the better. At the same time every great commander had recognized that it was sometimes a mistake to divide one's forces; it was not always a case of *divide et impera*; sometimes there was a failure. They had not a great deal of funds, and it might be found impossible—certainly during the current year—to divert anything away from America. But it was quite evident from what Ceylon had done that there was an "open door" in Russia.

Mr. Arthur Thompson observed that he was quite satisfied that the Russian market was being properly worked both here and in Russia by the buyers themselves. There was no doubt that after a short time Russia would take a large quantity of tea, especially fine tea, and that a large and increasing trade would be done with the country. Whether it would be worth while to spend there the small funds at the disposal of the Association, or whether it would be better to continue the work in America, which had shown such large progress, was a question for consideration.

#### THE AMERICAN TEA MARKET.

Mr. Blechynden, the Association's American Commissioner, on being called upon by the Chairman, said he had very little to add to his reports, but one or two matters had come up since he had submitted his annual report, and about these the members of the Association would perhaps like to hear something. One was with reference to the duty on tea which affected America considerably, a duty of 10 cents per lb. having been imposed as a war measure. It was looked upon as a temporary measure to tide over their present financial difficulties, and it was also thought that this being a tax which affected the poor man it would be used as a party cry and would therefore be removed before October. Either it would be removed at that time or a duty on coffee would also be imposed. As soon as this matter of the taxation took tangible shape buyers, by way of precaution, bought large quantities of tea, and for the present the market was practically paralyzed. There would be very little done in the way of purchases by grocers and other retailers for the next two or three months, and possibly until something more definite was known about the future of the tax. Statistics showing the increase in the sales of Ceylon and India had been prepared by the Association, but it was rather difficult to separate the proportions. Taking the two countries together there had been an increased export to America of 3,000,000 lb. over last year, and the tea consumption of America had increased in no other direction. The imports from China and Japan had fallen off somewhat. The position in America at present was very different from what it was even two years ago. It was then a very difficult thing to find retailers stocking Indian teas. It was only where teas were being advertised by the funds of this Association that retailers found it worth their while to stock them. But now it was a common thing to see Ceylon and Indian teas advertised by the grocers themselves. There were two channels through which their teas reached the consumer. One was the package firms and one the grocer's ordinary bulk tea, such as was sold over the counter in this country. Indian tea was now being largely substituted for the so-called English breakfast tea. Oolong tea, mixed with green tea, and sold as mixed tea was being largely consumed by the poorer classes. In the last few years attempts had been made to prepare a tea suitable for the American market, known as Nannuna tea. The earlier samples sold in America were not very favourably reported upon, but recently he had seen some

samples of tea which were not only favourably reported upon but were quoted at a price at which substantial orders were immediately forthcoming. The only one was that this tea was not prepared upon any scale in India, as it had only been prepared in an experimental way in a few places, and at a meeting held in Ceylon Mr. Mackenzie, the Ceylon commissioner, suggested that some support might be given to the producers of this green tea in the form of a guarantee against loss in its experimental preparation.

It was not, perhaps, a matter to be brought before a general meeting, but he would wish, with the permission of the Association, to prepare a short letter in reply to an inquiry he had received through the "Ceylon Times" on this particular subject. His own views had changed, and he was now of opinion that a great deal was to be said in favour of the preparation of green tea, and he thought it was a matter which should be brought permanently before the attention of planters. There was one point which he did not think the Association had placed before it, and that was that since last year there had been a considerable change in the position of the American market. About this time last year an agitation was started by the importers of tea into America for the improvement of the quality of the tea. But it was a matter which rested absolutely in their own hands. The Americans sought the support of their Government, and instituted certain standards, and the matter was very fully discussed, with the net result that a higher class of tea was now going into America. It was a little more expensive, and could be quoted perhaps 2s 1 lb. dearer. Fortunately for the India and Ceylon tea industry the Indian teas were of such a character that there was no fear of adulteration, and that being so, the quality of the tea to be sent there need not necessarily be raised. India was, therefore, in a better condition to compete as regards price with the teas coming from China or Japan, inasmuch as very low grade teas used formerly to be sent from those countries. The average price of the teas landed in America previous to last season was 13 cents per lb.

Mr. Arthur Thompson asked what price was put on the Nannuna teas.

Mr. Blechynden said from 18 cents to 23 cents. If he might throw out a suggestion it would be that the growers of green teas should have an understanding among themselves. In the case of a very high-class tea coming from Ceylon and known as the "Norwood" tea, when first sent to America it was found to be very suitable for the market, and fetched the extraordinary price of 80 cents per lb. Other firms were enabled to purchase those teas, and the popularity of the "Norwood" tea was so great that more "Norwood" tea had been sold in America than was grown in Ceylon. It seemed to him that it would be a very easy matter for those gentlemen who were proposing to experiment in the manufacture of these uncoloured green teas and Nannuna teas to arrive at some understanding whereby they would not be competing against each other and run their tea to ground. At present they could get very reasonable prices, but if two or three shipments were offered in different parts of the country their "drummers" would be competing against each other, and the result would be in accordance with the usual experience in the country that no profit could be got out of the tea.

A vote of thanks to the Chairman brought the proceedings to a termination.—*F. and C. Mail*, July 29.

#### CLUNES ESTATES COMPANY, LIMITED.

##### THE REPORT

was as follows:—

CLUNES DIVISION.—Superintendent: Mr. T. S. Luce. Tea in bearing 340 acres; New clearings 50 acres; Forest 764 acres; Total 534 acres.

ERACHT DIVISION.—Superintendent: Mr. C. F. S. Shaw. Tea in bearing 345 acres; Tea planted 1891—

20 acres; 1896-7—50 acres; 1898—92 acres; Forest and Waste Land 246 acres; Total 753 acres. Grand Total 1,317 acres.

The Directors now beg to submit to the Shareholders the Accounts and Balance Sheet of the Company, duly audited, for the year ending 30th June, 1898.

After providing for Depreciation of Buildings and Machinery, the result of the year's working shows a nett profit of R29,121-50, to which has to be added a balance of R1,852-37 brought forward from last year, making the total at credit of Profit and Loss Account R30,973-87.

The crops secured amounted to 395,535 lb. Tea, as against 388,842 lb. last year, being 24,465 lb. short of the estimate, due to unfavourable weather in the early part of this year. The nett average sale price was 32-22 cents per lb., the cost laid down in Colombo being 21-60 cents per lb., both of which figures under the circumstances may be deemed satisfactory.

With reference to the Coast Advances and Doubtful Debts Reserve Account, the Directors have carried to the credit of this account R700, the premium on 20 shares issued during the year; R86-98 Profit on Rice, and a sum of R468-83 out of this year's profits, and have written off R275-36 for Coast Advances irrecoverable. The balance now remaining at credit of this account the Directors consider will provide for all bad and doubtful debts due to the Company.

During the year another 50 acres of jungle have been opened up and planted on Clunes Division, and 92 acres on Erracht Division.

The estimate for the 1898-99 season is 400,000 lb. Tea against an expenditure on working account of R86,540.

In accordance with a notice already circulated to the shareholders, their sanction will be asked for permission to alter the memorandum and articles of Association, to enable the Company to borrow on mortgage. This has been necessitated by the subscribed capital being insufficient to cover the capital expenditure incurred on the properties, the cost of bringing the 200 acres of young tea into bearing, and providing the additions to factory and machinery necessary to cope with increase in crops. The required amount is estimated at R50,000.

The Directors recommend that, should the arrangements for the mortgage be carried out, a dividend at the rate of 8 per cent be paid on the paid up capital.

In terms of the articles of Association Mr. W. H. Figg now retires from the Board, but is eligible for re-election.

The appointment of an auditor for the current year rests with the meeting.

## PLANTING NOTES.

**PLUMBAGO.**—Hitherto the Kurunegala District in the North-Western Province has been the chief scene of the plumbago mining industry. But we learn with some surprise that for some time past a larger quantity has been obtained from the Kalutara District in the Pasdun Korale than even from the North-Western Province. We believe also that natives are hard at work in the surrounding country sinking pits; and many plots, as we know, have recently been purchased from Government for Plumbago mining. In other parts of the Pasdun Korale we are told many Plumbago pits are now in full work, and although it is, we believe, almost impossible to discover what quantity arrives in Colombo from Kalutara, Kurunegala, and other districts of the island, it is well-known that a very large proportion, if not the largest portion, and certainly some of the very best quality, comes from the Kalutara District; which seems to have a prosperous future before it, as the scene of Plumbago mining. Favourable indications of the existence of the valuable mineral have also been found on Ancoimbra estate, Matale, where Mr. Webster is about to collect coolies and sink shafts; and in many parts of the country inquiries are now being made as to what may be considered likely indications of the existence of the mineral.

**PLUMBAGO DEPOSITS.**—It is very interesting to note how closely allied widely differing forms of carbon, are in the geologist's list. First comes the Diamond, next Amber, then Plumbago, next Coal, Peat and Petroleum—all having their common basis in carbon. The diamond is pure carbon in a crystallized form; amber has 79 per cent of carbon; and plumbago has been described as "simply an impure form of native carbon"; while we need scarcely say how much carbon enters into the composition of coal, peat and petroleum.

**OUR PLUMBAGO EXPORT AND WHERE IT COMES FROM.**—Our contemporary reminds us that some of the plumbago carried by rail comes from the Southern Province and part from Mirigama (W.P.) as well as Kegalla (Sabaragamuwa).—It is a striking fact that there appears to have been very little working or export of plumbago until about the beginning of the "coffee" era. Dr. Davy, Scientist though he was, has only the scantiest reference to graphite or Plumbago and strangely enough, the neighbourhood of Balangoda is the place where he found it. Here is the passage:—

Belonging to the inflammable class of minerals, I know of two only that occur in Ceylon, viz. graphite and sulphur. Graphite in minute scales is very commonly disseminated through gneiss, and it occasionally occurs imbedded in this rock in small masses. In the latter form, it is pretty abundant in the neighbourhood of Balangoda, in the upper part of Saffragam. It is highly probable, it may be found in sufficient quantity to be collected and exported with profit.

That was in 1821. In 1837 there was an export 3,700 cwt.; in 1847=9,249; in 1857=33,497 cwt.; in 1867=45,836 cwt.; 1877=96,792 cwt.; 1887=238,600 cwt.; 1897=379,415 cwt.; and we expect that the year 1898, both in quantity and money value will, far excel all its predecessors.

**A FINE SALE OF HIGH GROWN TEA.**—High Forest comes again to the front. A fine invoice of tea from High Forest estate was sold in the sale on Wednesday, and realised the following prices:—

31 half-chests	Broken Pekoe ..	85 cts.
25 "	Orange Pekoe ..	65 "
21 chests	Pekoe ..	43 "
	Average 70 cts.	

This tea was, we believe, bought for the Russian market.

**THE NEW RANGOON RICE** is gradually finding favour with the labourers up-country, if one is to judge by the large and regular parcels which arrive from Rangoon by almost every steamer. The Bibby boat "Shropshire" expected today is bringing another consignment. Rumour has it that the coolies exchange this rice for Indian with the boutique keepers by giving them something extra for every measure they buy. There is more than one kind of Rangoon rice, and I am sure if the best quality is imported and sent to the Estates, it will have a better reception than that afforded to the stuff sent up now.

**POLISHING TEAK TO IMITATE ROSEWOOD.**—The first coat of polish should be coloured red with sanders or Bismarck to give a red undercoat and to kill the oil with which the frames are treated. The tone required may then be gained by the aid of brush polish; a small quantity of lampblack or gas black may be mixed with the red polish, and perchance a little rose pink in order to gain the exact tone required. Thin out with spirits, if necessary, and aim at gaining the result by several applications rather than by one. Apply with a camel-hair brush. When dry, apply a thin coat of spirit varnish with a trace of red in. When the varnish is dry it is ready for finishing either by polishing or several coats of varnish. Take care not to rub off any colour at the edges. Keep the face of the rubber perfectly flat yet pliable when used for levelling the varnish or for the flat portions.—From "Work" for August.

## Correspondence

To the Editor.

## ANALYSIS OF COCOA TREE.

Pathregalla, Potuhera, June 24.

DEAR SIR,—Mr. Cochran has asked me the following question:—

“Have you ever made an estimate of how long a leaf lasts? In other words by what number would you multiply 29 lb. leaves to get the whole leafage for one year?”

27 lb. was the green weight of leaves from the tree I sent him for analysis.

Would you mind looking up your files to see if you can find the necessary information, and send it to Mr. Cochran.—Yours faithfully.

## H. DE SANCTIS.

[Very sorry we cannot oblige; but Mr. Cochran is such a regular reader of our *Tropical Agriculturist* that if the information had been already published, in our monthly files since 1881, he would be sure to know. The “fact” wanted is just one never yet verified by cacao planters and they should now take observations in different districts in regard to this particular enquiry and also others of equal importance to the Chemist and Fungologist.—Ed. T.A.]

## INSECT PESTS.

Sir,—At a time when attention is being directed to insect pests, we think that the enclosed copy letter received from the Chiswick Soap Co. together with the article from the *Planters' Gazette* has been more than mere trade interest, and that you may care to publish it.

We may add that we have a small quantity of the Chiswick Compound which we would be prepared to issue to Planters' free of charge except our Godowns here on the understanding that they would experiment with it on cocoa or tea, &c, and report results.—Yours faithfully,

A. PHILIP & Co.

Chiswick, London, July 6, 1898.

Messrs. Alexander Philip & Co., Kandy, Ceylon.

Dear Sirs,—No doubt you will have heard of and very probably have seen the book recently published by Mr. Watt as to the result of his visit to some of the Tea Gardens and he mentioned in same that he is of opinion that insecticides are of little or no use, an opinion which is entirely at variance with what is done in all other countries and opposed to the opinion of many of the principle planters who are using Chiswick Compound with very excellent results. We enclose you copy of an article in an old *Planters' Gazette* recommending the use of the Chiswick Compound, evidently written by some planter who is now using the wash although we do not know in the least who the writer is. We make these few remarks for your guidance.—Yours truly,

(Signed) CHISWICK SOAP CO.

It is a somewhat extraordinary circumstance that so little is known about this pest. It has baffled the skill of all the scientists at home. If would appear to be established that any extreme climate condition produces it, and that is about all that is absolutely ascertained. Indeed, it would seem that atmospheric changes have more control over it than

anything that man can devise to counteract it. We do not agree that insecticides are no use, for there is little doubt that considerable advance has been made in this, and that the Chiswick Compound mitigates its ravages to a great extent; and although we do not imagine that this, or any other compound, will thoroughly eradicate it, still the amount often saved is very considerable; and a perseverance with it is to be recommended to those whose gardens suffer from the pest. So long as no control can be obtained over the elements, so long will red spider reign supreme. The extreme drought, now in some of the Tea districts, fosters it, and the same will hold good if we have continuous downpour after the drought breaks. The cases of cholera, which one so often sees, are excellent examples of what red spider is to the tea bush; and every doctor one has ever heard on the subject, will tell you that unless the patient's blood is in a certain state fit to receive the poison, cholera is harmless; that some subjects—weakly ones—are more prone to be attacked, no one will deny, so it is with the tea bush. The weakly ones fall victims first, and every annual attack leaves its victim more susceptible to attack as the constitution, so to speak, is weakened; and in addition to using Chiswick Compound freely, attention should also be paid to the bush by manuring or top-dressing, which are the equivalents to the course of soups, essences, etc., supplied to the human subject. We consider that those who follow the course will have no cause for regret, and we confidently assert will be well rewarded for their trouble.

The application of dry sulphur has for years been recommended as a cure by some of our oldest planters, and if our memory serves us rightly, by none more strongly than by Mr. Christison, when a tea-planter in Darjeeling. Now it stands to reason if sulphur applied in a dry state, was to a certain extent beneficial in checking the ravages of red spider, it must be much more so if applied in a soluble state, and although we are not possessed of the secret of the preparation of the Chiswick compound, one's olfactory nerves are not long in discovering the fact that sulphur is one of the principal ingredients. Many may not be aware of it, but it is a fact that sulphur is not soluble in ordinary water, except by the aid of lime; and the application of dry sulphur must be more expensive and, we should say, less likely to give out those gases which are necessary to act as insecticides. We notice Dr. Watt says he does not believe in insecticides, but we fail to grasp what he would have the planter to do. Is he to sit down and fold his hands, and say, it is “*kismet*,” or to try some remedy? If the planter does try some remedy, even if it fails, he has the satisfaction of knowing he has done his best in his proprietor's interests; but we venture to express an opinion that the Chiswick Compound has gone beyond the experimental stage; and, if it is not a cure, (and we don't say it is), it certainly mitigates the ravages of the red spider, and it remains to be seen whether a series of applications of, say, 3 to 4 years will not eradicate the disease, or, at any rate, leave so little behind it that it would not enter into a planter's calculations. The Chiswick Compound Co. should keep statistics of the factories that have been supplied with their Compound, and how many years in succession the same portion of a garden has been treated; and the information now wanting could be obtained for the benefit of future generations.—*Indian Planters' Gazette*.

## EUCALYPTUS: A CURE FOR TYPHOID FEVER.

Ang. 2nd.

DEAR SIR,—The planting correspondent of “*Indian Gardening*,” whose letter you quote on page 202, is quite right in calling attention to the general neglect of the *Eucalyptus* by the medical profession in India and his remarks apply perhaps with greater force to Ceylon. Being only an amateur medical practitioner, un-

biased by any profound reading for competitive examinations, I have made use of *Eucalyptus* in many forms and always with excellent results. The oil is a specific for malarial fever and ague. A decoction of the young sacculent leaves of the blue gum makes a good fomentation for sprains and rheumatism: for lung complaints the inhalation of steam from the boiled leaves is very efficacious, and for cold in the head and the feverish headache of influenza, the young leaves dried and powdered and used as snuff make a very simple and pleasant remedy.—Yours faithfully,

A CEYLON PLANTER.

### GREEN TEAS AND CARDAMOMS.

August 4

DEAR SIR,—It was with much interest I read the letter from "1874" (see page 191) re green tea. The proposals of the writer are very good, some but one must begin and why does not "1874" take up a lead and show the way by sending some green tea to America?

The prices at present are most disheartening and the position of many estates is clearly shown in Mr. Westland's letter and it would be well to have a try in green teas.

Would it not meet requirements if you Mr. Editor gave us some articles on "Manufacture and packing of green teas" and then if a few of the leading planters who have free hands would take the lead we might be able better to get into America.

Tea planters are unable to do much being employed by Companies which do not seem to like experiments.

I am astonished at your note in July 16th re Cardamoms did not bring in letters from cardamom planters.

Consideration must be taken to the fact that cardamoms will only crop for a limited number of years and that in the 4th and 5th year from planting, one gets the largest and finest crop. Thereafter both the amount realised per acre diminishes considerably and the fruit gets smaller in size.

The market is fully 50 cents lower this year than last per lb. and with the very big acreages now being planted up there is every likelihood that the price will go down very much more.—Yours faithfully,

X. Y. Z.

[We have called on "1874"—who is an Indian Tea Planter and perhaps not at liberty to do as he writes—to send us some letters on the manufacture of "green teas."—We took it for granted that the limitations of cardamom planting were understood; and the figures referred to were given as maximum and very exceptional ones.—Ed. T. A.]

### WHITE ANTS AND THE TEA BUSH: THE SOLUTION OF THE MYSTERY

Eton, Pundaluoya, Augt. 6.

DEAR SIR,—With reference to the letter, under above heading, in your issue of 3rd inst, the fact of the matter is that both disputants (A and B) are right—in their several statements. The confusion arises from the fact that many people are under the impression that there is only one kind of 'white ant' in Ceylon: whereas we have many different species—all with different habits. There is the common gallery-forming white ant (*Termes Taprobanes*) that at-

tacks dead but apparently sound wood, including sawn timber: another species that lives only in soft decayed wood: others whose habits have not yet been studied: and finally a species that certainly does feed upon the living wood of what are to all interests and purposes healthy plants. It is the latter species that I described and figured in my little work on, *Insect Pests of the Tea Plants*' p. 93. This insect is quite distinct from the common species. It makes its entrance into the plant underground, often by the tap root, works upwards through the stem and branches, and eventually leaves little but the shell of the plant. As the sap continues to circulate in the outer parts for sometime, the plant does not show signs of the damage until it is past remedy. The only thing to be done then is to carefully destroy that colony of the termites, to prevent any further attack. The stem of the injured stem will be full of the insects and others will be found in extensions of the galleries under ground.—The 'queen' of this species has not yet been found. If any of your readers are afflicted with this pest, I should be greatly obliged if they would send me a supply of living specimens (*properly packed in tin*) of the different stages of the insect.

Dr. Watt gives a large amount of interesting and valuable information about different species of 'White Ants,' in his recent elaborate work on "the Pests and Blights of the Tea Plant." Yours truly,

E. ERNEST GREEN.

### "IMPROVED PRUNING OF TEA"—AND BETTER CROP.

SIR,—I have been very much misunderstood in my letter published in the *Tropical Agriculturist*. At the end of my letter I said, that with pruning as detailed by me and liberal manuring every year, the yield of a whole estate should not stop short of 1,600 lb. of tea per acre.

The comment on this sentence (see page 46) is as follows: 1874 has startled our local community by his exposition of an improved system of pruning and manuring, which he says, ought to raise the yield of AVERAGE estates to 1,600 lb. an acre. Please note that I said "the yield of a whole estate" and not the yield of average estates. I imagined that the average planting mind would know that I meant the maximum and not the average.

This system which I have advocated is probably the oldest of all, and was recommended by Dr. Jacobson about 45 years ago. The Indian Tea Cyclopædia of 1881 will also show any one who troubles to read it, that the cutting down of bushes is strongly forbidden except only in the case of individual bushes which are evidently dying. I have not got any improved system, but I have reverted in practice to what all will acknowledge as common sense in theory. And as far as I know I am the only Planter who has tested the theory over a series of years, and found it to succeed in the main object, which is to improve the bushes. I ask to be informed if anyone has tested the plan of not cutting down and found it to fail?

I believe any planter who reads my letter to mean that I expected "1,600 lb. of tea from average estates" is either deficient in common sense himself, or did not give the matter sufficient thought. There is nothing in the bulk of my letter to show that I expect the system of pruning to work like a patent manure—could such

a man imagine the amount of labour required to make 1,600 lb. of tea per acre? 1,600 lb. of tea=6,400 lb. of leaf. Say that each plucking of the estate takes 5 days, then there will be 6 pluckings in the month and in 2½ months there will be 50 pluckings. Divide 6,400 by 50 and we have 128 lb. of leaf for each plucking per acre. Three pluckers would have to pluck 42¾ lb. of leaf to get in 128 lb. And this means that the bushes must yield sufficient leaf to take the best work of 3 pluckers per acre, at times 2 per acre and in heavy flushes 4 or 5 per acre. I believe the tea bush capable of this; but I doubt whether any estate can afford to keep up the enormous labour force required, even if it had command of local labour when required.

In time to come no estate will be able to keep up any, but the best plots of tea; there must be no waste for cultivating vacancies, the whole area must be covered with leaf—and when times become really hard for good estates, the periodical cutting down which is now universal will become a thing of the past. Planters will find out means of keeping the yielding area intact from year to year, and I have only tried to suggest the means. I am looking ahead. It is no use to merely keep level with the times and allow each improvement to be discounted by the fall in prices. One must go ahead by careful trial, and from actual experience I find that a certain system of pruning is the best. 1874.

#### HYBRIDIZING COFFEE.

DEAR SIR,—Judging from what I have read about the Coffee hybrid in the T.A. and from some experiments of my own 15 to 18 years ago, I am inclined to think that this new hybrid is worth trying, and therefore I am anxious to procure some seeds. So if you can assist me by informing me of the name and address of the Wynaad planter who claims to have discovered the hybrid, when you, as you probably will, come across them, I shall feel very much obliged. My experiments were not made with a view to find a H.V.-resisting type of coffee by hybridising, but to find one among the coffee then existing, and I believe I succeeded; but through misfortune there has been no result, all my plants having been killed by green bug. I would go more into details, but there is no use in writing about what has been practically a failure. If circumstances had permitted, the result might have been different as I might have been able to save a few of the plants.—Yours truly,

OLD PLANTER.

#### THE FLORIDA VELVET BEAN.

DEAR SIR,—It has more than once occurred that a so-called new product coming with a great reputation from abroad has proved to be a familiar plant with a new name. It will be remembered that the famous "cow-pea" turned out to be *Vigna Catians* which is represented in Ceylon by the legumes well known to the Sinhalese as *Gas-me*, *Li-me*, *Nil-me*, &c., and of which the common *Me-kaval* is only another variety.

The Florida velvet bean which was originally wrongly named *Dolichos Multiflorus*, has now been identified as *Mucuna pruriens*, var. *utilis*, a cultivated variety of the plant commonly known as cowhage or cowitch.

*Mucuna pruriens* is known locally by the Sinhalese name *Achariya-pala*. Dr. Trimen says that it is found in the "dry and intermediate regions; rather common." The Queensland *Agricultural Journal* for May last has a good plate illustrating a description of the plant.—Yours truly,

C. D.

[See the extract from *Indian Gardening* on page 242 where it is identified with "*Mucuna Nivea*" known to natives in India as "Kamach." A very high character is given to the bean and fresh seed from a new land may be of special advantage.—ED. T.A.]

#### PLANTING IN STRAITS SETTLEMENTS.

KLANG.—Notwithstanding the decrease in the demand for land, and the depressed condition of the coffee market, the European estate owners exhibit continued confidence in the future, and have not ceased to open and plant up new land. The natives on the coast are exhibiting interest in the new copra factory now being established at Kuala Selangor, and it may be anticipated that the work to be carried on there, and the certain market thus established, will materially stimulate the people to plant their land with coconuts. It has not been possible to obtain complete information regarding the amount of land newly opened by the European planters of the district during the year, but these figures which are to hand are evidence of substantial advance. In eight estates from which returns are available the total additional area opened up appears to be fourteen hundred acres. Principal among these are the Anglo-Ceylon Company, who have added about five hundred acres; the Kapar Estate, with three hundred and twenty acres; Mr. Christie's Laman-sara Estate, one hundred and ten acres; and Mr. Bailey's estate at Sungei Rengan, one hundred acres. Mr. Bailey is now erecting a complete and capacious coffee store and curing establishment, which will be of the utmost benefit to the neighbourhood. Up to the present there has been only one coffee curing establishment worked by steam, and the objections to a monopoly have been rather severely felt.

KUALA LANGAT.—Rent was paid on 3 560 acres of land taken up by European planters, for which grants had not yet been issued at the close of the year. The area of these estates is therefore not included in the total amount of land alienated, which is returned at 18,631 acres. There is included in this total 1,492 acres of land newly occupied by native cultivators in 344 holdings. The land in the occupation of Malays is mostly devoted to the planting of coconuts and coffee, regarding which latter cultivation the District Officer makes some pertinent remarks. He considers, and I think he has good ground for his views, that the cultivation of coffee is eminently unsuited to Malays, who will not devote the labour and time required to bring the trees into bearing. They seem to have been mostly imbued with the idea that the coffee trees, once stuck in the ground, would take care of themselves, so having done this they went and sat down to wait for the profits, which naturally have not fulfilled their somewhat elastic expectations. The fall in market prices has strengthened their recently formed conclusion that coffee growing is not what they once imagined, and efforts will now be made to attract their attention to coconuts as an alternative. The Sepang gambier and pepper estates are not being looked after as well as they ought to be, and consequently the amount of pepper and gambier exported was considerably less than in 1896.

