However, while trade interests in one form or other held the ascendancy at this meeting it is scarcely to be wondered at that their disregard by the Council of the Pharmaceutical Society, and its unfitness to represent the trade, should have been affirmed on equally vague and intangible grounds. But if any such incompatibility between the Council and the trade exist, it may be asked who is really to blame? Is it not, as shown by Mr. FRAZER, in his address to the Glasgow Chemists and Druggists' Association, at the opening meeting of the session in November, 1876, to the voluntary disability to influence the conduct of affairs under which those outside the Society place themselves, and still more to the indifference and apathy of those who are members that such a result must be ascribed? Does not any blame rest with those who thus refuse to perform the functions, which are their duty, with the view of returning members of Council who will represent them as they would desire? Would not such a legitimate exercise of their functions be more conducive to the general interests of the trade than occasional spasms of censorious dissatisfaction.

Transactions of the Pharmaceutical Society.

ADJOURNED MEETING OF THE COUNCIL.

Wednesday, January 8, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hanbury, Hills, Robbins, Sandford, Schacht, Shaw and Woolley.

The minutes of the previous meeting were read and confirmed. Also the minutes of the meeting held for election of annuitants, the result of which has already been published.

APPOINTMENT OF EXAMINERS.

A letter was read from the Privy Council, approving of the appointment of Examiners lately made by the Council.

The following, being duly registered as Pharmaceutical Chemists, were respectively granted a Diploma stamped with the seal of the Society:—

Brearey, Arthur William.
Brown, Thomas.
Cooper, John.
Gulliver, George Ekins.
Fisher, John Hutchison.
Hall, Edward.
Keith, John.
Leigh, Marshall.
Stammwitz, Louisa.
Will, William Watson.

ELECTIONS.

Pharmaceutical Chemists.

Allen, Henry.....London.
Bennett, Charles .....Bournemouth.
Bilney, Joseph Thomas .....Naini Tal, India.
Brearey, Arthur William.....Douglas.
Hall, Edward .....Swaffham.
Will, William Watson.....Montrose.

Chemists and Druggists.

Catarall, John .....Eccles.
Mason, Alfred James .....Bexley Heath.
Williams, Daniel Tudor .....Gadlys, Aberdare.

ASSOCIATES IN BUSINESS.

The following, having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Brooks, Charles Theodosius ...Lower Edmonton.
Foster, James Edward.....Bridgwater.
Gould, Robert George .....Andover.
Harris, Frank William .....London.
Henderson, Christopher .....Hoylake.
Randall, Frederick Joseph .....Chelsea.
Roberts, David Prosser .....Croydon.

Modified.

Allman, John Dowling .....London.
Cresswell, Frederick.....Lee, Kent.

ASSOCIATES.

The following, having passed their respective examinations, and tendered (or paid as Apprentices or Students) their subscriptions for the current year, were elected "Associates" of the Society:—

Minor.

Alldridge, Joseph Henry.....Brighton.
Allan, James Henry.....Stockton-on-Tees.
Bignold, Walter .. ..King's Lynn.
Borland, John .....Kilmarnock.

Bradbury, Thomas .....Ashton-under-Lyne.
Brooks, Tom.....London.
Broughton, Owen .....Sleaford.
Buckley, Walter .....Bradford.
Cox, Joseph .....Nottingham.
Evans, David .....Porth.
Fletcher, Ellis ....Atherton.
Gibbons, William.....Manchester.
Harrison, Frederick.....Brighton.
Hatton, Frederick William.....London.
Herington, Joseph Henry ..... Leighton Buzzard.
Howell, William .....Cheltenham.
Jackson, Joseph John .....Bridgnorth.
Knight, Charles ..... Gloucester.
Knight, Lindsey .....Cheltenham.
Lodge, George Henry .....Rotherham.
Mayger, William John.....Northampton.
Newbigin, Lesslie.....Alnwick.
Parkes, George James Robert...Tipton.
Smith, Morgan .....Trecynon.
Toon, Lionel Edward .....Haslar.
Turner, James .....Seaforth.
Waddington, John William.....Kettering.

Modified.

Brinsmead, Thomas James .....Torrington.

APPRENTICES OR STUDENTS.

The following, having passed the Preliminary examination and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society :—

Barlow, George Robert .....Congleton.
Bell, Charles Tompkin .....Retford.
Broad, Henry James ....Stourbridge.
Bunn, James Early Smee .....Halstead.
Cormack, George .....Tochabers.
Coull, George .....Edinburgh.
Crompton, William .....Bury.
Drew, Henry William.....Southwark.
Edmunds, Henry H. .....Mere.
Ekins, Arthur Dearlove .....Bedford.
Evans, Thomas.....Chorley.
Fenton, John Mailler .....Dunkinfield.
Freeland, Alonzo Joseph.....Angmering.
Fry, Samuel ....Bishop's Waltham.
Fryer, Charles Harry .....Leeds.
Gibson, George Edward .....Hull.
Hart, Thomas .....Darlington.
Hill, Arthur .....Leicester.
Holmes, Thomas Henry .....Donington.
Jones, Henry .....New Milford.
Jones, James ....Liverpool.
Le Sueur, Charles.....Exeter.
Levy, Harry .. ..Landport.
Maddox, John Thomas RowlandCarmarthen.
Maggs, Frederick William .....St. Leonards.
Maudson, Beresford Frederic H.Brighton.
Meadley, Arthur Lawrence.....Birmingham.
Morris, Humphrey .....Dolgelly.
Morris, John James.....Cardigan.
Palmer, James Spencer .....Penzance.
Pigott, Samuel .....Manchester.
Powell, William .....Swansea.
Powrie, Percival C. .....Mossel Bay.
Ray, Charles.....Eastbourne.
Sindall, George Edward .....Knaresborough.
Taylor, Fred.....Exeter.
Thomas, John ....Crosswell.
Treharne, Frederick Gwilym ...Weston-Super-Mare.
Turnbull, William S. .....Edinburgh.
Turner, Charles.....Hingham.
Wright, William Royle .. ..Southport.
Wyatt, Charles Frederick .....Old Brompton.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

Reports of Committees.

FINANCE.

The report of this Committee was received and adopted and sundry accounts ordered to be paid. It was also resolved to invest £1500, at present on deposit with the Society's bankers, in new three per cents.

BENEVOLENT FUND.

The report of this Committee included a recommendation of the following grants :—

£10 to a female registered chemist and druggist, who has had two previous grants of like amount.

£10 to a registered chemist and druggist, formerly in business, but at present out of employment and suffering from illness.

£15 each to two of the unsuccessful candidates at the late election.

An application had been received on behalf of the four orphan children of a late member of the Society, left by the death of both parents entirely destitute. The further consideration of this case was deferred in order to determine on the best mode of rendering assistance.

Mr. HAMPSON having mentioned another case which had not come before the Committee in time to be considered, but which was very pressing, the Council went into Committee to consider it, and ultimately decided to inquire into the case in the usual way before any grant was made. The report of the Committee as it stood was adopted.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian to the following effect :—

Attendance, November 1 to 30 : average during day, 19 ; evening, 10. Circulation of books, town, 161 ; country, 83 ; carriage paid, £1 16*s.* 9*d.*

Donations received :—

Vogl's Nahrungs- und Genussmittel aus dem Pflanzenreiche, 1872.
Vogl's Die Chinarinden des Wiener Grosshandels und der Wiener Sammlungen, 1867.
Vogl's Beiträge zur Kenntniss der sogenannten falschen Chinarinden, 1876.
Schneider and Vogl's Commentar zur österreichischen Pharmacopoe, 3 Aufl., Lief. 1.
From Dr. August E. Vogl.
Medico-chirurgical Transactions, vol. 61, 1878.
From the Royal Medical and Chirurgical Society.
Cooley's Cyclopædia of Practical Receipts, 6 ed., part 8, 1878. From Messrs. J. and A. Churchill.
Papers on the plant Gynocardia odorata, from which Chaulmoogra Oil is obtained, 2 ed., by R. C. Lepage, 1878. From Messrs. Corbyn, Stacey and Co.
Year-Book of Pharmacy, and Transactions of the British Pharmaceutical Conference, 1878.
From the Conference.

The Committee recommended the purchase of the following books for the Library :—

Dispensatory of the Royal College of Physicians in Edinburgh, translated by P. Shaw, 1727.
Tait's Lectures on Recent Advances in Physical Science, 2 ed., 1876.
Tait's Sketch of Thermo-dynamics, 2 ed., 1877.
Parrish's Pharmacy, 4 ed., 1874. Additional copy.
Danish Dictionary and Grammar.
Dutch Dictionary and Grammar.
Portuguese Dictionary and Grammar.
Swedish Dictionary and Grammar.
Hawtrey's Euclid.

The Librarian had again reported that more shelf room was urgently required.

The Curator had reported that in November the average attendance in the Museum had been, day, 12; evening, 4.

The following donations to the Museum were received:—

Specimens of Aceto-nitrate of Iron and solid Ethylate of Sodium. From Messrs. Hopkin and Williams.

Specimens of the Ammonio-citrate of Bismuth, Bichromate of Ammonium, Benzoate of Ammonium, and Sulphate of Nickel.

From Messrs. Morson and Son.

Specimens of Parker's Paper-fibre Lint, Dialysed Iron, Compressed Pills of Muriate of Ammonium, and other remedies, and Saccharated Pepsine.

From Messrs. Wyeth and Co., Philadelphia.

The Committee also reported that it had conferred with the Board of Examiners as to the desirability or otherwise of increasing the number of months in which the Society's examinations should be held during 1879, and in the result it had been decided to make no change in the arrangements for the present year, which were that the examinations should be held in London in February, April, June, July, October, and December. A letter had been received from Mr. Mackay stating that the chairman of the Board of Examiners in Scotland saw no advantage in making any change in respect to the examinations in Edinburgh.

The Professors had attended the Committee and reported favourably of their respective classes.

The Committee had considered the question of payment for papers read at the evening meetings, and recommended that they should be paid for as contributions to the Journal and included in the Journal account.

Mr. GREENISH, referring to the recommendation regarding the payment for papers read at the evening meetings, said it was determined twelve months ago that papers read at evening meetings should be paid for, and since that time they had been brought before the Finance Committee as payments for papers read at evening meetings. Mr. Sandford took exception to this and wished them to be put down as contributions to the Journal, but if this were acceded to the Journal would be debited with contributions which really ought not so to appear. He, therefore, took exception to any alteration being made, and though he had found himself in a minority on the Committee, he hoped the Council would reconsider the matter.

Mr. SANDFORD regretted that this matter should be re-opened. Mr. Greenish was certainly in error in saying that the Committee decided that papers read at evening meetings should be paid for as such. The facts were these. The former practice was that papers inserted in the Journal should not be paid for when they had previously been read at an evening meeting, but this was found to check the supply of papers to those meetings, because many men preferred to send the substance of such a paper in the form of a contribution to the Journal, for which they would receive payment. To meet this difficulty therefore it had been resolved, "That any paper selected to be read at an evening meeting shall, on the recommendation of the Committee, be paid for at the usual rate, when published in the Journal." Unless a paper were published it could not possibly be paid for, in fact they were all opposed to paying for papers merely read, and he might refer to the practice of other societies where the idea of paying for papers read at evening meetings was never entertained. To say that the Editor had no control over the papers read at the evening meetings was a little beyond the question. The Editor was one of the members of the Committee to look through papers before they were read, and therefore he had a perfect right to say "such and such a paper ought not to be read." But beyond that the Journal belonged to the Society, and it was in the power of the Council to insert such papers without the authority of the Editor. The Editor had no control over the proceedings of the Council, but he was required to publish the minutes. He therefore held that these papers should be paid for as contributions to the Journal.

Mr. SCHACHT said he could not take exception to the name under which the payment was made, if it was understood to apply universally to other evening meetings besides those held in that building. If the payment was limited to papers read there, then he distinctly thought the expense ought to appear under the heading under which it was incurred. If it were a fact, as it seemed to be, that this regulation operated as a premium to gentlemen to send papers for the evening meetings at Bloomsbury Square, so that a gentleman resident in the country had an inducement to send any paper he might prepare to an evening meeting in London, rather than read it before the local society to which he belonged, then he thought the evening meetings ought to be charged with the expense. If the rule had no such limitation he should not object to these payments appearing as Journal expenses.

Mr. SHAW thought Mr. Sandford had taken the correct view of the matter. It was not desirable that papers read at evening meetings should be paid for. Some years ago there was a difficulty in getting papers, and it was suggested that some of the papers sent to the Journal, which would be paid for as contributions, should be read and discussed at evening meetings, in order to make those meetings interesting. That being the case he could not see why the payment for these papers should not be charged to the Journal account.

The VICE-PRESIDENT thought the difficulty might easily be removed by the items being placed to the Journal account, and opposite it "paper read at evening meeting."

Mr. ROBBINS said that was where the difficulty arose. There was no controversy about the amount, is was only the heading under which it should appear.

Mr. ATKINS thought the Council was spending a great deal of time in discussing a very small matter, and one which had already been discussed before. The only question was how the payment should be described when made. It seemed to him that it ought to appear under the heading of the Journal. The Society ought not to pay for papers produced at evening meetings, but should cultivate the idea that papers read at evening meetings should be labours of love. When, however, the paper was inserted in the Journal, and occupied so many pages as literary matter, it should be paid for. One point of Mr. Sandford's remarks rather surprised him, viz., that the Editor had no control over matter of that kind; he should have thought that the Editor had entire supervision, and that if he considered that a paper read at the evening meeting was not worthy of publication he should omit it.

Mr. SANDFORD said in that case the paper would not be paid for.

Mr. ATKINS said that was another question. He was simply referring to the question of the Editor's discretion.

Mr. GEEENISH said the Editor had no power to refuse any such paper. If it were read it would go into the Journal.

Mr. BETTY said it was all very well to say that papers at meetings should be labours of love, but if Mr. Atkins knew how tedious and difficult those labours were, he would agree that the Committee had been judicious in offering a premium, small as it was, for the production of papers. It must be remembered that these papers filled up so much space in the Journal, and saved the necessity for other contributions.

Mr. FRAZER said he should be very sorry for it to go forth that the Society could not get papers for the evening meetings without payment, and could not believe that such was really the case. It was quite new to him to hear that the papers read must of necessity be inserted in the Journal.

The PRESIDENT said all papers read at evening meetings were first submitted to and approved by the Committee, and that approval was considered to be equal to the approval of the Editor. He understood that Mr. Schacht alluded to the question of paying for papers read before other societies.

Mr. SCHACHT said his position was this: if an individual read a paper before a provincial society, and it

was printed in the Journal, it was published as the proceedings of the provincial society, and the individual got no payment whatever for it; but if he read the paper at Bloomsbury Square it was published as part of the proceedings of the evening meeting, and the author was paid for it. Consequently, he thought it only fair to say that the expense was incurred for the sustentation of the evening meetings; it was not a Journal expense.

The PRESIDENT said the papers read at Bloomsbury Square were first submitted to a committee and approved, and that then they were published as a matter of course in the Journal. If the papers read before a provincial society were sent as communications to the Journal they would be paid for as communications, and therefore the argument was really worth nothing. He once inquired of the Editor about the matter which came from the provinces, and the Editor told him that the reports which came up were often very voluminous and had to be greatly condensed. If they were paid for at so much per column this could hardly be done. Some papers were very valuable, but others were not so, and if the Editor did not exercise his discretion the Journal would often be filled with matter of an undesirable character.

The report was then received and adopted.

Mr. BETTY suggested that the foregoing discussion need not be published.

Mr. SCHACHT saw no reason why it should not be, and Mr. Hampson also objected to its being omitted unless a formal resolution to that effect were proposed and carried.

No one being prepared to move such a resolution,

Mr. BOTTLE said if the discussion were published he should wish to place on record his opinion that a great deal of time had been wasted that morning.

The Communication from the Clerk to the Apothecaries' Society.

Mr. HAMPSON inquired how the communication from the clerk to the Apothecaries' Society, published in the Journal of December 28th, found its way there, and whether it had been asked for.

The PRESIDENT said he could very easily answer the question. No application whatever had been made for it. It was simply an early copy of a pamphlet which had been forwarded to the Editor, and which he, on the application of the Editor, thought of sufficient importance to warrant delaying the issue of the Journal to insert.

HOUSE.

The report of this Committee contained details of certain alterations in the sanitary arrangements of the building which had been determined on.

The report was received and adopted.

GENERAL PURPOSES.

The report of this Committee included a letter from the Solicitor explaining why the special case of the Society *v.* London and Provincial Supply Association had not yet come on for argument, and stating that it might be reached on any Saturday or Wednesday after the 11th inst.

Several cases of alleged infringement of the Pharmacy Acts had been before the Committee.

A long letter had been received from Mr. Stephenson, as chairman of a meeting of chemists and druggists held in Edinburgh, pointing out the difficulties which were felt in the trade, with regard to the new Weights and Measures Act, and stating that the inspector in Edinburgh declined to recognize apothecaries' weight, on the ground that it had been abolished by the Medical Council in 1864.

A letter had also been received from the Board of Trade, asking for a definition of apothecaries' weight, to which it was proposed to send a reply, giving the weights and asking the Board to receive a deputation on the subject.

The Council went into Committee as usual to consider portions of the above report and certain correspondence with the Solicitor, which was read.

On resuming,

Mr. CHURCHILL said there was an expression in the Solicitor's letter to the effect that there was a *suppressio veri* somewhere, and he understood him to mean that that consisted in suppressing the fact that the Society of Apothecaries did not intend to appeal against the verdict in the late Shepperley case. Now of course if there had been a *suppressio veri* it must have been on the part of the executive or officers of the Trade Association, and he and other members of that Association desired to assure the Council that when they met on Friday last they were in the position that they were threatened with an appeal against the late verdict.

The PRESIDENT said he had no doubt the Medical Defence Association at Nottingham intended to appeal.

Mr. CHURCHILL regretted that Mr. Upton had not made known to the Trade Association, who were engaged in defending the case, what he had made known to the Solicitor of the Pharmaceutical Society. He could only say that on Friday last the Apothecaries' Society had not notified to the law courts that it did not intend to prosecute the appeal.

Mr. SANDFORD said he was quite satisfied there was no intention on the part of the Trade Association to suppress the truth. There was no doubt the active party in the Nottingham Defence Association wanted to go on, and Mr. Upton said they should not, though he believed they had entered their appeal, and of course the case stood, and the defendant would not have notice that the case was withdrawn. He was sorry himself that those two ugly words had been used, and he was not particularly anxious that the letter containing them should be published. The only really important part of the matter was the information which Mr. Upton gave as to the condition of the suit.

Mr. SHAW said he believed the statements made in the circular of the Trade Association were made in good faith.

Mr. GREENISH said that Mr. Glaisyer being a solicitor in the country was of course dependent on his London agents for information on these points.

Mr. HAMPSON said he was not present at Birmingham when this circular was issued, but he was quite prepared to take the responsibility of it. He was very glad to hear from Mr. Sandford that that Council did not desire to impute anything unfair to the action of the Trade Association.

After some observations from Mr. ATKINS and Mr. WOOLLEY,

Mr. SCHACHT asked if the letters were to be published.

Mr. SANDFORD said he thought it would be quite sufficient if it were stated that the last paragraph in the circular had come under the consideration of the Council, and that information having been sought through the Society's own solicitor of Mr. Upton, Mr. Upton gave a distinct denial to it: reference need not be made to any unpleasant remarks which might have been used.

Mr. SCHACHT said unpleasant remarks were to be avoided, if possible; but in the conduct of public affairs at times there might be moments when unpleasant remarks became imperatively necessary. He did not think the Council would be doing its duty to its constituents if, having that circular before it, which had occupied their attention for something like an hour and an half, it did not record some opinion as to the propriety of issuing such a document. He did not wish to say that any gentleman had suppressed the truth, or suggested a falsehood, but he did think it was a lamentable thing that a document should have been delivered at his house that morning containing a statement of fact which was positively declared to be untrue on the 24th of December last. If that Society had done such a thing, it would have brought upon itself the severest comment from every one in the trade, and if another organization, which had for some time made itself conspicuous by its criticisms on the conduct of that Society, issued on the 6th of January a document containing a

statement absolutely contradicted in the most categorical manner on the 24th of December, it ought to receive an emphatic protest from the Council.

Mr. Woolley said Mr. Schacht was arguing entirely upon *ex parte* evidence. If it should turn out that Mr. Southall and Mr. Barclay, of Birmingham, had lent themselves to any such deception, he should be inclined to lose faith in human nature altogether; it was beyond the bounds of possibility. He would ask Mr. Schacht if he, having a law suit with several thousand pounds' worth at stake, would be content with a simple *dictum* such as that of Mr. Upton and be content to sit at home and take no notice of the action. He had seen things of that kind relied on and lead to the most disastrous results. If the Council committed itself to any expression of opinion on the acts of the gentlemen at Birmingham before it had the whole facts before it, it would make a very great mistake.

The President said he should like to know whether the circular referred to was the work of the Secretary of the Association individually, because there were statements in it which ought to have been verified before they were published.

Mr. Betty said he was very pleased to hear Mr. Woolley's remarks, that it was well to hear both sides of the question. He thought he could see pretty plainly what the result would be: that there would be a friendly suit between the Apothecaries' Company and the Pharmaceutical Society to decide how far chemists and druggists were licensed to carry on any counter practice at all. All the forces of the trade would be wanted for that contest, and he trusted with that prospect all differences would be sunk, not only that day, but at the general meeting on the morrow.

The President, referring to the Weights andMeasures Act, read the draft letter proposed to be sent to Mr. Stephenson of Edinburgh. He thought after the communication which had been received from the Board of Trade the Council would be able to remove any difficulty in the matter.

Mr. Atkins said it was very important that an interview should take place with the Board of Trade, and he trusted that any difficulty in Edinburgh would be held in abeyance until this conference had taken place; at any rate chemists and druggists in the north should be protected from any aggressive action until the matter had been settled.

Mr. Frazer said his experience was the very opposite to that in Edinburgh. It was not for the inspector to say that the provision was null and void when it was included in the Act. He had seen the inspector in Glasgow on the subject, and all that gentleman expected was that chemists should do what they had been accustomed to do, have their weights from a quarter of an ounce upwards examined and verified. The drachms and scruples he took no notice of, for he read the clause regarding drugs as exempting those weights. As to the graduating of glass measures he had no knowledge on the subject, and would not interfere with them in any way.

Mr. Robbins presumed that when this letter was sent to Mr. Stephenson it would be shown to the inspector and would enlighten him on the point on which he was now ignorant.

Mr. Sandford suggested that a copy of the letter from the Board of Trade should be enclosed in the one to Mr. Stephenson, which would probably remove all difficulty.

After some further disscussion it was resolved unanimously—

"That the same Sub-Committee as previously waited on the Board of Trade be requested to seek another interview with the authorities to settle the questions referred to in the communication received from the Board of Trade, and to have power to reply to the letter from the North British Branch."

Mr. Bottle suggested that there would be a difficulty with regard to the drachm, seeing that the dram avoirdupois was now legalized by Act of Parliament, as there would be two weights of one denomination. He did not see how the dram avoirdupois could be got rid of, unless by petition to the House of Commons to suspend the operation of the Act, but if this could not be done, he thought it would be as well to get rid of the apothecaries' drachm, and to go in for grains up to the troy ounce.

The President said this question was very seriously considered by the deputation which had previously waited on the Board of Trade, which agreed that it would be most injurious and impractical in writing prescriptions to abolish the drachm and scruple. The use of large number of grains was very likely to lead to blunders. If the avoirdupois dram could not be got rid of, a compromise might be made by spelling the one "dram" and the other "drachm."

Mr. Shaw remarked that it was not a re-introduction of the avoirdupois dram, since that had always been a legal weight, and it had, in fact, been much used by inspectors of weights and measures, for he had often seen in their reports that such and such a weight was so many drams defective. Some months ago he thought with Mr. Bottle that an effort might be made to agree to the Government suggestion, and make use of the grain weights for dispensing, but the majority throughout the country were so much against that opinion that it was abandoned.

Mr. Bottle said it would be lawful to sell by either one weight or the other; and he feared that cases might occur in which persons going for a drachm of quinine, perhaps to make up some domestic recipe, would get a very different quantity, and be charged different prices in different shops.

Mr. Frazer said in all his experience he had only known of one medical man who prescribed by the grain.

The President said as the sub-committee formerly appointed had advocated the retention of the drachm and scruple, it could not take a different course now.

The report of the Committee was then received and adopted.

PHARMACY ACT AMENDMENT.

This Committee had held a meeting and suggested certain verbal alterations in its previous recommendations, but had not agreed to any further report.

Fees to Examiners.

Mr. Betty moved the following resolution, of which he had given notice—

"That in future each member of the Board of Examiners be paid three guineas a day for conducting the examinations of the Society."

He said he had always looked on the Board of Examiners and its status as affording the best testimonial to the vitality and high repute of the Society. There was no doubt of one thing, that the practical working of the Pharmacy Act was really tested by the conduct of the Board of Examiners. Had those examiners not been competent men the Act must have collapsed at the commencement. This was matter for congratulation, and whereas in former days it was somewhat difficult to fill up the list of examiners, now there was not only a most efficient board, but really a considerable number of gentlemen willing to serve on it to choose from. He attributed this in some degree to the higher education afforded by the Society, and also to the fact that it was an object of ambition to the young men who had qualified themselves efficiently to conduct their business, and it was well that there should be in the Society certain posts of honour, to which it should be the ambition of every student to aspire. As it had been said that every private soldier carried the baton of a field-marshal in his knapsack, so every student who entered either Bloomsbury Square or any other school might look forward to the high office of examiner as the legitimate object of his ambition. The remuneration of this most important body had been progressive, and had altered with the conditions and progress of the Society.

At first the examiners gave their services gratuitously, then a nominal fee was given of four guineas between them, and then it was raised to one guinea each, and eventually it was made two guineas, at which it had remained for some years. But the examiners had very onerous duties to perform; they were subjected to much public criticism, and having selected the best members in the profession to undertake these arduous duties they should be treated as a professional body, and their fees should not be calculated from a huckstering point of view of what could be made in business, but on what it was really worth to occupy such a responsible position. Having to please the candidates by their fairness, to satisfy the trade at large, and also to keep on good terms with the medical department of the Privy Council and the Government he thought it was only justice that a higher remuneration should be given, and felt sure that his motion would be so received.

Mr. HILLS seconded the motion.

Mr. CRACKNELL was very glad that this proposal had been brought forward, and he should be pleased to support it. He desired, in the first place, to express the great pleasure he derived from the fact that the Society was in a position to offer a higher remuneration to the accomplished chemists and pharmacists who now conducted the examinations. He remembered the time when the examiners attended gratuitously, and he thought he might say they worked as faithfully and as well as if they had been paid ever so much. In the course of time a sum of four guineas was voted to be divided equally amongst the eight members of the Board who attended. He remembered that they were very pleased with that recognition of their services, and it enabled them to pay for their luncheon, and to ride to and from the examination room in a vehicle licensed to carry twelve inside and fourteen outside, but beyond that he did not know that they were very much benefited by it. The great interest they had at heart was the work they had to do, and the best way in which it could be done. Many an hour did they spend after the examinations were over in discussing that subject. Only a day or two ago, in turning over some old letters, he came across one from his old friend, Mr. Henry Deane, acknowledging the receipt of something he had sent him, and adding, "It will always remind me of the many arduous and anxious days we have spent together at Bloomsbury Square." They were very arduous and very anxious. The examination was not so long as it was now, but it was difficult to conduct and occupied a great deal of time and attention as to what was best to be done. At length the fee was increased to one guinea each, and the examiners were provided with sandwiches, and for a year or two before he left the Board, the sum was increased to two guineas, and a most substantial luncheon was offered them, and he believed they were all very well satisfied. But at the same time it was quite certain that the Society could afford to pay better for the services of these gentlemen, and another thing was also certain that they were much more highly educated and competent than in the days of which he had been speaking, and therefore he thought it was the duty of the Society to give them higher remuneration. Still, should the necessity ever arise—he did not suppose it would—for obtaining gratuitous services again, he was quite sure gentlemen would be found who would come forward for this important duty, which was the most important function of the Society. In these days of ruinous competition he thought the examination was a surer rock to fall back upon almost than an Act of Parliament; if an Act of Parliament were relied upon it was very apt at the time it removed one grievance to open the door to another which had not been anticipated, whereas the examination was constant and certain in its influence, and if it was kept up to the proper standard there would eventually be enlisted into the trade a set of men possessed of higher qualities, better educated altogether, and who would not lend themselves to any demoralizing association, or do their best or worst to damage the business which they would then feel they were bound in honour to protect and improve.

Mr. FRAZER heartily sympathized with the motion.

The PRESIDENT thought the true argument in favour of it was that the examinations were now compulsory, and very different to those which Mr. Cracknell had so vividly reminded them of in the early days of the Society. Having become compulsory they involved a very onerous responsibility both to the Council and the Board of Examiners, and he thought the proposed advance was most proper, and that even now the Society would be under obligations to gentlemen who gave their time to the arduous duties of examining the candidates.

Mr. ATKINS also supported the motion and expressed his gratification at what had fallen from Mr. Cracknell with regard to the gratuitous services in times past, and his belief that such would be forthcoming again if it should ever become necessary.

The PRESIDENT said he thought it proper to inform the Council that the amount of money involved would be about £500 a year.

Mr. BOTTLE said the motion had his sympathy.

Mr. SCHACHT said the voting of £500 a-year in perpetuity was a serious matter; the Council often had a great deal more discussion over the granting of £10.

The SECRETARY said he believed in the course of time it would be found that the better way would be to give a certain aggregate sum per annum, to be divided amongst the examiners.

Mr. SHAW suggested that in view of such a contingency it would be well to defer this matter for twelve months. It was not desirable to make a change now and then make another next year.

This suggestion not being taken up, the motion was put and carried *nem. con.*

REPORT OF EXAMINATIONS.

December, 1878.

Preliminary Examination.

Nine certificates were received in lieu of the Society's examination:—

1 College of Preceptors.
2 Incorporated Law Society.
6 University of Cambridge.

THE IRISH PHARMACEUTICAL SOCIETY.

The SECRETARY read a letter from the Editor enclosing one from the Registrar of the Pharmaceutical Society

of Ireland, asking that copies of the Journal should be supplied to the Society for circulation amongst its members, with the object of promoting friendly relations between the two Societies, and furthering the development of scientific and practical pharmacy by disseminating through the country a reliable and valuable record of the work done.

It was moved by Mr. GREENISH, seconded by Mr. HILLS, and resolved—

"That the request of the Pharmaceutical Society of Ireland for the copies of this Society's Journal be agreed to."

SPECIAL MEETING OF THE COUNCIL.

Wednesday, January 8, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hanbury, Hills, Robbins, Sandford, Schacht, Shaw and Woolley.

The Solicitor was also in attendance.

The PRESIDENT said the Council had met to consider the order of business at the special meeting called at 12 o'clock, and to consult the Solicitor as to the proper conduct of the same.

The PRESIDENT asked the Solicitor what he should recommend him to do with respect to any resolutions which would be placed before him by the requisitionists or others.

The SOLICITOR said the outline of the business was strictly defined. The meeting had been required *strictissimus*, and under the advice of counsel it was summoned *strictissimus*, and the requisitionists would of course proceed *strictissimus*, and any resolution to be proposed must be within the four corners of the requisition.

The VICE-PRESIDENT asked if the name of Mr. Shepperley could be introduced into the discussion, since it did not appear in the requisition.

The SOLICITOR said it could not be introduced into a resolution, but of course any one moving or speaking to a resolution could adduce any proper facts or arguments bearing upon it.

The PRESIDENT asked if a resolution were moved and seconded would it be legal for him in the face of counsel's opinion to put it to the vote.

The SOLICITOR said a resolution affirming or negativing the proposition in the requisition would be a good resolution to submit to the meeting, although when it was passed it would have no legal effect.

The PRESIDENT then asked the Solicitor if it would be desirable to communicate to the meeting the letter from Mr. Upton stating that the Shepperley case was not to proceed.

The SOLICITOR thought that it would be a matter to be dealt with as the meeting progressed, having regard to the arguments and statements advanced on any motion made. It was for the requisitionists to initiate their own course of procedure; on the other hand it was for the Chairman to keep the meeting in order. The absent members were as much entitled to protection as those present, and every one who stayed away, voluntarily or otherwise, was entitled to say he had done so on the faith of the laws of the body, those laws being that no business but that stated in the requisition could be brought before the meeting. Without some such regulation any one might get up and propose a resolution with regard to the Afghan war, or free trade, or anything else.

The VICE-PRESIDENT asked if it would not be desirable that letters having such an important bearing on the matter before the meeting should be read.

The SOLICITOR said he must respectfully leave the question of policy to the Council.

Mr. ATKINS drew attention to the last paragraph but one in the circular issued by the Trade Association, in which it was stated that the Council could vote money for a definite purpose, and asked if the Solicitor had had his attention directed to it.

The SOLICITOR said he had not taken counsel's opinion on the point, but he thought the course pursued by the Apothecaries' Society was a safe precedent, and if followed would be *intra vires* of the Society; that is to say, if a sum of fifty guineas were voted for the purpose of a specific payment; but a vote of fifty guineas to be administered by others would fall within the scope of the opinion of counsel.

Mr. WOOLLEY understood that money was granted by the Apothecaries' Society to another body, although it might be understood to be for a specific purpose.

The SOLICITOR said that might be the case, but at the same time it was distinctly charged with regard to its application, and if not thus applied, would have to be returned.

Mr. HAMPSON said he understood that a reporter representing the Chemists and Druggists' Trade Association had applied for admission to the meeting and had been refused. He thought the Council had nothing to fear from publicity and would move—

"That the reporter of the Trade Association of Great Britain be admitted to take a report of the proceedings of the special meeting held January 9th, 1879."

Mr. GREENISH seconded the motion.

Mr. SCHACHT thought it would be wiser to put the motion in more general terms, so as to admit any reporter who applied.

Mr. SANDFORD objected to the proposed amendment. He had no objection to admitting the reporter who had applied, but an objectionable reporter might apply and he thought a discretion should be exercised.

After some discussion, the motion as originally proposed was carried *nem. con.*

SPECIAL GENERAL MEETING.

A Special General Meeting of the Pharmaceutical Society of Great Britain was held at 17, Bloomsbury Square, on Thursday, January 9th, in compliance with a requisition presented to the Council, signed by fifty-three members and associates in business. The Chair was taken at quarter-past twelve by the President.

The Secretary having read the advertisement convening the meeting,

Mr. URWICK asked that the case submitted to counsel should be read, because the opinion as it stood was one-sided. If the case were read the meeting would be more capable of judging of the opinion given.

Mr. ANDREWS said he had given notice that he should ask for the case to be read.

The PRESIDENT said the case should be read if the meeting desired it, and there was not the slightest reason why it should not be published. It had been read before the Council at its meeting on the previous day and no objection taken to it, and he thought the meeting would be of the same opinion if it were read. But before that was done, he should like to say a few words. The present was a special general meeting of the Society, and as they seldom had one of that nature, he was quite inexperienced in the mode of managing such a meeting and should trust to the good feeling of the members to overlook any deficiences or shortcomings he might exhibit. It was very necessary in a meeting of that description that they should be careful as to form, to do everything in proper form and order, and that was why the advertisement convening the meeting was of a rather special and legal looking character. The truth was that it was considered necessary the advertisement should be drawn up by the Solicitor, and he placed it in language, perhaps better understood by himself and his own class, which looked very formidable at first sight to the outside public. However, it was necessary to do so, because it was a matter of form which

might hereafter be important. He was reminded that he should inform the meeting that the Society was an important public body, governed by laws, Acts of Parliament, and regulations, of a much more stringent character than other associations, and therefore it was necessary they should consider the rights of those absent as well as present, and that they should conduct their discussion in a way which would give satisfaction to all, and so as not to allow it to be called in question hereafter. He would say no more, except that he had no doubt the special meeting would prove like the ordinary annual meetings, full of good feeling and good sentiment, and that they would get on with their business and come to a conclusion which would be satisfactory to the body at large. He should be happy to hear any opinion or any resolution which might be placed before the meeting and he need not say, with respect to Mr. Urwick's request that the case should be read, that if a majority of the meeting thought it proper to have it read, there would be no objection to do so. But at the same time, as matter of form, a resolution should be placed before the meeting first, and that resolution must be in the words of the advertisement. He had no doubt that some one would be prepared to move such a resolution.

Mr. ANDREWS said the objection would be fully met if the case were published. He did not think it necessary to waste time by having it read.

The PRESIDENT said that having read it through, and heard it read at the Council meeting yesterday, his own opinion was that it was very fairly put although it was rather voluminous.

Mr. FLUX begged to remind the meeting that the case was prepared by the Solicitor of the Pharmaceutical Society, and not of any side.

Mr. URWICK thought it only fair to have the case read, because there were many things upon which they might form an opinion.

Mr. SLIPPER thought it would be a waste of time to have the document read. Although he was one of the oldest members of the Society he belonged to no party, and with all due respect to the gentlemen present, he thought they would not be able to understand the legal points of a question put to counsel. As it would take some time to read, he begged to say that he thought it would be a waste of time to have the document read. He believed that if it were read the members would be in a complete fog at the conclusion of it as to whether it was put rightly or wrongly.

The PRESIDENT said that perhaps he might be permitted to read one portion of it which was really the pith and point of the case, as follows: "Counsel are requested to advise whether a resolution in the terms of the requisition will, if passed by a special meeting, have any and what legal effect, and if not, then what course will be legal, fit, and proper for the Council to pursue in regard to the requisition and resolution which was passed at the Council for a special meeting to be held in accordance therewith and generally." Those were the questions which were put to counsel. The preceding portion gave the reasons and history of the transaction and how it arose, but those were the two questions put, and members had already seen in the advertisement convening the meeting how counsel had answered the questions. He thought the wishes of the members would be met by that portion having been read.

Mr. HAMPSON said he was not prepared to pronounce anything like an opinion upon the matter, but he certainly thought it would save time if it were not read, believing that they would not be much wiser after it had been read. Although perhaps he might take some exception to the case, he believed it had been fairly drawn up, and hoped it would be published in the Journal. He felt convinced they would get into a fog if it were read.

The PRESIDENT said he must call upon some gentleman to move a resolution, as that was the first business of the meeting.

Mr. FRAZER said he should much prefer the document being read.

Mr. CHURCHILL inquired whether the case would be published or not.

The PRESIDENT said he had no doubt it would be.

Mr. URWICK said he did not want the case read, but what he wanted was the case and the opinion to be put together so that members might judge whether it was necessary to take another opinion. He would move that the Council be requested to publish the case with the opinion.

Mr. FLUX said that was not part of the business of the meeting.

A MEMBER inquired whether the President would put the question to the meeting, if it should be read or not.

The PRESIDENT replied that he could not do so, because the special meeting was not called for that purpose.

The MEMBER asked if the President proposed to read it.

The PRESIDENT said the case should be read.

The SOLICITOR then read the case as follows:—

"EX PARTE THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

"CASE FOR THE OPINION OF COUNSEL.

"For the guidance of the President and Council of the Society as well as of the Treasurer thereof, resort is had to Counsel for advice concerning the following:

"The Society was incorporated by Royal Charter, that Charter was confirmed by statute, and amended by subsequent statute. The charter and statutes authorized bye-laws, confirmed and approved by Her Majesty's Privy Council, and accordingly there exist bye-laws duly passed, confirmed, and approved. The Society has and exercises statutory powers in regard to keeping registers, and in regard to examinations, the examinations being conducted in the presence of an officer appointed by Her Majesty's Privy Council, as required by the Pharmacy Act, 1868, section 6, and the Society receives fees, and subscriptions, 'for the purposes of the said Society,' as authorized by said charter, statutes, and bye-laws. (See last mentioned statute, sec. 7.)

"The charter, statutes, and bye-laws are printed in the Society's Calendar for 1878, sent herewith; they are at the pages marked by inserted slips.

"The Society has from the time of its incorporation steadily done its work, not neglecting any or either of the purposes or objects authorized, and by careful management, it has accumulated funds,—a General Fund, a Benevolent Fund, and Scholarship funds—of fair magnitude, but not excessive when regard is had to the objects for which they are required.

"It will be seen that the charter contains in lines 229—240, the following:—

"'And the said Council shall have the sole control and management of the real and personal property of the said Society, subject to the bye-laws thereof, and shall make provision thereout, or out of such part thereof, as they shall think proper, for the relief of the distressed Members or Associates of the said Society, and their widows and orphans, subject to the regulations and bye-laws of the said Society. And we do further will, grant, and declare, that the whole property of the said body politic and corporate shall be subject to the management direct, and control of the Council of the said Society.'

"We do not trace in either of the statutes anything which alters the quoted clause in lines 229—240 of the charter. There are in the bye-laws provisions which are consistent with the said quoted clause. They are as follows:—

"'Section XII. Treasurer. It shall be the duty of the Treasurer to receive all moneys, to pay such accounts as the Council may order by the signature of six members of the Council, in Council assembled, and to render his account at each monthly meeting.'

"'Section XVII. Funds and Property. 1. The Council of the Society, shall from time to time, cause such parts of

the funds in the hands of the Treasurer as may not, in their judgment, be required for carrying on the qusiness of the Society, to be invested in Government or real securities, in the corporate name of the Society. 2. The property and funds of the Society, other than moneys, from time to time in the bands of the Treasurer or Secretary, shall not be disposed of or otherwise dealt with except in pursuance of an order of the Council of the Society signed by six members at thc least in Council assembled.'

"'Sect. XIX. Benevolent Fund. 1. The Benevolent Fund shall consist of donations and subscriptions, and such grants as may from time to time be made by the Council from the general fund towards the particular objects of such fund, in addition to the sum already invested in respect of the same fund.'

"At a recent meeting of t'e Council, there was moved, and seconded, and put to .he vote a resolution in words as follows :—

"'That in consideration of the important interests of the members of the Pharmaceutical Society, and of the trade generally, which are likely to be seriously affected by an adverse decision being given in the case of the Apothecaries' Company *v.* Shepperley, which still awaits decision in a court of law, an adequate sum be granted from the funds of the Pharmaceutical Society in aid of defence in the said case.'

"Sundry members of the Council suggested that the proposed vote was *ultra vires*, but the matter was pressed to a division, and on a poll being taken the motion was not carried, the numbers appearing as follows :—For, 6 ; Against, 9.

"Immediately on the result being known, some of thc members of the Council presented a requisition, signed by the number of members required by the clause in the charter presently set out. It was for a special general meeting of the Society, and they pressed the matter to an immediate decision, with the result that a date in January was appointed for a special general mceting in compliance with the requisition. The object of the meeting, as expressed by the requisition, appears to be as follows :—

"'To the Council of the Pharmaceutical Society of Great Britain.

"We, the undersigned pharmaceutical chemists and chemists and druggists, members of the Pharmaceutical Society, respectfully request the Council of the Society to convene, with as little delay as possible, a special general meeting of the members and associates in business of the said Society, for the purpose of taking into consideration the advisability of the Society rendering substantial pecuniary aid to the Chemists and Druggists' Trade Association of Great Britain, to assist that Association in its efforts to defend the legitimate interests of the trade.'

"The clause in the charter relied upon by the requisitionists is lines 134—142 :—

"'That upon the requisition in writing of thirty members of the said Society, entitled to vote at any meeting, requiring thc said Council to convene a special general meeting of the said Society for the purpose specified in the requisition, such meeting shall accordingly be convened by the said Council within such reasonable time as the Council shall think fit, they first giving due notice thereof, and of the purposes for which the same is convened.'

"The points for consideration by counsel arise in connection with the said rcquisition. Of course any special meeting which may bc convened must be for the purposes specified in the requisition, and also, of course, in the words of bye-law 3 of section 20: 'No business shall be brought forward at any special meeting but that for which it is convened,' so that the sole business of the meeting will be to accept or reject a resolution on the lines of the notice convening the meeting, and if the resolution be passed, there will immediately arise considerations concerning its legal effect, and whether it will bind the Council to work on the lines indicated, and then whether if the Council do so work, and the Treasurer does accordingly part with moneys of the Society, the Society or the Council, or any members thereof, or the Treasurer, will be under any and what liabilities in respect thereof.

"There will be time for a special meeting of the Council to be held for the consideration of counsel's opinion, and the passing of any resolution which may appear necessary, whether for revoking the existing resolution in regard to the special meeting, or leaving the same in force.

"Concerning the constitution of the Society pointed to by the requisition, the result of our inquiries is that it is a voluntary society, which had its origin at, and has its centre of operations in Birmingham. An account of its origin appears in a publication called the *Chemist and Druggist*, under date July 15, 1876, the material passages of which are as follows :—

"'The laborious work undertaken by Messrs. Southall Brothers and Barclay, about two months since, of organizing a conference of chemists and druggists at Birmingham, with the view of forming a Chemists' Defence Association to represent the trade throughout the country, and to advance its interests, was brought to a successful issue on Tuesday last, the 11th inst. . . .

"'Mr. Radley moved a resolution, which was seconded by Mr. Jervis, and which, was ultimately agreed to, was in the following terms :—

"'That this meeting is of opinion that it is necessary to establish a Chemists' Trade Association for the protection of trade interests, and the defence of registered chemists and druggists from illegal and vexatious application of the Sale of Food and Drugs Act.

"'That those present agreeing with the objects in view now form themselves into an association having the following constitution :—

"'The association shall be styled the Chemists and Druggists' Trade Association.

"'That the management of the association shall be in the hands of a committee, consisting of a president, vice-president, treasurer, honorary secretary, and the members named in the following list, with power to add to their number.

"'That the subscription be 5*s*. per annum.

"'That the meeting of the members shall be held annually, to which the committee shall present the report of their proceedings, and the treasurer his financial statement, and that the officers shall be elected annually at this meeting.

"'That Mr. S. W. Jones, of Leamington, be elected president for the ensuing year; Mr. T. Barclay, of Birmingham, vice-president; Mr. William Southall, of Birmingham, treasurer ; and that the members of the provisional committee, and the following gentlemen be the other membcrs of the committee. Names.

"'The discussion on this proposal turned chiefly on the question whether subscriptions should be fixed at 5*s*. per annum absolutely, or whether that sum should be named only as the minimum rate. The feeling of the meeting was strongly in favour of a definite sum, and this was therefore agreed to. It was stated that further amounts might be given as donations.

"'The Chairman congratulated the meeting on having as their first President a gentleman of such discretion and tact as Mr. Jones. He was sure they would find him eminently fitted for the post.

"'The Chairman then declared 'The Chemists and Druggists' Trade Association' duly formed, and the President elect took his seat amid loud applause.'

"We do not trace when or how, or whether in fact the voluntary society has assumed the latter part of the title of the Pharmaceutical Society, viz., 'of Great Britain,' but we hold a 'Second Report of the Chemists and Druggists' Trade Association,' dated 'Birmingham, May 1, 1878.'

"The last-mentioned report concludes with a print of 'Rules,' whereof a copy is as follows:—

"'I. This Society shall be called, "The Chemists and Druggists' Trade Association.

"'II. Its objects shall be the protection of the legitimate interests of chemists and druggists from unfair attacks and encroachments, and the promotion of their common welfare.

"'III. The annual subscription shall be five shillings, due in advance on the 1st day of July in each year. Members whose subscriptions are in arrear will be disqualified from voting at any general meeting.

"'IV. The Annual General Meeting shall be held at some time within the months from May to September inclusive, at such place and time as the Executive Committee may determine. Notice shall be sent to each member by the Secretary not less than ten days previously.

"'V. The General Committee shall consist of representatives to be selected from the various districts throughout the country, in accordance with the scheme and resolution which have been adopted. In the event of a district failing to elect a representative the Executive Committee shall fill the vacancy.

"'VI. The Executive Committee shall consist of a president, a vice-president, a treasurer, an honorary secretary, and twenty other members, to be elected by ballot at each annual meeting. Five members to form a quorum. It shall be the duty of the General Committee to prepare and recommend to the annual meeting a list of the names of members to serve on the Executive Committee for the ensuing year.

"'VII. The votes at all meetings, where not otherwise provided for, shall be taken by a show of hands, but any two members may demand that the votes be taken by ballot, and in case of the members being equal the Chairman shall have a second or casting vote.

"'VIII. The railway expenses of the members of the Executive Committee shall be repaid by the Association.

"'IX. The duties of the paid Secretary shall be determined by the Executive Committee, who shall control them unreservedly.

"'X. The Association will retain within the discretion of the Executive Committee the right of determining whether action shall be taken in any cases that may be suggested to it, either for prosecution or defence, but it will consider its members to have superior claims to those of chemists and druggists who are not members. When it is desirable that information shall be promptly given to members upon any question affecting trade interests a private circular shall be issued to each.

"'XI. The rules shall not be altered or rescinded, nor shall any new ones be added, excepting at an annual general meeting or at a special one called for the purpose. At least ten days' notice of such meeting must be given and also of the alteration proposed.

"'XII. A special general meeting may be called either by the Executive Committee or on the demand in writing of any twenty-one members of the General Committee.'

"The requisitionists, and some inclined to support the requisition, point to the circumstance that the Pharmaceutical Society has itself been the recipient of donations and legacies, some specially in respect of its benevolent fund, some to found scholarships or prizes, and other or another for its general fund; and in particular that many years ago a voluntary association of London which, prior to the charter of the Pharmaceutical Society, existed for a kindred object, or the precise object, of the protection of those who carried on the business of chemists and druggists, recognizing that the Pharmaceutical Society was engaged in that object (with its others), gave its entire funds to the Pharmaceutical Society, and dissolved itself, and they suggest that as there now exists the new voluntary society of Birmingham, pointed to by the requisition, it is fit and proper and *intra vires* for the Pharmaceutical Society to calculate compound interest on the gift which it so received for and incorporated in its general funds, and hand over at least the amonut of the principal and interest thus ascertained (amounting to several thousands of pounds) to the said new voluntary society.

"The leading consideration, relating to a voluntary vote of money of the Pharmaceutical Society, may appear to be whether the vote is 'for the purposes of the Society'—whether, in fact, there has been intention to vest in the Council powers other than powers 'for the purposes of the Society,' and whether, indeed, the Society itself, levying as it does moneys by authority of Parliament, and incorporated as it is by Royal Charter confirmed by Act of Parliament, exists for and so as to accomplish or aid any object outside of 'the purposes of the Society.'

"The purposes of the Society appear of record in the charter and statutes, and the widest (and, indeed, the only general) statement of the purposes of the Society appears by the charter, lines 9 to 15, in words as follows:—

"'For the purpose of advancing chemistry and pharmacy, and promoting an uniform system of education of those who should practise the same, and also for the protection of those who carry on the business of chemists and druggists, and that it is intended also to provide a fund for the relief of the distressed members and associates of the Society and their widows and orphans.'

"Which statement is capable of subdivision as follows:—

"1. The purpose of advancing chemistry and pharmacy.

"2. The purpose of promoting an uniform system of education of those who should practise the same.

"3. The purpose of the protection of those who carry on the business of chemists and druggists.

"4. The purpose of providing a fund for the relief of the distressed members and associates of the Society and their widows and orphans.

"Section 22 of the Act of 1868 extended the object of No. 4 so that the Benevolent Fund may now be applied to more extended classes of persons than originally, but in regard to the other objects, although the statutes create powers in exercise and fulfilment of them, the language of the charter in regard thereto virtually stands in full force.

"The purposes of the Pharmaceutical Society being thus divisible under four heads, it would appear that the requisitionists cannot rely upon either of the Nos. 1, 2, and 4, and must point to No. 3, viz., the object of protecting those who carry on the business of chemists and druggists.

"The Pharmaceutical Society certainly has not abandoned, and does not intend to abandon, the object of 'protecting those who carry on the business of chemists and druggists,' and, on the contrary, the Society affirms that (duly exercising the discretion vested in the Society by its Council) it has at all times fulfilled, so far as practicable, all its (the four) objects, using for that purpose the machinery contemplated by the charter, acts, and bye-laws, and that it purposes continuing so to do.

"The charter does, as above quoted, say, 'The said Council shall have the sole control and management of the real and personal property of the said Society, subject to the bye-laws thereof,' and the bye-laws above quoted say, 'The Council shall, from time to time, cause such parts of the funds as may not, in their judgment, be required for carrying on the business of the Society to be invested,' and again, the said charter directs provision for the distressed, widows and orphans, etc., and the bye-laws (clause 1, section 19) contemplate grants by the Council from the General Fund to the Benevolent Fund, so that it may be considered that the Benevolent Fund is *quasi* residuary appointee, subject to proper provision for the other objects within the business of the Society.

"There arise considerations whether any general meeting (whether special or annual) can have any power at all to vote money, and whether the Council has, or can

derive from a meeting such powers to vote money as will enable it to comply with any resolution of a meeting favouring a vote in accordance with the requisition. The former consideration suggests the question, whether a special meeting can validly or with propriety be requisitioned and called for, or any meeting can validly consider a resolution for a purpose *ultra vires* the meeting—although it may accomplish a pressure on, or strengthen the hands of the majority in the Council—and the latter consideration involves the question whether the suggested application of moneys of the Society is for 'carrying on the business of the Society in the protection of those who carry on the business of chemists and druggists.'

"It be may suggested in the view of the requisitionists that although the Birmingham society is not in regard to objects on all fours with the Pharmaceutical Society, yet that there is a point of contact or in common, viz., within No. 3 of the objects of the Pharmaceutical Society, and that whether the objects of the Birmingham Society are or are not more extensive than the Pharmaceutical Society's object No. 3, yet that there is in common an object to 'protect those who carry on the business of chemists and druggists;' that such protection is, therefore, within the business of the Pharmaceutical Society, and that in the conduct of the Pharmaceutical Society's business it is not firmly tied and bound to act only by its own officers and in transactions within its own knowledge, but may vote moneys from time to time, at discretion—to any extent at discretion—to any Society, persons or person, which shall profess an object within the object of the Pharmaceutical Society, although not responsible to the Pharmaceutical Society in regard to any duty or accountable to it in respect of the moneys so handed over.

"It may be suggested on the other hand that the practice of the Pharmaceutical Society during the thirty-five years of its existence has been to conduct its business in all respects by its own officers and agencies, responsible and accountable to it in regard to the particular duties entrusted to them, and that in so doing the Society has acted up to the spirit as well as the letter of the charter, Act and Bye-laws. That it has no intention of abrogating or delegating the duty of protecting those who carry on the business of chemists and druggists to any society, persons or person, and that any such abrogation or delegation would be as indefensible as delegation of any other business or object of the Society, such as the conduct of examinations or the keeping and publication of the register, and that the voting of moneys to any society, persons or person, as proposed, cannot stand on the footing of a vote to an officer of the Society or otherwise for service or other valuable consideration, and, moreover, that the circumstance that the Society has received gifts does not imply powers to make voluntary donations.

"The case of the Apothecaries' Society *v.* Shepperley, named in the lost motion at the Council meeting, is one which the Council considered at its early stage, and which then appeared to the Council to involve special and grave considerations apart from the bare issue of fact on which the case actually turned at the trial. We do not trace that the plaintiffs tendered any evidence at the trial on the special matter which led the Council to the conclusion mentioned. The result of the trial was that the jury found on the evidence a verdict for the defendant, and the Lord Chief Baron sitting with Mr. Baron Pollock (who tried the case) refused a rule applied for, holding that the plaintiffs had to prove, and did not produce evidence which the jury would believe, that the defendant had acted as an apothecary; but the fact stands that the Council deliberately considered and declined responsibility connected with the case named in the resolution. The Birmingham society voluntarily took charge of the defence.

"The Pharmaceutical Society existed as a voluntary society some time prior to the charter, and the freedom then enjoyed by the Council of the Society may have led the applicants for the charter to ask for the quoted passage vesting 'in the Council the sole control and management of the real and personal property, subject to the bye-laws,' and subsequent like words which may be used for an argument favouring an absolute and uncontrolled power of disposition as complete as a man's power over his own property; but the words, 'subject to the bye-laws,' cannot be overlooked, and there is in the charter, at line 280, concerning bye-laws, 'so that the same be not repugnant to these presents nor to the laws of this realm,' and, moreover, the bye-laws do not appear to contemplate uncontrolled power of disposition. The quoted passage may, however, have been inserted in accordance with a practice in the granting of charters to vest the power in a select body; these are the cases of the city companies, where the powers are vested by charter in the courts of the companies and we would suggest that authorities on similar words in charters may be traced in the reports.

"There was a case of the Queen *v.* the Corporation of Sunderland, decided in the Queen's Bench Division, on June 22 last, reported in the *Times* of June 24, but not yet in the reports, in which an expenditure *ultra vires* a corporation was successfully attacked.

"We remember also a case where a company incorporated by statute for railways was restrained from expending its money in steam ships. Also a case, Taunton *v.* The Royal Insurance Co. (33 *Law Journal*, 406, and 2 Hemming and Miller, 135), in which an expenditure on an entertainment was held to be *intra vires* an incorporated trading company, and the case of Joint Stock Discount Co. *v.* Brown, in which Lord Chancellor Hatherley reviewed the cases; but generally we would rely on counsel in regard to authorities, and also in regard to the reasoning leading up to an accurate opinion.

"Counsel are requested to advise—

"Whether a resolution in the terms of the requisition will, if passed by a special meeting, have any and what legal effect.

"And if not, then what course will be legal, fit and proper for the Council to pursue in regard to the requisition and the resolution which was passed at the Council for a special meeting to be called in accordance therewith. And generally"

(*Copy*).

"*Joint Opinion.*

"We are of opinion that if a resolution were passed in the terms of the requisition it would have no legal effect. We think that the management of the Society's funds is vested in the Council, and that in the disposition of them the Council is not subject to the control of the members.

"We are further of opinion that the Council itself could not legally vote a sum of money in the manner indicated in the requisition. It is within the powers of the Council to apply the Society's funds in the protection of the interests of the trade, but we think that any money so applied must be applied by the Council, and not by another and an irresponsible body.

"We think that the Council should convene a meeting, pursuant to the requisition, but that it should at the same time give notice that the control of the Society's funds is vested in the Council and cannot be controlled by the general meeting, and further that it would not be in the power of the Council itself to dispose of the Society's funds in the manner indicated in the requisition.

(Signed) "John Holker.

"H. Burton Buckley.

"*Nov.* 18, 1878."

Mr. Shaw said he wished to say a few words upon one paragraph in the case, which stated that in regard to the accumulated surplus of several thousand pounds, and that the whole of the sum was asked for by the

members who voted for the grant of some amount of money a month ago. The persons who voted on that occasion did not ask for the whole of that sum, but simply asked for a grant of money without naming any sum at all. If they had received £500 instead of the £2800 accumulated at the present moment, they would have been perfectly satisfied.

The SOLICITOR said that when he was stating a legal proposition he was fairly entitled to say that the greater included the lesser. He had to convey to counsel the point raised, and in order to do so he studied the reports of the Pharmaceutical Society, and gave the amount; but it was quite immaterial whether the whole or less was asked for, and for his purpose it was not necessary to go into the amount. His duty was to raise the point, and that he had done.

Mr. RADLEY (Sheffield) said he rose to move a resolution, but before doing so perhaps he might be permitted to make a few remarks. As one of the founders of the Pharmaceutical Society he had always taken a great interest in the Society, and had supported the interests of chemists and druggists from a trade point of view. With respect to recent suits at law he felt very keenly, and after consulting with some others engaged in the trade he had adopted the course of requesting the Council to call the present meeting, thinking that the matter was of such moment and wide-spread interest, and that the opinion entertained by the Council did not represent the opinion of the trade. In addition to that he had taken a further responsibility, for which he hope dhe would not be blamed, namely, to request that a circular be issued to the members and associates of the Society, in order to ascertain their feeling, and within forty-eight hours of that being done replies had been sent to the question whether they approved of the proposition for granting the money by the Pharmaceutical Council towards the legal costs incurred by the Trade Association. Three thousand seven hundred and twenty-one circulars were issued, and of that number 1533 had been returned; 1449 approved of the course, and 84 did not, showing a majority of 1365 in favour of the proposition. During the present meeting a telegram had been received from Mr. Walker, of Bath, in which he stated that he had been prevented attending the meeting to support the grant of money, but that the opinion in Bath and Bristol was in favour of the grant being made. Perhaps these returns might be an apology for his temerity in calling the meeting. He had been actively engaged in the business of a chemist and druggist for upwards of forty-four years, and, during the whole of that time, it had been, according to his experience, customary for a chemist to be asked questions with reference to medicine, and to be called upon to treat simple cases of disease. He believed it would be admitted on all hands that that was the rule from time immemorial. And he thought that such an experience ought, to some extent at least, to constitute a sort of right. They were called upon at the present time to defend the rights of every chemist and druggist in the country. With regard to Shepperley's case, personally he did not know anything about Mr. Shepperley, nor did he wish to defend anything that gentleman might have done or said, but the principle of the thing was purely a chemist and druggist's question, and although it was said it would not settle the question, yet he was strongly of opinion, that if the case were lost, it would greatly affect the rights of the trade. They must contend stoutly for their rights; mutual concessions had been spoken of, and recommended, but in his opinion they were not called upon to make concession or to tolerate it, they having a right to something more. Counsel had advised that only the Council could expend the money of the Society, and taking that to be so, he thought they might venture to ask it to grant a certain sum without any great breach of what was right, and that was what he should propose directly to the meeting. If it was really a legal point, that the Council could not appropriate its funds to this particular case, still he thought it would be open to further consideration whether some of the old Druggists' Fund, which was instituted for the purpose of defending such cases, should not be appropriated, because he thought this might be done without reference to the legal points and the Act of Parliament. He based his remarks very much upon one of the fundamental rules of the Association, which stated that one of the objects was to defend or to promote the interests of chemists and druggists; and in the case before them he felt quite sure they were only doing what they had not sought to do, but were merely doing it in self-defence. He was strongly of opinion that of late years there had been less disposition in the trade to infringe in any way the rights of the medical profession. Still he did think that the public had a right in this question and that if the matter was to come into full force against chemists, the public would be great sufferers, and many lives would be sacrificed. In conclusion he begged to propose the following resolution:—

> "That this meeting hereby respectfully requests the Council of the Pharmaceutical Society to assist by a pecuniary grant the Chemists and Druggists' Trade Association of Great Britain, in the heavy expenses incurred in the defence of Mr. Shepperley, a pharmaceutical chemist, and a member of the Society, who has been prosecuted by the Apothecaries' Company, for simple counter practice."

He had not asked any gentleman to second the motion, but perhaps some one would be kind enough to do so.

The SOLICITOR said that, with a view of the meeting being in order, he would suggest to Mr. Radley whether he could not confine his motion to the precise words of the requisition, in order that the consideration of it might be *intra vires* of the meeting. The way he should put it would be: "That this meeting affirms the advisability of the Society rendering substantial pecuniary aid to the Chemists and Druggists' Trade Association of Great Britain to assist the Asssociation in its efforts to defend the legitimate interests of the trade." He had marked that for the guidance of himself and the meeting as being a resolution clearly *intra vires*.

Mr. RADLEY said he preferred using his own words.

The SOLICITOR said he should advise the President that any mention of the word "Shepperley" would be *ultra vires*.

Mr. RADLEY asked why it would be.

The SOLICITOR said there were more members absent than present, and it was the right of every member of the Society, whether present or absent, to have the constitution of the Society respected; and the constitution of the Society was distinctly set out in the notice convening the meeting, in order that none might be taken by surprise. The notice stated that the meeting was convened for the purpose specified in the requisition, and nothing else. If members kept within the four corners of the requisition they would be safe, and his advice to them was that they could not with safety or propriety travel outside those four corners.

Mr. RADLEY wished to know whether the resolution, as read by the Solicitor, was accepted by the President.

The SOLICITOR said he should certainly advise the President to accept it.

The PRESIDENT said the resolution would read as follows:—

> "That this meeting affirms the advisability of the Society rendering substantial pecuniary aid to the Chemists and Druggists' Trade Association of Great Britain, to assist the Association in its efforts to defend the legitimate interests of the trade."

The SOLICITOR said such a motion as that was clearly *intra vires*.

Mr. RADLEY asked if that was a matter upon which counsel's opinion had been asked.

The SOLICITOR said that was so.

Mr. RADLEY thought it would not be desirable to adopt the very words.

The SOLICITOR replied that they could not be turned out of the requisition.

Mr. SLIPPER said the resolution covered Shepperley's case.

The PRESIDENT said it would take in the whole of Shepperley's case, and as such it could be argued.

Mr. RADLEY said he would give way upon the point if it was the wish of the meeting.

Mr. URWICK thought the resolution was far too long.

The PRESIDENT said they were upon the horns of a dilemma, but he was advised that the resolution that he had just read might be discussed and put to the meeting, and the meeting could come to a vote upon it, though the result of the vote would not be binding upon the Council.

Mr. RADLEY said he quite accepted that.

The SOLICITOR said that the Charter of Incorporation provided that, upon receipt in writing of a requisition signed by thirty members entitled to vote, the Council should convene a special meeting, and the Council, having received that requisition, had no option in the matter: it was advised that it was bound to convene a special meeting. But for what? The purpose specified in the requisition; and then the bye-laws provided that at a special meeting nothing but the purpose for which it was convened should be brought before the meeting.

Mr. RADLEY asked whether his resolution altered the purpose.

The SOLICITOR said it certainly did, because it travelled outside the requisition.

A MEMBER hoped the Chairman would give the gentlemen present a little latitude.

The PRESIDENT said they might discuss as much as they liked; but he had no power to give latitude, being bound by the bye-laws.

Mr. URWICK was of opinion that the resolution as proposed by Mr. Radley was not wide enough, because it confined the grant entirely to Shepperley's case.

Mr. RADLEY said he was quite ready to alter his resolution as proposed by the Solicitor.

Mr. PROVOST (Eastbourne) seconded the resolution. He believed the intention of that meeting was to ascertain the views of not only the chemists and druggists belonging to the Pharmaceutical Society, but the views of the whole of the chemists and druggists of the United Kingdom as to whether or not the present Council of the Pharmaceutical Society really represented the view of chemists and druggists generally. That was the purpose for which they had met that day. So far as he was concerned, he must say the Council did not represent the feelings of the chemists and druggists generally. He was sure the Council of the Pharmaceutical Society would give him credit for not having any feeling upon the subject, because it was needless to say that such an esteemed body of gentlemen would look upon the thing in a charitable light. They felt that the Council had done its best; but at the same time it did not represent the views of the body at large.

The PRESIDENT said his attention was called to the fact that Mr. Provost's name was not upon the register of members.

Mr. PROVOST said he was local secretary for Eastbourne.

A MEMBER said that if their legal adviser miscarried in such an instance as that he did not know what they could think of his opinions.

The SOLICITOR said if anybody's mistake it was the Registrar's.

Mr. PROVOST said he had been local secretary for five or six years.

The SOLICITOR said that might be, but his name was not upon the register of members.

Mr. WOOLLEY said the register upon the table was not the authorized register.

The PRESIDENT inquired whether Mr. Provost was a member of the Society.

Mr. PROVOST: I am.

Mr. HAMPSON hoped the meeting would proceed with the business before it.

The SOLICITOR said it had always been the practice of the Registrar to check off each gentleman's name, and he was only performing his functions in looking for Mr. Provost's name.

A MEMBER asked for the proper register of the Pharmaceutical Society to be produced.

The SOLICITOR said if Mr. Provost said he had become a member during the current year the register should be looked at.

Mr. PROVOST said he had been a member for the past seven or eight years.

The PRESIDENT said he had just been informed by the Secretary that Mr. Provost was a chemist and druggist member of the Society.

The SECRETARY said he had overlooked the name of the member as being connected with the Society as a chemist and druggist, and begged to apologize to Mr. Provost for the oversight.*

Mr. PROVOST said he thought as several gentlemen might be unable to be present on that day he would take the opportunity of cutting a letter out of the *Pharmaceutical Journal* which appeared a fortnight ago, as that letter contained his views upon the subject, and with the permission of the President he would read it. The letter was written by Mr. W. T. Martin, and was to the following effect:—

"The Shepperley Case and the Council.—Sir,—Last week I intended to add my indignant protest to that of Mr. Feltwell against the general action of the Council with regard to the real and vital trade interests of the chemists and druggists of this country. It is a fact that we are continually being harassed by all sorts of prosecution and persecution by apothecaries, medical men, and others, which renders it impossible to carry on our legal business with any degree of comfort to ourselves. I am not prepared to bring any specific charge against certain members of the Council, whose speeches and voting from time to time might form sufficient ground for so doing, but I will content myself by saying that the Council (or some members of it) do not seem to have the interests of the whole body of chemists and druggists at heart as they ought to do; many of them, perhaps residing in London, with first-class dispensing and retail businesses, do not sufficiently understand the position of their less fortunate brethren in the country. The tenour of your remarks is often to be regretted and it is evident that you have a greater leaning towards the opponents of chemists and druggists than you have to your own constituents. Opinions confirmatory of what I have expressed above have been already given in letters appearing this week, in reports of meetings of the Sheffield Pharmaceutical and Chemical Association, etc., and it would be wise for the Council and yourself to notice which way the wind is blowing." They had met that day for the purpose of showing which way the wind was blowing. No doubt the members of the Council did what they considered right for the interests of the trade, but he certainly thought they were in error upon the matter. He did not take the Shepperley case as a criterion or guide, but he put this question to the members: Had the Council in years past exerted that energy in supporting the trade in the manner members looked forward to its doing? He thought not, and it was time now for the chemists and druggists to express their opinion. No doubt the Council contained gentlemen in a very elevated position

* The communication referred to in the Secretary's letter, at p. 592, is dated Eastbourne, 25th June, 1878, and reads as follows:—"Please accept my resignation as Local Secretary, and also as a member of the Society, and oblige, yours faithfully—J. A. PROVOST."

compared with the majority of the trade, and gentlemen possessed of first class dispensing businesses.

Mr. BETTY : No, no.

Mr. PROVOST said the members of the Council were gentlemen of considerable wealth and good men, but he was sure they had taken a wrong course in this instance. He had not come to that meeting as an interested party, but because he felt there was something due to his poorer brethren, and he hoped the Council would make a note of the feelings expressed that day. If the Council was not a proper representative of the trade—and it was a question with him whether it was—it would be for the members at the next annual meeting to remedy that, and no doubt the conduct of the Council upon the present occasion would be remembered. He also complained that the Council had not made use of the local secretaries in the way it might have done for ascertaining the opinions of the country members upon the subject. In conclusion he wished to say that he thought the mover of the resolution was entitled to a very hearty vote of thanks from the gentlemen present for the course he had pursued upon the present occasion.

The PRESIDENT said before any discussion took place upon the resolution he wished to refer to one matter which might perhaps influence the discussion very much, and it was necessary they should know it. They were aware that the circular sent out by the Trade Association contained at the end the following clause:—"The appeal in the case of the Apothecaries' Company *v.* Shepperley is entered for hearing before the Lords Justices of Appeal in the Appellate Court of the High Court of Justice, Westminster, at the Hilary Sittings, which commence on the 11th inst." That struck him as being such an important point that he requested their Solicitor to obtain, if possible, from the Apothecaries' Company some information as to the precise position the Shepperley case was now in, and he would read the answer received from Mr. Upton, the solicitor and clerk to the Apothecaries' Company. The letter was addressed to Mr. Flux and was as follows:—

"20, Austin Friars, London, E.C.
"8th Jan., 1879.

"My dear sir,—I have read the statement contained in your letter to the President of the Pharmaceutical Society of the 1st January, 1879, that 'as a litigation Shepperley's case is dead.' I annex a copy of a letter addressed by me to Messrs. Browne and Sons, of Nottingham, of the 24th December last, from which you will see that your expression is perfectly correct as far my clients are concerned.

"Yours faithfully, James Richard Upton.

"W. Flux, Esq."

He would also read an extract from Mr. Upton's letter as follows :—

"I must, however, inform you that not only will my clients not assist in the appeal, but they object to your clients proceeding with it ; and you must please receive this letter as distinctly intimating that they withhold their authority to any further steps being taken in the action."

Mr. RADLEY asked permission to add one or two words to his resolution in case it should turn out to be necessary.

The PRESIDENT said that could not be done as the resolution had been seconded.

Mr. FITCH (Hackney) in supporting the resolution said, it had been generally supposed that members of the Pharmaceutical Society had joined the Birmingham Society and helped in a sort of antagonistic action to the Council of the Pharmaceutical Society. Two years ago when he spoke in that room, he distinctly told them he had not joined the society, and should not do so if the Council took up the interests of the trade in an emphatic manner ; but they had been guilty—and he charged them with it—of the most cruel neglect to members of the trade. The Shepperley trial was one of the most important to the interests of the trade, though he would not go into the question whether Mr. Shepperley sat in a back room and prescribed or not. He only knew what appeared in the public prints, and from them he saw that Mr. Day, in opening the case, stated that it was brought forward as a test case, to decide whether what the chemists and druggists were doing was legal. If that case had been lost and he had prescribed in a simple case, very likely he would have received notice that he should be proceeded against, and when brought up in the County Court, the judge would not have heard any defence ; he would have said, "This has been tried and decided against you already and there is no appeal from it." If the case were one of a slight ailment it would not be common fairness to twist the decision into one against all the members of the trade. A plea was put forward that they knew nothing of prescribing, but surely the Society must be aware that they possessed three or four heterogeneous elements which were required by the Act of 1868 to form the Society. They had the old druggist, the educated pharmaceutical chemist, and several classes of men who had been brought up as apothecaries. How did the apothecaries word the indentures of their assistants at that time? They accepted money from the parents of the young man, they accepted his labour and service, and he supposed they engaged to teach something. They were on the horns of this dilemma, that either they taught them something, or did not. If they did teach them they knew something, but if they did not teach them they obtained money under false pretences, and if his master did not teach him anything, he charged him and the medical profession with obtaining money under false pretences, for he was engaged on the strength of such indenture. The indenture witnessed that the employer was to teach him his art, and that he (Mr. Fitch) was to be with him after the manner of an apprentice from such a date, and the master, in consideration of the premium, labour, and service of his apprentice, agreed to teach, or cause to be taught, the art of an apothecary. That was what these men had been doing, and yet they came into court and said chemists and druggists knew nothing about medicine. He believed he was right in saying that the Society required a student to pass the Major examination, in order that he might know something of toxicology. Now, what was that done for? In order that he should know what to do in the event of a simple case being brought before him. For the sake of argument, he would take the case of a child having swallowed some sugar of lead, and its parents, finding that their doctor would not be at home for some hours, brought the child into a chemist's shop. Was he not bound to give it an emetic; was he to refuse sulphate of zinc because it had a second action which he need not tell that Society would convert it into an insoluble salt and pass through the bowels of the child? If he was to be allowed to do that in the interest of humanity, why was he not to be allowed to do it in simple cases? As long as they confined themselves to simple cases they need not fear, but if they were not to consider whether a medicine would have a second or contrary action, he thought they were in great danger of being interfered with. He knew what counter practice was, but still he could not say that his assistants would not be asked that evening whether a Steadman's powder would do good ; and if they said they could not recommend it, but that they had a powder which would do good, they were virtually prescribing. And, therefore, if the Society would not protect them when they were only *de facto* carrying out what a chemist and druggist was entitled to do, he maintained the Society was not acting up to the privileges which the body at large had entrusted it with.

Mr. BARCLAY (Birmingham) : I think a very serious charge has been made against those who had anything to do with sending out that circular, because it would appear, so far as the statement has gone forth from the chair, that this case of Shepperley's is dead, and we ought to have known it since we are principals in that case. I

speak now as representing the Solicitor of the Trade Association, who is not present. The Solicitor, of course, has no entry here, and therefore I speak on his behalf, since there is a charge by the Chairman that this notice was put on that circular knowing that it was not a true statement.

The PRESIDENT: No.

Mr. BARCLAY: I am glad to hear that, but the inference from the Chairman's statement was to that effect. Mr. Frazer says "No;" but many I hear say "Yes." The inference from the Chairman's statement was certainly to my mind that those who were the principals in this case must have known more about it than Mr. Flux, and as Mr. Flux had the letter from Mr. Upton, saying that the case was dead, therefore, those who had to do with this circular must have known the same thing, and have published a statement which was not true. Now, I must say here that I saw the Solicitor last night, and he had had no intimation from Mr. Upton of the purport to which the Chairman has spoken.

The PRESIDENT: Mr. Flux's letter is dated the 8th of January—only yesterday.

Mr. BARCLAY: I think I ought to say that the last intimation which the Solicitor had from the Apothecaries' Company I hold in my hand, and that is dated the 13th of December. The Solicitors write: "We were informed to-day by Mr. Gloster, at the Registrar's Office, that there is no prospect of this appeal being heard until Hilary sittings. We presume, therefore, you will not consider it necessary to deliver your briefs until after the Christmas vacation," and so on. That is the last intimation we had from the Solicitor to the Society of Apothecaries. I just wish to correct the statement, and I wish that Mr. Flux, as representing this Society, would correspond, perhaps not with the Society of Apothecaries, because he is not a principal in this matter; but if he had had the courtesy to correspond with the professional gentleman who is actually engaged in this case, and has charge of it, I think it would be better both for this Society and the trade at large.

The PRESIDENT asked whom the letter was from which Mr. Barclay had just read.

Mr. BARCLAY: From Messrs. Swann and Co., 38, Chancery Lane. They are the agents for Mr. Brown, of Nottingham. This is the way the correspondence is carried on between the solicitors. This is the last communication which Mr. Glaisyer, the solicitor acting in this case, had from the Society of Apothecaries

Mr. SANDFORD: They are not the solicitors to the Society of Apothecaries.

Mr. BARCLAY: They are agents for Mr. Brown, the Solicitor of the prosecutor in the case. I have a letter, by the way, which has just been put into my hands, which I will read with your permission. This is from Mr. Glaisyer:—"26, Waterloo Street, Birmingham, 8th Jan., 1879. Dear sir,—Shepperley *v.* Apothecaries' Company. In reply to your telegram I may say I have not as yet received any notice that the appeal is stopped, and as Mr. Upton is not the solicitor concerned in the case, either as principal or agent, I shall require confirmation of the statement before giving any heed to it, though I shall not be surprised if it prove correct." I have also a telegram put into my hand on the very point. It is from Henry Glaisyer, solicitor, Birmingham, to myself. "Apothecaries' Company *v.* Shepperley. Plaintiffs' agents have not been instructed to abandon the appeal."

Dr. SYMES (Liverpool): It is not that I am very anxious to speak to this meeting, but I have been asked in case of the first resolution being ruled out of order to move another. I am afraid that would be slightly out of order, although it is a decided modification of it, and, therefore, I will instead speak to the motion before the meeting, although apparently that can have no real effect. But as gentlemen have said, we have come a very long way—I have come four hundred miles—to be present to-day and I have no doubt you will show us the courtesy you are accustomed to, and I will ask gentlemen present not to be too demonstrative one way or the other, because I have a very simple statement to make, and demonstration sometimes wastes time. In supporting this motion I am not supposed to be endorsing all the hard things which have been said about the Council. I take it we are not met here specially for the purpose of discussing the rights of chemists to prescribe but to discuss how far the objects of this meeting are legitimate and what can be accomplished by the meeting now we are come here. How far the objects of the meeting are legitimate does involve a certain amount of justification of a subject which has been spoken of, and that is the right of chemists to prescribe. Personally I am not interested in prescribing; the business of my firm being a dispensing business, we are very little called upon to prescribe and we avoid it as much as possible. It is not to our interest to prescribe. I do not put the proposition that I object to it on principle; but I simply say that I do not encourage prescribing; it is not to our interest to prescribe because our business is dispensing. That position, taking the whole trade at large, I am aware is somewhat exceptional, that is to say, that a business is sufficiently good in dispensing that prescribing can be ignored altogether; I am aware there are many gentlemen in London, and in the country, who possess such businesses, but it is not common. Still, I hold it would be exceedingly selfish for me to close my eyes to the fact that members of my own body, fellow members of my trade or profession, whichever you like to call it, are being hunted down by common informers, at the instigation of a body of men who are barely recognized by the better class of their profession, who—to say the least of it—are as thoroughly irresponsible as the body referred to in the circular convening this meeting, which I take to be rather a slur on the Trade Association. It might be a legal technicality, but as I read it I thought there was no necessity for regarding the Trade Association as so utterly irresponsible a body. These men are not receiving the support of the better class of their profession. I am daily coming into contact with some of the leading medical men in Liverpool, and they do not care a farthing about Shepperley's case or chemists prescribing, so long as it is conducted in a proper manner. They recognize it almost as a necessity; in fact, the thing speaks for itself. If the profession at large, such as those gentlemen who can afford to pay so many thousands for bringing over Cleopatra's needle, chose to fight this case they could find any amount of money. Yet we read that the Medical Defence Association worse off than the Trade Association. I admit there are some chemists who hold themselves out for prescribing, who seek it, and it is not the object of this meeting to encourage these men in doing so. The object of this meeting is simply to defend what appears to be a right. I am not a very old man, but I remember quite well when "Medical Hall" and "Medical Dispensary," and that kind of thing was very common over a chemist's shop. That is rapidly disappearing, and I believe the cases in which chemists hold themselves out for prescribing, and purposely violate the law, are very few indeed. I am not prepared to defend any legal right that chemists have to prescribe; that is, I do not see that there is any law in existence which defines the right of chemists to prescribe other than that of usage arising from necessity. Now usage, I have no doubt you are all aware, is often pleaded in courts of law—at least, the right by usage is often pleaded. I have been myself in a court of law where it was pleaded against me,—the right by usage to adulterate musk,—but it failed in that case. Then, as to the necessity. We are all aware of the necessity of the thing—the necessity of self-existance, and where necessity of that kind exists, it is above the law, not subject to it—it is an absolute necessity above the law. I may say that the law of this country does recognize the necessity in one particular case. It is a law which has been pointed out in the *Pharmaceutical Journal*, and I quote it because

I think it is representative of a great many others. The law demands that every vessel shall take to sea with it a medicine chest. Thus, thousands of vessels which sail out of the port of Liverpool every year all carry a medicine chest; but I know that there are very few which take a medical man. Now, it is a breach of the law not to take a medicine chest. It is recognized by law that the captain prescribes medicine for the sailors. The medicine chest is not taken away locked up to be brought back again locked. It is the custom of captains to give medicine to sailors, and they give them calomel to the extent of half a drachm or a drachm at a time. We have been told that we have no legal position in the matter, and I do not think until we are educated in the nature of disease that we shall have a right to inquire of people into the nature of disease. But in the room above I was once examined. I was asked the effect of ammonia on the system. I was asked something about the chemistry of ammonia, and then the dose of ammonia, and I replied, from 3 to 10 grains, and I was asked the effect of an overdose, say half a drachm. It was an emetic. One gentleman has remarked, putting it stronger than I can, that if you examined me in the nature and properties of these medicines, I am qualified in recommending the nature and properties of the medicines. I do not say in treating disease, but it is my opinion that in ninety-nine cases out of one hundred where chemists are supposed to prescribe they do not prescribe at all. Prescribing consists in the diagnosis of disease, and the application or giving a remedy. The chemist does one half, but the customer does the other. He explains what is wrong, and diagnoses the disease, and the chemist, so long as he knows the nature of the disease, simply recommends the nature and properties of the medicine that he gives; he of course keeps within the pale of what he has been examined in. Therefore, I think that is the way of simply getting at the border line. We cannot of course get an exact line of what is prescribing medicine. Next, we are told that the proposition before us is illegal and will have no effect. I should be very sorry to feel that we have all come from a long distance, and have done nothing, but this is the idea which occurs to me. It is somewhat crude perhaps, but I will tell you what it is. This Pharmaceutical Society is an institution for which we have all a great deal of respect. It has done much for the cause of pharmacy. Adulteration has been put down very largely since the institution of the Society. It has laboratories and professors, and a Benevolent Fund of which it may be justly proud, and of which any society might be proud. It educates men, and it examines men, but between the examinations and the Benevolent Fund, or rather, I would say, beyond the Benevolent Fund, there is a vast amount of space, that is the experience and the work of life. I would not say a word against any man who supports the Benevolent Fund, but I hold that the man who saves another from the Benevolent Fund is ten times greater than he who saves him by it. Therefore, the object of this meeting, I take it, is to save us from the Benevolent Fund. But this Society cannot do all these things for us without incurring certain responsibilities. It has acquired for us certain rights: the right to practise as chemists and druggists, and those are associated, if only by usage, with certain privileges. Then while it has got us all these rights and privileges it has, through the law not voluntarily, placed on us certain pains and penalties if we go beyond them, and it has been required of the Society, of course, to put those in force. The Society would not punish any member willingly, I take it, but it is required by law; it cannot have the privileges without having the pains and penalties, which is exceedingly fair. But as the trade grows up we come into contact with a great many difficulties which cannot be altogether provided for, and one of those difficulties is counter practice. The Society exists for the definition and maintenance of the position of the men it has educated and examined. If that were a sharp border line there would be no difficulty, and the Society, I have not the least doubt, would do its duty as a Council if the border line were a definite and sharp one. But there are no very sharp lines in nature, and this is a case in which there is no sharp line either. We overstep, perhaps, the province of the medical man, and the medical man certainly oversteps into ours. I am told that in Glasgow it is perfectly frightful, that there are more doctors' shops than chemists' shops. Mr. Frazer will correct me if I am wrong. I wish to avoid, if possible, Mr. Shepperley in this matter, because when Mr. Shepperley's case was first brought before the Council, I really think they were justified in, at any rate, reconsidering it rather than accepting the defence of it, and in the exercise of their discretion they did so. Subsequently, the Trade Association, another body with less responsibility,—not irresponsible, but with less responsibility, with less position to lose,—thought fit to risk such position as it had and took up that case. I thought it was doubtful myself whether they would carry it through, but they have carried it through, and they have done exactly what I said a few months ago, they have drawn a definite border line. The case now ceases to be the case of Shepperley. The case, either by the Association or by the law, has been brought to a definite issue; you can read it yourselves. It is said there are two cases in point, simply that a chemist looked at a man's throat and gave him some saline mixture for it, and looked into a man's face, saw some pimples, and gave him something for that. That is something definite to act upon. If the thing had been so definite when it came before the Pharmaceutical Society, perhaps they would not like to own it, but I have do doubt they would have taken it up. That is why I cannot quite agree with all the hard things which have been said. Now we have seen the thing is ended, we look at it differently to what we did at the time, but now it has come to that. Now there is a definite border line and we see exactly how the case stands, and the case is such as might occur to every one of us to-day or to-morrow. There is no excuse why the Pharmaceutical Society should not give the hand of fellowship and merge all differences, if differences exist. When there is peace on all sides we sometimes disagree among ourselves perhaps, but, when a common enemy presents itself, and here is a case in which we can defy that common enemy, if we only join in unanimity together, I do not see why both societies should not merge any petty jealousies that exist and get some beneficial results. If that is done none of us will have come here to-day in vain.

Mr. Hampson: I must apologize for trespassing a few minutes on your time, but having been somewhat mixed up with the question as to asking the Society to grant a certain sum of money, I feel, that on an occasion like this where a special meeting on the same question is called I could not sit still without offering a remark or two. Now, sir, when I attempt to take into consideration this question at all, I rather like to consider it in my own shop; I like to consider the law, which is likely to affect me there. I have had the misfortune to move about in search of health, and therefore, I have had several businesses, and know what business is throughout the country, and I find by experience, that we cannot do without a certain amount of prescribing. The West-end chemist may do it in one way, but still he does it. The East-end chemist is more compelled to do it than the West-end chemist, because he is amongst the poor; and I say that if we are to submit to the *dictum* of the Society of Apothecaries in this matter we shall lose our self-respect, and lose also a name worthy of Englishmen. Now I want to know what this Society of Apothecaries is. I find, in the first place that its licentiates keep open shops. I find that they compete with us as chemists and druggists. I find also that this society is an old society with certain privileges of dividing profits. Now I maintain that if such a society so constituted is to bring into action an obnoxious law, not only oppressive to the chemist himself but to the poor and to all classes of society, such a law ought to be

swept away as soon as possible. Maybe we may not obtain any money from this Society; this I regret, because I wanted this Society to share the honour of the fight. But we are only dealing with the present mood of the Governors of the Society of Apothecaries. The Shepperley case may be done with, but we are not safe, and that mood may be a passing mood; it may change and we may have other cases to defend, and so I conceive that we are not safe while the law is maintained in its present condition. I would therefore recommend that the attention of the trade be directed more especially to the repeal of the 20th clause of the obnoxious Act rather than to anything else. I maintain that in so doing we are most likely to settle this question finally. A fit occasion may not arise, but I hope, if I continue to have a seat on the Council, I shall take steps with others who think with me to obtain the removal of the clause; because I assert without any hesitation whatever that it is a monstrous position that a trade society, and a profit dividing society, should have the power to oppress chemists in the manner the Society of Apothecaries has done. I will not occupy your time any longer. I much regret that any legal obstacle exists or may exist to prevent the Society helping in the carrying on of this contention to a successful issue. I was hopeful that it might be different, but still I do think that this meeting will be of some benefit, and probably in the future we shall be more in accord in defending ourselves.

Mr. Humpage: It appears to me that this counter practice question cannot remain as it now is. If I understand the reading of all the publications that have referred to it the opinion is that to a certain extent counter practice cannot be prevented. It has come down to us from the very first day we entered the trade. As an old man I can speak of it as a fact fifty years ago; and then I ask what was the remedy to keep the chemist within proper limits? I was always educated to understand that the limit was confining himself to his own shop; that so long as he remained there he was safe, but immediately he went out and advised a patient he passed into another district and was beyond his province. Then the question arises, what restrained him from going beyond that province? Why this—the coroner's inquest. A chemist felt, if I continue a case in hand and the patient dies without a medical man having seen the case, what follows? No certificate of death—a coroner's inquest. I may also add, I do not say it at all offensively, that generally speaking the coroner is a medical man, and therefore his leanings towards what was called a "prescribing chemist" are not favourable. Probably the jury might acquit the chemist; the chemist perhaps stood forward and stated, this woman came to me, telling me her child was very poorly, that it was tight on the chest, and so on,—as you all know the kind of things they say—then the chemist gave a powder; he might perhaps have ventured to give a simple fever mixture. During the night the child dies. There is this coroner's inquest. When the chemist came before the jury and made his statement of what he had done, of course they did not find him guilty of manslaughter; but has he had no trouble, has he had no anxiety, is it not a very unpleasant thing to have it said "Mrs. Jones went to Mr. Smith's shop and had some medicine there that poisoned the child"? I contend that that punishment is severely heavy, and deterred the chemist from going beyond his limits. Why should not the same law now exist? It appears to me that the higher branches of the medical profession denounce this case, and can you be surprised at it? Did you ever read such a case as that of Shepperley's? A party accused of having given a gargle to one man, and of having given another person some sarsaparilla, and it is now contended he was doing an illegal act. Gentlemen, I have taken an interest in this Society for many years, and when I heard that the Council had decided to have nothing to do with Shepperley's case, I felt personally a little aggrieved; I went to the Society, and I will say too that whenever I have gone to the Society I have been treated most courteously, most kindly, in fact made almost too much of; but I asked a few questions about this case, and I was told "If you knew what we know, if you had the evidence before you we have, you would certainly say we have done right," and I was told quite enough to go away perfectly satisfied that the Council had acted rightly and had acted in such a way that three-fourths or five-sixths of those present would have approved of their proceedings. But when that same case comes into court with all its simplicity and the flimsiness of the evidence, I felt that the case as now presented in the court of law and the case which was presented before the Council are as two distinct cases as can appear. That I felt, and I have heard or read nothing to alter my disposition as to the feeling. Why did not the Council immediately they had this full report of the trial before them say through the Journal or at the Council Board, "Gentlemen, we, who are your representatives, should have defended Shepperley's case through thick and thin had it come before us as it has come before the courts of law;" but they did not do that. I have great respect for the gentlemen on the Council, but what do they do? When our Journal came out what was the tone of it? Was it friendly? Was it sympathizing? I should have been quite satisfied if in that Journal they had said the Defence Association has not acted thoroughly wisely. I never approved of Wiggins's case, and they did not; they were thoroughly misled. I have it on good authority that they would not have touched it if they had known of the evidence which came out on the trial. But how did this Apothecaries' Company act? Ought they not to have put the charges forward, and then the Defence Association would have withdrawn? Decidedly. I say, have the Council shown a sympathizing feeling towards this gentleman and to that Association, and all of us, for I am not ashamed to say that I belong to the Association? But I did not join it with any feelings of disrespect to the Council of this Society: I joined it—which I think I have stated—because I thought looking after the trade interests was so great a matter, and would occupy so much of the time of these gentlemen, that we had no right to ask of them to give that time and attention which a Society like this demands. I say, and I still am of opinion, that the Trade Association is an evil: it is an evil in itself. The highest authority says: "A house divided against itself cannot stand." The work of the Association I approve; but that work, in my humble judgment, should be accomplished by gentlemen in connection with the Council. They should have before them appliances which will make them fully acquainted with all the proceedings of our outside opponents and when any Bill or any action is being taken by the surgeons or apothecaries they should be a party; not Mr. A., not Mr. B., who has his own private business to attend to, but it should be looked to by those delegated paid parties who should call the attention of the Council to the fact that there was a clause in this Bill, I may say, which would be detrimental to the trade. The Council then should look to it and ask for an interview with the promoters of the Bill. What is the value of such interviews? They have invariably got what they asked for. I would say even of this last Act, the Dental Act, had their attention not been called to a certain portion, I do not know what would become of a chemist drawing teeth. His instruments would have become rusty. My view of it is this: let the dentists be protected and termed dental surgeons, and let any man who takes that title on himself, who does not belong to their college be prosecuted. But if a barber in a small town has a mechanical taste, and is clever at drawing teeth, I think he ought to be allowed to do so. To come to the point, cannot our friends on this Council enter into some arrangement with the friends connected with the Apothecaries' Company, coming forward, not with hat in hand, not as culprits having broken the law,

but as a body of gentlemen who consider they have rights to do certain work, and let us, if we can, understand the line in which we may travel safely, and I should say if any one is found to be going beyond the law, let the Apothecaries' Society communicate with him; then let that individual, if he feels he has not gone beyond his line, communicate with the Council; let the case be gone into, and if it is found that the chemist has not exceeded his rights, and also, if the solicitor of the Apothecaries' Company, having gone into it, felt he had not, then they would shake hands, we should pay the lawyer's bill, and there would be an end of it. But if, on the other hand, the chemist has exceeded his rights, and the case comes before this Society, and to them it is clear that he has done so, then our Society should say: You have broken the law, and must take the consequences. It seems to me, that nothing is more easy. There may be some outsiders, both apothecaries and chemists, who might say: You have not protected us enough, but I think it will be very easily found, that you were protected as far as chemists have a right to act. Time is going on, and I would simply say, that if any conference does take place, I should be glad if these gentlemen would point out to medical men how much they poach on our manor. It may be wrong of me to have a gin and catch one of their hares, but if they come on my ground, perpetually shooting my rabbits, I think I have some ground of annoyance. And, I contend this, the pharmacist having been educated to do the work of a dispenser, and to do it correctly, because of the knowledge which he must acquire before he is placed in that position, I say he is so educated his Society must do all it can to throw that part of the work into the pharmacist's hands. For that purpose I would say, is it quite right that that medical gentleman who drives up to that good house with his carriage and pair and charges his fee for his professional visit, and very fairly, is it right that if he sees it necessary that a mixture and a bottle of lotion should be ordered for the patient that he should go home and have that mixture and bottle of lotion prepared under his own roof and take the profit connected with it? Is not that stepping out of his proper province? He is paid as a professional man by his patient for his visit; then I ask what right has he to come and take profit which properly belongs to the pharmacist? I will not trespass longer on your time, but I do trust this meeting will lead to a pleasant kind of feeling. We must not quarrel if these gentlemen here, and I believe it, have no power to vote a sum of money to the Association. Then it is of no use pressing them to do it; but I will just say to them, cannot you find out a little circuitous route if you turn a little to the right or a little to the left? I think, if you are anxious to settle this question, it is within your power. We must not forget what this Council and our former Councils have done for us. Go into the rooms above here, or attend one of our annual dinners. Look round at the general status of the trade; see how it has risen. You young men who come up here and distinguish yourselves stand an infinitely better chance of getting positions than any of us old men did. I believe when my father brought me to London some fifty years ago, he would have given his right hand, probably, if he could have put me where I could have learned a little, for although I was brought up in one of the best establishments in the West of England, I had only learned to wrap up and to be polite, and so on. Your advantages are infinitely better. I am sorry to have said so much, but I am an old man, and old men are rather garrulous.

Mr. GOSTLING: Mr. Chairman, it affords me great pleasure to be at a meeting where there is so much good humour existing, and especially when I find that the fight is really against a shadow; for that is what appears to me that we are fighting, not a substance, but a shadow. I most certainly endorse the opinion of the gentleman who has just sat down, and because I endorse such an opinion, that it is the duty of the Pharmaceutical Society to defend the interests of the chemists whose interests are affected, I shall vote against the motion before the meeting. But I think there are certain things which really should be looked at. In the first place, the Council is looked upon as consisting of gentlemen occupying very first-class positions, indeed, having dispensing establishments perfectly independent of the prescribing, which is necessary over a chemist's counter. I think I am quite within bounds, and really we are fighting against a shadow for this reason. Let me explain. I think I understand that there is a necessity for counter prescribing, and it is recognized not only by ourselves as a body but also by the Council of the Pharmaceutical Society and by the Society of Apothecaries to a certain extent, which must be left to the discretion of the chemist. Counter prescribing is necessary. In the next place the Council through its solicitor has had an interview with Mr. Upton, the solicitor to the Society of Apothecaries, and I regard the arrangement or the understanding which was come to some months ago as being perfectly satisfactory to myself and it should be to all. Allow me to say that I regard it so, gentlemen, and I am not like those gentlemen who have got up and said they are not interested in counter practice. They are very kind certainly. They are most disinterested indeed. It is astonishing that men should have come so many hundreds of miles to defend that which they have no interest in, and I think it shows well for the character of Englishmen. But for my part I live in a very small town where medical men live many miles apart, and where the people also live at very great distances from each other, and to a certain extent prescribing is a necessity for my business; but I endeavour to conduct it in such a manner that I am not afraid of medical men interfering with it, and with such an arrangement, or such an honourable understanding, as was arrived at between Mr. Flux and Mr. Upton, I am quite satisfied. I beg to say that the gentlemen on the Council are perfectly interested in the welfare of this Society, and I think their acts show it. I would refer to the case at Liverpool; that was a case which Mr. Shaw, one of the advocates of the Trade Association, brought before Mr. Sandford, whose name has been brought before you as that of a gentleman who would not defend even the angel Gabriel, if he came down and kept open a chemist's shop. Mr. Sandford was consulted by Mr. Shaw, and I think it was at the suggestion of Mr. Sandford that it was decided to defend that case if a prosecution should be instituted. Speaking for myself and for my brethren, whom I have great pleasure in meeting at the Council table from time to time, their time is not wasted simply to accomplish their own purposes, and to carry out their own desires, but if the gentlemen who are so strong in their denunciations of the Council could only see how they work in their Committees, and the President who is always ready at all times, whenever necessity arises, to put himself out of the way for the interest of the Society, I am sure their ideas would be greatly modified.

Mr. PRESTON: Mr. President, I think the meeting is greatly indebted to the gentlemen who recommended that a wider resolution should be put before the meeting than that which was proposed in the first instance by Mr. Radley, because I apprehend in the interests of the trade it is far more important that the legitimate interests of the trade should be recognized and protected by the Council of the Pharmaceutical Society than even that they should support the defence of the action against my friend Mr. Shepperley. It seems to me that however interesting many of the speeches that have been made to-day have been, to some extent we have run away from the main point, and what we really want to come back to is this, has the Council the power to protect the legitimate interests of chemists and druggists? Now, I am prepared to say that the Council has that power. The Council has shown its interest in the trade in the most pronounced manner in regard to educa-

tion, and I think we are all considerably indebted to the Council for the interest it has taken in that department of the business. But, however interesting education may be, and no one recognizes that more than myself, still, I apprehend that we cannot live on education. I apprehend that the pounds, shillings, and pence argument must have something to do in connection with the trade, and I must say that when I heard the brief read by Mr. Flux I could not help coming to the conclusion that that brief had been written in the interest of the plaintiff and not of the defendant. It has been my privilege to be associated with many solicitors, and my misfortune to have been concerned in law proceedings, and I know perfectly well that cases can be put to counsel to produce an opinion either on one side or the other, and I am bound to say, as a man of common sense, as a man connected with commerce, that it was not a neutral case that was put before counsel. Now, sir, I am bound to refer for a short time to what have been the proceedings of the Trade Association. They have not been simply in connection with counter prescribing. The first thing that the Trade Association took up was the question of adulteration, and I venture to say that more frivolous prosecutions were never entered upon than the prosecutions in reference to adulteration. I confess myself, having felt considerable interest in the Pharmaceutical Society, and having relatives of my own who have passed the examinations, that I exceedingly regret that on that occasion, when it was shown that the transactions were of a frivolous character, that the Council did not come forward and protect the legitimate interests of the trade. There is not a gentleman here any more than there is on the Council who would for a moment profess to defend anything like adulteration. That was not the case in the majority of those instances where chemists and druggists were prosecuted at the instigation of analysts. Now, with regard to counter prescribing. Has the Trade Association defended every case that has been brought before them? As a matter of fact, they have used their common sense, as men of business, to see whether the cases were such as justified a defence, and there have been several cases which the Trade Association has refused to defend, because they felt that the chemist and druggist was transgressing the law. And I contend that there are other cases cropping up which will require the closest investigation and the greatest care to protect the interests of chemists and druggists. I have had the privilege of knowing a large number of gentlemen in the trade, those who have what are generally called first-class dispensing businesses as well as those in poorer neighbourhoods. I have travelled myself in town and in country over a very large portion of England, and therefore I do think that I am qualified to speak of what is possible with regard to the trade; and I venture to say that as a rule chemists and druggists do not transgress the law; they try as much as they possibly can to keep within their province, and the Council of the Pharmaceutical Society is bound, I think, to protect them when they do so. Now comes the question, can the Pharmaceutical Society vote money for this purpose? I say it can. It may be very ingeniously put that it cannot vote money to another association. I am not a lawyer, but I know how easy a thing it is to put a thing of that kind into words. Do you mean to tell me, or does any gentleman present mean to tell me that the Council of the Pharmaceutical Society has not the power of voting money to an individual when it feels that he is wrongly prosecuted, and is being persecuted? The Council may not have power to vote money to the Chemists and Druggists' Trade Association, but have they not power to vote money to pay Sir Henry James's fee? "Where there is a will, there is a way," and self-preservation is the first law of nature. So long as I am connected with the trade, and even if I were to retire from business, I should still feel an interest in the trade that I have been connected with for so many years of my life, and so long as I live I shall endeavour to do what I can to protect the interests of the trade through any association which may perform that function.

Mr. Hudson (Sheffield): I think we have gone a long way from Shepperley's case. If I understand rightly, the solicitor to the Society of Apothecaries says that case is dead. But is it not in the hands of other societies? are not a number of medical gentlemen carrying on the prosecution? If I am right in reading the Journal, the Society of Apothecaries has intimated that it only found 50*l.* towards it, and we all know that a great deal more than 50*l.* has been spent, because 50*l.* does not go far in a law case; and, therefore, it is right we should still have our eyes open to defend the interests of the trade. I have been in the business a long time, and my predecessor was a long time in it. He followed counter practice, and seeing that has been going on for such a length of time, I think chemists and druggists have a right to it, and that the Pharmaceutical Society has a right to defend them. All honour for their education scheme; but men do not live by science, and scientific chemists, I am sorry to say, many of them lose their teeth before they are able to chew their bread. There has been very little said on the other side, but I say look at the doctors, what are they doing? In London you have many of them opening shops, and some of them are not above selling half an ounce of salts, and in many other places they open provident dispensaries and sell medicines at a shilling, and some go so far as to give advice gratis, and say the chemists do not sell you good medicine, we will make the bottle up for you for a shilling. Is not that trespassing on the chemist and druggist? I should be very sorry to see this Council broken up, or to see a division in it. I think we ought to be united, all of us as one man. I have supported the Birmingham Association because I felt that the Council of the Pharmaceutical Society did not do its duty in many ways in protecting me as a tradesman. I should be very sorry should any difficulty arise, but if you do not lend a listening ear to country members a storm will rise. The country men put you in, and the country men can put you out. As was said by a member of Parliament the other day, the House of Parliament is only what the electors make it, and so is the Council of the Pharmaceutical Society. You have conducted our business in an honourable manner, and I should like to see you retain your places for many years to come. As far as I am concerned it makes very little difference to me which way it is, for I am getting old. I have a boy, and I should have liked very much to have brought him up to the trade, but such was the uncertainty I found it cheaper to bring him up as a medical man. Mine is an old established trade of some seventy or eighty years' standing, but the trade is in such a state you are never safe. There are many cases left yet undecided, and the Shepperley case will not decide them. There are many cases in different County Courts which are awaiting the decision in Shepperley's case. I think all honour is due to those gentlemen who did stand forward and call this meeting, and although it is held at an inclement season, and I ought to have been at home seeing to my books, I thought I ought to make the sacrifice and come here to-day.

Mr. Urwick: I think we have rather wandered from the point before us. Up to a certain stage I went with the Council. I knew no facts, and I was told there was much in the background which guided the Council which was not generally known, and I therefore thought that they were acting wisely. But since the case has really come before the court, it seems to me that being such a simple case I should have felt it, and do feel it, a disgrace to the Council not to have taken part in the defence. You know that at all the general meetings here I have always said you should be present at these cases to see that nothing trans-

pires to damage our interests hereafter; we should always be watching these cases, and in Mr. Shepperley's case I really see nothing but what every chemist does almost every day and perhaps every hour of his life if he is asked to do it. I do not hold with prescribing; I think it is a wrong term; I think we are generally called upon to advise. For instance, people come in in a time of cholera and ask you to advise them, perhaps with five or six receipts out of different newspapers in their hands, and you are asked to advise the best. That may be in a sense prescribing, but I do not call it so. The same with toothache and a number of minor things. The same in the dog days; you are often called upon to apply caustic to bites, and I have always considered we have a right to do so. When I joined the Society in 1841 or 1842, I remember I was urged to do it although I was an apprentice, and it was rather hard to find a guinea, for they were rather scarce with me, but so strong was the point put that we had rights to defend, and we must join the Society and put our shoulders to the wheel and maintain our position and our rights, that I joined the Society then; and when I could pay the guinea I did, and when I was a young man out of funds I did not, so that not taking up this case of Shepperley's is really committing a breach of trust. You got us into the Society saying you would protect us, and I think it is your duty to do so, especially now the case has turned out to be so simple; looking down a man's throat who had nothing the matter with him. I am afraid the law is against us from what I gather from the different judges, and if I could move the meeting to take any steps it would be the repeal of the 20th clause, for I think we never had such power in our hands as we have at the present moment. There has been a discussion whether the Society of Apothecaries is prosecuting or not, and I think it is almost a question whether it as a trading body should not be blotted out as licensing medical practitioners, and merged in another body. Of course we have been very much weakened by the action of the Council, but there is our point, to get that clause struck out of the Bill, even by the introduction of a short Bill doing it, or urging the Government to do it at the present time. We shall never have a better time for doing it. We are on the verge of a general election, and if every man throughout the country urges that matter on his representative I feel as sure as possible that we shall carry the day. But I say the Council has considerably weakened our position, and I will tell you how. One observation of the deputation which waited on the Duke of Richmond amounted to this, that the trade was not harassed. Was that true? I agree with them as to the other language. I do not say they were telling a falsehood, because a blind man on a sunshiny day might say that there was no light, though it is well known to those around him that the sun is shining in full vigour, and there is light, and you can only pity him that he is in that state. Those three gentlemen, I believe, said that there was no oppression. I forget the exact words, and the gentlemen who had the Bill to carry would naturally say, if there is nothing to find fault with why alter it. Yet at the same time Mr. Schacht had advised the Council to have a consultation with the Society of Apothecaries, and there are constant articles in the Journal—fifteen pages are devoted to the existing state of the trade, throughout the length and breadth of the land, in the January number—showing that the trade is vexed and worried by the acts of the Society of Apothecaries. Therefore, in my mind those observations have done us great damage. I feel that the gentlemen of the Council always do their best to a certain extent, but sometimes they do get benighted the same as they were on the poison question, but I hope that they will see the error of their ways, and we shall have them all going with us. Of course the expression of this meeting, I hope, will have its just weight. Now I come to the point that you have not power to spend money on the Shepperley case. You might have taken up Shepperley's case and have done it altogether, and if you have the power to do a thing wholly, surely you can assist in it. It seems to me most monstrous; you can spend a thousand pounds over a thing by doing it directly, and yet you cannot subscribe £50 to assist in doing it. I do not comprehend it. I have had a good deal to do with lawyers; in fact I had one kind offer—I can get you a different opinion to that if you want it. All the cases that go to court have been supported by different opinions, one on each side, so that half the opinions are wrong. And I think the present one may be wrong. And in the same way half the judges are wrong. But my desire is to see the thing settled, and I fear we shall never see it settled until that 20th clause is expunged, and a stop put to the apothecaries prosecuting us. Put it into the hands of another body, but do not let us be in the hands of a common informer. I think that is another reason why you should have taken up Shepperley's case. Then again I come to another point. I do not quite understand legal etiquette as it has been put to-day. If I were going to law with a gentleman about a question I should think it very wrong of a friend of mine, without saying anything to me, to go off to him muddling and meddling with my affairs. I say it is derogatory, especially to the Council of the Pharmaceutical Society, to put its lawyer to write to the lawyer who is engaged in another matter. I cannot comprehend gentlemen doing it in private affairs. I am sure in their private affairs they would blush to do it, and I am sorry they have done it in the affairs of the Society. Before I sit down I should like to ask you one question as you are always very kind in answering. That is, if the copyright of the Journal and the payment to the Editor have passed to the Society of Apothecaries, because the articles written in the Journal certainly indicate that. The Editor of the Journal is our paid advocate, as I should understand it, but instead of that he is sitting always in judgment upon us, and as a judge deciding always in favour of the Society of Apothecaries. If you read the articles for the last five or six months they all tend in that direction as presumptive evidence at any rate.

Mr. ELLINOR said, I, like my friend Mr. Hudson, have come from Sheffield as the representative of the Sheffield Chemical and Pharmaceutical Society. We have had a meeting there, and the members desire that we should vote on behalf of the Pharmaceutical Society giving a grant towards the expenses of the Shepperley case. They also desire that they should be properly defended by the Council of the Pharmaceutical Society. We must have fair play. The country demands it. There has been a great deal said and done, and in Sheffield and some other towns some of our members are getting very warm indeed. I am sure if it should be our good fortune to live a few months longer, I hope many of our friends here assembled will find us warm in another respect when they meet us at the Conference. We consider we have our rights and our privileges, and we equally demand them without any disrespect to the men on the Council. We have the greatest respect for them; we have met them on different occasions and hope to meet them again, and it is always a pleasure to meet them. Still in a large town like Sheffield, and all other large towns, it is impossible for the majority of chemists and druggists not to prescribe. They not only have to prescribe, but they must do a certain amount of surgery as well. They are compelled to do so. You may ask how is that? You must remember there are many large works in Sheffield, surgeons are not always in, and if a man has an accident he cannot be carried to the infirmary at once, so that we have to dress wounds when they bring them to us. If we can stop a hæmorrhage, why should we not? That would be a matter of inhumanity, and that we cannot commit. We have human feelings, and we must give way to them. But while supporting the resolution, I should like to say one thing; I think the statement of the case has not been put as I should have liked

to have seen it. As I have pointed out to the meeting at Sheffield, the resolution transferring the old Druggists' Fund to this Society, also transferred the obligation to carry out the purpose for which it was subscribed. Now, to that statement of our friend, Mr. Flux, should have been added the resolution transferring that at the time. That money was transferred before the Society obtained its charter, and therefore that resolution should have gone with it. We can get Counsel's opinion on everything and every side if we want it, so long as we pay for it, and, after all, we have to judge for ourselves. Sheffield is a large district. We have members there of all grades, from the most humble chemist and druggist to the greater scientific portion as well, and we have to bear with them, and their interests must be looked after. They must prescribe, and we must defend them to a great extent. Medical men defend them, they do not harass them so much as those who have been in the trade. The better class of medical men do not harass us the same as the others, and if possible we must be protected by the Council in our trade interests. I am sorry to see so much cold water thrown on what is termed the Birmingham Association. It was a matter of emergency that that society was brought in. We were harassed by the analysts, you know, and you have heard of the case where a minute quantity, amounting to two places of decimals of iron, was found in a sample of cayenne pepper, which was a most disgraceful thing, and as our friend Mr. Hill said, we should have a clause for adulterated chemistry ; and there was another case of a prosecution for a tincture of jalap on account of a deficiency of a small quantity of alcohol, without any proof that there was any deficiency in the properties of the jalap. These cases are brought into court, and we have to bear the expenses individually. I or any of my friends might be proceeded against, and have to defend ourselves. Therefore we want our friends on the Council to see their way clear to help us. We consider in Sheffield that it is quite possible for the Council to help us. With regard to this not being a test case, it is acknowledged to be a test case by the judges and counsel on both sides, and by everyone else. We must be protected, and I think this case needs the support of the Council, and I do hope it will see its way to it. That can be done either by paying the fees of the counsel or in some other way. We cannot give up prescribing because the public will not let us. We are the servants of the public; we must look at the pounds, shillings, and pence. Therefore, I have great pleasure in supporting the resolution of our friend Mr. Radley, who has been President of the Association at Sheffield for some time, and was formerly Treasurer.

Mr. Frazer said he did not wish to take any part in this discussion, because he thought it should be left to those outside the Council, but he might speak from local knowledge on the point of the power of the Council to vote this money. A short time ago, the Provost of the City of Glasgow brought forward a proposition for the Town Council to vote £5000 for the aid of the shareholders in the City of Glasgow Bank, and the whole of the members would have agreed to it, but it was found to be illegal, and could not be done. In the same way, there were eight leading banks in Scotland which would have each voted £10,000 for the same purpose but they found it was *ultra vires*.

Mr. Long, who rose amidst cries of "vote," said he should not occupy the meeting long. He thought this Society had fulfilled its functions in three cases out of four but not in the fourth, for it had given no protection or benefit to those who had passed under its examinations and obtained its diploma. Anybody else could do exactly what they did except call themselves chemists and sell poisons. They could keep a shop and although their widows were not allowed to carry on a shop, yet people by banding themselves together could employ a registered man and keep open a shop and invade the chemists' rights. Inasmuch as one of their members had been prosecuted, and all members of the Society were members of the body, it was quite possible and proper to vote this money. On other occasions they must not talk shop, and he did not want to talk shop then, but he wanted to live. What was the use of talking about the Council? The members appointed the Council, they were not self-elected, and it was the members' fault for not impressing on the Council the necessity of looking after their interests. Education was all very well, but it was no use to have teeth if you had no bread to eat. Every tradesman was allowed to recommend his wares, and they were just as much at liberty to recommend jalap or rhubarb or anything of the kind as a linendraper was to recommend a lady to have a sealskin jacket.

Mr. Carr : Mr. Chairman, I could not come here without saying a few words. Mr. Hampson made a very important point, I think, when he asked the question, what is the Society of Apothecaries? It is a rich company making profits and having trade interests. It sends informers about the country to catch poor chemists and druggists. When the case was brought forward it was said it was a difficult case and the Council of the Pharmaceutical Society said, it is not a case we can take up at all; bring us a good case and we will see to it. I say it is unworthy of the Pharmaceutical Society to go on in the way that it has done with regard to quibbling and hiding itself under a lawyer's opinion or counsel's opinion; all I can say is it might have voted the money, and if there was not a law for it, make a law, stretch a point. Chemists all over the country have been groaning under oppression and what is to become of them all, what prospects shall we have if we do not defend ourselves? A more liberal policy will have to be instituted and the Council will have to feel that chemists are in earnest and that it must now protect the interests of the trade.

Mr. Clarke agreed with Mr. Long. If their right of prescribing or recommending their wares were taken away they took also a privilege from the qualified chemist and druggist which was allowed to any other of Her Majesty's subjects. Any old woman could go and recommend lotions for the eyes and different medicines, and yet they wanted to take away that very privilege from chemists.

Mr. Slipper: Mr. Chairman, I must say I agree with what has fallen from Mr. Long, for he very much followed the line of argument which I should adopt in a matter of this kind. I have not been unfortunate enough to come amongst a pack of medical men who were unfriendly to me. When I commenced business there was a medical man with a shop at the other end of the street, and we were on very good terms. And so it has continued with his successors. I am also and always have been on very pleasant terms with all the medical men in the neighbourhood, and we do wrong when we start with the idea that our interests are antagonistic to those of medical men. If druggists would keep within their own line it would be all very well. I do not do much prescribing, but I do recommend some things in preference to some others which are asked for. A case occurred to me the other day which is a very good example of what happens. A woman came into my shop with one or two children and a lady with her ; she asked for a pennyworth of laudanum and a pennyworth of antimony wine. I asked her, "What are you going to do with it?" She said "I am going to give it to the children for a cough." "Are you going to mix it with anything else?" "No," she said. "How are you going to administer it?" She said "I am going to give them a few drops at a time." Now if I had labelled that "Poison" and entered it properly she might have gone away and killed two or three children, and I should have been perfectly free from blame, but I was stupid enough to say that that was not a proper thing to do. The lady doctor, who was standing by her, said she had bought it scores of times and administered it to children. I simply said, "You cannot have it from me." She said, "Can you give me anything better." And

that is what I did, and I do not know that anybody from the Apothecaries' Company is likely to come forward and prosecute me. I believe that I acted a proper part, both as an intelligent chemist and also as a good member of society. These sort of cases occur constantly. I do not think that if chemists were careful to keep themselves somewhat within their own bounds there are many members of the medical profession who would interfere with them. I have been nearly forty years in business in a very populous neighbourhood with ten or fifteen medical men around me, and one or two medical coroners in the district, but I am very happy to say I have never had to come before them on account of having killed any one, or of having any one die under my hands. The question before us is whether chemists and druggists are allowed a certain amount of legitimate prescribing, and whether the Apothecaries' Company would interfere with them if they kept to that. We have wandered a good deal from the question, but I say that chemists should take care not to go beyond their legitimate sphere. Well, then, the question is, whether we should ask the Council to grant the money to the Association. If the Council had the power I certainly should be very pleased to find them granting the money, and I would give them my vote in support of it, but if they have not the power of giving it themselves as a body, perhaps some of the more powerful of them would give some support themselves.

Mr. POND: This question seems to me to be simple and at the same time important. It seems to me that unless the Council grant a vote of money for the defence of such a case as this, that it literally shakes hands with the Society of Apothecaries and turn its back at once upon its own members. It is a question as important as the decision of the judge at the trial, because if we do not grant a sum of money for the defence in this case from the Society it seems as much as saying we are against prescribing altogether. We are against the decision of the judge who tried the case. He decided in favour of Shepperley, and we are against that, and turn our backs entirely upon our own members. It seems to me a question of most vital importance in that respect. I wish I could explain myself better to show that this is a question which will go a very great way with the judges in any future case, and with the Society of Apothecaries also. They will say, "Why you have everybody against you." The judges will say, "Why their own Society is opposed to it; they will not give any sum of money to the support of the case." It has been called a test question on both sides, and should be supported by the Society, and you evidently have the power, if you will use it rightly, to grant that money.

Mr. SANDFORD: Having so long had the honour of a seat on the Council of the Pharmaceutical Society, I cannot allow all that has been said against the action of the Council to go uncontradicted. It has been said the Council takes no interest in the affairs of the trade, that it is composed of certain men whose business is of a character not to require protection, and, therefore, they do not care about protecting those who are not in the same position. I have watched the action, and taken part in the action of the Council for the last quarter of a century, I may say, and I have never found that Council wanting in a desire to promote the interests of the whole trade. We are called to account for not interfering in certain cases to defend certain men who were threatened with prosecution; some gentlemen have certainly given us credit for having had, at the time we were asked to take up this defence, in our possession information which we could not publish, and so long as these cases were under the consideration of the courts we could not publish it. Now I will take the case of Mr. Shepperley. Shepperley's case has been so much talked of this day, that I will just read in the first place what the information was which went to the Society of Apothecaries. "To obtain direct and positive evidence is often attended with some difficulty, owing to the disinclination of persons who have been treated to give information; but we have abundant evidence in three cases, viz., A, who has been attended and prescribed for for about six weeks in respect of a uterine complaint; B, who has been treated for bad blood and blotches on the face; and C, who has been treated for an inflamed throat." It was stated in the course of the trial that Mr. Shepperley had been suspected for a long time of doing a large prescribing practice. Now when you imagine that all these things were known to the Council of the Pharmaceutical Society when asked to defend Mr. Shepperley you can scarcely think that the Council would have been justified in dragging the Pharmaceutical Society through the mud in defence of the acts of that man. Then, when you go a little further and see as the case went on it was shown at once to be a very simple case, I will just give you another paragraph in which it is stated that at a future trial, if such a trial should go on, all parties might produce any evidence in their power, and therefore this Council naturally supposed that other evidence would be brought against Shepperley. Then, again, I take the case of Wiggins, which we are blamed for not interfering with. I mention that for another purpose. I have said that that case damaged us very much; it damaged the position of you, of all the chemists in the country. I was told once that it turned a good deal upon sentiment, that when it was found there was evidence of the death of three patients brought against him it became a matter of sentiment with the jury. But if that be sentiment, I wonder where reality begins—the sacrifice of human life. Some gentlemen have talked a great deal about the repeal of the 20th section ——

Mr. BARCLAY: Would the Chairman kindly allow me to say that I should be happy to reply to Mr. Sandford at the close of his address, and I hope our friends will listen patiently. I am anxious that every word Mr. Sandford can say shall be heard.

Mr. SANDFORD: You will remember that the Duke of Richmond had introduced the Medical Act Amendment Bill, and he had repeatedly expressed himself to the effect that it was utterly impossible to prevent unqualified men practising, that all you could do was to protect titles, and although, strange to say, that did not appear in the body of the Act yet in the schedule of repeals he had put down the penal clause of the Apothecaries Act for repeal, which would have included of course the 20th section, and then we should have been quite free. What happened? The thing was kept very still; there was no agitation about it until the Wiggins case came on. It is said the Council has taken no interest. Now let me tell you that your Council immediately sought an interview with the Duke of Richmond and put all these things before him and begged of him that this 20th section should be repealed. In the meantime there had been a communication made, and the repeal of the 20th section was erased from the schedule of the Medical Act Amendment Bill. Why? I believe myself simply because of the agitation which had been occasioned by these trials, simply because those cases had brought upon us the notice and the antagonism, I may say, of the medical profession to a great extent, and they had interest to get this re-enacted. I think that is pretty good evidence that your action has not been wise, and has not been good, and therefore I think that is a piece of evidence why the Pharmaceutical Society should not hand over to you the money which is in its possession to defend your cases. I could not for one moment consent to sit on the Council and vote money for that purpose. The question before you is, shall we hand over a certain sum of money to the Trade Association? That is the question, and to that I address myself. I say that to hand over the money of the Pharmaceutical Society to the Trade Association would be a dereliction of

duty on the part of the Council, who is not only the trustee and the treasurer but also the administrator of the funds of this Society. Those funds should only be expended on our own judgment, and for the best purposes of the trade, and I believe they always have been and always will be devoted to that purpose. Mr. Shaw has said that inasmuch as we had received from the Old Druggists' Association what we now call the Old Druggists' Fund, we were bound to help on such cases as this. I will not say he asked for the whole sum, for he did not, but he said that was one reason why we should do it. That money was handed over to the Society for the general purposes of the Society, and to be used at the discretion of the Council, and therefore no other body can claim any right or title to it. If the Council gave up its right to control the expenditure of that money it would be giving up its rights to administer the affairs of the Society altogether. I think that is a sufficient answer on this point. When we are asked whether the Council represents the Society, that is a question for you. You have sent us to represent the Society. I read in a paper the other day that the Trade Association was not sufficiently represented on the Council. I thought that was rather an extraordinary statement for I really did not know that the Council was required to represent the Trade Association. I believe that the Trade Association desires very much to control the action of the Council. That is pretty clear and we shall perhaps have that tried bye and bye. Then one gentleman spoke of the action of the Council or the non-action of the Council in the Adulteration Act. I should like him to know what trouble the Council took in really getting provisions into that Act to protect chemists and druggists and what the Act would have been if passed in its original state. We, of course, cannot help an extravagant analyst who chooses to say, "I will take up tincture of jalap and nonsensical questions of that kind." We cannot control them, but there are means in that Act of getting the whole thing rectified, and the man was not fined, I think, for his tincture of jalap, but the analyst was floored. I tell you those provisions were inserted at our instigation and upon our representation. I cannot forget that Mr. Urwick talked a great deal about the deputation having stated that the trade had not been harassed. Now I happen to have been one of that deputation, and I am quite willing to tell Mr. Urwick that perhaps I said so; I do not know that I did, but I do not consider that the trade has been harassed. I am perfectly aware of what I am saying, and I tell you that the trade has not been harassed.

Mr. URWICK: Put it to the meeting.

Mr. SANDFORD: You have been made to believe that you have been harassed; but how many cases are there? Only two or three cases. There was Nottingham's case —not the Nottingham case—in which you know his own solicitor advised him not to defend the action, because he had clearly transgressed. Then there was the Wiggins case, which you know the solicitor of the Trade Association said could not be further defended. There was the Shepperley case, in which such circumstances were mentioned in the beginning that we could not take it up. Those may be in the back ground now; but at any rate we are assured the case is now at an end.

Mr. HAMPSON: There are other cases now.

Mr. SANDFORD: Then there was the Liverpool case, I really at the moment forget the name, but a man was charged with something. I happened to be on a visit to Liverpool at the time of the agricultural meeting in 1877, the date is not material. My friend, Mr. Shaw, knowing I was coming down, met me on the first morning I was there, and said "I wish you would come with me, there is something I want you to look into; So-and-so has been threatened with a prosecution under the Apothecaries Act." We went down to the man and entered into the particulars, and he satisfied me that he was only doing that amount of prescribing over the counter which I believe every chemist is entitled to do and is obliged to do. I believe he was carrying on his business quite legitimately. We had a long talk about it. We did not hurry the thing over at all, and a certain letter was drawn up there and then which he addressed to Mr. Upton, the solicitor of the Society of Apothecaries, telling him he had carried on his business legitimately, and giving him ample testimony from medical gentlemen and others that that statement was perfectly correct, and adding that if any specific charge should be brought against him he would be able to meet it. That letter was sent, and the man never heard another word from the Society of Apothecaries from that day to this. I tell you now that I think if all good cases were so represented to the Society of Apothecaries you would hear nothing more of these prosecutions at all.

Mr. CARR: What would have been the case supposing they had succeeded in Shepperley's case?

Mr. SANDFORD: This was in June, I believe, and at the August meeting of the Council I had to describe that case in the Council. I believe on the strength of what I stated and what Mr. Shaw was able to confirm, although I was not in the room at the time, there was a resolution passed that that particular individual—no names were mentioned of course, because we never mention names—should be defended if necessary; but it did not become necessary. He was not prosecuted, and the Council did not defend him; but the Council would have defended him, and it would defend any case as my friend Mr. Savage said, if and only if in the judgment of the Council that case deserved to be defended. Somebody told me the other day that if the angel Gabriel were a chemist and druggist and prosecuted, I would not defend him; and some one wrote a letter to me to ask me if I would not defend the angel Gabriel. My simple reply was I should look into his antecedents. There has been some attack made on the Journal for inserting certain articles and for inserting the paper from Mr. Upton. I think that was one charge. You say the Journal should be our advocate and should defend our interests. Well, so it should, and I think it does advocate our interests. Let me tell you that this article was a printed paper, which it was deemed advisable to circulate amongst the members of the Society, to show that from the Society of Apothecaries we had no fear whatever. The Society of Apothecaries had been led on, as Mr. Upton tells you in the paper, by an outside society—a Defence Association. Now, sir, that is an example for us. The Medical Defence Association itself puts the Society of Apothecaries into great trouble and great difficulty. It is always trying to instigate prosecutions, and I tell you that I think this Society may be very much damaged in the same way if we listen to the Trade Defence Association, which is pressing us to do the same.

