the crops are heavier, but the growth of weeds is tremendous and the extra cost of weeding counterbalances the extra crop. When I came to this district some three years ago, my neighbour, who has gone in for sugarcane, had near his house about 25 coffee trees that had been planted by the Indians at least 20 years ago. They had never had any attention at all and he was about to cut them down as they were unsightly, having three or four stems and a mass of old wood. They yielded that year three lb. on an average of clean coffee. I asked to be allowed to prune a few of them to demonstrate what pruning would do. I pruned four of them and was informed by four embryo American coffee planters that they certainly would give no crop next season. The next crop was carefully gathered from three of them (the fourth was so heavily laden with crop that two-thirds of it broke down), dried and cleaned and they averaged 13½ lb. per tree. Last year Mexico produced 14,817,662 kilos coffee, value \$9,876,532. I have seen no leaf-disease or heard of any.

#### CACAO.

I have seen no regular cacao grove here. The Mexicans plant cacao, coffee and rubber all together; and except a casual chopping down of weeds give them no attention, but gather what crops Providence sends them in a contented spirit. I have seen a number of trees under these circumstances 20 to 25 feet in height, bearing 5 lb. to 7 lb. per tree. The local value is 60 to 70 cents per lb. for the cacao nigra and 70 to 80 cents for the cacao colorado; the latter has the very finest flavour and if well cured should sell as high as the best in the European markets. The only enemy is the squirrel and a beetle—both easily destroyed.

#### RUBBER

grows wild all over this district and is tapped by the Mexicans in the most barbarous manner, the trees being hacked with a machete as high as they can reach; and the only wonder to me is that they do not bleed to death long before they do. It grows readily from seed and the cost of forming a grove is small. The underbush and smaller trees only need cutting down at a cost of some \$2 to \$2.50 per acre. The ground is chopped with a hoe and three or four seeds are dropped at whatever distance apart it is proposed to have your trees. I intend myself planting seed at stake 6 ft. x 6 ft., and when three years old, bleeding to death from root every alternate tree which will leave the permanent grove for regular tapping. The rubber produced from the trees destroyed will pay all the cost of grove. Rubber sells locally from 75 to 85 cents per lb. as crudely prepared by the natives and at that price a grove will yield \$200 to \$300 annually per acre.

#### SUGARCANE.

On account of the import duty, the manufacture of sugar and white rum pays well in Mexico, but of course the capital required is very much larger than for coffee, cacao, rubber, etc. The cost of clearing the land so as to be cultivated, by ploughs, alone costs \$50 to \$60 per hectare (2½ acres), but it will if properly cultivated yield profitably for 5 to 7 years without replanting. On these rich lands a hectare will produce 80 tons of cane, which yields 90 per cent of juice, or of white sugar 300 to 400 lb. or of panela (dark sugar) 600 to 800 lb. or aguardiente (rum) 15 to 20 gallons per ton. The local price for white sugar per 25 lb. is \$2, panela \$1.75, aguardiente (rum) 60 to 80 cents per gallon. The cost of producing being about the same as any West Indian Colony.

#### TOBACCO

is largely grown in this canton and brings a good price. A hectare (2½ acres) produces from 22 to 30 arobas (per aroba = 25 lb.) of the finer kinds of leaf worth in the local market \$8 to \$12 per aroba which leaves a good margin of profit; the coarser kinds produce much larger crops, but the value of course is lower which equalizes matters. I may here say that some Dutch tobacco growers from Sumatra, after looking all over Mexico, have just bought 1,800 acres of land adjoining mine on which to grow tobacco for the Amsterdam market.

#### VANILLA

grows well and is in great demand and might be grown on the shade trees amongst the coffee, cacao or rubber as a side crop. The large number of humming-birds here render the labor of artificial fertilizing of the flowers unnecessary to a very great extent.

#### FIBRE PLANTS.

There are many in Mexico: last year henequen to the value of \$7,500,000 was exported. It is said a machine for the extraction of fibre from ramie has just been perfected; if such is the case there should be money in that.

#### CARDAMOMS AND GINGER

both should pay here, every condition of soil and climate being suitable.

#### OF FOOD STUFFS,

maize, rice and beans all produce large crops with little cultivation; and fruits, the banana, orange, lime, avocate, mango, popoa, melons, pine apple and many others. Vegetables I have grown of every kind except Irish potatoes. So much for tropical Mexico on the high plateaus. The

#### MAGUEY

(*Agave Americana*) plant is the chief product: it is planted 10 by 10 or 12 by 12 ft. and at eight years old each plant yields \$10 worth of pulque, the drink of Mexico. Pure, it is a refreshing and wholesome drink, but as sold in the Mexican drink shops fortified with a plant called "datu stramonium." A few drinks will make the most peaceful peon "fighting drunk." Some of the large haciendas have 300,000 plants tapping from 20,000 to 30,000 a year, barley and wheat are sown between the rows of maguey. The value of the maguey produced in 1896 was \$6,768,002 and Mexico city alone daily consumes 280,000 litres of pulque.

#### THE CLIMATE

here is good. June and July have averaged 78° at mid-day and 68° night. The hottest day in three years was 96° and the coldest night 58°. The average rainfall 87 inches is well distributed over eight months, and there are showers and exceedingly heavy dews during the other four months. But Mexico has all kinds of climates (that of Gnadalajara being simply perfect) and all kinds of lands. In fact the large or small capitalist can hardly go wrong in tropical agriculture here if he has a knowledge of the business. Our rivers afford easy and cheap transport, and are full of fish, turtles and alligators. Game is plentiful, but on account of the dense undergrowth

#### HUNTING AND SHOOTING

are somewhat difficult. There are tapirs, three kinds of deer, two kinds of peccari hogs, two kinds of pheasant and (from Nov. to Feb.) ducks and geese without number in the lagoons and marshes. Jaguars pumas, and panthers can be got by looking them up: four of the latter made calls on my live stock at various

times, all of which I shot. My best jaguar skin is 9 ft. 3 in. Of course we have

OUR DISAGREEMENTS

like other tropical countries. The festive mosquito in the rainy season and sand-flies and ticks in the dry season make their presence felt; and I often hunger for my old Sinhalese cook and a good curry when tackling a chili-con-carne. The low price of silver has not affected us planters at all to our detriment, for excepting machinery and some tools everything we need is produced in Mexico and we sell our produce for gold. With our Banks declaring annual dividends of from 16 to 20 per cent and cotton mills from 20 to 55 per cent, and other enterprises equally as good, I hardly think that either the planter or the manufacturer has much to complain of in this country—I am, yours truly,  
E. O. DARLEY.

P. S.—The Mexican dollar is worth two shillings, £1 sterling exchanging for \$10.50 at present rate.

BRAZIL COFFEE NOTES.

—A phenomenal blossoming appeared on the coffee trees throughout a great part of the state of São Paulo during the last half of July. What the result will be, no one seems to know. The blossoms are due in September, but they appear some five or six weeks earlier. It is predicted by many that the blossoms will not adhere, and that they betray weakness in the trees.

—A project has been presented to the estate legislature of São Paulo, authorizing the state executive to acquire a pavilion at the Paris exposition of 1900 where the agricultural products of São Paulo, principally coffee, can be favorably exhibited. The purpose is to make a propaganda in favour of coffee, and for this purpose coffee will be placed on exhibition in every conceivable way, and cups of the beverage will be distributed to the public. All machinery for preparing coffee for the market, together with machinery and apparatus for roasting, grinding and preparing the beverage, will also be exhibited. It is a practical idea, but why should not the planters bear the expense, instead of the state treasury? Why should a Pindamonhangaba shoemaker pay for a propaganda calculated to benefit the coffee planters alone?—*Itio News* 2nd.

IMPORTS OF COFFEE INTO UNITED STATES.

The full report of the U.S. Bureau of Statistics shows coffee to be the most important article, measured by value; in the imports of 1898. The total net imports compare with five preceding years as follows:

Year ending June 30—	Pounds.	Value.
1898 .. ..	851,691,846	\$62,674,241
1897 .. ..	724,559,536	79,893,943
1896 .. ..	572,671,840	83,534,366
1895 .. ..	643,234,766	94,599,880
1894 .. ..	547,068,994	89,600,572
1893 .. ..	551,395,250	78,444,496
Total .. ..	3,890,621,732	\$488,747,498
Average per year	648,436,955	\$81,457,916

It is apparent from the above that the very large imports of 1898 were due to coffee imported in excess of requirements and in anticipation of the imposition of a duty. Stocks out of licensed warehouses are known to be heavy and variously estimated from 100,000,000 to 150,000,000 pounds. It allowance is made for increased consumption, due to growth of population and to the decline in price, we find that the imports in 1898 were too far above the yearly average to warrant the state-

ment that the increase was due to enlarged use of the bean. It is fair to assume that dealers and roasters are carrying from 1,000,000 to 1,500,000 bags more coffee than was held at this time last season.

The following table shows the average import price for the past six years:

Year.	Price per lb.—cts.	Year.	Price per lb.—cts.
1898 .. ..	7.3	1895 .. ..	14.7
1897 .. ..	11.0	1894 .. ..	16.4
1896 .. ..	14.6	1893 .. ..	14.0

The large imports at low prices show that a duty of three cents per pound might have been levied on coffee and still left the average cost for the year nearly one cent per pound below the cost in 1897.

The coffee imported was received from the following countries:

United Kingdom .. ..	1,796,985
France .. ..	859,419
Germany .. ..	7,334,801
Netherlands .. ..	2,409,967
Other Europe .. ..	2,427,834
Central America .. ..	35,862,385
Mexico .. ..	34,511,168
West Indies .. ..	6,412,209
Brazil .. ..	661,008,372
Other South America .. ..	90,113,241
East Indies .. ..	21,311,139
Other Asia and Oceanica .. ..	3,947,018
Africa .. ..	42,305
Other countries .. ..	1,477,352

Total .. .. 870,514,215

—*American Grocer.*

COFFEE-PLANTING IN COSTA RICA: AN OPENING FOR YOUNG MEN OF CAPITAL.

Writing from London on 2nd Sept., "J.L.S." thus gives his views about Costa Rica:—

"Some energetic young fellows of the right sort should go out to Costa Rica and open land for themselves. A man must have the command of not less than £3,000 and be not afraid to do a bit of work himself. There is magnificent coffee land in an excellent climate where even a sunhat is unnecessary, and good shooting and fishing. A young man could go to work very gradually perhaps with half-a-dozen or a dozen labourers and plant say 50 acres, that is at 300 trees an acre, 15,000 trees, which in four years would give him a clear income of £500 to £1,000 a year and go on doing so longer than he required an income.

"If I were twenty years younger I would go and plant most of those 15,000 trees myself (I wish I had a shilling for every cinchona tree I have planted with my own hands in Ceylon). Labour is dear, but you don't want much of it. Transport is at present bad, but by the time land now planted comes into bearing, it will certainly be much better. I do not say there are no such openings anywhere; but I say I know of no such opening. The Serapiqui Company would deal liberally in selling land, supplying plants, and in time curing the coffee. Mr. R. P. Macfarlane said after his return:—'If I were a young man again I would not hesitate to go off to Costa Rica at once.' Mr. Huntley Thring has been the means of two young men already going out. £3,000 is the least I should recommend a man to go with the command of; but of course he does not want it all at once, and he must not be afraid of

work and of roughing it at first. Every coffee plant he puts in with his own hands or any other hands will, four years after it is put in, bring him in a clear income of a shilling per annum for life. Surely it is worth doing where there is no risk of climatic danger."

But surely cacao and rubber may be planted as well as coffee? At this moment, coffee does not stand high, although the price of properly grown and prepared coffee has not fallen much, and we see reports of Brazil being likely to fall off in its crops. Still, the fine soil of Costa Rica may well be utilised for cacao, and rubber as well as coffee, so as to have several strings to one's bow.

#### THE WEST INDIES DEVASTATED.

Very terrible is the burden of Reuter's message recently as to the destruction in life and property, wrought throughout the Windward and Leeward Islands, by one of those awful hurricanes with which this region is periodically visited. The groups of islands named, range over nearly 8 degrees of latitude—from Tobago very near to Trinidad in the South to the Virgin Islands in the North or North-West. It would seem as if the storm took most effect about the 14th degree North Latitude, in the line of St. Vincent and the Barbadoes; and while 300 persons were killed and 20,000 rendered homeless in the former, we are told of 200 being killed and the whole of the sugar estates being ruined in the latter. This is far more awful destruction than in the recent battles of the Spanish and Americans. St. Vincent is a tiny island 13 miles by 11—not much larger than the area of the Colombo Municipality—with a population not much over 40,000. Barbadoes has always been regarded as about the best cultivated of the West Indian islands: it covers 166 square miles with a population of about 190,000. Strangely enough, here Dr. Morris was to establish his headquarters because of its central position, taking British Guiana as well as Jamaica into account. There are both European and Ceylonese officers in the West Indies, about whom relatives and friends in Ceylon will be anxious until further details are got. Dominica has several such including Mr. Templer and family; in Trinidad there is Mr. Wrightson and family; in St. Vincent we see Drs. Bruce-Anstyn and M. G. Pereira among Medical Officers and Mr. C. Messervy, Director of Public Works. Doubtless there are more in the several islands affected; but we trust there has been no casualty amongst them. Once again how thankful residents in Ceylon ought to be at its immunity from hurricane, cyclone or volcanic disturbances. We do not want to preach; but if such exemption does not find acknowledgment in more than mere words of thankfulness, there will assuredly be visitations in another form,—plague, pestilence or depression. It is "righteousness that exalteth a nation."

#### AUSTRALIANS AS TEA DRINKERS.

The following very clear and interesting statement is from the Melbourne *Leader*:—

The people of Australasia, as frequently remarked, are well in advance of the rest of the human race with regard to their consumption of tea. The Chinese, however, are omitted from the comparison, as owing to the lack of Celestial Empire statistics, there is no means of ascertaining what position it occupies

per capita in the list of the world's tea drinkers. The Australian average consumption per head is a fraction over 7 lb. a year. The United Kingdom comes next in the list with an average of 5½ lb. The following are the Australian tea statistics for 1897:—

Colony.	Population.	Tea Consumed
Victoria	.. 1,170,000	2,286,286
West Australia	.. 157,781	1,414,992
South Australia	.. 356,877	2,734,827
New South Wales	.. 1,311,440	9,594,198
Queensland	.. 480,079	3,074,080
Tasmania	.. 167,062	901,870
New Zealand	.. 719,292	4,561,640
	4,362,531	31,570,893

The value of the 31,570,893 lb. of tea is given approximately as £975,000. It is interesting to note that the quantities of tea consumed per head in the several colonies exhibit considerable variations. West Australia, with a consumption of about 9½ lb., is an easy first. Next comes Victoria with 8½ lb., whilst the other colonies, in order, are South Australia, 8 lb.; New South Wales, 7½ lb.; Queensland, 6½ lb.; New Zealand, 6½ lb.; and Tasmania, 6 lb. As coffee drinkers the Australians stand on a much lower scale, their average per capita consumption being about ½ lb. per annum.

Would that in Europe and North America tea was drunk up to 7 lb. a head per annum! It will be observed that West Australia is the largest consumer per head—no less than 9½ lb.:—while New Zealand, Queensland and Tasmania are below the average, only 6 to 6½ lb.:—the latter three markets should be worked up by Ceylon merchants.

#### PLANTING NOTES.

TO LAY OFF AN ACRE with approximate accuracy, you can measure 161 yards by 30 yards; 121 yards by 40 yards; 103 yards by 47 yards; 97 yards by 50 yards; 83 yards by 55 yards; 82 yards by 59 yards; 69 yards 5 inches by 70 yards. An English custom used to be to take 70 by 70 yards, but this makes 4,900 square yards, and is therefore too much by 90 square yards.—*Journal of the Jamaica Agricultural Society.*

THE FUTURE OF CEYLON TEA IN FIELD AND FACTORY.—A thoughtful as well as experienced Colonist, and who has much to do with tea and no small stake in the Colony, thus expresses his opinion in a letter now before us:—"I am afraid I am not sanguine enough to expect much from Mr. Bamber's investigations, nor do I quite see why money raised for the express purpose of 'pushing Ceylon Teas' should be thus applied, or rather misapplied. If planters were really in earnest they might find out a great deal for themselves as to the effects produced by different methods of treatment of Teas, both in the field and factory, and now that the shoe is beginning to pinch we may hope for more valuable information under these heads than has yet been available. We have much to learn from many of the Indian planters. In Northern India, teaplanting is a *business*, here in the majority of cases it is an *occupation*; and there is a vast difference between the two' This is a terrible slur on the reputation of Ceylon tea planters; of course our correspondent would, at least admit there are exceptions—and brilliant exceptions? Anyhow, no one can be better fitted than Mr. Kelway-Bamber after he has been a year or so in their midst, to say whether the training and application of Ceylon tea planters as a whole, is inferior to those of their Assam brethren.

THE LONDON QUARTERLY CINNAMON SALES.

THE SPANISH-AMERICAN WAR DEPRESSING  
"CINNAMON."

The reports which have come to hand by this mail, as to the quarterly sales of cinnamon, held at the end of last month in London, reflect the situation of the spice in the local market. Or rather, they explain the slackness of the demand here which has been noted for the past few months, as there can be no doubt that the market here is ruled by the prices which obtain in London. This may be less the case now, than it was when London was practically the sole emporium for the distribution of our spice. The opening of the Suez Canal, and the development of commercial enterprise among continental nations, have combined to divert much of the trade from London; but still, Mincing Lane is a fair gauge of European prices, as the direct shipments from here to European ports do not represent all the needs of the Continent. When we noticed the previous quarterly sale, we pointed out the influence which the Hispano-American war was having on prices; and the continuance of the war up to a few weeks ago naturally continued to exercise a depressing effect on the market. Spain is one of the largest consumers of cinnamon in the world, having regard to its area and its population; and if it is not actually the largest, it certainly is the buyer that pays the highest prices. Our best marks of cinnamon have for years past gone to Spain through London; and the buyers for that country had established a sort of monopoly in securing the best brands, and were so tenacious of keeping the trade in their own hands, that outside bids resulted in fancy prices. As a result, it was the best brands which had to submit to the biggest fall in prices. In June, a fall of 1d to 2d was recorded for them, as against an inappreciable drop, or the maintenance of former prices, for ordinary bark; and we now read that, whereas ordinary to medium sorts lost 3d per lb. on the June prices, fine qualities dropped fully 1d, and the competition for them dragged.

These facts, and the further one that a little less than one-half the quantity offered found buyers at the auctions, constitute the dark side of the picture—although it must be remembered that the offerings were much larger than usual. The excess of more than half as much again as was offered in June is not significant, as the third sale in the year is always heavier than the second; but the quantity catalogued was much larger than that offered at the corresponding sale last year, which was heavy enough; and that should in itself explain a slight fall. Another cheering fact, apart from the maintenance of prices and the inappreciable fall for ordinary bark, which constitutes the bulk of our output, is that chips ran up to prices which we believe were never before reached—the average having for a long time been 2d to 3d—and that chippings fetched 8½ to 9d. Not very long ago 5d to 6d used to be considered a good price for clippings—the ends and trimmings off quills; but here we have chips fetching nearly that figure! The inference is that there is a steady demand for spice of ordinary quality, and if Spain is able to resume her orders—as we hope she may, after the resumption of trade, although it may be a little doubtful,—the finer qualities will, we trust, be in better demand, and prices all round

look up. We say this, without meaning that the ruling rates are disappointing. They are almost 50 per cent. higher than the rates which ruled for years in the eighties and even in this decade.

We referred to the shifting of trade from London in recent years. Last year, the United Kingdom, which once almost monopolized our spice market, took about 11-26ths of our total exports—1,169,190 lb. of quilled cinnamon, out of an output of 2,674,537 lb. Every European country, except Russia, Sweden and Turkey, took our spice direct—Spain putting in a direct claim for 270,760 lb., and coming in third, with Germany second with 686,588 lb. The exports up to date this year are in excess of those for the corresponding months of last year, and that means of any year; but the United Kingdom has taken only about one-third of the exports—583,310 lb. out of 1,676,274—and Spain only 97,500 lb. direct. Germany, however, accounts for 465,577 lb. (not far behind the United Kingdom); while America has forged ahead, coming third with no less than 229,687 lb., as against only 109,828 lb. for the whole of last year. America would thus seem to be resolved to conquer Spain even in the peaceful pursuit of consuming cinnamon! May she hold her own there too!

The following is the Report of a leading London firm in the trade:—

London, Aug. 31, 1898.

CINNAMON.

The quarterly auctions were held on Monday last, when 1,517 bales Ceylon were brought forward against 959 bales in June and 1,393 bales at this period last year. There was again a lack of orders from Spanish buyers and the sales went off with a dull tone, about 720 bales only being cleared. On the average, ordinary to medium sorts met a decline of ½d per lb., and good to fine qualities ruled fully 1d per lb. cheaper with a dragging competition. Medium to superior "worked" firsts brought 11d to 1s 4d, ditto seconds 9½d to 1s 3d, fair to superior, thirds 10d to 1s 2d and fourths from 7d to 1s per lb.

Of the 964 bales "unworked" quill only a small portion sold:—Firsts 8d to 1s; Seconds 7d to 8½d; Thirds 7d to 8½d; and Fourths 7d to 8d per lb.

We had to buy in a few lots for want of fair offers.

Of Cinnamon chips, &c., only 140 bags offered and sold at 3d to 5½d for common to fine, and chippings 8½ to 9d per lb.

Stock of Ceylon 4,068 bales against 2,869 in 1897, 2,371 in 1896, and 2,292 bales in 1895.

The next auctions are fixed for 28th November.

A RUBBER EXTRACTOR.

One of the objections to the method of collecting rubber by aboriginals, whether in New Guinea or in other rubber-producing countries, is the crudeness of those methods. All sorts of extraneous matter are mixed with the product, and lengthy processes have to be adopted to turn out a pure article in first-class marketable condition. We seem to have now arrived at a point when invention will master all such difficulties. At an Agricultural Exhibition at Trinidad recently held in that colony, a most interesting exhibit was to be seen in working order in the Botanical Department in the shape of a new machine for the extraction of rubber from the *Latex* or milk of the *Castilloa* tree. In two minutes the rubber was separated, and then was set to dry. In the space of three hours, sheets or slabs of fine, clear, marketable rubber were produced, free from the usual amount of proteid and albumenoid matters which are usually found in rubber produced by the ordinary process.—*Queensland Agricultural Journal*.

BY ORDER OF THE COMMITTEE

C.lombo, 30th Sept., 1898.

PLANTING NOTES.

THE WYNAAD CORRESPONDENT of the *Madras Mail* reports that tea is looking exceedingly well, and further extensions appear under contemplation, despite exchange and low prices. It should, however, be borne in mind, he adds, that great uncertainty exists as to the future of the tea market, and that a potent factor in governing the value of such produce is associated with China.

TOBACCO.—The analysis of a perfect tobacco fertilizer should be 10 to 12 per cent potash, 8 per cent phosphoric acid, and four per cent nitrogen: It is quite an impossibility to get this analysis outside a mineral fertilizer. A great many growers do not get satisfaction out of their fertilizers because they apply them in the wrong manner and too near planting time.—*Journal of the Jamaica Agricultural Society* for August.

INDIAN AND CEYLON TEA IN NORTH AMERICA.—The *Financial Times* gives the import as follows according to our evening contemporary:—

6 months 1898=6,245,443 lb.

„ 1897=6,580,336 „

Considering the war and the war-tax, the figures for the present year are satisfactory; but we trust there may henceforward be rapid improvement.

A DISTINCTION AND A DIFFERENCE.—An Indian contemporary thus summarizes the different conditions under which the Oil Industry is carried on in America and in Russia:—

When petroleum is struck in the United States, at considerable depths, it has to be drawn up without regard to market requirements. It is diffused through the sandstone strata, and the Company that suspends pumping to economise its supply may lose that supply altogether. A neighbouring Company may appropriate the oil. The common practice is to drill along the boundary first. In Russia as *Knowledge* points out, the conditions are different; the oil is usually found at comparatively shallow depths often not more than one-fourth of the depth of the American wells. The strata in which the oil occurs are so disturbed as to practically constitute independent oil reservoirs, so that closely contiguous wells are found to be practically independent of each other, and there is no necessity for raising the oil until required.

COLOMBO PRICE CURRENT.

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."*

The following pages include the Contents of the *Agricultural Magazine* for October:—

Vol. X.]

OCTOBER, 1898.

[No. 4.

## SEASON REPORTS FOR AUGUST.

**WESTERN Province.**—Paddy. Yala harvest time, Maha fields beginning to be cultivated. Rainfall light. Crop prospects good or fair. Cattle suffered to some extent from murrain, but the disease

has disappeared.

**Central Province.**—Paddy. Yala crops ripening or being reaped. Maha cultivation commenced. Rainfall deficient, '84 in. in Matale, none in Nuwara Eliya. Health of cattle good, except for sore foot and mouth disease

**Northern Province.**—Paddy. Fields in preparation. Rainfall 4·52 in. in Jaffna, none in Mannar. Health of cattle good.

**Southern Province.**—Paddy. Yala harvest on, crops fair. Rainfall 1·47 in. in Galle, in Hambantota cattle are dying for want of water.

**Eastern Province.**—Paddy. Harvest time, crops fair. Rainfall, '93 in. in Batticaloa, 3'08 in, in Trincomalee. No reports of cattle disease.

**North-Western Province.**—Paddy. Yala harvest time, crops backward for want of rain. A good deal of cattle plague prevailed, and animals suffered for want of food and water.

**North-Central Province.**—Paddy. Maha crops reaped, Yala in various stages. Rainfall registered in Anuradhapura, '65 in. Health of cattle good.

**Province of Uva.**—Paddy. Maha harvest in progress, crops not good. Health of cattle good, though there is still some murrain prevailing.

**Sabaragamuwa Province.**—Paddy. Yala harvest, crops only fairly good owing to want of sufficient rain. Cattle disease in both Ratnapura and Kegalle districts, but is on the decrease. Rainfall at Ambanpitiya 1·14 in., at Ruanwella, 3·92 in.

Greatest amount of rainfall in any 24 hours on the 27th instant, '43 inches.

Mean rainfall for the month '03 inches.

Recorded by A. M. AHAMAT.

### KEKUNA OIL.

The demand that comes from abroad for Kekuna oil is one that should be widely made known throughout the villages where this tree, which is so known in certain parts of the Island, occurs.

It is curious that the Kekuna tree from which the oil is got (botanically known as *Aleurites triloba*) is an introduced plant, while another tree also known as "Kekuna" (botanically *Canarium Zeylanicum*) though indigenous to the Island is much less commonly met with. The two trees, of course, belong to distinct orders, and it is better to distinguish the former by calling it "tel-kekuna," or oil-kekuna. The oil as is well known is prepared by villagers for burning purposes, but we have seen a good deal of the nuts running to waste on the ground. If the fact were made known to the Natives that both nuts and oil have a marked value, there would be a possibility of our meeting the large demands from abroad, and the villagers would at the same time be able to benefit themselves.

Mr. Frederick Lewis, of the Forest Department, who must be looked upon as an authority in these matters, has given it as his opinion that if a sufficient demand for the oil sprang up it is possible that it would pay to plant the tree which grows so well and so freely, and which also affords a wood used for tea-boxes. The oil is very suitable for soap making and cloth dyeing as well as purposes connected with the arts. A large order—no less than a ton or over 200 gallons—has been received through the Imperial Institute, with the prospect of further orders, while enquiries have also come from America, so that native dealers would do well to encourage villagers to extract Kekuna oil.

### OCCASIONAL NOTES.

Dr. Bernard Dyer's paper on "The Analysis of Soil as a Guide to its Fertility," which we take from the last volume of the Royal Agricultural Society's Journal, will prove interesting reading to many. It shows how arbitrary are the standards that have been so long used in chemical analyses of soils, and also how unreliable, not to mention words, must have been many of the so-called complete (and expensive) analyses of soils as a guide to their fertility.

We acknowledge with thanks the receipt of the Reports of the Rothamstead Field Experiments for 1897, and also for 1898, with plans and summary tables, also a number of pamphlets by Sir John Lawes and Sir Henry Gilbert reprinted from the Royal Agricultural Society's Journal. These papers will be valuable for reference in the School Reading Room.

Referring to the distinction between plantains and bananas, Dr. Watt says:—"The fruit of the cultivated varieties of the plantain are sometimes popularly distinguished by the names of banana and plantain, according to whether they are eaten raw or cooked. These names are, however, very loosely applied, some calling any round and

plump fruit "banana," others making a distinction in size only, the smaller being "banana," the large plantain. It is, however, advisable to reject the arbitrary distinction which has arisen between the names, and to call all alike by the commoner name, plantain. This opinion of an accepted authority should settle the much-vexed question about the two names and the grounds for the distinction. It would appear that distinction is one without a difference, and the sooner it is done away with the better.

Among the exhibits at the last Fruit and Flower Show, held at the School of Agriculture, was a sample of paddy, labelled "Tulup Samba, a kind that weevils do not bore." We are unfortunately unable to identify the exhibitor (K. A. Perera), but have not given up hopes of finding out his address, so as to be able to elicit further particulars regarding his exhibit. It would be interesting to discover any reason that is assignable for this immunity of a particular variety of paddy against weevil, if it be really the case that the insects avoid the paddy. It may possibly be the case that there are other varieties of paddy which are also inherently immune against weevil pests, and if so, it would be useful to have a list of them all. The selection of weevil proof paddies may be one solution to the difficulty, which has caused so much trouble of late, in keeping off weevil from stored grain. It is well-known that certain varieties of crops are more liable to be preyed upon by pests than others; this is particularly the case as regards fungus pests, and we now have rust-proof wheats and phyloxera-proof grapes as instances of plants that are immune. Selection and hybridisation may yet give us a weevil-proof paddy!

We have already referred to the new branding medium, and the following is an extract of a letter received from the Secretary to the "Gibson Patent Brand Company, Limited," to whom we wrote some time ago:—"The Company have, pending the arrival of supplies of the patent brand, been giving demonstrations before farmers in different parts of the Colony (Queensland). Arrangements are being made for introducing the brand into all cattle-producing countries, and will very shortly be given effect to. The brand is being taken up by the Government officials, and it is expected that it will supercede fire branding. The cost is about 1½d. per head."

We welcome the announcement of the appointment of Mr. Kelway Bamber as Agricultural Chemist to the Ceylon Planters' Association. Though his duties are limited, we do not doubt that much benefit to the Colony must result from our being able to count among our residents for some time to come so distinguished an authority on tropical soils as Mr. Bamber.

The Colony is about to lose the services, temporarily in the one case and permanently in the other, of two able and useful public servants, by the departure from Ceylon of Mr. W. E. Davidson, the Mayor of Colombo, and Mr. E. O. Walker, Director-General of Telegraphs. Mr. Davidson, since his advent to the capital, has been using his

influence for the good of the community outside his official area, where it is acknowledged he has done more for the sanitation of the city in the short time he has been in office than any or all of his predecessors. In social circles both Mr. Davidson and Mr. Walker will be sorely missed, as both have gone out of their way to provide instruction and recreation for the masses, whose esteem and respect they have thus deservedly won. Philanthropic sentiments are rare now-a-days, particularly in officials, and we can therefore ill-afford to lose two such men as Messrs. Davidson and Walker. The School of Agriculture has reason to remember them both for their help.

We heartily welcome back Mr. A. F. Broun, Conservator of Forests, after an absence of some length from the Island.

#### THE PLANTAIN TREE AND ITS PRODUCTS.

The late Mr. George Wall, writing about the Plantain tree in 1894, remarks that as regards varieties the Philippines and the Indian Archipelago are richest, and, according to Moon, Ceylon comes next, with 47 varieties. He goes on to say that rich as the Island is in varieties, and though the list comprises some of the most delicious in flavour, and most productive and nourishing, Ceylon is far behind in the economic uses to which the fruit is applied, as compared with several other countries: His object in writing, says Mr. Wall, is to draw attention, in the interests of Ceylon and its people, to several important purposes to which the fruit has not yet been applied here, and to the great extension its present known uses might, with great advantage, be applied. He remarks that Ceylon is not over-abundantly supplied with either quantity or variety of food, and that it may be said, as an additional supply, and as an agreeable variety of wholesome food, the bananas and plantains offer the greatest scope.

Mr. Wall then goes on to refer to the opinion of Dr. Stanley and other authorities in the Indian Archipelago, British Guiana, and India, bearing testimony to the value of banana and plantain meal, and concludes with these words: "Such a variety of testimony leaves no doubt of the fact that in Ceylon we possess in the bananas and plantains, so abundant in supply, so cheap in price, and so delicious in flavour, not only a most remarkably wholesome food, but a singularly effective cure for indigestion, and a specially suitable food for infants and invalids."

As regards keeping qualities Dr. Shier refers to the great superiority of the dried plantain over figs in keeping qualities and in immunity from insect ravages. Comparing dried apples and bananas, it was found that while apples yielded only 12 per cent of their original weight, bananas with the skins removed, give within a fraction of 25 per cent of thoroughly desiccated fruit, Prof. Church, with fruit grown at Kew, obtained 31.7 per cent of dry matter from ripe fruit.

We were not aware when referring to the sample of plantain flour lately submitted to us as having been prepared by the chief clerk of the Anuradhapura Kachcheri, that this officer was identical with the late Secretary of the Grama Rakshaha Samagama of Dalugama, in which, curiously enough,

Mr. George Wall took such an interest. We recall to mind a most interesting village show of agricultural produce, which Mr. Wall himself patronised, some years ago, and which was an excellent model of what village shows should be.

The sample referred to above has already been despatched to New York, and we await with interest the opinion which the trade in America have to pronounce upon it. In the meantime we are anxiously looking forward to other samples of dried plantains and flour from Anuradhapura.

#### CITRONELLA OIL.

A subscriber has kindly placed the following information regarding Citronella grass at our disposal for the benefit of a correspondent from the Straits:—After Citronella grass is planted it usually takes one year for the first crop, but in good soil the first crop comes in in 9 months.

In some districts, especially Weligama and Matara, where the grass is extensively grown, four crops can be counted on in one year, but three is the usual number.

I am unable to say exactly what quantity of oil is got from 100 lbs. of leaf, but 100 bundles, of about 3 ft. circumference size each, will give 7 to 10 bottles of 22 ounces. In this distillery we get 8 bottles per 100 bundles.

The grass is planted 1 to 1½ ft. apart, and an acre, when fully planted, yields from 20 to 25 bottles oil.

After extracting the oil the leaves are spread on the land between the bushes to serve as manure, and this is generally the only return given to the land. When firewood is scarce, the exhausted leaves are used as fuel for heating the boiler of the distillery, in which case the leaves are lost to the land.

There are two kinds of Citronella grass, viz., "Maha pangiri" and "Lenabatu pangiri." The first has somewhat broad leaves and the bushes formed are larger than the second, but it has been found that this variety dies off after 10 or 15 years' cultivation. On this account it is hardly grown at all now, but some twenty-five years ago was the only cultivated variety, and "Lenabatu" was not known then. Maha pangiri, however, yields a larger percentage of oil. Lenabatu grass produces large crops under manure. The price of Citronella oil was R10 to R15 some twenty years ago, but it has been gradually decreasing and was brought very low by the adulteration of the oil with kerosine. Its value per bottle, of 22 oz., is now 80 to 90 cts.

There is always a good demand for Citronella oil, and during the month (September) we have sold at 86 cts. per bottle. Even now the price varies a good deal, going as low as 70 cts. and rising again to R2 or R2.50.

We shall be glad for any further information which growers of Citronella will supply us with, for the benefit of our correspondent.

#### THE CULTIVATION OF CHILLIES.

We are induced to refer to this subject after having watched the result of chilli cultivation by a planter, as a catch crop in land planted with

Coconuts. The returns in this particular instance, where the land was but lately reclaimed from forest were so large, that to mention figures would be to test the credulity of most people. The same enormous profits cannot of course be expected from all soils, but it at least implies the certainty that chillies can be made to yield a very substantial return on almost any soil.

While travelling from Madras to Tuticorin after a trip across the Deccan some five years ago, we were astonished to see the extent of land laid under this crop, and the enormous loads of dried chillies that were being shipped from Tuticorin suggested the question, why cannot also Ceylon carry on an export trade in this commodity? The fact, of course, is that so far from Ceylon exporting, it draws practically the whole of its supply of chillies from India. This is all the more astonishing, considering the great possibilities that exist in Ceylon for raising the crop in question, and the facilities for marketing it.

Indeed it strikes us that the chilli plant is perhaps more than any other adapted to the conditions of rural cultivation in Ceylon. It is a crop that requires little attention after having once settled in the soil. It has no enemies to speak of, and the peripatetic Moorman is always at hand to take over the produce without any after-treatment on the spot. All these circumstances greatly favour the adoption of the chilli as a crop for native cultivation.

We are aware that chillies are grown to some extent by the Sinhalese and particularly by the Tamils of the North, but such local produce is chiefly consumed in the fresh state. The largest demand for chillies is in the dry and not the fresh condition, for the preparation of a "curry staff" by grinding into a paste, and in this connection local produce is of little if any account. Why is it that the plant is not grown more extensively for supplying our markets with the dry chilli of commerce?

The *Kew Bulletin* for July last contains a paper on chillies which contains some interesting facts and figures.

We learn that about 100 tons of dried chillies are imported every year into England from the West Indies and the East and West coast of Africa. The prices fetched according to colour and pungency varies from 20/- to 40/- per cwt.

Mr. Consul Cave reporting on the Trade and Commerce of Zanzibar for 1897, says that the production in that Island was over 276 tons. The variety cultivated in Zanzibar for export is said to be *Capsicum minimum*, Bird's eye pepper, the Sinhalese nayi-miris, which forms the basis of Cayenne pepper.

From Natal the chillies exported are a variety of *Capsicum annum*, which is also used for Cayenne pepper. The Nepsul chillies, also a variety of *C. annum*, are the most esteemed for Cayenne owing to their violet odour when ground to powder.

The *Saturday Review* refers to two preparations of chillies in vogue in South America. In the case of the one, the pods are freed from seeds, ground to a paste, and in this condition packed in well-dried gourds about the size of an orange (or would it be the Calabash fruit) prepared for the purpose. The gourds are sealed over with clay and put in the sun to "ripen." When ready for

use these "spurious fruit" are said to have an "exquisite flavour and refined taste." In the second method of preparation the seeds are also taken, so that the paste is more pungent and is cooked as a condiment with other foods such as Indian corn. These preparations of chilli, called "aji," when specially made with an admixture of delicately-scented bark or other substance, is said to be looked upon as a most acceptable gift in the country of the Incas. Apart from its use for Cayenne pepper, chilli is also employed in medicines and as a food for birds to improve their plumage, for which purpose there is a very large demand. Dr. Watt remarks that there is great confusion in the nomenclature of the chillies. He names four species: *C. annum*, *C. frutescens*, *Capsicum grossum*, and *C. minimum* (*C. fastigiatum*).

All these species, of which there are many varieties, are represented in Ceylon. The first by the superior full fruits found in our markets, the second by the long, pointed (generally) curved chilli, the third by the largest variety, with thick fleshy skin and little pungency, generally spoken of as "Capsicum," and the fourth by the Sinhalese nayi-miris.

Dr. Morris, in his Catalogue of Ceylon Plants published in Ceylon, gives the following with reference to Chillies: (1) *Capsicum frutescens* var. rubrum, red chilli (ratu-miris), var. luteum, yellow chilli (gas or kala-miris) var. atrum, black chilli (kalu-miris). (2) *C. annum*, Guinea pepper. Rata-miris, a variety (olive chillies) being called kalu-miris.

Nearly Rs. 1,000,000 worth of "curry stuffs" are imported annually from India, and a good part of this in the shape of dry chillies, the production of which should be encouraged in every way in Ceylon. We trust the newly-formed Agri-Horticultural Society will see its way to offer, or induce Government to offer, rewards for the largest acreages of cultivated chillies, and for the best commercial samples of dried chillies.

#### THE ANALYSIS OF SOIL AS A GUIDE TO ITS FERTILITY.

BY DR. BERNARD DYER, F.I.C.

(Continued.)

In 1880 Prof. K. Schmidt of Dorpat published a series of analyses of Russian soils, in which he had determined not only the total potash and phosphoric acid, but also the proportions of these constituents soluble in hydrochloric acid solutions of various strengths, such as hot 10 per cent acid, cold 5 per cent acid, and cold 1 per cent acid.

In 1881 P. P. Deberain found some soils at Grignon on which phosphatic manures produced no effect, but which did not contain more than an average quantity of phosphoric acid. He ascertained that from  $\frac{1}{3}$  to  $\frac{1}{4}$  of the total phosphoric acid was soluble in acetic acid (a relatively weak acid), and he suggested that probably soils which contained phosphoric acid removable by acetic acid might be independent of phosphatic manures. These soils were cropped without manure for some eleven years, after which time he found that a moderate dressing of phosphatic manure, such as

in earlier days produced no effect, now sufficed to treble the yield of wheat. On analysis by means of acetic acid he found that these phosphate-exhausted soils now yielded only insignificant traces of phosphoric acid, and, although formerly, when they were independent of phosphatic manure, they yielded as much as '03 per cent of phosphoric acid soluble in acetic acid.

A. Vogel in 1882 made a similar suggestion with regard to acetic acid, and in 1894 Dugast published the results of an investigation into the composition of three soils of different degrees of fertility, on which he investigated the solvent action of acetic acid, ammonium oxalate, ammonium citrate, distilled water, and water saturated with carbonic acid. In the same year G. Lechartier suggested the use of a 2 per cent solution of ammonium oxalate as a means of gauging the available mineral contents of the soil.

In 1889 Eggertz and Nilson extracted a soil with a 2 per cent solution of hydrochloric acid, and after washing it, found that the available plant-food had been so far removed from it that barley would not grow in it, while, when the exhaustion was carried out with acid of double this strength, it was sterile to oats.

Wiklund in 1892 published some work in the same direction, criticising the work of the last mentioned authors, but dealing chiefly with the distinction between inorganic and organic phosphorus and sulphur in the soil.

Various papers by Berthelot and André appeared in the "Comptes Rendus" on the subject of the condition of the mineral ingredients of the soil, without, however, suggesting any satisfactory conclusion as to the best mode of distinguishing between available and non-available plant-food.

Petermann had long used alkaline ammonium citrate for the purpose, and Schloesing had suggested the use of dilute mineral acids only just strong enough to leave an acid reaction after neutralising the bases of the soil.

From this brief summary, which, though imperfect, illustrates sufficiently the general position, it will be seen that the difficulty which was early recognised in soil analysis has still persisted, although most chemists seem to have recognised that some very much weaker solvent than strong mineral acid must be used if the analyses were to indicate the proportion of actually available plant-food. The difficulty felt throughout, however, was that of arriving at any definite standard of weakness or strength in the solvent to be used. All that was clearly recognised was that it should be very much weaker than the acids used for determining the total ingredients of the soil.

The attention of agricultural analysts had been for some years engaged in a matter of more immediately pressing interest—namely, the determination of the degree of availability of the constituents of manures. It was no doubt interesting to determine how much available phosphoric acid might exist in a soil; but the rent of land is not fixed by the proportion of phosphoric acid that it contains, while the price of phosphatic manure is. It was recognised as essentially important for the farmer to know whether the whole—or at any rate a fair proportion—of the phosphates which he might purchase in a manure existed in a condition in which he might reasonably expect them to be

available for early utilisation by plants. In the case of manures in which the phosphates were soluble in water, no serious difficulty arose. The difficult cases were those in which the phosphates were not actually soluble in water, although experience showed that, to a larger or smaller extent, as the case might be, they were manually available. Various processes were devised, and are still in vogue—chiefly in the various Continental countries and in America—for determining what is called "available" phosphate in manures. Most of these processes take the form of ascertaining the proportion of phosphate soluble, under certain arbitrary conditions, in solutions of ammonium citrate of various arbitrary strengths, containing in some cases an excess of free ammonia, and in other cases an excess of free citric acid. The varying results obtained by the different processes are, it may be observed, constant sources of annoyance to manufacturers, dealers, and consumers, especially in international trade.

In 1884 Professor Stutzer of Bonn protested emphatically, but I am sorry to say, vainly, against the use of ammonium citrate, although granting its utility within certain limitations. He endorsed an earlier suggestion of Tollens to use dilute citric acid as a means of gauging the availability of the phosphates in fertilisers, and fixed the strength of the solvent at a solution containing 1 per cent. of citric acid. Both Stutzer and A. Thomson showed that the results obtained by acting on various fertilisers with a one per cent solution of citric acid were in fair correspondence with the comparative efficacy accorded to the fertilisers by practical experience.

The strength of the solution—namely 1 per cent—appears to have been arrived at more or less arbitrarily; but as it appeared to give fairly rational results when applied to fertilizers, it struck me forcibly that the same or some similar solution might very probably give useful results when applied to soils. A large number of experiments had been made in my laboratory on the solvent action on soils of water, carbonic-acid-saturated water, and ammonium citrate solutions of very various strengths, without leading to any definite conclusions. It was then decided to try the effect of dilute citric acid solution, in strength varying from 0.125 per cent up to 5 per cent on the same soil. It was found that when the proportion of solvent to soil was ample, there was not much difference as regards phosphoric acid at any rate, between the quantities extracted by the weaker solutions of citric acid employed, up to a strength of 1 per cent; but when the strength was increased to 2½ per cent the proportion dissolved was very much higher, and certainly indicated far more phosphoric acid than could be accounted readily available. There was, in fact, nothing to indicate what particular strength was preferable, and the problem seemed to me not much more nearer solution than before.

The 1 per cent solution of Tollens and Stutzer was very tempting, but, as applied to the soil, its use lacked justification, whether regarded from a practical or a scientific point of view. So long that what was required was a means of distinguishing between matter that a plant could take up and matter that a plant could not take

up, the possibility suggested itself that a key to the solution of the problem might be found in an appeal to the plant itself, namely, in a further study of the means by which it collected its mineral food. That a plant takes up some of its food (most of its nitrogen, for example) in a state of solution, or by a mere process of diffusion, is very probable; but from what we know of the solubility of most mineral constituents, the mere solvent action of water, even if saturated with carbonic acid—that is to say, of the very limited quantity of water that exists in even a wet soil—is wholly insufficient to account for the solution of the mineral plant food taken up by a crop.

It had, indeed, long been recognized that plants help themselves to at least a part of their mineral food by means of the solvent action of their root sap, the acidity of which had been noticed so far back as 1733 by Philip Miller Gardener to the Society of Apothecaries, who wrote that "when the juice enters the root it is earthy, watery, poor, and *acid*," while he also drew attention to "that tart liquor oozing from the root of the walnut tree when cut off in the month of May."

In more recent kinds the German vegetable physiologist, Sachs, had shown that when polished marble was buried in the soil in which plants were growing, the action of the root-sap was sufficiently corrosive to etch on the surface of the marble the pattern corresponding with the paths of contact between the roots and the marble.

In 1889 Sir John Lawes and Sir Henry Gilbert, in a paper "On the Present Position of the Question of the Sources of Nitrogen of Vegetation," described some experiments made with a view to ascertaining how far the acidity of the root-sap might enable plants to dissolve and assimilate nitrogenous organic matter in the soil. In the course of that investigation the authors experimented on the acidity of the root-sap of a large number of plants, although their quantitative determinations of acidity were not published. Few, if any, other attempts appear to have been made to determine the degree of acidity possessed by root-sap, although the fact of its acidity was well recognised.

It therefore appeared desirable to undertake some investigation into this acidity in the fine roots or rootlets of a number of plants.

## THE USES OF WOOD.

(Continued from page 10, Vol. X.)

In splitting and cleaving, the case is, like shearing, almost entirely one of transverse tension; with this difference, however, that the force is applied to a small area and acts on a lever (the side of the cleft); it acts, therefore, the more effectually the longer the cleft and the stiffer the wood. From what has preceded, it is evident that the adhesion of the fibres, or, better, the resistance to transverse tension, is of great importance. Examining the structure, it is quite apparent that this resistance is greatly influenced by the shape and relative position of the fibres. In hard woods the cells do not arrange themselves in rows; hence, there

is no natural cleavage planes (except at the pith rays). A knife will thus not merely have to separate two layers of fibres, but has to cut through the cells themselves, while, if passing through coniferous wood it finds a natural plane of contact of two sheets of fibres, and thus has easy work. Moreover, the course of the fibres in hard woods is rarely straight, the fibres are generally in oblique positions, they interlace, and if a piece of wood is split the surface is "fuzzy" with the myriads of fibres which are not merely separated, but were torn in tension, the very way in which they offer greatest resistance. For these reasons hard woods have generally a much greater strength in transverse section than conifers. Where this greater resistance to tension is accompanied by greater flexibility, by more "give," as is always the case with hard woods, the wood becomes tough; a blow may indent but does not shatter. This toughness is a combination of relatively great strength in transverse longitudinal tension together with a fair amount of flexibility or capacity to endure distortion. That toughness varies widely is well-known. Naturally the hard woods exhibit it to a much greater degree than conifers.

Hardness in wood means the resistance which any surface, but particularly the sides (longitudinal faces), offers to the entrance of a blunt body such as a hammer. The test in hardness is one of transverse compression of the fibres, and therefore depends on the resistance to collapse. In a single fibre this resistance depends on that of the material (presumably about alike in all wood), on the shape of the fibre, and the relative thickness of its walls. Fibres like those of hard woods with a hexagonal cross section and commonly scarcely any cell lumen or hollow, naturally behave like solid wood substance. They offer great resistance, so that if the outer surface of a stick is formed by such fibres its hardness is very great. If, on the other hand, the surface layer is composed of thin-walled vessels or tracheids, like those of the spring wood in conifers, the wood is soft. In the usual test the indentation extends but a short distance ahead of the instrument (as, for instance, when timber is struck with a hammer); but if the test is continued long enough, the compression results in destruction of all the thin-walled and much of the thick-walled tissue of the wood, so that timbers, such as have been buried under ground, are destroyed throughout. Such a crushed stick continues to resist further crushing, becomes compacted, dense and heavy, and loses nearly all its bending strength &c.; it takes up water rapidly, and when soaked crumbles like wood in the later stages of decay. Closer examination shows that all the thin-walled fibres have collapsed just like crushed pasteboard tubes, the break running along two or more lines the length of the fibre, the form of the cross section being changed from a hexagon to an S shape, or an approach to this form.

The hardness of wood in the sense as noted is quite variable, even in wood of the same species, varying on different sides and also according to the portion of the annual ring exposed at the surface, the extent of compression and other circumstances.

In nearly all wood used for construction, whether bridge timber, the studding or joist of a house, or

merely a table or chair leg, the stiffness of wood is an essential quality, and in many if not most cases it is far more important than the ultimate strength. Thus a rafter or joist need not be very strong, but it must bend but little under its assigned load, and even in furniture and smaller objects the piece must not only be sufficiently large to hold up its weight without breaking, but to hold it without being distorted to an unsightly or troublesome degree. In this case ultimate strength is not considered, but stiffness or elasticity rather, and in the majority of cases a "strong wood" is, with the artisan, really a stiff wood. The stiffness of a piece of wood depends on its weight and its structure. Single fibres of different woods may be found to be alike in stiffness, strength and degree of extensibility, both being practically alike chemically and physically, and yet there may be a great difference between the two woods. This difference must therefore be in the combinations in which the fibres occur in the wood structure, which is a ready and plausible explanation for such differences.

For instance, to contrast a typical hard wood with a coniferous wood; we find

1. The elements of structure are alike in conifers, unlike in hard wood.

2. They are all large (comparatively) in conifers, while in hard wood extremely small elements (fibres proper) form scattered bodies among larger ones (parenchyma) and very large ones (the vessels).

3. These bodies of small fibres, the strongest part of the wood, have extremely thick walls, compared to their size, in the hard woods, but much less so in the conifers.

4. The fibres in conifers are arranged in perfect rows (or really sheets, for the cells of each row are practically continuous), those of hard woods are found in divided bodies, and appear like separate strands of specially strong materials. In addition, the fibres, (tracheids) in conifers are usually much longer than those in hard woods. On account of these structural conditions the fibres in the conifers act much more perfectly together and allow less "give" than the heterogeneous elements, and especially the separated strands of fibres in hard woods, which arrangement permits more "give," and this "give" lessens the stiffness or elasticity of the hard wood. For if we return to our single cells we would have the upper part compressed when the fibre is bent, the lower extended, and the behaviour would simply depend on the shape of the fibre and the material of its wall, but if we have a set of fibres and vessels grown together and tested, the behaviour depends not only on their shape and the material, but also on the relative position of the fibres and other elements. Those which are crooked or oblique on the upper side of the stick will have their unfavourable attitude increased, those on the lower side will merely be straightened or but partly strained, while the main part of the load applied at first is borne by only a part of the fibres, that is, those straightest in their position. Here the large fibres of the conifer with their regularity of arrangement all fall in line at one, they are "straight grain," the "give" is small, and the timber is stiff. Moreover, when the load is removed the case is exactly reversed. The fibres

of coniferous wood, all being strained, exert the same power to return, while many of the fibres in the hard wood, on the other hand, are really under but little strain, they make little effort to return, the timber does not "spring back," and thus is neither very stiff nor springy or resilient; it is not very elastic. Thus it is that conifers are, as far as is known at present, generally stiffer than hard woods of the same weight, the difference of them being very considerable. The finer and the more even the structure of the hard wood, the straighter the grain, the greater the weight of any wood, and the more perfectly it is seasoned, the stiffer it is. In conifers this quality seems to vary directly with their weight. In hard woods the matter is too little known to warrant any general statement, though here, too, heavy woods like oak and ash are stiffer than light woods, such as poplar.

#### A DISEASE OF THE PLANTAIN TREE.

We find in the *Kew Bulletin* of August, 1894, the following remarks referring to plantains:—"Taking into consideration the immense area over which these plants have been cultivated, the lengthened period during which they have been subject to the control of man, it is remarkable that no chronic disease has manifested itself among them except in one or two localities."

In Ceylon, so far as we are aware, no attention has been drawn to any form of disease of the plantain tree, but we have heard of such in Fiji, and the following is a reference to it:—

A short account of the disease affecting banana plants in Fiji was published in the *Kew Bulletin*, December 1890, p. 272. Specimens of stools were received at Kew last year, but the results of an investigation of them were purely negative. Mr. Arthur E. Shipley, F.L.S., to whom they were submitted, was unable to detect anything abnormal in the roots, stems, and leaves. There appeared to be no trace in the specimens, as received in this country, of nematode worms, of insects, or of any fungoid pest. As indicated in the letter addressed by this establishment to the Colonial Office, dated 13th November, 1890, Sir Ferdinand Von Mueller, adopting the view that the disease was possibly produced by a nematode worm, recommended, failing success with various insecticides, ploughing the land, leaving it fallow, and alternating some other crop. The ground could then be re-planted with banana "stools" from an unaffected locality.

The view that the disease was caused, in part at least, by nematode worms, is apparently confirmed by an investigation with fresh material undertaken by Mr. N. A. Cobb, at Sydney, New South Wales. The results are published in the *Agricultural Gazette* of New South Wales, October, 1891, p. 622. The Fiji plants were found to be affected with aphides, which, however, could not be proved to have done much damage. In the root-stock a fungus was found, and the fact that this does some damage has been established. The presence was shown by a brown discolouration of the interior of the root-stock and roots,

"It is rather remarkable" (the report continues) "that in the soil about the roots of these plants, nearly 30 species of nematodes should be found, about 25 of which are new species. Two of these species have been shown to be injurious to the plants, one of them attacking the roots, and being found living parasitically on certain brown, rotten cavities, and the other being found between the sheathes of the leaves of the plant, and in some cases even at the very core, where the tissues appeared to be quite sound and white. It will therefore be seen that there are four separate causes for the diseases of these plants, viz., aphides or plant lice, a fungus causing rot in the root-stock, and two different species of nematodes.

"The remedies that are suggested in the present state of our knowledge, which, of course, is incomplete, are these:—

"i. That where the bananas are cultivated, a system of rotation should be adopted; that no attempt should be made to grow banana plants on the same ground continuously for a long series of years \* \* \*

"ii. Judging from the specimens sent, the soil about the banana plants is infested to an extraordinary degree with nematodes, therefore, it is best, in cultivating, to plough deeply, or to occasionally subsoil the land. These nematodes attack the roots of plants, and exist largely within eight inches of the surface. As they become rarer as the depth of the soil increases, it follows that if the land be ploughed deep and thoroughly so as to turn the soil exactly bottom side up, a soil comparatively free from nematodes will be brought to the surface, and, at the same time, the nematodes which were near the surface are buried so deep that they can do much less damage than they could if left at the surface.

"iii. \* \* \* The main difficulty in dealing with these plants is thought to be due to the attacks of the fungus mentioned above, and here the best remedy to recommend is great care in setting the new suckers, i.e., in making new plantations. As pointed out, the presence of the fungus is indicated by discolouration in the root-stock. Now, when suckers are cut off from the old plant with a spade, they should be inspected, and all brown and rotten portions should be carefully removed, and all suckers from which these brown and discoloured portions cannot be removed without destroying the chances of growing, should be discarded."

We regret that we have not access to the number of the Bulletin referred to in the above extract, which describes the disease as it exists in Fiji.

Our attention was drawn to this subject by the fact of our observing the result of an apparently diseased condition of a tree growing in the grounds of the School of Agriculture. This particular tree though apparently healthy, robust, and fruitful does not mature its fruit, which, after setting, gradually shrivel up and assume a blackened colour. The parent tree from which the present one grew was raised on the grounds of the Model Farm where the soil is a pretty stiff clayey loam. There the same peculiarity in the non-development of the fruit was observed. The tree in the School of Agriculture is growing in a very poor sandy soil,

and at its last fruiting a few weeks ago the results were as before disappointing. It should be remarked that the diseased tree both at the Model Farm and at the School grew among a number of other plantain trees which produced excellent fruit.

It would be interesting to know whether the disease in the tree referred to is anything like that which occurs in Fiji, and we are taking steps to ascertain this fact.

#### HOW INDIA HAS SAVED HER FORESTS.

[This is the subject of a paper by Mr. E. Kay Robinson in the August number of *The Century*. The paper opens with an account of the origin of the Forest Department, which is said to owe its existence to the pinch which was experienced just fifty years ago, in providing timber for building warships in Bombay. Major-General Michael, still alive, made a beginning of Forest Conservation in the Madras Presidency, and he was followed by Dr. H. Cleghorn and Sir D. Brandis. These three, the authors of Indian Forestry, succeeded in establishing a department which now exercises complete control over one-eighth of the entire Peninsula, producing a revenue of about £1,000,000 a year. This sum, says Mr. Robinson, may be regarded as the lowest possible interest from a growing capital created entirely for the benefit of posterity by the Forest Department of India, whose guiding principle is still the same as it ever was, viz., the subordination of current profits to the improvement of State property for the benefit of the people.]

The writer refers to the timidity of Government in incurring expenditure as the bane of successful undertakings, and how even the evidence of the mischief wrought by past neglect of forest preservation will not teach the lesson it should teach.

The history of the Indian Forest Department is of particular interest just at this juncture, when it is reported that Forest Conservancy in Ceylon is to be reported on by a Commission. We quote the latter part of the paper referred to.]

The three great difficulties in the way have been, first, the neglect of forests in the past, causing the denudation of land whose reforestation has become a Sisyphean task; secondly, the traditions of the villagers who had assumed a right of user in the matter of timber, fuel, and grazing to all forest land; and, thirdly, the habits of the people, who conceive that the best way of paying off a grudge against the Government, of securing a tender crop of fodder for their cattle next season, or in the case of jungle tribes, of preparing the ground for agriculture, is to set fire to a forest. Consequently, the preservation of reserved forests from injury by fire has come to be regarded, due allowance being made for the nature of the inhabitants, as the criterion by which successful forest work in India is judged, even more than by the maintenance of seed-bearing trees, the reproduction of valuable timber, or the pecuniary profit accruing to the State.

It is, however, the curse of forestry in India that its large domain of remunerative, scientific, and philanthropic public work should be dragged at the tail of the procession of political functions

appertaining to the Home Department. Yet, in spite of this, the Indian forest officers do splendid work over the vast area committed to their charge, in every extreme of climate, from the moist, impenetrable forests of Assam covering three-fourths of the province, to the arid hillsides of Beluchistan.

Enumeration of the timber wealth of India would give no idea of the variety of factors with which forest officers have to deal. In Sind, for instance, it so no unusual detail of a year's forest work that an officer in charge of a district should report, as in 1894, the acquisition of ten thousand acres of treeless waste, and the loss of six thousand acres of forest, through the vagaries of the river Indus, which annually shifts its bed to right or left, often wiping out villages and threatening cities in its course. It all comes in the day's work of the forest officer in the Punjab, also, that he should ride for miles over the coarse pasturage of treeless rukk land (coarse pasturage classified as "forest"), and personally impound the herds of half-wild buffaloes of neighboring villagers trespassing thereon. If he should have to encounter villagers sallying out with iron-shod bamboo staves, and offering forcible resistance—why, that comes into the day's work, too.

The task of the forest officer naturally divides itself under these heads: Settlement, by the adjustment of legal rights to the ground; demarcation, by the definition of boundaries to the land appropriated as "forest" by the State; survey, to determine the suitability of the land for the produce of timber, fuel, fodder, pasturage, etc., for the neighbouring population or for export; preparation of working-plans, whereby the resources of the land in these several respects may be best developed; provision of communications whereby the produce of the forests may be brought within reach of the people, and of buildings for the accommodation of the staff and establishment; of protection of the forests from fire, trespass, encroachment, and injury, and improvement by means of felling, reproduction, and other operations of forestry; working, whereby the largest annual output of forest produce compatible with the preservation of the undiminished fertility of the forest area may be secured; finance, whereby the working of the department in each of its subsections, whether divided latitudinally as regards operations; or longitudinally as regards locality, may be shown to possess a satisfactory balance sheet; maintenance of establishment, to secure efficiency in every detail of the work; conduct of experiments in the utilization of indigenous resources, and the acclimatization of exotic methods or material; regulation of the export of forest produce to other provinces or foreign lands; technical education and recruitment of men and subordinate officers suitable for forest work; and lastly, record of work done. From this brief and imperfect summary it will be seen that the work of the Forest Department demands legal ability, geometric skill, botanical knowledge, administrative talent, engineering faculty, scientific experience, police ability, and economic science, besides all the qualities required for success in the financial, educational, commercial, organizing, and record work.

In spite of its limitations and its difficulties, the aggregate work of the Forest Department of India has produced a result which has been rightly described by Sir Richard Temple as one of the greatest achievements of the Victorian era; and it has been a work, too, which, as another authority, Sir George Birdwood, has shown, was begun only in the nick of time. "A few more years' delay," he says, "would have resulted in the total loss of half the forest of India," of which now the "reserved" portions alone, where the State declares and maintains its right to the entire produce, cover more than seventy thousand square miles, a total to which large additions have yet to be made in Madras and Burma. These reserves, however, increase annually in value. Land which was once denuded of trees by the unrestricted grazing of cattle, especially of goats, which browse by choice upon the topmost-growing shoots of young saplings, is covered once more with forests which annually yield a richer output of timber and fuel. Valuable trees have replaced more worthless kinds. Carefully guarded, the rubber-tree grows more numerous and more productive, and in a country like India, where the mortality from fever largely exceeds that from all other causes combined, the cheap supply of quinine, dispensed in pice packets throughout the villages by Government agency, would alone more than repay the labors of the Forest Department. Yet its most striking and important achievement has been the acclimatization of valuable foreign trees. Already many Indian landscapes have been completely altered by the Casuarina and Eucalyptus (beef-wood and blue-gum) of Australia, while the introduction of the apple and chestnut in the Himalayas has brought new and important food-supplies within reach of the people. The Buddhists, the Arabs, and the Portuguese each added somewhat to the flora of India, partly from religious motives, and partly for luxury. To the British has been reserved the honor of surpassing their combined efforts by the exercise of a statesmanlike philanthropy which preserves and enriches the vegetable wealth of the land for the good of its population.

---

#### CATTLE AND THEIR MANAGEMENT IN THE INTERIOR.

---

Want of proper management is responsible to a great extent for the poor condition of cattle and the great loss by rinderpest and other diseases. Sufficient fodder is not raised or preserved, and they suffer severely during prolonged drought as they are doing now in most parts of the Northern, North-Central and North-Western Provinces. Some die of sheer starvation, while others are rendered more predisposed to disease. These become too weak to resist infection and mostly succumb to disease when attacked.

Many villagers keep more cattle than they can properly feed and take care of. The poor animals are allowed to shift for themselves and to feed as best as they can. No man ought to keep more cattle than he can look after, if he wants to be free from the charge of cruelty to animals. A few may be slaughtered for meat, if the owner has no prejudice against beef-eating, and the other

surplus cattle should be sold off. This is being done to a certain extent now. Cattle traders from the lowcountry come and purchase a good number of them, especially black cattle in this Province, Eppawela Korle being one of their favourite resorts. The sale of cattle from infected districts, is, however, prohibited.

Cattle cured of rinderpest (or "salted" cattle as they are termed at the Cape) are generally not sold; but whenever they are, it is obvious that, being proof against future attacks of the disease, they ought to fetch a much higher price than others, in a country where rinderpest is so common. Some special mark should, therefore, be placed on "salted" cattle to indicate their immunity from this dire disease, and a certificate to that effect issued by the headman of the place to the owner, who could make use of it while selling the animal.

The proper domestication of cattle is a great step towards their preservation and improvement. So long as they are in a semi-wild condition, it is extremely difficult to keep them in check when sick and to nurse and give them medicines. The housing of cattle combined with a little handfeeding would be an important factor in domesticating them. In addition to such treatment, it is worthwhile trying what dishorning and the use of the nose-string would do as regards the taming of buffaloes. When thoroughly tame and properly trained they are capable of more work than they are usually given credit for. It is not a rare thing in certain parts of the N.-W. Province to use buffaloes for drawing carts.

With regard to the usefulness of buffaloes, Dr. Shortt writes as follows in his Manual of Indian Cattle:—"The sporting buffalo is much prized by their owners; when the guns are fired close to their ears or even resting on their heads, they never flinch at the report and often display astonishing intelligence by seeming to know what is required of them. They are trained to carry the pack, draw the plough and cart, the latter often containing a load of grain approaching 2,000 pounds. The buffalo is supposed to be a stupid, obstinate animal, and it is the more surprising that they can be so well trained: I have doubts of the reports till I had ocular demonstrations of their practical training and doings."

Cattle-owners must be taught how to make the most of their cattle and to get the greatest possible use and profit out of them. Neat cows must be milked. To farmers in civilized quarters this would appear rather a superfluous statement; but it is a strange fact that, in by far the greater part of this Province, no milk is drawn from them, and the consequence is that it is difficult to buy any-

thing like a fair milch cow here. As no extra demand is made upon the cow's milk, the yielding property remains undeveloped, and nature provides her with only as much milk as is barely sufficient for the calf.

The following extract from the Government Agent's Report for 1896 might be quoted in this connection:—"Villagers have more cattle than they can look after, and in a great many instances I fail to see the value of black cattle, for they are not used in this Province for ploughing, nor are the cows milked; the animals run wild and commit trespass."

Breeding is another point that deserves the earnest attention of cattle-owners. Here and there some very good specimens both of buffaloes and black cattle are met with. But no effort is made to perpetuate good species by discreet selection and careful breeding and rearing. In India, where the conditions of climate and soil are very much like our own, distinct indigenous breeds are produced and typical specimens of good breeds fetch very high prices. Why should not attempts be made in Ceylon too to raise several distinct and superior types of country cattle for different purposes, *e.g.*, a draught breed and a milk breed both among buffaloes and neat cattle? A good trotting breed of bullocks can also be easily established in Ceylon. The systematic improvement of our native breeds by selecting among indigenous stock will most likely redound to greater and more permanent good than spasmodic attempts cross-breeding by imported animals. Besides, in cross-breeding there is the danger of "violent crossing" which is often overlooked by cattle-owners. Animals of entirely distinct breeds having very few points or none at all in common do not produce good results when crossed. Mr. Mollison says in his notes on breeding:—"Male and female different in type should not be mated, as the offspring would very often be a mongrel, *e.g.*, that of an Aden cow by a Gir bull."

The introduction of foreign elements in breeding is at best an experiment, and, like other experiments, may be either a success or a failure; but this uncertainty does not attach to breeding by means of well-sorted native specimens. Further, the latter method is within reach of the poorest cattle-owners, and there is no reason why he should not avail himself of it.

The castration of the "weeds" and prevention of immature animals from breeding are also essential to the improvement of the native breed of cattle.

E. T. HOOLE.

[No. 5.]

## “PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

*(Third Series.)*

WM. BOWDEN SMITH,

PLANTER, VISITING AGENT AND MERCHANT, M.L.C., J.P., 1858—1897.

M. BOWDEN SMITH was born in 1839—and spent the early years of his life at Brockenhurst, New Forest, Hants. From 1853 to 1857 he was at Rugby, Dr. Goulbourn being headmaster. In 1857 he was offered a cadetship in a Bengal Cavalry Regiment, which he declined, not liking the idea of such a long banishment from England.

In 1858 he was preparing for Woolwich examination, when he received glowing accounts of Ceylon and of the fortunes to be made there in coffee, from one of his brothers who was at that time on the East India Station in H.M.S. “Fury.” Accordingly Mr. Wm. Bowden Smith decided to give up Woolwich and try his luck in Ceylon. He travelled by the old P. & O. steamer “Colombo” from Southampton to Alexandria and S.S. “Nubia” from Suez to Galle. At that time the Egyptian Railway was only completed as far as Zag-a-zig, a short distance beyond Cairo, and from thence to Suez passengers were conveyed in two-wheeled vans, drawn by two mules and two ponies, into which six people were crammed sitting face to face. It was a very hot and

trying journey. Passengers were usually detained two days or more at either Cairo or Suez whilst their baggage was being brought across the desert on camels. The two days at Cairo enabled passengers to visit the Pyramids, but it was somewhat risky work in those days. The voyage out from Southampton to Galle took about 34 days and cost over £110 first-class, or nearly twice as long and double as much as it does now.

Mr. Bowden Smith landed at Galle in July 1858. On arrival at Galle, he received a hospitable welcome from Mr. Sonnenkalb, then a well-known merchant there, who has long since joined the majority and probably there are now few in Ceylon who remember him. Galle, with its numerous hotels and with the mail steamers constantly calling there, was a much more important and lively place than it is now. The journey from Galle to Colombo was performed by coach, which was always more or less exciting, as after each change of horses one of the pair usually refused to start and all the ingenuity of the driver had to be used to get the beast to move. Mr. F. B. Templer was at that time District Judge of Kalutara and with him Mr. Bowden Smith stayed three days on his way to Colombo. His old friend, Mr. James Murray Robert-

son, the founder of the firm of J. M. Robertson & Co., was then living at "The Priory," Slave Island, and under his hospitable roof he spent a pleasant month before proceeding upcountry and made the acquaintance of many kind friends, amongst them being Mr. and Mrs. Saunders (father and mother of Sir F. R. Saunders), Bishop Chapman, R. Tatham, Captain Evatt, Dr. Willisford and Mr. Charles Shand. Most of the Civil Servants and merchants lived either in Slave Island or Kollupitiya. More than one pleasant evening was spent at the old Ceylon Rifle Mess, now occupied by the Colombo Commercial Company. There were few roads through the Cinnamon Gardens and scarcely any houses, while packs of jackals used to run howling through the main road in Slave Island at night. The old Fort was guarded at night and no one could enter without the password.

From Colombo Mr. Bowden Smith went direct to Delta estate, Pussellawa, to learn coffee planting under Mr. F. R. Sabonadière, to whose able instruction and kind advice he owed more than to anyone else. He stayed a week as his guest at the big Delta bungalow before beginning work, and whilst there made the acquaintance of Mr. George Sherriff of Hellebodde, than whom a truer friend and kinder host never breathed. Many were those who spent the night under his hospitable roof on their way to and from Nuwara Eliya during the season; or if they wished to push on to Ramboda or Pussellawa, he would meet them on the road-side with a large basket of refreshments under a little strip of jungle he had christened the "Retreat." Pussellawa was then the crack coffee district in the island:—F. R. Sabonadière on Delta whose hospitality at the big bungalow was unbounded and whom all who knew loved; "Jack" Tyndall at Glenloch where Sir Henry Ward usually broke the journey when he went to reside at his house, "Rosebank," Nuwara Eliya, now owned by Miss Barbara Layard; Maurice Worms at Rothschild, a "chow" dog chained to each verandah post of the bungalow and a bull-dog at one end near the iron safe, kept guard—a glass of good old port wine was offered to each guest who called to see him; Col. Lilley with F. Kelson as his manager on Nayapane; Jack Gordon on Wavendon; General Fraser on Rangbodde; Havilland Durand on Choisy; Capt. "Gilks" Wilkinson on Newmarket; J. M. Sutherland on Stellenberg; A. J. Le Mesurier on East Delta; Walter Agar on Hannagalla and C. J. Mais on Black Forest. So Mr. Bowden Smith had the good fortune to be surrounded by men of culture and high standing on his first arrival in Ceylon, and though junior

to most of them had the privilege of their friendship. Alas! nearly all of them have "crossed the bar." "Jack" Tyndall was a frequent visitor at Le Mesurier's and Mr. Bowden Smith's bungalows on East and North Delta and many a practical joke did he play on each of the young planters.

Delta estate was then in its prime and from 1859 to 1863 it yielded average annual crops of over 11 cwt. of coffee per acre all round, in addition to which a great deal of crop was lost each year for want of labour to gather it. During crop months all hands had to be employed picking and by the end of December the weeds were as high as the coffee. But though the yield was large the price of coffee was low and any proprietor who obtained 60s. a cwt. all round for his crop was considered very fortunate. Transport was also a matter of considerable difficulty and carts were sometimes as long as two months on the road between Colombo and Pussellawa. Rice was always issued to coolies at 7s. 6d. per bushel and the loss under this head amounted to about £1 an acre. The currency was altered to rupees and cents under Sir Hercules Robinson's rule. Before the bridge over the Mahaweliganga was completed in 1869, communication between Pussellawa and Gampola was occasionally cut off altogether as the river was so rapid after heavy rains that the old ferry-boat could not cross. On these occasions the arrival of the beef and bread cooly from Gampola was anxiously looked for. Shingles for covering the roofs of bungalows and lines were first used on Delta in 1858, having been introduced into the planting districts by Mr. F. R. Sabonadière. In 1859 Mr. Bowden Smith accompanied Mr. J. Murray Robertson on a tour of inspection through Kotmale and Dimbula. Nearly the whole of the latter district was at that time a dense forest without even a bridle road beyond Mount Vernon estate. The old bridle road from Kotmale to Nuwara Eliya passed under the Great Western and through Hunugalla, Wattedodde, Louisa and Radella estates and was much frequented by elephants. The coffee on Louisa was at that time covered with "black bug" which caused the berries to drop off and the crops secured scarcely covered working expenses. Most of the high estates in Pussellawa and Ramboda suffered more or less at this time from "black bug." Mr. Bowden Smith then had the pleasure of making the acquaintance of R. J. Corbet, Keith MacLellan, "Col." Hood, Andrew Hunter, "Plum" Duff, James MacDonald and J. F. McLeod all good men and true and thorough sportsmen—all of whom he met frequently afterwards and greatly valued their friendship.

In 1861 Mr. Bowden Smith paid his first visit to the Dikoya district. Only three coffee estates had then been opened there, viz, Dikoya, of which old Squatter Davidson was manager and with whom he stayed; Darravella and a small part of Dunbar. The first 50-acre clearing of Hatton had just been felled. All the rest of the district was dense forest: no road beyond Dickoya estate and only the old pilgrims' foot-path through Maskeliya to Adam's Peak. There were numbers of elephants in these forests, and some of them used to come out on the estates in the evening and feed on the grass in the ravines. It was unsafe to travel on foot along the road between Watawala and Dikoya after 4 p.m., about which hour, elephants usually come out to feed. On his return journey from Dikoya he stayed a night at W. Grant's bungalow, Agrawatta, and started the following morning intending to ride on to Pussellawa through Ambagamuwa and Kotmale; but he got benighted on the Tyspane patanas owing to his watch having stopped and missed the track. It was pitch dark and raining hard and he had to spend the night out, wet through and covered with leeches. He did not reach the Rothschild ferry till daylight the following morning and for some years after suffered from frequent attacks of fever and ague. Mr. Bowden Smith had several other rough experiences of travelling in the olden days, but the night on the Tyspane patanas was the worst. In 1861, Mr. Bowden Smith went to reside on his own estate, New Forest, on the borders between Pussellawa and Nilambe, 10 acres of which he had cleared and planted the previous year. During this and the next two years, he cleared and planted another 400 acres for himself and others and was also given the general management of four neighbouring estates: so he had his hands full. After the planting season was over in 1862, he paid his first visit to Badulla where he stayed three weeks with F. Kelson who was at that time residing on Kottagodda. Mr. Bowden Smith was greatly struck with the wonderful productiveness of the coffee trees in the Badulla district as compared with the coffee on the Western side of the Island, the trees, in spite of weeds and neglect, being completely covered with berries. Bread was then an unknown luxury in Uva and biscuits or "rotties" were used instead. Here Mr. Bowden Smith first met E. C. Byers and John Brown, two of the well-known pioneers of coffee planting in Badulla.

In November 1863 Mr. Bowden Smith paid his first visit to England; and on his return to Ceylon went to reside in Kandy with one of his brothers, who had been looking after his work during his absence. The two brothers commenced business as Estate Agents and soon

secured the general management and visiting of a considerable number of properties. But as the work and the climate did not suit his brother, he returned to England and Mr. Wm. Bowden Smith carried on the business alone and went to live with his old friend, R. Beauchamp Downall, at Peradeniya. Mr. Bowden Smith's work at this time, took him to every coffee district in the island, including Madulsima and the Morowakkorale which had then been recently opened; so he obtained a thorough knowledge of all the planting districts, and during the last two years that he remained in Kandy had over 80 estates to visit and inspect. On the occasion of one of his visits to Doomoogahalande estate in Madulsima in 1869, he received a note from Keith McLellan, who happened to be visiting the adjoining property, Galoola, which belonged to him, saying that the leaves of a few of his coffee trees were attacked by some kind of blight and he wanted to know if Mr. Bowden Smith had seen anything like it. Mr. Bowden Smith went over and, after examining the leaves, told him the disease was quite new to him. This is believed to have been the first appearance of the terrible blight, afterwards known as "leaf disease" and which ruined so many planters. The following year Hantanne and some of the other old estates near Kandy,\* as well as one or two of the *young* estates in the Morowakkorale, were severely attacked by "leaf disease," whereas the intermediate districts were comparatively free from it till later on. There are many who assert that "leaf disease" was produced by over-cultivation. But as the fungus first appeared in young coffee giving its maiden crop in the isolated and new district of Madulsima and in the following year on young coffee in the Morowakkorale, that had only just come into bearing, it would appear quite clear that over-cultivation could not be the origin of the disease. On the other hand, undoubtedly after the blight once made its appearance, the coffee trees on old estates that had been highly cultivated for years and had a great deal taken out of them, succumbed much more rapidly than the younger and stronger coffee trees on estates more recently planted. As there was no railway at this time beyond Kandy and cart roads were not nearly so numerous as they are now, the visiting of estates was much rougher and harder work than it is now and Mr. Bowden Smith, at this time, was obliged to keep four or five horses to enable him to get through his work.

During Sir Henry Ward's rule the three large bridges over the Mahaweliganga, at Katugastota,

\* Mr. Keith McLellan lived on Amblamana (Hantanne) and may have carried the fungus on his tweed suit of clothes from Madulsima to this estate.—Ed. T. A.

Gampola and Nawalapitiya were constructed—an immense boon, as the river was at times impassable after heavy rains. The Branch Roads Ordinance was also introduced by the same Governor on the grant-in-aid principle which has done so much towards developing the country and opening up the planting districts. It was in his time also that a deputation of several of the leading planters and merchants offered to contribute 1s. a cwt. on all coffee exported from Ceylon towards the construction of a railway from Colombo to Kandy, the proposal being accepted with the remark that it was the first time he (the Governor) had ever heard of anyone asking to be taxed.

In the interval between Sir Henry Ward and Sir Hercules Robinson's rule, when Sir Charles MacCarthy was Governor, public works were neglected and many of the roads got into exceedingly bad order. But under Sir Hercules Robinson's able administration these evils were soon remedied and Grant-in-Aid roads were carried into the heart of the extensive districts of Dimbula and Dikoya where a large number of acres were being cleared each year and planted with coffee. During Sir Hercules Robinson's term of Government the districts of Madulsima and Morawak Korale were opened out and the latter was then supposed to contain such suitable land for coffee that the Government raised the upset price of the land to Rs20 per acre. The Morawak Korale, however, proved a complete failure as far as coffee was concerned and much good money was sunk there. Mr. S. LeCocq, a good planter and good man, pioneered there for some years.

Before the railway was opened,

#### KANDY

was a much more important place than it is now; and most planters transacted their business there instead of undertaking the tedious coach journey to Colombo. Several business firms had their head offices in Kandy, of which Keir, Dundas & Co. were the most influential. George Wall also had a branch in Kandy and he, Harrison and Leake spared no pains nor trouble to promote the planting enterprise in which they themselves were so deeply interested. The annual Planters' Association meetings were largely attended with generally a good fight for the Chairmanship.

In 1871, Mr. Bowden Smith joined the firm of Sabonadière & Co. On the 4th April 1872, Mr. Bowden Smith married Louisa S. Prinsep-daughter of Mr. Justice Prinsep of Indian fame—at Freshwater Bay, Isle of Wight. She was then living there with Mrs. Cameron from whose house they were married. Mr. Bowden Smith first met Mr. C. Hay Cameron senior, at Rahatungodde, Upper Hewaheta in 1860. Rahatungodde

then belonged to Mr. Cameron and he was living there for a short time with his son Ewen, then a boy. Mr. Bowden Smith walked over from Delta via the Gonavy Gap with J. Murray Robertson senior and Jack Tyndal to call on Mr. Cameron. They stayed the night with him and returned to Pussellawa the following day. He did not meet Mr. Cameron again till the autumn of 1871 at Freshwater Bay when he was living at his pretty house "Dimbula" named after the well-known district in Ceylon where he owned a large tract of forest known as "Cameron's Land." Mr. Cameron always loved Ceylon and often expressed a longing to spend the closing years of his life there. This wish was gratified later on and the remains of both Mr. and Mrs. C. Hay Cameron rest in the peaceful and pretty little churchyard at Bogawantalawa. Mr. Bowden Smith returned to Ceylon in July 1872, with his wife and went to reside at Darley House, Colombo.

In September 1873 Mr. Bowden Smith was unanimously elected by the Planters' Association as their representative in

#### THE LEGISLATIVE COUNCIL,

an honour quite unexpected, as he did not even know that his name was to be proposed at the meeting, and the first intimation he received was a congratulatory message from Sir W. Gregory, then Governor. In 1874 he induced the Government to amend the Branch Road Ordinance which required several alterations to meet altered circumstances. That this ordinance was carefully considered is proved by the fact that it worked well for 22 years and only had to be altered last year to meet fresh requirements. He resigned his seat in Council when he went to England in 1876 and was succeeded by old friend, R. B. Downall. Twice during Sir James Longden's rule and twice during Sir Arthur Gordon's (Lord Stanmore's) Government he was requested to take a seat in the Legislative Council, but declined the honour as he felt he could not devote sufficient time to the extra work of the Legislative Council without neglecting his other duties, though always ready to do anything in his power to further the interests of the Colony especially in respect to roads and railways. After 1873 he served on the different Railway Commissions appointed to report on the Nawalapitiya-Haputale extension, Nanu Oya-Haputale extension and the Northern Railway extension; and although he was in the first instance strongly in favour of a metre gauge he was converted by the vast amount of evidence he had heard and read against *break* of gauge if it can possibly be avoided and unless it can be shown that a very great saving can be effected both in construction and subsequent working expenses.

Mr. Bowden Smith took a prominent part in starting the Planters' Wards at the General Hospital, Colombo. When the Government took over the working of the Cooly Medical Aid Ordinance from the District Committees in 1874 or 1875, he was largely interested in the Pussellawa and Ramboda Districts and was able to induce the Committee of those two districts to pay the balance they had in hand, which amounted to a good large sum, towards starting the Planters' Wards instead of returning the money to proprietors of the estates interested *pro rata*. This formed the nucleus of the fund out of which the Planters' Wards were constructed. A few other districts followed suit, but not nearly all. He had several interviews with Sir W. H. Gregory and Sir W. Kynsey about starting the Planters' Wards and met with some opposition at first. He always took a deep interest in the Planters' Wards and they have undoubtedly proved a boon to all planters requiring careful medical treatment.

On 5th December, 1897, Mr. Bowden Smith (accompanied by Mrs. and Miss Bowden Smith) left Ceylon with great regret after the many happy years spent amongst the kindest of friends, several of whom, however, he hoped to meet again in England; where he was sure to take the deepest interest in the country in which he laboured for so many years. Alas! his hope of some years of usefulness in a business in the City of London was not to be fulfilled. He went home to succeed the late Mr. Thos. Dickson as London Manager for the Scottish Trust and Loan Company, 52, Gracechurch Street; but he had not been long at work when the great change came.

Up to the time we go to press, full particulars have not been received, but a telegram received by Mr. Cumberbatch announced the death of Mr. Bowden Smith which seems to have taken place on Sunday, October 16th, at his brother's residence in the country where he had been out shooting the previous day. The brief fatal attack, it is said, was due to heart-disease. So passed away in his 60th year the hale and hearty merchant and planter who left Ceylon only ten months previously, apparently in good health. Widespread and sincere sympathy has been felt for Mrs. Bowden Smith and family under this sad and sudden bereavement, and all who knew the deceased in Ceylon feel that a truly good man, and an excellent, hard-working pioneer colonist, has departed this life. Peace to the memory of of a man of worth.

—♦—  
 JAVA QUININE.—Our Amsterdam representative writes us on the 6th instant that another 600 kilos of quinine from the Bandœng factory are on their way to his city.—*British and Colonial Druggist*.

## CEYLON TEA-BOX WOODS.

BY FREDRICK LEWIS, F.L.S.,

Assistant Conservator of Forests, Ceylon.

The increasing export of tea from Ceylon, which must now be regarded as having more than fully taken the place of the island's former staple—coffee, has developed a correspondingly large trade in woods suitable for the manufacture of boxes for the packing and transport of the prepared article. Some notion of the volume of wood required yearly may be arrived at from the fact that, assuming all the tea exported from the island to be packed in 100 lb. chests, the total number of chests for one year's export alone would be over a million, or, roughly speaking, upwards of 18,000,000 superficial feet of planking.

Of this vast quantity, for some years past a great proportion of the wood has come from Japan, as both planters and merchants found by experience that the Japanese tea box was not only very neat, but it had the superior advantage over the locally made article, in possessing great equality of weight. The importance of the last consideration cannot be too highly valued by the planter, as fluctuation of weight would in all cases lead to the contents of the box being emptied out and re-weighed, for obvious reasons; entailing not only additional cost and delay, but a serious loss by waste.

London importers also raised objections to certain Ceylon wood packages on the grounds of "tainted teas," implying thereby that the teas themselves had acquired a taint from the smell of the outer wood package, notwithstanding the fact that between the wood and the tea itself is an air-tight envelope of lead. A still further objection was raised, that certain woods corroded the lead lining, an introduced poisonous matter.

It is, perhaps, foreign to the purpose of this paper to enter into any discussion as to the merits of the above objections, as, unfortunately, those most interested accept as final what is told them by their London constituents.

Now that the importation of tea-box wood has declined from Japan. Owing to the late Chino-Japanese war, the demand in Ceylon for local woods for cases at once increased, and the demand for soft light woods rapidly began to manifest itself. The trade is practically in native hands, and for this reason the planter is often placed at a serious disadvantage, as he is absolutely ignorant of the extent of seasoning his packages have received, and very frequently is equally ignorant as to the materials themselves.

The trader is interested chiefly in obtaining woods that are light, and these he buys from people who have wood for sale; and so long as these will float, the log dealer will invariably find a ready sale for his produce, no matter if it is composed of all sorts, or of wood; green or dry. It will be further understood that the log dealer—for so he is—buys his wood wherever he can get it near navigable streams, and as these are very subject to periods of flood, as well as periods of non-navigability, it follows that he must often be for months unable to move his wood, during which time it has either stranded in the stream, or in the forest just as it was felled. Such conditions are not conducive to improved seasoning; and, naturally, wood exposed in this manner to tropical atmospheric changes cannot but suffer in turn. It is, moreover, remarkable that tropical soft woods are much more easily affected than woods imported from temperate zones. Finally, in Ceylon, the forests cannot be regarded as possessing any large extent of gregarious woods; in other words, pure forests do not exist, so that the long dealer can only adopt his standard of lightness as his rule for selection, and not that of species only. It is not to be wondered at, therefore, that our locally made tea boxes are mixed as regards their composition, and equally mixed as regards their specific weights.

That much could be done to remedy this state of affairs goes without saying, and it is to be deplored that so large an industry suffers from want of systematic arrangement, which would go far to reduce the evils complained of, if not to absolutely eliminate it altogether. It is proposed to give a short list of local timbers in use in Ceylon, with their local names added, as in that country the native name is more generally applied than the scientific.

## MAGNOLIACEÆ.

No. 1. *Michelia nilagirica*, Zank. "Flora Brit. India," vol. i., p. 44. Singalese—*Wal-Sapu*.

This is a purely hill species, and is rarely found below 4,000 feet altitude, and not over abundant. It is demand owing to the neatness of package it affords and beauty of wood.

No. 2. *Michelia Champaca*, L. "Flora Brit. India," vol. i., p. 42. Singalese—*Sapu*.

Au introduced species, found chiefly in gardens, where it was probably introduced many years ago for the sake of its highly scented flowers which are used as offertories at Buddhist shrines. The wood is greatly prized, and only occasionally found in use for tea-boxes, for which it is far too good.

## ANONACEÆ.

No. 3. *Cyathocalyx zeylanicus*, Champ. "Flora Brit. India," vol. i., p. 53. Singalese—*Ippatta*.

Fairly abundant plant, and found through most of the wet forests in the western and Sabaragamuwa provinces, from practically sea level to 2,000 feet. It is a favourite wood, as it grows very straight, and only branches high up, so that it is easily worked.

No. 4. *Xylopiya parvifolia*, Hook f. and Thoma. "Flora Brit. India," vol. i., p. 81. Singalese—*Netawu*.

Like the last, is a wet forest plant; common, but not particularly abundant. It is, perhaps, more common in the Gillimalai country, at the base of Adam's Peak, than further to the east. It affords a nice, clean-looking wood, but is not in very high demand, as it is said to be too heavy.

## GUTTIFERÆ.

No. 5. *Calophyllum tomentosum*, Wight "Flora Brit. India," vol. i., p. 274. Singalese—*Kina*.

A hill species, and a favourite wood for building purposes in general, and occasionally used for tea boxes, but unsuitable on account of weight. A beautifully marked wood and very durable.

## DIPTEROCARPACEÆ.

No. 6. *Doona congestiflora*, Thw. "Flora Brit. India," vol. i., p. 312. Singalese—*Tiniya*.

A large tree, and found growing gregariously in many of the wet forests of the island. It affords a timber much like cedar in appearance, light, and easily worked, and, therefore, is in great demand.

No. 7. *Vateria acuminata*, Hayne. "Flora Brit. India," vol. i., p. 313. Singalese—*Ihal*.

A large handsome tree, widely distributed in the western, southern, and Sabaragamuwa provinces, but rarely found above 3,000 feet altitude or out of the very wet limits. The wood is in great demand as it is very easily worked, light, and lasting. This tree runs some risk of becoming destroyed altogether, as the natives strip off the bark from young and old trees, to assist in stopping fermentation in toddy, for which purpose it is freely used, to the destruction of the tree. The fruit is also eaten, so that the tree has many vital enemies to its existence.

## MALVACEÆ.

No. 8. *Bombax malabaricum*, DC. "Flora Brit. India," vol. i., p. 349. Singalese—*Katu-imbul*.

An enormous tree, scattered over the greater part of the west of Ceylon, up to 2,500 feet, above which it becomes very scarce. It is found in the dry districts towards the south, where it attains a stem circumference of 15 to 18 feet. Owing to its great lightness and the neatness of box turned out from the wild cotton tree, it is a great favourite and commands a good price. The natural reproduction of the tree is not good, so that in its wild state the tree stands some risk of being very much over-worked.

No. 9. *Cullenia excelsa*, Wight. "Flora Brit. India," vol. i., p. 350. Singalese—*Katu-boda*.

A common tree in all the wet forests up to 4,000 feet, and occasionally a gregarious plant. It has only of late years come into favour as a tea-chest wood, and bids fair to become popular, as the timber is light and easily worked, and rather pretty.

## SIMARUBACEÆ.

No. 10. *Ailantus malabarica*, DC. "Flora Brit. India," vol. i., p. 513. Singalese—*Wal-billin* or *Kumbalu*.

A large lofty tree, but found in no great abundance. It yields a very soft wood, and is easily worked. In parts of the Kegalla district the local carpenters pass off a good deal of this wood as wild cotton, so as to secure a sale for it, owing to the popularity of the latter species.

## BURSERACEÆ.

No. 11. *Canarium zeylanicum*, Bl. "Flora Brit. India," vol. i., p. 532. Singalese—*Kekuna*.

A very large forest tree, and found chiefly on rocky ground on the wet zone, up about 2,000 feet. Very common in suitable places in the western province, especially in the Pasdun Korah. The wood is very light, and easily worked, but is so soft that it decays very quickly. The bark contains a pungent, balsamic resin that is said by the natives to be a valuable specific against snakes, if burned in a house. The seeds are eaten, and in flavour are not unlike walnuts.

## MELIACEÆ.

No. 12. *Melia dubia*, Cav. "Flora Brit. India," vol. i., p. 545. Singalese—*Lunu-middella*.

A large and conspicuous tree, with crowded bipinnate leaves that form tuft-like terminations to the long thin branches. It is not a tree of very general distribution in Ceylon, as it seems to prefer certain soils, out of which it does not flourish. It is cultivated in the Kegalla district both by natives and Europeans, and, owing to its rapid growth, it is a favourite. The wood is in very great demand, both for its suitability for the making of out-riggers for native boats and for ceiling boards, and also tea boxes. It is light in weight, easily worked, and durable. This wood has been tried for fuel purposes, but is not found to be a success as such.

The cultivation of *Lunu-middella* is profitable, as in eight years the tree attains sufficient size as to be saleable.

No. 13. *Chickrassia tabularis*, A. Juss. "Flora Brit. India," vol. i., p. 568. Singalese—*Iulan-hick*.

A moderately large tree, but not common. It has been used a tea-box wood, but is not adapted to this purpose, for which it is much too good, owing to its weight. It is a very ornamental wood, and suitable for carving.

No. 14. *Cedrela serrata*, Royle. "Flora Brit. India," vol. i., p. 561.

This is an introduced timber tree, and is known as "Red Toon." Its introduction has been quite of recent years, and its success has been somewhat questionable, owing to the young plants being subject to the attacks of a "borer" that quite destroys the part attacked, and often the whole tree. The wood is a favourite for tea chests, and at one time was largely imported into Ceylon for this special purpose.

## OLACINEÆ.

No. 15. *Lasianthera apicalis*, Thw. "Flora Brit. India," vol. i., p. 581. Singalese—*Urukannu*.

A large handsome tree, the young leaves of which have a conspicuous coppery hue, and highly polished upper surface. It is abundant in parts of the western province, and ascends to a considerable altitude in the wet zone. The wood is not in great favour, chiefly because of its weight, but while it can be obtained easily, carpenters readily buy it for local use.

Trimen gives *Uruhouda*, *Urueta*, and *Kospenua* as further native names, but it is more generally known by the name given above.

## CELASTRACEÆ.

No. 16. *Kokoona zeylanica*, Thw. "Flora Brit. India," vol. i., p. 616. Singalese—*Kokoon* or *Kokoon-pottu*.

A very common tree in the very wet forests near the foot Adam's Peak, and in the districts extending towards the west coast.

The wood is not very favourable, because of its splitting so freely, but is suitable for small cases.

## ANACARDIACEÆ.

No. 17. *Mangifera zeylanica*, Hook. f. "Flora Brit. India," vol. ii., p. 16. Singalese—*Walamba*, *Etamba* (*Amba*, lit. a kidney).

A large and handsome tree of wide distribution, extending from the confines of the dry country in the south-west. all over the wet forests up to 2,500 feet, after which it becomes scarce. The tree attains a very large size with a long clean stem. The wood is a pale white, soft, and easily worked, and is in large demand for cases.

No. 18. *Semecarpus subpeltata*, Thw. "Flora Brit. India," vol. ii., p. 33. Singalese—*Maha-badulla*.

A moderately large straight tree, found in all the very wet forests of the Western Province and Sabaragamuwa, particularly within the water-shed of the Kaluganga river.

This wood is in particular demand for tea chests, though it is said to be one of the woods that corrode tea with lead or the lining used between the tea and the wood.

No. 19. *Semecarpus coriacea*, Thw. "Flora Brit. India," vol. ii. p., 32. Singalese—*Badulla*.

A common tree, found over most of the hill country above 4,000 feet. This wood is sometimes used, but it is considered too bad owing to the risk there is of getting any of the "milk" (Sing., *Badulla-kiri*) on the skin, as it at once sets up a violent inflammation. It is possible that two or more than those mentioned of this genus are used, as the Singalese name *Badulla* extends to both the large as well as small forms of *Semecarpus*, and the word coming within the "light" class would be accepted for the purpose intended.

No. 20. *Campnosperma zeylanicum*, Thw. "Flora Brit. India," vol. ii., p. 41. Singalese—*Arridda*.

A large dark-leaved tree, and in many of the wet forests in the vicinity of Adam's Peak it is a gregarious species. In Gillimali—at the foot of Adam's Peak, eight miles from Ratnapura—these trees are found in great abundance, attaining a girth of seven feet. It is in very high favour for tea-chests manufacture, as it affords a light, easily worked, clean-looking good, possessing all the qualifications necessary to commend it to the planter.

## RHIZOPHORACEÆ.

No. 21. *Anisophyllea zeylanica*, Benth. "Flora Brit. India," vol. ii., p. 442. Singalese—*Wellipenna*.

A tree attaining considerable size, and found in moderate abundance in all the wet forests of the western half of the island, up to 2,500 feet, after which it becomes scarce.

It is occasionally used for tea boxes, but is not a favourite for that purpose, as it is too heavy.

## DATISACEÆ.

No. 22. *Tetrameles nudiflora*, R. Br. "Flora Brit. India," vol. ii., p. 637. Singalese—*Mugunu*.

A very large tree, distributed mostly through the country having the intermediate rainfall between the wet and dry zones. The wood is very soft and light, and occasionally mixed up with harder kinds in the manufacture of chests.

## CORNACEÆ.

No. 23. *Mastixia tetrandra* ? Clarke. "Flora Brit. India," vol. ii. p. 745. Singalese—*Diya-taliya*.

A large wet-zone tree, and found in abundance in the valleys of the Kaluganga water-shed. The wood is much sought after, and is suitable owing to lightness.

## RUBIACEÆ.

No. 24. *Sarcocephalus cordatus*, Miq. "Flora Brit. India," vol. iii., p. 22. Singalese—*Bakmi*.

A rather common tree in the wet ground, with exceedingly large stipules. The wood is light and soft, but not in great favour.

## SAPOTACEÆ.

No. 25. *Chrysophyllum Roxburghii*, G. Don. "Flora Brit. India," vol. iii., p. 535. Singalese—*Laculu*.

A moderately large tree, scattered sparingly over the wet zone, and occasionally used for tea-box manufacture, but not in great favour, as trees of sufficient size are difficult to procure.

No. 26. *Palaquium grande* (?), Engler. "Flora Brit. India," vol. iii., p. 540. Singalese—*Mihiria*, *Kirihimbilia*, *Kirihiria*.

A very large, thick, brown-barked tree, of wide distribution in all the moist forests of the country, up to about 4,000 feet altitude. It is a favourite building wood on estates, and is often used for tea cases. The wood is reddish in colour, dark and close.

## APOCYNACEÆ.

No. 27. *Alstonia scholaris*, R. Br. "Flora Brit. India," vol. iii., p. 642. Singalese—*Rukattana*.

A very large, tall tree with pale grey stem and dark whorled leaves, found throughout the low country up to 3,000 feet, except in the dry zones. This wood is much sought after owing to its extreme lightness, and is greatly in use for the manufacture of coffins. In colour the wood is white, and when freshly cut is offensive in smell.

## MYRISTICACEÆ.

No. 28. *Myristica lawifolia*, Hook. f. and Thoms. "Flora Brit. India," vol. v., p. 103. Singalese—*Malaboda*, *Kerimarwara*.

A very common tree in all the wet forests up to 5,000 feet, and frequently found on the banks of streams in the dry zone. The wood, if carefully seasoned, affords a splendid packing-case material, but the difficulty in drying the timber is against its popularity. It splits freely and is of a pale yellow colour.

No. 29. *Myristica Horsfieldia*, Bl. "Flora Brit. India," vol. v., p. 106. Singalese—*Ruk*.

A large tree, fairly abundant in the moist zone, with a particularly sweet-scented flowers. The wood very much resembles the last in appearance, but is much more heavy, and for this reason is rarely used in the manufacture of tea boxes.

No. 30. *Myristica Irya*, Gaertn. "Flora Brit. India," vol. v., p. 109. Singalese—*Irya*.

A common tree on the banks of rivers and streams, and often in swampy places. It has a bright pink pericarp, with seeds enclosed entirely by a scarlet aril. The wood strongly resembles that of the last-named species, but is lighter and is in demand.

## LAURACEÆ.

No. 31. *Cryptocarya membranacea*, Thw. "Flora Brit. India," vol. v., p. 120. Singalese—*Tawanna*, *Walkos*.

A wet zone tree, and abundant in the Gillimali district at the foot of Adam's Peak and towards the "Haycock," on the borders of the southern province. A yellowish coloured wood, close-grained, and well adapted to tea box manufacture, but not particularly used owing to weight.

No. 32. *Machilus glaucescens* (?) *zeylanica* (Trimen's Catalogue, *M. Macrantha*, Trim. "Flora of Ceylon," vol. iii., p. 443). "Flora Brit. India," vol. v. p. 140. Singalese—*Ualu*.

A very large tree found in some abundance in the Avsavelia district and towards Adam's Peak. It is a favourite tea-box wood, as it is easily worked, and of a light weight. Dry saw-dust of this wood is faintly aromatic in smell.

No. 33. *Litsea schifera*, Pers. "Flora Brit. India," vol. v., p. 157. *L. chinensis*, Trimen. "Flora of Ceylon," vol. iii., p. 449. Singalese—*Eomi*.

A common tree throughout the island up to 2,500 feet, and well known to all local carpenters. The wood is in great favour for flooring boards as it is capable of taking a superior polish. Frequently used in the tea-box trade.

No. 34. *Litsea zeylanica*, Nees. "Flora Brit. India," vol. v., p. 178. Singalese—*Kududarula*.

A common tree in the hill country, between 2,000 and 4,000 feet, and in great favour not only for the tea cases but for door frames, sash bars, dados, and the like. The wood is light in weight, and will take a high polish of a yellowish orange colour.

#### EUPHORBIAEÆ.

No. 35. *Aleurites triloba*, Forst. Singalese—*Tel-kekuna*.

An introduced tree and common enough in native gardens, where it is cultivated for the sake of the oil that is extracted from the nut. Sometimes, but very rarely, used in tea-case manufacture. The wood is white, soft, and light.

#### URTICACEÆ.

No. 36. *Ficus nervosa*, Hayne. "Flora Brit. India," vol. v., p. 512. Singalese—*Kalamadua*.

A large-leaved tree, and occasionally found in the forests of the wet zone. The wood is soft and light but decays quickly.

It is probable that a few more species of the genus *Ficus* get mixed up with other light soft woods in tea-box manufacture, as they are easily procurable in common with so many of the woods mentioned above, but it is undesirable to record any doubtful examples. The list given includes most, if not all, of the recognised tea-box woods, and to which, but for the ignorance of the traders themselves, many more might be added.

The culture of woods for this special trade may in course of time be tried in Ceylon, as the wants of the planters make suitable wood more and more scarce; but it is noteworthy that no invention has yet been brought out by which compressed wood could be used instead of the present very laboriously manufactured article.—*Journal of the Society of Arts*.

### THE NATAL FIBRE INDUSTRY.

The following is an extract from a letter received in Durban from a well-known firm of merchants in London:—

"Natal Fibre.—We think it will be of interest to you to hear the position of this article at the present time, especially as it so favourable that we should like to induce you to start some shipments if it is possible. As you know, your Natal fibre is similar to Mauritius sisal hemp, the value of which is guided entirely by the prices of Manila hemp. Now, at our first valuation we gave you the price at about £17, but since then, owing to the insurrection in Manila and the war between Spain and the United States, the collection of hemp in Manila has for the time entirely ceased. Practically no parcels are coming forward, and all available stock in London is being rapidly snatched up. Owing to this, the price of Manila has risen to £35 per ton, and on this valuation our brokers, to whom we showed your fibre, and who make a speciality of all classes of hemp, report: 'Very good length, well dressed and fair strength, fair colour, present value about £30.' Of course, no one can foresee how long the state of affairs in Manila will last, but at the time of writing there are no prospects of and speedy settlement of matters, and even after the war has ceased it will be some time before further shipments are forwarded, and it is very unlikely that the prices will fall to any extent this year. Therefore, reckoning with as much certainty as possible, the very lowest prices that parcels of your hemp would realise would be £25, which is allowing a margin of £5 fall, which is most unlikely, and for any slight overvaluation on the part of the brokers. Therefore, if you can see your way to start a shipment . . . with a code for prices and repetitions, it is a splendid opportunity to get your hemp into the market. We look forward to hearing from you, and trust that the information we are giving you will prove useful."

—*Natal Mercury*.

### PLANTING NOTES.

PLANT DISEASES.—The browning of the Vine, which was treated with so much humour by Mr. Blackmore at one of the meetings at Chiswick, is now ascertained to be caused by a slime fungus. More recent researches show that it is by no means confined to the Vine, but that it is met with in Beetroots, Potatoes, Melons, Cucumbers, Artichokes, Laurel-Cherries, Ancuba, Cherries, Apricots, and Plums. The *Pseudocommis*—for such is the name of the slime-fungus or Myxomycete, determines the gumming, the fungus known as *Coryneum* being now exculpated. In addition to the plants mentioned, Apples, Pears, Chestnuts, Poplars, and Sugar-cane are mentioned by Mr. Roze as subject to this terrible scourge. In many cases the disease has been attributed to other fungi. The existence of the other fungi is not denied, but it is supposed that instead of being directly injurious, they merely feed on the tissues decayed and injured by the presence of the myxomycete. These are questions which must be settled as soon as possible in the botanical laboratory. The present state of uncertainty is worse than embarrassing to the practitioner. Inoculation of a previously healthy plant with spores of the several fungi was considered as sufficient proof of the malignity of that particular fungus, but the slime-fungus can as easily be introduced, and the evidence is as strong in the one case as in the other.—*Gardeners' Chronicle*.

MR. DONALD MACKAY has just returned from a trip to the upper portion of the Central Province, glad to get back from the cold and pouring rain of Nuwara Eliya; but much pleased with the improvement of the tea all along his route and more especially in the Atras, since he saw it four years ago. Mr. Mackay is now going up the Chilaw Puttalam road to visit coconut estates. He will see one of the most profitable routes for a Railway in the island and one that might have been served by the metre gauge on to Mannar, Jaffna and Trincomalee if the Railway Commissioners had only put down their feet and stopped the broad gauge at Kurunegala. As it is, a line on the 2½ feet gauge to Puttalam will have to be made and this gauge is quite enough for Jaffna (direct to Colombo) if only Mr. Chamberlain could be got to believe so, for there is nothing worthy of the name of main line beyond anuradhapura.

THE COCONUT AS A VEGETABLE FOOD.—In its life-supporting qualities the coconut is quite equal to the best of other vegetable products that have been ranked above it and although these nutritive qualities are admitted, the amount of nutrition derived is much greater than is generally supposed. As an example, we may refer to the account that has been published of a vessel which left San Francisco, with 400 passengers for Sydney. Running short of stores, they were obliged to put in at port, where a large quantity of coconuts was obtained. The remainder of the passage was attended with heavy weather, and the vessel became water-logged, only reaching Sydney after a perilous voyage of eighty days. Owing to the extreme length of the voyage, their provisions ran out, and men, women, and children were reduced to an exclusive diet of coconut, and owing to the scarcity of these, the quantity apportioned was in the proportion of one coconut to each adult. Notwithstanding this diet, wholly unrelieved by any change, not a life was lost, not single case of illness occurred, all the passengers landing in a healthy and well-nourished condition.

This is speaking well for the trade on shredded coconut, which, with the improvement in manufacturing the last few years, has almost entirely replaced the fresh coconut. This is because of its keeping qualities, and when prepared in the careful manner that the "Brazil" brand is, it is much healthier, and certainly more economical, for it will not turn rancid.—*"American Grocer,"* Aug. 3.

## COCONUT PLANTING IN THE EASTERN PROVINCE.

We had a very favourable account the other day from that veteran Surveyor and keen observer, Mr. O'Dowd, senior, of the new coconut planting district around Tirukovil, in which so many planting capitalists have recently invested. He thinks the soil equal to any already planted with coconuts in the Eastern Province; and when the palms come into bearing, it is pointed out that sea-transport will be very convenient. Meantime in the more northern districts of the Province, there are considerable extensions under way. Mr. Carey has instructions to plant up 300 acres of the reserves on the well-known Ouchterlony group of estates. These estates were recently valued for the proprietors by Mr. C. E. H. Symons; but the decision thereon was not to sell, but to extend cultivation. High exchange will, of course, react adversely on coconut as on tea estates; but there is not the large outlay for factories and machinery to encounter in the case of the former. Still, it may be a question, looking at the tropical world generally, whether the next cry may not be one of "over-production" for the exported products of the coconut palm! Our estimate of the area planted, or bought for planting, during the past three years in Ceylon, is not less than between 40,000 and 50,000 acres taking all the provinces into account. There is, however, the permanently large home consumption of the palm products to console, at least, native proprietors of estates; and we may hope to see new uses for coir and perhaps an extended demand for copra, for oil and for desiccated coconut, spring up.

## THE JAVA QUININE FACTORY.

Mr. Van Prehn, who has the technical control of the Bandong quinine factory in Java, has addressed a letter from the Hague (where he has been staying during a part of his sojourn in Europe) to the director and board of the Company owning the factory, protesting against the treatment he has received. His letter throws light on recent events in Java, and will be taken by some as another piece of evidence in support of the theory that the Dutch cinchona planters will never be able to agree on a scheme for their common protection. Whilst Mr. Van Prehn has been in Europe trying to come to an arrangement with the German quinine makers his conduct in other respects has been severely criticised in Java. We will give extracts from his letter, which will reveal the state of affairs between the various parties.

Mr. VAN PREHN says:—

I was affected in a most painful manner on learning the numerous complaints and reproaches cast at me insinuating that I had acted, and was still acting, in opposition to the true interests of the Bandong quinine manufactory. On numerous occasions, Mr. Van Heeckeren, in consultation with myself, drew up sundry draft contracts and distributed them amongst the cultivators of cinchona bark; according to the terms of these contracts, the latter were invited to

undertake to deliver yearly a certain quantity of cinchona bark to the Bandong quinine manufactory for the purpose of having quinine manufactured therefrom.

The producers, however, found they could not agree to the terms of [the last] contract, and consequently we do not receive a single offer. Many of them were unwilling to agree that these quinine should be consigned to a firm nominated by the Bandong quinine manufactory without any consultation on its part as to the wishes of the owners of the quinine. I was, moreover, unable to agree to the compulsory obligations which it was sought to impose upon the planters. Besides these, there were several other conditions which did not suit the interests of the producers. As a rule the sale outright of the raw material was preferred to the manufacturing of the same against payment of a stipulated price, with settlement at the end of the working year. Even the offer of an advance of 8 florins per kilo. of sulphate of quinine had no attraction for them. Many would have nothing to say to an advance, and demanded earlier and quicker settlements. That several planters accepted this advance was entirely owing to my efforts. I saw that it would happen that many planters after the first trial consignment would send no more cinchona bark to our factory, especially when a rise in the price of the bark clearly showed that the sale in the form of bark in Amasterdam was to a considerable degree more profitable than the manufacture in Bandong with subsequent delayed settlements. Besides all this, reports were circulated that others proposed to establish factories to compete with the Bandong manufactory and which would buy the bark. I allude to the Pengalengan manufactory, which declared that it had a million florins disposable wherewith to buy bark, and pay for the same on the spot.

Another project was that of Mr. Van Meeverden, who was already in correspondence with, and in negotiation with Mr. Henny, of Batavia, with the idea of

### BUILDING A QUININE MANUFACTORY,

and of buying the bark. Under these circumstances our Bandong manufactory, with its scheme of manufacturing for a stipulated recompense, could not continue to exist.

The scheme was a source of unceasing remonstrance and complaint; first one about a difference in weighing the bark, then another about the result of the analysis, and yet another about the time of settling and the pecuniary circumstances. For example, producers who had given in their bark when the price was 6 cents were not very well pleased with a final settlement on the basis of a lower average price &c., &c. The scheme when in operation was both unsatisfactory to the manufactory, and aroused dissatisfaction and complaints with the producers. I thought, and I am convinced, that I acted in the interests of the manufactory when I made, with a few favourably-inclined and independent planters, arrangements which enjoyed their favourable consideration.

I will refer to a paragraph which can be read in the circular of Messrs. Kerkhoven and De Vries:—"Three-fourths of the cinchona produced by Java will go in the usual manner to Europe and be manufactured there into quinine for the consumption of Europe, America and Africa. The remaining fourth part will be manufactured in Java for consumption in Asia and Australia, &c." When one of the Messrs. Kerkhoven asked me what I wanted for myself, I replied that I did not stipulate for anything for myself, and I only solicited their co-operation in order to save the shareholders in the Bandong quinine manufactory from loss and injury. I have chosen to enlarge thus upon this matter, because a fourth part of the early production of cinchona bark in Java represents twice as much quinine as the factory can at the present time turn out in a year.

Thus, I succeeded in rendering all competition on the part of others in Java impossible, because during the period the factories were in course of construction there would be no occasion to buy any bark, and at the

same time the Bandong manufactory was secured an ample supply of the raw material and a ready market, free from competition, for the manufactured article in Asia and Australia. With a view to extending the factory, a larger site had to be looked for, especially as many complaints were forthcoming with regard to the pollution of the water that flowed through the towns, and was injurious to the fish ponds.

It is my firm conviction that the plan, according to which the working of our factory is carried on, is not a plan conducive to the interests of the producers, and, as a direct consequence, is likewise not conducive to the interests of the shareholders. Now, what is

THE ACTUAL STATE OF AFFAIRS?

The manufacturers of quinine, who will be only too pleased if they can succeed in rendering the manufacture of quinine in Java an impossibility, have recently raised the price of the cinchona bark, and lowered the price of the manufactured quinine to such a degree that the producers find it more to their advantage to sell their produce in the form of bark than to have it manufactured at Bandong, and then to sell it in the form of a preparation. The manufacturers can always effect this with loss, or, at any rate, without only a slight loss for a short time. Planters naturally prefer to send their bark to Europe, and our factory without a supply of the necessary raw material must necessarily cease to exist, after which the manufacturers are masters of the situation, and the producers are ultimately the victims and bear the loss.

Mr. Van Prehn concludes by saying the Bandong factory must not cease to exist, but must rather be enlarged and furnished with the very best machinery, as well as with an expert specialist as manager, so as to manufacture as well and as cheaply as in Europe. The factory should pay for the raw material at a price corresponding to the prevailing price of the sulphate of quinine, and the cinchona producers should possess at least half of the shares of the factory.

Since his return to Europe he says he has done much, to further the interests of the factory and of the producers, but he cannot, and will not, publish what he has already done and effected in this direction, but he says that he has every reason to be satisfied with the results obtained.

He says he is in a position to declare that his efforts to improve the condition of the producers and to maintain the life of the Bandong manufactory have not been without success, thanks to the co-operation in the Netherlands of sundry parties interested in the cultivation of cinchona.

For all these reasons he asks that the vote of censure should be withdrawn.—*British and Colonial Druggist*, Sept. 2.

PLANTING IN THE NORTH-WESTERN PROVINCE.

Marawila, Sept. 20.

THE DROUGHT.

We are yet practically in the throes of the drought. We had a pleasant break in the weather on the 10th inst., when the rain that fell on that and the two succeeding days measured very nearly an inch. But that did not go for much, as the moisture did not go very much below the surface. As I am writing, the weather is very gloomy and a drizzle has fallen. We may have rain before long, but the North-East rains are not due before the middle of October or a month hence.

I have heard residents in Chilaw say that this is the most severe drought they have known for many years. Streams and water-courses that were always flowing, are now quite dry. The Kudawewa in this district is fast drying up. I have heard of an Estate in the Chilaw District where trees that have passed their prime are being watered! Low-lying sandy estates do not suffer to the same extent, as water is not very far from the surface in such places and is within reach of the roots.

THE ORIENT COMPANY'S MILLS.

The Engineer of the Orient Company's Mills at Veyangoda, who went home recently, has returned

and is to boss their Desiccating Mills here. The buildings are already up and with the Engineer on the spot it will not be long before the machinery will be up and the mills a going concern.

COCONUT BUTTER: A NEW COMPANY.

Coconut butter has been before the public for some years now, at least in name. A Company connected with Ceylon has been formed, it is said, for its manufacture. If white butter be wanted, white oil will be necessary and for white oil, white, sun-dried copra must be used. The oil from colored copra will be colored. It can be clarified and purified, but its color cannot be altered. It was said that the great drawback to the use of coconut oil by the Price Candle Company was its color. To secure white copra it will be more economical to establish mills somewhere here on the banks of the canal, than at Colombo. Here in the dug gone, most of the copra manufactured is of necessity white. Once it is known that only white copra will be purchased and good prices will be paid for it, most of the copra from Calpenty, Puttalam and Chilaw, not to speak of the Districts South of the latter place, will flow into the new mills. I make this suggestion gratis—for nothing.

THE PURCHASING PRICE OF THE RUPEE.

Writing on this subject in *Capital* (Calcutta, Sept. 8th) a correspondent "X" puts forward some very striking figures as follows:—

Now take a typical staple like common rice, and look for a moment at the annual average price in Bengal from 1861 to 1897.

	Seers sold for Re. 1.		Seers sold for Re. 1.
1861	.. 29 1	1880	.. 20 61
1862	.. 29 47	1881	.. 26 4
1863	.. 28 94	1882	.. 24 85
1864	.. 26 17	1883	.. 20 49
1865	.. 18 87	1884	.. 15 5
1866	.. 13 82	1885	.. 15 84
1867	.. 21 67	1886	.. 19 92
1868	.. 23 7	1887	.. 21 03
1869	.. 21 52	1888	.. 19 01
1870	.. 24 6	1889	.. 14 98
1871	.. 25 26	1890	.. 16 29
1872	.. 23 86	1891	.. 15 84
1873	.. 20 97	1892	.. 15 31
1874	.. 15 24	1893	.. 12 86
1875	.. 20 57	1894	.. 13 92
1876	.. 21 76	1895	.. 16 9
1877	.. 18 69	1896	.. 13 41
1878	.. 13 17	1897	.. 9 59
1879	.. 14 02		

If we talk the aggregate for these decennial periods as the index, they work out as follows:—

1861-1870.	1871-1880.	1881-1890.
237 86	.. 194 15	.. 194 41

but if we take the aggregate for the last 10 years, i.e., from 1888-1897, we get the extraordinary low index figure of 148 11

Nor turn back to our exchange. We find the aggregates of the decennial periods are as follows:—

1861-1870.	1871-1880.	1881-1890.
243 41 48	.. 216 23 32	.. 185 45 96

but if we take the aggregate for the past 10 years, i.e., from 1888-1897, we get the extraordinary low index figure of 156 7 64. Arrange the statement in this way—

	Aggregate Decennial Index.	Aggregate Decennial Index.	Aggregate Decennial Index.	Aggregate Decennial Index.
	1861-1870.	1871-1880.	1881-1890.	1888-1897.
Price of Rice	237 86	194 15	194 41	148 11
Rate of Exchange	243 41 48	216 23 32	185 45 96	156 7 64

Just think for a moment what this means. One rupee exchanged every year for the first 10 years would have produced £1-0-4: one rupee exchanged every year for the last 10 years would have produced 13s. One rupee spent in rice every year for the first 10 years would have purchased nearly 233 seers of rice; one rupee spent in rice for the last 10 years would have purchased 148 seers of rice, and yet writers of weight like Mr. T. Lloyd come forward and airily assert that local prices in India have not risen. The inclusion of 1897 in my calculations cannot be objected to on the score of being a famine year, for there have been frightful famines in the other years that are included. At the same time it is worth noting that in 1897 a rupee would purchase far less rice in Bengal than in any former year. The average price of rice in Bengal may be compared by those interested with the following table of cost of rice per bushel on a typical Ceylon upcountry plantation:—

**PRICES OF RICE ON ST. JOHN DEL REY ESTATE, BOGAWANTALAWA, FROM 1866 to 1898.**

(Supplied from 1866 to 1893 to the Currency Commission; after that by request for "Ferguson's Directory.")

GILES F. WALKER.

\* 6 months.—g.r.w.

**THE PINE HILL ESTATES COMPANY, LIMITED.**

**THE DIRECTORS' REPORT**

is as follows:—

The Directors have pleasure in submitting their Fifth Annual Report and Accounts audited for the season ended 30th June, 1898.

The amount earned on Profit and Loss Account including the balance brought forward was

Out of which an Interim Dividend of two per cent was paid absorbing

From the balance the Directors propose to pay a final dividend of 2½ per cent absorbing

And to carry forward the remainder ..

It will be seen that although the Dividend for the year is less than that paid in the previous year, the Estate has really done better than before, the Working Account showing a balance of R10,256-51 against R8,975-18 last year. Last year, however, the profit on the sale of Nahakettia was included in the Profit and Loss Account and increased the Dividend.

During the past year part of the uninvested Capital has been spent in buying a further 10½ acres of land and in clearing part of it. To clear and plant the whole will cost a further R10,000, making with the present Capital cost (R163,790-60) a total cost of say R174,000-00.

The Company will then own 381 acres of Tea, and the cost per acre will only be R460-00, a fairly low cost for the property.

Mr. J. Roydon Hughes having left the Island, the Directors have temporarily appointed Mr. H. St. C. Bowle Evans to act in his place as Visiting Agent and Inspecting Director, and they ask the Shareholders' approval of this arrangement.

There are two vacancies among the Directors, one caused by Mr. Hughes' departure and one by Mr. T. B. Campbell's retirement in terms of the Articles of Association. Mr. Campbell being eligible, offers himself for re-election.

An Auditor will also have to be elected.

Mackwood & Co., Agents & Secretaries

**MR. T. CHRISTY'S HOT-HOUSES AND NURSERIES.**

After one or two postponements, I went down to Wallington, near Croydon, to see over the hot-houses and seed-nurseries at Manor House, the residence of Mr. T. Christy, the Produce expert. His son, Mr. Gilbert Christy, met me at the gate where for a moment we watched a hot chase after a runaway cock pursued by two stable-boys. Proceeding through the greenhouses and grounds, which were spacious and contained a number of grand old trees, I was shown many plants of interest of which I will mention only a few. First I saw the family patent, called *Christia*, a sort of substitute for oil-silk, of which a long roll half-finished was hanging loosely out to dry in a shed that we passed through. This material is specially prepared for the tropics, for bandages, poultices &c., as preferable to oil silk which becomes affected by the heat. In the green-houses we saw a great many seedlings; one box of cacao-plants had been a great disappointment, the beans seeming to rot and not producing healthy plants, though successive lots had been watched and tended for nearly 2 years. African and Mexican coffee plants looked flourishing, numbers of these being exported annually. Fibre plants including ramie and a good specimen

THE PINEAPPLE CROP OF FLORIDA this year is estimated at 150,000 to 160,000 crates. Last year the crop amounted to 220,000 crates. Frost is to blame for there being less this year. -Journal of the J. A. S.

of Manilla hemp, various rubbers, and one or two kinds of Eucalyptus, amongst them being the sweet-smelling species, were also to be seen. Medicinal plants such as *Strychnos nux vomica* (of a miniature size), the Camphor plant, from which a heart medicine is prepared, (one of the two plants we saw being worth £10); and food plants, such as the aerial potato, a climbing plant, which has long fibrous tendrils often used for twine and the fruit of which grows along its stem at points where the leaves sprout, the edible yellow Passion fruit (*Passiflorus edulus*) the flavour of which Mr. Christy said was the best in the world, the coca plant, the Paraguay tea (Mattei), and the American ehickle or ehew-gum,—these occupied the major portion of the hot houses. There were also luxuriant growths of maiden-hair, and two varieties of eis-us, the one with delicately marked finely coloured leaves and the other with long straggling tendrils; and some good begonias, one being a new variety only lately discovered and introduced from a small island off the coast of Brazil. Coming out into the open we inspected a large bed of violets containing every conceivable variety from the Neapolitan, the red and the white, down to the common scentless blue single violet, and one violet only brought there a year before and called the Princess of Wales having a stalk a foot long and a flower as large as a pansy but without smell; a double sunflower seemingly all petals and no centre; a French raspberry (of rich flavour) obtained from Belgium; and a large bed of the rarer sorts of roses, Madame de Wateville, Docteur Grill, &c., many of which took prizes at the Belgian Exhibition last year.

#### MINOR PRODUCTS REPORT.

**CITRONELLA OIL.**—Quiet, eases at 1s 4d, and drums at 1s 2d spot. At today's drug auctions 15 drums were offered and bought in.

**CINNAMON OIL.**—Offered 7 cases. Sold 0. Good bark oil was bought in today at 1s 6d to 1s 8d.

**EUCALYPTUS OIL.**—Offered 18 cases. Sold 0. Cygnat brand was bought in at 2s. Good Portuguese globulous oil was sold before the auctions; it is selling privately at 1s 9d. Australian Amygdaltona oil was bought in at 1s 6d; it is offering at 9d.—*British and Colonial Druggist*, Sept. 2.

**CANELLA.**—There is great scarcity of this bark, for which there has been some demand here; but the principal holder wants 50s per cwt for the few bales he has, and we hear of nothing less than that.

**CINCHONA.**—The sales in Amsterdam on Thursday, August 25th, went off quietly, and as reported by cablegram in our issue of last week, the unit declined to 406c. A portion of the manufacturing bark sold as low as 3½c per unit, and the highest touched was 4½c per unit. The richest bark was a parcel of 20 bales Ledgeriana, which assayed 932 per cent of quinine sulphate, and the poorest was a *Suecibrubra* root-bark, which yielded 1.48 per cent. Of the 7,503 packages offered, 5,658 sold.

**COCOA BUTTER.**—The next auctions at Amsterdam will be held on September 13th, and will consist of 75 tons Van Houten; 10 tons Helm, and 18 tons Suchard brand. On September 6th 45 tons Cadbury's brand will be offered by auction in London.

**CINCHONA.**—South American crown and grey bark sold fairly well, good clean Huanoco quill fetching 9d to 10d per lb, and Loxa varieties 7½d to 8½d, according to condition. Thin cultivated yellow bark sold at 3d to 4½d, and 1d for dark and damaged stuff.

**COCA LEAVES.**—The only variety offered today was Ceylon, which sold at 11d to 1½d for good bright green. Privately, good green Truxillo leaves are offered at 5½d to 6d, and dark green Huanoco at

10d per lb e. l. f. There is reported to be an abundant stock of the former in New York.

**KOLA.**—Neglected. The only sale in auction was 3 bags of African quarters at 1s per lb, subject to approval.

**VANILLA.**—Only a poor assortment offered and mostly sold at easier rates. Bold Bourbon beans, of fine chocolate colour, realised 1s 6d to 2s per lb; foxy Bourbon, of various lengths, 5s to 13s for slightly crystallised; various mouldy lots 2s 6d and 3s 9d. Seychelles, fine frosted 6½ inches 19s.—*Chemist and Druggist*, Sept 3.

#### TEA PROSPECTS.

No one put the case for Indian and Ceylon *versus* China Tea and the influence of Exchange more clearly to the Currency Commission than Mr. S. A. Ralli of Ralli Brothers. Here is a passage from his evidence:—

Do you consider that the closing of the mints places the Indian and Ceylon produce at a great disadvantage in competition with similar produce from China and Japan?—Undoubtedly, but not immediately.

Do you think at present the tea trade is suffering from the high rate of exchange?—Those who are in the tea trade, who have gardens both in India and Ceylon, tell me so, certainly.

I am asking your opinion?—I have not been into tea gardens; I wish I had been, because they have paid very well in late years, but now they do not pay so well.

I do not know whether you have seen a prospectus that has come out this morning. There is a very large set of tea gardens for sale, and it is stated that the output of the estates for the season of 1896-97 was 1,955,680 lb.; in 1897-98 the output was 2,045,602 lb.; and the estimate of crops for 1898-99 is 2,210,000 lb. It is also stated, as to the principal estate which was formed in June 1896, which was after the closing of the mints and after the high rate of exchange, the first year's operations were sufficient to allow of a dividend of 12 per cent. on the ordinary shares, and the latest reports show a large increase of profits. Now if that prospectus is correct, about which I know nothing, it would imply that there is a very large prospect?—There was.

But this is money asked today in London for the property?—There was, but now there is not much profit. I wanted to tell you what is the reason of the great development of the tea trade during late years. They have been favoured by a low exchange, but that is not the principal reason. It is because tea is manufactured in India and Ceylon by scientific process. The Chinaman, who produces his tea as it was produced 4,000 years ago, has no chance whatever to compete with India and Ceylon. But immediately you have the central provinces of China under English control with English administrators, and there is safety for money and property, and the exactions of the mandarins cease, if China is on the 10d. basis, the tea industry in India will certainly be killed, and it is for that very reason that a great many of the tea planters of India instead of cultivating their gardens on their own account are turning them into companies.

And Sir F. F. Adam later on spoke out after this fashion:—

Do you think the development of China will be rapid?—I think, from the signs that we now see, that it is going to be rapid. Of course, we know that China is a marvellous country. It has a most industrious population and splendid resources, and I think that in the course of the next 10 years China will develop more than she has done in the last 200 years—or 800 years for the matter of that.

Have you anything to say about wages in China?—I think in China, as in India, wages move very slowly. The first effect of any development is of course on the price the landlord gets for his produce, and the effect of any great stimulus of production takes a long time to make itself felt by the class you call the wage-earning class.

THE CRISIS IN TEA

is the heading of an article in the *Indian Planters' Gazette*, in which we are told that as an average to cover expenses alone, the Indian tea crop would require to realize 6½ annas for Calcutta-sold teas and 6½ annas for London ones. Then comes an estimate of average prices got :—

	Annas.	Pie.
Assam ..	7	8
Darjeeling ..	9	3
Cachar and Sylhet ..	6	0
Dooars and Terai ..	6	0

Thus we say that even with last year's prices, the margin of profit in the case of the Dooars, Sylhet, Cachar and Terai gardens is very small and this is fully borne out by the printed reports of many of the companies of these districts, and what is it likely to be with the prices ruling in 1893? Have our agents and planters yet brought themselves to face the grim facts? The market this year is, we should say, quite an anna worse than last year, an that means an average price of 5 annas. To convince our readers we might arrive at the results here foreshadowed in another way. The average yield put down in the official paper referred to above, is—

	Per Acre.
Brahmaputra Valley ..	lb. 388
Surma Valley ..	435
For the whole province ..	408

which is just over 5 maunds per acre, or, if turned into rupees, Rs. 137.8-0 per acre for the Surma Valley and Rs. 157.8 for the Brahmaputra. In this calculation, of course, we have taken into consideration the fall of one anna per pound in price this year. Now it is quite pretty well-known axiom, that bushes will not yield unless liberal cultivation is given, more especially in the poorer soils of the Surma Valley, so that it is impossible to economise in this direction; and given this ordinary cultivation, we do not think we are erring on the side of extravagance if we put local expenditure on gardens in the Surma Valley at Rs. 110 per acre, and in the Brahmaputra we require to enhance that to Rs. 125. We are not very sure if there are many gardens that work to the above figures. That it can be done is instanced by more than one company's published accounts and those who cannot do it, will have to make room for those who can; but that is beside the question at present, although we may avert to it at some future date. Deducting then Rs. 110 from the result of tea sold in the Surma Valley, we find a balance of Rs. 27.8-0 left per acre to meet Calcutta, or Calcutta and London, charges, as the case may be; and, in the case of the Brahmaputra Valley, a balance of the same. In our preliminary examination we said that 25 to 30 per cent was considered a fair calculation for the item, and this is exactly what is left in the case of both Valleys, but what is the shareholder to get? With regard to the Dooars, Terai and Darjeeling, the conditions are so different, that we cannot well compare them with these Assam tea-producing districts. The labour question is quite on a different footing. In the case of the Dooars, the average pay of coolies is so much higher, that probably the increased yield is swallowed up in meeting this item, while the same may be said of the Terai. In Darjeeling the yield is very much smaller, and the labour conditions so different that comparison is hardly possible, although we believe the results will work out pretty much the same. We have purposely kept our figures of expenditure very low, and have, we think, erred on the side of caution, but let us hope we are wrong and have exaggerated these; for in this case there might be a bone to throw to the poor shareholder, although an extremely small one. Meantime, let us glance through the weekly sales and see how many figure in the four-anna column. As shown above, this is bound to leave a heavy loss behind it. We do not wish to take too pessimistic a view of tea as an industry, but it is at present in the throes of a crisis that will shake it to its foundation, and it behoves those interested to try and put their houses in order. Economy must be enforced, both in Calcutta and in the districts

generally, and there must be no sentimental feeling allowed to stop the process. The days of rupee or even eight-anna averages are gone never to return we are afraid, and the only thing to do is to look round and see where economy can be introduced without sacrificing efficiency.

THE EILA TEA COMPANY.

THE DIRECTORS' REPORT

is as follows :—

The Directors have to submit their Report and Accounts for the year ending 30th June 1898.

The Crops on both Kanangama and Eila Estates were considerably short of the estimate, partly on account of the unfavourable season which has been generally experienced since the beginning of the year, and on Eila Estate partly owing to an easier treatment of the bushes being adopted than that which had hitherto prevailed.

During the past year the remaining debentures were paid off and a sterling loan of £7,000 carrying interest at 6 per cent per annum was negotiated with the Standard Life Assurance Company on the primary mortgage of the property of the Eila Company. This loan was negotiated in order to pay off the debentures and provide funds for the working of the Estates. It is to be repaid in yearly instalments of £500.

The average price realized for the Tea after estimating the value of that unsold was for the two Estates 28.58 cents per lb. as against 32.66 cents for last season. Every efforts has been and is being made to improve the quality of the Tea and it is hoped that more success will be attained in this coming season than has been the case so far.

The net profit for the past season after writing off depreciation on buildings and machinery was only Rs. 3,038.77, to which must be added Rs. 2,443.09 the balance from last season making up a total of Rs. 5,481.86.

In view of the fact that the Company has to pay off £500 of the Sterling loan on 1st April 1899 the Directors regret that they are unable to recommend the payment of a dividend and they propose that the balance of Rs. 5,481.86 be carried forward to season 1898-99.

The Estates on June 30th 1898 consisted of :—

Eila—459 acres Tea 5 years old and upwards,
195 do 4 do do
62 do 2 do do
99 do under 2 years,
240 do forest.
956 acres
Kanangama—215 acres Tea 5 years old and upwards.
108 acres forest, etc.
323 acres.

During the year Mr. H. G. Bois was elected to the Board of Directors in the place of Mr. F. W. Bois who has left the island.

Mr. P. Bois retires in accordance with the Articles of Association, but being eligible offers himself for re-election.

The Shareholders will also have to appoint an Auditor for season 1898-99.

By order of the Board of Directors,  
J. M. ROBERTSON & Co., Agents and Secretaries.  
Colombo, Sept. 3rd, 1898.

QUININE MANUFACTURE IN JAVA is the subject of an interesting report by Mr. Van Prehn, who seems to have been the founder of the first manufactory in Java, that of Bandeng. The trouble and disappointment attending its inauguration are forcibly related—see page 303. Now the proposal is to enlarge and improve the Factory, so as to make it turn out a better article and so prove financially successful.

## TEA MAKING IN CEYLON.

The Special Commissioner of *The Engineer* continues his article on Ceylon in the issue of the 9th September. After dealing with the question of railways and incidentally with the strong feeling of the industrial population that narrow gauge lines should be run throughout the planting districts he says it is only natural that some consideration should be given to the staple product for the transportation of which such a line would be used. The article is accompanied with a number of very interesting photographs which serve to give a clear idea of the processes to which tea is submitted in Ceylon. The first of the photographs represents a characteristic tea plantation; the second gives an outside view of a large factory, and the others interior views showing the leaf being withered, rolled, dried, and packed. In concluding his description of the various processes the writer says:—  
 "The expense of tea manufacture mainly lies in the enormous amount of handling that is required. The laying out on trays in the withering sheds in itself entails a very great amount of labour, and although certain ingenious inventions have been brought out with a view to obviating this, they have not met with very great success, or at all events, not with the general approval of the planters. Automatic withering has also been tried, but the objection urged against this is that it damages the leaf to some extent by rolling it prematurely, that is to say, before it is fully withered. These difficulties will, no doubt, be ultimately overcome, in which case the price of Ceylon tea which I understand is extremely low, may possibly be reduced still further."

## PRODUCE AND PLANTING.

**ALLEGED ADULTERATION OF CHINA TEA.**—A case of alleged adulteration of "caper" tea was recently heard at Manchester, when a grocer was charged with the offence. A sample of tea retailed by the defendant was certified by the City Analyst to contain  $\frac{2}{4}$  per cent of foreign mineral matter, principally sand and ferruginous earth. It was not alleged that the foreign matter was injurious. The defendant denied all knowledge on his part that the tea was adulterated. He suggested that the analyst had made a mistake, and asked that a sample might be sent to Somerset House for analysis by the authorities there. The magistrates acceded to this application, and adjourned the case for a month.

**THE DRAFT ALLOWANCE ON COCOA.**—In the cocoa sale room of the Commercial Sale Rooms, Mincing Lane, E.C., a buyer, before Tuesday week's sale commenced, proposed a resolution to the effect that in future, on all bags of cocoa exceeding  $1\frac{1}{2}$  cwt, 3 lb of draft should be allowed instead of 2 lb. Mr. T. L. Devitt, who was selling, asked whether anyone would second the proposition, but no seconder being forthcoming the resolution fell to the ground. Mr. Devitt in a few remarks expressed the opinion that any attempt to impose more draft or allowance on cocoa coming into London would be about the worst thing the trade could do. They at present suffered in London from excessive and old-fashioned allowances, which in many trades were being done away with, because they could not compete with Continental markets. He felt sure, therefore, that and proposal to increase the draft would not be favourably received either by "the room" or the importers. He imagined that the excessively weighty bags were a very, very small percentage of the cocoa which came to London, and to

meet buyers' views it would be a good thing when bags were over the usual weight that the broker should either announce it or print it in his catalogue. No further reference to the matter was made.

**PLANTING IN THE WEST INDIES.**—Steps are being taken in some of the West Indies to replace the sugar industry. In St. Vincent cocoa planting is making steady headway, tobacco is grown with success, and there is a local market for the beginners; coffee cultivation is gradually increasing, and arrowroot and caseava starch are grown with profit. In some parts of the Colony of Grenada cocoa and coffee promise well.—*H. and C. Mail*, Sept. 9.

## INDIAN TEA ASSOCIATION (LONDON).

The following is an abstract of the proceedings of a meeting of the committee held on Tuesday, the 6th inst.:

**Indian Tea Fund.**—Mr. Blechynden laid before the committee a specimen of a Japanese fan which was being distributed in the United States as an advertisement for Japan tea, and also submitted a letter containing his views and suggestions on the important question of preparing Oolong tea for the American markets. This object will have the farther attention of the committee.

Mr. Blechynden received final instructions from the committee on his approaching return of America, the chief point being that he was to spend a larger portion of the Indian Tea Fund this year in subsidies than last year, and before leaving he was desired to interview the chief firms whom he proposes to subsidise and to endeavour to form a plan of campaign that would meet their views.

A remittance of £500 was ordered to be sent to the Bank of British North America.

ERNEST TYE, Secretary.

—*H and C Mail*, Sept. 9.

## PLANTING IN FIJI AND OTHER NEWS.

(Extracts from the letter of a resident to a friend in Ceylon.)

I am asked to remain on—at Holmhurst—till 30th Sept. I want to get away just to have a look at the new place "Wai Ni Koro"—12 or 14 miles from Labasa—where the Colonial Sugar Refinery Co. have taken up 2,000 acres of land. Gemmel Smith (manager of the Company) does not feel inclined to let fellows lease lands from them (the Company). He told me that if it paid us to grow cane for their mills, they (the Co.) might as well have these pickings. However, if I can't come to terms with him I must cast about for something else—go into business perhaps. As for rubber, seven years for returns, sobu, sobu (too slow)! And coconut, with all our unfortunate experiences of tropical atmospheric outbursts, makes me pause. Fine place Ceylon, where you don't get these kind of things in so severe a form.

I think O'Brien (the Governor) has the *malua* (wait-a-bit) fully developed in his system, otherwise he would have struck long ago. I am sorry that the Federal vote in New South Wales was lost. For there was some hope held out that Fiji would have been included in the Common wealth after a reasonable time. Price of labour kills Fiji. And no one with capital will ever attempt anything here till the native policy is done away with entirely or modified.

MR. BENJAMIN KIDD ON THE  
CONTROL OF THE TROPICS.

We are indebted to Mr. Benjamin Kidd for an exhaustive analysis of one of the most vital of contemporary questions. In the three articles which he has contributed to the *Times* he has reviewed the various aspects which the relations of Europe to the tropics have successively worn, and has sought to draw from the survey the lesson needed for our own guidance in the matter. "The first principle of the situation," he tells us, is "the utter futility of any policy based on the conception that it will be possible in the future to hold our hands and stand aloof from the tropics." There are two reasons which make such an attitude impossible. The first is the extent to which our civilisation rests on the products of the tropics. The second is that the very unlikeliness between these products and those of temperate countries makes trade between the two regions mutually and increasingly profitable. The wants of civilised man are constantly growing, and the machinery for supplying them includes in its sweep a constantly increasing area. Whatever may be the future of the native inhabitants of the tropics, there is no question as to their present inability to meet these wants, except under the control of the white man. All that remains doubtful is the part that the several nations of Europe are to play in providing that control and the best method of applying it. Mr. Kidd enumerates three such methods. There is first the "plantation" theory. According to this, tropical territory is simply an estate "to be worked for the largest profit it will bring in." Native interests are not considered, except so far as attention to them is likely to promote the interests of the occupying Power. The second method rests on the assumption that what England has done in the way of colonising the temperate regions of the earth other countries may do in the tropical regions. Mr. Kidd regards this method as a "blunder of the first magnitude," since it involves the acclimatisation of the white man to tropical conditions,—an idea which has probably led to "more physical and moral suffering and degradation" than any other which can be named. In the end, however, this second method is simply a return to the first. The land waits for the white colonists who never come, and in the meantime it is worked on the "plantation" system. The third method is the English plan, which differs from the first in that it dismisses altogether the idea of working the territory for the exclusive benefit of its white possessors, and from the second in that it contemplates the development of the tropical colonies under native direction, the Power which represents civilisation being there only temporarily. This was the conception of the tropics which prevailed in England in the middle of this century. Of late we have come to see that this too is a mistake. The tropics and the tropical races are no field for democratic experiments. But we have had no other conception ready to put in its place, and we have "had therefore to witness the strange spectacle of the revival of the oldest, the most indefensible, and in theory the most reprehensible of all forms of government in the tropics,—government by Chartered Company. It was as if successive Governments in England had shirked the national responsibility,—as if they had said: We admit the error of the old idea about the tropics, but we do not know where we are. Let any authority undertake the work. Only take the responsibility off our hands!" With Mr. Kidd's historical survey we are in com-

plete agreement; when we turn to the practical conclusions deduced from them they may seem to require a certain amount of criticism, though here, too, we are in the main entirely with him. To go to India for life, and to go to India for a term of years, even a long term of years, are different things, and though the latter may, on the whole and in the great majority of instances, be far the better thing, it is not the same thing, and so may not have some of the advantages which the former system possessed. But, having in view this great majority of instances, we do not question the superiority of the newer method, or feel any doubt that "the one underlying principle of success in any future relationship to the tropics is to keep those who administer the government which represents our civilisation in direct and intimate contact with the standards of that civilisation at its best." No desire to give natives a larger share in administration should be allowed even for a moment to obscure this cardinal maxim.—*Spectator*.

PLANTING NOTES.

AMSTERDAM BARK AND QUININE MARKET.—Our Amsterdam representative wires us on August 25th that the result of the bark auctions in Amsterdam on that date was a decline in the unit of '14 Dutch cents per half kilo, the average unit working out at 4'06 (rather over 7.10d per lb.) against 4'20 at the last auctions.—*British and Colonial Druggist*, Aug. 26.

COFFEE.—If the tales from the Brazils be true, and not the work of speculators, the recent movement in coffee will ripen into a substantial advance—says the *Grocers' Journal*, Sept. 10. Frost destroying the bulk of the crop would be a serious thing, and result in a great diminution of supply, and a consequent heightening of values. Prices have now got down ridiculously low, and it would not do much harm if a reasonable rise did take place, at any rate in the lower grades.

LEMON GRASS OIL.—*Andropogon Nardus L.*, has been largely cultivated in Ceylon and Singapore for the production of this volatile oil, which has an "odour strongly resembling the sweet scented verbena or lemon plant of our gardens." It has some reputation in India for medicinal purposes. According to the following information its production and that of similar oils seems to have fallen into some neglect in the Straits Settlements:—Extracts from letter from Director, Gardens and Forest Department, Singapore, to Royal Gardens, Kew, dated February 16, 1898. "The decay of the Lemon-grass oil trade in Singapore has attracted my notice, and I am writing a few lines to try and stir up the cultivation again. It was chiefly, I believe, produced by one man, who had a distillery for citronella, lemon-grass, &c., a little way outside Singapore. He died a few years ago, and I fear the whole business is diminishing. I hope it may revive and that others will take these oils up. There is nothing more in the industry than ordinary distillation of anything procurable that will produce a saleable oil. With citronella, lemon grass, vetiver, pathouli, (pepper oil, a supposed native specific for cholera, had a great run during the cholera scare, it was a perfectly awful beverage I believe), Cajuput, *Cananga*, *Blumea balsamifera*, *Cassia*, clove, nutmeg, *Ocimum*, camphor, *Artabotrys* and a lot of other things might also be tried by an energetic distiller. The natives would buy them if no one else did."—*Kew Bulletin*.

"TEA PRUNING."—A veteran tea planter writes that on this subject,—“opinions now are just as diverse as they were 20 to 30 years ago.”

FLORIDA VELVET BEANS—A Veyangoda planter, to whom we sent a few seeds, has been more successful than the correspondents whose complaints we published on Saturday. He writes, “I first put down three seeds in a bed in the flower garden, two of which failed to sprout; the third is getting on vigorously as a healthy plant, but does not grow at the rate of three inches a day! The remaining four seeds I put down about a week after. Of these, three germinated; but one plant was nipped, evidently by a “blood-ucker,” and died. The other two are flourishing.”

"THE AGRICULTURAL GAZETTE" of New South Wales, Vol. IX. Part 7th. Contents for July, 1898:—Wheat Testing—A Description of the Mill; The Caterpillar Plague; The Flora of Mount Kosciuszko; Botanical Notes—Supposed poisoning of Sheep by Native Fuschia; White Cedar Berries; Methods of Common-Sense Farming; British Miller's Requirements in Wheat; The Importance of Drainage to Agriculture; Highland Cattle; Pure Water for Farmers and Dairymen; Economical Feeding; Fruit Inspection; Poultry Notes; Bees, and How to Manage them. VII.; The Production of Honey; Improvement of N.S.W. Live Stock; Bee Calendar for August; Orchard Notes for August; Notes for Northern Rivers District; Practical Vegetable and Flower Growing for August; General Notes; Replies to Correspondents; List of Agricultural Societies' Shows; Label for Specimen.

"THE QUEENSLAND AGRICULTURAL JOURNAL."—Vol. III. Part 2. The following are the contents for August, 1898:—Agricultural and Pastoral Conference; Maize-growing on the Darling Down; Wheat-growing; Cow-pea, the Coming Crop for Central Queensland; Coffee; Noxious Weeds and the Necessity for their Eradication; Agriculture—The Queensland Agricultural College; The Sweet Potato; Panicum in the Bundaberg District, J. W. Fawcett; Silos; A. Labour-saving Tool, P. MacMahon; Purchase of Cane by Density, R. Dupont; The Black Mauritius, A. A. Benson; Dairying; Viticulture; The Orchard; Botany; Popular Botany; Tropical Industries—Coffee in Queensland and other Parts; Coffee-picking at Cairns; Pisciculture; General Notes; List of Agricultural, Horticultural, and Pastoral Association in Queensland; The Markets; Orchard Notes for August; Farm and Garden Notes for August; Cultural Notes for Tropical Queensland; Publications Received; Public Announcements.

CEYLON AND CHINA TEA SOILS.—Mr. John Hughes of Mark Lane has been telling our London Correspondent that never before has he had so many orders for the Analyses of Ceylon tea-soils, and that the cause is found in the “poorer teas” now produced. Mr. Hughes has yet to see the indignant remonstrance against the supposed deterioration of Ceylon teas put forth by Messrs. Bagot, Metcalfe, Roberts and other planters in Upper Dimbula and Dikoya. It is noteworthy, however, that we have not seen letters to the same effect from districts which grew coffee for 20 or more years on their soils before tea was put in. It is probably from old coffee districts that Mr. Hughes has chiefly got his orders? And there can be little doubt of the need and value of manures in such cases. We do not see any advantage for the present in getting samples of China tea soils or analyses, to compare with ours in Ceylon. Unless the different climatic conditions, the difference of jāt, and the varying modes of cultivation were fully taken into account, any comparison would be almost useless,

COFFEE IN BRAZIL AND THE WORLD'S SUPPLY.—The Americans as the largest consumers, are naturally much interested in coffee and Consul Frank Hill of Santos furnishes a very elaborate Report dealing with Brazil chiefly, but also with nearly all coffee-growing countries, of which early proof sheets are sent us under date June 23th, 1898. The most interesting part to us is the introduction which is concise and well put:—

VARIETIES OF COFFEE AND COFFEE TREES.—Of the twenty-two varieties of coffee plants (a rubiaceae plant whose original habitat was Abyssinia), seven belong to Asia, eleven to the west coast of Africa, two in Central and East Africa, and two in Mauritius. Among the different varieties, the following may be enumerated: Arabia, Mocha, Myrtle, Aden and Bastard, Moorish; Marron, of Reunion; Mourouan, coffee of Gaboon; Saurine, yellow coffee (café amarello), red coffee (café vermelho); and the common coffee of Mexico and Central and South America. All these varieties are variously subdivided, taking name from the districts where they are produced or from ports whence they are shipped. For example, Brazil coffees are Rio, Santos, Bahia, Ceara, etc. The ordinary coffee shrub is an evergreen plant that grows to a height of about 20 feet, with oblong, ovate leaves. The fruit is a fleshy berry, having the appearance and size of a small cherry. Each fruit contains two seeds, embedded in a yellowish pulp; the seeds being enclosed in a thin membranous endocarp.

REGIONS SUITABLE TO COFFEE CULTURE.—The regions best adapted to the cultivation of coffee are well-watered mountain slopes, at an elevation of from 1,000 to 4,000 feet above sea level; in latitudes lying between 15° north and 15° south, although it is cultivated with success from 25° north to 30° south of the Equator, where the temperature does not fall below 55° F. Frost is a deadly enemy of the plant, and excessive heat hinders its normal growth. The low, hot lands of Mexico, the Caribbean Sea region—which produces the best cocoa in the world—and the South Atlantic are not adapted to its culture, the coffee lands in all these regions being found on the highlands that rise from the sea. On the American continent, coffee is produced all the way from Paraguay to Mexico; the Argentine Republic, while the United States, and Canada being either too far north or south for its growth. The shape, size, and color of the seeds are the points that determine the commercial value of coffee. The shape depends upon the particular part of the plant upon which the seed grows, the size upon the nature of the locality of the growth; and the color on the degree of maturity of the fruit at the period of gathering the crop. Brazil is the great coffee country of the world being credited with 66 per cent of the total product. Nearly all the twenty States that form this vast mesopotamia extending from the Amazon to the River Plate produce coffee; but the true coffee zone is confined to the States of Rio de Janeiro, Sao Paulo, Espirito Santo, and Minas Geraes, Sao Paulo being the banner coffee State. This coffee finds its outlet at the ports of Santos, Rio de Janeiro, and Victoria.

The most astonishing statement made is that Venezuela has now about 404,000 acres of coffee yielding 304,800,000 lb. (2,721,428 cwt.) of crop, of which two-thirds are consumed in the country! This part of the Report we are not prepared to accept as correct, especially as a good deal of the coffee is said to be young. Hitherto, the maximum estimate for the Venezuelan crop was one million cwt.; but nothing was said about home consumption. Still, we cannot believe that 9½ million Venezuelans consume 80 lb. of coffee per annum per head (man, woman and child). The thing is absurd!

Correspondence.

To the Editor

WEIGHING CEYLON TEAS IN LONDON.

Kandy, 13th Sept. 1898.

SIR,—I enclose for publication copy of a letter with enclosure, received from the Metropolitan Bonded Warehouse, Limited, London.—I am, sir, yours faithfully,

A. PHILIP,

Secretary to the Planters' Association of Ceylon.

The Metropolitan Bonded Warehouses, Limited, 9 John Street, Crutched Friars, London, 9th August, 1898.

DEAR SIR,—We invite your attention to the enclosed paper, copies of which we are mailing you under separate cover, which we put forth as containing, in our opinion, instructions in weighing on the Ceylon Gardens, which, if carried out, would show the minimum loss in conformity with the English Customs House Bonded Regulations.

However carefully we, or others, may carry out the weighing in the face of these Regulations—there may frequently be a larger loss shown than is necessary unless the planter understands the same, and makes his weights accordingly. Of course it will be for him to decide as to whether le jen vantla chandelle that will depend upon the value of his tea no doubt. It is evident that the Warehouse keeper can in no way guarantee weights, we can only deal with the packages as they reach us, and very often indeed have to record a quite unnecessary "Shortage" upon invoice weights, owing to the want of a system on the gardens.

Of course superintendents can ascertain from their Colombo Agents whether their teas are generally rebalcked in London or not. We must add that our reason for thus coming before you and our only interest in the matter is the hope of being of some service to our planting friends in Ceylon, and we would ask you kindly to distribute the circular among the members of your Association at your next general meeting, and we shall be glad to have the consensus of opinion upon the subject.—We are, dear sir, yours faithfully,

THE METROPOLITAN BONDED WAREHOUSES, LT.

(Signed) LESLIE MARGETTI, Secretary.

A. Philip Esqre, the Secretary, Ceylon Planters' Association, Ceylon.

THE LONDON CUSTOMS' SYSTEM OF WEIGHING CEYLON TEAS.

(Instructions showing how to reduce the Loss to a minimum)

In order to avoid the loss usually experienced in Ceylon from the system of weighing in vogue by the London Customs authorities, viz., to give the turn of the scale against the importer, both on gross and tare, the following hints will prove of value to Proprietors and Superintendents of Estates.

1. The Tare (that is the weight of the empty package, complete with lid, lead, hoop-iron and nails) should in all cases weigh two to four ounces under the pound, whether the package be chest, half-chest, or box.

2. The gross weight of a package must in all cases weigh three ounces over the pound, whether the package be chest, half chest or box.

3. When a shipment of tea is not to be "Rebalcked" in London, the Customs' authorities "Average Tare" the break, that is to say a small percentage of the packages are opened and their tares ascertained, and from these an "average tare" for the whole break is struck. In this case it is imperative that the tare of each package weighs alike.

4. When a shipment of tea has to be "Rebalcked" in London, the tare of each package in the break may vary, provided the tare of each package is 2 oz. under the lb.

Subjoined is an example of the correct method of weighing two packages said to contain 100 lb. tea each, which have to be rebalcked in London.

GARDEN WEIGHTS, CEYLON

	Tare.	Tea Nett.	Gross Weight.
No. 1.	27 lb., 14 ozs.	100 lb., 5 ozs.	128 lb., 3 ozs.
No. 2.	28 " 12 "	100 " 7 "	129 " 3 "

CUSTOMS WEIGHTS, CEYLON.

	Gross Weight.	Tare.	Tea Nett.
No. 1.	128 lb.	28 lb.	100 lb.
No. 2.	129 " "	29 " "	100 " "

The two examples above will demonstrate the point, in as much as in No. 1 the loss is 5 oz. only, which is the least possible, while No. 2 shows a loss of 7 oz., owing to the slightly lighter tare.

5. The following is a very usual but incorrect way of weighing teas, possibly through faulty scales or weights.

GARDEN WEIGHTS, CEYLON.

	Tare.	Tea Nett.	Gross Weight.
No. 1.	27 lbs. 3 ozs.	99 lbs. 12 ozs.	126 lbs 15 ozs.
No. 2.	28 " 1 "	100 " 13 "	128 " 14 "

CUSTOMS WEIGHTS, LONDON.

	Gross Weight.	Tare.	Tea Nett.
No. 1.	126 lbs.	28 lbs.	98 lbs.
No. 2.	128 " "	29 " "	99 " "

The Customs do not recognize ounces. With regard to Example 1, this package the gross weight of which the Superintendent makes 126 lb. 15 oz., would only be called 126 lb. in London, the tare, according to the Superintendent, is 27 lb. 3 oz., over here the 3 oz. would be called 1 lb., and the tare is called 28 lb. The 28 lb. tare is deducted from the gross weight of 126 lb., with the result that the amount of tea in this package is said to be 96, the owner of the estate losing the 1 lb. 12 oz tea, which may quite possibly be in the package.

A still larger loss is to be seen in Example 2, in which the Superintendent has packed 100 lb. 13 oz. of tea, but only gets paid over 99 lb., the difference going into the pocket of the retailer.

6. A most important point is to have the weights of the weighing machine, used on the estate constantly checked, and for this purpose a set of test weights should be kept. A beam scale is to be preferred to a platform one, as the former is the more accurate.

7. When a Superintendent, to equalize the tares of his packages, adds pieces of lead or wood for that purpose, the material so added would be fixed inside the package, so as to prevent it falling out when the package is opened in London.

8. A Superintendent may "tare" and pack his teas with the greatest care, but if he afterwards permits his carpenter to place away from the top of the package before nailing down, all his careful work will be wasted.

The Metropolitan Bonded Warehouse, Ltd., Crutched Friars, London, June, 1898.

CEYLON TEA IN AMERICA: FAVOURABLE REPORT.

Ebor House, Colpetty, Colombo, Sept. 16, 1898.

DEAR SIR,—I am in receipt of the tabular statement from the United States Department of Agriculture sections of foreign markets, Washington D. C. showing the tea consumption in the United States for each fiscal year from 1860 to 1897. Knowing the vital interest that tea is to the people of the island in general and many in particular, the appended statement cannot be but of interest to such, showing the ever-increasing demand for tea, particularly from 1895 to 1897, and indications point to a more surprising statement for 1898. Information gleaned from private parties who have used Ceylon teas is very encouraging. The habit of afternoon tea is not confined to the wealthy class as in former years, but

is becoming an established custom among the poorer class. Although the nature of the American will not permit of stopping factories for afternoon tea (as in England), the employees have the privilege of taking their beverage while at work, and what is more cooling on a hot day, and if in winter time they can readily heat their tea on the steam pipes (used for heating purposes) to be found in all factories. I think the future of Ceylon tea in the United States most promising, and that Ceylon planters have a great market to compete for.—I remain, yours truly,

G. C. WARR.

CACAO AND ITS FUNGUS ENEMY.

Sept. 16.

SIR,—You may perhaps think the following remarks about the fungus attacking the cacao tree of some value. When sharing the mistake that the damage was caused by a beetle (*Tomicus perforans*) I applied to the trunk of many trees which did not seem attacked, a coating of margosa oil. With the exception of three of them on which the effects of the fungus showed themselves a few days after the application, the parts of the trees so coated have remained immune.

Bringing this together with the fact that some varieties do not seem to offer a field of culture to the spores of the fungus, I am led to think that the oil has put the bark of the criollo in that state that the spore cannot settle or grow on it. Of course any common oil, the cheapest to be found, would probably be efficacious.

Mr. Carruthers might perhaps think it worth to test this prophylactic.—Yours truly, A. V. D. P.

POULTRY FARMING AND NATIVE APATHY.

SIR,—The number of steamers calling at this port is daily increasing, and as a result there is a great demand for all food stuffs, and prices have considerably risen. Poultry alone has risen in price fully 50 per cent. and eggs the same. At present the dubashes supplying ships send men into the interior and buy up all the fowls and eggs they can. Every steamer leaving the port takes away large numbers of fowls and large numbers of eggs; so that local consumers are at a great disadvantage. It is surprising that local capitalists do not take to poultry-rearing on a large scale. It is an enterprise, which, if carefully managed, is sure to yield good returns. One great drawback is that they have not yet (except in one or two instances only) commenced the use of artificial incubators, as they largely do in India. The experiments of a gentleman at Kurunegala with these incubators have, I believe, to a certain extent been successful, and there is no reason why others with capital and improved modern incubators should not command success. The disinclination on the part of young native gentlemen to strike out in this direction is, I believe, that they consider it to be beneath them! They ignore the fact that their fathers and forefathers earned their curry and rice, by the sweat of their brow at the plough, in their ancestral paddy fields. Let them put their pride in their pockets and go in for some lucrative trade, such as poultry farming, whereby they may accumulate more wealth, instead of squandering what their parents have left them, and leave the next generation wealthier and better members of the community.—Yours truly,

C.

TEA PRUNING.

Northern India, Sept.

SIR,—I have not yet seen the letter of "An experienced Planter," who says that he has carried out some of the suggestions (in my last letter) for some years and does not approve of them, and has found other treatment successful. I shall have done some good if I gain for the public the experience of a man who *thinks and tries*.

I offered my experience, only as an alternative to cutting down tea bushes. It will do some good if it induces Planters to refrain for a year or two from cutting down a block of tea. My idea is that tea is cut down for the benefit of a few seasons, at the expense of the general good of the estate, and that the less severe the treatment of tea bushes, the better they will repay the care given them.

I have seen today an admirable illustration of my theory. An old bush has got one straight stem, about  $\frac{1}{2}$  of an inch in diameter; it is uncut from the ground to the height of 2 feet, above 2 feet it shows two prunings. The growth on this stem is fully 18 inches since the last pruning. The growth on the rest of the bush is barely 12 inches in the same time. I have got only this one straight stem because I have not as yet systematically cut out old wood—the old stems on this bush have all been pruned several times and have probably been cut down twice, but they are still too good to sacrifice. Now that I am convinced of what was only a theory, but has been proved by experience I will cut out some wood from each bush at each pruning. I look forward for the letter referred to, and I shall be able to judge whether the "other treatment" will suit my garden.

I found this place a mass of gnarled stems, I fancy that about 30 per cent. are straight and clean now (which I have allowed to grow), and within five years I hope to have all the stems straight and uncut up to the yielding point. During these five years I have to increase the yield, to keep pace with a falling market, or make much finer tea of the same amount. The question is, shall I do this more easily by cutting down  $\frac{1}{5}$ th of the estate yearly, or by my present method of preserving the

yielding surface and removing the least useful wood from each bush. This point is worthy of one of your circular letters, by which you get the opinion of many practical men. Letters of this sort will do us more good than Chemical Experts.

The second letter which I find in your *Tropical Agriculturist* of August 1898, by one "Willing to try" shows me that I have set men thinking, and thinking also will do more for us than "Experts." In this letter my system is said to be "New" but it is not new. I got all the ideas from the *Tea Cyclopædia* of 1881. I have published not "a new system" but my experience of say four years of a common sense system. Take for instance one sentence on page 88 of the *Cyclopædia*:—"We must never forget that the severity of a surgical operation is, except perhaps in the most desperate cases, always proportionate to the stamina of the patient. Similarly when contemplating how bushes are to be pruned, we must never forget to proportion the severity of the cutting to the condition of the bushes and the richness or poverty of the soil."

This hit my fancy, and I said that I would try. I found bushes which were rapidly becoming pensioners. I gave the old things a quiet time, more cultivation, no cutting down and really the effect is very good. You can cut down a plot of tea on good land and perhaps increase the yield, but in my opinion that plot will never again give the same average yield from year to year.

I did not intend to offer advice to men who have good tea bushes and good soil, but still I think that the best tea treated as I suggest from the beginning, and supplied with labour sufficient to take all the leaf produced would not stop short of 1,600 lb. per acre.

My garden yields 350 lb. of good tea per annum per acre. If it had been treated from the first on my present system it would give now fully 800 lb. per acre of the same leaf. Some of the bushes are splendid, and yield even now at rather more than this rate. With all the bushes equally good, I would have 90 per cent of the possible "plucking area," now I have barely 50 per cent of the ground covered by leaf. The good yield would have encouraged better cultivation and probably manuring; in fact this Company would have been made fully four times its present value. And the reason is that each man who worked it worked for the season, and not for the welfare of the estate. And I also believe that this is the reason why cutting down has become universal, so much so that it is hard to find a single instance of a tea estate that has not been cut down several times.

I may be utterly wrong, and perhaps the universal practice is the right one, and perhaps I myself may find in course of time that cutting down is necessary, but I have no doubt myself that I am right, and for this reason I believe that my experience will prove useful to many men, particularly to those who are taking charge of old gardens and who contemplate cutting down as the only remedy to renew the yield of the bushes. Cut down the whole show if you can afford to give it a rest and let it grow again before you pluck it, so that the following year you can prune the bushes to 2 or 3 feet and after that never cut down again. If you can't afford to wait for new bushes, then cut out a percentage of the worst wood yearly, and let the new wood growing up from below, be pruned as high as possible so as to give the greatest possible surface to the bush. Here is another hint from my old friend—"For each well-developed new stem cut out the worst or least productive stem. In this way a bush may be renewed in a year or two instead of butchered in five minutes"; and another: "It may be taken as a general rule that the higher the class of plant, i.e., the nearer it approaches indigenous (and the furthest from China) the more sparing one must be with the pruning knife. I trust that no one will accuse me of suggesting that my system of pruning will give 1,600 lb. of tea per acre from an average garden and with average labour for plucking.

The following will be a useful

TABLE OF THE LABOUR REQUIRED FOR PLUCKING :

		8 months for plucking=240 days			
		1	2	3	
		cooly.	coolies.	coolies.	
Per acre	Tea Leaf	ings			
400	1600	24	34	17	11½
800	3200	24	68	34	22½
1600	6400	24	136	68	45½
400	1600	48	17	8½	5½
800	3200	48	34	17	11½
1600	6400	48	68	34	29½

Referring to the above it will be seen, that given one cooly per acre, who can pluck 34 lb. of leaf at intervals of 10 days, the acre will yield 400 lb. of coarse tea. Also that with plucking at intervals of 5 days one cooly per acre on an average of 17 lb. of leaf per cooly, will give a yield of 400 lb. of fine tea. It would require a good acre to yield every five days, but such tea is not at all uncommon. But when you come to the 1,600 lb. per acre it is seen that at intervals of 10 days (i.e. for coarse tea) one cooly would have to pluck 168 lb. of leaf. Two coolies plucking 68 lb. each would do and be practicable off a very fine plot of tea. But, to get 1,600 lb. of fine tea per acre would require at least 2½ coolies per acre as an average i.e., at some seasons the plot would yield no more than 20 lb. per cooly, and during the rushes it would give 40 to 50 lb. per cooly. You must have the best of bushes, and the best of coolies, and lots of them.

To conclude I may state that this system of Pruning is of special value against the effects of drought. The bad effects of hard cutting are apparent according to the severity of the droughts. In the Doocars, a bush can be cllar-pruned and be a bush again in a few years, but it seems to me such a waste of everything to spoil a good plucking surface instead of preserving it intact and using sensible methods.

I hope soon to see a letter advocating the periodical cutting down of tea bushes.

Between the two opposite systems we shall all gain some good lessons—and be guided chiefly by our circumstances. But at any rate more of us will know what we are doing and not be ruled by convention. 1874.

MINING PLUMBAGO AND OFFICIAL REGULATIONS.

Sept. 17.

DEAR SIR,—The information you give under the above heading in your issue of 14th inst. is very interesting. It is much to be feared that many clauses of the "Mines and Machinery Ordinance No. 2 of 1896" are more honoured in the breach than the observance. If the clauses you quote as to the opening and working of mines are conscientiously obeyed, the Government Agents of more than one Kachcheri should by this time have imposing piles of notices. You do not mention what the penalty is for breach of these clauses, nor whether any reward is offered to informers (I infer there is none). I could tell you of more than a score of pits that have been opened in one district within the past six weeks: most of them, if not all, I feel sure without notice being given. This promiscuous digging is often done with the encouragement of the wealthy owners of old-established pits. As one of your correspondents recently pointed out, these gentlemen have now joined the ranks of the illicit receivers and are ready to buy any plumbago brought to them without caring to enquire whether it is stolen or not. This ought at once to be

stopped. As matters now stand, plumbago is not seldom dug on private lands without owner's knowledge, the diggers sometimes being merely catspaws of the gentry above alluded to.

Is there not a clause in the Ordinance compelling the owners to protect their pits with fences? I ask because no mention of fences appeared in the Mining Inspector's (unauthorised?) report a few months ago.

While on the subject of Ordinances it occurs to me to ask why the Government when, after much debate, they have added a new law to the statute-book, do not take the trouble to give the public some information on the subject. It may be bought, of course, from lawyers (at considerable expense); but the publication of each new Ordinance *in extenso* as a supplement to the daily papers would prevent a good deal of what the law regards as sinful behaviour. The Government does not even take the trouble to advertise its literary productions, and not ten per cent of the public know to whom to apply for copies of any Ordinance they may require.—Yours faithfully,

CRITICUS.

[A supply of Ordinances affecting the general public should be available for sale at each kachcheri.—Rules were to be made by the Governor in Executive Council under No. 2 of 1896; but in respect of Mines, have they appeared? Meantime as regards penalties we quote:—

6. Any person who shall open, work, or use a mine before furnishing the declaration required by sub-section 1 of section 3, or in breach of, or in any way contrary to, the provisions of this Ordinance or of any rules made under section 4, or who shall fail to furnish the further declaration required by sub-section 2 of section 3, and any person who shall hinder or obstruct any inspector when inspecting any mine or factory, or the machinery of any such mine or factory, under the provisions of this Ordinance or of any rule made thereunder, and any person who shall refuse or neglect to execute any work after receiving notice in writing in that behalf, and any person who shall keep any mine or factory in an insanitary state or condition, or without insuring the due ventilation thereof, and any person who shall commit any breach of any of the rules made under this Ordinance, shall be guilty of an offence, and be liable on a first conviction to a fine not exceeding fifty rupees, or to rigorous imprisonment for a term not exceeding three months, or both; and on every subsequent conviction to a fine not exceeding one hundred rupees, or to rigorous imprisonment for a term not exceeding six months, or both.

7. No prosecution shall be entertained for any offence under this Ordinance unless the same is instituted within six months from the date of the commission of the offence.

8. It shall be lawful to the court imposing a fine under the provisions of this Ordinance to award to the informer any share not exceeding a moiety of so much of the fine as is actually recovered and realized.  
—E. C. T. A.]

#### BUYING GREEN TEA LEAF FROM NATIVE GARDENS.

Ambagamuwa, Sept. 22nd.

DEAR SIR—I am positively certain that most factories from Peradeniya to Kaddawella have made little or nothing by buying native tea leaf during the past eight months of the year, in fact you may say since the inflated rupee began to play a prominent part. I will just quote an instance. We will say T's Factory buys leaf at six cts. a lb. Taking the year all round it would take a little more than 4 lb. gross leaf to a lb. of made tea—let us put it down 25 cts. a lb. of made tea. It costs T's factory quite six

cents a lb. to manufacture and lay down in Colombo—total cost 31 cts. Add to this 7 cts. for London charges and this works, out at 38. Tea realizes 6½d at 18 ½d equal to 33 cts. loss in weight in London—a mere detail! Even supposing T gets 7d he has a bare 3 cts. to pay for wear and tear of machinery. The only solution to this purchasing leaf system is for all factories in the vicinity I mention clubbing together and fixing the price month after month at a paying rate, each factory pledging itself not to harbour his neighbours constituents, leaf purchasing factories have the game in their own hands.  
C. T.

#### COST OF RICE AND EXCHANGE.

DEAR SIR,—You allude to the "striking" figures put forward by "X." in *Capital* (Calcutta.)

Yes, they are striking certainly; but quite in a sense opposite to the conclusion "X." draws from them. In fact they only prove the correctness of Mr. Lloyd's assertion which "X." so airily impugns.

They show conclusively that for the whole period between 1871 and 1890—a period of 20 years, during which the index of exchange fell from 16 23 32nds to 185 45 96ths—the index for rice was from 194 15 to 194 41. This shows that rice during the last half of that period was as steady as a rock, but if anything slightly cheaper than during the first half!

The figures for the decennial periods 1891 to 1900 are yet incomplete, and of course "X." could not give them; but even as far as they go, they are suggestive when we remember the course of exchange.—Yours truly,

MERCATOR.

#### THE FIRST WAGTAIL.

Lindula, Sept. 23.

DEAR SIR,—I noticed the first "wagtail" of this season yesterday afternoon, the 22nd September, and hear that one was seen on a neighbouring estate on the 19th inst. This is very early for this pretty migratory bird. He is a sure precursor of the N.E. monsoon.  
T. D.

#### TEA—INDIA AND CEYLON.

SIR,—I think your Thirty and P.A. Committees should use all the power they have got to get planters to send in quality instead of quantity. Transport, Rail freight, Colombo charges, Ocean freight, London Warehouse charges, are the same on a 1/- tea as they are on a 6d. one. See the grand prices that are being paid for Indian teas, but look at the splendidly prepared teas they are compared to Ceylon. It is simple nonsense to say that quality will not be paid for. All I know as to this is that I have to do so. And if experience is purely practical, W. G. I. from Ayr, writing the other day says,—"Cau't you send me some of the tea we used to get five and six years ago."—Yours truly,

TEA DEALER (Ex-Ceylon.)

TEA IN JAVA.—Mr. A. E. Wright has had a very pleasant trip to Java on the present occasion and he has been impressed with the goodness of the tea, generally in the rich soil of that country. Java tea planters are becoming very particular about jāt and factories with the best machinery are becoming available. So let intending planters of more tea—beware

## MAKING GREEN AND UNFERMENTED TEA FOR AMERICA:

PROPOSED BY A NEW YORK BROKER  
IN 1881 AND SECONDED BY THE TEA  
ASSOCIATIONS IN 1898.

### THE PROBLEM.

Within 2 years to displace 40 million pounds of tea from our London Market, and place this amount at a profit on the American market as an annual demand.

### INDIAN TEA IN AMERICA.

"In giving you such information as I possess relative to Indian teas in this country, I would say that of late there have been many efforts made to increase its consumption, and I believe these efforts have been to a certain limited extent successful. I say 'successful' and yet with 'limited' because with the present taste of the American public, there would appear to be little hope of the distribution of the ordinary Indian black tea, say, Congou, Souclong, and Pekoe, ever being other than limited, its use probably being confined to mixing with low grade black China teas. In taking up your questions as asked, 1st as to the best kinds of teas to send, of course this is the all important question, and perhaps the answer that will convey the best idea to you will be to give you approximately our consumption of each kind.

Japan estimated roughly at	34,000,000
Green " " "	16,000,000
Formosa Colony " "	10,000,000
Amoy and Foochow Colony	6,000,000
Congou " " "	4,000,000

"Now your Indian tea approximates most closely to Congou, which has the smallest consumption of all, and is indeed almost confined in its use to two or three of our large Eastern cities. You will note that Japan supplies about one-half of our wants; it is THE tea of the country, completely eclipsing 'Green,' although in itself it is really nothing more than a green tea. People have got the idea that it is uncoloured, at all events it is taken in all sections, and is increasing in popularity.

"Now the suggestion I have made is this: The Japanese have endeavoured to manufacture a Congou that shall compete in the English market with China tea, and failed badly enough; but the tea they produced certainly approximated in many of its characteristics to an Indian tea, lighter and thinner in the cup, but of similar character.

"Now why should not Indian Planters manufacture a tea that should compete favourably with Japan in this market?

"It will be necessary to bear in mind the necessity for a light-coloured liquor even at the expense of 'body.' As to the size of breaks, it might be well to begin with 25 to 50 half chests; if successful, these might be increased 150 to 200 half chests. The packages should resemble the usual American order package weighing about 70 to 75 lb. gross, tare 15 to 17 lb. papered, matted and rattaned. The expense will be refunded by the extra price, but great care should be taken that they run to even weights to save loss in taring.

"It is a fact worthy of the attention of Indian growers that 18 years ago, the teas of Japan were scarcely known in the American market, and now the consumption of them amounts to

over 34,000,000 lb. As Indian tea is intrinsically superior to Japan produce; the future of Indian tea in America ought to be undoubted, seeing that our consins are 'cute enough' to know a genuine article when they see it."

The above is an extract from a letter of a leading New York Tea Broker, and I have extracted it from the "Indian Tea Cyclopaedia" published in 1881.

The words sound as if they should have been uttered by Mr. Blechynden, who recently said that his views had changed, and he was now of opinion that a great deal was to be said in favour of the preparation of green tea, and he thought it was a matter to be brought permanently before the attention of planters.

It is useless now to search for the reasons of those who firmly opposed the idea five years ago, when the matter of the American campaign was so prominent.

In studying the subject, I referred to my old friend, the Tea Cyclopaedia of 1881 and the letter which I have given above struck me as the only rational method of gaining our object. In 1894 I gave my views in the *Ceylon Observer*—13 years had already been lost, and now another four have passed and at last we are reduced to the necessity of giving way; of humbling our pride to such an extent as to give people what they want, and not to force them to take what we design to supply.

Here is no necessity now to urge the making of suitable tea; "Norwood" tea has sold for 80 cents, and all the tea world will rush to make 80 cents per pounds.

It is time now to say. "steady—boys—steady"! Let us think out our problem; and go for it, bearing the end in view.

Our end is to place at least 40 million pounds of suitable tea permanently on the American market within a space of two years. Mr. Mackenzie suggests that some support might be given to the producers of this green tea, in the form of a guarantee against loss in its experimental preparation.

Logically then, Mr. Mackenzie, you should suggest that those who gain largely by these experiments shall contribute a share of the gains to the good of the new departure! Witness "Norwood" tea. Both these suggestions would be fulfilled by putting the experimental tea into the hands of an Association formed for the purpose of selling the new teas, and also for giving instructions in the art of making suitable tea.

We have got to wake up. The Proprietors, the Managers, Assistants, Associations, all have to wake up and decide once for all to make sure of gaining our end.

In four years, we find that we have placed 10 million pounds of tea in America, are we to go on wasting money and time on a rotten venture.

Until the fact is accomplished each individual must give up the idea of individual gain, and work merely for the general good.

We have wagged our heads and opened our purses to no effect so far and will it be said of Britishers that we have "failed" and can't see our way out of the wood?

I am anxious to see the Programme which will give us some hope that 16 thousand tons of our tea will be taken by America in addition to the small amount of black tea which Mr. Blechynden has removed from our shoulders with the help of pictures, lime light, and quenching the thirst of women's meetings. The failure is not his fault, he

carried out his orders admirably, but it was not "business." Time is of the most importance to us.

We must take steps to enable us to place the required bulk of tea on the American market in a short time, the Association must canvass for support, and awaken the interest of proprietors and tea planters.

The Association will (I feel sure) publish a pamphlet showing the admirable success of the small attempts made up to date. It will show how to make the tea which is required, and will circulate the pamphlet gratis to every one concerned.

The Association has two works to carry out. It has to induce Planters to make 40 million pounds of tea, and it has to induce the dealers to take this enormous mass of tea.

Common sense will dictate that by leaving the venture entirely to private, and unguided enterprise, the required bulk of new tea cannot be made within a reasonable time. Also it is very evident that we shall have to afford the dealers every facility, and give them tea, not only of the required quality, but in the quantities and packages they have been used to, and also under the same trade conditions as regards credit, &c., &c.

I heard of "Norwood" tea for the first time in the report of an Association meeting held in July, and by this time instructions how to make it, and any other sort of "American" tea should have been in the hands of every Planter. Calculate the amount of "new" tea already sent to America in proportion to the time we have (2 years) within which our task must be accomplished. Take the time—24 months—and the quantity—40 million pounds—and consider that as yet no step has been taken to place suitable *British* tea on the market.

Here am I, and hundreds of other planters ready to help; why have we not as yet been asked for help? Are any of you going to keep this show private? Are any of you going to find out how to make Norwood tea so as to benefit by high prices before the ruck of us come to spoil your game?

#### "THE ADVANTAGES OF MAKING GREEN TEA."

The chief advantage will be that with the same quality of leaf from which you now make 50 per cent of tea which will pass through a No. 12 sieve, you will get at least 80 per cent of the new tea through the same sieve.

In other words you will have 80 instead of 50 per cent of "Pekoe" grades, and 20 instead of 50 per cent of Souchong grades which include the broken tea. The reason of this is that the lightly fermented and green teas are rolled while hot. The rolling and firing are alternate, and the leaf gets more and more sticky. At length it gets so sticky or gummy that each folding of the leaf is firmly held.

In cold rolling (as in black tea) there is not sufficient gum developed, or rather the gum is too diluted with water, to make each folding stick tightly. Consequently in hot rolling the leaf, becomes very much more tightly folded up, and of smaller grade than in cold rolling.

I once made a sample of hot rolled tea which sorted out 80 per cent of Orange Pekoe, *i.e.* of tea which went through a No. 14 sieve. But the ordinary cold rolled black tea, from the same leaf gave me only 18 to 20 per cent of tea of No. 14 grade; but at that time there was no demand for that sort of tea.

Another advantage is that by the help of warm air the leaf takes much less power to make up with tightly curled and twisted tea.

I anticipate that within a few months (say 15 from now) we shall see the first green tea making machine; which will probably take the form of some way of supplying hot air into our present rollers. And for teas which are made by panning some form of alternate squeezing (or washing) and throwing the leaf against red-hot vertical iron plates, or forcing the leaf along an incline of red-hot iron, by means of an air draught.

I had a sample of Oolong tea (about five years ago) which showed evident marks of having been made on red-hot iron. Patches of brown could be seen on most of the leaves which were otherwise various shades of green. (I mean of course the infused leaves).

It is highly probable that most of us will be able to make "Green" teas in unsuitable weather, and black tea in good weather. At the present time this is just about the proportion of tea which we want to sell to America. About one-fifth of our leaf is spoiled for want of withering accommodation and the "New" teas do not require to be withered as the first process. The withering is done by heat, and the whole process of rolling and firing is much shorter than for black tea.

At present, black tea made from half-withered leaf is mixed up with tea made from well-withered leaf; and thus many of our biggest invoices are spoiled. If we can dispose of our unwithered leaf as green teas, our black teas will be much improved in quality. If this is true there is a bad time coming for London dealers; because they will have to pay us for improved quality and also for decreased quantity. I would solemnly advise the buyers to pay an anna or two more now, when our teas are cheap.

The greatest of all advantages in making silver tip tea will be that we shall not be able, at the beck and call of London, to withdraw the tea from America and sell it in London. Every rise in prices has caused a deficiency of supply for foreign markets.

London wants tea, offers higher prices, and the supply of foreign markets is withheld. Now that we are going to make tea FOR America, every pound that is made *will* go there. And so the American demand will probably rise by leaps and bounds instead of up one step and down two steps as before.

The Bombay markets are supplied by estates whose tea is not saleable in London.

Bombay offers better prices for these teas, and gets all it wants, and the demand increases steadily.

#### "GREEN" TEA.

Most "green" teas are "faced," or painted with a surface colour to make them look green. The reason for this must be that there is a superfine tea which is really green, and the price of this is so very high that the 'cute Chinaman (rather Jap.) painted ordinary teas of good quality to induce purchasers to pay more for them. If you place a tea leaf, fresh from the bush in perfectly dry hot air of about 150° to 180°, it will become desiccated and remain a vivid green colour. If you bruise the leaf it will dry up with various shades of green to black according to the severity of the bruising. And so I imagine that real green tea is made from fine leaf, treated so very delicately that it becomes rolled up like tea without being much discoloured. And then if you happen to have

good aroma and flavour in the leaf (as in Darjeeling) you could make superfine "green" tea. Of course with a bull dog jam-ram contrivance like our rolling machine it will be impossible to treat our leaf so delicately that it will become tea and remain green. But we shall be able to imitate the Oolongs and semi-green teas, which are wanted in large quantities. Real green tea, probably requires the gentle touch of a maiden's hand, and not 12 to 40 horse-power to call it into existence.

At one time of the year, between May and July, the tea bushes in Assam are liable to what is called "stunted" flush. The shoots are very thick, short and solid, the stalk zigzags between each leaf (just like the vanilla stem.)

When the blight is very severe the shoots are very small, and come out in clusters, as many as 60 in a bunch. The yield falls off, but the leaf is peculiarly rich in quality.

It is possible that real green tea is made from leaf of this description.

The green fly is supposed to cause "stunted" flush; it is known in Sylhet but never affects the flush to the same extent as in Assam. In 1886 I made tea in Sylhet which had a strong Darjeeling aroma, from stunted flush.

We should never forget that we want to lift 40 million pounds of tea from London to America and that to do so we must have no "maiden's hand" business, but put our horse-power into the job. "Green tea" is a misnomer, and we want some short term to express our intentions:—

Light Indian Tea }

" Ceylon " } would do fairly well.

Indian or Ceylon "Silver Tip" would sound well for the finer grades, as all these teas have silver (instead of gold) white " " " yellow } buds or tips.

" Indian China," or " Indian Japan tea " would be honest and would probably show the Americans that our China tea is better than that from China and so induce them to favour it.

#### ASSOCIATION.

Mr. Mackenzie is in America, get him to send samples of required tea to every tea planter, and if possible get him to send directions with each sample stating whether the tea was panned, or made over open charcoal fires. Appoint an American broker to value gratis every sample of tea sent to him, and ask him to give advice as to quantity of tea to be sent in a break, and the form of package. Then appoint a Committee to receive funds and to do all the business with the dealers, and the factories. That is to say to advance to the gardens on their teas according to the valuations of your broker, and to allow credits to dealers and collect dues, and to pay up balances due to gardens.

40 million pice represents 6 lakhs and 25,000 rupees. Surely this would be enough to pay the broker and the Committee, and any losses on tea, and free samples and pamphlets, &c., &c. If the plan succeeds we shall gain about four pice per pound on our whole crop. And what is the alternative to doing the work ourselves? It is that we shall pay at least four pice and probably eight pice per pound to intermediates. We shall have to find out (after many failures) what is wanted, and how to sell it, and it will take us at least five years to get 40 million pounds of "American" tea on to the American market, as an annual demand. And if we leave this project to individuals and the fate of chances it is quite certain that a very large bulk of ab-

solutely bad tea (which will result from want of knowledge in new methods), will be foisted on the market, and give our tea a bad name to start with. But under professional guidance, the dealers will be able to get good tea from us, and in large quantities, and it will be their own fault if they dabble with small parcels of inferior tea sent by those who will not join the Association, or who have been turned out of the Association for their inability to make the tea that is required. A. C.

#### THE LARGEST RUBBER IMPORTS YET.

During the fiscal year ended June 30, 1898, the imports of crude India rubber and Gutta percha into the United States were larger than in any corresponding period in former years, while the declared value was even more in excess for former figures. The official statement follows:—

	Pounds.	Value.
India-rubber .. ..	46,055,693	\$25,356,010
Gutta-percha .. ..	636,477	159,331
Total .. ..	46,692,170	\$26,545,391
Total 1896-97 .. ..	36,692,114	\$17,558,183
" 1895 96 .. ..	40,618,314	16,781,533
" 1894-95 .. ..	41,068,401	18,475,382
" 1893 94 .. ..	34,255,556	15,162,333
" 1892 93 .. ..	42,129,958	17,964,667
" 1891-92 .. ..	40,284,444	19,833,090
" 1890-91 .. ..	34,672,924	18,020,804

The official returns show the average value of India rubber (exclusive of Gutta percha) imported during the last fiscal year to have been 55.1 cents per pound, as against 42.8 cents per pound in the fiscal year 1892 93, or five years ago.—*India Rubber World* Sept. 1.

#### FLORIDA VELVET BEAN.

Under this name a leguminous plant has been prominently recommended in American journals as a forage plant and as admirably adopted for green crop manuring. Recently the beans have been offered for sale in this country. As frequent references have been made to Kew, it is desirable to place on record what is known of the plant and its capabilities. As to its identity, it was from the first conjectured that the seeds belonged to a plant very near the common purple-flowered Cowhage or Cow-itch plant of the tropics, *Mucuna pruriens*. The difficulty, in the absence of adequate specimens, in identifying it with this was the fact that in the cow-itch plant the pods are deusely covered with stinging hairs of a brownish colour. A plant so formidably armed, it was thought, could not safely be recommended for general cultivation. The name first given, *Dolichos multiflorus* (Dioclea Boykiinii), was clearly wrong. In these circumstances we are glad to find from the *Queensland Agricultural Journal*, vol. ii. pp. 370-371 (with a plate), that the plant has flowered and fruited in that colony, and that Mr. F. M. Bailey, F.L.S., the Colonial Botanist, has identified it *Mucuna pruriens*, var. *utilis*. In this variety of the cow-itch plant the pods are apparently devoid of stinging hairs. It is probably *M. utilis* of Wall., described in the *Flora of British India* (vol. ii., p. 176), as "a cultivated variety" with velvety not hairy pods. This is figured in *Wight's Icones* (vol. i., t. 280) According to Watt's *Dictionary of the Economic Products of India*, "the young tender pods are cooked and eaten as a vegetable." What may also prove to be the same plant, with jet black seeds, is cultivated as a rotation crop on sugar estates in Mauritius, under the name of "Pois Mascate." The accounts given by interested parties in America respecting the agricultural value of the Florida velvet bean, must be received with caution. It is undoubtedly a rapid grower and affords a large yield

of nutritious forage. It bears an abundant crop of seed and is therefore readily propagated. It may also, in common with many other leguminous plants, possess the power of obtaining its nitrogen from the atmosphere, and thus be admirably adapted for green crop manuring. How far it may be found superior in these respects to other plants it is impossible to say. As it is now being carefully tested in various parts of the tropics, it would be well to await reports which will, no doubt, be shortly issued on the subject. Meanwhile it may be useful to mention some of the more prominent leguminous plants that have long been used in tropical countries, both eastern and western, as rotation crops for fodder and green manuring: (1) *Vigna lutea*, the Chowlee of India, the Tow Cok of China and the Cow pea of the West Indies; of this there are several varieties with black and clay-coloured seeds (2) *Cajanus indicus*, the Pigeon pea (the small form is known as the Noye pea and the large as Congo pea); this is universally grown in St. Kitts and elsewhere in the West Indies as a "green dressing" on sugar estates; (3) *Phaseolus lunatus*, the sugar or Lima bean known in Mauritius as "Pois d'achéry"; "it remains on the land for three years and produces large crops of fodder." The ripe beans are however regarded as poisonous; (4) *Dolichos lablab*, the Madagascar or Lablab bean, this is known in Mauritius as the "Antaque"; (5) *Dolichos purpureus*, probably a variety of the latter known in Queensland as the Poor Man's bean; (6) *Phaseolus Mango*, the green gram of India, known in Barbados as "Woolly Pyroe." This is planted "after the canes are reaped and afterwards turned in as a green dressing."—From *Kew Bulletin* for August.

#### NYASSALAND COFFEE, CO.

The annual meeting of the Nyassaland Coffee Co., was held on the 26th Sept. at the offices of Messrs. Carson & Co. Baillie St. Mr. W P Metcalfe was in the chair and there were also present:—Messrs G Kent Deaker, H Creasy, F Macindoe, A Orchard, W Shakespeare, E R Waldoek, G J Jameson (by his attorney Mr. F Macindoe) Carson & Co., (represented by Mr. F Macindoe).