ULU LANGAT.—Eleven grants, including an area of about 2,600 acres were issued to European planters. All the permits previously issued for coffee estates were replaced by grants, and no

arrears of survey work remained in respect of large agricultural areas. Twenty-eight of the old agreements for leases were cancelled, leaving twenty only remaining to be dealt with, most of which will come in when the titles for the Un Langat village are issued.

**KUALA SELANGOR**—The starting at Knala Selangor of the business of the Coconut Oil Mills Company of which Mr. H. C. Holmes is manager has given a great impetus to coconut planting in the district; so much so, indeed, that the number of nuts saved for seed has had an effect on the price, which has risen considerably. Where coffee has proved a failure, as at Bukit Botan, the people are now putting in coconuts instead. This is a good work, for coconut planting is much more in the Malay's line than coffee cultivation. It is when planting ends and cultivation begins that the Malay fails.

### CEYLON TEA AND PROSPECTS.

An interesting commentary on the opinions recently expressed that Ceylon tea, when justice is done to it in plucking and manufacture, has not deteriorated in quality, is afforded in a communication received by us today from London. Our letter is from a tea expert and a gentleman deeply interested in Ceylon, but it was written for our personal information rather than for publication. We cannot refrain, however, from quoting one or two sentences with a special bearing on the current discussion. Writing on the 26th ultimo, our friend says:—"The market continues low in all conscience, and in spite of the stronger statistical position there seems to be no indication of an upward move. I often and often hear from the trade that finer teas, or rather teas of distinct quality and character are wanted, such as your island used to send home, not so very long ago either—but the mania for quantity is, in my opinion, in a great measure, at the bottom of the deterioration of your teas. Of course there are individual estates where the old characteristics are maintained, but they are few in number. *Quantity* invariably leads to less care in manufacture, and *quantity* also means working with coarser leaf, which it goes without saying, cannot possibly give the same flavour and quality as the younger and more succulent leaf."

Now it will be observed here that our critic just saves himself from absolute opposition to Messrs. Bagot, Metcalfe and Roberts by admitting that there are individual estates where the old characteristics are maintained; but clearly he indicates they are in a decided minority. If so, the proprietors, who have to face deterioration, ought at once to enquire as to their withering space, machinery and ratio of plucking; for, our present London critic is at one with local authorities in urging that the *quantity* of leaf harvested (in proportion to means of preparing, including skilled supervision) lies at the bottom of the mischief—that is fully explains any deterioration. Apparently therefore it is the Factory-builder and Machinist, rather than Mr. Kelway-Bamber, who will have to cure the evils which have caused a falling-off in quality. At any rate no proprietor has a right to grumble until he makes sure that his skilled, adequately-paid Factory supervisor has space and machinery adequate to the leaf plucked. And what the Planters' Association Committee will have to find for Mr. Kelway-Bamber are

estates on which, in spite of all Factory requirements being fully met, with moderate plucking, the teas have deteriorated? We adhere to our statement made on the authority of Mr. T. C. Owen—Compiler of the "Ceylon Tea Planters' Manual"—that he found in the early days of the industry here, an aroma appertaining to the teas of the first three or four years from bushes grown on virgin soil, which could not be secured—do what he would in careful preparation—after that period. This, at any rate is a matter Mr. Kelway-Bamber might look into; although even Mr. Owen may be challenged as to whether the difference in flavour was not partly owing to the larger quantity of tea operated on?

### TEA IN CHINA

Meantime, in another direction, here is disconcerting news for Ceylon and Indian planters. We quote from *The Economist* of July 23rd:—

Improvements in the Production of Chinese Teas.—In his report upon the trade of Shanghai during 1897, Mr. Acting-Consul Mansfield has something to say in regard to efforts that are being made to improve the production of Chinese teas, which will be of special interest to the British investors who have embarked many millions of capital in the competing tea industries of India and Ceylon. As an incident of the past season, he records "the experimental use at Wenchow of a machine roller, which proved beyond doubt that the most ordinary China tea is capable of astonishing improvement if made by modern methods. Wenchow tea made by the old native process is of the most inferior description, but by being carefully made and machine rolled, a very fair drinkable tea resulted." He adds that a company under the auspices of Mr. A. B. Moorhead, the Commissioner of Customs at Hankow, is being formed to experiment in this line in the Hupeh tea district, the safety of the men and machines being guaranteed by Imperial edict, and that "a somewhat similar company is already working in Foochow, and has, I understand, had some measures of success. It is now enlarging its operations." There are signs, he further states, that the Chinese Government are at last awakening to the fact that the tea trade is rapidly slipping away from their country, and will be willing to make some concessions to encourage measures for the improvement of the tea produced. And to this end a very feasible and efficient way would, Mr. Mansfield suggests, be for the Government "to grant facilities to foreigners to take up land in the tea districts, so as to introduce more careful cultivation of the plant, and to offer a premium in the shape of a large reduction of duty on tea prepared by modern methods."

### RUBBER.

**BRAZIL**.—Some people suppose that the supply of Amazonian rubber may become exhausted in the near future. The most competent authorities are not at all of this opinion, but maintain that the supply is inexhaustible, because the "hevea" is continually being reproduced by nature. Certainly some areas become exhausted when overworked, but when left alone for some time they recover. The district of Cameta, on the River Tocantins, gave an excellent quality of rubber. There was a special quotation for it in the foreign markets. This district, however, is now exhausted, because, for about forty years, thousands of men have tapped its trees. All new-comers flocked to Cameta to make their fortunes. There are many districts that have not been tapped. The area that is known to produce Para rubber amounts to at least 1,000,000 square miles. Further exploration will no doubt show that this area is under estimated. —*British Consul at Para.*

COCONUTS AND COFFEE.

A new settlement has been started by one of the most energetic Malays on the Perak river, Pawang Jais by name, who is planting coconuts and Liberian coffee, and has about twenty-five other settlers round him. The land is high, the natives say it is rich and suitable for coconuts.—*Perak Government Gazette*, July 29.

THE MOCHA TEA COMPANY.

A general meeting of the Mocha Tea Company, Limited, was held at the office of Messrs. J. M. Robertson & Co., the Agents and Secretaries, Prince Street, on the 19th Aug. The Hon. J. N. Campbell was in the chair and there were also present the Hon. Giles F. Walker, Mr. H. G. Bois, Mr. W. E. Mitchell, and Mr. A. Bethune. The following were represented by attorney:—Mr. H. Bois by Mr. H. G. Bois, and Mrs. E. F. Walker by Mr. G. F. Walker.

The CHAIRMAN moved the adoption of the report and accounts. They would remember, he said, that at the last half yearly meeting they decided not to declare an interim dividend, and now the accounts showed that the profit earned was equal to 14 per cent of the capital of the Company. He did not know if there was any other item in the report which need be dealt with. They would notice that the loan for the purchase of the Lanka and Craighill estates had been reduced from R60,000 to R43,000 during the year. He begged to move the adoption of the report and accounts.

Mr. BETHUNE asked for information as to the working of the estates, which some of the shareholders thought was high.

The CHAIRMAN said that the expense at Mocha estate was 26.47 per cent, which, less manure .76, made 25.71 per cent; at Glentilt it was 32.58, less manure 4.48 making 28.10 per cent and at the Lanka estate 36.99, less manure 6.52, which made 30.47 per cent. Last year Lanka estate was only worked nine months, and this year it had been worked twelve. The cause of the increase was in the manure, which had been applied, and they had not felt the effect from it they hoped they would. There was no other increase in the working of the estates, as they would get from the estate report. At Mocha it was a little less than it was before.

Mr. Bois:—The report for Mocha last year was 181,000 lb., and now it was 188,000 lb. At Lanka the crop for the nine months last year was 47,000 lb. as against 53,000 lb. for the past twelve months, not much increase for the extra three months.

After further conversation Mr BETHUNE seconded the motion for the adoption of the report, which was carried.

The report was as follows:—

The Directors have now to submit their report and accounts for the season ending 30th June, 1898.

The total quantity of Tea made on the Company's Estates was 378,052 lb. which cost 31.34-100 cts. per lb. delivered in Colombo whilst the net average price realized was 45.45-100 cts. per lb. as compared with 46.68-100 cts per lb. last season.

The net profit for the year after writing off R1,670-48 for cost of tea extensions is R55,961-79 which is equal to nearly 14 per cent on the capital of the Company. To this must be added the balance of R1,313-58 brought forward from last season less the shortfall on the old crop after deducting the value of Coffee sold.

There has been transferred to Depreciation account a sum of.. ..R10,147 60  
A bonus has been paid to the Superintendents of Mocha and Glentilt of ..R 2,000 00

Leaving a balance still to be dealt with of R44,683-59.

Out of this it is proposed to pay a dividend of 11 per cent absorbing.. ..R44,440 00  
and to carry forward ..R 243 59

The Company's properties now consist of:—

1,055	acres	tea in bearing
22	"	" under 2 years
56	"	Grass land
101	"	Forest and fuel trees
21	"	Buildings, roads, &c.

1,255 acres.

The estimated crops for season, 1898-99 amount to 389,000 lb. to cost R116,280 00 in Colombo from which must be deducted the receipts from the Glentilt bazaars.

Mr. F. W. Bois having left the Island, Mr. G. F. Walker was appointed to the vacancy on the Board.

Mr. G. G. Bois retires in accordance with the articles of Association, but being eligible, offers himself for re-election.

The meeting will have also to elect an auditor for season, 1898-79.

THE DIVIDEND.

Mr. W. E. MITCHELL proposed that a dividend of 11 per cent for the season, 1897-8, be declared forthwith.

The Hon. G. F. WALKER seconded.—Carried.

THE DIRECTORATE.

The CHAIRMAN had much pleasure in proposing that Mr. H. G. Bois be re-elected a director.

Mr. MITCHELL seconded the motion, which was carried.

THE AUDITOR.

Mr. BETHUNE proposed the election of Mr. Hercules J. Scott as auditor.

Mr. MITCHELL seconded.—Carried.

A vote of thanks to the chair concluded the business.

PLANTING IN THE STRAITS.

(An Administration Report on *Negri Sembilan* for 1897.)

The returns, in the Appendix, of land already alienated, only give the surveyed area which is permanently occupied; they take no account of over 86,000 acres of land that are owned by tapioca planters in the Negri Sembilan (old); they do not include the gardens and padi fields of some 30,000 Malays in those States, the measurement of which has only now been commenced; and they overlook numberless holdings which are cultivated without the knowledge of land officers. The most noticeable of land matters in 1897 (other than the cultivation of rice and coffee, with which I will deal on) have been the great impetus to the cultivation of coconuts and the influx of Chinese settlers in the Coast District; the activity in the manufacture of bricks and lime at Port Dickson, Seremban and Kuala Pilah; the improving protection of our forests and the better tillage of land in the State generally. Exclusive of small areas there are more than 25,000 acres of land held under coffee and coconut leases, of which about 6,000 acres have now been planted with an expenditure of over a million of dollars. Depressed prices ruled for the greater part of the year, but, as the estates are mostly young, only those will suffer which are already in bearing. The outlook, however, is not bright, for the opinion expressed in the London market on the quality of the coffee are far from encouraging. In those untoward circumstances the planters deserve and have the sym-

pathy of everyone interested in the development of the Malay States. In this, as in other States they are agitated by the question of how to cure their coffee so as to put it upon the London market under the most favourable conditions. Only a very few, who have formed companies with large capital would be able to incur any extensive outlay in preparing their own coffee, and may appear to favour the construction of a coffee-curing establishment at Port Dickson. Some such centralising scheme will, I trust, meet with general encouragement, since it is to be feared that in many cases planters have opened areas for which their capital and labour force are inadequate. The scheme for assisted immigration will prove a boon, but it is co-operation rather than external help that seems to be required. It is often remarked of our Planters that, notwithstanding their Associations and United Association, their motto is rather *quod homines, tot sententiae*.

### THE CONSOLIDATED TEA AND LANDS COMPANY, LIMITED.

The second annual ordinary general meeting of the shareholders of this company was held at the office of the company, 22, West Nile Street, Glasgow, on Friday last, Sir John Muir, Bart, presiding.

The Chairman, in moving the adoption of the report, said: We have now the pleasure to submit the accounts and directors' report for the year ending November 30th, 1897. You will be pleased to see that the result is very satisfactory, disclosing a profit of £108,340 3s 9d. This, with the amount of £14,235 5s 4d brought forward from last year, enables us to pay full dividends on the first and second preference shares, a 10 per cent dividend on the ordinary shares, and to carry forward a balance of £26,995 4s 3d to the next year. This result has been obtained in a year which has been a most trying one to the tea industry, as explained in the report, and it is a matter of congratulation to us all that our company has stood the test so well—a result which cannot but give us even greater confidence than before in future. On the whole, our staff in India has worked well; and it is particularly gratifying to report that, in several important instances, a distinctly superior quality of tea has been attained. This, as you are aware, has been the constant aim of the directors, and it will be kept prominently before our managers. There is an impression in the London market that there is a possibility of too large a quantity of low-quality tea being produced. The obvious remedy is, to a considerable extent, in planters' hands. By closer attention to the details of manufacture, by improved factories and withering accommodation, by up-to-date machinery, and a full labour force, a great deal may be done to secure improved quality, and your directors will not relax their efforts in this direction, as the matter is one of the first importance. You will notice that we have opened up further land during the year, to the extent of 3,472 acres, of which 726 acres are planted with accounts and cocoa. It is the policy of the board to encourage, wherever possible, the profitable growth on the company's estates of these and other products, as well as tea. This, we are confident, is a wise policy, and one which will greatly strengthen the company. We have arranged to extend a further area of 3,179 acres during the current year. A great portion of these extensions will be on land capable of producing high-quality teas, for which, we believe, there will be an increasing demand. You will be glad to hear our extensions in Upper Assam have been most successful, and we have an exceptionally fine property there, from which we expect very satisfactory results. The extensions made in the Doonars are on the finest lands, and are reported to be even better than the best parts of the older cultivation. The extensions to the Nakhati and Rungamtee Divisions have been specially satisfactory. The main extension of 380 acres in progress in Sylhet

is with a view of improving the health of the working force. It is not our intention, in the meantime, to add materially to the existing area of cultivation in that district. Our present aim is rather to increase our plantations in Assam, as we think this will secure better average results for the company. In addition to the estates the company possesses, you are aware we have a considerable investment in the Kanan Devan Hills Produce Company, Limited. We continue to have most encouraging reports of this large property, which will greatly increase in value when the necessary connecting roads now in progress are completed. The Kanan Devan Hills Company has given us this year the satisfactory profit of £5,283 11s. 1d. This was mainly derived from the company's Assam property. It will be two years yet before the Travancore Estates begin to earn dividends, as they are at present young, but after that time we confidently expect large profits from them. It is necessary to provide funds for the Kanan Devan Company, and also for our Assam extensions, and as contemplated in the prospectus, and stated in the present report, it is now our intention to issue the remainder of the ordinary capital—viz., 20,000 shares of £10 each. This will be called up gradually, as required, and within a period probably not exceeding four years from date of this new issue, in the same manner as the original issue of ordinary capital. Some shareholders have already applied for allotments, but it is the directors' intention to give all shareholders an equal opportunity of taking an interest in this issue, and they will endeavour, so far as is possible, to give effect to the wishes of applicants. A prospectus will be issued to shareholders tomorrow. The shares will be offered to them at par. You will observe with satisfaction that our efforts in opening up new markets continue to be successful. We are combining with the Amalgamated and Kanan Devan Companies in this work, which will be prosecuted with vigour and energy wherever in our judgment suitable openings occur. In addition to having materially increased our connections in the United States of America and Canada, we have made arrangements for pushing the trade in Russia, and more recently still in Turkey and Persia. We have every confidence that our primary object—viz., the introduction of our teas to new markets—will be successfully attained. But, in addition to this, we anticipate that we shall succeed in establishing profitable businesses in the countries where we operate, which will be a strength to the company, and an important factor in adding to our dividends. Of course, the establishment of such businesses takes time, but we think it well worth our while to encourage them in every way, and you may depend upon them receiving our constant attention. I do not think I need not detain you any longer. I will conclude by expressing a hope that we may have an equally satisfactory report to give you next year. I beg to move:

That the balance-sheet and profit and loss account for the year ending November 30th, 1897, with the Auditors' certificate and the Directors' report thereon, be and the same are hereby approved and adopted; that the dividend of 5 per cent, less income tax, paid for the year to November 30th, 1897, on the first preference shares of the company, and the dividend of 7 per cent, less income tax, paid for the year to November 30th, 1897, on the second preference shares of the company, be and the same are hereby confirmed; that the interim dividend at the rate of 10 per cent per annum, less income tax, for the six months to May 31, 1897, paid December 23, 1897, on the amount paid up on the ordinary shares of the company, be and the same is hereby confirmed; and that a final dividend at the rate of 10 per cent. per annum, less income tax, payable August 12, for the six months to November 30, 1897, be now sanctioned and declared out of the balance of the profits for the year on the amount paid up on the ordinary shares of the Company, and the balance of £26,995 4s 3d carried forward to next year.

Sir Robert D. Moncreiffe, Bart., seconded the motion, and the report was adopted.

The retiring directors—Sir Robert D. Moncreiffe, Bart., and Mr. P. R. Buchanan—were re-elected on the motion of the Chairman, seconded by Mr. A. W. Coats.

The auditors were also reappointed, and a vote of thanks having been passed to the Chairman for presiding, the meeting separated.—*H. and C. Mail*, Aug. 5.

### THE AMALGAMATED TEA ESTATES COMPANY, LIMITED

The second annual ordinary general meeting of the shareholders of this Company was held at the office of the Company, 22, West Nile Street, Glasgow, on Friday, the 22nd ult., Sir John Muir, Bart., presiding. After the usual preliminary business, the Chairman said:—

We have the pleasure in submitting for your adoption the accounts and directors' report for the year ended November 30, 1897. You will, doubtless, have perused these documents, which, therefore, I assume, may be taken as read. Altogether, the year under review has been a very trying one. The crops in Darjeeling and Assam were below the average, both in quantity and quality, and, owing to the rise in exchange and the famine, our expenses were necessarily heavier; nevertheless the result of the year is very satisfactory, and we are able to pay a dividend of 10 per cent per annum on the ordinary shares, and carry over a balance of £20,708 3s 10d to next year, against a balance brought forward from last year of £16,519 10s 8d. During the year 1,840½ acres of new plant have been added to the cultivation, which, together with the expense of upkeep, of all our non-bearing plant, has cost us £52,665 5s 1d, and we propose to plant a further area of 2,64½ acres during the current year. You will be pleased to learn that most of these extensions are in Assam and Darjeeling, and should be capable of producing teas of the highest quality, for which, in our opinion, there will always be a good demand. You will notice by the report that we have sold two small estates. These we were originally bound to take over from the Land Mortgage Bank, as we purchased the whole of that company's assets; but, at the time of purchase, we attached no value to these particular properties, and we are very glad to have been able to dispose of them so favourably, as they were not likely to be a source of profit to this company. We are glad to be able to report that the company's investment in the Kanan Devan Company has given us a good return for the past year, and we have full confidence that it will realise our expectations in the future. We have made an investment, in conjunction with the Consolidated and Kanan Devan Companies, in tea distributing businesses in the United States of America, Canada, and Russia. This we consider the most practical way of opening up new markets, and, whilst this is the first object of our investment, we have no doubt these businesses will yearly become more important and remunerative. In response to the wishes of many shareholders, we propose shortly to take steps to secure a Stock Exchange quotation for the Company. To do this it will be necessary to make some alterations in our articles of association, and formal meetings will be duly called for this purpose. With a view of providing funds to meet calls for the Kanan Devan Company, and also for the purpose of opening up the exceptionally fine land we have in Darjeeling and Assam, the directors propose to issue the remainder of the nominal capital. The works for which these funds will be required will greatly add to the strength of the Company, and will, in our opinion, ensure even greater prosperity in the future. You will be glad to know that the latest reports from the estates are satisfactory. They are all in good order, and yielding well, and we have every reason to believe that the estimated

crop will be secured—in fact, we have nothing that is not of a satisfactory nature to report to you today. I will not detain you any longer, but big to move: "That the balance-sheet and profit and loss account for the year ending November 30, 1897, with the auditor's certificate and directors' report thereon, be, and the same are, hereby approved and adopted; that the dividend on the preference shares of 5 per cent., less income tax, paid for the year to November 30, 1897, and the interim dividend at the rate of 10 per cent. per annum, less income tax, for the six months to May 31, 1897, paid December 23, to the amount paid up on the ordinary shares of the company, be, and the same are, hereby confirmed; and that a dividend at the rate of 10 per cent. per annum, less income tax, payable August 5, for the six months to November 30, 1897, be now sanctioned and declared out of the balance of the profits of the year on the amount paid up on the ordinary shares of the company, and the balance of £20,708 3s 10d carried forward to next year."

Mr. P. R. Buchanan seconded the motion, and the report was adopted.

The retiring director, Mr. A. M. Brown, was re-elected on the motion of Sir Robert D. Moncreiffe, seconded by Mr. A. B. Murray.

The auditor was also reappointed, and a vote of thanks having been passed to the chairman for presiding, the meeting separated.—*H. and C. Mail*, Aug. 5.

### MICA MINING IN BENGAL.

It is not generally known that mica comes from one-half the world's consumption of mica from a small district in Western Bengal. Mica—better known under the name of talc—is much used by the natives for ornamental purposes. The thin silvery plates are made into banners, tassels, fringes so much used by the poorer classes of Hindus and Mohammedans on all festive occasions. Large sheets form a most durable material, admirably suited for painting on, as being at once impervious to the attacks of insect pests and the weather. Scraps and waste mica are ground into a coarse powder, mixed with starch and applied to thin cotton cloths to give them a glistening appearance. It is said that as much as 10,000 maunds (320,000 lb.) were extracted annually and carried to Delhi and Patna for sale. The mica from this district, known to commerce as Behar mica, is the finest in the world. It is hard and tough and of a clear ruby colour, and answers best for furnace work where intense heat has to be withstood. Through apertures closed with sheets of mica, the workmen are able to see the reactions that are going on within the furnace without occasioning loss of heat by opening the furnace door. The ruby tint of the mica also protects the eyes of the workmen from the intensely bright light of the incandescent mineral being treated within the furnace. There are some 300 mines at work in the districts of Hazaribagh, Gaya and Monghyr. The out-put last year amounted to nearly 2,000,000 lb., of which about one-half was exported from Calcutta chiefly to the British Isles and the United States of America. The exported mica was valued at ₹10,00,000; that retained for home consumption, chiefly inferior kinds, at ₹1,00,000. Mica is found in veins of granite (pegmatite) from three to ten feet wide running through the gneissose rocks which make up the hills of this district. The mica occurs in large crystals sometimes as much as two feet long eighteen inches wide, and nine inches thick. These crystals readily split into sheets along their length. In many places as much as a third of the bulk of the vein-matter is mica, the other constituents being quartz and feldspar.

Although Europeans have lately taken up the mica industry and the bulk of the mines are in their hands, yet the mining is conducted under purely native methods. The out-crops of veins are opened out by cuttings to a depth of from twenty to fifty feet, the bottom of the cutting being reached by inclines, up

which the vein stuff is carried in baskets. These inclines follow down the rich parts of the vein, and branch off and zigzag in a most intricate manner. In order to give light and air to those tortuous passages, perpendicular shafts two and-a-half feet in diameter are sunk at intervals to meet the inclines. Where water is met with, double rows of women side by side extend along the incline from bottom to surface. Earthen gurralls holding about four gallons are filled at the bottom, and pass from hand to hand along one row to the surface: the empties coming down the other row. Only the softer portions of the vein are removed, and the crystals of mica loosened out by means of a steel chisel and hammer. A coarse gunpowder, manufactured locally, is sometimes used for blasting out hard pieces of rock. Latterly dynamite has been introduced by European proprietors. Not the least attempt at regular mining after European methods has been attempted even by the largest mine-owners, although as much as R5,00,000 a year is spent by one gentleman on wages, transport, up-keep, etc.

When the mica crystals are brought to surface, they are split into sheets of about one-eighth of an inch in thickness and all the frayed and loose layers peeled off. The edges are now trimmed with a sickle to remove all imperfections, and the plates sorted according to their size. The sheets are not squared or cut into any particular shape. Seven sizes are recognised in the trade.

Specials, having an area of more than 50 square inches.

No. 1	.. 32 to 50 Sq. inches.
" 2	.. 21 to 32 "
" 3	.. 16 to 24 "
" 4	.. 10 to 16 "
" 5	.. 6 to 10 "

6 anything between 4 and 6 square inches.

Mica is sold by weight. Specials fetch from 8 to 20 shillings a pound.

No.	s.	d.	lb.
No. 1	..	6	0 "
" 2	..	4	0 "
" 3	..	2	0 "
" 4	..	1	0 "
" 5	..	0	4 "
" 6	..	0	2 "

Four classes of mica are also recognised.

Hard, tough, ruby mica	.. First class.
White transparent mica	.. Second "
Other colour	.. Third "
Stained and discoloured	.. Fourth "

The first class would sell twice as much as the second, four times as much as the third, and eight times as much as the fourth class. Thus if a pound of first class would fetch eight shillings, second would sell for four shillings; third for two shillings; and fourths for one shilling. Large sheets of ruby mica fetch fancy prices, as they are admirably adapted for painting on. The smaller sheets are used for electrical purposes in secondary batteries, chimneys of incandescent gas lamps, fire, screens, stoves, etc. With the growth of the use of electricity in the arts, the demand for mica increasing.

The amount of mica available in the district is practically inexhaustible. The pegmatite veins from which the mineral is obtained, are numerous and of large size.—*Pioneer*.

## ODDS AND ENDS.

(By *Cosmopolite*.)

### LOOLECONDURA TEA.

I WAS glad to read that the oldest field of tea, in Ceylon, on Loolecondura estate, is still looking well, and yielding 400 to 500 lb. per acre. I can remember its being planted in the sixties, when I was in K. D. & Co.'s office in Kandy, and after the produce got into the market for local consumption, I drank no other tea but it, unless, perchance, my supply ran short and I

had to send my beef coolie to the Mincing Lane of Oodispattu to buy a 'break' of about half a pound of pure China clip stick tea.

### MEXICAN RUBBER.

And writing about that country affords me an opportunity of enclosing the following cutting from a paper:—

"Last year the output of rubber from Mexico was 1,000 00 lb. Hundreds of thousands of rubber trees are being planted, and in a few years most of the supply of rubber will come from that country."

This will badly affect the good prospects of the fine Para trees on Culloden estate, although I doubt not rubber will yet prove a capital string to the planter's bow. [We are not disposed to accept as reliable some of the statistical forecasts connected with Mexico, and this is one of them—*ED. T.A.*]

### CHEAP TEA.

Tea at 2½d a lb. reads cheap, but I daresay it was the dearest tea sold, in the Lane, that month. And just think of the joy of those V. A.'s., who made a profit of one cent. per lb. on such a sale, regardless of the injury they are doing to your chief industry. But what do they care for a hereafter, absolutely nothing; economy at any price is what they aim at, and which has culminated in that company's orders to their down-trodden superintendents,—“Raise your tea 2d, or expect to be sacked.” No wonder then the poor but honest planter is complaining that bad luck is being dropped on him like a ton of coals.