Mr. URWICK: I must protest. I am a member of the Pharmaceutical Society and I am here as such, and not as a member of the Trade Association.

Mr. SANDFORD: The Defence Association, I say, to which we are asked to grant money, and for that reason I describe it as a Defence Association—that Association is the first to instigate the Council of the Pharmaceutical Society to go in for all kinds of prosecutions. I go a very little way back and I may refer you to correspondence in which we were asked actually to discontinue sending, as we always had done, and as I hope we always shall do, a premonitory letter to persons accused of infringing the Pharmacy Act; to take the evidence which had been collected by that Trade Association and use it in our Council and, without sending a premonitory letter, to prosecute such men. Why, sir, it is exactly following the course of the Medical Defence Association which is said to be harassing and obstructing you so much. I shall be glad to vote immediately. I have very little doubt that so far as that vote goes it will be against what I have been saying, but the happiness I have is that the vote can have no effect. The vote will be *vox et præterea nihil*. If you choose to have the

Pharmaceutical Society dragged through the mud at the heels of the Birmingham Association then I say, "good bye to your prosperity."

Mr. SCHACHT: The fact of my living at the other end of England may require my leaving before the vote is taken; but I thought I should like to face these gentlemen for one moment, because to some extent I have committed myself to certain opinions which I am afraid will not be universally popular; but I have been endeavouring, during the progress of this meeting, to see if I could find some point about which it will be possible to rally all opinions; and I was extremely grateful to Mr. Humpage for the speech he gave us, more especially as you may naturally suppose, because a sentence of his was—pardon me for saying it—an echo of that which I have myself suggested—namely, that as practical men, we should endeavour to do that which we have all admitted and declared is the great purpose of our lives—namely, to defend our trade interests, in which sentiment no one is more warm and cordial than myself, But differences may probably exist amongst us as to the process by which we should reach that end. Now I have ventured as a practical man to suggest that difficulties exist in this matter, and I do not think that there is a candid man present but will admit that such difficulties do exist, from whichever point you approach it. Now, the difficulties seem to me to arise in reconciling contrary duties and contrary Acts of Parliament, and if a process can be arrived at by which those who have power in one direction shall be restrained to exactly those limits which we in conscience admit are proper limits, surely it is worth the attempt. The resolution as it stands is one to charge this Society with the position of antagonism to another body. We are asked to subscribe towards the opposition to another body. That might be all right under certain conditions; but although it has been said that this particular case for which we are asked to give money is a test case, it has only been called so by one side of the question. The advocates of one side of the question have called it a test question, but we have not admitted it to be a test question. [A Member: The judge did]. No, Mr. Day said it was a test question, but it could not be, for the judge declared that the whole decision turned on the facts of the case and not on any points of law. What we want to have determined, I take it, is whether it shall be legal for us to follow counter practice. That is the legal question, and it has never been raised in the Shepperley case. Do, pray, let me ask the gentlemen who are going to vote to consider that point. The Shepperley case is not a test question as regards the object for which we are all striving, and it cannot be taken to be such. If you were to beat the prosecuting company in half a dozen motions of appeal, you still would not touch the legal question. The case as it stands—I believe I am quite right in saying this before our Solicitor—rests entirely on the facts of the case. Sir Henry James was clever enough to point this out. His object was to gain a verdict. He did not care a straw about us; he wanted to get a verdict for his client and he got it on grounds which did not touch the legal question, probably because he knew perfectly well if he attempted to get a verdict on the legal question he would have been defeated. I fear he would. I am very sorry for the fact, but you must look the facts in the face. I wish it to be, if possible, arranged that those who have to put into execution this curiously unfortunate legal power should be made in some way to restrain their action. I believe that which is indicated by Mr. Humpage is the only practical way out of our difficulty. If some opportunity should arise to rescind this wonderful obnoxious clause in the Apothecaries Act, which is practically obsolete, well and good; let us by all manner of means avail ourselves of it; but do not let us make the mistake by supposing there is no other way of accomplishing that which we all desire. I believe there is another way, as I have ventured to indicate to you. Let me ask those who vote on this particular resolution to remember that the Shepperley case is not a test case and cannot be made so. I do hope that will be considered. I am in no way opposed to the mass of gentlemen here other than in the method and the process by which we should obtain the same end. And if I should not have the opportunity of staying to the division I hope you will excuse me for having thus somewhat peremptorily endeavoured to draw a distinction between two different things.

Mr. ATKINS: You are all anxious to divide and to depart, and I will not prevent your enjoying those pleasures. I came with a good intention, such as is often broken, to take no part in the debate, but simply to be badgered at your discretion. I am very much pleased indeed with the fact that we have had a free and full, and, I think, unfettered expression of opinion; and I am disposed to think that this ventilation shaft will do a vast deal of good to you and to us too. It is a breath of fresh air with some degree of oxygen in it, which I have no doubt will circulate our blood a little quicker. But allow me to say, as a personal matter, that I had not long by your favour had a seat at this Council Board, when I felt it my duty to raise this question which has come before you to-day, and I believe it was my privilege to move a resolution to this effect—that whenever a clean, clear, simple case of ordinary counter prescribing came before us, it was our duty as a Council to defend it; and with all good wishes to this Trade Association, which I believe has done a great deal of good work, and for the leading members—of whom I have nothing but the sincerest regard, for many of them I see around me who are very old friends, and will ever be friends of mine—I have yet felt this, gentlemen, that we have delegated, or permitted to be delegated, to another body than our own a work which we ought to have done. I knew it would be fairly easy to bring the house down upon me, but I did not expect to do so so readily. I felt that the views I entertained were to a great extent unpopular, but a man ought to have the courage of his convictions and, even if ninety-nine men are against him, he is not worth the name of an Englishman if he has not the courage to assert his opinions. All I have to say further is this, that, whenever I am convinced from a calm dispassionate examination of any particular case, that that case is a test case, and Mr. Schacht has called our attention to an important point there, whenever a case presents itself to me as a member of the Council, if I continue to be a member, which appears to me just the very case which we want to test this principle I shall support that case being defended.

Mr. BARCLAY: We have not much opportunity of replying to the gentlemen on the Council who frequently address themselves to their constituents. I speak now as a member of the Trade Association as well as of the Pharmaceutical Society. Mr. Sandford in his speech took a line with regard to the Trade Association, and therefore I am justified in replying to him. We have not an opportunity of replying as members of the Trade Association to members of the Council when they make speeches, as they through their organ, the Journal, have full opportunities of doing, and they use them well. The Journal has been used for the purpose of making charges against the Trade Association, which I am very glad to have repeated here to-day, so that an opportunity is given that we may fully reply to them. Mr. Sandford says with regard to Shepperley's case that it was not a fit case for the Council to take up, and in order to show that, he took the opinion of the solicitor on the other side. If Mr. Sandford had taken the opinion or the actual statement of facts which was made by Mr. Shepperley himself, who is a pharmaceutical chemist and a member of this Society, I think he would have arrived at a different conclusion. I have in my hand a copy of a letter which was written to the Pharmaceutical Society by Mr. Shepperley at the time when he was charged by the Apothecaries' Company, and he at that time asked the Society to undertake his defence. This letter states the

actual facts of the case, which are such only as have been borne out by the trial and by the correspondence, and which are really the facts which are now before the courts, so that Mr. Sandford, if he had taken his opinion, not from the solicitor on the other side, but from his own society, would have found the case was very different. If the meeting desires it I will read this letter.

The PRESIDENT: I think it is hardly worth while.

Mr. BARCLAY: Time is getting on, and I do not wish to detain you. I will not take long. [Mr. Barclay accordingly read the letter addressed by Mr. Shepperley to the Secretary of the Society, and also the Secretary's reply.] Now, as to its being a test case, it has been said by Mr. Schacht and Mr. Sandford that it is not a test case, but those who have brought the action ought to know what they want and what they mean. We have been defending the case considering it a test case, and those who brought the action consider it a test case also. I will just give you in a word a copy of a letter written by Mr. Hatherley, the Honorary Secretary of the Nottingham Branch of the Medical Defence Association in the *Lancet* in March last. [Mr. Barclay read the letter.] Mr. Day, the counsel engaged by the Apothecaries' Company,—and I think his opinion ought to have some weight because of his being retained by the Apothecaries' Company as their leading counsel in each case in which they appeared,—says, "We are here not so much to recover a penalty as to try the general question of the right to practise for what are termed simple complaints." Now it is said that the Apothecaries' Company knew nothing about this man Death. I think it has been said that being an informer if they had known that they would not have gone on with the case. But Mr. Day in his speech says that the Apocaries' Company employed him. He takes upon himself the responsibility. Of course it was done by the Medical Defence Association of Nottingham. "It is true in this case Mr. Death was not suffering much, he was employed by the Apothecaries' Company to ascertain the extent to which Mr. Shepperley was practising." There are other things I could bring forward with regard to its being a test case, but I will not detain you. I will now allude to Wiggins's case. A great deal of capital has been made against the Association for defending Wiggins's case, and we have not had an opportunity of replying to that until to-day. I am glad Mr. Sandford has reiterated against us that charge because I can now meet it. The defence of Mr. Wiggins has been supposed to be a serious matter for the interests of the trade. I take it it was not so. The trade did receive considerable advantage from the defence of Mr. Wiggins's case. In the first place, we got a court of justice fully to admit the evidence of the old gentlemen, Mr. Cupiss and Mr. Parsons and those who were in business before 1815, and Mr. Justice Field in his summing up, says: "The only question I am going to ask you upon that is, whether these three cases of Rhodes, Culverwell and Bennett were simple complaints within the custom so proved or alleged?" That is a very important admission, I think, for a judge to make. He admitted the evidence, which was of the greatest importance, which we, as chemists and druggists, were afraid would not be admitted into the higher courts. He then goes on to say: "Whether or no you come to the conclusion that those diseases or complaints under which the children were so suffering were such complaints as were within the practice detailed by Mr. Cupiss," etc. Then he states the evidence which Mr. Cupiss gave, which ends with, "I never dealt with any case that I thought dangerous." But the still greater importance of the case of Wiggins was in the decision, where the foreman of the jury, in giving the result of the deliberations of the jury, says: "My Lord, we find that the defendant acted as an apothecary in taking cases that were dangerous." I take it that was a very important verdict indeed for chemists and druggists throughout this country, because if that verdict was accepted, and it was the verdict of the jury, then they could assume from that that chemists and druggists might prescribe safely for simple cases, which is all we contended for. My friend, Mr. Urwick, reminds me that the Chemists and Druggists' Association, in taking up both Shepperley's case and Wiggins's case, took every precaution in trying to obtain information to guide it as to whether the cases they were charged with were such as ought to be defended. We have a resolution on our books that no case other than that of simple counter practice shall be defended. We went into Wiggins's case and did all we could to get information. We had Mr. Wiggins down from Birmingham and cross-examined him, and when we defended him, so far as we knew, those cases were simple cases. We took before a Judge in Chambers the great Apothecaries' Company, to try to compel them to give us the evidence of what he was charged with, but they held their mouths shut. They who now pretend through Mr. Upton to be so anxious to conciliate the trade. What did they do when we asked them to let us know what this man was charged with? Did they openly say he was charged with certain cases of visiting? No. We tried to compel them to give particulars and brought them before a judge, but the result was we had to fight Wiggins's case in the dark. They not only took this course, a very wrong course, because it is not English—it may be legal, but it is very un-English,—but they also in prosecuting Wiggins issued a writ for £40, not as they had done hitherto in County Courts cases, but brought him straight before the Exchequer Court on a writ for £40. That case was brought before this Society; we did not know what inquiries they had made about it; it may be they could get information we could not, but certainly the Council would not defend Wiggins. They knew nothing more about it, I apprehend, than we did, whether it was good or not, but if that had been settled in the Court of Exchequer without being defended, I take it it would have been a serious matter for the trade generally. Now as to that important charge against the Association with regard to the Duke of Richmond's Bill. That has been reiterated time after time, and I am very thankful that Mr. Sandford has repeated it now. The charge is that the Trade Association through its most injudicious action, and I do not know what other epithets were applied to it, but there were many others, by the action of the Trade Association a very important clause was put into the Bill, which previously had been omitted. In the schedule to the Bill which was first introduced by the Duke of Richmond there was a repeal of the 20th section of the Apothecaries Act, which was the penal clause. In the meantime Wiggins's case came on for hearing, and it was said that through Wiggins's case being defended by the Trade Association the result was that the Duke of Richmond re-introduced that clause, and so that Association was mischievous in its action in having brought about such a state of affairs, which would not have happened had Wiggins's case not been heard. Therefore, Wiggins's case was a very serious one for the trade, because such a terrible result came on the trade generally through its defence. Now what is the state of the case? Let me read it to you. Mr. Sandford was one of the gentlemen present. I am sorry to say that this charge has been made in the Council and in the editorial columns of the Journal, and not only then but also in the present number of the Journal it is repeated. Now just let me return to the report of the deputation which waited on the Duke. "The Duke, who was accompanied by the parliamentary draftsman and another gentleman, entered very fully and carefully into the points urged, and repeated an opinion that the public had a right to apply to whom they liked for advice." That is after Wiggins's case. I am glad he was not frightened. "He stated that words in the first draft of the Bill went further than was intended, that the clause was in fact inadvertently drawn, and in this he was confirmed by the draftsman." Now this statement I am glad to say was repeated by Mr. Hampson at the Council meeting that day and

I should like to see what the members of the Council that day, who held that Wiggins's case had caused this mischief, would have replied to Mr. Hampson and those who agreed with him, to have refuted the charges, because this is Mr. Hampson's speech at the very time when the report of the deputation was presented by the Council. Mr. Hampson said when the Bill was introduced into the House of Lords it was stated that the 5th schedule, repealing the 20th clause of the Apothecaries Act, had been introduced by mistake, and it was not removed in consequence of the opposition of any other body, it was simply an error on the part of parliamentary draftsman. Then the President kindly suggested a word that it was an inadvertence on the part of the draftsman and that its removal did not arise from our opposition or that of any other body. That is the reply to the charge with regard to Wiggins's case. I have showed that Wiggins's case was not a bad case for the trade. It brought about the admission by Mr. Justice Field of important evidence, and also obtained a ruling from him that a jury had to look at these cases as to whether they were dangerous or whether they were parallel cases to those spoken of in the evidence of the old men; also that the foreman of the jury will give a verdict that the cases being of a dangerous character the decision should be against the defendant. I have also shown that the introduction of this clause was not through the action of Wiggins's case at all, but through inadvertence. Mr. Sandford spoke about representation at the Council. I may repeat what Mr. Radley has said, that some voting papers have been sent out by Mr. Radley's instruction, and 1449 have been received in favour of a grant by the Society towards the Trade Association, and 84 negatives have been received. Now as to the Adulteration Act, no one said that the Pharmaceutical Society had done nothing in the Adulteration Act. No one made such a charge. I am sure that every one here fully agrees that the Pharmaceutical Society has done great services. We do not wish to blame it. I speak for myself, and I am sure I speak for many here who have perhaps been finding fault with the Council on some matters, that we do not wish to find fault with the Council for neglecting their duties generally, and on the Adulteration Act the Council has done its duty. The gentlemen who spoke simply said that the origin of the Trade Association was to put down the wrong action of incompetent analysts and other matters, and went on in that way, but it did not make a charge against the Society for having neglected its duty in that respect. I take it the Trade Association has a great deal of work under the Adulteration Act and similar things of that kind which this Society could not do if every gentleman on the Council were of the same opinion as myself with regard to counter prescribing and defending legitimate counter practice. Therefore I sympathize with Mr. Sandford in his wish to show that the Council has not neglected the important duty of looking after Acts of Parliament which are introduced. It is said that this case is of no moment, that the Apothecaries' Company have honourably carried out their agreement by the letter which Mr. Upton wrote. But I think it it may be known to the Council, it certainly is known to some of us, that throughout the country there are cases now pending in the law courts. Talk about not being harassed! We have one in Birmingham. There is a picture "Waiting for the Verdict," and there is a Birmingham chemist now waiting for the verdict in Shepperley's case. He has been before the law courts, and his case is pending the result of the Shepperley action. In Cornwall there is a case, there are cases in Sunderland and at Bradford, and many other chemists have paid penalties rather than go into court. I cannot regret that this meeting has been called at this time. We have given a very full expression of opinion, and it did seem absolutely necessary. To my mind the action of the Council in this important juncture is a very serious matter indeed. Talk about our jeopardizing the trade through our action in Wiggins's case! I take it the Council is injuring the trade by its inaction just now, and by its apparent sympathy with the Apothecaries' Company, and by the leaders which have been quoted by the medical journals out of the *Pharmaceutical Journal*, and by their turning the cold shoulder to Mr. Shepperley, who is a member of this Society, when he is oppressed by a big company like the Apothecaries' Company; for whatever the views of the Council may have been as to the origin of the case, they cannot shut their eyes now to the fact that the case is of the very simplest possible nature, and I take it that the Pharmaceutical Society by not assisting at this moment are doing all they can to damage the interests of the Society and the trade. I am anxious that they should to-day understand most thoroughly the views which their constituents hold on this great question. They have been fully expressed to-day not only verbally but we have had a very large vote to show them, and I am anxious that those gentlemen who are on the Council who have voted hitherto the other way will take this matter to heart and will take up the case if it goes further, and will put themselves in the position of Mr. Shepperley as far as they possibly can and defend him, and so, as some one has said, gain the honour which such a defence would be in the eyes of the trade. I am afraid if this meeting had not been held, and nothing is done by the Society, that great numbers of our members will leave it. I am very much afraid of that, and neither Mr. Sandford nor any one else here nor any gentlemen on the Council has the interest of this Society more at heart than I have; and I am anxious by my presence here to-day and by the action I am taking in this matter to do all I can to make the Society the object of the sympathy, the love, and the admiration of the trade; and that it may increase in utility and in power through the result of this meeting.

Mr. Broad: Mr. President, the question at issue is not exactly Shepperley's case, or any question in particular, but whether the Council of the Pharmaceutical Society has any right to grant a sum of money for the defence of its members. It appears by the legal opinion taken that it has not. Has the Council then any business to devote money to defend itself against the interests of the trade? because it has taken, not the advice of the Solicitor, but the advice of three counsel. Now I maintain that if it can expend money in that way to defend itself against the trade, why cannot it expend money to defend the interests of the trade? If you can lay out money to defend yourselves, why cannot you lay out money to defend us? I am not an old man, as you can see. I am not just going out of business, and therefore do not care anything about it; I am a young man that is coming in and want to earn an honest livelihood. I do not want to infringe on medical men, or anything of the sort; but I want to carry on the legitimate trade of a chemist and druggist and I want the Society to support me in that. The funds of this Society are derived from its members, and without these subscriptions the Society must come to nothing. If the Council will not support us we will not support the Council. Public opinion is running high in favour of chemists just doing ordinary prescribing for simple ailments just now, and it is our time. The waters are on the flood for us to go in and get whatever we want to maintain the interests of our trade. We are a trading body, not a scientific body, and if our Council members argue that we are scientific I would remind them at one of their scientific meetings they had tooth brushes on the table to be shown as curiosities.

Mr. Sandford rose to speak but there was too much noise to allow of his being heard for some time. He then said:—

I will read an extract if you please from your own account of Wiggins's trial. Mr. Justice Field said, "I think it might be considered by chemists and druggists whether they should not communicate with the Apothe-

caries' Company and see whether something might be done. I cannot help thinking there might be some modification." Listen to what follows. Mr. Howard says, "My Lord, I think I may say, on the authority of my client, who I believe attended a deputation to the Duke of Richmond a day or two ago, this question has been raised, and I believe his Grace has taken it into his considcration. I am not clear that there is not a proposal to transfer to the Medical Act the penalty which at present is to be found within the four corners of the Apothecaries Act. Probably that will have a beneficial effect." The intention of the Legislature would seem probably to remain the same. I take that on your own authority. I think I am entitled to attribute some little authority to that.

Mr. BARCLAY: I would rather take the words of the Duke of Richmond himself, who knows all about what he is doing.

The PRESIDENT: I must ask Mr. Radley if he wishes to reply.

Mr. RADLEY: I will not take up the time of the meeting with any remarks.

The PRESIDENT: I have now to put the resolution. I should have liked to have said a few words myself. I would only say a word in reply to Mr. Barclay. That letter from Mr. Shepperley which Mr. Barclay read has been read to the Committee.

Mr. HAMPSON: Excuse me, but if the debate is closed, I think it is inadvisable after the full discussion to enter into the question again. If you do so, I shall also feel disposed to go into the question.

The PRESIDENT: Then I will say no more, but will at once proceed to put the question. I think Mr. Hampson is in perfectly good order, and that I should have been out of order.

The motion was then put.

The PRESIDENT: The resolution is carried by a very large majority. It is my duty to remind you that according to counsel's opinion, it can have no legal binding effect.

Mr. URWICK: I would propose a vote of thanks for the very able manner in which Mr. Williams has conducted the meeting.

The motion was seconded, and carried unanimously.

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, January 1, 1879.

Present—Charles R. C. Tichborne, LL.D., Ph. D., President; Dr. Aquilla Smith, Vice-President; Dr. Collins; Messrs. Bennett (Kingstown), Boileau, Brunker, Hayes, Hodgson, Oldham, Payne (Belfast), Simpson.

The minutes of the meeting of Council held on December 4 were read and signed.

Some letters respecting alleged infringements of the Pharmacy Act were referred to the Law Committee.

Letters were read from Mr. Andrew McNaught, pharmaceutical chemist, of Belfast.

Read a letter from Mr. John Mortimer, of Londonderry, inquiring whether a person who has passed the preliminary examination can open a shop as chemist and druggist in any part of Ireland.

The Registrar was directed to state in reply that passing the Preliminary examination confers no privilege except entitling those so passed to present themselves for the final examination.

Read a letter from Mr. James A. Haslett, licentiate of the Pharmaceutical Society of Ireland, of Christchurch, New Zealand, informing the Council of the proposed formation of a Pharmaceutical Society of New Zealand, on the plan of those existing in Great Britain and Ireland; and enclosing a copy of the proposed laws and constitution of the new Society. Mr. Haslett referred to the necessity of seeking the recognition of the licence of the Pharmaceutical Society of Ireland by the New Zealand Society as a qualification for membership. He also asked for copies of the curriculum and rules of both the home Societies.

The Registrar was instructed as to the reply to make to the above letter, informing Mr. Haslett that the licence of this Society is recognized by the Pharmacy Board of Victoria; and also to send him a copy of the calendar of the Society.

The President informed the meeting that he had written to the Editors of the *Pharmaceutical Journal* and the *Chemist and Druggist* respecting the supply of copies of those journals to members of this Society; and read the replies which he had received. The Registrar was directed to write to the Editor of the *Pharmaceutical Journal*, requesting him to bring before the Council of his Society the request of this Council that copies of the Pharmaceutical Society's Journal may be supplied to the Pharmaceutical Society of Ireland, at a reduced price, for presentation to their members.

The Committee appointed to consider the subject of an annual dinner to the members of the Society, presented their report.

Proposed by Mr. Oldham, seconded by Mr. Payne, and resolved, that the report of the Dinner Committee be adopted; and that the Annual Dinner be held in April in each year.

The Education Committee presented their report, which concluded with the following resolutions:—

1. "That, considering the financial position of this Society, the Committee is of opinion that it would not be desirable for the Council to undertake the responsibility of a School of Pharmacy at present, however desirable that course might be at a future time."

2. "That this Committee is of opinion, after having read the letter from the Society's Examiner in Chemistry, that it would be most desirable that a certificate of having attended a practical course in chemistry be required from candidates presenting themselves for their Pharmaceutical Examination; and that certificates be received from the following schools only, viz.:—Trinity College, Carmichael College, Royal College of Surgeons, and the Queen's Colleges of Belfast, Cork, and Galway."

On the motion of Mr. Simpson, seconded by Mr. Hodgson, the report was amended by adding to the second of the above resolutions, at end—"The Royal College of Science, and such other schools as shall be approved by the Council."

The report was then adopted.

Mr. Holmes being absent, two motions, of which he had given notice, lapsed.

The following Pharmaceutical Chemist was elected a member—

George Ferguson, 1, Adelaide Place, Dublin.

Correspondence.

AN EXPLANATION FROM THE SECRETARY.

Sir,—In the report of the Special General Meeting, held yesterday, it will probably be noticed that I questioned the right of Mr. Provost to take part in the proceedings of the meeting on the ground that he was not a member of the Society. His name, however, appearing in the list of members published in the Calendar in January last, I withdrew the objection. Subsequently, however, I ascertained that I had, on June 26th last, received from Mr. Provost a formal resignation of his membership as enclosed.* At the time of his addressing the meeting that had not been withdrawn. ELIAS BREMRIDGE, *Secretary*.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Mead, Howard, Napier, Bransom, Frazer, Wilkes, Morrison, Downe and Blunt, Twemlow, Challice, Tilden, Parry, Macintosh, Baildon, Apprentice, Bolus, Kenbaan, Pharmaceutical Student, H., R. B., J. G., F. E. B., W., M. P. S.

* See foot note to report on p. 578.

ELECTRICITY AS A SOURCE OF LIGHT.*

BY PROFESSOR REDWOOD.

Thirty years ago I lectured in this institution on "Electricity as a Source of Light." The subject was then occupying public attention in very much the same way as it is now. It was known that by means of electricity a brilliant light could be produced, which Sir Humphrey Davy and Faraday had publicly demonstrated, and which the improvements effected in galvanic batteries by Daniel, Grove, and Bunsen, had rendered comparatively easy of attainment.

The dazzling spark between charcoal points, and the more subdued light of incandescent platinum, were familiar illustrations at the lecture table, and such effects, so easily produced by dissolving a few bits of metal in acid, could hardly have failed to draw attention to this wonderful agent, electricity, as a source from which a light of great intensity and purity could be obtained, which it was hoped might be made available for many if not most of the purposes for which artificial light is required.

Numerous improvements had previously been made in the systems of artificial lighting. We had progressed from rush lights to snuffed lights, from dips to moulds, from fats to fatty acids, and then from all these and many forms of improved lamps, a great stride had been made in the discovery of gas lighting.

But still we had not quite attained to perfection. The light was imperfect and the effects of all these systems of lighting were in one way or another objectionable. There was too much heat with the light. Then the vital element of the atmosphere was consumed in producing the light, and poisonous gases were substituted, including sulphur acids which corroded and destroyed the goods in our shops and the furniture of our houses. In these respects there was ample room for improvement, and this it was hoped was attainable through the agency of electricity.

Science had been making rapid strides, and especially the department of it which includes electricity. Galvanic electricity, although comparatively a modern discovery, had been developed with amazing rapidity, and the results of the researches of Faraday and others had then attained to the zenith of their fame.

This kind of electricity, the electricity of the galvanic battery, which is distinguished as current or dynamic electricity, is the only sort of electricity available for the production of a continuous light. It may, however, be produced by other means than that of a galvanic battery. Its distinguishing features are, the continuity of its discharge, the largeness of the quantity of the force that can be practically produced, and the comparative lowness or feebleness of the intensity of the force.

The continuity of the discharge gives it the character of a current, and serves to distinguish it from frictional or machine electricity, which is called statical electricity or electricity in equilibrium, just as a current of water is distinguished from a suspended drop of water, the latter being in equilibrium until by a single impulse it falls and is discharged.

The largeness of the quantity of the force that may be thus produced also serves to distinguish it from frictional electricity, the quantity of which, as produced by any practicable method, is infinitely small as compared with the electricity of the battery.

And lastly the comparative lowness or feebleness of the intensity of the force forms an important distinguishing feature in this kind of electricity, as evidenced by the fact that the electricity of a powerful battery will not pass through a space the two-thousandth part of an inch in length if filled with a non-conducting medium such as air, when the electrodes or poles are metallic.

Now all these qualities which are possessed by dynamical electricity contribute to adapt it for the purpose of electric lighting. We want a continuous current of a large quantity of electricity of comparatively low intensity.

The galvanic battery supplies this want, but it demands rather a high price for it, not only in regard to the materials consumed, but also in regard to the labour and risk of accident involved in keeping up the motive power.

The source from which this power is derived is practically the same as that from which the light of a candle or lamp, whether of oil or gas, is derived. In either case the force originates in chemical action. In one case we are burning up the metal zinc, and in the other we are burning the carbon and hydrogen of the combustible substance used. There is this difference between the two cases, however, that in the case of ordinary combustion for the production of light, the power developed by the chemical action which occurs is instantly and locally expended in the production of the new force,—the light which results,—that is to say, the effects are all produced in one and the same place; whereas in producing light by electricity the development of the new force may be transferred to, and applied at, a considerable distance from the point at which the chemical action occurs.

This is clearly so with reference to the galvanic battery, by means of which electric lighting was originally effected, and we shall see presently that it is so also with reference to the more modern method of producing currents of electricity for a similar purpose, in which we substitute the combustion of coals for that of zinc, and the application of steam power for battery power.

Among the early difficulties experienced in making electricity available as a source of light, the cost of battery power no doubt occupied a prominent position, but it was known then as it is now, that current electricity could be produced without employing galvanic batteries. Magneto-electric machines had been constructed forty years ago, and the principle of their action was well understood. I have one here that was in my possession more than thirty years ago, and although this Saxton's machine is little more than a toy when compared with those now constructed, yet it is capable of producing the electric light on a small scale without the expenditure of any other force than that which is required for mechanically rotating the armature of a magnet in front of the poles of the magnet.

Faraday, about the year 1831, had shown that if a conductor of electricity is moved so as to cut the lines of magnetic force of a magnet, a current of electricity will pass through the conductor. This is the fundamental principle, or at least one, and the most important, principle involved in the construction of these machines. In 1832 Pixii made the first

* Substance of a Lecture delivered before the Pharmaceutical Society of Great Britain, Wednesday, January 8, 1879.

practical application of the principle in the construction of a magneto-electric machine, which was improved by Saxton in 1833, and here we have Saxton's machine, which was subsequently improved by Clarke in 1836. Since then we have had many other improvements.

Now those were revolutionary days, and the great dynamo-electrical revolution had then commenced which has since resulted in the development of the system now so effectively applied for the production of artificial light by electricity.

Thirty years ago in discussing the subject of electric lighting we were speculating as to the practicability of improving galvanic batteries for the cheaper production of electricity, but nothing has since been done in that direction. We have no better batteries now than those we were then using for this purpose, and we have ceased to look to galvanic batteries for the large supply of electricity required for the electric light.

Even at that period, however, and with the means then available, there were men—practical and scientific men—who not only believed in the feasibility of making the electric light applicable for many if not most of the purposes for which we require artificial light, but who considered that it could be obtained at no greater cost than that usually incurred in producing by other means an equal amount of light of inferior quality. Many men were then as now enthusiastic on the subject. Patents were taken out and companies formed for introducing the electric light as a substitute for gas light. In fact there was just the same sort of excitement on the subject, although not the same amount of it, then as exists at the present time.

It was under such circumstances, and for the purpose of showing what was being done or proposed to be done, that I undertook, in the early part of 1849, to explain and illustrate the subject as far as means at my command admitted. Much of the apparatus I have here now was what I used on that occasion, and I may refer the younger portion of the audience to the 8th volume of the first series of the *Pharmaceutical Journal* for a report of the brief exposition then given of the fundamental principles involved in the application of electricity as a source of light.

And now after a lapse of thirty years we meet here again for a similar purpose to that which brought us together before, and the first question that presents itself is,

"What has been done during those thirty years, and how comes it that we are here discussing the subject of electric light as if it were a new subject?"

With reference to the first part of this question it may be said that after many trials of many forms of apparatus, some of which were identical with some of those now again patented, it was found impracticable to accomplish what was required. None of the proposed forms of apparatus could be relied upon for supplying a constant light without continued personal attention, and no method was known by which the current could be broken up so as to be distributed to an indefinite and varying number of lights. From a single motive power a single light of great intensity could be obtained, but the intensity of the light, while it adapted it for some purposes, rendered it unsuitable for general use. Faraday, at a meeting of the British Association in 1849, in a discussion on the electric light, remarked on the inapplicability of it for purposes of general illumination, stating that objects not directly illuminated appeared dark when the eye was embarrassed by the intensity of the light. The result was that it came to be considered a very suitable light for lighthouses, but not for the ordinary purposes of house and street lighting. And even for use in lighthouses the galvanic battery could not be relied upon for supplying a constant and sufficient current without incurring undue expense.

Then with reference to the latter part of the question it may be said the subject of electric lighting has two phases, one relating to the feasibility of applying for the proposed purpose the electricity developed by galvanic batteries, and the other relating to the application for the same purpose of the electricity produced by mechanical action; that in regard to the first part of the subject, the question was answered in the negative thirty years ago, but that with regard to the second, the question remains to be answered, and that thirty years' experience, coupled with practical demonstration of results, seem to justify the anticipation of at least a more favourable answer than would have been looked for some years ago.

It is therefore to the use of the magneto-electric machine, as the source of dynamic electricity, that we are to look, if at all, for the successful introduction of the electric light.

It is well known that for many years past light thus produced has been successfully applied to lighthouses, and there are many persons who, influenced by this and the numerous other demonstrations of the light that have been recently made, are ready to conclude that all material difficulties in the way of its general use have been overcome, and that we may anticipate its speedy introduction not only into our streets but our houses. Others, however, being less easily satisfied, desire to know what new law in natural philosophy has been discovered to render that practicable now, which was pronounced to be impracticable thirty years ago.

With reference to this question I may say at once that I am not aware of any such discovery having been made; but of course I admit, what indeed is very evident, that the means of applying electricity for the production of light have been greatly extended and improved, and as a result of this extension the effects now produced, and the manner in which they have been recently brought before the public, are calculated to give the impression of their being at least partly founded upon some newly discovered principle.

If I were briefly and broadly to endeavour to represent what the general nature of the improvements and the manner of their introduction had been, I would say that they had been effected by the power and through the means that have, at nearly the same time, effected one of the greatest revolutions on record, which commenced in this country and has rapidly spread throughout the civilized world,—a revolution, the effective agents of which are characteristic elements of our commercial prosperity, namely, iron, coal, and engineering skill. To these agents we are indebted alike for railroads, steamboats, and electric lighting.

We chemists were messing over our fuming acid pots, and wasting much valuable metal, when a great potentate, King Coal, stepped in, with a band of engineers and mechanicians, and fairly pushed us from our stools.

Electricity, in this application of it, has become a result of mechanical engineering. The chemical action with which we commenced, consisting in the combustion of zinc in strong acid, has been replaced by the combustion of coal and the modern motive power steam.

We thus find coal brought face to face with itself in another dress, as seen on the Thames Embankment and Holborn Viaduct. Let us hope that we shall not be tempted to exhaust our coal fields in an unprofitable contention between gas and electricity, or a useless attempt to violate the laws of nature by converting night into day.

When railroads were first introduced, it was predicted that horses would cease to be required, and that they would probably become wild animals of our woods; and now that the electric light has become a realized fact in our streets, shops, and factories, equally rash anticipations are formed of the extent to which this new light is to supersede the use of gas. The actual result will probably accord in the latter case with what it has proved to be in the former. Both will find their appropriate applications, the one supplying, as at present, sufficient light for ordinary purposes, and the other affording a more intense light for special applications. I very much doubt whether we do not, even now, use more artificial light than is good for us, which, to a great extent, arises from what has been and will continue to be a strong inducement to the use of gas, that as compared with the electric light it is what the horse, as a means of locomotion, is in comparison with railroads. It is docile and accommodating. We can provide and store it, and use it as required. From the storehouse or stable we can lead out a supply for an army or for an individual, and we can break up the supply, whatever it may be, into an indefinite number of branches of various dimensions. We can take it at a walk, a trot, or a gallop, at pleasure, turn it here or turn it there with the greatest ease, and provide for every requirement as it arises.

On the other hand, the intensity of the electric light may be compared to the speed of the railway train, while the ease and luxury with which locomotion is effected by the latter may be compared to the purity of the new light, and this intensity and purity cannot fail to be appreciated where such light is required.

It is quite possible, and I think very probable, that large fixed electric lights, where one, or at most half-a-dozen—but the fewer the better—are fed from one common current of electricity, may be provided at less cost than that at which an equal amount of light could be otherwise produced.

There is no doubt, therefore, that the electric light has an important future before it, and we are all anxious, as far as we can, to form a tolerably correct judgment as to what that future will be, and what the means are by which it will be realized.

In one respect no advancement has taken place since the early days of electric lighting, and in this direction there is still no prospect of advancement. The light is now, as it always has been, produced by the incandescence of carbon. Wood charcoal was first used; but common wood charcoal wears away too quickly,—it was therefore replaced by hard close-grained box-wood charcoal, which gives an excellent light; but even this is soon dissipated, and it has been found that the hard carbon deposited in gas retorts is much more lasting, although it does not give an equally white and good light. Gas carbon is still used, but not generally now in the state in which it is obtained from the gas works. In that state it contains a good deal of mineral matter which injures the quality of the light, and, therefore, processes have been adopted for preparing it for use.

The best carbons are principally made in France, where there are two makers, Carré and Gaudoin, whose carbons are largely used.

Carré is said to use coke or gas carbon ground to a fine powder and mixed with lamp-black, sugar, and gum. These are made into a paste with water, compressed into the form of sticks, exposed to a red heat, afterwards soaked in a solution of sugar, and heated to redness again.

Gaudoin's process is said to consist in first getting a pure carbon from tar, resin, and other similar substances, and making this into sticks by compression.

Similar manufactures have recently been started in this country.

Now, carbon, in either of the states referred to, possesses three important properties which adapt it for the purpose of producing the electric light. It is a conductor of electricity; its particles are held together by a comparatively weak cohesive force, and these particles, when intensely heated, emit a white light.

But although a conductor of electricity, carbon is not a good conductor, its conducting power being about a hundred times less than that of copper; it therefore offers resistance to the free passage of the current of electricity.

When, under the combined influence of intense heat and the electric current, the cohesive force of the particles is overcome, they fly apart, and pass with the current from one pole to the other. The highly incandescent particles, both those of the solid carbon points and those which have been volatilized and are passing over in the flame, become so many centres from which light is radiated.

The volatilized particles of carbon are the conductors of the electric current, without which the current would not pass, on account of the lowness of its tension.

The rarefaction of the surrounding air, or possibly merely the heat of the flame itself, when the poles (in a horizontal position) are separated from each other to a distance of half an inch or so, causes the intervening light to assume the form of an arch. This, which is called the electric arc, was first produced by Sir Humphrey Davy in 1813. The two solid carbon terminals were called electrodes by Faraday, this term signifying the way by which the electricity passes in or out. They are now more commonly called poles. The one at which the electricity passes out is called the positive pole, and is distinguished by the mark or symbol , and the other is called the negative pole, and is distinguished by the symbol —.

While the light is being produced, particles of carbon are constantly passing from the positive to the negative pole; the one is therefore wasting, and the other growing. This at least would be the case if there were no oxygen present, as, for instance, if the carbons were enclosed, as they might be, in a glass globe from hich the air was removed, or some gas free from oxygen were contained in it. But if the carbons are surrounded with atmospheric air or oxygen, they will both be consumed in the usual way, by combustion. The positive pole, however

will waste more quickly than the negative, partly because some of its particles will have gone over to the negative pole, and partly because the positive is always hotter than the negative pole.

The electric current cannot pass from one pole to the other, when they are separated, without having a continuous line of volatilized particles of carbon to conduct the force, and there must be a discharge of the electricity to produce the heat by which this volatilization is effected. The electricity we use, being in a low state of tension, cannot spring from one pole to another through non-conducting air. It is therefore necessary to bring the poles together at starting, so as to heat the few particles that thus are brought into contact to the temperature required for their volatilization, and then we can separate them to a certain extent to produce the light. The distance to which they can be separated will depend upon the tension of the electric force, and if from any cause the current should be broken, the poles must be brought together again to re-establish it.

Now one of the difficulties originally experienced was that of always keeping the poles at the proper distance from each other, and it has been to meet this difficulty that the various forms of lamp I have to bring under your notice have been invented.

The apparatus I have been using was introduced many years ago by Warren De la Rue, and is a very convenient one for the lecture table, but it does not possess any self-adjusting power, the position of the carbons being regulated by the hand of the operator.

In 1846, '47, and '48, patents were taken out by Mr. Staite, in which he describes several forms of apparatus to be used for regulating the position of the carbons. Two of his regulators are figured in drawings I have here, which are, in fact, the same that I used thirty years ago. It will be observed that one of these, in which the carbons are placed vertically one over the other, is essentially the same in principle as the Duboscq lamp which we are accustomed to use at our lectures, and also the Serrin, which, I believe, was the first publicly used for the production of the electric light in London, being that, or a modification of it, with which the lights are produced at the Gaiety Theatre.

In lamps of this construction the position of the carbons is regulated partly by clockwork and partly by the force of magnetism developed by the electric current. Several different forms have been adopted by different makers, some more simple than others, but they all consist of somewhat complicated mechanism.

Attempts have been made, originally in Mr. Staite's time, and again more recently, to simplify the apparatus. Here we have one of Mr. Staite's earliest productions, patented by him in 1846, which was a near approach to the Jablochkoff's candle. It consists of two carbon rods, partly enclosed in brass tubes, while the exposed points rest on a plaster of paris cylinder, against which they are pressed by springs contained within the brass tubes. The two points are thus kept constantly in the same relative positions notwithstanding the wasting caused by volatilization and combustion of the carbons.

Rapieff has a very similar arrangement to this, only that the position of the carbon points is reversed.

The more complex, and, I believe, more successful apparatus of Rapieff, which is used for lighting the compositors' rooms in the printing establishment of the *Times* newspaper, is a double arrangement of a somewhat similar description, in which there are two positive and two negative poles placed vertically, and kept in position by a weight and a magnet. One of the advantages claimed for this apparatus is that the carbons can be easily replaced, one at a time, without extinguishing the light.

Now these are all modifications of forms of apparatus that were among the earliest of those introduced thirty years ago. It must be recollected that at that time the electricity used was that of the battery, and the current, therefore, was all in one direction. It was no easy matter to get the required supply of electricity from that source, and practically it was impossible to maintain a uniform supply for any length of time. The fuming acid pots became exhausted. The force of the current slackened, and unless the position of the carbons was quickly readjusted, the light became extinguished, and the process of re-lighting had to be gone through. In fact, each light required an attendant to keep it in order.

Under such circumstances, after the lapse of a few years, during which the zeal of inventors wore itself out, by common consent the electric light was relegated to the use of lighthouses, where magneto-electric machines were brought into use for supplying the electricity.

A new era had now commenced in the history of electric lighting. In 1858 the system was first introduced at the South Foreland Lighthouse, and subsequently at Dungeness, Cape Grisnez, and elsewhere. In those cases the electric current was produced by means of large, ponderous magneto-electric machines, which, although required for supplying only a single light each, were giants in comparison with the dwarfish, insignificant-looking machines now employed for supplying all the lights at the Thames Embankment or Holborn Viaduct.

The merit of introducing this system in lighthouses is due to Mr. Frederick H. Holmes, who may be said to have thus laid the foundation of all that has been effectively done in the way of applying the electric light to any great and useful purpose.

It is a remarkable fact that the apparatus first employed by Mr. Holmes for the electric light had been constructed for a very different purpose, namely, that of producing gas from water, for which a company was formed in Paris in 1853. In connection with that undertaking, large magneto-electric machines were employed for decomposing the water and producing hydrogen gas. But the company came to nothing, and Mr. Holmes, who was employed in winding up the concern, conceived the idea of turning the machines to account for the production of light in another way, and applying it in lighthouses. The idea was at first ridiculed, for although magneto-electric machines were then frequently used for experimental purposes, no one had thought of making them available for the production of currents of electricity far greater, more constant and uniform than any previously produced. Mr. Holmes, however, demonstrated the feasibility of effecting his object, and having reconstructed and improved the machines, produced with them a light which, for lighthouse purposes, is certainly unequalled.

And now we arrive at another era. In 1876 Paul Jablochkoff, a Russian officer, invented a new method of producing the electric light by means of what he called his candle. This invention has attracted a

vast deal of attention, and excited great interest. The Jablochkoff candle, as it is commonly called, has been more extensively used for public lighting than any other form of electrical apparatus, and I believe it was this principally that led to the construction of the very beautiful, compact, compendious, and yet powerful machines, called dynamo-electrical machines, that are now used for the production of current electricity. The candle has the great recommendation of extreme simplicity. It consists of two thin rods of carbon placed side by side, with an intervening layer of plaster of paris. The carbon rods are connected at the top by a little bridge of carbon, through which the electric current, at starting, passes. This being very slight, becomes incandescent, and soon burns away when the electric arc is produced. The plaster of paris is dissipated in the flame, which, if the current be maintained without flagging, and the carbon poles do not alter their relative positions, will continue to pass across from one of the carbon rods to the other. The carbon terminals, however, would soon alter their relative positions if the current were always passing in one direction, because the positive pole would waste more quickly than the negative, but this difficulty is easily met by making the current an alternating one. With a galvanic battery of course the current always passes in one direction, and as I am using a battery I am unable effectively to keep up the light with this candle. In the magneto-electric machine the current of electricity, which is produced by the rotation of the armature in front of the poles of a magnet, is constantly reversing its direction, and this is precisely what is required for the Jablochkoff candle. It seemed to be the one thing wanting to make the candle capable of maintaining its action without further attention as long as the carbons will last, which is rather more than an hour.

The principal objection to the Jablochkoff candle is that if, from any cause, the light should become extinguished, there is no ready method by which the candle can be relighted. You must either go up to the lamp, take the globe off, and re-establish the current by means of a new bridge, or else you must turn the current to another candle (of which there are several in each lamp) by means of a switch provided for the purpose.

I understand that at the Holborn Viaduct they are sometimes left in darkness for several minutes (on one occasion for a quarter of an hour) while extinguished lamps are being relighted. There is an ingenious contrivance, represented on the diagram, by which, when a candle has burnt down to its socket, the current is automatically transferred to a neighbouring candle.

With the beautiful dynamo-electric machines which are now produced by Gramme, Siemens, Ladd, and others, there is no difficulty in getting any amount of either direct or alternating currents of electricity, and the only questions in connection with electric lighting that have to be solved, are first, the cost of thus producing the electricity; secondly, the best form of regulator for giving the light; and thirdly, the extent to which a current can be broken up and made economically available for many lights.

We have no data as yet to enable us to solve the first of these questions, and I shall not this evening attempt to deal much with the last, but in connection with the Jablochkoff candle, I may remark that in the public displays that are made of it in different parts of London, the largest number of lights, as far as have I been able to ascertain, that are supplied from one cable wire, is five. I have no doubt that a larger number could be supplied, but I presume not economically. This is a question we shall have to go into more fully at our next meeting. I only allude to it here incidentally.

In the Jablochkoff candle all complicated mechanism is done away with; that is a strong point in its favour. But it is short-lived and has no recuperative power, which are its drawbacks.

The Wallace-Farmer and the Werdermann regulators are also free from any complicated mechanism, for the former has only a self-acting electro-magnet, and the latter a weight, by which the poles are kept in position. These regulators have not yet made their appearance before the general public, but they are candidates for public favour, and are dressing their plumes in preparation for an early display of their powers.

The Wallace-Farmer regulator consists of two carbon plates, each about half an inch thick, nine inches long, and three inches broad. They are placed one over the other in a grooved frame with two of the longer thin edges of the plates brought vertically into contact, or nearly so. The lower plate is fixed, while the upper one, which forms the positive pole, slides up and down vertically in the frame, being supported when in action by an electro-magnet, which keeps it at a short distance from the negative plate. The electric discharge takes place at the point at which the surfaces happen to come nearest together, and as these wear away the light travels along the contiguous edges of the plates to and fro as long as the carbons last. These regulators, I believe, are not so much intended for use in lamps as for rough open air use in cases where an enduring light is required.

The Werdermann regulator is the last I have to notice; but although last, I by no means consider it the least promising of the several forms of apparatus we have before us. It appears to possess some very important advantages which adapt it not only for general use, but for some purposes where some regulators would be inapplicable.

Mr. Werdermann has kindly supplied me with some of his lamps, and he is here to correct me if I should give an imperfect description of them.

The first and most striking peculiarity in this regulator is the great disparity between the sizes of the two terminals or poles, the one being more than sixty times greater than the other. Then another peculiarity is in the relative position of the poles, the positive being below the negative pole, which is the reverse of what is usually the case. And then, again, unlike all the other regulators, the poles are kept constantly in contact, but the lower or positive pole being a rod of very small diameter, the points of contact are insufficient to carry the current, and they are, therefore, surrounded by the usual arc, although this is extremely short and scarcely perceptible.

Mr. Werdermann appears to have been led to the adoption of this arrangement as the result of a series of experiments in which he found that starting with the two poles of equal size, and as usual with the positive above the negative pole, then gradually increasing the size of the positive pole while the negative remained unaltered, it became necessary, although the current remained the same, to shorten

the distance between the poles until at last, when one pole was sixty-four times greater than the other, they were brought into contact and were required to be kept so in order to produce the light. In effecting these changes, while the lower negative pole was successively increased in diameter it was observed that an accumulation of carbon took place on the negative pole immediately under the positive pole and this continued until they came into contact.

The experiments were then carried in the opposite direction, the negative pole being kept of the usual small size and the upper positive pole being gradually increased until as in the other case it was sixty-four times greater than the other, when it was again found necessary to keep them in contact in order to produce the light. In these latter experiments, however, the larger pole, which was now the positive pole, had a depression or small pit formed on its surface instead of the elevation or pimple formed in the previous experiments.

The practical result in both cases was, that by increasing the size of one of the poles until it became sixty-four times greater than the other, a good and steady light was produced by keeping the poles in contact. It appears that the best effect is produced with this arrangement when the positive pole, in the form of a very slender rod is placed below the negative pole, the latter being about three inches in diameter.

THYMOL AND THYMOL-CAMPHOR.

BY CHARLES SYMES PH.D.

The pharmacy of thymol has already been ably treated in this Journal by Mr. A. W. Gerrard (vol. viii., p. 645), but as the substance continues to be largely used, fresh experience will, as a matter of course, be gained concerning it, and it is from the record of such from time to time that our knowledge concerning it and its relations will be perfected.

Some four or five weeks since an idea occurred to me (which has probably occurred to others also) that if thymol and chloral hydrate were rubbed together in a mortar they would possibly produce a liquid similar to the well known chloral-camphor. Experiment proved, however, that such is not the case; but if an equal quantity of camphor be added to the mixture, the whole at once liquefies and produces what should be a powerful antiseptic. An opportunity was at hand which enabled me to test this property, for at the moment I was examining a sample of urine containing pus, which was already in an incipient state of decomposition. A fluid ounce was separated, and to it two drops of the thymol compound were added: putrefaction was at once arrested, and at the present time the liquid has merely the odour of thymol, whilst the bulk of the urine from which it was separated became quite offensive in twenty-four hours.

Further experiments showed that thymol and camphor when rubbed together in the absence of chloral hydrate also become liquid, and that the proportions could be varied from two parts thymol and one of camphor to one part of the former and ten of the latter, the result being a colourless syrupy liquid; equal parts of each give very satisfactory results.

The solubility of thymol in water is not greatly increased by this combination, but it is a very convenient form from which to prepare the ointment. It was stated in the paper already referred to that when dissolved in warm vaseline, so as to form a five per cent. solution, and set aside for a few days, the thymol separated in small crystals, which were highly objectionable, whilst Dr. Balmanno Squire has pointed out (*Pharm. Journ.*, vol. viii., p. 602) that an ointment of greater strength than this will be required in the treatment of certain skin diseases. Now thymol-camphor can be mixed with vaseline, unguentum petrolei or ozokerine, in almost any proportion.

An ointment prepared with twenty per cent., equal to ten per cent. thymol, has been kept for some weeks without any separation whatever.

A saturated solution of thymol in water (1 in 1000) is found to be sufficiently strong for the spray during surgical operations, but for the throat and various other purposes it is often required stronger, and in such cases I know of no better aqueous solvent than milk, which takes it up readily in almost any proportion up to nearly ten per cent. of its weight; but it will rarely be required of such strength. Solution of borax is not a good solvent, but glacial acetic acid dissolves it most readily; a large proportion, however, separates on dilution. The acidum aceticum of the Pharmacopœia dissolves two grains in the fluid ounce. There appears to be some difference in the sp. g. of thymol, arising probably from the source from whence derived; that described by Mr. Gerrard had a sp. g. 1·028, hence was heavier thah water, whilst the specimens I have met with have only a sp. g. of 0·980 to 0·990, and float on or near the surface.

Business engagements have prevented me from carrying my experiments further, but I trust sufficient will be found in these notes to render them suggestive to the medical practitioner and pharmacist.

A CONTRIBUTION TO OUR KNOWLEDGE OF THE ALKALOIDS OF ERGOT.*

BY T. BLUMBERG.

(*Continued from page* 148).

III. Ergotinine.

In 1875, Tanret published a communication respecting a crystalline alkaloid that he had isolated from ergot,† and which he named "ergotinine." According to Tanret this alkaloid gave with "sulphuric acid of moderate concentration" a violet blue colour, but at that time he stated nothing further as to the strength of the acid. The alkaloid was distinguished by its great liability to decompose.

As to the preparation of ergotinine, Tanret gave the following directions:—Coarsely powdered ergot is boiled twice with 86 per cent. alcohol,† and the latter is distilled off in a water-bath.

The residue consists of a separated resin, a watery liquid and a layer of fat swimming on the top. The fat is skimmed off and dissolved in ether. The resin is separated from the aqueous liquor, washed with ether, and this is added to the ether solution of the fat, and the whole is shaken with water acidulated with sulphuric acid (1 to 15), which takes up the alkaloid. To remove the fat the acid aqueous liquid is washed with ether, made

* Inaugural Dissertation presented by the author upon attaining the grade of Magister of Pharmacy at the Imperial University at Dorpat.

* *Pharmaceutical Journal* [3], vol. vi., p. 522.

† This is not quite correct. Tanret says, "On traite, à deux reprises, par de l'alcohol à 86 degrees bouillant, etc." —Ed. Ph. J.

alkaline with potassium carbonate ; the alkaloid is then removed by shaking with chloroform, which is afterwards distilled off [*évaporer*, Tanret] under shelter from air. The aqueous liquor separated from the resin and fat is treated by first distilling off the remainder of the alcohol in an oil-bath, the air being displaced by hydrogen. A little potassium carbonate and water is then added and the distillation proceeded with. The distillate then contains trimethylamine. The ergotinine contained in the syrupy residue from the distillation is acidified, washed with ether, excess of potassium carbonate added, and the alkaloid removed by shaking with chloroform. It is said to have a strong alkaline reaction and to neutralize acids completely. It gives a precipitate with potassio-mercuric iodide, potassio-iodic iodide, phosphomolybdic acid, tannic acid, auric chloride, platinic chloride, and bromine water. It is soluble in alcohol, chloroform, and ether, and decomposes in the light to a resinous mass. Solutions of its salts, under the influence of light, rapidly become rose coloured and then red.

With respect to the physiological action of ergotinine, Tanret said nothing in his first communication.

Professor Dragendorff and v. Podwissotzky attempted to prepare ergotinine exactly according to the method first given by Tanret. They obtained no crystalline alkaloid, but a mixture which contained among other things sclererythrin and scleroiodin, and were hence led to express the opinion that the sulphuric acid reactio described by Tanret was dependent on the presence fn sclererythrin, but they expressly indicated that this opinion was provisional. The preparation gave precipqpitates with the group reagents, and it yielded a small apuantity of ecbolin upon shaking with chloroform. It appeared, therefore, probable that it was a mixture of Wenzell's alkaloid, sclererythrin and scleroiodin.

In the autumn of 1877 Tanret published a communication in which he maintained his opinion as to the existence of ergotinine. He now mentioned for the first time that this had been proved by its action, Dr. Molé having used it in uterine hæmorrhage. He stated further that he now agitated with ether instead of chloroform, and upon evaporation of the ethereal solution he obtained a light yellow spongy mass ; on the other hand, he obtained it crystalline from an alcoholic solution. Tanret gave also now, for the first time, the concentration of the sulphuric acid used as 7 parts of acid and 1 of water, to which he added some ether. The alcoholic solution of ergotinine is said to be coloured brown by exposure to air and red by acids; and further it is stated that on account of the readiness with which ergotinine is decomposed by atmospheric air, it is difficult to obtain it colourless.

I undertook the preparation of ergotinine in April, 1877, my experiment on picrosclerotine being commenced in August of the same year. I failed to obtain any crystalline alkaloid by the process published by Tanret in 1875, the product being a dark coloured amorphous mass, notwithstanding that when the greater part of the chloroform had been distilled off the remainder was evaporated under an air-pump. This method has the disadvantage that chloroform dissolves the resinous decomposition product much more freely than does ether. Moreover, by the boiling of the ergot with alcohol, sclererythrin and fuscosclerotic acid are dissolved and these require to be separated.

The resinoid substance and the fatty layer which separate from the aqueous liquid after the distillation of the alcohol I operated on in the manner described by Tanret, and also on the aqueous liquor, and I thus obtained a considerable quantity of sclererythrin and fuscosclerotic acid.

The aqueous liquor, after it had been freed from trimethylamine by distillation in an oil-bath with a little potassium carbonate, and acidified with sulphuric acid, upon being shaken with ether to separate the last traces of fat, coloured the ether a magnificent red. The shaking with ether was repeated until the ether remained uncoloured. After the ether had been distilled off the residue evidently consisted of sclererythrin and fuscosclerotic acid.

The preparation that I had thus obtained by Tanret's method not being crystalline, I could not look upon it as ergotinine. It was not coloured by concentrated sulphuric acid nor by a mixture of equal volumes of sulphuric acid and water. The alkaloid prepared by me acted upon frogs similarly to picrosclerotine, which was discovered about this time. I did not, therefore, then consider the existence of ergotinine demonstrated, although subsequent investigations altered this opinion.

Herr Kohler kindly furnished me with some of the bye-product obtained in preparing sclerotic acid.

The ergot was first freed from fatty oil by ether, and then extracted with 95 per cent. alcohol. Besides the oil, the ether removed only a portion of the ergotinine, as more of it went into solution upon exhausting with 95 per cent. alcohol.

From the ethereal and alcoholic extracts I obtained a crystalline alkaloid which in its physiological action and in its behaviour towards sulphuric acid and Frohde's reagent corresponded with picrosclerotine; of this I lost the greater part, as it decomposed with extreme readiness. The decomposition product, like that from picrosclerotine, formed a resinous mass. It dissolved in strong sulphuric acid and in potash solution with a brown colour. When heated with nitric acid it yielded picric acid, and when heated on platinum it burnt with a smoky flame.

The crystalline alkaloid I obtained in the following manner*:—The fatty oil obtained by exhaustion with ether was shaken with water acidulated with sulphuric acid, the fat separated from the watery portion, and the latter filtered. The filtrate gave precipitates with reagents for alkaloids.

A small portion of the filtrate was neutralized with sodium carbonate, when a precipitate was formed. This was filtered off, dissolved in dilute acetic acid, and the solution decomposed with potassio-bismuthic iodide; a precipitate resulted.

The acid aqueous liquid was shaken with ether, which took up the fatty oil. Upon distilling off the ether the residue had a strongly aromatic smell. The acid liquid, after the fat had been removed, was made alkaline with sodium carbonate, and the alkaloid removed by shaking it with ether; the shaking had to be repeated several times as the alkaloid passes into the ether with difficulty. The fatty oil was treated with fresh quantities of acidulated water as long as any alkaloid was taken up, and the acid liquor was treated as described.

The ether was distilled off until only a small quantity was left, and the retort was then corked while full of ether vapour. After standing some time crystals were deposited in the distillation residue. A small portion was dissolved in acetic acid, and upon being treated with the group reagents gave precipitates. The crystals consequently represented the alkaloid.

A portion of the acid aqueous liquid was supersaturated with sodium carbonate, the resulting precipitate removed by filtration and dissolved in aqueous solution of tartaric acid, and the alkaloid again precipitated with a concentrated soda solution. The precipitate was filtered off, washed with water, and treated with absolute alcohol, which dissolved it rapidly and completely. The solution was evaporated first by heat, and then over sulphuric acid. It deposited crystals, which like those found in the ether distillation residue were partially decomposed into a brown resinoid mass.

The distillation residue from the alcoholic extract was also shaken with water containing sulphuric acid, the remainder of the fat removed from the acid liquor by ether, and the liquor then made alkaline with sodium carbonate, which threw down the alkaloid. This was

* These experiments were made before the author had seen Tanret's last communication, published in the autumn of 1877.

dissolved in tartaric acid, again precipitated with sodium carbonate, the precipitate washed, and then dissolved in absolute alcohol. Upon evaporation of the alcohol crystals were deposited, which were partially decomposed.

These experiments were made during my investigation having for its object the obtaining of picrosclerotine. The crystals represented ergotinine. In observing their decomposition I found an explanation of the substance insoluble in acids which had formed from picrosclerotine.

A portion of the crystals that had been isolated from the fatty oil was dissolved in dilute sulphuric acid, and the solution was filtered and treated with one to two volumes of concentrated sulphuric acid. This produced for a moment a rose colour, which soon became an intense violet blue, and remained unaltered for thirty-six hours. Upon mixing the sulphuric acid solution with an equal volume of Frohde's reagent, it was coloured momentarily violet, but very soon assumed a splendid blue colour, which gradually changed to blue green. When heated, the blue solution became olive green. The alkaloid from the alcoholic extract behaved similarly with sulphuric acid and Frohde's reagent.

When a mixture of one volume of water and two of sulphuric acid was poured upon the crystals, the colour reactions were not observed, which may have indicated that decomposition had already commenced. The decomposition product, as already mentioned, colours sulphuric acid dark brown, by which the violet colour is obscured.

Tanret has made the experiment with a mixture of seven parts of sulphuric acid and one part of water, to which a small quantity of ether had been added. The ether, however, is not necessary to the success of the reaction, but it does appear to me indispensable that the ergotinine should be in solution when it comes into contact with the concentrated sulphuric acid. The dilution of the acid with water is then superfluous, as the reaction always takes place when one volume of the alkaloidal solution is mixed with one or two volumes of concentrated sulphuric acid. These observations corresponded with those made upon picrosclerotine, except that there the colour was not so intense as with ergotinine, though this may be because the ergotinine was in a purer condition than the picrosclerotine.

With another portion of the crystals some physiological experiments were made. About 0·02 gram, a portion of which had already decomposed, was treated with acetic acid and water, the solution filtered and injected subcutaneously into a frog. Soon after the injection the breathing failed; the head of the animal was drawn backwards several times, the back being bent inwards. At the side where the solution was injected the abdomen hung loose, while on the opposite side it was puffed out. At intervals of half a minute to a minute, the animal stretched out the hinder limbs for a few seconds, after the fore limbs had become paralysed. Gradually the paralysis became general, and the animal died twenty minutes after the injection. Ergotinine, like picrosclerotine, appeared to act strongly upon the spinal marrow.

The remainder of the crystals were treated with dilute sulphuric acid, the resinous substance filtered off, and the solution saturated with soda and shaken with ether. This was evaporated in a vacuum, but I was unable to obtain the ergotinine undecomposed. I could not, therefore, make an elementary analysis of either picrosclerotine or ergotinine, as both bodies so easily decompose.

I am unable to confirm Tanret's statement that acid solutions of ergotinine become red; I found them to become turbid through the separation of the decomposition product.

From the foregoing it appears that ether and alcohol extract ergotinine from ergot at the ordinary temperature. Further, that in the toxicological symptoms of picrosclerotine and ergotinine there is a complete correspondence. Both are bodies that readily decompose, and they behave similarly towards sulphuric acid and Frohde's reagent.

That ergotinine could not be obtained in the crystalline form according to the method published by Tanret in 1875 is evident. As before mentioned, the decomposition product is freely soluble in chloroform and passes into the chloroform when shaken up with it. The brown decomposition product either prevents the crystals being observed or hinders the crystallization. Tanret must have found this, since he subsequently replaced chloroform by ether. The difference in the results may be partially attributable to a fresher ergot being worked upon on one occasion than another. Tanret has, in his last communication, shown that by keeping the ergot the ergotinine is decomposed.

Further, the author believes his experiments prove (1) that the ergot resin examined by Ganser was a decomposition product of ergotinine; (2) that ether withdraws from ergot, besides the fatty oil, some portion of the active substance; and (3) that ergotinine was present in Wigger's ergotine.

MEDICINAL VALUE OF THE DROSERAS.*

There are something over a hundred varieties of the Drosera in existence, Australia, so it is said, having the greatest number. They flourish best in moist, shaded, boggy ground and blossom in July and August. They are all possessed in greater or lesser degree of the peculiar properties of so-called sensitive plants. They are called by various names, such as sundew, rosola, roselle, herbe aux gouteaux, etc.; their distinguishing feature being the long shining red hairs which beset the surfaces of the leaves and have upon their extremities drops of a glutinous shining fluid secreted by minute glands, and appearing most abundantly when the sun is brightest. The *Drosera rotundifolia* and one or two other varieties are known to have been employed in medicine as long ago as the sixteenth century, when it was given as a remedy for phthisis. Even then Dodorus, of Belgium, remarked that it was too acrid, drying, and hot in its nature to be serviceable, and it has altogether been but little used. Among homœopathic practitioners, however, it has been noted that in pathogenetic doses it would cause a spasmodic cough resembling that of pertussis, and it has therefore been resorted to in cases characterized by purely spasmodic cough from any source. Hughes reports numerous cases of whooping-cough rapidly cured by the use of the third, twelfth, and even the thirtieth dilutions. The experience of Dr. Eugene Curie, of Paris, is cited by Hughes and is also referred to by M. Vigier in the *Bulletin Thérapeutique*.

Through Dr. Curie, M. Vigier obtained in 1863, from a herbalist in the Vosges, a large quantity of the herb, which reached him in a fresh state, twice a week, and cost 10 francs per kilogramme. It was immediately bruised and placed in an equal weight of alcohol of 90 per cent. After macerating for a month, the mixture was expressed and filtered. Thus was obtained an alcoholate (weaker in alcoholic strength than a tincture) of drosera of which the density was 56° C.

This was capable of indefinite preservation, contained all the medicinal principles of the plant, had a dark-brown colour and a characteristic odour. When this alcoholate was distilled, there remained an extract of slight consistency, easy of administration and therapeutically active. With this extract, M. Vigier prepared pills having the following formula:—Extract of drosera, 5 grammes; Powd. liquorice root, q. s. To be made into 100 pills.

Several years later, M. Vigier had a quantity of drosera collected in the forest of St. Léger by several inhabitants of the neighbourhood, who gathered only *D. longifolia*. The collection of drosera in this region

---

* From *New Remedies*, September, 1878.

was slow and difficult, and it reached him in agglutinated masses, containing also the damp earth and mosses upon which the drosera always rests, giving it the appearance of being a parasite. In this condition it served only to make an extract which proved, however, to possess the same properties as *D. rotundifolia*. M. Vigier found the remedy too expensive for patients who are obliged to pay a fair price for it, and succeeded, at length, in reducing the cost of the crude drug to 5 francs per kilogramme at the very lowest, and finds that it requires 7 kilogrammes of fresh drosera to make 1 kilogramme when dried, which brings the cost of the dried product to 35 francs per kilogramme; 40 to 50 francs he considers to be a fair retail price, and this, owing to the rarity of the plant, would be increased by any considerable demand. An attempt by M. Vigier to cultivate droseras had failed.

The dried plant, when treated with alcohol of 60° strength, gives a quarter of its weight of extract. He gives also certain formulas which he has established: 1 kilogramme of fresh drosera and a like weight of 90 per cent. alcohol gives 1500 grammes of alcoholate, containing, therefore, the extractive matters of 666 grammes of the drosera; 1 kilogramme of alcoholate, when distilled, gives 25 grammes of extract; 1 kilogramme of fresh drosera gives 143 grammes of dry product; 100 grammes of dry drosera gives 25 grammes of hydro-alcoholic extract, as 1 kilogramme of alcoholate.

He recommends that 100 grammes of drosera and 1 kilogramme of 60° alcohol be macerated fifteen days, then expressed and filtered.

According to M. Vigier, the trials of the drug by Dr. Curie in phthisis seemed to show very favourable results, but upon further analysis of the cases he was disposed to think that those presenting symptoms of bronchitis were most favourably influenced.

FLUID EXTRACTS BY REPERCOLATION.*

BY EDWARD R. SQUIBB, OF BROOKLYN.

(*Continued from page* 349.)

The same formula and process were used as in the first repercolations of cimicifuga, with the exception of the menstruum, and the powder was from the same stock, and used on the same scale of a troy ounce = 31·1 grams for each part, and therefore 8 troy ounces = 248·8 grams of powder for each percolation; and in this case the whole four percolations were made. The following table gives the results of this repercolation, and contains the same elements obtained in the same way, but the first percolation attained a much more thorough exhaustion, while the subsequent ones were not carried so far on account of the apparent inertness of the extractive matter obtained. The third percolation was much less successful than the others in consequence of too short a maceration. This carried too much of the extract forward by the weak percolates into the fourth percolation, and overloaded it. But this serves as an excellent example of the way in which the errors of one percolation are corrected by those which follow when repercolation is used.

The first percolation of 8 troy ounces = 248·8 gram

required a total percolate of 958·57 grams for exhaustion, or nearly four times the weight of the powder, and gave 84·96 grams of extract, which is 34·14 per cent. of the weight of the powder. The 32 troy ounces = 995·33 grams of powder should therefore give (84·96 × 4 =) 339·84 grams of extract. But when the extract actually obtained from the four percolations is summed up, it is found to be only (84·96 + 86·23 + 71·92 + 73·84 =) 316·95 grams, or 22·89 grams less than the indicated quantity. This is therefore an apparent loss of (As 995·33 : 316·95 : 100 : 31·84, and 34·14 — 31·84 =) 2·3 per cent., which,

* From the *American Journal of Pharmacy*.

considering the apparent quality of final extracts in repercolation, is quite unimportant, at least in view of the far greater deficiences of the officinal processes, or any modification of them hitherto used.

Now if each troy ounce of powder is to be represented by a troy ounce of the fluid extract, and the fluid extract be adjusted to the solid extract obtained, then the reserved percolates should weigh, respectively, 186·6, 248·8, 248·8, and 248·8 grams and should contain 59·41, 79·22, 79·22, and 79·22 grams of extract. But by the table the reserves weigh 206·78, 266·60, 261·73 and 249·24, and contain 56·27, 67·43, 56·22 and 73·97, thus making a very imperfect exhibit, though still far ahead of the present or past officinal processes. The conditions being new, each percolation was varied in management in order to reach the best method. This was not reached until the fourth percolation; and one or two more percolations, using much more liquid to moisten the powder, would have been needed to obtain greater precision and uniformity. The total finished fluid extract which should represent 30 troy ounces = 933 grams of the drug, when made to bear the relation of minim for grain weighed 984 grams and was therefore considerably too heavy. This, and the tendency of the percolate to become overloaded with extractive, at the same time that it illustrates the value and appropriateness of the principle of repercolation, also shows that this new menstruum has too little alcohol, and leads to the inference that a menstruum of two parts stronger alcohol and one part water would be better adapted to cimicifuga than either of the extremes here tried. Such a proportion would, by repercolation, probably yield a fluid extract which in the proportion of weight for weight, would also have the proportion of minim for grain—or what would represent the drug better because more accurately than by any known method of percolation—including repercolation—namely, 90 to 97 to minims for each 100 grains of the drug. In readjusting all fluid extracts therefore to bear the relation of weight for weight to the drug, the weight should measure in minims from 90 to 97 minims for every 100 grains to make the therapeutic value of the minim and grain of the fluid extract and the drug practically equal. This can be readily done by variations in the menstrua used, but not without the expenditure of much time, skill and labour—an amount which no individual or committee can afford to give, but which a Pharmacopœia must have, in order to be respected as a standard. It may be mentioned in illustration of this point that all the time and labour that the writer could possibly spare, including at least three evenings of every week, for three and a half months, has been given to this paper, which embraces only two fluid extracts, neither of which are yet in the condition they should be for the Pharmacopœia for want of more time and labour.

(*To be continued.*)

MEDICATED SOLUTIONS OF ALUMINA.*

BY HENRY G. DEBRUNNER, F.C.S.

To the class of remedies that once had an almost general reputation, and now, in spite of their therapeutic value, are scarcely used, belongs the benzoinated solution of alumina, the preparation, dose, and mode of application of which we find in the United States Dispensatory, p. 1011, 13th edition.

Similar to Pagliari's styptic liquid, it surpasses the same in efficiency and purity in many respects, besides being at the same time by no means an expensive article (*vide* United States Dispensatory, page 174, 13th edition).

Instead of using an alum solution, as done by the before named Roman pharmaceutist, a solution of sulphate of alumina, $Al_2O_3,3SO_3$, previously saturated with alumina hydrate so as to make its composition approach that expressed by the formula $(Al_2O_3)_2,3SO_3$, is subjected to benzoination by being heated for several hours with a certain quantity of bruised benzoin. By this treatment a number of the constituents of benzoin are dissolved in the solution, among which benzoic acid, and a resinous, brownish body possessed of aromatic odour are the most important. By this mode of preparation the existence of free non-combined sulphuric acid, which might be found in Pagliari's original solution, is rendered impossible.

If properly prepared, the specific gravity of this compound is 1·26; it is perfectly clear and of sweet balsamic odour and taste. As to its medicinal qualities and value, I wish to refer to the authorities quoted in the United States Dispensatory, page 1011, 13th edition.

The styptic properties of this preparation are due to the immediate coagulation of blood or albuminous substances in general which it produces, assisted by the presence of benzoic acid. Unlike carbolic acid, which is possessed of a destructive action over the lower grades of organic life, whether vegetable or animal, it acts by mere coagulation, thus excluding the air, the vehicle of numerous spores. These considerations induced me to make experiments, with the view of obtaining a *carbolized* benzoinated solution of alumina, and of uniting the disinfecting power of carbolic acid with the antiseptic properties of the benzoinated solution. I found that 3 per cent. ($\frac{1}{2}$ f.oz. to pint) of carbolic acid could easily be incorporated into the first-named preparation. From the fact that the carbolic acid is easier taken up as a basic alumina solution than by water, it may be possible that it exists in the same as carbolate of alumina, which, however, is to be proved by further experiments. Carbolized solution of alumina may be used in the same way and mode as the benzoinated preparation. It is a clear liquid of 1·25 to 1·27 sp. gr.; the odour of carbolic acid is but slight, it being overpowered by that of benzoin. If exposed to cold it becomes slightly turbid, but will clear again on elevation of temperature.

* From the *American Journal of Pharmacy*, Dec. 1878.

NITRATE OF SILVER CONTAINING GOLD.*

BY E. B. SHUTTLEWORTH.

It does not appear that any of our chemical or pharmaceutical authorities give gold as one of the contaminations of nitrate of silver, yet such admixture is not only possible, but frequently to be met with in common grades of nitrate which have been prepared directly from solutions of the metal. All commercial refined silver contains gold, though perhaps in only the most minute quantity. Of nearly three tons which have been dissolved under the writer's supervision, none could be described as perfectly pure or free from the more precious metal. English refined silver generally contains more than American stamped bars, of which a considerable quantity must be operated on in order to render the gold appreciable.

If such silver be dissolved in ordinary nitric acid, containing traces of hydrochloric acid, both metals will be dissolved, and, as long as the solution is acid and concentrated, minute quantities of both chloride of silver and chloride of gold will be retained. Crystals deposited from the liquor will also contain traces of gold. Such crystals have a faint purplish tinge, as also the solution, so that in colour it resembles water containing a very small quantity of logwood ink.

I am not prepared to say in what particular form or combination the gold exists in the silver salt, nor yet to state the effect of this impurity on the photographic film. It is, however, possible that some of the troubles of photographers—as, for instance, that technically known as fogging—might in some degree be due to the presence of this contamination.

The impure salt may be readily prepared for experiment by adding to a concentrated hot solution of pure nitrate of silver a few drops of solution of chloride of gold. Flocks of chloride of silver holding gold are precipitated, but, by the addition of a little pure nitric acid, are dissolved, and if the solution be set aside crystals similar to those described may be obtained.

Nitrate of silver containing gold may be purified by fusion. On dissolving the cake in water the gold will be deposited, or may be removed by filtration through asbestos.

* From the *Canadian Pharm. Journ.* for Nov., 1878.

The Pharmaceutical Journal.

SATURDAY, JANUARY 18, 1879.

WEIGHTS AND MEASURES DIFFICULTIES.

Now that it may be hoped the Special General Meeting, held last week, has served the purpose of a safety valve in relieving the supertension of feeling in regard to the protection of trade interests, it is with some satisfaction we embrace the opportunity of again giving place to more purely pharmaceutical matters. At the present moment it is necessary to call our readers' attention to a subject which is now of special importance as a matter of trade, not only to chemists and druggists, but also to the whole trading community. We have, on several occasions within the past few months, referred to the provisions of the Weights and Measures Act, passed last session, and in order to place them within easy access of all the members of the trade, we last week issued, as a supplement to the Journal, a reprint of the entire Act together with the several schedules appended to it.

This Act came into force on the 1st of January, and questions as to the application and working of it have already become the subject of communication between the Council of the Pharmaceutical Society and the Standards Department of the Board of Trade. So long since as last March it was pointed out in this Journal that although, in apparent concession to the opinion expressed by the Council of the Pharmaceutical Society, provision for permission to use apothecaries' weights had been introduced into the Bill by the Government, still, no definition was given of any of the weights comprised in the apothecaries' system. Moreover, it was then shown that neither the scruple nor the drachm, nor any other unit of the apothecaries' system was represented by Board of Trade Standards, although according to section 24 it was provided that any person having in his possession for use in trade, a weight or measure not of the denomination of some Board of Trade Standard, would be liable to a fine of five pounds for a first offence, and ten pounds for a second.

This obvious inconsistency did not escape the notice of the Select Committee to which the Bill was referred; but the remedy at first applied did not quite satisfy the requirements of the case. By expunging altogether from the Bill the permission to use apothecaries' weight the inconsistency was removed; but if the Bill had passed in that form, it would not only have been illegal to use or possess an apothecaries' drachm or scruple weight, in buying and selling drugs, but it would have been a punishable offence to print any price list, price current, or market return in which such weights were quoted or referred to.

However the matter was not allowed to rest in that position, and the representations made to Mr. Farrer, of the Standards Department of the Board of Trade, by a deputation consisting of the President of the Pharmaceutical Society, Mr. Sandford, Professor Redwood and the Secretary, had the effect of ensuring such consideration of the requirements of the drug trade as to pave the way for effectually preventing the evils which it was considered would result if the Bill were to pass as it then stood.

In order to aid in the satisfactory settlement of the matter, Dr. Acland, the President of the Medical Council, and the Hon. E. Stanhope, who had charge of the Bill in the House of Commons, were present at the interview. The various points at issue were discussed, and before the Bill again made its appearance in the House notice had been given of various amendments having in view the removal of the difficulties which chemists and druggists anticipated would result from the abolition of the apothecaries' weight.

In accordance with the promise made by Mr. Stanhope, as the result of this interview, the exception to the 20th section of the Act that "drugs, "when sold by retail, may be sold by apothecaries' "weight," was introduced, and the fluid ounce, fluid drachm and minim were also introduced into the schedule. The only question left without complete settlement was that relating to the stamping of glass measures. The difficulty attending compliance with the requirements of the Act, so far as chemists and druggists' glass measures are concerned, is obvious, but the Government authorities do not seem now to be any more disposed to deal directly with this difficulty than they were when it was brought under their notice by the deputation from the Council of the Society, and when they were subsequently written to by a firm of wholesale druggists, see *ante*, p. 492.

However, it is not this difficulty that has been the first to make itself felt, but one arising from an unexpected interpretation of the exemption clause permitting the use of apothecaries' weight in the sale of drugs by retail. The inspector of weights and measures at Edinburgh has come to the conclusion that this clause is simply "null and void," since in his opinion it has been inadvertently transferred into the present Act from the old Act. This view of the matter, besides indicating a novel feature of the functions of an inspector of weights and measures, seems to show an ignorance of what passed between the Standards Department of the Board of Trade and the Council of the Pharmaceutical Society. In support of it the Edinburgh inspector contends that there is no such denomination as apothecaries' weight; that this system of weights was abolished by the Medical Council in 1864, and that in 1867 the drachm and scruple were admitted to be used only permissively for the convenience of prescribers. On these grounds it is argued that for all pharmaceutical requirements recourse must be had to the weights tabulated in the schedule of the Act, namely the avoirdupois and decimal grains, so that as a

corollary from this, all the weights used in pharmacy being subject to inspection, and requiring to be stamped, the four grain, six grain, two scruple, and drachm weights are illegal. If that were the case chemists and druggists would be subject to serious inconvenience in dispensing medicine and in the sale of such drugs as are generally sold in the quantities indicated by the weights just referred to.

But there does not appear to be any foundation for the conclusions which the Edinburgh inspector has arrived at. In the first place, the assumption that there is legally no such denomination as apothecaries' weight seems obviously in antagonism with the specific permission given in the Act for the use of that system of weights in the sale of drugs; it is also entirely at variance with the understanding upon which the exemption applying to that case was introduced into the Act, although it may gain some apparent support from the facts that there is no definition of apothecaries' weight in the Act, and that the scruple, drachm, etc., are not comprised in the schedule of Board of Trade standards, as pointed out in this Journal last March.

Still, however this may be viewed as a matter of opinion, it must be remembered that by section 8 of the Act the Standards Department of the Board of Trade has the power to legalize additional standards whenever the exigencies of trade demand that step. By legalizing standards of the scruple and drachm, as being respectively "equivalent to or multiples" of twenty and sixty grains, the present difficulty raised by the Edinburgh inspector would be so far overcome.

As regards the other assumption that the system of apothecaries' weights was abolished by the Medical Council, it involves the further assumption that the Medical Council had power to do that, which is, in fact, not the case. All that was done by that body and all it had power to do was to adopt the avoirdupois system of weights for certain purposes. At the same time the absence of any denomination of weight between the grain and the ounce of that system was recognized and admitted to be a grave defect, and though medical men were urged to avoid the use of the terms ounce and pound with reference to any other than the avoirdupois or imperial standard weight they were left the option of using the symbols of the scruple and drachm, as representing respectively twenty and sixty grains, if their use should be found to conduce to accuracy or convenience in prescribing and dispensing. That this is really the case there can be but little doubt, and that the retention of these weights for chemists and druggists' purposes is a necessity appears to have been thoroughly recognized by the Board of Trade.

The possibility that difficulties as to the legality of using apothecaries' weights in the sale of drugs appears quite recently to have become apparent to the Board of Trade and the authorities of the Standards Department have within the last few days called the attention of the Council of the Society to the circumstance that there is not in the Act any definition of apothecaries' weights nor are any Board of Trade standards of such weights provided under the Act. The Council has therefore been requested to furnish information as to what "apothecaries' weight" is at the present time and what are the several denominations of weights now used by chemists and druggists in retail trade. It may therefore be expected that standards of these weights will be introduced and any further difficulties in this respect obviated.

THE CHEMISTS' BALL.

We take the liberty of reminding our readers that the Chemists' Thirteenth Annual Ball will be held on Wednesday evening next, at Willis's Rooms, King Street, St. James's. Particulars as to tickets, etc., and a list of the Committee from whom they may be had, will be found in an advertisement on another page. The Honorary Secretary this year is Mr. Arthur L. Savory, 143, New Bond Street.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

A School of Pharmacy has been inaugurated at Aberdeen under the auspices of the local Society. The onerous duties of conducting these classes, which are purely gratuitous, have been very generously undertaken by Messrs. J. Gordon and Strachan. Mr. Gordon conducts the Chemistry, while Mr. Strachan takes charge of the Materia Medica and Pharmacy. The classes were commenced on the 17th and 19th of December, and the introductory lectures were enthusiastically met by large audiences of assistants and apprentices. It is expected a Botany class will be commenced after the above are finished, should they prove successful.

A CAUTION.

A correspondent writes to caution chemists and druggists against the proceedings of a scamp by whom he has himself been victimized. The method adopted by this fellow is to go into a chemist's shop, present a card upon which is written the name of a certain kind of pill, with the words, "Order of any "chemist," and the information where the depôt is, and ask for one or two boxes, as the case may be. The chemist, probably never having heard of the "patent medicine" before, has not got it in stock, and is politely requested to get it, and a small deposit is left. The end of the operation is attained when the chemist sends for a packet, as the pseudo-customer does not make his reappearance to redeem his deposit. The trick is not a new one, but perhaps this reminder may not be without service to some of our readers.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Wednesday, January 22, Mr. McKnight will read a paper on the "Past and Present Condition of Chemists' Assistants" before the above Association.

Transactions of the Pharmaceutical Society.

PHARMACEUTICAL MEETINGS.

MR. JOHN WILLIAMS, PRESIDENT IN THE CHAIR.

A Special Evening Meeting was held on Wednesday evening, January 8, when Professor Redwood delivered the first of two lectures on the Electric Light. The lecture was illustrated by experiments and diagrams, as well as the lamps, etc., of different inventors, in the exhibition of which the lecturer was assisted by Mr. T. Boverton Redwood and Mr. T. Horne Redwood.

The second lecture was delivered on Wednesday evening, January 15, at half-past eight.

The first lecture is printed on p. 593.

At the close of each lecture, on the motion of the chairman, a vote of thanks was given to the lecturer.

Provincial Transactions.

LEEDS CHEMISTS' ASSOCIATION.

A meeting of the above Association was held on Wednesday, Dec. 4th, in the Lecture Theatre of the Yorkshire College of Science, when

Mr. L. Siebold delivered a lecture on "Potable Waters, their Constituents and Impurities." The first part of his discourse dealt with the normal constituents of potable waters, the best modes of their detection and estimation, and the interpretation of the analytical results with reference to the question of the suitability or unfitness for domestic use of the sample of water under examination. Having explained these points the lecturer proceeded to a lengthy consideration of the organic impurities of water, the determination of which he regarded as the most important task of the water analyst. There was, he said, much diversity of opinion as to which was the best method for ascertaining the amount of organic contamination. Dr. Frankland's process was unquestionably a valuable one, but it was open to the objection that its indication of organic carbon and nitrogen referred not to the water itself but to the residue it left upon evaporation, and that the organic impurity contained in the water was not necessarily the same, either in its nature or quantity as that found in the residue. This objection, he feared, would prove a bar to its general adoption. Mr. Wanklyn's ammonia process, though much used in this country, did not appear to have found much favour beyond the shores of the United Kingdom. From his own experience he had no hesitation in saying that this method did not possess the merits claimed for it by its author, and he felt sure that all who made it the subject of a critical investigation would arrive at the same conclusion. With the utmost care in its manipulation it gave discordant results in the hands of different chemists; the albuminoid ammonia afforded no definite measure of the organic nitrogen present; and, what appeared to him the most serious objection, the resumption of the distillation, shortly after the termination of the process, invariably resulted in a further yield of ammonia, and continued to do so without any definite limit. He was quite ready to admit, however, that in the majority of cases this method was capable of giving satisfactory indications of the extent of organic contamination in a sample of water, provided its results were judged in conjunction with the behaviour of the water residue upon heating, the amount of chlorides, the presence or absence of appreciable quantities of phosphates, and the results of a microscopic examination of the water. Mr. Wanklyn did not allude to these points in connection with the interpretation of the results of his ammonia process; and this was to be regretted, as his process was extensively employed by medical men and others inexperienced in chemical analysis, by whom his directions would be considered as good as law. He (Mr. Siebold) had never deserted the permanganate process, despite all that had been said and written against it. He had had long and extensive experience with this process and felt more than ever convinced that its skilful application yielded results which, when judged together with the other points above alluded to, afforded the most satisfactory evidence as to whether or not a sample of water was sufficiently free from injurious organic contamination to be safe for domestic use. It was impossible in this way to mistake a water of doubtful quality for a good one. The addition of sulphuric acid to the water previous to the introduction of the permanganate was an essential condition to the success of the test. Sufficient time should be allowed for the oxidizing action of the permanganate, as this action upon organic matter was always slow. It was true that nitrates and ferrous salts interfered with the process, but the presence or absence of these substances could be readily ascertained by other means, and an experienced observer was not likely to confound the reducing effect due to these with that produced by organic matter.

With regard to nitrates and nitrites, Mr. Siebold said that while chemists were generally agreed that the presence of the former in potable water was not in itself an objectionable feature, the presence of nitrites was still looked upon with suspicion as indicating more recent contamination with nitrogenous organic matter. He had, however, met with samples of well-water containing considerable quantities of nitrites, which were exceptionally free from organic matter and ammonia, and in such cases, the presence of nitrites, like that of nitrates, appeared to him no reason why such water should not be used for domestic purposes. He strongly objected to the use of acetic instead of sulphuric acid in testing water for nitrites by potassium iodide, as it greatly reduced the delicacy of the reaction, and as there was no sound reason why pure sulphuric acid should not be used.

With reference to the contamination of water with lead the lecturer said it was difficult to give a decided answer to the question, what should be considered the smallest amount of this metal likely to render water injurious to health, if such water be consumed for a long period. He had, however, never heard of a single case in which injurious effects resulted from the daily use of water containing less than one part of lead per million. This proportion of lead could be distinctly detected by sulphuretted hydrogen in half a litre of water previously boiled with a few drops of pure sulphuric acid, especially if the mixture be compared with the same quantity of pure water treated in the same way. A similar trace of copper he felt inclined to regard as a harmless impurity, but so long as there remained the faintest doubt on this point. he should not recommend the regular use of a water thus contaminated.

Mr. Siebold's descriptions of analytical processes were illustrated by experiments.

ABERDEEN CHEMISTS AND DRUGGISTS' SOCIETY.

The first of a series of lectures to be given under the auspices of the Aberdeen Chemists and Druggists' Society has been delivered in the Rooms, St. Nicholas Lane, by Dr. F. F. M. Moir, on "The Dawn of Animal Life." Mr. Charles Coutts presided, and there was a fair attendance. The subject of address, the lecturer at the outset remarked, should perhaps have been more appropriately styled, "The lowest forms of animal life." On these he dwelt for almost an hour, elucidating the method of existence of the *Amœba*, *Foraminifera*, *Globigerina*, *Infusoria*, and *Sponges*, concluding with a few critical remarks on the theory of evolution. The lecture was freely interspersed with popular and attractive illustrative examples, reference being made to the Challenger expedition, to the formation of the chalk cliffs of Flamborough Head, to the mountain meal eaten by Laplanders

with fat, and to the earth-eaters of Orinoco, the natural phenomena observable in each of which instances were traceable to the action of some of the lowest forms of animal life. In regard to the evolution theory, the lecturer said a belief therein was not inconsistent with the belief in a divine Creator. On the hypothesis that all life was dependent on pre-existing life, the biologist, in the various steps of his reasoning, found himself face to face at last with the idea of the first germ. Who created *it*? There must have been a creator, a constant watching power exerting its influence through cycles of time. Belief, at any rate, in the theory of evolution did not jar with the belief in the primitive creative power of an Almighty Being. The lecture was illustrated by diagrams, and on the table were examples of organisms alluded to in its course, which were subsequently examined under a powerful microscope. At the close, Mr. Coutts proposed a vote of thanks to Dr. Moir for his able and interesting lecture, a lecture which had so happily inaugurated the course.

Proceedings of Scientific Societies.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At the meeting of this Association at its rooms, 32A, George Street, Hanover Square, on December 18, Mr. A. Sawden read a paper on plaster-spreading. The author gave the results of his own experience with regard to the saving of time and labour in spreading plasters. He also recommended a method by which plasters spread on paper (which might be kept in stock) were caused to adhere to leather or other material by means of heat, the paper being removed by moistening with turpentine or ether. This process was practically illustrated.

In the discussion which followed, Mr. A. W. Gerrard, of University Hospital, gave many interesting facts connected with the subject, for which he received the thanks of the meeting. Several other gentlemen continued the discussion, and at its close Mr. Sawden was awarded a hearty vote of thanks for his instructive and practical paper.

On Friday, January 10, a paper on "Pyrogenous Products" was read before this Association by Mr. Parker.

The paper gave a rapid and comprehensive sketch of the various products derived from the destructive distillation of wood, coal, bones, horn, etc., the more important substances, such as coal and wood tars, creasote, pyroligneous acid, aniline, paraffin and carbolic acid, being described in detail, with their purification and tests. In connection with creasote, Mr. Parker brought forward a little known but (as he stated) reliable test for adulteration with carbolic acid. The method consists in adding bromine water to an aqueous solution of the suspected liquid; if carbolic acid is present, a precipitate of tribromophenol falls; if none is present there is no change.

The paper was listened to with great interest, and at its close a hearty vote of thanks was awarded to its author.

PHILADELPHIA COLLEGE OF PHARMACY.

At a meeting of the College held November 19, 1878, Mr. Alonzo Robins in the chair, Professor Sadtler exhibited a sample of oil of turpentine brought from San Francisco, said to be derived from the sugar pine, *Pinus ponderosa*. It is claimed by some to be superior to ordinary oil of turpentine in not being liable to resinify upon exposure, but the sample disproved this statement.

Mr. Boring called attention to a sample of oil that had been purified by treating it in a patented apparatus which it is claimed will restore even rancid oils to their original sweetness. The apparatus was described as a jacketed churn into which cold air was forced by steam power, the temperature being kept at about 100° F.; as it was recommended in connection with cod liver oil, almost all the members who participated in the discussion thought it was unwise to dispense such oil as had undergone any process by which its remedial powers could be in any wise impaired.

Professor Maisch, on behalf of Mr. Garcia, a student of the present class from Cuba, presented a pod of *Theobroma cacao*, and also one of *Cassia brasiliana*. This last tree, a native of Brazil, has been introduced into the West Indies and grows there luxuriantly; the pod is thicker in diameter and longer, and yields a greater quantity of pulp but not quite so sweet tasted as the *Cassia fistula*, for which it is sometimes substituted.

Professor Maisch also exhibited a specimen of the *Phrysenoma cornuta*, or horned toad, which had been sent, from Texas by mail; it was a curiosity to most present and is singular in being able to exist for a long time without food; this individual had been without food for several days before starting on his travels, and two or three days after his arrival in Philadelphia had escaped from his cage, a paper box, and been wandering through the various rooms in the college for a week or two, still showing signs of vitality when so inclined.

Phenol-phtalein has been mentioned as a test for alkalies by Mr. Drew, of Brooklyn, and its delicacy was shown to be such that a single drop of alkali when added to a dilute neutral solution gives a distinct red coloration.

Professor Maisch presented a photograph of the inflorescence of *Calla æthiopica*, which exhibited partial transformation of the spathe into a leaf.

Samples of benzoinated and carbolized solution of alumina were sent by Mr. H. G. Debrunner, of Pittsburg, and a paper was read giving the process for preparing it. (see before, p. 602.)

As a matter of interest to the members present, Prof. Maisch stated the number of the present class to be about 166 in both junior and senior courses.

Parliamentary and Law Proceedings.

Poisoning by a Liniment.

An inquest was held on Dec. 22, at Newcastle, by Mr. Coroner Hoyle, on the body of Isabella Walters, who had died from the effects of poison on the previous Sunday night. John Walters, labourer, husband of the deceased, made the following statement:—On Sunday night, about twenty minutes past eleven o'clock, deceased and I retired to bed. About a quarter of an hour afterwards she said to me that she could not sleep on account of her cold and cough. I told her she had no need to suffer as she had medicine in the closet, and she should get up and take a dose of it. She accordingly got up and took a dose of what I thought was the medicine, but I did not see her take it. After she returned to bed, she said, "Charlie, I believe I am done for. I think I have taken the liniment instead of my own medicine." She seemed quite blue, and pointed to me to get her some help. I called in two of my neighbours, and then went for a doctor. I called on Dr. Hardcastle, but he would not come, and then I tried Dr. Baliol, and he would not come. He, however, recommended me to go to Dr. Wilson. I went to Dr. Wilson, and he would not come. He said I had better go and demand the doctor at the Police Station. I went there, and they telegraphed for a doctor, and Dr. Baumgartner came twenty minutes after the message was sent. When he arrived my wife was dead. She died in consequence of taking liniment instead of her own medicine. I was at Dr. Hardcastle's five minutes after my wife had taken the liniment, and then I went to Dr. Baliol, and he asked me the nature of the liniment, but as I could not tell him he would not come. I dis-

tinctly told all the doctors that my wife had taken liniment, and I expected when they knew this they would have come at once, but none of them came.—Mary Sullivan, of 52, Stowell Street, said she had been called up by the last witness about a quarter past twelve on Sunday night. On going into his house she found deceased lying on her side on the floor trying to vomit. A man gave her some mustard in luke-warm water to cause her to do so, and afterwards deceased said, "Lift me into bed; I have poisoned myself." Witness understood her to mean she had done so accidentally, and witness knew that the bottles containing liniment and cough mixture were exactly alike in size and shape.—This was all the evidence adduced, and the jury returned a verdict to the effect that deceased had died from the effects of poison taken in mistake for cough mixture.—*Newcastle Daily Chronicle.*

Poisoning by Paregoric.

An inquest was held by Mr. Coroner Hoyle, at the Royal Station Hotel, Byker, on Dec. 22, on the body of Edmund Lodge, an infant, who died suddenly on the previous Friday night. Ann Lodge, mother of deceased, said that she had obtained a pennyworth of paregoric at a chemist's and she gave the child, who had a cold, about half a teaspoonful just before putting it to bed for the night. Next morning when she awoke she found the child to be dead. Dr. Wm. Anderson having deposed that in his opinion the child had died from the effects of an overdose of paregoric, the jury returned a verdict based upon the evidence given above.

Poisoning by Aconite Liniment.

Mr. Harcourt MacLeod Busfield, a surgeon, of Boothfold, Newchurch-in-Rossendale, Manchester, died on the 28th ult., under the following distressing circumstances. He had been out of health for some weeks, and on the previous evening (the 27th) he retired to rest, but passed a very restless night. About half-past four both he and his wife got up. He went into the surgery, leaving his wife in the dining-room, and presently returned, and exclaimed, "I'm a dead man!" at the same time showing a bottle, the contents of which he said he had drunk. The bottle contained aconite liniment. He requested his wife to send for Dr. Wilson, a neighbouring medical man. In the meantime he drank freely of mustard and water, but he gradually grew worse, and died in about an hour, and before the arrival of a medical man. A bottle containing sherry was afterwards found next to where the bottle of aconite had been taken from, and as they much resemble each other in colour, there is reason to believe that the deceased drank the aconite in mistake for the sherry.—*Medical Times and Gazette.*

Suicide by Potassium Cyanide.

A man named John Livesey, 35 years of age, went into a public house in Liverpool, on Tuesday, and called for a bottle of ginger beer, which was supplied to him. He sat down in one of the parlours, and about five o'clock he remarked to a barmaid that he expected to meet a friend there. A short time afterwards the landlord went into the parlour and found him leaning forward with his head resting on the table. On raising him he observed that there was something wrong, and sent for Dr. Shain, Pembroke Place, who, on arrival, pronounced life to be extinct. Subsequently there were found upon the deceased a bottle which had contained cyanide of potassium, and a letter addressed to the editors of the Liverpool and Manchester newspapers, which set forth that he had been unsuccessful in obtaining a situation, and was hard up.—*Liverpool Mercury.*

Prosecution under the Pharmacy Act.

Last week George Barron, grocer, Foston, was charged with selling one ounce of laudanum, and eight pennyworth of opium, on the 26th of December, without having a label marked "poison" affixed to the drugs.

Defendant said his "missus" sold them.

Sergeant Cabourn said he sent a little girl to defendant's shop to purchase some laudanum and opium: he followed her, and saw Mrs. Barron supply the girl with the drugs produced. He went into the shop some time afterwards, and inquired whether she sold the articles. Mrs. Barron then denied ever supplying them. He produced the articles, and she then admitted selling them.

Mary Ann Young (10) said she went to defendant's shop and asked for an ounce of laudanum and eight pennyworth of opium. She paid for the goods, and gave them to the police-sergeant.

Superintendent Wynne said the proceedings were taken because he had heard of this sort of thing going on. There was a second charge against defendant of selling poisonous drugs, he not being a qualified person, but with the permission of the Bench he would withdraw that charge upon defendant paying the costs. The Magistrates consented to this course, and defendant was fined £1, and costs £1 0*s.* 6*d.*, for the first offence, and he agreed to pay 7*s.* costs on the second charge.—*Grantham Journal.*

Fatal Effects of "Soothing Syrup."

On Tuesday, Mr. F. Price, district coroner, held an inquest at the Victoria Hotel, Pendleton, touching the death of a child five months old, daughter of Richard Rawlinson, corporation labourer. The child was supposed to be teething, and its mother, Elizabeth Rawlinson, purchased a bottle of Mrs. Winslow's soothing syrup about a week ago, and administered ten drops about twice a-day up to last Friday. The child on that day appeared to be very unwell. At night Mrs. Rawlinson was nursing it when it fell asleep on her knee. In a short time she noticed that the child breathed very quickly. She lifted it up, and after giving three sighs it died.

The Coroner said that the effects of Mrs. Winslow's soothing syrups were those of a narcotic, and that the *Pharmaceutical Journal* of 1872 stated that two doses had caused the death of a child fifteen months old, with the usual symptoms of narcotic poisoning. Analysis of this syrup showed that one ounce of it contained nearly one grain of morphia with opium alkaloids. "It is not surprising," he added, "that it should prove fatal to infants in small doses." The jury found a verdict of "Death from misadventure" by repeated doses of the syrup.—*Manchester Evening News.*

[*** The above remark of the Coroner appears to have been made as if quoted from the article in this Journal pointing out the danger of indiscriminating use of narcotics with infants. But it is not strictly a quotation. —Ed. Ph. Journ.]

Obituary

Notice has been received of the deaths of the following:

On the 16th of December, 1878, Mr. William West Pharmaceutical Chemist, Henfield, Sussex. Aged 62 years. Mr. West had been a member of the Society since 1856.

On the 18th of December, 1878, Mr. Philip Hart,. Pharmaceutical Chemist, Higher Bridge Street, Bolton. Aged 23 years. Mr. Hart had been a member of the Pharmaceutical Society since 1877.

On the 22nd of December, 1878, Mr. William Nelsford, Chemist and Druggist, King Street, Plymouth. Aged 52 years.

On the 22nd of December, 1878, Mr. George Horne, Chemist and Druggist, Oxford Street, Manchester. Aged 59 years.

On the 26th of December, 1878, Mr. James Isherwood, Pharmaceutical Chemist, Old Kent Road. Aged 36 years. Mr. Isherwood had been a member of the Pharmaceutical Society since 1866.

On the 7th of January, 1879, Mr. John Wiggin, Pharmaceutical Chemist, St. Matthew's, Ipswich. Mr. Wiggin was a Founder of the Pharmaceutical Society, and formerly served it as one of its Local Secretaries.

BOOKS, PAMPHLETS, ETC., RECEIVED.

A Treatise on Chemistry. By H. E. Roscoe, F.R.S., and C. Schorlemmer, F.R.S. Vol. II., Metals. Part 1. London: Macmillan and Co. From the Publishers.

A Manual of Practical Chemistry: the Analysis of Foods and the Detection of Poisons. By Alexander Wynter Blyth, M.R.C.S., F.C.S., etc. London: C. Griffin and Co. 1879. From the Publishers.

On the Illumination of Lines of Molecular Pressure and the Trajectory of Molecules. By William Crookes, F.R.S. Presented by the Author.

On Artificial Disinfection as a Means of Preventing the Spread of Infectious Diseases. By Rev. J. H Timins, M.A., F.G.S. London: J. and A. Churchill. 1878. From the Publisher.

The House Surgeon, or the Doctor at Home. By A. Smee, F.R.S. Tenth edition. London: Accident Insurance Company. 1878.

Dispensing Memoranda.

[173]. Being the writer of the query in reference to this mixture, which has now caused so much correspondence, perhaps you will kindly allow me a few remarks. In the first place, I desire to thank those who have in any way helped to throw light upon the subject, and also to thank Mr. Henry Brown for the great trouble to which he has put himself over it. Perhaps the remarks of Mr. Green best answer the query, as he has definitely stated that no amount of manipulation will prevent the formation of the precipitate. Mr. Henry Brown, however, discovers that the precipitate is soluble when heated to 130° F. This discovery, however, is practically useless, as the precipitate comes out of solution upon the mixture cooling; therefore, the only thing which the dispenser could do in the matter was to show it to the prescriber, and this, I think, is the duty of a dispenser in reference to incompatible mixtures such as this one, when the desirability of omitting one or more of the ingredients is quite apparent. When a dispenser fails to dispense a prescription satisfactorily, he may not on his own authority care to tell a physician that his prescription cannot be dispensed; but when it cannot be dispensed by any of those who turn their attention to the "Dispensing Memoranda," I think he may fairly infer that the prescription is one which cannot be dispensed with any degree of satisfaction; he should, therefore, have no diffidence in showing it to the prescriber.

Belfast. John Morrison.

[*** Several other letters have been received upon the subject of this prescription, some of them unfortunately wandering away into personal and, therefore, irrelevant observations; but as opinion has already been so fully expressed respecting it, the correspondence must now be considered closed.—Ed. Ph. Journ.]

---

[173]. I see by the remarks in "The Month" of to-day's Journal that you are of opinion that a mixture instanced under this number (p. 460) should be made with the addition of "mucilage, or any equivalent agent, as it would be almost impossible that such a mixture could be administered so that each dose should have its proper proportion of camphor." It is on this ground that I am again troubling you and your readers, and the question I wish to ask is this: Would a dispenser be justified in adding any suspending fluid so as to make it "tolerably presentable" without the sanction of the writer? It had been previously dispensed by a well-known London house (whose name I enclose), and, from what I can gather, it had been sent out in a very similar way, with the camphor floating on the surface. I certainly coincide and appreciate the remarks of Mr. Henry Brown that the best course to be adopted in this instance is to send the mixture out in six 1oz. vials, adding the proper quantity of spt. camph. to each bottle.

J. W. Barnes.

---

[188]. In answer to W. F. W., I write to say there was a printer's error in copying the above prescription which I sent up for insertion; it was printed "aquæ ℥vj," it should be "aquæ ad ℥vj," making the double quantity as I said ℥iss, and giving in my opinion a very excessive dose of pot. bicarb. to an infant five months old.

T. H. N.

---

[201]. In answer to J. T. B.'s query I should say he was quite correct in dispensing liq. hydr. perchlor. for sol. perchlor., though no prescriber could have blamed him if liq. ferri perchlor. had been dispensed instead.

G. H. L.

---

[202]. Should suggest placing the ol. lini in a mortar, adding the balsam gradually with brisk trituration, and charge 3*s.* 6*d.* for dispensing the same.

G. H. L.

---

[204]. "Tyro" should triturate the aloes to powder, add extracts, and lastly the oil 6 minims (not 6 drops) and a beautiful mass will be obtained which will roll very easily.

I see no difficulty in dispensing this prescription and have often dispensed similar pills with the subsitution of hyoscyamus for belladonna, and should advise "Tyro" to try again.

Minor.

---

[205]. If the bismuth and tragacanth be thoroughly mixed before water is added a good mixture may be obtained with care. But a safer way would be to make a mucilage with the tragacanth and rose water, and add this to the bismuth with brisk trituration, adding the acid. hydrocyanic. lastly and directing it "Shake the bottle."

G. H. L.

---

[205]. Place the pulv. tragacanth. ℥ij. in a dry 12oz. bottle, pour on it spirit. vini rect. ℥ss, and shaking, add in successive portions a few ounces of the aq. rosæ; continue the agitation, a perfect mucilage being thus formed. Put up the bismuth. subnit. ℥ij. in a mortar with it, transfer to bottle, and add remainder of the aq. rosæ, and lastly the acid. hydrocyanic. dil. Label "Shake the bottle."

Sub Umbra Floresco.

---

[205]. Suppose prescription No. 205 to stand as corrected in "The Month," how ought it to be dispensed?

℞	Bismuth. Subnit.	℥ij.
	Pulv. Tragacanth.	℥j., gr. xij.
	Acid. Hydrocyan. Dil. . . .	♏ xij.
	Aq. Rosæ . . . . . ad	℥xij.

M.

There being no spirit or tincture in the mixture, would the addition of a small quantity of S. V. R. (say ℥ij.) be justifiable?

Tyro.

---

[208]. I should have added sufficient acid. sulph. dil. to dissolve the quinine, believing the small quantity ordered to be a clerical error of the prescriber. A short time since a prescription was brought me for a mixture containing quinine, without any acid to dissolve it. It had been previously dispensed, but I had no opportunity of ascertaining how. I added sufficient acid. sulph. dil. to dissolve the quinine, and when I saw the patient he told me that he was glad I did so, as it had been dispensed as written before, so that he was taking the water and leaving in the bottle the quinine, until he sent it back to the chemist who dispensed it to have some acid added to dissolve the quinine.

J. S. Hicks.

Looe.

[213]. Whilst we are on the topic of suggested alterations for a future Pharmacopœia, I should like to ask if some of our readers could tell me of a simple plan of mixing with water for use the pulv. rhei co. of our present Pharmacopœia, which is not unfreqently brought back by my customers for me to mix for them. Would it not be a great improvement to substitute the mag. carb. pond. for the magnes. levis in our next edition, which I believe is very commonly done in practice by chemists at the present time?

I should also be glad to know why adeps benz. should be used in making suppos. morph.; I have had considerable experience in their manufacture, but have never been successful in obtaining a satisfactory result according to the B.P., whilst the following formula leaves nothing to be desired:—

℞ Morph. Hydrochlor. . . . . gr. vj.
Ol. Theobrom. . . . . ʒij.
Ceræ Alb. . . . . ʒj.
M. Ft. Suppos. xij.

A. B. C.

---

[214]. I had a prescription to dispense to-day of which the following is a copy:—

℞ Hyd. c̄ Cretæ . . . . . ℥ss.
S.S.
Pulv. seidlitz in hora postea.

I hesitated in the dispensing of it and not knowing the prescriber I concluded it was a mistake. So I got the address of the prescriber from the patient, and the prescription was sent to him, when he immediately said it was quite right, and censured me for not dispensing it and concluded by saying I did not know my business.

Will any one kindly inform me what he would have done under the circumstances?

ASSOCIATE.

---

[215]. The following prescription was brought to me a few days ago:—

℞ Atropiæ . . . . . gr. $\frac{1}{20}$
Gelatin., etc. . . . . q. s.
Fiat pessar. Mitte vj.

Would some kind reader give a good formula for dispensing such an one?

JUNIOR.

---

[216]. Should plumbi acetas, B.P., be used in this prescription?—

℞ Plumbi Diacet. . . . . gr. vj.
Spt. Vini Rect. . . . . ℥j.
Aquæ Destil. . . . . ℥vss.
Misce. Fiat lotio.

COLLEGIA.

---

[217]. What is the best way to make an adhesive margin for a belladonna plaster?

COLLEGIA.

---

[218]. I had the following to dispense the other day:—

℞ Quiniæ Sulph. . . . . ℈ij.
Acid. Sulph. Dil. . . . . ♏v.
Syrupi . . . . . ℥ss.
Aquæ . . . . . ad ℥iv.
Misce. Capiat ʒj. secundis horis. When cool.

As the quantity of acid ordered is not likely to dissolve the quinine, was I justified in dispensing it as written? Or in adding more acid? I may say that I adopted the former plan, a "shake the bottle label" being necessary.

MINOR.

---

[219]. ℞ Pulvis Rhei Comp . . . . ℥ij.
Mitte in phiala et signa ʒj. h. s. p. r. n.
What should this be labelled?

SUB UMBRA FLORESCO.

[220]. "Dispenser" would like to know how to dispense this prescription so that it will not separate:—

℞ Ol. Ricini. . . . . ʒj.
Ol. Amygdal. . . . . ʒj.
Sp. Ammon. Ar. . . . . ʒij.
Tr. Opii . . . . . ʒj.
Aquæ . . . . . ad ℥iv.

---

[221]. G. H. L. asks how the following can be dispensed so that there shall be no sediment:—

℞ Potass. Chlor. . . . . ℥iij.
Pulv. Tragac. . . . . ℈j.
Aquæ . . . . . ad ℥ij.
M. fit. emulsio more dicto utend.

---

[222]. In your comments on the "Dispensing Memoranda," in your article called "The Month," in the Journal of December 28, you refer to the frequent occurrence of questions so similar that to all intents and purposes they may be considered the same; but many repetitions of the same word do not seem to suffice some of our brethren. I think a rule might well be laid down which would to some extent benefit them, as they hinder your valuable time and space. As a general rule, I would say, "Dispense all mixtures as written," provided, firstly—that on shaking (if required) they present a homogeneous mixture, by which I mean perfectly uniform doses; and, secondly, that they do not contain a dangerous dose,—in case they do communicate with the writer rather than alter the dose. If they do not answer the first condition, make some simple addition, if possible, using the utmost discretion. For instance, in No. 200 an addition of some kind of mucilage is necessary for proper admixture. In No. 207 an addition would be indiscreet, as mucilage would turn acid by keeping, and, of course, an alkali could not be used as an emulsifying agent; and, therefore the writer should be consulted. But I refer now to mixtures, which are the chief subject of inquiry. In 208 the dispenser conformed to my rule, although doubtless the writer intended a solution, which many dispensers would have effected as being more elegant dispensing. If the above rule were always attended to, complaints from customers that their mixtures were dispensed differently at other houses would be at an end. J. O. SMITH.

---

[223]. What would be the proper strength of the "Liq. Morph. Bimec." in undernoted prescription?—

℞ Ac. Hydrochl. Dil. . . . . ʒij.
Liq. Morph. Bimec. . . . . ♏xl.
Tr. Calumbæ,
Syr. Zingib. . . . . āā ℥iss.
Vin. Ferri . . . . . ad ℥iss.
ʒj. ter die ante cib. BOLUS.

---

[224]. J. S. WILKES, 236, Broad-street, Birmingham, will be glad to be informed the best mode of dispensing the following so as to produce a pill of suitable consistence. not exceeding five grains in weight:—

℞ Ext. Cannab. Ind.,
Ext. Nucis Vom.,
Galbani . . . . . āā gr. j.
Camphoræ . . . . . gr. iss.
Aloin . . . . . gr. ss.

---

[225]. I shall be glad if you will let me know, through your columns, if the following mixture can be dispensed in such a manner that the pulv. tragac. may be thoroughly dissolved. If so, how?—

℞ Bismuth. Subcarb. . . . . ʒj.
Pulv. Tragac. Ver. . . . . ℥ss.
Liq. Belæ . . . . . ℥ss.
Tr. Catechu. . . . . ℥ss.
Tr. Opii. . . . . ℈ij.
Aquæ Cinnamomi . . . . . ad ℥vj.
M. Capiat cochl. ij. magn. ter in die.

AN APPRENTICE.

[226]. I had the following prescription given me to dispense :—

℞ Spirit. Terebinthinæ . . . . . ℥ss.
Mist. Guaiaci . . . . . ad ℥viij.
M. Ft. mist.

Which is the correct way to make it up so as to prevent the oil remaining at the top?

OMEGA.

---

[227]. In the following prescription should sodæ carb. or sodæ bicarb. be used?—

℞ Pulv. Rhei . . . . . grs. xx.
Pulv. Zingiber. . . . . ℥j.
Sodæ Carb.. . . . . ℥ss.
Sodæ Sulphitis . . . . . ℥ss.
Misce. Fiat pulv. quorum sumat ℥j. quotidie ex aqua.

OMEGA.

---

[228]. Will you kindly say from what kind of opium tinct. opii, B. P., is intended to be made? Opium in coarse powder is ordered. Does this mean ordinary moist gum opium rubbed down in a mortar to a state of coarse division, air dried opium reduced to coarse powder, or otherwise dried powdered opium? If either of the latter, is any allowance to be made for loss of moisture, etc., by evaporation? I may say I have always taken it that to rub down the moist gum in a mortar with a little proof spirit and pass through a 36 sieve fulfilled the requirements of the B. P. without any loss of volatile principles.

T. T.

Notes and Queries.

[547]. SYRUP OF CROTON CHLORAL HYDRATE, containing 2 grs. in each fluid drachm, may be made by dissolving 16 grs. of croton chloral hydrate in 30 minims of absolute alcohol, or a drachm of rectified spirit, and adding syrup of any desired flavour, sufficient to make an ounce.

The following yields a nicely flavoured syrup:—

℞ Crot. Chlor. Hyd. . . . . gr. xvj.
Tinct. Aurant. Recent. . . . . ℥j.
Solve et adde
Syrupi . . . . . ℥vij.

Belfast. P. BOA.

---

[547]. SYRUP OF CROTON CHLORAL.—I make a syrup of croton chloral by dissolving the croton chloral in water in an evaporating dish, applying sufficient heat to do so, and adding sugar to make a syrup of the same strength as syrupus simplex, containing 2 grs. croton chloral in ℥j., and although not flavoured, children for whom it has been prescribed in cases of whooping cough with very great benefit do not object to the taste. Of course any flavouring agent could be added if deemed advisable. J. S. HICKS.

Looe.

---

[548]. TINCT. JABORANDI—

℞ Powdered Jaborandi Leaves . . . 10 ozs.
Rectified Spirit . . . . . q. s.

Percolate until a pint of tincture is obtained.

Dose ♏x. ad ℥j. vel ℥ij.

SUB UMBRA FLORESCO.

---

[549]. SYRUP. FERRI PHOSPHATIS COMP. (PARRISH).—In the manufacture of this preparation I employ three solutions, which I mix together and bring up with water to a certain measure, and to this is then added the sugar and the cochineal.

The solutions are prepared as follows :—

1. Dissolve ferri sulph. granul. in cold, and sodæ phosphat. in boiling water, mix the solutions, and, after carefully stirring, transfer the precipitate to a calico (or ordinary paper) filter, and having washed it with water until the filtrate ceases to be affected by baric chloride, dissolve it in acid. phosph. syrup. (sp. gr. 1·750) and water.

2. Calcis phosph. præcip., B.P., wash by decanting several times with cold water, and solve in acid. phosph. syrup. and water.

3. Sodæ subcarb. et potassæ. carb., solve in water and add acid. phosph. syrup.

These salts all appear to be perfectly dissolved in their respective solutions.

I have heretofore always succeeded in producing an excellent syrup from this recipe, but in the manufacture of my last batch, on mixing the solutions together a copious precipitate of a light bluish appearance was deposited, which I infer was phosphate of iron. The acid. phosph. syrup. employed was sp. gr. 1·500, but an extra quantity was proportionately added.

I should esteem it a favour if any reader could mention what caused the precipitate, or could suggest a good remedy in case of the recurrence of those distressing symptoms.

SUB UMBRA FLORESCO.

---

[549]. LIN. STOKES (?), GRAVES, OR ST. JOHN LONG'S.—"Sub Umbra Floresco" might search all the books in Christendom without finding out what he wants. There is no liniment properly called "Stokes." The late Dr. Graves was in the habit of ordering and strongly recommending a modification of St. John Long's celebrated quack preparation; and I know, when I was in Ireland, many medical men ordered "Lin. Stokes" instead of "Lin. Graves," they not paying any attention to the error, or more probably, not thinking about the matter, having once heard perhaps an old teacher expatiating upon its merits and who by mistake called it "Stokes" instead of "Graves." Thus errors are handed down for years, and even the future fails to eradicate them in many instances.

I shall give Dr. Graves's form from his celebrated lectures, and also the supposed form for making St. John Long's liniment. The lin. terebinth. acet. of the B.P. is a sorry imitation, and anything but a satisfactory form. I strongly recommended the article in the Journal upon the lin. terebinth. acet. by Mr. Symons, p. 505, to careful perusal.

Dr. Graves's form: "Strong acetic acid ℥ss, oil of turpentine ℥iij, rose water ℥iss, essential oil of lemon, a few drops, and yoke of egg, sufficient quantity to suspend the turpentine."

Supposed form of St. John Long's: "The yoke of one egg, oil of turpentine ℥iss, strong acetic acid ℥j, pure water ℥iij (some give rose water). Rub the yoke of egg, water, and acetic acid together; add the oil of turpentine and agitate." I may state the liniment improves by keeping and loses the yellowish tint.

The addition of the two drams of glacial acetic acid to the quantity (℥iij) is simply to increase the rubefacient properties of the liniment, and the order to "shut their eyes, open their mouths, and draw in their breath during each application," is given with the intention of the patients inhaling the fumes of the acetic acid and turpentine during the process of rubbing in upon the chest and neck. I may state neither Dr. Graves nor Dr. Stokes had much faith in inhalations. I candidly believe they were right, and may quote the following from 'Stokes on the Chest' :—"I have seen the most dreadful consequences from the use of stimulating inhalations, carelessly, or too long employed."

In regard to such irritants as chlorine, when used as an inhalation, Stokes says it is attended "always with bad effects." I do not remember any direction in "Graves" similar to the one quoted by "Sub Umbra Floresco," and think it is the instruction of the physician to his patients who orders "Stoke's liniment" instead of Graves' modification of St. John Long's.

Northallerton. HENRY BROWN.

[550]. As syr. ferri dial. will not keep, it may be made extemporaneously with equal parts of liq. ferri dial. and syrup. flor. aurant.

SERVUS.

[554]. ITCH OINTMENT.—Will any of the readers of the *Pharmaceutical Journal* supply me with a good formula for making "Itch Ointment" which does not contain sulphur.

HELLEBORUS NIGRA.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

EAST INDIA HOME-MADE CINCHONA ALKALOIDS.

The following letter, addressed to the Under Secretary of State for India, relates to an official publication containing a collection of papers showing the recent results of the trial of cinchona febrifuge, quinetum alkaloids and sulphate of quinetum, and issued by the Government of India.

We purpose taking an early opportunity of referring more fully to these results.—ED. PHARM. JOURN.

Sir,—I am in receipt of yours of the 29th ult., together with the "collection of papers," which I have studied, and will endeavour to meet the wishes of Lord Cranbrook by transmitting the following observations:—

I have always sought loyally and faithfully to serve Her Majesty's Government, and now see that a very considerable economy has resulted from the adoption of the line of action, which I believe that I was the first to suggest, viz., that of the substitution of the remaining alkaloids for quinine to a large portion of the total amount needed for the supply of India.

In so far I agree with Dr. Macnamara, but I am not disposed to endorse this gentleman's opinion that the "mixed alkaloids" from the Darjeeling bark can in their present form be made available for the purpose.

My own experience induces me to coincide rather with the conclusions to which the appointed "Committee" were "unanimously" led, that "the drug contains a nauseating principle, from which it ought, if possible, to be freed;" and that "there is good reason for suspecting that the nauseating principle really is the amorphous alkaloid."

For "alkaloid" I should substitute "alkaloids," for I have said in 1862 that "the characteristic peculiarity of red bark is that it ordinarily contains, and that quite irrespective of the brightness of the colour, as much as three to four per cent. of the substance of the bark, and this divided amongst the alkaloids, quinine, cinchonine, cinchonidine, quinicine (?) and aricine (?)."

I took some pains in the investigation, without arriving at full certainty as to the properties of the two last, but I have reason to believe that aricine is a powerful emetic, and if the "amorphous alkaloid" contains a modification of this substance I do not wonder that the effects are disagreeable.

The purified preparations, such as the quinetum sent from this country, or the preparation of Dr. de Vrij, have no doubt very different effects to those of the mixed residuary amorphous alkaloids. These are capable of producing death under a fearful aggravation of symptoms, such as have been observed in a milder form and registered in the "collection of papers." The occurrence of a death by misadventure from about an ounce of the solution taken in mistake for "black draught," showed the potency of the preparation; as the death of the young workman, who was the sufferer, occurred in about half an hour.

On the whole, I think it most important that the noxious element of "17 per cent. of amorphous alkaloid" should be eliminated. The Government would then possess in the remaining 83 per cent. a febrifuge of certain and ascertained properties not liable to the objections which attend the present preparation.

(Signed) JOHN ELIOT HOWARD, F.R.S.

To the Under Secretary of State for India.

Lord's Meade, Nov. 2, 1878.

WAS THE PHARMACEUTICAL SOCIETY REPRESENTED BY THE MEETING ON THE 9TH?

Sir,—I cannot think the whole of those present on the 9th were members of the Society, and should be obliged by the Secretary examining the entrance book, and reporting as early as possible, to remove the doubts of

A PHARMACEUTICAL CHEMIST AND MEMBER OF THE SOCIETY.

London, Jan. 15, 1879.

THE TRADE OF A CHEMIST AND DRUGGIST.

Sir,—Can nothing be done or suggested by those in power to ameliorate our conditions as men who want to live by their own legitimate trade, without, as now appears, being limited to conditions which must tend ere long to make us more generally than ever the "trade parasite" of the grocer?

With counter prescribing condemned and threatened, whilst at the same time patent and other medicines becoming more and more adopted as articles of every grocer's establishment, but made only to bear that tradesman's usual profit of from 5 to 10 per cent., the conditions are such that no chemist (excepting those few of us who live mainly by dispensing doctors' prescriptions) can long withstand; for if left to subsist out of such drugs, etc., as are comprehended in the schedule of poisons, and over which we enjoy such a complete monopoly (!), we shall soon be dead.

Now, Mr. Editor, I cannot but think that those of the Council, and of the trade who, fortunately for them, are not with us in the view we take on "counter prescribing," partly, if not altogether, no doubt, because of the dissimilarity of our several interests as involved in the question—I say I cannot but think that these gentlemen must see, through your advertisement columns, under "Businesses for Sale," how large a percentage of them yield no greater a turnover than from £100 to £300 per annum! This fact, but for the little prescribing they do, together with their sale in patent medicines, must make them almost valueless as livings.

In conclusion, I would just suggest that if the funds of the Society are not to be employed in defence of the real interests of the trade that they will at least be employed towards alleviating trade distress, which must be the inevitable outcome of the Council's present policy.

Dewsbury. H.

LINIMENTUM TEREBINTHINÆ ACETICUM.

Sir,—Mr. Symons in his paper on this preparation, published page 505, seems to have overlooked the activity of the turpentine and camphor liniment. I read his remarks at the Conference of 1875, and in consequence I have frequently made (and with the physician's permission dispensed) a liniment having the following composition:—

Glacial Acetic Acid	1 ounce.
Camphor Liniment	3 ounces.
Turpentine	3 ,,
Olive Oil, to make	6 ,,

This, I think, very nearly represents the official preparation, but if the excess of olive oil is objectionable spirit may be substituted, under the conditions Mr. Symons pointed out in his first paper on this subject.

P. B.

Hypochlorite of Sulphur.

Sir,—The fact of "Sulph. Hypochlor." being explosive, has, I know, been noticed before in the Journal, but I think it well to mention the following circumstance, as a warning to any who have to use it. I this morning had occasion to open a bottle containing it which had never been opened since I received it from the wholesale house (perhaps twelve or eighteen months ago). The stopper being fixed, I rolled the bottle in a cloth, and tapped the stopper with the handle of a spatula; presently it flew out with a bang, and the shop was filled with smoke, the fumes, of course, being anything but agreeable. Had the side of the bottle given way, instead of the stopper coming out, and had it not been covered with a cloth, the consequences to the hand might have been serious. I mention this as a reminder of remarks some time since made by one of your correspondents, and also as a caution to all in dealing with hypochlorite of sulphur, when enclosed in glass stoppered bottles.