The notice calling the meeting was read, and the minutes of the last meeting held on 25th September, 1897, were read and confirmed.

#### THE REPORT

The report was as follows:—

ACREAGE:			
10 acres	coffee	planted	December 1895
240	"	"	" 1896—Feb. 1897
383	"	"	" 1897—Feb. 1898
<hr/>			
633	acres	under	cultivation
2,843	"	reserve	

Total 3,476 acres

**PROGRESS OF WORK.**—During the financial year under review 383 acres were felled, cleared and planted. The Directors however regret to report that owing to scarcity of labour and heavy growth of weeds due to an abnormal rainfall, the clearings have not been a success, and will require much supplying. The scarcity of labour has been occasioned by disturbances in the districts from which labour is recruited, but these having now been suppressed and the natives pacified, the Superintendent anticipates that he will not experience further difficulty in this direction.

**ESTIMATE FOR SEASON 1898-99.**—Under the circumstances reported above the Directors do not consider it advisable to attempt to open further land this season. They have instructed the Superintendent that last year's clearings must be fully supplied next rainy season, and nurseries for this purpose have been laid down. A crop of some three or four tons

may be secured this year, but it is left to the discretion of the Superintendent as to whether it is advisable to allow the trees to bear any crop or not.

**FINANCE.**—The attached accounts close the Company's Books to the 30th June, 1898. To this date R63,742-30 has been absorbed in developing the Company's property, and there remains a balance in hand of R28,537-70, which will cover the expenditure for the current season. Store buildings and machinery will have to be erected in season 1899-1900, but the crop of that season should more than provide for these and ordinary working expenditure. Prices of Nyassaland coffee have been well maintained notwithstanding the general fall in price of coffee.

Mr. F. Macindoe retires by lot from the Board of Directors but is eligible for re-election.

The appointment of an Auditor for the ensuing year rests with the meeting.—By order of the Directors.

CARSON & CO.,  
Agents and Secretaries.

On the motion of Mr. METCALFE, seconded by Mr. ORCHARD, the directors' report and accounts were adopted.

#### THE DIRECTORS.

Mr. ORCHARD proposed, and Mr. KENT DEAKER seconded, that Mr. Macindoe be re-elected a director.—Carried.

#### THE AUDITOR.

The CHAIRMAN proposed, and Mr ORCHARD seconded, that Mr. F W Waldoek be appointed auditor for the ensuing year on a fee of R50 for each audit.

#### RAMIE FIBRE.

**CHINA.**—The most important fibre-yielding plant grown in Kwangsi is *Boehmeria nivea* L., from which rhea, ramie, or china-grass is derived. The chief centre of cultivation lies between Wnchow and Knei-lin, the capital of the province. Eight years ago I forwarded to the Foreign Office and to the Government of India a report on the cultivation of rhea in China and on the extraction and preparation of the fibre. This was published in the journal of the Agricultural and Horticultural Society of India (vol. ix., Part I., Calcutta, 1891) I mention this publication because I have received numerous letters from Europe requesting copies of this report, which I have been unable to supply. I have nothing new to add to the report; but since its publication, great progress has been made in Europe in inventing process for extracting and preparing the fibre and a Manchester house, in forwarding to me samples ranging from the raw material to beautiful dress fabrics of silk and rhea and wool and rhea mixtures, and of rhea plushes, tapestries, damasks, and sail-cloths, explains that what is now required is not the fibre as prepared in China, but the raw ribbons, that is, the ribbons as stripped from the stems without any further preparation except drying. I am informed that these raw ribbons can be laid down in London from India, etc., at from 8/ 9s a ton. Now the price here of the cleaned fibre is from 9 to 10 taels per picul, equal to 12½ to 13 9-10th dol. or at an exchange of 1s 11d per dol. to 1/ 4s to 1/ 6s 8d per picul, or 20/ 1s to 22/ 8s per ton. Add 2/ 10s per ton freight from Wnchow to London and the cost (without charges for commission and packing) would thus be 22/ 11s to 24/ 18s per ton in the London market. But the extraction of the fibre from the raw ribbons is the most expensive part of the whole process in China, and they should be procurable at less than half the cost of the cleaned fibre. I hope to be able to put a price on this raw material during the present year.—Mr. Alexander Hosi's report on Wnchow.

**A TEA-MAKING MACHINE.**—The *Japan Mail* says:—A Japanese has "invented" a tea-making machine "which takes the newly-plucked leaf and performs all the necessary operations preliminary to packing—rolling, roasting, and polishing." With one man and a boy it will manufacture 1,666 lb. of tea in 24 hours.

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898 :— "All the seeds done well, and now some of the plants from them are 13 inches high." This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898 :— "I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants."

*For price, instructions and particulars see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied.

*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kiriki** (African Rubber).—A creeper Seed and Plants.

Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes :—

DEPARTMENT OF AGRICULTURE,

CAPE TOWN, 27TH JULY, 1898.

MESSRS. WILLIAM BROS.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo River at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,

(Signed) P. MACOWAN,

Government Botanist.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

Agents in London :—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Agent in Colombo, Ceylon :—E. B. CREASY, Esq.

Telegraphic Address :

WILLIAM, VEYANGODA, CEYLON.

A.I. and A.B.C. Codes used.

J. P. WILLIAM & BROTHERS,

Tropical Seed Merchants,

HENARATGODA, CEYLON.

## CACAO AND ITS FUNGUS:

RETENTION OF MR. CARRUTHERS, F.L.S., ON THE  
CEYLON OFFICIAL STAFF, CALLED FOR.

The old saw that "Experience teaches fools" has long ago been discredited; for it is only the wise who benefit in this way; a fool, never! Still, like many another untrue statement the proverb lives on, to mislead the unwary. In Ceylon it would seem as if often the school of experience had closed its doors, and that the teachings of the past were to remain disregarded. Facts from which golden lessons might have been deduced, influence nothing: and the old hap-hazard style of trusting to things coming right somehow, reigns today quite undisturbed, as if there had been no bitter experience in the days that are gone, nor pitfalls in the future.

We are led to write in this way from learning that Mr. Carruthers—our Cacao Expert—is shortly to leave the island: and his departure appears to be as nothing to the wise Government of Ceylon. We have preached for many a long day on the duty of the authorities to assist the agricultural interests of the island by providing at public expense the best scientific guidance to help them in keeping well abreast of the world, and to enable them to meet at an early stage the incoming of any new pest or disease which was likely to jeopardise those interests. But Ceylon today stands pretty much where it was:—the first of Crown Colonies through the energy and "go" of its Colonists, and the most backward in scientific equipment through the niggardliness and wrong-headedness of the Government which lavishes salaries in certain over-manned civil departments, and grudges a few thousands of outlay in a truly reproductive direction. We see this in the matter of Mr. Carruthers. He was landed here through private enterprise, and although when he was caught, the Treasury did contribute somewhat towards his expenses, had we waited till the official world had found him, the Cacao disease would have done its work; and if he had been secured at last his advent would have been as inopportune as was that of Mr. Marshall Ward, too late to do anything except to demonstrate in a scientific way, that hope was fled, and the enterprise was doomed. Mr. Carruthers during his stay amongst us has impressed all who have had dealings with him, as being the man who is specially wanted, a permanency in Ceylon: enthusiastic, energetic, resourceful and skilled; and much good has already resulted from his expert advice. But the campaign is not by any means over, nor the fungus disposed of, and that he should leave us now in the thick of the business, as it were, does seem particularly unfortunate. From many sides we hear of the dying out of Cacao, which is likely to be increased, now that the back of the drought is broken, and the welcome and much-needed rain has fallen. For with the moisture about, the fungus will spread fast, and the unpleasant sight of diseased trees will be sure to mortify the grower. With more experience, who knows how necessary it might

be for Mr. Carruthers to revise and extend his system of cure? To cut out the diseased patch, and properly shave the bark around it, may be what is needed; but we hear that this is not always successful to arrest the fungoid growth, and other measures might be recommended as the result of extended observation. Then it is far from being established that the spread of the fungus is due to shade; for, trees in the open, die and are dying. That the want of potash in the soil has been thought to have something to do with the heavy mortality is another idea; although the vigour with which healthy suckers spring up, would seem rather to point to the roots being healthy and the soil suitable. Then there is the fungus on the pods, who knows how properly to tackle that added trouble? Indeed up to this date the problem has been as yet but half-worked out, and for the Cacao-growers of Ceylon to be deprived at this time of their "guide, counsellor and friend" when he himself is hopeful of having the enemy by the throat, greatly and rightly worries the planters concerned. Many men who have money sunk in Cacao estates, feel this keenly, and the early recall of Mr. Carruthers will soon be a general cry. One such Planter writes:—

"Our Government like big schemes evidently, a railway to Jaffna, for example, where such a scoop is taken out of the island's surplus in one dip, as would meet the outlay for a trained band of scientific agricultural experts for a generation to come. His Excellency may desire to hand down his name as an up-to-date railway man, and leave his mark in that dreary region of the North-Central Province; but he is more likely in my opinion, by this policy, to stop progress in the future, to hasten the going back of planting prosperity and to increase the burden of the people who are now crying out for 'free rice.' As compared with a Scientific Department of Agriculture this railway to the North is as nothing. The whole country depends for its prosperity on the well-being of the planting class, and this covers the Native as well as the European, and yet in spite of the enormous stake which the whole Colony has in planting success, that scientific help which other Colonies enjoy, and which is so much needed here at all times—for one never knows what new trouble may appear—is denied to Ceylon. You increase schools, you tabulate the scholars. You pass laws of all kinds in the Legislative Council; you build breakwaters and run wild about sanitation and a dozen of other good things; but in all the progress of the day the keen eye of the reformer has never lighted on the reform we plead for—skilled scientific advice for agriculture."

Surely, if ever an outburst was pardonable, the above from a vexed Cacao planter comes into the category. The writer is wrong, however, in thinking "the reformer" has never urged a Department of Agriculture. Let him refer to our illustrated book on Ceylon so far back as 1884, and he will find this very want prominently urged, while each successive Governor since has had it pressed on his attention. We have even urged that Cadets for the Ceylon Civil Service should like their compeers for Java, go through a course of Agricultural Instruction. Still, it is true that Ceylon is today almost as backward in supplying good scientific advice to Agriculturists, as it was a generation ago. We stand still while the world moves on, and if the Colony has held its own, and maintained its premier position, it has not been through any paternal coddling on the part of the Government; nor is coddling wanted.

To help men who help themselves is not an unhelpful business—and if the Government would but realize that, as trustee for the revenue, it has the deepest interest in the prosperity of the Planting Industries of the island, it would at once see that for it to provide trained scientific advice open to all, would not be a heavy tax on its resources for the splendid returns it draws from its share in the business. We must not allow it to be said that we are inconsistent in urging fresh expenditure with one hand, while calling for relief to Planters and Poor on the other. The actual practical outcome of our preaching today is the retention of Mr. Carruthers, if not as a permanency, at least for a term of years; and this would not cost more than a very few of the Cadets who are dancing their heels about Kachcheris to very little practical result. Had the Revenue Department in 1893 been cut down as Sir Arthur Havelock promised, and a properly Scientific Agricultural Department established with the savings, well would it have been for the Staple Industries of this island.

## COUNTRY PADDY AND THE COURSE OF TRADE.

(By a Sinhalese.)

The ordinary course of the trade in country paddy is through Coast Moormen who have boutiques in the villages and are the principal buyers of local surplus crops. They are accustomed to advance to the cultivators, money, carry stuffs and even rice, on condition of being paid after the harvest, and besides going about to collect the paddy for their advances, they also buy any paddy that may be offered for sale by the cultivators. The Coast Moormen sometimes store up the paddy they buy, and sometimes if the market is good they send the paddy to their brethren in Colombo. They also occasionally convert the paddy into rice and sell the same at their boutiques.\*

There are also Sinhalese people who go about the villages after the harvest for the purpose of buying paddy, but this is seldom intended for sale, but for their own use. The trade in country paddy is not spread over Colombo, but in a few boutiques at the Pettah, and in one boutique at Mariakadde, and the trade is only brisk for a few months after the reaping season, the boutique keepers being supplied with country paddy by the village boutique keepers, who buy rice from the cultivators. Amongst the well-to-do Sinhalese there are residents in Colombo who own large extents of paddy fields, and thereby obtain a large quantity of paddy from the cultivators as groundshare,—most of these gentlemen reserve the paddy they obtain for consumption at their houses and for their dependents, and it is very seldom that they sell any paddy. Some land owners lease out their paddy fields to the cultivators on a fixed annual rental. There are also natives who advance seed paddy, and money to cultivators,—on condition that the paddy is delivered to them at a certain rate per bag, when their crops are gathered; but even these people, I understand, do it for the purpose of obtaining paddy for themselves, and not for sale.

According to what I gathered from some of the natives, there are some houses in Welikade, Borella, and in Grandpass where paddy is sold to neighbours after the harvest. These are people who obtain paddy as their ground share of the fields in the villages close to Colombo. It is however not customary for people to buy this paddy for the purpose of converting it into rice in the town, as the same could not be had in sufficient quantities by the people for this purpose. This is however bought by hopper boutique women for converting into *raw* rice, when obtainable.

The regular trade in paddy in the town is confined to a few boutiques in the Pettah—in Bankshall Street, First Cross Street, Second Cross Street, &c.—where there are about a dozen boutiques—three or four boutiques at Mariakadde in Maradama, and a couple of boutiques at Grandpass. Most of these boutiques are carried on by Coast Moormen, who carry on this trade along with poonac and other horse and cattle food. Their supplies are by imports from Rangoon, and some South Indian Ports. These imports are not very frequent, and are of small quantities ranging from two or three hundred to seven or eight hundred bags at a time, the largest imports, according to one of the boutique keepers being consignments of 1,000 bags. The trade is carried on in a very small scale, each of the boutiques having only two or three hundred bags at a time. The average sale in a boutique is said to be between twenty to twenty-five bags per week. But at times there are larger sales when purchasers come and buy 20 or 30 bags at a time. The purchases made at these boutiques are not for conversion into rice, but it appears paddy in large quantities is gathered in some other provinces, and a large trade in country paddy is carried on at Trincomalee, Batticaloa, Habantota, Matara, Tangalla and several other towns, where paddy, as well as rice made from this paddy, are sold, in large quantities: a good deal being sent away from Matara to other Provinces, and also from Batticaloa, in the latter case chiefly to Jaffna.

## GREEN TEAS FOR AMERICA.

We do not see any justification for the attitude adopted in some quarters towards the "Thirty Committee" for their decision to encourage the shipment of "green teas" by a bonus according to quantity, certified by broker and bill of lading. How is "black tea" to be benefited by this process?—ask two or three indignant planters who do not mean to bother about "green" tea, and have no faith in the enterprise. Now, supposing the experiment to prove another failure, we should suppose "black tea" men would realize that there is still undoubted benefit to them in so much less of *their* product being exported or thrown on the London market? For our part, we think it most advisable to try and cut out the Japanese— even more than the Chinese—by supplying the American people with a natural, wholesome "green" tea, not only unadulterated, but with no artificial addition or "facing" whatsoever. It may be remembered by some, that, in crossing from Japan to San Francisco in 1884, we had the authority of the largest American buyer of Japan tea for stating that there was not an ounce of it, but was artificially treated, coloured with Prussian blue or some other artificial substance. Now is the time for Messrs. Mackenzie and Blechynden to make capital of this fact. We give them permission to quote our authority as a visitor to Japan and America in the year referred to, making special enquiry as to teas, and never once did we have the fact denied of the many million lb. of Japanese green teas being all artificially faced.

In this connection we call attention to "A.C."s. paper on the making of Green and Unfermented Tea for America, given on our second page. It appears rather opportunely and we trust may contain hints of some use to local planters about to make "green" teas, although our Indian correspondent so mixes up his practical advice with speculations as to "Association," &c., on a big scale, that it is sometimes difficult to follow him. It will be time enough to plan for clearing out the 40 millions of Japanese teas, when it is seen that the first million or 500,000 lb. of green tea sent

from Ceylon to America have caught on with our cousins. We must walk before we run; and work through individuals until the proper time comes—if it ever does—for an "Association" of Pure Green Tea Exporters.

We may as well add here an extract from our letter to the *Observer* from Japan, early in 1884:—

The Japanese mode of preparation has been described as follows:—the tea leaf brought from the field in flat baskets is laid (in these) over a steaming apparatus for a few seconds, the steam permeating and wilting the leaves; the leaf can then be rolled easily before being thrown on paper pans over a slow charcoal fire kept up for several hours, while the rolling and stirring with the hands is constant. Next, the tea is sorted by the women and children, a small quantity being placed by each on a tray from which by the use of chopsticks the stems and coarse leaves are cleverly separated, the large and small leaves being also separated. The tea is then sifted to separate dust and broken leaves, and all is then ready for the market at the port of export. The finer teas are often packed in earthenware jars; but the larger portion is packed in chests of 75 lb. upwards, and occasionally the tea is transported in bales made of paper. (The Japanese have excelled from time immemorial as paper-makers.) In the merchants' Godowns, the different purchases are bulked according to quality; the whole refired and sifted losing from 5 to 10 per cent in moisture and dust; the firing is done in pans over separate furnaces attended by Japanese, so that some godowns have hundreds of these separate furnaces; but I learned that a good deal has been done, in Kobe especially, in applying labour-saving machinery; one gentleman especially, who has devoted a good deal of attention for years to the subject, having patented several machines which are working successfully in his tea garden. Of the nature of the machinery I did not get a clear idea, though evidently rolling, drying and sifting were expedited and rendered more regular. Of course nearly all the Japanese teas exported are "doctored": America only cares for green, that is artificially-colored teas, although it may be that a small proportion of the tea sent is genuine green tea. Still it is acknowledged that the vast bulk has foreign substances added, before the half-chests are neatly made up in the style in which Japanese workmen excel. Many of the wooden cases which came down from the tea districts are utilized to make these half-chests, and as many as 500 men are employed in a godown in the busy season, the average day's wage for ten or more hours' labour being under ten-pence. As regards spurious and doctored teas, I do not suppose the Japanese are so much to blame as American retailers and middle class dealers who will have something cheap and even trashy. The following outspoken remarks are from the report of an American Consul in Japan, written about six months ago, and with special reference to the Hiogo-Osaka districts of which Kobe is the first:—"The tea trade has gone from bad to worse, until it has now become unsatisfactory, both to the Japanese producer and the foreign exporter. Whether as a result of oversupply, or of such deterioration in the quality of the teas shipped as tends to check consumption, the prices to which tea has fallen in the United States are ruinously low, and if some improvement be not effected, this important commerce will be shunned by all who have anything to lose. Some movement is now taking place among the growers of tea here against the production of the inferior leaf which gives the exporter his excuse for colouring the article to conceal that inferiority, and probably a larger proportion than usual of pure uncoloured tea will this year be shipped to the United States. But this movement will fail of success unless tea drinkers in the United States can somehow be awakened to the fact that bluish-gray and broken leaf is not the natural and proper form of this precious commodity, and that coloured teas are neither clean nor wholesome, whereas the natural leaf of Japan is both good and delicious. If the American demand could be redirected towards these

sound and pure teas, it is probable that the use of the fine and fragrant leaf produced in Japan would so increase as to restore vitality to a trade now vitiated by manipulations which naturally disgust all who become aware of them, and are perhaps the principal cause of the paralysis now prevailing in the tea business."

## THE PUTUPAULA TEA ESTATE CO., LIMITED.

### REPORT OF THE DIRECTORS.

ACREAGE:	
Tea in full bearing..	.. 421 Acrea.
" " partial bearing ..	.. 86 "
" " new clearing for Para and Tea ..	.. 4
Liberian Coffee and Para ..	.. 10
Forest—	} .. 228
Grass, &c.	
Waste land }	
Grand total ..	659 Acres.

The Directors beg to submit to the Shareholders the accounts for the year ended June 30th last.

The crops amounted to 162,113 lb. tea against an estimate of 170,000 lb.

The nett average price realised was 34.63 cents per lb.

The season has been an unfavourable one for tea, the bushes suffering greatly from drought in the early part of the year. The shortfall in crop must further be accounted for by the necessity of having to allow certain fields to run on without pruning to equalize pruning periods.

No manuring operations have been carried on during the past season, but it is proposed to treat 50,100 acres this year.

The old Engine and Boiler were found in an inefficient state and it was necessary to provide fresh machinery. An 8 H.P. Engine and 10 H.P. Boiler were purchased at a cost erected of R5,740 61 and are working satisfactorily.

In terms of a resolution passed at the Extraordinary General Meeting held on 10 November last to provide sufficient Working Capital, the Directors arranged for a loan of R150,000 bearing interest at 7 per cent allowing, as security for repayment, a mortgage over the Company's property to be executed.

The net profit for the year amounts to R14,154-64 and with the balance brought forward from last Season, the balance at credit of Profit and Loss account amounts to R21,911-58.

The Directors recommend that a Dividend of 7 per cent be paid absorbing R14,000. R4,000 be placed to reserve fund, and the balance R3941-58 be carried forward.

The Estimated Crop for the Current year is 175,000 lbs. on an estimated outlay on working account of R58,618.

In terms of the Articles of Association Mr. Kingsbury retires from the Board of Directors and being eligible offers himself for re-election.

The appointment of an Auditor for the current season will rest with the Meeting.

By order of the Directors. AITKEN SPENCE & Co.,  
Colombo, 19th Sept. 1898. Agents & Secretaries.

AGRICULTURAL TRAINING FOR WOMEN.—When can we expect something of this kind in Ceylon? We quote from an English paper:—

"At Heverle, near Louvain, there is a college with 750 pupils which receives the daughters of farmers and *petits propriétaires*, and gives them a good general education, a sound knowledge of housewifery in all its branches, a thorough theoretical and practical knowledge of dairy-work, and, at their parents' option, of poultry-rearing, pig-feeding or bee-keeping, and all at the low cost of £12 a-year."

## THE COLOMBO TEA SHARE RULES.

The second Resolution proposed at the recent meeting of the Tea Trader's Association (for report see page 333) had, we think, only to be mentioned to commend itself to all practical men, and it was accordingly carried unanimously.

There is also, it is evident, a substantial grievance to be removed by Mr. Mackwood's Resolution as he fully showed in his speech: The 100 chests of tea packed on the estate for export to London may be contrasted with 100 chests intended for sale in the Colombo market. We are not sure that planters make the allowance of a few ounces extra in the latter case; but anyhow when 3 lb. or 4 lb. for samples are taken out of the usual proportion of chests in Colombo, and such nailed down again, ready for shipment, there must be the risk of the Melbourne (or some other) Custom-house coming across one of such short-weight chests, and classifying the whole as under weight. To prevent such risk, it is well, we think, there should be a distinguishing mark on the "sample" cases.

## TEA IN AMERICA, GERMANY AND FRANCE.

MR. WM. MACKENZIE, in sending us some papers, writes:—

"Note particularly the letter in *American Grocer* showing the difficulty in getting in *packet* teas. The tea dealers don't like these. Nor would the wholesale importers in the STATES touch *our* teas, were they not compelled by Tetley, Lipton, Larkin, &c. With the exchange in their favour, they can get China teas 3d cheaper; and in China they have capital sunk in establishments.

"Canada is different, and there we are doing well. Ceylon tea especially India has lost ground this year, but unfortunately India has lost ground.

"Tell Westland, it is France not Germany we should attack. German coffee and beer *habits* have been our greatest enemies in the States. In a German town of 60,000 people, in Pennsylvania, not a pound of tea is drunk. When made for them in Colombo, Germans very politely say they like it, but they won't drink it.

"In France, there is to be the grand opportunity of the great Exhibition. There are tea drinking English families everywhere *economising*, and the French are *not beer-sodden* like the Germans."

This reminds us of what we learned from Dr. MacAll—the founder of the MacAll Mission—when with him in Paris in 1878. He told us that at one of his earliest meetings Sir Edward Baines of Leeds gave an address and concluded with a regular teetotal exhortation. Dr. MacAll did not like to pull his coat-tails; but he said the Parisians thought the British visitor had suddenly become crazy, in asking them to give up their light wines as drunk at meals. "But"—said Dr. MacAll—"seven years have elapsed, and now a temperance or teetotal address would be perfectly understood and appreciated by the Parisians at our meetings, so terribly has the 'absinthe' and even 'beer' habit grown on the French"; and the venerable evangelist pointed out as we walked along, establishment after establishment which he had known as flourishing *cafés* for coffee and chocolate, turned into drinking bars for beer, absinthe, &c. So much for the change in Paris since the Franco-German War. At the same time, Dr. MacAll said in 1878:—"If I were a young man nothing would please me better than to open a wholesale tea-

selling firm in Paris and to subsidize tea rooms, with a full belief in financial success." On the other hand, our Commissioner who depreciates the German nation, has to learn that there is a growing trade with Germany and that the British Consul at Stettin says Indian and Ceylon teas are much wanted. And how does he account for the fact that at the greatest German watering place—Carlsbad—only *tea* is drunk; while at the next principal European watering place, Vichy, in France, not a cup of tea is seen? Very opportunely, we receive "J."s letter (see our last page) showing, certainly, how great is the consumption of coffee and beer in Berlin; but then Mr. Hagenbeck is attacking that capital; and in answer even to the cry of the British Consul at Stettin, we learn from a Colombo merchant the following interesting particulars:—

"Northern Germany and that part of it known as East Prussia have for some years past taken a great deal of tea. Being close to the Russian frontier the inhabitants follow to some extent the customs of their neighbours, and drink tea. There is a big business done in Königsberg, but rumour says a lot of the tea that goes in there is smuggled across the Russian frontier. The bulk of the tea used was China; but now Ceylon and Indian tea if not pushed is at any rate well-known in the Eastern German Provinces. It is all bought in London. Many London Houses send hundreds of samples of Ceylon tea up for auction and buy on order for Germany. The big Bremen and Hamburg Houses all told me they can buy Ceylon tea much cheaper in London than in Colombo, and they buy precious little China now in London. You may put the import into Germany as one-half China, and the balance is divided between Ceylon, India and Java. I fear Java has the preponderance: the teas are cheaper than ours and their *appearance* beats Ceylon hollow. Several Mining Lane Firms are engaged exclusively in the Continental tea trade. These people (mentioning a long list of firms) are all pushing tea in Germany." The exports of tea direct to Germany from Colombo up to Sept. 29th this year equal 249,474 lb. against 189,503 lb. up to same date last year. To France the comparison is 59,714 this year and 39,403 lb. last.

TEA SHARES.—Says the Calcutta correspondent of the *Pioneer*, 1st October:—*A propos* of tea, I recently mentioned that Phoenix Tea shares had changed hands as low as Rs2 per Rs5 paid up share. This week a further call of Rs5 per share has been made. I now understand that another of Messrs. Bury and Company's gardens, the Bhootan Doars Tea Company, is rapidly following in the footsteps of Phoenix, and not only need shareholders expect no dividend, but it has come to be a question whether it is worth while keeping the garden in cultivation. Unlike the Phoenix, this is a new garden only about three years old. The company's capital is three or four lakhs of rupees, for which there is apparently not going to be much to show. Now this is a company which from its inception has had the advantage (?) of a rising exchange and of the consequent reduction in the rupee outlay for its stores. It has even had a year of comparative fixity of exchange at one and four pence. What have the unfortunate shareholders got to say as to the result? [And what have certain local quidnuncs to say?—Ed. T.A.]

A COMPANY,  
CEYLON, LTD.

The annual meeting of the Doomoo Tea Company of Ceylon, Ltd., was held on the 30th September in the offices of the Agents and Secretaries, Messrs. J M Robertson & Co. Mr. W D Gibbon occupied the chair and the others present were Messrs. W B Kingsbury, A Cantlay, H G Bois, Herbert Bois; Henry and F W Bois by their Attorney Mr. H G Bois; H J Vollar and Capt. Deane by their Attorney Mr. W D Gibbon.

The notice calling the meeting having been read and the minutes of the previous meeting confirmed.

THE DIRECTORS' REPORT.

The report was submitted as follows:—

Directors.—W D Gibbon, W B Kingsbury, H G Bois. The Directors have now the pleasure to submit their Report and Accounts for the year ending 30th June, 1898.

The quantity of Tea received from the two Estates was 205,902 lb. against 170,000 lb. estimated, and the price realized for that sold was 43.13 cts. per lb. against 49.43 cts. last year. The Directors regret the fall in price and hope that the Teas yet unrealized will sell to more advantage.

During the year an interim dividend of 3 per cent. was paid, absorbing R12,000, and after writing off R1,745.82 for the remaining balance of preliminary expenses and transferring R2,500 to depreciation account there is a sum of R14,400.01 available.

This amount the Directors recommend being disposed of as follows:—

That a final dividend of 3 per cent. (making 6 per cent. for the year) be paid on the capital of the Company, absorbing .. .. .	R12,000 00
And that a balance be carried forward of .. .. .	2,400 01

R14,400 01

The estimated of crop for the current season is 220,000 lb. tea and the estimated expenditure is R72,946 00 which includes a sum of R6,500.00 allowed for cost of new machinery and factory alterations on Verallapatna.

The acreage of the two Estates now stands as follows:—

Doomoo—  
210 acres Tea 5 years old and upwards.  
3   "   "   2   "   "  
28   "   Timber.   "   "  
58   "   Grass Land.  

---

299 acres.

Verallapatna—  
310 acres Tea 5 years old and upwards.  
35   "   "   3   "   "  
120   "   "   2   "   "  
35   "   "   1   "   "  
24   "   under 1 year.   "  
10   "   Grass Land.  
154   "   Waste and Chena.  

---

688 acres.

During the year Mr. F. W. Bois having left the island Mr. H. G. Bois was elected to the vacant seat on the Board.

In accordance with the Articles of Association Mr. W. D. Gibbon retires from the Board, but, being eligible, offers himself for re-election.

It will also be necessary to appoint an Auditor for season 1898-99.

By order of the Board of Directors,  
J. M. ROBERTSON & Co.,

Colombo, Sept. 13.

Agents and Secretaries.

The CHAIRMAN said the report had been in the hands of the shareholders for some time and if they had any questions to ask or if they wished for any explanation he would be happy to give it.

Mr. H G Bois thought an explanation might be given as to the difference in the cost of working between Verallapatna and Doomoo as there was a large discrepancy.

The CHAIRMAN said the two estates were supposed to be worked separately, but there was a great deal of work done at Verallapatna which would usually be done at Doomoo in the way of manufacturing tea. If they looked carefully into the accounts they would find that the expenditure on Doomoo tea landed in Colombo was about 23.48 and on Verallapatna 31.98 and putting both together the average would be about 28.21. These figures include profit on manufacturing teas for outside estates and receipts from rents.

Mr. CANTLAY referring to Verallapatna estate said he noticed the entry "profit on manufacturing tea."

Mr. H G BOIS said that was a mistake. The word should be "receipts."

The CHAIRMAN added that it had always to be remembered too that expenditure in transport was much heavier in Uva than in Dimbula. They had about forty miles of a cart road to Bandarawella. Another thing they had to bear in mind was that on Verallapatna there were 200 acres of tea not in bearing. Replying to Mr. Cantlay he said that the tea in the young clearings was a very fine jat. Of the old tea he would say that 100 acres was poor and the rest very fair. Doomoo was a beautiful jat and the yield was over 400 lb an acre.

Mr. KINGSBURY said Verallapatna had done much better than they thought it would.

The report was then adopted on the motion of the Chairman seconded by Mr. CANTLAY.

On the motion of Mr. BOIS seconded by Mr. KINGSBURY a final dividend of 3 per cent (making 6 per cent for the year) was declared.

Mr. CANTLAY proposed and Mr. Henry BOIS seconded the re-election of Mr. Gibbon as director. Carried *nem con.*

On the motion of Mr. Cantlay seconded by Capt. DEANE, Mr. John Guthrie was appointed auditor for the season 1898-99.

The proceedings terminated with a vote of thanks to the Chairman proposed by Mr. KINGSBURY.

“THE TROPICAL AGRICULTURIST.”

A planter writes that he has always found our Monthly exceedingly useful for reference in respect of all Tea (and other Produce) Sales in Colombo and London, as well as for practical lots of information in planting. "There is another matter," he adds, "in which its usefulness for reference has often been found by me, namely, for the Annual Reports of our Planting Companies; but I wish to point out that you occasionally miss some of these. I was disappointed the other day in turning back for a particular Company's Report, not to find it in the T. A. pages."—This very deficiency, curiously enough, was remarked on by a mercantile subscriber some weeks ago, and we took steps at once to secure that henceforward every Annual Report of the Directors of Planting Companies should find a place in our T. A. pages, and be available by means of the Index, for ready reference.

## THE CEYLON TEA TRADERS' ASSOCIATION.

### SELLERS AND BUYERS.

A special general meeting of the Colombo Tea Traders' Association was held at 3-30 p.m. on 1st Oct. at the Chamber of Commerce rooms:—

The Chairman, Mr. W. H. Figg, presided, and others present were Messrs. F M Mackwood, H Tarrant, Geo. Thomson, G H Alston, F Macindoe, F Street, C E H Symons (secretary), W E Drury Wright, W E Mitchell, Gordon Frazer, S P Jeffrey, A H Barber, Davies, and representatives of Bathgate Pim & Co., and of Crossfield Lamard & Co.

The SECRETARY read the notice calling the meeting.

The CHAIRMAN (Mr. W. H. Figg) in opening the proceedings said it was a special general meeting to consider two resolutions which were in themselves very simple and would be amply explained by the movers, and doubtless would receive their support. Before calling upon those gentlemen to speak to the resolutions standing in their names he would like to make a few remarks upon the subject of the 3 lbs. allowance resolution which was passed at their last general meeting. In regard to that there was some correspondence between the Chamber of Commerce and the Planters' Association in Kandy, and the Committee of the latter body passed a resolution to the effect "that it regrets the want of courtesy shown to the Planters' Association by the action of the Tea Traders' Association in entirely ignoring the interests of the sellers." Had these remarks been simply made in the course of a meeting in Kandy by one particular member it might have been advisable perhaps to take no notice of them, but inasmuch as they were contained in a resolution standing on the books of the Planters' Association he thought he would be distinctly wanting in his duty if he did not controvert them and show how utterly wrong and, in his opinion, how unwarranted were these statements (hear, hear). Perhaps it might be as well to state that before that resolution was passed, in fact as far back as March last, the Planters' Association, in his opinion, somewhat peremptorily wired down to him as Chairman of the Chamber asking him to use his influence to stop

### THE 3 LBS. ALLOWANCE RESOLUTION

being passed by the Tea Traders' Association, and that was followed up by a deputation of three of the leading members of the Planters' Association who pressed upon him the views of that body and asked him to do what he could to induce the Tea Traders' Association not to pass the resolution or bring it into force. He explained to them the reasons for the resolution and assured them that in his opinion it was absolutely necessary to pass such a resolution. He did all he could to persuade them that it was a resolution that should be passed and that they should recognise it and give it their support. They would not, however, take his view—in fact they rather took umbrage at his remarks—and this resolution was the outcome.

Mr. GEO. THOMSON:—When was that resolution passed in Committee.

The CHAIRMAN said it was passed on the 8th of July and this was the first time they had the opportunity in general meeting of refuting it. They were charged with a want of courtesy and

entirely ignoring the interests of the sellers. Well as to the want of courtesy they came to him as Chairman and he did all he could to show them that in the opinion of the Association the resolution was

### IN EVERY WAY NECESSARY.

Unfortunately they did not accept the Association's views and although it was passed almost unanimously at the meeting of the Traders' Association at which the sellers were represented, they yet said that they were not shown courtesy. As to ignoring the interests of the sellers he repeated that the sellers were represented at the general meeting and he was quite sure he was right in saying that in the opinion of the majority of the sellers the 3 lbs. allowance was a just and proper one. Having said that in defence of the resolution passed at their last general meeting perhaps it might be as well to explain further with regard to the 3 lbs. allowance which seemed to be utterly misunderstood by the majority of planters and those interested in the matter upcountry. For years past the trade had been gradually growing and up to the present time the 3 lbs. were found absolutely necessary to supply the trade with sufficient samples in order that they might fairly judge the tea, and he claimed that if the buyers were to be properly treated it was absolutely necessary that they should have sufficient tea whereby they could judge what was submitted for sale. The number of buyers on this market was considerably over 30, and he learned that at least 30 samples were sent out by the brokers weighing anything up to 1½ ounces which could not be considered an excessive allowance. Besides that it was also necessary for the broker to have a certain amount of tea in hand in order that the buyers might afterwards compare it. He thought that sufficiently explained the necessity for the resolution that had been passed. They did not ask the seller to put more tea into the chest, and they did not at all wish to go into comparisons between this and the London market. The conditions here did not compare with those in London, and if they tried to impose the London conditions they would have further trouble. They were content to make their own conditions and to change them as they saw necessary as had been done in this case. He merely mentioned these facts because he thought it was necessary that some public explanation should be made as to why the 3 lb. allowance had been passed. He also thought it right that they should take this public opportunity of absolutely refuting what he called not merely an unnecessary but an unwarranted and misleading resolution by the Planters' Association. He trusted that in making this statement he had their approval. (Hear, hear and loud applause).

### THE MARKING OF PACKAGES.

The resolution standing in the name of Mr. F. M. Mackwood was then brought up for consideration.

Mr. MACKWOOD said that in speaking to the resolution he proposed with their consent to draw attention to other points connected with their tea weights which required consideration from the various interests concerned before a specific resolution thereon could be brought forward. As all present knew

### THE CHIEF TROUBLE

in tea shipments was that of out-turn of weight, and the satisfactory solution of it would go far

to increase the import of tea into the colonies and foreign countries, and to stop the prejudices and complaints constantly arising from shortage in weights. He saw no reason why the difficulty should not be overcome. One cause could be at once removed if his resolution in regard to factory-bulked tea was adopted. For the unbulked tea he thought that if the local market was always treated by those using it in the same way that the majority of estates treated the London market when shipping on garden account the trouble would be ended except in such cases as that of weighing machines in factories getting out of order. His resolution was as follows:—

"That the Selling Brokers when drawing Samples of Tea from Factory bulked packages of Tea shall mark the packages from which the Samples are drawn in such manner that they can be identified by the buyers.

The rules of the Tea Traders' Association stipulated that ten per cent of such invoices should be inspected and the number of packages was never to be less than three. The result, taking

#### A TYPICAL LINE

of 15 chests of 1,500 lb., would be that they had 3 lb. of tea drawn from three chest out of the 15, and the invoice to the buyer would be 1,497 lb. At present there was no outward or visible signs—unless they found three chests more knocked about than the others—to show from which three chests the 3 lb. of tea—1 lb. each—had been drawn. Supposing for arguments' sake that they shipped the 1,497 lb. of tea down to Australia the Customs authorities, following the plan obtaining in England,—and as far as he could make out the colonies had adopted that plan,—would take a certain number of packages and average the contents of those drawn. Now it had happened strangely enough, and, of course, there was no reason why it should not, that in some of these smaller lines one of the sample drawn chests in Ceylon, and in other instances two but one would be sufficient,) was selected and the result had been that the whole invoice had been classed as containing 99 lb. of tea per package making on the whole a loss of 7 lb., that was, in addition to the three allowed for here, the total weight thus being 1,490. This aggravated both the shipper and the importer and there was correspondence and claims.

#### THE MAN WHO SCORED

was probably the grocer or blender or whoever bought the tea. The remedy for that seemed to him to be perfectly simple, viz., that when the brokers were sampling the tea they should put some such mark as the letter "S" in red on the package so that the buyer could at once identify it. The weight might be filled up to 100 lb. or perhaps easier still the 100 lb. might be erased and 99 lb. substituted. The Customs authorities in the country of import would get their full duty, the shippers of the tea the full tea paid for, and the importer would receive the 1,497 lb. assuming that the factory marked weights were correct. This was a matter so obviously simple and so entirely within their control that he presumed there could be no possible objection. Coming now to unbulked tea every package had to be opened and if they followed up the example he had given of 15 packages of 100 lb. they had three lb. drawn from these which was equal to 48 ounces or something over three ounces a package. Ship the tea as they liked it was impossible to

get more than 99 lb. given in any country where the English rule prevailed. The first argument might be that they should have the tea opened up and five ounces put in every package. That might apply in a country with a nice dry climate but it was not applicable in this country, and the depreciation in the quality of the tea would be greater than the loss that might occur in the weight. Here came in his argument, that this difficulty could be solved if the local market was treated in the same considerate way that the London market was treated. In this matter he spoke from both sides of the question. His firm sold tea in the local market and also shipped on garden account, and he made no difference in all estates over which he had the control or influence. In every package of tea whether for the local or London market, when the weight was ascertained they put an extra four ounces of tea in, but he had heard of others doing more and putting in as much as 6 ounces and of local proprietors also putting in an extra amount. He could remember the time when the local sales were very small, when all the tea they produced practically went home, and it was no uncommon thing to find that the difference in weight between that accounted for in the account sales and that shipped in Colombo was fully 3 per cent. The result of experience had been to show that it could be reduced to a minimum of 1 or 1½ per cent by taking care of the packages, by being careful in their weights, and by putting in this extra quantity of tea. That had been his experience, and he had asked a great many both in Colombo and upcountry and they were quite content to accept 1½ or 1¾ per cent. Taking a typical line again of 15 chests of 100 lb. each and putting 4 ounces into each that was 60 ounces, and when the account sales came back the owner of the tea was quite content if he got the tea paid for less 1½ per cent. That of course covered the trade allowance and various other things. If they took 1½ per cent on 15 packages that gave about 19 lb. of tea the loss of which in addition to the 4 lb. put in originally the seller in London was quite content to accept. Against that the 3 lb. given here was practically insignificant. He maintained that the interests of the sellers in Ceylon would be furthered if they all would in addition give to the local market that which many firms and many individual proprietors gave viz 4 ounces per chest extra. If the seller would give that to the local market he would be in the position of having the unbulked invoices of tea passed down at the original weights. From a seller's point of view he objected to the 3 lb. sample at first and wanted to be satisfied. He was satisfied on the point and contrasting with that what he was perfectly willing to accept in London, found the 3 lb. was insignificant. He used the local market because he thought it was a more advantageous market. All sellers expected to get more money for their tea in the local market and they got paid very much quicker. He thought it was a little unreasonable and unfair to the local market to shorten it of the privileges that they accorded to the English market where they were content with much worse results. He offered these remarks because he thought it was to the sellers' interest to keep up this market, and that they believed in the local market was proved by the fact that whenever they heard of a new buyer coming in they cordially welcomed him. In fighting the battle of introducing their tea and probably with much keener competition than they had it was incumbent upon them to

do their best in every possible way. Many of the countries must be exploited from Ceylon. Various parts such as the American continent might perhaps be better exploited from London but undoubtedly there were parts which could only be exploited from Ceylon, and it would be very bad for them if instead of trying to improve their system of weights, they shut their eyes and did nothing.

#### ADVANTAGES TO PRODUCER AND SHIPPER.

Mr. H. TARRANT had much pleasure in seconding the resolution which had been moved by Mr. Mackwood. It was manifestly to the advantage of every one that buyers should get exactly what they paid for and that there should be no uncertainty about the weights of the packages that were delivered. He thought this was to the advantage of both the producer and the shipper. As Mr. Mackwood had pointed out in the case especially of breaks of 30 packages or under, there must, under the present system be a certain number of packages short by 1 lb., and if the buyer happened to open one of these packages, he would possibly conclude that he had been swindled and probably that Ceylon teas were generally packed short, and, as in the case of China teas, the weights were nearly always over rather than short, this would tend to the disadvantage of Ceylon tea as against China specially though to a certain extent Indian also. As Mr. Mackwood had spoken very fully on the subject he did not think he need say anything more in seconding the resolution.

The CHAIRMAN, replying to a question by Mr. Drury, said Mr. Mackwood had simply suggested that the packages should be marked.

Mr. DRURY said that if this resolution was carried would it be settled how the packages were to be marked. He understood that the selling brokers would mark them.

The CHAIRMAN:—Yes with the letter "S."

Mr. MACKWOOD said it had struck him that this was a detail to be settled subsequent to the passing of the resolution, but in his speech he had mentioned marking with the letter "S."

Mr. THOMSON said it was a simple thing when the selling broker had drawn a sample, for the person who went round with him to mark the letter "S" in red.

Mr. W. E. MITCHELL suggested that packages from which samples were drawn should be marked with a chalk mark, and then the buyers could mark the package with the correct weight when they came to ship it.

Mr. MACKWOOD said that with the leave of the meeting he would make a slight addition to his resolution so as to make it read:—

"That the selling brokers when drawing samples of tea from the factory-bulked packages of tea shall mark the packages with the letter 'S' in red from which the samples are drawn, so that they can be identified by the buyers."

Mr. DRURY thought the letter "S" was rather indefinite, and he was understood to suggest that the short mark be put on the package. Was the letter "S" to be put on in red paint or what? In London the mark was generally put on in white chalk.

The CHAIRMAN:—We prefer it in red in Colombo.

Mr. DRURY:—Red what?

The CHAIRMAN:—Stencil ink.

The resolution was then put and carried.

A conversation took place as to when the resolution should come into force and it was

agreed on the suggestion of the Chairman that it should be as from the 19th of October, that was the third Wednesday's sale.

#### THE QUANTITY IN PACKAGES.

Mr. GEO. THOMSON then moved the resolution standing in the name of Messrs. Finlay, Muir & Co., as follows:—

"That the attention of Planters be drawn to the fact, that packing more than 100 lb. in a chest, when the Teas are for sale on the Colombo Market, is prejudicial to the Sale of such Teas. This is owing to the action of the Mail Steamship Companies Stamping all Bills of Lading for the Colonies, with the Clause 'no package to contain more than 100 lb. nett' and their declining to pay claims, when packages contain more than this amount."

The resolution he said, spoke for itself. It more particularly referred to packages containing broken pekoc or broken orange pekoc (a voice --and dust) and dust. With regard to big lines of broken pekocs there was a very serious loss very often incurred on shipments to the colonies. With regard to dust he did not think that any packages should contain more than 75 lb. at the outside.

Mr. DRURY in seconding said they had had practical experience of some of the disadvantages of packages containing over 100 lb. and he hoped the Planters' Association and other bodies would take notice of the resolution and do something practical in the way of seeing that the packages were not over 100 lb.

On the suggestion of Mr. G. H. Alston Mr. Thomson altered his resolution so as to read:—

"That the attention of Planters and Agents be drawn to the fact &c., (as in the original resolution) and "that a copy of this resolution be sent to the Planters' Association."

Mr. MACKWOOD supported the resolution. He had to do with one or two places upcountry in which there was joint authority. The other exercising authority with him thought that he packing of 105 and 110 lb. in a chest was a distinct gain and seemed to think that the argument advanced by him was an academic one. However he did take his (Mr. Mackwoods) advice and the result was that he brought into competition other buyers for the Australian market who had stood out in consequence of the Steamship Company clause, with the result that they got an average, he thought, of 4 cts. a lb. over. He merely mentioned this to show the planters the advantage of the proposal.

Mr. W. E. MITCHELL was understood to ask whether the Steamship Companies could legally maintain the position they had taken up.

The CHAIRMAN.—I am not a lawyer.

The resolution was then put and carried.

This was all the business.

TEA *vs* SIBERIA.—We (*Chemist and Druggist*) mentioned recently that Russia had an eye on the tea-trade. Matters have got to such a point that a continental official paper says that the completion of the Siberian Railway will take the exportation out of the hands of the English and give it to Russian merchants, who will place it on the market at fifty to sixty per cent less cost. The tea will go to Irkutsk (South Siberia) by land carriage, thence by the Siberian Railway, and Eastern and Central European goods will be taken as return freight.

## LIQUID FUEL:

FOR STEAMERS, LOCOMOTIVES, GAS-  
WORKS, FACTORIES (TEA AND  
OTHERWISE), &c.

We are on the eve, in this progressive Colombo of ours, of a notable revolution in respect of the fuel required for steamers, locomotives and factories, which cannot fail to have a great and beneficial influence on the amenities, if not health, of the city, and on the progress of trade and local manufactures. We refer to the substitution of petroleum residuum, the liquid fuel known to the Russians as "astaki" or "mazot" for ordinary coal. This substitution is much nearer practical realization at this port than the public are generally aware of. We have become accustomed to the bulk petroleum installation of the great London Company with its £1,800,000 of capital (owners of the "Shell" line of steamers, as well as of deposits of petroleum, in Europe and the East, and of installations at every Eastern Port) for whom Messrs. Delmege, Forsyth & Co. are the local representatives. But it is not known that this same Company, having secured a Concession of 200 square miles at Koti in Dutch Borneo, with an inexhaustible supply of petroleum and especially of the residuum, now proved to be so valuable for liquid fuel, are making arrangements for separate installations on account of this new article of trade to be supplied at every port of any note between Yokohama and Suez. At Singapore, the installation is already complete, and a vessel has arrived with 1,000 tons of the residuum. Colombo is not so far ahead, owing perhaps to the puzzlement of the Government as to how this new product of petroleum should be treated. It took some time to show that it cannot possibly be used as an illuminant; but only as a fuel and substitute for coal or wood. Consequently, it has been properly decided that no Customs duty can be charged on it any more than on coal, and that there is not the slightest need to guard against the risk of accident with the fuel, as there is with kerosine oil. This having been now fully realised, legislation to enable the new fuel to be readily dealt with at Colombo will shortly be passed. Meantime Messrs. Delmege, Forsyth & Co. have had waiting for erection, two enormous tanks each capable of holding 4,000 tons of this material, one of which tanks now about to be erected is expected to be finished by January next. (The largest petroleum oil tank at present in Colombo does not exceed 1,500 tons.) When this is done a supply from Borneo will be available to be pumped into the tank and thence distributed for local as for steamer purposes. Before the close of the present year we shall probably find steamers coming into our harbour using this new fuel,—although they cannot be supplied here before February 1899—but an experiment is to be made on a locomotive in Colombo before the end of this year and this may lead to its adoption all along our railway lines. It is too soon to speak of price; but supplied to us from Borneo, it is very likely that Ceylon can be exceptionally dealt

with as to cost and that the Dimbula planters may be rendered independent of the Elgin forest supply! The home calculation at present is that 1 ton of this new fuel is equal to  $1\frac{1}{2}$  to  $2\frac{1}{2}$  of coal according to circumstances; while among other great advantages is its far less bulk and room required, and strange to say, the much less risk of accident, from combustion, &c. In the case of steamers with the machinery fitted on to spray the liquid fuel from the tanks into the furnace, no stokers are required; while nearly all the space now required for coal can be used for paying cargo. In the case of locomotives no tenders for coal will be required. To get rid of coal-dust alone should be an advantage to Colombo as well as to our engine-drivers; while all humane persons will rejoice that there is to be no further need of "stoking" in the Red Sea or Tropics. What is to be done with our Colombo Coal Sheds on their new sites is a point that can be settled a little later on!

Sir Marcus Samuel stated at the trial that the "Trigonia," which had already started on her Eastern voyage, was really the pioneer of the Shell fleet in using fuel. The intention is to save Canal dues, by supplying installations from North Borneo at all ports up to and including Suez, and on the other side of the Canal to have supplies at the usual "coaling" ports from Russia. In the East, Sir Marcus said his Company aimed at delivering the liquid fuel at a rate to successfully compete with coal and he believed the supply from their field in Borneo to be practically inexhaustible. Five of the "Shell" steamers had now been adapted for liquid fuel. The following extract is of local interest—Sir John Darston, K.C.B., being Engineer-in-Chief of the Navy:—

Mr. E. T. Delmege proposed the health of the directors of the "Shell" Co., on whose behalf Mr. Samuel Samuel briefly responded.

Sir John Darston in proposing the toast of "The Builders of the Hallelotis," said that to his mind what had kept back the question of liquid fuel in the past was the difficulty of supply, but after what Sir Marcus Samuel had told them it would appear that the supply was assured, and that the only question became one of the experience.

Throughout the entire run not a hitch of any kind occurred. Steam was readily maintained and smoke entirely absent.

"Fair Play's" shipbuilding authority stated in July last that this new fuel may compete with coal wherever the latter exceeds 30s per ton. But this does not allow for a number of savings from using the former:—in space, in expense of stokers, in time of loading, the "mascot" being pumped into its tanks (no coal dust again for passengers, saloon, cabins or deck—what a blessing!) The Shell fleet to be devoted to this liquid fuel distribution, is reckoned to carry one million tons a year—so Indian and Australian as well as Japanese and British coal mine owners must look out for competition. The use of liquid fuel is expected to add enormously to the speed of vessels, and the comfort, from getting rid of stokers and coal-holds on men-of-war, torpedo-boats, &c., will be very great. Land for oil-tanks for the new fuel has been obtained at Suez, Colombo and Singapore, and at other ports arrangements are in a more or less advanced state, so that as Sir James Laing said in July last, "coal consumption, and especially so far as the Eastern trade was concerned, was doomed to a very sudden death, because the advantages of liquid fuel were so preponderating that it must supersede coal as a motive power."

## THE RUBBER SOURCES OF BRAZIL.

We have been asked "How many rubber trees are actually known to exist within any given area?" The number varies very much, as the trees are not planted artificially but are on the spot where nature has put them. Generally speaking each workman has about 100 trees under his control, a greater number not being advisable as the work would then probably not be done with the proper care. A narrow way or path leads from one tree to another. Sometimes it takes three or five minutes to get from one tree to the next, while in other instances a large number of trees is found within a small space. If the distance between the trees is too large, the work of gathering rubber cannot be done profitably since the laborer is obliged to make each day a certain quantity of rubber in order to be able to meet his expenses. Besides the milk remains liquid for only a certain space of time, so that the workman is bound to limit his work of tapping within a certain distance from the hut where the smoking or curing of the milk is performed. On the upper rivers the result of a man's work during the season—from March to October—varies between 400 and 800 kilograms of rubber, 600 kilograms being a fair average. We think that a certain number of rubber trees die annually in the Islands district, but these probably are succeeded by new plants as nature continues producing them. The production of Islands rubber has been increasing on a moderate scale from the beginning. Some rubber estates are exhausted to such an extent that people are more or less obliged to abandon the work, but other plantations, which were abandoned some years ago and which have had time to rest, are now giving satisfactory results. On the upper rivers, especially on the Madeira, the owners of the rubber plantations take great care of their property, most of them giving the trees a rest of a full year after having tapped them during a season.

There is undoubtedly still a large number of virgin rubber forests, especially in the Amazonas district, even in those districts already privately controlled. It happens often that on a sudden a large plantation is discovered quite close to a place where rubber-gatherers have been living for many years. Besides, the terms "explored" or "discovered" refer simply to a small belt of land along the rivers, the interior remaining almost unknown. The cost of acquiring such land differs very much, due especially to its position.—*India Rubber World*, Sept. 1.

## COAGULATION OF RUBBER-MILK.

The extensive use of India-rubber in the arts and manufactures, renders the production of this substance a matter of general interest. One of the most important problems that awaits solution is a simple and effective means for coagulating the rubber-milk and producing an article free from impurities and capable of being worked with as little preparation as possible. In the following paper, which has recently appeared in the *Annals of Botany* (Vol. xii., pp. 165-171), Mr. R. H. Biffen, B.A., Demonstrator in Botany at the University of Cambridge, has given an admirable summary of what is already known on the subject. Mr. Biffen accompanied Mr. E. W. Howard last year on a tour through the rubber-yielding countries of Tropical America. They visited Mexico, Central America, Brazil and some of the West India Islands. Mr. Biffen has therefore had a favourable opportunity for becoming acquainted with the conditions under which rubber is at present prepared, and is in a position to suggest scientific methods for the improvement of the industry. \* \* \* The summary is very scientific, but ends as follows:—"To these must be ascribed the well-known 'fermentative change' which causes a considerable loss by converting the solid blocks of rubber into a foul-smelling spongy substance. In the Para rubber the creosote absorbed from the smoke of the burning nuts acts as an anti-septic and prevents this proteid decomposition. To

test for the coagulated proteid is not an easy matter; continued boiling with a concentrated solution of caustic potash will, however, extract small quantities of alkali-albumin. 'Balata' gives good results most readily. On extraction with caustic potash a flocculent precipitate is obtained, which is readily soluble in dilute nitric acid, and is reprecipitated on the addition of alkalies. Boiling precipitates it either in acid or alkaline solutions, and it gives no precipitate with acetic acid and potassium ferrocyanide. The proteid is thus identical with the albumose, described by Green, from the latex of *Minutops globosa*.—R. H. BIFFEN, Botanical Laboratory, Cambridge February, 1893, in *New Bulletin* for August.

## PRODUCE AND PLANTING.

TEA SOUP.—Apparently there is still some slight misapprehension about the right method of tea infusion. In an answer to a correspondent which appears in the columns of an evening paper we note the following: "Stewing tea for sixteen or eighteen minutes is utterly spoil the finest tea, and the surest way to cultivate dyspepsia." Tea planters may struggle to produce high quality teas, and grocers may advertise the "finest tea the world produces," but if the consumer indifferent to the labour wasted on his behalf, will continue to make soup from the leaf, and thus untimely perish of dyspepsia, what is to be done? Printed instructions are of no use; lectures fail of their purpose; the warning voice of the medical journals is in vain. Economy is the great idea, and as long as the brew, once made, will bear the addition of hot water and keep some sort of colour the popular superstition believes that it is both healthful and invigorating any time during the day or night, even though the leaf be stewed to something approaching a pulp in the process. In this connection it may be pointed out that tea drinkers not only have a difficulty in procuring drinkable tea at railway refreshment rooms, but in some cases they cannot get it at all. We notice the complaint of a Colonel who writes to the papers from the Army and Navy Club stating that although he wired to Basingstoke station that tea might be ready on the arrival of his party by a certain train, none was forthcoming. The Colonel adds pathetically: "A little boy was wandering up and down the platform with a pile of trays, each containing a diminutive plate of bread and butter, a teacup or so, and a teapot; but the latter, on inspection, contained only dried leaves, and these, unwatered, are hardly calculated to allay a thirst." If the Colonel had been in need of beer or whisky he would certainly have had no difficulty. These matters may be of small importance in themselves, but they are factors in the problem how to increase the demand for tea.

ELECTRICITY AND THE GROWTH OF PLANTS.—One of the most attractive papers read on the closing day of the British Association related to the effects of electricity upon the growth of plants. Some striking experiments were described, showing how electricity hastened the development of plants. Under electric influence, for instance, strawberries yielded a crop 75 per cent better than that grown under normal conditions; whilst the time necessary for maturing the fruit was lessened by one-third. Some of the facts mentioned were not new, but the novel theory was advanced that electricity helped the growth of plants by enabling them to absorb water in greater proportions; and in the water, of course, there contains, in solution, the mineral matter that goes to form the structure of the plant. The whole question, however, does not seem to have passed beyond the experimental stage, and it is noteworthy that Lord Kelvin, who took part in the discussion on the subject, did not appear convinced of the soundness of some of the arguments used to show the favourable influence of electricity upon plant growth.—*H. and C. Mail*, Sept. 16.

## COFFEE "HYBRIDS" AND "DISEASE."

A rather curious discussion took place in Committee during the last annual meeting of the United Planters' Association of Southern India on the subject of Leaf Disease and Hybrids. As regards the former, it is a pity that all concerned do not take Mr. Marshall Ward's Report as final, in regard to the life-history and action of *hemiteia vastatrix*, and save themselves the trouble of describing appearances and attacks. But certainly there must be a wonderful difference between Mysore coffee and the best left in Ceylon in view of what Mr. Graham Anderson states:—

I should like here to give it as my opinion that little if any deterioration has set in with regard to our coffee. We have coffee in Mysore on some of the old estates opened as much as 50 years ago, which is as healthy and productive now as ever. In addition to this, I believe all the original Babubuden temple trees, which are about 150 years' old, are still to the front. Far from being anxious about the matter, there is nothing in the world that I can think of which is more hopeful than coffee. There has not been a single horticultural arrangement applied to it, and yet we can regard it with entire confidence. We should be happy that it is an industry that involves a certain amount of trouble. Otherwise it would be taken out of our hands altogether. (Cheers.)

One would like to know whether Mr. Anderson's crops per acre over his estates for 1893-8 as compared with those of 1883-8 justify his cheerfulness. The coffee crops in Mysore as a whole have, we suppose it will be admitted, fallen off greatly in the period named. Mr. J. Cameron of the Mysore Government Gardens was very enthusiastic at the meeting about the importance of changing seed, and cultivating hybrids. Here is one passage:—

Mr. PARSONS:—Mr. Cameron has told us one thing which is indeed serious, and that is that if we go on as we are doing now, it is quite possible our coffee may become altogether sterile.

Mr. CAMERON:—Yes, if you are going on as you do now. We have in India about 165 varieties of rice planted in different parts of the country, which would indicate that the natives have found out the benefit of introducing new varieties.

Mr. HARRIS:—How about coffee? We never go in for rotation of crops; but we do go on feeding the soil.

Mr. CAMERON:—That is what I say. Going on that principle, a time will come when the soil will get exhausted and you will gradually get less crop. It is not only the soil we have to consider, but the water and atmosphere generally. You have also certain factors which you can never change.

As to hybridisation, Mr. Brooke-Mockett is the most advanced and Mr. Cameron was so much impressed with what he saw on his estate, that he started a small experiment of his own:—

I have about 130 bushes, in three different kinds of coffee, under irrigation. When these begin to flower, I shall at once begin to fertilise, and when, after being fertilised, these plants come into fruit I shall be able to cultivate and judge the results of hybridisation. In this case it would not take more than three or four years. I don't mean to say the most favourable results will come from these young plants. I think, perhaps, that the experiments should be made with older plants and not with young seedlings. Of course, there may be results from seedlings giving their maiden crop; but it is a good deal more probable that better results would ensue from plants of ten to fifteen years.

Mr. GRAHAM ANDERSON:—With regard to Mr. Brooke-Mockett's hybrids, I may say that the experiment has now entered upon its second phase. He

has got now trees which he has named the Improved Nak Nad and others the Improved Coorg. It is really wonderful what sports these hybrids have produced. By a system of careful management, he has picked the fruit of all the second generation of a promising nature and has planted the seed separately in marked baskets, and so this very useful experiment is proceeding. In regard to a number of trees, some are true to the parent stock, and others are sports or different strains altogether. He had an idea that if he kept the different strains separate and planted them out under auspicious conditions, it would be possible to perpetuate them. Mr. Brooke-Mockett's manager is an extremely clever man and has taken a great interest in this experiment. He has now got to the stage that when the young seedlings have grown to a certain extent, he is able to discriminate between them and say that they will be in accordance with one type or another.

Mr. J. W. HOCKIN:—As we have had considerable experience of hybrids in Wynaad, the meeting may like to hear of it. About half-a-dozen hybrids, discovered accidentally, are now large trees bearing crop. Two are, I believe, no good, as the crop generally fails. The others are grand trees filling a space about nine feet cube at five or six years of age, and bearing heavily without any signs of leaf-disease. They have, of course, been taken every care of and manured heavily, but even so, the growth and vigour is very remarkable. Their seed has been used for planting out. Some gentlemen tell me about 15 to 25 per cent of the second generation come true to type; but one gentleman has a clearing in which he says all but a small percentage are good vigorous trees free from leaf-disease, though not all, I take it, of the same type as the first generation. It will probably take a long course of careful selection to establish a fixed type. I myself had Liberian nurseries for five years without finding a hybrid. Last year I found three hybrids, which were easily distinguished, as they were two feet high when the Liberian plants were only one foot high. The rapidity of the growth of the hybrids is very remarkable. At two years from seed my plants have the following measurements: one 6½ feet high by 5 feet high by 5½ feet high by 6 feet across; one 5 feet high by 5½ feet across one; the second tree has a few berries on it. All hybrids of whatever generation will grow when it is quite impossible to get Arabica supplies to grow. I had another experiment which promised well, but turned out a failure. In the parchment coffee, picked from Arabica with Liberian coffee growing in it, I found a considerable number of very large canoe-shaped beans. These from their extraordinary size I concluded must be hybrids of which Liberian was the father and Arabica the mother plant. I thought this an extraordinarily good discovery, as I had a very large bold seed with a good Arabica colour and appearance. Unfortunately, the plants raised from these seeds got leaf-disease as badly or worse than ordinary Arabica, and turned out of no value. This would seem to prove that the vigour to resist leaf-disease only belongs to hybrids of which Liberian is the mother plant.

Mr. H. G. PARSONS:—Are we quite right in selecting Liberian as a means of improving our strains, or would you suggest any other varieties?

Mr. J. CAMERON:—It is difficult to say. I do not know that we have had enough experience in the matter.

Mr. H. G. PARSONS:—Are there any other strains?

Mr. J. CAMERON:—Oh yes, these are the varieties that can be got from Jamaica, Johore, Mocha, and West Africa.

Mr. H. G. PARSONS:—But these must all have come from Arabia originally.

Mr. J. CAMERON:—Possibly in most cases; but it must have been so long ago that they are bound to have incurred some sort of change from the original type.

Mr. E. G. WINDLE:—In Jamaica, as far as I know, coffee does not suffer from leaf-disease; but with us Jamaica coffee suffers almost as badly if not worse than the other varieties.

The best hybrids so far obtained seem to be between Maragogipe coffee and Arabica.—Later on, Mr. Cameron said:—

In addition to the work of hybridisation you could do a good deal by selecting the seed. That is a time-honoured practice at home, not only by seedsmen and nurserymen, but also by farmers and agriculturists of all sorts. In selecting seed you will find the farmer is very particular only to have the heaviest, finest and best. And it should be the same with the planter in this country. He should not be satisfied with mixed seed; but should make sure that he has the heaviest, largest and finest in every respect. He should exchange his seed by sending it to other parts of the country to friends and asking them to send him back their specimens of seed equally carefully selected. He should also try and introduce seed from other countries, such as West Africa, Brazil, Jamaica and all places where coffee is largely grown. I don't know that I can add anything to these remarks; but as you seem very keen on fertilisation and seed selection, I think it right to tell you that by means of these two methods a man can do a great deal. Of course, high cultivation you thoroughly understand, and it is needless for me to say much about it. I believe, however, that you are going to bring up a proposal concerning the appointment of an Agricultural Chemist. In this connection will you allow me to say that there are chemists and chemists. (Hear, hear). If you are going in for the services of a chemist, I strongly advise you to get the very best man available. You will have to pay a heavy salary for such a man, but do that ungrudgingly, and your money will be returned to you twenty-fold. It is no use going to a cheap man, who will make you believe this, that, and the other thing till eventually you find nothing good. I strongly advise you to get the best man possible, and if the Mysore Government or any other Government can help you in the matter, take their help and be thankful.

There can, of course, be no doubt about the importance of the principles laid down. Ceylon planters were very careful about their coffee seed and planting between 1835 and 1865; but many of them got recklessly careless in reference to nurseries and planting when the districts between Great Western and Adam's Peak were rushed into coffee. In our Leaf Disease era, fresh seed from Mocha, East and West Africa, Jamaica, &c., were tried again and again without advantage; but no experiment in hybridisation was made or at any rate persevered in. It will be interesting to watch coffee developments in Mysore, Coorg and Wynaadh.

#### MANUAL OF NEW SOUTH WALES GRASSES.

We have received from the author a copy of this useful work\* which must be invaluable to the agriculturist and stock-owner in great pastoral Colonies such as are most, if not all, the divisions of Australia, and which contains information of value to botanists and cultivators all the world over. The illustrations which are numerous and well-executed, enable the different grasses to be readily identified and the information both scientifically and popularly full and instructive, the order usually being to give the botanical name and explanation; botanical des-

cription; and notes, synonym and vernacular name where possible; where figured; value as a fodder; other uses; (sometimes "fungus found on this grass"); habitat and range—of each particular grass. The contents of the Manual are as follows:—

Contents.—Introductory page iii.; Cultivation of Native Grasses 1; Conservation of Native Grasses 2; Analyses of Grasses 3; Plan of the Work 4; List of Works consulted 5; Grasses for Special Purposes and Situations 7; Key to the Genera 8; List of Grasses 15; Descriptive Account of each Grass 18; Index 195.

Besides a brief introductory chapter, we have concise deliveries on the Cultivation and Conservation of Native Grasses, also on Analyses of Grasses; Plan of the Work; List of Works consulted; a list of Grasses for special purposes or situations; Key to the Genera and then the main work, with a full index at the end. One passage we must quote from the "Conservation of Native Grasses":—

Mr. Thomas A. Williams gives the following summary of his recommendations for the renewing of worn-out pastures of native grasses:—(i.) Avoid overstocking; (ii.) When the soil begins to get baked and packed stir it up with a harrow; (iii.) Give an occasional light top-dressing of well-rotted stable manure; (iv.) Fill in thin with hardy tame or wild grasses before the weeds get a start; (v.) Keep the weeds mowed off so that the grasses may get the benefit of all the plant-food there is in the soil."

And in conclusion we quote a specimen of Mr. Maiden's method of imparting useful information, taking the perennial "*Eriochloa punctata*," "Early Spring grass" of Australia, "Everlasting grass" of some parts of America:—

VALUE AS A FODDER.—One of the best pasture grasses of the Colony, particularly of the coast districts, though it will endure considerable drought. It grows freely, is succulent, and much esteemed by stock. A good account of New South Wales experience with this grass is by Mr. Secombe, who experimented with it on the Richmond River. He reported: "This perennial grass is fairly plentiful, and in sheltered situations in this district it maintains some growth all the winter. It grows rapidly from very early spring to late summer, and, if undisturbed, reaches a length of 2 or 3 feet. It grows on various kinds of soil. Under cultivation its growth is wonderful, as well as its power of seed-producing. I took as much as six cuttings for seed off my plot during the season 1894 to 1895. This grass has been introduced to our district, no doubt through the agency of travelling stock, for it can be found more or less on the old, much-used highways. It is seldom seen to any satisfaction in open situations, as stock and pademelous keep it cropped very close. This close clipping has given rise to frequently-expressed ideas that *Eriochloa punctata* banishes Mullumbimby Couch [*Kyllingia monocephala*, a great pest.—J.H.M.]. It is a grass, I feel confident, our dairy-farmers should introduce to their holdings; it has great vitality, unquestionable milk and butter qualities, as well as the invaluable property of rapid reproduction."

Mr. Maiden's ambition has been to supply a Manual that would meet a twofold demand—that of the farmer and pastoralist, and that of the botanist; and we think he has fully succeeded and deserves the thanks of both classes.

TEA SHIPMENTS.—Through the courtesy of the Secretary of the Chamber of Commerce, we are enabled to state that the shipments of tea to London during September were 7½ millions, the estimate for October being 7 to 7½ millions.

\* A "Manual of the Grasses" of New South Wales, By J. H. Maiden, Government Botanist and Director of the Botanic Gardens, Sydney. (With Illustrations.) By Authority of the Minister for Mines and Agriculture. Sydney: William Applegate Gullick, Government Printer, 1898.—[4s 6d.]

### THE AVAILABILITY OF ATMOSPHERIC NITROGEN FOR AGRICULTURAL PURPOSES.

It is generally known that plants owe their nitrogenous food to the circulating nitrogen among plants, animals, and the soil, and that with this circulation the nitrogen of the atmosphere has very little connection: in other words, that it is the decomposition of organic matter and the nitrification of the organic nitrogen contained in it that furnish the soil with the nitrates which are ultimately available for absorption by the roots in the small proportion of ammonia and nitric acid which are held to be directly absorbed by the leaves.

The comparatively small contributions which are made by atmospheric nitrogen to the stock of nitrogenous food are due to the combination of the nitrogen and oxygen through natural electric discharges, and to the fixation of nitrogen by the bacteroids (root bacteria) found in the root tubercles in certain plants. These phenomena are recognized as the only two original sources of combined nitrogen to the plant, imparting, as they do, compounds directly derived from the elementary nitrogen of the atmosphere into the general circulation of nitrogen through soil, plant and animal. The possibility of making use of these two natural processes, or artificially reproducing their results, so as to render the agriculturist altogether independent of the nitrogenous fertilizers now in demand, is an important speculative problem. Indeed, in the case of the action of root bacteria in storing up atmospheric nitrogen in the tissues of certain plants, the process has been practically applied for fertilizing the soil by using nitrogen-collecting plants either in rotation in the case of annuals, or as a mixed crop in the case of perennials, so as to secure the results of their action on crops that follow or grow contemporaneously with them. The attempt to facilitate this action by means of pure cultures of root-bacteria ("nitragin") has so far not produced sufficiently reliable results warranted to make the use of inoculating media of any practical value.

As regards the other original source of combined nitrogen to the plant, it has remained for Sir William Crookes, in his address before the British Association, to declare his belief in the possibility of artificially producing the combined nitrogen for which we are now indebted to the action of natural electric discharges, whenever they occur, in the atmosphere. This he proposes to do by utilizing water power to generate an electric current for bringing about the oxidation of nitrogen and thereby the production of nitric acid.

Chemists tell us that the process of assimilation in plants, whereby they exhaust the carbonic acid of the atmosphere and replace it with oxygen, is necessary for preserving the air we breathe, in a condition suitable for the requirements of animal life, which would otherwise be rendered intolerable if no such counter-action went on, and if the process of animal respiration continued to exhaust the oxygen and replace it with carbonic acid gas. Chemists also refer to nitrogen as an eminently inert substance, whose rôle as a constituent of the atmosphere is as a diluent of the oxygen (the two gases existing respectively in the practically constant proportion of 4 to 1) since an atmosphere of pure oxygen gas, or even one in which oxygen predominated would be unsuitable for animal respiration.

If we may be permitted to speculate with Sir William Crookes, how, we would ask, is the constant ratio of nitrogen and oxygen to be maintained in the atmosphere, and the composition of the air preserved in the most suitable condition, if agriculture all the world over is to flourish by the exhaustion of atmospheric nitrogen? Where would be the counteraction by which the supply of the diluent is to be kept up, and the composition of the air remain unchanged, if it is to be drawn into the general circulation of combined nitrogen and never drawn out again in the elementary condition?

So far, as we have stated, the nitrogen of the air has been looked upon as a neutral element, and it appears strange to the student of nature to think of such a character, for so valuable a substance, taking part as it does in the constitution of the highest organic compounds. But who can say what discoveries have yet to be made through scientific research in the future, after we have seen "argon" eluding the search light of Chemistry all these many years since the first chemist entered his laboratory? Who knows but that there will yet be an explanation of the apparently anomalous character with which scientific men invest nitrogen, and that we shall learn what would seem to be less inconsistent with the designing power of Nature, that atmospheric nitrogen also plays its part in the general economy of the world, or at least as Sir William Crookes predicts, that it is destined to do so, while still subserving its purpose in maintaining a suitable atmosphere for the benefit of mankind and the inferior animals, if its presence is indeed really necessary for this end?—C.D.

### INDIAN TEA ASSOCIATION.

#### TEA FOR PERSIA—GREEN TEA.

The Committee considered the question of the local consumption of tea referred to in the London Secretary's letter of 5th August and the suggestion put forward by a member of the London Association that tea should be packed in small 2-oz. tins and disseminated throughout every bazaar in India. The Committee believed that the imports of China and Ceylon teas into India for use in the country were not nearly as extensive as was apparently believed in London, as a large proportion of tea thus imported is re-exported to the Persian Gulf and other foreign markets. The Secretary was instructed to write to the Bombay Chamber of Commerce for particulars of the imports of tea from China and Ceylon and also for the exports of tea from Bombay to Persian Gulf ports. The general question of the sale of Indian tea in this country was to be fully taken up at the next meeting of the Committee after consideration of the papers now in circulation.

Considered letters of the 13th, 23rd, and 29th July and 5th August from the Secretary, Indian Tea Association, London, in connection with the American Market Fund. The reference made by Mr. Blechynden at a meeting of the London Committee to samples of Green and Oolong teas sent from India and highly appreciated in America was considered by the Committee. Information was afforded by the members of the Committee as to their own experience with manufacture of Green tea and it was stated that experiments recently made proved that it was almost impossible to produce tea at all equal to samples sent out, even with panning and hand-rolling. In addition to this the cost of manufacture was very high,

REVISED ESTIMATE OF INDIAN TEA CROP, 1898.

The General Committee regret to state that they are unable to present a revised estimate of the whole of the crop, as they have failed to obtain completed figures from five firms of Tea Garden Agents who submitted a total original estimate of 10,830,780 lb., and they have also been unable to revise the estimates for Dehra Dur and Kumaon, and for private and native gardens amounting to 6,000,000 lb. The Committee are consequently in a position to present only a revised estimate of the crop of such gardens as have now sent in completed figures, as der following particulars :-

	Manufacture to Balance to be made.		
	15th August 1896.	Season 1898.	Total.
	lb.	lb.	lb.
Assam ..	30,690,857	31,895,276	62,586,133
Cachar ..	8,321,434	11,386,949	19,708,383
Sylhet ..	8,012,971	14,221,269	22,234,240
Darjeeling ..	3,609,647	2,237,007	5,846,654
Terai ..	1,884,505	1,059,327	2,943,832
Doonars ..	10,051,444	14,375,876	24,427,320
Chittagong ..	305,119	616,441	921,560
Chota-Nagpore.	94,049	100,551	194,600
Kangra ..	1,302,900	651,030	1,953,000
	64,272,026	73,543,696	137,815,722

The above revised estimate must therefore be taken in comparison with the original estimate of the crop of 1898, viz. :-

	lbs.
	158,681,312
Less as per para. 2 ...	16,830,780
	141,850,532

If from this be deducted 137,815, 722 lb the result shows a deficit of 4,034,810 lb on the original estimate of the gardens that have submitted completed returns, or say about 2.8444 per cent on their crop, and applying this percentage of deficiency to the 16,830,780 lb above referred to, the total revised estimate would be 154,167,877 lb

Estimating shipments to America, the Colonies and other Ports with local consumption at 18,900,000 lb there will remain about 136,000,000 lb for export to Great Britain.

Actual shipments to 15th September to Great Britain are 58,204,109 lb as against 58,139,550 lb to the same date last year.—*Indian Planters' Gazette*, Sept. 24.

PLANTING NOTES.

GINGER.—Good prices are prevailing in London market for Jamaica Ginger. Parcels of very fine quality may realize over 100s per cwt and even better results may be expected where good shipments are made direct.—*Produce World*.

THE COMMERCIAL ASPECT of the West African problem, Mr. Freeman, in a new book, deals with in some detail. He is convinced that the trade of the far interior has been over-estimated, while the possibilities of Ashantiland itself have not been sufficiently recognised. The kola nut was the real wealth of the kingdom. "It was to the kola nut," he says, "that Ashanti was indebted for nearly the whole of its great caravan trade with the Mohammedan countries of the north and east—a trade that had supplied it with articles of use and luxury, and had even augmented its stock of gold." But with the passing away of the powerful Ashanti kingdom the cultivation of the kola plantations has been much neglected, and the country has consequently declined in prosperity.

"RUBBER FORESTS."—Henri Condreau, who has discovered so many rubber forests, says the *India Rubber World* of September 1st, has again ascended the river Curupuby to the *cachocira grande*, and terminated his investigation in the Tuéré. This year he intends to explore the region between the rubber-bearing rivers Tocantins and Xingu, returning to Para in December. It had been intended, by one of M. Condreau's companions, who died of fever on the upper Anapa, to establish a model rubber plantation at Para.

MICA.—The tests as to whether the mica is good for anything, or whether, as the natives say, "it is alive," are its firmness, specific gravity, and the power of reflecting the countenance free of contortions. The latter test shows the perfect parallelism of its individual plates and consequent likelihood to split well. The heavier the mineral and the more perfect the reflection, the more valuable is the mineral considered. All the plates not standing the necessary test are of a soft and flimsy nature, without any of the brilliant sparkle of the better sort, and are called by the natives "dead mica."—*Invention*.

"GREEN OR UNFERMENTED TEA FOR AMERICA."—On page 323 will be found a paper on this subject by an Indian Tea Planter. "A.C." opens well, but he rather loses himself in wordy reiteration later on and makes impracticable suggestions about a special Association organizing the business. So far as Ceylon is concerned, the "Thirty Committee" have done the right thing in their offer of a bonus for a limited period to give the new teas a good start. However in the following part of his manuscript "A.C." becomes more practical, as will be seen later.

NYASSALAND COFFEE COMPANY.—We regret to learn from the report published on page 126 that owing to scarcity of labour and an unusual rainfall causing heavy growth of weeds success has not attended the work of clearing and planting 383 acres accomplished during the past year. No further land will be opened this season and the energies of the Superintendent will be directed towards fully supplying last year's clearings. It is gratifying to know that no further difficulty is anticipated in regard to labour and that the prices of Nyassaland coffee have been well maintained.

FISH AS MANURE.—An illustration of the intensity of the heat in London is found in the condemnation of fish at Billingsgate Market, 221 tons having been destroyed in the first 25 days of the present month, against 135 tons in the 31 days of August, 1897. The quantity so treated last month was only 93 tons, and in June 78 tons. Last Monday was the hottest day of the current month, and the result was that no fewer than 34 tons of fish were found to be unfit for consumption. This wasted food is hermetically sealed in tanks with carbolic acid, taken to Belvedere down the Thames, and made into fish guano, excellent for land.—*Home paper*.

THE YANGTSE VALLEY.—In the September *Contemporary Review* a solid and valuable article is Mr. Archibald Little's description of the Yangtse Valley. Frankly disclaiming his ability to discuss general English policy in China in spite (or because) of forty years' residence in the Celestial Empire, he gives a most valuable account of the marvellous river with its 3,000 miles of navigable water (including its tributaries), serving a population of 180,000,000 all ready to multiply their expenditure on foreign commodities ten fold. In spite of his disclaimer, he concludes with a plea for securing it as our "sphere of influence."

**BAMBOOS AND ARCHITECTURAL FEATURES.**—The monopoly enjoyed by the Weeping Willow threatens to be broken down. We have lately seen some Bamboos in association with monumental urns and similar constructions; and the effect was excellent.—*Gardeners' Chronicle*.

**TEA COMPANY PROSPECTS: A HINT TO THE "THIRTY COMMITTEE."**—One interested, writing from home by this mail, makes rather an original suggestion for the benefit of that much-talked-of body, the "Thirty Committee." He writes:—

"I hope Ceylon Tea Companies will shew up better at the end of this year than they did at the end of last; but all round for the year, so far, the market has been no better, and exchange is higher: so great things cannot be looked for. It is places like ——— in the lowcountry that feel it most, i.e. among the *good* places—for, of course, there are a lot of poor properties at mid-elevation which must simply be struggling to keep alive. The Tea Cess Fund Committee might do worse than buy up a lot of worthless property and abandon it for the general good!"

**"KEW BULLETIN."**—The contents of the August number consist of articles upon the Coagulation of Rubber-milk; Kendir Fibre (*Apocynum venetum*, Lin.), a fibre plant successfully used in the manufacture of Russian paper-money; Carob-tree (*Ceratonia siliqua*, L.), including a report on the cultivation of the Carob as a shade-tree, and its seeds as forage for horses when on long journeys; *Shinia* in Cyprus (*Pistacia Lentiscus*), used in the adulteration of Sumach (*Rhus coriaria*). *Shinia* is the Cyprian name of the plant. The number contains descriptions of a number of new Orchids, and short notices of *Bamboo vulgaris*, *Artemisia pallans*, *Lemon grass-oil*, hybrid Coffee, Florida Velvet Beans, now identified by Mr. F. M. Bailey, F.L.S., the Colonial Botanist, Queensland, as *Mucuna pruriens* var. *utilis*. It is probably *M. utilis* of Wallich, described in the *Flora of British India*, vol. i., t. 280, "a cultivated variety," with velvety not hairy pods.—*Gardeners' Chronicle*, Sept. 3.

**HYBRID COFFEE.**—A note on hybrid coffee in Mysore was recently published in the *Kew Bulletin* (1898 p. 30). According to the *Tropenpflanzer* (1898, p. 164), Dr. Burk has recorded a similar hybridization of Arabian and Liberian coffee in Java. The results in that island are, however, not considered so favourable as in Mysore. In Java the hybrid plants are said to yield very sparingly, while some are quite barren. Herr F. von Braun is quoted as stating that "of the many hundred hybrid plants in the experimental gardens at Tjikeuneh, near Buitenzorg, a few only produce fruits." On the other hand, grafted plant (Arabian coffee on Liberian coffee) are said to be very promising. Hybrid coffee plants appear to have been also produced in the West Indies, but nothing is stated as to their productiveness. Extract from letter from Curator, Botanic Station, Dominica, to Royal Gardens, Kew, dated June 8th 1898. "I noticed in the *Kew Bulletin* a note on hybrid coffee in Mysore. It will interest you to hear that there is a coffee grown in Martinique which is said to be a hybrid between the Arabian and Liberian kinds. A gentleman here obtained a small plant of it for me, and I am now growing it at this Station. The leaves of my small plant are as large as the leaves of Liberian coffee, but in appearance they are similar to the leaves of Arabian coffee, and like the latter are badly attacked by the coffee fly."—From *Kew Bulletin* for August.

**PROBABLE SCARCITY OF CACAO?**—It is an ill wind that blows nobody any good, Ceylon Cacao planters may be inclined to say when they read the details of the terrible cyclonic visitation to the West Indies. Many cacao estates in both St. Lucia and Grenada are said to be ruined, and it is a question if Trinidad has escaped, and it will be remembered that these are the islands which yield the larger proportion of cacao sent to Europe from the West Indies. Our reckoning in our World's Produce review is 250,000 cwt from Trinidad, 100,000 cwt. from Grenada and 3,000 cwt. from St. Lucia,—together about ten times the export so far obtained for Ceylon.

**THE YANG-TSE VALLEY AND ITS TRADE.**—Mr. Archibald Little, who has lived forty years in China, describes—in the *Contemporary Review*—the region that is supposed to be the sphere of British interest. The river is about three thousand miles long, and two thousand of these are navigable. Another thousand miles of its principal affluents are also navigable, so that we have a waterway of three thousand miles in length flowing through the most populous regions on the earth's surface. Great Britain and her colonies do about two-thirds of the ten millions sterling imports and exports in this region, but Mr. Little says that our proportion is steadily waning owing to the competition of Germany and the United States:—

It is no exaggeration to say that, given a stable and progressive Government, affording encouragement to capitalists with security for their investments—resulting in improved means of communication and a corresponding development of its natural resources—the Yang-tee valley will increase its trade by leaps and bounds, and the £30,000,000 of today will be £300,000,000 to-morrow.

**TEA AND ECONOMIES.**—Hitherto—says the *India Planters' Gazette*—too much time, money and labour has been devoted to extensions and too little attention paid to improvements on existing cultivation. It should be remembered that every acre of extension adds to the expenditure under which the garden may be groaning perhaps; whilst if one can add a maund, or part of it, per acre to any portion of his existing cultivation, he receives at once some return for his expenditure. There is at the same time no extra outlay in cultivation so long as his attention to improvement is directed to old areas; it costs the same to hoe an acre yielding three maunds, as it does to hoe one giving six or eight maunds, but the result in the one acre is very different from the result in the other. We briefly pointed out before, that a planter cannot work his garden under an expenditure of R100 per acre locally, and if we allow R30 more for Calcutta, it should do; so that R130 must be realised before the shareholder can expect any profit. At this calculation, a garden must yield all round over five maunds per acre of five-anna tea, and we don't think it is safe to calculate higher than this; in fact, we imagine we are taking an outside figure when we allow this. However, let this stand, and the conclusion is, that by studying economy in every way, a small margin can be got for the shareholder if the planter can raise his yield all round to six maunds (504 lb.) per acre, and this should be his aim and object. Some will ask how this is to be done. We reply by cutting down all unnecessary expenses, more especially relating to the native establishment, line chowkidars, etc.—a very large reduction in which could be made, provided planters would only form themselves into an association to protect mutual interests.

## PLANTING IN THE STRAITS.

MR. DONALD MACKAY ON COCONUTS,  
PEPPER, COFFEE (LIBERIAN AND  
ARABIAN) AND RUBBER.

Mr. Mackay is enthusiastic over the prospect before coconut planters in certain divisions of the Straits Settlements and from actual experience already gained, we confess, he has some reason for his strong faith. He expects, now that Liberian coffee has turned out a comparative failure (in price even more than cropping), that there will be a "rush" to plant up the palm instead. The great advantages of the Perak State, for instance,—where the property in which Mr. Mackay is interested, is situated—over even the South-West coast of Ceylon for the coconut, are better soil and better-distributed rainfall. In no month of the year is an appreciable fall of rain wanting in Perak and the total is about 120 inches a year. As to the soil, a good deal is alluvial for a certain depth with a loose sandy subsoil in which the palm gets on well, especially with its feeding roots in the alluvial. The particular property referred to—on which 500 acres are now planted with coconuts—is some distance inland, and between 100 and 200 feet above sea-level. It is favoured with a detached limestone hill on one of its boundaries, in the base of which are a number of caves, frequented by bats, so that there are deposits of natural guano ready for future use, a very important matter—since the most experienced palm planter in Ceylon has declared that no cultivation responds so readily and handsomely to manure as that of the coconut. For transport, the estate uses a road 12 miles to Taipeng, the capital of the State and thence there is a railway 8 miles to the seacoast at Port Weld; but in a couple of years the railway will be up to the plantation. Now for actual experience: the first 100 acres planted are 5 years old, and although the trees were put in only 53 to the acre, already the branches cover the soil and the lateral roots are found to meet! Still more convincing is the actual crop of nuts. We do not say that coconut palms bearing in five years are unknown in Ceylon; but we scarcely think 100 acres here can be pointed to, yielding an average of 20 to 30 fully formed nuts per tree at that age. A limited number of trees with 100 nuts we do not make much of; because such exceptions in particularly favourable spots, or where great attention has been given, are not unknown wherever the palm has been tried. But, in Ceylon, we consider seven to eight years quite time enough to look for such returns as apparently this Perak plantation gives two years earlier.

Another profitable product is PEPPER, and Mr. Mackay has brought us two interesting samples well worth the attention of any in Ceylon thinking of going in for pepper. We have more than once urged—and we do so with renewed force after hearing Mr. Mackay's experience—that every estate in the Kelani Valley, Kegalla and Labugama districts ought to have some pepper and areca (if not coconut) palms added to its cultivation. The first sample is of ordinary pepper to shew the effect of the system adopted to clean and whiten it. The pepper is put in bags and then placed in the river (which runs by the estate); when taken out, the skin of the peppercorn is so softened and loosened as to be readily removable and then some drying in the sun finishes the process.

Of this pepper as much as 200 piculs (about 235 cwt.) have been shipped from a crop and realizes 9d a lb. But there is another finer and smaller pepper, which is 50 per cent more valuable when prepared by a process of "hulling" and the result is a tiny seed, less than half the size of the ordinary peppercorn. The mucilage and skins in both cases, amount to about 40 per cent and are not altogether useless—indeed may be shipped sometimes at a profit. As to the growing of the pepper vine, not much trouble has been experienced, although four years have to elapse before a crop worth gathering arrives. Mr. Mackay's experience is over some 29 acres planted first with Dadap trees as supports, but latterly with areca palms interspersed in some parts with hard-wood posts. The white ants, though common, have never been found to interfere. The usual distance is 8 by 8 feet for the arecas; but this has been found too close (as to shade) for the pepper. An areca palm and post alternating do well, giving all the light necessary for the pepper. Then, recalling the fact that the Dutch 160 years ago got up to an annual export of nearly 500,000 lb. of Pepper—chiefly gathered in the Kegalla, and some in the Matara, district, is it not a shame that Ceylon should do so little now with this valuable product, which at present is rising in price in the home markets? How the Sinhalese came to give up the cultivation is very clear: the British soon after assuming the administration removed the Crown levies from all but Paddy, and looked after besides, only cinnamon which remained a monopoly; and the Kandyan (and others) finding that they were no longer compelled through their headmen to collect and deliver so much pepper, as in the time of the Dutch, soon neglected the culture altogether. We trust, however, the time has now come under European direction for a revival of pepper cultivation on a considerable scale in the districts favourable to it.

As regards RUBBER, Mr. Mackay has not much to tell us: a certain number of "Para" plants obtained from Government Gardens has been planted out, and a little done with native rubber trees.

As regards COFFEE, Mr. Mackay has seen a good deal of Liberian doing very well at the Straits where interspersed with coconuts. Sir Graeme Elphinstone, who accompanied Mr. Mackay to Penang, and who speaks of going home shortly, has a large extent of Arabian as well as some Liberian coffee on his property which runs from 1,800 to 2,500 feet altitude. "Logie" has indeed planted 300 acres since he came out three years ago. He has several of his old Ceylon conductors or kanganyes (including "Cyclops"); and although the fungus is not absent, it is not virulent and is especially light on the Liberian. We sincerely trust that Sir Graeme may get a due return for his hard work, continued at a time of life when most men avoid anything like clearing and planting.

To return to Mr. Mackay, the estate with the 500 acres of coconuts (to yield 4,000 nuts per acre at 10 years old—price at Singapore just now about R48 per 1,000!) with a certain proportion of Liberian coffee, areca palms and pepper vines,—is called Gapis and the proprietorship has just been resolved into a Limited Company, "the Kwala Kwangsa Plantations Company, Limited," whose fortunes we shall follow with interest and whose success will be hoped for on account of the plucky promoter. Mr. Mackay has still planting interests in our Kelani Valley and we hope he will encourage the culture of Pepper of the best type in that district.

### FUNGUS PESTS ON PRODUCTS OTHER THAN CACAO.

We have already urged that Mr. Carruthers' services should not be lost at this time in the interest of Cacao planters. But there are others who should be quite as much interested in the retention of the Cryptogamist. We do not wish to raise any alarm; but no one can read the several works published in India on tea pests, without realizing that our staple has its fungus enemies quite as much as Cacao. It will be remembered that a recent number of the "Kew Bulletin" was devoted to the consideration of several of these, and in Dr. George Watt's large volume on the "Pests and Blights of the Tea Plant," there is very plain speaking as to the serious effect which the "grey blight" and the "blister blight"—both fungi—may have on tea in Assam, if the beginnings of their attacks are not watched and promptly dealt with. For this reason alone, is it not indispensable to have a Cryptogamist on the spot to be ready to deal with any fungus pest on Ceylon tea. Even now such is not unknown at certain seasons of the year and it would be wilful blindness not to take the needful precautions when the right man for the work is already in the island.

### THE BACTERIOLOGY OF PLAGUE.

We have no doubt that our local medicos are keeping abreast of the knowledge which is available to them from professional sources, on the terrible disease which has taken such a fatal hold of portions of the adjoining continent, and are treasuring the information with which their brethren are able to supply them through the medical journals. The subject, however, is of surpassing interest to lay folk as well; and whatever information can be placed within their reach in a popular form, is sure to be useful in one or more of two ways—in inducing due precautions, and in protecting against groundless apprehensions. Dr. E. L. Marsh is a specialist who has been sent to India from home to assist Professor Haffkine in his investigations; and his Lecture, delivered in the Hall of the Wilson College Literary Society, Bombay, is of the simple and informing character, which the general public should welcome. The lecture was delivered under the presidency of Surgeon-Lieut.-Col. Hatch, the Principal of the Grant Medical College; and we are sure a brief summary of parts of it, as published by an Indian contemporary, may be read with profit by our readers, at a time when plague is so much in the air, and when we are living in constant apprehension of its introduction into the island, notwithstanding the vigilance of the Government and medical authorities here and in India.

In tracing the development of bacteriological research through, and since, the labours of Pasteur, Dr. Marsh points out that the establishment of the connection between living germs and the causes of disease has led to the discovery that many diseases are traceable to parasites; and further to the adoption of treatment which can check their activity. Thus, Pasteur found that the germs of decomposition could be controlled by parboiling the foods containing them, or by excluding the air in which they abounded. Hence the use of refrigerating chambers, and of certain chemicals which destroy germs; hence, too, the filtration or boiling of water, or preferably both, which it is so difficult to make most people to practise. The importance of seeking the aid of science is proved

by the ascertained possibility of intensifying mischief by injudicious applications of so-called disinfectants, or by disturbance of the soil. Thus, the bacillus of enteric or typhoid fever is said to be greatly benefited, instead of being destroyed, by the application of a weak solution of carbolic acid to the material nourishing it. Next, the various well-established methods of protecting against infectious diseases are discussed, such as those of Jenner and Pasteur, which artificially weaken the infection and produce a less virulent form of the disease which protects against virulent disease; that of Haffkine, who inoculates extinct cultures of the micro-organism and its products, with similar results; the method of Behring which confers temporary protection against virulent disease by inoculating blood or serum endowed with immunizing properties—as in the case of tetanus and diphtheria. The extent of the protection which each of these methods confers is next considered; and then we are told that Dr. Haffkine's method of protecting against plague has established confidence in the resources of bacteriology.

Speaking of the results of inoculation, Dr. Marsh concludes thus:—

The inoculations have been applied to many thousands of persons exposed, less or more, to the infection of plague. I make use of the records of 5,655 persons in whom the circumstances of exposure were exactly similar, the only differentiation being that 2,709 of these persons were struggling to escape the disease *secundum naturam*, while 2,946 were aided against the disease *secundum artem*. Of the 2,946 inoculated persons, 111, or 3.8 per cent, suffered from plague, and of these 45 or 39.4 per cent died. But of the 2,709 uninoculated persons 367, or 13.5 per cent were attacked with plague and of these 264, or 71.9 per cent died. Had the incidence of attack and the cases of mortality of the inoculated persons equalled that of the uninoculated then 255 more cases of plague and 242 more deaths from plague would have resulted. Inoculated persons, therefore, even when their armour of protection is put on in the presence of the enemy, have an immense advantage over the uninoculated in respect of the number killed and wounded. It is not difficult to understand how an inoculated population would attain a still greater resistance to the disease if inoculation preventive was established early instead of being relegated to the position of an expedient when the disease had already caused frightful mortality. Thus, more and more, the practice of preventive medicine is having to adapt itself to the experience and study of the natural history of bacteria; and whatever Nature teaches of the limitations she imposes upon these lowly forms of life must form the basis of procedures which purport to prevent bacterial disease. The advances made in recent bacteriology, as a science of disease causes, entitle this science to an important position in preventive measures. In proportion, as it occupies the position its consequence demands, will it be contributive of real service. It would be easy to elaborate the argument as to the importance of protective inoculations in plague, but I must content myself with the plea that the statement I have given, imperfect as it is, of the principles of disease prevention when the disease is of bacterial origin, will sufficiently imply what more might be said for a "Science which is becoming more and more able to preserve and strengthen to men their gift of life."

CACAO TREES, writes a planting correspondent, are still to be seen in a moribund condition on estates lying between Matale and Ukuwella. Mr. Carruthers' services should be retained by Government at least for six months more; for we are likely to have a spell of wet, after all this dry weather, which will be in favour of the destructive cacao fungus.

### A TEA PRUNING EXPERIMENT AND ITS RESULTS.

[The following paper must be regarded as of permanent value in giving a faithful report of actual experience in regard to the pruning of tea grown at a medium elevation and in an old coffee district. Roseneath, the plantation referred to, grew coffee, we suppose, for nearly 40 years before its fields were turned into tea. The property is now to be taken over by the Kandy Municipality to be gradually turned into a forest with quick-growing trees and added to the reservation around the Water Supply Reservoir for the town. The Manager of Roseneath takes charge of his own tea estate in the Knuckles: but before leaving he has been good enough to place before us his experience of a system of pruning which some authorities would consider too frequent in its operation if not too severe. —ED. T.A.]

When I last had the pleasure to see you, Mr. Editor, we had a talk about Tea Pruning. I told you of my experiment here and the results; and now that this property is changing hands—passing to the Kandy Municipal Council—and my connection with it ceasing, it might be well to put on record what has been done, and the outcome so far. For those who do not know the estate I may say that part of it might have been opened fifty years ago; that for the first twenty years there were few or no drains: that it has a poor quartz hungry soil, and but for the liberal and enlightened policy of its proprietors who have always allowed steady manuring, it would long ago have lapsed into thin scrub or weakly mana grass. It has been kept alive and going by Kandy rubbish, and now that this savoury fertilizer is to go elsewhere, and the tea now growing is to work out its own destiny unaided, I expect it will be short-lived. The "City Fathers" have taken the property to their bosom—a dignified and hallowed resting place! What I have done in the way of pruning is what I hold will help similarly situated estates, medium elevation 2,400 feet with old coffee land, undistinctive teas, and low yields. There are numerous properties of this kind—"bound to go to the wall" so it is said—and it is to prevent if possible this heart-breaking process, by showing a way to a considerable saving in working, that I send you what has been done here.

I used to prune my tea every 18 months. In 1894 I had come down to 15 months. Since the beginning of 1895 the whole estate has been pruned yearly. The daily averages of leaf gathered per cooly for these years are as follows:—

1894 pruning every 15 months ...	lb. 15·09
1895 do 12 do ...	„ 17·00
1896 do do do ...	„ 20·09
1897 do do do ...	„ 21·01

This makes cheap working. I may say I went round every 10 days. What was beginning to impress me most was the *steadiness and regularity of the flush*—no big rushes and no lean months. In 1897 the months which were under 20 lb. average were January 18·09 and August 19·09; the two highest were April 22·07; November 22·04.

The pruning was a light pruning costing rather less than R4 an acre. I had a small gang of experts who did little else. Supplied with decent knives they finished their task by 3 p.m. I found that after pruning I had to tip for the first time in about two months.

The teas made got fair prices, considering the medium plucking and the elevation. Last year, for instance, the average for the *whole* crop sold was 34½ cents.

I have often been told that I would ruin my tea by the plan I have adopted. It is possible; but who has the experience to speak, and on what other authority are they entitled to speak? Why should 18 months' pruning be considered safe and 12 months unsafe? It's a thing that has to be tested. How was the man regarded who first advocated and applied the knife vigorously to roses? Is it not an axiom in grape-growing countries that you should never prune your own vine; but get another to do it, that the plant may get the thorough treatment it needs?

Anyhow if the medium properties are "bound to go to the wall," as some of them are being worked at present, might they not go in *on the chance* of surviving the yearly pruning, lessen their cost of production, and give a wider field for generalizing on the merits and effects of quick and light pruning? Better to die with the old pluck at the fore, and ready to grasp at every advantage before the fatal plunge is taken, than doing nothing, or at best a hum-drum following of the leader to possible disaster. I have seen numbers of places where the returns wereshort—the plucking average too low for anything—and the leaf gathered, bangy abomination most of it—which with an earlier application of the knife would have done ever so much better.

I don't claim all the advantages to the pruning: it produced the leaf, but it had to be plucked and I was blessed with a really hard-working lot of coolies and an exceptionally energetic Conductor to run them. *He* takes a lot of the credit, classes himself in a new order of merit, that of being *not* "a half-past six feller," which I presume stands for up-to-date with us. Doubtless there is also a hidden allusion to the lazy cooly late for muster. The manuring too has played a part, but I generally think of that as only bringing up the soil which obtains here, to a fair average elsewhere.

Roseneath, Oct. 4, 1898.

J. L. D.

### INDIAN TEA CROP.

#### A REDUCTION OF 4½ MILLION LB.

The Indian Tea Association's revised estimate of this season's crop—see page 340 for details—now puts the total output at 154,167,877 lb., as compared with the first estimate of 158,681,312 lb. The shipments to America, the Colonies and other ports, with local consumption, making up 18 million pounds, will leave 136½ million pounds for export to Great Britain.

This makes a total reduction of about 12 million lb. in the Estimated Indian and Ceylon Tea Crops for 1898, while the total shipments to the United Kingdom will scarcely exceed—if indeed they reach—those of 1897.

COFFEE BLIGHT IN BURMA.—News from Toungoo says that blight is working great destruction amongst the coffee plantations there, all the gardens north of Leikhto being badly damaged, while those nearer Toungoo are now showing signs of being affected. Sulphur is wanted as a preventive, but the provisions of the Arms Act put serious difficulties in the way of planters securing a supply from Rangoon.

PLANTERS' VERSES.  
SING A SONG OF TENPENCE.

## I.

Sing a song of tenpence  
The planters all exclaim,  
It's what we want to set us up  
And bring good luck again.  
Our crops are short, exchange is high,  
Our balances are low,  
Rupees are up, for this we sigh,  
It is a bitter blow.

## II.

We've Borer, Scale, and Leaf Disease;  
As yet there is no cure  
For these drawbacks to planting life,  
Of that we feel quite sure.  
But in the happy future  
A specific may be found  
To exterminate these evils  
And renovate the ground.

## III.

So much was heard of Ladybirds,  
We sent across the seas  
A trusty friend to bring some back  
To clean our Coffee trees.  
Alas! the voyage proved too much  
For the Ladybirds' frail health,  
They one and all gave up their life,  
Nor added to our wealth.

## IV.

And now we want the Government  
The Mints to open wide,  
It is a simple plan, yet all  
Are sternly kept outside;  
We Planters, and the Ryots brown  
Whose grievances we share,  
Would like Exchange to go low down  
To lighten all our care.

—*Indian Planters' Gazette.*

MARCUS.

THE AVAILABleness OF ATMOSPHERIC NITROGEN FOR AGRICULTURAL PURPOSES.

It may be noted, in perusing the communicated article on this subject in last night's issue, that criticism can be anticipated to the effect that the argument as to the exhaustion of atmospheric nitrogen by its appropriation for the nutrition of plants applies equally well to the exhaustion of the free oxygen of the air, since the combination of the two elements through elastic agency, and their ultimate exhaustion as free gases, would be in a constant ratio. The necessity for speculation as to the return of elementary nitrogen to the atmosphere would there also stand in the case of elementary oxygen, in order to account for the preservation of a uniform atmosphere for the respiration of animals. This would demand a further hypothesis! And how is it to be supplied?

Sir Wm. Crookes refers to the sea as the receptacle for the almost incalculable amount of organic nitrogen which reaches it under present conditions of civilized life, and points to the immense loss of nitrogen to the plant and soil through the disposal of sewerage by this means—a factor which tends to bring about that crisis in Agriculture which he predicts.

Agricultural Chemistry further tells us that the largest loss of nitrogen from the soil occurs by the washing away of nitrates—among the most soluble of salts—which ultimately reach the sea.

Is it to be supposed, then, that the greater sea which is being enriched at the expense of the lesser land, is holding these reserves of

nitrogenous compounds for a future generation,—to be redeposited through geological agency in the form of natural formations of nitrate as in Chili? Or should we rather give further licence to our speculative powers and think of the sea as the medium by which elementary nitrogen and oxygen are returned, through chemical or organic agency, to the atmosphere, just as it is the medium, though, in a different sense, by which the water lost from the earth is given up to the atmosphere to be returned as rain. The denitrification theory, so much discussed of late, teaches us that certain organisms, the denitrifying bacteria, are instrumental to some extent in supplying the atmosphere with free nitrogen derived from the organic matter in the soil, and why may not a similar phenomenon occur as regards the immense amount of nitrogenous compounds which reaches the sea? Such a hypothesis may be supposed to equally balance the profit and loss accounts of soil and air as regards their nitrogen and oxygen, but how dare we adopt it?—C.D.

INDIAN TEA INDUSTRY.

To the Editor of the *Financial Times*.

Sir,—Your interesting article of Friday last on "The Indian Tea Industry" directs attention, quite properly, to certain possible dangers which threaten this industry, as well as to remedies for these dangers which appear to be within reach. As you truly remark, over-production has for some time "been held out as a danger." It might perhaps be more correct to say that it has constituted a grave danger. The prospect, however, of further and increasing danger on this score may now (it is generally admitted) be regarded as being less likely, owing to the decided check which has been given to extension by the unprofitableness of the past season. It may, indeed, be fairly contended that, instead of production being likely to largely outstrip consumption, a steadily increasing relief may be looked for, owing to the strides that are being made in introducing both Indian and Ceylon teas into new foreign markets, as is shown by Board of Trade figures, especially those of the past three months. Your remarks regarding the opening out of North America as a fresh market of consumption are quite correct. May I point out, however, that there are other even more important markets now showing signs of opening up, chief among which are, first, the great Russian Empire; Germany and Scandinavia coming next, with the various Latin countries all likely, in time, to follow. Taking all these together, as well as the widespread British colonies—all expanding in population—it may safely be said that the fresh outlets which may be looked for are practically boundless in extent. But, of course, further development of these markets will require time, much energy and the spending of a good deal of money, either on the part of the "Liptons," "Mazawattees" and other large distributing agencies, or by the planting communities themselves. As regards the further reduction of the duty, from the purely selfish point of view of the planter, there does not appear to be any very urgent need of this, as the tendency of any such reduction would probably be rather to put a premium on the reintroduction of cheap China teas. As regards the currency question on which you, Sir, appear to have an open mind the rise in exchange, while apparently telling against profits, will, no doubt, before long be accompanied by some compensation reduction in rupee cost of production in the shape of lower costs of food grains for the labourers—equivalent, virtually, to reduced coolie wages, while even European salaries, and all European stores, &c., will tend to cost less in rupees—just as they tended upwards during the decline in the value of the rupee.—I am, &c., GEO. SEYON, 120, Bishopsgate-street, E.C., 17th Sept., 1898.—*Financial Times*, Sept. 20.

## CACAO CULTIVATION AND ITS ENEMIES :

## MR. CARRUTHER'S FINAL REPORT.

We must direct attention to this interesting and able Report given on page 359, although we have yet to give it that careful perusal and consideration which should alone entitle one to deal with its contents. We may be permitted, however, to refer to some of the main points which even a glance over its paragraphs makes evident as of special interest. In the first place, it is a great relief to Cacao proprietors and the Colony generally to learn that, in Mr. Carruthers' opinion, the presence of the canker on estates in no way threatens the profitable cultivation of cacao in Ceylon; and though it means an extra outlay, this and the additional attention required may yet tend to such improvement in methods of culture, as to secure an increased yield of crop. Nevertheless, Mr. Carruthers has to confess that among the 40 cacao estates visited by him, while some have not suffered at all, yet others have been practically wiped out by the canker. This, we infer, is due to the disease not being dealt with in time, the great matter being to excise the diseased part when first observed. Mr. Carruthers shows very clearly that the roots are not affected, only the stems and branches; while the pods are subject to a distinct enemy. A complete life history of the canker fungus is afforded in the present Report and Mr. Carruthers emphasizes all that has been said as to the superior robustness of the Forastero variety which can also be brought to a higher state of cultivation than the Red or Criollo. The current opinion is that the life of Cacao in Ceylon is limited to fifteen years; but Mr. Carruthers points to plantations twenty years old, which are, so far, the more flourishing the older they become; and he thinks that not even forty years should be placed as a life limit. We have frequently mentioned that in the Guianas—Dutch, French and British, but especially the first-named,—a well-established Cacao "Walk" or Plantation was considered safe to last and produce profitable crops for *one hundred years*, that is, if once the tenth year be passed; but that no cultivation gave more anxiety, if not trouble to the planter until that period was left behind. Let us hope that wherever soil and situation are favourable, "hundred years" old flourishing Cacao plantations may prove to be the rule in Ceylon, carrying us on to 1970-80! Mr. Carruthers gives excellent practical advice in regard to "shade" and also as to the use of "fungicides" and again in respect of the growth of "suckers," and what to do with shade trees affected by the canker. Finally, the "pod disease" is dealt with and very clear warning as well as advice how to act, given to the planter on the subject. Mr. Carruthers calls this his "Final Report" and so it is, according to his present engagement with the planters. But it is quite evident that prolonged observation and experience would enable Mr. Carruthers to convey a good deal more of useful information and practical counsel to aid Cacao planters. But this is not all: other staple products have to be examined and dealt with for fungi; and we, therefore, trust that Mr. Carruthers will not be allowed to leave the island by the Government without an extended engagement—so that even if he has to run home temporarily, he may speedily return to resume his most important investigations in respect of our staple products and their fungoid enemies.

Since writing the above, we are glad to learn that Mr. Carruthers has put off his departure till the end of the month and that he is now investigating some new pest that is attracting attention in the Kelani Valley.

## EXPERIMENTS IN TEA MAKING :

MR. KELWAY-BAMBER'S APPOINTMENT.  
HINTS TO THE P. A.

[We direct the serious attention of the Committee of the Planters' Association to the following paper by Mr. John Hughes received by a recent mail. —ED. T.A.]

After writing for twenty years and recommending the scientific manufacture of tea in accordance with the Chemical principles involved, it is very gratifying to the writer to learn that the appointment of a distinguished and able Chemist as expert has at last been made. On reading in the last "Overland Observer" the account of the meeting of the Dikoya Planters' Association however, in reference to Mr. Bamber's proposed work, I could not help thinking that the terms of the appointment were either misunderstood, or that the benefit to be derived from Chemical research in the manufacture of Tea had not been fully thought out by those who made the appointment.

So far as the analysis of the soil or samples of different soils are concerned the work which is long and tedious, can be more readily and cheaply performed here than in Ceylon, with the advantage of having a great number of previous analyses for *comparison*; and I am sure that Mr. Bamber, with whom I am personally acquainted, will fully bear me out in this remark.

What cannot be done however at all by home Chemists and what I have endeavoured for so many years to impress upon planters is the work of local, personal and daily research into the Chemical principles of tea-making by a persevering, industrious and fully qualified man such as I believe the Planters have in Mr. Bamber. It would be a most unfortunate mistake if the time of such a man were to be taken up in the analysis of soils from different estates.

It is not so much the making of soil analyses that is difficult, but rather the difficulty of having sufficient previous knowledge of the composition of really good estates, so that one can make a practical comparison.

I am reminded of a distinguished Dimbula Planter who met me during my official tour through the planting districts in 1877 and was very anxious that I should visit his estate in order as he said that I should analyse the soil on the spot and who was greatly disappointed when informed that such an arrangement would be impossible on account of the absence of the requisite apparatus for performing the chemical analysis and the time that such analysis would require.

If the planters would take my suggestion about a matter that I have been thinking out for years, Mr. Bamber should be allowed to make his own selection of a well-appointed factory in reasonable distance of his bungalow at Hatton and where day by day he would superintend the manufacture of tea according to his own views, carefully analysing the natural leaf and the prepared leaf during the different stages of manufacture, with due regard to the temperature and the humidity of the air in the several processes,

Travelling about the districts afterwards may be useful, but until some practical work in the factory, aided by chemical analyses in the Laboratory close at hand, has been completed, it will only be a waste of valuable time to go from place to place.

All scientific investigations must be carried on in properly arranged works and Laboratories and according to a definite pre-arranged plan, and under careful personal supervision otherwise no useful results could possibly be obtained.

I feel sure that Mr. Bamber will cordially support me in these suggestions and probably will have anticipated me in these remarks; if so, they will be useful in supporting his own views; but having taken a great personal interest in the importance of instituting chemical research in the manufacture of Tea I felt that the opportunity favoured a definite statement in regard to the most practical way of carrying out the same and I trust these lines will be accepted in the same spirit as they have been written.

JOHN HUGHES, F.I.C.

Analytical Laboratory, 79 Mark Lane London, E.C., September 23rd 1898.

### THE FIRST FRENCH MERCANTILE HOUSE IN COLOMBO:

MESSRS. COCHERY AND PERIGNON.

We are very glad to welcome Messrs. Cochery and Perignon who arrived a fortnight ago from France in order to establish a mercantile House in Colombo. It is very singular that although the "Messageries Maritimes" has been in existence for wellnigh 35 years, giving regular and ready communication between France and Ceylon, no French merchant has hitherto started in Colombo. Messrs. Cochery and Perignon deserve all the greater welcome, therefore, for their enterprise and they are eminently qualified for their mission, speaking English well and knowing all about the requirements of France and the Continent generally. It will be especially gratifying to our planters to know that a particular object with the new firm is to introduce tea freely into France. There is a steady and growing demand now all over the north of France, although so far it has been chiefly met by China tea. Of course, other products—of the coconut palm especially, cacao, plumbago, &c.—will not be overlooked. But being on the spot to buy their tea in the Colombo market, it may be confidently assumed that the new firm will be the means of introducing a growing quantity of Ceylon tea direct into France. Messrs. Cochery and Perignon also expect to get orders from Russia. They have not yet settled about an office and warehouse in the Fort, but hope soon to do so.

**CONGO STATE COFFEE.**—The poor quality of the coffee despatched to Antwerp from the Congo Free State last January has now been followed by a further shipment, which experts declare to be a considerable improvement over the previous samples tested at the beginning of the year. The Congo coffee, whilst resembling the Ambriz product cultivated in the Portuguese colonies in Africa, is said to be far superior to it. It has a pleasant although somewhat unusual taste, and by admixture will facilitate the burning process of other and better qualities of berry where the flavour is not affected. The tests made show generally that considerable progress has been made in the method of cultivation and treatment of the coffee raised near Stanley Falls.

### PLANTING IN THE STRAITS.

#### COFFEE—COCONUTS—RUBBER—RICE.

(From Report in the Kuala Langat District.)

**CULTIVATION.**—Apart from the pepper and gambier estate at Sepang, the greater part of the land taken up has been planted with coffee or coconuts. I regret to say that much of the land planted with coffee by Malays has been sadly neglected by the owners. Coffee cultivation is eminently unsuited to Malays, who will not devote the labour and time required to bring the trees into bearing. The general idea amongst them here seems to have been that they had only to plant up an acre with coffee and sit down for a year or two, in order to realise a fortune. Experience has, to a very great extent, now disabused them of this notion and I do not anticipate many fresh applications for coffee land nor shall I encourage such applications. Coconuts, on the other hand, thrive extremely well and, except in the immediate neighbourhood of Jugra, the trees have suffered little from the ravages of beetle. In several instances native coconut gardens have realised very good prices.

The cultivation of rice has not increased to any appreciable extent, but I hope that it may do so before long. A start was made in Ulu Labu, with considerable success. The coffee craze having to a certain extent died out amongst Malays, every inducement should, I think, be offered to them to return to the cultivation of products which they are naturally adapted to, such as rice, nipah, rotan sega, coconuts, etc., and that every effort should be made to encourage them to improve the methods they use for such cultivation. On the other hand, they should, I think, be discouraged from attempts to imitate Europeans, with whom they have neither the energy nor the capital to compete, and whose methods they are unable to emulate. On the two European estates at Telok the coffee is still young; but some 70 acres belonging to Mr. Borring, which came into bearing, is reputed to be as fine as any coffee yet produced in Selangor.

(From Report on the Ulu Langat District.)

There are five European-owned estates in this district, the areas under cultivation at the end of the year were:—

	acres
Coffee ...	1,435
Coconuts ...	30
Rubber ..	38
Durians ...	9
Maize ..	3

The abnormally high price of rice early in the year had the effect of inducing the Malays to plant padi on a much larger scale than usual. The total area of padi planted in all mukims amounted to 1,065 acres, the crop from which was at the commencement of harvest, estimated by the Penghulus at 157,991 gantangs.

(From Report on the Kuala Selangor District.)

#### COCONUTS.

Since Mr. Holmes started the Oil Mills Company's work at Kuala Selangor, a great impetus has been given to the coconut planting amongst the natives, so much so that the number of nuts saved for seed has had an effect on the price, which has gone up considerably during the year. Javanese who took up land on the Bukit Rotan Road and planted it with coffee, which was destroyed by flood water, the drain having been dammed by the Public Works Department to use as a canal for transport of metal, have now most of them planted coconuts as also have many others who hold land on the inland side of the Coast Road which as my predecessor pointed out, acts like a long dam from Sabak to Kapar, as if built purposely to prevent the water getting to the sea. By planting each coconut on a mound six feet high it has a chance to get a start without being flooded; but you cannot grow coffee like that. I am in hopes that there will be a regulation soon to fight the coconut beetle with at present it does much damage.

Mr A E Wright of Ceylon, took up 600 acres for cocout cultivation and work is now being commenced on the land.

#### COFFEE.

Mr. Francis Welford's coffee estate at Kampong Nior is improving; the whole estate will be very soon completely drained, which will allow the land to be worked more effectively. Mr. Welford has now about 100 acres of coffee planted. Mr. Tollemache has done a good deal of draining, felled his first block, and has a fine nursery ready to plant out; his hungalaw is now completed. Mr. Tanner, who purchased two of Mr. Jackson's blocks, is just commencing work. Mr. Jackson's other block has not yet been started.

Nipah is a great help to the natives of this district. The Selangor, Bernam and Tinggi Rivers are bordered with very fine nipah for several miles; those from Bernam are nearly all taken across to Sumatra, whilst the Selangor people take theirs to Klang. The trade on the Tinggi River has not yet been properly developed; a more energetic Pengbulu is required; at present the ataps are all purchased by one Chinese trader, who gives about half a fair price for them, and pays the cost in rice and shop goods charged at 50 per cent. above Kuala Selangor prices; it is needless to say that his trade, though profitable, is very small.

(From Report on the Ulu Selangor District)

Agriculture in Ulu Selangor consists principally, at present, of small Malay coffee gardens, inter-planted with fruit trees; and bearing, where an acre or two of swampy land presents a favourable opportunity, a small crop of "padi." Except at Ulu Yam and Ulu Bernam, there is no serious attempt at rice cultivation on any considerable scale.

The combined effects of the low price of coffee and the high price of rice, generally prevalent during 1897, were severely felt by the owners of these small plantations, and there is now little or no demand for coffee land. Many of the planters realise that their chief interest should lie in the production of a sufficient quantity of rice to tender them independent of the market outside; but it is a matter of some difficulty to find land in Ulu Selangor suitable for "sawah" cultivation. At Kuang there is an extent of, perhaps, a thousand acres which I have asked Government to irrigate, and I have little fear of difficulty in getting this taken up if the irrigation is carried out.

Titles for Mr. Pasqual's coffee estates at Serendah were prepared and issued during 1897, and applications were received and registered for additional blocks from him and from Messrs. Meikle and Glassford, who are planting coffee at Batang Kali.

The grant of a block of 500 acres at Serendah has been sanctioned, on special terms, to some gentlemen desirous of planting gutta.

#### INSECT STINGS.

[I enclose a cutting from the "St. Anstell Star" re wasps; they have been very plentiful here lately; has this pest been bad in other districts? I was nearly blinded by one of the "beasties" last week.—*New Galway Cor.*, Oct. 7.]

The fact of death occasionally resulting from the sting of insects, such as bees and wasps, is no doubt largely responsible, says the *Lancet* for the species of terror which the presence of these insects brings upon many persons. Only last week, for example, a case was reported of a labourer who placed in his month a gooseberry which proved to contain a wasp. The wasp stung him at the "root of the tongue; he went into his cottage and medical aid was summoned, but death ensued in five minutes." In this instance, of course, death most probably supervened on suffocation due to intense swelling in the throat, and was not due directly to the poison itself. Vomiting, fainting, delirium, and stupor strongly suggest a highly virulent substance of the nature of a toxin. The precise nature of the poison of wasps and bees

is not known. They possess a poison bag and sting and the fluid secreted is as clear as water, exhibits an acid reaction, and, in fact, contains formic acid. But this acid can hardly account for the severity of the symptoms sometimes following a sting. Fatal results have, indeed, occurred which could only be attributed directly to the toxic action of the sting. Some persons, however, endure the sting with impunity, others develop alarming symptoms, such as blood-poisoning, and undoubtedly the toxicity of the sting depends very much upon the condition of the "soil" into which it is implanted. One of the old-fashioned remedies, and we believe a good one, is to apply immediately to the part stung the juice of a raw onion. The "rationale" of this remedy is not clear, the sulphur oil in the onion possibly serving as a palliative. The sting, at any rate, if it remains in the wound, should be extracted, and the puncture dressed with a little weak ammonia, and afterwards a little bromide of ammonia may be added, which frequently serves as a sedative. Judging from the great number of wasps which have somewhat suddenly appeared in the country during the recent hot weather this seasonal pest promises to be of no small dimensions. The intense irritation caused in some persons by mosquito "bites" may be promptly relieved by the application of ipecacuanha, either the "vinum" or the powdered root, made into a paste with water or vinegar, being used.

#### TEA AND CURRENCY.

A well-known, veteran proprietary planter, Mr. G. A. Dick (who is shortly returning to Ceylon) makes the following remarks in the course of a letter by a recent mail:—

"There has been a great improvement in the quality of Ceylon tea during the last four years. In every village in Scotland, good, very good tea is brought within the reach of everyone. Indeed it is quite the exception even to be offered a poor cup of tea and it is wonderfully cheap. Lipton's 1/8 tea has greatly improved, shewing that he is using more and more high-grown tea in making up his packets which are now not only ordered by the artisan classes, but in an increasing degree by the higher classes in the community. I have been reading the evidence given before the Currency Committee T. N. Christie's evidence is very strong as to the injurious effect of the rise of exchange. I don't know if his evidence as to the cost of an estate and the average cost of production will receive universal approval. Some one remarked to me that it was giving the Colony away and might be used as an argument for the carrying out of the Government policy which desires the fixing of a high ratio of exchange. The evidence I like most of all is that of Mr. Ralli. He is an immense exporter of all Indian produce. After all, the question will turn on the effect of high exchange on the 100 millions of Indian produce. He more than any other seems to be in touch with the cultivator. His blunt way of saying 'I know the effects of high exchange from my own knowledge and experience and from living in touch with his many agents in the agricultural provinces of the Empire' must carry great weight. The Lindsay scheme is much commented upon in banking circles. Many people think that Government will adopt it, especially as he argues, that even if it fails it will lead up to what the Indian Government evidently hopes to reach,—a convertible gold and silver token currency. Ralli says that a gold currency established in India will require to begin with an enormous amount of bullion which the Govern-

ment could not get and that as the cultivation of the Empire extends and the capacity of the soil is fully developed, the hoarding habits of the natives will be a constant and ever-increasing drain on the gold supplies of the world. This hoarding tendency is hard to understand by those not intimately acquainted with orientals, and I fear a majority of the Commission will not give it the attention which it deserves. The evidence so far as it has gone, is a perfect mine of information. In its variety, its contentiousness, the insight it gives into the methods of Indian finance, the light it throws on the special characteristics of both the members of the Commission and the different witnesses examined—all men of mark—it certainly forms the most remarkable Blue Book that I have ever perused. It is difficult to forecast what the ultimate decision will be; but on all hands one hears that a speedy decision is most imperative. All the expert and official evidence continues to be in favour of a gold coinage with a 1/4 exchange. The voice of the people (and the class to which I belong) has been well and strongly put; but confronted with the opposition of 'the finest Service in the world,' there is little ground for hope. I myself would be satisfied if we got a 1/3 rupee. It would do for my day. It is possible that China may go in for a gold coinage, if she survives the attack of the commercial vultures now attacking her on all sides; if not the ratio will again have to be revised in time. European enterprise will not be throttled so easily. Our Government in India and Ceylon is only defensible so long as our measures conduce to the prosperity and happiness of the people and 'with material prosperity all other prosperity begins.'

### THE CINCHONA INDUSTRY IN JAVA.

The British Consul at Batavia, in his last report on the trade of Java, mentions an important development in the cinchona industry of the island. Java produces about two-thirds of the world's supply of cinchona, and it has for years been regularly shipped to Holland, where it has been sold by public auction. The large quinine manufactories, which are mostly situated in Germany, supply themselves with the raw material in the Dutch market, and of late years the manufacturers have combined to keep the prices at such a low level as to render the cinchona cultivation unprofitable, although the manufacturers of quinine have been earning large dividends. To meet this combination it was resolved to establish a quinine factory in Java, and this has been done at Bandoeng, where the first Java quinine has been produced. This is described as of excellent quality and equal in all respects to the best European brands. Some of the planters were tempted early last year by the rise of prices in Europe, consequent on the establishment of the factory at Bandoeng, to consign their cinchona to Europe rather than to their own factory; but more recently they have seen that this course must result in the destruction of their own factory, and now the latter is being well supported with the local raw material. Some large shipments of Bandoeng quinine have been made to London, and smaller ones to other parts of the world, and the future of Java quinine will depend on the result of these ventures. Last year the total production of cinchona in the island was over 8½ million pounds, avoirdupois.—*London Times*, Sept. 23.

### PLANTING NOTES.

**COFFEE IN BRAZIL.**—The *Rio News* of August 9th tenders the following advice in all seriousness:—

If there is a prospect of a failure of the next crop, as many planters allege, why not try the effect of fertilizing and pruning? If the coffee-trees are exhausted by the heavy crops of the last two years, then the trees should be carefully pruned as a means of concentrating their strength, and careful cultivation should be employed to restore exhausted vitality.

**THE SEYCHELLES.**—Mr. George Waddell, who went from here, seconded in Ceylon P.W.D. for service in the Seychelles, early in the present year, is now in Bombay to recruit a labour force for Seychelles, where labour is very scarce. Mr. Waddell (interviewed for a Bombay contemporary) speaks in the highest terms of the salubrity and beauty of Mahé and thinks it the very place for a big hotel to induce visitors—the Seychelles being only eight days of a pleasant voyage from Bombay and Zanzibar four days distant. Here is an attractive passage:—

If there are no hotels, bungalows can always be had and at reasonable rates, but it is not easy to get them furnished, and it is safer to bring your own furniture. The climate seems well adapted for women and children, who keep particularly healthy. As for picturesqueness I know nothing prettier than the view from the ridge which runs down the centre of Mahé, surrounded as it is by the smaller islands and by water to which the coral bot om imparts the most exquisite and subtle tints. It is a very quiet place, for of the total population of eighteen thousand, about seventy-five are only English, but it is just the spot for a lazy holiday. The fishing is capital, and the boating very good.

Then we are told:—

Mr. Waddell's own work in the Seychelles is to construct an extensive system of roads. At present nearly all traffic is carried on by boat, a method of transportation which is greatly facilitated by the physical configuration of the coast. The products of the plantations on the slopes leading to the sea are carried down to stores on the shore, and the outer reefs act as a breakwater and make the passage of the boats—big canoe-shaped craft propelled with a pole like a punt—to the central depots easy and safe. The lack of proper cart roads has, however, greatly hampered the development of the growing trade. Recently a loan of £20,000 was obtained for the purpose of remedying this defect, and this will allow of the construction of nearly fifty miles of good metalled road.

The outlook in the Seychelles is, in Mr. Waddell's opinion, particularly bright. The vanilla crop has now assumed large proportions, and the Seychelles bean is reckoned the best in the market, and commands a correspondingly high price. Recent yields have been good, but the vine is a peculiarly uncertain growth, and often fails for several years in succession. In good seasons it gives little trouble to the grower. Cultivation is not only unnecessary but absolutely deleterious, and all that is required is to fertilise the flowers, which is done by hand with a brush, as the necessary insects are wanting. Of late there has been a considerable extension of the land under cultivation, and with favourable seasons there promises to be a considerable development in the value of this industry. Cocoa has altogether failed on account of the rats eating through the fruit to get at the seeds as soon as it ripens. Considerable success has, however, attended the efforts to grow coffee. The mistake was made at the outset of attempting to grow the Arabian species, an attempt foredoomed to failure, but since planters have realised their error and have substituted the Liberian variety a very fair prospect has opened up. The importance of the coconut and coconut oil trade has already been referred to.

## THE CACAO FUNGUS AND MR. CARRUTHERS' REPORT.

(From an Agricultural Authority.)

This Report, (see page 359) is undoubtedly an able document showing as it does a great deal of work behind it, and proving the author, to judge from his deductions, a most careful observer. At the outset we find a very important and welcome statement, viz.:—"In my opinion the result of the investigation has been to show that though no doubt the presence of the canker will mean an extra expense in cultivation (though not a serious one) it in no way threatens the profitable cultivation of cacao." Mr. Carruthers refers to some estates which have not been attacked at all, and these have no doubt proved valuable object lessons of the methods of cultivation and environments which are calculated to keep off the fungus. A damp condition is pointed out as one of the factors which favour the pest and for that reason Mr. Carruthers preaches against dense shade for cacao. "There is no doubt," he says, "that the cacao is much safer from canker when grown absolutely in the open" . . . . "A light flickering shade is in most cases enough to keep away *Helopeltis* in great quantity, and such a shade at some distance above the cacao trees does not keep the undergrowth at all damp."

We should also have expected that attention would have been called to the need for looking to the better draining of cacao lands—which are as a rule of a dense and heavy character—so as to minimise the dampness against which Mr. Carruthers complains; while, to the same and other ends and to the benefit of the tree, might have been recommended the benefits of liming heavy lands.

As regards suckers, Mr. Carruthers says:—"My observation leads me to doubt the advisability of the hard and fast rule to remove suckers from the tree without regard to the respective requirements of each plant, and in cases of estates where they were left, the health and cropping of the trees seem to be better."

It is further pointed out that there is very little tendency on the part of suckers to be attacked by the fungus. The practice of leaving suckers alone, unless under exceptional cases of over-crowding, has been strongly advocated by a small section of cacao-planters who now have the satisfaction of learning that the practice is one calculated to minimise the ravages of the fungus. It will be remembered how some time ago, when the cacao disease was attributed to the boring beetle *Tomiscus perforans*, the question of "suckering" was warmly discussed in the press; and one writer referred to the process as "a method of rejuvenating itself and guarding against dissolution, that the tree has provided for it." How true has it proved that the methods adopted in the agriculture of one country, though with reference to the same crop, may not answer in another part of the world! The removal of suckers, which is the common practice in the West Indies, has certainly proved an undesirable one for Ceylon.

It is certainly surprising, however, to find Mr. Carruthers overthrowing what may be called an axiom by stating that it is misleading to suppose that an unhealthy tree is more liable to disease than one full of vigour, and further that as regards cacao canker "the evidence points

more to the infection of healthy trees than unhealthy ones," though he admits that the former are in a better position to fight the disease than the latter. "No special disposition of the tree is necessary for the attack of the fungus," but may not the conditions of excessive atmospheric and soil moisture due to shading overhead and dampness of land beneath induce a "softening" effect—not apparent, perhaps, externally—which makes the cacao tree under such conditions a suitable host for the parasite?

Again, as regards varieties, Mr. Carruthers says "both experiments and observations point to the fact that the Forastero is much less attacked by the canker than the Criollo. In fact, the Forastero seems more robust in resisting all the enemies of cacao." The hardness of the Forastero will of course, be admitted by all; but there is the objection to growing this variety in the fact that the produce is of a lesser market value than that of the Criollo. Mr. Carruthers, however, only refers to the typical Forastero, which he describes as that with the white or green pod, and makes no mention of what is spoken of some times as the pink Forastero or hybrid variety, which appears to combine the hardness of the typical Forastero with the superiority of seed of the Criollo. It would be interesting to hear something of his experience with regard to this particular form as distinct from the white and green-podded tree on the one hand and the distinctly red-podded tree on the other. Hybridisation has been of much service to agriculture, as is witnessed by its results in vine culture and wheat-growing, and may yet prove to be an important consideration in relation to the cacao disease. Mr. Carruthers mentions the occurrence of cacao canker on the common shade used on plantations which he refers to as *Erythrina umbrosa*. As it is important that the tree should be identified, and since at least four species of *Erythrina* are used for cacao shade, it would be well to know that the shade tree refers to is really *E. umbrosa*. The commonest tree thus used is, however, *E. Indica* (Sin. Erabadu), which is a thorny species.

On the whole, Mr. Carruthers' Report is very reassuring; and, as he himself puts it, it is to be hoped that the cacao scare "will lead to an improvement in methods, and a consequent increase of yield."

We rejoice to hear that he has deferred his departure from the Island, and trust that this will give a tardy Government an opportunity to decide as to the retention of the services of a really useful Scientist.

### THE AGRICULTURAL MAGAZINE.

The following are the contents of the October number of this monthly:—1. Season reports for August; 2. Rainfall taken at the School of Agriculture during August; 3. Kekuna oil; 4. Occasional notes; 5. The plantain tree and its products; 6. Citronella oil; 7. The cultivation of chillies; 8. The analysis of soil as a guide to its fertility; 9. The uses of wood. 10. A disease of the plantain tree; 11. How India has saved her forests; 12. Cattle and their management in the interior.

We note that there are enquiries from abroad for the oil from the kekuna tree (*Alcurites triloba*) to be distinguished from another kekuna (*Cannarium Zeylanicum*), and trust that it will lead to the

development of a large trade in the article. The wood of the tree is said to be good for tea boxes, and the planting of it for timber and oil may yet become a practical possibility, if good prices are obtainable for the oil. In the Occasional Column are some interesting notes regarding an alleged Weevil-proof Paddy and a new branding medium. The Plantain tree is treated of in two articles, as regards its products and with reference to a so-called disease affecting it. The cultivation of Chillies is an industry which is advocated for the Sinhalese cultivator, and the possibilities of its remunerative cultivation in the island is a matter worthy of the attention of both Government and the Agri-Horticultural Society as deserving of their encouragement. We would recommend that a leaflet on the subject be printed in the Vernacular and circulated in the villages. Among other interesting articles is a contribution from Mr. E. T. Hoole, the Veterinary Surgeon, who always writes much to the point, on cattle and their management.

CINCHONA BARK AND QUININE IN JAVA.— Some interesting information on this subject will be found on page 353. A well-known Java authority thinks there never was a better time than now to go in for the planting of cinchona, that is in Java which now supplies nearly three-fourths of the world's supply. But why should the enterprise not be tried in some parts of Java, where bark grew so well some years ago. If fresh seed were got from Java or South America, we do not see why Mr. Macfarlane's experience might not be repeated.—The Java authority, however, over-estimates the present consumption of the world, through accepting certain loose figures (10,000,000 ounces of quinine) given for consumption in the United States. We think this is far too high and that 6 million ounces must be the maximum. We make the world's consumption of quinine about 800,000 lb. against 1,200,000 lb. given in the Java extract. Nevertheless, supplies of bark have so fallen off from all quarters, save Java and West Africa, that the prospect before cinchona planters is undoubtedly good.

QUININE IN JAVA:  
AND THE PROSPECT FOR THE WORLD'S  
SUPPLY;

CINCHONA-PLANTING IN JAVA  
RECOMMENDED.

Sydney B. Everett, United States Consul at Batavia, makes the following Report under date of June 17, 1898:

Although for some years Java has been the principal country for producing cinchona bark, yet the actual manufacture of sulphate of quinine here has only just begun; it nevertheless, I think, deserves a passing notice.

My attention was first called to the matter by an invoice being brought to me on January 18, to be certified for a shipment to the United States, of 10,000 ounces of sulphate of quinine. This is the first shipment on record and marks the beginning of a new, and, I hope, very profitable era in the trade relations between Java and the United States.

Since then there have been other shipments, and up to the present date there have been shipped, or rather invoiced for shipment, to the United States 49,300 ounces of sulphate of quinine, valued at \$11,395.55; and I have every belief that more will follow.

There is at present only one factory for working the cinchona bark in Java and it has been running a very short time; but, in spite of the drawbacks, its owners are full of energy, and the success of the enterprise is possible.

Just now things look especially bright, as the war has resulted in the rise in quinine quotations. Quinine from this factory (Bandoengsche Kinine-fabrik), which the latter part of April was at \$6.15 per unit\* had risen by the middle of May to \$7.54.

I think I can best describe the industry, its history and its prospects by enclosing a letter written by Mr. F. W. Sijthoff, the manager of the factory above-mentioned, who has been very courteous and has offered me every facility for acquiring information. He describes matters better and more graphically than I could.

As regards the cultivation of the cinchona bark, the result of the Government plantations here does not bear out the common opinion that commercial ventures are better managed by private enterprise. An official report just published shows that the Government in 1896 cleared a profit of over \$33,500 from its cinchona estates while the same year was, as a rule, a very poor one for planters, owing, Mr. Sijthoff says, to the manipulations of a particularly unscrupulous European trust.

I cannot conceive of a better investment than the planting of cinchona in Java. The shortage in production in a few years will be very large, and prices will take a big jump. Concessions of land are not hard to get here if one is on the spot, and the climate of the interior of Java is as perfect as that of the coast cities is bad.

EXTRACTS FROM THE LETTER OF MR.  
SIJTHOFF TO MR. EVERETT.

I shall gladly give you the information requested. At first it was claimed that no quinine could be made in the tropics, and that, even in case we could make quinine, we could never sell it, because the quinine trade was entirely in the hands of the manufacturers in Europe.

The first year was for us one of adversity and disappointment; now we have not only succeeded in delivering a good product, but can sell it to advantage, the demand increasing constantly.

\* The unit of quinine means the percentage of sulphate of quinine in half a kilogram (1.10 pounds) of cinchona bark; thus, bark yielding 1 per cent. with the unit price 4 cents would bring 4 cents per half kilogram, while bark yielding 5 per cent of sulphate of quinine would bring 20 cents per half kilogram.

Our factory is now producing 90 to 100 kilograms (198 to 220 pounds) of quinine a day, which is sent to America, England, Amsterdam, Straits Settlements, Hongkong, Japan and Australia.

For a few years after cinchona plantations were laid out in Java, fabulous profits were made. Ceylon transformed all its bad coffee enterprises into cinchona plantations with the result that the production kept pace with the consumption, and prices declined. When the Ceylon plantations were seven to nine years old, it appeared that the soil and climate of that island were not good for the tree. After 1894, Ceylon was entirely exhausted, and the production fell off very sharply. A Trust that had been formed in the mean time, and that had already fixed a price for manufactured quinine, fixed also the price of cinchona bark. Thus quinine planters, although coming to the market with a moderate crop and one not satisfying the consumption, always got inferior prices for their product.

Our factory buys no bark and carries on no trade in it, still less in quinine. We work the bark for a commission of 7 florins per kilogram (\$2.81 per 2.2046 pounds) of quinine, the actual proceeds of the finished product going to the planter.

Just now the production is considerably short, so that the deficiency is made up from the stock of quinine on hand, and bark of very bad quality, which has already been lying piled up for twenty years. In another two or three years these stocks will be entirely used up, and the world will have to face a shortage of quinine.

I am firmly and sincerely convinced that now is the time to begin a new Quinine Enterprise which, with the benefit of a long experience, will be a model estate and yield in a few years great profits.

Mr. England, in the Chemist and Druggist, says that North America in 1897 imported in cinchona bark and quinine 10,000,000 ounces of sulphate of quinine. The rest of the world needs some also; let us say 300,000 kilograms (661,380 pounds), which makes the total 585,000 kilograms (1,289,691 pounds). The world's output is only 385,000 kilograms (788,771 pounds), of which Java produces about three-fourths.

When Africa and China are opened up, the consumption will naturally increase, especially in the latter country with its 460,000,000 inhabitants.

Java has attained its highest crop yield, and it will be some years before we can expect any satisfactory enterprise to be undertaken.

The quinine made by American houses comes from bark which is first sent from Java to Amsterdam for sale and then shipped over to the United States. We certainly could produce satisfactory raw quinine for use in America, which would make that country entirely independent of Europe. The transportation of the crude quinine would be simpler and less costly.—*Drug Reporter of New York.*

STROBILANTHES IN CEYLON.

The variety of strobilanthes which has lately come into blossom on our Indian hills is well-known in Ceylon. It is called the *nilloo* by the planters (from nil, blue); and I have been told by them that they have as many as seven different kinds which are tolerably common in their jungles. The commonest of all is the *kunthianus*, which has a flower of the most delicate lavender tint. Of the other six I can say little except that they vary very much in appearance and the flowers are not all blue as their name should indicate. One is white and another has a pale yellowish blossom. They all form an undergrowth in the jungle and are said to blossom periodically in flushes; but none of them equal the lavender variety in beauty or profusion of flowers. The *kunthianus* blooms in Ceylon at different periods, varying from seven to twelve years. The period is not the same throughout the Island; one District will have its flush in a year when another

does not possess a single blossom; probably this has something to do with altitude and climate.

#### BLOOMING ON THE HILLS.

The Ceylon forest is different from the forest of the Nilgiris and Pulneys; it does not cling so much to the valleys; it clothes the hill-tops and frequently forsakes the valleys leaving the rivers to flow in a succession of clear pools and foaming rapids through patana or grass land. The *nilloo* never looks better than in the jungle high up on the hill sides. It grows luxuriantly in dense masses of undergrowth to a height of about fifteen feet forming an impenetrable jungle except for the game tracks which pierce it in all directions.

#### THE HORTON PLAINS.

It was in blossom on the hills about the Horton Plains in the year 1887 when I had the good fortune to be staying on a tea estate in that neighbourhood. It was indescribably beautiful. The jungle seemed to be hung with a delicate curtain of lavender gauze. One has seen marvelous atmospheric effects on the outskirts of Madras from the blue wood smoke of the huts hanging over the luxuriant landscape. This was the blue haze glorified into a pearly lavender, converting the Ceylon jungle into a veritable fairy-land. The flowers trembled with myriads of bees in search of the wealth of honey contained in their depths; and every variety of butterfly to be found on the hills hovered in the sunlight over the masses of bloom. At night the moth family revelled at the feast, and the entomologist, had he been there, would have made a record harvest of specimens. Later on the blossom was replaced by seed, which ripened in August and September. The bees and butterflies vanished and the strobilanthes swarmed with seed-eating birds of all kinds. Amongst them was

#### THE CRYLON JUNGLE FOWL,

a most excellent game-bird which will bear comparison with the pheasant in flavour although it is not so large. Its handsome chestnut red plumage is like that of the bantam fowl and some of its feathers are much prized by the salmon fisherman for the manufacture of fishing flies. As soon as it was known that the jungle fowl had arrived, shooting parties were arranged by those planters who lived within reach of the jungle. The sport was as good,—so they said,—as any *battue* shooting at Home, though the bags were not so big. Six or seven guns stationed themselves in open spaces outside the jungle, whilst a gang of at least a hundred coolies served as beaters and turned out the game. The *nilloo* was too thick to work in regular order as in an English covert; the coolies made up for the deficiency in beating by employing tom-toms and other implements of noise to make the birds take wings. The fowl were as fat as butter from their high living and very unwilling to leave their feeding ground. Following the game tracks the beaters with the dogs succeeded in scaring the game over towards the guns; and a good morning's bag numbered anything between fifty and a hundred, not counting pigeons and other quarry thought worthy of powder and shot. The shooting lasted from six weeks to two months and came to an end all too soon for the sportsmen, for the ladies who joined them in their picnic lunches, and for the careful housewife. She lives upcountry in Ceylon in a chronic state of puzzlement how to vary her menu with nothing but the everlasting beef to fall back upon, and the jungle fowl are a most welcome addition to the larder. When one is tired of them roasted with bread-sauce and fried bread-crumbs, a game pie comes as a delightful variety.

#### BIG GAME.

After flowering and seeding, the *nilloo* dies down and a young crop springs up looking not unlike a bed of nettles. The sambur, miscalled in Ceylon the elk, are dearly fond of the young *nilloo* shoots; and the planter with his hounds, bent on a certain find and a good run, knows where to look for the deer when the *nilloo* is springing up again. The old stems stand till they rot, supported by their density, or until they are tempted down by the big game, and they form a cover for the new generation of young plants. Elephants sometimes wander through the strobilanthes in their peregrinations after food and water; it is possible that they find the canes an admirable means of brushings away the flies and other insects which torment them. In spite of its thick skin, the animal it said to be peculiarly sensitive to the stings of insects; flies, mosquitoes and leeches prove as irritating to it as to a human being. On one occasion a sportsman with his hounds on elk intent came suddenly upon three cow elephants standing amongst dry *nilloo* sticks. It was difficult to say who was most upset by the encounter. The hounds ceased searching for a find and gave tongue at the calves, which screamed with fear. The cows flurried and annoyed at the distress of their young, trumpeted and snorted; whilst the sportsmen thought it desirable to swarm into a substantial tree till the racket was over. And there was a fine racket, indeed, as the big cumbersome beasts romped through the dry *nilloo* sticks in search of their wandering young. The *nilloo* though standing twelve feet high, went down before their broad feet like bean stalks before a raging bull in a bean field at Home. What with the smashing of dry wood, the screaming of the calves and the trumpeting of the excited mothers, the tree'd huntsman could have fancied himself in a railway accident. He was not sorry when the family party renited and made tracks for another district, leaving him and his hounds in undisturbed possession of the strobilanthes.—F. in *Madras Mail*, Oct. 8.

#### PLANTING NOTES.

PLANTING IN CEYLON.—Several Planters' sons are about to take up the occupation of their fathers. A son of the late Mr. Keith Maitland, who met with such a tragic death near Reading in 1896, is to learn his work on Glenomera Estate. Mr. Andrew Greig will do the same, under his father on Laxapana, Maskeliya; whilst the second son of Mr. Edward Annesley Cooke, for so many years Superintendent of Tillyrie, Bogawantalawa, is expected shortly to "creep" at Tangakellie, Lindula, under Mr. T. G. Hayes.

THE COPPERAH MARKET.—There is evidence of a keen demand for Copperah just now, but unfortunately it has come at a time when the slack season of the year is on from the producer's point of view. In addition to this, the wet weather we are having in Colombo and throughout the Island generally acts as a serious obstacle to drying and curing operations. The consequence is that the output is quite out of proportion with the growing demand. During the past few weeks no more than a half dozen boats, on an average, arrived at Grandpass and these found ready buyers. The beginning of this week saw a decided rise in prices. Good Calpenteyn and estate fetched R43.50 per candy during the last week, but on Monday that figure rose to R44, and buyers are even now prepared to pay a little over that sum. Marawilla and Madampe copperah has correspondingly gone up in price, the quotation yesterday varying from R42.50 to R45.50 per candy.

MR. KELWAY BAMBER'S MISSION.

ESTATES CHOSEN :

DIMBULA.

We understand, at the Committee meeting of the Dimbula District Planters' Association held on Monday, HAUTEVILLE was chosen for the top end of the district and DRAYTON for the lower end. Hauteville, which belongs to Mr. Charles Strachan is an estate of 320 acres, of which 275 are planted with tea and 42 with timber trees. Drayton belongs to the Drayton Ceylon Estate Company, Limited, and consists of 883 acres of which 797 are cultivated—763 with tea and 28 with timber and grass.

KALUTARA.

PANTIYA has been drawn (first choice) for Mr. Kelway Bamber's visitation in this district, but when our informant wrote he had not heard whether the offer had been accepted. Pantiya estate belongs to Mr. J. H. Strachan and contains 733 acres, of which 464 are cultivated with tea.

AMBAGAMUWA.

In this district at the meeting held of the District Association on Monday, CAROLINA estate was selected. It belongs to the Carolina Tea Company of Ceylon, Limited, and consists of 491 acres of which 277 are planted with tea.

KELANI VALLEY.

The two estates selected in this district are ELSTON and DUNEDIN, and failing Dnedin the reserve is Polatagama. Elston belongs to Mrs. Hayes and Mr. H. C. Harrison and contained 1,166 acres of which 800 are planted with tea including some Rubber trees. Dnedin is owned by the Ceylon Tea Plantations Company, Limited, and consists of 525 acres of which 474 are planted with tea; while Polatagama belongs to the Yatiyantota Ceylon Tea Company, Limited, and contains 1,491 acres of which 1,027 are in cultivation with tea including some coconut plants.

PUSSELLAWA.

At the meeting of the Pussellawa Planters' Association today the following estates (one of which will be taken) were selected: ATTABAGIE, NEW PEACOCK and ROTHSCHILD. Attabage Group belongs to the General Ceylon Estates Company, Limited, and contains 1,272 acres of which 505 acres are cultivated with tea. New (and Old) Peacock is the property of the heirs of Sir J. Wilson and consists of 1,698 acres of which 636 are planted with tea, 10 with cardamoms, and 134 timber and grass. Rothschild estate is owned by the Eastern Produce and Estates Co., Ltd., and contains 1,177 acres of which 1,000 are planted with tea.

PUNDALUOYA.

The NORTH PUNDALUOYA and HARROW estates are selected for this district. The former belongs to Rosehaugh Tea Company, Limited, and contains 843 acres of which 537 are in cultivation—402 tea, 50 coffee, 10 tea and cinchona and 75 timber and grass; while the latter (with Kalaoya) is the prosperity of Mrs. Travers and Mr. H. E. Daunt and consists of 519 acres of which 300 are planted with tea.

DOLOSBAGE.

In the Dolosbage and Yakkessa district, Penylan has been chosen. Penylan includes Hamdalkellie and belongs to the Tea Corporation, Ltd. It consists of 920 acres of which 523 are cultivated—520 tea and three timber and grass. The estate runs high and low in altitude.

MASKELIYA.

Laxapana is the estate here chosen. The group includes Laxapana, Johu's Land, York and

Snluganga, the acreage being 1,021, of which 835 are in cultivation with tea. It is the property of the Ceylon and Indian Planters' Association, Ltd.

NUWARA ELIYA.

As already stated Kandapolla has been selected. It is owned by the Kandapolla Tea Estate Co., Ltd., and contains 189 acres of which 179 are planted with tea.

DIKOYA.

Campion estate, Bogawantalawa, Darrowella, and Dikoya, have been chosen by the Dikoya Planters' Association. Campion (with Kohinoor) belongs to Mr. Charles Strachan and contains 724 acres of which 600 are planted with tea. Darrowella is the property of the Anglo-Ceylon and General Estate Co., Ltd., and consists of 675 acres of which 613 are in cultivation—591 tea and 22 timber and grass.

UDUGAMA.

A meeting of this District Association has been summoned for 9th Oct. to consider the choice of an estate.

BADULLA.

The Onvah Coffee Company's factory in Badulla has been selected for visitation. The following are the estates which belong to the Onvah Coffee Co., Ltd.:—GLEN ALPINE including Deyenegalla, Graham's Land, Ballagalla and Rockhill containing 1,955 acres of which 1,652 are cultivated—1,057 with tea, 414 coffee and cacao and 181 timber and grass; HINDUGALLA, in extent 592 acres of which 533 are in cultivation—413 tea and 120 timber and grass; LEDGERWATTE, containing 531 acres of which 413 are cultivated—393 with tea and 20 with fuel trees; and NARAN-GALLA which contains 394 acres of which 382 are cultivated—273 with tea, 58 coffee and cacao and 51 timber and grass.

HAPUTALE.

The estate selected in this district is Lunugalla, the present manager of which is Mr. James Bisset. It belongs to Poonagalla Valley Ceylon Co., Ltd., and contains 820 acres of which 496 are cultivated—390 with tea, 15 with coffee alone, 44 with tea and coffee, and 47 with fuel trees.

PASSARA.

The estate selected for visitation by Mr. Kelway Bamber at a general meeting of the Passara Planters' Association held on the 24th inst. was the ELTEB GROUP which belongs to Capt. E. H. A. Gordon and contains 1,724 acres, of which 563 are cultivated—529 with tea and 34 with timber and grass.

THE NORTHERN DISTRICTS.

A correspondent repeats to us the following:—

"Allagalla .. .. .	3,301 acres Tea.
Kadugannawa .. .. .	3,600 "
Kurunegala .. .. .	2,584 "
Polgahawella and Kegalla .. .. .	1,982 "

Total acres Tea .. 11,467

and well adds,—

"Are surely entitled to choose at least one estate to be visited by Kelway Bamber?"

UDAPUSSELLAWA.

St. Leonard's estate has been chosen by the Udapussellawa Association. It belongs to the Standard Tea Company of Ceylon, Ltd., and is managed by Mr. C. H. Bagot. The acreage is 725½, of which 519 are cultivated; 408 with tea and 111 with coffee and cinchona.

## PUNDALUOYA.

We understand that the agents of North Pundaluoya have approved of the choice of this estate, and that it has consequently been definitely chosen.

## MATURATA AND HEWAHETA.

A quorum not being obtained at the Committee meeting called for this purpose, a list was however circulated to all the estates with the result that the Loolecondura Group consisting of Loolecondura, Wakoya, Naranghena and Codagalla received the unanimous vote of Upper and Lower Hewaheta with two exceptions, one in favour of Hope estate and one Great Valley. The members living in Old Maturata do not think the Loolecondura Group in any way represents them and want an estate extra in Old Maturata and name Gonapattiya. The voting comes out:—Loolecondura Group 20, Gonapattiya 9, Hope 1, Great Valley 1.

## DUCKWARI (CEYLON) TEA PLANTATION COMPANY, LIMITED.

## REPORT BY THE DIRECTORS TO THE EIGHTH ORDINARY GENERAL MEETING OF THE COMPANY.

The Directors beg to submit the Accounts for the year ending June 30th, 1898.

The balance of Profit and Loss Account, after writing off Ten Per Cent depreciation on value of Machinery and Buildings, is .. £1,841 14 11 which the Directors propose should be applied as follows:—

(1) In payment of Seven Per Cent Dividend on Preference Shares ..	£840 0	
(2) In payment of Five Per Cent Dividend on Ordinary Shares ..	400 0 0	
		1,240 0 0

Leaving .. .. . £601 14 11 to be carried forward to next year.

The returns of crop have been 229,670 lb. tea, and 12,655 lb. cardamoms.

For next season the yield is estimated at 250,000 lb. tea, and 10,000 lb. cardamoms.

The Directors, in furtherance of their policy of high cultivation, have expended the sum of £471, 7s 10d in manuring, during the year.

A general survey of the Company's Estates has been made, and their boundaries clearly defined. The total acreage is 1,698 acres, 3 roods, 27 poles, of which 921 acres, 17 poles are under cultivation.

During the year £118 2s have been required for iron roofing lines, and £92 13s 4d in completion of the new engine and boiler, which sums have been placed to the debit of Machinery and Buildings Account.

With the consent of the Trustees for the Debenture Holders, £600 of the proceeds of the Maryland sale have been utilized in payment of six Debenture bonds of £100 each.

Mr. Hull retires from the Direction by rotation, and, being eligible, offers himself for re-election. The Auditors, Messrs. Brown, Fleming and Murray, also retire, and offer themselves for re-appointment.

P. G. SPENCE, *Chairman.*

R. CROSS AITKEN, *Secretary.*

17, Philpot Lane, London, E. C., September, 1898.

## ASSOCIATED TEA ESTATES OF CEYLON, LIMITED.

The following is from the Directors' report for the twelve months ended June 30:—The area of the company's estates, as per the conveyances, was 2,759 acres and at June 30, 1897, the extent under tea was 1,836 acres, but there has been abandoned on Horagoda Estate 20 acres, and on a re-survey the planted area of Silver Kandy was found to have been over-stated to the extent of 18 acres. New planting has been done on Silver Kandy, Chesterford, and Doragalla, to the extent of 91 acres, making a net planted area of 1,889 acres. Further extensions of about 25 acres are in progress, being the uncompleted portions of extensions previously sanctioned. In addition to the planting out in new clearings a large extent of supplying to vacancies has been done, principally on Chesterford. Some of the immature tea taken over by the company had been very unsuccessfully planted, and has had to be supplied several times over. The Nurseries were put out with a high-class lot of seed, and have proved very successful, leaving on hand a large supply of seedlings after satisfying immediate requirements. The yield has been as follows:—Silver Kandy, 89,468 lb; Chesterford, 344,757 lb; Horagoda, 59,311 lb; Doragalla, 214,403 lb; total, 707,969 lb. This, although showing an increase of 22,228 lb. over the previous twelve months, is 57,031 lb. less than the aggregate of the superintendents' estimates, each of the estates having yielded more or less under the estimate furnished for it. The deficiency in yield is attributable to the character of the weather experienced, and it would probably have been more serious had there not been so much young tea coming into bearing to help the out-turn. Of the crop, the entire produce of two estates was sold in Colombo, and of two others, partly in Colombo and partly in London. The portion sold in Ceylon, 544,680 lb, realised an average of 34.69 cents, and the 163,289 lb in London, an average of 9.90d, making together, after allowance for shipping charges to London, a gross average of 7.11d per pound. This compares with 7.28d per pound for the previous year. Considering that the general average of all Ceylon tea sold in London public auctions fell from 8.04d to 7.76d in the respective periods, this company's price may be considered satisfactory. The decline on the aggregate average was caused by one estate, Doragalla, as the others showed advances, obtained partly by improved manufacture and partly by more advantageous sale. The superintendent of Doragalla Estate resigned his position at the end of April, and the directors consider that his successor will probably be more successful in the management. The Chesterford and Madritenne Estates were amalgamated as from October, with a satisfactory result as to economical and efficient working. The new factory for the combined estates started working in February, and it is in every way as perfect as modern experience can make it. The repairs and alterations at Silver Kandy and Doragalla factories have been completed, and there remains to be provided only some additional withering accommodation at the latter to make all the company's factories as complete as could be desired. The estimates for the twelve months ending June 30, 1899, are for a crop of 783,750 lb, an increase of 75,781 lb over the yield for the previous year, and the directors consider that the figures are reasonable, and likely to be realised. The visiting agent's reports on all the estates show that matters generally are now in very satisfactory shape, both as to manufacture and cultivation. With the exception of two estates, which are deficient to a slight extent the labour force is good and ample. The revenue account shows a net profit of £4,694 10s 9d, to which falls to be added the balance of £164 13s 7d brought forward from last season, making a total of £4,859 4s 4d. Out of this the directors paid £3,050, being interim dividends at the rate of 3 per cent. on the preference and 2½ per cent. on the ordinary share capital, leaving a balance of £1,809 4s. 4d., out of which the

directors propose to pay the final dividend at the rate of 3 per cent. on the preference share capital (making 6 per cent. for the year), which will absorb £1,800, and to carry forward the balance to next account. The directors regret that the revenue has proved insufficient to pay a further dividend on the ordinary share capital, but the circumstances which operated against the company during its first twelve months' working have again been strongly against it during the second. The yield has not been reasonably progressive; the level of market prices has been lower; the rate of exchange has been still higher than before; the supply of rice has again been carried on a loss instead of a profit; and, in addition to these adverse circumstances, there has been the state of transition and reconstruction at the principal factories, which could not fail to affect results both as to expenditure and income. The last-named cause will not operate in the new season; the yield estimated for is moderate; the estimates have been made up at low prices and at the current high rate of exchange, and therefore it is reasonable to expect that they will be realised, and, if so, the shareholders may look for a marked improvement in the results. A material addition has been made to the block account, caused by the cost of various extensions, the upkeep of immature tea, the new factory at Chesterford, and the additions and alterations at Silver Kandy and Doragalla. Further outlay will be necessary on the immature tea, and to a small extent on additional buildings required. Under the articles of association, Mr. John McEwan retires from the directorate, and, being eligible, offers himself for re-election.—*H & C. Mail*, Sept. 23.

PERAK DUTY ON COFFEE.

Under the provisions of Section 3 (i) of the "Customs Duties Enactment," No. 10 of 1893, the Resident, with the approval of the Resident-General, has been pleased to impose the following export duty on coffee:—

Price of Coffee per pikul.	Duty Ad-valorem-
Below \$ 19	free.
19 and upto \$ 21	1 per cent.
Over 21	1½ "
" 23	2 "
" 25	2½ "

The above scale to come into force on and after the 1st day of October, 1898, until further notice. Note.—The price of coffee will be taken as that published fortnightly in the *Gazette*, 22nd Sept., 1898.—*Perak Government Gazette*.

RUBBER AND COFFEE IN NORTHERN QUEENSLAND.

The London Correspondent of a Queensland paper writes of 20 bags rubber ex ss. "Junana" selling in London at 2s 8d to 2s 9½d per lb., and he then goes on to give results of an interview with Mr. Thomas Christy (not "Christie" as given in the "Queensland Agricultural Journal") of Lane Street; and there follow the following paragraphs with some rather peculiar information:—

"Mr. Christy was very enthusiastic over an important discovery that has recently been made in connection with rubber, and of which he gave me full particulars. It appears that some few months ago a traveller, in a region not very remote from the Suez Canal, came across a weedy grass with an extraordinary root—a root that grew yards and yards under ground a few inches below the surface. On examination he was agreeably surprised to find that the plant produced rubber, and subsequent investigation proved that the plant was of extraordinarily rapid growth. The rubber obtained proved to be of the very finest quality, and at the present state of the market would realise a heavy price. The plant was extremely hardy, and was admirably adapted for growing in Northern

Queensland. That the plant is of recent discovery could be judged from the fact that there was not even a specimen of it at Kew Gardens. A name has not yet been bestowed upon it, but Mr. Christy, junr., is about shortly to start for the district where it is growing, and on his return I shall be able to supply much fuller details. So far as I understand at present the rubber is obtained from the rhizome, and it is of such remarkably quick growth that a full crop can be obtained from the plant at the end of the first year. This circumstance renders it particularly valuable to colonists in Mr. Christy's opinion. This 'grass' grows about 2½ feet high, and does not require much attention. It can be grown in an inferior soil to that required for the ordinary varieties, and one very important feature, from the cultivator's point of view, is that it is very easy of treatment for the extraction of the juice.

"In connection with this subject, Mr. Christie informed me that a new process for separating and purifying the rubber has just been found out, and it is so simple that one wonders that it was never thought of before. The whole theory of the new system is centrifugal force, and I am told that an ordinary cream separator will serve admirably for the purpose, and the great consideration is that this operation is completed in a few minutes, and every particle of dirt is removed, whereas the old process takes days. This new system results in an increased value of the material to the extent of 25 per cent.—in other words, the rubber which at one time realised only about 2s 3d. per lb. now fetches 2s 11d. Messrs. Christy hope to have several specimens of the new plant I have referred to at their premises before long.

"On the subject of vanilla Mr. Christy was encouraging, and said it was a very good commodity for Queenslanders to 'go in' for. It paid well, and it was one of those substances that never seemed to glut the market. No two places had a big crop at the same time, with the result that shipments were never too heavy, and prices remained firm. Mr. Christy told me that he had only just recently sold a large quantity of vanilla at from 18s to 22s 6d per lb., the last-named price being an advance of quite 1s 6d on the average for last year. There is a good profit on this article, too, and it is a commodity that is easy to handle. Many people gave up the cultivation of vanilla because it required, so they said, such a lot of care, but, as a matter of fact, anybody with ordinary intelligence, when once they had mastered the initial stages of its cultivation, would find but very little trouble in cultivating it. The great thing was to keep a large stock, for the demands from buyers were often very sudden and erratic. Mr. Christy said he had just sent a very large parcel to British Central Africa."

Next we come on, in the above journal, a paper on "Coffee at Buderim Mountains" by Mr. A. P. Corrie, accompanied by a plate showing a very primitive-looking pulper, evidently made on the spot, by the patriarch holding on to it; while above are a few luxuriant bushes and the proprietor. The Editor says that special attention is now to be given to coffee, and articles are to be reprinted from reliable sources, and "more especially from the *Tropical Agriculturist*, Colombo." But why can we not be told something of the extent planted with coffee in the different districts of Northern Queensland?

JAVA QUININE.—Part of the arrival of Java quinine, which we noticed some weeks ago as having been sent to Amsterdam from the Baudouin factory, was put up yesterday in auction. Our Amsterdam representative wires us that all the three hundred kilogrammes (say, 10,500 ounces) put up was bought in at 16 florins per kilogramme (about 9d per oz.)—*B. & C. Druggist*, Sept. 28.

\* A parcel of what?!—*Ed. T.A.*

## PLANTING NOTES.

ACME TEA CHEST COMPANY, LIMITED—we earn have just declared a dividend of 8 per cent. for year ending 31st July last and has brilliant prospects before the Directors and Shareholders. They have patented another chest and laid down an expensive plant—and are now turning out both the Acme and the new one.

Dr. MORRIS's new Department of Agriculture has naturally excited widespread comment, and his immediate departure for the West Indies is followed with interest, but it cannot be said with any particular hope. It takes time to work out new theories of agriculture for old planted colonies. It is so easy to say that if they cannot grow sugar at a profit, they should grow something else. In former times other productions were in vogue. The fertile hills of Dominica were covered with coffee trees until disease swept them away. The cotton industry of British Guiana was rendered unprofitable by the cotton growth of the United States. Another attempt was made during the American Civil War, but this was rendered hopeless on any extended scale by the termination of the war. But the climate and soil of the West Indies have always been particularly adapted to sugar growing. So stable and permanent has this industry seemed that it has attracted an enormous amount of capital, which on the whole has been a profitable investment. For hundreds of years in some parts this industry has been carried on. It has survived restrictive legislation, labour crises, equal competition with slave-grown sugar, and for the last thirty years the bounty system of the European continent. And if the bounties were abolition it still would have a chance of a prosperous future, for it can be shown that cost for cost cane sugar can be produced as cheaply as the beet—more cheaply, indeed, with stricter economy of working. If Dr. Morris can do anything to assist in this matter his departmental expenses may be money well spent.—*H. and C. Mail*, Sept. 16.

NATAL TEA EXHIBIT.—Mr. Hindson's letter to the Chairman of the Natal Committee of the Grahamstown Exhibition, a copy of which we publish in another column, contains a suggestion that we have no hesitation in saying should be adopted, not only in connection with Grahamstown, but with all future exhibitions or shows in South Africa at which Natal tea is entered for competition. No good, but, on the contrary, much harm is done by the exhibition of samples of tea specially prepared for show purposes, and the sooner steps are taken, such as those suggested both by Mr. Hindson and Mr. Fraser to put a stop to the sample exhibit business, the better it will be for the industry. The judge at the last Durban show drew forcible attention to the matter, and, on the face of it, there is not the shadow of a doubt that the custom hitherto prevailing was wrong in every respect. The marketable article is what is wanted, especially when the idea of exhibition at all is to advertise the industry and open up new markets. When the Customs Convention is ratified, Natal teas should find their way very readily into both the Cape and the Free State and the Grahamstown Exhibition will be a very excellent means of introducing and popularising them, but it will be useless sending exhibits of teas that cannot be supplied to buyers in bulk. The suggestion made is a capital one, and we trust the Committee who have to deal with the matter will see their way to adopt it.—*Natal Mercury*, Aug. 26.

EXPORT DUTY ON PERAK COFFEE.—From tomorrow there will be a new export duty on coffee from Perak. When the price is below \$19 export will be free; from \$19 to \$21, 1 per cent. will be collected; from \$21 to \$23, 1½ per cent.; from \$23 to \$25, 2 per cent; over \$25, 2½ per cent.—*S. F. Press*.

THE DOMOO TEA COMPANY.—At the annual meeting held on Sept. 30, a final dividend of 3 per cent. was declared making 6 per cent. for the year which is not at all bad considering that there are 200 acres of young tea not in bearing, and we think the result of the year's working must, in all the circumstances, be regarded as satisfactory. The quantity of tea received from the two estates exceeded the estimate, but there was a falling-off in the price realised. It is hoped however that the tea remaining unsold may fetch a higher price.

PARA RUBBER SEED FROM CEYLON FOR THE WEST INDIES.—There is a rather curious correspondence in the "Proceedings of the Agricultural Society of Trinidad" just come to hand. It originated in Jamaica with a strong protest from the Governor and other officials there, against Trinidad or any West Indian island receiving not merely coffee, but *any*, seed from Ceylon, for fear of introducing the terrible *H. V.* fungus. In reply Mr. Hart, of the Trinidad Gardens, points out this is going too far and he sums up a Report to his Colonial Secretary as follows:—

1st. There appears to be no authority, or law under which the government are able to prohibit importations of plants and seeds.

2nd. The disease has existed virulently in Ceylon for over twenty years, during which time constant importations of seeds and plants have been made, without introducing coffee disease. The Botanical Officer in Jamaica states it to be capable of introduction by correspondence and by travellers, but the evidence in favour of their being eminent danger is decidedly weak.

3rd. The ineffectiveness of the prohibition policy is shown.

4th. There is little danger of infection from spores, and it is argued that there is little danger of infection from plants, if they are "found healthy when landed from England" *ergo*; if found healthy when landed from Ceylon?

5th. If diseased they should undoubtedly be at once destroyed.

6th. Any prohibition would act very adversely upon the new Rubber industry: which must for some years be dependent on Ceylon for its supply of Para Rubber seeds in quantity. (*Hevea brasiliensis*.)

7th. A system of inspection should be instituted with power to quarantine, destroy or pass in as uninfected, all plants from infected and non-infected countries.

8th. Attention is called to want of authority to declare Trinidad a non-infected place, for any disease of plants.

9th. Power should be taken to deal with all pests likely to be imported, the "San Josse Scale," a pest on American orange trees is to be specially guarded against.

The specially interesting fact is that brought out in number 6, shewing that Trinidad is, and (in Mr. Hart's opinion) must continue for some years dependent on Ceylon for its supply of Para Rubber seed in quantity! And the Para region where *Hevea brasiliensis* is indigenous is comparatively close to Trinidad on the adjacent South American Continent; while Mr. Hart thinks it best to send all the way to Ceylon for a supply of seed, though our very oldest trees of Para Rubber do not exceed 22 years. This strikes us as being very strange, and also significant of the way in which one British Colony helps another.

## CACAO DISEASE.

## MR. CARRUTHERS' FINAL REPORT.

Kandy, 8th October 1898.

From The Secretary Planters' Association of Ceylon.

SIR,—I enclose for publication Mr. J. B. Carruthers' Final Report on Cacao Disease and in continuation of his interim Report published a few months ago.—I am, Sir, yours faithfully,

A. PHILLIP.

## TO THE PLANTERS' ASSOCIATION OF CEYLON.

In preparing a report on the cacao canker it is difficult to select from the facts observed those which teach more clearly the lessons which it is important for cultivators to know and not to burden the pamphlet with an amount of detail which in some cases sheds only a small amount of light on the subject.

I shall endeavour to make this account as popular as is consistent with accuracy so that cultivators having a practical and not scientific knowledge of cacao may not lose any information it may contain.

When my investigations had been in progress for three months, I submitted an interim report, and in that described the methods by which I endeavoured to discover the nature and life history of the disease or diseases attacking cacao, so that in this report for the sake of brevity I need only give the facts arrived at. Any who are interested in the processes by which these facts were gained can by reading the interim report trace the method of investigation.

Happily, the statements previously recorded need in no case to be corrected and the further information gained as to the life-history of the canker fungus shows that the deductions based on these facts were trustworthy.

## THE DISEASE AND ITS EFFECT.

In the first place, I propose to describe the disease as it appears to the planter and the effect produced on the tree and its crop; next giving the life-history of the fungus causing it—on the cacao—the means by which it spreads and the conditions favouring it and its increase, and then describe the treatment which after a series of varied experiments gave the best curative results—and seems to a great extent successful, as well as the preventive means which should ensure that all plantations at present not attacked by the disease may be kept free from it.

It may be well to state here at once that in my opinion the result of the investigation has been to show that though no doubt the presence of the canker will mean an extra expense in cultivation (though not a serious one) it in no way threatens the profitable cultivation of cacao and we may hope that it will lead to an improvement in methods and a consequent increase of yield. Of course an unknown enemy is always more alarming, but now that we have a knowledge of the nature of the evil, it loses to a great extent its terror. The appearance of cacao both of the Forastero and Criollo varieties is well-known to all cultivators, and the number of deaths due to drought and the attack of insects and fungi was in Ceylon extremely small until about five or six years ago when some planters noticed a great increase in the number of casual deaths; and this increase went on until it became a most serious matter and seemed to endanger the profitable cultivation of cacao in Ceylon. It was not until the disease had done damage to a very considerable extent that scientific help was asked for and no doubt the loss might have been spared in great measure if investigations had been made soon after the disease appeared, and not delayed, until it had spread over such a large area. This, however, is nearly always the history of such plant diseases and will be so until the experience has been dearly bought—that in plant life just as in human sanitation, sporadic diseases

should be carefully observed and measures taken to prevent them becoming epidemic. It is a very self-evident fact,—but one that requires reiteration that the usual method of cultivation, viz., the unnatural crowding together of one species—favours the rapid spread of diseases due to foreign organisms and therefore make prompt measures the more necessary.

## THE AMOUNT OF DAMAGE.

It is not very easy to estimate the amount of damage done as in many cases by supplying new plants, the estates have partially recovered, but there is no doubt that a serious monetary loss has been incurred, both by decrease of the crop and expense of supplying up diseased estates. I have visited some 40 estates in all districts of Ceylon, and though I am glad to say some places have for reasons afterwards mentioned not been attacked at all—yet in other cases, some estates have been practically wiped out by the canker. That the canker is confined to the stem and branches of the cacao, and does not affect the roots, is clearly shown by the following facts:—1st when suckers are formed from the stumps of diseased trees cut down, they are quite healthy, and show no sign of disease. 2ndly, new cacao plants put in a few inches from the diseased trees grow vigorously and without disease, though the roots of the two plants must be touching in many places; and 3rdly, the examination of many roots of cankered trees showed no trace of the fungus, and all attempts to induce it in roots by inoculation failed.

## SIGNS OF THE DISEASE.

The first sign of the disease apparent to the naked eye is a darkening of a portion of the cortex of the tree caused by an excess of moisture immediately below it, and this is usually not accompanied by any "shuck" appearance in the tree. In some cases the cortex has been pierced by insects at the moist places, and this causes an exudation at each puncture of a drop of claret-coloured fluid, which when it runs down the cortex, and dries, gives the tree a rusty appearance over the dark spot. If the cortex be shaved off the tissue will be found to be soft and of a darkish claret or neutral colour, and so full of moisture that small drops exude from all over the cut surface; which feels soapy and moist to the touch. This condition is due to the presence of the mycelium or roots of the fungus in the bark tissues in large quantity. The tree to replace the damage done to its tissues sends an abnormal amount of sap to the diseased spot. The existence of such a moist area in the bark, means that the disease has been for some time—a varying time: in some cases, weeks; in others months—in the tree, as it is now until the fungus has got a good hold of the tissues that such an effect is produced.

This characteristic discoloration of the bark tissues is variable; in cases where the mycelium is only present in small quantity, the colour is very little different from that of the healthy bark, and in many cases it is impossible for the eye to detect it. When the mycelium exists to any extent a neutral tint is produced, and this is gradually intensified until when the fungus has completely permeated the bark cells, the discoloration is most marked. If this infected area is closely observed in the course of time—and as I will shortly point out this time varies considerably—a number of whitish pustules will be seen on the surface of the cortex (Fig. 1). The pustules are of just about the size of a pin's head, and increase to the size sometimes of a large pea, and as a rule, they become pink later. These are the reproductive bodies of the fungus, and consist of a mass of spores (spores may be for all practicable purposes, considered as the seeds of the fungus.) It is by means of these spores, that the canker spreads from tree to tree. If we examine the tissues of the bark at a diseased spot microscopically, we shall find all the cells from the cortex to the old wood permeated by their strands (Fig. 2)—almost colourless. The mycelium of the fungus and these are more massed at the points where they have forced their way through the cortex and produced their spore, pustules. The cortex of parts of a tree some eight or ten years old is as a rule slightly cracked in places and it is at these weaker parts that the spore masses are found protruding. As was mentioned

above these spore pustules change from a dirty white to a pink colour. In the white stage—which is the first—the spores formed are extremely small oval or egg-shaped, and formed in chains. In order to afford some notion of the size of these spores—at a rough calculation about five million one layer thick would be required to cover the surface of a ten cent piece. Later on from behind second and differently shaped spores are formed which are much larger—about six times the size of the primary spores—and are in the form of a crescent or bent cylinder and septate *i.e.* having a number of transverse partitions usually eight.

If one of the small spores be placed in a suitable medium and kept moist in the course of from 12 to 15 hours they begin to germinate, pushing out a tube which as it grows branches frequently often coalescing with neighbouring branches, and in about 50 hours producing spores like those from which they originated. Unfortunately though this method of cultivating and observing the growth of spores is of the greatest interest yet it is of less value than observing the growth of the fungus in the living cacao stem (and this is unfortunately impossible) because the rapidity and vigour of growth varies according to the media employed. Thus in a water or gelatine culture, the spore in germinating does not behave as it does in the tissue of the cacao bark, where of course the resistance to growth is greater and the nutritive material different.

The method of growth of the secondary spores is very similar except that a number of tubes are sent out from the spore even sometimes one from each of the eighth chambers into which the spores are divided. As a rule the growth is not nearly so rapid.

Both these forms of spores are technically called "gonidia." The fungus, however, in addition to producing the simple gonidia spores has a third and more complex fruit which will be described later called "sporangia."

#### PROGRESS OF THE DISEASE.

In order to trace the further progress of the disease if we leave the diseased spots still longer and allow them to spread until they either completely cover the bark or else go completely round the tree and thus "ring" it and prevent any nutrition passing up to the branches above, then the tree dies—the time taken to kill the tree depends on a number of very varying circumstances and conditions, *viz.*—the quantity of mycelium in the affected tissues—the vigour of the remain healthy portions of the tree; the amount of moisture in the soil capable of being used by the roots; and the damage being done to the tree by other enemies, borers &c. Clearly, therefore, it is not possible to give any exact data as to the time taken by the fungus to kill the tree and in my inoculation experiments (described in my interim report) there was the greatest diversity in the rate of growth even in trees apparently equally vigorous and under exactly similar conditions. In one case after the tree was inoculated and a diseased spot produced the area of the diseased portion increased only just a noticeable distance (about  $\frac{1}{4}$  inch) every day; in the next tree experimented on the spot increased its area very rapidly, and in about ten days covered a space more than two feet long, and almost round the tree. In these cases, however, the difference in time is explicable in other ways also. In the one case a great many of the spores used in inoculating the part may have germinated, and in the other few, and also the condition of the cells, more or less damaged by the cut made for the inoculation and the quantity of sap they possessed, would naturally influence the growth of the mycelium.

When the tree is being killed by the canker fungus, it exhibits all the symptoms of death from want of nutrition, *i.e.*, the browning of the leaves and fruit, and the gradual drying-up of the bark of branch and stem. Before the bark has quite dried the third, and more perfect reproductive bodies are produced. They are easily recognized with the naked eye as small crimson spherical bodies generally in clusters (Fig. 3). They are individually not so large as

a pin's head, but a number together are easily detected by their size as well as their colour.

The best place to look for these is on the cortex of old trees and branches cut down because dead.

These spherical bodies are the coverings of the third form of spores and contain a number of sack-like transparent bodies which in their turn contain each eight spores. These spores are larger than the primary gonidia spores and are uniseptate, *i.e.*, having one division (Fig. 4.)

A very large and important group of fungi are characterised by the possession of these spores—asco spores—so called from their being enclosed in asci or the sack-like bodies described above, and in many of the fungi in the asci group—the formation of gonidia spores precedes the production of the spherical sporangia enclosing the asci.

We have here the complete history of the canker fungus, which passes all its life on the cacao and produces all its three forms of spores there. It only grows on the back of the stem and branches, and not in the root, often spreading down below the surface of the ground to the root, but never invading it and never passing into the leaves.

#### LIABILITY TO CANKER.

With regard to the relation of the two varieties of cacao grown in Ceylon, the Foretero, with the white or green pod, and the Criollo or Red with the red fruit, the canker—both experiments and observations point to the fact that the Forastero is much less attacked by the canker than the Criollo. In fact the Forastero seems more robust in resisting all the enemies of cacao, I have seen a fine Forastero tree towering many feet above its neighbours, all of which were Criollo, and were damaged by the wind. There can be no doubt that the Forastero can be brought to a higher state of cultivation here, than the red or Criollo, and all supplies should be of the hardier variety.

#### CLIMATIC CONDITIONS.

With regard to climatic conditions affecting the canker, the matter is one on which, to a certain extent, a misunderstanding exists. There is a prevalent idea in the case of the cacao canker as well as in other specific diseases that an unhealthy, and not vigorous, tree is more liable to the disease than one full of vigour, this is misleading. There is no proof whatever that such is the case, and it might almost be said that the evidence points more to the infection of healthy trees than unhealthy ones, but it must always be borne in mind that the healthy trees when attacked fight better against the disease and have more chance to overcome it whereas in the case of weaker plants they succumb sooner. No special predisposition of the tree is necessary for the attack of the fungus, the only conditions needful are moisture and heat. The latter we have always in sufficiency in this country, and therefore, it is the dampness as the condition which varies, and which is prejudicial to the tree when considering attacks of canker. The easiest way to understand these conditions is to remember that for all practical purposes the conditions necessary for the germination of a seed are the conditions necessary for the germination of the spores of fungi. In the case of the canker the spores may be blown upon a tree during a dry period and will after being exposed to dry air, for some time (and of course much more quickly if in direct sunlight), lose their power of germination. If however these spores alight on the cortex of a tree, when the air is charged with moisture, and when the stem itself is damp it is almost certain to penetrate and infect the tree. With regard to the entrance of the germinating tube of the spore into the bark tissues, there is here a rather difficult point to decide whether the young mycelium can force its way through, hitherto unbroken cortex or whether it must find an opening caused by a natural crack an insect puncture or a casual injury. My experience on this subject leads me to think that in the case of young trees or the young parts of old trees; the mycelium can penetrate but in the case of thicker cortex on old trees there must be some opening by which an entrance can be effected.

## THE LIFE OF THE TREE.

In this connection reference may be made to a belief which is current that the period of healthy life of the cacao tree is limited to about 15 years. A visit to some of the older plantations in Ceylon 20 years and older, many of which are bearing now more per tree than ever before would dispel this idea, and there seems to be nothing to contradict the belief that if the cacao tree is properly treated, and has room to grow it should yield good crops for twice twenty years, and probably longer. In many cases where the borers, are allowed to ravage the tree without hindrance, the life of the tree is short, and in most cases where deaths are seen at so early an age as that mentioned above, it is due to this or other external causes.

The most important part of this report to the practical planter, however, is the portion dealing with preventive and curative measures.

## PREVENTIVE MEASURES.

The conditions necessary for the growth and spread of fungi have been described above, and these conditions must, as far as possible, be kept away—but there are other enemies to consider in growing good cacao besides the canker *Helopeltis*, is in many cases a very serious evil, and experience has shown that in many cases where the shade is taken away, the result is such an increase in the number of the *Helopeltis* that the cacao is seriously damaged. Wind is also very injurious to cacao in many places, and make it impossible to grow it without protecting shade trees. Much depends on the situation with both the enemies. There is cacao in Ceylon growing in the most excellent vigour (and this in one of the hottest districts) without a vestige of shade, and where the *Helopeltis* does not do much damage, there is no doubt that the cacao is much safer from danger of being attacked by canker when grown absolutely in the open. However, taking the *Helopeltis* as an enemy that must be reckoned with, it is important that the shade employed to keep away this pest should not be too dense to prevent the sun getting through, and keeping the air, and the stems of the trees dry. A light flickering shade is in most cases enough to keep away *Helopeltis* in great quantity, and such a shade at some distance above the cacao trees does not keep the undergrowth at all damp. For wind, of course, belts are the most efficacious, and not numerous trees growing among the cacao.

In some cases the cacao trees are placed so near together (I have seen cacao 12–15 years old, six feet apart) with the branches overlapping each other that, although the overhead shade may be light, the cacao itself is keeping the atmosphere around the stems damp and such conditions apart from the cramping effects on the trees are most favourable to the increase of the canker fungus.

The preventive measures, therefore, are to keep the cacao under conditions which do not favour the germination of the spores.

With regard to application of fungicides as preventive means. The best of these are those having sulphate of copper (blue stone) as their basis, Bordeaux mixture, &c. Sulphate of copper is the most powerful fungicide which has comparatively little effect on the external tissues of the plant, we know of. Experiments show that spores will not germinate in a solution of copper sulphate containing only one part in 500,000. If a thin coating of this substance could be kept on stem and branch no doubt this would, effectually prevent the germination of any of the spores on the trees, but the time when the spores germinate is the time when there is continual rain, and during these periods it is practically impossible to keep the copper sulphate on the trees—every shower washing it away. Though I am a firm believer in the efficacy of copper sulphate as a preventive to fungi yet it seems to me that in the case of cacao cultivation it is not practicable.

## REMEDIAL MEASURES.

Remedial measures are in plant pathology peculiarly hard to prescribe and my time has been mainly occu-

pled since I have become acquainted with the nature of the disease with this most important question.

In all cases of canker of bark whether fruit or timber trees the remedy has for many years been surgical, viz.:—To cut out the diseased tissue—and there is no doubt that in the case of the cacao canker this is the safest and most effectual remedy. I have tried several experiments with different substances applying them externally in nearly all cases I had no expectation of success, but tried them owing to the belief in them held by practical men. In no case has there been any success and it is more than improbable that there should be. The mycelium of the fungus permeates all the cells, the diseased tissue and any substance applied which would kill the mycelium of the fungus and must necessarily kill the tissues as well and will most probably damage a larger area of bark than is attacked by the fungus. The knife does exactly the same work and in a more efficient manner and even if a substance which could be trusted to destroy the parts affected were employed, it would be very much more expensive in Ceylon than the cost of labour. Two cases have come under my observation of estates where the canker appeared some two or three years ago and the plantations have been kept practically free from canker by this method of cutting out, and there is no doubt that, if this had been carried out generally, that the loss by canker would have been out inconsiderable.

With regard to the application of "Tar" it is in most cases absolutely harmful, as it acts as a waterproof over the diseased parts, keeps them damp and the growth of the fungus goes on beneath. It is also a mistake as it conceals any bad work in cutting out when, for instance, no margin in left.

The above treatment, viz., cutting out all the diseased tissue, and also a good margin of healthy tissue beyond, in order to take away the outlying strands of mycelium, which are not present in sufficient quantity to discolour the bark—has in no case I have seen failed, and I have seen many hundreds of trees so treated; but there are unfortunately many estates in which the trees have been so long diseased, and such a large area of the bark invaded by the mycelium of the fungus that it is impossible without killing the tree to entirely remove all the disclosed tissue. In such cases other treatment must be resorted to; but it should clearly be understood that complete excision is the only sure method of curing the tree.

In cases where a large area on a tree is claret or neutral coloured the treatment by shaving the cortex has been tried with varying success, in one estate it has been practiced for some three years with almost invariably successful results.

A sharp pruning knife is the best instrument, though a spoke shave is very useful when the surface to be shaved is fairly even. All the discoloured part should be exposed, and, in addition, a margin of one and a half to two inches should be also exposed round the discoloured part, leaving the claret or neutral portion in a frame of healthy bark. This is necessary as has been already explained because the mycelium spreads from the discoloured patch beyond and unless it is in a certain quantity gives no clue to its presence by any abnormal colour or moisture in the bark. All the shavings should be strictly collected and burnt as they contain in nearly every case on the outside the spores of the fungus.

When this shaving is properly done the exposure to the air (more especially with very thin shade) dries up the diseased tissue and in some cases the dry and dead tissue scales out and drops away; while the remainder of the bark being relieved from its enemy forms a healthy callus round the injury and in the course of time completely covers over the shaved part. This treatment has been tried on a good number of estates and only succeeds in a proportion of cases. I should estimate about 50 per cent. is certainly not too high. The other 50 per cent. on examining the trees a week or ten days later the mycelium though greatly weakened in ac-

tivity is found to have spread gradually and if this is again cut out as a rule the fungus is killed. In all cases where this second attempt or at any rate the third has been made to kill the fungus by exposure and without success the best plan is to cut down and burn the tree leaving of course a stump as far as possible for the production of "suckers."

The question of growing "suckers" in cacao is an extremely interesting one. Apart from the question of the canker, but in regard to the canker more important still. In my experiments I inoculated the stems of 30 healthy trees and 26 of these acquired the canker, but in the case of "suckers" out of ten "suckers" so treated I only procured the disease in one instance. The infrequency of canker on the suckers compared with stem and branches even in badly diseased estates is most noteworthy; and this is a most important recommendation in support of the practice of leaving the suckers and not as is the usual practice cutting them out wherever they appear. The whole question is perhaps more for the experience of the planter to deal with, but my observation lead me to doubt the advisability of the hard and fast rule to remove suckers from the tree without regard to the respective requirements of each plant; and in cases of estates where they were left, the health and cropping of the trees seem to me better. So that when in addition to this we find that the suckers are less affected by the disease it still further points to the desirability of at any rate trying the plan of allowing trees to produce suckers. One is told that suckers take a long time to produce fruit but from observations taken we find that fruit is borne on suckers very little more than a year old. In all cases where a tree is cut down to a stump it is well to put in a supply plant so that should the suckers not form or not produce a good tree, time will not be wasted.

#### SUMMING UP.

To sum up the measures which experiments have shown to be of value.

1st. In all cases of cankered trees to excise all diseased tissue, being careful to cut out all round beyond the discolouration.

2nd. Burn all diseased parts so removed.

The treatment by shaving only to be resorted to, when the entire removal of the diseased tissue would be likely to prove fatal to a large number of trees.

The best time for examining the trees is just after the rainy season when the stems of the trees are dry. It is very difficult to detect any signs of the canker on the cortex, when the trees are wet during rains and the fungus which begins during the damp weather has not had time to produce a noticeable patch. In all estates there should be an inspection, and in places where the disease is unknown, it would be advisable that an intelligent coolie should be sent to an estate where the canker exists in order to make himself familiar with its appearance; two or three days with the canker cutting coolies on any good estate, would enable an average coolie to readily recognise it, and he would also learn the most workman-like methods of cutting out without doing more damage to the tree than is necessary.

If any doubt is felt with regard to a dark spot on a tree, a slight scratch with a knife will reveal the bark below either healthy or discolored.

There is another advantage attached to this cutting out of cankered spots which the planter will soon find out. The white borer originates in the great proportion of cases in the cankered places, the soft wet tissue there being more easily penetrated; on an estate, therefore where cutting out the borers has had to be carried out pretty frequently a great decrease will be found, when all the diseased patches are removed, and the same coolies who deal with the canker can easily add the cutting out of borers to their duties.