### LANTANA.

In the days of king coffee, had any one discovered a poochie that would kill off lantana, he would have been considered a saviour of our industry, and probably been made a K.M.G. But now that a poochie—a foreigner too—has taken a contract to eradicate lantana in two or three years, a howl has got up to spare their old friend who was once their enemy.

## COCONUTS IN FIJI.

While coconut property in Ceylon has been regarded as a valuable possession amongst its inhabitants for the past century or more, commanding its figure in the market, its creation as an industry is a comparatively new one in Fiji, and, at the outside, it is not more than 25 years since the regular planting of coconuts was first entered upon by Europeans. It is therefore only of later years the coconut property has grown to be looked upon as a real live asset, and that it does not today command a large figure on the exchange than it does is owing principally to the fact that very little new capital has, for some undefined reason, found its way to this country. That there will be a change in these conditions presently there can be very little doubt, and coconut property will then realise its proper value in the open market. In Ceylon papers we frequently read of coconut estates realising £30 per acre for very small patches, and the larger ones must intrinsically be worth a great deal more per acre. In fact the question may be asked: How is it that coconut property in Ceylon realises three or four times more than it does in Fiji, where climate and soil are a long way superior? It may be that Ceylon is on the high road to more numerous and nearer markets than Fiji is, and that consequently the industry here is handicapped with additional freight charges. However this may have been the

case in the past it can hardly hold good today in face of the starting of a considerable enterprise in Sydney for reducing copra into those oleaginous articles of commerce which the manufactures of the world are open to receive. The colony will have to consider whether it will be best to erect a manufactory on its own account or accord a bonus to some European firm for the establishment of a concern. The idea is not an original one, and was first suggested by our last Governor, Sir John Thurston. With copra however at £10 per ton—the highest price we have known it to realise in Fiji is fifteen guineas—the industry should be an exceedingly remunerative one, and there is nothing like fair market values to stimulate an industry. The following data as regards acreage in coconut estate properties owned by Europeans will be interesting. It is only a rough estimate, but it is approximately a correct one. Kanacia, the property of Messrs. Miller, Headley and Co., heads the list with something over 2,000 acres. Mango Island and the island of Rabi come next with something like 2,000 acres each. Cicia, one property, 1,200 acres; Naitaba, 800 acres; two properties on Taviuni belonging to Mr. Coubrough of 800 and 600 acres each; Messrs. J V Tarte and Co., Vuna, Taviuni—a specially fine area—800 acres and arrangements in course of progress for the putting in of 900 additional acres; the island of Lancala, 700 acres; Mr. W. Peckham, Wairiki, Taviuni, 500 acres; and Mr. Rennie's property at North Taviuni, some 400 acres. There are many other coconut estate properties in Fiji ranging downwards, but it is difficult to arrive at their acreage. —*Fiji Times*, June 11.

#### TEA BULKING AND TARING CHARGES.

We have received the following from the Secretary of the Kaugra Tea Association:—

Your correspondent, who on page 96 of your issue of 23rd July, takes exception to my remarks on Mr. Buckingham's circular about bulking and taring charges, has been misled at the outset by a printers' error. "Infraacted 5d per 100lb" was originally hieroglyphiced by me "in practice 5d per 100lb." It is perfectly true that the charge for (1) bulking, (2) or taring, (3) or weighing net varies from 3d to 1s 6d per package, as may be seen on page 46 of that useful hand book, "The Tea Planters' Compendium," which gives full details about these charges. But it is impossible to suppose that any one who can get a tare to pass customs would knowingly incur a charge of 1s to 1s 3rd per chest for such a simple operation as bulking. The taring is the lion in the path, and as at present all breaks are "in practice" tared, so "in practice" the bulking charge is the difference in the rates for taring and bulking and taring only, and 5d a chest is a fair average to take.

I do not get at the £100,000 (in the second paragraph) by the same process as your correspondent does, but as there is only a difference of £5,000 between his figures and mine, the point is immaterial. I reckoned £75,000 could be saved by the industry on taring and £30,000 on bulking charges.

The question of whether 1s 5d or 1s 8d per chest is saved is a question of timber. It is my misfortune to have to use a wood which tares about 35lb (with lead) for a hundred pound chest. A lighter wood would save me 3d per chest, but the saving would be swallowed up in the extra cost of the timber. It would be interesting to hear from some of your readers how much these average chests, holding 100lb tea, tare. It requires a good deal of dodging to shave under the present warehouse scale. I can do it best with a 95lb. chest, which I can gross to 128lb by selecting boxes. And 120 lb chests work out nicely to 155lb or thereabouts. But chests holding intermediate quantities are charged relatively higher.

Your correspondent's last paragraph is open to criticism. He says: "10 per cent. only of the break is weighed, and 1s charged for each chest, or a little over 1d per chest." This is a specious but spurious argument. Why debit the nine chests with a charge they have not incurred? As a fact (granted the gross is under 29lb.) the charge for weighing 100 lb of tea net is a shilling less 10 per cent. Will your correspondent defend that charge? I doubt if it costs the wharfingers 2d. They have excellent scales, and labour at 6d per hour per docker. They do not re-solder the lead after shovelling the tea back into the box. Say, two men and a clerk are employed at an outside cost of 1s 6d an hour (for you may be sure the poor devil of a clerk does not get so much as the horny-handed son of toil, and I allow the extra 1d or 2d for proportion of foreman's wages). Well, how many boxes ought three to weigh net in an hour? Shall we put it at a low estimate at 12, that is, one in five minutes? (They shovel and tramp expertly, those same dockers, and I think 20 would be nearer the mark.) Taking 12 as a fair number, the warehouse gets 12s less 10 per cent. for 1s 6d paid on wages. For you must remember "management" has already been charged at 1s 10d a chest, and rent at 6d a chest remains to be charged. With these figures before him, I ask your correspondent, is one shilling less 10 per cent. a chest an excessive charge for the simple process of net weighing 100 lb of tea, or is it not? My opinion is, it is, in view of the rudimentary operation performed and the other charges made for the same chest. And if we are able to obtain facilities that will enable us to factory tare or teas, leaving the wharfingers only the net-weighting of tea chests in the hundred to do, unless they considerably reduce their present scale, I should consider we are being charged three times as much for the work as we ought to be.

Another incidental point that is worth consideration is the waste or loss by weighing (in addition to the 1lb draft) which the planter suffers. Most factories use packing machines now-a-days to avoid breaking the tea. But when the tea is tared or net-weighted in London, and has to be got back into the same chest without a packing machine, then the slaughter begins. Ramming and grinding and breaking and smashing in is part of the process, and the balance that "can't be got in no how, sir"—that, I fancy, is "loss by weighing."—*Planters' Gazette*, Aug. 6.

#### THE NORTH-WEST PROVINCE.

POUDRETTE: BARREN SOILS.

MARAWILA, Aug. 23.

In continuation of the treatment of night soil discussed in my last communication and its use as a manure, I read that in the Straits the treatment of night soil by incineration has been found successful, but its sale as a fertilizer has not taken place as yet. By the way, has the incineration of the Colombo night soil been given up as a failure? It seems a sinful waste that while thousands and tens of thousands of rupees are annually sent out of the island for manures, we allow to go to waste what ought to be, or can be made, a valuable fertilizer. I am not forgetful of the failures of the attempts of Sir John Grinlinton in Colombo, and of C. I. Byrde in Kandy to manufacture and sell pouquette. If I am not mistaken, these failures were chiefly owing to the bulk of the substances. Cost of carriage is a very important consideration in manuring. People do not wish to pay for the carriage of a ton of manure which has only a few lb. of valuable stuff in it. If it be possible to prepare Pouquette in a more concentrated form by the addition of artificial fertilizers, there is the possibility of people living not far from the seat of manufacture purchasing and using it. Somewhere at Kelani will be good as transport will be possible both by rail and river.

Barren soils are discussed in the current number of the *Agricultural Magazine*, especially with reference to the white sand of our cinnamon gardens' soils,

There are portions of cinnamon estates where the pure white sand prevails; and which are devoid of surface vegetation and where cinnamon bushes are stunted in growth. Such places in native parlance are said to have "maradang valle." I leave to philologist the question whether the "dung" in the first word has any reference to the *Eugenia jambolana*, and whether the word Maradah is a corruption or an Anglicized form of "miradang." What is noticeable in these soils is that while surface vegetation refuses to grow on them owing to the entire absence of vegetable matter or mould in their composition, yet trees grow fairly well on them. It will be noticed that the particles of sand are coarser here than elsewhere, and consequently the spaces between the particles are greater. This allows of the free passage downwards of any accumulation of mould lying on the surface. The decay of the leaves of trees forms a mould which, after a shower of rain, is to be found on the surface in depressions. This gradually finds its way below the surface by the action of the feet of man or cattle. A little observation will show that though the soil on the surface is bleached perfectly white, a little below the surface particles of black can be seen which flow to the surface of the soil be placed in water. My idea is that all the elements of fertility in these "barren soils" are, owing to their open composition, to be found in the soil below the surface, and in the water always to be found not far from the surface. This explains the apparent paradox of fertility to be found in these chemically infertile soils. The subsoil and the water in it ought to be analysed for an explanation of what now is regarded as a riddle. Most of these soils have a kind of frame a few feet below the surface formed by particles of sand closely packed. It is probably here that all the fertility in the soil is to be found, and becomes available to the roots of deep-feeding trees.

## THE FRENCH TEA TRADE.

BY EDWARD CORNER.

(Special.)

Although the usage of tea in France does not progress by leaps and bounds, it is making its way slowly but surely. Coffee has had a good half century of a notoriety start upon tea, and was only first used in Paris in 1669, though known in the country fifteen years previously. Both beverages were bitterly opposed when they appeared. Coffee, declared the doctors, was "a dangerous drink," and Gui Patin fulminated against tea, as an "impertinent novelty." Both products have lived down their detractors. The customs and manners of France are against any rapid growth in a taste for tea. The first breakfast in France when not soup, is *café au lait*; after the second breakfast or *dejeuner* black coffee, the latter also succeeding the dinner in the evening. Hence there is no room for a tea to come in. True there is the very modern institution called "Five o'clock tea," but that is a mere social bagatelle for exhibiting toilettes and indulging in gossip. It is not a "meal." Another cause for the non-consumption of tea in France, resides in the reputation it has enjoyed as a "medicament" since its introduction into the country. The French do not dispute the refreshing qualities of tea, but do not lose sight either of the comforting effects of a cup of black coffee, or a glass of generous wine. While the French faculty declared their hostility to tea Cardinal Mazarin, about 1660, asserted it cured him of his gout. That was the year when Samuel Pepys took "his first cup of tea," and when the leaf sold at £6 to £10 per lb.

Without going the length of Boutekoe, a Dutch enthusiast, who proclaimed that tea could cure every human ill, and that 200 cups of the infusion might be taken daily, it is an excellent stomachic; it slightly excites the circulation, stimulates the work of digestion, acts on the nervous system by imparting to it more physical and intellectual energy, while at the same time keeping it more healthily active. Tea is excellent for travellers, it assuages thirst, and diminishes fatigue as the Russian army testifies. The active principle of tea, caffeine, is sold by French pharmacians or chemists; it is the same principle as is in coffee, only the percentage is higher in tea. It is that principle and tannin which impart to tea its stimulating and diuretic properties; while its stomachic and gently heating qualities are due to its essential oil. The acid flavour of green, as compared with black tea, is due to the greater presence of tannin. French commerce handles the two chief varieties of tea, green and black. Among the greens most in demand are *Hyson*, *Perte* and *Poudre a canon*, so named from its large grains recalling gunpowder. In the black teas, the favourites are *Souchong* and *Pekoe*. Flavour, colour and perfume are left to the judgment of the tea-tasters, who as scrupulously and minutely test the teas as do the wine-tasters of the wine brands of Bordeaux and Burgundy. *Bohea* is the most common of black teas, and is the variety on which adulteration is most practised. The Caravan teas had purchasers among the wealthy till some years ago, when the demand died away. It was too dear, and its legendary qualities asserted to be acquired by overland carriage on camels' backs, were in time found not to be superior to the tea conveyed in the hold of a ship. Caravan tea will never be more than a Russian importation, for Russian markets and will so continue till ousted by British teas.

Adulteration is not much practised; tea being better known, there is no demand for sloe and ash leaves; it is only the lowest grades of tea that are doctored, and for which the buyer is prepared. But tea is relatively good and cheap, and each importer has his own laboratory, in addition to that organized by the Municipal Council. The latter's laboratory in 1899, analysed 182 samples of coffee, chicory and tea; separate results are not given. Only 9 samples were handed in by private individuals; the others were collected by the Food Inspectors. Of the 182 examined, 116 were pronounced to be "good." The remainder contained "foreign matters." France imports the greater part—or two-thirds—of her tea direct from China, paying for it either in cash or in merchandise. It is England, and in a very minor measure Russia that furnishes the rest. The history of her importations is as follows; the average in the decennial period, 1827-1836, 355 tons; 1817-1836, 237 tons; and in the year 1859, 469 tons; now England in 1858 imported 34,000 tons of tea. The mean decennial consumption, 1827-1836 was 119 tons, while for the year 1859, it was 284. In 1894, France imported 1477 tons of tea, of a value for 4½ millions of francs. Of the total imported, 702 tons were consumed, being 418 tons more than in the year 1859. Of the 1477 tons imported in 1894, 900 came from China; 364 from England; 60 from British India; 21 Japan; 40 Turkey; 7 Egypt; 47 Belgium; and the remainder from sundry countries. In 1894, France exported tea to the amount of 862 tons, valued at 2½ fr. millions; of this total 51 tons were sent to the Russian

Black Sea ports; 446 to England; 47 to Spain; 92 to Switzerland; and the remainder to other places. At the close of 1894, the principal depots had in bond, the following quantities. Paris 351 tons; Marseilles 165; Havre 16; Bordeaux 9; the rest in other Customs Stores. At the same date there were 121 tons of tea in transit, chiefly for Switzerland, Italy, and Spain; of this total, 45 tons were from English stocks.

The present import duty on tea is 3 fr. 5 centimes per kilogramme; say 1½d. per lb. It is free of octroi duties at Paris. In 1806, Napoleon I. decreed the import duty on tea at 3 francs the kilogramme, nearly its present rate; in 1810, he raised it to 9 francs. In 1814, after the Restoration, the duty was lowered to 3 francs, with fractional differences in favour of tea imported in French bottoms. In 1826, in order to encourage direct commercial relations with China, the French Government reduced the duty to 1½ fr. per lb., if carried in French ships, but if transported by foreign bottoms and the tea of other origin but Chinese, the duty was 6 francs. English tea agencies continue to be established in Paris, evidence that business is to be done. Some have shops, that deal also in coffee, others vend liqueurs and very many supply tea made by the cup. By the bye, in 1639, tea in England was "brewed" and so sold; further it was taxed eight pence per gallon. The larger agencies have simply offices, employ local travellers, and inundate the public with circulars. It must be a keen competition. The lowest price, for the lowest grade of tea, is 2 fr. 40 centimes. The scale of prices is then graduated up to 10 and 12 francs per lb. About 6 to 7 francs per lb. is the average price paid by the middle class consumer. The members of the English colony in Paris generally club and order a chest of tea from London or Liverpool, and subdivide as agreed upon. French grocers who sell tea, now do so invariably in packets varying from one quarter of a pound to one pound, they are not equipped to sell it direct from the canister, they have no scoop scales to commence with. The quality which French grocers push is *Souchong* which sells at 6 francs per lb. Tea possesses the seduction that once tasted, the initiated likes to return to the temptation. But the masses are strangers to tea in France; they can buy their favourite one pound of coffee roasted for a little over 2 francs, while the most superior coffee costs 3 fr. 50 centimes per lb. These quotations are to be pitted against "tea-dust" which costs 2 fr. 50 centimes, and *Souchong* 6 fr. per lb. Therein lies the whole problem of the French tea trade.

The French Colonies produce no tea. During the 1889 Exhibition, a real John Chinaman, but evidently "smart," opened a pagoda-shop, in the Rue des nations. France was then deeply interested in her Congo colony. The Celestial improved the occasion, he displayed on his sign board an appeal to the French, to support their Colonies, and try his celebrated "Congo" tea. He made money. Mr. Lefèvre Pontalis, who was a member of the Pavia Mission in 1890-91 has studied the hill-slopes round the Delta of Tonkin, and pronounces them to be a region suitable for the culture of tea, as practised in Java, and Ceylon. Already, it produces a coarse tea, much in demand by the natives. There is an excellent tea, patronized by the Chinese residents, sold in Tonkin, that grows in the vicinity of the rivers Noire and Mékong. The Ipang brand is much in request. The tea imported from Canton and Fo-

kiew, arrives in the junks by the Red River. It is in the form of *gabettes*, or cakes wrapped up in dry banana leaves; it is tea coagulated by vapour. The cakes are enclosed in packets of seven, and twelve *paquets* or 84 cakes net 10 piastres or 40 to 50 francs. These packages are stored in Hanoi, and other large towns in Tonkin. There is also another form of coagulated tea sold in "Cubes," 150 of the latter cost 12 piastres. M. Pontalis recommends to purchase Ipang teas, where they are grown, and to sell them very dear at Hanoi, the Chinese would arrive to buy them, and Hanoi would thus become an important centre for the Indo-China tea trade.

#### THE FUTURE OF TEA IN CEYLON.

A planter of much experience and who, as Inspector of estates, travels a great deal over the country, reminds us of a possible result of better prices and low exchange which is apt to be forgotten. He writes:—

"I do not at all share the hope that exchange will go down and prices of tea advance; for if either the one or the other were to happen, it would lead to further planting and we should be no better off. I would rather see things remain as they are until the flow of capital has been diverted into other channels; and once this happens it will take some time to bring it back again. Then, our Ceylon tea prospects will improve.

"The doctrine that Ceylon tea has deteriorated, I regard as a most dangerous one, as likely to still further cheapen our produce and give it a bad name, which, of course, all should try and avoid. Nor do I believe that there are any good grounds for thinking that Ceylon tea is any worse than it was. The yield on a great number of estates has no doubt increased, and quality suffers as a matter of course if a maximum output is secured; but this is not *deterioration* as I understand the term."

This puts the matter in a very practical light as regards the danger attending further extensions of tea planting, and certainly the larger the present area under tea in India and Ceylon is found to be, the stronger, surely, the *discouragement to further planting*. This is a view which may well be commended to the attention of certain short-sighted critics. Again, our correspondent's deliverance against the theory of "deterioration," preached chiefly in Mining Lane, is compatible with the fact that increased crops and insufficient withering room or deficient power for machinery must inevitably mean unsatisfactory preparation and inferior tea. It must be very easy for each proprietor to find out whether his factory and arrangements are up to the proper standard, and, if not, improvement in that direction should be the first object kept in view. Especially may this be pressed on any who are anxious to add, less or more to their planted acreage: are they doing full justice to what they have already planted, should be the first question.

#### WANARAJAH TEA COMPANY.

The sixth ordinary general meeting of the Wanarajah Tea Company of Ceylon, Ltd., was held on the 26th Aug. in the offices of the Agents and Secretaries, Messrs. Baker and Hall. Mr. A. Cantlay occupied the chair and the others present were:—  
Messes. J. W. Vanderstraaten, J. P. Baker, F. W. Burt, Keith Rollo, H. Creasy, and J. Paterson. Those represented by proxy were Mrs. J.

F. Baker, and Messrs. C. A. Hutson and T. W. Hall. Mr. F. J. de Saram was present as attorney for Messrs. Taylor and Noble.

The notice calling the meeting having been read by Mr. Baker and the minutes of the previous meeting confirmed,

#### THE REPORT

was submitted as follows:—

Directors:—Messrs. Thomas Mackie, A. Cantlay, and Mr. J. W. Vanderstraaten.

#### ACREAGE.

Tea in bearing over 6 years			
old	..	acres	541
" planted	1892 ..	"	291
" "	1893 ..	"	124
" "	1895 ..	"	72
" "	1896 ..	"	12
" "	1898 ..	"	20
—————1,068 acres in Tea.			
Timber Trees	..		20
Forest	..		27
Grass, &c, not available			27

Total 1,134 acres.

The Directors have the pleasure of presenting to the Shareholders the Report, Balance Sheet, and Profit and Loss Account for the year ending 30th June, 1898, and to congratulate them upon the result of the Company's operations during that period.

The crop harvested amounted to 367,599 lb. of tea, against an estimate of 355,000 lb., of which quantity 296,999 lb. have been sold in London at a net average of 55 cents per lb., and equally good returns may be anticipated from sale of balance of the crop. The previous year's crop yielded 53 cents per lb. with the advantage of a lower rate of exchange and a higher Ceylon tea average than prevailed during 1897-98, clearly indicating the improvement of quality and manufacture of the Company's produce during the past season.

The cost of manure and its application has been R9,173-72, and the acreage treated 206 acres.

The balance at credit of profit and loss is shown at R101,475-90, and after payment of the interim dividend of February last at the rate of 8 per cent., there remains a balance available of R69,723-90.

The Directors now recommend the declaration of a final dividend of 12 per cent., which will absorb R45,360, making 20 per cent. for the year, and that the balance of R24,363-90 be carried forward.

The estimated crop for season 1898-99 is 390,000 lb. of made tea, at an expenditure of R118,637-76. In addition to this, it is proposed to expend R5,460-24 on Capital Account.

The Visiting Agent's reports can be seen by Shareholders at the Company's office.

Mr. Thos. Mackie retires from the board by rotation, and is eligible for re-election.

The Shareholders are invited to elect an Auditor for the ensuing year, and Mr. Guthrie again offers his services.

By order of the Board,  
BAKER & HALL, Agents and Secretaries.  
Colombo, 3rd Aug. 1898.

The CHAIRMAN said:—Gentlemen, I have now the pleasure to submit the accounts and report for the season 1897-98 for adoption by you. You will all doubtless have perused these accounts and I presume they may be taken as read. The report and accounts give full details of the year's working; and I think we may congratulate ourselves on the satisfactory results, in a year such as the past, when smaller profits and lower dividends are the order of the day. I do not think there is any occasion for me to detain you longer, but before sitting down I should like to state that in your Director's opinion the satisfactory results are in a great measure due to the able management of Mr. Rollo and his staff of assistants. (Applause.) With these remarks,

Gentlemen, I move the adoption of the report, and should any one have any questions I shall be happy to reply them as well as I can, and Mr. Rollo who is present will, I am sure, be willing to assist me, should I fail.

No questions were asked.

Mr. BURT seconded the Chairman's proposal and the report was unanimously adopted.

The next business was the declaration of a DIVIDEND.

Mr. H. CREASY proposed that a final dividend of 12 per cent. (making 20 per cent. for the year) be paid forthwith.

Mr. VANDERSTRAATEN seconded and the motion was carried *nem con.*

#### ELECTION OF DIRECTORS.

Mr. ROLLO proposed that Mr. H. Creasy be elected a director in place of Mr. Thos. Mackie who had left the island.

Mr. BURT seconded.

Mr. DE SARAM moved that Mr. Mackie be re-elected.

Mr. VANDERSTRAATEN seconded.

On a show of hands being taken it was found that each nominee had three votes.

It was stated that the Chairman could exercise his right and give a casting vote.

Mr. ROLLO then said that for himself he would withdraw the nomination of Mr. Creasy.

Mr. MACKIE was thereupon declared re-elected.

Mr. BURT said that this would leave only two directors to do all the work.

In the course of some conversation it was stated that the shareholders could elect five directors, and that as one of the three who now held office was out of the island—Mr. Mackie might not return for nine or ten months—it might be advisable to elect another director making four altogether.

Mr. ROLLO proposed that Mr. H. Creasy be elected the additional director.

Mr. BURT seconded.

Mr. F. J. De SARAM proposed that Mr. John Paterson be elected, stating that he had no objection to Mr. Creasy if they were going to have five directors.

On a show of hands Mr. Creasy was elected by 3 to 2.

#### AUDITOR.

On the motion of Mr. Vanderstraaten, seconded by Mr. Rollo, Mr. J. Guthrie was re-elected auditor.

This was all the business and the proceedings terminated with a vote of thanks to the chair, proposed by Mr. Burt.

#### INTERIM DIVIDENDS.

Afterwards an extraordinary general meeting was held for the purpose of considering and passing the following resolution:—

"That to the 76th clause of the articles of Association of the Company the following words be added:—'and the directors may from time to time pay to the shareholders such *interim* dividends as in their judgment the position of the Company justifies.'"

Mr. VANDERSTRAATEN explained that the articles of Association did not give power to the directors to declare an interim dividend. For the last four years they had been declaring rich dividends, and at the general meeting such declaration had been confirmed by the shareholders. Doubts had been raised as to the power of the directors in the matter and therefore he proposed the resolution given above.

Mr. CREASY seconded.

The resolution was unanimously adopted.

Mr. BAKER stated that another meeting would be held a month hence to confirm the resolution. The proceedings then terminated.

DYSPEPTIC'S TEA.

A lady writes as follows to a Sydney contemporary:—Milk contains all the ingredients needful for human sustenance, and is of all things the easiest of digestion. The unfortunate part of it is, however, that so many people dislike milk; even those who tolerate it in health seem to have a rooted objection to it in the form of "sick-diet." One of the best methods I know for administering it is by Sir Andrew Clark's recipe for "dyspeptic's tea." The simplest way to prepare it is as follows:—Fill a breakfast-cup with milk, to which a small quantity of water (hot or cold) has been added, and pour into a sauce pan. Put two teaspoonfuls of tea into one of the tiny strainers (sold for a few pence for making single cups of tea), and as soon as the milk is boiling pour it through the strainer straight into the cup. This makes both a palatable and a nourishing drink, and is taken with relish by many who would not touch plain milk, and with whom tea made in the ordinary way does not agree. According to Sir Andrew, the boiling milk precipitates the tannin, and thus the stimulating properties of the tea are secured without the deleterious results from which dyspeptics are apt to suffer.

HAPUGAHALANDE TEA COMPANY.

The fourth annual general meeting of the shareholders of the Hapugahalanda Tea Co., Ltd., was held on the 27th Aug. at the offices of the Company, Messrs. Lewis Brown & Co., the chair being taken by Mr. W. Milne. The notice convening the meeting having been read, the minutes of the last general meeting were confirmed; and the chairman then moved the adoption of the report and accounts, which was duly seconded and carried unanimously. On the proposal of Mr. Robt. Davidson, seconded by Mr. Thos. Mackie's attorney, a final dividend of 4 per cent was declared and carried *nem con*: Mr. Cantlay was re-elected Director and Mr. John Guthrie Auditor of the Co.'s accounts for the season 1898-99. With a vote of thanks to the Chairman the meeting closed. The following is the

REPORT.

ACREAGE:

	A.	R.	P.
Tea in full bearing ..	235	0	0
New clearings ..	150	0	0
Jungle, &c. ..	369	1	3
<b>Total Estate ..</b>	<b>754</b>	<b>1</b>	<b>3</b>

Your Directors beg to submit their Annual Report and Accounts for the twelve months ending 30th June, 1898, which they regret show as compared with those previously issued a falling off in profit due mainly to the fall in value of Tea and high rate of exchange.