Shirley. F. B. W.

Revision of the Pharmacopœia.

Sir,—As the subject of Pharmacopœia revision is from time to time discussed in your columns, there are evidences that certain additions and expulsions will ere long be required.

It is difficult to understand why potassæ sulphas occupies a place in the national Pharmacopœia. Its office is to dilute p. ipecac. co. and give stability to pil. colo. co.

Either of these subordinate tasks would be equally well performed by potassæ tartras acida, thus obviating the possibility of an abbreviated prescription, written "pot. sulph. ℥j" without directions for use, having the above inert substance supplied instead of liver of sulphur.

Another article in the chemical section not having the confidence of the faculty is p. antimonialis, proved by the fact of medical men still clinging to p. jacobi ver. (by the bye may this mysterious powder be the product of cremation?). Some things weak in themselves may prove useful auxiliaries, and Dr. (P.B.) James might be of some use to Dr. Dover. It appears evident that a mild compound powder, intermediate possibly in effects between p. ipecac co. and tartar emetic is required, one that will not like p. antimonialis, receive the "frigid limb."

Alfred Jones.

[*** It is now a timely opportunity for practical pharmacists to offer such suggestions as may occur to them for the future amendment of the Pharmacopœia, and we trust that in this respect our Correspondent's example will be followed by many others.—Ed. Ph. Journ.]

Unusual Doses and Alterations in Prescriptions.

Sir,—Referring to the prescription in the Journal for Nov 30, it is certainly a very extraordinary one, if it has been correctly copied. I thought at first it surely must be santonicæ one-half ounce troy, instead of santonini. I find in Neligan's 'Medicines,' 1853 edition, there are two kinds of santonine mentioned, a brown, dose five to ten grains, and a pure white kind, dose one to two grains; there is also a form for brown santonine lozenges with ol. limon., etc., and I observe ol. limon. is ordered in the prescription quoted.

One large single dose may often be ordered, but I do not think any prescriber would intentionally order twenty grains three times a day of the pure santonine.

In the article on Ascarides, in Dr. Stone's 'Epitome of Therapeutics,' where Drs. Spencer Cobbold and Kückenmeister, and the best authorities at home and abroad, are quoted, I cannot find anything approaching twenty grain doses; average two to five grains. In Dr. Scoresby Jackson's 'Pharmacology,' the dose is given as five to ten grains for an adult, once daily or on alternate days.

In Wood and Bache's 'Dispensatory' it states that a child of four years was made seriously ill by a dose of three grains. Regarding the subject of unusual doses generally, medical men might adopt a very simple and effectual plan, by underlining the quantity ordered, and putting their initials at the side, so that the dispenser might have full confidence in compounding the medicine.

Respecting alterations in prescriptions, any alteration or addition would be noted at once, if it were dated and initialled on the left hand side of the prescription in brackets: and the dispenser's attention would be called to it, so that he might make the necessary alteration in the copy in the prescription book.

I look upon prescriptions as confidential communications, and think every care should be used to make them quite clear and to show that any alteration has the prescriber's authority, as some patients are apt to make alterations of their own.

About six months ago, I had a prescription with a fictitious signature, and on my asking where the medical man lived who had written it, as I wished to refer to him, the reply was, "Refer to 'Cassell's Magazine,' from which the prescription has been copied." This contained liq. arsen. hydrochlor. in large doses, and was not, to my thinking, a proper medicine to be used, except under medical advice, and with due precautions.

In the event of any accident happening from this arsenical mixture, great responsibility would attach to the chemist who supplied it, and there is reason to fear that there are a great many unauthorized prescriptions in circulation.

Frater.

Errata.—On p. 572, col. 1, the date of the meeting of the Special Meeting of the Council should be "Thursday January 9." In Mr. Frazer's remarks on p. 586, col. i, line 15 from bottom, *for* "eight leading banks in Scotland which would have each voted £10,000," *read* "seven leading Scotch banks which each were expected to have voted £10,000."

A. Perkin.—The following formula for such a preparation is given by Squire under the name of Liquor Chloroformi Compositus. See also the discussion on the composition of Chlorodyne in vol. x. of the second series of this Journal:—

Chloroform	4 oz.
Ether	1 oz.
Rectified Spirit	4 oz.
Treacle	4 oz.
Extract of Liquorice	2½ oz.
Muriate of Morphia	8 grs.
Oil of Peppermint	16 minims.
Syrup	17½ oz.
Prussic Acid (2 per cent.)	2 oz.

Dissolve the muriate of morphia and the oil of peppermint in the rectified spirit; mix the chloroform and the ether with this solution; dissolve the extract of liquorice in the syrup, and add the treacle; shake these two solutions together and add the prussic acid."

Walter P.—The Dental Act is printed on p. 52 of the present volume, and information respecting the procedure for obtaining registration under the Act is given on p. 169. Questions as to any further details should be addressed to Mr. Miller, the Registrar under the Act, 315, Oxford Street, W.

C. T. Brooks.—The quantity of opium is not written sufficiently distinctly.

C. E. L.—A copy of the Weights and Measures Act was issued with the Journal of the 4th inst.

M. P. S.—A person registered under the Act is "entitled to practise dentistry and *dental surgery*."

"*Pharmaceutical Student*" is recommended to bring the subject under the notice of the Secretary.

F. E. B.—Numerous recipes for colours for carboys have already been given in this Journal.

"*Minor.*"—Apply to the Secretary for a copy of the pamphlet entitled, 'Hints to Apprentices and Students.'

J. Thompson.—We believe that such legislation as exists respecting the practice of pharmacy in the Dominion of Canada provides that persons holding the certificates of the Pharmaceutical Society of Great Britain shall be entitled to registration without examination. We do not know of any restriction on the practice of dentistry in the Dominion.

Communications, Letters, etc., have been received from Messrs. Nicholson, Rimmington, Goodrick, Whyte, Brooks, Cassamajor, Fennel, P. Boa, Puntan, and Lewis.

Messrs. Cox, Abraham, and Swinn are thanked for the newspaper reports forwarded by them.

"THE MONTH."

The wintry weather which has during the past month, almost without interruption, clothed the face of nature with a mantle of white, has left but little visible to the eye of the botanist, and our calendar of medicinal plants for this month must of necessity be a small one. Although those accurate observers of vegetation, the hares and deer, have in the north of Britain been dying of starvation in large numbers for want of herbage, in the south a few flowers still venture to struggle against rude Boreas, and put forth their blossoms with a confidence and daring which sometimes meets an adequate reward in the notice of admiring human eyes. Thus, on the 29th of last month a correspondent forwarded from the Isle of Wight specimens in blossom of the furze (*Ulex europæus*), the butcher's broom, a buttercup, ragwort (*Senecio Jacobœa*) and the wild cornel tree (*Cornus sanguinea*) with unopened flower-buds. To-day he sends catkins of the hazel just shedding their pollen, and on the same stem the bud-like pistillate flowers adorned with tiny crimson tassels of stigmas. The "flourishing of the green bay tree" in that pleasant island is evident from the abundance of its flower-buds, while to the

> "Dark yew. . . . . .
> . . . . too, comes the golden hour
> When flower is feeling after flower;"

and the lover of microscopical amusements will be repaid for his trouble if he shakes a little of the pollen off and carefully examines its structure. Thus far from the Isle of Wight. Further south news comes from sunny Italy that on New Year's Day a larger total of flowers were in blossom than on the same date during the two preceding years, and Mr. Thomas Hanbury sends to the *Gardeners' Chronicle*, a long list of plants in blossom in his garden at Mentone, among which may be noticed *Eucalyptus globulus* and *Datura alba*, the sandarach plant (*Callitris quadrivalvis*), wild senna (*Globularia Alyspum*), *Aloe africana*, the strawberry tree, the pomegranate, St. John's bread (*Ceratonia siliqua*) and many other plants well known in British gardens and greenhouses. Even in Italy, however, the cold has been unusually severe, and at Cannes, which is much more exposed than Mentone to the northerly winds, many of the more delicate plants are frozen and dead. Mr. Hanbury relates a vexatious case of official zeal, which we may repeat here as a warning to any botanists who purpose collecting specimens in Italy in the coming summer. A botanical friend who paid him a visit last spring found, to his intense disgust, that a number of specimens which he had carefully collected and dried were, when they arrived at the Custom House, taken out of the pressing paper, pounded up to powder and burnt! The apparent object of this excessive zeal is to prevent the introduction of the vine pest (*Phylloxera*) into Italy. Although the officials "strain at a gnat," they do not hesitate to swallow a camel, for much larger packages of plants, equally open to suspicion, viz., loads of hay, are allowed to pass the frontier without comment. A somewhat similar case happened with six boxes of plants, among which it is presumed were tubers of the gigantic aroid recently discovered by Dr. Beccari, and alluded to in a former number, which on their arrival at Genoa were not permitted to be landed. Fortunately the objection was ultimately withdrawn, or one of the most remarkable plants introduced of late years to botanical science might have shared the fate of the other botanical specimens. It is evidently quite time that the Customs authorities should have a scientific officer or referee on their staff.

But although the weather is comparatively milder in the south, undoubtedly it will destroy many valuable plants. From Belvoir Castle reports come that the *Eucalyptus globulus* is dead down to the ground, although singularly enough in the Isle of Man, according to a report recently read at the Edinburgh Botanical Society, the blue gum trees have been uninjured by the frost, although birds were dying by the score. Another writer in the *Gardeners' Chronicle* reported, however, that early in the year five species of *Eucalyptus* were not injured by the frost at Menabilly, in Cornwall.

The curious butchers' broom, *Ruscus aculeatus*, deserves a short notice on account of its mode of growth. The apparent leaves are believed to be flattened branches terminating in a short spine, and having an axillary flower bud, underneath which may be seen a few membranous bracts, the lowest of which is bristle-pointed, the true leaf being scarcely visible as a linear tapering membranous scale at the base of the apparent leaf. The transition of the rounded to the flattened branches may be occasionally noticed, and some of the flattened branches do not develop flowers. Formerly the plant was esteemed as a remedy for gravel and as a diuretic, and the decoction of the roots is said by Gerarde to be of value as an expectorant.

In the *Journal of Botany* for this month a notice is given of an interesting paper by the late Alexander Braun on the examination of the vegetable remains in the Egyptian Museum in Berlin, which possesses an important bearing on botanical science. Naturally one of the most attractive questions leading to this examination was whether the vegetable remains, nearly five thousand years old, presented any important difference from present forms of the same species. It seems, however, that with the exception of a few unimportant variations from the present forms of the fruits of the pomegranate no actual difference exists between the ancient and modern specimens of the same species. The special inducement to the examination made by the late Professor Braun seems to have been the remarkable discovery by Professor Oswald Heer, of Zurich, that the flax found in the lake dwellings does not belong to the species now cultivated, *Linum usitatissimum*, L., but to the *Linum angustifolium*, Huds., which is not now cultivated, although a native of the Mediterranean region, France and Britain. The species which was cultivated in Egypt is, however, not yet settled. *L. angustifolium* has fruits and seeds only half the size of those of *L. usitatissimum*, so that the two are easily distinguished.

Some recent researches by Mr. G. Dutailly upon the axillary formations in the cucurbitaceæ reveal the fact that in the axil of the leaf of *Ecballium Elaterium*, *Bryonia dioica* and some other plants of the same family, there is developed but a single axillary leafy bud, of which the lower two internodes are extremely short, and that the branches which are inserted on them are of a special nature. At the lowest internode is a tendril (which is absent in *Ecballium*) and at the second node a flower or inflorescence is given off; the third node is always normal, bearing an ordinary leaf. The tendril in cucurbitaceæ ap-

pears, therefore, to be a modified branch, and not a stipule or leaf, as hitherto supposed.

A curious instance of the way in which plants are occasionally lost sight of for a number of years, so that their existence in a particular locality after a time becomes a matter of doubt, has recently come to light. In *Harper's Weekly* Professor Asa Gray announces the re-discovery in the same district, after the lapse of over one hundred years, of a plant called *Shortia galacifolia*, formerly obtained by Michaux in the mountains of North Carolina.

The Reporters on the biliary secretion of the dog with reference to the action of cholagogues,* appear to be rendering good service to medical science by pointing out in some cases the unsuspected value of some remedies and the comparative feebleness of others. Among other curious results it has been shown that every purely purgative drug depresses the action of the liver, while acetate of lead is the only one yet experimented with which depresses its action without producing purgation.

The Reporters consider hydrastin to be a hepatic stimulant of moderate power and a feeble intestinal stimulant, and juglandin to be a mild hepatic stimulant and mild purgative well worthy of the attention of physicians in this country. The preparations used in their experiments were the resinous substances prepared respectively from the roots of *Hydrastis canadensis* and the bark of *Juglans cinerea*, in a similar way to that in which podophyllin, leptandrin, etc., are prepared.

Benzoate of sodium has been found to be a very powerful stimulant of the liver, and the corresponding salt of ammonium slightly less so, while salicylate of sodium appears to be a certain and powerful hepatic stimulant, "never failing, when placed in the duodenum, to excite the liver within half an hour."

The preliminary report to the same committee on the action of anæsthetics already inpicates that considerable light will be thrown upon the action of these valuable aids to surgery. Thus, in the experiments which have been made it has been demonstrated that chloroform and bichloride of methylene both deteriorate the action of the heart, while the new anæsthetic, ethidene dichloride ($C_2H_4Cl_2$) (made by the action of chlorine on ethyl chloride, or by distilling aldehyde with pentachloride of phosphorus), causes no sign of failure of the heart's action, while it produces anæsthesia in rabbits and frogs in four or five minutes, and on dogs in three minutes. In one case, however, in which, for the sake of contrast, dichloride of ethidene was replaced by chloroform, the activity of the heart rapidly failed.

The preliminary experiments which have been made seem to point to ethidine dichloride and isobutyl chloride, C_5H_9Cl, as more likely to be serviceable than the other liquids which have been tried, since they do not interfere with respiration and apparently do not produce convulsive effects. The authors point out as worthy of observation the curious fact, that two substances, butyl chloride and isobutyl chloride, having the same chemical formula, should exhibit such different actions. Ethene dichloride and ethidine dichloride, which are also isomeric, illustrate the same fact, the first producing severe convulsions while the second is an excellent anæsthetic, without any convulsive effect. The authors also make the remark that the bichloride of methylene of commerce has not a definite boiling point and is therefore obviously a mixture.

Mr. T. Bird, in the *Medical Times and Gazette*, states that his experience leads to the conclusion that ethidine dichloride is a good anæsthetic for children, but fears that its stimulant action on the heart might cause, in lengthy operations, a reaction in an opposite direction.

In the French Academy of Medicine, a serious charge has been brought against French pharmacy by Dr. Maurice Perrin, in respect to the present supply of chloroform. This he alleges to be far inferior to what used to be available; his experience being that it now requires twenty, thirty or even sixty minutes to produce complete narcotization with it, instead of five or six, whilst it sometimes produces also such unpleasant results that the patient suffers more from the anæsthetic than from the operation. Other speakers, however, testified to the good quality of the chloroform they had operated with, especially in the hospitals, and it was suggested that Dr. Perrin's experience was due to the idiosyncracies of his patients. Nevertheless the editors of the *Répertoire de Pharmacie* have thought it advisable to urge upon pharmaciens the propriety of assuring themselves, by examination, that when this anæsthetic agent is supplied by them it has in every case the chemical and physical characteristics of pure chloroform.

Some interesting observations have recently been made on the poison of serpents by M. Lacerda, in the physiological laboratory of the National Museum at Rio Janiero, which have led him to the conclusion that, in some cases at least, the venom contains an organized ferment presenting some analogies to bacteria. M. Lacerda states that a drop of venom removed from a rattlesnake under the influence of chloroform and examined with the aid of a microscope appears as a "species of filamentous protoplasmic matter consisting of a cellular aggregation disposed in arborescent form resembling certain lycopods." The development and reproduction of these cells is described in a paper read before the French Academy of Sciences (*Comptes Rendus*, lxxxvii., 1094). Similar phenomena were observed in the blood of animals that had been bitten by the rattlesnake, and it was found that such blood was capable of setting up the same change in the blood of other animals when injected hypodermically, and that this change was always followed by the death of the animal.

Some experiments have been made in M. Vulpian's laboratory with the object of elucidating the physiological action of the dried leaves of the *Ilex paraguayensis*, otherwise known as maté, jesuits' tea, Paraguay tea, etc. A large quantity of materials was supplied by the Brazilian minister in Paris, and the experiments were made on dogs, by M. L. Couty. From these it would appear that maté exercises a local action, especially on those organs which are relatively most independent of the nervous centres, such as the intestines, the bladder, and the accelerator nerves of the heart.

Dr. Hesse has examined chemically a bark that was formerly looked upon as a cinchona bark, and has been known at various times as "écorce de l'autour," "china nova," "china californica," "china brasiliensis," and "china paraguatan." Its present cognomen is "lotur bark," and its botanical source is the *Symplocos racemosa*. Dr. Hesse reports (*Ber.*

* *British Medical Journal*, Dec. 28, 1878; Jan. 11 and 18, 1879.

d. deutsch. ch. Geselsch., x. 1) that he has obtained from this bark three alkaloids which he has named "loturine," colloturine," and "loturidine," and between which he thinks probably there is the same relation as exists between cusconine, aricine and cusconidine. Loturine is present in largest quantity (0·24 per cent.); it is crystalline, and forms crystalline salts. Colloturine is also crystalline, but loturidine is amorphous. All three alkaloids in dilute acid solutions show an intense blue-violet fluorescence. Winckler some years ago obtained from this bark an alkaloidal substance which he named "californine," but Hesse believes this to have been a mixture of the acetates of the three alkaloids.

Reference was made in the Report on the chemical exhibits in the Paris exhibition which recently appeared in this Journal to the production of trimethylamine compounds during the utilization of beet root residues according to the process of M. Vincent.* The hydrochlorate of trimethylamine yielded is usually contaminated by small quantities of chloride of iron and hydrochlorate of ammonia. This can be removed by decomposing with soda and collecting the gas in pure hydrochloric acid, removing from the solution a slight crystallization of hydrochlorate of ammonia that forms, and treating the mother liquor with soda. The pure trimethylamine thus obtained boils between 9° and 10 C., and has a density at zero of 0·673. On bringing such trimethylamine kept in the liquid state by low temperature into contact with carbon bisulphide a violent reaction takes place and a new crystalline body is formed. This substance can also be prepared more readily by passing a current of gaseous trimethylamine into a mixture of carbon bisulphide and alcohol; the alcohol dissolves it as formed, and afterwards yields it on evaporation in fine white acicular crystals. The new compound is a sulphocarbamate of trimethylamine, resulting from the union of one equivalent of trimethylamine with one of carbon bisulphide,

$$N(CH_3)_3 + CS_2 = N(CH_3)_3CS_2.$$

It melts at 125°, but decomposes at the ordinary temperature. It is soluble in dilute alcohol and chloroform, but nearly insoluble in absolute alcohol, carbon bisulphide, ether, benzol and with difficulty in water. The compound has been studied and other of its properties described by M. Blennard. (*Comptes Rendus*, lxxxvii., 1040.)

Dr. S. Shapter states that citrate of caffein in doses of three to six grains acts as a valuable diuretic and cardiac stimulant in some cases of cardiac dropsy. If any valuable application could be found for this alkaloid, the demand would soon lessen the price, it having been stated some time ago that it could be obtained with but little trouble and in large quantities by a simple arrangement connected with coffee roasting apparatus.

Naphthalene has recently been used with success in the bronchial catarrh of old people, and is said to possess the advantage of alleviating cough without interfering with any other than the bronchial secretion. It appears to act as a stimulant expectorant. It is given in doses of one or two grains, either alone or combined with codeia.

Among the numerous new remedies advertised in the United States, two until recently have gone under a fictitious name. These, which are called respectively *Cascara sagrado* and *Yerba reuma*, have lately been identified, and although professedly from the Pacific coast are reported by Dr. Gibbons of San Francisco to be unknown there. Professor Maisch stated at the pharmaceutical meeting in Philadelphia in December last, that *Cascara sagrado* is the bark of *Rhamnus Purshiana*, and that *Yerba reuma* is *Frankenia grandifolia*. The former is used as a remedy for habitual constipation, and probably has a similar action to the bark of *Rhamnus frangula*. The latter is used for mucous discharges, catarrh, etc.

Japanese aconite is gradually finding its way into retail commerce. Specimens received last week from Exeter were stated to have been sent out from a wholesale firm as ordinary rad. aconiti. It is necessary, therefore, to warn pharmcists that since its relative strength has not yet been determined, nor even the identity of its alkaloids with those of *A. Napellus*, it will not be safe to make any preparations for internal use from it. It appears to be even stronger than *A. Napellus*. It is easily recognized by its plump, scarcely shrivelled appearance, and white, very starchy fracture. So far as can be learned at present, the plant yielding it is the *A. Fischeri*, a plant fairly distinct from *A. Napellus*.

In the United States the volatile oil of *Asarum Canadense* is said to be now used to a considerable extent in perfumery for strengthening the odours of other perfumes. Its odour is compared to that of rhodium or sandal wood.

The *Indian Medical Gazette* reports that the jalap cultivated in the Nilghiri hills and sent to this country for examination is stated by Dr. Forbes Watson to yield from 14 to 15 per cent. of resin, which yields 80 per cent. of jalapin, a result which will probably lead to the extended cultivation of the plant in India.

In the drug market this month some remarkably large and fine Tampico jalap appeared in some quantity, and several drugs which are of comparatively rare occurrence, such as Mocha aloes, Ceylon cardamoms, Nepaul cardamoms, Mahwa flowers and seeds, Mechoacan root and China root. The "Calabar beans" offered for sale were the same as reported last month, viz., the seeds of *Entada scandens* mixed with a few seeds of a species of *Mucuna*. True Calabar beans appear to be very scarce at present, as well as Goa powder. Shensi rhubarb, which *New Remedies* states has been out of the American market for some time, was this month offered for sale in London. The scarcity of this variety of rhubarb is by that journal attributed to the famine, which is said to has carried off 7,000,000 of people in the province or Shensi alone.

The application of electricity for purposes of artificial illumination has been very amply illustrated during the past month by the lectures of Professor Redwood and Professor Tyndall. The main result has been to recognize that, except in regard to the conversion of mechanical power into electricity, the practical application of electricity as a source of light is not much further advanced than it was some thirty years ago. A variety of detail improvement has been introduced without, however, exactly attaining all that is desirable so far as constancy and steadiness is concerned. In this respect the new lamp of Mr. Werdermann, however, seems to be very promising. The possibility of subdividing the electric light to such an extent as to make it available for domestic use, or for any other purposes than

* See before, p. 342.

the lighting of very large rooms and open spaces seems to be still as far off as ever, and the latest news of Mr. Edison's inventions does not encourage the hopes raised by the first announcement of what they had secured. It is only a few days since that Mr. Edison's first English patent was sealed. It bears the title of "Improvements in the method of and means for developing electric currents and lighting by electricity," and is dated October 23, 1878. The grant of this patent had been opposed on the ground that it resembled a prior patent of M. Arnaud. Some time, however, may still elapse before the nature of Mr. Edison's improvements is made public, as he has two more applications for patents proceeding in relation to the same subject.

Gas lighting will probably continue for some time longer the chief means of illumination in streets as well as houses, and the first shock of the excitement caused by the prediction that it was to be at once superseded having passed off, the capabilities of gas are being made practically evident. The conditions under which gas is supplied to the local authorities for street lighting are not such as to insure the best effect that can be produced, and keeping the outlay as low as possible seems to have been one of the chief objects in view. An experiment which has lately been made in London proves that the faulty lighting of streets is not altogether chargeable to the use of gas, but rather to the over-sparing of expense that has been practised. To obtain good lighting with gas seems to be to a great extent merely a question of cost, and the increase in the amount of light produced in burning gas being proportionately much greater than the increase in the rate of consumption of gas per burner, there is in one sense a positive advantage in burning gas at such a rate as to get out of it the utmost illuminating effect. Of course the attainment of this result involves regard to a number of details in the construction of burners, etc., and in this respect the London burners invented by Mr. Sugg, the well known gas engineer, have been very successful. These burners were used in the experiment above referred to, with the result that a newspaper could be read by the light at the middle of the Waterloo Road. The cost of lighting in this way was at the rate of 1*s.* 10*d.* per hour, as compared with $5\frac{3}{4}d.$, the cost of the old system, and although most ordinary circumstances would not justify such an increased expenditure for street lighting, the comparison is very much more favourable than that between even this increased expense and the cost of lighting by electricity. This practical illustration of what can be done with gas at a price will serve the useful purpose of showing that there is still a great future for the application of this useful commodity without much fear of interference from the application of the electric light, unless, indeed, some further discovery should be made of which there is at present no sign.

The remarks of last month on new remedial agents are strikingly exemplified in prescription No. 207, where vaseline is prescribed in an eye lotion. This substance, described by its importers as a "novelty" and of "great value in pharmacy," is of comparatively recent introduction and seems now to be shaking down to its proper place as a basis for ointments. It is said to replace glycerine in "ocular therapeutics" and probably therefore the writer of the prescription considered that it had, like glycerine, the property of mixing with water in any proportion. Nothing satisfactory can be done with vaseline in an eye lotion; its introduction must have been ordered in ignorance of its nature, and the observations above referred to may be reproduced here: "that in the case of a new remedial agent a few minutes' conversation on the part of the prescriber with an intelligent dispenser would put him in possession of the pharmacy of the article." In this particular instance the prescriber must be referred to, when some substance such as glycerine may be suggested to supply the place of vaseline.

The prescription No. 208 requires consideration; the quinine is so much in excess of the acid prescribed with it that it would not be safe to assume that the writer intended the quinine to be dissolved. Had the acid been ordered in such a quantity that little quinine was left undissolved, then a further small quantity of acid might have been added with propriety; but in this instance it may be assumed that there was an object in view in the relative proportions of acid and quinine. Quinine is, for instance, prescribed for women whilst suckling their children, and then without sulphuric or any other acid, so as not to interfere with the secretion of milk. In such instances it is simply rubbed down and diffused through the mixture. One at least of our most eminent accoucheurs was in the habit of so prescribing it and with that object in view; therefore if the writer cannot be referred to it would be more safe to adhere to the letter of the prescription, and the quinine being diffused, not dissolved, a label to shake the bottle should be attached.

The pills prescribed in No. 209 are composed of cupri sulph. and ext. opii, and more in each dose than is usually prescribed. The writer of such a prescription should have attached his signature to it, and the dispenser very properly sent it to him to have that done. In the Brit. Phar. the dose of cupri sulph. is $\frac{1}{4}$ to 2 grains and of the ext. opii. from $\frac{1}{2}$ to 2 grains; therefore the quantity of the former was under the maximum pharmacopœia dose, whilst that of the latter did not exceed it. A prescription so clearly written and not exceeding the maximum dose of each ingredient, may, with the writer's signature, have been dispensed without any further hesitation, and particularly as in the absence of written directions it seems probable that the patient had special instructions with regard to their administration. With reference to doses the dispenser must be guided by his pharmacopœia. In other books authors may say what they think proper, and their remarks will generally be found to apply to special circumstances, but when a difficulty occurs in connection with the dose of a pharmacopœial drug, or preparation, met with in a prescription, the pharmacopœia must be consulted, and may with propriety be quoted by the dispenser in bringing the subject under the notice of the writer.

The pharmacist is educated to recognize unusual doses and must take the British Pharmacopœia as his guide. When the dose ordered in a prescription exceeds the maximum pharmacopœial dose, then it is his duty to bring that prescription under the notice of the writer; he has himself no medical education to guide his judgment in what a physician may term exceptional circumstances.

The mixture No. 210 will not have the colour and appearance of clear sherry. It owes the whole of its colour together with a slight turbidity to the tr. gentian. co., but the opacity is mainly due to the sp.

ammon. arom., and in twelve hours or so there will be a deposit.

The prescription No. 211 contains a therapeutic agent which has of late acquired some reputation. There is no official preparation, but a 5 per cent. liquor seems to be generally, but not uniformly, adopted. In a mixture made with such a solution there will be a flocculent separation of a chocolate-brown colour, and on standing the clear fluid occupies one-sixth or more of the bottle. Differences will occur in prescriptions containing dialysed iron, while there is no recognized strength for the solution, and the importance of its being dispensed with uniformity in the same establishment will be apparent to the dispenser.

Prescription No. 212 should be dispensed as written, with the B. P. potass. citrat. It must not for a moment be assumed that a granular effervescent preparation is intended where such is not prescribed. It is difficult to understand why this question should have been asked; there is no ambiguity in the prescription or its directions.

In No. 213 A. B. C. remarks on pulv. rhei. co. that it would mix better with mag. carb. pond. than with mag. carb. levis. Many others are of the same opinion, and it is a subject that may very properly engage attention in anticipation of a new edition of the British Pharmacopœia. Also with reference to suppositories, there is no doubt but that the practical experience acquired by many pharmacists with reference to these articles of the B. P. will be allowed a hearing when the proper time arrives. The British Pharmacopœia should be a model national pharmacopœia, the most perfect extant, and there is no reason why it should not be so, if practical pharmacists take their proper place in its compilation. Returning to the suppositories, however, the cacao butter alone leaves nothing to be desired, and the addition of wax is unnecessary and must increase the melting point.

It is not unusual for a dispenser to meet with excessive doses as in prescription No. 214, but as has previously been stated, he must take the pharmacopoeia as his guide, and the dose of hyd. c. creta in this prescription is nearly four times the quantity of the maximum dose there named. It was his duty to refer it to the writer, who should have initialed so large a dose. Of course it was competent for the writer to say the dispenser did not know his business, but in this instance the cap was placed on the wrong head. "Associate" is referred to the remarks under No. 209, as to a dispenser's duty and responsibility in the presence of a dose in the excess of the maximum given in the B.P.

Prescription No. 215 refers to gelatine pessaries. "Junior" should make some experiments with gelatine and glycerine so as to arrive at the proper proportions necessary to make a jelly of the requisite consistence. He will find valuable information on this subject in *Pharm. Journal*, Dec. 14, p. 502. Having made his jelly it is only necessary to liquefy by means of a water-bath sufficient for the number of pessaries required, and having previously dissolved the atropia in a small quantity of spirit, to add it to the gelatine and pour into slightly oiled moulds. The pessary of glycerine jelly should be of such a consistence as to liquefy at the temperature of the body from 95° to 96°. It must be borne in mind that various samples of gelatine differ materially, and there is no safe guide to the proper proportions other than the liquefying temperature, which is a matter for experiment, but when once determined it will do for all the jelly made from that sample of gelatine.

Plumbi acetas, B.P., should be used in prescription No. 216. It is not unusual to meet with it written plumbi diacet.

"Collegia" inquires in No. 217 the best way to make an adhesive margin for a belladonna plaster. An expert will do it very neatly with emp. resinæ and a plaster iron, but a tyro does it usually with a paper mould from which the plaster shape has been cut just damped at the edges and laid down on the leather. The former is more businesslike, but the latter may suit a "prentice hand."

The quinine prescription No. 218 is the same as that of No. 208, and the remarks under the latter will apply here without further note or comment.

No. 219 is a powder with the direction "signa ℥j h. s. p. r. n." The question is what should this be labelled? The symbol is the apothecaries' drachm, and the label should be "one drachm or sixty grains at bedtime, occasionally." A teaspoonful, which in fluid measure is often written as the equivalent of the symbol ℥j, is not in this instance admissible.

In prescription No. 220 "Dispenser" concludes that the ingredients should be mixed so that they will not separate; this is an assumption on his part. The composition would seem to indicate that it was an external preparation, probably for the hair, having reference to the ingredients and the quantity when completed. There is no room for anything capable of forming an emulsion, and if an emulsion of the two oils were formed by the addition of mucilage, the presence of spirit would determine a separation. In the absence of more specific information there seems no reason to conclude that it was intended, or that it would be expected by the patient in a mixed or homogeneous condition.

In answer to G. H. L., there is more potass. chloras. than can be retained in solution by the water, but the quantity of tragacanth ordered in excess of that required to make the mucil. tragac., B.P., will make a very thick mucilage, and the only course open to the dispenser is to rub the potass. chlor. to a very fine powder and suspend it in the mucil. tragac. As the pot. chlor. is not dissolved, but only suspended, if time be allowed there will be a deposit even from the thick mucilage.

The remarks of T. O. Smith in No. 222 are very much to the purpose, but merely emphasize those rules which have on several previous occasions been given in these pages. "It amounts to this, that experience, seasoned with the necessary amount of discretion, will tide the dispenser over most of these difficulties, but the latter is sometimes wanting, and there has been no opportunity of acquiring the former of these two ingredients in the composition of a qualified dispenser."

In answer to "Bolus," No. 223, there is no official form for liq. morph. bimecon. It may therefore differ in appearance, and probably also in strength, when obtained from different houses. Squire, in his 'Companion,' says that it is the same strength as tr. opii, devoting half a page to the merits of the preparation, but none to the formula. If its value is to be judged by the space devoted to its special qualities, as compared with other preparations of opium, it seems a pity that it is not more generally used, and more fully appreciated.

Mr. Wilkes wishes in No. 224 for the best mode of

making certain extracts with galbanum, camphor, and aloin, into a pill of suitable consistence: If the galbanum be manipulated with the extracts on a warm slab, or on a water-bath, there will be no difficulty in making the pills, but much will depend on the consistence of the two alcoholic extracts. If very soft the prescription will give more trouble, and require more care; but if of nearly pilular consistence there will be little difficulty, and a small quantity of tragacanth may be added to make up for the slight loss by evaporation.

In prescription No. 225 the quantity of pulv. tragac. is just sufficient for making mucil. tragac., B.P., with the cinnamon water. Pour ℥ij sp. vini rect. into a ℥vj bottle, and on it the pulv. tragac.; agitate so that the spirit may separate the particles of the gum, then add the aq. cinnam., and shake well till the solution is completed; afterwards put the bismuth. subcarb. into a mortar, mix it with the mucil. tragac., and finally add the other fluids in the prescription. It should make a thick homogeneous mixture that will hold the bismuth in suspension.

The turpentine in No. 226 should be first emulsified in a mortar with ℥ss of *fresh* mucilage, and to this should be added the mist. *guaiac.* The turpentine must be emulsified or it will float on the surface, and the mixture cannot be taken in divided doses.

In prescription No. 227, in the absence of more specific information, it would be generally assumed that the "sodæ carb." should be read "sodæ bicarb." But from previous correspondence it would appear that on this subject there is some difference of opinion, although it is beyond question that in the majority of cases where sodæ carb. is ordered in a prescription sodæ bicarb. is intended.

"What kind of opium should be used in making tr. opii, B.P.?" is the question No. 228. The opium of the pharmacopœia is the inspissated juice of the unripe capsule of the *Papaver somniferum*, Linn. One character, among others, is that when fresh it is plastic, tearing with an irregular, slightly moist surface. In the directions for testing it the pharmacopœia says: "Take of opium 100 grains;" this is the opium corresponding with the above characters. In making the tinct. opium, however, the directions are "take of opium in coarse powder." It is evident therefore that the opium for the tincture must be the drug which has been dried spontaneously, or by the aid of heat, and then reduced to a coarse powder, previous to its being weighed. The loss in drying commercial samples of opium is about 12½ per cent. This is the result of laboratory observations.

With reference to some remarks of J. W. Barnes, p. 608, it may be observed that an answer cannot fairly be given to his question: "Would a dispenser be justified in adding any suspending fluid so as to make it tolerably presentable, without the sanction of the writer?" The term "tolerably presentable" is one that has not been used in "The Month's" remarks. The object of the dispenser should be to fulfil the intentions of the prescriber, and when it is the evident intention of the writer that a definite quantity of camphor shall be taken by the patient, then to carry out those wishes it is necessary to use a little mucilage so as to diffuse the camphor through the mixture; but the same procedure may not be admissible simply to make a mixture presentable. The suggestion of Mr. H. Brown that such a mixture should be sent out in one ounce vials is practically inadmissible, and by the method suggested rendered unnecessary. The addition of mucilage causes the diffusion of the camphor, but produces no alteration in any one of the therapeutic agents of which the mixture is composed.

THE PRODUCTION OF OIL OF ROSEMARY IN DALMATIA.*

While the rosemary appears in northern Europe only as an ornamental plant, and is easily destroyed by frost, it is found wild and in great abundance along the shores of the Mediterranean, of the Adriatic, and on some Dalmatian islands, particularly upon Lesina, the rocky calcareous soil of which is almost entirely covered with it. It thrives best on the southern side of this island, also upon Lissa and Maslinica; but, singularly enough, it is entirely absent upon the neighbouring islands Brazza, Curzola, Meleda, and Lagosta, and the other Dalmatian islands. Elsewhere in Austria, it is only met with near Spalata and Ragusa, along the Croatian coast, near Trieste and Fiume, and upon a few islands of the Quaterno. It is likewise largely grown along the western shores of Italy, upon Sicily and Corsica, in some portions of southern France, in Spain, Greece, Egypt, and Algiers.

Upon the Island of Lesina the plant grows to a height of 12 to 24 inches; special nursing causes it to grow to about 45 inches, with a stem of ¾ to 1¼ inches in diameter. During the entire winter it is covered with dark-green leaves, and it flowers from February to April. The narrow oblong leaves are slightly revolute towards the lower surface, dark-green above, white below. Upon the under surface are situated the glands or cells containing the essential oil. The production of this upon the island of Lesina is constantly increasing. Although there exist no reliable statistics on the quantity of the oil produced, it is known that ten years ago the value of the annual production already amounted to about 30,000 florins (=$13,590), and that about double the amount is produced at the present day.

Every third year, during the month of May, the biennial shoots of the plant are cut off with knives, dried for about eight days in the sun, and deprived of their leaves. The latter are then moistened with water and transferred to copper stills, which are heated over a naked fire, near the sea-shore. The essential oil passing over with the steam is condensed in the usual manner, and received in flasks. As the apparatus is very crude, and the condensation imperfect, a good deal of the oil is lost, and fills the atmosphere over a large circuit with its odour. As soon as the oil is separated from the water, it is poured into tins, and shipped to Trieste. Oil of rosemary is chiefly used in perfumery; but the high import duties of olive oil in various European states have caused oil of rosemary to be also used for fraudulent purposes, namely, to flavour olive oil, so as to pass for oil of rosemary. The former, of course, thereby becomes unfit for use as salad or table oil, but is still well adapted to technical purposes.

Trieste supplies the market annually with 34,000 to 40,000 pounds of oil of rosemary, which finds its way to northern Europe, to America, and even to France and Italy. The average price of the oil is 46 cents per pound.

For a long time there has been prepared in France and Spain an alcoholic perfume from oil of rosemary and other ingredients, which was known under the name "Aquæ Reginæ Hungariæ." This appears to have originated upon the island of Lesina, for, since the times of the Hungarian Queen Elizabeth, the so-called "Queen's Water" has been prepared there from oil of rosemary, and is still used as a popular remedy.

Besides essential oil, the islands of Lesina, Lissa, and Maslinica supply the market also with dried rosemary leaves, which are shipped to Trieste. They are employed as spice, as an aroma for smoked meat, or for preparing wine or vinegar of rosemary.

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

CO-OPERATIVE TRADING.

WHEN the first NAPOLEON spoke of the English as being "a nation of shopkeepers," he could scarcely have said any thing more calculated to disgust those who were not actually engaged in trade. But opinions have largely altered since that time, and amateur shopkeeping has become not only a fashionable pursuit and considerable source of profit to many who would formerly have regarded it almost a disgrace, but also a cause of serious deprivation to the regular trading community.

The injurious effect of certain forms of co-operative trading upon the business of retail dealers has at length induced an attempt to take some common action with the view of protecting the interests of the class which has hitherto been the sole means of supplying the general public with the various articles of daily requirement. The first step has been to hold a conference at which the several grounds of complaint could be stated and discussed. The credit of initiating this movement is due to Mr. S. WEBB and Mr. J. E. SHAND, who, last month brought forward at the Vestry of St. Anne, Westminster, a resolution affirming that the present practice of Crown servants conducting retail business to the extent of some millions a year, under the name of Civil Service Stores, and with little or no profit, is extremely unjust to the regular trading class, and likely in the end to prove detrimental to the State.

Among the reasons assigned for this view it was stated that retail tradesmen constitute the most heavily taxed class in the community, and that, since the salaries, pensions and superannuation allowances of public servants are largely supplied by the taxes paid by retail tradesmen, the continuance of such payment and of the system of civil service store trading are inconsistent with each other. As a remedy for this obviously incompatible state of affairs, it was suggested that the work of public servants should be made to extend over longer hours with full employment, or that there should be a large reduction of salaries.

There can be no question that in very many respects retail traders have much ground for complaint, at least, against that form of co-operative trading which is carried on by members of the civil service. In the first place the magnitude of the business done by these stores is such as to amount of the value of about six millions sterling. The regular retail tradesmen are by so much the losers of business, and that alone is an important deprivation. But the more serious thing is that this enormous business abstracted from ordinary tradesmen is carried on under conditions which give the "stores" an unfair advantage over the regular retail trader. Thus, for instance, the estimated assessment to the premises of the Civil Service Stores doing the amount of business mentioned above is for local taxation about £5000. But if that business were distributed between several tradesmen it would require one thousand doing at the rate of six thousand a year each, and the collective amount of their assessment would be at least one hundred thousand pounds. Consequently for local taxation alone, the business of the stores is carried on at an advantage corresponding to the difference of some ninety thousand a year. This advantage also represents a corresponding deficiency as regards the objects for which local taxation is imposed, and as it must be made good somehow, the very class that is damaged by the unjust competition of the stores will be made to suffer still further by the augmented incidence of taxation upon them.

Again the burden of income tax, or what is termed Queen's taxes, falls much more heavily upon the retail tradesmen than upon the Civil Service Stores, which at the rate of profit rendered possible by such a gigantic business would not pay Queen's taxes on more than about £100,000, while a thousand tradesmen doing in the aggregate the same amount of business would have to pay taxes on at least £500,000. Here is another great advantage in favour of the stores and a corresponding deficient contribution to the public expenditure which must be made good from another source.

Moreover, the stores not only escape their proper share of taxation, but they take away the best customers from almost every kind of business. If this be continued there is a prospect of a very general collapse of successful retail trading, and it is to be anticipated that the evil effects will sooner or later be seriously felt by the upper classes who are now supporting the stores, making it a fashion to buy at the stores even at great inconvenience to themselves, as compared with the attention they expect and receive at the retail tradesman's warehouse.

The daily press has lately given much prominence to the discussion of this matter of co-operative trading, and though in some of the articles there is at least an effort to endorse the views of retail traders, it is at the same time evident that the tendency of general popular prejudice is kept in view so far as to make the support of that class against the stores but lukewarm. Even the *Daily Telegraph*, which is the paper most in favour of the trading community, in describing the meeting last Monday as having been free from any violence of language or extrava-

gance of proposal and admitting the impossibility of ignoring the fact that the speakers were convinced they had a real substantial grievance so far as the Civil Service Stores are concerned, expressed doubt whether the prospects of tradesmen would be improved even if they succeeded in obtaining the points claimed in that respect. The only way, according to the *Telegraph*, by which private retailers can hope to recover the customers that have been attracted from them to the stores is to imitate the tactics of those who decoyed them away, in other words to carry out the principle of small profits and quick returns by selling for ready money the best goods at the lowest possible prices. It is assumed that the desire for cash purchases is so general with the public as to make such a system of trade possible, and the prospect of a bright future for retail tradesmen is considered to depend on their adopting this popular element in the policy of co-operative trading. The article in the *Standard* is far less encouraging and while admitting that it is easy to understand and sympathize with the annoyance felt by shopkeepers at finding themselves undersold by firms of civil servants whose capital and leisure have been, in a sense, created by the very men they are helping to ruin, no greater consolation is offered than a comparison of their case with that of the factory operatives thrown out of employment by the introduction of machinery in place of hand looms, the displacement of carriers by canals, of canals and mail coaches by railways, and so on. According to this suggestion the retail shopkeeper may expect soon to share the fate of the dodo, and those who have been engaged in this way will require to seek some other means of livlihood. This is indeed the purport of the whole article in the *Standard*, which seems to regard the obliteration of the small tradesman as a natural event now in progress, much in the same way that other classes of middlemen such as brokers, commission agents, and so on, have been dispensed with by the aid of telegraphs, railways and steamships.

The *Daily News* leans more to the popular prejudice in favour of the stores, and speaks of tradesmen who complain of co-operation as being in the not uncommon position of the man who feels he has a grievance but is not able to define it. The convenience provided by shopkeepers is recognized as a justification of their existence, but at the same time no sympathy is shown with the shopkeeper's objection to be competed with by civil servants, military officers, or members of the clergy, to whose support he contributes by the payment of taxes and otherwise. On the contrary it is contended that every servant of the Crown or the public has a right to employ his spare time in managing co-operative stores or as he pleases, provided he does not neglect his duties. and for removing the evils experienced by the tradesman as resulting from amateur shopkeeping it is suggested that he must not be content with being a mere salesman, taking with one hand from wholesale dealers or manufacturers, and handing with the other to the customer, but must attract custom and profit by inspiring confidence in the goodness of his wares being guaranteed by his own special care and exercise of judgment in selecting them.

The *Times* is even less sympathetic. Referring to the approximation of producer and consumer which has been brought about in various ways, it is admitted to be provoking, and worse than provoking, for the small shopkeeper to find his custom drawn away from him; but the *Times* thinks he must reconcile himself as best he may to the fact that his local monopoly is at an end, and must recognize co-operative stores as one of the forms of competition with which he has in present times to fight.

At any rate it is clear that whatever remedy is to be found for the injury done to retail traders by co-operative stores, the means of carrying it into effect must be provided by those who suffer the injury, and it is therefore satisfactory to find that the matter has been taken in hand with such evidence of earnestness as was manifested at the late conference.

THE CHEMISTS' BALL.

THE Thirteenth Annual Chemists' Ball took place on Wednesday evening last, in WILLIS's Rooms, and we are pleased to be able to announce that it has once more proved to be a most successful gathering. A very large number of chemists and druggists and their friends—upwards of three hundred—were present. The single toast of the evening, "Success to the Chemists' Ball," was proposed by Mr. THOMAS GREENISH, who in the course of his remarks took the opportunity of paying a well-deserved compliment to the Honorary Secretary, Mr. ARTHUR L. SAVORY, for the admirable manner in which the arrangements for securing the comfort of the company had been carried out. As to the music it is sufficient to say that it was rendered by the band under the direction of Mr. DAN GODFREY.

CHEMISTS' ASSISTANTS' ASSOCIATION.

THE annual dinner of this Association takes place at the Holborn Restaurant on Wednesday next, at 8.30 p m.; Mr. J. E. STUART in the chair.

PUNISHMENT BEFORE CONVICTION.

A STORY of a strange and cruel experience that has happened to an Italian pharmacist reaches us from Rome. In 1873 this person, whose name is FRANCOIS AMATO, was charged with poisoning a man named GROSSI by means of henbane, and for five years he has been lying in prison awaiting his trial. When at last this took place, two questions were left to the jury, Was the dead man poisoned at all? and if so, Was the prisoner guilty? The jury answered the first question in the negative. The judge addressing the prisoner said, "AMATO not only "does the verdict of the jury exculpate you, but it "declares that the crime of which you have been "accused has never been committed." The audience applauded vehemently, whilst the poor pharmacist, who had borne his five years of "*préventive*" imprisonment with great patience, staggering like a drunken man under the shock, was just able to murmur his acknowledgments "Thanks, gentlemen; "thanks to you all!" Surely he was thankful for small mercy.

Transactions of the Pharmaceutical Society.

PRELIMINARY EXAMINATION.

At a meeting of the Board of Examiners for England and Wales, held in London on Thursday, January 23, 1879,

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Carteighe, Gale, Martindale, Moss, Plowman and Taylor,

The undermentioned certificates were received in lieu of the Society's Examination:—

Certificates of the College of Preceptors.

Fieldsend, John Francis.....Boston.
Filer, Ernest William ....Weston-super-Mare.

Certificates of the University of Cambridge.

Atkins, John.....Uxbridge.
Crowder, Charles J. H. .....London.
Smith, Albert ....Stalybridge.

Certificate of the University of Glasgow.

Cunningham, John J. .....Cambuslang.

Certificate of the University of Oxford.

Harrop, John Harrison .....Rochdale.

The report of the College of Preceptors on the examination held on January 7 was received.

Three hundred and sixty candidates had presented themselves for examination, of whom *one hundred and seventy-two* had failed. The following *one hundred and eighty-eight* passed, and the Registrar was authorized to place their names upon the Register of Apprentices or Students :--

(Arranged Alphabetically.)

Adam, James Bell D. .....London.
Allen, William Humphries.....London.
Andrew, Robert .....Ayr.
Archer, Luke.....Bolton-le-Moors.
Baines, Joseph Charles .....Lowestoft.
Bancroft, Charles Frederick ...Great Grimsby.
Banes, Walter William .....Southampton.
Bartlett, Walter .....Maidstone.
Bartlett, Warwick Wilcox .....London.
Barton, Frederick William.....Lincoln.
Beck, Herbert Edwards .....Ryde.
Bell, Henry ....Port Glasgow.
Bevan, William Arthur .....Upton-on-Severn.
Boorne, William Hanson.....Bristol.
Botham, Frank John .....London.
Bowman, George Fell.....London.
Brooke, Thomas Noden .....Retford.
Brookes, Alfred Fincher.....Walsall.
Britton, William Brannam... ..Barnstaple.
Brown, John..... .....North Wingfield.
Browne, Percy Frank .....Lower Clapton.
Burden, Rosina Ellen .....London.
Bunting, James .....Chesterfield.
Byrne, Godfrey Widdrington...Mortlake.
Cant, Evans .....Northampton.
Cattermole, Arthur Edward ...London.
Chapman, Herbert Manning .. Stowmarket.
Clark, Brown .....Boston.
Coley, Robert .....Melton Mowbray.
Coope, Thomas .....Farnworth.
Corby, John Henry .....Thrapstone.
Davies, Daniel .....Saundersfoot.
Davies, Edward Chas. James...London.
Davies, Thomas Watts .....Haverfordwest.
Denham, Albert Shaw.....Preston.
Dickinson, Frederick .....Stamford.
Duncan, Adam.....Edinburgh.
Eaton, Henry Arnold .....Furness Coll. School.
Ebbage, Henry Edward .....Halesworth.
Elliott, Stephen James .....Preston.
Ellis, Herbert Alfred .....Ely.
Evans, John Charles .....Ely.
Fields, Tom William .....Beverley.
Fitton, George Webster .....Melton Mowbray.
Fitzhugh, William Henry .....Royston.
Forbes, Robert .....Aberdeen.
Forsyth, John .....Dundee.
Fox, Hugh Clayton .....Coddenham.
Francis, James Bridge.....Wrexham.
Gabbetis, Thomas Holmes .....Etton.
Gale, William Gillam .....Worksop.
Gledhill, Robert .....Dewsbury.
Glew, Frederick Harrison .....Wakefield.
Glover, Thomas John .....Cambridge.
Gibbs, William Pierie .....Darlington.
Giles, Charles Edgar .....Manchester.
Goodwin, Henry Edward .....Manchester.
Green, Sidney Herbert .....Bilston.
Grierson, George Arthur .....Edinburgh.
Griffin, John Willifer .....Banbury.
Griffiths, John Samuel .....Newnham.
Griffiths, Joseph .....Llanelly.
Grimes, Francis .....Milverton.
Guiler, James .....Holywood.
Haggart, Allan.....Dundee.
Hallawell, Joseph L.....Ayr.
Halpin, Richard .....Coventry.
Harris, George James .....Loughborough.
Hart, Edward Bosomworth ...New Cross.
Hayes, Richard Orchard.....Cirencester.
Heath, Henry Stoneham.....St. Mary Cray.
Hearne, Robert Moore .....Worksop.
Heselton, Charles James.....Beverley.
Hodges, Arthur Lovell .....Sunderland.
Hope, Herbert .....Uppingham.
Hudson, Alfred George .....Nottingham.
Hunter, David .....Edinburgh.
Hunter, John ....Penrith.

Lewis, Thomas .....Llangain.
Lindsay, John .....Aberdeen.
Litchfield. Ernest.....Nottingham.
Lockwood, Ben.....Huddersfield.
Lovely, Charles Newton..... ...Ipswich.
Lumsden, Thomas .....Edinburgh.
Macdonald, Thomas.....Dingwall.
McDonald, John Alexander ...Glasgow.
McKither, Alexander Buchan...Dundee.
Maltby, William John .....Lincoln.
Marson, Cyril Darby .....Stafford.
Masser, Arthur William.....Foleshill.
Meadows, Robert Charles .....Ipswich.
Mitchell, Henry Bryant .....Falmouth.
Monckton, Harewood Lascelles..Tunbridge Wells.
Moore, John Arthur .....Bradford.
Morris, Henry Ridley .....Ipswich.
Morrison, Edward .. ..Kelso.
Nurse, James Aldis .....Lowestoft.
Over, John . .....York Town.
Panting, Charles Henry .....London.

Parker, E. L. P. .....Nottingham.
Pearson, William.....Sunderland Green.
Penrose, George .....Downham Market.
Penrose, James Doyle.....Downham Market.
Perkins, Henry Bowen .....Haverfordwest.
Pierce, Bedford..... ...Liverpool.
Pierce, Robt. Wynne Chas.....Bangor.
Pisani, Orestes .....London.
Plummer, Robert James.....Stokesley.
Powell, John Scott .....Eastbourne.
Pratt, Josiah Beswick.....Heath Town.
Pritchard, Edward Josiah .....Frome.
Pumphrey, Arthur .....York.
Purchase, Francis William .....Bideford.
Pursey, George Foreman .....London.
Ratcliffe, George .....London.
Rees, Charles Joseph .....Swansea.
Rennie, William .....Dumbarton.
Riddiough, Fred. .....Leeds.
Ridout, Alfred Richard .....Wirksworth.
Robertson, John .....Aberdeen.
Robinson, Charles William.....Rochdale.
Roper, Herbert John .....Heckmondwike.
Rowell, John George .....Headingly.
Russell, Harry Edward .....London.
Scott, Ernest Harrold .....Norwich.
Seely, Charles Leman .....North Walsham.
Sewell, Edward Ernest .....Whitby.
Short, Charles Henry .....Tattershall.
Shuker, Charles Beddoes.....Heightley.
Simon, William .....Ruthin.
Sinderson, James Francis .....London.
Skipper, John ....East Dereham.
Smith, Ernest ....Buxton.
Smith, Harry Robert .....Banbury.
Smith, John William .....Manchester.
Sollom, Benjamin Augustus ...Wolverhampton.
Somerville, James Young .....Edinburgh.
Somerville, William Alexander Chorley.
Spencer, Charles .....Coventry.
Spyvee, William .....Lincoln.
Steeples, William Stanley .....Ripley.
Stephen, Alexander .....Liverpool.
Stevens, Arthur .....London.
Stevenson, Frank.....Todmorden.
Stuart, Harry .....Glasgow.
Summers, Thomas Daniel .....Durham.
Sutherland, John William .....Edinburgh.
Sweetapple, Thomas Pyke .....Taunton.
Tabb, John Sleeman .....Padstow.
Taylor, Arthur Robert.....Rugby.
Thiele, Johann Fritz .....London.
Thomas, Frank Howard .....London.
Thomas, Lewis.....Bristol.
Thornton, Leonard Booker.....London.
Tibbits, John .....Lincoln.
Tomlinson, John .....Hull.
Tupholme, Frank.....London.
Twivey, Arthur .....Tadcaster.
Viggars, George Daniel .....Stafford.
Wakeham, Frederick James ...Helston.
Walder, Frank ....Arundel.
Warburton, Edward Schofield Farnworth.
Ward, Charles Herbert .....Worksop.
Watson, William .....Glasgow.
Webb, John .....Coventry.
Weller, James Mills.....Chichester.
Wharton, John.....Grimsby.
White, Henry Hardy .....Nottingham.
Wigg, Lewis Neriah, junr. .....Ipswich.
Williams, David Cadwaladr ...Holywell.
Williams, Robert .....Lampeter.
Wilson, Harry .....Buxton.
Wilson, Joseph.....Bradford.
Wrenn, William Albert .....Penge.
Wright, George Arthur .....Plymouth.

The following is a list of the centres at which the examination was held, showing the number of candidates examined at each centre and the result:—

	Candidates.				Candidates.		
	Examined.	Passed.	Failed.		Examined.	Passed.	Failed.
Aberdeen	8	3	5	Lancaster	5	4	1
Birmingham	20	9	11	Leeds	14	12	2
Brighton	5	3	2	Lincoln	10	7	3
Bristol	6	6	0	Liverpool	16	6	10
Cambridge	9	7	2	London	59	28	31
Canterbury	1	1	0	Manchester	26	14	12
Cardiff	5	2	3	Newcastle-on-T.	9	2	7
Carlisle	7	1	6	Northampton	8	5	3
Carmarthen	10	7	3	Norwich	14	10	4
Carnarvon	1	1	0	Nottingham	14	9	5
Cheltenham	2	2	0	Oxford	3	2	1
Darlington	7	2	5	Peterborough	3	1	2
Dundee	6	3	3	Sheffield	12	6	6
Edinburgh	14	8	6	Shrewsbury	5	3	2
Exeter	8	4	4	Southampton	4	2	2
Glasgow	12	8	4	Truro	4	3	1
Hull	16	6	10	Worcester	5	0	5
Inverness	3	1	2	York	9	0	9

The questions for examination were as follows:—

First or Preliminary Examination.

January 7, 1879.

Time allowed: Three hours for the three subjects.

I. LATIN.

1. Translate the following passages into English:—

A. Cæsar *hac oratione* Lisci *Dumnorigem* Divitiaci fratrem designari sentiebat, sed, quod *pluribus præsentibus* eas res jactari nolebat, *celeriter* concilium dimittit, Liscum retinet: quærit ex solo ea quæ in conventu dixerat. Dicit liberius atque *audacius*. Eadem secreto ab aliis quærit; reperit esse vera.

B. *Horum* vocibus ac timore paulatim etiam ii qui *magnum* in castris usum habebant, milites centurionesque, quique equitatui præerant, perturbabantur. Qui se ex his minus timidos existimari volebant, non se hostem vereri sed angustias *itineris* et magnitudinem silvarum *quæ* inter eos atque Ariovistum intercederent, aut rem frumentariam ut satis commode supportari posset timere dicebant.

2. Parse the words in italics.

3. Give the infinitive mood, the preterite, and the past participle of the verbs *dico, quæro, habeo, dimitto.*

4. Decline the nouns *frater, usus,* and *res*; and the pronouns *is* and *qui.*

5. Translate into Latin:—All these things are true. The council was dismissed by Cæsar. The timid soldiers fear the march. This speech alarms the centurions.

II. ARITHMETIC.

[The working of these examples, as well as the answers, must be written out in full].

6. What number multiplied by 265 will give 1490097385 for the product? Express the above two numbers in words.

7. Find by how much $\frac{5}{8}$ of $\frac{4}{10}$ *minus* $\frac{7}{9}$ of $\frac{4}{21}$ exceeds $\frac{5}{6}$ of $\frac{2}{15}$ *minus* $\frac{3}{8}$ of $\frac{4}{18}$.

8. Reduce $\frac{7}{16}$ and $9\frac{4}{5}$ to decimals, and multiply the one decimal by the other.

9. If 16 horses eat 96 bushels of corn in 42 days, in how many days will 7 horses eat 66 bushels?

10. Give the length of a metre. How is the litre related to the metre? What is a gramme? Express 296 miles 3 furlongs in metres.

III. ENGLISH.

11. Explain the difference between Transitive Verbs and Intransitive Verbs; and give two examples of each, with sentences illustrating their use.

12. Explain the different ways in which the word *that* may be used in English, and give two examples of each.

13. Parse fully each word in the following sentence:—

"The soul's dark cottage, battered and decayed,
Lets in new light through chinks that Time has made."

14. Write a short composition on one of the following subjects:—*Amusements, Winter, The Theatre, Spare Hours, Self-Reliance.*

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, January 16, Dr. Gladstone, F.R.S., President in the chair.

After the announcement of visitors, the minutes of the previous meeting were confirmed. The following certificates were read for the first time:—Messrs. W. Spottiswoode, P.R.S., T. Whitaker, J. L. MacMillan, J. A. Ogilvie, W. S. Lawson, V. H. Veley.

The first communication was made by W. H. Perkin, F.R.S.—

On the Action of Isobutyric Anhydride on the Aromatic Aldehydes.—When an aromatic aldehyde is heated with normal butyric anhydride and a butyrate, an angelic acid is obtained containing the hydrocarbon radical of the aldehyde employed. Thus benzoic aldehyde yields phenyl-angelic acid, etc. The author has studied in the present paper the reaction which takes place when isobutyric is substituted for butyric anhydride. A mixture of cuminic aldehyde, isobutyric anhydride and sodium isobutyrate was heated in sealed tubes to about 150° C. for twenty-four hours. On opening the tubes much carbonic anhydride escaped. The product was mixed with water and boiled in a retort until the distillate was nearly free from oily matter. On cooling, the aqueous portion was separated from the thick oily product and the latter boiled with an excess of a solution of sodium carbonate. The boiling alkaline solution was acidified and deposited a thick oily acid. This was dissolved in petroleum spirit, and after some time the solution deposited oblique crystals. These proved on analysis to be a compound of cumenyl-crotonic with isobutyric acid. A similar experiment with benzoic aldehyde gave phenylcrotonic acid. When isobutyric acid, prepared by repeated fractionizing, and so, as far as possible, freed from propionic anhydride, was used, very much smaller quantities of the crotonic acids were obtained. The author estimated the amount of carbonic anhydride produced in the above reaction, and examined the oily matter which distilled over on boiling the products of the above reactions with water; it proved to consist principally of butenyl benzene $C_{10}H_{12}$ (when hydride of benzoyl was used), boiling at 184° to 186°, yielding on oxidation with chromic acid, benzoic and acetic acids. The author proposes to call it β butenyl benzene; its dibromide bromo-derivative, and the dibromide of the latter, were prepared and examined. With cuminic aldehyde β isopropylbutenyl benzene was obtained

$$C_6H_4(C_3H_7)COH + (C_4H_7O)_2O =$$
$$C_6H_4\begin{cases}C_3H_7\\C_4H_7\end{cases} + C_4H_8O_2 + CO$$

It boils 8° lower than the α body. When cinnamic aldehyde was used, butenyl cinnamene was obtained—

$$C_6H_5C_2H_2COH + (C_4H_7O)_2O =$$
$$C_6H_5,C_2H_2,C_4H_7, + C_4H_8O_2 + CO_2.$$

It oxidizes rapidly and forms a red crystalline compound with picric acid. By heating the sodium derivative of the hydride of salicyl itself with isobutyric acid ortho-butenylphenol $C_{10}H_{12}O$ was obtained as a colourless oil, boiling 223°–225°, having a smoky and cedar-like odour, sp. gr. = 1·0171. Many reactions of this substance are given in the paper. By treating paroxybenzoic aldehyde in a similar way, parabutenylphenol was obtained, boiling 230°–235°, crystallizing at low temperatures. Similarly from anisic aldehyde β parabutenylanisoil, $C_{11}H_{14}O$, was obtained, fusing at +7°; it boils 236°–237°. In conclusion the author discusses the isomerism existing between the bodies obtained in the present research and these obtained previously by using normal butyric acid and especially that of the butenylbenzene.

After some remarks by the President, and Drs. Frankland and Armstrong, on the theoretical part of the above paper,

Dr. Dupré read a communication—

On two new Methods for the Estimation of Minute Quantities of Carbon: (1) Gravimetric: (2) Chromometric; and their application to Water Analysis. By A. Dupré and H. Wilson Hake. (1) *The Gravimetric Method.*—This method consists essentially in burning the small quantity of carbon in a stream of oxygen in an ordinary combustion tube containing some granulated cupric oxide. One end of the combustion tube is drawn out and bent downwards at an angle of 120°, so that it can easily be attached to a Pettenkofer tube charged with a perfectly bright solution of barium hydrate. The stream of oxygen passes through a long tube containing caustic potash before entering the combustion tube, and before commencing the combustion the tube with the cupric oxide is heated to redness and the oxygen passed until carbonic acid ceases to be evolved, as tested by passing through bright baryta water. The Pettenkofer tube is charged with baryta water, various precautions being taken to prevent the slightest access of any air containing carbonic anhydride, and connected with the combustion tube. The substance is introduced and burnt in the usual way; the carbonic acid is completely absorbed by the baryta water; at the conclusion of the combustion the barium carbonate formed is filtered and washed by an ingenious arrangement, completely out of contact with ordinary air, first with water saturated with barium carbonate and finally with pure water; the Pentetkofer tube is then rinsed out with dilute hydrochloric acid, and the washings poured on the filter containing the barium carbonate. The barium chloride solution is then evaporated in a very small platinum dish, converted into sulphate by ignition with sulphuric acid, moistened with nitric acid, again ignited, and weighed on an assay balance.

The following are results thus obtained with known quantities of sugar:—

Carbon taken.	Carbon found.
0·01344	0·01340
0·00755	0·00748
0·00535	0·00551
0·00390	0·00398
0·00137	0·00163
0·00079	0·00085
0·00034	0·00027

The method is therefore quite accurate enough for determining the carbon obtained from a litre of a first class potable water. The authors found the end of several blank experiments to be equal to three tenths of a milligram of carbon; they therefore subtract this quantity from each result.

The chromometric, or, as the authors name it, the nephelometric method consists essentially of burning the carbon as above, but the carbonic acid is conducted into a standard solution of basic acetate of lead (2 per cent.), and the turbidity produced estimated as compared with that produced by the carbonic acid evolved under similar circumstances by a known and nearly equal quantity of carbon (sugar). The difference between the two being estimated by a Mills colorimeter. The authors find that the precipitate produced in the acetate of lead is very similar in appearance under widely different circumstances and that it settles slowly. This method is extremely delicate, and a difference produced by $\frac{3}{1000}$ of a milligramme can be clearly estimated. The authors also propose to prevent any chance of loss in scraping out a residue by the

use of a collapsible silver foil dish in burning water residues. The water is evaporated in the thin silver dish, which is placed under a platinum dish for support and when the residue is dry the silver dish with the residue is rolled up and the roll introduced bodily into the combustion tube. The dishes hold about 50 c.c., they are made by Johnson and Matthey, and cost about 3*s.* 6*d.* Using these methods the authors estimated the carbon in a water, using 200, 100, and 50 c.c., with the following results:—

Carbon in residue from 200 c.c. water, gravimetric method = 0·34 per 100·000.

Carbon in residue from 100 c.c. water, nephelometric method = 0·31 per 100·000.

Carbon in residue from 50 c.c. water, nephelometric method = 0·26 per 100·000.

It must be understood that the authors do not recommend the use of such small quantities of water, but the results show the delicacy of the processes. In conclusion the authors suggest the use of the above methods for estimating the carbon in iron and the carbonic acid in air.

Dr. Frankland said that every chemist must feel indebted to the authors for the very ingenious methods they had brought forward; methods which seemed to be sufficiently accurate and delicate for the purpose intended. There still remained, however, the estimation of the nitrogen, which was of equal importance with the determination of the carbon. He would like to ask whether the condition of the precipitate in the plumbic acetate did not vary somewhat with different conditions, *e.g.*, the rate at which the carbonic anhydride was evolved.

Dr. Armstrong asked how the complete combustion of all the carbon could be ensured with the silver dish; alkaline carbonates might be formed.

Mr. Thorpe said that he had scraped out many water residues and had never experienced any difficulty in the operation; an apparatus similar to that used by the authors had been employed by Fleming, at Cheltenham College. He, however, decomposed the barium carbonate and read off the carbonic anhydride evolved.

Professor Hartley remarked that Dittmar had suggested methods for easily estimating the C and N in water residues. He absorbed the carbonic acid by soda lime. The nitrogen was converted into ammonia by soda lime, the ammonia absorbed in weak acid and nesslerized.

Dr. Dupré replied that the precipitate in the basic acetate of lead seemed to be remarkably uniform, that the water was evaporated with phosphoric acid, so that no alkaline carbonates could be formed. That although the residue from a litre of water might easily be removed, that from 50 c.c. could hardly be detached and transferred without loss.

Dr. Frankland then read a communication—

On Stannic Ethide.—By E. Frankland and A. Lawrance. In endeavouring to prepare stannous ethide by the action of zinc ethyl upon dry stannous chloride, the authors discovered that the reaction was—

$$2\,SnCl_2 + 4\,ZnEt_2 = Sn + SnEt_4 + 4\,ZnEtCl$$

and that by its means stannic ethide could be prepared more conveniently and in larger quantities than has been possible hitherto. Fragments of fused stannous chloride were added to zinc ethyl contained in a flask cooled by immersion in water. As soon as the mixture ceases to fume in the air when a sample is taken on the end of glass rods enough chloride has been added. The pasty mass is distilled in an oil-bath. The distillate, which should contain some free zinc ethyl, is poured into water, the zincic hydrate dissolved in dilute sulphuric acid, and the heavy oily layer of crude stannic ethide separated and purified. The pure substance has at 180° C. no action on aluminum, sodium, magnesium, acetone, or ethylic oxalate. It acts slightly on benzoic aldehyde. At ordinary temperature neither ammonia, carbonic anhydride, carbonic oxide, cyanogen, nitric oxide, oxygen, nor sulphuretted hydrogen affect it. Sulphurous acid is slowly absorbed, a crop of crystals being formed after some weeks; these were soluble in ether and proved to be stantriethylic sulphate, identical with the sulphate of sesquistanethyl of Cahours and Buckston. The syrupy liquid from which the above crystals had separated was found to contain stantriethylic hydrate combined with ethylsulphuric acid. The reaction was probably—

$$SnEt_4 + SO_2 + O = SO_2Et(SnEt_3O).$$

The reaction was tried when air was rigorously excluded during absorption of SO_2, but the final products were the same; much metallic tin was however formed. The authors therefore infer that oxidation occurred during the solution and evaporation of the products.

The President said the above paper furnished a ready method of preparing stannic ethide, so that it could be obtained with facility if it were required as a reagent. It was singular that it should resist the action of so many substances.

The next paper was read by the Secretary; it was entitled—

On Aurin. Part II. By R. S. Dale and C. Schorlemmer.—In previous researches the authors found that by the action of alcoholic ammonia on aurin rosanilin was obtained, and a dilemma arose that if aurin had the formula $C_{20}H_{14}O_3$, rosanilin could not have the formula which Hofmann had proved it to have, $C_{20}H_{19}N_3$. The authors therefere again prepared pure aurin, and confirmed their previous analyses. Cräbe and Caro also assigned the same formula to aurin. Zulkowsky states, however, that the method employed by the authors yields wretched results, and cannot be used on the manufacturing scale. The authors, however, affirm in the present paper that under certain conditions, which they are not at liberty to divulge, a fairly good yield can be obtained. The authors have used two methods to purify aurin, one by converting into ammonia aurin, and the decomposition of the latter by hydrochloric acid, and secondly, by taking advantage of the fact that the solubility of aurin in alcohol decreases with the removal of the bye-products. The analyses of pure aurin thus obtained completely confirmed the formula $C_{20}H_{14}O_3$. The correctness of the formula was also proved by E. and O. Fischer, who explained the above discrepancy by showing that the rosaniline obtained from aurin was pararosaniline, $C_{19}H_{17}N_3$. The authors next consider the formation of aurin, which they consider takes place as follows:—

$$C_2H_2O_4 + 3\,C_6H_6O = C_{19}H_{14}O_3 + CH_2O_2 + 2\,H_2O.$$

The paper contains the examination of several compounds, and derivatives of aurin, such as ammonia aurin, $C_{19}H_{14}O_3(NH_3)_2$, and tetrabromaurin, $C_{19}H_{10}Br_4O_3$. The authors have studied the action of acetylchloride and acetic anhydride on aurin. A white compound, easily decomposed by hydrochloric acid, was obtained with the formula—

$$C_{19}H_{14}O_3 + C_4H_6O_3,$$

melting at 168°. Aurin forms unstable compounds with bases, but combines with acids to form stable salts, which crystallize well. The bodies formed with acetic, hydrochloric, sulphuric, and nitric acid, were prepared and examined. Aurin also combines with sulphuric dioxide to form a compound $(C_{19}H_{14}O_3)_2SO_3H_2 + 4\,H_2O$. Rosolic acid resembles aurin in the fact that it combines with acids to form salts. The authors therefore propose to call it rosaurin. In conclusion, the authors thank Mr. O'Shea, who has performed the analytical work in the paper. Some beautiful specimens were exhibited in connection with this paper.

The next paper was—*On the Derivatives of Diisobutyl*, by W. Carleton Williams. Diisobutyl, prepared by the action of sodium on isobutyl-bromide, boils at 108°, 745 mm., and does not solidify at = 17°; sp. gr. at 0° = 0·7088. Ref. ind. at 16° 1·3901, for the red K line; refraction equivalent 63 78. The isoprimary alcohol from the hydrocarbon has an orange-like odour and hot burning taste; it is liquid at—17°; boils 179–180°, 765 mm. Sp. gr. at 0° = 0·841. On oxidation it yields isooctylic

acid, an oily liquid boiling at 218-220°, soluble in alcohol and ether, almost insoluble in water, sp. gr. at 0° = 0·926. The most characteristic salts are those of strontium, calcium and copper. Ethylisooctylate is lighter than water, boils at 175°. The isosecondary alcohol is obtained in smaller quantities than the isoprimary; boils at 160-163°, sp. gr. at 15° = 0·820. On oxidation it yields a ketone boiling at 159-161°, sp. gr. at 14° = 0·865. The ketone on oxidation splits into acetic and probably isobutyric acids.

The next paper was—*On the Action of Chlorine upon Iodine*; by J. B. Hannay. The author has re-examined the question as to the existence of the compound ICl_4 and has come to the conclusion that such a body has no existence, for two reasons; 1, that the reaction for its formation is impossible, as no high chloride of iodine can exist in the presence of free iodine; and 2, that careful experiments by which chlorine is added to iodine in the most advantageous manner for the formation of a high chloride fail to indicate such a body.

The Society then adjourned to Feb. 6, when the discussion on Dr. Tidy's paper on the various methods of water analysis will take place.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, January 9, when Mr. R. H. Parker took the chair.

The minutes having been read and confirmed, Mr. W. R. Dunstan read a paper entitled "Chemical Science to the End of the Eighteenth Century." This paper was the first of a short series intended to be read before the Association by various members during the session, and was partly introductory to them. The author gave in the first place a brief sketch of chemical philosophy before the time of Lavoisier, the history being divided into four periods. The first period, from the origin of chemistry to the eighth century A.D., comprised the names of Aristotle, Lucretius, and the Alexandrian chemist Gebir. The second period extended from the eighth to the sixteenth century, and included the names of Albertus Magnus and Roger Bacon. The third period was the period of medical chemistry when alchemists began to turn their researches from the philosopher's stone to the elixir of life, Paracelsus, Linadius, Van Helmont and Sylvius being the chief men of note. The fourth period was treated of more fully, the labours of Boyle and Becher and especially the "Phlogiston" theory of Stahl were discussed, and the progressive steps made in chemical science by Black, Priestley, Mayow, true discoverer of oxygen, Cavendish, Scheele, and Bergman described. The fifth period of chemistry began with Lavoisier, and extended to the present time; with the life and times of this chemist, the latter part of the paper was particularly occupied. The chief facts in connection with Lavoisier as a scientific man were the following:—The discovery in 1772 that the increase of weight observed to take place in the process of calcination was due to the fixing of air; the discovery of the composition of air and the properties of its constituents in 1777, and the discovery of the composition of water in 1783.

The claims put forward by Lavoisier to the discoveries of Priestley and others were next criticized and refuted, and the paper concluded with an account of the theories of the former in their relation to the "Phlogiston" theory of Stahl.

A discussion followed the reading of the paper in which the chairman, and Dr. Senier, Messrs. Symons, Naylor, Hutchinson, Branson, and Warrick took part; anda vote of thanks to Mr. Dunstan brought the meeting to a close.

AMERICAN PHARMACEUTICAL ASSOCIATION.

The following report of the meeting of this Association is taken from the *American Journal of Pharmacy*:—

First Session. — The twenty-sixth annual meeting assembled in Concordia Hall, in the city of Atlanta, on Tuesday, November 26, at 3 o'clock p.m. President Saunders occupied the chair, J. M. Maisch acted as secretary. Hon. Mr. Angier, Mayor of Atlanta, was present and d-livered an address of welcome, to which Mr. Saunders replied, on behalf of the Association. A Committee to Examine Credentials reported that such had been received from the Colleges of Pharmacy of Ontario, Massachusetts, New York, Philadelphia, Washington (National), Cincinnati, Chicago, St. Louis and Louisville; from the Alumni Associations of Massachusetts, Philadelphia and St. Louis; from the State Pharmaceutical Associations of Connecticut, New Hampshire, Pennsylvania, South Carolina, Georgia and Kentucky; from the Pharmaceutical Associations of King's county, N. Y., Newark, N. J., Richmond, Va., Augusta, Ga., and from the Literary and Scientific Society of the German apothecaries of New York.

The President's annual address was listened to with marked attention. In it he traced the progress of pharmacy from ancient times down to the present day, compared the manner of conducting business during the last century with that of the present age, and dwelt at some length on the additions to materia medica from the western hemisphere.

Invitations were received from Professor Geo. Little to visit the rooms of the Geological Survey of Georgia; from the faculty of the Atlanta Medical College to visit that institution; from the Atlanta City Brewing Co. to visit their establishment, and from the druggists of Atlanta to a complimentary dinner, on Wednesday. Invitations were extended to the Governor, members of the Legislature and judges of the Supreme Court of Georgia, to the mayor and to the medical profession of Atlanta, to attend the sessions.

When the roll was called 48 members answered to their names, and subsequently 49 members were elected. The various committees handed in their reports, with the exception of that on metric weights and measures, which was not received.

The report of the Executive Committee, which was read by the chairman, gave an account of the work performed during the year, related the action taken wit regard to the postponement of the meeting, and closed with obituary notices of members deceased during the year. After the reading of the Secretary's report, the Association then adjourned to 9.30 o'clock on Wednesday morning.

Second Session.—At this session the Nominating Committee presented their report, and the following officers were duly elected to serve for the ensuing year: President, Gust. J. Luhn, of Charleston, S. C.; Vice-Presidents, Fred. T. Whiting, of Great Barrington, Mass., Henry J. Rose, of Toronto, Canada, and Wm. H. Crawford, of St. Louis, Mo.; Treasurer, Charles A. Tufts, of Dover, N. H; Secretary, John M. Maisch, of Philadelphia, Pa.; Reporter on Progress of Pharmacy, C. Lewis Diehl, of Louisville, Ky. The standing committees (Executive, on Drug Market, on Papers and Queries, on Business, on Prize Essays and on Legislation) were likewise elected. The President and Vice-Presidents present were introduced to the meeting, and on taking the chair Mr. Luhn expressed his thanks for the honour conferred upon him, and promised to use his best endeavours to advance the cause and increase the membership of the Association.

The Treasurer read his annual report, accounting for receipts during the past year amounting to 5313.49 dollars, the disbursements being 4451.18 dollars, leaving a balance of 862.31 dollars in his hands. The report was referred to an auditing committee.

The following annual reports were read and referred:

of the Committees on Drug Market, on Prize Essays, on Legislation and the report on the Progress of Pharmacy. Mr. Kennedy reported on the Centennial fund that the committee had collected only 163 dollars, but that the secretary of the local committee had informed him that the time in which to make up the whole amount of 525 dollars would be extended for another year.

The Association then proceeded to examine the specimens on exhibition, and adjourned afterward until 2.30 o'clock.

Third Session.—After the reading and approval of the minutes, Mr. Kennedy read the report of the executive committee in relation to the proposed discontinuance of the exhibitions in connection with the annual meetings. The report was in favour of continuing the exhibitions, but proposed some regulations with the view of excluding objectionable articles, and to embody these regulations in the bye-laws. The report was accepted and the consideration postponed to the next session, when they were adopted. These regulations invite manufacturers and others to exhibit crude drugs, chemicals, pharmaceutical preparations, chemical and pharmaceutical apparatus and utensils, and objects of general scientific and special pharmaceutical interest. The following articles will not be admitted: Proprietary and patented medicines, medicinal or pharmaceutical preparations the names of which have been copyrighted or the complete working formula of which is withheld, and such chemical preparations or mixtures which are offered under other than scientifically recognized names. The report on the exhibition is to include such comments as in the judgment of the committee may be deemed proper.

The report of Mr. Chas. Rice, chairman of the committee on the revision of the Pharmacopœia, was read and referred, and resolutions of thanks were passed to the Hon. Wm. M. Evarts, Secretary of State of the United States, to the diplomatic officers of the United States, and to all those gentleman who have extended aid to the committee. The resignation of Mr. Rice as chairman of the committee, tendered on account of impaired health, was accepted with regret.

Mr. Kennedy read a paper on "Pharmaceutical Preparations of Coca," suggesting a fluid extract of coca to be prepared from the powdered leaves by exhausting them with a mixture of three measures of strong alcohol and one measure of water; also an elixir of coca made by percolating four troy ounces of powdered coca leaves with 70 per cent. alcohol until twelve fluidounces of tincture are obtained, dissolving in this six drops of oil of orange and two drops of oil of cinnamon, and adding four fluidounces of syrup.

A very comprehensive paper on "*Erythroxylon coca*," by James G. Steele, was also read. Mr. Steele reduces the leaves to powder by grinding them with one-third their weight of sugar; the powder is exhausted with a mixture of equal measures of strong alcohol and water, the fluid extract being obtained by expressing strongly at least twice, no heat being employed. If bicarbonate of potassium had been added during the process, the taste of the fluid extract was less agreeable and the effects were less convincing than with the hydro-alcoholic fluid extract.

Mr. H. J. Rose, however, stated that he had obtained very favourable results with a fluid extract of coca in the preparation of which a small quantity of syrup of lime had been used.

Query 5, "On the Affinity of Glycerin for Water," was continued to Mr. Kennedy at his request; his experiments are not yet concluded, but thus far have proved that glycerin, when exposed to a damp atmosphere, absorbs much larger quantities of water than is generally supposed.

Query 7 was answered verbally by Dr. Menninger. The damiana originally introduced is a species of *Turnera*; another variety is a species of *Haplopappus*. Neither the one nor the other possesses the aphrodisiac properties for which the drug has been lauded.

Mr. S. A. D. Sheppard's paper on "Compound Resin Cerate" suggested the substitution of the linseed oil by an equal quantity of paraffin oil, for preventing the preparation from becoming tough. Expressed oil of almonds will likewise obviate the difficulty, but it is less desirable than paraffin oil.

Professor Sharples, in answer to query 10, reported a considerable number of poisonous or injurious substances used for colouring candies, among which may be mentioned gamboge, chromate and other compounds of lead, compounds of copper, arsenic, antimony, cadmium, etc.

A very interesting paper on the "Berries of *Benzoin odoriferum*," by Dr. A. W. Miller, was read and samples of the products exhibited. By warm expression and by subsequent treatment of the press cake with gasolin, the author obtained 50 per cent. of fixed oil, having the consistence of castor oil, and a greenish brown colour. The berries were found to contain about 1 per cent. of a thin bright green volatile oil, having the sp. gr. ·850, and resembling in taste that of allspice and prickly ash; it appears to possess carminative properties.

Query 17 was answered in a paper by E. L. Boerner, who recommends in preparing fluid extract of colchicum seed to deprive the powdered seeds of fixed oils by treatment with gasolin, which is preferable for this purpose to ether, the latter solvent dissolving also notable quantities of colchicia. The advantages of this treatment are that the preparation is free from fixed oils; hence is more elegant in appearance, mixes with aqueous liquids without causing turbidity, and may perhaps be useful for hypodermic medication if the glycerin be omitted.

Mr. Shinn reported verbally on "Fluid Extract of Wild Cherry" and exhibited various samples. The treatment of the powdered bark with a mixture of glycerin and water is considered to yield a better preparation than the process of the Pharmacopœia.

On motion of Dr. Menninger, a committee consisting of Messrs. Lemberger, of Pa., Ingalls, of Ga., and Drake, of Mo., was appointed to draft resolutions expressive of the sense of the meeting relative to the recent death of Mr. Thos. H. Powers.

A letter from Messrs. Wallace Bros. was read, inviting the members to visit Statesville, N. C., and the invitation was accepted. The Association then adjourned until Thursday morning at 9.30.

Fourth Session.—After the reading of the minutes, an invitation from Mr. William J. Land, State Chemist, to visit his laboratory, was received and accepted. Invitations were also received from Portland (Me.), Indianapolis (Ind.), and Cincinnati (O.), to hold the next annual meeting in the cities named. On motion, a committee was appointed to consider and report on the time and place of the next annual meeting.

Dr. Murray introduced several resolutions, urging some measures with the view of simplifying the popular introduction of the metric system of weights and measures, namely, to memorialize Congress praying to authorize the chief of the Signal Service to add to the meteorological table a column giving the temperature in the centigrade scale; and to authorize the director of the Mints to stamp the different gold, silver, nickel and copper coins with their respective weights in grams and centigrams. The resolutions were referred to the executive committee, to report thereon at their convenience.

A paper, by Professor Remington, in answer to query 18, on "Fluid Extract of Liquorice Root," was read and referred for publication. The formula proposes to exhaust sixteen troyounces of powdered liquorice root with a mixture of four fluidounces of alcohol, three of glycerin, eight of water, and one of stronger water of ammonia; the percolation is continued with alcohol diluted with three times its bulk of water until twenty-four fluidounces are obtained, the first twelve of which are reserved, and the remainder evaporated to four fluidounces, and

then mixed with the reserved portion. Prepared in this way, six cubic centimetres of the fluid extract, when treated with a slight excess of diluted sulphuric acid, yielded a precipitate of glycyrrhizin, which, after washing and drying, weighed 0·967 gram, or a larger quantity than from five other fluid extracts, made by different processes. Syrupus glycyrrhizæ may be made by mixing two fluidounces of this fluid extract with fourteen fluidounces of simple syrup. Elixir glycyrrhizæ aromaticus may be obtained by mixing two fluidounces of the fluid extract, four of alcohol, six of syrup, ten minims of oil of cloves, five minims of oil of cinnamon, twelve minims of oil of nutmeg, and sufficient water to make one pint.

Mr. Lloyd read a very interesting paper "On the Preparation of Salts of Berberina," in answer to query 26, and illustrated the subject by numerous samples of the products in various stages of manufacture.

The report of the committee on the next annual meeting was read by Mr. Eastman; it proposed to meet next year in Indianapolis, on the second Tuesday in June. After some discussion the report was adopted with the amendment that the meeting be held on the second Tuesday of September.

Mr. Lloyd exhibited a number of samples of resin of podophyllum, and read a paper on the same subject in answer to query 27. It conveys the information that a very light-coloured resin may be obtained by precipitating the tincture with pure cold water and drying the precipitate in the cold. A solution of alum added to the water imparts a greenish-yellow colour to the resin; the use of heat during precipitation and drying darkens the colour, and with common water different shades of colour are obtained, according to the saline matter dissolved in the water.

A paper by J. L. Lemberger, in answer to query 29, on "A Liquid Preparation of Lactucarium," and illustrated by various specimens, was read. It proposes a fluid extract of lactucarium, to be made by heating sixteen troyounces of lactucarium, depriving it of caoutchouc and lactucerin, by treatment with thirty-two fluidounces of petroleum benzin, after drying, powdering it with an equal bulk of sand, and exhausting it in a percolator with diluted alcohol. The first four fluidounces are reserved; the remainder is distilled and evaporated to ten fluidounces, filtered, and the filter washed with sufficient diluted alcohol to make the whole fluid extract weigh sixteen troyounces. By mixing one troyounce of this fluid extract with sufficient diluted alcohol to make eight fluidounces, tincture of lactucarium is obtained, and on mixing the same quantity with sufficient simple syrup for sixteen fluidounces, a nearly transparent syrup of lactucarium may be made, having all the bitter taste of the officinal syrup.

Mr. Lloyd read a paper in answer to query 43, on "Tinctures Prepared with Fresh Plants." The author's experience is in favour of tincturing plants containing essential oils while fresh. Other plants may be partially dried, but complete drying previous to exhausting them appears to dissociate some of the active principles. A tincture prepared from undried veratrum viride was found to be an inferior preparation, but when the root was recently dried, the tincture prepared from it had the proper effects.

A paper by Professor Sharples, in answer to query 48, on "Distinguishing the Cinchona Alkaloids," elicited some discussion, it being maintained that from the recently precipitated alkaloids, even in the presence of a large excess of cinchonia, all the quinia and quinidia may be readily extracted by ether, together with cinchonidia and some cinchonia, and that the undissolved portion does not show the thalleioquin reaction with chlorine water and ammonia.

An adjournment took place until 2.30 p.m.

Fifth Session.—An invitation from the Committee on Arrangements to attend a concert and social entertainment on the same evening was received and accepted.

A paper by Mr. J. R. Mercein, on "Chemicals manufactured by Apothecaries," was read in answer to query 52. The author advocates the more general preparation of many chemicals by the pharmacist, and enumerates a number which may readily be made with very simple apparatus, such as are found in every pharmaceutical store.

Dr. Murray read a paper on "Uniformity in Chemical Terminology,' urging the general adoption of certain terminations in designating elements and compounds of different classes.

Mr. Saunders exhibited many samples of sachet powders, and read a paper on this subject, in which he recommended their preparation by the following formulas:—

Heliotrope.

Rose Leaves	2 ounces.
Orris Root	1 ounce.
Lavender Flowers	1 „
Tonqua Leaves	2 drachms.
Benzoin	1 drachm.
Musk	5 grains.
Oil of Bitter Almonds	3 drops.
„ Santal	30 „
„ Neroli	10 „

Clovepink.

Orris Root	2 ounces.
Lavender Flowers	1 ounce.
Patchouly Leaves	½ „
Cloves	2 drachms.
Deertongue	2 „
Pimento	1 drachm.
Musk	2 grains.
Oil of Rose	10 drops.
„ Neroli	12 „
„ Santal	20 „
„ Lavender (Engl.)	10 „

Mille fleurs.

Lavender Flowers	6 drachms.
Cloves	2 „
Cassia Buds	2 „
Coriander	½ ounce.
Benzoin	½ drachm.
Nutmeg	½ „
Vanilla	1 „
Orris Root	2 ounces.
Musk	5 grains.
Oil of Rose	5 drops.
„ Neroly	4 „
„ Patchouly	2 „
„ Lavender (Engl.)	4 „
„ Verbena	2 „
„ Santal	10 „

Jockey Club.

Lavender Flowers	½ ounce.
Rose Leaves	1½ „
Orris Root	2 ounces.
Vanilla Bean	½ drachm.
Musk	4 grains.
Extract of Jasmin	2 drachms.
Oil of Santal	20 drops.
„ Neroli	5 „
„ Rose	10 „

Frangipanni.

Orris Root	2 ounces.
Rose Leaves	2 „
Vanilla Bean	1 drachm.
Benzoin	1 „
Oil of Lavender (Engl).	15 drops.
„ Bergamot	16 „
„ Cassia	6 „
„ Pimento	10 „
„ Santal	30 „
„ Neroli	16 „
„ Rose	8 „

Wild Flowers.

Asarum Canadense	1 ounce.
Deer Tongue	½ „
Lavender Flowers	„
Sweet Flag Root	1 drachm.
Coriander	6 drachms.
Patchouly Leaves	1 ounce.
Nutmeg	1 drachm.
Oil of Bergamot	40 drops.
„ Neroli	10 „
„ Santal	20 „
„ Verbena	5 „
„ Patchouli	5 „
Extract of Jasmin	2 drachms.

Mr. Maisch exhibited a sample of the volatile oil of *Asarum canadense*, and stated that Messrs. A. H. Van Gorder and Emil Boerner considered it to be an ingredient of "Hoyt's German Cologne," and that the last-named gentleman had used it not only in perfumery, but likewise in medicine, in the form of medicated water and of syrup, the latter prepared by dissolving sugar in the asarum water.

Mr. J. U. Lloyd read a paper entitled "Miscellaneous Notes." In 1875 he had reported on dilute hydrocyanic acid, prepared with alcohol in August, 1872; of 112 one-ounce vials of this acid, the contents of two have become black, and in both the acid has been in contact with organic matter, the stoppers having been waxed. Another lot made in July, 1874, has been kept in a one-gallon bottle, which was opened from time to time, acid being withdrawn until only a few ounces remain, which are colourless, and contain 1·43 per cent. HCy, the strength having decreased about one-fourth.

A sample of tincture of *Geranium maculatum* was made in March with alcohol of sp. gr. ·835, and was found gelatinized in June, having at the same time acquired a faint odour of wintergreen. A sample of fluid extract of stillingia, which had been converted into a jelly-like mass, was likewise shown. The causes of these changes are not known.

Mr. Lloyd also exhibited a specimen of the bark of *Mangifera indica*, which has been recommended and used to some extent in the United States in diarrhœa and diseases of the mucous surfaces.

Attention was also called by Mr. Lloyd to some California plants which had been introduced under fictitious names, one having been called *Yerba reuma* was found to be *Frankenia grandifolia*, nat. ord. Frankeniaceæ, a common plant of California, having a very salty taste. The article introduced under the name of *Cascara sagrado* was ascertained to be the bark of *Rhamnus purshiana*. The mountain or Oregon grape of the Pacific coast is usually referred to as *Berberis aquifolium*, but Mr. Lloyd has found *B. repens*, *B. nervosa*, and *B. pinnata* substituted for it.*

In commenting on Mr. Lloyd's paper, Messrs. Maisch and Saunders referred to censurable practices which had become rather frequent of late years and should be discountenanced—such as the introduction under fictitious names of drugs and chemical preparations and the copyrighting of names for preparations intended for medicinal use.

The auditing committee reported having found the accounts of the Treasurer correct, and proposed that this officer should be required to preserve his vouchers for the space of three years, after which time they may be destroyed. The motion was carried.

Mr. Lemberger read a paper by J. F. Hancock on "The Arrangement of Store Room and Cellar" in answer to query 56.

Mr. Saunders read a paper by Dr. E. R. Squibb, entitled "Fluid Extracts by Repercolation," which gives in tabular form the results of a large number of observations on all the fluid extracts in common use.

On motion of Mr. Saunders it was resolved that when the Association again meets in the Southern States the meeting should take place during the spring months.

The propositions of the Committee on Ways and Means were called up for consideration as amendments to the bye-laws, but after some discussion the members were evidently not prepared to vote thereon, and the proposed amendments were ordered to be printed, and made the special order of business for the third session of the twenty-seventh annual meeting. The committee favours the accumulation of a permanent fund from fees which may be received from life memberships, and proposes a graded fee for those who may have paid their annual contributions for five years or more. The committee further proposes that at each annual meeting, if necessary, a *per-capita* tax shall be levied and collected to cover estimated deficiencies, as may be determined by the auditing committee. Life members shall be furnished with the Proceedings upon application to the Secretary.

The Association then adjourned until Friday morning at 9 o'clock.

Sixth Session.—A large number of fluid extracts were exhibited, illustrative of the results detailed in Professor Diehl's paper. A paper on percolation, written by Mr. E. A. Joy, was referred to the Pharmacopœia Committee. In view of the inability of several members of this committee to participate actively in the work of revising the Pharmacopœia, on motion of the Business Committee, Messrs. E. H. Sargent, J. U. Lloyd, and L. Dohme were appointed in place of Messrs. Ebert, Wayne, and Hancock; and Mr. Dohme was appointed chairman in place of Mr. Rice, resigned. Mr. Lloyd desired to decline, but was prevailed upon to accept the appointment.

Mr. Lemberger, on behalf of a committee appointed for the purpose, submitted a resolution, which was adopted, expressive of the Association's sense of the loss sustained in the death of Mr. Thomas H. Powers, of Philadelphia.

The following resolution was also offered by Mr. Saunders and passed:—

"Resolved, That the heroism of our fellow-pharmacists in the plague-stricken districts in the valley of the Mississippi, who have nobly stood at their posts in the hour of danger, is worthy of commendation, and this Association desires to place on record at this time its admiration of their noble doings in thus aiding suffering humanity at the risk of their own lives."

Mr. Maisch exhibited a section of the stem of cork oak, a piece of the bark and a sample of tea, all grown in Georgia, and handed in by Mr. Ingalls; also specimens of saffron adulterated with a white powder (gypsum?), and saffron cultivated in Lebanon county, Pa., handed in by Mr. Lemberger.

Resolutions were passed thanking the Committee of Arrangements, the druggists and citizens of Atlanta, for their kindness and attention, and the officers for services rendered.

At 11 o'clock the Association adjourned, to meet again at Indianapolis, Ind., on the second Tuesday of September 1879, at 3 o'clock p.m.

---

* Most of the samples received by us were *B. nervosa*. All these species appear to contain berberina, and probably possess alike properties.—EDITOR A. J. P.

Dispensing Memoranda.

[205]. If this mixture is to be dispensed as corrected in the "Month," I do not see the necessity, indeed I think it is not justifiable to add ℥ij or any quantity of s. v. r. as suggested by "Tyro." With proper manipulation it should form a satisfactory result. I should put about 8 or 9 ounces of aq. rosæ in the bottle, add the tragacanth, agitating briskly for a few minutes until perfectly diffused, and strain if necessary. Triturate the

mucilage with the bismuth in a mortar, add the remainder of aq. rosæ, and lastly the acid. hydrocyan. dil.

J. W. B.

---

[208]. I think Mr. J. S. Hicks took an unpardonable liberty with this prescription in adding sufficient acid. sulph. dil. to dissolve the whole of the quinine, without the sanction of the writer. If the prescriber really intended a neutral solution of the sulphate to be taken, it was his own error in not writing the proper quantity of acid, and not that of the dispenser's. If Mr. Hicks had done this in this neighbourhood, I am afraid his future prescriptions with certain medical men, would have been few and far between from their recommendation.

J. W. Barnes.

---

[213]. May I ask A. B. C. his reason for adding cera alba?

W. H. R.

---

[213]. In answer to A. B. C., I believe the adeps. benz. is intended as a vehicle for trituration with the active ingredients of the suppositories, although for this purpose some of the melted ol. theobrom. on a warm slab answers as well. I think he need find no difficulty with the similar B. P. forms if he will stir the mixture constantly, until cool enough for the moulds, to prevent the wax granulating, which, if allowed, would give a bad result. The form he recommends may leave nothing to be desired as regards appearance, but I believe nothing short of cremation would cause the suppository with this quantity of wax, to melt in the body.

G. B.

---

[213]. There is no difficulty in mixing pulv. rhei co., B.P., with water, even if made with magnes. levis, if the water be added by degrees to the powder, as every experienced housekeeper prepares mustard for the table. It would be highly improper to use mag. carb. pond. in preparing the powder, as the bulk would be considerably reduced, and a teaspoonful of one would be considerably stronger than a teaspoonful of the other. I am surprised that A. B. C. has not been successful with the B. P. form for suppos. morph., especially with his "considerable experience." I have never been unsuccessful in making them strictly according to the Pharmacopœia, except when I have been too impatient to wait for them to cool.

C. H. J. S.

---

[214]. The dose of grey powder was certainly unusual, but from the mildness of the mercurial preparation I consider that communication with the prescriber was quite unnecessary. I regret that "Associate" did not meet with the same courtesy as I have always received from members of the medical profession with whom I have had occasion to communicate on professional matters.

Hamilton.

---

[214]. Had I received this prescription, and had it not been previously dispensed, I would have communicated with the prescriber before preparing it.

When doctors order unusually large doses (much larger than the B.P. maximum dose), and if they do not signify that it is their intention to order such doses by some special mark against them, I think it is reasonable, and in many cases more safe, for the dispenser not to prepare the medicine without receiving the sanction of the prescriber.

Urge Igitur Semper.

---

[214]. In dispensing prescription No. 214, I should follow the prescriber's directions, which admit of little doubt or difficulty, and are to give the powder directly, and a seidlitz powder an hour after.

Norwich. P. De Carle.

---

[214]. "Associate" did perfectly right in hesitating to dispense this prescription, as the maximum dose B.P. is only 8 grs.

℞ Hyd. c̄ Cretæ . . . . . ℥ss.
S.S.
Pulv. seidlitz in hora postea.

B. Walker.

---

[215]. "Junior" will find a form for gelatine basis on p. 503, No. 442 of the Journal. To this add the requisite quantity of a strong solution of atropine (say one in thirty), the steam heat necessary to liquefy the basis will dispel the solvent. About 170 grains of basis is required to fill an ordinary ℥ij mould.

G. B.

---

[216]. Plumbi acet., B.P., no doubt should be used. I have dispensed a similar prescription, and I used the plumbi acet., B.P.

Acacia.

---

[216]. I should have used plumbi acetas, B.P., in this prescription, as no doubt that was intended.

Xanthus.

---

[216]. The prescriber in this case evidently means plumbi acetas of the British Pharmacopœia to be used.

Hamilton.

---

[217]. "Collegia" should be reminded that belladonna plaster contains resin and that an adhesive margin is never required.

Hamilton.

---

[217]. "Collegia" will find this a good plan for making adhesive margins. Cut a paper shape the size of plaster required; then cut another of same shape, but three-quarters of an inch larger all round; place the outside shape of this large one on the leather, and the centre shape of the smaller one, which corresponds to the size of plaster ordered, in the centre; spread the adhesive plaster on the space thus left between the two papers. Then take off the centre paper, and place the smaller outside shape, from which this was cut, over the margin, which it will exactly cover, then spread the bare centre with the plaster ordered. I have used this method for some few years, and always find it satisfactory. By placing the centre paper before spreading the margin, the objection of a double thickness of plaster is avoided. The margin must be smeared with paste or soft soap to prevent paper adhering.

London. G. B.

---

[217]. "Collegia" will find that the best way to make an adhesive border for a belladonna plaster, is to spread the belladonna on adhesive plaster.

B. Walker.

---

[218].

℞	Quiniæ Sulph.	℈i.
	Acid. Sulph. Dil.	♏v.
	Syrupi.	℥ss.
	Aquæ	ad ℥iv.

Misce. Capiat ℥j secundi horis.

When cool "Minor" must rub the quinæ sulph. with the syrup, then add the diluted sulphuric acid, and fill up with water to four ounces.

B. Walker.

---

[218]. I think that "Minor" was decidedly wrong in leaving the quinine undissolved, and putting "a shake the bottle," as the acid. sulph. dil. is certainly ordered for no other purpose than dissolving the quinine, and no doubt an oversight on the doctor's part in ordering such a small quantity.

Acacia.

[218]. I admire the "faithfulness" with which "Minor" dispensed the prescription which he thought fit to publish, but am surprised that he did not use his own common sense and judgment and add sufficient acid. sulph. dil. to dissolve the quinine. The prescriber, of course, intended the alkaloid to be dissolved, but overlooked the fact that such a quantity of it would require more acid than he ordered.

HAMILTON.

---

[218]. I think "Minor" was justified in dispensing prescription as written. I have frequently dispensed similar prescriptions, knowing the prescriber did not wish the quinine dissolved. I always powder the quinine and label, "shake the bottle."

XANTHUS.

---

[219]. In answer to "Sub Umbra Floresco" I should say "a teaspoonful occasionally at bedtime" would be the proper direction.

ACACIA.

---

[219]. In answer to "Sub Umbra Floresco's" question respecting the label for pulv. rhei. co., I should send it in a wide mouthed bottle and label it "One tablespoonful at bed time occasionally."

REX.

---

[219]. "The Powder.—A teaspoonful to be taken occasionally."

W. H. R.

---

[221]. G. H. L. is apparently ignorant of the solubility of the very common salt which forms the principal ingredient of the form which he publishes. If he is serious in asking as to whether the mixture can be made without a sediment occurring, I may say that is quite impossible.

HAMILTON.

---

[223]. LIQUOR MORPHIÆ BIMECONATIS.—"Bolus" relates a case which came under his notice, ℥xl of the liquor was ordered in a ℥iss mixture, dose ℥j thus containing ℥ 3⅓ of liq. morph. bimec. As regards its strength, that sent out by the wholesale houses is as a rule labelled "Dose 5 to 40 minims." Some time ago I asked through the columns of the Journal for the formula for its preparation, but with the exception of one correspondent's reply stating that it was sometimes coloured with pulv. rad. glycyrrh, I have been unable to obtain any further information, and as it is expedient that uniformity in the strength, taste, and appearance of medicine should predominate, I trust that some chemist, more learned than I, shall state his opinion on the subject.

SUB UMBRA FLORESCO.

---

[223]. LIQ. MORPH. BIMECONATIS is of the same strength as tinct. opii, B.P., and usually given in the same doses. It is considered by some prescribers a better and more soothing preparation than tinct. opii.

J. W. B.

---

[224]. Powder and mix the camphor, galbanum and aloin, weigh the extracts, place on slab, and apply a gentle heat until a hard extract is obtained. Mix this with the powder and add sufficient liquorice powder to make 5 grain pills. I adopted the above method, and the result was satisfactory.

XANTHUS.

---

[225]. "An Apprentice" will find if he rubs the pulv. tragac. ver. in a mortar with boiling water (say one ounce), then pour into the bottle and add the other ingredients, he will have a nice mixture.

REX.

[226]. Rub the turpentine with the guaiacum, sugar and gum acacia in a mortar, then add the cinnamon water very gradually, triturating well after each addition. If made in the above manner no separation of turpentine will ensue, but a perfect emulsion will be the result.

W. H. R.

---

[226]. The nicest and cleanest way to dispense this mixture is as follows:—Put the turpentine in a dry eight ounce bottle, add to it twenty grains powdered gum, mix well, then add two ounces of the water, shake briskly, and a perfect emulsion will be formed at once. Then mix as usual the guaiacum, sugar, and gum (less twenty grains), and pour over the turpentine already emulsified.

Lime Street, Liverpool. G. B.

---

[229]. Would any reader be kind enough to inform me how he would dispense the following prescription?—

℞	Pil. Coloc. Co.	℥j.
	Hyd. Chlor.	grs. vj.
	Tr. Capsici	gt. xxx.

M. Ft. pil. xij. One to be taken when required.

KENBAAN.

---

[230]. How should the following be dispensed:—

℞	Zinci Sulphatis	gr. xxiv.
	Tinct. Quinæ	℥ij.

M.

I powdered the zinci sulphatis very finely and mixed with the tincture, but on standing it produced a most unsightly mixture, in fact became almost a jelly. I also tried dissolving in water, and water with a little acid. sulph. dil., but with very little better results. What is the gelatinization due to?

J. T. B.

---

[231]. When St. John Long's liniment is ordered in a prescription, is it proper to supply lin. tereb. acet., B.P., or that prepared according to the old formula, containing the yolk of egg?

DELTA.

---

[232]. When pil. assafœtidæ is ordered in a prescription should pil. aloes et assafœtid. or pil. assafœt. co. be used

DELTA.

---

[233]. When pil. hydrarg. subchlor. is ordered in a prescription it is proper to use pil. hydrarg. subchlor. co, there being no officinal formula for pil. hydrarg. subchlor. in the present B.P. or in that of the old London, Edinburgh, or Dublin Pharmacopœias?

DELTA.

Notes and Queries.

[549]. DR. STOKES'S LINIMENT.—Beasley gives the following:—

℞	Ol. Terebinth.	℥iij.
	Acid. Acetici	℥v.
	Aqua Rosæ	℥iiss.
	Ess. Limonis	♈iv.
	Vitel. Ovi	No. 1.

M. A. M.

---

[549]. LIN. STOKES.—"Sub Umbra Floresco" will fiind a formula for Stokes's liniment in the 'Year-Book of Pharmacy,' 1875, page 364.

J. S. WHYTE.

---

[549]. SYRUP. FERRI PHOSPH. CO. (Parrish).—If one follows strictly the Philadelphian formula, excluding, however, hydrochloric acid, and using instead citric acid, one ounce, the best possible results are obtained. The last-named acid prevents the occurrence of

all ferruginous deposits, either on heating or standing. By no other means can satisfactory results be obtained. The cheapest form of tricalcic phosphate is bone char, prepared for the sugar refineries, containing not more than ·08 per cent. Fe. In round numbers it contains 75 per cent. tricalcic phosphate. By weighing 125 per cent. of bone char, calculated on the tricalcic phosphate wanted, dissolving in HCl, etc., the proper amount of precipitate is obtained. The pure ferri sulph. should be dissolved in cold, previously boiled, distilled water; the sodæ phosph. in well boiled distilled water; the sodæ acetat. ditto. The precipitate should be washed with well boiled and boiling distilled water, keeping a continuous stream running on the filter till finished. The phosphoric acid should not be less gravity than 1·700. The respective solutions on being mixed and boiled will give no precipitate in presence of the citric acid. Without it they always do. This precipitate is usually lost to the syrup, and most trade Parrish's syrup should be named syr. acid. phosp. co.

TEUFELSDROECKH.

---

[549]. STOKES'S LINIMENT.—Mr. Henry Brown, North Allerton, says that "Sub Umbra Floresco" might search all the books in Christendom without finding out what he wants, etc., respecting this liniment. Either or both of them may, without much trouble, find the following form in Meade's 'Manual for Apothecaries' Hall,' recommended by Dr. Stokes for use after bronchitis, etc.:—

℞ Sp. Terebinth.	℥iij.
Acid. Acetic.	℥ss.
Vitell. Ovi	j.
Aq. Rosæ.	℥iiss.
Ol. Limon.	♏j.

"Thus errors are handed down for years, etc."—

C. J. H. S., *Associate.*

---

[549]. LIN. STOKES.—Mr. Henry Brown is hardly correct when he says in last week's Journal that "all the books in Christendom" might be searched in vain for the formula required. A book tolerably familiar to chemists, Beasley's 'Pocket Formulary,' gives on the 238th page, eighth edition, immediately following lin. tereb. acet. B.:—

"Dr. Stokes.

Oil of Turpentine	℥iij.
Acetic Acid	℥v.
Rose Water	℥iiss.
Essence of Lemons	♏iv.
Yolk of one egg.	

This is said to resemble Mr. St. John Long's celebrated liniment."

I have some now before me which has been made for at least two years; it is beautifully white and shows only a slight separation.

Being milder than the B.P. lin., it is, I think, more suitable for the tender skins of young children.

Dover. J. F. BROWN.

---

[554]. ITCH OINTMENT.—"Helleborus Nigra" will find ung. hyd. nit. an excellent ointment for itch, applied night and morning. REX.

---

[557]. SYR. CALCIS HYPOPHOSPH.—Will any reader kindly furnish me with a recipe for making this syrup so as to contain 5 grains of the salt in a fluid drachm? J. T. K.

---

[558]. "CARBOLINE" TOOTH PASTE, PINK.—Can any of your correspondents furnish a first-rate recipe for the above? ANALYSIS.

---

[559]. SYR. FERRI ET CALC. LACTOPHOS. CONC.—Can any one give receipt for making of this syrup? J. T. B.

Correspondence.

REVISION OF THE BRITISH PHARMACOPŒIA.

Sir,—I beg to offer one or two suggestions towards a revision of the B.P. Although most of them have probably been made before, still they may be of some service.

Acetum Cantharides to supersede liq. epispastic.

Acetum Scillæ to be made without spt. tenuior, the only effect of which appears to be to cause a deposit.

Acid Nitro-Hydrochlor. dil.—This I always make by diluting each acid with half the aq. dest. and mixing immediately. The result is most satisfactory, and there is no unpleasant evolution of fumes.

Suppositoria might be made with ol. theobromæ, or, better still, a form given for making them with gelatine.

Tinctura Cardam. Co.—Raisins might be advantageously omitted, as they usually cause a deposit.

Tinct. Cinchon. Co., Tinct. Rhei. Co., Tinct. Opii Am.—Saffron, *ut supra.*

Tinct. Valerian. Ammon.—A very nice tincture can be made by percolation, much better I think than by the B.P. process.

Ung. Hydrarg. Nitrat.—The lard and oil should be of the same temperature (the higher the better) as the sol. hydrarg. nit., but a beautiful ointment can be made by using ozokerine (which should be made official) instead of the lard and oil. This keeps a beautiful bright colour, and also retains its softness. It can, if desired, be afterwards diluted with lard in any proportion.

Ung. Hyd. Nit. Oxid.—I always make this with lard simply, and always produce a satisfactory result, as it seems to keep its colour almost any length of time.

Vin. Ipecac.—I have experimented with this in the following way:—I macerated the rad. ipecac. in oss. acid. acetic. dil. (1–7) for seven days. Added the vin. xeric. and filtered. The result appeared to be a much more stable preparation than the B.P., and of greater medicinal effect, although I prepared some of each from the same parcel of root.

It would be a great improvement, in fact there is almost a necessity for it, if the B.P. defined coarse, medium, and fine powders, in the same way as the U.S.P. does. While there is a standard for almost everything else, it seems inconsistent not to have one for what is really an object of importance. Hoping that if the above notes are of any use you will insert them, or any of them.

ROBERT MODLEN.

WHAT SHALL THE FUTURE OF THE RETAIL DRUG TRADE BE?

Sir,—Great has been the commotion, and fierce the battle fought between the Council and its supporters, on the one hand, and those pharmaceutists and chemists and druggists differing from them, on the other, respecting the action recently taken under the ægis of the Apothecaries' Company. No less than twenty pages of one issue of the Journal were occupied by the recital of the fray, and from John o' Groat's to the Land's End the trade has been stirred to its utmost depths. And yet the whole matter is utterly insignificant, not worth a moment's thought compared with an evil so momentous that it threatens with absolute ruin at least one half—at a moderate computation—of the entire retail drug trade.

I have endeavoured in your columns to draw attention to it before, and pointed out how the evil could be readily squelched; but strange to say, to me it seemed very strange, my remarks failed to elicit any notice whatever. I venture again, deeming the present a favourable opportunity, to endeavour through your courtesy to awake the honourable portion of the trade to a sense of the danger which threatens them. I am a subscriber, and have been a donor, to the Birmingham Association. I mention this to show that I have sympathy with its efforts. Yet, though throughout a long business career, I have taken £2 for prescribing, for

every £1 that I have taken for dispensing, I viewed without alarm, the recent law proceedings, convinced that whatever the result I should have no hesitation in supplying an astringent or a purgative, an emetic or a vermifuge, a diaphoretic or a diuretic, when such medicine might be required from me, and that the public would never be driven, against their wish and will, to pay an apothocary 2*s.* 6*d.* or 3*s.* 6*d.*, when they could get what they required for 6*d.* or 1*s.* of a druggist. But the evil to which I would fain awake attention that will not again slumber can hardly be exaggerated, and unless the Trade Association evinces an unmistakeable disposition to combat it, I shall be disinclined to send any further donation or subscription to its treasurer. I allude to the scandalous underselling of certain chemists and druggists (I do not know if there be any members of the Pharmaceutical Society so disloyal to their brethren), one of whom is to be found in almost every town of any importance in the kingdom, who sell articles the price of which the makers have fixed at 1*s.* 1½*d.* (deeming the profit that price allows none too much for the retailer) at 10½*d.*, and everything else in proportion. That is to say, with the hope of aggrandizing to themselves an amount of business which had previously supported three or four of their neighbours, they attempt to carry on a retail drug business with a percentage of profit which might pay a large druggists' sundries house, whose customers paid monthly, and which turned over its capital three or four times a year, but which would inevitably render bankrupt and recipients of the Benevolent Fund, or denizens of a poorhouse, more than half the retail druggists if all attempted to carry on business on similar terms. Those who live in smaller towns or large villages may hug themselves with the (fallacious) belief that they are secure from the effects of the evil, but if so they are living in a fool's paradise. For in these days of rapid and general railway communication, the evil affects not only competitors in the town in which the unprincipled underseller is located, but all the druggists living in any towns or villages within a radius of ten or a dozen or more miles. I was surprised to find how druggists carrying on businesses miles away from the town in which I write complained of their trade being affected by the action of one unprincipled druggist in it.

I have before observed that the consumption of and trading in medicines are singularly exceptionable to those of all others. Lessen by one-half the price of meat, and probably the consumption will be doubled. Reduce to the same extent the cost of sealskin jackets or satin dresses, and possibly two members of a family will wear one, where only one does now. Lessen the cost of gold chains and gold watches 50 per cent., and probably each of my daughters may get one at sixteen, instead of waiting till she is twenty-one. Materially lessen the price of pine apples, and one of the finest may adorn our table on the occasion of the "birthday" of any one of the thirteen, instead of figuring on it only on the anniversary of that of the mother and mistress. In each of the supposed cases an increase of trade would result. But sell Holloway's Pills, instead of 1*s.* 1½*d.* at 10½*d.*, and seidlitz powders at 9*d.* instead of 1*s.* 6*d.* per box, and not one additional pill or powder will be swallowed, although some "wretch, concentered all in self," may aggrandize himself at the expense of his brother druggists by so doing, so long as they desist from retaliating.

The matter in question, however much some may poohpooh it, or decline to notice it, will ere long become a life-and-death struggle; if the thing is to continue, not one-half of the existing number of druggists will possibly be able to obtain a livelihood. And yet, as I have before pointed out, an effectual estopper can be put to the evil, and it may be certainly and speedily stamped out. A retail drug business cannot be carried on at grocer's profits, with less than two or three assistants besides the principal. Let no assistant be found so disloyal to his fellows, or so consummate a fool to his own interests, as to take service under any one acting so dishonourably and disreputably, and inevitably and speedily the occupation of those thus acting will be gone, and their establishments shut up. Let every man in business urge this matter on the serious attention of his assistants and apprentices. Let every thinking young man, possessed of reasoning powers, urge it seriously on his fellows with whom he may be acquainted. Let the Birmingham Association do all that in it lies to assist to the "consummation so devoutly to be wished." I recommend all young men who may thoughtlessly have entered such service, who shall read this letter, to ponder it well, and consider if it be wise to continue to serve those who are their greatest enemies, who are doing their very utmost to blast their future prospects, and to prevent them obtaining an honourable livelihood in the profession they have chosen.

I trust that I shall not this time have written in vain, but that my present appeal will be responded to throughout the length and breadth of the land by men better able than myself to deal with the question. I trust too that you will not be chary of your space; but that you will offer the fullest facilities for the thorough ventilation of the subject, convinced that there is none other that may so seriously affect the destinies of the trade generally, and consequently of the Pharmaceutical Society.

HAMPSHIRE.

THE TRADE OF A CHEMIST AND DRUGGIST.

Sir,—In this week's Journal, page 611, appears a letter with the above heading, which letter would lead us to suppose that the trade is overstocked, and apparently making this an excuse for infringing on the medical profession. Now let me assure the students of the Pharmaceutical Society that there is far more room in the world than this shopkeeper would lead them to suppose. Look at page xvii of the same Journal at the high salary offered to chemists willing to go abroad, and the chemist who possesses a little money need not go out as assistant, if he is a careful man, for most of us have friends or relatives abroad, either in the colonies or other foreign countries, to advise us: and the chemist may take out with him the rudiments to commence his business. I state this from experience, having done this in my younger days not unsuccessfully.

But I am not satisfied that the trade at home is overcrowded; the chemist who succeeds abroad would most likely have succeeded at home. But instead encroaching on the medical man, let him look to manufactures in his laboratory and he may there go legitimately beyond pharmacy in assaying of metals, etc. I am well aware how much the shop interferes with the laboratory; in fact, the chemist is in the predicament of John Gilpin:—

"Three customers come in
So down he came; for loss of time,
Although it grieved him sore,
Yet loss of pence full well he knew,
Would trouble him much more."

The annexed card is merely to confirm my statement of having been in business abroad, many years ago; viz. 1831 to 1837.

Downside, Chilcompton, Bath. JOSEPH LEAY.

T. Wilkinson.—Newsholme.—Your letter has been handed to the Secretary.

"*Beta.*"—The Dental Act provides that a person registered under it shall be entitled to practise "dental surgery," but as to the use of the title mentioned you are recommended to consult the Registrar appointed to carry out the provisions of the Act.

R. W.—Some years ago, Dr. Symes pointed out in this Journal (2nd ser., v. 161) that lemon juice heated to 150° F., and excluded from the air at that temperature, remained free from decomposition for a considerable time, especially if the operation were carried out in the winter season.

"*Associate.*"—A paste made of isinglass and strong acetic acid forms a good clear cement. Other recipes also have been given in the present series of this Journal.

C. T. Brooks.—Ten grains of opium is certainly a large quantity for a man to consume daily, but there is no law to prevent him doing so if he please. Whether it is right, in such a case, for a chemist to supply the opium is a question that can only be decided by the chemist, using his judgment upon the circumstances of the particular case.

A. G. R.—Kaolin is another name for China clay, or porcelain earth.

P. Boa.—The proportions given by Mr. Squire were ℥j of thymol to ℥j of lard. See vol. vii., p. 603.

"*Quaestor.*"—See the Calendar of the Royal College of Surgeons.

Stainer, Domeier, Williams, Pollard, Saunders, Norman, Brook, Houlding, Barnes, Walker, Ainslie, Martindale, Vint, Princep, Hicks, Plowman, Watson, Gorrie, E. B., U. D. B., E. W., G. H. L., Coaguline, Jam jam, Associate, Student, Dispenser.

ELECTRICITY AS A SOURCE OF LIGHT.*

BY PROFESSOR REDWOOD.

Hitherto I have referred exclusively to those processes in which the electric light is obtained through the medium of incandescent carbon. In all the processes that have been practically adopted the light has been obtained through that medium, but there is an electrician on the other side of the Atlantic, whose name is familiar to us all, Mr. Edison, who is said to have a process in hand for applying incandescent platinum, or an alloy of platinum and iridium, for the production of a light more suitable for domestic use than is the intense light of the electric arc.

I purpose now to refer to this method of producing light by means of electricity. There is, of course, nothing new in heating a platinum wire to a red or even a white heat by passing a current of electricity through it. It is one of the most familiar experiments at the lecture table, so much so, indeed, that I should hardly consider it worth repeating here if I had not something more to do than merely to show the result. Neither is there anything new in the use of iridium, for platinum coated with iridium was used many years ago for a similar purpose, and since the introduction of Deville's new process for getting platinum from the native alloy by fusion alloys of platinum and iridium have been common.

The novelty in Mr. Edison's process, we are told, consists in the adoption of a method by which the wire can be heated to a sufficiently high temperature to produce the required light, while means are provided for preventing the heat reaching the melting point of the metal.

Many persons have been taken with the idea of using incandescent platinum or iridiumized platinum for the production of light by electricity. When superficially viewed the subject appears to present some very attractive features, by which those who have not carefully studied it may be deceived and led to attach undue importance to processes by which light is thus produced.

The heating of a wire until it becomes luminous by passing a current of electricity through it is a very different thing from the disruptive discharge of electricity such as occurs in the electric arc, for in this case contact is never broken and there are no poles or electrodes to be adjusted, as in the other case.

The heating of the wire is caused by the resistance it offers to the conduction of the electricity through it. For the production of luminous effects by this means, therefore, bad conducting metals that have a high melting point and that do not readily burn in air are necessarily employed, and platinum is in every respect well suited for the purpose. Its conducting power is about one-seventh that of copper, and therefore a current of a certain strength will heat a platinum wire the sectional area of which is seven times that of a copper wire which the same current would heat to the same temperature.

The heating and consequently the luminous effect produced in a wire through which a current of electricity is passing depends on the strength or quantity of the current, and this is irrespective of the length of the wire. The same quantity of electricity that will heat a platinum wire a foot in length to redness will heat a hundred feet or a thousand feet, or any other quantity, to the same temperature.

Now this looks very much like an economical production of heat and light, which may induce us to inquire further into the subject, and in pursuing this inquiry we may gather knowledge that will enable us better to understand the meaning of the terms used, and also what it is that limits the extent to which the current can be broken up and divided. We have two objects, therefore, in pursuing this inquiry, and although its practical bearing in connection with electric lighting has reference chiefly to the electricity of dynamo-electric machines, I shall be best able to explain and illustrate the subject by referring to the galvanic battery which we are using.

The battery is the source of the power we have at our command. The force we are using originates in the chemical action which takes place in each cell of the battery. What the nature of the mysterious agent we call electricity is, which we thus develop, it would be vain for me to attempt to explain, or even to suggest, but we must have some ideas with reference to it, and if these ideas are not inconsistent with observed facts, we may use them in the explanation of results which are obtained. Bodies under the influence of electricity assume a condition in which they are said to be polarized, that is, in which two extremities are in different states, one of which is called positive and the other negative. These opposed states may be acquired by masses of matter, such as the charcoal terminals employed for producing the electric arc, and also by the ultimate particles or molecules of which the masses are composed, such as those which fly across from one electrode to another in producing the arc. This polar condition pervades the solid and liquid elements of our battery and also the conducting wires through which the force is conveyed. It originates in the chemical affinity existing between one of the metals in the battery, the zinc, and the radical of the acid in contact with it.

But this polar condition admits of various degrees of intensity. Bodies or particles may be slightly polarized or strongly polarized, and this we may assume to arise from the separation, to a greater or less extent, of what we call the positive and negative electricities, and their accumulation at or about the opposite extremities or poles.

In consequence of the repulsion existing between similar and the attraction between dissimilar poles, we assume that the particles when thrown into an electrical condition acquire a symmetrical arrangement, in which all the positive poles point one way, and all the negative poles the opposite way. We should thus have continuous lines of polarized particles, and these are called polar chains. They start from the surface of the active metal, the zinc, in the battery, they extend across the liquid in the cell to the inactive metal on the other side, and from thence through the conducting wire attached to the inactive metal, while similar polar chains pass in the opposite direction through the wire attached to the active metal.

Now, there are two things to be considered with reference to these polar chains. The first is the number of such chains or lines of polarized particles in a circuit. Each chain must be continuous throughout every part of the circuit. If anything should occur to break a link in any part of a chain, all the

* Substance of a Lecture delivered before the Pharmaceutical Society of Great Britain, Wednesday, January 15, 1879. For previous Lecture, see p. 593.

force resulting from that chain is immediately lost. The number of chains starting from the active metal of the battery will depend partly upon the available surface exposed by the metal, partly upon the chemical energy existing between the metal and the acid, and partly upon other conditions present in the circuit.

The second thing to be considered in reference to the polar chains is, the polar condition of each link in a chain. As I have already said this polar condition admits of different degrees of intensity. The opposite electricities may be either slightly separated and gathered to opposite poles, or they may be separated to a greater extent and brought into a state of greater tension. With a single cell only a slight separation of the forces and feeble tension can be effected, but this is increased with each additional cell through which the force passes, and this is the object of employing batteries of many cells.

Quantity then signifies number of electro-polar chains, and intensity or tension signifies extent of polarity of the particles throughout the circuit.

These conditions of the force are uniform throughout the whole circuit. Whatever they are in one part they are equally in every other part.

The work that can be done at any point by the circulating force will mainly depend upon the number of polar chains in the circuit.

The same thing applies to the electricity produced with a magneto- or dynamo-electric machine, in which, as well as in the battery, there are means for altering the relation between quantity and intensity. In the machine long thin wires to the armature are used for intensity, and short thick wires for quantity.

In speaking of the strength of a current we allude to quantity.

In speaking of electro-polar force we allude to tension or intensity.

Both the strength and the electro-polar force originate in the battery or the machine, and are conveyed through the wires, which are conductors of electricity.

Copper is one of the best conductors and is therefore used for the purpose. If a copper wire of sufficient size be used and the circuit be established or closed, the current of electricity will pass without any sensible effects being produced. But we have no perfect conductor of electricity, and even copper, although next to silver the best we have, offers a certain amount of resistance to the free passage of the force. If the size of the wire be reduced, the resistance offered by it will be increased, and when this has been carried to a sufficient extent a sensible amount of heat will be developed which may be increased to the melting point of the metal.