Since beginning to write this Report I have had brought to my notice a canker on the thorny Bois—a tree extensively used for shade in

cacao estates—(*Erythrina umbrosa*)—a canker which on examination, proved to be the cacao canker, and indeed experimentally proved by inducing the canker in cacao trees with inoculations of diseased tissue and spores from the *Erythrina*. There is no doubt—considering the infrequency of this disease on the Bois, even in estates where the majority of the cacao trees are cankered that it has come from the cacao to the *Erythrina*, and not *vice versa*, but it behoves planters to look to their shade trees, and to treat them surgically as well as their cacao trees whenever they notice any signs in them suspected to be canker.

Though in the first instance these investigations were directed to the canker disease and its effects another disease attracted my notice, and is of great importance to cacao growers as it affects the pods, and consequently damages the crop in some cases to a very large extent.

#### POD DISEASE.

This pod disease is very easily distinguished from the other enemies affecting the pods, viz., *Helopeltis*-borers, and squirrels &c. It causes a browning of the husk, which almost invariably begins either at the stalk or point of the pod and not in the middle, and is marked by a definite line. (Fig. 5). On cutting the pod open, it is found not to be superficial like the brown, or black marks caused by *Helopeltis*, but to spread through the entire thickness of the husk, and if it has been going on for a few days affecting, and discolouring the seeds also. This disease is caused by the presence of the mycelium of a fungus in the soft tissues of the fruit, the fungus belongs to the same group as the Potato disease. It produces its fruits of reproductive bodies in the furrows of the pod where they can be seen as a white mould. On examination microscopically they will be found to consist of spherical or egg-shaped bodies containing round spores.

Pods attacked by this fungus are completely destroyed in about ten days. An important fact to remember is that once the pod is attacked by this fungus the seeds never increase in size all the nutrition being taken up by the quick growing mycelium. It is, therefore, of no use to keep any diseased pods on a tree as no ripening or enlargement of the seeds takes place—only increase and spread of the fungus. Very strict measures should be taken on estates where this disease exists, and all pods affected should be taken off directly any sign of the disease is noticed and *burnt*. By this means the number of spores is reduced, and if carried out for some time the evil should be lessened to a great extent. Of course as in the canker the wet season is the time when this fungus flourishes in a dry season it is not often met with.

Before concluding this Report I must refer to the great assistance I have received in carrying out these investigations without which it would have been almost impossible to have gained any of the knowledge which is recorded here. The information afforded by planters has been most valuable. Of the greatest use are records which are usually kept—the rainfall; the crops each month; the deaths due to disease—ravages of insect enemies, &c., &c., all of which lead to an increased knowledge in helping cacao to a healthy life. Agriculturalists at home might well take a leaf out of the Ceylon planters' book in regard to these matters.

My thanks are especially due to those planters whose estates I visited and who in all cases added to the pleasure of my visits by their hospitality and kindness.

These investigations have at times presented to me disappointing difficulties, but have always been of the greatest interest to me, and with so much still to learn of the cultivation of cacao, and the battle with its various enemies, fungi, insects, &c., I leave my observations and experiments with regret; but still with the hope that Ceylon cacao planters will continue to gain knowledge as to their cultivation, so that they may grow cacao to greater perfection and with increased profit.

J. B. CARRUTHERS,

PLANTING NOTES.

**GREEN TEA.**—That the Indian Tea Association should fight shy and think "green tea" cannot be made up to samples, is surely no reason why Ceylon Planters should not succeed. How often have Ceylon men led the way and shown their brethren on the opposite Continent, "how to do it."

**ROYAL GARDENS, "KEW BULLETIN,"** of miscellaneous information for September 1898 has the following contents:—China grass: 1891 onwards; Decades Kew-enses: xxxi-xxxiii; Miscellaneous Notes—Commissioner of Agriculture for the West Indies—Mr. D. Tannock—Colonial Work of Kew—Botanical Magazine—Flora of China—Incense Trees of the West Indies.

**"COLONIA: THE COLONIAL COLLEGE MAGAZINE."**—The following are the contents for Summer Sessions, August, 1898—Old Students' Column;—Communications from Africa, Canada, Ceylon, West Indies, United States and Central America; College Notes; The Athletic Club Report; Weather Report—May to July, 1893; Estate, Farm and Building Notes; Veterinary Notes; Laboratory Notes; Reviews of Books; A Chat About our Body Heat; The Mission of the Colonial College; Rhodesia; The British South Africa Police; Old Students' Directory (revised); Notice to Correspondents.

**RAMIE OR CHINA GRASS AND ITS FIBRE: VERY IMPORTANT DELIVERANCE.**—The latest "Kew Bulletin" (September) has a full record of the present position of this industry and of the working of several machines and processes invented, including the "MacDonald-Boyle." Here then is the summing-up of the whole matter:—

SUMMARY.

Few practical problems have consumed so much time and energy as the attempt to bring China grass and Ramie into use for manufacturing purposes. Notwithstanding all the expenditure of mechanical skill and inventive ability, the conclusion cannot be evaded that we are still as far off as ever from being able to place upon the market a finished product which will effectually compete with silk, flax, and the better qualities of cotton.

The plants can be grown with the greatest ease. But when the problem of treatment is solved, the supply of the raw material will be limited to warm countries. The cultivation of China grass in temperate regions will never be able to compete successfully with that of Ramie (or perhaps of China grass) in the tropics. It is known that when ribbons can be produced sufficiently cheaply, these can be degummed and turned into filasse at a small cost. The whole question then still turns, as in 1888, on the production of ribbons. We are still waiting for a decorticator which will not merely turn out ribbons fit for further manufacturing processes—that has been accomplished—but will turn out, say, half a ton a day at a small cost. Till this has been found, the planter cannot profitably deal with his crop, and the degumming processes now almost entirely dependent on hand-cleaned fibre from China are paralysed for want of a supply which will allow the finished product to compete with other fibres.

The ribbons must be susceptible of being delivered to the degumming factories at a cost not exceeding £7 to £9 per ton. This would pay the planter if he had a decorticator which would enable him to prepare the ribbons at a cost which would leave a profit. At present he cannot produce ribbons under £12 to £15 a ton.

Then the degumming processes should turn out filasse at a total cost of £36 to £40 per ton. At this price the demand would be considerable, and a large and prosperous industry would result. To put the position in other words, filasse must be put upon the market at about 4d a lb. To use the words of one of the speakers in the discussion at the Society of Arts, "unless it could be brought down to something like the price of cotton or flax, it was impossible to make any profit out of it."

**COFFEE PROSPECTS.**—The American *Grocer*, after giving statistics showing the World's Supply of Coffee on 1st September, adds:—"These figures show a total visible supply equal to about one-half the world's production—a pretty good insurance against any rise in price until there is a marked failure in production."

**THE DUCKWARI TEA PLANTATION CO.**—We direct attention to the report which we publish on page 356, and congratulate the shareholders upon the dividend declared—7 per cent on preference shares and 5 per cent on ordinary shares. The Company goes in for high cultivation and during the past year the directors have expected £471 7s 10d in manuring.

**TEA IN INDIA.**—There has been a discussion on the subject of cultivation and preparation of tea, in the columns of the *Pioneer*, and one of the most instructive letters we have seen is signed "H. C." Here are two extracts giving practical information of a practical character in answer to a would-be mentor who signs "Sirocco":—

My plucking off China was rigidly two leaves and, the bud; and off Assam hybrid about a third finer, that is half the leaf was only 1 leaf and the bud. The great question now is whether or not to cut the second leaf altogether, as is being done, I am informed, by one or two gardens in Assam that habitually top the market with their teas of Assam indigenous. Assam hybrid will, I believe, pay better with one leaf and the bud, than with two. China, I am very doubtful about. I believe the loss of crop by dropping the second leaf would not be compensated for by the increase in price. China is the rottenest stuff in the world, and I don't believe Confucius himself could make a decent beverage out of it, pluck it how he would. I do not know what district "Sirocco" works in; but when he talks of cropping from February to December, say 10 months, I have to take a back seat, for I never get more than seven months, and last year and this my cropping season was and will be completed in 6½ months.

What would be really interesting is to hear from "Sirocco" (1) how much has tea averages in the market. (2) What is his outturn per acre. (3) What is his profit per acre. Any planter can work out the other details for himself—excepting of course what the middlemen get out of the tea. I lay special stress upon the *profit per acre*: it is the only true criterion. Dividends are delusive things. For instance I have, for my sins, to pay a dividend on a capital of R1,080 per acre. Looking into the pages of *Capital* I see one favoured garden which is only capitalised at R147 per acre. A dividend of 1½ per cent on my concern, would work out 10 per cent on the concern I have my eyes on. Therefore let us stick to *profit per acre* and we shall know where we are. And not to ask for more than I am willing to give, here are my figures:—

	Actual 1897	Estimated 1898.
Average value of tea at Calcutta ..	6½ as lb	5½ as lb.
Outturn per acre ..	423 lb	410 lb,
Profit per acre ..	R37-1-0	R16-13-0

I don't call R16-13 profit per acre "making a tea garden pay." In a risky investment like tea R30 per acre at least is required to gain that distinction. My estimated deficit this year as compared with last is R20-4-0 per acre. I apportion and debit it as follows:—

	R	a.	p.
To the Government of India account			
currency policy ..		10	0 0
To the Clerk of the Weather			
account, drought ..		3	0 0
To the middleman account ex-			
cessive charges ..		7	4 0
And there you are

BY ORDER OF THE COMMITTEE

C Colombo, 4th Nov., 1898.

TEA IN INDIA AND CEYLON.—It is curious to find the following in Colonel Campbell's interesting book on Ceylon, published so long ago as 1843, the author's residence in this island having been in the "twenties."—

The capabilities of many parts of India, the fertility of much of its soil, the cheapness of food and labour; and the certainty that the best cotton, sugar, &c. can be produced there; have long been admitted. But, in these, and in many other respects, Ceylon cannot be surpassed by any country of the same extent. Other articles of extensive consumption in the United Kingdom, and elsewhere, have been long exported from India; and we are continually adding new staples to our imports from thence; such as tea from Assam, linseed, tallow, &c. With respect to the tea produced in Assam, the existence there of the tea plant, in a wild state, had for some years been known to the agents of the East India Company; and a correspondence on the subject of its cultivation, had taken place between the Government in India and the Directors in England. Specimens of the tea prepared from the wild plant had been forwarded to Europe, and though they were of a quality inferior to the ordinary teas of China, they were still sufficiently good to justify the belief, that, by cultivation and improved manipulation, a marketable article might be produced. With this view directions were given for the cultivation of the tea plant on a limited scale; and natives killed in the various processes to which the leaves are exposed were engaged at Cauton. Not long ago, a portion of the produce of the establishment arrived in this country. The contents of four chests were gratuitously distributed to various commercial and political departments in the United Kingdom; also to the leading tea-brokers, tea-tasters, &c. with the view of testing the merits of the tea by the opinions of competent judges. The result was extremely favourable; so much so, that the remaining chests were submitted to the trade by auction. But, it is the decided opinion of many, that several parts of Ceylon are also admirably adapted for the growth of the tea plant; and, with the aid, in the first instance, of a few Chinese to instruct the settlers and natives in the process pursued in its preparation for market, there can be no doubt but that those Europeans who may attempt its cultivation will be successful.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo, Nov 1st, 1898

EXCHANGE ON LONDON:—Closing Rates Bank Selling Rates:—On demand 1/4; 4 months' sight 1/4 1-32; 6 months' sight 1/4 1-16.

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."*

The following pages include the Contents of the *Agricultural Magazine* for November:—

Vol. X.]

NOVEMBER, 1898.

[No. 5.]

## SEASON REPORTS FOR SEPTEMBER.

*ESTERN Province.*—Paddy. Yala harvest on, and land in preparation for Maha. Rainfall ample; Health of cattle fair.

*Central Province.*—Paddy. Harvesting of Yala crop in progress, prospects generally fair. Rainfall in Matale, 9.75 in. Health of cattle good.

*Northern Province.*—Paddy. Sowing of fields. Rainfall 6.59 in. in Jaffna, 1.33 in. in Mannar. Cattle disease in the Mullaitivu district.

*Southern Province.*—Paddy sowing for Maha crop going on. Rainfall general, 3.01 in. in Galle. Health of cattle good.

*Eastern Province.*—Paddy. Munmari sowing commenced. Rainfall, 5.24 in. in Batticaloa, 5.46 in. in Trincomalee. No reports of cattle disease.

*North-Western Province.*—Paddy. Yala harvest practically over, and preparations for Maha crop in progress. Rainfall light, .58 at Puttalam. Murrain prevailing in the Kurunegala district.

*North-Central Province.*—Paddy. Yala crops being reaped and threshed. Rainfall 1.37 in. in Anuradhapura. Health of cattle good.

*Province of Uva.*—Paddy. Maha harvest still going on, results not very satisfactory. Yala cultivation begun. Weather: early part dry, latter part wet. Health of cattle good.

*Province of Sabaragamuwa.*—Paddy. Yala harvest generally fair. Maha cultivation begun. Rainfall in Kegalle 19.35 in. Murrain still prevails.

## RAINFALL TAKEN AT THE SCHOOL OF AGRICULTURE DURING THE MONTH OF SEPTEMBER, 1898.

1	Thursday	..	.15	17	Saturday	..	Nil

Total.. 8.63

Greatest amount of rainfall in any 24 hours on the 28th September 2.9 inches.

Mean rainfall for the month 1.28 inches.

Recorded by A. M. AHAMAT.

## HYBRIDISATION IN AGRICULTURE.

The influence of Hybridisation in horticulture, and particularly in floriculture, are well known in the new varieties of fruit and the endless varieties of showy flowers that are constantly being brought to public notice.

In Agriculture proper, hybridisation has done something towards the production of disease-resisting plants, and it was only in our last issue that we were speculating as to the probability of a weevil-proof paddy being obtained by this means. Since then we hear of an important

departure in the employment of the process of hybridisation which bids fair to revolutionise agriculture. It is well known that there are numberless varieties of cereals and grasses, all of which have their special qualities in early ripening, in finer grain, in hardness, and so on. The problem then is, how to combine the best qualities of all in one or more distinctly new varieties. To do this in the case of animals is a comparatively easy matter, but with plants and especially those belonging to the grass family it is very different.

To fertilise the pistils in the flower of a wheat plant, by the introduction of pollen from another plant, is an operation which requires infinite care, skill, and patience. Not only must this be done, but the anthers containing the pollen in the flower to be operated upon must be removed without bursting them, and if one of these anthers should be burst, and the pollen it contains let out, the object of the operation would be defeated. Then the resulting grain, or seed, must be carefully watched until it attains maturity, and its descendants have to be watched as well, and it may be years before a grain may be found among its progeny which is worth preserving. When we consider how minute some of these flowers are, and, consequently, how delicate must be the hand and eye of the operator, we may understand the difficulties in the way of the experimenter. And, indeed, these difficulties have been so great in the past, that very little has been accomplished so far as grain is concerned, and nothing at all so far as regards grasses. Messrs. Maund and Raynbird carried out some experiments in 1846, and specimens of new varieties of wheat were exhibited by them at the Exhibition in 1851. Messrs. Carter, the well-known seedsmen, have also experimented since 1883, and they have succeeded in putting new varieties of wheat on the market.

But it has been left to two young men in Lancashire to grapple successfully with this mighty problem, and after eighteen years of hard, unremunerative work to open up a vast field of new discoveries in the cultivation of cereals and grasses, which bids fair to revolutionise agriculture. In 1880, John and Robert Garton, the sons of a Lancashire corn merchant, began their experiments in the production of new varieties of cereals by means of cross-fertilisation at Newton-le-Willows. Hitherto, with the two exceptions which have been referred to, improvements in grain had been brought about by carefully selecting the best ear in a field, and the best grain in that ear, and then keeping the produce of that variety for seed. And a change of seed from one district to another, *e.g.*, planting wheat grown in Midlothian in Kent, or *vice versa*, has been found to be beneficial, as differences of environment sometimes lead to improvement in the produce. But the number of improved cereals to be obtained in this way is strictly limited, and they cannot be said to be new varieties at all. On the other hand, the labours of Messrs. John and Robert Garton have been productive of new species of wheat, oats, barley, and grasses, the number of which seems only to be limited by the time and trouble which may be taken by the experimenters. "I spent a day during the present week at Newton-le-Willows (writes a representative of the *Daily Chronicle*), and saw enough to

convince me that a work was being carried out, destined to have a remarkable influence over the future of agriculture."

Already wheat has been produced the average weight of the grain of which is 60 per cent heavier than that of ordinary wheat; with oats even greater success has been obtained. Varieties of wheat and oats got by hybridisation promise to yield 30 and 40 per cent more per acre than ordinary varieties, and so increase the produce of a country by that amount.

Specimens of different kinds of the particular cereal to be improved have been obtained from every quarter of the globe. Of wheat 350 varieties have been collected from the British Isles, France, Germany, Russia, Hungary, Greece, Italy, India, Australia, Japan, and America. Similarly 100 varieties of oats and 70 varieties of barley have been obtained. Even wild forms or weeds have been brought into requisition with good results. Thus the wild oat of China is said to have no hull or husk, and by crossing British oats with this variety an oat has been got which has no hull at all, and can be at once used for preparation as food, thus doing away with the necessity of removing the thick and tough hull of oats which impairs its flavour and value as food.

Messrs. Garton began their work in 1880. For the first two or three years they did not meet with much success. Their first successful crossing resulted in a grain which partook of the characteristics of both of its parents. But in the second generation, all sorts of queer abortions made their appearance. It is not until the fifth or sixth generation that these tendencies to sport or to revert to original types ceased. After this, the new species became permanent and fixed. I saw magnificent specimens of cereals, in every one of which the valuable characteristics of the parents were intensified and improved. The wild wheat of Southern Asia (*Triticum spelta*) has a grain which firmly adheres to the chaff and is thus not liable to be beaten out by high winds after ripening and before harvesting. It is also a strong glutinous grain calculated to impart "strength" to flour. All these qualities have been fixed in the hybrid produced from it. In barley the ear has two rows of grains, but more of unfertile flowers. Mr. Garton has succeeded in getting an excellent barley which has six rows of good grain.

Even the matter of the straw of cereals has received attention so as to produce a stiff and sturdy plant, while better varieties of grasses and clover have also been brought out by hybridisation.

Mr. John Garton thinks that all cereals and grasses have a tendency to deteriorate unless crossed with new blood, and he places no limit on the improvements, which may be made by judicious scientific hybridisation. The work of the Gartons has naturally attracted the attention of botanists. Professor McAlpine, Botanist to the Highland and Agricultural Society of Scotland, takes a great interest in the work which is being done, and he has reported several times to his Society. He has written two papers, which appear in the "Transactions" of the Society, one in 1894 on the cereals, and one during the present year on the new grasses.

Dr. Robert Wallace, Professor of Agriculture at the University of Edinburgh, bears testimony to the value of the new breeds of cereals and grasses, and says that having visited many countries in the interest of agricultural research he has seen nothing to rival, in scientific interest or national importance, the work in which Messrs. Garton are engaged.

Mr. Alfred Smetham, Consulting Chemist to the Royal Lancashire Agricultural Society; Mr. James Macdonald, Secretary of the Highland Agricultural Society; and Dr. McDougall, Lecturer on Agricultural Botany at the Royal Botanic Gardens, Edinburgh, all bear similar testimony to the value of Messrs. Garton's discoveries, not only from a scientific, but from a practical point of view.

#### OCCASIONAL NOTES.

The Report of the Milk and Butter Tests at the Royal Show of England held this year, gives some idea of the height of perfection to which breeding for milk and butter has been brought in England. The prize for the best butter cow of Jersey, Guernsey, Kerry and Dexter breed went to the Earl of Cadogan's Six-year Jersey "Clemency." She had calved about six weeks before and yielded 22½ lbs. in the morning and 16 lbs. in the evening, which produced 38½ oz. butter. To put these facts in a clearer way, she yielded 31 imperial pints (to a fraction) milk, which produced butter at the rate of just about 1 lb. butter to 1½ gallons milk, the ordinary proportions being in England 1 lb. to 2½ gallons. The best milk cow produced 59½ lbs. milk or 47½ imperial pints, the winner being a red short-horn. Another short-horn yielded more, viz., 64½ lbs. or 51½ imperial pints, but she was not placed as she did not come up to the standard of solids, viz., 3 per cent fat and 12 per cent total solids.

We may be pardoned for comparing great things with small and making a comparison between these prize-winners and the Government Dairy cattle (Sind breed), as the comparison is interesting. As regards quantity our Cattle fall far short of English milkers, the best cow in the dairy giving only up to 20 pints, but this is very good for the low country where English breeds will not thrive. As regards butter, however, we can compare favourably, for while the standard adopted at the Royal Show was 3 per cent fat, the analysis of a sample of milk from our best milker (Queenie) by the City Analyst gave 8.92 fat, and the prize butter cow above referred showed 4.7 per cent and 6.2 per cent fat in her morning and evening milk respectively. Our record is certainly a noteworthy one of which we might justly be proud.

A trial has been made in the drying of fruits and vegetables in India by means of Dr. Ryders' American Fruit and Vegetable Evaporator. The Director of the Sharunpore Botanic Gardens reports the results in a letter to the Director of Agriculture, N.W.P. The cost of the fruits and vegetables for the evaporator naturally varies,

but the other items are fairly constant and are estimated as follows:—

Preparation of the article for the evaporation and attendance during drying ...	... ½	anna per lb.
Tins and labels ...	... 2	" "
Interest on evaporation and premises ...	... ½	" "
General supervision ...	... 1	" "
Add as trade profit ...	... 2	" "
	—	
Total... 6	" "	

The cost estimated under each kind of fruit and vegetable includes market value of fresh article and cost of wood used for drying. Adding 6 annas to this cost we get the sale price per lb. of the following fruits which we select from a long list of both fruits and vegetables experimented with: Green mangoes about 13 annas; ripe mangoes about 12 annas; guava about 10 annas; plantains (green) 15½ annas; plantains (green), 10½ annas. It is disappointing to find, however, that Messrs. Treacher & Co., of Bombay, report unfavourably on the samples of dried fruits sent to them.

The *Indian Agriculturist*, referring to the Report on the working of the Civil Veterinary Department for the past year as a remarkable record of useful work efficiently done under exceptionally trying circumstances, says: "Of even greater importance is the remarkable stride that has been made during the year in the matter of dealing with rinderpest. The investigations of Vet. Capt. Raymond in Bengal in this connection are specially noticeable, as this gentleman has succeeded not only in confirming and utilising with the happiest results the inoculation prophylactic devised by Dr. Koch, but he has been able to dispose once and for all the germ discovered by Dr. Simpson as the *causa causans* of this dreaded cattle-plague. Special mention is also made of Vet. Capt. Gunn's work in the Punjab, and that of Vet. Capt. Evans in Burmah,

We have already made reference to a trial of Dr. Ryder's American Evaporator with Indian fruits. It will be there found that the sale price of dried unripe and ripe plantains is given as equivalent to 93 and 63 Ceylon cents per lb. These would seem to be absurdly high figures, and on looking over the details of cost we find the buying price of the fresh fruit given as equivalent to R1.36 per 100. We understand that a pound of sun-dried plantains such as was sent to us lately from Anuradhapura could be produced at something less than 20 cents!

#### THE CACAO CANKER.

The second (but we hope not the final) report of Mr. Carruthers, who specially came over to Ceylon to study this disease, while throwing a good deal of light on the nature of this new enemy to the cacao industry, is particularly valuable for the practical hints it contains. The two most important points in this latter connection are his recommendations (1) that light shade

should take the place of heavy shading, and (2) that "suckers" should not be removed indiscriminately if indeed removed at all. These recommendations are based on the grounds (1) that the fungus which is the cause of the disease delights in damp surroundings, and (2) that suckers are little susceptible to fungus attack. Cacao planters have thus the preventive treatment for the canker prescribed for them, and they will we doubt not lose no time in thinning out their shade trees and observe a cautious reticence in interfering with the growth of sucker stems. Mr. Carruthers further draws attention to the fact that the common tree used as shade in cacao plantations—a species of *Erythrina*—is also liable to be attacked by the same fungus as causes the canker in the cultivated crop. Planters will, therefore, do well to pay due attention to this fact and take care to make their estates as uninviting as possible to the pest.

Another fact which must not be overlooked is the tendency on the part of one variety of cacao to resist the disease better than another. Mr. Carruthers believes that the Forestero variety is less liable to contract, and better able to withstand the canker. This is a point of much practical importance to future growers.

In view of the fact that a damp condition is favourable to the parasite, we would add to the valuable suggestions offered by Mr. Carruthers, and advise that due attention should be given to the question of drainage which is so intimately connected with a damp or dry condition.

We find in a quotation on the subject of plant diseases in the *Agricultural Magazine* last year that the writer lays special stress on the necessity for seeing to the proper drainage of lands as a preventative against fungus attack. In the cases of trees dead or dying from such cause, it is recommended that they should be destroyed by fire, even to the stump and main roots.

Again, keep the place free from rotting and decaying timber.

Disinfect with tar the wounds on trees, either those caused accidentally or by pruning.

Cut away the wood from all "sore" places.

Then: *Look out that the drainage is good. This is a most important precaution against timber-destroying fungi. Damp ill-drained plantations are their natural home.*

#### RHEA OR RAMIE FIBRE.

The *Kew Bulletin* for September contains a review of the Ramie fibre question which contains much that is of interest to intending cultivators.

As regards the different forms of the plant it is laid down pretty clearly that China grass is the *Boehmeria nivea*, easily recognised by the white underside of the leaves, and that *Ramie* and *Rhea* apply to *B. tenacissima* which has the mature leaves green underneath: the former being the temperate and the latter the tropical form of the plant.

In planting it would seem that 12 inches apart and 18 inches between the rows is the best distance on fair land, but on strong land 18 in. to 2 ft. are recommended.

Mr. Dodge, the fibre expert of the United States Department of Agriculture, gives the following figures as regards yield: 2 cuttings of the second year's growth should give 20 tons of green stalks with leaves, each ton of which 46½ lb. of clean, dry ribbons or raw fibre, giving 25 lb. of degummed fibre. We have, therefore, a return per acre from two cuttings equal to 930 lb. of clean ribbons and 500 lb. of degummed fibre or flasse.

Other results are also given, but as the *Kew Bulletin* remarks, the field of clean dry ribbons per acre on a large area with 2 or 3 cuttings will average 900 to 1,000 lb. per acre.

After touching on the various contrivances for decorticating the fibre, the *Kew Bulletin* says:—The plants can be grown with the greatest care, but when the problem of treatment is solved the supply of the raw material will be limited to warm countries. The cultivation of China grass in temperate climates will never be able to compete successfully with that of Ramie (or perhaps of China grass) in the tropics. . . . The whole question turns on the question of ribbons. We are still waiting for a decorticator that will not merely turn out ribbons fit for further manufacturing processes—that has been accomplished—but will turn out, say, half a ton a day at small cost. Till this has been found, the planter cannot profitably deal with the crop, and the degumming processes now almost entirely dependent on hand cleaned fiber from China are paralysed for want of a supply which will allow the finished product to compete with other fibres.

The ribbons must be susceptible of being delivered to the degumming factories at a cost not exceeding £7 to £9 per ton. This would pay the planter if he had a decorticator which would enable him to prepare the ribbons at a cost that would leave a profit. At present he cannot produce ribbons under £12 to £14 per ton.

[A practical point which is worth settling by actual experiment is whether with the clean labour in Ceylon the ribbons cannot be got by hand-cleaning, as in China, at a price per ton that will leave a fair margin of profit to the grower. The price per ton now offered is rather more than £7 to £9 given by the *Kew Bulletin*.—Ed. A.M.]

#### MORE ABOUT KEKUNA (*ALEURITES TRILOBA*).

Mr. J. T. de Silva, Agricultural Instructor, Mahawalatenne, who is working on the property of the well-known Ratamahatmeya of that name, writes with regard to kekuna, that besides being used for producing oil for lighting, the kernel is sometimes substituted by the villagers for coconut in their curries. The pericarp is, as is well-known, much liked by pigs, so that there would seem to be a probability of the fruits of the tree being useful as food both for man and beast.

Referring to Dr. Watt's Dictionary of Economic Produce of India, we find that high authority stating that the cake, after expression of the oil is a good food for cattle and useful as a manure, so that this "poonac" as it would be locally called should enter the lists with other oil cakes such as coconut, gingelly (sesamum) and groundnut (arachis) if the extraction of oil comes to be carried on on a large scale.

Roxburgh states that the kernels taste very much like fresh walnuts and are reckoned wholesome. Indeed, those who have tasted them will at once be struck with their pleasant nutty flavour. Again, the oil is recommended as a substitute for castor oil—over which it has a considerable advantage in possessing an agreeable flavour and taste—its action being certain and unattended with either nausea, colic, or other ill-effects.

The roots afford a brown dye used for dyeing cloth, while as before stated, the wood has a marked value.

### THE ANALYSIS OF SOIL AS A GUIDE TO ITS FERTILITY.

BY DR. BERNARD DYER, F.I.C.

(Continued.)

Altogether about one hundred acidity determinations were made on some sixty species of plants belonging to twenty different natural orders. The details of the process used for determining the acidity are fully set forth in my original paper in the *Chemical Society's Journal*, and as they are interesting only to laboratory workers, I need not burden the present article by a repetition of them. It should be said, however, that no attempt was made to identify the actual organic acids to which the acidity was due; but as it was proposed ultimately to use citric acid as the actual solvent for soil analysis, the acidity was in each case calculated in terms of citric acid.

The reason for preferring citric acid to any other organic acid was, firstly, that citric acid is a very convenient material to use; and secondly, because it was the actual weak acid successfully, as was considered, employed by Stutzer in gauging the availability of phosphoric acid in fertilisers.

The average acidity, in terms of citric acid, shown by the hundred plants examined, was about 0.86 per cent. If, however, the plants coming under each natural order were averaged, and these averages again averaged, the twenty natural orders showed an average acidity of 0.91 per cent in terms of citric acid. Further analysis of the results showed that in the orders Ranunculaceæ, Crucifere, Caryophyllaceæ, Leguminosæ, Araliaceæ and Boraginaceæ, the averages lie between the limits of 0.81 and 1.12 per cent. In the orders Tropæolaceæ, Primulaceæ, Umbellifere, Compositæ, Campanulaceæ, Chenopodiaceæ, and Graminæ, the average acidity ranged from 0.53 to 0.68 per cent.

In the case of the Dipsaceæ and Solanaceæ, (single species only) the figures were below the average, viz., 0.44 per cent and 0.34 per cent, while the plants examined belonging to the Liliaceæ averaged 0.36 per cent, though one of the plants examined in this order was as high as .56 per cent.

The plants examined belonging to the Rosaceæ, Plumbaginæ and Onagraceæ gave high results. Of the Onagraceæ only two plants were examined, both of the same species—namely, *Cnothera*, or Evening Primrose. These both gave nearly two per cent of acidity, while two specimens of *Armeria* (Thrift) (Plumbaginæ) showed over two per cent. Of the Rosaceæ four specimens were examined, namely, two of *Geum* and two of

strawberry. The latter both showed nearly two per cent, while the rootlets of the two plants of *Geum* showed respectively 4.24 and 5.53 per cent. With the exception of these orders, however, the results are not very far removed from the averages already mentioned, and appear to indicate that the sap acidity of the rootlets probably generally falls within, and not very far from one per cent, calculated as crystallised citric acid.

It should perhaps, for the sake of clearness, be here stated that by "sap acidity" is meant the ratio of acidity to the total moisture contained in the rootlets of the plant; so that the statement that a plant has a root acidity of one per cent means, in more precise language, that 100 parts of the moisture naturally contained in the roots have such an acidity as would be arrived at by dissolving one part of citric acid in 100 parts of water.

As was pointed out in my paper, the results arrived at in this inquiry were of but a crude kind, and were obviously open to much criticism from a physiological standpoint, but, on the whole, it was considered that, however wanting the results might be in a scientific sense, they seemed to lend confirmation to the wisdom of Stutzer in adopting a solution of one part of citric acid in 100 of water as a standard test of the availability of phosphates in fertilisers, though he appeared to have fixed on that particular strength by experiments based on quite other grounds.

Whether or not such a solution could be usefully adopted for extracting the available mineral plant-food from soils, could of course only be ascertained by practical experiment; and such experiment could only be carried out on soils, the relative fertility of which, as related to the various ingredients of plant-food, was already known. The obvious spot to turn to for such soils was Rothamsted, and Sir John Lawes and Sir Henry Gilbert were good enough to allow me to draw, for the purpose of testing the powers of the solution, a series of samples of soil from the well-known Hoosfield, which had borne barley for forty years, and in which, during that period, each plot had year after year been subjected to the same manurial treatment.

The manurial treatment adopted in the Hoosfield barley experiments was, moreover, such as to render these soils particularly well-adapted for the purpose in view.

These soils samples, twenty-two in all, were first analysed in the ordinary way, by determination of the total phosphoric acid, and by determination of the potash dissolved by strong hydrochloric acid, the total potash in all forms being also determined.

A weight of air-dried soil was then taken from each sample, corresponding to 200 grammes of completely dry soil, and each of such portions was treated in a "Winchester quart" bottle with two litres of distilled water, in which 20 grammes of pure citric acid had been dissolved (that is to say, with two litres of a one per cent solution of citric acid). The soil was allowed to remain in contact with the solution for a week, with frequent agitation. At the end of that time the solution was filtered, and in each case a portion of solution corresponding to 50 grammes of soil was taken for the determination of dissolved phosphoric

acid, and a like quantity for the determination of dissolved potash.

The chemical details of the mode of determination need not here be further described than to explain that portions of filtrate were evaporated and ignited in platinum vessels, the phosphoric acid and potash respectively being determined in the residual ash.

#### BY HIGHWAYS AND HEDGES.

We have all heard of the possibility of getting spirits from the cashew apple (the swollen peduncle of the cashew nut), and if I am not mistaken I have also heard of some experiments being carried on in Ceylon in this connection. The *Kew Bulletin* for January and February, 1898, says that a new use has been found for the cashew apple in Portuguese East Africa. According to a Report furnished by H.M. Consul in that region the natives inhabiting the peninsula opposite the island and city of Mozambique have, since they have been emancipated, taken to brewing and distilling the juice of the fruit of cashew trees. This new industry is unfortunately having a very demoralising effect on the natives, of whom it is said that "during the cashew season (October, November, December) they give themselves up to their favourite beverage, and during that time they become perfectly useless." We are further told that there are millions of trees beyond Portuguese control where at present natives brew and distil liquor to their hearts' content.

I wish Mr. Stouter of Anuradhapura all success in his laudable efforts to start a new industry in Ceylon. I find in the *Agricultural Magazine* so far back as November, 1893, the following relating to Banana meal:—"An enterprising firm in Cairns, Australia, has recently sent a trial shipment of banana meal to London. The following are some particulars regarding it: "We dried by heating steam pipes, but found the process slow and expensive, 80 % of fluid having to be evaporated to secure 20 % of solid. The packing and drying is an exceedingly tedious and expensive item. We are convinced it will take 8 or 10 dozen bananas to produce 1 lb. of meal or flour. We have found 3 table-spoonfuls to make a vegetable dish of most agreeable porridge. We sell at 10s. 6d. per doz. tins." What does Mr. Stouter say to this?

The *Kew Bulletin* referring to the Mangosteen says:—"Plants of this well-known and delicious tropical fruit have been widely distributed from Kew to the West Indies. The Mangosteen is a native of the Molucca Islands, and is cultivated in the Straits Settlement, Java, and in one or two localities in India and Ceylon. The fruit is regularly shipped from Singapore to the Calcutta market. The first West Indian fruits were produced at the Botanic Gardens, Trinidad, in 1875. In September, 1891, the Governor of that island forwarded some West India Mangosteens for presentation to Her Majesty the Queen. The Mangosteen fruited for the first time in the Jamaica Botanic Gardens in 1886 (*Kew Bulletin*, 1895, p. 79). Last year a box was received at Kew from Mr. J. H. Hart, F.L.S., of Trinidad, containing nine fruits of Mangosteen, which were perhaps the first to reach

this country in a condition to allow their merits to be appreciated. Each fruit was separately packed in a compartment with pine wool. Owing to the firm consistency of the outer wall of the fruit, it appears to travel well. The fruits were distributed to the Secretary of State for the Colonies and others. The reports received were uniformly favourable. One fruit was sent to Mr. George Munro, one of the leading fruit merchants in Covent Gardens, to obtain an opinion as to the prospects of shipments of mangosteens to England. Mr. Munro reported: "Yours to hand. I cut open the fruit and showed it to some of my best customers, and they think with me that if they come in good condition and not too many at first, a business could be worked up in them. At any rate I should like to try some, and if sent, will do all I can to get a trade for them. They appear to be a fruit that will carry well."

Those who visited the last Fruit and Flower Show will remember the excellent specimens of mangosteens exhibited by Messrs. W. H. Wright, S. C. Obeyesekera and Liveris Fonseka Mudaliyar. We believe that Mr. Wright has shown that the mangosteen fruits in a comparatively short time if properly taken in hand, and as the plant thrives in various situations and elevations (Kalutara, Veyangoda and Kandy for instance) it is surprising that it is not more freely planted, seeing that it is a prolific bearer and that the fruits fetch a fair price in the market. Mr. H. D. Lewis, Sub-Inspector of Schools, Central Province, has by a system of manuring brought the mangosteen tree to a high state of perfection in his garden near Kandy, and his experience on this head should prove interesting if retailed.

I have always thought that there is much to be done with tobacco in Ceylon by using better seeds and adopting better methods of curing. I was, therefore, glad to meet a new-comer to the Island who has already arranged to try the cultivation of tobacco, of which he has had much experience in the Eastern Province. There are many who will shake their heads over such an enterprise, and point to the failure of the Ceylon Tobacco Company, but what companies cannot do is often within the reach of a single man of energy with experience to back him. Mr. \_\_\_\_\_ has my best wishes for his success.

*Mucuna pruriens* (identified with the now famous Florida velvet bean) is thus referred to by Dr. Trimen in his Flora—among plants indigenous to the Island: *M. Pruriens*.—An annual (?) Semi-woody twiner, branches slender, usually clothed with short white deflexed hairs; leaves large, rachis 3—5 in., sparingly deflexed hairs, stipules hairy linear-setaceous, leaflets 3—4 in. on short thick hairy stalks, terminal one smallest and two rhomboid-oval, lateral ones very unequal with lower half greatly dilated, all acute, mucronate, pubescent above, densely covered with shining silvery adpressed hair beneath; flowers numerous, 1½ to 1¾ in: long, on short pubescent peduncle, usually 2 or 3 together at intervals in a slender pubescent raceme 6—12 in. long, bracts ½ in: lanceolate,

hairy soon falling; calyx densely silky, two upper segments completely connate, lowest much longest; pod  $2\frac{1}{2}$ —3 in. by about  $\frac{1}{2}$  in. broad, linear, blunt, falcately curved at both ends, with a longitudinal rib along whole length of each valve but with cut wings, densely covered with close rather weak orange-brown irritant bristles pointing backwards and readily detached, 4—6 seeded with partitions between them; seed ovoid,  $\frac{1}{4}$  in., compressed, brownish mottled with black, hilum oblong, not half the length of the seed.

*Var. B. biflora*.—Leaves smaller, more hairy above; peduncles about 1 in., erect, 2-flowered. Dry and intermediate regions; rather common.

*Var. B. BATTICALOA*.—Flowers January-February; dull dark purple, the keel yellowish-green. Found throughout the tropics. This is the cowage or cowitch plant, Moore's name is wel-damaniya. The Sinhalese name given by Trimen is acheriya pala.

The Florida bean is now bearing profusely at the Colombo School of Agriculture, having been raised from the seed kindly presented by Mr. J. P. Williams of Henaratgoda.

Phallin is the active poison found in poisonous mushrooms. Nothing of the same character was known in plants except abrin the poison of *abrus precatorius* (Sin. olinda). A similar substance exists in the venom of the common rattlesnake and other poisonous reptiles and insects, and in the cultures of such disease-causing bacteria as those of diphtheria and typhoid.

Bamboo and cane are now largely used for making furniture, and though such furniture has many advantages over wooden articles, it must be admitted that the former are liable to deterioration sooner than the latter. I have been asked whether something could not be done to prevent bamboo furniture from going bad. There are, of course, many methods of preserving timber, all of which require more or less expensive plant and laborious treatment of the wood, but as a cheap and easy means of preserving bamboo ware, I would recommend the immersion of the materials (after being thoroughly dried) in a solution of sulphate of copper or bluestone—which is cheaper than any or other chemical salt with the required properties, and besides leaves no unpleasant odour behind. The strength of the solution should be about 1 lb. of bluestone to 5 gallons water, and there should of course be enough for the material to be thoroughly immersed and left till completely saturated.

Simmonds, in his Tropical Agriculture, states that in 1870 there were more than 70,000 acres under chillies in the Madras Presidency. England is said to import about 80 tons per annum from the W. Indies and Africa. I am glad to hear that there is prospect of 100 acres being laid under chillies by an enterprising planter.

There are a number of what may be called velvet beans indigenous to Ceylon besides *M. pruriens*. *M. monosperma*, *M. atropurpurea*, and *M. gigantea*, are all furnished with reddish brown hair on the pods.

Last month I had an application for seeds of the jak and breadfruit tree from the Political Superintendent, Palanpur, and was surprised to learn that these two trees are little known on the Bombay side of India—if indeed they are common in other parts of the peninsula. The jak seeds, or nuts as they are sometimes called, were not difficult to obtain, but in the case of the cultivated breadfruit (*Artocarpus incisa*) which cannot be propagated by seed, a few short (about 3 inches) root-cuttings with incipient buds were despatched with the jak seeds, packed in coirdust in a cigar-box. I have since heard from Palanpur that the contents of the box arrived in excellent condition.

Through the courtesy of Mr. Geo. Warr, whose name is familiar in connection with ramie fibre cultivation, I secured a small parcel of American rice seed. The parcel was unfortunately much damaged in transit, and I am afraid that much cannot be done with the very small quantity of good grain that was got from the parcel. I hope, however, to make another effort to introduce one of the excellent varieties of American rice.

#### THRIPS.

#### TRANSFERRING BEES TO A BAR-FRAME HIVE.

A correspondent has asked for advice as to the best way of transferring a colony of bees, which have for some time been domiciled in a gin-case, to a bar-frame hive. To the inexperienced and timid person this seems a formidable undertaking, but when you see it done by an expert operator, the matter is as easy as falling off a log. Let us say the colony has been at work in the gin-case for twelve months or so, and have filled it with comb. Choose a nice sunny day. Take all the bar-frames out of the new hive and place it on a box or table in a clear space. See that all the frames are in good order and put them—without any comb foundation—in a handy place. Then get a lot of pieces of narrow tape about 30 inches in length, and put them where you can reach them easily; also a sharp thin-bladed knife. When everything is in readiness, take off your coat and roll up your sleeves to the elbow. Seems a hazardous thing to do, but if your sleeves are dangling round, and a bee happens to get squeezed in, it will sting like a fiend possessed. To protect the face and neck, a veil should be worn; and as a gentle persuader a smoke bellows with a piece of smouldering sacking will be all that is necessary. Take up the gin-case as carefully as possible, and carry it to the table, on which it should be placed with as little jarring as possible, upside down. The bees will come out and fly around some. Just stand quietly, and if one alights on you, do not make a violent effort to dislodge it. If a bee really means to sting you, it comes right at the spot like a bullet. Some bees will fall to the ground, and to prevent them crawling into your trousers, just pull your socks over the ends of the unmentionables. Give a few puffs of smoke in the corner of the gin-case that appears easiest to get at, and with the knife cut the first comb out by running the blade along the top or as near to the

top as you can get. Sweep any bees off that comb with a little brush of leaves and put it aside. Then cut the rest out one by one. The bees will cluster round in the corners of the old box, while you take each comb, and fit and tie it with tapes into a bar-frame. If the comb is deeper or wider than the frame, lay it on top, and run the knife along. It cuts quite slick. When all the frames are fixed up, and you have taken care that on some part of them there is a full queen cell left, put them into the bar-frame hive. This should then be placed over the gin-case. The latter should be rapped to drive the bees upwards into the new hive, and as a rule they will go up readily. Of course this part of the business is expedited by gently seizing the queen, and placing her in the new hive, when her followers will troop in after her. When all are snugly housed, take the new hive back to the site of the old one, and be careful to place it in exactly the same position. In tying the comb in with tape, be careful to knot it in a way that the fastenings can easily be undone without jarring the comb. After the bees have been in their new quarters a few days, and if they appear to be contented, raise the lid of the hive, and you will probably find that the combs have been cemented to the top of the frame with wax. If that is so, undo the knots and carefully withdraw the tapes.

[The above information, which, from the many enquiries we have received should prove acceptable to our readers, is taken from the *Agricultural Gazette of New South Wales*.—Ed. A.M.]

#### MANURING OF COCONUTS.

We have been asked to consider the case of a coconut garden in which it is practicable to use neither cattle manure nor bone dust, and to suggest a means of fertilising the soil with other manures. The garden in question is so situated that there are no supplies of cattle manure available, while the absence of all pasture on the land makes it impracticable to keep cattle for manuring purposes. As regards bone dust there is the likelihood of the stuff being appropriated or sold for use on paddy lands.

One of the best local authorities on coconut planting uses the following mixture, *when no cattle manure is available*:—

Castor cake ...	... 6 lb.	} per tree.
Bone dust ...	... 2 ,,	
Wood ashes ...	... 8 ,,	

This suffices for 2 years. Half the quantity of castor cake would suffice if two head of cattle were tied per tree for say 5 nights.

Taking the percentage of phosphoric acid in bone meal as 22 %, and in Thomas' phosphate as 18 % (as supplied by Messrs. Freudenberg) we find that the amount of bone dust might be replaced by 2½ or say 3 lbs.; and taking the average percentage of potash in ordinary wood ashes as 5 % and in kainit as 12 %, we find that the 8 lbs. of wood ashes may be replaced by 3½ or say 4 lbs. of kainit.

Mr. Cochran gives the following proportions of the important elements of plant food in manures, as giving good results in moist soils:—

Nitrogen ...	... 1 lb.	} per tree.
Phosphoric acid ...	... 1.25 ,,	
Potash ...	... 75 to 1 ,,	

These proportions calculated for castor cake, Thomas' phosphate and sulphate of potash would work out as follows:—

Castor cake ...	... 15 lbs.
Bone dust ...	... 5 6 ,,
(Or Thomas' phosphate	7 ,,)
Sulphate of potash ...	2 ,,

But Mr. Cochran puts down the Thomas' phosphate at only 3 lbs., explaining, however, that the item was made a *little* less owing to its being more soluble, and therefore more readily available than bonephosphate. But the reduction which makes the item less than half the quantity can hardly be described as a "little less."

The quantities of castor cake and bone dust equivalent to the above formula of important elements of plant food will strike many as being rather high—15 lbs. castor cake and more than 5½ lbs. bone dust.

We are assuming, of course, that the manuring is intended to be done once in two years, but perhaps Mr. Cochran intends that it should be done less frequently?

#### THE USES OF WOOD.

(Continued.)

WEIGHT is an important indicator of the mechanical qualities of wood and a direct measure of its value as fuel or material for coaling and dry distillation, and often determines the choice of woods for a particular purpose. Thus, panels and other surface lumber in vehicles, thrashers, and other movable articles, which should be no heavier than necessary to perform their function, and all lumber for shipping crates and boxes, especially where these must be tight and stiff, are invariably selected from the lightest wood obtainable. Generally speaking, our conifers are lighter than the hard woods, but there are light and heavy kinds in both.

Shrinking, swelling, warping, and checking are the greatest drawbacks to the use of wood, and are all expressions of the same property of wood material, namely, its hygroscopicity, or capacity to absorb or give off water and thereby change its volume. All the walls of the cells grow thicker if a dry piece is moistened. This increases the size of the cells and thereby the size of the piece. The larger the single cell elements the more rapidly the water can get to or from all parts, and the nearer all cells are alike in size the more nearly they shrink and swell alike.

This explains why pine or other coniferous wood shrinks and swells much more evenly than hard woods, and also why they are more susceptible to moisture. It also accounts for the fact that the lighter hard woods give so much less trouble in shrinking and swelling than the heavier ones.

Since the chemical composition of the cell wall of all woods is quite similar, the value of wood as fuel and in dry distillation merely depends on its weight. Of the chemical properties important in construction, it is chiefly durability, and colour which enter into the selection of materials, both dependent on chemical combinations. What the substances are which make the heart of cedar and white oak durable and what

the processes are which lead to their formation are as yet but little understood. It is certain that these bodies are present only in very small quantities, but perfectly permeate the cell walls and commonly appear together with more or less sharply marked changes in colour.

Generally, trees with durable wood form a distinct heartwood, but their sapwood is no more durable than that of other kinds. Since durability depends mainly on resistance to living organisms, proper experiments to determine the relative durability of woods are exceedingly complicated, and satisfactory results are still wanting. In the absence of better data, the "life" of railway ties as commonly observed will in some measure answer this purpose.

Besides being intimately related to the mechanical properties, the structure also determines the texture and almost entirely the beauty of the wood. Texture may be said to be coarse when large pores in rows or scattered, appear as holes on the ends or as dark streaks (troughs) on the sides, as in oak and ash; it is moderately coarse if all its elements are large, as in pine, and it is fine if all the elements are small, as in cherry, and much more so in boxwood. Apart from the appearance of the wood, the texture is often in itself a property which fits or unfits the wood for a particular use. Thus red oak is useless for a faucet or for a delicate piece of carving, because in the one case it leaks, in the other its own coarse-texture lines will mar and distort the picture.

Structure is the first element of beauty in wood. Its uniformity of structure makes white pine monotonous; the striking difference of spring and summer wood renders hard pine obtrusive; the arrangement of vessels, fibers, and pith rays characterize oak, and the peculiar arrangement of the same elements gives to elm those handsome figures of dark wavy lines on an even background of brown.

Without analyzing or inquiring into their cause, the several patterns have become familiar to all, and our bedroom sets in oak and maple, cherry or walnuts, testify to their recognition and importance.

Size, form and abundance of wood more than any other features have influenced the development of our wood industries. Man is indebted to the large, long shafted and well-formed conifers to a degree rarely appreciated for assisting him in his progress. Occurring on extensive areas and combining most useful qualities, they are generally sought for structural purposes. Masts of spruce and pine are carried across the seas, telegraph and other long poles of the same species are hauled hundreds of miles because of their form and the ease with which straight, elastic material can be found among them. If a carpenter were obliged to rely upon beech, birch, chestnut, oak, poplar, etc., and had to use them in combination, house building would be not only much more difficult and costly, but unsatisfactory. While the stringer or joist of pine would keep straight, its neighbour, the oak, would sag down, the chestnut would warp out of line, the beech and hickory would soon be infested with boring insects, and the whole would be a failure. Abundance in suitable size, form, and qualities have made white pine the king of American woods, and so fully are these properties appreciated in practice that it required a severe struggle to introduce even such unexcelled material as cypress as a substitute.

#### GENERAL ITEMS.

The Eucalypti are roughly divided into three classes: Gums, stringy-barks and iron-barks. It has always been remarked that the stringy-barks do not make good firewood. As a matter of fact, says the *Timber Trades Journal*, this wood will not burn as other wood does, for though the bark and leaves are combustible the timber cannot be burnt without being mixed with some more inflammable material. No tests have yet been made to discover how far the wood of Jarrah (*E. marginata*), *E. obliqua*, *E. piperita*, *E. Macrorrhyncha* and other stringy barks will resist fire. Logs or sticks when placed in a fierce fire have, however, been observed to char through very slowly, and this process goes on only as long as a fire fed with inflammable wood is kept up. When this firing is removed the logs become black and cold at once. The discovery of a timber which may be used for internal fittings without danger by fire has engaged the attention of architects and others for some time past, and numerous methods of treating woods, for the purpose of rendering them non-inflammable, have been suggested. Many of these experiments have been made with that most inflammable of all timbers—pine. Whether they would have been more successful had they been made on a timber like stringy-bark, which has a natural power of resistance to fire, cannot be said positively, but its probability cannot be doubted. Stringy-bark is reported to be very sensitive to moisture. Hence, although it is easily worked, can be smoothly planed and takes a good polish, it is liable to warp when exposed to damp. The warping takes the form of a swelling of the fibres, so as to produce small ridges on the surface. How far this would be detrimental to its use for internal fittings must be decided by experts, but there can be little doubt in the mind of any person fully acquainted with the characteristics of this wood, that its use as joists, or for staircases, would enormously reduce the losses by fire in cities. Staircases and lift-wells form natural chimneys in case of fire, and if these were lined with timber as difficult to burn as stringy-bark is known to be by practical bushmen in its natural state, fires, which now burrow out a whole building, might perhaps be confined to a single floor or room, or prevented altogether.

The Report of the Royal Commission on Tuberculosis is an interesting document, and among the numerous suggestions for securing pure milk and wholesome meat which the Commissioners make, we find many valuable hints as regards improvements in the sanitation of cowsheds and byres and slaughter-houses, the qualifications of meat inspectors and other matters of local interest.

*Ischaemum angustifolium*, better known as Bhabar grass, and belonging to a genus well represented in Ceylon, is a minor forest product of some importance in North India (Saharanpur) whence it is largely exported for paper-making and is also used in the local industries of rope-making. The quantity cut annually cannot be estimated exactly, but is probably over 200,000 maunds, and the outturn could, if necessary, be considerably in-

creased. Bahabar grass, which has a large sale, is principally found in the hilly portions of the Division. The rope made from it is used for all purposes of cordage, and the cord which is made fine and coarse into coils of 150 ft. length sell at R2 and R1½ per maund respectively. A large amount of the grass finds its way to Cawnpore and other places for paper-making. Another forest product is *Munj* grass (*Saccharum ciliare*) used for rope, mat-making, and thatching, and the construction of rough furniture.

An egg is made up of several parts which may be reduced to three principal names—the shell, white, and yolk. The shell is made up chiefly of mineral matter, and according to many autho-

rities, when free from moisture, it contains in 100 parts about 91 parts carbonate of lime, 6 of phosphate of lime, and 3 of nitrogenous organic matter. The white of a hen's egg has about the following composition:—In 100 parts—water, 84·8; albumen, 12; fat, sugar, extractives, and membranes, 2·0; and mineral matter, 1·2 parts. The yolk shows a much greater degree of richness than the white. According to analysis by Professor Church it contains:—In 100 parts—water 51·5; casein and albumen, 15·0; oil and fat, 30·1; pigment, extractives, &c. 2·1; mineral matter, 1·4 parts. The mineral matter of the contents of hens' eggs, though small in quantity, is rich in quality, consisting as it does mainly of phosphates of lime, potash, soda, magnesia, and iron.

## “PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

(Third Series.)

### THOMAS WOOD,

PLANTER PIONEER IN UVA FOR MANY YEARS:—1847-1880; MANAGER  
OF THE RICHEST COFFEE PLANTATION IN CEYLON.

[We are indebted to an old friend and partner of Mr. Wood, of many years' standing in Uva, for the following account of the Spring Valley patriarch. We visited the district and was the guest of Mr. Wood in 1865 when Spring Valley estate was in its prime, before passing from Mr. Bannatine to the Company formed by Mr. John Brown. Mousagalla was just being opened in coffee. There was then no baker in all Uva and Mr. Wood had seen no wheat bread for months, living on rice cakes and tinned biscuits. We found Mr. Wood to be still active and hearty, full of his recent visit to Nuwara Eliya to welcome Mr. Bannatine—both meeting as old men when they had parted in their early prime. But we must not go on, but rather leave our friend to tell his very ample tale.—ED. T.A.]

THE SUBJECT OF THIS NOTICE takes us to Ouvah—now spelt “Uva,” the principal town being Badulla—of which the surrounding mountains and valleys, hills and dales, villages and fields are amongst the most lovely and charming

in this most beautiful land. I “surveyed” it all again only the other day after many years of absence, from the new Railway line, with all

the same surprise and delight that its first view afforded me now so very long ago. There stands Namunukula majestic and alone, with its many peaks pointing everlastingly to the skies, its flanking ridges far outspread, guarding the valleys and streams and slopes with which my feet were so familiar. These remain, but man does not. He flourishes for a day, seemingly the lord of it all, and then dies, and the place that knew him knows him no more for ever; but the everlasting hills still stand watching the mortal procession, and seem to laugh at man's ephemeral existence and transitory rule. *There* are the haunts of my early years; but where are the men with whom I lived and worked, and amongst whom my early lot was cast? Of them only one remains, and he is preening his wings for flight; and I who look in from afar sigh and think of the little churchyard under the shadow of that great hill where such a goodly company of my old neighbours sleep their last long sleep together. But let me for a brief space cause my old friend to live again in these lines, so that the reader may know the sort of man he was, the place he filled, and the rôle he played.

THOMAS WOOD,

the subject of this brief sketch, was for many years one of the most conspicuous figures in

the planting community of old Uva. His hospitality knew no bounds, and few, if any, of the many strangers who visited Badulla in those days, offered him the offence of not partaking of it. Not that he was singular in this respect; but few others held the prominent position he did, so conspicuous from the town, and but few others enjoyed the same wide reputation all over the country. His house was his castle, but its gates were ever open and inviting; and over its portals might have been inscribed: "Abandon dulness ye who enter here." Not his the ambition to be lord of many lands, the owner of many estates, though, had he so chosen, few could have followed him in his lead. He was content to be the master of what then was, and still is, the largest and most prominently placed estate in the district; and if he did not open other estates right and left, as he might well have done, he added a large new clearing every year to "Spring Valley," and so maintained his position as the manager of the largest estate in all Uva.

It is true that others had gone before Thomas Wood in pioneering the opening of the Namunukula lands for cultivation, prominent amongst whom we may name Sir William Reid, John Oliver, A. Bertlin, the Shands, Graham, Miller and E. C. Byers. Sir William Reid had opened the first clearings on Spring Valley, adjoining the far-reaching boundaries of which estate or not far away were Cannaverella, Gouravilla, Kottagodne and Wewelhena, about all that was opened in that immediate neighbourhood. Work had not been going on very long before the arrival of Mr. Wood—he was only two years after Mr. Byers—and if we consider the number of estates that soon after sprang into existence and the unceasing war waged by Mr. Wood with his famous writing "battery" upon the Government and officials as regards outlets, before the days of District Planters' Associations, we cannot deny him a place amongst Uva's pioneers. He took over charge of the

#### SPRING VALLEY

(Beddegamme) estate in the year 1847, and from that time he never left the country, (and only once left the district) till his death in 1880. Thus for over 33 years he lived continuously in Uva. While men of wider activities had played their parts and left, he remained and no other name is, or can be, more intimately associated with Badulla than that of Thomas Wood. His eccentricities indeed were many, and it is the object of this paper to slightly lift the veil as far as prudence and good taste permit in order to point the moral of his life.

Thomas Wood, Esq., of the Beddegamme, or Spring Valley Estate, Badulla, the subject of this memoir (known to his early contemporaries more familiarly as "Tom Wood," and to the younger generation of planters in the "fifties" and widely throughout the country as "old Wood") was for many years the most conspicuous figure in the planting community of "Uva," in those "days of old" which so few are left among us now to represent. If we except his contemporary, neighbour and friend, E. C. Byers (who still lingers hale, hearty and strong in the district), the changes of time and circumstance have removed from Uva almost all to whom Mr. Wood was personally known, though there are, doubtless, many remaining in Colombo and other places—veterans of the community, who still remember the

hospitality extended to them by Mr. Wood when visiting the remote district of Badulla in those now remote times. And as a boyish jocularly and a flow of soul and humour always accompanied this lavish hospitality, these reminiscences will doubtless all be of the most pleasurable nature, for Mr. Wood loved his joke and his pun, and the merry twinkle of his eyes and the ripple of his laughter were infectious; and, as he generally took care on such occasions to send for several of his neighbours, a social evening followed that was not readily forgotten. He was a "Ceylon Planter" of the best and truest type in the best days of planting, when

#### "COFFEE WAS KING"

and money was plentiful, easily earned and freely spent, and all alike were prosperous and content. In these days of low exchange, adversely affecting one part of the community, of dear rice limiting the coolies' earnings, of over-production and low value of the new staple, affecting all alike—it is hardly possible to realize the prosperity of those old times, and the good humour and high spirits which generally prevailed whenever planters met at home or abroad. A night with Wood or with Byers was indeed a time of enjoyment long to be remembered. But, alas! *tempora mutantur et nos mutantur in illis*—which remark of course refers only to those who remember the times I am now speaking of. A different spirit is now abroad, in which the new generation doubtless find their pleasure, not unmixed, perhaps, with sentiments of pity and contempt for those old times when tennis was unknown, and even cricket was seldom played, and "ladies" were few and far apart. But planters of the old school look coldly upon these things, and think lightly of them. In those old days men depended more upon themselves and upon one another for enjoyment, which sharpened their wits and gave them wider knowledge and perhaps a little more sense. Well, of those old times Wood was eminently a true type, and his memory is a standing monument. He was a gentleman, and the son of a gentleman, his father having been the sixth in succession of as many generations of Physicians in Edinburgh. His brother, the late eminent Doctor Andrew Wood, was the seventh, and his eldest son, who unhappily did not survive him, was, and would now have been, the eighth doctor of his family in succession. After what has already been said it will surprise many to learn that Thomas Wood was of a reserved, shy, and even taciturn nature, these qualities becoming apparent each under the varying circumstances that arose to influence him, especially when away from his own house and place, and towards his own family. "Why does Tom never write to me?" pathetically asked his old mother of the writer, to which question the only possible answer was an assurance that "it was simply his nature to be reserved" (though a fixed habit of procrastination in such matters had also much to do with it), and that "he was too brimful of goodness of heart and human kindness and sympathy to entertain any but the most loving sentiments towards his mother, which indeed I had often heard him express." From the day he left his father's house he became practically a severed branch. He first went out to

#### JAMATCA

where he was employed as a coffee planter for, I think, nearly ten years. I forget the name of the firm, but when they had extended

their operations to Ceylon he was sent here to assist Sir William Reid in forming that since famous property the "Spring Valley Estate," which soon became the undivided property of Mr. Bannatine of Glasgow. Here Wood reigned with absolute sway for nearly thirty years, adding to the estate a large clearing every year, till it became one of the largest in the country, as well as one of the finest and most productive, yielding its fortunate but wealthy absent owner a princely income. The time, however, came when old age and a plethora of wealth induced the owner to listen to the wiles of the charmer in the person of the company promoter, and to sell his fine property to Mr. John Brown and his co-adjudors for the sum of £40,000, and by that act the days of poor old Wood's glory came to an end and he was never the same man after. Did he retire with his well-earned fortune and independence, to spend the end of his days in his own country, and with his own people? Alas! no. That fact itself did not much trouble him, and he bore his happy and habitual manner to the last. He had acquired no fortune wherewith to retire; and this he knew and admitted to the writer who enjoyed his confidence, perhaps, more than any other person. Few men ever enjoyed better opportunities to become a wealthy proprietor, and few (Scotchmen though he was) ever threw such opportunities away, or cared less for them. To his assistants and the coolies he was a strict disciplinarian, and though he would not have a word of "shop" after 5 o'clock in the bungalow, it was not easy to get a smile out of him in the field between 6 a.m. and 4 p.m. The coolies' names were entered to even a quarter of a day's name, the check-roll being full of  $\frac{3}{4}$  and  $\frac{1}{2}$  day's names, and no mere straight strokes for full days, but an initial letter indicating the nature of the work done each day by each cooly. His stolidity, however, gave way one day when, on asking one of his assistants what the letter "O" stood for in his check-roll, he was gravely told "Ho! O for 'Oling, sir." We often had that joke trotted out afterwards. Then one whole day was set aside every month for all hands to make up the accounts and monthly reports, printed on loose sheets. This was never omitted, and once done they were stowed away in a large box under his own bed. Imagine my surprise when, years after, he confided to me that he had never rendered an account to the proprietor, but only wrote him long letters. When

#### MR. BANNATINE

informed Wood that the estate had been sold, he said:—"I hope you will not feel leaving the place very much. You have never rendered me any accounts; but I know that you are an honest man, and I have much pleasure in presenting you with 5 per cent on the selling price, viz., £2,000." Incredible as it may appear, however, he never applied for this donation, and never received it. What conclusion could the proprietor come to but that he had saved plenty and did not need it? But never was there a greater mistake. Wood had saved practically nothing. I do not believe that he ever drew the liberal salary to which he was entitled, year after year, during all the time he was in full charge. I believe he only paid his bills as they became due out of the money he drew for the estate,—that this did not nearly amount to his due, and that the proprietor unconsciously benefited by this extraordinary habit, and that the £2,000 would have gone but a short way to recoup Wood for all he had lost by his unaccountable action. "Procrastination," he admitted to me, had been the bane of his life,

much to my surprise, as I had always thought his character to have been the very reverse of this; but to this evil habit must, in some way, be attributed this mystery of his life, that is, in putting off bringing accounts and correspondence to a point, and in squaring up. His very principles of honesty and honor seemed to stand in his way; yet all whom he employed fared well, and were liberally and punctually paid. He only neglected himself.

If a man's biography is worth writing at all such truths as these are worth the telling, to point a moral as well as to adorn the tale. This unfortunate proclivity never left him. It had not for its foundation any desire to evade duty in any form, or to shirk work, for he was most conscientious, and his industry was remarkable. It was in his nature an idiosyncrasy better left to the physician than to the moralist to explain. Even when, in after years, he had become a Superintendent in the employment of a Colombo firm (again under an absent proprietor, though not directly so) he furnished no accounts until, after many months, Messrs. Geo. Steuart & Co. were instructed to demand them from the beginning, and, *then*, in due course, they were all forthcoming, correct to the smallest item. And in like manner, doubtless, the Spring Valley accounts could also have been produced, given the necessary time and labour. So, too, the accounts of an estate in which the writer and Mr. Wood were jointly interested, for a short time, were not forthcoming, and were never demanded, for I easily made up a retrospective "estimate," and was more than satisfied with the cost of the work done as represented by the money that had been drawn. Many a man in Ceylon has come to grief over his accounts, not exactly in the way followed by the subject of this memoir, but through an unconquerable hatred of the toil of keeping them up, day by day, and the periodical labour they entail. But "*it is work that must be done*" is the moral of this story; for Wood's experience on Spring Valley would certainly not occur many times in a generation; and, even as it was, what but ruin to him was the consequence?

But it must not be thought that this vice of procrastination as it would be considered by men of business, or weakness, as moralists would call it, since the greatest men have ever been the greatest workers, was perceptible in Mr. Wood's daily life. On the contrary, those who knew him best would have been the first to defend him from any such imputation, and but for his own admission it could not have been even suspected, much less ever known. It affected only one phase of his character and that the most private, for in his daily work and duties his restless activity had no bounds, and those subject to his control were permitted no respite during working hours. He never indulged in couches and easy chairs, and he did not smoke. For a man of his attainments he was not a great reader except of the daily and home papers, and I look back with surprise at the few books which adorned his bungalow. In his own bedroom, which I never knew anyone but the servant to enter, it may have been different, though I think not. But on the other hand he was a most industrious writer of letters of business and of war, and he kept a copy of all that he wrote in his "manifold-writer," which became a terror to all against whom he had cause of complaint. Indeed so often and so vigorously was his pen turned upon the public officials, including the Assistant Government Agent, on

road and other matters, that it came to be familiarly known as

#### WOOD'S "BATTERY."

Well, in those old times there was one curious circumstance that seemed to be characteristic of all the old men of Uva, namely an aversion amounting to an obstinate refusal to leave their beloved district. Decade upon decade went by and still found them in their places, never having left them; while half the country had in turn visited them in their homes round about that grand old mountain Namunukulakanda, that towers like some guardian angel over the sweet vale and town of Badulla. Without its lake Kandy itself would not be nearly so beautiful, nor can many places in the island be found to equal its calm repose and soothing charm. From a great height, on a spur close to the side of this noble mountain, Wood's bungalow looked down upon this scene, over a lovely foreground and nuddle distance of paddy-fields and native villages, and it too, could easily be discerned from the town. But, alas! for all human aspirations and intentions. In plotting out his bungalow and selecting the site Wood had projected a long façade whose whitened front should shine a conspicuous object in the view from the town, and be a standing invitation and guide to all strangers to visit it. Mighty stones were collected and the *long* foundation was laid, and then behind a room was built well to the right to serve for the kitchen. Into this room Wood went temporarily, and as time went on one room after another was added to this "kitchen" till it assumed the comfort and dimensions of the permanent abode which it became; and, doubtless, the foundation of the *projected* bungalow remains to this day, a mystery to the uninitiated, and a monument to Wood's intention, if not to his procrastination? But the time came at last when Wood was destined to be obliged to go on

#### A JOURNEY FROM BADULLA.

Mr. Bannatine, the proprietor, who had been content through all the past years to leave his property in Mr. Wood's sole care, thought he would like to see it before accepting the offer of the Company promoters, and actually arrived in Ceylon for that purpose. He got as far as Nuwara Eliya; but there either his courage or his strength failed him, and after travelling seven thousand miles he refused—on account of the bad roads—to go the remaining forty or fifty miles that still separated him from his splendid property. Poor Wood was much put out by this, and at first flatly refused to go up to Nuwara Eliya; but the proprietor was firm, and he went, only to be told that the contract to sell had been signed. In due course Wood handed over, and the place which had known him so long knew him not again. The proprietor could not have paid a large price for the land, in the first instance, and the estate itself paid for the yearly extensions. Even had he possessed nothing else it would have kept this rich man in affluence all his days, while the man who did the work during long years of expatriation got his bare living and nothing more. So do some men fare in this life.

Mr. Wood's religion hung lightly upon him, as not seldom it does upon those who have been trained too strictly in their youth. But the seeds that had been sown were there, the roots alive without any upper growth; for if Wood had any unreasonable prejudice it was against the parsons. But what he may be said to have lacked in outward show of religious observances he made up in his humanity, in the simplicity of his

character, the loving kindness of his heart, and in his sympathy for all suffering. Never had the coolies a truer friend or one more full of solicitude for them in all their troubles and ailments, and his care for them in sickness would put to shame the ostentatious, officious benevolence of these later times. He never did any man a wrong knowingly, and was always far readier to give than to receive. For long years he enjoyed robust and never-failing health, but a time came at last when this failed him, and he certainly did not make a good patient. He was impatient of bodily weakness, and to this was added the real fear of death, and a concern for his "soul." He did not hesitate to talk to me about his thoughts, and I fear I gave him inadequate consolation. But he recovered. On another occasion when he fell ill, the rumour spread that he was dead; and without waiting to hear confirmation of the report, the planters came into town to attend his funeral, for he was much respected by all. Imagine their surprise, to say nothing of his own, to see him appear in their midst almost as well as ever. And so their mourning was turned into joy, and a big feast followed.

As a planter Mr. Wood was not afraid of being singular, and of doing things not known to or approved by his neighbours. He was the father of "dibbling" in Ceylon, and after his time not many holes were cut in the rich Uva soil for planting coffee. He did not use the alavangas or spade-bars, which afterwards became so universal, but long poles, eight or nine feet long, newly cut from the jungle, one or more coolies being told off to keep them sharp and serviceable with wette-katties. If any reader feels inclined to laugh at this, let me recommend him to try them first and he will probably laugh no longer, for many are the acres of coffee I have planted by these poles, and much of that coffee is lingering still and the last to succumb. I do not mean to say the poles had anything to do with that fact; but that the clearings were efficiently planted is thereby proved. Another fad of his was to plant all his roadsides up with guinea-grass, and none in the ravines. With this grass he not only fed his cattle and horses, but thatched his lines and buildings also. Then, as there was a large new clearing every year, the whole of it was planted with Indian corn of which always a rich crop was harvested for horses, fowl and cattle. He always made his own castor-oil, too, and along roads where cattle passed, they were offered a good hedge of roses to eat instead of the coffee.

His servant was an old Portuguese man, the only one of the kind I have ever known. Anything approaching a smile was never known to light up John's face. Sometimes, after he had been with Mr. Wood for twenty years or more, his master would complain that this or that was cracked or broken. "Twas done before I came, sir" was the never-failing answer of John.

Mr. Wood, of course, had not left himself wholly without means. He had a sum invested to yield him a moderate income; and had, besides, a modest accumulation of interest in the hands of his friends at home, for while still young a wealthy relative had left him a small annuity. Instead of going home to England he was content to live on this income retired in the neighbourhood of Badulla, which locality it appears nothing could induce him to leave. He was found dead one day, on the roadside, having fallen from his horse; and now he lies at rest in the pretty graveyard under the shadow of his beloved mountain, and within sight of the estate so long associated with his name.

We had difficulty in getting any photograph of Thomas Wood and had at last to fall back on a rather faded portrait, taken with one of his "Sinna Durais", now a well-known planter, who writes as follows to us on seeing the collotype (which was with difficulty reproduced) and in reminiscence of his old superior:—

"The collotype is very good considering the poor picture the artist had to go by. The photo was taken early in 1866. Coffee planting in 1864, the year I was at Spring Valley, did not differ from later days. Only, on that estate. Wood followed the West Indian way, and planted Indian corn between the lines of young coffee. Watchmen were put on to guard it, when it began to ripen. There was some difficulty in finding a market for such a quantity, but in the famine year they scored, by issuing it to the coolies. I remember a gang of coolies were constantly employed in pulling stumps in the jungle—plants grown from monkey coffee. These were sent to Madulsima which was then being opened. This may have been one cause of the origin of leaf-disease. The young coffee 2 to 3 years old on Spring Valley gave from 10 to 12 cwt. per acre."

## RUBBER:

### SOME RECENT DEVELOPMENTS IN RUBBER-CULTIVATION.

During a trip of several months through the old rubber-producing regions of Central America and the northern states of South America, I found a great interest in rubber cultivation, and preparations were being made to start very considerable undertakings, particularly in the British West Indies, where the fact that rubber never has been indigenous to those islands is not considered in the enthusiasm of the people. On the island of Trinidad I found this enthusiasm increased to a substantial boom. Rubber seeds were selling at five cents each, and young trees were wanted at fifty cents, though owners were refusing to sell year-old trees about two feet high for less than a dollar a piece. It was reported that two English companies were about to begin operations in Trinidad and were proposing to invest a combined capital of \$5,000,000, while private enterprise would probably bring \$2,000,000 more to the island, making a total of \$7,000,000 prospective capital to be invested in that one locality. Other islands were becoming interested. In Grenada seeds were in demand, with the prospect that a very considerable acreage will be set out.

The most interesting point under discussion in relation to rubber-planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of the *Castilloa elastica*. It has been found that seeds sown broadcast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory where, with ordinary machinery operating a simple process, 8 per cent. of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates, and not from remote forests as at present. A series of

experiments has shown that the young tree contains about 8 per cent. of rubber, which would at present prices return an estimated profit of \$200 to \$400 per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.

*Castilloa elastica* will grow almost anywhere, but it will yield a profitable flow of milk only under favourable conditions, and these conditions are dependent on the geological formations and topographical features surrounding the trees. To form an opinion in regard to these matters requires an economic geologist of some skill, and because of the fact the greatest losses will be made, for, as it is in mining and kindred enterprises requiring technique skill, uninformed people always considered themselves competent to judge and most of them will have no use for the trained observer. As rubber-trees will grow almost anywhere, and as the period of waiting before a crop can be expected is a long one, the successes that some will make afford an example on which to secure money and lose it to the profit of promoters and their associates who will claim to be thoroughly posted and to control lands that fulfill every requirement.

By forestry cultivation I mean the care of rubber trees in their natural forests, assisting nature to reproduce them; by husbandry I mean the cultivation of rubber-trees in plantations and an attempt to force them under conditions different from their natural surroundings.

Opinions in regard to suitable rubber lands vary to an unusual extent. This is because many observers have noted one species of rubber-producing tree and its special surroundings, but have never noted all the conditions common to the several species. In America rubber is mostly produced from *Castilloa elastica*, and several species of *Hevea*, each of which is found under quite distinctive surroundings. As a result, general opinions on rubber lands, are three times differently expressed. One man will feel assured that rubber to be successful must be planted on land that is inundated a few feet at least once a year; another will say that low ground near a wet swampy country is the only available locality; while still another will talk of the medium upland country as the most promising.

These are widely different opinions, yet each is correct. Some species of *Hevea* do best on low ground that is subject to slight annual floods. Other species of the tree thrive over low, rich woodlands just beyond the reach of floods. *Castilloa elastica* does well on the foot hills wherever there is a rich, clean soil and abundant water. It is also found in low, swampy ground, but amid such surroundings does not yield as fine rubber as in the healthier localities.

Rubber is taken from a number of trees and vines, but the species that I have noted yield the commercial supplies of America; of these *Castilloa elastica* is of the most interest to people who think of planting, because it does well on healthy ground where a man from the temperate regions can expect to live and see his trees develop.

The proper land should be clean, rich, and abundantly watered, with a good drainage. Such lands give the best returns. The trees grow abundantly on low unhealthy lands, but do not yield so good a quality of rubber, for which reason if one proposes to cultivate it is well to have the best, and on this much will depend, for it will have an important bearing on results. Of the two methods of cultivation that are being tried little has been done with forestry as yet, but the few experiments that have been almost universally successful and promise important developments for the future. Husbandry so far has not been a great success, and in many places rubber-trees have been carefully planted and tended for a long term of years but have not given any returns, though it is claimed that some of the trees are twenty to forty years old,

The claims in favor of husbandry are that a great number of trees can be planted on one acre, and that all are within easy reach, while better returns can be expected from cultivation than from the natural conditions of the forest. It must be borne in mind, however, that *Castilloa elastica* is a tree of the shade, and that the flow of sap, and not beautiful proportions or an abundant yield of fruit is the object sought. Another important point is that the tree has a comparatively tender bark in the shady woods, which in an open cultivation becomes much heavier as a protection against the sun and dry air at the expense of the flow of sap, and the provisions of nature which permit the tree to grow anywhere defeat the objects of the planter and makes rubber-cultivation a doubtful undertaking. Hence in many cases the thousands of dollars that are being invested in such enterprises will be the source of grievous disappointment. On the other hand, a careful selection of a run of forest property where rubber-trees reproduce themselves naturally, must yield returns that will surprise even the most sanguine expectations.

*Castilloa elastica* reproduces itself freely. It has been compared to the pine—a slow-growing tree which does not propagate itself rapidly. It should, however, be compared with the chestnut of our northern forests. If a stretch of well-situated land were allowed to grow up wild here at the north, it is certain there would be a fair proportion of chestnut-trees that would probably come up on the property. If, besides these natural results one or two camps were established on the place and a few men were kept working about through the woods planting chestnuts and looking after the trees, it is certain that the care and attention would result in a heavy percentage in favor of the planter. Similar results can be expected in the tropical forest, using the same methods but substituting the care of rubber-trees for the chestnut-trees that I have taken as an illustration.

I have noted strong evidence in the tropical forests that rubber-trees will reproduce themselves whenever the locality is naturally adapted to such reproduction, and with a little care such as could be given by three to ten men according to the size of the property taken in hand the results will be beyond the most sanguine expectations. The great question is to secure a good run of healthy forest land in a suitable location. This being done, but little more is required. A few ordinary laboring-men and the investment of a small amount each year will after a time return thousands annually. In the forests the rubber-tree can be relied on to produce an abundant flow of sap. In open cultivation it must protect itself from the sun and dry air, and the results are doubtful, though some well-situated plantations will certainly yield bountifully. Another important point is that forest land is cheap in most rubber countries, and it is no object to secure a maximum yield from a given amount of land. The object should be a minimum cost of production without regard to the amount of land employed.

After having travelled through all the desirable rubber regions in Central America and northern South America, I am satisfied that suitable tropical forests which can now be had at a low price—often for a few cents an acre—present an opportunity for the profitable employment of capital such as has seldom been offered in the world's history, but the serious point is to secure the proper land. Those who acquire it will have more than they expect, but natural rubber lands are not to be had by simply making a chance location. Though the tree will grow almost anywhere, it is only the most favored spots that will yield those spontaneous returns that are so very profitable. It is fair to state that if people go to taking up tropical forests promiscuously ten will be disappointed to every one who secures a prize.—*India-rubber World*.

## NOTES ON COFFEE IN AND FOR CENTRAL AFRICA.

Now that the sale of Shire Highland Coffee has closed in the London Markets for the season, several inquiries have been received regarding it. One is: "How do you account for the superior flavour and delicate colouring of the first class samples of coffee sent from the Shire Highlands?" I have no hesitation in answering that this is due to the purity of the water used in pulping and preparing, and to the careful personal supervision of European planters from the gathering of the berries to the packing of the coffee for exportation.

It is not merely a matter of soil. No soil could be better fitted for the growth of coffee in perfection than that of Guatemala, Bolivia, Colombia, or Brazil; but in neither of those countries have you a water supply of such genuine purity as that of the Shire Highlands. Take for instance the three great coffee estates at Zomba, viz, Messrs. Buchanan Brothers, at Mlungusi; Messrs. Hynde & Stark of Singers and Messrs. Sharrer & Co. of Chemlumbes. The rivers that run through these estates take their rise in Mount Zomba, and there are no native dwellings in the basins to taint the water. The pulping is done on the banks of these rivers, and the water in the mill race is so clear and pure that Europeans drink it without filtering. The same may be said of the Manje water supply. Nothing could be more perfect. If possible, it is even better than the supply on the Zomba estates, while at Cholo and Namasi the water supply is equally good. This fact should be made widely known, as it gives confidence to the consumer to know that the very purest water has been used in pulping the coffee.

Another matter of great importance is the personal supervision of the European owner. In the Shire Highlands the owner has generally only a small estate, and is always present to see that everything in connection with the coffee is scrupulously clean. In Brazil and other countries, on the contrary, we are told that the owner seldom if ever visits the coffee estate—his business being principally in connection with the rate of exchange and the current prices in the London market. The home consumer can hardly form an idea of the extent to which planters in this country carry their supervision. A personal visit to the estates at pulping time could alone convince them of the efforts made to perform all the processes with perfect cleanliness. Not only in the pulping, but in the curing and drying on the bamboo benches, the packing and sorting,—in fact everything connected with it. Under these circumstances it is not surprising to hear that many English families buy Shire Highland coffee in preference to all others.

**BOLIVIA.**—Next to the Shire Highlands, it is said that the best coffee in the world is grown in the province of Yungas, which is situated to the northeast of La Paz. The quantity however is inconsiderable, being hardly more than sufficient for the planters' own wants.

**GUATEMALA.**—The coffee industry has long been established in Guatemala, and last season's export totalled 68,773,633 lbs. of which about half was sent to market in husk. Every country in Europe got some of this crop, with the exception of Spain, but then Spain has coffee growing colonies of her own, or instance, Porto Rico, and she gets the bulk of her requirements from them. Britain might do well to follow her example and patronise her own young colonies a little more than she does, especially as Britain goes to heavy expense in lives and money to bring some of them into existence and maintain them till they are self-supporting. According to the reports issued by the Foreign Office, England figures as a buyer in all the coffee markets of the world.

**LOANDA.**—Planters are said to be extending their coffee plantations, but the great fall in the European markets has been very discouraging to them. The larger part of the coffee brought in is grown by natives.

**MEXICO.**—The planters around Vera Cruz gather their crop between December and April, but then

it must be remembered that they are distant from British Central Africa from 30 degrees of latitude. Last season's out-put amounted to 11,463 tons valued at £310,330.

In many localities the trees are attacked by an insect of the genus "dactylopius" known in some parts as the "mealy bug," which does not seem to have raised much alarm amongst planters. In some places the diseased trees are simply cut down and replaced by others, while a few planters destroy the insect by syringing with petroleum and soap. It seems that this disease is worst in wet seasons and has been known to cause considerable local loss. It spreads from tree to tree, and threatens, if neglected, to become some day a matter for serious consideration.

**BRAZIL.**—The coffee production of Brazil would require a separate notice. I can only mention here that the total output for last season was 7,330,806 bags, *i.e.* including both Rio and Santos. There is a general complaint from Rio of the fall in prices. The farmers have gone in for coffee cultivation alone, and their output is so enormous that they have affected the universal rate. They still realise 80 per cent on the cost of production, and if this return is not adequate to the requirements of the planters, the cause must be found in the maladministration of the estates, few of which are personally superintended by their owners. It has been argued that the recent low prices will eventually be a blessing rather than a misfortune, inasmuch as the greater cheapness of coffee, by bringing it within the purchasing power of even the poorest classes, will tend to make it an article of general consumption, by which the demand will be extensively and permanently increased.

There is one thing we might learn from the lesson of Brazil, *viz.* that coffee planters should not go in for the exclusive cultivation of any one crop. By so doing the supply is increased, and this has a tendency to lower the price, the demand remaining the same; whereas the advent of disease would be utter ruin to many. Farther, you become dependent on the outside world for almost everything else. For instance, we import tobacco into British Central Africa, although British Central Africa is the natural home of the Tobacco plant and could grow enough tobacco to supply half Europe. The same could be said of sugar, wheat, and many other crops.

**HONOLULU.**—The amount of coffee exported is falling off, and last season's output very little exceeded 120,000 lbs.

**SAMOA.**—A new coffee Company has just leased some of the best coffee land in Samoa, but it is feared that the clearing, and keeping clear, will prove too costly.

**PORRO RICO.**—The value of last season's crop amounted to £2,382,608. Of the total export Spain took 5,568 tons.

**MEXICO.**—The sudden development of the Coffee industry in Mexico is ascribable to the coincidence of the increase in the price of coffee in the United States with the decrease in the cost of labour in Mexico, consequent on the depreciation of the silver dollar which called the attention of investors to the large profits to be made by its cultivation. The export for last season was 334,059 cwts, valued in the returns at £1: 3: 9 per cwt. Nine-tenths of the whole export went to the United States.

**MARTINIQUE.**—I have received nothing later than the report for 1896. The export then was 3,124 kilos, just the same as on several previous occasions. The "Liberian" and "Mocha" are extensively cultivated.

**PERU.**—Reports from Callao state that the cultivation of coffee is on the increase there, and that it bids to become one of Peru's staple articles. The latest figures available show that the export for 1896 was about 1,066 tons.

**PANAMA.**—The coffee exported during 1896 was valued at £987,192. Growers felt a certain degree of uneasiness on account of the depression in prices which has been experienced since the early part of last year. This depression is attributed to the enormous amount of coffee exported from the Brazils.

**COLOMBIA.**—The estimated export of coffee last season was just under 37,000 tons. This is a vast yield of coffee and considering the distance of the estates from the sea, some 800 miles from the seaport Savanilla, credit is due to the enterprising planters.

The River Magdalena, with several of its tributaries, afford to a large extent the means of transport to Honda. the produce is carried by mules from the mountain slopes to the river, thence in rafts down the current to Honda, from 3 to 5 days' journey. From Honda, whence also is shipped the produce from the great coffee-growing province of Cundinamarca, the coffee is conveyed by steamers, and two short railway routes, to the sea—600 miles. Independently of the Upper Magdalena and its tributaries, many thousands of mule-loads of coffee are annually brought to Honda, partly from Tolima, but chiefly from Cundinamarca, thus from 3 to 5 days' journey to Honda only. The cost of transport from the plantation to the coast amounts in English money from £9. 6s. 8d. to £14. per ton, a very heavy item. In this connection it may also be mentioned that from several of the large growing coffee provinces of the Republic the cost of transport is still higher.

Notwithstanding the great difficulties appertaining to distance from the sea, and the consequent cost of transport, the Tolima planters are quite able to compete with planters in far more favourably situated countries, which are in a position to transport coffee to their seaports at a comparatively trifling cost. Magnificent land abounds on the colossal Andes most admirably adapted for the cultivation. Well cultivated plantations on these Cordilleras are unsurpassed by those of any other country, and this observation applies not only to the quality of the produce, but also to the quantity. Land is obtainable, in general, at a nominal cost; and it is available to a large extent though, it may be mentioned, in the adjoining department of Cundinamarca, where great enthusiasm prevails relative to coffee cultivation, and where it is being much more extensively planted than in Tolima, the price of the more conveniently located sites for plantations has augmented very materially; indeed, as much as 40 and 50 dol. (paper currency), says £2. 13s., to £3. 7s., at exchange now ruling of 15 dol. to £1. per hectare (2½ acres) is now paid.

The extension of this cultivation in Tolima, and this applies to the whole country, is in general confined to districts accessible to settlements or villages. More remotely removed from populated districts widely extending mountain slopes, eminently fitted for coffee, remain in a state of nature. It may also be noted that the quality of the labour itself is satisfactory, for it is on the whole industrious and intelligent 80 c. (about 1s.) per day Colombian currency, are the average wages for peons, and for women about 50 c. (about 8d.).

As regards the productive capabilities of these Cordilleras, coupled with the labour resources, *i.e.* where it is sufficiently abundant it may be stated that the cost of coffee production at the plantation ranges from 30 to 35 dol. per mule-load of 250 lb., or from 12 to 14 dol., Colombian currency, per 100 lb. With the rate of exchange which has prevailed during several years (1 dol. ruling rather less than 2s.), this shows that planters are acquiring enormous profits. With money at par the nominal cost of production would be about the same, although in reality the price measured in gold would have much more than doubled. It should, therefore, be remembered that the depreciation of Colombian currency must be attributed in a great measure to the rapid expansion of the coffee industry. At the same time exceptionally high prices for the article have ruled during recent years, a result partly due to the abolition of slavery, in coffee-growing countries, and partly to the revolutionary movements in Brazil, where coffee is grown on a gigantic scale. Now that coffee has become a stable industry of Colombia there can be no doubt that the country is able to maintain a prominent position among all rivals.

**METHOD OF PLANTING.**—The number of coffee trees planted per hectare (2½ acres) in Colombia averages about 1,500. The general average yield per tree per annum on well-kept plantations is 1½ lb., or 2,250 lb. per hectare—900 lb. per acre. On many other plantations the average yearly crop does not exceed 1 lb. per tree—600 lb. per acre. Thus the number of trees planted per acre in this country strikingly contrasts with the number planted in British Colonies, where twice as many are planted per acre, notwithstanding heavier crops are secured in Colombia. In the palmy days coffee cultivation in Ceylon the average was 5 cwt. per acre.

**SHADE.**—One of the chief elements of success appertaining to this cultivation in Colombia must be assigned to the systematic inter-planting of shade-trees with the coffee. At altitudes ranging from 3,000 to 5,000 feet more densely-foliaged shade-trees are employed than is the case at plantations between 5,000 and 6,000 feet, where a slender shade is afforded by a species of *Cassia*. The shade-trees utilised at plantations situated between 3,000 and 5,000 feet are a species of *Erythrina*, and another leguminous tree, a species of *Inga*, which latter is becoming very generally adopted by planters. Some people strongly recommend this *Inga* for adoption by British colonial coffee planters, as it is most admirably adapted for the purpose. It grows rapidly, and the large compound leaves fall abundantly at the season in which the plantation requires the least degree of shade, whilst the abundance of fallen leaves from this tree check in a very marked manner the irrepressible growth of weeds. Moreover the general result of the beneficial influence of this congenial shade reduces to a minimum all cultural expenses; indeed, it may be safely computed that the good offices of this tree curtail the cost of actual cultivation to the extent of some 50 per cent. as compared with coffee devoid of shade. It is a remarkable fact that British colonial coffee planters have in the main ignored the application of shade to the coffee tree. Without shade the tree certainly flourishes, but its full exposure to the sun, at any rate as the sun is wont to shine here, is detrimental in the long run to its most congenial state of productiveness. However, near the upper limit of the cultivation, namely from 5,000 to 6,000 feet, shade is not to be recommended.

From the foregoing it will be seen that Colombia is making rapid strides in coffee cultivation and the strides are so remarkable that it already produces about two-thirds as much coffee as all British Colonies and possessions combined.

On the whole, after a careful consideration of the coffee production of the world, one comes to the conclusion that there is a downward tendency in prices, and that the quantity thrown on the market is very considerably increased from year to year. There is no means of finding out whether the number of consumers increases in the same ratio, because the humble customers of retail dealers are beyond the scope of Government returns. It is clear, however, that there is either an increase in the number of consumers or that the consumers use more than they formerly did,—both amounting to the same thing, *viz.* the absorption of the quantity produced.

The fall in price however refers to the medium qualities, and cannot affect the coffee planters of the Shire Highlands whose aim is to produce the very best of coffee.—*British Central Africa Gazette.*

**ONE WAY TO ADVERTISE TEA.**—The United Kingdom Tea Company (Limited) thus place their wares before the British public:—

The Revolutionizers of the Tea Trade. Tea Merchants to H.R.H. the Prince of Wales. Tea Merchants to the House of Commons. Tea Merchants to upwards of 1,000 Hotels. Superb Tea! Direct from the Growers. The best that money can buy. At prices effecting an immense saving. Write for samples.

### GUATEMALA COFFEE.

A report on the trade and finance of Guatemala, by Mr. Consul C.H.M. Trayner, received at the British Foreign Office in June, and partly printed in the *London Grocer*, states that the year 1897 was an unsatisfactory one in Guatemala from a commercial point of view. The export of coffee—the sole form of wealth which the country possesses—did indeed increase, but the price obtained abroad had diminished in a much greater degree, and although something like 130,000 quintals more were exported, the receipts were less by about \$4,000,000 gold than during the preceding year. The tropical situation of the country, the proximity of every portion to the sea on both coasts, the diversity of altitude and consequently of temperature combine to make the agricultural capabilities of Guatemala equal to any in the world. Every kind of crop, from those of the tropical coast regions to those of the cold highlands (the latter having a climate corresponding with that of Northern Europe in summer), may be raised. There are districts where even four crops of maize are obtained in one year. At the present time the cultivation of coffee absorbs the attention of almost all the landowners, for until the past year the high price at which Guatemala coffee was quoted abroad, stimulated the planting of many large coffee plantations. The principal districts of the coffee-growing industry are found in the departments of Quezaltenango, San Marcos, Chimaltenango, Santa Rosa, Retalhulen, Escuintla, Zacapa and Alta Vera Paz. The conditions essential for the growth of coffee are, in this latitude, an altitude of from 2,600 feet to 4,500 feet above the sea level, a considerable depth of vegetable soil and a clay subsoil. Lands of this description are found in almost every department of the Republic. The coffee tree is easily cultivated. The young trees are planted in little pits about fifty centims. deep, and at a distance of about 1½ metres from each other. Every three months the plantation needs thinning out, and the first harvest is obtained the third or fourth year after planting the trees. The cost of a coffee plantation and the profits which it yields are not easy to state accurately, and are estimated very differently by different persons. There has not been much change in the cost of raising coffee or its yields in the last twenty years. On March 21 of this year (1898) a petition on behalf of the coffee planters was presented to the National Assembly asking that the export dues on this product (about \$3,65c per quintal) be abolished, pointing out that the low price of coffee now current abroad makes it impossible to compete with Brazilian and other foreign coffee, and that as the contract assigning a certain portion of this tax to the Northern Railroad lapses in May, neither government nor railroad would lose by such a measure, as it had practically been determined to sell the concession for the new part of the railroad, along with the part already built to foreign contractors. The result has been that a decree has recently been issued lowering the export tax on coffee to \$1 silver per quintal.—*American Grocer.*

**A "CORNER" IN FRUIT.**—Whence comes all the fruit now meeting with so ready a sale in London streets, and at so cheap a rate? Every nochin with a half-penny or a penny to spare can regale himself with wholesome fruit from the Continent, Spain, America, or from English Orchards. There is just now a little "corner" in the Farringdon Road, between the Metropolitan Railway-station and the Corporation Fruit and Fish Market, where Covent Garden is represented in miniature. It is a great place for youngsters. Plums sell here at from 1½d. to 4d. per lb., Pears at 1d. to 4d., Apples 1d. to 3d., Oranges at two for 1½d., English Grapes may be had from 8d. per lb., and foreign Grapes from 3d. to 6d. per lb.; Bananas meet a ready sale at 1d. each, or seven for 6d.; fine Damsons are sold from 2d. per lb. If some vegetables are scarce or dear, there is an abundance of wholesome fruit.—*Gardeners' Chronicle.*

## PLANTING IN NORTHERN DISTRICTS:

KNUCKLES, &amp;c.

CACAO—FREE RICE—WEATHER AND COOLIES—

PLUMBAGO—ROADS—LANTANA BUG—

SANITARY REFORM.

*(Communicated.)*

Cacao is a thing that few people like to speak much of. If you press for information, "Well, there is not much disease about here," is what you are told, and are asked "Have you seen it in Dumbara"? You meet another fellow and you pose him with the question: "Have you seen the cacao in Dumbara"? "Oh! that's the result of the drought" says he—high and mighty—and later on, in the same keen pursuit of knowledge, you try a second man with how the drought has killed out the cacao in Dumbara, and he evidently regards you as a kind of idiot. "Drought!" he exclaims. Then putting his hand to his mouth, he says in a mysterious stage whisper,—"It's something—echo!" And the Government is doing what? But is the latter more supine than the planters themselves? Only a few here and there make a stir; the rest sit still. All the same the existence of cacao is threatened and the whole enterprise is at hazard. There is a cape to be doubled, and with dirty weather about, the man who is most likely to succeed in rounding it, Carruthers, is sent about his business at the critical time! "What a world we live in!"

It is quite as bad with the case for "Free Rice." The apathy about, regarding this subject, is simply amazing. People *won't* put themselves to the trouble to understand it and with the clear and able expositions which have appeared in the leader and other columns of the *Observer*, ignorance now is inexcusable. If you tell them how much they themselves pay, *then*, there is a flare up. You want a lot of that and there will be the blaze by-and-bye. Meanwhile, that big soulless stolid thing—the Government—has got to be made to move. "Dah, dah!" you keep crying, and probe it up with another leader, pointed with the unanswerable figures and facts; but it is a weary business. Let the cry of "help for the poor" fill the land, and even *our* authorities will feel ashamed of themselves in time—anyhow it will reach sympathetic ears at home and also willing hearts. Your constant hammer-and-tongs style is just the thing that is wanted. "The *Observer* keeps harping on the one string," is what is said. Exactly; and therein lies its wisdom, Mr. Editor. You remember what John Morley says in his "Life of Cobden":—"A political or religious agitator must not be afraid of incessant repetition. Repetition is his most effective instrument. The fastidiousness which is proper to literature, and which makes a man dread to say the same thing twice, is in the field of propagandism mere impotency." Why, oh! why, did John Morley forsake letters for politics?

If the Knuckles have been dry this year, it is not dry there now. It rains pretty steadily, and blows vigorously, like the burst of the S.-W. rather than its going out. The result is that flush has retired, and the drooping returns, which in August and September were looking up a bit, are back to where they were. Only on manured and lately pruned tea, are any decent flushes to be got; the rest is looking about

for a sun which never shines now, and will dance to no measure till it appears. The coolies are not hard worked—too many of them. There was short time during the drought which lasted so long, and to have short time now that the rain has come, is a little like having your disadvantages pressed down and overflowing—"rubbed in" in fact. Ramasami is not the only one who has been subjected to this style of massage. It seems, however, to have had a fine humbling effect upon him, and his old cry, when his wishes for more advances were disregarded, of "Give me my tundu," has died wholly out of the land. If you want now to tame the wildest Tamil on the estate, you have only got to touch him up with the *threat* of a "tundu"—to write one out!—then your office is besieged with pleaders, who can't say enough about the temerity and folly of the man who in those days lets a "tundu" see the light. The whirl-gig of time does bring round some strange revenges! [But are these coolies likely to return to Ceylon once they get to the Coast?—ED. T.A.]

The hunt for PLUMBAGO, which has been stimulated by the late high prices, is hot all about; and I did hear of one planter who had struck a vein, which may yield a lot yet. Mining is generally classed among the most speculative of pursuits, but tropical agriculture takes a lot to beat it. A fellow who has the two combined need not complain of existence being hum-drum! If the tide is running in, he may soon be floated on to fortune; but if it begins to turn, it may be "a tide as moving seems asleep," but it is dead certain to keep *him* lively anyhow, and would not take long about it either.

It is a comfort to know that the KNUCKLES ROAD is now very much better than it was and when the repairs in progress are completed it will be, while driving over it, like a glimpse of "the days of old."

The lantana bug is making its way about in quite a pronounced way: I saw it as far up the road as Panwila. It may have no heritage of bother for the planter, but—I don't like the look of it. For a bug, it has in a very short time taken quite a position in the landscape—come to stay evidently. It resembles the American pill that did not fool around, but went straight to business. I hope it will mind its own business and leave the planters alone.

These are great days of SANITARY REFORM, and the doctors, when they want to be down on a bad spot, emphasize their opinions by signing themselves as the holders of this or that sanitary diploma. Everybody is on the *qui vive*, and it would seem as if officialdom were bitten to make *other folks* clean up. You remember the old days, when estate lines were condemned freely which might have posed as models for those owned by the Government. This sort of thing still obtains—evidently. Witness the sanitary condition of the Wattegama Resthouse. I knew it in the days of old; they say it is not improved and complaints have gone in to Government, that it is too bad for anything. And yet nothing has been done to remedy it. The story further goes that a prominent official went out to see what all the noise was about. Placing his hand on the shoulder of the Resthouse-keeper, "Francis," said this wiseacre, "you know the planters *will* complain."

I don't know how much there is in the above, but it is what one hears said, and *per se* is not incredible.

## THE TEA CRISIS AND HOW TO MEET IT.

We are in receipt of the following interesting and practical expression of opinion from a well-known member of the planting community:—

Just now I think we are on the verge of a serious crisis, owing to the London buyers' combination—for I believe it to be nothing else,—which is now keeping down the price of our teas. They need not have lowered the prices as they have done. It is our business now to do all we can to find other markets, and thus lessen the quantity for them to handle. Every planter ought to do his utmost in this direction and the time may come when the tea-grower will reap a fair share of the profits with the others who handle it before it reaches the consumer. I think the question how can we best push our teas into new countries of far more importance to us planters than the reduction of the duty on rice. Take this estate, say I get 5,000 bushels of rice a year plus 15c half duty=R750. Take my crop 220,000 lb. tea; if by opening new markets London prices go up one cent per lb.=R2,200. The benefit being to the estate and the coolies will share, whereas the consumer ought to get the benefit of the reduction of the rice duty in the first instance. Remember I am quite with you that the rice tax should be reduced if it cannot be abolished, but there is at least this one thing of far more importance to us at the present time which I should like to see you take up with as much zeal as you show in the matter of the Rice Duty.

We are in entire sympathy with the views above expressed and more particularly because they, in reality, do not clash with those we hold in reference to the Rice Duty as the one above all other local levies calling for attention, first, on account of its manifest injustice, and secondly, because it is the only tax whose reduction and removal would benefit colonists and natives alike. It is impossible to say that the interest of planters in this matter is not identical with that of their coolies or that all classes of employees are not benefited by remission of taxation which better the condition of the labouring classes.

At the same time, we quite see the force of the argument of our correspondent about the great benefit to the tea industry from the campaign to push the sale of our teas in new countries being energetically advanced. This is a matter the planters have in their own hands through their representative Committee; and we believe there is no lack of funds; but it does seem a pity that the "cess" should be taken for anything but "the campaign" for which it was specially started. In a year when the Government are likely to have a surplus of a million of rupees—following on one of R2,300,000—it surely would not be too much to expect the necessary outlay for Mr. Kelway's uber's investigation and the Coolgardie Exhibition to come out of such surplus. Had this been done there would have been well nigh R23,000 more to spend in pushing our teas on the European Continent, and in Russia and Germany more especially.

"THE AGRICULTURAL MAGAZINE," COLONBO.—Oct., 1898. Contents:—Season Reports for August; Rain-fall taken at the School of Agriculture during the month of August, 1893; Kekuna Oil; Occasional Notes; The Plantain Tree and its Products; Citronella Oil; The Cultivation of Chillies; The Analysis of Soil as a Guide to its Fertility; The Uses of Wood; A Disease of the Plantain Tree; How India has Saved Her Forests; Cattle and their Management in the Interior.

## CASTOR OIL MANUFACTURE.

The seeds are first cleansed from dust and fragments of the capsules, and submitted to a gentle heat, not greater than can be borne by the hand, which is intended to make the oil more fluid and more easily expressed. A whitish oily fluid is thus obtained, which is boiled with a large quantity of water, and all impurities are skimmed off as they rise to the surface; the water dissolves the mucilage and starch and the albumen is coagulated by the heat, thus forming a layer between the oil and the water: the clear oil is then removed and boiled with a small quantity of water until aqueous vapour ceases to rise, and a small quantity taken out in a phial remains perfectly transparent and cool. The effect of this is to clarify the oil and rid it of volatile acid matter. Care is necessary not to carry the heat too far, as the oil would acquire a brownish colour and an acid taste. In India the seed is first shelled and then crushed between rollers placed in hempen clothes, and pressed. The oil is afterwards heated with water in a tin boiler until the water boils. This serves to separate the mucilage and albumen, the product being then strained through flannel and put into canisters. Any oily-press would suffice for extracting oil for ordinary purposes, and by decantation and some process of filtration it would be purified.

The use of castor oil as a lubricant for the cylinders of locomotives and other steam-driven engines creates a market for the product if the quantity is equal to the imported article. For use medicinally the oil is cold drawn, and is only fitted for a medicine in that form.

The plant itself is easily cultivated, it requires little care, is hardy, and is said to enhance the value of the land on which it has been grown. It is said that locusts are killed by eating the leaves, and this is quoted as a reason for planting the shrub around paddocks and cultivated land in districts infested by locusts. Cattle should be kept from the plant, as in times of scarcity the green leaves might prove tempting to them, and the effect would probably be that the animals would be seriously affected, if not actually killed. Judging by the reported luxuriance with which the plant grows in the Esperance district, the extraction of the oil should be profitable industry. *Queensland Agricultural Journal.*

## PLANTING NOTES.

BRAZIL COFFEE NOTES.—There is much complaint of drought in the state of Rio de Janeiro. In many localities the food crops are a total failure. Many coffee trees have died and others have suffered so much that they will not bear next year.—*Rio News*, Sept. 6.

THE "QUEENSLAND AGRICULTURE JOURNAL," issued by direction of the Hon. the Secretary for Agriculture. Edited by A. J. Boyd, F.R.C.S.Q., Vol. III; Part 8, for September, has for contents:—Agriculture; Dairying; Poultry; The Orchard; Viticulture; Botany, Economic Botany; Apiculture; Horticulture; Tropical Industries; Gutta-percha—Its History, Rubber Cultivation in Australia, India-rubber and Other Produce, Coffee at Buderin Mountain, Coffee-picking in Queensland, Coffee in British Central Africa, Liberian Coffee and Insect Pests, Coffee Notes, and Growing and Separation of Fiber, North Queensland; Science; Animal Pathology; Tick fever; Pisciculture; and General Notes.

TEA BLIGHTS.—We some time ago called the attention of our tea planters to the "Grey and Blister Blights" of Assam and to the need of being on the watch for diseased leaves and burning them as well as prunings. Messrs. Wills and Carruthers are likely very soon to emphasize this counsel, in more detail; but it is satisfactory to know that both authorities do not think much of what they have seen of any fungus on tea in Ceylon so far.

CONSOLIDATED ESTATES COMPANY, LIMITED.

SEVENTH ANNUAL REPORT.

Authorized Capital £100,000; Dividend into 5,000 Preferred Shares of £10 each entitled to a Cumulative Preferential Dividend of 8 per cent, £50,000; 5,000 Ordinary Shares of £10 each, £50,000—total £100,000.

Seventh Annual Report of the General Managers, to be submitted to the Shareholders at the General Meeting, to be held at 34, Great St. Helens, E.C., on Wednesday, the 5th October.

The General Managers have the pleasure to submit their Seventh Annual Report and Balance Sheet together with Statement of Accounts for the Crop Year ending 30th June 1898.

The Profit and Loss Account shows a balance (including £598 3s 3d brought forward from last year) of £4,070 4s 0d, after paying Interest on the Debentures and an Interim Dividend of 4 per cent on the Preferred Shares.

To this sum the General Managers propose to add £250 taken from the Reserve Fund, making a total of £4,320 4s, and to appropriate that amount as follows, viz:—

To pay a Balance Dividend of 4 per cent on the Preferred Shares, making 8 per cent for the whole year which will absorb ... ..	£.	s.	d.
1,200 0 0			
To pay a Dividend of 4 per cent on the New Preferred Shares requiring ..	280	0	0
* To set aside for redemption of 5 per cent of the Debentures at 103 ..	2,000	0	0
To pay a Dividend of 2 per cent on the Old Ordinary Shares, requiring ..	640	0	0
To pay a Dividend of 1 per cent on the New Ordinary Shares, requiring ..	70	0	0
Carrying forward the Balance, viz: ..	70	4	0
	£4,320	4	0

\* By the Articles of Association it is provided that five per cent of the Debentures must be redeemed before any Dividend can be paid on the Ordinary Shares.

The following shows the result of the year's working, viz:—

NET PROCEEDS OF CROP.			
1,250,823 lb. Tea at an average net price of about 6½d. per lb. realized ..	£	s.	d.
32,482 15 10			
Cocoa and Cardamoms ..	905	7	2
Interest on Account ..	86	0	0
	£33,474	12	0

EXPENDITURE ON ESTATES.			
Messrs. Geo. Steuart & Co.'s drafts—R393,070 at an average of 1s. 4 1/16d. per rupee ..	£	s.	d.
26,283 3 0			
Less Capital Expenditure ..	666	13	4
	£25,616	9	8
Less Balance of Coast Advances ..	76	7	8
	£25,540	2	0
Bonus to Supts.—R5,000 at 1s 4 1/32d. ..	333	19	8
	£25,874	1	8
	£47,600	10	4

The Season just over has been a somewhat chequered one; during the first five or six months

the weather was favourable, the tea flushed well, and there seemed to be every prospect of a crop out turn considerably in excess of the estimates. But early in January a severe drought set in which lasted more or less for three months, the flushing was greatly checked and the intake of leaf fell off very materially, so that instead of a surplus, there is a deficiency as compared with the estimates, of about 90,000 lbs., representing a net value of about £2,000 or over 5 per cent. on the Ordinary Share Capital. This deficiency, combined with the high Exchange referred to below, has seriously affected the Company's profits, thereby, unfortunately, necessitating a material reduction in the Dividend on the Ordinary Shares, and even such Dividend has had to be provided to some extent out of the Reserve Fund.

Such a drought as that above referred to is quite unusual in Ceylon and the General Managers do not apprehend a recurrence of it, nevertheless the estimates for the new season have been prepared with caution, and are as follows:—

	Tea.	
	Expenditure.	Crop.
	R.	lb.
Wattegode ..	98,460	350,000
Hoonocotna ..	70,326	240,000
Ellegalla ..	29,453	90,000
Tallagalla ..	56,955	230,000
Waringalla ..	54,311	180,000
Rutland ..	54,671	172,000
Sorana ..	87,493	130,000
Totals R393,659 @ 1/4 =	£26,977 5/4	1,392,000

Also 9,000 lb. Cardamoms and 20 cwt. Cores from Waringalla.

With normal weather a considerable increase on the above Crop Estimate may fairly be looked for.

With regard to Exchange, it will be seen that the average rate (for three months' draft) has been 1s 4 1/16th d, against 1s 3 1/4 last year, viz. a difference of not quite a penny per rupee. The Company's expenditure in Ceylon is about £10,000 rupees and it therefore follows that the loss occasioned by a rise of a penny per rupee would amount to 400,000 pence or £1,666.

The strenuous effort which the Indian Government are making to maintain a high exchange by artificial means is no doubt within the knowledge of the Shareholders. The whole subject is now being inquired into by a Special Indian Currency Committee, whose Report is awaited with some anxiety. The enclosed Memorandum on the subject, prepared a fortnight ago, for the information of Planters in Ceylon and South India may be interesting to the Shareholders.

Since the date of the last Annual Report, the Company has acquired a group of Estates which will henceforth be known as Sorana, regarding which full particulars were given to the Shareholders in the Circular Letter of 23rd November, and at the Meeting held on the 1st December last.

This group adjoins Tallagalla which has hitherto proved one of the Company's most productive and remunerative Estates, and as the conditions on Sorana are almost precisely similar the General Managers have every hope that it will prove an excellent purchase. The Estate was acquired on very moderate terms from a Sinhalese Proprietor, and a good deal of expenditure on buildings, machinery, etc. was necessary to bring it into a thoroughly satisfactory condition; of this expenditure two-thirds have been charged to the Purchase Account and one-third to the Factory and Extension Account.

The following approximate particulars of the Estates now held by the Company will be interesting to the Shareholders:—

Name of Estate.	Ceylon District.	In Cultivation.		
		Fall Bearing.	Partial Bearing.	Recently Planted.
Wattegodde ..	Dimbula ..	800	Nil	Nil
Hoonocotna ..	Kotmale ..	553	6½	25
Tallagalla ..	Kalutara ..	380	65	105
Ellagalla ..	Matale ..	217	3	11
Rutland ..	Hewaheta ..	415½	27	10
Warriagalla ..	Nilambe ..	406	19	153
Sorana ..	Kalutara ..	178	85	236
		2,949½	275½	541
		Reserve Suitable for Tea.	Forest Waste, Water, &c.	Total Acreage.
Wattegodde ..	Dimbula ..	Nil	95	895
Hoonocotna ..	Kotmale ..	45½	132	762
Tallagalla ..	Kalutara ..	106	35	632
Ellagalla ..	Matale ..	13	201	415
Rutland ..	Hewaheta ..	151½	59	663
Warriagalla ..	Nilambe ..	59	624*	1,261
Sorana ..	Kalutara ..	127	95	721
		502	1,211	5,439

\* of which 93 acres are planted with Cardamoms and 40 with Cocoa.

From the foregoing it will be seen that 541 acres of Tea have been planted during the past few years, and during the current season it is proposed to open up 70 acres more, chiefly on Tallagalla and Sorana. When this tea comes into full bearing the position of the company should be greatly improved.

The expenditure on Factory and Extension account during the past season for the purposes mentioned in the last report amounted to £7,426 16s. 3d, a great part of which has been provided out of the additional capital recently created, such provision having been duly authorised by the Shareholders at the meeting on 1st December. This expenditure includes one-third of that incurred on Sorana as explained above, and also the purchase of a small plot of land adjoining Rutland.

A rather heavy outlay will be necessary during the coming season for buildings and machinery on Wattegodde, Hoonocotna and Warriagalla, and for the extension of cultivation above referred to; also a further acreage is being planted with Cardamoms on Warriagalla where the land is suitable and the cultivation very remunerative on a small scale; and it is proposed to plant a small portion of the Tallagalla and Sorana Estates with Para rubber. The total of such expenditure on capital account is estimated at about £70,000, say rather less than £5,000. The General Managers hope that the above will nearly complete the outlay required for buildings and machinery for a long time to come.

It is proposed to raise the necessary funds for the above Capital Expenditure by a small issue of five per cent. Debentures at par and any Shareholders desirous of subscribing to such Debentures are invited to communicate with the General Managers.

ARBUTHNOT, LATHAM & Co.,  
General Managers.

26th September, 1898.

## ASSOCIATED TEA ESTATES OF CEYLON, LIMITED.

(Special Report for "Tropical Agriculturist.")

There was a large gathering of shareholders of this Company at the third ordinary general meeting, held on September 26th in the board room at the office, 19 and 11 Lime St., London. The Chairman, Sir Alexander Wilson, presided, and he was supported by Messrs. S. R. Earle and John McEwan (Directors.)

The Secretary (a representative of Messrs. Mac-Meehin & Co., secretaries and managing agents) having read the notice convening the meeting,

The CHAIRMAN said: I propose to take up the various matters which call for comment from me in the sequence of the report to the shareholders, which, you will observe, follows the work of the Company in a natural progression from the unplanted lands to the final disposal of the produce. No addition has been made to the land area since the Company was formed, but you will notice that 91 acres of

### NEW TEA

have been put out. This is more than was contemplated at the date of the last general meeting, but the circumstances for extending were favourable, and the extensions have been successfully and economically completed, with the exception of about 25 acres. Beyond that, it is not the intention of the directors to proceed in the meantime. It is unfortunate that the work of our predecessors had been badly done, and that we have, in consequence, had to incur capital expenditure in filling up the vacancies, besides losing somewhat of the increased yield which we should now have been getting in. At the time the Company was formed we had, deducting the 28 acres, written-off in the report 1,370 acres of matured tea, while now we have 1,702 acres, and 187 of young tea—a material increase. The yield is disappointing, but that is an experience we share with the majority of the tea Companies in Ceylon as well as those in India (hear, hear.) I complained of the abnormal weather conditions when presiding over the annual general meeting twelve months ago, and I have again to speak in a similar strain this year. You have doubtless observed how we are experiencing a locally marked lack of moisture in the London district, the rain-fall for the year up to date having been the lowest since 1813. That is only a local feature in the general deviation from normal weather conditions by which so many parts of the world have suffered for several years back. It is not the actual shortening either in sunshine or in rainfall that is the cause of complaint, but the distribution of both as compared with the average. Let me explain how this affects

### OUR TEA ESTATES.

During the two periods of twelve months each ending at June 30th which we have dealt with the rainfall averaged:—

At Silver Kandy	106 inches
Doragalla	118 "
Chesterford	147 "
Horagoda	189 "

any one of which is amply sufficient for good tea cultivation if properly apportioned over the year. But in Ceylon the tea is pruned at irregular intervals, and not, as in India, in the winter season, when, by the ordinary course of nature, it ceases to make new growth. Now, taking our 1,700 acres of tea in full bearing there is always

more or less of the area in a pruned-down condition, when the yield from it is absolutely nil. The time and extent of pruning both vary according to circumstances, and in the case of our estates the acreage pruned during our last working twelve months was 1,179. Now, the loss of yield from the pruned area is, of course, a serious one, but that is reckoned for in all estimates. What cannot, however, be closely estimated is the time the bushes will take to recover from the pruning and to again "come away" with a satisfactory flush of leaf. Unfortunately the superintendents had repeatedly to record that after pruning, wind and drought or hot and dry weather instead of rain were experienced, with unfortunate results. On the disposal of our crop I can speak more encouragingly, and I think our Managing Agents

#### ARE TO BE CONGRATULATED

on the manner in which they have succeeded in getting the best of both markets and raising the prices for the produce from three of our estates, in the face of a general fall in the market value of Ceylon teas. Their good work was, however, more than neutralized by the very unsatisfactory result from Doragalla, which so far has proved a most unfortunate estate to the company. The late manager of it was taken over with the estate, under the arrangements made with the vendor, and it cannot be said that he was successful in his management of it for us. Under his control the yield fell off, the prices declined, the machinery broke down, and a somewhat serious loss in connection with coolie advances was made. The directors are satisfied that under his successor a marked improvement will be shown and that the estate should be during the new season a source of revenue instead of a loss. In connection with tea estates it is not possible or advisable to abruptly adopt any change of policy, and it takes frequently a long time for the effects of a change in administration to tell, but this company's estates are certainly now in a state as regards cultivation, management and general efficiency superior to that of any period since we took them over (Hear, hear).

THE LAST REPORTS OF THE VISITING AGENTS are most satisfactory, and even the labour deficiency referred to in the report has particularly been removed. The improvement has not been got without a considerable capital expenditure, it having been found necessary to spend nearly £6,000 during the year on buildings and machinery, an outlay which the directors saw no way of avoiding if full efficiency was to be obtained both for the present and the future. We have received by a recent mail a photo of the new factory of the amalgamated estates with Chesterford. We have now ample space and

#### A PERFECTLY-EQUIPPED FACTORY

capable of turning out half a million pounds of tea, which we hope we may ultimately get from the estate. The account which generally concerns shareholders most particularly is the revenue account, and I would like to amplify the report in explanation as to why the anticipations of a year ago, and of two years ago, when this Company was formed, have not been fulfilled. The position generally of tea production matters is well-understood by investors, and I am sure you will be pleased to learn that although our report went out the 16th instant to the 310 shareholders on our register, only two of these have up till now thought it necessary to write and com-

plain about the results. If I may say so, I think their letters show an imperfect realization or circumstances. I cannot more simply explain matters than by referring to the very useful and carefully prepared diagram of Messrs. Gow Wilson and Stanton, which very fully and satisfactorily explain and difference between the position as it was two years ago and as it stands today, the rupee exchange from 1886 to 1897 is shown in the tables, and the average price; and you will notice that the fall in tea has very closely followed the fall in exchange. In 1890 there was a slight rise in the sterling value of tea, which hardly agrees with the boom in exchange in that year; but it lasted a very short time, and, indeed, it did not have time to affect the prices of tea. When exchange began to fall, from 1873, we saw week by week and month by month the sterling value of tea going down. Then the diagram gives a chart showing the equivalent in rupees, and you will see how much exchange has been tampered with by the action of the Indian Government. This I may fairly claim to be what

#### NO PRUDENT MAN COULD HAVE FORESEEN

when the Company was formed. In 1894-95 we had exchange very low—1s 1<sup>3</sup>/<sub>4</sub>d and a trifle over. The London average during those years was in the neighbourhood of 8<sup>3</sup>/<sub>4</sub>d to 9d. That took place with exchange at 1s 1<sup>3</sup>/<sub>4</sub>d. In 1896, immediately after the closing of mints by the arbitrary action of Indian Government, an artificial rise in exchange took place—a rise not justified by the commerce results of the country—a rise from 1s 1<sup>3</sup>/<sub>4</sub>d to 1s 2<sup>3</sup>/<sub>4</sub>d between 1895 and 1896, and it brought down the price of tea by about 6 cents a pound. And that was further emphasised in 1897, when exchange rose to 1/3<sup>1</sup>/<sub>2</sub>, although the sterling average was very much what it was before. It brought down the rupee equivalent of sterling price to 7 annas, 3 pies—or about 44<sup>1</sup>/<sub>2</sub> cent. That is a state of things that I cannot conceive anyone would have anticipated which, I am bound to say—and it is borne out by statements made by the Government of India at the closing of the mints—that no man could have told what the result would be, and you will see from the preliminary report of the Currency Commission that there is still a great diversity of opinion as to what will happen if there is any further tampering with the currency. I am inclined to think that we will find the result of the report will be that things

#### WILL REMAIN IN STATUS QUO.

But that is only my opinion. But this statement tabulated by Messrs. Gow, Wilson & Stanton very clearly shows that we have been victims of circumstances over which we have no control. Exchange is, of course, still the serious point. And I must take this opportunity of correcting an error which somehow crept into my remarks at the last annual meeting. The difference made by a rise or fall of 1d in the exchange value of the rupee to this company is £999 (not £500, as I then said); and you will readily see how our results are affected when you know that the average rate of our exchange for the twelve months covered by these accounts was 1/3 (hear, hear.) There is scope for encouragement, however, in the tables showing the figures for produce, home consumption, and consumption outside the United Kingdom. The progress in the development of foreign consumption is very hopeful. In 1897 the combined consumption in this country and abroad amounts very nearly to the total of the production, and I, for one, do not take the pessimistic view held by many people, that

we are to suffer from over-production of the article (hear, hear.) Even if we are, the results of the present year generally throughout India and Ceylon have been such as will effectually prevent any further extension of cultivation. True, we may see some increase in production, because young companies like our's have tea that is just coming into bearing; but after that has come into account we will see a distinct check upon production. I am given to understand that no one is contemplating extensions at the present moment, and for the first time in my experience, which dates from 1864, tea-seed was practically unsaleable at the beginning of this year. I think probably we have now got to about the hed-rock, and I do not think we need fear anything worse than what I have, unfortunately, had to lay before you today. It may be asked why the 2½ per cent distributed on the ordinary shares was not held over till the year closed. At the time the interim dividends were paid, the yield of the estates had been so satisfactory and the prices so good that it appeared probable we should realise the estimates. That, however, is six months since, and the working during the latter part of the twelve months is where the deficiency took place. As to the future, I can say no more than is stated in the report, but I have a confident hope of meeting you in pleasanter circumstances at our next annual general meeting. Meantime, gentlemen, I can assure you that the board and the managing agents will do their very best for you. (Hear, hear.)

Mr. DIENER:—Considering the low prices, why do we sell so much tea out in Ceylon?

The CHAIRMAN:—It is a question of quality. In Ceylon there is a market for poorer quality teas, for sending to Australia and markets up in the Persian Gulf.

Mr. DIENER:—I see you got nearly 10d in London, and only about 5½d for tea in Ceylon.

The CHAIRMAN:—I am bound to say I feel that we could not have done better under any circumstances. We sold in Ceylon at a time when we were getting distinctly better prices than the equivalent in London. Even if we knew what we know now, I really feel that we could not have done better than we have done.

The CHAIRMAN then formally moved:—“That the report be received and adopted and that a final dividend of 3 per cent be paid on the preference shares (making six per cent for the year on preference shares, and 2½ per cent on ordinary shares), and that the balance be carried forward to the next account.”

Mr. S. R. EARLE seconded the proposition, which was carried unanimously.

On the motion of the CHAIRMAN, seconded by Mr. LEOPOLD F DAVIES, Mr. John McEwan was re-elected a director of the Company.

Mr. EDWARD LOEWENSTEIN moved the re-election of the auditor, Mr. J M Henderson, F.C.A., and this was seconded by Mr. ARNOTT and carried.

Mr. LOEWENSTEIN proposed a vote of thanks to the Chairman for the able address he had put before the meeting. He had given them, said Mr. Loewenstein, some crumbs of comfort for the future (hear, hear). Their thanks were also due to the managing agents, who had done the very best they could under all the circumstances (hear, hear).

Mr. DIENER seconded the proposition, which was carried unanimously.

The CHAIRMAN briefly responded, and the proceedings then closed.

## KOSHIENA COCONUT ESTATE COMPANY, LIMITED.

A meeting of the above Company was to have been held yesterday afternoon at Mr. Symons' Office, but was postponed for 3-30 p.m. on Tuesday next, as a quorum could not be got together. The following is the

### ANNUAL REPORT.

The Directors have now to submit the accounts for the third year ending 31st December, 1897. They regret to say that the property, though having had careful attention and being in excellent order, has not yet given the returns expected. The Vendors' guarantee for a 5 per cent. dividend extends for another year. Messrs. C. Ramalingam and Bastian Fernando retire by rotation, and, being eligible, offer themselves for re-election. In consequence of the result of the year's working not having been as favourable as was expected, the Directors have waived their fees up to date. It will be necessary to appoint an Auditor for 1898.

### PRODCE AND PLANTING.

THE DECLINE OF COFFEE DRINKING.—Although some medical authorities assert that coffee is an antiseptic and disinfectant and very effective in cases of typhoid, the general consumption of the berry in England does not increase. It will be seen from a reference to the Customs' returns that coffee is still on the decline. This is due no doubt to the ease with which tea can be brewed by comparison, and the tremendous spurt made of late years by the wealthy firms engaged in pushing the sale of tea. Coffee is left to struggle on and live upon its ancient reputation—a reputation, by the way, held in affectionate regard by steady-going coffee drinkers, who resist all efforts to wean them from their beloved beverage.

BRITISH GUIANA AND COOLIE LABOUR.—The sugar planters of British Guiana are hampered by labour difficulties in addition to other troubles. They declare that they cannot do without imported and indentured coolie workmen, and they have to pay, according to a recent regulation of the Colonial Office, two-thirds of the cost of bringing the labourers from India, instead of one-third as formerly, and one-half the cost of their return home.—*H. and C. Mail*, Sept. 30.

## FISH-CULTURE IN CEYLON.

We are pleased to learn that under the auspices of the energetic Honorary Secretary to the Ceylon Fishing Club an effort is to be made to find out the best kinds of fresh water fishes suitable for stocking the Nuwara Eliya lake for food purposes as well as "sport." The funds of the Fishing Club, we are glad to understand, are equal to some little outlay in this direction and the matter will probably be brought up at next month's meeting. In the meantime we have a correspondent elsewhere today asking for information in regard to the Gouramie, and he reminds us that an acre of water ought to produce a greater weight of food than an acre of land! In that case Nuwara Eliya lake ought certainly to be much more useful than it is, apart from the advantages it offers to anglers. In respect of fish-culture, as in some other things, Ceylon is much behind India and still farther behind the Dutch Dependency of Java. The late lamented Mr. Moens of the Java cinchona plantations used to declare that Pisciculture in the Netherlands India Colony is scarcely second in importance to Agriculture. "The natives here," said Mr. Moens "get two crops of nearly equal value from their fields, first the harvest of paddy and then the harvest of fish." The prevalent fish in Java is a good-sized carp, coloured like gold-fish, and we believe it to be allied to, if not identical with, the very Gouramie our correspondent is enquiring about. At any rate Mr. Moens is strongly of opinion that if we had not already got it in Ceylon, it might well be introduced here, and would be certain to flourish. But in reality the list of good fresh-water fish in Ceylon is by no means a scant one. What appears to be needed is the stocking and proper culture of the best kinds in ponds and tanks after a fashion which is most profitably prevalent in and around Calcutta, and also in many of the tanks in Southern India. Our correspondent refers to the *Tropical Agriculturist* of a few months ago. But that was only a passing reference, whereas in earlier volume, of our periodical there are some extremely valuable papers dealing with the known fresh-water fish in Ceylon most worthy of attention from pisciculturists. Meantime to satisfy our correspondent's enquiry we copy from "The Fauna of British India" (Fishes, Vol. II. by Day), the description of the genus to which the Gouramie belongs and also a note on that particular fish showing that its habitat is China and the Malay Archipelago, but that it has been naturalised in Mauritius and Australia, and introduced near Calcutta, Madras and the Nilgiris;—also that it is a fish which attains a weight of twenty pounds, and is excellent eating when taken care of. We quote as follows:—

3. Genus *Osphromenus*\* (Commerson), Lacepède. Syn. *Trichopus*, Lacep.; *Ctenops*, McClelland; *Trichopsis*, Kuer.

\* *Osphromenus olfax*, Commerson.

*Osphromenus olfax*, *Hardwicke, Zool. Journ.* iv. p. 313 *Day, Fish. India*, p. 372, pl. lxxix, fig. 6 (see synon)

*Osphromenus gonurami*, *Cuv. & Val. II. N. Poiss.* vii. p. 377, pl. 198 (immature).

D. 11-14/11-12. A. 9-12/19-21. L. 1. 30-36. L. tr. 5-8/13. Vert. 12/18-19.

The abdominal profile more convex than the dorsal. Fins—dorsal commencing above origin of anal, in anterior half of body; spines increasing in length to last, sixth and seventh rays longest; first ventral ray reaches base of caudal. Colours—greenish brown, lighter below; four or five vertical bands in the immature.

Branchiostegals six. Body moderately elevate compressed. Opercle without a spine; opercula pieces serrated in the immature. Mouth small, oblique, protractile. Small and fixed teeth in the jaws, none on the palate. One dorsal fin, its spinous portion sometimes in excess, but generally less in extent than its soft part. Anal spines in varying numbers. Outer ventral ray long, filiform, the remainder being generally rudimentary. Scales stenoid, and of moderate size. Lateral line, when present, uninterrupted. Air-bladder present. Pyloric appendages two.

*Geographical Distribution.* South-eastern Asia and Malay Archipelago. One species has been introduced into India; and another is found in Assam, N.-E. Bengal, Sikkim, and Nepal.

*Uses.* Excellent as food.

In conclusion we would ask whether our correspondent has a copy of "Tank-Angling in India" by H. S. Thomas, Madras Civil Service, F.L.S., F.Z.S.? Mr. Thomas' chapter on "Stocking Ponds," specially written with reference to the circumstances of Madras, is just the guide required by the Nuwara Eliya Fishing Club, should they take up the very desirable work of stocking Nuwara Eliya lake; and if not already in his possession, we shall be very glad to lend the little volume to the Honorary Secretary or to any member specially interested in Pisciculture.—We cannot trace that the "Gouramie" is now in, or has ever been introduced into, Ceylon. But will cause further search.

## PLANTING NOTES.

"THE AGRICULTURAL GAZETTE" of New South Wales, Volume IX. Part 8. Edited by W. H. Clarke. Contents for August, 1893, are as follows:—Bovine Tuberculosis, M. A. O'Callaghan; Tobacco Growing in New South Wales, A. M. Howell; The Weight per Bushel of Australian Wheats, N. A. Cobb; Practical Science, W. S. Campbell; New Varieties of Sugar-cane at the Richmond River Farm; Reports by G. M. McKeown and H. V. Jackson; Poultry, J. J. McCue; The Production of Honey, W. S. Pender; The Export Trade; The Importance of Drainage to Agriculture, III.—D. Hanneman; Notes for Hawkesbury District, Geo. Valder; Notes for the Northern District for September, H. V. Jackson; Orchard Notes for September, W. J. Alfen; Vegetable and Flower Notes for September, W. S. Campbell. With a Special article on Herbs; General Notes &c.

ANALYSIS OF CACAO SOILS.—Trinidad cacao planters do not go in for analysis even when offered free! We quote as follows:—

(Read before the Society, 9th August, 1893). With reference to the investigation into the character of our Cocoa Soils, I have to report that only a few Estate owners have responded to the offer made through the Agricultural Society to analyse soils free of charge. The nine soils already analysed do not show sufficient variation to allow of any definite conclusions to be drawn from the analysis. A much larger number is necessary, and more attention should be given to the selection of the samples. It is of primary importance that an analysis of good soils, and of soils in which the cultivation of cacao has been actually and unsuccessfully tried, should be contrasted. Samples of the latter kind are now requested.—P. CARMODY, Government Analyst. 18th July, 1893.

*Hab.* China, and fresh waters of the Malay Archipelago. *Naturalized* in Mauritius, Cayenne, Anstraria, and introduced into some parts of India, viz. near Calcutta, Madras, and the Neigherries. Attains 20 lb. or more in weight, and is excellent eating when kept in clean water.

"THE AGRICULTURAL LEDGER."—1898—No. 9. Gossypium Sp. (Egyptian Cotton.) Dictionary of Economic Products, Vol. IV., G. 331; Experimental Cultivation of Egyptian Cotton in Radhanpur; A Memorandum by M. T. Lyde, I.S.C., Administrator, Radhanpur State. No. 10. Silk (Mulberry), Dictionary of Economic Products, Vol. VI., Part III. S. 1822; Sale of Raw Silk for the Kashmir Darbar; Official Papers including Memoranda on the sale by Sir George Birdwood, K.C.I.E., opinions of Sir Thomas Ward, Kt., and other experts consulted, etc.—No. 11. Ananas Sativa (Pine Apple). Dictionary of Economic Products, Vol. I., A. 1045-57; Pine Apple Fibre; Review of Correspondence showing results of a chemical examination in the Scientific Department of the Imperial Institute of a sample of the fibre prepared in Assam.

THE GREY BLIGHT ON TEA.—We omitted in our reference on page 386 to say that the simple directions in the "Kew Bulletin" (reproduced in the *Tropical Agriculturist* for September) if attended to, will, in Mr. Willis's opinion, easily keep the trouble in check. This grey blight has been in the island for years, but latterly has appeared in several new places; and, for that reason alone, should be watched and attended to by planters. We may add on Mr. Willis's authority that it is not likely to be more than a temporary trouble in a few localities, unless people get it spread far before noticing it. The description in the *T.A.* should be carefully read. Mr. Willis will probably have a Circular on the subject ere long and doubtless Mr. Carruthers will have his say.

TEA SHARES.—Our evening contemporary compiles the Rupee Companies' Share Lists for the past quarter with the following total result:—

Ordinary capital, R46,230,540; Quotation on 30th June 1898, R15,692,490; Quotation on 30th September 1898, R14,799,860. Net drop during quarter R901,550. From the remarks given we quote:—

At the end of June term no Company in the list showed a rise; but on the present occasion three have gained this distinction:—Agra Oovah to the extent of R38,500; Knavesmire R31,125; and Ruanwella R19,875; making a total appreciation of R89,500. The total depreciation on the other Companies is R991,450; and thus we arrive at the net reduction of R901,550. The slump in the preceding quarter was R867,820. Then there were still sixteen concerns above par; four at par; and twenty nine below. Now thirteen only are at a premium: the same number at par; and thirty-two at a discount. Those which have contributed most to the fall are Mochas, which fell R275 per share of R500, but continue above par; St. Heliers which have fallen from R800 to par (R500); Wanarajahs, whose R500 shares are R1,200 instead of R1,300; High Forests on both fully paid and part paid shares; Nahavillas which are at par, against R550; Palmerston which have fallen R25 to R450; Pine Hills, whose shares of R60 have dropped from R50 to R30; Roeberys, which are now R40 in place of R60; Clydes, which have dropped 50 per cent to R40; Kalutaras, which are R250 against R325; Raigams, from R60 to R50; Clunes R100 to R90; and Eilas R50 to R40. The others have fallen less than R28,000. The "stand-out" Companies which continue above par make the following notable list:—Agra Oovah, Drayton, Glasgow, Great Western, Hapugahalande, Kirkless, Maha Uva, Mocha, Ottery, Tonacombe, Upper Maskeliya, Wanarajah, and Yaderiya. We regret to say, however, that whereas the total of the ordinary paid-up capital of our Rupee Produce Companies is R46,230,540, present quotations represent only one-third of this, the loss thus being R30,000,000 from par—not from the position of two years ago, which represents a much greater fall.

Clearly, the industry as represented by our Rupee Companies is one that would be much the better of the relief that rice freed from the import duty would give to it.

PORTO RICO and its rich planting districts are thus referred to a Special Correspondent of the *London Times* in a recent issue:—

From Aibonito, which is the highest point on the road between Ponce and the capital, we descended rapidly to the village of Cayey, a distance of 14 miles. The greater part of the way lay through the valley of the Rio de la Plata, one of the most fertile spots it has ever been my fortune to see. Coffee plantations cover the mountain slopes, sugar cane estates and farms of all kinds fill the bottom lands of the valley. Everywhere the country is thickly populated, homesteads peeping out in all directions as far as the eye can reach.

SAMPLES OF RUBBER sent by Mr. Cardew, and forwarded to London by Mr. Mahon, have been submitted to an expert, and the following report received:—"Rubber from 'Landolphia flouda,' received. Messrs. Hecht, Levis & Kahn report that this rubber is of very good quality and has been properly prepared. Its value today is 3s to 3s 1d per pound. Any quantity of this rubber, provided it is as clean as the sample in question, would find a ready market here for some years to come at a minimum price of 2s 6d to 2s 9d per pound. Messrs. Hecht, Levis & Kahn would be glad to put a consignment of this class of rubber on the market at any time."—*B. C. Africa.*

LORD ROTHSCHILD AND INDIAN EXPORTS.—Without professing to have any personal acquaintance with the circumstances of India, no one spoke more emphatically than Lord Rothschild about the importance of increasing its Export trade. Here are a few passages from his evidence of general interest:—

On the advisability of a gold standard and a gold currency for India—and I cannot separate them, though for a time the gold may not be put into circulation—I must emphatically remark here that a change of that kind, desirable as it may be in the interests of India, will be of no avail and will effect no permanent good unless steps are taken to increase the exports of India, because it is on the magnitude of the export trade that the future of a gold standard and gold currency depends.

The prevalent idea seems to be that if you could ensure a certain fixity of exchange money would flow to India; my belief is that the Indian Government will attract money to India for public work and for the great undertakings if they set to work in the right way. I also believe, although I may be quite wrong on the subject, that quite apart from the fluctuations in exchange, the great banks which now carry on the Eastern trade have discovered this the right and only policy for them to pursue to keep their capital intact in London and to be continually sending it backwards and forwards. The policy of borrowing money in London and allowing one's agents in distant branches, not only in India, but elsewhere, to lend it out on security, the value of which is unknown at the head office, has been curtailed for a great number of years.

Then you disapprove of the policy of Sir James Westland and the Government of India in trying to force up the rate of exchange, and in so doing to force up the rate of interest upon all the merchants of India?—You ask me whether I disapprove of forcing up the rate of exchange by increasing the stringency of the money market. I certainly do disapprove of it.

I may state that merchants all over India, both exporters and importers, are looking for even a worse state of matters in the coming busy export season. That being so you would more emphatically disapprove of any policy which would lead to such a result?—Certainly.

I was very pleased indeed to have your emphatic opinion (because we have had different views stated by two or three witnesses) that you approve of the magnitude of exports from India being largely increased so as to make as big a balance as possible in favour of India?—Yes,

## Correspondence

To the Editor.

## CACAO AND A SCIENTIFIC AGRICULTURAL DEPARTMENT.

Northern District, Sept. 29.

DEAR SIR,—Your editorial (see page 328) will, I hope, not prove too late in directing the attention of Cacao Planters, Colombo Agents, and the Government to the necessity of trying "at once" to secure the continued services of Mr. J. B. Carruthers as Consulting Cacao Cryptogamist. Why has the Chairman, P.A., not called another meeting of "Cacao Sub-Committee" to meet Mr. Carruthers and ascertain the opinion of experienced cacao planters long ere this? Is it because the acreage under cacao is only 21,260, about one-seventeenth (1-17th) of that under tea, and because say only £1,000,000 sterling is invested in the product, and because the hullabaloo at present is all about high exchange and low tea prices, oblivious of the fact that "over-production" is the cause of low prices (combined of course with absence of honest competition for our teas among the large packet dealers in London)? Why, sir, if those who are so interested in tea would only give a little more attention to cacao, and invest in future in cacao and coconuts, and not add another acre of tea till there is a little more demand in new countries, they would in years to come see the far-sighted wisdom of those who urged more attention to cacao. There are many who will argue, "We have tried it, it failed, and we had to plant tea after all to avoid total loss." That was largely because the question of shade and shelter were not properly understood, and too close planting was indulged in to get quick returns, and we began with the most delicate variety—the so-called Caracas. Tea grows like a weed, cacao needs patient, intelligent cultivation.

There is a good time coming for cacao. If we could only get the European nations to supply their armies and navies with the wholesome food-drink (solid and liquid), consumption would very quickly overtake the world's present production. And the beneficent effects on plucky, hardy Tommy Atkins and Jolly Jack Tar ... I need not enlarge upon. Talk of sending tea to cousin Jonathan's Johnnies,—try them with cacao! I think I hear the ghost of H... t... s C. a... e growl out "You've got to grow it first, raise your crops and save them from fungi and fugitive thieves!" Can't you hear him chuckle? Well, his valley will have to stick to tea for the present, and we must hope his factory will be spared the visits of disappointed cacao robbers! Meanwhile there are thousands of acres under tea which will grow good Forastero cacao and tens of thousands of acres of jungle and chena suitable.

What is wanted now is, continued patient investigation of right methods of cultivation, of combating diseases and fungi of all kinds, of the proper fertilisers to use and the right amount of the best shade and shelter trees needed (for protection against wind and helopeltis). In young cacao clearings, nutmegs and para rubber might be added.

Mr. Carruthers has taken a wonderfully quick grasp of the situation, and it would be nothing less than criminal for Government to let him

leave the island, if he thinks he can further help us and is willing to remain. The latter I imagine is simply a question of remuneration, and I can hardly believe His Excellency the Governor would refuse to recommend a special vote in Council. For the natives, if they only knew it, are deeply interested in cacao cultivation. This may raise a laugh from those who suffer from dishonest village neighbours. Well, one can enjoy a good healthy laugh even in these doleful days of reduced screws and commissions; but seriously, cacao is pre-eminently a product to encourage among the Sinhalese, for wherever paddy will grow, I believe a few cacao trees would thrive round the cultivators' houses, and tethering their buffaloes to the trees will give them grand crops.

Mr. Cochrane's cacao analyses, I regard as most valuable, and Mr. E. E. Green could with advantage study cacao insect pests (and insect friends!). Mr. Carruthers may find ere-long that "Tea planters want investigations into fungi affecting tea bushes." For these and many other reasons I would urge my fellow planters to do all they can towards securing the immediate\* establishment of a Scientific Agricultural Department (in connection if possible with the Botanical Gardens at Peradeniya).

Let the P. A., take this up at once, without any more useless and harmful delays.—Yours faithfully,  
T. K.

## No. II.

SIR,—Your article on the need for retaining Mr. Carruthers' services is admirable. The Governor will do wisely in shewing his sense of the value of agricultural industry by retaining the services of a Cryptogamist who is a sound, clear-headed man of science, and one who has gained the respect and favour of the Planting Community. He has been from Dan to Beershaba;—Dambool to Monaragala and Kurunegala to Rakwana.

We can dispense with the services of a cadet Writer or two, so that agriculture in the Island may be scientifically and professionally served.—Yours truly,  
TEA AND CACAO.

## CEYLON TEA IN AUSTRIA AND HUNGARY.

Kandy, 6th October, 1898.

SIR,—I enclose copy of Report which has been received from Mr. G. A. Marinitsch on the subject of his enquiries as to the best means of extending the consumption of Ceylon Tea in Austria and Hungary together with the annexures therein referred to.—I am, sir, yours faithfully,  
A. PHILIP.

Secretary, "Thirty Committee."

Vienna, 14th September 1898.

The Chairman, "Thirty Committee," Kandy.

In compliance with your instructions dated the 9th July last appointing me the authorized Representative of the Ceylon Planters' Association for the purpose of making enquiries as to the best means of extending the consumption of Ceylon tea in the Austro-Hungarian Empire I beg to submit the following report:—

After a stay of four days at Trieste I proceeded to Vienna in which city I made my head-quarters

\* I say immediate because we have competent men here now who may be gone tomorrow. It is even possible that Mr. Ernest Green may leave for other pastures, and nothing could be more lamentable than to lose at this time his valuable, practical Ceylon experience.—T. K.

up to the 6th July, visiting in the meanwhile Buda-pest, Prague, Lemberg, Krakau, Karlsbad, Pressburg, Pilsen etc., etc., all being important centres of the Monarchy and at which places I made adequate sojourns.

Everywhere I met with a hearty reception and ready response to my inquiries and I desire to place here on record my deep sense of gratitude to Herr Ritter von Mauthner (President of the Vienna Chamber of Commerce), Herren Hofrath Ebner von Ebenthal and Baron Alexander Koller (of the Imperial and Royal Board of Trade), Herr Ritter von Jarsch, General Agent Austrian Lloyds Company, Herr Heinrich Klingner and a host of others who helped a great deal affording me statistical and other information, and supplying me with letters of introduction. I enclose herein

#### TWO STATISTICAL STATEMENTS.

(a.) Showing the quantities of tea entered for Home consumption during the years 1894 to 1897 inclusive.

B. Showing the population of the Empire and giving a list of cities having more than 50,000 inhabitants.

The consumption of tea in Austria-Hungary may at first sight appear a small one if calculated in proportion to the population, but if one would take into consideration that coffee (of which over 81,000 tons were imported in 1897) is decidedly the beverage of the country, and also the existence of large tracts of wine producing districts, the quantity of tea consumed should be regarded as satisfactory.

From the statement A you will observe that the figures for last year when contrasted with those of 1894 show an increase in consumption of about 200,000 lb. equal to 10 per cent. in the space of four years and such a result may be safely taken as a good sign for the future chances of tea drinking in the country.

There is certainly a distinct inclination towards tea drinking and the casual observer cannot fail to detect the existence of a desire on the part of some people to drink tea as an alternative to coffee at certain times and this change of habits is especially noticeable in the hotels patronized by the indigenous population.

So far however the wants of the trade have been supplied by China, the product of which country holds sway as you will gather from the annexure A., the share taken by our own staple being indeed very small and hardly worth recording.

I endeavoured to find out the reasons for such a discrepancy, especially considering that Ceylon tea is well-known to the principal dealers, two of whom indeed take nothing else for their private use.

In the course of my inquiries I certainly heard many views and was also confronted with conflicting statements, due no doubt to the desire on the part of dealers to protect "vested interests," but all the same there appears to be a consensus of opinion that Ceylon teas are too strong, give too dark a liquor and have a rather too pungent a taste as compared to the delicate China teas hitherto imported and to which the palates of the majority of the consumers are accustomed. There is no doubt that the teas imported from China and sold here in retail, are of very good quality and of this I had the corroboration in the report given by Messrs. G. White & Co., upon a collection of teas Mr. Ryan and myself purchased at Vienna and sent on to Mr. W. Martin Leake for valuation.

I report the foregoing merely as what is being said by the dealers, not being in any way prepared to back altogether their opinion because from my own experience in this line I have always found that Ceylon teas of superior quality and of high cultivation have pleased those who gave to them an earnest trial and I fully believe in consequence that Ceylon teas will be appreciated and consumed in larger quantities by the bulk of the public if only properly brought before them which has not been the case up to this time for reasons

which it is needless to enquire into, more than what is disclosed by the opening remarks of this paragraph taken in connection with the one immediately preceding.

Unfortunately for our staple the duty on tea in Austria is very heavy and certainly acts as a barrier to the natural expansion of the now noticeable tea drinking proclivities and so long as the duty remains as it is, there are no hopes of a development greater than what is shown by the statistical information.

Duty on tea in Austria-Hungary is as follows:—

For teas imported by sea (Austrian Ports) 90 Kreuzers in Gold per Kilogram, equal to 93d per lbs. For teas imported by land the duty is 20 per cent. dearer.

I shall not concern myself with the latter as it does not affect our interests nor is it of any real significance as it falls upon importations of so called Caravan Tea and also of small parcels of tea coming from abroad per parcel post.

In actual working however the duty by sea comes to 103d. owing to the system of collecting the same, which consists of taking the gross weight of the packages deducting therefrom 23 per cent. and charging duty on the remainder 77 per cent. which are considered to represent the actual net contents but which are invariably much more, and thus the duty becomes heavier in proportion of the packages being smaller, so much that for one lb. packets the duty may be fully reckoned at 1s 2d per lb.

This is certainly very excessive and in the interests of Ceylon Tea I deemed it a good thing to write to call the attention of the authorities to such heavy taxation which is a distinct hindrance to trade.

I addressed therefore a detailed circular letter to the principal Chambers of Commerce of the Monarchy and posted also copies of same to the Imperial and Royal Ministries of Finance and of Commerce. Herewith enclosed I send you also a copy of the said circular to which I have attached a precise translation for your information hoping that you will approve of my action. I have received many replies, some being mere acknowledgements, others promising to consider my remarks, but of all answers the most important, to my mind, is the one vouchsafed by the Vienna Chamber of Commerce and of which I send you the original with a translation attached, and from the same you will gather that the Vienna Chamber has recommended to the Government a reduction of 50 per cent all round in the rate of duty on tea. This very authoritative suggestion in support of my letter circular will certainly produce a good impression with the Government and I am in hopes to hear that the recommended reduction in the tea duty may become a *fait accompli* some time next year. In the course of an interview I have had since with the President of the Vienna Chamber of Commerce I have acquired further persuasion that we have in him a good ally in the endeavours to obtain a reduction of the duty. All the teas imported by sea come via Trieste where every facility is offered to the trade in the same way as obtained in London and Hamburg, there being a portion of a large warehouse specially devoted to the bonding of tea and where also importers can carry their packing and blending operations paying duty as the teas go out of the warehouse, and these arrangements give much satisfaction.

I have had interviews with officials at the Board of Trade who have all shown disposition to see that the tea trade be fostered and I gathered from them that the Railway Companies will be approached with some recommendations for the treatment of tea transports and from the Austrian Lloyd's Co's Directors I have been promised that instructions will be given to the effect that tea be specially attended to. Altogether I am glad to say that from all quarters I have received assurances testifying to the good disposition entertained towards the development of the tea trade and the Press is generally in favour of such an expansion.

As a noticeable feature that Ceylon Tea is now being taken into serious consideration I send you a number

of the Railway "Gazette," where appears an article referring to the projected new line of the Lloyd Co. between Trieste and Calcutta via Colombo and in which the writer refers to Ceylon Tea, as one of the principal articles to be carried by the steamers on that line. Considering that I had not the occasion of speaking to the writer of the article, his mention of Ceylon Tea in such a prominent manner shows evidence of the great interest that is being taken in our staple product.

Trusting that the foregoing remarks about the Tea Trade in Austria-Hungary may convey an idea of the state in which things stand at present I will now come to the question of the best means for increasing the consumption of Ceylon teas in this Empire.

The only practical manner to attain such a praiseworthy object is to advertise, but the question arises whether the Tea trade in Austria is sufficiently large to warrant any outlay and whether prospects for future development of Ceylon tea here are favourable? My answer will be in the affirmative, there being a distinct inclination noticeable towards tea drinking and such a tendency can only be fostered and increased by advertisements. The desired results will not certainly be immediate, but all chances are in favour of Ceylon tea, the general taste appears now to be entering into a transitory phase and the opportunity is a very good one for giving it a direction towards Ceylon tea. As regards the way to be adopted I have given to the question my best consideration and for the present I do not think it will be possible to carry out here the arrangement wherewith the Thirty Committee lay out a certain sum for advertising Ceylon tea, provided the parties thus benefited do on their side spend an equal sum as that granted by the Committee. The Tea trade in Austria is fully cognizant of the qualities of Ceylon tea but all the same it will be difficult to find any reliable firm that will promise to deal solely with our staple to the exclusion of China sorts, for at the very best the sale will be small at the commencement. To entrust a beginner with Ceylon is not advisable, nor will any old established tea dealer discard China at once in favour of Ceylon lest he should lose his clients and ruin his business.

Now, my view of the question is to leave the dealers severely alone and simply advertise "Ceylon Tea" in leading papers, afterwards adding a liberal display of posters and occasionally getting short notices published in the body of the papers relating to the great progress made by Ceylon tea all over the world. By this means the attention of the general public will be decidedly attracted to a good purpose for, judging by human nature many will be those who in consequence of reading the advertisement will ask their grocers for Ceylon tea and it will not take long before all grocers and retailers will purchase and stock Ceylon tea and sell it as such and not with any other high flown title. Then the time will come for the Thirty Committee to negotiate with some dealer or dealers who will be prepared to stock solely Ceylon teas and receive a subsidy, in the shape of free advertisements, in exchange of their services to Ceylon tea. This system has been adopted with excellent results for many other new articles such as cacao, soaps and the like, the introduction of which appeared at the beginning as a work of education surrounded by uphill and other difficulties, but which were soon surmounted by the co-operation of the public curiosity which is a prime factor in the introduction of new things; I do not mean any disrespect to Ceylon tea, certainly not; but I reckon a good deal upon human curiosity to help us in the achievement of the object for which we are all striving, namely the development of Ceylon Tea Consumption in Foreign Countries.

With regard to estimates, etc. etc., I cannot quote the figures as I have given all particulars to Mr. Ryan who will separately write his views.—I am, dear sir, yours faithfully,  
G. A. MARINITSCH.

PRECIS OF CIRCULAR LETTER ADDRESSED TO TWENTY-FOUR CHAMBERS OF COMMERCE AND INDUSTRY IN AUSTRIA AND HUNGARY.

Dated: Vienna 1st June 1898.

By request of the Ceylon Planters' Association I have just concluded a voyage through the most important centres of the Monarchy for the purpose of studying the Tea Trade and I deem it in the interest of the trade to submit to you the result of my enquiries in the course of which I acquired the very gratifying impression that the consumption of tea was distinctly on the increase and there were visible signs of a decided inclination towards this beverage.

I was struck, however, by the very heavy duty charged upon tea and which on the average comes to over 75 per cent. ad valorem and no doubt this heavy taxation prevents the much desired development of the trade.

Doubtless when the tariff was framed tea was considered a luxury and, as such, was heavily taxed, but now things have changed and thanks to careful cultivation and most perfect machines, tea can be produced cheaper and of better quality, and forms, now a part of every day requirements in almost of every household in the world.

I would therefore suggest that the tariff upon tea be reduced and brought to a point in proportion of other duties now existing; and to stimulate direct importation from the centres of production I would further suggest that duty on such teas be reduced by 50 per cent whilst remaining the same as now for teas imported by land or otherwise.

Once the tea duty is reduced the importations of the leaf will be rendered easier and cheaper, thus the poorer classes will be the first to benefit from such a reduction besides avoiding to the trade resorting to manipulations which in some cases contains teas quite deleterious to health.

In the end the State will also be the gainer by the enhanced importations that are sure to follow a reduction in duty.

Finally I beg to point out that in Belgium the tea duty has been abolished since the 1st January of this year.

## REPLY.

Translation of reply received from the Chamber of Commerce in Vienna:—

With reference to your letter of 1st June, de pras. z. 6,337, with regard to Reduction of the Duty on Tea in Austria-Hungary, the undersigned institute beg to say that it has asked the k.k. Ministry of Commerce, to submit the matter to the Industrial and Agricultural Board, which is an effective corporation, for the consideration of alteration in Custom duties, which will meet soon.

The undersigned institute have recommended that the duty on tea be reduced without regard to the origin and to be as follows:—

50 kreuzer per kilogramm for tea imported by land, and  
45 " " " " " sea.

(Signed) The Vice-President: KITSCHLT.  
The Secretary: Maresoh.

### THE PROSPERITY OF THE COLONY:—IS IT DUE TO CAPITAL INTRODUCED AND LOST, OR TO PROFITS?

October 8.

DEAR SIR,—I have been discussing the following problem with a mutual friend and we have agreed to refer the question to you as arbitrator. Is it true that a great deal more money has been brought into Ceylon than has ever been or will ever be taken out of it; and that Ceylon owes its prosperity not to what the soil has produced, but to the constant influx of capital, a proportion of which is lost every year?

It would be very interesting to know the extent of the losses or profits in connection with coffee, cacao, cardamoms, cinchona and tea—of course crediting all cultivated area on the basis of the present profits. On which side would the balance be, think you?—Yours truly,

#### COFFEE AND TEA PLANTER.

[Our friend has set us a hard nut to crack, and we do not see how the necessary information as regards the estates of private proprietors is to be got, to enable any reliable reckoning to be made. In respect of Limited Companies, all their financial business—capital, expenditure, returns—being public, a fair approximation can be made. But that would be but a small proportion of the whole, especially if we count from the beginning of the Tea Enterprise. The late R. B. Tytler made out after 40 years of coffee, and before the final crash came, that

only 10 per cent of all the planters he knew, from the practical beginning of the enterprise in 1837, had bettered themselves materially by coming to Ceylon. Let our two friends make a similar calculation for tea—only it is rather too soon to do so, until we see what the next few years are to bring about. One thing is certain: that whether there is a due return or not for all the capital introduced, all those dependent on tea in the island—coolies, artificers, cartmen, etc.,—and the general revenue especially, benefit by its introduction. Every acre opened means employment for so many more people and so much more grist to the Government exchequer. For a further deliverance on the subject see pages 166 to 170 of our "Handbook and Directory" in our Planting and Agricultural Review.—Ed. T.A.]

### CEYLON AND ITS DISTURBANCES.

DEAR MR. EDITOR,—There are two errors, in the foot note to your article on the career, in Ceylon, of the late Capt. J. K. Jolly.

Lord Torrington and Mr. Parsons had nothing to do with the arrangement for the execution of the Buddhist Priest. The priest was not hanged at all; but shot by sentence of Court Martial for treason, the Kandyan Territories being at the time under Martial Law.

The man who was set up temporarily by the rebels as a king, was tried by the Supreme Court, and sentenced to be hanged. I was present at the trial. The sentence was commuted to 100 lashes and transportation for life to the Straits Settlements.

The pseudo-King was flogged in Kandy at the crossing of Trincomalee Street and the main (Colombo) Street. I saw this man as he was being taken back to the jail, after undergoing the flogging.

The only other man shot in Kandy by sentence of Court Martial (in 1848) was an escaped old jail bird and noted marauder, Poorang Appu by name, who found promptly to his cost, that rogue's lawyers were of no avail, before a General Court Martial, and the swift punishment it meted out to robbers.—  
Faithfully yours,  
J. M.

### PLANTING COCONUTS IN KEGALLA.

[When a witness in the Crown case deposed that coconut plants in this District bore fruits within five years, our Solicitor-General, Mr. Ramanathan, who elicited the fact in cross-examination did not believe him and he mentioned that 16 or 17 years are required for coconut plants to bear in Colombo District. I should wish to know what your correspondent "D." has to say on that point.—Cor.]

Kegalla Library, Oct. 12.

DEAR SIR,—With reference to the letter of your correspondent "D." Ekelle Estate, Jaala, October 9, 1898, appearing in your paper of the 11th instant, I have to inform you that my method of planting coconuts has always been head topmost. After four or five months the nuts sprout and roots gradually make their appearance through the husk on all sides; the young plants are then placed in the holes previously prepared for that purpose and within six or eight weeks the roots of the young plants enter into the soil and nourish the plants and within five years the young plants in this district

begin to bear fruits. Coconut plants whose roots have been injured on their removal from the nursery to the planting ground take some months before they send fresh roots and a large percentage of the plants whose roots are injured never thrive.—Yours faithfully,

W. D. HERAT APPUHAMY,  
Kandyan Goiya.

#### MEXICAN GULF AGRICULTURAL CO.

Kansas City, Mo, U, S A., 9th Aug, 1898.

SIR,—At the request of Mr. H. W. Bennett, we are pleased to forward you under separate cover, souvenir pamphlet just issued by our Company, containing descriptive scenes on the Isthmus of Tehuantepec and the Dos Rios district in particular. We trust you will be pleased with this pamphlet which please accept with Mr. Bennett's compliments and we remain, yours truly,

R. E. SHRYOCK.

[Mr. Bennett is President of the above Company and the souvenir is an interesting and attractive one. We make a few extracts:—

Dos Rios was founded on the fourth day of October, 1894, by Major George H. Clemow, then as now, our superintendent, and the first white man in those parts. Accompanied by half a dozen Indians, he landed at four o'clock in the afternoon, and when the moon rose over the valley of the Chalchijapa that night, the first house had been built and first clearing made. In 1897, Dos Rios was made the county seat of the district of Dos Rios, with a mayor, tax collector, police judge and policeman, all of whom are employees of the Company. The town is also visited regularly by a priest, and has its own post office.

The nurseries of Dos Rios are the largest in the world. They contain 5,000,000 coffee trees and 500,000 rubber trees. Three tons of coffee were planted for seed.

Figures: coffee trees planted in Sitio 1, 850,000, 860,000 trees planted in Sitio 3. Rubber trees planted in Sitio 1, 125,000. 175,000 trees planted in Sitio 3. Labourers employed in 1897, 350. \$36,200 worth of merchandise sold in our store in 1897.

1896.—Average Temperature 77°, Minimum 57° and Maxm. 96°. 1897.—Average Temperature 76°, Minimum 54° and Maxm. 103. Annual Rainfall, 114 in.

The illustrations include some rich coffee bushes laden with fruit; township, plantation and river scenes with "types" of the people.—Ed. T.A.]

#### FLORIDA VELVET BEANS.

Kola Estate, Veyangoda, 14th Oct., 1898.

DEAR SIR,—The result of the Florida Velvet bean seeds planted at the above estate by me imported direct from Florida two weeks after your free distribution is now as follows:—

1. Planted in rich soil, creeper 12 feet high and growing about 1 foot a day, flowers have appeared two feet from the ground up to 8 feet, throwing out many branch creepers.

2. Plants in gravelly soil 6 to 7 feet high, no flowers or branches yet.

3. Plants in sandy soil 3 to 5 feet high, no flowers or branches yet.

Growth in gravelly soil about 4 to 6 inches and in sandy soil (moist) 3 to 4 inches, ditto (dry) 1½ to 2 inches a day.—Yours faithfully,

J. P. WILLIAM.

#### THE "THIRTY COMMITTEE."

MEETING AT KANDY.

Kandy, 18th Oct. 1898.

SIR,—I enclose Minutes of Proceedings of a meeting of the "Thirty Committee" held at Kandy, on Monday the 17th day of October 1898 at half-past seven o'clock in the morning.—I am, sir, yours faithfully,

A. PHILIP,  
Secretary.

Minutes of Proceedings of a meeting of "Thirty Committee" held at Kandy, on Monday the 17th day of October 1898, at half-past seven o'clock (7-30 a.m.) Present:—Messrs. F G A Lene (Chairman), A Philip (Secretary), R S Duff Tytler, H O Hoscason, R A Galton, Hugh B Roberts, J H Renton, J B Coles, Hon'ble J N Campbell, Messrs. W D Gibbon, A E Wright.

The notice calling the meeting was read. The Minutes of Proceedings of a meeting of the "Thirty Committee" held at Kandy, on Saturday, the 10th day of September, 1898, were submitted for confirmation. Resolved that they be and they hereby are confirmed.

MEMBERS OF COMMITTEE.

Read letter from the Secretary, Ceylon Chamber of Commerce, notifying that Mr. Horsfall having resigned his seat on the "Thirty Committee" Mr. Gordon Fraser had been elected to represent the Chamber in his stead.

CORRESPONDENCE.

Intimated that correspondence (enumerated and already published) had been circulated to all the members of the "Thirty Committee."

FINANCES.

Submitted letters from the Treasurer of the Colony. Submitted sketch memo of the position of the fund as at 17th October, 1898.

Read letters from the Manager, National Bank of India, Limited, on the subject of Mr. William Mackenzie's credits, read also Secretary's replies. Resolved:—"that they be approved and confirmed."

GOVERNOR IN EXECUTIVE COUNCIL.

Read letters from Government stating that the Governor has been pleased with the advice of the Executive Council to sanction the proposed appropriation of £1,000 sterling in advertising Ceylon Tea in Germany.

Read letter from Government intimating that the Governor has been pleased with the advice of the Executive Council to sanction the appropriation of a sum not exceeding £2,000 sterling in order to give effect to the Resolutions of the Committee of Thirty relating to Green Teas.

Read letters from Government requesting to be furnished with copies of certain correspondence.

GREEN TEAS.

Read correspondence with Messrs Forbes and Walker. Read letter from Mr. H. V. Masefield enclosing Bill of Lading for 2010 lb Green Teas of Tillyrie Estate, Dikoya, and requesting payment of 10cts per lb Resolved:—"That payment of the grant be made on production of the invoice with a certificate to the effect that the shipment represents all grades."

(2) That the Secretary do make public a memo showing the payments under the grant, and the balance still available of the sum of £2,000 appropriated therefor.

UNIVERSAL INTERNATIONAL EXHIBITION TO BE HELD IN PARIS IN THE YEAR 1900.

Submitted correspondence on the subject. Read also letter from Leon D'Espagnac. Considered letter from Lipton Limited. Resolved:—"That the letter be acknowledged and that it be stated that the matter will have early consideration."

AGRICULTURAL CHEMIST.

Read letter from Mr. Kelway Bamber and submitted the abstract of replies received showing the names of estates chosen for the visit of the Agricultural chemist in various districts, and that from two districts, viz., Kotmalis and Rakwana, and Morawakkorale no estates names had been sent in up to date. Resolved:—"That Mr. E. M. Hay be asked to do the needful as regards Kotmalie."

## REPRESENTATIVE IN AMERICA.

Submitted letters from Mr. William Mackenzie with connected papers.

## CEYLON TEA IN RUSSIA.

Read letter from Government transmitting copy of a letter addressed by Her Majesty's Ambassador to the Secretary of State for Foreign Affairs regarding the treatment of British goods in Russia.

Read letter from Mr. M. Rogivue stating that Mr. Christie had written to him on the subject of further advertising Ceylon tea in Russia and that he had just sent Mr. Christie the tender of one agent in Moscow for such advertisements.

## CEYLON TEA IN GERMANY.

Submitted correspondence and considered the question generally. Resolved "with reference to Messrs Ch. & A. Bohringer's letter of the 5th October, 1898, that the letter be acknowledged. (2) that the Thirty Committee cannot make Mr. C. Bohringer solo representative in Germany, (3) that the 'Thirty Committee' would be prepared to support the scheme suggested excepting No. 2 with regard to which the Committee will await the result of the trial now being made, (4) that the Committee would be prepared to grant £100 on accounts and vouchers showing expenditure of £300 sterling being submitted and copies of newspapers with the advertisement inserted therein, (5) that in the event of Mr. Bohringer expending a larger sum the Committee would be prepared to consider a further application."

Read and considered letter received from Mr. Westland. Resolved "that Mr. Westland be thanked for his letter and be informed that his scheme will be considered with other schemes 'for pushing Ceylon Tea in Germany.'"

## CEYLON TEA IN NORWAY AND SWEDEN.

Read letter from Mr. Oscar C. W. Dickson on the subject of pushing Ceylon Tea in Sweden, Mr. Dickson who was present personally explained his views to the Committee.

Read letter from Mr. John H. Starey on the subject of pushing and advertising Ceylon Tea in Norway:—Resolved. "That Mr. Starey be thanked for his letter and asked to have an estimate submitted before next meeting to be held in November; it is suggested however that the names of those from whom Ceylon Tea can be procured in Norway should be printed on the post card."

## CEYLON TEA IN AUSTRIA &amp; HUNGARY.

Submitted letters received as per schedule. Resolved. That consideration be deferred to next meeting: (2) that the sanction of the Governor in Executive Council be obtained for the appropriation of a further sum of £200 in connection with pushing and advertising Ceylon Tea in Austria and Hungary.

## COOLGARDIE EXHIBITION 1899.

Read and considered correspondence. Resolved:—"That the sum of £500 sterling be voted towards the representation of Ceylon Tea at the Coolgardie Exhibition 1899, (2) that the sanction of the Governor in Executive Council be obtained to the appropriation, (3) That Mrs. Mackenzie be thanked for her letter and informed that the Committee will reply as soon as the question of a representative to the Exhibition has been decided; in the meantime the Committee will be glad to receive any further suggestions as to the working of the proposed Tea Room."

The Thirty Committee then adjourned.

A. PHILIP, Secy. to the "Thirty Com."

## FACTORY SUPERVISION.

SIR,—Considering the extremely hard times that most estates and companies have experienced lately owing largely to low prices, and partly to high exchange, would it not be as well to again draw attention to the amount of Factory Supervision which, even in large concerns, is still left in the hands of low paid native tea makers. Can this possibly pay in the face of the fact that India,

which has always had European factory superintendents, but which we were ahead of in prices till Ceylon managers had too much work put on their shoulders, now beats us regularly. With the large number of planters now out of berths, many of them with a thorough knowledge of factory work, and willing to accept small salaries with commission on prices, surely it is an opportunity which should not be missed to at least try what the effect of a European tea maker would be. There are instances of Firms being sufficiently alive to their interests to have a European to supervise their factories and to pay him well, and I am sure that they find it politic to do so. There is, I think, no doubt that our greatest mistake has been in putting up small factories for each estate, instead of concentrating in large central factories, when the cost of a European tea maker, divided among the several estates would not come to much more than the present system which I think far greater benefit to the estates concerned.—Yours faithfully  
PLANTER.

## REDUCTION OF THE BRITISH TEA DUTY.

Kandy, Oct. 19.

Sir,—I enclose for publication copy of letters addressed to Mr. E. J. Young, from London Brokers, and from Mr. H. K. Rutherford, which Mr. Young recently submitted to the Committee with reference to the subject of reduction of the British tea duty.—I am, sir, yours faithfully.

A. PHILIP.

Secretary to the Planters' Association of Ceylon.

## MR. YOUNG'S CIRCULAR LETTER.

Colombo, 12th July 1898.

Messrs. \_\_\_\_\_

Mincing Lane, London, E.C.

Dear Sirs,—A movement is on foot in Ceylon to memorialize the Chancellor of the Exchequer for the abolition of the Duty on Tea. Might I ask you to be good enough to give me your opinion as to the probable effect on the consumption of Ceylon Tea if total abolition (1d), or a moiety of the duty (2d), be removed and whether in your opinion the import of the China product would be increased thereby. With your permission I intend to make use of your opinion before the Planters' Association of Ceylon.—I am, Yours faithfully,

(Signed) EDWARD J. YOUNG.

## REPLIES.

## LETTER FROM MR. RUTHERFORD.

Copy. Bude, N. Cornwall, August 27th, Polmont, Kenley, Surrey.

My dear Young,—I had yours of 12th ult. and would have answered it earlier but many things intervened to prevent me. I am afraid my opinions on this question of the abolition or reduction of the tea duty are of no more value than those possessed by the men around you.

We have not been able to get the Indian Association Committee to arrange a joint meeting to discuss the subject. They had a discussion on the question about a year ago and as opinions vary very much as to the desirability of pressing it on the Government they came to the conclusion to do nothing.

Opinions differ among the members of the Ceylon Association in London as to the advisability of having the duty either lowered or abolished and I scarcely think unless there is a considerable majority among the planters in favour of taking action it would be politic to ask Government to move in the matter.

I believe in all cases of a reduction of duty the consumer does not get any benefit for a year or so, but there can be no doubt in a few years' time we would see a much larger consumption of tea if the

duty were abolished. The people perhaps would not actually drink much more than they do but there would be more waste.

The annual increase of the population of England is 300,000, so that the natural increase of tea consumption would be only say 1,500,000 lb. (5 lb. per head) but since the duty was lowered the average annual increase has been 5,300,000 lb. so that we may claim an increase of 3,800,000 lb. per annum due to the reduction of duty.—Yours truly,

(Signed). H K RUTHERFORD.

41 Mincing Lane, London, E.C. Aug. 5th, 1898.  
Edward J. Young, Esq.,  
c/o Messrs. Whittall & Co., Colombo, Ceylon.

Dear Sir,—We are in receipt of your letter of the 12th July, and in reply to your questions, we are of opinion that the Home Consumption of Ceylon Tea would in all probability receive some stimulus, in common with that of other growths, from a reduction or total abolition of the duty; any alteration would we think, affect every growth alike, with this exception, that inasmuch as the present fixed duty imposes a relatively heavier tax on low priced tea, any reduction or total abolition of duty would give considerable impetus to the exportation of common tea from China, which would in that case become once more an important factor in the trade, interfere considerably with Ceylon and Indian Tea in the market for low grade tea for "price"—The total abolition of the duty and the consequent absence of proper Customs supervision would also greatly facilitate the importation of worthless or adulterated leaf, which has hitherto not been allowed to be entered for Home Consumption.

You are quite at liberty to use these remarks before the Planters' Association of Ceylon, and trusting that you will find them useful.—We are, yours faithfully,  
(Signed) WILSON, SMITHETT & Co.

38 Mincing Lane, E.C. London, August 8th, 1898.

E. J. Young, Esq.

Dear Sir,—In reply to your letter of July 12th we write to say that opinion differs very widely among those who are interested in the question as to the probable result of an abolition or reduction in the duty on tea.

If the tax were removed we think probably the number of distributors might be increased, with the result that for the time at least demand would be brisk and clearances large which would deplete stocks to the benefit of importers—but it is by no means certain that a large permanent increase in consumption would follow:—seeing how very cheap tea—as a beverage now is.

Some think the remission of the tea would render it more easy to admit unsonnd and spurious tea. We think, on the contrary, the vigilance of the Inspectors would not be lessened and if it were a stimulus could quickly be applied.

Looking at the question broadly we incline to the opinion (not generally held) that abolition of duty would turn the scale in favour of the best as against the cheapest tea—thus directly encourage the production of the finer kinds in Ceylon—but importers could not expect to obtain more than a part of the total remission and that only for a time.

We are, dear sir, yours faithfully,  
(Signed) WM. JAS. & HV. THOMPSON.

23, Rood Lane, London, E.C. 12th August, 1898.

E. J. Young, Esq., Ceylon.

Dear Sir,—We beg to acknowledge receipt of your favour of 12th ulto.

In considering the points on which you ask our opinion we think it well to record our figures of Home

Consumption. Taking these from the Board of Trade returns they read as follows:—

	HOME CONSUMPTION. YEAR ENDING 31ST DEC.		
	1895 lb.	1896 lb.	1897 lb.
Tea from—			
India ..	116,343,314	122,941,096	124,534,194
Ceylon ..	74,023,899	80,294,475	85,433,554
China ..	26,201,374	19,831,678	17,242,247
Other Countries	5,231,640	4,718,251	4,129,783
	<u>221,800,137</u>	<u>227,785,500</u>	<u>231,399,778</u>

Again taking figures just published and showing results for first seven months of this year—

	HOME CONSUMPTION, SEVEN MONTHS ENDING 31ST JULY.		
	1896 lb.	1897 lb.	1898 lb.
Tea from—			
India ..	70,162,579	71,952,593	76,127,862
Ceylon ..	44,883,290	48,223,876	48,079,216
China ..	11,228,204	10,452,219	8,683,588
Other Countries	2,751,194	2,126,748	2,764,789
	<u>129,025,267</u>	<u>132,655,436</u>	<u>135,660,455</u>

We are of opinion that a decided stimulus would be given to the consumption in this Kingdom of Ceylon Tea if the present duty were reduced by 2d per pound; but inasmuch as the conditions under which Teas must be entered and warehoused and handled for the mere purpose of securing and collecting the Duty are necessarily cumbersome and expensive the value of such a concession would be more than double by a total abolition of the present duty of 4d.

We see no reason to suppose that China Tea would be specially benefitted by such changes in our Duty but assuming that the percentage of increase in its consumption to be equal that of Ceylon Tea such increase would be about one sixth of the Ceylon increase. We are of opinion that such fiscal changes would still leave the general position untouched, this general position being as shown in the above figures that our use of Ceylon Tea is increasing—our use of China Tea is decreasing.—We are Dear Sir, Yours faithfully,  
(Signed) WALKER, LAMBE & Co.

37, Mincing Lane, London, E.C. 18th Aug. 98.  
E J Young Esq., Messrs Whittall & Co., Colombo.

Dear Sir,—In reply to your letter of 13th July asking us to give you an opinion as to the probable effect on the consumption of Ceylon Tea if the duty were abolished or a moiety thereof removed, and whether the Importation of China Teas would be increased, we have now the pleasure to inform you that we have discussed these questions with several dealers and Brokers in the Lane and find they are generally against the total abolition of the duty, but would not object to a further reduction. If the Chancellor entirely removed the duty all check on the movements of the article entirely disappears consequently no reliable figures could be obtained. Doubtless the consumption of all classes of Tea (not only Ceylon) would be increased, but we fear it might encourage the importation of the commoner productions from Java, South Africa, and other countries, where they are beginning to cultivate tea and would most likely also induce growers to send us the inferior qualities to a greater extent than they do at present.—We are, Dear Sir, Yours faithfully,  
(Signed) SANDERSON & Co.

13 Rood Lane, London, E.C. Aug. 12th, 1898.  
E Young Esq., Colombo.

Dear Sir,—We are in receipt of your favor of the 12th ulto. addressed to our Mr. Gow asking his opinion as to the probable effect on the consumption of Ceylon Tea if the Duty is abolished, also as to the

effect of the duty being reduced 2d. Mr. Gow is now away on his holidays, but we shall have much pleasure in placing your letter before him on his return when he will doubtless address you fully on the subject. —We are, &c. (Signed) Gow, WILSON & STANTON.

### COFFEE PLANTING IN "SWITZERLAND" (SUMATRA.)

Oct. 7.

SIR,—It is rather a startling idea, isn't it? But the explanation is that the sub-district of Upper Serdang on the East Coast of Sumatra, is locally known in two divisions, viz., Serdang East and Switzerland: and as these remarks are intended to refer chiefly to Mr. Van der Poorten's admirable notes on "Serdang and the Coffee Enterprise": and as Mr. V.D.P. visited only the estates in Switzerland, I have chosen the above somewhat startling head line.

These notes have been read with interest and very well received throughout the district. The Manager of Begerpang writes as follows in reply to a query of mine as to whether the statement that his estate was the largest is correct. "That Begerpang will be the

#### LARGEST ESTATE OF SERDANG

is the verity, because I will have 400,000 trees till the end of the year, and plant 100,000 more during the next year.

"I would like to see in another article the cost price of one picul of coffee sold in Europe. I think that this price will not be more than fl 20 (guilders) a picul (including 5 per cent rent of capital) on a fully bearing estate where the youngest trees are not less than three years old. The prices now in this bad season paid in Europe are fl 36 to fl 38 (guilders) a picul. B B estate sold lately for 62 to 65 centimes per 500 gr. in Havre. This will be fl 38.75 to fl 40.62 per picul. So we can always reckon that we will get an average of fl 35 to fl 37 over a long period." Now the above is most interesting taken in this connection. It is dated 28th August 1898, while a few days ago I received a letter from a friend in Ceylon dated 5th Sept. 1898, a difference of only seven days, and writing of

#### LIBERIAN

he says:—"The prices are too very bad! Here it sells at R20 per cwt. or R3'87 per bushel parhement." Another estate that I know has never netted during all this time of depression, less than \$29 per picul. Again, a few days ago I was visiting a friend, and I said, in chaff, 'Folks say that you put \$10 a picul on to the price of your coffee.' He went straight to his office and showed me his last account sales—50 bags—(fr 64 nett.)

#### THE BATTLE OF THE DISTANCES

rages here nearly as savagely as the Battle of the Gauges with you in Ceylon. Regarding it, my first-quoted correspondent from Begerpang writes:—"I have myself adopted the distance of 10 feet by 10 feet and think that this will be the best. 12 feet by 12 feet would be very nice, but regarding the wealthy growth of our weeds, I would not be brave to use this distance. Less than 10 feet by 10 feet is certainly not enough. The soil in the lalang (illook) is quite the same as in the forest. Altitude 300—600 feet. Rainfall all right. Returns of 10 to 12 cwt. per acre after four years (two katties per tree) all right."

As to distances, as I have said, the battle rages. My Begerpang friend sticks out for 10 by 10 feet. Another man says 12 by 12 feet. Yet another 12 by 12 feet with a quincunx, and again 14 by 14 feet with a quincunx. On his

way to Ceylon, Dr. Treub, of Buitenzorg, had a glance at the district. Unfortunately he had no time to go through it; but he is reported to have said that, taking into consideration soil and climate, 15 by 15 feet was the distance for Liberian coffee in Serdang. And here your humble servant slips in. From the first time I saw coffee growing here, I advocated 7 by 7 feet. Take off two crops, and thin out till you are 7 by 14 feet. Afterwards thin out as occasion calls, until you are 14 by 14 feet. Some friends adopted my views, and are now growing in spirit. They confess that the returns are grand, more than could have been anticipated. But what cuts them to the heart is the prospect of having to cut out such magnificent coffee. "Throw sentiment to the winds my dear boy, and look at the Bank-book." This, it is confessed, is the right view, but still sentiment has its sway. The idea of the soil being exhausted under this treatment cannot for a moment be entertained in this district.

When I first knew Serdang three and a half years ago, there were

#### FOUR COFFEE ESTATES,

all in the initial stage, aggregating about 600 acres. There are now

#### TWENTY-THREE ESTATES

(possibly more) with fully 8,000 acres planted in coffee, and extension is still the word. Two or three estates there are that began with small capital when coffee was \$40 upwards at Singapore, looking forward to easy borrowing times later on: and of course depression put these into a quandary for a time. But every one of them has struggled through the rapids. Switzerland has started its Ober-Serdang club, which gave its house-warming last month. A bowling-match, a dinner, an entertainment, concluding with dancing. There were over 40 people present, including four ladies and two controleours (magistrates). I was told afterwards that one piece was staged of which Mrs. Ormiston Chant would not have approved. But I was in the green room, dressing at the time, so I can't speak from personal knowledge.

W.T.McK.

### THE INTRODUCTION OF THE GOURAMI FISH INTO CEYLON.

Ratnapura, Oct. 22.

DEAR SIR,—I am glad to see that the Gourami is again attracting attention. Several attempts have been made to introduce it into Ceylon. Some were imported by Sir William Gregory which arrived safely, and were placed in ponds in Kandy; but so far as I can learn, were no more seen. Another attempt was made later (by Mr. LeMesurier, I believe) and a solitary specimen was to be seen for some time in the basin in the Gordon Gardens, Colombo. In 1894, with the kind assistance of Messrs. Bois Bros. and of the late Capt. Bayley, I obtained a consignment from Mauritius. They were most carefully shipped and cared for *en route*; but most unfortunately were all sent off to Nawara Eliya at once on arrival, and next morning all were dead.

Messrs. Scott & Co. of Mauritius had warned us that it was doubtful whether the fish would thrive in such a cold climate, and we had intended to distribute them at different elevations. I intended to try again; but was moved elsewhere a few weeks later.

The Gourami has been introduced into India, and the Hon. Secretary of the Nilgiri Game Association told me that it had been a great success. I believe that it is quite common in Java.—Yours faithfully,

GEORGE M. FOWLER,

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898 :— "All the seeds done well, and now some of the plants from them are 13 inches high." This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases] 500 plants in each, wrote 5th April, 1898 :— "I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants."

*For price, instructions and particulars see our Circular No 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars see our Circular No 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied.

*See our Circular No 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants** of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes :—

DEPARTMENT OF AGRICULTURE,

CAPE TOWN, 27TH JULY, 1898.

MESSRS. WILLIAM BROS.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo River at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,

(Signed) P MACOWAN,

Government Botanist.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

Agents in London :—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Agent in Colombo, Ceylon :—E. B. CREASY, Esq.

Telegraphic Address :

WILLIAM, VEYANGODA, CEYLON.

A.I. and A.B.C. Codes used.

J. P. WILLIAM & BROTHERS,

Tropical Seed Merchants,

HENARATGODA, CEYLON.

## Correspondence

To the Editor.

## THE GOURAMI FISH.

DEAR SIR,—It is said that the Gourami may be inferior from a sportsman's point of view, but otherwise is by far the more important fish, and could in a few weeks be established by transporting a couple hundred live fish, which should prove neither very difficult nor costly.

The Gourami is supposed to have spread from Cochin China, which is given as its native habitat, and where, existing in a wild state, it is found up to 100 lb. in weight. In other countries the fish domesticated and being kept in captivity, and is usually marketed before it is 12 lb. in weight—when, no doubt, it proves better eating and is more profitable than when larger. Many consider the Gourami the finest of all fish. The flesh is of a pale straw colour, firm, flaky and very delicious.

The fish is said to be very tenacious of life, being generally taken to market alive, and if not sold returned to the water. It is described as being very hardy and growing fast—mainly a vegetable feeder, but eating any form of waste food. Any one with a pond in his garden can keep the fish and a scroop net is only necessary when one is wanted for dinner. A writer says that it would be difficult to find a new industry which would yield such satisfactory results to any one who owns water, such as a pond or lagoon, as the cultivation of Gourami. For the above facts I am mainly indebted to Mr. D. O'Connor, a Queensland authority on Pisciculture.

The scientific name of the Gourami is *Ospromenus olfax nobilis*. Besides being so commonly found in Mauritius as well as Java it has been established in many other parts, and is found in the tanks of Calcutta, Madras and the Nilgiris where it attains 20 lb or more in weight and is considered excellent eating when kept in clean water.

Dr. Watt, writing a few years ago, says that there the Government of India were considering the introduction of a Fisheries Bill, to remedy the wholesale destruction of fish, by preventing fish poisoning, regulating the size of net fish, guarding the mouths of irrigation canals against the entrance of fish, levying a tax on the use of fishing implements, &c.

It is said that the Seind fresh-water fisheries in 1882-3 yielded a revenue of R92,541, and in Burma in 1883, 12 to 13 lacs of rupees were netted,—and these instances are given as arguments in favour of the introduction of a Fisheries Act into other provinces of India, and why not also into Ceylon.

We read that Mr. D. O'Connor lately arrived in London with four specimens of the *Ceratodus* peculiar to Queensland which he succeeded in keeping alive. Two were purchased by the London Zoological Society for £90, and he was offered £100 if he delivered the other two alive at the Jardin des Plantes, Paris.

Mr. O'Connor has determined that on his way back to Queensland he will bring living Gourami from Java or Mauritius, as he considers that Queensland waters are eminently suited to be habits of the fish which he expects to very easily acclimatise. The Mauritius Government was enquiring after Sinhalese cattle a little time ago, why should not the Ceylon Government see about getting over some of the Mauritius fish?—Yours truly,

C. D.

## COCONUT GROWING.

Sea View Estate, Veyangoda, Oct. 25.

DEAR SIR,—I send you per passenger train this morning to Fort Station one self-grown coconut plant eyes downwards in a bush under a coconut tree found today on this estate unattacked by white ants: I think that this mode of growth will turn out better than plants grown eyes upwards or slanting. On the 15th July last I have placed in open nurseries 4,000 coconuts eyes downwards at this estate and at Kola estate and ought to begin to germinate from 15th January next; so far none of the nuts were attacked by white ants; I shall let you know the result in due course.

I hope coconut plants grown eyes downwards will be a success and an improved method of cultivation.—Yours faithfully,

J. P. WILLIAM.

[The plant sent us is a healthy one. But let Mr. William try 100 nuts under equal circumstances, in the three ways, and report results.—Ed. T.A.]

## ALL ABOUT TEA.

DEAR SIR,—The following is one of the lessons in the First Graphic reader series (Collins') so much used in schools now-a-days:—

## MAKING TEA.

"Mother, let me make the tea this time."

"Have you ever made it, Milly?"

"No, mother, but I wish to try now."

"Well, take some tea from the can, and put it into the tea pot."

"How much shall I take?"

"Fill the spoon once for each one of us."

"One, two, three, four, five, and a big one for Frank, makes six."

"That will do, now pour in some hot water, and set the tea pot under the cosy, so that the tea can infuse."

"How long must the tea infuse?"

"Only a little while. The hot water will soon make nice tea for us. Can you tell me what tea is, Milly?"

"Yes, mother, I think I can. Tea is made of the leaves of a plant that grows near the sea. Men pick the leaves from the plant, then roll them up, and dry them. When the leaves are quite dry, they are put into boxes and sent to us in large ships. The tea plant grows in lands that are very far off, and the ships have to sail a long, long time before they get to us."

That graphic account of tea manufacturers (underlined) is simply delicious.

The illustration attached to this brilliant description shows a garden laid out in small beds like those for vegetables, with some carrot-like plants in three or four rows.

Surely it is time that a popular lesson on tea-making or on the tea-plant in general should be drawn up by the Thirty Committee and sent off to Messrs. Collins, Macmillan and other publishers to be embodied in their reading books.—Yours truly,

D.

## INSECT PESTS IN HAWAII (AND ELSEWHERE) AND MR. KEBELE.

Eton, Pundaluooya, Oct. 24.

DEAR SIR,—I have to thank you for the copy of the "Sugar Journal" and "Tropical Cultivator" of September 15th.

The interesting article on "Insect Pests in Hawaii" must be by our friend Mr. Albert Kæbele who, since his visit to Ceylon, has been busily employed in importing beneficial insects from all parts of the world for the benefit of the Hawaiian planters. He has even gone further, and pressed into his service bats and toads, which were previously unknown in the islands. The latter seem

to have been successfully established, but the imported bats are said to have disappeared. I wonder that Mr. Kœbele has not tried moles. I have often thought that these little animals would be of great use in reducing the number of underground insects such as cockchafer grubs, wireworms, cut-worms, and even white-ants. Their introduction would be unattended by any danger. Even in England the only harm they can be said to do, is that they spoil the neat appearance of the grass sward by the numerous little hillocks of earth thrown up during their subterranean wanderings in search of the grubs that feed upon the grass-roots. It is said that the wholesale destruction of moles in England has led to a serious increase in damage from underground larvae. Mr. Kœbele himself quotes an instance of the value of the mole. He tells us that a gentleman of Yokohama, "in building a lawn for a cricket ground, had a brick wall surrounding this to a depth of several feet to prevent the moles from injuring the lawn. All went well for a few months, at the end of which the grass began to get yellow and die off. All efforts with manure and water were useless, and he continuously found larvae of Scarabæids (Cockchafers) that had come to the surface to die. Nothing could be found to remedy the evil until the gentleman was advised to take down the wall and give the moles access to the larvae, which was done, and the lawn soon recovered."

Mr. Kœbele may be called the "Apostle of Natural Remedies." He altogether refuses to recommend artificial remedies, as being effective only for a short time and too expensive.

In view of the failure that so frequently attends the freezing process, it would be interesting to learn what plan Mr. Kœbele has found most successful for the transportation of the numerous consignments of lady birds and other beneficial insects he has been procuring for the last three or four years.—Yours faithfully,

E. ERNEST GREEN.

I have worried a good deal lately to find some reason for the prevalence of cutting down, and I believe that I have found the reason, and I expect to hear that those planters who do not fear the "Gormandizer" are not much given to cutting down their tea bushes. For the present I do not think much more need be said until this point is settled. But I want to start a new discussion which I have never seen before in print, *i.e.*,—

THE PROPER TREATMENT OF YOUNG TEA.—Opinions vary, and young tea is generally allowed to grow untouched for a term of years. The first pruning is given at the end of the second year after planting, or at the end of the third year. Some seedlings are cut to a few inches when they are planted if they are over 18 months in the nursery.

This also is a very important subject, and as I have some new planting I should like to get professional opinion.

I have filled in a plot of ground on which there are about 10 per cent of plants alive. It was planted about 15 years ago, and a few of the bushes are as good as can be desired, others are sickly and a few just alive. The soil *cannot* be bad or there would be no good bushes after 15 years of struggle.

My intention is to pluck the new and old plants at 2 feet from the ground. I intend to go on plucking the new plants until they get strong enough to prune. Above 2 feet I shall consider all growth to be mine, and below that all shall be given to the bush.