The quantity of Tea manufactured during the season (including estate and bought leaf) was 188,455lb.

Estimating the unsold Tea at a safe valuation and excluding a surplus of R528.50 on last year's crop, the net amount realised for this product totals R61,057.74, which is equal to 32.39 cents per lb.

An interim dividend for the season of 5 per cent amounting to R8,500 was paid on 1st March last, and the sum now available for distribution (including R466.66 brought forward from last account) after setting aside R2,367.09 for depreciation on buildings and machinery is R6,923.61. From this sum the Directors recommend payment of a final dividend of 4 per cent absorbing R6,800.00 and leaving R123.61 to be carried forward.

The opening of Uralindatenne in Tea has steadily progressed, 100 acres having been planted during the season, bringing the total at date to 150 acres, which it is intended to slightly increase before the close of this year.

To meet the expenditure thus incurred, the Directors in preference to issuing debentures or fresh capital, propose negotiating a loan, and will take an early opportunity of consulting the Shareholders on the subject.

Mr. Keith Rollo has accepted a seat on the Board. In terms of the Articles of Association, Mr. Alexander Cantlay retires from the office of Director, but being eligible offers himself for re-election.

The appointment of an Auditor for the current season will rest with the meeting.

EXTRAORDINARY MEETING.

An extraordinary general meeting of the shareholders of the above Company was held afterwards, the chair being taken by Mr. W. Milne. The notice convening the meeting having been read, the following resolution was put and carried unanimously: "That the Directors be and are thereby authorized and empowered to borrow or raise from time to time for the purposes of the Company, any sum or sums of money not exceeding in all £2,000 sterling of lawful money of Great Britain at such rate or rates of interest, and generally upon such terms and conditions in all respects as to repayment or otherwise as they may determine or think proper, and to mortgage all or any of the Company's estates and properties as security for every and all the sum or sums of money so to be raised and borrowed and the interest thereon. The meeting then closed with the usual vote of thanks to the Chairman."

MR. QUINTIN HOGG ON THE CEYLON PLANTERS.

In an interesting interview between a representative of the *Financial News* and Mr. Quintin Hogg—at one time of Ceylon—we find the reporter asking with reference to the depression in the West Indies, whether the planters there could not try to produce something else more profitable than sugar, and Mr. Hogg replying that he had grown sugar and several other things in various parts of the world, but he did not see what could be done in the West Indies. A little coffee could be grown, a little cacao perhaps, and some cotton in some parts, but, asks Mr. Hogg, who could do it? and points to the enormous amount of capital that will be lost if sugar fails. Who, he asks, is going to make any further effort? To which the reporter rejoined:

"But when Ceylon planters failed they took to tea and made big profits. Surely you could change from sugar to something else."

"Yes, but it is necessary to bear in mind that it costs little to change from coffee to tea. There were not big amounts of capital to be abandoned. You talk of energy. The Ceylon Planter never showed anything like the energy of the West Indians. We used to grow sugar at £23 to £24 a ton. We have fought all the way down to £10, and we have done it by improved methods and so forth. We have not stood still I can assure you."

"How about indiarubber as an alternative product?"

"Well, we tried it in Ceylon and it was a great failure. It is a difficult tree to grow and takes some time to establish. The planters will not throw away money in wild speculation of this

kind. You might as well talk of establishing oak forests in England to start a new industry with. Tea gave profits in three years to the Ceylon planters. Indiarubber would take many years before success was assured."

#### NILGIRI GAME AND FISH PRESERVATION ASSOCIATION.

The following are extracts from the report of this Association for the past year:—

##### DESTRUCTION OF VERMIN.

The following are a detailed statistics of the above for the past five years:—1893-94, 6 eagles, 13 wild cats, 5 mongooses; 1894-95, 23 eagles, 43 wild cats, 20 mongooses, 14 crow pheasants, 1 wild dog, 1 otter; 1895-96, 58 eagles, 42 wild cats, 31 mongooses, 6 crow pheasants, 6 wild dogs, 10 otters; 1896-97, 263 eagles, 96 wild cats, 52 mongooses, 24 crow pheasants, 8 wild dogs, 6 otters; 1897-98, 45 eagles, 108 wild cats, 37 mongooses, 52 crow pheasants, and 2 wild dogs.

##### INCREASE OF GAME AND RESULTS OF PROTECTION.

As remarked last year, it is impossible to pronounce definitely on this subject. There are plenty of sambur in various parts of the district. In Kodanad there has been a marked increase of late years. In the South-East Wynad forest sambur are this year particularly numerous. On the other hand bison seem to be diminishing in Mudumali. In the Mayar and adjacent reserves there are a goodly number of spotted deer.

##### POACHING.

The amount of poaching in the Secgur Rango is, however, deplorable. Every salt-lick is watched from *machans* or screens, and a great many animals must be done to death by these means. The Forest Department ought to be more on the alert, but is short-handed as usual.

##### RAIDING SAMBURS.

Special measures have been taken to prevent the raiding of sambur by Kurumburs during the monsoon, when no Europeans are about. The success of these measures cannot be judged by the number of "cases" detected, for the Kurumbur is too smart to be caught, but in the year or two the result may be evident in a large number of deer on the grounds.

##### IBEX SHOOTING

has been thrown open, and some very good heads have been bagged, some small ones, too, and a doe or two by mischance. Sportsmen, must for their own sake, look to it that the shooting is not overdone and try to detect any case of immature bucks or of does being killed, whether by accident or otherwise. Without such care another long period of closure must be enforced.

##### A REGISTER OF THE NAMES OF SHIKARIES.

While dealing with the protection of game, another register which has been opened in the District Forest office may be mentioned, for, if successful, it may have very important results. This register is to contain the names of all shikaries recommended by reliable sportsmen of experience. It will take some time to work properly, perhaps, but if, as is hoped, license-holders will give the preference to the men on the Association register, the best men will readily look themselves and think twice before they do anything to forfeit their privilege, while the loafing, poaching Kandal scoundrel, and who is anything by turns and nothing long will find his chief occupation gone. These are the men who get hold of young hands and induce them to kill game not worth the powder, but for the sake of the meat which falls to their own share, and do not hesitate to break bounds in the pursuit, of game into reserves closed against shooting.

##### TROUT CULTURE.

Major Grant reports with regret that all efforts to obtain a consignment of trout ova this season have failed, through the Director of the German Government Fish Farm at Kensington being unable to arrange for the proper shipment of the ova. In future Major Grant thinks the Association should

always arrange for the shipment of the ova, and suggests that the Madras Chamber of Commerce might be willing to assist. The bad effects on the ova and fry of the swamp water, which supplied the old hatching house at "Snowdon," was told in last year's report. Accordingly a new hatch house has been built on the stream in Glenrock, near the Rifle Butt there. It is hoped that much better results will be obtained with hatching work in the future. The trout in the Khenda river are doing very well, and Major Grant has reason to believe that there are many more of these than was previously supposed, and that this river is sufficiently choked to allow fishing to be opened.

#### INDIAN AND CEYLON TEA COMPANIES.

About a couple of months ago we dealt with the results for the year 1897 of a number of Indian and Ceylon tea companies. For the most part these were disappointing, nearly all of the undertakings showing, as compared with the previous year, a decline in profits, entailing the payment of reduced dividends, and accompanied by a considerable decline in the market value of their shares. And now, from the analytical table published annually by Mr. George Seton, which covers the operations of a much larger number of companies, it appears that the results then brought out were not exceptional, but were characteristic of the experience of the industry as a whole. Mr. Seton's table embraces 45 companies registered in London, with an aggregate paid-up capital of £7,216,000. That is the same number as was dealt with in his statement of last year; but the composition of the list is not the same, some companies which were then included being now omitted, and others substituted in their place. For this reason any comparison of the amount of capital, acreage, and yield of crops shown in the two statements would be fallacious. A comparison of average results, however, holds good, and in nearly every respect that is unfavourable. The one satisfactory feature is a very trifling reduction in the cost of production. That averaged 7-13d per lb. as compared with 7-16d in 1896. On the other hand, however, the receipts, which in 1896 averaged 9-31d per lb., fell last year to an average of 8-71d per lb. As a consequence, the margin of profit, which in 1896 was 2-15d per lb. was reduced to 1-58d. And as the profits had to be spread over a bigger amount of capital, the proportion of profits to capital showed a still larger decrease, falling from 9-48 per cent to 5-98 per cent while the dividends on the ordinary and preference share capital, which worked out in 1896 to an average of 9 per cent dropped to 7½ per cent there being also a proportionate reduction in the balances carried forward.

For this reduction in profits the main causes were a fall in the selling price of tea and a shortage of the crop, the yield per mature acre having fallen from an average of 496 lb. in 1896 to 470 lb. in 1897. But in a circular issued this week, Messrs Gow, Wilson and Stanton seek to lay the blame for the less profitable condition of the industry at the door of the Indian Government. "The artificial value recently given to the rupee by the closing of the mints by the Government of India handicaps," they say, "the growers of India and Ceylon in their competition with their rivals in other tea-producing countries whose currency is ruled by natural laws. The force of this assertion, however, is obviously weakened by their further statement that "hitherto fortunately for Indian traders, the Chinese have not been able to avail them-

selves of the [currency] advantage they have over their Indian competitors." For an alleged drawback that is not yet existent cannot be held accountable for past results. Thus far, indeed, it is confessed that the Chinese producer has been at a disadvantage, for we are told that "China tea has to bear certain internal and export duties, besides which there is some slight loss in converting silver into copper cash, in which part of the producing charges are paid in that country. And further, when it is argued that in the interest of tea producers and others, the Government of India should cease to endeavour to maintain the exchange value of the rupee, the fact is overlooked that if that were done then there would be a heavy deficit of revenue, which would necessitate the imposition of new taxes, of which the tea-producing companies must expect to be made to bear their full share. Besides the fall in the prices of Indian tea is largely due to the excessive influx of capital into the industry, which has caused production to increase more rapidly than demand, and this state of things a sharp drop in exchange would tend to intensify and perpetuate. Thus there is great exaggeration both as to the effect that the rise in exchange has had upon the Indian tea-producing industry and the advantages which a low exchange might be expected to bring to it. And when shareholders in the various undertakings are asked to pin their faith to currency legislation as a sovereign remedy for all their troubles they will do well to be sceptical.—*Economist*."

### THE INDIAN TEA ASSOCIATION.

(From the *Financial Times*.)

In our last issue we published a summary of a highly-interesting report on the industries of India and Ceylon, presented by the well-known firm of Messrs. Gow, Wilson and Stanton, whose opinions on this subject naturally carry considerable weight; and, in view of the peculiar circumstances which exist at the present moment, the document is calculated to attract a great amount of attention on the part of the numerous class of investors who have put money into tea plantations in our great Dependency. The outlook has for some time past been clouded by fears of increased production outrunning increased consumption, and, as recent reports have shown only too plainly the effect of the advance in exchange on undertakings which have to remit funds to India has been very unfortunate. To this latter point Messrs. Gow, Wilson and Stanton devote the bulk of their attention, and it is not surprising to find that that they are labouring under a strong sense of grievance. They point out that the gold which the Chinese trader obtains in Europe by the sale of his goods returns in silver coin about 50 per cent in excess of what it does in India and Ceylon. This is, of course, an indisputable fact, and there is no denying the deduction that the Chinese trader is thus placed at an enormous advantage. From the merchant's point of view, the margin is looked upon as a differential tax on British-grown tea; an advance of a penny in the exchange now means a loss of £400,000 sterling to the tea producers, and we are told that "the artificial value recently given to the rupee by the closing of the Mints handicaps the growers of Indian and Ceylon in their competition with their rivals in other tea-producing countries whose currency is ruled by natural laws." The

attitude is a perfectly natural one, but, to our mind, it illustrates very forcibly the danger of approaching a problem so complex as that of Indian currency from the standpoint of one industry, or even of a group of industries. That the value of the rupee has been hoisted to the neighbourhood of 1s 4d by artificial means is a well-known fact; that these means were deliberately adopted with the object of bringing about a stable rate of exchange is a matter of common knowledge, and that the programme which has been entered upon will be persisted in may be regarded as an absolute certainty. We are told that this policy means a differential tax on British-grown tea; would it not be more correct to say that the depreciation of the rupee had previously constituted a bounty, which is now withdrawn? Producers in other countries, "whose currency is ruled by natural laws," have the whip hand for the time being, but can it be seriously argued that a volatile exchange, such as that which ruled in China last year, is anything but a standing menace to general commerce? A wholesale disorganisation of import trade is hardly a desirable occurrence, but this, as events have proved, is a danger worth keeping in mind. When the subject was under discussion in the House of Commons last spring, Lord George Hamilton, in speaking of the proposal to appoint a committee to consider the problem, remarked that "it is desirable that, while we get gentlemen associated with banking and commercial interests, we should try and not put gentlemen on with too direct a personal interest in the exchange one way or the other." In other words, interest warps judgment, and individual persons and individual industries must adjust themselves to the conditions which are imposed for the general welfare.

During the few years prior to 1896 the steady and continuous decline in the prices for Indian and Ceylon tea in London was counteracted by the falling exchange; since the closing of the mints both factors have operated in an adverse manner. Meanwhile land which has been planted of late is approaching the stage of maturity, and the increased supplies will therefore be coming on the market under most unpropitious circumstances. China has, of course, been letting her old monopoly slip through her fingers, and the flavour of Indian and Ceylon descriptions has become a strongly-acquired taste. But a vital change has come over the situation. As Messrs. Gow, Wilson and Stanton point out, the scramble for concessions, territorial acquisitions, and trading privileges that has been taking place in China recently brings into the range of possibilities the application of European skill and capital to the creation in China of the industries which have made such remarkable strides in India. Our Consular representative in Shanghai, in the course of a report received only the other day, remarked that the Chinese Government appeared at last to be awakening to the fact that the tea trade was rapidly leaving the country, and he perceived signs that it would be willing to make some concessions to encourage measures for the improvement of the tea produced. At Wenchow a machine-roller had been experimentally used, and the effect had been to prove "beyond doubt that the most ordinary China tea is capable of astonishing improvements if treated by modern methods. Wenchow tea made by the old native process is of the most inferior description, but by being carefully made and machine rolled, a very fair drinkable tea resulted." The displacement of China tea in the past, as the circular under discussion

reminds us, was largely due to its inferior quality, and if this objection be removed the position may be partially regained, although the process is not at all likely to be a rapid one. But the cultivation of new markets must be taken in hand vigorously without loss of time. It may be assumed that in our own country there is very little room for further expansion beyond what is provided by the increase of population and the raising of the standard of comfort. Foreign markets present unlimited possibilities, but in respect of these the Indian planter stands simply on merits, and derives no assistance from patriotic impulses. If China do awaken in real earnest, and if by reason of varying exchanges its produce can be delivered at a lower figure than that quoted by its competitors, the question of restricting the areas under cultivation may easily become one of great urgency. But it is certainly to be hoped that the Indian and Ceylon Tea Associations will carry on their excellent campaign, and that the assistance they require from planters will be readily forthcoming. Passive resignation to the prospects of an acute crisis would be a most disastrous policy to adopt at the present time.

The elaborate table compiled by Mr. Gregory Seton, showing the "results of working of forty-five Indian tea companies registered in London" during the 1897 season, comes at a timely moment, and affords an opportunity to take a bird's-eye view of the general position. In 1896 the profits per pound came to 2½d, yielding in the aggregate the sum of £450,000. Last year—owing to influences with which all our readers are familiar—the figures were 1½d and £430,000 respectively. The statistics relating to the cultivated area make a somewhat remarkable showing:—

	Mature.	Young Plant.	Total.
1896 ...	102,397 ...	14,613 ...	117,010
1897 ...	140,029 ...	33,045 ...	173,074

The bulk of the advance, it should be explained, is accounted for by the omission of some seven comparatively unimportant concerns, and the insertion of an equal number of fresh enterprises in their stead. But this, of course, does not detract from the significance of the expansion to which the figures bear witness. The paid-up capital represented by the whole group as it now stands is not far short of seven and a quarter millions, and their produce last year came to the imposing total of 65,726,000 lb. The crop per mature acre worked out less satisfactorily than in the previous year, but the cost per lb. remained practically unaltered. The average dividends distributed work out at just under 6 per cent (including those on preference issues), absorbing £420,000, as compared with 7½ per cent. requiring £360,000, and the amounts carried forward and the reserves totalled £559,000, or 7.75 per cent, as against £413,000, or 8.74 per cent. It will be seen, therefore, that, despite the unfavourable developments which have occurred to check the prosperity of the industry, the most recent results hardly afford sufficient reasons for despair. Progress may be temporarily arrested, but the fruits of the past few years' labour are not likely to disappear at a moment's warning. We showed in a recent issue the extent to which securities of this description had depreciated during the past twelve months, the decline averaging about 20 per cent. There is surely, there-

fore, some justification for hoping that prices have now reached bed rock, even if no decided rally can be looked for until the outlook assumes a more promising aspect.

#### DR. MORRIS, C.M.G.

While all who know Dr. Morris, the assistant director of Kew Gardens, will join in congratulating him upon the important appointment conferred upon him by the Government, everybody in this neighbourhood will regret that it involves his removal from our midst. Mr. Chamberlain, Sir Edward Grey, and Sir John Lubbock bore the highest testimony, in the House of Commons, on Tuesday, to the ability of Dr. Morris and his fitness for the important post to which he has been called, and there seems to be no doubt that an excellent selection has been made, for, apart from his high position in the world of science, Dr. Morris has a special acquaintance with the West Indies. But for all that, many will regret the loss of an excellent neighbour, and one whose good work in this district will not soon be forgotten. To the Richmond Athenæum especially he has rendered services of the highest importance. A couple of years ago, when that institution was not so flourishing as it is now, Dr. Morris came forward with fresh suggestions and help which seemed to put new life into the concern. Now that he is about to leave us we shall all think of his good work, and wish him all happiness and prosperity in his future career.—*Richmond and Twickenham Times*, Aug. 6.

#### TEA IN AMERICA.

New York, Aug. 9.

The auction sale, of today, by the Montgomery Auction and Commission Co. of 14,022 pkgs., will be a good test of the market, which has ruled firm since our last. Demand has been light. The sale includes new crop teas, including Formosa. Medium to good medium Japan, 25 to 27c. The Appraiser's office rejected during July 802 pkgs. tea, or 32,816 pounds, of which 629 pkgs. were Pingseny. There were passed 33,045 pkgs. or 2,043,850 pounds. Not a package of Formosa, Foochow, India, Ceylon or Japan tea was rejected.—*American Grocer*.

#### OIL FUEL.

A very interesting experiment was recently made at Portsmouth, when oil fuel was tried on board the torpedo-boat destroyer "Surly," the first occasion on which this fuel has been tried in a British warship at sea. The system which the Admiralty have permitted to be fitted up on board the "Surly" is that invented by Mr. Holden, of the Great Eastern Railway. The apparatus has been adapted to two out of her four boilers. Coal fires are first lighted in the furnaces, but as soon as sufficient heat has been generated bricks take the place of the coal, and oil is fed to them in a spray from an overhead tank the difficulty of furnishing a regular and adequate supply of oil having been overcome by the last mentioned provision. The trial, which was made over the mile in Stokes Bay, appears to have been fairly successful, a sufficient spray being obtained as well as heat, the thermometer indicating as much as 150 degrees (Fahrenheit) in the stokehold. It was hoped to obtain a speed of sixteen knots but three runs over the mile gave a mean of only fourteen knots, results which seem to be sufficiently encouraging to induce the authorities to continue the experiment.—*London and China Express*.

CONSUMPTION OF CHINA TEA  
IN RUSSIA.

We direct attention to Mr. T. N. Christie's letter elsewhere on this subject. He does not do justice to our authority which was a Committee of leading Shanghai Merchants expressly appointed to consider the position of China tea and collate all the statistics referring to its export. These gentlemen published a very valuable Report and full tables of exports for a series of years and the figures they gave under "Russia" are apart from "other countries." Mr. Christie, as we gather, supposes that "Russia" in the case of the Shanghai figures includes tea for, or re-exported to "Asia." But to what part of "Asia" would Mr. Christie send the 37 million lb. of brick tea which were sent from China in excess of the figures he gave for consumption, and which tea was shown in the Shanghai Report, to be mainly imported into Russia "via Kiachta"? Is there any part of "Asia" (outside China and Tibet) using brick tea not under the rule or protection of Russia?

However, the readiest means of settling the point will be to refer Mr. Christie's Statement and the present letter to the Shanghai merchants who drew up the official Report of January 1897. The point at issue is:—Mr. Christie (on Russian official authority, of course) gave the total consumption of tea in Russia in 1896 as follows:—

Leaf teas	52 million lb.
Brick and Slab teas	40 " "

Total 92 million lb.

The Shanghai Committee of merchants gave the total exports of China tea to Russia in 1896:—

Green and Leaf tea	55,618,666 lb.
Brick tea	76,949,200 "
	132,567,866 lb.

Of course, there must always be an allowance for stocks and for tea in transit, &c.; and we only dwell on the great difference in the case of "brick tea" and for this reason: of the total, only 2,717,283 lb. "brick" tea went via Odessa; the rest apparently via Kiachta. Now we do not think the Shanghai Chamber would take cognizance of tea sent from one part of China to another; we understand that *bonafide* exports into Russian territory are meant by the heading "Russia" in their tables. Of course, if it can be shown that Russia re-exported so much as 37 million lb. of "brick" tea, there would be an end of the matter; but that, as at present advised, we cannot consider probable. However, a reference will be made to Shanghai.

“FIELD-NOTES ON THE LAND-BIRDS OF  
SABARAGAMUWA PROVINCE, CEYLON.”

BY FREDERICK LEWIS, A.C.F., CEYLON, F.L.S.

We have already acknowledged the receipt of a copy of this paper. Mr. Lewis does not tell us that his Notes add to the information in Legges' "Ceylon Birds"—to which he bears the highest testimony—but his introduction is interesting in itself as the following extracts will show:—

Briefly, the province contains very nearly the greatest range of altitude in Ceylon, and if Pidurutalagalla, our most lofty mountain, excluded, this

general statement is more nearly correct, as Sabaragamuwa extends from about 50 feet above sea-level to close on 7,250 feet. In this wide variation of altitude there is, naturally, wide variation in temperature. Not only does the thermal variation show wide differences, but the rainfall is still more variable, for it ranges from, roughly speaking, 40 inches at Embelipitiyé in the dry zone, in the east, to close on 300 inches in the valley of the Kuruganga, within the influence of Adam's Peak.

Amid such rapid variations, both of temperature, altitude, and humidity, a still more changeable state of soil and vegetation is met with. In the hot and dry flat country—The Bintenna of the Sinhalese—a rich soil is found. In the wet steaming forests, within the limit of high rainfall, the soil is sandy, poor, and usually shallow, while up in the high altitudes the forest-clad hill-ranges are frequently broken by long open stretches of grass-or "patina"-land. The presence of these patina-lands is not clearly accounted for, and various theories have been put forward to explain why there should be a hard-and-fast line between high forest and short grass; but though some of the explanations are distinctly plausible, they do not answer all the conditions of the problem. I may here state that patina-land is not the exclusive characteristic of the hill-country, but its occurrence has an undoubted effect on the distribution of the birds, and as such forms an important factor. Not only so, but the conditions of forest distribution are also to some extent affected.

Taking the general physical conformity of Sabaragamuwa as a whole, it may be regarded as very mountainous over two-thirds of its entire area, the flat country being mostly to the south and nearest the sea, while the hill-ranges begin rapidly to rise from Ratnapura, the chief town of the province, both to the east, north, and north-west; but in making this general statement it must not be supposed that all the hill-ranges radiate from the spot mentioned. The great mountain-zone that divides the Sabaragamuwa Province from the Central Province may be said to take its rise from the bottom of the valley through which the Kalani river forces its way into the lower plains, and rapidly rises until it reaches Adam's Peak, comprising with that area the wettest part of Ceylon. From Adam's Peak a continuous high altitude is maintained towards the east, where vast precipices are found, around which some of the most curious variations of vegetable life occur. The hills then undulate a little to the north, when the Horton-Plain country is reached, and the basin of the Belihuloya stream terminates the province-boundary to the east, after which the Uva Province takes up the continuation of the great hill zone.

The high rainfall already referred to of necessity gives rise to a great number of streams that in turn form rivers of considerable magnitude. None of these rivers are, within the province under description, subject to tidal action, but all of them, during the period of high rainfall, overflow their banks, causing (except in the case of the Wallawey river that flows for the greatest part of its entire length through the "Bintenna," or dry zone) floods over large portions of the country.

The wet forests, or areas in which the mean humidity is high, contain by far the largest proportion of vegetable life, and it is here that the greatest profusion of birds may naturally be expected to occur, but such is not the case as regards species. Numerically the individuals in the wet forests may be abundant, but for variety of species the dry zone has the preponderance in its favour. Thus, taking two extreme points, at Kittulgalla, where the rainfall is over 200 inches, it is unusual to find more than five species of Hawks; on the other side of the province, at Embelipitiyé, more than a dozen kinds will be found in a day.

Another very important factor in bird-distribution is the influence of the monsoons. During the south-west monsoon months, that extend from the early part of May to the early part of September, most of our migratory species are absent. High winds prevail, and in parts of the province, especially to the north:

east, the whole of the vegetation of the country is passing through a continuous period of unrest. Insects are blown away to more sheltered spots, flowers are few, and when formed are rudely torn off and lost, and those birds that remain are forced to a state of comparative privation.

When on the other hand, the north-east monsoon comes in, with its sharp local thunderstorm, a still air, and a burning sun, then bird-life is found in profusion. The first of the migratory species to appear is generally *Motacilla melanope*. This beautiful little Wagtail will be found often on the 1st of September, and in a few days, from the banks of the cold bubbling streams in the heart of the "wildercess of the Peak," down to silent rivers of the "Bintenna" country, this ever active little bird will be found in restless movement in search of its food. Soon after and often together with this Wagtail, will be found *Merops philippensis* and *Hirundo rustica*, while more to the south, in the swamplands and rice-fields (paddi-fields), the sportsman of the country hopes to record his bag of the "first Snipe of the season." The Snipe (*Gallinago stenura*) arrives about the 2nd of September and departs at the end of April, though it is not uncommon to find individual specimens so late as the 10th of May. In the hills, as well as in the low country, migratory species begin to increase in number, counting among them such species as *Cerchneis tinnunculus*, *Hierococcyx varius*, *Lanius cristatus*, *Trochilophona paradisi*, *Phylloscopus nitidus*, and *Pitta coronata*, not to mention many others that are less noticeable. The stream of migration is difficult to follow, as it has never been regularly observed at different points at right angles to its course simultaneously; but the impression I have gathered from my own observations is that in this province the incoming stream strikes well to the south of the main mountain-ranges, while the outgoing may be taken at first as a gradual thinning of species in the hills and increase in the plains, after which the departure takes place, probably in the course of a few nights. I have not been able to find any special places or points at which birds of any one species congregate previous to departure, and I receive with doubt the statement insisted on by some observers that this association does take place, as it has not been supported by my own direct experience, beyond a few occasions on which I have found large assemblages of birds of one species within one isolated area. These occasions, however, were not those periods when the onward migration was commenced, but rather on the contrary. I will, in its proper place, again refer to this fact in its relation to migratory as well as endemic species.