As the temperature increases the resistance to the current also increases because the wire becomes a worse conductor as it becomes hotter. But all this means expenditure of power.

The heating of the wire is caused by the number of polar chains crowded through it, and under such circumstances these polar chains can only be maintained by the tension of the current, that is the electro-motive force, and if this fail or the channel be too small, chains are broken and power is lost.

When, therefore, we say that the quantity of electricity that will heat a foot of wire would equally heat a hundred or a thousand feet, it is to be understood that quantity means number of polar chains, and that the heat of any part of the wire depends upon the number of polar chains established there, and if the circuit be closed these must extend unbroken through every part of it, whatever its extent may be, and every part therefore that offers the same resistance will be equally heated.

If we assume that every part of the circuit offers the same resistance, and that the current passes, the whole must be heated without any increase of quantity. The question then arises, how is the current enabled to travel through long lines of conducting wire under such circumstances? This is effected by the tension or electro-motive force of the current, the special function of which is to overcome resistances.

Thus, if I have a current of a certain quantity of electricity of low tension it will heat a wire the thickness of which will depend upon the quantity of force, but the length of it that can be so heated will depend upon the tension by which new resistance at every step in its progress will require to be overcome. As I lengthen the wire, therefore, I must increase the tension, or if I fail to do so the heat will become less, because polar chains will be broken so as to lessen resistance. It is tension alone that enables us to maintain unbroken chains through imperfect or restricted conductors.

So also in the disruptive discharge of electricity it is tension or electro-motive force that enables the current to leap across from one electrode to the other in the production of the electric arc, and there will be a demand therefore for this form of the force in proportion to the number and amount of the resistances thus presented.

There appear to be two methods by which a single current of electricity is made to support several lights, as adopted in the arrangements hitherto introduced. One consists in carrying the current directly from lamp to lamp, and thus having several breaks in it, through which when in action it leaps, as is done with the Wallace-Farmer lamps and the Jablochkoff candles, and the other consists in leading off short branch wires from the main cable to each lamp, in which case some resistance is interposed, as appears from the published accounts and the drawings relating to Werdermann's system.

In either of these arrangements the number of lamps that can be supported on one current will depend on the tension of the current. If the former method be adopted and the tension is sufficient to support an arc of one inch in length for a single lamp, this may be broken into four or five arcs of proportionately shorter length for the supply of that number of lamps; and as I have previously stated the largest number of breaks practically adopted has been about five. If there be this increased number of breaks and the current fails at any one of them all the lights in the series will be extinguished. Mr. Werdermann's method is designed to obviate such a result.

If the current is passing through a long circuitous cable wire portions of it may be led through small wires by a shorter path, but in such case heat will be developed and power lost.

One of the difficulties in the way of dividing the current for the production of a variable number of lights is that there must be expenditure of motive power equal to the production of the maximum amount of force required, and as there are no means of storing

that which is not used, if there should be excess it is necessarily lost. We thus see the importance of adjusting the quantity and tension of the current to suit the nature and amount of the work to be done.

I have now disposed of the part of my subject which relates to the production of heat and light by the incandescence of an unbroken conductor, and have, in the next place, to refer to the machines by which electricity is now so easily and profusely produced.

I have already alluded to the introduction of magneto-electric machines in 1832, 1833, and 1836 by Pixii, Saxton, and Clarke.

I have also alluded to the use, by Mr. Frederick H. Holmes, of large cumbrous magneto-electric machines for the production of light in some of our light-houses, which took place first in 1858, and then permanently in 1863.

The most modern machines, such as are now used, are called *Dynamo-electric*, but they are really *Magneto-electric* machines, in which the weak magnetic condition of the iron of which they are partly composed is made to produce currents of electricity, which, although at first extemely weak, are capable of intensifying the magnetic condition of the iron and then of receiving the increased effect of that intensified magnetism, so that by mutual action and reaction they become sources of almost unlimited supplies of current electricity.

The credit for having effected the transition from the early magneto-electric to the modern dynamo-electric machines has been claimed on behalf of Mr. H. Wilde of Manchester, Dr. Werner Siemens of Berlin, Sir Charles Wheatstone, and Mr. Ladd in connection of the Wallace-Farmer machine. Mr. Wilde in 1866 showed "that electric currents and magnets indefinitely weak could by induction and transmutation produce magnets and currents of indefinite strength." He applied this principle in the construction of a machine in which a small magnetic battery was made to supply a current by which a powerful electro-magnet was charged, and from this a current of great strength and force was produced. (The Wilde machine was illustrated and explained by referrence to drawings.) This formed a step from the machines with great permanent magnets such as were used by Mr. Holmes, and such in fact as are illustrated by the beautiful little Gramme machines, one of which we are using, and the dynamo-electric machine which has been kindly lent us by Mr. Ladd. In the latter permanent magnets, in the ordinary sense of the words, are done away with. As originally used these magnets were a costly part of the machines, and in the use of those employed at the Dungeness lighthouse it was found that the magnets soon lost much of their power. It was therefore considered a step in advance to be able to dispense with permanent magnets and the machines now constructed by Gramme, Siemens, Ladd and others are of that description. But, as I have already said, these so called dynamo-electric are really magneto-electric machines in which advantage is taken of a little magnetism commonly found in iron, or remaining in the iron cores of electro-magnets that have been in action. I recollect seeing Faraday show that a cannon ball has magnetic poles the position of which correspond with the direction of the earth's magnetism, and which therefore shift as the ball is moved. I may also be able to show that a bar of iron which I hold in my hand and which, while pointing east and west, on presenting either end of it to a magnet freely suspended, will attract either end of the magnet, after being held for a few seconds in the direction of the earth's magnetism, and especially while in that position if it be struck with a hammer so as to throw the particles into a state of vibration, will become magnetic so that either end will repel one of the poles of the suspended magnet. And again as readily it can be brought back to its original condition by altering its position and throwing it into a state of vibration. The iron cores of these dynamo-electric machines are therefore weak magnets.

The principle upon which these machines are constructed was discovered by Faraday in 1831, and may be thus expressed:—

"Whenever a piece of metal or other conductor of electricity is moved either before a single pole or between the opposite poles of a magnet so as to cut the magnetic curves, electric currents are produced across the metal and transverse to the direction of the motion;" and "The act of making and of breaking contact in a voltaic circuit, or between the poles of a magnet, is equivalent to the motion of the metallic conductor."

This at least is the fundamental principle, but in order to understand the manner in which the remarkable effects of modern dynamo-electric machines are produced, it is necessary more generally to refer to the mutual action and reaction of magnetism, electricity and motion.

The following positions have been established:—

First, that magnetism and motion produce electricity.

Secondly, that electricity and motion produce magnetism.

Thirdly, that electricity and motion may reproduce electricity.

And fourthly, that electricity and magnetism produce motion.

These results have an important bearing upon the action of dynamo-electric machines, and I purpose giving a few experimental illustrations tending to show in what manner their influences are or may be exerted.

I have already referred to the first position as that which Faraday established in 1831, and which, in its full significance, is expressed in the terms I have just used.

Of the second position we have abundant evidence, for we cannot send electricity through any body without developing the magnetic force around it. But the effect is only produced while the electricity is in motion. Electricity while at rest or in equilibrium, as for instance a charged Leyden jar, produces no such effect, but when the charge is put into motion the conductor through which it passes acquires magnetic properties, and the force thus induced surrounds the conductor, forming concentric circles in a plane at right angles to the direction of the electric current.

It is by means of this action that electro-magnets are produced. The conducting wire itself would acquire magnetic properties, as, for instance, if the current were passed through a coil of copper wire, but in order fully to develop the magnetic power the coil must have an iron core within it. It then acquires a degree of magnetic force which we are unable to obtain by any other means.

The power of the electro-magnet will depend upon the amount of iron which it contains, and the

quantity of electricity which circulates around it, exerting its inductive influence upon the iron.

A given amount of iron requires a certain quantity of electricity for the full development of the force, but it is probable that there is a point beyond which further increase of electricity is of no avail for increasing the magnetic force.

The weight of the iron in the large electro-magnet which I am using is three hundredweight, and the length of the wire upon it is about 1500 feet, and I find that it requires a battery having an intensity of at least twenty elements, and a quantity of two or three of Grove's pint cells to bring the power to anything like its maximum.

I am using such a battery force, and you see what immense power is developed in the magnet. Before coming near to it, while in action, I have taken the precaution of divesting myself of my watch or I should have expected to find the balance wheel converted into a magnet and its action rendered very irregular. Observe, too, that while the magnet is thus active, if I hold a plate of copper, which is a good conductor of electricity and not in the slightest degree attracted by the magnet, between the poles but not in contact with them, and move it to and fro in a direction transverse to that of the poles, a force is exerted which opposes its free motion through the air. It might be thought a very easy thing to move this plate of copper through air as if we were sawing the air, but practically the copper feels as if it were set in some soft cement which opposes its motion. Now this arises from the effect alluded to in my fourth position, namely, that electricity and magnetism produce motion, and it occurs in this way. On moving the plate of copper between the poles of the magnet I cut the lines of magnetic force and therefore produce a current of electricity through the copper; but that current of electricity which flows in a particular direction, when acted upon by the magnetism of the magnet tends to produce a motion of the copper in an opposite direction to that in which the copper was moved for its production.

The law may be thus expressed:—"When a current of electricity is induced in a conductor by the motion of the conductor between or opposite to the poles of a magnet, the induced current flows in such a direction as tends to give to the conductor a motion in the opposite direction."

The cutting of the lines of magnetic force by a conductor of electricity, such as the rotating of the armature of a magnet in front of the poles, is not therefore so easy an operation as it might be supposed to be.

The third position is the last I have to allude to, and I can do so but briefly and imperfectly, for the subject is a wide one and I have already exceeded the prescribed time for my address. We say that electricity and motion may reproduce electricity, and this may occur under several conditions. Thus when a conductor of electricity, such as a copper wire, forming a closed circuit, is in the vicinity of a current of electricity, a secondary current will be induced in the conductor in the direction and under the circumstances following:—

A current which begins,

A current which approaches,

A current which increases in strength, induces in the neighbouring conductor a momentary current in an opposite direction to that of the primary or inducing current; and

A current which stops,

A current which recedes,

A current which decreases in strength, induces in the neighbouring conductor a momentary current in the same direction as that of the primary or inducing current.

It is by the application of these observed facts that means have been devised for the construction of apparatus which is now so extensively used for modifying the character of currents of electricity which are produced either through the medium of a small galvanic battery or the rotation of a magnet, and these induced currents as they are called, which have no other connection with the primary or inducing current than that of induction, may have such an amount of intensity as to give them much of the character of frictional electricity. Thus, I have a small five-celled Grove's battery here which will only just give a visible spark when the wires are rubbed together, and if now I connect this with a coil of copper wire having a bundle of iron wires running through it, on placing this coil near to another closed circuit having no source of electricity attached to it, I can cause a momentary current of electricity to pass through the latter whenever the conditions are such as I have specified. This latter circuit is called the secondary circuit and the effects produced in it are especially marked when the former or primary coil is put within the secondary.

In the more perfect apparatus of the same sort to which I will now attach the little battery, there is an arrangement for making and breaking contact in the wire attached to the battery with great rapidity, the result of which is that a succession of induced currents of great intensity are produced in the secondary wire which are capable of leaping across an open space of some length.

Now these results all contribute to the effects produced or producible by machines with which electricity may be generated and adapted for the purposes of electric lighting.

I have thus brought under notice various questions involved in the consideration of the extent to which we may expect to find electricity available for the production of artificial light, and capable of being practically applied for that purpose. A candid review of the subject will probably result in the opinion that much has already been done in that direction but that much still remains to be done.

Errata.—In the report of the previous lecture, at page 597, third line from the bottom, for *positive* read *negative*, and for *negative* read *positive*.

Note.—In a report recently presented to the Municipal council of Paris, by M. Carnesson, on behalf of a commission appointed to consider an application from the Compagnie Générale d'Electricité for an extension of their privileges in lighting parts of Paris, there are some interesting details given with regard to the cost and illuminating power of the electric light.

The commissioners appear to have had ample means afforded them for ascertaining the results of the recent experiments made with the electric light in Paris.

They say that in the production of the electric light by means of the Jablochkoff candle, as exhibited in Paris for several months, a 20-horse power steam

engine has supplied the motive power for sixteen lamps.

The representatives of the Compagnie d'Electricité hope to be able to reduce the amount of motive power required, and say that recent experiments justify the expectation that 1-horse power may suffice for three lamps, but at the present time this reduction cannot be relied upon, and therefore assuming that 1-horse power costs 55 centimes per hour, and that it takes 1·25 horse power to supply each lamp per hour, we have $1{\cdot}25 \times 55 = 69$ centimes per hour as the cost of motive power for each lamp.

The commissioners say the light supplied by the Jablochkoff candle is, from various causes, liable to become extinguished, and the extinction may affect either one, several, or even the whole of the lights at the same time.

In the Avenue de l'Opera, where a record has been kept of the extinctions that have occurred between the 30th of May and the 10th of October. 1878, such extinctions occurred sixty times, and they lasted from 1 to 45 minutes, with intermediate periods of 2, 3, 5, 10, 15, 30 and 35 minutes. The extinctions usually occurred to four lights at a time, but sometimes to fourteen or sixteen.

No means are known by which the liability to these extinctions can be entirely prevented.

Experiments were made for the purpose of determining the illuminating power of the electric light by means of the ordinary photometer.

The standard or unit of illuminating power in Paris is a carcel lamp, burning forty-two grammes of purified oil per hour. This carcel lamp gives a light equal, or nearly equal to, that of a gas lamp (bec de ville), burning one hundred and forty litres of gas per hour. In effect 1 bec de ville gas lamp = 1·10 carcel lamp.

The bec de ville gas burner corresponds to an argand gas burner consuming five cubic feet of gas per hour, and if supplied with the ordinary London gas such a burner would give the light of sixteen sperm candles.

It results from the experiments made that the electric light from a Jablochkoff candle is equal to the light of thirty carcel lamps. But as it is found that such intense light cannot be advantageously used without softening it by transmission through opaline glass, its illuminating power is thereby reduced to that of eighteen or twenty carcel lamps. This is its power when estimated by measurement of the rays passing horizontally to a focus, but measured as the rays fall obliquely to the ground it only equals the light of 12·10 carcel lamps.

It thus appears that the light of one electric lamp with the opaline globe throws on to the ground as much light as 12·10 carcel lamps, or 11 gas lights burning 140 litres or 5 cubic feet of gas per hour. In other terms it may be stated that a Jablochkoff candle, enclosed in the usual opaline globe, affords available light equal to 176 sperm candles, and at a cost, for motive power alone, of sixty-nine centimes (nearly sevenpence) per hour.

The commissioners having ascertained these facts, and being instructed to advise the Municipal Council respecting an application from the Compagnie Général d'Electricité for a concession for three years of powers to light certain parts of Paris from nightfall to midnight with one hundred and seventy-one electric lights at a charge for each light of sixty centimes per hour, made the following calculation of the cost for one year of lighting the specified parts of the city by electricity, as compared with the present cost of lighting it with gas:—

Number of hours in the year between nightfall and midnight	2073	
Proposed number of lamps	171	
Proposed charge per lamp per hour .	60 centimes.	
	francs.	centimes.
Then $2073 \times 171 \times 60 =$	212,689	80
	= £8507	12s. sterling.
Present cost of lighting the same district with gas	34,347	54
	= £1373	18s.
Difference in cost . .	178,342	26
	= £7133	14s. sterling.

In view of this great disparity in the cost of the two systems the commissioners did not consider themselves justified in recommending the Municipal Council to accede to the proposition to its full extent, either with regard to the number of electric lights to be introduced or the amount to be paid for them. Moreover, a proposition having been made by the Compagnie du Gaz that they should be allowed to try an improved system of gas lighting in a district in which it could be compared with the electric lighting, the commissioners have suggested that the Compagnie d'Electricité be allowed to light certain parts of the city with eighty-three electric lamps at a charge of thirty centimes per hour for each lamp, and that the Compagnie du Gaz should have a neighbouring district assigned to them for exhibiting their improved system of gas lighting, such arrangement being limited to one year from the 15th January, 1879.

ANTHELMINTIC VALUE OF THE SEEDS OF THE CUCURBITA MAXIMA.

BY J. LAKER MACMILLAN.

From a note, p. 168, No. 427, vol. iii., present series of the Journal, it appears that the seed of the *Cucurbita maxima* are common in use among the people of Northern Italy for the expulsion of tape worm: its advantage over other vermicides being that it seldom fails to bring away the head, which the now official remedy, *Filix Mas*, often fails to do. Signor Vacchieri of the Farmacia Internazionale San Remo has been good enough to send me a quantity of a confection, which he prepares for the projector of the remedy, Dr. Bröking, and which he informs me has been used with success in some of the German hospitals. Dr. Pearson Irvine, lecturer on forensic medicine at Charing Cross Hospital and physician to the Victoria Hospital, has been good enough to put it to the test,—in one case only as yet,—the result, however, being as predicted and favourable to its future employment. The worm was expelled entire a few hours after the administration of the remedy, and not piecemeal, and wanting the head, as is often the case when *Filix Mas* is employed. Signor Vacchieri says that this *Confectio semen. cucurb. max.*, evidently a plasma of the powdered seeds, sugar and mucilage, becomes inert after mould commences to form on it, and this I find takes place in the course of a few days, so that it is essential, if success be guaranteed, that it be freshly prepared before administration. I asked Signor Vacchieri for some

seed, with the view of attempting a permanent and less bulky preparation than this confection, which is put up in pots containing, I should think, four ounces, one fourth of which is directed to be taken every ten minutes, starch diet during the day previous having been enforced. Dr. Irvine's patient, a boy of six years, took nearly two hours to consume three fourths of this quantity, and could not finish the remainder; what he did consume had the desired effect, but the bulk of the dose is a decided objection. Signor Vacchieri did not favour me with the seeds, and as it is stated that those only grown at San Remo possess vermicide properties, those who wish to test their value will for the present have to be content with the confection, which Signor Vacchieri offers to supply gratis for experiment, applicants paying carriage. Dr. Bröking pronounces the seed collected in other parts of Italy, even in places adjacent to San Remo, to be valueless. The remedy is harmless, agreeable to the taste, mildly cathartic, and produces no disagreeable sensations.

PITURI.

The following information respecting this substance has been communicated to the *Lancet* by Mr. James P. Murray, late surgeon to the Victoria Contingent Search Expedition into Central Australia:—

First, with regard to name, "pituri" appears intended, but fails, to convey the native sound of the word. Howitt, the able leader of our party, who spoke the Cooper's Creek dialect fairly well, always spelt it "pitchery," which conveys the true sound, the accent being placed upon the antepenult "pitch," as in almost all trisyllabic words of this language. "Pitch'ery," therefore, or the more modern form, "pitchiri," is correct if it be desirable to maintain the native pronunciation of such words.

This substance was apparently unknown in 1862 (the year of Howitt's expedition) to natives south of the drainage line of Cooper's Creek, which trends S.W. from its sources in the dividing ranges of Queensland (lat. 23°, long. 145°, about) to its terminal expansion and desiccation in S. Australia (lat. 30°, long. 137°, about). It is probable that its use formerly extended south of this boundary, and that it receded before the white man's tobacco, now the chief luxury and current coin amongst the blacks of the out-settlements. We often questioned the Cooper's Creek natives as to where they got their pitchiri, and they invariably pointed northward as the quarter it came from, using at the same time the words "tooch tooch," "far away, far away." Howitt discovered that they traded regularly for it with the natives beyond Sturt's stony desert, and he found it convenient, on account of water, to follow their trading track in one of his exploration trips from our depôt, or Cooper's Creek, to Willes' Creek beyond the desert (from about lat. 27° 50′, long. 141° 5′, to lat. 25° 48′ long. 139° 30′). Referring to this journey, he says, in a dispatch from Angipena, S. Australia, dated September 2, 1862: "The track I followed across the desert is one made use of by the natives of Lake Hope, Cooper's Creek, and Kyejeron on their journeys to procure the *pitchery*, so much used by them as a narcotic, and on this account I conclude that it is the shortest route known to them." It is, I think, quite certain that this plant does not grow on Cooper's Creek, else the natives would possess it more abundantly, and would have pointed it out to us when so frequently questioned on the subject. Thus they made no secret of showing us their *nardoo*, *papa*, and *bowa* seeds, nor objected to inform us about their edible fruits, herbs, roots, and ground nuts, although one would naturally expect them to be jealously watchful of every ounce of food in so inhospitable a country. Pitchiri, in short, was so scarce amongst the Cooper's Creek tribes that they parted with only small quantities in barter for wax matches, which was our golden currency. The men carried it in small skin bags tied round their necks or under the axillæ, but I never noticed the women with any. They never travel without it on their long marches, using it constantly to deaden the cravings of hunger and support them under excessive fatigue. King, the survivor of the Burke and Willes expedition, who had lived seven months with these natives when rescued by Howitt, states that when his food became so scarce and bad as barely to support life, he sometimes obtained a chew of pitchiri, which soon caused him to forget his hunger and the miseries of his position.* It also plays an important part in the social rites of these natives. At their "big talks" and feasts the pitchiri "quid"—for I can find no more appropriate word for it—is ceremoniously passed from mouth to mouth, each member of the tribe having a chew, from the *pin'aroo*, or head man, downwards. This singular wassail cup never fails to promote mirth and good fellowship, or to loosen the tongues of the eloquent. I have not been able to ascertain if the excitement it produces can be pushed to actual intoxication, or whether natives suffer from its use. There is a curious mode of greeting on Cooper's Creek. When friends meet, they salute with "*gaow, gaow*" ("peace, peace"), and forthwith exchange pitchiri "quids," which when well chewed are returned to their owner's ears! They extended this custom to us; but the fullest appreciation of their hospitality in offering their highly prized and indeed only stimulant could never overcome our repugnance to the nauseous morsels hot and steaming from their mouths. I may add, they always accepted our want of politeness good-humouredly. The "quid" which I have spoken of, which is carried behind the ear, is composed of pure pitchiri, green leaves, and wood-ashes. The pure pitchiri I saw resembled unmanufactured tobacco of a very coarse kind, dried and pulverized. It had the same brownish colour; but the stalks and midribs, which were strong, preponderated over the finer parts of the leaf. I could never obtain an unbroken leaf, nor even a good piece of one as a specimen. It had no particular smell, but a most pungent taste, which to me appeared like tobacco, and chewing it promoted a copious flow of saliva. The natives take a good pinch of pitchiri, and knead it with green leaves, I think to increase the size of the masticatory and moderate its power. We know that the Malays add sirih-leaf (*Piper betel*) to their areca-nut, and lime to increase its stimulant properties; but I could never discover the use of any condiment in this way by the Cooper's Creek blacks, all non-poisonous leaves appearing to be used indifferently. By the addition of wood-ash to the masticatory, the alkaloid is slowly liberated, and thus the strength of the "bolus" gradually augmented by keeping, as noticed in the *Lancet's* annotation. Natives, on using our tobacco, call it "whitefellow pitchiri," and conversely some whites who smoked pitchiri pronounced it a good substitute for tobacco. From these confessedly rough and ready data I have always up till now regarded this substance as a variety of *Nicotiana*. Its toxic action and that of tobacco, to judge by the experiments of Dr. Bancroft, are singularly alike; for the successive stages of mild cerebral excitement, loss of inhibitory power, copious salivation and subsequent dryness of mouth, irregular muscular action, nausea, dilatation of pupil, languor, drowsiness, and paralysis of the respiratory functions of the medulla appear in both. But the experiments of Drs. Ringer and Murrell with the alkaloid of pitchiri point to marked physiological differences between it and nicotia, more especially in the pupil indications. I must leave the discussion of these nice points to competent hands, as I aim no higher in this letter than to give a traveller's account of pitchiri.

The Pharmaceutical Journal.

SATURDAY, FEBRUARY 1, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE FUTURE OF THE DRUG TRADE.

ALTHOUGH there has recently been a marked cessation of the more violent symptoms of irritation throughout the drug trade, it is not to be assumed that the sense of suffering under a grievance, or under grievances, has been in any material degree reduced. So far as the matter of counter prescribing is concerned, we are disposed to believe that calmer consideration of the circumstances which gave rise to apprehension that a foray was to be made by a certain class of medical practitioners upon the business of the chemist and druggist will have led to the conclusion that such apprehension was somewhat exaggerated and to a conviction also, that whatever might have been the desires of the medical men who from special circumstances were inclined to look with a covetous and evil eye upon the counter practice of their neighbours in the drug trade, the prevailing feeling between the medical profession and chemists and druggists is of such a nature as to prevent any fear that there could be serious conflict between the two classes.

Let us hope also that the more enthusiastic and enterprising defenders of the rights of medical practitioners will have acquired greater moderation and some disposition to be influenced by the sage suggestion of Mr. JOHN SIMON that the special province of medical men should first be defined before attempts are made to prevent others from infringing upon it, so that they will in future abstain from activity which makes the Society of Apothecaries as aggravating to chemists and druggists as a red handkerchief is to a bull.

In any case the chief sore and source of irritation is now healed, and it is with much pleasure we have seen in the daily newspapers the statement that all further proceedings in the action known as that of the Society of Apothecaries *v.* SHEPPERLEY have been stopped. It is scarcely possible to have had any other view of this being the natural and even necessary result of the communication made by the Clerk to the Society of Apothecaries to the Solicitors of the actual plaintiffs in the case, so far back as the 24th December last; but now we have the information that formal notice has been given to the defendant that the plaintiffs will abandon their appeal and a communication to the same effect has subsequently been received by us from the Secretary of the Trade Defence Association which undertook the defence of Mr. SHEPPERLEY. We trust that between medical men and chemists and druggists this will be regarded on both sides as a burial of the hatchet, affording opportunity for the development of those relations of harmony and mutual esteem which ought to obtain between them for the benefit of their respective pursuits and the advantage of the public.

Like the shifting of scenes in dissolving views, however, the disappearance of this enemy of chemists and druggists is accompanied by the presentation of another, and one which bids fair to become far more seriously detrimental. Last week we gave a general account of one of the forms in which this enemy to the trade interests of chemists and druggists manifests itself and in the same number of the Journal, a correspondent who often writes on matters of trade interest under the cognomen of "HAMPSHIRE," called attention to another form of it which he regards as an evil so momentous as to threaten with absolute ruin at least one-half the retail drug trade, one as compared with which he regards the whole question as to counter prescribing as being utterly insignificant.

The excessive competition now carried on is sufficiently felt in general retail trade to involve a question of life or death with very little chance of the former alternative for very many. Whether the underselling to which that competition gives rise be carried on by large trading organizations doing business under the fashionable designation of co-operative stores, or whether it be practised by shopkeepers in a smaller way, one against the other, the inevitable result appears to be the extinction of a large number of small tradesmen. Even those who may maintain a position of survival will have to regulate the conduct of their business in conformity with the practice which admits of the remunerative supply of articles at very low profits.

The state of the case is graphically illustrated by *Punch* in a cartoon where retail trade is represented by a loaded waggon travelling over an exceedingly rough road on which the word co-operation is traced. The waggoner on his knees imploring HERCULES to to help him, receives the answer, "put your shoulder 'to the wheel, my lad! and try 'co-operation' "yourselves."

In adopting that course the general trader has the advantage of being more or less a purveyor of indispensable necessaries—bread and cheese and broad cloth in some form or other every one must have, or at least fairly presentable substitutes, and even articles of luxury find eager purchasers if they are only supplied at a sufficiently low price. But physic, the commodity which the chemist and druggist supplies to the public, is by no means so generally indispensable' and is only in exceptional cases a necessity. To a great extent, therefore, the trade in medicine is not influenced by its price If that price were reduced to

one half or a third, no patient would thereby be induced to swallow more than enough to make him well. Competition in the sale of medicine must, on this account, therefore, be kept within narrower limits than competition in the sale of gold chains, or satin dresses, etc.

Moreover, the trade in medicine is one involving other kinds of responsibility, more serious than those of a dealer in commodities of food, clothing, or luxury. The chemist and druggist is not merely a vendor of wares accountable only for their being of the substance, nature, and quality demanded by the purchaser. From the mixed nature of his business, as generally carried on, he is that to a great extent; but as exercising the functions of the pharmacist, the services he renders are of a character more approaching those of a professional man. In performing the duties of that office he has entrusted to him the fulfilment of the physician's intentions as regards his patients, upon him depends—so far as provision of the means is concerned—the successful issue of the physician's treatment, and even more, the very lives of his customers are in his hands, and their safety is guaranteed only by his skill and care.

These are circumstances which place the services of the pharmacist quite beyond the scope of considerations as to price as compared with the intrinsic value of commodities. As a question of prime cost it matters little whether pills are made up with five grains of calomel or five grains of corrosive sublimate, a powder containing three grains of strychnine would not differ much, as regards prime cost, from a powder containing three grains of santonin. But the difference to customers would scarcely be compensated for by the saving of a few pence in the price of the medicine, nor would even the application of Lord CAMPBELL'S Act provide the patients or their relatives with a fully satisfactory solace for the consequences of such substitutions.

We regret that our correspondent "HAMPSHIRE," in his argument against the reduction of chemists and druggists' prices to the level of profit which may suffice for a grocer or linen draper, has directed attention only to the sale of patent medicines or proprietary articles, and has left unnoticed the far more important points we have above referred to. We quite agree with him that, with or without assistants, a retail drug business cannot be carried on at grocer's profits. For the reasons we have already given it is not compatible with the safety of the public, any more than it is consistent with the interests of the chemist and druggist, that the attempt should be made. But when the argument is confined to the case of dealing in patent medicines, we confess to having our sympathies with it considerably refrigerated. On the contrary we are more disposed to accord excuse to those who—feeling the pressure of competition, as well as the necessity of making a living—conform in that particular branch of business to the custom of their neighbours. We would suggest that the disregard of "Hampshire's" previous letters, which has given him so much surprise, is in reality to be ascribed to his having thus misdirected his argument.

In this respect we are more in accord with our Hull correspondent in this week's Journal. The gist of Mr. FOWLER'S letter is that patent medicines are the bane of pharmacy. In a general way we quite agree with this, and think that the endeavours of chemists and druggists to wrest the trade in patent medicines from the hands of their original vendors—the booksellers and grocers—betrays a disregard or a misapprehension of the true interests of chemists and druggists as carrying on a branch of trade requiring for its exercise special educational training and legal qualification, and as carrying on that business so as to justify the confidence of the public in the proper fulfilment of duties far more onerous than any a purveyor of ordinary commodities is called on to perform, and to place them on totally different footing as regards the rate of profit or remuneration they are entitled to.

Tracing in this way the probable influence of prevailing tendencies upon the future of the drug trade we find the various arguments brought forward leading to the question whether the business of a chemist and druggist is to be so reduced and levelled down as to be undistinguishable from that of the grocer or linen draper save in the vast inferiority of its returns or whether the number of those engaged in it shall be reduced by at least one half.

UNQUALIFIED WOMEN PHARMACISTS IN FRANCE.

FRENCH pharmacists, like some of their English brethren, are just now having their souls vexed by what is considered an intrusion of the gentler sex upon the domain of pharmacy. The "sisters" in connection with various religious bodies manifest an irresistible *penchant* for pharmacy, and this has in some districts developed into a very serious competition. It is in vain that they have been admonished in the spirit of the old proverb, "*ne sutor ultra "crepidam;*" the candid reply has been that they find their spiritual consolations more valued when accompanied by material help. Indeed in the Aisne department affairs have gone so far that the Prefect, not being able to persuade the legal pharmaciens to supply medicines for the relief of the poor at a fixed tariff, has entrusted the whole of the supply to a religious house. The remonstrance of the local pharmaciens has been under the consideration of the Minister of Agriculture, who has in turn asked for the advice of the Committee of Hygiene. The report of this body appears to be adverse to the pharmaciens, the ground being taken that since the religious body does its part gratuitously, and only acts as an intermediary between the pharmacien from whom the medicines are obtained wholesale and the poor, it does not infringe the rights that are secured to them by law. It is not probable, however, that the dispute will be allowed to rest there.

Transactions of the Pharmaceutical Society.

NORTH BRITISH BRANCH.

The fourth meeting of the session was held in the Society's Rooms, 119A, George Street, on Wednesday evening, January 15th. Mr. J. B. Stephenson in the chair.

The minutes of the previous meeting were read and confirmed.

The Honorary Secretary intimated the presentation to the library of the 'Year-Book of Pharmacy' for 1878, from the British Pharmaceutical Conference, per Professor Attfield.

The Chairman then read a letter which he had received from the President in London in reply to a communication from himself, as representing the chemists in Edinburgh, bringing before the Council in London the difficulty in which the Edinburgh chemists were placed by the position taken up by the inspector of weights and measures in that city with reference to the new Act. This difficulty lay in the construction of the "exemption clause," section 20 of the Act: "Drugs when sold by retail may be sold by apothecaries' weight." Other inspectors—at least, those of Glasgow and Manchester—had read this as exempting all the grain, scruple and drachm weights from their supervision. The inspector in Edinburgh, on the contrary, held it as "null and void," in consequence of apothecaries' weight having been done away with by the Medical Council in 1864, and therefore he insisted that all weights used by chemists, either in dispensing or selling, were subject to his inspection,—implying verification and stamping,—and that only such weights as were included in the schedule of the Act were legal, and that in consequence the 4-grain, 6-grain, 2-scruple and 1-drachm weights were illegal. The subject had been before the Council, and the letter read was the result of their consideration. On all the disputed points it was considered to be very satisfactory. The "exemption clause" was not only not transferred from the old Act inadvertently, as the inspector contended, but was specially re-enacted at the instance of the Council, and all dispensing operations were admitted by the promoters of the Bill to be outside the provisions of the Act. The abolishing of apothecaries' weight by the Medical Council in 1864 was stated in the letter to be quite beyond both the power and the intention of that body. The reference to the "measures" was equally satisfactory. There was also a reference at the end of the letter to a proposed interview with the Board of Trade with a view to further explanations, and the Chairman intimated that when the report of this came to hand it would be communicated to a special meeting of the trade, to be called for the purpose.

William Inglis Clark, D.Sc., Pharmaceutical Chemist, read the following notes on—

(1) The Effect of Sugar on the Composition of Gallate and Tannate of Iron.

The power of sugar to prevent oxidation of ferrous salts has long been known, but I am not aware that the influence it exerts on the composition of ferric salts formed in presence of it has been noticed at all. Under this belief I wish to draw attention to some interesting results which I have obtained while working with the gallate and tannate of iron.

When a solution of tannin is mixed with that of ferrous sulphate, in proportion as the ratio of the iron salt is to the tannin present, so approximately is the amount of blue black precipitate which is deposited in a given time: thus with 100 parts of tannin, 1 part of iron as sulphate gives an amount of precipitate equivalent to 1; while with 560 parts of iron, the precipitate corresponds to 40, an immense increase, as will at once be evident. The amount of precipitate obtained is modified by many other circumstances, such as the temperature at which the solution is kept, the amount of air passing over the surface, the length of exposure and the amount of agitation which the liquid may receive. In order, therefore, to be able to examine the amount of precipitate obtained, not only must the solutions be of the same strength and volume, but they must be exposed in similar vessels, at the same temperature and with a regulated supply of air. In compliance with these requisites I started a series of thirty-three vessels, each containing in 50 c.c.—

Tannin	·268 grm.
Ferrous Sulphate	·268 ,,

along with the percentage of sugar indicated in the table, and have selected sixteen of these for our examination, the others being duplicates.

Table for Tannin Experiments.

Sugar per cent. in liquid.	Weight of precipitate.	Iron per cent. in precipitate.
None	1600	8·82
0·8	1878	9·09
1·6	1972	8·86
2·4	2096	8·53
3·2	3094	6·52
4·0	1644	7·94
6·0	1432	
8·0	1406	9·51
10·0	1322	9·26
12·0	2038	6·97
14·0	1852	9·41
16·0	1974	9·05
18·0	1740	9·06
20·0	1806	9·32
22·0	2022	7·96
32·0	1214	6·16

From the table appended we may draw a diagram indicating the rise and fall in the weight of precipitate obtained, as well as the percentage of iron contained in the precipitates, and we then see at a glance that the addition of sugar causes a marked increase in the precipitate, but on further adding sugar the weight of precipitate varies in a very curious way, the percentage of iron contained showing an exactly reverse motion. That this is not accidental is shown by duplicate experiments as well as by the remarkable coincidence in this alternation of large precipitate and small percentage of iron with small precipitate and a high percentage of iron.

Table for Gallic Acid Experiments.

Sugar per cent. liquid.	Precipitate.	Iron per cent. in precipitate.
None	None*	45·75
0·4	2100	25·?2
0·8	2144	24·53
1·6	2200	23·8
2·4	2240	21·1
3·2	2281	22·1
3·6	2280	23·5
8·0	2295	23 0
16·0	2285	20·3
20·0	2258	20·4
22·0	2257	15·3

Experiments made with similar solutions of ferrous sulphate and gallic acid to a slight extent agree with the tannin series, but it will be noticed that after the first great increase in the precipitate with 3·2 per cent. of sugar no considerable variations are noticed on the extra addition of sugar.

The facts to be noticed are then:—

1. The addition of sugar very markedly increases the rate of precipitation, more especially when the percentage of that body present is but slight. The amount of precipitation does not steadily increase with increase of

* Although no precipitation took place in this case the percentage of iron was determined from another experiment containing no sugar by long exposure.

sugar, but rapidly attains its highest value, in both cases this being reached at 3·2 per cent. of sugar. With more sugar the precipitate is variably less, and excessive additions prevent it altogether, as when 40 per cent. was present no precipitate was obtained from the tannin solution until after long exposure, and in this case it was very finely divided.

2. Whenever an extra addition of sugar causes a diminution or an increase in the amount of precipitate, it is found that the percentage of iron in it is affected in a manner exactly the reverse, being diminished when the precipitate increases and *vice versâ*. This rule is very closely borne out in the case of the tannin, but the gallic acid does not correspond so exactly. To explain these results my present investigations are inadequate, and I therefore trust that discussion may throw some light on the subject.

---

(2) Action of Gallic Acid on Iron.

When metallic iron is placed in a solution of gallic acid a slow action goes on, bubbles of hydrogen are disengaged, and in ordinary circumstances a deep purple coloured liquid is obtained. The application of heat greatly accelerates this action, and if the liquid be contained in a flask and be brought to the boil, after a longer or shorter time the purple colour disappears and a clear greenish solution is obtained. If the disengagement of steam be stopped, even for a few moments, the dark colour returns. To avoid this alteration I connect the flask by means of glass tubing with a supply of mercury, which, covering the aperture of the exit tube, admits of the passage of the air and disengaged hydrogen outwards, but effectually prevents any return of air to the contents of the flask. By causing the mouth of the tube to dip deep into the mercury a certain pressure is exercised, and the solution of gallic acid may thus be raised to a higher temperature, thus promoting its action on the iron.

Under these circumstances a greenish precipitate is thrown down, which appears under a lens as acicular crystals or as granules, under varying conditions as to strength of solution; but these, unfortunately, I have been unable to analyse, owing to the extraordinary rapidity with which they are oxidized on exposure to air or even by the addition of water. I hope shortly, by the aid of a glass box furnished with india-rubber gloves forming part of the walls, to be able to separate these crystals in an atmosphere of hydrogen or coal-gas, and to determine their nature and formula. It would be natural to suppose that the substance is ferrous gallate, but as gallic acid has four atoms of replaceable hydrogen (as will be seen from the constitutional formula shown on the diagram) the exact nature of the salt is still uncertain.

If instead of acting on iron at a high temperature, and in the absence of oxygen, the vessel containing the substances be freely exposed to air, after some time a very finely divided precipitate is thrown down, which can only be washed by the aid of a Bunsen filter-pump, and on drying this I have found it to be spontaneously inflammable at a temperature varying from 110° C. to 120° C., burning with vivid scintillations, evolving much dense smoke and leaving a residue of ferric oxide free from carbonaceous matter. If, on the other hand, the iron be dissolved in the gallic acid by the aid of heat and oxidation conducted at a high temperature, with free exposure to air, the precipitate is dense and scaly, easily washed and does not ignite even at 160° C., although slow decomposition takes place at lower temperatures. If, again, the clear green solution obtained in the absence of air be boiled in the presence of air black crystals are obtained which are stable a little above 100° C., but which are not spontaneously combustible at a slightly higher temperature. Different samples of the first kind were analysed after being dried at 110° C. and the iron estimated as ferric oxide, with the following results:—

·1958 grm. (part of sample which ignited) gave . .	Fe_2O_3	·0553 grm.	= Fe 28·24 per cent.
·3288 grm. gave .	Fe_2O_3	·0661 „	= Fe 20·12 „
·2685 „ „ .	Fe_2O_3	·0607 „	= Fe 22·62 „
·8968 „ „ .	Fe_2O_3	·1677 „	= Fe 18·7 „

From these results I concluded that decomposition to a variable extent had preceded the inflammation of the substance, and to determine this, and at the same time to avoid it, I prepared a quantity of the gallate, applying heat to accelerate the oxidation and dried this *in vacuo* over sulphuric acid. This was a very tedious process, extending over three weeks, and the substance was considered dry when two samples, the one after fourteen days and the other after twenty-one days, gave practically the same results, viz.:—

(*a*) Dried for 14 days = Iron 21·61 per cent.
(*b*) „ „ 21 „ = Iron 21·85 „

The crystals obtained on the admission of air to the boiling green solution were dried on paper and gave—

(*c*) Dried on paper = Iron 21·42 per cent.

From these figures I thought it probable that the salt might correspond with the formula—

$FeC_7H_3O_5 2H_2O$ = Iron 21·62 per cent.,

which if dried might give—

$FeC_7H_3O_5$ = Iron 25·15 per cent.,

and on drying samples *b* and *c* at 120° C. I found—

	I.	II.
(*b*) = Iron . .	24·87 per cent. . .	24·92 per cent.
(*c*) = Iron . .	24·57 „	

a tolerably close approximation to the numbers required. On further heating sample *b* to 160° C. I found—

b at 160° C. = Iron 27·81 per cent.,

so that decomposition proceeded further than the mere elimination of water, and therefore possibly the agreement of my figures with the required ones might be only accidental. To determine this I made two combustions of the sample *b* after heating to 120° C., and then containing 24·92 per cent. of iron, and obtained—

No. 1.

·1517 grm. gave CO_2 = ·1910 grm.
H_2O = ·0279 „

No. 2.

·1185 grm. gave CO_2 = ·1487 grm.
H_2O = ·0197 „

The salt $FeC_7H_3O_5$ requires—

		Carbon.	Hydrogen.
		37·67 per cent.	1·34 per cent.
Found.	No 1. . .	34·33 „	2·04 „
„	„ 2. . .	34·23 „	1·85 „

and therefore the substance at 120° C. did not correspond with the formula to which the estimation of iron pointed.

I had hoped to have made a combustion of the salt dried at ordinary temperatures and containing 21·6 per cent. of iron, but unfortunately have been unable to get this completed. This would probably have explained the nature of the substance, but I must be content to wait till further examination clears up the subject.

The paper was illustrated by diagrams and experiments.

Mr. H. B. Baildon was to have followed with a paper entitled "Thoughts on Botany," but owing to the lateness of the hour it was deemed advisable to postpone it until the next meeting.

A hearty vote of thanks to Dr. Clark brought the meeting to a close.

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The sixth general meeting was held at the Royal Institution, January 16, the President, Mr. T. F. Abraham, in the chair. The minutes of the previous meeting were read and confirmed.

The donations to the library and the museum were duly acknowledged. Mr. Houghton was unanimously elected a member. After some miscellaneous communications, a paper was read on—

The English Standards of Weight and Length and the New Law relating to their Use.

BY T. F. ABRAHAM.

The paper first dealt with the standard of weight, the avoidupois pound, from which all the other weights are calculated. Its relationship to the Egyptain mina, to the Jewish mina, and to the Roman librum was also referred to.

The Saxon pound was the direct ancestor of the Norman, which was followed by the new Exchequer Standard of Henry VII. This remained in use till the time of Elizabeth, when it was destroyed and a new one provided. This remained in continual use for about two centuries and a half, being superseded in 1824. During that time, as far as can be ascertained, its weight became reduced from 7002 grains to 6999. It is still in existence, and weighed in 1873 about half a grain more, due to oxidation.

In 1824, Parliament ordered the construction of new standards, which were deposited in the vaults of the House of Commons, where they were destroyed on the burning of the building in 1834.

Shortly afterwards a commission was appointed agreeably to the directions of the Act of 1824, for the restoration of the lost standards. The Act specified that in case of loss the standards were to be restored by reference to a fixed natural standard. The standard was to be the length of a pendulum beating seconds of mean time at the latitude of London, in a vacuum. The standard yard was to bear to such a pendulum the ratio of 36 to 39·1393. From this the weight of the new standard pound was to be deduced, it being set forth that a cubic inch of distilled water at 62° Fahr., barometer 30 inches, should weigh 252·458 grains, of which the standard troy pound should contain 5760.

The commission after three years' work reported against the plan proposed by Act of 1824, considering the data therein given as inadequate to the attainment of the desired degree of accuracy. They recommended that this certainly very interesting scientific method should be abandoned in favour of an appeal to various measures and weights which it was known had been carefully compared with the lost standard.

The committee must not be condemned as unscientific and ultra-conservative. Their chairman was Mr. (afterwards Sir George) Airy, and they availed themselves of the highest scientific talent of the day. They recommended a return to the avoidupois pound, the troy pound made legal in 1824 never having been adopted to any considerable extent by the public, although it had at that time, 1842, been officially recognized for nearly twenty years.

The work of carrying into effect this and other recommendations was entrusted to a new commission appointed in 1843 and dissolved on the completion of their labours in 1854. The chief difficulty arose from the fact that the densities of the metals used in constructing the various existing standard troy pounds were not accurately known. Eight standard troy pound weights were selected, three being of platinum, the rest brass. All had been compared with the lost standard troy pound made in 1758.

Of the eight, two were selected as specially accurate. One belonged to Professor Shumacher and the other to the Royal Society. They had been made in 1829 and were intended to be one pound weight in air. The relation of the former to the lost standard had been arrived at as a mean of 300 observations, and of the latter 140. The mean ascertained variations were found to be ·00857 and ·00205 of a grain respectively.

From the mean of these two weights a new troy pound of platinum was made, and from that the new imperial standard (avoirdupois) pound was deduced.

Four copies, referred to in the new Act as "Parliamentary copies," were made and deposited respectively at the Royal Mint, Royal Society, Greenwich Observatory, and within the walls of the New Palace of Westminster; thirty-six standard pounds of bronze gilt were made, their weights both *in vacuo* and in standard air being carefully determined and their densities recorded. These were distributed amongst various public institutions at home and abroad.

The standard troy pounds are of their true weights in air at ordinary temperature (62° Fahr.), and barometric pressure 30 inches, whereas the imperial standard (avoirdupois) pound is of its true weight *in vacuo*.

The reason for this is that platinum is the only metal, otherwise suitable, that is not affected by oxidation, and being much denser than the brass or bronze weights with which it would have to be compared, would, if weighed in air be about half a grain too heavy.

The officials tandard weights, which practically regulate all commercial weights, are so made that when weighed in air at ordinary temperature and pressure they shall exactly balance such a weight as weighed *in vacuo* against the imperial standard of platinum would balance it.

Having thus briefly described the means taken to provide an absolutely correct standard of weight, I will detain you but a very few minutes to describe the means taken to provide a similarly exact standard of length. The work of constructing the new imperial standard yard was commenced in 1843, and completed in 1854.

The work was commenced by Mr. Baily, continued by Mr. Sheepshanks, and concluded by the Astronomer Royal. In its progress upwards of 200,000 micrometer readings were taken and recorded.

The length was taken as the mean of the most authoritative standards that had been compared with the lost standard yard which perished along with the standard pound in the burning of the Houses of Parliament.

The lost standard had been made in 1760, its length being taken from that of one made in 1758, which was derived from a comparison of the Queen Elizabeth standard of 1588 with that of the Royal Society of 1742. It consisted of a solid brass bar of 1·05 inch square, and 39·73 inches long. On one side were sunk two gold pins $\frac{1}{10}$ inch in diameter, and the standard yard was the distance between the centres of these pins. The repeated application of compasses for purposes of comparison, produced a wearing away of the metal and left room for a slight inaccuracy.

The new imperial standard yard measure was the mean of the length of the five most authoritative standards in existence, all of which had been compared with the lost standard.

The extreme variation between the longest and the shortest was only about $\frac{1}{50000}$ of a inch. After much deliberation it was decided to construct the standard of an alloy composed of copper 16 parts, tin $2\frac{1}{2}$ parts, zinc 1 part. The bar is solid, 1 inch square, 38 inches long.

The measurement of the imperial yard is taken between two points marked by very fine lines drawn on the surface of two gold pins, sunk into the bar at the bottom of two holes drilled from the upper surface to the mid-depth of the bar. Forty such line standards were made, and the best set aside as the imperial standard yard. The four next best were selected as "Parliamentary copies," and deposited as were the "Parliamentary copies" of the "imperial standard" pound. The remaining thirty-five

were distributed, as were the like number of bronze standard pounds, amongst various public bodies at home and abroad.

The "imperial standard yard" is authoritative only at 62° Fahr., the "Parliamentary copies" respectively at 61·91°, 62·10°, 61·98° and 62·16°. The whole of the forty have their appropriate temperatures marked distinctly on them.

In using the imperial standard yard it is provided that it shall be supported on four brass rollers, which by an ingenious arrangement of levers each receive an exactly equal portion of its total weight.

The relationship between the unit of weight and length in our system and in the metric was next referred to, as was also the descent of our yard from the Egyptian cubit and the attempts made to find out a simple relationship between the length of the base of the great pyramid and a degree of the meridian.

The English yard is just double the Egyptian cubit, and differs by only $\frac{1}{100}$ of an inch from the yard of Henry VII., which was a copy of the yard of the Saxons.

Mr. Abraham then briefly referred to the new law about weights and measures, and while fully recognizing the correctness of the principle by which its promoters were actuated and the desirability of such an enactment, expressed his regret that such superfluities as drams, pennyweights, gills, pecks, poles and chains should have received a fresh official sanction.

The introduction of the dram he regarded as especially unfortunate, as at present in retail sales a "dram or drachm" *may* mean either 27 or 60 grains, whilst in wholesale transactions it *must* mean the former only.

The paper was listened to with much interest, and at its close a discussion took place in which Messrs. Arthur Haddock, Charles Symes, Ph.D., R. Parkinson, W. McQuie, and other members took part. A cordial vote of thanks to the author was carried by acclamation.

MANCHESTER CHEMISTS AND DRUGGISTS' ASSOCIATION AND SCHOOL OF PHARMACY.

An ordinary meeting was held in the Memorial Hall, on Wednesday evening, January 22. Mr. W. Wilkinson, Vice-President, in the chair.

The minutes of the previous meeting having been read, fourteen associates were elected.

Mr. J. T. Slugg, F.R.A.S., Vice-President, then delivered a most interesting and amusing lecture entitled "The Shop Clock," in which much information respecting ancient and modern means of measuring the flight of time was associated with many humorous anecdotes.

On the motion of Mr. Siebold, seconded by Mr. Benger, a cordial vote of thanks was tendered to Mr. Slugg.

Messrs. Geo. S. Woolley and W. Wilkinson made an appeal to the members present on behalf of the Benevolent Fund of the Pharmaceutical Society, strongly urging an endeavour to increase the length of the Manchester subscription list.

The next meeting was announced for Wednesday, February 19, when a paper on "Hydrobromic Acid," by Mr. A. N. Palmer, will be read.

GLASGOW CHEMISTS AND DRUGGISTS' ASSOCIATION.

The fourth meeting of the session was held in Anderson's University, on January 15, Mr. Kinninmont, F.C.S., President, in the chair. After the minutes of the previous meeting wers read and approved of, the President introduduced Professor McKendrick of the Glasgow University, who delivered an interesting lecture on "The Methods of determining the Physiological Actions of Alkaloids."

Dr. McKendrick began the lecture by mentioning that since Sertürner discovered morphine in opium in the year 1816, and Pelletier and Caventou quinine in the year 1819, the minds of scientific chemists had been directed to the investigation of a great variety of all kinds of vegetable substances, to discover their active principles. Until 1840, when Fritzsche made by artificial means aniline, the colouring matter obtained from indigo by distilling it with caustic potass, the alkaloids or other organic substances were considered to be only produced by the vital action of the plant or animal.

Alkaloids are composed of carbon, hydrogen, nitrogen, and oxygen; those containing the four elements cannot be distilled without being decomposed, but some that contain no oxygen can be distilled without decomposition. Alkaloids behave like ammonia in forming with radicals, such as ethyl bodies, called amines, *e. g.* ethylamine, and with acids amides, *e. g.* acetamide.

Dr. McKendrick, in describing the analogy that exists between some of the artificial organic compounds and the natural alkaloids, said by acquiring a greater knowledg of these bodies we might by and by be able to produce the alkaloids by synthesis in the laboratory of the manufacturing chemist, and thus confer a great boon on mankind.

The Professor also stated that the use of the alkaloids to the plant in which they were formed, i fthey had any, was not known. The plant stores them up into its tissues instead of excreting them as the human body does organic bodies formed within it, such as creatinine, tyrosine and urea, which are excreted after the body had no further use for them.

Dr. McKendrick spoke also of the progress of physiological science, and the methods of research adopted by physiologists in carrying out their investigations. He said that before the actions of the alkaloids on the human body could be studied accurately a thorough knowledge of its mechanism and its various functions must be attained; knowing these the physiologist could conduct experiments on the lower animals such as the frog, the rabbit, etc., with these substances and deduce facts therefrom, which would guide the physician in prescribing them in his general practice.

He then mentioned the action on the body of strychnine, quinine, curare, etc., pointing out that some of them affect the heart, some the motor nerves, some again a single nerve. At this point of the lecture he showed the action of woorara on a frog, showing how it destroys the power of motion without arresting the heart's action; he showed also how it paralysed the sciatic nerve, but yet it did not affect the muscular tissue, for on passing a weak electric current through the tissue of the frog's leg it moved it upwards instantly.

The Professor concluded his lecture by referring to the investigations of the late Professor Anderson of the Glasgow University, on the chinoline and pyridene series of organic bodies, and said that although the results of recent experiments on the lower animals were rather encouraging, when some of them were tried on the human subject they did not realize what was expected from them.

At the conclusion of his very interesting and valuable lecture the Professor was awarded a very hearty vote of thanks.

Proceedings of Scientific Societies.

EDINBURGH UNIVERSITY CHEMICAL SOCIETY.

The third meeting of this Society was held on January 15, 1879, Mr. G. Carr Robinson, F.R.S.E., in the chair.

A paper was read by Mr. J. Adrian Blaikie, B.Sc, on the "Salts of Trimethylsulphine," containing further results of an investigation carried on by Professor Crum Brown and the author.

The decomposition product of the hyposulphite of tri-

methylsulphine (see *Pharmaceutical Journal*, March, 1878) was found by analysis to be represented by the following equation:—

$$\left\{(CH_3)_3S\right\}_2 S_2O_3 = \begin{matrix}(CH_3)_3S\\CH_3\end{matrix}\Big\} S_2O_3 + S(CH_3)_2.$$

The methylhyposulphite of trimethylsulphine thus obtained is very hygroscopic, and is gradually oxidized to a sulphate. The solution of the substance does not decolourize iodine solution. These results point to—

$$\begin{matrix}(CH_3)_3S-O\\CH_3-S\end{matrix}\!\!\diagdown\!\!\diagup SO_2$$

as the probable rational formula of the substance.

The sulphite of trimethylsulphine was obtained by the action of sulphurous acid on the hydrate. It crystallizes well, but there is some difficulty in preparing a perfectly normal salt. The salt, as nearly normal as possible, does not, like the hyposulphite, give up its water of crystallization in the cold over anhydrous phosphoric acid; at 140° C., however, it becomes anhydrous. Heated to 175° C. it gives off sulphide of methyl—8·3 grams lost 2·32 grams, or 27·95 per cent. On cooling, the clear liquid residue solidifies, forming a hard, very hygroscopic crystalline mass. This substance was so deliquescent that no analysis of it was made. The mode of formation leads to—

$$\begin{matrix}(CH_3)_3S\\CH_3\end{matrix}\Big\} SO_3$$

as its most probable formula.

In order to ascertain the nature of this substance the authors converted it by double decomposition with iodide of potassium into the corresponding potash salt, which was purified from the iodide of trimethylsulphine by crystallization.

$$\begin{matrix}(CH_3)_3S\\CH_3\end{matrix}\Big\} SO_3 + KI = \begin{matrix}K\\CH_3\end{matrix}\Big\} SO_3 + (CH_3)_3SI.$$

This potash salt was found to agree in properties and composition with the "sulphometholate" or "methylsulphonate" of potash.

$$\begin{matrix}KO\\CH_3\end{matrix}\!\!\diagdown\!\!\diagup S\!\!\begin{matrix}\diagup\!\!\diagdown O\\\diagdown\!\!\diagup O\end{matrix}$$

The bearing of this fact on the constitution of sulphites is obvious.

The acetate of trimethylsulphine is formed by treating the iodide of trimethylsulphine with acetate of silver.

$$(CH_3)_3SI + CH_3 - COOAg = (CH_3)_3S - OOC - CH_3 + AgI$$

On leaving the strong solution over sulphuric acid *in vacuo* for three weeks no crystallization took place. The strong solution on being heated to 100° decomposed into water, acetate of methyl and sulphide of methyl.

$$CH_3 - COO - S(CH_3)_3 = CH_3 - COO - CH_3 + S(CH_3)_2.$$

The benzoate of trimethylsulphine is formed by treating the iodide of trimethylsulphine with benzoate of silver.

$$(CH_3)_3SI + C_6H_5 - COOAg = C_6H_5 - COO - S(CH_3)_3 + AgI.$$

This salt is very soluble in water. On standing for two weeks over sulphuric acid *in vacuo*, only a very few crystals were formed, which it was difficult to separate from the very thick mother liquor. It is slightly less soluble in alcohol. The imperfectly dried salt on being heated to 110° decomposes into water, benzoate of methyl and sulphide of methyl.

$$C_6H_5 - COO - S(CH_3)_3 = C_6H_5 - COO - CH_3 + S(CH_3)_2.$$

The dithionate of trimethylsulphine is obtained by neutralizing an aqueous solution of dithionic acid with the hydrate of trimethylsulphine. On evaporating the solution of the salt on the water-bath, it begins after a time to crystallize out. On leaving the saturated solution to cool a large quantity of clear cubical crystals were obtained. These are not hygroscopic, insoluble in hot alcohol, and without any smell of sulphide of methyl. These properties prove it to be one of the most stable of the salts of trimethylsulphine. Analysis agrees with the formula

$$\left\{(CH_3)_3S\right\}_2 S_2O_6 \cdot H_2O.$$

On heating the salt to about 120° water is given off. On raising the temperature to 220° sulphurous acid is given off, and afterwards along with it sulphide of methyl, and the salt froths and melts. The heating at about 200° was continued until very little gas was given off. 8·015 grams were found to have lost 3·325 grams equal to 41·4 per cent. On cooling, the liquid solidified. The crystalline mass was very hygroscopic and dissolved in alcohol. On adding ether to the alcoholic solution the substance was precipitated as an aqueous syrup, and on standing over sulphuric acid crystallized out in beautiful long fine prismatic needles. The presence of the trimethylsulphine radical was proved by double decomposition with iodide of potassium, when the iodide of trimethylsulphine crystallized out. The presence of methylsulphuric acid was also proved. These results, along with estimations of carbon and hydrogen, prove the substance to be the methylsulphate of trimethylsulphine. The decomposition of the dithionate is therefore expressed by the following equation:—

$$\begin{matrix}(CH_3)_3S\\(CH_3)_3S\end{matrix}\Big\} S_2O_6 \cdot H_2O =$$

$$\begin{matrix}(CH_3)_3S\\CH_3\end{matrix}\Big\} SO_4 + SO_2 + (CH_3)_2S + H_2O.$$

A paper was also read by Mr. J. W. Drake on "The Constitution of Inorganic Salts."

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, January 23, when Mr. R. H. Parker took the chair.

The minutes of the last meeting were read and confirmed.

A paper on "Urine" was then read by Mr. E. Reilly. Having described the general characters and properties of urine, the author proceeded to give a detailed account of its more important constituents. 1. *Urea* was discovered in 1773 by Rouelle the younger: besides its occurrence in urine, it forms 30 per cent., according to Millon, of the solids contained in the vitreous humour of the eye. About thirty grams are discharged daily in the urine of an adult, a decided increase occurring in the case of patients suffering from typhoid fever. The production of urea, both from urine and artificially, was described and its origin discussed. 2. *Uric Acid* was discovered by Scheele in 1776; the best source for its production is the excrement of boa-constrictors, of which it forms more than 90 per cent., but its production in a state of purity from urine itself involves considerable difficulty. 3. *Kryptophanic Acid*, a transparent gummy solid body, soluble in water, was discovered by Thudichum in 1869, and is considered by him to be the normal free acid of urine. The paper, which was illustrated by specimens of urea, etc., made by the author, concluded with an account of the colouring matters of urine, and their origin in that body.

After a discussion, a vote of thanks was passed to Mr. Reilly, and Mr. Naylor then exhibited and put into action Russell and West's apparatus for the estimation of urea by hypobromite of sodium, and a discussion was carried on concerning certain points in the analysis of urine by the Chairman, Dr. Senier, Messrs. Naylor, Symons, Arnold, and Dunstan. After a vote of thanks to Mr. Naylor, the meeting adjourned.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Jan. 22, Mr. J. McKnight read a paper before this Association, on "The Past and Present Condition of Chemists' Assistants." Touching lightly on the past, Mr. McKnight went on to notice the present condition and status of chemists' assistants, whether they were in keeping with the times, and with other trades and professions; on these points Mr. McKnight's views were generally rather desponding. The paper served to introduce a discussion, which was conducted throughout with moderation and good sense, several gentlemen challenging Mr. McKnight's propositions. On account of the late hour, further debate was adjourned to Feb. 5.

Parliamentary and Law Proceedings.

Death of a Chemist's Assistant from Poisoning by Prussic Acid.

An inquest was held on Monday at the Shakespeare Tavern, Woolwich, before Mr. Carttar, coroner, relative to the death of Edward Johnson, aged 24, a chemist's assistant.

Mr. F. T. Atkins, chemist, Powis Street, Woolwich, said that the deceased had been in his employ only one day, and appeared to be a very respectable young man. On Thursday afternoon he exhibited signs of intoxication. Witness induced him to go upstairs to his bedroom. At half-past nine a man was sent up to see if he wanted anything, and found him dead.

Mr. Atkins, surgeon, son of the last witness, said he saw deceased almost as soon as he was discovered, and considered that he had been dead about an hour. He was lying on his bed, and at the foot were placed a bottle containing prussic acid and another containing brandy. His lips smelt of prussic acid, but the features did not indicate a violent death, and the position of the bottles, properly corked, was inconsistent with the supposition that a suicidal dose had been taken. It was well known amongst chemists' assistants that prussic acid in small doses was an antidote for drunkenness, but it was a most dangerous remedy. Four or five drops, or minims, was as large a dose as could be taken with safety, but there was no measure in the room, and deceased had probably taken about 20 drops, which would cause death in something under half an hour. The deceased was not in needy circumstances, for he had 5*l.* in his pockets and a watch and chain, and his parents were in good circumstances at Spalding, in Lincolnshire.

The Jury returned a verdict of Death from an overdose of prussic acid.—*Standard.*

Reviews.

Year-Book of Pharmacy: comprising Abstracts of Papers relating to Pharmacy, Materia Medica, and Chemistry contributed by British and Foreign Journals from July, 1877, to June, 1878. With the Transactions of the British Pharmaceutical Conference at the Fifteenth Annual Meeting held in Dublin. London: J. and A. Churchill. 1878.

Some weeks ago we were enabled to announce the appearance of the Year-Book for 1878, and since probably it is by this time in the hands of most, if not all, the members of the Conference, they will have had an opportunity of judging of its merits. The soundness of Mr. Siebold's work is now too well established to need adulation or to fear criticism, and assuming it to be the wish of the Executive Committee of the Conference that in preparing the Year-Book, and in respect to the form of the abstracts and the order of the arrangement, the same principles should be followed which have hitherto obtained, we have no hesitation in saying that the present volume is well up to the standard to which the present editor has accustomed us.

But we have on more than one previous occasion suggested, among other things, that an arrangement by which extracts bearing upon a particular article of the materia medica were brought together so as to form a history of that article for the year, would present some advantages. This need not interfere with the present plan of giving full extracts in the words of the original paper whenever thought necessary. We do not suppose that this point has been overlooked, and grant that the present arrangement is probably intentional. But we fail to see, for instance, what is gained by having in a Year-Book one "test for morphia" on p. 36, another on p. 112, and the assay of opium dealt with on pp. 56 and 110. Then Tobein's paper on the veratrum alkaloids occurs on p. 132; Hesse's paper on the sabadilla alkaloids on p. 98 and Wright and Luff's on p. 168. But of course we only express our opinion, which must stand for what it is worth.

One error that has crept into the volume it may be useful to point out. In Mr. Squire's formula for "ointment of thymol" (p. 342) the thymol should be ℥j (not ʒj) to ℥j of lard.

Jahresbericht uber die Fortschritte der Pharmacognosie, Pharmacie, und Toxicologie, herausgegeben von Dr. G. Dragendorff. 12 Jahrgang 1877. Göttingen: Vandenhoeck und Ruprecht. 1878.

Notwithstanding that a good Year-Book in his own language is now within the reach of the English pharmacist we should recommend him, if he is able to read German, to supplement it with Dr. Dragendorff's Jahresbericht. On a former occasion* we sketched the systematic classification adopted in this annual, and it need now only be said that it resembles more closely that followed in the celebrated 'Jahresbericht für Chemie' than that of our own Year-Book. The ground covered is enormous, as may be learned from the fact that although as a rule only a *précis* is given of each paper, the work extends to nearly 600 closely printed demy octavo pages. Of course this is more than could be done by the Editor alone, and he acknowledges the help of Messrs. E. Masing and E. Johanson; and also of Dr. Julius Morel for Belgian, Mr. Nentwich for Hungarian and Dr. Von Wasswicz for Polish excerpts.

One feature in this Year-Book is its Bibliography. The list given of books and pamphlets published in 1877 on subjects allied to pharmacy contains 416 items, and this is followed by a brief running commentary on the principal of them.

Obituary

Notice has been received of the deaths of the following:—

On the 4th of December, 1878, Mr. William Calvert Appleby, Chemist and Druggist, Hilderthorpe. Aged 71 years.

On the 17th of December, 1878, Mr. John Grimshaw, Chemist and Druggist, Pemberton, Lancashire. Aged 45 years.

On the 18th of December, 1878, Mr. Joseph Hargreaves, Chemist and Druggist, Preston, Lancashire. Aged 73 years.

On the 20th of December, 1878, Mr. William Goosey, Pharmaceutical Chemist, Stepney, London. Aged 73 years. Mr. Goosey had been a Member of the Pharmaceutical Society since 1853.

On the 25th of December, 1878, Mr. George Pates, Chemist and Druggist, Fore Street Hill, Exeter. Aged 58 years.

* Vol. viii., p. 198.

On the 11th of January, 1879, Mr. Edwin Rider, Chemist and Druggist, Lympstone, Devon. Aged 70 years.

On the 15th of January, 1879. Mr. Horace Edwin Harding, Chemist and Druggist, Batherstone. Aged 36 years.

On the 15th of January, 1879, Mr. John Davidson, Chemist and Druggist, Berwick-on-Tweed. Aged 79 years. Mr. Davidson joined the Pharmaceutical Society in 1846. He retired from business four years ago, and leaves a widow and daughter to mourn his loss. He was held in high esteem in his town, and was much respected by a large circle of friends.

Dispensing Memoranda.

[173]. Mr. Henry Brown writes to say that he does not admit the correctness of the opinion expressed in "The Month" that his method of dealing with Mr. Barnes's prescription is "practically inadmissible," and he contends that in his suggestion there is no tampering with the prescription at all, but that there would be if mucilage be added.

---

[205]. I do not think either "Tyro" or anybody else would be justified in adding ℥ij or ℥ss of s. v. r. to this prescription, in order to make an emulsion according to their order of procedure, when a good and satisfactory emulsion could be produced without that addition being made by proceeding in the order given on the 18th in G. H. L.'s answer to this query. This is only a very minor matter, but if such a practice were sanctioned as a precedent some dispensers might look upon physicians as prescribers subject to their approval, which in some cases would meet with very varied results.

ROTHERHAM.

---

[213] In reply to W. H. R. I beg to say the reason why I use cera alb. in the manufacture of suppositories is in order to give them increased stability, which not only greatly facilitates their manufacture and application, but as their solubility is thus rendered more gradual, I consider the absorption of their active ingredients is likely to be more complete. And in reply to G. B. who seems to doubt their solubility I would say, if he would not mind taking the trouble(which by the by is less than in the B. P. method) to make some according to my formula and would tie one up in a small piece of French gut skin and place under the arm or in the mouth, he would find from ten to twelve minutes quite sufficient to entirely dissolve it. I supply several surgeons and have never yet had a complaint on that score. I certainly fail to see the necessity of using lard to make them soft and wax to make them hard when ol. theobrom. alone would to my mind be preferable. Of course constant stirring until cool enough to pour into moulds is necessary in either case. May I ask if C. H. J. S. has been successful in turning out more than one lot from the same mould in the course of a hot summer's day?

In reference to the desirability of using mag. carb. pond. instead of mag. levis. in pulv. rhei. co., I am quite aware the dose would require altering. This of course might easily be managed in a revised edition of the Pharmacopœia, in relation to which I addressed my remarks. I still maintain it is difficult to mix, each dose requiring quite five minutes' vigorous stirring, even if it be mixed by one skilled in the culinary art of mustard mixing.

A. B. C.

---

[213]. It is evident G. B. speaks from theory, and not from experience, when referring to the melting of suppositories from the form given by A. B. C. in a previous number.

XANTHUS.

---

[214]. "Associate" asks:—"Will any one kindly inform me what he would have done under the circumstances?" he having had a prescription to dispense as follows:—

℞ Hyd. c̄ creta . . . . . ℥ss.
S. s.

Pulv. seidlitz in hora postea.

I do not see any difficulty in the case. "Associate" may not know that 15 to 30 grains of calomel are often ordered as a purgative in certain inflammatory diseases in warm climates, and I have often given 10 to 15 grains of calomel when called to a case of apoplexy, and in America 50 to 100 grains of calomel have been given as a diuretic. Therefore, if a medical man choose to order ℥ss of hyd. c̄. creta as a purgative, I can see no reason why it should not be at once dispensed.

No doubt the dose is larger than that given in most text books. and hyd. c̄. creta in ℥ss doses is not frequently prescribed, hence, perhaps, the reticence of "Associate."

Northallerton. HENRY BROWN.

---

[216]. "Collegia's" question,—Should plumbi acetas, B.P., be used in this prescription?—

℞ Plumbi Diacet. . . . . gr. vj.
Spt. Vini. Rect. . . . . ℥j.
Aquæ Destil. . . . . ℥vss.
Misce. Fiat lotio.

is one of those which admits of a little doubt if we adhere strictly to the letter of chemical nomenclature. Diacetate of lead, in the form of a salt, is insoluble in alcohol, and the liquor plumbi subacet. dil. is one of those preparations which may well be expunged. The crystalline diacetate, oxyacetate, or subacetate is a salt which requires great care in the preparation. The liquor plumbi subacet. must be evaporated so as to exclude air. The crystals are needle-shaped, and, so far as I am aware, the diacetate, in the crystalline form, is only used in analytical operations. It is found to precipitate organic acids in the extraction of alkaloidal substances, and is also used for eliminating colouring and gummy matters. I am not aware that it has ever been used in medicine except in the form of solution, viz., liquor plumbi subacetatis.

I therefore think the compounder of any prescription in which plumbi diacetas, is ordered, is justified in using the acetate or sugar of lead. In the case under consideration I consider it is evident sugar of lead was meant, and not the diacetate as used in analysis and as explained above.

Northallerton. HENRY BROWN.

---

[218]. My advice to "Minor" would be in the case given to dissolve the quinine with as little acid as possible, so as to effect complete solution. It is clearly a mistake on the part of the writer of the prescription, for no medical man pretending to have any knowledge of his profession would order ℈ij. of quin. sulph. to be dissolved in water with the addition of ℥v. of acid. sulph. dil. I do not know if any but the disulphate is now used in dispensing, and it is the salt which is invariably prescribed, and called by many quinæ sulph. for shortness' sake.

Northallerton. HY. BROWN.

---

[218]. In reply to "Minor," I should have added acid. sulph. dil. to dissolve the quinæ or else consulted the prescriber on the point.

I had a similar prescription handed to me a short time ago, when I adopted "Minor's" plan of dispensing it as written, when the customer shortly returned with it and asked me if I would filter out those "feathery bits," as when it had been dispensed in London it was perfectly clear and did not require shaking.

I may say that in this case I deviated slightly from my general rule and added more acid. sulph. dil. without

explaining the reason, lest it should raise a suspicion that in the first instance I had not dispensed it correctly as written. G. H. L.

---

[219]. In reply to "Sub Umbra Floresco," I should label it, "A teaspoonful at bedtime occasionally."

G. H. L.

---

[219]. "Sub Umbra Floresco" asks what should this be labelled?—

℞ Pulv. Rhei. Comp. . . . . ℥ij.

Mitte in phiala et signa ℥i. h. s. p. r. n.

I should recommend in all cases like the above to simply put on the label, "The Powder. A teaspoonful at bed time, occasionally." I should not recommend the addition of "Gregory's powder" (?) or "compound rhubarb powder." May I point out that "Rex" gives "a tablespoonful at bed time, occasionally." "Tea" is meant.

On page 610, second column, Dr. Graves's form should read (℥) instead of (℈), where ounce occurs.

Northallerton. Hy. Brown.

---

[223]. The ordinary strength of liq. bimeconatis morphiæ is 4 grs. to ℥j. I make my own thus:—℥ij. spt. vini rect.; ℥vj. aq. destil.: 4 grs. morph. bimecon. The bimeconate is easily soluble. I may state that Squire's is brownish red, but it has no advantage over the above form, and I dislike the smell of some samples sent to me.

Northallerton. Hy. Brown.

---

[225]. If "Apprentice" will try adding the tr. opii and tr. catechu to the mixed bismuth. subcarb. and tragacanth, then gradually the aq. cinnamomi, he might easily get the tragacanth to emulsionize if not entirely to dissolve. But is there not a printer's error in the quantity of tr. opii as given in your query?

G. H. L.

[*** The prescription is printed as written.—Ed. Pharm. Journ.]

---

[226]. In reply to "Omega," half fill your 8-oz. bottle with mist. guaiaci, add the turpentine in very small quantities at a time, shaking after each, and when it is thoroughly mixed fill up with mist. guaiaci gradually.

As an experiment I tried the proportions as given by "Omega," and found them very difficult to emulsionize, yet not impossible, and should favour directing it "shake the bottle," lest after standing more than three days it should separate. G. H. L.

---

[228]. Considering that the amount of moisture contained in opium varies from 3 per cent. to 15 and 20 per cent., it would scarcely do to use moist opium as imported when opium in coarse powder was ordered.

I take it that the B.P. directions intend us to drive off as much moisture as if we were going to make pulv. opii, but simply not to powder it so fine, and I may add that a tr. opii (from some reason which I cannot fully explain) made as above directed is not nearly so nauseous and objectionable as one made from moist opium.

G. H. L.

---

[229]. In reply to query No. 229, I should advise "Kenbaan," to use the powdered pil. coloc. co.; add the hydrarg subchlor, and then the tinct. capsici, mix thoroughly and evaporate on a tile before a fire, or over a water-bath, to a suitable consistence. I have just dispensed the prescription and the pills are all that could be desired. Chas. Stocks.

---

[229]. Mix the tinct. capsici with the pil. coloc. co. (or an equivalent quantity of pulv. pro pil. coloc. co.) and evaporate by a gentle heat to a suitable consistency; then mix with the hyd. chlor. and roll into pills. Xanthus.

[229]. I should use pulv. pil. coloc. co. and mix the other ingredients well with it, and add sufficient quantity of water to form a nice pill mass.

Rex.

---

[230]. I think if J. B. T. added the pulv. zinci sulphatis to the tr. quinæ (gradually) and dissolved it by the aid of heat he would have a better mixture.

Rex.

---

[231]. When pil. assafætida is ordered in a prescription I should use the pil. assafætida co.

Rex.

---

[232]. I should take it for granted that the doctor forgot to finish writing the whole name of the ingredient, and should therefore use the pil. hydrarg. subchlor. co.

Rex.

---

[233]. Can any reader kindly state formula for vapor benzole? The prescription in which it appeared was as follows:—

℞ Sp. Æther. Chloric. . . . . ℥j.
Aldehyde . . . . . ℥j.
Vap. Benzole . . . . . ad ℥iij.

Misce.

Did the prescriber intend vapor benzoini (Throat. Hos. Pharm.)?

A. P.

---

[234]. Liquor Emetinæ.—When this is prescribed, what should be dispensed? I am aware that it is uniform in strength with vin. ipecac., B.P., but am unacquainted with any formula for its production.

Sub Umbra Floresco.

---

[235]. In the following prescription should the liq. arsenici chloridi, P.L., or the liq. arsen. hyd., B.P., be used?—

℞ Tr. Ferri Mur. . . . . ℥ij.
„ Nucis Vom. . . . . ℥j.
Liq. Arsenici Chloridi . . . . ♏ xxxvi.
Aquæ . . . . . ad ℥vj.

M. ℥ss bis die sumendus.

Student.

---

[236]. Would any correspondent kindly inform me the best way of making up the following prescription, so that each pill shall contain one drop of the oil?—

℞ Ferri Sulph. exsic. . . . . gr. ½
Ext. Nucis Vom. . . . . gr. ¼
Ol. Pulegii . . . . . gtt. j.
Ext. Gentianæ . . . . . gr. iij.

Ft. pil. Mitte xxiv.

Silver.—One to be taken morning and evening after breakfast and dinner.

W.

---

[237]. The following prescription was brought me. The medical man tells me I should have used the glycerinum acidi carbolici in place of the liq. carbol., as being the only official preparation. Kindly insert this for the opinion of others:—

℞ Liq. Carbol. . . . . ℥j.
Glycer. . . . . ℥j.
Acidi Sulphuros. . . . . ℥ij.

Ft. unguentum.

148, *King Street, Hammersmith.* W. P. Parry.

Notes and Queries.

[549]. DR. STOKES'S LINIMENT FOR PAIN IN THE CHEST.—The following formula has been forwarded by E. H. K.:—

℞ Linim. Saponis,
Tinct. Aconiti,
Chloroformi . . . . . āā ℥ss.
M. ft. embrocatio part. affect. applicand.

[553]. CHILBLAIN LINIMENT.—In reply to "W. M." (553) in Notes and Queries, for an elegant chilblain liniment, I can recommend the tamus communis of the homœopathists. It is very effectual, more so than any of the formulæ which have appeared in the Journal. I give the formula for its preparation:—

℞ Rad. Bryon. Nig. . . . . 2 ozs.
Spt. Vini Rect. . . . . 10 ozs.
Aquæ . . . . . 2 ozs.

Macerate seven days and filter. Apply night and morning with a camel hair pencil.

T. W.

[560]. SOLUTION OF CARBOLATE OF IODINE.—Will any reader kindly give me the formula of the above?

J. HOLDING.

[561]. UNG. CITRINI DIL.—On the 5th of October I prepared some ung. hydrarg. nit., B. P., which is of a beautiful colour and consistency, in fact it has been frequently admired by physicians to whom it has been supplied, and more than one wholesale drug-traveller has pronounced it superior to what his house turns out. But the other day I had occasion, for the first time, to dilute it to form ung. citrini dil., and was surprised to find that when mixed—either with adeps, adep. benzoat. or ung. simplex—the product had within half-an-hour turned green. I may mention that no spatula other than bone or vulcanite has ever been used, and no iron vessel was employed in its manufacture. I should feel deeply indebted to any reader who could either suggest the cause of this alarming symptom, or venture a cure in case of its recurrence.

SUB UMBRA FLORESCO.

[562]. SYRUPS OF HYPOPHOSPHITES OF LIME AND OF SODA.—Will any reader please supply formulæ for these syrups, that each teaspoonful may represent an ordinary dose of the salt?

K. B.

[563]. SYR. LIMONIS.—Would any reader of the Journal favour me with a formula for lemon syrup, made with citric acid and ess. limon., where the lemon does not separate and float on the top? I have prepared a syrup and tried to dissolve it, but cannot get anything to effect its complete solubility without separating when mixed with simple syrup.

ALPHA.

[564]. CEMENT.—"St. Tudno" would be glad of a recipe for a good "cement" suitable for fastening the tops of spirit flasks, one that would resist the action of spirit and also water.

[565]. CLEANSING DRINKS.—Would some correspondent of the Journal give me a good recipe for cleansing drinks?

T. W.

[566]. LIN. SAPONIS.—Will some correspondent kindly explain the cause of the difference existing between two samples of lin. saponis? I have in my care fifty two-pound bottles of that preparation, of which twenty-five bottles were supplied by one house, and remain in a liquid state, of a bright reddish-brown colour; while the remaining twenty-five bottles were supplied by another house and have become of a semi-opaque gelatinous solid, with a white coral-like substance dispersed through it.

J. G.

[567]. INDIAN BRANDY.—Can any one oblige "Lewis" with a formula for "Indian Brandy?"

[568]. DRY SOAP.—"Lewis" wishes to know the ingredients used in the manufacture of "Dry Soap."

[569]. GINGERETTE.—Will any one give me a recipe for the concentrated preparation for making the winter drink—to be clear when mixed?

CHREMES.

[570]. SOLUBILITY OF TANNIC ACID IN WATER.—Squire says it is soluble 10 in 8, but I find that even the purest tannic acid is not soluble, nor anything like it, in this proportion.

J. G.

[571]. GUAIACATE OF LITHIA.—Can any one inform W. C. respecting guaiacate of lithia, its composition, dose and properties?

Correspondence.

CO-OPERATIVE TRADING.

Sir,—In common with many I have read with pleasure the able and temperate article on "Co-operative Trading" which appeared in your issue of Saturday, the 25th instant; but I beg space in your columns for a few words which I think will enable your readers to form a clearer and more definite opinion on this question.

The second paragraph of your article says:—"The injurious effect of certain forms of co-operative trading upon the business of retail dealers has at length induced an attempt to take some common action, with the view of protecting the interests of the class which has hitherto been the sole means of supplying the general public with the various articles of daily requirement. The first step has been to hold a conference, at which the several grounds of complaint could be stated and discussed. The credit of initiating this movement is due to Mr. S. Webb and Mr. J. E. Shand, who, last month, brought forward at the Vestry of St. Anne, Westminster, a resolution affirming that

the present practice of Crown servants conducting retail business to the extent of some millions a year, under the name of Civil Service Stores, and with little or no profit, is extremely unjust to the regular trading class, and likely in the end to prove detrimental to the State."

Without taking any exception whatever to the quoted paragraph, I would ask you, sir, to allow me to state that I am of opinion that but for the meeting of Metropolitan elegates, held in the Board Room of the Westminster District Board of Works, on Monday last, there would have been a possibility of the action of Messrs. Webb and Shand resulting in affirmation only.

At the meeting just mentioned, I was called upon to second a resolution, which I venture to affirm has given something like a living and useful shape to the affirmation of Messrs. Webb and Shand. The resolution was as follows: —"That this conference is of opinion that the direction of so-called 'Civil Service Stores,' in connection with the Army and Navy and Civil Service, by persons in the employ of the Government, or in receipt of pensions therefrom, is subversive of the order and welfare of the State, by convulsing and crippling that social balance of the community at large which is necessary in all phases of political and social economy. That this Conference, therefore, is desirous that statesmen and politicians of all classes should give their serious attention to the question, in order that the inexpediency, not to say unfairness and injustice, that now exists, may be removed; at all events, to consider whether it is just, reasonable, or politic, that the titles of Government departments should be permitted to be assumed by these associations, which no doubt have considerable prestige with the public."

I beg to assure you, sir, that the gentlemen who composed the conference are determined not to allow the question to end with the proceedings of Monday last; but that they are bent on putting forth every just and proper effort to save the interests of the legitimate retail trader from suffering by reason of the competition of such "co-operative trading" as that to which exception was then taken.

Since the meeting of the conference, I have received many approving and encouraging communications in respect to the action I have already taken. I shall be glad to receive more such communications, and I shall also be glad to afford all possible help or information to any one interested in, and affected by, "co-operative trading" carried on by the servants of the Crown.

Being a member of the Pharmaceutical Society, and a chemist and druggist, I feel anxious, as such, to render aid in the attempt to remove the evil as affecting myself and others in the same business, and to help tradesmen in general to rid themselves of so unfair and unjust a competition.

H. Bowman Spink.

3, *Marsham St., Westminster, S.W., Jan.* 25, 1879.

The Future of the Drug Trade.

Sir,—As one who has written to you on former occasions on the subject of "low prices," and as one who has always regarded the system of underselling as a very cancer in our midst, I was much pleased by the perusal of "Hampshire's" practical and sensible letter in your last week's Journal. It must I am sure have been welcome and refreshing to every well-wisher of the trade.

It does seem strange that a subject of such vital importance should be suffered to drop without anything being done to remedy the evil complained of; but, alas! so it has been. A chemist conducting his business in a fair and honourable manner, finds himself being ruined by the selfish behaviour of a neighbour, whose highest aim is by tempting prices to draw all the persons he possibly can to his establishment. Suffering patiently for a long time, he at length naturally writes to the *Pharmaceutical Journal*, describing the nature of his grievance, and trusting thereby to obtain some little comfort and redress. He is, however, doomed to disappointment. Perhaps his letter may be followed by one or two others, written in the same spirit as his own, then there will be one or two in which the mask is so transparent that the features behind it are plainly discernible—verbosity has been used to disguise the principles of these last correspondents; but nevertheless it is clearly to be seen they belong to the very same class of undersellers. And then after this little excitement a silence prevails, the painfulness of which is only to be fully understood by those who have been unsupported and thwarted in an earnest endeavour to do good.

It is to be hoped "Hampshire's" letter will arouse the Council, our trade society, and our own right-minded brethren, to a determination to use every effort to save our poor business from utter extinction. Let the very students be taught to shun the men who are doing their utmost to degrade and ruin the profession for the membership of which they are toiling so hard, and then I think we may reasonably hope that "a better time is coming."

J. R. Summers.

86, *Curtain Rd., E.C.*

Sir,—It is said that spectators see the most of the game, and as an onlooker I have perused with much interest the letter in your last week's issue under the above heading, signed "Hampshire," and also his former correspondence on the same subject, and I have been surprised that the matter has not been taken up and discussed by the retail trade generally, to whom it must be of such vital importance.

I hardly think it possible, under existing circumstances, looking at the question from an outsider's point of view, that the "consummation so devoutly to be wished" can be obtained by the means suggested. It is very true that though the prices of drugs were to be reduced 50 per cent. the demand for them would not be materially increased; and if it were a matter in the hands of the retail druggists alone the remedy proposed by "Hampshire" might be effective if there were unity in the camp; but the question embraces a far wider range, at any rate in many of the larger towns in the kingdom, though possibly the same state of things may not yet have extended into Hampshire.

In this town, for instance, there are some establishments, having no connection whatever with the drug trade, which by paying the nominal annual licence, are enabled to issue lengthy lists of patent medicines as a decoy for their other wares, quoting the former at about 5 per cent. profit on the net wholesale prices for cash.

In order, therefore, to secure the desired object it would be necessary for the manufacturers of patent medicines and the wholesale houses to agree with the chemists not to supply their proprietary articles to any but those in the trade. If this cannot be managed (and I very much doubt it, as there are exceptions which would have to be made, and these would open the way for infringements of the arrangements), representations might be made to Parliament for a short and concise Act to restrict the sale of medicines to those who by examination have duly qualified themselves, and when this was accomplished the time would be ripe for the chemists and druggists to come to definite arrangements as to the prices at which these medicines should be sold.

Trusting that the subject may be fully discussed by those who, being more personally interested in the matter than myself, may look upon it in quite a different light.

66, *South John Street, Liverpool.* Fredk. S. Wallis.

Sir,—I should like to say a word in reply to your correspondent "Hampshire," whose letter appears in your last week's issue. I quite agree with him that the underselling evil, which threatens the retail trade, and not only threatens, but is actually at work in it, is proving and will prove infinitely more disastrous than any action which may be taken by the Apothecaries' Company. But the remedy "Hampshire" suggests with so much fervour, viz., that every assistant should bind himself not to accept service under any principal who does not maintain full prices, would, I think, be found altogether inadequate for the stamping out of the disease. This may perhaps account for the neglect which—to his surprise—his previous communications have suffered.

I will, for example, briefly describe the position of the business in which I am engaged, as I know it is not an isolated case, and should like to know what good "Hampshire's" assistants' union would do in this instance. About three years ago an enterprising grocer here (who was then doing, I believe, the largest business in the town) converted his splendid premises into a "store" for the sale, amongst other things, of drugs, patent medicines and sundries of all sorts at 10 per cent. above cost, supposing he bought in the

cheapest market and paid cash. He advertised well from house to house and otherwise. We chemists held a consultation as to what we should do, and decided to maintain our prices. All had done so without flinching until a short time since, when I was informed by the others that in their opinion the time had come when we should compete for the sale of patent medicines, etc. I did my best to point out that the aggregate sale of these things in the place would not be increased in the slightest degree by any reduction we might make, and used other arguments. I was met by these replies: "We have maintained our prices these three years past, hoping that we should have been helped in some way or other by the Legislature, through the instrumentality of the Pharmaceutical Council; but no help has come. We find that notwithstanding the time and money we have spent in qualifying ourselves we are in no better position than the grocer. We have seen our trade gradually going from us, until we feel that unless we would lose it entirely we must compete with our 'store' neighbour." They have done so, and I can assure "Hampshire" that they are not the unprincipled men he would have us believe all are who lower prices.

This is now the only business in the town in which prices are maintained, and also the only one employing the number of assistants with which "Hampshire" thinks a cutting business might be made to pay.

No one can fail to see that the current of public opinion is setting more and more in favour of large concerns carried on upon co-operative principles, and I believe that (so far, at any rate, as the ordinary tradesman in our large towns is concerned) it is only a matter of time when he will either have to yield to that current or sink.

I am not one of those who think that the Pharmaceutical Council has not the interest of the trade at heart. I feel how difficult its work must be, but I do wish that every member of that Council who has no experience of the evil could be removed from his present business and for six months made to manage one surrounded by competing houses, for contemplating in ease an evil at a distance and actually facing it are very different things. I feel sure they would not then rest until they had at least attempted to obtain an enactment which should to some extent protect us from whom so much is required. More capital might, I think, have been made out of the "arsenical violet powder" cases, which excited so much public attention everywhere and about which one is still frequently reminded by the public. Perhaps even now these cases might serve as a text for preaching the advisability of restricting the preparation and sale of such things to registered chemists.

I think a step, although but a short one, might be made in the direction of the "Schedule of Poisons." If sulphuric acid, carbolic acid, sulphate of copper and a few others were added it would be a considerable safeguard for the public and would preserve for those who do an agricultural trade the sale of wheat dressings, etc., which is rapidly being lost.

DORSETSHIRE.

"O wad some Power the giftie gie us
To see oursels as others see us."

Sir,—Upon entering a railway carriage a few days since, I found on the seat a copy of the *Pharmaceutical Journal* of the 25th inst., probably left behind by a former occupant of the carriage. As the train sped on I turned over the leaves of the Journal to beguile the time. There was much in it I neither cared for nor understood; but I read a letter on page 631, signed "Hampshire," with mingled feelings of surprise and amusement, and it occurred to me that possibly your readers would not object to a few remarks in reply from an outsider—one wholly unconnected with the drug trade—yet one who knows something of business.

"Hampshire" speaks of the recent litigation, Apothecaries' Company *v.* Shepperley, as "utterly insignificant, not worth a moment's thought compared with an evil so momentous that it threatens with absolute ruin at least one half—at a moderate computation—of the entire retail drug trade." Before passing on, let me here say a word respecting counter prescribing. I have read the case as reported in the daily papers; I have read the editorial remarks, and it seems to me the case stands thus:—A man is educated to sell and to dispense medicines; he passes an examination in, as I suppose, the natures and qualities of drugs and their doses; but he is not examined as to diseases or anatomy. How few of us possess any knowledge of the various parts of that grand structure, "the house we live in," and yet how few of us, but know from experience the characteristic traits of many of the ills to which flesh is heir. What mother that cannot distinguish many of the infantile disorders? What man of the world that is not conversant with the symptoms of most diseases? Of course I do not refer to complications, which at times baffle the penetrative abilities of our best physicians, but to common complaints. Well, sir, if patent medicine makers can assist us by their descriptions to understand when our liver is out of order, and can offer us a panacea for our ailment, why may we not seek the same information and relief from a man whom we know to be educated for his work of dealing in drugs, who it is but fair to infer has more honesty in him than the patent medicine pretender, who may or may not have a knowledge of medicine, who may be a mere adventurer whose sole object may be to sell his stuff largely, and so he announces that it will cure everything and everybody?

But I may be told I run a risk by employing an unskilful man, and that I ought to go to a doctor. Well, all doctors are not equally skilful, and if I am willing to take the risk, and the chemist is willing also to take his share of the risk, —for if he makes me worse, I can bring an action against him, and if he kills me the law will punish him—why should I be debarred from following the bent of my inclination, and saving the consultation fee of the physician? Remember again, I am not talking of complications, of chronic diseases, or of accident. The physician and surgeon are necessary members of the community. But this attempt to stop counter prescribing does not reflect credit on those gentlemen, and it is an attempt at interference with the liberty of the subject which should be opposed not only by the chemist but by the public.

And now, as to the second part of "Hampshire's" letter, referring to a matter to which he said he has drawn attention before, "and pointed out how the evil could be readily 'squelched'" (what a pretty word,—what does it mean?), "but strange to say, to me it seemed very strange, my remarks failed to elicit any notice whatever." He alludes, he tells us, to the "scandalous underselling of certain chemists and druggists," whom he, forgetting all about brotherly kindness, and the charity which suffereth long, refers to as "disloyal," "unprincipled," "wretch concentred all in self," "acting so dishonourably and disreputably," etc. And "Hampshire" airs his grievance, which is so great that although his previous letter on the subject "failed to elicit any notice whatever" is yet of such a nature that it "will ere long give rise to a life and death struggle; if the thing is to continue not one-half of the existing number of druggists will possibly be able to obtain a livelihood."

Now "Hampshire" is wrong as to his arguments and deductions, and I wish, as no one in the trade has noticed him, to offer a few remarks which may benefit some of the other members of the trade also.

Chemists, though educated men, are, as a body extremely short-sighted in their views of business. There are some notable exceptions, but how few after all have made any mark in the world. They are conservative in the extreme; "As it was in the beginning, is now, and ever shall be," seems the motto of many of them. In this rut is "Hampshire" evidently. The tendency of the age is to go ahead, and if chemists will not move with the times, they will find that grocers and others who do, will steal away as large a portion of their trade as they legally can. The day of "protection" is gone and the new era of free trade has dawned, nay, not only dawned, but is in full noontide; don't let any body try to eclipse the luminary, but rather help to get rid of the clouds and fogs which keep us from enjoying to the full the blessing to be derived.

I glance to the page following "Hampshire's" letter and see a patent medicine advertised. A 2*s*. 9*d*. article at 27*s*. per dozen, thirteen to the dozen, less 10 per cent., thus costing 1*s*. 10½*d*. Does "Hampshire's" conscience justify him in charging 2*s*. 9*d*. for this? And is this what he is wroth about, because some other chemist, stepping out of the groove, deems 20 per cent. a fair profit and sells the article at 2*s*. 3*d*.?

I see Seidlitz powders advertised on the next page at 8*s*., 9*s*., 10*s*. per dozen boxes, and yet does he want the old fashioned 1*s*. 6*d*. per box for them? I always thought it a joke when I heard about chemists getting 11¾*d*. out of the shilling; I believe it now as to some of them. I see another advertisement offering an "immense reduction in price" of glass bottles; and I see other advertisements

not all of novelties, but of articles brought prominently forward because of the price. Is it "Hampshire's" idea that chemists should buy as low as possible,—advance with the times as regards buying,—but keep to the old-fashioned prices of the days gone by as to selling? What would "Hampshire" think of his baker if he adhered to the price the loaf was charged a few years since? And what if all the grocers agreed, notwithstanding the abolition of duty, not to let him have his Congou under five or six shillings a pound, as it was in days of yore? And as to his argument respecting every other commodity but physic increasing in consumption with the reduction of price, let me ask "Hampshire," if he be a middle aged man (and he must be, I suppose, to be the happy possessor of thirteen olive branches), to carry his memory back a few years. I suppose for every one chemist then there are now two. I do not know anything of the statistics of the trade, but travelling up and down the country, both before and since the railways have been, I see a marked change in the number and position of the country chemists. We know that slow as chemists are, prices have altered during that period, Quinine is more freely used now. Cod liver oil is become quite an article of commerce, and glycerine a domestic necessity. And a dozen or more articles I could name have become considerably reduced in price, and therefore are more generally used. Somebody I suppose commenced the reduction, and the others followed suit. The benefit, however, has been to the whole trade, as well as to the public.

As to the remedy "Hampshire" proposes, I would warn him as to the consequences of the measure. I disbelieve in trades' unions, and would advise him and his brethren to allow every young man to follow the bent of his own inclination without attempt at coercion, lest some day the assistants find they have a grievance, and in a body object to the long hours, and the unnecessary (in the majority of cases) Sunday trade. How the young men have stood the latter impost so long I am at a loss to conceive. But I would not say a word to cause a disruption between employed and employer, and so end my letter, hoping you will find room for the insertion of these hasty remarks from

AN OUTSIDER.

THE TRADE OF A CHEMIST AND DRUGGIST.

Sir,—Your correspondent Mr. Joseph Leay, whom, to be polite, I won't epithet as he has done me by the dignified name of shopkeeper, has evidently been alarmed at my letter, which according to his imagination goes to favour the idea of our trade being overstocked, thus making it almost appear as if "trade-breeding" with him is as much a part of his business as the retailing and dispensing of medicines.

Now as Mr. Leay may think he has said much to refute the "false notion" my letter is likely to produce of our trade being overcrowded, I would just take this opportunity of informing him of—what perhaps by this time he may have discovered for himself—how reverse is the effect. Only take for example his appeal to those young aspirants, the students of the Pharmaceutical Society. What does he say among other things? Well, here are his words: "But I am not satisfied that the trade at home is overcrowded," and as if further to confirm us about his doubts he continues "the chemist who succeeds abroad would most likely have succeeded at home." If such are his views about the state of pharmacy at home I am afraid he will have injured rather than promoted his object in encouraging further accessions to our trade.

Dewsbury. H.

THE SALE OF PATENT MEDICINES.

Sir,—With reference to the subject of patent medicines now so much discussed by those interested in the retail drug trade, I think it is quite time chemists and druggists should give the matter their serious attention and consider for themselves whether it is advisable to continue the cultivation of a portion of their business which has hitherto been attractive because it has been profitable. But is it not questionable whether it has ever been a credit to the trade generally that chemists should have so materially assisted in the distribution of these so-called "patent medicine" preparations, the composition of which is unknown, except to, in many cases, uneducated proprietors, and by so dealing, allying themselves, not only in the opinion of the medical fraternity, but also in that of the intelligent public, with a system of quackery that might otherwise have been considered as altogether beneath the calling and capabilities of members of an essentially skilled trade? I think our connection with these articles has always been a source of social disadvantage and consider it a much more discreditable feature in these days when chemists are presumably an educated body, having necessarily an intimate acquaintance with drugs and chemicals, and possessing likewise an understanding as to their actions and uses. The chemist of to-day being thus constituted, I think it behoves every individual entering our business to make the best use of such knowledge, and to recommend as far as possible only such remedies as he himself has been concerned in preparing, and the composition of which he fully understands; by so doing he would secure to himself the legitimate advantages of his position. It was one of the great aims of the Pharmaceutical Society by imparting a sound educational training and knowledge to its apprentices, associates and members, to raise the social status of the future pharmaceutist, and I consider every chemist who has entered the trade, especially through this portal, should feel it his duty to combine with the Society in attaining the desired end; but I do not think we can secure our object by being merely vendors of patent medicines and certainly not by reducing prices all round, which will only throw us into unfavourable and unprofitable competition. Far better we should use our own brains and by constant industry and perseverance strive to improve our position, instilling into our customers a knowledge that we can at least do as well for them as any patent medicine proprietor, and so by conscientiously doing our best, inspire them with confidence that they, finding benefit, may not only return to us as circumstances require, but recommend their friends and friends' friends, to patronize the same establishment. It is this confidence we ought to struggle to secure and without which I hold a chemist's business to be of small account indeed.

Hull. EDWIN FOWLER.

LIN. TEREB. ACET.

Sir,—The following formula, I believe, resembles the official one nearer than any other yet proposed:—

Oil of Turpentine	3 parts.	by measure.
Glacial Acetic Acid	1 ,,	
Olive Oil	2 ,,	
Liniment of Camphor	3 ,,	

It differs only in the water contained in the acetic acid being replaced by olive oil, so the proportions of anhydrous acetic acid, turpentine and camphor remain the same as in the present formula. It mixes perfectly.

The use of spirit, as has been suggested, I should think would be objectionable, as acetic ether might be formed in the liniment if kept long. PHILIP PRINCEP.

"*A Chemist of Five Years' Standing.*"—Your letter appears to be founded upon misapprehension.

"*Highlander.*"—See an article in the present series on *Fucus vesiculosus*, by Professor Maisch, vol. vii., p. 290.

"*Kenbaan.*"—The *Journal de Pharmacie et de Chimie*, published by Masson, 120, Boulevard Saint-Germain, Paris, or the *Répertoire de Pharmacie*, published at 117, Rue Vieille-du-Temple.

S.—Such an inference would be wrong. There can be no doubt as to the right of such a person to use the title of "chemist and dentist." The title of "pharmacist" can be legally used by pharmaceutical chemists only.

M. P. S.—A Member of the Pharmaceutical Society is not exempt from jury service unless he be a pharmaceutical chemist.

"*A Ratepayer, Sheffield.*"—The Pharmacy Act does not in any way control such appointments.

G. H. L.—Applications respecting the Dental Register should be made to the Registrar under the Dental Act, Mr. Miller, 315, Oxford Street.

"*Minor.*"—The Register of Chemists and Druggists for 1879 is in the press and will shortly be ready. Copies will then be obtainable from the Registrar, price 5*s.* each.

W. F. Norman.—*Calluna vulgaris*; probably the result of careless gathering.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Joly, Hayes, Taylor, Corry, Benger, Wood, Smith, Brown, Walton, Fennell, Hesse, Pollard, White, Wallis, Holloway, Bradshaw, Whitehouse, Barnes, Major Associate, Senex, Peter Heyn, Kenbaan, K. W., R. M.

MYRTUS CHEKAN.*

BY E. M. HOLMES, F.L.S.

A considerable quantity of the leaves of this plant having recently been imported with a view to their trial by the medical profession in this country, it occurred to me that a summary of the facts known concerning the plant might be not altogether without interest to the members of this Society at the present time.

Myrtus Chekan, Spreng., is an evergreen shrub, from 4 to 6 feet high, indigenous to the central provinces of Chili, where it grows abundantly, forming a kind of underwood in all the quebradas or ravines which follow the course of the small streams. In general character the plant bears a strong resemblance to the common myrtle (*Myrtus communis*); it is much branched, the leaves are evergreen, opposite, entire and smooth, oval, lanceolate in shape, from one-half to two-thirds of an inch long and about half as broad and tapering towards either end, the largest leaves not being more than one inch long and eight lines broad. The flowers are white and resemble those of the myrtle in appearance, and are solitary in the axils of the upper leaves; when these leaves fall off, as they sometimes do, the flowers have the appearance of being arranged in terminal racemes or cymes, and have been thus described by some authors.

The plant is not altogether unknown in this country, having been introduced, it is believed, by Messrs. Veitch and Sons as early as 1862, and a figure of the plant from a specimen which flowered at Kew was published in the *Botanical Magazine* in July, 1866, *sub* 5644. The flowers differ from those of the common myrtle in having only four petals, which are more rounded, and, as well as the sepals, ciliate at the margin. The leaves also are shorter and broader in proportion than in those of the myrtle.

As now offered in commerce Chekan leaves present the following characters. The leaves vary from one-half to one inch long by one-quarter to one-half inch broad; they are oval-lanceolate in outline, are furnished with a very short stalk less than one line long, are of a clear green colour, scarcely paler on the under side, a little depressed above the midrib, and slightly rolled back at the edges by drying; the veins of the leaves are scarcely visible on the upper side and only slightly so on the lower. Both surfaces of the leaves present a minutely wrinkled appearance. When held up to the light the leaves are seen to be dotted all over with minute oil glands. When chewed the leaves first produce in the mouth a peculiar taste resembling faintly that of bay leaves, in this case, however, followed by a pungency and slight bitterness due to the setting free of the essential oil; this taste is then succeeded by astringency.

At first sight Chekan leaves present somewhat the appearance of the smaller kind of buchu leaves (*B. betulina*). From these, however, the odour and entire margin of the leaves easily distinguish them.

By some authors this plant has been placed in the genus *Eujenia*, which differs from *Myrtus* in little except the characters of the seed. It is on this account now referred to the genus *Myrtus*. Under the name of chekan, chequen, or cheken, the plant has long been known and used in Chili in cases requiring an aromatic astringent of considerable power.

The leading physician in the German hospital at Valparaiso, Dr. Dessauer, speaks very highly of the value of Chekan. His attention, he states, was first drawn to the plant by the successful self-treatment by one of his patients in a case of purulent inflammation of the bronchial tubes. Dr. Dessauer then tried the chekan on members of his own family with equal success. He considers it to possess tonic, expectorant, diuretic, and antiseptic properties, and states that he has used it with great success in bronchitis, catarrh of the bladder, and other affections of the mucous membrane; also that at the same time the digestion is improved.

Dr. Dessauer uses the leaves and shoots in the form of infusion, fluid extract, syrup, and inhalation. The infusion is made in the proportion of one part of the leaves to ten parts of boiling water. The fluid extract is prepared according to the process given in the United States Pharmacopœia for extractum cinchonæ fluidum. The syrup is made in the proportion of one part of the leaves to two of syrup. The dose of the fluid extract is two or three drachms four or five times a day. Dr. Dessauer recommends the syrup as being more aromatic and more easily given to children than the other preparations. The infusion he uses for injections, and the inhalation for sore throat and bronchitis. The taste of the syrup and fluid extract he describes as being much more palatable than those of the *Eucalyptus globulus*, while equalling them in value. These are, however, not the only uses to which Cheken has been put, for an old writer on the "Medicinal Plants of Chili,"* speaks of the plant being used in his day as a sovereign remedy for inflammation and other eye diseases. The juice of the leaves and young wood was expressed, and diluted with water, and used as an eye lotion. A decoction of the bark is stated by Don to have been used successfully in cases of dysentery.

Aromatic and astringent properties may be said to be common to nearly all the plants of the myrtle family, and it seemed to me necessary to inquire whether chekan leaves possess any properties equal or superior to those of the eucalyptus, and with this view I desired Mr. C. H. Hutchinson to submit the leaves to a preliminary chemical examination. This he has kindly done in the limited time at his disposal with the following results:—

"Since most of the preparations of chekan are of an aqueous character it appeared desirable to ascertain what substances are contained in an aqueous extract.

"A portion of the leaves were therefore exhausted with warm water, and solution of acetate of lead added. After the brownish-white precipitate which this reagent produced was no longer formed, solution of subacetate of lead was added, which produced a white precipitate. The two precipitates were then together decomposed by passing sulphuretted hydrogen through water holding them in suspension.

"The filtrate from the sulphide of lead thus formed was found to contain a kind of tannin, which since it gives blue-black colour with ferric sulphate evidently belongs to the same group as gallo-tannic acid."

"Various reagents were then applied to the solution with the following results:—

"Ferric sulphate gives a deep blue-black colour and a precipitate after standing for a short time.

"Ferrous sulphate gives a precipitate in a neutral solution, but not before the solution, which is natu-

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, Feb. 5, 1879.

* 'Feuille Observ.,' vol. iii., p. 46,

rally acid, has been neutralized. On warming after the addition of reduced iron, a deep purple coloured liquid was produced.

"Sulphate of copper gives a precipitate only in the neutral solution.

"Tartar emetic causes a precipitation.

"Gelatin also gives a bulky precipitate.

"The solution from which the lead compound had been filtered showed no signs of tannin; it was tested for alkaloids with the ordinary reagents, which gave no precipitates, except phosphomolybdate of ammonium, which caused a green coloration changing to blue after the addition of ammonia, a precipitate falling at the same time. Ammonia also caused a precipitate in the solution to which none of the phosphomolybdic reagent had been added.

"The powerful odour of the leaves and the presence of oil glands in them led further to the supposition that they might contain a volatile oil. A portion of the leaves was therefore placed in a flask connected with a condenser and receiver and a current of steam was passed through them and into the receiver, where it condensed, carrying a few drops of oil with it, which floated on the surface. This oil produces a greasy stain on paper, which quickly disappears, thus proving its volatility at ordinary temperatures.

"It is soluble in chloroform, ether and ethylic and amylic alcohols and insoluble in water; these were the only solvents employed. It burns with a brilliant white flame.

"Its odour somewhat resembles that of oil of bays, a character which is also possessed by rectified oil of the common myrtle, with which oil of chekan also agrees in being lighter than water. Whether the two are identical or only closely allied it is impossible to say without further examination, which the limited amount of material and time at my disposal have hitherto prevented."

In connection with this subject, it is interesting to note that in a recent communication to a French journal, *La Ruche Pharmaceutique*, that M. Linarix attributes exactly the same properties to the oil of myrtle that Dr. Dessauer does to chekan leaves. It would therefore appear that an alcoholic solution would be a better preparation than either of those mentioned above, since alcohol dissolves both the essential oil and the tannin.

[*The discussion on this paper is printed at p.* 666.]

AN EXAMINATION OF DISTILLED ESSENCE OF LEMON.*

BY WILLIAM A. TILDEN.

In a paper read before the British Pharmaceutical Conference two years ago, I gave an account of experiments made upon essential oil of lemon with the object of ascertaining the nature of the hydrocarbons of which it consists. Those observations were confined to the essential oil of commerce, which is obtained in Sicily and Calabria from the rind of the fruit by excoriation and expression, without distillation. I had every reason to believe that the sample I then operated upon was as good as could be procured. Nevertheless having found by its optical characters and by chemical tests that it did undoubtedly contain some appreciable quantity of a turpentine, I was left in doubt as to whether this was a natural constituent of this essential oil or whether it had been added for the purpose of adulteration. Moreover, the chief constituent is a hydrocarbon which I had expected would very closely agree in chemical characters with the terpene of orange and bergamot, but for some reason which I could not explain had encountered great difficulty in preparing its characteristic derivatives.

The matter being left in this unsatisfactory position I determined to examine some essential oil of lemon, the freedom of which from admixture of turpentine or anything else should be beyond question. I was therefore glad to avail myself of the kind assistance of Mr. John Moss (of Messrs. Corbyn and Co.), who prepared for me a quantity of the essential oil by distillation from the fresh peel. Two batches were made. The first, of three and a half ounces, was obtained from forty-seven pounds of peel. The second, of eight and a half ounces, came from fifty-two pounds of peel, which this time was crushed, under stone runners, previous to distillation, a precaution to which no doubt the better yield is chiefly to be ascribed. It had a pale yellow colour, and a most deliciously fragrant odour of the peel, superior, in my opinion, to that of the foreign essence. Both portions had the same specific gravity at 20° C., viz., ·852. They differed, however, to a very slight extent in their action on polarized light. The rotation of the smaller portion, determined by Wild's polaristrobometer, using the sodium flame, was +58° 34′ per 100 mm., whilst that of the larger portion was +59° 16′. These numbers agree very nearly with the rotatory power of a specimen of foreign distilled lemon oil, examined by Hanbury and Flückiger ('Pharmacographia'), which they give as 28·3° for 50 millimetres.

The two portions were mixed together, and nearly the whole taken for distillation. A few drops of water came over first, and the thermometer then mounted to 177°, at which temperature the liquid began to distil. The products of the distillation were as follows:—

Temp. C.	Distillate.
At 177°–180°	190 c.c. (*a*).
„ 180°–185°	52 c.c. (*b*).
„ 185°–190°	15 c.c. (*c*).
„ 190°–250°	20 c.c. (*d*).
Residue about	3 c.c.

Decomposition appeared to be going on towards the last, a few drops of water containing acetic acid separated, and the residue was viscid and pale brown. The distillates were colourless, except *d*, which was straw yellow.

A, *b* and *c* were mixed together and stewed with sodium for some hours and then distilled. After several repetitions of this treatment the whole came over below 179°.

It would be tedious to recount in detail the somewhat complicated operations to which the various fractions were submitted. It will be sufficient to say that the following substances were recognized:—

1. A turpentine ($C_{10}H_{16}$) agreeing in general properties with terebenthene, the chief constituent of French turpentine oil. This could not be entirely separated by fractional distillation, neither could it be completely purified, and therefore the quantity of it cannot be stated, but a rough estimate would represent it at perhaps 5 per cent. of the original oil

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, Feb. 5, 1879.

2. A characteristic hydrocarbon, a terpene $C_{10}H_{16}$, for which, perhaps, the name *citrene* may be retained, constitutes at least 70 per cent. of the crude oil. This hydrocarbon when pure differs very little from the corresponding terpene of the orange as to odour, and it boils at the same temperature, viz., 176° C. But it is distinguished by several peculiarities. For some time I supposed that the crystals of terpin hydrate which are so easily obtainable from essence of lemon by mixing it with nitric acid and alcohol according to Wiggers's process were due to the turpentine present, but repeated comparative experiments have convinced me that this is not so, and that terpin hydrate, differing in no respect from that obtained from turpentine oil, is really producible from citrene. The hesperidene of which orange oil mainly consists yields no terpin when treated in the same manner. Citrene is also distinguished from hesperidene, as I have lately found by the action of strong sulphuric acid, which converts the latter into viscid products which cannot be distilled below 240°, whilst citrene yields by the same treatment a large quantity of an optically inactive hydrocarbon, boiling at the same temperature, viz., at or about 176° C.

3. Cymene, about 6 per cent.

4. The original distillates *c* and *d* consist chiefly of an oxidized compound, $C_{10}H_{18}O$ or $C_{10}H_{16}OH_2$. This boils at a little over 200° and agrees in general properties with terpinol,* except that unlike ordinary terpinol, which is inactive, it possesses the power of rotating the polarized ray to the right.

This ingredient forms 10 to 15 per cent. of the crude oil.

5. The viscid residues of the distillation consist partly of polymeric hydrocarbons $(C_{10}H_{16})_n$ and probably also partly of a compound ether, $C_{10}H_{17}(C_2H_3O)O$, which is decomposed by heat into a hydrocarbon $C_{10}H_{16}$ and acetic acid.

To sum up the results of this investigation the constituents of pure essential oil of lemon appear to be as follows:—

A terpene, $C_{10}H_{16}$, boiling below 160°, a small quantity; a second terpene, $C_{10}H_{16}$, of peculiar character, boiling at 176°, the chief constituent; an oxygenated substance of alcoholic properties, probably formed by the combination of one of the hydrocarbons with the elements of water. To the association of these three the characteristic odour of the oil is chiefly due. Besides these there are minute quantities of several less important substances which do not contribute appreciably to the fragrance of the oil.

The distilled oil of lemon deposits none of the greasy matter commonly met with in ordinary essence of lemon.

These results agree to a certain extent with the observations of Blanchet and Sell, Deville and Berthelot made many years ago. But although Berthelot states that oil of lemon consists of a mixture of two liquids which may be separated by distillation *in vacuo*, he does not appear to have identified his products with any known hydrocarbons; nor to have made out their properties very clearly. I am carrying on the examination of the peculiar terpene, called in this paper citrene, and hope to publish a more complete account of it at a future time.

[*The discussion on this paper is printed at p.* 666.]

* *Journ. Chem. Soc.*, June, 1878, p. 248.

APPARATUS FOR CONTINUAL DIALYSIS.*

The apparatus hitherto in use for dialysis usually consisted of drum-shaped vessels floating upon distilled water, or of a series of perpendicular membranous septa contained in a trough, each alternate compartment of which is charged with distilled water. With a view of diminishing the amount of distilled water required and increasing the extent of dialysing surface, Mr. Eug. Lebaigue has devised a new form of apparatus.

The apparatus consists of a large flask with faucet at the bottom, full of distilled water; a series of glass funnels to the short neck of each of which is attached by rubber-tubing, a curved syphon that passes upwards and over the brim of the next funnel, placed at a slightly lower level, the last syphon discharging into a receiving vessel. Each funnel is provided with a plaited filter made of parchment paper, and projecting $\frac{3}{4}$ to $\frac{7}{8}$ inch above the edge of the funnel. This is necessitated by the increase of volume of the contents of the filters. The first filter is now charged with solution of chloride of iron (ferric oxychloride) to about three-fourths of its depth. Distilled water is then poured into the funnel and allowed to remain in contact with the filter for twelve hours. Then the second filter is charged in the same manner and the faucet of the flask carefully opened, when the water of the first funnel will be gradually forced over into the second, and will be replaced by fresh distilled water. After twelve hours, another funnel with filter is connected with the series and this is continued with as many filters as is desired. The rate at which the distilled water is allowed to pass is controlled by its dropping from the last syphon-tube.

Whenever the contents of the first funnel cease to have an acid reaction, and to be precipitated by silver nitrate, they are withdrawn, the second filter is made the first, and a new funnel with filter inserted at the end.

The proportions which Mr. Lebaigue has adopted for making dialysed iron are the following:—

Water of Ammonia, sp. gr. '920	400 parts.
Distilled Water	400 ,,
Solution of Ferric Chloride, sp. gr. 1'260 .	1000 ,,

Mix the distilled water and ammonia, and add the mixture gradually to the solution of ferric chloride, under constant stirring, until a clear mixture results.

Experience having shown that among crystalloids the chloride of sodium dialyses best, Mr. Lebaigue thinks it would perhaps be an advantage to replace the ammonia by soda, or sodium carbonate.

The Weights and Measures Act.—Correspondence with the Board of Trade.

16, Cross Street,
Hatton Garden,
February 6th, 1879.

To the Editor of the *Pharmaceutical Journal.*

Dear Sir,

Please insert in the Journal the following statement of the correspondence and interview of the Sub-committee appointed by the Council at its January meeting with the authorities of the Board of Trade in reference to the Weights and Measures Act.

I am, dear Sir,
Yours truly,
John Williams,
President.

The following letter was read to the Council at its meeting of January 8th:—

"Board of Trade, (Standard's Department),
"7, Old Palace Yard, S.W.,
"January 6th, 1879.

"Sir,—I am directed by the Board of Trade to call the attention of the President and Council of the Pharmaceutical Society of Great Britain to 'The Weights and Measures Act, 1878,' which came into operation on the 1st instant, particularly with reference to apothecaries' weights.

"Clause 20 of the Act provides that drugs when sold by retail may be sold by apothecaries' weight. There is in the Act no definition of apothecaries' weight, nor in reference to the operation of clauses 8 and 24, are any Board of Trade standards of such weight provided under the Act.

"The Board of Trade would be glad therefore to be informed what at the present day is apothecaries' weight, what are the several denominations of weights now used by apothecaries in retail trade, and whether or how far in practice they now differ from avoirdupois weight.

"I am, Sir,
"Your obedient servant,
"(Signed) C. CECIL TREVOR.
"The Registrar and Secretary,
"Pharmaceutical Society of Great Britain."

The following reply was sent in pursuance of the resolution of the Council reported in the proceedings of the January meeting:—

"Pharmaceutical Society of Great Britain,
"17, Bloomsbury Square,
"London, January 10th, 1879.

"C. Cecil Trevor, Esq.,
"Board of Trade,
"(Standard's Department).

"Sir,—I beg to acknowledge the receipt of your letter of the 6th inst. which I have laid before the Council of this Society, and am instructed to furnish you with the several denominations of apothecaries' weights as requested.

		Symbol.
"1 grain.		
"20 grains	1 scruple .	℈.
" 3 scruples	1 drachm .	ʒ.
" 8 drachms	1 ounce .	℥.
"12 ounces	1 pound .	lb.

"The above table represents apothecaries' weight as it has always existed.

"For the present purposes of dispensing and selling some drugs by retail it seems to be desirable to omit the standard of the pound.

"I am directed by the Council to beg that you will kindly receive the President and two others members of the Council, who are anxious to confer with you on certain points in the Act which appear to have occasioned doubt in the minds of some inspectors."

"I am, Sir, Your obedient servant,
"(Signed) ELIAS BREMRIDGE.
"*Secretary and Registrar.*"

An appointment was made by Mr. Farrer, the Secretary to the Board of Trade, for Friday, January 24, and on that day, the President, Mr. Sandford, Mr. Hills, and the Secretary, had a prolonged interview with him. At the close of the interview, Mr. Farrer requested the deputation to furnish him with a written statement of the explanation which they deemed it necessary for the Board of Trade to give authoritatively in reference to the provisions of the Weights and Measures Act.

The following statement has therefore been sent to the Board of Trade:—

"Pharmaceutical Society of Great Britain.
"London, January 30th, 1879.

"T. H. Farrer, Esq.

"Sir,—In accordance with your request made at our interview with you on Friday last, I have the honour of submitting a memorandum setting forth the points with reference to which it would be desirable in the opinion of this Society, for the Board of Trade to add definite instructions to the Weights and Measures Act, 1878.

"I have the honour to be, Sir,
Yours obediently,
"(Signed) JOHN WILLIAMS,
"*President.*"

"*Memorandum.*

"As section 20, subsection 2, of the Weights and Measures Act, 1878, legalizes the use of apothecaries' weight, it is necessary to describe that weight and its denominations authoritatively in order to bring the various parts of the Act into harmony with each other.

"This may be done, and the law made sufficiently clear, by adding a new column of weights to the second schedule, enumerating the denominations of the apothecaries' weights now in use with their relative value or proportion to each other.

"Thus—1 ounce equal to 8 drachms.
1 drachm equal to 3 scruples.
1 scruple equal to 20 grains.
1 grain.

"The above is the exact table of these weights; but if it be deemed necessary to set down all those which are in daily use in chemists' shops and medical dispensaries, in order that they may bear the stamp of verification, the following will serve:—

	Symbol.		
1 ounce	℥j.	equal to	480 grains.
½ ounce	℥ss.	"	240 "
2 drachms . . .	ʒij.	"	120 "
1 drachm . . .	ʒj.	"	60 "
2 scruples . . .	℈ij.	"	40 "
½ drachm . . .	ʒss.	"	30 "
1 scruple . . .	℈j.	"	20 "
½ scruple . . .	℈ss.	"	10 "
6 grains.			
5 grains.			
4 grains.			
3 grains.			
2 grains.			
1 grain.			
½ grain.			

"The set of weights sent herewith will enable the Board of Trade to decide to which, if any of them, the stamp of verification can be applied, some of them being obviously too small to bear any mark in addition to that which denotes their value and must necessarily be always distinct to ensure the safety of the public.

"It will be observed that the pound of the apothecaries' weight, 12 ounces, is not put down in the foregoing table.

"This is purposely omitted for two reasons, firstly, it is not used, secondly to prevent confusion.

"Still it may be neccessary to verify 2, 4, 6 and 8 ounce weights, in a similar manner to troy weights, as set forth in the second schedule of the Act.

"Although the troy and apothecaries' ounce are equivalent, it must be observed that section 20 especially limits the articles which may be sold by troy weight, and states the weight which may be used for drugs. Hence the necessity for separate description and verification.

"The measures used by chemists must be of glass, and unlike metal measures are not filled to the brim, answering for one quantity only, but are graduated in many subdivisions.

"Taking a six ounce measure as an example, there appear on it lines denoting ½ drachm, 1 drachm, 1½ drachm, 2, 3, 4, 5, 6, 7, 8, 10, 12, 14 and 16 drachms or 2 ounces, after that each ½ ounce is marked upwards to the top line of measurement or 6 ounces.

"The drachm measure has marked on it twelve subdivisions of 5 minims each.

"It is of course for the Board of Trade to say whether all these minute graduations shall be verified, but seeing that the necessity for them arises more in compounding medicines than in selling liquid drugs unmixed, commercially, it may scarcely be important to do so."

The Pharmaceutical Journal.

SATURDAY, FEBRUARY 8, 1879.

THE REGISTRAR'S STATISTICS.

FOR reasons that are obvious the statistical report which the Registrar, in accordance with his annual custom in February, presented to the Council on Wednesday last ought to be scanned with special interest. This report gives the number appearing on the several registers upon the 31st December last preceding, in conformity with the provisions of the Pharmacy Act. It is satisfactory to find as a gross result that notwithstanding there has been a small decrease in the number of registered chemists and druggists there has been also a small increase in the number of those who subscribe to the Pharmaceutical Society, and that once more we are able to say that at no previous period of the Society's history was it so strong numerically as it is now.

Turning our attention first to the general Register of Chemists and Druggists we find that during the year just closed 338 persons acquired the right, by passing either the Minor or the Modified examination, to be registered. There were besides 9 persons who had their names restored to the Register, and 14 who were registered after proving that they were in business before the passing of the Pharmacy Act. The total of these additions amounts to 361. On the other hand there have been 161 erasures from the Register after evidence had been received of the death of the registered person, and 211 erasures from other causes, principally through the exercise by the Registrar of the powers entrusted to him by the tenth section of the Pharmacy Act, 1868. The erasures have therefore been 372, or 11 in excess of the additions, and by this number the whole Register of Chemists and Druggists has been reduced as compared with the previous year. The new Register for 1879, which will be issued shortly, will contain 13,309 names, whilst that for 1878 contained 13,320.

It will be interesting to carry our investigation further and see what effect the past year has had upon the class of pharmaceutical chemists. Of the above 13,309 registered chemists and druggists the Registrar reports the number belonging to this higher class as 2,287, which compared with last year shows the disproportionate decrease of 20. This is much to be regretted, for it appears to indicate that unless the number of men passing the Major increases the time is yet distant when the influx of examined men into this important class will be sufficient to compensate for the annual loss. But it must not be forgotten that up to the year 1853 the acquisition of the title of Pharmaceutical Chemist was not necessarily and in all instances dependent upon examination, but that up to that time many acquired the rank of pharmaceutical chemist without examination and were admitted into the Society on account of their previous position in the business and their contributions in support of the Society. Although this portion of the pharmaceutical chemists now represents only 40 per cent. of the whole, to it belong no less than 56 out of the 74 erasures from this Register that have become necessary through death and other causes during the past year.

Next with respect to the numerical strength of the Pharmaceutical Society, and the relation it bears towards the whole body of chemists and druggists. It appears that, as might be expected from the figures just quoted, there has been a decrease of 33 in the number of Pharmaceutical Chemist Members; also that the inevitable decrease due to the gradual extinction of Chemist and Druggist Members has been again manifested to the extent of 2; and finally that there has been a decrease of 24 in the number of Associates not in Business. On the other hand, in the important class of Associates in Business, which doubtless will ultimately form the backbone of the Society, there has been an increase of 85, or 26 in excess of the total of the decrease in the other classes. To sum up, as a gross result, out of the 13,309 chemists and druggists upon the general Register, there are now 4536 in connection with the Pharmaceutical Society as Members or Associates, or 34·08 per cent. against 33·86 per cent. twelve-months since.