I have never tried this system, and will of course modify it if I find that it does not succeed, but I have great hopes that this will be the best way of getting the new plants to become bushy and strong, and come into full bearing gradually.

The system of growing for 3 years and then cutting, back to a certain level, I consider to be a great waste of material, and of no use whatever to the bush for its future growth. During these 3 years one has induced a heavy growth at a point where it is not wanted, and when the bush is pruned one is left with three or four straight sticks which have to make new growth before plucking can commence, whereas by judicious plucking and pruning, one might have a fat round bush ready to give any quantity of leaf.

1874.

### AN INDIAN PLANTER OF 24 YEARS' EXPERIENCE ON TEA PRUNING.

SIR,—I have read several of the recent letters on Pruning, and from one of them I have received a perfect revelation. This revelation hinges on the word "Gormandizer." I read that gormandizers or straight shoots growing from below have been carefully cut out.

Consequently, the bush could *never* be renewed, and in the course of eight, ten, or twelve years the existing branches become worn out. Then they have to be cut down in order to get a new set of gormandizers?

The words gormandizer and sucker have a certain fascination about them, and on my word I believe that this epithet has been the cause of incalculable loss to tea estates. It has not been tested whether the sucker sucks up and makes leaf of it. Tea planters have got the word from fruit-growers, who naturally do not want leaf, and have used it to the destruction of the only means which the bush has to renew itself. No doubt, the destruction of new shoots will cause a slight increase of growth on the old branches and in course of time the bush may cease to try and force out growth through new channels. It is highly probable that this is the cause of deterioration in tea bushes, and the blame has been placed on poor soil, or bad weather or over-plucking.

My own experience is that my best branches are suckers, which I have allowed to grow and come to maturity. In each bush where one sees growth extending well above the level of the bush a sucker will be found, growing straight up from the ground or from low down on some old branch.

### POULTRY DISEASE.

Oct. 29.

Dear Mr. Editor,—Many thanks for the interesting information about the shooting stars, lately given us, which has interested many. Can any correspondent give me a cure for the following disease which has attacked my poultry, and which I find very fatal, especially to chickens? It first appears in the form of a small spot, on the comb, generally near the eyes, spreads very rapidly and swells to a great size, until the fowl is blinded, which happens in about three days, and of course dies from starvation. I have tried the native remedy of saffron and coconut oil, but without effect. I am now trying carbolic acid and sweet oil. If any fowl fancier can advise me, I shall feel very grateful. I hear that native fowls are dying in great numbers from this disease just now, in the lines and villages.—Yours, etc.

### UPCOUNTRY SUBSCRIBER,

[An authority on poultry reports:—"A mixture of lime juice and saffron must be applied. The fowls and chickens must be fed with soft boiled rice as the mouth is very tender. The fowl-house must be well smoked out daily with fumes of coal tar which should be heated in a chatty in a corner of the fowl-house."—ED. T. A.]

### THE INDIAN TEA INDUSTRY: STARTLING NEWS.

DEAR SIR,—Depression in the Tea industry in Assam, according to a communication to the Calcutta *Englishman* from a Cachar planter, is attributable to the following causes:—Overproduction by widespread extension and the opening out of large tea tracts; high exchange; unseasonable weather and late monsoons; short seasons resulting therefrom; drought and injury to plants from various causes, inferior quality and small outputs of tea; impossibility of reduction of working expenses and cost of manufacture.

There is one strong point made out by the writer and that is the reduction of the Calcutta Agents' charges. If, as he states, two annas per lb. of tea are run up by the charges of these magnates, there is certainly room to reduce them by 25 per cent. Two annas equal 12 cents, so that 9 cents per lb., would leave a fortune to our Colombo Agents, whose charges hardly reach three cents per lb. even if they sell in the country and are Agents and Secretaries for a Company. The startling announcement is made that 200 planters are likely to be in Calcutta, looking out for employment at the end of the year. Perhaps that is an Indian edition of the yarn that was started by your evening contemporary.

China, this writer thinks, will eventually be the place for the surplusage of planters in India, when once the valley of the Yantsekiang is available. If so, the unfortunate unemployed planter of the present will have sometime to wait.  
—Yours truly,  
PLANTER.

### CURRENCY AND PLANTERS.

Claverton Manor, Bath, Oct. 14, 1898.

SIR,—As the Indian Currency Committee is now understood to be considering the question of a Gold Currency for India, I send you a memorial I addressed in May last to the Colonial Office and the reply thereto.

You will see that my proposals are very similar to those of Mr. H. D. MacLeod, excepting that, where he advocates the minting of sovereigns and half-sovereigns at Calcutta. I propose the minting there of one 12/6 Gold Coin, which—taking exchange at 1/3—would represent R10 and so fit in with the existing Indian and Ceylon note issues. The sovereign would necessitate an entirely new Note issue and is in itself a coin of too high value for the currency requirements of a native population.

On the other hand a 12/6 Indian coin might at home largely supersede the half-sovereign, which is said to be very uneconomical as not wearing well.—Yours truly,

E. HARCOURT SKRINE.

Downing Street, 13th May, 1898.

Sir,—I am directed by Mr. Secretary Chamberlain to acknowledge the receipt of your letter of the 9th instant, respecting the question of the Indian Currency, and to inform you that a copy of that letter will be communicated to the Indian Currency Committee.—I am, sir, your obedient servant,  
C. P. LUCAS.

E. HARCOURT SKRINE, ESQ.

New University Club, St. James Street,  
9th May, 1898.

To the Right Honorable J. Chamberlain, M.P.

Sir,—As an owner of tea property in Ceylon I have the honor to offer some remarks on the subject of the currency which has, I understand, been dealt with in a memorial to the Colonial Office by the

Ceylon Planters' Association. That memorial had not been published when I left Ceylon last month, and it was therefore not in my power to address any representation on it through the official channels, but, inasmuch as I deduce some very different conclusions from the premises upon which the case for the planter is there argued, I venture to hope that I may be allowed to submit this letter for your consideration.

In so far as the Planters' Memorial is descriptive of the mischievous results to the Ceylon Tea Grower from the enforced contraction of the currency, it must command the loyal support of all producers, but, when it goes beyond this, to recommend as a remedy the re-coining of silver on the basis, as I understand, of a somewhat lower Exchange for the rupee, I think it is time to bring to light some of the fallacies that in my opinion have obscured the judgment of the drafters of that memorial.

To instance these fallacies I must refer you to clauses 20 and 26 of the memorial.

The concluding paragraph of clause 20 says: "The rate for Peasant Labour in the Central, Western and Sabaragamuwa Provinces appears to have remained fairly constant at about three days' labour for a rupee, but that rate had only recently been attained in 1870. The rate in 1864 was generally a little lower."

Clause 26 says:—"With reference to the possible re-adjustment of local wages and prices measured in silver, while we find that there is in Ceylon a slight tendency towards increasing wages and a more general tendency towards increasing prices, such increase bears no actual proportion to the progressive decline in the gold price of silver and it can hardly be attributed thereto. It is our opinion that the date of such a general adjustment of wages and prices is uncertain—that it will probably be remote, and that it may be postponed for an indefinite period of time."

The object of both these clauses is to establish the contention that India and Ceylon as Silver-using countries are incapable of re-measuring their commodities in gold. I admit that there is much apparent justification for this contention, opposed though it be to an inevitable natural law, but the fact that it is so opposed should have led the planting body to regard their inferences with suspicion.

The Planters' Association accepts the fact that the rate for peasant labour has remained constant at about three days' labour for a rupee from 1870 to 1898 as proof that the decline in the Gold price of Silver has not resulted in a proportionate rise of wages. It is the purpose of this letter to shew that while the labour wage has, it is true, remained constant at three days' labour for a rupee, the value of that wage to the cooly has been enhanced fully 40 per cent during that period—or the equivalent of the fall in Silver—by compensating advantages.

To trace these it is necessary to give a brief review of the Labour Wage for the past 34 years.

The Memorial admits that (1) during a period of par of Exchange 1864 to 1870 the Cooly Wage was rising to some slight extent. That rise was commensurate with a stable trade price for coffee, and may fairly be taken to indicate a normally appreciating Labour Wage.

(2) A second period, 1872 to 1881 was a period of great inflation, coffee prices rising from 65s per cent to 130s. This inflation was reflected in Ceylon by correspondingly higher cultivation. Labour that had in previous years been paid off after crop, to return to distant homes in India, was kept on for manuring and other works. Consequently the normal condition of a slowly rising wage was arrested, and made up to the cooly by this new found employment during the slack season. This period of high cultivation, the latter years of which balanced the first fall in Silver, may be said to have ceased in 1881 when leaf disease and a collapse in the price of coffee brought the country to the verge of bankruptcy. It was succeeded by (3) a period of transition from the cultivation of coffee to that of tea. During this period, 1881 to 1885, the Cooly Wage was, it is true, still constant at three days' labor for a rupee, but the coolies were often not paid at all and on some estates worked for years on a bare subsistence in Rice. On estates worked with reserve capital, a

very rigorous task was exacted, such as is certainly quite unobtainable from the cooly of 1898, and a fuller value to the producer was undoubtedly obtained for the same wage. The argument of the apparent uniformity of the wage at the period preceding Tea is, therefore of little account. The coffee enterprise, while favoured by the exchange may be compared to a ship with a favoring breeze struggling vainly against a Maelstrom. Indeed, so disastrous to labor was the ruin of coffee that, notwithstanding the collapse of Silver which accompanied it, wages that should have risen in accordance with a natural law, were actually lower, estimated in the balance of earnings available to the cooly than they were when the exchange was at par. The natural result of all this was that the country was being rapidly denuded of coolies.

With these conflicting influences at work, it is idle to assume that the uniformity of wage had, up to 1855, anything necessarily to do with the question.

Period 4.—Subsequent to 1855 the uniformity of wage argument is still further discounted by the altered circumstances to the cooly in tea. Whereas in coffee, a large proportion of the labor force was paid off to return to their homes at the end of crop, the women that remained worked half time, and the children not at all, the whole Tamil family finds, in tea, a constant full wage all the year round, and the women and children—the least useful laborers in coffee—have become the labor most in request in tea. The wage continues the same, "three days' labor for a rupee," but the earnings of the Tamil family have increased fully 40 per cent., or very nearly, if not quite the equivalent of the fall in the Gold value of Silver, which the Planters' Memorial contends has had no such result. These advantages to the cooly (equivalent to a direct rise in wages) have been further added to by improved journey facilities to India. The Southern Indian Railway to Tuticorin, made in 1875, gave the cooly direct communication with his Indian home, superseding a toilsome march of many hundred miles by the circuitous Northern Ceylon route via Mannar, a route which was quite impracticable for weakly women and children. I am satisfied that this view of the question has been entirely overlooked hitherto, and that, if it is fairly sifted, it will be found that the cooly has been more than compensated for the fall in the purchasing power of his wage by the increased volume of wage earnable, and by easy access to his country.

The contention of the Planters' Memorial—that prices have remained unaffected by the fall in Silver—can be similarly tested in the history of the Rice market. This article, less than any other produce, lends itself to remeasurement with the rise or fall of the precious metal used as currency, because it is cultivated on lands that can grow little else.

It will be found that previous to the great famine in 1876, rice was selling in Kandy at Rs 3 per bushel and in 1895 previous to the last famine at Rs 50, or a rise of 16 per cent. The latter price, however, by no means represented the real rise in value paid to the Indian producer, for his cost of transport in 1896 had been enormously reduced by railways and cheaper freights. If allowance is made for this it will be found that the price received by the Indian Rice grower in 1896 was some 30 to 40 per cent. higher than in 1875, so that here again the natural law of remeasurement of the commodity in the currency had been at work.

In these two main instances—the cooly wage and the price of rice—a nominal but deceptive sameness of rate in Ceylon is used as an argument to support the contention that these commodities have not remeasured themselves in Silver, and therefore will not re-measure themselves in Gold if the latter currency is resorted to. I arrive at the opposite conclusion, and am of opinion that if the depletion of the Indian Original Currency—Silver—is rectified by an influx of Gold to restore the equilibrium between currency and commodities that the Producer, equally with all other classes—will be benefited. Mr. Allan Arthur, in his Standard letter, has shown the disadvantages certain to recur by a partial reopening of the Mints to Silver, which is what the Ceylon Memorial advocates. The result to Ceylon Tea of such a policy,

would be to foster the existing over-production which is likely, in any case, for some years to be a greater hindrance to profits than the recent high Exchange.

On the other hand, the introduction of a Gold Standard will have the following beneficial effects. If the transfer is made at a fair rate, and I consider a fair rate to be that which was ruling before the American Legislation which led to the closing of the Indian Mint in 1893 and which I will take for this and other reasons, at 1s. 3d. per Rupee—the results to the Tea Producer will be (a) he will have a fair amend made to him for the unduly high rate recently forced upon him; (b) the stringency of the money market, as evidenced by prohibitory Bank rates of interest will cease; (c) the English investor will acquire confidence and lend money on mortgage in Ceylon at 5 per cent where he would not now (under the uncertainty of ever getting his capital back) lend it at 10 per cent; (d) there will be a mitigation if not an end to the recurring periods of inflation and depression which has been most injurious to sound enterprise and must continue to occur with an untrustworthy currency medium. There will be less phenomenal profits but they will be constant. (e) The transition to Gold will furnish the opportunity for reconsidering the cooly wage. If the Southern Indian rate of 4 annas for men and 2½ annas for women commands a full supply of Labor there, the Ceylon rates of 6 annas for men and 5 annas for women, taken in connection with the new journey facilities, would appear too high. At any rate the subject would have to be reconsidered, if only to supersede the custom of making profits on rice which has always been a considerable factor in Ceylon in the wage question. These profits are likely to be very considerable if rice comes to be remeasured in Gold, and, being always open to misconception, it would be better to abandon them in favour of a reduced wage. (f) The steadiness given to the cost of production would induce the Planter—instead of looking to the fall of Exchange to help him—to develop his own latent economies. There is no doubt that Labor is not nearly as efficient as it might be, estates having been flooded with new and untrained coolies supervised by young men from England who are gaining their experience at the expense of the Industry. (g) When these results have been worked out, it will be found that there is little to fear in the competition from Silver-using countries on which so much stress is laid in the Planters' Memorial.

Our China competitors will be unsupported by cheap capital, as in Ceylon, and Rice—the food of the China cooly—must rise in price as the Gold countries purchase it. The quality of China Labor must also deteriorate in proportion as it is ill-paid and ill-fed.

I have ventured to suggest the transition from a Silver to a Gold currency at the rate of 1s 3d. per Rupee not only because it appears a *just* rate, but also because it will lend itself better than any other to the double necessities of England and India, seeing it would be represented by a Gold coin the equivalent of 12s 6d in England and R12 in India. The present stock of Rupees is not more than sufficient for token requirements, and it must be remembered that the burden of currency work in the East will always fall on the token coins, e.g. in monthly payments for Labor the individual wage after deducting food supplies but seldom reaches R10. This fact disposes of the idea that the demand for Gold for circulation in India will ever in any way compare with the like demand for it in England where the Labor wage is so much higher and food is not made part of the terms of payment.

This letter of course accepts the theory that the Indian Government was justified by the cyclonic disturbance to the currency created by American legislation, in contracting the Indian currency to meet a special danger, but the object having been served, it is bound to revert to a sound principle which at the present stage can only mean a *bona fide* Gold Currency for India.—I have the honour to be, Sir, your obedient servant,

E. HARCOURT SKRINE,

## IMPERIAL TEA DUTY.

We think the inference of most people from the interesting and varied Correspondence of the London Brokers with Mr. E. J. Young, (see page 398) will be that any reduction in the Imperial Tea Duty should not exceed 2l a lb. in the first instance, if the interests of Indian and Ceylon producers are to be studied. When the effect of such reduction is seen as to the possibly considerable introduction of cheap and even trashy teas, then will it be time enough to settle about "abolition." Of course the people who can influence Sir Michael Hicks-Beach are the home consumers; but a very considerable proportion of these would be glad to vote according to the wishes of British tea planters, who indeed, have a very wide parliamentary influence through relatives and friends in the United Kingdom.

## THE GOURAMI FISH FOR CEYLON.

We are much indebted to Mr. Fowler, Acting Government Agent, Ratnapura, for his resumé of past attempts to introduce the "Gourami" into Ceylon. Seeing how well it has prospered in Mauritius and on the Nilgiris, not to speak of Java, there can be no good reason why it should not be a great success in Ceylon. If specimens were brought from the Nilgiris they ought to be well-suited for introduction into the Nuwara Eliya Lake. We trust the experiments about to be made by the Fishing Club at Mr. Burrows' instance may be fully successful.—The scientific name of the "Gourami" (misprinted on Saturday) is *Ospromenus olfax*.

## INFERIOR AND REFUSE TEA.

A planter calls attention in a letter below to the large quantity of very inferior, even trashy, teas which continue to be offered for sale in the local market, justifying to some extent the satirical remark by metropolitans that the Colombo market was becoming the "dustbin" of the trade! Our correspondent considers that all tea selling under 20 cents a lb. must be made at a loss, so that its sale can do no good to the proprietor, while injuring planters as a body. But we are creditably informed that much of the said tea is from native gardens, the owners of which take no account of their labour, but consider every cent received as grist to the mill. We fear the Press can have no dissuading influence on such sellers; and if the teas were not shipped outside the island, no harm would be done. But the natural fear is that a good deal is bought to be shipped, or blended, to the damage of the name and fame of Ceylon tea. The only remedy we can think of is that such tea be all bought for the "Thirty Committee" to be used in some guarded way for sale and distribution in local, or bazaars for sale, under a guarantee, for the purpose of manufacturing "caffeine."

When in Manuheim in 1891, we went over the extensive Chemical Manufactory of Messrs. Bohringer and apart from the main purpose of our visit (the manufacture of cinchona-bark into quinine, &c.), we were interested in seeing and learning about "tea fluff" and the manufacture of "caffeine." Now,

we learn that so great is the demand for "fluff" and "factory refuse" for caffeine, that Messrs. Bohringer & Co. of Colombo can take 200,000 lb. a year at a price not exceeding 4 cents per lb. A cent or two of profit made from the collection of "refuse" sold in this way, is legitimate enough; for the buyers are ready to guarantee that not an ounce is diverted from the Chemist. But this after all does not affect the main question of the trashy, inferior, made teas selling between 4 and 20 cents per lb. for export from the island. It is for the "Committee of Thirty" in conjunction with the Committees of the Planters' Association and Chamber of Commerce, to devise some means of mending or ending this evil practice.

## CEYLON TEAS AND SELLING RUBBISH.

SIR,—I have gone to the trouble of extracting from last Colombo Tea Sale the total of teas sold under 20 cents per lb. on that day the 19th. The total of the sale that day deducting "not arrived" parcels was 698,661 lb. and the total of tea sold under 20 cents ranging from 7 cents to 19 cents was 39,851 lb. which works out to nearly 6 per cent of teas that are being put on the market by the growers at a loss; and were these teas destroyed it is surely safe to say the buyers of this muck would have to contend for better teas and materially raise the average value. Why has the parent Planters' Association done so little in bringing this before the planters. It is suicidal sending these teas to market.

OLD PLANTER.

## CEYLON TEA IN WURTEMBERG.

We are glad to learn that Ceylon tea has been freely introduced not only into Stuttgart, but into Southern Germany generally, by Messrs. Bohringer & Co., although chiefly so far throughout Wurtemberg. In Stuttgart alone there are no less than sixteen of the leading grocers now selling Ceylon Tea supplied by the above firm. Mr. Geyer, of the firm, who is now in Colombo, is very hopeful of a wide extension of the sales all over the country, and we have seen the printed forms used in the different agencies in Wurtemberg, so that there can be no doubt of a very considerable business having been started. "The Thirty Committee," who support Messrs. Bohringer & Co. in this matter, will be interested in the progress made and still more in what is anticipated.

## THE PESTS AND BLIGHTS OF THE TEA PLANT.

This latest monument of Dr. Watts' labour and research\* is of great interest to tea planters, for it is not only a scientific description of the many and various evils affecting tea, but also a practical discussion of the best means of warding them off. The book took its origin in a journey undertaken for the purpose of studying the matter and of reporting on the use of an infusion of the leaves of *Adhatoda Vasica* as an insecticide. On the latter point Dr. Watt finds that

\* The pests and blights of the tea plant by Dr. G. Watt, C.I.E., etc., Superintendent, Government Printing, Calcutta, 1898.

syringing is of service in checking the first attack of some pests, but that on a large scale it is impracticable.

On the subject of tea fertilisers, due prominence is given to the effect of Symbiosis in making atmospheric nitrogen available to the roots. The Leguminosæ are divided into three subdivisions, Papilionaceæ, Mimoseæ and Cæsaliinæ, according as roughly, the flower resembles the Pea, or the Babul, or is irregular like the *Gulmohr*. The two former of these subdivisions alone are known to possess the root-nodules which are the results and visible evidence Symbiosis. A few other trees, such as Alder and *Eleagnus Hortensis* possess the same power. As Symbiosis involves the work of a Microbe or Bacterium, a gelatine cultivation or vaccine has been made for the purpose of propagating it. This is called Nitragin, and has only to be diluted and mixed with the soil. Unfortunately for its utility in this country, it has to be kept in the dark and at temperature not above that of the human body. The natural method of inoculating a poor soil would be to scatter over it a considerable quantity of soil known to be rich in the Bacteria, or to flood it with water drained from such soil. Dr. Watt's method is to divide a 500 acre estate into 5 or 10 plots, each in turn to be sown with *Phaseolus acuminifolius*, or other Leguminous crop; after the legume is ripe, the green stems are hoed in, and left till complete decomposition has taken place. The soil will then be highly charged with Bacteria, and by scattering it in handful all over the estate the soil becomes inoculated. Tea produces no nodules but it certainly benefits by the presence of plants that do. The favorite trees generally grown as tea protectors are "sau" *Albizia stipulata*, and "Sissoo," *Dalbergia Sissoo*. Dr. Watt protests that a good deal of harm is done by excessive hoeing. He thinks that weeds are not always harmful, and suggests that a lot of good might be done by riding estates of useless Composite, &c., and replacing them by Leguminous weeds, which could be hoed in with great profit. The practice of burying prunings meets with strong condemnation, as the surest way of propagating blight and many other pests that ought to be burnt once.

Some idea of the ravages of these pests may be formed from the fact that the "caterpillar," *Andraca bipunctata* belonging to the Bombycidae, and sometimes called the "brown" or "bunch" caterpillar, costs an estate R1,500 in six months for the labour of coolies who collected no less than 69½ maunds. In another case 8 to 10 maunds have been collected daily. Another hairy caterpillar, probably belonging to the Arctiidae, furnished a daily yield of 50 maunds, without making any visible impression on the stock. The Psychida, Bag-worms and Faggot-worms, are not very dangerous if a sharp eye is kept on them, and any tendency to multiply nipped in the bud. But they are rather insidious, as a few apparently old abandoned grub-cases may suddenly burst forth into crowds of hungry little caterpillars, and the bite of some of them is supposed to act like a poison on the tea plant. The most curious of this curious family is perhaps the limpet caterpillar, *Acanthopsyche Reidii*, which is about an inch long, in shape like a cow's horn with a flat sucker attached over the open end. It puts the sucker down on to a leaf, and sucks out a spot every 5 minutes. When the leaves are gone the bark is attacked. There may be a score or more on every leaf, so that the unfortunate tea bush appears to have developed a formidable crop of thorns. *psyche assanica* is a similar species, of tendencies as bad or worse. The Cossidae are represented among the pests by *Zeuzera Coffee*, the rod Borer. The female moth has a long hard ovipositor with which she deposits eggs in the crevices of the bark. The young caterpillar gnaws into the small shoots and works down into the roots, eating out the pith and surrounding wood. The Limacodidæ have the genera *Thosia*, *Parasa*, and *Belippa*, with caterpillars protected by a formidable 'cheveux de frise' of stinging hairs or spikes. The Lymantridæ are also hairy stinging caterpillars, and utilise their cast-off coat to

protect the cocoon. Both these families are noxious, not only by eating the plant, but by sometimes even laming the coolies. The tea Noctuidæ, like the bunch caterpillar, feed at night, but the former grub hides underground in the day time, preferably in nursery beds whence it can sally out, cut off the tops and branches of a dozen seedlings, which it only eats the succulent bases of, and retire to its burrow, leaving the clean-cut twigs only, as evidence of its work. It must be sought carefully, an inch below the surface, and sometimes puts up a name-plate in the shape of a leaf half drawn down a hole. The Cocoon is a ball of earth. One way of catching the pest is to make conical holes with smooth sides, by rotating a pointed post in the soil. Into these they fall and fail to get out. The leaf-rollers and leaf-tiers are loopers belonging to the genera Tortricidæ and Tineidæ. Generally, an egg is laid on the underside of a leaf, the grub emerging, first burrows, in a sinuous course between the upper and lower skins. It then emerges and proceeds to roll the leaf more or less, in accordance with the habits of the species. The Sandwich caterpillar is a disagreeable creature. It simply makes a flat sandwich of several leaves, eats out the middle, leaves its droppings inside, and goes off to make another sandwich while the old one rots. The Chrysalis is unusually agile, being able to jump. The life-history of *Helopeltis Theivora* called tea-bug, blight, green fly or as Dr. Watt calls it, tea mosquito, a creature of the Rhynchota class, and the most serious of all the tea pests; is of exceeding interest, but too long to extract.

The Coleoptera are not very numerous. First come the Melolonthidæ, with the white grub, or larva of the Cockchafer, *Lachnostrona impressa* which leaves on roots. Next the orange beetle, *Diapromorpha melanopus*, of which 20,000 have been caught in a day, and 300 by one man in an hour; also the green beetle, *Astecyus chrysochlorus*, and other defoliators. Finally the wood-borers, *Xyleborus formicatus*, *Curculio tanymecus*, perhaps *Crioceris impressa* and *Oides bipunctata*, and probably at least one longicorn.

On the question whether white ants do, or do not, attack living plants, there are various opinions. The truth seems to be that the common kind does not attack perfectly healthy and sound ones, but if an otherwise vigorous tree has been pruned, or had its armour of bark injured so that dead wood is formed the termite will eat the dead, and cause the death to spread, following it up till the tree is a ruin. But there are other species of white ant that will attack and kill the healthiest of seedlings.

The questions of pruning, of watering, drainage, of culture, of seed production, of growth and nutrition, of vegetable foes, &c., are well discussed, and altogether, the book is one that cannot fail to be of interest and service to every planter, and to many who are not planters.

F. GLEADOW.

—Indian Forester.

## TEA IN SOUTH CAROLINA AND IN SOUTH AFRICA.

Simultaneously, accounts reach us of the results of tea-growing in South Carolina and in Natal, see our *Tropical Agriculturist*. The former is written of as a great success, although the inference is based on only 1,000 bushes or so, in a garden here and there, and on crops of a few hundred lb. It will be time enough to treat the enterprise seriously in America when we hear of 100,000 bushes or over growing in a garden in South Carolina and of labour being available at a paying rate, to undertake the plucking of flush from such a garden. We very much doubt whether this can be achieved in a land where the lowest labour price for an adult is a dollar per day, more especially if the war duty on tea is abolished as it ought to be.

In Natal, though the press does not make so much of it, the enterprise is in reality much more important, being represented by a million lb. of tea per annum. But "a sworn tea broker of the city of London" wonders why Natal (having begun tea two years before Ceylon) should have allowed herself to be so greatly distanced. Well, surely the explanation is on the very surface. How is it possible for Natal to compete with Ceylon in cheapness of labour? Surely Mr. John Fraser, now of Natal, will admit as much, and no man is better able to make a comparison. Even if Indian coolies be allowed to work on Natal tea gardens, their wages must be much in excess of what is paid in Ceylon. It is curious to find that tea was first begun in Natal for the same reason as in Ceylon, namely, the failure of coffee. The *Natal Mercury* in reviewing "the situation" affords some useful information and pungent criticism, the latter none the less useful, because "pungent." We quote as follows:—

Five years ago one of our local tea planters stated that the acreage of tea in Natal should supply the requirements of the whole of the tea, drinking population in South Africa, and that within the next two or three years considerable quantities would be exported to London, where the success of Natal teas would have to be proved. The manner in which the trade statistics of the Colony are compiled makes it impossible to say how much Natal tea was actually exported or where it was sent to, but in any case the local product has not as yet made a name in the London markets, nor is it yet exported in considerable quantities. Apart, however, from either the London or other foreign markets, there is a very big market in South Africa which has hardly yet been touched. During 1896 the Cape imported 3,000,000 lb. and Natal 1,148,000 lb., so that we are sure we are under the mark in saying that there is a market in South Africa alone for at least 5,000,000 lb. of tea, and in this market the Natal producer has advantages that neither the Ceylon, Indian, nor Chinese growers have. This will be particularly the case when the Customs Convention comes into force. The Natal grower then will have a clear start of 6d. per lb. over all competitors, but as matters stand just now it is questionable if the Natal grower is in a position to supply the Cape and Free State markets opened up to him on such favourable terms. The Grahamstown Exhibition affords a most favourable and opportune chance of advertising the Colony's products, yet the applications for space by planters and other producers have been so meagre that in order to save an utter failure the Government have had to step in and offer producers free space in order that they may advertise their goods. The Ceylon and Indian tea planters have associations, and these associations, with increasing energy and enterprise, have opened up new markets all over the world. Every exhibition has been visited, space taken, and the teas advertised in a manner that has compelled public attention. We want something of the kind here, otherwise the tea industry will never get out of the crawling stage. We have written in no spirit of depreciation of the industry. All honour to those who introduced it, and to many who amid difficulties have laboured to make it a success, but we cannot say honestly that after twenty years it has made the progress expected, nor that it has expanded as fully as could be desired. Of late there have been signs that an era of improvement in the quality and quantity of the tea produced has set in. The widening of the protected area has been long desired by the planters. They have virtually got it now, and it remains to be seen whether having got it they will take the advantage of it the colony has been led to expect, and so develop the industry that, like Ceylon, they will be able to go over the sea and enter the world's markets in open competition with all comers.

## MANURING TEA.

In answer to a rather absurd letter in the "Times" trying to shew that Manuring does not pay, the well known V.A., "E.S.G." has sent the following in correction:—

For the sake of convenience I reproduce his figures, and alongside them will be found the necessary corrections:

	F. S. E.	R
320,000 lb. of tea at 25 cents ..	..	80,000
Manure and application ..	..	12,000
Interest on advances ..	..	100
Depreciation on Lines ..	..	100
Do Factory ..	..	100
Do Machinery ..	..	500
Total cost of 320,000 lb. of tea at 29 cts. a lb.		92,800
Nett profit (at 5 cts. a lb.) on 320,000 lb. of tea		16,000
Original profit on 180,000 lb. tea at 9 cents		16,200
Balance in favor of Manuring ..	..	?

CORRECTED FIGURES.		
180,000 lb of tea at 25 cents ..	..	45,000
140,000 lb of tea at 15 cents ..	..	21,000
Manure and application ..	..	12,000
Other items as per F. S. E.'s Memo ..	..	800
Total cost of 320,000 lb. of tea at, say, 24 60 ..	..	78,800
Nett profit at 9 40 cents on 320 0 lb of tea, say ..	..	30,000
Original profit on 180,000 lb. tea at 9 cents ..	..	16,200
Balance in favor of Manuring ..	..	13,800

As will be seen from the foregoing, the error "F.S.E." has fallen into is in his estimate of the cost of obtaining the extra 140,000 lb. of tea which the manure has produced. The allowance I have made, viz., 15 cts. a lb. for this increase of yield is sufficient to cover the cost of plucking, manufacture and transport, &c., and there is nothing else to enter against it, superintendence, weeding, pruning, &c., not being influenced by the additional crop,—though the superintendent might be entitled to commission on the increased yield. The f.o.b. cost of the whole crop therefore instead of being 29 cts. a lb. as he estimates (which would be an abnormally high figure for an estate giving 800 lb. an acre) is reduced to 24 60 cts., leaving a margin of 9 40 cts. per lb. for profit, as against 5 cts. a lb. only before manuring was introduced. I have taken the figures "F.S.E." has furnished us with, not because I agree with all that they imply, but in order to shew that even with a low selling price of 34 cts. nett, profitable results cannot fail to follow the application of manure if it produces an increase of 350 lb. an acre on the natural yield of an estate. Whether so large an addition can be reckoned on is open to very grave doubt. Personally I do not know of a case where such results have been produced, and anyone contemplating manuring operations in the hope of making the profits "F.S.E." foreshadows may be grievously disappointed. The broad question as to whether manure pays or not is one which circumstances must decide, the element of chief importance being the selling value of the teas.

Judiciously carried out, there can be little doubt that Manuring is a profitable operation. In fact, the question has been asked as to what is the use of stopping planting "Extensions," if instead, planters generally take to "Manuring"? Say that 100,000 acres were manured so as to add, on an average, even 150 lb. an acre to the crop, and we should get an additional output of 15 million lb. of tea, or the equivalent of 43,000 additional acres at 350 lb. per acre!—Perhaps, from this point of view, manuring would cease to pay.

"TEA CULTURE IN AMERICA A SUCCESS?"

THE OUTPUT OF A TEA GARDEN IN SOUTH CAROLINA.

Less than ten years ago, and soon after the abandonment of the last serious attempt to grow commercial tea in the Southern States, it seemed worth the effort to Dr. C. U. Shepard, of Summerville, to repeat the experiment on a much more diversified plan, in the hope that conditions might be found favourable to the successful development of a new industry. It is not necessary at this time to enter into a description of all of the "Pinehurst" tea gardens and the outcome of the various experiments instituted therein. It suffices to state that all available sorts of tea, of soils and situations were utilized, and very divergent results obtained, which further investigations may modify, but hardly reverse. All of which data are to be published later, through the kind interest of the honorable Secretary of Agriculture, James Wilson.

But, in view of the chief motive underlying the work, and especially because of certain results recently established which apparently prove the feasibility of making commercial tea in the Southern States, it may be well to publish an account of the "Rose Garden" patch of tea. Its site was an old piney woods pond, with a black, rich (in humus) but sour surface soil, overlying quicksand and, yet lower, clay. The ground was thoroughly subsoil drained, heavily sweetened with burnt marl and deeply ploughed. About 1,000 plants of acclimatized Assam-hybrid tea were set out at 6 by 6 feet, "quineux." Whether from the slowness experienced in overcoming the original acidity of the soil or from the comparatively feeble growth of the seedlings during the first few years—in this respect resembling its relative, the *camellia japonica*—little progress was made from 1890, the date of the establishment of the garden, until 1894, although some leaf was plucked from it in 1892.

Again, the system of pruning practised at the start of the experimentation, whereby clean stems were maintained had to be abandoned after the loss of many plants and a degree of disappointment which almost caused the cessation of further work in this direction.

At present the garden contains about 800 vigorous bushes each one composed of many stems, the result of cutting out the original main stem and inducing a luxuriant sucker growth. There are also about 200 younger plants occupying the places where older ones died; they naturally produce less leaf. Altogether this garden of less than an acre may be fairly regarded as containing the equivalent of 900 plants in good bearing.

The output of green leaf from it has been as follows:—Crop of 1892, 56 pounds; crop of 1893, 81 pounds; crop of 1894, 151 pounds; crop of 1895, 333 pounds; crop of 1896, 600 pounds; crop of 1897, 648 pounds; crop of 1898, 1,000 pounds to September 1st, with the prospect of reaching almost 1,200 pounds by the end of the season.

It is to be noted that there has been a material increase each year over the preceding amounting to almost if not quite 100 per cent with the exception of 1897, when a prolonged autumnal drought materially interfered with the leaf production. It is, of course, impossible to foretell to what limits this expansion may extend before reaching that slight annual variation which marks the maturity of the plant. But it would not be surprising if the outturn were doubled within a year or two. Twelve hundred and sixty pounds of green leaf will afford 300 pounds of standard Pinehurst black tea.

On a basis of 900 plants in the "Rose Garden," the production per bush is five ounces of tea. If it were a full acre the yield would approximate 400 pounds. And if the plants had been placed at shorter distances apart, as is the practice in the Orient and now at Pinehurst, the output per acre should be materially larger. The average yearly production per bush in

Japan does not exceed one ounce; in China it is from one to two ounces; in India and Ceylon three to five ounces. In the last-named countries there are estates which annually produce over 1,000 pounds of tea to the acre; but they constitute the rare exceptions. Oriental tea gardens usually contain about 2,000 plants to the acre.

This gratifying productiveness of an experimental garden of almost an acre affords good ground for the belief that commercial tea may be grown in South Carolina in quantity quite comparable with the average yield of the most favourably situated Oriental countries. But the "Rose garden" is not to be regarded as an exceptional result nor of difficult imitation. Two larger gardens, also formerly piney woods ponds planted with Darjeeling seedlings, promise successful rivalry within a few years. And yet others appear to be awakening to a more vigorous productiveness.

The cost of a crop of 300 pounds of tea from the "Rose Garden," by reason of its greater productiveness, is much less than that from Pinehurst, as a whole. And yet it is evident that very material reductions might be secured were its area even only ten-fold enlarged, much more so did it contain 100 acres. The following tables show the actual cost of the several operations in the growth, picking and curing of the crop of 1898 in the Rose garden, as also the estimated and materially reduced expense for the same rate of production on a larger scale:—

	Actual cost per pound.	Possible reduced cost per pound.
Pruning .. ..	3c	2c
Manuring ... ..	3c	2c
Cultivation ... ..	1½c	1c
Leaf picking .. ..	14c	8c
Factory work ... ..	6c	3c
	27½c	16c

A glance at the above table shows that the chief expense is that of gathering the leaf. Experience has demonstrated that a smart lad or grown girl can pick from a good "flush" twenty pounds of green leaf in ten hours, or, say, enough to make five pounds of tea. This should be done for 30 cents, or at 6 cents, per pound. The supervision in the field will add 1 cent. With immature plants or poor "flushes" there is necessarily much more labor to be spent, and consequently more time in securing the same amount of leaf. Again, the "fineness" of the plucking materially influences its cost. The picking of a coarser and larger leaf or two from each shoot greatly increases the yield and lessens the cost. But with medium leaf picking and in Southern localities where labor is cheap, with an outturn of at least 400 pounds of tea to the acre, this expense should not exceed 8 cents per pound.

There remains to be considered the cost of superintendence and the fixed charges for the outlay in the establishment of the garden and its maintenance until self-supporting. As to the former, the cost will largely depend on the size of the crop; on a production of 100,000 pounds per annum it should not exceed 2 cents per pound of tea. The expense of putting the land in suitable condition for a tea garden should not exceed that for any other intensive crop. The cost of raising and setting out the tea seedlings will vary from \$25 to \$50 per acre, according to whether raised from domestic or foreign seeds. In the establishment of a large tea estate the initial expenses are necessarily heavy, but it should be borne in mind that once well done it is practically for all time. The best Japanese tea is said to be gathered from bushes 200 years old.

The leaf plucked from the "Rose Garden," as indeed from the whole estate, is fine; i. e., it very rarely consists of more than the Pekoo tip and two leaves, and then only to the first Sonchong. Heretofore, and without the aid of a protective duty, it has been possible to sell all of the Pinehurst (black) tea at \$1 per pound retail. It remains to be

seen whether the duty will be repealed now that hostilities have ceased, or, if not, what effect it will have on the price of the better grades of tea. But after all deductions—and they are not to be underrated—it must be realized that there is a wide margin of profit between the cost of one pound of "Rose Garden" tea, if produced on a large scale, say 25 cents, and the wholesale price of an equally good imported tea, say 50 cents. A profit of 10 cents per pound means a profit of \$40 per acre on an annual production of 400 pounds of tea. And higher profits per pound, with increasing yield per acre, will rapidly swell the income.

The "Rose Garden" has apparently demonstrated that commercial tea may be successfully grown in South Carolina. The utilization of this knowledge may be along several lines, but all of them involve the erection of a suitably equipped factory, costing from a few thousand dollars upwards, according to the proposed scale of operations. In some countries the bulk of the tea leaf is raised by small farmers, who, at the most, only prepare it sufficiently to insure its safe delivery at factories in the larger, often distant, towns. Or in other districts the extensive tea estates erect factories sufficient to handle not only the output of their own gardens, but also that of the smaller producers in their neighbourhood. As in all other branches of manufacture, the modern tendency is towards centralization and the cheapening of processes by increasing the volume of production. Machines have been successfully substituted for almost all manual operations in the manufacture of black tea, and thus it has come about that a well equipped factory is indispensable in making that sort.

The preparation of green tea still involves much and skilful manual labor, and it is, therefore, questionable whether it can be profitably produced in this country, in spite of a decided national preference for this sort. Machines adapted for making this class of goods will surely follow the commercial realization of the taste of the tea-drinking public.—*News and Courier*, Sept. 15.

### NATAL TEA INDUSTRY:

#### WHAT AN EXPERT SAYS: CONTRAST WITH CEYLON.

TO THE EDITOR OF THE "NATAL MERCURY."

Johnnesburg, Sept. 10.

Sir,—Ever since the introduction of the tea plant into Natal I may say that I have been interested, more or less, in the growth of the industry, and have been often grieved at the poverty of the results. I fancy I am correct in saying that 20 years ago I was called upon to offer an opinion upon Natal-grown tea, and was obliged to condemn it as unfit for the London market. Since then, notably with one exception, little progress has been made either to increase the quantity or to get rid of the "herby" flavour so objectionable to all lovers of good tea. As competition, and a knowledge of what your competitors are doing are the two most powerful incentives to progress, I would ask you as a favour to myself, and to those engaged in tea manufacture, to kindly find space for this letter, but most of all to print in *extenso* two letters addressed to the London *Times* by Mr. J. Ferguson, of the *Ceylon Observer* and *Tropical Agriculturist*, to be found on pages 2 and 3 of this mail's weekly edition, and dated August 20th, 1898.

From these letters the Colonists will learn something, and when it is remembered that Natal was growing tea at least two years before Ceylon, the figures given in that article ought to cause deep searchings of heart. Of course, there may be circumstances more favourable to the manufacture of tea in Ceylon than in Natal. Labour may be cheaper, but no doubt they have difficulties unknown to us. One thing, they have nothing like such a market at home as Natal has in the Transvaal and adjacent countries—they depend mostly on London.

Some 15 or 18 years ago the Chinese fancied that Europeans wished for low-priced tea, and they commenced to manufacture such, until now they appear to have lost the art altogether, and an expert will look in vain for the choice peach-flavoured Ningchows from the north, or for the fine Lapsang Souchongs from the south of China. The British public used to pay up to 5s and 6s per lb. for these teas, and, I think, would do so again if procurable. In the meantime Ceylon has seized upon the tea trade, and out of 120,000,000 lb. exported from Colombo, some 70,000,000 lb., chiefly medium and common qualities, reach London. I should rejoice to see Natal taking a larger share of the tea trade, and my taking a leaf or two out of the Ceylon book of enterprise it may not be too late even now.—I am, &c.

J. L. Wood,  
Over 20 years Sworn Tea Broker of the City of London.

### COFFEE-PLANTING IN MYSORE AND CEYLON.

The name of Mr. Graham Anderson has long been familiar to us as a Mysore planter of prolonged experience and a well-informed writer on planting topics. In answer to our enquiry as to the coffee crops of recent years as compared with ten years previously, he writes a long and interesting letter which we reproduce below,—but without exactly answering our question save in a general way. However, it is quite clear that Mysore coffee has never suffered from the leaf fungus to the degree that coffee in Ceylon did. But strangely enough, what we have always heard of as the chief cause of this comparative immunity, namely, shade-trees for the coffee, rich soil and a dry climate, are scarcely alluded to. Mr. Graham Anderson makes much of abnormal seasons; and, alas! this only serves to remind us of the voluminous writings on Tyler's dry and wet cycles, favourable and unfavourable seasons which began as coffee went back in Ceylon. Between 1840 and 1875 there were many "glorious seasons" because coffee was vigorous and capable of yielding good crops. After 1875 somehow, the seasons got out of joint all over the country, but it soon became evident the coffee was "out of joint" too. However, Mr. Anderson mentions one very significant fact, namely that since certain Mysore estates were replanted with Nalknaad coffee, they have given better crops than ever before. We have no such experience in Ceylon. Nalknaad coffee seed was experimented with in one or two districts here; but without permanent success. A few catch crops were got and then coffee gave way to cacao usually.

### COFFEE CROPS IN MYSORE.

To the Editor.

Sir,—Although it is not my rule to reply promptly to questions which are asked in the public press and with which my name is associated, I entertain such profound respect for the Editor of the *Ceylon Observer* as one who has done yeoman's service for planters generally, that I venture most respectfully to point out that although the coffee crops on these estates and many others in Mysore have undoubtedly been less during the last five years than between 1883-88, the cause is attributable (and clearly proved to be so by carefully-kept registers) to faulty distribution of rainfall. It was my special duty and my earnest endeavour at the meeting of the U.P.A.S.I. to clear away for ever the idea that plant pests have been

solely responsible for the diminished yield which has characterized the last five years in Southern India. The distribution of rainfall is far and away more important to agriculture generally than the actual quantity, and although it may be said that in regard to Coffee, the great thing is to note how much rain falls in the locality between January and May, I would go farther and maintain that as the success or failure of a crop is entirely dependent on the blossoming of the trees, it is absolutely essential that the rainfall be properly distributed so as to produce properly developed bearing shoots and that rain must not be either in defect or excess during the critical period when the flower is maturing. I have heard of a grower of rare flowers in England having lost hundreds of pounds in a single day owing to faulty arrangements in the glass houses connected with maintenance of the requisite amount of heat, light and moisture. I regret to have to record the fact that I have lost many thousands of pounds during my life by the faulty distribution of rainfall during the blossoming of Coffee.

The most complete immunity from plant-pests or all the culture in the world will not prevent loss occurring if the rainfall is badly distributed at blossoming and other critical periods of the coffee plant's existence.

It is a well-known fact that during the last five years agriculture in India generally has suffered very serious losses. The question asked is a personal one. Mysore is a very large territory, and one of its peculiarities is the varieties of climatic conditions which are met with or experienced in localities situated only a few miles apart. I hope, therefore, that any general statements I may make may be understood mainly to apply to the estates within a few miles of those in which I am interested, even though I feel sure they also apply to many others which are situated in localities where the climatic conditions are identical with or nearly the same as those under which my experience has been obtained.

The great famine in Mysore in 1877 was caused simply by the failure of a few showers in September when the millet was about to throw up its fruit-stalk. In the same way, I hope the following statement will clearly prove the principal reason of the coffee crops being small, not only on those estates but on many others in the years 1896, 1897 and 1898.

In 1896, after one of the hottest and driest seasons imaginable (nearly 5½ months without a single drop of rain), a shower of 42 cents of rain fell on the 11th April and was followed two days afterwards by 9 cents. This fall was not followed up during the ten days which constitute the period in which the blossom is either matured or ruined. The effect on well-formed spike can readily be imagined.

In 1897, rain commenced, after a late crop and before "spike" was formed, on the 16th February, and 1.55 inches fell between that date and the 19th February, but this rain was not followed up until 15th April.

The result was a grand flush of early wood and no subsequent budforming.

In 1898, 4.28 inches of rain fell in 11 days in April, of which .41 cents fell on the open blossom, and these showers were followed by 1.23 inches immediately after the blossom had matured.

The show of flower was the finest I have ever seen in my life, but a large percentage was ruined by the heavy rain interfering with fertilization.

A few estates which had favourable rains in March and early in April in all three years did very well and picked crops above their average. During this last season also, nearly all the estates in Northern Mysore had excellent rain in March to bring out their blossom, and it is the exception to hear of any of those properties doing badly.

During all the years between 1883-88 we had the most perfect blossom showers, and the crops were in the aggregate magnificent in spite of plant-pests and abnormally irregular aggregate rainfall.

No accurate deductions can be made except from an analysis of the distribution of rainfall during the blossoming season and the North-East Monsoon when the shoots, for the following year are maturing.

The aggregate rainfall during 1896 and 1897 was 232.52 inches, and produced two of the worst crops on record.

The aggregate rainfall during 1883 and 1887 was only 190.55 inches, and produced two of the best crops ever known.

The largest crop, which was in 1887, was produced by only 71.42 inches, and the worst crop ever known was in 1897, with an aggregate of 105.47 inches of rainfall.

In conclusion, permit me to point out that there was only a small amount of leaf-disease last year, and that this pest during the last five years has not been nearly as bad as I have known it to be in many previous years.

I would also desire to draw attention to the fact that the North-East Monsoon of this year is the best that has been experienced for fifteen years.

The finest North-East Monsoon was in 1883, the beginning of the period during which good crops occurred.

The next best was in 1887, when the record crop was produced and was followed by a high average crop, which was most remarkable.

Far from not accepting Professor Marshall Ward's report relative to the life-history of *Hemileia vastatrix* as final, every planter of any experience is quite satisfied that all that the most eminent cryptogamist could effect has been done by him. Lasting credit is due to him for his painstaking devotion to our interests.

His last words were to the effect that future investigation must be associated with the experimental investigation of the nutrition of plant cells, a subject which can only be studied in a laboratory equipped to the highest possible standard of efficiency. It is this investigation which I venture to hope may claim the first attention of experts in the near future.

Professor Marshall Ward also sounded a most excellent word of warning when he impressed upon us the vital importance of paying increased attention to methods and time of pruning and handling, so as to have such shoots on our trees as local experience may have indicated as best fitted to withstand or even resist the attacks of the pest. Where many practical planters differ from his opinions is simply in regard to the fact that the experience gained on many thousands of acres of coffee clearly demonstrates that attention to the selection of seed and variety of coffee and the class of shade and its regulation; the use of suitable manures, together with improved methods for maintaining proper physical condition of the soil, more especially if associated with judicious pruning and handling; have one and all a most decided tendency to mitigate the effects of the scourge. Professor Marshall Ward's most excellent report, while in some places clearly supporting these facts, also contains the bone of contention that the entire requirements of the fungoid parasite are a plentiful supply of healthy cell-sap and a little moisture, which rightly or wrongly has been interpreted by many to mean that nothing can be done to save us from the pest, and that in fact the more we work and the better heart we keep our trees in, the more attractions there will be for the pest.

I have been a planter for 36 years. Our estates have produced more crop since we entirely re-planted them with Nak Nad Coffee than they ever did even in the glorious seasons of former years.

At this moment they are looking far finer than I have ever seen them do before, and consequently I humbly venture to say that I have every right to my cheerfulness.

Let us hope that your kind intention to watch the developments in Mysore may be rendered agreeable by the beneficial results of the present North-East Monsoon aided by a good distribution of rainfall at next blossoming.

I earnestly hope I may not be blamed for most cordially agreeing with you that systematic and persevering work are essential to success in all agriculture.

undertakings, and for believing that good distribution of rainfall at blossoming and also for the development of the proper class of good-bearing shoots are of vital and paramount importance in connection with all fruit-growing industries.

GRAHAM ANDERSON.

Barguai, Munzerabad, 18th Oct., 1898.  
—*Planting Opinion*, Oct. 22.

### MR. KELWAY BAMBER'S MISSION.

We are informed by Mr. G. Crabbe, the Hon. Secretary, that at a meeting of the Ratnapura Planters' Association held at the Resthouse on Saturday 22nd Oct., Hopewell Estate, Balangoda, was the estate chosen to be visited by Mr. Kelway Bamber. Hopewell belongs to the Hopewell Tea Co., Ltd., of which Messrs. Finlay, Muir & Co., are agents, and contains 624 acres of which 476 are in cultivation with tea. Mr. W. M. Taylor is the Superintendent.

### FINANCE OF FIVE-O'CLOCK TEA.

VIEWS OF TWO EXPERTS ON THE SUBJECT—PROSPECTS OF THE TEA TRADE GENERALLY.

A vague rumour has been circulated that one of the most firmly established of British institutions—the five-o'clock tea table—is showing signs of approaching dissolution, says the *Financial News*. The news induced a representative to approach one of the leading tea brokers in the City, Mr. George Seton, of 120, Bishopsgate-street Within, to obtain an authoritative opinion on this point in particular, the effect of the alleged approaching event on tea shares, and the prospects of the tea trade generally. Mr. Seton believed that the rumour was utterly unfounded, and that the excellent custom was as general as ever.

"The consumption of tea," said Mr. Seton, "is steadily increasing among all classes, and I may tell you in confirmation of that statement that during last month alone the statistics show an increase of over 1,000,000 lb above those of September last year."

Is it not the fact, however, that many eminent medical men discourage the practice of tea drinking?"

"It is; but I am not so sure that even they themselves practise what they preach. The late Sir Andrew Clark, I believe, was an example of this class of Mentor. He is said to have often condemned the five-o'clock tea and then gone straight home to enjoy the luxury at his own house. What the doctors really condemn, and ought to condemn, is the way in which tea is often prepared."

"Does that remark apply to all tea?"

"Well, China tea does not require the same strict attention as Indian and Ceylon. The latter now form nearly nineteen-twentieths of the consumption, and only the cheaper qualities come from China. This British tea is excellent, and gives a strong, dark liquor, quite equal, if not superior, to many of the China teas, but it requires a little more care in preparations."

"Does the darkness of colour indicate any superior quality?"

"Not all. The light straw-coloured liquor was quite as good and strong; but housewives imagine that if tea produces a good dark shade it is stronger and better, and so the growers humour them by treating the leaves in a particular way."

"Are you in favour of still further reducing the duty of tea?"

"Well, I am one of those who think there is no hurry for that. At the present time we may take the value of China tea as about 4d. a pound and the Indian tea at 8d. a pound (without duty). If you add the duty, which is 4d. per pound weight, you find that the duty on China tea is 100 per cent., while that on the Indian tea at 8d. is only 50 per

cent. A reduction would therefore be more favourable to the China than the Indian tea, and the result would be that a large quantity of cheap rubbish would be put on the market. In course of time, too, the China, or non-British, tea trade would probably revive, and in that way the interests of companies and others engaged in the Indian tea trade would no doubt be injuriously affected."

"Is that view held generally?"

"No. There is another party which holds that a reduction of duty would lead to increased consumption and increased business. They do not think injurious competition such as I have pointed out would be likely to follow. However, I hold to my own views on the subject."

Our representative afterwards called on Mr. Wilson (of Messrs. Gow, Wilson and Stanton, tea brokers, 13, Rood-lane, E.C.). Mr. Wilson insisted that five-o'clock tea was as popular a custom as ever, and could not imagine how it could be supposed to be falling off. "Not only is it as popular as ever," he said, "but it is rapidly spreading, not only here, but on the Continent. The great bulk of the tea sold is consumed by the masses. Even if the five-o'clock tea were suddenly to cease as a 'society' institution it would really have little or no effect on the total consumption."

"Can you give me any figures in regard to the home consumption?"

"I can. You will see from our circular for October that for the four months from June 1, to September, 30, this year there has been an increase of 5,000,000 lb., in the quantity of tea delivered in England over the quantity received for the same period last year. That year only showed an increase of 2,000,000 lb., over the corresponding period of 1896. That does not look like any check in the habit of tea-drinking."

"It is said that there is over-production of Indian tea. Is that true?"

"Quite the contrary. The estimated surplus of the crop for the whole of this year over that of last year is only about 3,000,000 lb., while, as I have already said, the consumption for only four months has risen by 5,000,000 lb., over the figures of last year. As a matter of fact, I anticipate a deficiency this year—a circumstance that has only occurred twice since 1889. The supply will therefore be really under the demand."

"Was there not a decrease in the home consumption last winter owing to a boom in cocoa?"

"Well, there was a slight decrease, I admit; but it was a purely temporary effect caused by immense quantities of new cocoas being thrown on the market. Dealers had to stock all these cocoas; but I think you will find that, as a matter of fact, the great bulk of that cocoa is still in stock and unsold. The figures did not indicate the actual quantities consumed, but only the amount delivered for consumption."

"Then you think the prospects of the tea trade, as regards the producer, the shareholder, and the merchant, are good?"

"I certainly do. Tea drinking has now become such a firmly-established British institution that it bids well to last in all its vigour for many years, if not centuries, to come. Holders of shares in sound tea companies have nothing to fear."—*H. and C. Mail*, Oct. 14.

### THE CONSOLIDATED ESTATES COMPANY, LIMITED.

The seventh annual general meeting of the Company was held at the offices, 34, Great St. Helens, E.C., on Wednesday last, 5th October.

The chair was occupied by Mr. G. Arbuthnot, Chairman of the Company.

The Secretary having read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, said:—Gentlemen a copy of the report and balance-sheet has been sent to every shareholder, and therefore I presume we

as read. Before I proceed to move the resolutions necessary to give effect to the recommendations of the General Managers, I think you would like me to say a few words as to the position and prospects of the Company. I need not tell you how greatly we regret the necessity for so serious a reduction in the dividend, but that has been so fully explained in the report that I need hardly go over the ground again. With reference to the statement made in the report that the drought experienced from January to March is unusual, I may say that in all our experience of Ceylon tea-growing we have only once before known the flushing of the tea so seriously interfered with as it was last year—viz., in the year 1893, when there was a decided deficiency of rain and a considerable shortage of crop; and, further, I may remind you that we are now commencing the eighth year of the company's existence, and never, except in the year referred to, have the crops fallen short of the estimates, so that it does seem, humanly speaking, very improbable that we shall have again to deplore a serious shortfall during the current year. The estimates for next season have been carefully prepared, and I think we may hope that the crop will be fully up to them. I believe, in fact, that if the weather is normal they may be exceeded, but at least they will come up to the mark. I may mention that we have weekly returns from each of the company's estates of made tea, and that so far these returns from the commencement of the crop year, viz., July 1 to the date of our last advices from Ceylon, are well up to the estimates, and are considerably in excess of the returns for the same period last year. If you will refer to the report you will see that while the estimated expenditure for the new year is very little in excess of the year just closed, viz., R395,469, against R393,070, the estimated crop is larger by nearly 150,000 lb. than that of last year, which at 6½d a pound would amount to something like £4,000, or 10 per cent on the ordinary share capital. But, of course, that depends upon the prices realised, and it would be ridiculous for me to attempt to predict how the market will go. However, the price of Ceylon tea is so low that any further fall does not seem probable, more especially as the consumption seems to be overtaking the production, and if the Chancellor of the Exchequer could be induced to decrease the duty on tea next year it will naturally tend to improve the consumption. Last year he hesitated between tea and tobacco, but eventually decided in favour of tobacco, and we must hope our turn will come next year. A third factor, and a most important one in regard to the profits of the company, is that of the Indian exchange. That is a matter which would take me not five minutes but five weeks to explain, so I will not attempt to do it. At our meeting last year I expressed a hope that we should see a fall in exchange, and for a time that hope was realised, so that at one period forward exchange could have been fixed at 1s 3d per rupee, but owing to various reasons it again hardened, gradually rising to 1s 4d, at or near which it has since remained. At present I fear there is not much hope of any reduction in the near future, for the officials in the Indian Government are so strongly committed to the maintenance of a high exchange and the control they exercise over the currency is so powerful that for a time at least they will be able to keep the rate of exchange up to 1s 4d, or near it, although, speaking for myself, I believe that in so doing they are injuring materially the welfare of the country. However, if any of you wish to study the subject for yourselves you cannot do better than lay out the modest sum of 2s 8d in the purchase of the *Blue Books* published a few weeks ago, giving the minutes of the evidence taken so far before the Indian Currency Committee, which is thoroughly examining the subject. As regards the condition of the estates, which of course, is a very important matter, I think I cannot do better than read you some extracts of the letters recently received from our Ceylon agents, Messrs. Geo. Stuart and Co. The first extract is as

follows:—"We may add that everything necessary to maintain the condition of the estates has been done. They have been liberally manured and well cared for generally, and so far as the current season's prospects depend on circumstances in any way under control they seem no less satisfactory than they have ever been." This is a short extract, but it is all very much to the point and very satisfactory, the more so because our visiting agents' reports are in a similar strain, and what they say may be thoroughly depended upon. The second extract is from an earlier letter, and refers specially to Talagala and Sorana. It reads as follows:—"After a bad year such as we have just had it is encouraging to know that the tea promises well for the current season, and having regard to the fact that in the case of Talagalla there is a good deal of younger tea coming into bearing we trust it may be found that the crop there has been rather understated. On Sorana the bushes have not yet had time to show the benefit they are deriving from careful treatment, and no doubt we shall see a marked improvement in the yield when the coconut and shade trees here have been removed and the manure applied. Both estates seem to be reaping all the advantages of careful management, and the planting of the new clearing on Sorana having been done in good time, a successful result may be confidently looked for. The planting of Para rubber is contemplated on both estates, and from all we can gather the soil and climate should be well suited to the cultivation of this tree. We also understand that the well-being of the tea need not be interfered with if the trees are planted at wide distances apart." I do not think, gentlemen

have anything further to say in regard to the report or the position of the company and its estates, but I should like to add a word of explanation as to the accounts. One of our shareholders has written to say that there are two items in the accounts he cannot understand, and if they have puzzled him, it may well be that they have puzzled other shareholders. The items in question are both deductions from the factory and extension account. The first is the item, "Charged to Sorana," £1,175 8s 8d." If you will refer to the report you will see it explained that the general managers have decided to charge the Sorana purchase account with two-thirds of the capital expenditure on this estate, and the item in question is that two-thirds. Originally the whole of this expenditure was charged to the factory extension account, and therefore the two-thirds referred to had to be transferred out of that account, and in the summary of accounts take the form of a deduction. The second item which the shareholder could not understand was the deduction of £3,000 for balance of the 1898 issue. This seems simple enough. The 1898 issue was £21,000, the cost of the Sorana estate was £18,000, and consequently the balance was £3,000, which was placed to the credit of the factory extension account, and therefore was deducted from the expenditure on that account, as specially provided when the issue was made. I think that is all I have to say, and unless any shareholder wishes to ask any question I will proceed to move the following resolution:—"That the seventh annual report of the general managers, together with the annexed statement of accounts, duly audited, be now received, approved, and adapted."

The resolution was seconded by Mr. Charles G. Arbuthnot and carried unanimously.

The Chairman then proposed, "That balance dividends of 4 per cent. on the old preferred shares, and half-year's dividend of 4 per cent. on the new preferred shares (less income tax), also 2 per cent. on the old ordinary and 1 per cent. on the new ordinary shares (free of income tax) be and hereby are declared payable this day."

The resolution was seconded by Mr. H R Arbuthnot and carried unanimously.

The Chairman proposed, "That there be set aside a sum of £2,060 in terms of the articles of association for the redemption of 5 per cent. of the outstanding debentures at £103."

The proposal was seconded by Mr. Charles Arbuthnot and carried.

Mr. E. Worthington then moved the re-election of Mr. William Wright as auditor. This was seconded by Mr. P. Moore, and carried unanimously.

On the proposal of Mr. G. R. Fife, seconded by Mr. C. Linder, a vote of thanks was unanimously accorded to the chairman and the General Managers of the company.

The Chairman, in responding, stated that he had occupied the chair for seven years, and hoped he should occupy it for many more.

The proceedings then terminated.—*H. & C. Mail*, Oct. 7.

#### INDIAN AND CEYLON TEA TRUST COMPANY, LTD.

The following is the report of the Directors presented to the shareholders at an ordinary general meeting held at the offices of the Company, at 34, Nicholas Lane, London, E.C., on Friday, October 28th:—

The Directors, in presenting the first annual report and accounts, made up to 30th June 1898, regret that the period elapsed since the formation of this Company has been an unsatisfactory one for the tea industry generally. The chief causes of depression were the rise in the exchange and the fall in the price of tea, but the Directors now look forward to a general improvement in the conditions.

The experience gained shows that there is room for the establishment of such an organization as this Company. The income receipts shown by the accounts may be considered satisfactory, and in normal and more favourable circumstances the result would undoubtedly be better.

The accounts accompanying this report show that the total income earned to 30th June 1898, amounted to £3,061 4s 10d, and after paying interest and the expenses of carrying on the Trust, a net balance remains of £2,139 1s 8d.

The investments of the Company are shown in the balance sheet at cost price, but the present state of the tea industry has necessarily caused some depreciation in their value.

Under these circumstances, the Directors regret that they are unable to recommend the payment of a dividend, and propose that the profit be carried forward. They have also resolved to forego the fees payable to them under the articles of association.

In accordance with the articles of association, Mr. Keith F. Arbuthnot retires from the office of Director, but being eligible, offers himself for re-election.

Messrs. Singleton, Fabian & Co., the auditors, do not seek re-election as such, as they have accepted responsibility for the secretarial work of the Company.

#### PLANTING NOTES.

**ARECAS IN THE STRAITS.**—A Chinaman, who has been doing a small trade in preparing arecans for the Siamese market, was so satisfied with his venture that he has purchased 50 acres of land from Malays, who had practically abandoned it, for the purpose of planting areca-nuts. This produce is prepared for the Siamese market by gathering the nuts green, cutting them into thin slices, and drying them by fire.—*Report, District Officer, Kuala Selangor, for Sept. 1898.*

**FACTORY SUPERVISION.**—With reference to "Planter's" letter, (see page 111) his suggestion is a good one in the case of factories turning out, say, 300,000 lb. of tea and upwards. But as a matter of fact in Ceylon, can "Planter" point to estates under similar circumstances, the one with a European in the factory and the other a native—and the former getting a much better price for its tea? Our native assistants in Ceylon are superior to any in India we suspect. A planter calling on us as we write, who gets a fair price, has never had a teamaker, but the store kangam of the old coffee days.

**IVORY.**—If we are going to civilise Africa it appears we must make up our minds to do without ivory. For India is in these days unable to support herself in the matter of ivory. Therefore it is African ivory for us or none. The sales of ivory in London have gone on dwindling until for the last three months they have reached an insignificant half-ton, a quantity that could be obtained from the tusks of forty or fifty elephants. The remedy, of course, is to preserve elephants, so that in future African sportsmen may have a red-letter day in their almanac—"elephant-shooting begins."—*Daily Chronicle*, Sept. 27.

**THE VELVET BEAN OF FLORIDA.**—[To the Editor of the *Spectator*.] Sir,—The "velvet bean," as might have been expected, has done no good here. Half of the shilling bag which was sent me I raised in a frame. Nearly every bean came up. I put them out in the middle of June, but a cold night checked them and they have hardly grown since. The other half was sown in the open in a sheltered kitchen garden, and was carefully watered and cultivated. About half the seeds came up and have struggled to from 3 ft. to 4 ft. high, and not shown a sign of a flower-bud. The scarlet-runners close by are unusually gigantic. Will any one from the Southern counties record his experience of the bean?—I am, Sir, &c., LUCY BETHELL, Newton Kyme, Tadcaster, Oct. 3.

**RUBBER GROWN IN PERAK.**—has just been sold in London to the quantity of over 1½ cwt. at 3s 1d per lb. The London Brokers reported as follows:—

We have this morning received a letter from our friends who tested your rubber. They write us that the particular lot we sent them lost 26½ per cent in washing, but that they presume it would not be expected to arrive in bulk as dry as these two cases. They continue assuming therefore that the loss in washing would reach 30 per cent. We consider its value 22 per cent below Fine Para. Taking Fine Para at 4s 3½d per pound this will bring value of the parcel in question to nearly 3s 5d, but we expect manufacturers will scarcely give full value considering the trouble and expense put to in this instance, but future lots will command full price.

**SOILS AND MANURE.**—After some complimentary remarks on our "Handbook and Directory" which was the immediate cause of his writing, Mr. John Hughes adds in a letter dated Oct. 7th:—"I have received so many soils for examination and report during this year, that I think a tabulated statement of the results (without the names of the estates) would be of general interest to Tea planters because it is one thing to make the analysis and quite another thing to draw correct conclusions from the results. In order to make a practical report one should have a number of reliable results for comparison. Hence soil analyses and reports, require some practical experience in order to give useful recommendation in regard to the important constituents, that require to be artificially supplied in any mixture of manure."

**COFFEE SUPPLY.**—Messrs. Rucker and Bencraft report early in this month that the visible supply of coffee is 400,000 tons,—“another record”!

**INSECT PESTS AND MR. KÖBELE.**—We attract attention to an interesting letter from the Honorary Government Entomologist Mr. E. E. Green on the abundant and good work Mr. Köbele is doing for the Hawaiian Islands.

**MR. CARRUTHERS'** decision to delay his departure is not due simply to a request to watch the cacao fungus in the wet weather; but also to the discovery that some of the bark canker was spreading into the pod. This is rather a new development and Mr. Carruthers does not care to leave before investigating it, as he has been requested to do so. This may take two months and Mr. Carruthers is likely to make Warriapolla Matala, his headquarters during this period.

**THE RICE CROP OF 1896**—says Mr. Robertson in his Indian Trade Report just issued—was very deficient in Bengal and Madras, and a large part of the surplus of the Burma crop was diverted to those provinces to supplement the deficiencies in the food supply.

**THE ARTIFICIAL MANUFACTURE OF PEARLS** is becoming a regular industry in America. They are produced by introducing a glass bead or some other substance between the shells of a freshwater mussel. This, in the course of six months, becomes coated, as in the case of oysters, with a slimy substance, and a pearl is thus formed.—*London Times*.

**TEA-SEED.**—Here it may be mentioned that the export of tea-seed from Bengal, mainly to Ceylon, has been in the last three years as follows:—

	Cwt.	Rx.
1895-96 ..	3,232 ..	35,985
1896-97 ..	4,173 ..	52,825
1897-98 ..	5,347 ..	87,853

**IMPORTS OF TEA INTO INDIA.**—The sources of supply are China, Ceylon, the Straits and Java, from which countries the imports in the last five years have been:—

	China.	Ceylon.	Straits.	Java.	Total
	lb.	lb.	lb.	lb.	lb.
1893-94	6,016,244	930,507	360,770	303,333	7,657,757
1894-95	4,630,327	901,971	413,417	362,366	6,326,122
1895-96	5,890,052	997,925	399,792	187,438	7,497,703
1896-97	6,342,962	748,127	431,672	306,328	7,874,832
1897-98	1,689,564	1,059,716	450,585	291,674	3,515,013

**THE ORANGE TRADE** in Southern California is reported not to have been so profitable this season as in former years. Over six thousand car loads were despatched from various sections of the state to the eastern market. Some arrived in first-class condition and brought fair prices. It is stated that a large part of the crop has not realized good prices, so that the average has been a loss to the owners.

**LARGE NUMBER OF TALIPOTS IN FLOWER.**—A planter who has just come down by railway, tells us that he never saw so many talipot in flower along the line of railway before. On the way down no less than 21 trees, in full flower are to be seen. We never heard of anything like this number being in flower along the line at one time. Our informant tells us that there is a beautiful clump of 6, all in flower together, about a mile and a half on the Kandy side of Rambakkana, in the north side of the line. They ought to be well worth inspection.—*Local “Times.”*

**CITRONELLA OIL AND SOUTH CEYLON.**—Messrs. Schimmel and Company of Leipzig send us their reports for this year upon oils and essences and in reference to citronella oil devote three or four pages to descriptions of the methods of cultivation and preparation of the oil, and to diagrams illustrating the distilleries. They also give a map of South Ceylon, shewing the situation of the principal scenes of citronella cultivation and quote from our Ceylon Handbook. Mr. Karl Fritzsche has been in the island collecting full information for the firm. The book contains also a large map of Tonquin showing where the Sternan Plantations are situated.

**THE TEA INDUSTRY.**—In another column (see page 410 of this number) we publish a letter from Mr. J. L. Wood, of Johannesburg, whose experience as a tea-broker makes his remarks on the tea industry of the Colony of something more than ordinary value. We have also reproduced, as requested, the valuable letters contributed to *The Times* by Mr. J. Ferguson, of Ceylon, a gentleman who is well for his painstaking accuracy and knowledge on questions connected with the industries of the East. Mr. Ferguson's letters, we are sure, will be read with interest by all Colonists, and, as Mr. Wood remarks, something should be learned from them.—*Natal Mercury*, Sept. 23.

**BANANAS: A VERY DANGEROUS PEST**—says the *Planters' Monthly*—has attacked the banana plant in Australia, and a shipment of eleven thousand bunches is reported to have been condemned on arrival at Sydney, and were ordered to be destroyed. The insect is stated to be a fly that attacks the fruit, and destroys its value as food. A report states that this pest has appeared also in Fiji. If so, it is likely to be imported in any of this fruit brought from that group by the colonial line of steamers which touch here, and which are usually supplied with bananas grown south of the equator. While there may be no immediate danger of this pest being introduced in this way, it is well to be on our guard against it.

**CONSOLIDATED ESTATES COMPANY, LIMITED.**—On page 412, we reproduce a report of the proceedings at the seventh annual general meeting of the Consolidated Estates Company, Limited, at which a very clear statement was made by the Chairman (Mr. G. Arbuthnot) as to the position and prospects of the concern and the condition of the estates. Apart from details concerning the Company, the Chairman also gave expression to his views on general questions such as that of decreasing the duty on tea (which he thought would result in increased consumption) and that of exchange, his opinion that by keeping the rupee at its present high rate the welfare of the country was materially injured.

**GROWERS OF TEA IN INDIA AND CEYLON** are now meeting with an active rival in the Japan variety; and judging from a pamphlet which reaches us from Tokio, the merits of tea from the Mikado's Empire are to be pushed, in the United States especially, with all the resources of modern advertising skill. In the *brochure* before us, attention is drawn to the extreme cleanliness of the Japanese, and to the fact that of the 93,000,000 lb of tea imported into the United States in 1896, 61,000,000 lb came from Japan. Some useful hints as to the making of tea are also given, and the general arrangement and get-up of the circular show that the Japan Central Tea Traders' Association, from whom it emanates, are apt students in modern methods of pushing commercial commodities.—*B. T. Journal*, Oct. 1.

**THE BIGGEST TREE IN BERAR.**—The picture, which we present to our readers this month, is a photograph of a big Baobab the (*Adansonia digitata*) at Karwand in the Buldana District, Berar, which we recently received from the Conservator, Mr. C. Bagshawe. The tree, whose size can be gauged by the figure of Mr. Bhukan, Extra Assistant Conservator of Forests, who is standing in front of it, is 42 feet in girth.—*Indian Forester* for September.

**THE NEW DIMBULA CO., LD.,** has had a very prosperous year up to 30th June last; for, according to a telegram to our contemporary, the profits were £21,000 against £18,647 in the previous year! The dividends to the several classes of shareholders remain the same (at 16 and 14 per cent, about the heaviest now given by any Ceylon Company; but the Reserve Fund has been raised from £11,000 to £17,000; while £643 have been written off on extension account, and £1,179 on factory and machinery account. We need not say that Diyagama is perhaps, on the whole, the most valuable tea plantation in Ceylon, with fine soil, good climate, favourable lay of land, good jat of tea, and an admirably-equipped factory; but all this would not avail so much were it not for the experienced and judicious management of Mr. J. E. Dick-Lander, seconded by the care and experience of Mr. W. Herbert Anderson and his Board in London. The Manager and his Assistants, the Secretary and Directors, are all to be specially congratulated.

**THE INDIAN TEA INDUSTRY.**—On page 346 we reproduce a letter on this subject commenting on an article which appeared in the *Financial Times* of the 16th ult. In his article our contemporary said the small profits made during the past year by Indian tea companies generally compared with previous years have naturally caused some anxiety among those who favour this kind of investment, and some doubt has been expressed as to the actual cause for the diminished returns. Over-production has for some little time been held out as a danger, and there is undoubtedly a well-founded probability that unless a stop be put to the continued extension of gardens, production will far outstrip consumption. But that this cause was not entirely responsible for the comparatively poor results of the past year is evident from the statements made at the recent meeting of the Indian Tea Association held at Calcutta. First there was the famine then plague and next the currency question. Perhaps the most encouraging statement at the meeting was the Chairman's remarks in regard to the Indian and Ceylon tea campaign in the States. According to Mr. Anderson, the consumption of the British-grown leaf in North America has nearly quadrupled since 1892, and as a large quantity of these teas is used for blending with those of China and Japan, it is hoped that in the near future we may see a repetition of what took place in this country, and that the British-grown tea will eventually displace its rivals in the Great Republic. That there is a promising field across the Atlantic is obvious to anyone who has visited the country. Among the agriculturists especially of the North American Continent tea is regularly drunk at every meal. Until recently the green teas of China and Japan have been the favourite leaf, but during the past year or so experience has shown that the North American is not indissolubly wedded to the Chinese product, and further energetic efforts to introduce British-grown teas can scarcely fail to largely increase the consumption of our colonial-grown produce.

**\* LIBERIAN COFFEE.**—Last year more than 10,100 cwt. of Liberian coffee, valued at Rs. 47,663, was imported from the Straits. About 60 per cent was re-exported to Arabia and Persia. So we learn from the Report just issued on the Trade of India by Mr. J. A. Robertson, Officiating Director-General of Statistics.

"**KEW BULLETIN.**"—The number for the present month contains an exhaustive account of the Para rubber, *Hevea brasiliensis*, a native of the damp, shady forests of northern Brazil, where the temperature is very uniform, ranging from 75 degrees at night to 87 degrees at midday. The first half of the year is very wet, the other half relatively dry. Thanks to Kew, the trees have been sent to Ceylon, where they have borne seed, so that the number of trees on private estates is estimated at 200,000. The rubber collected in the Ceylon Botanic Garden has been valued at the highest market price ruling at the time, so that, on the whole there is a prospect of a good return on the capital invested. Reports from Tenasserim and the Straits Settlements are also encouraging. In other colonies the experiments have not been continued sufficiently long to give commercial results. The samples from Trinidad are reported as excellent.

**ALLEGED REVIVAL OF THE CHINA TEA TRADE.**—Says the *Indian Planters' Gazette* of Oct. 8th:—

The question which will no doubt exercise the mind of the Indian planter and his Ceylon confrere shortly, is whether there is any likelihood of the revival some people predict in the China tea trade. We learn from last home advices that those pioneers of tea machinery, Messrs. W and J Jackson, no doubt stimulated by stagnation in business from the slump in tea here, have resolved to send out their representative, Mr. Dalgarno, to see what business can be done in China. Under these circumstances there may be partial recovery in this trade, but we do not for a moment think that there can ever, even with the assistance of depreciated silver, be any serious displacement of Indian tea by China. The conditions under which tea is manufactured in the Flowery Land are quite different to those practised in India. There are no large plantations such as exist here; every man tills his own bit of ground, gathers his leaf in, prepares it as best he can, and when in need of the ready wherewith to buy the necessities of life, carries his basket away and sells it as best he can at some of the "Hong's;" in fact, every Chinese tea-grower farms his own "Kail Yaird," and in every way Chinese methods of dealing with the leaf are entirely opposite to those of the Indian planter. The merest tyro in tea knows that to allow the manufactured article to lie about is fatal to the retention of the aroma, or, as a broker would call it, "nose;" and that the sooner tea is set up in a tin-lined box after it becomes a manufactured article, so much better will be the result in the way of briskness and other qualities, without which tea now will not sell. It is true that were the venture in China taken up by a syndicate of Europeans, they would no doubt try to adapt the Indian method to the Chinese leaf if they could get it in proper condition, but in this no doubt lies the greatest difficulty that would have to be combated. To begin with, leaf must be in a certain condition, from the moment it is plucked and put in the basket on the field, to make good tea; and that condition is perfect cleanliness; next, to be put lightly into the basket, and not pressed down, but left so that air can freely permeate through it. Every planter knows this, and tries to act up to it, although there is never perfection in it we are quite aware; and until chemical knowledge is brought to bear on the subject, we shall never know how much damage a leaf plucker does when she tramps her leaf down into a solid heated mass, and which pluckers are so fond of doing. We do not wish it to be understood that an improvement cannot be made in the manufacture of the China leaf,—far from it.

## NEW DUMBULA COMPANY, LIMITED.

REPORT, SEASON 1897 98.

The Directors, in submitting their Thirteenth Annual Statement of Accounts, are again able to congratulate the Shareholders on the satisfactory result of the past year's working.

The yield of Tea exceeded the estimate; the yield per acre was larger, though it was not an ideal season for flushing, and the prices obtained show a slight improvement on those of the previous year, while the cost of production has been reduced; on the other hand the rate of exchange ruled higher.

The Estate is reported in good order throughout, including Factory and Machinery.

The area of Tea in full bearing is 2,193 acres, according to the existing plan of the Estate; a new detailed survey is being prepared, showing the various acreages more accurately. The extensions during the past two seasons amount to 152 acres.

The accounts now presented show a surplus of £22,751 11s. 5d. after writing off the amount of Tea Extension Account, viz., £738 15s. 9d., and the amount of the Factory and Machinery Account, viz., £238 2s. 2d. The Directors propose a dividend of 8 per cent. per annum on the "A" and "B" Shares, and 6 per cent. per annum on the "C" Shares, for the year ended June 30th last, a moiety of which was paid in March; and they further propose an additional dividend of 8 per cent. on all Shares, and the placing of £6,000 to the Reserve Fund.

The interests of the Company have, as usual, been very efficiently looked after by the Resident Manager and the Staff in Ceylon, the value of whose work the Directors heartily acknowledged.

By order of the Board, A. CRABBE, Secretary.

## INDIAN TEA.

The Indian Tea Association should issue tracts about Indian Tea. They are needed. A correspondent sends us some particulars which throw light on the fancies indulged in by some ladies with regard to Indian tea. Our correspondent came across the report of a meeting of the National Union of Women Workers held in London some months ago, at which the president of that body, Mrs. Alfred Booth, delivered the following denunciation of Indian tea: "Now," said the lady, addressing an assembly of school teachers, "for the one or two articles of diet which teachers ought to bear in mind. The first is Tea. When I first came to England it was said that you could always get a good cup of tea, but I am very much afraid that now we shall have to drop that, for it is very seldom that you can get a good cup of tea. We all drink Indian tea because it is a new industry introduced into this mighty Empire, but may I call your attention to Indian tea and ask you to study it from a scientific point of view, and find out how much more tannin there is in it than in China tea? You are, as reformers, in duty bound to consider this subject, and the effect upon the constitution of drinking Indian tea which has stood more than one or two minutes in hot water. A lady who has lived in China tells me the reason Indian tea is so much ranker than China tea; it is because it is grown in virgin soil, and in fifty years Indian tea will become delicate like China tea. We generally think virgin soil is the most delightful soil for anything to grow in, but until it becomes seasoned—fifty or sixty years hence—will you ladies please be careful when you are giving your lessons on drinks to dwell particularly on the tannin in Indian tea, and its deleterious effects on the constitution?" The tea-growers of China should be deeply obliged to Mrs. Booth, and the Indian Tea Districts Association might with advantage send the lady a few facts in connection with Indian tea which would, unless she be hopelessly prejudiced, induce her to modify her opinion, and encourage the spread of sound knowledge. If the school teachers thus addressed have been carefully echoing her views the tannin bogey will be very much to the fore again before long.

H. and C. Mail, Oct. 7.

## TEA IN THE CAUCASUS

Writing in the *Pall Mall Gazette* about the resources of the Caucasus, Mr. E. Brayley Hodgetts says: "Of late years the great tea merchants of Moscow, notably the celebrated firm of Popoff, which has estates in China and offices in Mincing Lane, have started tea plantations in the Caucasus. These plantations, which were first tried as an experiment, have answered wonderfully well, and already large quantities of this Caucasian tea have been placed upon the Russian market. The first tea raised was sent to the late Emperor Alexander III., who had the courage to drink it, and pronounced it to be excellent. As nobody has ventured to ascribe his Imperial Majesty's premature decease to this cause, we are compelled to assume that this Caucasian tea is harmless as well as palatable. When I was travelling through the Caucasus I was very much surprised and amused to come against numbers of beaten Chinese, in correct Celestial attire—pig-tails and all complete. They formed a most incongruous element in the scenery. I discovered that these gentlemen were tea-planters, who had been imported along with their own tea, and were now engaged in betraying their country's secrets to the barbarian. There is a colony of these Chinamen on the Caucasus. They have brought their houses with them, together with their manners and customs, and they get on uncommonly well."—*H. and C. Mail*, Oct. 14.

## MATURATA TEA COMPANY.

At the meeting of this Company, held at the offices of the Maturata Tea Company on Friday, October 7, the following report was submitted:—

The Directors' report and statement of accounts to 30th June last, which was submitted to the meeting, stated that there was a net profit of £931 after payment of debenture and preference interest and London charges (Directors' fees, &c.) It was proposed to write off the whole of the preliminary expenses, amounting to £306, leaving a balance of £625, out of which the Directors recommended that a dividend of 6 per cent. be paid on the ordinary share capital, less income-tax. This would absorb £480, leaving a balance of £145 to be carried forward. As the accounts were only made up to the 30th June, the dividend was at the rate of 8 per cent. per annum, and the Directors considered that, as the last year had been an unfortunate one for the Ceylon tea industry, this result was very satisfactory.

## HOW TO MAKE TEA.

AN INSTRUCTIVE PAPER BY DR. GOODFELLOW.

The Grocers' and Allied Trades' Exhibition is proving a great draw to the public. The Agricultural Hall was crowded last night with visitors who, for the main part, seemed to be bent on collecting handbills and "samples." In the evening an interesting paper was read by Dr. Goodfellow on "Tea and Tea Drinking" in the lecture hall. The following remarks to which he gave utterance should be useful to housewives who often sin in the matter of tea making.

The facts to be borne in mind in the preparation of a cup of tea, said the doctor, are, first, to develop the aroma; second, to obtain the maximum quantity of theine with the minimum percentage of tannic acid. In order to do this to perfection, he added, it is necessary to have two hot, dry, earthenware teapots, and as soft a water as possible. Should the water be hard it should be used directly it has started to boil, otherwise the precipitation of the hardening salts will interfere with the solution of the constituents. Last, but not least, good tea must be used. The teapots should be placed in front of the fire, or on the hob, to get them warm. Good tea can seldom be made in a cold or wet tea-pot. When the water has come to the boil, the tea should be

placed in one of the hot pots, and allowed to remain with the cover on for half a minute; boiling water should then be poured in quickly to the amount required, and the pot allowed to stand under a cosy for four minutes, or from three to five minutes, according to the kind of tea used. After this period has elapsed, the infusion should be used at once, or if required to stand for a little while should be poured off into the second hot pot. On no account is a second brew permissible if the tea prepared is to be non-injurious, and although this method may appear wasteful, yet it is not so, when conducted in a proper manner.

Usually an excess of tea leaves is placed in the pot, in the first instance, for the purpose of obtaining the second brew, by the addition of hot water, but the same result in quantity would be obtained if the original tea were divided into two portions, and two separate infusions made, with the additional advantage of a smaller quantity of the astringent tannic acid. When the leaves are allowed to stand for a time in the hot water, notable quantities of the tannin are dissolved out. When, therefore, hot water is added to the leaves that have been standing in the pot, the result is a solution of tannic acid, which being astringent and biting in taste, the properties are looked upon as the strong tea of the brew, but as the stimulating properties of tea depend upon the theine, it is obvious that special tea does not produce the refreshing effect for which tea is taken.

To those who will persist in making a second brew in this way from used leaves, I would say that it would be well to drain the tea-pot from the first brew, so that the leaves are not steeping in water. This would reduce the quantity of tannic acid in the second infusion. Many people believe that the color of the infusion indicates its strength with regard to its refreshing properties. This is wrong, as theine is colorless. In fact, very often the deep color of common tea is due to the tannin, and such tea is usually poor in theine. The fact is that very high-class teas do not produce deeply colored brews. Such teas usually possess a high percentage of theine, with low proportions of tannic acid.—*Daily Chronicle*.

## CINCHONA BARK AND QUININE

### TO THE FRONT.

We would very seriously advise a renewed attempt at cinchona cultivation in Ceylon, especially in the Uva districts where plants did best and lived longest in years gone by. If fresh seed is got from Java or Northern India, there is no reason why both nursery and clearing—judiciously chosen—should not be successful; or it might be enough from the nursery to plant up all the boundaries, sides of roads and drains. A rather satirical, but still instructive, criticism of Java quinine and cinchona planting from the *Chemist and Druggist*, (see page 419) winds up with the pregnant remark that "it is astonishing how the consumption of quinine goes on," and gives facts and figures in demonstration.

Moreover, our contemporary dwells on the great and growing demand, which has set in for cinchonidine, which is rapidly rising to the price of quinine. Now we have learned from Messrs. Bohringer that Ceylon cinchona bark—what is

left of it—excels in its proportion of cinchonidine and here is a new reason for once again extending the cultivation. We know what in disappointment the plant has been to many a the past: but was not that due in many cases, to the use of local seed and hurried injudicious planting on exposed or badly-drained clearings. At any rate there is much to encourage the planting up of boundaries and roadsides throughout the Uva districts, Udapussellawa, Matunata and some other divisions where the plant did well in bygone times.

## THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

We have to acknowledge the receipt of a nicely-bound volume containing the proceedings of the Fifth Annual General Meeting of the United Planters' Association of Southern India held at Bangalore in August last. The *M. Mail* says:—We who have followed the proceedings of this body carefully from year to year since, six years ago, it started as the Planters' Conference, cannot fail to notice how as the years have gone by the subjects that have come up for discussion have gradually increased in importance and interest. The Report under notice, in our opinion, gives place to none of its predecessors in this respect.

## TRAVANCORE TEA.

Mr. H. Drummond Deane, of the "Stagbrook" Estate, Peermaad, has ventured upon a new departure in the direction of pushing the sale of Travancore Tea on the local market, his main idea being to get directly at the consumer by making it possible for the purchaser to buy even small quantities of the produce straight from the Estate. With this object in view, he has appointed Messrs. Marse & Co., of this city, his local agents for supplying packets of the leaf containing from  $\frac{1}{2}$  lb. to 2 lb. each of carefully selected teas of three different grades, viz., "Orange Pekoe," "Choice Pekoe," and "Pekoe Souchong," all of which are securely packed and made available at extremely low rates. Orders of 60 lb. and upwards will be attended to directly on the Estate, but smaller weekly or monthly supplies of fresh leaf can be arranged for with Messrs. Marse & Co. Mr. Deane, as some of our readers are doubtless aware, is no novice at this business, for he has had something like twenty years of planting experience in Ceylon, where he was among the first to undertake the manufacture of tea with the aid of machinery, his success in this line being amply attested by the fact that he has taken several prize-medals for the excellence of his output, among them being two premier awards at the Chicago Exhibition. His manufacture has also found favour with Sir Arthur Havelock, to whom he was the chief purveyor during the whole time that personage held the Governorship of Ceylon. We have been favoured with sample packets of the three grades of leaf now manufactured on the "Stagbrook" Estate, and have no hesitation in pronouncing them the very best of their kind we have ever tasted anywhere. This opinion is shared by all to whom we have submitted samples for trial. Considering how largely tea is coming into use among our Native fellow-subjects of all classes, and taking into account the unquestionable excellence of the samples under notice, together with the low price at which they are offered, we are disposed to predict a big "boom" for "Stagbrook" outputs in the near future. At any rate, Mr. Deane deserves to be congratulated on his enterprise, and on the success it bids fair to achieve.—*Western Star*.

JAVA QUININE.

(From the *Chemist and Druggist*, Oct. 15.)

PLANTERS' PROSPECTS.

The future of Java cinchona need no longer trouble the producers. U.S. Consul Sidney B. Everett, of Batavia, has taken Java under his wing, and has told his Government how America can buy from Java and be independent of Europe so far as "raw quinine" is concerned. Mr. F. W. Sijthoff, manager of the Java Quinine-factory, is Mr. Everett's authority for the statement; but if Mr. Everett's other information is derived from the same source, his prophecy must be taken cautiously, as he seems to be labouring under the impression that quinine is stuff worth a few pounds per ounce. "There have (he says) been imports and shipped to U.S.A. from Java this year 48,300 oz. of sulphate of quinine, valued at \$11,395,053," and "more will follow, of course, but not at that price." No American citizen is required to pay a dollar for his maternal quinine-pill, although the "war has resulted in a rise in quinine quotations." Mr. Everett's figures have got mixed somehow; there are bound to be millions in it before a U.S. Consul dare touch a thing, and a paltry 48,300 oz. of quinine in face of "North America's annual consumption of 10,000,000 oz." was too little a thing to go by itself we fancy, especially as one object of the report seems to be to induce Americans to put their money in Java. We fancy, however, that Mr. Everett cannot be responsible for the \$11,395,055. "Now is the time," he says, "to begin a new quinine-enterprise. The stock now laid up will be consumed in two or three years, and the demand will immediately be largely increased." (We may remark, parenthetically, that cinchona-trees are always growing.) He "cannot conceive of a better investment than the planting of cinchona in Java. Concessions of land are not hard to get there, if one is on the spot. The climate in the interior is as perfect as that of the coast cities is bad. The Dutch Government has made a great success of the planting, clearing a profit in 1896 of over \$38,500 from its estates. The world's output is only 758,771 lb., of which Java produces about three-fourths." The last sentence refers to quinine, not cinchona.

This invitation to American financiers is not altogether unreasonable, for the thing that Java cinchona-planters lack most is the wherewithal to prevent them realising bark as they dry it. They must get money—they must take what buyers give them for the bark. The successful attempt of last year to advance the unit (which increased threefold from January to December) resulted in such accumulation of bark that many have been forced to realise this year, the result being that, so far, a fourth more bark has been offered. This is shown by the following figures, which give the results of the auctions for the eight months of this year:—

Year.	Weight of Bark. Kilos.	Quinine Sulphate in Bark. Kilos.	Average per cent of Quinine Sulphate.	Quinine	Quin-
				Sulph-	ine
				ate	bought in
				Sulphate	Kilos.
1898 ..	5,175,316	257,678	4.88 to 5.43	178,539	79,139
1897 ..	4,005,504	221,058	5.26 ,, 6.10	186,444	34,614
1896 ..	4,528,277	240,309	5.05 ,, 5.83	202,126	38,183
1895 ..	4,636,859	225,367	4.63 ,, 5.17	141,314	84,053
1894 ..	3,443,031	161,659	4.61 ,, 5.12	125,727	35,932
1893 ..	3,930,594	172,982	4.23 ,, 5.02	97,679	75,303

These sales also reveal the fact that this year's quality of bark has sensibly deteriorated—a condition which often accompanies deplantation, or indicates that carelessness on the part of the planters which results from unprofitable enterprise. However that may be, it is

regrettable to see any sign of deterioration in a place where it is so easy to keep up the quality. These are considerations of practical utility to the American investor. It is astonishing how the consumption of quinine goes on. The above figures do not, perhaps, convey much, but when we say that at Amsterdam a fortnight since the bark sold represented 35 tons of quinine sulphate, and that one quinine-manufacturer bought two-thirds of it, everyone can grasp how important in volume the quinine trade has become of recent years. It is also worth noting that although quinine is cheap, and the British Pharmacopœia has de-officialised cinchonidine, the latter alkaloid is growing in demand and is rapidly coming to the price of quinine.

MINOR PRODUCTS REPORT.

LONDON, Oct. 6.

COCA-LEAVES.—Fair green Truxillos leaves can be had on the spot at 8 per oz.

LONDON, Oct. 13.

CAMPHOR.—The crude market is in a peculiar position. Wednesday's cabled advices from the East gave 107s to 110s per cwt for Japan, but buyers laugh at such prices, and refuse to buy. There is no quotation for Chinese. It is notable that no crude camphor of any kind arrived in Europe last month, and it looks as if Eastern holders were to starve the home market into the higher prices. Refined firm but unchanged. A consular report on the trade of Higo and Osaka during 1897 states that there was a manifest falling-off in the quality of the Japanese product, which was not observable in the Formosan. Consequently the latter was preferred for the European market, whilst the American market, less discriminating, took more than double the export of 1896. India took an increasing proportion of refined camphor, Europe and America of crude. The exports from the above two ports in 1897, were 1,524 tons, valued at £132,472, as compared with 936 tons, valued at £118,443 in 1896. Hongkong advices dated September 3rd report the stock at 7,500 cases, with sales of 750 cases at 83s 6d per cwt, c.i.f., and arrivals, since August 20th 1,031 cases. The exports from Canton and Hongkong to the United Kingdom since January 1st 1898, have been nil; 1897 nil; 1896 756 boxes; 1895 5,989 boxes; to the Continent since January 1st 1898 12,935 boxes; 1897 20,329 boxes; 1896 16,644 boxes; and 1895 17,019 boxes.

CINCHONA.—At the London auctions on Tuesday the small supply of 1,740 packages was offered, the whole of which was practically cleared with a brisk demand on a unit basis of 13-16d to 3d, equal to about 4 1/2c Dutch. Barks containing cinchonidine sold at about twenty per cent higher rates. Nine brokers offered supplies, the aggregate of which was as follows:—

	Packages offered.	Packages,
Java cinchona ..	755 of which	755 were sold.
East India cinchona ..	471 do	365 do
African cinchona ..	260 do	260 do
Ceylon cinchona ..	148 do	108 do
South American cinchona ..	106 do	106 do
	1,740	1,594

SOUTH AMERICANS.—Fair to good Bolivian cultivated Calisaya, 4 3/4d to 5 1/4d per lb.

JAVA.—Ledgeriana red stem chips 2 5/8d to 3d; root 1 3/4d; branch chips 1d to 2 3/4d; ditto fair to good 2 3/8d to 3 3/8d; and rich 4d to 4 3/4d per lb.

CEYLON.—Succirubra: Fair to good natural red stem chips and shavings 2 1/2d to 2 5/8d; ordinary renewed ditto 2d to 2 1/4d. Officialis: Natural stem chips 2 1/2d to 2 3/4d per lb.

**EAST INDIAN.**—Red stem chips and shavings 2d to 2½d; poor renewed ditto 1½d to 2½d. Officialis: Crown chips and shavings 2½d to 3d; renewed 4d. Ledgeriana: Natural small stem chips 2½d to 3½d per lb.

**CROTON SEEDS.**—A parcel from Yokohama of doubtful quality was bought in at 85s per cwt, no bid being obtainable.

**KOLA NUTS.**—Bold washed and sound Demerara sold at 3½d per lb, and mouldy ditto at 3½d to 4d. African was limited at 3d. At the spice-auctions 2½d to 3½d per lb was paid for West Indian.

**CINNAMON OIL.**—In good supply, but only one broker managed to sell 39 cases (about 750 bottles) of leaf oil at from 3½d to 3½d per oz, and this was without reserve Bark oil, best quality, is 1s 6d per oz.

**EUCALYPTUS OIL.**—There was absolutely no bid in auction and the following were the limits stated by the brokers:—Platypus 2s 6d; aldehydic globulus, 1s 10d; and amygdalina 10d.

**LEMONGRASS OIL.**—Privately the market is steady at 3½d per oz on the spot. Samples of the public offerings were not available at the usual time.

**VANILLA** sold, with good competition, at about 6d to 1s per lb better prices for the finest qualities. The following were some of the prices obtained:—Madagascar good bold crystallised beans 6½ to 7½ inches, 18s to 20s; 6½ to 7 inches, 19s; 5½ to 6½ inches 17s 6d; 5 to 5½ inches 16s 6d; 4 to 5 inches 15s to 15s 6d; 6 to 7 inches 13s 6d. Tahiti, of good chocolate-color, brought 8s per lb, but were mostly bought in. Mauritius 2 to 6 inches 7s 6d to 7s 9d; 5 to 7 inches 18s 6d to 19s; 5½ to 6 inches 17s; 6 to 7 inches 11s 6d. Seychelles 5½ to 6 inches 18s; 7 inches 15s 6d; 5 to 6½ inches 12s 6d; mixed sizes 14s 6d subject; and 6½ to 7 inches 19s per lb.—*Chemist & Druggist*, Oct. 15.

#### RIO COFFEE CROP.

According to the message of the President of the State of Rio de Janeiro the average coffee crop of the state from 1881 to 1895 has been as follows:

Between 1881 and 1885	...	131,572,011	kilos
" 1886 "	1890	90,543,270	"
" 1891 "	1895	75,366,276	"

#### BRAZIL COFFEE INDUSTRY.

The *Rio News* suggests that: "if there is a prospect of a failure of the next crop, as many planters allege, why not try the effect of fertilizing and pruning? If the coffee trees are exhausted by the heavy crops of the last two years, then the trees should be carefully pruned as a means of concentrating their strength and careful cultivation should be employed to restore exhausted vitality."

Nature revolts against excessive fruitage and invariably exacts a penalty whether it comes in the shape of a failure of a crop of peaches prunes or coffee. The farmers of Delaware grew peaches and failed to restore to the soil any nourishment and today the peach orchards over a great area of that State are a matter of history.

The great variation in the coffee crop of Brazil shows that a continuation of mammoth crops is not to be expected unless due to a very extensive increase in the number of trees coming into bearing from year to year which is the case in Brazil. Now it seems possible that for lack of foresight on the part of the planter the old coffee plantations are threatened with decay and that means chronic disease and an easy prey to insect pests.—*American Grocer*.

**THE ART OF ADULTERATION.**—The report of the Local Government Board shows that tea continues to be free from the distinguishing touches which once marked it when the bulk of it came from China, "Coffee" is still found to consist of chicory in large quantities. On sample sold as "French" contained as much as 80 per cent. Between seven and eight per cent. of the samples of sugar were impure, the impurities generally being an aniline dye used to colour the white crystals of beet sugar in imitation of cane sugar.—*H. and C. Mail*, Oct. 14.

#### TEA IN FRANCE.

##### INTERESTING INFORMATION.

The imports of tea into France in 1894 amounted to 1,477 tons, out of which they exported 775 tons, presumably to the adjacent countries and their own colonies, 900 tons were from China, 364 tons from England, 60 tons from British India, and the balance from Japan and sundries. Swiss hotels in the same consumed 376,000 francs worth of tea, which means at least 50 tons. Assuming the average cost of first, second and medium qualities of tea landed at Marseilles to be 12 annas a pound—and this is probably a high estimate for tea bought in the open market at Calcutta—the following cost figures may be useful in considering the subject, only it will be necessary to deal with French weight; and money—2 lb. 3 oz. equals 1 kilo, and one franc is equal to 10 annas or 10 pence.

	Fcs.	Cms.
1 kilo at Marseilles	..	2 75
Marseilles expenses and rail carriage to Paris	..	0 10
Customs duty at 20sf. per 100 kilos	..	2 10
Paris expenses, manipulation, etc.	..	0 25
Cost price landed at warehouse	5	20

I have sold Ceylon tea at 3 francs 50 to 4 francs per pound; India and Ceylon mixed at 8 francs per kilo in tin canisters, and 5 kilo boxes of Indian for a concession price of 40 francs, and all these prices for tea probably not realising more than 8 annas per pound in the Calcutta market. I know shops in Paris and Marseilles where you cannot get a really good tea under 14 and 16 francs the kilo. Taking Paris, all hotels and good restaurants keep tea, of sorts, but they still require considerable education in brewing it, and to distinguish between tea and tea. The British resident gets his tea from home generally, and visitors frequently carry their tea caddy with them. Again, the cost of tea is considerably enhanced by being sent from England or any European entrepôt, as the French Customs House authorities then enforce a surcharge of 60 francs per 100 kilos. When sent direct from the country of production the ordinary duty of 208 francs per cent kilo operates. The French do not grow tea, I believe, in any of their colonies. The French themselves have begun to appreciate tea, particularly the upper and bourgeois classes; their 5 o'clock teas are an institution and there are several large places in the shopping districts where ladies on pleasure bent call for a gossip and a cup of tea. These cups of tea are sold at about 50 cms. each, and is a profitable business to the man who has the means to decorate and furnish suitably. Perhaps on reading this article the Indian tea planter may be disposed to consider whether he cannot assist in opening up this particular market and there is no question of philanthropy in the idea, simply a consideration of what is good for himself, and I do not think he may expect any help from the Calcutta agent.—*W. S.—Indian Planter's Gazette*, Oct. 22.

#### KINTYRE TEA ESTATES COMPANY, LTD.

The ordinary general meeting of the shareholders of the Kintyre Tea Estates Company, Limited, was held at the offices of the Ceylon Association in London, 61 and 62, Grace-church Street, E.C., on Monday last. The chair was occupied by Mr. G. A. Talbot, chairman of the company.

The Secretary read the notice convening the meeting. The Chairman, in moving the adoption of the report and accounts, said:—The report which has been circulated among you will, I presume, be taken as read. The year dealt with in the report has been, I may say, a critical one for the proprietors of tea estates; the rate of exchange rose 1d, causing an increased cost of pro-

duction of about  $\frac{1}{4}$  a lb. of tea, the tea market in the early months of the year was depressed, the weather was very unfavourable during the first six months of the year, causing a shortage of crop, and the dislocation of trade caused by the fear of the plague in Calcutta caused the rates of freight to rise considerably. I am glad to be able to congratulate the company on having weathered the storm very creditably, if I may as a director use the expression, though not without a certain loss of profits. The 1s 4d exchange has, as far as I can judge, come to stay, for whether a gold currency be adopted or not the weight and influence of the Indian officials will probably be able to keep up the rupee to that rate, prejudicial as it is acknowledged to be to the producing interests and trade of India and Ceylon. On the other hand, the tea market has improved, and is now as high as it was at this time last year, the fear of the plague has in a great measure passed away, and freights have resumed their normal rates, and it is hoped that the short fall of crop in the first half of the year 1898 will in a measure be made up during the last half. Turning to the accounts you will see that directors' fees and income tax in the aggregate are £140 17s 4d more than in the accounts of last year; this is because the income tax on the profits of the company for both years is charged in 1897-98 expenditure. Then we come to the profit earned, which is £607 less than last year. This is accounted for by the loss of 15d by exchange, amounting to £390, and the shortfall of 25,000 lb of tea which is responsible for £225, aggregating £615. You will see that the price realised for our tea was more by  $\frac{1}{4}$  of a 1d. than last year. Roughly speaking, this has been swamped by the increased cost of production in a minor degree, and chiefly by the higher rate of freight. I may tell you that in the early part of the year I went to Ceylon and had the advantage of talking over the working of the estates with our agents, Messrs. Geo. Steuart & Co. I also visited the Kintyre estate. Any questions that any shareholder may wish to ask I shall be happy to answer. I now move the adoption of the report and accounts.

The proposal was seconded by Mr. W. Nevett. In reply to questions from Mr. Fort, the Chairman stated that the price of the Kintyre tea sent to Australia was 10s 8d, the net price being 8s 6d, while the net price realised in London was 6s 18d. He went to Kintyre to ascertain whether there was a fair division of the two classes of tea. The tea maker stated that they were the same, but Mr. Bell, the manager, was of opinion that the teas sent to Australia were rather better. The prices in Australia were very good—much better than in England. The latter had, however, improved of late, but were not what they ought to be. The estimate for this year was 460,000 lb. of tea, and the cost 26 $\frac{1}{2}$  cents, including manure.

Mr. Fort suggested that in future more particulars should be given in the report.

The reports and accounts were then unanimously adopted.

On the proposal of the chairman, seconded by Mr. Baumann, the retiring director, Mr. W. Nevett was unanimously re-elected.

Mr. Fort proposed and Mr. Worthington seconded the re-election of the auditor. The proposal was carried.

The proceedings closed with a vote of thanks to the chairman.—*H. and C. Mail*, October 21.

Second report of the Directors submitted at the general meeting held on Monday, the 17th October, at the offices of the Ceylon Association in London, 61 and 62, Gracechurch Street, E.C.

The net profit on the sales of the Company's produce amounts to £4,660 16s 7d, and after paying Directors' fees, income tax, etc. £466 9s 9d and Commission to the estate Superintendents £232 6s 6d, there remains a balance at profit and loss account of £3,962 0s 4d. The Directors have paid half-yearly the dividends on the Preference Shares absorbing £1,000; they have written £400 off preliminary expenses thereby extin-

guishing that account and put aside £250 for wear and tear of machinery, etc., and they now recommend that a dividend of 5 per cent for the past year be paid on the Ordinary Shares which will absorb £2,250, leaving a balance of £73 10s 8d to be carried forward. The Company's estate suffered a good deal from unprecedented dry weather, which while it does not appear to have inflicted any permanent injury on the trees, greatly affected the quantity of leaf gathered. Not only was the tea crop considerably short of the estimate, but it was much under last year's output, only reaching a total of 434,790 lb. and this in spite of the young tea on Ayr which came into bearing.

The average yield of tea in bearing was 519 lb. per acre. The gross average price of the tea sold in London and Colombo was 7-64 d., this being exclusive of the Kintyre produce sold in Australia.

PLANTING COCONUTS.

Mr. Thornhill Meedon, writing on the subject of planting coconuts, says:—"I recollect when I was a new chum in the early sixties assisting in planting some coconuts under the supervision of an old West Indian planter, who placed them all eye downwards, giving as a reason that in a natural state the majority of those that grew were such as fell in that position. He also stated that if the nuts was not buried the shoot would always seek the ground to root before growing upward. Those we planted mostly came up, but were subsequently destroyed by cattle, so that I can say nothing as to final success of this method of planting."—*Queensland Agricultural Gazette*.

THE VANILLA CROPS.

Paris reports that the 1897-98 crop of Bourbon and other vanilla producing countries has now completely arrived in Europe. As foreseen, 120,000 kilos have been supplied by Bourbon; the exports to the end of July from St. Dennis amounted to 120,802 kilos, and there was then about 5,000 kilos, on the spot.—

	Kilos.
Seychelles supplied the market with ..	30,000
Madagascar, Mauritius, Comores ..	25,000
Bourbon about ..	125,000
	-----
Total ..	180,000
The most exact conjectures for this year are:—	
	Kilos.
Seychelles .. ..	22,000
Madagascar, Mauritius, Comores ..	13,000
Bourbon .. ..	80,000
	-----
Total ..	115,000

The large decrease in the crops of Mayotte, Great Comores, Anjouan and Mokali is due to the two disastrous cyclones which destroyed most of the Comores crop in February. From Bourbon, the news of the large decrease, consequence of the persistent drought of the first months of 1898, is now confirmed some think it will amount to fifty per cent, but a crop of 80,000 kilos as a maximum may be reckoned upon, so that we should have a decrease of 65,000 kilos. on the 1898-99 crop, as compared with that of 1897-98. Stocks are not much larger than last year in spite of the very large production of 1897-98, owing to great increase in the consumption. The stock in Paris is 23,000 kilos; in Bourdeaux, 17,000 kilos; together, 40,000 kilos, composed principally of very ordinary vanilla, and some of doubtful preservation. In London, Hamburg, &c., the stocks are small. We are only now getting into the busy months; stocks will be quickly dwelt with, and at the beginning of 1899 the deficit in the new crop will be ascertained. But already the fine extra qualities are very scarce

and dear. Prices have been going down gradually for a year to about twenty-five per cent, having fallen from 75f to 55f net per kilo; for first quality, 18c. From 8f to 12f per kilo has been paid at Bourbon for green beans, which is exactly the parity of the net quotations in Europe, which proves the confidence of importers in the future of this article.—*Chemist and Druggist*, Oct. 8.

### STRAWBERRY GROWING IN INDIA.

A small fortune awaits the man who raises a first-class strawberry. Vigour, quality, fertility and suitability of the plant to stand our climate must be qualities all combined if possible. To produce a strawberry suitable for any soil or part of India is not to be expected, but an ideal kind fit for general cultivation may be the reward of the patient painstaking propagator anxious to raise the standard of this all popular fruit.

The raising of strawberry plants from seed is a simple undertaking. The fruit from which the seeds are to be obtained should be the very finest, both in size, flavour and colour, and it should also be dead-ripe when gathered. It may either be crushed in water and the seeds removed from the pulp, or the berries may be spread out upon stiff paper and allowed to dry gradually.

The small seeds may germinate in the open ground, but it is better to sow under glass in pans or boxes, and if a gentle bottom heat can be afforded so much the better.

The soil should be light and rich, and the seeds only barely covered: partial shading is necessary and the soil must never be allowed to get dry. The seeds germinate irregularly, but many young plants will show themselves in two or three weeks. Plenty of air will be needed as the plants develop; when the second or third leaf has appeared, the tiny plants may be transplanted into small pots or into a sheltered bed made of good rich soil. The following season the plants should be set out into ordinary beds when the majority of them may be expected to bloom and fruit.

Those plants which promise well as regards freeness of fruit and flavour should be marked and reserved for further trial while a large number may be at once destroyed, or if space is no object, they may be left for another year.

But to obtain the best results careful selection and hybridisation are necessary. The plants to be operated upon should be apart from all others, set out three or four of the best pistillate or female plants, together with the number of the staminate or male plants. Just before the plants expand their blossoms place over them a piece of fine-network, so that all bees and flies be kept outside, this can easily be kept in place by means of a few light laths. When in flower, on a hot and dry day, lift the net, and with a fan or other material, fan the pollen from the male to the female plants. This should be done several days in succession. Then select the finest fruits for their seeds. It should be mentioned that all runners should be removed from the seedling plants until they have fruited.—*Indian Gardening*.

### COFFEE PLANTING; COCONUTS; (AND RUBBER) IN NEW GUINEA:

#### GREAT ENCOURAGEMENT TO PLANTERS WITH CAPITAL:

The representative of a leading Australian firm in ordering our monthly periodical and a supply of planting manuals, affords us the following interesting information on the above subject:—

"Coffee planting is at last being undertaken in earnest here as we are forming a plantation on the Astrolobe

Mountains about 20 miles from Port Moresby, at an altitude of 2,500 feet, where we hope to put about 30 acres under trees in February. The Hon D. Ballantine is also starting a plantation a little farther inland at Sogeri, and others are talking of taking up land for the same purpose. The coffee and tea already planted out are looking splendid, as also the young plants in the nurseries. Liberian and Arabian coffee has already been planted in several districts, and is everywhere doing well, but so far the Arabian variety has been neglected. On the Astrolobe we intend to plant the latter kind only.

"It is strange that none of your planter-capitalists have paid us a visit so far. They could have any kind of soil or climate, and the pick of the country at 2 6 per acre, whilst our Government is contemplating the giving of blocks of land free of charge to *bona fide* settlers.

"Rubber is found nearly everywhere; maki and kindred trees on the low country, and vine rubber on the ranges. Prices in London up to 2 11 per lb.

"Coconuts started bearing when three years old at Mekeo and other places. Writer and partner, Mr. Anderson, have 17,000 or more at Dedele, many of which started bearing when a little over three years old. We have good land on coast with 99 years' lease of foreshore, splendid shipping point,—cost only 2 6 per acre."

### THE FLORIDA VELVET BEAN.

Mr. Drieberg writes from the School of Agriculture:—"I send some Florida beans off my creeper, on which there are some hundreds of fruits". These are the largest we have seen.

A resident of Slave Island writes to us as follows:—"I had half-a-dozen seeds given me some time towards the end of July, and was successful with four of them which have developed into fine healthy creepers, covered with a mass of beans."

Mr. J. Melley Wood, curator of the Natal Botanic Gardens reports as follows:—"The seeds of the 'Florida Velvet Bean,' which I obtained from England, have been all distributed, and those planted here are above the ground, but many of the plants have been destroyed by insects. The plant turns out to be '*Mucuna pruriens* variety *utilis*,' and is not by any means a new plant, but I fear that it has been somewhat overrated."—*Natal Mercury*.

Frequent reference is made in our exchanges (says the *Planters Monthly*) to the 'Florida Velvet Bean' as a fertilizing crop, or as food for animals. Analysis shows that it contains 54 per cent of nitrogen and 20 per cent of crude protein. When planted in drill rows four feet apart, it will produce a solid mass of vine and foliage three feet deep. It commences to fruit at the hill in clusters like the raisin grape, thence along the entire length of the vines at intervals of 10 in. to 20 in. pods in clusters of from two to twenty appear. Therefore the fruitage must be immense. For twenty years this bean has had a home in Florida, and has been known among the people as 'the climber.' In good rich soil it will climb 50 ft. to 60 ft., blooming and fruiting all the way up,—a most beautiful and lovely sight to look upon. To plant an acre takes sixteen quarts of seed; to plant an acre in rows 4 ft. apart each way about twelve quarts. In good soil this acre will produce four to five tons of green forage, and fifteen to seventeen hundred pounds of beans. As a fertilizer, it is one of the best known.

## PLANTING NOTES.

**PLANTS REQUIRE A CHANGE.**—Professor Beal who has had the management of the Botanic Garden, Michigan, for many years, tells us that he finds that there is no such thing as planting once for all time. There is no such thing as stability, for plants need a change sooner or later and will have it or perish. The longer a plant remains in one place in quantity, the more likely is it to be disturbed by enemies—animal or vegetables, big or little.—*Gardeners' Chronicle*, Oct. 22.

**ALOES AND WHERE THEY ARE TO BE FOUND.**—A Veyangoda proprietor writes with reference to a merchant's enquiry, that:—"he has aloes over a considerable extent of his boundaries; and, though he has not enough for a regular supply, a few thousand large leaves could easily be rendered available. As the estate is within 25 miles of Colombo, the situation may be considered desirable for experimental purposes; and inquiries might disclose more plants within a reasonable radius."

**SIXPENNY TEA AND INDIAN DISTRICTS.**—A planter correspondent writes:—"What is to be the outcome of sixpenny tea; for this is what Sylhet and Cachar are at this season? Does any one know? Has anyone considered! Has anyone ever thought that this may last for a year or two? It is all very well saying, 'Oh, yes; this year I am bound to make a loss;' but what if this goes on for three or four years? How many proprietors will fork out (asks the *Planter* October 22nd)? Another thing is, even if European proprietors won't go on, the garden will be put up for sale and bought for an old song by natives, and the places will go on yielding, and making bad tea—"muck," one might say,—do harm to the district, and prices will remain at the same level. We heard rather a novel idea suggested that—to remedy this, the amount subscribed to the American Fund should be diverted buying up gardens such as we have referred to above and allowing them to revert into jungle, and thus reduce the outturn for a year or two; and there is sense in it, we think. But we will no doubt hear in our columns from our numerous correspondents what their views are. In a multitude of councils there is wisdom."

**CHARGES ON TEA.**—The General Committee, (Indian Tea Association), in the course of discussion, thought it would be well to point out that the Agents' and Brokers' commissions were much reduced by the fall in prices, and further that most Agents and Brokers were large shareholders in tea concerns, and consequently suffered equally with other shareholders. The question of wharfage charges had been already referred home to the London Association and was occupying the attention of their Committee. One thing seems abundantly evident from the report, says the *Planter*, and that is that Agents and Brokers do not see their way to any further reductions of their commissions. There are always two ends to a stick; and, as is noted, Agents and Brokers being generally large shareholders, and also very often directors of tea concerns, it appears that in this matter planters have the wrong end of the stick. No doubt, as shareholders, Agents and Brokers suffer from the present depression in the industry; but where economy is so rigidly enforced, sometimes to the detriment of efficient working, on the gardens, it is surely possible that some economies might be found feasible and practicable in Calcutta. It is hardly a question to be dismissed in a few words, as it seems to have been, and surely deserved fuller consideration.

**THE TEA PEST.**—We are glad to learn once again from Mr. Willis that he does not think the disease will be serious if planters only take measures against it as soon as they notice an outbreak of it on their estates. If they neglect to do so no one can answer for the consequence. Mr. Willis is intending to make a tour through some of the planting districts shortly, to notice the extent of the disease on the tea. It is of course, far more a visitant of tea in Assam than in Ceylon where it has only been seen occasionally in certain localities.

**HOW TO MAKE CHARCOAL.**—To make charcoal readily on a small scale, place small pieces of wood in a clay crucible, cover it with wet clay, and heat in an ordinary fire about an hour; thus all the volatile matter is driven off, and on cooling the charcoal will be found in the crucible. On the large scale charcoal is made by burning wood in large heaps or piles, covered with earth or clay, or in ovens or kilns to which only a limited supply of air is allowed access. Any kind of wood may be used, but the hard woods, such as oak, beech, and fir, produce the best and densest charcoal. Charcoal is also produced by heating wood in iron retorts, the volatile products, such as wood, tar, creosote, and acetic or pyroigneous acid, being condensed in receivers and utilised.—From "*Work*" for October

**PLANT-GEMS.**—Among the minor results of the American occupation of the Philippines has been the attention called to a very curious natural product of those islands. Several vegetable growths appear to possess the faculty of secreting mineral concretions, resembling in all respects certain familiar precious stones. These plant-gems were first investigated by the well-known American naturalist, James Smithson, and there can be no doubt as to their authenticity. One of them is the bamboo-opal, which in its delicate green and red tints rivals the best stones. It is, however, small and very rare, for a thousand stems may be cut up before a single specimen is found. The cocoa-nut pearl is rather more common, and not so astonishing, inasmuch as all pearls are organic products. Those found in the Philippine cocoa-nut vary in size from a pin's head to a pea, and very closely resemble the pearls derived from oysters.—*Daily Chronicle*, September 26.

**THE POPULARISING OF COCOA.**—Under this heading the *Grocers' Journal*, of the 15th Oct., has an article referring to the gigantic efforts made by those interested to increase the consumption of cocoa and chocolate and the recent Grocers' Exhibition, the opinion being expressed that the result of the extraordinary enterprise there shown in the matter of cocoa will be an additional fillip to this growing industry. The remarkable thing about this awakening is, it is said, "that new firms are everywhere springing up for the manufacture and sale of cocoa, while firms we have long known in other departments are hastening to make hay while the sun of prosperity shines in this quarter. The most agreeable feature about this progress of cocoa is that it appears to be increasingly 'made in England'; for though our imports have largely increased, the manufactured side is less represented than before, the raw article coming along largely ahead of the quantity received last year. This is pleasant reading to those having the care of British industry at heart; yet it must not be forgotten that all the best things are not made at home. There is little the foreigner can teach us in regard to the preparation of commodities in whose manufacture we have been engaged for ages, but we cannot disguise from ourselves—nor should we do so—that continental nations are capable of turning out good cocoas which it would not be fair to prevent a sale of here."

**NORTH TRAVANCORE: PLANTING ACTIVITY.**—We understand that the several Companies at work in this direction expect to open and plant some 4,600 acres during 1899, of which not less than 2,000 acres are to be in coffee and cardamoms. The ropeway and tramway, of which we heard a good deal, are being rapidly pushed on: the former, as we understand it, runs from 1,600 to 6,000 feet and then there will be a motor car on a tramway for several miles. Altogether much enterprise and hard work mark operations in this "New Ceylon," and we cannot but admire the way in which all is being pushed on and wish success to the old "Ceylon *durais*" who are responsible.

**TWO NEW EUCLYPTUS.**—We have received from the author a copy of his paper (with plates) on two well-known but hitherto undescribed species of Eucalyptus. The author is Mr. R. T. Baker, F.L.S., Assistant Curator, Technological Museum, Sydney. These are:—

*E. Bridgesiana*, sp. nov. "Apple," "Apple-topped Box," "Woolly-butt," of New South Wales. "But-but" of Gippsland, Victoria. "A tree of considerable size" (Woolfs); "grows to a great height, particularly in loamy soil" (J. Manns). Bark whitish-grey, wrinkled or tessellated, short and brittle in the grain, not fibrous, almost exactly identical with the Box, *E. hemiphloia*, when freshly cut giving out an aroma similar to the ordinary oil obtained from Eucalyptus leaves, extending almost to the ultimate branchlets.

*Hab.*—VICTORIA: Gippsland ("But But," "Apple-tree," "Apple-tree Box," "White Box," A.W. Horvitt, F.G.S.). N.S. WALES: Colombo\* ("Apple-top Box," W. Bäuerlen); Albury ("Apple," Dr. Andrews); Gero-gery ("Woolly-butt," J. Manns); Rylstone ("Woolly-butt," R.T.B.); Bathurst ("Bastard Box," W. Woolfs).

**TIMBER.**—It is a fairly hard, whitish-brown timber, but it is only good for indoor work as it decays rapidly when exposed to the air or placed in the ground. It is not used where strength and durability are required; fairly good for fuel.

*Oil.*—(a) *Leaves.*—646 lbs. of leaves with branchlets, distilled Feb., 1898, gave 59 ounces of oil, or an average of 571 per cent., a very satisfactory result. The oil is a little red in colour, and a few preliminary tests indicate it to be a good oil.

*EUCALYPTUS PALUDOSA*, sp. nov.—(*E. Stuartiana*, F.v.M., var. *longifolia*, Benth., B.Fl.iii. p.244). "Manna," "Yellow," "Ribbony," "Swamp," or "Flooded Gum."

A tree "not exceeding 80 feet in height" (Sir W. Macarthur), with a diameter 6 feet from the ground 1ft. 6in. to 2 feet. In the young state up to a trunk of 5 to 6 inches it is very similar to *E. viminalis*, Labill. Bark brown at the butt, bluish-white on the trunk and main branches, and yellow on the smaller branches and limbs, decorticating into long ribbons of 30 feet or more suspended from the forks and trunks of the trees.

*Hab.*—Monga (Braidwood, W. Bäuerlen); Delegate (Bombala, W. Bäuerlen); Wingecarribee W. Woolfs; Hill Top (J. H. Maiden); Barber's Creek (H. Rumsey).

**TIMBER.**—The timber is much more difficult to season than that of *E. Gunnii*, Hook., and is also specifically heavier. It is a close-grained, hard timber of a light reddish colour, and I should consider it a much more durable timber than *E. Gunnii* or *E. viminalis*. Sir W. Macarthur states that it is "said to be good." Dr. Woolfs was of opinion that it is not suitable for any purpose, but Mr. H. Rumsey, of Barber's Creek, informs me that sound logs will last 30 years in the ground. My own opinion is that if well seasoned it is a good, sound, hard, durable timber, and useful for many purposes.

*Oil.*—The leaves are not rich in essential oil, as 394 lbs. of leaves with terminal branchlets, distilled June, 1898, gave 15 oz., or 243%. It is slightly red in colour and is probably (from preliminary tests) not a good oil, and as the yield is not good it could not profitably be extracted.

\* We did not know before that there was a "Colombo" in New South Wales.—Ed. T.A.

**LIBERIAN COFFEE IN SUMATRA.**—We direct attention to an interesting letter from our well-known correspondent "W.T. McK." on page 400. The heading he gave of "Coffee Planting in Switzerland" was so startling that we could not avoid adding "Sumatra," albeit "Switzerland" is the appellation of a very fine coffee-growing division of that island.

**DR. JOHNSON AND TEA-DRINKING.**—Mr. Thomas Auld, of Belfast, writes in *Notes and Queries* of October 1st:—"The late romantic R.L. Stevenson, in his essay 'Ars Triplex,' has thus written: 'Already an old man, he [Dr. Johnson] ventured on his Highland tour; and his heart, bound with triple brass, did not recoil before twenty-seven individual cups of tea.' Is not this twenty-seven a small romance in itself? I fancied I had read most of the Johnsonian literature in existence, yet I have never heard of the doctor disposing of more than twenty-four cups of tea at one sitting. It is as well to point out this (if it has not already been noted) lest some other writer, à la Sir John Falstaff, should add a few more cups to a number which is already large enough in all conscience.—T."

**TEA INFUSION.**—Dr. Goodfellow's seven golden rules are worthy of special record:—

The golden rules he laid down with regard to tea-drinking were: always to use good tea; use water which had just got to the boil; infuse about four minutes; do not allow the leaves to stand in the infusion; avoid second brews and the used tea leaves; avoid tea at the principal meal; and, if suffering from heart or nervous complaints, only use the very finest qualities of tea, with short infusion.

The London *Standard* winds up an appreciative notice with some unjustifiable remarks in regard to Indian, specially Ceylon, teas:—

The truth is that the excessive use of these teas is a very great evil. They have made their ways and ousted the China leaf, mainly because they are cheap, and "strong," otherwise black. The average Englishman reckons his tea by the blackness, and the average housewife buys the kind with which she can make most cups of the standard shade, so to speak, out of a pound. Indian tea, and in a less degree Ceylon, will make half as many cups again of sufficient colour and "twang" as China. It represents, therefore, a very substantial economy to the thrifty housekeeper; but the blackness and the strength are not desirable qualities from the dietetic point of view. As Dr. Goodfellow said yesterday, the deep colour is due simply to the tannin, and such tea is usually poor in theine, which is the exhilarating principle. High class teas do not produce a deep colour, but they are rich in theine—neither black nor strong—which has such a wonderful effect on the tired nerves when taken at the right time. It seems to spread through the body in a moment, and dispels the sense of lassitude like magic. Taken once, or even twice, a day it is a real blessing. But to swill strong black tea, as many of the working classes do, at every meal—well, they had better by far be drinking beer.

Now, our contemporary ought to know that Dr. Goodfellow's rules were specially drawn up for India and Ceylon teas, not for the weaker and comparatively fusionless China kinds, and that if these rules are observed nothing but benefit can come from drinking our teas. Further he should know that Ceylon teas as a rule come between the Assam and China kinds. Then again, let him note that the greatest tea drinkers in the world—the Australians—are among the most athletic and that they are rapidly abandoning China, in favour of Ceylon and Indian teas.

## CEYLON BRICK AND TILE COMPANY.

*(Investors' Guardian Oct. 22.)*

CEYLON BRICK AND TILE Co., L.D. 59,113.—Registered October 12th, with capital £20,000, in £1 shares to adopt an agreement with Walker, Sons & Co., and to carry on in Ceylon and elsewhere the business of brick, tile, and pipe manufactures, builders, contractors, masons, engineers, &c. The subscribers are:—

	Shares.
E. Walker, 36, Basinghall Street, E.C., merchant	1
W. J. Walker, 36, Basinghall Street, E.C., merchant	1
R. A. Ziederburg, 36, Basinghall Street, E.C., merchant	1
J. Walker, 36, Basinghall Street, E.C., merchant	1
D. S. Pace, 36, Basinghall Street, E.C., merchant	1
A. Armstrong, 36, Basinghall Street, E.C., clerk	1
A. H. Martin, 36, Basinghall Street, E.C., clerk	1

Table A mainly applies. Registered by Sandom & Co., 52, Grace-church Street, E.C.

One half the authorised capital of £20,000 is, says the local "Times," to be issued at present; and of the 10,000 £1 shares, 7s 6d per share is all that is wanted just now. The shares are being offered first to the shareholders and employees of Messrs. Walker, Sons & Co., and it is not known yet whether any will be available to the general public. Suitable clay land has already been procured between seven and eight miles from Colombo, on the Avisswella road, not far from the Kelani river; and the building of the kilns is just about to commence. There is already a pug mill and small machine on the spot. The heavy machinery is coming out later from home; and the whole plant and building will cost about £4,000 sterling. The capacity of the manufactory is to be 3,000,000 hard pressed bricks and 1,000,000 Calicut tiles per annum; and as there is both Government and private demand for good materials, and bringing them from India adds 50 per cent to the cost, the concern, under the excellent management which it is to have, should prove a highly prosperous one. The Manager is to be Mr. H. Wilding, who has already been in the island some time, engaged in preliminaries. Samples of the clay have been sent home and been most favourably reported on, and there is nothing to prevent the Company going straight ahead with its work. Careful calculations show that a profit of 10 per cent can be made on the called up capital, allowing a substantial margin for contingencies. The first Directors are Messrs. W. J. Walker, Edmund Walker (who is also Secretary *pro tem*), Walter Lamont, David S. Pace, and E. Barkley Roe, (Messrs. Walker, Sons & Co.'s local engineer). The London offices are the same as those of the promoting Company—36, Basinghall Street, E.C.

## PRODUCE AND PLANTING.

TEA PROBLEMS.—While all those who are interested in the tea industry are endeavouring to discover the cause of the present depression the problem has been settled for them. Planters, as a rule, we know are of opinion that dear silver has a great deal to do with their troubles, and this opinion finds support in London where members of the tea community meet. It is admitted readily enough that cheap silver stimulated production, and that too much tea was in consequence rushed upon the market, but few tea proprietors would attribute the present state of things entirely to over-production. The Calcutta *Englishman* does not hesitate to do so, however. In one of its articles on the subject, after giving an array of figures in support of its contention, it

says:—"A careful examination of these figures shows to any student of the Currency Question that the fall in the price of tea has unquestionably throughout been entirely due to excessive production," and that this cause has had the same effect since the mints were closed as before, and that the reduced China export has played no part in the fall. There is no compromise here. Over-production and this alone has caused all the trouble, and dear silver is merely an incident of the position. The view taken by the *Englishman* is built upon facts and figures, but theories based even upon this apparently solid foundation have sometimes gone wrong. No one, so far as we are aware, wishes to minimise the evil of over-production, but it is possible to make a fetish of figures. As a writer in *Capital* points out: "The planters must know where the exchange shoe pinches them, and as tea is practically all export, and foreign markets other than the existing ones are still to be captured, surely it is easy enough to understand that planters should chafe a little under this talk of 'over-production,' when they know that an artificially raised standard allows them little chance of meeting outside competitors on anything like equal terms."

ADULTERATED TEA.—Before the days of Indian and Ceylon teas the lower grades of Chinese tea were sometimes manipulated in a manner that did credit to the ingenuity of the Celestial, but did not promote a feeling of confidence in him. The dodges resorted to were so numerous that a book might have been published on the subject. The Custom authorities, slack at first about the matter, began to wake up just about the time when China was losing her hold of the London market. When pure British-grown teas began to take the place of Chinese tea there was less occasion for watchfulness on the part of the Customs, for the Chinese, finding their tea trade departing, neglected the art of adulteration for a while, but do not seem to have entirely abandoned it. The latest Customs report points to the fact that more bogus tea finds its way here than there was a year or two ago. There is nothing very alarming in the report. Of 701 samples tested, 629 samples were considered satisfactory. The remaining 72 samples represented teas of a doubtful character, the results of analysis of which were reported to the Board for their decision, with the following results:—71 samples, representing 1,085 packages, were refused admission to home consumption and restricted to exportation as being exhausted within the meaning of the Act, or as being mixed with other substances. One sample, representing 64 packages, was found to be unfit for human food and destroyed. Of the 403 samples of tea examined by public analysts in 1897 only one was found to be adulterated. As to this sample, which contained small stones and sand, the analyst for Derbysire reports that at one time this method of increasing the weight of tea was not uncommon, but that since the Custom House authorities have undertaken the examination of tea when imported it is extremely rare to meet with an adulterated sample. We should be sorry, in the absence of clear evidence on the point, to attribute these artistic efforts entirely to the Chinese. But this rubbish certainly does not come from India or Ceylon, and as there are previous convictions against the Chinese, on this account it is but reasonable to assume that the Celestial grower or dealer is the offender. We notice that these teas which are not considered fit for consumption here may be "exported." While this generously permits the foreigner to indulge in the luxury of "exhausted" tea leaves we trust that the nationality of the culprit who sends this stuff to market is made clear.

JAVA COFFEE PLANTING INTEREST.—From a circular issued by the Netherlands India Agricultural Company to the 6½ per cent. bond-holders it would appear that the Dutch India coffee growing industry is not so prosperous as might be desired. The directors say that the April interest could not be paid to the bond-holders referred to owing to the necessity of keeping the available cash to maintain the good condition of the undertakings and to pay interest and redemption of the mortgage debt. If the cultivation is not

satisfactorily cared for; the value would rapidly decrease, and the estates might be ruined. A reasonable bid in that case could scarcely be expected. Provisionally there is no prospect of a reinforcement of means. The 1898 coffee crop has not realised much, and it has now been proved that even the most moderate estimates have not by a long way been equalled. As regards the 1899 crop no reliable estimate can be given as yet. On September 4th, a wire was received that the crop was estimated at 4,500 piculs, but the result of the months of September and October must be known before anything definite can be said.

A PLANTER'S PARADISE.—Puerto Rico is clearly a pleasant place for tropical agriculturists. The *Times* correspondent gives an interesting account of its possibilities, and the United States Government will make the most of them. The conditions for sugar-cane cultivation are not unlike those found in Jamaica. The present production of sugar in the island is about 80,000 tons, and of this amount 60,000 tons are available for export. Under favourable circumstances, such as the admittance of the products of Puerto Rico duty free into the United States, the export of sugar could be easily increased to at least 200,000 tons, and the capital necessary to bring about this development in the planting industry would be very speedily forthcoming if the conditions to coffee cultivation offered a somewhat stronger attraction to the possessors of limited capital than sugar-cane planting. Fertile forest land suitable for the formation of coffee plantations can be purchased at rates varying from £2 to £3 sterling an acre. The expense of cultivation may be taken at £7 to £8 sterling for each acre planted until the trees begin to yield a return in the fourth year. Puertorican coffee has always brought very high prices and does so to-day in spite of the over-production of the bean in Brazil and elsewhere. At present the total exports of coffee from the island amount to some 25,000 tons annually, and this quantity might easily be doubled, or even trebled, if capital was available for the extension of the industry and more attention was paid to the methods employed in the cultivation of the plantations—difficulties that should now be easy to overcome. Tobacco cultivation also offers very considerable scope for increased production. One of the most serious questions in connection with tropical agriculture must always be the supply of labourers available for work in the fields. If numbers are any criterion to judge from Puerto Rico must be considered exceptionally favoured in this respect, the population of 900,000 giving a density of more than 240 to the square mile.—*H. and C. Mail*, Oct. 28.

## NEW DUMBULA COMPANY, LIMITED.

### CHAIRMAN'S SPEECH.

The fourteenth ordinary general meeting, was held at No. 52, Gracechurch Street, London, on Wednesday, 19th October, Mr. W. S. Bennett, in the chair.

The Secretary having read the notice convening the Meeting,

The Chairman said: I now beg to move that the Report and Balance Sheet as presented by the Directors be received and adopted. The report which the Directors have to lay before the Shareholders this year is as satisfactory as any of its predecessors, although several circumstances have made against successful results generally. The rupee is higher, rice has not yet returned to its normal value, and latterly there has been a drought throughout Ceylon, which has affected the yield. The result of the working, despite the drawbacks mentioned, gives a proof that we have a first-class property, and that the working staff in Ceylon, especially the Manager, Mr. Dick Lauder, are thoroughly up to their work. Last year the yield was 1,043,791 pounds of tea, this year it is 1,160,953, an excess of 112,162 lb. off the same acreage. The net price of the tea is slightly higher than last year, whilst the cost of production has been rather less, making the

profit per pound about a farthing more. The price of the rupee has been seven-eighths of a penny higher. You will see, if you compare the reports of the two last years, that whilst the expenditure in the island has been one thousand pounds more, the returns on tea sold are about three thousand more. All works undertaken have been paid for out of current revenue, and both "Tea extension" and "Factory and Machinery" show a clean sheet. All other matters have been carefully and economically looked after. It will possibly be the proper time now to mention what will be of great interest to Shareholders—namely, that the Directors have for some time past had under consideration the possibility of arranging a scheme for assimilating the various classes of shares, and they hope, in a short time, to submit a plan for this purpose to the Shareholders, which will also deal with the considerable reserve fund now to the credit of the Company. I don't think I need say any more, but we shall be pleased to answer any questions that Shareholders may wish to put.

## CAROLINA TEA COMPANY OF CEYLON, LTD.

The sixth annual report of the Directors of this Company for which Messrs. Leechman & Co. are the Ceylon agents was to be submitted to the ordinary general meeting of this Company to be held at the Offices of the Agents, Messrs Frith, Sands & Co., Winchester House, 50, Old Broad Street E.C., on Monday, 31st Oct. The report is as follows:—

Your Directors beg to submit the Balance Sheet and Profit and Loss Account for the year ending 30th June 1898, duly audited.

The surplus of £5,227 13s 6d it is proposed to appropriate as follows:—

Net Profit	£5,227	13	6	
Amount at Credit of				
Ordinary Shares	110	4	7	
				£5,337 18 1
Debenture Interest	£2,450	0	0	
Dividend on Ordinary Shares				
at 5 per cent per annum	2,500	0	0	
Proposed to place to Reserve Fund	275	0	0	
				5,225 0 0

Balance to be carried forward to the credit of the Ordinary Shares .. £ 112 18 1

The actual Tea crop from the Company's properties was 939,491 lb., as against an output for the previous season of 893,283 lb., exclusive of Bellongalla Estate (sold in 1896-97, and which produced 36,773 lb. Tea in that season).

The cost of the Tea free on board at Colombo was 5.10d per lb. compared with 4.88d per lb. for the previous season, the extra cost being due entirely to the advance in exchange.

The average gross sale price in London was 3.02d as against 2.6d in 1896-97.

In addition to the Tea crop 441 cwt. of cocoa and 307 bushels of coffee were obtained, as compared with 450 cwt. and 413 bushels in the previous season.

The reduction of profit shewn by the accounts from the earnings of last and previous years, was caused mainly by the considerable advance in rates, both of exchange and freight during the season, and which entailed an extra cost of working equal to nearly 3½ per cent on the capital of the Company, while the average selling price of the Tea was about ¼d per lb. below that of the previous year's crop.

The total quantity of land now under cultivation is 2,577 acres, comprising:—

Tea in full bearing ..	1,550	(yielding 480 lb. per acre)
Tea in partial bearing	556	
Tea not yet in bearing	312	
	2,428	acres.

Cocoa, Coffee, &c. 149 "

2,577

To the Reserve Fund has been added £1,200, made up as to £275 from the profits of this year, together with the sum of £925 transferred from the amount of Timber profit held in suspense, bringing the total of the Reserve Fund to £7,200.

Your Directors have to express their entire satisfaction with the working of the staff in the Company's employ.

The Directors retiring by rotation are General Hopkinson and Mr. H. St. J. Oscar Thompson, who, being eligible, offer themselves for re-election.

C. A. W. CAMERON, Chairman.

### SCOTTISH TRUST AND LOAN COMPANY OF CEYLON, LIMITED.

Capital, £125,000; First Issue (fully subscribed), £75,000; of which paid up, £45,000; Reserve Fund, £10,000.

Directors:—James Haldane, C. A., Edinburgh, John Wilson, of Messrs. Honeyman & Wilson, Edinburgh and Henry Johnston, Q.C., Advocate Edinburgh.

Secretary:—Francis A. Bringlee, C.A., 123 George Street, Edinburgh.

Registered Office:—123 George Street, Edinburgh. London Office:—Adelaide House, 52 Gracechurch Street, E.C. Wm. Bowden Smith, London Agent\*.

Agents in Ceylon:—Messrs. Cumberbatch & Co., Colombo.

The following is the report of the Directors of the Scottish Trust and Loan Company of Ceylon, Limited, to the Twenty-first Ordinary General Meeting of Shareholders, held within the Company's Registered Office, No. 123 George Street, Edinburgh, on Wednesday, the 26th day of October:—

The Directors present their Twenty-first Report being for the year to 31st August 1898.

**ESTATES IN THE COMPANY'S POSSESSION.**—The past season has not been favourable for the flushing of Tea; the estimated yield has nevertheless been realised, and the crop has averaged about 407 lb. per acre. The substantial rise in exchange, the fall in the price of Tea, and a reduced Coffee crop are answerable for the decreased returns as compared with the two previous years.

The Company's Estates now have 1,489 acres of Tea in bearing, 102 acres in partial bearing, and 364 acres of young Tea which is coming on well. The remaining Coffee land is being gradually planted up with Tea.

**FACTORIES, BUILDINGS, AND MACHINERY.**—All the buildings have been maintained in thorough repair, and the machinery is in good working order. It is anticipated that it will be necessary this year to make some addition to the Annfield Factory, to provide more withering space for the increased quantity of leaf that has now to be manufactured.

**MORTGAGES HELD IN CEYLON BY THE COMPANY.**—The loan of £9,000 over Lawrence Estate was repaid in November 1897, and the proceeds applied in meeting debentures maturing at Martinmas, in capital expenditure during the year, and in reducing the temporary advance from the Company's bankers.

**DEBENTURE DEBT.**—The debenture debt has now been reduced to £1,000.

**REDUCTION OF CAPITAL.**—The re-arrangement of the capital of the company referred to in last report was, during the financial year just closed, duly carried out under the sanction of the Court. The shares are now of a denomination of £5 each, with £3 paid. The reduction of the liability for uncalled capital to £2 per share, in the opinion of the Directors, materially enhances their marketable value.

**ACCOUNTS.**—The Balance at the credit of Profit and Loss Account is £6012 18 9

And the Directors propose—

To pay a Dividend of 5 per cent. per annum, free of Income Tax, £2250 0 0

Note.—Two and a half per cent.

of this was paid as an Interim

Dividend at Whitsunday 1898.

And a Bonus of 5 per cent. free

of Income Tax, 2250 0 0 4500 0 0

Thus leaving .. £1512 18 9

to be carried forward to next account.

Since the close of the financial year, the Directors have sustained the loss by death of their colleague, Mr. J. H. Beilby,\* who, for many years, was associated with the management of the Company, and whose sound practical judgment was greatly valued by his co-Directors. They desire to place on record an expression of their regret and of their appreciation of the services which Mr. Beilby rendered while a member of the Board.

The Director retiring by rotation is Mr. Henry Johnston, q.c., who is eligible for re-election. The vacancy in the Directorate caused by the death of Mr. Beilby will be filled up at the Annual General Meeting of Shareholders.

The Auditor for the current year falls to be appointed.

Edinburgh, Oct. 18.

FRANCIS A. BRINGLEE,  
Secretary

### VOGAN TEA COMPANY.

#### PROPOSED PLUMBAGO MINING.

An extraordinary general meeting of the shareholders of the Vogan Tea Company of Ceylon, Ltd., was held Saturday afternoon (Nov. 12th) in the offices of Messrs. Lee, Hedges & Co. "to consider the advisability or otherwise of authorising the directors to spend money in mining plumbago on the Company's land." Mr. W B Kingsbury occupied the chair and the others present were the Hon. W W Mitchell, Messrs. V A Julius, Gordon Bois (attorney for Mr. Henry Bois), G E Woodman, W E Mitchell, W N Tisdall and A L Kirk, proxy in favour of the Chairman.

The CHAIRMAN having read the notice convening the meeting said they had known for some time that there was plumbago on the property, but their hands had been so fully occupied with extensions in tea and one thing and another, that they had not had time to look into the matter closely until about two months ago, when the directors received such favourable reports of the possibility of obtaining plumbago in paying quantities that they decided to spend a sum of about R1,500 to R2,000 in experiments. The best thing he thought he could do now was to read the report which had been received from the Manager of the estate, Mr. Tisdall, and which would give them an idea of what had been done. The report was as follows:—

The work was started the first week in September. The old existing pit was abandoned as it was too wide for sinking a proper shaft. A new shaft was sunk about 15 feet to the east side so as to strike a vein which appeared in the old pit. Work was continued in the old pit on some surface veins, and about three tons of plumbago of an average value of R110 have been extracted. This work is still being carried on and I anticipate getting several tons more of the same quality. To date, the new shaft, properly planked and supported with

\* Alas, that we should have to say, the Agent is no more: we have not heard yet who is to be his successor.—ED. T.A.

\* We fear this must be a relative of a respected Ceylon planter of the same name, and if so, sympathy is due.—ED. T.A.

two winches, &c., has been sunk to a depth of 51ft., and tunnelling was commenced this week. A rough plan enclosed will show the way the tunnelling is being worked. In the eastern tunnel the miners are following a vein of from two to six inches in thickness and about three quarters of a ton has been got out in three or four days. Some of this is good lump plumbago of excellent quality, and the miners think that by following up this vein they will strike a larger vein. The indications are improving as they go on. The plumbago is mixed with quartz which they say is a good sign of the mineral in quantity. The expenses roughly to date, deducting the value of the mineral extracted, is about R1,500. It may not be necessary to spend the R5,000 now asked for as the plumbago being taken out of the pit daily will pay about half of the working expenses and may increase considerably. In case the Company find the working too expensive as they go on, the pit may be leased and a share of the profits given to the Company. Indications of the mineral are to be found in several other places both on Vogan and Iddagodde, and it may be worth the Company's while to obtain the services of a European expert to prospect.

Well, although the outcome of the two tons of plumbago that they had cured was disappointing, the quality was very good. They sold a small quantity, 33 cwt., and of that the lumps sold at the rate of R565 a ton which, he thought they would admit, was a very good price, and chips at R340 a ton. Of course this was only surface plumbago and he should think that probably if they got into a vein it would have been a good deal better and yielded a larger proportion of lumps. One of the best experts in Colombo reported:—

Herewith we return samples and valuations, two tons Vogan lead. The out-turn is disappointing. This is due to the small proportion of lump which is of excellent quality. No doubt as mining progresses the plumbago will improve in quality and the proportion of lump increase considerably.

Well, he thought that with the price of tea so low as it is they should make every effort to increase their income. Without being too sanguine, it looked as if they had here a chance to do so. It must be borne in mind that they had had a good deal of preliminary expenditure which would not occur again and whatever money they spent now it would go a good deal further than what they had already spent. The directors were anxious to get the sanction of the shareholders to spend a certain amount if they saw fit in further prospecting and making the shaft deeper. If any shareholders had any questions to ask he would answer them to the best of his ability.

The Hon. Mr. MITCHELL said he had never known a European to make anything out of plumbago mining. It seemed to him to be essentially an industry for natives to pursue. He could not help thinking that, if this Company took it in hand, the chances were that they would sink a lot of money. The Chairman had said that the preliminary expenses had been got over, but the digging of plumbago was a constant source of expense. The shafts were continually falling in altogether or partially, and they had to be reopened and shored up, fresh tunnels had to be made, and contingencies of all kinds were constantly arising which they could not foresee, involving heavy expenditure. The plumbago was good enough of the kind, but he was afraid they would find that native men were much more likely to succeed in carrying on work of that kind than they were. The present prices of plumbago were high, inflated he should say, and it seemed to him that they were not likely to continue when the supplies were brought out which they would undoubtedly

be as soon as this weather was over. Everybody was making a rush for plumbago just now, the supply was far in excess of the demand, and the prices would undoubtedly drop back to where they were before the inflation. He should strongly recommend that, if anything was done at all, it should be to let the mine to natives to work and take a share of the profit. He was strongly opposed to the Company going on spending money and doing the work themselves.

The CHAIRMAN said it was never the intention of the directors to spend a large sum. Their idea was not to expend more than R5,000 or R6,000.

Mr. GORDON BOIS moved "that the directors be authorised to spend from time to time moneys in the working and mining of plumbago, provided that the moneys due on this account to the Company, after crediting proceeds of sales of any plumbago, shall not exceed R5,000." He was quite aware, as Mr. Mitchell had said, that Europeans had hitherto not made much out of plumbago, but he did not think that Europeans had given it a fair trial on their estates, and he thought it was worth while spending a sum, which was not excessive, in getting an article which at present was of great value. At all events the initial cost would be repaid if they could get the article out without paying a large sum of money in tunnelling, shoring-up operations, and things of that sort.

Mr. TISDALL seconded.

The Hon. Mr. MITCHELL proposed that the action of the Board be confirmed in what they have done in searching for plumbago, and that the pit now be leased to a native for further working as thought desirable.

Mr. W. E. MITCHELL seconded.

Mr. JULIUS said that looking to the small attendance at the meeting and the importance of the matter, it would be advisable to defer the matter until they had obtained the opinion of the shareholders.

Mr. WOODMAN said they might adjourn, but in the meantime this expenditure would be going on.

Mr. TISDALL was understood to say that the expenditure was about R35 a day.

Some conversation then took place as to adjourning, the outcome of which was that the two resolutions were withdrawn and the following, moved by Mr. GORDON BOIS and seconded by the Hon. Mr. MITCHELL was unanimously adopted:—"That as the views of the shareholders present do not coincide as to what should be done and the number of shareholders present is small, it is proposed that the resolutions before the meeting be withdrawn, and that this meeting be adjourned till the 26th Nov. at 12 o'clock, by which time the agents and secretaries are requested to obtain, if possible an expression of opinion from shareholders generally to submit to the adjourned meeting. In the meantime it is agreed that the work be carried on as small a scale as possible and that the past action of the directors be sanctioned."

The meeting terminated with a vote of thanks to the chair, proposed by the Hon. Mr. MITCHELL.

**DIGGING FOR PLUMBAGO.**—Our Geological and Mineralogical Survey when it comes should surely remove much of the objection to Europeans engaging in Plumbago mining? Meantime, we believe Mr. Tottenham is well satisfied with Capt. Tregay's developments on his Monerakande property,

## TEA IN NORWAY AND FRANCE.

Writing to us from Edinburgh, 27th Oct., Mr. A. L. Cross gives us some interesting information:—

“When in Norway it seemed to me there was a field for pushing Ceylon Teas. I gave some of the Norwegians I became acquainted with a little of our Ceylon high-grown tea, and they liked it. The teas they got, poor stuff mostly, cost five to six kroners per lb. duty paid, and good teas nine to ten kroners. The duty is two kroners per kilo, a kilo being 2½ lb. English. They might easily relieve the Ceylon market of one million lb. of tea. The Norwegian housewives are however splendid coffee makers, and after a course of good coffee drinking, tea does seem poor stuff. Coffee is drunk at 4 o'clock in place of afternoon tea, and tea is given at supper at 8 o'clock, a bad hour for those who can't sleep well after it.

“Push Ceylon teas in France as much as possible, but I don't believe the French Government will reduce the duty. In fact I have little belief in exhibits at Foreign Exhibitions. They simply prick the brains of exhibitors, and keep prohibitive duties against the introduction of the articles. What was the result of the previous French Exhibition? They, the French, talk of growing tea largely in their Tonquin possession.” Mr. Cross does not tell us the value of “kroners.” The “Statesman's Year Book” gives the Norwegian “krone” at 1s 1½d or “18 kroners to the pound sterling.” This would give prices of tea 5s 7½d to 11s 3d per lb.! Prodigions! The duty as given in our “Handbook” is 9½d for Norway, while at 2s 3d per kilo, it should be quite 1s per lb. Mr. Cross may be able to clear up the monetary difficulties.

## HANDBOOKS, &amp;c.

## WHAT THE “PLUCK” OF CEYLON PLANTERS DID.

FERGUSON'S CEYLON HANDBOOK AND DIRECTORY for 1898-99. (Colombo: A. M. Ferguson; London: John Haddon and Co., Salisbury Square.)

Aberdeen has long taken a special interest in Ceylon, and much of the best literature on the subject of the island has been contributed by Aberdonians. Just 101 years ago a young Episcopal clergyman “set out”—as he quaintly tells us in his admirably written book of travels—from the New Inn, Aberdeen, after saying “good-bye to the great and good Dr. Beattie.” The fly left at 3 a.m.; the passengers breakfasted at Laurence-kirk, and slept at Perth. In Edinburgh he met Dr. Bell, the educationist, and in London took part in the rejoicings on hearing of the Camperdown victory. Sailing from Portsmouth on 6th November, 1797, our traveller reached his destination in 6½ months. There were giants in those days, and he got interesting introductions to and glimpses of Wellesley—the great duke to be—Clive, and Mr. North, afterwards the Earl of Guildford and first English Governor of Ceylon. Altogether we have an elaborate and fairly accurate account of Ceylon by this keen and very industrious observer. Forty years later we had another work on this favoured and most interesting of tropical islands by our late neighbour, Major Forbes Leslie of Rothienorman, perhaps the ablest and most important work in many respects which has yet appeared on the

subject, tracing, as it does, in polished and beautiful language the history of the Sinhalese for well-nigh 3,000 years. With the help of his friend Mr. Turnour he interprets the Mahawanso—the principal historical records—while his descriptive writing is eminently accurate. Ceylon, indeed, has been peculiarly fortunate in her historians. Putting aside the monstrous fables of Sir John Mandeville, the De Rougeumont of six centuries ago, few countries can show a more copious, interesting, and reliable history. Early in the thirties and forties a few earnest and capable young men went out to this “utmost Indian isle” for the purpose of introducing an improved system of tropical husbandry, particularly the cultivation of coffee. Amongst these were our Boyds, Haddens, Tytlers, Gavins, etc., and more recently shoals of youths have gone out eager to blend tea with sport.

Nowadays there are few in Aberdeenshire who have not a relative or friend in Ceylon, and not a grocer of the least pretensions to respectability who does not pride himself in supplying the best products of the spicy isle. Mr. Ferguson's Directory shows what has been accomplished and what is being accomplished from year to year, and no one interested in the island, however remotely, ought to be without a copy of this invaluable handbook. “I doubt very much,” said Lord Stanmore, “whether any colony, except perhaps Victoria, where they take immense pains with their annual returns, has anything approaching to it in completeness and accuracy.” There is literally nothing one could desire to know with regard to Ceylon that may not be found in this goodly volume of 1,600 pages; and all who are interested in the antiquities or products of this flourishing and beautiful island would do well to secure a copy.

Amongst the numerous facts and figures in this wonderful compilation the outstanding developments of the past fifteen years are the rise of the tea enterprise and the increasing importance of the port of Colombo, tea having increased from 1,000,000 lb. to 120,000,000 lb., while the shipping has gradually grown to about 7,000,000 tons per annum. It is interesting to note that the revenue, which 100 years ago was only £226,000—chiefly derived from pearls, cinnamon, arrack, gambling, and cockfighting!—now amounts to 23,411,000 rupees one of the principal items of which, we are sorry to see, is from a tax on rice, the chief food of the people—a blot on the escutcheon of the Colonial Government which we hope will not long remain. On the whole, however, the island is well and judiciously governed, the best test being the increase of native population from 1,250,000 to over 3,000,000 during the present century. The acreage in cultivation has increased by leaps and bounds, notwithstanding the vicissitudes encountered. Everybody knows of the calamity that befell coffee planters, but everybody does not know how the pluck of the planter carried him through the dark days of transition from coffee to tea, till now Ceylon is in a better position than ever it was in its most palmy days. Free alike from the hurricane which devastates the West Indies and the earthquake which shatters the hopes of the Java planter, Ceylon is an ideal tropical home, and while its mild, moist climate is eminently suited for the abundant productions of the finest flavoured teas, its proximity to an inexhaustible labour supply and facilities for transport give it an advantage few countries can compete with. More healthy than Assam, better governed than any South

American colony, the chief calling port of all the great mail and passenger steamers for Australia, China, or Calcutta, it is no wonder that Ceylon has become one of the favourite winter resorts and popular show places of the Eastern world, or that young men are still dazzled with the prospect of a planter's life in the land

Where every prospect pleases.

Mr Ferguson, of course, does not confine himself to tea, but every tropical product of any consequence is more or less dealt with—coffee, cocoa, coconuts, cinnamon, areca, kitul and palmyra palms, rubber, nutmeg, ginger, and vanilla, the great variety of fruits such as pineapple, plantain, oranges, mangoes and mangosteens, spices and essential oils, fibre-yielding plants, etc. for a full account of all of which we must refer the reader to the book itself.—*Aberdeen Journal*, Oct. 17.

### SELANGOR PLANTERS' ASSOCIATION.

General meeting—October 22nd. Mr. E. V. Carey, Chairman.

With regard to the question of arranging for funds to meet the expenses of the U.P.A. delegates to Java the Chairman said that in consequence of a suggestion from the S.P.A., the U.P.A. Committee had decided that an effort should be made to send delegates of the Association to Java to investigate the methods of treating Liberian coffee adopted there, with a view to improving his quality of our own, and Messrs. V. R. Wickwar and G. Shepherd had been asked to go. Unfortunately Mr. Wickwar was prevented from going by illness, but Mr. C. Meikle had been asked to go in his place and both he and Mr. Shepherd had kindly consented.

A telegram from Mr. W. W. Bailey to the Chairman on the subject of sending delegates to Java and protection of a Dutch pulper was read to the meeting, but could not be dealt with, as the question raised by Mr. Bailey had already been settled.

### TEA PROSPECTS—CROPS AND PRICES.

A planter, who travels a good deal over the tea districts, reports as follows:—

Every one is complaining of the weather. The ground is sodden, and tea is not flushing so well as might have been expected after a dry August and September. Indeed, in some districts the yield in October and November will be very disappointing. The surprising thing is that tea is not higher in price, seeing that supplies have been falling short for some time past. I am afraid wholesale buyers and distributors and other Cheap-Jack people have done us a good deal of harm in the old country if only the truth were known."

### CACAO Vs. CHOCOLATE.

Wishing to know what was really the percentage of sugar in manufactured chocolate of the best makers, I obtained a sample which was sold at the rate of 3 shillings per lb in Port-of-Spain, the capital of Trinidad. Now out of this pound I found 65 per cent of sucrose, which might be either the sugar of the cane, or beet sugar. At any rate there was present 65 per cent of sugar in the one pound of chocolate allowing this to have been of the very best class it could not have cost the manufacturers at wholesale prices more than 3 cents per lb.

The 35 per cent cocoa and other material may be well estimated as follows;—The loss on roasting and

grinding cocoa by hand is 27 to 30 per cent. The value of raw cacao per lb is about 14 cents, and by adding 30 per cent to the original cost and make up for waste, we have a value of clean unground cacao of some 20 cents per lb. Take manufacture, grinding, &c., to represent a value of 100 per cent (which would be an extreme estimate) we should have 40 cents as the price of 1 lb. of prepared chocolate without admixture of sugar. If again, we take 35 per cent of 40 cents—we have 14 cents for the cost of the cacao mixed in a pound of chocolate. This added to the cost of the sugar (some 1 cents) gives 18 cents or 9d, as the cost of first-class prepared chocolate which is sold at 400 per cent above this value or 3 shillings per pound.

It seems a curious thing that the public have not as yet become alive to the fact that they are paying for sugar in the form of chocolate at a ridiculously high rate. For out of every 100 tons of chocolate sold, there are 65 tons of sugar sold at 3s per lb or at the rate of £336 per ton, while the poor planter is glad if he can get some £8 to £12 per ton—a matter which seems to be deserving further inquiry on the interests of West Indian planters.—*Key Bulletin* for Oct.

### MINOR PRODUCTS REPORT.

CINCHONA.—Good Huanocos and Guayaquil crown and rusty red barks were the principal offerings today. The following were the prices realized:—Medium to bold Huanoco bright was limited at 7d, one seron of water-damaged selling at quill 6½d, small dark Guayaquil Loxa was bought in at 1s; Guayaquil crown thin quill realized 7d 8d, and 10d; damages were limited at 6d and 6d for unbroken ditto 4½d, was refused. Of red bark 46 packages offered, and mostly sold at 3s for hold open quill of good colour; ditto not so good, 2s 1d. 2s 3d; chips 8½d, and rusty 3½d per lb.

ONOTON SEEDS.—The Japanese described in our last issue was limited at 8½s 6d per cwt, and 65s is wanted for good bright Ceylon.

KOLA.—No business could be done publicly. The exports from Shiloango and Lnkula Congo Free State, during March, April and May 1898, amounted to 1,311 kilos (2,884 lb).

VANILLA.—Reports to hand this week from Bordeaux intimate that some important transactions have been put through during the last three weeks, and that stocks of good quality have been reduced. This briskness has been brought about by the present low prices and the good consumptive demand. Slightly dearer prices were paid today, and practically everything was sold. The following were some of the prices paid:—For brown poor Tahiti 4 to 6½ inches 6s 6d was bid and refused 8s being required. Madagascar sold well, with fair competition at 22s for good chocolate 5½ to 7 inches; 6 to 7 inches 21s; 6 inches 20s 6d; 4 to 5½ inches 18s to 20s; mixed sizes 19s to 19s 6d; 5½ to 6 inches 17s to 18s; 3 to 4 inches, 4 to 5 inches 16s 6d; and 3 to 4 inches 15s 6d per lb. Bourbon 6 to 6½ inches 24s; 5½ to 6 inches 23s; 4 to 5½ inches 21s to 23s; 7 to 8½ inches 21s 6d to 22s 6d. Seychelles sold with keen competition at 20s 6d for 5 to 6½ inches; 6½ to 7 inches 22s 6d to 23s; 4½ to 5½ inches 20s; 5½ to 7½ inches 19s 6d; 5 to 6½ inches 14s; and mixed sizes 13s to 14s per lb.—*Chemist and Druggist*, Oct. 23.

### BRITISH NORTH BORNEO.

"The country is going ahead and planting extending. Gold is now being dredged for in the Segammah, the manager being satisfied with his prospects. Tobacco is doing well and the improved prices for coffee may lead to further extensions. Our pearl fisheries at Kudat are bringing riches to the natives and traders. At Lincabo and Paitan on the East Coast seed and pearl fisheries are steadily improving."—*Cor.*

## THE GAURAMI FISH FOR CEYLON.

We have had an interesting visit from Mr. D. O'Connor on his way back to Queensland after his successful expedition with rare fish never before seen in Europe, referred to below. Mr. O'Connor is strongly of belief that the gaurami to stock Ceylon tanks, could be most conveniently got from Java by British India steamer to Colombo. In Java as in Mauritius, the gaurami is now a great article of food; but it is cultivated almost entirely in private ponds and tanks, bearing the same relation to other fish that a barn-door fowl does to game-birds. True, the gaurami in its native habitat of Cochlin-China manages for itself; but elsewhere it does best in private tanks or ponds. Mr. O'Connor does not think too that it will succeed well at Nuwara Eliya (although we spoke of apparent success on the Nilgiris) and for this reason, that he knows it was tried in the hill-country of Mauritius and never could be got to breed there; but succeeded excellently when taken to the low-country. Mr. O'Connor thinks the gaurami should do well in Colombo and the country around; but he would have householders experiment with it as they would with poultry, being assured that few investments if properly carried out are likely to be more satisfactory or profitable.

Mr. O'Connor is very hopeful of getting gaurami from Java to acclimatize and prosper in Queensland.

## THE GAURAMI FISH.

Dear Sir,—It is said that Gourami may be inferior from a Sportsman's point of view, but otherwise is by far the most important fish, and could in a few weeks be established by transporting a couple hundred live fish, which should prove neither very difficult nor costly.

The Gourami is supposed to have spread from Cochlin China, which is given as its native habitat, and where existing in a wild state, it is found up to 100 lb. in weight. In other countries the fish domesticated and being kept in captivity, and is usually marketed before it is 12lb. in weight. When, no doubt, it proves better eating and is more profitable than when larger. Many consider the Gourami the finest of all fish. The flesh is of a pale straw colour, firm, flaky and very delicious.

The fish is said to be very tenacious of life, being generally taken to market alive, and if not sold returned to the water. It is described as being very hardy and growing fast, mainly a vegetable feeder, but eating any form of waste food. Any one with a pond in his garden can keep the fish and his scoop net is only necessary when one is wanted for dinner. A writer says that it would be difficult to find a new industry which would yield such satisfactory results to any one who owns water, such as a pond or lagoon, as the cultivation of the Gourami. For the above facts I am mainly indebted to Mr. D. O'Connor, a Queensland authority on Pisciculture.

The scientific name of the Gourami is *Ospromenus olfax nobilis*. Besides being so commonly found in Mauritius as well as Java, it has been established in many other parts, and is found in the tanks of Calcutta, of Madras and the Nilgiris, where it attains 20 lb or more in weight and is considered excellent eating when kept in clean water. Dr. Watt writing a few years ago, says that there the Government of India were considering the introduction of a Fisheries Bill, to remedy the wholesale destruction of fish, by preventing fish poisoning, regulating the size of net fish, guarding the mouths of irrigation canals against the entrance of fish, levying a tax on the use of fishing implements. It is said that the Scind fresh-water fisheries in 1832-83 yielded a revenue of Rs2,541, and in Burma in 1883 twelve to thirteen lacs of rupees were netted and these instances are

given as arguments in favour of the introduction of a Fisheries Act into other provinces of India, and why not also into Ceylon. We read that Mr D O'Connor arrived in London with four specimens of the *Ceratodus* peculiar to Queensland which he succeeded in keeping alive. Two were purchased by the Zoological Society for £90 and he was offered £100 if he delivered the other two alive at the Jardin des Plantes, Paris.

Mr. O'Connor has determined that on his way to Queensland he will bring living Gourami from Java or Mauritius as he considers that Queensland waters are eminently suited to be habits of the fish which he expects to very easily acclimatise. The Mauritius Government was enquiring after Sinhalese cattle a little time ago, why should not the Ceylon Government see about getting over some of the Mauritius fish?—Yours truly,  
C. D.

## RARE FISH.

We had another call from Mr. D. O'Connor, a scientific resident of Brisbane, (fish and fruit being his hobbies) who sailed on the afternoon of the 9th Nov., on his return to Queensland. Mr. O'Connor who has been 40 years in Australia, went to England a few months ago with four specimens of a great piscine rarity, the *Ceratodus fosterii* (socalled by Gerard Kreif of Sydney after a squatter, Mr. Foster, who first shewed him specimens). The fish reached England in fair condition, and in due time two of the specimens were bought by the Directors of the Zoological Gardens at Regent's Park, the remaining two being purchased for the Jardin des Plantes in Paris. These are the first specimens of the species that have found their way to Europe; the type *Dipnoi* to which they belong, contains two other genera, the *Lepidosiren paradoxa*, found in the tributaries of the river Amazon, and the other *Protopterus annectens* a native the large rivers of tropical Africa. We quote the following from the *Encyclopædia Britannica* :—

Together with the Australian *Ceratodus*, the lepidosirens are the only living representatives of a very old type of fishes, the *Dipnoi*, which reaches back to the Devonian age, thus giving us an insight into the organization of fishes of which nothing but some obscure and fragmentary impressions of the hard parts are preserved. The body of *Lepidosiren* is eel-shaped, and covered with small thin scales. A single vertical fin surrounds the posterior part of the body and the tail; the paired fins are reduced to two pairs of long threads, internally supported by a series of small cartilages. The dentition is very characteristic, and consists of a pair of conical pointed vomerine teeth, and a pair of large cuspidate and ribbed molar teeth on the palate and in the lower jaw. The skeleton is notochordal; and lungs are present in addition to gills.

Mr. O'Connor's specimens were obtained from the rivers Mary and Burnett in Queensland. The news of their safe arrival in London and Paris excited great interest in the colony from which they came, and telegraphic messages announcing the same were to be found in all the Australian papers. The fish is an edible one, the flesh being of a reddish colour, but many people dislike using it for food, on account of its close connection with the lizard and other reptiles. The *Ceratodus* is, in fact, a link between the reptile and the fish.

Mr. O'Connor, in exchange for the fish he has taken home, brings back for introduction into his adopted colony specimens of the edible frog, *Rana esculenta*, which he hopes to convey safely to their destination. They had this morning accomplished the first part of their journey without injury to their constitution. The frogs were obtained in Paris,

where consumption of this animal is one of the local customs so distasteful to Englishmen. In Queensland, however, Mr. O'Connor introduces it chiefly in the interests of science. "There," he said, somewhat regretfully, "we do not want more food, only more mouths to be filled—that is, of men who are not afraid to work, not loafers from English towns." Mr. O'Connor, before leaving, promised to send us word, on his arrival, of the condition of his croaking charges.

### GRAFTING CACAO.

(Trinidad, 13th Sept. 1898.)

It has no more than one occasion been asked whether it is possible to graft *Theobroma Cacao* and hitherto I have not been in a position to reply in the affirmative. I have now to report for the information of The Society that experiments have been carried out at the Royal Botanic Gardens, by inarching several varieties of Cacao upon young Seedlings with all the success that could be desired; and I hope that the grafted plants will be sufficiently hardened to be shown at the next meeting of the Society. The course pursued has been to inarch a branch of a desired variety upon a well grown and healthy Seedling, and the result has been that the union has taken place very freely, and there can be little doubt that in future any desired kind or variety can be perpetuated by this means.

I desire to point out the opening this process will afford for the extensive planting of any desired variety or kind, and that it will enable the planter to put samples of Cacao upon the market with less variation in size and quality of the Bean than has hitherto been possible.

I also desire to point out, that it may be possible, as it is with apples and pears in a temperate climate—by grafting weaker growing varieties upon kinds having a larger amount of vegetative vigour—to increase the yield of such kinds as that known as "Criollo," to as much as that of the more commonly productive varieties.

It will also be possible to maintain perfectly true, any kind which may have arisen from seed, on any plantation, and to preserve indefinitely any particular kind that may be desired. We have yet to prove, however, how the grafted plants will thrive, but judging from grafted plants of other kinds I see no reason to anticipate that there will be any difficulty under this head. I recommend the practice as well worth the attention of planters who have on their estates single trees, which are noted for the quality of the Bean and the quality they produce.

### CACAO DISEASE.

I have been requested by a successful and prominent planter, to bring up before The Society the question of Disease among Cacao trees in Trinidad for discussion. This gentleman has forwarded to me several specimens of (so called) diseased Cacao, but after a careful and lengthy microscopical examination, I have not been able to say that the pods have been destroyed by disease. I am free to confess, however, that there is possibility of disease arising in any culture, and therefore in Cacao; but I must reprehend as strongly as possible the spreading of views that we have disease of certain kinds until it has been fully proved that such do exist, as it is calculated to do an immense amount of harm to the Cacao Industry. A strict watch, however, should be kept for any thing which appears to be of a pernicious character, and planters would, I think, do well to forward affected specimens to me, to be transmitted to mycological authorities, if necessary. So far, I may say, I have not found anything of a pernicious character, and I should be glad to hear my idea confirmed, that at present there is little cause for alarm.

J. H. HART, F.L.S.

### THE GOOMERA (CEYLON) TEA ESTATES COMPANY, LIMITED.

The following is from the fourth annual report:—  
The accounts, after paying debenture interest, show a loss of £131 16s, which, when deducted from the credit balance brought forward from last year, leaves sufficient to pay the preference dividend, and this has accordingly been satisfied. The result of the year's working has been most disappointing. A drought of almost unprecedented severity, covering the best plucking months of the year, reduced the quantity of tea manufactured in Goomera so that it turned out 58,000 lb. below last year's crop figures. There was also a shortage on Hunu-galla from the same cause. This large falling-off caused a great increase in the cost per pound of the actual crop harvested, so that the prices realised left a very small margin of profit. Markets for the company's class of tea were poor throughout the year, but had the estimated crops been obtained a dividend would have been earned for the ordinary shareholders. The estates of the company are reported to be in thoroughly good order. The directors believe that the poor results of the last year's working do not affect the producing power of the company's property.—*H. and C. Mail*, Nov. 4.

### KORALE TEA ESTATES, LIMITED.

The following is from the report of the directors, to be submitted at the second annual ordinary general meeting of shareholders, to be held at the office of the company on Tuesday next:—

The net amount at credit of profit and loss account, after providing for general expenses, is £1,623 19s 2d, to which should be added the balance brought forward from June 30th 1897, 131 6s 8d. It is proposed to pay a dividend of 3 per cent., which will absorb £1,436 11s, and to carry forward a balance a £218 16s 10d. The year ending June 30th has been generally the worst, so far, experienced in the history of Ceylon tea; in addition to the upward tendency of the rupee, rice has again been dear and freight higher, owing to the port of Calcutta being closed from fear of spreading the plague. In addition to these causes, the island has suffered from a most unusual drought, and the Ouwah side of the country, where Wewesse is situated, has not for many years been known to have so small a rainfall. This has checked the flush of the tea and caused a smaller yield than was expected, not only there, but at Glenloch and Karagastalawa. A new factory with improved machinery has been erected on Wewesse, and this will enable the tea to be better made than hitherto, resulting, the directors hope, in a better price in the market. During the past year 126 acres have been planted with tea on the company's estate. This year the directors did not deem it prudent to clear an interim dividend, but owing to the improvement shown in the latter part of the year, are glad to be now able to recommend one of 3 per cent for the past year on the preference shares, which judging by the experience of many other companies during the same period, may be considered a satisfactory result. During the year the directors have negotiated a mortgage for £6,000, at 4½ per cent, which sum is being devoted to the extension of the estates, principally Wewesse, and building the new factory on that estate, thereby releasing the revenue from charges strictly capital. Though the directors feel great disappointment at the full dividend of 6 per cent not having been earned on the preference shares, they feel that these shares are an improving property, and that better results may be looked for in the future. In concluding their report the directors have to express their general satisfaction with the work of the staff in Ceylon, and trust that year by year a better result will reward their labours.—*H. and C. Mail*, Nov. 4.

## Correspondence

To the Editor.

## ALOES.

SIR,—Your correspondent who enquires for Aloe plants ought to be able to get any quantity from estates along the railway between Nanuoya and Kotagala, unless the Government have already bought them up all for the Northern line, to keep out elephants and bears?—Yours faithfully,

TRAVELLER.

[It is interesting to know where Aloes abound, even though "Merchant" has already learned from us where he can be served much nearer Colombo. Kelebokka, New Galway, Dimbula are among the districts from which we have had responses.—ED. T.A.]

## RUBBISHY TEA.

Oct. 26.

DEAR SIR,—It is to be hoped that something will be done soon to remedy the evil complained of by "Old Planter," who points out that nearly 700,000 lb. of tea were sold last week in Colombo at prices ranging from 7 to 19 cents per lb. Taking the average cost of our teas at 28 cents, it is clear that, as your correspondent points out, the whole of this must have been made at a loss. But with reference to the question of its being all rubbish, it is hardly fair to fix the limit at 20 cents. A good deal of drinkable tea, especially dust, is often sold at prices below this rate. When writing on this subject some months ago, I took 12 cents as the limit, and suggested that all teas valued below this rate should be destroyed as unfit for food. Of what use is a Public Analyst if all this trash is allowed to be sold?

If, as you suggest, a great deal of it is the produce of native gardens, the sooner these gardens go out of cultivation the better. How the owners manage to make the cultivation pay\* even if they work more cheaply than Europeans, can only be guessed at, but when the Government begin to galvanize the police and headmen to effect the suppression of illicit traders and receivers, these gardens will probably suffer.

The "Ceylon Standard" takes a broad view of the question of rubbishy teas. In an editorial review of planting matters on the 22nd inst. it is stated that "The tea that goes to the Persian Gulf and the North-Western districts of India is nothing but mere rubbish. There is no prospect of ever being able to educate the poorer classes of Persia to look with any favour on good tea. Their specialty is red leaf and sweepings...it will be well to make endeavours to push this class of teas in the countries mentioned and create an increased demand for them in that direction...there is no reason why we should not be able to dispose of all the rubbish we can produce in that particular market." And the article concludes with this remarkable statement which is commended to the attention of all interested in the island's welfare:—"A few leading plantations may voluntarily agree to destroy all their red leaf and sweepings, but this will only serve as an encouragement to others to increase the output of a particular class of teas."

\* That is just what the owners of many native gardens never think of: they do not count the time of themselves and families in plucking the leaf. &c.  
—ED. T.A.

The planters of Ceylon are surely as fully entitled as the Editor to any information that may help their enterprise. In future issues of the "Ceylon Standard" we may look for the regular publication of lists of "Buyers for the Persian Gulf," and of copious complimentary extracts from Persian newspapers which circulate amongst the poorer classes.—Yours faithfully,

INCINERATOR.

No. II.

SIR,—Both your correspondents, "Old Planter" and "Incinerator" in advocating the destruction of rubbishy teas argue that all these teas must be produced at a considerable loss: I should like to point out, however, that this is not in reality the case.

The larger portion of the teas which are sold locally at a lower price than 20 cts. per lb. consists of dust and fannings, which no one, I imagine, purposely manufactures; but whatever system of manufacture is in vogue there must necessarily be a certain proportion present, varying from 2 to 8 per cent of the total tea made.

These teas therefore are merely by-products and when calculating the cost of putting them on the market, they ought only to be charged with the cost of packing (about 2 cts.), of transport to Colombo (say 1½ ct.), and broker's charges or about 4 cts. per lb.; so that on a dust realizing 20 cts. per lb. there is a profit of about 16 cts. or in other words if we destroy such a tea we are throwing away 15 cts. on each lb. destroyed.

As to whether this loss would be counter-balanced by the better price we should obtain for our higher grades, if these cheap teas were compulsorily destroyed, is another question. I am inclined to agree that it would.—I am, &c.,  
G. B.

[But all the same, we fear there never can be agreement to destroy "dust and fannings."—ED. T.A.]

No. III.

8th Nov. 1898.

DEAR SIR,—"G. B." states that those who advocate the destruction of rubbishy teas are wrong in supposing that such teas are made at a loss. They are merely by-products, and if only the packing, transport and Colombo charges, say four per cents per lb. are taken into account, a dust tea, for instance, realizing twenty cents shows a profit of sixteen cents per lb! I placed the limit for rubbishy teas at twelve cents only, and admitted that drinkable tea was procurable at twenty cents. I cannot agree with "G. B." as to his treatment of dust and fannings, &c. Of course, the manufacture of these is unavoidable, but as to their being "by-products" are they not included in the estate estimate? when "G. B."'s long-headed but short-tempered Visiting Agent comes round on his quarterly visitation does he eliminate these from his calculations, or, when calculating the expenditure, divide it by the whole total of tea made up to date. There is an enormous amount of abominable tea sent away from factories, for public sale, merely to make up estimates of crop. I know of instances in which a Superintendent has 'faked' large quantities of badly-made and of mouldy teas by steeping them in a decoction of some of his higher grades, and briskly re-firing. It is this malpractice which we want suppressed. The more the manufacture of low-class teas is condoned, the greater the demoralisation of tea-makers throughout the country, the lower the average market rates for all teas now, and the worse for the

future. Of course, if all the inferior teas could be bought and consigned, under the patronage of the Editor of the "Ceylon Standard" to Persia, the local market might not suffer so seriously; but the dismemberment of the Persian empire will come about soon enough without the Ceylon planters conspiring to slowly poison the Shah's poorer subjects.

We can apparently get no help from the Public Analyst, nor can Colombo buyers be trusted to condemn as unfit for consumption any stuff which can be used for blending purposes, so the rubbish must be destroyed on estates.—Yours faithfully,

INCINERATOR.

#### A CURE FOR BUG ON LIBERIAN COFFEE.

Greenwood, Nov. 4.

DEAR SIR,—I enclose one of some leaves of Liberian coffee which a friend has just sent me from Serdang (Sumatra). He writes: "A large amount of trees were attacked by green bugs. The orange tips on the under surface of the leaves are I think a cryptogam. One fortnight after I had remarked their appearance, all the green bugs on the plantation were dead."

"These orange tips are to be found on every tree where there is bug and everywhere large and small are dead."

This is more efficacious than the lady-birds and it might still be worth experimenting here to develop the growth of it where there is coffee left.—Yours truly,

A. V. D. POORFEN.

[We referred the leaf to the Honorary Entomologist and Mr. Green is good enough to report:—

"The yellow fungus on the leaves is evidently a parasitic growth that has killed out the bugs. And it must have done very great service in checking the pest. Our local 'green-bug' (*Lecanium viride*) is subject to the attack of another kind of fungus, of a greyish-white colour, which frequently destroys very large numbers of the insects; but a sufficient number always escapes to replenish the stock. I am keeping the leaf, and shall try to propagate this Sumatran fungus upon our Ceylon coffee bug. It may possibly prove a more effective check than the disease to which they are already subject."—Ed. T.A.]

#### AN INDUSTRY IN DRIED PLANTAINS, COFFEE, COCONUTS, PARA RUBBER AND TIN IN THE STRAITS.

Straits Settlements, Oct. 24.

DEAR SIR,—I have been very interested to read in the columns of the T.A. of the suggested industry in dried plantains. I believe myself that the fruit can be made to pay handsomely if shipped in bunches to Penang and Singapore; but a rush would soon over-do the business, and it would be wise to keep the possibilities of export in the dried form in view. I write therefore to ask you, if you or any of your numerous correspondents can give me any hints as to the best method of drying and packing plantains, whether any sugar should be used in the curing or not, etc., etc., etc.\*

Coffee beans which went down with the recent slump from \$45 to about \$16 per picul (133½ lb.) has recovered slightly and is now in the neighbourhood of \$23 for the best quality, and this is a price which would pay 15 to 20 per cent on capital cost on estates in full bearing, i.e., giving 5 to 6 piculs an acre. But some investors show

signs of chucking their interests before giving their places a chance. The large majority however are sticking to their guns, and planting Para rubber and coconuts, in many cases through the coffee, sufficiently far apart to minimise the effect of the too dense shade. The discovery of tin on their totums has raised the hopes of a good many, and one estate which was once very nearly converted into a Company in Ceylon is said to have struck it pretty rich. The Government at one time were all for putting difficulties in the way of planters mining their land without first surrendering their agricultural titles, but our present Resident took up a strong position and helped us through. It is early to prophesy; but it is nevertheless quite on the cards that a good deal of land originally taken up for coffee may bring the proprietors in a considerable revenue from the tin, which is now quoted at the splendid price of \$48 per picul (133½ lb.) There can be no doubt that the country has a great agricultural future before it; for everything your plant grows luxuriantly, especially in the rich alluvial soil of the coast districts, almost all of which is reclaimed swamp land which ought to be a hot-bed of fever and its attendant evils, but is on the contrary extraordinarily healthy, infinitely more so than the interior where fever and dysentery in some localities, just about break one's heart.—I am, dear sir, yours faithfully,

EX-CYLON PLANTER.

#### VENESTA CHESTS AND THE SAVING WHICH MAY BE EFFECTED BY CAREFUL TEA PACKING.

DEAR SIR,—I think the following figures will prove of interest to planters shewing as they do how great a saving may be effected by carefully following Brokers' instructions on taring and weighing gross.

The London Warehouses weigh packages gross and then, having turned out the tea, they weigh the packages themselves; deducting the tare from the gross, they deduce the net weight.

If the gross weight of a package be 120 lb. 15 oz. the 15 oz. is disregarded and the planter loses on that score 15 oz. of tea, being credited with only 120 lb. gross.

If the chest itself weigh 20 lb. 1 oz. the tare is called 21 lb. and the planter loses on that score another 15 oz. of tea, making with the draft 1 lb. which by custom is always allowed, (on chests and half chests) 2 lb. 14 oz. tea or more than 3 per cent of his crop.

To avoid to the utmost such a loss, chests must be thoroughly seasoned. If it is desired to have a 20 lb. tare, the chests should be made 19 lb. 14 oz., i.e., 2 oz. under the number of lb. desired, while the gross weight should be 2 oz. over the number of lb. required. A beam scale should be used, platform scales being frequently inaccurate. The following weightings of teas from three Ceylon factories speak for themselves:—

An estate sent home four consecutive invoices weighing 50,660 lb and gained 13 lb tea over Factory weights. Another estate sent 184,211 lb tea with a loss of 54 lb when packed in Venestas, as compared with 1,113 lb loss last year when packed in Momis, and as only 2 oz extra tea has been put in this year as compared with 4 oz per chest the proprietors remark that the gain is over 1,300 lb of tea." A third estate sent home 172,915 lb tea with a gain of 66 lb.

\* See T.A. for October 1896 page 257; also November page 335; and specially October this year page 230.—Ed. T.A.

All these highly favorable results have been attained not by putting in excess quantities at the Factories but by putting in the minimum quantities recommended and by carefully following the Brokers' instructions.

You will note that in one instance the gain was equivalent to £50. All these teas were packed in Venestas.—Yours, &c. A. S. PENNY.

Secretary of "Venesta Limited."

#### ALLEGED DETERIORATION IN TEA.

SIR,—“The Deterioration of Quality in Tea.” “Tea for price and the great combine will ultimately kill fine teas.” See “Old Fogie's” amusing and instructive letter page 271 *Tropical Agriculturist*, Oct. 1, 1898.)

Reasons and suspicions are numberless in this question. We want to find out why the brokers run down the teas of the present day as compared with those of say 20 years ago. I do not think that anyone has as yet attributed the cry of deterioration of tea to its actual improvement.

But! as the quality of the low grades improves so will the appreciation of the best teas decrease. When we plucked five and six leaves we made dreadful trash, and at that time worse “muck” was accepted as saleable from China. The retail price was 2s 6d, and high prices were paid for strong teas which would enable the buyers to sell the trash. And this strong tea was of course praised and looked for, and it stood out in very strong contrast to the bulk of British tea.

Since those days the planters have abandoned one leaf after another until we have come to two leaves and a bud, with exceptional cases of three leaves and the bud; and by the vast improvement in appliances there is no really bad tea made. By bad tea I mean such stuff as Cachar planters made in 1876. The red leaf tea was soaked in ink, made by boiling old leaves in an iron pan, and his ink blackened the red leaf and put on an anna or two per pound. Blackened red leaf sold for ten annas instead of seven and eight annas.

Again in Assam in 1880 I saw tea made out of “slates” *i.e.* fifth to seventh leaf on the shoot. They used to say that it was dangerous to stand below when the leaf was tumbled down from the lofts. A hundred other facts will prove that the average tea of today is much better than that of 15 years ago, or even ten years, or even five years ago. And still the complaint comes out that teas are deteriorating. The brokers may be honest—and I think they are—but they probably forget, or perhaps they are misled by the want of contrast, and one can understand that because bad teas have improved, good teas have become less important, and consequently are reported to have deteriorated. This improvement of the bulk is removing the necessity for blending for price. Blending for *taste* will continue, but the present dealer is able to make a decent tea out of several lots varying at the most from eight to six annas, and this fact will gradually remove the necessity of procuring *strong* teas. In a few years the only possibility of getting high prices will be to make teas of peculiar and distinct flavour, and to make these in quantities sufficient to keep the demand from a particular set of buyers who cater for a special market.

In 1884 this estate got an average of seven annas for the year, plucking three and four leaves, no machinery, very little accommodation of any sort this year with ample accommodation, no leaf rolled unwithered, plucking two leaves and a bud and good machinery. I have barely got 6 annas average. And yet I hear that tea has deteriorated.

This idea is absolutely sickening to planters. It seems to be such absolute rot, as to be hardly worth refuting, or else to be so absolutely false as to require stronger measures than mere words. An Alderman at the end of a big feed would not give much praise to a juicy mutton chop, and would probably say that mutton had deteriorated from the days when he got it only once a week. He would

not be telling lies, but he would be very wrong! And the fact remains that we shall have to go on improving our tea and taking less for it, dropping out those who cannot move with the times, and landing eventually into a very hard earned 5 to 10 per cent. This is the meaning and reason of Free trade. Producers have to improve and take less while the consumers get better goods and pay less for them. Nothing but monopoly, or rings, or some unholy form of bolstering up incompetence will enable Tea Estates to continue to make large profits. There is enough new tea planted to run the average down to six pence unless sufficient new outlet is found. But new outlets *will* be found because of the *good* tea now made and sold so cheaply. If there are any more complaints of deterioration we should ask those who complain whether they allude to tea in general, to tea from any district or Estate, and if it is stated that tea in general has deteriorated I would say that this statement is deliberately made to deceive, in order to gain some particular end. A. C., India.

#### THE MANURING OF COCONUTS.

Nov. 17.

DEAR SIR,—In your issue of last night, I find a reference to my remarks on the above subject which appeared in the November number of the “Agricultural Magazine.”

I must take exception to your correspondent's expression, “critic of Mr. Cochran,” by which he refers to me. It does not sound nice and makes it appear as though I wrote with the avowed object of criticising Mr. Cochran of whose work I have the highest opinion. Why cannot two people carry on a discussion for mutual and general edification without importing objectionable elements into it?

But let me examine your correspondent's contention. He says “I assume that castor cake contains no phosphoric acid whatever.” This he has no right to state as the question of the presence or absence of phosphoric acid does not crop up in the course of my remarks and no calculation given by me is at all affected by this circumstance. If, in valuing the castor cake, I had taken no account of the phosphoric acid present, or in considering its fertilising qualities, ignored the amount of the phosphoric acid imported into the soil, it would have given your correspondent an opportunity of pointing out the omission which he lays to my charge. The only reference made to Mr. Cochran was to the effect that his formula gave larger quantities of bone dust and castor cake than are usually used, while the amount of Thomas' phosphate was—as given by him—considerably lower than it should be by calculation according to his formula. As to revising my figures I really cannot see how I can do it, so as to alter anything, or I should be only too glad to do so and admit my indebtedness to Mr. Cochran, and even to your correspondent.

Without going to Tatloch's obsolete figures, we have local up-to-date analyses, furnished by Colombo merchants, that will not allow us to lose sight of the fact that there is phosphoric acid in castor cake!

Here is the latest I have received, made by the newest agricultural chemist in Ceylon:—

Mixture	..	..	8.85 per cent.
Organic matter	..	..	80.69 ”
Ash	..	..	10.81 ”
			99.85 ”
Containing	nitrogen ammonia	8.16	per cent.
”	Phosphoric acid	2.20	”
”	Potash	1.86	”
”	Sand	4.55	”

and this cake quoted at R70 per ton is I think, good value for the money.

But there is one little bone I have to pick with my critic. He postulates that castor cake containing 2.94 per cent. phosphoric acid will give 7 oz. of the acid in *barely* 1 lb. of the manure! I do not know about this fact having "escaped my observation," but it certainly passes my understanding.—Yours truly,

A. M. C.

DEAR SIR,—I have no desire to continue this correspondence, if it is to evolve heat of any kind. My sole object in writing was to point out that in the article under review, a calculation had been made on the important matter of manuring coconuts, in which the item of phosphoric acid in castor cake had been omitted. This has not been denied.

As to the "bone" offered me "to pick," all that is necessary to show that it does not exist, can be said in a word. "A.M.C." reads "a dose" of the manure, as "1 lb." of the manure. He will now see at once, that this correct reading causes his problem to vanish. As far as I am concerned this closes the discussion.

A COCONUT PLANTER.

TEA PRUNING.

SIR,—The letter by "J. L. D." (see page 345) is certainly of permanent value to Tea Literature. Any piece of real experience must be of value. The only thing one has to guard against is *making sure* that one man's success will serve our own purpose without due consideration of circumstances. But we can always make the record of another man's success the basis of enquiry and experiment.