#### A NEW FLOORING.

Has been invented and patented by a House (for which Messrs. Whittall & Co. are local Agents) which is likely to prove more economical, durable and efficient than either cement or concrete. Generally speaking it is a mixture of iron slag ground down and cement and many thousand yards are likely to be used by our Railway authorities and also possibly at Hultsdorf Mills, if the tests now being applied are satisfactory, which we have no doubt they will be. This new flooring does not crack as cement often does.

#### BAMBOO BASKETS: A HINT FOR PLANTERS.

A "WRINKLE."

Dimbula, 5th Sept., 1898.

DEAR SIR,—It may be not generally known, or at all, that the giant bamboo—of which there are magnificent specimens in the Royal Botanic Gardens, Peradeniya—makes a very good basket.

I have tried it for roll baskets in the tea house, and for manure, and it is likely to be good for plucking and carrying baskets. Indeed, it may turn out better than cane which is often bad. The canes of the big bamboo when ripe, split easily, especially when steeped in water for some time—and with the thin "splittings" the baskets are made. These bend sufficiently, without breaking, for the work. It would still, be an improvement to boil the "splittings" in a cauldron, as basket-makers do at home. The big bamboo (which, by the way, is not botanically speaking a bamboo, but belongs to an allied genus), will grow at any elevation, from sea level to 5,000 ft.

It thrives best in moist sandy soil, and least so in stiff clay, and does not live in bogs or where there is stagnation.

The bamboo is easily propagated, by division of roots, or in hot climates by cuttings of the bamboo: canes laid in the ground etc.

Yours faithfully,  
M. K. G.

#### COCONUT IN NORTH-WEST PROVINCE.

Whether the white ant attacks live wood is a question that periodically is discussed in the press. Every observant agriculturist or horticulturist knows that it does. They have evidence of it always. There is an article on "White Ants as Agricultural Pests" in the August number of the "Agricultural Magazine." Pests they undoubtedly are, but under certain circumstances they prove to be friends to the agriculturist. In seasons like the present the planter will observe that the ground is alive with white ants attacking every bit of dry wood lying on the ground and converting it into soil. That is benefit number one. Number two is that that the soil is literally honey-combed by the tiny termites and is thus being thoroughly aerated now and all will render the passage of water through it easy when the rains do come. So like the humble earth worm it answers a very useful purpose in the economy of nature and under certain circumstances is a very useful friend to the agriculturist.

#### THE INDIAN TEA INDUSTRY.

The cooly "bonuses" given by the Cachar and Sylhet Gardens, the *Englishman* informs us, are very heavy and liable to abuse. It is calculated that if the Planters there did away with the system, an annual average saving of R7,000 per estate would be effected. Ceylon Coast Advances are bad enough, but there appears to be a much lower sink of principal as well as of interest in Indian Gardens.

London and Ceylon Brokers always hold up the average of Indian Tea to their Ceylon constituents. In India, however, there are Districts and ——— Districts. The average for Assam, where there is a large area of young tea coming now into bearing, is 7 annas and 8 pice. The Surma Valley, however, gives only an average of 5 annas and 11 pice. The area of the former is 6 annas to 4 annas of the latter.

The Indian Tea Association seems to be divided on the subject of telegraphing estimates of tea crops early in the year to London as they are not to be depended on, but the Association intends to discuss the matter fully at its next meeting. The following remarkable passage appears in the Indian Tea Association's report, and we trust our contemporary of the "Times" will not have a fit when he reads it:—"the total planted area represented by the Association during the year is 308,921 acres.

This shows a SATISFACTORY increase of 34,470 acres on the former year." This beats Ceylon with a vengeance! We only put out 55,000 acres in 2½ years.

The following pertinent remarks from the *Pioneer* of September 1st, are very applicable to Ceylon :—

The annual report of the Indian Tea Association recently published offers some food for reflection to the many shareholders in tea companies resident in this country. Within the limits to which it has confined itself the Association has done good work, and the recent resuscitation of local branches in districts, such as Sylhet, where they had disappeared, is a healthy sign of its influence. A strange omission in the report is the absence of any reference to the present condition of the tea industry. We search in vain for some indications of the serious troubles under which, we so constantly hear, tea planters are labouring. So far as this document, published under such distinguished authority, is concerned, the industry might be sailing in smoothest seas. And yet only a short time ago, Mr. Buckingham, the Chairman of the Assam branch of the Association, publicly stated in his speech before that body that the tea industry is passing through a crisis probably worse than that which was experienced in the sixties, when tea shares, it will be remembered, were begging buyers at a few annas each on the stock exchange. If it to be true the industry is in this parlous state, it seems passing strange that the Indian Tea Association's annual report should completely ignore so grave a matter: the more so as the existing depression might have been legitimately urged to give weight to the argument that union is strength, and to summon all interested in tea to marshal their powers and combine their forces to meet the difficulties ahead. Unfortunately combination is not a characteristic of tea planters, wherefore it is all more the important to encourage it, and if necessary compel it.

In the matter of exploiting America as a new market for Indian teas, the Association in alliance with Ceylon has a good record to point to. We think it is wise in its decision to continue the campaign for another year, notwithstanding the demand already established, which absorbed over five million pounds of Indian tea in 1897. But we could wish the Association had exhibited equal interest in other markets for Indian tea, and corresponding energy in invading them. The greatest market of all is India itself. If such impoverished countries as the Central Asian Khanates, Persia, Afghanistan and Kashmir can afford to drink Indian tea and pay highly for it too, it is strange there should be so little consumption of the article in India proper. An industry that spends over a lakh of rupees yearly in establishing a trade of five million pounds in so distant a country as America, may reasonably be asked why it does not capture the market at its very doors. Tea is almost universally drunk in China, but the qualities in common local consumption consist chiefly if not entirely of dust and coarse leaf. We observe from week to week the sale of hundreds of chests of dust tea at the Calcutta and London auctions at values which create wonder. In a recent sale, for instance, 300 packages fell to the hammer at prices ranging from tea pies, or two and a half annas per pound. Are not these the very teas with which to tempt the thrifty native of this country to make a start and squander his anna on what is at first a luxury, but speedily becomes a necessity? A direct benefit would ensue by the relief afforded the Loudon market if three million pounds of dust tea were taken off it, and that amount is probably a fair estimate of the annual production of this quality. It is obvious that at the prices quoted it cannot pay the planter to pack such teas in lead and sell them on the public market. It is also obvious from the Association's report that many plantations shirk contributing their quota to the American market fund. A planter who may be a miser with his money, is often prodigal with his tea, as missionaries and charitable institutions

are aware. Why not start an Indian market fund, and in lieu of monetary subscriptions assess contributions in the shape of dust tea, packed-lined boxes or even bags, and to be sold for what it will fetch in the chief cities of the Empire? It is hardly possible there could be any loss on such operations; for carriage and sale expenses from one end of India to the other would not exceed one anna per pound. Force the article on the natives by putting it in their midst and leaving it there. They are bound to try it, and the taste once acquired would probably lead to tea becoming as necessary to the people of this country as it is to those of Central Asia and Persia.

The Indian tea industry is made up of three component parts: the shareholder, the planter, and the middleman. In the latter category must be included every individual or corporation which deals into the tea from the time it leaves the factory until it reaches the consumer. Of such are railway, river, and ocean steamship companies, agents, directors, brokers, exchange banks, bonded warehouse keepers, wholesale buyers, retail sellers. All these exact their utmost dues with unflinching punctuality from every pound of tea before it is sold over the counter to the consumer. Agency houses reap as much profit for the work done as any other folk. They and the brokers charge the same percentage for their services, now that tea is selling at a loss, as they used to do when it sold at a handsome profit; and we certainly have not hitherto observed any reductions in the Calcutta or Loudon cost of administration of tea companies. We are creditably informed of companies prying their directors and agents the same remuneration now that they are working at a loss, as they did when their operations resulted in handsome profits. The value of the hundred million pounds of tea produced in Assam and Cachar in 1897 is given at about 6 annas 10 pies per pound in the Association's report. After deducting the tribute demanded when running the gauntlet of the various middlemen, the bare balance that remains to the shareholder or planter in the majority of cases does not in many cases repay the cost of production. This the scores of tea companies' reports for 1897 that we have looked into, show to be a proven fact.

The time has come when further economy cannot be enforced at the plantations by the barbarous method of dismissing manager after manager who cannot pay a profit as well as his Calcutta or Loudon expenses. The economy of the future must be extended to a reduction of the charges and taxes levied on teas in Calcutta and Loudon. But who is to enforce this? The Chairman of the Indian Tea Association, in his speech dealing with the report, let drop a pregnant remark. Alluding to a certain matter he said it ought to have the attention of "our managers." That puts the position in a nut shell. The planter, whose whole stake is in the tea industry, is to the members of the Indian Tea Association merely "our manager"—not our *confreere*. How shall the subordinate control the master? It is too much to expect the Indian Tea Association to reform itself. There is no dismissal for its members if Calcutta expenses are too high. And yet, in order to place the industry in a healthy condition, it is the members who control it, who should be, as a community, subjected to criticism and control. If they will not take up crying abuses to which their attention has been publicly directed, then some one else must. There is still room for a modicum of profit in tea planting if the same economy is enforced at Calcutta and Loudon as has been achieved under pressure at the plantations. Unfortunately the Indian Tea Association in its reports displays but a quarter-hearted interest in the reduction of the excessive charges which are known to every tea planter, and should be made known to every shareholder. We fear the Association is not the organisation to deal with the evils indicated. It is the planter whose voice should be heard now at the council table of the Association, and he should be backed and supported by the shareholder. It is the planter who has made the Indian tea industry, not the Calcutta or Loudon agent, who has merely passed on

him the money subscribed by the public. The planter and the shareholder are the people whom the shoe is pinching—the middlemen are in velvet slippers still. Economy is wanted all down the line which only begins at the plantation gate, and extends through carrier companies, directors, agents, brokers, exchange banks, and wharfingers right away to Mincing Lane. A trades union or alliance of planters and shareholders is the tonic the Indian tea industry requires to pull it round.

#### POULTRY FARMS.

The subject of poultry breeding on an extensive scale is just now occupying the attention of many Durbanites who think there is money in the business. Messrs. Munger and Aarons have started a farm at Malvern, and it has been fitted up with patent incubators capable of turning out 1,000 chickens per month. Incubators have also been erected at Umgeni, in connection with the Queen's Bridge Hotel, for duck-breeding.—*Natal Mercury*, Aug. 12.

#### AN INDUSTRY OF QUININE.

Professor Koch has published a severe indictment of quinine, in which he urges, that the extent to which the alkaloid is used in tropical and malarial countries not only does not effect the object for which it is taken, but is open to a far graver charge. According to the eminent professor quinine is given in such excessive doses in the treatment of malarial fever that in many cases the more dangerous black-water fever is induced. One of the causes which is no doubt responsible for the consumption of such enormous quantities of the alkaloid is the immense cheapening in price which has taken place in recent years. Residents in tropical countries are accustomed not only to take the drug in large doses intermittently, but also regularly, with the object of impregnating the system and rendering it proof against malaria. Many persons who have lived in the tropics aver that quinine does not effect the object of rendering the consumer immune against malarial fever, and that its excessive use tends to debilitate the system and cause the fever, when it does attack the subject, to be far more dangerous. It is also said that antipyrin and antifebrin have similar effects. In support of this theory it is stated that the mortality in certain portions of West Africa is increasing, in spite of the fact that conditions of life are rapidly improving. Whether there is any ground for this belief in the injury caused by the continued consumption of quinine we do not know, but there is no doubt that the use of it has increased enormously of recent years, this being partly due, leaving out of the question the present price of the drug, to the fact that it is now presented in such palatable forms as sugar-coated tablets. It is asserted, too, that women are unable to take quinine to the extent that men do, and that, therefore, the mortality of women on the West Coast of Africa is much less in proportion to that of males. It must, however, be borne in mind, in this connection, that European women at any rate, in such regions as we are now dealing with, are not exposed to such trying circumstances as are men. In ordinary cases of fever on the West Coast of Africa doses of 70 grains or more in 24 hours are said to be by no means uncommon. Professor Koch also advances the argument that cases of black-water fever occur almost exclusively among white men, and the disease only exceptionally attacks women and natives. This he ascribes to the fact that the consumption of quinine is far greater among the European male population than among any other class of the community. Professor Koch concludes his article by saying that the treatment of black-water fever with quinine must cease, and that malarial patients, who have had one attack of black-water fever, must have quinine given them with extreme

caution, and it is far better to give some other remedy instead. These are weighty words coming from a man like Dr. Koch, and we are waiting with considerable interest to hear what eminent authorities will have to say in favour of a drug like quinine, the reputation of which has been so long established, and which reputation we cannot think will be swept aside without some very strong arguments being advanced in opposition to those we have summarised above.—*British and Colonial Druggist*, Aug. 19.

#### QUININE IN SOUTHERN INDIA.

The report on the administration of the Government cinchona department during 1897-98 is very satisfactory and shows that the amount of quinine distributed during the year was the highest on record and exceeded the previous year's issues by 428 lb. The sales of quinine packets by postal agency continued to show an increase, having amounted to 658½ lb. against 628 lb. in 1896-97. On the other hand, sales by the Revenue Officers necessarily showed a further decrease. The demand of the Government medical depots for febrifuge fell considerably. The total receipts and charges amounted to R98,464 and R95,300, respectively against R147,310 and R82,549 in 1896-97. The fall in receipts was mainly due to the fact that the price of quinine supplied to Government medical depots was reduced from R18 in 1896-97 to R11 in the year under review. From the balance sheet it appears that the profit in the year's working amounted to R32,852-15 10. Mr. Standen, the Director has richly deserved the thanks of the Government for his efficient working of the plantations and factory during the year.—*M. Standard*.

#### THE SEYCHELLES.

One writing enthusiastically in a contemporary on the various advantages and delights of the Seychelles, especially as a recruiting place for worn Anglo-Indians who have not the time or money to run home, says that apart from their attractiveness as a health resort the Seychelles afford a very fair opening for an energetic man with a little capital. It is claimed for this little British colony that it offers advantages for a young man with a thousand pounds to spare not to be found elsewhere. Some planters from Behar who recently visited Mahé were so favourably impressed with its possibilities that they have decided to give up indigo planting and try their fortunes in the Fortunat Isles.—*M. Times*, Sept. 4.

#### NORTH BORNEO ITEMS.

There is a strong feeling in British North Borneo that a large amount of trade will soon take place between that Colony and the Philippines, now that an up-to-date Power has the control. Previously squeezes of the same character as exists in China handicapped commerce. There will now be a doing away with discriminative duties and restrictions, and there will be the opening of new ports.

The Bakow Company exported lately 22 cases of Cutch. This is now one of the most flourishing industries in Sandakan.

A sale of Pearls took place at Marudu Bay by auction and \$2,563 were realised, one pearl fetched \$150. A survey of the banks is likely to be made so as to regulate the fishing. A new bank has just been discovered.

## MR. R. E. PINEO ON MEXICO.

We call attention to an interesting letter from (see next page) this well-known Uva planter on coffee planting in Mexico. The picture he draws is very different from the highly-coloured ones of the promoters of Companies in America or of Syndicates in London. Mr. Pineo shows very plainly the difficulties with labour. He does not, however, refer to the present low prices of coffee. He gives us news of Mr. E. O. Darley and also of the *Observer's* correspondent, Mr. W. J. Forsyth: both are evidently very busy. It is more interesting, however, to learn of Mr. Pineo himself: he is now established in the capital of Texas as agent for Mr. Elwood May's "Blud and Tiffin tea" and "Lanka Coffee." We may as well quote what Mr. Pineo says in a separate note, for it will be of interest to his old friends out here:—

"I am now here in the interest of Mr. May endeavouring to sell his brands of Ceylon pure Tea, and I see that one of the stores has a packet tea styled 'Holyrood' on sale and two places have bulk Ceylon's on exhibit. It is a pity, I think, that the Ceylon planter is going in for quantity, and not quality, as the markets of the world have a sufficiency of rubbish already to take care of.

"It has grieved me to see the notices of so many deaths among the old residents of Ceylon who helped much to make its history. The late Mr. Byers was among the many good friends who helped me in Ceylon, and the late Major Skinner was one of the men who gave me a helping hand when most I needed assistance."

We trust Mr. Pineo will be very successful in his Texas mission both for his sake and that of old Lanka where, he must now understand, the tea planters are especially set on *quality* during the present season.

## "PROGRESS IN CEYLON."

Under this heading, the *London Times* of 19th August—the day the last Mail left London—contains a letter from our pen covering nearly a column-and-a-half of leaded type. We did not expect to find it inserted in full; long letters being so often cut down. The subject we need scarcely say is a review of the latest statistics connected with the Planting Enterprise not only in Tea and Cacao plantations, but also connected with Cocoanuts and other products more especially in native hands. Were produce the latter on page 274, so that our readers may see what has been published in the leading metropolitan journal. The parts that are of most local interest are where we emphasize the benefit that may result from the stoppage put on planting extensions, through the large area now under tea and the big crops in prospect, if all continues to be cultivated. We are strongly of opinion that nothing is more likely to deter Sir John Muir and other big capitalists from opening more land for tea, than to put before them the enormous extent now covered with the product in Ceylon as well as in India. Next we point out that Ceylon has a full supply of planters and no young men should come here "seeking." But of far more importance is the possible effect of the Currency Committee's decision on our tea planting and other export industries, and to this we refer more than once, and in the end we venture to leave the following expression of opinion with the home public, official and otherwise:—

"I would just mention that, should the decision of the Indian Currency Committee prove unfavourable, the Ceylon tea planters and produce exporters

generally are likely to press Mr. Chamberlain for an amelioration of fiscal burdens in two directions, namely—(1) a reduction (with a view to eventual abolition) of the import duty on rice; and (2) a reduction in the Government railway traffic rates, which are out of all proportion higher than those charged on any Government railways in India."

Before this, we had shown the utter failure of the policy of abolishing the Paddy rents and "protecting" the local industry, so far as lessening the imports of rice which have, instead, risen from 7,282,411 to 8,723,750 bushels between 1892—the year before abolition—and 1897.

We refer, further, to the importance of Russia as a tea consuming country and to the wisdom of reducing the prohibitory import duty which we trust the present Finance Minister, M. Witte, may take in hand and lessen gradually. Finally, we close with a reference to the Colombo Harbour Works and the great future before the trade of our Port, especially if connected by railway with Southern India, and if gradually relieved of the obstruction offered by a long and troublesome Customs tariff.

## MINING PLUMBAGO!

In our reference to this subject yesterday we were thinking only of the "royalty" (now an export duty) and forgot all about the obligations of the "Mining and Machinery" Ordinance No. 2 of 1896. We quote an obligatory clause as follows for the information of planting and other friends:—

(1) If any person intends to open, work, or use any mine, he shall, one week at least before commencing to open, work, or use such mine, furnish the government agent of the province within which such mine is situate with a declaration in writing containing the following particulars:

(a) The name and boundaries of the land in which the mine is to be opened, worked, or used;

(b) The nature of the right of the applicant to open, work, or use the mine on such land; and

(c) The name or names and residence or residences of himself and of the person or persons under whose management or superintendence the mine is intended to be opened, worked, or used.

(2) If such person ceases to have an interest in such mine, or if any person or persons other than those named in the declaration shall be entrusted with the management or superintendence of such mine, such person shall forthwith make a further declaration thereof to the government agent.

## PLANTING IN SUMATRA: A PARTNER WANTED.

With reference to an advertisement sent us and which appears elsewhere, Mr. Turing Mackenzie writes:—"Soengey Poetitie is the finest young Liberian coffee I have ever seen, and Daisydale is a good second. For this especially I wanted Mr. Vander Poorten to come to me. But it was not to be. He confined his attention to coffee planting in 'Switzerland' and could not spare a day to come to Serdang East or the more cosmopolitan end of the District. At the time, I was in the agonies of 'fitting,' in fact movings myself, from Cosmopolitania (Serdang E.) to Switzerland (Serdang W.), so I could not get to meet Mr. Vander Poorten. The coffee in Switzerland is very fine, but I think Cosmopolitania is even better. More power to your elbow. You will surely get relief on the Currency Question, and prosperity will return once more. It is not as if planters only raised the outcry. Importers and Exporters in Ceylon and India combine against the Government."

## Correspondence.

To the Editor.

COFFEE PLANTING IN MEXICO BY  
MR. R. E. PINEO—OLD CEYLON  
MEN THERE.

Galveston, Texas, 20th July 1898.

DEAR SIR,—In view of the fact that many Ceylon Coffee Planters are giving their attention to possibilities of profitable coffee cultivation in Mexico, it may not be uninteresting to yourself and to the readers of your valuable journal to learn what the impressions of an Old Planter, gathered during a short visit to that country, were and are.

I entered Mexico at Porfiorio Dias in the North and left it at Progreso, Yucatan, in the South. The country has a progressive and able President, who gladly welcomes Foreign Investors, and it is being opened up by railroads, and its nearness to the markets of the United States, gives it a pull over any other coffee producing country. As a rule, the visitor to a coffee district will find it a wilderness of coffee growing and being treated in precisely the same manner as the native coffee of Ceylon, with this difference, however, that in Mexico the Plantain Tree is very extensively used for shade, although, in my opinion, no shade whatever is needed, which fact is just beginning to dawn on the progressive Mexican gentleman. In many parts, the old Disc Pulper is to the front, but it has a solid metal drum and the punch is cut in this metal, hence it is rigid with an ignorant person in charge much damage might be done.

Cordoba and Oaxaca are among the most favoured and profitable districts owing—partly—to superior climatic conditions and to transportation facilities, but many claim that Chiapas is the best country for coffee in the Republic, although it has its drawbacks in the absence of roads, and all coffee must be carried by river and pack to Frontera to be shipped. The Isthmus of Tehuantepec is being boomed by land dealers as the favourite, and they will show you photographs of trees, twelve and fifteen feet in height, in proof of their claim. This district is better adapted to the cultivation of tobacco and sugar and these products should be very profitable—always provided the labour supply is sufficient. At Cotapec a Swiss gentleman has a modern, perfectly equipped coffee pulping and curing establishment, and he will take in your cherry and give you back clean coffee highly polished. He has splendid water power, two Gordon pulpers, cisterns, drying machine, winnowers, sizers and two polishing machines. The drying and polishing machines were patented in Guatemala. The matter that will confront the careful, cautious Investor is the labour problem, and I confess that it appears difficult of solution. When you talk to the old resident about improved cultivation, he will tell you that it is an utter impossibility with the labour conditions as they are and always have been, and he will say that it is not certain that improved cultivation is either desirable or even profitable, and he is determined to let things go on unchanged. One gentleman who had been in the country for upwards of twenty years and always identified with coffee told me, he intended putting in a new clearing this year, that he would

plant the trees very close, and, after they had borne for two or three years, he would thin them out!

About midway between Puebla and Oaxaca, the enterprising American Law started in for coffee planting and already he is beginning to experience the difficulty of finding satisfactory labour conditions. One gentleman told me that when he began operations he secured labour at fifty Mexican cents per day without rations, but that he was then paying sixty Mexican cents and giving rations in addition. When will this thing end? If, with the small quantity of labour required in the beginning, the rate has increased more than twenty per cent, what will it be when a large force is needed in the harvesting season? Some advocate the employment of colored labour from the Southern States of the United States and the introduction of Chinese from California, but they—apparently—have not taken into consideration the cost, and I am of opinion that this class of labour can never be secured at a rate that the coffee planter can afford to pay, nor that, if obtained, it would be satisfactory. The only solution to this labour problem that I can suggest is, the importation of Japanese. The Mozzo or peasant is oftener than not armed with a pistol which he is disposed to use on very slight provocation, and when one sees a train load of them going to a bull-fight fully armed, it would appear that there was some good reason for it, although those best able to judge claim that the peasant is harmless and inoffensive. I met two prominent Mexican gentlemen about proceeding to their Hacienda, that had been in possession of their family for generations and when I questioned them about their going armed they said it was absolutely necessary.

The climatic conditions of certain portions of Mexico are favourable for the cultivation of coffee, and land can be secured at reasonable prices, but the investor has the labour question and low prices for the commodity staring him in the face, and he would be a bold man indeed who would invest under existing conditions.

I had not the privilege or pleasure of meeting my old friend, Forsyth (he assisted me for a short time on Kalupahani), and I was, consequently, very greatly disappointed. He was, I understood, engaged in erecting a plant on a plantation owned or partly owned by the President of the Republic. Mr. Forsyth is held in high esteem by those who know him and is considered the best authority on coffee in Mexico.

Mr. Darley is in charge of a property on the Isthmus. The Isthmus is reached by a Mexican steamer leaving Vera Cruz for Coaxacoalcos, from which point there is a railway crossing to Salina Cruz and at both Termini the harbours are to be greatly improved by means of breakwaters and piers. It is claimed that the Isthmus has an elevation of 1,200 feet, that coffee, rubber, tobacco, cacao and sugar can be profitably cultivated and that it has many advantages over any other district in the Republic, but these claims are not verified by actual experience extending over a number of years, and I feel doubtful about coffee proving a permanency there, although, as before stated, tobacco and sugar ought to do well. Vera Cruz is the great shipping port of the Republic, with Tampico trying hard for first place. The first-named place is a veritable death trap, owing to its vilely dirty and unsanitary condition, and it is the home of yellow fever, while Tampico can give it or any other place odds on mosquitos and then come out ahead.

The churches and hotels of the Republic were a disappointment to me, but on the whole, it is a very interesting country to visit, and it is rapidly coming to be recognised as a progressive and, of course, wealthy country.

If you think the foregoing will be of any interest to your readers you may, perhaps, give them space in your columns, or you may decide that they are suitable for the waste paper basket.

—Yours faithfully,  
R. E. PINEO.

### ENEMIES OF TEA.

Nawalapitiya, Aug. 16.

DEAR SIR,—Under separate cover I am sending you some Tea Shoots off bushes pruned about three months ago. I also found the same shoots on tea pruned over a year ago; it is not general but is quite in evidence. This looks very serious. I have been trying to fix it to many surroundings such as the drought we are experiencing in what is one of our wettest months; August in every year has been famous for its stormy weather; never a year without 30 inches of rain; last year we had no less than 36.44 inches and up to date this year we have only registered 2.78 and more than half the month is gone; today it is quite bright like any day in December or January. I also thought the tea bushes in rocky soil were affected and not others, but here again I was disappointed; I found it on tea, where there are no rocks within 100 yards. Do sir, ease our mind by referring the matter to some experts and let us know how to guard against this evil. As the Planters' friend, I have not the least doubt you will give us all the help you can. C. T.

[We have referred the injured shoots to Mr. S. Green as the nearest authority.—ED. T.A.]

### HAS CEYLON TEA DETERIORATED?

August 16, 1898.

SIR,—With all due humility and perhaps a slight sensation of fear and trembling, which I think pardonable, considering the number and strength of our enemies, I venture to record my vote in favour of the minority who contend that our Ceylon teas have not deteriorated.