The class of Apprentices and Students numbers 1040. This shows a small decrease of 14 as compared with the previous year, but a glance at the analysis of the examinations for the two years will show that the successful candidates at the Preliminary examination, from whom alone this class can be recruited, showed a falling off in 1878 of 39.

In order to facilitate a comparison with the statistics of the last two years, these results are shown in the following tabular form:—

	1878.		1879.	
	No.	Per cent. of whole.	No.	Per cent. of whole
Pharmaceutical Chemists, Members of the Society .	2035	88·21	2002	87 54
Other Registered Chemists and Druggists connected with the Pharmaceutical Society	2475	—	2534	—
Total number of Registered Chemists and Druggists connected with the Pharmaceutical Society . . .	4510	33·86	4536	34·08
Registered Apprentices subscribing to the Society . .	1054	—	—	—

Some general idea as to the proportion of those acquiring legal qualification who associate themselves with the Society may be gathered from the following figures. Last year there were 338 persons who became entitled to registration, 324 by passing the Minor and 14 by passing the Modified examination. On the other hand there were elected 153 Associates in Business and 195 Associates not in Business, or a total of 348. Thus even after making ample allowance for those who simply passed from one class to the other it is evident that the residue is equal to a large proportion of all who became qualified during the year.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held at 17, Bloomsbury Square, on Thursday February 13, at 8.30 p.m., when a paper on "Cantharidin" will be read by Mr. H. R. ARNOLD.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, February 5, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hills, Mackay, Robbins, Sandford, Schacht, Shaw and Woolley.

The minutes of the previous meetings and of the Special Council Meeting of January 9 were read and confirmed.

Members of Council who Retire.

The lot being taken in the usual manner for the seven members of the Council who should retire in May next, the following names were drawn :—

Atkins	Hampson	Williams
Betty	Savage	Woolley.
Frazer		

The following who remained in by lot last year now retire by rotation :—

Bottle	Hanbury	Robbins
Churchill	Rimmington	Shaw
Cracknell		

The following remain in office for another year :—

Fairlie	Hills	Sandford
Gostling	Mackay	Schacht
Greenish		

Elections.

MEMBERS.

Pharmaceutical Chemists.

The following, having passed the Major examination, and having tendered their subscriptions for the current year, were elected Members of the Society :—

Abraham, Thomas Fell .....Liverpool.
Brown, Thomas.....Hull.
Hogg, Edward Grindle .....London.
Jackson, Alfred Henrick.....Manchester.
Keith, John .....Brighton.
Leigh, Marshall .....Brighton.
Mather, John Henry ....Weymouth.
Oldham, William .....Wisbeach.
Pumphrey, John Henry .....Bengeworth.

Chemists and Druggists.

The following registered Chemists and Druggists, who were in business on their own account before August 1, 1868, having tendered their subscriptions for the current year, were elected Members of the Society :—

Green, Frederick .....Martham.
Humble, John Bawtree .....Putney.
Reeve, John .....Nottingham.
Thomas, Henry Joseph .....Bath.

ASSOCIATES IN BUSINESS.

The following, having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society :—

Minor.

Broomhead, George Emmet.....Aberdeen.
Crook, Charles W. W. .....Hungerford.
Gibson, Frederick.....Fleetwood.
Hayes, James Roberts .....King's Lynn.
Howell, Evan John .....Narberth.
Knight, Charles .....Penzance.
Price, Charles William .....Abergavenny.

Modified.

Beattie, Thomas .....Langholm.
Howe, Joseph Mason .....Hull.
Leuty, Thomas Wm. Chard ...Kensington.
Moate, Benjamin .....Birmingham.
Tabor, Samuel .....Pimlico.

ASSOCIATES.

The following, having passed the Minor examination, and tendered their subscriptions for the current year, were elected "Associates" of the Society :—

Alcock, Frank Harris .....Burslem.
Binks, Burcham .....Lynn.
Capern, Francis Thos. Mesmer..Weston-super-Mare.
Corlett, Edwin .....Ramsey.
Ekins, Charles .....Lincoln.
Graham, Henry.....London.
Hayllar, James.....Luton.
Hughes, Evan .....Chelmsford.
Laing, Alexander Gordon .....Turriff.
Lord, William Henry .....Kennington.
Martlew, Thomas .....Carlisle.
Robinson, John Edward .....Boston.
Sell, William Henry.....Bath.
Stephens, Stephen.....Llandilo.
Symons, Netherton Hosking ...Peterborough.
White, John Thomas .....Dudley.

APPRENTICES OR STUDENTS.

The following, having passed the Preliminary examination, and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society :—

Atkins, John.....Uxbridge.
Ashworth, John Robert .....Ramsbottom.
Baines, Joseph Charles .....Lowestoft.
Banes, Walter William .....Southampton.
Bell, Henry .....Port Glasgow.
Benson, George William.. .....Bradford.
Bowman, George Fell .....London.
Britton, William Bannam .....Barnstaple.
Brooke, Thomas Noden .....Retford.
Brookes, Alfred Fincher.....Walsall.
Byrne, Godfrey W. .....Mortlake.
Cattermole, Arthur Edward ...London.
Camm, Alfred .....Kidderminster.
Clarke, Walter George.....Leeds.
Coley, Robert .....Melton Mowbray.
Cox, Webster .....Liverpool.
Cripps, Richard Augustus .....Upper Holloway.
Elliot, John Sebastian.....Woolwich.
Ellis, Herbert Alfred .....Ely.
Filer, Ernest Williams ....Weston-Super-Mare.
Fitton, George Webster.....Melton Mowbray.
Fitzhugh, William Henry .....Royston.
Foden, Edwin ....Eccles.
Fox, Hugh Clayton ..... Coddenham.
Glover, Thomas John .....Cambridge.
Griffiths, Joseph .....Llanelly.
Guiler, James .....Holywood.
Haggart, Allan..... ...Dundee.
Harris, Edward John .....Taunton.
Harrop, John Harrison .....Rochdale.
Hayes, Richard Orchard.....Cirencester.
Heyes, Harry .....Bolton.
Hurn, Albert Joseph .....Bristol.
Joint, Francis' ....Barnstaple.
Jones, Charles .....Ashton-under-Lyne.
Jowett, William Hall .... Blackburn.
Kennedy, James Duncan .....London.
Kent, William Worsley .....Manchester.
Lacy, Herbert .....London.
Leech, John Henry.....Cambridge.
Lewis, Arthur John .....Abergavenny.
Lyle, William .....Kelso.
Lynn, John Robert .....Stroxton.
Milford, James Emery ....Bath.

Newton, George Harry .....Ashton-under-Lyne.
Pearson, William... .....Sunderland Green.
Phillips, Sidney ..... Wolverhampton.
Pratt, Josiah Beswick.....Heath Town.
Pursey, George Foreman.....London.
Ratcliffe, George, jun.....London.
Roberts, Arthur Harry .....Barrow-in-Furness.
Robinson, Joseph White.....Wigton.
Rowell, John George .....Headingley.
Shackleton, Thomas .....Accrington.
Short, Charles Henry .....Tattershall.
Shrubshall, William Wyatt ...Tunbridge Wells.
Sinderson, James Francis .....London.
Smith, Harry Robert .....Banbury.
Spink, Henry Joseph .....Dudley.
Tabb, John Sleeman .....Padstow.
Taylor, Arthur Bertie.....Sheffield.
Taylor, Arthur Robert .....Rugby.
Thompson, Arthur Stevens.....Barking.
Thompson, Leonard.....Richmond, Yorks.
Thornton, Leonard Booker.....London.
Turner, Arthur..... ..Aylesbury.
Walder, Frank.....Arundel.
Walker, William Grayston.....York.
Walton, Frederick M. W. .....Reading.
Warburton, Edward S. .....Farnworth.
Watkinson, James .....Farnworth.
Watson, John .....Newcastle-on-Tyne.
Wells, William George .....Maidstone.
Williams, David Cadwaladr ...Holywell.
Wilson, John .....Southsea.
Wood, James Arthur .....Barnsley.
Wrenn, William Albert .....Penge.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

The names of the following persons were restored to the register of Chemists and Druggists :—

Rowland Adams, 112, Wick Road, South Hackney, London, E.
John Edmunds, 11, York Rise, Dartmouth Park, London, N.W.
Henry Williams Evans, Westgate, Dewsbury.
Charles Scanlan, Market Street, Droylsden.
Richard Shillits, 22, Meadow Street, Holbeck, Leeds.
George Sowter, 59, Mildmay Grove, London, N.

The Registrar's Report.

The Registrar's Report on the Strength of the Society was laid upon the table. The Secretary said that at the next meeting he should be able to present the financial statement, when the whole matter might be discussed more fully than at present. This Report is printed on pp. 660 and 661.

The President drew attention to the fact that the subscribing pharmaceutical chemist members were 1759, but of registered chemist and druggist members there were only 825; this was caused by the fact that those who passed the Minor examination, though they were registered as chemists and druggists, could only be elected as Associates, or Associates in Business. Those who joined the Society in this way were but a small proportion of those who passed the examination, proving, it appeared to him, that the inducement held out to them was not sufficient. When the Council came to discuss the proposed amendments in the Pharmacy Act it would be well to consider whether any alteration could be made so as to put the Minor examined men on the same level as the chemists and druggists who were in business prior to 1868.

Mr. Shaw said it appeared that the Society was losing members every year except as regards associates; these had increased from 814 to 899 in the year, but taking the whole of the five classes he found there was altogether only an increase of 16 in the number of persons connected with the Society. Another thing he should like to know was the number who passed the examinations and were on the Register. In 1875 there were 1248 men on the Register who had passed the Major examinations; in 1876 there were 1281, being an addition of 33; in the next year there was an addition of 34, and he should have liked to know how many were on the Register this year. This had not yet been made up, but he hoped that it would be found that there was again an addition to the Major men, because from that source the Council and Board of Examiners must in future years be recruited.

The President said he should like to see the Minor men in connection with the Society increasing in number.

Reports of Committees.

FINANCE.

The report of this Committee including the recommendation of the payment of sundry accounts was received and adopted.

Mr. Mackay asked for further information with regard to the item in the accounts for papers read at evening meetings. The resolutions and remarks made at the last meeting were quite unintelligible to members in the north. Questions had been put to him which he had not been able to answer, whether papers read at the evening meetings at Bloomsbury Square were paid for at the same rate as those which appeared in the Journal and were not read, also if payment were made for papers read at evening meetings in Edinburgh, Glasgow, Bristol, or elsewhere. There had been lately several good papers read in Edinburgh, and some gentlemen had asked him if they would be paid for as communications when inserted in the Journal.

Mr. Sandford said that by a resolution of the Committee, which the Council approved, it was arranged that papers read at the evening meetings in Bloomsbury Square when inserted in the Journal should be paid for at the usual rate. That was the only question before the meeting, the question of papers sent up from the country was not before it. The papers read at Bloomsbury Square had to pass the Committee.

The President added that the authority of the Committee was considered equivalent to the authority of the Editor with regard to an ordinary communication. The Editor informed him that many papers read before provincial associations were not of such a character as could be paid for in justice to the Society and the Journal. If a paper submitted to the Committee was not considered suitable, it was not read or paid for. He was also informed by the Editor that if a good paper were read to a provincial society, it could be sent to the Journal as a communication and be paid for.

Mr. Mackay expressed himself perfectly satisfied with the explanation that had been given, and said he did not wish to disturb the rule in any way.

BENEVOLENT FUND.

The report of this Committee included a recommendation of the following grants :—

£15 to the widow of a member who had received a previous grant of £10 in 1873.

£15 to the widow of a member who also had received a grant of like amount in June, 1877.

£10 to a registered chemist and druggist, formerly in business, but for many years an assistant, and suffering from an accident.

£20 to a member of the Society—from 1853 to 1877—aged 65, formerly in business, but lately an assistant, and now prevented getting a situation from ill health.

£50 for the four orphan children of a late member, to be applied at the discretion of the President and Secretary. It was also recommended that a full statement of this case should be published in the Journal.

The consideration of another case was referred for further particulars.

The President, in calling attention to the last-mentioned recommendation, said the case of these fou[r]

* These having already been included in the number who passed the Minor, do not increase the numbers on the Register.

Number of Pharmaceutical Chemists on the Register, December 31st, 1878 2,287
„ „ Chemists and Druggists 11,022
13,309

children was a very hard one. The father, who had been in business many years, and as associate and member connected with the Society for many more until the time of his death, died last Christmas day absolutely insolvent, leaving four children without mother or relations of any kind upon whom they could depend for support. Kind neighbours took the children in to give them temporary shelter until some provision could be made for their future maintenance. The youngest child had since been adopted by a benevolent chemist in the neighbourhood: the eldest was a little girl of eleven, very intelligent, so much so, in fact, that for some time during her father's last illness she had acted as a kind of assistant, and served in the shop. There was some idea of sending her to an asylum in Bristol, but it was thought by those who took an interest in the case that it would be a pity to do so if it could be avoided. A Mr. Bourdon had taken the eldest boy, and might keep him if some assistance were given him. The next boy was at present in a temporary place of refuge, and some permanent home must be found for him. It was suggested that £15 should be given to each of the first three, and £5 to the youngest one, and he must remind the Council that unless friends came forward in some special way to provide for these children a large sum would be required for them in future.

Mr. HAMPSON said the Committee had instructed the Secretary to state the case fully in the Journal for the purpose of letting its readers understand its peculiar and interesting nature. If this were done he thought the Council might depend on a good response from the benevolent portion of those who could afford to assist in raising a special fund for this case. The Society could not undertake the responsibility of paying entirely for four children for several years, but if a special fund were raised, the children could be maintained in a respectable position until they were able to support themselves.

Mr. MACKAY said he had seen the two gentlemen who appeared before the Committee on behalf of these children, and it was quite evident that those gentlemen were quite prepared, the one to keep the girl, and the other one of the little boys, provided some small sum per annum were allowed them. In like manner they hinted that the other child would be provided for by the person in whose house it was now lodged. Under these circumstances he thought it would be most desirable for the Council, if possible, to prevent the children being drifted away into any asylum, however good it might be. The advantage to the children of being brought up in families was so great that he thought every effort should be made to keep them in their present positions.

Mr. ROBBINS said it was gratifying to find that three children out of the four were already provided for, if a small amount of money in aid were voted. There was still one left, at present with a woman who had a large family of her own, and who would not, therefore, be likely to keep her. What was desired in publishing the case was to find some one who would come forward and take this little boy with or without a small premium.

Mr. SANDFORD said he had had the most complete and reliable evidence as to the great hardship of this case, the poor children having been positively turned into the street.

Mr. ATKINS hoped that in the statement about to be published, full particulars of the age, etc., of the child still left without a home would be given.

Mr. BOTTLE said that in all his experience in connection with the Benevolent Fund, he had never had such a painful case come before him, and he hoped that the matter would still be kept on the minutes, and the President and Secretary be requested to report when the money placed in their hands was expended, so that it might be dealt with further if necessary.

Mr. SCHACHT reported as to the expenditure of £10 which had been placed in his hands some months ago to dispense to an applicant. He found the person was in a very bad condition of health, and thought it best to give him £1 per week. This continued for nine weeks and then he was informed that the poor man had died. He sent the final pound to the widow, and as she had made no further application he trusted that having lost her husband she might be able to appeal with more effect to her own immediate friends.

The report was then unanimously adopted, and a rider added embodying Mr. Bottle's suggestion, and directing that the matter should be brought before the Committee by the Secretary in January next.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian to the following effect:—

Attendance, December 1 to 31: average during day, 13; evening, 8. Circulation of books, town, 110; country, 50; carriage paid, £1 5*s.* 2½*d.*

Donations received:—

Angström's Mémoire sur la polarisation rectiligne et la double réfraction des cristaux à trois axes obliques, 1849.
Brande's Manual of Pharmacy, 1825.
Goddard's Chemist's Counter Companion or Retail Price Book, 1846.
Leicestershire Association of Chemists and Druggists: Rules [184—?].

Chemists and Druggists' Diary, 1879.
From the Proprietors.
Pharmaceutische Chemie, 2^er^ Theil, 1878.
From Prof. Flückiger (Author).
Massachusetts College of Pharmacy:
Address by T. S. Hunt; Valedictory, by W. P. Bolles, 1875.
Twelfth Annual Catalogue, 1878.

The Committee recommends the purchase of the folfowing books for the Library:—

Blyth's Manual of Practical Chemistry, 1879.
Wigand's Lehrbuch der Pharmakognosie, 3 Aufl., 1879.
Muspratt's Chemistry, latest ed., by Vincent.

The Curator had reported that in December the average attendance in the Museum had been, day, 13; evening, 4.

The following donations to the Museum were reported:—

Specimen of Sublimed Vermilion and Crocus of Antimony, from the Paris Exhibition.
From Messrs. George Atkinson and Co.

Fine Specimen of Plumbago from Ceylon; Japanese Oil of Peppermint; and Grass Tree Gum from Adelaide. From Mons. Chantre.

Specimen of Duboisia Leaves and Cola Nuts.
From Mr. T. Christy.

Specimen of Compressed Ergot.
From Messrs. Corbyn and Co.

Specimen of Chekan Leaves and Fluid Extract of the leaves. From Messrs. Wyleys and Co.

Specimens of platino-cyanide of magnesium, asparagine, formiate of copper, bichromate of ammonium, dambonite, erythrite, chlorate of sodium, alanine, tyrosine, leucine, nitrate of uranium, pure glucose, mannite, sulphate of cadmium, neutral tartrate of antimony, crystallized bismuth, and small specimens of crystals of indigotine, isatine, alizarine, sodium, silicium, platino-cyanide of potassium, platino-cyanide of potassium, prepared by Messrs. Billault and Billaudot; fine crystals of permanganate of potassium and sulphate of glucinum, prepared by Messrs. Poulenc and Wittmann; roses tremières. From Mons. Petit, Paris.

Fine specimen of Diopside. From Mrs. Garden.

Specimen of Bismuth Pentoxide.
From Mr. John Davies, Laboratory Student.

The Curator had reported that he had distributed duplicate specimens of materia medica to the Kew Museum; the Universities of Dorpat, Strassburg, and Brussels; the School of Pharmacy, Paris; the North British Branch; Midland Counties Chemists' Association; Coventry and Warwickshire Pharmaceutical Association; Leicester Chemists' Assistants' Association; South London School of Pharmacy; Central School of Pharmacy; Dr. Watney, St. George's Hospital. The duplicates of indigenous plants had been distributed between the Birmingham, Coventry, and Leicester Associations, the Central School of Pharmacy, and Mr. J. Foster of Carlisle.

The Professors had attended and reported favourably of their respective classes. Professor Attfield had stated that there were two lady students now in the Laboratory.

Mr. WOOLLEY asked if all the duplicate specimens were disposed of.

Mr. GREENISH said no, not all.

The PRESIDENT drew attention to the reprint which had been made from the Journal of the various articles reporting on the Paris Exhibition, and suggested that a vote of thanks should be passed to the reporters for the very able and interesting way in which they had performed their duties.

Mr. GREENISH desired to bear testimony to the admirable manner in which the report had been prepared. He hoped the Council would in the future be encouraged to arrange that all similar exhibitions, even of a smaller character, should be reported upon.

The PRESIDENT also drew attention to Professor Redwood's recent lectures on the electric light; they were by no means ordinary lectures; they had been reported in the public journals and had attracted a great deal of attention. They had, in his opinion, been more instructive than any lectures of the kind he had heard upon the same subject, and he had heard lectures by some very eminent professors. He did not think the Council ought to allow the opportunity to pass without passing a special vote of thanks to Professor Redwood for the labour he had undergone in preparing these most important lectures.

Mr. BOTTLE had much pleasure in seconding the vote of thanks, having had the privilege of hearing the first lecture.

Mr. GOSTLING proposed a vote of thanks to the reporters on the Paris Exhibition, which was seconded by Mr. GREENISH.

The PRESIDENT said it was very satisfactory to find that Professor Attfield had reported that there were two ladies working in the laboratory, and that no inconvenience resulted.

The report was unanimously adopted and the respective votes of thanks mentioned above were also carried.

THE SHEPPERLEY CASE.

Mr. HAMPSON said he had had some correspondence with one or two members with regard to the absence of any proper statement in last week's Journal of the termination of the Shepperley case. It appeared to him that when an important matter of this kind was completed that the fact should be properly announced in the Journal; but such was not the case. There had been an editorial article on the future of the drug trade, in which it was incidentally mentioned, but that was all, and he thought it a great disadvantage to the Journal, and likely to injure its popularity, that such an important fact should not be properly announced. There was no reference in the table of contents to the fact, and he thought it was a most regrettable omission on the part of the Editor.

Mr. BOTTLE having stated that he had not up to that moment been aware that the case was definitely settled,

Mr. GREENISH read the formal notice given by the plaintiffs' solicitor to the defendants, dated January 25, stating that the plaintiffs had abandoned the appeal.

Mr. CHURCHILL said Mr. Haydon, the Secretary of the Trade Association, was instructed to send an official copy of that notice to the Editor for insertion. The Editor must have received it, or he could not have alluded to it in his leading article. As it was a matter of great importance, and as a prominent member of the trade had not seen it and was not aware of it, he thought it a great pity that the letter was not printed in the Journal.

The PRESIDENT said he had received a letter from the Solicitor, which, being private, he would not read, but the effect of it was that every one in his profession knew that the case was practically over on the 27th of December.

Mr. WOOLLEY said it was not known on the 27th of December. He put the point to the Solicitor as clearly as possible, and he could not say that he was wrong, that on the information then before him the defendants' solicitor could not have advised that the case was over.

Mr. SHAW said it might have been a matter of common report that the case was over, but there was no official statement.

Mr. CHURCHILL said if it were known amongst a few professional men in London, it was not known to those most interested in the case.

Mr. GOSTLING remarked that although the Editor might not have given this information exactly in the form in which Mr. Hampson would have liked to see it, the language used in the article was pretty definite.

The PRESIDENT could not see anything to complain of.

Mr. ATKINS supposed Mr. Hampson suggested that the matter should have been included amongst the items of intelligence, apart from being a portion of a leading article. It was really somewhat amusing to see the absurd mistakes made by intelligent papers with regard to their position and interests as pharmacists. Only recently a paper of large influence, published in his city, had an article, headed "Dispensing by Pharmaceutical Chemists," which stated that it had now been definitely settled that chemists were allowed to dispense.

Mr. HAMPSON said what he objected to was that there was not a proper publication of the announcement which had been sent and no notice in the contents.

The VICE-PRESIDENT said all must rejoice at the termination of this case, and the less the trade now moved in the matter the better. Medical men had learned a

lesson they were not likely to forget in a hurry, and the future of chemists and druggists would depend very much on themselves; if they managed to keep to legitimate prescribing they would not be interfered with.

HOUSE.

The report of this Committee was received and adopted. It contained nothing of any importance.

GENERAL PURPOSES.

The report of this Committee included the usual report from the Solicitor as to cases which had been placed in his hands. The Secretary had also reported certain cases in which complaints had been made, and in two instances it had been decided to recommend that the Solicitor should be instructed to take proceedings.

Mr. WOOLLEY asked if anything had been done with regard to the Homœopathic Pharmaceutical Society of Great Britain.

The SECRETARY said there had been nothing done as yet.

Mr. WOOLLEY did not wish to do anything antagonistic to the Homœopathic Society, but at the same time it was highly desirable, if possible, that the title should be kept distinct.

PHARMACY ACT AMENDMENT.

The report of this Committee was laid before the Council, and a discussion arose whether it should be considered openly or in committee.

Mr. ATKINS thought it was a pity there was not an intermediate course between giving a full report of the discussion, and suppressing it altogether by going into committee. Very recently he had been present at a meeting of bank proprietors at which a reporter was present, but at the conclusion of the meeting a resolution was passed that the report should be placed in the hands of the directors to decide what portion should be published. He thought the constituents of the Council should be informed that it was not unmindful of the matters, which, when discussed in committee did not appear in print.

Mr. SHAW moved that the discussion be taken in committee.

Mr. WOOLLEY seconded the motion, and thought the course suggested by Mr. Atkins would be a very dangerous one to adopt.

Mr. ATKINS said he only wanted it to be known what questions the Council had been discussing.

Mr. HAMPSON, though he was usually in favour of the utmost freedom of public discussion, was clearly of opinion that some of the proposals made in the report of the Committee could not be so well discussed openly as in committee.

It was resolved almost unanimously to go into committee on this report; and a long and animated discussion ensued on the different proposals brought forward.

The report and recommendations as amended were unanimously adopted.

Mr. HAMPSON asked what steps could be taken to put these amendments into the form of a Bill.

The PRESIDENT explained the proper steps to be next taken in the matter.

Mr. MACKAY said the Council had simply accepted the report. He apprehended that next month the important question would have to be discussed whether the Council should go for a Bill.

The SECRETARY said the report as revised would be printed and circulated amongst members of the Council.

Mr. HAMPSON gave notice that he would move the appointment of a Committee to draft a Bill and carry it through Parliament if possible.

THE GUILDHALL LIBRARY.

An application having been received from the Librarian of the Guildhall Library for a set of the Journal, it was resolved that, if possible, a set be supplied.

THE CONVERSAZIONE.

The SECRETARY asked if he should apply to the authorities at South Kensington for the use of the Museum for a Conversazione in May as usual. It was resolved that the Secretary should make the application.

LOCAL SECRETARY FOR LIVERPOOL.

The Secretary reported the resignation of Mr. John Abraham, as Local Secretary for Liverpool, and on the motion of Mr. Shaw, it was resolved to appoint Mr. Thomas Fell Abraham to fill the vacancy.

PHARMACEUTICAL MEETING.

Wednesday, February 5, 1879.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

The minutes of the previous meeting having been read and confirmed,

Mr. HOLMES described the specimens on the table. He referred first to some specimens from British Guiana, which he believed were the first that had appeared in this country. They consisted of a portion of the stem and bark of the tree which yielded the curari poison. Another product of considerable interest, also from British Guiana, was the oil obtained from a kind of laurel, *Orcodaphne opifera*, Nees. Mr. W. H. Campbell, of Georgetown in that country, had given the following account of the oil with specimens sent to the London Exhibition in 1862, and of how it was obtained. He said "This oil is used extensively by the natives in affections of the joints and for rheumatism. It is also an admirable solvent of india-rubber. Señor Francisco Jose Silva, who has resided for many years on the Lower Orinoco, states that the sassafras, or laurel oil is obtained from the trees which yield it by boring an auger hole to the heart. It is not every tree that produces oil, but those which contain it begin to yield it as soon as the cavity containing the oil is reached. It is then simply received in a basin and does not require purification." He (Mr. Holmes) thought it possible that the oil might be used in this country for the purpose of dissolving india-rubber, for he believed it could be obtained in quantity. He had on the previous day put a small piece of india-rubber into a portion of the oil and it had then become quite soft and gelatinous. Then there were two specimens of copaiba, also from British Guiana. As far as appearance went, this specimen seemed quite as good as the copaiba obtained from Brazil. He believed that it was very seldom imported from Demerara, whence these specimens came, and would be glad to hear from any gentlemen present opinions as to its quality. Certain specimens on the table were presented by M. Petit, and some of them were extremely remarkable for the beauty of the crystals. There was, for instance, a large and perfect crystal of sulphate of cadmium which showed, very nicely, the crystalline form of that substance. These specimens were a portion of those exhibited by Messrs. Billault and Billaudot, and Messrs. Poulenc and Wittman, in the Paris Exhibition, and had been purchased by Mons. Petit and presented to the Society. He would also call attention to a salt of the new alkaloid duboisine which he did not think had ever been produced in its present form, the neutral sulphate of duboisine, which was apparently in small crystals, also presented by M. Petit. Among the donations to the museum was a pressed specimen of ergot. Mr. Moss might be able to tell them something about it. Whilst speaking of ergot, he (Mr. Holmes) would call attention to some which was very common in Algeria; and, although it differed very much in form from the ordinary ergot, it was said to be produced by the same fungus which produced ergot of rye. He believed it to possess equal strength and certain advantages. The advantages were that it was more slender and hence dried more quickly, it was less hygroscopic, not liable to be attacked by insects, so that it kept very much better

than the ordinary kind. The gentleman, M. Lallemant, of D'Arba, from whom this specimen of ergot came, stated that at certain times of the year,—for instance, in September,—the ergot contained more oil than it did in June, July and August, and that the amount of oil it contained varied according to the soil on which it grew. The donor also stated that the ergot in different districts contained different quantities of oil. He (Mr. Holmes) should be glad if someone would say if such was the case with ordinary ergot. Mr. Holmes next referred to a series of specimens representing the cinchona barks of Java, and consisting of fine specimens of the barks and of sections of the trunks, and which he considered of great value. There were also some curious forms of catechu, from the Dutch East Indies.

Mr. Moss asked whether Mr. Holmes could tell them from what part of the curari plant the poison was obtained. Sometime ago, he (Mr. Moss) made an examination of the poison itself, and he came to a conclusion which he should be glad to have either removed or confirmed.

Mr. Groves suggested that a liquid extract should be made of a small portion of the specimen in order to ascertain whether the extract coincided in physiological qualities with the imported extract. It was commonly said that the imported extract contained a variety of ingredients—four or five.

Mr. Moss said that as regarded the ergot, the sample on the table was part of the result of an experiment carrying out a suggestion, made by Mr. Groves in the course of a discussion on some preparation of ergot at the meeting of the British Pharmaceutical Conference at Dublin and previously to himself in a letter. Mr. Groves suggested that ergot pressed into a firm coherent cake, so as to remove the oil, would withstand the attacks of insects and the effects of the atmosphere much better than when in the ordinary condition. Some seven pounds of ergot had been pressed in three lots. Each lot was subjected to a pressure of about 140 tons, and from the seven pounds he obtained twelve or fourteen ounces of oil. One-half of one cake so formed Mr. Groves had in his possession, and the other would be placed in the museum in order that the members might see how it behaved itself from time to time. It would appear that Mr. Groves was right in supposing that ergot in that form would keep better than ordinary ergot. It exposed a smaller surface to the atmosphere, and the oil which was perhaps the great inducement to insects to attack the ergot had been removed. The ergot was more active in proportion to the amount of inert oil which had been removed. It was also easy to break it up into a coarse powder ready for exhaustion, or for being put through any other process.

Mr. Groves said that the piece of ergot which he had was in a store room with other drugs, and he should allow it to remain there for seven or eight years, if he lived so long, and at the end of that time he would report whether it had lost any of its properties.

Mr. Moss said that the other two cakes had been and were still wrapped in paper on the upper shelf of a warehouse, side by side with some of the same ergot which had been wrapped in paper without being pressed, and also with two other lots in bottles, one containing camphor.

Mr. Greenish asked Mr. Moss whether the quantity of oil which had been expressed from the ergot was the whole quantity which he believed to have been in the ergot.

Mr. Moss replied in the negative.

Mr. Greenish said that the quantity which he had obtained from ergot by means of benzoline was certainly very much more than Mr. Moss had stated.

Mr. Moss said that he dared say that the quantity of oil remaining in a hundredweight of ergot subjected to the same pressure would be no greater in proportion than the quantity which was left in the seven pounds upon which he had operated, viz., about twelve ounces; this loss, perhaps, was due to the oil being absorbed by the cloths in which the ergot was pressed. Some little remained also in the margin of the cake, and would possibly prove the weak part of the experiment. The process might be carried on so as to be more perfect by cutting away the margin of every cake and pressing it again, keeping only the central portion, which was as dry as a board and to all appearance contained no oil at all.

Professor Attfield said that such pressed vegetable matters naturally retained something like 10 per cent. of oil. That, he believed, was the common amount found in linseed cake, or such cakes as contained 25 to 30 per cent. of oil to begin with.

Professor Bentley asked Professor Redwood whether he found any difficulty in keeping ergot, provided it was perfectly dry and in a glass bottle. He (Professor Bentley) had got ergot which had been kept in a dry state for about ten or twelve years, he believed, and it was perfectly free from insect attacks at the present moment.

Professor Redwood replied that he had no experience whatever in the matter.

Mr. Umney said that he could quite corroborate what Professor Attfield had said as to the quantity of oil which was left in residues, that had been submitted to hydraulic pressure. He could give no better instance than almond marc. Almonds would be found to contain 52 or 53 per cent. of fixed oil; but if they were subjected to hydraulic pressure they would not, at the best of times, yield more than 42 or 43 per cent. The pressure to which Mr. Moss had subjected the ergot marc, as he described it, appeared to be something enormous. He stated it to be one hundred and forty tons. He (Mr. Umney) did not know whether Mr. Moss meant that that was the pressure on the whole surface of the press, or the cake, or per inch.

Mr. Moss said that he meant on the whole surface of the press. He expressly stated that the pressure of one hundred and forty tons was on each cake.

Mr. Umney said that it was usual to work with a pressure of about two tons on the square inch. It was not possible to work with safety at more than two tons or two tons and a half to the square inch with an iron press. He believed that ergot would contain about 10 per cent. of fixed oil.

Mr. Holmes said that he could quite confirm Professor Bentley's statement, that if ergot was once thoroughly dried it would keep for years in a perfect state. The insects only attacked ergot in a damp state.

Mr. Giles said that the question as to keeping ergot was one of practical importance, and there was some little inconvenience attending the drying of ergot. His recollection was that a good many years ago it was suggested that ergot should not be kept in a bottle under ordinary circumstances, but should be kept in a wooden box with a loose cover. For many years he had been accustomed to keep it in that way in a dry warm closet, and he had done so with perfect security.

The President: Or a canvas bag hanging from the roof.

Mr. Giles added that he thought that it was an exploded notion that ergot should be sealed up. The best way for pharmaceutists to keep their ergot was to put it, as they received it from the wholesale houses, into a wooden box with a loosely fitting cover, and keep it dry and warm. Under such circumstances it would keep as long as a man was justified in keeping his stock.

Mr. Holmes said it was not always possible to have a dry and warm place. If ergot as soon as it was received into stock was dried properly in a drying closet, and then put into a stoppered bottle with a little vaseline rubbed round the stopper, the access of air would be prevented, and the substance would retain its properties for an indefinite length of time.

Mr. Gerrard said that as Mr. Holmes had referred to the specimen of duboisine which had been presented to

the Society by M. Petit, he (Mr. Gerrard) should like to say that he had himself prepared sulphate of duboisine in a crystalline form, and communicated the fact to the Society when he read his paper on that subject. Duboisia was a very important drug, and unfortunately the supplies of it in England were very scarce, and therefore the price was very high. He hoped that their friends in Australia would send a supply of the substance over to this country in order to bring the price down. If the price was more moderate the drug would be much more used than it was. There were many applications from which the alkaloid was excluded by its high price.

Dr. LEE exhibited his steam draft inhaler, using for the purpose of explanation the machine which was made under his directions for the Children's Hospital in Great Ormond Street, where it had been applied to the treatment of whooping cough with carbolic acid with very satisfactory results. The principle on which a jet of steam might be applied to the production of a current of air was shown to be valuable for the special treatment of cases of croup, diphtheria, whooping cough, etc. The relation between a jet of steam and the diameter of the surrounding tube was the chief point of interest in the mechanical construction of this inhaler, and the method by which a variation of temperature in the vapour was obtained simply depended on the admission of more or less into the draft tube. This latter improvement Dr. Lee considered would be found of great importance—the various diseases of the organs of respiration requiring such difference of temperature. The small inhaler constructed on this principle was also exhibited and its general advantages were highly pointed out.

Mr. BAKER then explained the action of a patent mixing and sifting machine of which samples of different sizes were exhibited. He said that in its present form it possessed advantages over that in which it had hitherto been known. It was constructed with a metal agitator which worked to and fro in the ingredients to be sifted or mixed closely above a concave sieve. This sieve could be of any degree of fineness and could be readily changed. The sifted materials fell from the sieve into a receiving drawer, which could be removed and replaced by another when necessary. The whole apparatus was covered by a lid, by which means the escape of dust was prevented. The two pivots upon which the agitator worked were controlled by side springs, which kept the agitator close to either a coarse or a fine sieve. It was claimed that with this machine it was possible to sift and mix with great rapidity, and with finer sieves than those ordinarily employed. By passing the ingredients through a second time, in special cases, a most perfect mixture was obtained. Mr. Baker then illustrated the action of the larger machines upon about six pounds of flour, which passed through a sieve having a mesh of the dimensions of an ordinary flour sieve in a few seconds. The mixing capabilities were satisfactorily illustrated in a smaller machine with the ingredients of Gregory's powder.

A paper was then read on—

MYRTUS CHEKAN.

BY E. M. HOLMES

The paper is printed on p. 653, and gave rise to the following remarks:—

Mr. GREENISH, in referring to the statements of the author, that the fluid extract was wanting in aroma, inquired whether Mr. Holmes knew how that extract was made.

Mr. HOLMES said that he did not know.

PROFESSOR BENTLEY said that he should like to know the amount of oil contained in the extract, for he imagined that the volatile oil would be an important factor in the drug, if it was found to have the properties which were stated. As in the case of the eucalyptus leaves, there appeared to be no trace of alkaloid.

This was followed by a paper on

AN EXAMINATION OF DISTILLED ESSENCE OF LEMON.

BY W. A. TILDEN.

The paper is printed on p. 654, and gave rise to the following discussion:—

Mr. GILES said that it struck him as being very remarkable, and contrary to the ordinary presumption in such matters, that the essence of lemon which was prepared by Mr. Moss and obtained by distillation was said to be superior in quality to the foreign essence of lemon obtained by expression. He recollected hearing some forty years ago of a London house endeavouring to establish in Sicily a factory for the preparation of essence of lemon by distillation, and failing most signally. He had always understood that the amount of heat to which the oil was subjected in distillation was fatal to the quality of the odour. Of course the lemon peel upon which Mr. Moss operated was that of ripe lemons. Perhaps Mr. Moss could tell them in what condition the lemon peel was which was used abroad. Everyone who had travelled in the south of Europe was very well aware that green lemons were infinitely superior in aroma to the yellow lemons which were got in this country. Probably the lemons used abroad were in the green state. He should like to have a comparison of the operation of obtaining oil of lemons, as performed by Mr. Moss in this country and the usual operation abroad, for, if it were possible, as was suggested in the paper, to make a superior oil of lemon by another process, it would not be long, he imagined, before that process was adopted if it was a good one.

Mr. MOSS said that he could give no more information about the essence of lemon to which the paper referred than was contained in the paper. He distilled the essence for Dr. Tilden, and that was all that he had had to do with it. Of course it was distilled with water. The lemons were in a fresh condition, but the peel was of a yellow colour. As to the failure of the manufactory to which Mr. Giles had alluded, he (Mr. Moss) thought such a failure might be due, not so much to the non-production of a good essence of lemon as to the product being not sufficient to pay expenses. If the quantity of peel used for the purpose referred to in the paper was compared with the product, it would be found that the essence cost considerably more than one hundred shillings a pound. At that price it could not compete with essence selling at twelve shillings a pound, and which was prepared by the process of scraping and squeezing, as it was practised by the natives of Sicily.

Mr. UMNEY said that there was a great deal of weight in the question which Mr. Giles had put before them. He (Mr. Umney) had been in the habit for some years past of using large quantities of lemon peel. He made use of the rind while in a fresh state, and he always used it in the month of December. There was no question that at that time the essential oil was present in probably two or three times as large a quantity as in the summer months. In Messina and, Palermo, where essence of lemon was made, it was prepared at that particular time of the year, and the London market had been during the past month receiving the essence of lemons which had been made in those countries during November and December.

Professor REDWOOD said he was surprised to find it stated in the paper that essence of lemon obtained by distillation was superior in odour to that which was commonly made, and which, as they knew, was not submitted to distillation at all. Taking an ordinary commercial esssence of lemon of good flavour and odour and submitting it to distillation, a process which he had repeatedly performed, he had never been able to obtain an essence which was at all comparable to the same substance before distillation, and he had inferred, partly from that fact, that the process of distillation was not available for the purpose of producing an essence which should be good with regard to odour and taste. Other facts which had come under his notice had led to the same conclusion.

One of his sons had been for some time engaged at Montserrat, in superintending the operations connected with the production of lime juice and lime essence at that place; and one object which they had in view there was to obtain a good essence of lime which could be substituted for essence of lemon, or which could be used for similar purpcses. A great number of experiments in that direction had been conducted for many years, and all those which involved distillation had entirely failed. When distillation was performed, the quantity of the product was certainly greater, but the quality was very far inferior to that which was obtained by the ordinary process of scarifying the rind and submitting it to pressure. Pains had been taken to ascertain what were the processes which were adopted in the places where essence of lemon was principally produced, and it appeared that the process of scarifying and submitting to pressure was the only process used in those places, the distillation process having been repeatedly tried, and having in all cases failed, solely because the distillate was far inferior in flavour.

The PRESIDENT remarked that of course Dr. Tilden's paper was mainly upon the chemical composition and constitution of the essence, and his motive in having the essence made by Mr. Moss was simply that he might have one of which he could depend upon as being perfectly genuine. It was certainly remarkable that Dr. Tilden should give the preference to the flavour of that essence rather than to the ordinary commercial essence, made by expression.

Mr. Moss said that if he had known that the paper was to have been discussed that evening, he would have looked up the notes which he made on the occasion of the distillation. He had, however, in his possession a small quantity of one of the distillates of essence of lemon, and he should be happy to place it on the table at the next evening meeting.

Votes of thanks were passed to the donors of specimens and the authors of papers.

NORTH BRITISH BRANCH.

The fifth meeting of the session took place in the Society's rooms, 119a, George Street, Edinburgh, on the evening of Friday, January 31st, 1879, Mr. J. B. Stephenson presiding.

The minutes of the former meeting were read and confirmed.

The Honorary Secretary intimated the addition to the Library of the 'Report on the Exhibits connected with Materia Medica, Pharmacy, Chemical Industry, etc.,' in the Paris Exhibition, presented by the authors, Messrs. Paul, Holmes and Passmore.

Mr. H. B. Baildon, B.A. Cantab, Pharmaceutical Chemist, then read a paper entitled "Thoughts on Botany." This paper will be printed in an early number.

Mr. J. R. Young, seconded by the chairman, proposed a hearty vote of thanks to Mr. Baildon for his interesting communication, which was most cordially responded to.

Provincial Transactions.

GLASGOW CHEMISTS AND DRUGGISTS' ASSOCIATION.

The assistants' section of this Association held its third meeting for the present session in Anderson's College, on Wednesday evening, 29th ult. Mr. R. A. Taylor, President of the section, in the chair. Mr. George Gilmour, Vice-President, read a paper on "Infusions," enumerating and commenting on those contained in the Pharmacopœia and suggesting some methods whereby he (Mr. Gilmour) thought they might be better preserved. The paper elicited considerable discussion in which most of the members present took part. After a vote of thanks had been awarded to Mr. Gilmour, the meeting separated.

SUNDERLAND CHEMISTS' ASSISTANTS AND APPRENTICES' ASSOCIATION.

The first meeting of the above association was held on Monday night at Lockhart's Cocoa Rooms, corner of William Street. There was a large attendance of members, and, in the absence of Mr. Ald. Thompson, Mr. John Harrison was voted to the chair.—After a few introductory remarks from the Chairman, in which he expressed the sympathy felt by the chemists of Sunderland towards this association, he called upon the President, Mr. R. H. Mushens, to deliver his inaugural address.

Mr. Mushens thanked the members for the honour conferred upon him by electing him as their president, and then in an elaborate address pointed out the great object of this Association, which was to diffuse amongst its mumbers such scientific and commercial knowledge as will not only assist them to pass their examinations with credit, but also fit them for any position in which they may be placed. He then impressed upon those present the desirability of acquiring the habit of careful, earnest, systematic study, which once acquired would never forsake them, and he condemned in strong terms the pernicious system of "cramming" so common among students of the present day. He was glad for the honour of pharmacy that the idea entertained by many candidates that a month or two of study would suffice to pass their examinations had been negatived, the numerous failures being plain proof that such supposition was entirely groundless. He then enlarged upon the advantages to be derived from such associations as these, and adduced as evidence the success attending those candidates who had studied at them in other towns. Mr. Corder, of Norwich, had said, "That since he had been on the Board of Examiners in London he had found the young men coming from these associations far better prepared than those who studied in London, and it only stood to reason that three months' 'cram' in London could not possibly make up for four years wasted in the country." He compared the state of pharmacy of the present day with what it was ten or twelve years ago, when any person, regardless of education or qualification, could open a shop for the sale of poisons, etc., and expressed his belief that ten years hence the difference will materially increase, even more than in the past. He entreated all to work with a determination to get knowledge, and that too of the best possible kind; who could say what anyone might become? Humphrey Davy and Faraday had no better opportunities than the young men of the present day; then on what did their success depend? Why, by making the best use of their talents, and not allowing them to lie dormant, as too many do in the present day. In conclusion, he strongly urged upon the members the necessity of punctual and regular attendance at the meetings of the Association, and expressed his belief that from the kind support and sympathy which he had received from all, both masters and assistants, there was every indication of success in a movement which was calculated to raise the status of the assistants, and thus advance the interests of their employers.

After a short discussion, and the usual votes of thanks passed to the President and Chairman, the meeting terminated.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The annual supper in connection with this association took place last Tuesday evening at the George Hotel, when nearly forty members and friends sat down to an excellent repast, under the presidency of Mr. R. Fitzhugh,

F.C.S., the vice-chair being occupied by Mr. W. H. Parker. After the usual loyal toasts had been given from the chair and duly honoured, Mr. Rivers Langton rose to propose the toast of the evening, "Success to the Nottingham and Notts Chemists' Association." He eulogized the value of such associations, both for educational and trade purposes, and recommended their support as a means of promoting good feeling amongst the members, and coupled with the toast the name of the president, who suitably responded.

Mr. W. H. Parker next proposed the health of "The Officers and Council of the Association," which was responded to by the treasurer, Mr. J. Rayner, and the honorary secretary, Mr. R. Jackson.

Mr. Rayner then gave "The Pharmaceutical Society," to which the local secretary, Mr. Fitzhugh, responded.

Mr. Warriner next proposed "The Teachers of the Associates' Classes," which was responded to by Mr. Widdowson.

The remaining toasts were "The Visitors," proposed by Mr. S. Parr, and responded to by Mr. F. H. Spenser; "The Chairman," proposed by Mr. Bolton; and "The Vice-Chairman," proposed by Mr. G. Shepperley, both of which were suitably responded to.

Proceedings of Scientific Societies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, January 30, to discuss the question introduced by the President, Professor Attfield, at the opening meeting of the present session, "What kind and amount of knowledge is requisite or desirable for the successful carrying on of the practice of pharmacy?"

Mr. R. H. Parker presided.

After the reading of the minutes of the previous meeting, the chairman called upon the secretary, in the absence of Mr. W. R. Atkins, to introduce the discussion.

The Secretary (Mr. H. Allen) having defined the character of the discussion as simply educational, proceeded to call attention to what, in his opinion, constituted the general preliminary knowledge required by a youth on entering pharmacy. Comparing this with the present requirements of the Preliminary examination, he held that the latter did not afford a reliable test of a candidate's knowledge in Latin, seeing that it easily admitted of cramming in that subject; he would recommend that the book selected for translation be varied at each examination, and that a passage should be set, not taken directly from the book, but made up of words and phrases occurring in different parts of it. With reference to the mathematical portion of the examination, he thought that the elements of algebra and geometry should be required of candidates. He considered a knowledge of these necessary for the intelligent study of the chemistry and physics required in the subsequent examinations, while the nature of the subjects scarcely admitted of cramming and formed a very useful mental discipline. In regard to the "Minor" he regarded the amount of dispensing given insufficient to be a true test of a candidate's capability in that direction, while, as he thought, the minute acquaintance with the Pharmacopœia generally supposed to be required was excessive, and the examination should be limited to the principles involved in the making the various preparations of that book, together with their ordinary medicinal doses.

The Chairman thought that the standard of the Preliminary examination should be raised, to keep pace with the general advance of education, and that a more extended knowledge of mathematics should be required. In reference to the Minor examination, he considered the recognition of pharmaceutical preparations essential, as a guarantee of a candidate's practical acquaintance with his business, while the knowledge of the Pharmacopœia required in this examination was such as every pharmacist should possess, and could be most easily and permanently impressed on the memory, if a few minutes daily were devoted to it during apprenticeship.

Mr. Branson thought it would be advisable to make it compulsory that any one entering pharmacy should have previously passed the Preliminary; he considered the relatively higher social position of French pharmacists to be due to the greater stringency of their first examination and expected a similar benefit might arise if the standard of the Preliminary were to be raised.

Mr. Stuart held that the technical knowledge at present required in the Pharmaceutical examinations was amply sufficient. These examinations had been appointed by law as a test of a man's capability to sell and dispense poisons and other potent substances, and this had been done simply in the interest of the public safety; it would therefore be wrong in his opinion to make those examinations more severe, solely for the social elevation of those who might pass them.

Mr. Jackson concurred in this remark. He maintained that the introduction of algebra and other such subjects into the Preliminary examination would be fitting candidates to become students, not pharmacists, and would have the effect, not of frightening youths from the trade, but of tempting them to enter it without troubling the Board of Examiners at all.

Mr. Sangster suggested that the subjects required in the University local examinations might be advantageously substituted for the present Preliminary. French should be included to enable a pharmacist to read prescriptions written in that language.

Mr. Alcock said that the long hours of business left an apprentice very little time to work for the Preliminary. He thought that more time should be given to each subject in the "Minor," especially to dispensing, as a candidate was often very nervous, on entering the examination room, if sent off at once to dispense.

Mr. Symons agreed with Mr. Branson that the Preliminary should be passed by a youth before entering pharmacy, but thought that, until pharmacists should have a monopoly in the sale of drugs, as in Germany and Russia, the standard of the examination could not be raised.

After some remarks by Messrs. Eaton and Warrick,

Mr. Naylor, after criticizing some remarks made by the chairman at a previous meeting, said that the number of professions in this country was limited to three, and that no increased stringency in examinations would cause pharmacy to cease to be a trade, and raise it to the rank of a profession. He thought it well for a pharmacist to know how to test his drugs, and to make preparations more advantageously made by the wholesale druggist, but the latter, by the constant employment of a chemist on his premises, should render such testing, etc., on the part of the retail chemist quite unnecessary.

Mr. Wordsworth (a Visitor) considered that the Latin required in pharmacy could be best acquired by the reading of prescriptions. In answer to this, the chairman noticed the occurrence of words in prescriptions, which, though simple enough to a fair Latin scholar, would puzzle one who had picked up his acquaintance with Latin solely from the medical terms of ordinary prescriptions. In connection with this, he should like to see the next British Pharmacopœia written in Latin, as it would then be intelligible to foreigners, an advantage which several continental pharmacopœias already possessed.

The Secretary, in noticing some of the criticisms elicited by his opening remarks, said that some of the speakers seemed to have misunderstood him in regard to the importance he attached to the dispensing portion of the Minor examination; so far from underrating its value, he advocated a much longer time being devoted to it, and four or five prescriptions being given to each can-

didate to dispense. The theoretical knowledge required could, as suggested by Mr. Jackson, be tested by means of written papers; this method of examination would greatly tend to decrease the nervousness of candidates, and if the papers comprised the entire range of the knowledge required, would at any rate possess two advantages over the present system of *viva voce* examination.

A vote of thanks was passed to the Secretary for opening the discussion, and the meeting adjourned.

CHEMISTS' ASSISTANTS' ASSOCIATION.

Annual Dinner.

This successful gathering took place on Wednesday, January 29, at the Holborn Restaurant. Over seventy gentlemen were present, among the visitors being Professor Bentley, Mr. Moss, Dr. Muter, Messrs. Piper, Postans (who has contributed much to the success both of the Association and its dinners), Professor Redwood, Dr. Stocker, Messrs. Reid, Stuart and Wills. Dr. H. Dobell and Mr. A. Bishop, who, among others, were unable to be present, sent respectively cheques for £1 and £3 3*s*. for the funds of the Association.

The chair was taken at 8.30 p.m. by Mr. J. Stuart. After the repast the toast of "The Queen and Royal Family" was given by the Chairman and suitably responded to.

Mr. E. Marshall next proposed "The Medical Profession," dwelling gracefully on the cordial relation which should and does exist between pharmacists and medical men.

Dr. Stocker responded.

Mr. Wallis (President of the Chemists' Assistants' Association) then gave "The Pharmaceutical Society," which he recognized as the parent and home of British pharmacy, and whose feeling towards the Association to which he belonged was manifest in the presence of some of its well known members that evening.

Professor Redwood, in reply, expressed the pleasure he felt at meeting so many assistants, who, if he judged by physiognomy, were kindred spirits and gentlemen. He was glad to find that they acknowledged, by the toast which had just been drunk, the services of the Pharmaceutical Society in promoting education. But in this the Society was not alone, and he was pleased to find that not only professors from Bloomsbury Square were among them, but others who were engaged in the same good work.

The Chairman, in proposing the toast of the evening, "The Chemists' Assistants' Association," alluded to its objects, the promotion of social intercourse among assistants and the discussion of subjects tending to the welfare of all interested in pharmacy. These objects seemed to him very laudable; he recommended assistants to support the Association. He concluded with a compliment to those who had contributed to its past and present success.

Mr. Wallis replied.

Mr. Branson proposed "The Pharmaceutical Press," so important to pharmacists, and by which the Association had been so well supported.

To this toast Mr. Piper responded.

The next toast was "The Visitors," proposed by Mr. C. E. Stuart and replied to by Mr. Moss, who said he was reminded by the festive board at which they were assembled of another board of which he was a member, not usually associated with festivity, but which had at heart the welfare of young men entering the profession, and who he was glad to see that evening.

The toast of "The Chairman" was proposed in a few suitable words by Mr. E. Bull and was acknowledged in the same manner.

After a short address from Dr. Muter the chair was vacated.

Between the toasts a capital programme of songs, piano duets and recitations was carried out by members and their friends.

Parliamentary and Law Proceedings.

The Sulphur Question again.

At Guildford, on Wednesday, Mr. Joseph Bentley, grocer and provision dealer, of High Street, appeared to an adjourned summons charging him with selling as milk of sulphur an article which was not of the nature and quality of that demanded by the purchaser.

Mr. Ferdinand Smallpeice, the town clerk, appeared on behalf of the Corporation to prosecute; Mr. George White defended.

Mr. Smallpeice said that the Bench would recollect that the adjournment had taken place to allow the analyst to attend, and be examined. That gentleman was in attendance, and he would at once call him.

Mr. Arthur Angell, of Southampton, the analyst for the borough, said that on January 3 he received from Mr. Superintendent Law a sample, which was sent as milk of sulphur. He analysed it, and found that it was not milk of sulphur, but simply sublimed sulphur. This contained the elementary constituents from which milk of sulphur was prepared. Both were pure sulphur, but differently prepared. Milk of sulphur was a drug, and was assimilated by the stomach in a different way to sulphur sublimate. The latter was a cheaper article than milk of sulphur, although the latter was made from it. Sulphur sublimate could be purchased for 16*s*. 6*d*. per cwt., but milk of sulphur could not be purchased under 38*s*. per cwt. The latter was a medical preparation, and he believed the Pharmaceutical Act prevented a grocer selling it.

Cross-examined by Mr. White, the witness said that the purchases of the sulphur by the officer, under the Act, were suggested by him. He did suggest that grocers should be applied to, although he knew that they did not sell drugs. He had referred in his certificate to *lac sulphuris* of the British Pharmacopœia, but he found in the edition handed to him that it was not mentioned.

Mr. White called the attention of the Bench to the fact that the edition handed to the witness was the last published.

In answer to Mr. White, the witness said that in his certificate he stated that the doses were different according to the British Pharmacopœia. He could not see, in the editions handed to him, that there was any difference in the doses.

Mr. White said he submitted that there was no case against his client; 1st, because the officer purchasing the sample had not offered to divide it into three parts, according to the Act; 2nd, because no adulterated article was sold; and 3rd, because the purchase had not been to the prejudice of the buyer.

He called Henry Williams, an assistant to Mr. Bentley, who said that the officer asked for powdered sulphur. He said he wanted it for analysis, but did not offer to divide the sample. He merely said, "You can have some of it, but I see you have some in the drawer." Witness did not know the difference between sulphur and milk of sulphur.

Mr. Smallpeice said that a similar case against Mr. Snoxell, oilman, of High Street, and which had been heard at the last Bench, he would elect should stand or fall by the present case. Two other cases, those against Mr. Frederick Wheeler, chemist, of High Street, and Mr. E. Waller Martin, chemist, of High Street, were different. In the case of Mr. Wheeler, he had sold sulphur for milk of sulphur, and had charged 2½*d*., the drug price for it. In the case of Mr. Martin, he had sold milk of sulphur which contained 7 or 8 per cent. of, sulphate of lime. The purchase in both cases was proved

and, in the case of Mr. Martin the analyst proved that the sample contained 7·8 per cent. of sulphate of lime.

Mr. Martin contended that according to the Pharmacopœia precipitated sulphur was not the same as milk of sulphur, and that he had adhered to the formula in preparing the milk of sulphur with sulphuric acid, which made the presence of the lime inevitable. He cited a case decided at the Knutsford Quarter Sessions as confirming his contention.

The Bench, after a long deliberation, decided that in the cases of Mr. Bentley and Mr. Snoxell a mistake had unintentionally been made, and they would be fined the nominal sum of one farthing each. In the case of Mr. Martin the article sold was a genuine one, and the summons against him would be dismissed, and in the case of Mr. Wheeler, who was a chemist, and had not sold the article demanded, he would be fined 20*s.* and costs.—*West Sussex Gazette.*

Poisoning by Chloroform.

An inquest has been held at Tranmere, before Mr. Churton, coroner, on the body of Elizabeth Boniface. From the evidence, it seemed that some time ago the deceased was kicked in the face by a horse, and afterwards she suffered great pain. With a view to allay the pain she was in the habit of taking small quantities of laudanum internally, and applying chloroform to her face. On Tuesday night her husband went to bed, leaving her on the sofa. Next morning he found her lying on the sofa, with her face covered with a handkerchief, through which she had been inhaling chloroform. By her side was a small bottle marked "poison," and containing a small quantity of laudanum. The jury returned a verdict of "Died from the accidental inhalation of chloroform."

Poisoning by Carbolic Acid.

On Monday, the 27th ult., a young man named Richard Williams, living in Cheapside, Liverpool, committed suicide by swallowing a quantity of carbolic acid.—*Liverpool Mercury.*

Co-operative Trading.

Sir,—Your interesting leader, in conjunction with the letters and articles in the morning papers, place the subject in a very clear light as far as the public and the general traders in goods are concerned, but they scarcely touch the question as it relates especially to the chemist and the people. Whatever may be argued as to the merits of competition between grocers and other tradesmen does not apply to the chemist.

The stores close their doors at seven in the evening, at an early hour on Saturday, and do not open them again until Monday. Most tradespeople are also free to enjoy their night's rest undisturbed, and can call Sunday their own.

The gentlemen in the Civil Service, paid servants of the public, having performed their arduous duties for a few hours each day are their own masters after office hours; but what is the position of the chemist? At all hours of the night he is called from his bed and has his sleep disturbed to dispense prescriptions, that have too often the stamp of a co-operative institution impressed upon them. On Sundays the chemist, even if he is independent enough not to open his door or show signs of business, has his bell continually ringing for trifling articles that on another day would have been purchased in larger quantities at the stores. Why should the chemist be expected to hold himself, or an assistant, if his business allows him to keep one, in readiness at all hours of the night and on Sundays to oblige those who, when the stores are open and it is convenient for them to go with ready money, would not think of applying to him for their requirements? The chemist has more liberties taken with his privacy than any other class of the community, and ought in consequence to receive exceptional advantages and profits. If any one on Sundays, from indiscretion over night, requires a seltzer, or soda, or seidlitz, no one would think of knocking at the grocer's door, or at the publican's, where their cheap mineral waters are bought in the week; but who for a moment would hesitate to worry the chemist for the most insignificant articles? People, who on the Saturday obtained their bronchial, rheumatic and influenza medicines from the stores think nothing of sending to the chemist on the Sunday for mustard, linseed meal, turpentine, or even a dose of castor oil: and in many cases do not send the money for sick-room necessaries that they could not obtain elsewhere before the following day. This sir, is certainly not competition, it is not even honourable dealing; certainly not fair play. It is merely making an accommodation of the chemist to the selfishness of the public who encourage the stores. Putting aside the question of educational requirements, examinations, restrictions, and expenses incurred in order to become qualified to take charge of poisons and dispense medicines, the mere fact of the pharmacist being at hand in cases of emergency, night or day, to supply medicines when life itself may depend upon their being obtained without delay, removes the chemist from the position of being a competitor only in the sale of goods, and gives him a position occupied by no other class of tradesmen. Most families obtain from the stores sufficient grocery, wines, and sauces to tide them over from Saturday until the Monday, and if they failed to do so the consequences would not be serious; but what would be the result if they had to wait until the following week for the stores' dispenser to supply them with medicines in case of accident or sudden illness? It would be considered a great hardship if the chemist at such a time declined to supply medicine to those who at other times patronized the stores. This, sir, would be competition in its true sense. When the stores are prepared to supply medicines at all hours of the night, and on Sundays, when they are ready to retail drugs in small quantities, when they will procure articles, patent and proprietary, that are not in general demand, and that they do not keep in stock, then we may allow that competition exists. I have, sir, great objection to puerile grumbling, or incessantly complaining without any effort or action following, and I cordially approve of Mr. Punch's suggestion, that instead of calling upon editorial Hercules, we should stand our ground, and meet the enemy with whatever weapons we may command. I have no faith in any amount of writing; for I believe the more publicity that is given to the fact that at certain cutting chemists, or co-operative stores, twopence can be saved in a purchase, the greater will be the rush upon those places. The public have no sentimentality when it can save twopence in the shilling.

The Legislature will not help us. Assistants cannot be expected to act as "Hampshire" would desire; for it is too often these young gentlemen who commence business by lowering the prices, in order to make a start, and take from those established in the same neighbourhood. I have adopted a plan in self-defence, and if all the trade were to stand upon their own defence, and not be so subservient to the public, it would do more to settle the future of the trade than any amount of writing. I never open my place on Sundays, or supply anything that is not absolutely necessary. I close on Bank Holidays. I never yet sold a patent or a proprietary article under its credited value, and rather than do so I will give up selling them altogether. I am willing to oblige my regular customers to any extent, but I positively refuse to dispense any prescription at night, or on Sundays, for those that do not deal with me, and that I know at other times procure their chemists' goods from the stores. I am willing to take 15 per cent. off all orders for cash that exceed one pound in value; but for nothing under. Only two days ago I informed a gallant captain who sent an order for half a dozen soda water, that "it was not worth my while to book the few goods that he sent for, but that I would willingly supply him with any thing for cash." This officer,

who deals at the stores, but who, since August last, had become indebted to me for 5*s.* for mineral waters on Sundays, in all the majesty of his wrath and indignation paid the sum which otherwise I might have waited another six months for. I am convinced that there is no other remedy than for the chemist to fight the stores in an independent manner. When the public once understands that we intend to protect ourselves, it will pay us a little more regard, and will see that we are something more than mere traders in goods. "Outsider," although ignorant and careless of much in your Journal, holds his brief as though he had been specially retained and well instructed to plead against us. He thinks druggists make too much profit, but he has not the candour to admit that the majority make but a very small annual income, notwithstanding. He reminds me of a remark that was made by a young lady at one of our conversaziones at South Kensington some few years ago. Some three thousand persons were there. Some hundreds of chemists, with female relations. Many of the ladies were dressed in a superior style, and the young lady observed "What profits these chemists must make to enable their wives to dress in this style!" This young lady's remark is something akin to "Outsider's" arguments, and about as forcible.

The future of the trade rests with right-minded chemists standing their own ground with the public, being indifferent to other wrong-minded contemporaries, and striving to bring about a better understanding with the medical profession; while holding fast to their right of counter practice, as hitherto carried on, endeavouring in every way to induce the medical profession to relinquish supplying their own medicines.

Our future is dispensing, and it is the duty of our leaders, and of the Council of the Society to urge upon medical men to come to such an arrangment that neither branch of the profession shall encroach upon the other.

JOHN WADE.

174, *Warwick Street*,
February 1, 1879.

CO-OPERATIVE TRADING.

Sir,—Co-operation has become a "burning question," and retail traders seem inclined to adopt a policy which will prove about as effective as a society of coach proprietors would have been forty or fifty years ago to prevent the development of railways. So far as chemists are concerned, they appear to be making the error of the man in the old story who had a fish and a fowl which he wished to keep alive, and put them both into water, which suited the fish very well but fatally disagreed with the fowl. The fish and the fowl of the chemist are the professional and the stric ly commercial elements of his business. For care and skill I believe the public are willing to pay where care and skill are required. But the public fail to see in what respect a box of Holloway's pills served by the barber's boy differs from a box of Holloway's pills sold over a chemist's counter, and very naturally hesitate to pay more in one place than another. The two branches of the business require different treatment, but in both there is need of earnest co-operation on the part of chemists to meet co-operation elsewhere. There are abundant proofs, not only in the daily and weekly press, but also in the more literary organs, that the principle of co-operation is a rising tide which it will be folly to attempt to stay. We shall probably find it out too late. As in many of the preparations which have now become household necessities, ours will be the work of laboriously introducing them to the public, for they rely upon the intelligence of chemists, and then, for want of the true commercial instinct, we shall allow grocers and others to reap the eventual profit. We shall be left with the glorious reward of having maintained the "principle" that goods about which we have had no trouble, the demand for which has been created by the proprietors, are not worth selling for less than 45 or 50 per cent. profit.

Some of your correspondents may attribute these remarks to a desire to undersell. That is of small moment. As a matter of fact, I am constantly refusing to supply patent medicines under the advertised price, as I desire to co-operate with my brethren. I apprehend, as a consequence. that this branch of our trade will leave both them and me before we awake to a sense of the real state of affairs.

HENRICUS.

THE FUTURE OF THE DRUG TRADE.

Any one may err,
Only a fool will persist in error. BERKELEY.

Sir,—I was much interested with your leader on the above subject, as also with the letter of "Outsider." After giving his ideas of counter practice, which to say the least of them were good, he goes on to speak of the drug trade in general. Speaking of chemists generally he says, that though educated men they are as a body extremely shortsighted men, conservatives in the extreme and the motto of many of them is, As it was in the beginning, is now and ever shall be. Though a chemist myself, I am sorry that I should in my own idea endorse those sentiments; I have found his statements to be too true in my own experience. Let a traveller call upon a respectable chemist with some chemicals and drugs at extremely low prices, as example, cream of tartar and the like, which chemists only should command the sale of, and what is the almost universal response of the chemist? It is this,—Well, I do not think I can do any thing with you, I have all my goods from so and so in the town and I do not suppose for a moment that they would think of overcharging me; it is a most confidential firm, and besides I do not care to open an account with any one else. Or may be the chemist is tempted to buy and his purchases are so small that the traveller will turn away with disgust feeling disinclined to execute the order; and supposing he has not found a buyer in a chemist, he will naturally call upon the grocer opposite, who although probably not so well educated, is ever ready and open for commercial transactions and has the push, tact, and thrift, which I am sorry to say so few chemists possess. The traveller here gets better treated, for he finds that a grocer goes to the best market and gets his goods at a very great discount as compared with the chemist, buying larger, and cheaper, thus placing him in a position to sell the very goods that a chemist only would sell, had he the push in him, at a considerable discount to the chemist himself. I know it would grieve me very much if I thought that the grocer opposite was doing well in my best heavy trade, such as carb. soda, cream tart., tart. acid., camomiles, senna, castor oil, etc., etc., just because he was lower in price; I should at once lower mine and keep my prices down, for I know that buyers would prefer to trade with a chemist in such articles.

Let the chemist consider this matter and not sell senna and camomiles at such exorbitant prices as 3*d.* and 4*d.* per ounce while his neighbouring grocer sells the same at 1*d.*, 1½*d.* or 2*d.*; and he will find that the purchasers would after a time never think of going to a grocer for such goods.

But "Outsider" goes on to speak of patent medicines thinking that they should be sold below the advertised price. This is foolish, for there the price is useless and it would be far better for the maker to lower his published prices, if they can be sold for less. I strongly oppose selling goods under advertised prices unless you have an antagonist who is trying to cut you out; but this is rarely the case, then why should it be done? Besides if "Outsider" were a chemist, he would very soon find, that to please his customers he would have to keep hundreds of patent medicines in stock, some of which would be seldom wanted, others after getting a supply would never again be inquired after. Take for example the very kind he saw advertised (Widow Welsh Pills) of which I purchased two boxes full six months ago, and I may say I did not get the advantage of thirteen to a dozen; these cost me 4*s.* 1*d.* I sold a box for 2*s.* 9*d.*, the other box is likely to remain in the drawer with a lot of such others; thus so far I have lost on this article 1*s.* 4*d.* Again the seidlitz powders he speaks of, I always sell at 1*s.* per box and was not aware that 1*s.* 6*d.* was ever obtained for them; and lastly respecting the immense reduction in glass bottles he speaks of, I purchased some myself and found that although they were superior in quality they were very much dearer in price. So that "Outsider" was crowing with his 11¾*d.* to the 1*s.* over something he knew nothing about.

Nevertheless let us as chemists, remembering that all are not thieves that dogs bark at, take a little sound advice and strive to create greater and more business-like transactions, making a determination not to be cut out by any one in the quality or price of our goods, and then I feel sure we shall always hold our position amongst tradesmen prominently in the commercial world. I trust these few hints may not be lost sight of by all business men amongst us.

NIL DESPERANDUM.

Sir,—Having been connected with the drug trade in all its details for the last twenty-five years, it will afford me some small satisfaction to say a few words on the above subject, if not taking up too much of your valuable space.

I quite and thoroughly endorse the remarks of your correspondent at Hull. It appears to me the chemist must stand by himself, and, quite apart from trade considerations, must rely on his own endeavours, be they scientific or otherwise, to obtain his living. If there is room for a physic trade (and there should be, or else he should not) so much the better, but if not I feel he had better not help to cut up the business by competing in price with grocers and unprincipled men of his own trade, who for their own gain are fast cutting the drug trade to pieces. Better sell no patent medicines at all than lose the legitimate profit.

I speak feelingly on this matter. This, our town of Croydon, tries us rather severely. Every medical man here supplies his own medicine, and, to make matters worse, an examined member of the Society has started a store in which he hopes, by cutting down prices to one penny profit, to enrich himself at others' expense.

What is the chemist to do to live under such circumstances, unless that which is not considered legitimate? My principal object in writing this is to get the retail druggists generally to awake to the necessity of impressing upon the manufacturers of patent medicines the importance to us and to themselves, too (as they will find to their cost if they do not), that they should confine the sale of medicines to chemists. If the whole trade would unite against them, if they do not assist us, I feel sure they would see their own interest was best consulted by keeping physic apart from bacon and cheese and other "store" articles.

Excuse this long ramble, but, as the old lady said, "Every little helps," it may assist to avert a calamity, which I fear will drive half of us out of the trade and make it hardly worth while for the other half to continue "respectable chemists," as the vendors of patent medicines say.

Croydon. J. L.

Sir,—In your issue of to-day appears a letter on this most important subject from "An Outsider." If by designating himself as such he had intended to convey to the minds of your readers that he was totally ignorant of the practical part of the business, he only seconded what was only most evident throughout his letter, viz., that he had obtained all his information from a solitary number of the Journal which some gentleman had left behind him in a railway carriage, and which had thus come into his possession. If before rushing into print he had made a few inquiries, if he is possessed of any common sense, he would not have made many of the statements which appear in his letter. Perhaps he does not know that the returns of many country chemists depend in no slight degree upon the sale of patent medicines, and that if these men, with their small returns, are to sell their articles at the same rate of profit as that generally obtained by grocers and others who have returns probably five or six times more than theirs, the trial, if made, will result in failure and probably the workhouse.

As your correspondent mentions free trade, I may say that I yield to none in my admiration of it as a national institution, but at the same time I hold sacred the proverb, "Live and let live," and think that before chemists as a body lower their prices in patent medicines or anything else that they will see their way to introducing something into their business to make up the loss that will otherwise be the result. Further, he asks what would "Hampshire" think of his baker if he adhered to the price the loaf was charged a few years since, and he makes the same reference to tea, which I may say was charged after the Peninsular War in 1819 from one shilling to sixteen pence per ounce. By referring to the official returns we find that the use of tea in this country increases annually, and to what must we attribute this change but to the reduction in price, which has made people willing to use more, until at the present there are thousands who regard it as a necessary of life and a luxury not to be given up? But by lowering the prices of medicines shall we be enabled to persuade the public to purchase two boxes of Parr's or any other pills where they only purchase one at the present time? or will they become convinced that medicine in some form or other must become a portion of their daily food? or will any one prove to their entire satisfaction that it is a luxury within the reach of all, and that therefore it is their duty to patronize it to the utmost of their power? In my opinion the lowering of prices will not increase the sale or persuade people to take more medicine than is necessary.

He says that chemists are slow, but if that sloth consists in bringing to light the medicinal properties of many of the articles we see daily around us, and offering to the public many elegant and agreeable preparations for the cure of simple complaints at a comparatively low price, then I, for one, glory in it; but if, as he appears to hint that they have made no progress during the last few years, I entirely repudiate the statement as false, unwarranted and misleading. He then goes on to say that quinine, cod liver oil, glycerine and other articles are much reduced in price and consequently are more used. I agree with that statement, but must remind him that by improvements in production or manufacturing the cost to the chemist has been very materially lessened, and he is consequently able to retail them at the same profit but at a much lower price.

There is one more point to which I should like to direct the attention of "An Outsider," and that is to the fact that before a man can commence business as a chemist he must pass an examination that is not merely nominal but a reality, and to pass which he must spend a great deal of time and energy, together with a certain amount of expense.

In concluding, I hope that "An Outsider" may gain more information on this important subject, and also that he will try to show more of that true charity which should begin at home, but which should go abroad, that although he may have a preference for some other trade or vocation he will have a generous feeling for others, and, as Shakspere says, that he may be ruled and led by some discretion.

Heaton Moor, Feb. 1, 1879. T. Swindells, Jun.

Lin. Terebinth. Acet.

Sir,—I think the preparation of lin. tereb. acet. has occupied as much space in your Journal as can fairly be claimed for it, but I cannot allow the letter of Mr. Philip Princep (printed on page 652) to pass without pointing out that he has simply corrected the printer's error in my letter (on page 611). My formula should have been printed thus:—

Glacial Acetic Acid	1 oz.
Camphor Liniment	3 oz.
Turpentine	3 oz.
Olive Oil	to make 9 oz.

I thought the error (the substitution of six for nine) would be so apparent to every one who read the remarks which followed the formula, that I did not correct the mistake.

P. B.

Major.—The Secretary to the Chemical Society, Burlington House.

"*Minor.*"—We know of nothing to prevent him from doing so.

A.P.S.—The annual subscription to the British Pharmaceutical Conference is 7*s.* 6*d.*

M.P.S.—It would be illegal for such a person to use the word "pharmaceutical" in the manner described.

THE AMOUNT OF ASH AND SOLUBLE MATTER IN THE THREE SORTS OF BUCHU.

BY HENRY WILLIAMS JONES, F.C.S.

The following results were obtained during an examination of a number of samples of buchu intended for commercial purposes, and, in the absence of any exact information respecting the composition of the three sorts, yielded, respectively, by *Barosma betulina*, Bartling, *B. crenulata*, Hooker, and *B. serratifolia*, Willd, it is thought such results, though necessarily imperfect so far as showing the actual composition of the species is concerned, might prove interesting.

It has been previously shown by Mr. P. W. Bedford* that of the three species the short-leaved yield on an average 1·21 per cent. of volatile oil; whilst the long-leaved, *B. serratifolia*, gives only ·66 per cent.

The drug was successively treated with dry ether, alcohol, and water until exhausted. The resulting solutions were evaporated to dryness on the water-bath, and the extracts so obtained dried in an air-bath at 240° F., until they ceased to lose weight.

The ether extract when so dried was quite free from the characteristic smell of buchu, and therefore contained no essential oil, and represented the chlorophyll, fixed oily matter, and such other substances soluble in ether.

In the case of the aqueous extract the amount of mineral matter present was deducted.

ASH AND SOLUBLE MATTER IN THE THREE KINDS OF BUCHU.

(*Three different samples of each species*).

	Percentage Results.			
	Ash.	Soluble in ether.	Soluble in alcohol.	Soluble in water.†
Barosma betulina .	4·69	4·62	12·11	13·91
,, ,, .	4·47	4·29	13·96	14·25
,, ,, .	4·40	3·85	8·79	17·91
Barosma crenulata .	4·32	5·70	11·26	13·99
,, ,, .	4·01	5·86	15·73	20·72

The ash was remarkable for containing a large amount of manganese, and the aqueous extract for a large quantity of mucilaginous matter. One hundred grains of *B. serratifolia*, when powdered and boiled with water, yielded ten fluid ounces of thick mucilage. To separate the fragments of exhausted leaves the thick liquid so obtained was filtered through a plug of cotton wool, by atmospheric pressure, into a flask exhausted of air. A bright liquor was thus obtained, which under the microscope showed no leaf fragments.

17, *Bull St., Birmingham.*

† The mucilage is diffusible rather than soluble.

NOTE ON THE MORE ACCURATE ESTIMATION OF QUININE IN FERRI ET QUINÆ CITRAS, B.P.

BY W. STEVENSON.

The Pharmacopœia process for the estimation of quinine in ferri et quinæ citras frequently occasions some difficulty as regards the amount of washing required by the precipitated quinine. If the whole of the iron is to be removed, a loss of the alkaloid must occur to some extent, owing to its slight solubility in pure water. The following modification has been found to give more accurate results.

Five grammes of the citrate to be taken. Dissolve in 50 c.c. of water, add a slight excess of dilute ammonia ·960, stir well, and after standing five minutes pour on to a double filter, made of two filter papers of open texture, tared on a balance, one against the other, by cutting down the heavier; the smaller one to be placed outside to prevent the precipitate getting between the two. This dispenses with weighing and drying a filter, as both have the same solutions passing through them and remain equal in weight.

Instead of distilled water, the following solution is to be used for washing: 1 oz. of ammonia ·880 is added to 80 ozs. of distilled water. The precipitated and washed quinine from one drachm of the sulphate is added to the dilute ammoniacal solution and well shaken during twenty-four hours. As much as may be required is then filtered and used in an ordinary wash bottle.

The precipitated quinine may now be freely washed with this solution; no quinine will be lost, and if the precipitation has been properly performed, every trace of iron may be removed in from five to ten minutes, leaving the alkaloid white and granular. In this short time, any quinine deposited by evaporation of the washing solution would be so small that it may be neglected. Remove the filter from the funnel and thoroughly drain on bibulous paper for two or three hours. If the drying be commenced without this precaution, the water held by the precipitate will, on becoming hot, dissolve a portion of it. Dry at a temperature not exceeding 100° F. until constant in weight, the outside filter acting as a counterpoise.

Very accurate results have been obtained as above, known weights of quinine having been added to ferri citras, ferri et ammoniæ citras, etc., and, though it may appear an unnecessary complication of the B.P. process, it really requires less time when the solution is kept ready made up. The suggestion is simply an adaptation of Teschemacher's excellent method of estimating morphia in opium.

THE TURPENTINES AND RESINOUS PRODUCTS OF THE CONIFERÆ.

BY DR. JULIUS MOREL,

Professor of Chemistry in the Industrial School, Ghent.

(*Continued from Vol. VIII., page* 1025.)

XXI. AMBER.

Synonyms.—G.: ἤλεκτρον, a name given to it because of the resemblance traced between its colour and the sun's rays.—L.: Lapis ardens; Electrum; Succinum.—F.: Succin; Carabé; Ambre jaune: the word *ambre* was introduced into France by the Cru-

saders, and came from the Arabic word *ambar*.—G.: Agtstein; Bernstein (from *brennen*, to burn).

*Botanical Source.**—Amber is a fossil resin found in terrestrial strata, principally with fossil wood in the tertiary lignites; it is also met with in the greensand, in the chalk, and in the gypsum. It occurs abundantly upon the shores of the Baltic. The waves, washing away the soil from the shore, carry with them pieces of amber, which are fished for with a net during the flow of the tide; but a portion remains behind among the pebbles and earth. It is also found in various localities in England, Holland, Belgium, France, Spain, Italy, Sicily, Germany, Poland, Sweden, Siberia, and North America.

Amber is an exudation from trees that are now extinct. Many specimens, those from Sicily, for example, contain in their midst vegetable detritus and insects, perfectly intact, the greater part of which belong to species that have disappeared from our globe. At the present time, only the North American *Lepisma saccharinum* is known.

Göppert, in his excellent *Etude sur les Conifères fossiles*, published in 1853, has determined, from the *débris* found around and within the amber itself, the nature of the trees by which it must have been produced. Besides *Pinites succinifer*, Göppert has shown that amber has also been yielded by about fifty other plants of the same family that have been found in its neighbourhood. Not only has this author been able to determine this large number of plants belonging to the sub-orders *Cupressineæ* and *Abietinæ*, but in the neighbourhood of amber he has recognized the presence of 162 species of plants belonging to twenty-four genera of different families.

In 1869, Frisdedt published a very interesting memoir upon the origin of the amber in the *Upsala Läkareforenings Forkandlingar*, iv., 203.

The principal market for amber is at Dantzig, and in that city, as well as at Konigsberg, Stolpen, Breslau, Lubeck, Constantinople, Vienna, and especially Paris, this substance is employed in the manufacture of fancy objects.

Characters.—Amber, as met with in the earth, occurs in commerce under the form of fragments of variable size, most frequently angular, sometimes irregularly rounded. At Breslau fragments are found weighing about three kilograms. The surface is rugose and unequal, and its colour varies from yellow to brownish or even brown. Its fracture is generally conchoidal and more or less shining. The pieces recovered from the sea have been deprived by it of the rugose coating which is present in that obtained from the earth; and further the pieces are harder and less brittle. Without the rugose coating the pieces are sometimes transparent and sometimes translucent, or in some cases completely opaque.

According to Sir David Brewster certain pieces of amber present cavities filled with a brownish yellow viscous liquid. Upon drying this substance becomes transparent and presents some analogy with amber. Upon heating it becomes first orange red, afterwards black, and at last disappears without charring. On one occasion Brewster observed the evolution of gaseous bubbles in a specimen while heated, from which he inferred the presence of a volatile body.

It has already been stated that amber is solid, hard and brittle. Further, it has no odour or taste at the ordinary temperature; but it imparts to the bottles containing it a sweet aromatic odour. It also develops this peculiar perfume when it is rubbed or pulverized. Amber is only slightly heavier than water, its specific gravity being 1·065 to 1·070.

When rubbed amber acquires negative electric properties, which are manifested in a very marked manner by the attraction it exercises upon light bodies. It burns in a candle flame, swelling up but not running or falling in drops. Whilst burning it gives off a strong aromatic odour. It melts at 287° C.; and at a higher temperature it is decomposed.

When amber is submitted to dry distillation, there are obtained as volatile products, water, succinic acid, and combustible oil of amber, and as residue amber colophony, containing very little ash. Amber is almost completely insoluble in water. It is very slightly soluble in alcohol, ether, and fixed and volatile oils. Weak acids do not affect it. When boiled with linseed oil it softens sufficiently to allow of any desired shape being imparted to it. It is insoluble in acetic acid, carbon bisulphide, oil of turpentine, benzol and rectified petroleum. It dissolves in solutions of the alkalies, giving a liquid that is then miscible with water and alcohol; this solution is facilitated by fusion or by the addition of camphor. Sulphuric acid dissolves amber with a brownish coloration, but on diluting the solution with water the greater part is precipitated. Ammonia is without action upon amber. A mixture of alcohol and oil of turpentine dissolves it completely when the mixture is heated in a closed vessel. When amber in small portions is boiled with nitric acid it dissolves after a time, the liquor depositing upon cooling about one-twelfth part of the weight of the amber as succinic acid. At the same time there is volatilized a white substance analogous to laurel camphor ($C_{10}H_{18}O$). This same substance is also formed when amber is boiled with caustic soda. According to Berthelot and Buignet it is Borneo camphor ($C_{10}H_{18}O$) that is obtained under these circumstances, and probably it is an ether of that alcohol which pre-exists in the amber.

Amber can be turned and polished; hence its employment in the manufacture of fancy articles.

Commercial Varieties.—Lebert has divided the commercial varieties into seven classes, based upon the physical characters of the amber.

1. Shining amber (*ambre luisant*): pale yellow or greenish.
2. Bastard amber (*ambre bâtard*): non-transparent; citron yellow and darker yellow.
3. Bone-coloured amber (*ambre couleur d'os*): dull white; very rich in succinic acid.
4. Agate-coloured amber (*ambre couleur d'agate*).
5. Impure amber, containing organic fragments.
6. Cloudy amber (*ambre nuageux*): unequally coloured; usually clear yellow.
7. Transparent amber, of various colours.

The commercial value of amber usually increases with the size, form and colour of the pieces.

Chemical Composition.—Ether removes from powdered amber 10 or 12 per cent. of a yellowish liquid product that may be considered a remnant of the original turpentine of the amber. Upon evaporating the ether and distilling the residue with water a volatile oil is obtained, having the aromatic penetrating odour of rosemary and pepper and a refreshing taste, and which is rather soluble in water. There

* Some time ago Dr. Dragendorff, professor at the University of Dorpat, published a very interesting paper in the transactions of the *Dorpater Naturforscher Gesellschaft*, "Die Entstehungsgeschichte des Bernsteins, erläutert mit Hülfe von Beobachtungen an Copalpflanzen."

remains in the retort a resinous residue consisting of a resin soluble in 84 per cent. alcohol and in caustic alkalies, and a resin insoluble in cold alcohol, soluble in boiling alcohol and deposited upon cooling as a white powder. The soluble resin is represented by the formula $C_{20}H_{32}O_2$. The water used for the distillation of the substance extracted by the ether yields upon concentration crystals of succinic acid, which acid can also be extracted by treating powdered amber with an alcoholic solution of caustic potash.

The greater part of the amber—80 to 90 per cent. of the entire weight—consists of a yellow principle, insoluble in ether, fixed and volatile oils, alcohol, and alkalies, which Berzelius named *bitume d'ambre*, but which other chemists have since called *succinin*. If this substance be heated in presence of atmospheric air, it becomes brownish without undergoing previous fusion, and then gives off the odour of burnt fat. Schrötter and Forchhammer represent succinin by the formula $C_{20}H_{16}O_2$. When succinin is heated in a retort a combustible oil distils over and amber colophony is left as a residue. This substance, which also constitutes the residue in the dry distillation of amber, is yellow and waxy, and when treated with alcohol gives up to that solvent a white body containing 95·3 per cent. of carbon and 3·5 per cent of hydrogen. It commences to fuse at 160° C., boils at 300° C., and is coloured blue by sulphuric acid. The portion insoluble in alcohol resembles Laurent's chrysene, which contains 94·4 per cent. of carbon and 5·8 per cent. of hydrogen, and commences to fuse about 240° C.

En résumé, according to Berzelius amber is composed of a volatile oil, a soluble resin, an insoluble resin, succinic acid and succinin. According to Drapiez it has the following percentage composition: carbon 80·59, hydrogen 6·31, oxygen 7·73, lime 1·54, alumina 1·10, silica 0·63, loss 2·10. In this loss must be included 0·002 to 0·005 of sulphur, which Baudrimont discovered in amber, and the presence of which may be easily demonstrated by exposing paper saturated with acetate of lead to the vapour arising during the distillation of amber. Baudrimont states that the sulphur found is always in inverse proportion to the succinic acid. Amber in the crude state, *i.e.* covered with an external crust, always contains a larger proportion of succinic acid than amber recovered from the sea, the surface of which is clean.

Adulterations.—Amber can be adulterated with copal, colophony, or coloured glass. An adulteration by copal can be readily detected by the following tests:—

(1) Copal takes fire in the flame of a candle, melts completely and falls drop by drop; amber, much less fusible, swells up while burning but does not run.

(2) After being extinguished, and whilst yet warm, copal gives off a feeble odour of copaiba. The odour from amber is strong, bituminous and disagreeable.

(3) Copal, which is very soluble in 80 per cent. alcohol, becomes pitchy and white when moistened with it and left for the spirit to evaporate; amber treated in the same manner remains dry and transparent.

(4) According to Napier-Draper these two products differ essentially in that copal is completely soluble in essential oil of cajeput, whilst amber is totally insoluble in it even at a temperature equal to the boiling point of the oil.

(5) When distilled, copal yields no succinic acid, a product that is always obtained in the dry distillation of amber.

(6) Copal treated with a solution of potash acquires an odour that has been compared to that of copaiba balsam; amber treated similarly does not give off this odour.

(7) Amber when strongly heated in a test tube gives off sulphuretted vapour which readily blackens paper impregnated with acetate of lead, a reaction that does not occur with copal or any other resin.

According to Ebermayer the raspings of amber are sometimes adulterated with colophony. These raspings are usually very impure, being mixed with small stones, sand, and wood splinters; they have been met with containing one fourth of their weight of divided colophony, recognizable by the manner in which they behave upon a lighted coal and with alcohol. 31 grams of amber thus adulterated when macerated with 125 grams of alcohol during six hours and frequently stirred, yielded an alcoholic solution that left, upon evaporation, a residue of colophony equal to one-sixth of the weight of amber employed.

Nearly every one is aware that at the present time coloured glass is frequently used in the place of amber in works of art, but such a substitution is easily recognized.

Uses.—About 100,000 kilograms of amber is collected annually upon the shores of the Baltic and about two-fifths of this quantity is used in the manufacture of oil of amber and amber lac, which are employed in painting and photography. The remainder is used in the manufacture of necklaces, bracelets, and other fancy objects, the finest pieces being reserved for jewellery and turned articles. In pharmacy the small fragments and *débris* from this manufacture are utilized in the manufacture of succinic acid, an empyreumatic oil and an oleaginous liquid formerly known under the name of spirit of amber. They are utilized also in the preparation of certain varnishes. It will be well to repeat here that the *débris* are often adulterated with colophony, a method for detecting which has been given.

It has already been stated that for industrial purposes amber is softened by plunging it into boiling oil, when it can be pressed into any shape required. Fragments may be made transparent by heating them progressively for some time in sand or oil.

In medicine amber is employed as an antispasmodic, a tincture and a syrup being prepared; it is rarely used in fumigations.

As an appendix to this article may be given a very brief account of oil of amber and succinic acid, both of them being products employed in pharmacy.

Volatile Oil of Amber (Oleum Succini).

The volatile oil of amber is obtained as a residue in the preparation of succinic acid. Marsson, working upon 6 pounds of amber, obtained 3½ pounds of colophony, 6 ounces of rectified oil of amber, 3½ ounces of succinic acid, and an acid liquid containing caproic, valerianic, butyric, propionic and acetic acids.

Crude oil of amber is thick and brownish with a greenish tinge; it still contains a resin and succinic acid in solution. It gives off a characteristic disagreeable bituminous odour and has a caustic acrid taste. When recently prepared it has a slightly yellowish colour which becomes gradually darker upon exposure to the light. Crude oil of amber of a brownish red colour has a specific gravity of 0·922 at

15° C. When submitted to rectification the first part that distils is a colourless liquid having a composition represented by the formula $C_{10}H_{16}$ and a specific gravity of 0·840 at 15° C.

It is soluble in two parts of 80 per cent. alcohol, but if it be adulterated with petroleum oil twenty parts of alcohol are required for its solution. If oil of turpentine be present, this adulterant can be detected, according to Flückiger, by the property it possesses of forming terpene when the oil is treated with half its volume of a mixture consisting of 1 part alcohol, 2 parts nitric acid, and 2 parts water.

When the oil is brought into contact with sulphuric acid there is a slight evolution of heat and the oil becomes turbid and coloured dark yellow. Upon subsequently mixing it with alcohol the colour becomes yellowish, and upon boiling the mixture it becomes clear, small oily drops floating upon the top.

Uses.—Formerly oil of amber was used in the preparation of certain perfumes. It was used in the preparation of *Eau de Luce*, in the proportion of 1 part to 24 parts of 83 per cent. alcohol and 96 parts of water. Further, it entered into the composition of *Liquor Ammoniæ Succinici.* It was also used in the preparation of artificial musk, by mixing carefully 1 part of rectified oil of amber with 3 parts of nitric acid, avoiding all rise of the temperature. A resinous matter was thus formed which was freed by washing with water from excess of acid. This product possesses a strong odour of musk ; it is soft, of a more or less deep orange colour or even brown. In alcohol, ether, and the fixed and volatile oils it is very soluble, and all these solutions have an acid reaction and become milky upon the addition of water. A solution of this resinous matter in 8 parts of water is known under the name of *Tincture of Artificial Musk.*

Succinic Acid ($C_4H_6O_4$).

Succinic acid exists already formed in amber and can be obtained by extracting a powder of that substance with water or with alcohol. But the acid also exists in nearly all the fossil woods and the strobiles of fossil Coniferæ found on the shores of the Baltic, in several species of Terebinthaceæ and other plants, and even in certain pathological and physiological animal products. It is formed also by the fermentation of the malate, asparaginate, fumarate, and aconitate of calcium, and of asparagin, which is met with in many plants. It is also a product of the alcoholic fermentation, and is formed by the oxidizing action of nitric acid upon beeswax, Japan wax, stearic and other fat acids, paraffin, and the resin of amber. Succinic acid has also been prepared synthetically.

Preparation.—Succinic acid may be isolated from amber by submitting it to dry distillation. The distillate is thrown upon a previously moistened filter to separate the oleaginous liquid from the aqueous solution ; the latter gives upon evaporation *crude succinic acid.* This is dissolved in distilled water, filtered, and concentrated until the crystals obtained upon cooling are no longer of too deep a yellow colour. This product is the *medicinal succinic acid.* To obtain it chemically pure it is sublimed, or its solution is previously decolorized with animal charcoal. Bley obtained from 16 parts of amber, 0·4 to 0·85 parts of succinic acid, 3 to 4·5 parts of volatile oil of amber, and 9 to 10·5 parts of amber colophony. If sulphuric acid be added to the amber before distillation a better yield of succinic acid is obtained. Chemically pure succinic acid is also prepared in other ways, especially from calcium malate.

Characters.—Succinic acid, when pure, occurs under the form of white nacreous, prismatic crystals, inodorous, and having an acid and acrid taste. That which is employed in medicine contains most frequently adherent oil of amber, causing a modification in the colour of the crystals which are then yellowish or brownish. Its sp. gr. is 1·55. It commences to fuse at 180° C., boils at 235° C., and sublimes without residue, forming white irritating vapours, provocative of coughing. It is soluble in 25 parts of cold water, in 5 parts of water at 16° C., and in 2·2 parts of boiling water. It also dissolves in 1·4 parts of boiling concentrated alcohol. It is slightly soluble in ether and volatile oils, and insoluble in chloroform and benzol, a character that distinguishes it from benzoic acid. When sublimed several times it loses the elements of water and is converted into succinic anhydride ($C_4H_4O_3$). Succinic acid is not attacked by chlorine, or by a mixture of potassium chlorate and hydrochloric acid, or by boiling nitric acid, or even by chromic acid. Distilled with a mixture of peroxide of manganese and sulphuric acid it is converted into acetic acid. Fusing with caustic potash converts it into oxalic acid.

Besides the presence of oil of amber succinic acid has been met with adulterated with various substances (acid salts, crystalline acids, sugar, etc.), but it is easy to determine its purity.

(1) It is completely volatilized by heat, which distinguishes it from boracic acid, chloride of sodium, nitre, etc.

(2) It is completely soluble in hot absolute alcohol and in 15 parts of water at the ordinary temperature.

(3) When treated with excess of caustic potash it gives off no ammonia, neither does it when very pure undergo any alteration in contact with potassium permanganate, in which it differs from tartaric acid and sugar.

(4) When neutralized with lime water it gives no precipitate upon being boiled, in which it differs from oxalic, citric, and tartaric acids.

(5) Complete solubility in ether would indicate the presence of suberic acid.

Uses.—Succinic acid is used in pharmacy in the preparation of solution of succinate of ammonia (liquor ammonii succinici, ammoniacum succinicum dilutum, spiritus cornu cervi succinatus), an old preparation dating from the seventeenth century. It is prepared by dissolving the official succinic acid in 8 parts of water and saturating this solution, heated to about 50° C., with empyreumatic carbonate of ammonia (from hartshorn) and filtering. Recently prepared succinate of ammonium is of a pale yellow colour ; the colour becomes darker with lapse of time, the preparation containing besides pure succinate of ammonia, volatile oils partly derived from the salt, from the spirit of hartshorn, and partly from the officinal acid. The taste is saline and empyreumatic. It is completely volatile, water being at first given off, and the succinate of ammonia then subliming. The official succinate of ammonia should neither be too pale nor too dark. Its reaction should be neutral to litmus paper, and on evaporation it should leave only a brown coloration. Treated with acid it should not give off carbonic acid gas. Pure succinate of ammonium is employed in analytical chemistry as a test for ferric salts.

THOUGHTS ON BOTANY*.—*continued.*

BY H. B. BAILDON, B.A. CANTAB.

The Gramineæ—the Coniferæ—the Ascending Axis—Twining Stems.

It would be alike tiresome to you and laborious and unprofitable for me in continuing our meditative review of the Plant-world, if we were to attempt to notice every class of plants with even the same amount of detail and deliberation which we bestowed on ferns and mosses. Nevertheless it will assist us in giving form to this treatment of the subject if we maintain the direction if not the velocity of our progress. If we consider that this planet must at one time—and this seems highly probable, if not absolutely certain—have been in a molten condition, it follows that, upon its first solidifying, the rock would be all of a voltaic character and perfectly naked of soil. We have already observed, however, that there are forms of vegetation which can, under conditions of moisture and heat, attach themselves even to such naked rock and flourish thereon, and while doing so gradually deposit a thin layer of mould. This, as was previously pointed out, is the function of the lichen. And in this first stage of this soilless globe it is evident that no plants save lichens and algæ could exist. We also observed how the moss succeeded the lichen and made provision for the fern. In alliance with these humble and silent agents some mightier, yet not more nccessary, natural forces were at work. The adamantine tooth of frost gnawed into crumbs the hardest granite, and slowly the tempest and torrent swept the gathering spoil to swell the hoard of rude soil that was growing in hollow and valley. By such incessant, unresting processes was the earth accumulated and enriched till it became capable of bearing what we call the higher forms of vegetation. But, if we consider the aspect our earth was then assuming and the soil-covered state to which most of its surface has attained, we easily divine that some new agent was now wanted to complete nature's staff of labourers. It was not sufficient that the rocks should be crumbled, powdered and carried down to the lowest ground, but it was evidently requisite that this denudation should be checked so that not only the lower and level tracts but the higher places and slopes should become soil-clad. Had any intelligent human being contemplated the condition of the earth at this stage, he must necessarily have remarked that some agent was now required to give the soil coherence, to bind it together so that it should retain its own position and even arrest the downward progress of the newly forming earth. Accordingly there does appear, when thus demanded, an agent which accomplishes this object in a most complete manner. It seems as though at such an epoch a creative fiat had gone forth, "Let there be grass?" And there was grass. And lo, the shifting restless sand was wonderfully laced and woven and a task more difficult than Michael Scott gave the demon quietly accomplished, and the loose soil at the mercy of the flood was stitched and bound and tied till it became solid immovable turf. And the green irresistible conqueror rose like a gradual wave up the slope and mounted the hill, till the tides met on the summit and the rugged, once uncouth and naked, hulk of rock was clad in a smooth and seamless garment. Grass is not an individual, but an association; not a tribe like the fern, nor a colony like the moss-plot; the grass is a republic, a community, which seems to have recognized, æons since, the modern maxim of liberty, equality, fraternity. Even in cultivated forms this principle is preserved. How scrupulously every ear of wheat seems to respect the rights of his neighbour ears, so long as prosperity and strength enable him to do so, unlike in this respect the forest trees that thrust out rival arms against each other. The two forms to which the flowering heads of grass tend, the limiting forms which are well and clearly represented by our common cereals, the wheat and barley representing one form and the oat the other, are in this reference worthy of notice. In the former the glumes are arranged in close-fitting rows along the axis of the stalk and thus form a clean, firm and compact ear, so free of encumbrance and well contrived that, until it is itself injured or its stalk bruised, not the wildest onsets of the wind can bring it into hurtful collision with its neighbours. It might seem that if this model were departed from a less happy result would be obtained, but on the contrary we find that by a different route the same goal is reached. The head of the oat, representing the second form we specified, is constructed on an opposite principle from the first. The glumes of the oat, instead of being sessile and close laid to the axis, are hung out on fine flexile pedicles at some distance from it, thus forming a spreading and, when ripe, slightly pendent head. But these heads, from the slimness and smoothness of the glumes and the sensitive flexibility of the pedicles, do not tend to abrade or injure one another any more than the compact ears of wheat. If we wished to have single terms for each of these two opposite styles of formation, we might call the one the "serried" and the other the "open" order. And we might divide all grasses into three orders, the serried, the open, and the mixed or intermediate. Now the observations we have made on this subject suggest the reflection, or rather the deduction, which may be supported by hundreds of other natural facts, that nature frequently accomplishes a similar end in diverse ways. This brings to our mind an objection which has been urged against the theory that the forms we meet with in nature are to be entirely accounted for by natural selection and survival of the fittest, or on what we may call a purely competitive system of evolution. We are bound to suppose that grass in its primitive form was intermediate between the serried and the open order. It is difficult to suppose how it could prove to its advantage and contribute to its survival to be both a little closer *and* a little opener. We can conceive its proving advantageous to be either a little closer *or* a little opener, but it is not easy to see how it could be beneficial both ways. Indeed, we are here brought in mind of a great and standing difficulty in the way of accepting the Darwinian theory, viz., that of understanding the use and operation of that slight change which is supposed always to commence that divergence which results in the production of distinct species. The fact is that to a mind divested of the bias of a pet theory, there seems to reside in nature a certain prophetic instinct, urging on development in those directions which produce remote and future advantages rather than near and immediate ones. No one bears in reality, if not verbally, more ample testimony in favour of this belief than Mr. Darwin himself, in his masterly and interesting series of researches on the subject of cross-fertilization. For, proving as he so completely does, that there is a transition, a progress from self-fertilization to cross-fertilization, he at the same time proves, whether he has observed it or no, that such a system could not arise blindly, at haphazard, but was actually aimed at by nature as though conscious of its immense advantages. So positively marvellous are the contrivances by which cross-fertilization is promoted, and such the nicety with which it is accomplished, that one is rather tempted to attribute to plants a faculty of "thinking for themselves" than to deny in such a matter the operation of mind. But we have not yet arrived at that portion of our subject where it will be most convenient to discuss this question in full, and must, therefore, relinquish it for the present, in its general form at least, in order to return for a little to the grasses. Before leaving this subject we cannot avoid the reflection that the presence of grass in any form, such as still exists, implies the possibility, not only of that vast portion of the animal kingdom which we call graminivorous, but also of man. The grasses are, indeed, the foundation, the basis of the present animal economy, the

* Read at an Evening Meeting of the North British Branch of the Pharmaceutical Society, January 31, 1879. The preceding paper was read February 22, 1878.

sea upon which the ship of life is upborne. Without grass civilization, yea, humanity itself, were impossible. As it may be said to have civilized the savage primeval world in a physical sense, so it teaches civilization, and even, as we have seen, politics to man. All those animals which aid the food-raising operations of man are graminivorous; the horse, the ass, the ox, etc. Until he has subjugated and utilized these, he cannot be said to have reached the first plateau of civilized existence. When he has, he obtains some breathing space; his purely physical labour is done for him, and hence arises leisure, thought, culture. It would be easy to expatiate at length upon the economic importance of this order of plants, but as our present aim is rather to condense than to elaborate, we must refrain from so doing. But there remains yet another aspect under which we may consider it, viz., the æsthetic or decorative.

Whether we regard the grass collectively, as forming that lovely natural carpet, so elastic and grateful to the foot of man or animal, or in the beauty of its individual forms, we find a fertile source of delight and admiration. There are in nature few fairer sights than a meadow on a bright day of June or July, when the grasses are in flower. No web from Lyons loom ever wore a more sweet and silken lustre than those acres of rippling grasses, over which the breezes seem to pass a-tip-toe, and fleet beyond our furthest view, ever returning, so it would seem, to renew their joyous race, calling on the staid, slow-sailing cloud-shadows to join them in their unwearying play, while before them the broad grass-billows flee, glancing and shimmering in the sunlight, as though they were happy mates and playfellows of old. Or again, what more pleasant than to lean one's head back in the deep grasses and indulge in the phantasy of dreaming one's-self to be one of those minute creatures that haunt that miniature jungle, or an invisible daylight fairy exploring those steep greenlit glades, or surveying that tiny forest from the top-gallants of one of its mimic masts. Here, though we may in some sort allow fancy to become the exponent of fact, it is nevertheless true that it is the inherent beauty in the aspect of these things that touches the heart with delight, and wakes pleasant fancies in the brain; or, if we look upon the various forms that grasses take, whether in the leaves themselves or in the flowering stems, we cannot fail to be struck by the exquisite beauty by which the majority are characterized. They, like the ferns, appear to employ form rather than colour as a decorative agent; they are the delicate draughtsmen and designers of natural chasing and fine tracery, the elvin armourers that prepare swords and lances and bayonets, standards, pennons and plumes. It is, indeed, impossible to decide whether they exceed in beauty or in utility. Man thus served is like the hungry Geraint waited on by Enid, when he must have doubted for which he was the more grateful, the good fare or the lovely face.

I am quite aware that much that has been said applies more to the grasses of temperate than to those of tropical countries, but the difference is rather in detail than in principle, and there is no doubt that while the latter may be coarser in appearance, they are likewise often more conspicuous and splendid in their attractions. It is not here contended that the whole of this immense order is equally perfect in design and entirely beneficial to man. There are some less sightly than others, and some either poisonous, as the darnel is suspected to be, or dangerous and annoying, as the New Zealand spear-grass certainly is. But such exceptions can hardly weigh, so exceedingly rare are they. So much, too briefly, and yet, considering the range of our subject, also too lengthily, of the grasses.

There is another order of great beauty and likewise of immense usefulness to man, which, before passing on it behoves us to notice—I mean the Coniferæ, the pine order. They appear historically to have even preceded the grasses, and, following our plan of taking into account the gradual process of soil formation, it is easy to see that they would naturally be contemporaries of the ferns, etc., because we find it characteristic of them to be able to subsist on the merest modicum of soil, on the all-but-bare rock. All they really seem to require is a safe anchorage, and this is best secured on mountain side, precipice, or cliff, where the roots can grapple themselves with more than iron grip about huge boulders, or to the cracks and friendly seams, fissures and angles of the living rock, herein performing a mechanical feat which would defy the appliances of man. It would be as impossible to secure a pine, once felled, to its former position, on the same principle that nature does of merely tying it by the root, so as to resist the enormous leverage it affords to the wind, as it would to put together the Humpty-Dumpty of the nursery rhyme. The strength of those living clamps and cordage seems little short of miraculous. The pine cannot therefore draw its chief nutriment from the soil; dew, mist, rain and snow are its seeming ethereal food, and it is extremely interesting to note how admirably adapted for arresting and absorbing these forms of sustenance it is. The fine innumerable spines catch and secure all these as in a close, almost impermeable, web or net. In nearly all instances the most important agent in its nutriment is the snow, for as a race the coniferæ affect great altitudes, at which the snow lies through a great part of the year. Now when the earth is iron-bound with frost, it seems obvious that the tree must feed on the snow. Only this winter, during the severe weather, I was struck by the admirable adaptation it exhibits for this purpose. At first one notices how heavily laden all the trees of this order become with snow, and it appears a disadvantage, as though they would be more injured than other plants. On looking closer and reflecting more deeply it becomes evident that this fact is of great service. Let us take four species of quite different habits, and see how they adapt themselves. Take first the common Scotch fir that we sometimes see riding the tempest under almost bare poles. In this case it is evident the snow does tend to remove the lower branches, but mark how the summit spreads itself into broad palms, which will receive and retain the greatest amount of snow, almost as much as if it were feathered to the ground. Consider, secondly, the cedar of Lebanon, which sends out its lusty limbs at a slight upward incline, and expands into broad trays and terraces, which only become horizontal under a considerable weight of snow. We may take as a third example the deodore, and we find that in a quite different way it carries out the same purpose. Its branches leave the stem at right angles, or even with a slight downward incline, and they are, especially at the point, supple and pendent. The snow thus tends to slip off the upper and lith r boughs and descend upon the lower branches, which are already resting on the ground or their lower fellows, and which thus become thickly "happed" about with mounded snow. A fourth and equally distinctive case may be found in the araucaria, upon whose long bristling arms I have seen a deep ruff-like ridge of snow fully two inches and a half high, which did not seem calculated to injure or inconvenience the plant, so easily was it sustained. These facts taken together with that, that when the ground is hard frozen a tree which so far maintains its vigour as to remain ever green, as all of them do, can draw little or no nutriment from the earth, absolutely convince me that the pine feeds upon the snow through its leaves. The method in which it does so, as I believe, I will endeavour to explain. Firstly, it is ascertained by careful and repeated experiment that plants in general develop a certain small amount of heat, the result of which is that in summer the temperature of the plant is below, in winter above that of the surrounding atmosphere. Secondly, this temperature, besides depending on a chemical process in the plant, varies also according to that of the ground where the roots are. Thus, for example, the heaping of the snow round the deodore will tend to the increase of the temperature of

the whole plant. My belief is that the temperature of the pine is from such causes sufficiently high to melt, as it were, but a film of the snow next its leaves, and thus absorb it. A confirmation of this theory will be found in the way that snow, which has lain on a pine for a short time, will thrust itself home along the lengthy spines till it rests against the branch itself. From all this we gather that these four species of coniferæ, at least, are most excellently adapted, though in quite different ways, for receiving and retaining a share of fit winter provision. We imagine that a human being who had never seen a cedar or a deodore, and yet had conceived them and their special modes of adaptation to snow-catching and bearing, would be thought a person of exceptional intelligence; and yet we are seriously asked to believe that these things have come into existence without thought, guidance or design. Call the process of the production, evolution, growth, creation, what you will, but do not try to persuade sane men that the element of evolution, the conditions of growth, do not as surely imply intelligence and foresight as would the fiats of a Creator.

To attempt duly to extol this noble race of trees would be indeed like trying

"To add a perfume to the violet."

Their beauty is varied, and exceeding, from the less attractive but solemn and impressive yews and cypresses, and the picturesque ever-interesting Scotch fir, to the more clothed and reverend pine, the patriarchal cedar, the haughty affluent wellingtonia, and the refined and lovely deodore. But the spirit of the order is that of aspiration. All its higher members send their shafts straight heavenward without division or divergence. I doubt not the human notions of spire and pagoda came from the pine and the larch respectively. The pine is truly nature's priest, worshipping literally in the high places, gathering its solemn choirs about her mighty hill-altars, and chanting an eternal psalm. (Though I am no philologist, I should be hard to persuade that the very word psalm did not arise from an attempt to reproduce the grave and meditative murmur of wind in a pine forest.) The motto of the tree is "Excelsior," and its forests sweep up the mountain flanks in huge green waves, in serried hosts, as of a gallant army flinging itself indomitably up the steep glacis and against the mighty outworks and bastions that defend the fortresses of the frost and the shining citadels of snow. Like a sane, yet aspiring soul, the pine anchors itself to the solid fundamental rock, and straining upward, with constant purpose, is nourished by the pure skies to which it ever tends, fed with food from the heaven to which it points.

(*To be continued.*)

THE PREPARATION OF SINGLE REGULAR CRYSTALS OF ANY DESIRED SIZE.*

Mr. Ferdinand Meyer, who has for thirty years studied the conditions necessary for obtaining large, single, and regular crystals of chemical salts, has published his method in the *Archiv der Pharmacie*, Oct., 1878, from which we take the following:—

Prepare a solution of any salt in water of such a strength that, after standing twenty-four hours, a portion of the salt will separate in crystals. Pour off the mother-water, select a few of the best-formed crystals, and place them on a plate of glass, which lies in a rather tall vessel. Then re-dissolve a little of the dry salt in a small quantity of the mother water, add this supersaturated solution to the main bulk of the mother water, pour this upon the crystals on the plate of the glass, and place the vessel into a room where the temperature remains as uniform as possible, best in the cellar. The temperature of the room should be ascertained by a thermometer, and in case of any changes of temperature, a further quantity of the salt is to be dissolved in the mother water. This must be repeated every twelve or fourteen hours, until the crystals have reached the desired size. If the solution is too strong, single regular crystals are seldom obtained at once, but this is generally of no consequence, for, as long as one side at least is perfectly formed, it is only necessary to turn them two or three times, to cause the other sides likewise to become perfect. As the crystals increase in size, care must be taken to give them a correct position on the plate of glass; and, if the solution is at all concentrated, the crystals must be carefully freed from adhering irregularities, and then replaced in the solution.

In a solution of alum, a very oblique octoëder is usually obtained first. This may be allowed to reach a considerable size, after which it is to be laid successively on the narrow sides, when it will gradually become a regular octoëder. If it is always kept lying on the broadest sides, it will continue to grow obliquely.

It is well known that several isomorphous salts may be crystallized, one over the other, in layers, without a change of crystalline form. Chrome-alum crystals may thus be covered with crystals of ordinary alum. The largest crystal of this kind obtained by the author weighed over three pounds.

The author also observed that, when employing the same mother water for a considerable time, the crystals began to show blunt or flattened points. This happened with regular as well as with oblique crystals, so that in place of eight surfaces, the regular crystals gradually assumed sixteen equal sides, and the irregular ones, fourteen smaller and two larger sides. If, however, the mother water be acidulated with a little sulphuric acid, this flattening of the points occurs but rarely.

As a general rule, by changing the position of the single crystals of any salt, but particularly of sulphate of zinc, copper, nickel, or magnesium, and of Rochelle salts, different forms of the same system are obtained. If crystals of Rochelle salt, which may easily be obtained of large size, are always placed upon one and the same side, one half of the crystal will become perfectly developed; but if they are laid, alternately, upon the two opposite long surfaces, the development is less regular. On placing large crystals of the same salt, even if only half developed, lengthwise into the liquid, alternately upon either end, development of the lateral surfaces proceeds very regularly.

It is not advisable to introduce crystals into a solution if the latter is at all warm, or to pour a warm solution into a cold one containing crystals, as the latter are thereby generally torn or broken. If a portion of a crystal has been by accident broken off, it may be repaired by subjecting it to the above-detailed process. In a crystal of chrome alum, from which a piece weighing ten grams had been broken off, the gap was completely restored, by subjecting it to the feeding process for a fortnight.

As soon as the crystals have attained the desired size, it is best to place them into less concentrated solutions, in a slightly cooler place; this after-treatment causes the surfaces to become smooth and levelled, and the edges to become sharp.

* From *New Remedies*, January, 1879.

COMPOSITION OF THE MILK OF THE COW TREE.*

(*Brosimum galactodendron.*)

BY M. BOUSSINGAULT.

At a recent meeting of the French Academy of Sciences the author gave some information respecting this remarkable tree and the liquid which it yields. He first made his acquaintance with the "milk" some years since whilst

* *Comptes Rendus*, vol. lxxxvii. p. 277.

engaged in making astronomical observations at the little town of Maracay in Venezuela near lake Tacarigua, where the natives brought in supplies daily to be consumed with coffee or chocolate. He afterwards saw the tree growing abundantly in a forest mentioned by Humboldt near the rapids of Naguanagua, in the neighbourhood of New Valentia.

The liquid, which is obtained by making an incision in the trunk of the tree, is white and viscous, having more consistence than cow's milk, and a slightly acid reaction; when exposed to the air it turns sour and deposits a voluminous coagulum of caseous matter. During the author's stay at Maracay he made some incomplete experiments with the milk, and found in it the following constituents: —(1) A fatty substance resembling beeswax, fusible at 50°C., partly saponifiable, very soluble in ether, slightly soluble in boiling alcohol. This was probably a mixture of several substances, and acquired after melting and cooling the appearance of virgin wax. It was used to make candles. (2) A nitrogenous substance analogous in its fibrous structure to cascin, and recalling the vegetable fibrin observed by Vauquelin in the juice of *Carica papaya*. (3) Saccharine matters, the nature of which was not further determined. (4) Salts of potash, lime and magnesia, including phosphates. The quantity of fixed matters were estimated at 40 per cent. of the milk.

Recently the author has had the opportunity of making a more thorough examination of some "milk" sent in bottles to the French Exhibition by the Venezuelan Government. In 100 parts of extract of the milky juice obtained in conditions where it had not undergone fermentation were found:—

Wax, Fatty Matters.	84·10
Inverted Sugar.	2·00
Non-invertable Sugar.	1·40
Gum, easily saccharifiable.	3·15
Casein and Albumen.	4·00
Alkaline Ash and Phosphates.	1·10
Undetermined Non-nitrogenous Substances	4·25
	100·00

Calculated to 100 parts of juice containing 42 parts of fixed matter there was:—

Wax and Saponifiable Matters. . . .		35·2
Saccharine and Analogous Substances. .		2·8
Casein and Albumen.	1·7	4·0
Alkaline Earths and Phosphates. .	0·5	
Undetermined Substances. . . .	1·8	
Water.		58·0
		100·0

The vegetable approaches cow's milk in its composition, in that it contains a fatty body, saccharine matters, casein, albumen and phosphates. But these substances are present in very different proportions; the total amount of fixed substances is three times larger than in cow's milk; in fact the vegetable milk is comparable rather to cream, as is shown by the following representing an analysis of fresh cream by Jeannier:—

Butter.	34·3
Milk Sugar.	4·0
Casein and Phospl ates	3·5
Water	58·2
	100·0

Thus the butter in cream is present in nearly the same proportion as the waxy matter in the milk of *Brosimum galactodendron*. This analogy explains the nutritive value attributed to the vegetable milk, or rather cream, since, according to Claude Bernard fatty matters susceptible of being split up into acids and glycerine are assimilable.

HYDROBROMIC ETHER, OR ETHYL BROMIDE.*

The method of de Vrij for preparing this ether, which will be described below, has been taken exception to by various observers, because it was found to produce some by-products which could not be readily removed; but some recent improvements of the process appear to have removed almost, if not entirely, this objection. The process is particularly well suited to the manufacture on a large scale, while for small operations, Professor J. P. Remington's process (see *Proc. Am. Pharm. Assoc.*, 1877, 454) is probably preferable.

De Vrij's process depends upon the reaction of ethylsulphuric (or sulphovinic) acid upon bromide of sodium or potassium:—

$$C_2H_5HSO_4 + KBr = C_2H_5Br + KHSO_4$$

ethylsulphuric acid + potassium bromide = ethyl bromide + acid potassium sulphate.

The ethylsulphuric acid is prepared by adding to one volume of 95 per cent. alcohol, contained in a leaden vessel, an equal volume of sulphuric acid (sp. gr. 1·830), in a constant gentle stream, and under continuous stirring. The quicker the mixture is made—avoiding, however, accidents from overheating, etc.—the larger will be the yield of ethylsulphuric acid. After standing for some time, the mixture is diluted with one-fifth to one-fourth of its weight of water. The addition of the latter is necessary to obtain ample yield; otherwise a large quantity of ether and free hydrobromic acid will afterwards be found in the distillate. The operation of preparing the ether may be conducted as follows:—

Into a boiler, of about thirty-four inches height and thirty-six inches diameter, lined with lead, and either set in brickwork or provided with a steam chamber, one hundred pounds of potassium bromide are introduced; a leaden lid, containing two tubulures, is hermetically fastened upon it, and a mixture prepared, as above directed, from one hundred pounds of 95 per cent. alcohol and two hundred pounds of sulphuric acid (which make about equal volumes), diluted with thirty pounds of water, is poured through one or the tubulures, which is then closed with a rubber-stopper, carrying a long thermometer. From the other tubulure arises a leaden delivery-tube, which passes through a *well-cooled* condenser. If the boiler is heated by a fire, the fire-hearth had better be constructed on the outside of the building containing the apparatus and condenser. If steam is used, it must have a tension of at least seventy-five pounds, as the temperature, towards the end of the operation, must be raised to, and kept for some time at, 130° C. (=266° F.). The reaction begins already at 90° C. (=194° F.); towards the end it requires a temperature of 125–130 C.° (=257–266° F.). It is remarkable that bromide of sodium requires 10 degrees more of heat than bromide of potassium before the reaction begins.

The resulting distillate is caught in stone-jars, which are completely filled with cold water; the hydrobromic ether sinks to the bottom, and displaces a corresponding amount of water over the rim into the tub in which the jar is placed. These jars are frequently changed, care being taken to have as high a layer of water on the ether as possible, because the contaminating by-products of alcohol, ether, and free acid are thereby washed out. In proportion as these are removed, the solubility of the hydrobromic ether in water diminishes until it becomes insignificant.

This process, carefully worked, will yield in practice very nearly the theoretical quantity of hydrobromic ether of 1·300 to 1·350 spec. grav., and of satisfactory purity.

MILK OF SULPHUR.

IN the trial of the cases of prosecution under the Food and Drugs Act, reported in last week's Journal, evidence is again furnished of the tendency of public analysts to exceed their proper functions in a manner that we have already pointed out to be undesirable for the public benefit, as well as making the operation of the Act unnecessarily harsh in regard to the vendors of certain articles. In two of the cases referred to ordinary sublimed sulphur was supplied when milk of sulphur was asked for, and while in one of these cases, where the seller of the article was a grocer, his probable ignorance of the difference between milk of sulphur and sublimed sulphur was admitted by the magistrates as a reason for acquitting him of an infringement of the Act, the chemist who, in the other case, did the same thing was fined twenty shillings on the ground that he was to be assumed to have known the difference.

In the case of Mr. MARTIN, who supplied as milk of sulphur the old-fashioned preparation containing sulphate of lime, it was decided that no infringement of the Act had been committed, and that the article sold was that demanded by the purchaser. This decision of the magistrates was, however, opposed to the views of the public analyst, at whose instigation it appeared these prosecutions had been instituted. The result of his analysis showed that the article sold contained sulphate of lime, and therefore it was contended to have been an adulterated article, since in the opinion of the analyst milk of sulphur ought not to contain any lime and since according to his view milk of sulphur and precipitated sulphur should be synonymous terms.

One of the magistrates, who appears to have been a medical man, mentioned the circumstance that medical authorities dating back for more than a century recognized lime as a component part of milk of sulphur, and he expressed the opinion that such a preparation was preferable to the precipitated sulphur of the present Pharmacopœia, stating at the same time that many other medical men thought the same.

It is evident from the evidence given by the public analyst in these cases that he had formed the opinion that the term "milk of sulphur" necessarily means precipitated sulphur, and that it was this opinion that induced him to suggest that the grocers and chemists of Guildford should be called upon and asked for milk of sulphur for examination.

It is this kind of action on the part of public analysts that we take objection to, inasmuch as it is no part of their duty to volunteer decisions as to what is to be understood by such terms as "milk of sulphur," and in causing prosecutions to be instituted on such speculative grounds they are merely making themselves oppressive to tradesmen without due cause.

After what has been made public with regard to the particular article in question in these cases it is quite time that public analysts should have recognized the fact that though some people insist the term "milk of sulphur" ought to be understood as meaning the precipitated sulphur of the Pharmacopœia, such a view is not universally accepted by authorities on the subject. The term "milk of sulphur" is not used in the Pharmacopœia to indicate precipitated sulphur, and though this latter preparation is official it does not supersede the older and, it may be said, the more familiar preparation, as well as the one more approved by many. This fact that many persons prefer the preparation containing sulphate of lime is indeed the most cogent reason that can be urged for the perfect legitimacy of its sale when milk of sulphur is asked for, and we think that the supply of precipitated sulphur in such a case would be in reality an infringement of the Food and Drugs Act, since that is certainly not of the nature, substance and quality of the article which would be demanded by very many persons asking for milk of sulphur.

We would therefore suggest to public analysts that it is unwise on their part to persist in the attempt to maintain a doctrinaire view of this matter and to continue to harass chemists and druggists or others with prosecutions founded upon such fallacious grounds. Not long since, the President of the Society of Public Analysts complained that members of that body were "often abused as prosecutors," and he spoke of this treatment as a hardship inflicted upon them, but we cannot agree with this opinion when we see instances where public analysts assume to instigate and suggest prosecutions in such cases as the sale of milk of sulphur, and we think the hardship complained of might be most effectually removed by recommending public analysts to confine themselves more carefully to the efficient performance of their proper duties.

CHEMISTS' ASSISTANTS' ASSOCIATION.

ON Wednesday evening, February 19, at the meeting of the above Association, at its rooms, 32A, George Street, Hanover Square, Dr. STOCKER will give a lecture on "Vision."

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, February 5, 1879.

Present—Charles R. C. Tichborne, LL.D., Ph.D., President; Dr. Aquilla Smith, Vice-President; Sir George Owens, M.D., Dr. Collins, Messrs. Allen, Bennett, (Kingstown), Boileau, Brunker, Goodwin, Hayes, Hodgson, Holmes, Payne (Belfast), Simpson, Whitla (Monaghan).

The minutes of the meeting held on January 1 were read and signed.

Read a letter from the Editor of the *Pharmaceutical Journal*, enclosing copy of one from the Secretary of the Pharmaceutical Society of Great Britain.

Proposed by Dr. A. Smith, seconded by Mr. Payne, and resolved—

"That the following resolution passed by this Council at the December meeting of last year be rescinded, viz.: 'That members be supplied with either the *Pharmaceutical Journal* or *Chemist and Druggist*.'"

Proposed by Mr. Payne, seconded by Mr. Bennett, and resolved—

"That the Journal of the Pharmaceutical Society of Great Britain be supplied to all members of this Society who have paid their subscriptions, and that the thanks of the President and members of Council of the Pharmaceutical Society of Ireland be, and are hereby, tendered to the President and members of Council of the Pharmaceutical Society of Great Britain, for having unanimously agreed to the request of this Council to supply their Journal at reduced terms."

Read a letter from Mr. Michael H. Macnamara, of Tuam, requesting to be admitted to the Preliminary and Final examinations at the same time, and at an early date. The Registrar was instructed to inform him that he can only be admitted on conforming to the regulations.

Read a letter from Mr. W. J. Madden, of Belfast, inquiring whether two years' compounding with a pharmaceutical chemist in England would fulfil the requirements of this Society, from an intending candidate. Resolved—

"That Mr. Madden be informed that the Council will take the subject of his letter into consideration, and send him a reply."

Read a letter from Mr. Joseph H. Ridge, of Parsonstown, inquiring whether the Council would accept, as evidence of compounding, the certificate of a deceased apothecary. Resolved—

"That the said certificate be accepted, on Mr. Ridge making a statutory declaration that it is genuine."

Read a letter from Dr. Drinkwater, lecturer on chemistry in the Edinburgh medical school, requesting that his certificate in practical chemistry be recognized by this Society, under the new rule. Resolved—

"That Dr. Drinkwater be informed that the resolution adopted by the Council does not at present recognize any schools out of Ireland."

Read a letter from Mr. James D. Carre, of Belfast, requesting the Council to recognize the lectures on chemistry, etc., delivered to the science classes throughout Ireland, in connection with the Science and Art Department, as fulfilling the requirements of the new regulation.

The Registrar was directed to inform Mr. Carre that his request cannot be acceded to.

Proposed by Mr. Brunker, seconded by Mr. Simpson, and resolved—

"That, in pursuance of the resolution passed at last meeting, the Registrar be directed to communicate with the authorities of the various chemical schools named, informing them that their certificates will henceforth be accepted for a course of not less than three months' duration, with a compulsory attendance of at least three-fourths of the working days."