The difficulty up to now has been to get men to relate their experiences.

"J. L. D." has found that 12 months' pruning has given better results at 2400 feet elevation, than 15 or 18 months' pruning.

The table given of daily average plucked by each cooly is of no use because he does not state whether there were the same number of coolies employed in 1894-1895 &c.

Annual pruning is the *universal* practice in the Indian Plains Districts. In Chota Nagpur the bushes are pruned every second year, but pruned *thoroughly, i.e.,* leaving only wood which is as thick as a pencil.

In Kangra the bushes are pruned hard—(i.e. half inch wood left) every 5th to 10th year, and every January the year's growth is pruned off but as the bushes are hard plucked, the growth is about eight to six inches after the hard pruning, and about five to three inches in the succeeding years. So we see that there is as yet no hard and fast rule about pruning.

"J. L. D." describes his pruning as "light," and it is probable that several years of light pruning, i.e., cutting off only three or four inches of growth will in course of time render it necessary to cut the bush down, or to thin out the light wood under half inch diameter. Light pruning has a technical term in Assam, it is called "PRUNING FOR LEAF"; this means that it supplies leaf at the expense of the bush; which will have eventually to be thinned out, and that when this is done the yield will be reduced for a time.

I have written a good deal against "cutting down," and more might be said about leaving too much when pruning the bushes.

Cutting down is necessitated by the policy of *pruning for leaf* for too many years in succession, so that one year has to pay for the heavy yield of former years. And generally a new manager has to risk his reputation because the one before him did not calculate for the *permanent* good of the estate,

I quite agree with "J. L. D.", that if you fear that you are bound to go to the wall, *any* measure is better than none, and to run a risk is better than to continue in the way that has failed.

After many trials I have found the following the best system:—

The district is Chota Nagpur; elevation 2,000 feet. The rainfall averages 56 inches, which falls in a few months; 4 inches October to May; 52 inches, June to September.

We prune our bushes in May and June so that they can begin to grow when the rains come.

In May the bushes are absolutely dormant, from the great heat (up to 106 degrees, F) and want of moisture, (the difference between wet and dry bulb thermometers is sometimes 33 degrees).

In May I prune only half of the garden thoroughly, i.e., cut off all wood less than a pencil in girth. The new flush is plucked when it has 4 leaves (about 6 inches length of stalk). I pluck one leaf and a bud; the next flush I leave 2 leaves taking 2 leaves and bud; the growth is then about 9 inches. The next flush (middle of September) I leave one leaf, taking 2 leaves and bud. After this (end of September) I take each shoot as soon as it has 2 leaves developed. This plucking is continued until the bush is pruned again in 2 years from last pruning.

The bush never feels the knife for two years. The new growth is good, solid, and matured, and as soon as it is pruned it throws out vigorous shoots.

I could get more leaf by pruning every year, but the bushes would not stand it without manure.

I think that my system gives me the greatest yield of fine leaf without any harm to the bush; in fact it allows them to improve year by year without manure. I am doing well under this system; when I find that it fails me, I will adopt stricter measures. I am going to try a plot which shall be pruned annually, and manured if it fails to improve.

The cause of the first flush after heavy pruning being of inferior quality:—

This an interesting problem.

It certainly is a fact that the first picking from heavily pruned bushes makes bad tea.

The outturn in the cup is dark and nasty, the liquor is thin.

I pluck only one leaf and the bud of the first flush after pruning, and even this makes bad tea which sells poorly.

I can imagine one cause of this to be that the sap which has remained under the bark is forced up again mixed with new sap, and that it has acquired bad properties, or been robbed of its good qualities while the bush lay dormant previous to commencing a new growth.

Whatever the cause may be it is to be regretted that a heavy bulk of bad tea made from first pickings is annually placed on the market, and it would do a great deal of good if only one leaf and the bud (i.e. only half the weight of bad tea) could be made and sent for sale.

There would be no loss in profit.

The difference in price between tea (of the first flush) made from two leaves and the bud, and tea made from one leaf and the bud would be fully *two annas*.

First, two leaves, cost of plucking, manufacture, packing, freight, selling would be about 12 rupees per maund.

2nd. One leaf and bud, same charges, would be about R13 per maund allowing R1 extra for finer plucking. Then

	Maunds tea	Sold at annas per lb	Equal to R. per maund	Rupees Gross proceeds.	Cost of making, &c.	Deduct cost Rupees	Balance Rupees
1 leaf	100	8	40	4,000	R13	1,300	2,700
2 leaves	200	6	30	6,000	12	2,400	3,600
1 leaf	100	6	30	3,000	13	1,300	1,700
2 leaves	200	4	20	4,000	12	2,400	1,600

It will be seen from the above that it would not pay to take half the weight if the two-leaf tea is expected to sell for 6 annas and the one-leaf tea for 8 annas.

But there is a decided balance to the good if the 2 leaf tea is expected to fetch only four annas and the 1 leaf tea to get 6 annas.

The same remarks apply of course to the tea of the rest of the season, but the tea made later on is not so absolutely bad as the tea from first picking.

This question of first flush tea is of course pertinent to the body of this letter about Pruning, because the more often one prunes the more frequently one is forced to make a certain quantity of bad tea.—A. C.

#### ON THE ABOVE BY A CEYLON PLANTER.

Nov. 15.

DEAR SIR,—I return you the paper on "Tea Pruning." It is interesting, but I question if in Ceylon we have any district,—where the conditions are at all akin to Chota Nagpur 58 inches of rain, 52 of which fell in four months, and only four inches for eight months, or half an inch a month! Each man has to be guided by his circumstances. All the same as "A.C." evidently thinks for himself and works out his own problems, his letters merit attention.

His shot at the cause of the poor quality of leaf from newly pruned tea does not strike me as very happy. He says:—"I can imagine one cause of this to be that the sap which has remained under the bark is forced up again mixed with new sap and that it has acquired bad qualities while the bush lay dormant previous to commencing a new growth." There can be very little sap to force up from trees that have roasted in a temperature of 106 degrees for eight months, besides, is it not the case that if the sap is not flowing up it is flowing down? I expect that the laboratory is the place where the difference between good and bad flush will be accurately ascertained, and that guessing, happy or otherwise, won't lead to much.

"A.C." is wrong in saying that because it is not stated by me "whether there were the same number of coolies employed in '94, '95, etc. etc. the table given was of no use. It was the cost of plucking I was illustrating, and it matters nothing what coolies you have nor what crop you have, if the coolies bring in an increased weight of leaf, and their wages remain the same. It results in the plucking being done cheaper. I have not the estate books with me to give exact figures, but speaking generally, the pluckers were latterly fewer to some extent, but the tea was considerably increased.

CEYLON TEA PLANTER.

#### CACAO DISEASE.

Kandy, Nov. 19.

SIR,—I enclose for publication some prefatory remarks and rules which have just been drawn up by Mr. Carruthers in reference to cacao disease, which the Committee of the Planters' Association hope Government will have translated into Sinhalese and Tamil for distribution among the native cultivators of cacao, so that preventive and curative treatment may be carried out generally.—I am, dear sir, yours faithfully,

A. PHILIP.

Nov. 18.

The cacao disease is caused by the presence in the tree of a fungus. A fungus is an extremely small plant and in this as in many other cases it lives in another plant and gets all its nourishment from the sap of the other plant.

The fungus consists of two parts, 1st the mycelium or roots which are small threads, too small to be seen with the naked eye, and which run through the tissues of the cacao tree and 2nd the spores or seeds which spring from the mycelium. The spores are very small indeed; several millions, one layer thick, would only

cover a ten cent piece. If these spores alight on a cacao stem, branch or pod in damp atmosphere they will grow and produce another canker spot.

The canker in the bark can be seen as a rule by a darker patch and by drops of red coloured fluid exuding, and when the dark outer skin is scraped off the place will be seen to be quite brown or red coloured and moist and slimy. In the pod it makes the part where it is brown or blackish brown. The spores are in white or pink masses on the surface of stem and branches and of all sizes from what can hardly be seen up to three or four times the size of a grain of rice.

If the dark patches are allowed to remain in the tree they will spread and kill it and form many millions of spores which may attack other trees. The cutting out, if the disease has not gone too far, does not materially injure the tree or its bearing qualities; and it is no use to keep diseased pods on the tree as directly they have a spot of disease the seeds no longer increase in size or ripen, but begin to deteriorate. When the trees are diseased, suckers should be allowed to grow.

#### RULES FOR CURING DISEASE.

In the bark, cut out all discoloured tissue and two inches all round it.

In the pods, take off all pods with any trace of disease (the small pods of an inch or so in length are generally not diseased but dry up from want of nourishment).

BURN ALL PARTS CUT OUT AND ALL DISEASED POD HUSKS.

In case where burning is quite impossible, bury the bark and pods deep. Lime put on them is advantageous.

(Signed) J. B. CARRUTHERS, F.L.S.,  
Cryptogamist to Ceylon Planters' Association.

#### CACAO CULTIVATION AND PRICES.

DEAR SIR,—It seems surprising that none of your cacao-planting correspondents have yet addressed you on the subject of the present condition of cacao, either as regards new methods of cultivation or as to the continued low prices.

With regard to the former question Mr. Carruthers in his last report on the cacao canker has urged the removal of the greater portion of our shade trees so as to afford only "a light flickering shade, at some distance above the cacao trees, not so dense as to prevent the sun getting through, and keeping the air and the stems dry." And as regards the distances at which cacao should be planted, he mentions having seen cacao which had been planted, as we used to grow coffee, at 6 feet apart!

In the matter of thinning out the shade trees most planters have already adopted his advice, (though native gardens are of course generally neglected), some perhaps even going too far in this respect; but with regard to the planting of cacao, is there any one who has yet attempted to profit by the advice given? *It is very doubtful if there are even half a dozen estates in the island which are not suffering from too close planting*, yet we see the supplying of vacancies still being done at the same distances as formerly: the ambitious planter must have his 400, or at the least his 300 plants, to the acre whether they die soon or late. The writer has seen a small field of cacao which was planted, with other (temporary) products interspersed, at fifteen feet apart, and this distance is by no means too great. Even the small number of 193 healthy trees per acre is better than double that number chronically diseased.

With the removal of most of the shade trees we shall to a large extent get rid of the leeches which are at present a very serious hindrance to good work on many places and the presence of leeches is always an indication of excessive damp; but more regular attention might in very many estates be advantageously given to the clearing of drains. It is too much the custom to look on this work as one of the least importance, and as long as they are kept sufficiently deep to carry off rain-water, the aeration of the soil is completely forgotten.

And in the selection of seed more care is certainly necessary. Too often it is the custom to select the handsomest pods for this purpose, utterly regardless of the character of the trees from which they are taken. A fine looking pod may frequently be found on a tree of imperfect growth, or even on one suffering from canker or specially liable to attacks of *Ilelopetis*, and the character of the beans themselves, whether of good shape and colour or flat and flinty, is very often disregarded.

Mr. Carruthers in his Report, referring to a fungus attacking the shade trees, speaks of them as *Erythrina umbrosa*. The trees examined by him, if of this species, are only one of four kinds commonly used for shade purposes, but the tree which was first adopted for the planting of shade on cacao estates and which is mostly used is the Dadap, *E. lithosperma*. Since one of these four kinds is liable to be attacked by the cacao fungus, we may safely conclude that none of them will be proof against the canker. The Dadap in addition is frequently attacked and sometimes killed outright by colonies of the large, strong-smelling brown bug, which feed on its sap, while its foliage at present on many estates, forms the principal food of the brilliantly-coloured locusts. The thinning-out of our shade trees may do much to reduce their liability both to the attacks of the fungus and the ravages of insect-pests, both being probably due to overcrowding; but it is evident that we ought to reduce our risks of these dangers by growing a larger variety of shade trees. Many estates have still a considerable number of indigenous trees of different kinds as shade, either original jungle trees or trees that were planted or allowed to grow up when shade of any kind was welcome. Many of these are injurious and most of little use; though they afford shade, the cacao beneath them gives but little crop. The *Mallotus albus* (Kenda, Sinh.)\* and the *Lunumidella* appear to be two species which may with advantage be planted: some of your readers can probably suggest others.

With regard to Prices, how long is the Ceylon planter to be content with the rates now ruling? Considering the largely extended consumption of cacao it seems reasonable to expect an improved market. No one has yet suggested that our cacao is subject in the same way as Ceylon tea to the operations of a "ring"; but if no combination exists among buyers, what is the cause of low prices? I cannot help thinking it is mainly due, as is partly the case with tea, to the increasingly large quantity of rubbish exported. Native dealers will buy damaged cocoa of any sort; they have methods of 'onring' and 'making' which apparently baffle the scientific attainments of the Colombo merchant! I have been told, too, that 'palm oil' is freely used in order to get any very spurious parcels accepted. Of course a fair percentage of good cacao beans is added in order to pass muster, but when the merchant prepares the stuff for export, does he pick out the worthless beans and see them destroyed?

We want more light on the Colombo market: its present methods are ruinous to the planting industry. Failing an improvement locally we must get the Ceylon Association in London to hunt down and expose those who trade in stuff "unfit for human consumption."

\* We want more intelligence, too, amongst native growers of cacao. At present they mostly ruin even their best produce by washing the beans within two days after the pods are gathered; they say it is not worth while to ferment it properly at present prices!—as long as the beans are bright and well-washed the Moorman dealer, they say, is quite content. And the dealer's standard of course is debased by the large amount of stolen produce which he buys, and which for obvious reasons cannot often be properly fermented, washed and dried.

\* In Mr. Wm. Ferguson's "Ceylon Timber Trees," the *Kenda* of the Sinhalese is the "Macaranga tomentosa"—"abundant up to 3,000 feet."—ED. T. A.

The Government has for a long time been trifling with the question of Theft's of Prædial Products. It is to be hoped that the Planting Member of Council will be able this Session to bring about a reform. The licensing of traders in estate produce is a measure which would confer an immense benefit: the honest dealer would gain as well as the planter by the suppression of illicit traders and receivers, and the Government would have a welcome addition to its depleted exchequer.—Yours faithfully,

A MISCELLANEOUS PLANTER.

## THE CRYPTOGAMIST AND CACAO DISEASE.

Northern District, Nov. 20.

DEAR SIR,—It is a great pity His Excellency the Governor was not better posted up on the subject of Mr. Carruthers' latest investigations. Although that gentleman may be thought by some to have brought his enquiries to a satisfactory conclusion, any cacao planter acquainted with recent developments knows that there is still a large field for enquiry. Neither from a scientific nor a practical planting view are the results arrived at satisfactory.

At one time it was given out that the fungus that affected the pods was entirely distinct from that which attacked the bark and that the pod disease would not spread to the trees nor *vice versa*. The last few weeks have proved the incorrectness of these premature conclusions.

The bark fungus does attack the pods and spreads from the stalk of the fruit to the bark, so that each pod may become a centre of infection to the tree. Let any cacao planter examine his trees, and he will find the fungus working through the stem of affected pods into the adjoining bark.

It is hardly possible to exaggerate the seriousness of this development, and Mr. Carruthers will have to write a supplementary report yet to correct some of his views prematurely arrived at (before the N.-E. rains set in) and misleading to planter and scientist alike.

Had His Excellency known this, his reply in Council to our planting member would have been different.

And I believe, too, that Mr. Parkin is quite qualified to continue investigations; after all cryptogamy is only a branch of the greater subject, Botany.

Mr. Giles Walker's position is absolutely sound. "A stitch in time saves nine" especially where fungus spores are concerned.

Instructions to headmen in the Cacao Districts should be given at once for treatment of trees and pods in affected areas. It is childish to ask *cui bono*? Picture what a centre of infection one diseased tree may prove, when we are told 5,000,000 spores are required to cover the surface of a ten cent piece.—Yours truly,

T. K.

Warrissapola, Matale, Nov. 22.

SIR,—Will you allow me to explain a misapprehension as to the pod disease of the Cacao which I think your correspondent "T. K." is under in his letter above.

There is an entirely distinct fungus affecting the pods in addition to the canker fungus. I did not state in my reports that the canker fungus did not spread to the pods, as it is only recently that I have been able to be working with the trees in fruit to any great extent.

This is not a new development of the canker though we have only recently been able to observe

and investigate it. I hope to explain this in my additional report.

The methods prescribed to be used for the prevention of the fungus in the pods are the same, whether the fungus is one species or another.

I do not consider that if measures are taken as advised in all the reports, to destroy the pods with any sign of disease that cacao planters need view with any additional alarm the fact that the canker fungus spreads into the pods—indeed it explains to a great extent the rapid increase of the canker on some estates at certain seasons of the year and gives us reason to hope that now that we know what to do to combat it, we may be able more quickly to get rid of our enemy.—Yours faithfully,

J. B. CARRUTHERS.

#### ARISTOLOCHIA GIGAS.

Sir,—This plant, recently advertised by Mr. Creasy was, I believe, first introduced into Ceylon (R. B. Gardens) from Jamaica in 1880, under the name of *Aristolochia grandiflora*. There are several varieties of it growing in the island. It is altogether a very curious flower; and is, I believe, allied to the *Darlingtonia*. The liquid substance found in the flower is said to be equal to the gastric juice in animals. The plant being carnivorous; flies and other insects falling into the flower are said to be "devoured," the liquid in it assisting in their digestion. By this means the plant derives partial nourishment. To the uninitiated this may appear to be a little too far-fetched, but there is nevertheless some truth in it. C.

SIR,—With reference to your correspondent "C," he is quite mistaken in supposing that *Aristolochia Gigas* var: *Sturtevantii*, is the same as *A. Grandiflora*. It is an entirely distinct variety with much larger flowers and I introduced it into Ceylon. There are many kinds of *Aristolochia* but only two indigenous to Ceylon according to Dr. Trimen's work on Ceylon Flora see vol. iii. p. 421. *A. Gigas* which I advertise has the largest flowers of any known variety. E. B. CREASY.

#### No. II.

Nov. 21.

DEAR SIR,—With reference to the correspondence in your columns on the above plant, "C" is not justified in classifying it under *Aristolochia grandiflora*, or in the assertion that "several varieties of it are growing in the Island," and its barbarous to term this handsome climber a "carnivorous plant," which is no more a flesh-eater than a favorite Lime or Orange tree which may be fed with dead pariah dogs and cats. Plants may of course, according to their need, derive nourishment from decomposed animal matter by means of their root organs, but that they can take in such nourishment by their flowers or leaves is not yet proved. An accumulation of dead insects round the ovary of a plant is thus more likely to be adverse to the health of that plant than otherwise, though as it reaches the roots in decomposed condition it may afford nutriment as manure.

Many flowers, owing to their certain peculiar formation, require the agency of insects to fertilize them, and the *Aristolochia* is only a single example. The insects in this case, attracted no doubt by the strong offensive odour, can hardly be said to "fall in" as "C" says, and their egress from the flower is prevented by means of the curvature of the flower-tube and the downwardly pointed hairs on the inside; and instead of being "devoured or digested in the liquid," which does not exist, they are liberated after unconsciously effecting pollination. The *Aristolochia* moreover is not related to *Darlingtonia*, which it no more resembles than a pomelo. The *Darlingtonia* is the "pitcher plant" of

California, and like the North American pitcher plant (*Sarracenia*) it has most remarkable tubular leaves rising erect from the ground to about 2 feet in height, and in the case of *Sarracenia* to 6 ft. sometimes. A sweetish fluid secretion in these pitchers entices insects to enter, which in consequence of the internal hairs pointing downwards and a peculiar lid at the top, are unable to escape. As the leaves live to some age they are often found half-full of dead insect matter, which enriches the soil where the plants flourish.

A familiar example of a pitcher plant in Ceylon is the climber known as "Bandura-vel" (*Nepenthes*), which has the ends of the leaves formed into pitchers, which also invariably contain a quantity of fluid, and capture insects in the same manner as previously described. Many plants however act as Fly-catchers by a totally different method:—e.g. the "Sundew" (*Drosera*) by means of the viscidly tipped hairs on the upper surface of the leaves, and the "venus fly-trap" (*Dionaea*) by reason of a high degree of irritability in the leaf blade which, when touched, instantly closes its bristled margins together, in which state they remain until all movement ceases.—Yours faithfully, E.

#### CEYLON TEA IN AMERICA.

LETTER FROM MR. W. MACKENZIE.

Kandy, Nov. 23.

DEAR SIR,—I herein enclose a letter from Mr. Wm. Mackenzie to Mr. Lane, on the subject of Ceylon Tea in America and Canada together with, for perusal and use, the advertisements and other matter referred to under separate cover.—I am, dear sir, yours faithfully,

A. PHILIP,  
Secretary, "Thirty Committee."

NEW YORK, Oct. 22.

DEAR LANE,—In my last letter from here, I gave you an idea of the dullness of the tea market in the States. I mentioned that one prominent man had described the condition produced by the tax as "disastrous," while another said the "trade was paralyzed."

Since then I have been in Canada. On my way there I spent a day in Boston. One of our friends there said the business was "dead"; another firm, that has spent much money on advertising our teas during the last year, were going "out of the business" at once, and so on, and so on.

As regards the consumer, there is no doubt that with coffee so very cheap, he does not drink as much tea at 40 cts, as he did before the duty went on, when he could get it for 30 cts. But the very great decrease in the shipments of all teas to America so far this year, a drop of one-third, or from 52 millions to 35 millions to end of September, is not due entirely to the falling off in consumption. Dealers are living from hand to mouth on old stocks, which were in before the imposition of duty. The stocks must be very low, and when replenishing begins, the imports should be large. Meantime, grocers are afraid to buy in case the duty should be suddenly taken off, and they be left with stocks on hand on which the duty had been paid.

In Canada, matters are very different. There is nothing so much advertised there as Ceylon tea. Not only are the papers full of it, but walls of houses and boardings of empty spaces in the towns are covered with large placards, while many grocers' shops have two and three signs in large white enamelled letters on their windows, "Sale in Ceylon Tea," "Monsoon," "Kolonna," "Blue Ribbon," "Tetley's," etc., etc. I came across four new packages the "Ceylon-Ceylon Tea," the "Rakwana," etc., etc. In Montreal a large van was being drawn by four horses at a rattling pace through the streets, from the top of which men were throwing samples on to the pavement. This was a new brand; the "Anglo Saxon."

All this advertising is very costly, and in some cases is done at the expense of the quality of the tea. I have learnt since coming over of two orders for 1,000 chests each, one for Calcutta and one for Colombo, of tea to be delivered here at a fraction over 5d. The one for Calcutta is from a firm advertising Ceylon tea only and boasting of their fine cup quality!

It is a matter for congratulation, that whereas the total imports of teas to the States and Canada show such an immense falling-off, Ceylon teas are an exception. The shipments from Colombo direct and via China are two and a half times as much as last year, while up to end of September, shipments from London were slightly in excess of last year.

Were there a duty on tea in Canada, it is probable there would be discrimination in favour of British-grown teas. But as there is no duty, one will not be imposed on foreign teas, to favour us. It is at present generally believed in Canada that a duty will be imposed next year, in which case it may be somewhat lower for our teas, than for Japan or China teas.

Several Canadian tea dealers expressed the opinion very strongly that Ceylons were rapidly ousting Japan teas in Canada. On the other hand a leading Japan dealer told me he never sold his imports so easily in Canada as this year. On quoting this statement of his to the former gentlemen they said "Very likely, because he never had so few to sell," exports from Japan having fallen off so much this year.

Be this as it may, there is no doubt that although the Japanese are increasing their advertising in Canada, there is ten times as much noise made in that way by the offensive and aggressive Ceylon and Indian package people, as by the old dealers in China and Japan teas, who are the defensive party. I believe the special work we are now beginning in Canada will greatly aid our friends.

What Congress will do with regard to taking off the duty in the States or putting a similar duty on coffee, it is as yet impossible to say. Coffee is grown largely in some of America's new possessions, especially Porto Rico. A duty may be put on Brazil coffee to protect the newly-acquired colonies. In one of this morning's New York papers, it is stated that the cost of the war has been only one-seventh of the \$800,000,000 appropriated for it. If so, the war duties may be withdrawn, unless, as is quite possible, every man who was enrolled for service and all his relatives be put on the pension list. So far this year, 17,000 new pensioners of the war which ended in 1864 have been put on the list. Pensions for that war have been doubling every three or four years since the war ended, and now amount to \$33,000,000 (not dollars) a year.

Two men met on the street a few days ago. One said, "Glad, war is over, business will be good now." "What is your business?" asked the other. "Pension Attorney."

I enclose a list of 48 papers in which we are advertising in the States. This does not include magazines or ladies' papers; also two of our recent advertisements which the Colombo papers might reproduce. An article on "Tea Culture in the South," worth printing; one on "Making China Teas Like India and Ceylons," one on "Ceylon Tea Shipments," where the editor of the *Canadian Grocer* corrects an error regarding Russian taste in tea, at my request. One on the "American Tea Eye," which should please the editor of the *Tropical Agriculturist*; a circular on "Ceylon India Blossoms," "Connoisseurs Delight," by a leading Philadelphia house; and one about "Hondi" Ceylon tea from a Vancouver paper. I send the cover of the 20th October number of the *Youth's Companion*. For the front page, Baker & Co. paid £1,500 for one insertion of their Breakfast Cocoa, while Mellin's Food paid £1,000 for the back page.

On the page of *Canadian Grocer* with article on "Ceylon Tea Shipments," see also article on a "Tea Duty Mystery," showing how political influences determine this, as everything else here.—Yours truly,

WM. MACKENZIE.

## TEA AND OTHER CEYLON PRODUCTS, AND LIFE IN TEXAS, U.S.

Galveston, Texas, Oct. 25.

DEAR SIR,—Your principal product has, among other things in this country, to contend with not only the taste for and low price of coffee, the War Tax of ten cents per pound on tea, and the cheap teas that are in general use, but the formidable task of changing the taste of a people, and getting them to buy and use an article unfamiliar and new to them, and which they fear to be a fraud, like so many other new things presented to their notice.

The wholesale and retail prices of COFFEE, as they appeared in the daily papers, are:—Wholesale: ordinary about 8 cents; good ordinary 8½ cents; fair about 9½ cents; prime to choice (!) about 11 cents; "Cordoba" (under which name nearly all Mexican and South American Coffee is sold) and washed 11½ cents to 17 cents; Peaberry 13 to 14½ cents; and roasted Ariosa (Arbuckles) at 1½ cents.

The retailers advertise nine pounds of clean or green coffee for one dollar, the "Crescent" brand (put up in one pound packets by a New Orleans house) at 10 cents per pound roasted, and other styles are sold at from 25 cents and Mocha and Java at 30 to 35 five cents per pound roasted.

CEYLON TEA is sold by one store here from the chest, at one dollar per pound, while the tea in common use is oftener priced at 25 cents the pound and that two in quantities of 5 cents worth.

A drummer for a wholesale house may sell what a retailer would rather not have, and which he makes no effort to dispose of; and so it hangs fire until it loses its strength and flavour, and then the retailer declares he wants no more of it. In other words the retailer buys to please the drummer and then shelves the purchase. Hence, a cheap tea is put up by a Baltimore house, and that has for years been extensively advertised and has the grip on the Southern consumer; and how Ceylon tea is to reach him is an enigma, when we take into account the apathy and indifference of the retail dealer.

When my present effort was first made here, I sent out a neat booklet and circular, together with a postal card, on one side of which was the address of the Company and on the reverse a place for the applicant's name and the different brands and prices. About 1,500 went out at first and not one was ever returned! Numerous canvassers have gone out to return unsuccessful, which discouraged them and made them quit.

On many days I have myself gone out and solicited, and one day's experience will tell you the whole story. On this occasion I took in every house on each side of the street for eighteen blocks, and secured an order for one half-pound of tea to be delivered a week later on. How is that for encouragement? If any one wants to learn of the difficulties of introducing Ceylon tea to the consumer in the South, let him come to Galveston, and he will learn enough in one day to drive him out of the business. The people here are wedded to cheap, rank strong coffee, which is oftener than not composed of chicory and other foreign substances. Some that I induced to use our Pure Lanka Coffee decided that they did not like it, that it was too weak, etc., etc.

In one little town I made a free distribution of fifty-one half-pound packets of

### CEYLON TEA,

among the best families of the place, with the pleasing, satisfying result that not one family gave me an order, although some of them stated they did not dislike it.

In many places the consumer has his axe to grind and he is afraid of offending his grocer. In this city the largest and most progressive dry goods dealer got an architect to draw up plans for a building that he contemplated erecting, and so arranged that it would accommodate almost any class of business, in fact a modern departmental store, and he had actu-

ally rented space when he found he was being boycotted, and upon investigation he discovered that his grocer, the jeweller and others were opposed to any such innovation, and he concluded and did change his plan and now has a very beautiful store, confined exclusively to his own line of trade—that of a retail dry goods dealer.

#### GALVESTON

is unique in very many ways. Nearly every corner has its grocery and beer store, generally kept by an Italian or Greek, and with a population of 65,000 it has only three first-class grocery stores doing a retail business. It is said to be a very wealthy city, and one is told that it has twenty-seven resident millionaires. It is nearly a dead level with well-laid-out streets, of which a few are paved with wood, while the rest are either deep in sand in dry weather or just as deep in mud in wet weather. Each residential street has, on each side of it, a line of trees and a row of oleander bushes, and as the houses are generally built back from the side-walk, with a lawn between the two, some of the streets are not lacking in beauty. Its sewerage or want of sewerage system is a blot upon the city and where there are sewers the householder has to pay the Company a dollar or so per month for their use! The lanes and alleys are a standing menace to health and a disgrace to any city and yet the Health Officer declared, not long ago, in public print, that the city would compare favourably in regard to cleanliness with any other city in the Union. The streets running north and south are known by numbers, while those going East and West are styled avenues, and are supposed to be lettered—beginning at the north—with the letter A, and thence on to M; when this letter is reached, you have M $\frac{1}{2}$ , N, N $\frac{1}{2}$  and so on; but the streets and avenues are bare of either letters or numbers, and the stranger must ask the passer-by where a certain street may be and how best he may reach it; consequently it is not an easy matter for him to find his way about the place. Galveston is the largest of the Gulf shipping ports I believe, and during the season about 25,000 bales of cotton are received daily; while for the last nine months upwards of 4,000,000 bushels of corn and 6,000,000 bushels of wheat have come in for shipment, besides many other products of the State. There is very little difference here between the Sabbath and any other day of the week. Many of the stores, all the corner stores, the cigar shops, saloons and theatres are wide open on Sundays, and I presume do a thriving business. Sunday before last I heard an obscure minister declare this city to be the most wicked and ungodly in the country, while another clergyman last Sunday referred to the Galveston Sabbath in terms set forth in an abstract from his sermon, which I cut from a newspaper and now enclose to you, so that you may know that I have not exaggerated the matter in the least:—

"Now what shall we say concerning our own city—the city we all love, the city for which we all would make any reasonable sacrifice? Think of our Sunday saloons with their open doors. Think of our gambling places in full blast on the Sabbath evening. Think of our open theatres on the Lord's day. Think of the open beer joints and corner groceries on the Lord's day. Think of our city as the only port of the world, save in China or Japan, heathen countries, that forces men to load and unload foreign vessels. The men must obey the ship broker or lose their jobs. Think of our offices where men are profaning God's day. Think of our Sunday picnics. Think of our Sunday baseball. Think of our Sunday excursions. Think of our utter disregard of the Lord's day. What does it mean? What will be its result? The declension of religion, the declension of morality, yea, the loss of free institutions. I plead in behalf of our holy religion; I plead in behalf of public morality; I plead in behalf of free institution; I plead in behalf of physical nature itself; I plead for the Sabbath. Hold the Sabbath! To the last man! Always the Sabbath! If the Sabbath is lost all is lost!"—Part of a sermon preached in Galveston, 23rd October, 1898, by Rev. W. D. Bradford.

A prominent lady told me not long ago that it was as much as a minister's position was worth for him to refer to certain subjects, and when he so far forgot

himself as to do so, he was quietly told that a repetition would endanger his billet, and lead to his separation from the Church!

So far as I can learn none of the towns in  
TEXAS

hold out very promising or flattering inducements to the vendor of Ceylon tea, and it will be a matter of time and education before any perceptible hold can be got on this market. If there be any benevolent individual, having a million or so to lose, in advertising and exploiting your tea in the "Sunny South," and is prepared to wait, he may, in the course of a decade or two, make converts; but to the person of limited means, my advice is to dump his money in some convenient river, and thus save himself an infinitude of trouble and worry, and prevent himself from attempting to invade this particular part of the country, addicted to cheap, fearful compounds, termed coffee. It would be unfair to this bright (?) city to omit to mention its want of an up-to-date modern Hotel, where cleanly prepared food could be obtained, or to make mention of the many so called Restaurants where the food is stacked upon a counter, in all kinds and conditions, and where one sits on a stool and where he is jostled and crowded until he is not quite sure that he is a wedge or a bit of jelly. The traveller had better fight shy of the Galveston Restaurant and its neighbour in iniquity and uncleanness the boarding-house.

Texas is a large and an important state that needs developing, and that is destined to become the producer of immense crops of almost every kind, so soon as the so-called farmer can be brought to know something beyond the planting of cotton and corn, learn a little about his business and go in for diversified crops. The person in the South styled a farmer is, no doubt, a good cotton and corn planter; but beyond this he is a back number. He doesn't want to work every day in the year, nor does he go in for rotation of crops; but he goes on his own sweet way, tickles the soil a few inches, applies artificial manure, goes on cropping the same piece of land, year after year, with the same crop; and when that bit of land is completely exhausted, he clears up another patch and repeats the same old dose, and follows the same ancient methods that prevailed ages ago. His clearing for years is a picture of slovenliness, for he does not cut down all the trees, but leaves many of them to die and rot—standing. He has no vegetable garden, but depends upon some other state or on canned goods for his vegetables, and as for his house and out-building, why?—a coolie would weep over them if he had to become an occupant thereof.

I will now take a leap over to

#### THE DOMINION,

where everything that is produced is of the very best. No place on this continent can produce more deliciously flavored or handsomer fruit, and the vegetables are beyond compare. There the buildings are, as a rule, neat, warm and comfortable, and the out-buildings are now of the very best kind, while the gardens are something to be proud of—and all this in the face of the long bitter winters that the producer has to face. A friend of mine in New Brunswick writes that the Maritime Provinces will not in 1899 import 2,000 half-chests of China tea, and that Ceylon and Indian teas will be almost solely imported! He ought to know whereof he writes for he is and has been Agent for years of the largest China and London Tea houses.

This letter may possibly interest some of my old and dear friends in Ceylon. I hope so, if you think it worth publishing.

R. E. PINEO.

#### INSECTIVOROUS OR CARNIVOROUS PLANTS:

[INTERESTING AND INSTRUCTIVE TO ALL WHO HAVE TO DO WITH PLANTS.]

SIR,—Your correspondent "E," who has treated us to a popular account of the insectivorous or carnivorous plants, is very far behind the age in

saying that it has not yet been proved that these plants can digest and absorb nitrogenous compounds from captured insects. Has he not heard of Mr. Darwin's researches in this subject? I send a quotation from Dr. Master's 'Plant Life,' referring to the question at issue. D.

The leaves of certain plants are endowed under certain circumstances with a power of digesting and absorbing animal substances placed in contact with them. When a minute fragment of meat, for instance, is placed upon the leaf of

#### A DROSERA, OR SUNDEW,

the tentacle-like glandular hairs of the plant bend over to grasp the intruding morsel, a peculiar digestive fluid is formed as a result of the contact—just as the gastric juice in the human stomach is secreted when food enters that organ—and this fluid effects the solution of the meat, the nutritive solution so formed being absorbed and applied to the benefit of the plant. To common observation the actual gain to the plant by this method of feeding may appear slight, or even none; but the more delicate tests applied by the botanist have sufficed to prove, not only that the processes just mentioned really do go on, but also that they are beneficial to the plant, and contribute to the formation of more numerous and more robust seedlings. The rationale of this mode of obtaining nutrition seems somewhat analogous to that in the root, where also the acid fluid with which the cell wall is permeated, when it comes into contact with the particles of soil, determines their solution and renders them fit for absorption into the plant. Practically this admittedly exceptional mode of nutrition by the leaf might seem of little moment; but it is probable that in the future direct nutrition by this means will be shown to be of much greater importance than it appears to be at present. In any case, the fact that ammonia-solutions and ammonia-vapours are absorbed by leaves with increased manifestations of vital activity renders this mode of feeding a matter of some consequence to the agriculturist; and the escape of ammoniacal vapour from the muck-heap may not after all be the wasteful operation it is usually supposed to be—that is, if the circumstances are such that plants can avail themselves of the exhaled vapour.

It is a very remarkable fact that fluids which

#### DO NOT CONTAIN NITROGEN

do not give rise to the movements of the leaves, the changes in the protoplasm, the formation of a digestive fluid and other consequences, which Darwin has discussed in his work on insectivorous plants. Mere mechanical irritation of the leaves is not sufficient to ensure the formation of the ferment requisite for digestion. The different effects of salts of soda and of potash, in the case of the leaves of *Drosera* are also suggestive, for while soda salts give rise to the physiological activity in the leaves potash salts do not do so, and some of them are even poisonous. Neither the one nor the other is poisonous to the roots, unless applied in very large quantities. Phosphate of ammonia and phosphate of soda act with remarkable vigour on the leaves, while phosphate of potash is quite inert, the activity in the former cases being probably due to the phosphorus.

It would thus appear that while almost all plants absorb the inorganic elements, including their nitrogen from the soil and derive their carbon from the atmosphere, there are others such as *Drosera*, which digest and absorb nitrogenous matters by means of their leaves. Such plants can even extract

#### NITROGENOUS MATTER

from pollen, seeds and bits of leaves (Darwin). Other plants absorb ammonia by means of the hairs covering their leaves, and this class is probably more numerous than the foregoing. Others, again, have no faculty of digesting by their leaves, though they absorb solutions of decaying animal matter by their means. Some, such as the bird's nest orchis, feed on the decay of vegetable matter, and are themselves nearly or quite destitute of chlorophyll. Lastly, there

is the case of true parasites such as the broom-rape (*Orobanche*) and dodders (*Cuscuta*) which affix themselves to living plants, and being themselves destitute of chlorophyll, are unable to live except at the expense of the plants upon which they grow.

### CEYLON TEA IN AUSTRIA AND HUNGARY.

Kandy, November 25th, 1898.

SIR,—I enclose Report received from Mr. Ryan on the subject of Ceylon Tea in Austria and Hungary.—I am, sir, yours faithfully,

A. PHILIP,  
Secretary "Thirty Committee," Kandy.

### CEYLON TEA IN AUSTRIA AND HUNGARY.

REPORT BY JAMES RYAN TO THE "THIRTY COMMITTEE," KANDY,  
VIENNA.

I arrived in Vienna on July 1st, 1898, and was met by Mr. Marinitsch—to whose intimate knowledge of that city and linguistic ability I am much indebted. Through his help I was able to do my work in Vienna and Budapest at a considerable saving of time and money.

#### HOW TEA IS SOLD IN VIENNA.

The Vienna tea shops are fairly numerous and are of the best class of shops gauged by a local standard. I was surprised to find tea in such general use as to make it in many instances the principal article sold, although as a rule coffee, spices and Japanese curiosities were sold in the same shops.

I visited a large number of these tea shops and purchased samples of teas, which I forwarded to the Secretary of the Ceylon Association in London for valuation and report. Messrs. George White & Co. examined these teas, but found them so out of condition that anything like a minute valuation was impossible. They report, however, that some of the teas had originally been of very fair quality. This might very well be the case as the teas ranged as a rule from eight shillings per lb., one sample being retailed at about one sovereign English per lb.

In making these purchases Mr. Marinitsch and I did not disclose our identity or pose as experts, professing to be ordinary travellers anxious to purchase tea for their private use.

In all instances China tea was recommended as the best. Ceylon tea was as a rule known by name, but was generally depreciated and the geographical position and British occupation of the Island were evidently unknown to many of the vendors—some of whom had a vague idea that it was a province or insular appendage of China.

In one or two of the shops, however, Ceylon tea was procurable unmixed and we saw it in the original packages—(half chest)—I noticed particularly the names of Abbotsleigh (pronounced in Vienna "Albertslake") and St. Johns. These teas were Orange Pekoes, wiry tippy and clean of dust.

#### MEMORANDUM 76 TEAS WANTED IN VIENNA.

It appears that only leafy teas—(absolutely free from dust and small broken and flat leaf)—have any chance in this market. The merchants tell me that their London constituents do not supply them with teas suitable to their requirements in this particular, but that Hamburg vendors do manage to do so. Complaints to London of dustiness are met with the reply that such a percentage of dust cannot be avoided. If this is actually the case, the cause may be due to the tea being broken in the repacking necessitated by the London Warehouse regulations, as my experience in Ceylon leads me to think that most factories sufficiently comply with the requirements of the Vienna merchants taking the teas as they leave the estate.

What struck me, however, was that, so long as teas were free from dust, the twist was not greatly looked to and wiriness was not directly recognised as a desir-

able quality. The most expensive the "Caravan" and "Kaiser Melange" types (ranging from 12 to 20 shillings per lb.) contained a large percentage of leaf which was hardly rolled or fermented at all, very large and bold and of a Souchong type. Broken, flat leaf, however large, did not appear to be disliked, so long as it was free from dust and small broken leaf.

The tip when present was prominent, bold and silvery (not golden) in colour in these (China) teas. Dust then appears to be objected to mainly as a suspected impurity, and possibly as productive of too dark and pungent a liquor.

#### PRICE OF TEAS.

Even making allowance for a duty of nearly 10d per lb. and the expenses of carriage *via* London and Hamburg or overland *via* Russia, the price of teas in general use in Austria is prohibitive of a daily consumption in an ordinary household. The teas are really good teas, but sold at an exorbitant rate, and it will be a hard fight to induce the trade to forego their present enormous profits. The bird in the hand seems worth two in the bush, and they have no desire whatever to make a smaller profit per lb. on the sale of a much larger number of pounds.

Still there is a wonderfully large consumption of tea under the circumstances, and the demand appears to be on the increase, especially on the Galician frontier where Russian influence is very marked, and this demand might be increased by the following means:—

1st.—A reduction of duty.

2nd.—Competition between dealers, reducing prices.

3rd.—The spread of the knowledge of the fact that a good tea can be got, at about a quarter of the present price.

I may add that I am opposed to the free distribution of tea although I, at one time, believed strongly in it. I am now of opinion that a large proportion of tea distributed free is never consumed at all, but allowed to lie forgotten: until it is spoiled, and unless tea, when drunk for the first, time is made by some one who knows how to properly infuse it, it stands a good chance of being actively disliked, and the advertisement works against instead of in favour of the tea.

Besides this there is the tendency a man always has to under-value a thing he has got for nothing, whereas he values exceedingly what he has had to pay for, although he may have paid dearly for a bad article.

#### PROSPECTS OF TEA.

I am everywhere informed that the use of tea (even at the present prohibitive rates) is on the increase, and I have no doubt that a carefully conducted campaign will be productive of a further increase of consumption.

I cannot too strongly, however, express my opinion that we must have a reliable representative on the spot for some few weeks at least every year. Such a representative must be able to talk German at least and as many as possible of the other (8 or 9) languages in use in the Austrian Empire, so as to be able to collect information and listen to complaints at first-hand. He should go round the various cities twice per annum, in Spring and Autumn, and facilitate trade by every means possible.

For this work Mr. Marinitsch would be in many ways suited, especially as being an Austrian subject and a first-class linguist, he is also already known in Court and commercial circles as your accredited representative. I should be glad to hear that the Thirty Committee confirm my opinion.

I understand that Mr. Marinitsch's services would be available.

#### REDUCTION OF DUTY.

This should not be lost sight of as the present high duty is probably based by the Fiscal Authorities on what they know to be the retail price of Tea in Austria.

Individuals have been surprised on being informed of the fact that the present Import Duty exceeds the average wholesale price of Ceylon Tea in London.

It might be well officially to acquaint the Fiscal Authorities with the respective market values of Indian, Ceylon, and China Teas in London. The Consular Representative in Vienna and Buda Pesth would be the proper channel through which to address such communications.

#### ADVERTISING.

Mr. Marinitsch has formulated a scheme for advertising Ceylon Tea by Posters and also by advertisements in the Press. It would be noticed that the cost of advertising is comparatively cheap.

#### GENERAL OPINION OF ADVERTISING.

Indiscriminate advertising must be avoided. In Austria, the populace is not an advertisement-reading one to the same extent as Germans are, and advertising generally is much less prominent, while comparatively few people advertise. On the other hand the small number of press advertisements secures greater attention being paid to such goods as are advertised.

Austria proper being a German-speaking nation there is a free interchange of newspapers, and in this way all advertising of Ceylon tea in Germany (already sanctioned by your Committee) would do good work in Austria and *vice versa*.

Advertising being more or less restricted in Austria I think it... will be difficult to get persons to do business on the lines of our paying one-half or one-third only of the expense of advertising. I therefore think that the best way would be for the "Thirty Committee" to prepare for general continental use a good taking advertisement of Ceylon tea, leaving space at the bottom for the name or names of the individual vendor or vendors in particular towns and to defray the whole expense themselves (to begin with at least).

This would do more general good than the distribution of free samples costing a greater sum and would sensibly help the dealer to do his work.

If your agent chanced to find any dealer failing to supply Ceylon tea or not making satisfactory increase on his sales, he could withdraw the said dealer's name from the Committee's advertisements and substitute another name if necessary. If business was at a standstill in the particular town advertising could be stopped altogether.

#### HOTELS AND RESTAURANTS.

The only form of free distribution of tea that I would countenance would be that certain first-class hotels and restaurants should get a grant of tea (say 500 lb. weight) one half to be infused in cup and sold to customers and the remainder to be sold in packet—the whole profit to go to the vendor.—There are several good shops in Vienna where the fashionable world goes to drink coffee and tea, and eat ices and confectionery of an afternoon, and one of these might be induced in the above manner to make a specialite, once or twice a week in the season, of Ceylon tea.

The others would be forced to follow suit if the thing became fashionable. I should not propose to risk more than say £100 sterling to begin with in this form of advertising.

It would be of course advisable for your Agent to be on the spot at the time so as to give the scheme fair play.

#### TEA FOR THE AUSTRIAN TROOPS.

Owing to the courtesy and help of His Excellency Sir Horace Rumbold, and Col. Wardrop, I was able to see certain members of the Imperial General Staff. In conversation, their attention was drawn to the Military aspects of the late British Campaigns conducted on teetotal principles, and it was suggested that anything in the nature of an experiment as to the value of tea in Army Manœuvres would receive the co-operation of the Ceylon Planters who would guarantee that a reliable sample of tea would be supplied for purposes of experiment. The incidence of cost was not directly mentioned, but it was made clear that the Planters were not acting as retail vendors, but as producers of tea, wishing, politico-economically to extend their area of operations.

In reply we were informed that:—(1) No ration of tea was issued in the Austrian army; (2) That the

Atbara and Chital Campaigns had received appreciative attention; (3) That no compulsion was at present used to make the soldiers drink anything non-alcoholic to the exclusion of alcohol.

4th. That the soldier could buy as much beer, wine, etc., as he liked in canteen. (There is practically no drunkenness in the Austrian Army).

5th. That if I could supply the General Staff with further detailed information as to the value of tea for forced work, that my communication would receive attention.

I suggest then that the matter be treated as follows:—

That a Sub-Committee be appointed to draft a treatise on the dietetic value of tea. An analyst would be the best man to procure for the scientific portion of the work and a little co-operation from practical planters would be sufficient to give the work a permanent value. The pamphlet could be printed for permanent use in the extension of the use of Ceylon tea in Europe and America.

This pamphlet should be freely circulated among the medical press, and any favourable criticisms appended to later editions.

Your Continental Agent could personally approach professors of Medical Science in Austria and Germany on this point. Much attention is paid by the public to their pronouncements and many of these gentlemen are already predisposed in favour of Ceylon tea.

#### CONCLUSION.

It must be noted that my report is to a certain extent barren of practical result as I was not empowered to make any specific promise of assistance to certain persons who are willing to consider the question of dealing in Ceylon tea only, and this indefinite state of affairs must continue until your Committee have a discriminating representative on the spot.

A distinct offer to pay for advertising would bring forward, not one, but many firms of repute willing to give prominence to Ceylon tea.

In conclusion I have to thank His Excellency Sir Horace Rumbold, our H.B.M. Ambassador, and Col. Wardrop, British Military Attache, as well as Mr. W. N. Beauchamp, H.B.M.'s Consul at Buda-Pesth for their help and assistance. I have also to acknowledge the personal pains taken by Mr. H. W. Cave to make the volume of Picturesque Ceylon, presented by your Committee to the Emperor Franz Joseph on the occasion of his Jubilee, worthy of the occasion. He also supplied me with an album of photographs relating to tea which was of much value in explaining from time to time the nature of the Island Industry.

#### CEYLON TEA IN HUNGARY.

The remarks made as to tea in Vienna practically cover the question of tea in Hungary. The Hungarians are a less conservative and more pushing people than the Austrians and (although at present consumers of but a small quantity of tea) shows signs of taking an increased amount in the near future.

#### TEA IN GERMANY.

In my passage through Dresden, Berlin and Bremen, I was able to note the large strides that are being made in the consumption of tea in Germany. I particularly noticed the efforts of Mr. Hagenbeck to push your staple in Berlin. He has expended a large amount of capital in the best possible way, and I have no doubt will be successful in introducing tea to thousands of persons who otherwise would not have heard of it.

From Stuttgart Mr. Charles Bohringer reports satisfactory progress and Mr. Charles Osswald is advertising extensively and in the most attractive manner from Winterthur.—I have the honor to remain, your obedient servant,

(Signed) JAMES P. RYAN.

Kingsland, Hereford, Oct. 27.

#### THE MANURING OF COCONUT—IN FINE.

DEAR SIR,—I thank "A Coconut Planter" for the conciliatory tone of his last letter; I would, like him, wish to say a last word.

I must still maintain that the charge made against me is unwarranted as I shall explain. My remarks in the *Agricultural Magazine* may be divided into two parts. (1) I gave the proportions of a mixture of castor-cake, bone dust and ashes recommended by a high authority, and converted the last two into their equivalents in Thomas' phosphate and kainit. (2) I quoted Mr. Cochran's formula and remarked that the quantities of castor cake and bone dust corresponding to it were larger than those usually applied. Had I taken account of the phosphoric acid in castor-cake it would have warranted me in making a further complaint as to the large quantity of bone dust recommended. But enough of this quibbling over the percentages of phosphoric acid or potash in an essentially nitrogenous manure such as castor-cake, or over the nitrogen in an eminently phosphatic fertilizer such as bone dust.

With regard to the arithmetical puzzle propounded by "A Coconut Planter" as to the quantity of phosphoric acid which castor-cake imports into the soil, the explanation in his last letter has not helped to clear the confusion which apparently led me astray. Even now it is not known what he means by 'a doze of the manure.' What manure? Presumably a mixture of castor-cake and bone dust. Then, if the former is to supply 7 oz. (allowing it the highest percentage) of phosphoric acid and the latter (22 per cent) 9 oz. so as to make up the pound between them, the quantities of the fertilizers used will, as nearly as possible, need to be 15 lb. and 3½ lb. respectively—altogether disproportionate quantities.

The fact is that an attempt has been made to evolve a mountain out of a mole hill—an unprofitable undertaking. In these fast times, we cannot afford to linger over *minutia* for fear of giving an ounce too much of phosphoric acid to our hungry soils!—Yours,  
A. M. C.

#### CEYLON TEA IN AMERICA.

The set of Newspaper cuttings, &c., sent us includes a list of some 50 American newspapers in which the Commissioner now advertises Ceylon tea. This is as it ought to be, and we think 50 more representative of the Middle, Western and even of a few of the Southern States should be added. The time is surely fast approaching when, judicious advertising contracts being entered into to last some time, the subsidising of any separate firms may be discontinued? At any rate "to this complexion it must come at last." In the meantime we are glad to note specimens of the attractive advertisements inserted and to see further the coloured cover of an American periodical, "The Youth's Companion," the front of which is occupied by a "Cocoa" advertisement costing, we are told, 7,500 dollars or £1,500! Mr. Mackenzie also includes extracts showing the extreme uncertainty prevailing as to the future of the American tea duty. The war being over, one would expect the duty to disappear; but "political" reasons may cause its continuance, although we trust not for long. The great increase in the shipments of Ceylon tea to Russia is attracting the attention of American journalists and several references are made to the fact. But perhaps the most amusing and telling deliverance is one in the American *Grocer* on the "American Tea-eye" based on an extract from the *Tropical Agriculturist* and in which special reference is made to "the able work of the Ceylon and Indian Tea Commissioners."

Our Commissioner's own Report on the present occasion—see page 439—is not a very encouraging one as regards New England and the States generally; but compensation is found in the very satisfactory state of affairs depicted in the Dominion. Everything now turns on the removal of the war duty on tea in the United States and with the probable settlement with Spain over the Philippines, surely the last excuse for continuing the tax will have disappeared.

#### PLANTING NOTES.

**MANURING OF COCONUTS.**—A correspondent says:—"In the *Agricultural Magazine* for November (which is given as a Supplement bound with your *Tropical Agriculturist*) a critic of Mr. M. Cochran under the heading 'Manuring of Coconuts' assumes in his remarks that white castor cake contains no phosphoric acid whatever. This is not so. According to Mr. R. R. Tatlock, Glasgow City Analyst, and Chemist to the Agricultural Society of that city, best white castor cake as sold in Ceylon, contains 2.94 per cent. of phosphoric acid. The critic in question will require to revise his figures, as in a dose of manure containing barely 1 lb. of phosphoric acid 7 oz. of this substance have altogether escaped his observation."

"**Ceylon and its Tea Industry**"—is the heading of an interview with a well known Colombo resident given in the *American Grocer*. We read:—

A representative of Messrs. Whittall & Co., of Colombo, Ceylon—Mr. Alfred H. Ayden—is now here in the interest of his firm, and especially to investigate the position of Ceylon tea in America.

Mr. Ayden says: "The present acreage devoted to tea in America is about 300,000 to 320,000 acres.

Then follow details familiar to Ceylon readers, but we may quote the following:—

"The Ceylon tea industry has not yet reached its limit. There is a good deal of land coming into bearing this year and next, and there is a great deal more land in the higher districts of Ceylon which belong to the Government which is available for tea, but the Government at the present time is not disposed to sell, their greatest objection being that the removal of the forests diminishes the water supply by destroying the numerous springs, the existence of which depends upon the maintenance of the forests."

"It would appear that the people of the United States, although taking increasing quantities of British-grown teas, are not yet familiar with the correct way of brewing the same. Consumers have yet to learn that the tea should not brew longer than three to five minutes and that they should use only one-third the quantity that they have been in the habit of using of China or Japan tea."

And again as to tea in Russia:—

"One merchant in Moscow told me that two years ago he used in his blends 5 per cent of Ceylon tea, but now uses 25 per cent."

"A merchant starting in the tea trade in Russia must first pay the equivalent of \$500 for the privilege, and further must guarantee, before importing any teas, to pay a duty equivalent to 40 cents a pound upon 40,000 pounds weight of tea. On account of this policy the tea trade is in the hands of a few large and wealthy merchants, for the merchant with small capital is not able to guarantee the payment of such a heavy duty in twelve months."

"In Russia tea is drunk from glasses, is made very weak and taken with a slice of lemon and a little sugar. Milk used with tea is quite unknown."

"It is my purpose to return to London, and go from there on a tour through South Africa, which country is looked forward to as a promising field for British grown machine-made tea, which is rapidly growing in favor the world around."

Mr. Ayden certainly deserves well of Ceylon planters for doing his duty by "Ceylon tea."

"**THE AGRICULTURAL LEDGER, 1898**—No. 12. *Daucus Carota*. (The Carot.) Carrot Cultivation as an emergent crop at seasons of threatened scarcity or famine.—No. 13. Sugar-cane Disease. (*Trichosporia Sacchari*). An account of the fungal disease attacking Sugar-cane in the West Indies, together with remedial measures recommended by the authorities of the Royal Gardens, Kew. Concluding with Dr. Bourne's report on the Occurrence of the disease in *Godavari deltas*.

**EUCALYPTUS GLOBULUS IN CORNWALL.**—According to the *West Briton* there is now growing in the garden of Mr Charles H. Hext, at Polgwin, a specimen of *Eucalyptus globulus* commonly known as the "Blue Gum-tree," showing quite a large number of seeds. For a tree of this kind to bloom and seed in the district is exceedingly rare, the gardener, Mr Frank Polkinghorne, never having come across a specimen, either in the neighbourhood or elsewhere.—*Extracted from the Pharmaceutical Journal*.

**THE MOSQUITO AND MALARIA.**—In an article dealing with the investigations of Major Ronald Ross of the Indian Medical Service and Dr. Patrick Manson as to the spread of malaria by mosquitoes the *Madras Mail* says:—

It is not contended that this is the only way in which malaria is spread, and in fact Manson thinks it probably is not. It is at least one way, and a very important way too. The knowledge Ross has acquired for us by his labour has put in our hands a very important key, and one which may unlock great possibilities. If the mosquito is an important factor in the spread of malaria, the destruction of that insect is an obvious indication. At first sight this seems an impossible feat; but on a small scale much may be done by house owners and others. The breeding grounds of mosquitoes in the neighbourhood of houses may be destroyed. Ponds and marshes should be drained. Fishless ponds should be peopled with fish, for it has been shown that various species of fish feed on mosquitoes. This latter remedy for the evil has been employed on the Continent and in America with very marked success. There is still another means at our disposal, which is within the reach of all, *viz.*, the use of kerosene oil spread on the surface of the water on which the mosquitoes are known to breed. This has been tried experimentally in America with excellent results.

**CINCHONA GROWERS IN INDIA** may be interested to learn that the competition which was, at one time, threatened by the United States, has come to nought. In an American official report it is stated that the value and demand for quinine were strong incentives to home production, and the cinchonas which furnish the drug were raised and distributed for cultivation, mostly in California and Florida. But in no instance was success obtained; and it is further remarked that cinchona bark is so largely furnished by plantations in the East Indies. [That is in *Java*.—Ed. T.A.] And so cheaply, that West India growers have abandoned the culture of the trees. We may note also that in America the eucalyptus tree has not proved a success, except in California, though there was at one time a great demand for plants owing to the reports from Australia that plantations tended to reduce fevers in malarial tracts. It is now stated that no special merit, either in hardness or in utilisable economic products, has been found in any of the 40 species experimented with, so that their further propagation was abandoned several years ago. In India also the blue-gum tree has been a failure in most places where it has been planted.—*Pioneer*. [Surely not on the Nilgins and Madras hill ranges generally. In Ceylon the blue-gum flourishes in all the higher planting districts.—Ed. T.A.]

## PLANTING NOTES.

"TIMEHRI."—The Journal of the Royal Agricultural and Commercial Society of British Guiana. Part I. The contents are as follows:—Papers—On Faulty Rum and its Alleged Cause, by J B Harrison, M.A., F.I.C., F.C.S., etc., and F I Scard, Chemist-in-Chief to the Colonial Company Limited; Notes on Labour and the Necessity of Immigration for Sugar Estates; Some Common Trench Flowers, by C A Lloyd; The Poisonous Snakes of British Guiana, by J J Quelch, B. Sc. (London), C.M.Z.S.; Occasional Notes; Reports of Society's Meetings, from January to June, 1898.

To TEST DRINKING WATER.—Here is a simple test given by the *Asian* for the presence of sewage in water. All drinking water should be tested frequently, as there are other impurities besides sewage which are quite as deadly, and every cistern of water is liable to be a source of blood poisoning. Mice, rats and other pests must have water, and many a case of typhoid is caused by such as these following into the cistern and remaining therefore months in a decomposed state. To detect the impure conditions is very simple and unfailling. Draw a tumbler of water from the tap at night, put a piece of white lump sugar into it, and place it on a table or anywhere that the temperature will not be under 60 degrees Fahrenheit. In the morning the water, if pure, will be perfectly clear: if contaminated by sewage or other impurities it will be milky. This is a simple and safe test well known in chemistry.—*Pioneer*.

COCONUTS AND GERMAN EAST AFRICA.—According to some recent letters received from German East Africa, the future of that country apparently promises to be very very promising. Almost all Ceylon products are successfully cultivated and coconut plantations are reported to be doing wonderfully well. Extensive tracts are under the cultivation of this palm, and already some estates are now in bearing. The yield is said to be more abundant than that of the best estates of our North Western Province and hopes are entertained of big crops throughout the year. German East Africa will soon send a parcel of copperah to Hamburg, and before long there will be a keen competition in this line with Ceylon. Mr. C. W. Bohlmann, late manager of the local branch of Messrs. Volkart Brothers, is the Managing Director of a large estate company at Tanga, and his company are pushing on extensively the cultivation of coconuts and other tropical products in its estates in German East Africa. The company seems bent on turning out the best copperah in the East and this is not impossible, given the right climatic conditions.—Local "Times."

Vol. XVIII.

COLOMBO, JANUARY 2ND, 1899.

[No. 7.]

### VISITATION OF SPOTTED LOCUSTS.

CIRCULAR FROM ROYAL BOTANIC GARDENS,  
CEYLON.

ATTENTION was called to this visitation by a resolution of the Planters' Association dated October 18, 1898, to the following effect:—"That the attention of Government be drawn to the visitation of locusts in Kurunegala, Matale, and Kadugannawa, with a request that the Director of the Royal Botanic Gardens, Peradeniya, be asked to advise as to the best treatment." Further information has since been obtained through the Planters' Association, and the districts affected have been visited by Mr. E. E. Green. The following report may be quoted as illustrating the usual history of the affected estates:—

To the Secretary of the Planters' Association.

*Locust Pests.*—These I first observed in 1895, and did not take very much notice of, as they merely ate the leaves of jungle shrubs. In 1896 they appeared again, and had increased to about double the number, and then they ate the dadap leaves and bark on young shoots, to which they did a good deal of damage. In 1897 they increased very much and were about four times the number I saw in 1896, and it was during this year I first noticed where they laid their eggs, which is in the ground.

This year the increase was very great, I should think as much as ten times the number I noticed in 1897, and must have numbered some millions. They made their appearance in March or April, and the dadap, cacao, coffee, and in fact all kinds of growth were bent down and quite black with them. Although so numerous they have this year diminished more rapidly, still a considerable number remains. The damage done this year is great, dadaps being pretty well stripped of their leaves and bark; cacao, of which they prefer mature leaves, suffered considerably, but the food they seemed to prefer most was the leaves of coconut and arecanut trees, which were completely stripped. This year the wild pigs

took to eating the locusts, to the damage of the cacao, the branches of which they broke down to get at them; so far I have not noticed any other animal or bird preying on them. The locusts go steadily along eating up all the leaves there are, and leaving the trees bare skeletons. Tea they eat, but do not seem to care very much for. When their wings develop they do not seem to use them very much, their flights being short and individual. I think the only time to destroy them effectually is when they are depositing their eggs in the ground. By the way they increase, serious attention should be turned to getting rid of this pest.—Nov. 13, 1898.

The following account of the insect, report of visit to infected estates, and recommendations for treatment, are extracted from Mr. Green's full report:—

I found the locusts very abundant on an estate in the Kadugannawa district; they proved to be the Spotted Locust (*Phymateus punctatus*). This is a very conspicuous insect, easily distinguished from all other locusts by its brilliant colouring.

The head is black, with a broad yellow band across the front. The upper part of the fore-body (thorax) is curiously roughened, of a shining black colour with a bright yellow border, and an irregular tubercle immediately behind the head. This roughened part of the back gives to the insect the appearance of wearing a cape. The front wings are of a brownish-green tint, irregularly spattered with large bright yellow spots. The hind wings are of a dull smoky hue, except towards the tips, where they are greenish. The under parts of the body are bright red with broad black transverse bands.

The male locust differs in general appearance from the female only in its rather smaller size.

In the early stages the insect is more soberly coloured, being chiefly of a dull brownish tint. It can progress only by hopping, as the wings do not appear until the insect is full-grown, though rudiments of them can be distinguished in the two previous stages. The black and yellow markings become more prominent in each successive stage.

Evidence of their work was very noticeable upon areca and coconut palms, the leaves of these trees being eaten quite bare in some parts. The dadap trees (*Erythrina*) used as shade for the cocoa had also been badly attacked. A few breadfruit trees were more or less completely deprived of leaves. The locusts were also observed to be feeding upon cinchona and amatto plants. It was noticeable

that the cacao trees were almost exempt from attack, nor did the tea appear to suffer to any great extent.

My visit on November 8 was most fortunately timed, as I found the insects pairing, and was shown several small patches of ground where they were congregated in vast numbers, evidently for breeding purposes. In one such patch, about four yards square, the insects had completely covered the ground three or four inches thick, and had partly filled up a drain that crossed the place. It was a most remarkable sight, and the noise of rustling wings and low chirruping, could be distinguished from a considerable distance. The air, too, was charged with the acrid smell produced by the insects.

On examination of the ground it was evident that the impregnated females were freely depositing their eggs here. The soil was closely pitted with holes, each about three inches deep and half an inch in diameter. In these holes masses of eggs were deposited encased in a frothy yet firm covering, and above them the whole was filled up with the same porous matter. The eggs when first laid are pale yellow, but gradually darken to a reddish brown or purplish colour. The porous matter in which they are enveloped has a pinkish tinge.

The holes are excavated by the abdomen of the female insect, which is enormously distended with eggs. The normal length of the entire insect is only 2½ in., but during oviposition the abdomen alone attains a length of about 3 inches.

I was unable to determine the exact conditions that regulate the choice of the breeding sites. They appeared to be selected quite at haphazard, but all were more or less shaded by the cacao trees. The nature of the soil did not appear to exercise much influence in the choice, for the eggs were equally distributed in loose sand, stiff clayey soil, and ordinary loam. In one instance the pits had been excavated in the hard beaten earth of the footpath.

It is very evident that the most favourable time to attack the pest is when the locusts are crowded together on these breeding grounds. They may here be collected and destroyed with the greatest ease (as they make no effort to escape), and at a very small cost, by sweeping them into sacks, which may then be sunk under water for three or four hours till the insects are dead. Bags made of coir-matting are most suitable, as they admit the water readily. A trial bag filled at one of these places of assembly was found to weigh 166 lb. As a single insect weighs on an average just one-eighth of an ounce, this bag must have contained about 12,800 individuals, allowing 6 lb. for the weight of the bag. From this one spot 20 such bags could have been filled without any difficulty.

After repeatedly clearing away and destroying the insects till they cease assembling there, the ground on the immediate spot and for a short distance all round should be broken up to a depth of 6 inches and quicklime turned in. This will ensure the almost complete destruction of the brood. The mere breaking up of the earth would probably of itself prevent the greater number of the eggs from hatching out, by exposing the egg-masses to the drying action of the air and to the attacks of birds and predatory insects such as ants and beetles, which would readily feed upon them.

The locusts appear to be confined to a limited area at present, and could be practically exterminated in the course of one or two seasons. The fully-grown insects die off after pairing and depositing their eggs, so that the most important part of the work is the destruction of the eggs. A certain number will no doubt escape and appear later on as small wingless grasshoppers. The breeding grounds should be carefully watched, and if the

young locusts should appear in any numbers they may be destroyed by driving them into trenches and covering them with earth which should be well stamped down above them.

I am now carrying out experiments to ascertain the time that elapses between the laying of the eggs and the birth of the young locusts. The eggs of an allied species in India have been proved to hatch out in about four weeks, and the insects were fully grown in three months' time. It is very probable that there are two or more broods of the spotted locust in the course of the year. The young locusts were noticed on the above-mentioned estate in April. If the life-cycle of this locust is similar to that of the Indian species, these young insects would have emerged from eggs laid in March, the parents of which would have resulted from the previous October-November breeding season.

There may possibly be a third breeding period in July-August. On the other hand, it is possible that only one brood occurs in the year, the eggs laid in October-November remaining underground until the following April. This should be made a matter for careful observation.

From inquiries on the spot I learned that the locusts were first noticed on that estate in large numbers in June, 1897. They are said to have died in thousands and disappeared when the north-east rains came on, and to have re-appeared in March or April of the present year in greatly increased numbers and over an extended area. It is probable that the great mortality noticed in the north-east monsoon occurred in the ordinary course of events, after the pairing of the insects and the deposition of the eggs.

These locusts seem to be exempt from the attacks of birds, lizards, and other predatory animals, being protected by an acrid frothy fluid which they can discharge when irritated, both from the mouth and from pores on each side of the thorax.

Baits composed of bran poisoned with arsenic were tried, but though a few of the insects were found feeding upon the bait, it did not prove sufficiently attractive to repay any extension of the plan. Nor do I consider that any other measures than the collection of the living insects on the breeding grounds and the destruction of the eggs are, under existing circumstances, necessary.

The following more important points may be repeated:—

At certain seasons of the year, of which October, November has been found to be one, the locusts assemble in vast numbers upon limited patches of ground where the females—still accompanied by the males—bury their eggs in pits about 3 inches deep. A watch should be kept for these places of assembly, and natives should be encouraged to report the occurrence of breeding grounds upon their gardens or any waste land in the neighbourhood. The locusts should be collected and destroyed from day to day as they collect on these spots. As soon as they cease assembling, the ground should be dug up and well mixed with unslaked lime. Upon the appearance of any swarm of young locusts, trenches should be dug, into which the insects can be swept and afterwards buried.

Attention to these particulars cannot fail to result either in the practical extermination of the insects in the locality, or in so reducing their numbers that they can do little or no damage.

E. E. GREEN,  
Hon. Govt. Entomologist,  
JOHN C. WILLIS,  
Director, Royal Botanic Gardens,  
Peradeniya, November 25, 1898.

**THE PROPOSED AGRICULTURAL DEPARTMENT FOR CEYLON.**

(To the Editor, "Tropical Agriculturist.")

PRACTICAL SUGGESTIONS FOR NATIVES.

SIR,—A proposal has recently been made in the Legislative Council to establish an Agricultural Department for this Colony, and the idea is a good one; but it goes without saying that the utility of such a department must, in a great measure, depend on the qualifications of its members; and should it be established, of course it would be the intention of Government that, while giving due attention to the interests of the European planters, it should not neglect those of the native peasantry who are generally too ignorant and too poor to do anything for themselves, in the way of improvements in agriculture, without assistance. Their poverty is not owing to any intrinsic impossibility of bettering their circumstances, and they are not so apathetic as is commonly asserted; but they do not know how to utilise the resources which lie at their disposal unless they are shown the way to do it, and to do this would be part of the duty of the proposed Agricultural Department. Dr. Trimen was very desirous of inducing the villagers to take up the cultivation of cacao, and in this he was to some extent successful, but not so successful as he wished, because he was dependent for assistance on the Government Agents and headmen, who, however willing they may have been to second his efforts, could not do it otherwise than as a work of supererogation. No doubt cacao is a product well adapted for the native peasantry, but there are others which would suit them equally well, if not better, and in support of this assertion some instances may be adduced. -

**HEDGES**—I begin with hedges because, on land exposed to the inroads of cattle, a secure fence is the first essential to success in any kind of cultivation. Nobody likes the trouble of planting hedges, because they give no direct return; but no amount of chemical or botanical knowledge can be of much practical use to a cultivator if his plants are liable to destruction by trespassing cattle. It would be impossible for an obervant person to travel in this country without noticing the almost complete absence of effective hedges, and yet there is no country in which they are more needed, owing to custom which obtains here of allowing cattle to go about at liberty. A common fault in the planting of hedges in this country is that of making them too narrow, a single row of hedge plants being generally considered sufficient, whereas a hedge, to be effective, should be not less than a yard in breadth. To some this may seem to be a waste of land, but the grudging of a yard's breadth of ground for a hedge is a case of "spoiling the ship for a halfpenny worth of tar." For hedging some recommend Sapan, others prickly pear (*Opuntia*) and others American Aloes (*Agave* and *Fourcroya*); but I have tried all three and cannot say that any of them have proved satisfactory according to my experience. A sapan hedge requires fairly good soil, because in poor soil many of the young plants die off, leaving too few to be effective as a fence. Its tender leaves are, moreover, eaten by cattle, so that wherever these animals can get at it, a hedge of it requires a temporary fence of some kind for its own protection: Prickly pear makes a good fence in good soil, but it will not answer where the soil is poor. In Mexico (of which

country it is the national emblem in the same way as the rose, thistle and shamrock are the national emblems of England, Scotland and Ireland respectively) there are said to be impenetrable hedges of prickly pear twenty feet high; but in this country the plant seldom attains half that height, and is usually not more than a foot and a half or two feet high and so brittle that a touch is enough to break it, so that a hedge of it is of no use whatever as a protection from cattle. American aloes would be the best hedge plants we have, were it not for their liability to be damaged or destroyed by porcupines; but this renders a hedge of them unreliable in any place infested by these destructive animals. I think the best style of hedge for this country consists of two rows of some rigid, thorny shrub, one yard apart, with Maha Eraminiya (*Zyzyphus rugosa*) planted at intervals of ten feet or so in the space between the rows; but I have not quite made up my mind on the subject, and this will be one of the first matters for the consideration of the proposed Agricultural Department, should its establishment become an accomplished fact.

**SISAL HEMP**.—When sisal hemp is cultivated on an extensive scale, of course the most profitable method of cleaning the fibre is to do it with a machine; but a machine is not indispensable, as by steeping the leaves in water and beating them by hand, the hemp can be extracted from them as easily as coir from coconut husks in the same way; and it is only by this mode of cleaning the fibre that the plant is ever likely to be of much practical use to the native peasantry, because it would be impossible to construct any machine capable of doing the work efficiently which would not be prohibitive to them by reason of its costliness. Mauritius hemp (*Fourcroya gigantea*), Cuban hemp (*E. cubensis*) and Pita hemp (*Agave americana*) can also be cleaned by hand, though not quite so easily as the sisal hemp, as the fibre of the three former plants is finer than that of the last mentioned, and consequently more liable to break. For a long time I thought it useless to try this method of cleaning aloe fibre, because I believed that it would be impossible to rot the leaves in water without at the same time rotting the fibre also; but having at last made the experiment, I find that this idea was a fallacy. Of course the fibre will be spoiled—as any other fibre would be—if the steeping be too much prolonged; but that needs not happen, as the leaves can, during the rotting process, be examined from time to time to ascertain if the steeping has been sufficient. When aloe leaves are large they should, however, be crushed before steeping, because otherwise the thin parts of them will be too much rotted before the thick parts are sufficiently so.

**PALM OIL**.—The *Elais guineensis* grows well and flowers freely in this country, but its flowers often come to nothing, and this is probably one reason—though not the only one—why it has not hitherto been cultivated here, except as an ornamental tree. The reason of its not bearing much fruit in this country, in proportion to the abundance of its flowering, does not seem to be generally understood; and indeed so small is the interest which most people here take in it that not even its correct English name is commonly known, though the information that it is the "Oily Palm" can be obtained from no less popular an authority than Webster's Dictionary. The frequent abortiveness of its flowers in this country

is due to their not being fertilised by any insect. Presumably there exists in Guinea some insect by which its flowers are fertilised, for the reason, among others, that its flowers, unlike those of most other palm trees, have a very pleasant smell, and that the natural use of this perfume is probably for attracting insects to fertilise the flowers; but this perfume does not seem to be attractive to any Ceylon insect, for I have observed that the *apis trigona*, the small black bee which is the chief agent in the fertilising of the diceous flowers, of the wild date, never touches those of the oily palm, nor do the flowers of the latter appear to be visited, except accidentally, by any other Ceylon insect. Hence the tree does not bear fruit in this country—or at most bears only two or three fruits on a spadix—unless there are male and female flowers on the same spadix, which is not a frequent occurrence. If, therefore, the tree were cultivated as an economic product in this country, its flowers would, like those of the vanilla, require to be artificially fertilised; but the flowers of the oily palm could be fertilised in a manner much less troublesome and less tedious than is necessary for those of the vanilla; and palm oil might eventually become one of the principal products of this island if the cause of the frequent failure of the tree to bear fruit, though flowering plentifully, were generally known. Some think that the oily palm could not be profitably cultivated here because palm oil in any required quantity can be obtained from the trees growing wild in jungles nearer England than the East Indian; but this is also the case with cinchona bark, and yet the cultivation of cinchona did pay very well here until the trade in the bark became unprofitable to grow by reason of overproduction; but an overproduction of palm oil is a contingency not much to be dreaded, at least for a long time to come, because the annual imports of it into the United Kingdom are, according to the "Encyclopædia Britannica," about six times as large as those of coconut oil. For domestic purposes, the oily palm is not so useful a tree as the coconut; but, commercially speaking, I think the former is the more valuable tree of the two. Palm oil is more easily made than coconut oil; porcupines, which are often very destructive to young coconut palms, do not attack the oily palm, except when it is very small, being deterred from so doing by the thorns on the leaf-stalks of the latter; the red weevil, another formidable enemy of the coconut palm seems never to attack the *eleis*, nor does the latter tree seem to be liable to damage by any other insect except the rhinoceros beetle—which also damages coconut palms—but the rhinoceros beetle does not kill the tree, though it injures and disfigures it; and the *eleis*, being itself a jungle tree, can, when once established, hold its own without any cultivation. It does not require a longer time to come into bearing than does the coconut; and its produce would not be easily stolen from the tree—not an unimportant practical advantage with a village product. The worst enemy of the oily palm seems to be the bandicoot, which occasionally proves destructive to young plants of it in a nursery; but with a steel trap and a bait of roasted coconut, bandicoots can be caught as easily as common house rats.

**PALM SUGAR.**—Another Palm tree which appears to receive less attention than it merits is the Gomuti or Java Sugar Palm (*Arenga Sac-*

*charifera*). For suitable situations no better palm than the palmyra is likely to be found; but the palmyra requires a dry, hot climate and a deeply permeable soil, whereas the gomuti seems to thrive well in any situation adapted for its relative, the kitul; and the kitul is very liable, when young, to destruction by porcupines, but they do not seem to attack the gomuti, being probably hindered from so doing by the large quantity of black fibre which they would have to tear away or bite through in order to get at the heart of the latter. I have not had any opportunity of experimenting on the gomuti, but I have made many experiments on the kitul, and it may be presumed that any mode of treatment which suits the latter, would suit the former also. Most Europeans imagine the extraction of tari from the kitul to be a very simple process—all that is required, as they suppose, being to bind the flower-bud with a string and cut off the end of it. I was of that opinion too, until I tried my hand at the business; but I then found that it was not quite so simple an affair as I had imagined. By merely binding and cutting the flower-bud, half a pint or a pint of tari in twenty-four hours might be obtained, but even that little would stop in the course of a week or so, by reason of the hardening of the flower-spikes, after which no more tari could be got from the same flower. In order to obtain tari from the spadices of palm trees it is necessary, not merely to bind and cut the spadix, but also check the natural tendency of the flower-spikes to pass from the saccharine into the woody stage. Most of the jaggery made in India is obtained from a species of date—the *Phenic sylvestris*—and the tari of the date is said to be obtained from a notch cut in the stem of the tree just below the inflorescence; but I venture to doubt this and think it more likely that the tari of the date is, like that of other palm trees, obtained from the flower-bud, and that the real object of notching the stem of the tree is, not to obtain tari from the notch, but to half-kill the spadix and thereby check its development. In the coconut and palmyra the development of the spadix is retarded by constantly beating it with a wooden implement made for the purpose, or with the solid end of a buffalo horn; but the spadix of the kitul is too brittle to bear such treatment as that, and other means must therefore be adapted with it. The native jaggery people generally succeed in obtaining tari from the tree, but they do so by following traditional methods of the real effects of which they are ignorant; and when the operation proves a failure, as does occasionally happen, even with men experienced in the work, the failure is ascribed not to any want of knowledge or want of skill on the part of the operator, but it is either thought that the operator has an "unlucky hand," or the blame of the failure is cast upon the tree. Those who are desirous of obtaining tari from the kitul must make up their minds to the disfigurement and injury of the tree, because, without spoiling the beauty of the tree, it is no more possible to obtain tari from it in profitable quantity than it is to "eat your cake and have it." The jaggery people think it necessary to expose the tender flower spikes to the sunshine, and for this reason, the first thing they do, when they take a tree in hand, is to lop off any leaves that may be shading the spadix. Then they take the bracts and spathe off it, and leave

the sun to act upon it for one full day. On the third day, having propped or stayed the flower to prevent it from falling down, they make in the part of the stalk near the stem of the tree a cavity into which they introduce a mixture which they call the "medicine," consisting of garlic, chillies, mustard and other stuff pounded up together; then they bind the flower-spikes, usually with split cane, about as far as the end of the central stalk, and cut off the rest of the flower. Next day this flower is cut again once, and the day after, twice, morning and evening, a pot being hung to it in the evening. The process varies somewhat with different operators, some of them thinking it better to leave on the bracts of the flower-stalk, and to do the medicining one day instead of two days after exposing it to the sunshine; some washing the flower-spikes with Kafir lime juice, others with a decoction of dried gamboge fruit, others omitting the acid lustration, and so forth. That is the ordinary way, and there are three other ways of which I have been informed, but have not seen practised. Not much tari is obtained at first and it is usually insipid and fit only to be thrown away; but in a few days it increases in quantity and improves in quality. The jaggery people commonly pretend that the composition of their so-called medicine is a valuable secret; but the ingredients of it vary much with different men. I make use of no mixture at all and do not believe in it, and I have been informed that none is used in Rakwana, where kitul trees are planted and cultivated as coconut palms and in the maritime districts and where the management of the former is therefore presumably better understood than in parts of the island. When the "medicine" is used, it is necessary to make the cavity for its reception far down the flower-stalk, because near the tree it is tough and fibrous and will not break in two at that part; whereas it is very brittle near the spadix, and might break off by the mere weight of the flower if the cavity were made far from the stem of the tree. In order to get at base of the stalk for this purpose, it is usually necessary to cut away part of the sheathing leaf-stalks, and as this weakens the leaf-stalks, they not unfrequently break in high wind, so that the leaves to which they belong hang down against the stem of the tree; and this, together with the lopping away of the higher leaves, causes the tree to present a very dilapidated appearance, looking as if it had been used as a target for artillery practice with chain shot. The jaggery people deny that cutting off the leaves above a flower does any harm to the tree, and say that, as the tree flowers from the top downwards, the leaves above a flower are of no further use to the tree, having already served their natural purpose; but I have observed that kitul trees which have been partially mutilated of their leaves flower at intervals varying from a year and a half to three years, whereas those which have all their leaves intact flower two or three times in one year, from which it is obvious that cutting off part of the leaves *does* impair the vitality of the tree. It is, however, the injury which the jaggery people do to the tree by depriving it of part of its leaves that is the real secret of their success, although they do not know this. They ascribe their success partly to the exposure of the tender flower-spikes to the sunshine, and partly to the stuff which they introduce into

the flower-stalk; but the truth is that neither the direct sunlight nor their so-called medicine has any effect at all in promoting the flow of saccharine sap. By cutting off the leaves, they impair the vitality of the tree, thereby preventing the flower from going to seed so soon as it naturally would, and that is the whole secret of the matter. I shall not venture on any directions as to the best mode of pruning the tree, as that is a question which must be settled by experience. If the tree be insufficiently pruned, it will, by reason of the flower too quickly running to seed, produce less tari than it would be possible to obtain from it; but if the pruning be done to excess, the intervals between the successive appearance of the flowers will be too much prolonged; and this is another matter for the investigation of the proposed Agricultural Department.

I will now endeavour to explain what I believe to be the philosophy of the subject, promising, however, that the explanation is only a theory, and that it is to be taken for no more than a mere theory is worth. When I was at school, about forty years ago, I learned that, in the growth of trees—exogenous ones of course—sugar is first formed in the sap near the root of the tree; that the sap, containing sugar in solution, ascends by way of the cambium to the leaves, where the sugar is by the action of solar light converted into starch; and that the sap, now containing starch instead of sugar in solution, then returns from the leaves, by way of the pith and medullary rays, to the branches and stem, when the starch undergoes a further conversion into lignin or woody fibre. This, I believe, was then the generally accepted theory, and it accounted in an apparently satisfactory manner for the flow in the spring season of saccharine sap from the sugar maple trees of North America; but it is now exploded, and the common opinion of botanists of the present day is that sugar in plants and trees is always formed from starch (or its chemical equivalent) and not starch from sugar, although the manner in which the change is effected is not well understood. Starch is artificially converted into sugar in the manufacture of glucose—an industry of some importance in Germany and the United States—and of the natural conversion of starch into sugar there are familiar examples in the malting of barley and the ripening of bananas. A process analogous to the ripening of bananas takes place in the kitul palm, except that the starch, after conversion into sugar, undergoes a further conversion into lignin or woody fibre. While the tree is in the growing stage a store of starch, in the form of sago flour, is accumulated in the stem; and when the tree flowers, part of the starch passes into the flower-bud, where it is, about the time of the bursting of the spathes, converted into sugar, which would, in the course of nature, soon be in turn converted into woody fibre; but the chief art in palm sugar making is to stop this last change, and keep the flower as long as possible from passing from the saccharine into the woody stage. Perhaps this may not be the true explanation of the matter, but for practical purposes it is a good working hypothesis.

In this connection a few remarks on DATE SUGAR may not be out of place, although date sugar is not a product of this island. If, as has been previously suggested, the tari of the date is obtained from the flower-bud and root,

as is commonly asserted, from a notch cut in the stem of the tree, then the practice of notching the tree is probably not necessary, because the lower leaves must in any case be cut away in order to get at the flower, and this pruning would alone prevent the too speedy development of the inflorescence. Fruit trees other than palms are pruned for the purpose of making them bear more than they naturally would, but pruning a palm tree has the opposite effect. Some years ago, before I knew the cause of the oily palm frequently failing to bear fruit in this country, I read in a local paper—the *Observer* I think—an extract on palm oil in which it was asserted that the only cultivation which the oily palm receives in West Africa consists in cutting off its leaves to increase its bearing; and, having a few oily palms, I thereupon tried the effect of pruning upon some of them, but found that instead of its causing them to bear more fruit than before, they did not flower at all for a long time afterwards. Someone had probably seen oily palms from which the Negroes had been cutting away the leaves in order to facilitate the gathering of the fruit from them, and had erroneously inferred that the pruning had been done for the purpose of making them bear more abundantly than they would in their natural condition. It would be a practical advantage to the cultivation of sugar date palms in India if the notching of the tree could be dispensed with, because the practice, besides injuring and disfiguring the tree, sometimes proves fatal to it by reason of the notch affording a lodgement for the eggs of the palm weevil. Weevil grubs cannot get into a palm tree unless the tree has been wounded, because the parent weevil is not provided by nature with any instrument for making a receptacle for her eggs. Sometimes porcupines bite a small piece of the skin from the stem of a young coconut palm and then leave the tree, finding that it is too hard for them; and if this is noticed in time, and tar is applied immediately to the wound, no harm results to the tree; but unless the wound be immediately tarred, it commonly affords a lodgement for the eggs of the palm weevil, and then the destruction of the tree is a certainty; and if the practice of notching the date palms could be given up, their destruction by weevil grubs would probably seldom or never happen, because the mother weevil would usually be unable to find in them any suitable place for the reception of her eggs. As the making of date sugar is an important industry in India, this is a matter deserving of investigation; but both here and in India the Government seems to have been hitherto more intent upon getting excise duties from intoxicating drink obtainable from sugar palms than upon encouraging the utilisation of the trees as producers of sugar.

The arenga does not bear productive seed in this country, though it flowers freely; but it is not singular in this respect. The sugarcane also flowers freely in this country, but produces no seed, although Mr. Daniel Morris propagated it from seed in Jamaica when he was Director of the Botanical Gardens there. The American aloes also flower in this country, but bear no seed. I have had the same experience with Manila hemp (*Musa textilis*), and when the original home of plants of this habit can be known, I think it will generally be found that they are indigenous to volcanic regions. If the failure of the arenga tree to bear pro-

ductive seed in this country is due to the soil of Ceylon being deficient in some necessary volcanic element, it might be practicable to supply the deficiency artificially by manuring; but of course there would be no advantage in producing more seed than would be required for propagation, as arenga seed is of no use for anything else; and one arenga tree would bear seed enough to plant a forest of it.

Some say that the manufacture of palm sugar would not pay; but it used to be said not very long ago that sugar could now be profitably made from anything except the cane, and the manufacture of sugar from beetroot has become a great European industry since then. The manufacture of beet sugar began in Germany with a yield of only five per cent of sugar, but a yield of twelve or fourteen per cent is now obtained; and it is not impossible that a similar improvement might be effected in the production of palm sugar if the subject were scientifically investigated. Moreover, it is only within the memory of living men that Europeans have taken up the production of tea, but in that short space of time they have introduced more improvements into the process than the Chinese could think of in the two thousand years during which they had previously been at the business; and, for aught anybody at present knows to the contrary, it is possible that the process of palm sugar making may be capable of being improved in a similar manner.

The investigation of these and other similar matters would be part of the proper business of an Agricultural Department, and although the proposal that it should be established, originated in the Legislative Council with the Honourable Mr. Campbell, yet it is not at all to be supposed that the Department must necessarily exist for the benefit of the European planters only. The establishment of an Agricultural Department would not interfere with the proper functions of the Botanical Department already in existence, but on the contrary, the one department would rather be the complement of the other. The Botanical Department can and does introduce and acclimatise useful exotic plants, but it cannot be reasonably expected of it that it should undertake or understand the curing of all sorts of products, or that it should even be able in every case to afford information regarding the best methods of their cultivation; and hence the need for an Agricultural Department as well as a Botanical one.—Yours &c, ALEX. T. GEDDES.

#### FISH CULTURE IN CEYLON.

Mr. C. J. R. LeMesurier writes:—I notice in the very interesting report of the Ceylon Fishing Club that it is proposed to introduce the "Gourami" into Ceylon. I may mention that I put three of these fish together, with some labo, both kinds from Madras, into the Kandy lake, some years ago, and that they should have bred and multiplied there by now. I also put some into the pound in Lady Hortou's Walk above the Pavilion where, if the others have not eaten them, they and their descendants should be now. There is, however, no need to introduce the Gourami into Ceylon, for it, or at any rate a fish almost exactly like it, exists in great abundance in the lakes, and back waters and rivers in the Batticaloa district. It is there called the "Chettal" and it is delicious eating. I used to propagate this fish when I was District Judge at that station. I enclose copy of a letter I wrote to the Local Board when I left

in July, 1895. It may interest some of your readers, and serve to show how difficult it is to keep up local interest in such matters. When I left Batticaloa in 1895, the experiment was dropped. Fish culture should be made a department of the Government, as it is in America, not for the purposes of sport, but as a cheap, easy, and efficient means of increasing the food-supply of the country.

Batticaloa, 30th July, 1895.

Sir,—As I am leaving the district and shall not therefore be able to continue my experiment in fish culture I have the honour to return the balance in my hands out of the R100 voted to me together with a statement and vouchers, &c. for what I have already expended. I trust, however, that my experiments will be continued by the Local Board. They are very simple and efficacious, and will result in the lake being furnished with a yearly supply of the best kinds of fish that are to be obtained in the locality. My method is a very simple one. It is to create sanctuaries where the fish can breed freely and where they can find their way into the lake during flood time. My present and only sanctuary is the backwater in front of the Flagstaff at the bar. I have dammed this up at either end to prevent ingress and egress. I drag it once a month with a madel, at a cost of Rs5 each time, to get rid of the predatory fish, the owner of the madel taking all the fish he catches except those mentioned below which are thrown back alive into the water. I stop all net fishing in it and I stock it from time to time with fair sized Chettal (? Gourami), Mannale (Mullet) and Kelakan (? Smelt). These are the best kinds to propagate; they are good eaters; they grow quickly; they breed very freely and they are non-predatory. During flood time my dams will be washed away and the progeny from the parent stock, then well grown and able to take care of themselves, will escape into the lake to replenish the stock there. When the floods are over the dams, which are very cheap, should be renewed, the predatory fish should be kept down as I am keeping them down now and the pond restocked with a few hundred more fish of each kind.

I employ as watchers two of the guards at the Custom house and I pay them R2.50 a month, each.

I am Sir, Your obdt. servant,  
(Sgd.) C. J. LEMESURIER.

THE PRINCIPLES AND PRACTICE OF PRUNING.

There are many ways in which the gardener may avail himself of Nature's workmanship, and one of these consists in the production of a great variety of luscious fruit from trees which, in the wild state, bear fruit of a single uniform type, sour, insipid, and unfit for the human palate.

From the Crab he has obtained the nutritive Apple; from the wild Pear all the juicy varieties of that fruit; from the wild Gooseberry, scarce larger than a bullet, the swollen, sweet-tasting berries of our kitchen garden, an inch across; and so on with very numerous other kinds.

How has this feat, far-reaching indeed in its beneficent results, been brought about? By dint of careful and patient cultivation through centuries, if not millennia of years, of the rough-hewn products of Nature dispersed around us in the world.

Almost all horticulturists agree that pruning should play a part in the cultivation of our fruit-trees, for its usefulness has been established over and over again.

The practice of pruning is founded on the fundamental biological fact that in the growth and life-history of every plant there are two forces at work—the force which tends to the production of vegetative, and that which tends to the formation of reproductive organs.

In Nature an even balance between these two forces is almost always ultimately struck, the one ever subserving the other, neither being in any way exaggerated or hurried, the ultimate result being that condition which is, to all intents and purposes, most perfectly adapted to the plant's immediate environment, and hence to the needs of its adequate and full existence.

As attractive-looking, sweet-tasting fruit is always produced by a plant in order that animals of some kind or other may pluck it, devour it, and so help towards the dispersal of the seeds which it contains, this result being finally attained, the plant has realised the aim of its existence. The Crab-tree and the wild Gooseberry-hush have reached the point of sufficiency for the needs of their life in the production of the fruit which the wild birds probably fully enjoy.

But civilised man, appearing on the scene, will have something still better than this; and in order to attain his end, he, alongside of other and equally important modes of cultivation, such as planting in properly-treated soil, cross-breeding, assignment of a spacious position, and protection from insect-pests, sets to work to upset the equilibrium established by Nature between the two forces above-mentioned, thus creating a disturbing and restraining influence upon the free course of the tree's life. For he recognises the principle that, by restraining the force which tends to the formation of vegetative organs, he can increase that which tends to the formation of reproductive organs. This artificial interference of man's part with the ordinary life-conditions of the tree must lessen the vigour and shorten the life of latter to a certain extent; but we shall see that the advantage accruing to man from his action far outweighs any loss of robustness or shorter duration of fruit-bearing activity which the tree may suffer therefrom. Hereafter, the cultivated Apple-tree of the orchard will lack the strong vigour of the wild Crab-tree of the forest; but the latter, if it could do so, would marvel at the wonderful change in the character of the fruit produced by its descendant. Man, by the swift process of artificial selection, has followed in the wake of the slower process of natural selection, and the result is unique.

We have now to consider some of the more detailed methods by which the force which tends to the formation of vegetative organs is diverted, and that which tends to the formation of reproductive organs, viz., the fruit allowed freer play.

It is but natural that the orchard fruit-tree, if left to itself, as regards the knife, will from vegetative growths, and fruit pretty much after the same fashion as the wild Crab-tree. There may be some difference in quality of the fruit, owing to the richer soil and more favourable situation and precedent ancestry, but this difference will be but slight and inappreciable. Something else will have to be done in order to induce the predominance of fruit-formation to that of vegetative growth. And this is pruning.

This important factor must come into play in the very first infancy of the tree, as it gradually develops and grows from the grafted or budded scion. The pruning at this stage of its life-history will depend on the mode of training to which the tree is hereafter to be subjected. If the future fruit-bearer is to be a wall or espallier-tree, the growth of the main stem or leader must be subordinated and more or less sacrificed to the growth and development of the lateral branches; for, if Nature were allowed free play, the main stem of the tree would soon overtop the wall and the lateral branches become subordinate

and of comparatively insignificant length. But the object which the gardener has in view in the training of these trees is that the wall or espalier shall be well covered by the tree, and the space available thoroughly economised, so that the tree must henceforth, from its youngest state onwards, pursue a horizontal rather than a vertical direction of growth. It will thus be seen that the tree departs from its natural habit of growth, not only by this horizontal development of the lateral branches at the expense of the main stem or leader, but also in the fact that the lateral branches are allowed to develop in one plane only, viz., that of the long extension of the wall or espalier. Few forms could be more unnatural or more utterly unlike the habit of the tree in its native state; and the fact that the tree will submit to this and other almost equally artificial methods of training, and bear good fruit, argues that fruit trees have been under training and cultivation for untold generations, and have thus become gradually inured to such severe treatment.

The young grafted tree, at an early age, is topped, or shortened, for several inches, which interruption in the normal flow of the sap upwards causes the latter to accumulate in greater abundance at the place of insertion of the uppermost lateral eyes or buds, and from these to induce the precocious development of lateral branches, while a new leader is allowed to develop from the highest bud or not, as the case may be. Supposing the leader to grow upward rapidly again after this treatment, it must the following winter be again topped in order to start a second pair of laterals above the first formed, and so on year after year, the pruning always being performed in the winter-time, when the active life of the plant is suspended, and when, therefore, there is less fear of interfering with its vitality and its proper course of growth.

The lateral branches are not to be shortened at all in the case of most hardy fruit trees with vigorous growth, but are to be allowed to grow right ahead as far as space will permit. If shortening took place, the sap, instead of being evenly and equally distributed throughout the whole length and thickness of the branch, would be thwarted in its natural course, and induced to accumulate to excess in the lateral buds or eyes, especially those near the end of the pruned branch, and these eyes being caused to shoot, the result would be, instead of the fruit-spurs which would naturally have appeared all along the untouched branch, a great production of tertiary woody shoots and a consequent absence or great reduction of fruit-forming twigs. The topping of any leading shoot inevitably induces the formation of lateral members—a wise provision of Nature for the continuance of the temporarily thwarted vegetative growth of the shoot, but which is exceedingly detrimental to all immediate fruit-forming capacity, and thus to be avoided by the cultivator. Certain kinds of trees, however, such as the Peach, Nectarine, Apricot, which are less vigorous and active in their growth, owing perhaps to the fact that they hail from under more southern skies, are not nearly so liable to the formation of woody outgrowths when their lateral shoots are shortened; hence, where found advantageous, this practice may with these more frequently be indulged in.

If it is desired to form a "pyramid," the same process of topping of the young budded tree must be practised, and a number of branches induced to develop all round the stem, which must be kept at even distances apart, and proportionate in length, so that the lowest are always the longest and strongest, otherwise the pyramidal form will not be retained. To obtain this result, the lateral branches will require carefully watching and training, and frequent shortening to the proportionate distances, otherwise they will naturally tend to grow irregularly in length and in direction.

In the formation of standards by pruning, the main object is to obtain a well-formed symmetrical head or crown. After the young tree has reached a certain height, its natural growth is severely interrupted and

suppressed, owing to the fact that henceforth a number of spirally-arranged lateral branches are caused to develop from the uppermost eyes, entirely at the expense, and to the ultimate complete extinction of, any further growth in length of the main mother-stem.

The latter is first of all topped, in order to induce the out-growth of the lateral shoots, but not in the manner described for the "pyramid," close above an eye, but some little distance above, so as to leave a blind stump. By this means the topmost eye of the mother-stem will be caused to grow in an obliquely ascending direction upward, as an uppermost lateral shoot, instead of forming a vertical continuation of the main axis, as it would do if no stump were left. The second service performed by the stump is to draw for a time some of the sap away from the topmost eye, and so prevent its developing too vigorously and more strongly than the others. Eventually the stump must be removed. This same kind of topping must be adopted, with all the lateral and every succeeding shoot in the same way, until, after the tree has for a few years been put through its youthful training, it is eventually left entirely to itself.

These are the three principal types of the artificial form to which fruit-trees are trained in the garden. As we have seen, the desired form must be early induced in the young tree, when its tissues are as yet plastic and yielding, for it goes without saying that it is difficult to force an older tree, especially when it has begun to form fruit, into a habit of growth to which it is entirely unaccustomed.

One main object of the training of fruit-trees into various shapes is, of course, to please the eye; it is elegance or strangeness of form which we desire to see; but the chief object of the cultivation of fruit-trees is the production of fruit. We have no wish to see an abundance of fine fruit developed on an uncomely tree; but neither do we wish to see a beautifully formed tree with a paucity of fruit. The ideal towards which we have to strive is a mingling of the two characters; the abundant production of fine fruit and an elegance of form in the tree. And the elegance of form of the tree (at least, in its younger state), and the quality, if not quantity of the fruit which it bears, must be superior to what we find in Nature.—W. C. WORSDELL, F.L.S.—*Gardeners' Chronicle*.

(To be continued.)

#### DUTCH GOVERNMENT CINCHONA PLANTATIONS.

—We have room this week for the insertion of a short paragraph relating to a part of the report (mentioned last week) on the Java cinchona plantations of the Dutch Government. The returns and expenditure are items that merit further notice. The total expenditure in 1897 was equal to about £7,689, of which about 5-9 was incurred in new buildings and repairs. The estimates exceeded this expenditure by £155. In 1896 the expenditure was about £7,559. These figures work out a cost per lb. of 23-5d in 1897 against 25-11d in 1896. The gross returns for the crop of 1896 amounted to about £17,644 at the sales in Amsterdam, with a profit of about £3,100, to which has to be added profit made by sales in the East Indies, which brings the total profits to about £3,300. The expenditure of about 25-11d has to have added 6-11d for freight and commission on sales, which makes the cost of the bark per lb. to the Government 32-11d. Deduct this from the average price obtained per lb.—namely, 59 11d—and we see that a net profit of nearly 27-11d per lb. remains, which seems a very satisfactory margin. We have rendered Dutch sums and weights into English equivalents all through this paragraph into as near absolute accuracy as makes no matter.—*B. and C. Druggist*, Dec. 12.

## CEYLON TEA IN GERMANY.

We are glad to see that the important question of pushing our staple product in the land of the Tenton is gradually gaining serious attention at the hands of the Planters' Committee. We can testify from a recent tour through several towns in Germany that the class of beverage supplied there under the name of "tea" is, in many cases, of the poorest quality of China; and it is, therefore, no wonder that the drink has not hitherto become popular among the Germans themselves. Hence the introduction of tea of real excellence ought to make rapid progress directly the new taste has germinated. In Southern Germany the work of "pushing tea" was begun some time since by Messrs. Bohringer, and no doubt the beneficial result will soon be felt; and Mr. Hagenbeck's work in Berlin and the North is too well-known to need more than the passing reference of approval. Special thanks, which we note were duly accorded by the "Thirty Committee," are due to Mr. James Westland of Gammadia for his persistent advocacy of the energetic furtherance of the sale of Ceylon tea throughout the Germanic States. Germans, like most new hands, require perhaps some little education in the *brewing* of the beverage—upon which so much depends. And we venture to make a suggestion, which we made to Mr. Westland only a short time ago, that in order to win over the German "Frau"—a great point in the contest—to appreciate the merits of the inimitable and stimulating afternoon drink, we ought to bethink ourselves of the uses of the pamphlet and a small sample of fine tea. A pamphlet might well be drawn up, and submitted to the Planters' Association before translation into the tongue of the Kaiser and his people. It should describe in a racy and instructive manner the history of tea in all its vicissitudes from the estate to the table, and it should be illustrated with a number of representative views of the estate, the factory, the shipping, the sale and perhaps even the consumption of the article, concluding with brief but carefully worded instructions as to the "making" of the tea pot drink. If some such publications were produced (with all necessary attractiveness in printing, paper and illustration) accurately translated, and discreetly distributed by Mr. Hagenbeck, for instance, and other agents, together with a small but choice packet of tea, by a house-to-house visitation among the upper and middle classes in the chief German towns,—we feel sure that large results would accrue to an original effort of this kind. No one need be alarmed by the apparent extensiveness of the proposal here put forward. For, in commencing, only one town of large size, some city where the Ceylon article is not well-known, need be selected and a test distribution made there. A short interval would be sufficient to judge of the effects of the enterprise and estimate, from the forthcoming increase or development of demand in the locality, whether it is worthwhile to pursue this method of advertisement with redoubled vigour. The experiment seems to us worth a trial, or, at least, some consideration.

## ALOE FIBRE.

We are apparently on the eve of an important development in regard to the utilising and cultivation of the aloe plant in our midst. The new machine to which we referred the other day is a patent of Mr. A. Silburn who has come to us from South Africa, where he has already secured patent rights, and who is going on to India, where the patent is also being arranged for and where extensive experiments in cultivation of the plant, and in working the machine, are to be undertaken. Meantime Mr. Silburn's attorney Mr. Parkinson is anxious to learn where aloe leaves in quantity can be obtained in a district not too far from a sea-port, and also where land suitable for a experiment in cultivation can be obtained. We have recommended Kurunegala as a good centre for their enquiries and a place to which possibly the natives could bring an appreciable quantity of the leaf if a factory were established, and cash paid for the leaf on delivery. We may, however, be mistaken as to the aloe being as common in this district as it was in "days of old." In local experiments made a good many years ago with a primitive machine invented by Mr. C. Shand, the best results were about 3 per cent got from the *Sansiviera Zeylanica*, the small parti-coloured garden aloe common in Colombo; but the short fibre of this aloe is of no use for Mr. Silburn's purposes. On the other hand Mr. Silburn's patent machine is said to give up to 7 per cent of good marketable fibre from leaves of the *Agave Fourcroya* and the longer they are the better, 7 or 8 feet if possible. At present, Mauritius has an export trade in Aloe Fibre equal to from R250,000 to R300,000 a year. We wish all success to Messrs. Silburn and Parkinson in promoting a new industry in Ceylon, and one which, if successful, would be certain to benefit many native landowners as well as many of our labouring class.

Since writing this we learn that Mr. Silburn, having secured preliminary protection here, has gone on to India, leaving Mr. Parkinson to represent him. One of the patent machines is now under construction and should be ready in about six weeks. It is indispensable that it should work alongside a river on account of the quantity of water required in the crushing and washing process as well as in the final preparation of the fibre. The banks of the Maha-oya between Ambepissa and Polgahawela would seem to offer a suitable choice of site.

CEYLON TEA AND MR. KELWAY-BAMBER—  
A recent mail has brought us, from a Dinbula proprietor in the West of Scotland, the following expression of opinion as to Mr. Kelway-Bamber's mission and work:—

"I am glad to see that you have got a chemist appointed to study tea manufacture and cultivation. I only hope that he will not be asked to attempt too much at first. The point in which chemists have so helped brewers is 'fermentation,' and that is where I expect Mr. Bamber or some chemist will eventually assist tea manufacture, and it is to that point that I hope you will use your influence to confine his researches at first."

The above is very much what Mr. John Hughes meant in his word of warning to planters, namely, that the Chemist should be distracted as little as possible from his work in the factory until he had arrived at definite results.

## THE TEA CESS.

We do not think it advisable to increase the Tea Cess at this time and for several reasons which, we think, will weigh with the planting community. First and foremost is the temptation presented to use the Cess Fund, for purposes for which originally, it was never intended. We have not one word to say against the engagement of Mr. Kelway-Bamber: on the contrary we most highly approve of his mission and think it one of the fortunate events of the current year. But we very much question whether, with an overflowing exchequer (millions of surplus revenue) these two years, almost solely due to the influence of "tea," one cent of the expense of this scientific and practical investigation for the benefit of our leading industry, should have come out of the Tea Advertising Fund. And we are quite sure that the very least that should have been insisted on—even if the claim went to the Secretary of State—was that half the expense should be borne by the Government. So with the Coolgardie Exhibition. Why should not the Government of the Colony with revenue beyond all precedent—two millions of rupees stuffed into the Supply Bill for 1899, beyond what is needful or what can be in all probability, judiciously expended—come forward to do justice to all our Ceylon products, and especially to our staple product, at this Westralian Exhibition? If the practice of going to the Cess Fund for purposes of this kind, continues, the very best evidence in the world will be afforded that the Tea industry of Ceylon in place of standing in need of relief from Government, is under-taxed, since its representatives voluntarily undertake pecuniary liabilities which, in any other Colony, would be borne by the general revenue. Then, again, as our contemporary notices, there is the fact that while Indian and Ceylon teas are equally advertised by Messrs. Mackenzie and Bicchyn den in their American campaign, the larger share of the cost has been borne by the Ceylon planters, and that there seems no means of stirring up all the Indian tea proprietors to do their duty in this matter. We would say that in North America henceforward, Ceylon should not spend one cent more than India; but rather advance rupee for rupee; and devote an increasing part of the Cess Fund to the Continent of Europe where the campaign, of course, must be on account of "Ceylon teas" only. Now we see no reason to doubt that there will be enough of money for this purpose and for other legitimate purposes; while to increase the collection would mean to increase the temptation to divert funds to purposes which are really calculated to relieve the central Government of its plain duties and responsibilities. Next year at the present rate of collection, the cess should produce from R240,000 to R250,000; while the proposal of the Thirty Committee is that R60,000 more should be taken from the pockets of tea exporters, for the Fund. But we feel sure that, if the "Thirty Committee" go prudently to work in their administration of the lesser amount, and avoid any temptation to divert money from the original and only purpose of the fund, there will

be no difficulty in doing justice to the claims of Europe as of America—to prosecute an active campaign in Russia, Germany, Austro-Hungary and France as well as in the States and Canada.

We may be told that Mr. Kelway-Bamber's mission should be prolonged. Most probably, and very desirable is such work; but, if so, let the demand for the required additional outlay be made in the proper quarter. There is something ludicrous in the position of the tax-payers of South Ceylon, and especially of the planters, at this time, towards the Executive Government. The latter ignoring the necessities of the staple industry and of the populous districts which periodically suffer from floods in the Keani-ganga, fill up an unprecedented Supply Bill with big votes for new Buildings and Irrigation Works; and this Bill is likely to be allowed to pass without contest; while some of our planting and mercantile leaders even think the occasion is opportune for proposing to take some more money from the pockets of estate proprietors! We much mistake the signs of the times if either the Chamber of Commerce or Planters' Association is likely to sanction this proposal to increase the Cess levy on tea. Were there no other reason for throwing it out, than the way in which such an increase could be used in official circles both here and in Downing Street, to show that the planters did not feel their burdens but voluntarily agreed to add to them, that risk alone should be fatal to the foolish and untimely suggestion emanating from the last meeting of the "Thirty Committee."

CACAO CULTIVATION AND DISEASE.—Our columns contain a good deal of useful information on this subject. Mr. Carruthers has acted very wisely in drawing up a few simple Rules for the use specially of the village cultivators of cacao and for that reason to be translated into Sinhalese and Tamil. But none the less are they useful in their conciseness as a guide to ordinary planters. Following Mr. Philip's letter with these Rules on our sixth page will be found an interesting and suggestive letter from "A Miscellaneous Planter." He pertinently inquires as to the number of cacao planters who have followed the very plain advice already tendered by Mr. Carruthers in respect of shade, thinning out of plants, keeping estates clean, &c.; and he winds up by insisting that justice is not done either in the Colombo or London market to the better qualities of our Cacao; and the Produce Committee of the Ceylon Association in London are asked to take an interest in the subject. As to improved native modes of culture and preparation, agri-horticultural shows with prizes yearly at each Kachcheri—not on an expensive but thoroughly practical scale—ought to do much. The theft of Prædial Products is an old complaint; but the Government has recently promised to do all it can to check the evil. We have a further letter on the subject of cacao from a well-known planter, received this afternoon. Our correspondent will find he is forestalled in regard to Rules for natives by the prompt action of Mr. Carruthers and the Planters' Association. It is certainly an important matter, if Mr. Carruthers has to go, that Mr. Parkin should continue the cacao disease investigations: it is a pity these should be interrupted, while the rubber experiments though important, are by no means in so great a hurry.

### THE WANT OF GOOD TEA IN ENGLISH HOUSEHOLDS.

A visitor to England after an absence of some years, makes the following remarks as the result of his observations:—

"One thing I have to note. It is observed that the taste of tea has much deteriorated in England notwithstanding the enormous quantities consumed and all the facilities for obtaining good teas. To whom do we owe such state of things? To the 'Blenders'! It is a problem in many households where to go to find good tea, and that is a remark I heard set forth by many people."

"Drink pure Ceylon tea" ought to be preached up and down the old country along with a recommendation to deal only with firms supplying pure tea and to have nothing to do with "blends."

---

### CEYLON TEA FOR RUSSIA: GOOD NEWS.

We learn that the Russian buyers have been buying freely in the Colombo market for some time, and as four distinct firms are establishing branches in Colombo, it is evident that they mean "business," and see a future in the Colombo trade. If we are not greatly mistaken our direct exports to Russia next year will show a very considerable increase. Our informant has heard "10 million lb." estimated as probable, and he adds,—“I really don't think this will be far out.”

---

### EUROPEAN LIFE IN THE TROPICS.

The series of papers which, under the title of "The Control of the Tropics," Dr. Benjamin Kidd lately contributed to the *London Times*, have attracted a good deal of attention and have now been published in a separate form. This volume has provoked considerable difference of opinion among critics; but perhaps the most interesting contribution made to the discussion is a letter from the well-known Naturalist, Alfred R. Wallace. We republish nearly all of this letter in our daily and *Tropical Agriculturist* and pronounce it well worth reading. Dr. Wallace, speaking from his own experience of twelve years, chiefly in the Eastern Archipelago, denies that life in the tropics is inimical to Europeans, while he shows how distinctly beneficial it is in many cases. What he tells us of the good health of Dutch families settled for 200 years in the Moluccas is of interest; and, of course, the history of the West Indies shows how far European settlement can be carried in the tropics. It is needless to say that we fully agree with most of Dr. Wallace's statements in contravention of Mr. Kidd's views. Some striking illustrations of the fact that residence and hard work in the tropics are compatible with good health among Europeans, can be furnished from Ceylon. The case of Major Skinner with his fifty years of active life here and his retirement at 65 years in splendid health, is the first that is suggested to us. The Rev. Wm. Oakley of the C.M.S. gave 52 years of his life to Ceylon without intermission. Col. Watson was here about 65 years. Our relative and predecessor in the *Observer* with 55 years' residence, much of it spent in sedentary, mental labour, and dying in

Colombo at the good old age of 76 years, is another case; and Mr. A. M. Ferguson often said that he did not believe he could have enjoyed such continuously good health had he remained in his native Highlands of Scotland. The same is true to a lesser degree in our own case with 37 years of residence; and from our biographies of "planting pioneers" not a few colonists can be named who have laboured in Ceylon—within seven degrees of the equator—with exceptionally good health for 25 to 40 years. Two notable cases occur to us as we write—Mr. John Stephens of Dolosbage, who lately celebrated his 82nd birthday here, arrived in Ceylon on the 25th July 1841, and has since spent not more than 7 years out of the Colony; and still more remarkable is Mr. W. B. Lamont, coffee, coconut, and tea planter, who arrived on 17th February 1841, and has not been away from Ceylon more than twelve months in the well nigh 58 years which have passed since he first saw Ceylon. Both these gentlemen still reside in the island. As to the second and even third generation of Europeans prospering in Ceylon we have also abundance of evidence, only as a rule, it is indispensable to robust health and due moral and mental training; that children should spend ten or more years in the motherland. As to Dutch families, we are aware that there are several in the island who claim a pure descent from settlers who arrived from Holland 150 or more years ago, and who have maintained a very satisfactory average of health in the low hot country of Ceylon. Among Europeans, indisputably robust health is chiefly found among planters and public officers whose work and residence are in our mountain regions from 1,600 feet and upwards above the sea. But that is no wonder; because our Ceylon hill-districts from 4,000 feet and upwards include the finest climate in the world—with an average annual temperature of from 57° to 65° against an average of 81° at Colombo by the seaside.

---

### CEYLON TEA IN AUSTRIA AND HUNGARY.

Mr. James Ryan, of Dimbula, sends the "Thirty Committee" a very perspicuous and readable Report on the condition and prospects of our staple throughout the Austro-Hungarian Empire. Mr. Ryan's experiences in Vienna remind us of our own in the same city—duly reported and for which we had the thanks of the Planters' Association—in 1891. But a considerable change for the better has evidently taken place in the seven years and Mr. Ryan is able to adopt an encouraging tone as to the future, while he makes sensible suggestions as to the best way of expediting the general demand for Ceylon tea. Mr. Ryan did not visit Carlsbad—the great Bohemian watering-place—where he would have found 20,000 to 30,000 visitors drinking nothing but tea, and very good tea, as part of the "cure." Here in 1891, we were flatly told by one of the largest dealers there was no such thing as "Ceylon tea" and he was very much astonished when we promptly produced a sample. This, however, he tested and welcomed as representing a new and good tea. We quite agree with Mr. Ryan that an effort should be made to secure a reduction of duty both in Austria and Russia—the German standard of 6d being taken as a model in the first instance—and also to disseminate useful information on the subject of Ceylon tea.

## TALIPOTS IN BLOOM.

Frequent mentions in the press of talipots in flower to be seen upcountry just now, led me to keep a careful watch on my journey up lately, and to count accurately the number visible from the line. There were 20 in all, between Rambukkana and Kadugannawa. The first is on the right immediately after quitting Rambukkana station—a magnificent head of bloom. Nos. 2 and 3 follow soon after on the same side but further out. Then on the left we see Nos. 4 and 5 not far apart. Next come a group of five, comparatively close together, but far away from the line. Then on the right again No. 11 comes in view deep down in a hollow, but towering well above the surrounding trees, and standing out finely against the dark ground-work of green. No. 12 is nearer to the railway. No. 13 appears deep down in the valley; then five more away across the river, picture-quely grouped on rising ground, and at our feet No. 19 on the river-bank is soon outlined—a mass of golden white—against the brown flood. Darkness was gathering, but a glimpse of No. 20, also on low ground, was obtained ere we turned the last corner up to Peradeniya.—*Com.*

## THE VOGAN TEA COMPANY.

## PLUMBAGO MINING.

An extraordinary general meeting of the shareholders of the Vogan Tea Company of Ceylon, Ltd., was held on the 26th Nov. in the offices of the agents and secretaries Messrs. Lee, Hedges & Co., to consider a proposal to authorise the directors to spend money in working and mining plumbago. Mr. W. B. Kingsbury occupied the chair and the others present were: the Hon. W. W. Mitchell, Col. McComb (by his attorney Mr. Shattock), Messrs. E. M. Shattock, J. McAnish, G. E. Woodman, F. Liesching, Henry Bois by his attorney H. G. Bois, C. E. Haslop, Capt. Whitley, W. Lawrence, C. Link, Percy Bois, G. W. Sulren, R. Davidson, W. E. Mitchell and A. J. G. Field representing the agents and secretaries, and Mrs. M. E. Bois by her attorney Mr. Percy Bois. Proxies were received in favour of Mr. E. M. Shattock from Mrs. L. H. Deaker, in favour of Mr. G. E. Woodman from Capt. Rutherford and Mr. C. M. Buckworth; in favour of the Hon. W. W. Mitchell from Messrs. M. J. Alderson, P. C. du S. Leather, R. W. Harrison, C. Ross Wright, C. Healy and E. B. Creasy and Sir A. Murray; in favour of Mr. J. McAnish from Messrs. W. C. Gowans, W. Finlayson, and J. C. Bell; in favour of Mr. W. B. Kingsbury, from Messrs. Thos. Moore, John Emerson, A. L. Kirk, R. C. Wright, E. C. Ebert, W. P. Metcalfe, A. Bethune, E. Bowder Smith, F. G. A. Lane, N. Orchard, C. Davidson and J. Dorman, J. E. Dunlop, W. L. Tisdall, F. C. Radcliffe, A. F. White, W. Moir, V. A. Julius, M. Lynam, S. E. James, C. F. H. L. Liesching, J. M. Layard, A. Leighton, C. J. Jones, and J. K. Foster Mellior Miss L. E. Mayes and Mary C. Layard.

The notice convening the meeting was read.

## THE CHAIRMAN'S SPEECH.

The Chairman said—Gentlemen I have no doubt that you have all perused Mr. Feilding's report which has now been in your hands for some time. I think it should be borne in mind that very little prospecting work has been done hitherto so that it must be rather a difficult matter for him to give more than a general opinion of what he considered your pros-

pects were as regards plumbago; but your directors thought it advisable to invite him to visit Iddagodde, prior to this meeting so as to place before the shareholders an English mining expert's report and that he might advise them what course they should adopt in future operations should you sanction the small outlay asked for in the motion before you today. The results so far, from a pecuniary point of view, have been exceedingly encouraging—far more so than we ever anticipated. We have obtained between 6 and 7 tons of plumbago of the value of between R300 and R1,000 for an expenditure of about R2,300 but I wish to impress upon you that the real object for which we ask R5,000 is prospecting and you must not be disappointed if we do not go on obtaining the same proportion of the mineral as we have done hitherto. What we propose to do is to follow the lines sketched out in Mr. Feilding's report, that is, to sink our present shaft and the proposed one near the northern boundary till we get down to solid country, and let the result decide our future action. Whatever we do we shall work on a European system, not on a native one which both Capt. Tregay and Mr. Feilding condemn in the highest degree. From what I have heard from one or two shareholders who are

## AGAINST FURTHER PROSPECTING

their objections appeared to be three in number. One is that no Europeans have been known to make money out of plumbago mining hitherto, and therefore they can never do so. The second is mining on principle, and the third, the fear that as soon as this R5,000 is spent you will be asked to vote further sums of money. Now as regards No. 1 there is a superstition amongst the white population of Ceylon that no Europeans can mine plumbago at a profit, and the origin of this superstition is derived from one fact only—that no European with sufficient capital and sufficient knowledge of mining has ever gone in for it. Now things are altered and I happen to know of more than one instance where plumbago is now being mined by Europeans at a profit, and I have permission to mention Moran-kande and Springwood are two places where the results so far have been highly satisfactory. As regards saddling the shareholders with

## FURTHER EXPENDITURE.

and the objection to mining on principle as we are a Tea Company, I can most emphatically assure you that your directors have no intention whatever of asking for further money, but they do think that we are more likely to be offered better terms by others who might be inclined to lease or purchase our land if by spending a certain sum of money, we are able to show actual proof of the existence of plumbago than we should do if we sat still and took no interest in the matter. I think there is no doubt that European capitalists at any rate would be more likely to approach owners of mines which have been worked on a scientific principle than of those where there is no system whatever.

## OUR MAIN OBJECT

therefore is to prospect and to endeavour to make our properties more valuable from a mining point of view. We have no intention of mining in the ordinary sense of the term, although we would most certainly take out as much plumbago as we could consistent with systematic and proper development.

The Hon. W. W. MITCHELL.—I cannot say, sir, that I have very much to add to what I stated at last meeting beyond this,

that I have received proxies from seven gentlemen, and I need hardly say altogether unsolicited by me, and it is only right that I should express their views as I have been asked to do so. But before referring to their letters I would just allude to the

#### REPORT OF THE EXPERT,

Mr. Feilding, and remark upon it, that it does not appear to me to be a very satisfactory document, or a very encouraging document I may call it. I would refer to two passages in it. One is—"Water will be the great difficulty to contend with in opening up these veins. It is already very troublesome, but will not always be so much as now, when a great deal of surface water from the recent abnormal rains is finding its way into the workings. With regard to future development I cannot too strongly warn you against native methods of mining, as being uneconomical and, from every point, of view, bad." Then in the last paragraph he says "all the work at present being carried on should be discontinued."

#### OTHER SHAREHOLDERS' VIEWS.

With reference to the letters of the gentlemen who have sent me their proxies I would like to say that Mr. Henly of Amba Tenne, Kalutara says "from what I have heard locally there is a great deal of water in the present pit, and if operations are extended much further, expensive pumping will probably be required. Mr. Alderson of Clyde estate, Kalutara, asks for a full statement of the expenditure up to date, and "on what authority has the directors voted monies for the mining of minerals when the articles of Association of that Company grant them no power whatever." That, however, has been ascertained by the directors and I understand that a resolution will be brought forward today to deal with the matter. Mr. Ross Wright of Hatherleigh, Rakwana writes to me—"Reading what you said at the last meeting I quite agree with you. I have had a deal of experience from time to time in plumbago mining for which enterprize there is plenty of scope in Rakwana district, and have long ago come to the conclusion that it is a very great risk, and have now adopted the better plan, and certainly the safer, of leasing out the mining rights, securing one-fifth or one-eighth as the case may be as royalty for the estate or parties concerned of all plumbago land, thus securing a sure profit without any expense. Of course any damage done to property is made good by the lessee or lessors." Mr. Harrison of Culloden says:—"I am most strongly against the work being done on estate account. Even if the miners find a good vein, they will at once proceed to cover it up, and after a time when operations have been stopped a Sinhalese will offer to prospect on his own account and reap the benefit of all the money that has been previously spent. Plenty of experienced miners are prepared to lease the pit now, giving one fifth of all plumbago found to the estate. This surely is the better way to work it." Mr. E. B. Creasy writes:—"I quite agree with the views you expressed at the last meeting with regard to plumbago mining. The mine should, in my opinion either be leased to a native under suitable terms or if worked by the Company, it should be with a special capital raised from such of the shareholders as might care to subscribe. On no account should any of the revenue derived from tea be used for mining purposes." These are the remarks of the different shareholders who have sent their proxies to me.

#### HARD-EARNED EXPERIENCE.

There is only one other remark I won't like to make and that is with regard to what the Chairman said in his opening speech to the effect that objections have been taken to mining by Europeans. He referred to it as a superstition that was abroad that mining on the part of Europeans cannot be attended with success. In reply to that I would only say that it is anything but a superstition; it is the result of hard-earned and dearly bought experience. I would move the resolution which I brought forward at the last meeting, namely, "that the action of the Board of Directors be confirmed in what they have done in searching for plumbago and that the pit now be leased to others if further working is thought desirable."

The CHAIRMAN seconded as proxy for Mr. J. K. Foster Mellior.

#### CAPT. TREGAY'S OPINION.

Mr. G. W. SCHRENK said he had to put before them a letter which he had received on the subject from Capt. Tregay. He began his letter with some personal remarks on the speech made by Mr. Mitchell at the last meeting, but he would not refer to these. Capt. Tregay said:—"It was rather a sweeping remark for Mr. Mitchell to make that he had never known a European to make anything out of plumbago mining. A number of people in Ceylon have the opinion that none but natives can work plumbago successfully and apparently for no other reason than that it was attempted by a few planters without any knowledge of mining to guide them and because they, as might have been expected, made a hash of it, people jump to the conclusion that plumbago mining can only be conducted by natives. That this opinion should prevail amongst the natives themselves one can very well understand, but that Europeans and Englishmen at that, should harbour such an opinion is beyond me to comprehend. A mine, no matter what the mineral may be, to be worked economically and safely must be opened up in a scientific manner, and this can only be done by those possessing a full knowledge of the business namely, mining engineers, and whoever attempts to do the work without this knowledge and experience is bound to come to grief sooner or later, generally sooner. As regards the native miner, what I have seen of him has shown me that he knows very little about mining and has no knowledge whatever how a mine should be opened out. The native method of working is slow and most expensive and I do not know how better to express myself than by saying that they begin everything at the wrong end. I was very much amused when I first started to open up a mine. Most of the men I had with me had previously worked in the neighbouring pits and called themselves miners of course. They one and all condemned my method of opening up a mine and all offered me advice which for obvious reasons I did not take as you may suppose. They do not offer it now. As I said before if you choose at the next meeting of the Vogan Company to quote Morankande as an example of European enterprise in plumbago, I have no objection and if there is anything in this letter worth quoting you are at liberty to make use of it." That he thought was a very encouraging letter. No doubt he was a man who had had money at his back to work the mine and although it could not be so very much that he had spent in one year yet he

had recovered all he had put in and had got something to go upon. In his (Mr. Sahren's) opinion the Rs. 5,000 asked for was very little for the Vogin Company; it might amount to  $\frac{1}{4}$  per cent dividend they would have to forego and that was not very much. Then they had to think of the advantage they would get if they could show that there was plumbago to work, that there was something to sell when they wanted to sell, and for their Rs. 5,000 they might get a lakh. It was not that the Rs. 5,000 would develop the mine properly, but they might prospect and show what there was to sell, and on that account they would certainly vote for the Rs. 5,000 being given to the directors.

#### AN EXPLANATION.

The CHAIRMAN, with reference to what Mr. Mitchell had said about the last paragraph in Mr. Feilding's report said that the reason he suggested they should stop the work was that they were more or less working on native methods which as he said before they would not do any longer. He also could read to them about thirty letters. He had 24 proxies in favour of the motion besides a lot of other proxies which were not, for various reasons, of any use, and it might take up the time of the meeting too long if he were to read them all. He could not say whether it was due to their having opened this mine, but he might mention that prior to their beginning the work there, there was some talk of their getting a sixth or something like that from a native to lease it. That morning he was informed that they had been offered one third. Whether that had anything to do with the opening of the mine so that the natives could see what was in it he would leave them to judge.

Mr. H. G. BOIS said his opinion did not quite coincide with Mr. Mitchell's—indeed it was diametrically opposed to it. The letter which Mr. Sahren had read was a most interesting one and he entirely agreed with the remarks of Mr. Sahren. If the Company were asked to put out a very large sum he would not approve of it, but it was not a very large amount that was asked and he thought they would be neglecting their resources if they did not develop them to the extent of this particular sum. He moved that the directors be authorised to spend from time to time moneys in the working and winning of plumbago provided that the moneys due on this account to the Company, after crediting proceeds by sale of any plumbago, shall not exceed Rs. 5,000.

Mr. PERCY BOIS seconded.

The amendment was then put to the meeting and was declared carried by 42 to 10, these proxies including 31 in favour of and 9 against the amendment.

#### ALTERATION OF MEMORANDUM OF ASSOCIATION.

The next proposal on the agenda was that the memorandum of Association of the Company be altered by the addition of the following clause:—  
"To mine, search for, work, win, and dig for plumbago or other minerals and to sale and realise the same, or to let or lease land or mines for working and winning plumbago and other minerals and to carry on the business of mines and mineral workers in all its branches."

The CHAIRMAN said the reason they asked that the memorandum should be altered was that the articles were somewhat ambiguous. Some people seemed to think that they could mine and others that they could not. To be on the safe side they thought it better to insert the clause proposed.

Mr. H. G. BOIS proposed the resolution.

Mr. SAHREN seconded.

The resolution was carried on a show of hands by 12 to 1. The proxies in favour of it were 32 and 7 against.

This was all the business.

It was agreed that the confirmatory meeting should be held this day three weeks.

#### TEA PRODUCTION AND COST

Attached to the first annual Report of the Directors of the "Ceylon and Indian Planters' Association, Limited," which, by the way, so far seems to include only four well-known Ceylon estates, is a table of "analysis of cost f.o.b. Colombo," which cannot fail to command attention. Except in the case of the "Ceylon Tea Plantations Company," we do not think such full details have ever been made public before by any Company's Directors. It is not simply that there is an analysis of the year's working so far as crop, acreage, cost per lb. "mumre included," average rate of exchange, yield, profit, estimates, &c. are concerned; but that the details of expenditure for each property is given in cents per lb. of tea manufactured. This latter analysis is a guide to tea planting in the present day of the most practical and reliable kind as regards the districts represented. "Plucking and Baskets" represent the largest proportion of the cost and varies from 10.65 cents per lb. on St. Andrews to 11.96 cents Maha Eliya; manufacture, plucking, &c., goes from 3.55 cents on Laxapana to 4.75 cents on Kandaloya; while weeding shows so wide a discrepancy as 2.42 cents on Maha Eliya and no less than 5.44 cents on Kandaloya. The total cost per lb. of made tea runs from 29.61 and 29.65 cents on Laxapana and St. Andrews respectively (in the same district and close together) to 31.91 cents for Maha Eliya and 33.33 cents on Kandaloya. The profits per acre were highest (£3 11s. 8d.) for Maha Eliya in Upper Dimbula; next £2 10s. 3d. and £1 17s. 7d. respectively for Laxapana and St. Andrews in Muskeliya; while Kandaloya lower down in Yakkessa only netted a profit of 10s. 5d. per acre. Evidently the last-mentioned estate must have suffered from the prolonged drought, for against an estimate of 191,000 lb. only 134,352 lb. of tea were made. All four estates indeed were short of estimate; the total of the Company's crops being 625,141 lb. instead of 755,000 lb. estimated. The detailed figures have no doubt been supplied by the experienced General Manager and Visiting Agent, Mr. George Greig and the Directors and Shareholders' interests could not be in safer hands.

NEW FRUIT TREE.—A new fruit tree is described by Andree in the *Revue Horticole*. The name of the plant is *Feijoa sellowiana*. It is indigenous in La Plata, South America, but also thrives in Southern France. The tree which blossomed and bore fruit in Andree's garden attained a height of 3½ metres, and had the form of a shrub. The fruit is an oblong, egg-shaped berry, four to six centimetres long and three to five centimetres wide, retaining its colour even in the ripe condition. The meat of the fruit is firm, of white colour and sweet taste, containing much juice, and giving off an extremely agreeable and penetrating odour. The flavour is said to remind one of the pineapple.—*Public Opinion*.

THE CEYLON LAND PRODUCE  
AND CO., LD.

Deserves a special word of editorial commendation in this year of general depression for the handsome way in which its tea, cacao and coffee, under good management in Ceylon and at home, have kept up the splendid dividends of the past few years. This time, apart from the 6 per cent guaranteed to Preference Shareholders, there is no abatement in the 15 per cent and 5 per cent bonus usually given to the ordinary shareholders. We congratulate all concerned and especially the Directors and Ceylon Estate Managers, on so good a result in this year of high exchange and low prices.

The sheet of statistics for nine years furnished by the Directors is extremely interesting: it shows their crops of tea have risen from 354,842 lb. in 1890 to 753,151 lb. in 1898, the average per acre improving from 314 to 460 lb.; but the average price fell from 9'46d to about 6'25d. In cocoa the fall is about the same from 95s 11d to 66s 7d per cwt. on an average, the crops increasing from 1,224 cwt. to 2,523 cwt. and thereby enabling the splendid dividends to be kept up.

THE COMING VEHICLE FOR  
CEYLON:—TONGAS.

This is the Indian *tonga*, a two-wheeled carriage peculiarly fitted for service on hilly or rough roads and with restive bullocks or horses. Mr. Rudolf, a native of Aberdeen and a world-wide traveller, is at present upcountry paying his annual visit to Ceylon. He comes on this occasion from Toronto last, where, I may mention in passing, he saw the elsewhere, familiar advertisement of "Cey on tea" becoming general. Mr. Rudolf has travelled a good deal in India, and having seen these vehicles used largely in Government service to and from the hill-station of Simla, and noticed how badly in need we are in this island of some such conveyance, he is of opinion that their introduction into Ceylon would prove a great public boon. The weight of (and in) the vehicle can be regulated, according as the course is up or down-hill, by means of a screw, and the animals are yoked in with such security that their wildest antics cause comparatively little annoyance. For fuller details of this Indian cart I must refer you to Mr. Rudolf himself who hopes to call when he arrives in Colombo two or three days hence. The idea of getting such a vehicle introduced here was borne in upon him very strongly when he noticed how heavy, unwieldy, badly balanced and full of jolts is the ordinary hired carriage that residents in, and visitors to, the island have hitherto had to put up with.—*Com.*

**SUNFLOWER.**—The percentage of oil in the Russian sunflower ranges from 16 to 28 per cent. On the average about 12 per cent of oil can be extracted by expression cold after crushing the seed. This is the highest quality of oil, and any additional amount that might be extracted by steaming would be lower grade. It is estimated that 50 bushels of seed may be harvested to the acre, and roughly the yield would be about a gallon of oil to a bushel of seed. These are foreign figures, where the crop is grown for the oil.—*Oil, Paint and Drug Reporter.*

AMSTERDAM BARK AND QUININE  
MARKET.

Our Amsterdam representative wires us that the result of the bark auctions in Amsterdam this week was an advance of '62 cents in the unit, the average unit working out at 4'67 Dutch cents per half-kilo (rather under 17-20d per lb) against 4'05 at the last auctions. A very satisfactory feature again was the small amount bought in. The lowest price for *Manufacturer's* bark was 63½ cents and the highest 45 cents, and the lowest for *Druggists'* was 8½ cents and the highest 99 cents. The tone of the market was firm. Out of 7,181 packages offered, 6,724 sold.—*B. and C. Chemist, Nov. 4.*

CEYLON FISHING CLUB.  
ANNUAL GENERAL MEETING.

The annual meeting of the above Club was held at the Hill Club at 2 p.m. on the 26th Nov. when the following were present:—Messrs. Ross Clarke, C. H. Bagot, North C. Davidson, Maitland, Turner, W. L. Murray-Menzies, H. V. Masefield, J. M. Purdon, F. G. Saunter and S. M. Burrows.

The annual Report was read and passed.

Proposed by Mr. MASEFIELD and seconded by Mr. BAGOT:—"That not less than 75 per cent be reared in small stew ponds: Messrs. Bagot, Ross Clarke, J. M. Purdon and Maitland undertake to make small stew ponds."

Resolved:—"That Messrs. Andrews be asked to send 25 per cent of rainbow trout ova, the total bill not to exceed £60 and a special shipment of these trout to be sent."

Proposed by Mr. TURNER and seconded by Mr. BAGOT:—"That the close season next year commence on October 1st and end on March 1st."—Carried.

Resolved:—"That the attention of members be earnestly invited to the fact that there is a record book at each of the Hotels and at the Club, in Nuwara Eliya and at the Horton Plains, and members are requested either to enter their catches in the books or to send a list monthly to the Honorary Secretary for entry."

Proposed by Mr. BAGOT and seconded by Mr. MAITLAND:—"That the Board of Improvement be requested to revert to the old arrangement and close Lake Gregory for carp fishing during the trout close season."

ANNUAL REPORT, CEYLON FISHING CLUB  
NOVEMBER, 1898.

MEETINGS.

The last annual Report was read at the general meeting held in November 1897; and after that date two meetings were held; one on February 22nd 1898, at which it was resolved that the Committee should be empowered to "fence" streams in charge of the Club, and that a sanctuary be formed on the Horton Plains; and one on April 9th 1898, at which arrangements were made for the distribution of the available fry.

FINANCE.

The financial position of the Club continues to be quite satisfactory; and, after paying all liabilities, the certified balance to our credit on Oct 31st (when our financial year closes) was R941 79. In spite of "low prices and high exchange the interest taken in the Fishing Club continues steady and encouraging. The subscriptions of members during the year amounted to R51; as against R780 in 1897; while licenses brought in R1268 50, as against R1885 for the preceding year, Eleven new

members were admitted during the year. This of course shows a decrease under both heads, but only perhaps what was to be expected in hard times.

#### THE OUTTURN OF OVA.

A glance at the last report will show what a tale of disaster it was then necessary to unfold under this head. This year was marked by a similarly disastrous commencement, and a successful finish. Messrs Andrews asked leave to try a new method of transporting ova—in an air-tight case; promising to pay for the eggs if the trial was unsatisfactory. The case duly arrived early in January, and was transported from Colombo with great care and promptness by Mr. Elhart. I opened it here with breathless interest, only to be met by an uncompromising mass of corruption. Eyes and nose agreed that the experiment was an utter failure. Luckily 40,000 ova had been ordered in addition, to arrive in two batches. The first batch came by the "Golconda" about the middle of January; as soon as they were opened, it was plain that insufficient care had been taken of them on boardship, and decay had already begun to spread through the trays. It was entirely, due to the unremitting care and skill of Mr. Elhart and his assistant, that even a portion of the eggs were saved, and 1,500 fry eventually hatched out. The second of the two batches came by the N. D. L. "Gera" and went to prove the tantalising fact that, if only proper care is taken, carriage ages need do very little harm to ova. It was evident on unpacking the boxes that they had not been disturbed, by tilting over and rough handling, and that they had been regularly iced. This is all we ask, and we hope to secure it by employing the German line, and by a largely increased fee (R100) to the Steward, to be paid on the return voyage of the ship. We are quite content that our ova should be partly "made in Germany" if they turn out as well as these did. They were in remarkably good condition, and we hatched out over 10,000 fry—perhaps the best result ever obtained. The fry were distributed as follows:—

3000 to Nuwara Eliya streams
3343 to Horton Plains
1100 to Pattipola Gorge and Dimbula
800 to Sita Eliya and Elk Plains
400 to Maskeliya streams
500 to Bopataloya
490 to Lower Kurunduoya
1300 to
200 to Nuwara Eliya Stew Ponds

11043

The thanks of the Club are due to Messrs. Bagot, R. Jackson, J. Fraser, Lyall and Cnff for supervising the distribution to several of the above streams. Good accounts have been received from Messrs. Jackson and Bagot of the progress of the fry.

#### THE FISHING DURING 1898.

The fishing during the year has been decidedly poor. One record is annexed which, as compared with the record sent by the same gentleman last year and published in appendix 1, of last year's report, is certainly inferior; while other members have written to lament diminished takes. This was only to be expected considering how very few fry were put in in 1896 and 1897; but it may fairly be hoped that this year a more bountiful supply will greatly improve affairs. Moreover the extraordinary drought in June, July and part of August militated strongly against successful fishing. I do not believe that many fish are poached now. The keeper goes round all the Nuwara Eliya waters daily;

and the doubling of the cost of carp licenses has had the desired effect: only those people take them out who really fish for sport; and the crowd of dubious sportsmen, with carp rds and poaching instincts, has disappeared. No doubt the otters do a great deal of harm, but war has been declared upon them, not without good results. Four large ones have been trapped in the Lake within the last month, and Mr. Grimlinton also shot a fine specimen. Five traps are now constantly set, and would do better business if they could be set on the land, but this would be very dangerous for dogs and children. A very fine trout weighing 9 lb. 10 oz. was caught in Nuwara Eliya by Mr. H. V. Masfield, while it was being hotly pursued by an equally fine otter.

#### STEW PONDS.

It is a much debated question whether Stew ponds should be used (1) universally, or (2) partially, or (3) not at all. In 1896, H.E. the Governor kindly allowed us to make use of one of his fine ponds for the purpose. It was prepared at considerable expense, gravelled and fenced off, and all big fish removed. One hundred fry were put into it in March 1897, and it was netted in January 1898. Not a sign of a trout was to be found. We took out a great many larvae of dragon flies; and Mr. E. E. Green (Hon. Entomologist to Government) who was with me, was of opinion that any one of these was big enough to swallow fry. It is obviously no use hatching trout to feed dragon flies. On the other hand the fry put into the very small pond behind the hatchery, and into the pond at St. Leonard's by Mr. Bagot, appear to be doing well. The difficulty is to discover the subsequent history of the fry put direct into the streams; and this can only be done if fishermen are good enough to observe, and record their observations. I am myself in favour of making more small stew ponds, and putting into them at least half of the fry hatched out. But it is a matter to be decided by more competent trout specialists than myself. It is evident that by the present method the loss of fry is enormous. On the other hand it may be interesting to note the exact result of the experiment in the small stew pond at the hatchery. Two hundred fry were put in about the middle of April. The pond was emptied today (November 19) in my presence; and 43 fish were taken out. This represents a loss of  $\frac{3}{4}$ , but on the other hand the fish taken out were remarkably strong and well grown, measuring from four to five inches and full of go. They were at once put into the Nuwara Eliya stream and not one died in transit. The pond is most carefully wired in so that otters can have had no share in the loss. It would thus appear that if in a very favourable year, we hatched out 20,000 fry, we might under the small stew pond system, expect to put 5,000 fine young fish into the various waters. It is for members to say whether it is better than the uncertain results of the present system.

#### SPAWNING.

There is still no certain evidence whether trout are yet breeding in our waters or not. There is certainly any quantity of spawns in the females and a curious deficiency of milt in the males. One member writes that he has seen what he is certain must be locally-bred fish; and I myself have seen suspicious looking pairs lying together in shady pools up the Elk Plain streams. The direct evidence goes no further; and failing the advent of that person whom we all pray for—a leisured man with past experience and with time

to observe and report—we must be content for the present with hope and importation.

SUBJECTS OF GENERAL INTEREST.

I am anxious to extend the operations of the C.F.C. in one or two directions.

(1) I think a further effort should be made to import "Gourami" into Ceylon. I have ventured to add, in an appendix, an interesting letter signed "C.D.," which appeared in the *Observer* on the subject of this fish, and is a sufficient testimony to its value. The last experiment failed because the imported fish (which arrived quite safely from Mauritius) were all brought up to Nuwara Eliya, where the climate is too cold for them, and they all died the first night. I am in correspondence with Messrs Scott & Co. of Mauritius and Messrs. Bois Brothers, agents of the British India Company, and if they are kind enough to help, I will ask the Club on a later occasion for a vote.

(2) With the help of Mr. F. G. Saunder, I have made out from that valuable book "Tank Angling in India," a list of fish procurable locally which are likely to afford good sport and good eating if introduced into tanks. I am employing my headmen to collect as many varieties as possible from the rivers of this district, and propose to put them into Barrack Plains reservoir, the large pond at Queen's Cottage (kindly lent us by H.E. the Governor) and the various other ponds in the place. If this succeeds the next step will be to import yet more varieties from India. Mr. Saunder's letter and list, which will be found appended to this report, will, I am sure, be read with interest.

(3) The importation of trout ova from New Zealand would, I am certain, be worth trying. They have had there the same difficulties about spawning as we have had, and have overcome them, and it is quite possible that the ova of these acclimatised trout would do better here than those imported from England. I am not without hope that, by means of certain influential aid in the matter, I may be able to obtain a consignment.

(4) Mr. George Fowler suggests that it would be well worth while to try and import May-fly larvæ. It is quite certain that the very large trout in our lakes and streams here are sluggish and do not rise freely to flies, either, because their fancy fly is absent, or because they get an abundance of food at the bottom. It may be that the presence of May-flies on the water would get them out of these bad and unsportsman-like habits; so I have asked Messrs. Andrews to send out a consignment of May-fly larvæ with the first lot of trout ova; and I am sure the Club will join with me in wishing success to the corrective diet.

(5) As to the migration of fish, Mr. George Fowler writes:—"When at Bilihuloya, I heard that a villager had caught a trout of about 1 lb. weight down below the road. It must have been washed down the river, descending about 6,000 feet in a very short distance.

(6) I have also, on the suggestion of Mr. Dew, asked Messrs. Andrews to send out a consignment of grayling to be sent to us with the first or second consignment of ova. There seems to be every probability that they will do well in these waters, and the experiment will be well worth trying.

As this is probably the last report I shall have the honour of laying before the Club, I may perhaps express my regret that its management has not fallen into more experienced hands than my own, and at the same time say what pleasure it

has given me to be even of the slightest use to such a sporting institution as the Ceylon Fishing Club.  
(Signed) S. M. BURROWS,  
Hony. Secretary.

APPENDICES.

National Bank of India, Ltd. Nuwara Eliya, Nov. 10th 1898.

I certify that the balance standing at credit of the account in the name of Ceylon Fishing Club at the close of business on 31st October at this Bank was R491-79 (say rupees four hundred and ninety one and cents seventy-nine.—Signed, J. D. MURRAY, Agent.  
Nuwara Eliya, 2nd October.

The Hony. Secretary, re-Ceylon Fishing Club, Nuwara Eliya.

RE-STOCKING THE NUWARA ELIYA LAKES WITH FISH.

DEAR SIR,—Referring to our conversation on the above subject, I find the method of stocking tanks etc., with fish, recommended in "Tank Angling in India" to be as follows:—

Fresh water fish in the tropics are highly migratory—it is as fry that they migrate, either in search of food or to escape their natural enemies. This instinct drives them to leave the rivers and tanks and to ascend the smaller streams where they too often fall victims to the native fisherman's basket work traps or "cruiaves."

It is there then the fry can be obtained for stocking purposes—at a cost in India of eight annas per 1000. The usual method of transport is to place the fry in round earthenware chatties fixed to a "pingo" the mouth of the pot being covered by a net of fine mesh; (a cloth should not be used as this keeps out the necessary circulation of air), the oscillation of the pots keeps the water in motion and thus renews the supply of oxygen to the water without which the fish would be asphyxiated. The open net also allows occasional inspection of the fry. This is necessary as dead fry should be removed immediately to prevent the water from being contaminated. Fry of several food varieties of fish are obtainable in Ceylon, and no doubt could be obtained through the good offices of headmen in the low-country.

Information as to getting other kinds of fry from India would doubtless be willingly accorded by the Hony. Secretary. "Rod in India" Club, Madras.

In this connection I may state that the author of "Tank Angling in India" sent Mahseer fry to Nuwara Eliya from 527 miles beyond Madras, and out of 21 fry shipped, 19 arrived well and vigorous. They being fed on Mosquito larvæ.

I append list of fresh water fishes to be found either in India or Ceylon suitable for stocking purposes.—I am, dear sir, yours faithfully, F G SAUNDER.

P.S.—It is obvious that fishes having Sinhalese names are to be found in Ceylon, and very possibly the others whose Sinhalese names I have been unable to find out. It would be wise in introducing the larger varieties of fish to also include any small varieties, such as food for the trout that may be procurable

LIST OF FRESH WATER FISH SUITABLE FOR STOCKING PURPOSES.

Scientific name.	Tamil.	Sinhalese.	Remarks.
Labeo (several varieties)	Shaalcandai	Petiya	Grows to 3 feet in length and averages 5 to 20 lb. weight.
Cirrhina cirrhosa (white carp)	Vencandai	?	Grows to 1½ feet in length; a very active fish and good eating—an allied species "Cirrhina mrigala" runs up to 18 lb. wt.
Barbus chrysopoma (Olive Carp)	Thanicandai	Kendeya	
Barbus carnaticus (Carnatic Carp)	Pooree or Saalcandai	?	Attains at least 25 lb. in weight has been introduced into the Ootacamund Lake.

(Continued.)

FRESH WATER FISH.—(Continued.)

Barbus hexatichus	Candai	Kendaya	Grows to 3 feet in length, common in Ceylon.
Barilins gattensis (River carp)	Aart-candai	?	Kodi-kanal Lake is stocked with these, and 7 dozen have been taken with a fly in one morning.
Barilins bola* (Indian carp)	Maritan candai	?	Runs up to 5 lb., a very game fish and takes the fly well and can also be taken spinning.
Barbus tor* (Mahseer)	Pumeen candai	Lela or Lel-Kuriya	These are already in the Barrack Plains Lake and more should be procured as they are obtainable in Ceylon.
Ophiocephalus strfatus*	Veralu	Lula	Attains to 3 feet, will take a salmon-fly, can be procured in Ceylon, as also the allied species "Ophiocephalus gachua"* called "Kanaya" by the Sinhalese.
Callichrous bimaculatus (Butter fish)	Chota or Chelawahla	Vala-potta	Runs to 1½ foot and 5 lb. weight.
Etrophlus suratensis	Karssar or Pilliuchan	Koraliya	Runs to 2 lb., good to eat.
Gobius giurid* (Indian Gudgeon)	Uluway	Weligouwa	Grows to 1½ foot and 2 lb. weigh takes bait freely.
Wallago attu*	Vala	Walaya	Attains 6 feet length and is in eating good.
Notpoterus kapirat (Barber's Knife)	Ambutanwahlah	Potubara	Grows to 2 feet and 2 lb. weight.
Megalops cynoides (Big-eye)	Moran candai	Ellaya	Grows to 1½ feet,
Anabas scandens (Climbing perch)	Paunieri	Kavaya	

N.B.—Fishes marked \* are only snitable for the Barrack Plains Lake, as if put into Lake Gregory they might destroy the young trout. F.G.S.

ENGLISH REGISTERS FOR CEYLON LIMITED COMPANIES.

A leading Colombo merchant has brought under our notice the following very forcible and practical article in the *Overland Mail* on a subject which concerns Ceylon quite as much as India and one on which readier action might follow in regard to this Colony than in the case of our big neighbour. The article is as follows:—

ENGLISH REGISTERS FOR INDIAN COMPANIES.

It is difficult to understand what reasonable objection there can be to the proposal for legitimising by statute—either British or Indian—the establishment in the United Kingdom of branch registers of shares in Joint Stock Companies formed in India—with rupee capital. The advantage is obvious enough, and has indeed been recognised in principle in an analogous case by the Statute 46 and 47 Vic. cap. 30, by which, any company registered in the United Kingdom, whose objects comprise the transaction of business in a colony, is authorised to open a branch register of shareholders in that colony. The result is to facilitate transactions in the company's shares with the colony, and avoid the inconvenience of having to wait for weeks until transfers can be registered at the head office in London. It has been pointed out that a very much larger business could be transacted in Indian shares were registries opened in Great Britain and quotations obtained on the Stock Exchange. At the India Office the opposition to this proposal, which is strongly backed by the Bengal Chamber of Commerce and no doubt would be supported by the commercial community throughout India, seems to be based on some crude notion that it is inconsistent with the much-cherished object of raising money locally for railway and other schemes. Why these companies should be tied down to mere local investors the cleverest financial head in the India Office would find difficult to make good against any decent financial opinion outside. Most men of business, we fancy, would say that local investments would be rather stimulated than discouraged by bringing in the help and competition of outside capital. We are not quite sure that the end desired by the Bengal Chamber of Commerce could be effectively attained by legislation in India, for, as has been pointed out in a correspondence with the Indian Government on the subject, while the Indian Government might give powers to Joint Stock Companies for the opening of branch registers, no Indian enactment could give power to the Courts in the United Kingdom to recognise branch registers in the way in which registers in India are recognised by the Indian Courts. We imagine, however, that the difficulty could be got over by legislation in Parliament. In any case, the Secretary of State might well consider whether it would not be to the advantage of India to give the suggested facilities for transactions in Indian shares in the home market. We need add nothing to the above on the practical advantages of having English registers for Ceylon Companies. But we would ask if there are objections to the course recommended not apparent to us at present? If not, the sooner Mr. Chamberlain is moved to help us in this matter the better.

## BRAZIL COFFEE NOTES.

The Ger. str. "Belgrano" left for Hamburg yesterday with a record cargo of coffee, from Santos and Rio, of 88,000 bags. This is one of the largest cargoes of coffee ever sent out of the country. Other large cargoes shipped by the steamers of the Hamburg company have been: "S. Paulo" 85,000 bags from Santos exclusively, and "Asuncion," 84,900 bags from Rio and Santos.

*Leslie's Weekly* says that two-thirds of the world's supply of coffee comes from Brazil, and nearly half of the whole supply goes to the United States, where twelve pounds per head of population is consumed annually. The Brazilian export duty of 11 per cent has always been considered prohibitive, but with superior coffee being produced in the Antilles and the Philippines, it is estimated that American enterprise within three years will entirely supply the United States from those sources to the detriment of Brazil.

We are a nation of coffee drinkers, according to the treasury bureau of statistics, which has just issued a report showing that our imports of coffee for the present fiscal year reach 870,514,215 pounds, and that the annual coffee bill for the country for the past ten years has averaged \$87,500,000. We have usually purchased the bulk of our coffee in Brazil, paying chiefly cash instead of goods of our own production, and attention is now called to the fact that in the acquisition of Cuba, Porto Rico and Manila we have secured sufficient coffee growing territory to supply our own wants in this direction.—*Weekly Picayune*, N. Orleans.

## THE INDIAN TEA ASSOCIATION.

## TEA AND STERLING PRICES.

A meeting of the General Committee of this Association was held on the 7th instant, Mr. G. G. Anderson in the chair. There were also present Mr. H. S. Ashton, Mr. A. C. Lawrie, Mr. M. R. Quin, Mr. T. Traill and Mr. W. Warrington.

It was reported the London Association had under consideration the subject of a proposal for the reduction of the present duty on tea, as it was thought that the increase of consumption, on such a step being taken, might have the effect of supporting the prices in London.

The London Committee had before them the resolution of the United Planters' Association of Southern India in favour of a reduction being made, and a Sub-Committee had been formed, consisting of Messrs. W. H. Verner, A. Bryan and C. C. McLeod, to meet the representatives of the Ceylon Association, with a view to discuss the measures to be taken in endeavouring to obtain a reduction on the duty. It appeared that dealers and brokers in the Lane were generally against the total abolition of the duty, but considered that the consumption of all classes of tea would be increased if a reduction in the duty were made.

The Committee had also considered the question of endeavouring to secure the enforcement of a compulsory cess on tea, but were informed that a considerable section of the Indian tea industry were not in favour of this proposal: and until unanimity could be secured, it would be impossible to obtain Government co-operation.

Considered a letter from Mr. W. T. Carter, enclosing copy of a letter addressed by him to the *Englishman* on the subject of "Tea and present low Sterling Prices." Mr. Carter suggested that the merchants of India and Ceylon should combine to supply the retail portion of the trade according to its requirements by placing only a certain quantity of tea on the market every week throughout the twelve months, so as to equalise to some extent offerings at auction and consumption month by month.

In support of this opinion Mr. Carter supplied figures comparing the amounts of tea offered in London and consumed during the year 1896. The

Secretary was instructed to send a copy of Mr. Carter's letter and figures to the London Secretary with the view to an expression of opinion by his Committee as to whether any action in the matter could be taken.—*Madras Mail*.

## THE DISTRICT OF UDUGAMA.

## ELEPHANTS—TEA—PADDY-FIELDS—FORESTS AND TIMBER.

The planting district is situated 24 miles north-east of Galle and 30 miles inland on the left bank of Gindura river. Leaving the railway station, Galle at 11-30 a.m. I travelled by waggon. The whole distance between the 12th and 14th mile stones showed a luxuriant district cultivated with paddy. The distance between the 14th and 16th mile stones consists of a vast forest bordering on the wilds of Maliduwa and Morawak Korale from which elephants migrate from time to time. A rogue elephant is said to be prowling in this forest at present. A she elephant and her baby devastated the paddy fields of Yatalamatta and damaged the tea and coconut plants of Marminadola estate, six months ago, baffling the skill of the European planters of Udugama, whom are well-known sportsmen. The she elephant was shot down by Mahasena, the son of Don Elias Jayasinha, Mndaliyar of Nagoda. The baby elephant which remained by her mother for three hours after her death ran with great vehemence back to the forest from which they migrated when he was convinced that all hopes of raising the mother were gone.

The distance between the 16th and 25th mile stones from a vast track of tea estates irregularly arranged. Tea form the principal product in this district. There are ten extensive estates of which six belong to individual proprietors and four to the Udugama Tea and Timber Company. The latter I understand owns about 3,000 acres of valuable forest land abounding with good timber trees for building purposes as well as par excellence wood for tea chest boards; but no cabinet wood is said to be found except a few nadun trees. The floatable trees of the Private Forests (Company's) are cut down by contractors into logs of convenient lengths so as to enable easy transport by river to the sawing mills at Gintota where they are sawn into scantlings and to other sizes for different purposes. I inspected some of these valuable forests and I think much more could be done by improved modes of felling, logging, hauling and rafting the timber for transport. The villagers of Udugama carry on a trade in boat making, the trees used being tolan, del, and aridda; but I find that there are other kinds suitable for this purpose. The majority of these boats are converted at Galle for fishing boats on the sea.

I learn that there is only one tea estate in the district giving over 500 lb. of tea per acre. Two of the estates of about 250-300 acres in extent are worked exclusively by Sinhalese labour, the villagers settling in the lines on the tea estates. The planters appreciate Sinhalese labour, being cheap without Coast advances and attend to the wants of the laborers carefully. The ruling wages here also are 33 cts. for adults and 25 cts. for women and 1½ cts. per lb. for picking. The extensive paddy fields in Udugama are cultivated both for Yala and Maha harvests. The seed paddy sown here is quite a different kind from the paddy used in the Western Province. Great improvement may be made by the interchanges of the seed paddy as such introduction leads to increase of produce. The mode of cultivation, gathering, reaping and threshing also differ from the methods in the Western and North-Western Provinces where threshing is always done by cattle except when the crop is too scanty, treading the corn while the goiyas turn the straw with flails until all the paddy come out of the ears, while thrashing paddy in Udugama district is done by coolies trampling on the ears of paddy until paddy separates. The coolies are paid 1-12th of the produce for thrashing. The wages for

reaping paddy are four measures (kurumi) and one meal a day per head. The sugar mill at Udugama worked by four pairs of cattle turns out only brown sugar but the sugar mill at Nagoda, ten miles from Udugama which is worked by steam makes refined sugar also.

A STRANGER.

### SPORT.

#### PEAFOWL SHOOTING IN CEYLON,

By J. E. S.

It was one morning in October—a very dry season, the rains being unusually late—that I left my station, Hambantota, in the Southern Province of Ceylon, to ride to my friend L.'s camp, distant about eighteen miles, and situated on the bank of the largest river in the colony, the Mahaveliganga. As usual, my horse-keeper and box-coolie, carrying between them my clothing, guns, ammunition, horse requisites, and other things, packed in the mysterious manner known only to inhabitants of the "gorgeous East," had made an early start at daybreak for the same place. Having allowed them three hours' start, by which time they would have got well over half the distance, I saddled my horse and having filled my game-bag with various little necessaries which had not been taken on by the coolies, I mounted, and set forth at about 8 a.m., followed by my faithful old dog, Mack. Poor old Mack! He died about a year after the trip to be now described, and lies buried in a mangrove swamp near the little station of Chilaw, on the north-western coast. He was a good and game dog, and served me well for many years. Extraordinary though it may sound to English sportsmen, it must be explained that he was a mongrel—a cross between a fox-terrier and a beagle, and in appearance more like the former than the latter—all white, except a brown patch over one ear and one eye. He possessed a rare nose for fur or feather, was an invaluable dog for hare or junglefowl, and was madly in love with the gun. He was, moreover, a plucky fellow; would fight with his own kind or assist in tackling a porcupine, as occasion demanded, and was at the same time an affectionate, faithful friend. Porcupines, barking-deer, and pariah dogs, had all left their marks on old Mack's hide and he looked what he was—a scarred, brave old warrior. Well, this is a digression, but old Mack's memory deserves it. The horse walked, and in places where the jungle path allowed it, cantered along, and the dog followed at his heels, while I smoked many cheroots. After some three and half hours of this kind of progression along the apparently interminable track, we arrived at L.'s camp at high noon. We are not exhausted, for a jungle track is generally shady, and the pace, owing to the roughness of the ground, can never be killing.

L. was in charge of a gang of pioneer coolies engaged on an irrigation scheme. He was ready at his hut to give a hearty welcome to man, horse, and dog, and it was not long before we were all made very comfortable. A swim in the river preceded such a breakfast, as it appears to me nowadays, one can only get in the Ceylon jungle, and, the meal being over, we talked about shooting and determined to go for peafowl that same afternoon. Old Mack, who thought nothing of his eighteen-mile trot, would not hear of being left behind, so, about 3 p.m., we started for some neighbouring "chenas." "Chenas" are portions of forest land which have been cleared for the cultivation of fine grain, and then, after the crop has been taken, abandoned. The ground is only capable of producing one crop, and the wild jungle at once asserts itself, and in the course of a few years such lands are covered with thick scrub, affording the best of cover for game of all sorts, particularly peafowl. It must be understood that we were in a very wild part of the island (in no civilised spots will peafowl ever be found)—a few small hamlets at long intervals, with a very scant native population, being all the evidence of human life to be seen for many miles. L. had

been having some sport with peafowl since his arrival here, and knowing the likelihood, directed the way accordingly. Mack was soon busy on hare, but the scrub was too thick to admit of even snap-shooting, and, as several peafowl rose out of shot, we took the dog up and tramped the first one or two chenass slowly out, employing several men to beat it well, for sometimes peafowl will lie very close. At last five or six peafowl rose all at once, close to us, and we got four barrels into them, each of us getting one hen. One might suppose that a flying peafowl could not be missed. Nor can it be very easily, but it can easily be allowed to get away. To bag peafowl requires very steady, careful shooting. The head and neck alone should be aimed at, and a charge of No. 5 or even No. 7, if properly directed, is quite sufficient to drop a bird dead at 40 yards. It was the largest I have ever killed out of many scores, weighing 12 lb., the usual weight being 7 or 8 lb. They certainly have a suspicion of musk about them, and, in a country like Ceylon, where the filthy musk-rat abounds, this is objectionable, but, if carefully garbaged, they are not bad eating, and I have often been very glad of them. In the course of the morning I collected two brace of jungle-fowl, three large pigeons, one spurfowl, three hares, and a pea-hen. This latter rose out of a chena within fair shot, and flew straight away from me. The two barrels knocked a cloud of feathers out of her, but she held on, apparently little injured. However, after flying some 150 yards she suddenly rose up in the air and toppled over dead. This is the solitary instance of a peafowl towering which has come within my experience.—*Shooting Times and British Sportsman.*

### PRODUCE AND PLANTING.

A WONDERFUL TRANSFORMATION.—The invention of a French engineer, M. Robiu Langlois, is one upon which all interested in the sugar growing industry will be glad to keep an eye. According to *La Nature* it is a simple and inexpensive process for transforming rapidly into cubes or square blocks, possessing absolutely the external appearance and properties of refined sugar, all raw sugars made from cane or beet, hitherto whitened and purified by the methods at present in use in the factories of the world. Under the new process the transformation of raw sugar into refined sugar takes only a few hours, while in the refineries today it requires from fifteen to sixteen days. M. Langlois's invention may have important consequences for the sugar industry, and the development of the process he has discovered will be watched with interest.

PINE APPLE FIBRE.—The Imperial Institute authorities, we learn from an evening paper, are expecting a trial shipment of pine apple fibre from Assam. The rough outer covering of the fruit is the raw material from which this new material is made, and an Assam planter is, we are told, sending over several tons as an experiment. The new material is very like flax, and may supplant other materials in the manufacture of twine, while it can be softened so as to be available for fabrics. Its estimated value is from £20 to £25 a ton. There may be some prospect of a new industry in the province.—*H. & C. Mail*, Nov. 18.

THE JAVA CINCHONA controls the market for this drug the world over—and the efforts of its conscientious experts should not be untold.—*Pioneer.*

QUININE is the chief topic of conversation this week in London (November 10th) in our markets so far as the articles then dealt in concern us. Practically all the makers except the leading English one have ceased selling at last week's prices, but no official advance in the "combination" figures has been made. Cinchona Bark advanced over 1-16d per unit at the London auctions on Tuesday.—*B. & C. Druggist.*

## THE DEPRESSION IN TEA.

TO THE EDITOR OF THE "HOME AND COLONIAL MAIL."

SIR.—The improvement in the manufacture of Indian teas appeals to all having any interest therein.

The general cry at present is the positive and immediate necessity of finding new markets for our teas. Good work has been done in America in this direction, and the outlet is yearly increasing, but not to the extent of making a very appreciable difference to the over supply of the London market. We are at present introducing our ordinary black teas in America, and it has taken a long time to reach the present figure of export to the United States, and it will take many more years yet to wean the Yank from his China and Japan teas.

Instead of insisting on the tea drinking public of America taking our black teas (in fact, they must take them or have no Indian teas) let us make teas that they will drink, and give them something they are used to and been in the habit of drinking; teas, in fact, that assimilate in flavour those they are at present drinking, instead of forcing our (to them) unpalatable teas down their throats, and such teas as require considerable education of palate.

There is an enormous field outside the United States that could be induced to drink Indian teas if they were not so totally different to what the populace have been in the habit of drinking. *Verb. sup.* Let us supply these teas, and in a short period of time millions of pounds of tea will be taken off the London market, and our teas will be demanded where not one pound is now supplied.

I am of opinion we have put too many of our eggs into one basket. There are other enormous markets besides the U.S. which have been entirely neglected. As retail dealers in New York, &c., are advertising and stocking our teas, they might be left to make further developments themselves.

The Continent of Europe, and Russia in particular, is well worthy of attention. Common black teas will have an innings in years to come, no doubt, but to inaugurate the crusade let us introduce teas of a really good quality and flavour, something more than the common teas that flood the home market.

Oolongs and green teas are, to my mind, undoubtedly the teas to meet the requirements of introducing our teas into new countries. To meet this, action should be taken at once to produce these classes of teas. It seems the art of making teas of this kind is more or less a lost one, but a little careful nursing will soon put the intelligent planter in the way of making the right sort. There should be no reason why an expert should not be employed by the association to travel through the tea districts to give instructions and make experiments, and also test teas made and see that the proper kind of tea is produced.

It is astonishing what little is done to divert from the accepted methods of manufacture. We have all got into a certain groove and stick to it. By far the greater number of tea factories have not sufficient machinery to do anything else but to rush their tea through their machines when the leaf is coming into the tea house in large quantities.

The production of Oolongs and green teas in any quantity will, of course, require special machinery for the purpose, as that existing is hardly suitable.

I would suggest the Tea Association form a sub-committee of men really interested to carry out details of a scheme to improve the manufacture of India teas. Companies and larger estates might be asked to undertake to manufacture the first year 5 per cent. of their crop in the way suggested by the committee for the purpose of export to new markets. I am of opinion when these teas of the right sort are sold that the request will not have to be made again, but rather all will be eager to make a tea that sells so well and creates a demand in countries in which heretofore it did not exist. An enormous benefit would accrue to all concerned, as the home market would also be relieved of the ever-increasing supply, and up would go the London prices.

—I am, Sir, yours, &c., TEMPORA MUTANTUR,

## THE INDIAN SUGAR INDUSTRY.

Just as the Nationalist Irish are believers in agrarian outrage and murders, as the best means of drawing attention to the needs of the peasantry, and the dreams and aspirations of the professional agitator in Ireland, so, almost every school of reformers has its own special means of striving to secure attention to its demands. It is comforting to know that the secure running of trains has been very widely ensured without the sacrifice of Bishops; and that Colonial Dependencies of Great Britain have succeeded in having their wants understood before being finally snuffed out of commercial or political existence. It is not that there is not the will at home to help the outlying Dependencies of the Empire; but, too frequently, there is not the requisite knowledge; and when this difficulty is overcome, economic principles which are held sacred by the nation, or political engagements with other States, oppose insuperable obstacles. It is in this way that the West Indian Colonies, whose prosperity hinged on the sugar industry, have been brought to the verge of ruin. Countervailing Duties, or any interference with Free Trade, being prescribed, continental bounty-fed sugar practically commands the market. The only alternative has been direct financial help from the mother country, and that is now being extended in the hope of promoting effective self-help. But we, while watching with sympathy the struggles of far-off sister Crown Colonies against adverse circumstances, and while noting with satisfaction the measures which the Home Government have devised to place the West Indian Colonies again on their legs, have either lost sight of the similar struggles of our big neighbour, or bestowed on them but scant attention.

Recent Indian files have made us acquainted with the action which is being taken by our neighbours, to secure some relief from troubles which seem to be on all-fours with those which have well-nigh ruined the Colonies in the Far West. The Bengal Chamber of Commerce have drawn the attention of the Bengal Government, to the critical position in which the Indian Sugar Industry has been placed by the increasing importations of foreign bounty-fed sugar, and have asked for the adoption of means to protect the industry. In May last, the Government of India had, at the instance of the Chamber, suggested to the Secretary of State the appointment of Mr. E. C. Ozanne of the Bombay Civil Service, as a British Delegate at the Brussels Conference; but the Conference had to dissolve without being able to secure anything in the direction of the removal of bounties, chiefly owing to the attitude of France and Russia. The British Delegates in their Report were able to see only two courses open:—(1) To come to some agreement with all sugar-producing countries, whereby a modification of the French and Russian systems might be adopted by all, in suppression of bounties; (2) To conclude a Convention with the sugar-producing countries that are agreeable, for the total suppression of bounties within their borders, and for either the exclusion of bounty-fed sugar from their markets, or the imposition of countervailing duties. Failing any international negotiations on the lines of the above suggestions, the Chamber ask for countervailing duties without delay, as the sugar industry is being gradually ruined. The importance of the industry is proved by the fact that no less than 2½ million acres are under sugar-cane culti-

vation in India, apart from the extensive acreage under date-sugar cultivation; that the industry gives employment to about two million persons; that it represents an annual turn-over of 12 to 15 crores of rupees; and that the revenue derived by the Government from the land under sugar-cane is about 35 lakhs of rupees. Already a large number of sugar-refineries have been closed in the Jessore District, and the effect of the failure of the Brussels Conference to come to an agreement, and of the imposition by America of countervailing duties, having been to flood the Indian market with bounty-fed sugars to a greater extent than ever before, the remaining refineries may have soon to be closed. The argument that countervailing duties would operate against the consumer, is met by the statement that India is differently situated from England, as refined sugar enters into consumption only among the well-to-do classes, and that the tax which may save an industry in which millions of the poorer classes are engaged, will not be seriously felt by the wealthy.

So far as we are aware, no answer has yet been returned to the representations of the Bengal Chamber, and it is not to be expected that a definite answer is possible in a hurry. Meanwhile, the Government of India have directed all Local Administrations to institute special inquiries, and to report how far the increased importations of sugar have affected the area under cane cultivation, the prices of locally manufactured sugars in the market, the land and canal revenue, etc. The tenor of the inquiries would seem to suggest that the demand for coarse sugars is unaffected, and that it is the refiners and not the growers and manufacturers, of sugar, who are beginning to feel the pinch of increasing importations. That, there has been a growth is indisputable, with the value of imported Austro-Hungarian crystallized sugar increased from R63,582 in 1895-96 to R10,450,000 in 1897-98, and the increase from other protected countries has been in proportion; while Mauritius sorts have fallen off. The outcome of official inquiries will be eagerly looked for.

#### COFFEE IN UVA.

(Communicated.)

At the Pass how it does blow!—the cape of your waterproof is lifted over your head, and the raw cold and drifting mist are twin horrors to the lowcountry man, and the resthouse is not by any means a cheerful place at this season.

The old King Coffee is putting on quite a regal appearance this year at Haputale. Whether it is that the planting of tea through the coffee, where tea was before spurned at, has had any effect, certain it is that the coffee crop this season is remarkably fine—what a wealth of it! Berries clustering everywhere and crowding out each other in all stages of ripeness. "Not expected that the trees will be able to carry it," is what was told me. Is it a new version of the song of the dying swan, which was always sweetest with death in sight? There will be rare times for the coffee thieves! I have heard of stripping coffee in the old days to relieve a heavily-bearing place, though I must say I never knew the man who had the nerve to do it; but when the relief comes in an erratic way—and through the good services of our coloured Aryan brother—well it may save the tree, but it's mighty hard luck for the planter.

The lantana bug is said to be flourishing at Judge's Hill, Badulla—imported from the Peradeniya Gardens, it is reported! It would not take long to spread through the province; and if there is trouble in its track, it will be poor comfort to know that the Principality has to thank the Royal Botanical Gardens for the gift of the blight. We all want a Scientific Agricultural Department, but for other work than scattering fungus broadcast.

#### THE CEYLON HANDBOOK AND DIRECTORY.

The new Ceylon Handbook and Directory for 1898-99, compiled and edited by Messrs. A. M. and J. Ferguson, of Colombo, has grown to be a portly volume of some 1600 pages, full of information regarding Ceylon especially and other countries incidentally. India being so near a neighbour to Ceylon, it is natural that subjects which are of interest to both countries should be compared; for the Handbook is a history and encyclopædia as well as a Directory. Thus, in regard to the tea enterprise, we are told that India and Ceylon together have 840,000 acres under cultivation, while tea is expected to yield 275,000,000 lb. in 1898. The area under tea in India exceeds the Ceylon tea cultivation by only 100,000 acres, the totals being, respectively 470,000 and 370,000 acres. This represents a development of but thirty years in Ceylon, the first ten acres of tea, planted in 1867, having reached a thousand acres in 1875, and 100,000 ten years later. Since 1885 the progress has been phenomenal, and the danger now is over-production. An interesting table shows the "Tea consumption of the World in 1898," amounting to a grand total of over a thousand million pounds, of which China is supposed to consume 400,000,000 lb. and the United Kingdom 240,000,000 lb. a year. There are statistical tables of great value, besides a calendar, containing a chronological table, showing the principal historic and traditional events connected with Ceylon from the earliest times. One page contains a list of upwards of seventy principal Indian stations, with particulars of population, latitude and longitude, height above sea level, mean temperature, etc. It is interesting to note that the recorded mean annual temperatures of Lahore and Poona exactly correspond, though the Punjab capital has far greater extremes of heat and cold than the capital of the Deccan. Darjeeling appears to have the least amount of heat of any of the Indian sanitarium, its mean temperature being only 45° e. The meteorology of Ceylon is fully dealt with, and elaborate statistics of rainfall temperature, etc., are given. Questions of revenue and taxation, railway extension, and harbour works, all find their place, and a closer connection with India is anticipated with the proposed railway by Adam's Bridge. The Directory proper contains upwards of 12,000 names, and includes every inhabitant of any standing in the colony, besides a directory of roads, estates and professions. It is difficult to imagine anything of interest in regard to the Island of Ceylon that has been omitted or forgotten, while a complete index of sixty pages makes it an easy matter to find out facts and figures which must have been compiled with an incredible amount of patient labour and research.—*Statesman*.

#### DEATH FROM HONEY-SEEKING.

Recently a cooly on Cymru Estate, Dimbula, taking advantage of the present season while the *millu* is in its septennial bloom, met his death in the pursuit of honey-seeking. He had climbed a high tree on which a swarm of bees had deposited their honey, and in his eagerness to obtain the luscious prize before him, missed his hold, and falling to the ground was almost instantly killed.

## THE HENERATGODA GARDENS

Are entered by a long avenue of arecas; and just now as you approach the bungalow a delicious scent of cloves meets one. A little bungalow is now put up (as at Hakgala) for visitors who bring their breakfast or lunch, and we can think of no pleasanter way of spending an off-day than by exploring these gardens, which abound in shady trees and great varieties of palms and shrubs.

The 600 rubber trees are specially interesting, and they gave the Gardens a handsome profit last year. A handsome flowering tree with large crimson blossom, the *Spathodia*, is now flowering. —*Cor.*

## PLANTING IN TRAVANCORE.

## GENEROSITY OF THE BIBBY LINE.

The ss. "Cheshire" brought to our shores recently Mr. W. Hendry, formerly a coffee planter in Ceylon, but who of late years has been farming in Scotland. He has accepted an engagement under Messrs. Finlay Muir & Co., and left by the M. M. ss. "Dupleix" for Madras, en route to the estate of which he is to take charge.

Mr. Hendry was one of the passengers, who unfortunately contracted typhoid fever while on board the ss. "Cheshire" and has been for several weeks in the Colombo General Hospital. Since he left the hospital he has been upcountry and has derived much benefit from his renewed acquaintance with our hill scenery and hill climate. He speaks very highly of the liberal spirit in which Messrs. Carson & Co., the local agents of the Bibby line of steamers, have met him and his fellow-passengers with regard to their detention, &c., in consequence of illness. He imputes no blame to the Company.

## MINOR PRODUCTS REPORT.

LONDON, November 3.

**CARDAMOMS.**—During the period, January 1st to September 27th 1898 367,635 lb were exported from Ceylon, of which 233,214 lb were shipped to the United Kingdom, 69,685 lb to Germany, and 43,298 lb to India. A good jobbing business has been doing since the auctions at 3d advance.

Broken Ceylon partly scented with coconut oil, sold at 8½d at this week's auctions; coarse broken bark sold at 4½d to 5½d.

**KOLA NUTS.**—Goods Grenada nuts sold at this week's spice auctions at 3d to 3½d.

**CITRONELLA OIL.**—Steady. The c.i.f. quotation is now 11½d. Little or no business appears to be doing in the oil.

**LEMONGRASS OIL.**—Quiet, as it has been for some time, interest appearing to have dropped out altogether in this substance. The c.i.f. price is 2½d.

**QUININE.**—This week has been similar in tone to the two preceding ones, but there has been an idea in one or two quarters that makers would advance prices if today's Amsterdam auctions went off well. The Amsterdam factory, however, has not waited till the result of these bark auctions was made known, for it has already advanced its price to 11d for the sulphate in bulk. Other German makes are unchanged, and Howards price for 1,000-ounce lots in 100-ounce tins is 1s —*British and Colonial Druggist*, Nov. 4.

**COFFEE IN QUEENSLAND.**—We have a letter in our *T. A.* from a Queensland settler enquiring about our "Coffee Manual" and telling us that "having taken a farm" (in the North of Queensland) he intends to try Coffee planting! It will, of course, be on a small garden scale.

## TRAVANCORE ZOOLOGICAL GARDENS.

The public gardens at Trivandrum, and especially their Zoological section, form the subject of a lecture recently delivered at the Travancore capital by Mr. H. S. Ferguson, one of the authorities. Mr. Ferguson, after dealing with the history of the gardens, which were begun early in the sixties, gives a very full account of the Zoological Department. The nucleus of the collection consisted in 1863 of a few animals—two marabons, two Arabian sheep, and one monkey—all taken from the private menagerie of the Maharajah of Travancore who became the patron of the new scheme. In 1867, on the construction of cages for the accommodation of more creatures, tigers and leopards were transferred from the disreputably kept menagerie to the newer and cleaner abodes. One old tiger was overpowered by the unwonted luxury, pined away and died in a few months. Between 1871 and 1880, thanks to liberal Government grants, the Committee entrusted with the care of the Department, was enabled to add largely both to the buildings and to the collection; and subsequent additions have rendered these Zoological Gardens representative, not only of Travancore, but also to a considerable extent of the Indian Empire. We can only give a brief enumeration of the more interesting animals of which Mr. Ferguson speaks. They include: the lion-tailed and bonnet monkeys, the long-tailed black Nilgiri Langur and two (foreign) stump-tailed macaques, obtained from Bombay in exchange for leopards; numerous specimens of the cat tribe, the peculiarity of which (the cheetah alone excepted) is that they can sheathe their claws when not in use; lions, descendants of a pair which came, the male from a Liverpool dealer and the female from the Clifton Gardens; one surviving tiger, a somewhat nervous animal compared with its once fearless mate, now deceased. The cats include the fishing cat, the civet or musk cat, the rusty spotted, and the leopard cat. Amongst the mongooses is the Ceylon brown species, one considered peculiar to the island. Mr. Ferguson mentions also: two of the so-called wild dogs that hunt in packs, live on deer, and belong to a genus entirely different from that of the domestic dog; the Himalayan bear and the sloth; the European and the smooth Indian otter; a great one-horned Rhinoceros from Bangalore, the largest beast in the gardens; tapirs, which are among the oldest living mammals, as proved by their anatomical resemblance to extinct fossil forms; specimens of all deer found in Travancore "from the lordly sambar to the tiny little moose deer hardly bigger than a rabbit;" of the antelope tribe, the black bude, the blue Nilgiri bull, and a female example of the Nilgiri wild goat—the only goat living south of the north temperate zone, excepting only the mountain Ibex of Abyssinia. Beside the Indian animals the gardens have also a fair selection of African and Australian ones, the most remarkable being the red kangaroo and the African crowned crane, which has a loud trumpet-like call and a peculiar fondness for dancing, so that it often indulges in a *pas seul* before breakfast. Mr. Ferguson's lecture contains much further information on the habits of many of the animals to which we have merely referred.—It is a disgrace to Ceylon that no Zoological collection has yet been established in its capital.

## PLANTING NOTES

**THE COCONUT TRADE.**—Intelligence has been received in Rangoon that the exportation of coconuts from the Straits this year show a marked diminution. When the ss. "Palamotta" arrived from Singapore on her last voyage to Rangoon she brought in the smallest consignment on record, while similar small shipments by other vessels confirm the reports of the fall in the coconut trade between Singapore and Rangoon.—*L. T. in S. F. Press.*

**COFFEE PLANTERS** in British Central Africa have been informed by Mr. John Hughes that the soil on which coffee is grown in the Cholo district in British Central Africa, at an elevation of 3,200 feet, and with a rainfall of 50 inches, is very similar to the coffee soil of Ceylon, its only deficiency being nitrogen, which it is believed can be supplied by ploughing in vegetable matter. The soil is rich in iron and alumina.—*Indian Planters' Gazette.*

**AN OLD CEYLON PLANTER IN TEXAS.**—We call attention to the chatty and instructive letter in our daily issue and *Tropical Agriculturist* from Mr. R. E. Pinceo, from Galveston, Texas. He does not give a very bright account of the prospects of Ceylon tea in that quarter of the States; but perhaps it would improve if our Commissioner took an interest in backing it, although Mr. Pinceo himself inclines to the Canadian Dominion as offering the better field. In a separate note, Mr. Pinceo says:—

I am in receipt of a letter from the British Vice-Consul in Los Angeles, California, in which he states that several Englishmen have, during the past ten years, attempted to do business there in Ceylon tea, and that they all failed. He promises to send me a report on the prospects of Ceylon tea in that section of California, emanating in the Chamber of Commerce of Los Angeles. I have now had a very varied and bitter experience, extending over 13 years, in trying to introduce Ceylon tea into the homes of this country. Anything that suggests itself whereby I can be of service to the Ceylon Tea Industry, or any firm to help it on, in either this country or Canada, will be greatly appreciated.

**THE FUTURE OF THE TEA INDUSTRY** is thus referred to by a writer in the *Calcutta Englishman*:—

As already noticed briefly above, there is still a future, and a fair one, for tea, provided promoters and speculators with capital work upon broad and safe lines. With plenty of first class land still available, and as proved by those estates and tea tracts which are already reaping a remunerative return, for capital judiciously expended upon their creation, we may consider that tea is commercially a sound investment in spite of present depression to it in time; so I hope this note of warning which is being sounded will not be without effect. From a political point of view some years hence the influence of the British Empire, which is gradually but surely making itself felt in China will probably in the interests of commercial enterprise lead to the re-opening up of the China tea question. And herein lies the secret of future success for the tea industry generally, as it would open up a large field of labour for the planting community which with its valuable experience, aided by improved machinery and cheap labour, would revivify and bring to perfection China tea such as it has hitherto never known. There need be no fear that this enterprise would upset the Indian tea market, or prove destructive to our interests in this country, for the opposition would necessarily have a somewhat slow progress. It would not be rushed—we have seen the folly of this already—and would be doubtless conducted upon scientific principles. This may seem a far-fetched idea, but I maintain that it is not unreasonable to hope that even in our own day such a dream may come to pass, and thus relieve the present strain by absorbing the surplus available European labour in this country.

**TEA IN INDIAN MARKETS.**—Ceylon provides India with a million pounds of the foreign tea imported, the bulk of the imports being Chinese (says the Officiating Director General of Statistics). Of the 7½ million pounds left in India, 4½ are Indian and 3 are foreign. Part of this may represent stocks in hand, and the exports across the frontier by land, which are but imperfectly recorded, may be understated. More than a million pounds are purchased annually for the British army, and a larger quantity must be consumed by the European and Eurasian civil population. In relation to the population of the country the quantity consumed is infinitesimal, and the use of tea by the native population is practically limited to a small minority in the larger towns.

**PLANTAIN (BANANA) DISEASE.**—"A very dangerous pest—we read—has attacked the banana plant in Australia, and a shipment of eleven thousand bunches is reported to have been condemned on arrival at Sydney, and was ordered to be destroyed. The insect is stated to be a fly that attacks the fruit, and destroys its value as food. A report states that this pest has appeared also in Fiji. If so, it is likely to be imported in any of this fruit brought from that group by the colonial line of steamers which touch here, and which are usually supplied with bananas grown south of the equator. While there may be no immediate danger of this pest, being introduced in this way, it is well to be on our guard against it." Should not care be taken not to allow Australian plantains enter Ceylon?

**COFFEE PLANTING IN TOENGOO, UPPER BURMA.**—We had an interesting call from Mr. James Petley, whose father Capt. Petley, after long service in Burma, retired to plant coffee on one of the Karen Hill ranges in Upper Burma. Here Capt. Petley secured 200 acres of fine forest-land at an elevation of 3,000 feet, the Karens agreeing through friendship to his having it, and the Government sanctioning the transfer. He got his first coffee seed in 1875, the son thought, from Ceylon; but it must have been from Mysore, since no leaf disease appeared on his plantation of 120 acres until last year. Had the seed been from Ceylon, the disease would have developed much earlier; but how or why it developed last year is a puzzle. For the plantation is quite isolated—no other coffee in Burma until Tavoy in the far South is reached, where Mr. Watson from Ceylon (supposed to be dead) pioneered. The Messrs. Petley got good coffee crops for 10 or 11 years and they did well, because they sold it all locally in Rangoon, prepared, ground and in tins—so combining the planter's, the merchant's and middleman's profits. They used one of Walker's pulpers. Now, however, the leaf fungus has wrought sad havoc, and Mr. Petley came to us for information as to planting Para rubber. We showed that it was impossible at 3,000 feet. He would require to find a piece of suitable land in the low country. We advised an experiment in cinchona—seed from Bengal—on the coffee plantation; also to see if cardamoms (or local sale) would not do in the jungle. Tea, Mr. Petley said, they could not touch; because the labourers (Karens) got nearly double the daily pay of coolies in Ceylon. He says there are great stretches of very fine land; but there is difficulty in getting any of it, as Government will do nothing for would-be purchasers; the owners being the Karens. Mr. Petley had been in England on furlough and is now on his way back to Burma,

LANKA PLANTATION COMPANY LIMITED.

Directors.—George Allen, Esq., (Chairman), William Austin, Esq., Henry Bois, Esq., and Edward Pettit, Esq.

Agents in Colombo.—Messrs. J. M. Robertson & Co. Secretary.—Mr. Charles M. Robertson.

REPORT.

To be presented at the Eighteenth Ordinary General Meeting of the Lanka Plantations Company, Limited, to be held at the office of the company, on Wednesday, the 16th November.

The Directors now submit their Report for the twelve months ending 30th June last, together with the Balance sheet and accounts of the company made up to that date and duly audited.

The coffee crop shipped to London was 247 cwts., against 572 owt. last year, and realised £1,072 11s 8d net. The acreage under coffee alone is nominally 164 acres.

The total crop of cocoa gathered on Yattawatte amounted to 1,509 cwts. against 1,272 cwt. last year, and realised £4,806 14s 10d. During the season 34 acres were planted with cocoa, and 18 acres of available land adjoining the estate have been purchased, making a total of 268 acres new land. The cost of the land and the new planting are charged to capital account. On the same estate 2,125 lb. cardamoms were gathered realizing £269 16s 6d.

The tea received from the company's estates amounted to 731,593 lb. and has been sold at an average of 7'45d per lb. net realizing £22,840 18s 1d. Last year the company received 701,112 lb which was sold at an average of 7'53d. per lb. net, and realized £22,002 8s 4d. The cost of production has been increased by a further rise in the sterling value of the Rupee.

The average rate at which drafts were negotiated on Account of the season's crops was 1s 4-3/32. per rupee, against 1s 3d last year; this further rise representing a loss of about 1 per cent. on the ordinary share capital of the company.

The following statement shows the acreage and state of cultivation of the company's estates on the 30th June last:—

Estate.	Coffee.	Tea.	Cocoa.	Grass.	Chena & Patena.	Forest & Timber Trees.	Total.
Ampittiakande Arnhall	50	414	..	4	167	70	705
Fruithill	..	227	..	..	10	..	237
Fordyce, Garbawn, Gonagalla and Paramatta	..	794	..	7	..	135	936
Rappahnock	..	322	..	31	30 <sup>3</sup> / <sub>4</sub>	90	473 <sup>3</sup> / <sub>4</sub>
Rillamulle	..	232	..	..	6	20	258
Thotulgalla	114	264	..	..	64	113	555
Yattawatte	..	..	*751	95	287	82	1,215
	164	2,253	751	137	564 <sup>3</sup> / <sub>4</sub>	510	4,379 <sup>3</sup> / <sub>4</sub>

The net Profits for the past year amounted to £6,149 13s 8d, to which must be added the sum of £495 8s 2d to the balance brought forward from the year 1896-7, making together £6,645 0s 11d.

Having already paid a half-year's interim dividend on the six per cent. Preference shares to the 31st December, 1897, amounting, less property tax, to £426 6s 0d, the Directors recommend payment of the dividend on these shares to the 30th June last, requiring, less property tax, a similar amount, and having deducted £1,398 2s 0, being one-tenth of the sums charged to suspense account during the 10 years ending 30th June, 1897, they further recommend a dividend of 5 per share, being 2<sup>1</sup>/<sub>2</sub> per cent. free of income tax on the ordinary shares amounting to £3,750, carrying forward a balance of £644 6s 11d to the next account.

CENTRAL TEA COMPANY OF CEYLON, LIMITED.

The following is the report of the Directors which was to be submitted at the third annual ordinary general meeting of shareholders to be held at 20, Eastcheap, E.C., on Monday, the 7th November:—

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending 30th June 1898, duly audited.

The nett amount at credit of profit and loss account, including the balance brought forward at 30th June 1897, and after providing for general expenses, Directors' Fees, income tax, &c., is

£	s	d	£	s	d
			2,729	2	2

Dividends on the 6 per cent preference shares were paid for 1897-8 (less income tax) amounting to

1,133	0	8
-------	---	---

It is proposed to pay a dividend of 6 per cent (less income tax) on the ordinary shares which will absorb

1,073	0	0
-------	---	---

And to carry forward to next year a balance of

523	1	6	£2,729	2	2
-----	---	---	--------	---	---

The Directors trust the results of the year's workings of the estates will be considered satisfactory by the shareholders.