V. A. interrogating grizzly old fossil like myself as to new estimate:—"Field No. 1, 20 years old, what yield for 97?" "843 lb. 15 oz." "put it down at 950,—natural increment you know"

Managing Director prancing around and making himself generally disagreeable. "What the — has Brown Stone been about that he hasn't frothed up to 10d at least and as for Coek o' the North I'll scrag him for his chickenheartedness over those confounded coolies. Pluck coarse ye beggars and study grindstones or gunny bags."

"He will return I know him well." Ample supervision properly remunerated did ye say? No fear! Cheap and nasty is the order of the day and cheap and nasty it is, sir, in a great many cases.

Now for London:—Tea for Price and the great Combine will ultimately kill fine teas, for though they keep on howling for quality, you won't find them pay for it and the reason of this, in my opinion, is that so many upcountry men nowadays go in for quantity and produce a tea with some flavor and quality (precious little of either though) which the country grocer thinks good enough for general use and therefore does not see his way to rise to the extra superfluous, though the best the

world produces is put at only 1s 7d, so even were there no combination there would be but limited competition for fine teas.

Look at recent sales and you will find close on 1,000 packages from Dimbula sold thus: London 6½d and 6¾d, Colombo 33 cents. These estates got stand-out prices not so very long ago, so why this thushness? Coarse plucking and nothing else which simply spells suicide were all to indulge in it.

The Thirty Committee, I take it are neutral. They act on the hue and cry as in duty bound and see no harm in more light like the rest of us. Mr. Bamber is welcome to a leaf from my catechism: "Your yield and average in '94? 400 lb. and 11d

Do. Do. '9 ? 600 and 8d Q.E.D.

Now for J. R. Many a time and oft have I marvelled at the experience and expertness of our worthy friend as a taster of the whisky wine, but still more do I now wonder to hear he has become an authority on tea. He lives by it of course and it is naught, it is naught, says J. R. and all this would be positively amusing did the press not swallow it so seriously. Did J. R. ever make a pound of tea worth 6d. in his life and if not what right has he now to pose as an expert on the subject, and why should the "Times" back up such twaddle and as it were foul its own nest?

It is comforting to be assured that planters are now doing a little work; have renewed the bottoms of their kettles and set their pluckers to hunt the shy and wily flush at the rate of about three days in seven as this is to give them good prices later on. I was under the impression, prices usually improved from now for a few months; that planters worked all the year round, some like editors, but as the latter constantly say no and of course, they know everything even to the law of libel, I suppose there must be a certain amount of veridancy about me, though with apologies for this lengthy yarn I feel bound to sign myself—Yours faithfully,

OLD FOGIE.

II.

Aug. 22.

Here is something worthy of the serious notice of the *Observer* even. Per last mail I had a sample of my own tea sent me, which had been seen in a grocer's shop and sent him by a large buying firm as a very good substitute for Darjeelings.

It was priced 4d per lb. in bond more than it had fetched in the market, and seeing the grocer had still to have his 4d or 6d per lb. for his trouble, do you think we are getting anything like fair play whether our teas have deteriorated or not?—Yours faithfully,

"OLD FOGIE."

### RE DIMBULA VALLEY (CEYLON) TEA COMPANY, LTD.

DEAR SIR,—With reference to the paragraph in the London letter of the "Times of Ceylon" of the 1st August inst., headed "Dimbula Valley Company; management severely criticised" and to the publication in "The Times of Ceylon, of the 8th inst., and your own report of Mr. Jas. Sinclair's speech from the chair at the meeting of the Company on the 19th July last, I desire to point out to you and through you to the general public, the injustice Mr. Sinclair has done me in his criticism

of my work as manager of the Company's estate. Mr. Sinclair makes a general charge of mismanagement against me, but gives no particulars as to how I mismanage the estates and then goes on to say in his speech, of the 19th July, that the Company's tea cost thirty-four cents, f.o.b., when in the previous year it cost but twenty-nine cents. Now the following figures will show at a glance the yield of the Company's estates for 1896-97, 1897-98 and Mr. Sinclair's estimate for 1897-98. There was nothing whatever to justify such an increased estimate in the case of any of the estates. The actual yield is shown in the third column and the actual cost per lb. f. o. b. in the fourth column. How Mr. Sinclair makes up his estimate of thirty-four cents I do not know, but he must have debited items which should go against capital to the yearly expenditure. Thus in the case of Tillicoultry, which was in my immediate charge, R3,097.48 have been added to general expenditure, which should have gone to capital account:—

Yield for 1896-97.	Mr. Sinclair's Estimates, 1897-98.	Yield for 1897-98.	Cost as shown from actual working by Mr. Pattenson.	Cost of production in 1896-97 when similar items charged to expenditure as Mr. Sinclair charges in 97-98.
lb.	lb.	lb.	ct.	ct.
111,271 lb.	.. 140,000	112,150	32	33-80
Belgravia 177,074 lb.	.. 200,000	163,477	26	26
Mousella Langdale ..	—	116,892	28 62	00
121,513 lb.	.. 140,000	129,580	24 65	25-86
Berwell 117,472 lb.	.. 130,000	109,719	28-02	27-52
Lippakelle ..	150,000	116,116	29-47	30
Tillicoultry 105,873 lb.	.. 149,000	81,026	36 80	31
Elgin ..				

I challenge Mr. Sinclair to deny the accuracy of these figures, and, if they are unnecessary, to point out that Mr. Sinclair must have been wrong in the allegation that 34 cents was the cost of production.

As regards the second allegation of under-plucking, by which the crop is alleged to have been reduced from nearly a million pounds to 833,000, due (as implied) to my under plucking; the leaf on all the estates was plucked in the same way in which it had always been plucked, but crops were short all over the island and on many of the Company's estates I was compelled to prune large areas which had been allowed to run too long. Thus in the case of Elgin three years, Tillicoultry three years, and Belgravia two to three years; I had also to prune nearly the whole of Lanedale.

This pruning would of itself increase the cost of tea in the particular year under review. Moreover some 50 acres on Elgin were abandoned by Mr. Sinclair's order, as far as plucking was concerned, for 12 months, the bushes being too much to pluck. From Mr. Sinclair's own statement it would appear that the alleged mismanagement will secure good returns to the Company in the future, and I feel that I have been made a scapegoat, as Mr. Sinclair was unable to redeem the large promises he had previously made to the shareholders.—Yours faithfully,  
C. J. PATTERSON.

STRAWBERRIES.

Near Nuwara Eliya Aug. 22.

DEAR SIR,—Are you partial to strawberries? If so now is the time to take your well-deserved holiday trip and pay a visit to Mr. John Cotton's gardens, Nuwara Eliya. From two small patches, each about 8 yards by 12½, he picked on Saturday last 39 lb of beautiful ripe strawberries: (please work it out, I make it 726 lb to the acre). This was only one picking, but from the same patches he had already taken this season, about the same quantity in smaller lots, and even now does not consider that he has got in more than half the crop.\*

I trust this record will "catch the eye" of the gentlemen who sat on the prelied products thefts' Commission, a few years ago at the Bandara-wella hotel, as during an after-dinner discussion, on fruit, some of the present were surprised at a statement made by me re strawberries that I had grown here. They can now see for themselves what can be done in Nuwara Eliya and Mr. Cotton's plants having been propagated in the usual way from the identical plants that were then bearing here, is proof that they have not deteriorated.—Yours truly,  
AMATEUR.

BREAD FRUIT IN CEYLON.

22nd Aug.

DEAR SIR,—Re recent paragraphs on this subject, I was told by the late Dr. Trimen that the species in the island was by no means a good one, and that a far superior variety is grown in Fiji. Any ordinary gardener like myself would expect the Government to use every opportunity to introduce all desirable plants, giving Consuls and others no peace till satisfied. I suppose we must form an Association and do these things ourselves.—Yours faithfully,  
RUSTICUS.

CEYLON TEA IN AMERICA.

PLANTERS' ASSOCIATION OF CEYLON.

KANDY, Aug. 23.

SIR.—I enclose copy of a further letter from Mr. Wm. Mackenzie to Mr. Lane, together with the various specimens of advertisements received at the same time.—I am, sir, yours faithfully,

A. PHILIP,

Secretary, "Thirty Committee."

LONDON, July 28th, 1898

DEAR LANE,—I have not much to tell you this week. I enclose press copy of our advertisement which appears today in the papers of which I sent you a list last week. I also enclose an article on "Preparing, &c., for Market," which is to appear gratis in perhaps sixty to eighty papers; note the last paragraph. Last year two gentlemen known to W. Blechnien and myself, started round the world to take interesting views for Edisons & Co. We asked them to look into some Factories in China and Japan with the result that we have this statement. We may yet get photos from these. Mr. W. Chipman: I have not yet heard from this gentleman, but at last I have heard of him.

From Winnipeg the report is "never heard of here." But from Vancouver I hear "Chipman sells Nirvana packet, Ceylon tea, but does very little advertising or business." Still if he writes me, and satisfies me that he is able to contribute money and energy, I shall help him on the usual terms in Vancouver. I have arranged with Laikin for Eastern

\*Last year he got over 100 lb.

Canada. (Tetley thought that district too expensive): with Tetley for some special work in central Canada: with Lipton for Winnipeg and Manitoba, and may arrange with Chipman for Vancouver. This will cost more than the special grant of \$500, but I can contribute as much more from the savings effected from my not going over during this hot weather, &c., &c. To show how one Canadian man follows another, where the pioneer work has been done, I may mention that in Montreal, where a year ago Larkin and Tetley had the field practically all to themselves in Ceylon advertising, there are now about ten firms pushing Ceylon packets. Larkin writes he is certain his opponents will soon be after him in the Eastern provinces, and that he now is convinced the many firms advertising Ceylon teas are making considerable impression in "Japan."

From the States, I have doleful accounts: "Since imposition of duty business does not pay postage stamps, &c." We must, as I said before, help the English Houses to peg away. The war is nearly over.

I see the *Observer* agrees with me—the establishment of Russian buyers in Colombo means that the Russian market will fast open to us.—Yours truly,  
(Signed) Wm. Mackenzie.

Kandy, 23rd Aug. 1898.

Sir,—I enclose copy of a further letter from Mr. Wm. Mackenzie to Mr. Lane together with the various specimens of advertisements received at the same time.—I am, sir, yours faithfully,

A. PHILIP.

Secretary, "Thirty Committee."

Scotland, 2nd August, 1898.

DEAR LANE,—American mail just come in and with it much interesting correspondence. Our New York Pressman, whom we have sent round the large cities to be interviewed, writes me he had been very successful in getting our story (copy sent for last week) into the papers. He secured five insertions in Philadelphia, six in Pittsburg, four in Chicago, four in Toledo and four in Detroit. He is also getting in the story of the present of 100 chests to the American Army, which was unfortunately stepped by neutrality considerations. All this costs us nothing beyond the Pressman's travelling expenses, as the Provincial Press lend the courtesy of their columns to a New York brother while we could not buy the space.

I have heard from Mr. Chipman and have replied offering to aid him as per terms of your letter of 1st June—copy of which he sent me. I have explained our method fully, and have pointed out that I have no power to appoint Commissioners for certain territories, as he requested.

Mr. Wright's greens.—Writing me on 31st July, Mr. Larkin says again that he had no received Mr. Wright's samples. Mr. W. promised me he would send them to a number of firms of which I sent him a list. I enclose Tetley's report on them, also a report and valuation from Buchanan & Co.'s agent in Toronto. Both agree with me that these teas should compete favourably with Japans. But I think the Toronto man values them low, hoping no doubt to secure them at his own figures. Therein lies the difficulty not in making the teas, but in breaking through the ring of vested interests already in possession of the field, and the trade. The importers with establishments for firm, blending and packing to standards in Japan hold the trade as the large breweries hold "tied houses" in the beer trade. I send all information regarding these greens through you, because I think the Committee entitled to the benefit of all work I do.

This mail brings papers containing many advertisements and references to "Salada Ceylon" tea. You will see it is now advertised in 480 papers. I send one of my circulars constantly being sent out. Indian tea occasionally appears. I send one hitting at Ceylon as well as China and Japan. Buffalo

dealers are now following this example in Montreal, and are advertising Ceylons extensively. One by one the towns fall in. The more the dealers do, from rivalry, the less we need do. Helping one to give a lead is our best policy.—Yours, &c., (signed.)  
W. MACKENZIE.

#### PLANTING NOTES.

CEYLON TEA IN AMERICA.—Mr. Warr sends us the kind of letter that Ceylon planters will like to read as coming from an American gentleman, resident in Colombo. What a bond of union we should have between this "Eden of the Eastern Wave" and "the great American Republic" if we converted her 80 millions of people to drink Ceylon Tea in preference to Brazilian Coffee! Mr. Warr must help us in the battle!

THE WEST INDIES assume a new interest for us now that Dr. Morris of Kew at one time of Peradeniya (who will be his successor may be asked?) is going to the Far West, to establish an "Agricultural and Botanical Department," on which £17,000 a year (or, say \$255,000) is to be expended. This is what Ceylon ought to have. It remains to be seen where Dr. Morris is to fix his headquarters. Meantime if any one wishes to visit the West Indies, it may be interesting to learn that he should fix on "Trinidad as the centre and headquarters of a visit to the West Indies. It is accessible, not expensive, and makes an admirable centre for further voyages. There are good lines of steamers direct from Europe, and a first-class return fare is only \$175. The island has the best hotel in the West Indies, with charges of from \$2 to \$3 per day. For a further \$150 the visitor can make a cruise to St. Thomas Santa Cruz, Antigua, St. Lucia, Barbadoes, and Demerara, and make a trip up the Orinoco. For four months he can wander among the islands, living on comfortable steamers at a cost of \$250 per day; and we (*Spectator*) agree with Mr. Stark that he will probably never regret the experiment."

FLORIDA VELVET BEAN.—The Director of the Florida Agricultural Experiment Station, in his *Bulletin* 43 for September, 1897, on page 637, gives the name of this Bean as above instead of *Mucuna pruriens*, as given in a recent issue of the *Gardener's Chronicle*, and speaks of it as follows:—"Another legume that has lately come into prominence, and that promises to be a valuable agent in reclaiming the worn-out soils of Florida, and also a most excellent food for stock, is the Velvet Bean. During the past two years this station has been conducting experiments with this plant, and the results have been very promising. It is now known that the plant will grow luxuriantly all over the State, and stock of all kinds are exceedingly fond of it. The practical results of feeding have been all that could be desired, and we believe it to be equal to the best legumes in feeding value. In the near future it is proposed to make a complete chemical study of this plant in different stages of growth, and to publish the information for the benefit of farmers. There is scarcely a doubt that it will yet play an important part, not only in solving the forage problem in Florida, but in improving both the mechanical condition and productive capacity of our thin sandy lands, by increasing their stores of both nitrogen and humus, and exerting various other beneficial effects." The present retail price of the Beans is about 2½ dollars per bushel. W. E. G. in *Gardener's Chronicle* of Aug. 20.

## PROGRESS IN CEYLON:

### PLANTING STATISTICS:—TEA, CACAO, COFFEE, RUBBER, COCONUTS, &c.

TO THE EDITOR OF THE [LONDON] "TIMES."

SIR,—At intervals during the past 30 years I have at the cost of much time and trouble compiled statistics of the planting enterprise of this colony and have periodically sent you the results for publication. No agricultural industry in the world probably has a fuller or more reliable record than is obtained through the inquiry thus conducted. My last report to you was dated August, 1895, so that nearly three years have elapsed, and all interested in the first of Crown colonies and its most notable industry will be glad to have the following figures:—

	Acres.
Total area of 1,938 plantations and planting properties ...	807,079
" of 1,534 plantations in cultivation with 1,564 superintendents and assistants ...	434,540
Total approximate extent under Tea ...	363,807*
" " Coffee (Arabica) ...	11,988
" " Coffee (Liberica) ...	2,428
" " Cacao ...	21,260
" " Cardamoms ...	5,153
" " Cinchona (5 to 6 million trees) equivalent ...	1,178
" " Rubber ...	1,071
" " Grass (cultivated) ...	4,413
" " of Annatto, Coca, Kola, Rumie, Vanilla, Pepper, Cloves, Citronella grass, Divi-Divi, Cloon, Castor-oil, Aloes, Cinnamon, Tobacco, Cotton—in our plantations' list ...	6,242
Coconuts, Arecas, Nutmegs, Fruit trees (on the cacao, tea, or coffee plantations) ...	16,603
Of Fuel, Timber, Sapan, and Kapok (on the tea, cacao, or coffee plantations) ...	6,505

Without entering into any elaborate comparison, I may mention that in the three years over 55,000 acres have been added to the total area under cultivation; but the increased extent under "tea" in the same period is over 59,000 acres (indeed 66,000 acres if native gardens are counted), the difference being obtained by a further supercession of coffee (Arabica), due to the persistency of its several enemies, and of cinchona (no longer a profitable product). While there are 9,600 acres fewer under ordinary coffee, the cultivation of the harder Liberian species has not increased, the full in price having discouraged planting; but if an experiment now being made to import ladybird beetles from Queensland to clear off the bug (coccus) which is troubling coffee in Mysore and Coorg be successful, Ceylon is sure to profit by the example and it is possible that there might then be a fresh departure with our old staple.

The area under cacao (chocolate plant) has, I am glad to say, considerably increased over 3,000 acres having been added in the past three years, while our export is fast rising. So also with the cultivation of rubber trees a considerable advance has been made, and great interest is now being taken in the culture of Para rubber by planters in our lowcountry districts.

I am thus particular in specifying certain minor industries before touching on the present overshadowing staple, tea, because it has been my constant endeavour, in writing for the planters in our daily Press, as well as in the monthly *Tropical Agriculturist*, to impress upon them the great advantage, wherever possible, of having two or more strings to their bow, and my hope is to see the cultivation of cacao, rubber, ramie, and other fibre-yielding plants, and useful and

ornamental timber trees freely extended during the next few years in the Ceylon planting districts.

Nevertheless, I am bound to confess that so far tea has proved the most profitable culture. Although we have now got far beyond the *maximam* area ever planted with coffee (280,000 acres coffee in 1878-79, against 370,000 acres in tea in 1898), yet the tea plant is reported everywhere healthy and vigorous, and crops fairly satisfactory. Nowhere, apparently, can tea be grown more economically than in the favoured divisions of Ceylon, and any enemies of tea can be much more easily fought and conquered than those of coffee. Shortness of the labour supply is occasionally in some parts a difficulty, dearth of rice (all imported from India for the coolies) and cost of transport are further drawbacks; but these have been overshadowed since the beginning of this year by the great check which adverse exchange—the artificial raising of the rupee to 1s 4d by the Indian financial authorities—and scarcity of money has given to the tea planter. Lower prices for his product in the London market he cannot help, although every effort is being made to conquer new markets in North America and Russia, and to create a direct trade through advertising distribution of samples, demonstrations at food exhibitions, &c., the funds being provided by a self-imposed cess on the planters' crops as exported. In common with all producers (for export) in India and Ceylon, the tea planters have a special stake in the issue of the Indian Currency Commission, and the future of a proportion of our tea plantations must hang in the balance, until the result is known. Meantime good has been done in the check given to farther planting. It is felt that Ceylon has quite enough area under this one product. The Crown for the present will sell little or no land for tea.

But it may be of interest to mention that during the administration of Sir Arthur Gordon (now Lord Stanmore), 1883-90, the area planted with tea rose from 32,000 to 220,000 acres, while 81,000 acres were added in the time of Governor Sir Arthur Havelock, against no less than 65,000 acres in the 2½ years of Sir West Ridgeway's energetic administration. This, has been largely due to the advent of wealthy capitalists hitherto interested in Assam, but who, through several powerful limited companies, have added greatly of late to the area planted with tea both in Ceylon and North Travancore. The large number of plantations sold by private individuals to limited companies, formed either in London or Colombo, is also a typical feature of the experience of the past three years. I may further mention that the ranks of Ceylon planters are very full at present, and that there is no room for additions in young men who hope for a career here, although our plantations continue, in my opinion to be the best tropical agricultural school for young men who are prepared after their training to pioneer with rubber, cacao, coconuts, coffee, &c., in the Malayan Peninsula, Samatra, North Borneo, tropical Australia, Uganda or Nyassaland in Central Africa.

The export of Ceylon tea, which was only about 1½ million lb. in 1883, will for this year probably reach 120 million lb. and I see no reason why this should not be maintained (if not exceeded) for many years to come, provided there is sufficient encouragement in prices and the effect of the new Indian currency does not prove seriously detrimental to the industry. As an evidence of the shrinkage in value of Ceylon tea investments which has already taken place, I may mention that the shares in our local limited (cupae) tea companies, almost entirely held in Ceylon, show a less aggregate value in July, 1898, than in January, 1897, of no less than 7,336,832 rupees. Of course, much of this difference is due to undue inflation and speculation which prevailed 18 months ago, but even since January 1898, there has been a shrinkage from a total value of 16,485,310 rupees to 15,617,490 rupees.

A word or two may be permitted as to the more purely native agricultural industry in Ceylon. I calculate that there are some 50 million of coco-palms growing in regular plantations or small native gardens in Ceylon, covering about 700,000 acres and yielding

\* This is apart from some 7,000 acres at least in native tea gardens of small extent, so that the grand total under tea in Ceylon at the middle of 1898 cannot be less than (more likely over) 370,000 acres.

an annual harvest approximating in value to that gathered from the area bearing with our tea plants. A certain proportion of the "harvest" is exported—in coconut oil, up to 508,000 cwt.; copra "and" "poona" (the dried kernels), up to 300,000 cwt. coir fibre, rope, and yarn up to 190,000 cwt.; in coconuts (14,000,000), as pulled or with the husk off; and in a new and fast-expanding industry in "desiccated coconut," 12 to 14 million lb. But a large perhaps the larger, proportion of our coconut crop, is consumed for food and domestic use by the people of the island, apart from the large and, unfortunately, growing quantity of arrack (the whisky or brandy of Ceylon), prepared from the sap of a number of palms set apart for that purpose. Of other palms (palmyra, kitul, and areca chiefly) and fruit trees in great variety, I count the Cingalese and Tamils of Ceylon have over 300,000 acres planted, and most of this yielding crops, as additions to the food supply and, in some cases, exports. Of our famous ancient spice, cinnamon (which was carried from Ceylon and sold in Rome in the time of Augustus Cæsar for the equivalent of £8 sterling per lb.), there are still about 35,000 acres planted in Ceylon, the annual exports of the quills and chips keeping in excess of 3½ million lb. This industry is in Ceylousee (chiefly Singalese) hands. Cardamoms, pepper, cloves, nutmegs, and some other spices claim more attention from the European planters; but the cultivation of citronella and lemon grass for essential oils is solely done by the natives, as also, of course, the great paddy or rice-growing industry in Ceylon.

Since the abolition of paddy rents from January 1, 1893, this industry is now "protected" (the Cobden Club Committee consenting) to the extent of a Customs duty of 20 cents per bushel on all rice imported from India; but the result so far has not affected our imports, which are as follows:—

Year	Imported from India	Bushels.
1892 ..	..	7,232,411
1893 ..	do	7,447,376
1894 ..	do	7,556,505
1895 ..	do	8,722,737
1896 ..	do	7,594,413
1897 ...	do	8,723,750

If it should be said that the imports are for immigrant coolies it must be answered that the total consumption by them cannot exceed three million bushels, while local and imported rice competes in every bazaar in the towns and throughout the island; and the poorest classes in our towns are solely dependent on imported rice.

Finally I may mention that the trade in our only mineral of commercial importance, plumhago, is increasing in importance and we now export close on 400,000 cwt. of it, largely to the United States, London coming next, while Germany and France have begun to take increasing quantities in direct shipments. But in regard to direct shipments to the Continent, our greatest satisfaction rests in the establishment of Russian merchants in Colombo and their increasing shipments of our tea and coconut palm produce direct thence to Odessa. The Russian people next to the English are the best judges of good tea, and, if only the heavy duty of 2s 1d per lb. were reduced, a great increase of tea consumption might be expected in the Russian Empire. I have ventured to address the Russian Minister of Finance, M. Witte, on the subject, pointing out how tea in the United Kingdom had to pay a duty of 2s 1d when Queen Victoria came to the throne, and how mainly through Mr. Gladstone, the duty now stands at 4d, with the result that the consumption has increased from 30 to 237 million pounds (or from 1½ lb. to 5½ lb. per head of population) while the revenue last year was £3,856,662 against £3,190,125 in 1837.

Ceylon has from time immemorial been famous for its precious stones—rubies, sapphires, cat's-eyes, and moonstones—and these continue to be freely found, the digging and selling being in native hands and the proceeds largely carried away by visitors or despatched in registered postal packets. An English syndicate with patent machinery is now endeavouring to develop a steady industry.

Coincident with the rise of the tea industry, the revenue of the colony—which had fallen to 12,336,580 rupees in 1853, the year of Sir Arthur Gordon's (Lord Stanmore's) arrival, and only recovered, under his very able Administration, to 16,288,769 rupees the year he left us (1890)—rose to 20,982,809 rupees for 1895 (the last year of Sir Arthur Havelock, who came in for a good time), and is estimated at 23,411,000 rupees for this, the third year of Sir West Ridgeway's energetic Administration. But clearly this, like everything else connected with our prosperity, must receive a check should the present cloud over the tea industry not be dispelled.

I would just mention that, should the decision of the Indian Currency Committee prove unfavourable, the Ceylon tea planters and produce exporters generally are likely to press Mr. Chamberlain for an amelioration of fiscal burdens in two directions, namely—(1) a reduction (with a view to eventual abolition) of the import duty on rice; and (2) a reduction in the Government railway traffic rates, which are out of all proportion higher than those charged on any Government railways in India.

Apologising for the great length of this letter, may I wind up by saying that the two notable material facts in the history of Ceylon during the past 18 years are—(1) the rise of the tea growing industry from 9,000 acres planted in 1880 to over 370,000 acres in 1898; (2) the immense growth and ever-increasing expansion in the tonnage and trade of the capital, Colombo. The total tonnage of the port in 1880 was 1,300,000; while last year the aggregate (inwards and outwards as before) had reached 6,704,747 tons. If, in place of being shackled with a long list of Customs burdens and restrictions, Colombo were to get some of the fiscal advantages of Singapore, or even Bombay, it would more and more rapidly become the great port of Southern Asia (and especially of Southern India); and such increase of prosperity for the port and city would be further confirmed and extended if it were directly connected by an Indo-Ceylon railway with Southern India, as originally projected by the late Duke of Buckingham and Sir William Gregory, and towards which result the present policy of Mr. Chamberlain and Governor Ridgeway, to a certain extent, is directed.—I am, sir, yours respectfully.

J. FERGUSON, of the *Ceylon Observer and Tropical Agriculturist*.

Colombo, Ceylon, July 7.  
—London Times, Aug. 19.

## THE PLANTING INDUSTRY OF INDIA AND CEYLON.

The following supplementary letter appeared in the London Times of August 20th, the day after our long report on Ceylon was inserted. We think it will be allowed that the case for tea in India and Ceylon is put in such a light as at any rate to discourage capitalists from speculating in a further extension of cultivation. It will be seen that, writing in July, we put the probable total export of Ceylon tea this year at 120 million lb. (against 119 just fixed by the Planters' Committee); but the export to the United Kingdom was only counted at about 100 million lb. The large area of young tea—larger in Ceylon apparently than in India—cannot fail to attract attention. Finally, we urge a reduction of the imperial duty on tea as well as the pushing of our teas in the American and Russian markets:—

To the Editor of "The Times."