The report of the examination for pharmaceutical chemists, held on January 2, and of the Preliminary examinations, held on January 6 and 7, were laid on the table. The following passed as pharmaceutical chemists:—

John Hely, Cappoquin, Co. Waterford.
Thomas Martin Keown, Monaghan.

Fourteen candidates passed the Preliminary examination and four were rejected.

Alexander John Paterson, 33, Lower Buckingham Street, Dublin, who was proposed and seconded at the January meeting by Mr. Simpson and Mr. Hodgson, was elected a member.

Some bills for printing and other necessary expenses were laid on the table and ordered to be paid.

HUGH JAMES FENNELL,
February 11, 1879. *Registrar.*

Provincial Transactions.

LEICESTER CHEMISTS' ASSISTANTS AND APPRENTICES' ASSOCIATION.

The half-yearly meeting of the members of this Association was held at the rooms, Halford Street, on Thursday, January 30, 1879. The report, which was unanimously adopted, stated that the attendance of members in the early part of the session had been good, but that it had fallen off during the last few weeks, partly owing to some of the members attending the science and art classes of the town.

An arrangement had been made with Mr. W. J. Harrison, F.G.S., to hold a botany class in the rooms of the Association, in connection with the Government Science and Art Department. This class is held at a late hour (9.15 p.m.) to enable members in retail shops to attend. The attendance has been good, and it is hoped that more members will avail themselves of the advantages offered by this class.

Thanks were tendered to the gentlemen who have delivered lectures during the session. Also to the Pharmaceutical Society for the Journal, and for a large and interesting collection of materia medica and botanical specimens, and to other donors. The number of honorary members is 21, and of ordinary members 21.

After the transaction of routine business the members proceeded to elect the Committee for the ensuing session, with the following result:—

Mr. C. T. Raynor, President; Mr. W. S. H. Brampton, Vice-President; Mr. S. F. Burford, honorary secretary; Mr. W. B. Clark, treasurer; Messrs. J. J. Edwards, C. B. Lomas and W. Thirlby.

The Treasurer's report showed a balance in hand of £7 12*s*.

On Thursday, February 6, a meeting of the Association was held, when the President, Mr. C. T. Raynor, delivered the following address:—

"I have again to thank you for having elected me as your President. It is usual for your President to say a few words to you at the opening of the new session. The time, however, between the election of officers and the presidential address is so very short, that it is a difficult point to prepare a suitable address, or even to fix upon a subject. I came to the conclusion that a few words upon pharmaceutical education would be a very appropriate subject.

"It was about thirty-six years ago that the Pharmaceutical Society of Great Britain was founded for the purpose of advancing pharmaceutical education, and forming a uniform system of the education required by

those who practise pharmacy. It was in 1852 that an Act of Parliament was passed to legalize the title of pharmaceutical chemist, and another in 1868 to retain the title of chemist and druggist for those only whose education was sufficient to stand the test of an examination. Those chemists and druggists who were in business at the time of the Act passing were allowed to retain the title without passing the examination, and those persons not in business at the time of the Act passing, but being above twenty-one years of age, were allowed the privilege of passing a Modified examination. All this was required for the safety of the general public, who admitted and recognized the importance of a pharmaceutical education measured by examination. By these means the standard of the trade has been raised, but at the present we have only a very mixed body of men, many of these being far from what we aim at, or what a chemist and druggist should be.

"Compulsory examination being the law, we must consider the means of education within the reach of the young pharmaceutical chemist. A few of the Pharmaceutical Society are anxious that sound education should be provided for the young men who are legally compelled to pass the Minor examination before they can be styled chemists and druggists. The majority of the young men endeavour to obtain only a sufficient amount of information to enable them to pass.

"In looking through the back numbers of the *Pharmaceutical Journal* we find many different schemes upon education. That of Mr. Schacht seemed to be the most elaborate. It was based upon a similar footing to the Science and Art Department of the Government, viz., formation of local associations, and, having formed classes, holding examinations of the members and making money grants upon the results; also giving prizes to the successful members. Much discussion arose both for and against this scheme. Some said, why pay or bribe young men to do that which is beneficial to them? We may as well expect to conduct ordinary schools without giving prizes or holding out some inducement to encourage students to do their best. Many of our young chemists have nothing to live upon but what they earn, so that we cannot expect many of them to be able to get six months' study in London; and again, after being engaged in business all day and in many cases most evenings in the week, it is very hard to give up the little time at the young men's disposal to close study. Very few are able to take hold of subjects they know nothing about without the assistance of a friend who has overcome the subject. One writer stated in a letter that experience had taught him that nine months' study in a small country village with but self help would enable any one with ease to pass the Minor with honours. If all young men were like this one, what a small amount of money would be expended in education, and what little work our examiners would have, when candidates passed the first time, instead of going up several times, and perhaps having to leave the trade through not being able to pass.

"In conclusion, I must say a few words on behalf of this Association. It has lived now for ten years, and has done very good work in the past, and through the migrating propensities of chemists' assistants a very large number have passed through it, every session bringing and losing members. I would ask of you that want assistance in your studies to join us, and also those more advanced to join also, and assist their fellow students with a sufficient knowledge to instil into them a desire for more. We have numerous evidences around us in this room to tell us what persevering energy has been displayed by past members. The cases containing a valuable and numerous collection of materia medica specimens, books, microscope, etc., share the constant though gradual growth of the Association. We are greatly indebted to the honorary members in the town, and also to the Pharmaceutical Society, for without the pecuniary aid they have afforded us we should not be in the state we now show."

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, February 6; Dr. Gladstone, President, in the chair.

After the announcement of visitors, the minutes of the previous meeting were read and confirmed.

The Treasurer, Dr. Russell, then announced that he had received a bequest of £1000 from the executors of the late Mr. Sidney Ellis, of Nottingham.

The following certificates were read for the first time:—A. W. Stokes, T. L. Teed, C. H. Hutchinson, G. Rait, W. Stone. T. Griffiths, W. Palmer.

During the meeting the following gentlemen were ballotted for, and declared duly elected Fellows of the Society:—F. R. Japp, C. F. Cross, H. Wilson, C. E. Cassel, A. E. Menke, J. J. Broadbent, E. A. Letts, E. H. Rennie, W. Stevenson, S. Spencer, C. W. Smith, A. J. G. Lowe, T. Gough, R. Gracey, and P. P. Bedson.

The President said that it was scarcely necessary to remind the Fellows that the discussion on Dr. Tidy's paper had been adjourned to this evening, and that it was his duty to preside over the champions of the three processes for determining the organic matter in potable waters, and to see, if he might be allowed the expression, that the lists were clear, and the fight was fair. The question to be discussed that evening was that of the relative merit of the processes, and there was the question behind, viz., how far these processes disclosed whether a water is fit to drink or not. It was one thing to determine the carbon and nitrogen, and quite another to decide whether such quantities so detected were hurtful or not. He should like to mention that two curves, which formed part of Professor Tidy's paper, had not been published with the letterpress, on account of the delay which had arisen during some corrections. The curves would be published in the forthcoming number. He would call on Mr. Riley, as he moved the adjournment, to open the discussion; Mr. Riley, however, not being present,

Dr. Frankland opened the discussion. Though quite aware that the discussion must be based on the feasibility and practicability of the processes, he hoped that it would be as slightly combative in its nature as possible, and he did not think that the author had brought it forward at all in that spirit. He had heard and read the paper with great pleasure, both for the philosophical spirit in which it was conceived, and for the conscientious work which it contained, and though he could not agree with the author on all points, he thought that when a man attacked a subject in this way, he was entitled to great credit and consideration, and the Society was much indebted to the author for the lucidity with which he had stated his views, and the manliness with which he had renounced several of his former opinions, after stating his reasons for so doing. The author had moulded his paper on a technical application of chemistry, and he trusted that in criticizing some points in the paper he should not be misunderstood as wishing to imply that the paper was not an exceedingly valuable and satisfactory production. Professor Tidy started with a statement of the advantage of estimating the organic matter in the water itself, instead of in the residue. In that statement every one would agree with him, and if they could devise a satisfactory process it would be superior to all others. No such process was known, so they must resort to the water residue for information as to the organic impurities. Dr. Frankland also agreed with the author as to the, at all events, great variety in the organic matter present in water, and that most of the organic matter was innocuous, and might be taken with impunity for any length of time. He did not agree with the strictures on the process of evaporation. All chemists knew that certain volatile organic matters may be dissipated, and others changed more or less during evaporation; but he did not think that any carbon

and nitrogen would thus escape determination in the residue, and he must dissent strongly from one suggestion made by the author, *i.e.*, that particles of organic carbon might be mechanically removed. From extensive experiments he had proved that the disengagement of vapour or gas was necessary for any mechanical loss of liquid; in fact, ordinary chemical operations would become impossible if fixed salts were lost by evaporation, and there would be an end to all accurate determinations. In the author's criticism on the combustion process it is suggested that the poisonous constituents of sewage are of a highly volatile nature (*Chem. Soc. Journ.*, Jan., 1879, p. 53). This can hardly be meant seriously, as on the same page it is stated "that the evils arise probably from invisible particles, germs, or whatever else you like to call them." Now, no germ can be conceived of as a liquid, still less as a gas, for a germ must be an egg, which is capable of propagating its own species, and this could hardly be if it were a volatile body, like hydrocyanic acid or arseniuretted hydrogen. Some remarks were made as to the great danger of oxidation, and Professor Tidy suggests that, notwithstanding the sulphurous acid, oxidation may be possible, and so organic matter be lost. Now, unless oxidation goes on to the full extent of converting carbon into carbonic acid, and nitrogen into nitric acid, substances would be formed on oxidation which would be probably less volatile, and so the danger of loss would be diminished rather than increased, and this extreme oxidation is not likely to take place in an atmosphere of sulphurous acid, when it can hardly be effected with potassic permanganate. As regards the estimation of the disease-producing matter, Dr. Frankland quite agreed with the author in the conclusion that chemistry is entirely powerless. Professor Tidy's failure in the reduction of large quantities of nitrates was due to his not quite following the directions, and to his not using enough sulphurous acid; moreover, the difficulty was more imaginary than real, as a water containing such a quantity of nitrates must come from a sewer or a cesspool, and can be rejected at once as unfit to drink. As to the difficulty of obtaining pure cupric oxide, Dr. Frankland at first used to make it by oxidizing thin sheet copper in a muffle, but during the last eight or nine years he had obtained roasted copper ore (for making copper sulphate) from Tennant and Co., London Road, Manchester, in quantities of a hundredweight, and this at first sight—crude product—after treating it in an iron tube in a Hoffmann combustion furnace, is everything that can be desired for water analysis. Professor Tidy had generously stated that after a long experience he was quite satisfied with the carbon determination, but still had doubts as to the nitrogen estimation. Dr. Frankland pointed out that the occlusion of nitrogen could hardly be the cause of inaccuracy. He then passed on to the portion of the paper which treated of the albumenoid ammonia process, and on this he touched but slightly, because one of the authors of the process was in the room and would probably himself give his experience to the Society. As regards the main question, *i.e.*, is a water wholesome or not? Dr. Frankland believed that the albumenoid ammonia process does not give us a satisfactory answer; it condemns, for instance, peaty matter, while it acquits urea and uric acid. Professor Tidy had performed a great service in bringing the results of the oxygen, the albumenoid ammonia, and the combustion processes fairly together. Looking at the results obtained by the albumenoid ammonia process, could it be believed that in 1876 the water supplied by the Chelsea Company was safe in January, dirty in March and August, safe in November, and of extreme purity in December, when the water supplied by three other companies, though drawn from the same source, was pronounced dirty; again, floods are known to make river waters dirty, yet during the flood season the albumenoid ammonia curve pursues the even tenor of its way quite regardless of floods. Professor Tidy had suggested that his (Dr. Frankland's) want of faith in the oxygen process was due to the way in which he used it. There is not much difference in the two methods, but, on the whole, the method given by Professor Tidy was preferable; it was, however, extremely doubtful whether everything capable of oxidation is oxidized. (Professor Tidy subsequently explained that his meaning was everything capable of oxidation by permanganate). The paper contained some important results as to the influence of mineral salts on the permanganate test; sulphuretted hydrogen and ferrous salts present no difficulties. Nitrites, however, in his (Dr. Frankland's) opinion, offer formidable obstacles which he does not think Professor Tidy has overcome, by noting the amount of permanganate used during a few minutes; because some organic matters are also rapidly oxidized, and although this objection had not so much force in objectionable matters, it became serious in the case of pure deep well waters and spring waters which sometimes contain nitrites. To this presence of nitrites Dr. Frankland is disposed to attribute the discrepancy which exists between the numbers obtained by the oxygen and combustion processes when applied to the Kent Company's water, which water is believed to contain, when first pumped up, some nitrites; at all events, the water requires nearly three times as much permanganate when freshly pumped as it does after standing two or three days, whilst it can be shaken for a month with air without altering the quantity of organic carbon. Dr. Frankland then pointed out how erratic the results of the oxygen process were in the case of the Kent Company's water, whilst the results with the other companies' water agreed well with those obtained by the combustion process. At page 78, *loc. cit.*, it is stated, "that the oxygen used affords the most positive evidence of the relative quantity of matters likely to be injurious." Where was the evidence of this fact beyond dispute? If it could be produced the oxygen process would be placed on an indisputably firm basis; as a matter of fact, no known process can distinguish the hurtful from the harmless constituents. Water analysis can take account of starch, cane-sugar, gelatine, urea, uric acid, etc. Professor Tidy asserts these substances to be quite innocuous, but how do they get into potable waters? There is a sufficient observance of the maxim "waste not, want not," to prevent such substances being thrown into streams; they passed first through the alimentary canal before reaching the stream, and would Professor Tidy say that such substances as gum, gelatine, sugar, having passed through the alimentary canal may not be contaminated with the potentials of disease, or that they are as harmless as when they leave the grocer's shop? At page 79, it is said that, "in the case of the London waters the amount of oxygen × 8 gives very nearly the actual quantity of organic matter present." Would Professor Tidy mention the experiments which prove this statement? There is no method known by which the actual quantity of organic matter can be even approximately determined; if the author is acquainted with it why does he not describe it? Such a process would sweep the oxygen, the albumenoid ammonia and the combustion processes into oblivion. Dr. Frankland then considered the colour test as used by Professor Tidy; from his experience which was not so extensive as that of the author, this colour test seemed to be chiefly valuable from an æsthetic point of view. No one would drink water which appeared coloured in a quart decanter. A layer of the purest water in a tube fifteen feet long exhibits a blueish green tint; but a small minority of organic substances is coloured, whilst urea, uric acid, etc., are quite colourless. Professor Tidy says the tint is to some extent an indication of the quality, and the tint depth of the quantity of organic matter present, but they were unaware of the grounds on which this assertion is used. The spectroscope might at this point afford some help, and thus, perhaps, the tints given to water by urine and peat be differentiated. From Dr. Frankland's experience waters may contain much organic matter and yet be but little coloured.

This was especially the case with water which had been agitated with finely divided mineral matter, such as the water from the "stamps" in mining districts. Such a colourless water may contain ·544 parts of organic carbon in 100,000. Even in peaty waters the quantity of peat cannot be estimated from the colour, because some specimens of peat, such as Welsh peat, colour waters more intensely than other peats, such as the Cumberland peat. In 999 cases, however, out of 1000, a water might be pronounced to be of great purity if in a two feet tube it exhibited either no colour or only a bluish-green tint, but the estimation of the carbon by the tint depth must be deprecated, and on the whole a quart decanter was to be preferred to a 2-ft. tube, and it is to some extent a libel on a water to pronounce it coloured because it is so when viewed through a 2-ft. tube, whilst it is colourless in a quart decanter. Dr. Frankland cordially agreed with Professor Tidy's comments on the curves, on page 90, and also with his opinion, on page 91, that a water should be judged as a whole, and he pointed out the minuteness and thoroughness of the author's analyses which were well worthy of imitation, especially as regards the mineral constituents. He would venture to modify the division into four classes by making a more liberal scale for upland surface waters, which may contain peaty matters, and a stricter scale for spring and well waters; he should propose for upland surface waters a 1st class not exceeding ·2 parts of organic carbon per 100·000; 2nd class, ·2 to ·4; 3rd, ·4 to ·6; 4th, ·6 and upwards. For other waters, 1st class less than ·1; 2nd class, ·1 to ·2; 3rd class, ·2 to ·4; 4th class, ·4 and upwards. The translation of the quantity of oxygen used into the quantity of carbon, as determined by combustion, requires further consideration. Still there was a marvellous coincidence, especially with the London waters, and the oxygen process could be strongly recommended to all who shirk the labour requisite for the combustion process as a rough-and-ready method which rarely leads astray; but where the quality of the water is of the utmost importance in its relation to the health of large communities, the organic carbon and nitrogen should never be left undetermined. The curves lend great support to the oxygen process. The striking coincidence between the results of the oxygen and combustion processes was first noticed by Mr. Grosjean, and the similarity had been displayed most remarkably by Professor Tidy. Dr. Frankland then pointed out that the factor by which the oxygen used had to be multiplied in order to give the quantity of organic carbon was, in the Lambeth Company's water, 1·64, Grand Junction, 1·65, Southwark, 1·64, New River, 1·55, East London, 1·85, Kent, 5·1, other waters, 6·9, 1·8, 4·0, ·57 and 4·5. So that they could not accept Professor Tidy's suggestion that the results of the oxygen process are unerring indications of the quality of a water. Still, Dr. Frankland had hopes that it might be considerably improved in that respect. In conclusion, he congratulated the author on the addition he had made to the literature of the subject and on the clearness with which he had expressed his views. The comparative tables were of the greatest value, and should be most carefully studied by all chemists, as well as the paper in which the rocks to be avoided were so clearly shown "that he who runs may read."

At the conclusion of Dr. Frankland's address a general wish was expressed to hear Mr. Wanklyn, who made the following remarks: Unfortunately he was not able to take so favourable a view of the paper as Dr. Frankland. He would restrict himself to the subject of the paper and hardly say anything about the paper itself. He believed that he was not bound to notice the paper, and should therefore deal with the subject of it. One of the subjects was the controversy between Dr. Frankland and himself, which commenced in 1867, in the pages of a journal no longer published—*The Laboratory*—and as long ago as that date Chapman, Smith and himself directed attention to the cardinal defect of the combustion process, and this defect had never been overcome; it was this, that the organic matter in the water does not survive the evaporation to dryness. This may be doubted; but consider what the organic matter. There was modified cellulose, which is very sensitive to the action of dilute acids; *e. g.*, in a few seconds a solution of cane-sugar, when heated with dilute sulphuric, becomes converted into grape-sugar so as to reduce the copper test; if once cellulose gets into the plastic condition it does not need oxidation to break it up. If the organic matter of the residue is not that of the water it is plain that the process is not valid; this consideration and the practical difficulty of the process have prevented Mr. Wanklyn from making many water analyses by the combustion method. Dr. Frankland said that he would be content if he had a process to burn up the organic matter in the water itself. Messrs. Cooper and Wanklyn had invented such a process and had burned up substances in solution. The results obtained were interesting. The actual organic matter present in the London Companies' waters does not exceed two and a half milligrammes per litre. Dr. Frankland had found 3·99 milligrammes per litre as a mean of many experiments in his paper; the quantity really does not exceed two and a half. After this discrepancy comment on the process was needless.

Mr. Kingzett said that with regard to the occlusion of nitrogen by copper, Thudichum and himself had shown that copper prepared from the nitrate is quite free from nitrogen. Professor Tidy's experiments, on p. 78, proved that permanganate practically did not act on gelatine; as albumenoids were admitted to be dangerous by all, this fact was a stumbling block to the process, as it overlooked albumenoids.

Professor Bischof said that Dr. Frankland's reply had been so exhaustive that he would confine himself to a few remarks. Though all agreed that it would be preferable to estimate the organic matter in water, yet it must be recollected that by evaporating the water the organic matter was concentrated, and so could be estimated with even more accuracy than in the water itself. He asked Professor Tidy whether he had made any experiments by condensing the vapour given off, during the evaporation of water for an analysis, which proved that a loss of organic matter had taken place, so as to be able to say the oxygen process had detected so much volatile matter in the distillate. His plan of evaporating water prevented to a great extent the destruction of organic matter, because it avoided the frequent alternate exposures to hot water and air. Could Professor Tidy detect by the oxygen process any difference between milk infected, say with typhoid and scarlet fever, and the same milk not so infected? He would like to know the precise meaning attached by Professor Tidy in his reports of the London waters to the words "efficiently filtered," also why Professor Tidy continued to use the ammonia method in his reports to the Medical Officers of Health when he had admitted that the results of that method are unsatisfactory? In conclusion he would submit to the President the figures obtained by Professor Tidy and Dr. Whitmore, both using the albumenoid ammonia method in their analyses of the West Middlesex and Grand Junction waters, figures which differed by nearly 100 per cent., and ask if Mr. Wanklyn, or any one else could account for this discrepancy.

Mr. Wanklyn remarked that he had never had any difficulty in obtaining his alkaline permanganate free from ammonia, and could not tell what results might be arrived at by using impure solutions of permanganate and allowing for the impurity; it was also very important that chemists should be trained in a correct manner.

Dr. Voelcker said that an impartial observer would come to the conclusion that all methods were more or less defective, and some gave very erroneous results. He would most earnestly urge the importance of determining all the constituents of a water, organic and inorganic, and not founding an opinion on one factor.

Mr. Grosjean said that all must have recognized the

great advantage of having a paper printed before it was discussed, and trusted that it would form a precedent, and ultimately the rule. Professor Tidy did not seem to have standardized his permanganate, but had apparently assumed it to be pure. It was usually standardized, and hence probably the origin of the multiplication of the oxygen used by 8, as the equivalent of oxygen × 8 = nearly the equivalent of oxalic acid. The commencement of the action of permanganate on oxalic acid is characterized by a tardiness which was explained by Vernon Harcourt, *Chem. Soc. Jour.*, 1867.

Dr. Dupré protested against the assumption that a chemist who used the albumenoid ammonia process did so to shirk the trouble of the combustion process, and moreover did not see why the time, expense, and trouble of a process should not have a certain weight. He had used both the ammonia and the permanganate processes, and found the results fairly concordant, however, with strange exceptions now and then. He had not had any difficulty in preparing alkaline permanganate solution free from ammonia. He gave as an instance of concordant results obtained by the ammonia process, the results obtained by six chemists in examining 249 waters; of these 66 were first class waters, and all agreed that 64 were first class waters, and 2 second class; 60 were second class waters, and all agreed that 53 were second class, 6 first class, 1 third class; 123 were cistern waters, and 6 were put in the first class, 81 in second class, and 36 in the third class.

Mr. W. Thorp asked Professor Tidy what his conception was as to the nature of the organic impurity, as he had compared it to hydrocyanic acid, etc. He did not think that any free sulphuric acid was likely to be formed during the evaporation, as the carbonates present would be more than sufficient to neutralize any that might be formed. If there was any chance of such an occurrence, it might be avoided by the addition of a little pure sulphate of sodium. He did not think that Professor Tidy had done justice to nesslerizing, when in work his (Mr. Thorp's) error in estimating tints was only 3 per cent. Railway men were not accustomed to judge minute differences and so their arrangement of nessler tints was by no means a fair experiment. He thought great difficulty would be experienced in applying the oxygen process to waters containing nitrites, moreover, some waters containing no nitrites rapidly reduced permanganate. He did not place much reliance on the colour of a water.

Dr. Hake remarked that when copper was cooled in CO_2 no occlusion took place.

Professor Tidy thanked the Fellows for the kind manner in which they had received his paper, and expressed his satisfaction at having provoked such an interesting discussion. He had concluded that the poison in water was volatile from analogy, because when it did act it was very virulent, and virulency and volatility usually go together. He relied on the colour of a water more as a useful adjunct to the results obtained by analysis. In the Thames water the oxygen used × 8 gives the difference very nearly between the inorganic salts and the total residue.

The warmest thanks of a crowded meeting were carried by acclamation and tendered to Proferror Tidy for his paper.

The Society then adjourned to February 20, when the following papers will be read.—Investigations into the Action of Substances in the Nascent and Occluded Conditions, Hydrogen continued, by Dr. Gladstone and Mr. Tribe. On some methods of Vapour Density Determination, by J. V. Brown. On the Quantitative Blowpipe Assay of Mercury, by G. Attwood.

EDINBURGH UNIVERSITY CHEMICAL SOCIETY.

A meeting of this Society was held on January 29, 1879, Mr. Alexander Macfarlane, D.Sc., F.R.S.E., in the chair.

A paper was read by Mr. J. S. Thomson on "Paraffin, and what is got from it, as illustrated by Exhibits at the Paris Exhibition of 1878." A full account was given of the modes of preparation of these exhibits, which consisted of specimens of all the commercial products of the Addiewill Chemical Works. These included naphtha, burning oils, lubricating oils, solid paraffin in blocks weighing not less than seven hundredweight each, sulphate of ammonia, and candles of various kinds made from the paraffin wax. The methods of preparation of other products of paraffin was also explained, of normal paraffins alkaline bases of the leucoline series found in the acid tars, phenols and analogous bodies found in the soda tars, chrysine and paraffins of various melting points from 21° C. to 65·5° C.

Parliamentary and Law Proceedings.

Poisoning by Carbolic Acid.

Another case of poisoning by carbolic acid that had been served out instead of an aperient medicine is reported from Ryde. The deceased was a seaman on board the brigantine Standard. The evidence showed that the ship's stores of black draught and carbolic acid were kept in jars in the same locker, the label on the carbolic acid being nearly defaced, and that the steward who was not aware of the presence of the poison, gave deceased a dose of the acid instead of black draught.

The jury found a verdict that deceased had been accidentally poisoned, and recommended the captain to be more careful in keeping poison apart from other mixtures.

Prosecutions under the Pharmacy Act.

At Lincoln (Lindsey) County Petty Sessions, on Friday, Feb. 7, Lord Monson and a full bench of magistrates investigated a number of charges preferred by the police against village grocers and general dealers of selling laudanum and vermin killers, contrary to the provisions of the Phrmaacy Act, 1868. It was proved by different police officers that they had purchased various quantities of laudanum and packets of "Battle's Vermin Killer"—the former without the poison label being put on the bottle containing it, and the latter without the name and address of the person selling it being printed on the packet.

Inspector Taylor said that no trader, unless he was a registered chemist, could, under the Pharmacy Act, retail the poisons contained in the schedule.

The line of defence adopted by the defendants was ignorance of the state of the law, and the assertion that they thought they were doing right because their parents had done so before them. In one case the defendant said his father had kept shop for fifty years and had sold the laudanum.

Lord Monson told the defendant that what might be right before the year 1868 ceased to be so afterwards, because in that year a very stringent Act was passed, which declared that poisons should not be sold unless they were properly labelled.

Inspector Taylor said that in each case a second offence had been committed, because none of the defendants were registered chemists, but that the police did not wish to press unduly on the parties.

George Hemingham, grocer, Fillingham, and James Monk, grocer, Sturton, were each fined 11s. including costs, for selling laudanum; and Mary Willcox, general dealer, Langworth, Robert Bates, grocer, Ingham, Millicent Bell, grocer, Ingham, William Walsham, grocer, Bishop's Norton, and John Brown general dealer, Spridlington, were each fined 11s. for selling Battle's Vermin Killer against the provisions of the Act.

A rather amusing point was raised in the case of Wm. Marshall, grocer, of Glentham.

A policeman dressed in plain clothes, from a neighbouring village, deposed that he went to the defendant and asked for an ounce of laudanum and a packet of Battle's Vermin Killer. Defendant had neither article, but produced a packet labelled "Gowan's Vermin Destroyer—Poison," which he said was not quite so rapid in its effects as Battle's preparation, and on that account the customer should have it for half price. Defendant now declared that he had been duped by an "agent" in the matter of the preparation, which he asserted was perfectly harmless.

Inspector Taylor asked that the case might be adjourned to enable the contents of the packet to be analysed; and although defendant admitted that he was ignorant of the law, and should have sold poison knowing it to be such, this course was eventually decided on, and the case adjourned for a month.—*Nottingham Daily Guardian.*

Charge against a Herbalist.

At the West Riding Assizes on Monday, the 3rd of February, Hezekiah Thornton, forty-eight, carrying on business as a herbalist in Leeds Road, Bradford, and whose name is on the Register of Chemists and Druggists by virtue of his having been in business before the passing of the Pharmacy Act, 1868, was indicted for having feloniously and unlawfully used a certain instrument with intent to procure the miscarriage of Margaret Allison, at Bradford, on or about the 4th September last. At the last Winter Assizes in Leeds, the prisoner was indicted for the wilful murder of Margaret Allison, but the jury returned a verdict which acquitted him of the capital charge. He was no sooner discharged from the dock, however, on that occasion than he was arrested, at the instance of the Chief Constable of Leeds (Captain Bower) on the minor charge.

The jury found the prisoner guilty, with a recommendation to mercy, and Mr. Justice Lopes sentenced him to be kept in penal servitude for ten years.

Obituary

GEORGE WELLER.

It is with regret we have to announce the death of George Weller, Esq., J.P., an old member and founder of the Pharmaceutical Society, who died at his private residence, at Queen's Terrace, Windsor, on Saturday, December 28, 1878.

Mr. G. Weller was born at Rochester, in Kent, in the year 1810; he was apprenticed to the business of a chemist and druggist with Mr. Foster, of High Street, about the year 1824, in the "good old times" when the chemist's stock was more comprehensive and selected more for profit than medicinal effect. He afterwards became assistant, then partner, and eventually sole possessor of the business, which was carried on for so many years in the names of Foster and Weller; and except for his daily morning walks (taken with the greatest regularity), he was scarcely known to leave the premises until within the last few years, when he was compelled by his health failing to retire to a private residence. Although he did not see the necessity for an improved pharmaceutical education yet he was almost from the first a subscriber to the Pharmaceutical Society, the Benevolent Fund, and the Pharmaceutical Conference. He qualified as a borough magistrate in 1870, but on account of his ill health had been unable to take his seat on the bench for some time past. In his business habits he was a pattern for the rising generation, as he was unremitting in his attention and perseverance; he was always at his post ready to receive his friends and customers with such a bright beaming countenance, that it could scarcely fail to cheer the most depressed and desponding, while his gentlemanly and patriarchal appearance invariably commanded the admiration and respect even of strangers.

Notice has also been received of the death of the following:—

On the 26th of November, 1878, Mr. William Bremner, Pharmaceutical Chemist, Thurso. Aged 78 years. Mr. Bremner had been a Member of the Pharmaceutical Society since 1846.

On the 6th of January, 1879, Mr. Henry Peters, Chemist and Druggist, Birkenhead. Aged 38 years. Mr. Peters had been a Member of the Pharmaceutical Society since 1869.

On the 12th of January, 1879, Mr. Daniel William Evans, Chemist and Druggist, Llanstephan, Carmarthenshire. Aged 26 years.

On the 18th of January, 1879, Mr. Henry Thomas John Denton, Chemist and Druggist, Exeter Street, Plymouth. Aged 48 years.

On the 26th of January, 1879. Mr. Edward Alfred Nowers, Chemist and Druggist, Lydd, Kent. Aged 57 years.

On the 31st of January, 1879, Mr. James Bamford, Chemist and Druggist, Bradford. Aged 55 years.

On the 1st of February, 1879, Mr. Thomas Sullivan Moody, Chemist and Druggist, Great Quebec Street, London. Aged 22 years.

Dispensing Memoranda.

[213]. In reply to A. B. C. with reference to suppos. morph., B.P., I beg to say that I have, even in the south-west of England, on a hot summer's day, turned out more than one lot from the same mould. I was invariably successful, with occasional exceptions, the reason for which I stated before; my mould was a bell metal one for half a dozen, but as I had to make fifteen for a customer every week, I was compelled to use the mould thrice and twice, alternately, reserving three from the first mouldings to make up fifteen the second time when I only made a dozen. In summer I hastened the cooling by the aid of a stream of cold water from the tap.

C. I. H. S.

[218]. In answer to "Hamilton," I should like to refer him to Squire's 'Companion,' 3rd edition, p. 179, where he will find that quinine when given in large doses is best suspended in water, as its bitterness is then not so intense. I should also like to ask "Hamilton" where he gets his authority for saying that "of course" the prescriber intended the alkaloid to be dissolved. As I have had a similar prescription from the same source, I still think and believe that it was his intention to have it simply diffused through the liquid.

Minor.

[219]. I beg to differ with Mr. Henry Brown that this should be labelled "one teaspoonful." I dare say the prescriber may have intended that quantity to be taken, but as he uses the symbol (℥j) there is no alternative, but to say one drachm or sixty grains. It would have been better, if "Sub Umbra Floresco" had been more explicit in stating whether the powder was for a young or adult person, as such would materially alter the case, but in the absence of such information, or being unable to communicate with the writer, I should certainly write "one drachm or sixty grains at bed time occasionally," which would represent as nearly as possible "one tablespoonful."

J. W. Barnes.

[221]. As potass. chlor. is soluble only to the extent of one in twenty of cold and two and a half parts of boiling water, but deposits on cooling, G. H. L. must powder it

very fine so that it may suspend properly in the mucilage of tragacanth.

DAN GORRIE.

---

[223]. LIQUOR BIMECONATIS MORPHIÆ is made the same way and is of the same strength as liq. morph. mur. B.P. with the difference that ext. glycyrrh. is added q. s. to colour. R. M.

---

[231]. I should say "Delta" would be correct in dispensing pil. assafœt. comp.

VASELINE.

---

[232]. I should advise "Delta," if he has not got one, to get one of Squire's 'Pharmacopœias of the London Hospitals,' where he would find a formula for pil. hydrarg. subchlor. and I think it would prove useful to him.

VASELINE.

---

[233]. The following is the formula for vapor benzole as used at the "Central Throat and Ear Hospital," Gray's Inn Road:—

℞	Benzole Rect.	ʒiij.
	Magnes. Carbon	ʒiss.
	Olei Cassiæ	♏ xx.
	Aquæ	ad ʒiij.

M. ft. vapor.

This was probably intended; certainly not vapor benzoini (Throat Hosp. Phar.).

OWEN WALLIS.

---

[233]. In reply to A. P., the formula for vapor benzole is as follows:—

℞	Benzole Rect.	ʒiij.
	Ol. Cassiæ	♏ xv.
	Sp. Camph.	ʒij.
	Mag. Carb.	ʒiss.

THOS. B. JONES.

25, *Princes Street, Leicester Square.*

---

[235]. I think that "Student" would be justified in using liq. arsen. hyd., B.P. unless the P. L. preparation was distinctly ordered by the letters P. L. being placed on some part of the prescription. The dose of liq. arsen. hyd. is from 2 to 8 drops, while that ordered in the prescription is three. Liq. arsen. chlor., P. L., is only about one third the strength of the B. P. preparation, consequently if that was intended the dose would be very small, being equal to about 1 minim of the B. P. preparation.

Heaton Moor. T. S.

---

[235]. "Student" had better observe whether the prescription is dated previous to 1867, if so, by all means use P. L. strength; if otherwise, as the dose is in conformity with either strength, and as B.P. is our present infallible guide he will be justified in using it, as three min. dose is by no means large and is only ordered twice a day.

Milton next Sittingbourne. A. STOOKE.

---

[235]. Here the dose would indicate the B.P. preparation, viz., liq. arsen. hydrochlor.

F. STEVENS.

---

[238]. Probably the pil. cupri ammoniata of the P.E. is meant. This was named pil. cupri ammoniureti in the 1839 edition.

[239]. HEBRA'S TINCTURE.—In Waring's 'Therapeutics,' 3rd edition, page 493, Hebra's tincture is said to consist of equal parts of tar, soft soap and methylated spirit. T. W.

---

[240]. I see no objection to using syrupus simplex when sugar is prescribed, providing that aq. dest. is ordered to be used in making the mixture up to a certain quantity. If any other article is ordered to be used for making up to a certain quantity, then an objection arises, which in some cases may be serious, namely that water has been introduced into the mixture in place of something else. But if time and circumstances allow I think that it is always desirable to keep as near the text of the prescription as possible and use sugar when it is ordered and syrup when it is ordered.

Heaton Moor. T. S.

---

[242]. I think if J. G. would try conf. rosæ gal. he would get a good firm pill, with the addition of a little pulv. tragacanth. co.

[247]. How should the following be dispensed?—

℞	Ferri Sulphatis	ʒij.

Solve et adde—

	Vaselinæ	ʒij.

M. ft. ungt.

Dublin. WILLIAM N. ALLEN, jun.

---

[248]. When tr. chloroform is prescribed, what should be dispensed, tr. comp. or spt.? I used the former; was I right in so doing?—

SUB UMBRA FLORESCO.

---

[249]. How should this be dispensed?—

℞	Potassii Iodidi,	
	Spt. Vini Rect.	āā ʒj.
	Iodi Resub.	gr. v.
	Adipis Benzoat	ʒj.

M. ft. ung.

SUB UMBRA FLORESCO.

[250]. UNG. SULPH. HYPOCHLOR. Co.—Thinking that vaseline would be a good substitute for lard in making the above, I prepared some in the proportion—

Sulph. Hypochlor.	℥j.
Vaseline	℥j.

And put it aside in the cellar. It was then of the usual golden yellow colour.

A week afterwards I found that, while the surface of the ointment was of a pale yellow colour, it was otherwise pale brown throughout, and on being stirred with a knife, evolved a vapour similar to, but much less pungent than that of the hypochloride.

Vaseline is commonly reputed unoxidizable, and I am at a loss to account for the change.

J. R. W.

Notes and Queries.

[549]. The precipitate contains much calcic phosphate; as it is less easily soluble in phosphoric acid, the addition of some acid muriatic is an improvement. After dissolving the recently precipitated phosphates in the acid phosph., add the subcarbonates of soda and potass. During the effervescence a precipitate is formed, which allow to subside, then remove the supernatant liquid with a syphon, add as much strong hydrochloric acid as will dissolve the precipitate, mix the two solutions and dissolve the sugar without the aid of heat, as it would cause the formation of grape sugar and oxidize the iron.

DAN GORRIE.

[560]. CARBOLATE OF IODINE.—Dr. Holtz who proposed carbolic acid and iodine for diphtheria gives the following formula (further information will be found in the 'Year-Book of Pharmacy,' 1872):—

℞ Acid Carbolic Cryst.,	
Alcohol	āā ℥j.
Aquæ	℥v.
Tinct. Iodi.	℥iv.

M.

As it is an American formula, the alcohol is 90°, sp. gr. ·835, and the tincture of iodine 1 in 16 without potassium iodide.

J. S. WHYTE.

[560]. SOL. CARBOLATE OF IODINE.—The following is the printed form given by the agent for the "patent pocket inhaler":—

Carbolic Acid	45 per centum.
Camphor	10 „
Acetic Acid	8 „
Alcohol	10 „
Iodine	1 „
Water	25 „
Oil of Cassia	1 „

38, *High Street, Rochester.* J. A. WILLET.

[561]. UNG. CITRINI DIL.—"Sub Umbra Floresco" will find that if he dilutes his ung. hyd. nitratis with oxygenated lard, he need not fear the return of the "alarming symptoms."

LAVANDULA.

[563]. SYRUP LIMONIS.—"Alpha" will find the following formula to yield a satisfactory syrup:—

℞ Acidi Citrici	℥iv.
Tinct. Limonis	℥iss.
Syrupi	ad ℥xvj.

Dissolve the acid in the syrup and add the tincture.

SUB UMBRA FLORESCO.

[563]. SYR. LIMONIS.—"Alpha" will find the following to answer his purpose perfectly;—

℞ Acid. Citric.	℥ij.
Sacchar. Alb.	lb. v.
Ess. Limonis	℥j.
Sp. V. R.	℥ij.

Add ess. to sp. and then allow sugar to absorb it, and add the whole to one quart of water to form a syrup. Two tablespoonfuls of this to a tumblerful of water form a delicious beverage.

„ „ Carui,	
„ „ Cymini	āā ℥ij.
„ Glycyrrh.	℥j.
„ Zingiberis,	
„ Pot. Nitratis	āā ℥ss.

M. To be given in three or four pints of gruel.

C. HENDERSON.

[566]. LIN. SAPONIS.—In answer to J. G. concerning lin. saponis which has partly congealed, it is evident that the manufacturer did not pay proper attention to the temperature indicated in the B.P., viz., not exceeding 70°. The B.P. orders about one-fifth too much soap in this liniment,—it should be 2 oz. instead of 2½ oz.,—and some chemists digest it at a higher temperature than is ordered, in order to dissolve all the soap; the consequence is that when such a liniment is exposed to a low temperature, the soap is thrown out of solution.

But I am at a loss to know why the other twenty-five bottles should be of a "bright reddish brown colour." If made with the ingredients ordered in the B.P. they should be of a faint straw colour.

LAVANDULA.

[566]. If Lin. Saponis be made strictly according to the B.P. (viz., by allowing the ingredients to macerate for seven days at a temperature not exceeding 70° F.), a bright reddish coloured preparation will result, but I have found that if that temperature is exceeded, a gelatinous preparation will result, owing, I believe, to the stearate of soda contained in the soap becoming dissolved. This, I think, will account for the difference in appearance as mentioned by J. G.

Heaton Moor. T. S.

[567]. INDIAN BRANDY.—In answer to "Lewis" Indian Brandy is made as follows:—

Spt. Æther. Nit.	℥ss.
Tinct. Rhei Co.	℥ss.
Syr. Simplicis.	℥j.

M. ft. mist.

MINOR.

[571]. GUAIACATE OF LITHIA.—If W. C. will refer to Squire's 'Companion to the British Pharmacopœia,' p. 190, 11th edition, he will find the information he requires respecting guaiacate of lithia.

47, *Piccadilly.* GEORGE W. SANDFORD.

[572]. LAC BISMUTHI.—Will any reader kindly inform me how to make lac bismuthi, so that it has the appearance of milk, and after standing some days, to have only a slight deposit? It must be a preparation of hydrate of bismuth, and the dose from one to two drachms.

A preparation of this kind is, I know, made by a firm in Liverpool, but the price is such that when from two to three ozs. (this being frequently the case), are ordered in an ℥viij mixture, it leaves the margin of profit very small.

PETER HEYN.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

The Future of the Drug Trade.

Sir,—There have now appeared several letters upon the above subject; allow me to add another, and as the *Pharmaceutical Journal* is the only means of trade communication, I hope the trade may be allowed fully to criticize any letter which appears in its pages, especially when treating of matter of such importance as the present subject, convinced that any opinions, however personal or extreme, will afford material for discussion, and that interchange of opinions will enable us to define plain and honest dealing, to filter out the worth from the worthless, and in fact to winnow the chaff from the grain.

In the second paragraph of "Hampshire's" letter, he says he subscribes to and sympathizes with a worthy and deserving association and that conditionally he prescribes. Very good.

He will not, however, subscribe any further unless it combats an evil which he endeavours to point out, viz. the underselling of recognized trade prices, in other words reduced prices.

Does any reader suppose that the Pharmaceutical Society, Council or Journal, or the Chemists' Trade Association, can compel any druggist, or that any society or trade association can compel any business man who has an open door to regulate the prices of his own goods according to their idea of profit and loss?

If "Hampshire" desire immediate action why does he not himself take the suitable steps for the prevention or opposition of his evil, etc., instead of nervously writing half a dozen times to (in this instance) an almost impotent agent, and then chuckling at his handiwork, coolly squatting in his chair, arms folded, legs stretched out, gazing blandly into the fire, wonders why and grumbles that others will not espouse his cause and fight his own battle.

"Hampshire's" position is amusingly absurd and utterly indefensible,

Let us now examine his incalculable evil, another cancer in our midst.

How gratifying is the sight of a letter such as "Outsider's" in our Journal; how much greater is the pity it had to be written by an outsider, that the leaven of honourable trading had to be communicated to us instead of being generated in our midst.

To be explicit I strongly advocate honest profits, that is prices considerably reduced, but not to a stores' percentage.

I do not do so from any desire to aggrandize or to be a "wretch concentred all in self," or to do a cutting trade, etc., but from a heartfelt conviction that the present charges for many prescriptions and drugs are not in accordance with legitimate trading, but are extortionate and dishonest in the fullest sense of the word.

It has been a general custom for many years no doubt, seldom departed from, but for which there can never be any possible defence. I need not enumerate, for prices are pretty general.

Why do so many young men rush into business as they find opportunity, but because of the enormous profits, knowing full well that they can hardly become bankrupt if careful?

Reduce profits and we minimize the probabilities and expectations of young starts, then in a few years we find the reduction amply recouped by a larger and more extensive business. This done I have no doubt druggists will be able to pay higher and proper salaries to their almost slavish assistants, who by this better remuneration will not be tempted to embark in business. Thus by the reduction of immediate profiits, we have at work two agencies, resulting in doubled business and therefore greater ultimate profits.

I think this is self-evident and I hope no one can be so short sighted or obstinate to as deny the benefit this will confer upon the trade internally and externally.

I hear some say that if we reduce profits or prices by 25 per cent. or more, our incomes or the number of druggists will be equally reduced, or that we require the large profits the trade being overstocked. Well, let those of that mind, who cannot live by honesty of purpose, leave the trade altogether and try another in which it is to be hoped they may learn to reason and be reasonable. The fraternity will be well rid of them.

Others say we have bought this privilege of extortion by a superior training and education; we are of a higher caste than our benighted neighbours, drapers, grocers, wine merchants, boot makers, and I do not doubt some will add jewellers also, and are entitled to draw from £200 to £500 a year from a business in which we have invested these amounts only, while these sums are quite enough for the animals who have risked ten or twelve times that amount, with the probability of failing and losing their all.

There is no disguising the fact that grocers, drapers and such are far keener business men and politicians than druggists. Their minds are enlivened, their wit sharpened by the pleasure and success of honourable competition.

They are members more useful to a community, men of much larger experience and therefore better educated than the ordinary druggist, who has to pass the great ordeal of comparatively easy examinations, only because he is compelled to, not from a love or desire for higher culture.

How many druggists can in their evening years ask themselves without compunction, Have I fulfilled my mission? Have I treated my neighbours with the golden maxim "Do to them as I would them do to me," or have I spent an useful, upright and honourable business career?

Now would I caution "Hampshire" and his fellows. Let them ask who has been "dishonourable," "scandalous," "disreputable," unprincipled," "wretch," etc., themselves, the extortioners, or those content with legitimate profits, and if ever they pen another letter, let them remember the old school story, "the stone that rebounded," and if they have not gentlemanly natures (it is never too late to mend) let their endeavour be, to be so at least upon paper, and not hurl at any one epithets which rebound with crushing effect upon themselves.

Apart from the question of a general reduction in prices, why in such a time of want and trade depression, should the price of drugs remain stationary while every other commodity has fallen?

I have had this reduction question before me some time, and had intended to intimate my views at the meeting which takes place here annually, but was unavoidably absent, and seeing the question in our trade organ, I deemed this even a more suitable opportunity.

EDINBURGH.

Sir,—I have read the letter signed "Hampshire" with much pleasure, as it seems to me he goes in for it very earnestly and with much spirit. However the only way to fight the co-operative societies is with their own weapons, *i.e.* buy for cash in the cheapest markets and sell at a low price. I am now alluding to patents and perfumes. It must be far better for us to make twopence where we have been in the habit of making sixpence, than allow drapers and grocers, etc., to take that part of our business away, as they are doing fast undoubtedly.

I disagree with "Hampshire" that there is anything *infra dig.* in a chemist selling his goods at a lower rate than another who persists in charging the old prices, especially as it is done only in self defence.

As for drugs of all descriptions, I feel very strongly on that point; no one but properly qualified chemists should be allowed to sell them, and I think it would be almost impossible so speak too strongly on that subject. Drapers to my knowledge are selling tinctures and drugs, at the same time knowing literally nothing of them.

I think it disgraceful that men who have to struggle hard to pass difficult examinations should have to contend with such people as these.

Almost any M.P. would introduce a short Bill into Parliament to the effect that no one but chemists are allowed to retail, dispense, or sell drugs. The justice of such an act would be apparent at a glance and would at once and for ever put an end to any such piratical enterprise.

I do trust sincerely that this may be taken up strongly at once so that no time may be lost.

J. C. MEACHER.

Sir,—I was pleased to see our friend "Hampshire" come forward again, with his protest against reducing prices, and have often wished he had a seat on the Council to infuse a little of the trade element into that assembly.

I do not agree with him, however, in his remarks about assistants, as you cannot reasonably expect them to care about reducing prices, when the principals do not know any better. It is almost like blaming a child for its parent's shortcomings.

Going from assistants to apprentices, I think their parents or guardians ought to be correctly informed about the present position of the trade before taking steps to enter as pupils, or passing the Preliminary examination.

I should hesitate myself now to take a pupil, as I scarcely think it right to receive a good premium, and have my pupils turned out into the world to compete with all sorts of miscellaneous dealers and dabblers in drugs.

In my opinion it is far better that all the facts of the case should be mentioned beforehand, than found out when it is too late.

I follow the example of Mr. Titjens, the tea merchant, and believe in his motto, "Individual skill and responsibility," to which I would add, promptness and accuracy, *versus* the annoyance of being kept waiting at the stores, and the luxury of being your own porter. If people choose to go to the stores and buy inferior drugs they must take the consequences.

I have been asked for co-operative zinc ointment, but that would not suit me, as I prefer the B.P. kind. Some of the store ointment was once substituted for mine, but as it was more like granulated zinc cream, the medical man ordered it to be discontinued.

I also know a lady who had two large pots of Hebra's ointment made at the stores. The first lot was pinkish and full of lumps, and the next was burnt black and both lots had to be thrown away and I was requested to try my hand at making it.

I could supply instances enough from my own experience to fill two or three columns of having to do work after the stores.

Do not let us listen to "An Outsider," or anybody else advocating cheap physic, it is a mistake and a delusion; rather let us read the remarks of one, who we all acknowledge as an authority and whose memory we cherish in fond remembrance. I allude to a paper in the Chemists and Druggists' Almanack, 1870, on "Prices of Medicines," by the late Daniel Hanbury.

Our calling is in danger, and we are sadly harassed in many ways, and I hope the Council will stretch forth a helping hand to protect trade interests before it is too late.

In reply to your leader of February 1, we cannot live in the country without the sale of proprietary articles, and specialities, stamped or unstamped, are one of our chief branches of trade. The grocers have already robbed us of enough in the Italian warehousemen line. There was a time when Crosse and Blackwell's goods were only sold by druggists in country towns, but now their travellers do not call upon us, and if we take to giving up selling patents, etc., I shall think the time is coming when ordinary retail druggists will be improved off the face of the earth; besides it would not be very convenient for us to purchase chlorodyne at all hours of the night, at grocers', to make up prescriptions. Druggists do not live by supplying gratuitous information and people often buy chlorodyne at these omnium gatherum establishments and come to us for the dose.

I hope the Council will see their way open to help us in this matter, and try to get all patents (stamped or unstamped) containing poisons, struck out of the exemptions under the Pharmacy Act. As you are doubtless aware, there are proprietary medicines we can safely recommend, as well as others we cannot; but the question does not rest there at all, as the proprietors recommend them quite enough, and our position as vendors is only to supply them when asked for.

I do not think you would like to see our customers going to the grocer's with prescriptions ordering Squire's Parrish's food, or Savory and Moore's pancreatic emulsion, or Morson's pepsine wine, and beg to refer you to the circulars of the above firms and other well known makers of specialities to show that they consider the druggist as the proper person to supply the public. I do not prepare any specialities myself, and should like to address a few words to Mr. Fowler, whose idea is very good and certainly worth trying to carry out, but am afraid it cannot be managed successfully in the majority of cases. I must confess that I have not met with much success in that way, and people say, I had rather have a patent medicine, if you can recommend one. I was certainly glad to see the Excise taking active measures to make the numerous American and French proprietors stamp their compounds, as these gentlemen had a very happy way of stating composition to avoid duty, and the English market was becoming flooded with their specialities.

The importance of the subject, and the interest I take in it, must be my explanation for asking you to grant me so much space for insertion.

FRATER.

Sir,—A correspondent last week says:—"Take a little sound advice, and strive to create greater and more business-like transactions," and his advice is to lower our prices to those of the grocer and oilman, etc. Surely "Nil Desperandum" is not in earnest. Has he seen the senna, camomile flowers, salts, etc., usually sold by them? Supposing we were to follow his "sound advice," what quality would he recommend—Howard's beautifully bright and dry mag. sulph., the fol. sennæ, lin. opt., and flor. anthem. aug. duplex; or shall we go in for senna at 5*d*. per pound, get a cask of mag. sulph., small, damp and discoloured, and sometimes dirty, or packed in thin soiled packets, labelled, "purified epsom salts?"

I have been in my present shop five years, and am surrounded by grocers and oilmen, but after the first three months, the grocers' customers for drugs appreciated a fine bold senna leaf and mag. sulph. pure and white, in a good wrapper, with name and address; the consequence is that their sale by them is greatly diminished, and one oilman has given up drugs, etc., usually sold, as they got soiled, and so much dead stock. I would strongly advise chemists to go in for quality, and charge a fair, not an exorbitant, price, but by no means take the grocer and oilman as their standard. I have the Liverpool chemists' price book, and find on looking through it, that my prices differ but very slightly. Speaking of "Welch's pills," "Nil Desperandum" says:—"So far he has lost 1*s*. 4*d*. on the two boxes." He cannot call it "lost" if he has the 1*s*. 4*d*. worth in stock. I suppose when he sells that box he will "lose" 4*s*. 1*d*. by having to get two more boxes to keep in stock. "Nil Desperandum" should see the pounds I have "lost" on all my stock of patents, etc., waiting in my glass cases for customers. We must keep them, and they go off by degrees. Adopt for your motto, "Good quality and fair prices."

STANDFAST.

Sir,—Without proposing to accept all Mr. Wade has written on this subject, I am glad to express my gratification at reading his letter. It is quite refreshing to meet with a man so outspoken and decided in his views, and with all care enunciating a policy. I quite agree that no help can be given by the Legi lature, but I have some hope that these communistic societies will some day burst by their own distension. To my mind there is something rotten about them, or else it is the first step to socialism and all its levelling influences.

Assuming that there will be a general lowering of prices in our trade, what will be the result? Nobody will do more business and many people's income will be reduced, and not a few must go to the wall.

To talk of competing with the stores is simply an impossibility. The public will not deal with us on the same terms as the stores, either as to payment or the attention required. When it is considered how small is the amount of physic required by any individual and the large amount of benefit conferred for the small expenditure, the insatiable appetite of the English public for small savings is truly wonderful.

I altogether approve the vigorous discussion that has been carried on in the daily press. I do not believe in being skinned and not squealing.

One thing has struck me in the numerous letters that have appeared in the papers, the persistent idea that exists

in the public mind relative to adulteration. It is evidently quite a mania.

In conclusion, I will express a hope that the members of our trade will retain their self respect and not be frightened into a panic. The clouds of adversity are dark and threatening in all branches of business, but let us not despair of a returning prosperity.

ROSICRUCIAN.

Sir,—"An Outsider" asserts that I am "wrong as to my arguments and deductions." It is one thing to assert, another to prove. I contended that if Cockle's pills or seidlitz powders were reduced in price, no more would be consumed. That physic formed a singular exception to the general effect, following from the cheapening of merchandise, and "An Outsider" has not, and cannot prove the contrary. He alludes to quinine and cod liver oil being more used than formerly, and disingenuously infers that it is attributable to their lessened price; whereas the very contrary is the case. Cod liver oil is not cheaper than it was wont to be, and quinine is much dearer, yet there is as much or more taken than ever, proving the correctness of my "arguments and deductions," and the reverse of my opponent's. He says "chemists, as a body, are extremely short-sighted in their views of business . . and few have made any mark in the world." This is—to say the least—a gratuitous assertion. Chemists and druggists are by no means a numerous class, yet more than a fair sprinkling of them are among the foremost men in every town in the kingdom with which I am acquainted. In the town in which I write they have been, and are to be found among its magistracy, occupying the highest offices in the corporation, and two chemists are the respective chairmen of its two educational boards. In fact, every body must know, whose knowledge is not exceedingly narrow, that this assertion of "An Outsider" is wholly unwarrantable.

"An Outsider" says, "the tendency of the age is to go ahead," and that "the day of protection is gone." I take exception both to his exemplification of the former, and the correctness of the latter assertion. To reduce the profit on articles, which by so doing will be likely to increase in an equal proportion their consumption, is "to go ahead;" but to reduce the profit on articles, which by so doing, cannot possibly increase their consumption is "to go astern." The day of "protection" is not gone. The solicitor, the barrister, the surgeon, and the physician, have each to undergo an examination necessitating a costly education, and they are protected, and rightly so. The pharmaceutical chemist has also to undergo an examination, necessitating a comparatively costly examination, and it is equally right that he should be protected. The Pharmacy Acts are presumed to protect him. Do they protect him sufficiently from "the grocers and others stealing away a large portion of his trade?" I think the protection little more than a sham. The law forbids my practising as a physician, or as a medical man, or from appearing as an advocate in a county court, though the case in dispute should involve only a question of a few shillings, and it is a fair and pressing question, whether the 'Schedule of Poisons' forms anything like a sufficient "protection" to those who have had to acquire the education, and pass the examination to which I have alluded.

Does "An Outsider" think a physician is not sufficiently "go ahead" because he demands a guinea fee, instead of supplying a bottle of medicine at 20 per cent. profit? Or that a lawyer is stupidly "conservative" because he is not content with a similar profit in the deed which his clerk prepares, as a builder would charge on the wages that he pays his men?

"An Outsider" is disingenuous in his allusion to the advertisement of a patent medicine sold at thirteen to the dozen. He knows that that rate of sale is almost a solitary exception to the thousands of proprietary articles sold, and that without the addition of the thirteenth, the profit is 10, and not, as he says, 20 per cent. His remarks about the baker and grocer I have virtually answered, and besides are nothing to the point. We all know that bread and tea are only half the price they were forty years since. What of that? Meat, on the contrary, is double the price, but neither circumstance affects my contention. During that time the recognized retail prices of drugs and chemicals have been generally lessened, fully in proportion to their lessened wholesale price. The original price of seidlitz powders was 3*s*. 6*d*. per box. My contention that the demand for drugs is limited, and that as their aggregate consumption cannot be sensibly increased by any reduction in price, if they are to be sold at grocers' profits, one-half the retail druggists must disappear from the scene, remains unassailed.

"An Outsider" says that travelling up and down the country since and before the railways (!) he sees a marked change in the number and position of country chemists. It would be odd if he did not in a period of some forty years. Chemists have doubtless increased with the increase of the general population, and theirs are not the only shops in which plate glass fronts are now the rule instead of exceptions.

The last paragraph of "An Outsider's" letter is the most disingenuous of all. He is a very pretty specimen of "the candid friend." He "would not say a word"—(of course not, he is too good, and too pious)—"to create disruption between employed and employer." (As I perused his peroration I found myself inwardly murmuring the immortal words of an immortal author, "If ever there was a saint that doctor is one.") But in the same breath he expresses his astonishment that the young men have stood so long the treatment they have endured from their employers, and prophesies that they will rise in a body to redress their grievances, yet he "disbelieves in trades' unions!" In passing I may observe that all must regret the long hours of the drug trade. The exigencies of the public seem to require it, the same as they require still longer hours for hotels and refreshment houses to be kept open. All, too, must be pleased to feel that the evil is gradually being ameliorated, but it cannot be denied that those who keep open latest are those who most recently were assistants, and not old-established proprietors.

"An Outsider" wilfully charges me—evidently desiring to stir up strife—with attempting "coercion." I simply offered advice. As I have before written, the interests of employers and assistants in the drug trade are and must be one. For neither of them have "trades' unions" and "masters' associations" any alarm, because the assistants of to-day will be the employers of to-morrow.

The evil that I am so anxious to stir up every honourable man in the drug trade to combat affects more or less every individual member of it. It effects me, and such as I am—I mean those who after years of toil have acquired a competency—least; it affects my neighbours, some of whom, having attained to a livelihood, are hoping to save a little money for their families, and others who are yet striving to live by their business more, but it affects the assistants, students, and apprentices infinitely more than either, and it is well for them—they being the most grievously affected by it—that they have the power to stamp it out.

HAMPSHIRE.

INDIAN JALAP.

Sir,—Perhaps I may be allowed to supplement a note "On Indian Jalap," in "The Month" now before us. It is just ten years since a specimen of Ootacamund jalap-hiber (dried in slices, and in excellent condition) was given to me for examination by the late Mr. Daniel Hanbury, who had received it from a correspondent. It contained 18 per cent. of resin. There should be some good reason why Indian jalap has not ere this taken a prominent place in the drug market.

JAMES W. WHITE.

52, *York Crescent, Clifton, Bristol.*

A.P.S.—You are recommended to consult the Registrar's Report, and see whether the assumptions upon which your remarks are based are warranted by the facts there set forth.

"*One who is preparing for the Minor.*"—We are informed by the Registrar that after a careful investigation he came to the conclusion that the person mentioned had established the validity of his claim, and that a notice to this effect was sent to the Local Secretary early in the present month.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Lance, Tanret (Troyes), Guaineri (Florence), Goggs, Jackson, Reynolds, Brown, Watson, Smith, Hatcher, Hesse (Feurbach), J. M., J. K. N., N. T. O., J. G., J. G. B., W. S., A. P. S., Rosicrucian, No Nonsense, Ignoramus, Standfast, Nemo, One who is preparing for the Minor, Yorkshire.

"THE MONTH."

Cloudy skies have so obscured the face of the sun during the past month that—notwithstanding the mild and damp weather with which a considerable part of England has been favoured—the usual harbingers of spring are later even than last year in putting in an appearance. The elm is not yet bristling with flower buds, the violets as yet have not perfumed the hedgerows, and the favourite snowdrop seems to have lost its usual disregard for weather and is seen but sparingly. In the south of England, and indeed, as far north as Norwich, the *Daphne Laureola* is just beginning to open. In cottage gardens the mezereon has not yet opened its blossoms, and the winter flowering jessamin and the *Cornus mascula* are only just beginning to unfold their flowers. In the Botanical Gardens the out-door beds present a desolate appearance, only relieved here and there by the white blossoms of the Christmas rose or the yellow ones of the winter aconite. The conservatories, however, seem to be already stirred with new life, and at Regent's Park the hyacinths, tulips, narcissuses, cyclamens, azaleas and acacias, render the large conservatory quite a bright picture, the beauty of which is still further enhanced by the magnificent magenta blossoms of the tree rhododendron, and the dark glossy green leaves of the camellias which are now profusely covered with snowy blossoms. The only medicinal plants which appear to be coming into blossom at present are the Winter's bark tree, *Drimys Winteri*, and the Socotrine aloe.

'Medicinal Plants' for this month treats of *Rosa Canina*, *Æthusa Cynapium*, *Humulus Lupulus*, *Crocus sativus*, *Smilax officinalis*, *Smilax Medica* and *Lycopodium clavatum*. The figures are quite equal to any previously issued, and the information is brought up to the present date.

M. J. Lichtenstein has given in the *Comptes Rendus* an interesting account of the development of the insect which forms on the pistachio tree, the curious flattened pear-shaped galls that occasionally appears in the drug markets in this country. This aphis (*Anopleura Lentisci*) runs through the following stages: The fecundated female deposits in May or June its eggs on the pistachio tree; these hatch into a wingless form to which the pistachio gall owes its origin; the wingless form produces, without being fecundated, another brood, which acquire wings and quit the gall and pass to the roots of certain grasses (*Bromus sterilis* and *Hordeum vulgare*), and then produce wingless young, and these after a longer or shorter series of wingless generations, until the period of swarming and of the appearance of the nymphs, furnish a winged sexual generation, which return to the pistachio tree and again commence the cycle.

Lichtenstein has shown that a somewhat similar migration takes place with regard to certain species of phylloxera frequenting different kinds of oak. It may be hoped that these interesting researches will throw some light on the life history of the destructive phylloxera of the vine.

M. Jousset de Bellesme, in a note in *Comptes Rendus*, states that fuchsine is not so frequently used to colour wines in France as is generally supposed, since it possesses too lively a red colour. For this purpose he states that "grenat" or the residue from the manufacture of fuchsine is preferred, since it approximates more closely to the natural colour of wine. In his experiments upon the action of "grenat" on the animal economy, he found that death always followed its administration, usually in three or four weeks in small mammals, and in six weeks in frogs. The symptoms produced by its use appear to be persistent diarrhœa, ravenous hunger, and an excess of urea in the blood. M. Bellesme concludes that although "grenat" can scarcely be included in the category of powerful poisons, it must nevertheless be classed among substances exerting a slow, but very pernicious, effect upon the animal economy. Its presence is easily detected in the excrement and in the tissues, in which the colouring matter is deposited unchanged.

A paper from M. F. Hetet, in the same journal, states that he has discovered veratrine in the leaves of *Sarracenia purpurea*. The crystals are of the same form, give the same results with various solvents, and the same reactions with alkaloid reagents as the veratrine obtained from *Asagræa officinalis*. He also finds in *Sarracenia purpurea* another alkaline substance and an amine, the chemical constitution and characters of which he has not yet fully investigated. This interesting research, if confirmed, will afford another example of the same alkaloids occurring in families of plants, which in a botanical point of view are widely separated. Judging, however, from the want of results obtained in this country by its use, it hardly seems possible that *Sarracenia* can contain much of the alkaloid veratrine, or its physiological effects as a powerful irritant or depressant of the heart's action would have been noticed.

A M. Lacour has invented a new test paper. He adds to powdered rhubarb twice its weight of liquid ammonia, and after maceration for a quarter of an hour filters the liquid. Strips of paper dipped into it are dried, and are of a red purple colour. These when touched with acids become of a lemon yellow, and with alkalies regain their former colour. It is said to be a very sensitive test.

A short time ago some American honey in the comb was successfully brought over to this country, as much as eighty tons being landed at Liverpool from a single ship. The comb, however, has a somewhat unnaturally white appearance, and the honey, as is said to be often the case in hot countries, has much less flavour than that produced in cooler and temperate regions, like our own country.

It is only when looked at in the aggregate that we can readily appreciate the value of those industrious insects, the bees. For instance, it is stated, that in central and southern France there are more than two and a half million hives of bees, which produce annually over three thousand tons of wax and about one thousand two hundred and fifty tons of honey.

In connection with this subject, Mr. A. S. Wilson's researches on the amount of cane sugar and glucose in the honey of flowers* are full of suggestions to bee keepers. The flowers which yield the most sugar and the best aroma might, if made to replace the wild plants which give only a small quantity, considerably increase the yield of honey in any district. It is a rather singular fact that the fuchsia, the honey of which yields 1·69 of glucose and 5·9 of cane sugar, is not deprived of its nectar by any bees in this country. Only a short time ago it was stated that some ingenious American had invented a means of inducing bees to form combs of a given size by preparing by machinery a wax founda-

* See *Pharm. Journ.*, before, p. 163.

tion presenting one wall of the hexagonal cells, and it has been further implied that the bees themselves have been fed from glucose. Whether this be the case or whether the inferior flavour of the American honey be due to the climate of the States where it was collected, must remain an open question. That which has recently been imported to England is, however, said to have been the partial product of twelve thousand swarms of bees, distributed throughout the honey-producing sections of the United States in apiaries of one hundred swarms each, by a large mercantile firm which is interested in the honey trade.

Possibly the experiment of making combs ready for the bees might be carried a little further, for Mr. Darwin has shown that the cell walls are first built very thick by the bees and afterwards gnawed down to the requisite thinness. Any little irregularities in such artificial combs would doubtless be rectified by the intelligent insects.

Dr. J. Biel, in a paper on the purity of drugs and chemicals, makes some singular statements with regard to benzoic acid, saying that it is now only sublimed from benzoin in a few large English factories, and, he concludes that as there has been (as he supposes) no Siam benzoin in the European market for several years, and as the sublimed benzoic acid of English manufacturers does not contain cinnamic acid, that it cannot be made from Sumatra benzoin. Siam benzoin, and of good quality, has certainly been in the London market during the last few years, in fact three packages are offered for sale in the *Public Ledger* this day, although of too high a quality and price to be used for the manufacture of the acid, and Sumatra benzoin has never been proved to invariably contain cinnamic acid. Dr. Biel does not seem to be aware that another variety of benzoin, Palembang, is used to a considerable extent in this country for the manufacture of benzoic acid, of which good samples contain as much as 20 per cent. The Siam benzoin would appear, according to Dr. Biel's statement, to be used in the manufacture of chocolate, probably on account of the vanillin which C. Rump has recently shown that it contains. It is extracted by ether from the watery filtrate left after the precipitation of benzoic acid by the lime process. On resolution in hot water it crystallizes out in long thick white needles which turn yellow on exposure to the air. It is rather a curious fact that Siam benzoin in tears was called vanilla benzoin in the United States long before it was known to contain vanillin.

C. Etti has discovered in Malabar kino 1·5 per cent. of a crystalline substance, called kinoin, soluble in water and ether. It is obtained by separating the kino-red by dilute hydrochloric acid (1—5) and then extracting it from the aqueous solution by ether. Direct treatment of the kino by ether does not answer, on account of the gum speedily caking together so as to prevent further action.

Dr. Griessmayer, in *Dingler's Polytechn. Journal*, states that the skin of the ray, particularly that species of the fish known as the thornback (*Raja clavata*), has been much used recently as a substitute for isinglass as a clarifying agent in brewing. The clarifying mixture prepared from it is said to be colourless, tasteless and odourless, and to clear any turbid liquid in twelve hours, or at the most within three days, if the liquid is kept in a cold place. A kilogramme of these ray skins is said to be sufficient to clarify forty or fifty gallons of beer, whilst it costs in Austria only half as much as Russian isinglass.

Dr. R. Godeffroy reports in the *Zeitschrift* of the Austrian Pharmaceutical Society (Jan. 20, p. 33) the results of the examination of a suspected specimen of castor, which turned out, however, to be genuine, though so abnormal as to be unfit for use in medicine. It was fairly uniform in composition throughout and when incinerated left about 47 per cent. of ash, consisting of carbonate of lime and a trace of silica. According to Hager a good specimen of castor should contain at the most 3 per cent. of carbonate of lime, though cases are recorded in which larger quantities have been observed than even in the present instance.

Some reports appear to have obtained currency in Germany to the effect that the *role* of thymol is nearly played out. But these are met by Messrs. Metzner and Otto, of Leipzig, in their "Berichte" by the statements that during the months of September and October their house alone sent out more than a ton of it, that their works are occupied day and night in its preparation, and that the demand for thymol and thymol wadding is greater than ever. This firm appears to use the seeds of *Ptychotis ajowan* as the source of thymol, but they state that they have advices that not only has the price of these seeds advanced through a bad harvest, but also through the increased consumption of them in India by the natives during the very sickly season of last year.

From the United States there comes a rumour of the discovery in Southern Utah and Arizona of immense deposits of mineral wax, said to be identical with zietrisikite, the mineral wax of Moldavia, which differs from ozokerite in being insoluble in ether. According to Dana the Moldavian substance is of a deep red-brown colour with a greenish reflection, but that now found in America is described as a snow-white resinous substance. It is said to occur in beds twenty feet in thickness extending over many square miles.

In Roumania amber has been found which differs from that of Prussia in being of different colours, sometimes red, blue, green, rose, brown and black. It does not appear however to differ in chemical compostion.

Messrs. C. G. and J. U. Lloyd, in their paper on "Berberidaceæ," point out that in their experience the water used to precipitate podophyllin from the tincture should be cooled to a temperature below 50° F., or the resin will run together and enclose water in little cavities, so that it cannot readily be dried, and sometimes becomes mouldy and decomposed. They recommend the tincture to be reduced to the consistence of honey and poured in a thin stream into ice-cold water with constant stirring; this gives as a result a light coloured friable precipitate which readily dries by exposure to the atmosphere. When dry it is a shade darker than powdered ipecacuanha and leaves only 2 per cent. insoluble when treated with alcohol.

A writer in *Die Natur* remarks that the starch of horse chestnuts yields an extremely adhesive paste, which curiously enough is not attacked by insects. It might perhaps be worth while to investigate the cause of this fact and to inquire whether it be due to traces of æsculin, and if so whether other principles allied to saponin are equally distasteful to insects.

According to accounts received at Amsterdam, the

nutmeg and mace crop at the Banda Islands was a total failure last year. The flowers were destroyed by heavy rains followed by a prolonged drought, and the small crops of badly developed fruits were afterwards destroyed by a storm.

The report on the biliary secretions of the dog, with reference to the action of cholagogues, is now concluded, and in the *British Medical Journal*, for February 8 and 15 inst., a summary of the results obtained is given. That the amount of work done is a step in the right direction, and is a harbinger of the time when the knowledge of the action of medicine will be no longer empirical but based on the scientific laws which regulate their action, must be evident to all who take the trouble to peruse these very valuable papers. The authors of the report have tried on the human body the effects of euonymin and iridin, and find that the action is the same as on the dog. They state, "As yet we have found four grains of iridin, made into a pill with confection of roses, and taken at bedtime, a certain remedy for biliousness. It produces no disagreeable sensations, and on awaking in the morning the yellow tongue is found to be clean and the headache and *malaise* gone. As iridin, though a powerful hepatic, is not a powerful intestinal stimulant, it is well to give in the morning an ordinary mild saline aperient, such as Pullna water or some other. But iridin though an agreeable remedy at the time leaves a somewhat depressed effect; and it probably should not be taken oftener than once a week or so. Euonymin is a hepatic stimulant in man as it is in the dog. Two grains of it, made into a pill with confection of roses and taken at night, seem to be as efficient a remedy for biliousness as iridin. If the dose be not too great, it leaves no depression. As it is a feeble intestinal stimulant, it is well to follow it in the morning by a dose of Pullna water or other saline aperient. I have been much struck with the success of euonymin in functional hepatic derangement in several persons who had tried nearly all the commonly used cholagogues with varying and very limited success. I have no doubt that in consequence of our experiments euonymin will come to be a universally employed hepatic stimulant." This expectation is already being realized, for numerous inquiries are already being made for euonymin at some of the wholesale houses.

This report stands as an incontrovertible argument against the teachings of the antivivisectionist portion of the community, who would be doing a service to humanity if they would offer themselves to be experimented upon instead of the animals to whose sufferings they object, and concerning which the authors justly remark, "We have indeed occasioned by our experiments a considerable amount of pain to a number of dogs, but considering that our discoveries are calculated to relieve much suffering, not only of men, but also of dogs for all time to come, we believe that we have spared infinitely more suffering in the future than we have occasioned in the present."

The subject of water analysis is one which has long been the source of much bitterness and contention among chemists, and the personalities which have been introduced into the discussion of various analytical methods recommended for this purpose have probably not done much to raise chemists in the estimation of the general public. It might have been hoped that the time had now come to leave the decision as to the merits of particular methods in the hands of those who may be called upon to apply their chemical skill to the settlement of questions respecting the quality or wholesomeness of water, but the significance of the results obtained by the different methods recommended is, in fact, so much a matter of opinion and the value to be attributed to them in particular instances is so much dependent upon considerations as to the history of the water in question, that there is unfortunately too ample room for dispute in regard to this very important matter.

The latest contribution to this subject, or perhaps it may more correctly be said the latest renewal of the strife which has prevailed in various degrees of intensity for some years, has been furnished by a bulky communication from Dr. Tidy to the Chemical Society, an abstract of which appeared in the report of the Society's proceedings at p. 500 of this Journal, and the discussion of this paper was published last week. In this paper Dr. Tidy criticizes two of the methods of water analysis recommended respectively by Professor Frankland and by Mr. Wanklyn, and he also describes a method which he recommends himself as giving results that may be relied upon to indicate the quality and wholesomeness of water. The result at which he apparently arrives is that both of the first-named methods are open to serious objections, and that an amplification of the method based on the reduction of permanganate of potash, to which he gives the name of the "oxygen method," is the only one which can be relied upon as giving results that are absolutely trustworthy or free from such inconstancy as excites suspicion. Strange to say, however, in summing up the arguments and evidence produced in support of this view, Dr. Tidy says that so far as the three methods, viz., the combustion method, the ammonia method, and the oxygen method, are concerned, the latter gives results closely concordant with those of the combustion method, but that the ammonia method gives results which are often at direct variance with both the others. This is certainly a most extraordinary conclusion to arrive at if there be any ground for the opinion that the use of the combustion method involves a chance of entirely failing to detect the very substance which for the purpose of the sanitarian it is of the first importance to ascertain the presence of in water. With such a possibility having any claim to recognition as a reality in some instances even, the testimony furnished by the agreement between the results of the combustion method and the oxygen method seems rather to point in the direction of discredit to both of those methods, than to inspire a chemist with confidence in either of them.

It must also be remembered that the grave inconsistency between the objections to the combustion method and the alleged agreement of its results with those of the oxygen method was not a circumstance pointed out in the course of the discussion upon Dr. Tidy's paper, but that it was one of the main conclusions come to by the author himself from his exposition of the subject, and as the result of laborious experimental work.

Altogether there seems to be much reason for thinking that too much is made of the existing methods of water analysis. So far as sanitary questions are concerned the amount and still more the nature of organic substances in water are the points upon which definite information is required, and in

regard to these points none of the methods of water analysis now in use give results which have any absolute value. However skilfully those results may have been obtained by one or other method, they still require interpretation before any value can be assigned to them. Identical results from different samples of water may have widely different meaning as regards the sanitary question, and consequently the value of the information obtained will depend largely upon the interpretation of the results; it is less a result of analytical determination than of the exercise of individual judgment.

At present there seems to be little ground for anticipating that the important subject of water analysis will be much, if at all, advanced beyond this position.

In a paper read before the Royal Society on the 6th, Dr. R. Angus Smith described some very interesting and suggestive observations made in the border-land between physics and chemistry, in continuation of some reported to the British Association in 1868. Dr. Smith finds that different gases are absorbed by charcoal in distinct and definite volumes and that these appear to bear a close relation to their chemical equivalence. Thus calling the quantity of hydrogen absorbed by a given quantity of charcoal 1 volume, the same quantity of charcoal will absorb 8 volumes of the dyad element oxygen. The average of nitrogen experiments gives 4·52 volumes, but the removal of all the nitrogen from the charcoal is very difficult; still, this number is very close to 4·66, or 14÷3 nitrogen being a triad element. Other numbers given are—

Carbonic Acid,	22	volumes	=6+16.
Marsh Gas, CH_4	10	,,	=6+4.
Protoxide of Nitrogen	12·66	,,	=8+4·66.

Dr. Smith suggests that we have here evidence of "the formation of a new series of molecules made by squaring our present chemical atoms and by certain other divisions peculiar to the gases themselves; or it may be that the larger molecule existing in the free gas and chemical combination breaks it up." At any rate there is great probability that further investigations in this direction may throw much light upon the laws of chemical combination, and may also "modify some of our opinions on atomic weights and the motion of gases."

At the Society of Arts last week, Mr. John Hollway brought forward a new application of a process of rapid oxidation by which sulphides are utilized for fuel. Instead of allowing the roasting of pyrites to go on in the usual slow manner, in which the heat developed is lost, Mr. Hollway proposes after starting the oxidation by adventitious heat to drive a rapid current of air through the molten sulphide; it is claimed that the whole of the oxygen of this air is abstracted while passing through, and the high temperature attained by the accelerated oxidation accomplishes in a few minutes what in the case of cupreous pyrites takes many months. In some preliminary experiments made with a Bessemer converter, the heat developed was found to be sufficient to render the operation continuous.

Professor Cannizzaro has been following up his investigations on santonin, and in a paper just published (*Journ. de Pharm. et de Chim.*, February, p. 166), read before the French Association for the Advancement of Science, he states that santonin, by the addition of the elements of water, is capable of forming not only the bibasic photosantonic acid, but also four other isomeric monobasic acids, having the formula $C_{15}H_{20}O_4$. These are santoninic acid, santonic acid, metasantonic acid, and parasantonic acid. The first, santoninic acid, which was discovered by Hesse, and is the first immediate product of the action of bases on santonin, is distinguished from the others by being reconvertible into santonin. Santonic acid is produced by the action of energetic bases on santonin; when heated to 290° it yields metasantonic acid. Parasantonic acid is obtained by boiling in a solution of caustic soda an isomer of santonin, called parasantonide, formed upon heating santonic acid to 260° C., in the presence of glacial acetic acid. If the temperature be only raised to 180°, a second isomer of santonin, santonide, is obtained. Still another acid, hydrosantonic acid ($C_{15}O_{24}O_4$) is produced by the action of nascent hydrogen upon santonic acid.

A case of poisoning by santonin, communicated to the Medical Society of Nancy, by M. Duclaux, throws some light upon the question as to the maximum dose of this substance, recently discussed in this Journal. A child, four years old, having had two lozenges of "anthelmintic chocolate" given to it, approved of them so much that it took the opportunity of being left alone to help itself to ten more. Severe symptoms of santoninic poisoning set in, and lasted with more or less intensity during thirty-six hours. The quantity of santonin estimated to have been taken in the twelve lozenges, was nearly four grains.

Science has lost a distinguished follower in Dr. Heinrich Geissler, the inventor of, among other things, the mercury air-pump, the vaporimeter, and the "tubes" that bear his name. He died at Bonn on the 24th ult., in the sixty-fifth year of his age. In announcing his death to the Berlin Chemical Society, the President, Dr. Hofmann, said that Dr. Geissler could be best described in the English words "a self-made man."

In the last "Month" comment was made on a prescription, No. 214, containing a dose of hyd. c. creta much in excess of that of the Pharmacopœia, and a reference to the prescriber was suggeste Several correspondents have referred to this prescription, and one of them apparently has thought that, the preparation being mild, the dose could have done no harm. It cannot be too frequently repeated that a dispenser must be guided by the Pharmacopœia, and when a dose is in excess of the maximum there indicated, it is his duty to refer the prescription to the writer. The dispenser would necessarily know, from experience, what is usual, and his pharmaceutical education should have taught him that this was much in excess of the B.P. dose; but he has received no medical education to guide him as to whether ℥ss of hyd. c. creta be safe or otherwise. In the remarks of Mr. Henry Brown on this subject, p. 467, he states that 15 to 30 grs. of calomel are often ordered as a purgative in certain inflammatory diseases in warm climates, and that he has often given 10 to 15 grains of calomel in a case of apoplexy; also, that from 50 to 100 grains of calomel have been given as a diuretic; therefore, he concludes, "if a medical man choose to order ℥ss hyd. c. creta as a purgative I can see no reason why it should not be dispensed." Neither, it is presumed, does any dispenser, but the question that will occur is, Does the medical man intend ℥ss for one dose, it being just four times the maximum dose of the B.P. and the writer having omitted to initial it? There-

fore, a dispenser would naturally, and very properly, hesitate in assuming the responsibility of dispensing a dose of hyd. c. creta which may have originated in an error on the part of the prescriber.

Whilst on this subject a few remarks on "The responsibility of the dispensing chemist," in the *Pharmaceutical Journal* of March, 1847, may be quoted here. "The dispensing of prescriptions is not merely a mechanical operation, as many persons imagine; it is an occupation requiring a constant exercise of thought, judgment and experience. In the event of any doubt arising, the first and most important duty of the chemist is to guard against any possible injury to the patient. He ought to be acquainted with the ordinary doses of all *recognized medicines*, and if in any case he should observe that a dose prescribed is such as might endanger life, he would incur responsibility by preparing the prescription. In such a case it is his duty to call upon the author of a prescription to inquire whether such a dose was intended. It may happen that the particular constitution or condition of the patient required an unusually powerful remedy; if so, the chemist will incur no blame for taking the precaution; but if it should be found that an oversight had occurred, the importance of rectifying the error is obvious." To these remarks nothing need be added; the dispenser's duty is clear; he possesses a knowledge of pharmacopœial and usual doses, but he has received no *medical* education to guide his judgment.

The first prescription requiring notice is that of No. 229, where thirty drops of tr. capsic. with other ingredients are ordered to be made into twelve pills. This is a quantity of liquid in excess of that the sixty-six grains will take up without the mass being rendered too soft for rolling into pills. The tr. capsic. being a rectified spirit tincture, if allowed to evaporate spontaneously, would soon be of a proper consistence, or a warm slab may be used to assist the evaporation of the spirit previously to the other ingredients being added. The spirit must be to a certain extent, but carefully, driven off, or the mass will be of a consistence too soft for the pilular form.

In reply to J. B. T., No. 230, the zinci sulphas. should be very finely powdered and diffused through the tincture of quinine, the mixture should have a "shake the bottle" label on it. If the tr. quinæ be made in strict accordance with the Pharmacopœia, no gelatinization will take place. A solution of the sulphate of zinc in water can only be adopted at the expense of the tr. quinæ, and this is not admissible. Each dose would most probably be taken by the patient in a certain quantity of water, which would at once dissolve the sulphate of zinc previously in suspension.

In No. 231, "Delta" asks, When St. John Long's liniment is ordered in a prescription, is it proper to supply lin. tereb. acet., B.P.? Certainly not. It should be prepared according to the old formula, containing yolk of egg, supposed to represent this celebrated liniment. On this subject "Delta" is referred to some remarks in "Notes and Queries," No. 549, p. 610 of the present volume. Pereira says that St. John Long's liniment consisted of oil of turpentine and acetic acid, held in suspension by yolk of egg, and Beasley gives a formula which is said to resemble it. On the proper mode of mixing the liniment, reference should be made to some remarks in "The Month," May, 1878, p. 938.

The question, No. 232, is, When pil. assafœtida is ordered in a prescription should pil. aloes et assafœt. or pil. assafœt. co. be used? The latter unquestionably. In the London Pharmacopœia the only pill containing assafœtida was the pil. galban. co., and the pil. assafœt. co. of the B.P. is much the same, omitting the sagapenum; but the pil. aloes et assafet. is altogether a different pill, from the introduction of the socotrine aloes, an element not indicated in the prescription.

In No. 233 the pil. hydrarg. subchlor. co. should be used in a prescription where pil. hydrarg. subchlor. is ordered without the "co." It is the only pill in the B.P. of which hydrarg. subchlor. forms a part. The "co." is now and then omitted by prescribers, when their intention is not so evident as it is in this instance.

Under the same number, 233, there is a question with reference to a form for "vapor benzole." This appears to be a hospital formula, which is given as that of the Central Throat and Ear Hospital, by Owen Wallis, in the last number of this Journal, p. 688. Another formula is given following this one; each has the same relative proportion of benzol, but in the latter there is an addition of spirit of camphor. The first formula therefore would, in the absence of more definite knowledge, be the more simple and preferable one.

There is no official formula for liq. emetinæ. It is a proprietary preparation, and will be found in the monthly list of Messrs. Southall, of Birmingham, to which the writer is referred for further information.

In prescription No. 235 the liq. arsen. chlor., P.L., should be dispensed. The name is plainly written and the dispenser has no option in the matter. He should also remember that the liq. arsen. hydroch. corresponds in strength with liq. arsenicalis and is nearly three times the strength of liq. arsen. chlorid., P.L.

No. 236 is one of those prescriptions where the essential oil is in excess of that desirable for a good pill mass. The result will much depend on the condition of the ext. gentian.; if too soft it should, with the extract nuc. vom., be evaporated, until, the ol. pulegii being added, the mass is not too soft for a pilular consistence. A little tragacanth powder would give stability to the pills.

In prescription No. 237 the liq. carbol. ordered is most probably intended to mean liquid carbolic acid, but it is scarcely reasonable to suppose that glyc. acid. carbol. is intended. The title more closely approximates to liquid carbolic acid than to the glycerine preparation, and the directions should have been "fiat pigmentum" rather than "unguentum," as it would resemble what is called an application more than an ointment.

There is no official formula in the B.P. for pil. cupri ammon. acet., in prescription No. 238. It may be a hospital or proprietary preparation, or it may refer to the pil. cupri ammon. of the Edinburgh Pharmacopœia, of which the following is a copy: ammoniated copper in fine powder, one part; bread crumb, six parts; solution of carbonate of ammonia, q.s.; beat into a mass and divide into pills containing one-half grain of ammoniated copper in each.

"Delta," in No. 239, inquires for a formula for Hebra's tincture, and a correspondent, under the initials J.W., supplies one from Waring's 'Therapeutics,' where it is said to consist of equal parts of

tar, soft soap and methylated spirit, but the preparation being Austrian, one from where methylated spirit is unknown, rectified spirit is most probably intended.

"Senex," in No. 240, states that a prescription came under his notice where saccharum ℥iij was one of the ingredients, and asks, was he justified in using ℥ivss fluid of syr. simp. But he does not state whether the prescription was a powder or a mixture. If a powder, of course sugar in powder should have been used. In a mixture syrup may generally be used where sugar is ordered, and ℥iij of sugar would as nearly as possible be represented by ℥iiiss fl. of syr. simp., B.P., not ℥ivss as he seems in his inquiry to imagine.

The prescription No. 241 is very likely to be a hospital or private formula, and can only be answered by some correspondent who may have a knowledge of its existence and composition.

In answer to J. G., No. 242, one of the best excipients for croton chloral is conf. rosæ can. In this instance the excipient of tragacanth and glycerine of the usual consistence is too soft. At the same time a very stiff excipient of glycerine and tragacanth, made for this purpose, would answer equally well; but the conf. rosæ can. being ready to hand will generally be used for the purpose.

The ointment, No. 243, will turn yellow after being made some time; there is no known method of obviating this change of colour. The theory of the change which takes place will be found in the remarks of one of the preceeding "Months."

No. 244 is one of those indefinite queries which now and then find their way into the "Dispensing Memoranda." "Juvenis" does not say what information he wants—whether how many doses should be sent, if separately, or in one bottle, or is it how tr. guaiac. ammon. may be best emulsified? It would usually be sent out six or eight doses in one bottle, and if ℥ij of mucilage be mixed with the water previously to the tincture being added a perfect emulsion will result, which will retain its character for any resonable length of time.

In reply to No. 245, sulphur præcip. should not be used in an electuary where sulphur is ordered. It is not necessary here to enter into the chemical phase of the question, and it has not been proved that the state of division of the precipitated sulphur has any influence on its aperient and other effects.

In whatever order the ingredients of No. 246 be mixed a bulky precipitate of ferrous carbonate will necessarily result, at first of a light green colour, gradually darkening as oxidation of the iron proceeds.

It is probable that in prescription No. 247 the character of vaseline is not understood by the writer of the prescription. The ointment should be made by rubbing down the ferri sulph. to a very fine powder and then mixing it with the vaseline. A solution of the ferri sulph. would not be miscible with this vehicle.

No. 248 is a prescription where "co." has been omitted. The occasional absence of the "co." in prescriptions has already been alluded too. When tr. chlorof. is prescribed the tr. chlorof. co., not the sp. chlorof. should be used.

In prescription No. 249 there is not sufficient spirit ordered to dissolve the potass. iodid. If ℥ss of it be replaced by ℥ss of water a satisfactory result will be obtained. But if the water be added to the spirit already in the prescription, the resulting ointment may be inconveniently soft.

The subject in No. 250 is an interesting one, but as the composition of vaseline is a secret, the decomposition which ensues on mixing sulph. hypochlor. with it must remain involved in some obscurity; it seems clear, however, that vaseline is not suited as a diluent for the external use of sulph. hypochlor., and as vaseline is now being extensively used as a substitute for lard, any information relating to decomposition resulting from its use is of value, and should receive careful consideration.

THOUGHTS ON BOTANY*.—*continued.*

BY H. B. BAILDON, B.A. CANTAB.

The Gramineæ—the Coniferæ—the Ascending Axis—Twining Stems.

(*Concluded from page* 679).

It is a true saying that truth is stranger than fiction, but it is no less true that nature is more wonderful than what we call miracle and magic. You may search all mythologies and legends, you may ransack all fairy stories and magic tales, but you will not find anything more truly marvellous than a pine tree. Consider the elements of which it is built up, the conditions of its growth. There is first of all the bare or nearly naked rock and a dry, apparently dead, chiplet, we call the seed. Add to these water, with a small amount of other chemical substances in solution, in the various forms of dew, mist, rain and snow, and these under the influence of solar heat become a large and lofty, a strong, tough, firmly founded and solid, a green-clad, shapely, increasing, complex, organiezd, a spined and plumed, aspiring, wisely-planned, utile, solemn-sounding, soul-suggesting thing, we call a pine tree. Everything in legerdemain, magic legend or mythology, however astonishing and supernatural it may seem, is but a poor and shabby wonder beside this one and a thousand others which nature daily and continually accomplishes. Yet because these are gradual and common we pass them by unwondering, if not unadmiring. It is not that science rightly considered either has explained or ever can explain away that wonderfulness which man in the youth of the race found everywhere in nature, and which gave zest and poetry to existence. Rather, on the other hand, has man, bearing the lamp of science in his hand, like the hero of some Eastern tale exploring a magic cavern paved with emeralds and roofed with rubies and diamonds, found in exploring the arcana of natural phenomena, ever new galleries and halls, ever fresh and alluring vistas of research and discovery. Perhaps the present and growing tendency of science to arrange her spoils in graduated series has some effect in detracting from the sense of marvel we would otherwise feel. It is natural that it should be so; yet we must see on reflection that it does not really detract from the power exhibited that the process should be gradual, any more than we ought to admire a picture or a statue less when we know it is the product of a multitude of individual touches or strokes. Nature will not, indeed, condescend to sudden effects and surprises, will not stoop to any *coups de theatre* to startle us into admiration; she presents us with things wonderful, complete, beautiful. If we are blind and say "They are nought," she seems to reply in silent scorn "Indeed they are, *to the blind*, as the diamond to the earth-worm, as the light of noonday to the mole and the bat; they are for the eyes and the hearts that can see." One cannot fail to suspect, on noting the cold and sometimes even disgustful tone in which nature is sometimes spoken of, that certain scientific pursuits, like certain mechanical arts, which by too close and continuous

* Read at an Evening Meeting of the North British Branch of the Pharmaceutical Society, January 31, 1879. The preceding paper was read February 22, 1878.

application injure the sight of the operative, superinduce, in the case of too exclusive a devotion to them, a species of mental, if not of moral, ophthalmia, so that one is inclined to adopt in the case of science the famous replies of Schiller when asked what religion he was of. "Of none," he said. "And wherefore of none?" "For religion's sake!" He feared by adopting the tenets and promoting the objects of a particular sect to lose the larger and loftier emotions and ideas which he felt constituted the truly spiritual and essential part of religion. So we may say, "We will not be, in spirit at least, geologists, botanists, biologists or any of the 'ists' at all, not because we do not respect and credit science, but just because we fear to narrow our conceptions and lose our sense of that wider and higher science, that true knowledge of things in which are embraced and sublated all these partial studies and subaltern pursuits."

It will not be any longer possible for us to follow out what we may call the historic order of Plant-life, according to the hypothesis we had adapted that the various stages of soil-formation would give us a clue to this order; for when we find that the soil has arrived at the point at which it can support the grasses and pines we must see that it is or shortly will be in a condition to support also a great variety of plants of quite distinct orders. We shall, therefore, so far change our method of progress as to consider those various parts of the plant, such at least as have not been already touched upon, in something like a natural and convenient order. Having already devoted some attention to the descending axis or root, we may now proceed to the, formerly deferred, consideration of the ascending axis or stem.

The more one reflects upon the phenomena of life, especially of vegetable life, the more is one convinced that they can only be caused and directed either by a consciousness existing in the organism itself and controlling its conduct, or some pervasive consciousness without the organism which ordains for it its actions, either of which hypotheses seems to imply some pre-existing intelligence; for nature must be a power even more miraculous than we esteem her, if she be either herself wise without thought and prudent without knowledge, or capable of endowing her productions with a consciousness, wisdom, and foresight, of which she herself is innocent. Thus, with regard to a seed, there resides in that organism a faculty of discerning between up and down, and that even when in darkness,—for I have not yet heard of a seed, although many must alight or get down the wrong way up, sending its radicle upwards or its plumule downwards. By a certain and infallible instinct the true direction is always taken, the future root seeking the darkness, and the future stem the air and light. No doubt the sun may be regarded as supplying the physical energy for this action of the plant, as for all, but it cannot be said to have given direction to the movement, the direction being determined by certain qualities in the seed itself, even as in a humanly contrived machine the motive power, heat, supplies the energy, but the intellect of the inventor, as realized in the machine, conducts this energy in the desired course. This is a highly important principle, by losing sight of which men have fallen into the error of reckoning this universe to be the necessary outcome of the undirected action of the various forms of energy. Perhaps no more ludicrously insufficient reason for a fact was ever rendered than that which is seriously assigned as the cause of the upward direction taken by the plumule, viz., that it takes this direction in opposition to the force of gravitation. This is surely the first time that the movement of any body in one direction has been ascribed to a force pulling it in another. There is surely in the plumule no natural, one is tempted to say piggish, obstinacy which causes it to go one way because it is pulled another. All we know, and I believe can know on such a point, is that the plumule is so constituted as to seek the air and light, indeed to take and, if strong enough, maintain that vertical direction through assuming which the plant may best avail itself of the action of air and light; for the natural aim taken by the young growing point is not toward the quarter from which the maximum of light comes, although the tendency of a plant when it loses rigidity is to lean toward the light. The advantage of this fact for that plant which may be said to have a perfect stem, that is, a permanent one, rigid enough to resist the downward attraction of the earth, is obvious, as it is thus enabled to balance itself and maintain its upward course in a way it could not do if starting with a sunward slant. In this, as in all instances, the plant seems to proceed as though possessed of a perfect consciousness of its future, and with a matured scheme of living and complete strategy for the campaign of existence ready to unfold itself. There are thus plants which seem aware from the first that they will not be able to reach the light, to exalt themselves above the surface of the earth. They come, therefore, provided with properties and implements for attaching themselves to bodies more rigid, and thus climbing to the light and upper air. Upon this point I should like to dwell a short time and to quote to you from Mr. Darwin's fascinating and instructive monograph on 'Movements and Habits of Climbing Plants,' sufficiently to show what truly astonishing powers and provisions exist in this class of plants. There are several ways in which these supple-stemmed creatures attach themselves to their stronger fellows or other means of support. They may either twine their stems round some object they meet with and thus rest a part at least of their weight on it, or they may attach themselves at various points by means of hooks and tendrils, or, like ivy, they may clasp with crampions. It is obvious, then, that the first aim of the plant must be to find something suitable to which to attach itself. With this view it executes a circular or elliptic revolution, so that it feels over a considerable circuit and continues this process till it meets with the object of its search. Then either the stem itself twists about the support or the various grappling apparatus lay hold of it. In the former case the whole plant above the first point of contact continues to revolve and wind itself round the stick or stem it has found. In the other the unattached tendrils or hooks remain voluble and sensitive, and proceed to seek and clasp at fresh points. Especially remarkably is it that this sensibility remains just so long as there is hope of its being of use or need for its employment. The following from page 79 of Mr. Darwin's work, referring to the *Gloriosa Plantii*, a plant climbing by its leaf-tendrils, will fully bear out this statement.

"The hook when first formed, before the leaf has bent downwards, is but little sensitive. If it catches hold of nothing it remains open and sensitive for a long time. Ultimately the extremity spontaneously and slowly curls inwards and makes a button-like, flat, spiral coil at the end of the leaf. As soon as the tip has curled so much inwards that the hook is converted into a ring its sensibility is lost, but as long as it remains open some sensibility is retained.

"While the plant was only about six inches in height, the leaves, four or five in number, were broader than those subsequently produced; their soft and but little attenuated tips were not sensitive and did not form hooks, nor did the stem then revolve. At this early period of growth the plant can support itself; its climbing powers are not required, and consequently not developed; so, again, the leaves on the summit of a full-grown flowering plant, which would not require to climb any higher, were not sensitive and could not clasp a stick. We thus see how perfect is the economy of nature." This last exclamation is not mine, but Mr. Darwin's own, and no wonder; dull must be the mind that is not attracted, charmed and exhilarated by contemplating so exquisite and accurate adjustment of means to end. As illustrating the versatilty of nature's contrivances note the following. Speaking of *Bignonia littoralis* Mr. Darwin says, "The

species last described, *Bignonia Venusta*, ascended a vertical stick by twining spirally and seizing it alternately with its opposite tendrils, like a sailor pulling himself up a rope hand over hand. The present species pulls itself up like a sailor seizing with both hands together a rope above his head," page 92. Of *Bignonia speciosa* he says, "The whole terminal portion of the tendril exhibits a singular habit, which in an animal would be called an instinct, for it continually searches for any little crevice or hole into which to insert itself," page 95.

"Tendrils will not clasp each other, and if they have done so, unclasp again" (page 131).

"A nice case of co-adaptation here comes into play; in all the other tendrils observed by me, the several branches become sensitive at the same period. Had this been the case with the *Hanburya Mexicana*, the inwardly-directed, spur-like branch, from being pressed during the revolving movement against the projecting end of the shoot, would infallibly have seized it in a useless and injurious manner. But the main branch of the tendril, after revolving for a time in a vertical position, spontaneously bends downwards, and in doing so raises the spur-like branch, which itself also curves upwards, so that by these combined movements it rises above the projecting end of the shoot, and can now move freely without touching the shoot; and now *it first becomes sensitive*" (page 134).

On page 181 of the same work, Mr. Darwin, frankly and modestly, and with true scientific spirit, confesses, "Why a delicate touch should cause one side of a tendril to contract, we know as little as why, on the view held by Sachs, it should lead to extraordinarily rapid growth of the opposite side."

This sentence shows that Mr. Darwin himself, if not possessing a truly philosophic mind, has at least sufficient philosophic sense to avoid confounding *cause* and *means* in the way some of his so-called followers frequently do. To certain of these it would appear a sufficient explanation of *cause* to say that the tendril clasped the support because the outside part grew faster than the inner; but this is really only an explanation of *means*, for we want to know the cause of this different rate of growth, which evidently is some extraordinary faculty of the plant, not to be explained on either mechanical or chemical principles alone. For if it rested on mechanical ones, how can we explain why one tendril either does not clasp another at all, or, having done so, unclasps again? It is not a little gratifying to me to find Mr. Darwin driven to use the same expression with regard to these tendrils which I ventured to apply to the conduct of rootlets—viz., instinct. There is, indeed, no other term, so scientifically precise, that can be applied; for instinct simply means the faculty of performing necessary and beneficial actions without consciousness or ratiocination. It is, therefore, as correct to say that the conduct of tendrils and rootlets is guided by a vegetable instinct, as to say that action of young animals is guided by animal instinct. Instinct is then a characteristic of both kinds of living matter, and it may be traced very low, if not indeed to be very lowest forms of life; and it is a quality completely absent in dead unvitalized matter. This conclusion gives no little support to our contention that vital action is as distinct from mechano-chemical action as mechanics and chemistry are themselves distinct. We are at any rate in this case shut up to one of two inferences from the facts Mr. Darwin has placed before us, either that these plants have both some consciousness of their surroundings and a capacity of acquiring the properties necessary to their well-being, or that some intelligent agent has constructed them so and endowed them with such faculties that they are specially and wonderfully adapted to the situation in which they are found. Which hypothesis is the more credible one may safely leave to the verdict of any sane mind. As an example how what we look upon as human inventions and contrivances have been anticipated by nature the following may be quoted from the same work:—

"A tendril which has not become attached to any body does not contract spirally, and in the course of a week or two shrinks into the finest thread, withers and drops off. An attached tendril, on the other hand, contracts spirally, and thus becomes highly elastic, so when the main footstalk is pulled the strain is distributed equally between all the attached discs" (page 147).

Whatever mortal first discovered and applied the principle of the spiral spring doubtless considered himself, and was esteemed by others, a very clever person; but nature had been quite as clever long before. And what art is there in nature, what still unrivalled wealth of beauty! How we should miss the solid greenery of the ivy, that adorns alike the wrecks of nature and the ruins of human works. How could we spare the sweet woodbine, that twines innocently about the rude trunk and breathes its honey-luscious fragrance through the evening woods? or could we afford to lose from nature's bounty the purple-blooming clusters of the grape? Yet all these and hundreds of other plants—so dear to the sight, so grateful to other senses—are only enabled to exist by means of those extraordinary and beautiful provisions which we have been considering. Had this world been the result of a mere blind struggle for existence, unguided by purpose or prevision, it seems in the highest degree unlikely that these plants could have developed such powers in time to avail them in so intense a struggle. There may, indeed, be in nature many problems which try the faith and defy the penetration of the acutest intellect, many sorrowful, apparently cruel, facts which sadden the heart, but the more deep and loving our study of nature becomes, the more, I thoroughly believe, will a faith be strengthened in us, that it is neither without intelligence, without foresight, or wisdom, nor yet without at least mercy and benevolence that the universe we contemplate has been constructed and is still controlled.

THE COBALT HYGROMETER.*

Unsized paper, as thin blotting or filtering paper, is to be dipped into a solution of chloride of cobalt, common salt, and a little gum arabic. It is red at first, but while drying becomes more pink, bluish-red, and finally blue when quite dry. As the paper thus prepared is slightly hygroscopic, it will easily attract atmospheric moisture, and be coloured more or less reddish in proportion as it finds more moisture to attract. The *Manufacturer and Builder* suggests that if it is to be used in very dry climates, a very little glycerin or chloride of lime may perhaps be added to the solution, when it will be more capable of indicating the difference in moisture in comparatively dryer kinds of air. A good addition to this arrangement is a disc painted with half a dozen or more shades of red and blue for comparison, as enumerated below, which shades may then be marked thus:

Rose-red.	Pink.	Bluish-pink.	Lavender.	Violet.	Blue.
Rain.	Very moist.	Moist.	Middling.	Dry.	Very dry.

REMOVAL OF ODOUR OF MUSK.*

Mr. Ernst Biltz, in his admirable work, 'Notizen zur Pharmacopœa Germanica,' states that the disagreeable persistence of the odour of musk, on the hands and on utensils, may be readily removed by powdered ergot. About a teaspoonful of the latter is placed into the hollow of the hand, warm water is added to make a thin paste, and both hands are then well rubbed with it. The odour immediately disappears, and does not return. The author made this observation while making some powders containing musk and ergot; he had triturated the musk with sugar previous to the addition of the ergot, otherwise the resulting odourlessness of the mixture might have caused him to doubt whether he had added any musk or not.

PROPOSED MEDICAL LEGISLATION.

A BILL to amend the Medical Act, 1868, has been prepared and brought in by Dr. LUSH, Sir TREVOR LAWRENCE and Sir JOSEPH MCKENNA. It contains little or nothing that directly affects chemists and druggists, and its provisions relate mainly to the constitution of the Medical Council, the mode of electing its members, and the establishment of a joint board for the purpose of granting certificates of qualification for practising medicine and surgery as well as for registration.

The provisions of the Bill in reference to unregistered persons are to the effect that if a person who is not registered in the medical register takes or uses the designation of any medical diploma which entitles a person to be so registered, or the designation of licentiate in or professor of medicine or surgery, or a branch of either, or any designation or description used to distinguish registered practitioners, or any designation implying that he has obtained a qualifying certificate or is registered or entitled to be registered in the Medical Register, each person shall for every such offence be liable on summary conviction to a fine not exceeding twenty pounds.

The second paragraph of the section provides that where such an unregistered person "practises for "gain" or professes to practise, or publishes his name as practising medicine or surgery, or a branch of medicine or surgery, "or is engaged for gain," or professes to be engaged or publishes his name as being engaged in the cure or treatment of diseases or injuries, takes or uses the designation of physician, surgeon, apothecary, or doctor, or of any medical diploma or any designation or description used to distinguish registered practitioners of medicine or surgery, or of a branch of medicine or surgery, or any medical or surgical designation or description, or any designation or description implying that he is qualified to practise medicine or surgery or a branch of medicine or surgery, he is to be liable to a fine of twenty pounds as above.

The first paragraph of this section of the Bill seems to be clearly and exclusively directed towards preventing the improper assumption of titles indicative of legal qualification to practise medicine and surgery and to have the object of enabling the public to discriminate between such medical practitioners as possess a legal qualification to practise and others who do not possess such legal qualification. It only thus indirectly recognizes the existence of medical and surgical practitioners who possess no legal qualification to practise. But the second paragraph is explicit in its recognition of the fact that there are such unqualified practitioners who "prac-"tise for gain," and even hold themselves out as being engaged in the treatment and cure of disease, injuries, etc. The object of the provisions contained in this paragraph of the section is not to prevent such persons from continuing to practise, but simply to prevent them from "taking or using" designations or descriptions which would lead the public to believe they were in possession of legal qualification to practise.

It does not appear that in the provisions of this section there is at present anything to justify apprehension that the ordinary trade and business of a chemist and druggist as established by usage could be interfered with; but what is of more significance in this respect is the circumstance that in the schedule of Acts proposed to be repealed, the Apothecaries, 1815, is not included. It would appear, therefore, that the promoters of this Bill do not contemplate dealing specifically with the question that has been productive of so much discord between a particular class of medical practitioners and chemists and druggists.

It may be that they consider that the claims put forward as to the application of the Apothecaries Act have been sufficiently exploded by the recent litigation, and the very general expression of public feeling in opposition to those claims. It may also be inferred that since the Bill recognizes the existence of avowed medical practitioners possessing no legal qualification, and since it does not attempt to prevent such persons from continuing to practise, no idea is entertained of interfering with chemists and druggists who, though sometimes carrying on what is termed "counter practice," do not assume medical titles or hold themselves out as medical practitioners.

So far, therefore, we may congratulate those of our readers who are more especially interested in this matter that the first instalment towards the medical legislation of the coming session is without any sign calculated to excite their suspicion or to give reason for uneasiness.

The Bill to be brought in by the Duke of RICHMOND, however, has yet to come. It has not yet been printed, but as soon as it is we shall place the substance of it before our readers, especially as regards any point by which they may be affected in the exercise of their business.

SALE OF FOOD AND DRUGS ACT AMENDMENT.

THE very unreasonable construction that has been put upon the Sale of Food and Drug Act in regard to the absence of any prejudice to the purchaser of an adulterated article when such purchaser is an inspector under the Act, and he purchases the adulter-

ated article for the purpose of analysis only, is so obviously inconsistent with object and spirit of the Act that it is not surprising to find an attempt being made to remove this obstacle to its application.

We have always looked upon the defence set up on the ground above stated as being one of the merest legal quibbles, for the officer whose duty it is under the Act to purchase samples for the purpose of analysis should, in our opinion, be regarded as representing, in such case, the public which is likely to be prejudiced by the sale of adulterated articles. It is in that representative capacity he purchases samples for analysis, and if the articles are found to be adulterated, the fact of his not being individually prejudiced ought not to protect the sellers from liability to the consequences of their malpractice.

Accordingly a Bill has just been brought in by Mr. ANDERSON, Mr. P. A. TAYLOR and Mr. WHITWELL to amend in this respect the Sale of Food and Drugs Act. It provides that in any prosecution under section 6 of the Act of 1875 for selling to the prejudice of the purchaser any article of food or any drug which is not of the nature, substance and quality demanded by the purchaser, it shall be no defence to such prosecution to allege that the purchaser, having bought only for analysis, was not prejudiced by such sale.

In regard to the sale of spirits this Bill also provides that in determining whether an offence has been committed under section 6 of the Act, by selling to the prejudice of the purchaser spirits not adulterated otherwise than by admixture of water, it shall be a good defence to prove that such admixture of water has not reduced the spirit to any greater degree than 25 per cent. under proof for brandy, whiskey, or rum, or 30 per cent. under proof for gin. This provision if passed will furnish a minimum standard for the strength of spirits which will serve to do away with much of the difficulty that has been experienced in dealing with cases in which spirits have been sold with large admixtures of water, and purchasers have thus been prejudiced at least in a pecuniary sense.

DISPENSING.

AN attempt is being made by the Rochdale and District Chemists' Association to effect an arrangement by which the dispensing in the district may come into the hands of the pharmacists instead of being done, as at present, by the medical men. A sub-committee has been appointed, which in order to obtain reliable data to guide in drawing up such an arrangement has sent out to different parts of the kingdom a circular, containing the following three questions: — (1) Do medical men in your town dispense for their own patients? (2) If not, are prescriptions free to be taken to any *bonâ fide* chemist? (3) If so, how does it affect the medical man, and the public as regards fees, and does the arrangement meet with general approval? We hope that gentlemen who may receive this circular will, as far as possible, supply the information asked for, in order to aid in securing so desirable an object.

SCHOOL OF PHARMACY.

THE courses of lectures on "Chemistry and Pharmacy" and "Materia Medica and Botany," in connection with the Pharmaceutical Society's School of Pharmacy, 17, Bloomsbury Square, will commence on Saturday, March 1, at 9 o'clock in the morning, when Professor BENTLEY will give his first lecture on botany. Students who have but a limited time at their disposal will find the ensuing five months to be a favourable period for studying at the School of Pharmacy, for between the 1st of March and the end of July, they will not only have the opportunity of attending in the laboratory, and at the usual courses in chemistry and pharmacy, and materia medica and botany, but also, the lectures on systematic and practical botany, which are delivered at the Royal Botanic Society's Gardens in the Regent's Park, where every opportunity will be afforded to them of obtaining a better practical acquaintance with plants than can be obtained in any other way.

OXYGENATED SURGICAL DRESSINGS.

In a paper recently read before the Medical Society of Victoria, by Mr. John Day, upon the application of nascent oxygen to the disinfection and deodorization of wounds and ulcerated surfaces, the following formula is given for the preparation of a liquid for impregnating flannel, calico bandages, cotton, wool, lint, tow, and sponge intended for use as surgical dressings:—

Benzine	14 parts.
Old Oil of Turpentine	2 „
Oil of Lavender	1 part.

The articles soaked in this mixture should be slowly dried in a well-ventilated and well-lighted room, and will then have become capable of absorbing oxygen from the atmosphere and giving it up in a nascent or active state when brought into contact with either blood or gas. Dr. Day ascribes this action to the formation of peroxide of hydrogen, and by pouring over surgical dressings, prepared as above, a solution of potassium iodide, the liberation of iodine causes them to become more or less dark brown. Dr. Day suggests that the liberation of iodine in this way may be useful in the treatment of cancer and other diseases in which local application of iodine is desirable, since it would be a convenient means of diffusing iodine over tender or painful surfaces in nicely regulated quantities by varying the strength of the solution of iodide.

MISDIRECTIONS.

SOME considerable inconvenience having been caused by the sending of advertisements for insertion in the Journal to the Editor's office instead of to the publishers, we find it requisite to call the attention of our readers to the notices printed each week at the top of the editorial columns, directing applications for copies of the Journal, as well as advertisements, to be sent direct to Messrs. CHURCHILL, New Burlington Street. We may also take this opportunity of mentioning that letters and other communications should not be sent to the publishers, but to the Editor's office, at 17, Bloomsbury Square. The disregard of these arrangements is sometimes a cause of inconvenience and disappointment, which it is not in our power to avoid.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held on Thursday, February 27, at 8·30 p.m. precisely, when Mr. J. DAVIES will read a paper on "Some Compounds of Bismuth," and Mr. H. ALLEN a note on "The Estimation of Bismuth."

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The seventh general meeting of this Association was merged in the associated *soirée* of the Literary, Scientific and Art Societies of Liverpool, which was held in St. George's Hall, January 31, 1879. The whole of the building, the great hall, concert hall, two large courts, two small courts, library and numerous other rooms were appropriated to the purposes of the *soirée*, which was attended by three thousand persons.

The various societies were represented by contributions appropriate to each.

The chemical department consisted of a lecture on "Phosphorescence," by Mr. E. Davies, F.C.S., etc.; lecture on "Electric Lighting," by Mr. J. N. Schoolbred, B.A., C.E.; exhibition of Geissler's tubes, by Mr. A. Haddock.

There were exhibited in the great hall a selection of specimens from the museum of the Association, series illustrative of aniline dyeing, sugar refining, the manufacture of glycerine and paraffin, complete series of opium derivatives, just presented to the museum by Mr. A. H. Mason, F.C.S., series of gold, silver and other ores from Nevada, tangent galvanometer, fine crystals of platinocyanide of magnesia, of bismuth and of borax, an improved microphone, etc., etc.

The meeting passed off most successfully, and a general hope was expressed that the associated *soirée* may be regarded as an annual affair.

The eighth general meeting was held in the Royal Institution, February 13, the President, Mr. T. F. Abraham, in the chair.

The minutes of the previous meeting were read and signed.

Various donations were announced to the library, and to the museum a series of specimens illustrative of sugar refining, presented by Mr. J. T. Armstrong, F.C.S.; also specimen of seeds and oil of *Helianthus annuus*, from Mr. A. H. Mason, F.C.S.

Votes of thanks were accorded the donors.

Mr. T. H. Johnson, F.C.S., read a paper, which was illustrated with specimens and very fine diagrams, on "The Influence of High Pressure on the Decomposition of Vat Liquors in the Manufacture of Caustic Soda."

A discussion followed, in which Messrs. A. C. Abraham, Armstrong, Conroy, Davies, Garside, Haddock, Simpson, Symes and Tate took part.

A vote of thanks to Mr. Johnson for his valuable paper was passed unanimously.

OLDHAM CHEMISTS' ASSISTANTS AND APPRENTICES' ASSOCIATION.

The annual meeting of the above Association was held on January 28, at the Church Institute; the President, Mr. J. Wood, occupied the chair.

After the usual preliminary business, the Honorary Secretary, Mr. R. Thatcher, read his report for the preceding year, in which he stated that during the year classes had been held by Mr. Wood for the study of the different subjects required for the pharmaceutical examination, and that papers on those subjects had been read before the Association.

The President, in addressing the meeting, said that he must congratulate the Association on the progress it had made since it was first formed nine years ago, and dwelt very strongly on its advantages to students preparing for the pharmaceutical examinations. He was sorry to say that during the past year the Association had lost some of its best members, owing to their leaving the town, and he urged on those present to try and get the assistants and apprentices who were not already members to become so, remarking that he was sure it would be a great help to them in their studies to have a room, such as the Association had, at their disposal, containing as it did a good chemical laboratory, a select library, and specimens of the drugs and chemicals of the British Pharmacopœia. The Chairman concluded by saying that he hoped the ensuing year would be a prosperous one, and that the members would strive towards that end.

The following is a list of the officers elected for the coming year:—President, Mr. John Wood; Vice-President, Mr. J. Naylor; Treasurer, Mr. R. Taylor; Librarian, Mr. A. Harrison; Honorary Secretary, Mr. Robert Thatcher.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

The usual monthly lecture was delivered in the rooms of the Aberdeen Diocesan Young Men's Association on the evening of Wednesday, Feb. 5. Mr. John Gordon occupied the chair.

The lecturer (Mr. R. D. Presslie) chose for his subject, "Electricity." He briefly explained the theory and practical application of electricity, illustrating his subject by experiments. In the course of the lecture he explained the principles upon which the electric light ignited; and although the light produced was a mere spark, his audience could easily understand the invention by the experiment. The other experiments were very successful and much appreciated.

After votes of thanks had been passed, an opportunity was given to those present to send telegrams, converse by means of a telephone, listen to the tick of a watch magnified by means of a microphone, etc., etc.

The meeting was largely attended.

The third annual conversazione of the chemists and druggists in the city and district was held in the Music Hall Buildings on Thursday evening, Feb. 12, all the fine suite of rooms being engaged for the occasion, except the large hall. The party assembled in the Square Room at half-past eight o'clock. Mr. David Ritchie presided.

In his opening remarks the Chairman said: Three years ago this social gathering was instituted by a few employers in the drug trade with an object beyond that of a mere evening's entertainment once a year. That object was to organize and consolidate their assistants and apprentices into an association, with the view to secure for them the means of preparation for the examinations it is now legally necessary for every druggist to pass before he can lawfully prosecute his business. Our first year's work consisted of a public entertainment only; our second of a public entertainment and a course of monthly lectures; and this, our third year's work, has resulted in this assembly, monthly lectures, and a systematic course of bi-weekly instruction in chemistry and pharmacy, conducted gratuitously, and very encouragingly attended. Those who disregard them now will some day soon discover the great mistake they make in neglecting the opportunities now placed at their disposal. Not the least pleasing aspect of the matter is that it appears to be the younger apprentices who most avail themselves of the privileges offered them. Mr. Ritchie then noticed the duty laid upon employers of properly training their assistants, and remarked that complaints were made as to want of time for training in consequence of the great number of hours the shops were kept open. He asked if it was necessary to have late trading in drugs, and said he believed the profits from such business were not large. He hoped a better state of matters would soon exist. In conclusion, he said: We have here the foundation and the materials for a local school of pharmacy, an institution much wanted for Aberdeen and the north. But in order to make it a permanent success two things are absolutely necessary. We require a numerous and regular attendance of the assistants and apprentices on the one hand, and on the other the hearty co-operation of the employers

by removing any obstacles which might interfere with that regular attendance of those in their employment. Let us, therefore, by uniting our efforts and conserving our means amongst ourselves, in preference to sending subscriptions to the Pharmaceutical Society in London, establish a school of pharmacy here which will vie with kindred institutions in the south."

The speech, which was well received, was followed by an excellent concert, vocal and instrumental music being given by talented amateurs in a very effective manner.

Votes of thanks were then awarded, and the company adjourned to the ball room, where dancing was engaged in with great spirit for several hours. Supper was served in the square and round rooms; but only temperance beverages were provided. The want of spirituous liquors did not seem to be felt as any deprivation, and certainly did not detract in any way from the happiness or enjoyment of the large and gay party.

The whole conversazione was a decided success, and the committee deserve warm commendations for their excellent arrangements.

MIDLAND COUNTIES CHEMISTS' ASSOCIATION.

The annual *soirée* of the Midland Counties Chemists' Association was held in the Town Hall, Birmingham, on the 23rd ult. There was a large attendance of chemists and their friends. Among those present were Alfred Hill, M.D., F.C.S., Dr. Bottle, and Mr. A. Bottle (Mayor of Dover).

The hall was brilliantly illuminated by the electric light, the nine Jablochkoff lamps used for this purpose were supplied and worked by Messrs. Martineau and Smith, of Birmingham. The light was steady and beautiful, producing but little heat, the temperature of the hall remaining comparatively cool throughout the evening. The entertainment commenced with a promenade concert and operatic selection by Messrs. Symes and Gilmer's grand military band and the organ.

The music was well rendered and highly appreciated, especially the air from "Nazareth" and the march from "Naaman," which were finely given by the band and organ together, Mr. Stimpson presiding at the organ.

Mr. H. W. Jones, F.C.S., F.R.M.S., then exhibited a series of interesting and instructive chemical experiments in the corridor, showing the combustion of a steel spring in oxygen gas; the burning of carbon in oxygen, producing a new gas, which instantly puts out a burning candle placed in it. The effect of monochromatic light was explained and illustrated, engravings and flowers beautifully coloured by daylight appearing quite black under the influence of monochromatic light. The demonstrations were attended by a large number of visitors who were much interested.

Professor Neddyson afterwards delivered a highly humorous lecture upon his experiments and discoveries, which much amused the audience until about half past nine o'clock, when dancing was commenced, and was kept up till a late hour.

Proceedings of Scientific Societies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held at 17, Bloomsbury Square, on Thursday, February 13, when Mr. C. H. Hutchinson took the chair.

The minutes of the last meeting were read and confirmed.

Mr. H. R. Arnold then read a paper on "Cantharidin." Having briefly referred to the insect (*Cantharis vesicatoria*) yielding this body, and its mode of collection, the author proceeded to notice some of the official and non-official preparations of the same. He suggested that in "acetum cantharidis" the quantity of cantharides should be increased, and that they should be used bruised, not powdered. In "liquor epispasticus" he advocated the use of glacial acetic acid. The special subject of the paper was next dealt with. Cantharidin was first isolated in 1810, by Robiquet, by means of alcohol. It is now usually prepared by exhausting the flies with chloroform, distilling off the latter, and washing the residue with carbon bisulphide to remove fatty matters. Cantharidin is generally regarded as an anhydride, its formula being $C_5H_6O_2$. Combined with water it forms cantharidic acid; the latter forms salts, having the general formula $R'C_5H_7O_3$. Cantharidin is very slightly soluble in water, alcohol, and carbon bisulphide. It is soluble in ether, and very soluble in chloroform. It dissolves in hot glycerine, but is deposited again on cooling; its solution in sulphuric acid is precipitated by addition of water. A specimen of cantharidin in fine nearly colourless crystals, deposited slowly from liq. epispasticus, was exhibited.

A discussion followed, in which Messrs. Parker, Atkins, Naylor, Senier, and Branson, took part, and a vote of thanks was passed to Mr. Arnold for his interesting paper.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

[219]. Mr. J. W. Barnes writes that when the symbol ℥j is used, as in ordering a dose of Gregory's powder, "one drachm or sixty grains" should be written on the label, and not a teaspoonful. I altogether dispute his dictum. As a physician I say it is absurd to suppose any patient to whom Gregory's powder is ordered is expected to weigh every dose, or to know how much sixty grains, judged by the eye, should be. It would puzzle much shrewder men than Mr. Barnes to guess sixty grains of Gregory's powder. Let people exercise their thinking faculties, and we shall have less of those crotchets, and "I beg to differ," in your columns over such matters. I say when a medical man orders ℥j of Gregory's powder to be taken at bedtime, occasionally, he does not mean a tablespoonful, but a teaspoonful. The patient is not supposed to be skilled in drachms, ounces, or grammes. It is, therefore, useless in Mr. Barnes to stir up crotchets when common sense is outraged thereby.

The dose of Gregory's powder is 20 to 60 grs. or more. It contains one part of rhubarb in four and a half parts. A measured drachm is about 12 grains, or 77 centigrammes. A modern ordinary teaspoon measuring 80 minims, when filled without packing with Gregory's powder (B.P.) will hold conveniently about 20 grs. A tablespoon = ℥v (fluid measure) will hold 70 grs., equal to 4 grammes and 65 centigrammes.

A measured ℥ss, without packing, will weigh about 49 grains, or 3·25 grammes.

A large tablespoon, moderately packed, and the bowl exactly filled, will weigh 64 grains.

Look at any label—"one to two teaspoonfuls"—is the direction thereon, and, if we are to stick to the letter and not to custom, the sooner chemists alter their Gregory's powder labels the better. Everybody knows Gregory's powder is a mild cathartic, and as such it is ordered, but I have yet to learn that when a physician uses the symbol ℥j he means a tablespoonful of this old and universal remedy. As shown above, a large tablespoonful will weigh about 60 grains; but it is idle to dwell upon such matters when ℥j clearly means a teaspoonful measure of the powder.

Northallerton. HENRY BROWN.

[231]. I believe it is a general rule to retail for assafœtida pills the pil. aloes et assafœtidæ, B.P., and for galbanum pills the pil. assafœtidæ co., B.P., and to coincide with this I should feel safe in using pil. aloes et assafœtidæ when I had pil. assafœtidæ ordered in a prescription.

BURNHAM.

---

[235]. "Student" should or might well use his own discretion; but the liq. arsenici chloridi of the P.L. was, I think, evidently intended. The liq. arsenici hydrochloricus, B.P., is about three times the strength of the P.L. or De Valangius' solution. Three drops (a small dose) was De Valangius' quantum at the commencement of arsenical administration.

Northallerton. HY. BROWN.

---

[237]. I think the medical man who expected Mr. W. P. Parry to use glycerinum acidi carbolici must have found out his own mistake, and wished to roll it upon the back of Mr. Parry.

Glycerine of carbolic acid only contains one in five, and with the addition of ℥j glycerine, and ℥ij acid. sulphuros., it would make a most presentable ointment indeed—(?) lotion.

Northallerton. HY. BROWN.

---

[238]. Mr. Richard Twemlow asks for the formula of mas. pil. cupri ammon. acet. (?). What the writer of the prescription meant was, no doubt, the pills of ammoniated copper of the Edinburgh Pharmacopœia. They were made by mixing one part of cuprum ammoniatum vel ammonio-sulph., with six of bread crumbs, and adding solution of ammonia so as to form a mass.