The gross average price realized for the tea was 7'75d per lb., as against 7'52d per lb. last season, and the rate of exchange 1s 4d as against 1s 3 1-32d.

The total crop amounted to 351,646 lb. or 409 lb. per acre of tea in bearing.

Under clause No. 24 of the Articles of Association Mr. W. H. Anderson retires on this occasion from the Board, and, being eligible, offers himself for re-election.

The Auditors, Messrs. Harper Brothers, chartered accountants, also retire from office, and offer themselves for re-election.

At an extraordinary general meeting, held in May 1897, it was resolved that the share capital of £45,000, divided into 1,500 6 per cent preference and 3,000 ordinary shares, be altered to 2,250 6 per cent preference and 2,250 ordinary shares. The necessary agreement drawn by the Company's solicitors, was signed by all shareholders, and duly registered with the Registrar of Joint Stock Companies on 14th July 1897.

157 ordinary shares were cancelled, and 157 preference shares issued in lieu thereof. The 593 unissued preference shares were offered to the public in December 1897, at a premium of £2 per share. These shares were duly taken up, and the premiums arising therefrom, viz. £1,186, it is now proposed to write off from the capital accounts of the estates.

WM. JOHNSON, Secretary.  
London, October 31, 1898.

GREEN TEAS.—A North Indian correspondent thinks Ceylon planters have now a splendid opportunity of making a big impression on the American market if they only turn out a sufficiency of well-made, natural "green" teas to oust "Japan's." We agree in this proposition and in the wisdom of following the advice in this matter of Messrs. Mackenzie and Blechynden; but would ask what are Indian tea planters themselves doing, to back up Ceylon in this effort?

\* 63 acres interlined with Liberian coffee.

## INDIAN AND CEYLON TEA TRUST.

## EASTERN BUSINESS UNDER A CLOUD.

The first general meeting of the shareholders of the Indian and Ceylon Tea Trust Company, Limited, was held yesterday at 34, Nicholas-lane, E.C. Mr. Keith F. Arbuthnot (Chairman of the Company) presided.

The Chairman said that the balance-sheet covered the period from April, 1897, when the company was started, to the 30th June this year. The directors were extremely sorry that they were unable to place a better statement before the shareholders, but, as they were no doubt aware, all business in the East, and especially the tea industry, had been under a cloud, having suffered from the rise in exchange. When this company was commenced the rate of exchange was 1s 2½d per rupee, and it had increased to 1s 4½d, and companies which were earning fair profits in the old days were now rarely able to pay expenses. He was glad to say prices for tea were now rather better, and if they remained so, companies would again resume the payment of dividends. In addition to investing in shares, the company made advances to tea companies, and they had done a fair amount of business in this way, which would no doubt have been increased had they had larger funds at their disposal. The directors were the largest shareholders—in fact, he believed he was the largest shareholder in the company. He had not sold any of his shares, as he had not had the opportunity. (Laughter.) But for the deplorable shrinkage in the price of tea shares, he was confident they would have been able to present a very different balance-sheet. The Board had received several communications from shareholders desiring more information than appeared in the accounts. (Hear, hear.) They considered it advisable not to publish a list of the company's holdings, but if the majority of the shareholders wished them, they would be only too glad to do so. Shareholders could always be supplied with particulars on calling at the offices. In conclusion, the Chairman moved the adoption of the report and accounts.

Mr. J. Barrett-Lennard seconded the motion.

Mr. Ross said he could not understand why the Board had borrowed £15,000 at 4 per cent., when they had only called up £1 10s per share. The tea trade at the present time was in a very bad way, and, in view of the low prices of the shares, the company had a favourable opportunity for investment. He should, therefore, prefer to pay up the liability on his shares.

A Director pointed out that if they called up further capital, it would remain a permanent charge, whereas they could pay off the loans at any time.

## THE DESIRABILITY OF ALLOTMENT QUESTIONED.

Mr. Gardiner remarked that it was questionable whether the company ought to have gone to allotment at all. (Hear, hear.) The preliminary and formation expenses, amounting to £2,767, were heavy when compared with the capital subscribed—namely, £14,659.

The Chairman: I think all that was taken into consideration at the time the company went to allotment. The capital was nearly all held privately.

Mr. Gardiner suggested that in view of the report presented perhaps it would be wise to gradually work the company off—dissolve it altogether. It would be far better than going on in the present way. He admired the directors for not taking their fees. (Laughter.)

Mr. James McClough said he cordially supported the views of the last speaker. The report in every way was very unsatisfactory. The Board proceeded to allotment on one-third the number of shares offered to the public—only 10,000 being allotted out of 30,000. They must have known a Stock Exchange quotation could not be secured as originally intended. He understood from the prospectus that the preliminary expenses were to be paid by the holders of the deferred shares.

The Secretary stated that 1,000 deferred shares were set aside for that purpose, and the preliminary expenses only appeared in the balance-sheet as a matter of account.

Mr. Barrett-Lennard said that if the company had been dependent upon public subscriptions they would not have gone to allotment, but the directors and their friends having subscribed for a very large proportion of the capital, having confidence in the future of the company, they felt justified in doing so. He differed from the opinion that the state of affairs demanded the drying up of the company and the distribution of the assets. They had made profits. It did not allow that the company would continue to be unsuccessful. He did not think the directors could be blamed for the fall in prices. (Hear, hear.)

The Chairman said that it would be the policy of the Board to act with caution at the present time, and they did not propose entering into any further business until they had called the shareholders together again. (Hear, hear.)

A Shareholder: Can you call us together in six months' time?

A Director: Should you want a balance-sheet?

The Shareholder: No, we do not wish you to go to that expense.

The Chairman considered the calling of a meeting in six months' time a good suggestion.

The report and accounts were adopted.

Mr. Lough, in proposing the re-election of Mr. Arbuthnot as a director of the company, said the criticism on the accounts had been very severe, but the Board had not attempted to conceal the fact that the business had not been satisfactory. The directors had taken no fees. He had made inquiries and found that the investments, so far as could be judged, were of a satisfactory character. He did not see any signs of immediate improvement in the tea trade. After the promise given by the Chairman that no new business would be entered into until the shareholders had been consulted, he thought they could not do better than re-elect him. (Hear, hear.)

Mr. Gardiner seconded the proposition, which was agreed to.

The auditors, Messrs. Singleton, Fabin & Co., having been reappointed.

A shareholder expressed the hope that the proceedings of the meeting would not be made public.

Another Shareholder said he believed a representative of the *Financial Times* was present.

A vote of thanks to the Chairman terminated the proceedings.—*Financial Times*, Oct. 29.

THE KOLA NUT IN THE SOUDAN—alluded to by a correspondent elsewhere—has not yet developed into an export trade of any consequence, so great is the local demand among the "Hausas" for the nuts. One caravan from the coast to the interior towns and villages was estimated to have £100,000 worth of kola nuts!—and the price rises on the borders of Lake Chad by 50 to 60 fold of what it is where grown in the coast districts. Mr. Robinson (whose book "1,500 miles through the Central Soudan", we shall quote from, in our Monday morning's issue) thinks a Railway through the British Soudan-Niger territory would pay far better than the Uganda line. Salt sells in the interior at one shilling per lb. Kano, the capital of Central Soudan (with 100,000 people), has two millions of people passing through it yearly, so great is the trade. Next to salt, scents and perfumes of all kinds are in great demand; bits of camphor worth 2d in England selling readily for 1s near the coast even; English shillings sell well to set in rings; the only coin appreciated in the Soudan (besides cowries by the thousand) being Maria Theresa dollars which contain 2s worth of silver, but buy 3s 6d to 4s worth in cowries. A railway would do more than anything else to put an end to slavery as slaves are required as porters at present.

LOCUSTS:  
IN CEYLON AND ELSEWHERE.

(From a correspondent.)

The absence of any reference to Locusts in your *Bg Book* is I suppose due to the fact that there are practically no official reports on these insects in their relation to the island. Now and again news has been received that locusts have appeared here or there, but fortunately their ravages have been on a comparatively limited scale. But of course that is no reason why every effort should not be made to thorough study the species which are found in Ceylon, not only for the benefit of those whose crops are at present liable to attack by the pest, but in order that we may be forearmed in case the ravages of the insect become more alarming in character.

The "literature" on this subject is very extensive indeed, and the various remedies recommended and tried have been legion, and yet an eminent authority, writing quite recently with reference to the migratory locust, (*acridium migratorium*) says that human ingenuity has practically proved powerless against the destruction caused by these insects. It is, as stated above, important that the types of the Ceylon insects referred to as locusts should be clearly identified, as there are very different forms of the pest characterized by very different habits. Indeed the term 'locust' is very loosely applied, many insects, not true locusts, being called by that name. *Acridium peregrinum* (supposed to be the locust of the Bible) has been known to appear in Upper India, while the pest which caused such havoc in Lower India is thought to be *A. succutatum*.

It would be unprofitable to refer to the different forms of locusts, their ravages in various parts of the world (Algeria, the Cape, &c.) or to the laborious but generally futile efforts made to destroy them, but I would draw attention to the very important and successful measures now being employed at the Cape, viz. the use of "Toxine" or "Locust Disease Fungus." The Cape Government has recognised this inoculating medium, which is being supplied by Dr. Edington of the Bacteriological Institute, and is now distributing it far and wide. Both Europeans and natives have acknowledged the efficacy of the new "medicine" which is in great request.

The Queensland Government has already approached the Cape authorities with a view to utilizing the fungus, if possible against such locusts or grasshoppers or even beetles which devastate crops in that Colony. I enclose a cutting referring to the Rhodesia locust 'campaign' 1897. C.D.

The supply of "Toxine" was distributed to the various Civil Commissioners, who, in their turn, issued it to the most practical farmers, who could be relied upon to carry out the instructions carefully, when inoculating, and who would report the results of their experiments to this office. By the end of June so many encouraging reports had been received, particularly from Umtali and Bulawayo, that it was decided upon to organise a locust campaign at the end of the present year on the young locusts. Accordingly Dr. Edington was asked to supply all Civil Commissioners with a stock of the "Toxine," which he had cultivated freshly, and forward to the different districts with the utmost despatch. A circular has now been issued through our Rhodesia giving full detailed particulars of the different methods of distribution of the Fungus, copy of which is enclosed. This "Toxine" is issued free of charge upon application to any Civil Commissioner, or to this Office—due precaution being taken to avoid any waste.

The cost of the "Toxine" is 3d per tube, so that, allowing for 1,500 tubes for distribution in Mas'sonaland, the actual cost will not exceed £75 including postage. It is unnecessary to explain that if only one large crop in Rhodesia is saved, it will amply repay this expenditure indirectly.

LOCUST DISEASE FUNGUS.

Small tubes containing this Fungus may be had upon the application to the Civil Commissioner of the District, or to this Office.

METHOD OF DISTRIBUTION.

1. Catch some locusts and after smearing them with the fungus, let them go.
2. Smear patches of dampground, where the locusts alight to feed, with contents of a tube.
3. Confine some locusts in a box or basket, which contains some favourite food, lightly spread with the fungus, and release them when the food has been eaten.

4. Dissolve the contents of a tube in about a pint of tepid water, then dip some captured locusts into the solution and release them into the swarm. Great care must be taken neither to crush nor drown the locusts.

5. Locusts, which have died from the disease, should be gathered and dried in the sun, and then ground into a fine powder. With three tablespoonful of this powder, add one pint of tepid water, and when thoroughly dissolved use the solution as in Method No 4.

Natives should be informed of and instructed in the use of this method.

Highly satisfactory results have hitherto been obtained and it is particularly requested that all persons using the Fungus will report the results of their experiments to this office.

When the fungus is present in a locality amongst the acridia, or insects of the locust species, and the latter increase to any considerable extent, the fungus appears to assume an epidemic form, and there is no doubt that there are many grasshoppers, which will help to keep the fungus alive in the locality where it once takes hold, and their natural habitat is in the damp shady places, notably by the banks of streams and similar situations.

As locusts should be treated, when in the hopping stage, or about 6 weeks old, all persons desirous of experimenting, are requested to secure a supply of fungus before the end of the present year.

Agricultural Branch,  
Salisbury, 12th October, 1897.

P.S.—No. 4 is the most popular method.

TRADE OF INDIA FOR SIX MONTHS ENDING 30TH SEPT. 1898—compared with 1897 and 1896. —The official Report with all the details of import, export and re-export trade has reached us. We quote some figures of local interest:—

## THE PROBLEM OF THE TROPICS.

THE EDITOR OF THE "DAILY CHRONICLE."

SIR,—In the interesting article on Mr. Kidd's hook, "The Control of the Tropics," in the *Daily Chronicle* of last Monday, there is a pervading assumption—I presume made also by Mr. Kidd—that White men cannot live and work there. Your reviewer makes this statement three times, as if it were an absolute fact, undisputed and undisputable, and it is probably this assumption which has made it so difficult for Mr. Kidd to give any satisfactory solution of the "Problem of the Tropics." As one who has lived (and worked) for twelve years in the tropics, perhaps you will allow me space to discuss this interesting question.

No great problem can be solved if we begin by assuming data which are erroneous, and I maintain that the assumption as to what men not being able to live and work in the tropics, in good health and in full enjoyment of existence, is not only untrue, but is the very opposite to the truth. It is because white men, as a rule, do not work enough in the open air in the tropics that they so often suffer in health, and for anyone who lives rationally as to food and clothing, and who conforms in his dwelling and surroundings to ordinary sanitary laws, a fair amount of bodily exertion is, there as much as here, one of the conditions of perfect health, and to those who thus live I affirm that the tropics, as a whole, are more conducive to health than the temperate regions. A large body of facts go to prove this contention, and I will briefly enumerate them.

First, I may say that I owe to my twelve years' residence in the tropics the comparatively good health I now enjoy. When about seventeen I nearly died of lung-disease, but breathing the pure, warm air of the equatorial zone for twelve years completely restored them, so that, ten years after my return home, a physician informed me that my lungs were perfectly sound, and that, in fact, I had the chest of an athlete. Is it not also a well-known fact that, in India, the men who suffer least from the climate are the enthusiastic sportsmen, who seize every opportunity of getting away from civilisation, and who often submit to privations and fatigue with benefit rather than injury to their health. But, turning to a better illustration, do not the rank and file of our European soldiers work, and work pretty hard, too, in every part of India, especially on a campaign, and has a been ever alleged that they "cannot live and work" there, or that they suffer in health from the mere fact of working? On the other hand, the class that does no outdoor work at all in India, and which has fewest outdoor occupations and amusements—the women of the ruling classes—are those who suffer most from the climate. But more striking still is the object lesson we have just had in the Sudan campaign, where English soldiers and officers have been continuously working and fighting for two or three years in one of the hottest and most trying parts of the tropics, and with certainly not more illness than in similar campaigns in temperate climates.

Again, turn to our sailors. \* \* \*

Then, again, as to there being anything injurious to white men who are permanently settled in the tropics, all the evidence is favorable. In the Moluccas there are many Dutch families who have been there for two or three hundred years, and who are not only perfectly healthy and prolific, but who retain the fair complexions of their European ancestors. In many of our West Indian islands there are, I believe, Creole families of pure English blood, and there are considerable populations of pure Spanish blood in various parts of South America.

It is only when we come to agricultural labor that we find white men refuse to work, and the demand is made for a supply of native colored laborers, and the reason for this is not difficult to see. Agricultural labor among us has always been considered the lowest class of labor, as it is the worst paid, though, as Mr. Ryder Haggard has recently told us, it is

really skilled labor of a very pronounced kind. It is also work in which there is no great excitement, and no chance of getting wealth, except when practised on a large scale with a full supply of very cheap labor. But there is, really, no occupation so full of interest, so enjoyable, so health giving as agriculture to him who practises it for himself; and in the tropics nature is so productive and lavish that five or six hours' work a day would give a larger return than double the amount in our own country.

The more favorable portions of the tropics, extending about 15 deg. on each side of the equator, afford, I believe, the most healthy and the most enjoyable abodes for man, where with the least labor he can obtain the greatest amount of the necessaries, the comforts, and the luxuries of life, and can at the same time develop and cultivate his higher nature. But to do this he must go there not with the object of making a fortune and coming home to live in luxurious idleness, but as a true settler, determined to make his home there. And he must not go with the intention of hiring native labor—a more or less modified form of slavery—but determined to work with his hands as well as with his head. This can be best done—can only be successfully done—by some form of co-operative colonies, of which the Ruskin Colony in Tennessee is perhaps the best type. There, associated labor loses all its terrors, while all the members being approximately equal in education and refinement, there is ample scope for healthy and varied social enjoyments. Such a colony established in some healthy part of the tropics, guided by adequate experience, and with a moderate capital to start with, would soon attain to a condition of social and economic prosperity that could hardly be reached elsewhere. The economies of such a colony as will be shown by the fact that at Ruskin the whole cost of three good meals a day is less than a dollar a month a head. And in a tropical colony of sufficient size, when once fully established, every necessary of civilized life would be produced, such as sugar, coffee, cocoa, &c., while the cost of houses and clothing would be a minimum.

Here then is a clear and definite solution of the "problem of the tropics." They must be gradually occupied by white men in co-operative association to establish permanent homes, which, surrounded by the glories of tropical vegetation, may in time become something like the legendary paradise.—Yours, &c.,

ALFRED R. WALLACE.

## TEA—AND CYCLING—IN FRANCE.

Mr. A. E. Scovell—whom we are glad to see looking exceedingly well after his trip home—picked up some curious information as he journeyed by rail, or cycle, through France. In Normandy, for instance, he found that the bill for tea for a small party averaged some 2.84 francs a cup! In Paris, he saw a placard respecting tea, opposite the Louvre, giving prices from 7 to 17 francs per half kilo (1 1-10th lb). The latter price—13s a lb.—was, of course, for some special "golden" orange pekoe; while the lowest rate, say 5s 6d per lb., would probably only purchase an indifferent tea. (The duty on tea entering France be it remembered, is only 9d to 11½d per lb). Mr. Scovell's bicycle trip began on this side of Paris, and he enjoyed it extremely by Fontainebleau and Autun crossing thence to Lyons, and then trying both sides of the Rhone, but staying at Orange, Avignon and Arles. Between Paris and Marseilles, Mr. Scovell took some ten days and much enjoyed the trip. Of course, nothing was seen or heard about tea in the South of France; but as regards the country generally, Mr. Scovell thinks there is every reason to anticipate progress in the consumption of Ceylon tea if it is brought properly under the notice of the people.

THE CALEDONIAN (CEYLON) TEA  
ESTATES, LIMITED.

ANNUAL REPORT.

Trustees for the Debenture Holders:—Sir Cecil Clementi Smith, G.C.M.G.; Mr. H. K. Rutherford.

Directors:—Sir Alfred Dent, K.C.M.G., Chairman; Messrs. William Gow, Alexander Ross.

Manager in Ceylon:—Mr. J. Stanley M. Ross.

Secretary:—Mr. H. F. Stanley.

Offices: 11, Old Broad Street, London, E.C.

Report of the directors to be submitted at the first annual ordinary general meeting of Shareholders to be held at the offices of the Company on Thursday, 24th November, 1898, at 12 o'clock noon. The directors beg to submit the balance sheet and profit and loss account for the year ended 30th June, 1898, duly audited.

The profit and loss account, after providing for interest on debentures, London charges, directors' fees, &c., shows a balance at credit of £2,268 14s 1d.

The directors recommend the payment out of this amount of a dividend on the preference shares at the rate of 6 per cent. per annum, from the dates of payment of the several instalments thereon to 30th June last, amounting to £1,133 12s 8d., and a dividend on the ordinary shares of six shillings per share, amounting to £1,050.

The result of the first year's working falls short of the original estimates, owing to causes which have affected returns from most, if not all, tea estates in Ceylon.

The season proved generally dry and abnormally cold, causing a serious shrinkage in yield throughout the tea districts. This and the low prices prevailing have contributed almost entirely to bring about the comparatively disappointing result of the season's operations.

This being the first year of the Company's business, and in view of the fact that part of the buildings and machinery are new, whilst a considerable sum has, during the year, been spent on upkeep and repairs and charged to current expenditure, the directors have not thought it necessary to write off anything for depreciation.

The estimates for the current year ending 30th June next, taking exchange at 1s 4½d and the average price of the tea at 7d per lb. net (which is below the present average), promise a satisfactory return on the ordinary shares, after providing for debenture interest, Preference share dividend, London charges, &c., owing to the large area now beginning to come into bearing.

The present statistical position of tea, together with the increasing demand for British grown tea for foreign and colonial markets, justify the directors in contemplating hopefully the future of the Company's business.

The Auditors, Messrs. Singleton, Fabian & Co., offer themselves for election for the current year.

By order of the Board, H. F. STANLEY, Secretary.  
11, Old Broad Street, London, E.C., 14 Nov., 1898.

THE CRYPTOGAMIST AND HIS WORK.—An experienced planter writes:—"H.E. certainly 'put his foot in it' when he stated that there was no more work for a Cryptogamist in Ceylon. We have not heard the last of cacao pest—and we hear of the spread of gray fungus in tea—in different quarters."—We are glad to learn that Mr. Carruthers is staying on till December 22nd, so that he will see the rainy season out. We most certainly think that with the re commencement of the rainy season in June-July, a Cryptogamist ought again to be at work and unless Mr. Parkin (now at the Peradeniya Gardens, engaged in valuable physiological investigations in rubber) is willing to take up the post and deal with our fungi, Mr. Carruthers ought to be invited to return on a permanent engagement.

IRON ORE IN CEYLON.

It is pointed out to us that if our ore is worth "16s a ton on the spot," as Mr. Bainbridge said, the question of transport and freight is one for the purchaser and not the seller. True enough certainly, if a contract were so concluded; but we suspect our "M.P." visitor had in view, ore delivered at some port or at any rate on the banks of a navigable river in Ceylon. If, for instance, the Geologist, so long looked for by Sir West Ridgeway, came here at last and enabled us to rediscover the iron ore spread over some 15 miles in Sabaragamuwa, on the existence of which Gygax so explicitly insisted in his Report fifty years ago, it is very likely that the Sinhalese would find it pay them well to deliver such ore for R12 a ton on the banks of the Kaluganga. It is not improbable, too, that that the purity of our ore, over 80 and 90 per cent of iron, would enable the world-be smelter to allow a rather better price than 16s per ton. But we must all remain in the dark as to this problem and many other questions of a similarly practical kind, until the Geological Survey of Ceylon is *un fait accompli*.

"ALL ABOUT TEA."

We gather after perusal of our Indian files that Indian planting opinion is exercised on the subject of Pruning Tea now that the Indian tea season is virtually over.

The general opinion seems to be that *under* pruning is safer than *over* pruning. The former can be remedied, but a mistake through the latter sometime takes years to remedy. A style of pruning that suits Darjeeling does not, of course, suit the Plains. Cold weather appears to have set in earlier this year than usual and Sylhet and Cachar will pan out badly in 1898.

The Indian Tea Association has not succeeded in getting the Indian Government to allow Post offices to be distributing centres for small packets of tea to be consumed by the villagers. Tea, says the Indian Government is not "medicine like quinine though a useful and beneficial beverage."

"TEA; ITS CULTURE AND MANIPULATION" is the title of an illustrated work by Monsierr V. Bontilly, recently published in Paris. The *Revue des Cultures Coloniales* describes it as the most complete and best compiled that has yet appeared in France. Of its five chapters the first deals with the origin and botany of tea; the second and third with the working of Ceylon estates and the methods of preparation, the fourth handles estimates of expenses, returns, &c. In the fifth the authors run over the colonies suitable for tea cultivation. Indo-China, he says, at present gets all its tea from China but as soon as the natives learn the processes of its manufacture they will cease to import a product they can make themselves. "Guiana, New Caledonia, Réunion and a large portion of the high plateaux of Madagascar seem as though they ought to lend themselves equally well to this cultivation, for the climate of these various regions does not sensibly differ from that of the interior of Ceylon." Finally the author gives an estimate for the working of an estate in Réunion, where expenses would be the same as in Ceylon, were it not for the scanty labour-supply, which is twice as costly.

## MERYTA SINCLAIRI.

## (THE PUKA TREE.)

In reference to the very interesting letter of Mr. Boscawen's in our last issue, we may now cite the following passage from Kirk's *Forest Flora of New Zealand*:—"This noble species is one of the rarest plants in the world, being restricted to a few individuals growing on one or two small islands near the northern extremity of the colony; its leaves are larger than those of any other plant with entire leaves in the New Zealand flora. It does not occur on any part of the mainland. In 1869 Professor Hutton and myself visited the Taranga Islands, where we had the good fortune to find a few trees which had long been known to the Maoris, when a description was published in the *Transactions of the New Zealand Institute*.\* The plants found at that visit were confined to old Palæozoic rocks on one of the small islands of the group. Mr. Robert Mair has recently discovered a few plants on another island; and T. F. Cheesman has found a single plant on the largest island, which is entirely volcanic. The plant forms a small tree from 12 feet to 25 feet high, with stout branches; it is charged with a peculiar resin in all its parts, and the bark is easily wounded, producing large callosities as it heals. The leaves are alternate, crowded near the extremities of the branches, and carried on long leaf-stalk, which vary from 4 inches to 14 inches in length, the blades being from 9 inches to 20 inches long, many of the leaves were 30 inches long, including the leaf-stalk, and from 4 inches to 10 inches broad, equally rounded at both ends, or slightly contracted below the middle, with the margins slightly waved, and strengthened by a remarkably stout marginal nerve. They are of a thick texture and bright-green colour. The male and female flowers are developed on separate trees, and are arranged in panicles from 8 inches to 16 inches long at the extremities of the branches. *Meryta Sinclairi* is of great value as an ornamental tree, and is easily cultivated in Auckland, Taranaki, and Hawke's Bay, but is unable to resist the light frosts experienced at Wellington. It is easily propagated from seeds, and, under cultivation, makes a handsome symmetrical tree, very different in habit from the somewhat naked irregularly-branched trees on the Taranga Islands. The finest cultivated specimen is one raised by Mr. Justice Gillies from a cutting brought from the Taranga Islands in 1869. Its present height is 25 feet, the trunk is 4 feet 8 inches in circumference, and the spread of its branches 28 feet. *Meryta Sinclairi* is only known with certainty to be found on two or three islands of the Taranga group, opposite the entrance of Whangarei Harbour, in the province of Auckland district. It is reported to grow on the Poor Knights, further to the north, and may possibly occur on one of the Three Kings Islands, about thirty miles from the North Cape." A specimen of the tree, 3 feet in height, is now in the Temperate House at Kew.—*Gardener's Chronicle*, Nov. 19.

## THE KOLA-NUT IN THE CENTRAL SOUDAN.

(From "Hausaland" by C. H. Robinson.)

To pass on, then, to the import trade of Kano, there is one article scarcely known even by name in Europe, which far and away surpasses in importance every other article of commerce throughout the whole of the Western and Central Soudan. Though not found originally in any part of the Hausa States, there is nevertheless no village or hamlet, however small or remote, in which it is not constantly used. The article to which I refer is the kola nut. It is the product of a tree called "*Sterculia acuminata*," which is found in greatest perfection in the country to the back of the Gold Coast Colony. It is also found as far east as the river Gambia, and, with more or less frequency, in all the intervening country. The fruit resembles a large sized chestnut,

and is encased in long pods, each containing four to six nuts. It grows like chestnuts, in bunches of three or four on the tree. Round the kola nut there is usually black line, sometimes two, at which it can be divided or subdivided. The colour is generally brick-red, though in some countries, especially in the far west, there are all sorts of intermediate shades between red and white. In the country of the Bambarra tribe the kola nuts play an important part in private and public life; the colour in this case has a special significance: a white kola is always a sign of friendship and hospitality; proposals of marriage, acceptances or refusals, detentions, declarations of war, etc., are conveyed by the sending of a number of kola of the prescribed colour. The kola from Gambia, which is of a uniformly red colour, is the one most frequently brought to Kano, as it keeps better than any other. The most minute care and attention on the part of the merchant is necessary in order that the kolas may reach the market in good saleable condition. They are carried for the most part in Kano-made baskets, each of which contains three or four thousand kolas, while two of them form a donkey-load. If treated with the utmost care, the nuts may be preserved fresh two or even three years, but in order to secure this they must be kept constantly damp. If exposed to the air and allowed to dry, the kola opens along the black line mentioned above wrinkles and becomes as hard as wood. In this condition it has lost ninety per cent of its value. During the march the nuts are packed in basket and covered with fresh green leaves. Every four or five days they ought to be repacked, in order that the leaves may be renewed, and that the nuts which are touched with mildew may be removed. The large profits obtainable on the sale of those which reach the various markets in good condition compensate for the risk and trouble of their carriage. A Gambia average nut costs five cowries; at Say, on the middle Niger, seventy to eighty; at Sokoto, a hundred; at Kano, a hundred and forty to two hundred and fifty; at Kuka, on Lake Tchad, two hundred and fifty to three hundred.

What, then, one may naturally ask, are the peculiar virtues of this fruit, which forms by far the most important article of commerce in the Central Soudan? The fact that for generations past it has been eagerly sought after by rich and poor alike, and that men will constantly spend the last cowries they possess in buying one to chew, seems clearly to show that it is something more than a mere luxury. The scientific analysis of the nut shows the existence of a large quantity of tannin and of an alkaloid analogous to theine and caffeine. The natives believe that it keeps off the pangs of hunger and enables them to work for long periods without food. As a stimulant it takes the place which tea and coffee occupy with us, both of these being here practically unknown. Owing to its extremely bitter and unpleasant taste we were prevented from giving the sustaining properties of the kola a fair trial. On the occasions when, through lack of food, we would gladly have made the experiment, we were unable to obtain the nut. Whatever its real virtues may be, it is certain that the commercial power of Kano is to a very large extent dependent upon the millions of kolas which its market contains.\*

If a railway to Uganda be necessary in order to check the slave trade there, one to Kano is tenfold more necessary for the same reason. If it be necessary there in order to secure the establishment and maintenance of order, how much more is it needed here for the same objects! Lastly, if a railway to Uganda can reasonably be expected to pay a dividend, passing as it will through a great part of its length, through districts the natural products of which are almost valueless, how much safer an investment would be offered by one which would

\* For several of the above details in regard to the kola nuts I am indebted to Colonel Monteil's recently published: "St. Louis à Tripoli par le Tchad."

pass through one of the most fertile and productive districts in the whole of tropical Africa. The carriage of the kolanut from the coast to the interior would alone go far towards providing a dividend on such a railway. On one occasion I met a native caravan consisting about a thousand men, together with a large number of donkeys, carrying kolanuts up towards Kano. The value of the nuts in the caravan, which was only one out of several that annually come to Kano for the same purpose, was little less than a hundred thousand pounds sterling. The whole of this immense trade is at present in the hands of natives, as the course of the Niger is not such as to allow of the kolas being carried by water any part of the way.

MADRAS SCHOOL OF ARTS,  
THE ALUMINIUM INDUSTRY.

Their Excellencies the Governor and Lady Havelock, accompanied by Captain W M Campbell, A.D.C., paid a visit yesterday afternoon to the Madras School of Arts. Their Excellencies on alighting at the School were received by Mr. W D Porterfield, Superintendent of the School, and Mr. A Chatterton, B. Sc., who is in charge of the Aluminium Department. The Governor and Lady Havelock first visited the Aluminium Department where an extensive stock of aluminium vessels was laid out for inspection. The introduction of aluminium into the School of Arts for the purpose of making it into vessels for household purposes is comparatively new, having been started only a year ago. The metal-working classes in the School were put to the work, and it was soon found that good articles could be turned out and sold at a slightly higher price than the copper and brass utensils now in vogue. The vessels thus turned out have been used both in European and Native households and gradually the industry has reached fairly satisfactory dimensions. Skilled workmen have been engaged and Mr. Chatterton is confident that with the judicious combination of machine and hand work the articles turned out will be of a high class and eminently satisfactory in the matter of price. The special object of the visit was to inspect this department of the School of Arts, as the development of that industry is now under the consideration of Government. This industry has completely outgrown the resources of the School and Government is considering what steps should be taken to carry out the industry in future. His Excellency suggested that it was not the function of Government to undertake any commercial enterprise, but the exceptional conditions under which aluminium had been brought into the country rendered it extremely desirable that Government should, in some way, actively support the movement, which is likely in the immediate future to give rise to a new and important industry in this Presidency. His Excellency inspected the Workshops and was particularly struck by the various equipments which are now being made for the Military authorities, especially for the Medical Department. Just at the present time the aluminium industry in the School of Arts is attracting a great deal of attention, and there is likely to be a great extension of operations at the beginning of next year. His Excellency was then taken to the Art Department, where the designs, chased and in relief, on the jugs and plates were of an artistic character. After an inspection of the carpet-weaving rooms, and the other Art Departments, Their Excellencies brought their visit to a close.—*M. Mail*, Dec. 7.

PRODUCE AND PLANTING.

CANDID FRIENDSHIP.—The uses of adversity are not always sweet, but they teach some useful lessons. One of them is that friends become unusually candid when fortune is unkind. "If my advice had been followed," or "If he had not made the mistake of," &c. We all know and resent the cackle which is offered us by way of comfort if we have made a mistake or are the victims of circumstances, although there may be unpalatable truth concealed somewhere about it. Those engaged in the tea industry must not expect to escape the plain speaking of those candid friends who feel compelled to tell them why tea is under a cloud. Planters are becoming used to the statement that over production is the cause of all the trouble, and that the exchange question has little or nothing to do with it. If any doubt exists about this it should now be dispelled, for a trade paper, the *Produce Markets Review*, joins the chorus of accusers, and takes the opportunity of referring to one or two additional shortcomings in connection with tea which it is its duty as a candid friend to point out. Possibly the trade authority who writes in the *Produce Markets Review* feels that he ought in the interests of the tea trade to say all this on the better-late-than-never principle. Any way, he does not hesitate to shoot, and whether he hits the mark those who are aimed at must decide. He says: "A telegram in a recent *Times* shows that the Darjeeling planters consider one of their chief grievances to be the artificial raising of the rupee to about 1s 4d, which has been caused by the closing of the Indian mints by Government. As the London *Economist*, however, points out, the less favourable exchanges would not affect planters, were it not that the supplies of tea had been in excess of the demand. They would, had the reverse been the case, simply have recouped themselves by raising prices. Nor is there much in the contention that the growers in China benefit to the extent of something like 3d in the rupee's worth, or, say, 1½d on each pound of tea, owing to their having the benefit of a natural exchange. Unhappily as some people think, happily as the Indian planters thought, China tea counts for little here, for the coarser Indian and Ceylon teas have nearly driven it out of use, except among the faithful, who either like delicacy of flavour or dread too much tannin. Wild suggestions are made in India, such as calling upon the home Government to counterveil the bounty which the exchange gives to foreign growers by putting a much higher duty on foreign-grown tea, or by levying duty on foreign tea only. Such remedies are not only impracticable as being contrary to our settled financial policy, but they would be useless, because no appreciable quantity of foreign-grown tea is used here."

THE WHY AND THE WHEREFORE.—"Here again appears the surprising increase of 8,782,000 lb over the delivery of Indian tea in 1897, eclipsing all former records, and confirming, in a striking degree, the 'stronger demand' that, so far back as last spring, was looked forward to with well-grounded confidence by both importers and dealers. It should, however, be explained that a portion of the augmentation in the above clearances is due to the larger quantities taken for exportation from the United Kingdom this year, which, as officially returned, have equalled 5,984,850 lb, as compared with 4,235,750 lb in the ten months of 1897, and 2,901,950 lb in the previous year. The separate entries of the same kind of tea for home consumption from January 1 to October 31 aggregated 108,506,200 lb, in lieu of 102,367,350 lb and 99,732,164 lb respectively in 1897 and 1896. As we have repeatedly observed in our market reports, the demand has run chiefly upon the common and low medium leafy sorts, from 5½d to 8d per lb, teas 'for price' being, more than ever, a prominent feature of the season. At its commencement quotations were at a moderate level, and on comparing them with those for similar grades of Ceylon, it was at once seen that Indian teas offered decidedly better value for money. The latter there

fore have served as a great boon to the big blenders of packet teas and exporters on Continental account, and, inquiries having gone on increasing rather rapidly, subsequent purchases have been made at gradually hardening rates."

**MORE FAVOURABLE STATISTICS.**—"In alluding to the size of the present season's crop of Indian tea," says the *Grocer*, "we can speak in only general terms, as no detailed statement, giving the yield for each important district under cultivation, has yet been received. The nearest approximation to what the total production is likely to reach is that contained in the 'revised' estimates forwarded from Calcutta to the Indian Tea Association (London), which put the aggregate crop for 1898-99 at 154,000,000 lb. as contrasted with a trifle over 148,000,000 lb. actually grown in 1896-97 and 1897-98. Of this season's crop it is reckoned that 136,000,000 lb. will be available for the United Kingdom, which is about 4,000,000 lb. below what was originally estimated, and 2,000,000 lb. more than in 1897. The statistical position of the article, as at present, is thus represented to be more favourable than it was at the beginning of the new season, and the improvement is mainly owing to the largely expanded shipments direct from Calcutta to 'outside countries,' such as Australasia, America, Bombay, and sundry ports, which, from April 1st to September 30th (the latest date named) embraced 8,099,100 lb. in comparison with 5,204,400 lb. last year, and 5,710,800 lb. in the year before. By these means, and the additional demand from shippers that has arisen here, the home market has been sensibly relieved of accumulating and excessive stocks, and prices instead of declining have been pointing towards recovery, a tendency which will probably be maintained for some time to come."—*H. and C. Mail*, Nov. 25

### THE PRESENT POSITION OF THE TEA PRODUCING INDUSTRY.

To the Editor of the "*Home and Colonial Mail*."

Sir,—Recent articles and correspondence in some of your contemporaries would indicate that there is at present a state of panic among tea estate shareholders and proprietors. An undue amount of importance is frequently attached to the ex cathedra utterances of editorial or epistolary anonymity, and I would suggest to those interested in tea property that it would be wiser to be guided by men who have spent a lifetime in connection with tea business rather than to be influenced by unknown contributors to newspaper columns.

I have often admired the manner in which a professional pressman will go round and pick up information on a subject of which he practically knew nothing previously, and how remarkably well, in the main, he will make use of his facts; still, a specialist in any department of commerce can readily recognise the hand of the amateur, however, capable he may be in the literary way. It takes little practical knowledge of tea matters to see that the *Pall Mall Gazette* writer has merely gathered together a few out-of-date impressions to create an alarmist scare, which can serve no purpose today; but which, if engineered four years ago, might have been of value to investors. He appears to be in communication with someone of the planter class in India, probably a man unsuccessful in his own line, and therefore unlikely to be in a condition to take a broad and general view of the position.

There is, of course, something approaching to all crisis in the tea-producing industry, but having in view the comparatively large extent the business has now attained, the situation is nothing like so serious as during several prior crises. Men are still alive and active who saw tea-planting started in Assam, and who have witnessed its many fluctuations. The present position is that the old holders or original shareholders in companies which have not been recently reconstructed on an increased capitalisation have seen

the value of their shares go back to something like the level current before the time of inflation. Recent investors have seen a fall in what they subscribed for or bought at the top of the market. The general investor is much to blame for, a few years ago, running up the prices of preference and ordinary shares in tea companies to a level where the annual return did not allow for such a set-back as is now being felt. Then the public have subscribed freely for new issues in companies, the avowed object of which was to plant larger areas of tea, and thus increase production. Many of those companies were carefully schemed out and judiciously planned, and have not yet suffered much in net revenue by over-production and consequent low prices. What they have suffered from are the unforeseen contingencies, for which in a semi-speculative business like tea-planting an ample allowance should always be made. Famine, drought, abnormal weather conditions generally, earthquake, labour expenses, and above all exchange, are so far responsible for more loss than are low prices. The almost continuous fall for many years in the level of exchange with silver-using countries gave a reasonable justification for the belief generally held until about two years ago, that only a check to the production of silver would stop the fall in the exchange value of the rupee. Consequently, many people reckoned on a lower, rather than a higher, level of exchange. How much this affects the position will be seen when it is known that the difference in annual net income to the owners of all the Indian and Ceylon tea estates, as between exchange at its present level and at its lowest point, is about £1,000,000, an amount which, if distributed in dividends now, would go a long way towards advancing share quotations to the highest on record.

The market prices of tea are undoubtedly lower than ever, but that was a result clearly foreseen by many, and only in keeping with the experience of the last twenty or thirty years. It was anticipated and provided for in most cases by extensions which were designed to increase the yield, and so to maintain the net revenue.

History has repeated itself in tea, as in other matters, and every general decline in price has been followed by an increased consumption. During 1898 the increased consumption of Indian tea at home and abroad has been on a larger scale than ever before in the history of the industry, and there is no doubt now that within the year much more will be consumed than has been produced. There is little need to agitate for new markets. The largest and best of those have opened up themselves through the ordinary channels of trade, and every possible outlet in new directions is closely watched by practical distributors eager to widen their connections. It is merely a question of price, and lower values have done more in the last twelve months to increase the sale than the efforts of special missionaries in as many years. The remarkable point about the increase is that it has taken place chiefly in quarters where no special efforts have been made—except by ordinary traders—to push British-grown teas. This fact may suggest to the associations in Calcutta and Colombo the advisability of withdrawing their commissioners and devoting their attention and funds in other directions. If they still consider it necessary to appeal for voluntary, or to collect forced levies, let them apply the money raised to some scheme having in view the improvement of quality, and the reduction of the quantity of inferior tea.

The position is gradually modifying, as it has done before. Unprofitable estates, or sections of such, are being abandoned; expenditure is being more closely watched; greater efforts are being made to produce tea of good quality, with the result that there is some reduction in the quantity made. The abnormal weather conditions referred to above have doubtless restricted yields, and there is much reason to be thankful. One of the most serious risks ahead is that of a "bumper crop" coming simultaneously in India and Ceylon before the volume of consumption has advanced sufficiently to absorb easily the yield,

Some cranks may take the advice given them by one writer and destroy good sound tea by making it into Oolong or green, and they will be wiser after the event; but anyone with an expert knowledge of tea who expects Indian unfermented teas to "rive out" Japan is only fit to herd with those who for the last years have been shouting the parrot-cry, "Capture the American market."

In conclusion, let me repeat the advice to investors and producers, not to allow themselves to be influenced by anonymous scribblers, but rather to consult experienced tea or share brokers, who have an expert knowledge of the producing and distributing conditions of the great tea industry.—I am, sir, yours faithfully,  
JOHN McEWAN.

10, Lime Street, E.C., London, Nov. 21, 1898.  
—*H and C Mail*, Nov. 25.

**SALE OF TEA ESTATES.**—The sale of the Binaguri and Dim Dima Tea Estates by Messrs. Gow, Wilson, and Stanton, at the Commercial Sale Rooms, Mincing Lane, on Wednesday last, was well attended, and created a good deal of interest. The reserve price not being reached, the properties were withdrawn to be treated for by private negotiation.—*H and C Mail* Nov. 25.

THE CALEDONIAN (CEYLON) TEA ESTATES, LIMITED.

The First Annual Ordinary Meeting of this Company was held at the office of the Company, 11 Old Road Street, London, on Thursday, 24th Nov., Sir Alfred Dent, K.C.M.G., in the chair.

The Secretary read the notice convening the meeting, and the Directors' Report and Accounts to 30th June last were taken as read. The Board recommended the payment of dividends at 6 per cent per annum on the Preference Shares and 6s per share on the ordinary shares.

The Chairman stated that the Company in common with all other Ceylon Tea Companies had during the past season exceptional difficulties to contend with—drought, extremely cold weather, low prices in London and high exchange. The rise in exchange had been anticipated in the prospectus, the rate having been taken in the estimate at 1s 4d., but the unusual dryness and cold of the season could not of course be foreseen. The crop owing to the causes named had fallen considerably short of the estimates, and the dividend on the ordinary shares was therefore not so good as anticipated when the Company was formed.

The prospects for the current season were however, much more promising, and a cable received from the Manager in Ceylon on the 16th inst., reported a very satisfactory increase in the yield to that date, over the corresponding period last year. The prices of the teas sold so far on account of the present season also showed an improvement, and if these prices were maintained, the next annual accounts would show a very different state of things.

The statistical position of Ceylon tea was satisfactory; notwithstanding the increase in imports the stock in London at 31st October was nearly one and half million lbs less than last year, and the way in which the consumption was being pushed all over the world was shown by the large quantity shipped to countries other than the United Kingdom.

With regard to the Co.'s Estates the Manager in Ceylon reported that they were all looking well and he (the Chairman) felt sure that the Company's interests were quite safe in the hands of their

General Manager—(Mr. J Stanley M Ross) who was himself a considerable shareholder, and was doing all his in power to make the Company a success.

He concluded by moving the adoption of the Directors' Report and Accounts, and the resolution having been seconded by Mr. Alexander Ross was carried unanimously.

The election of Messrs. Singleton, Fabian & Co. as Auditors and a vote of thanks to the Chairman concluded the proceedings.

RUSSIA AS A TEA-GROWER.

Serious attempts are now being made, says the St. Petersburg correspondent of *The Financial News*, to introduce in Russia the cultivation of tea, especially in the Caucasus, where, according to official statements, experiments so far made have given very satisfactory results.

During the current year about 400 Chinese families have settled down in Southern Russia with the special mission of initiating Russian planters into the secrets of this branch of agriculture. The tea fields are situated in the immediate neighbourhood of the sea, running along the Batoum-Tiflis line. The harvest, on a grand scale, is to begin shortly, with the help of the Chinese, who are kept here by contract, and are already getting accustomed to the climate.

At the same time, I may mention the announcement which I have been unable to verify, that a German syndicate, including well-known capitalists, is about to found colonies in the Crimean regions of Alma, Katscha, and Balbeka, where tea, cotton, and sugar-cane plantations are to be established.—*H. and C. Mail*, Nov. 25.

**TOWER TEA.**—The directors have declared an interim dividend of 7½d per share on the ordinary shares for the half-year ended September 30th. The transfer books will be closed from Thursday, Nov. 24th, to Thursday, December 1st, and warrants for the dividend will be issued on December 1st.—*H. and C. Mail*, Nov. 25.

FLORIDA BEANS: AN ENORMOUS CROP NEAR BENTOTA, CEYLON.

Kalutara South, Dec. 12.  
I send you per train today some velvet beans, part proceeds from the dozen seeds you sent me, I never saw anything like it, the crop is enormous. I think one good creeper will keep a family going—this climate seems particularly well suited for it. [The beans kindly sent us are of a large size, well-filled.—ED. T.A.]

THE CEYLON HANDBOOK AND DIRECTORY.

I have your new Directory and the map here, and can only repeat opinions formerly expressed in regard to their predecessors as to their get-up, completeness and usefulness. The general appreciation of your work must be very gratifying to you and your staff, and some recompense for the trouble and pains taken.—"*Ceylon Colonist*" now settled in London.

The Secretary (Mr. J. S. Callie), of the Financial Reform Association of Liverpool (established 1848—and just holding its jubilee), writes:—

"Many thanks for your Ceylon Handbook and Directory. It is a wonderful compilation and reflects credit not merely to you the compiler, but also to the colony."

### “THE POSITION OF TEA.”

We are much obliged to the Colombo Merchant who has drawn our attention to the pungent and telling article in the “Produce Markets Review” which, as reproduced and commented on by the “Home and Colonial Mail” will be found on page 480. Written from the point of view, and in the interests of certain tea-dealing houses—whose organ our contemporary mainly is—the article nevertheless, embodies opinions which have long been passing through the minds of many merchants and planters, in Ceylon at least; and although there is severe criticism of the latter as responsible for over-production, yet we feel sure, our producers will thank the writer in the “Review” for speaking so plainly and for affording information not within our reach in Ceylon in respect of one side of the question. We now leave the article to speak for itself.

### LIQUID FUEL STEAMER.

The ss. “Sultan Van Langkat” arrived here recently from Lancat on the east coast of Sumatra via Calcutta. She is an oil tank boat, but on the present occasion has a cargo of coals. The Company to which the steamer belongs have five other steamers and several launches worked with this oil, and we understand that there is a small railway at Klang, near Penang, where the engines are worked very successfully with this fuel. The speed of the vessel is fast, 12½ knots an hour, and she performed the voyage between Calcutta and this port in 4½ days.

### THE CHARGES ON TEA.

Our correspondent “W.H.M.” deals elsewhere with a standing grievance in regard to the regulations and charges affecting tea in the London market. We trust he will not let the matter rest, until he sees it further considered in Committee of the Planters’ Association, and, if need be, referred to the Tea Committee of the Ceylon Association in London. Of course the existence of the regulations complained of, may be regarded as an argument, or inducement, for planters, to sell in the Colombo rather than the London market. But it is strange how opinions vary in this matter? One planter at a high elevation only the other day wrote to us that, dissatisfied with his experience of the Colombo market during 1898 (for fine teas), he is going to ship once more to London in order to try Mincing Lane in the hope of doing better during 1899. Let him take note of the obnoxious regulations and charges before he shifts his patronage.

“PLANTAIN MEAL” is the subject of a report by Mr. Driberg of the Agricultural School issued to the press and embodying information gathered from the West Indies and India. We think most of the information has already been given in one shape or other in the volumes of our *Tropical Agriculturist*; but we are looking up our pages to see what is new. Both Mr. Hart, of Trinidad, and Mr. Fawcett, of Jamaica, have little hope of a trade in banana meal and yet the West Indies (so close to the grand market in North America) have a far better chance of developing such a trade than has India or Ceylon. Perhaps Cuba, with American enterprise, may lead the way.

### COCONUTS IN THE NORTH-WESTERN PROVINCE

#### THE NEW DESICCATING MILLS.

MARAWILA, Dec. 11.

The weather seems to have set fine at last. Previously, we had a day or two of fine weather and it changed to wet without any warning. The rainfall for November was 31.71 inches, more than half of which fell in three days. The canal is again at its normal level and is very muddy. This month so far we have had 3½ inches of rain. The soil will be none the worse for a little drying and airing.

The Orient Company’s Desiccating Mills here started work at the beginning of this month. These are the days of small things so far, and like all enterprises in new centers it is feeling its way. Local hands have to be trained after they are attracted to the Mills. Possibly by next year the work of desiccating will be in full swing.

The price of nuts has gone up; whether it be due to increased local demands or to a rise in the price of copra this dependent knoweth not. The result, due to whatever cause, is an advantage to coconut estates. A disadvantage is that the higher rate of wages and perhaps more congenial work is drawing away our Sinhalese labour to the Mills.

### USEFUL KIND OF ORCHID.

A fine specimen of the Vanilla orchid is now producing an exceptional quantity of its fruit in one of the banana-houses in Earl Percy’s garden at Syon House, Brentford. The Vanilla planxolia is well-known to science as producing the best vanilla, which is so greatly valued for its flavouring properties. The fruit is produced in pod-like bunches, as many as ten to eighteen pods growing in a single cluster.

While possessing such value in the fruit, which is straight and of a dark olive green, the blossoms are usually dull and uninteresting. The plant is of climbing habit, and largely distributed over the tropical regions.—*Daily Mail*.

### FACTORY EXTENSIONS.

The extension to the Haputale estate factory is well-nigh completed. The original factory was about 98 ft. by 40 ft., and now an additional length of 26 ft. is being put up. Another factory is in course of erection on Berragalla estate, under the supervision of Messrs. Brown & Co., Hatton, whose engineer, Mr. Turnbull, has been up here often about it.

It is rumoured, and is probable, that a very large factory on the famous Dambetenne estate, so well-known as the estate where the late lamented Hon. Mr. R. B. Downall spent most of his days whilst a planter, and now the property of Liptons Ltd., is to be erected shortly. Everything in connection with the same, it is said, is to be indented for from England—even the engineers.—*Haputale Cor.* of Local “Times,” Dec. 12.

NEW TEA BOXES.—An old Ceylon resident at home with no interest in the box we believe, writes:—“I send you particulars of a small company called the ‘Colinda Tea Chests’ a consignment of a few thousands having just been despatched to Ceylon. They are the best I have yet seen and surpass the ‘Venesta’ so far as fastening goes.”

JAVA CINCHONA.

The report of the Batavia Government on the operations of the Government cinchona-plantations during 1897 has just been published, but it contains few features of special interest or which have not been referred to already in this journal. During the year the plantations sold 321,773 kilos of bark, and the profit for the year was 9,900 florins—not a large figure, but the director says it would have been double were he not bound down by rules which prevent free action. The report concludes with a paragraph of significant advice to private planters, which is notable since it has the endorsement of the Batavian Government—viz., that if the planters are far-sceing enough to support the Badoeng quinine-factory, and only send moderate supplies of bark to Kurpe, the future should be a bright one for them, and they should have no difficulty in keeping up prices.—*Chemist and Druggist*, Nov. 26.

DUTCH COLONIAL TEA Vs.  
ENGLISH TEA :

(A hint for the Board of the "Soekaboemische Landbouwvereniging" and those interested in the growth of Dutch Colonies and trade.)

Under the above heading, Mr. J. van der Chys, head of the firm of Wel. J. van der Chys en Zoon's tea department, Delft, writes as follows in the *Indische Mercuur* of Nov. 19:—

Knowing that the *Indische Mercuur* has a place in the offices of all Indian branches, and is read by Dutch capitalists as well as by the planters of Java, so that a communication published in it reaches the eye of every interested individual, I prefer to take advantage of this means of bringing the following under the notice of the abovementioned Company and all others interested.

The cultivation of tea in Ceylon and English [*sic*] India has developed in only a few decades to an unprecedented degree.

The production of both countries together amounts to about 250,000,000 English pounds per annum. In both colonies [*sic*] some 1½ million natives by this find employment, whilst the place of sale—London—becomes thereby provided with hundreds of offices, the source of subsistence and welfare of staff and dependents.

Java now after improvement of method yields a product that competes with the best English colonies. New plantations are now opened in Java on a comparatively modest scale, yet the crop there at most amounts to only 10 to 12 million pounds, or about as much as thirty years ago, when British colonial tea was as good as an unknown quantity. By the reports of those engaged in the cultivation, and according to well-known published figures of dividends, it is in Java very profitable to the growers.

Cinchona estates also that no longer give returns are now being altered for the growth of tea.

The world's consumption is steadily increasing, and Java tea must find an entrance in every place where the English houses have pushed their product and have known how to guide the popular taste in this direction in their own interest.

Java tea therefore with greater production finds a way already opened up for eventual surplus crops and the supplanting by our product of the English-Indian teas, which are exactly parallel to it, pre-

sents therefore few difficulties. These difficulties are however considerably less than those that the English combination had from the commencement to overcome, viz. the alteration of the taste accustomed to China tea to that of the teas of their own colonies. Truly a gigantic leap, and upon which every business man is agreed.

I think the above introduction necessary in order with greater emphasis to bring before the eyes of those interested the enormous importance of the two following reports, both of which I append in the original English text:

The firm of Carritt & Co. wrote in their report, dated Calcutta, Sept. 1:—

"The return to producers at the present low rates for tea generally is most discouraging, and in many instances the margin of profit to growers has reached vanishing point. The position may in a great measure be attributed to the fact that consumption has not increased to the extent as was the case with the supply; the prosperous days of low exchange led to a great opening out of the country, the produce of which has now to be dealt with under the burden of an appreciated rupee; and whereas, when exchange was low, prices were high, the exact reverse now obtains. By materially reducing the acreage under tea, which means the loss of thousands of pounds of British capital, and working up new markets, the level of prices may by slow degrees be raised, always supposing that China, with an enormous bounty of nearly 50 per cent in her favor\*, does not attract English energy and capital. The outlook, with the rupee on its present appreciated basis, is therefore far from reassuring, and it is not surprising that it is viewed by those holding large stakes in the industry with less equanimity than that displayed by many supporters of the Government."

Since writing this I have read in the *Grocer* of Nov 12th last the following report under the heading "Indian Tea Growers and the state of Exchange":—

"The Darjeeling Tea Planters' Association has resolved to hold a special meeting on November 14, at which the following resolutions will be proposed: (1) that this meeting views with great alarm the present proposal before the government for fixing exchange at 1s 4d as calculated very seriously to injure, if not to ruin, the Indian Tea Industry, and resolves that the tea Associations of Assam, Cachar and all other tea districts of the Indian Tea Association, also the Tea Association of London, be addressed on the subject with the object of taking united action and, if thought advisable, of drawing up a petition to the Secretary of State praying that some aid may be afforded, either by imposing a higher duty on foreign-grown teas in proportion to the difference in exchange or by altogether removing the duty from British-grown teas, as a counter-balance to the abovementioned rate of exchange. (2) That in view of the critical position of the tea industry in India and Ceylon a conference be held in Calcutta, which one or two delegates from all the Associations shall be invited to attend, to discuss means for ameliorating the same, the proprietors also being invited to attend."

In my opinion, English industry (especially Manchester, which, to mention the single example of the cotton goods industry, has a monopoly of sale for this article among nearly the whole of the British Indian population, and the gigantic figure of which is well-known) has interests at too great variance with the tea planters, whose branch of business is at once allowed to sink into nothing,

\* The firm takes no account of the tea export duties in China, which amount to about 35 per cent of the value of tea (taken in round numbers). Their estimate is therefore reduced to only 15 per cent, which gives China the advantage over English India. Why is nothing said in the report about Java? Perhaps: Sleeping logs . . . &c.?

rather than that the English Government should give an ear to the above cry. Should however such be the case, against the interest of our planters, and the English Government take the means referred to, it would be desirable, that our Government took methods of reprisal, and, as a set-off to the restriction of Java teas in the English market, caused an equivalent ranging in the tariffs of *all* teas imported here from England.

The fall in the quotations of some of the principal English-Indian tea-growing companies may be seen from a comparison of the quotations on the dates given below :—

#### THE LATEST "TEA CHEST."

This, as we have already intimated, is the "Colindia" Tea Chest which is made of "British Colonial Vencer" and for the promotion of which "The Timber Tea Chest Co., Ltd." has been formed with offices at 22, Fenchurch Street, London. The Directors, we learn, are Messrs. J. L. Anstruther, Edmund Walker and Edward Ames—all men with Ceylon experience and who ought to know what they are about in bringing out a new tea chest. Their Company is to have a capital of £8,000 with an issue of £7,000 and the Agents in Ceylon are Messrs. Carson & Co. and Messrs. Walker Sons & Co., Limited. Mr. James Francis Bennett is the London Secretary *pro tem*.

Great advantages are claimed for the new chest: the material used is perfectly inodorous; and no piece of wood is placed in contact with the tea; all boxes to be the same weight and consequently even tares; so that *half the cost* of the "Colindia" chest is to be saved to the shipper in freight and dock charges! The Directors go on to claim that "a better article is offered at a cheaper price than either 'Momi' or 'White wood' chests." Instructions for setting up the "Colindia" tea chest are given and "40 to 50 chests per day can be constructed by an unskilled workman" we are told. Anything *new* in the way of tea chests or other contrivance to benefit the tea industry is of interest to the Ceylon public and that is our reason for publishing these particulars from papers sent us. The prices, &c., will, no doubt, be advertised in due course. As yet, we believe, no consignment of the new chests has reached the island, though one is on the way.

"A PRELIMINARY STUDY OF THE PRICKLY-PEARS NATURALISED IN NEW SOUTH WALES"—By J. H. Maiden, Government Botanist, and Director of the Botanic Gardens, Sydney, has just reached us in pamphlet form with several fine illustrations. It gives much useful information.

#### PLANTING NOTES.

**ALOES IN CEYLON.**—A colonist writes:—"I see a letter in the T.A. from W. M. Young—a man of many experiments and vicissitudes. There are plenty of aloes in Ceylon; but they all flower at 8-9 years, after which they are useless. W.M.Y.'s aloes will be a flowering jungle now. Old William Smith experimented on a big scale once, I believe, but all failures."

**A NEW FOOD PRODUCT**—for the lowcountry, may well be found in "the Florida bean," the seeds of which (provided from Australia by our late friend, R. L. M. Brown, who was ever ready for new experiments) we distributed some months ago. It will be observed that in South Kalutara district the creeper flourishes exceedingly, and returns a really abundant crop of very nutritious beans for family use.

**BUDDING THE MANGO** has been generally considered an impossibility, but this is a mistake because it is done by experts in Florida, and it can be done by others when understood. The secret lies in taking the buds from about the middle of the growing shoot where they are well developed, and yet not too tender—where the color of the bark is just turning from green to purple—and at a time just prior to a vigorous stage or growth in the tree to be budded. The shield method has been used, but I believe the ring or plate style would be better.—*Journal of the Jamaica Agricultural Society* for October.

**THE AMERICAN "TEA EYE."**—Under the above heading the *American Grocer* says, in reference to the letter (which it quotes) of our correspondent, who calls for big vigorous measures to open American eyes to the excellence of Ceylon teas, that Americans are not "absolutely blind but keenly alive to the merits of Ceylon tea." In proof it quotes the circulars of two prominent distributors of good products on the Atlantic and Pacific coasts. We copy the former:—

#### CEYLON TEA.

Oriental Visitor of High Caste.—From that pear-shaped island south-east of India, described by some as the "Modern Garden of Eden."

They know how to grow fine teas there, and how to prepare them. Strong point about Ceylon teas is their cleanliness; another their fragrance and strength, making them more economical to use, because you need less of them.

Very rosy flavour. You may not like it at first, but probably will before long.

It goes on to affirm that the American "tea eye" is wide open on both sides of the Continent for whatever method may supplement the able work of the Ceylon and Indian Tea Commissioners. The article concludes thus:—

We must recognise that the flavour and strength of British-grown machine teas are so different from China and Japan teas that Americans must be educated step by step up to an appreciation of their merits. They are not a tea-drinking people, preferring coffee and beer, which condition is by some attributed to climatic conditions; but whatever the cause there is abundant promise to the persistent advocates of Ceylon and India tea that every year will see an increased demand. "We may not like them at first, but will before long."

Not, however, if low-grade or trashy tea is forced on this market. Just so long as there is merit in the teas of Ceylon and India they are here to stay. The popular taste is fickle and varies in different sections. The Eastern and Middle States prefer fermented tea; the Western and South-western, green or unfermented leaf, and it is folly to attempt to force a change in the character of the demand, except by intelligent and persistent effort.

**CEYLON TEA IN CANADA.**—It is a pity that the advantage which the new tariff will give to British-grown teas in the Dominion does not ensure the supersession of a larger proportion of Japan and China teas than is now consumed. Unlike the United States, Canada has long been a good customer of Ceylon and Indian teas. We gave a lecture, urging the superiority of Ceylon over China teas to a select body of merchants and tea dealers in Toronto, so far back as 1884. We only trust that our cousins in the States may follow the good example of the Canadians, in their taste for superior teas.

**DRIED BANANAS.**—An enterprising firm in Queensland, where enormous quantities of bananas are grown, recently sent over to the officers of the colony, Victoria-street, Westminster, some cases of the fruit in a dried condition, for which it is thought there should be a large market. It is not claimed that dried bananas will find a high place among pippins, prunes, or apple rings, as stewing transfers the flavour to the juice to a marked degree but when used instead of raising in a pudding, the dried banana has an exceedingly agreeable taste. Moreover, it has no seeds and need not be "stoned," like dried grapes, a point worthy of note in these labour-saving days.—*Daily Mail*.

**THE NORTHERN DISTRICT PLANTERS** are ambitions in their way. They do not want cacao to be lost sight of, and quite right to; but we do not think that any steps taken by the Parent body will result in any fuller or better information than we present at the present time each month—which ought to be filed by every cacao as well as by every tea planter. We watch every Consular Report issued for the tropical world as well as every magazine, Report or paper, for anything bearing on cacao or other special tropical products; and we should be much surprised if the Planters Committee could add much to the material at command. As for crop estimates they are unknown; and for cacao have not yet been adopted even in Ceylon!

**LONG DISTANCE MAXIMUM OF ELECTRIC POWER.**—At the Society of Arts, Mr. L. Gaster said that he had visited some institutions in Switzerland, and had seen a steam-engine factory where a current of 5,000 volts was transmitted from a river  $12\frac{1}{2}$  miles away with an efficiency of 77 per cent., and it was used for all the purposes of the factory. Some time ago Mr. Wallace read a paper at the Society of Chemical Industry on the utilisation of water-power, in which he said that by that means power could be supplied at a profit for £4 per annum per horse-power, which was cheaper than steam. The one requisite was to have a very large central station, as in that way it was produced more economically. For long distances the way to reduce the charge for copper was to increase the voltage. From Laufen to Frankfort, a distance of 108 miles, a high voltage transmission (although double transformation was used) gave an efficiency at Frankfort of 73 per cent. Large works always produced power more cheaply than small ones, and small manufacturers did better by obtaining their power from such sources than by working independently. Professor Forbes had shown that long distances were no obstacle, and there was every reason to believe that the time was not far off when this method would be very largely adopted. If England had no great amount of water-power she had cheap coal, and if large central stations were established near the coal pits it would be a great benefit to the people at large.

**PLANTING IN COSTA RICA.**—Mr. Huntley Thring has a high opinion of the prospects of coffee and cacao in this, about the best-governed and richest of Central American States. He considers that young men of the right stamp with £2,000 to £3,000 of capital, going out there now would stand "to make a fortune" (after the old fashion in Ceylon) which it is well nigh impossible to do in India or Ceylon now.

**THE CRYPTOGRAMIST.**—H. E., the Governor said quite truly that the services of a competent Cryptogramist are very difficult to get. The more pity then, if Mr. Carruthers is allowed to resume duties in England without making him such an offer as would induce him to take up permanent work in Ceylon; for it is absurd to suppose that any scientist is more necessary than he, in a land so rich in fungi.

**CINCHONA PLANTING.**—We direct the attention of planters, who think of following our advice about giving a fresh trial to cinchona, to the letter of "Old Uva." There is much truth in its statements and we trust not a few plantations will get fresh seed and do justice to cinchona nurseries and the result in planting out. We feel sure they will not regret the little expense involved in such an experiment.

**AN ELEPHANT'S SICK DIET** is recorded as the result of an illness at the Zoological Gardens of Frankfort-on-the-Main. A female elephant there suddenly refused food, groaned continually, "wept," it is said, and became weaker and weaker. She was given draughts of brandy (pints), and reduced to a diet of buckets of gruel three times a day, each bucket containing forty quarts. She soon recovered, but the dieting still continued, and the last bulletin describes her present diet as thirty buns, a hundred-weight of hay daily, and suitable drinks.—*D. Chronicle*.

**TEA IN INDIA.**—Mr. H. R. Irwin spoke as follows at the Darjeeling planters' meeting a month ago:—

Of the teas sold in Calcutta this year I believe I am within the mark in saying 75 per cent of them have barely covered the cost of production, and if that is the case, it requires very little argument to prove that another similar season must mean the abandonment of thousands of acres of tea and the ruin of hundreds of Europeans, not to speak of natives thrown out of employment; in fact I fancy there are many gardens to which a very difficult question next season's financing will be, and already there are rumours going round of more than one large concern about to be totally abandoned. The first thing to consider is, what is the cause of the present disastrously low range of prices? A great many argue that it is due to over-production, but looking at statistics, I do not see how this contention can be sustained. Personally I fully believe that the "rotten" artificial rupee, inflated to very much more than its true value is at the bottom of the bad state of the industry, and nothing else.

Proposed by Mr. H. R. Irwin, seconded by Mr. Nosworthy: "That this meeting views with alarm the present proposal before Government for fixing exchange at 1s 4d as calculated to very seriously injure if not ruin the Indian Tea Industry, and resolves that the Tea Associations of Assam, Cachar, and all other Tea Districts, the Indian Tea Association, and also the Tea Association in London, be addressed on the subject of taking united action; and if thought advisable, drawing up a petition to the Secretary of State for India, to be signed as widely as possible by all interested in Indian Tea praying that some relief may be afforded either by imposing a higher duty on foreign grown teas, as a counter balance to the Bounty practically being offered to foreign teas by the above-mentioned rate of exchange."

**LIBERIAN COFFEE** (writes a Sumatra planter) after standing for a long time at \$17 in Singapore (per picul) has by slow degrees got up so far as \$21; but Singapore is no market for Liberian—nor is London. Havre, Hamburg and Amsterdam all pay better prices than London—and from what I have heard, I believe Trieste would be well worth a trial.

**SPANISH CHESTNUT.**—With reference to the cutting from the *Planter*, of 15th October, re Spanish Chestnut, I quite agree with the remarks made therein:—

The Spanish Chestnut. This is a fine ornamental tree, and it is pretty well known this way that a recently retired distinguished member of the Indian Government waxed enthusiastic about it, and its fruits, or rather nuts, as a valuable famine food; but Portugal and Spain are not India, and even up here where the nut should keep if anywhere, it rapidly deteriorates, and the plains such as the Dun, where it has been introduced it is bad and useless; in a very short period, and is just about as likely to become a famine food as apples, to say nothing of the intolerable time of waiting before the trees come into bearing. From a commercial or economic standpoint this European nut in India must be written off as a failure. Darjiling planters have a climate and elevation that would grow the Spanish chestnut well, and an isolated plant put in here and there, apart from a few seeds of nuts for home consumption, would form fine, attractive and very distinct objects in a few years.

We have a couple of plants here and though fairly healthy they do not make much headway and it will be a very long time before they are fit for bearing.—*Cor.*

**THE BAHAMAS.**—Governor Sir Gilbert Carter has sent a very interesting report on the Bahamas to the Colonial Office. The present population of the group exceeds 52,000, the coloured inhabitants outnumbering the whites in the proportion of six to one. The sponge industry continues to flourish, and the cultivation of sisal or Bahamas hemp is reviving after a threatened collapse. The price of sisal fibre has advanced very considerably, a fresh impetus has been given to the industry, and, while the sanguine anticipations once entertained will have to be modified, there is good ground for the belief that the colony will ultimately benefit largely from the cultivation and manufacture of sisal. The orange growers have done well, and the opinion is expressed that "if the hundreds of young Englishmen who have had such disastrous experiences with orange groves in Florida had made their experiments in the Bahamas, their fate would have been very different." A new source of profit for the Bahamas has been tapped by the exportation to the markets of New York of over 600,000 grape fruit. The fruit, sometimes called the pomelo or "forbidden fruit," has suddenly sprung into great popularity in the United States. Its bitter-sweet flavor is very refreshing, and the juice is considered to have a remarkably good effect on the digestive organs. Five millions of pineapples were also exported to the United States, four-fifths going to the canning factories at Baltimore. The salt industry of the Bahamas has received a severe blow by the heavy protective duty now imposed by the United States' tariff. Turtles abound in the shallow seas around the Bahamas, and it is believed that an enterprise for the preparation of a concentrated form of turtle soup, such as has recently been established in Jamaica, would prove a profitable undertaking. The report concludes by describing the general condition of the colony as flourishing, a very material improvement having taken place during the past five years.—*Daily Chronicle*, Oct. 5.

**MOSQUITOES.**—Throw a bit of alum, about the size of a marble, into a small bowl of water, and wet the hands and face and any exposed parts lightly with it. Not a mosquito will approach you. They hum about a little and disappear.—*Zanzibar Gazette*, Nov. 16.

**WHAT TEA COSTS.**—Says the *Indian Planter's Gazette*:—our reason for quoting the figures of the British India Company is because, so far as we know, it is the most cheaply managed Company whose accounts we have come across, its properties are divided between Cachar and Assam, and it is a fair average property. It is outside our purpose here to quote all the figures, the following extract will suffice for our purpose:—

				per lb.
				d.
Gross proceeds of tea sold ..	£23,985	0	1	7 11
Less Expenditure—				
Total Indian including English Stores ..	£26,417	18	2	7 8 2
Less Equation of Exchange ..	£10,149	7	5	3 00
	£16,268	10	9	4 8 2
Freight, Dock Dues, Insurance Agency ..	£14,889	7	11	1 4 5
Total Expenditure ..	£21,157	18	8	6 2 7
Commission to Garden Managers ..	141	7	0	0 0 4
Grand Total under all hands ..	£21,299	5	8	6 3 1
Profit ..	£ 2,685	14	5	0 8 0
	£23,985	0	1	7 11

Now to deduct from above a six-penny tea, leaves a loss of 31 of a penny behind it. If this Company's gardens are not the most cheaply worked we know of they are amongst those, and the cost of production locally is close on 5d, or 3½ As. per pound. There is no earthly use in putting forward imaginary figures, and going on calculating profits, when none exist. Each garden Manager knows best what style of plucking pays best on his own estate. Any attempt to educate men as to the relative merits of fine or coarse plucking, and showing a profit where none exist, is doing more harm than good."

**THE IVORY TRADE.**—The greater part of the ivory imported into Europe comes from different regions of Africa; British India and Ceylon furnish a comparatively small quantity. Africa, according to the *Moniteur Officiel du Commerce*, contributes about 1,764,000 pounds of ivory annually distributed among the different centres of exportation as follows: From Zanzibar, 441,000 pounds; Mozambique, 223,000; Gaboon, Cameroons, Lagos, 165,000; Niger Territories, 166,000; Loanda, Benguela, 221,000; Cape Colony, 110,000. The principal markets for ivory are London, Liverpool, and Antwerp. Hamburg also carries on an important trade, but a great part of it has first passed through the London market. Of the work imported at Antwerp, the larger part is from the Congo Free State. As regards the uses to which ivory is put, France, England, Germany, and the United States manufacture the four principal articles in ivory, viz., billiard balls, piano keys, comb and knife handles; in addition France makes a speciality of brushes, fancy articles, handles, of umbrellas and carved goods. Spain manufactures a considerable quantity of billiard balls; Italy and Turkey, combs; Austria, billiard balls and keys; Holland, a very few balls, and Belgium some fancy and carved goods.—*Journal of the Society of Art.*

Correspondence

CEYLON FISHING CLUB.

To the Editor.

INDIAN FRUITS AND THEIR ENEMIES.

United Planters' Association of Southern India,  
Madras, Oct. 31st, 1-98.

(The Editor, *Tropical Agriculturist*, Colombo).

SIR,—I shall be extremely obliged if you or any of your readers can put me in a position to reply to the following inquiry from South Africa :—" Are your '(i.e. Indian)' fruits— all or any of them—attacked by maggots, and if so is there any chance of the mother fly being *Ceratitis capitata* (Wied)—*citriperda*, (MacL)?"—I am, sir, yours faithfully,

HARRY ORMEROD, Secretary,

United Planters' Association of Southern India.

We referred the above to the Honorary Entomologist, who kindly replied as follows :—

November 4th, 1898.

DEAR SIR,—With reference to enclosed letter—Oranges in Ceylon are very frequently attacked by the maggot of a fly which completely ruins the fruit for eating purposes. Some months ago I submitted specimens to Mr. Austen, of the Natural History Museum, romwell Road, who informs me that they belong to the genus *Dacus* allied to (*Ceratitis*.) He is unable, at present, to determine the species, and thinks they may possibly prove to be new.

Another species of the same genus attacks the fruits of the vegetable marrow and cucumber.

I have not come across maggots in any other Ceylon fruits, though I believe that the mango is sometimes affected in this way.

Our "orange fly" is quite distinct from *Ceratitis capitata*.—Yours truly,

E. ERNEST GREEN.

ALOE FIBRE.

Sunnyside, Baddegama, Nov. 28.

DEAR SIR,—My attention has been drawn to an article on Aloe Fibre in a recent issue. Allow me to refer you to one of your earliest issues of the *Tropical Agriculturist* wherein I think you will find my account of the preparation of this fibre and your remarks on the sample which was fully seven feet long and white as silk. In 1870 prior to going home I planted a fence of this on Anchintoul Estate about a mile and a quarter in length. In 1879 I found that it had grown so thick that it was injuring the coffee, so I cut down, netted, scraped by hand, washed and dried about half a ton which realized gross about £20 in London on £40 per ton; yet it did not give any profit. If however Mr. Parkinson is willing to give me a commission in return. I think I can guarantee him from my place alone some sixty tons clean fibre with a running stream close by; but I am not sure as I abandoned the estate some years ago and have not seen it since. At the time I mention Messrs. Denison, Barton and Munro in the same district also cultivated the Aloe for fences and I have no doubt large quantities can be obtained from their old estates. Mr. John Stephens on Coorunduwatte near Gampola had also a large avenue of it—I am, dear sir, yours faithfully,

W. McD. YOUNG.

Nuwara Eliya, Nov. 29.

DEAR SIR,—In your account of the annual meeting of the Fishing Club the balance to the credit of the Club is incorrectly given. It should be R941.79, and was so written in my report and in the certificate from the Bank.—Yours faithfully,

S. M. BURROWS, Hon. Sec.

[We regret the blunder of our Nuwara Eliya Correspondent; for our printer is in no way to blame; and strange to say the "Times" also gives the erroneous figures.—ED. C.O.]

THE STAMPING OF CEYLON TEA PACKAGES.

Dunedin, N.Z., Oct. 29.

SIR,—I have read with much interest your remarks upon my suggestion that the Government of Ceylon should issue a stamp to be placed upon all packets and 5 and 10 lb. boxes of tea as a guarantee that they are packed in Ceylon.

You say why should not the N.Z. Government do so? For the reason that the authorities here are not in the slightest degree interested in the matter! On your side it is quite the reverse, and you are naturally more immediately interested in the extension of the markets for Ceylon tea.

The proposal I made is one which I am certain would achieve the end desired, and nothing short of a Government guarantee would suffice to assure consumers that the packets of tea they are using have *actually* been packed in Ceylon, and are consequently pure. As I said before much tea is packed in these colonies in lead packets and sold as pure Ceylon, the character of which is more or less doubtful. The Government of Ceylon are even now subsidising the advertising of Ceylon tea, and why should it appear in any way an impossible thing for them to guarantee that all tea shipped from your side is actually grown there?

The labels would be sold in hundreds by the Government as stamps are, and only to *bona fide* packers. The system could be carried out with little trouble and expense—one such "guarantee stamp" being affixed to each package or box.

As to the possibility of forging such stamps, well I hardly think this at all probable. It is also possible to forge postage stamps and Bank Notes, but it is a thing not often done. The job is too risky, and if these stamps were issued by the Government they would rank in the same category as postage stamps, except that they would have no financial value.

Again urging the adoption of this, or some other similar scheme to secure the same end,—I am, sir, yours faithfully,

GEO. T. K. MCKENZIE.

CEYLON TEA IN AMERICA.

New York City, Oct. 29.

SIR,—To the Ceylon Planters. It may be of interest to you to learn the views of an American on the work done here which I shall give to you with malice toward none.

If it were only necessary to win success in Ceylon tea culture in your Island to have the requisite amount of money to purchase land, clear it, and follow the ideas of an inexperienced individual then any one with money might set sail for Ceylon with success assured and be independent of the old planters or their experienced co-workers. All your

representatives have come to this country feeling that your backing meant assured success, and is all that is necessary.

This is shown by the fact that they ignored everyone who have laboured here for years in British-grown teas.

The stranger here generally after he has spent his money, sees that there is a concrete mass of combinations to fight. The wholesale merchant whom he has won, under the rose, is working with the people he always has been, and pushing the old article harder than ever. All the large houses here count upon tiring out and using up the funds of newcomers, before they find out that they have a hold of the wrong end of the stick. I have recently travelled over the New England territory and British-grown tea has the name of an exploited failure. To win success in the introduction of an article, to replace a well-known staple product in this country, is indeed a task, and must be handled from basic principles the different localities such as the Eastern States, the Southern States, &c., &c., require different treatment, and great experience to get enough of a foot-hold to have the business go on. Things that move slowly are generally doomed, every one helps to execute them to get them out of the way. It has hurt Ceylon to attach India to it; first it is confusing, second it appears from all the advertising that Ceylon and Indian Tea mixed is the only beverage to use, not Ceylon Tea alone, oh no. It is the most arrant nonsense to say that the way to introduce Ceylon tea is to push India tea also. China and Japan tea, they have been introduced separately and against each other. Having won a place, here the merchants advertise for sale China and Japan Tea. You might as well say that the way to introduce Bass ale is to add Guinness's stout and use Bass & Co.'s money to do it with. There is a season for every thing and I know why they are working Ceylon and India together, but the courtesies that obtain among decent-minded people seal my month. You will not get this market to any large extent until certain things are done, they have not been done and while some good has been accomplished, not enough of an impetus has been given to the enterprise to make it lasting. Your money has largely been spent by Englishmen to get experience. If you think they have accumulated enough of it to win success the thing to do is to go on; if you stop, every thing will pretty much be thrown away. It is not fair to count Canada imports with North America, Canada was won before you spent any money here and readily yielded to any efforts made owing to your own people being largely there. Through overwork and worry in upholding Ceylon tea against India and the many persecutions I have had to encounter in this fight my health has given way, but I have provided for all contingencies by bringing into the business my only child Horace Prall May, who I will educate to assist me and continue the work of pushing Bhud Tiffin and Bungalow Teas should my malady develop into anything serious. In the event of my not being spared to complete this introductory work I commend my son to your most gracious favor. I shall always do what I can for Ceylon tea.—Believe me gentlemen, yours very faithfully,

S. ELWOOD MAY.

#### TEA IN GERMANY: NO. 1.

Veyangoda, Nov. 27.

DEAR MR. EDITOR,—I saw a good many articles and letters in your Journal lately re "Tea in Germany." With all the increase in the produce of tea it is evident that no time should be lost in opening up new markets for our Ceylon staple article "Tea." The latter subject has been discussed a good deal lately and different suggestions have been made as to the best and most practicable way of the introduction of Ceylon tea into Germany. Some people are very keen on advertising and I am sorry to see, in the interest of the Thirty Committee; that they waste ridiculous sums of money in this way, but I doubt very

much whether it will repay the monstrous amounts spent. It is not likely that the word "Tea" would strike a healthy German Hansman although printed ever so temptingly, as she is accustomed to coffee. You will find pages full of advertisement for the sale of tea in German Newspapers; some of these teas—herbs—are said to purify your Blood, others have the miraculous power to restore to health your bud liver etc. To confound our Ceylon teas with those so-called teas, by advertising them cheek by jowl, would only lead to a wrong estimation of its value and superiority. Other people again propose distributing tea samples! Many Germans never saw nor drank tea, what they would concoct would be very interesting to see. Distributing pamphlets in the language of the Kaiser, as suggested by the Editor, *Ceylon Observer* is about the best scheme, but, considering that nearly in every street corner a pamphlet distributor may be found, a person would come home with so many packets and pamphlets, that he would take hardly any notice of the latter and the chief reason of the scheme would be lost. A far better way to introduce Ceylon tea into Germany and make the product of our industry appreciated, would perhaps be to publicly demonstrate through lectures and secular practice the preparation of a cup of tea and its valuable quality. Schools, Kindergartens, Public Halls, and all other public establishments for entertaining the public may be advantageously taken into requisition. Without a practical demonstration it may be a very tedious and difficult matter to convince the Germans of the refreshing and stimulating powers of tea. Even in Great Britain, where tea is known for some time, it is an acknowledged fact, that almost nine out of ten persons have not the faintest idea of preparing a decent cup of tea and if in Germany or any other new country where our product is to be introduced, great care is not taken to teach our new customers how to make an unapproachable beverage, it would be naturally difficult to wean them from their customs of coffee, cocoa, etc. And all sums expended on the bare advertising of tea, even with the distribution of samples, I would regard at least as unsatisfactory in its results.—Yours faithfully,

R. M. ECKERT.

P.S.—I just, after closing above, come across Mr. J. P. Ryan's letter to the Thirty Committee on "Tea in Austria." This letter will in general corroborate my expressed opinion on the distribution of tea in Germany, in which I mentioned a few other facts besides, which may be of interest to you.

#### No. II.

Ruanwella, Nov. 26.

DEAR MR. EDITOR,—If I was astonished to find in your issue of the 1st November of the "Tropical Agriculturist" a remark printed, emanating as you say from Mr. McKenzie, to the effect that the Germans are a beer-sodden "nation" it would only express my feeling inadequately. For a Commissioner to the Thirty Committee to use such an expression of a new customer that is to be, is at least to say very injudicious, if not altogether unwarranted and uncalled-for. That this will not do the Planter's cause and the more so Ceylon's product much good in Germany is more than likely and may perhaps cause the new customer to fight shy of a representative of a community, in whose interest, it must be to count the good-will and co-operation of his future new client. It would be interesting to know how the commissioner would proceed to efface the bad impression his remark must cause in Germany and how he intends to meet his customer? Still more vital for him will it be to answer his patrons, if he should be taken to task for his wantonly endangering Ceylon's industry in a country like Germany. But why appoint an English Commissioner at all, who in the best does not know the country, nor, anything of the people's customs and habit? Why is there not a German representative on the board of the Thirty Committee to assist the latter with his knowledge as

to the best way to further Ceylon's interest? Mr. McKenzie may be capable to treat Englishmen, but he evidently lacks all ability for Germany. He may find it very difficult to introduce tea in Germany, but that is no reason that he should get already disheartened at so early a stage of the campaign; and in his disappointment make use of questionable expletives. It would be a new way of acquiring customers. Mr. McKenzie may or may not have the "unanimous" approval and confidence of the Committee, but if he holds the same still, the latter evidently loses sight of the Planters' interest. Even a disavowment of the remark made by its commissioner will not enable the Committee to smooth the matter over entirely, if at all. It were a pity, if at the very outset the Ceylon industry should be seriously handicapped. The Germans may be great beer drinkers, but what about the English and their whisky? Do Germans give the British nation an opprobrious appendix to its name on that account? There is a proverb about a "glass house," &c.

"ATHOS."

["Athos" should know that Mr. McKenzie is Tea Commissioner only for America and has nothing to do with Germany.—ED. T.A.]

PALK'S STRAIT AND PALK'S BAY.

Croydon, Oct. 21, 1898.

DEAR SIR,—Now that the discussion in your columns on the origin of the above names has come to an end, perhaps I may point out that more than three years ago I gave your readers the information that it was Governor Palk whose name was thus immortalized. This, however, is not my object in writing; but to send you, in confirmation of Sir M. E. Graut-Duff's authoritative statement, the following extract from Sir Clements R. Markham's interesting book "Major James Rennell and the Rise of Modern Geography" (London, 1895), pp. 40-41:—

On the 21st of October, 1763, a hurricane destroyed every ship in Madras Roads, not two Europeans being saved out of the crews of twelve large vessels. Provisionally, young Rennell was on shore, but he lost everything he had in the world. He had, however, made numerous friends at Madras; and amongst the warmest and most active was the Governor himself, Mr. Robert Palk,\* who soon found employment for the youthful sailor where his services would be most useful. The home of the Palks, on Haldon Hill, almost overlooked the little town of Chudleigh, so that home feelings may have had something to do with Mr. Palk's steady friendship, which endured through life.

Rennell was appointed to the command of a small vessel, called the "Neptune," belonging to a worthy Madras merchant, and he was recommended by the Governor as a proper person to superintend the landing of stores and the disembarkation of troops for the siege of Madura, in the extreme south of the Madras Presidency. . . . On the 16th of December, 1763, Rennell sailed in the "Neptune" on the duty with which he had been entrusted, and which he performed to the satisfaction of the Governor. The troops for the siege of Madura were landed without accident, and Rennell was then ordered to remain between Ceylon and the continent, in charge of a fleet of small vessels, ready to land reinforcements. It was at this time that he executed surveys about Cape Calimir and the Pamben Channel, and

\* Mr. Robert Palk, the Governor of Madras in 1763, had married Anne, sister of Mr. Henry Vansittart, the Governor of Bengal. He was created a Baronet in 1782, and died in 1791. His son, Sir Lawrence Palk, Bart., was M.P. for Devon, and his great-grandson was created Lord Haldon in 1880. [Lady Haldon recently passed through Colombo.—D.F.]

the Strait between Ceylon and Tinneveli was named after the Governor—Palk Strait. After the completion of this arduous work, Captain Rennell returned to Fort St. George, and had the gratification of receiving the thanks of the Madras Government and a handsome present of money. While commanding his little squadron, he held the local rank of Commodore.

I will only add, that in my communication to your columns three years ago (and lately in the pages of the Journal of the Royal Asiatic Society) I commented on the absurd statement of Schlagintweit, that "Palk" meant "The Whirl" in Sinhalese. Almost as ridiculous is the assertion of Captain Percival, in his work on Ceylon (p. 77), that "Paulk's [*sic*] Passage" is called "from a Dutchman of that name, who first attempted it"! The Tamil name for Palk's Bay, mentioned by your Indian correspondent "R.I.P.," viz. Pakku-kndakkadal ("arecannut bay"), is an admirable example of "popular etymology.—Yours truly, D. F.

DIETETIC VALUE OF TEA.

Nov. 29.

DEAR SIR,—In Mr. Ryan's letter *re* Ceylon tea in Austria and Hungary I see reference is made to the dietetic value of tea, and in this connection I think enclosed abstract from an American Scientific Paper may interest your readers.—I am, sir, yours truly, T.

We may state that one pound of good tea contains about a third of an ounce of theine, two and a half ounces of caseine, one-twelfth ounce of volatile oil, two and a half ounces of gum, half an ounce of sugar, half an ounce of fat, four ounces of tannic acid. Mineral matter or ash, water, and woody fibre make up the remainder. Caseine of which there is so large a quantity, it will be remembered, is the nutritive principle of milk; vegetable caseine, or legumen, is analogous in principle. Tea is therefore a highly nutritious substance, and fully capable of forming flesh and sustaining life. Peas and beans are highly concentrated forms of food, and yet analysis shows that the better qualities of tea are as rich in the nitrogeneous element or nutrient principle as are these seeds. Caseine is identical in composition with the muscular fibre and with the albumen of the blood, and is easy of assimilation.

[We trust our American cousins may read, mark and inwardly digest the above.—ED. T.A.]

TREATMENT OF DOGS IN CEYLON.

SIR,—In Dalziel's "Diseases of Dogs," arecannut powder is said to be a safe vermifuge for dogs but experience has taught us that this is not so. Arecanut may be a good expeller of worms; but it is positively dangerous to the dog, its effect being too drastic, many valuable dogs have succumbed to it. Intestinal parasites are very common in dogs in this country, especially in the puppy stage: the administering of arecannut powder should however be scrupulously avoided. If it is found necessary to resort to a vermifuge, Santonine (from 2 to 5 grains) mixed in a lump of butter may be safely given on an empty stomach, to be followed within ten or twelve hours by a table-spoon of castor oil. A local remedy easily procured may also be used with equally good results: a decoction of the leaves of the *Hydrocotyle Asiatica* or the *Gotu kola* of the Sinhalese; a handful of these leaves boiled down in a cup full of water to half a cup, and administered with a spoon, and the effect is very satisfactory.

*Gotu kola* is a common weed found in almost any garden in the Island and is well-known to all Sinhalese servants. Its Tamil name is, *Vallari*. C.

## THE MARKET VALUE OF KOLA NUTS.

DEAR SIR,—In a leading paper from one of our Southern Colonies there is a review of a work on the Gold Coast, by the Rev. C. Robinson, which may be of interest to those who are growing kola nuts in Ceylon. The writer states that "one caravan was observed by Robinson of 1,000 men and a large number of donkeys carrying these nuts, and the value of the caravan was estimated at £100,000. The nuts are in great demand and fetch high prices in the interior."

It is a pity the number of donkeys is not stated. If we allow as many as 500, carrying each a load of 125 lb., and the men each carry as much as 75 lb., we get a total of 137,500 lb. The average value of the nuts thus appears to have been over 14s 6d per lb.

In your columns of 25th ult. I find the following in the Minor Products Report, dated London, Nov. 3:—"Kola Nuts.—Good Grenada nuts sold at this week's spice auctions at 3d to 3½d." There is obviously something wrong with the London market, if with the large recent demand for these nuts the price paid is barely sufficient to cover transport and packing charges.—Yours faithfully,

AN OLD BOY.

[Curiously enough we have just been reading and marking Mr. Robinson's book, in regard to kola nuts and some other matters. But the trade in 'kola' described is altogether a local one—from one part of the Soudan to another: the use of kola nut being universal in the Soudan villages. We quote from the book elsewhere.—Ed. T.A.]

## FLORAL; NOTES FROM PERADENIYA GARDENS.

SIR,—Some of your readers may be interested to know that the following objects of interest may now be seen in convenient parts of these Gardens, viz:—

A *Victoria regia*, the giant water-lily, in bloom in the Lake. This Brazilian aquatic develops only one flower at a time, every third or fourth day, and regularly at 5-45 in the evening. The flower, measuring about a foot in diameter when expanded, can be seen gradually unfolding its numerous creamy-white petals, which emit a powerful and pleasant odour. The leaves are completely circular with a turned up margin, each being about 4ft. 10in. in diameter when full grown. In warmer waters, however, they attain a much larger size and are frequently photographed with children floating on them.

A cannonball-fruit tree, a member of the "monkey-pot" order and native of tropical America, bearing three globular fruits suspended by straggling flowering branches issuing from the trunk at a height of 12 ft. from the ground. The fruit, the pulp of which is relished by the natives where it grows, is appropriately named, being about the size of a man's head, the largest at present measuring 11 inches in circumference and is still growing. The tree itself, introduced in 1881, and probably the only one in the East which has as yet borne fruit, is one of a row of the same species planted along the East river-drive, all apparently of the same age, viz. 17 years, and averaging about 55 ft. in height.

In close proximity to these is a handsome specimen of a Talipot palm in flower and which has been found to be of

the following dimensions:—height of trunk to inflorescence 73 ft.; height from this to top of inflorescence 30 ft.—total height 103 ft.; girth of trunk at base 13 ft. The inflorescence, which tapers to the top, consists of 50 main branches, one of which has been found to measure 15 feet in length, having 26 "branchlets" averaging 2 ft. in length. The branch measured, required three strong coolies to carry it; thus, making allowance for smaller branches at top, quite 100 coolies would be required to carry the whole inflorescence. The Talipot "flower" collectively is therefore by far the largest in the vegetable kingdom. The individual flowers are inconspicuous, cream-coloured, unpleasantly scented, and are blown about by the wind, giving a snowy appearance to the ground underneath. Estimating by the number counted on one spike the whole inflorescence contains over 60,000,000 flowers.—Yours faithfully,

H. F. MACMILLAN,  
Curator, R. B. Gardens, Peradeniya.

## TEA CHESTS.

DEAR SIR,—I should be glad if you would kindly allow me to reply to Mr. John Hill's letter of 28th November and Mr. E. B. Creasy's letter of 1st December re tea chests.

Mr. Hill must be singularly unfortunate in his choice of carpenters and if he will put on an intelligent cooly he will find his Venestas cost four cents a piece to make. A carpenter has been known to do 40 in a day.

The "lead foil" used in Venestas is stronger than four oz. lead.

Then as regards the "minnte holes" made by the fasteners, it would be just as reasonable to say that a ship had 100,000 holes in her hull, because 100,000 rivets had been used in her construction.

Mr. Hill's agents seem as unfortunate as himself in employing a "carpenter" who took 13 minutes to open and close a Venesta.

I can do it easily in four minutes.

Mr. Hill is of opinion that a Venesta will not hold as much as a Momi, but if Mr. Hill will work out the by no means difficult sum of deducting 3/16 in. all round from a five foot Venesta and half in. all round from a five foot Momi he can prove the fallacy of his opinion.

Mr. Hill's prices of Momis R2.60 and Venestas R3.45, finished are extravagant, and as regards Venestas inaccurate.

Mr. Creasy after stating that "good wine needs no bush" appears to have forgotten his text and to have gone off at a tangent. Now nobody has gaineved the fact that Momis are "cheap light of even tare" but Venestas by long extended trial have been proved, in ultimate cost, to be cheaper, they are very much lighter weighing complete with lead only 17 lb. versus Momi 25 lb. and are of perfectly even tares. They tare to three or four oz.

Venestas have never been known to impart "a cheesy or toyshop flavour" to the tea; six planks make a chest and there are no knots to fall out as frequently happens with the Momi chest.

The light tares of Venestas in a vast number of instances will permit a planter to get his teas home under the 129 lb. limit instead of over it as at present, which alone will mean a saving of several pence per chest.

Since Venestas were first introduced to Ceylon the price has been considerably reduced and I may add there is no intention of raising it neither is there the remotest probability of the supply running short. Venestas have come to stay.—I am, dear sir, yours faithfully,

(Signed) A. S. PENNY,  
Secretary, Venesta Lt.

THE "FLIGHT OF BUTTERFLIES."

DEAR SIR,—Not having seen an *Observer* for several days, I may be a purveyor of stale news in writing about a flight of butterflies which I witnessed on Friday last, December 2nd. In a very unscientific and amateurish way I take an interest (fed largely by the stimulating intellectual pabulum supplied in your valuable journal) in what scientific people conveniently label the "fauna and flora" of Ceylon. A remark of yours a few weeks ago set me on the look-out for the annual flight of butterflies. I saw nothing of the kind till the day above-mentioned, when between Pelmadulla and Madampe in the Sabaragamuwa Province, I saw one of the thickest flights I have ever witnessed. At some points the coach drove through *clouds* of butterflies. Their flight was distinctly and almost unvaryingly due South to North. They evidently preferred to keep the Government road where its course was not too tortuous. This preference may be due to the fact that the road is hotter than jungle or paddy-field, and this matter of temperature is, I am persuaded, one of the most controlling factors in this annual phenomenon. The flights only take place on roasting hot days. Since Friday there has been no repetition except a very much milder one on Monday; all the days since having been cloudy. If the two hours of bright sun on Monday had continued a bit longer we should have witnessed a butterfly display equal to that of three days before. As it was, the creatures began to get so warmed up to their work that I noticed they often went full-tilt at a wall of a verandah that seemed to come in their way. The velocity of their flight is not the least remarkable matter.

A couple of months ago we were overrun with caterpillars everywhere. These caterpillars disappeared, changing into the chrysalis state. Perhaps a specially hot sun-shiny day assists their emergence from this state of hibernation and tends to bring them out in the swarms that so interest us, and the "flight" as we call it is just the joy of the new life asserting itself in the love of travel and quest of adventure. What draws them onwards and directs their flight? The love of warmth, perhaps, and the search for warmer and yet warmer places. Why do they all go in one direction? Why, ah why, but for the law of gregariousness which governs so much of the conduct of even more intelligent creatures?

ROLLING-STONE.

THE INDIAN AND CEYLON CURRENCY QUESTION.

Claverton Manor, Bath, Nov. 23.

Sir,—I enclose copy of a letter I have received from the Secretary of the Indian Currency Committee and of a communication I have today forwarded for its consideration. The Secretary's letter lends no support to the "Times of Ceylon's" off-hand view that my paper might just as well have been torn up for all the chance there is of the Indian Government altering its 1s 4d rupee rate. My arguments apply with equal force to India as to Ceylon. Ceylon has failed in its advocacy of silver, as it inevitably must have failed. Let it remember the words of Milton:

"What though the field be lost, all is not lost," and display the same energy in advocating a sound cause as it lately has an unsound one and the 1s 3d rupee may yet become an accomplished fact.—Yours truly,  
E. H. S.

Treasury, S.W., Nov. 22.

Dear Sir,—I have to acknowledge the receipt of your letter of the 18th inst., further on the subject of Indian and Ceylon currency.

In reply, I have to say that your previous letter has been printed for the Indian Currency Committee, precisely as the Ceylon Planters' Memorial. If you desire to make a further communication, I will undertake to circulate it forthwith to my Committee who welcome any practical suggestions from those who are familiar with the important question referred to the Committee.—Yours faithfully,

ROBERT CHALMERS.

E. Harcourt Skrine, Esq.

Claverton Manor, Bath, Nov. 23.

To the Members of the Indian Currency Committee, c/o Robert Chalmers, Esq., Secretary, The Treasury.

Dear Sirs,—As Mr. T. N. Christie has been examined at great length on the Currency question, as it affects the Ceylon planter, by your Committee, I venture to request that I may be allowed to supplement my own paper in support of a different view on the same subject by the following remarks:—Whereas the Ceylon Planters' Memorial in effect represents the views of the local agents of dividend-earning Tea Companies of recent growth, my connection with Ceylon dates from 1872, during all which time I have remained in possession of my estates as a *bona fide* cultivator and continued to develop them through all the vicissitudes of production. On the ground, therefore, of the producer I claim to speak with experience, if not with authority. The producer, however, represents but one of at least three conflicting interests affected by the Currency question, and I can well understand that his evidence should be limited in just proportion.

My own views however are not those gained by a Producer *only* for I have had quite as much experience as an Importer of Manchester Goods. During the three years which marked the first great fall of silver—1876 to 1879—I was in charge of a business house in Southern India and was fully sensible of the injurious effect of the depreciation of the Rupee on Import business. Whatever therefore my private feelings might be, as a Producer, of the advantages of cheap silver, its disadvantages to the Importer were equally apparent. I venture to think that this dual experience is one not generally shared in by the witnesses you have examined. Moreover since my Memorial was sent in much additional light has been thrown on the feasibility of a Gold Standard in India and it is in connection with this question that I should like to supplement my paper. In it I advocated the transition from a silver currency to a Gold one at 1s. 3d. per Rupee, having for its basis a Gold Standard and Currency Coin, to be minted in India, the equivalent of R10.

It has been remarked to me that others have advocated 1s. 2d. and others again 1s., why then should a 1s. 3d. basis be accepted more than either of these? On the same argument it might be added that the Government proposal of 1s. 4d. is equally fanciful, but I venture to submit that the claim to transfer at 1s. 3d. has alone, of all others, a logical basis inasmuch as that was approximately the rate current when the Mints were closed. From a purely logical, and therefore just, point of view, the transfer should then and there have been effected and any forcing up of the value of the Rupee subsequently is, on economical principles, indefensible. As it is my duty to confine my arguments to Ceylon I shall show that the 1s. 4d. rate is injurious to the interests of both Labor and Capital in that country.

My Memorial has shewn that under the circumstances of Tea—the labor wage is abnormally high at present. The Tea industry, which could afford to pay that wage with a 1s. 3d. Rupee, cannot do so if a 1s. 4d. basis is insisted on. If this industry—on which the Island Revenue depends—is to be sustained it must be by either lowering the rates of cooly pay or by giving effect to the logical and

just Exchange rate of 1s. 3d. The first solution would be a drastic but dangerous remedy which can only be imposed by the Proprietary or accepted by the Laborers after much distress and incalculable loss to both, which will have its echo in England in raising the price of Tea, the principal beverage of the masses. If such a result comes about its origin will be fully explained to them. On the other hand it is in the power of the Government to ease the situation by transferring at 1s. 3d. and save Ceylon from a calamity which may only in degree be inferior to the state of things in Barbadoes, and which it will have itself imposed.

I have still two remarks to add to my Memorial. The first is to anticipate the assumption that a Gold currency in the East will be absorbed for hoarding. Lately in Ceylon I have had sovereigns offered me by a Native banker in the interior at below their Colombo market value and, seeing that the enormous volume of gold which is absorbed annually in the East is obtained at cost price, the demand for hoarding is fully met, as it is. An Indian Mint would come into competition with this demand and attract gold now hoarded, more especially in times of stringency.

The other remark, also from a Ceylon standpoint, is as to the necessity, if a Gold Standard is adopted, that it shall be reasonably effective for purposes of Currency as well, and that it shall correspond with the Note circulation. The Sovereign does not meet those requirements. It corresponds with no Note Issue in India and, in Ceylon, where the Colony has been made to think in decimals by the Government, it will have no currency utility whatever. It will serve only to illustrate the expression—"If thy son ask bread of thee wilt thou give him a stone?"

—I am, yours truly,

E. HARCOURT SKRINE.

#### CACAO THEFTS—PRICES AND "CRIOLLO" PROSPECTS.

Galagedera, Dec. 3, 1898.

DEAR SIR,—It is a remarkable fact that the stealing of cacao, so rife formerly, has been gradually lessening to such a degree in this judicial district, that this season no case has been reported yet. This is certainly due to the policy of our able P. M. who, with his usual acumen, has taken in hand the headmen and inspired them so well with a sense of their responsibility as to obtain this most satisfactory result.

Crime of all kinds has diminished also to such an extent that lawyers must be bewailing.

If Government paid the P. M. as doctors are said to be paid in China, according to their ability of keeping away disease (crime is another form of disease) Mr. W. Dunuwille would draw a large salary.

The Price Current of the Chamber of Commerce is often at variance with facts; on November 29th their prices for cacao are: unpicked and undried R1, picked and dried f.o.b. R53. Unpicked and undried cacao must differ in weight at least 5 per cent and containing all the flat underfermented beans, diminishes it another 10 per cent in value, so that there would be a difference of R7.50 when the picked and dried is quoted at R50. On the 30th of November no better price than R47.50 could be obtained for a fair sample of picked and dried.

There is still some hope that some of the cacao trees of the criollo variety will survive the attacks of the fungus in this district, till the next century. Yours truly;

A V. D. P.

#### CHEAPENING THE COST OF TEA.

Dec. 9.

DEAR SIR,—In your August T. A. there is a very pertinent article:—A Paper read by the Secretary, before the Kangra Tea Association on Cheapening the Cost of the Production of Tea. A good deal of the article applies more particularly to India than Ceylon, but there are one or two points very much applicable to both, and for which a remedy ought to be sought and found. Amongst these on page 74 is one on Taring. The writer submits that a margin of two pounds on the average tares of a break is insufficient for practical purposes that if the margin were increased to three lb., the difficulty of factory taring would be greatly reduced and if it were increased to four lb. the difficulty would disappear. He says further:—"I cannot see what harm the Customs in London would suffer if they raised the margin of permissible variation in tares from two to four lb. All that the Customs want to ensure is a correct net weight of tea, and if a variation of tares up to four lb. were permitted I fail to see how this would materially interfere with the essential point aimed at—nor have I ever been able to fathom the philosophy which deters the Customs from weighing net instead of weighing gross and then deducting the tare, etc. But I maintain that the process of weighing net for duty is more sensible, more exact and more expeditious."

He gives figures to show that by bulking and taring at the Factory the saving on a crop of 144,000 lb. packed in 100 lb. chests would be £99. 18s.

On page 76 he comes to the unnecessary trade levy? Draft, as he says is a free pound of tea given away with every chest weighing over 28 lb. gross.

In this connection I give my own experience. Sometime ago my London Broker wrote suggesting that I should pack a certain tea in 20 lb. boxes as by so doing a higher price might be obtained, at the same time warning me to be careful that the gross weight did not exceed 28 lb. otherwise each package would be liable to a draft of 1 lb. But packing in (even neat) country-made packages I found I could not keep within the 28 lb. gross consistently with stability, necessary to stand the treatment of rail, shipping, etc. We must remember that in addition to the mere case there is lead lining, solder, nails and at the corners at least, scraps of hoop iron. Let me again quote from the Secretary's paper:—"A box containing 20 lb. net and weighing 27½ lb. gross, gives no draft, yet there are twenty turns of the scale at least. A box containing 25 lb. net is taxed 4 per cent by the lb. draft; on the other hand a chest containing 150 lb. of fine dust is only taxed 2-3rds per cent. This of course, is simply inverting the ratio of necessity. In my crop of 144,000 the amount for draft was 1,626 lb. which at 7½ per lb. cost me £19 2s 4d. But suppose my plantation had been up on the Range and to enable my coolies to carry my teas to the cart road I had packed in 40 lb. half chests, then I should have been mulcted 3,600 lb. valued at £108 15s."—On pages 76 and 77 he gives a long list of surplus payments, but I refrain from inflicting more. But I commend the earnest personal, or impersonal of the article to all connected with tea production. Surely in these times when the margin is getting so fine for the producer the non-productive portion ought to abate a little of

their perquisites also. As Bret Harte, had he been a planter "could, or would, or should have sung";—

"Do I sleep? do I dream?  
Do I wonder and doubt?  
Are things what they seem?  
Or are visions about?  
Is our civilisation a failure?  
Or the 'poor honest planter' played out?"  
—Yours faithfully, W. H. M.

CACAO DISEASE.

SIR,—I enclose for your perusal a specimen of the translation in Tamil of the Rules drawn up by Mr. Carruthers in reference to Cacao Disease, published for distribution by the courtesy of Government.—I am, sir, yours faithfully,

A. PHILIP.

Secretary, Planters' Association of Ceylon.

Kandy, December 10th.

[A very useful Tamil Circular.—ED. T.A.]

FLORIDA VELVET BEAN: "THE EATING O.T."

Dec. 16.

DEAR SIR,—With reference to the comments in the *Observer* of the 13th inst., on the Florida Velvet Bean, it would be interesting to know from some person who has actually eaten the seed whether any ill effects have been afterwards experienced. I understand the seed is not considered edible in Florida, as the following extract from a Florida paper will show: "A number of people were made ill from eating some velvet beans shelled out of the green pods and cooked. The symptoms were nausea, purging of the bowels, headache, and violent action of the heart. Afterwards some beans were given cooked and raw to chickens, some of which died, and the beans they had eaten were found indigested."

The seeds you kindly sent me of Mr. R. L. Brown's consignment have grown remarkably well in the neighbourhood of Kandy, and if you wish I shall be pleased to send you some to try. The chief value of this climber seems to be for green manuring and fodder.—Yours faithfully,

"G."

[We can at once answer "G." We have twice partaken of a dish of the beans grown in Ceylon during the past two months and enjoyed them without any ill effect afterwards. Our appu and cook seemed to recognise the beans as old acquaintances and perhaps they treated them differently from the cook in Florida?—ED. T.A.]

GREEN BUG IN COFFEE AND ITS CURE.

SIR,—I send an extract from "Das Echo" (translated from German) giving a cure for the green bug:—

"According to a preliminary report, Professor A. Zimmerman of the Botanical Garden of Buitenzorg has discovered upon the green bugs of the coffee a fungus which causes their epidemical death. This fungus is easily cultivated upon the plant Ogar-Ogar so as to obtain a sufficient quantity of spores to propagate the infection on a large scale. Professor Zimmerman recommends to touch the bugs with a brush which has been dipped in the culture of the fungus, late in the afternoon on plants which are out of the sun's rays. After four days the new growth can be seen with the naked eye."

It is to the interest of coffee planters of other countries to study this fungus which they can procure from Buitenzorg. This is another instance of the importance of scientific investigation.

PLANTER.

PRODUCE AND PLANTING.

INDIAN TEA

As the tea industry is at present under a cloud there is no lack of good-natured friends to sigh over the position and say: "We told you so. But for a really depressing, never-hope-again way of regarding things the following from the *Pall Mall Gazette* deserves special mention. The writer of this dirge says: "The public should be in the mood at present to consider the dross in their treasuries, and we commend Indian tea shares to their unfriendly attention, should they be budened with this particular class of security. There can be but little doubt that the trade is entering upon a crisis, which will account for the anxiety of certain retailers to convert their undertakings into limited liability companies. The weak spot is the planter. The enormous increase in output and the increase in the area under tea are having results usual when production is outstripping consumption. Some of the pessimists profess to see in improved Chinese methods an influence that will act adversely to Indian growers. It is sufficient for the present in this respect to note that the Indian planter always has the initial advantages of cheaper labour and the actual hold on the markets. The real difficulty is over-production. Private advices from planters of experience in Assam assures us that the falling off in prices has led to resolutions to considerably increase the out-put, and it does not require an economist to show that where quantity and not quality becomes the controlling influence the outlook is gloomy enough. That Ceylon will feel the pinch more than Assam is probable. In fact, at the present time we should scarcely desire to see our dearest enemy a holder of the average Ceylon tea share. But the crisis is rapidly approaching in Assam. There being no controlling influence in the matter of the output it is a case of every man for himself. The weak companies and the small planter must inevitably go to the wall during the next few years, and meanwhile there are low prices and seriously curtailed profits to be faced by the sounder concerns. It is thus time that the investor in Indian shares should seriously consider his position, and although the storm may not loom up immediately it cannot be deferred for any very long period." There is not too much "crisis" about this, but just enough. A few figures may be useful, therefore, in order to show that the position is not quite hopeless. The imports of Indian tea for the period June to October this year were 62 million lb, against 61½ in 1897, while the deliveries were this year 55½ million lb. against 48½ in 1897, and the stock is less now than it was this time last year. These figures are much more to the point than the *P. M. Gazette* jeremiad.

INDIAN AND CEYLON TEA.

To the Editor of the *Pall Mall Gazette*.

Sir,—Our attention having been called to your article in yesterday's issue on Indian and Ceylon tea shares, we venture to place a few facts before you hearing on the subject.

For many years past the production of Indian and Ceylon teas had been outstripping consumption, but since January last this has not been the case, as in markets outside the United Kingdom, particularly in America, Russia, the Continent of Europe, and also largely in Australia and New Zealand, a very important demand has sprung up for British grown teas. Owing to the recent increase in this outside demand the danger of overproduction, which has been facing the British grown tea industry appears to have already passed. In support of this we now place before you a few rather important figures. For the first nine months of this year the use of Ceylon tea in markets outside the United Kingdom has increased 7 million pounds, the figures being 23 million pounds, as against 21 million pounds for the same nine months of last year. During that period production of Ceylon tea showed an increase of about 2 million pounds, but the net result is that 5 million pounds of Ceylon tea were diverted from the home market,

The use of Indian tea in foreign markets is also showing a satisfactory development. We can, however, look to the home market to take our extra supplies from that country. We find that for the first four months of the season, namely, June to September, there has been an increase of five million pounds in the deliveries of Indian tea a remarkable expansion, while it is estimated that the total production from India will only exceed that of the previous year by some two or three million pounds.

Trusting you will see your way to publish this letter.—We remain, dear Sir, yours faithfully,

GOW, WILSON AND STANTON.

Rood-lane, London, E.C., Nov. 1.

[We publish this communication with much pleasure. But we see no reason whatever, from the information at our disposal, to alter our view as to the prospects for tea shares during the next few years.—Ed. P. M. G.]

The *H. & C. Mail* adds:—This is a long-range prophecy, even allowing that the editor of the *Pall Mall Gazette* is in possession of information quite out of the reach of ordinary mortals.

#### CACAO AND ITS MANUFACTURE.

Although the consumption of tea is far ahead of cocoa, the proportion being 10lb. of tea to 1lb. of cocoa, the public taste for the latter is increasing, and the *Grocer*, in commenting on this, calls attention to the fact that foreign cocoa manufacturers are seriously threatening the position of English manufacturers in their own markets. It gives the following table, which shows the quantities of the articles retained for home consumption in the United Kingdom in the years specified, and the increase or decrease per cent. in each year compared with the year preceding:—

Articles.	1888.	1895.	1896.	1897.
	lb.	lb.	lb.	lb.
Cocoa ..	19,909,569	27,155,360	28,046,711	36,201,101
Increase	p.c. 13.3	p.c. 8.8	p.c. 3.3	p.c. 29.1
	cwt.	cwt.	cwt.	cwt.
Chicory and coffee ..	373,173	331,286	328,990	325,699
Increase	p.c. 1.3	p.c. 1.7	p.c. —	p.c. —
Decrease	—	—	0.6	1.0
Tea ..	185,416,238	221,731,490	227,722,561	231,323,156
Increase	p.c. 1.0	p.c. 3.4	p.c. 2.7	p.c. 1.5

Thus, says our contemporary, it appears that although the amount of tea consumed is enormously disproportionate to that of cocoa, the yearly amount of the latter has, at any rate, nearly doubled in the ten years. If the present rate of increased consumption continues it is estimated that our population will before long consume more cocoa than coffee. But when we examine the details of the import returns we find that it is the cocoa of foreign manufacture which is really making headway. The import duty on raw cocoa is 1d per lb. and on manufactured cocoa 2d—a protection of 1d a lb. to the home manufacturer. But the increased consumption of foreign manufactured cocoa goes on in spite of this protection. When the imports of 1890 and 1897 have more than doubled those of 1896 the position becomes alarming. It is clear that the article as made abroad finds increasing favour, and there is every sign that the public taste for what may be called the new style of cocoa will continue to grow. To explain the sudden rise in the consumption of imported cocoa, we must bear in mind that the Continental article is made on a different principle from that most generally adopted in this country. In the former, the superabundant fat is reduced by pressure; in the latter, it is often diluted by the addition of another substance. We have British cocoa manufacturers who certainly have nothing to learn from Germany, Holland, or France. But, taking British cocoa all round, there is ground, at any rate, for asking whether the trade is not too conservative. Some of our manufacturers make a pre-

paration similar to that of the Continent; but the sale is not pushed to the same extent as is that of the old-fashioned mixtures. There is no reason why our manufacturers should not make rapid strides if they care to bestir themselves. There are fashions in cocoa as in other things, and our manufacturers should be careful to study them. Are the public growing tired of the thick emulsion with which they have for so many years been supplied, and giving preference to the tea-like preparation of the Continental manufacturers? Or can it be that what we see taking place is merely the result of the art of modern advertising? Whatever may be the cause, the result is too important to be lightly overlooked, and the lesson taught by the sudden change in the public taste from China to Indian teas should not be forgotten. The figures we have quoted above demand the serious attention of our British cocoa manufacturers.—*H. and C. Mail*, Nov. 4.

#### TOBACCO CULTIVATION.

It is supposed that the discovery recently made by Mr. W. Daroczi of Buda Pest, Hungary, editor of the *Magyar Dolanyniszag*, that the tobacco plant is a perennial—will work a revolution in its culture in Southern India, whence we derive our celebrated Trichinopoly and Dindigul cheroots, and where European capital and intelligence are employed in the industry. It does not, however, seem that this feature of the tobacco plant is altogether unknown to the ryot in the part of the country. To begin with, no second crop of tobacco is gathered, it being found that where the sprouts are collected in a second season, as is the case in some parts, the leaves instead of being superior to those gathered from transplants are alleged by Mr. Daroczi, are actually of very inferior quality. Moreover in partially exhausted soils, tobacco is grown only once in two years, so that the method advocated by him is not practicable.

Coimbatore and Madura are the districts that supply the raw material for the Trichinopoly and Dindigul manufacture. In the former, the superiority of the tobacco is attributed to the alluvial richness and suitability of the soil, the careful attention paid to the cultivation, and to the irrigation water which is obtained from wells containing much saltpetre. The Dindigul tobacco is derived from a division of the Madura district and is produced on soil selected with equal care and with an alluvial character artificially imparted to it. In both places only a small quantity of water is supplied to the field, and this is done by mechanical appliances, for excessive damp is prejudicial, and the soil used generally stands high. Before transplanting, the seedlings are gently watered by hand. Heavy rain detracts from the value of the tobacco, which is also the effect sometimes of irrigation: not less, however, does deterioration follow from scarcity of water. If there is an insufficiency when the plant is topped, it causes the roots to throw out a white growth like asparagus, which has the effect of preventing the full growth of the leaf and of injuring the quality of the prepared article. If too at transplanting time the weather is unseasonably dry, the leaves become covered with spots or a description of scald, which is equally injurious. Again if the weather is cloudy and foggy at the time of topping, or if the east wind prevails, then the leaves become white as if wood-ashes had been rubbed over them, and they are entirely spoiled. The manures used are the droppings of sheep and goats penued on the land before cultivation. Cattle dung and urine with ashes and sweepings, and in as great abundance as the ryot can afford. Towards the end of the year is the period for culture. The seed germinates in a week and the seedlings are ready for transplanting in about five weeks afterwards, when they are five or six inches high. The plants are placed from a foot to a yard apart, sometimes on ridges, sometimes on the flat surface of the field, and as they grow the upper leaves are nipped off to strengthen the dozen or so that are to be left below. Two months after transplanting, or as soon as some

of the lower leaves show symptoms of returning yellow, the tobacco is ready for harvesting. Where American seed has been tried in Coimbatore and Madura, every field process is retarded, and altogether more labor and expense are involved in the cultivation. It has also been found that the product is not so good for smoking or shewing as the country tobacco. The leaves are certainly larger and broader, but they are thinner and have not the same strength and pungency of flavour.

Various methods of curing are practised, but in Coimbatore and Madura the leaves, after drying in the field for a day or two, are hung over poles or ropes, or, where the milk hedge is grown over it preferentially, to acquire thence a flavour, but in the shade; and subsequently stacked in heaps which are regularly pressed till the curing is completed.

Doubtless the tobacco grown in the south is capable of great improvement, but no stimulus is given for the production, of a superior article, because the demand for the coarse tobacco is very great and really greater than the supply, and it is found to pay better to grow a large quantity of inferior leaf than a small quantity of superior. The perennial character of the tobacco plant is thus not calculated to exercise any material influence on the cultivation down south.

Another discovery made by the same foreign expert may prove of greater utility to the tobacco grower, namely, that the plant can be propagated by layering and that the layered plant resists the ravages of insects better than the plant raised from seed, but this presupposes a vast amount of delicate agricultural labor, which the Indian ryot is not prone to expend on any product however valuable.—*Pioneer*, Dec. 14.

rate is a sum of £1,100 for manure, which under ordinary circumstances would have been spread over the whole year, as well as a large item for weeding and pruning some of the estates which had been neglected. The whole of this has been debited to working expenses.

Although the crop for the first six months fell short of estimates, the production of Tea for the year amounts to 1,112,606 lb., and the Directors are of opinion, that if Mr. Tatham had had control for the whole of the time, this total would have been materially increased.

The working of the estates shows a profit of £1,701 18s 4d., after wiping off the loss on the first six months, and charging the whole of the Ceylon expenses. After charging London expenses and Debenture interest there is a loss of £1,620 6s.

Your Directors have recently authorized a certain amount of prospecting for plumbago, with the result that a vein was struck on Springwood, as well as two small veins on other estates, which are reported as being of good quality. So far the profit on the plumbago secured has been so satisfactory that your Directors have sent instructions for operations to be energetically continued.

The estimates furnished by Mr. Tatham for 1898/1899 are encouraging. He hopes to secure over 1,300,000 lb. of Tea at a cost of about 25 cents per lb., and about 500 cwt. of Cocoa.

The Director retiring in rotation is Mr. Vivian Hugh Smith, who, being eligible, offers himself for re-election.

The Auditors, Messrs. Broads, Paterson & Co., also retire, and offer themselves for re-election.

E. T. BARTLETT, Secretary.

TEA CORPORATION, LIMITED  
(OF CEYLON).

REPORT OF THE DIRECTORS AND ACCOUNTS TO  
30TH JUNE, 1898, TO BE SUBMITTED TO THE  
SECOND ANNUAL GENERAL MEETING OF  
SHAREHOLDERS ON THE SEVENTH  
OF DECEMBER, 1898.

The Directors beg to submit herewith the accounts of the Company for the year ending 30th June, 1898, and they regret that the results shown therein are not satisfactory.

The period covered by the accounts has been one of depression for the Tea industry generally. The rise in exchange, the increased cost of rice, combined with the high freights which prevailed during the greater part of the year, have added materially to the cost of production; while, on the other hand, the depressed state of the Tea market has resulted in lower prices being obtained.

The Company was formed to take over and work certain estates in Ceylon from 1st July, 1897; owing, however, to legal difficulties and delays in Colombo, which your Directors were unable to control, the estates were not conveyed to the Company until the end of that year. Consequently, for the first half of the period under review the original owners managed the properties on account of the Company, and the result showed, when their accounts were presented, a considerable loss on the working.

As soon as your Directors got possession, they took steps to improve the management and curtail the expenditure as far as possible, and in this they were ably seconded by Mr. Tatham, the Managing Director, with the result that the cost of the Tea per lb. F.O.B. was reduced from 42.65 cents to 25.96 cents; included in this latter

SPRING VALLEY COFFEE COMPANY  
LIMITED.

DIRECTORS.—Alfred Brown, Managing Director;  
Leon Famin and P. C. Oswald.  
SECRETARY.—J. Alec Roberts.  
OFFICES.—5, Dowgate Hill, London, E.C.

REPORT

To be presented to the Thirty-fourth Ordinary General Meeting of the Company to be held at No. 5, Dowgate Hill, London, on Tuesday, the 13th day of December, 1898, at 12 o'clock noon.

The following annual Accounts are now presented to Shareholders, viz.:—Profit and Loss Account for Crop 1897-8; Balance Sheet made up to 31st July, 1898.

Additional Capital having been subscribed for planting with Tea the balance of the available land, and for providing the necessary factory accommodation, there is no longer any reason for deferring the issue of the Accounts to the date adhered to in former years. The Ordinary General Meeting has therefore been convened for the 13th instant, or six months earlier than usual, in order that the Accounts may be in the hands of Shareholders as soon as possible after the close of the season which ended on 31st July last.

CROP 1897-8.

A small crop of Coffee was secured for the above season, the actual weight sold in London being 175 cwt. 3 qrs. 22 lb. This crop inclusive of clean and refuse Coffee sold in Ceylon realized £865 5s 4d, the average selling price being 96s 5d per cwt. as compared with 85s 10d per cwt. obtained for crop 1896-97.

The crop of Tea amounted to 391,400 lb., and this, together with 85,080 lb. brought from neighbouring estates and manufactured at Spring Valley, sold for £16,365 19s 1d, or an average of 82½d per lb., the average selling price last year being 8-40d per lb.

The yield from the 1,045 acres of Tea in full and partial bearing was 375 lb. per acre against an

estimated yield of 400 lb. per acre, and this would have been secured but for severe drought during the latter part of the season which was felt throughout the Island, and more particularly in the Badulla district.

The total proceeds from the sale of produce amounted to £17,231 4s 5d and expenditure in Ceylon and London was £14,559 2s 6d, leaving a profit on the year's working of £2,673 1s 11d. To this profit a sum of £691 1s 4d has to be added, being the balance brought forward from last year, and after debiting £100 16s 8d for Income Tax and £900 for Dividend on Preference Shares to 31st July 1898, there remains a balance of £2,363 6s 7d now to be dealt with.

The Directors recommend the payment of a Dividend of 2½ per cent for the year on the Ordinary Shares which will absorb £2,000 of the above sum and that the balance of £363 6s 7d be carried forward to next year.

During the past season the sum of £7,191 13s 11d has been spent on Capital Account, and recent advices from the Manager on Spring Valley lead the Directors to believe that the whole of the contemplated extensions, both of the Tea area and Factory, will be completed by the close of the present year.

The area of the estate as on 31st July, 1898, was as follows:—

TEA.		Acres.
5 years old and over	..	811
Planted November/December	1893	234
Do.	.. 1894	173
Do.	.. 1895	145
Do.	.. 1896	159
Do.	.. 1897	194
Area under Tea		.. 1,716
Do.	Coffee	.. 114
Do.	Fuel	.. 167
Forest Patna and Waste	..	262
Total Area		.. 2,259

The Tea crop now being plucked is estimated to produce 499,400 lb. of made Tea, exclusive of bought leaf, and though the effects of the drought continue to be felt, this yield is still looked for. The latest advices report the estate to be in good order and condition throughout.

The Directors regret to report the death of their much esteemed Colleague Mr. Norman Stewart.

Mr. P. C. Oswald, a member of the Board, retires on this occasion, and, being eligible, offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths & Co., the Auditors, also offer themselves for re-election.

By order, J. ALEC ROBERTS, Secretary.

Dec. 3rd, 1898.

### SALE OF AN INDIAN TEA ESTATE.

As showing the extent of the depression in the tea industry, Messrs. Mackenzie, Lyall and Co., of Calcutta, under the order of the proprietors, sold by public auction, without reserve, on the 14th instant, the valuable tea estate known as the Mattigurah Tea Estate, as a going concern as from the 1st January next. The estate, which is situated below Darjeeling, comprises an area of about 570 acres, of which about 346 acres are under tea cultivation, held under renewable Government *puttahs*. The outturn of the past season was 93,292 lb., and the estimated outturn for the current season is 120,000 lb. The bidding started at R1,000, and gradually rose to R3,300, at which low figure the estate was knocked down to Mr. Smallwood, of Messrs. Davenport and Co., Calcutta. The number of bidders was very small. —*Madras Mail*, Dec. 16,

### PLANTING NOTES.

TEA IN AMERICA.—Mr. Elwood May sends us a characteristic letter for the benefit of Ceylon tea planters. It is Mr. May's fixed belief that we are paying too much for the benefit of Indian tea in America, that Ceylon tea pushed by itself would make its way more rapidly, and that to spend much money in Canada is superfluous, as the Dominion of British subjects is on a sure way to use only British-grown teas, whether advertised and subsidised, or not. Mr. May would have us believe that, apart from Canada, very little progress is being made in America; but we are glad to think that our figures of exports from Colombo shows a steady increase both Westward and through the Pacific Coast. We regret to learn of Mr. May's ill-health, glad he has a son to temporarily relieve him in the tea business, and trust he himself will shortly recover his usual vigour.

ELECTRICAL TRANSMISSION OF POWER.—At the Society of Arts last night Professor George Forbes, F.R.S., read a paper on the "Long-Distance Transmission of Electric Power." Sir J. Wolfe Barry was in the chair. The lecturer began by remarking that, though long-distance transmission had been much talked about, little had been done, and there were few people who realized what a vast field there was in that way for investment of capital on a sound commercial basis. He proceeded to refer to some instances with which he had to deal in India, New Zealand, and Egypt in which long distances were concerned. Thus he found, when considering the utilization of the Nile cataracts, that the electric lighting of Cairo could be done more cheaply by power generated at the First Cataract—400 miles distant as the crow flies—than by steam engines at Cairo, and he believed that if the gold mines in Rhodesia were really good it would pay handsomely to transmit electric energy 500 miles from the Victoria Falls of the Zambesi, provided the surveys showed the falls to be as satisfactory as they appeared by the photographs and provided that fever was not an insurmountable obstacle. Many a gold mine, hitherto considered worthless because of the cost of power, would be found to be valuable if water-power were available within a few hundred miles. People were often appalled at the capital required for copper conductors, but he suggested a simple financial transaction which he believed copper merchants or others would willingly make and which might avoid the huge capital required by those that transmitted power. He proposed to divide the capital account into two parts—ordinary stock that might be looked on as speculative, and bonds on the copper, which would be as sound an investment as could be desired. Most of the capital of a transmission company was required for the copper. On this, which might be removed if the enterprise failed, and was an absolutely safe security, a mortgage might be raised, 4 per cent being probably sufficient to cover the chances of a change in market value, and thus by a simple transaction a great reduction might be made in the total capital required by the transmitters of energy, with consequent increase of interest earned. Professor Forbes concluded by explaining some methods elaborated by himself for rapidly estimating the cost, on the ordinary lines of working, of any particular case of long-distance transmission of power by electricity. A discussion followed the reading of the paper. *London Times*, Nov. 24.

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898 :—“ All the seeds done well, and now some of the plants from them are 18 inches high.” This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898 :—“ I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants.”

*For price, instructions and particulars, see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars, see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied

*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants** of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes :—

MESSRS. WILLIAM BROS.

DEPARTMENT OF AGRICULTURE,  
CAPE TOWN, 27TH JULY, 1898.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo River at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,  
(Signed) P. MACOWAN,  
Government Botanist.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

Agents in London :—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Tropical Seed Merchants,  
HENARATGODA, CEYLON.

CEYLON LAND AND PRODUCE COMPANY, LTD.

DIRECTORS.—Mr. James Wilson, Chairman, Mr. William Keiller, Sir N A Staples, Bart.

The following report of the Directors, was to be submitted to the Fourteenth Annual General Meeting of shareholders in London, on Monday, the 14th day of November.

Your Directors have the pleasure to submit the Annexed Profit and Loss Account and Balance Sheet for the Crop year ending 30th June, 1898, duly audited.

The amount at credit of Profit and Loss Account is £10 02s 10s 6d, which, with the sum of £755 11s brought forward from last year, leaves £10,778 1s 6d to be distributed.

On the 1st July last an Interim Dividend of 7½ per cent on the Ordinary Shares and 3 per cent on the Preference Share was paid, and your Directors now propose to pay on the 15th day of December, 1898, the balance of the fixed Cumulative Dividend on the Preference Shares (3 per cent) making 6 per cent for the year, and 7½ per cent on the Ordinary Shares, making 15 per cent for the year, and in addition, a bonus of 5 per cent on the Ordinary Shares—all free of Income Tax. It is also proposed to transfer £3,000 from Profit and Loss Account to Reserve Fund, increasing that account to £13,500, and carrying forward the balance of £1,251 1s 6d, subject to the Directors' remuneration for the year under review, to be fixed at the General Meeting, and to the payment of Income Tax, &c.

In accordance with a Resolution of the Board, a call of 10s per share was made upon all members holding Preference Shares under which only £3 had been paid, and the same was payable on the 1st July, 1898.

The crop of Tea slightly exceeded the estimates framed at the commencement of the Company's financial year, and but for the drought experienced during March, April and May last, the intake would have been much larger. The Cocoa Estimates were secured, though the practical failure of the spring crop must be recorded. The net prices obtained for Tea were again lower than those realised for the previous crop, due partly to lower Markets in London and Colombo, and partly to the rise in Freights.

As will be seen by a reference to the Statistics enclosed herewith, Cocoa values are in excess of last year.

The reduction in the margin of profit on Tea, due to increased cost of production brought about mainly by the rise in the gold value of the Rupee, has been compensated in a measure by the larger Cocoa crop; your Directors are, therefore, pleased to present to the Shareholders a report which bears witness to the continued success of the Company.

TEA.—Owing to unfavourable weather in many of the districts of the Island, the output has been somewhat short of the original estimate, and shipments from Ceylon to this country as in the current year have shown a slight diminution as compared with those of the first nine months of 1897, so that the quantity passed through the London auction room, from the 1st January to the 31st ultimo, is rather less than in the same period of the previous season, viz., 984,300 packages versus 990,800 packages; the average realised, however, being identical—7½d per lb.

Quality as usual has shown a good deal of irregularity, no doubt largely due to climatic influences. During the spring and early summer the portion of the Crop landed here was in many cases deficient in flavour, though of fair strength in cup, and quotations ruled somewhat low, but latterly more attractive Teas have been coming forward, with the result that prices generally marked a rise.

The efforts being made in Ceylon to foster trade with other countries than Great Britain, appear to be fairly successful, especially so far as the Australian Colonies and Russia are concerned. It is also satis-

factory to note that business between the United Kingdom and outside Market indicates a decided expansion.

COCOA.—This article has sold well during the great part of the year, and your Directors are pleased to report that good red qualities have realized fair prices, although below the best of last year, but the enhanced rates obtained for the lower grades make the average values very satisfactory.

COFFEE.—As anticipated by your Directors in their last report, the market value of this article has further declined, and although sales were effected at opportune moments prices have been on a much lower basis. The value of good bold yellow Ceylon Liberian is now about 30 per cent.

ACREAGES.—The following statement shows the approximate acreage of the Company's Properties at date:—

Name Estate.	Tea.	Cocoa, coffee, coconut, &c.	Forest, grass, chena,धान, &c.	Total acreage.

	2,423½	1,590½	1,250½	5,264

\* And coconuts.

Your Directors hope that the current year's Estimate of Tea will be realised, though at the moment the intake is somewhat less than that at the same period last year, owing to a recurrence of the drought; however, latest reports advise more favourable weather. It is, of course, too early in the season to express an opinion upon the forthcoming Cocoa crop.

Sir N. Staples, Bart., by rotation, retires from the Directorate, but being eligible, offers himself for re-election. Mr. James B. Laorie, the Auditor, also retires, but he is eligible, and offers himself for re-election.

JAMES WILSON, Chairman.

ALFRED E. LOCK, Secretary.

INDIAN TEA ASSOCIATION, LONDON.

The following letter has been received by the Secretary of the Indian Tea Association, London, from the London Wholesale Tea Dealers' Association:—

Ernest Tye, Esq., Secretary Indian Tea Association, London.

Dear Sir,—Reports have reached my committee that some teas have a cheesy taint, and in certain instances have consequently been thrown up.

From exhaustive inquiries made, it is supposed the cause of the cheesiness is that the wood used in the manufacture of the packages is sometimes put together in a green state, and the action of the heat causes the sap to exude, which sap working on the lead lining produces the cheesy smell in the wood and lead.

This injurious effect may take place either during the transport of the chests from the gardens to Calcutta or in the hold of the steamer during the voyage to England.

This fault is not found in metal packages or in chests made from wood imported into India from Japan, as such wood is thoroughly seasoned before the packages are actually made up at the gardens.

Another matter respecting dust teas has also caused considerable inconvenience, by the chests being in some instances so insecure that carriers refuse to take them on account of the claims for leakage.

I am, therefore, desired to ask if your committee could kindly see their way to induce importers either to adopt better seasoned wood to meet the first case, and in the matter of dust teas to have them packed in some well-tested and approved metal chests.—I am, dear Sir, yours faithfully,

R. SHAGWICK, Hon. Secretary,  
London Wholesale Tea Dealers' Association.—H.  
and C. Mail, Nov. 11.

HORNSEY TEA ESTATES COMPANY, LIMITED.

SECOND ANNUAL REPORT, 1897-1898.

The Directors beg to submit the audited Accounts for the year closing 30th June last.

The total crop has been 146,226 lb., against last year's crop of 150,967 lb. The average sale price in London has been 8.95 per lb., against 8.72 per lb. last year, and 35 cents for tea sold in Colombo, against 32½ cents.

The average rate of exchange is 1s 4-3.32d, against last year 1s 2-29.32d.

The cost of production has been 36 cents per lb. or at exchange 1s 4-3.32d equals 5½ f.o.b. Colombo, against 5 per lb. last year.

The estate has been kept in good cultivation, and the smallness of the crop is entirely due to a long drought, which has affected all Ceylon estates alike. With young tea coming into bearing it is very disappointing that the crop should be less than the previous year.

Prices have ruled higher during the period under review, which may be attributed to better tea being made at the Battalgalla Factory, ow-

ing to the completion there of the new Withering House, which now affords ample room.

Prospects are more encouraging for the ensuing year. The crop from 1st of July to 20th September is 11,757 lb. made tea ahead of the corresponding period last year, and prices are satisfactory.

The Directors after paying Mortgage Interest and Preference Dividend for the year carry forward £126 3s 2d to the debit of profit and loss account.

By the Articles of Association Mr. C. A. Reiss, by rotation, retires from the Board, and, being eligible, offers himself for re-election.

The Auditors, Messrs. Singleton, Fabian & Co, also offer themselves for re-election.

CHARLES A. REISS, Directors.  
W. S. SICHEL, " "  
ALBIN B. TOMKINS, Secretary,  
London, Oct. 26th.

CEYLON AND INDIAN PLANTERS' ASSOCIATION, LTD.

FIRST ANNUAL REPORT, 1897-1898.

The Directors in presenting this the first report and accounts regret that the result of the year's working is not so favourable as anticipated.

The past season has been a bad one of the tea industry in Ceylon, a long drought having caused a considerable shortage in crops, and, as may be seen by the accompanying table, this Company has been a sufferer to a large extent. The large decrease at Kandaloya is to some extent caused by finer plucking, but compensation has been obtained by a much higher price for the teas; the difference being about 3d per lb. more for the last invoice sold, compared with the same time last year.

Prices have averaged rather higher than for the previous twelve months for Ceylon tea generally, but the improvement does not compensate for the loss of tea caused by the drought.

The St. Andrew's group of estates was taken over from the 1st September 1897, so only shows the result of ten months' working. The directors think the purchase will prove a satisfactory one to the Company, and are pleased to have the presence on the Board of Mr. Thomas North Christie (the late owner), whose knowledge of Ceylon matters is of great assistance to them.

It will be noted that there are yet 366 acres planted to come into bearing; a future source of profit to the Company.

The directors wish to record their appreciation of the work done in Ceylon by Mr. George Greig and his assistants during a trying and disappointing season. Every effort is being made to reduce the cost of production, and to improve the teas.

Prospects for the new season are more encouraging, as all the estates show increased output since the 30th June last.

The accounts show that, after paying interest on mortgage and preference dividend for the year, there is a balance to credit of profit and loss of £268 15s 6d; from this the directors have appropriated £185 18s 3d for the writing down of preliminary expenses account, and carry forward the balance of £82 17s 3d to next season's account.

The Auditors, Messrs. Singleton, Fabian & Co. being eligible, offer themselves for re-election. Directors: C. A. Reiss and C. F. Dickson; Secretary: A. B. Tomkins.  
London, October 26.

## THE CENTRAL TEA COMPANY OF CEYLON.

The ordinary general meeting of the shareholders of the Central Tea Company of Ceylon was held at the offices of the company, 20, Eastcheap, E.C., on Monday (November 7.)

The chair was occupied by Mr. J. Sanroft Holmes, chairman of the company.

The Secretary (Sir Wm. Johnston) read the notice convening the meeting.

The following is from the report of the directors:—

The total crop from the estates for the past season was 751,791 lb, against 713,330 lb last year, being a substantial increase, though 30,000 lb. under the estimate, chiefly owing to the abnormally dry season. The total sales, including bought tea, were 1,025,963 lb, averaging 5.85d per lb. The manufacturing business shows some improvement. The yield of cocoa was 492 cwt., against 507 cwt., but owing to the average price being 62s 3d. per cwt., against 51s 2d, shows a larger profit.

Seventy-two acres have been cleared during the year, and there are now 234 acres tea under three years old. The directors regret that the season's operations have not resulted more favorably. The profits have been effected by the higher rate of exchange, averaging 1s 3 9/16d per rupee, against 1s 3 3/4d last year, and also by the difference in price realised by the company's teas, which averaged as above 5.85d per lb, against 6.35d last season. The net profits for the year amount to £4,099 0s 7d, which, with £1,351 12s 4d brought forward from last year, shows a sum of £5,450 12s 11d available for division. Of this sum, £638 11s 9d has been written off for transfer duties, &c., and £1,500 has been applied to the payment of a dividend at the rate of 6 per cent. per annum on the preference shares to December 31st 1897. The directors now recommend a dividend at 6 per cent. on the preference shares to June 30th, 1898, leaving a balance of £1,811 18s 2d to be carried forward. It has been determined to rebuild the factory at Weywetalawa at an estimated cost of about R28,500, on a new site nearer the cart road, and the work is now in progress. Your directors have given much consideration to this expenditure, which has been forced upon them by the unsatisfactory prices obtained for the tea made at the old factory, and is, in their opinion, unavoidable. In view of this expenditure and the desirability of having the interim dividend on the preference shares in hand, they have deemed it necessary to write off the above-mentioned transfer duties in one sum, and to recommend no dividend on the ordinary shares.

The Chairman, in moving the adoption of the report and accounts, said:—

Comparing season 1897-8 with 1896-7, the accounts show a satisfactory increase of over 30,000 lb. in the crop secured, of £1,300 in the amount realised, and of 3/4d in the net average price obtained. The cost of production calculated in rupees is practically the same, but owing to the rise of about 1d in exchange the cost in sterling is 3/4d per lb. higher. If exchange had remained stationary the profits would have been increased by £460, if the same as in 1895-6 about £900, a sum which represents two per cent on the total capital of the company. Applying a similar calculation to the whole tea produce of Ceylon, say 120 millions, it appears that the toll levied on the profits of the tea industry by the rise of 2d in exchange which has taken place in the last two years amounts to no less a sum than £250,000 per annum. In the face of these figures it is not surprising that planters are anxious as to what the future of exchange is likely to be. Any considerable further rise in the cost of rupees, unless a corresponding advance in the value of tea takes place, must seriously jeopardise a large portion of the planting industry. Having regard to what has taken place in the past in India, and to the very general feeling which appears to exist in this country, that it is legitimate for the Government of India to manipulate exchange with a view to relieving the strain upon its own finances, it seems certain that the rupee will not be allowed to find its natural level. The question then arises, is the produce of Ceylon and India, not only tea but all other produce which finds a market in this country, to be made permanently liable to a tax which the experience of this company proves to be one which amounts to an annual charge of no less than two per cent on its capital, and to something like 25 per cent of its profits? If this is so, East Indian industries of all sorts, whether native or British, must be seriously

handicapped when competing in our home markets with similar industries established in silver-currency countries where the medium of exchange finds its natural and unrestricted market value. That the Indian Government has temporarily benefited by artificially raising the value of the rupee is unquestionable, but it seems impossible that anyone can fail to see that it has done so at the expense of the whole body of Indian producers who depend upon the home market. The difficulty of the Indian Government in meeting the annual charge upon her gold-bearing debt will increase if diminishing profits on her exports brings, as it must, a decrease in the volume of her shipments to this country. It is very satisfactory to notice the largely-increasing demand for British-grown tea which is now arising both in the colonial and foreign markets. This, coupled with the fact that little fresh land is now being brought under tea, has an appreciable effect on the quantity arriving to the London market. Year by year estates are being better equipped with all the necessary buildings and machinery, which should result in a continued improvement in quality. It is to be hoped, in the interests of Ceylon, that the Government will recognise the prime importance at this juncture of doing everything in its power to assist planters by reducing railway rates to a minimum, by increasing railway facilities, and by liberally assisting in making roads wherever there is a reasonable prospect of developing traffic. Cheap and quick transport is the very essence of profitable cultivation, and the planter has a right to demand that his pluck and enterprise in the face of many difficulties should be met and encouraged by the Government, and that where public works can promote the well-being of the tea industry, no time should be lost in pushing them forward with the utmost vigour. With a steadily-increasing rate of consumption at home, a quickly-growing demand abroad, and a but slightly enlarging annual output the prospects of the tea industry are improving and give good reason for hoping that the current season will prove a more profitable one than the last.

The report and accounts were then unanimously adopted, and the retiring director, Mr. W H Anderson, was re-elected.

The proceedings closed with a vote of thanks to the chairman.—*H. and C. Mail*, Nov. 11.

THE KORALE TEA ESTATES, LIMITED.

The ordinary general meeting of the shareholders of the Korale Tea Estates, Limited, was held at the offices of the company, 24, Rood Lane, E.C., on Tuesday last.

The chair was occupied by Mr. W. S. Bennet, chairman of the company.

The Secretary read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, said: You have had before you for some days the report and balance sheet for the past year ending June 30th last, and although it is not as favourable as either directors or shareholders could wish, it might have been worse, and if any satisfaction can be derived from the knowledge, we are aware, that many Ceylon companies are worse off than we are. We cannot control Nature, and if she, at times chooses to inflict an unusual drought on a country, we must put up with it. This has been the case this year, and has most seriously affected the yield on some of the estates. Riverside has not felt this so much as the others, but we regret that the price of tea has fallen about 3d per pound, equal to about 1/3 per cent on the dividend. The price of Wewesse tea has also been lower, but this we look upon as exceptional, owing to the transition state in the factory. The new factory being now completed we look forward to better prices for the tea. Another cause for disappointment is the rise in exchange, it being 3d higher this year than last, and on the expenditure makes a difference in excess of about £280, equal to 1/2 per cent on the dividend. The dividend now recommended is really a completion of that of 1896-7,

and still leaves a cumulative dividend of 6 per cent due on the preference shares to June 30 last. You will observe that about 160 acres, principally on Wewesse, are coming on, and in the course of two or three years should add materially to the output of tea. Every endeavour will be made to improve the prices obtained in the London market. After the adoption of the report and balance sheet has been seconded, we shall be pleased to answer any questions the shareholders wish to put.

Mr. Shand, in seconding the proposal, said the chairman had dealt with the various causes which oblige us to again tell our shareholders a tale of disappointment and I need not repeat them. I can only say we are doing our utmost to exercise the strictest economy compatible with good management in London, in Colombo, and on the estates, and also to improve the quality of the tea manufactured. The natural causes to which the chairman has referred we cannot control, but we have suffered loss from a great unnatural cause, the fictitious raising of the value of the rupee, which places us at direct disadvantage in the competition with other silver-using countries, whose currency flows naturally and has not been tampered with, and which only requires to be carried out sufficiently far to mean ruin to Ceylon tea growing and many other Indian enterprises. It behoves the directors of this company, as of all other similarly situated companies, to leave no stone unturned to restore the currency of India and Ceylon to its fair and natural basis.

In reply to questions the Chairman said that last year the directors waived their fees entirely. This year £280 had been carried forward, and the directors proposed to allocate £150. During the year thirty acres had been planted on Karagastalawa, and ninety-three on Wewesse. The factory at Wewesse had been rebuilt on a better site at a cost of £3,000.

Mr. Tye suggested that the directors should give their attention to the manufacture of unfermented or Oolong teas. He believed there was a demand for these teas in America.

Mr. Brett (a director) stated that Oolongs were considered of very small value, and so far as this country was concerned he did not think it would pay to manufacture them. He could not answer for America.

The Chairman stated that the matter should have the attention of the board.

The report and accounts were then unanimously adopted.

On the proposal of the Chairman, seconded by Mr. Brett, a dividend of 3 per cent., making 6 per cent. for the year 1896-7, was declared.

On the proposal of Mr. G. Shaw, seconded by Mr. Tye, the auditors were re-elected.

The proceedings closed with a vote of thanks to the chairman.—*H. & C. Mail* Nov 11.

DIGALLA CEYLON TEA ESTATE COMPANY, LD.

The following Report of the Directors was to be submitted at the second annual ordinary general meeting of shareholders to be held at 20, Eastcheap, E.C., on Tuesday, the 22nd Nov.:

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending 30th June 1898, duly audited.

The net amount at credit of	£	s	d	£	s	d
profit and loss account, after providing for general expenses, Directors' fees, income tax, &c., is				450	4	6
Dividends on the 6 per cent preference shares were paid for 1897-8 (less income tax) amounting to	348	0	0			
Leaving to carry forward to next year a balance of	102	4	6			
				£150	4	6

The Directors regret that owing to the fall in the price of tea, and the expenditure incurred on

the cultivation of tea not in bearing, they are not in a position to pay a dividend on the ordinary shares. The amount expended on tea not in bearing in the past season was £450, on the factory £900 11s 3d, and on new clearings £1,248 17s 10d, in all the sum of £2,599 9s 1d, which has been added to the capital cost of the estate.

The acreage of the Company's property is now as follows:—

Tea in bearing..	..	420	acres
Tea not in bearing	..	99	"
New clearings ..	..	80	"
Jungle ..	..	151	"

Total .. 750 acres

The gross average price realised was 6·17d per lb., as against 6·47d per lb. last season, and the rate of exchange was 1s 3 27-32d per lb., against 1s 3 3-16d.

The total crop amounted to 190,818 lb., or 454 lb. per acre of tea in bearing, which includes 37 acres young tea in partial bearing.

Under clause No. 24 of the Articles of Association Mr. R. B. Reid retires on this occasion from the Board, and, being eligible, offers himself for re-election.

The Auditors Messrs. Harper Brothers, chartered accountants, also retire from office, and offer themselves for re-election.

WM. JOHNSTON, Secretary.

London, Nov. 10.

## CHRISTMAS ISLAND.

WHERE IT IS SUMMER FROM JANUARY TO DECEMBER.

Mr. Charles Andrews, of the Natural History Museum, has been lecturing to the Royal Geographical Society, giving an interesting description of a visit recently paid by him to Christmas Island, in the India Ocean, the expenses being borne by Sir John Murray.

During the year which this explorer spent upon the solitary islet he must have almost forgotten how to grumble at the changes in temperature which, it is said, make our countrymen what they are, seeing that the thermometer only varied 19 deg. Fahrenheit throughout the whole time, rising once towards the end of November to 89 deg., and dropping to 70 deg. in the middle of February. This state of things becomes almost ideal when one learns that south-easterly breezes blow for nearly the whole year through, that there is plenty of fresh water, and that the island is perfectly healthy.

To begin with, the spot explored was originally an atoll, like the Cocos Islands, upon which Darwin based his theory of coral islands, and lies some hundreds of miles to the north-east of these and 190 south of Java. Christmas Island has a maximum length and breadth of twelve and nine miles respectively, and roughly contains forty-three square miles of surface covered with dense forest. For the last eight years or so Mr. Andrew Ross has lived on the island, which previously was uninhabited by man, and the population when Mr. Andrews left was about forty, chiefly Malays.

The animals are not many, and perhaps those which serve as food are most interesting generally, and they must be to the inhabitants. Seabirds are very numerous, and two species of frigatebirds form the chief contents of the larder. Of the several land-crabs the robber-crab (*birgus latro*) provides a dainty dish, which is also substantial seeing

that the animal is often six inches or more across the carapace.

A plentiful supply of rice, which with other stores is left by Mr. Ross's boats on their way from Java to the Cocos Isles, provides vegetable food, and Mr. Andrews says that the coolies who were brought by the engineer to lay down the road to render available the valuable deposits of phosphate of lime looked as if they had never had a square meal in their life, and found themselves in a land of plenty.

In passing it may be said that the solid phosphatic rock represents what was once guano when the island was not covered with trees and was the resting-place of multitudinous birds.

The settlers have proved the suitability of the place for growing coffee, and have planted coconuts and fruit trees.—*Home paper.*

## SOUTH TRAVANCORE TEA CO., LD.

### DIRECTORS' REPORT.

The outturn of tea was 212,046 lb., being 32,954 lb. below the estimate. The area now under tea amounts to 743 acres. The average price realised was 5·55d per lb., as against 5·85d obtained last season, the gross profit £1,304 15s 3d., as against £1,672 11s 10d last year. The net profit amounts to £740 7d., which, with the balance brought forward from last year, makes a total of £941 15s 4d. Shortness of tea crop, unusual drought, high freights, high rate of exchange, failure of coffee, and lower prices generally have combined to produce so disappointing a result. Your directors are of opinion that the capital expended in developing the estates since the formation of the company will now bear fruit, and that the current year will show more satisfactory results. The latest crop reports show that for the first three and a-half-months of the current year 90,000 lb. of tea were made as against 54,891 lb. during the corresponding period of 1897, and so much of this as has been sold has realised a satisfactory price. Mr Valentine, who has recently been appointed visiting agent, reports under date September 23rd, that the garden and factory are in good order, reflecting great credit upon the manager (Mr. Stewart) and the assistant (Mr. Macdonald.) Mr. Valentine estimates the probable outturn for this season at 350,000 lb.

At the request of your directors, Mr. Forbes Laurie, early in the present year, visited the company's tea gardens in South Travancore. His report on the properties, with the exception of two small divisions, was favourable. Negotiations are proceeding for the resale of the latter to the vendor on terms favourable to the company. During the period under review, 1897-98, Mr. Alexander resigned the management of the company's properties, and Mr. Stewart was appointed manager in his place.—*H. and C. Mail*, Dec. 2.

## MR. F. H. WIGGIN AT CHELTENHAM.

The *Cheltenham Observer* reports that, at the recent Cheltenham fruit and flower show, Mr. F H Wiggins, formerly of Sogama, Pussellawa, won ten prizes as follows:—

Three buttonholes of chrysanthemums with ferns or grasses for gentlemen—(open) F H Wiggins 2.

Do for ladies—F H Wiggins 2.

Bouquet for hand—F H Wiggins 2.

Collection of culinary apples—F H Wiggins 2.

Collection of dessert apples—F H Wiggins 1.

Single dish of culinary apples—F H Wiggins 3.

Collection of pears, 12 dishes—F H Wiggins 1.

Twelve pears for weight, of one sort—F H Wiggins 1.

Grapes (black) one dish, two bunches, distinct varieties—F H Wiggins 1.

One dish, two bunches, one variety—F H Wiggins 2.

## PRODUCE AND PLANTING.

## INDIAN TEA PLANTERS AND THEIR SYSTEM.

Under this heading, the *Produce Markets Review* returns to the charge in its issue of last Saturday, and continues its indictment against tea planters and "their system." It says: "Last week we pointed out that the causes of the great fall in value were over-production, particularly of common sorts, the unregulated and reckless method of selling, the discouragement of the larger buyers and widespread but glaring misrepresentations to the public as to the proper price of fine tea. The remedies indicated could only be a partial cure, but such as they were they consisted in better regulated auctions, larger lots, and the revival of sales by private contract for a considerable portion of the imports. In addition to the abandonment of the suicidal policy of sacrificing quality to quantity, and of still further glutting an over-supplied market at a time when a reduction is more called for than an increase, the Indian planters have to consider whether they cannot materially decrease their expenses. The various kinds of tea, apparently supplied from one estate at one time, are really grown on the same plants at the same time; Pekoes, Pekoe Souchongs, Souchongs, and Congous, dust, and so on, are simply different-sized leaves sifted out by the coolies after they have been roasted, with the result of a considerable addition to cost. The Pekoes and so on, of course, fetch more than the larger leaves, but the lower price of the residual dust created by the sifting must go far to neutralise this gain. The separate sizes continue to be so badly mixed that they have to be compulsorily re-blended in the London public tea warehouses. The cost of this operation is  $\frac{3}{4}$  per pound and in addition to this the tea can never be improved in the operation, and is often materially injured. Finally, all the various Pekoes so elaborated, sifted out, and at such great cost are, as the lawyers say, brought into hotchpot, and once more mixed together either by wholesale or retail blenders, showing, in any case, how little the tea trade appreciate all these careful and expensive divisions. So far as the planters are concerned, the original sifting and the re-blending here must one way or another cost them  $\frac{3}{4}$  per pound, a charge of about £390,000 a year on 140,000,000 lb. of tea."

## THE QUESTION OF BLENDING.

"Quite apart from the cost of the sifting process, it forms," says the writer in the *Produce Markets Review*, "the main reason of the small breaks which go far to prevent the rational sale of tea in Mincing Lane. The present system of separate sized leaves is certainly a lamentable one, and accounts to some extent for the most unsatisfactory position. The question arises whether, if the Indian planters do not adopt a more sensible system, some very drastic remedy will not have to be found as the trade increases, to enable the parcels offered to be sampled and valued. No doubt when the produce of the various estates is being blended at the public warehouses here, it would be a simple and effectual cure to forcibly blend all the different sizes together again, in order to produce decent sized lots, but it would of course be far better if this were done on the estates, and in addition that the blending there should be so conducted so as not to call for re-blending here prior to the sales. It surely ought to be a simple matter on all the larger estates to make, say 200 chests at a time of an even quality, and not differing from chest to chest, as is often now the case. If the Chinese can, and do, properly blend 500, or even 1,000 chests in a single 'chop,' where is the difficulty in India with much smaller lots? The difficulty of the irregular size of chests which necessitates the turning out of each chest for taring, is simply a proof of imperfect appliances. Tea chests can surely be cut to seals as they are in China, or if not the ready-made iron chests can be substituted, or some of the new light patent packages now being made and freely used in this country.

## SMALL BREAKS.

"The small breaks are," according to this authority, "not only a source of expense and loss to the planters, but they prevent a considerable number of buyers from properly tasting and valuing the sales—for it requires a large staff to taste hundreds of samples a day. This is an injury both to the producer and to the home trade. The small breaks also inflict immense cost and inconvenience on the wholesale houses who mainly distribute their tea through travellers and the cost of supplying them with samples of trivial lots is just the same as if the parcel consisted of hundreds of chests. Then both they and their travellers as well as the retail buyer, have to do at least five times the amount of tasting and valuing as used to be the case for a similar weight of China tea. Large breaks would therefore, be most advantageous for these reasons both to the producer and to the distributor, and we pointed out last week how the present system discourages the larger buyers and tends to bring prices to a dead level, to the injury of all concerned.—*H. and C. Mail*, December 2.

## CACAO AND ITS ENEMIES :

## MR. CARRUTHERS' FAREWELL REPORT.

Mr. J. B. Carruthers, F.L.S., Cryptogamist, landed in Ceylon early in December 1897, and he returned home by the P. & O. mail-steamer on the 22nd Dec. He has, therefore, given a full year to the investigation of the Cacao Fungus; and apart from the series of useful Reports, marking the stages of his investigation, which have already been noticed in our columns, Mr. Carruthers very appropriately marks his departure by a final Report, which will be found in our columns elsewhere today. If there is anything specially new in what he tells the planters today, it is with reference to the very close relation between the fungus on the pods and that on the tree proper. At one time, Mr. Carruthers thought they were not only distinct, but that the one never meddled with the other. Now he has found and demonstrated that disease passes from the pods to the trees and that the cacao planter is bound to give as close attention to the first appearance of fungus in the pods, as he is to canker in the stem and to pluck off and destroy in the one case, just as he must excise and burn in the other. It is encouraging to find the Cryptogamist so strong in the belief that the cacao planter can really wage a successful contest with his fungoid enemies. If he is watchful for the beginnings of the trouble and trains his coolies to look out for disease in pod or stem, he may be able to prevent any widespread attack and to keep his trees in good condition. Such watchfulness and readiness to deal with the first beginnings of the attack are now all the more necessary, because Mr. Carruthers has come to the conclusion that "Forastero" cacao has by no means the special exemption from fungoid troubles, generally claimed for it. "Criollo" is undoubtedly the most liable to attacks; but the hardier kind has also to be watched and guarded against the prevalent enemy.

Altogether Mr. Carruthers, as Cryptogamist, has done valuable service to the cacao planters of Ceylon during his year in their midst. He has shown a special interest in, and aptitude for, the work entrusted to him; he has won general confidence and esteem among the planters; and his Reports have always afforded practical information and instruction in a way readily understood. He has, in fact, been emphatically the right man in the right place; and this makes us anxious that his connection with the

Colony should be officially renewed at an early date. Now that we are beginning to hear a good deal more of the troubles affecting tea—fungoid as well as insectivorous—and considering the vast importance of the enterprise, it is a matter of pressing moment in our opinion that Mr. Carruthers, equally with Mr. Green—the one as Mycologist and the other as Fungologist—should be made fully available for the Planting Enterprise. We feel convinced that before Sir West Ridgeway goes home on leave, he will be able to convince himself, that apart from the Staff of the Peradeniya Botanic Gardens and the important investigations there carried on, there will be a pressing need for the constant presence of the two Scientists named, in the Planting districts. If, as we believe, Mr. Green takes up his official duties in September next, we would fain hope that Mr. Carruthers may have an official call to come back to Ceylon not later than that date. Meantime we say farewell, with all good wishes for future prosperity, whether here or elsewhere, to Mr. Carruthers.

#### PLANTING NOTES.

**COFFEE AS AN AUXILIARY TO TEA.**—From information to hand—says the *Indian Planters' Gazette*—it would appear that a few gardens in Sylhet and Upper Assam are seriously contemplating putting out from 50 to 100 acres of coffee. Failures there will be, no doubt, but careful selection of land, good seed, good pits, careful planting and intelligent cultivation afterwards, ought in a great measure to reduce the failures to a minimum.

**A DISH OF TEA.**—The literature on tea, and tea drinking increases rapidly and the *Lady of Oct. 13* adds to the mass of reading, already noticed and quoted by us an interesting article dealing with Dr. Goodfellow's lecture at the Agricultural Hall Islington. Those who have attended the annual Grocery and Provision Trade Exhibitions held in this hall know the interest that is taken in them not merely by the public but the retail traders in the large towns of the United Kingdom. With them Dr. Goodfellow is always popular: a genial lecturer, full of wit and wisdom as well as chemical knowledge, his lectures (from which we quote elsewhere) are well received. The *Lady* reproduces much of what he says and ends with an audacious parody of the Duke of Rutland's memorable distich—

"Let wit and wisdom, laws and commerce flee,  
But give us still our soothing cup" of tea.

ON THE "STRINGYBARK" TREES of New South Wales, especially in regard to their Essential Oils. By R. T. Baker, F.L.S., Curator, and H. G. Smith, F.C.S., Technological Museum, Sydney. Part I. Read before the Royal Society of New South Wales, July 6th, 1898. A copy of this pamphlet has reached us and we copy a summary of the results arrived at:—

1. Baron Von Mueller's classification of the "Stringybarks" is endorsed. 2. That an oil having a less specific gravity than 0.910 has been found to exist containing over fifty per cent of eucalyptol, and answering all the tests laid down in the British Pharmacopœia of 1898, except that of specific gravity. It is thus seen that the specific gravity test for Eucalyptus oil as given in the B.P., if enforced, might be the means of excluding some excellent oils. 3. That phosphoric acid is not a satisfactory qualitative test for eucalyptol in some crude Eucalyptus oils. 4. That endesmol, the stearoptene of Eucalyptus oil, exists in large quantities in the oil of *E. macrophylla* and can be readily purified.

THE OLIVE-GROWERS of California will probably gather this winter the largest crop ever known in the Union, says the *Retail Grocers' Advocate*, and for the first time the production of this fruit is expected to be in excess of the demands for consumption in California alone. An enormous planting of olive-groves has been made in California in the last few years, estimates putting the area of bearing-olive groves at about 6,000 acres, while the total orchard area is about 24,000 acres.

**INDIARUBBER.**—The market is firmer, and fine Para  $\frac{1}{2}$ d. dearer. Sales up to 3s. 9 $\frac{1}{2}$ d. for spot and forward delivery, closing with rather buyers at this. Scrappy negroheads further sales at 3s. 3d. for near at hand, and 3s. 4d. now asked. Camitas sold down to 2d. 5 $\frac{1}{2}$ d. for forward delivery, but have since advanced up to 2s. 7 $\frac{1}{2}$ d. At auction there was, rather more demand, but prices show little change. Clean, hard rubber sells well, and is scarce, soft and mixed, cheap and plentiful. —*British Trade Journal*.

**FULL EMPLOYMENT FOR ESTATE COOLIES.**—Mr. Gosset of Pussellawa has spoken out on a matter that closely affects the future prosperity of tea as well as of the estate cooly. Writing to our contemporary, he made the following unmistakable reference:—

What is at the bottom of this combine is the very serious indebtedness of estate kangannies and coolies to chetties and kaddie people, caused in a great measure by the miserable balances of pay that so many coolies now get, consequent on the scandalous amount of short work that is now almost universal throughout the country. Some people may say that short work is due to the over-supply of coolies at the present moment, but short work has been the rule on many estates for years past, and is likely to continue until some more reasonable system of pruning than that now in vogue is adopted.

And questioned as to "pruning" he replies:—

The system of pruning most generally adopted is to prune large acreages in January-March and July-September, and on some estates in January-February and July-August. Under this system it is always a case of a feast or a famine of leaf. In the famine months caused by such a system, coolies are worked from five down to two days a week. What I would call a reasonable system of pruning is to prune all the year round wherever possible; of course there are many estates that suffer from wind drought or excess of rain, during some months of the year, when it would not be possible to prune every month of the year, but on most estates it is possible; and am convinced that it is the only system by which coolies can get practically full work all the year round. The big rushes of crop now experienced would be almost entirely avoided, and there would always be a considerable acreage ready to respond to any kind of weather. Coolies would thus get the full work that they are entitled to by law and common honesty. With full work, all questions connected with labour would improve: such as coast advances; indebtedness of kangannies and coolies to chetties and kaddie people; and, indirectly, managers of estate and coolies would be in a better position to withstand the ever-present combination of chetties upcountry, and elsewhere, against them. The short work that has been prevalent on so many estates (especially during the last three months), is a scandal and a disgrace to the planting community, and will most certainly react upon it whenever better times set in Southern India. The Planters' Association of Ceylon and all District Associations are very keen about the Labour League and kangannies' pay. Would it not be as well if some of this energy were diverted to the root question of the full employment of the unfortunate cooly? If this were solved, the questions of coast advances, kangannies' pay, and the chetty combine could then be undertaken with some reasonable chances of success,

Correspondence.

To the Editor.

THE LOCAL DISTRIBUTION OF TEA IN SMALL PACKETS.

DEAR SIR,—As the Indian Government has refused to sanction the sale of tea in small packets at post offices, we may conclude that the Ceylon Government would also refuse to grant permission. But there can surely be no objection to our numerous outstation Dispensaries being utilised for this purpose. The distribution of tea in this way would be of great benefit to thousands of the poorer classes, and should lead to a large reduction in the quantity of abominable stuff at present sold at absurdly high prices, and introduce tea to distant parts of the country where it is at present unknown.—Yours faithfully,  
TIPS.

IRON ORE IN CEYLON.

DEAR SIR,—I do not think a Geological expert is required to 're-discover' the iron ore in Sabaragamuwa. On the boundary of the Province, in the neighbourhood of Halpe, the hill sides are covered with iron stone of very fine quality.—Yours faithfully,  
TRAVELLER.

[Ah, but what we want to re-discover is Gygax's 15 miles of iron ore, thus:—

"But there is another description of iron ore," says Dr. Gygax, in his official report to the Ceylon Government, "which is found in vast abundance, brown and compact, generally in the state of carbonate, though still blended with a little chrome, and often molybdena. It occurs in large masses and veins, one of which extends for a distance of fifteen miles; from it millions of tons might be smelted, and when found adjacent to fuel and water-carriage, it might be worked to a profit."—Ed. T.A.]

CACAO DISEASE.

From the Secretary, Planters' Association of Ceylon. Kandy, 19th December, 1898.

SIR,—I herein transmit an additional report on Cacao Disease by Mr. J. B. Carruthers.—I am, sir, yours faithfully,  
A. PHILIP.

ADDITIONAL REPORT ON CACAO DISEASE.

After writing my report in September last, I had brought to my notice the fact that in some cases the bark of the tree behind the diseased pods was cankered, and this led me to carefully examine a number of diseased pods, and I came to the conclusion that there was an undoubted connection between the canker in the bark and the diseased pods. I, therefore, agreed to remain in the island during the recent wet season, i.e., the North-East monsoon, and carry on my observations and experiments; and my doing so, I venture to think, has been of value—first, because I am able to add to, and to a certain extent correct, my former reports; and, second, because I have been able to watch the effects of the different methods of treatment, during the season when the canker is most active.

I propose to describe my investigations INTO THE POD DISEASE and what has been learnt from them and what it teaches us with regard to the treatment of cacao, and then to give the results of observations on the curative means—and how they have succeeded in combating and curing the canker.

In explanation, I must refer to the statements in my previous reports that the disease in the pods was due to an entirely different fungus to that in the bark, and that the pod fungus which belonged to the group of the *Peronospora* could not grow in the bark.

When I first began these investigations in Ceylon I examined diseased pods and found them to be permeated by quantities of mycelium which was different in character to the mycelium in the bark, and which bore masses of sporangia, i.e., egg-shaped bodies containing the spores or seeds of a fungus totally different in structure from what I afterwards found to be the fruits of the canker fungus. These sporangia, on being applied to healthy pods, induced in them the characteristic disease of the pods. The immense masses of the sporangia prevented me from seeing what I have now found even in my preparations made when I first began my work, that among them are to be found the much smaller and inconspicuous goodia spores of the canker fungus. It is only recently that I have been able to see and examine pod disease again; as during the larger portion of my stay there has been very little crop on the trees and consequently no diseased pods.

In order to prove the action of the CANKER FUNGUS ON THE PODS I carried on the following experiments:—

A.—Pieces of cankered bark were placed in selected healthy pods on sound trees. Five pods were so treated. In all cases the pods became diseased after about eight days, and in less than 14 days, spores of both fungi were produced in abundance.

B.—Pieces of diseased pods were placed in the bark of sound trees. Eight of these experiments were made. In all cases canker was produced in the bark, after about ten days, and the spores of the canker fungus, but not of the *Peronospora* were found after about 17 days.

C.—Pieces of cankered bark were placed in the bark of sound trees, just above the stalks of healthy pods. Seven of these experiments were made. In all cases the pods became diseased and on them were produced the spores of both fungi, in about eight days, and on their stalks, the spores of the canker fungus only.

D.—Pieces of diseased pods were placed in healthy pods on sound trees, and the disease having been produced, the effect on the adjoining bark was observed. Six of these experiments were made. In three of these experiments, the canker was produced in the bark of the tree adjacent to the stalk, and in the other three cases, the stalk of the pod was cankered, but not the adjacent bark,—in one of them the canker went into the wood of the tree through the stalk, but without affecting the bark surrounding the stalk.

These experiments show conclusively:—1st. That the canker fungus can spread from the bark to the pods; 2nd. That the canker fungus can spread from the pod to the bark and 3rd. That the disease before described affecting the pods does not grow in the bark, and is confined to the pod tissues not running into the stalk of the pods.

They also show that the canker fungus grows much more rapidly in the pod than in the bark and produces its spores much sooner on the former than on the latter. On the bark it takes weeks and often months for the spores to form, on the pods it is a matter of days. The prompt appearance of the *Peronospora* fungus after the canker has infected the pods is shown by experiment C, but the exact share which these two fungi take in the destruction of the pod tissues should be made the subject of further experiment and observation during the next wet season.

I may here mention that one or two careful observers stated to me when I was first investigating the origin and nature of the disease, that the canker on their estates first appeared on the trees surrounding the holes where the pod husks were buried, but this I found not to be always the case, and having no further data to support it in my knowledge of the life history of the fungi I imagined it to be a coincidence. This fresh knowledge of the canker fungus points to the fact that the spores from the diseased pods had in these cases infected the trees near which they had been deposited.

That the diseased pod should not be buried in the holes with the healthy ones has been insisted on in the previous reports, and this shows clearly the danger of such a proceeding.

On examining some hundreds of diseased pods, the fungi are in practically every case found associated. The explanation of this seems to be that the *Peronospora* fungus (which belongs to a group most of which are parasitic *i.e.*, growing on living tissue, but which also has some members which are saprophytic, *i.e.*, growing on dead tissue) at once succeeds the canker fungus and lives on the tissue killed by it. This I have endeavoured to prove, but have not, up to the present, been able to do, owing to the difficulty in isolating the *Peronospora* spores so as to get a pure culture of them for the purposes of inoculation; and so I have not been able to observe the action of the *Peronospora* spores *alone* on a healthy pod. The action of the canker spores alone I have been able to observe on a healthy pod, but in the space of about two hours, it was joined by the *Peronospora* fungus and spores of this latter produced.

The characteristic brown patch which is very moist to the touch when cut, caused by the presence of these fungi on the pod is more frequently found at the ends than on the middle parts of the pods. This is due to two or three causes.

In the first place the central tissue of the pod is frequently the means of conveying the mycelium of the fungus from one end to the other, and this is always the case when the stalk is affected. On cutting open a pod diseased at both ends or the stalk and point diseased longitudinally, the central tissue bearing the seeds will be seen to be discolored owing to the presence of the mycelium of the fungus. There is also a greater tendency for the spores to germinate at the stalk end or the point than on other parts—at the stalk end there is a naturally-formed cup round the stalk, which retains moisture longer than the sides of the pod, and at the tip a drop is often formed, which remains for a sufficiently long time to enable a spore to germinate and push its germ tube into the tissue of the pod.

In observing the general effect of the pod disease all over an estate, one finds that the diseased pods are gregarious on individual trees, so that on one tree ten or twelve diseased pods are seen, and none on the neighbouring trees; while on a tree at some little distance again there are a number of diseased pods. This is more marked where the trees are grown at a reasonable distance apart. This is mainly due to the rapid spread of the disease from pod to pod, the spores being produced in a few hours, and conveyed to the nearest pods which they, in their turn, affect and produce more spores.

The spreading of

#### THE SPORES OVER AN ESTATE

is a most interesting and the most important question in relation to the canker, and has received a great deal of thought and attention from me, as it is, by means of the spores that all the increase of the disease comes about. Though I have seen cases of infection from pod to stem and *vice versa*, by actual contact, these cases are so rare, that we can neglect them and consider that the spores are responsible for all the extension of the disease.

The methods of infection of different trees are very various; but we can distinctly point to three or four chief means of attack which have been constantly observed. In the first place, the wind has no doubt the largest share in spreading the spores, especially over large distances, and it is the wind which enables the disease to spread from estate to estate. Instances of this may be mentioned. In one case an estate was chiefly and first attacked at the point nearest to a native garden which had been entirely killed out by canker, and the trees allowed to remain after they were dead; a prevalent wind blowing from this direction. Cases similar to this are numerous. On the other hand, the disease is often absent from sheltered hollows, even though there were present all the conditions which favour it, because the wind passed right over, and not through the cacao.

The next and nearly as important an agent is water—both rain and river. Rain washing down the trees and dripping off the pods on to other pods or parts of branches and stems, carries

with it the spores from infected places, and leaving them causes fresh spots. I have seen a tree covered with a mass of small fresh diseased places all independent of each other, below an old patch of canker, which was covered with spores. There have been many and clear proof of rivers spreading the disease. In some cases, I fear, by the dead timber being thrown into the stream and conveying its deadly cargo to other places lower down; and also a number of instances of cases of flood washing the spores over a flat area of cacao and infecting the trees. A very clear case of this was found in one young clearing where practically every tree was cankered just above the surface of the ground, where a few inches of water had stood for a short time during a flood.

But, in addition to both, wind and water, ants and other small animals are the means of spreading the disease to an extent that I think is hardly recognised. Anyone who has watched the ceaseless activity of ants in running over stem, branch, and pods of cacao tree, cannot fail to see how they must be the means of carrying from one place to another the spores when they pass over them. I have examined the legs and bodies of some ants which had been travelling over a tree having spores on its bark, but without discovering these spores on them. But, considering the extremely small size of the spores, this does not materially weaken the contention, and, indeed, I should have been surprised if in any of the few cases I examined I should have discovered any spores. The fact that the ants frequent the pods where they feed on the secretion from the backs of the white coccidæ that live on the juices of the pod alone, makes it probable that in the case of the pods the ants are responsible for a good deal of damage in carrying infection.

How much part

#### THE PODS

take in spreading the canker in comparison to the stem and branches, it is very hard to determine, but the rapidity with which the fungus grows in the pods, produces its spores, and spreads to other pods and to the bark, leads to the supposition that in many cases the majority of the damage is due to the disease in the pods. It is unfortunate that in most estates the time when the largest number of pods are on the trees is the wet season which is most favourable to the fungus, and a suggestion may be offered in this connection; it is well known to cacao planters that the amount of fruit produced by each tree at the different crop times varies; that one tree produces a bigger spring crop and not so big an autumn one as another—this is an individual characteristic which is in many cases quite pronounced. If such characteristics are carefully selected in propagating (as had been done to produce the early and late varieties of cereals and many other cultivated plants), a plantation may be formed which will, in normal seasons, habitually produce its largest yield of fruit in the spring when the dangers of attacks of fungi are much less and when the planter has the advantages of sun in ripening his pods and curing his seeds. By continually using seed which has been produced in the spring, no doubt this would be gradually done; but it would be more effectually and quickly brought about, if the planter would observe for a year or two those individual trees which bear their fruit more in the spring, and by using the seed from them, get in time a spring crop variety. The attention of planters might also with reason be drawn to the practice of grafting which Mr. Hart, of Trinidad, has shown to be practicable in cacao, and which would, without doubt, lead to most interesting results.

With regard to

#### THE CURATIVE EXPERIMENTS,

the interest of my stay over the wet season has been to me very great, for I have been able to visit some ten estates in different districts, in all of which curative treatment has been carried on, and in all cases the treatment has been to a great extent successful. It must be remembered that in the previous reports

the treatment by shaving was not recommended as the best, but as a second method when trees were so badly diseased that the more drastic method of entirely cutting out the diseased tissue was likely to kill the tree. The conditions necessary for the success of the shaving are a dry atmosphere or still better direct sunlight. In estates where, because of shade, the atmosphere is seldom dry, except during a long drought, the shaving treatment does not succeed so well. By "shade" is not meant merely the shade produced by other trees put in for that purpose, but the shade produced by the cacao trees themselves. If the trees are so close that the branches overlap each other, then the ground is shaded just as if heavy shade trees were present. Where the canker is prevalent, the danger of such proximity in spreading and favouring the disease is very marked, and in more than one case where the air has been let in by judicious pruning as well as by cutting down shade trees, the good effects have been most marked.

But in all cases where the effect of

#### THE SHAVING

have not been marred and even nullified by excessive shade, the trees as a rule, were cured. I have examined more than 300 trees, the diseased parts of which had been carefully shaved as recommended, and in only 36 of these was there any sign of the disease. In the case of some estates which had been visited by a most unusually prolonged dry period, the trees had, in nearly every case, been cured, but in these places a proportion of the trees which were badly diseased, and required to be shaved over a large surface, had succumbed to the effects of the drought and the shaving combined; but, in these cases it cannot be said how long the trees, would have survived had they been left; and it is probable that the disease would have itself killed them in a not very much longer time, while, by shaving off the diseased bark and destroying it, a vast amount of danger to the remaining trees was removed.

However, the rule laid down in the last report still holds good; in my opinion, where possible, the whole of the diseased tissue and a wide margin should be entirely excised and destroyed, but in the cases of badly diseased trees the shaving may be tried, and it must always be remembered that having shaved them they are not yet safe; and must be, after a short period, examined to see if the treatment has been satisfactory, and if any active canker still remains, it must be cut out.

The experience which we have gained during the wet season shows us that it is possible, even in cases of estates seriously diseased, to combat the disease; but, it also shows very clearly how much more easily the disease is kept in hand when it is looked after in its initial stages; and it is therefore of great importance that all growers of cacao who have no canker, should be the victims of a wholesome dread of the disease, and by constant watchfulness discover the first signs of any canker and destroy all affected parts, whether occurring in stem, branch or pod.

The statement in the second report that

#### FORASTERO

was much less attacked by the canker than the Criollo, there is reason to think should be to a certain extent modified—though all the data still point to the Forastero being less attacked; yet the existence of fairly large areas of Forastero badly affected show that given the conditions necessary, the disease can in both, bark and pod produce great, and if not checked, fatal damage to an estate which is entirely Forastero.

The cutting out or shaving of trees is an operation that calls for great care, but a very little instruction enables the cooly to understand and practice it. I have seen it carried out perfectly by large bands of coolies on several estates. However, planters will find that a great deal of supervision is necessary to avoid scamped work, which is in many ways more dangerous than not doing the work at all, as it induces a false feeling of security. The application of lime and other washes, while beneficial as a preventive, makes the

detection of the cankered parts more difficult, in fact, the disease goes on growing under the applications until it is noticed by the bleeding, and this means that it must have been active in the tree for some time.

The necessity for a continual

#### INSPECTION OF CAJAO

tree is rendered more imperative by the fact that in a considerable proportion of the cases of canker examined, the mycelium of the fungus has penetrated to the wood and runs along the wood and breaks out at another place in the bark; but if the parts of affected bark are all removed in most cases this mycelium in the wood is starved out. Still, this habit of running under the bark in the wood is insidious and calls for special observation even when a tree appears to have been properly treated. Special coolies who show themselves clever at their work constantly examining the trees of an estate, will be certain to repay a hundred-fold their daily wage.

In conclusion, it appears from a further period of observation, that if the methods before laid down for battling with the disease are carefully carried out, this enemy to cacao cultivation may be gradually exterminated, and it behoves all cultivators, however small the area of their plantation to do their best to fight the disease and to see that they are not the means of spreading the spores of the fungus to the detriment of their neighbours and the destruction of their own trees.

17th Dec. 1898.

J. B. CARRUTHERS.

#### "COMPOSITION OF CINCHONA SOILS."

London, E.C., Nov. 30.

SIR,—In the last *Overland Observer* bearing the date of November 4th, there is on page 1,549 a short editorial note under the heading of "Cinchona Bark and Quinine to the Front" in which a renewed attempt at cinchona cultivation is seriously advised especially in the Uva districts.

Bearing in mind the disappointment caused in the past, through the failure of cinchona plantations to produce profitable results, it would be desirable and certainly wise to ascertain first, whether the land selected is likely to be suitable for the purpose intended. Also whether the average rainfall is sufficient in quantity and fairly equally distributed throughout the year.

In 1886, for his own information, the writer specially obtained through Mr. R. Thomson, a specimen of soil, from the Central Cordillera of the Columbian Andes, upon which *Cinchona lancifolia* were growing and it may be useful to planters if the analysis, particulars of rainfall and situation were made public at the present time.

Mr. Thomson's notes are as follows:—

"The best varieties of *cinchona lancifolia* grow upon this soil, the elevation is 8,000 feet and the average rainfall is about 100 inches. One variety of *lancifolia* gave 6.20 per cent of quinine, while several other indigenous species of *cinchona* in the same locality contained from 1 to 2½ per cent of quinine. The subsoil to a great depth is the same as sample sent, for the immediate surface soil specially rich in vegetable matter was excluded when taking the sample. This subsoil is sandy and porous so much so that after heavy rains the soil quickly becomes perfectly dry. The sample was taken from virgin forest and represents the quality of the soil throughout the entire Cordillera."

The most noticeable points in the analysis are the high figures for natural moisture 4.823 retained in the air-dried sample, and 18.687 combined water and organic matter; showing considerable retentive properties, which are probably due to the decayed vegetable matter present,

and also to the apparently large amount of alumina suggestive of a somewhat stiff soil. Mr. Thomson, however, states that the soil is very porous and is not injuriously affected by heavy rain. It is fairly rich in phosphoric acid though the figures for potash are low. In nitrogen, however, this specimen is very rich, the figures being much above what is usually found in soils of average fertility, and a nitrogen is a very important constituent of the alkalioids it appears essential that soils suitable for cinchona should be rich in nitrogenous vegetable matter.

Let us now see how the composition of this soil compares with that of the Indian cinchona soils, samples of which were kindly supplied the writer in 1882 by the Madras Government authorities:—

No. 1.—Neddivattam, formerly forest land, now planted with succirubras, which are growing very well, average annual rainfall during five years from 1877 to 1882 was 92.41 inches.

No. 2.—Neddivattam, formerly grass land now planted with succirubras and condamineas, the former growing very badly and the latter fairly well.

No. 3.—Dodabetta, rich surface soil, elevation 7,200 feet, average rainfall during five years from 1877 to 1882 was 51.70 inches, growing Condamineas and doing well.

No. 4.—Dodabetta, poor gravelly soil elevation and rainfall same as No. 3 growing Condamineas.

ANALYSIS OF CINCHONA SOIL.

From the Central Cordillera of the Columbian Andes in the District of Chaparral.

SENT BY MR. R. THOMSON, 1886,

Composition of the air-dried sample.

REGISTER OF RAINFALL AT THE CINCHONA PLANTATIONS, CHAPARRAL, REPUBLIC OF COLUMBIA.

	1883	1884	1885	1886
January		6.88	5.10	8.62
February		3.25	7.23	5.11
March		15.63	12.50	6.88
April		12.28	18.97	15.90
May		15.25	11.47	
June		9.17	6.89	
July		2.98	2.08	
August		2.30	4.68	
September		5.05	8.47	
October	10.53	12.25	20.67	
November	9.33	6.30	5.84	
December	4.85	5.73	13.32	

97.09 117.22

From the above returns, it will be seen that the rainfall is heavy and pretty evenly distributed throughout the year; though March, April, and May, appear to be the months of greatest rain. October, however, seems to be a damp month and in 1885 experienced the record downfall of 20.67 inches.

Evidently cinchona thrives best in a comparatively damp hot climate with only occasional short intervals of really dry weather.

INDIAN CINCHONA, SOILS.

Composition of the air-dried Samples

	Neddivattam.		Dodabetta.

	100.000	100.000	100.000	100.000
* Containing Nitrogen	.485	.299	.496	.107

On comparing the analytical results with the remarks of the authorities, who forwarded the samples, it will be observed that the soils which yielded the best growth were those which contained the most natural moisture (retained in the air-dried condition) the most organic matter and the most nitrogen.

It will also be noticed that the best soils namely, No. 1, from Neddivattam plantations and No. 3 from Dodabetta plantations, are both of them much richer in lime, potash and phosphoric acid the important mineral constituents. In other words, the analyses are a reliable guide in estimating the probable future crop results.

It is important as well as interesting to notice that the alumina varies very considerably, being highest in No. 1 and least in No. 4. The figures for oxide of iron on the contrary being highest in the poorest soil No. 4, of which in fact it forms just one-fourth or 26.870 per cent and consequently is unusually ferruginous in character.

There are undoubtedly many Ceylon soils that are equally rich in nitrogen, but the average plantation soil does not contain as much as these Indian soils do. While as regards potash and phosphoric acid, which are most important mineral constituents, there is also a corresponding deficiency, the amount of lime being about the same.

The success which has attended the Indian Government cinchona plantations, is generally recognised; therefore it is fair to assume that the analytical results have been fully borne out in the respective yield of valuable alkaloids.

In making therefore any future experiments in Ceylon it would obviously be desirable to proceed with caution and to select a favourable situation in a locality having a rainfall of 90 to 110 inches per annum and a soil rich in nitrogenous organic matter and capable of retaining moisture during periods of occasional drought.

Usually it will be found that richness in nitrogen is also associated with richness in the important mineral constituents, except of course in the case of peaty soils, which though rich in nitrogen and vegetable matter, are sadly deficient in potash, lime and phosphoric acid.

JOHN HUGHES, F.I.C.,  
Analytical Laboratory, 79 Mark Lane,  
London, E.C., Dec. 1.

## USEFUL NOTES.

**SAN JOSE SCALE.**—This is, says Dr. Fletcher, the well-known entomologist, the most serious pest that has ever occurred in Canadian orchards. We mention this, as there is a tendency to minimise the dangers that may arise from the introduction of this scale. If it breeds so freely in Canada, it may do so here. Fortunately, so far as we know, it has not appeared here in a living state.—*Gardeners' Chronicle*.

**DO NOT ALLOW FERTILIZERS** to come in direct contact with the seed of any crop. This caution is constantly urged in fertilizing pamphlets and otherwise, but most of us fail to properly heed it. Careful and scientific tests have shown that "ammonia nitrate of soda, chlorate and sulphate of potash and ammoniated superphosphates exert an injurious effect upon the germination of seed in general." But this can be wholly avoided by mixing the fertilizer with the soil.—*American Agriculturist*.

**PINEAPPLE FIBRE.**—We see from *Agricultural Ledger* 1898, No. 11, that the cultivation of pineapple as a fibre-producing plant has been taken up by the Hon. Mr. J. Buckingham, C.I.E., at Amguri, Assam. Specimens of fibre prepared by him have been sent to the Imperial Institute, and reported well of. The fibre is said to nearly resemble flax and to be suitable for spinning into fine twine, and if properly softened, for textile purposes. Its value is set down as from £20 to £25 per ton. We are not told how the fibre has been prepared from the leaf.—*Indian Forester*.

**THE CACAO TREE** has a very good proportion of Phosphoric Acid, distributed through the tree with a concentration of it in the seed. Any deficiency in this constituent in the soil will, therefore affect more the fruit bearing power of the tree. All parts of the Cacao tree are rich in Potash with concentration in pods and seeds. Lime is the predominant constituent in root, stem, branch and leaves and magnesia is distributed in considerable proportion through all parts with concentration in the seed. A soil, therefore, deficient in Potash, Lime or Magnesia is likely to produce sickly trees and such are usually less able to resist parasitic blights even if a sickly condition does not induce an attack.—*Jamaica Agricultural Society*.

**THE OLIVE CROP IN SPAIN.**—The accounts received as to the baleful effects of the recent inundations in the provinces of Grenada and Seville are very serious. Not only does there appear to have been a great loss of farm stock and of human life, but we are told that the Olive crop has been nearly or quite destroyed.—The waters seem to have risen to the height of the Olive-trees, and swept away the fruit. This must prove a great calamity, especially as things now are in Spain; and it is to be hoped that the services of the civil engineer and of the forester may be called in, so that a recurrence of such a catastrophe as that recorded may be rendered, as far as may be, impossible in the future.—*Gardeners' Chronicle*.

**LADY GARDENERS** are making headway in England. The first woman to take sole charge of a garden on exactly the same terms as a man is Miss Gulvin, who left Kew Gardens in January of last year to take charge of the garden of Mr. J. Brogden, Iscoed Ferryside, S. Wales. Her success has been great; and, clever as she is, many are surprised that one so young should have conquered all the difficulties of a first-rate situation which was not of the apple-pie order. The charge includes four vineries, orchard-house, and cucumber frames, with flower and fruit gardens, and five acres of kitchen garden. Miss Gulvin has a lady gardener as an assistant and four men besides. Her staff is now quite contented to be controlled by one of the weaker sex, and her situation is quite an agreeable one.—*Indian Agriculturist*.

**THE CULTIVATION OF THE BANANA** is assuming large dimensions (for South Africa) between the Gouubie and Hex Rivers, South African Republic. One family of Scotch farmers alone has 100 acres under cultivation, and many Scotch and German farmers cultivate from one to ten acres.—*Jamaica Agricultural Society*.

**PERSIMMONS.**—This tropical fruit is getting commoner in our markets than was the case a few years ago. Numbers of well-developed fruits of the size of an ordinary St. Michael Orange, but rather flatter at the top and bottom, were this week remarked in several fruiterers' shops in Covent Garden Market in a state fit for immediate consumption. Now that it is known that, like the fruits of the Medlar and Sorbus domestica, it has to be ripened (bletted), and the consumption of it not attempted in the very inviting brilliant red dress of maturity, people will acquire a liking for Persimmons. The fruit now imported come from the Canary Islands, the cultivation of the tree having been taken up by the natives. We hope soon to hear of consignments from some of the West India Islands.—*Gardeners' Chronicle*.

**A LIQUID FERTILISER FOR CHRYSANTHEMUMS.**—The following preparation after a formula given by Professor Paul Wagner, director of the German Experiment Station at Darmstadt is recommended in the special Chrysanthemum number of the *American Florist*, by a writer who has used it with satisfactory results during three seasons. It is called Wagner's Solution, and is prepared as follows:—

Phosphate of ammonia, 2 oz.  
Nitrate of soda, 1½ oz.  
Nitrate of Potash, 1¼ oz.  
Sulphate of ammonia, 1½ oz.  
Water, 50 gallons.