Sir,—May I be allowed to supplement the planting statistics referring to Ceylon in my last communication by adding now the figures for tea and coffee for all India as well. For these I depend chiefly on the official returns (which, in view of the universal "land revenue," are far more reliable than any figures in the Ceylon Blue-

books); but I am able to offer certain corrections, more especially as regards Travancore, which is fast becoming an important tea-growing division and which has always maintained a close connexion with Ceylon, being occupied chiefly by planters trained here. Evidently, returns for Travancore had not reached Calcutta, and altogether I arrive at a total extent of tea throughout India, including newly-planted fields, of 468,751 acres, or 45,000 acres in advance of the Director-General's return. It is only fair, however, to add that the latter does not come beyond 1897, whereas my reckoning is, as far as possible, to the middle of the present year. Here are the combined tea statistics for India and Ceylon:—

	TEA	
	In Bearing Acres	Young Acres
Assam .. .. .	263,213	47,337
Bengal (Darjiling, Chittagong &c)	93,000	14,000
Kumaon, Dehra Dun, &c ..	8,000	
Kangra Valley .. .. .	10,000	
Burma .. .. .	1,200	
Bombay Presidency .. .. .	1	
Nilgiris, Wynad, &c .. .. .	1,000	5,000
Travancore .. .. .	10,000	13,000
<b>Total for India .. .. .</b>	<b>339,414</b>	<b>79,337</b>
Add Ceylon .. .. .	278,000	93,000
<b>Grand total .. .. .</b>	<b>667,414</b>	<b>172,337</b>

	Acres
Total of tea planted in India =	468,751
Total of tea planted in Ceylon =	371,000
<b>Grand total, acres .. .. .</b>	<b>839,751</b>
	Lb.
1898—Estimated crop—India	158,000,000
Ditto Ceylon	120,000,000
<b>Total .. .. .</b>	<b>27,800,000</b>
Allowing local consumption in both countries .. .. .	6,000,000
<b>For export .. .. .</b>	<b>272,000,000</b>

Say 233,000,000lb. to United Kingdom and 31,000,000lb. to other countries.

In my calculations of area for Ceylon I include 7,000 acres native tea gardens—2,000 young and 5,000 in bearing, and I take between four and five years as the limit between young and mature tea. Let it be further noted that the Assam tea planters have a reserve of land not yet planted equal to nearly 700,000 acres, while the reserve in private hands on Ceylon plantations equals 367,000 acres, of which 120,000 acres may be fit for planting.

In round figures we may now say that in all India there are 470,000 acres planted with tea, and in Ceylon 370,000 acres, so that our big neighbour is only 100,000 acres in advance of us. The time has, however, come for suspending further planting operations until it is seen what is to become of the additional crop (say, 50,000,000 lb. at least) which the young tea is capable of producing. If crops aggregating 272 million lb. can, with difficulty this year, be disposed of at a profitable rate, how, within the next four years or so, can 50 million more lb. be taken off? That is the problem; and one that can only be solved, probably through a reduction of the Imperial duty on tea and consequently increased consumption in the United Kingdom, and also with the aid of Russia and

the United States. It is the earnest hope of Ceylon planters that these latter countries may increase their demands for British grown teas, by leaps and bounds, year by year.

Turning to coffee, the record is a very poor one comparatively:—

Coffee cultivated in "India" ..	347,165 acres
" " " Mysore ..	145,500 "
" " " Travancore ..	423 "
<b>Total .. .. .</b>	<b>204,991 "</b>

But, inasmuch as I feel sure the official return is too high for the Wynad and Nilgiris districts, I am inclined to reduce the figures and estimate 290,000 acres as the approximate area now under coffee in all India, against not more than 18,000 acres in Ceylon for plantations, Liberian and native gardens. Much of the area in India must be bearing very little; for the total export in 1897-98 was only 225,008 cwt. It is surmised however, that there is a far larger local consumption of coffee in India than has hitherto been credited perhaps as much as 151,000 cwt.; but even then we should not get an average yield over all the coffee area of  $1\frac{1}{2}$  cwt. per acre.

I am, Sir, yours obediently,  
J. FERGUSON, Editor of the *Tropical Agriculturist* and *Ceylon Handbook and Directory*.  
Colombo, Ceylon, July 21.

#### TEA IN SICILY.

From the Diplomatic and Consular reports issued by the Italian Government we take the following in regard to Sicily:—

The total amount of tea imported during the year was, according to the customs returns, under 1,000 lb.

The taste for tea among the upper classes in Palermo is increasing, and there is no doubt that with a little judicious education the demand would increase rapidly. At present tea can only be obtained at one or two places, and this is of an inferior quality, and very expensive, about 8 lire (64 per lb).

The duty on tea is about 1s per lb. if in bulk the cases being included in this rate. High class Ceylon and Indian teas could be sold at a fair profit at from 3 lire 50 c. to 4 lire 50 c. per lb.

#### ARTIFICIAL INDIA-RUBBER.

The demand for India-rubber has led to an attempt being made, with partial success, to manufacture artificial india-rubber in France and Germany. The french products is a very complex composition; the German preparation consists mainly of oxidised linseed oil and jute refuse. The first has for its foundation a substance called resinoline which itself is made up of oil treated with three or four times of its bulk of metallic carbonates, and then with nitric acid. After undergoing numerous chemical processes, this compound is mixed with oxide of manganese, zinc, and methylated spirit, the whole mass, when kneaded and compressed, being found to possess some of the properties of fine india-rubber.—*H. & C. Mail.*

ROYAL GARDENS, KEW.—We have received from the Secretariat a copy of the "Bulletin of Miscellaneous Information" for July, the contents are: Diagnoses, Africanæ, XI: Fiji India Rubber; San Jose Scale; Chillies; Miscellaneous notes,

MR. CHRISTY ON FIBRES—THE NEW  
MONTHLY JOURNAL AND CEYLON—  
DR. MORRIS AND THE WEST INDIAN  
AGRICULTURAL DEPARTMENT.

I called again on

MR. T. CHRISTY

the Produce Export, to get his opinion on the fine fibre you sent me (from the Agricultural School). He did not consider it of high quality; not of sufficient strength and endurance or rope-making, but might be serviceable for weaving or some such purpose as that. There was an abundance of fibres to be had, Mr. Christy said; the only difficulty was to discover a good process for extracting them. He was just then engaged in experiments for a new process of extraction that seemed to promise well. Details of this were naturally not forthcoming. Before leaving I made arrangements to visit the firm's Seedling Houses at Wallington next week. As an evidence of the success of Para Rubber Mr. Christy stated that he had lately exported thousands of young plants for plantations.

A NEW MONTHLY JOURNAL.

Before returning home I had the good fortune to catch the Editor of the new monthly journal, *British Indian Commerce*, which made a good start in July and of which I had seen a notice in the *Daily Chronicle*. He was really holiday-making he said, but just happened to be in town that morning. "If you will call again at the end of the month" he said "perhaps we might knock up something mutual." They were not at present including Ceylon in the Journal. I said we were so close to India and so largely connected with it that we ought to be brought in. He said that Ceylon had come so much before his notice since the Journal was started that he foresaw its inclusion was inevitable. After further personal conversation he said some years since he used to know Bishop Copleston intimately, and the latter was accustomed to call him by the playful sobriquet "My little schoolfellow." *B.I. Commerce* is published at the same office as the *Mercantile World*.

In the afternoon I rode over from Ealing to Kew to see

DR. MORRIS

again, before he retires from his present post of Assistant-Director at Kew Gardens on the 27th inst. Though very busy just now, he was able to favour me with a long walk round the Gardens. I asked his views on the "lautana bug." He thought that a needless fuss was being made over it, and that by taking effective measures with the bushes affected by it the spread of the disease might easily be prevented. It was not likely that it would ever attack tea he thought. With regard to his departure to the West Indies, I enclose a cutting from the *Daily News*, which gives a good account of the Agricultural Scheme of which he will be in charge.\* Dr.

\*PLANTING IN WEST INDIES:

HOW THE WEST INDIAN GRANT WILL BE SPENT.  
THE SCHEME AND THE WAY IT WILL WORK.

(From the *Daily News*.)

I had an interesting talk an afternoon or two ago with Dr. Morris, the gentleman whom the Government has just appointed to be the head of the Agricultural Department to be established in the West Indies. Upon the success of this venture will largely depend the future of those delightful islands which stud the Caribbean Sea like so many gems over an area which stretches through seven degrees of lati-

Morris showed me two or three Museums, besides Miss Marianne North's wonderful Gallery of Botanical Paintings; also the Mexican and Australian houses, where from around the high gallery, one obtained beautiful sights of tropical foliage the tree fern flourishing in great perfection. These latter houses were designed under the patronage of the Prince Consort many years ago; but the

tude. The bounty-fed sugars of France and Germany have nearly ruined the industry upon which they have mainly depended for generations. It will be the business of the new office to do what it can to improve the cultivation of the cane when only cane can be profitably grown, and to promote the development of a hundred other resources which undoubtedly exist, but for one reason and another have hitherto been largely neglected. To do this the House of Commons has just voted a grant of 6,000*l.* a year, to be increased later to 17,000*l.* which Dr. Morris will administer; and a further 10,000*l.* a year to subsidise a special line of steamers for trading amongst the islands. It is obviously a big business, the progress of which will be closely watched; in the islands themselves, by whites and blacks; in England, which owns them, finds the money, and has plenty more if a decent interest on its gold is forthcoming; in America, which has been pushing trade with them for a long time. The new scheme, then, is the direct outcome of the Commission which Mr. Chamberlain sent out to investigate the condition of our oldest colonies, and the man who is appointed to work it out sails in a few weeks to begin his arduous duties. It was concerning these that he talked in his office at Kew Gardens, of which he has been the Assistant Director for twelve years. Most of those who visit our famous gardens think of them only as pleasure grounds, but as a matter of fact it is the centre to which those who cultivate the soil in all parts of the world come or send for advice. It will easily be understood, then, why one of its heads is going out as the chief of the new department. Nor are the West Indies new ground to him. Dr. Morris, after serving in the Ceylon Gardens, went to take charge of the Gardens at Jamaica, and afterwards came to Kew. He accompanied the West Indian Commission as expert, and is now returning to put his advice into practice. With this little introduction I will now repeat the gist of what he told me as to his immediate operations, and the organization which he is preparing. It is not often that a man has such a field for an experiment of such far-reaching importance. But he expresses every confidence in the results which will follow in a few years' time. Let it be quite understood that it is not to bolster up the sugar, but the development of new industries which the infinite prodigality of Nature has made possible, that is the main object of the mission. In the first place Dr. Morris will establish his headquarters at Barbadoes, which he calls the Clapham Junction of the West Indies, by reason of the number of inter-island steamboats which call there. From this convenient base he will be able to journey from one island to the other with the least delay, forming as they do a chain, the component parts of which are divided by intervals of sea varying from 20 to 100 miles across. Let us now give in precise detail the exact duties which the department will set itself to perform. They will be as follows:

THE WORK OF THE DEPARTMENT.

1. To supervise and extend the work of the present hotanic stations.
2. To start industrial schools for training boys in agricultural pursuits.
3. To encourage the theoretical (and to some slight extent the practical) teaching of agriculture in elementary schools.
4. To promote the teaching of scientific agriculture in colleges and schools.
5. To organize horticultural shows and exhibitions, implements and machinery suitable for cultivating and curing tropical products.

plans lay idle until Mr. Chamberlain, one day visited Kew and, coming across them, asked their purpose. Being told they were designs for houses which they required money to build, he obtained a promise from Sir William Harcourt, then Chancellor of the Exchequer, to attend to this need at Kew Gardens. Sir William Harcourt demurred at the figure required, but gave the promise and was kept to his word by Mr. Chamberlain when at one time shewing an inclination to lay the matter aside. The houses, of which the third is now being completed will, when the interior doors

6. To prepare bulletins, leaflets, and other literature on subjects suitable for cultivation in the West Indies. So much for the skeleton scheme, the bones, the fabric as it were. Now to enter into details:

THE WORKS OF THE BOTANIC STATIONS.

These are already in existence on a good many islands. It is proposed to extend the work which they are at present doing. They are to devote themselves in a systematic manner to the work of introducing, propagating, and distributing all the promising economic plants of the tropics; they are to initiate the experimental cultivation of new or little known plants, and assist in the efforts made in the larger colonies to secure improved varieties of the sugar cane. They are to act as centres for diffusing accurate information, and as training institutions for the practical teaching of tropical agriculture; also as the headquarters from which agricultural instructors could be sent to give lectures and demonstrations bearing upon the selection of land for tropical economic plants, their suitable cultivation, and the best methods for curing and packing the produce.

Such, roughly, then, is the outline of Dr. Morris's work. It must be understood that blacks as well as whites are to participate in the benefits which may arise from the work of the new Department. Their numbers are vastly in excess of the whites, and it is to their efforts largely that we must look for the future prosperity of the islands. It will be the business of Dr. Morris's instructors to help them to help themselves. They will be taught how to get the most out of their patches of ground; they will be told what produce it is best fitted for; seeds and plants will be given or sold to them. This will all be a slow business, and Dr. Morris says plainly that the experiment must take ten years before we shall see its full result. The aid given by such botanic stations as are at present in existence, though much under-manned, we may repeat here a few of Dr. Morris's figures, showing the number of plants distributed in Dominica (for example) during six years:—

1891....	9,000 plants.	1894....	30,000 plants.
1892....	17,000 "	1895....	36,000 "
1893.....	22,000 "	1896....	42,000 "

These are, of course, all economic plants. The great demand has been for Liberian coffee, of which over 75,000 plants have been sent out. The others were chiefly limes, cacao, oranges, kola, nutmegs, and vanilla. The cost of a cacao plant in a pot is a farthing, of coffee plants less than a farthing, whilst nutmegs cost a penny. The distribution of seeds was also large, no less than 2,233 cacaopods of good varieties, capable of yielding 4,660 plants, having been sent out to local planters in three years. At present the most flourishing industry is the production of lime juice. And yet fifty years ago it exported 6,000,000 pounds of coffee in one year. These are suggestive figures. Today the people are emigrating to Cayenne and Venezuela, and those who remain are in immediate need of assistance. The working of the Government's scheme is well illustrated by Dr. Morris's plan for dealing with it when he reaches the Islands. Dominica, he thinks, may be saved by establishing at once a trade in bananas and other fruit with New York or London. He proposes to employ two agricultural instructors at the Botanic Station, to have six students, and start an industrial school for training 25 boys. The result, says the Doctor, will soon show itself. And the cost

are open, afford an immense vista from end to end, the entire length being 600 ft. or that of an Atlantic liner. Description of the numerous plants I saw would take a great deal of space, more than their interest demands. An insect-devouring plant, discovered by Dr. Morris in the West Indies, and named after him *Threnasi Morrisii* was most strange in appearance. Its many months resemble minute green purses with a single opening, toothed round its edges. The newest plant was one from New Guinea of which the flowers were long woolly-looking tassels. The beautiful *Victoria Regia* was in fine blossom, its huge tea-tray-like leaves resting calmly on the surface of a hothouse pond. I saw also the paper mulberry (*Brosnonia Papyrifera*) the fibre of which is put to innumerable uses. From it are manufactured Japanese table napkins, paper, cloths, rope &c. Rolls of "tapa" cloth made from it are handed down in

is interesting, as it gives an idea of how the grant is to be spent:—

Director	..	£200
Two agricultural instructors at 150/.	..	300
Travelling allowance	..	80
Foremen	..	180
Twelve labourers, 15/.	..	180
Six students, 10/.	..	60
Tools and manure	..	50

Industrial School	..	£1,000
		500

Total .. £1,500

The following figures give the totals:

Head office	..	£2,200
Nine botanic stations and four industrial schools	..	9,700
Sugar-cane experiments in British Guiana	..	1,000
Horticultural Show, exhibition of implements	..	500
Literature	..	500
Elementary school teaching and school garden	..	500
Colleges and schools for teaching scientific agriculture	..	2,600

£17,000

One of the great difficulties which has hitherto stood in the way of the small cultivator has been the absence of markets. It is to help him to ship his produce, fruit, or whatever it may be, the moment it is ready, that the subsidy for the establishment of a special line of coasting steamers has been granted. And the masters of these must not only carry but buy. The sugar mills, which are to be erected with borrowed money, of which the Government guarantees the interest, scarcely comes within Dr. Morris's province; and for the present it is too early to discuss the proposed purchase of estates upon which to place small proprietors.

A heavy burden of responsibility obviously rest on the head of the new office, which will require steady plodding, indifference to difficulties and opposition, and restless energy. The sugar planters are still crying loudly for bounty or duty as the only hope for the West Indies.

Those who are fearful of scientific methods of putting a country on to its legs again may be referred to this list of West Indian products which economic Botanical Departments have introduced and widely distributed within a hundred years:

Ginger.	Bourbon cane.	Camphor
Nutmeg.	Coffee.	tree.
Clove.	Mango.	Yam.
Black pepper	Logwood.	Orange.
Guinea grass	Cinnamon.	Lime.
Sago palm.	Bamboo.	Citron.
		Cacao.
		Shaddock.
		Lemon

And ever so many more.

Japan from father to son as valuable legacies. In one of the Museums was one roll two miles long by 120 ft. wide, and also a copy of the *Polynesian Times* printed on it, besides many other specimens of its use. I must close now for the mail. I suppose you have seen Dr. Morris' four lectures on Rubber before the Society of Arts, and will make use of them for the *Tropical Agriculturist* as also in the forthcoming new edition of your "Rubber Manual" ?

R. H. F.

EALING, August 19.

### AGRICULTURE AND PROGRESS IN MADAGASCAR:

MADAGASCAR ALREADY A MODEL COLONY;  
GREAT SUCCESS OF GENERAL GALLIENI'S OPERATIONS;  
(A SIR EDWARD BARNES AND SIR HENRY WARD COMBINED).

(Translated from the *Figaro* of August 15th.)

We still continue to receive excellent accounts of Madagascar. Our youngest Colony has made a good start, which is a timely consolation for what is taking place in the others.

I wish to cite the example of Madagascar not only as a source of consolation, but also and above all as a ground for further hope. Why should not Frenchmen do in other places what they are doing there? There they are showing themselves to be men of initiative and action; soldiers and civil servants are working as hard as the colonist; these three classes of men, whom one would have expected to be naturally hostile to one another, are there living side by side in perfect understanding, and what is still more wonderful, the native complains of none of them. All forces are working in harmony united in quest of the common welfare. It is an organic association such as is dreamed of by the philosopher. And yet these public servants, these officers, these colonists, are all of the same race, have received the same education, and have been turned out of the same mill as those men in the other Colonies of whom we have only too often good reason to complain. What next? Why this, that at Madagascar there is a guiding head, a leader; and that this leader not only is prepared for his task by long years of colonial apprenticeship, but possesses in the highest degree all the qualities of a leader.

We could hardly expect the Government to place men of this stamp in *all* our colonies. Nature, alas, produces too few. But what one can demand is that the principles, methods and systems which are responsible for the pacification, organisation, and administration of Madagascar shall not remain the monopoly of this colony; but shall be employed throughout all, with racial and local adaptations, of course, wherever necessary.

A "Colonial Code" has yet to be made. For this we must look to General Gallieui. He is the only man of the present day qualified to render this service to his country. Meanwhile, he continues out there to astonish us by his prodigious activity. You call to mind the good old fable about the eye of the master. He is living it out in his capacity of Governor. The bad season he spends at Antananarivo looking ahead, making preparations, organising everything; he appoints for each man his task. But directly the season arrives when roads become practicable and the sea negotiable, he is off. He must see everything himself. With his presence he encourages the good feeling in every district. And all that he orders is thus performed by its appointed time. His subordinates take a pride in imitating the example of their leader, whom they trust implicitly. They do their work. No task seems too difficult when the General has commanded it. If he orders a thing to be done, it is in their eyes, a proof that it can be done,

and so it *must* be carried through. In this order and discipline, the true history of Madagascar presents the elements of an exceedingly interesting study for professors of physiology.

In the Sakalava districts for instance on the Tsiribina and Manambaho, it was, with their weak resources, an almost superhuman task which was imposed on our officers who were charged with the "pacification" of these immense new tracts of territory. The general demanded it. They performed the work. And when the leader congratulates them on their success, they reply "We followed out your instructions." Instructions which we can trust! *That is everything.* Our France possesses for colonizing purposes the most wonderful instruments one can desire; we have soldiers, civil servants; we have colonists, we have all necessary specialists; when these instruments are united under sound administration as they are in Madagascar today, there comes a success so brilliant that all similar successes of other nations, including the Anglo-Saxon, grow pale besides it. (—Translator).

In places where we have occasion to complain of the result, it is simply and solely because the Administration is bad. We know now what is required to render it sound.

### AGRICULTURE IN MADAGASCAR.

Next to the pacification of the country, General Gallieni makes it his chief business to assist towards the prosperity of agriculture. Moreover he encourages by all the means in his power the utilisation of the soil. To all the Agricultural Colonists which are capable of working it, he gives a grant of land. Wherever it is necessary and his "budget" admits of it, he gives a start to the Trial Gardens, where work is done, not for the Museum, but for practical colonisation. Around the military stations he causes "Plantations" to be started. In Emyrna which the Hovas had stripped of its timber each station supports a "nursery for the forest restoration" entrusted to the soldiers. In every village he favours the cultivators by special measures. For this purpose he has revived old customs which had fallen out of use. He organises "Rustic Shows." The *Official Journal* gives regular reports of these festivities. I have just read the account of the last one, held not far from Antananarivo. All the grandees of the city were present. Numerous prizes were awarded to the native gardeners and cultivators. And let no one imagine a show, like what one sees in an operetta. No. The natives had brought thither 3,000 fatted oxen. The rest I will speak of later.

And it is like this in every Province.—R. H. F.

### TEA, SUGAR AND FRUIT IN NATAL.

(By an ex-Ceylon Planter.)

MR. JOHN FRASER AT SUGAR AND FRUIT  
PLANTING AS WELL AS TEA.

Natal, 17th Aug. 1898.

I am sending you by this post papers with reference to our Natal Shows in which the writer has taken part with a certain amount of success; showing that his early Ceylon training has not been altogether lost! Our colony has sustained a very heavy loss just now in the retirement of Sir Walter Wragg. The whole colony appears grieve very much over its loss. I am sending you papers reviewing his past life in Ceylon as well as Natal, which may interest some of your older readers at least. He was from all accounts a splendid type of a judge. I had a letter from Mr. Leonard Acutt, of Tongaat, Victoria County to whom I had sent a copy of your *Tropical Agriculturist* and with which he was very pleased, and intends ordering it. Send him copies containing letters or paragraphs on

manure or manuring. I send specimen copy of the *Natal Advertiser* enclosed with the other papers showing quotations from the *T.A.* and with many useful hints on sugar in the cultivation of which I am now largely interested having almost completed the planting up of 400 acres since I took charge about eighteen months ago with 700 acres of tea. Roughly the estates are 2,400 acres: cultivated sugar 500; tea 300; fruit 180 acres equal to 900 acres under cultivation or will be by end of Dec. 1898.

#### THE COST OF LABOUR

in Natal is very heavy and handicaps all industries very much—including everything. Our coolies cost over 1s a day on the average—a day's work here is much the same as in Ceylon, our 4d "protection duty" keeps us on about a level with Ceylon as regards the cost per lb. made tea. We will have a wider field for our produce, when the new Customs Convention between the Cape Colony and Natal goes through, which it is likely to do eventually although at present there is a strong opposition by the "working man" especially in Durban.

#### CEYLON'S "GO" WANTED.

If Natal had only half the *go* of Ceylon, it would be a grand Colony. As it is we have no poor, but with equal truth I may say we have few rich. Money seems to come lightly and go as lightly.

With regard to the "Show" that our correspondent refers to we quote the following:—

"The Barrow Green Estates, Limited, received gold medal for best teas in the ordinary grades—three firsts, and first prize for navel oranges, as highly commended for 50 small Spanish lemons in the fruit section. "I think (writes Mr. John Fraser) the judge of the teas will bear me out when I say the whole of the teas on show this year (first and second as well as special prize teas) have never been equalled before on any show in South Africa, in either appearance or quality."

With regard to the teas the "Witness" says:—

"The exhibits of tea were exceedingly disappointing, numerically; but the quality was really magnificent. The Barrow Green Estates' display was beyond comparison for Colonial tea, and inspired judges of good tea with ecstatic eulogistic comments. In the higher grades, a wonderful improvement over last year's exhibits was noticeable, and the fancy teas were the finest ever shown in Durban. The Barrow Green's Pekoe tips were a very valuable collection, one sample tin, containing about a pound of tips, being estimated to be worth £5. It was essentially exhibition tea, of course. Mr. McMillan secured all the prizes in the second grade. Mr. McMillan deserves a word of praise for assisting in the tea display. It is a pity the same cannot be said of other large growers."

We congratulate our correspondent, Mr. John Fraser, (the well-known planter formerly of Lagalla and Lower Dikoya) on the good work he has already done, and for the "*T.A.*" specially his experience as a Sugar and Fruit Planter will be very welcome.

There is also a very appreciative notice of Sir Walter in *The Natal Advertiser*. In the same paper we notice allusion to the article in the *Tropical Agriculturist* pointing out the great difference between the most approved preparation of artificial manure and that recommended by well-known analytical chemists. It is added:—"That such difference should exist is another proof, if one were wanted, that experiment is the only thing upon which we can rely in our selection of a formula for 'artificial.'"

#### TEA AND COFFEE AND CEYLON PLANTERS IN COIMBATORE.

Mr. E. J. Martin, of Avisawella, who has purchased 1,500 acres of land at Annamalai, Coimbatore—North of Travancore and under the British flag—started from Colombo on Monday for his new possession. He travels via Tuticorin—although Calicut will eventually be his point of export—and takes with him about thirty Sinhalese, and thirty to forty Tamil estate labourers. He could not obtain any unopened land in Ceylon, and says he is obliged to go out of the island to get Government land. We think the local authorities are right in restricting the opening of any fresh land, in the low country at any rate; but in the meantime we lose Mr. Martin, who says there will always be a market for high grown-teas, and his land is from 3,500 feet to 5,000 feet in elevation. Mr. A. O. Bannatyne has also purchased 2,500 acres adjoining Mr. Martin's block; and the latter, while clearing 100 acres annually of his own land, has to open up 200 acres of his friend's property. Mr. Martin's estate, when made, he will call Monica, and he will cultivate both tea and coffee. In explanation of why he is taking away estate labourers from this island, the new pioneer said that Ceylon could spare them very well just now; and the reason why he was taking a gang of Sinhalese was that they were to be employed in felling the jungle. The natives of the locality, Mr. Martin says, cut down one tree at a time, and work terribly slowly, cutting all round the trunk, and sometimes felling only one tree a day. Sinhalese will, of course, work all right, removed far away from their villages and paddy fields. Mr. Martin's nearest neighbours will be representatives of Messrs Finlay, Muir & Co., one of whom is supposed to be a former Ceylon planter.