The dose of the cuprum ammoniatum was from half a grain to one grain. It has almost gone out of fashion. I have used it in epilepsy, but to no purpose.

Northallerton. HY. BROWN.

---

[239]. "Delta" asks for Hebra's formula for his (tar) tincture. Equal weights of soft soap, archangel tar (not gas tar), and rectified or methylated spirit of wine. My plan is to put all into a tin vessel, and immerse in a basin of boiling water, carefully stirring during the process of melting, and taking care not to have the tin vessel over full. A short time completes the process.

Northallerton. HY. BROWN.

---

[239]. In reply to "Delta," the formula for Hebra's tincture is—

℞ Picis Liquidæ (Wood Tar),
Sapo Moll.,
Spt. Vin. Rect. (Methylated). . . P. æ.
Ft. tinct. sec. art.

Lincoln. N. T. O.

---

[244]. I think "Juvenis" would have been safe in dispensing the prescription thus:—

℞ Tr. Guaiaci Ammon. . . . . ℥iv (4 drams).
Aquæ . . . . . ℥vj.
M. Sig. Two tablespoonfuls three times daily.

If the patient lived at a distance I would be inclined to send a double-sized bottle. W. SCOTT.

Dublin.

---

[244]. If "Juvenis" nearly fills his bottle with aqua, and then adds the tinct. guaiac. ammon., pouring it into the centre of the water, he will make a satisfactory mixture. REX.

---

[249]. In answer to "Sub Umbra Floresco," I have made the ointment by rubbing the pot. iodid. and iodine together into a very fine powder, then adding spt. and finally the lard. REX.

---

[249]. In answer to "Sub Umbra Floresco," I should certainly dispense the prescription by first dissolving the potass. iodid. in ℥j aq. destillat., and mix with the adeps., then add the iodine, previously dissolved in the ℥j Spt. V. R.

Dublin. W. SCOTT.

---

[251]. GLYCERINE OF TRAGACANTH.—The following is inserted in answer to "Patrington" and several other inquirers:—

Pulv. Tragacanth. . . . . ℥j.
Glycerinæ . . . . . ℥j. by measure.

Put the tragacanth into a mortar, and add the glycerine with constant stirring; when mixed pour it into a covered pot. In a day or two it will solidify and become transparent; in this state it may be kept for use on the dispensing counter, and requires no addition for its preservation.

---

[252]. Would any reader oblige by stating the best way to make up the following:—

℞ Acid. Carbol. . . . . gr. j.
Ferri Sulph. Exsic. . . . . gr. j.
Pulv. Opii . . . . . gr. ¼.
Pulv. Gentianæ . . . . . gr. j.
Ft. pil., in arg. j ter die.

EXONIAN.

---

[253]. What is the best and quickest mode for making up the following:—

℞ Ferri Iodidi . . . . . ℥j.
Pil. Phosphori . . . . . ℥j.
Acidi Carbol. . . . . ℥ss.
M. ft. pil. 40. Capt. j, ter die.

EXONIAN.

---

[254]. Will some of your readers kindly inform me how the following mixture should be dispensed, as I apprehend it was the intention of the prescriber to be poured out in ℥ ij doses in ℥ij of water.

℞ Quinæ Disulph. . . . . gr. xij.
Magn. Sulph. . . . . ℥vj.
Acid. Sulph. Arom. . . . . ℥ij.
Tinct. Aurantii . . . . . ℥iss.
Aq. . . . . ad ℥iij.

℥ij in ℥ij of water before food two or three times a day.

This prescription had previously been dispensed by one of our great guns (Major). "Hence my alarm."

W. N. G. LANCE, M.P.S.

207, *Copenhagen Street, Islington, N.*

---

[255].

℞ Tr. Nucis Vom. . . . . ℥j.
Ac. Hydroch. Dil. . . . . ℥ij.
Aq. Destil. . . . . ad ℥iss.
M. ℥j ex. aq. ter. in die.

This made a very unseemly mixture; in the course of two days a thick cloudy film floated on the top. I should feel obliged if any reader would enlighten me on the subject.

KENBAAN.

---

[256]. The following was presented the other day and I should like to know if I did right or wrong in adding a little suspending fluid without the sanction of the writer. Seeing that it would make a very inelegant mixture, one which the patient could not possibly take with the proper proportion of guaiacium in each dose, I took the liberty to add ℥vj of mucilage to give a satisfactory result:—

℞ Potass. Iodid. . . . . ℈j.
Tinct. Guaiaci Co. . . . . ℥iv.
Spt. Ammon. Arom. . . . . ℥ij.
Aq. . . . . ad ℥vj.
M. ft. mist. Capt. ¼ pt. bis dil.

J. W. BARNES.

[257]. In the following prescription it would be a great saving of trouble, if, instead of rubbing the gum and oil together in a mortar an equivalent quantity of fresh mucilage was used and shaken in the bottle with the oil.

Might the mucilage be used, and could an equally good mixture be obtained?—

℞	Ol. Santalis	℥vj.
	Pulv. Acaciæ	℥iv.
	Potas. Bicarb.	℥ij.
	Aquæ ad	℥vj.

M. et ft. mist.

J. H. G.

---

[258]. Will some of your readers kindly give their advice as to how the following prescription should be dispensed to produce a presentable mixture?—

℞	Quinæ Sulphat.	℈j.
	Acidi Citrici	℥iiss.
	Syrupi Ferri Iodidi	℥j.
	Potassii Iodidi	℥j.
	Tincturæ Iodi	℥iss.
	Aquæ ad	℥viii.

Misce. Fiat mistura. Cap. $\frac{1}{8}$ part. bis die.

KENT.

---

[259]. Will any one inform me how to dispense the following?—

℞	Balsam. Tolu.	gr. 120.
	Ol. Rosmar.	♏xx.
	Tinct. Canth.	℥iv.
	Ol. Ricini	℥j.
	Adipis Præpar.	℥j.

M. To be brushed into the scalp night and morning.

I inquired if the prescriber had not made a mistake in writing "Tolu" instead of "Peru," but was informed that the prescription was correctly written. W. M.

---

[260]. Opium is described in the B.P., page 230, as "the juice inspissated by spontaneous evaporation," etc., and the strength of tinct. opii is given as nearly 33 grains of the above to the ounce, which corresponds to 1½ oz. of opium (moist or dry, as its normal condition may be) to 1 pint. If dried opium is to be used for the tincture the statement on page 231 is incorrect, as the strength of tr. opii will be about 40 grs. of normal opium to the ounce.

Pau. PHARMACIEN.

---

[261]. Will some of your readers kindly inform me if mist. ferri comp., B.P. (chemically speaking), contains saccharated carbonate of iron? I was told the other day by a medical man that he supposed when ordering the same he was prescribing saccharated carbonate of iron.

Islington, N. W. N. G. LANCE.

---

[262]. Would any one supply a formula for preparing lin. potass. iod. c. sapone, so as to form a clear liniment? Professor Tichbourne prepares a clear liniment the same strength in potass. iod. as that of the B.P.

DELTA.

---

[263]. What should be sold for spirit of hartshorn? How should hartshorn and oil be prepared?

JAMJAM.

---

[264]. Is it correct to send out a 10 oz. or 8 oz. mixture when it is ordered:—

Aquæ ad *O*ss.

There seems to be a great difference of opinion. I always send out a 10 oz. mixture. Please say if I am correct in so doing, and oblige.

A. P. S.

---

[265]. Will an experienced pharmacist kindly tell me the best excipient for pil. hydr. subchl. co. when in powder? And does he not think something might be found to replace castor oil in the B.P. mass, so that it might be kept in a miscible and rollable condition?

J. H. G.

Notes and Queries.

[553]. CHILBLAIN LINIMENT.—

℞	Cupri Sulph. Purif.	gr. vj.
	Eau de Cologne	℥ss.
	Aquæ Dest.	℥ss.

M. ft. solutio. To be applied twice a day with camel hair brush.

W. M. I have found the above to be a capital remedy to arrest the inflammation in chilblains. E. H. B.

---

[554]. OINTMENT FOR "ITCH" NOT CONTAINING SULPHUR. — In reply to "Helleborus Nigra," I send the following formula for unguentum styracis compositus:—

		Grams.
℞	Olei Cetacei	90
	Styracis	30
	Ceræ Flavæ	15
(U.S.P.)	Tincturæ Benzoini	·5
	Anchusæ Radicis	·5

Melt the wax, add the oil and the alkanet root, strain through muslin, lastly adding the storax and benzoin tincture.

Boston, Mass. FRANK A. DAVIDSON, PH.G.

---

[561]. UNG. CITRINI DIL.—If "Sub Umbra Floresco" will turn to the *Pharmaceutical Journal* for February 23, 1878, p. 681, he will find what he wants. To state the case briefly, the discoloration is due to the *de*-oxygenation of the oxide of mercury. This is accelerated by fresh lard. Nothing, up to the present time, is so good as vaseline for diluting ung. hyd. nit.; spermaceti ointment is far inferior.

Northallerton. HY. BROWN.

---

[562]. SYRUP OF HYPOPHOSPHITES OF LIME AND SODA.—Squire gives the following formula for syr. calcis hyphophosphitis.

℞	Calcis Hypophosph.	℥iij.
	Sacchar.	℥xxxvi.
	Water	℥xxx.

Solve.

This is readily made, provided no heat is employed in dissolving the lime, and contains nearly 3 grains in the dram. It forms a rather thin syrup, however, and the following will be found more suitable.

℞	Calcis Hypophosph.	℥j.
	Glycerini	℥ij.
	Syrupi Simplicis	℥xviii.

Solve et misce.

This also contains 3 grains in the dram, and is prepared by finely powdering the lime, rubbing in the glycerine and adding them to the syrup. Agitate occasionally and in about a day a solution will have been effected. If a larger proportion of hypophosphite is required, recourse must be had to hypophosphoric acid to dissolve it. Squire gives the solubility of the lime as one in six of water, but I think this must be a mistake as I have not been able to prepare a solution stronger than one in eight.

The hypophosphite of soda being readily soluble, K. B. should find no difficulty in preparing, with ordinary simple syrup, such a syrup as he desires.

Edinburgh. T. M.

---

[563]. SYR. LIMONIS.—I should recommend "Alpha' to use either syr. limonis, B.P., or the following:—

℞ Succ. Limonis . . . . . ℥iss.
Lemon Flavour (*Not Ess. Lemon*) . ♏x.
Aq. Aurant. Flor. . . . . ℥ij.
Syrupus Limonis, sp. gr. 1·330 . . ℥x.

if he is determined to make it as he himself suggests. I may say that I once made one as follows, but have now abandoned it for the above, which is a more preferable article by far:—

℞ Acid. Citric. . . . . grs. 40.
Ess. Lemon . . . . . gtt. ij.
Lemon Juice . . . . . ℥iss.
Syrupus . . . . . ℥xvj.

Mix the ess. lemon with the acid. cit. and allow it to stand in a closed bottle for seven days, then add the syrup, and lastly the lemon juice.

E. H. B.

---

[565]. CLEANSING DRINK.—T. W. will find as under a recipe for a good cleansing drink:—

℞ Pulv. Potass. Nit. . . . . ℥j.
Sulphur Subl. . . . . ℥j.
Ferri Carb, ... ℥ss.
Pulv. Diapent.* . . . . . ℥ij.
Sodæ Sulph. . . . . ℥ij.
Magnes. Sulph. . . . . ℥iv.

Mix and divide into two drinks; administer each with a suitable quantity of warm gruel.

E. H. B.

---

[567]. INDIAN BRANDY.—

℞ Sp. Æther. Nit. . . . . lbx.
Aq. Puræ . . . . . lbj.
Syr. Simplicis . . . . . lbiv.
Sacch. Ust. . . . . ℥ij.
Tr. Capsici. . . . . ℥ss.

"Lewis" will find the above recipe a good one for what is sold under the name of Indian brandy.

E. H. B.

---

[571]. GUAIACATE OF LITHIA.—W. C. asks what guaiacate of lithia is, etc.

It was introduced by Dr. Garrod. The dose is about five grains, and it may be useful in gout and rheumatism.

It is made by digesting guaiacum resin in a solution of lithia, evaporating, and then scaling, as is done in ferri cit. c. quina, etc.

Northallerton. Hy. Brown.

---

[573]. TINCTURE OF IODINE (CHURCHILL).—I would be very much obliged if any of your readers would communicate me a formula of the composition of "Churchill's Tincture of Iodine."

Esser.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

Ergotinine.

Sir,—It is with astonishment that I have just read in the last number of the *Pharmaceutical Journal* the reclamations of M. Blumberg. According to that author, ergotinine could not well be other than the body that he calls "picrosclerotine," which was mentioned for the first time in the *Pharmaceutische Zeitschrift für Russland* for October 15, 1877. Also that it was obtained in a quantity so small as to be insufficient for its investigation.

My reply shall be brief; for the principal question rests upon dates and is easy to clear up. In 1875 I presented a *preliminary* note to the Paris Academy of Sciences. Having then been compelled to suspend my researches upon ergot of rye I did not resume them until 1877. It was then that I communicated to the Academy of Medicine a note accompanied by observations of Dr. Molé. This was on the 21st of August (which is not quite autumn, as stated by M. Blumberg). The *résumé* appeared in No. 31 of the Bulletin of the Academy and the entire note was published in the *Archives de Toxicologie* in the beginning of September. A final note appeared in vol. lxxxvi., p. 888 of the *Comptes Rendus de l'Académie des Sciences.*

In my reply to M. Dragendorff,— a reply that was published in the *Journal de Pharmacie et de Chimie*, and which was kindly reproduced in the *Pharmaceutical Journal*,— I have shown that the nearly colourless ergotinine (since I have obtained it quite white) cannot contain red sclererythrine and incidentally I have indicated the employment of ether in saying that "acids remove ergotinine from its ethereal solution."

In my note on the 21st of August I say expressly that it is necessary to substitute ether for chloroform, the disadvantages of which I had soon observed.

As to the characteristic reaction of ergotinine, M. Blumberg will see in a detailed memoir which is about to appear that I now recommend in order to obtain it to dissolve the alkaloid in a few drops of acetic ether before adding the sulphuric acid. Every chemist knows that the colour reactions obtained by the action of energetic reagents upon akaloids are delicate, and are sometimes capricious according to the mode of operation and the greater or less purity of the body. Also, if I have given variations, and I give yet another one now, it is because I maintain that the reaction indicated can be obtained certainly and easily, and to this I now adhere. I would remark that the characteristic of this colour reaction is that the coloration, at first red-yellow, then violet-blue, does not disappear upon the addition of a large quantity of water. As I pointed out this reaction in my note at the end of 1875, how is it that the ergotinine obtained by the process that I described has not given it?

M. Blumberg has not been able to analyse his picrosclerotine and ergotinine because of their great instability! Ergotine is very instable, I admit, but not so much so as this author wishes to make out. With certain precautions it may be obtained and preserved perfectly white and well crystallized. By referring to my last note he will see what is the composition of crystallized ergotinine.

Thinking that it would be acceptable I would ask you to present to the Pharmaceutical Society of Great Britain the specimen of crystallized ergotinine that I send to you at the same time as this letter.

Troyes, February 6. C. Tanret.

Hypochlorite of Sulphur.

Sir,—In the Journal of Jan. 18, "F. B. W." recounts his experience of the unpleasant results following the sudden release of gases long pent up in a bottle of hypochlorite of sulphur. Such a discomfiture has been the lot of most of us at some time or other, and an easy way of avoiding its recurrence without risking deterioration should be a desideratum.

The following is an unobjectionable plan, and proves to be remarkably convenient in practice. Let the evil smelling compound as soon as it is received be very smoothly

rubbed with three times its weight of lard, and then stored in a wide-mouthed bottle. The hypochlorite is not apparently the worse for six months' association with the fat, which is more than can be said of it after solitary confinement for the same period, and the dispenser will not damage his bottles, scales, or nerves, when he prepares his ointment.

Clifton, Bristol. J. W. WHITE.

THE TRADE OF A CHEMIST AND DRUGGIST.

Sir,—The correspondence in your columns respecting the position and prospects of chemists and druggists is very interesting, and I have no doubt obtains the serious attention of many a member of the trade, who, squeezed between the grocer or oilman, on the one hand (trading in almost everything but the scheduled poisons), and on the other, by the surgeon dispensing all his own physic, thinks his case hard; but added to these gentlemen, and worst of all, he has a serious drain upon his fair and legitimate business area, from which he should obtain customers, by the various stores in the City holding out inducements sufficient to allure his neighbours to their net, and in many instances the tradesman finds himself in a growing neighbourhood with a declining business.

Our country brethren have not at present felt this pinch so painfully or generally as London and suburban men, but their turn will inevitably come, and it behoves us all (town and country) to take some steps to enable us to meet the difficulties against which we must contend, or be swept aside by the competing forces.

Three courses are open. We can leave things as they are, inspired by the faith of Mr. Micawber, and vainly imagining that the public with their hunger and greed for cheapness will not prefer to save 3*d.* out of 1*s.* 1½*d.*, or that the fashion and mania for stores will wane, and the supporters thereof will return to us in penitence for having so unkindly left us.

The second course is to procure legislative interference on our behalf, and thereby confine the sale of medicines and drugs to registered chemists and druggists. I would ask, who are the men in either House of Parliament to represent us? What influence can we bring to bear to attain our object? And is it reasonable to expect that in a house composed for the most part of scions of the nobility, you will find sufficient sympathy for chemists and druggists to induce them to pass a Bill in our favour, and in defiance of the principles of free trade, which are (spite of the reciprocity cry) now more firmly established than ever.

The third course is to gird up our loins, put on our armour, and fight. Failing to do this we are in the position of the waggoner praying to Jupiter, with his vehicle imbedded to its axle trees in the mud.

We must sell cheaper.

Granted that our profits are not greater than in most cases we require in order to live.

Granted that these are justified by our education, examinations, responsibility, etc.

Granted that if we do this many of our number cannot live, and must inevitably go to the wall, towards which they are even now being hopelessly driven.

I would ask, will the public allow these reasons to influence them in their selection of a shop where to buy their drugs, etc.? Will they not go where they can get them cheapest, even at any amount of personal inconvenience, and only use the nearest chemist on Sundays or at night, when their usual resort is not available.

To sell cheaper we must buy cheaper.

The co-operative and store system does away with the middleman; we must adopt that system, and obtain our stock at first hand. I say nothing against wholesale houses, but I do ask from whence do the various stores obtain their drugs, chemicals, and patent medicines?

Wanted to carry out this object: Premises in a cheap locality, a sufficient number of chemists and druggists as shareholders to provide the necessary capital, all pledged to support their own store, a committee of inspection, an experienced buyer and manager, and a proper working staff.

What are not wanted: Several principals to live out of the concern, an expensive staff of travellers, long credit to customers, and the inevitable concomitant, bad debts.

Perhaps you will say all this is very crude and theoretic, doubtless it is so; but all that is wanted to make it *un fait accompli* is unity, mutual confidence, co-operation, and energy.

Is it possible for druggists to rise above the petty details of the counter, and attempt a solution of their difficulty in this manner, or are we still to persevere in the attitude of the waggoner aforesaid?

89, *Acre Lane, Brixton.* NATHANIEL W. GOGGS.

Sir,—As one who has not long left the ranks of the assistants to enter those of the principals, I venture a few remarks on this well worn subject.

As regards competing with the "stores" or cutting tradesmen by lowering our prices, whether of patent medicines or drugs, it seems altogether out of the question. You, sir, in your able leading article on co-operative trading in your issue of January 25, instanced the Civil Service Stores to show to what extent they injure the retail trader; any one carefully reading the statistics there given will see that 2 per cent. is over-estimating their profits. Can any retail chemist live on such a profit, even supposing his gross returns by lowering prices should be increased to a considerable extent? The answer is self-evident.

There is a great deal in Mr. Wade's observation, "Our future is dispensing;" but some of our country brethren will doubtless think such a future very far distant from them. Business differs so much in various localities that it is impossible to lay down any hard and fast line for prices or anything else; but if the future of the trade is to be brighter than the present I think it will have to depend largely on individual effort, rather than on any help we shall derive from "the powers that be."

Let each member of the trade take for his motto, "*Facta non verba*," and strive to elevate his calling in the eyes of the public; depend upon it the public will estimate a man by his own standard. If he cuts prices and degrades his business he will not gain its respect and ultimate support the same as the man who, taking an independent stand and having qualified himself by study and experience to select or manufacture pure drugs or chemicals and dispense the same, looks to the public to acknowledge his qualifications; it will never do that if he underrates them himself.

Herne Hill. ALFRED PEEL.

Sir,—While recognizing the sound common sense which pervades the letter from your correspondent, "Edinburgh," in last week's Journal, I would draw attention to some statements contained in it which ought not to pass unnoticed. I refer especially to the latter part of his communication, where "Edinburgh" seems to take it as a matter about which there can be no question that chemists are inferior to their neighbours, the grocer, draper, etc., in business qualifications, in experience, as politicians, and as educated men.

I would like to ask "Edinburgh" if our apparent inferiority as men of business is not due to the fact that our trade gives little scope for the display of business qualifications. It has, undoubtedly, its commercial aspect, but the greater part of our duties are more strictly professional than commercial. It is, I believe, on the careful developing and perfecting of this branch of our profession the future of our trade depends. The selling of patent and proprietary articles, which might be equally well performed by any huckster, ought to be steadily discouraged. They lower our standing in the estimation of the public, curtail the sale of our own drugs, yield small returns, and are likely to yield less. It is by aiming at a high standard of proficiency, supplying only the best material, and charging a fair and remunerative price, rather than by any extraordinary display of business acuteness, that we, as chemists, may hope to command success, and obtain the esteem of our fellow men.

As to want of experience, I must confess I scarcely understand "Edinburgh." It is no unusual thing to find chemists holding offices to which only men of experience and discretion would be appointed. This is perhaps not so noticeable in our large cities as in our smaller provincial towns and villages, where we invariably find chemists looked up to as men of experience and ability. It is, doubtless, quite true that from the greater amount of time and attention which we must devote to our profession,

grocers, drapers, etc., hold many offices and perform many public duties which we would not be justified in accepting. This want of time on our part is recognized by our Legislature, which provides that all pharmaceutical chemists shall be exempted from service on juries or inquests. I therefore conclude that to attribute to inexperience, that which is referable rather to a peculiarity of our profession, is decidedly unfair.

Politics may also be put down as demanding, for its successful prosecution, a much larger amount of spare time than any ordinary chemist has at his disposal. I have, nevertheless, found chemists, as a rule, keen political disputants, holding distinct and well defined convictions, which they are at all times prepared to defend, though they may not find it convenient to obtrude.

It seems that in the matter of education we must be content to stand second to our "neighbours" already mentioned. This is giving but a sorry account of the years of persevering exertion which have been devoted to raising the educational status of chemists by the Pharmaceutical Society. The course of study required to pass the examinations which "Edinburgh" chooses to regard with such undisguised contempt renders the very comparison odious, and the assertion absurd. He gives us credit for passing these ordeals only because we must, and not from any desire for higher culture. I am not prepared to say that this is not the rule, but if it be so, I maintain that it is a rule to which there are many exceptions, as proved by facts within the cognizance of all. I can also bear testimony from personal experience, that the study required for these examinations, owing to disadvantages, induced by long hours and small pay, demands no small amount of honest hard work.

That is but a gloomy retrospect which "Edinburgh," by implication, presents to the chemist in his riper years. Most people would say, that any man who claimed to have at all times obeyed the maxim of "Doing to them as I would them do to me," did but demonstrate his own blindness and partiality, and I fail to see why the experience of chemists in this respect should differ from that of other mortals.

Trade is depressed over the whole world, and it is little wonder though we should feel the effects of the prevailing commercial disorganization. Let us faithfully perform our part to the utmost of our ability, and though we may not in our later years be able to say that we have "fulfilled our mission," we shall at least have the satisfaction of having done what we could.

Edinburgh. FIAT JUSTITIA.

Sir,—It is a trite saying "Extremes meet" and here is an instance. "An Outsider," who is quite ignorant of the subject on which he presumes to address you, coolly dogmatizes as to what chemists and druggists should do in the conduct their important duties.

An "Insider" styling himself "Edinburgh" is irate with one "Hampshire" for squatting in his arm chair, arms folded, legs stretched out, etc., "a position amusingly absurd and utterly indefensible," a graphic description truly, suggestive of the natural attitude of "Edinburgh" when he thinks he has demolished an adversary.

Sitting by "his ain fireside" glowing with the effects of good cheer, his admiration rises at the "sight of such a letter as 'Outsider's," but he cannot understand why "Hampshire" does not take the suitable steps for this prevention of the evil instead of writing to an "almost impotent agent." This, sir, I must say is anything but complimentary language, and is inconsistent with the concluding sentences of this incomprehensible letter:—"I have had the reduction question before me some time," "seeing the question in our trade organ (the 'impotent agent') I deemed this a more suitable opportunity."

I have neither time nor desire to dissect this illogical jumble of nearly two columns of your valuable space, but should certainly advise "Edinburgh," if he does not himself use his filtering apparatus, or his winnowing machine, to take a light course of Whately, or if this hard-headed thinker is beyond his usual habit of thought, the milder form of Dr. Isaac Watts's 'Improvement of the Mind' or his 'Easy System of Logic;' he will then be more competent "to intimate his views at the annual meeting" or in "our trade organ," and to insure a more patient auditory or readers.

SEXAGENARIUS.

Sir,—I am loth to intrude further on your space in reference to the above subject, and I write rather on behalf of others than myself, though further I am anxious not to be misunderstood. So long as quack medicines may be prepared and dispensed by any ignorant old woman or mendacious charlatan, and their compositions are kept secret, it is most absurd to suppose that the Legislature will pass any enactment empowering druggists only to be the ultimate purveyors of them to the public.

In my communications I made no allusion to co-operative stores. I specially attacked the "cutting traders," *alias* "cutthroats" (the term is not my own, but I am not ashamed to employ it) of our own body; but of course my advice to assistants applies equally to their taking service in the pharmacies of the stores.

As it is imperative on the pharmaceutists of Great Britain, like their professional brethren in France, and Germany, and Russia, and other European countries, to pass an examination to qualify them for the exercise of their profession, it is a legitimate and important question, whether the pharmaceutists of this kingdom, having duly qualified themselves, are as efficiently protected as they should be. The pharmaceutists of the continental countries have as absolute protection as the legal and medical practitioners of England have. They only can dispense medicines and deal in drugs and chemicals, and even herbalists in France are compelled to pass an examination. Why, then, if British pharmaceutists are obliged to qualify themselves and submit to an examination, should Britain be the only country in Europe in which all drugs and chemicals—save a comparatively few, scheduled as poisons—may be sold by grocers and others, instead of only by the legally qualified pharmaceutist? It is an anomaly—a wrong, which surely admits of a remedy, and which should be sought earnestly and secured if possible.

"Oh! that my enemy would write a book!" I wish your correspondent who signs himself "Edinburgh" would write one on Pharmaceutical Ethics. It would certainly be entertaining;—whether it would be instructive is another thing. He discerns immorality in a druggist's profits being greater than a draper's. In the course of a very long day's work a man standing behind a druggist's counter will take on an average £2. Another behind a draper's counter will probably take in a day two-thirds the length of that of the druggist from £8 to £10. Fix the profits of each at 25 per cent.; the druggist will have earned 10*s.*, while the draper will have earned from £2 to £2 10*s.* Therefore, to urge that their percentage of profit should be equal is palpably absurd.

My name is Brown; I carry on the business of a pharmaceutist in the principal street of my native town. Jones first and Robinson, higher up the street, are my nearest competitors. For years we carried on our respective businesses amicably, obliging each other with anything of which we might have run out, and charging what are generally considered fair—not "tip-top," not "extortionate"—prices. *Ex gratiâ*, 1*s.* 6*d.* as a rule for mixtures,—less, of course, if it were for a poor person,—3*d.* per ounce for castor oil, and 4*d.* for finest picked senna, and so on. All at once Jones, without any intimation to Robinson or myself, suddenly issues a priced catalogue, not only to his own customers, but to Robinson's and mine, and to those of every other druggist in the town, announcing that he is going to sell every drug, chemical preparation and proprietary article at such a reduction that his percentage of profit will be fully two thirds less than it was before. *Ergo*, supposing our three businesses equal, he must do more business than we all three had previously done—for his staff must be increased in proportion—to get the same amount of income as he had in the past. In short, he must hope to aggrandize himself by virtually swallowing up the businesses of Robinson and myself, for I know he is not such a fool as to suppose that the public had only been waiting for a reduction in the price of castor oil and epsom salts to enjoy the luxury of purging themselves three times where before they could command the luxury but once. In "Edinburgh's" opinion Jones is a worthy,—his conduct reputable, well principled and honourable. Unfortunately, I,—with an "unenlivened mind," lacking "wit" and the "education" with which "bootmakers and grocers" are blessed,—fell into the error of characterizing Jones's conduct with epithets of an opposite kind. The result is that I have brought "Edinburgh's" heavy hand down on me, who not content with proving (?) that Jones is righteously "fulfilling his mis-

sion," and "spending a useful, upright and honourable business career," denounces me as an "extortioner," and without a "gentlemanly nature," because I have acted loyally to my professional brethren, and charged the prices that were wont to be approved by the whole trade, also by the medical profession, and were satisfactory to the public. He predicts that as a consequence, I shall "in my evening years" (alas! they are already upon me) be the victim of harrowing remorse and "compunction," unable to answer affirmatively "Have I fulfilled my mission?"

I have no doubt others will be disposed to expose "Edinburgh's" shallow sophistry and very peculiar morality, and I must be tempted to say but little more. I would just observe that having succeeded in climbing himself, and doubtless by his disinterested and philanthropic conduct secured a "roaring trade," he would fain render the path of ascent for his younger brethren as difficult as possible. That young men can now with a capital of from £200 to £500 enter into business with hardly a possibility of "becoming bankrupts if careful," is a matter of regret to him, and he would "minimize the probabilities and expectations of young starts," and doom to a life-long assistantship, hundreds, perhaps thousands, at least as worthy as himself, who hitherto may have had good hope of becoming after a few years their own masters. Let him succeed in minimizing the number of employers and maximizing that of *employés*, and the latter may become the slavish class which it is a libel of "Edinburgh's" to say they now are. I am happy to know that they are paid 100 per cent. more than it was customary to pay assistants when I was one, and that they are better lodged and better fed. In short they are as a rule treated as gentlemen and the equals of their employers. Were any attempt made to subject them to "slavish" treatment, I am quite certain the assistants in no other trade or profession would evince more independence or determination to resist it. It is right that so it should be.

Feb. 18, 1879. HAMPSHIRE.

Sir,—I have read with much pleasure some of the letters which have appeared in the Journal on the above subject, but was really disgusted and felt ashamed of myself to belong to the honourable calling of chemists when I read "Edinburgh's" letter last week.

"Edinburgh" asks "Does any reader suppose that the Pharmaceutical Society, etc., can compel any druggist who has an open door to regulate the price of his own drugs to their idea of profit and loss?" Certainly not; but he would have it to be so according to his opinion, nor do respectable druggists require compelling, for as a rule they can agree to get a fair profit and that only; it is only those "black sheep" chemists who need the Society to interfere.

In "Edinburgh's" next paragraph he tries to do a little theatrical business, which probably he is more fit for than being behind the counter.

Again he says, "Hampshire's position is amusingly absurd and indefensible." I beg to differ from him. I contend his letters have been written with common sense (which is lacking in that of "Edinburgh's"), and that if we abide by what he has written we shall before long (and the sooner the better) drive such as "Edinburgh" from our midst.

He asks "Why so many young men rush into business as they find opportunity?" and answers by saying because of the enormous profits. It does not appear so when we see so many chemists keeping open their establishments fifteen or sixteen hours out of twenty-four. I should rather think it was because those who cut prices cannot afford to give their assistants more than the paltry sum of £25 or £30 a year as salaries. Indeed, I hope the day is not far distant when such men will be unable to get assistants at all.

All admit except the *ignorami* that chemists are a superior class of people compared with drapers, grocers, etc., for they as a rule receive better education and must be better read in order to pass examinations. Moreover a conscientious chemist disposes of the greater part of his spare time in keeping himself up with the advance of science.

"Edinburgh" should remember his own seeming favourite adage "the stone that rebounded," and the still fitter one of "those living in glass houses," etc. Here he is quietly and contentedly casting the accusation at chemists as being dishonest through the profits of business, with no given proof but that of his own seemingly despicable experience and selfishness. Who but one blinded with selfishness could put forward the maxim "do to others," etc., when he himself is trying to show up the trade and its profits to all who care to pursue his unjustifiable attack? Every "man" wishes his neighbour to live (seemingly except "Edinburgh") and if the daily returns of the trade be, as I am bound to say they are, 50 per cent below those of the "lucky learned" trades, we must make up with extra profit in exchange for the education, study, experience and responsibility undertaken to the advantage of the public.

In conclusion, I think the members of our trade are entitled to more respect than to have the epithets applied by "Edinburgh" bullied down their throats. Apologizing for occupying so much space.

LEPO.

Sir,—We who have been residing in the land o' cakes during this very memorable winter, no doubt have felt the bracing influence of the lively discussions which have enlivened the pages of the *Pharmaceutical Journal* with respect to the dark future of the drug trade—more especially in the matter of prescribing, when we were supposed to be encroaching in the rights of our elevated "henbane divining" brethren.

But now we have a new cause for grateful satisfaction to our rulers in being so mindful of our existence. We have the Dental Bill and co-operative trading. How unhappy is the existence of the modern refined chemist, persecuted at all points, well may he exclaim, "O Ichabod, Ichabod, thy glory has departed from thee!" and how much more he has increased in consideration since the days of Shakspere; Truly we ought to be thankful.

It must be a great comfort to some of our much abused brethren to give vent to their feelings in the columns of the *Pharmaceutical Journal*, and highly edifying to the general community. To read some of the maundering letters on the subject of co-operation, one would think the death knell of the drug trade had been struck. Others remind me of the wailings of a kitten, when being strangled, in its last dying agonies, and the go-and-do-likewise policy might chime in there excellently well. What I would like to see written on the subject would be something with a more healthy ring about it, more like

> "The growlings of a fierce watch dog
> Newly aroused from sleep."

It seems to me that chemists are too apt to complain south of the Tweed, and too ready to give vent to their emasculate useless ideas; it is a pity we have not a Disraeli in our ranks—or even a Kenealy—the one by prudent silence, and the other by noisy declamation might eventually restore the drooping spirits of desponding chemists.

The way to treat this terrible grievance is not by underselling, but by endeavouring to do without the patents as much as possible and substituting proprietary articles in their place whenever it is practicable to do so; by entirely ignoring the existence of these worthless tradesmen; and if all that will not do, then as a last resource to remove oneself entirely from the vicinity of the bugbear.

I believe it has been the custom in every small town and village in the United Kingdom since time immemorial, for grocers and other tradesmen to undersell patent medicines, and I can speak from experience. Where I was an assistant for some years it was the custom of a co-operative store to supply patents and many simple drugs at a reduced rate. We were only a few doors from them, and yet we never to my knowledge undersold a single patent or drug during that time. What I maintain is this, that it is quite impossible for the public to do without us; they may buy a box of Holloway's pills at a store, but they are bound to come as necessity arises to the chemist.

My only fear is this, that chemists will ultimately require to go on the parish on account of the number entering its ranks; soon there will not be a corner to fill up in this tight little island of ours; nothing will be left for us but to combine with our chartered business the trade of shoemaking or painting, and to vary the monotony by having a fling at the Pharmaceutical Society occasionally to keep the blood warm.

Live and let live should be our motto, and until we have Imperial government in full force we can never hope to see free trade curbed, nor yet a man's inclination to start a store for the sale of cheap drugs checked so long as it is within the pale of the law. As regards that it is also a

custom in many towns for wholesale druggists to supply medicine to the public at cost price, and to dispense prescriptions also at the same rate. Such a thing is well known here, yet nothing is ever said about it, and we evidently wag out our daily lives little the worse of it, and as a rule quite indifferent whether they do so or not.

Edinbro'. J. K. N.

Sir,—Your Dewsbury correspondent "H" asks (page 611) if nothing can be done or suggested by those in power to ameliorate the condition of the chemist and druggist, a question which it is much easier to ask than to answer satisfactorily, for there seems to be a great difference of opinion amongst members of the trade. Writing on the subject of counter prescribing, Mr. Barnard Proctor (page 564) says, "that public safety has all the protection which it can hope to gain from law when the legally qualified man bears the hall mark."

According to his view, therefore, which cuts in two different directions, the entrance to the drug trade ought to be thrown open to all,—dispensing, sale of poisons, everything; it is sufficient, in his opinion, that a man is legally qualified. I do not know whether this is the opinion of many members of the trade, but judging from the letters which have appeared in the Journal, I think there are some at least to whom it is scarcely acceptable. At the same time, I would ask those who justify counter prescribing by men not educated for that purpose, if they think they can, with any consistency, ask Parliament, as some of your correspondents suggest, to give them, simply because they have the pharmaceutical mark, a monopoly in the sale of patent medicines and drugs in general?

Your correspondent "Hampshire" thinks the "whole matter" of counter prescribing "insignificant,"—consoling himself with the thought that he can go on supplying diuretics and febrifuges, etc., when such medicines might be required. One can scarcely, however, call the supplying of such things prescribing. I should rather apply the latter term to those cases where the chemist makes some examination of the patient, forms a judgment of the causes, etc., of the disease, and chooses a remedy to be administered for the cure. However, it is clear that if the medical profession ought to be thrown open, so also ought the drug trade, and if the chemist and druggist ought to be privileged by law, so ought the medical man.

But in the case of patent medicines and drugs in general, is it not in vain to appeal to the Pharmaceutical and Trade Societies or to Parliament? What can they be expected to do in the matter? If a grocer or any other shopkeeper reduce the prices of patent medicines, etc., there are two courses for the druggist to take; viz., to keep up the price and lose the sale, or to reduce the price and continue the sale.

This latter of course will reduce the profits, but vain repetitions and appeals to the Pharmaceutical Society will not mend the matter. Can then, nothing be done to improve the position?

It has been suggested that the patent medicine proprietors be asked to supply their medicines to chemists only, so as to keep up the prices. This is a question for the proprietors to consider, for it is certain that unless this be done every chemist will consider it to be his interest to make, recommend and sell, his own preparations.

Circulars have just been issued by the Leeds chemists (who have been compelled to reduce the prices of patents and sundries), asking,—

"1. Do you think that the formation of a company, under the Limited Liability Act, for purchasing patent medicines, proprietary articles (and possibly even drugs and chemicals) direct from the manufacturers, and re-selling them to *Registered Chemists and Druggists* only, on the lowest remunerative terms, is a desirable step?

"2. In the event of such a company being formed would you be likely to become a shareholder?

"3. How many £5 shares would it be probable that you would apply for?

"If a considerable number of favourable replies are received, a general meeting of the trade will be called to consider the matter.

"Replies to be sent on or before February 20, addressed to E. Yewdall, Wade Lane, Leeds."

If it be impossible for the sale of patent medicines to be confined to the chemist and druggist, may not, at all events, those containing poisons? And if the sale of drugs in general cannot be confined to the trade, may not many of the pharmaceutical preparations? This is a difficult subject to handle, and there seem to be differences of opinion even amongst non-members of the trade, for whilst "An Outsider" (page 651) declares that, "the day of protection is gone," more than one coroner's jury have recorded it as their opinion that the sale of drugs should be left to the educated chemist and druggist.

If the Councils of the Pharmaceutical and Trade Societies can do nothing for the trade in this matter (and in my humble opinion very little will be done), members of the trade will naturally ask themselves of what use it is to continue their subscriptions and to give their money for that which is not bread. Certain it is that if something be not done many will find themselves sinking in the struggle, and will have to seek some other means of livelihood (see edit. art., January 25); for "the inevitable result appears to be the extinction of a large number of small tradesmen." (Edit. art., February 1).

Dewsbury. I. J. K. L. M.

Sir,—None of your readers in the retail trade could fail to be as deeply interested as your correspondent "Nil Desperandum" with your graphic leader in the Journal of February 1, which treats the above subject with such cogency that it cannot fail to carry weight, the force of which every individual, deep-thinking chemist and druggist, who has at heart the cause of the future of legitimate pharmacy must feel, and must echo and endorse its sentiments as the exact counterpart of their own ideas. We ought really to be truly thankful to your correspondent "Outsider" for the rare privilege (through his uninitiated instrumentality) "to see ourselves as others see us" by the "power" of his "green" spectacles. I quite agree with him in his belief that a chemist may do as well for the public as any patent medicine maker, as the latter may be anything, from a qualified medical practitioner to the possessor of an odd three-half-pence, which sum would pass the most deadly poison under its cover into the hands of the public without any investigation whatever; in fact I take it that as the law now stands, the chemist may prescribe in any case, be it simple or complicated, so long as the protecting, all-powerful patent medicine stamp is affixed to the containing vessel of the "mysterious medicated concoction." They "manage these things much better on the Continent." But before "Outsider" imputed to us the motto "as it was in the beginning, is now, and ever shall be," he should have considered the peculiar position (as regards trading) in which the retail chemist and druggist is placed by the very nature of the avocation which he has chosen, in comparison with that of any other trading community. He stands alone, his hands tied to a certain extent, he must be nearly always in the shop and always on the *qui vive* whilst there, or the slightest error occurring in the substitution of one article for another would be attended with far more disastrous consequences than would befall the grocer, in such an error. And where, I would ask "Outsider," "would be the quiet of the dispensing counter and the nerve and necessary calmness of the dispenser of a well-regulated pharmacy, were we to enter into competition with the grocers and co-operative stores in the bustling heavy trade?" As to the $11\frac{3}{4}d.$ theory, I would disabuse his mind of that erroneous idea by reminding him that "all that glitters is not gold," and if he were to join the trade he would soon find out that the bright picture he draws in the Journal (a symphony in green and gold) would soon fade so far as the gold was concerned ($11\frac{3}{4}d.$ out of the 1*s.*) and leave him to ponder how verdant he must have been to have entered a trade which demanded of him so much time and care, both in and out of business hours, with no protection from the Legislature beyond having the exclusive privilege (?) to deal in poisons, which, having sold, he cannot be certain that they will be safe in the hands of the customers, and if by some rash act on their part the chemist is called to account, his name and business is brought into disrepute, losing thus the confidence and support of his customers, however blameless he may be in the eyes of the law.

Perhaps the chemist would have a better chance if he were able, like "Outsider," "to travel up and down the country," and as a merchant make his bargains in hundreds

of pounds, instead of taking those paltry sums over the counter which the grocer would despise, and for a few pence to have to talk ten minutes or a quarter of an hour to a customer as to the respective merits of certain remedies. Drugs not being in every-day consumption (in many cases not necessaries—and certainly never luxuries) ought to be paid for ungrudgingly when really required, including the skill, discretion, responsibility and advice (pharmaceutical) of the chemist and druggist, as the medical practitioner is paid for his advice (medical), and seeing that no other trade holds the life of a customer in its hand as does the chemist and druggist, he ought not to be placed on the same footing with ordinary tradesmen. It appears to me that if we do not unite promptly, and do something (besides talk) towards the amelioration of our condition, that the chemist and druggist of the future will be the dispenser at open surgeries of the medical men, and the retail drug trade will drift to the grocer entirely, and we shall probably find the annals of the Pharmaceutical Society of Great Britain deposited in the archives of the British Museum.

YORKSHIRE.

Sir,—That the above subject may be fully considered and discussed is my only excuse for presuming to occupy a space in your Journal. The remarks of your very conscientious correspondent, "Edinburgh," call for some retaliation. He strongly advocates honest profits, that is, reduced prices; not from any desire to be a "wretch concentred all in self;" not at all, but he says, reduce prices and you reduce profits, and thus minimize the probabilities and expectations of "young starts," and in a few years the result is a doubled business, and greater ultimate profits, and I would add, and a total annihilation of at least one half of the fraternity to which he belongs; but I doubt the wisdom of reducing profits. We will suppose, for example, that "Edinburgh" sells a dozen boxes of seidlitz powders per week, at 1*s.* 6*d.* each, result 18*s.*, and we will also suppose him to have a clear profit of 9*s.* upon the transaction; but his finely-strung conscience will not allow him to pocket such an extortionate and dishonest profit, and he very considerately throws away 3*s.* of clear profit, and conscientiously reduces the seidlitz about 17 per cent., or to 1*s.* 3*d.* each. Now, to realize his former profits he must needs find six additional customers, or increase the consumption 50 per cent.; thus eighteen boxes, at a profit of 6*d.* each, result 9*s.* I would remind "Edinburgh" that people do not consume physic with the same agility as they do porridge or Scotch marmalade; and I would also ask him whether in his judgment the consumption would be increased 50 per cent. by a reduction in price of 3*d.* per box. I certainly think not, and I entirely fail o see how in a few years, by thus reducing prices, the profits can be ultimately greater; but I can see, that the Register of Chemists and Druggists through the same means will become gradually smaller and beautifully less, and "Edinburgh" will probably find in his declining age, that his natural life has been considerably shortened by his adding 50 per cent. more care and anxiety to his already-burdened brain, with no additional profit.

FAIR PROFIT.

THE PHARMACEUTICAL EXAMINATIONS.

Sir,—As you very properly remark in your recent leader, the statistical report presented to the Council "ought to be scanned with special interest." In doing so, no part of the report is more important or interesting than that relating to the examinations. I will not now attempt to do more than draw attention to the percentage of rejections both in England and Scotland. We have in England 36·36, 51·33 and 56·00 per cent., and in Scotland 50·00, 39·64 and 57·14 per cent. failures in the Major, Minor and Modified respectively. Surely there must be some reason why so large a proportion are rejected, and why so small a proportion of Minor men go in for the higher degree.

It has long been my opinion that much of this must be owing to the terrible battery of examiners a candidate has to face. The report says that in England the average attendance of examiners has been 13·8, and in Scotland 7·20. This is formidable enough, for it simply means that each candidate has, on an average, to face 13·8 examiners in London and 7·20 in Edinburgh; but it will come out much more clearly if we take actual numbers instead of averages.

I find that during 1878 the number of candidates in London has been 77 Major, 528 Minor, 25 Modified, a total of 630, and the number of examiners (not individuals) has been 347 (this does not include Dr. Greenhow or other visitors present at the examinations), that is, more than half as many examiners as candidates!

Now, men are forced to pass the Minor, but can any one be surprised at so few facing the Major, although doubtless a very large percentage of the Minor men could pass, if so disposed when the higher examination is hedged in by such a battery of examining power as would terrify any but the most daring and venturesome?

As a matter of fact, the seventy-seven Major candidates of last year had to face one hundred and forty examiners, that is, very nearly two examiners to one man! And yet three examiners are considered by the University of Cambridge to be amply sufficient to conduct their mathematical examinations.

The four Major candidates in Scotland had the honour of being attended to by no less than twenty-two examiners: no wonder 50 per cent. of them grew nervous and failed. There seems very great waste of examining power somewhere; perhaps some one will be able to point out where.

DEVON.

A. B. C. (who should have sent his questions to the Editor).—(1) *White Oils or Egg Oils.*—The following is from Gray's 'Supplement':—Common Vinegar, ℥iss; Oil of Turpentine, ℥iss; Spirit of Wine, ℥iss; Goulard's Extract, ss: the white and yolk of two eggs. Mix the oil of turpentine and Goulard's extract with the eggs, then add the vinegar gradually, and last the spirit of wine. (2) See before, p. 689.

W. T.—For the probable impurities see a paper by Mr. Williams in vol. viii., p. 785.

Nobody.—We cannot assist you in your task of writing upon "nothing." Indeed, to judge from your lettter you appear to be a master in the art.

M. D.—Chloride of zinc or sulphate of iron.

COMMUNICATIONS, LETTERS, etc., have been received from Professor Dymock, Messrs. Codling, Mead, Gilmour, Wylde, Martin, Hardwick, Wallis, Challice, Taylor, Buck, A. P. S., W. C. M., B. B. B., Alpha, Nigel, Tom, Cheshire, Awlnot.

NOTE ON EASTON'S SYRUP.

BY WILLIAM GILMOUR.

In making Easton's Syrup the question has often forced itself upon me, how much quinine does it contain?

Some time ago the amount of iron entering into all the syrups of this class was investigated, but so far as I can recollect no notice has been taken of the quinine, and although the following experiments were undertaken in the first instance to satisfy my own curiosity, I think the conclusions may not be without general interest.

I may state at the outset that I have made no examination into the amount of quinine in commercial samples of Easton's syrup, for I do not for a moment doubt that the strictest adherence to the published formula is observed. What I assume is that in making the syrup the plan generally adopted is to reprecipitate the quinine from an aqueous solution of the sulphate by the addition of ammonia and then redissolve the precipitate thus formed in phosphoric acid. In doing this the amount of sulphate taken in the first instance is in proportion grain for grain to the amount of phosphate of quinine required for the syrup. The theory of grain for grain would in the main be correct enough were it not for the intermediate decomposition and necessary washing of the precipitate, and it was more immediately to determine the loss sustained in this operation as well as to ascertain the circumstances in which the loss would be reduced to a minimum that my experiments were principally directed.

Of all the authorities which I consulted previous to beginning my experiments, I found no two were agreed as to the solubility in water either of the sulphate of quinine or the pure alkaloid. I, therefore, had to begin as if I had no data to go upon, but this probably mattered the less seeing that it was next to impossible, proceeding as I did, to produce identity of experiment with any published authority, and therefore uniformity of result could scarcely be anticipated. One thing was quite apparent at the very outset, namely, that the less ammonia there was employed to produce complete precipitation of the quinine the less waste there would be in every way of the quinine. Now theoretically the amount of ammonia required to reprecipitate a solution of quinine made by adding one drop of dilute sulphuric acid to each grain of quinine, is less then half a drop of the strong solution of ammonia for each grain of sulphate employed. Practically, however, slight excess is requisite, and I found half a drop sufficient, and it is a quantity easily remembered. From my own experience I am convinced that large excess of ammonia is generally employed and a considerable waste thus takes place of the quinine. In these proportions I found that two waters were amply sufficient to wash the precipitate; the smell of ammonia as well as its action on test paper ceasing some time before the filtrate ceased to give a precipitate with barium.

In other words, experimenting with 87·2 grains of sulphate of quinine (that is one-tenth of the molecular weight of sulphate of quinine in grains), dissolving it in round numbers in 90 drops of dilute sulphuric acid, previously added to 10 ounces of water and reprecipitating with 45 drops of strong solution of ammonia, it required other 20 ounces of water to wash the precipitate free from any trace of sulphate, the free ammonia, however, ceasing to show before this quantity of water was passed through. I believe from other experiments as well, these conditions to be the most favourable to produce the plain quinia with the least possible loss. Employing still the same quantities, and under the foregoing conditions, to ascertain the actual loss, the mean of two experiments showed the loss over the 87·2 grains to be 8·6 grains of quinine, or nearly 10 per cent. This makes the actual quantity of phosphate of quinine present in Easton's syrup as nearly as possible ·9 grains to the fluid dram instead of one grain.

NOTE ON HERBA SANTA MARIA.

BY F. REY.

The plant which goes by this name in Brazil is the *Chenopodium ambrosioides*, L., or *C. suffruticosum*, W. It is a native of Mexico, but is now quite naturalized in Brazil. In the southern provinces of that empire it is known under the name of Herva de Santa Maria, and in the northern under the names matruz, mentruz and mastruco. These three names are used also for *Chenopodium anthelminticum* and for several plants of the natural order *Cruciferæ*, viz., *Lepidium sativum L. Bonariense*, *L. Senebiera pinnatifida*, D.C., and *Senebiera incisa*, Willd. In Lisbon and in the Azores, *Chenopodium ambrosioides* is known under the name of "herva tormiguera."

The plant has an almost woody stem about the size of a goosequill and from one to two metres in height. The leaves are alternate, lanceolate, sometimes slightly sinuate, or even strongly dentate; the flowers are very small and of a greenish colour; the inflorescence consists of simple leafy spikes. The fruit is small and entirely covered by the calyx. The seeds are very small, polished, and of a black colour. The root is yellowish externally and white inside. The whole plant has a powerful aromatic odour. In Europe it has been used by Plenk with good results in nervous affections, chiefly in chorea. He has usually given it in the form of infusion, made in the proportion of 8 grams of the herb to 230 grams of boiling water, with some bruised peppermint, a tablespoonful being taken morning and evening. He quotes several cases in which this remedy had given relief after all others had failed.

Dr. Mik (of the grand hospital), of Vienna, obtained equally good results from its use in similar complaints. He, however, always used it in conjunction with cinchona. In Brazil, the tops of the plant are used as a vermifuge, in doses of 6 to 8 grams, either in infusion or made into an electuary with castor oil, forming a dose which, although very disagreeable to the taste, is remarkably efficacious. In smaller doses it is given in infusion as a carminative, diaphoretic and emmenagogue in amenorrhœa, and in coughs and congestion of the lungs. *Chenopodium anthelminticum* also enjoys a great reputation as an anthelmintic.

Chenopodium ambrosioides is often confounded with *C. anthelminticum*. It differs from the latter in having a leafy inflorescence and in its less powerful but more agreeable odour. Another species, *Chenopodium Botrys*, L., which with *C. anthelminticum* shares the name of "Jerusalem oak" in the United States, is said to have been used in France with advantage in catarrh and humoral asthma.

The Herba Santa Maria of Piso belongs to an entirely different family of plants. It is the *Dracontium polyphyllum* of Linnæus, a plant possessing powerful stimulant properties.

E. The Amboyna Pine.—G. Die Knorrentanne.

This plant grows upon the mountains in the Moluccas, in Borneo, Java, and Sumatra. The greater part of our supply of the resin yielded by it comes from Amboyna, but for several years past the plant has been cultivated in Java also.

Extraction.—Immediately above the root of this plant there occur a number of excrescences, sometimes as large as a man's head, from which there flows an agglutinative liquid that solidifies after some days, the resin taking the form of elongated masses. The resinous liquid comes especially from the lower parts of the stem. To obtain the resin in larger quantities incisions are sometimes made low down in the stem, and according to Duplessy, immediately below these incisions are placed small reservoirs in which the liquid resin collects. According to Miquel this making of incisions at the base of the tree is useless, as the quantity of resin naturally excreted is very large. The dammar which exudes from the upper part of the stem solidifies and is eventually detached in the form of large stalactites, at first vitreous and colourless, but gradually taking a golden yellow tint. Large masses of dammar are very often met with on the banks of rivers in Sumatra, and are collected by the natives. Sometimes large fragments are also seen floating on the rivers.

Characters.—White dammar comes ordinarily into commerce in irregularly rounded pieces, $\frac{1}{8}$ in. to $\frac{1}{4}$ in. in diameter. Pieces occur, however, of a much larger size. On the exterior the fragments are covered with a white powder, which gives to them the appearance of pumice stone. Dammar yielded by the above-mentioned plant always occurs clear* or of a yellowish colour; it is transparent or translucent. It splits readily and is very friable; between the teeth it is reduced to a white powder, which adheres to them slightly. It is scratched by copal, and the softer pieces even by mica; but it is harder than colophony. Heated in the hand for a few seconds it adheres, but only very feebly. It softens at about 100° C.; at 150° C. it commences to melt, yielding a clear liquid that diffuses an agreeable resinous odour. When thrown upon burning coal an odour is quickly developed that recalls that of the pine and mastic.

The fracture of white dammar is conchoidal and vitreous. Very frequently in commercial samples gaseous bubbles are quite perceptible to the naked eye; in other cases fragments are quite turbid in consequence of the presence of an enormous quantity of gaseous bubbles and of small portions still liquid. Sometimes, also, vegetable *débris* is met with. If the surface of fracture be examined, as well that of recent fragments as of those that have been exposed to the air, lines are seen, proving the existence of a mass of fissures and flakes which can easily be recognized by the trained eye. The free surface presents nothing particular, and its characteristic aspect is to be attributed for the most part to the presence of a large quantity of gaseous bubbles. A very important character mentioned by Bernardin is that white dammar splits and cracks at the temperature of the hand.

The odour of white dammar is balsamic when the resin is quite recent; otherwise it is hardly noticeable. The taste is very slightly resinous. Its sp. gr. varies between 1·062 and 1·123.

Water removes from white dammar a small quantity of lime that occurs in it combined with sulphuric and organic acids. The white powder is not miscible with water, but it can be melted in water, forming a yellow mass that can be drawn out into threads which solidify as soon as removed from the water. White dammar is incompletely soluble in cold alcohol. It is moderately soluble in ether, the ethereal solution becoming turbid when treated with alcohol. It is soluble in boiling alcohol and the fixed and volatile oils, especially in oil of turpentine and boiling linseed oil. It is also soluble in chloroform, carbon bisulphide, benzol, and petroleum spirit; acetic acid, nitric acid, caustic soda, and ammonia do not dissolve it. Its alcoholic solution treated with lead acetate gives a precipitate the greater part of which disappears on boiling. The same solution treated with ferric chloride becomes pale green or brown, and sometimes there is produced a slight turbidity which disappears by heating. Ammonia causes a turbidity in the alcoholic solution. Bromine solution produces a brownish green colour. Alcohol saturated with hydrochloric acid produces a rose colour which changes to brown. Concentrated sulphuric acid dissolves the dammar with a brownish red colour, which under the action of alcohol gives a brown turbidity that changes to violet. The sulphuric solution treated with water gives white or very pale brown flocks. Carbonate of soda dissolves it in the cold or with heat, giving a colourless liquid.

* The differently coloured dammars of commerce are derived from a different source. Thus "black dammar" comes from *Canarium strictum*; "rose dammar" comes from another plant not yet determined; "saul dammar" comes from the *Shorea robusta*, etc., etc.

This solution treated with acetic acid becomes slightly turbid upon being boiled. Chloride of lime produces no change. Hirschsohn found in it no sulphur, nitrogen, cinnamic acid, or umbelliferon. Its solution in petroleum spirit was colourless and gave with solution of iodine a brownish turbidity. The residue from the evaporation of the petroleum spirit solution was coloured green by chloral hydrate. Sulphuric acid and Frohde's reagent dissolved it with a yellowish colour passing to a reddish yellow.

Composition.—According to Dulk, cold dilute alcohol removes from white dammar dammarylic acid ($C_{45}H_{37}O_4$), a white powder, melting at 50° C., having an acid reaction and capable of combining with bases. If absolute alcohol be added to the residue after treatment with diluted alcohol, it removes dammarylic anhydride ($C_{45}H_{36}O_3$), which resembles dammarylic acid, but its acid reaction is much more decided, and it only commences to melt at 60° C. The residue after these two treatments gives up to ether dammaryl ($C_{45}H_{36}$), a white shining powder, which softens at 145° C., and begins to melt at 190° C., forming a clear yellow oily liquid, which under the action of moist air quickly passes to dammarylic acid. The part insoluble in alcohol and ether is resinous, shining, and friable; it commences to melt at 215° C., and dissolves freely in hot oil of turpentine and in petroleum. Dulk calls it the "hemihydrate of dammaryl," and represents it by the formula $C_{90}H_{37}O$. The following represents the centesimal composition of white dammar :—

Dammaryl	13·0
Dammarylic Acid	36·0
Dammarylic Anhydride	43·0
Hemihydrate of Dammaryl	8·0
Gum (Arabin)	0·1
Inorganic Matter	0·2

Uses.—White dammar has been recommended for some years for use in making a sticking plaster. White dammar is used in the preparation of varnish and lacs. A varnish is made from it for pictures which is said to be superior to that which has copal for its base; it contains 3 to 3½ parts of resin to 14 parts of oil of turpentine and 2 parts of absolute alcohol .The presence of alcohol favours the drying of the varnish. The inferior qualities of the resin are employed in the heating of ships; the natives also make torches of it that are used in the lighting of the public streets.

Dammar lac is used for mounting microscopic preparations, and some microscopists prefer it to Canada balsam.

XXIII. KAURI RESIN.

Synonyms.—L. : Resina Kauri.—E. : Kauri Resin; Cowdee Gum; Cawree gum; Cowree Copal.—F. : Résine der Dammara australis; Dammar austral, Dammar de la Nouvelle-Zélande.

Botanical Source. *Dammara australis*, Lamb.

E.: Kauri Pine; Yellow Pine.—G.: Neuseelandische Dammarfichte.—Vare and Kauri are the names given to it by the natives.

The name kauri is applied to several species of *Dammara* occurring in Oceania, and yielding resins that are more or less used. Besides *D. australis*, already mentioned, may be instanced the *C. ovata*, C. Moore, *D. Cookii*, R. Br., and *D. lanceolata*, Lindl., of New Caledonia, and the *D. Brownii* of Queensland. The greater part of the dammar of commerce comes however from *D. australis*.

Extraction.—At certain seasons of the year there exudes from the lower parts of the trunk of this plant, either spontaneously or assisted by incisions, a yellowish white liquid of good consistence, which is very viscous and gives off a pleasant odour of turpentine. This liquid hardens gradually, forming a product of which the colour varies from milky white to pale yellow or even dark brown, thus resembling amber in colour and transparence. Very often it is used by the Maoris as a masticatory, although the resin from *D. australis* has no action either as a stimulant or as a narcotic.

Recent kauri resin is not esteemed in commerce, and only that is exported which is obtained at a distance varying from a few inches to a few feet below the surface of the soil in localities now entirely devoid of trees, being the product of trees destroyed by fire in previous years, or such as has accumulated in the soil at the foot of existing trees as the result of the runnings of many successive years. It is in North Auckland that the greater part of this resin is met with.

It is not rare to meet with blocks of kauri resin weighing upwards of 50 kilograms. Julius Wiesner reports in his work* that at the Paris Exhibition in 1867, a block of kauri resin was exhibited by Messrs. Clark and Co., an English firm of varnish makers, which was a metre long and 40 to 50 centimetres deep and wide.

Characters.—Hochstetter first pointed out that when kauri resin first runs from the tree it is soft, milky, opaque, and has an opaline appearance; it is under this form that it is used as a masticatory by the New Zealanders. In commerce kauri resin occurs in large pieces. The fossil resin is usually pale-yellow or greenish-yellow, presenting sometimes an opaline lustre; that of inferior quality is of a more or less dirty brown colour. The outside surface is covered with a crust resembling a whitish efflorescence varying in thickness from that of paper to an inch. Julius Wiesner examined specimens from New Caledonia and found that some in which the interior portion was thin and whitish were brownish or even blackish on the outer surface, presenting here and there a metallic aspect. The outer surface is very irregularly indented at the part where the crust separates clearly from the resinous mass. Upon the surface of fracture may be noticed dentate and undulated edges; but frequently the separation between the crust and the resin is not clear and then description of the surface is not possible.

The fracture of kauri resin is conchoidal and vitreous. Frequently long striæ are met with analogous to those of agate, the result of the deposition of successive layers of different degrees of colour; especially is this the case in the original resin from New Zealand. Fragments completely transparent

* Die technisch-verwendten Gummiarten, Harze und Balsame, p. 162.

have not hitherto been found, the most transparent show the greatest transparency towards the exterior. The central portion is consequently the most frequently turbid, showing striæ, and brown, red, or even black spots.

A microscopic examination made by Julius Wiesner showed that this nebulous state is due to the presence of liquid matter and partly also to gaseous bodies forming more or less rounded or elliptic cavities. The liquid particles are generally recognized in the clearly defined cavities, whilst the gaseous products occur in cavities having their sides covered with a granular deposit. This would appear to indicate that the liquid particles become resinified and contribute to the formation of the granular deposit.

The surface of a recent fracture of kauri resin does not show many fissures communicating with the striæ, but in pieces where the surface of fracture is old the fissures are numerous.

Kauri resin has a balsamic odour which is very pronounced and characteristic in pieces recently broken or that have been preserved in a well closed bottle. Its taste is aromatic and pleasant; when chewed it is rather adherent to the teeth. It readily melts and dissolves in boiling alcohol and in oil of turpentine. In sulphuric acid it dissolves with a red colour. The sp. gr. of the New Zealand kauri is from 1·062 to 1·109, and that of the New Caledonia is 1·119.

Composition.—According to Thompson when kauri resin is treated with dilute alcohol, dammaric acid ($C_{40}H_{30}O_7$), a crystallizable body is separated, while absolute alcohol separates a neutral resin, called dammarane ($C_{40}H_{30}O_6$). According to Muir this resin contains 48 per cent. of matters insoluble in alcohol. Among the 52 per cent. soluble in alcohol besides resins are small quantities of succinic and benzoic acids. By dry distillation it yields an oily liquid which boils between 155° and 165° C.

Uses.—Kauri resin is used for nearly the same purposes as white dammar. The New Zealanders utilize the property it possesses of diffusing a dense thick smoke, which is condensed and then constitutes the black pigment employed by the Maoris in tattooing. It is also used in the preparation of varnishes which appear capable of rivalling those having copal as a base. For several years the cotton manufacturers have used it to give a gloss to calicoes and other fabrics. About 1865 an attempt was made in London to manufacture candles from it. It is also used to varnish buckets, and, mixed with tar, to cover pallisades. Lastly, kauri resin having the property of softening when heated, is used in the manufacture of ornaments which resemble amber very well, the resin being softened in moulds. It would be very interesting to know to what extent this practice is carried in the present day.

THE CHEMISTRY OF ALOES.*

BY F. W. BRANSON.

The varieties of aloes may be said to form three classes:

1*st Group. Barbadoes and Curacao.*—The latter has distinct odour, but agrees with Barbadoes in most respects.

2*nd. Socotrine and Hepatic.*—The latter is most likely a variety of Socotrine, but Dr. Farre considers it the product of a distinct species.

3*rd. Natal and Cape.*—Both have similar odour, but the latter does not contain aloin in a crystalline condition. Smith has, however, obtained aloin from Cape aloes.

The vessels which yield the bitter juice are those directly beneath the epidermis; the central pulpy tissue, which in plants in this country is excessively developed, contains a colourless, tasteless mucilage, and is actually used as food. This mucilage reduces Fehling's copper solution when heated and is precipitated by neutral acetate of lead, therefore it differs from mucilage of acacia gum.

Preparation and Characters of Aloes.—The best way to obtain aloes of superior quality is to transversely incise the leaf and allow the juice to evaporate spontaneously in thin layers. By this method the mucilage is excluded. Barbadoes is prepared as follows:—

The leaves are cut during March and April, and quickly placed in an inclined V shaped trough, which receives the juice; no pressure is applied and the leaves are removed in about one and half hour. Aloes prepared in this manner will contain but a small proportion of mucilage.

The juice is generally evaporated in a copper vessel and poured whilst hot into gourds or boxes.

Cape Aloes is prepared by a similar process, but as the manufacture is generally carried on when more profitable employment fails, the industry is conducted in a careless and desultory manner, and the product is seldom what it should be. The heat used to effect the evaporation having been too great this variety seldom or never shows crystals when treated with proof spirit as described in the British Pharmacopœia.

Socotrine Aloes.—According to 'Pharmacographia' nothing is known as to the mode of preparation, but Hermann states that the leaves are pressed,—this will account for the amount of feculent matter Socotrine aloes sometimes contains; the juice is then put aside to deposit and allowed to evaporate spontaneously in the sun. Some observers state that artificial heat is applied.

Natal Aloes.—A specimen of good quality contains nearly 20 per cent. of aloin. Upon placing a portion to which spirit of wine has been added under the microscope, the spirit readily dissolves out the amorphous matter and leaves the crystalline aloin plainly visible, especially when viewed with polarize dlight.

Natal Aloes is prepared by an analogous process to Barbadoes, but is generally evaporated in iron pots and poured whilst hot into wooden cases.

The chemical constituents of aloes may be conveniently referred to three groups:—

(*a*). Aloin, the bitter crystalline principle.

(*b*). Resinoid matters to be subsequently described.

(*c*). Albuminous and mucilaginous principles with a very small proportion of salts.

The aloetic acid of some text-books does not exist in aloes, but I find the juice from a freshly cut leaf possesse acid; properties, probably some organic acid is present in free state.

The odour is due to a minute quantity of essential oil. The purgative action of aloes is doubtless due to both aloin and the modified amorphous aloin. Some samples do not show any trace of crystals when treated with spirit as described in the Pharmacopœia, yet by suitable treatment will certainly yield aloin in a crystalline condition. In the manufacture of aloin the drug which shows the largest number of crystals is to be preferred, having most likely been prepared by allowing the juice to evaporate spontaneously; for if the liquid Socotrine aloes, now frequently found in commerce, which usually contains an abundance of crystals, be evaporated, it will be found to have permanently lost its crystalline character. Dark coloured aloes which contains excess of gum has doubtless been prepared by pressing the leaves and evaporating carelessly. Very inferior kinds are prepared by decoction.

The percentage of bitter principle in the plant is said to be greatest when the leaf is changing from green to

* Read before the Chemists' Assistants' Association, on October 23, 1878.

brown, and the exuded juice, at first colourless, soon becomes brown.

Microscopical examination of aloes sometimes reveals the presence of parenchyma, spiral vessels and other impurities, which show that the juice has not been properly strained before evaporation. Aloes dissolves completely in water when heated and the solution darkens on addition of ferric chloride; it gives also a yellowish precipitate with plumbic acetate. Cold water dissolves about half its weight of aloes and the filtered solution reddens litmus paper. I have not been able to determine the acid constituent, but it is not the resinous principle, a solution of which in spirit is neutral.

If the concentrated cold aqueous infusion is mixed with more water a considerable turbidity is produced. Aloes fused with caustic potash gives paraoxybenzoic acid, which is also obtained by treating benzoin in the same manner.

As regards the preparation of aloin any given process will require modifying according to the composition of the drug operated upon.

Barbaloin.—Tilden's method is a good one with light coloured Barbadoes, and as a manufacturing process is probably the best, especially if the evaporation is conducted in a partial vacuum. The following is an outline of the method :—

A 10 per cent. aqueous solution is acidulated with sulphuric acid, the resinous precipitate is separated by filtration, the filtrate evaporated to a syrupy consistence is set aside in a cool place for a day or two, and the product recrystallized from dilute spirit.

With one sample of Barbadoes aloes I found the following modification of Histed's process gave a larger percentage of aloin :—

Triturate in a mortar the aloes in coarse powder with about two thirds of its weight of spirit (methylated may be used), allow them to remain in contact for a little time and strongly press to remove the spirit, which contains much of the colouring matter and resin; if hydraulic pressure is at hand the quantity of spirit may be reduced. The process may be repeated if necessary with as small a quantity of spirit as possible. The resulting yellow mass of impure aloin is dissolved in a warmed mixture of 3 parts spirit and 5 parts water (as a rule the quantity required will be about equal to half the quantity of aloes taken); set aside in a cool place for a day or two, drain away the mother liquor and again press strongly on calico, dissolve the crystalline mass in dilute spirit and set aside for forty-eight hours. This process with different drugs gave a yield of barbaloin equal to 16 per cent. and 12 per cent. respectively.

Large crystals can only be obtained by working on a large scale, and crystallizing from a somewhat dilute solution. The crystals have a curious tendency to break up and assume a powdery condition, as may be seen in specimens I made about twelve months ago, and which then consisted of fine crystals.

Great care must be taken in drying aloin, or a discoloured product is sure to result; indeed the colour is best preserved by drying without heat over sulphuric acid.

Socaloin.—Groves obtained 10 per cent. by a process very similar to that more recently advised by Tilden for the preparation of Barbadoes aloin. As the amorphous matter of Socotrine aloes possesses about the same solubility in ordinary solvents as aloin, the isolation of the latter in quantity is a matter of difficulty. The easiest way to prepare socaloin is to take some of the crystalline deposit from liquid Socotrine aloes, and shake with spirit; the aloin rapidly subsides, and may be separated by subsidence and filtration. Re-dissolve in warm dilute spirit, using a smaller proportion than for barbaloin, and crystallize; re-crystallize from acetic ether, which is a very good solvent.

My experiments with Socotrine aloes have always yielded a much smaller percentage of aloin than Barbadoes aloes.

Nataloin is very easily prepared in the crude state by treating the drug with spirit as described for Barbadoes aloin. The aloin is very slightly soluble in spirit, so scarcely any loss occurs. The purification is tedious, as nataloin is little soluble in warm or cold alcohol. The best way is to make a saturated solution in spirit of wine or methylic alcohol, and allow the solution to evaporate spontaneously. In a day or two crystallization commences, and the comparatively large tabular crystals have a more orange tint than the smaller ones exhibited. Nataloin does not appear to give either a chloro- or a bromo-derivative.

Aloin is generally admitted to have a close relation to the phenol class, but sometimes it is said to be a glucoside. Tilden has shown that a solution of aloin which has been boiled for some time with dilute acid, and then neutralized, does not undergo fermentation, therefore does not contain glucose. It is useless to rely on Fehling's copper test, as aloin itself reduces it to cuprous oxide. Chemists differ as to the empirical formula of aloin, but Tilden's figures have been very nearly corroborated by Schmidt. Some consider that the aloins form a homologous series, but Tilden states that they are isomeric, differing only as regards water of crystallization :—

Nataloin, $C_{16}H_{18}O_7$	Anhydrous.
Barbaloin, $C_{16}H_{18}O_7$	H_2O.
Socaloin, $C_{16}H_{18}O_7$	$3H_2O$.

But the amount of water is certainly not constant. Barbaloin, for instance, takes up during crystallization varying amounts of water, according to the temperature and strength of the solution. It will be remembered that an analogous case occurs with chloride of ammonium, which is usually anhydrous, but when crystallized at a low temperature contains a large quantity of H_2O. Sodium sulphate is another salt which contains varying amounts of water, according to the temperature at which crystallization took place.

Aloin loses all water of crystallization at a temperature of 100° C. over sulphuric acid.

An aqueous solution of aloin gives a copious yellow precipitate with acetate of lead.

The bromo-derivative of barbaloin $C_{16}\left\{\begin{matrix}H_{15}\\Br_3\end{matrix}\right\}O_7 3H_2O$ is easily prepared by mixing an excess of bromine water with an aqueous solution of aloin; three atoms of hydrogen may be thus replaced by the same number of bromine. Instead of an aqueous solution I prefer a stronger solution of bromine dissolved by the aid of a little bromide of potassium. The precipitate is washed with water, dried and crystallized from alcohol. A nicely crystallized specimen has been thus prepared by me.

Bromo-aloin contains three molecules of water of crystallization and is insoluble in ether or water. A chloro-derivative of barbaloin may also be formed.

Characters of the aloins:—

Barbaloin in solution gives an olive coloration with ferric chloride; treated with sulphuric acid it gives a sulpho-salt, the barium compound of which is soluble in water; with boiling strong nitric acid it yields aloetic, chrysammic, and finally picric and oxalic acids.

Socaloin also gives with nitric acid chrysammic acid.

Nataloin does not yield chrysammic acid, but oxalic and picric acids only.

The three aloins may be distinguished by the following reactions—

Barbaloin with cold nitric acid gives an intense crimson, which is said to rapidly fade, but with good commercial samples the colour is sometimes permanent for days.

Nataloin gives a similar tint but not so deep. It is readily distinguished from barbaloin by a sulphuric acid solution giving an intense blue colour when a crystal of potass nitrate is passed into a drop of the solution on a slab. It is interesting to note that the acid solution gives with bichromate of potass a similar reaction to strychnine.

Socaloin generally gives but little coloration with nitric acid and often only a pinkish hue. I cannot affirm the statement that there is no change of colour with nitric acid.

Chrysammic acid may be prepared by the action of nitric acid on alocs or aloin (excepting nataloin); the crude aloin may be used. After trial of both processes I would advise the latter as being the more manageable. Briefly, the process is as follows:—Treat aloin with six times its weight of nitric acid, sp. gr. 1·45; the aloin should be added in small quantities and the acid kept cool. After some hours the solution is cautiously heated, more acid added, and gently boiled for some time in a fume chamber as nitrous fumes are copiously evolved. When cold, the addition of water causes a precipitation of aloetic and chrysammic acids; the latter are collected, dried and boiled with an excess of acetate of potassium. On cooling the potassium salt of chrysammic acid crystallizes out, potassium aloetate remaining in solution. Both acids may be prepared by decomposing the salts with nitric acid. Aloetic acid is completely converted into chrysammic acid by the action of boiling nitric acid.

Potassium chrysammate possesses the rather rare property of dichroism.

Lead chrysammate strongly polarizes a ray of light.

The so-called resin is obtained in the manufacture of the extract. 1000 grains treated exactly according to Pharmacopœia gave 370 grains of dry resin, which was separable by long boiling with water into two parts, one being rendered permanently soluble in water, the other, weighing 110 grains, being insoluble in water.

The soluble resin is, according to Tilden, closely allied to aloin in chemical composition; it gives a large amount of chrysammic acid when treated with nitric acid.

The insoluble resin, according to Drs. Garrod and Farre, is quite inert; with nitric acid it gives little or no chrysammic acid.

An alkaline solution of aloin absorbs oxygen and loses its bitterness. Dec. aloes comp. undergoes this change, and at length gives an acid reaction. Vinum aloes also loses its bitter taste, but not so rapidly. From the experience of a physician who largely prescribes dec. aloes comp. and prefers the freshly made preparation, it appears that the purgative property diminishes in nearly the same proportion. It is important that these points should be thoroughly investigated. From an experiment I have made, a spirituous acid solution appears more stable. The German Pharmacopœia contains an acid preparation containing spirit, aloes, myrrh and saffron.

In the preparation of the decoction the use of the potassium carbonate makes a brighter article, but when acidity sets in copious deposition results with absorption of oxygen, as may be noticed by cautiously removing the stopper of a well-closed bottle occasionally.

It would be interesting to determine to what extent the presence of myrrh and liquorice favour the production of acidity. I have kept for several months a solution of extract of aloes with potass. carb. in dilute spirit, each ingredient in the same proportion as directed for decoction; one solution was boiled before addition of spirit, and the other was dissolved *sine igne*; neither solution at the present time has any acid reaction.

In concluding I must state that much information has been derived from Dr. Tilden's researches, also from Pereira's 'Materia Medica,' 'Pharmacographia' and other text-books.

BLUE-BLACK WRITING FLUID.*

Digest together for a fortnight 18 ounces of bruised galls, ½ ounce bruised cloves, in 10 wine pints of water. Press and filter. Add to the clear liquid 6 ounces of sulphate of iron and 2 fluid drachms of sulphuric acid, shaking well until solution is effected. Next add an ounce of indigo paste, and filter if necessary. The ink must be kept in well-corked bottles, and it should be made in vessels of glass or stoneware.

* From *Canadian Pharmaceutical Journal*, Feb., 1879.

SULPHUR MINING ON THE PACIFIC COAST.*

Among the variety of mineral productions of the Pacific Coast, the mining, the various processes for the reduction of ores, the curious formations of the metalliferous lodes, etc., there are few subjects of more interest to the Eastern pharmacist or chemist than the production of sulphur. Through Nevada and Montana territories sulphur deposits are found in numerous places, and the element quarried out in masses of considerable size and of remarkable purity. In the mines near Humboldt, Nevada, the sulphur exists in veins among the quartz. The greater part, however, of the sulphur produced on the coast requires to be purified before it can be utilized for either pharmacy, agriculture or the arts. For illustration I shall select two impure forms in which it occurs, as the typical crude material from which the sulphur is extracted. The first is from the Pluton Mines, in Pluton Cañon, Cal.

This mine is situated near the foot of the mountain, which rises rather precipitously from the bottom of the cañon, and is evidently the remains of an extinct "geyser." The ground in the immediate vicinity is cinnabar bearing, and the breasts of the mine are worked directly into the reddish-grey, semi-fused, ashy mass, consisting largely of minute sulphur crystals, interspersed with magnesium and calcium oxides and hydrates, the whole deriving its colour from the ferric oxide and mercuric sulphide. In many places are fragmentary masses several pounds in weight, of nearly pure fused sulphur, but the largest part is a grey ashy mass of easily pulverulent sulphur crystals. This yields readily to the pick, and is transferred by cars to the reduction works, there dumped into the "purifier," which—the invention of the efficient superintendent, Mr. Eames—may be described as follows:—

The "purifier" is composed of wrought iron, about the thickness of boiler iron, riveted together, and shaped not unlike a percolator. It has a diameter of about four feet and a height of probably eight, and has a capacity of about a ton of charge. The bottom is perforated and funnel-shaped, while the top is covered by a wrought iron lid with bolt attachments. The charge of crude sulphur having been properly dried, is dumped into the purifier, a double thickness of heavy gunny cloth having first been carefully spread over the perforated bottom of the cylinder. The lid being securely attached, superheated steam is turned into the purifier through a tube in the side of the cylinder, and the sulphur, gradually melting, settles to the bottom, where it is drawn off by means of a stop-cock, either into moulds or boxes. The greater part is run into wooden moulds. As the whole apparatus swings upon a pivot, the work of withdrawing the charge can be effected in a few moments. It may be readily seen that sulphur is here extracted at the lowest cost of working, while the cost of erecting the entire plant is a merely nominal sum.

At Sulphur Banks Mine, near Lakeport, the sulphur occurs with the cinnabar, the whole in the form of a dark grey ash, entirely free from rock or sulphur crystals. The sulphur is procured by following the process above given as at Pluton, or by the dry process, which is as follows:—

The mixture containing both sulphur and cinnabar in paying quantities, and being worked for both, is placed in the usual cinnabar reduction furnace, and the mercurial vapour, in common with the sulphur, passed into the first receiver, where, under the influence of superheated steam, the sulphur is liquefied, the mercury passing to the second receiver and there condensed.

Formerly some sulphur was prepared by sublimation, the product being collected in powder, and then cast into rolls or placed on the market as collected, but none at present is so prepared by any of the manufacturers on the coast.

The Pharmaceutical Journal.

SATURDAY, MARCH 1, 1879.

THE INFLUENCE OF EXAMINATIONS UPON EDUCATION.

The delivery, year after year, of the "Hunterian "Oration" must be a task which, contrary to the usual rule, increases in difficulty with every successive performance. *A fortiori*, the undertaking to tell again the more than thrice told tale of Hunter's life, whilst yet men's ears were ringing with the eloquent words in which Sir James Paget clothed the story, was one that required considerable boldness. But it is only just to Professor Humphry to say that his address, delivered at the Royal College of Surgeons on the 14th ult., was fully worthy of the occasion, and this especially because of the happy and successful manner in which the speaker used the opinions of Hunter as a teacher to combat a custom that is undoubtedly exercising a very injurious influence upon the education of the day.

Some important questions propounded and answered in the affirmative by Professor Humphry may be briefly summed up as follows: Is there not a great tendency in the present day, and especially in this country, for the student to tire of his work? In looking for the cause, he refuses to see it in the pupil, on the ground that the love of knowledge is an inherent and active principle at all ages and in all races. On the contrary he is disposed to lay the fault at the door of the teaching—or, rather, too much teaching and too little education—which is so characteristic of the present day, and which is the natural and inevitable consequence of the constant struggle going on more or less vigorously in almost every school to bring pupils safely through certain examinations. The result is the overloading of the mind with a mass of undigested information, creating such a loathing that when the emergency that led to it is over the student turns with repugnance from even healthy mental work. Moreover, what is of more importance, the information acquired with so much labour, lacking the principles for its application, proves to be most evanescent. The justice of this accusation will be but too evident to any one familiar even in a slight degree with the books that are now issued in shoals, professedly as text-books and manuals of science and other subjects, but really dealing only with such portions of the fringe of them as will prepare the reader for the questions usually put in the examination room.

But it would be wrong to assume hastily that Professor Humphry is antagonistic to examinations. Indeed we do not think their merits could be more fairly stated than in his own words—"They are "necessary as tests of knowledge, and therefore cannot "be dispensed with. They furnish a stimulus to work "which is obviously needed in many, if not in most, "instances; they have the great merit of compelling "the student to clear his ship for action, to make his "knowledge clear, defined, precise, and producible, "and they induce him to cultivate the very important "faculty of concentrating his mental batteries, and "bringing them to bear quickly and effectively upon "the required point." The problem therefore is to realize from the examinations, which have become the "despots of education," the maximum of good with the minimum of evil, and to this result a clear conception of the origin of the evil will contribute.

Few will fail to agree with Professor Humphry that the baneful side of the influence which examinations now exercise upon the education of the country is due to the tendency that they foster to make facts preponderate over thought. The enormous rapidity with which facts are accumulating in every department of science, coupled with the possibility that a pass may depend upon an examinee's capability to give an answer with respect to almost any one of them, induces a heaping up in students' minds of a chaotic mass of facts without the connecting links of the principles which run through them all, and by the aid of which only can they be assimilated and rendered useful. The connection between this and the subject of the oration will become apparent upon reading a quotation from Hunter's 'Principles of Surgery,' where starting with the premise that his object as a teacher was to fit his pupils to act as occasion may require from comparing and reasoning upon known principles, the author argues, "Too much attention "cannot be paid to facts; yet too many facts crowd "the mind without advantage, any further than "they lead to establish principles." Froude only varies the words without changing the idea, when he says, "The knowledge which a man can use is the "only real knowledge, the only knowledge which "has life and growth in it and converts itself into "practical power. The rest hangs like dust about "the brain, or dries like rain-drops off the stones."

The most effectual means for solving the stated problem lie, in the opinion of Professor Humphry, in the hands of the examiners. How large a share they have had in creating the difficulty he suggests in the significant remark, that it is a far easier and quicker process to test a student's knowledge of a fact than his capacity and habit of thinking upon and turning the fact to account. He therefore appeals to examiners to recognize that they are not simply judges of the students who come before them, but that upon them devolves the higher responsibility of influencing for good or ill by their requirements the whole educational current of the future. The examinations, he thinks, are probably sufficiently severe for the present, but he recommends that they should be made less exacting in the amount and variety of detail, and that more importance should be attached to the intelligent appreciation of the knowledge possessed. Examinations would then, besides being tests of fitness for certain positions or

rewards, take a place as invaluable guides of teaching and of study.

Of course there is nothing very new in all this; the weak points of the examination system have for some time furnished food for thought and a topic for discussion. Nevertheless we think that Professor HUMPHRY has done admirable service in once more drawing attention to them, and indicating in so clear a manner the direction in which help is to be found.

PROPOSED ALTERATIONS IN THE FRENCH PHARMACY LAWS.

IT is rather remarkable that just at the time when the Council of the Pharmaceutical Society is occupied with the subject of the amendment of the Pharmacy Act of 1868, the Council of the General Association of Pharmaciens in France has also been drawing up a *projet de loi* for remedying the imperfections in the present French laws relating to the exercise of pharmacy. Although the conditions under which pharmacy is carried on in the two countries are so different, there are several points in the draft Bill just published in the *Répertoire de Pharmacie* of considerable interest to the readers of this Journal.

The proposed Bill starts with a provision that no person shall be allowed to exercise the profession of a pharmacien, or to keep a shop for the preparing, vending or delivering of any "*médicament*," unless he has obtained a diploma in a French school. Much therefore would depend upon the meaning of the word "*médicament*," and this is defined as "any "substance, simple or compound, natural or prepared, "possessing or alleged to possess preventive or curative "powers, whether intended to be taken internally or "applied externally." But the sale of a certain number of non-poisonous indigenous medicinal plants, of which a list is to be annexed to the Codex, would be left free.

Recognizing that the grade of pharmaciens of the second class is a convenience to the State in supplying the needs of small places, it is proposed instead of abolishing this class, as has been proposed, only to exclude them from practice in the principal cities and places having upwards of ten thousand inhabitants. The pharmaciens of the first class would on the other hand be allowed to practise in any part of France or her colonies.

The Bill prohibits pharmacists, or any other persons, from dealing in secret remedies, these being defined as simple drugs sold under names not their own, or preparations of which the exact formulas have not been published in the official collection. This would not extend to the compounds of the French or other official pharmacopœias, or to preparations that have received the authorization of the French Government on the recommendation of the Academy of Medicine.

Whilst according to the Bill the pharmacist would not be allowed to practise medicine, it would forbid on the other hand a medical man or a veterinary surgeon dealing in medicaments. Neither would any person be allowed to practise medicine, or veterinary medicine, and pharmacy, simultaneously, and it would prohibit all associations of persons for carrying on these callings in common. It would also forbid a pharmacien taking as a partner a person not possessing a diploma, except for the purpose of forming a company having for its object the carrying on the business of a shop or the manufacture and sale by retail of one or several pharmaceutical preparations. Finally it would prevent a pharmacien carrying on more than one pharmacy at a time, or the carrying on of a business under a borrowed name.

With respect to another subject that has excited much discussion in this country the Bill provides that upon the death of a pharmacist his widow or heirs should be allowed to carry on his business during one year dating from the day of his death, provided that it be under the superintendence of a qualified person.

Religious communities, hospitals and other public establishments would be precluded by the terms of the Bill from having a pharmacy except for their own particular purposes, which would put a stop to a grievance recently alluded to in these columns. But in order to provide for the wants of a place more than eight kilometres removed from a pharmacy the communal authorities would be allowed to establish a *dépôt* of the most necessary medicines, to be at the disposal of medical men, and to be supplied by the pharmaciens of the commune.

There are several other provisions and penalties proposed for infringements, but the foregoing will give a fair idea of the scope of the Bill. What probability there is of its becoming law does not appear.

PROPOSED MEDICAL LEGISLATION.

THE President of the Council introduced his Medical Acts Amendment Bill into the House of Lords on Tuesday evening, when his remarks were confined to the institution of a "conjoint board," which he now proposes to make compulsory in England, and the composition of the Medical Council. The Bill was read a first time. On Wednesday, Mr. A. MILLS obtained leave to bring into the House of Commons a Bill to amend the Medical Act of 1858. The Bill was afterwards read a first time, and the second reading has been fixed for the 12th instant. At the time of going to press neither Bill had yet been issued from the printers.

THE CHEMISTS' BALL.

A MEETING of the Committee to wind up the business connected with the late Ball was held on Monday last, at 17, Bloomsbury Square, when it was resolved that the sum of thirty guineas, taken from the balance in hand, should be presented as a donation to the Benevolent Fund. The Committee also passed a vote of thanks to the office bearers, and especially to the Honorary Secretary, Mr. A. L. SAVORY, for the efficient way in which he superintended the arrangements of the Ball, and in so doing expressed, no doubt, the feeling of every one present on that occasion.

Transactions of the Pharmaceutical Society.

EXAMINATIONS IN LONDON.

February 19, 1879.

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was present on behalf of the Privy Council.

MAJOR EXAMINATION.

Seven candidates were examined. *Two* failed. The following *five* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Goodall, William Anthony.....Clifton.
Gravill, Edward Day .....Gainsborough.
Harpham, John .....Newark.
Jackson, Joseph John.....Bridgnorth.
Minshull, Rose Coombes.....London.

MINOR EXAMINATION.

Twenty candidates were examined. *Seven* failed. The following *thirteen* passed, and were declared qualified to be registered as Chemists and Druggists:—

Adams, Benjamin .....Grantham.
Arnfield, John Cash..... .....Ashton-under-Lyne.
Bence, Frederick Hubert .....London.
Botwood, Charles Walker .....Great Bridge.
Brandsma, Dirk Gerhard .....London.
Brunt, Edwin .....Great Grimsby.
Brunt, George Henry.....Norwich.
Cherrington, Geo. Widdowson...Newark.
Compigné, Eugène .....London.
Cory, Francis Albert .....Newport, I. W.
Dowdeswell, Jonathan .....Tiverton.
Everett, William John Hugo...London.
Francis, Frederick Charles.....Cheltenham.

MODIFIED EXAMINATION.

The undermentioned was examined, and was declared qualified to be registered as a Chemist and Druggist:—

Orton, Edward Arthur .....Marston Gabbett.

February 20, 1879.

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was present on behalf of the Privy Council.

MAJOR EXAMINATION.

Seven candidates were examined. *All* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Pain, Edwin .. ..Dover.
Palmer, Charles Edward.....Ely.
Pocock, Wm. Frederick Henry..Cape Town.
Smith, James William.....Cambridge.
Smith, Joseph .....Salford.
Stacey, Peter.....London.
Stuart, Charles Edward .....London.

MINOR EXAMINATION.

Twenty candidates were examined. *Eight* failed. The following *twelve* passed, and were declared qualified to be registered as Chemists and Druggists:—

Frost, Frederick Philip .....Bury St. Edmunds.
Gibbs, Robert Darton .....Wolverhampton.
Hamilton, Edmund Harry .....Bromley
Hartley, John .....Bradford.
Hobson, George William.....Buxton.
Howard, George William .....Tunbridge Wells.
Howse, Charles Turk .....Cheltenham.
Kelly, Francis Charles.....Great Yarmouth.
Knight, Ramsey .....Handsworth.
Lawton, John Dyson .....Louth.
Laxon, Matthew .....Wisbeach.
Lomax, Allan Edward.....Liverpool.

February 21, 1879.

MINOR EXAMINATION.

Present—Mr. Savage, Vice-President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Moss, Plowman, Southall and Taylor.

Twenty-eight candidates were examined. *Thirteen* failed. The following *fifteen* passed, and were declared qualified to be registered as Chemists and Druggists:—

Lyle, William .....Kelso.
McCrindle, Thomas.....Northampton.
Mann, George Frederick.....Wells, Norfolk.
Mann, Samuel William .....Hotwells, Bristol.
Padley, William .....Goole.
Pisani, Orestes Victoriano .....London.
Phillips, Alfred James.....Truro.
Ritson, Fletcher .....Carlisle.
Sims, George Samuel .....Derby.
Stone, Samuel .....St. Just.
Wakefield, John .....Birmingham.
Weary, China Thomas .....Stoke.
Williams, Thomas Robert .....Ipswich.
Williamson, William .....Altrincham.
Wimpenny, John McMillan ...Waterloo.

PRELIMINARY EXAMINATION.

The undermentioned certificates were received in lieu of the Society's Examination:—

Certificates of the University of Cambridge.

Marston, Henry John .....Tunbridge Wells.
Norman, Valentine .....Northampton.

Certificate of the University of London.

Peggram, Albert Cole ....Kennington.

Provincial Transactions.

MANCHESTER CHEMISTS AND DRUGGISTS' ASSOCIATION AND SCHOOL OF PHARMACY.

An ordinary meeting of the members of this Asssociation was held in the Memorial Hall on the evening of Wednesday, February 19, the chair being occupied by Mr. W. Wilkinson, Vice-President.

The lecturer for the evening was Mr. A. N. Palmer, who read the following paper on—

Fothergill's and Wade's Hydrobromic Acid.

About two and a half years ago Dr. J. Milner Fothergill published in the *British Medical Journal* an article on hydrobromic acid and its uses as a medicinal agent. The article, a portion of which was quoted in the *Pharmaceutical Journal*,* included a formula for the preparation of the acid. To 5188 grains of bromide of potassium dissolved in 4 pints of water, 6337 grains of tartaric acid were directed to be added. Bitartrate of potassium and hydrobromic acid would be formed. The first would be precipitated, the second remain as "a clear, bright, almost colourless fluid."

Hydrobromic acid made according to this formula has since been frequently prescribed.

In the spring of 1877 I had occasion, in the ordinary course of my work, to examine several samples of Fothergill's hydrobromic acid, and found that all these, when evaporated, left a residue which, dried at 230° Fahr., amounted to about 14 per cent. of the weight of acid taken. This fact I announced in the *Pharmaceutical Journal*. The residue referred to, which I at first took to be bitartrate of potassium, was found on further examination to consist wholly of bromide of potassium and free tartaric acid.

I then myself made a batch of the acid, using the quantities prescribed by Fothergill, but modifying somewhat his method; that is to say, instead of adding the dry tartaric acid to the bromide of potassium dissolved in

* *Pharm. Journ.*, March 3, 1877.

the *whole* of the water, I dissolved the tartaric acid and bromide of potassium *separately* (by help of a gentle heat and in stoppered bottles) each in half of the water ordered, and then thoroughly mixed the two solutions, thus making sure that all the tartaric acid was dissolved, and in a condition to take part in the reaction on which the method was based. The mixture was then cooled down to a low temperature, and the precipitated bitartrate of potassium filtered off. The filtrate, which I shall hereafter call "Fothergill's hydrobromic acid (original formula)," was then examined. When evaporated it left a residue of the same amount and of the same character as the samples previously examined left.

On calculating out the quantities of bromide of potassium and tartaric acid given in Fothergill's formula it became evident that those quantities were not to each other in molecular proportions, that there was in fact a deficiency of 202 grains of tartaric acid. Another batch of hydrobromic acid was therefore made using the same quantity of bromide of potassium, but 6539 grains of tartaric acid instead of 6337 grains. The acid so prepared, which I shall henceforth call "Fothergill's hydrobromic acid (amended formula)," yielded on evaporation a residue of the same character and almost of the same amount as before.

I now determined to make a complete analysis of the two batches; the result of that analysis I have now to lay before you. I will begin with the acid made from the amended formula.

Fothergill's Hydrobromic Acid (amended formula).—This acid, made at about 50° F., when evaporated to dryness, left a residue which after drying at 230° F. amounted to about 14 per cent. of the weight of acid taken. When the residue from 7·2 grams was ignited, the faint alkalinity of the resulting ash was destroyed, and its solution rendered distinctly acid by so little as one-tenth of a cubic centimetre of standard sulphuric acid. The residue could not therefore have contained any appreciable quantity of acid tartrate of potassium, and was in fact composed of 7·61 per cent. of tartaric acid, and 6·06 per cent. of bromide of potassium. It is to be noticed that the tartaric acid and bromide of potassium are here to each other in almost molecular proportions, 7·61 per cent. of the former requiring 6·03 per cent. of the latter. Besides the determinations just referred to, those of the total bromine and the acidity were also made. They were all made directly. The acidity, determined with standard soda, and calculated as hydrobromic acid, equalled 12·62 per cent., whereas if *all* the bromine present is calculated into hydrobromic acid, it will equal only 8·22 per cent., so that it is evident the acid must contain besides hydrobromic acid some other substance having an acid reaction.

If now we assume that the tartaric acid and bromide of potassium found in the evaporation-residue exist as such in the acid from which that residue is derived, then the composition of Fothergill's acid (amended formula) will be represented thus :—

Hydrobromic Acid	4·10 per cent.
Tartaric Acid	7·61 „
Bromide of Potassium . . .	6·06 „
Water (by difference)	82·23 „
	100·00

But it is by no means certain that the bromide of potassium and free tartaric acid found in the evaporation-residue exist as such in the acid itself. All the analytical data I have obtained are quite consistent with the representation given above, but they are also consistent with the supposition that all the bromine in Fothergill's acid exists as hydrobromic acid and all the tartaric radical is associated with all the potassium as acid tartrate and that in short the composition of Fothergill's acid when made according to the amended formula is as follows :—

Hydrobromic Acid	8·22 per cent.
Acid Tartrate of Potassium. .	9·71 „
Water	82·07 „
	100·00

I am myself inclined to think that the arrangement just indicated represents the true state of the matter, and shall henceforth give the results of my analysis of other acids, made with bromide of potassium and tartaric acid, under this form. We are of course to assume that when the acid so constituted is evaporated, a molecule each of hydrobromic acid and acid tartrate of potassium react, forming bromide of potassium and free tartaric acid.

An observation that I have two or three times made, though capable of opposite interpretations, is not without interest in this connection. When bitartrate of potassium is dissolved in pure hydrobromic acid (and it dissolves therein with tolerable readiness) the solution, evaporated to dryness, leaves a residue containing not bitartrate of potassium (for the ash of it is not alkaline or is only faintly alkaline), but bromide of potassium and free tartaric acid.

When Fothergill's acid, cooled to a given temperature, is exposed, after filtering, to a lower temperature still, a slight further precipitate of acid tartrate of potassium takes place. The acid, whose analysis has just been given, when exposed for more than an hour to a temperature of 35° Fahr., yielded in this way a small precipitate. This was separated, but the filtered acid was found still to contain no less than 9·56 per cent. of the acid tartrate in solution.

I now come to Fothergill's hydrobromic acid made according to the original formula. The acid analysed before examination was maintained for several hours at a temperature just above freezing point, and then filtered. It left, on evaporation, a residue containing 6·48 per cent. of tartaric acid and 5·41 per cent. of bromide of potassium; these are not quite molecular proportions, the latter being somewhat in excess. The composition of the acid may be represented thus :—

Hydrobromic Acid	8·18 per cent.
Acid Tartrate of Potassium . .	8·12 „
Bromide of Potassium (excess of)	·27 „
Water	83·43 „
	100·00 „

It remains now to speak of Wade's hydrobromic acid. In an article published in *New Remedies*, for April last, and quoted in the *Pharmaceutical Journal*,* Dr. De Witt C. Wade claims to have been not only the first to prescribe hydrobromic acid, but also the first to prepare it by the reaction of bromide of potassium and tartaric acid. He says that Dr. Fothergill has erroneously "transcribed" his formula, which, so transcribed, not only gives the bromide of potassium and tartaric acid in the wrong proportions, but represents an acid much weaker than Dr. Wade had ever been accustomed to employ. He says that his formula has all along been one which has provided for ten grains of bromine in a fluid drachm of the finished preparation. The formula referred to is thus given in the paper :—

Bromide of Potassium . . .	120 grains.
Crystallized Tartaric Acid . .	153 „
Water	1 fl. oz.

Dr. Fothergill's formula reduced to terms of a fluid ounce stands thus :—

Bromide of Potassium . . .	64·8 grains.
Tartaric Acid	79·2 „
Water	1 fl. oz.

Dr. Wade continues :—"Dissolve the bromide, and then the acid in the water, and keep it at a low temperature till precipitation ceases, and decant." The acid resulting Dr. Wade suggests should be called "*dilute*

* *Pharm. Journ.*, June 15, 1878.

hydrobromic acid, in conformity to the rule applying to the other mineral acids." He claims for it that it is sufficiently pure. "The solubility of bitartrate of potassium," he says, "is given in the United States 'Dispensatory' as 1 part to 180 of water. Therefore half a fluid drachm of hydrobromic acid contains about one-sixth of a grain of this impurity, which I am sure is sufficiently free from serious contamination to be regarded as unobjectionable."

Now it may be quite true that bitartrate of potassium is only soluble in water to the extent of 1 part in 180 of water, but we are here not dealing with the solubility of bitartrate of potassium in water, but with its solubility in hydrobromic acid; and if we boil a little freshly precipitated bitartrate of potassium in a test tube with water we shall get in the upper part of the tube a saturated solution of the bitartrate, and in the lower part a deposit of bitartrate which the water will not dissolve: if now we add pure hydrobromic acid, drop by drop, we shall see, as we shake the test tube, the deposit gradually disappearing until finally it is all dissolved. It will thus be evident that bitartrate of potassium is very much more soluble in hydrobromic acid than in water; I find, in fact, that half a fluid drachm of Wade's hydrobromic acid (made at about 50° Fahr.) contains, not a sixth of a grain of bitartrate of potassiun, but five grains, or thirty times the sixth of a grain.

It may well be that the "contamination" so indicated, if we like to call it contamination, is not "serious," and it may even happen that some of the efficacy of the medicine is due to "the contamination." A remedy, made according to a given formula, which has secured for itself a distinct reputation, should still be made according to that formula. I am not quarrelling with the composition of Dr. Wade's acid: I am only giving an account of its composition.

I find, then, that Wade's hydrobromic acid yields an evaporation-residue containing 10·15 per cent. of bromide of potassium and 12·72 per cent. of free tartaric acid, and that, in short, without going further into details, it contains of—

Hydrobromic Acid	13·23	per cent.
Acid Tartrate of Potassium .	15·94	„
Water	70·83	„
	100·00	

The sample whose analysis has just been given was made at about 50° Fahr., in the manner already explained, and may stand for Wade's hydrobromic acid as it will generally be met with. The next sample was made with extreme care. Not only were the contents of the stoppered bottle containing the solutions of bromide of potassium and tartaric acid cooled before mixing, but the hydrobromic acid resulting was not filtered until after it had been exposed for several hours to a temperature just above freezing point. The result of maintaining the acid for so long a time at so low a temperature was a considerable reduction in the amount of dissolved bitartrate, though the latter still reached 13·5 per cent. The percentage of hydrobromic acid was also higher. Its composition may be represented thus:—

Acid Hydrobromic	13·60	per cent.
Acid Tartrate of Potassium .	13·50	„
Water	72·90	„
	100·00	

Drs. Wade and Fothergill have introduced a very valuable remedial agent, and we are indebted to them for it, and if they have not undertaken an investigation into the chemical composition of the remedy whose method of preparation they describe this was a task to which they were not necessarily called.

Of course it has now for some time been known that the hydrobromic acids of which I have just treated, do in fact contain bitartrate of potassium, but I am not aware that any one has taken the trouble to ascertain exactly how *much* those acids contain, or what is their actual chemical composition, and therefore I have thought that the observations herein recorded might be not without interest.

At the close of the discussion which succeeded the lecture, the thanks of the meeting were tendered to Mr. Palmer on the motion of Mr. Wilkinson, seconded by Mr. Slack.

MIDDLESBORO' CHEMISTS' ASSOCIATION.

A meeting of this Association was held on Tuesday, February 18, Mr. J. Middleton, President, in the chair.

After the transaction of local business, the question "How to meet the present difficulty with respect to Patent Medicines?" was discussed, when the following resolution proposed by Mr. Middleton, and seconded by Mr. Harrington was passed:—"That in consequence of the large quantity of poisons sold under the protection of patent medicine licence and stamp, viz., laudanum, chloral hydrate, prussic acid, chlorodyne, mercury, etc., etc., Parliament be petitioned to pass a short Act, prohibiting the sale of patent medicines by any one but registered chemists, except in country places where there is no chemist within a radius of two miles; and, that there shall be no loss to the Revenue, that chemists' licence be increased to 20*s*."

The Secretary was requested to write to the Committee of the Chemists' Defence Association, asking them to issue circulars to all local secretaries for signature by their brother chemists and for presentation by their own members of Parliament.

EDINBURGH CHEMISTS' ASSISTANTS' ASSOCIATION.

The fourth monthly meeting of this Association was held in the Pharmaceutical Society's rooms (North British Branch), 119A, George Street, on Friday evening, 21st inst., Mr. John Young, President, in the chair.

After the minutes of the previous meeting had been read, Mr. Fisher read a most interesting paper on "Opium," in which he treated of the early history of the drug, its cultivation, preparation and its different varieties, with a short notice of some of the principal alkaloids obtained from it. Mr. Fisher mentioned in his paper that the red poppy not only yielded more opium than the other varieties, but also yielded about three times as much morphia, and gave as a reason for its non-cultivation, the conservative nature of the growers who prefer the cultivation of the white as their fathers had done before them.

The paper was criticized by the chairman, and the discussion was continued by Messrs. McLaren, Maben and Aitken. At its close a hearty vote of thanks was awarded to Mr. Fisher for his interesting paper, and the chairman having intimated that the next meeting would be announced by post card, the meeting separated.

Chemists & Druggists' Trade Association.

A deputation from this Association waited on George Anderson, Esq., M.P., P. A. Taylor, Esq., M.P., and John Whitwell, Esq., M.P., at the House of Commons, on February 20, 1879, at 4 p.m.

Mr. Haydon (the Secretary of the Association) having introduced the deputation, said that as a Bill was before the Legislature for the purpose of amending the Sale of Food and Drugs Act, 1875, the Association he represented had deemed it advisable to appoint a deputation to wait upon those Members of the House of Commons who had

charge of that Bill, with a view to suggest certain other amendments in the Act, which he trusted would meet with their approval and be embodied in the Bill. He would more particularly direct their attention to clauses 14, 15 and 21. By the 14th clause it was enacted that a purchase having been made of any article, within the meaning of the Act, for the purpose of analysis, the purchaser shall "forthwith notify to the seller or his agent selling the article his intention to have the same analysed by the public analyst, and shall offer to divide the article into three parts, to be then and there separated, and each part to be marked and sealed or fastened up in such manner as its nature will permit, and shall, if required to do so, proceed accordingly, and shall deliver one of the parts to the seller or his agent." As the clause at present stands, the purchaser offers to leave a sample of the article purchased with the vendor, but if the vendor does not accept that sample, then, by the provisions of the 15th clause, the purchaser transmits the whole of the article purchased to the analyst, who is empowered by the same clause "to divide the same into two parts, and shall seal or fasten up one of those parts and shall cause it to be delivered, either upon the receipt of the sample or when he supplies his certificate to the purchaser, who shall retain the same for production in case proceedings shall afterwards be taken in the matter." It so happened that in the majority of cases in which they had been called upon to defend their members in the law courts in prosecutions under the Act, the vendors refused the duly sealed official sample when offered by the purchaser, and consequently it was only after the Association had been put to considerable expense and by the courtesy of the various town clerks residing in boroughs where the prosecutions had occurred, that sealed samples were obtained from the authorities by the Association for the purpose of independent analysis; those samples when so obtained had previously been in the hands of the analysts, who in many cases suggested the prosecution. For the better protection of vendors he would suggest that clauses 14 and 15 of the Act should be repealed and that clause 14 should be re-enacted with the omission of the words "offer to" in the fifth line, "and shall, if required to do so, proceed accordingly," in the eighth line. This would make it compulsory on the purchaser to leave a sealed sample with the vendor at the time of purchase.

Mr. Anderson: What difference does it make if the vendor does not want a sample left with him?

Mr. Glaisyer (the Solicitor of the Association): In the carrying out of this Act we find in nine cases out of ten the vendor says, I "do not want the sample, because I have plenty in bulk," and we think that when a purchase is made for the purpose of analysis a portion of the article bought should be left with the vendor.

Mr. Anderson: The purchaser is bound to do that.

Mr. Glaisyer: No. He is bound to offer it.

Mr. Anderson: But if the seller does not want it, what good would result from leaving it on his counter?

Mr. Glaisyer: You then supply him with a means of defence.

Mr. Haydon: It also prevents the whole of the sample purchased being placed in the analyst's hands.

Mr. Anderson: The vendor might throw it away; if he does not want to take it when it is offered, how can you force it upon him?

Mr. Hampson: If a sealed sample were left with the seller he would look upon it as distinct from his ordinary stock and would be disposed to take care of it; under any circumstances he thought the whole of the article purchased should not be forwarded to the analyst.

Mr. Whitwell: The way to obviate that is to enact that in case a sample is refused by the vendor the purchaser shall be bound to retain some portion of the article purchased in his own possession for a certain length of time, to be surrendered to the vendor on application being made and on payment of any costs that may have been incurred.

Mr. Anderson: I ought to state that the Bill is to a certain extent out of my hands; it is referred to a Select Committee, and I am anxious to obtain your ideas in order to bring them before that Committee when it sits.

Mr. Taylor: The absolute division of the article purchased into three parts would be of public advantage, because all parties would then have a sufficient means of ascertaining the facts of the case.

Mr. Haydon: If the words I have previously referred to in the fifth and eighth lines of the fourteenth section of the Act were erased, the whole of clause 15 becomes inoperative and may be repealed.

Mr. Taylor: I think the Bill would be better in that form.

Mr. Whitwell: I also think it would.

Mr. Anderson: I see no objection to it.

Mr. Glaisyer: The next point is with reference to the twenty-first section. "At the hearing of the information in such proceeding the production of the certificate of the analyst shall be sufficient evidence of the facts therein stated, unless the defendant shall require that the analyst shall be called as a witness, and the parts of the articles retained by the person who purchased the article shall be produced," and so on. In working under this Act I have demanded the attendance of the analyst on the part of the defendant and when the case for the prosecution terminated it was closed with the production of a certificate and evidence of the purchase of the article, and on the part of the prosecution they did not put the analyst in the box. I had to call the analyst and on his own testimony the case broke down. I should wish the twenty-first section to be made more definite, although I have no doubt at all as to what construction the superior courts of law would place on the section. It would be that when the defendant requires the analyst to be called, his certificate is not sufficient without his verbal testimony in support of it. The bench of magistrates to which I allude took a different view; they said it was necessary he should be in attendance, but not necessary for the prosecution to call him.

Mr. Anderson: You want to change it and make it compulsory for the analyst to be present.

Mr. Glaisyer: Yes.

Mr. Anderson: That is throwing over the analyst's certificate altogether.

Mr. Glaisyer: It is practically thrown over by the clause as it stands.

Mr. Anderson: Then the defendant has power to insist on his attendance, and you say the case for the complainant is incomplete until he is put into the box. Then you say the bench of magistrates say that they would require the analyst to be present if the defendant wants him.

Mr. Whitwell: The defendant may summon him.

Mr. Glaisyer: The Act does not require the complainant to put him in the box.

Mr. Whitwell: *Primâ facie* the certificate of the analyst is proof. I have been present when two or three cases have been decided in that form.

Mr. Glaisyer: My suggestion is, that if the defendant, under the machinery supplied by the twenty-first section wishes the attendance of an analyst, he shall be put in the box to prove his certificate.

Mr. Hampson: It would not be required in every case, but only in contested cases.

Mr. Whitwell: If the person supposed to be offending, summons the analyst to appear, he can cross-question him on his certificate.

Mr. Glaisyer: By a rule of law if I call a witness I am not at liberty to cross-question him; I must examine him as if he were my witness, and that places me at a disadvantage, as in many cases the prosecution is recommended by the analyst.

Mr. Whitwell: Then you have to bring counter-evidence. I think the defendant is always placed in a better position if he has a substantial analyst, and if that analyst

is able to say he has carefully investigated the question. If a man of authority were to say the certificate is not correct, I think that magistrates would be much more prone to rely on him.

Mr. Hampson: In one case where the analyst appeared in the box we had to pay the expenses, although the case was decided in our favour through his own evidence.

Mr. Haydon: We have never yet obtained costs under the Act.

Mr. Anderson: Have you tried to get them?

Mr. Glaisyer: I have invariably applied for costs, but I have been told we think the police did right although they failed in proving the case, yet there was a sufficient question for them to bring forward. We failed to obtain costs when a case broke down on the evidence of the analyst himself.

Mr. Whitwell: Have you had many cases to defend?

Mr. Glaisyer: I think about ten or twelve chemists' cases.

Mr. Whitwell: We all agree that it is undesirable that adulterated articles should be sold. I think the Act is in favour of all honest men.

Mr. Glaisyer: Undoubtedly, and I may say we have not lost a case yet, for although we have been unsuccessful before the magistrate, the decision has been reversed on appeal.

Mr. Haydon: In one case we spent upwards of £200 in defending a most frivolous prosecution.

Mr. Whitwell: Do you represent the whole of the chemists and druggists in the country.

Mr. Haydon: We represent between 4000 and 5000 chemists residing in Great Britain.

Mr. Whitwell: You have a record of all cases.

Mr. Haydon: We have.

Mr. Whitwell: Where is your centre?

Mr. Haydon: Birmingham.

Mr. Whitwell: Have you large subscribers?

Mr. Haydon: The subscription is 5*s*. per annum from each chemist and druggist.

Mr. Whitwell: Does your Association deal with other questions?

Mr. Haydon: With every question affecting the trade of a chemist and druggist.

Mr. Whitwell: I remember some cases in which I think you have done good work. In that case which you say cost the Association £200, on what grounds were the costs refused?

Mr. Taylor: That no provision was made for them.

Mr. Glaisyer: No provision was made for them except on appeal, and then they are left in the discretion of the Court.

Mr. Whitwell: Then magistrates have power to grant them.

Mr. Glaisyer: They say there is a special provision in the Act for the payment of costs on appeal, but no provision made for payment of costs on the hearing in the first instance, and therefore they do not allow them. I may mention that the county magistrates have to administer the funds out of which the costs would be granted, whereas, in boroughs, the Town Council have to pay if the magistrates allow costs; so that in the cases of boroughs costs are seldom allowed, and in the counties they are invariably refused.

Mr. Anderson: I should think that was a hardship, not allowing costs in the case of a failure.

Mr. Taylor: Are those the only points?

Mr. Glaisyer: Yes; I have put the suggested alterations down on paper, and will hand them to you if you think they will be of service.

Mr. Anderson: We will bring these suggestions before the Committee, when it sits, and take them into consideration.

Mr. Whitwell: You do not ask for an alteration in the Bill itself?

Mr. Glaisyer: No, sir, we feel very glad that you have brought it in.

Mr. Hampson: On behalf of the deputation I beg to thank you for your attention and courtesy.

The deputation then withdrew.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, February 20, Dr. Gladstone, President, in the chair. After the confirmation of minutes, etc., the following certificates were read for the first time:—W. North, F. Podmore, W. Y. Gent, W. Radford. The list of officers for the ensuing year as proposed by the council was then read—President, Warren de la Rue, F.R.S.; Vice-Presidents, the list remains unaltered with the insertion of J. H. Gladstone, and omission of Warren de la Rue; Treasurer, W. J. Russell; Secretaries, W. H. Perkin, H. E. Armstrong; Foreign Secretary, Hugo Müller. Other members of the Council, M. Carteighe, A. H. Church, W. N. Hartley, C. W. Heaton, E. Riley, W. Chandler Roberts, T. E. Thorpe, W. Thorp, J. L. W. Thudichum, W. A. Tilden, R. V. Tuson, R. Warington.

The following gentlemen were elected auditors for the year:—R. J. Friswell, J. Spiller and J. M. Thomson.

The President then called on Dr. Otto N. Witt to read paper on—

Colouring Matters derived from Diazo-compounds.—During the last three or four years aniline colours have come into such general use as to, in many instances, replace the old costly artificial and natural dyes. Although there has been known for some time a great variety of magenta, violet and blue aniline dyes, green and yellow dyes were almost unknown until quite recently. Three years ago the author, in a paper read before the Society, indicated a theory as to the relation between chemical constitution and the colouring power of aromatic substances. In this paper he pointed out that there existed a series of compounds the colour of which was in close relation to their chemical constitution. The first link of this series is azobenzene $C_6H_5-N=N-C_6H_5$. This substance is of a deep yellow colour, but being devoid of salt-forming groups, is not applicable for dyeing. By introducing amido or oxy groups, compounds can be formed, having strong affinities for textile fibres, which increase with the addition of each salt-forming group into the molecule. At the time this paper was read amidoazobenzene and triamidoazobenzene were the only dyes of this class known; the first was of a beautiful bright yellow colour, but fugitive, the second was fast but dull. Since that time the intermediate diamidoazobenzene has been formed and named chrysöidin; it combines the beauty of the monamido and the fastness of the triamido bodies. The preparation of chrysöidin is then given. Griess has shown that not only can amidoazo compounds be obtained, but that the oxy derivatives of azobenzene and other similar bodies can be prepared by the action of diazo-compounds on the corresponding phenols; these oxy derivatives are also dyes. So that these diazo-compounds have opened out an almost inexhaustible mine of new and beautiful dyes. Since Hofmann's paper on chrysöidin, investigations on this class of compounds have been set on foot in the laboratories of almost all aniline colour manufacturers. The patents taken out for their production are constantly increasing in number. In consequence of his connection with Messrs. Williams, Thomas and Dower, the author has not been able to carry out his original intention of describing fully the preparation and properties of all his new azocolours. The prototype of these compounds is chrysöidin. The author has already given a description of the properties of this substance in the *Journal of the Chemical Society*, 1877, ii., 457; he has since prepared in a pure state the following analogous substances, closely resembling the typical product:—Orthotolylphenylenechrysöidine, para-

tolylphenylenchrysöidine, phenyltoluylenechrysöidine, orthotolyltoluylenechrysöidine, paratolyltoluylenechrysöidine, phenyltoluylenechrysöidinesulphonic acid, naphthylphenylenechrysöidenesulphonic acid and naphthyltoluylenechrysöidinesulphonic acid. Each basic colour has an acid counterpart, similar in shade and constitution, but containing hydroxyl in place of amido groups. The acid counterpart of chrysöidin has been prepared by Baeyer and Fäger, and studied by Typke. This compound is a beautiful but unstable dye; the author therefore introduced a sulpho group into its molecule by treating resorcin with paradiazobenzenesulphonic acid. The substance has since been described by Griess: its constitution is that of metadioxyazobenzenesulphonic acid. Its acid sodium salt is sold under the name of tropæolin O. By a similar reaction monoxyazobenzenesulphonic acid has been obtained from phenol; its sodium salt is known as tropæolin Y. Tropæolin OOO, No. 1, is oxy α naphthyl, and tropæolin OOO, No. 2, the sodium salt of oxy-β-naphthylazophenylsulphonic acid; tropæolin OOOO is isomeric with tropæolin OOO, Nos. 1 and 2. Another class of azocolours can be obtained if the salt-forming properties of amidoazobenzene and analogous compounds be intensified by introducing one or more sulpho groups; thus, by acting with paradiazobenzenesulphonic acid on dimethylaniline a dye is obtained, in which, however, the basic properties are too prominent, and to obtain a proper equilibrium one phenyl instead of two methyl groups must be introduced into the molecule of amidoazobenzenesulphonic acid. Thus is produced one of the most beautiful of the azocolouring matters; it is known as tropæolin OO. The author gives a detailed description of the preparation and purification of phenylamidoazobenzene, which, when pure, forms leaflets or needles of a fine golden yellow colour, M.P. 82°, soluble in benzoline, alcohol, ether and benzene. The author reserves for a future communication a description of amidodiphenylamine. Phenylamidoazobenzene, when treated with amylic nitrite and acetic acid yields a nitrosamine, crystallizing in orange needles, melting at 119·5°; its formula is $C_{18}H_{14}N_4O$. By the action of diazobenzenesulphonic acid on diphenylamine, tropæolin OO is obtained; it is a powerful acid and forms well defined salts. The author gives a description of the potassium, sodium, ammonium, trimethylamine, barium, calcium and aniline salts. In conclusion, the author trusts that he has succeeded in giving a sketch of what may be called the genuine azocolours, the true oxy and amido derivatives of azobenzene and analogous compounds. Compounds derived from amidoazo bodies by the action of amines as well as coloured substances containing the azo group—N=N—may also be termed azocolours. The author hopes in a future paper to lay before the Society his researches on these more intricate compounds.

The President said that all must have appreciated the very lucid and brief manner in which Dr. Witt had described this beautiful series of compounds, interesting both from a scientific point of view and from their application as dyes.

Mr. Perkin said that the paper was of peculiar interest to him as showing the enormous strides which aniline dye stuffs had taken during the last few years. He would like to ask whether these dyes were suitable for silk, wool, and cotton.

Dr. Armstrong remarked that the brief description given by Dr. Witt conveyed but a slight notion of the enormous amount of work concentrated in the results. He would ask Dr. Witt if he could point out the influence of the different groups in modifying colour, and also if he had any experience of tropæolin OO as an indicator in alkalimetry.

Dr. Witt said that most of the dyes, especially the sulpho compounds, were only suitable for silk and wool; the amine compounds dyed cotton. He had already pointed out two groups concerned in the tinctorial power of a substance which he had called chromogens and chromophors;* subsequent results had confirmed these conclusions. Oxy and amido groups principally had to do with the colour of the dye-stuff; the sulpho group weakened the colour but conferred stability on it; also *cæteris paribus* the more oxy or amido groups contained the more powerful is the dye. It does not follow, however, that the beauty of the colour increases with its intensity. The heavier the molecule the more the colour tends to the violet end of the spectrum. Some importance must be attached to the localization of the salt-forming groups, *i.e.*, the nearer they are together in the molecule the more powerful is the colour. Tropæolin OO has been recommended as an indicator by Von Muller; it is not affected by CO_2, and only after some time by SH_2, so that it can be used to titrate crude soda. A still better indicator is the dimethyldiazobenzensulphonate of ammonium.

Dr. Russell then took the chair during the reading of a paper by Dr. Gladstone, entitled—

Investigations into the Action of Substances in the Nascent and Occluded Conditions (*Hydrogen, continued*). By J. H. GLADSTONE and A. TRIBE. From a recent study of the behaviour of nascent and occluded hydrogen†, the authors concluded that these conditions of the element are not, as hitherto supposed, different, but are closely related, if not identical, and that the activity of the so-called nascent hydrogen is the consequence of its intimate association with the metals employed to bring about the liberation of the element. In the present paper the authors have examined the action of nascent and occluded hydrogen on nitric and sulphuric acids. The nascent hydrogen was obtained by electrolytic decomposition of the acids in Hofmann's arrangement for illustrating the composition of water electrolytically.

Nascent hydrogen and nitric acid.—Faraday and Bourgoin have shown that electrolytic hydrogen reduces strong nitric acid, but only imperfectly, or not at all when diluted with an equal bulk or more of water. If the oxidation of the freed hydrogen in this action results from its being in the occluded condition, the reduction of the acid would depend on its strength only in so far as this facilitated the de-occlusion of the hydrogenized electrode, and the stronger acid might be expected to do this the more readily, and it follows that with a given strength of acid the amount of free gaseous hydrogen should bear some relation to the rate at which the electrolysis takes place, for were the gas freed from its nitric radical not faster than it could be occluded, none should pass through the liquid; but if the evolution of the gas were faster than the occlusion, free hydrogen should escape. The authors have proved that this is the case. Their results are given in the annexed table:—

Grove's cells used.	Proportion of acid to water.	Time of experiment.	Reduction in c.c. of oxygen.	Free H
1	1 acid 68·2 p. c. 0 water	3 hours	31·5	0
2		55 minutes	28·4	0
4		22 „	28·8	0
8		10 „	29·4	0
1	1 acid to 1 water	215 „	30·6	0
2		42 „	29	2 c.c.
4		19 „	24·2	9 „
8		8 „	16·8	22 „
2	1 acid to 2 water	61 „	17	30 „
4		18 „	0·5	65·7
8		8 „	0·3	68·7

Each experiment went on till 35 c.c. of oxygen collected at the anode. In the second, third and fourth experiments of the series one to one, the evolution of hydrogen at the cathode ceased quite suddenly at the end of three minutes. This is due to the presence of nitrous acid, which prevents the escape of hydrogen with eight cells when present in the proportion of 0·059 gram to 100 c.c. of one to one acid.

* *Chem. Soc. Journ.*, 1876, ii., 403.
† *Chem. Soc. Journ.*, 1878, 306.

Occluded hydrogen and nitric acid.—Nothing is known as to the action of occluded hydrogen on nitric acid. Dr. Armstrong infers (*Chem. Soc. Journ.*, 1877, 82) that it has no action. The authors charged some finely divided platinum with hydrogen; on pouring on it some pure nitric acid the metal became red hot, the liquid became yellow and nitrous fumes escaped, so that occluded as well as nascent hydrogen acts on nitric acid. Palladium charged with hydrogen dissolves in nitric acid, one to one, without setting free any gas, so that the hydrogen in this case must be oxidized.

Nascent hydrogen and sulphuric acid.—The acid was decomposed electrolytically; the authors conclude that hydrogen associated with platinum reduces oil of vitriol very readily, sulphurous acid being sometimes formed; a film of sulphur also appears on the negative electrode.

Occluded hydrogen and sulphuric acid.—Finely divided palladium did not reduce the acid, but the metal charged with hydrogen immediately gave the odour of sulphurous acid when the sulphuric acid was poured on it. Platinum charged with hydrogen also reduces sulphuric acid. In conclusion the authors give the results of some experiments made by plunging a small piece of sheet magnesium into an excess of strong nitric acid diluted with an equal bulk of water; the metal dissolved in one or two seconds, gas being given off which was combustible and explosive, and contained hydrogen. The authors claim to have demonstrated the possibility of the replacement of hydrogen in nitric acid by a metal, and to have established the close likeness of character and therefore of condition between the so-called nascent hydrogen and the hydrogen occluded by metals.

Dr. Armstrong said that he had not stated in the paper referred to by Dr. Gladstone that occluded hydrogen had no action on nitric acid but had asked the question, has occluded hydrogen, etc.? He had dissolved some pure nickel given to him by Dr. Russell in nitric acid and obtained hydrogen, whereas crude nickel gave none; he therefore concluded that the pure nickel might contain some occluded hydrogen. Though admitting the extreme value of the authors' experiments he did not quite agree with all their conclusions.