The cost of the ingredients is very small, and the preparation, says the writer, is an excellent liquid fertiliser for other plants as well as Chrysanthemums.—*Ibid*.

**INQUIRIES** are sometimes made as to the likelihood of Northern Queensland and of New Guinea being able to grow rubber trees at a profit. But, judging from latest reports received from South America, the probabilities are small indeed of Australasia or neighbouring country being able to compete with the native production in the Amazon districts of Bolivia and Peru. Mr. Churchill, the British Consul at Para, says that the total quantity of rubber shipped in 1896 from the valley of the Amazon amounted to 20,981 tons, valued at nearly 3½ millions sterling. The supply is regarded by competent authorities as inexhaustible, because the tree is being continually reproduced by nature. Some areas have become exhausted, but when abandoned for a time they recover, and many districts have not been tapped at all. The area producing Para rubber amounts to a million square miles and further exploration will probably show that this is underestimated.—*Indian Agriculturist*.

**CLEAN WOOD ASHES** are better than all the condition powders for the farm horses. In fact, many of the so-called powders are composed chiefly of salt and wood ashes, mixed with probably something else of minor importance. This being the case I find it much cheaper and easier to administer the wood ashes direct. The ashes can be given to the horses twice a week in their oats at the rate of even teaspoonful each time. If given carefully and regularly I believe that no other medicine will have to be given to horses that are fairly treated and cared for. Every one familiar at all with farm matters must have observed certain habit in many horses and cows to gnaw wooden posts, trees and similar objects. This craving for something which they do not get from their daily food is satisfied when wood ashes are administered regularly to them. It is just as natural for the animals to desire this as it is for us to have a craving for acids, salt and even pepper.—*Indian Farmer*.

BY ORDER OF THE COMMITTEE.  
Colombo, 6th Jan, 1899.

PLANTING NOTES.

TIN CAN IRRIGATION IN GARDENS owing to the scalding of the plants or the baking of the ground, surface application of water during the hot, dry seasons often injurious rather than beneficial. By thoroughly saturating the subsoil, leaving the dry surface to act as a mulch, the plants get the full benefit of all water applied, without harm. This can be done by digging a miniature reservoir a foot or so from the plant hill, and with a long, strait rod opening an underground passage to the roots of the plant. A much better plan, however, is to take old tin-cans that can be picked up in any quantity in all rubbish piles or dumping grounds, and perforating their sides near the bottom in a number of places, set one in the ground a few inches from the hill to be watered. Fill with water and the roots of the plant will do the rest. Often the rootlets enter through the perforations and form a mat in the bottom of the cans. This plan is especially adapted to vines of all kinds.—*American Agriculturist.*

CINCHONA-CULTIVATION IN CEYLON.—In consequence of the increased value of the Succirubra-bark, endeavour is being made in Ceylon to extend the cultivation of cinchona, and especially to obtain from Java the seed of the cinchonas which are richest in quinine. It would be rash to say that the movement will lead to anything, as Ceylon planters have been too severely bitten by their cinchona operations; but as the failure of these was evidently due to their cultivation of inferior barks, it is probable that with Ledgeriana bark, and a moderate amount of Succirubra, they would make more of it now.—*Chemist and Druggist.*

JADOO, LIMITED: ANNUAL MEETING OF SHAREHOLDERS.—The third annual meeting of the shareholders in Jadoo, Limited, was held at the offices of the Company, Palace Gate, Exeter, on Wednesday, October 26. Col. HALFORD THOMPSON presided. The Company, as we learn from the report of the meeting, is pushing the business in Continental countries, and in the colonies, but the turnover was small, and seems scarcely satisfactory; and as the chairman said at the meeting, the sum of £4000 to £5000 was required to still further develop the concern. They were, however, enabled to recommend a dividend of 5 per cent. per annum upon the paid-up capital. The sum of £200 ls. 4d. would be carried over to next year's trading.—*Gardeners' Chronicle.*

THE  
AGRICULTURAL MAGAZINE,  
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for December-January:—

Vol. X.] DECEMBER, 1898—JANUARY, 1899. [Nos. 6 & 7.

NEW YEAR GREETINGS.

SEASON REPORTS FOR NOVEMBER.

THE issue of our Magazine at the opening of another year gives us an opportunity of offering our good wishes to our readers both in the Island and out of it. We trust that the next twelve months will prove to each and all a prosperous year, and that the earth will yield her plenty to those engaged in the independent and honest occupation of cultivating the soil.

Of late years science has come to the aid of agriculture in so many ways that the condition of the agriculturist may be said never to be absolutely hopeless. But of course we must be prepared for the "ups and downs" of life even in this department of the world's economy. It is the strong that win the battle, and those who are strong in energy, in the wisdom of nature as she works in the soil and through the plant, in the knowledge of all that pertains to the art of agriculture, who will succeed in their honourable vocation. We need to be of a liberal and yet cautious and discriminating disposition if we would be good agriculturists; conservatism on the one hand and rashness on the other are to be alike condemned.

We have made many friends already, but we hope the coming year will bring us more. To our readers in the Colony, in Queensland, the Cape, the West Indies, the Straits and India we wish a happy and prosperous New Year, and to the kind Editors of the many 'exchanges' we receive, we wish all good fortune.

*Western Province.*—Paddy. Crop in early stages of growth, a good harvest expected in the Colombo district, some damage done by flood in Kalutara district where the weevil is said to have appeared in the previous harvests' grain. Rainfall abundant. Cattle: a few cases of murrain in Kalutara district.

*Central Province.*—Paddy. Maha fields nearly all in plants. Rainfall sufficient, 7.03 in. registered at Matale. Health of cattle good.

*Northern Province.*—Paddy in plant. Rainfall very heavy, 25.19 in. registered at Jaffna and 14.72 in. at Mannar. Health of cattle satisfactory.

*Southern Province.*—Paddy. Tender crop promising. Rainfall heavy, 11.70 in. registered at Galle. Cattle free from any serious disease, some foot and mouth disease in Hambantota district.

*Eastern Province.*—Paddy. Munmari cultivation extensive and promising. Rainfall registered at Batticaloa 14.10 in., at Trincomalee 21.16 in.

*North-Western Province.*—Paddy. Young crop promises well. Rainfall particularly heavy in Puttalam district where it registered 21.27 in. Health of cattle fair.

*North-Central Province.*—Paddy. Preparations for Maha cultivation. Rainfall ample, 12.10 in. registered at Puttalam.

*Province of Uva.*—Paddy. Yala crops thriving and prospects good. Health of cattle good.

*Province of Sabaragamuwa.*—Paddy. Yala harvest over, Maha cultivation going on with good prospects. Rainfall registered at Ruwanwella 17.66 in., at Ambanpitiya 10.95 in. Cattle plague has ceased in Kegalle district, but continues in the Ratnapura district.

RAINFALL TAKEN AT THE SCHOOL OF  
AGRICULTURE DURING THE MONTH  
OF NOVEMBER, 1898.

Greatest amount of rainfall in any 24 hours  
on the 13th inst. 3.6 inches.

Mean rainfall for the month .58 in.

Recorded by A. M. AHAMAT.

OCCASIONAL NOTES.

It is not generally known that coconut milk can be treated like cows' milk for the production of butter. The term coconut milk is often erroneously applied to the fluid endosperm found in the nut, while it should refer to the product got by mixing the scrapings of the solid endosperm with water, and squeezing out and filtering away the solution. If this milky or creamy substance be cooled down and churned in an ordinary English churn it will be found that it will produce butter in a few minutes. The butter unlike the so-called commercial "coconut butter" is not lardy but beautifully granular and snowy white. The normal temperature of the air in Colombo is, however, too high to permit of this butter remaining in a solid state, so that in a very few hours it passes into the liquid condition when it appears after filtering, as a clear limpid oil. The application of the churning process is probably of little use in the production of a pure coconut oil, but it strikes us as being capable of application in other directions in which we are at present experimenting.

The *Kew Bulletin* mentions the following nitrogen collecting plants useful for fodder and green manuring:—*Vigna catiang* (cowpea), *Cajanus indicus* (pigeon pea or dhal), *Phaseolus lunatus*, *Dolichos lablab*, *Dolichos purpureus* and *Phaseolus mungo* (green gram). These are all well-known pulses in Ceylon.

A small sample of the Caoutchouc-like substance referred to by Dr. Biffen in our remarks with reference to the milk of the Breadfruit tree, and prepared by us with the help of the ordinary centrifugal cream separator, was thought to be of no value when submitted to the Royal Botanic Gardens, Peradeniya.

*Erratum.*—In the number for November last, page 48, at the end of the first column, for *moist* read *most*.

In another column we refer to the experiments with nitragin in Scotland, and the conclusion of Dr. Aitken that it is a practically useless substance. Another substance has now come into the market under the name of Alinit—a yellowish powder supplied in small tubes by Messrs. F. Faber & Co., Elberfeld, Germany. It also contains a micro-organism discovered by Mr. Caron of Ellenbach, and hence called *Bacillus Ellenbachensis alpha*, but which seems to be no other than the *Bacillus Megatherium* of De Bary. The manufacturers issue instructions for its use, and they claim for it the power of enabling cereals to absorb free nitrogen from the air. Let us hope that it may be less disappointing than its predecessor. The proof that it can enable cereals to assimilate free nitrogen are far from complete, and that it should be boomed over the Continent as a substance that renders the application of nitrogenous manures for the growth of cereals unnecessary is, to say the least of it, premature.

Prof. Hendrick of Aberdeen University, has written an exhaustive paper on "Seaweed as Manure," in which he supplies detailed analyses and refers to numerous field experiments with it in order to compare its fertilizing properties with various other manures. He summarizes the results of his observations as follows:—It will be seen that weight for weight of manure, seaweed gives just as great a crop of potatoes as farmyard manure. When superphosphate is applied along with seaweed the crop is in every case increased. On the other hand in no case does the addition of superphosphate to farmyard manure give any corresponding increase of crop. The crops with dung alone and with dung and superphosphate are practically the same. Even when potash also was added to the dung there was no improvement but the contrary. It should be mentioned, however, that dung had the advantage over seaweed in quality of produce.

Dr. Bernard Dyer referring to the estimation of lime in soils says:—I have for some time been in the habit of adopting the presence or absence of an appreciable amount of carbonate of lime (enough to make the soil effervesce when a mineral acid is added to it) as a means of deciding the frequently put and often vexed question as to whether a given soil should be manured with an acid manure like superphosphate or dissolved bones, or whether it should be treated with a non-acid manure such as bone-meal, basic slag or guano.

The same authority, referring to sulphuric acid as a constituent of soils, remarks:—The proportion of sulphates in a soil is a matter to which insufficient attention has been given. When farmyard manure is liberally used the supply of sulphates in the soil will probably be well kept up; and where superphosphate is used, which, needless to say, contains much sulphate of lime, there can be no lack of sulphates; and the same holds good if sulphate of ammonia is used. But on fields on which dung is little used, and where superphosphate has been replaced by basic slag, and where nitrate is used as a source of nitrogen, the occasional use of gypsum (sulphate of lime) may be desirable. At all events the question

one worth bearing in mind by those who have opportunities of studying, both practically and analytically, the composition of soils. That too little attention has been paid to it has been suggested, as the result of his examination of certain Essex soils, by my friend Mr. T. S. Dymond.

Since writing a note on Rinderpest Inoculation in India we have read of the success of Mr. G. W. Sturgess, Colonial Veterinary Surgeon, in the same direction. We have not been favoured with a copy of this report, but we heartily congratulate Mr. Sturgess on his good work.

---

#### RUBBER.

---

In H.E. the Governor's address at the opening of Council on November 7th, occurred the following reference to this subject, taken from a report by the Director of the Peradeniya Gardens:—"The whole question of rubber cultivation has however assumed a new aspect in consequence of the discoveries of Mr. Bitten of Cambridge. By the aid of a machine on the principle of the cream separator he can in a few minutes obtain the pure caoutchouc from the milk of any species of rubber tree, and the product thus obtained is practically identical whether got from the Para, Ceara, or other species. The best results are perhaps obtained from the milk of *Castilloa Elastica*, and it thus becomes a question whether the planting of this species should not be taken up in Ceylon in the dry parts of the hills where Para rubber will not grow."

The following description will give some idea of the method adopted by Mr. Bitten, who is the Demonstrator in Botany at the University of Cambridge: As the rubber exists in particles in the latex, it seemed possible that the centrifugal method of separation might be adopted in examining the phenomena of coagulation. A modified form of the ordinary centrifugal milk-tester was, therefore designed capable of being rotated some 6,000 times per minute.

The latex was taken directly from the tree, strained through wire gauze to remove any pieces of bark, and then, if very thick, diluted to about the consistency of thin cream. The first experiments were made with the latex of *Castilloa elastica*. After centrifugalizing for from three to four minutes, the rubber particles completely separated as a thick, creamy, white layer from the deep brown solution containing tannic acid in which they had been suspended. This layer was taken off, shaken with an excess of water to thoroughly wash it, and again separated. The separated particles were then shaken with water, so as to form an emulsion, and alkalies were added. No coagulation now occurred, even though the mixture was allowed to stand for several days. The particles could, however, be brought into a solid mass by pressure, by gently heating, or by drying off the water with a porous tile. So prepared, the rubber formed a pure white mass, without any trace of its usually characteristic smell. On exposure to the air for several days, the surface became brown, probably owing to oxidation.

The percentage of rubber in the latex was estimated at the same time by separating 50 c.c. The weight of the dry substance was 12.5 grammes, which, as the specific gravity of *Castilloa elastica* latex is practically 1.0, gives a yield of 25 per cent.

On treating the latex of *Hevea brasiliensis* in the same way for a slightly longer time, a similar separation occurred. The same purely physical means as those employed in the case of the separated *Castilloa* rubber-particles caused them to coalesce to form a solid mass, while the addition of acetic acid and the action of the smoke of burning urucuri nuts had no effect.

The yield of rubber estimated as before, was from 28 to 30 per cent. The latex of *Manihot glaziovii* also separated readily and gave results completely parallel with those mentioned above. The latex is interesting, as it is readily clotted by churning. A soft spongy clot is formed in a few minutes containing in its meshes the greater part of the solution in which the rubber-particles were suspended. If this clot is cut into slices while still soft and pressed between sugar-cane crushers, or in a heavy press, the bulk of the solution is extracted and a fairly pure rubber is found. On drying it does not give off the putrid smell characteristic of the ordinary Ceara "scrap."

---

#### PLANTAIN FLOUR.

---

This is the subject of a second report by the Superintendent of the School of Agriculture who furnishes some fresh information gathered from the West Indies. It would appear, however, from the report, that the outlook for a trade in the article referred to is not a hopeful one, and it has been pointed out in the *Ceylon Observer* that if the flour was in demand, the West Indies would, with greater facilities for marketing, be more likely to benefit by the trade than we in Ceylon who are at some disadvantage from not being in such close proximity to American and English markets. But there are other facilities from an agricultural point of view which Ceylon has over the West Indies and India for the cultivation and production of plantain flour, but it is not our intention to point to these at present. Our object in writing is to state that since the publication of the report referred to above, encouragement has been given to those interested in the development of a trade in the article. On being referred to in this connection we put the likely parties in communication with each other with a view to facilitate business. What we should like to make clear is that a very business-like enquiry has come from a desirable quarter with reference to the samples of Ceylon-made plantain flour we have been forwarding, and that the prospect of opening up a trade is decidedly hopeful, though it will be two or three months before it can be known whether the trade details at present being worked out will suit producers and buyers. In a short time the question of a trade in plantain flour will be finally settled, and if the decision be favourable the demand for the stuff will be practically unlimited. It, therefore, behoves all those who think they can benefit themselves by this prospective new opening to make their preliminary

arrangements to meet the demand that may arise for the flour. They should at least be familiar with all details of preparation which, however, are simple enough, and arrange for extension of cultivation if necessary. We were lately informed of the rate at which plantains were being sold in parts of the North-Western Province, and, indeed, the prices were ridiculous enough. We believe that there are many districts with suitable land and favourable conditions for cultivating plantains, but where cultivators have but poor marketing facilities *in situ* and no reasonable means of bringing their produce to larger market towns. These are the places which should reap the benefits of a trade in plantain flour, or banana meal as it is sometimes called.

Much credit is due to Mr. Stouter, the Head Clerk of the Anuradhapura Kachcheri, for taking the initiative in this matter, particularly when it is remembered that he has no personal interest in the development of the industry which he has endeavoured to start. We have done what we could to second him, and are glad that our efforts have not been wholly futile, though we are not yet in a position to say anything more definite than that very business-like enquiries have been made after plantain meal from those to whom we forwarded samples. We trust we shall have the satisfaction of seeing a good demand spring up for the article. We shall be glad to give any information to correspondents if they will apply by letter to the Editor of the *Agricultural Magazine*.

---

#### NATIVE MEDICINAL PLANTS.

---

The most striking difference in the administration of drugs in native and European medicine is that while in the former the raw materials in the form of bark, roots and other parts of vegetable organisms are used, in the latter it is the active principle in the form of alcoholic extracts, salts of alkaloids, &c., that the drugs are administered. The same difference is to be seen in other connections, for instance, in the process of tanning; for while in the native method barks or fruits are used, it is the extract from tanning substances that is utilized in western countries. The advantage of the latter system is obvious, since it deals with preparations of standard strength whose action can be better gauged than that of raw substances, which, though dealt with by weight, may not always be of the same composition. It is well known that the composition of plants is affected by the nature of the soil and other natural conditions. The quality of tea varies in different localities, the development of fibre in fibrous plants is controlled by the nature of soil and climate, the flavour, succulence and sweetness of fruits are not the same in one district as in another, and so on. It is thus quite reasonable to suppose that the active principle of medicinal plants does not always occur in the same proportion, and it is therefore not to be expected that drugs prepared from raw materials taken by weight will always be of the same strength as regards the active principles they contain, and, *eryo*, have the same efficacy.

Apart, however, from this consideration of the method of administering native medicines, there are

undoubtedly many plants unknown to European practice possessing important medicinal properties. The virtues of the seeds of *Plantago ovata* and of the leaves of *Plectranthus Zeylanicus* in the treatment of dysentery, of the root-bark of *Moringa Pterygosperma* as a stomachic, are instances of the efficacy of native drugs which even those who practice European medicine resort to the use of. There are scores of other plants used in Sinhalese medicine which are acknowledged as useful agents by qualified doctors of medicine.

We have been informed by a medical man lately returned from England that he had enquiries for the bark of *Calatropis gigantea*, and the leaves of *Hydrocotyle Asiatica* while in London, so that it is probable if small parcels of such plants as *Hemidesmus indicus* (which possesses properties very similar to Sarsaparilla) and other native drug plants of acknowledged merit were sent to the proper authorities for examination, that a demand might spring up for many of them.

In view of the interest that has arisen in native medicinal plants and in tropical diseases, we are of opinion that it would be an advantage to have a collection of growing specimens of all the drug plants used in native medicine made, with a view to the identification and study of them by local and foreign medical men, and also in order that samples of all may be gradually sent for examination in England. The collection would of course be an enormous one, but if proper provision were made for getting together and preserving it, there is no reason why it should not be undertaken by the local School of Agriculture. Eventually the cultivation of certain medicinal plants on a large scale may come to be an important industry in the island.

---

#### MILK OF THE BREADFRUIT TREE.

---

Referring to the genus, *Artocarpus*, Dr. Watt says, although it is known to yield caoutchouc, it is still a question which experiment alone can decide, whether rubber of sufficient economic value could be obtained from the different species. In Mr. Biffen's account of his experiments in coagulating rubber milk, the writer states that *Artocarpus incisa* contains a very viscous latex employed by the Brazilians as a bird-lime and as a substitute for glue. When diluted and centrifugalized it separates readily, giving a creamy white layer which dries to a resinous mass somewhat resembling guttapercha. At the ordinary temperature this is quite hard and brittle, but if the temperature is raised slightly it becomes plastic, and at the temperature of boiling water it is soft and excessively sticky. The substance is soluble in carbonbisulphide and insoluble in alcohol and water.

From acquaintance with the breadfruit tree and jak tree (*Artocarpus integrifolia*) one is inclined to think that Mr. Biffen is referring rather to the milk of the jak than that of the breadfruit, but assuming that his experiments were with reference to the latter, it will at once strike those familiar with the jak that there may be greater possibilities of utilizing it as a rubber-producing tree. The milk of the jak is well-known as bird-lime and cement, and is described as

'elastic, leathery, water-resisting, and capable of removing pencil marks.'

According to a writer to the *Indian Agriculturist*, quoted by Dr. Watt, each fruit of the jak yields about 2 oz. of milk, from which  $1\frac{1}{2}$  drachm of caoutchouc-like substance can be obtained.

#### RINDERPEST INOCULATION IN INDIA.

Veterinary Capt. Raymond's further report on experiments with rinderpest forms the subject of the *Indian Agricultural Ledger* No. 6 of the Special Veterinary Series. After detailing a number of experiments carried out by him, the writer offers the following remarks:—

These experiments tend to show that this method might be safely used with advantage on Wards' Estates, etc., when rinderpest is known to be raging in the neighbourhood, for it would probably confer immunity long enough for the disease to die out in the surrounding villages. From the Wards' Estates its use might spread as the neighbours acquire confidence. I may add that it has been clearly proved that there is no danger of the inoculation with bile conveying rinderpest, if properly performed. It has also been proved that the operation does not interfere with the ordinary work of the bullocks.

For the pre-ent the buffalo bile method is the simplest way of conferring temporary immunity on cattle in Bengal. But it has the obvious drawback that a delay occurs in obtaining the bile in necessary quantity and purity. It cannot be obtained from the cattle for local reasons. A further delay of about 7 days occurs while the inoculated cattle are acquiring immunity, because they do not become immune at once. Hence 12 very important days, at least, are lost.

I have made a few experiments with a view to testing the serum method of treating rinderpest, because it has been laid down as a principle that immunity extending over a very long period can only be acquired after an attack and recovery from rinderpest.

The preliminary difficulty is, of course, to control the strength of the attack which is to confer immunity, otherwise the animal may be killed.

Though I am not yet prepared to offer a definite opinion as to whether a constant control can be maintained over the virulence or mildness of the disease, it seems probable from what I have done that my injecting virulent blood into a healthy animal and immediately afterwards injecting defibrinated blood taken from an immunised case, the healthy animal becomes subject to an extremely mild attack of rinderpest and recovers. This is what has happened in my experiments, but it remains to be seen if the attack is always as mild as has happened up to the present.

Should this method become recommendable for practical use it will have this advantage, viz., that a mild attack of rinderpest can be run through a herd (isolated for the purpose), and the owner's mind set a rest for, possibly, some years.

I do not think this method will commend itself to the raiyats of these Provinces, as it is rather too complicated for them to understand. Moreover, the dose of defibrinated blood required is large, which is also a drawback.

I have been for some time engaged in attempting to prepare a serum of greater immunising power than is obtained from animals that have recovered from an ordinary attack of rinderpest. Should I succeed, it may be possible to keep a stock of material for distribution.

#### REVOLUTION IN SOIL ANALYSIS.

In this number we conclude Dr. Dyer's important article on "The Analysis of Soil as a Guide to its Fertility," and those who have perused it (and it is worthy of perusal by all intelligent agriculturists) will agree with us in thinking that it is a strong impeachment of the ordinary analytical chemist who professes to be able to tell us the proportion of "available" plant food in the soil and the necessity for manuring it with this or that fertilizer. These chemists have apparently been working in the dark all along, and like those who cannot see and attempt to guide others have only helped to lead their lay-brethren astray. For, according to Dr. Dyer, their deductions, as shewn in the case of potash have been inconsistent as well as incorrect. *Tempora mutantur!* It is pretty clear that the old order of chemical analysis must give place to the new, for we cannot afford to be misled any longer as to the condition of our soils and the treatment they need. The hydrochloric acid bottle must be put on a back shelf in future, and the new solvent brought to the front. Who will now say that a study of modern chemistry is not essential to an enlargement of our agricultural knowledge? Liebig, the father of Agricultural Chemistry, himself fell into a grave error when he believed and taught his Mineral Theory, as did de Candolle with his Excretory Theory, and it is no surprise that those who have mechanically followed the beaten track of soil analysis, without any original research on their own account, should now discover that they must abandon their old formulas for the new teaching, and the sooner this is done the better for the cultivator of the soil who looks to them for guidance,

#### KEKUNA OIL.

We are glad to state that what was originally thought to be an impossible task, namely, to meet large orders for kekuna oil from abroad, is now being accomplished. We were always struck with the wide distribution of the kekuna tree (*Aleurites triloba*) and the manner in which the nuts were allowed to run to waste, though some of them were used for expressing oil for lighting purposes in certain districts. The great difficulty at first was to find an agent in Colombo who would deal in the oil. In fact it was at first reported that many of the Colombo firms who had been communicated with had never heard of such an oil and would not receive orders for it, while it was considered impracticable to procure 100 gallons, which, if by some means, was got together, it was thought would exhaust all resources. We may mention that we did eventually find a gentleman in Colombo who undertook to work up the business in kekuna oil, and we have given him

every personal assistance, with the result, which we have already stated that large orders received by him are now actually being met. We are convinced that there are a great many neglected industries that are waiting to be worked up in Ceylon. It is quite common to read that this or that little known article is capable of such and such uses, and if taken in hand will prove remunerative. But beyond writing it seems nobody's business to work for the development of a trade in these neglected products. It is some satisfaction, therefore, to find that our efforts to bring a new (new to the trade) industry, which has been passed over as too insignificant for notice in the rush for tea and coconuts, have been to some extent successful. "There is safety in numbers" is an old saying, but all the same very true, and especially so of agriculture, in connection with which the plan of putting all our eggs in one basket has been often condemned. We hope before long to see a thriving business carried on in our so-called minor industries and the agricultural prosperity of the island so established on a firmer basis.

#### EXPERIMENTS WITH-NITRAGIN.

Dr. A. P. Aitken, Chemist to the Highland and Agricultural Society of Scotland, had made an interesting communication to the Society Journal on the above subject. We have before now referred to this substance and the circumstances which led to its manufacture and introduction as a marketable agricultural commodity in Germany from whence we ourselves were furnished with specimens. Nitragin is an artificial pure culture of the *Bacillus radicicola*, a micro-organism existing in the soil and spending part of its life in the roots of leguminous plants. It entered the roots at a very early period of the plants' growth, and at the place where it entered a disturbance or irritation was set up which caused the growth of a warty excrescence or nodule, within which the bacillus grew and multiplied at a great rate. These nodules were found to be highly nitrogenous substances, and in some way not yet quite clearly understood, they enabled the plant to assimilate the nitrogen of the air and convert it into albuminoid matter, with the result that not only the plants themselves but also the soil in which they grew became enriched in nitrogenous organic matter. Apparently the bacillus is capable of bringing about the oxidation of the free nitrogen of the air with the result that a compound is produced which is further oxidisable with or without the aid of the bacillus: the soil being enriched indirectly through the store of nitrogen in the root-tubercles.

The discovery of the bacillus and of the important function performed by it in the plant and soil, afforded at least a partial explanation of what was known before, viz., that leguminous plants did not use up the store of nitrogenous matter in the soil as cereals did, but on the contrary increased it and fitted the land for the better growth of cereals. The explanation of this long-known and unexplained peculiarity naturally created a profound and widespread interest, and great hopes were entertained that it

might lead to very important results in agricultural practice. The manurial constituent most expensive to buy and most difficult to accumulate in the soil is nitrogenous matter, and it was evident that if this could be done by tapping the unlimited stores of nitrogen in the air, a vast saving would result to the agriculturist. All that seemed wanting was a sufficient stock of the *Bacillus radicicola* in the soil to stimulate the growth of leguminous plants in order that the much desired end should be attained. The credit of cultivating this organism in a pure state and of a kind best suited to each specimen of leguminous plant is due to Messrs. Nobbe and Hiltner of Tharand. The manufacture of it on a commercial scale passed into the hands of a large firm of chemical manufacturers in Germany, who lost no time in putting it upon the market and extensively advertising it. The prices charged were comparatively small, 3s per bottle, sufficient to inoculate a half or a whole acre, and no doubt there was a large demand and ready sale.

Dr. Aitken in his paper describes the arrangements made for fully testing the efficacy of nitragin by the Science Committee of the H. and A. Society, and also supplies the details of the experiments carried out and the results obtained by different experimenters in different localities. There were some fifty trials in all, but Dr. Aitken states those who have reported "are unanimous in finding that the application produced no visible effect whatever."

He concludes: It will thus be seen that this new and interesting departure in the treatment of land, so far at least as it has been tried in Scotland, has failed to produce the beneficial results that many expected of it. It is too soon yet to say that it is an entire failure as an agricultural resource; but if it has a use, it is evidently a very limited one, and the results hitherto received have evidently justified the doubts I expressed regarding it in a previous report. It is conceivable that soils may exist somewhere that are so poor in nitrogen as not to be capable of growing leguminous plants well, and which owing to some drastic treatment, have been deprived of the *Bacillus radicicola*. In such cases the importation of the organism would doubtless be beneficial provided that the character of the soil was such as to favour its growth; but such cases must be extremely rare. In ordinary circumstances there seems to be no want of the organism in the soil, and considering the rapidity with which such organisms multiply when the conditions are favourable, it is evidently quite unnecessary to import them. On the other hand, if the conditions of the soil are unfavourable, it is vain to hope that an importation of organisms will do any good.

The conditions under which we are warranted in expecting that nitragin will be of service to agriculture are the absence of sufficient nitrogenous matter in the soil capable of producing a full leguminous crop, and the absence of the *Bacillus radicicola* which enables the plant to obtain a sufficient supply of nitrogen from the atmosphere. It is doubtful if these two conditions will be found to co-exist in any soil under cultivation in this country.

This deliverance of Dr. Aitken is certainly a counterblast to the glowing advertisements of Nitragin that have so long been appearing, but the conditions under which it might be of use

referred to by him as non-existent in a country where rotation of crops is the rule, do occur in other countries where rotation is either not practised though possible, or is impracticable, and in such cases nitragin would serve its end. But still the demand for it would be but a limited one.

#### THE ANALYSIS OF SOIL AS A GUIDE TO ITS FERTILITY.

[Dr. Dyer next confines his attention to the estimations of phosphoric acid, but there is so much of technical detail in this part of the paper that we have summarized his remarks, touching upon the most important results obtained. He furnishes us with an elaborate table showing the determinations of both total and citric-acid-soluble phosphoric acid in the Rottamstead plots referred to, and taking the previous treatment of the land into considerations, he makes certain important deductions. He shows that judging by the produce in crop the citric-acid-soluble phosphoric acid indicates the fertility of a soil as regards its phosphoric acid more correctly than total phosphoric acid does; and from a general consideration of the results of a long series of analyses he ventures to draw a provisional conclusion that when a soil showed as little as '01 per cent of phosphoric acid soluble in a 1 per cent solution of citric acid, it might be regarded as in need of phosphatic manuring.]

In the process of soil analysis as generally carried out the potash determined is such as dissolves in strong hydrochloric acid. Some of this may be in a condition as to be readily available as plant food, but most of it is certainly not. Further more the determination has not even the merit of being an absolute determination, as in the case of the ordinary phosphoric acid determination, in which case the results represent the total percentage present in the soil.

In the case of ordinary potash determination, the quantity can scarcely ever present the total potash contained in the soil, for the great majority of soils contain potash in the form of silicates, which are not decomposed even by the strongest hydrochloric acid. In the Rottamstead soils, for instance, there is considerably more than 1 per cent of total potash present, only a fraction of which is dissolved by hydrochloric acid.

If the proportion dissolved by hydrochloric acid in any given soil were constant, the determinations might possess some arbitrary value; but even this is not the case. The quantity dissolved depends upon the fineness to which the soil is ground, the strength and quantity of the acid taken, the length of time during which it is heated, and a number of other considerations which will at once occur to the practical analyst. A knowledge, therefore, of the proportion of potash soluble in hydrochloric acid is in most cases of small value.

I venture to think however, that the determination of the potash dissolved by a dilute solution of citric acid is possessed of much more value. (Dr. Dyer then furnishes another comprehensive series of analysis to prove his deduction.) In the case of potash it might be said that when the available (citric-acid-soluble) potash is shown to

be as high as '01 per cent, it may be assumed as probable that the direct application of potash salts will be unnecessary.

I have not attempted in this paper to deal with the question of nitrogen. The total determination of nitrogen in a soil, which, with present methods, is simple enough, gives, no doubt, an indication of its potential fertility as regards this element, but it gives no indication as to the immediate abundance of nitrogen which may be regarded as present plant-food. A determination of the nitrogen existing as nitrate would probably be the nearest measure that we could get of the nitrogen-fertility of the soil at the moment, but nitrates are so easily washed from the soil that the quantity present today may be very much less than the quantity present yesterday, if the soil be an open one and a heavy shower has intervened.

What is most important as regards nitrogen would be to know the total nitrate-producing power of the soil, a power depending not merely upon the quantity and nature of the nitrogen naturally accumulated in the soil, but, firstly, upon the presence and multiplicity of those various micro-organisms on whose action depends the transformation, through many stages, of insoluble vegetable nitrogen compounds on the one hand into soluble nitrates on the other; and, secondly, on the chemical and physical conditions of the soil itself, such as scarcity or abundance of lime, density, porosity, climate, drainage, aspect, and a number of other circumstances; and here analysis can do little to help us. Since nitrogen, however, on land that is in healthy physical condition, is not only freely nitrified, but is also, when unassimilated, freely washed away in drainage, it may be generally assumed that all soils under old arable cultivation require a reinforcement of nitrogen in some form or other, and it is much more often a matter of doubt (which the chemist is often asked to solve) whether a soil needs a dressing of sulphate or muriate of potash, than whether it requires a dressing of nitrate or of ammonia salts.

#### THE EFFECT OF GRAFTING.

The extent of the influence of the stock on the scion has hitherto been but imperfectly understood; non-scientific cultivators have been at a disadvantage in not having any definite data to go upon in their practical operations. The following authoritative statement in the *Gardeners' Chronicle* is therefore welcome, as to a great extent, settling points which have up till now remained in dispute.

"It must be remembered that the theory of the graft has been completely altered during the present decade. The orthodox opinion on the subject implied that hereditary variation was purely of sexual origin, and in a textbook which was published less than seven years ago, one of the most distinguished European botanists stated that the graft is a valuable means of fixing and conserving all the variations introduced into the embryo, because the process itself does not produce the slightest variation.

A very important communication on this subject was read at the recent Horticultural Congress at Paris, and afterwards at the Académie des Sciences. The author, M. Daniel, gives a *résumé* of all the experiments which he has made relating to the reciprocal influence of the scion on the stock and *vice versa*, including the effect on the taste and quality of the fruit.

It is not possible to give more than the following abstract of the results, which have been published in detail in the *Mémoires* of the National Horticultural Society of France:—

1. The reciprocal influence of the scion and of the stock cannot be denied, even though it may not act with the same intensity.

2. This influence may bear on the general nutrition of the plant, and directly on its size, vigour and resistance to parasites; or it may affect the internal and external morphological character of the plant, including its organs of reproduction, *i.e.*, the fruit.

3. Those variations are frequently of an hereditary character, and frequently appear during the course of the second generation.

4. This effect of the graft offers general practical advantages, *viz.*, the production of larger and better fruit and vegetables (such as an improvement in their taste), and the direct production of new varieties, *e.g.*, a modification of the colour of flowers, of the shape of fruit, &c.

5. The effect is more marked in herbaceous than in ligneous plants, and on the progress of the grafted plant than on the plant itself.

6. The graft, which produces variation in the seed may be employed to produce new varieties. The variation may frequently be diverted culturally so as to impart almost assuredly, after repeated graftings, certain qualities (taste, colour, shape, &c.) to a plant which did not originally possess them, and which varies easily under cultivation. As regards other plants, the graft still affords the means of obtaining variation, however difficult it may be; and as soon as the change is observed, it can be pursued in the desired direction and with good results.

#### THE IMPORTANCE OF HUMUS TO SOILS.

In an address on Green Manuring by Mr. J. W. Mills of the Pomona Experimental Station, the following facts were brought forward in support of the practice of green manuring as being the most satisfactory of all methods of maintaining the fertility of the soil:—

"At the Grignon Experimental Station in France, large glazed casks were placed on tripods in a ditch. The tops of the casks were on a level with the surrounding field so as to obtain, as near as possible, natural conditions. Vessels were placed underneath to catch the drainage water from the casks. Parts (some) of the casks were filled with earth from the field that had been fertilized with barnyard manure, and parts (some) were filled with earth naturally rich in humus. During one year the soil fertilized with barnyard manure lost 51.7 grains of nitrogen, while the soil rich in humus lost but 17.6 grains.

"In heavily-manured land  $\frac{1}{2}$  to  $\frac{1}{3}$  of the nitrogen that was made available was washed out in one

year. If the nitrogen from this source is so easily lost, we must look for something additional to supply our soils with humus and nitrogen. Nitrogen from inorganic sources is easily lost and mineral manures never restore the original productiveness of soil. It produces no humus, and the loss of humus from poor soil means its loss of power to retain moisture and nitrogen, and the loss of power to assimilate phosphoric acid and potash and make it available to plant growth. If humus is such a desirable thing let us look into the subject and see how it gets in the soil through nature. You have seen land that has given an abundant water supply by some new agency. It produces rank growths of vegetation that fall down year after year. It is not long until the soil takes on a dark colour, and year after year the vegetation becomes ranker and more luxuriant. Some of our richest lands are formed in this way. What then can we do to our cultivated land that we may give it this life-giving element, humus? Nature lets the weeds grow, but in most cases we fight them. It has been demonstrated that weeds not only supply humus, but during their life they help to retain in the soil that most evasive and subtle element, nitrogen.

"At the Grignon Experimental Station casks were filled with the same sort of soil. In part of these quick-growing crops, such as mustard and rape were grown, while in other casks nothing was allowed to grow. It was found that the soil in which nothing grew lost five times as much nitrogen as that in which the plants were growing. The such plants save the nitrogen in the soil in two ways: Firstly, using up the nitrogen as fast as it is made available; and second, by taking up a large part of the water and evaporating it through their leaves, instead of letting it pass through the soil and take the nitrogen with it."

The growth of ordinary grass in experimental plots at Grignon showed a marked increase of soil nitrogen, which was no doubt due to a great extent to the presence of the innumerable roots that fill the soil and take up the nitrogen as fast as it becomes available; but we do know from what other causes, since we cannot see into nature's dark laboratory.

It is stated that 160 lbs. of nitrogen that is put into the soil by legumes is equal to about 1,000 lbs of nitrate of soda.

Much has been written about the properties of special plants, such as the cow-pea as nitrogen collectors. No doubt some legumes have an advantage over others in this respect, and the highly-recommended Florida bean is now to the front as one of the best for the purpose, but what we would like to see in tropical agriculture is the acknowledgement of the importance of green manuring and some beginning made in the adoption of practical measures for preserving the humus of our soils, for it has been proved beyond a doubt that it is in this element of soil that the permanent fertility of land lies; and that the simple and inexpensive system of growing legumes between annual crops and together with perennials, for the purpose of green manuring, if adopted as a regular item of cultivation, should do much towards the reduction of the cost of cultivation and the maintenance of the fertility of our soils.

## CURING CIGAR TOBACCO.

BY R. S. NEVILLE,  
*Tobacco Expert.*

Growers of tobacco should bear in mind that the housing and curing of a crop is the most important of all the work done, and that drying tobacco is not curing it. It should be allowed to ripen well before cutting, and the aim should be to regulate the planting that not too much time will elapse between harvesting the first and the last of the crop. The importance of this will be recognised when it is known that different styles of the curing require different treatment, and tobacco cut at different times will require a different treatment at a given time which cannot be given unless you have a number of curing sheds. A short time will not seriously affect results, but two or three weeks elapsing between the cuttings may be serious. You can tell by the thickening of the leaves and brown spots appearing on it when the tobacco is ripe; also by folding the leaf it will break; but the farmer that carefully watches his crop will detect the first signs of ripening.

It is best to do the cutting after 3 p.m., when the sun is not so hot, unless the day be cloudy and cool, when it may be cut at any time; but never cut or handle tobacco when it is wet with rain or dew. A hard rain will wash the gum off, and unless the tobacco is very ripe it is best to let it stand a few days to again gather gum after much rain, but if it is very ripe it is best to continue cutting as soon as it has dried off. Splitting the stalks is not generally practised in cutting cigar tobacco. Many methods of gathering the crop are in use in the United States, but that most commonly practised is what is called stalk curing, and it is not a settled fact that other methods are better, except where the plant ripens unevenly. Take the stalk in the left hand near the middle, and bend it over slightly, and with a quick stroke cut it off 2 or 3 inches above the ground. Lay the plant down carefully with back to the sun, being careful not to bruise or break the leaves. When it has wilted (*z. e.* withered), so as to be handled without breaking, it should be taken to the shed and hung. If hauled in the cool part of the day, it may be laid carefully on a board-bottom frame, butts out and tails lapping, but should be taken to the sheds at once and hung, as it will heat if left on too long, and ruin the leaf. Two methods are practised in hanging. Some use a spear, hollow at one end to fit over end of stick, and thus push the spear through the stalk 4 or 5 inches from the butt, and passing it on over the stick, and when full remove the spear and put it on another stick, and so on. Others use a string, tying the plant to the stick. Do not tie the plants together, but tie each separately, first on one side of the stick and then on the other, about 6 or 7 inches apart. If you tie two together they press against each other, and you are liable to have pole-burn if the weather is damp. The sticks of tobacco when placed in the shed should be about 12 inches apart, so that the plants will scarcely touch each other. The curing shed should be so arranged so as to make it very open and very close as desired, with ventilation at top and gables; the gable windows being hung up in pivots so as to be opened or closed as desired;

also openings on sides from base board to eaves, and base board hung upon hinges so as to be lifted up and give bottom ventilation to create currents of air when other openings are closed.

By this means you can create light currents of air when not too much is needed—doors in the ends of the shed. For the first 10 days or 2 weeks after housing the shed should be kept open, unless you have hard and heavy drying winds, in which case the windward side should be closed to prevent too rapid drying. After this the shed should be kept closed during the day if the weather is drying, and open at night if the weather is not damp or foggy. The idea is to keep the leaf in a moderately soft or pliable condition during the curing process, and never let it get dry and harsh; and sometimes it is necessary to sprinkle the floor to prevent this. On the other hand it should not be allowed to get wet or it will rot, but keep the air in the shed moderately moist, thus keeping the tobacco curing at a uniform rate all the time. If there should be a continued wet spell, and there is danger of the tobacco getting too soft, it is then well to have a heating stove with pipes running outside, and build fires just enough to keep the air at a proper humidity, being careful not to get it too dry. If the wet weather continues only for a day or two and then turns off drying, open your shed until it has dried out and then proceed as before. During the last stages of the curing light should be excluded, as strong light will injure the colour. With these instructions you must use your own best judgment as to how to proceed under any special conditions. The time required to cure a shed of tobacco is from 8 to 12 weeks, depending upon the season.

Stripping and hauling up should not commence till the stalk and stem are thoroughly cured, and in taking down the tobacco for this purpose, it should be done when the tobacco is coming in condition, and never when it is drying out. If it gets too soft then let it alone until it dries out completely and you get another season. When tobacco is drying out you cannot tell its proper condition as the stem is likely to be surcharged with moisture, and when put into bulk this is distributed back into the leaf and the tobacco gets too soft and will damage. The proper condition for cigar tobacco is when the leaf is pliable and the stem just soft enough not to break in working; when in this condition it is ready to strip and bulk. In sorting put leaves of the same colour and same length together; put those perfectly sound, partly sound, and the inferior each in a class to itself. In packing the tobacco down to be sweated, put it on a raised floor, having the floor tight that no dampness may penetrate. In bulking make two rows, heads out and tails lapping in the middle 5 or 6 inches; cover over the bulk well and put on weight to press it down. Watch it carefully to see that it does not get too hot, and if found to be getting so, shake it out and rebulk; but this will not be necessary if condition is made right at the start. After it has been in bulk 4 or 6 weeks it should be put into boxes and well pressed down, leaving a space of one inch between the bulks and the end of the box. Pack heads towards end of

box and tails lapping in centre. Do not squeeze up the tobacco in the hand in bulking or packing.  
—*Queensland Agricultural Journal.*

### A NEW PLOUGH.

Ploughing has been rendered impossible on certain lands owing to the occurrence of tree stumps and boulders, but the inventor seems to have overcome these difficulties, as the following cutting referring to the "Stump-Jumping Plough" proves:—"We (the Agricultural Journal of Cape Colony) learn that a Stump-Jumping plough which Messrs. Halse of Carnarvon have imported from Australia is found to be a great success. It is a large and powerful implement. It covers a width of 6 feet and can be set to plough 10 inches deep, but at this depth it requires 18 good oxen, and they go but slowly. It was thought possibly the depth and resistance of the soil to be moved would prevent the plough "jumping," but it works as steadily as an ordinary plough till it comes in contact with a boulder, when it jumps and passes over it. The implement has been put to severe tests, which no set gang plough would have borne, but up to the end of several day's work not even a share has been broken. As such large areas of our soil contain lumps of iron stone and other boulders and roots, which smash up ordinary ploughs, all trials like the above are interesting, and the result may encourage the use of stump-jumpers for breaking up new land." This new plough should, it strikes us, be also useful in tropical cultivation in working up land newly opened for perennial crops. The power required to work seems to be a serious objection, but we fancy the difficulty could be got over by the employment of elephants as ploughing animals as is done in the Kurunegalla district.

### GENERAL ITEMS.

Rhea or China grass is the subject of the *Agricultural Ledger*, No. 15 of 1898, issued by Dr. Watt, Reporter on Economic Products to the Government of India. It covers no less than 129 pages, and, as may be imagined, the subject is very exhaustively treated.

The writer's conclusions will prove very disappointing to all who have been interested in the cultivation of the plant, particularly to patentees of machines and methods of treatment of the fibre. Regarding the latter Dr. Watt says: "A cheap and effectual machine or process is as much a desideratum now as it ever has been." What have Messrs. McDonald, Boyle & Co., and the many other companies and individuals with similar interests say to this authoritative opinion?

*The Planter* (Calcutta) referring to the failure of agricultural education among the cultivating classes, attributes it to the undecided character of Government action and the absence of inducements

to attract the better educated natives. It expresses no surprise that the majority of students who join Agricultural Schools should look to Government for employment, and believes that the only solution to the problem of how to reach to cultivating classes is to educate those who from circumstances and position would later on be able to help others and so contribute materially to the wealth and prosperity of the country. We entirely agree with this view.

The Professor of Dyeing of Yorkshire College Leeds reporting on the bark of *Cerriops Candolleana*, one of the mangroves so wellknown in Ceylon, said that the bark extract behaves, as regards its dyeing properties, in a similar manner to a good quality of catechu. With indigo when the latter is applied in a ferrous sulphate (copperas) vat, the extract combines with the iron and produces a grey colour, which in conjunction with indigo blue gives black. The extract, says Prof. Hummel, "would certainly be of value to dyers."

*The Kew Bulletin* for August refers to the Florida velvet bean. Dr. Watt is quoted as saying that "the young tender pods are cooked and eaten as a vegetable." At any rate we ourselves have found the seed when boiled most delicious and delicate. Reference is made to another variety of *M. pruriens*, with jet black seeds, cultivated as a rotation crop on Mauritius sugar estates and called "Pois muscate." This variety is also found in Ceylon—the fruits forming longer clusters containing more fruits than the true Florida bean. This Mauritius black (referring to the seed) is described and figured in the *Queensland Agricultural Journal* for August.

*The Kew Bulletin* for August last contains a note on Lemon grass under the name *Andropogon nardus*. The latter, however, is the name of the grass producing the citronella oil of commerce, while lemon grass oil is the product of *A. citratus*.

The Director of Gardens and Forests Singapore, thinks that many other plants (besides citronella and lemon grass) yielding volatile oils are worthy the attention of the distiller, most of which are well known in Ceylon: Vertiver (cuscus) *Andropogon muricatus*, Patchouli, *Blumea balsamifera*, cassia, clove, nutmeg, ocimum, *Artabotrys cananga* &c.

Of sugarcane pests two borers are well-known. One, *Diatraea sacchari* (*Phalæna saccharalis*) is of New World origin, though not now entirely confined to it, and is common in Tropical America and the States, while it is reported by Cotes to be found also in India. *D. striatalis* is said to be an Old World species, and has not been recorded in any part of the new. Its present area of distribution includes Ceylon, Mauritius, Java, Singapore, Sumatra and Borneo, and it is said to have been introduced into Mauritius with sugarcanes from Ceylon in 1848 and so spread in the East Indies.

[No. 8.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

*(Third Series.)*

CHARLES TOTTENHAM,

CIVIL ENGINEER, SURVEYOR AND PLANTER:—1859-1899.

HE subject of our present notice has had one of the most varied careers of any included in our list of pioneers. This will be seen when we mention that Mr. Tottenham as a young man went out to try his fortune in 1851 in California; thence

he passed to Australia, and afterwards to China, visiting most of the Treaty Ports, while he was out again during the time of the siege of Canton. Mr. Tottenham also visited Persia and Arabia during the Persian War, and thence came to India during the Mutiny, visiting all the Presidencies; afterwards he travelled in Java, Borneo, the Straits Settlements, the Cape, Canada, and the Eastern and Western States of the American Republic.

Mr. Tottenham first landed in Ceylon in 1859, and his immediate object at that time was to shoot elephants which, forty years ago, were very numerous and destructive. So much was this the case that one elephant which fell to his rifle was declared by the headman who accompanied Mr. Tottenham to have killed no fewer than 27 men in his village alone. The short spell of sport then experienced made Mr. Tottenham always ready for more, and during his stay in the island he never missed an opportunity of a turn at the elephants. It is in-

teresting to note that one young elephant caught by Mr. Tottenham developed into a very fine “tusk” and that he has figured prominently for a quarter of a century in the annual Perahara festival and procession in Kandy and still continues to do so occasionally. In his younger days, a planter christened him “Timothy” and his manner was perfect: he used to follow Mr. Tottenham about like a dog and got quite put out if his master had to leave him even for a short time.

Mr. Tottenham's most noted connection with coffee-planting was as a pioneer in the district of Haputale. He was known to be a good judge of soil, and we well remember hearing how Colombo and Kandy capitalists were found ready to bid for certain blocks of land offered for sale at the Kandy Kachcheri because they had been selected by, and surveyed at the instance of, Mr. Tottenham. This led to competition and high prices for some of the Haputale lots of forest-land. In the earlier days of coffee, it was considered a point of honour not to oppose a purchaser who had gone into the jungle and selected and caused a lot of land to be surveyed and offered for sale. But competition became too keen for this rule to be observed after the early “sixties.” So that as it may, soon after Mr. Tottenham's arrival, influenced by the coffee-fever and in conjunction with his friends, Wm. Bain and Alexander Adam, he acquired the Moncrakande

and Mousakelle estates in Haputale as well as Moragahagalla estate in the Knuckles. Mr. Tottenham subsequently opened Lunugalla in Haputale, purchased Amanadawa and another estate in the then newly-formed district of Madulsima; besides Bambrella and Dawatakelle in the Knuckles; Wattagalla in Rangala; and Mousava, Morankanda, Udahena and Bulugahatenne in Kurunegala district. In this way Mr. Tottenham became the owner of a larger number of coffee plantations than almost any other individual proprietor in the island if we except, perhaps, Mr. A. C. White.

Mr. Tottenham never settled down himself to manage any of his properties, though he took a general interest and oversight: engineering work was however more congenial to his taste. He was fortunate enough to secure a contract from the Ceylon Government for the survey of Temple Lands at a fixed rate per acre which, it was understood, resulted in considerable advantage to the Contracting Surveyor. Mr. Tottenham imported a considerable staff of Surveyors amongst whom were Messrs. H. S. Deane (Chief Assistant), T. Smith, James Gunn, Borron, Collinson Agar, and L. P. Tottenham, a younger brother of his own; and very speedily disposed of the work entrusted to him. Some of his staff afterwards joined the Survey, Public Works and Railway Departments; and others went to the Straits Settlements. Soon after this, while in Europe, Mr. Tottenham took great interest in contriving a means for securing better means of transport for the Uva districts. His proposal took the form of a Wire Tramway to be operated chiefly by water power, and to run from the neighbourhood of Kandy *via* Dumbara, Lower Hewaheta, Maturata and across Udapussellawa by the Nildandahena Pass to Haputale and Badulla. The experiment went so far, that a trial overhead wire tramway was erected on Brighton Downs, and there we had the pleasure of personally inspecting it in 1870 in company with Mr. Tottenham, when we were certainly very favourably impressed with the prospect of its practical success. (We had, afterwards, at Mr. Tottenham's invitation, in London the opportunity of meeting representatives of the coffee enterprise from nearly every part of the world, not only Ceylon and India, but Java, Brazil, Guatemala, Jamaica and Natal, the dinner party including Mr. Rucker, senior, who told us he had sold Ceylon Coffee in his day at 18s. and 118s. per cwt.) The Wire Tramway, however, did not quite satisfy Mr. Tottenham and was finally abandoned.

Early in 1872 and after a memorable visit to Uva, we began writing on the subject of Railway extension from Nawalapitiya to Haputale, collecting the needful statistics of acreage and coffee crops and drawing up the first Memorial on the subject to Governor Sir Wm. Gregory. Mr. Tottenham very kindly placed the benefit of his professional knowledge at our service, and supplied an estimate of cost for a narrow-gauge line to run from Nawalapitiya, *via* lower Kotmale, Pundaluoya and the valley of the Nanuoya to Upper Dimbula and so across to Haputale. Mr. Tottenham went so far as to indicate his readiness to construct such a line for £11,000 sterling per mile. But the Ceylon Government was far too slow to act on any such offer, and the time was then fast approaching when Mr. Tottenham was to sell out of Uva and quit Ceylon for a number of years. This transfer of interests occurred in 1873 when all the Haputale and most of the other estates were sold to the late L. St. George Carey on his establishing the firm of Carey, Straehan & Co. To the

same firm Mr. Tottenham sold the estates of his late cousin, Cornwallis Tottenham, and the group belonging to Sir John Cheape which included Galaha, Kitulamoola, the three Vedahettas (North, East and West) and one or two other places. About this time Mr. Tottenham with the aid of the late John Gordon (of coffee pulper fame) introduced from Liberia

#### THE FIRST LIBERIAN COFFEE

ever seen in the East. By means of wardian cases, Mr. Tottenham sent out a large quantity of ripe cherry coffee and a large number of well grown plants; and Mr. Bull, the well-known Chelsea nursery-owner, who attended to Mr. Tottenham's plants in transit, afterwards raised seedlings and plants from cherry and sold them for some time, as a tropical novelty, as high as ten shillings per plant! Since that year, 1873, Liberian Coffee has spread to many parts of the Eastern world, notably to the Straits Settlements and Java, although in Ceylon much has not been made of it. In introducing it Mr. Tottenham (like every one else who took an interest in it) fully anticipated that a variety of coffee, so hardy and coarse in its growth, would be able to withstand the fungus *Hemileia vastatrix* "Coffee-leaf disease," which had begun to ravage the Ceylon plantations of the Arabian kind. But this anticipation was doomed to disappointment in Ceylon, although farther East the cultivation has been persevered in with a considerable measure of success.

Mr. Tottenham was absent from Ceylon from 1873 till 1897; but he was by no means idle. He is indeed of the type of colonist and professional man who must always be occupied with some useful practical undertaking. It would take too long, and occupy much space, if we entered into anything like adequate mention of Mr. Tottenham's experiences in financial and industrial undertakings in the United Kingdom as well as other countries—as a contractor, for instance, for the construction of the Northern system of Docks in Liverpool, now used by all the large American Liners, or of his Mining investments in Spain and other parts of the world. But we must mention his candidature for a seat in the Imperial Parliament, a return to which he missed (or escaped!) solely through the Borough for which he stood being merged in the County, by the Re-distribution of Seats Act in 1885.

A more notable circumstance—and one that must have given Mr. Tottenham much satisfaction—was his bringing under the notice of the British War authorities, in 1888—the first time their attention had been drawn to it—the very important, not to say vital, question of "high explosives." This reminder resulted in the experiments undertaken at Lydd, and the adoption of what is now called "Lyddite" by the British Government. Through Mr. Tottenham's business connections with different continental countries, he was at the time (1888) in possession of records of certain "high explosive" experiments in other countries which were both new and astonishing to the British authorities. Since then "high explosives" have received and are receiving much attention on the part of the officials of both Army and Navy, who thus show that they fully realise the importance of keeping pace with other countries in experiments and preparations, however much we may desire that peace, and the Czar's "truce of God," may prevail.—It may be mentioned that Mr. Tottenham is a member of the Wellington and Carlton Clubs in London.

## RETURN TO CEYLON IN 1897: PLUMBAGO AND PLANTING.

Although he had sold out of the valuable Uva properties and some others on the Kaudy side, Mr. Tottenham continued to hold the extensive Morankande and Udahena properties—situated on the borders of the Matale, Kandy and Kurunegala districts, though counted in the Estates' list of the last-mentioned district,—and covering some 1,545 acres of which some 650 acres are in cultivation with tea, cacao, some coffee and minor products. Through this property (and his agents Messrs. Whittall & Co.) Mr. Tottenham with a succession of managers who included Messrs. W. G. Rollo, Andrew Polson, A. J. Thomas, &c., maintained his connection with our planting industry from 1873 onwards, through the worst days of coffee disease, making experiments with "Liberian," participating in the short-lived cinchona era—*fiasco* indeed, so far as the lower districts were concerned—cultivating cardamoms, rubber, cacao and finally tea. Even now, Mr. Tottenham has, on Morankande, large clearings in contemplation to be planted during next south-west monsoon. Apart from this, there is the important plumbago mining industry initiated by him on his visit to the island during the winter of 1897. By his engagement of an experienced mining engineer—Capt. Tregay—who had previously worked for Mr. Tottenham in other parts of the world in connection with iron, copper and gold ventures,—a new departure altogether in connection with our one mineral of commercial importance, plumbago, has been taken; and we trust a due measure of success will follow the public-spirited action in this respect of one who had already done much to develop the resources of Ceylon. Capt. Tregay we are glad to know, is well satisfied with what has been already achieved and still more with the prospects of the mine on the Morankande property; and Mr. Tottenham's example has already been followed by the European owners of lowcountry plantations with outcrops or evidences of plumbago. In this way, Mr. Tottenham will be undoubtedly the pioneer of the Colonists who develop plumbago on their plantations in Ceylon.

Mr. Tottenham's return to this island in the winter of 1897, which has already been fruitful in renewed enterprise, was primarily due to the need of seeking a warmer climate on account of his lungs which are not so strong as they were in his prime. Still, no one who knew him, as we did thirty years ago, would see much difference to look at Mr. Tottenham. He carries his years well, looking very little older and is apparently as active, physically and mentally, as when he drew up for us, in 1872, his Estimate of a Railway from Nawalapitiya to Haputale Pass. This reminds us, by the way, that Mr. Tottenham with exceptional knowledge of the country North of Kurunegala, has not hesitated to condemn Railway Extension in that direction which he considers folly, while the further use of the broad gauge in a country devoid of population and traffic, he deems utter madness. He strongly supports our view that the way to serve North and East Ceylon is by a narrow gauge from Colombo via Puttalam. This by the way.

On returning to Ceylon after an absence of 24 years, Mr. Tottenham of course saw very great changes, notably in Colombo Harbour Works, Public Buildings, &c. Still more was the change in the *personnel* of the Colonists brought home to him, his mind naturally reverting to the Pioneers of early days among Ceylon Colonists, so few of

whom remain either here or above the sod. Reverting to the Ceylon of the "fifties" and "sixties," Mr. Tottenham's memory is filled with the kindest recollections of such old friends as the Cruwells, MacLellans, Tyndall, Corbet, Byers, John Brown, John Gordon, Lyon Fraser and other Frasers, Catts, John Martin, Donald Bain, John Kennie, Chippindall, Morrison ("Bengal Tiger"), Peter Moir, Abercrombie Swan, Drs. Boyd Moss and Baylis, Dr. Kelson, Esdaile, Lambert, Scott, John Davidson, the Macdonalds, Forsyths, W. D. Gibbon and a host of others—all good men and true—fit to lay the foundations and ensure the success of any Colony; while he would not omit to give a special place to his very old friends and partners, Adam and Bain, than whom better and truer men and planters never lived. One can understand how sad it must be to revisit the Colony and miss so many old friends; but

Good and true men still remain,  
If good and true are gone.

And we are glad to know that Mr. Tottenham is pleased with his first trip, and so interested in his own property and its development, that he is likely (p.v.) to make a regular Winter and Spring visit to the Colony of his early choice for several years to come, and so avoid the trying part of the year in the old country. Mr. Tottenham's earnest hope is that Ceylon has a long era of prosperity still before her and in a letter which now lies before us he says:—"I know our British Colonies pretty well; but to my mind none compare favourably with Ceylon in the amenities, "conveniences and comforts of existence." This is high praise from one who has travelled so widely and observed so closely as Mr. Tottenham has, and in enrolling his name among the Planting Pioneers of Ceylon, we think it is a uniquely interesting fact that he should return, after a quarter century's absence, to take a share as Estate proprietor, in the further Planting and Mining development of the Colony. There are other absent proprietor-pioneers of the long ago who might do worse than follow Mr. Tottenham's example; for, to escape the severe English winter and early spring and to spend it with pleasure and interest if not with profit, in Ceylon should be a very successful way of extending one's usefulness and improving one's health, if not prolonging life itself. All such returning old Colonists will, we feel sure, meet with the hearty welcome which is due to the subject of our notice and colotype portrait, Mr. CHARLES TOTTENHAM.

#### INSECT PESTS IN CALIFORNIA. TRIUMPHS OF PRACTICAL ENTOMOLOGY.

"I guess you want the bug inspector. He's right in there." It was thus that a polite gentleman on the San Francisco press replied to my inquiry concerning the office of Mr. Alex. Crow, who is by the act of the Legislature "clerk of the Publishing and Quarantine Bureau of the State Board of Horticulture." I found this officer occupying offices in a modest wooden building on the water front of the city, and more prominent than the office furniture were enormous large glass vessels containing friendly beetles feeding upon rations of injurious insects. When I called on another occasion Mr. Crow was out, and an obliging gentleman in the office said, "He'll not be back for quite a time. Guess he's gone across the bay to get food for his beetles." It soon became apparent, therefore, that beetles and the food of beetles constituted an interest of supreme importance in the office of the chief officer of horticultural quarantine. One was familiar with the romantic

history of the destruction of the dreaded cottony cushion scale by the imported ladybird beetle, but quite unprepared to find how important that incident had been, or how far the principle of fighting insect pests by the introduction of their natural enemies had been turned to practical account. The magnitude of the interests which were seriously threatened by the spread of insect pests under the peculiarly favourable conditions of the Californian climate are well known. The pressure of these large interests operating upon the peculiarly free and open mind of the Californian have brought about results of the most surprising kind—results full of information and suggestion to scientists throughout the world, and especially important to the inhabitants of Australia.

#### BEEBLE v. SCALE.

"Let us spray" is no longer the watch-word of the Californian fruit grower. "Start an Australian colony" is a much more up-to-date proposition. The spray, or more frequently fumigation, is used in the case of diseases for which no effective natural enemy has yet been found, but the greatest good has been done by "our little Australian friends," and the great aim of the fruit grower is to discover the natural enemies of the remaining pests. The results of the discoveries already made, and the vast benefits accruing, have been to elevate entomology to the first rank of importance. It is no longer looked upon as merely the amiable pursuit of sticking pins through harmless beetles, and finding hard names for the most simple insects, but the science has become a subject of the highest practical value. "It has saved the State millions of dollars," and in America, especially, where the value of anything can be stated in dollars, its position is secure. The first triumph was the discovery of the Australian benefactor, *Vedalia cardinalis*, the enemy of the cottony cushion scale, *Icerya purchasi*. The citrus fruits of California are valued at £1,250,000 sterling per annum, with a rapid expansion of production as the result of an increasing area of plantation. Some years ago, when the Australian scale got to work on the trees, the industry was confronted with apparently total extinction. The scale had killed out the orange trees at the Cape, and in spite of remedies, it was found that the disease made rapid progress in California. The Scale could be held only partly in check by treatment, and the expense was too great. It was at this crisis that Australia, which sent the bane, produced the antidote, and this valuable and growing industry was saved. The ladybird beetle, when introduced, commenced on the scales, and finding plenty of food ready to hand, and being free from their own parasites, which they had left at home, devoured the pests, and soon began to die owing to the scarcity of scale food. Thus the most dreaded of all diseases of the orange has now ceased to give any serious trouble in California. There is, in fact, far more anxiety to preserve sufficient scales to keep the Australian beetle from dying out than that the pest will otherwise give trouble. Many growers are cultivating scale to feed their ladybirds, but Mr. Craw assures them that they need not do so, as he is keeping sufficient stock to supply all the requirements of the State. It seems strange enough that those simple looking glass jars in Mr. Craw's office contain that which is capable of ensuring the great citrus industry of California against such a destructive pest as the deadly scale. It is true, however, and what is more, the vessels contain many other beneficial insects destined to play havoc with pests almost as destructive to other fruits, as the cottony cushion scale is to citrus trees.

#### THE KOEBELE DISCOVERIES.

The science of entomology in California has been stimulated, and in a measure directed, by practical suggestion. The Californian fruit grower has no use for "scientific information" which cannot be turned to practical account. When the orange industry was in its greatest strength, entomologists

came out from Washington to recommend and direct the use of certain remedies which had been beneficial in other States; but the leading growers said, "Don't waste your time in that way. We know all about your sprays and washes, but they are not good to us. You can't kill all the insects, and in this country what are left are enough to keep us spraying all the time, and the thing won't pay. We want you to hunt up the natural enemy of the scale." It was a fortunate thing for California when the President appointed the late Mr. F. M. Coppin, of San Francisco, as American commissioner to our Centennial Exhibition. Efforts to get the Government to send a scientist to Australia in search of the natural enemy of the orange scale had failed, and might not have succeeded to this day. But Mr. M. Coppin said to a large fruit grower, "Well, I'm going out to Australia. Can I do anything for your interest?" The reply was, "There is only one thing to be done. Take a scientific man along with you, and let him find something that will cure the orange scale." Mr. M. Coppin knew this was good advice, and he acted upon it, paying the cost of the scientific expedition out of the exhibition appropriation. The selection of a scientist for the work was a most happy one—viz., Mr. A. Koebele, a young entomologist of the United States Department of Agriculture, who had been working for some time in California. How Mr. Koebele discovered the *Vedalia cardinalis*, and saved the Californian lemon industry is well known. The work was better appreciated in California than at Washington, so that when afterwards Mr. Koebele was wanted to go out again, and also to visit India, China, Japan, and the Pacific Islands to look for the enemies of the other pests, no encouragement was received from the Federal Department. California, however, knew the value of work of this kind, and the State Legislature voted £1000 for Mr. Koebele's second mission. The second journey brought great gain to the movement in favour of natural remedies for insect pests. The black scale of the citrus and olive trees, the mealy bugs and other pests had effective natural enemies, which Mr. Koebele discovered and sent home, thus completing the transformation which has taken place in the treatment of insect pests in California.

#### THE SECOND KOEBELE EXPEDITION.

Three beneficial insects, which have proved themselves admirably effective, as well as several other promising ones still on their trial, are the result of Mr. Koebele's second mission. One of the most important is an Australian beetle, *Rhizobius centralis*, which preys upon the dirty black scale of the olive and orange *Teecomium Olex*. Mr. Ellwood Cooper, the great olive grower of California, had to pay from £600 to £1000 a year in keeping this scale within bounds. Soon after introducing the *Rhizobii* the trees became free from the pest, and he now spends nothing upon remedies. His only care is to preserve the beetles. This gentleman has stated publicly that he has spent £20,000 on insect pests. Mr. D. Freeman, a large orange grower, had his crop reduced from 250 tons to 350 boxes by the black scale, but this Australian beetle saved the grove and brought it back to full productivity. These are only examples of the general experience. Another valuable acquisition is the *Cryptolæmus montrozieri*, an effective enemy of the mealy bug (*Dactylopius*), and two others introduced at the same time promise to be very useful. The third proved acquisition of this mission is an Australian ladybird, which works on the original *Vedalia cardinalis*—viz., the *Novius Koebelei*. These, with certain other beneficial insects, introduced in some places accidentally, have brought about the great change in the treatment of pests which has been already referred to. Scores of colonies of the beneficial insects are sent out in little boxes from Mr. Craw's office every month, and before the pests were so well under control as they are now the colonies sent out ranged from 300 to 800 per month.

## SAN JOSE SCALE AND BROWN SCALE.

The San Jose scale, which is still playing havoc with the orchards in Maryland and some other eastern States, has long ceased to be a serious pest in California. San Jose is about fifty miles from San Francisco, and the place should not have given its name to this deadly scale. The scale was innocently introduced into that district from Chili by the late Mr. Lick, the great benefactor, whose astronomical observatory, with its immense telescope, crowns Mount Hamilton, over-looking the orchard district of San Jose. This pest is the true pernicious scale, *Aspidiotus perniciosus*. It preys upon all deciduous fruits, except the apricot and a certain black cherry, and at one time did immense damage in the orchards of California. The effectual treatment in this case also was the cultivation of the scale's natural enemies. It was cleared out of the State as a serious pest by one internal parasite, *Aphaleinus fuscipennis*, and two beetles—the twice stabbed ladybird (*Chilocorus bivulvarus*) and the Australian brown necked ladybird (*Rhizobius Toowoombæ*). Now it is found only as a rare insect on isolated trees in towns where the scale is able to thrive because its enemies fly off and have no neighbouring trees to light on. The brown scale of the orange *Lecanium hesperidam*, is quite as destructive as the more notorious scerya. Some thirty years ago the orange groves of Southern California were seriously attacked, and large numbers of them were killed, notwithstanding the most vigorous efforts of the growers. The disease, however, at length died out, having apparently "cursed itself." This was before the days of the new sectional survey system, but it has since been discovered that the cure was the work of two internal parasites, viz, *Eucyrtus flabis* and *Cocophagus lecani*. The brown scale has given no trouble for many years. The yellow scale of Japan, *Aspidiotus citrinus*, gives little trouble, being kept in check by an internal parasite, *Aspidiotophagus citrinus*, and sanguine hopes are entertained of finding effective insect remedies for other pests.

## THE LIMITATIONS OF THE SYSTEM.

The remaining scale which gives trouble, and for which no effective natural remedy has been found, is the "red scale," *Aspidiotus aurantii*. Until the natural enemy of this scale is found, spraying and fumigating will have to be continued. For the various pests of deciduous trees also, spraying and fumigation have still to be carried on. Reports, however, have just been received from the Los Angeles district of another striking instance of the success of natural remedies. The ornamental trees of the city and surroundings got so bad with scale diseases that their removal was seriously contemplated. The beetles got to work, however, with such good purpose that now it is believed the trees will soon be clean. It may be asked why this system is not so successful in the other States of America. The answer is a simple one. It is a matter of climate. The beetles are more highly organised forms than the scales, and cannot stand the severe winters so well. This was foreseen by the Californian discoverers, and still Eastern people are surprised when they make the discovery for themselves. There are so many climates in Californian that difficulties have been found in getting the scheme to work in some districts. Perseverance, however, is securing success in unexpected quarters, and means may yet be found of making the Californian scheme of treatment available in regions possessing frozen winters. Fortunately there is no climatic bar to the application of the system in Australia. Without assistance it kept the Parramatta orange-trees clean for more than 100 years. It probably saves the Australian continent from being devoured by locusts, and vigorous research should be continually carried on with the view of applying it to all descriptions of insect pests.—MR. T. K. DOW, in the *Melbourne Leader*.

## THE PRINCIPLES AND PRACTICE OF PRUNING.

(Concluded from page 455.)

As regards the detailed pruning of a tree, this must be taken in hand at two periods of the year, viz., in the winter and the summer. In the former season the most important part of the operation must be performed, viz., that dealing with the older wood, with the training of the parts of the tree, and the more careful and accurate preparation for fruit-formation; for more can naturally be done during the dormant condition of the tree, when the sap is at rest, than during the summer, when life is active. In the summer it is more a question of general thinning-out, or suppression of the redundant green twigs, which have sprung up everywhere on the tree, as a result of the vigorous summer activity of the latter which, throwing off the restraint of cultivation, tends to revert to its original ancestral condition.

The following observations are concerned only with general principles, and will not usually, therefore, distinguish between winter and summer-pruning, the main features of each of which have respectively been stated above.

There are various of the more detailed processes in pruning which require really more knowledge, care, and tact than the untrained practitioner would at first imagine. For instance, in pruning-back a main lateral branch, this should always be effected close above a lower eye or bud, for the outgrowth from the latter, which is to form the continuation of the branch, will not tend so much to spoil the general curvature of the branch as would an outgrowth from an upper eye, for the cut surface immediately above its origin would be more quickly covered, owing to the fact that the tissues increase in thickness more rapidly on the upper than on the lower surface of a shoot, and thus the even continuity of the new out-growth with the branch would be the sooner established. Moreover, the reason why it is always, in the case, at least, of these main branches, advisable to prune to an eye, lies in the fact that if a dead stump of wood be left beyond an eye, the outgrowth from the latter will not only be considerably diverted from its right direction of growth as an even continuation of the mother-branch, but as a result of this, will not draw the sap in such full an sufficient quantity to the fruit developing all along the whole branch. For it is obvious that along a straight or evenly-curved branch the sap will be more even in flow and more unchecked in quantity.

I have stated above that in the case of our hardy fruit-trees trained to walls or espaliers, it is dangerous to shorten the lateral branches, as this induces the production of too many woody twigs; this rule applies in a general way to all trees, but is less to be regarded in the case of pyramids, standards, &c., as attention has in these latter to be paid to the acquisition of the proper form, when some shortening of the lateral branches is inevitable; but this shortening partakes usually only of a slight character. But where shoots which are nipped or cut off low down, as in the vigorous green tertiary shoots formed in summer, are liable to break out again very shortly, and perhaps with as great vigour as before, it is advisable, though involving a little more time and labour, not to remove the shoots at all, but to twist them with the finger and thumb at a point near the base so as to leave them still attached and banging from the injured portion. In this way they for a time draw a portion of the sap, which prevents the buds below from bursting forth, and yet does not detract to any appreciable extent from the supply of sap to the fruit spurs on the mother branch. These hanging twigs at length gradually wither up, when they can be easily pulled off. If, however, the nipping of these green twigs takes place towards the end of the summer, say at the end of July or August, the likelihood of their again shooting out will not be so great (except in a wet season), for

the activity of the sap's movement and the general vigour of the tree have passed their maximum, and a gradual decline of the life-energy has set in. Yet it is probably the better plan to undertake the summer pruning and training early on in the season, say in May or June, for the superabundance of green twigs being removed and the branches trained as far as possible into their proper positions, the sun, air, and rain-showers will have freer access to the tree all through the summer, which will be a most important factor in the formation of good fruit the same year, and in the ripening of wood for the production of fruit the ensuing season.

As it is a fact that no two branches of a tree are alike in character, but that some are more vigorous in growth or more fertile than others, it follows that each branch must receive its own peculiar treatment, and that the same treatment must not be applied to all alike, as if the tree were a mere machine, for in a tree, as in everything else, true unity is always constituted by variety in its separate parts. If a branch is too rank as compared with the others about it, that is to say, if it tends to produce too much wood at the expense of fruit-spurs, its vigour must be diminished. This may be done either by leaving it entirely unshortened, so that the sap at length exhausts its exuberance in the natural manner throughout the length of the branch, with the result that the surrounding branches again equal it in strength, or the effective measure may be adopted of bending the too vigorous branch out of the perpendicular or obliquely-ascending plane into the horizontal, or in the case of many wall or espalier trees, out of the horizontal into an obliquely-descending position, so as to induce the shoot to grow towards the ground. The more horizontally-inclined or decumbent is the direction of growth of a shoot or branch, the less vigorous will inevitably be its growth. In a horizontally-growing branch, for instance, the leafy twigs, instead of being more or less radially disposed around a branch as in an upward-growing shoot, will appear on the upper side only, where the fullest amount of light is to be obtained and consequently the sap will be drawn principally to the upper side of the branch, resulting in a lop-sided development of the latter (a transverse section of the branch showing its upper side to possess a much thicker layer of wood than the lower); this uneven distribution of the sap and consequent one-sided development of the branch must result in a retardation of the growth in length of the branch and of its general vigour. The natural course of the sap is upward, and when this course is in any way disturbed or thwarted, weakness of the organ concerned must ensue. Hence, wall and espalier-trees with horizontally-trained houghs will be less vigorous in vegetative growth, and therefore adopted to produce finer fruit, than pyramids and other forms with ascending houghs, and, to take an illustration from our forest trees, the "weeping" varieties will always be found to be less vigorous than the type form. So that in Nature there are very few instances of plants with perfectly horizontal or "weeping" vegetative branches, for this is an unnatural and, as I have shown, a mode of growth unfavourable to the attainment of true vigour and the fulfilment of the proper life-functions.

Another method of reducing the rankness and strength of a branch is that of making in the lower part thereof a deep transverse incision reaching as far as the inner and older layers of the wood; in this way a considerable portion of the area of the pathway of the sap being interrupted (this pathway lying chiefly in the younger layers of wood), the nutrition and, consequently, the vigour of the branch will be very much lessened; but the incision being only on one side of the branch the sap will continue to flow, though in diminished quantity, through the branch, and after a time the wound will heal.

If, in an unfruitful branch, it is desired to induce the formation of fruit-spurs from dormant eyes, this may frequently be done by making an incision

in the stem immediately below the eye, reaching as far as the wood but not penetrating the latter, or by entirely removing a circular area of the cortex all round the branch at that point; this practice is founded on the well-known fact that the elaborated sap containing the organic food substances, such as the sugars and proteids, assumes a descending course through the cortical and bast-tissues of the plant; these tissues, therefore, being removed below the eye which it is wished to force into a fruit-bearing twig, the substances above-mentioned accumulate here in great quantity, and causes the sprouting of the eye.

The same practice may be applied when it is wished to increase the size or improve the flavour of fruit already in process of development, the incision being made below the fruit-spur on the mother-branch. It is to be noted that in these instances the ascending sap is quite unaffected in its course, the wood being left quite undisturbed.

Conversely, to these branches of the tree which are lacking in the necessary vigour, the process of shortening must be applied, as also the nipping off of the fruit-forming buds, and in this way the production of more woody growth will be induced, and a spur to greater vegetative vigour be given. Here again, the method may be applied of making a deep incision into the younger wood on one side of the main stem of the tree, just above the insertion of the branch which it is desired to strengthen; by so doing a portion of the ascending sap will be interrupted at that point and diverted into the branch, increasing thereby its nutrition and vigour.

There is a natural tendency in all vertically-growing stems for the upper appendages, as branches or flowers, to develop at the expense of the lower ones; this may be, in some measure, overcome by giving the branch at first a horizontal direction of growth prior to the natural ascending or vertical one.

In order to secure a proper development of the fruit, careful attention must be paid to the tending of the fruit-buds as they form; if the twig on which they appear requires shortening owing to its too woody extension beyond the buds, this must never be done until the buds are considerably advanced in the formation of the floral organs, for if the twig be pruned too early the fruit-buds might be induced to change their mode of growth owing to the great accumulation of watery sap in their immediate neighbourhood, and develop into vegetative shoots instead of into flowers; this, however, will not be possible when once the distinctive character of the organs enclosed in the bud are laid down, and the shortening of the twig will then act beneficially by increasing the quality and vigour of the individual flowers, and eventually of the fruit. I need hardly add that thinning of the buds or flowers will frequently have to be practised where the size of the fruit is a consideration.

In certain forms and kinds of fruit-trees, and by certain cultivators, as in Belgium and France, a systematic rejuvenating process is forced upon the tree, whereby, as the old stem or branches become unfit for fruit-bearing, they are, at the proper time and place, replaced by younger shoots, which themselves, at a future period, are in turn succeeded by others, and so on throughout a long period in the life of the tree. A young lateral shoot is carefully trained exactly parallel with the old one in such a way that at the proper time, when the latter is removed, the former may supply its place and function. By this method of perpetual rejuvenescence, as it were, of the tree, there is no doubt that a large quantity and a better quality of fruit will be produced in a given time, and superior fruit will be obtainable for a longer period. But the very severe wounding treatment involved in this process must in the long run weaken the vitality of the tree. On the whole, it seems advisable to adopt less slashing and wounding, and more natural methods.

In spite of all that has been said in favour of pruning, many will, no doubt, assert, and with truth, that many kinds of fruit trees, if left entirely to themselves, and which never feel the knife or the support of the wall or espalier, will yet, even when young, produce an abundance of fruit year after year. Nevertheless, while not doubting this statement, the fact remains that, on the whole, and in the long run, trees which are carefully trained and pruned while young, will repay the grower by a more regular and abundant supply and a better quality of fruit than those trees which are left entirely to their own natural devices.

The fact that the old trees of farm and cottage orchards are observed to bear, year after year, an exuberance of luscious fruit of excellent quality is a natural result, firstly, of the probable early training and pruning of the trees when young and easy of manipulation; and, secondly, of the arrival at maturity of these trees when, the acme of their vegetative vigor and growth having been passed, and the ultimate natural form and size of the tree attained, this vegetative growth at length, in the fullness of the trees' maturity, has been equalled by that of the reproductive organs—the flowers and the fruit; this process resulting in the striking of an even balance between the two forces mentioned in the opening paragraphs of this article—the vegetative and the reproductive; a return to the more perfect ways of Nature being the result. And such trees in their maturity are always more beautiful to the eye than when, in their younger state, they are under the domination of the knife and the wall. The superior quality of the fruit in such orchard trees, as compared with the wild crab-trees of a similar shape and mode of growth, and bearing an equal abundance of fruit, is due to their training and pruning when young, and all the other methods of cultivation throughout their life, and to their descent from an age-long cultivated ancestry.

The point more particularly to be insisted on here is that it is during the youthful active vigour of the tree, when the vegetative growth is at its strongest, and when naturally the tree is striving upwards to that maturity of size and form when it will be best fitted for the bearing of fruit, that this natural vegetative vigour must be firmly but judiciously restrained, side by side with other methods of cultivation, in order to the premature production of a superior quality of fruit both in the early and the later periods of the tree's existence; but the tree, having passed a certain age, and beginning to enter on maturity, may be left largely to itself to work out its own salvation in the attainment of an equilibrium between its vegetative and reproductive growth. *W. C. Worsdell, F.L.S.—Gardeners' Chronicle.*

### ANOTHER FRUIT ENEMY.

#### A NEWLY INTRODUCED SCALE-INSECT (DIASPIS (AULACASPIS) AMYGDALI.)

It may be well to state at the commencement that this pest is quite distinct from the San José scale-insect (*Aspidiotus perniciosus*, Comstock) of the American fruit-growers, which up to the present moment has engaged the attention of the whole fruit-growing industry of the world. But it belongs to the same destructive family of scale-insects (*Coccidæ*), and being of western Asiatic origin, inhabiting a region with a climate somewhat resembling our own, gives us far greater cause for alarm than did its sub-tropical relative—the San José scale.

#### HISTORY OF INTRODUCTION.

In January of the present year a consignment of several hundred Japanese Cherries (*Prunus pseudocerasus*) was imported into this country from Japan, which ultimately fell into many hands, and were disseminated over the British Isles without any knowledge they were badly infested with scale. In the following April two of the plants from the con-

signment were submitted to the writer for the purpose of identifying the insects upon them, which proved to be the destructive scale-insect, *Diaspis amygdali*, of Tryon.

#### DISTRIBUTION.

It was originally discovered by Professor Tryon in Australia on the Peach. Mr. Green records it from Fiji, and says that in Ceylon it feeds on many species of plants, but that it is partial to the Pelargonium. Professor Cockerell found it injurious to a large number of plants in Jamaica, including the Grape and Peach. The same author also received it from Trinidad. It was in 1892 that it first attracted attention in the United States, where it is a serious pest to the Plum and the Peach. It was also found there on a dwarf-flowering Almond and fifty Tea-bushes imported from Japan; the latter were destroyed (*vide Psyche*, March, 1898, pp. 190, 191). Professor C. Sasaki, of the Agricultural College, Tokyo, describes it (under another name) as a pest to the Mulberry-trees in Japan. Seeing that the insect was originally discovered in Australia, it might be supposed to be indigenous to that country; but I agree with Dr. L. O. Howard and the late Dr. C. V. Riley (*Insect Life*, vol. vi., pp. 287, 295), that Japan is very probably the original home of the species, as we have now three authentic instances of its occurrence on freshly-imported plants from that country.—*Gardeners' Chronicle.*

### PINE-APPLE INDUSTRY OF THE BAHAMAS.

After sponge, the most important productions of the Bahamas are pine-apples, of which no less than nearly 5,000,000 were shipped to the United States in 1897. The report of the Acting Colonial Secretary states that they are chiefly grown in the islands of Eleuthera, San Salvador, and long Island; but nearly every island of considerable size possesses soil which is suited to the cultivation of pine-apples. The species produced is known as the "scarlet," or "red Spanish," and is of inferior quality. It is, however, a good traveller, and four-fifths of the output of these islands go to the canning factories of Baltimore. The methods of cultivation are exceedingly primitive. As many as 20,000 plants are crammed into an acre of more or less rocky ground, and it is only during the last three or four years that chemical fertilizers have been used in these fields. In most cases the pine-apples are grown on the *metayer* system, the owners of the large tracts of land sharing with the cultivators the crop of fruit. These proprietors make advances in cash or provisions to the labourers until the reaping of a crop, and the cultivator is precluded, under an agreement, from selling his share to any other than the landlord. The price to be paid for the fruit varies from 1s. to 1s. 6d. per dozen, according to the date of production; and as the cultivator does not receive more for a fruit weighing six pounds than he does for one that is only half the size quantity and not quality is the object of his labours. From eighteen months to two years must elapse between the planting and a reaping of a crop of pine-apples, and in that interval the cultivator will have required so many advances in cash and provisions for the maintenance of his family that his account with the landlord in the shipping season is very often on the wrong side. The system is open to much objection. Apart from the unsatisfactory transactions in truck, the method acts as a bar to any improvement in cultivation, and tends to the elimination of any independence on the part of the labourer. When ripe the pine-apples are cut and carried on the heads of men and women to the beach nearest the plantation, where they are shipped in large American sailing vessels. The Acting Colonial Secretary says it will hardly be credited that in most cases the fruit is shipped in the bulk in the ship's hold, and as a large schooner will carry from 75,000

to 150,000 pine-apples, the condition of the fruit in the lowest layers, when it arrives in Baltimore, after a 10 days' passage, may be better imagined than described. In spite, however, of these intensely primitive methods, the pine-apple cultivation in the Bahamas is one of considerable profit and importance to the colony; but there is every reason to believe, if more care were taken, and a superior grade of fruit cultivated, the result would be manifestly more profitable to every one concerned. Tentative efforts are now being made to encourage the cultivation of the finer varieties of pine-apples, and there seems to be no reason why the London market which is now principally supplied by the Azore and Canary Islands, should not provide a profitable outlet for Bahamas fruit of a superior grade. Factories for the canning of pine-apples have lately been established in Nassau and in Eleuthera, and in 1897 they shipped more than 20,000 cases of preserved fruit.—*Journal of the Society of Arts.*

DOES MANURING PAY?

Sir,—With reference to the correspondence on manuring, I enclose overleaf a couple of estimates. One for an estate of 300 acres, which is not manured, and another for a similar estate, which, for three consecutive years, has been liberally treated with manure.

The result is somewhat curious. Instead of increasing the cost per lb. of made tea, the application of manure apparently reduces the expenditure by nearly 4 cents.

In the first case the profit per annum is R9,360—and in the second case, even allowing for a drop of ½d. per lb. in the gross price realised (a drop which I personally think would not occur) the profits amount to R18,840, or nearly double the previous return.

There is, of course, no question that in the first and second year of manuring, the profits would not be so encouraging.

The first year would probably show a considerable drop in the returns. In other words the first year's manuring should be treated as capital expenditure, just as much as if an additional acreage in tea was opened up. I do not think my estimates of yield can be taken exception to; at least if they are, I can point to three adjacent estates in the district, two giving a yield of 300 lb. an acre, and the third, which has been regularly manured at the rate of ½ ton per acre to 1/3 of the estate per annum, for the past few years, now yielding a crop of over 600 lb. per acre.

From the above, it will be seen the manuring apparently increases the cost of the following items, viz., general contingencies, tools, lines, agency charges weeding and pruning, while plucking and manufacture are decreased, owing to the freer flushes, and larger crop dealt with. The net result is an increase of yield to a very considerable extent, and a large drop in the cost of production.

It is unnecessary to point out that these results are not, and cannot be obtained if manuring is taken up in a half-hearted way. Fifteen to twenty tons of manure on a 300 acre estate with worn out soil, dribbled in yearly at the rate of quarter to one-third ton per acre, does not pay and never will pay. It is absurd to except one-third ton per acre, or less to remain unexhausted for five years. The effect will last, perhaps, two years, but after that the yield will be found to drop below that of the unmanured fields; thus, probably in time leaving little if any net increase of crop from the estate, while an annual loss equivalent to the cost of the manure, and its application, will be incurred.

If manuring is to be made to pay, proprietors and agents must be prepared to find the extra capital for increasing their factory and line accommodation and

for covering the cost manure during the first year; otherwise, if the factory accommodation be not extended, the inevitable drop in prices which is too often aid to the "discredit" of manure, is sure to follow. Maskeliya, Nov. 10th. H. M. A.

TEA IN MINCING LANE AND "CORNERS."

Again and again of late has the opinion been expressed that the law of "supply and demand" will not explain the persistently low prices for Ceylon and Indian teas prevailing in the London market. The statistical position was seldom if ever more favourable. "Fine plucking" has been the rule in Ceylon, new markets have been opened up and shipments to London have been kept below those of the previous year—and yet prices have not risen or even been maintained. How is this? Can there be some truth in reiterated allegations respecting the adverse influence of the large tea buying and packet-distributing houses that have, of late years, come into existence? We know what "corners" and "trusts" have done with certain branches of trade in America. Is there something of the same kind to be realised in the United Kingdom? We hope not. But it is not pleasant nor reassuring to read as we do—in an Australian contemporary—of what is still going on among our cousins across the Atlantic:—

Monopoly finds its most hideous development in the monstrous trusts which seek to control the food supplies of the nation. The intention of this usurpation is to wring out of the necessities of the people the highest price they can be induced to pay without incurring the danger of a revolution. Sometimes it may happen, when rogues fall out and fiercely contend together, that honest men receive a temporary benefit. This is happening at the present time in consequence of a struggle between the two opposing combinations of gigantic monetary resources. Havemeyer, the aggressive head of the Sugar Trust, and Arbuckle, the controller-in-chief of the coffee roasting monopoly, have their hands on each others throats. The cause of quarrel arose two years ago, when the Sugar Trust curtly notified to the Arbuckles a rise in the price of refined sugar. The coffee firm were large customers of the American Sugar Refining Company, but the trust confident in its monopoly after the defeat of the Spreckels' combination, felt able to raise its prices, not only against the inarticulate public, but also against its most prominent supporters. Arbuckle was expected to protest, entreat, and then submit. But to him the rise meant annihilation, for it absorbed every cent of profit on the five pound package of "Angel" coffee—coffee and refined sugar mixed—on which the Arbuckle wealth had been built up. When he represented this to the trust, "all things happen in business" was Havemeyer's cynical reply. "It's business to grow rich; it's business to ruin others when you think they may ruin you." Arbuckle determined to take his ruin fighting, and so he sought to start rivalry in sugar refining, and the trust retaliated by going into coffee. It has now become, as the "New York World," declares, a fight of millions against millions, of brute force against brute force. Both combatants are bleeding at every pore. The Arbuckles have sustained a loss in two years of 4,000,000 dol. And the depression in sugar is costing Havemeyer from 5,000 to 6,000 dol. a day. And the competition is growing fiercer as the new mills are ready to be brought into active operation. What will be the outcome? Will the fight continue until it ends in the welcome tragedy of the Kilkenny cats, or will the solution be found in another gigantic combine? Meanwhile housewives in America are rejoicing at the phenomenal cheapness of two staple articles of domestic consumption.

Such an example of unintentioned benefit to the public is of exceptional occurrence. The gigantic trusts in the United States are not only equivalent to an organised system of robbery, but are a menace to public liberty. Some idea of the extent to which these combinations dominate the commercial interests of the

country may be gathered from the statement that the American Sugar Refining Company controls 76 per cent of United States refineries, with an output annually of 1,330,000 tons of sugar; that the American Tobacco Trust controls 60 per cent of the cigarette and smoking tobacco factories in the United States; and that the American Cotton Oil Trust, controlled by the Standard Oil Trust, the largest monopoly of them all, owns 70 crude oil mills and 16 refineries. The Standard Oil Trust, which represents a capital of 97,000,000 dol., is now in process of liquidation, some tribute to the effect of the anti-trust laws of the State of Ohio; but there is danger of reorganisation under the more accommodating methods which New Jersey is willing to authorise. The formation of an iron and steel trust, with enormous powers, has given rise to the suspicion that the ultimate intention is to solidify all the giant interests into one colossal corporation, which shall throttle all possibility of competition, and, at the same time, enormously increase the profits by the great reduction of expenses.

THE LONDON CINNAMON SALES.

The Quarterly Sale of Cinnamon, held in London, on the 28th Dec. justified the fears we had been expressing for some time past, in our review of the periodical sales, that the increasing quantities of the spice we have been pouring into the market must bring down prices. One should have thought that the unpleasant experience of cinnamon growers—and that not so very long ago—from over-production, would prevent extensions, especially seeing that the article is not a necessary of life, but a luxury for which the uses are limited; but when has there not been a rush into any product which is reported to be remunerative? Whether it is that the advice and warnings are suspected, as being inspired by selfish and interested people, or that each believes that he will be able to sweep in the gains before the fall comes, there is little use in preaching caution and moderation; and, perhaps, experience is the best teacher; while, after all, it is only moderate profits one can expect from any investment in these days of keen competition. If one wants to find out something likely to yield large profits, one will have to remain idle; while others less ambitious, or less greedy, succeed in earning a living from suspected and prescribed industries, and even in securing a competence.

Anyway we find the growth of exports of cinnamon from the island, reflected in the London market, which, although it no longer monopolises the trade, still continues to attract about one third of our outturn, and is yet our largest customer. According to the last Chamber of Commerce Circular, the exports of quills to 13th December, reached 2,400,796 lb., of which the United Kingdom took 891,469 lb., Germany coming a good second with 731,740 lb. The total exports are so far as follows:—

	Quills.	Chips.
1898 ..	2,400,796 ..	1,321,806
1897 ..	2,414,084 ..	1,007,446
1896 ..	2,104,579 ..	765,776
1895 ..	2,024,271 ..	842,446

It will be noticed that last year shows a slightly larger quantity of quilled cinnamon exported than this year—about 13,000 lb.; but, on the other hand, chips have risen this year by over 300,000 lb. It is only in recent years that quills have reached two million lbs., and now chips, which used to be thrown away in the early seventies, and before, when the spice commanded

high prices, and which were sought to be suppressed a few years ago by proprietors who saw how it was sending down the price of quills, have now topped the round million. Nor is the trade in chips likely to languish, with the present prices which they command. But, as we were remarking, the large exports from here are seen in the London catalogues; for whereas the August sales brought 1,517 bales to the hammer and the November sales of last year 3,093—itsself a phenomenal quantity—last month found 3,901 bales in the catalogues. It is no wonder that prices receded in presence of perhaps the largest catalogue ever presented to the trade, even if the cloud under which our best customer, at any rate for the best sorts—Spain—would not tell adversely on prices. But we saw how at the two previous sales, during the Spanish-American war and after, the demand from Spain fell off; and it is not to be expected that trade will begin to flow in the old channels there, at any rate for some time to come. The finer sorts therefore met with less competition, and had to submit to a drop in price of from 1d to 21 per lb., while ordinary and coarse sorts fetched only 3d to 1d less than at the previous sale. It will be noted that quillings etc.,—the ends and sides that are scissored off in trimming the quills—continue to command exceptional prices, and so do chips; so that producers are fairly compensated, and the development of our exports will not yet be arrested. The statistical position of the spice is, however, not very re-assuring with larger stocks than were ever before reported. Still there is no reason for alarm. We quote as follows from the Report of a leading London Firm in the trade:—

London, 30th November, 1898.

**CINNAMON.**—The concluding auctions of the year were held on Monday last when a total of 3,901 bales Ceylon was presented against 1,517 bales in August and 3,093 in November last year.

The large supplies offered were more than the market could take, but as a disposition was shown to sell at best rates buyers responded. The good clearance of about 2,450 bales being effected. Prices ruled irregular, "good" to "fine" showing the heaviest decline of 1d to 1½d and occasionally 2d per lb., while ordinary and medium quill went about ½d to 1d per lb. cheaper. The demand from Losin was very poor. Firsts sold at 10d to 1s 6d; seconds 8d to 1s 4d; thirds 8d to 1s 3d; fourths 7½d to 11d and common firsts to fourths 5½d to 9d per lb.

Quillings, &c., sold to 5d to 9d and chips at 3½d to 4½d per lb. about 400 bags being sold out of 849 packages offered.

1895. 1896. 1895.

Stock 6,116 bales against 4,384 2,100 5,679 bales.  
The next sales will be held 27th February, 1899.

THE DUTCH have had possession of Java for over 300 years with a short interregnum by the British, and have pursued a system of administration at once prosperous to the people and profitable to Holland. It covers an area of 50,000 square miles and the population numbers 24,000,000. The natives are governed just the opposite of the way we employ with natives in India, yet the Javanese are happy and contented.—*Pioneer Cor.* [That is the natives in Java are treated as well-fed servants, forbidden to learn Dutch, or to rise out of the position of servitude.—*Ed. T.A.*]

## CEYLON TEA IN GERMANY.

### MR HAGENBECK'S ENTERPRISE.

We had the privilege of inspecting specimens of three sizes of retail tins which are now being used by Mr. Hagenbeck in his tea enterprise in Germany and also a large advertisement on glass which he is distributing to all grocers who sell the "Ceylon Tea" supplied by his firm. They are very attractively got-up in different colours and cannot fail to catch the eye of those who, it is hoped, will become customers in increasing numbers. The glass advertisement in addition to having the name of the firm as Ceylon tea merchants prominently displayed on it, has also a large representation of an elephant with a pile of tea boxes on its back. Miniatures of this picture are painted on one side of the tins, the other sides showing a bullock laden with tea chests, a tea garden with a coolly plucking in the foreground and a native attendant serving the cheering cup. Mr. Hagenbeck desires great credit for his enterprise and we heartily wish him all success.

## PRODUCE AND PLANTING.

**CHANGES IN THE TEA TRADE.**—The *Produce Market's Review*, which we presume is written by grocers for grocers, in its series of articles on the tea trade has, in its issue of last Saturday, something to say about the changes in the trade, and also about blending. It points out that "not many years ago it was a general practice among the larger grocers to hold relatively very large stocks of tea in bond, but the recent developments in the trade have greatly modified this custom. It is not only the wholesale trade who are no longer sufficiently interested to lock up their money in tea, but the far larger aggregate stocks that used to be held by the retailers have been so greatly modified as to the comparatively a negligible quantity. Overwhelming and constant public sales throughout the greater part of the year, coupled with the miserably small lots and with the fall in prices and in profits, of course account for this change. Nevertheless, the change is not wholly beneficial, as notwithstanding the deluge of teas or perhaps in consequence of it, it is increasingly difficult for the retailer to maintain the flavour and strength of his blends at a standard where his customers do not notice any change. Any noticeable alteration at once leads to complaint on the part of the captious though non-critical British public, strangely ignorant as it is of tea, and demanding chiefly two things—a black infusion and a strong thick flavour."

**BLENDING.**—"It is partly this difficulty of maintaining standards on a small scale," says the *Review*, "that has caused the great increase in wholesale blending of the late years, for the large stocks always held by the larger London leaders and their being constantly in the market, ensure their having a supply at all times of the suitable sorts to prepare any blend that may be wanted. They have, of course many other advantages. Work on a large scale is always cheaper than on a small one, especially when, as in this case, machinery can be employed which is not only far more economical, but does the mixing far more evenly than can be done by hand, with the advantage also, which is not possessed by the smaller retailers, cutting the leaf to an even size—the important matter when tea is measured into the pot in a spoon, and is not weighed. Besides this the wholesale dealers, from the greater extent of their experience are certain to make more saleable blends—for it is a common place that far too many of the grocers still spoil the tea which they try at great cost to improve. Nor is it a trifling consideration to save all the worry and mess of such a dusty and

troublesome operation as tea blending in a shop, or on premises where many other goods are stored. The grocer who buys his tea ready blended from a large wholesale dealer effects the following savings:— 1. He need hold practically no stock. 2 His teas are more cheaply blended. 3. The teas are likely to be better. 4. A great deal of labour and dirt is save. On the other hand, it may be said that all this only partially applied to large retailers who can work on a sufficient scale, and this is true. It may also be argued that all these advantages will be charged for, but competition soon settles that point. If the grocer cannot buy blended tea more cheaply, all things being considered, he will simply continue to buy unblended tea. It is a matter for a comparison of samples and prices, and for the intelligent judgment of each individual. As a matter of fact, there is absolutely no royal road to tea blending, any more than there is to anything else. It is a question in the first place of an adequate knowledge of tea tasting, and then of a sufficiently large business and capital to enable the necessary stock and machinery to be employed. There is absolutely no secret about any of these things any more than there is about the catch-penny trick, employed in some cases, of selling the lowest tea at a loss. This simply means that the loss must be put on to the higher priced tea, and whenever this obvious artifice is used the remedy is simple. It is to send large orders for the teas sold at a loss, and for no others."

**THE COMPETITION OF PREPARED COCOA.**—"Besides these hindrances to an expanding commercial enterprise, there has been the severe and unflagging competition of 'prepared cocoa' in various attractive forms, which, being pushed to the front by all legitimate means, has in some degree weakened the hold which the raw material had for many years retained upon the great mass of consumers in the United Kingdom.

**PROSPECT.**—"In short, prospects for the article have entirely changed within the past few weeks and that too without precise warning to anybody in particular. Even the best informed in the trade were not aware of the impending reverse in the value of cocoa till its significance and repetition left no room for doubt; and instances could be recorded where the parcels of West Indian and African sorts disposed of, by auction or privately, have shown a depreciation of 5s to 8s per cwt from the recent highest point. Nevertheless, there is ground for satisfaction in the steady progress which the home consumption of cocoa is making in the British Isles, and especially in London, where for the present year to date 154,000 bags have been delivered on payment of duty, in contrast to 135,000 bags in the same period of 1897.—*H. and C. Mail*, Dec. 9.

**IS IT TRUE?**—The *Financial Times*, thinking the allegations of this correspondent of the *Times* well worth inquiring into, despatched a representative to the offices of Sir T. Lipton, but found that Sir Thomas was away on the Continent. Reconrse was next had to Mr. Duncan McDiarmid, the general manager of the company, who stated that he could not say anything in regard to Sir Thomas's scheme in connection with the West Indies as it was entirely a private matter of Sir Thomas's, and had no connection with the company. Asked as to the allegations made by the correspondent against Sir Thomas in regard to his trading with Ceylon, he ridiculed the assertions. It was true, he said, that his company had cut prices, but this certainly benefitted the consumers. Grocers and other competitors, who formerly made considerable profits, naturally objects to this, and the low prices which have prevailed have given rise to a similar feeling among planters. As a matter of fact, he continued, the falling off in price is due principally to over-production, and another factor which injuriously affects planters is the rise in exchange. "Ceylon," he said, "is not the only country affected by the causes mentioned. Indian tea is also down in price, and for precisely the same reason."

**ANOTHER VIEW.**—Mr. Geo. Seton, writing on the subject of the function of popular distributing agencies and the charge brought against Sir T. Lipton by the correspondent whose letter in the *Times* we have quoted, says: "Let the planting community, at any rate, 'give the devil his due,' and endeavour to seek out in the proper quarter the real 'origo mali.' I hold no brief for cheapness, the driving of which to its extreme issue is undoubtedly one of the evils attaching to the present system of the retail and distributing trade in all its branches, which cheapness is a doubtful benefit to any section of the community. At the same time it cannot be denied that, with the enormous increase in the output of both Indian and Ceylon tea which has been the feature especially of the last five or ten years, disaster would most certainly have overtaken the combined industries much sooner than it has done had it not been for the go-aheadness of the large packet tea and other similar agencies. These, by narrowing the margin of profit, have given an enormous stimulus to the sale, both at home and abroad, of Indian and Ceylon as well as China and other teas. Of these agencies Lipton's is only the most recent form. It is to be regretted, no doubt, that the advertising distributors should go out of their way almost (so to say) to invite the consumer to pay the lowest price. Two facts, however, must not be overlooked as regards the advantages to be derived from this system: 1. As regards the great mass of the poorer population of this country—or, indeed, of any country—the quantity of an article like tea which they can consume has practically no limit except that of the length of their purse, and with an increase quantity obtainable for the same sum of money that increased quantity will undoubtedly be consumed. 2. As regards a very large proportion of the better and more well-to-do class, they refused to be hood-winked by the minimum of cheapness which is offered them, and still continue to buy a better, though dearer, article. Admitting these facts, we are led to the conclusion, I venture to submit, that this extreme method of pushing the trade is, on the whole, for the planters' advantage."

**SO DISINTERESTED.**—An ex-Indian official in the *Pall Mall Gazette* expounds at some length the official view of the financial outlook, and if his way of looking at things represents the official position generally the Indian planter can tell pretty plainly what to expect from that quarter. Says the "ex-Indian official": "One class alone appears to be immovable in its preference for open mints—namely, those producers and exporters who believe that they can continue with a falling exchange to pay in a depreciating metal while they receive the same sterling prices for their produce. When these people loudly proclaim the benefits which Indian agriculturists and labourers enjoy by being paid in a metal that is constantly falling in its purchasing power, it is not ill-natured to suppose that their vision is dulled by the mist of their present and immediate interests." According to the "ex-Indian official" a gold standard would give India that sound financial position and staple exchange which selfish Indian producers, having only their own pockets to consider, would deny her, and from his point of view the grandest bogey of all the phantoms used in the work of endeavouring to prevent the adoption of a gold standard is that of the threatened destruction of the tea planting interest. He says, "If China has not an open door for anything else, she has it for silver, and therefore, it is argued, she will be able to beat India out of the market. Chinese labourers will be paid in silver, while Indian workmen must be paid in rupees. This is a question which has to be threshed out. The fear that English or European capital will start plantations and mills in China and produce articles as good as the Indian at a cheaper price seems, to say the least, premature. I doubt if any of the capitalists who own Indian property would feel very safe under the Chinese Government. Has Indian tea won its way by cheapness or by quality?" This is supposed to settle the question and to satisfy all whom it may concern that the real friends of India are those who would establish a gold standard. The taunt

of self interest used against planters and exporters by this "ex-Indian official" is delightfully ingenious.

**TURNING THE TABLES.**—While some people think a gold standard is the panacea for Indian financial trouble, Mr. James R. MacArthur, writing from 134, Fenchurch Street, suggests as a cure for the distress in the West Indies the adoption of a silver standard. He says: "The West India islands, like many other poverty-stricken countries, are groaning under the burden of a gold standard. If a silver standard were substituted for a gold one, they would be able to produce sugar at a price which would drive bounty-fed beet from every market in the world, and these islands would become as prosperous as the Straits Settlements, where a two-shilling dollar has practically secured for Singapore and Penang merchants a monopoly of the tin trade."

**SEIZING THE OPPORTUNITY.**—The Americans are making the most of the fact that Lady Curzon is their country-woman. In an advertisement of tea there is a portrait of her ladyship, under which can be read:—"Lady Curzon, Vice-Empress of the Tea Countries.—Teal Teal Thou soft, thou sober, sage, and venerable liquor; thou innocent pretext for bringing the wicked of both sexes together in the afternoon; thou female tongue-running, smile-soothing, heart-opening, wink-tipping cordial, to whose glorious insipidity I owe the happiest moment of my life, let me fall prostrate and adore thee!" At the \_\_\_\_\_, the teas of Ceylon and India are of the very finest grown."—*H. and C. Mail*, Dec. 16.

**THE RUSSIAN MARKET.**—The Russian Empire takes some ninety million pounds of Chinese tea annually, a large proportion of it being imported at very cheap rates in returning vessels of the Volunteer Fleet that take out troops, convicts, armaments of war, and railway material to the Far East. Indian and Ceylon growers, in their desire to push their produce in Russia, have a great deal of prejudice to overcome, but with the two millions of pounds of British tea now sent thither they have made a fair beginning. If it were not for the heavy duty of 1s 9d per lb., which, of course, is all in favour of China, Indian and Ceylon teas would make rapid headway.

**THE CEYLON ASSOCIATION IN LONDON AND THE CEYLON NORTHERN RAILWAY SCHEME.**—The members of the Ceylon Association in London showed a unanimous opinion in opposition to the Ceylon Northern Railway scheme at the meeting of the Association held to consider the matter on Monday last. As was very truly pointed out by Mr. Harcourt Skrine the planting industry is, and must continue to be, the mainstay of Ceylon revenue, and although the Ceylon planters are ever ready to do all in their power for the benefit of the industry, they can hardly be expected to submit to a taxation which is opposed to the true economies of the colony. The population and traffic lie at the extreme end of the proposed line, and for at least a hundred miles the line would pass through a tract of country where no single product could be successfully grown for export. This being so, it is difficult to see how a railway—which is to be broad gauge—could be worked without an annual deficit. The deputation to the Secretary of State will be ably represented by Lord Stanmore, who has the interests of the colony at heart and has an intimate knowledge of its requirements. We understand that an answer has been received from the Ceylon Chamber of Commerce in reply to the telegram sent after the meeting, in which it is stated that support will be given to efforts to obtain reconsideration of the broad gauge.

**TEA STATISTICS.**—It was necessary that the Indian Tea Association should move in the matter of the issue of accurate official figures about tea. We are glad, therefore, to see that a circular is to be issued on the subject.

**TOO GENEROUS.**—The Admiralty cannot be said to encourage the consumption of tea and cocoa in the Navy. The total abstinence men, and others who do not care to take their allowance of grog, have hitherto been allowed to draw its equivalent in tea, coffee,

cocoa, and sugar. And if they cared to economise, even on these articles, they were permitted to carry them ashore duty free, for the use of their families. They may do so still, but under a new Admiralty order, only on condition that they pay the duty on the tea and cocoa.

**COMPETITION IN THE RUBBER TRADE.**—As a result of some previous representative meetings on the subject, a meeting of the leading Indian rubber manufacturers of the Kingdom was held last week in Manchester to discuss proposals for a combination of the whole trade. The main object of the new association of British rubber manufacturers is to control prices and output in view of competition. After considerable discussion it was determined to form the association, rules were adopted, and officers were elected. The feeling prevailed that although prices may be to some extent advanced in consequence of this decision, the rapidly growing competition in all departments of the rubber industry by France, Germany, and America must continue to be a powerful check upon any such advance.—*H. and C. Mail*, December 23.

### CEYLON TEA CORPORATION:—A DISASTROUS COMMENCEMENT. SIR CHARLES LAWSON'S VIEWS ON THE POSITION.

TO THE EDITOR OF THE FINANCIAL TIMES.

SIR,—In its issue of last Wednesday a financial contemporary of yours offered some suggestive remarks about the impending "combine" of three tea Companies, and urged that since much is made by the promoters in their "private and confidential" prospectus of Companies which stand at a considerable premium, mention should also be made of those that stand at a heavy discount. Will you allow me to tell a tale that contains a moral for those persons who may be nibbling at the proposed "amalgamation"?

Once upon a time—and that time was only 17 months ago—the prospectus of the Tea Corporation, Limited (Ceylon), was issued from the office of Messrs. Antony Gibbs and Sons, and was largely advertised in and favourably noticed by several papers. It appeared from this that Messrs. Antony Gibbs and Sons, had accepted the position of its commercial agents; that the corporation would be accommodated in that firm's office, and that the Board of Directors was formed of Mr. Cyril Garvey, of Thomson, Hankey & Co.; Messrs. Hamilton Hancock and Thomas Lawrence, directors of the Ceylon and Oriental Estates Co.; Mr. Vivian Smith, of Hay's Wharf; and, last but not least, Mr. Henry Tugwell, of Prescott, Dimdale, Tugwell and Co., the bankers. The association of the Gibbs, Hankeys, and Prescotts—names to conjure with in the City—with the concern seemed to many people to afford a guarantee that the bright hopes held out in the prospectus would in all probability be fulfilled.

The corporation was stated to be formed with the object of acquiring, working and developing as "going concerns" several "valuable" estates in Ceylon, equipped with the requisite plant. These estates were said to have yielded 1,060,463 lb. of tea in the year ended 30th June, 1897, and the opinion was expressed that for the year 1897-98 they "should yield" 1,250,000 lb. which "should sell" at an average of 6½d per pound. The directors set forth in prominent type that in their judgment "a considerable economy will be effected in the cost of administration by the combination of the above interests under one management." An elaborate calculation was given which went to show that if a million and a quarter pounds of tea were produced at a cost of 25 cents, and if exchange remained at 1s 2½d, and if the produce sold at only 6d per pound net, the profit would be £12,370. A further £600 was anticipated from cocoa, thus bringing the total profit up to £12,970, or sufficient to pay 5 per cent on £65,000 debentures, 6 per cent on £65,000 cumulative preference shares

and 10 per cent on £51,000 ordinary shares. Moreover, "a considerable increase of profit on the above estimate may be expected in the future as the young tea and coffee come into bearing," and "the planting up of the available land will also be proceeded with as the directors deem advisable." The vendor of the estates was Mr. Theodore Ford, and the price to be paid for them was £169,000, in shares.

The prospectus went on to show that the consumption of Ceylon tea in the United Kingdom had gone up greatly of late years, and that a further increase in the demand for the tea for the Russian, German and American markets was probable. Then a table was appended in support of the directors' remark that "investments in Ceylon tea companies are now much sought after owing to the satisfactory dividends paid and the high premiums at which many of the shares stand." Six Ceylon companies were named, and it was shown that their £10 paid-up shares were worth, at the date of the issue of the prospectus, £29 10s, £20, £13, £24, £25 and £23 respectively, and that the dividends for 1896 were 15, 15, 17, 17½ and 15 per cent. And the name of a seventh company was added, whose £3 share was worth £8 and whose 1896 dividend was at the comfortable rate of 20 per cent.

Now compare the above figures and statements with those contained in the very brief report of the directors for 1897-98, the first year of the corporation's existence. The directors say that they "regret" that the results shown in the accounts "are not satisfactory." They attribute this to the depression in the tea industry generally, the rise in exchange, the increased cost of rice, the high freights and low prices. Then, owing to some legal technicalities in Ceylon, the directors were not able, they say, to have the estates conveyed to them and brought under their own control until the end of 1897. "consequently for the half of the year under review the original owners managed the properties on account of the company, and the result showed, when their accounts were presented, a considerable loss on the working." But when at length the directors gained possession of the estates their manager succeeded in reducing the f.o.b. cost of the tea produced from 42 65 to 25 96 cents. The crop for the first six months—or during the period when the estates were not under the control of the directors—fell short of the estimate, but that for the second six months was better, and the yield for the twelve months consequently amounted to 1,112,606 lb.

But, strange to add, the working of the estates shows a profit of no more than a paltry £1,701, after wiping off the loss of the first six months, and charging the whole of the Ceylon expenses. This is bad enough, but worse remains, for "after charging London expenses and debenture interest there is a loss of £1,620." The funds are not forthcoming, therefore, to pay any interest on the cumulative preference shares, and the liability for 1897-98 on account of that interest has to be carried forward: while, of course, there is not a penny for the holders of the ordinary shares to bless themselves whithal.

All this means that the shareholders have a bitter pill to swallow. The directors might have assisted its deglutition, and have atoned at the same time for the meagreness of their statement, if they had issued a report in some detail by the manager explanatory of the position and prospects of the estates. But, as to prospects, they deem it sufficient to say that the manager's estimates "are encouraging," and that they "have sent instructions for operations to be energetically continued" in prospecting for—plumbago! They have reduced their fees, which is to their credit under the circumstances, but those fees, with the accountant's charges, amounted as it was to £1,084, and nothing is said about the agents' commission. Their balance-sheet is more condensed than instructive, as though directors are not under an obligation to anticipate and meet the shareholders' want of full information. No statutory meeting of the corporation was held, and the opportunity afforded by such a meeting to acquaint shareholders with the amount of capital subscribed and the outlook, if

their investment was neglected. But an extraordinary general meeting was held on 13th December, or nearly six months after the corporation was established, to effect some alterations in the articles of association, in compliance with the requirements of the Stock Exchange before a quotation of the shares would be allowed. At that meeting it was resolved that "the qualification of a director shall be the holding of shares of the company of the nominal amount of £500." It might be interesting to the shareholders to learn the amount of the holdings of the commercial agents and their colleagues in the management. The so-called "second annual general meeting of shareholders," which is, however, the first meeting of the description, has been convened for Wednesday, and it is to be held not under the roof of the agents, as the extra-ordinary meeting was—where adverse criticism would seem like a breach of etiquette—but in the neutral atmosphere of Winchester House. The directors owe it to themselves, to the agents (one of whose partners is M.P. for the City of London), and the shareholders generally to refrain from adopting an air of haughty reserve, while the shareholders will be well advised, in the presence of the grave position revealed by the Board's report, if they appoint a committee of independent shareholders to investigate the genesis and outlook of what has already proved to be their over-capitalised and most unfortunate concern. This may be resented in some quarters, but it is about time that their responsibility should be brought home to persons—no matter what their position in the City may be—who provoke such a comparison between promise and performance as I have ventured to make.

To all and sundry, therefore, who are thinking of investing hard-earned savings in new tea companies it will be a kindness to offer "Punch's" memorable advice to those about to marry—namely, "Don't."—I am, &c.,

CHARLES LAWSON.

5th Dec., 1898,

#### CEYLON TEA IN MINCING LANE.

Under the heading of Bedford news, a well-known Ceylon proprietor, now at home, jocularly asks the question as to whether Ceylon teas could not be offered in Mincing Lane at a fixed upset price, in order to check the effect of combination and secure fair play. That something will have to be done may be judged from the remark of another proprietor with very wide and varied experience, who also writes by this mail as follows:—"The combined purchasing interests at home keep down our prices, although the shipment to other countries has taken so many million lb. that London shipments have decreased. These big blenders cannot now get enough of our cheap teas, i.e., low grades which other countries take. Large profits they must have to earn dividends on their over-capitalized Companies. They are therefore lowering the prices of the finer teas." This is a nice result of "plucking finer," if result it be; but surely there is no lack of low-grade teas from the lowcountry districts; and how can blenders afford to give more than a certain quantity of fine teas and so raise their blends to a quality which they may not be able to maintain?

NEGROES AND PETS.—It was noted by Sir Samuel Baker that a negro has never been known to tame an elephant or any wild animal. A person might travel all over Africa and never see a wild creature trained and petted. It often struck Sir Samuel that the little negro children never had a pet-animal.

DUTCH COLONIAL TEA vs. ENGLISH  
DITTO IN CONNECTION WITH  
THE RUPEE EXCHANGE.

Under the above heading the *Indische Mercur* of Dec. 3rd has the following further communication from Mr. van der Chys, head of the tea department of the firm of Wed. J. van der Chys & Zoon :—

In connection with and conclusion of my article on the above subject in the *Indische Mercur* of 19th ult. (No. 889) I placed myself in further communication regarding this matter with H.M. Consul-General in London, the Hon. Mr. H.S. J. Maas, who for the sake of the great Dutch advantages to be anticipated eventually therefrom, was so obliging as to collect statements from the most competent persons. Having liberty to use any of these according to my judgment, I specially give the following on this subject, which I think it is perhaps of importance to bring to the notice of parties interested. \* "The agitation of the Tea Planters' Association in Calcutta appears so far to have caused less sensation in London than one would have reason to suppose from their cries of distress, since there has not been received there a single telegraphic communication, regarding what was done at the gathering at Calcutta, on the 14th ult. The notes of this meeting, which we shall see in a few weeks, will however be sent me by Mr. Maas, and will then be made public by me in the *Indische Mercur*, if permission is granted me. As to what the *Grocer* says regarding eventual State assistance, either by a total abolition of the duties on tea of British Indian origin, or by raising the duties on the so-called 'foreign teas' in proportion to the losses arising from the fixing of the rupee rate of exchange at 1s 4d for English subjects, towards neither of these two methods does the English Government give cause for fear. As regards the first, there has for some years been a struggle by the labour party for a total abolition of the tea duties (the so-called "free breakfast table") but this has, at present at least with the growing expenditure for war material, little immediate chance of success, and moreover the infraction of the free trade policy is so revolutionary to the whole English system of commerce, that there can scarcely be a talk of such methods, in contrast with that mentioned by the *Grocer*.

The following paragraph appeared in the latest number of that paper (26 Nov.) in connection with the preceding :—

The Indian Government's proposal to fix the Indian rate of exchange at 1s 4d appears to be viewed with considerable disfavour by those interested in the tea-growing industry of India and Ceylon. The secretary of the Indian Tea Association and the secretary of the Ceylon Tea Association have both protested. During the present season Ceylon has exported to foreign ports 7,000,000 lb. more tea than she did last year.

[\* As there are no quotation marks given at the conclusion of the citation, it is impossible to tell whether all that follows is from the correspondent, or whether some of the remarks are Mr. Van der Chys own.—Ta.]

DISTRIBUTION OF CEYLON TEA  
IN 1898.

We take from our evening contemporary the following statement of the shipments of tea to London and the Colonies,—together with total shipments to all countries—as compared with last year :—

UNITED KINGDOM.			
	1897		1898
	lb.		lb.
January	8,542,897	..	8,152,769
February	6,348,232	..	6,726,001

DR. JOHNSON AND TEA-DRINKING.—In *Notes and Queries* for 19th November, are two more communications on this subject. Mr. Geo. Clulow writes :—"The inordinate consumption of tea which, even under his own confession, belongs to the personality of the good Doctor, may, after all, have not been so, and especially if judged by modern standards. It has to be remembered that tea was, in the Johnsonian age, a luxury, and was dispensed in small doses. As I write I have before me some tea cups of that era—such as were in ordinary use—the fluid capacity being but a little over one ounce. Twenty-four of such cups would total surely a pint and a half." Mr Edward H. Marshall, M.A., Hastings, writes :—"Johnson himself gloried in having swallowed twenty-five cups, in revenge upon a lady who tried to exploit him, while at the same time he 'did not treat her with as many words' (Cumberland's Memoir)."

## CEYLON TEA AT COOLGARDIE.

In view of the part which Ceylon is to take in the forthcoming exhibition at Coolgardie, readers will no doubt peruse with interest some notes of a conversation which one of our representatives had with Mr. J. L. Denny (formerly of Ceylon) and now of Messrs. Russell, Denny & Co., Ltd., Stock and Sharebrokers, and Mining Engineers, of Perth, Fremantle and Kalgoorlie, the headquarters of the firm being at Perth which is about 323 miles distant by railway from Coolgardie. The firm, of which Mr. Denny is a partner, only started business about eighteen months ago, but so much energy and enterprise has been displayed by them that they are now looked upon as one of the leading firms in the Colony, and from the nature and extent of their business they are in a position to speak with some degree of confidence as to the industrial position of the country. "I cannot tell you off-hand," said Mr. Denny, "the exact area of Western Australia, but you may form some idea of it when I mention that it is as big as France and Germany put together and that, incredible as it may seem, the population only numbers 170,000. The resources of the country are very great and you can understand how, for the development of the same, the Government should be anxious to encourage settlers both as capitalists and labourers. This is one of the objects which I hope may be attained by the Exhibition, and as the population increases the greater will be the demand for such produce as Ceylon is able to supply, if only you get a footing early, and see that your interests are persistently pushed by some one who knows tea and knows Australia, following up the advantage you may gain at the Exhibition by steady and determined effort. The Australians themselves are enterprising and appreciate that quality in others. There is some Ceylon tea imported, but this is indirectly done and the quantity is by no means large. I myself took over some Ceylon tea with me but, of course I could not give the time or attention to the business that it requires, although I never fail to praise and recommend it as I can conscientiously do from my experience here as against the very inferior sorts used there and which are sold at about 1s per lb. The people there like a very strong flavoured tea, and I am sure that if you could, at the price I have mentioned, supply them with such a tea they would take to it. There are two brands chiefly sold there, but the quality, as I have said, is very inferior to anything I have ever tasted in Ceylon; and although no doubt it would take some time to overcome the competition by the retailers of these teas, I am certain that in the end the victory would be yours if you set about the campaign in a thorough and energetic manner. I believe the average consumption per head per annum is about 6 lb. and that I think is an inducement to those engaged in the Ceylon trade to have a look in. The Exhibition will I am sure be a great success as an Exhibition and will attract visitors from all parts of the colonies, affording a splendid chance for advertising your product. The tea room will, I am convinced, take well, and I think that the free distribution of samples would be attended with good results. The work must not begin and end with the Exhibition, but be vigorously prosecuted afterwards; and a warehouse or warehouses should be provided where retailers could conveniently get their supplies at whatever time they required them."

"Gold," continued Mr. Denny, "has now been found at the 500 ft. level, so that the industry is an assured thing for a long time to come. There is a variety of other minerals, coal especially. The last reports were excellent and the Government are, I believe, now using the coal themselves. Then there are splendid prospects for those who wish to go in for agricultural pursuits, whether as cultivators or sheep farmers, and the Government are offering facilities to the people to come and settle upon the land. The taxes are being cut down, and duties reduced so as to remove the complaints that were made by miners and others from the eastern colonies that they could not afford to fetch over their families and settle down in Western Australia owing to the cost of living. A scheme has now been settled (principally through the instrumentality of the Premier, Sir John Forrest) to pump water from Helena Vale to Coolgardie, a distance of 330 miles in order to improve and cheapen the supply, the rate for which has been very dear hitherto—so scarce indeed was the water that it was difficult to get it at any price. At present low grade mines are shut down because they cannot be worked at a profit, but the result of this new water scheme will be that many will be re-opened, and of course that means an influx of population. Taking all these things into consideration the colony is bound to go ahead and it would be a great mistake if Ceylon were not now to make a strong effort to secure a firm footing in the market."

THE SARAPIQUI ESTATES COMPANY, LIMITED. (Costa Rica) have for Directors Gilbert D Jennings, 28 Gracechurch Street, London E C; Oswald C Magniac, Hay's Wharf, Southwark, S E; J Loudoun Shand, 24 Rood Lane, E C; J Huntley Thring, J.P., Alford, Castle Carey, Somerset; R P Macfarlane, 13 Albany Street, Edinburgh; F H Phipps, 8 Great Tower Street, London, E C. The Directors have just made an issue of registered mortgage debenture stock for £10,000. The estate comprises 23,190 acres of freehold land selected out of a district of Costa Rica best adapted for coffee planting, and also suitable for cocoa, rubber, tobacco and other products. On the property are timber trees of great value. The survey shows of cedar alone 5,000 trees of 12 tons each. Ample power is obtained for the saw-mill and other machinery by means of natural water courses. The total outlay on machinery amounts to £2,187. Up to the present time 639 acres of forest have been cleared and 339 planted with coffee. When this attains maturity a yield of coffee may be expected of 15 cwt. per acre. The quality of the shipments up to date is of the finest, and commands high and well-maintained prices. The yield from trees already in bearing, the crop from which is now being secured, shows a substantial margin over cost of production, more than sufficient to pay the interest on the debentures now issued. A village has been erected to secure permanent labour, and already 30 to 40 houses are built. It is expected that a large sum will, in course of time, be realised by sale of land to other planters, the whole of which will be applied to the redemption of debentures until they are extinguished. The present issue of debentures bears interest at 6 per cent, and will be secured by an effective mortgage on the Company's property, registered in Costa Rica, in the names of English trustees,

## FAILURE TO IMPROVE CHINA TEAS.

We take the following from our evening contemporary:—

Mr. Thomas Fairhurst, who arrived on Wednesday from Foochow, and is now up-country, will continue his journey to London by the "Australia," which leaves Colombo on the 5th January. A representative of the local "Times" saw Mr. Fairhurst before he left for Dimbula, and in answer to questions respecting the Foochow Tea Improvement Company which has just collapsed, he said the Company tried their experiments in improving teas about twenty miles from Foochow, in order to avoid any possibility of friction with the natives. The experiments, which were superintended by Europeans, were carried out in a very poor district, and it had since been thought if they had been undertaken in the more productive districts, 200 or so miles distant, such as Panyong and Scumoi, a larger measure of success would have attended them. The great difficulty respecting this, however, was the inadequate means of transport, the only method of communication or outlet being by a river full of rapids or by cooly-back, and there was another great drawback in the circumstance that the experiments in the better districts could not have the indispensable European supervision without considerable inconvenience, and, perhaps, danger to them. The reason for the collapse of the Company, Mr. Fairhurst continued, in reply to an enquiry by his questioner, was the high cost of production, this being accounted for by the difficulties of transport, high wages both to Europeans and Chinese, and the heavy Chinese export duty, which averaged something like 20 per cent.

With regard to China teas generally, Mr. Fairhurst said there was a great demand in the English market for common teas at about 4½d or 5d, and China could produce better teas at that price than Ceylon was able to. He gave as an explanation of this, that the Chinese method of manufacture of cheap teas was the better one, as although machine manufacture improved the appearance of fine teas, it had not that effect with the common kinds. Ceylon tea, Mr. Fairhurst remarked, ought to do well, considering the shortness of the amount exported from China and India, the falling-off during the past year with regard to China black teas, as compared with the previous year, being approximately 5,000,000 lb. The demand in London was, as he had before stated, for common teas.

## WEIGHING CEYLON TEAS:

## THE LONDON CUSTOMS SYSTEM.

(INSTRUCTIONS SHOWING HOW TO REDUCE THE LOSS TO A MINIMUM.)

In order to avoid the loss usually experienced in Ceylon from the system of weighing in vogue by the London Customs authorities, viz., to give the turn of the scale against the importer, both on gross and tare, the following hints will prove of value to proprietors and Superintendents of Estates.

1. The Tare (that is the weight of the empty package, complete with lid, lead, hoop-iron and nails) should in all cases weight two to four ounces under the pound, whether the package be chest half-chest, or box.

2. The gross weight of a package must in all cases weigh three ounces over the pound, whether package be chest, half-chest or box.

3. When a shipment of tea is not to be "Rebuked" in London, the Customs authorities "average tare" the break, that is to say a small per centage of the packages are opened and their tares ascertained, and from these an "average tare" for the whole break is struck. In this case it is imperative that the tare of each package weighs alike.

4. When a shipment of tea has to be "Rebuked" in London, the tare of each package in the break may vary, provided the tare of each package is 2 oz. under the lb.

Subjoined is an example of the correct method of weighing two packages said to contain 100 lb. tea each, which have to be Rebuked in London.

## Garden Weights, Ceylon.

No.	Tare.	Tea Net.	Gross Weight.
No. 1	27 lb., 14 oz.	100 lb., 5 oz.	128 lb., 3 oz.
No. 2	28 " 12 "	100 " 7 "	129 " 3 "

## Customs Weights, London.

Gross Weight.	Tare.	Tea Nett.
128 lb.	28 lb.	100 lb.
129 "	29 "	100 "

The two examples above will demonstrate the point, inasmuch as in No. 1 the loss is 5 oz. only, which is the least possible, while No. 2 shows a loss of 7 oz., owing to the slightly lighter tare.

5. The following is a very usual but incorrect way of weighing teas, possibly through faulty scales or weights.

## Garden Weights, Ceylon.

No.	Tare.	Tea Nett.	Gross Weight.
No. 1	27 lb., 3 oz.	99 lb 12 ozs.	126 lb. 15 ozs.
Nr. 2	28 " 1 "	100 " 13 "	128 " 14 "

## Customs Weights, London.

Gross Weight.	Tare.	Tea Nett.
126 lb.	28 lb.	98 lb.
128 "	29 "	99 "

The Customs do not recognize ounces. With regard to example 1, this package, the gross weight of which the Superintendent makes 126 lb. 15 oz., would only be called 126 lb. in London, the tare, according to the Superintendent, is 27 lb. 3 oz., over here the 3 oz. would be called 1 lb., and the tare is called 28 lb. The 28 lb. tare is deducted from the gross weight of 126 lb., with the result that the amount of tea in this package is said to be 98 lb., the owner of the estate losing the 1 lb. 12 oz. tea which may quite possibly be in the package.

A still larger loss is to be seen in example 2, in which the Superintendent has packed 100 lb. 13 oz. of tea, but only gets paid for 99 lb., the difference going into the pocket of the retailer.

6. A most important point is to have the weights of the weighing machines, used on the estate, constantly checked, and for this purpose a set of test weights should be kept. A beam scale is to be preferred to a platform one, as the former is the more accurate.

7. When a Superintendent, to equalize the tares of his packages, adds pieces of lead or wood for that purpose, the material so added should be fixed inside the package, so as to prevent it falling out when the package is opened in London.

8. A Superintendent may "tare" and pack his teas with the greatest care, but if he afterwards permits his carpenter to plane away from the top of the package before nailing down, all his careful work be wasted. The Metropolitan bonded Warehouses, Limited  
Crutched Friars,  
London, June, 1898.

SCHOOL OF TROPICAL MEDICINE.—A school of tropical medicine has been founded in London, with headquarters at the Seamen's Hospital, Victoria and Albert Docks, E. The class-rooms, &c. (now in course of erection), will not be ready until October of next year, by which time the constitution and curriculum of the school will have been formulated.—*Chemist and Druggist.*

## THE WYNAAD TEA COMPANY, LIMITED.

The following is from the report to be presented at the fourth annual meeting of shareholders, to be held at No. 20, Eastcheap, at the office of the Ceylon Tea Plantations Company, Limited, on Monday next:—

The directors, in presenting to the shareholders the profit and loss account and balance-sheet for the year ending April 30, 1898, have the pleasure to report that the Peringodde Estate, purchased from Mr. R. K. Walker, has been duly transferred to the company, and that, on the other hand, the sale of the Nelimunda Estate, sanctioned at the extraordinary general meeting, held on May 27 last, has been carried out, and the purchase money, R45,000 remitted to London. The operations during the past season have mainly consisted in the erection of the tea factory, the cultivation and extension of the acreage under tea, and the up-keep of the company's coffee and cinchona. The company is now provided with a first-class factory, fully equipped, and capable of turning out 250,000lb. of tea per annum. The crop of coffee and cinchona harvested during the season 1897-98 has only yielded a net income of £1,071 17s 9d, a small amount of pepper, and a first shipment of tea, making up the total to £1,093 11s 2d. Prices of coffee and bark have ruled much lower than in previous years; the coffee crop only amounted to 11½ tons, and realised 6s 3d per cwt. net. The amount charged to revenue account being £2,723, there is a loss of £1,629 13s 10d carried forward to the debit of profit and loss. Under these circumstances the directors regret they are unable to recommend a dividend for the past season. The prospects for the season 1898-99 are much brighter, the coffee crop, estimated at 35 to 40 tons, has been sold to arrive at 78s per cwt. cost freight and insurance, and the pepper crop, chiefly from Peringodde Estate, estimated at 15 to 20 tons, at £45 10s per ton, landed terms; besides which regular shipments of tea have now begun, and 50 chests are advised as being shipped this month. The directors, therefore, hope to have a balance as the result of the 1898-99 season to the credit of profit and loss account. Owing to the large outlay on the factory and on the young tea on Cootacovil and Chundale debited to capital account, together £4,521 11s 11d, the company is still considerably in debt, after deducting the amount of about £3,000, realised by the sale of the Nelimunda Estate. The directors are anxious to reduce the debit balance as soon as possible by the issue of the remainder of the preference shares, amounting to 3,937, reserving the issue of the balance of the ordinary shares, numbering 6,552, for a later period. The above-mentioned heavy outlay is now drawing to a close, and as the area under tea, which comprises 550 acres, is gradually coming into bearing, the annual returns should show a gratifying increase during the next few years. The directors trust that the shareholders, who have done so much for the company in the past, will come forward once more to take up the remaining preference shares, the intrinsic value of which is about £2, taking the value of the company's property cultivated and available for cultivation at over £30,000. Under the new arrangement with the Ceylon Tea Plantations Company, Limited, Sir William Johnston has succeeded Mr. F. A. Labouchere as secretary, and the London expenses will be considerably less than during the past season.—*H. and C. Mail*, Dec. 16.

THE "PRODUCE MARKETS REVIEW"  
AND THE TEA TRADE.

To the Editor of *The Home and Colonial Mail*.  
SIR,—The articles which you have lately quoted from the *Produce Markets Review* deserve attentive consideration. The writer is a high authority in the branch of trade with which he is connected—and if all his conclusions cannot be accepted, we may welcome his independent attempt to explain what no one else has yet been able to account for—viz., the continuous decline in the value of tea. It is im-

possible to maintain that overproduction is the cause in face of the fact that between June 1, 1890, and June 1, 1893, we used more tea than was imported. In the interval Indian tea declined 2d and Ceylon tea 3d per lb. in average value.

The position at the moment is perfectly anomalous. Trade is good; there is abundance of capital at command of buyers, owing to the resources of the large joint stock companies which now handle tea. Statistics are unusually favourable, and yet prices for most kinds stand at almost the lowest point on record. All experience of the relationship which supply and demand bear to sterling value is contradicted.

Now the writer of the articles tries to find reasons, and he suggests two principal causes for the depreciation of value. 1. The excessive number of separate samples put upon the market by producers, who will not take advantage of the Customs' permission to hulk together in the London warehouses the small invoices which it suits them to send down from factories. 2. The system of what is, practically, forced public auction as the only medium of business between seller and buyer.

To anyone familiar with the practical working of the public sale system *under present conditions*, instability of value seems to be the natural and inevitable result.

His diagnosis of the complaint leads him to suggest remedies: 1. By reducing the assortment of the leaf, in order to put upon the market much larger lines and a greatly reduced number of separate samples. 2. To resume sale of tea by private contract as an alternative to the auction room. The first proposal has been made by London brokers year after year, but without much effect. The second suggestion is a new one, and if it would effect what the writer has in view—viz., the rehabilitation of the wholesale dealer as such, the result would probably be beneficial. Of late years the market has suffered from the successful efforts of four or five enterprising and wealthy firms of comparatively modern origin to get the bulk of the trade into their own hands. Upon their action the strength or the weakness of the market now depends. There is sound sense in the argument that producers would benefit if the buying powers of the trade were more diffused and contingent profits more widely distributed. The debatable point is whether facilities for buying privately will set the wholesale dealers on their legs again, for they surely cannot expect to enjoy them to the exclusion of their modern supplinters.

But I am not writing in order to debate, but to induce importers to consider the points raised; and I will conclude with a hint to those who desire that sales by private treaty should be resumed. They must meet sellers in a businesslike spirit, take wider views than some buyers do, and not haggle over the farthings; and they must be prepared to hear with equanimity of transactions to which they have not been parties. The essence of such business is its privacy. It would have been developed years ago if it had not been for the obstacles raised by the dealers themselves, owing to their jealousy of each other.—Yours, &c., A SELLER.—*H. and C. Mail*, December 16th.

## INDIAN TEA ASSOCIATION (LONDON.)

The following is an abstract of the proceedings of a meeting of the committee held on December 13:—

Present:—Mr. D. Cruickshank (in the chair), Messrs. A Bryans, R Lyell, J Riddell, A G Stauton, and W H Verner.

The Secretary read the notice convening the meeting; Minutes of last meeting, held on November 29, 1898, were read and confirmed.

Correspondence with Mr. Blechynden (New York), and with Calcutta, which had been previously circulated to members, was laid upon the table.

## INLAND STEAMER AGREEMENT (AMENDED).

After discussion it was decided to recommend members to accept the new agreement as revised,

subject to the omission in clause 3 of the words in the second line "on and after the 1st March, 1899."

The draft circular as submitted to the committee was approved of with the addition proposed by the secretary

#### DUTY ON TEA.

Read letter from the Ceylon Association of the 8th inst. with copy of resolution on this subject passed in Ceylon, viz.: "That the committee is not yet sufficiently convinced of the desirability of reduction in the tea duty in England to induce the committee to take up an agitation on the matter at the present time."

It was noted that a duty of five cents per lb. of tea is expected to be imposed in Canada, where British Indian products enjoy a preference of 25 per cent.

Copy of the Government publication on "The Cultivation of Tea in India" and copy of the proceedings of the meeting of the Calcutta Association of November 7, copies of which had been circulated to members, were laid upon the table.

ERNEST T'YE, Secretary.

—H. and C. Mail, Dec. 16.

### RECENT IMPROVEMENT IN MR. W. JACKSON'S TEA MACHINERY.

Several improvements which cannot fail to commend themselves to planters have recently been made in Mr. Jackson's tea machinery.

In briefly referring to these we may point out that the 42-in and 72-in Venetian dryers, 1898 pattern, are from new designs and patterns throughout. These dryers are specially made when required with a covering to the trays to adapt the machines for the final firing of the finest of assorted teas. The adoption of this system does not to any material extent detract from the capacity of the dryer as a dryer of fermented leaf. These machines are specially adapted as auxiliary dryers in large factories for the final firing of small or light teas, or for finishing teas three-quarter dried in larger machines.

The patent Paragon tea-dryer machine, medium size, has been specially designed as an automatic dryer "for small estates," where the employment of a larger paragon would not prove remunerative. It has been designed on similar lines to the well-known paragon dryer, and embodies a number of improvements, bringing it up to date in every way. This particular machine, however, has no mechanical feeder, the leaf being simply scattered by hand on to the small endless feeding web with solid gill plates which delivers it on to the large perforated trays. An adjustable shutter, which can be instantly raised or lowered to admit a larger or smaller quantity of leaf as may be desired is provided to regulate the thickness of the feed. The endless webs are six in number, and are arranged to turn the tea over five times during the drying process, thus thoroughly exposing the leaf to the current of air—a very important matter in drying all classes of leaf. There are five speeds on the driving belt cone pulleys, which bring the treatment of the leaf under perfect control. The gear wheels are made from machine-cut iron patterns, and are protected by strong guards. There are also a number of improvements in connection with the exhaust fan and the air heater which will doubtless commend this machine to the practical tea maker. The approximate capacity of the machine is 180 lb to 220 lb, but this naturally depends on the nature of the leaf, the weather, and the temperature. The machine, when required, can be equipped with perforated trays specially adapted for final firing. When used as a final firing machine alone, the patentee recommends differential speed gear for driving the fan. The details of the machine generally have been carefully worked out, and the machine will doubtless give as good satisfaction to the tea maker as the larger machines have done.

We have recently had an opportunity of inspecting one of Mr. Jackson's rotary tea breakers, which have

been specially designed by him for the purpose of reducing or "breaking down" large tea previous to sifting, or the larger leaves after assortment. In this machine the tea is forced through mesh-wire of any required size. The mesh-wire is fixed in the under table, and can be quickly changed when desired. The tea is placed inside the upper moving shell, which has a grating in the bottom of it, the movement of which automatically forces the leaves through the fixed mesh-wire. An adjustable dust sieve is placed underneath, and is suspended from the moving shell by four hangers. This machine is calculated to reduce or break from about 320 lb to 480 lb of tea per hour, according to the quality and condition of the leaf fed into it. Merely nominal power is required to drive this little machine, which is calculated to render good service to the tea maker.

Mr. Jackson has recently introduced a new tea packer, which he claims possesses some remarkable and unique features. It is simple in construction, very substantial, and the working parts are reduced to a minimum. The machine platen on which the chest is placed is mounted on angular bracket-shaped steel springs without any joints or links, and to the platen is imparted a very fast vibrating motion. This motion being in a true plane, it imparts a like motion to the tea in the chest, right up to the top, until the chest is full, without any risk of shaking the tea over the top edges of the chest. No pressure of any description is put on the tea during the process of packing, hence immunity from breaking or crushing the leaf or making dust. Samples taken from the top, middle, or bottom of the chest are all even, showing perfect regularity of packing. The machine is fitted with fast and loose pulleys, 8 in. diameter, and the speed is 750 revolutions per minute. Size of belt required, 2½ in. The power required to drive the machine is nominal.—H. & C. Mail, Dec. 16.

### TEA CHESTS.

#### A NEW AND UP-TO-DATE PACKAGE.

(From a Casual Correspondent.)

Ever since the soft sheen of the coffee leaf gave place to the harsh and dark green leaf of the tea bush, the Ceylon tea planter has been exercised in his mind as to how and where to find tea chests. As a matter of fact, the bulk of the forest trees were lying about, as it were, the coffee clearings, before the newer product came into being, gradually from "Hal," "Milla," and "Mallaboda," to "Kekuna," "Mangowood" and other baser kinds, has the tea planter been using up his supply.

It is odd to think that the vast reserves of virgin forest, spread in countless acres at his feet, as it were, is yet far out of his reach. It cannot pay to transport the timber along jungle paths from the heart of the vast lowcountry jungles, and so it came about that the Ceylon planter, who ever comes up smiling from his every difficulty, was obliged, in time, to depend upon other countries for the supply of his tea chests. The wild peach tree of Japan (Momi wood of commerce) has been for many years his best friend, but the Japanese have lately become alive to the fact that their supplies are not limitless. The annexation of Formosa necessitated the importation of thousands of standards of this soft and aromatic timber, and so the planter received due warning by increased prices and irregular supply that this reserve too was becoming a closed one to him. Sweden and Norway, who for many generations have sent over "caseboards" to the British Islands was now drawn upon very largely, but it is a curious fact that, with perhaps two exceptions, the great Saw Mills of this vast Peninsula, did not rise to the occasion, and, in my opinion, the white-wood tea chest, as turned out at Christiania and the Baltic Mills, are not entirely suitable for the carriage of tea, which is after all green vegetable stuff!

I pass by the metal packages, which have been of many types, and which, though "backed" by wealthy combinations, have never quite satisfied the

require neuts of the trade, partly because they are so difficult to get rid of by the retailer. It seemed now as if most of the supplies were exhausted, and the Planter, in many cases, dropped back upon native chests, but the contractors could not grow the timber, and had to rely upon inferior growths, the result of which was, and is that, for some time past, there has been a cry of "cheesy" teas,—an appalling and lamentable effect of some oiliness in the wood. Then it was that "Vencer" of three-ply was thought of for tea chests, and many thousand ingenious packages have been thrown upon the Colombo market. Success for the time being crowned the efforts of those responsible for those packages, but, in my opinion, strong, light and beautiful as Vencer undoubtedly is, no material of this nature of less than a quarter of an inch in thickness is capable of withstanding the rough usage that full-sized tea chests are undoubtedly exposed to in transport, lading, and delivery over the ship's side.

Now my object in touching upon this subject is to send you a *New "Vencer"* package, which, as far as I know, meets the tea growers requirements in every respect. This package is called "The Colindia". The wood is cut from Canadian maple, the cement—which binds the ply together—is a secret composition, the thickness of the material makes the strength of the box equal to an inch plank in resistance. It is extremely light and packs in its outer case as snugly as a box of child's bricks. You will see the sides are made strong, rigid, and waterproof at the corners, by a continuous steel fistener (patented) which is held together by clenched nails. The bottom is very strongly attached, as the nails are driven into an oak batten, which is, in turn, clenched on. The tea cannot come into contact with any wood, the lining being welded and whole. The tare, a most important matter, is perfectly even, the lid easily removed, and its lightness and compactness for shipment saves a power of freight!

These packages are being sent out to Colombo and Calcutta in large quantities, eleven complete "Colindians" with two extra ends, nails and instructions complete being sent in every outer chest, which, when empty, is ready for use as a tea chest.

I suppose an advertisement will appear in your paper in due course, giving prices and agents names, &c.; but I would ask you to pass your own judgment upon this package, sincerely wishing it "bon voyage," and a speedy return to the old country filled with and preserving in good condition your excellent teas for the thirsty British millions.

I would only add my own best wishes for Ceylon's continued prosperity, and a Happy New Year to yourself and all old friends.

## THE CRYPTO GAMIST'S REPORT ON THE CACAO DISEASE.

(Communicated by a Practical Planter.)

At first glance the perusal of Mr. J. B. Carruthers' concluding report on the cacao fungi, the result of twelve months' careful observation and experiment, appears extremely satisfactory. The life history of the fungi has been traced, the causes which favour their growth are related in detail, the time of year at which they are most prevalent pointed out, and the period when remedial measures can be most successfully employed clearly stated. It would seem to be impossible for those interested in cacao cultivation to require any further help.

But further consideration tends rather to show that, though the cryptogamist's work has been so thorough, we are still very far from being able to say that the cacao enterprise is saved from

the extinction which threatened it. The more sanguine amongst us may be misled perhaps by our own success in applying remedies over a limited area; others may point triumphantly to the export figures as proof of the disease having been already reduced; such hopes are delusive. The mere adoption of remedial measures on some estates, with the consequent more careful cultivation which these entail, should naturally result in a larger yield of crop from the healthy trees and so balance the loss entailed by the destruction of those diseased. The last experiments made by the cryptogamist, even if they prove the bark fungus and the pod fungus to be totally distinct species and not only varieties produced by the difference of the food they prey upon, only point to the necessity for the very closest attention to the first appearance of disease on either the tree or the fruit, since the canker in the bark may very rapidly produce disease in the pods.

We are not told on how many estates remedial measures are now being employed: it is much to be feared that very many planters still neglect to incur either the necessary trouble or expense. And how few have the courage to fully adopt the advice given as to the removal of superfluous shade, or even to attempt by better draining to get rid of excess damp?

Mr. Carruthers tells us very clearly how easily the disease is spread from one place to another by various agencies—wind, rain, insects, etc.—and in many cases through dead branches and stems being thrown into streams and carried away to estates below. To these agencies must surely be added the clothing of coolies. It will thus be seen that, even if all planters worked together to combat the disease, the task involved is one requiring both intelligent care and prolonged perseverance. And, inasmuch as there are men amongst us whose ideas of cacao cultivation are limited to the gathering of as much crop as possible with the smallest expense necessary, and who are more penurious even than the much-despised villager, it is clear that no permanent impression can be made on the disease without legislative compulsion. And when we consider the very large amount of cacao grown in every district, in the hands of natives, fully half of which is maintained merely as a cloak for concealing their habitual thefts from neighbouring estates, it is obvious that Government interference will have to contend with widespread opposition. The cryptogamist mentions the case of a native garden, entirely destroyed by the fungus, in which the trees had been left standing and had infected an adjoining estate. This is a type of what may be expected all over the island, wherever cacao has at any time been planted.

The suggestions made as to planting seed from spring-bearing trees, so as to reduce the pod disease which is most severe in the later and wetter months, and as to the cultivation of the hardier types of Forastero cacao deserve most careful attention. The advantage of having crop to ripen in the sunny months, when the drying of the beans in the open air would result in improved prices, is so obvious that it is surprising the plan has not been before this generally adopted. As regards the planting of Forastero, the writer in January last called attention to the disease having attacked some of the Forastero trees growing in the Henaratgoda Botanic Gardens, and it is evident that very careful selection of

seed will be necessary. But unless vigorous measures are adopted to exterminate the disease, these proposals for improved cultivation will lose a great deal of their value, and the Planters' Association should at once call upon the Government to lend its support.

### TEA AND TEA-DRINKERS.

EXTRACT FROM "A CHRISTMAS CUP OF TEA" IN THE FIRESIDE CHRISTMAS NUMBER.

One of the first tradesmen in London to publicly advertise the sale of tea was one Garraway, whose coffee-house, at the close of the seventeenth century, was in the neighbourhood of the Exchange. His wares included tea, coffee, tobacco, and—as usual then in coffee houses—many quack medicines. Garraway issued a handbill in praise of his tea, which is a curiosity of early commercial advertising. It ran thus:—"Tea in England hath been sold in the leaf for six pounds, and sometimes for ten pounds the pound weight, and in respect of its former scarceness and dearness it hath been only used as a regalia in high treatments and entertainments, and presents made thereof to princes and grandes till the year 1657. The said Garraway did purchase a quantity thereof, and first publicly sold the said tea in leaf or drink, made according to the directions of most knowing merchants into those Eastern countries. On the knowledge of the said Garraway's continued care and industry in obtaining the best tea, and making drink thereof, very many noblemen, physicians, merchants, &c., have ever since sent to him for the said leaf, and daily resort to his house to drink the drink thereof. He sells tea from 16s to 50s a pound." Mr. Garraway understood the art of puffery almost as well as a modern manufacturer of soap and pills. It is to be feared that the allusion to the many noblemen and gentlemen who patronised his house in order to drink tea was something of a flourish. Coffee was a masculine drink long before tea was much used by men. Henry, Earl of Clarendon, noted in his diary of 1637 that "Père Couplet supped with me, and after supper we had tea, which he said was really as good as any he had drank in China." But, as the elder Disraeli long ago remarked, if his lordship had been in the habit of drinking tea, he would hardly have noticed this particular occasion in his diary. We can but admire the courage of the two men in drinking tea after supper. Insomnia had not been heard of in those days.

The seductions of tea gradually conquered masculine prejudice. Men began to brave the cry of "milk-sop," and to realise that a cup of tea was an excellent thing. Colley Cibber, early in the last century, talks of tea as an innocent pretence for bringing men and women together in a morning. The fragrant beverage evidently promoted sociality, and then, as now, checked excess. Some tea-drinkers, however, in their love for the infusion developed new excesses. Dr. Johnson is the familiar example of the excessive tea-drinker. He was a shameless bibber of tea. When Jonas Hanway—the man who first had the courage to carry an unfurled umbrella in the streets of the metropolis—published an attack on tea, in which he denounced it as a dangerous custom—pernicious to health, obstructing industry, and impoverishing the nation—both Goldsmith and Johnson entered the lists against him. The author of "The Deserted Village" made fun of Jonas in the pages of the *Monthly Review*, while the doctor hit him heavy blows in the *Literary Magazine*. In the course of his trenchant review, Johnson described himself as "a hardened and shameless tea-drinker, who has for many years diluted his meals with only the infusion of this fascinating plant; whose kettle has scarcely time to cool; who with tea amuses the evening, with tea sojourns the midnight, and with tea welcomes the morning." One stands amazed at the doctor's powers of digestion; though the tea doubtless had something to do with his hypochondriacal troubles. Yet the tea-drinking hero lived to the age of seventy-five. There were giants in those days!

### THE INDIAN TEA ASSOCIATION.

#### THE GREY BLIGHT IN TEA.

The London Secretary forwarded, for the opinion of the Committee, copy of a letter addressed to his Committee by Messrs. Alex. Lawrie and Co., on the subject of tea blights, in which they referred to "The Pests and Blights of the Tea Plant" by Dr. Geo. Watt. They specially drew attention to a blight named "The grey blight" which, according to Dr. Watt, is one of the most destructive and dangerous of blights to which the tea plant is liable. As there was no good remedy known for this disease, Messrs. Alex. Lawrie & Co. had suggested that the Calcutta Association should take up the question of appointing a scientific expert to investigate blights. It was decided by the Committee that a communication should be addressed to the Assam Administration on the subject, enquiring if Government could see their way to assist the Association with funds, with a view to the appointment of such an officer.

At the first meeting of the Joint Committee of members of the Indian Tea Association and the Ceylon Association to consider the subject of duty on tea in England which was held in London, the question of a reduction of duty on tea was thoroughly considered. Considerable difference of opinion was expressed as to the advisability of any action being taken, as it was pointed out that the present tax of 4d per pound on tea constituted a heavier imposition on China than on British-grown teas. It was ultimately resolved that, as the Ceylon representatives had received no instructions on the subject from Ceylon, it was inadvisable to take any action at present in the matter.

Mr. Blechynden, who advised his arrival in New York, reported that business so far as tea was concerned, appeared to be absolutely dead for the present. The reason was owing to the uncertainty as to the duty question, an agitation being on foot to remove the war tax now that peace had been proclaimed. He considered that until something definite was known there was small chance of revivifying the business. Mr. Blechynden again brought forward the question of the manufacture of "Oolong" teas in India, as several enquiries had been made on the subject. He urged that systematic experiments should be made with teas of different districts, so that the Indian Tea Association could get some of the trade that Ceylon was pioneering. He considered that "Oolong" teas would be used as substitutes for higher priced Japan teas, and would go in blends with China teas; and he thought that although these teas might not sell well for by themselves at first that might come after experience, and the gradual education of taste, by the blenders increasing the use of these teas. The General Committee, after considering this subject, were of opinion that it would not pay the great majority of gardens to go in for "Oolong" teas. One firm had sent samples to New York, which were approved, but when rolling with machines was tried the quality was much inferior to the sample made by hand. This firm had, however, sent a shipment to America. It was generally agreed that "Oolong" teas might be satisfactorily manufactured with hill teas, but it was impossible with teas grown on the plains. Apparently Mr. Buckingham's green teas, and the reports thereon by local brokers and by Messrs. Gow, Wilson and Stanton were ignored or forgotten. Mr. Buckingham has certainly made "Oolong" in the plains—at Anguri. Some firms were making experiments with a view to see if they would be likely to succeed in the manufacture of this class of tea. The Secretary was instructed to inform the Secretary of the London Association that one or two firms were trying to make Oolong teas, and that a few small shipments had already been sent home.

The Secretary reported that the amount of contributions promised to the American Market Fund was \$1,02,031-13-6.

A letter from Mr. Shirley Tremearne, Official Agent of the Western Australian Mining and Industrial Exhibition, was considered, in which he handed prospectus of this exhibition, which was to be opened next March in Coolgardie, and suggested that, with a view to further pushing the sale of tea, the tea industry of India should be represented thereat. The Committee considered that very short notice had been given, and that it would be difficult to avail themselves of Mr. Tremearne's suggestion, especially seeing that the end of the season was at hand. At the same time, however, the Secretary was instructed to send out a circular to Agents of all tea gardens, asking them to send samples for exhibition.

With regard to the resolutions passed by the Darjeeling Planters' Association Committee on 10th September, which were referred to the General Committee by the Darjeeling and Duars Sub-Committee for settlement,—as follows:—

"That this Association protests against the present contraction of the Calcutta market, as prices realized there for teas from this district compare most unfavourably with prices in London.

"That this Association also protest against the way in which teas are characterized and run down by Calcutta Brokers when the market is low.

"That a copy of this resolution be sent to the Indian Tea Association with a request to ascertain whether the Selling Brokers are also Buying Brokers, and, if so, whether steps should be taken to put a stop to this."

The Committee considered that the statements made by the committee of the Darjeeling Planters' Association were very sweeping and general in their nature. They thought that an assertion such as that contained in the second resolution should not be made unless accompanied by specific instances sufficient to warrant it, and that until some proof of the statement (which was not borne out by the experience of the committee) was submitted, it was unnecessary to make any enquiry in connection with the subject of the three resolutions. The Secretary was instructed to address the Honorary Secretary of the Darjeeling Planters' Association to this effect.

Messrs. Lyall, Marshall and Company's proposal to work the disposal of tea dust among the poorer class of Natives, and enquiry as to the terms upon which the tea was to be given to the Indian Tea Supply Company, was considered; and the Secretary was instructed to reply that the idea of the committee was that tea dust should be delivered (if it appeared hereafter that gardens were disposed to subscribe thus in kind) to them for cost of freight and packing, in order that it might be disposed of among the poorer class of Natives at a purely nominal cost.—*The Planter*, Dec. 24.

**SPEED CALCULATION FOR CYCLISTS.**—A simple method, says the *Engineer*, for a bicycle rider to determine at what speed he is riding is to count the number of revolutions made by the crank in eighteen seconds; multiply this by the gear and divide by one hundred. The result will be in miles per hour. For instance, say that the crank makes 20 revolutions in 18 seconds, and that the bicycle is geared to 60 then  $\frac{20 \times 60}{100} = 12$  miles per hour. This is a calculation that can be made by the cyclist mentally at any part of the ride, but the difficulty will be to average one's speed during a ride by simply counting the number of revolutions for only 18 seconds of time. The intimate connection between brain and muscle will, I fear, vitiate even the calculation itself, no matter how accurately the rider may time his revolutions. Watching the hand of a stop watch, for instance, will insensibly increase the revolutions as the pointer approaches the 18 seconds limit. But as a species of mental gymnastics the idea is not a bad one.—*Pioneer*,

## THE TEA CORPORATION, LIMITED.

Our old friend Sir Charles Lawson—whom we recall when a merehant at Cochin before his long and honorable connection with the Madras press—has begun to take a special interest in the Tea industry of Ceylon in consequence, apparently, of his holding shares in the Tea Corporation, Limited. He has succeeded in getting a Committee of Enquiry into the management of the Company for the first year, a proposal in which the Directors readily acquiesced, having nothing to hide and not much, we fancy, to reveal beyond what appeared in their Report. The press of Ceylon has been asked to throw light on the working of the Company, and especially on the remarkable discrepancy between the financial anticipations and results for the first year. But we cannot see that there is much to explain. It may be that the estimates of dividend were, at the time they were framed, a little too sanguine; but there is clearly much excuse for the Directors as to the non-realization of a dividend in the fact that certain properties were not given over at the date fixed and in the remarkable difference in the cost of the tea before and after that period. Then the uniform prevalence of high exchange and the continuance of dear rice, no Directors could foresee; while it is evident that altogether the Company did not get fair play during the first year of its existence. As regards the future, we can assure Sir Charles Lawson and the Committee of Enquiry that they could not have a more reliable Ceylon Manager than the gentleman in charge of their properties, well seconded as he is by experienced Colombo Agents and by a staff of Superintendents who—so far as we know—are as hardworking and efficient as any in the island. As to the Corporation's properties, we are not in a position to say whether too much was paid for them in view of adverse exchange and a general tendency to fall in the price of tea; but the estates themselves are well-thought of and mostly situated in good tea districts. Our advice therefore to Sir Charles Lawson and other naturally critical if not impatient shareholders, would be to "possess their souls in patience" and to await the result of a full year's fair trial of the working of the properties under present management.

## THE TEA PLANTERS' NEW BOGEY.

(From the *Saturday Review*, Dec. 10.)

Tea planters in Ceylon are confronted with a new bogey in the guise of *Orthesia insignis*. This entomological curiosity derives its title from a Frenchman named Dorthies, who seems to have discovered and classified it towards the close of the last century. It traces its descent from the family of *Coccidæ*, but belongs to the homopterous, as opposed to the hemipterous, branch; that is to say, its wings are of uniform texture, unlike those of its half-brother, better known but known for worse, the bug, whose wings are partly hard and partly soft. It is a small scale insect, covered with a white, waxy secretion, and varies in length from one-eighth to a quarter of an inch. It is appallingly prolific. The male has wings, but the female is apterous. At present it is reported to have specially attacked lantana, for which it deserves our thanks, and, so far, has done little damage to tea. So we may hope that no more will be

heard of the pest, as it generally confines itself to one species of plant. There is no record of this insect in Sir Emerson Tennant's exhaustive book, and the natural history collection of the British Museum do not contain a specimen.

#### TIMBER TEA CHESTS COMPANY, LTD.

The following prospectus has been issued:—Share Capital £8,000. Divided into 8,000 shares of £1 each. Present issue £7,000 of which £2,000 is now offered for subscription, payable 10/— on application and 10/— on allotment.

Directors.—\* Edward Ames, 52, Lee Terrace, Blackheath, S.E., James Lloyd Anstruther, Hyde Park Court, S. W., Ernest Henry Gregory, 83, Bishopsgate Street Within, E.C. Secretary (pro. tem) and Offices Theodore Hamilton Hoste, 22, Fenchurch Street. Solicitors.—King, Burrell & Marzetti, 77, Gresham Street, E.C. Auditors.—Singleton, Fabian & Co., 31, Nicholas Lane, E.C. Bankers.—London Joint Stock Bank, Ltd., Great Tower Street, E.C.

This Company is incorporated to carry out a Contract with the Ceylon and General Syndicate, Limited, to acquire and carry on an agency for the sale in India and Ceylon of Vener Tea Chests.

The purchase price to be paid by the Company for the above Contract has been fixed by the Ceylon and General Syndicate, Limited, who are the vendors and are selling at a profit, at £5,000, payable in 5,000, fully paid £1 Shares of the Company, leaving the sum of £3,000 in £1 shares to be subscribed for, and it is now proposed to issue 2,000 in fully paid up shares of £1 each, which is considered to be sufficient for the working capital.

The vendors will pay all expenses of and incidental to the formation and registration of the Company up to allotment.

The following contracts relative to the said Agency and the acquisition thereof by the Company have been entered into:—

An agreement dated the 28th day of October, 1893, and made between William Cuthbert McCallum and Peter George Stanhope Payne of the one part and Edward Ames of the other part.

An agreement dated the 1st day of November, 1893, and made between the said Edward Ames of the one part and the Ceylon and General Syndicate, Limited, of the other part.

An agreement dated the 2nd day of November, 1893, and made between the said Ceylon and General Syndicate, Limited, of the one part and James Bennett, as Trustee for and on behalf of the Company, of the other part.

Application for shares should be made on the form accompanying the Prospectus, and can be sent to the Company's Bankers with the amount payable on application.

If no allotment is made the deposit will be returned in full, and in case the number of shares allotted is less than the number applied for, the balance will be applied towards the payment on allotment.

Dated this 21st day of Nov., 1893.

PLANTING IN SOUTHERN INDIA.—Writing from the Coimbatore district about the end of the year, Mr. E. J. Martin formerly of the Kelani Valley, reports:—"We have some magnificent soil and a fine climate and I am much pleased with the land and climate up here, after the Kelani Valley. I have several Sinhalese here who are felling and are quite happy and contented. Being a new district we have many difficulties to contend with, one especially being transport; but, a cart road is being pushed on as fast as possible and the engineer's only difficulty is that he can't spend the money fast enough."

\* Will join the Board after Allotment.

#### TO COFFEE PLANTERS.

We (*Rio News*) have received the following letter from an experienced coffee estate manager in Ceylon, who desires an engagement in Brazil. As some of the new undertakings may wish such a manager, we give such parts of the letter as will show his capacity and experience, and will gladly give his address to any one who may wish to correspond with him direct. Our correspondent, who writes 28th September, says:

"The enclosed newspaper cutting taken from the daily *Ceylon Observer* of yesterday's date\*,—a paper doubtless well known to you,—leads me to take the liberty of asking you if there are any Coffee companies, Brazilian, English or German, in want of the services of a thoroughly competent and experienced coffee planter,—one well up in coffee cultivation and curing in all its branches, and able to take up the entire management of a company's properties; and, should there be, I shall feel very much obliged if you could put me into communication with any such companies.

I may state that I have had 23 years' experience altogether as a practical planter in coffee and in other products, and hold first-class testimonials and can give first-class references if need be. I am thoroughly versed in all the technicalities of pruning and manuring coffee and in draining the land and roading it, and thoroughly acquainted with Coffee machinery and the erection of all necessary buildings; and I feel sure I could do a good deal, not only to improve coffee cultivation generally, but to raise the price of the cured coffee.

SIR W. JENNER AND "TEA."—We are much obliged to Mr. C. Tottenham—now on his way out to Ceylon—for drawing our attention to a paragraph in the *London Globe* of 13th December, containing Sir W. Jenner's experience of tea drinking. No doubt the deceased doctor took care to have his tea properly infused. We quote as follows:—

Tea drinkers can point to the life of the late Sir W. Jenner as evidence of the virtues of their particular beverage, even when taken to excess, for throughout his busy career the distinguished physician's sole stimulant was tea. He drank it with his lunch, he took it in his carriage while on his rounds of afternoon consultations, he drank it again at dinner, and tea was taken as a "nightcap." With many persons tea causes indigestion, but not so with the deceased doctor, for with his affection for tea was combined a love of the table. According to Dr. Cooper Bentham, who was his assistant for 15 years, he was "a great feeder." During those years from 1875 until his retirement in 1889 Sir W. Jenner made a large income averaging from £12,000 to £15,000 per annum, not counting exceptional fees. Dr. Bentham, in a communication to the "*Telegraph*," says the late Sir A. Clark boasted he once made £24,000 a year, but it was hard to understand how he did it. Sir William received two very large fees in the course of his practice, each of £5,000 and from Americans. He took as much as 1,000 guineas a day in country journeys. Sir W. Jenner, who was Physician-in-Ordinary to the Queen, attended the Prince Consort in his last illness, and brought the Prince of Wales safely through the attack of typhoid fever in 1871. We need merely add that Sir W. Jenner was 83 when he died.

\* The cutting is that of our note in reference to the "Coffee Planters Manual for 1893," compiled by Mr. J. Ferguson, of Colombo, Ceylon, which could be ordered through Messrs. Crashley & Co, of this city.—Eds. *News*,

## THE TEA CONTROVERSY IN AMERICA:

## CHINA vs. INDIA AND CEYLON TEAS.

New York, Dec. 2.

Editor of "The Journal of Commerce and Commercial Bulletin."

Sir,—Knowing your desire to have your representative paper give the public facts I again ask your indulgence.

The article which I sent you on November 3rd, making a plain statement of fact regarding the relative purity of China teas and India Ceylon teas, has provoked replies from those interested in advertising the latter teas in this country, and this was to be expected, as no one has hitherto come forward to refute their extravagant statements used to advertise their wares. For instance, I quote from an advertisement in your issue of October 26.

"Imports of tea from China and Japan are scarce, dear and bad, and are apparently at a standstill."

Comment on such a statement as this is unnecessary. The facts remain just as I then stated them, for it is absolutely true that the Formosa Oolongs and China Congous imported under our present laws are purer and of better flavor and quality than Indias and Ceylons. This fact should be known to consumers who otherwise might be led by the extensive advertising of foreigners seeking to introduce India and Ceylon teas here to believe that those teas were better. The quality of China teas imported here has improved very much during the last two years, owing to the inspection law and import duty, and I speak of the facts as they exist today and will exist in the future under our present laws.

That Ceylon and India teas have some merit and are desirable in blending is true, as, owing to the climate, soil and stuff used in fertilizing they have a rank growth and a correspondingly strong and rank flavour, which is usable to a degree when blending with China teas having a more delicate flavor and greater purity. Such celebrated medical authorities as Sir Andrew Clark and Dr. Hale White, of London, have pointed out the extreme amount of tannin contained in Indian teas and warned the consumers of its injurious effect upon the nerves, and advised them to use China teas and to be "satisfied with flavour and not desire intoxication."

While hundred thousands of dollars are being spent annually in this country to advertise Indian, Ceylon and Japan teas, my only purpose is to tell tea drinkers whenever such advertising becomes misleading, as it has lately, and is now. Mr. Blechynden's answer to my first statement is not to the point, as he wrongly assumes that I am defending Japan teas and colored teas from his advertising attacks. He will see by reading my article again that I spoke of comparing Formosa, Oolongs and China Congous with India and Ceylon teas, and no matter by what process of preparation the results are obtained the facts remain just as I stated them, that "the China Oolong and Congous teas are decidedly clearer in water and without the muddy liquor of the Indian and Ceylon teas, and are also of decidedly better flavor and quality." I will not answer the parties seeking to advertise their particular brands through the medium of correspondence in your column.—Yours truly,

E. A. WILLARD.

New York, Dec. 3, 1898.

Sir,—Although I am confessedly advertising India and Ceylon teas in America I ask the courtesy of your columns, as I desire to be put upon the same footing as those heavily interested in Japan and China teas, to whom you extend this privilege, and who thus advertise for nothing. I welcome the reappearance of Mr. Willard as one of your correspondents, as, to use his own expression no one else appears desirous to try and "refute the statements we make in advertising our wares." Let us see how much success attends Mr. Willard's own efforts in this direction. The correspondence originated with a letter from Mr. Wil-

lard reflecting on our advertising of India and Ceylon teas. To this I replied, challenging him to deny the main contention they contain, viz., that India and Ceylon teas are manufactured, by machinery, are uncoloured and unadulterated, and that Japan and China teas are rolled by hand—frequently by foot—and that the bulk of them which come to this country are artificially colored. To this he has made no reply, so that your readers may draw their own inference and see how much of refutation he accomplished. Mr. Willard now charges other correspondents with being interested in our advertising and with booming their own brands. Besides Mr. Willard and myself there have so far been five other writers, two of whom, Mr. Nicholson and Mr. Robertson, are importers of India and Ceylon teas, and are thus open to Mr. Willard's charge. The other three are Messrs. Eppens, Smith & Wiemann, Mr. Thomas Martindale and Mr. Jenks, who I need hardly tell the trade sell any tea their customers want. Many of your readers must, like myself, have been struck by the evident sincerity of the writers, and as for the jibe at brands, a simple statement of fact made by Mr. Martindale, that by adding India and Ceylon teas to one of his mixtures he has trebled its sales, is worth any quantity of loose generalities. I have further to point out that the advertising of India and Ceylon tea is of the most general character, and is intended to benefit the trade; there are now few if any firms who do not sell these teas, and consequently any one of them taking a part in this correspondence is open to the charge that they are interested. Even were this not the case it would be obviously unfair to debar those who import this tea and are the most familiar with the growing demand for it from stating facts known to them. If Mr. Willard attacks these teas he must expect to hear from the other side.

I will now reply to the charge that our advertisement saying that Japan and China teas were scarce, dear and bad, was wrong as a matter of fact.

According to Montgomery's return the shipments of these teas on the 1st of December, 1898, were 7 million pounds less than shipments to the same date last year. To this shortage has to be added the large quantity of rejections, which cannot be much short of another million pounds. Now, the shipments last season were considerably short of previous years, and it is clear that these teas are by comparison scarce.

The new tea law is admittedly excluding the most inferior teas, and by its action has put a premium on the stocks of unsaleable rubbish which has lain over from previous years, none of which would pass inspection now, and some of which has been in this country over twenty years, and was fit only to be consigned to the same destination as "salt which has lost its savor." Such tea was selling—when it could be sold—at, say, 4c per pound; it now brings 18c or 20c. It is dear and bad.

As to the statement that India and Ceylon teas owe their strength to the use of fertilizers it is absolutely at variance with the facts. The tea plant is found wild in its native home, India, and every tea-man knows that the "indigenous" and "hybrid" varieties of the plant are richer in the essential properties of tea than plants grown for centuries on the same soil under artificial conditions. The plants in China and Japan owe their very life to the domestic habits of the thrifty Mongolian, who preserves and carries to the field that which the caste and religion of the natives of India and Ceylon prohibit being touched. Night soil is the great fertilizer in China and Japan, and is absolutely unused in India and Ceylon, where the tea gardens flourish on practically virgin soil.

I could if it were desirable quote medical authority against the use of all tea, and especially against the use of green tea, but in this case India, Ceylon, Japan and China have a common interest in doing nothing which will reduce the already small consumption of teas generally in America.

I may, however, point out that the active principle of tea is caffeine, and India and Ceylon tea contain

sometimes as much as 4 per cent of this alkaloid, whereas China tea contains less than one per cent and Japan tea barely a trace, and that black teas contain less tannin than green trees. The fling at the advertising being done by foreigners is not much to the point, and is suggestive of the pot-house politics of an era happily passed away. Has not the Japan Diet voted a sum of money for advertising Japan tea in this country, and are Japanese less "foreigners" than Englishmen? The question of home production is not an issue at present.

Having I think, replied to all the points raised by Mr. Willard save that of comparative clearness of liquor, which I leave to the more able pens of experts, I wish to repeat my contention.

I maintain that all the green tea from China and Japan is artificially colored, and that not one single ounce of India or Ceylon tea is artificially colored. It is therefore ridiculous to say that any tea can be purer than those from India and Ceylon. In round figures some 87½ million pounds of Japan and China tea came into North America last season. Will any ohampion of these teas say what proportion of these teas was free from artificial coloring?—I am, &c.,

RICH'D BLECHYNDEN.

HEAVY TEA CROPS IN CEYLON DURING 1898:

MARIAWATTE, GAMPOLA; AND WARAKAMURE, MATALE.

We are indebted to Mr. Mascfield, Manager of the Ceylon Tea Plantations Co., Limited, for the appended return of the tea crops on the far-famed Mariawatte plantation, bringing up the information to the close of 1898. Mr. Mascfield remarks:—"You will notice that the rainfall was abnormally short, and this has affected the yield considerably." This is an experience common to most of our tea districts during the past year, and it is especially true of all plantations in the lower Kandyan valleys between Nawalapitiya and Matale, as we shall see from a Matale return later on. Meantime, here are the figures for Mariawatte, and although the crop for the whole estate has been short, it will be observed that for the now celebrated "101-acre field," the return of made tea was actually heavier per acre than in 1897, the average being as high as 1,073 lb.! The statistics for this field are now complete for fifteen years, and we suppose nothing in the history of tea cultivation in India can approach the high average yield for that period which amounts to 1133 lb. of made tea per acre. The return is as follows:—

MARIAWATTE ESTATE, GAMPOLA.

Year.	Made Tea.	a. r. p.	
		Yield of old Tea ...	101 1 0
	lb.	Yield per Acre.	lb.
1884	109,230	..	1,078

(Signed) D. M. SALMOND, Superintendent. Mariawatte Estate, Jan. 1st, 1899.

Of course, the continuously high return for the best field on Mariawatte, and the estate generally, is due to well-considered cultivation, judicious management and regular manuring. But there have been some wonderful returns from Ceylon tea gardens without any manure. To one of these, we allude in our latest "Hand-book and Directory," in Mr. E. Storey's Warakamure estate, Matale, which—in 1896 and 1897—gave 993 lb. and 1,066 lb. made tea per acre without any manure. But a dry year like the last, has made a woeful difference. Replying to our inquiry as to the experience of 1898, the Manager, Mr. H. Storey—who only returned to Ceylon at the end of December, after nine months' absence—writes:—

"In reply to your letter of 31st ultimo, re above estate's yield for 1898, I am sorry to say that it only turns out to be 720 lb. per acre. The unprecedented series of droughts during 1898 simply played havoc with Matale lower valley crops. If you will not my former reports you will see that my crop depended for big results entirely on rainfall—the higher the rainfall the higher the yield. 1896 and 1897 were at least 20 inches each year above our average rainfall, and the result was for each year, respectively, 993 lb. and 1,066 lb. per acre, without manure. During the latter part of last year, I manured some 60 acres, and am still manuring, as the tea has been rather weakened by the great drought. At present the tea looks first-rate as the manured portions are beginning to show up, and I intend to keep on with it now in case of future droughts. I only returned to Ceylon last week, after nine months' absence, and my 'locum tenens,' Mr. E. C. Anderson, had the 'pleasure' of grappling with the drought and its results, which he did successfully."

We congratulate the Messrs. Storey on their fine property—there are 264 acres in tea, besides some cacao and minor products on Warakamure—and we feel sure 1899 will show a crop exceeding 1,000 lb. tea per acre.

CEYLON TEA IN AMERICA.—The Ceylon Commissioner, Mr. Wm. Mackenzie, sends a lively letter this time to Mr. Lane as Chairman of the "Thirty Committee": it is devoted to some spicy criticism of editorial utterances at this end, some of them, as we said at the time, of an extremely foolish, short-sighted character. Our own share in Mr. Mackenzie's comments is comprised in his opening (third and fourth) paragraphs referring to Japan teas; and here we learn from the Commissioner—we believe for the first time—that, although it is true all green teas from Japan were artificially coloured (as we learned on the spot, in 1884), yet of recent years, there is a change for the better and natural green teas have been reaching America even from Japan. On the other hand, the price has increased and is increasing, of such superior teas, and there is the chance of our beating them in fair competition. We hope so.

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898 :—“ All the seeds done well, and now some of the plants from them are 13 inches high.” This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898 :—“ I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants.”

*For price, instructions and particulars, see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars, see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied

*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants** of Cinnamon, Nutmeg, Clove, Kolianut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes :—

MESSRS. WILLIAM BROS.

DEPARTMENT OF AGRICULTURE,

CAPE TOWN, 27TH JULY, 1898.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo Run at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,

(Signed) P. MACOWAN,

Government Botanist.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

*Agents in London :—*MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

*Agent in Colombo, Ceylon :—*E. B. CREASY, Esq.

*Telegraphic Address :*

WILLIAM VEYANGODA, CEYLON.

A.I. and A.B.C. Codes used.

## THE FERTILITY OF THE SOIL.

It now seems safe to formulate a few general principles as being sufficiently established to justify building upon them a scheme of horticultural management:—

1. The carbon of green-leaved plants is absorbed directly and practically exclusively from the atmosphere, through the medium of the foliage. At least, the soil supply of carbon is a matter of minor importance.

2. The oxygen of such plants is chiefly absorbed in like manner by the foliage or taken up by the roots in combination with hydrogen in the form of water; although a minor and comparatively unimportant source of oxygen and hydrogen may be found in the breaking up of nitrates and ammonia by nitrification.

3. The nitrogen of such plants is obtained invariably from the soil either directly from compounds of nitrogen with oxygen, hydrogen, or mineral or organic compounds—such as nitric acid, ammonia, nitrates and humus; or indirectly through symbiotic growth of micro-organisms living in the soil, which have the power of assimilating the free nitrogen of the atmosphere; this symbiotic growth being apparently confined almost altogether to leguminous plants.

4. The mineral constituents of such plants are taken directly from the soil, being absorbed by the roots in the form of solution in water.

5. The ten or more mineral elements found in the ashes of plants are furnished in abundance by practically all fertile soils provided there be present a sufficient quantity of available phosphoric acid and potash, and sometimes also of lime.

6. The various elementary substances found in plants are combined with each other in certain definite proportions, varying for different species, but held within very narrow limits for each species; and the growth of the plant is measured and limited by the least amount of the various elements required for their growth.

Reducing these principles to the lowest terms, and stating them in general form, we may say that the plant will secure a full supply of carbon provided other nutrients are furnished; that the supply of oxygen and hydrogen is chiefly dependent upon the water supply; that the supply of nitrogen may be regulated by the use of mineral nitrates of ammonia salts, or the setting up in the soil of those conditions which favour the growth of nitrogen-working micro-organisms; and that having provided a full nitrogen supply, we may control the growth of the plants by giving or withholding phosphoric acid and potash.

7. The water-supply of plants is a matter of supreme importance, for not only does water comprise three-fourths or more of the actual weight of cultivated plants when growing, but it is the vehicle in which all the mineral and nitrogenous constituents of plant-food are carried to their destination. In performance of this function it is constantly passing through the plant, being absorbed by the roots and transpired by the foliage; it being estimated that more than 300 pounds of water must pass through the tissues for the deposition of a single pound of dry substance in the plant, and thus the question of the maintenance of the water-supply becomes one which cannot be neglected in the garden.

The nitrogen supply takes rank next to water in importance, for it is the ingredient which may be most quickly exhausted by an improvident system of horticulture, and which is the most expensive to replace by artificial methods.

When it is considered that the plant-food in the soil must be of very slow solubility, in order that it may not at once be washed away by heavy rains and artificial waterings, and when we reflect upon the observed fact that when we apply certain forms of soluble plant-food, such as superphosphate for instance, a large portion of it is immediately converted into an insoluble or very slowly soluble condition by reactions within the soil, it is absurd to expect to realize in the growth of a single season, or even in that of many seasons, the entire quantity of plant-food applied in manure.

But accepting the fact which seems to be demonstrated beyond question, that the entire amount of plant-food applied in a fertilizer will not be returned in one crop, the question arises, especially in view of the light which recent discoveries have thrown upon the methods by which the inert nitrogen of the soil is converted into assimilable form through the agency of nitrifying organisms, and upon the still more interesting problem of the assimilation of free nitrogen through the agency of symbiotic growth, whether we may not hope to be able to modify existing systems, and obtain the object in view more quickly and efficiently. — J. J. WILLIS, Harpenden. — *Gardeners' Chronicle*, Dec. 17.

## WYNAAD TEA COMPANY, LIMITED.

The fourth annual general meeting of the Wynaad Tea Company, Limited, was held at the company's offices, 20, Eastcheap, E.C., on Monday last. The chair was occupied by Mr. James Labouchere, chairman of the company.

The Secretary having read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, said: Gentlemen, I am sorry to see so few shareholders here today, but I trust that on the other hand it is a proof they have nothing very much to complain of, because, as a rule, shareholders only come in numbers when there are important items to be discussed. The report having been taken as read, the chairman explained that there were only really two great facts to register, one of them being the acquisition of the Peringodde Estate from Mr. Walker, and the other the sale of the Nelimunda Estate for 45,000 rupees—about £3,000. Both these moves on our part have been dictated by the policy that we should try to get our managing director in India to be interested to the greatest possible extent in the success of the company, and we have been able to do that in a very satisfactory manner by securing the Peringodde Estate for £2,500 in shares. The Peringodde Estate being situated between the two places where tea has been opened, we selected that estate to build the factory, which is now in the centre of our tea growing, and which will obviate the necessity of making a second factory on the Chundale Estate. The Nelimunda Estate was sold because we wished to reduce as much as possible the risk arising from the cultivation of coffee. As a result we have reduced our acreage of coffee, but we have till coffee enough to bring us in a fair income in fair seasons, yet not too much to risk a large loss if there were a failure of the crop. We have made enormous progress in the planting of tea, having planted altogether 550 acres, which is very good work in so short a time. On the other hand, we have not attained this result without a comparatively heavy outlay, although the cost of the tea per acre has not been high. On account of the amount of money that is due by the company we have decided to stop any further extension of tea for the present. But this question of further outlay is entirely subordinate to the necessity of finding further capital. In looking over the accounts you will see that we had a very poor

coffee crop last year, the amount obtained being £1,093 11s 2d, although the expenditure was no more than that of former years. This has raised the debit to profit and loss account to £2,634. It is with a view of reducing this debit balance and the large amount now due for the building of the factory and the opening out of the tea planting that the directors are anxious to issue the remainder of the preference shares. We have no definite plan yet to lay before the shareholders, but it is evident that either these shares will have to be taken up, or, as it has been suggested, the preference shares at 10 per cent. be altered to 6 per cent. cumulative preference shares. This plan is especially advisable because we are now getting into smooth water, for besides the coffee, cinchona, and the pepper we have on the property, we should have every year an increasing supply of tea. The first bill of lading for 3,970 lb is now to hand, and the production of tea for October amounts to 5,169 lb. The results up to the present are very satisfactory, and that when we meet in a year's time we trust we shall have a good report to show. The directors have sold the present crop of coffee, estimated at 35 to 40 tons to arrive, and have also sold the pepper crop, chiefly from the Peringodde Estate, estimated at 15 to 20 tons, so that with this and the shipments of tea we shall have a much better result to show for the current year.

The motion was seconded by Mr. Sanderson, who said that the company was giving the proposal to alter the character of the shares their very serious consideration. They proposed to alter the ordinary preference shares to 6 per cent cumulative shares. An action of this kind would put their company on a much better financial position. Before any definite steps were taken the shareholders would be called together.

The Chairman then moved the re-election of Mr. Chas. M. Miller as a director. This motion was seconded by Mr. R M Inman, and carried unanimously.

The auditors, Messrs. Lovelock, H W S Whiffin, and Dickinson, were then re-elected.

Mr. Sanderson then moved a vote of thanks to the manager and staff in India for the way in which they had done their work during the past season. They had had great difficulties to contend with in building the new factory, and he thought that they thoroughly deserved a hearty vote of thanks for the efficient way in which they met these difficulties. This was seconded by Mr. R M Inman, and unanimously adopted.

The meeting concluded with a vote of thanks to the chairman.—*H. and C. Mail*, Dec. 23.

### THE OTTERY TEA COMPANY OF OF CEYLON, LIMITED.

The annual general meeting of the Ottery Tea Company of Ceylon Ltd., was held at noon yesterday at the offices of the agents and Secretaries, Messrs. Lee Hedges and Co., Baillie Street. There were present Messrs. R H S Scott (in the chair), Messrs. W B Kingsbury, J A Julius, E M Shattock, and Lt.-Col. McComb, by his attorney Mr. E M Shattock.

The report submitted by the directors was as follows:—

The Directors have now the pleasure to submit to the shareholders their report and accounts for the year ended September 30th, 1898.

Owing partly to unfavourable climatic conditions, and also to a somewhat finer system of plucking which was adopted towards the end of the season, the crop has been considerably short of the estimated yield, the amount of Tea secured being only 152,978 pounds against the original estimate of 170,000 pounds. The tea has cost without manure cents 25.05, and has realised a nett average price cents 42.40.

During the year, a sum of £125 has been paid in further reduction of the mortgage, and this, together with the amounts previously paid, and the profit which has been derived from the favourable rate of exchange at which the mortgage has been reduced, has been transferred to a Reserve Account. From this account a sum of R2,500 has been spent on manure, and it is proposed to provide from the same source a further sum of R1,000 during the present Session.

After making provision for the interest on mortgage, &c., the balance of profit available amounts to R22,951.68. Of this sum R1,864.08 was absorbed by the payment of £125 in further reduction of the mortgage, and an Interim dividend of 3 per cent to March 31st has been paid, leaving a balance available of R12,147.60. From this it is proposed to pay a final dividend of 4 per cent, absorbing R11,920, and to carry the balance R227.60 to next account.

At an extraordinary general meeting held on the 24th June, 1898, it was decided that the Directors be authorised to enter into an agreement with the mortgagee to make the balance principal secured by the mortgage payable at twelve month's notice on either side, instead of by annual instalments of £500, and this was accordingly done.

In terms of the Articles of Association Mr. A. R. Wiggin resigns his seat on the Directorate, but being eligible offers himself for re-election.

An Auditor will also have to be appointed for season 1898-99.

It was proposed by the CHAIRMAN and seconded by LT. COL. McCOMB that the report and balance sheet be adopted.—Carried.

#### THE DIVIDEND.

Mr. E M SHATTOCK proposed and Mr. W B KINGSBURY seconded that a final dividend of 4 per cent be paid as soon as possible.—Carried.

#### THE DIRECTOR.

On the proposition of Mr. E M Shattock seconded by Lieutenant-Colonel McComb, Mr. Wiggin was re-elected a director of the company.

#### THE AUDITOR.

It was proposed by Lieutenant-Colonel McComb, seconded by Mr. E M Shattock, and carried, that Mr. J D Forbes be re-appointed auditor.

#### THANKS.

A vote of thanks to the chair brought the meeting to a close.

### THE NEED OF FUMIGATING INTRODUCED FRUIT.

We direct special attention to the letter of Mr. John F. Jowitt on the risk we run of introducing one or more pests with importations of Australian fruit. Ceylon has so long been a terror to her neighbours from the fear of the terrible coffee fungus, that it may seem a little strange we should wish to guard ourselves against insect or other enemies. But we think Mr. Jowitt gives very good reasons why precautions should be taken and in the number of the *Agricultural Gazette* of New South Wales which we had the pleasure of laying before Mr. E. E. Green from whom Mr. Jowitt had a perusal, we learn how to guard against the introduction of any pest with fruit by adopting certain practical instructions for fumigation. It will be for the Planters' Association and Chamber of Commerce to see to it, that the Government is moved to cause the needful fumigating chamber to be provided at the Customs premises. The instructions referred to by Mr. Jowitt are as follows:—

#### FUMIGATION OF FRUIT WITH HYDROCYANIC ACID.

The following notes on some experiments conducted with the object of ascertaining whether it was possible

to destroy scale in oranges, lemons and apples, by exposing the infected fruit to the fumes of hydrocyanic acid without rendering them unfit for market, may be of interest to fruit exporters.

A small fumigating chamber was constructed which could be closed air-tight, having a capacity of 16 cubic feet.

In this chamber a number of oranges badly infested with scale were exposed for three hours to the vapours of hydrocyanic acid produced from 50 grammes cyanide of potassium,  $\frac{3}{4}$  oz. sulphuric acid, and 1 oz. water. These proportions are the same as those recommended for adoption in actual practice, but the length of time during which the fruit was treated was longer, so that it constituted a pretty severe test as to the possible injuriousness of the process on the market value of the fruit.

After three hours the fruit was taken out and allowed to remain in the open air for half an hour. They were then examined for any traces of hydrocyanic acid. There was no trace of any odour or taste of the gas, and on shredding a quantity of the fruit finely and subjecting it to distillation with sulphuric acid no trace of hydrocyanic acid could be detected in the distillate. A special test was made by grating the outer skin of a number of the oranges and distilling this separately, as it was thought that if the gas had not penetrated the fruit it would be found in the outer skin or in the scale. No trace of hydrocyanic acid could, however, be detected, either in the pulp or in the shredded skin separately. The exposure of half an hour to the air after fumigating would appear to be quite sufficient to enable the whole of the gas to escape.