#### INDIAN TEA COMPANIES IN 1896 and 1897.

Last year must be considered to have been a thoroughly bad one for Indian tea-growing, and with all allowance for the sanguine temperaments of those connected with the business, it may be presumed that the industry is not likely to meet such an experience again for some time to come. Not only was the season poor in regard to the quality, but the earthquake in Assam seriously upset the working of many gardens, and the famine led to high prices for rice, which the Indian Government compels the planter to supply to his coolies at a fixed price of 3 rupees per maund, or, roughly, 4s per 80 lb. In times of good harvests the natives can obtain their grain on cheaper terms than this, and so do not trouble the planter, but in a famine they all take advantage of the law and, consequently, the companies were last year at times supplying the grain at 3 rupees per maund when it cost them six. They almost all, therefore, sustained a considerable loss on this account. Furthermore, even at this fixed tariff, food was dear, and the coolies suffered in health. The amount of work done by each labourer was below the average, while sickness was more prevalent. To these bad conditions, of an exceptional nature, the standing troubles of the higher exchange and overproduction must be added, and result in a combination of untoward conditions which has filled the cup of the poor Indian planter with bitterness to the brim.

The rise in the exchange is, as we have explained in previous articles, a serious

matter to the tea planter, and more particularly to the Indian as compared with the Ceylon planter. The Indian average price of tea is distinctly higher than that of Ceylon, as is also the cost of production. To raise the value of the rupee means a compulsory increase in the cost; for the tea sold in London produces a less number of rupees when the sterling receipts are exchanged into Indian currency, and, at the same time, the expenditure on the estates is pretty well at a uniform level, with a disposition to expand. The currency policy of the Indian Government has caused the value of the rupee in the last two years to rise 1d each year to an average price last year of 1s 3½d per rupee, and the consequent reduction in the number of rupees obtained for the £1, as compared with the preceding year, was about 7 per cent. Of course, this does not mean an increase in expenses to that extent, for certain charges are met in gold but on the whole, the change has led to a reduction in profits of at least 4 to 5 per cent. each year. In many industries such a reduction would have been followed by less of the product being thrown upon the market, but unfortunately the output of tea cannot be thus regulated. To produce tea means the planting of shrubs which have to grow for at least four years before they can be stripped of their leaves. In the seasons prior to 1897 the tea planter had been adding heavily to the area under plants, and consequently there was bound to be automatic addition to the output, as the following table will show:—

INDIA :

Year.	Crop.	Average Price of	
		under Tea.	Indian Tea.
	Lb.	Acres.	Per lb.
1886	82,425,812	298,219	12d
1887	92,252,082	312,803	11½d.
1888	99,792,544	324,327	10¾d.
1889	107,042,875	333,701	10¾d.
1890	112,036,000	344,827	10½d.
1891	123,857,000	362,437	10¾d.
1892	121,994,000	374,869	10d.
1893	132,247,000	395,839	9½d.
1894	134,713,000	422,551	9¼d.
1895	135,500,000	436,000	9d.
1896	146,500,000	450,000	8¾d.
1897	148,250,000	471,000	8½d.

Owing to last bad season, the increase in the output is much less than the addition to the plucking area might have led us to expect, and possibly an improvement might have been seen in the price had it not been for the poor quality of much of the tea turned out, and the heavy stocks that were on the market at times. In these circumstances a heavy reduction in profit was only to be expected, and the following tables show how severely the companies have suffered. In these tables we have endeavoured to show the results of the important companies, but it will be noted that two large concerns—the Consolidated Tea and Lands and Amalgamated Estates—are not included. They have been purposely omitted, as the manner of drawing up profits pursued by those two companies is so peculiar that we believe it would mislead rather than inform the public if they were treated in the same way as the rest. We dealt pretty fully with these concerns in our issue of four weeks ago.

From the above it will be seen that a reduction in dividend was almost the rule, and even then the actual rate of distribution was usually only made possible by trenching on the reserve or balance forward. Two companies in the list managed to maintain their distributions, but in 1896 they had put large sums to reserve, and, of course, nothing of the kind was done this time, whilst one of the two had to draw freely from the balance forward. There has been much discussion about the policy of the boards of the better companies in reducing their dividends so freely when, in many cases, they had considerable reserves at their disposal. But, after all, these good com-

panies now pay dividends of 8 to 12½ per cent., and such high distributions ought to imply great caution on the part of their directors. It was only by being cautious in this respect during the past that dividends at present rates are possible, and we have seldom come across a board of directors which, when all the pros and cons are taken into consideration, deliberately vote for an unnecessary reduction in dividend. And if one board were so disposed, the feeling of terror is not likely to have had a deterrent effect upon those in control of half-a-dozen of the best-managed concerns in the industry.

Taking into account the attitude of boards of companies that have witnessed the ups and downs of Indian tea-growing for twenty or thirty years and the general position of affairs, we fear that tea companies in general have yet many anxieties to go through. Presumably there will be no loss in the near future from another earthquake, and as harvests have been bountiful this year, the companies ought not to lose much from cost of rice, although this will be a little dearer than the average, and of course the coolies ought to work better this season than last. On the other hand, the exchange will probably be screwed further up against the planter, for whatever the Currency Committee may agree upon, its deliberations are not likely to interfere with the determination of the bureaucracy to force and keep the rupee up at all costs. Then the effects of over-production, which were not experienced to any material extent last year, are bound to be more pronounced this, so that we should not be surprised if the year works out with a further decline in the average price of tea in spite of the reduction in the crop estimates recently cabled. On the whole, therefore, the current twelve months is not likely to produce much improvement in profits, although the exceptional loss in rice will be almost eliminated.

Present conditions are working towards good in the end, for, barring a few flagrant exceptions, where companies are carrying the whole cost of extensions and their upkeep to capital account, the policy of expansion has well-nigh stopped. Then, the sudden rise in working expenses, caused by the advance in exchange, must lead to economies in management, and we do not suppose that exchange can rise much above 1s. 4d. per rupee, the now ideal standard. The industry has been in an unhealthy condition through the "boom" which was partly the result of the decline in exchange, and the present period of adversity—due to the propped rupee more than ought else—will bring it back to a sounder financial state. The preposterously capitalised companies of this time of inflation have yet to exhibit their true character, and when such concerns as the Consolidated Tea and Lands, the Lungla, and the Amalgamated Estates have been put thoroughly to the proof, and their dangerous policy of extending and maintaining extensions entirely out of capital has proved to be bad for all concerned, there may be reason to expect that soundly-managed properties will see an improvement in their profits; but until this policy of extension blindfold is stopped there can be no safety for the industry from the attacks of unscrupulous company promoters.

We have not entered into the question of the danger of a revival of Chinese tea-growing. It must not, however, be forgotten that the rise

in the Indian exchange has placed the planter there at a disadvantage of 30 per cent. compared with his Chinese competitor. The difference in currency indeed shows 50 per cent. of a handicap, but a considerable proportion of the expense has to be met by both Indian and Chinese planters in gold. Improvement in treatment is also being applied to China teas, and undoubtedly such teas on the whole seem far less injurious to the human constitution than those of India or even Ceylon. But taste goes for a great deal, and we believe it is impossible to grow tea in China to any extent possessing the distinction and now popular qualities of Indian tea. So long as this proves to be the case there is little danger of China teas regaining their lost ground. To endeavour to replace a strongly astringent and highly-flavoured article by one less pronounced, when once the former has become acceptable to people's tastes, is no light task, and so we think there need not be any immediate fears of a return to the milder leaf of China. At the same time, an improvement in China teas will render further attempts to dislodge that article from its own markets all the more difficult, and upon such dislodgment in the near future from the markets of Russia and America the British tea planter in India and Ceylon has placed a great deal of hope. From various aspects, therefore, the prospect is not without clouds.—*Investors' Review*, Aug. 26.

#### CARDAMOMS—CHENAS—AND TOBACCO.

(From a Planter)

I think the Cardamon crop generally in this North-Eastern district will be short this year. We had too little rain in August. We are now getting slight showers every day, and still from the S.-W.

At present the villagers are busy Chena felling. These lands round here contain a lot of young satin, hora, mililla and other valuable woods. It is a pity Government does not conserve them, and besides it is hopeless to expect the ordinary Kandyan to improve generally and be more industrious as long as he is given a free hand to indulge yearly in this ruinous system of cultivation.

The planting of Tobacco—principally by Moors and Tamils—is largely on the increase round Teldeniya. Jaffna merchants come here and buy it very often in its green state. These traders like the planters feel the want of a telegraph station at Teldeniya very much.

TEA PROSPECTS.—Much dissatisfaction I hear—says the Calcutta correspondent of *Pioneer*—is expressed among tea garden shareholders at the present low prices obtaining for tea in the Calcutta auction room, and in view of the strong position of tea as shown by the London August figures, there is evidently some cause for complaint. While imports to London of all descriptions—Indian, Ceylon and China—amount to practically the same weight as in 1897 and 1896, deliveries to consumers are 2 million lb. more in 1898 than in the two previous years, while stocks held are 3 millions less than in 1897 and nearly 6 millions under 1896 figures. Stocks in London have not been so low as they are now for many years. Direct shipments to London will probably be made by garden proprietors in preference to selling here, and no doubt this is the proper course to follow until buyers are able to make up their minds to pay fair prices.

COFFEE-PLANTING ON THE NILGIRIS.

The following further particulars regarding the coffee alluded to, on the Nilgiris, by Mr. T. C. Anderson, have been furnished us by the proprietor:—"The estates are the Leighwood and Northern Hay estates. In the good old coffee days they yielded two or three times one ton per acre, and on an average of several years 13 cwt. an acre. On the advent of leaf-disease they were semi-abandoned and the present proprietor, Mr. L. W. Grey, bought them for a song. By manuring (with cattle manure) irrigation and shade, he has brought them round to their present high state of cultivation, and the present crop now being picked is estimated at 7 cwt. per acre all round—a safe estimate. The irrigation is secured by tapping the Pykara River below the falls, 3,000 feet above the estates, and diverting the water into their own Valley. During the blossoming season the water is turned on to the coffee and field after field irrigated. By judicious management this allows the coffee to ripen gradually, so that there is no danger of a rush of crop and loss, for want of labour. The greatest enemy of the coffee and shade trees are the wild elephants, which do a certain amount of damage at night. There is splendid shooting on and near the estates—present area about 300 acres planted, and another 400 to be opened out. Estate always open to inspection."

This is all very interesting. The late Mr. Tytler and his partners spent £20,000 on irrigation works for their Dumbara Valley coffee estates and yet could not make irrigation pay. Will Mr. Grey tell us if his coffee has always been, and is now, free of the leaf fungus? Were it not for our pests of the fungus and green bug, we should say that the experiment of growing coffee under shade, in Ceylon, with manure and irrigation, would be worth a trial, wherever such trial could be given under favourable circumstances, say on a small area with good soil and a convenient stream.

CEYLON PLANTERS IN MEXICO;

We are glad to have a long letter from Mr. E. O. Darley on life in Mexico and treating of its coffee, caeao, rubber, tobacco, and which appears on page 285. Mr. Darley kindly adds:—"I will be glad to send you any information you wish; and whilst I am no scribe and the rifle or pruning knife feel more at home in my hands than the pen, you may rely on any statements being facts and not hearsay."

He also adds that Mr. W. L. Malcolmson is at present in London, but that he and another ex-Ceylon man much enjoy the *Observer* and Ceylon news.

A LABORATORY FARM.

Mr. John Mills supplies the *Humanitarian* for August with a highly instructive account of the laboratory farm founded and endowed by Sir John Lawes, under the heading "Scientific Agriculture at Rothamsted," near St. Albans. For more than fifty years careful experiments in agriculture and agricultural chemistry have been carried on there.

The rainfall is carefully studied. Results prove that the "fertilising rain" is an incorrect phrase, for the rain washes out the nitrogen which is the fertilising element from the soil! Nitrogen is the principal element, it appears, in the fertility of land. Arable land treated only with mineral manures without nitrogen becomes im-

pooverished. Conversion to permanent grass is needed to restore the nitrogen, which is, however, also restored by its fixation from the atmosphere by growing leguminous crops. Even when nitrogen is present in manures, the plant cannot assimilate it except the soil be "infected" with the power to do so; and this power is supposed to be the work of bacteria. These bacteria flourish in the roots of leguminous plants, and once present enable the plants to take up nitrogen freely from the air. Hales, two hundred years ago, found that a plant growing in a pot of soil increased in weight out of all proportion to the very slight diminution in weight of the soil. The Rothamsted chemists have shown that 95 per cent. of the weight of the plant comes from the air, not the soil.

Experiments with and without manures have yielded the following results, which Mr. Mill put in this tabular form:—

Averages.	14 Tons			
	Farmyard Manure every year.	Without Manure every year.	Mixed Mineral Manure alone.	Ammonium Salts alone.
	Bushels.	Bushels.	Bushels.	Bushels.
8 years, 1852-59 ...	34 $\frac{3}{8}$	16 $\frac{1}{8}$	19	32 $\frac{3}{8}$

The average without manure for fifty years is above the average of the United States, and about the average for the whole world.

A DRUGGIST'S GARDEN :

MR. T. N. CHRISTY AT WALLINGTON.

About twelve months ago did the Manor House Wallington, pass into the hands of Mr. Thos. Christy, who is exceedingly busy in an endeavour to bring it and the gardens into good condition. The Manor House and grounds occupy nearly 20 acres, and the land is situated between two roads, one of which leads to Hackbridge, the other two Croydon. The residence is a famous house, and parts of it are very old. Almost underneath the drawing-room even is an old Norman chapel, and quaint steps leading thereto. It is said that the first Italian roof put upon a residence in this country was that used in the case of the Manor House. There is evidence that at one time the gardens were the subject of intelligent interest, as, for instance, in the selection of the trees and shrubs, which according to report, was the work of an Italian. Everything has since been neglected. The trees have overgrown each other, the fine, extra large, variegated Hollies and other ornamental species are either in unsuitable positions, or are hidden by less worthy specimens. A year ago there were no laws, unless a meadowlike greensward may be described as such; there was no kitchen-garden, and the Rockery, which, in spite of its neglected condition, may be capable of improvement, was utterly overgrown with undesirable plants. Mr. Christy has done much in the direction of improvement, by attacking the most needed reformations first. There is now, therefore, a kitchen-garden, with good crops of vegetables, and young fruit trees have been planted. There is a conventional but pretty flower-garden close to the house, and the surrounding lawn has been brought into as good a condition as the time would permit.

Walking with Mr. Christy through the vegetable-garden, we were made aware of a fact that we suspect gardens in rural districts may not know so well as their suburban *confièrès*. The Cabbages were

Protected by nets, just as were the Strawberries; and it was affirmed it is difficult to preserve the Brassicas from the voracious appetites of the wood-pigeon. Mr. Christy has for many years been a zealous Fellow of the Linnean Society, he is also the head of a large firm of wholesale City druggist, and one department of his garden indicates that his greatest interest lies in the cultivation and distribution of economic plants. There is a good collection of these interesting plants, which his special knowledge of the value of drugs has led him to acquire. Mr. Christy disposes of the plants commercially over the whole world. He must have a wide correspondence, for as we pass along the house, this plant is described as having been sent from the West Indies, that from Queensland, the other from Columbia or Japan, others from east and west Africa, and so on.

#### TROPICAL PLANTS.

In this way Mr. Christy acquires plants without names, but with wonderful descriptions. They frequently turn out to be unimportant, no doubt, but now and again quite a new plant is flowered. Thus we were shown a new ornamental *Begonia*, several important Rubber-plants, and other species that may turn out to be valuable. But there is no doubt in respect of such well-known plants as the Coffees, Vanillas, Cocas (*Erythroxylon Coca*, and *Theobroma Coca*), which we noticed in some quantity, nor as to the Ginger (*Zingiber officinale*), the Pepper (*Piper nigrum*), the Arrow-root, &c. *Piper nigrum* produces the Pepper of commerce, though there are many other sorts of Pepper that are obtained from other genera. All Pepper-corns are black, and the white form is obtained by fermenting the seeds. Black Pepper has always the best flavour.

The Nutmeg-tree too, is here. It is *Myristica moschata*, or *officinalis*, and grows to 25 or 30 feet in height, being cultivated extensively in the Banda Isles, Sumatra, Java, and the Mollucca Isles. There is also a large Camphor tree 9 feet high. Close to the plants which furnish all these tasteful articles was the deadly poisonous *Strychnos* (*S. nux vomica*), a member of the Loganiaceous group, almost all of which are more or less poisonous. The *Strychnos* is a native of India, grows to a moderate size, and its fruits somewhat resemble Oranges. Besides being a deadly poison, *Nux vomica* is also a valuable drug. There were many varieties of the *Strophanthus* that yield the heart tonic. Next we notice the Mahogany-tree (*Swietenia Mahogany*), but there are many kinds of Mahogany from various countries, and obtained from different species of trees. Passing a species of *Hibiscus* in bloom in the stove, Mr. Christy observed that by a new process, yet in an experimental stage, it may be possible to utilise the full length of the fibre contained in this plant.

We next notice the Cassia in bloom, the origin of the school-boy's medicine—"senna." It is a yellow-flowered leguminous plant, of quite ornamental appearance. One species, *C. occidentalis*, of the Indies furnishes a Coffee in use by the negroes. Next is the *Guaiacum officinale*, which yields the Gum *Guaiacum* of commerce, and a very heavy wood also; *Eucalyptus* in several species; and the Cinnamon (*Cinnamomum zeylanicum*). This Lauraceous plant furnishes the best Cinnamon, and is cultivated extensively for the purpose in Ceylon. *Cecropia peltata*, the Trumpet-tree of the West Indies and tropical America, said Mr. Christy, will supersede the Bamboo for many purposes; its hollow, light wood grows very quickly. A friend sent the plants from Columbia, advising that they be planted out-of-doors, stating that in that country the tree grows to a height of 60 feet. *Passiflora edulis*, and many other economically interesting plants we saw, but must refrain from enumerating them. As we looked at a plant of *Ilex paraguayensis*, Mr. Christy surprised us by remarking that it is in great demand, and that even in England there are thousands of people now taking the Paraguay Tea as a beverage. We tasted it, a long time ago, but our memory of the liquid is still vivid, and we have no intention of repeating the experience. On the roof of one of the houses were *Cissus discolor* and *C. albonitens*, the latter with aerial roots 8 feet long. A variety

of purple-leaved *Coleus* was noteworthy too, the leaves being larger in all respects than is usual.

Near to the southern entrance to the residence is a very old plant of *Wistaria sinensis*. It has been slung across to a variegated Holly-tree, and now covers the top of this. An iron chain from one to the other has become embedded at either end, through the growth made by the *Wistaria* and the Holly.

Before taking leave of Mr. Christy, our attention was drawn to a Wardian-case, then being filled with young rubber plants (*Castilloa elastica*) for exportation. The plants were dibbled into a compost in rows, and a flat lath placed over the surface between each. Then two laths were placed longitudinally along the sides of the case, and over the ends of those between the rows, thus securing the soil and plants from becoming loosened.—*Gardeners' Chronicle*.

#### PLANTING IN THE STRAITS.

(Extract from Report on the State of Pahang for the Months of June and July, 1898.)

British Residency, Pahang, 31st July, 1898.

In company with Mr. Owen, the Superintendent of Ulu Pahang, I travelled over the whole length of the Trunk Road during July, and made the selection of the reserves which I think will be needed in the future in the event of applications being made for large areas for planting. The aspect which the district presents is one of ever increasing prosperity and activity, in very marked contrast to its condition a very few years ago. Land is being eagerly taken up all along the length of the Trunk Road, and the coffee and other plantations look exceedingly prosperous. The number of foreign Malays now settled permanently in the district is very considerable, and the price of land is still rising.

RUBBER IN MEXICO.—A Colombo merchant sends us the following extract from a letter he has received:—

Tepec, Mexico, 23th July.—"As to rubber there is only one kind known here, and we have not found out for sure, the botanical name of the tree. We believe it to be '*Siphonia Elastica*.' The tree begins to yield after 5 to 7 years, 6 to 8 years 10 pounds, if properly treated, and soil and climate agree. Up to now there are only wild growing trees; we only began to plant some 3 or 4 years ago. The seed we sow in nursery beds, covered about 3 to 4 inches distance about 4 inches, when about 6 inches high every second plant is transplanted to 8 inches distance. Later on, when plants begin to develop they are left at about 16 inches distance. At the beginning deep shade is necessary; we lessen shade gradually till plants, at a height of about 2 feet are left in the full sun. This is to make them hard. The soil has to be worked before about 2 feet deep, so that the roots get not hurt when you take out the plants. If the soil is not moist, in the beginning a light daily irrigation is necessary, but if kept too moist the seeds will rot. We have found out that therefore it is more convenient to sow with irrigation, because you have in hand the degree of moisture. Later on, in order to harden the plants, and make the roots go deep, a weekly irrigation will be sufficient, but of course this depends entirely on local circumstances and the look of the plants will tell. You plant in more or less deep shade, at a distance which will depend on the shade-trees, and on land with natural moistness, (or which is to be irrigated). The tree also grows on pretty dry land, but you get considerably less rubber out of them. Some people talk here about 15 to 20 pounds of rubber to a tree, but we will not assure this. We get out quite a lot of rubber every year, but do not know the exact number of trees. The time for seed is the June."

The "*Siphonia Elastica*" is nothing more nor less than Para rubber; but they have much to learn in Mexico, as in so many other places, about rubber.

## COFFEE IN QUEENSLAND.

At 6 feet by 6 feet apart an acre will contain 1,201 trees. Allowing 3 lb of clean marketable coffee to each tree, we get 3,603 lb per acre. At the above calculation of about 5 lb of berry to 1 lb of clean coffee, this would mean that 18,015 lb of berry would have to be picked. The cost of the labour for picking at  $\frac{1}{3}$  per lb, would reach £37 10s 7 $\frac{1}{2}$ d, and the value of the commercial bean produced £135 2s 3d; from which we deduct picking expense, leaving £97 11s 7 $\frac{1}{2}$ d, from which all the above-mentioned items have to be deducted. As, however, paper calculations rarely are borne out by practical results, a considerable reduction may doubtless be made on the figures denoting returns.—Mr. E. Cowley, Manager of Kamerunga State Nursery, Cairns, in *Q. A. Journal*.

## CACAO IN TRINIDAD.

**CACAO BLIGHT.**—Correspondence published in the *Grenada Government Gazette* respecting a blight belonging to the genus *Thrips* affecting Cacao pods, forwarded by the Acting Governor for the information of The Society was read. Mr. Hart said that *Thrips* are best treated with plenty of cold water or soap suds. They generally occur and do damage in very dry seasons, but not otherwise. Documents ordered to lie on the table.

**CACAO—ANALYSIS OF SOIL.**—A letter was read from Dr. W. H. Ince, dated 28th May, expressing his willingness to undertake further analyses of cacao soils or to otherwise assist the Agricultural Society.—Mr. Hart exhibited two pods of aligator cacao.

## JAVA QUININE.

Trouble looms ahead for the maker of it. We hear that a meeting of the shareholders of the Bandoeng quinine-factory is to be held in Samarang on December 14, 1898, to consider the following propositions of the directors:—(1) To dismiss Mr. H. J. Van Prehn, technical director; (2) to determine the conditions of his dismissal; (3) to alter the articles of association so that in future the managements will consist of one managing director and three—or, at most, four—ordinary directors. The immediate cause of the friction between Mr. Van Prehn and his co-directors seem to be the failure of the former's scheme of co-operation between the quinine-works and the planters. Full details of the agreement, on the basis of which co-operation was desired, were published in our issue of May 21. In practice the scheme is found to be unworkable, a good many planters objecting to the condition that the quinine should be consigned to a firm appointed solely by the works, without consulting the planters. The almost general opinion is that the bark should be purchased for cash by the works, instead of paying a fixed manufacturing charge and a percentage of the net proceeds of the quinine. It has also been found more profitable to sell the bark at the Amsterdam auctions than to forward it to the Bandoeng works. The result is that not one single planter has accepted the terms of the agreement. Under these conditions, and threatened by the erection of competing quinine-works in Java, Mr. Van Prehn devised other means for successful co-operation between the planters and the Bandoeng works, and formulated the proposals that three-fourths of the usual annual production of Java bark should be exported to Europe, and the remaining fourth be manufactured in Java for consumption in Asia and Australia. This would necessitate the extension of the Bandoeng works, as one-fourth of the ordinary yearly production represents double the quantity of quinine that can be manufactured at present at

Bandoeng. Unfortunately Mr. Van Prehn did not succeed; had he done so, he would have established a monopoly which, on the basis of co-operation, would have been profitable both to the Bandoeng factory and the planters. The object of European manufactures is considered to be the extinction of Java competition, and they may succeed in this by temporarily increasing the price of the bark, so that the planters will find it more profitable to export their produce, when naturally the Bandoeng works would stand idle and soon come to grief. Mr. Van Prehn, who is at present in Europe, is fighting against this, and for what he believes to be the mutual interest of planter and manufacturer in Java; and that, in his absence, his colleagues should have made arrangements for the meeting indicates as well as anything how happy a family they are out in Java, and how effectually they will kill the goose if they do not take care.—*Chemist and Druggist*.

## PLANTING IN MEXICO.

COFFEE, CACAO, RUBBER, SUGAR, FIBRE, TOBACCO, VANILLA, &c.

(By an ex-Ceylon Planter.)

MEXICO, 30th July 1898.

DEAR SIR,—I have seen your paper of May 22nd and read with much interest your remarks on Mexico. I thank you for your kind wishes and will endeavour to give you the information asked for. I have not got your paper by me and my quotations are from memory, so subject to correction.

Messrs. Clarke and Fort, whom you quote as saying

## COFFEE

did not pay in Mexico, on account of present low prices, can hardly have looked very closely into the matter—in fact I heard that they were never off the rail road and only saw the poorest part of Mexico, and the one coffee district of Cardoba, the oldest certainly, but having the thinnest soil and smallest crops, though the dearest land because being easy of access to Mexico city and Vera Cruz. On the Isthmus of Tekuantepec, in Oaxa and in Chiapas, as fertile land as any in the world, suitable for every tropical product, can be bought in small blocks of 200 to 1,000 acres, with good transport facilities, for from \$15 to \$25 silver per acre, large tracts at a much cheaper price, and I will guarantee to plant coffee and bring to bearing for \$120 (one hundred and twenty dollars) per acre. Coffee can be produced for from \$5 to \$8 per 100 lb., the former dried in cherry and peeled, the latter pulped, washed, peeled and classified ready for market. The former is quoted today at \$20 per 100 lb., and the latter in New York at \$30 and \$32; and as coffee bears here some crop at two years old and one lb. per tree at three years old and at least two lb. per tree at five years old, with 1,000 trees per acre, there is still a very handsome profit even at the present low prices. Mexican coffee when properly cured will always bring a good price in New York for mixing with the inferior South American, so much used in the United States, to give it a flavor. Since Messrs. Clarke and Fort were in Mexico, eight American Companies have bought

## 250,000 ACRES OF COFFEE LAND

on the Isthmus alone, which does not look as if the Americans feared for the future of Mexican coffee. The soil here is so rich that crops have to be seen to be believed and coffee if grown under *high moderate shade* only needs pruning once and weeding four times a year; if grown without shade