With regard to the effects of this treatment on the scale, I forwarded samples of the fruit before and after fumigating to Mr. Froggatt, Government Entomologist. He reports on the original oranges—"About half the adult red scale was dead and dried up, a quarter was dead, and the other quarter alive. Upon each orange I found live active larvae under the adult scale."

On the fruit after treatment—"no live scale of any kind, both the fully developed females and the larvae were quite dead."

The fruit was, moreover, in good condition and quite hard.

Similar experiments were made of samples of apples and lemons infested with scale, with the same result.

#### ROYAL COLONIAL INSTITUTE.

A meeting of the Royal Colonial Institute was held yesterday afternoon in the library of the institute, when a paper on the sugar industry of Mauritius was read by Mr. James Forrester Anderson. Mr. Henry J. Jourdain presided and among those presents were Sir Frederick Young, Mr. G. R. Le Hunte, Governor of New Guinea, Mr. Justice Coudé Williams, Mr. R. A. Macfie, Mr. A. E. Aspinall, Mr. W. R. Arbuthnot, Mr. Henry Brandon, Mr. J. A. Ferguson, Mr. R. A. Swan, Mr. D. M. Hogg, Major Cunningham, Mr. E. S. Rawson, Mr. Grieve, Mr. J. P. G. Williamson, Mr. W. H. Sherlock, Mr. J. Goodliffe, Mr. L. P. Ford, Mr. J. Louis, Mr. W. S. Sebright Green, and Mr. J. S. O'Halloran (secretary). The lecturer described the staple industry of the island of Mauritius from its early days to the present time. In speaking of the various species of the cane he dealt with comparative richness in sugar of certain species, the diseases of the cane, and the havoc made by the destructive moth, the "Borer" (*Ayleborus perforans*), the only remedy for which is the cutting away of the contaminated shoot and burning it. The disappearance of former rich species of cane, which yielded an average of five tons per acre, was due in his opinion to the exhaustion of the soil and to the intermittent cultivation of a single species from year to year, the feebleness of constitution thus produced rendering the cane more liable to disease. Several estates had been worked over 90 years without remission; hence the soil needed to be renovated

by high doses of guano and good manure, and when the planter today realized an average crop of two tons per acre he considered himself most fortunate; this was far from the handsome average of bygone years, when his predecessors were able to get £1 8s. per cwt. for their sugars, instead of 8s.—i.e., 10s. 8d.—or even less, which was the present day average market price due to the abnormal and unfair competition of the bounty-fed beet sugar on the Indian and European markets. He enumerated the difficulties against which the Mauritius planter had to contend—namely, droughts, diseases of the cane, coupled with the attack by the "Borer," and cyclones. Droughts, which were now much more frequent than in the past, were undoubtedly occasioned by the stagnation of the watercourses, specially in the low lands, brought on by deforestation, which had been the cause of ruin to many an estate, and which had carried desolation and barrenness into localities once rich in luxuriant vegetation, and where the much-to-be-dreaded malaria was never known before. The only radical remedy was for the Government to buy up all the lands surrounding the watercourses and rewood them with good, hardy forest trees; but the local Government was altogether unable to do anything in that direction without material help from the home Government. A cyclone was the most terrible foe of the Mauritius planter. The planter passed through anxious times from the month of October to the month of May, the hurricane season; hence the barometer was a most valuable piece of furniture in the Mauritius home. The Mauritius planter was surely to be congratulated for his spirit of energy and enterprise in face of the ravages of the bounty-fed monster on the markets of the world. He was doing his very best to produce his sugar at the lowest possible cost, which could never be lower than 6s. (8s.) per 100 lb. (50 kilos.), as only at that cost would he be able to derive a reasonable profit on his sales. Many an estate did not realize more than 7-80s. (8s. 9d.) as their average last year, and could hardly put anything by. The sugar crops, or rather the exports of sugar, for the last ten years to 1896, in round numbers were as follows:—1886-87, 102,276 tons (1,000 kilos. per ton); 1887-88, 124,073 tons; 1888-89, 132,172 tons; 1889-90, 124,564 tons; 1890-91, 129,443 tons; 1891-92, 124,759 tons; 1892-93, 94,037 tons; 1893-94, 87,408 tons; 1894-95, 139,449 tons; 1895-96, 117,439 tons.—("Garrioch's Mauritius Almanac," 1895.)

The largest exportation was to India, which in 1896 took over 48,000 tons, while Australia, which at first took the most of the sugars of the island, received only 13,000 and odd tons; the Cape Colony had surpassed her by 3,000 tons; the United States of America now stood fourth in the Mauritius sugar markets, taking in 1896 about 10,000 tons.

Mr. LE HUNTE, in the discussion which followed the lecture, said he quite agreed with Mr. Anderson as to the irreparable damage done by the deforestation of large tracts of country in Mauritius.

Mr. JUSTICE CONDE WILLIAMS said that the problem in Mauritius might possibly be solved by the peasant proprietor becoming the cultivator of the cane, thus leaving the production of sugar more entirely to the manufacturer.

Mr. LOUIS, Mr. R. S. ASHTON, Sir F. YOUNG, and Mr. MACFIE also spoke, and the CHAIRMAN brought the proceedings to a conclusion by moving a vote of thanks to the lecturer.—London Times, Dec. 14.

A CEYLON TEA DUST COMPANY.—"C.T." makes a suggestion in a letter on another page, which we commend to the attention of our readers, though we do not support *all* that he advances. Still the subject is one that will have to be taken into consideration, and has (as our readers know) been already discussed: the lines on which "C.T."s communication runs are interesting.

INDIAN NATIVES AND GREEN TEA.

A planter, who spent some months travelling over India with an eye to selling tea amongst the natives, wrote: "Many native tea drinkers asked me for green tea, as they have a theory that green tea is less heating to the system than black tea. Some of them told me that they drink tea regularly during the cold weather, but have to give it up in the hot weather, as it is too heating, but if they could get green tea they would drink it all the year round. I cannot pretend to say how far this theory is founded on fact."—*Pioneer*, Jan. 3.

COFFEE PLANTING IN BRAZIL.

Some months ago an interesting monograph on coffee planting in Brazil was published by J. H. de Bussy, of Amsterdam, Holland. Its author is Dr. F. W. Dafert, of the agricultural institute at Campinas, S. Paulo, whose competence for such a discussion is universally conceded here in Brazil. The monograph is in Dutch, and we therefore make use of the following translation and digest prepared for the *American Grocer* by J. F. Geisler, Ph. C., of New York.

The total amount of land under cultivation for coffee in 1895-96 was estimated at 2,245,557 hectares, and the world's product at 836,000 tons, of which Brazil produced 460,000 tons upon a cultivated area of 1,000,000 hectares. Although Brazil embraces about 8.3 million square kilometres (an area equivalent to that of Europe), and only about one-tenth of this is excluded from the possibility of coffee culture, yet economical reasons exclude nine-tenths of the theoretically available area. Of the latter, much is of poor quality, but can be made very productive through artificial fertilization, which would bring into active factors the *campos* (grass lands) and *terra exhausta* (exhausted soils).

The lands originally selected for coffee plantations were almost exclusively such whose *flora* consisted of primitive forests or wood lands. Rarely were the *campos* ventured upon. While nature of soil, amount or moisture, and climate are the prime factors in the selection for plantations, the lands should not be exposed to frosts or the cold south winds. The soil should not be wet, and must be porous and deep, to prevent injury to the tap root.

Geologically, the best coffee lands are those of recent volcanic origin, as evidenced by the diorite, melaphyre, and porphyry rocks. To this group belongs the *terra rosa*, a dark red soil. The *terra vermelha*, a lighter red soil, inferior to the former, originated from the paleozoic and triassic ages. One of the best S. Paulo soils, known as *massape preta*, is a rich humus soil. The best soils are rich in phosphoric acid and potash, containing usually 18 to 35 per cent. of the former and 10 to 26 per cent of the latter. The fertility of the soil is usually indicated by the number, strength, and character of the trees.

The varieties of climate in Brazil are so great within the cultivated zone that Rio coffee is usually marketed a month sooner than Santos coffee, while the crops of Braganca and Atibaia do not mature before October.

Of the varieties of coffee, the *cafe nacional* is the most widely cultivated. It is less productive than the *cafe Bourbon*. The latter exhausts the soil very quickly, and is, therefore, not very popular with planters. *Maragogipe* is a large berry of limited production and high market value. *Botucatu*, a local yellow variety, known in India as Golden Drop coffee, is not much cultivated. The variety stands between *cafe nacional* and *cafe Bourbon* in productiveness. A very scarce variety of scientific interest in the *cafe hybrico*, with four to six berries instead of the two berries common to the other varieties.

At present the varieties cultivated are divided approximately at 75 per cent. Arabian, 20 per cent Bourbon, and the rest between *cafe Botucatu* and *Maragogipe*.

The abolition of slavery in 1838 raised the cost of production of coffee and, in a measure, also the method of cultivation. By the old method, as soon as a land showed a tendency toward short crops the planter with his slaves moved to the interior, where he had acquired new lands. The primitive forest was cut down and the land planted with young trees from the old plantation, or seedling was resorted to. It required three and a half to four years before the new plantation became productive. By the new method a well-manured seed-bed is prepared and the young plants carefully nursed and transplanted two or three times, and gradually accustomed to the sun. The small trees are then transplanted in baskets in rows, carefully spaced, so as to permit the use of machines for hoeing. The careful nursing of the plants yields in one and a half years what the old method scarcely produced in four years. The land is kept free from weeds, and for this purpose is machine-hoed at least five times.

To restore the amount of mineral matter annually removed by the crops the added fertilizer should contain about eight grammes phosphoric acid, thirty-five grammes potash, and sixteen grammes nitrogen per tree. Stable manure must also be applied to the soil to get the best results.

For practical purposes the farm or plantation should be divided into two sections—one for coffee cultivation proper and the other for food and fodder. The ratio for practical purposes should be at least, for 10,000 trees, fifteen hectares fodder land and five hectares animal land. The manure from the latter plays an important part in the successful working of the plantation.

In gathering the crops the ground under the trees is carefully cleaned and the berries allowed to fall on the same. Double picking, to separate the ripe and unripe berries, is frequently resorted to, but is not a universal practice. The picked berries were formerly dried in the sun on mats, the operation taking several weeks. The dried berries were then shelled, cleaned, sorted, and marketed. The average yield per tree was 300 to 900 grammes, the hectare containing 900 to 1,100 trees. The maximum yield ranged between the tenth to fourteenth years, and varied from 270 to 990 kilos per hectare. In the modern plantation the trees are planted in line four to six metres apart, and the soil fertilized with a mixture of stable manure and chemical fertilizers.

The preparation for the market of the picked berries is done by both the wet and dry process. Usually the picked berries are put through a decorticator, in which the ripe berries are crushed, while the unripe hard berries pass through unchanged. The latter are dried separately. Since the ripe berries float and the unripe berries are heavier, this method is frequently resorted to for their separation. The berries are spread out in layers for drying, the decorticated berry requiring about five days (if dried in shell, eight days), while the green berry requires twenty to thirty days, according to the weather.

The drying process is now much improved by sorting the berries according to their size. The berries are first dried in the sun for a few days, by which operation they lose about 50 per cent of the moisture. They are then transferred to drying chambers, and the drying rapidly terminated; so that the whole operation is finished within five days, whereas the old method required twenty to thirty days. Moreover, the degree of moisture of the berry is more accurately judged during the artificial drying. Thus the blue berries contain more moisture than the green, and the latter more than the yellow.

The modern method of applying fertilizers tends to an increased production of coffee. Thus the products from fifty trees raised in the trial gardens averaged per tree as follows:—

	1892. gram.	1893. gram.	1894. gram.	1895. gram.	1896. gram.	1897. gram.
Unfertilised ...	25	35	200	90	605	560
Fertilised ...	40	120	780	485	700	900

For well-fertilized trees twenty years old the products should average 2.5 kilos per tree. Relative to the future of coffee culture in Brazil, there is nothing in the natural conditions to prevent either the continuation or expansion of raising coffee. The principal difficulties are in the management.

The present position of the planter is very precarious, and most of them may be compelled to sell or surrender their properties to the mortgagees. In that event the new possessors could work the plantations to advantage at the present prices. A great many Italians have been imported and have displaced slave labour on the plantations. There is no likelihood of these Italians emigrating, as no other land offers any better advantages for obtaining subsistence and which condition invites further immigration.—*Rio News*, Nov. 29.

### THE SUGAR INDUSTRY.

We remember the question was publicly raised some time ago, whether the West Indian Sugar Planters are as enterprising and as up-to-date as they should be, and whether their misfortunes have not been aggravated, if not caused, by their failure to do their best for their lands, and to avail themselves fully of improvements in machinery and manufacture. Of that we cannot judge; but here is an extract showing that in Hawaii, there is no lack of enterprise and go:—

"The Hawaiian sugar and coffee planters set a good example to Indian planters in their methods. They act on the old but still true maxim that the gods help those who help themselves. Sugar, it may be mentioned, is Hawaii's chief article of export, and coffee one she is trying to develop. The sugar planters have a laboratory and experimental station of their own, where cane of different varieties is grown and tested; and they show great enterprise in making proper trial of fertilisers, irrigation plans, and new machinery, such as the nine-roll mill for juice extraction, the clarification of juice by the Deming apparatus, and crystallisation in motion. We are not surprised to hear as a sequel that the sugar industry of the islands prospered last year, all the plantations paying large dividends. The export of coffee is small as yet—only 337,158 lb. last year,—but last year doubled the year before; and it is proposed to appoint, at Government expense, a commission of experts to promote a knowledge of the best methods of cultivation, to watch markets, and so on.

### CEYLON TEA IN THE UNITED STATES AND CANADA:

STRONG FEELING IN THE FORMER IN FAVOUR OF "BLENDS" AND "OOLONGS."

GOOD PROSPECTS FOR CEYLON TEA IN AMERICA, ON THE CONTINENT OF EUROPE AND IN AUSTRALIA

We publish on page 555 a long, chatty letter from our old friend, Mr. MacCombie Murray, who has now watched the American tea market for a good many years since he gave up planting in Ceylon. He lays the result of that experience and a number of facts gathered at first hand before his friends, the tea planters of this colony, and it behoves them through their representative bodies in the Planters' Association and "The Thirty Committee" to give due consideration to the informa-

tion now brought to light, and more especially as to what is said respecting "blends" and "oolongs." With respect to the dislike of American families for "pure Ceylon tea," however, on their first experience of the same, we should like to ask Mr. MacCombie Murray whether he is quite sure that the said families understood that a less period of infusion should be given to Ceylon tea than to the weaker China and Japan products? Here, for instance, are the typical instructions in the case of "Ceylon Tea":—

"How to MAKE A GOOD CUP OF TEA.—First fill your kettle with FRESH water, then see that it really BOILS. Next warm your TEAPOT, and put one small teaspoonful of tea for each cup required; then pour on the required quantity of boiling water, infuse for FIVE minutes, then pour off the tea into another teapot ready for use. Thus treated, CEYLON TEA will give a liquor, pure, delicious and fragrant."

Now, the above (printed in English, Sinhalese and Tamil) was intended for household servants in Ceylon. In the case of American or other families, unaccustomed to our teas, we should recommend at first only "four minutes" of infusion in place of "five," and we should like Mr. MacCombie Murray to get any member of "Finlay Acker's" staff or other tea-dealers to experiment in this way and say if pure Ceylon tea is still too strong and "herby" in taste, for the delicate American palate? As regards "oolongs" we have recommended that trials should be made with natural "green" teas from Ceylon, and we trust samples will be sent to Mr. MacCombie Murray to get the opinion of the large tea distributing house that he names. We sincerely hope that our correspondent may speedily build up a remunerative and steadily extending tea business in the great city of brotherly-love with its over a million of population, all no doubt well-to-do comparatively, and all of whom ought to be drinkers of Ceylon tea!—let alone the several millions of customers available in the State of Pennsylvania.

From another quarter altogether, last mail brought us some interesting information regarding tea prospects in America. This corresponds ent—largely interested in Ceylon tea property—writes from London, 22nd December, as follows:—

"I enclose three cuttings to show you what is happening in Canada, with regard to the proposed differential duty on tea. No. 1, you see, advocates this differential duty; No. 2 tells of the attempts the Japanese Consul is making to stop it; while No. 3 deprecates any change in the tariff.

"The statistical position, the home consumption, the large increasing demand from 'other countries,' the small increase in production—all should tend to better prices in London and Colombo. But while the very existence of the half-dozen large blending and distributing over-capitalized companies depends on beating down prices, they can manoeuvre successfully to that end. Russian orders defeated them in several cases last Tuesday, when they wished to divide lots 1d to 1½d under Russian limits. These orders were for good high-grown and high-priced teas, which unfortunately Australia and America hardly touch. Calcutta has been supplying large quantities lately to America, delivered at 4½d to 5½d, prices which must show a loss. Why this stuff is produced heaven only knows! Agents in Calcutta may benefit—shareholders do not. Yet the Indian people seriously think of stopping their Campaign Fund and leaving Ceylon alone to find markets! With Russia taking (as you think) 10 millions next

year, Australia 16, America perhaps eight, and other outside countries six—if Ceylon produces 125 millions, there will remain only 85 for London, which Britain can easily absorb. It is India that really needs other markets, and instead of stopping the Fund, it should, like Ceylon, double it for a year. I call upon your brother planting editors of Bengal to take the matter up."

We trust Indian tea planters, Calcutta merchants and the trade generally will take warning from the above. In place of giving up, they ought to double their fund for advertising in America and on the Continent of Europe. If, on the other hand, they choose to withdraw, it will become the duty of the Ceylon Tea Committee to devise means to advertise the good name and character of Ceylon teas alone and to ignore "Indians" as no longer worthy of the same attention.

THE FUTURE OF TEA: INDIAN EXTENSIONS AND THE CURRENCY.

Under date, Edinburgh, 15th Dec., Mr. A. L. Cross writes:—"I enclose prospectus of a New Issue of first mortgage Debentures of the Lungla (Sylhet) Tea Company, Limited:—

The Company was formed in 1895 to acquire extensive Tea Estates in the district of Sylhet and province of Assam, having an area of 14,882 acres, of which 3,907 acres were under tea. The total cost to the Company was £190,000, including all existing buildings and machinery on the Estates.

The Directors, from the commencement of the Company's operations, adopted the policy of extending the area of cultivation with indigenous plaut, and up to the end of the year 1897 the expenditure on extensions amounted to £40,159, in addition to which the sum of £9,677 has been expended on new buildings and machinery, making a total capital expenditure incurred to the date named on extensions and new works of £49,836. The outlay for the maintenance of the extensions to the end of the year 1898 will probably bring this amount up to £60,000, and it is estimated that from £10,000 to £15,000 more will be required before the extensions are brought in'o full bearing.

The result of the above expenditure on the extensions already commenced is expected to bring up the area of tea under cultivation to 5,400 acres, and it has now been decided to make an issue of Debentures to replace the amount expended on capital account.\*\*\*

The profits earned in each year since the formation of the Company have been as follows, viz:—

1895	..	..	£12,706
1896	..	..	13,217
1897	..	..	7,608

The annual charge for interest on the Debentures will be £3,750.

The outturn of the Company's Estates for 1897 was considerably below the normal owing to the season being throughout India an unfavourable one for the production of tea, while, on the other hand, the expenditure was increased by the advance in the rate of exchange.

Lungla, Shunshernugger and Kannyhatti, which are the principal Estates of the Company, are well known as being among the finest properties in Sylhet, and with normal seasons and the large extent of new cultivation coming forward, it may be reasonably anticipated that the result of the Company's operations will improve in the near future.

"This does not look like restricting the output of Tea? I gather from the Chairman's speech at a recent meeting that it is the intention of the Company, notwithstanding the high rate of exchange, to go on with further extensions. It is surely a foolish proceeding for all interested in tea, to

go on opening large areas in tea to still further glut the market.

"Unless producers can make a big row in Parliament over the exchange question as affecting producers you may depend on it the present Government will impose a gold currency in India. The formation of the Currency Commission is simply scandalous. It is almost entirely composed of men pledged to play into the hands of the Indian Government. I wonder why the Native States of India don't make a noise about it. My own impression is that exchange is now likely to keep up to about 1s 4d so there is no necessity for a gold currency.

"We are having rather more settled weather at present, but it has been a more stormy winter than the last two. I heard Kensis's speech on the subject, 'Why are we Protestants?' and he gave me the impression of being a very manly, straightforward fellow, but 'Cockney' in speech somewhat."

DR. WATT'S BOOK ON TEA PESTS AND BLIGHTS.

A planter, who has got this book through our office and read it carefully, is very earnest in insisting that there ought to be a copy in the hands of every estate Manager in Ceylon, and that connected and united action should be taken to fight certain pests and blights at their very first appearance in tea. Dr. Watt is very clear in his description of these blights and the sooner his book is read and studied the better.

FROM COOLGARDIE, WESTERN AUSTRALIA.

(Extract from letter of a Ceylon visitor.)

COOLGARDIE, 30th Dec. 1898.

The heat up here for some days was enough to knock bronchitis out of anyone. Saturday, the day before Christmas, it was 105 in the shade, and on Wednesday it was from 106 to 110 in the shade with a hot wind blowing—something fearful. All say that I stood it very well, but in the afternoon I had to find the darkest room and lay up for a few hours. At 11 p.m. it was 98 in the shade. I spent about eleven days in Perth. It is a fine town, well laid out, and it has now some very fine brick and stone buildings in it. There are between twelve and fifteen banks in the town and a few good hotels, or what they consider good here. I was staying at the Palace Hotel, a fine building, built about two years ago; in fact, most of the good buildings have been put up these last two or three years, I am told; but the sanitary state of the town is far from satisfactory, and the water is far from good: in fact, I could not drink it—it had such a nasty taste. The thing that astonishes me is where they managed to get the money from, to build such a fine town in such a short time. Strange to say I did not see *Ceylon tea* advertised at all about the town. I think there should be a good opening there for any agency. The journey from Albany to Perth was a very tedious one, about 350 miles—a night journey with four men in one compartment was anything but nice. I arrived at "Coolgardie" about eight days ago. I was much surprised to see the extent of the town: it is well laid out with very broad streets, but I consider about half filled up with buildings to

all sorts of material, principally iron. The Club and the Coolgardie Chamber of Mines, the Court-house, Post and Telegraph Offices are all good stone buildings. Also the Beaconsfield Chamber, several hotels, banks, and stores are built of stone and brick; the rest of the shops principally of iron and lit up with the electric light. So I think it a good town to be built in three or four years. The great Kalgoolie Mines are about 20 miles from here. I hope to see them in a day or two. There are a good many very fine mines giving very large yields of gold. On Christmas morning about 4,000 miners came over to spend Christmas at Coolgardie to take part in sports, and a stronger, finer-built, well-dressed body of miners I never saw, and I can also testify to their good behaviour—a very jolly lot—and I scarcely saw any of them much the worse for liquor; that speaks volumes for the improvement on the gold-fields.

### PLANTING NOTES.

**PRICKLY PEARS IN NEW SOUTH WALES.**—A recent issue of the *Agricultural Gazette of New South Wales* contains an important paper, with numerous illustrations, by J. H. Maiden, on the "Prickly Pears Naturalised in the Colony." The subject is briefly summed up thus by the author:—"The principal indictments against the prickly pear are: 1. It frequently occupies good soil. 2. The profusion of spine of some species, which prevent cattle browsing on it, or man dealing with it, the plants thus become a harbor for vermin. 3. The abundance of seeds it produces, which, being eaten by birds and animals, are disseminated through their agency. I have heard it stated that imperfectly-ripe fruits, are a far more certain source of reproduction than perfectly ripe ones. 4. The vitality of the plant. When joints are broken off, they readily take root in most parts of the colony during the greater part of the year. Having said all the harsh things we can against the Prickly Pear, let us see what we can say in its favour: 1. Some species can be utilised as food for stock. 2. Some species yield fruit, of which many people are fond. They should be gathered with gloves, and the bristles rubbed off with a napkin. 3. Some species form fire proof and cattle proof hedges. In some parts of the United States, they are used to fence in railways. 4. They are very desirable for horticultural purposes, both for rookeries and for scenic effects in gardens generally." The various species alluded to above are *Opuntia ficus indica*, *vulgaris*, *tuna*, *monacantha*, *striata* (*inermis*) and *brasilensis*. None of them is indigenous, but having been introduced at different times, they have flourished and increased to an enormous extent, so that the mischief caused by them far out-weighs their value. The importance of the question may be gathered from the rigour of the Prickly Pear Act, under the provisions of which, "a citizen failing to comply with the regulations is liable to a fine of £20." Total eradication of the pest by burning or deeply burying it is required, and has been tested; while, as an alternative, puncturing and spraying the plants with "scrub exterminator" powder has been tried. For details of these experiments reference must be made to the *Gazette* where, in the paper under discussion many interesting facts are given of the history of the *Opuntias* in the colony and elsewhere, together with several good illustrations.

THE EUCALYPTI OF AUSTRALIA have become very familiar in Ceylon: and there is no end to the new species. We have just received a pamphlet (with two plates) made up from the Proceedings of the Linnean Society of New South Wales, 1893, Part 3rd, September 28th, on two new species of Eucalyptus, by R. T. Baker, F.L.S., Curator, Technological Museum, Sydney. (Plates x.-xi.)—The new species are:—

*Eucalyptus lævopinca*, sp. nov. "Silver-Top Stringybark." A very tall tree in favourable situations. Bark fibrous but brittle, a feature that distinguishes it from that of "Red Stringybark," *E. macrophylla*, F. v. M., and "White Stringybark" *E. eugenioides*, Sieb.; ultimate branches smooth. Timber.—A very hard, close-grained, interlocked, pale brown coloured timber, difficult to distinguish from *E. pilularis* (Blackbutt), and no doubt of equal excellence. It is durable in the ground, and free from gum-veins as a rule. Suitable for bridge decking, wood blocking, posts, rails, and general building purposes requiring a hard durable timber. In the case of "Red" and "White" Stringybark, the bark soon becomes detached after the timber is felled, but in this species the bark remains attached till the timber decays.

*Eucalyptus dextropinea*, sp. nov. "Messinate or Stringybark." A tree attaining a height of from sixty to hundred feet or higher, and a diameter up of five feet. Bark dark or black on the outside, fibrous and longer in the fibre than that of the other species. Branches smooth for a considerable distance down, but this feature varies. Timber.—A dark brown coloured timber. Seasons very badly, and is evidently worthless.

Another pamphlet is on the Pinenes of the Oaks, of the Genus *Encalyptus*.—Part I. By Henry G. Smith, F. C. S., Technological Museum, Sydney. Read before the Royal Society of New South Wales, October 5th, 1898.

**RICE FROM SIAM.**—We had a call yesterday from the proprietor of the principal paper in Bangkok and the conversation turned on the Rice export trade which, he said, is increasing by "leaps and bounds"—new mills continuing to go up. This is borne out by the following, from the "British Trade Journal" since received:—

#### BANGKOK RICE EXPORTS AND MILLS.

British Vice-Consul Black states that in 1897 the exports of rice from Rangoon (clearly Bangkok—Ed. C.O.) amounted to 557,736 tons, valued at 2,312,619l. This is 75 per cent. of the whole exports. The rice business—that is the buying from the cultivators, the milling and the export—is now almost entirely monopolised by Chinese merchants, many of whom have the command of very large capital. They export the rice principally to Hong-Kong and Singapore, and it would seem from the fact that so small a share of this business falls to European merchants, that it is impossible under the conditions of trade prevailing in the East for the European to compete with the astute Chinaman in this particular business. Of the twenty-six steam rice mills in Bangkok only four are European, two British, belonging to one firm, one German, and the fourth nominally registered as French. All the others are either owned or managed by Chinese. Six of these Chinese firms, ranking amongst them the largest and most prosperous, are British, that is, they are owned by Chinese who were born either in Hongkong or the Straits Settlements, one is French and two are Siamese. The proprietors of the remaining thirteen are Chinese under Siamese jurisdiction. It will thus be seen that the share of English firms, strictly speaking, in this important branch of trade in Siam is of itself comparatively small, but by including the Chinese British subjects it may be said that quite one third of the trade is in British hands. We are calling for some special information; because the grand advantage of dealing with Siam (over India or Burmah) is its silver currency against our inflated rupee.

## CEYLON TEA IN AMERICA.

MR. MACCOMBIE MURRAY (FORMERLY OF DOLOSBAGE) ON THE PROGRESS MADE.

HE RESUMES BUSINESS IN PHILADELPHIA AS TEA AND COFFEE EXPERT.

THE OPINIONS OF CHIEF TEA DEALERS IN FAVOUR OF BLENDS—AND "OOLONGS."

INTERESTING EXPERIENCES.

From a long letter from Mr. MacCombie Murray—who was for ten years a Ceylon planter—we quote as follows:—

From the enclosed circular you will understand that I am not only keeping up my interest in Tea but am actively engaged in the business:—

## TEA AND COFFEE.

From seed to cup—I know them both,  
With daily care have watched their growth  
A science made of How to cure,  
To Buy, to Blend and Sell them Pure.

J. M. MURRAY.

HIGH GROWN PLANTATIONS: TEAS AND COFFEES.  
PRINCIPLES OF BUSINESS.

Teas and Coffees sold on their own merits at the lowest possible price, and no goods sold which cannot be recommended as good.

## CLAIM.

Judgment in buying, and practical as well as scientific knowledge as an expert in the art of blending.

## PHILOSOPHICAL AND PERSONAL.

With an experience of two years in the London Tea and Coffee Market, ten years cultivating and curing tea and coffee in Ceylon, E. India; and five years as importer and dealer in Philadelphia, it stands to reason that I should be able to serve my customers to their advantage, and it is to my own best interests to do so.

From time to time I have been financially interested in this line while professionally engaged in Music, but not since I had to give up my store, now eight years ago, have I put my entire time into it. Once again, however, I am an out-and-out Ceylon Tea man, busily engaged at my desk addressing envelopes and writing personal letters to old customers. The "Kootee" Brand is not now my property, but it has been and is now carried on and advertised by the present owner as "The oldest Brand of Ceylon Tea in America, introduced by Professor J. McCombie Murray, for 10 years Tea and Coffee planter in Ceylon." In spite of the loss of money it represents, I have a sort of affection for the old Brand yet, and tried to get Mr. Harkness to give me back an interest in it at a price, but he won't. Not only the "Kootee" Brand did I see advertised on Chestnut street on my return from New York city (where I had spent a year, and for part of the time selling Ceylon Tea for Mr. Elwood May), but a "Murray" Brand had been born into existence as being also the oldest Brand in America. This was done without any authority from me, but it may yet serve my own interests as an advertisement, as I have certainly the right to use my own name for this purpose. My idea, however, is to immortalise the face and features of my old ayah, who was a sort of mother to my eldest boy Andrew, now a fine boy of nearly 14 years of age, and by us called Amah. By the way, I would very much like to know of her whereabouts in Ceylon and if you can, through your columns, find where she is and let me know how to address her, you will do me a great kindness. She was about two years over here with us, and was very useful and attractive to my exhibits

when I was trying to bring Ceylon Tea before the American public at State Fairs, Pure Food Expositions, &c.

To give you particulars as to the success of the

## CEYLON TEA ENTERPRISE IN AMERICA

would be difficult at present, that is, for me to do as I am not sufficiently posted;—but to correspond I will do my best to keep you posted in all such information as I think would be of interest on this side of the ocean.

The latest statistics of exports from Ceylon, for instance, would always be of value to me, as they would form text for advertising.

The attempt of Dr. Shepherd to cultivate

## TEA IN SOUTH CAROLINA

is of course interesting to Americans, and it affords them some degree of satisfaction to say that they can grow tea and everything else of God's creation in this country. It seems strange, however, that there is only *one* man in it—for Yankees are not slow to catch on to any scheme that has money in it. Those who speak of the feasibility of the enterprise are of course in ignorance of the nature of the field work, and the comparative cost of labor, and a few statements in this connection results in a change of subject. So far as climate is concerned, I believe, South Carolina to be favorable, and the yield very fair. The samples I have tasted did not suit *my* palate, but of course, *taste* is a matter of cultivation. I now mean to write to Dr. Shepherd and have him send me a few samples of more recent manufacture; and should he favor me, I will send them on to you.

From what I see today of the position of Ceylon tea in the market, I do not think I was mistaken in statements made by me in your column in the earlier years of my experience here.

I have, in Germantown, a friend whose success as a retailer of tea and coffee (as a sole interest) is unequalled in my personal experience and connection. He had quite a small store when I was "pushing" my tea, and "knew not Joseph" as a prophet worthy of attention when I elaborated on the excellent merits of Ceylon tea, and the prominent part it would play in the near future in the American tea market. Suffice it, that he knows *now*, and fully appreciates the force of my past statements. Our positions have changed—for instead of my having to act as solicitor, he is in a position to sell to me probably as favourably to my interests as anyone. No one be could found as a better and more disinterested authority on the question of the actual position of Ceylon tea in the retail trade, and I have his remarks fresh in my memory as made only a few weeks ago, before I thought of going into the business. While he orders about 120 chests of a kind at a time for his retail requirements, and has *now* the finest tea and coffee house, not only in Germantown, but all Philadelphia, still he holds that Ceylon tea straight will *never* command the popular taste of the people. You may remember my connection with a repeated reference to

## FINLAY ACKER

as a power in the grocery line. This man has turned out a veritable wonder. I would not be in the least surprised to find his name on the advertising pages of the *T.A.* as there seems to be no limit to his reach or bound to his interest. He it was who *first* listened to me when I pleaded

the cause of Ceylon tea. I mean as a grocer. Busy as he was, and precious as his time must have been, he found it convenient to spend a forenoon in my office tasting Ceylon teas and experimenting with blends. Without any question as to price he bought of me, both in packets and in chests, and it was satisfactory to me to advertise pretty freely the fact that the "Kootie" Brand was handled by Finlay Acker.

Soon, however, there appeared an "Acker's Ceylon Blend?" and in his monthly magazine "Table Talk" his references to an article written by "your humble servant" a real planter from Ceylon, &c. He did not make mention of the "Kootie" Brand in this connection, but the skilful blending of tea which had so mystified the world at large—outside the holy of holies at Acker's was to become more mysterious still by the introduction of a *new* element, the effects of which could only be appreciated by taking advantage of his offer to sell a pound at the nominal cost of 75c cash. Now, while the old Professor starts his little store in Germantown, humbly craving the patronage of every Tom, Dick and Harry that he may meet, and wondering how he will stand when the little stock he has, gives out, Finlay Acker is proprietor of

#### ACKER'S CEYLON BLEND

he helped to make for him and of which probably a few thousand pounds are shipped by the said Acker every week or perhaps *day* for all that I know. I saw Finlay Acker a few weeks ago, and had some 15 or 20 minutes' interesting conversation with him. Does he sell Acker's Pure Ceylon? No?—Why? Is his name not attached to almost *every* line of Groceries on the market, and is he not successful in turning *every one* of them into money? I have just hunted up one of his catalogues which I will probably send you with this letter. Fifty-eight pages. Do you wish say Wilbur's cocoa—certainly there it is, but Acker's heads the list, Chocolate, Coffees, Teas, (Ceylon Teas represented by Acker's C. Blend *only*)—Beverages of every kind—Bou Bous and Confections of *every* kind and make—Baking Powders. *Methods* of baking, fruits can'd, jams and preserves of *every* brand—vegetables and every brand of every kind of eatable under the sun. Toilet utensils and all articles sold by chemists outside medicines in a straight unprepared form, cigars and what not? All are catalogued under every brand sufficiently advertised to receive attention, but what is the use of mention at all when Acker's heads the list as far and away the best. But where is the packet labelled "Pure Ceylon Tea"?—Is it not a significant omission? Were the demand for this article *likely* in his opinion to *ever* become popular, do you not think he would honor it with that distinctive title of Acker's in some shape or form. I have *his* opinion also, and I do not think *anyone*, who has watched his career and the unprecedented growth of his business as a grocer, will dispute his integrity or the good judgment he has displayed, and of which his palatial store is positive evidence. "No, Mr. Murray, I'm afraid Ceylon Tea in itself will *never* become palatable to our American people. What may be the *reason* it is hard to state, unless it is that the climate is such that people are affected by it in their taste for food. However that may be, the fact remains that Americans do not like heavy teas, but shew almost an universal preference for the lighter kinds. Only those who arrive comparatively fresh from England appreciate the merits of that class of tea generally characterized as English Breakfast,"

And considering the excellence or super-excellence of Ceylon tea, the cheapest of them all. Is not *money saved* by subscribing for the catalogue, so that it may be read as "Acker's Weekly" by *everybody*, and no more exhibitions of foolish extravagance indulged in by the American people who purchase these inferior Brands we see so clearly shewn up in "Acker's Weekly"?

Well, Acker may overestimate the extent of superiority which seems to accompany his name on everything he deals in, but it is true without doubt that he is one of the most far-seeing business men America has ever produced.

#### JOHN WANAMAKER

is supposed to stand first in the list of successful merchants—but with this exception I think that Finlay Acker is second to none. From a comparatively small store on eighth street in my time, he has erected a mass of buildings in the most densely populated centre of the city, the value of which in very *rent* room must be enormous. Mostly all articles of a proprietary nature, put up in cans or otherwise, candies and other manufactured articles, are manufactured and put up on the premises, as Acker's. What others can accomplish in specialties of this kind can be done by him, under his own eye on his own premises, and in his own name.

This is in effect what Finlay Acker thinks and says, and his method of introducing Ceylon Tea through his well established channels, is, and always has been, after a *little* experience in the business, the only *feasible* one when look'd at from a business standpoint.

To recommend Americans to the use of

#### CEYLON TEA PURE

is absolutely suicidal to the man who does so, if he is dependent on the tea business for a living. Would it not be foolish on my part, for instance, with all my past experience fresh in my memory, to ignore facts which now stare me in the face, and discourage nine out of ten would-be customers from patronizing me, and force them to give their money to my competitors who are obliging enough to sell them what they ask for without informing them that their taste is bad, requires to be educated and that the worthy citizens they may have dealt with and known personally as good friends and honest men are and have all along been victimizing them; selling poisonous herbs, and passing off adulterated stuff as pure tea, &c. In the first place they don't. In their hearts, believe you. They know enough to know that the case is exaggerated and that they are, as a matter of fact, in wonderfully good health after using these horrible teas from China or Japan for so many years. They take some Ceylon tea home, making the family expectant and preparing them for a treat. But how depict the "facial contortions" indulged in after tasting? "Herbs," says one, "Oh! the very smell makes me sick" says another. "Avoid that store in future," says another, "and don't forget to call 'Acker's' wagon as it passes. Mamma, for goodness sake make us some coffee. It can't do more than keep us awake, and the smell of that tea would keep me awake for a night. As for *drinking* it, I would be sick to my stomach till I died."

Such is the *general* reception given to Ceylon Tea by an American family of the middle class—representing "the people" on whom a retailer of Tea and Coffee depends for his custom and his bread and butter. Acker appreciates the fact, and does not like his name associated with what he looks upon as distinctly unpopular.

Now—on the other hand—there is scarcely a grocer who is not obliged to have *some* Ceylon and Assam tea in stock. There is scarcely a grocer who does not have a blend of his own too, and he uses a little Ceylon or Assam in it. This goes, and I am persuaded in my own mind that this idea has done a great deal towards increasing interest and consequent demand for Tea as a beverage.

I do not think that tasting Ceylon pure has done much to make tea drinkers, but *pushing*, advertising, and newspaper articles on the subject of

#### TEA CULTIVATION IN CEYLON

and India have awakened a new interest in tea generally. Grocers have had to make themselves familiar with the subject, and have gradually found that Ceylon and Assam teas could be used to their own advantage. Acker did some good work in this direction when he even employed the name of Ceylon in his business as a *leader*. His blend was at once a public interest, and the grocers became inquisitive. The blend was analyzed and imitated as closely as possible. They knew it contained some Ceylon tea, and they were led to *buy* it in consequence.

Now why, in the name of all the gods at once, should Ceylon planters continue to foster in their hearts a prejudice against blending their produce with China and Japan teas when the American Grocer informs them that he wants 100 chests at market price. That is his interest in the American Grocer, not how the American Grocer treats his customers.

Let it be true that of the 100 chests, 10 or 15 are sold straight and the rest mixed in with other teas to make blends, &c. What need the planter care? The grocer knows best how to run his business, and doesn't care a rap about how the tea was planted, plucked withered, rolled, fermented, dried or—well I won't say *packed*—for he does. These old boxes are subject to all the dreadful epithets used by, and almost patent to the American Grocers' handy man. I will not enlarge, but leave the subject in its suggestiveness. The *iron* boxes are, on the contrary, eulogized in ratio. They are useful in the store when empty for blending tea or coffee and make very good coffee bins, &c. I cannot imagine planters failing to adopt this style of packing box. Possibly they cost a little more, but the teas arrive so much better condition in the metal boxes that it would pay in the end.

The tea market is rather unsettled at present on account of the Spanish-American war and other causes. A war duty of 10 cents per lb. was imposed, but some of our representatives in Government think the revenue from this is not enough and it is possible that a further duty of five or 10 cents may be added, as also a duty on coffee which has escaped as yet. Then, there is now a law similar to that in England to prevent the importation of rubbishy teas from China. As I understand it, a tea must be worth 15 cents per lb. to be placed upon the market. This makes tea worth at least 25 cent per lb. as an up-est price, so you can easily understand how we feel about it, when we have to sell at popular prices.

How are

#### CEYLON OOLONGS

getting on? Do any planters make a specialty of very fine fancy teas? There is a class of Americans who will pay up to \$3. and \$5, per lb. for a very fine tea. The best tea I ever received was a very black, clean and pretty broken pekoe,

with a large percentage of golden tips contrasting beautifully with the small black leaf. It was handsome in appearance, and delicious in flavor. It cost 2s 3d or thereby in London, but it was worth the money, and sold well. If I recollect aright it was "Rookwood" tea, but of this I cannot be certain.

While I have argued so strongly in favor of blending Ceylon tea, I don't wish you to set me down as any less an enthusiast in the interests of the product. I am *personally* heart and soul in enterprise, and hope soon to command the trade of *most* of the Ceylon tea drinkers in German town, and extend my field gradually. To tell you the truth, there is no really *fine* Ceylon tea in the market and now that I am in the Tea business again, presumably for the rest of my life, I mean to wait until such time as I can command *the very best* that Ceylon produces, before I adopt

#### A BRAND OF PURE CEYLON TEA

I am willing to pay 2s 6d and 1s 3d for Broken Pekoe and Sonchong respectively delivered at my store for ordinary trade. The present duty of 10cts per lb. is against me just now, as I would always pay this price for the tea. The consumer will not take the duty into consideration and pay more, so they have to be content with a less expensive tea, as the retailer cannot pay much over 30cts for a 50cts tea and make his business profitable. I will mail this letter now and start a new one which may treat of other subjects of general interest. My letters may be long-winded, but I like to scribble down my thoughts when alone, and visit in spirit my old hunting ground. Salaams to all old friends in Colombo and up in the hills.

J. MCCOMBIE MURRAY.

#### THE CEYLON TEA MAKERS' HANDBOOK.\*

This is a very handy little manual for tea-makers, containing well-nigh 70 pages of letterpress divided into four parts:—(1) the General Duties of all the Factory Staff from the Tea-maker to the Watchmen; (2) Manufacture with practical remarks on each department; (3) Machinery with information and hints as to every possible machine in use; and (4) Useful Notes for Tea-makers. In a modest preface, the author deprecates the notion that his work is any more than it professes' namely,—“a handy book for the Tea-maker. He expresses his indebtedness for hints to his brother and to Mr. Kelway Bamber for permission to utilize information from his well-known work on tea. We can very cordially recommend Mr. Pett's little compilation as full of useful information of the most practical kind. To young tea-makers, the handbook should prove of peculiar value. There ought to be a copy in every tea factory in Ceylon—and for that matter, in India as well.

DR. TRIMEN'S "FLORA OF CEYLON."—We learn from Mr. J. C. Willis that the fourth volume of this work is now ready and that Sir Joseph Hooker wishes to present copies to those in Ceylon to whom the late Dr. Trimen sent presentation copies of the earlier volumes. Mr. Willis addresses us a letter to be found on page 562, to which we draw attention.

\* The Ceylon Tea-makers' Handbook—compiled by Geo. Thornton Pett. Price R2 Nett. Colombo: Printed at the "Times of Ceylon" Steam Press, 1899.

◆

To the Editor.

THE DANGER OF INTRODUCING "SCALE"  
AND OTHER PESTS WITH FRUIT  
FROM AUSTRALIA.

SIR,—Has it ever struck you that the increasing importation of Australian fruit, especially that of apples and oranges, is a source of danger to the Colony?

Apples and oranges are particularly liable to carry living scale insects and this is so fully recognised that I believe I am right in stating that some colonies absolutely prohibit the importation of fresh fruit and other countries only admit them under certain restrictions.

In the *Agricultural Gazette* of New South Wales for October 1898 there is an interesting article on "Insect and Fungus Diseases of Fruit Trees and their Remedies." Of the scale insects mentioned in the article we already have several (I write under correction) but we are at present, I believe, free from the two most important pests, viz., "The Fluted or Cottony Cushion Scale" (*Icerya purchasi*) and "The Olive Scale" (*Lecanium Oleæ*).

"The Fluted Scale" you will remember was the pest that almost ruined the Californian fruit growers, and would undoubtedly have done so, but for the signal services rendered by "*Vedalia cardinalis*," a predaceous beetle introduced by the Entomologist of the Hawaiian Government, Albert Kœbele.

The "*Lecanium Oleæ*" is reported to render more oranges in Australia unfit for sale than any other pest, red scale (*Aspidiotus aurantii*) only excepted.

That pests have been introduced into the island on imported plants cannot be denied and but for the introduction of "*Lecanium viride*" coffee might still be flourishing on many estates in the island. The survival of coffee in Haputale is a mere question of time; the three years I have been there witnessed the gradual incursions made by this fell pest on otherwise healthy coffee.

There is an old adage, namely, "An ounce of prevention is worth a pound of cure," and my object in writing to you is to point out that the remedy is in our own hands and the introduction of pests into the island can be prevented by the fumigation of all imported fruits. The treatment is simple, inexpensive and absolutely harmless to the fruit.

I send you the account in the *Gazette* referred to above, of experiments in the fumigation of fruit; and this, I think, conclusively proves that we can guard ourselves without interfering with the growing fruit trade.

I would submit in the interests of fruit-growers in Ceylon and of planters in general that all fruit imported should be inspected, and if necessary fumigated at importer's expenses. Great attention is being paid to these matters in the Australian Colonies and if it were known that fruit thence exported was liable to be fumigated on arrival in Ceylon, the exporters would be careful to send nothing but sound fruit.—I am, &c.,

JOHN F. JOWITT.

## CEYLON TEA IN AMERICA.

Kandy, Dec. 28.

SIR,—I enclose extract from letter received from Mr. William Mackenzie which gives interesting information on the subject of Ceylon Tea in America.—I am, sir, yours faithfully,

A. PHILIP,  
Secretary, "Thirty Committee."

On a leading avenue in Chicago, close to the wholesale grocery district, there is a large building called the Ceylon Building, full of business offices, one of which is Masravilla Ceylon Tea Co. On the ground floor of a large restaurant, called the Ceylon, on the menu card of which is to be found "German sausages a la Ceylon, Pork and Beans a la Ceylon," but no Ceylon Tea, yet I met several handlers of our teas at luncheon there.

From Chicago I went about 500 miles West to Omaha, to see the splendid Western Exhibition—the grandest thing of its kind ever done in America, excepting the Chicago Fair. Omaha, west of the Mississippi, was 50 years ago inhabited by Indians, buffaloes and a solitary trapper or two: it is now the thriving door or entrance to a country having 22 millions of white people.

A magazine which I send gives pictures and an account of the show. In it is also to be found on pages 81 and 82, an interesting account of great Trusts, like the Sugar Trust, and a sketch of the Arbuckle's.

The Japanese had an exhibit which they called a tea garden, but it was not in good situation, in that it was a strong contrast to Lipton's beautiful pagoda, which was in the most frequented part of the Exhibition, and which in the three days, I was there, certainly had a deal of patronage. It cost about £800, of which Ceylon contributed £200.

I called on Mr. Porter of the Omaha Tea and Coffee Co. He said Ceylons had an increasing trade in the teas, but it was still very small. I found he had four chests of good Ceylons, besides Lipton's, Tetley's and the Mousoon packages.

Mr. Weaver, the Manager of the Tea Department of Paxton & Gallagher, a leading wholesale grocery house, took a great interest in our teas, especially in our green samples, which he appraised very highly. He had been in Japan himself, as a buyer, and said he saw few teas there, equal to the Brunswick Young Hysou, yet the very slight difference between the Brunswicks and the Japans in use, might make the former difficult to sell for a time. The chief differences were a little too much fermentation which made the water when infused slightly red, whereas Japs do not; and the want of artificial coloring to which the grocer has been accustomed.

I asked him what influence he thought the World's Fair Exhibition had on our teas. He said, many of their customers when they returned West from Chicago, "thought they wanted our black teas," his very words; but when they bought them, they did not like them, because they could not stand steep steeping. The usual story.

But he added "had Ceylon exhibited those green samples at the World's Fair, you might be selling millions of pounds in the West now."

I dined at the best restaurant in Omaha. I asked for Ceylon tea, the waiter did not understand. The proprietor came forward: he had never heard of it, he kept Japans, but he had never tasted tea in his life. He was an elderly German.

From Omaha, I went north to St. Paul and Minneapolis, known as the twin cities, and containing about 450,000 people. They are the centres of the wheat and corn milling and lumber trades. I called on a firm of wholesale tea merchants. I found their store full of Japan tea chests. I asked if they did anything in Ceylon teas. They said about 25 chests a year; we keep them to mix with very weak Japs, they bring up the strength.

I saw Mr. Wenham, the tea buyer of Griggs and Cooper, Lipton's wholesale agents in St. Paul. He told me they sold a few hundred chests a year to the trade, chiefly in Montana, where there were a lot of Welsh and Cornish miners. They had also an Indian and a Ceylon Tea packet of their own. I asked him if he would not make a special push with our teas, provided I guaranteed him \$5 a week for some months towards wages of demonstrators.

His reply was what I have heard from many, but which he put in fewer and terser words than usual. It is a clear statement of the condition that exists everywhere in business, where business is successfully conducted. He said, "I keep my appointment here by making a profit for my department. Each of our travellers cost \$7, say 30s. a day for travelling expenses, besides his salary, and the profit we expect him to make for us. Each traveller knows we have no use for the man who cannot do that. Were the traveller to spend his time trying to sell the grocer what the consumer does not want, and what would be returned on our hands, he would be a ruined man. Men in business with keen competitors cannot afford to push what is not wanted, unless they want their rivals to get their trade. Our travellers have not time for proselytising, only "*cranks can fool with missionary work.*" I was so much impressed with his direct way of putting it, I wrote down his words at once.

About my offer to pay for demonstrations, he said he would consult his partners of the firm, and let me know. He has not written, so it is clear that they did not think it worth while.

This difficulty meets us everywhere. We can work only through grocers, it does not pay them to give time to our teas. Customers pressed to take those black teas by their grocers, try them, don't like them, and go to other grocers next time. I may mention that \$7 a day cover the expenses of travellers only because they stop at all small towns, short distances apart, going only to large towns as I do. The railway fare alone averages double that amount.

From St. Paul I went away north 500 miles to Winnipeg, travelling chiefly through North Dakota, a state which allows no liquor to be sold in the trains while passing through it. Buffet must be kept closed. The soil is very rich. It is a country of wheat, corn and divorces, the former being the main support of the farmers, the latter of the lawyers and hotels. But the latter industry seems doomed or at all events it looks as if it were to lose the privileges it has hitherto enjoyed. For I see the lawyers are advertising to restless or unhappy couples everywhere to hurry up, as the time requisite for residence, before securing divorce, may shortly be lengthened.

So far as the eye can see for hundreds of miles along the river, the country is a level plain, with hardly a tree visible, except a few fruit or shelter trees around some of the farmers' houses. The harvest has been reaped, and steam threshers and steam elevators are everywhere in evidence. It is strange how few animals, horses, cattle or sheep one sees. Yesterday on a long day's journey, I saw a herd of pigs, today a flock of turkeys and a few horses.

In Ireland the pig "pays the rent," but in the West, I see by a Kansas paper, "the hog is the debt payer, the mortgage remover, the promoter of progress and the buttress of prosperity. High class wines are impossible among low class people" Kansas' wine are the product of "Kansas' grain and brain."

The stations on the railway are the centres of industry; here is the Post Office, the school-house, several churches, always the hotel, a store where everything is sold, groceries, clothes, furniture, etc., and above all, the huge elevator to which the farmers bring their grain for export. The store has nearly always a large sign, which is visible from the window of the car. Foreign names prevail; the last one we passed bore the names of Bovis and Ramo-usaan, suggestive of old clothes, tobacco and coffee, hardly of tea. What they can be, Turks, Armenians, Bulgarians, Jews certainly.

Nothing surprised me more than the number of small churches. At one small village yesterday, I saw four close together. At several two. Competition and Salvation is as strong here as edibles, drinkables and wearables, perhaps because of the many nationalities. On telegraph poles are many advertisements, "Yeast-foam Baking Powder," "Carter's Little Liver Pills," "Hood's Sarsaparilla," "Chew Century Plug," "Chew Battle Axe Plug," etc., etc.

In the country between the stations are innumerable large fires. Fifty years ago, these would have suggested Indians torturing the whites or vice versa. Now it is only the farmers burning the straw, which seems of no value as yet, while wheat crops can be secured without manure.

In the morning when the train stopped at a station a boy came in selling papers. I bought one, and each page of it reminded me we were now in Canada. For in it were not less than five advertisements of Ceylon Tea, none of which were paid for by us. It was a Winnipeg paper. Winnipeg at present contains about 45,000 people, and is the capital of Manitoba, which has about 200,000. It is a great distributing centre, being on the junction of the Red and another river, and the converging point of many lines of railroads. It should some day be a very large city.

It has many initial advantages. The sign boards bore the names of McKenzie, McLean, MacIntosh, MacDonald, MacFarlane, Fraser, etc., only one Elsingher caught my eye, then "Dewar's Whiskey," "Best Hot Scotch in Town" and Ceylon Tea were prominent everywhere. Never had I seen so much advertising of our Tea in so small a compass. The papers were full of it, huge boards, 12 to 20 feet square stared at one from every point of vantage, bearing the name of some well-known brand, "Tetley's" being in this respect, far a head of all others. But Lipton's, Salada, Mousoon, Blue Ribbon, Ram Lal, etc., were everywhere. It was easy to come to the conclusion that we need spend no money in Winnipeg.

WM. MACKENZIE.

Kandy, 4th Jan. 1899.

SIR,—I herein enclose letter from Mr. Mackenzie to Mr. Lane dated London, 14th December, also extract of letter dated 15th December together with the letters referred to from Messrs. E. A. Willard and Richard Blechlynden, all of which are of considerable interest and I would ask you to have them published in full accordingly.—Yours faithfully,

A. PHILIP.

Secretary, "Thirty Committee."

London, 14th Dec., 1898.

DEAR LANE,—In my last report, I said I stopped

AT DETROIT

on my way back to New York. Lipton's and Tetley's teas are held by some distributors in this town, but the only teas that are vigorously pushed are the Salada brands. Mr. Larkin has a branch office in the town, and a man whose business it is to visit the grocers' shops. His teas are seen in 512 shops, but although advertised regularly in the daily papers, the average sales are about 370 lbs. a week, or less than 1 lb. per shop per week. No wonder the grocers say they can give no time or attention to articles the public do not want. This is

A GREEN TEA TOWN,

so far as tea is drunk at all, but there are many people from the old country whom we are gradually reaching. For instance, Mr. Larkin's man told me the following story:—He called on a grocer several times, who had rather a prominent store, but who refused to take in any of Larkin's packets, because there was no demand for pure black tea. A Welsh family settled near this grocer's place, and the lady made her grocery purchasers there. She complained bitterly to the grocer of the quality of his tea. He gave her different kinds, but could not satisfy her. Wishing to retain her custom, he got a package of "Salada," which he sent her. She called next day, and thanked him, saying that was what she wanted. The grocer said,

"there is no use my keeping that tea, as you will be my only customer." She said, "No, there are several old country families near me, I'll ask them to tea, and make customers for you." Within a week, she had sent him several customers.

This surprised him so much, that he took a packet home and had his wife make it. He tried to swallow it, but felt he was getting sick, and spat it out. But his customers returned for it, and he resolved to give it another trial. This time he forced himself to swallow it, he tried it again, and now he and his wife drink it regularly!

A few days after returning to New York, Mr. Blechynden and I went to Philadelphia, Baltimore and Washington.

AT PHILADELPHIA

We found our friends Messrs Park & Co., had a large demonstration at

A "FOOD SHOW."

In the Tea Department they had ten girls. It was a wet day, and there were few people there. I considered it a very good advertisement for Parke and Co., who being wholesale people, wished to impress the retail grocers, but far more expensive than the occasion justified from our point of view, as we were contributing towards the cost.

I asked for a cup of Ceylon tea, and one of the girls gave it to me. I asked her if she liked the tea herself. She replied "I can tell the people all the good points of the tea, but candidly I cannot drink it myself." I pointed out to the manager that it would be better if he had girls who liked the tea, and could speak from their own experience. He agreed with me. But he said, the woman in charge is English "and drinks Ceylon tea, but we cannot get American born girls to drink it. We have to be content to have girls who can repeat intelligently the story we teach them about it."

We have three other Firms who are helping us strenuously in Philadelphia—advertising and demonstrating. Two of them are eager buyers of any Ceylon or Indian greens that come on the market

IN BALTIMORE

I found Tetley's teas for sale, and bought Ceylon tea in several shops—But the total quantity sold is very small. I asked one firm why they kept it, as they sold so little of it—the reply was—"There are people of all 'Nationalities here, and those from the old country asked for it." We found it was dropped and forgotten at one large Department store, where we had assisted to demonstrate and introduce it last year.

This we found was also the case in

WASHINGTON,

notwithstanding demonstrations and advertising.

Two days after returning from Washington I saw

AN ARTICLE IN A CHARLESTON NEWSPAPER,

in which it was said "Indian tea has twice as much tan-nin (poison) as Japan tea" &c. &c. This was probably inserted by the Japanese. But the curious part of it is, that when I called on a tea-packer and blender that afternoon in New York, he showed me an order he had a few days before, for so many packets of Japan and Ceylon teas, from a Charleston Firm. Also a letter he had a few days later, cancelling the order for Ceylon tea. I have no doubt this was due to the article in the Charleston paper.

I know that two papers in Canada which had been advocating

A DIFFERENTIAL DUTY

in favour of our teas in Canada, suddenly "modified" their views, when the Japanese sent them some large advertisements for insertion. This is more legitimate bribery than that which caught the English Aristocracy, for Hooley's "Front page" in his many prospectuses. However, I believe there is now every chance that a duty of five cents (2½d.) will be imposed in Canada, with a differential of 25 per cent rebate in the case of British grown tea.

I see by Messrs. Gow, Wilson and Stantons, figures to end of September, that 1¼ millions more Ceylon

and India tea went to America during the first nine months of this year, than in the same months of 1897. This is

VERY ENCOURAGING,

seeing that the war tax has had sent an injurious effect. But for the tax, I believe, we should have been three millions ahead of last year.

W. Martindale, the Philadelphia tea merchant, who wrote two years ago to Li Hung Chang, telling of the evil our advertisements were doing to China tea, has recently written to the leading commercial and trade papers, telling how with fear and trembling he began using our teas in his blends. He found

COMMENDATION FOLLOWED COMMENDATION,

the more frequently, the larger proportion he used. He candidly admits his

TRADE HAS TREBLED

by the introduction of those teas in his blends. He blends them with Oolongs, where Oolongs are used—with Formosas where those teas are in favor, and with pure greens for the rest.

Their cheapness too, as compared with the teas from China and Japan which the standards admit, is much in our favor, and this fact we are advertising in all trade papers of any standing.

Then the packets of pure Ceylon or Ceylon and Indian tea, are being so energetically pushed where ever there are British residents in the States that we are

GRADUALLY GAINING

their trade.

Yours truly,  
WM. MACKENZIE.

Extract from Mr. Wm. Mackenzie's letter, 15th Dec. 1898.

A correspondence has been going on in the columns of the leading New York commercial papers, on the comparative merits of Ceylon and Indian teas, as compared to China and Japan. It was started by a Tea Broker "Mr. Willard." I enclose his last letter, with Blechynden's crushing reply. You will see how Willard tries to prejudice us as Foreigners. Also his allusion to the "Stuff used in fertilizing." I think the reply will make him sorry he spoke.

PLANTING IN AMBAGAMUWA :  
A PROPOSED TEA DUST COMPANY.

Ambagamuwa District, Jan. 4, 1899.

DEAR SIR,—It may possibly be of interest to you and your readers and to the planting world in particular to be given a glimpse at the rainfall of this the wettest district in the island for some years past. Herewith rainfall for six years, as gauged on this estate:—

Year	inches.
1893	207.70
1894	209.93
1895	212.40
1896	200.06
1897	203.82
1898	174.48

You will thus notice that 1895 gauges the highest rainfall, whilst 1898 has the lowest record for the six years. Had only the rainfall last year been distributed evenly throughout the 12 months, no one could have wished for a better year for tea; but as the year was phenomenally remarkable for fiftful weather such as we never experienced before, the attending results are easily accounted for. Estimates, as a rule, have been anything but realized, but the appearance of the tea fields ought to compensate for shortage of crop. Never have I at this time of the year seen the tea look so luxuriant. Given good seasons, Ambagamuwa ought to have a record year in 1899.

Why should we in Ceylon not have a company formed to buy up all the dust tea, to distribute the same for sale amongst the millions in the island who at present cannot get a decent cup of tea for want of centres where a cheap tea can be easily procured to suit their scanty purses. A company formed, having selling centres in every district and village, would be of immense service both to the tea planter and the unfortunate village squatter. There will then be no

difficulty to dispose of our cheap teas. This would also tend to a very great extent to minimise thefts of tea from factories! Would not Lebbe & Co. find their sweet occupation gone, when a really good drinkable tea can be offered by the (may I say) "Tea Dust Company"'s agents at say 30 cents a lb. in packets, or 20 cents a lb. in bulk. The "dust tea" invariably sells at from 12 to 15 cents in the local sales and not very much more in Mincing Lane. Apart from this, it would be to the interest of the planters one and all to sell their "dust tea" to such a company direct from the factories and thereby help to strengthen both the London and Colombo markets for their better grade teas.

Would not some of our philanthropists who have the island's interest at heart, and who have the push and energy and the means to promote such a laudable and yet withal paying enterprise, move in this matter? I see the Indian merchants have already made a start. Are we to be behind a country against whom we have always had the credit of forging ahead? Wake up, ye Colombo Company promoters! here's a scheme worthy the name! Wishing the "Old Rag" a very prosperous and happy New Year—Yours truly,  
C. T.

#### CACAO PREPARATION AND PRICES.

DEAR SIR,—One of your correspondents lately called attention to the methods, in vogue amongst native cacao-growers, of drying their cacao beans with little or no fermentation, and attributed the continued low prices partly to this practice. But recent enquiries clearly show that this new, cheap method of curing cacao is by no means confined to native growers and thieves. On several estates a system is now adopted of washing the beans in the morning after the pods have been broken, and drying gradually for periods of three hours daily. By this method a large amount of the sugary mucilage is dried with the beans and their weight consequently increased. The old idea of getting an outturn of bright, well-washed, well-fermented beans has been given up, and Ceylon cocoa, instead of topping the market, seems likely to take the lowest place!

It would seem to be more reasonable for planters to combine in adopting the remedies suggested by the Cryptogamist to exterminate the cacao fungus than to try to make up estimates of crop by these methods.

A complaint was recently made in your columns against the Chamber of Commerce entry, in prices current, of cocoa as 'unpicked and undried': as regards a considerable quantity the heading appears to be perfectly justifiable. It would be fairer though to have two headings, 'fermented' and 'unfermented,' so that honest growers should not suffer for the artful dealings of others.

We have, unfortunately, merchants in Colombo who will buy the lowest grades of any product and make use of the prices so paid to lower the rates for all grades accordingly. Can nothing be done to prevent the sale of such produce? Can we not have some standard fixed so as to prevent unprincipled dealers and receivers pandoring to the ingenious middleman? With Ceylon Tea "faked" in the way "Incinerator" lately pointed out, and cacao "cured" without fermentation, it is hardly fair for the Ceylon planter to continue to throw stones at the "heathen Chinese"!—Yours faithfully,

#### A MISCELLANEOUS PLANTER.

#### RUBBER AND COFFEE.

Coonoor, S. India, Dec.

DEAR SIR,—Can you recommend any short description of Rubber cultivation, more especially as regards Castilloa in conjunction with coffee as a possible shade?

Hevea is, I understand, a surface-feeder and would not therefore suit coffee; regarding Castilloa the information especially wanted is:—

Suitability as shade for coffee.

Distance for planting.

Returns per tree at 3,000—4,000 feet elevation.

Has it been tried successfully as a sole product?—Yours faithfully,  
W. RHODES JAMES.

[Our compilation of available "Rubber" information for the planter is in the printer's hands. Castilloa is just as much a surface-feeder as Hevea and we have the authority of the Director of the Botanic Gardens for saying this; and neither of these rubbers will do well above 2,000 feet.—Ed. T.A.]

#### PROPOSED CEYLON "TEA DUST CO."

Ambagamawa, 10th Jan., 1899.

DEAR SIR,—With your kind permission, it is my desire to lay before you and your readers such figures as would convince the most sceptical, that a "Ceylon Tea Dust Company" started to purchase and dispose of all the Dust Tea manufactured (in Ceylon Factories) for consumption within the Island, would not only reflect to their credit as a laudable philanthropic move, but as a scheme which must undoubtedly in the near future prove a very remunerative undertaking. As I pointed out in my last, it would be to the interest of all planters to bind themselves to sell their Dust Teas (*bona fide* dust only) to such a company at say 15 cents a lb, packed in chests and delivered in Colombo. A slight concession may be made to those estates at an elevation over 3,000 ft. in the shape of the "Tea Dust Company" paying the rail freight and giving those estates 15c nett in Colombo. It is not the 15c per lb. we can thus get, that would revert to our benefit, but the enormous advantage gained by keeping back these teas which now go to swell the Colombo and Mincing Lane markets and which must tend in a great measure to keep down our average. When they are no more available to those markets it is but natural to suppose that prices for our better grades must harden: a rise of a penny for these grades would more than compensate those estates where Dust Teas may now sell at a few cents higher than the 15c limit, I have quoted as the selling price of the dust to the "Ceylon Tea Dust Company" *only*. This is the main object we must keep in view.

Now for figures! Let us take the Ceylon Tea crop for 1899, and for the sake of argument put the crop down at say 120,000,000 lb—5 o/o (five per cent) of this will be Dust Tea equal to 6,000,000 lb. available for the "Ceylon Tea Dust Company." The company at its inception cannot well be expected to dispose of this vast quantity in the Island: those thousands who now know tea only by name and perhaps not, have to be reached; and this can only be done by dint of firm perseverance of a good working staff scattered throughout the length and breadth of the Island. We can then have no reason to doubt that the whole of this quantity within a few years would be more than annually absorbed by the 2,000,000 or so which form the poorer classes of our Island population—every outlying village must be reached and no effort spared to have a good drinkable and yet withal a cheap tea within the purchasing powers of the poorer classes.

A company disposing of these teas at 30c a lb. in one lb. leaden packets or 22c a lb. in bulk, can safely reckon on a profit of 5c a lb. and when such a company can dispose of the 6,000,000 lb. annually, they will turn over the nice little sum of Rs300,000. With such a figure to be reached, are there no philanthropists in our metropolis to rise to the occasion and float such a company?

We are now verging on a very critical crisis : the Currency Committee's deliberations are nearing the end, what the ultimate result is to be no mortal can foresee ; but of this much we may rest convinced—their utmost endeavours would tend to bring about a scheme to benefit the *poor unfortunate* Indian official element who lose such a fortune with a low exchange. The agriculturists and producers of that vast empire are an unknown quantity, why give a second thought of them ? let them rot !

Let us therefore be up and doing, seize every opportunity and spare no effort to overcome all impending evils. We have to face the inevitable ; let us use every means in our power to alleviate the trouble when it does arrive.

With a high exchange and present prices few indeed have worked 1898 on the right side of that office ledger ; and if prices are still further to fall, blank ruin would and must overtake a large proportion of the Ceylon estates. The only feasible outlet to avoid a recurrence of a falling market is to use our utmost endeavours to lessen as much as possible the export of tea. The old woman was heard to say in a very serious emergency "every little helps" and to the best of her ability I am told she rendered such help. In the same manner. Why not our city magnates take the invitation and help the unfortunate tea farmer by finding a market at this end to dispose of his lower grade tea and thus help to ease the export trade. An Indian planter from Chota Nagpur was years ago on a visit to me ; in the course of a discussion he remarked "To you Ceylon men nothing seems impossible." Oh ! that it may in this instance prove to be gospel.—Yours truly,

C. T.

#### DR. TRIMEN'S "FLORA OF CEYLON."

Royal Botanic Gardens, Peradeniya, Jan. 12th.  
SIR,—May I, through the medium of your paper, ask those who have received from the late Dr. Trimen, presentation copies of his "Flora of Ceylon" to inform me of the fact as early as possible, and at the same time to let me know which volumes and plates they have received. Sir Joseph Hooker informs me that volume IV. is now ready, and he wishes to present it to those to whom Dr. Trimen presented copies of the earlier volumes. Some of those who have received presentation copies from Dr. Trimen must, I think, have complete sets, as I have a number of odd volumes which Dr. Trimen left.—I am, etc.,

JOHN C. WILLIS.

#### THE FLIGHT OF BUTTERFLIES.

DEAR SIR,—"Rolling-stone"'s letter is very interesting. If it were possible to get a few more careful observers to report the time at which the first day's flight of butterflies passes different stations from south to north of the island, it would be very useful. We should learn the rate at which they travel, and the northern gentry could tell us what becomes of them all. Do they all fall exhausted into the sea at or north of Calpentyne, and, if so, does the annual flight attract large shoals of fish to that part of the coast ?

Your correspondent does not tell us how many species composed the flight, nor on what vegetation he saw the larvæ feeding a couple of months previously. They must create a perfect wilderness.

I think your correspondent is wrong in supposing the butterflies travel only in very bright, hot weather, I have seen them going over the Ilaputale and Balangoda ranges on dull days against a cold wind, but rainy weather stops them. As to their preference for the Government roads in level country it is probably not altogether on account of the extra warmth, but they incur less danger there from birds and lizards and other enemies.

The flight seems this year to be later than usual, perhaps through cold weather prevailing while the caterpillars were feeding, or during the chrysalis stage.—Yours faithfully,

COLLECTOR.

#### COLOMBO TEA SALES: INCREASED SUPPORT WANTED.

Gammadua, Jan. 16

DEAR SIR,—I ask your permission to impress on my brother planters how important it is to them and the tea industry generally that the Colombo Wednesday's tea sales should be better supported by all who have the power to offer their tea for sale in the local market.

The market was never in a better position, I understand, than it is now, for sellers getting similar value for their tea as they would get were they shipping to London ; while the local vendor has the advantage of prompt payments against five to four months' delay when shipped to London.

In addition to the many buyers for Australia and the Continent of Europe, there are a number of Russian buyers who have for a time settled in Colombo with a view to buying large quantities of our teas should suitable teas be offered. Every effort, therefore, should be made by independent proprietors to encourage those gentlemen to remain in our midst, by trying to meet their wishes and the wishes of other buyers, by offering not the Red-Leaf Dust and inferior grades only of their breaks, but by offering full breaks of the various grades.

The local demand will thus be met and Continental and other markets than London supplied direct. Those shipping to London would find that prices would rise there and as local prices are in a great measure guided by London market values, we should reap the benefit here.

If planters do not keep up the supply of good household teas in the local market, we shall in all probability find that our Russian buyers will have to leave, being unable to get what they want, and we shall have ourselves to blame if they turn their attention to India or Japan,

By the latest shipping returns, Germany had 256,584 lb. of our tea in 1897, and 352,252 lb. in 1898 ; Russia 439,349 lb. in 1897 and 2,714,003 lb. in 1898. Now we are bound to ship to both countries much greater quantities this year from Colombo, if buyers can get the teas they require. Then we have Australia taking over 15,126,000 last year, and America ought to take more direct, from this than 2,180,000 after so much expenditure in advertising and in trying to meet the requirements of their markets : while the other countries in the shipping list referred to would all take more if suitable teas were offered. For the above reasons let every one who has the power do his level best to support the Colombo market, and thereby lessen the quantity to be thrown on the London market which has more than it requires.—Yours faithfully,

JAMES WESTLAND.

INDIAN AND CEYLON TEA EXPORTS:  
HAS THE MAXIMUM OF EXPORTS  
BEEN ATTAINED?

Our question may seem a startling one to some people; but there is more in it than appears on the surface. India has made very little advance in her tea exports during the past three seasons. The average up to the season closing March-April next, will probably be under rather than over 150 million lb., and it would not be surprising if this were found to be about the maximum crop—a little more in a good season; rather less when not so favourable. We may, of course, be reminded of the wide area of young tea—in Southern India especially—but one has only to read Dr. Geo. Watt's book regarding the pests affecting tea in Assam to realize that there may be agencies at work, calculated to counterbalance the returns from tea yet to mature,—apart from the discouragement which lower prices must offer to further extensions.

So in Ceylon. It is quite possible that with 120 million lb. of tea exported, we may have reached our practical maximum,—running up some millions beyond perhaps in a favourable season, but falling behind when adverse circumstances prevail. For 1899, few men anticipate a much, if any, larger outturn than that for the past year,—indeed the district estimates are coming in for rather less. Nor is this due simple to “finer plucking,” nor to the influence of low, non-profitable prices, shutting up native gardens and also poor fields on regular plantations. It is useless to deny that over a considerable expanse of our country, the crops are now affected by the same agencies as in Assam, namely the blights and other pests described by Dr. Watt. One Visiting Agent with a considerable area of young tea, has distinctly told us that the additional crop from this source will not do more than make up for the shortage he estimates from the older tea in his charge, from the causes we have referred to. There is nothing alarming in this. The pests referred to can be fought and they are more or less fugitive according to season. The tea planters concerned must soon commence a systematic attack on the enemies of their plant albeit that the tea-plant is one of the hardiest and most persistent that has ever come under cultivation in the tropics. Nor is it needful to take a long view of things or to say more than that, probably, the maximum export of Ceylon tea—*unless prices permanently improve*—has been attained. What is of immediate practical importance is that Ceylon is not likely to do better in 1899 than in 1898, and that, therefore, London dealers must be prepared for a considerably shorter supply, since Russia, Australia and America are bound to increase largely their direct demands. With no more than from 88 to 90 million lb. of Ceylon tea going to Mincing Lane during the current year, surely prices are bound to improve?

DUTCH COLONIAL TEA *versus* ENGLISH  
DITTO IN CONNECTION WITH THE  
RUPEE EXCHANGE.

Under the above heading the *Indische Mercuur* of Dec. 17 last, has a further communication from Mr. J. van der Chys, dated Delft, Dec. 17, as follows:—

A certain John McEwan writes in the *Grocer* of the 3rd inst. the following, which, in complement of my too former articles on this subject in the *Indische Mercuur*, is perhaps also of interest for a portion of its readers:

[Then follows a translation of Mr. McEwan's letters; and Mr. van der Chys concludes as follows:—]

In connection with the foregoing it appears from the report of the directors of the “Tea Corporation of Ceylon” for the year ending 30th June last, that the results were anything but brilliant. That period, however, was distinguished by an uneasiness in the whole (English) tea industry. The rise in the rupee exchange, the increased prices of rice, together with the high freights which during the course of the year were the order of the day, have caused a considerable increase in the cost of production, whilst on the other hand the low prices of tea in general aggravated the position of affairs still further. Our tea production amounts for the year to 1,112,606 lb. The profits realized on the plantation amount to £1,702, after writing off the loss for the first six months and the expenses incurred in Ceylon. After deducting the expenses in London and interest on capital the loss is reduced to £1,620.

PRODUCE AND PLANTING.

THE RUSSIAN TEA MARKET.—The Baku correspondent of the *Times* in a communication, in which he discusses the Russianising of the Black Sea trade, makes an interesting reference to the tea trade. He says: “Meanwhile Russia, by the creation of the Volunteer Fleet, rendered it possible to take into her own hands her trade with the Far East. This fleet, the joint product of national patriotism and of Government aid, was designed to fulfil the double purpose of commerce and defence, to serve as a mercantile marine during peace, and as a subsidiary naval force in event of war. It received an annual subvention of £31,600 from the State, and by low freights quickly increased the exports from Odessa to Vladivostok five-fold, from 6,567 tons in 1890 to 32,225 tons in 1894. During later years it has undergone a development of much interest to the British tea industry in India and Ceylon. From the first it brought back considerable quantities of tea, and it determined to increase this branch of its business by calling at Colombo. The Ceylon planters promptly took advantage of the cheap transit thus afforded, and a considerable quantity of their tea is now finding its way into South Russia, and even across the Caucasus and Caspian into Central Asia. The efforts of Russia to destroy the Indian land trade with its Asiatic territories told in favour of the sea route. Under the regulations by which the Khanate of Bokhara was included in the Russian customs' zone, the duty on tea imported from India through Persia and Afghanistan was raised, while the same article, if landed at the Russian port of Batum on the Black Sea, was passed on in transit without paying duty, and was charged by the Bokhara customs house at less than one-third of the duty levied on teas entered for consumption at Batum. Such transit tea is of an inferior green quality and it remains to be seen whether the Indian tea exporters can recover by the Russian

Volunteer Fleet via Ceylon, the land trade which they have lost through Persia and Afghanistan. In 1845 the so-called 'Indian' tea that passed through Batum to the Caspian and Central Asia amounted to 800 tons; the last Consular report returns it at 1,330 tons in 1897. The trade in this low class green tea is independent of the large question of the introduction of the finer Indian teas into Russia itself. A movement in that direction is taking place and the Russian shipments of British-grown tea from Ceylon rapidly rose to 439,350 lb. in 1897, besides over one and a half million pounds of Indian and Ceylon teas from London, and an unknown quantity transmitted through German ports. Hitherto the Ceylon and Indian teas have only been used in Russia for blending. If they could be brought into general use a vast new field would be opened to the British industry. But this would involve either a change in the Russian taste or an adaptation of the Indian teas to the Russian market. The movement may, however, receive an impulse from the expected steps towards the equalisation of the Russian duty on sea-borne and land-borne teas, as part of the revised customs arrangements incident to the extension of the Siberian railway towards China."

**INDIAN TEA IN TIBET.**—Mr. Robert Laidlaw calls attention in the *Times* to the revised treaty between India and Tibet, which is subject to revision in May next, and upon which the Indian Tea Association is no doubt keeping an eye. Under this treaty Indian tea is absolutely prohibited from entering Tibet. To the very large class who are directly or indirectly interested in one of India's chief industries, one in which many millions of British capital are employed, it is very important, as Mr. Laidlaw points out, that this restriction should be removed. The Tibetans are great tea drinkers, probably the greatest in the world, their estimated consumption being 12 to 15 million lb per annum; all of this is now taken from China, whereas, but for the "closed door," this trade would naturally be done with India, which produces a better article at a lower price. The Tibetans have now to pay a high price for a very inferior brick tea, and, as the distance between the tea districts of India and Tibet is much shorter than that over which the China tea is carried, transport would be cheaper; the change would therefore be beneficial alike to the Tibetans and the Indian industry. "The Tibetans have free access into India and no restrictions are put upon their exports into that country," says Mr. Laidlaw. "Chinese influence alone is responsible for our not having the same privileges, and it was Chinese influence which prevented the friendly commercial mission which the Indian Government proposed and prepared to send to Lhasa in 1889. The present position is a most humiliating one. Surely the influence of Peking cannot longer be allowed to retard British enterprise and shut our trade out of a country where the Chinese have no more right than ourselves. If our engineers were allowed to go into Tibet to unearth their minerals it would be an immense advantage to the Tibetans themselves, some gain to us, and no detriment to China, but for that I fear the time is not yet. When revising the treaty the Government should be satisfied with nothing short of equal privileges to those enjoyed by China in the east and Russia in the north. Give us an 'open door,' and in a few years Tibet will be a large and increasing market not only for Indian tea, but for many articles of British manufacture."

**NICE TEA.**—The competition in the retailing of tea has brought about some interesting ventures in the art of tickling the consumer. Here is a list of presents advertised by a retail tea company: Given with quarter pound of tea, at 7d per quarter: Large tin saucapau (with steamer), pair of lace antimacassars, two large honeycomb towels, hairbrush (all bristle), good washleather, fancy china cream jug, strong wood horse, cocoa broom (red back), strong bass broom, six-part tin kettle, good clothes or shoe brush. Given with half-pound of tea at 7d per quarter: 8 ft. 6 in. bamboo cornice pole (rings and ends complete), large oval bath, white table cloth, clothes basket (good size). Given with one pound of tea at 7d per quarter: Nickel

lever clock, wool-bordered parlour door mat, white table cloth (large size), one yard best floor oil cloth (two yards wide), blanket (good size). With two pounds of tea: Eight pint copper kettles. With four pounds of tea: Pair blankets (full size). Customers may save their tea checks for any article they see in shop or window, and change them at any time.

**PLANTING IN NEW GUINEA.**—Possibly there may be an exodus of Indian and Ceylon planters to New Guinea. As will be seen in another column, Sir Wm. Macgregor says that the colony is well adapted for tea, coffee, tobacco and cotton, and the climate is not bad, land is cheap, and there are friendly natives who may be induced to work. The fear of being eaten need not trouble settlers, for cannibalism is nearly a thing of the past.

**QUEENSLAND COFFEE.**—Not content with her triumphs in the way of sugar production, Queensland agriculturists recently turned their attention to coffee as there are considerable areas of tropical coast lands suitable for the cultivation of the coffee plant. A quantity of unhusked coffee berries had just arrived from the colony for introduction in Mincing Lane. Half-a-dozen leading firms of brokers have reported upon this Queensland coffee, which they state to be well cured and dried, and to compare well with the Central American article in general quality.

**WHAT THEY ARE DOING AT KEW.**—The organisation at Kew Gardens with regard to the culture of tropical plants is admirable. Special departments have been founded in the more important colonies, which keep continually in touch with the establishment at Kew on botanical questions, and especially those of economic importance, and there are, in addition to these larger Colonial establishments, a considerable number of botanical stations, first founded to meet the special requirements of the smaller West Indian Islands, and since extended to West Africa, and even to Fiji. In many of our colonies the fruit trade of late years has become of great importance, and to this Kew has paid special attention. With its aid the tree tomato, the chocho, and the cherimoyer have been transferred from the West Indies to Ceylon and India, and the debt has been repaid by sending back new varieties of bananas and mangoes. There are also many plants which are valued not for their floral beauty, but for their utility. The fibre plants, as one group about seventy in number is collectively called, of which hemp and flax are the oldest and most familiar examples, have now been carefully studied at Kew for not a few years past. China grass forms the subject of a recent article in the *Bulletin*, from which it appears that, if certain difficulties could be overcome in preparing the fibre, it would be a formidable competitor in the market with silk, flax, and the better qualities of cotton. The cultivation of rubber plants and the discovery of new sources of this material, now that the demand for it is so great, is a question which evidently has not been neglected at Kew, and some of our colonies seem likely to benefit by its studies. Besides these, a host of other horticultural questions of economic importance have been investigated—such as Bermuda arrowroot, quinine, vanilla, the growth of dates, sandal wood, incense trees, even the artificial production of indigo. In all this work the indefatigable labour of the late director, Sir Joseph Hooker, and of his successor, Mr. Thimelton Dyer, seconded by the very able scientific staff of the Gardens cannot be too fully recognised.

**THE ADULTERATION OF SPICES.**—Although the more romantic side of the spice trade is referable to a bygone time, it is not without its pleasant fictions at the present day. The piquant flavour of spices depends upon a volatile essential oil which readily diffuses itself through any less pungent commodity with which it is brought into contact. Hence it follows that the adulteration of spices is both easy and profitable. It is possible, indeed, to manufacture "ground spices" without any admixture of real spice whatever, and as mills exist for the express purpose it cannot be doubted that such a form of enterprise is in active existence. Ginger is "made" from various corn

meals, from ship-biscuit, turmeric, and cayenne. Pepper is turned out which consists exclusively of gypsum, mustard husks, cereal starch, linseed meal, and powdered capsicums. Cloves are ground up with 50 per cent. of charred walnut shells; while the bulk of cinnamon is increased by admixture with coconut shells. In all these cases a judicious soupçon of cayenne is added to supply the lack of pungency in the adulterants. Thus are compounded those gay deceivers the "spice mixtures," which, masquerading as a "term of art," are ever in waiting to beguile the unwary.

**RICE CULTIVATION IN RUSSIA.**—The Russians commenced rice cultivation in the early eighties, and in 1888 the first rice cleaning steam factory was opened in Baku, producing 100,000 pounds (1,612 tons) the first year. According to Consul-General Holloway, of St. Petersburg, there has been a steady increase in the production, and there are now five rice-cleaning steam factories in operation with an annual production of 3,000,000 pounds (48,387 tons). An additional factory is now in course of construction, which is to be supplied with the most improved machinery. The demand for rice is increasing, and it is now generally used by the peasants throughout the empire, the quality of the native product being equal to that of the imported article.—*H. and C. Mail*, Dec. 30.

MARKET FOR INDIAN TEA SHARES,  
1898.

It was not until well on in the spring of this year that the full effects of the unfavourable conditions prevailing during 1897 (referred to in our annual review of that year) began to make themselves manifest in the results actually obtained from that year's working. When accounts came to be balanced up it was found not only that the actual rupee expenditure on the gardens had, in most cases risen owing to increased cost of food and labour competition, but that the abnormal rise in the rupee, occasioned by the closing of the Indian mints to silver, had told much more heavily against the gardens than even the most pessimistic croakers had foretold. The weight of the crops, too, kept down the price in Mincing Lane, so that practically tea producers found no compensation at all to balance off their higher costs of working. Those companies, of course, which had laid aside something for a rainy day, and those which had only undertaken limited programmes of extensions were less seriously affected than the weaker ones, but one and all suffered to a greater or lesser degree, and it soon became evident that in most cases there would be a considerable diminution in profit, and, of course, also in dividends, while drafts would need to be made on reserves to help out even the lower dividends, which were the rule rather than the exception. Notwithstanding a general uneasiness among investors in tea property, however, values of shares held their own pretty well up to the middle of the year, but since then there has been a considerable drop all along the line.

The season now in progress has been more favourable than the last in Assam and also in the Dooars districts, but in Darjeeling and in Cachar and Sylhet it has been unfavourable—the latter districts having suffered severely from drought in the early stages, which has caused both shortness of crop and poorness of quality.

The tea interest has been well represented before the Committee of the House of Commons on the Currency question, but it would not appear unlikely that the Indian Government will recede materially from their attitude of closed mints, notwithstanding its admitted adverse influence, for the time being, upon the tea planting and other similar productive industries. It can only be hoped that "time will bring its compensation" in the shape of a curtailment of production, with its probable attendant improvement in the price of the produce. It cannot, however, be overlooked that any material rise in the price of tea may not unlikely render the task of capturing new markets for the produce even more difficult than it has been in the past.

Notwithstanding the various aforesaid disabilities, it is satisfactory to record that continued and increasing progress has been made in opening up new channels of consumption for Indian and Ceylon tea, notably in America and the British Colonies, but also in Europe—especially in Russia and elsewhere.

With the close of 1897, the flotation of new companies came to a standstill—this having been previously, as had been feared, rather overdone. Some of the older companies, however, have made additional issues, either in the shape of share capital or in debentures as follows:—

Baraora, £20,000 debentures, 5 per cent; British Assam, £8,500 debentures; Cachar Dooars, £16,000 debentures, 5 per cent; Chubwa, £39,000 shares; Doom Dooma, £23,000 shares; East India and Ceylon, £30,000 shares; Lungla, 75,000 debentures, 5 per cent; Moabund, £20,000 debentures; Makum, £25,000 debentures (1897); Majuli, £8,500 shares; Singlo, £30,000 shares. While the Amalgamated and Consolidated Companies of Glasgow have each made a call of £1 on their Ordinary shares, amounting to £50,000 and £40,000 respectively.

The Moran Company reconstituted its capital making its shares fully paid up instead of part paid, as formerly, and the old Upper Assam Company reduced its £204,000 of Ordinary and Preference capital to £45,000 of Ordinary capital only.

We append our usual abstract statement, showing, in the case of the best known shares, the range of values during the year:—

Company.	Year 1893.				
	Jan.	Top.	Bot.	Dec.	Fall.
Assam ..	62½	62½	52½	52½	10

*H. & C. Mail*, Dec. 30.

THE BLACKMAN SYSTEM OF  
CACAO DRYING.

The Blackman Ventilating Company, Limited, of 63, Fore Street, London, who are the makers of the well-known Blackman Fan, so generally used for withering tea leaf, have been engaged during the last two or three years experimenting with and improving their system of cocoa drying, and now advise us that the reports received from planters confirming the satisfactory working of their apparatus enables them to confidently recommend their system to those who

are anxious not only to hasten the drying, but to produce cocoa that is evenly dried and of excellent appearance.

The main features of the Blackman system are that an abundance of warmed air is brought into contact with each separate bean, that the temperature of the air is under control, and further, that no matter what the weather may be, the cocoa is thoroughly dried in a very few hours, day or night.

Those who have experienced the disappointment of seeing their cocoa almost dry in the evening after a fine day, and found on the following morning that it has gone back considerably during the night, will appreciate the improved condition under which they may be quite independent of cold or rain, and instead to have at their command a warm dry wind in abundance at a trifling expense, and so directed that every bean will receive equal treatment.

Those also who already have drying ovens in which the cocoa is baked or stewed in stagnant heat will do well to communicate with the Blackman Company, as we understand that with very little outlay these ovens can be greatly improved by a modification of the system. We have recently seen letters written by a well-known planter in the West Indies, who writes:—

"The fans which I imported from you some time ago have proved a thorough success; the cocoa driers to which they are attached are the only ones in the island which work satisfactorily.

"That they turn out a good article the prices realized for the cocoa sufficiently attest."

And we are informed that during the last few months five other planters who have seen the arrangement have placed orders with the Blackman Company for similar additions to their drying houses.—*H and C Mail*, Dec. 30.

## GOLD IN PERMANENT MINES, WESTERN AUSTRALIA,

### PAYABLE ORE AT 600 FEET DEPTH.

When we visited Ballarat in 1869, the 36 feet mine we went down was considered a very deep one but it will be seen from the following that 600 feet is not thought wonderful now. The article from the *Coolgardie Pioneer*, Dec. 24th, gives a fair summary of the history of the Western Australian, gold mining industry, which is of special interest to Ceylon readers at this time:—

Payable ore struck at a depth of 600 feet in the Great Boulder mine is, apparently, a simple announcement to make, but its full significance and the almost illimitable prospects it opens up for the gold-mining industry of Western Australia will be fully appreciated by those who understand what gold proved at depth means to this considerable portion of Australia. It places beyond all question the fact that West Australia is destined to become the foremost gold producer of the world, and affords another wonderful illustration of the impartiality of nature in the bestowal of her choicest gifts on those who have the energy and enterprise to dare her most forbidding aspect in the search for what humanity holds dear. Without a single physical attribute to attract the attention of man, the eastern portion of the colony was some six years ago entered upon by the gold-seekers as a possible treasure house in which the royal metal was confined. The pioneers had little but hope to guide them until this district was reached; then the indications of gold became more promising, and although water was practically unobtainable, animal life was indiscernable, and the general surroundings were desert-like, trials were made. Hardships were overcome, toils were endured, and eventually pluck and determination proved successful, and the phenomenal finds at Bayley's were announced to the world. The immediate effect was an influx of population that quickly altered the features of the landscape. A solitary wilderness was converted into a human hive of busy workers, all engaged in the struggle for

Nature's golden store that to some extent was revealed by other numerous rich discoveries, and the further men went the better became the prospects of the field. West Australia at once arose from the position of the least considered of the Australian colonies to a land with certain possibilities, and for a time all looked bright and cheerful. The rich surface finds at Hannans, following on those of Coolgardie, induced the belief that the new El Dorado, the "Tom Tiddler's ground" of the schoolboy, had at length been discovered. The tales of marvellous finds travelled, capital was attracted to the colony, claims were pegged out, and companies were formed to work properties all over the district. Men who knew as much about mining as a blue-bottle fly does of the fourth dimension blossomed forth as experts on the soil or were sent out from England to take charge of properties, with the inevitable result. The phenomenal surface deposits were abstracted from their beds; no others were discovered to fill their places and maintain the golden glamor. Nature demanded her tribute. Hard and intelligent work, with some skill in mining, was required, and as the then existent expert and mining engineer was entirely without these qualities, the worst of reports about the eastern goldfields were sent abroad. First-class properties taken up in common with others that were as innocent of gold as the ordinary blue-stone quarry, were abandoned, and men who had devoted their principal energies to the consumption of champagne and the affectation of the digger's style, having spent the money entrusted to them by their directors, notified their companies that the eastern goldfields consisted principally of surface shows. Fortunately, some of the good properties got into the hands of capable managers, and the output of gold gradually increased until even the expectations of the most optimistic were almost realised. Unfortunately there still clung to the goldfields the reputation of having received thousands of pounds of public money for which there had been no returns, and even the marvellous yields from moderate depths on the famous Boulder belt, together with the ever increasing monthly output all over the colony, failed to reassure the investing public that West Australia was destined to be the great gold producer of the world. The people who had put their money into most of the concerns did not know that it had been frivelled away, but merely that it was gone. They were quite prepared to admit that the eastern goldfields had, their age considered, yielded marvelously, but with the cautiousness characteristic of the average speculator, they preferred to await developments before putting any more of their good sovereigns into what, after all, might prove a chimerical pursuit of the metal in the rough. Prove your mines at a depth has been the favorite cry of the capitalist, both in Australia and abroad, when offered a property which afforded fair scope for investment. The enterprise of the Great Boulder management has done this. It has shown that the lodes in that marvellous district carry gold at depths that would seem to demonstrate that the rich mines of the Rand are not to be compared with those we have in our midst at similar distances below the surface, and those who have pinned their faith to the permanency of the rich reefs in Hannan's Boulder, Coolgardie, and other districts will have the proud satisfaction of realising that their optimism is likely to be rewarded, and speedily too. The immediate effect of the Boulder strike is not likely, in the present disturbed state of international politics in Europe, to result in an inrush of foreign capital, but it will hearten those who have money invested in the colony's goldfields, and induce them to take little heed of the reports of individuals whose ignorance and mismanagement prevented them carrying on mining development in a proper manner. To this, more than to anything else, is to be attributed the slump which has passed through the fields, but as what the Boulder has done others can do, a period of renewed activity can be looked for all over the proved fields. There are scores and scores of mines off the Boulder main reefs that only want working to return payable results,

and as the auriferous bodies have now been proved of a permanent character, there should be little difficulty in getting the necessary capital to develop them. Few of the mines, even in the richest districts, are likely to yield immediate or mammoth returns to those interested in them, but the fields offer a secure source for the investment of capital. In Coolgardie itself all that is wanted to make many of our mines payable is judicious management, through development, an adequate supply of water, and fair treatment. These conditions granted, the goldfields generally can look forward to a season of steady prosperity that to the community generally will prove more acceptable than the strongest and longest-sustained boom that ever yet existed.

### THE IMPERIAL DUTY ON TEA:

“A FEW REASONS WHY THE PRODUCER SHOULD NOT AGITATE FOR A REDUCTION OF THE TEA DUTY IN GREAT BRITAIN”:

#### HOW TO COUNTERACT THE BLENDERS.—THE BEST RELIEF FOR PLANTERS.

We very readily give prominence to the following paper, compiled by one of the most thoughtful members of our planting community, in order to show reasons why tea planters should hesitate to promote the reduction, much more the abolition, of the imperial Customs duty on their product. We confess that our own view has been in favour not of total abolition, but of reduction by a penny or at most twopence a lb. But what is said here of the effect of the last reduction from sixpence to fourpence tends to upset our belief in the advantage of any further reduction. However, for the present, we may content ourselves with laying before our planting readers for their careful consideration what the compiler modestly calls “a few reasons” why the producer should not agitate for a reduction of the Tea Duty in Great Britain:—

Total consumption per head in England of tea is now nearly 6 lb. This represents about 360 pints of liquor. Can we expect to increase this amount? If we could, would it be in our own interests, seeing that the abuse of tea might seriously affect the industry? I venture to think there is not any large class in England unable to buy the cheapest form of liquor in the form of tea.

The reduction from 6d to 4d per lb. did not affect the price of tea. The average price of tea, according to the London Custom House returns, was in 1889 10-79d, a year before the reduction; in 1891 10-79d; 1892 10-07d—so that the reduction in duty did not affect the producer as far as price goes.

In 1879 the total consumption of tea in the United Kingdom was 160,432,000 lb. or 4-68 lb. per head, of which 78 per cent. was China tea and 22 per cent. Indian. In 1889 it was 185,600,000 lb. or 4-99 lb. per head or a gain of -31 lb. in ten years; but the proportions had changed:—33 per cent. of China tea, and 67 per cent. of Indian; in 1889, seeing that Indian and Ceylon tea make half as much liquor again as China, the increase of liquor per head was much larger than the figures show.

From 1889 to 1897 the consumption has risen from 4-99 lb. per head to 5-82 lb. per head and the proportions in 1897 were 90 per cent. of Indian and Ceylon and 10 per cent. only of China; so that we

must admit that consumption has increased more steadily during the last decade than in the previous decade; but the increase is more due to the cutting of prices of the blenders—who knock out our teas to suit their blends rather than to the blends suiting the tea,—instead of the decrease in duty, the latter fact enabling the blenders to cut the trade finer as the duty locks up one-third less money than previously.

(Your contemporary’s argument that “he will not be satisfied until tea and coffee are taxed the same” is childish, seeing that 1 lb. of tea makes 50 pints of strong tea, and 1 lb. of coffee eight pints only of good liquor).

The only result I see if the duty on tea is reduced to 2d per lb. is that the blenders will lower their blends by 2d per lb., and being a few, against thousands will knock down the prices of teas another 1d and make more money than they are now doing. We want the wholesale country tea dealers to realize that the blenders are doing them out of their legitimate profits, then perhaps they will come into the tea market in London and make a more open market of it than it is now. With the Colombo market yearly expanding, we may hope that the reduced quantity sent to the London market may tend to harden the markets generally in the world. But it will be a hard fight for Ceylon; for, with present prices and high exchange, a goodly number I fear of estates round Kandy and other parts of the island will show no profit this last year, and I think these old districts want more help even than distant Uva and should have railway rates reduced generally and all grant-in-aid and private cart roads taken over by Government. This would help the planters most. This latter will require no increase of staff as Government do the work now, but only supply half the funds.

We are clear that the older planting districts (including Uva) should be specially considered in extending relief; but we fear the natural corollary of Government taking over the grant-in-aid roads would be the extension of the poll-tax to the coolies. Still there are some anomalies connected with road taxation which loudly call for rectification. To find a single estate paying R1,500 a year or R3 per acre (as we have heard) seems monstrously heavy if not unjust.

#### NUWARA ELIYA AND HAKGALA GARDENS.

The visitors’ book at Hakgala Gardens gives a fair idea of the diversity of tourists (and others) who include the Ceylon Sanatorium in their Eastern or world-wide travels. Ten nationalities represented since the opening of the present year make a fair show; and we feel sure on one who makes the excursion from the Plains on a sunny afternoon, such as recently prevailed, will feel disappointed. There is much to gratify the observant traveller *en route*:—The Hazlewood field of tea of the pure China variety with its trim, squat bushes and small leaf—one of the few places in the island where the pure China type of tea can be seen at its best; the wonderful growth of the introduced Australian trees (Acacias and Eucalypts) surrounding the square plot of tea lower down the road; also the splendid bank facing the road of New Zealand flax (*Phormium tenax*) from which a rich harvest of leaves might be gathered to test a fibre-cleaning machine, if one were established on the side of the stream a little lower down the defile. By and bye we have the romantic glen, down which

the classical "Seeta-Ela" comes tumbling or purling along—according to the season—carrying us back to the old-world Hindu stories of Rama and Ravana and Hanuman, the monkey-king who bridged the passage to Lanka which some of us would now fain see crossed by the iron-way and locomotive; those friends of mankind which have filled this nineteenth century with greater wonders than ever entered into the brains of the old mythologists to conceive. How Seeta fled to the highest mountain regions of Ceylon and was there guarded until rescued, and how henceforth for the Kandians, both on the Uva and Kotmale sides, these higher regions between Pedro and Totapola, Hakgala and Kirigalpotta became sacred to demoniac agents and agencies and every stream had its tutelary goddess and every boulder or mountain its Yakko, need only be mentioned. And so we pass down one of the splendid roads with which the genius of Sir Edward Barnes and the indomitable perseverance of a Skinner scored the mountain as well as the low country, thereby driving away many superstitions and finally establishing the "Roman Peace" so essential to the welfare of the Sinhalese as of so many more subject peoples. But our way lies down, down; we mark the wonderfully diversified colouring of the mantle of forest alongside the delightfully clear warbling stream, the miniature cataract or quiet trout pool, until suddenly there bursts on the ken, the first view of the Uva panorama of far-extended grassy patana, sparkling rivulet, bright rice-field, darker tea-field, or bare clearing, backed by Nanunukulakanda, which rises above the capital of the ancient Principality to the height of 6,680 feet above the sea, or 30 feet higher than the well-known Elbeddekande between Dimbula and Dikoya. How well we recall our first glimpse of the mountain when following the tracks of Governor "Sir Hercules Robinson" on his first visit to Uva in 1865 and which ended for us in a memorable couple of days under the hospitable roof-tree of old Thomas Wood on Spring Valley. But we have arrived opposite the Gardens and the view extends round to Haputale with its wide extending ranges so fully occupied first by coffee, next cinchona and finally by tea fields, and the smoke of the locomotive reminds us of the still more memorable ride. It was that of a Colombo merchant, a visiting agent and editor from Gongalla through Balangoda to Lunugala and thence to Cannavarella and back to Dimbula, during which, when lying in front of the old Bandarawela resthouse waiting for the inevitable "moragie" to be caught, spitted and served, we first conceived the idea of the Uva Railway, and there and then we thought out the heads of the Memorial which afterwards secured a Commission and Survey for the Nawalapitiya-Haputale Railway. Days of old indeed! Where now is the band of Uva and Dimbula-Dikoya pioneers who upheld that great effort after transmountain Railway Extension—Cruwell and Rose, Kelly and Wm. Smith all gone; while Logie in the farther East and Pileo in the far West remind us that C. A. Tottenham who drew up for us the very first estimate ever framed for a locomotive line from Nawalapitiya to Haputale Pass, is once more in the land where he did so much good work, busy and interested as ever in the development of its hidden wealth.

But here are the Gardens—the entrance bearing the well-known year 1861, the one in which we first landed in Ceylon, and which

saw in the East, Clements Markham with his precious burden of cinchona plants and seed from the South American jungles, the beginning of the important industry which has been fraught with so much benefit to the millions of India, China as well as of many European and American lands. We first saw Hakgala Gardens in 1865 and each successive visit since has indicated progress and improvements. Poor old MacNicol, the first Superintendent, a victim to dysentery, would not know the place if he were to

#### Revisit the glimpses of the moon.

The place, is, of course, far more interesting to one who has seen it in the day of small things and has kept note of its development, than to the casual visitor who sees it for the first time. From the economic point of view, how much benefit has been derived from Hakgala? In cinchona alone, it afforded the bridge which kept heart in half of our then coffee planters until tea (also largely from Hakgala) came to their deliverance. Then, nearly all the Australian Eucalypti and Acacias, with the many representatives of Cupressus, Cryptomerias, Auracarias and other ornamental forest and garden trees have come from Hakgala; while in more modern days, the colony is indebted to the same Gardens and its most intelligent Superintendent for the introduction, or bringing to light, of exceedingly useful vegetables and fruit which have added greatly to the food products of the people, especially in our upland regions. We need only mention the prolific tree tomato and mountain papaya, the invaluable "cho-cho" (vegetable marrow of Uva as it may be called, though introduced by Mr. Nock from the West Indies), the "Arracacha," and the many English berries as well as varieties of potato first tried at Hakgala. Humorous old Wm. Kellow (how well we recall the stewart Cornishman and his equally burly but wiser and more responsible brother Mark) as he used to tell us that he manured his potato field just below Hakgala with egg-shells and so produced the clean shiny coats upon them!—but that the porcupines were so devoted to them that when they rooted up whole drills and ate till they could eat no more, they rolled about until they got a potato transfixed on each quill and so carried off a feast for the following day! It was the same humourist who used to say that the flower he liked best was cauliflower! And there was old, rubicund George Cotton—as round as a barrel and as full of laughter at a joke as an egg is full of meat—who began life as a slim young jockey and came to Ceylon like the Kellows and Fowler in the train of Sir Samuel Baker and his brother. What a change in Nuwara Eliya itself since 1867 for instance, when we spent a few weeks out of the season (after about a fever) on the plains, the witty Irish Chaplain, Rev. W. Kelly (afterwards of St. Peter's, Colombo) and a couple of young lieutenants making up the entire European populations, with the permanent residents already mentioned. We four spent nearly every evening together for some weeks and many were the Padre's stories about the begging tramps who had turned up at Matale and Nuwara Eliya in his day, or of the hunts and jungle excursions in the season; while in the daytime we studied and practised horticulture (with trips to New Cornwall or Warwick, and of course to Hakgala under the best of auspices).

But *revenons à nos moutons!* The Gardens are looking their best to our minds, on this sunny

January afternoon of 1899. We have seen a finer floral display on certain previous occasions under Mr. Nock's care, and we are pained to see some valuable introductions looking drooping and sickly. The explanation we got is the blighting drought of the past year, the short water supply, and the want of means to fight the drought by supplementing the watering from the abundance not far off. This seems very hard—a penny-wise and pound-foolish policy on the part of the authorities whoever they may be; for, of course, in a matter of this kind, the old adage is true that "a stitch in time saves nine." We strongly advise the Superintendent that the next time a severe drought occurs, he should try and compass a visit from the Governor, or at least some leading member of the Executive. How much can a liberal-minded Governor not do in respect of a public resort and institution, such as the Hakgala Gardens—"a boon and a blessing" to all visitors to, and denizens in, the Sanatorium and neighbourhood—and yet kept up at how little cost! An addition of 500 or at most of 1,000 rupees to his usual vote would, we verily believe, be regarded as a little fortune to Mr. Nock. Question him as to the Governor who, in his time, has manifested most interest in Hakgala, and he frankly names Sir Arthur Gordon; but he adds,—we owe protection for our plants and flowers from hare and other enemies, to that admirable wire fence and netting granted through the direct personal interest of our present Governor Sir West Ridgeway. His Excellency deserves special thanks from the growing number of visitors to Hakgala; and we trust he will see before he leaves that the Gardens are provided with a permanent, well-distributed water supply—a work of comparatively trifling expense—from the stream or spring not far off on the mountain-side.

What have the Gardens to shew us on the present occasion? We are most struck with the wonderful growth of some of the introduced timber trees, and what planter, forester, Government Agent or intelligent colonist and native in the island will not be interested to learn that a *Cupressus macrocarpa* (a Californian tree) recently cut down gave no less than 823 superficial feet of one-inch boarding of very considerable width—specimens of which may be seen in a rustic "arbour" recently erected by Mr. Nock at a delightful vantage-point opposite a little lake where one of the water-plants in flower smells exactly like English hawthorn. This arbour with its shingled spire as well as roof; its peeled rhododendron tiny branches serving for the ornate rustic work in the sides and its convenient seats and table of the *Macrocarpa*, is a model to be copied, as far as possible, in estate and villa gardens for thirty miles round. But if Mr. Nock had to fell one giant tree, he has many still remaining. Another *Macrocarpa* that towers up, spire-like to a great height would probably yield over 1,000 feet of similar boarding. Then there are the grand *Auracarias*—a "*Montezuma*" (Mexican) exceedingly fine, and yet not more attractive than its brethren of the Far East and South—the Moreton Bay pine which we recall admiring thirty years ago in its native Queensland, and the still finer Norfolk Island pine. Some fine specimens of *Cupressus torulosa*, *Cryptomeria japonica* and *Cedrela toona* attract attention, and still more a magnificent *Pinus longifolia*; while we always stop at some of the "gums"—the peppermint and lemon-

scented, and still more one whose bark is covered with a red powder which the natives have already turned to medicinal account, finding it useful in dysenteric attacks. Mr. Nock—who fortunately is able to spare half-an-hour, making the visit doubly interesting—points out the Chilean (fan) palm with its wax-covered leaves from which in South America as much as 20lb of wax for candles are gathered from a single tree in South America. Next to the giant and ornamental trees in interest, come the tree-ferns. Who ever tires of looking at the graceful feathery fronds of the finest of Ceylon, as it is the most beautiful of Asiatic (if not of world-existing) ferns, the *Alsophila crinita* which may be seen in the jungle along the Nannoya and Hakgala roadsides as well as in the Gardens. It is indeed the Queen of tree-ferns and bears comparison with the most interesting of introductions. One of these, a Formosan tree-fern, was given to the Gardens by the colonist who, of all others, took most interest in them, the late Capt. Bayley, P. & O. Agent, while two specimens of *Dicksonia anartica* presented by Mr. W. H. Wright, the veteran planter and horticulturist, must have come from Australia by his friend, Capt. Murray, Commander in the same service. How much has the good old P. & O. Company done one way or other for Ceylon—directly or indirectly—in carrying Wardian cases of plants, or in presenting rare specimens through its officers and agents: let us not be ungrateful! The Elkhorn-fern and the New Zealand silver tree-fern are always interesting, as also the "John Crow-bush" of Jamaica, now freely seen in Nuwara Eliya Gardens, which reminds us that the finest specimen of the "Soap-tree" (whose scientific name escapes us) is not in Hakgala, but in the grounds of Naseby Cottage, a great handsome tree 30 to 40 feet high with silvery birch-like stem and leaves, whose bark offers a capital substitute for soap! This recalls another economic product in which Mr. Nock is much interested—Camphor from the well-known Formosan tree which flourishes well in the Gardens and from the leaves of which camphor has been readily distilled by Mr. Owen of Lindula; while the range of the tree is so great that Mr. Nock believes the finest group in the island is that reported by Mr. Corrie on the property of the Udagama Tea and Timber Company in the Galle district. Among minor products, camphor should not be despised and we may yet see it more freely patronised by Ceylon planters than even rubber, considering its ready growth at all elevations and the handsome attractive (cinnamon-like) character of the tree. Another group of economic plants in the Gardens are the Agaves (although they may grow more luxuriously lower down) and we are interested in *Agave Morrisii* recently called after Dr. Morris, of whose labours in the West Indies, so much is now expected. The huge Abyssinian banana with leaves 10 to 12 feet long, set off by scarlet midribs, offers a striking contrast to the tiny China variety with its pretty flower. The tree fuschia often mistaken for lilac, leads us to the balsams, one of the finest of the latter being called after the grandfather of Mr. Chapman Walker of Colombo, *Impatiens Walkeri*, Colonel and Mrs. Walker being among the most accomplished botanists who ever resided in Ceylon. Strangely enough, their son, Colonel Walker who came here in command of the 2nd-25th (K.O.B.) in the "sixties," was also a botanist who much enjoyed talks with the late W. Ferguson, F.L.S.

"And here," said Mr. Nock, "is a plant, the name of which I first learned from 'W.F.'" How deliciously cool and sweet looking is "the fernery" corner with its wealth of maiden-hair and some rare allied specimens; while in rich contrast is the colouring of the tastefully-arranged beds of begonias, pansies, violets, geraniums, verbenas, petunias, mignonette, and still more the rosaries with their varieties of fragrant and showy flowers. We have omitted to mention the camellias, almost as good as those we saw in Japan; but we must not forget to do honour to a specially successful introduction of Mr. Nock, namely the *Cherimoya* of the West Indies (allied but superior to our custard apple) and which shares the honour with the strawberry of being the most delicious fruit in the world. It was Lord Macaulay who declared that he would not exchange a "pottle of strawberries from Covent Garden" for all the fruits he had tasted while in India; but he had not included *Anona cherimolia* in his experience. Hakgala is too high, wet and cold perhaps, to bring the fruit to perfection; and Mr. Nock says that Udapussellawa is far more congenial, Mr. C. H. Bagot on St. Leonards being able to bring them to perfection. Mr. Bagot is otherwise distinguished as one of our foremost amateur horticulturists, ever ready to try new introductions and with one of the best gardens in the country. But the most pleasant of afternoons must come to an end; and we say goodbye to Mr. Nock and Hakgala after noting the wonderful manner in which the tiny, ivy-like creeper *Ficus repens* has covered the wooden walls of the coach-house to its great ornamentation as well as, no doubt, the preservation of the timber. Returning to the Plains, we were favoured with one of the most glorious of sunsets among the mountains, the golden illumination of peak, forest, plain and lake being, for a few minutes, perfectly enchanting; while the successive withdrawal of the waves and rays of light to give place to the pale clouds of mist creeping up from Uva and spreading over the length and breadth of the Sanatarium,—

Round a holy calm diffusing,  
Love of peace and lonely musing—

afford a transformation not readily forgotten by the visitor accustomed to the royal but shortlived sunsets off Kollapitiya where the lord of day

Sinks like a warrior to his rest  
With his blood-red shield before him.

#### HOW TO DISPOSE OF "DUST" AND POOR TEA.

A thoughtful proprietary planter writes:—

"Be the letter of 'G.T.' in *Ceylon Observer* the other day, would it not be better to try and start a company to buy up dust and low grade teas and turn it into 'Theine, etc. I believe Mr. Kelway-Bamber thinks it would pay."

This is a most important suggestion and we commend it to the attention of the "Committee of Thirty," who should invite an expression of opinion from Mr. Kelway-Bamber on the subject. If it were favourable and showed a practicable way of manufacture at a profit, shares in a company, to buy up all tea below a certain price in the local market, would, we think, be speedily taken up.

#### SELANGOR PLANTERS' ASSOCIATION.

Minutes of a general meeting held in the Victoria Hotel, Kuala Lumpur, on December 17th: present:—Messrs. E. V. Carey (Chairman), C. Meikle, R. W. Munro and R. C. Kindersley (Members of Committee), F. B. Hicks, T. S. Dunbreck, G. Shepherd, Hon. Poulett, H. M. Darby, D. Robertson, A. Barnwell, Cathcart, Bumpke and Tom Gibson (Hon. Secretary). Visitors: Messrs. Macbean, Cowie and Stainer.

Read letter from Secretary to Government asking to which districts reference is made in the statement "that the provisions of the Coconut Trees Preservation Enactment are not being strictly carried out in every district, and Hon. Secretary's reply that "the districts of Kuala Lumpur and Kuala Selangor were referred to," as it had been stated that certain trees have been cut down but no attempt made either to bury or burn them.

Mr. Darby said he had been asked by residents in the Coast districts to bring the following resolution before the meeting—viz., "That in the opinion of this Association a European medical officer is urgently needed in the coast districts."

In support of this he informed the meeting that there were 70 European residents and over 2,500 estate labourers in the coast districts, and the only medical advice available nearer than Kuala Lumpur, which was 22 miles from Klang, was that of the hospital dressers at Klang, Jugra and Kuala Selangor.

Mr. Gibson in seconding the resolution said that the figures given by Mr. Darby must be added all the coolies employed on Government works such as roads, railways, wharves, etc., the native population of Klang, Jugra and Kuala Selangor, and the Eurasian and native clerks employed at these stations, and thought that as a European medical officer was stationed in Ulu Selangor, the coast districts were deserving of as much or even more consideration if the population was taken into account. The Chairman said that Dr. Travers had told him officially that a European medical officer for Klang had been provided for in the 1899 estimates, and would probably be appointed in a few months, but he thought it as well to let the resolution go before the meeting, so that a record should exist in the event of the matter having to be brought up again.

The resolution on being put to the meeting was carried unanimously.

Mr. Meikle proposed and Mr. Munro seconded the following resolution, which was carried unanimously—viz., "That the Government be asked to revise the present system of summoning members of the English speaking community to serve on juries, without in any way compensating them for loss of time or even out of pocket expenses." The Chairman said he had ascertained that jrymen from Province Wellesley were now paid, and, as most of them knew, such had always been the case in Ceylon. It was very hard on those living at a distance to be summoned to Kuala Lumpur and get nothing towards their necessary expenses.

Mr. Darby said jrymen were paid in Perak.

The Chairman said he had received from Mr. F. A. Toynbee the draft of a scheme for the retail sale of coffee in Ipoh. Mr. Toynbee had taken great trouble to work up this matter and had found that although the large dealers would not touch it, the smaller men were prepared to support it and he wanted the Selangor planters to supply him with a ton of coffee per month to meet this demand. The Chairman understood that possibly the Hantbornden Association might take up this matter and supply Mr. Toynbee with the necessary coffee so in the meantime nothing need be done by the Association.

CACAO PREPARATION AND PRICES.—"A. V. D. P." sends us an interesting letter on this subject, which we publish elsewhere. It criticises the statements made by "Miscellaneous Planter" (see page 561) and expresses doubts as to the cure proposed by Mr. Carruthers.

## CACAO AND TEA CULTIVATION—AND SCIENTISTS.

A shrewd, observant planter of both products offers the following suggestive criticism:—

“Mr Carruthers’ work I look upon as invaluable though open to severe criticism in some points. We know now that fungi are at the bottom of cacao troubles; before, we were all making wild guesses and confusing cause with effect. We do not know yet whether the same species of fungi live on jaks and erythras, and in our jungles and chenias whence insects of all descriptions may convey infection to healthy cacao. We do not know how long the spores can live without a congenial host, and we do not know how pods become infected.

“It would be worthwhile trying to find out if the West Indies had this self-same blight and whether Forastero varieties survived after all Caraquez were killed out. [We must at once ask Mr. Hart of Trinidad to answer these questions.—Ed. T.A.]

“As regards tea, I think Mr. Kelway-Bamber may learn a lot, but question if he can teach us much of practical value. Suppose he could and we did all improve the quality of our teas, prices would be worse than ever, since fine teas would become common, ergo cheap? His system of firing was known ten years ago. He cannot alter climatic conditions and he cannot improve withering arrangements so long as men are told to do the best with what they have. Davidson & Co. are now elaborating a machine-witherer, and we must hope it will meet with more success than Gow’s huge revolving “tun” on Mariawatte some years ago.

“Bamber and Watt do not agree on the subject of shade trees for tea—vide Watt’s valuable remarks 172-173 regarding absence of blight under the shade of *albizzias*. Bamber on the other hand (p. 178 disparages the “sau” shade.

“Dr. Watt condemns burying prunings (and rightly so I consider). Bamber on the other hand says burying prunings “fresh” is no doubt the best method (!). I have found buried prunings covered with fungi.

“For supplying vacancies Bamber recommends two or three baskets of cattle manure placed at the bottom of the holes (what sized baskets and holes?!!) after digging a large hole and mixing soil removed from old hole with quicklime!! Great Scot! what would Companies say to estimates based on such methods of supplying vacancies.

“No. Some books are interesting reading, but I guess we shall not learn much that is new from Mr. Bamber. When you have time you will find it interesting to refer to Hughes’ report to the P. A. on Ceylon Coffee Soils and Manures.” November 1877 he arrived—21 years after, 1898, and coffee becomes historical and the costly visit..... Kelway-Bamber is to go to some two dozen estates in various districts, during the 12 months of his engagement. Possibly the estates he visits may get a little benefit from his personal experiences, but what earthly benefit can you picture all Ceylon gaining, i.e., all tea planters I mean; and what is to prevent other countries gaining the same benefits by the publicity that must be given to such results?

“Buyers may get better value taken for their money, but unless the *Direct Supply* Association is a success he shall not score a single cent!

“When I have time I will try and send you some remarks on Dr. Watt’s book, which I regard as a most valuable one to careful enquiring planters.”

We had recently a very interesting account of Mr. Kelway-Bamber’s *modus operandi*, and have no doubt that his visits to the several estates and his work for them in the laboratory must be of benefit to such plantations, and by inference to others similarly situated. Before making any analysis of soil, we believe, Mr. Kelway-Bamber always likes to visit the estate concerned. One suggestion we would make to the “Thirty Committee” is that *ad interim* Reports might be published. After six months’ experience and observation, Mr. Kelway-Bamber might have something to say, worthy of attention; and time is an important element in these days of depression for so many planters.

## THE INDIAN TEA ASSOCIATION, LONDON.

The following is an abstract of the proceedings of a meeting of the committee held on Tuesday last:—

Present: Mr. W H Verner (in the chair), Messrs. A Bryans, G W Christison, R Lyell, A G Stanton, C W Wallace, T Carritt and A Thompson (of the firms of Messrs. Lloyd, Matheson, and Carritt and Messrs. W J and H Thompson) were present by invitation.

The Secretary read the notice convening the meeting.

The minutes of the last meeting, held on December 13, 1898, were read and confirmed.

Correspondence with Calcutta and New York, which had been previously circulated, was laid upon the table.

A letter from the hon. secretary London Wholesale Tea Dealer Association, with circular as to fire insurance claims, was read, and it was resolved that a reply should be sent intimating that two members will be deputed to attend the Conference which it is proposed to hold at the end of this month to consider the question.

A letter from Mr. Robert Hart, dated January 3, was read, with reference to

*The Conditions of Public Sale.*—These were discussed at considerable length, and it was finally resolved that the questions raised should be postponed, with the view of taking the opinion of the Broker’s Association on the subject.

—H & C Mail, Jan. 6. ERNEST TYE, Secretary.

## THE CHINESE-RUSSIAN TEA TRADE.

(From a French official report.)

BY EDWARD CONNER.

The Russians anticipate an extensive commerce, in tea with China, when the Trans-Siberian railway shall be opened. Despite the activity of the works, the communications between Russia and the Extreme East are very difficult. The railway is being constructed from both ends of the line simultaneously; two trunks or sections are already open: the longest, at Moscow terminus, crosses the Volga at Syzran’ onwards to Tchelabinsk, Omsk, to Krasnoiarsk, which it has passed by a few hundred verstes (one verst equals two-thirds of an English mile). The second section is very short; but 174 verstes have been constructed, from Vladivostock to Imaue. Already commerce benefits largely by the construction, and has not waited for the full completion of the works: a matter still of several years. But the break, not the less, is a great drawback to business relations between Western Russia and her Pacific ports. In fact, a Russian merchant, who desires to send a bale of goods from Vladivostock to Moscow, must take charge of the transport himself, through the region which the Trans-Siberian line does not yet pass; that is, from Krasnoiarsk to Imaue, a distance of several thousands of verstes. In order to lessen this

inconvenience, the Minister for the Public Highways has concluded with certain carriers a contract that Russian opinion states will largely aid to develop the transport of goods in general, but more particularly to facilitate the conveyance of tea to China.

For the future, the intervention of the owner of the goods will be unnecessary. The merchandise will be transported from Krasnoiarsk by railway, to as far as the extending works will permit; then it will be placed on vehicles, to bring it to Sretensk. Arrived at this point, by utilizing the course of the river Amour, and its affluent the Chilka, boats will carry it to Khabarovsk, on to the port of Nicolaiev, or, if the goods be destined for Vladivostok, they must, from Khabarovsk, have to ascend the Onsoussi, up to Imane, where the second section of the great line will be encountered. This new route will not prove a formidable rival to the transport service organized by the Volunteer fleet, plying between Vladivostok and Odessa. The carriage by land will exact more time, while costing three times more dear than the transport by sea; but in proportion as now sections of the Trans-Siberian railway line will be opened, the circulation will be more rapid, and with the advantage of that facility, the cost of carriage will diminish. Be these advantages what they may, the new line will have great importance upon the transport of tea. At present the importation of Chinese tea into Russia is effected by two different routes. One at Shanghai, where the tea is shipped for Odessa. By the second route, the tea is transported by caravan, as far as Kiakhin on the Chinese frontier, and from thence across Siberia, to Moscow. Despite the long distance, and the expense that it involves, this old route which formerly absorbed all the trade to be had, still maintains a certain importance, notwithstanding the competition made to it by the maritime route, and its cheaper cost. That is due in part to the Russian tea-merchants who quote as dearer the teas which have not undergone a long journey, and to another cause, that the teas of Kiakhin are protected by established dues, so that on arriving in Moscow, the caravan teas are not sensibly higher in price, than those shipped from Shanghai to Odessa. Thanks to the opening of the new route Moscow-Onsoussi, Amour, the teas will be able to be transported by sea to Vladivostok. Protected besides, by the customs dues, which are levied at the Chinese frontier the teas will benefit by a notable economy, and this transport, effected by the care of Russian agents will present more security, than the actual transport by caravan.

Not the less, Chinese tea is disappearing more and more from the European markets, to make way for the products from Ceylon, and India. Out of the 269 million pounds of tea imported into England in 1897, China only figures for 10½ per cent.

## PRODUCE AND PLANTING.

**TEA PROSPECTS.**—The outlook for tea is brighter, and in calling attention to this Messrs. Gow, Wilson, and Stanton in their circular published in our last week's issue drew attention to the importance of remembering that the present more cheerful outlook has been caused by increasing consumption, coupled with a check in production. "Any sudden opening out of new tea areas would therefore only cause a recurrence of the late depression." Consumption has out-stripped production, but there must be no headlong folly in the form of further extensions, or the last state will be the worst. Unfortunately there is no law against rashly conceived tea planting operations, and a brighter outlook is tempting.

**CEYLON TEA IN 1898.**—Ceylon tea has at last had to cry "halt" to increasing deliveries and public favour. "The fact is," says the *Greener*, "that the bulk of the supplies are too light and pointless, and the trade would be glad to do without them very often, as they always have to take losses on stock that does not sell at once, owing to their losing the freshness and flavour within a few weeks of arrival.

Again, the sale of 'pure Ceylon' packets (compelling those who label it 'pure' to use only Ceylon) is being greatly interfered with by the big blenders, whose numbers and power grow rapidly each year; the competition has therefore benefitted the stronger and more pointy Indian growths to the detriment of Ceylon and China. Our imports for the year show an increase of about 1 million lb, or say 94 million lb against 93 million in 1897. Deliveries, however, have fallen off 1 million lb—viz., about 94 million lb against 95 million lb in 1897. Deliveries for home consumption have fallen off still more—viz., 2½ million—but this discrepancy was made up by an increase of the exports of over 1 million lb. It will be noticed that these increases and decreases in Indian and Ceylon tea respectively commenced from last April onwards. The stock on January, 1898, was 10½ million lb, and next year (1899) we shall start with about the same. We notice by our Ceylon advices that the total crop for 1898 shows an increase of about 4 million lb. over 1897. However, foreign countries outside the United Kingdom have taken some 5½ to 6 million lb. more direct, while 1½ million less have been sent to the United Kingdom. Australia has taken one-sixth more, or say 2½ million more; America three times more, or say 1½ million more; and Russia six times more, or say 1½ million more. Direct exports from Colombo to other countries outside the United Kingdom, together with the exports from here, may therefore be roughly put down at 34 million lb., so that some 22 million lb. have been diverted from the home market. The market opened with low quotations for Pekoe Souchongs and Pekoes, viz., 4½d to 6½d, and capital broken Pekoes at 8½d to 9½d, but finer teas were light and difficult of sale up to 1s, finest being scarce. There was a steady demand all through January, but in February quite a slump set in, and the prices ruling for broken Pekoes at 6d to 9½d were simply astonishing. Trade in March was very quiet, but prices showed no change for the ordinary kinds, which were condemned by the trade and the shippers as poor and thin; anything with quality and colour, however, brought rather firmer rates, and grades above 1s were conspicuous by their absence. In April the quality began to improve, and with a better trade demand from 65s to 75s per cwt. in their 'green' state, which would be of immense service in helping the blenders to furnish consumers with a good wholesome beverage at a moderate figure; and at the same time ensure them a constant supply of this aromatic article without its patrons having to forsake it for some other form of nonalcoholic drink."

**THE PRICE OF RUBBER.**—The position of the rubber industry is one which is watched with especial interest just now, for whilst the raw material tends to a still higher level of prices, particularly for the fine Para variety, which is so necessary to the production of serviceable tires and other rubber goods, quotations for the manufactured articles have for some months past gone rather the reverse way, and seem likely to go still lower. It is only two or three years since the prized Brazilian and Venezuelan raw rubber styled "fine Para" ruled at from 3s to 3s 3d per pound, but by July last the quotation, which stood at the beginning of the year at 3s 7d, was up to 4s 5d per pound, whilst the present price is about 4s 1d. British manufacturers of mechanical rubbers have by agreement raised their minimum price-lists twice in the course of this year—10 per cent in February, and a like amount in July last; but it is affirmed that this rise does not nearly cover the enhanced price of the raw material, labour, &c.

**ANOTHER PLANTER'S PARADISE.**—M. Lionel Deele has, in *The Fortnightly*, a very appreciative article on the Rhodesian schemes, and particularly on the Tanganika Railway project. The Tanganika Railway, according to M. Deele, will open new markets and carry to the south scores of thousands of "magnificent Wanyamwezi labourers," who are urgently needed there. It will cross regions rich in minerals, admirably adapted to agriculture, and suitable to the cultivation of coffee, sugar, and tobacco. When it is built the trade from the East coast with the interior will

become insignificant, and the cession of Zanzibar to Germany might be contemplated if an adequate exchange of advantage can be negotiated. M. Declé's account of some of the expected produce of the new territory is as follows: "The Zambesi Valley possesses a climate and soil suitable to sugar plantations; indiarubber is already found in the Ro-Angwa Valley—I have had samples of it sold to me by the natives. Then we must forget that tobacco is cultivated by the natives in every one of the districts which will be crossed by the railway, and the experiments carried out by Messrs. Buchanan Brothers in Nyassaland prove that tobacco of the best quality can be obtained from imported plants. Already, in 1893, I bought from these planters light-coloured tobacco almost as good as the Turkish tobacco sold in Europe, and they were beginning to make cigars equal to many of the Indian brands; this was only two years after they had made their first experiments from imported plants. I have, therefore, no doubt, and I must insist on the point, that Northern Rhodesia and British Central Africa will, with cheap transport, soon be able to compete with Sumatra, Manila, and India as tobacco-producing centres. Neither must we forget to mention coffee; it has, as is well known, already given unhopd-for results in the Shire Highlands, and the coffee which has been grown there for the last eight or ten years—not as an experiment, but on a large scale—has fetched the highest price in the London market. The climate, altitude, and soil of the plateau extending from Lake Nyassa to Lake Tanganika offer conditions similar to those found in the Shire Highlands, and with the advent of the railway those now unutilised lands will soon be covered with coffee plantations."—*H. & C. Mail*, Jan. 6.

TEA IN AMERICA.

NEW YORK, Dec. 21.

At the auction Dec. 15, 7,359 packages of tea were sold. The Greens sold at firm prices. No Pingsnoys offered, nor were any Japans sold. Good common to fair Old Crop Amoy brought 19c., and common to good common, 18½c.

The Formosas, 5,274 packages, were briskly bid for. The low grades were very strong. Choice, 33 to 34c; finest, 28 to 29c; fine, 25 to 26c; superior, 24 to 24½c; good, 23½c; fair, 23 to 23½c, good common. 22½c.

James & John R. Montgomery report the statistical position of China and Japan tea for United States and Canada as follows:

Total afloat to Dec. 15, 1898... ..	2,410,637
Receipts to Dec. 15, 1898 ... ..	53,934,642

Total shipment advised by mail... ..	56,345,279
Leaving to be shipped ... ..	26,154,721
Estimated supply, seasons 1898 and 1899	82,500,000
Supply, seasons 1897 and 1898... ..	87,711,780
Afloat, Dec. 15, 1897 ... ..	3,476,336
Receipts to Dec. 15, 1897 ... ..	67,562,828

Total shipments advised by mail to December 15, 1897 ... ..	71,039,146
--	------------

Wed. J. Van Der Chijs & Zoon's (Delft, Holland, Dec. 7.) Report:—Today's Amsterdam Java tea sale—the eighth or last auction of the year—comprised but some 7,000 packages in all. Quality has kept up quite to its former excellent standard, if same has not been improved upon again. The old-fashioned "Earthy" Javas that we used to see on our market in quantities but few years back have entirely disappeared. Being now a thing of the past, we hope their memory will soon be forgotten. The good bidding and firm prices are no doubt to some extent attributable to the above-named improvement in the quality. The few really common teas, such as Bolangs, commanded, however, quite as stiff rates, being only fractionally cheaper than good, sound tea, on account of the great scarceness of the former. Such stuff

commanded 5d. per lb., English parity, whereas at a farthing or a half penny more money good, sound tea, was obtainable. Broken leaf about the same figure. Several parcels of fine Flowery Peccos and stylish Orange Peccos extreme rates.—*American Grocer*.

We have received a lengthy communication from Mr. Elwood May, of the Ceylon Planters Tea Company, New York, in which he deprecates the efforts that have been made to push Indian and Ceylon teas in America "on English lines by Englishmen."

After recounting the numerous attempts that have been made, Mr. May points out that much of the advertising that has been done "has been in bad taste, and has offended what may be termed the tea traditions of householders, merchants, and importers."

Mr. May maintains that the only chance of success is to have a superior article and to attack the consumers from every quarter on well known lines. This he avers has not been done.

Mr. May touches upon controversial matter, but we do not think any useful purpose can be served by the publication of this.—*H. and C. Mail*, Jan. 6.

GRAPHITE IN BOHEMIA.

Since the Cumberland and also the Siberian deposit of graphite, or plumbago, have been practically exhausted, the chief supply of this mineral has been derived from Bohemia, in the south of which country, near Schwartzbach and Mrgan, deposits of pure graphite are found in the gneiss, accompanied by crystalline limestone. The mines and works at the former place are owned by Count Schwartzenburg, and those at the latter by the peasants; and these two centres yield the purest graphite now available, that of Krumman being far inferior. When the mineral is not sufficiently pure to be sent away as natural graphite, it is ground in mills constantly traversed by a stream of water that takes up the powdered graphite, which is afterwards thrown down in the form of mud; and when the mud layer has attained a sufficient thickness, it is subjected to a pressure of six atmospheres (88 lb per square inch) in a filter-press. The resulting cake, containing more than 20 per cent of water, being then dried in a stove heated to 90 or 100 degrees (mean 203 Fahr.) for 24 hours. Out of the 9,000 quintals (885 tons) of graphite which are turned out yearly on an average in Bohemia, two-thirds are exported; but it is only during the last few years that the production has been considerable. Out of the twelve graphite mines in Bohemia only the three named above are actively worked, occupying 728 hands. Although the prices of graphite, and especially natural graphite, have slightly fallen since, the best quality, now obtains only 15·2 florins (23s 7d) instead of 20 florins (33s 4d) per metric quintal (2 cwt.) as formerly the mean annual cost of production has increased from 3·22 florins (6s 0½d) to 5·12 florins (9s 7¼d), owing to the heter qualities being more in demand than the inferior.—*Journal of the Society of Arts*, Dec. 30.

SIR T. LIPTON AND SUGAR.—The Glasgow correspondent of a contemporary recently had an interview with Sir T. Lipton. Sir Thomas stated that the flotation of his American business may take place in March next, but that if certain circumstances arise it may be delayed for a year. As to his West Indies sugar scheme, his experts aro, he said, out there at present, and if their reports aro satisfactory he will erect central sugar factories. Sir Thomas further said that he meant to run the whole island of Barbados, and that with the most modern machinery he hope to get a larger percentage of sugar out of the canes than by the present windmill propulsion. If sugar bonitics are not increased he calculates to sell cane sugar in Britain as cheaply as beet sugar.—*H. & C. Mail*.

## THE EXPORTS IN 1898 OF THE PRODUCE OF THE COCONUT PALM.

The growing importance of the Coconut Industry, and the readiness with which, in recent years, Europeans have invested their capital, after a prolonged withdrawal, in coconut plantations, and even in opening up land for a product which is about the slowest to yield returns, render it desirable that we should offer some remarks on the figures for last year, bearing on coconut products, which we published last week as a Supplement. Out of the 24 columns in which our exports are tabulated in the Chamber of Commerce returns, the products of the, to us at least, premier palm, claim no less than eight columns; and these supply an illustration of the diversity of the uses to which the tree and its produce are put, though they by no means exhaust those uses. Tea which is our leading export—and long may it continue to be so!—has not even the double column which its great predecessor of the hill country claimed, under the divisions "Plantation" and "Native"; and Cinnamon is the only other product which shares with Coffee two columns. But, as we explained when discussing the statistics of 1897 last year, it is the price of the Oil, which is the most ancient of our coconut products, which mainly regulates the market for nuts, though the figures in some of the other columns look more formidable. The exports of oil are shewn in cwt.; and as each cwt. represents about 500 nuts, the 435,933 cwt. exported in 1898 stand for 217,966,500 nuts, whereas the 13 million odd lb. of desiccated coconut mean only 39 million nuts, which again throw into the shade the 12 million odd coconuts we sent away in the shell last year. The only product of the palm which can compare with oil in importance is Copra, or the dried kernel, of which we sent away last year no less than 596,277 cwt. which, at an average of 240 nuts to the cwt., would mean 121,506,480 nuts; but last year was an exceptional one for copra exports, and the prices paid for the article for export were often quite independent of the price of oil.

To go back, however, and begin with oil, though the quantity exported in 1898 was well ahead of that for the three previous years, it was only a fair average quantity. It was exceeded twice during the last decade—in 1894 when 487,571 cwt. were taken away, and in 1891 (the year of our largest export) when the quantity reached 550,977 cwt.; and it was approached in 1891 and 1897, with close on 410,000 on each occasion. There has not thus been that steady advance in exports which we have learnt to associate with increased production in such articles as coffee, tea, cinnamon, cocoa, and cardamom, of which almost the whole crop is sent away. The manufacture of the oil is controlled, to a great extent, by the demand for it in the European and American markets, and more recently from India and the Straits Settlements as well; and we doubt whether the island has ever yet been called upon to send away its largest possible output. It may be that we should have shipped considerably more oil last year than we did, but for the mishap which destroyed the Hulfsdorp Mills, owned by one of the most respected and enterprising of our local Foreign Firms, and which restricted the outturn for one-half of the year practically to one large mill. However that may be, the exports of oil were only average, and leave little room for exulta-

tion, though the prices were probably better during the latter part of the year than they were for a considerable time before. It is for activity in the trade in Copra that 1898 was most remarkable. It will be seen that the quantity sent away was almost five times that of 1897, when the exports were 106,601 cwt., and that was more than double the quantity for 1896 which stood at 50,049, and more than treble that for 1895. The demand was certainly phenomenal, and led to the price per catty (of five cwt.) being maintained at considerably over R40, while occasionally it ran up even beyond R50. It is a mistake, however, to suppose—as we confess we were ourselves inclined to do, having regard to the figures for only the three previous years which were published in the Chamber of Commerce circular weekly—that the export trade was practically a new one. In looking up the figures for earlier years, we find that the exports for 1886 to 1888 were 129,794 cwt., 137,853 cwt. and 138,578 cwt., respectively. Since then the fluctuations were considerable—going down as low as 30,642 cwt. in 1894, and rising to us much as 134,590 cwt. in 1892. The figures, however, never approached to one-third of those for last year. How far the troubles in the Philippines, which grow coconuts largely, contributed to the unusual demand, and to what extent the demand may be considered certain, only those in the secrets of the trade can tell. Looking to the geographical distribution of our Exports—and that is an interesting subject which we must reserve for another article—we are hopeful that the demand for Copra will not altogether fall off with the settlement of Philippine affairs; but it would not be safe to calculate on the high prices for Copra of last year, and of nuts of three or four years ago, with the immense extent of land placed under coconut cultivation—not merely here, which may be as a drop in the ocean, but in the Southern hemisphere, in the Eastern Archipelago, in Africa, and in the Pacific Islands. As against the apprehensions of over-production, may be placed the hope of new uses for nuts and copra, and the resulting oil and poonac, for man and beast.

In desiccated coconut, the upward tendency was maintained; but looking to the very gradual growth of exports for the past four years, as compared with the strides in previous years, and specially to the fact that the 13,040,534 lb. sent away represented an increase of only 986,082 lb. over 1897, we may regard the limit of expansion as practically reached. Of coconut poonac, which is the refuse of the dried kernel after the expression of oil, a larger quantity than ever was sent away; and the 216,620 cwt. on the export table, being about one-half the weight of the oil exported, represent a curiously close approximation to the full results of milling operations for export purposes. The oil weighs about 2-3rds of the copra operated on, and the poonac about one-third; so that, practically, we sent away all the poonac which was obtained after the oil we exported was secured, while retaining for local consumption, all the poonac which was left after extracting oil for local needs! But, as we have often said, we would rather retain all the poonac the island produces for feeding stock and for manuring land; but its uses are appreciated in Europe, and the prices offered are such as to ensure sales. The number of accounts in the shell exported in 1898, fell short of that for each of the two preceding years by between 1½ and two millions, but it was in excess of the number of any previous

year. So that the trade in that item also was only a fair average. So with coir, under the distinctive heads of rope, yarn and fibre. The exports of the two former had been previously exceeded, especially of yarn; but the 95,779 cwt. of fibre place 1898 nearly 20,000 cwt. ahead of the next highest year. Part of the fibre comes back to us in brushes; and we are not sure that, through bleaching and other chemical processes, its character is not so entirely changed as to become horse-hair! Anyway, the demand for fibre seems strong.

Summing up,		
The 435,933 cwt. oil exported represent	217,966,500	nuts
506,277 cwt. copra	121,506,480	"
13,040,534 lb. Desiccated	39,121,602	"
Coconuts in shell	12,027,714	"

Total 390,672,296 nuts.

This number is fully a hundred million nuts in excess of the number computed as the exports for 1897 on pages 114 and 649 of the last edition of the *Ceylon Handbook and Directory*; and it may be accepted as the largest out-turn of the coconut palm ever sent out of the island—even exceeding the out-turn of 1892, which was the record year for oil.

### THE DISTRIBUTION OF COCONUT PRODUCTS IN 1898.

It will have been noticed from our columns during the past year or two, that a very unusual interest is being shown in the distribution of the products of the Coconut Palm; and we should not be surprised if, before long, that interest should prove to be as great as that with which the destination of our tea and the new markets we are seeking to discover for it, are now discussed. New markets and widespread distribution have, of course, a very important bearing on prices; and no product can afford to disregard them—leastwise those which are being steadily developed, and to which capitalists are being attracted in all climes by the prospect of adequate returns. Though the extension of coconut plantations has spread, not only here, but also in many other lands, happily new uses have been found for the kernel of the palm and its products, so that old prices have been fairly maintained. Not only so, but they have even advanced in many directions, notably in the vicinity of Desiccating Mills, which represent an industry which has sprung up within the last decade, and also within easy reach of a port of shipment. There are not more than four countries, of those which find a place in our Chamber of Commerce Circular, to which one or more of the products of the Coconut Palm does not find its way; and that almost every year finds some new territorial customer is a most hopeful sign. Not less encouraging, from the point of view of the producer—for it is from his standpoint that we regard the situation—is that the concentration of trade in large centres is being gradually dissipated. London, even the United Kingdom as a whole, does not take as much of all Coconut products as it used to do. If that meant lessened consumption, there would, of course, be ground for regret; but, so far as it is due to direct shipments to ports and countries which used formerly to draw on the great metropolis, it means increased competition, and therefore better prices.

The figures for last year do not point to a discontinuance of large shipments of Oil to London, which the figures for 1897 had suggested; but we took care to point out then, that cheap tallow probably accounted for a lessened demand. Even

with that allowance the calculations of last year have been rather upset. Writing a year ago, we noted that, whereas the United Kingdom took 72,004 cwt. of Coconut Oil in 1897 against 91,710 in 1896, India, which had claimed only 86,796 cwt. in 1896 took 166,238 or nearly double that quantity, in the following year. But 1898, with shipments aggregating 123,316 cwt. to the United Kingdom, distances both years, and offers us a puzzle as respects India which, after taking more than double the quantity the United Kingdom wanted in 1897, is content with much less for last year, or only 2,300 cwt. more than the mother country! There has, therefore, not been that great shifting of trade which the figures for 1897 seemed to suggest. On the other hand, it is worthy of note that Great Britain and India between them have absorbed more than five-ninths of our total output. The third in the list of our customers is Singapore; and a very good customer it is, with 91,893 cwt. for the year; and, what is more, a steadily advancing customer. In 1896 it took 34,133 cwt.; the following year it nearly doubled that demand with 64,058; and now it stands for almost half as much again. America was content with 65,800 cwt. against 88,030 in 1897 and 76,540 the previous year; but Austria and Germany have taken appreciably more Oil in 1898 than in 1897, though still less than in the previous year. That about exhausts our large customers.

It is however, in Copra that most surprises await one. We said in our last article, that the exports for 1897 of this product were nearly quintupled last year, which was quite a record year with 506,277 cwt., against less than that for the seven previous years combined! A not less remarkable fact was that Russia was, far and away, our best customer—taking no less than 143,638 cwt., or more than our aggregate export in any single previous year, and more than three or four times the total quantity we had sent away in several years since 1896. And yet Russia had taken less than 10,000 cwt. in 1897! Why she wanted fifteen times that quantity last year, we cannot say; but there is reason to believe, from the demand that has again sprung up after a lull of a few weeks, and the prices that are now ruling, that her needs were not temporary. Nor must we forget, in our gratitude and admiration for Russia as our best customer, our obligations to Belgium, Germany and France, which have each claimed, in the above order of precedence, from upwards of 92,000 cwt. to upwards of 80,000; while the United Kingdom has been content with 51,067 cwt. On the other hand, the mother country takes a distinct lead in Desiccated Coconut, having claimed nearly 9½ million lb. out of the little over 13 million we have sent away. America is the next best customer with over 2¼ million, being followed by Germany and Australia with over half a million each. That, too, is a product which has been helpful to the plantation-proprietor; and, though it can scarcely run up by the leaps and bounds which have distinguished copra, it should continue to be a very useful string to our export bow, if millers and confectioners find the industry profitable, as we hope they do. Germany was our largest consumer of poonae last year, as in previous years, having taken 109,832 out of 216,620. The remainder was divided between Belgium and Great Britain, in the proportion of 3-4ths to the former and 1-4th to the latter. Coconuts in the shell have a far larger number of customers, of whom the mother country stands first, having taken nearly 10 million nuts out

of a little over 12 millions sent away. The countries which have run into six figures are, in their order, Africa, Germany, India and Holland. Almost all our rope, 11,589 cwt, out of 12,333, went to Singapore; India taking 645 cwt. and the United Kingdom 99; but in yarn the last mentioned stands first among many competitors, with 60,963 cwt. out of 75,819. In fibre too the United Kingdom leads the list with 66,107 out of 95,779 cwt.—Germany and Belgium taking each 11,939 and 10,223 respectively. That product too finds a number of customers. It will thus be seen that coconuts have done well last year; and may that experience be repeated in 1899!

#### THE MANUFACTURE OF PERFUMES IN FRANCE.

Enormous quantities of flowers are used in the Alpes Maritimes in the manufacture of perfumes. It has been estimated that of roses alone 2,000 tons are annually treated; orange flowers, 2,500 tons; jessamine, 200 tons; cassie (*Acacia Farnesiana*), 150 tons; tuberose, 150 tons; and violets, 200 tons. The average selling price per pound of flowers is, in the case of violets and cassie, 1s 8d; tuberose, 1s 3d; jessamine, 1s; roses, 3½d; and orange flowers, 3½d. Of the flowers producing essences, the orange flower produces 1 lb of essence—which is called "neroli"—for each 500 lb of flowers. As regards the proportionate yield of the other flowers, it is as follows:—Rose, 12,500 lb of flowers, 1 lb of essence; geranium, 500 lb of flowers, 1 lb of essence; mint, 500 lb and 1 lb of essence; lavender, 500 lb of flowers to 1½ lb of essence, and the same proportion for eucalyptus. There are two processes used for the purpose of extracting perfume from flowers which do not contain the volatile essence. The first may be described as the cold process, and the second as the hot process. The former is generally used for cassie (*Acacia Farnesiana*), jessamine, jonquils, tuberose, violets, and some other flowers. Freshly gathered flowers are spread upon a layer of pure lard a quarter of an inch in thickness, spread over a sheet of glass about two feet square, which is framed in wood and forms a kind of tray. These trays—sometimes about 40 or 50 together—are then piled upon one another, the flowers are then changed every 12, 18, or 24 hours, according to circumstances, and the process is thus continued until the lard is sufficiently charged with perfume. Jessamine and tuberose are frequently changed as often as 50 times before the lard is considered to be sufficiently impregnated, cassie and violets from 30 to 40 times, and jonquils about 20 times only. The fact thus obtained can be packed in air-tight tins and conveyed anywhere. When the hot process is resorted to for the purpose of obtaining the impregnated fat, about 40 lb of grease are placed in a copper vessel together with about 10 lb of flowers; the vessel is then placed over a slow fire and the contents are well stirred. After allowing the compound to boil for 10 minutes the vessel is left to cool for some hours; an additional 10 lb of flowers are then added, and the process is repeated until the fat has absorbed the requisite amount of perfume. The hot liquid is then poured through a sieve, and the greasy flower paste that remains is subjected to hydraulic pressure. It is in these two ways that the "pommades" of trade are produced. From these "pommades" perfumed and alcoholised liquids are extracted by means of grain spirit and also by spirits of wine. These are the "extraits" of trade, and it is by the judicious blending of the different essences and concentrated perfumes, obtained by the processes above described, that the numerous scents are produced.—*Journal of the Society of Arts.*

#### TEA PESTS.

A Maskeliya planter writes:—"When pruning a field here I noticed that a considerable number of the bushes had been attacked by some sort of a

borer. I think it is the work of ants, and nothing to be alarmed about, for on most of the adjoining estates a few bushes here and there are attacked in the same way; and from what I hear the damage done to the tea is not serious. I am sending by parcel-post part of a bush, showing the damage done, also a tin containing a few of the grub." The damage has been done, as our correspondent supposes, by "white ants." We extract from Mr. E. E. Green's graphic account of this pest and how to deal with it:—

It will be convenient to commence the account from the time of the periodic flights of the winged insects. The males and females, each provided for the occasion with four long brown wings, issue from the ground at dusk in countless numbers and flutter aimlessly about, a prey to numerous enemies, and bats make havoc in the fluttering crowd. An army of toads swarm over the ground and snap up the fallen insects. Cats and dogs, rats and mice, all come to the feast. Even the Tamil cooly includes them in his bill-of-fare. So great is the combined slaughter that it has been estimated that scarcely one out of every thousand escapes. After a short fight the survivors shake off their wings and recommence their wanderings on the ground. Here they are said to be found by some of the 'worker' ants and conveyed to a place of safety underground, each pair being elected king and queen of a new colony. The body of the 'queen' ant becomes enormously distended with eggs. She is enclosed in a chamber which has a series of openings through which the 'workers' come and go, removing the eggs as fast as they are laid and storing them in nurseries where the young ones are carefully fed by their attendants.

A certain proportion of the eggs develop into males and females; others into the two kinds of neuters, the 'workers' and 'soldiers.' The 'workers,' as their name implies, are employed in building and excavating tunnels and in attending to the larvae, while the 'soldiers' are supposed to defend them from attack. The 'queen' ant is said to live for several years, during which time she steadily increases in size. Specimens have been found nearly six inches in length. The number of eggs produced must be enormous. Each fresh brood of males and females finally attain wings and migrate in vast flights, as described above. From the central nests subterranean galleries and covered ways are carried to great distances in search of food. The ants never work exposed to the light. If they have to ascend a rock or the outside of a tree, they make covered ways of clay beneath which they can travel unseen. In a country like Ceylon, where we have abundant evidence of their work, it is needless to dilate upon the destructiveness of the insects,—a destructiveness enhanced by the insidious way in which it is effected. From the above account it will be seen how important it is to find the headquarters of the colony, and especially to destroy the queen insect. In the present case, where the insects have no necessity to wander far afield in search of food the nest would probably be found in the immediate neighbourhood of the injured trees.

The above was written in 1890, and since then we have not heard of much damage done to tea by white ants.

#### RAMIE FIBRE: A NEW COMPANY.

CHINA TRADING AND RAMIE SYNDICATE, LIMITED.

Registered January, 3, by Foss and Ledsam, 5, Fenchurch-street, E. C., with a capital of £100,100 in £1 shares. Object, to adopt and carry into effect an agreement made between H. C. Bennertz of the one part and this company of the other part, for the acquisition of a secret process relating to the manufacture of yarn by the degumming of ramie or China grass or other like materials, to develop and work the same, and to open stores in the treaty ports and else-

where in China and Corea. The signatories are :—

	Shares.
G J M Kearton, 28, Fenchurch-street, E C.	.. 1
F Fleming, Greenroyd, Halifax ..	.. 1
E Scarborough, 19, Crossley-street, Halifax ..	.. 1
H C Beinertz, Shanghai ..	.. 1
W Woodhead, Halifax ..	.. 1
M Thomas, 65 and 68, Basinghall-street ..	.. 1
W Spanswick, 26, Rosenau-road, Battersea-park ..	.. 1

The first directors—of whom there shall be not less than three nor more than seven—are to be elected by the signatories. Qualification, 250 shares. Remuneration, £100 per annum each; chairman, £150. Managing director, H. C. Bennertz.—*Financial News*, Jan. 13.

DUTCH COLONIAL TEA VS. ENGLISH DITTO.

IN CONNECTION WITH THE RUPEE EXCHANGE.

UNDER the above heading, Mr. J. van der Chys of Delft writes on 21st Dec. last, in the *Indische Mercuur* of 24th Dec., as follows :—

In connection with and continuation of my former articles in the *Indische Mercuur* on this subject, there has reached me through the kindness of our Consul-General in London the report, just received by the mail from Calcutta, of the meeting of planters held in that place for discussion and mutual deliberation as to what they should do in order to pass successfully through the crisis hanging over their heads. This crisis in the English tea industry does not appear to be of such importance, it is true, as the English planters would fain have had the English Government believe was the case; yet nevertheless it is evident, that it cannot be entirely pooh-poohed, and that it will therefore also make its influence felt in such a manner that the cultivation in English India, in the immediate future at all events (and, if Java bestirs herself actively, later on as well), will undergo no further extension. When one considers that the demands of consumption are always for more tea of the Assam-Java character, and that Ceylon, as mentioned by me in a former article, in a single year produced and sold more tea as a surplus quantity than the whole annual outturn of our Java amounts to, there is not the least doubt, that, if suitable land can be found in Java, the cultivation of tea can be doubled, and with success not only for the new plantations, but even more for the old, because the large foreign buyers, who now avoid Amsterdam on account of its small importance as a tea-selling place, would come to that market for making their purchases, if double or treble were sold there of what there now is.

According to the statement of Mr. Maas, who sounded a well-known tea broker on this subject, it cannot be expected that the English Government, at the desire of a small body like the Darjeeling Tea Planters' Association, should immediately affect a total alteration in its policy. The extract from the report of the above-mentioned planters' association sent to me runs in the original text as follows :—

At a meeting of the Darjeeling Planters' Association, held on the 14th inst., Mr. Grant Gordon was in the chair. Twenty-four members were present. A motion was brought forward by Mr. Irwin that the association should not approach the Government with a view to altering exchange, such a course being recognised as useless, but should endeavour to obtain an equalisation of the silver value of tea, as compared with China, either by a large tax upon China tea in England, or by the reduction of the duty on Indian tea. The motion was carried unanimously. A motion, carried unanimously, to approach other District Planters' Associations to send delegates to Calcutta to discuss all questions bearing on the present crisis in tea among themselves first, and then to invite agents and brokers to a conference, to settle amicably the present vexed questions with a view to calming the present strained relations.

THE AMOUNT OF HUSK IN CACAO SEEDS OF VARIOUS ORIGINS.

Under the above heading Mr. Bruijning of Wageningen, writes to the *Indische Mercuur* of Dec. 17, as follows :—

The cacao shells, which in the technical working-up of the cacao seeds fall off, possess little value from an industrial point of view; they are useful for few purposes, and serve now and then for the adulteration of agricultural food-stuffs and inferior chocolate. It is evident that the amount of husk in a lot of cacao seed is not entirely immaterial to the manufacturer.

By the kind intervention of the firm of A. Driessen, of Rotterdam, I was afforded the opportunity of examining 15 original samples of various origin, and to ascertain the amount of husk in them.

The results obtained are comprised in the following table :—

Name, as reg. origin.	100 gram seed consist of		Average weight of a seed (unhusked.)
	kernels.	shells.	
Java cacao ..	92.9 %	7.1 %	1.236 gram
St. Thomas cacao ..	92.3 "	7.7 "	1.348 "
Surinam cacao II ..	91.4 "	8.6 "	1.149 "
Trinidad cacao ..	90.9 "	9.1 "	1.286 "
Para cacao ..	89.8 "	10.2 "	1.136 "
Porto Plata cacao ..	89.5 "	10.5 "	1.292 "
Haiti cacao ..	88.6 "	11.4 "	1.317 "
Bahia cacao ..	88.4 "	11.6 "	1.379 "
Puerto Cabello cacao ..	88.1 "	11.9 "	1.598 "
Surinam cacao I ..	88.1 "	11.9 "	1.637 "
Machal-Guayaquil cacao ..	88.0 "	12.0 "	1.537 "
Aribba Guayaquil ..	87.0 "	13.0 "	1.628 "
Carupano cacao ..	86.8 "	13.2 "	1.469 "
Caracas cacao ..	86.6 "	13.4 "	1.504 "
Grenada cacao ..	86.6 "	13.4 "	1.230 "

From these figures it appears evident, that not unimportant differences exist between the amounts of husk of different varieties of cacao; at the same time it appears from this, that there is no definite connection between the amount of husk and the weight of the grain. I must first, however, wait for a closer description of the varieties referred to, as only a thorough examination of a large number of samples of different years would be able to show how far the various peculiarities of the samples already examined are constant.

MINOR PRODUCTS REPORT.

LONDON, Dec. 22.

COCA LEAVES.—Business has been done in good Truxillo leaves this week at 9d, for Huanco kind 1s 3d is asked.

CARDAMOMS.—The sales appear to have been confined to some half-dozen cases or so. A case or two of medium pale Mysore containing a few split have sold at 3s 1d, and 2s 5d has been paid for small-medium long pale.

CINNAMON.—Ceylon Quills to the extent of 12 bales sold at this week's auctions at 8½d for first sort, 7½d for second 6d and for third and 5½d for fourth. Nearly 80 bags of Ceylon chips at from 3½d for common to 4½d for fairly good.—*B. and C. Druggist*, Dec. 23.

THE DIMBULA VALLEY TEA COMPANY is doing very well this year, seeing that an interim dividend of 4s per share (£5)—4 per cent.—has been already declared. The year ends on 31st March. For the nine months ending December the quantity of tea secured is in excess of last year at same date; while the average selling price per lb. is nearly 1d better. This is exceedingly satisfactory and the shareholders and directors may well be congratulated.

## THE SLUMP IN TEA.

Never, perhaps, in the history of the Indian Tea Industry have prospects been less favourable than at present. Most of the large companies now know, within a fraction of an anna, what their dividends will be, and the feeling is one of depressions. One thing is at least certain, and that is that it is only the big amalgamated companies that will pay any dividend whatever, and even some of those that are burdened with played out gardens which they were forced to acquire in order to obtain possession of the more eligible lands will find themselves on the wrong side of the ledger. The fact is that we have reached the time when the ever-increasing production of Indian teas has led to an excess of supply over demand and this, naturally, has had a disastrous effect on prices. The margin of profit on many gardens was already much too small, and the lower scale of prices now ruling has led to attempt to further reduce the cost of production; but the lowest limit has now been reached and it is difficult to see in what direction any further reduction in the cost of working the gardens can be effected—except, perhaps, under the head of imported labour, the cost of which, in the case of coolies obtained through contractors and *arkuties* is generally recognized as excessive. Every item of expenditure on a garden is, now-a-days, rigidly curtailed, and most of the smaller gardens are already very much under-manned. In fact we know of some gardens that are working with a labour force equivalent to three-fourths of an adult per acre, which means ruin. The only way in which expenditure can be further reduced on these small gardens is by cheapening manufacture and bringing the leaf from a number of gardens to one central tea house. Immediate action is necessary, for if fresh outlets are not vigorously sought for and obtained the inevitable results must follow—they are, in fact, already sufficiently obvious. The smaller and older gardens will not be able to survive in the struggle that is now going on. They will go down, leaving their stronger neighbours to fight out the battle till the operation of the eternal laws of economy brings equilibrium. Action—if any can be found to counteract the rush of jealous rivalry that is carrying the industry in India and Ceylon into danger—must be immediate. It is useless to attempt to stem the increasing flood of extension and over-production, and nothing but largely extended foreign markets will prevent that interecine competition that will spell disaster to the tea industry..... Calcutta is full, just now, of plantors seeking billets—good men, the pick of their calling in many cases—who have been asked to accept a rate of pay altogether ridiculous, or to take the alternative and seek elsewhere. Our sympathies are entirely with these men who, after perhaps many years of hard and good work, are thus crowded out of their legitimate billets by the greed and grasp of syndicate promoters. Syndicates have been most disgracefully overloaded with capital—with which the promoters have, in many cases, walked away—and out of the dry bones of what has been left the planter has been expected to show impossible results.

Our contention is that it would be far better for all concerned to manufacture a sufficient quantity of drinkable tea that would at once go into consumption, than send in a quantity of unsaleable rubbish which nobody wants and which only goes to increase stocks, thus giving Ceylon and China a further opening.—*Indian Sportsman*, Jan. 21.

## THE GLASGOW ESTATES COMPANY.

At the eighth annual meeting of this Company held on the 28th Jany. at the offices of Messrs. Whittall & Co., the secretaries and agents, there were present:—Messrs. J G Wardrop (in the chair), Jas. Forbes and W H Figg (directors), J H Starey, Alex Stevenson and G H Alston. By

Attorney:—Messrs. E John by C E Haslop, A H Dingwall by J H Starey, G W Carlyon and A Thomson by G H Alston, G C Walker by Jas. Forbes, J K Mandy acted as Secretary.

After the formal business had been gone through

The CHAIRMAN proposed the adoption of the accounts and report.

Mr. JOHN'S attorney seconded, and after a few questions had been asked by the two gentlemen, the motion was adopted.

## THE DIVIDEND.

On the motion of the Chairman seconded by Mr. Stevenson, a final dividend of 10 per cent for 1898 was declared to be payable forthwith.

## ELECTION OF OFFICERS.

On the motion of Mr. STAREY seconded by Mr. JOHN'S attorney Mr. J G Wardrop was re-elected a director.

Mr. STEVENSON proposed and Mr John'S attorney seconded the re-election of Mr. H J Scott as the auditor.

This concluded the meeting.

## ANNUAL REPORT.

ACREAGE.	
Tea in full bearing	.. 431 acres
Do partial bearing	.. 167 "
Do not in bearing	.. 36 "
Tea clearings	.. 16 "
Grass	.. 2 "
Jungle, &c.	.. 62 "
Total	.. 714 acres

The Directors herewith submit their annual report and the accounts of the Company for the year ending 31st December last.

The cost of delivering the tea from the Company's estates in Colombo was 26.79 cents per lb. The crop secured amounted to 290,109 lb. Tea against 277,600 lb. in 1897. The nett average price obtained was 49.71 cents per lb. against 51.57 realized last year.

After allowing for depreciation of buildings and machinery the amount at credit of profit and loss account for the year's working is R57,828.65, being equal to 17.79 per cent on the paid-up capital of the Company. To this must be added the sum of R2,403.51 brought forward from last year, making a total of R60,232.16 at the credit of profit and loss account. An interim dividend of 5 per cent was declared on 28th July last, and the Directors now recommend the payment of a final dividend 10 per cent making 15 per cent for the year.

In accordance with the policy approved of at the Annual General Meeting held last year, a sum of R10,693.90 was placed to the Extension Fund. The Directors again deem it advisable to place a further sum of R10,000 to credit of this account, and it is trusted that this will meet with the approval of the Shareholders. The addition of this R10,000 will bring the Extension Fund up to the substantial sum of R60,000. This leaves a balance of R1,482.16 to be carried forward to the current year's account.

The estimate for this year is 315,000 lb. of tea against an expenditure on working account of R79,660. A sum of R2,400 is estimated on capital account for completion of withering house and upkeep of tea, not yet in hearing.

Mr. H. Tarrant having left the Island, the remaining Directors appointed Mr. Jas. Forbes to fill the vacancy. In terms of the Articles of Association Mr. J. G. Wardrop retires from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

TEA PROSPECTS:—THE "CURRENCY" QUESTION AND "ABANDONMENT OF POOR TEA FIELDS."

WE have the greatest respect for the opinions of Mr. Robert H. Elliot, whom we know to be an enterprising capitalist and planter and a charming as well as instructive writer on his experiences in Mysore. But when he returns for the second time—in the letter we publish on page 580—to "the only policy left for the tea planters of Ceylon and India" and to urge on the former especially to lose no time in abandoning every acre they can, we suspect not a few of our readers will begin to say or think,—

Metinks he doth protest too much!

The fact is that it is the most difficult thing in the world to apply a policy of abandonment. In theory,—in the abstract,—what can be easier than to say that it is judicious, wise and politic to abandon tea fields that do not pay, that are cultivated at a positive loss; and on paper it is not easy to controvert the arguments adduced by our respected correspondents "W.D.B." and Mr. Elliot himself and in our editorial columns; but when we come to apply these arguments and theories to concrete cases, whether of districts or plantations, we are met by opposing views and difficulties which show that there is another side to the question. For instance, we take an old coffee estate—and never a very profitable one—that has been turned into tea, with perhaps a certain number of acres in addition on virgin land. The place has not yet left any margin of profit from tea, nor will it do so this year; but those owning it, or interested in the estate, declare that with time the tea is bound to improve—in fact it has been improving year by year—and they are as confident now as any time during the past thirty years of making a financial success out of the old wattle! In contrast with this position, we may place that of the impulsive proprietor or manager all in a hurry for returns and who will have nothing to do with a manure or any treatment that does not show an appreciable return in a few months! Of course, in some cases where unprofitable, or barely profitable, estates are kept on, it may be a case of no choice, since the mortgagee who at least gets his interest, will permit of no change, and refuses to think of taking over the property, while the Agents are content to carry on with hand-to-mouth returns. On the other hand, in regard to the unprofitable outlying field of an otherwise paying estate, we have heard weighty arguments used against "abandonment" or the lopping off of the weakly non-paying member. In the first place, the actual saving—unless the Superintendent's salary is docked in proportion to reduced acreage—is a comparative trifle; and in the second, there is the great advantage of securing work for a full number of coolies, equal to a time of pressure in plucking over the specially profitable fields. In other words, it pays to have a poor outlying field to give occupation to extra coolies—whose wages are at least covered—if on emergencies, which periodically recur, these coolies can, most usefully and profitably, be added to the plucking force over the rest of the estate. These then are some of the arguments which indicate "another side" to this question of abandonment.

Then there is always the question,—“Who is going to begin?” Can Mr. Elliot tell us

of deliberate abandonment taking place in any part of India; or any one else of a Company, Agents or individual proprietor ordering such abandonment in Ceylon? Some time ago we did hear of the policy being applied in a Northern district; but the remark was made "let tea prices only begin to take a turn upwards again and there will be a speedy attempt to recover and repluck the lost fields!" It is most difficult to lay down a rule in such a case. We have been accustomed to hear, for instance, that 360 lb. of made tea per acre, save at a high elevation, could scarcely be made to pay; but we have heard of a case of a poor estate with poor jāt, apparently poor soil and medium elevation, being made to pay handsomely at that rate of bearing or plucking, simply through the indefatigable attention of its Manager both in field and factory, to getting his subordinates to understand how really fine teas were to be secured in the leaf plucked, and in careful manufacture. The moral seems to be that extra attention to plucking, withering and manufacture generally, especially firing, may possibly make a profit out of what has hitherto been considered unprofitable returns of leaf. Individual planters can alone decide on a point of this kind, each for himself. For, who has not heard of fine, even "beautifully made," teas being turned out; but so miserably poor in the cup, as to indicate there was nothing in the soil that would make a good tea! What can any planter or teamaker do in such a case? Either to manure judiciously according to analytical results, or to "abandon," would seem to be the alternatives.

As regards Mr. Elliot's view, that the present condition of our Tea and Labour Markets puts a new complexion on the Currency Question, we must point out that the superabundance of coolies this season is due to perfectly natural causes. The year of a short supply—1897—was a year of much briskness in planting, extensions in every district, many thousands of acres in some cases had been felled and had to be planted, Coolies had a splendid full-time-working year. They naturally appreciated it and at the end of 1897, a surplus of 10,000 coolies remained with us as compared with 1896. The good news, moreover, spread to Southern India and so an unusual influx took place during 1898 just as depression had set in and all further extensions were stopped and orders issued for the strictest economy in all departments. The result was not an actual reduction in the rates of wages—so far as we have heard—but a diminution in the number of days of work per week, which could be given to coolies on estates. We fear Mr. Elliot cannot make much out of these circumstances in reference to the Paper which he has to send in to the Currency Commission. He was expected to appear personally; but this will be impossible in view of his stay in Egypt during the Spring months.

It may be hinted that we have written today in discouragement of the "abandonment" of unprofitable fields of tea. No such thing. In fact, we do not consider that writing has much influence one way or the other in such a case. Each planter has his own peculiar circumstances and decides for himself. We merely desire to say facts as given to us before our readers and one useful purpose to be served is to dispel the notion either here or in India, that an era of tea "abandonment" has set in, and that therefore "it will be safe to go on with that clearing, after all you know, in place of leaving it unplanted!"

"THE ONLY POLICY LEFT FOR THE  
PLANTERS OF CEYLON AND INDIA."

Galle Face Hotel, Colombo, Feb. 2.

SIR,—Since writing to you, on January 25th, a letter which you were good enough to publish in the *Observer* of Jan. 30th, I have received letters on the subject from Ceylon Planters of past experience and am now more than ever convinced that the policy of judiciously abandoning unprofitably or only slightly profitable portions of estates is really the only course open to us in order to diminish, as far as possible, the results of the disastrous Currency policy of the Indian Government. For what hope can there be of turning the Government from its course?—a Government which practically consists of Indian officials, who want to get their savings remitted home on the most favorable terms. They started the movement and they will certainly persevere with it to the end, and while they have all the power of the Indian Government, at home and in India, at their back,—we have merely the purely nominal power of the House of Commons, the members of which, with but very few exceptions, neither know nor care anything about the subject.

Then so far from having any security that the officials will content themselves with a 16d Rupee, we have the Government (*vide* Sir David Barbour's speech of June 26, 1893) assurance merely that "it is not attended to do more at present" than aim at this rate. A higher rate then is evidently determined on, and what that may be no one can tell; and even if the existing officials were contented with a moderate further rise, it by no means follows that their successors may not aim at a much higher rate. The whole situation in short bristles with uncertainty so far as the Currency is concerned, and it is therefore evident that we must betake ourselves to our only certain refuge—judiciously abandoning every acre we can, and thereby reducing production, labourers' wages, labourers' advances, and the risks of the season, which of course, are far less on rich, sheltered lands than on the poorer and more exposed portions of estates.—Obediently yours,

ROBERT H. ELLIOT.

PLANTING PRODUCTS.

(From the Northern Districts Planters' Association Report for 1898-99.)

During the year three general and five Committee meetings have been held in Kandy. The roll of members who have paid their subscription is considerably below that of last year—viz. last year 84, this year seventy-three members.

Several important subjects have been discussed by the association this year—notably Plague rules, Labor Federation, the Licensing of Boutique-keepers and the appointment of Mr. Kelway-Bamber.

Your Committee are glad to say that Labor Federation is now an accomplished fact and hope the rules which have been made and published will be of benefit to the Planting Community. The Association gave its support to the Dinuba Association's resolution *re* the licensing of Boutique-keepers, but so far without any result.

Three estates in the Northern Districts were selected to be visited by Mr. Kelway-Bamber, viz. Bandarapola, Elkadua and Knuckles Group. The Association passed a resolution that the districts of Kurungala, Allagala, Kadugannawa and Polgahawela be included in the list accepted by the Parent Association from which one estate be selected to be visited by Mr. Kelway-

Bamber, these districts having been omitted in the list. This resolution was forwarded to the Parent Association, but without result which your Committee much regrets.

This Association on the motion of Mr. VanStarrex discussed the question of—and passed a resolution which was duly forwarded to the Hon'ble the Colonial Secretary on the condition of the roads in the districts was improved since your Association suggested the desirability of appointing unofficial Inspectors.

NORTH ROAD.

Your Committee deprecate the action of Government in closing the North road, but hope that it will be reopened for coolie traffic at the earliest opportunity. The crop estimates have been checked as carefully as was possible for the year 1899. 39,520 acres are in bearing, estimated to yield, 15,370,000 lb. as against 15,548,650 lb. estimated in 1898 showing a decrease of 198,650 lb.

Your Committee have for the first time made an estimate of cacao and cashew crops for the coming year, and great care has been taken in the collection of figures.

Some gardens belonging to natives may have been left out, but you may take the following figures as approximately correct. The acreage under cacao in bearing in fourteen districts represented by this Association is 15,825 estimated to yield a crop of 36,346 cwt. Acreage not yet in bearing 2,587. Total under cacao is 18,412 acres.

Your Committee wish to point out that this is the bulk of the island's crop and ask other District Associations where cacao is grown to collect similar returns.

CARDAMOMS.

Total acreage under this product is 2,596, of which 2,406 acres is in bearing, estimated to yield 345,900 lb.

BENEVOLENT FUND.

Your Secretary has collected R235 for this fund which has been duly forwarded to the Treasurer. Your Committee heartily recommend this fund for your further support, and would point out that a number of members paid direct to the Treasurer.

CEYLON MOUNTED INFANTRY.

Your Association supported other districts in asking for a grant to the members of this corps suggested by Government.

THE CRYPTOGRAMIST.

Three reports of the work done by Mr. Carruthers have been issued, all of them showing careful investigation of coca canker and pod disease, but proving that there still remains much to be done. Your Committee have urged the necessity for engaging a cryptogamist permanently on the Government Staff and hope the concession will follow since Mr. Green has been appointed Government entomologist. Your Committee urgently ask the attention of cacao planters to the necessity of destroying the diseased pods and cutting out and burning all diseased bark. The matter of a permanent cacao sub-committee of the Parent Association is deferred from consideration, the opinion meanwhile being that the N. D. Planters' Association should undertake the work itself. Your Committee, however, hope that the members will urge on the Planters' Association the desirability of conceding what has been asked for by a resolution passed at our last Committee meeting.

CACAO STEALING.

Cacao stealing has increased to such an extent as to be a scandal and disgrace to a civilized Government. Your Secretary has procured a return of all cases of theft of prædial products instituted in the Matale and Panwila Courts, the return shows 79 cases as having been instituted in Matale and 36 cases as having been instituted in Panwila last year.

ANALYSIS OF THE CACAO TREE.

At the instance of Mr. De Sauctis, the Parent Association had an analysis of the cacao tree made by Mr. Cochran for whose report and hints on manuring your Committee passed a vote of thanks.

OBITUARY.

Your Association regret the loss by Death of Mr. James Rigby, a member of your Committee.

AGRA OUVAH ESTATES COMPANY, LD.

THE ANNUAL REPORT.

ACREAGE.

31st December, 1893.

AGRA OUVAH.		FANKERTON.	
acres.		acres	
Tea in full bearing	302	Tea in full bearing	165
" not in bearing	20	Timber clearing	10
Grass and Jungle	9	Grass, Patana & Scrub	18
<b>Total Estate</b>	<b>331</b>	<b>Total Estate</b>	<b>193</b>
<b>Grand Total 524 acres.</b>			

The Directors have now to present to the Shareholders the accounts of the Company for the past year.

The Crops secured amounted to 271,241 lb. Tea, as against 269,087 lb in 1897. This total is about 9,000 lb. below the estimate, and the shortfall is accounted for by the unfavourable weather prevailing during the last few months of the year.

After deducting the cost of manufacturing 77,953 lb. Tea from other estates the cost of delivering the Company's tea in Colombo was 25.47 cents per lb. The average nett price for the tea was 53.82 cents per lb. against 55.05 cents per lb. in 1897. The gross amount of income from manufacturing tea for other estates was Rs,964.61. It is satisfactory to note that the Coast Advances outstanding have been reduced by nearly Rs,2,000.

After making the usual ample provision for depreciation of buildings and machinery the amount at credit of profit and loss account for the year's working is Rs67,719.23, equal to 18.06 per cent on the capital of the Company. To the above has to be added a balance of Rs16,039.21 brought forward from 1897, making the total balance at credit of profit and loss account Rs83,758.44. An interim dividend of 7 per cent was declared and paid on 13th August last, absorbing Rs26,250, and the directors now recommend the payment of a final dividend of 11 per cent, making 18 per cent for the year, and that the balance of Rs16,258.44 be carried forward to the current year's account.

The estimate for this year is 280,200 lb. Tea on an expenditure on the Estate of Rs5,531.26, which outlay includes the cost of manufacturing 150,000 lb. Tea expected from other estates for that purpose, and also additions to the Machinery and the cost of watercourse referred to below.

The Directors are glad to announce that they have arranged with the proprietors of a neighbouring estate for the use of water from a stream passing through that estate; the expense of diverting the stream will be small, and a considerable saving in fuel is anticipated.

In terms of the Articles of Association Mr. W. H. Figg retires by rotation from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

TEA CHESTS.

A NEW AND UP-TO-DATE PACKAGE.

Ever since the soft sheen of the coffee leaf gave place to the harsh and dark green leaf of the tea bush the Ceylon tea planter has been exercised in his mind as to how and where to find his tea chests. As a matter of fact, the bulk of the forest trees were lying about, as it were the coffee clearings before the newer product came into being; gradually from Ilul and Mellia and Mallabodda to Cakuna, mango wood and other baser kinds has the tea planter been using up his supply. It is odd to think that the last reserves of virgin forests, spread in countless acres at his feet, as it were, is yet far out of his reach.

It cannot pay to transport the timber along jungle paths from the heart of the vast low country jungles, and so it came about that the Ceylon planter was obliged in time to depend upon other countries for the supply of his tea chests. The wild peach tree of Japan (moni wood of commerce) has been for many years his best friend, but the Japanese have lately become alive to the fact that their supplies are limited. The annexation of Formosa necessitated the importation of thousands of standards of this soft and aromatic timber, and so the planter received due warning by increased prices and irregular supply that this reserve, too, was becoming a closed one to him. Sweden and Norway were now drawn upon very largely, but with perhaps two exceptions, the great sawmills of this vast peninsula did not rise to the occasion. It seemed now as if most of the supplies were exhausted, and the planter in many cases dropped back upon native chests, but the contractors could not grow their timber, and had to rely upon inferior growths, the result of which was and is that, for some time past, there has been a cry of "cheesy teas," an appalling and lamentable effect of some oiliness in the wood. Then it was that "veneer" of three-ply was thought of for tea-chests. A new package of this description has recently been introduced. This package is called "The Colindia." The wood is cut from Canadian maple, in Canada; the cement which binds the ply together is a secret composition. The thickness of the material makes the box equal to an inch plank in resistance. It is extremely light, and the shooks lie very compactly in their outer case. The sides are made strong, rigid and waterproof at the corners by a continuous steel fastener (patented), which is held together by clenched nails. The bottom is very strongly attached, as the nails are driven into an oak batten, which is, in turn, clenched on. The tea cannot come into contact with any wood, the lead lining being welded and whole. The tare—a most important matter—is claimed to be perfectly even. The lid is easily removed, and the lightness and compactness in packing saves a power of freight. Twelve complete "Colindias," with two extra ends, rails, and instructions complete are sent in every outer chest, which, when empty, is ready for shipping back again. A planter of many years standing assures us that this package is likely to be a great success, and we are glad to add our testimony to what is, in our opinion, its great suitability as a good tea carrier.—*H. and C., Mail*, Jan. 13.

THE FUTURE OF CEYLON TEA CROP.

"W. D. B." undoubtedly gives good advice to his brother planters in the older districts at medium elevation where tea has been planted over coffee fields. We have no doubt that "judicious management" has, in many cases, already done its work in abandoning corners or fields of tea that, with present low prices, can only be cultivated at a loss; and we took this process into account the other day, to some extent, in venturing to suggest that Ceylon had probably attained its average maximum export of tea in 120 million of lb.—a good season giving a few million lb. above and an unfavorable one, a return as much the other way. "W. D. B." works out his argument in a very practical way, and we have no doubt his figures will bring home the wisdom of discarding unprofitable bits of tea, to some who have not yet thought of the matter in their own cases. Of course, if there was a revival of better prices and increased demand, the policy would be speedily reversed; but Russia (the Continent of Europe generally) and America must be properly conquered before that good time can be anticipated.

Correspondence.

To the Editor.

THE COST OF PADDY CULTIVATION.

DEAR SIR,—Below I give the expenses required to bring an acre of paddy land into cultivation as was requested by your correspondent "B P" in your paper of the 6th inst. The figures represent the expenditure required, and the yield in the Ekala (Jaala) district.

What has "F B" to say of the millions that are engaged in paddy cultivation in India, China, Burma, &c.? Had "F B" been an experienced paddy cultivator, his words would have carried some weight, but to cultivate for once only a stagnant maddy pool in a corner of a coconut estate, paying no regard whatever to the suitability of the soil for the growth of paddy, and to denounce paddy cultivation as "the most unremunerative industry," is most ridiculous:—

Cost of ploughing one acre three times (one man taking 2½ days each time, at 37½ cts per day)	R c	2 81
Buffalo hire at 50c a pair a day for 7½ days		3 75
Cost of sowing one acre (½ a day's work)		25
Cost of seed paddy, two bushels at R1.50 per bushel	..	3 00
Cost of manure, 56 lb, at R3 per cwt.	..	1 50
Cost of reaping an acre	..	2 50
Cost of threshing, winnowing, etc.	..	2 50
Cost of regulating water, etc.	..	1 69

Total cost of sowing an acre R18 00

Yield of two acres, 30 bushels at R1.25 per bushel	..	37 50
Value of straw	..	6 00

43 50  
Deduct Expenses of sowing as above .. 18 00  
A net profit remains per acre of .. R25 50  
Reckoning that an acre of paddy land be worth R150, an income of R25 a year shews that the work brings an interest of nearly 16 p. c. on the investment. I have, of course, taken into consideration only the average yield in this district (15 fold) but some of the best lands yield from 25 to 30 fold, but the expenses seldom exceed the figures I have given. The length of time a crop takes to ripen varies from two to seven months according to the variety of paddy sown and those kinds of paddy that take from two to four months are generally known as *balā vi* and in the paddy lands in the North-Central Province are usually sown twice a year yielding as a rule a much higher fold than in the poor soil in the low-country fields.—Yours faithfully,

A NATIVE PADDY CULTIVATOR.

IMPROVING THE TEA MARKET.

Agras, Jan. 24.

SIR,—Every little helps at a time like the present, when many estates are existing on a bare margin of profit, and some even working at a loss. My suggestion which would relieve the market of a certain amount of low-class tea has no doubt been considered by the greater number of Estate Inspectors, and the obstacle to carrying it into effect is probably the disinclination of the Companies to propose to their shareholders a reduction of acreage, and, perhaps, the feeling of private owners that to cut off acreage is to lessen the amount to be obtained by a possible sale, but, if this be the case, it is, more or less a delusion as purchasers now-a-days have the figures

pretty closely looked into by experts before they venture their capital. My suggestion is not applicable to the high-lying and young coffee districts, but to the old districts where I know for a fact that there are many hundreds of acres producing only 200 lb. per acre, and under. Such acreage should, I hold, be abandoned forthwith; it cannot hope to make a profit with the most scientific manuring. The method of calculation can be applied to each individual estate, and a study of the sale lists will show that there are a very large number of estates whose average price is below 35 cents per pound net, at which I have made my calculations. Every million pounds of tea taken off the market at the present time probably adds a cent to the value of the remainder, and it is the low-grade teas which want most relief, and will I think, most quickly find it in any lessening of the quantity. Reduction of quantity by working for quality does not pay below 3,000 feet, but, at the same time, lessening the quantity in many cases means more room for withering, and, therefore, the best quality obtainable. I take as typical example an estate of 350 acres, in which it is supposed that 50 acres give only 200 lb. and the remainder 400 lb. per acre, and by abandoning the 50 acres it is seen that the profits are not lessened, and will probably be increased by the rise in the market, and the better wither.

	350 acres R.	300 acres R.	Decreased Expendi- ture. R.
Superintendence at R1 per acre, and a Conductor ..	4,320	3,720	500
Allowances ..	240	240	..
Weeding at R1 per acre ..	4,200	3,600	600
General Transport ..	50	50	..
Contingencies ..	600	550	50
Roads and Drains ..	350	300	50
Bungalow, Lines, &c., upkeep ..	500	500	..
Factory and Machinery at ½ ct. per lb. ..	650	600	50
Tools and Baskets, &c. ..	150	150	..
Pruning at R6 ..	2,100	1,700	300
Plucking ..	12,500	10,800	1,700
Manufacture at 2½ cts. ..	3,250	3,000	250
Packages at 2½ cts. ..	2,600	2,400	200
Carriage at 1 ct. ..	1,300	1,200	100
Sundry Expenses, Insurance, &c. ..	500	500	..
Charges in Colombo at 1 ct. ..	1,300	1,200	100
Visiting ..	500	500	..
Total ..	35,010	31,110	3,900

350 acres produce 130,000 lb. at 35 cts. net, equal to R45,500, Profit R10,490.

300 acres produce 120,000 lb. at 35 cts. net, equal to R42,000, Profit R10,890.

It costs in fact 39 cents per lb. to produce the 200 lb. per acre, which is sold at 35 cents.

W. D. B.

THE DIRECTOR OF THE KEW BOTANIC GARDENS has just been knighted, and we beg to congratulate Sir William Turner Thistleton-Dyer, K.C.M.G., F.R.S., LL.D., on his well-earned advancement. Son-in-law to Sir Joseph Hooker, the present Director began his useful scientific and economic career at Kew under the happiest auspices, and his work hitherto (and, we trust for many years to come) has been most beneficial to British Dependencies all over the world, as well as to science at home.

## USEFUL NOTES.

**CINNAMON.**—*Quills* are dearer, the price of the usual sort to arrive being now 8 13-16d. c.i.f., January-March shipment. A fair business has been done on the spot since our last.—*British and Colonial Druggist*.

**OILS, ESSENTIAL.**—All East Indian Oils are quiet, *Japan Cemenholised Oil of Peppermint* is selling at 3s. 9d. spot, and 2s. 7½d. c.i.f. *Lowgrass Oil* is obtainable at 3d. spot. *Star Anise Oil* is 6s. 1d. to 6s. 2d. spot. *Oil of Cassia* is unchanged.—*Ibid*.

**VANILLOS.**—A special auction was held of these to-day at which 1,095 tins were offered and 1,017 sold. The auction began quietly, but the demand increased afterwards, prices being irregular; but, on the whole, steady. The following shows the rates obtained:—*Seychelles*: Good beans sold at 28s. for 8 + 8½ ins., 26s. for 8 ins., 25s. 6d. for 7½ + 8 ins., 22s. 6d. to 25s. for 7 + 7½ ins., 21s. to 23s. for 6½ + 7 ins., 21s. to 22s. 6d. for 6 + 6½ ins., and smaller sizes ranged from 19s. for 3 + 4½ ins., to 21s. for 5½ + 6 ins. *Beuwen*: Fair beans sold at 19s 6d. for 5 + 6 ins., and 18s. for 4½ + 5 ins. No *Mauritius* or *Madagascar* beans were put up, and the offerings of *Tahiti* and *Ceylon* begin confined to a few tins.—*Ibid*.

**TRANSMISSION OF ELECTRIC POWER.**—Professor GEORGE FORBES writes:—"Referring to the suggestion made in my recent lecture to the Society of Arts that the copper used in electric works should be mortgaged. I find that the mention I made of Mr. Thwaite's name in a subsequent notice in the *Journal* (see ante. p. 103), led some people to believe that he was the originator of the scheme. This is not the case; my attention has been drawn to the facts that his paper was read on the 12th November, 1892 and that in my Cantor Lecture to Society of Arts on the 25th January, 1892, I had said "That far more copper would be put down in mains if people realised the low rates at which money could be raised in debentures on them."—*Journal of the Society of Arts*.

**PURE WATER AS A POISON.**—H. Koeppé has made a very interesting contribution of a recent number of the *Deutsch Medicinische Wochenschrift* (1898, 624) upon the subject of water, and has arrived at the conclusion that absolutely pure water is a poison, a sentiment long since adopted in Kentucky. Isolated living elements and single-celled organisms die in distilled water, since this deprives the cells by osmosis of the salts which are essential to life. The epithelial cells of the stomach are destroyed by free ingestion of distilled water, and eventually thrown off. This local poisoning is indicated by the nausea and vomiting which follows the ingestion of distilled water. In support of this singular view Dr. Koeppé cites the fact that the very pure water which results from the melting of glaciers and of snow upon mountains is very unwholesome. Another link in the chain of evidence is the fact that a certain spring known for hundreds of years as the "poison spring" yields water which, on chemical analysis, appears to be absolutely pure.—*American Druggist*.

**GENERAL RESULTS.**—1. The alkaloid is not contained in the sieve vessels, but in the parenchyma. 2. It is present in the green cells. 3. The alkaloid appears as a constituent of living parenchymacells or cells of a kindred nature. 4. Cells containing oxalate of lime contain no alkaloid. 5. Generally speaking (there are exceptions) we find in the case of young organic matter at the growing point the alkaloid dissolved in the cell sap, but in older organic matter, as in the secondary bark, we find it in an amorphous solid condition. 6. Sometimes the alkaloid is present in the form of the tannate, whether it occurs combined with other acids was not investigated. 7. Very active organic matter, such as a cambium, at the farthest portion from the growing point contains no alkaloid as a rule; but close to this centre of activity it is found in considerable quantities. 8. In the neighbourhood of the growing point of the stem much more is found to be present than in the neighbourhood of the growing point of the root.—*British and Colonial Druggist*.

**AROMATIC COD LIVER OIL.**—According to Duquesnel the addition of two drops of oil of eucalyptus to each 150 gms. of cod liver oil is sufficient to completely mask the taste and odour of the oil.—*American Druggist*.

**THE BOTANICAL LOCALISATION OF THE CINCHONA ALKALOIDS.**—Dr. J. P. Lotsij, Government Botanist in Java, has made a very exhaustive report on the localisation of the alkaloids in the cinchona plant. We give below a translation of this report, omitting portions which are of an elementary botanical nature:

Report upon the Localisation of the Alkaloid in the Cinchona Plant, issued by the Laboratory of the Government Cinchona Plantations.—*British and Colonial Druggist*.

**IN AN INTERESTING PAPER ENTITLED "CACAO LEAVES."**—Contributed to the *Western Druggist* (Chicago) for December by A. Schneider M.D., Ph.D., the author enters into a consideration of the comparative merit of the several varieties of cacao leaves placed upon the market, and arrives at the following conclusions:—(1). The gross differences between the leaves of Bolivian, Peruvian, and Brazilian cacao are quite marked. (2). To observe the essential differences in the ridge along the upper surface of the midrib it is best to examine cross-sections under a medium power. (3). It is practically impossible to distinguish the powders of Bolivian and Peruvian cacao. Powder of Brazilian cacao may be recognised by the prominent globoso papillæ on the cells of lower epidermis.

**VANILLA AUCTIONS.**—The vanilla auctions to-day were very lengthy, and six catalogues took four hours to go through. Altogether 1,095 tins were offered, of which 1,017 sold. Mr. W. W. Green (Brookes and Green), while Mr. Dalton (Dalton and young) was in the rostrum, said that the course adopted by some of the brokers of offering single-tin lots which only weighed a few pounds was not an advantage to either buyers or sellers, and it was the desire of the trade that the lots should be made as large as possible by grouping the same lengths together wherever practicable. Mr. Heideman said that the offering of small lots was convenient for those who did not require large quantities, but he agreed with Mr. Green's remarks. Mr. Dalton said that he would see into the matter.

As the sales were so long, Messrs. Brookes and Green conceived the happy idea of offering the buyers some light refreshment in the shape of tea and sandwiches, and therefore, at about two o'clock the unusual sound of the rattling of cups and saucers was heard in the sale room.

Particulars of the prices of vanilloes are given in our detailed items below.—*British and Colonial Druggist*.