Dr. Russell said that he had heated and pumped the nickel referred to repeatedly, but had never succeeded in obtaining hydrogen.

Dr. Wright suggested that the metal might contain a trace of oxide, and when heated the hydrogen would be converted into steam.

Dr. Gladstone briefly replied, and then took the chair.

Mr. J. T. Brown then read a short paper—

On Some Methods of Vapour Density Determinations.—The author criticizes the methods, and especially the formulæ of Hofmann, Wertheim, W. M. Watts, Goldschmidt, Frerichs, and Meyer. As the actual tensions of the vapour of mercury under various conditions are not known, the author suggests that they might be determined by estimating the vapour tension of a substance over Wood's metal and mercury at different temperatures. He offers the suggestion in the hope that some one will take up the subject. Wood's metal is a fusible alloy, composed of Bi, 15; Pb, 8; Sn, 4; Cd 3.

Drs. Witt and Armstrong pointed out that the new method suggested by Meyer was almost perfect, as exact results could be obtained by it with facility.

The Secretary then read a paper—

On the Decomposition Products of Quinine and the Allied Alkaloids. By J. J. Dobbie and W. Ramsay.—In a previous paper the authors gave the results of their experiments on the oxidation of quinine by permanganate; in the present paper the authors have extended their investigation to the oxidation products of quinidine, cinchonine, and cinchonidine. All these bodies yield by oxidation with permanganate, acids which are physically and chemically identical. This acid the authors prove by analysis, etc., to be tricarbopyridenic acid; they give in detail the method employed. More than 10 per cent. of the acid was obtained from each base. The paper contains an account of the properties and form of crystallization of the acid, with many analyses. The acid is tribasic. Potash, soda, ammonia, silver, calcium, barium, strontium, zinc, and copper salts were prepared and are described. The formula deduced from the analysis of the acid and its salts is $C_8H_5NO_6+1\frac{1}{2}H_2O$. The result of these present investigations confirms the conclusions previously arrived at by the authors, viz., that there is a close relation between the cinchona bark alkaloids and the bases of the pyridene series, and proves that the four principal alkaloids derived from the cinchona bark all yield on oxidation the same acid. In conclusion, the authors draw attention to the fact that their first paper was published March, 1878, and that in the *Ber. der deut. chem. Gesell.*, February 11, 1879, is a paper by Hoogeweiff and Von Dorp, which confirms the authors' researches as regards quinine.

The Society then adjourned to March 6, when the following papers will be read:—"The Quantitative Blowpipe Assay of Mercury," by G. Attwood; "On Gas Analysis and Gas Apparatus," by J. W. Thomas; "The Isomeric Dinaphthyls," by Watson Smith; "On the Action of Isomorphous Salts in Exciting the Crystallization of Supersaturated Solutions of Each Other," by J. M. Thomson.

EDINBURGH UNIVERSITY CHEMICAL SOCIETY.

The fifth meeting of the session was held on February 12, Mr. George Macgowan, F.R.S.E., in the chair.

A paper was read by Dr. W. Inglis Clark on "The Action of Chlorinated Substances on Alcohol," in which he described the practical method of preparing chloroform, and the chemical reactions which most probably occur in its formation.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting held on Wednesday, February 19, at 32A, George Street, W., Mr. O. Wallis, President, in the chair, a very interesting lecture was delivered by Dr. J. S. Stocker on "Vision." The lecturer expressed himself pleased to appear before the Association, and remembered many pleasant evenings he had passed in the same room some years back when the British Medical Association met there. He considered vision to be the highest gift of the Almighty. The laws of refraction and reflection of light were very clearly explained, and the diffusion and transmission of it mentioned. Allusion was made to the beautiful effect of the setting sun in the Alpine districts. Dr. Stocker then proceeded to describe very minutely the structure of the human eye and explained the effect of light on the optic nerve.

The lecture was illustrated by numerous diagrams, lent for the occasion by the authorities of Guy's Hospital, and a beautiful model of the eye. At the close of the lecture several pertinent questions were asked, to which Dr. Stocker briefly replied.

On proposal of Mr. Branson, seconded by Mr. Marshall, a vote of thanks was given to Dr. Stocker.

A letter was read from Professor Bentley expressing himself highly pleased with the work of the Association, and enclosing a donation of one guinea to its funds.

Notes and Queries.

[572]. LAC BISMUTHI.—In reply to the inquiry of Mr. Heyn respecting lac bismuthi, I have pleasure in supplying him and any other of your readers whom it may concern with the form:—

℞	Bismuthi Subcarb.	ʒiv.
	Mucil. Acaciæ	ʒj.
	Syr. Flor. Aurant.	ʒj.
	Aquæ . . . . . ad	ʒvj.

M. John Stewart.

[577]. SYR. CALCIS HYPOPHOSPH.—This salt I find very insoluble in water, and I would be indebted to any reader who could furnish a receipt for preparing a syrup of the strength of five grains in each fluid drachm.

SUB UMBRA FLORESCO.

[578]. CURRIE POWDER.—Could any reader kindly give through the *Pharmaceutical Journal* a good recipe for currie powder?

REGISTERED STUDENT.

[579]. PERFUME.—Would any reader of the Journal kindly give me a recipe for a good and delicate perfume for lime juice and glycerine? Also one for pomade. I have an objection to bergamot and ess. limonis.

J. N. C.

[580]. BROWN HAIR DYE.—Would any reader kindly favour me with a formula for brown hair dye?

M. P. S. I.

[581]. PHOSPHORUS IN BALDNESS.—I am informed that phosphorus is an excellent remedy for baldness. If any reader has seen it employed for this purpose, I should be pleased to learn how it is used, in the form of oil, lotion or pomade, and of what strength?

SUB UMBRA FLORESCO.

[582]. LIQUOR TOLU.—One part added to three parts of cold simple syrup will form syrup tolu, B.P., Could any reader mention a formula to produce a liquor of this strength or of 1 to 7?

SUB UMBRA FLORESCO.

[583]. METAL PASTE.—Will any reader kindly furnish me with a good recipe for "Non-Corrosive Paste," for rubbing on bright steel to prevent rust?

TOM.

[584]. ENEMA BALLS.—Would any of your numerous readers kindly inform me how I am to soften or render pliable india rubber enema balls hardened by age and exposure? B. B.

[585]. FILTER.—U. D. B. would be obliged for a form for cement or information how to stop a crack in silicated carbon filter. It is a narrow crack and the edges cannot be pressed together.

[586]. PIL. DE VALLET.—Will any reader kindly inform me how to make the above-named pill?

NIL DESPERANDUM.

[587]. TESTING OILS.—Can any of our readers inform me of a good method for testing oils, such as ol. olivæ, etc.?

MINOR.

[588]. EFFERVESCENT SALINE.—Will any one kindly supply a form for a good effervescing saline similar to those now so generally sold?

S. G.

[589]. STRAINING OF DECOCTIONS AND INFUSIONS.—Should decoctions and infusions be strained through muslin, tow, or cotton wool? Is it permissible to filter through paper? In many cases the medicinal value as well as the appearance is altered, according as to which medium is used.

In making infusions should allowance be made for the water absorbed by the drug?

P. B.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

[219]. Mr. Henry Brown's "disputing" that ℥j of Gregory's powder does not mean 60 grs. will not induce practical chemists to embrace his opinion of the question, as it is in direct opposition to the written orders of the prescription, which is most reprehensible at any time, as chemists I fancy, are morally bound to carry out the instructions of the physician to the letter. If they do not and do as Mr. Brown suggests, it is asserting that the writer of the prescription does not know what he means, and I am sure that even Mr. Brown would take objection to such an opinion on a prescription emanating from him. It is not always convenient or desirable to return a prescription; the patient is perhaps waiting for the medicine, and if asked to leave it to communicate with the writer, either thinks that the chemist cannot read it or the prescriber has made a mistake. Mr. Brown produces a very good argument for the other side of the question, viz., "look at any label, one or two teaspoonfuls is directed thereon;" then why do not medical men do the proper thing also, and write cochl. min., which, I have always been taught meant a teaspoonful? Suppose for argument's sake a prescription came in as follows:—

℞ Pulv. Rhei Co. . . . . ℥j.
Mitte vj.

Would Mr. Brown send a teaspoonful for the ℥j? If it is done in one case, it must of necessity be in the other. I can see here that "common sense" would be "outraged" considerably if this occurred. I also fail to see where Mr. Barnes has suggested it should be guessed, and must take this opportunity of saying I have always read his notes with the keenest interest considering them the matured opinions of one who has had an extensive and varied practice of pharmacy, and should like to know the number of the Journal that contains the "crotchets" from this gentleman. Mr. Brown has evidently arrived at the conclusion that he can vanquish all other opinions with his dogmatical notes. Such I hope will not be the case and I am sorry to see the strong and personal manner in which some of the arguments have been carried on of late, feeling assured that the object at point is neglected thereby.

SEMLOH.

[219]. I do not desire to enlarge your useful "Dispensing Memoranda" column with unnecessary correspondence, but quite agree with Mr. Brown's remarks that when ℥j of Gregory's powder is ordered, the translation should be "one teaspoonful." If we were to follow Mr. J. W. Barnes's mode of direction and order 1 drachm or 60 grains, I think such a direction would not only be antagonistic to the dictates of common sense and reason, but would probably puzzle the patient quite as much as the actual Latin itself.

ROBERT ROE.

[219]. I quite concur in the opinion so ably set forth by Mr. Hy. Brown, respecting the rendering of the sign ℥j in the customary directions for powder "in bulk." The illustration regarding inconsistency is also good. There are some men who will not vend "milk of sulphur" "because it is not pure" (*sic*), cannot conscientiously sell the popular toilet preparation "lime juice and glycerine" without adding a little glycerine—forgetting the other half

of the pseudonym, yet regularly use cane sugar in place of raisins in B.P. preparations, cassia pods weight for weight in lieu of cassia pulp and never keep "magnesia" B.P. in stock.

J. B. L. M.

---

[219]. In answer to Mr. Henry Brown's comment on 219, I think that if prescribers mean drachms or teaspoonfuls they should write drachms accordingly.

The directions on labels are usually one or two heaped teaspoonfuls for a dose.

EDINBURGH.

[231, 235, 245]. I admit the correctness of the replies in "The Month" to these questions, but I consider such at variance with the answers given to Nos. 233 and 248, for while advocating adherence to nomenclature in the two former instances the expositor recommends the interpolation of a syllable in each of the other cases referred to.

I maintain that "Plummer's pill" (pil. hydrarg. subchlor. co.) containing guaiacum and sulphurated antimony was never meant by the writer, or at least is not implied in the prescription, but pills containing two grains of calomel in each, such as are kept ready made in many pharmacies (as well as different other strengths of that mercurial). Further I should unhesitatingly supply such a pill as I have indicated.

J. B. L. M.

---

[232], I disagree entirely with the remarks in "The Mouth" upon this question, and from experience in the three kingdoms can corroborate the statement of "Burnham." Assafœtida pills (pil. aloes et assaf.) are used largely as a popular carminative and purgative for cases of constipation and flatulence in which galbanum pills (so called Pharm. Lond.) would not alone suffice as a remedy. Indeed the latter pill is seldom asked for by the public, though frequently prescribed as a valuable antispasmodic in hysteria and chlorosis.

However, it would be better were these preparations designated pil. assafœtidæ co., and pil. galbani co. respectively to prevent any confusion.

J. B. L. M.

---

[240]. What I required to know about sacchar. ordered in the prescription which came under my notice—"it being a mixture c̄ aq. destill. and not pills"—was the quantity and whether it ought to be weighed or measured. The quantity mentioned in the "Month" I cannot imagine to be sufficient according to the B.P.

SENEX.

---

[248]. Here, again, unless from an acquaintance with the prescriber, the dispenser knew it to be a *lapsus pennæ* I would advocate the use of spt. chloroformi, and consider such in conformity with the prescriber's intention. It is as much a "tincture" (which really means a solution of a medicinal substance—not necessarily coloured) as tr. iodi, B.P., or tincture of steel. Nay, more, I hold that it would not be right for any one to dispense spt. lavand. co. for spt. lavand., or tr. camph. co. for tr. camph., yet the words italicised are adopted as synonyms for tr. lav. co. and spt. camph. in our standard, the Pharmacopœia.

J. B. L. M.

---

[252]. As one pill is ordered to be taken three times a day, twelve pills may reasonably be sent. In preparing them, it would be proper to use equal parts of ext. gentian. and gentian. pulv., as there is no excipient.

W. McN.

---

[254]. Dissolve the quinine in the acid previously diluted with six drachms of the water; finely pulverize the magnesia salt and triturate with the remainder of the water; lastly add the tincture, mix the whole and affix a "shake the bottle" label. Such mixtures are occasionally desired for convenience to patients travelling. The sediment will quickly dissolve in the "wineglassful of water."

J. B. L. M.

---

[254]. In this prescription tinct. aurant. ℥iss. was probably written in error for ℥iss. Dissolve the quinæ sulph. in the acid, add the magnes. sulph., dissolved in a portion of the water, then the tincture, and make up to three fl. oz.

W. McN.

---

[255]. When tinct. nucis vom. is added to the water it becomes slightly opalescent, owing to the precipitation of the resinous substance contained in it.

W. McN.

---

[255]. The cloudy film consists of resin precipitated from the tinct. nuc. vom. by the acid.

PULVINUS.

---

[256]. When tr. guaiaci am. is ordered it is quite customary and proper to add a small quantity of mucilage to prevent the resin from being thrown out of solution; a less quantity than that used would, however, have been sufficient, if care be taken to pour the tincture gradually into the centre of the liquid, shaking frequently.

W. McN.

---

[256]. Mr. Barnes did quite right, for although it is possible to make up such a mixture without any addition, after a few days the resin invariably desposits on the sides of the bottle. Still, it might be better in such a case to use tragacanth, since one-twenty-fifth of the weight of the acacia requisite suffices to suspend the precipitate.

J. B. L. M.

---

[256]. "Carey" is of opinion that Mr. J. W. Barnes exceeded his duty in making any addition whatsoever to the ingredients ordered in the prescription. Had Mr. Barnes dissolved the potass. iodid. in ℥v ℥ij aquæ dest., and afterwards added quickly the tinct. guaiaci co. and sp. am. co. (mixed previous to adding), and then well shaken the bottle, he would not have had reason to complain of the inelegant appearance of the mixture.

---

[257]. It is generally easier to use gum than have fresh mucilage every day. If recently prepared an equivalent quantity of mucilage would be preferable, but to secure a nice emulsion a mortar should be used in either case.

J. B. L. M.

---

[257]. It is quite correct to substitute mucil. acaciæ for acaciæ pulv., the equivalent quantity in this case being about one fl. oz.

W. McN.

---

[258]. Dissolve the citric acid in a portion of the water, and add the quin. sulph. To this add the pot. iod. dissolved, lastly the syr. ferri iod. and tinct. iod. and make up to the required volume.

W. McN.

---

[258]. Dissolve the acid first, then the quinine in ℥ss. of the water, by the aid of heat in a test tube, and add gradually to the other ingredients (previously mingled with the rest of the water). Let the mixture be quite cool before stoppering.

J. B. L. M.

---

[259]. Rub the bals. tolu in a mortar with the tinct. canthar., and strain or filter. Warm the lard in a pomade bottle, and add the strained tincture, the castor oil, and ol. rosmar.

W. McN.

---

[261]. Mist. ferri co. undoubtedly contains ferri carb. sacch. This, however, is not a definite chemical compound, being a mixture of sugar with about 37 per cent. of $FeCO_3$ and traces of $Fe_2O_3.H_2O$

W. McN.

[262]. If "Delta" makes his lin. pot. iodid. c. sapone with oleic acid soap he will obtain a transparent liniment.

PULVINUS.

---

[263]. Equal parts of liq. ammon., B.P., and water is the usual strength of the sp. hartshorn sold by retail. For retail purposes hartshorn and oil may be prepared with equal parts of olive oil and the above solution. For dispensing purposes it is usual to make the B.P. preparation as it is required, as the liniment becomes inconveniently thick when made for a short time.

W. McN.

---

[263]. Spirit of hartshorn is liq. cornu cervi, and hartshorn and oil should be made by mixing three parts of spt. hartshorn with four parts of almond oil.

PULVINUS.

---

[264]. Send out a ten ounce mixture unquestionably. It is really surprising to hear that there could be any difference of opinion on such a matter, the imperial pint of twenty fluid ounces having been the standard for such a length of time.

Dublin. W. M. McN.

---

[265]. J. H. G. will find that if he tries rectified spirit as an excipient for pil. hyd. subchlor. co., he will learn something to his advantage. PULVINUS.

---

[265]. In answer to J. H. G., the best excipient to use for pil. hyd. subchlor. is glycerine of tragacanth; it keeps the mass in a miscible and rollable condition.

F. D. B. Y.

---

[265]. "Carey" has found sp. vini rect. answer exceedingly well for making the pulv. pil. hyd. subchlor. co. into pills. It is true they become hard, but they readily diffuse in water at a temperature far less than that of the body.

For the mass nothing can excel castor oil if used in the proportion of ℥vj to ℥iv of the powder. It is only necessary to spend a fair amount of time in beating the mass up to obtain a highly satisfactory result. A mass thus prepared for consistency, miscibility and plasticity is not to be equalled.

---

[265]. In answer to J. H. G. for the best excipient to make up pil. hydr. subchlor. co., I have been in the habit of using s. v. r. and ol. ricini, taking special care that the mass is not too soft. Pills made of the above preserve their round form and are quite smooth.

W. CORNISH.

---

[266]. Will any reader inform me if 3 minims of Fleming's tincture of aconite is an unusual dose—half a drachm is ordered in a ten ounce mixture, two tablespoonfuls to be taken every four hours? D. H.

---

[268].

℞ Potassii Bromid. . . . . ℥xxiv.
Syr. Aurantii . . . . . ℥ss.
Aquæ . . . . . ad ℥iij.

M. Sig. A teaspoonful three times a day.

The above prescription was recently presented to me to dispense. As I could not readily communicate with the prescriber, what should I have done under the circumstances?

Glasgow. W. P.

---

[271].

℞ Sp. Ammon. Co.,
Syr. Aurantii. . . . . āā ℥ss.
Aquæ . . . . . ad ℥ij.

M. ft. haust. statim sumend.

The prescriber not being near, was I justified in substituting ℥ss for ℥ss sp. ammon. co.? D. H.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

THE FUTURE OF THE DRUG TRADE.—CO-OPERATIVE STORES.—THE SALE OF PATENT MEDICINES.

Sir,—If "Hampshire" is not satisfied, he ought to be, with the result of his perseverance, considering the flood of correspondence which his letter of January the 25th has let loose.

I have waded through this correspondence, and, for the reputation of my brethren in the drug trade, all I can say is, I am thankful that your Journal is not read by the general public.

Fortunately, there are some exceptions, notably the letters of "Dorsetshire" and J. K. N., but I fear they are exceptions which establish the rule that, as a class, if we are forced out of a beaten track we very soon get bewildered. This is no fault of ours; it is due to the semi-professional, semi-commercial nature of our calling.

Doubtless, the writers mentioned above will be classed by "Outsider" amongst the was,—and is—and will be sort, in opposition to the go-ahead sort to which he and "Edinburgh" evidently belong. If "Outsider" had signed "Bagman" to his remarks, pilfered from the *Standard* and possibly other newspapers which I do not read, they would have misled no one and would have been estimated at their proper value, instead of being quoted as golden truths by some of your correspondents. If "Outsider" feels that I have under-estimated his social status, and will give his proper name and address, I will apologize to him in your Journal the week following.

The fact is, sir, the legitimate calling of a chemist and druggist is altogether incompatible with the go-ahead commercial ideas of the present day. Nor can his profits be estimated by the standard of any other business. His calling is associated with duties and responsibilities to which all other businesses are strangers, and capable of being undertaken by the representatives of no other business; he is entitled to a remuneration incalculable by the rules of ordinary trade, and this fact is fully known and acknowledged by the general public. If he were to reduce his prices, it would have the effect of simply reducing his returns in proportion, whilst his working expenses would remain the same.

Chemists are making a great mistake in selling patent medicines at invoice prices. The idea was initiated by the grocers, and forthwith chemists got into a panic and a great many are doing likewise.

Hitherto, chemists have been the medium by which advertising nobodies have made money, and, instead of losing their heads, if they had decided to stand their ground and insist upon being legitimately paid for what they sold, no matter how few, they would ultimately have been in a far better position than they will ever be by selling at the reduced price at a so-called ten per cent., which, when other things are set against it, is no profit at all. Those who will have their patent medicines at the reduced price, let them buy their physic with their tea and coffee.

As for the co-operative stores system, I look upon it as a craze, which will have its day and die a natural death, although in the meantime it will do incalculable mischief to retail trade. At the present the public are captivated with the idea of living at cost price, but time will prove to them that their interests are served best only by a division of trade as of labour into its natural branches and by an adequate remuneration of individual enterprise. It is contrary to all experience that a huge firm of general dealers should flourish for long when they know nothing whatever of the nature of the articles they deal in, but leave the details of their business to *employés* "with no interest in their work." Employers know well how responsible duties are likely to be carried out under such conditions, and in time the public will find it out for themselves and trade will return to its natural channels.

As for the future of legitimate drug trade, I believe it will stand as hitherto, but I fear there will be a painful weeding out of its weaker members.

Darlington. JAS. SWENDEN.

Sir,—If "Hampshire's" former letters have been disregarded, his recent one is receiving a compensating amount of attention. It is interesting to note what different criticisms are passed upon it, showing that the trade as a body is very much divided in opinion as to the best method of combating the evils from which it is suffering.

This is no doubt to a great extent accounted for by the different degrees of pressure imposed upon different localities. The chemist rarely commences the "cutting trade," therefore until something can be done--if that be practicable, in the form of an amendment to the Pharmacy Act—we must be as charitable as we can towards those who in self-defence reduce prices; yet in our individual interests, and those of the trade in general, every effort should be made to preserve the respectability of the business and shun "cheap physic."

The perusal of the letter signed "Edinburgh" induced me to venture into your correspondence columns for the first time, notwithstanding the "caution" to "'Hampshire' and his fellows."

It appears to me there is much "chaff" to winnow from a little "grain" in his communication. "Edinburgh" is so excessively amused at "Hampshire's" "absurd and indefensible position" that he is not aware that he has assumed a peculiarly untenable position himself.

While we as a trade are attacked on every hand by medical defence associations, co-operative stores, grocers, barbers, and others, each filching what they can from us, shall we remedy the matter by giving up our limited morsel of private property by reducing the price of prescriptions and poisons?

I think if pharmacists have nothing weighing heavier on their consciences than the extortionate (?) charges for drugs, most of them may die happy, whereas if by reducing the price we doubled the consumption of physic, what would some of us have to answer for?

If "Edinburgh" looks at the businesses advertised for disposal any week in the Journal, he will find that the business worth £200 or £500 show about equal amounts for receipts, not profits, out of the percentage on which all expenses areto be paid. Then add to the sum invested the cost of qualification, which may be reckoned as "stock-in-trade."

Again, either "Edinburgh" or I am very ignorant about the returns and profits of the trades he cites, viz., drapers, grocers, etc., as we greatly disagree in our opinions of them.

The position of the chemist and druggist is undeniably unique among tradesmen, and though the public often banter us about $11\frac{3}{4}d.$ in 1s., my experience is that the reasonable part of them readily allow that we are not over-paid, taking into consideration the responsible nature of our duties.

In the interest of the trade I trust we shall not find the ideas of "Edinburgh" reduced to practice.

Hull. H. W. Awlnot.

Sir,—I have read with great interest the recent animated discussion in your columns upon trade topics, such as "Co-operative Trading," "The Future of the Drug Trade," etc., but there is one other (mentioned by your correspondent Mr. J. C. Meacher in your last issue) which, in my opinion, is of vital importance to the trade; a grievance, the removal of which would tend in no small degree to resuscitate our present shattered prospects—I allude to the present unrestricted sale of drugs and tinctures by grocers, oilmen and other unqualified persons. The extent to which this is now carried on by persons having not the slightest knowledge of the quality or properties of drugs, whilst the sale of the less remunerative "scheduled poisons," with the responsibility and trouble conected with them, are alone restricted to the registered chemist, indicates a flaw in pharmaceutical legislation.

I would suggest that the sale of all drugs and chemicals (subject to certain exceptions) should be the monopoly of the qualified chemist and druggist, and for the convenience of the public in places where no registered chemist exists, would propose that a special list of all the more ordinary drugs should be prepared, and one person in each such place (upon application to the proper authorities) be allowed to retail the same, provided they are supplied to him by a registered chemist and druggist, and that the name of the chemist appear on all labels with which such drugs shall be required to be labelled. The desire of such a monopoly on the part of chemists is only just and natural, particularly as we have a precedent in the case of our continental neighbours.

I would respectfully recommend this subject to the consideration of the committee appointed to inquire into the amendments necessary in the Pharmacy Act. Our reason for desiring this monoply should be the same that obtained us the Pharmacy Act of 1868, viz., the interest and safety of the public, for if it is to the interest of the public that we should have an intimate knowledge of the characters of drugs and of the various methods of detecting their adulteration before we are allowed to sell them, it then follows that it must also be for the "public good" to prevent their sale by persons not possessing this knowledge which in our case is said to be such an absolute necessity.

My object in expressing these views in your correspondence columns, is to evoke the opinions of others upon the subject. If a monopoly similar to that indicated were secured us, it would form a safe barrier against the present serious encroachments upon our business.

Owen Wallis.

Sir,—I have read with much amusement the numerous letters that have appeared in the Journal *in re* co-operative trading. I am amongst those who feel certain that chemists cannot possibly compete with co-operatives, but that we must be firm and stand no nonsense. Let every chemist in a town get a list of the people who obtain the bulk of their goods from a store, and, without fear or favour, charge those who do double for all the odds and ends they are obliged to come to us for, at the same time telling them the truth in plain language, thus: "It is impossible for you to get at all times all you want without coming to us; we are bound to live; if we charge you as the stores do we must starve; therefore, if you make a convenience of us merely, you must pay accordingly."

I will, in conclusion, repeat a remark I made to a clergyman some little time since who owed me an account of three years' standing, and who got most of his things from London. "I have made up my mind that in future if the minister under whom I sit, and to whom I pay five pounds a year pew rent, sends away for what he can buy of me, I also shall cease dealing with him, but send to the stores for co-operative sermons, which will be a far cheaper plan, be probably in many cases better worth study, and read them quietly by my own fireside." I do not think the hint was lost.

No Nonsense.

Revision of the British Pharmacopœia.

Sir,—I beg to offer one or two suggestions towards a revision of the B. P.

As concentrated infusions are largely used by chemists, it would be advisable that the new edition should sanction same by giving a form for those in common use.

I have made infusion of gentian, calumba, and quassia, for many years with very good result as under—

(Two macerations).

Inf. Calumb. Conc.

1 and 7.

Rad. Calumb.	1 lb.
Spt. Vini Rect.	℥vj.
Aquæ	Oij.

Macerate one month with occasional agitation and press.

Second Liquor.

Aquæ	℥viij.
Spt. Vini Rect.	℥vj.

Macerate two or three weeks with occasional agitation, then press. Mix the two liquors and stand to clear itself.

Inf. Gent. Conc.

1 and 7.

Bitter Orange Peel, Rad. Gentianæ. āā	4 oz. and 170 grs.
Fresh Lemon Peel	8 oz.
Water	℥xxxv.
Spt. Vini Rect.	℥v.

Macerate one month with occasional agitation and press.

Second Liquor.

Aquæ	℥v.
Spt. Vini Rect.	℥v.

Staud two or three weeks, then press. Mix the two liquors and staud to clear itself.

Inf. Quassiæ Conc.

1 and 7.

Quassia	4 oz. and 170 gr.
Spt. Vini Rect.	℥x.
Aquæ	℥xxx.

Macerate one month with occasional agitation, press and filter.

Linimentum Saponis.—Sapo mollis in place of sapo durus, and made with proof spirit.

C. H. BRADSHAW.

95, *Mare Street, Hackney.*

Sir,—As the above subject seems at present very likely shortly to occupy the attention of the Council, I will venture, through your suggestion of the 18th inst., to offer my "mite" in the hope that more able writers may be induced to improve on the same.

Amongst the powders of the Pharmacopœia the first requiring revision is pulv. amygdalæ co., in which the almonds are directed to be "steeped in warm water until their skins can be easily removed." Having tried this and several other ways (perhaps more out of curiosity to get at the best way of blanching almonds than really to make pulv. amygdalæ co.) I have found that when made according to B.P. the powder in fourteen days' time gives off that unmistakable odour of "going rancid," which is no doubt due to the action of the heat of the warm water upon the fixed oil of which almonds contain from 40 to 60 per cent. I therefore came to the conclusion that it would be far better to blanch the almonds with cold instead of warm water and then made a powder accordingly, and, although I cannot but admit it takes a longer time to blanch almonds with cold than with warm water, yet the results are incomparably such as to leave no one in doubt as to which is best. I have a sample of each make, and the one with "cold" is perfectly sweet and fresh, whilst the "warm" is almost unbearable.

Pulv. Catechu Co.—I think the rhatany might be left out with advantage.

Pulv. Cretæ Arom. is a very complex mixture of aromatics, so much so that few chemists make their own, but entrust it to their wholesale houses with uniform results and general satisfaction.

Pulv. Ipecac. Co. is so standard a preparation in the eyes of medical men that it would be considered presumptuous to attempt improvement on it.

Pulv. Rhei Co.—I am told this was introduced to take the place of Dr. Gregory's powder, which had become a general nostrum in the trade, but I find the B.P. gives dissatisfaction in most districts, and we get it "sent back" with the message that it is not the Gregory of former times. I have found the following to come up to their idea, producing as it does better results as a gentle aperient and stomachic.

℞ Pulv. Rhei.	℥iv.
Pulv. Zingib. Jam.	℥iij.
Sodæ Bicarb.	℥j.
Mag. Bicarb. Pond.	lbj.

Whilst this does not materially alter strength of rhubarb, it produces a powder more soluble, effectual and agreeable than the present pulv. rhei co.

Pulv. Glycyrrh. Co. is contained in the additions to the B.P. and is to my mind a complete failure. It was introduced to correspond with preparation in the German Pharmacopœia, the composition of which I have found some chemists was thought identical whilst others have held various and erroneous notions of the composition of the same. For the benefit of such and for the comparison of the two I here give the original as near as possible.

Powdered Alexandra Senna	8 oz.
Powdered Liquorice Decorticated	8 oz.
Oil of Fennel	2 drams.
Precipitated Sulphur.	4 ozs.
Powdered Sugar	28 ozs.

Surely when the present form is revised we shall have this powder something like the original and no more have cause to have it prescribed with *Pharm. German.* after it underlined, indicating that the foreign preparation is preferred by medical men to ours.

I hope also we shall have a thorough revision of the doses of the Pharmacopœia. Whilst some of them are large, others are ridiculously small; viz., ext. nucis vomic. is 2 grains, whilst the maximum dose of the tincture (1 in 10) is 20 minims. And why should the doses of ext. opii and pulv. opii be both 2 grains when opium yields 50 per cent. of extract?

The wines also will bear revision, the sherry in it would not be any use as a beverage much more as a medicine.

Vin. Quinæ. In this there is not sufficient citric acid to ensure the quinine being all dissolved. To put 40 grains instead of 30 grains makes a much better "quinine wine."

Mist. Scammonii would be better made with 6 grains of the gum resin instead of 4 grains of the resin.

The essences are too few and stronger than required, 1 in 8 would be preferable.

In liq. potassæ and liq. sodæ respectively, we are directed to dissolve the carbonates in water, heat to boiling in a clean iron pan and add the slaked lime.

I prefer to proceed the way of the B.P. leaving out the boiling and making it entirely in the cold, as the B.P. way dissolves out the silica and alumina from the lime.

Lin. saponis would be better for the substitution of either soft soap or curd soap for hard soap.

Many additions might be made with advantage. Excipients for pills, Easton's syrup, salicylic acid and soda salicylate, with many others, but I have no doubt attention will be given to it by the better pharmacist of the day.

Bradford, G. H. L.

Sir,—The *Canadian Pharmaceutical Journal* for this month contains an article under the above head, and points to a matter which is of sufficient importance that I have thought it desirable to extract the following:—"Although the preparations deemed necessary and declared official in Great Britain have as a rule proved acceptable in other parts of the British Empire, yet they have not in all cases been found sufficient to meet the wants of the medical profession. We could cite several instances of remedies which are almost universally used in legitimate practice in this country, and for which there is no authorized standard of strength or definite directions regarding their mode of preparation. Consequently they are of somewhat uncertain composition, and are a source of confusion both to the prescriber and dispenser, while it is possible that the patient does not altogether escape. We speak advisedly in this matter and think the subject demands the serious attention of the Medical Council. The additions need not be numerous, as far as Canada is concerned, and we dare say that the wants of other countries would not swell the bulk of this volume very materially. However this may be, we claim for the Colonies some consideration, and hope that the coming Pharmacopœia may be one truly British, rather than one applying exclusively to Great Britain."

I have already written to Mr. Shuttleworth (the editor) asking him to publish such list, with any further remarks appended to the same that he might deem desirable, and if you, sir, would through the medium of this Journal call the attention of pharmacists in other colonies to the importance of having their requirements represented in the next issue of the British Pharmacopœia, I have no doubt but it will add considerably to the more general usefulness of the work.

Liverpool. CHARLES SYMES.

C. Thornley.—Mixtura oleosa-balsamica, Ph. G.—The following is the formula:—

ESTIMATION OF DIASTASE.*

BY W. R. DUNSTAN AND A. F. DIMMOCK,

Assistants in the School of Pharmacy of the Pharmaceutical Society of Great Britain.

When cereals are allowed to germinate, a peculiar principle is formed, probably by the oxidation of part of the albuminoid bodies existing in the grain, which is called diastase. It probably also exists in many plants. When absolute alcohol is added to a strong aqueous solution of a malted cereal, together with albuminoid substances, diastase is precipitated. It has never been obtained in a perfectly pure state, and therefore its formula is not definitely known. Diastase has the power of converting starch into a sugar isomeric with cane sugar, called maltose, which was discovered by Dubrunfaut in 1847. In 1872 O'Sullivan confirmed the work of Dubrunfaut, and completed it (*Journ. Chem. Soc.*, July, 1872). The work of this latter chemist was confirmed by Schulze (*Ber. der deut. chem. Gesells.* 2—vii.—1858). Together with maltose, dextrin is formed. The relative proportion of dextrin to maltose varies considerably where different temperatures are employed; but, according to O'Sullivan (*Journ. of Chem. Soc.*, Aug., 1876), the following equation represents the reaction that takes place below 145° Fahrenheit: our experiments were made at 100° to 120° F.

$$\underset{\text{Starch.}}{3\,C_6H_{10}O_5} + H_2O = \underset{\text{Maltose.}}{C_{12}H_{22}O_{11}} + \underset{\text{Dextrin.}}{C_6H_{10}O_5}$$

It will be seen from this equation that the diastase simply acts as a ferment in the same manner as pepsin and emulsin. Maltose has a reducing power one third less than that of glucose; that is to say, that 100 parts of maltose will only reduce as much of the cupro-potassium tartrate solution as 65 parts of glucose. It is not attacked by diastase, but is converted into glucose by ebullition with excess of dilute mineral acids. The dextrin which is formed has been shown to be an isomeride of starch, and is converted into maltose by simple hydration.

$$\underset{\text{Dextrin.}}{2\,C_6H_{10}O_5} + H_2O = \underset{\text{Maltose.}}{C_{12}H_{22}O_{11}}$$

There is no direct method by which diastase can be estimated. There are, we believe, only two recognized methods for the indirect estimation of it. The first consists in allowing the diastase, or substance containing diastase, to act upon starch in presence of water at a temperature of from 100° to 120° Fahrenheit in an atmosphere of carbonic anhydride, for constant results by this method are not obtainable in the air, as shown by Baswitz (*Journ. Chem. Soc.* xxxiv. 903). Then filtering the solution and estimating the maltose in the filtrate by the cupro-potassium tartrate solution. If the experiments of Musculus and Gruber (*Bull. Chem. Soc. Par.*, 20 July, 1878) be correct, the results obtained by this method will not be accurate, as they state that the dextrin reduces the cupro-potassium tartrate solution. Moreover, Musculus and Gruber state that a small quantity of glucose is formed by the action of diastase on starch, which would also reduce the cupro-potassium tartrate solution. O'Sullivan, however, maintains that dextrin does not reduce the cupro-potassium tartrate solution, and that the formation of glucose by the action of extract of malt on starch is not due to diastase, but to the acidity of the extract. The second method was, we believe, proposed by Coleman (*Chem. News*, xxxvii. 177). It consists in determining the amount of matter yielded by bread to water, and if working with a solution, such as malt extract, determining the amount of solid matter contained in it. A weighed portion of bread is mixed with water, a weighed quantity of malt extract added, the solution rendered slightly alkaline with bicarbonate of sodium, the mixture allowed to stand at 100° Fahrenheit for some time, the solution filtered and the amount of solid matter determined in the solution by evaporation to dryness. The amount of solid matter in excess would consist mainly of maltose and dextrin. This method has the objection that if any liquid other than water be present in the malt extract, such as alcohol or glycerin, the matter which would probably be dissolved from the bread by them would be weighed as maltose and dextrin resulting from the action of the diastase on the starch contained in the bread, and hence the error. There is another method which, however, is not quantitative but comparative. It consists in weighing into each of two basins half an ounce of starch, adding five ounces of water, raising to the boiling point, cooling down to 100° Fahrenheit, then adding a weighed or measured quantity of the solution containing the diastase to one and a corresponding amount of water to the other, keeping both at 100° Fahrenheit for one or two hours and allowing to cool. The one to which the solution containing diastase has been added will be more or less liquid according to the amount of diastase present, the other will be perfectly firm.

We have recently estimated the relative value, chiefly as regards diastase, of several different kinds of malt extract, and have found the following process to answer very well. It differs from the other processes which we have described in dealing with the direct action of diastase upon starch, independent of the products of that action. By means of this process the starch converting power is determined with considerable accuracy. Two flasks of about a quarter litre capacity are selected, and into each from ·1 to ·3 gramme of starch previously dried at from 180° to 212° Fahrenheit is added. About 100 c.c. of water are poured into each, and both are heated with constant agitation over a Bunsen burner until the starch is all gelatinized, as diastase has no action on ungelatinized starch. The flasks are then cooled down to 100° Fahrenheit. 10 grammes of the malt extract or solution containing the diastase are made into a solution with 100 c.c. of water. To one of the above flasks a certain number of c c. of the diluted solution containing diastase are added, and to the other just twice that amount. The flasks are now allowed to remain for three hours at a temperature of 100° to 120° Fahrenheit. At the expiration of this time a drop of the solution out of the flask, to which the largest amount of diastase solution had been added, is placed on a white porcelain plate, and near it is placed a drop of a dilute solution of iodine in iodide of potassium. If, when the two drops are mixed, any colour results, more of the solution of diastase must be added; but if no colour is produced in the flask to which the largest amount of solution has been added, then the flask containing the smaller amount must be tested in the

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, March 5, 1879.

same way. If any colour be produced, more diastase solution must be added until the exact point is reached when no colour is produced, three hours being allowed between each addition of the diastase solution.

An example will make this clear. Two flasks, each containing a solution equal to ·1 gramme of starch, made by boiling that amount of starch with 100 c.c. of water, are cooled down to 100° Fahrenheit. A solution of the malt extract is now made containing 10 grammes in 100 c.c. of water. Into one of the flasks 10 c.c. of the solution of malt extract are accurately measured from a burette. To the other flask 20 c.c. of malt extract solution are added, and the flasks allowed to stand for three hours at from 100° to 120° Fahrenheit. At the end of this time a drop of the solution is taken from the flask, to which 20 c.c. of solution of malt extract have been added, and tested with the iodine solution and found to give no colour; a few drops of the solution of iodine are also added to the solution in the flask to make quite sure that no starch remains unconverted. The other flask to which 10 c.c. of malt extract solution have been added is now tested in a similar manner with iodine on a white plate, and found to give a blue colour; of course no iodine need be added to the liquid in the flask when this is the case. We now know that the amount required is between 10 and 20 c.c. Therefore, to the flask to which 10 c.c. had been added, 5 c.c. more of the malt extract solution are added, and the solution set aside for three hours at the same temperature as before. At the expiration of this time, it is again tested with iodine, and is still found to give a blue colour, but not so decided as before; 2 c.c. more of the malt extract solution are now added, and the flask allowed to stand for another three hours. On testing it now with iodine, a very faint colour only is produced: ·5 c.c. more of the solution of malt extract is now added, and the solution allowed to stand for a further three hours, as before. At the end of this time no colour is produced, even when the iodine solution is added to the flask. Therefore, all the starch has been converted, and has used up 17·5 c.c. of our standard malt extract solution. Now, 17·5 c.c. of the malt extract solution are equivalent to 1·75 grms. of malt extract. And as ·1 grm. of starch requires 1·75 grms. of malt extract, one gramme of starch will require 17·5 of malt extract to convert it into maltose and dextrin. This process has been applied to all the malt extracts which we have examined, and by its use we have obtained very good results. With the same extract, using different quantities of starch, the following were the results of four experiments by different operators—17·4, 17·2, 17·2, and 17·5 grammes of malt extract were required to convert one gramme of starch.

We are at present engaged in endeavouring to apply this process to the estimation of the diastase in different samples of malt. The above process accurately indicates the point at which the last trace of starch is converted. Large quantities of diastase are necessary to effect this entire conversion of every trace of starch; whereas, as is well known, very small quantities of diastase will convert relatively large quantities of starch into a fluid condition.

[*The discussion on this paper and the following printed at p.* 750.]

EXTRACT OF MALT.*

BY W. R. DUNSTAN AND A. F. DIMMOCK,
Assistants in the School of Pharmacy of the Pharmaceutical Society of Great Britain,

Extract of malt represents the matter dissolved from malted cereals, generally malted barley, by water. It is met with in trade in three forms. The first, as a more or less viscid extract, containing from 20 to 35 per cent of water. The colour varies much—in accordance with the temperature at which it has been evaporated, and the colour of the malt used—from a golden yellow to a deep brown. The second form is that of a thin solution, containing from 60 to 80 per cent. of water. The third form differs from the second, in containing from 3 to 4 per cent. of alcohol, apparently the result of fermentation. Amongst the various brands the first form is the most commonly met with. The matter dissolved from malted barley by water consists of albumenoids, phosphates, maltose, dextrin, and a peculiar principle termed diastase, the properties of which we have alluded to in a previous paper. Extract of malt may be considered both as a remedy and as a food. In disease, where artificial digestion is desired, it appears to have a very important application, quite analogous to the application of pepsin to the artificial digestion of albumenoids. Extract of malt is commended as a sort of *elixir vitæ*, but, probably, its value depends almost entirely upon the amount of diastase which it contains.

Without going fully into the question of the manufacture of malt extract, a few remarks upon it may not be out of place. Diastase is said, when heated in aqueous solution to a temperature of from 155° to 158° Fah. (O'Sullivan), to lose its power of converting starch. This temperature, then, ought not to be exceeded in manufacturing the extract; indeed, a lower temperature than this should be observed to prevent the coagulation of albumenoids, thereby rendering them insoluble. It is, however, almost impossible to evaporate at so low a temperature without the use of costly vacuum apparatus, and hence it might be expected that malt extract made by pharmacists without such apparatus would contain little, if any, diastase. The method of the German pharmacopœia, which is largely followed, directs digestion of the malt with water—first, in the cold, then at 150° Fahrenheit, and the solution thus obtained filtered and evaporated at 212° Fahrenheit. Of course no diastase survives this evaporation. Another method is to heat the malt with water at 150° Fahrenheit, until no starch remains, filter and evaporate at 212° Fahrenheit. This method differs from that of the German pharmacopœia, inasmuch as part of the diastase is used up in converting the starch of the malt, and the remainder only is destroyed by the evaporation. We have made malt extract by both these methods, and have found no diastase result in either case. We have also examined extract made by macerating the malt in cold water, straining and evaporating under a low atmospheric pressure at a temperature not exceeding 155° Fahrenheit, and have found it to be rich in diastase. Such a process as this is recommended by the Pharmaceutical Society of Paris.

The following table includes the results of the examination of a number of trade samples of extract of malt. The albumenoids were calculated from the

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, March 5, 1879.

results of nitrogen combustions in the usual manner. We hope at some later date to be able to determine which of these albumenoids are coagulable and which amidic. Phosphates were determined in the ash as pyrophosphate of magnesium. The maltose was estimated by a standard solution of cupropotassium tartrate. The dextrin was estimated by boiling a solution of the malt extract with dilute sulphuric acid and estimating the sugar present by the cupropotassium solution as glucose—for maltose and dextrin are both convertible into glucose by ebullition with dilute sulphuric acid—calculating the glucose into maltose, then subtracting from the whole the amount of maltose found before boiling with dilute acid and calculating the remainder into dextrin. The starch converting power of the extracts was found by the process described by us in a previous paper. We beg to draw attention here to the fact which we have stated before, that this process trustworthily shows the relative value of different samples of malt extract, inasmuch as it accurately indicates the point at which the last traces of starch are converted. Large quantities of diastase, and therefore large quantities of malt extract, are necessary to effect this entire conversion of every trace of starch, whereas, as is well known, very small quantities of diastase and therefore very small quantities of malt extract will convert relatively large quantities of starch into a liquid condition, that is, will practically digest large quantities of starchy foods. Such a result, useful enough for purposes of digestion, but not sufficiently sharp for analytical purposes, is obtained by using the pudding process which we have described in a previous paper, and which we may say was tried as a rough indication of the presence or absence of diastase on all the extracts which we have examined.

THE PRODUCTION OF THALLEIOQUIN IN DILUTE SOLUTIONS OF QUININE.

BY S. R. CHALLICE.

Having experienced some difficulty in obtaining the green coloration in very dilute solutions of quinine by the ordinary process with chlorine and ammonia (in consequence perhaps of the chlorine not being freshly prepared), I have made several experiments with the following solution with very good results, and as it can be prepared without any trouble, I think it will be of some service to students who have not the time and necessary appliances at hand to prepare the solution of chlorine.

Put half an ounce of solution of chlorinated soda into a ten ounce stoppered bottle, add sixty minims of diluted hydrochloric acid, and allow it to stand half an hour, then pour in half an ounce of water and agitate for a few minutes, when it will be ready for use.

To six drops of this solution, mixed with two drachms of a solution containing one grain of quinine in forty ounces of water, add one drop of strong solution of ammonia, when a decided green coloration will be gradually produced, and also the red colour upon adding solution of ferrocyanide of potassium between the chlorine and ammonia.

In applying this test the chlorine and quinine should be agitated for several seconds before adding the ammonia as the colour is not developed if the ammonia is added immediately after the chlorine. After dropping in the ammonia, the solution should not be shaken until a decided colour appears at the upper portion of the liquid. If it is then slightly agitated the colour gradually deepens on standing for a few minutes.

THE BOTANICAL SOURCE OF SARCOCOLLA.

BY W. DYMOCK.

Gum sarcocolla is imported into Bombay from the Persian port of Bushire in bags which contain about two hundredweights. The total quantity imported must be considerable, as from twelve to twenty bags may be seen in a single warehouse.

The original packages always contain portions of the plant, of which the following is a description.

Fruit.—Pedicels short, slender; calyx three-quarters of an inch long, tubulo-campanulate, chaffy, mouth narrow, five-dentate; it entirely encloses the remains of a papilionaceous flower, and an ovoid, rostrated pod as large as a grain of rice, the external surface of which is covered with a felting of white cotton-like down, consisting of long simple hairs matted together. Although the pod is mature the remains of the flower continue firmly attached, even after maceration in water.

The pod is two-valved; attached to its dorsal suture on one side is a single greyish-brown, vetch-like seed, having a diameter of one-eighth of an inch; when soaked in water it swells, bursts, and a mass of sarcocolla protrudes; some of the pods are abortive and contain grains of gum.

Stem, woody, composed of numerous, radiating, wedge-shaped bundles, thorny; thorns three-quarters to one inch long, and together with the young branches more or less covered with cotton-like down, and encrusted with sarcocolla.

Leaves, not found.

A handful or two of the fruit may easily be collected from a bale of gum, but most of it has lost its

chaffy calyx from friction. As leaves are never met with, it is probable that the sarcocolla is collected by beating the bushes after the leaves have fallen. The exudation must be so abundant as to flow on the ground, as masses of sand glued together with it, of large size, occur in the packages. I think there can be little doubt that the sarcocolla plant will prove to be one of the desert Leguminosæ, belonging to, or very near to, the genus *Astragalus*.

I hope to forward by next mail a box containing a set of specimens for the museum.

Note.—Meer Muhammad Husain, in his Makhzan-ul-adwiga, states that unzeroot (sarcocolla) is the gum of a thorny tree called sháyakeh, which is about six feet high, has leaves like those of the frankincense (pinnate), and is a native of Persia and Turkistan. The Bombay commercial name is Gūjăr.

Bombay, January 26, 1879.

METEORIC DUST.*

Mr Cowper Ranyard has made a communication to the Astronomical Society on meteoric dust, in which he has thrown out some interesting speculations as to the explanation of the relative distribution of land and water on the globe and as to geological climates. He says that meteoric dust exists to a much greater extent than was formerly suspected. In 1867 Dr. Phipson published the result of many experiments in many countries, which showed that, by exposing a sheet of glass covered with pure glycerine to a strong wind, he has collected on it black angular particles, which he has by chemical tests found to be iron. It is, however, only in the winter months he has found this to be the case. In 1871 Dr. Nordenskjöld collected by a magnet meteoric iron particles from snow which had fallen near Stockholm. In 1872 he collected much of it from snow lying on ice in Finland. The Arctic Expedition of 1872 had opportunities of collecting snow far removed from human habitations, and they found large proportions of magnetic particles. M. Tissandier, in 1874–5–6, published in the *Comptes Rendus* a series of papers on atmospheric dust, in which, among other things, he has alluded to the iron found in the dust collected on the towers of Notre Dame. Again, Dr. Walter Flight published in the *Geological Magazine* in 1875 a paper in which he collected the evidences of iron "dust" found in holes in the ice in Greenland. In 1876 Mr. John Murray published a paper in the 'Proceedings of the Royal Society of Edinburgh,' in which he gave an account of his examination of the bottom of the oceans and seas visited by Her Majesty's ship Challenger. In many of the deposits magnetic particles were found. It was suggested that the nickel present prevented oxidization, while the fact that the meteoric particles which had fallen into the sea had not been washed away was attributed to the water being deep and not near the scourings of land surfaces which would cover it up. Again, in 1876, M. Yung examined the iron particles found in the snow which had fallen at the Hospice of St. Bernard. Mr. Ranyard submits that all these facts go to show that meteoric matter falling in the lapse of ages must materially contribute to the matter of the earth's crust. In the course of a year millions of meteors enter the earth's atmosphere. Most of them are "consumed" in the higher regions, but many particles reach the earth without having undergone change. There is little doubt that high above the earth's surface the air is impregnated with dust. The researches of Von Niessl show that many of the meteoric masses enter the earth's atmosphere in directions indicating that they do not belong to our solar system. It is therefore probable that a large quantity of meteoric dust is derived from sources outside our system. The earth and the planets as they are carried along with the sun in its motion through space would thus receive a larger proportion of meteoric matter on their northern than on their southern hemispheres, and Mr. Ranyard suggests that this may account for the preponderating mass of the continents in the northern hemisphere of the earth and for the fact that the great peninsulas all taper to the south. Another important inference to which Mr. Ranyard directs attention is that it is known that when meteoric masses are heated large amounts of occluded gas are given off. One of the results from a continuous fall of meteoric matter is that gaseous matter is probably being continually added to the atmosphere. According to whether the earth were passing through a region of space in which there are many or few meteors, the height of the atmosphere would be increased or decreased. When decreased, the temperature at the sea level would be that of our mountain tops and a glacial period would result. When increased, the temperature would probably be like that of the carboniferous period.

* From the *Times*.

THE HANBURY MEMORIAL FUND.

A meeting of the General Committee was held, at 17, Bloomsbury Square, on February 19, 1879. Present—Mr. T. H. Hills, in the chair; Messrs. Williams, Linford, Gale, E. Bremridge, Bentley, Moss, Flux, Southall, Carteighe and Attfield. The minutes of the previous meeting of the General Committee were read and confirmed.

Professor Attfield, one of the Honorary Secretaries, reported that altogether about £465 had been received, nearly the whole of the British subscriptions having been collected in 1876, and the foreign subscriptions in 1877 and 1878, though a few of the promised subscriptions from abroad had still to be remitted. The various amounts had been acknowledged in the *Pharmaceutical Journal*. The expenses for printing circulars, etc., had amounted to about £30, the postages to rather over £30, while the cost of the die for the medal already agreed upon as the form the memorial should take—a medal to be awarded "for high excellence in the prosecution or promotion of original research in the natural history and chemistry of drugs,"—would be under £50. Hence not less than £350 would be available for investment, yielding, even at 3 per cent., some £10 or £11 a year.

The following resolutions were passed:—

"1. That the balance in the hands of the Treasurer, together with any subscriptions or sums that may hereafter be received by the Secretaries, be invested in Government Stocks."

"2. That the Pharmaceutical Society of Great Britain be requested to act as trustees of the Hanbury Memorial Fund, the Council of the Society biennially requesting adjudicators to award the medal, and the said Council thereafter presenting the medal in accordance with the award."

"3. That if at any future biennial adjudication the dividends shall have sufficiently accumulated two medals may be awarded."

"4. That the following gentlemen be in due course requested to award the medal:

"The respective Presidents for the time being of the Linnæan, Chemical and Pharmaceutical Societies, and of the British Pharmaceutical Conference, together with one pharmaceutical chemist, who shall, prior to each award, be nominated by the last named two Presidents."

"5. That the medal be of gold, two and a quarter inches in diameter, having on the one side a likeness of Daniel Hanbury, with the words, 'Daniel Hanbury, born 1825, died 1875,' and on the obverse a central space for the name of the recipient of the medal, a surrounding wreath, and encircling the latter, the words, 'Awarded for Original Research in the Natural History and Chemistry of Drugs.'"

"6. That in due course a cash account and balance sheet be sent to the *Pharmaceutical Journal*."

The Pharmaceutical Journal.

SATURDAY, MARCH 8, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

SOME RESULTS OF THE SCHOOL OF PHARMACY.

IT has sometimes been urged as an objection to the course of study which students are required to pass through at the School of Pharmacy, that it has a tendency to divert young men's attention from the duties which appertain to the practical exercise of their business, and to render them in some degree less fit for the performance of certain indispensable details of the work to be done as part of the daily routine of a chemist and druggist's shop. It has also been urged in support of this objection that many of the most promising students are so far influenced in this manner as to abandon altogether their previously intended career as pharmacists and to direct their talents and energy to other pursuits, either in the field of general science or manufacturing enterprise, or that of medical practice. Any one familiar with the history of the School will at once call to mind instances in which former students of that school who might have been expected by this time to figure prominently among our leading pharmacists, have long ceased to belong to our ranks, and occupy in various other capacities distinguished positions, well calculated to excite regret that they have been thus lost to pharmacy. Without making any invidious distinctions, we may mention the names of H. D. POCHIN, R. D. GRINDLEY, J. C. MAJOR, and E. C. C. STANFORD, as among those students of the School of Pharmacy who have abandoned pharmacy in favour of other commercial and manufacturing pursuits. Among those who have done so to devote themselves to the cultivation of science we may recall the names of W. A. TILDEN, JOHN WATTS, A. PEDLER, and W. A. SHENSTONE, as being still engaged with credit in that direction.

In medicine again we may mention J. LANGDON DOWN. In all these instances it may be held that pharmacy has suffered considerable losses. Nor can it be denied that such losses were the direct consequence of the influenced exercised by the course of study carried on at the School of Pharmacy; but in admitting this much we do not at all concur in the idea that such a diversion of talent from the particular sphere for which it is the special business of the School of Pharmacy to qualify its students is to be regarded as in any way a reproach to that school, or an indication that it is unfitted for the performance of its particular object of giving a sound scientific training to intending pharmacists. This is now admitted among ourselves, as in other countries, to be a necessity and the fact that in some instances pharmaceutical students are induced to extend their studies so far as to qualify themselves for action in wider spheres than that of pharmacy is one which in reality reflects considerable credit upon the school where the desire to adopt such a course was awakened.

But while we regard this fact as being so far in every way creditable to the School of Pharmacy, it must not be forgotten that the impulse to take up a more special and extended cultivation of any branch of science that comes within the range of the pharmaceutical curriculum is to a great extent a personal matter, and though it may have been in some instances stimulated by the influence of the School of Pharmacy, analogous results have been brought about without that influence, causing in the same manner equal losses to pharmacy. It was in this way that one of our present most distinguished professors of chemistry passed directly from the position of apprentice to a chemist and druggist to that of a student of chemistry, and has now attained the highest honours in that capacity. In another case the former pharmacist has become an eminent geologist, and we might enumerate several other instances in which similar results have been brought about by the mere force of natural inclination.

There are some other instances in which pharmaceutical students, instead of taking up the practical exercise of the business of pharmacy, have devoted themselves to the cultivation of special branches of science without this change of pursuit being a loss to pharmacy, but in reality a very considerable gain. ROBERT BENTLEY, DANIEL HANBURY, and JOHN ATTFIELD did not, it is true, carry out the intention which we may assume was originally contemplated when they entered the School of Pharmacy, but while devoting themselves respectively to the study of botany, pharmacology, and chemistry, they not only shed lustre upon the school in which they had been taught, but contributed very materially to the future maintenance of its position, two of them by taking the places of professors, and the other by acting as a member of the Board of Examiners.

Probably no better sign of inherent vitality could be furnished than this development of teachers from within the school itself, and though DANIEL HANBURY never occupied a professorial chair in connection with the school, his labours as a pharmacologist have been of incalculable benefit in improving and adding to the knowledge of drugs and their natural history. It was therefore only fitting that an effort should be made to establish a permanent memorial of him as a former student of the School of Pharmacy, and of the services he had rendered, and it is with much satisfaction that we are able to record the

successful issue of the project originally suggested by Professor DRAGENDORFF in this Journal.

The fund that has been raised for the purpose is one of very modest amount, inasmuch as it was thought desirable to obtain numerous rather than large contributions, and with that object the subscription was limited to one guinea. After paying the expenses of circulars, correspondence, etc., and the making of a die for a medal, there is a sum of about three hundred and fifty pounds available for investment, and this will yield ten or twelve pounds a year which is to be expended upon the medal, to be awarded for high excellence in the prosecution or promotion of original research in the natural history and chemistry of drugs.

The request that the Trusteeship of the Fund should be undertaken by the Pharmaceutical Society has been acceded to by the Council, and the award of the medal is to be placed in the hands of the presidents for the time being of the Linnean, Chemical and Pharmaceutical Societies and the British Pharmaceutical Conference and one pharmaceutical chemist to be nominated by the last two named presidents.

MEDICAL LEGISLATION.

THE Duke of RICHMOND'S Bill has now been printed, and we have to state for the information of our readers that the provisions relating to unregistered person practising medicine are essentially the same as those in the Bill introduced by Dr. LUSH, the details of which were stated at page 701 of the Journal. The effect of this portion of the Bill is simply to prevent the assumption or use of titles indicating that the practitioner is legally qualified. Among the Acts proposed to be wholly or in part repealed is the Apothecaries Act of 1815.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held on Thursday, March 13, at 8.30 p.m., precisely, when a paper by Mr. C. E. STUART, on "Fruits," will be read.

COVENTRY AND WARWICKSHIRE PHARMACEUTICAL ASSOCIATION.

WE are pleased to learn that, under the auspices of the above Association, an opportunity will be given to the chemists of Warwickshire to meet in a social way at a Dinner to be held at the Castle Hotel, Coventry, on Wednesday next. On the following day, Thursday, there is also to be an "Associates'" Dinner. Particulars may be had from the Hon. Secretary, Mr. F. J. BARRETT, 75, Hertford Street, Coventry.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A MEETING of the above Association will be held on Wednesday next, the 12th inst., when a paper on "Parasites," by Mr. W. SMART, will be read.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, March 5, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hills, Rimmington, Robbins, Sandford, Schacht, Shaw and Woolley.

The minutes of the previous meeting were read and confirmed.

THE CONVERSAZIONE.

The SECRETARY read a letter which had been received from the authorities at South Kensington, granting the use of the Museum on Wednesday, May 21, for the Conversazione. It was unanimously resolved that a Conversazione be held on that evening, and that the President, Vice-President, and Treasurer, and Messrs. Betty, Robbins and Sandford be appointed a Committee to carry out the arrangements, with an instruction that no refreshments be provided by the Society.

The following being duly registered as Pharmaceutical Chemists were respectively granted a Diploma stamped with the Seal of the Society:—

Goodall, Wililiam Anthony.
Gravill, Edward Day.
Harpham, John.
Jackson, Joseph John.
Minshull, Rose Coombes.
Pain, Edwin.
Palmer, Charles Edward.
Pocock, William Frederick Henry.
Smith, James William.
Smith, Joseph.
Stacey, Peter.
Stuart, Charles Edward.

ELECTIONS.

MEMBERS.

Pharmaceutical Chemists.

The following having passed the Major examination, and having tendered their subscriptions for the current year, were elected Members of the Society:—

Ashweek, John Sydney	London.
Gulliver, George Ekins	London.
Jackson, Joseph John	Claverley.
Palmer, Charles Edward	Ely.
Pocock, William Frederick H.	Cape Town.
Smith, James William	London.
Smith, Joseph	London.
Stacey, Peter	Killock.

Chemists and Druggists.

The following registered Chemists and Druggists, who were in business on their own account before August 1, 1868, having tendered their subscriptions for the current year, were elected Members of the Society:—

Bird, Alfred	Birmingham.
Hogg, John Thomas	Hamilton, N.B.

ASSOCIATES IN BUSINESS.

The following having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Burrell, John Benjamin	Rayleigh.
Cooper, Frederick Richard	Manchester.
Fryer, Charles Hart	Kidderminster.
Grinstead, John	Preston, nr. Brighton.
Hall, Robert	Middlesborough.
Hugget, Sydney	Liverpool.
Jackson, Barnet Edward	Manchester.
Rowe, Walter	Leicester.
Simpson, John George Povey	Preston.

Sugden, Samuel.....Bolton.
Tebb, Henry .....Graaff Reinet.

Modified.

Fox, George Clement .....Old Charlton.
Hall, Joseph .....Wellington.
Jones, Edwin.....London.
Jones, William Edward .....London.
Presley, Edward .....Bristol.
Smith, John .....Mayhill.

ASSOCIATES.

The following having passed the Minor examination, and tendered their subscriptions for the current year, were elected "Associates" of the Society:—

Minor.

Allen, Frederick Charles.....Birmingham.
Arnfield, John Cash.....Ashton-under-Lyne.
Bence, Frederick Herbert .....London.
Botwood, Charles Walker .....Great Bridge.
Brandsma, Dirk Gerhard.....London.
Dowdeswell, Jonathan.....Tiverton.
Dunlop, Thomas .....Govan.
Fawcett, Christopher Airey.....Windermere.
Frost, Frederick Philip .....Bury St. Edmunds.
Griffiths, Benjamin .....Cardiff.
Gulliver, William Incle .....London.
Hughes, Thos. Ignatius James...Liverpool.
Laxon, Matthew .....Wisbeach.
Lyle, William .....Kelso.
Mann, George Frederick.....Wells, Norfolk.
Mann, Samuel William .....Bristol.
Massingham, Hugh Mortimer...Royston.
Scammell, William Joseph .....Adelaide.
Stone, Samuel .....St. Just.

Modified.

Strode, Thomas.....Honiton.

APPRENTICES OR STUDENTS.

The following having passed the Preliminary examination, and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society:—

Badcock, Harry D. .....Ottery St. Mary.
Bancroft, James .....Halifax.
Blaikie, James .....London.
Barton, Frederick Wm. .....Lincoln.
Bartlett, Arthur Henry .....Newport, I. of W.
Beck, Herbert Edwards .....Ryde, I. of W.
Bridge, George Edward .....Maidstone.
Clark, Brown.....Boston.
Crowther, Arthur .....Tickhill.
Goodwin, Henry Edward.....Manchester.
Grimes, Francis ....Milverton.
Gulliver, Walter Frederick.....London.
Johnston, John, junr. .....Aberdeen.
Jones, Nathaniel Stevens .....Fulham.
Koster, Jacob Willem .....London.
Laslett, Edwin Arthur .....Hull.
Lowther, Thos. William .....Cardigan.
Penrose, James Doyle .....Downham Market.
Penrose, George .....Downham Market.
Shields, Robert Henry.....London.
Smith, John William .....Manchester.
Steeples, William Stanley .....Ripley.
Taberham, Frederick William...Wells.
Wild, George Frederick .....Hyde.
Willson, Robert.....Boston.
Wimshurst, Frederick .....Southborough.
Wright, William .....Dumfries.

Two persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

Reports of Committees.

FINANCE.

The report of this Committee was received and adopted and sundry accounts were ordered to be paid.

BENEVOLENT FUND.

The first portion of this report related to the orphan children of the late Mr. Isherwood, and included correspondence with a chemist and druggist at Birmingham, who had offered to adopt the eldest boy if the sum of £15 a year were paid to meet the expenses of his education. The Committee had decided to recommend that the £15 a year be voted. A chemist and druggist at Goole, also, had offered to adopt the girl if on seeing her he and his wife felt disposed to do so. The Secretary had sent the child to Goole, and had received a communication saying that the impression she had produced was favourable. It was also reported that the youngest child had been adopted by a third gentleman, and the Committee recommend that a grant of money be made to the persons with whom the other child was now living, and who were willing to keep him until he was of an age to be admitted to an asylum.

The Committee also recommended the following grants:—

£31 10*s.* towards obtaining the admission of Katherine Annie Peele, the orphan child of a late member, into the Royal Masonic Institution for Girls, the amount to be placed in Mr. Robbins's hands. In 1877, a twin sister of this child was placed in the British Orphan Asylum, the election having been secured with the assistance of a grant of fifty guineas from the Benevolent Fund.

£10 to be placed in the Secretary's hands to be applied to the relief of the widow of an associate, if the further inquiries which it was deemed advisable to make should be answered satisfactorily.

£31 10*s.* to be placed in the Secretary's hands to be used, if he deemed it advisable, in procuring the admission of Hugh White Naldrett into the Infant Orphan Asylum at Wanstead. In 1877 a grant of fifty guineas was made to assist in securing the election of the brother of this child to the same asylum.

Several other cases were deferred for further inquiries, and one was not entertained.

Some conversation took place with regard to the orphan children of the late Mr. Isherwood.

Mr. Sandford asked if the Council could grant £15 per annum; whether that was not granting an annuity.

The President said it was proposed to make a grant of £15 at present and recommend future Councils to continue the same until the boy was about fifteen years old. Of course this Council could not bind future ones, but there was little doubt the payment would be continued if matters were satisfactory.

Mr. Hills suggested that the grant to be placed in Mr. Robbins's hands should be somewhat larger, in order to ensure the election of the candidate.

Mr. Robbins said a great many members had votes for the election, and if the case were published no doubt they would send him votes.

The President said he had no doubt that if Mr. Robbins found it necessary to expend a little more to secure the election he would do so, and trust to the Committee to reimburse him.

Benevolent Fund, 1878.

The Secretary presented the following statistics with regard to the Benevolent Fund.

		s.	*d.*		£	*s.*	*d.*
169	Subscribers @	2	6	=	21	2	6
878	,,	5	0	=	219	10	0
71	,,	10	0	=	35	10	0

Mr. WOOLLEY did not think the claims of the Benevolent Fund were brought so prominently before the trade as they might be. The figures just read showed that only the minority of the trade subscribed, and he thought if the matter were put before the non-subscribers more forcibly many would subscribe.

The SECRETARY said he had been hammering at this for years.

The PRESIDENT thought there would be more subscriptions received but for an idea that the Fund did not require assistance, inasmuch as money was being invested every year. But as the annual expenditure had been greatly increased for annuities and otherwise, more money was really wanted.

The SECRETARY produced a circular asking for subscriptions, which he said was sent to every person who became connected with the Society in any way. He also sent a number of them annually to local secretaries. He always found that where the local secretary subscribed himself, and took a warm interest in the Fund, it received considerable support in the district, but where he did not, it got very little.

Mr. WOOLLEY said that if he were supplied with a quantity of these circulars, Mr. Wilkinson and himself would undertake to work Manchester thoroughly.

The report and recommendations of the Committee were received and adopted.

The Chemists' Ball.

The SECRETARY reported that he had received thirty guineas for the Benevolent Fund from the Committee of the Chemists' Ball. and also a letter from the Honorary Secretary, Mr. Carteighe, expressing the thanks of the Committee for the use of the room in the Society's house, in which its meetings had been held.

A vote of thanks was unanimously passed to the Committee for the donation.

AUDITORS' REPORT.

The report of the Auditors, with the Financial Statement, was presented and adopted by the Council, after explanations had been given by the Secretary as to various items.

Mr. ATKINS asked if the expense of the Preliminary examinations had been much reduced in consequence of the reduction of the number of centres.

The SECRETARY said no doubt there would be a reduction, but it would not be shown in this statement, as the new arrangement had only been in operation for six months.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian to the following effect:—

Attendance, January 1 to 31: average during day, 20; evening, 11. Circulation of books, town, 155; country, 70; carriage paid, £1 5*s.* 7½*d.*

Donations received:—

Dowse (T. S.), Abbreviated Notes on Gelsemium sempervirens and Jaborandi, 1879. From the Author.

Hirschsohn (E.), Beiträge zur Chemie der wichtigeren Gummiharze, Harze und Balsame, No. 2, 1878. From Prof. Dragendorff.

Lallemant (C.), Etude sur l'Ergot du Diss, 1863. From the Author.

The Committee recommended the purchase of the following books for the Library:—

Brande (W. T.), Manual of Pharmacy, 2 ed., 1829.

Watts (H.), Dictionary of Chemistry, supplement 3, part 1, 1879. (2 copies.)

Monthly Journal of Science.

The Professors attended and reported had favourably of their respective classes.

Professor Attfield had stated that three ladies were working in the laboratory.

The Curator had reported that among the letters of thanks for copies of the 'Report on the Paris Exhibition,' one had been received from M. Ch. Lallemant, pharmacien, of D'Arba, near Algiers, who also sent a pamphlet on Ergot du Diss, and offered to make a collection of indigenous medicinal products of Algeria for the Society's museum.

Also that he had received the following donations for the Museum from Messrs. J. F. Macfarlan and Co., of Edinburgh, being specimens of their exhibit at the Paris Exhibition:—

Apomorphia Hydrochlorate.
Tetramorphia Hydrochlorate.
Dibutyryl-morphia.
Tetracetyl-morphia.
Morphia-succinic Acid.
Trimorphia Hydrochlorate.
Dibenzoyl-codeia.
Nitroso-morphia.
Diacetyl-codeia.

Two other unnamed bodies.

The Committee recommended that a special letter of thanks be sent to Messrs. Macfarlan and Co., for their valuable donation.

In reply to an inquiry, the Curator had reported that further duplicate specimens would be available for distribution after the arrangement of the specimens from the Paris Exhibition.

Mr. Howlett had attended the Committee and submitted an altered plan, specification, and estimate, amounting to £105, for new shelving for books in the ante-room.

The Committee agreed to the plan with certain modifications, involving a further cost of about £5, and recommended its acceptance by the Council.

Mr. BOTTLE asked if any practical difficulties had been found in the case of the lady students in the laboratory on account of no special accommodation being provided for them.

The PRESIDENT said none at all. He had made particular inquiries of Professor Attfield on the subject and was informed that the ladies were quite satisfied with the accommodation afforded them, and were working well and steadily.

The report and recommendations of the Committee were received and adopted.

HOUSE.

The report and recommendations of this Committee, referring simply to small matters, were received and adopted.

HANBURY MEMORIAL FUND.

The PRESIDENT read the correspondence and proceedings of the Hanbury Memorial Fund Committee, as printed on p. 736, and suggested that the Council should accept the trust therein offered it. He was happy to say that Mr. Flux had offered to draw up the trust deed without charge, so that the Fund would not be put to any legal expense.

Mr. SCHACHT asked if he understood that the award was to be made biennially.

The PRESIDENT said, yes. The Fund would not yield enough for a good medal every year, and there might be a difficulty in finding a worthy recipient every year. But a provision was made that two medals might be awarded in one year if the funds were sufficient.

Mr. GREENISH moved—

"That in response to the request of the Committee of the Hanbury Memorial Fund, the Pharmaceutical Society of Great Britain consents to act as trustees of that Fund, and the Council of the Society also agrees biennally to request adjudicators to award the medal, and will thereafter present the medal in accordance with the award."

It had been hoped that a medal could be given every year, but the funds would not allow of it.

Mr. HILLS seconded the motion.

Mr. SCHACHT, as representing the Pharmaceutical Conference, begged to support it. He felt much gratified at the request from the Committee that the management should vest mainly in the hands of the Pharmaceutical Society. The recognition of the Conference was a graceful act, and he was quite sure that that body would be only too pleased to concede the honour of the first place to the Pharmaceutical Society of Great Britain.

The resolution was passed unanimously.

THE WEIGHTS AND MEASURES ACT.

The PRESIDENT submitted to the Council the correspondence with the Board of Trade on this matter which has already appeared in the Journal. He also read a letter which he had, on the 3rd instant, addressed to the President of the Medical Council, requesting the co-operation of that body in urging on the Board of Trade the necessity of publishing an Order in Council legalizing the use of apothecaries' weight.

GENERAL PURPOSES.

The report of this Committee included the usual letter from the Solicitor with regard to the state of business placed in his hands. It also referred to several cases of complaints of infringement of the Pharmacy Act, and to the case of the Homœopathic Pharmaceutic Association, a diploma of which society had been submitted to the Committee and which it was recommended should be submitted to the Solicitor for his advice thereon. A resolution had also been carried that the Council be recommended to present a petition to the House of Lords, praying for a modification of the 20th clause of the Apothecaries Act. A long correspondence had taken place with regard to the case of Daniel Tudor Williams, of Aberdare, who had been placed on the Register and recently admitted to membership of the Society, as having been in business prior to the passing of the Act of 1868, and the Local Secretary had waited upon the Committee with regard to it. The medical practitioner who had signed the declaration had withdrawn his name,

and consequently the Committee recommended that the name of

Daniel Tudor Williams

be removed from the Register.

Mr. SHAW hoped that in future the names of all persons applying to be placed on the register would be published.

Mr. HAMPSON submitted that the Council had only to deal with the specific case before it.

Mr. SHAW said he would not discuss the matter at present, but he would give notice that he should bring the question forward again, and propose a motion.

The Council then went into committee to discuss some of the points mentioned in the report, and on resuming, the report and recommendations of the Committee were adopted, with the exception of the clause referring to a petition to the House of Lords, and a Committee, consisting of the President, Vice-President, and Treasurer, and Messrs. Betty, Hampson and Sandford, was appointed to watch the progress of the Medical Act Amendment Bill through Parliament.

THE ANNUAL REPORT.

It was resolved unanimously that the preparation of the annual report be referred to the Library, Museum and Laboratory Committee.

Mr. BETTY wished to bring forward a matter referred to, relating to the conduct of the examinations, but the President ruled that as the report had been adopted, it must be brought forward as a substantive matter at a future meeting.

ADMISSION OF WOMEN TO THE SOCIETY.

Mr. ROBBINS then moved the following resolution, of which he had given notice:—

> "That it is desirable to obtain an expression of opinion from the members generally on the question of the admission of ladies as members of the Society, and that, therefore, a small printed form be enclosed with each voting paper at the next election of Council, requesting it to be returned in a similar manner, with signature, indicating approval or disapproval of such proposed change."

Having explained the reasons why he had delayed so long in bringing this forward, he having given notice of it in November last, Mr. Robbins said this question of the admission of ladies to the Society had caused more feeling of excitement than almost anything else. It had been a burning one for some years past, and unless some means were taken out of the usual course, he could see no probability of its being satisfactorily settled. When his name was first placed in nomination as a member of the Council, he received several letters from the country requesting to know his views upon this subject, and intimating that he would receive support or otherwise according to the opinions he held. The Council had previously deliberated on this matter, and had been unable to arrive at a decision, and had therefore referred it for consideration of the annual meeting in 1873. At that meeting a direct decision was avoided, and an amendment carried, postponing the consideration of the subject *sine die*, and from that time to the present this question, in some form or other, had been constantly turning up for discusion. The opinions of the Council appeared to have been very evenly balanced, and it had never been able to come to a conclusive resolution. It therefore referred the matter again to the annual meeting, when Mr. Wade moved a resolution, the object of which was to admit ladies to membership. To that Mr. Vizer proposed an amendment, the result of the voting being fifty-seven on one side and fifty-nine on the other. The majority was given to Mr. Vizer, but owing to some confusion at the time, the majority was claimed afterwards by Mr. Wade. But it mattered very little which had the highest number, for he considered that no important question could be satisfactorily settled by so small a majority. The plan he proposed for getting out of this difficulty was to obtain an expression of opinion from every member of the Society who took sufficient interest in the question, and this could readily be accomplished with very little cost and trouble to the office by adopting the terms of the resolution. At the last Council meeting in conversation one of his *confrères* had said to him that he could not show that such a thing had been done by any regularly constituted government. Now curiously enough a few days before he had seen this statement in the *Times* newspaper:—A curious and interesting struggle had just taken place in Switzerland. The question was whether a subsidy voted by the Federal Council some time since, should be sanctioned or not, and it was decided by a vote of the whole people. The inhabitants of some of the remote cantons, thinking that they should derive little benefit from this expenditure objected and demanded an appeal to the citizens, which it appeared they had the privilege of doing according to the constitution, and it was done. His proposition did not go so far as that. These papers must not be considered as voting papers, but merely as an expression of opinion. They in reality would be equivalent to voting papers, because he was quite sure that the members of the Council would at once give effect to the expression of the majority, whatever their individual opinions might be. The one, and the only objection he had found raised against this proposition was that it would be a precedent. No doubt it would be so to a certain extent, but it could be in very rare cases that such a thing could happen again, and under similar circumstances he thought it would be a very desirable one to follow; namely, when a case had come before the Council year after year, and then when the Council had sent it to the annual meeting on two occasions the question still remained undecided. He was not asking the Council to shirk its own duty by sending every troublesome question to the decision of the members. His own opinion was that in future, as hitherto, such questions, even although they were troublesome, should be decided by the Council. It would still be for the Council to say whether it should be settled in this way or by themselves. If his proposition was not a good one a better one might be suggested, but it was high time the question should be settled in one way or another, and he thoughtthis way would meet the approval of the members generally. If it were done in the way attempted last year, by going to the annual meeting, whichever way the majority might be the members at large would not be satisfied. In sending this matter to the annual meeting the Council was supposed to appeal to the members, but it was in fact only a part of the members who attended, and he simply went a little further and proposed to appeal to the whole body, and then he was sure the Council would settle the matter, and give general satisfaction. He concluded by moving the resolution.

Mr. BOTTLE said after the full explanation Mr. Robbins had made to the Council it required very few words from him to support the motion. He for one should certainly object to this mode of deciding any matter that had not been fully discussed and previously entertained, because he thought it was of itself a very bad precedent; but here was a question which had been before the Council on several occasions and had been very warmly discussed and it had been before two annual meetings without arriving at an issue. If it were not disposed of in some way it would be a burning question at another annual meeting, and therefore this method commended itself to his mind and he thought it was a very proper way of disposing of the subject. When Mr. Robbins said he did not desire that this mode of action should become a precedent, he (the speaker) must remind the Council that if the Society admitted ladies, a lady might become President, and that was a view which should not be lost sight of. For himself he should have no objection to seeing a highly educated lady, who having gone through the curriculum of study had passed the Major examination, occupying such a a position, but like the electric light, which was

throwing a long shadow before it, he thought it would be a long time before it came to pass.

The PRESIDENT said the Council could not help this becoming a precedent.

The SECRETARY asked if Mr. Robbins wished the voting papers to be a guide to the annual meeting or to the Council, because they would not be examined until the annual meeting was over.

Mr. ROBBINS said it would be for the Council, not the annual meeting.

The PRESIDENT did not like the idea of asking people to give a vote or opinion upon a question which they had not discussed. It was a bad principle which he disliked very much indeed. He should be glad to see this lady question settled amicably and reasonably, and to keep it out of the discussion at the general meeting, because it occupied time which might be better employed, and it had been discussed so much already that it ought to be settled. If it could be done in some way he should be very glad, although he had great objections to sending out papers to be returned at the whim of anybody.

Mr. HAMPSON said he was certainly taken by surprise to find that two reasonably conservative members of the Society should propose such an extremely revolutionary method of settling any question. There would be no doubt that the resolution, if carried, would establish a precedent, and when it was found that the Council for two or three years could not agree on a particular question, and the annual meeting could not agree, it would become necessary to resort to that disagreeable method of settling it. He liked questions to ripen in their natural form, and if Mr. Robbins and Mr. Bottle would allow this question to gradually ripen, it would probably bear its natural fruit in an annual meeting or two, and the question would be settled. He was much astonished that they should make such a to-do about it at all. That morning a gentlemen from Australia had been elected an associate and there was no objection raised; his impression was that if an intelligent Zulu or an educated Hotttentot, or any such gentleman, passed an examination, the Council would elect him as a matter of course, notwithstanding his colour and the country from which he came; but when two or three of their own countrywomen had come before the Board of Examiners and satisfied it thoroughly, and then came before the Council to give them what was absolutely and technically their legal right, the members could not make up their minds. He thought Mr. Robbins was very badly advised in pressing forward this motion. When it was necessary to alter the bye-laws the annual meeting was considered competent to make, as it were, a fresh law, and surely it ought to be sufficient to decide a question of this kind. He thought it was extremely undesirable that such a dangerous precedent should be established.

Mr. ATKINS had no doubt the members of Council would all be extremely glad to get this matter settled, and they would also be glad, if possible, to get at the opinions of the whole of their constituents upon it, but he must somewhat demur to the proposal, and he did so for this reason, which he knew had been taken exception to by a very high authority and it was challenged at the annual meeting, but he still held to the conviction he then expressed that the Council was not bound to register the vote of an annual meeting. If it were, its decisions simply became those of delegates rather than that of independent members who came there to consider and listen to the arguments advanced and decide upon them and arrive at a just and equitable decision. At the annual meeting referred to the question was brought forward and discussed with considerable warmth and a large amount of sentimentality, and it was doubted what the result was. It might be said to be six on one side and half a dozen on the other; or, perhaps, if he said they were all at sixes and sevens he should be more accurate, only the difficulty lay in saying on which side the sevens were. If papers were sent out and they all came back,—for his part he did not believe they would, for such a thing was never known to take place,—but if they did and there was a small balance as there was at the annual meeting, those who were in favour of the admission of women would somewhat hesitate, in the light of this vote of the constituency for whom they were legislating, to introduce a great organic change; and on the other hand he might venture to speak for those who were not in favour of it. No man worthy the position he held at the Council Board would abdicate his own independent position, simply on account of a vote of that kind. He would say, on the contrary, to those who sent him there, if he did not represent their opinions, remove him and put some one else in his place. But if the great body of pharmacists were convinced that ladies ought to be admitted, they had the old constitutional mode of deciding this question by electing a majority who held that opinion. Therefore, without at all dealing with the arguments on either side, he thought they might fairly let the question ripen, and as soon as the country generally was in favour of the admission of women, it would be found that that opinion was strongly represented at the Council Board.

The VICE-PRESIDENT said that when the matter had been so frequently argued, it seemed unnecessary to adduce any fresh arguments in its favour; but he thought that one was that the Medical Council had recently come to a unanimous decision that ladies were to be admitted for examination, and it therefore did seem extraordinary that after these ladies had undergone the examination they should be refused membership. The arguments adduced in favour of issuing such a circular very much depended on the kind of circular sent out, and he was very much afraid members would get into the same mist as they did at the last annual meeting, when it was quite evident that some gentlemen did not clearly understand the question, and at last the confusion became worse confounded, and the division was anything but satisfactory. He believed if these circulars were sent out, unless they were very carefully drawn, many country members would be under the impression that they were introducing ladies into the profession as rivals, whereas they had all the privilege of trading precisely the same as themselves. The point was to make them clearly understand that this was not a matter of rivalry, but merely a matter of justice.

Mr. SHAW said he held the same opinion as he had expressed on former occasions, that this was a matter which belonged exclusively to themselves as a Council. They had to decide as to the election of members, and the bye-laws gave certain instructions how that should be done. Therefore it was a pity it should ever have been remitted to the general meeting. He recollected the first meeting when the question was brought forward; a great deal of misunderstanding did take place, and the President had to call the attention of various speakers to the fact that they were not discussing the question of admission to the trade, but admission to the Society. His impression was that if this circular were sent out a good deal of that misunderstanding would again take place. He looked upon the matter as having been practically settled at the last meeting. But he thought he could name three gentlemen whose opinions were very strong upon the point, who left the meeting just before, and if they had remained the matter would have been carried so far without any hesitation. He objected to that Council abdicating its functions, and thought it would be wrong to do so. It would form a bad precedent for the future, and the same thing would be done whenever any difference of opinion took place between the Council and the members outside as to poison regulations or anything else. With regard to the admission of ladies, the President had stated that that was an important public society, and if so, then the persons having passed the examination, no matter whether male or female, had a right to be elected. This question was making progress, for the Duke of Richmond at the present time was making arrangements by which a joint

Board of Examiners should be formed compulsorily for the medical professions, which should admit ladies to its examinations, and after they had passed that joint board they would have a right to become members, he believed, of any of the various corporations which had refused them admission on former occasions.

Mr. FRAZER said he had always supported the admission of women, but he thought it should be done in a constitutional way, and he could not approve of this motion. He thought Mr. Atkins put the thing in the right way. The Society would soon be sending fourteen new members to the Council, and if the country wanted women to be admitted, they would send in fourteen gentlemen who would vote for their admission.

Mr. GREENISH said he must vote against Mr. Robbins's resolution, because he thought it would be a very bad precedent. The opinion he held, as he had stated before, was that it should never have gone from the Council to the general meeting at all; but, having gone to the general meeting, let it be settled by the general meeting. He was not at all sure that it would be settled by sending out circulars. Those who paid no attention to the matter were not likely to take the trouble to sign papers. Besides, if this question were once taken from the general meeting, there would be no faith for the future in any question being settled by an annual meeting.

Mr. ROBBINS, in reply, said the principal objection made to the proposal was, that it would be a bad precedent, but, as he had endeavoured to show, such a position was not likely to occur again in their lifetime. In the whole history of the Society this was the first time the Council had declined its responsibility. It appeared still to decline it, and this had been going on now for a period of over six years. Mr. Hampson had said the question was not yet ripe, but it appeared to him (the speaker) that it was not only quite ripe, but was getting very stale. Then the President had said it had not been discussed, but he did not know any question which had been so much discussed, and on which so much had been said on both sides. At the last general meeting one gentleman went to the expense of coming up all the way from Cornwall to record his vote, and another came from Scarborough to vote the opposite way. He did not see why it should be assumed that the votes should go against the ladies, which seemed to be the impression.

Mr. HAMPSON said no one had expressed any such opinion.

Mr. ROBBINS said the Council ought to decide how this question should be finally settled, whether by the Council or at the next annual meeting. But by sending it to the next annual meeting the members generally would not be satisfied. When it came to a balance of two it could be easily turned one way or the other, by a little extra exertion on the part of one or two members, and the decision so arrived at could not be said to represent the feelings of the country. There was a difficulty to be grappled with in one of two ways either by the Council doing it itself, which was, perhaps, the best way, or by leaving it to the members generally. He was quite sure if it were sent to another annual meeting, there would be a great deal of confusion again, but if it were settled in this way it would give satisfaction to the members generally.

The PRESIDENT said it would invalidate the election of members of the Council if carried out as proposed, because the signatures of the members would invalidate the voting papers.

Mr. ROBBINS said he would omit the words "with signature" from the motion.

The motion was then put to the vote, when there were four votes for it, and nine against. It was therefore lost.

PHARMACY ACT AMENDMENT.

Mr. HAMPSON then proposed the following motion:—

"That a Committee consisting of Messrs. Betty, Bottle, Hampson, Robbins, Sandford, Savage, Williams and Woolley be appointed, with power to obtain the necessary legal assistance, to draft a Parliamentary Bill embodying the recommendations of the Pharmacy Act Amendment Committee as accepted by the Council."

He thought it was hardly necessary to say anything in support of the motion. The Committee had been appointed, and had submitted its report, which had been accepted by the Council, and it therefore followed that a Committee should be formed for the purpose of putting those accepted propositions into legal parliamentary shape. He also asked for legal assistance, because it was not to be expected that a lay committee would be competent to do this work. He thought no one would oppose the motion, and therefore he would not detain the Council further.

Mr. BETTY seconded the motion. It was a matter which would require great care and consideration; the sentiments and opinions of the gentlemen who had in hand the preparation of the Bill would, he trusted, be so representative as to embody the wishes and secure the interests of the whole body of the trade. He hoped that the Committee suggested would present such a Bill as would pass, and which would carry out every legitimate wish of chemists and druggists, and he trusted their labours would thus result in good fruit for themselves and all engaged in pharmacy.

Mr. SANDFORD said he had heard his name read as one of the proposed members of the Committee, and it was very kind of Mr. Hampson to put him on it; but he must ask to have his name removed. His own opinion was that there was not enough in the amendments to go to Parliament for. There were things in them he could not support in any way, and he should be rather a clog than otherwise on the action of the Committee. The very first clause he could not support, and he also objected to several other matters.

Mr. FRAZER entirely sympathized with Mr. Sandford's remarks. He only rose because he did not wish it to be considered that the Council was unanimous in accepting these amendments. He objected on principle to certain portions of them and objected very strongly, on the point of expediency, to the whole.

The PRESIDENT said he believed the amended proposals had passed without any dissentient vote.

Mr. SANDFORD said that was not so; he had voted against them.

Mr. WOOLLEY said he was surprised that Mr. Sandford should object to the first clause, inasmuch as he had not opposed it in Committee. Mr. Sandford, he believed, had said that he had no authority for making that statement. The only authority he had was his own ears, and he certainly never heard Mr. Sandford raise any objection in Committee against that first clause. It was very disheartening, after the Committee had gone to the labour of preparing those ten clauses, that they should be told by Mr. Sandford that all their labour had been thrown away. He must still support the motion that those ten clauses should be put into the hands of the Solicitor, with the view of having the Bill drafted to be printed on a suitable occasion.

Mr. HILLS said he had read these various propositions over and over, trying to agree with them, but he found he could not; consequently he could not support the proposed Bill.

Mr. SHAW was rather astonished to find exception taken to the proposed Bill, since it appeared in the report of the last meeting that the recommendations, as amended, were unanimously adopted.

Mr. GOSTLING said that was not so; he recollected Mr. Hills objecting.

Mr. FRAZER said he also had held up his hand against them.

Mr. SHAW said at any rate it was voted by a large majority.

The PRESIDENT said he had had a communication from

one of the members of the Council, who was not present, stating that if able to be there he should have opposed the proposition of Mr. Hampson.

Mr. SANDFORD said he thought the President need not scruple to say that it was Mr. Mackay who had expressed that opinion.

The PRESIDENT said that was so; but of course he might alter his opinion after hearing the arguments.

Mr. SHAW said on a former occasion there was a division as to the appropriation of moneys derivable from criminal prosecutions, and he thought that might form a portion of the proposed Bill. The Committee had spent a large amount of time in discussing the merit of these amendments and he thought it had concluded that they were desirable. Having discussed the amendments the question then arose whether the Council should go to Parliament or not. His impression was, that suggestion having been made, it was essential they should be proceeded with and carried out.

THE PRESIDENT said the Council must bear in mind the chance of succeeding in getting it through this session.

Mr. HAMPSON said the motion said nothing about this session.

Mr. GREENISH, as a member of the Committee, although he had not attended all the meetings, said it seemed to him that the members of the Committee were extremely unanimous with regard to the amendments required in the Pharmacy Act, and that they had no doubt that these amendments were urgently required. Then came the question whether it was wise or prudent to have them embodied now in a Bill, and make an effort to get them passed into an Act. On that point he was not capable of giving an opinion, but he should certainly vote in favour of the motion. If the Council did not proceed in the matter very much of the trouble taken would be thrown away.

Mr. BOTTLE said the main objection to proceeding seemed to be a feeling in the minds of some that they had not sufficient matter for a Bill. But he thought that might be readily got over by asking Mr. Hampson to add to the motion such further alterations as might be deemed desirable.

The PRESIDENT said that these would have to come before the Council.

Mr. SANDFORD said the Council had been asking for amendments for two or three years, but they did not come, and he apprehended that was because there were none to come.

Mr. SCHACHT supported the motion, because it was only consistent with the previous acts of the Council. Merely drawing up these suggested alterations and taking no further steps seemed a very lame and impotent conclusion after so large an amount of work. He could not, moreover, agree in the conclusion that there was not enough to go to Parliament for. They touched four or five very important questions, and four or five more, also important, if not quite so important as the others. If in addition to that the next motion, which stood in his name, were carried it would be additional matter to put in the Bill. It was possible that the Council might not succeed in getting everything that was there, but it certainly would not unless it tried.

Mr. GOSTLING thought, although there was a great deal in the remarks of Mr. Sandford with reference to there not being much in the recommendations, and although the Council might not be able to secure the passing of some of the recommendations, yet there was one very important recommendation, which the public as well as chemists and druggists most thoroughly appreciated, and that was the provision with regard to the Patent Medicines Act. He should certainly vote for the motion.

Mr. SANDFORD said the patent medicine stamp did not legalize the sale of poisons by unregistered persons.

Mr. HAMPSON in reply, said that he regretted having introduced Mr. Sandford's name into the list of the proposed Committee, as that gentleman now declined to serve upon it, but he was utterly surprised at his objections. Mr. Sandford had been a member of the Committee, and had helped to frame the various amendments. If he objected to the proposals he ought to have brought forward his objections when they were formally discussed, or to have withdrawn from the Committee. It seemed scarcely fair after having given his services to the Committee, that he should endeavour to do what he could to nullify the work that had been faithfully done. He did not conceive that the work of the Committee was labour lost; he believed that it was something done. The very fact of bringing a number of gentlemen together to discuss the various weaknesses in the Pharmacy Act was a good thing, and there could be no harm in putting the result into a legal shape. He knew from various matters which had dropped occasionally from him, that Mr. Frazer objected to all legislation with respect to pharmacy, and that being so he could not understand how it was that Mr. Frazer accepted a seat at the Council.

Mr. FRAZER: It was because he had to administer the law as it stood.

Mr. HAMPSON repeated that those who objected to all legislation ought not to sit on the Council. Notwithstanding this opposition, which he had not expected, the views of the Committee had received an almost unanimous vote at the Council, and he was certainly surprised that some of the leading spirits should endeavour to throw cold water on the motion.

The motion was then put with the following result:—

For—Messrs. Betty, Bottle, Churchill, Cracknell, Gostling, Greenish, Hampson, Rimmington, Robbins, Savage, Schacht, Shaw and Woolley.

Against—Messrs. Frazer, Hills and Sandford.

The motion was therefore carried.

FURTHER PROTECTION OF TITLES.

Mr. SCHACHT then proposed the following resolution:—

"That Clause XV. of the Pharmacy Act be so modified as to include within its prohibition the assumption of the following titles in addition to those already mentioned:—

'Dispensing Chemist, or Druggist, or Pharmacist.'
'Practical " " " "
'Operative " " " "
'Allopathic " " " "
'Homœopathic " " " "
'Botanical " " " ""

He said that he scarcely knew how it was that this suggested alteration was not embodied in the proposed amendments to the Pharmacy Act; but he was not altogether sorry that it was not so. The spirit of all legislation now going, on or proposed to be carried on during the session with reference to other medical Bills, lay mainly in the direction of the protection of titles, the idea apparently being that the duty of the Legislature lay mainly in enabling the public to judge as to who had and who had not such qualifications, and it was with the object that that idea should be carried out more completely with regard to their own department of the practice of medicine and that a few more titles should be added those from which the uneducated and uninitiated were to to be excluded, that he brought this forward. The object he had in view was to prevent these titles being used by those whose object and purpose it was to mislead the public.

Mr. WOOLLEY seconded the motion, and in support of it he would say that it was a very important and a very sound one, and he thought that Mr. Schacht might have gone further. Subject to that gentleman's approval he would suggest that nobody keeping a shop open for the sale of drugs, or dispensing medicines, or selling poisons should use any qualifying adjectives before the words "chemist and druggist," except the word "pharmaceutical" as

authorized by the Society. There were analytical chemists and others, and other adjectives might be used.

Mr. SCHACHT said there were certain expressions the trade could not legitimately claim. They had already abandoned the title of "professional chemist," which could not be denied to gentlemen like Dr. Frankland and others of that stamp.

Mr. WOOLLEY said those gentlemen did not keep an open shop.

The SECRETARY said that if the words of the Act of 1852 were added, which prevented any one using or exhibiting any name, title, or sign implying that he was registered under that Act, he thought that would meet the case.

The PRESIDENT said that the Act of Parliament already contained virtually all these titles. The real point he thought Mr. Schacht's resolution aimed at was—the use of the title "homœopathic chemist."

Mr. SCHACHT said his motion was mainly intended to hit that class of persons.

The PRESIDENT thought the question should be argued on its merits. He had thought over this proposal, and he should like to limit these titles, if possible, to registered chemists and druggists; but he felt more and more that it would be very dangerous to introduce such a clause, and would ruin the prospects of the proposed Amended Pharmacy Bill passing. He objected to attempting to throw the net too wide to catch little fish, and doing something which would wreck the boat altogether. He did not think homœopathic chemists really came within the range of anything like what chemists and druggists did.

Mr. SHAW supported the motion. On many occasions complaints had come before the Council with regard to persons keeping open shop for the sale of drugs of all descriptions, and even of poisons. They had been very careful with regard to the title they had used, so as not to infringe the Pharmacy Act. They had called themselves homœopathic and botanical and various other kinds of chemists, and it was considered not desirable to prosecute them, seeing it was possible that the authorities might take exception to control the action of those parties in the use of those special words. But when they found that the public went to those shops, which they looked upon simply as chemists' shops, those terms ought to be restricted to those qualified to use them.

The PRESIDENT asked whether the words "practical chemist" would mean a manufacturing chemist?

Mr. SHAW said that a manufacturing chemist did not keep an open shop.

The PRESIDENT said he thought most homœopathic chemists were also registered as chemists and druggists.

Mr. ROBBINS said that homœopathic chemists were a totally distinct class of men from ordinary chemists. The public did not go to them to buy tincture of rhubarb or jalap.

Mr. SANDFORD thought Mr. Schacht was under a mistake in saying that the Council had abandoned the title of professional chemist to a certain class of men. The year before last, when the Institute of Chemistry was established, attention was called to the fact that the promoters of the institute proposed to assume the title of professional chemist. The Council then remonstrated, saying that the term professional chemist was a general one, and that any man who was a chemist at all was a professional chemist; but the words "analytical" or "agricultural" or "homœopathic" were used to distinguish men of a certain character. The title "analytical chemist" could not be denied to gentlemen like Dr. Frankland or Dr. Tyndall, and many others he could name. Again he saw no objection to a man calling himself a homœopathic chemist: and if the Council were to deprive him of that, which was his proper and legitimate title, it must invent another for him. What was it to be? If this motion were to be adopted it would endanger the Bill altogether, for there were a great many men in both Houses of Parliament who were very fond of homœopathy, and they would simply laugh at the idea. They would say that this was not sought for the protection of the public, but for the privilege and advantage of chemists and druggists. He thought the Council should not meddle with these titles.

Mr. FRAZER said he had a strong impression that the greater included the less, and that the general name in the old Act was much more protective than a detailed list.

Mr. BETTY said it was a relief to find that there was at all events one clause in the Act which had Mr. Frazer's approval. He thought that this clause was quite necessary for the protection of the trade. It was known that there were adjectives put before the word "chemist" to evade the wording of the Act which protected the title. They might find eclectic chemist, family chemist, operative chemist, anything which would allow a man who kept an open shop to evade the Act. The true operative or practical chemist would be left untouched, because he did not keep a shop; it was only intended to avoid the prostitution of these terms by men who had no qualification. He thought there would be no fear of jeopardizing the Bill, and he would not only vote for the motion, but add the words, "with power to add to their number." He thought the word chemist should not be used either alone or preceded by any adjective by unqualified persons keeping an open shop. Mr. Schacht had given them a half dozen words, but such persons would soon find a half dozen more. He (the speaker) would have the word "chemist" kept as the property of chemists and druggists. He knew there were shops in London with adjectives before the word "chemist," saving the proprietors from prosecution. With regard to the word "homœopathic," he admitted that there was a difficulty, and that that would be better omitted.

The SECRETARY said that in carrying out the provisions of the Act of 1868 no difficulty had ever been found in taking legal proceedings for preventing the improper sale of poisons under the Act, by whatever title persons might describe themselves.

Mr. CRACKNELL asked if the word "operative" was intended to cover the word "co-operative" chemist.

Mr. SCHACHT in reply said that the objections taken were of two kinds. First, that the Council had better not be too exact in its definitions, but make a general declaration which should include all qualifying adjectives, and then an objection was taken to some individual adjectives he had used. With regard to the first objection, he should like to remind the Council that a certain advantage attended a definite list of adjectives, because it showed what the chemists and druggists wished to appropriate to themselves more or less. It was in virtue of using such a distinctive list that it became possible to exclude such titles as professional and analytical chemists, in regard to which he thought that Mr. Sandford was mistaken. It was because he did not wish to protect the title of professional chemist, as a privilege, that he did not include it. He did not say that that title had been given up to another body, but it had been neglected to take it as a title to which registered chemists had an exclusive use, and the same with the word "analytical." It was with this view that he stated the words he wished to exclude. Then an appeal was made that he should omit from the list "homœopathic chemist," and it was urged that it would be better not to attempt to interfere with the practice of homœopathic chemists. He did not wish to do so, but seeing that it was perfectly clear that homœopathic chemists dealt in poisons, he thought it should be most distinctly included in the privileged list, and that every homœopathic chemist, if he wished to practise and pass his examination, should come on the register. He had no more right to deal in poisons, unless on the register, than anybody else. A great many homœopathic chemists were already registered, and all who wished to practise should pass the examination. He

did not think that it was a matter of primary importance, but he thought that it would be an improvement to the Pharmacy Act.

The PRESIDENT said that was a very important question, and he was sorry that so many members of the Council had left before it was put to the vote.

Mr. GOSTLING moved an amendment which was seconded by Mr. SANDFORD to the following effect :—

"That the Pharmacy Act of 1868 be so far amended as to render it penal for any person to use any name, title or description, implying that he is a registered chemist and druggist, unless he has been duly registered under that Act."

On being put to the vote the amendment was carried and it was thereupon put as a substantive motion and carried.

REPORT OF EXAMINATIONS.

February, 1879.

ENGLAND AND WALES.

Preliminary Examination.

Four certificates were received in lieu of the Society's examination: —

1 Faculty of Physicians and Surgeons, Glasgow.
2 University of Cambridge.
1 University of London.

THE PRELIMINARY EXAMINATION.

The following joint recommendation of the Boards of Examiners for England and Scotland, was then proposed for adoption by the Council:—

"That the following be annexed to the printed regulations of the Preliminary examination: 'That candidates for the Preliminary examination shall be required to translate simple sentences from English into Latin.'"

Mr. GREENISH thought this was rather an important matter. To translate from a foreign language into English was a very different thing to translating English into a foreign language. The number of rejections in the Preliminary examination were already very large, and he feared if this alteration were made they would be very much larger.

Mr. FRAZER said he had always protested against additional restrictions on examinations, and this was another step in the same direction, making the entry into the profession more difficult. He thought he had a thorough respect for the Board of Examiners, but he thought its members were apt to look at matters too much from their own point of view.

Mr. SANDFORD said this was only following out the Act, and he thought the Council ought not lightly to reject the opinion of the Board of Examiners.

Mr. SCHACHT said this was a very simple matter. The Act of Parliament required that these young gentlemen should be examined in the Latin language. This examination was put into the hands of a certain body of gentlemen who knew how to examine in the Latin language, and to put a limit on them, and say how they should examine seemed an absurdity. It was only a means of testing the candidates' knowledge.

Mr. BETTY said the question was a very simple one, and he thought that the Council should decide upon it at once. From some acquaintance with Latin he was quite confident that after three months' putting Latin into English, any schoolboy could put English into Latin. A person could translate Latin into English and still be ignorant of the groundwork of the Latin language, its grammar ; but to write Latin with correct terminations grammar is indispensable.

The PRESIDENT said the Act of Parliament said that a candidate for the Preliminary should be examined in the Latin language.

Mr. BETTY contended that a boy ought not to be examined in the Latin language by the half process hitherto adopted.

It was then resolved :—

"That candidates for the Preliminary examination be required to translate simple sentences from English into Latin, from and after December 31st, 1879."

PHARMACEUTICAL SOCIETY OF IRELAND.

The SECRETARY read a letter from the Pharmaceutical Council of Ireland thanking the Council for acceding to its request with regard to copies of the Journal. He also laid on the table a copy of the Calendar and Register of that Society, which had been received.

PHARMACEUTICAL MEETING.

Wednesday, March 5, 1879.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

The minutes of the previous meeting were read and confirmed.

A sample of an acid syphon, for drawing acid from the carboy, was exhibited by Messrs. Barnett, Son and Foster, of Shepherdess Walk, Hoxton.

Mr. HOLMES described the specimens on the table. He first called attention to specimens of the derivatives of opium alkaloids presented by Messrs. Macfarlan and Co., and specimens of the recently discovered opium alkaloids, meconoisine, gnoscopine, and cryptopine, and several other specimens, from Messrs. T. H. Smith and Co. These were portions of specimens which had been shown at the Paris Exhibition. He wished to express the pleasure which he felt in finding that the museum was made increasingly, year after year, a depository for chemicals of this kind. He thought it highly desirable that specimens of rare chemicals, resulting from scientific research, should be placed in public institutions, where they could be referred to by future investigators, instead of being lost sight of on the shelves of private laboratories. The two alkaloids, gnoscopine and meconoisine, were described in the June and August numbers of last year's Journal. Meconoisine, he believed, was obtained from the mother liquor after the crystallization of meconine, and gnoscopine was obtained in the same way, after the preparation of narceine. There was upon the table a specimen of senna obtained from *Cassia obovata*, presented by Messrs. A. Faber and Co. This was cultivated at Barcelona, and sold there for about a shilling a pound. He believed that *Cassia obovata* was said to be not quite so active as the ordinary form of Alexandrian senna which came to this country (*Cassia acutifolia*); but, in appearance, the present specimen was better than the

ordinary senna of commerce. He would also call attention to a specimen of oxygenated surgical dressing which was exhibited by Mr. Robbins. This subject was mentioned in the Journal a short time ago. One specimen contained or developed peroxide of hydrogen, and the other, by the presence of free iodine liberated from iodide of potassium, showed that such was really the case. Mr. Moss had placed upon the table a sample of the distilled essence of lemon, prepared for Dr. Tilden, which was mentioned at the last meeting, so that those present might judge for themselves whether it was better than the expressed essence of lemon or no. He had also to call attention to a large collection of Japanese drugs, presented about two months ago by Mr. T. Christy. The reason that these were not exhibited at an earlier date was owing to the difficulty in identifying them, the only clue to their botanical source being the Japanese characters on the bags in which the specimens arrived, and which in almost every case were the native, not the botanical names. Through the kindness of Mr. Kingo Takemura, a Japanese gentleman at present studying in the laboratory of the Society, who translated into English sounds these characters and interpreted portion of a valuable Japanese botanical work, the 'So Mokou Zoussetz,' which had recently been presented to the North British Branch, he had been able to identify all the specimens with the exception of three. Japanese drugs might at first sight seem to possess but little interest. It must not be forgotten, however, that large quantities of Japanese aconite root were now constantly in the market, while Japanese camphor was not unknown, and not long ago a Japanese valerian root, which, as regarded odour and taste, was very superior to ordinary valerian root, was offered in London. He would like to call attention to the excellent manner in which the roots were dried and cleansed from earth and impurities; although they had been lying at the dock warehouse for some months, there was not the slightest trace of mould upon them, so carefully had they been dried and packed. He thought it not at all impossible that at some future time some Japanese drugs might yet come into competition with European ones. His examination of these specimens led to the following grouping. The collection might be divided into those which are represented in most collections of materia medica; secondly, into those which are common to China and Japan; and thirdly, those peculiar to Japan. In the first group there were coriander, fennel, bitter orange peel, white hellebore, pomegranate rind, zedoary root, and several others. An account of those which were common both to China and Japan might be found in the work on 'Chinese Materia Medica,' by Dr. Porter Smith. The third group represented those drugs which were peculiar to Japan, and of which there had been no previous samples in the museum. He would just call attention to one or two of these specimens. The yellow powder in one of the bottles was the pollen of a kind of reedmace (*Typha Bungeana*), and it had the same inflammable property as lycopodium, as might be seen by throwing it across a flame. Another specimen was a very singular preparation which looked something like vegetable fish hooks. It consisted of the lower portion of the fruit stalks of the catechu plant. The stalk bearing the tuft of flowers was, as it were, formed of two parts jointed one to the other. The upper portion bearing the fruit fell off, and the lower portion of the stalk, which remained, became hard and strongly curled in the peculiar way which he had just pointed out. It was singular in a botanical point of view, rather than in a medical, as it possessed in a slight degree only the astringent property of catechu. The gardenia fruits, which were abundant in China, were of interest, as they contained crocine, which was supposed to be identical with polychroite, the colouring principle of saffron. Among Chinese remedies there was a coptis root (*Coptis Teeta*), which was used both in China and India. It contained berberine, and he believed that it contained it in a larger proportion than any other known plant. In the Japanese materia medica this was represented by the root of *Coptis anemonœfolia*, which might be equally rich in berberine, but had not, he believed, been yet examined quantitatively. One of the three specimens which he had been unable to identify was also of some interest, since it had been found by Mons. Petit, of Paris, to contain a new alkaloid.

Mr. Robbins, in further alluding to the oxygenated surgical dressing, said that, as they were aware, Dr. Day had, for a long time been experimenting on the oxygenation of the essential oils of benzine and other things of that kind. He brought forward his paper in 1869 for the first time, at a meeting of the medical society at Geelong, and from that time he had been working at the subject. He believed that they must give the honour to Schönbein of discovering that turpentine was capable of absorbing oxygen and forming peroxide of hydrogen. Dr. Day had found that nearly all essential oils and fatty substances were capable of absorbing oxygen, producing peroxide of hydrogen, the presence of which could be easily demonstrated by the guaiacum test. The sample of oxygenated wool on the table had been treated with a mixture of fourteen parts of benzine; two parts of turpentine (the older the turpentine the better); and one part of oil of lavender. After it had been so treated it was found to be capable of oxidizing iodide of potassium. He believed that it was proposed by Dr. Day as a surgical dressing, and it was very nice to employ whether as cotton or as lint. The smell was most agreeable, and, of course, it contained peroxide of hydrogen. Dr. Day also proposed to use it, when treated with a solution of iodide of potassium, as an iodine dressing in cancer and other diseases. It was a preparation which every one could make for himself.

The President remarked that the principle was the same as in Sanitas.

Mr. Robbins said that it was so, but Dr. Day was working on the subject long before Mr. Kingzett.

Professor Bentley, in reference to the specimen of *Cassia obovata*, said that those who were familar with the early history of Alexandrian senna knew very well that obovate senna used to form a certain proportion of it. At the present day, as a general rule, it was entirely absent from Alexandrian senna, although occasionally a few leaflets might be found. It was certainly not collected now in anything like the systematic manner in which it was formerly; the reason being that in Egypt and in other parts of Africa, it was considered a very inferior senna, and was called wild senna. The leaflets, which now constituted the essential part of Alexandrian senna, were derived from *Cassia acutifolia*, as it was called by botanists, or *Cassia lanceolata*, as it was termed in the Pharmacopœia; and were regarded as being far more active than the leaflets of the *Cassia obovata*. That experience was entirely corroborated by the early history of senna. It was, however, interesting to notice that the senna now exhibited was the first that was introduced into Europe. It was brought to Europe by the Moors, and was subsequently cultivated in Spain, the north of Italy, and the south of France, and it constituted that which was known as Italian senna. The cultivation in Italy, France and Spain had been given up, but it appeared now to be renewed in Spain. What might be the special reason for recultivating it he was unable to state. Some years ago, some senna was exhibited before the Society, which upon examining, he found to be *Cassia obovata*; it was well known in some of the West Indian islands and was generally known as Jamaica senna or Port Royal senna, and it was suggested that it should be cultivated for use in this country. Then, again, Dr. Pereira spoke of varieties of senna which he called Tripoli and Senegal sennas, all of which had been figured in 'Medicinal Plants.' Both those sennas, which were derived from *Cassia obovata*, had ceased to be commercial

articles. This senna would certainly attract by its fine appearance and purity, but he might add that the mere fact that the obovate senna had ceased to be collected in Africa seemed to show that it was very inferior in its medicinal properties to lanceolate senna.

Professor REDWOOD said that he gathered from Mr. Robbins that he ascribed to Schönbein the first notice in 1869 of the fact that oil of turpentine was capable of absorbing oxygen and giving it off again in the form of peroxide of hydrogen. That circumstance was alluded to on more than one occasion publicly, by Faraday. In bringing the matter before the Royal Institution, Faraday made very special references to Schönbein's investigations, and he demonstrated the fact that, when a heated tube or rod was introduced into a vessel containing oil of turpentine, there was always a development of vapour which was capable of fulfilling all the effects of ozone and of peroxide of hydrogen. That must have been long before 1869.

The PRESIDENT said that that statement, if he recollected rightly, was made in a lecture delivered upon anastatic printing, which was certainly not only before 1869, but he should think before 1849.

Mr. ROBBINS said that his statement was that Dr. Day had read a paper on that subject before the Medical Society at Geelong, in 1869, but Dr. Day did not give the date of the discovery by Schönbein. He might say that the lint took about two ounces of the mixture described to one ounce of lint for saturation, and cotton wool took about three ounces.

Mr. Moss asked what kind of turpentine had been used in preparing the wool. It was well known that the three kinds of turpentine which were met with in commerce oxidized with various degrees of facility—Swedish the most readily, then French, and then American.

Mr. ROBBINS said that he believed the turpentine which he used was American.

The PRESIDENT said that since he had been in the chair he had had placed in his hand a bottle containing ethidene dichloride, presented by Messrs. Burgoyne, Burbidges, Cyriax and Farries. This was an anæsthetic which had fallen into disuse, but was now being used again. It was produced by the action of pentachloride of phosphorus upon aldehyde, and was said to be a very good anæsthetic.

Dr. PAUL called attention to two specimens which had been placed in his hands for presentation to the Society. The first was a specimen of cinchona bark which had been grown in Ceylon. It was the crown bark, and had a remarkable development of the corky layer of bark to which that kind of bark was particularly prone. The specimen had been sent by Mr. William Howard, of Stratford, who had found that it was remarkable for the relative proportions of the alkaloids in its different parts. Some time ago Mr. David Howard pointed out in the Journal some facts relating to the distribution of the different alkaloids in various kinds of cinchona bark. He showed that in the root bark there was a remarkable increase in the gross amount of alkaloids present, but that increase was due more to the augmentation of the cinchonine and the less valuable alkaloids than it was to the augmentation of the quinine. In the trunk bark the total amount of alkaloids was less, but the proportion of quinine was greater than in the root. In the branch bark, which was of still later growth, the same difference was again observable. The peculiarity of the present specimen was that in the corky portion the total amount of alkaloids was less than in the older bark underneath, but the proportion of quinine was much greater than in the older part of the bark. This fact agreed with the opinion of Mr. David Howard that quinine was to be found in the largest proportion in the youngest development of the tree. The second specimen to which he (Dr. Paul) asked attention was one of the products of ergot of rye. Some two or three years ago Professor Dragendorff, of Dorpat, published a paper on the constituents or the products of ergot, and he sent illustrative specimens to the Society. Chemically considered, all those substances were somewhat destitute of character, being either powdery or gummy. There was nothing about them crystalline or indicating externally any specific individuality. The only one which had come into use was sclerotic acid, which figured now, especially in American price lists, as a medicinal agent, at a very high price. Some time before M. Tanret, the French pharmacien, had given his attention to the subject, and had succeeded in producing from ergot a substance which he described as an alkaloid, and had isolated in a crystalline form. It was obtained in very small proportions, not more than about one-tenth per cent.—a gramme from a kilogramme. M. Tanret had published an account of the production and characters of the substance in a late number of the *Comptes Rendus*. In the paper of Professor Dragendorff no mention was made of any definite substance of that kind, but in a later paper, by a Mr. Blumberg, who had been working in Professor Dragendorff's laboratory, there was a reference made to a substance which seemed somewhat approximate to the ergotinine of Tanret, and questions have been raised between those two workers as to originality and the identity of these substances. Readers of the Journal would have observed that about a fortnight ago there appeared a letter from M. Tanret, making some comments on Blumberg's paper. M. Tanret had sent a sample of the ergotinine, and requested him (Dr. Paul) to present it to the Society's museum. It was a subject well worth following up more closely. From physiological experiments which had been made, ergotinine appeared to be a very potent agent, and although, on account of its alterability, it was very difficult to obtain, it was still in a very definite form in the sample which was now presented. The physiological action of ergotinine was very strong, but the experiments which had been performed with it had been made chiefly upon frogs.

Mr. HOLMES said that he was told a short time ago that sclerotic acid had been tried in this country without much success. With regard to the bark which Dr. Paul had shown, it appeared probable that the larger proportion of quinine in the corky layer might be due to greater facility for oxidation offered, as also in renewed bark. The fact that the young twigs yielded more quinine in proportion than the old seemed to suggest the same theory. With regard to the subject of ergot, he should like to ask if any gentlemen present would inform him what ergotine it was which was used for subcutaneous injection at the present time. Dr. Watney, of St. George's Hospital, had told him the other day that the liquid ergotine sold for the purpose of subcutaneous injection was very effectual.

Mr. Moss said the experience of his firm with regard to sclerotic acid was the same as that which Mr. Holmes had stated. They had supplied it to hospitals and to practitioners in various parts of the country, but only in experimental quantities, and so far as he could learn the trials had been attended with indifferent success.

Mr. GERRARD mentioned that sclerotic acid had been used to some extent at University College Hospital, and with very doubtful success. He prepared a solution of one grain in three minims of water, and he had noticed that when the bottle was returned the solution was exceedingly acid, and had a strong smell of acetic ether. If the solution was left for a great length of time it turned mouldy. As to the kind of ergotine which was used, they found at University College Hospital tha they got a very excellent substance by treating the liquid extract in the following manner. Ordinary extract was deprived of its alcohol by evaporating down to one fourth of its original bulk. It was then treated a second time with about an equal volume of alcohol. This precipitated a considerable amount of crystalloids, and the alcoholic solution was evaporated and heated again with alcohol. This was done three times and the solution was preserved in each case. The final one was very powerful in odour, and was acid in reaction. Before using the

ergotine so prepared, one part was mixed with two parts of water, and after dilution and before use it was always neutralized with a little ammonia. This neutralized solution was as free from crystalloids as it was possible to to obtain it. One grain prepared in this manner was found to be more active than the so-called sclerotic acid. The alcohol was entirely eliminated.

Mr. GREENISH said that, at the British Pharmaceutical Conference at Plymouth, he ventured to remark that he thought that Japanese aconite was not so strong as *Aconitum Napellus* obtained from Germany. He should like to ask Mr. Holmes what Japanese aconite was used for in this country, and whether he had any knowledge as to its relative strength.

Mr. HOLMES said that he did not know what became of the Japanese aconite, but Mr. Umney had stated at a former meeting that it was even stronger than the German aconite and should not be used for internal administration. He supposed that it was used for liniments.

Dr. PAUL thought that he might venture to say that Japanese aconite was used much in the same way as ordinary aconite for pharmacopœia preparations. With regard to its strength, he could say with some positiveness that there were very great variations of strength and character in different specimens. Some two years ago, Mr. Holmes gave him a sample of Japanese aconite, and he (Dr. Paul) found that it contained a very large amount of crystallizable alkaloid of very definite character and considerable potency in physiological action. He had since worked upon a larger quantity of Japanese aconite obtained from another source, and the only product that he could get was a sort of resinoid gummy substance. This substance was certainly acrid, but it was far from being so potent as that which he had previously obtained from the smaller sample.

The PRESIDENT said that he could corroborate Dr. Paul's observations as to the difference between the Japanese aconite which had been lately imported and that which was imported about four years ago. Dr. Wright was working very largely upon this subject, and at the next Conference they might expect to have it brought before them.

Dr. PAUL added that the first sample of Japanese aconite which he had examined consisted chiefly of roots which presented a starchy aspect. Amongst these was a small proportion—about one-third—which, when broken across, were quite resinous, and of a dark brown colour, and these were quite firm, and had not starchy character at all. The last samples upon which he operated were merely starchy or chalky.

Mr. GREENISH said that the substance which gave the resinous aspect to the roots was not resin, but a gummy substance similar to dextrine.

Dr. PAUL said that he was speaking merely with regard to the texture.

The following papers were then read on—

THE ESTIMATION OF DIASTASE.

and on—

EXTRACT OF MALT.

BY W. R. DUNSTAN AND A. F. DIMMOCK.

The papers are printed on pp. 733 and 734.

In answer to Mr. Moss,

Mr. DUNSTAN said that the heading "Grammes of extract required to convert one gramme of starch" referred to the starch being wholly converted into sugar.

Mr. NAYLOR said he thought that there could be no question that there were great difficulties in the way of manufacturing a good malt extract, and when it was attempted to overcome one difficulty, another was introduced. What was required was a malt extract which should not only be rich in diastase, but also contain a fair proportion of albumenoids in a coagulable condition, or one which was readily assimilable by the system. It ought also to contain a fair amount of maltose, and a relatively small amount of dextrine, and thus the matter became one of very great difficulty as regarded the best mode of operating. A malt extract rich in diastase might be obtained by using a larger proportion of water with an initial temperature of 140°, and then raising the temperature to a little over 150° towards the end of the mashing process. But in this method, in which a relatively large amount of water was used, it would be very likely to affect an alteration in the albumenoids. At all events, acetification would very readily set in, and there was great danger of effecting a change during the evaporation process. Again, with reference to the use of water, he thought that it was preferable to begin with a low temperature rather than a high one, because the malt partly agglomerated and could not be so readily mixed with the water at the higher temperature. He thought that it would have been advisable to give in the paper some idea of the percentage of the coagulable albumenoids. Probably the authors would find in their future experiments that the nitrogen was not all present in the form of albumenoids. It certainly did not exist in that condition in the meal itself, and he thought that it was fair to assume that it had not undergone a change; but he was persuaded that the albumenoids did undergo a change.

Dr. SENIER drew attention to the authors' remark that extract of malt, instead of being considered an *elixir vitæ*, might be regarded as a remedy and as a food. He thought it was important that these two properties should be kept distinct. In the first place there was no doubt that, as a remedy, the extract ought to contain diastase, and that, in the therapeutic action of the extract, the diastase was the all-important constituent. In malt extract, as a food, the other constituents were to be considered, and it might be worth while to compare the composition of wheaten bread and extract of malt in regard to the chief of the other constituents. The albumenoids in wheaten bread were about 8 per cent., and in extract of malt they were very nearly the same. In malt extract in and wheaten bread, then, they had two substances containing the same amount of albumenoids, one of them costing about 2*d.* a pound and the other about 4*s.* He should therefore think that extract of malt regarded as a food, was very expensive. He was glad to see that the question of the coagulability of the albumenoids was to be further investigated. Extract of malt was then primarily a remedy, and it might be taken for granted that a remedy ought not to be used as a food. With reference to the remarks of the last speaker, it appeared to him (Dr. Senier) that the attention of manufacturers should be directed chiefly to the preparations of malt extract containing diastase, and that the albumenoids and other constituents were matters of secondary importance. It had occurred to him that possibly pepsin, having the property of dissolving albumenoids, might dissolve the albumenoid diastase, and indeed, that was an important consideration in connection with this subject. With that idea in view, he had made a few experiments which he would submit to the meeting. The pudding method was employed in all the experiments, exactly in accordance with the directions laid down in the paper. Good service had been done by the authors in giving such explicit directions for conducting the pudding process. For a rough qualitative experiment, it was extremely useful. Nine puddings were made; one was reserved as a standard of comparison, and was unchanged at the expiration of the three hours' standing. The results obtained are exhibited in a table he would read. The hydrochloric acid used was that of the British Pharmacopœia, and the pepsin was previously tested and found to be active. These results were in one sense negative, but they were not devoid of interest. It would be seen that they pointed towards the fact that pepsin did not interfere with the action of diastase, but that hydrochloric acid did interfere with that action when present in a certain proportion, and

that proportion appeared to be at any rate possible in the gastric juice.

The following were the results:—

Substance added.	Result after three hours at 100° F.
Five c.c. extract of malt	Liquefaction.
Five drops hydrochloric acid . .	No liquefaction.
Five drops hydrochloric acid and five c.c. extract of malt . . .	Liquefaction.
Four grains pepsine	No liquefaction.
Four grains pepsine and five c.c. extract of malt	Liquefaction.
Ten grains pepsine and five c.c. extract of malt	Liquefaction.
Twenty-five drops hydrochloric acid and five c.c. extract of malt	No liquefaction.
Ten grains pepsine, twenty-five drops hydrochloric acid, five c.c. extract of malt	No liquefaction.

Dr. PAUL said that no doubt extract of malt presented very many attractions as a form of food, which was the use to which it was originally applied. In Germany he had lately seen it in the form of bonbons. Its use as a medicine was more recent, and in the medical journals they had lately seen mention of various preparations of extract of malt into which medicinal agents had been introduced, such as iron salts, extract of beef, hypophosphites, and cod-liver oil. But there was another aspect in which the possibilities of extract of malt would have to be considered, and that was as a poison. Not only from a pharmaceutical point of view, but also in the interests of the public, it was desirable to call attention to the recent introduction of a preparation of extract of malt containing strychnine. Extract of malt had such attractive properties that a bottleful of it might be eaten by a child, being mistaken for treacle or some sweetmeat, and therefore it was not a desirable vehicle for such a potent medicine as strychnine. In any case it was a somewhat dangerous preparation to be sold under the guise of a patent medicine which, under present circumstances, need not necessarily come from the hands of a pharmacist, by whom precaution might be exercised, but might be sold at any grocer's or co-operative stores.

Mr. PLOWMAN, alluding to a passage near the beginning of the paper on the estimation of diastase, inquired whether the authors took any precautions to allow the action to take place in an atmosphere of carbonic anhydride, or whether they operated in the ordinary atmosphere of the laboratory.

Mr. Moss said that extract of malt was becoming very fashionable, and demanded a good share of attention. As to the process which the authors employed for estimating the converting power of the various extracts of malt, he should say that the process itself, if it worked well, was an extremely good one; but there seemed to be a weak point in it. A ten per cent. solution of extract of malt was prepared for converting the starch, and was added at intervals of some hours. A very great change might take place in the testing solution itself during the progress of the experiment which might extend over twelve to fifteen hours. Turning to the table contained in the second paper, he would call attention to the grammes of extract required to convert one gramme of starch. It was found that there were only three extracts of malt out of the fourteen which were examined which would convert starch at all; and yet they were told that most of these extracts were of the highest possible value both as remedies and as foods. It required 17·3 grammes of the strongest of the extracts (No. 5) to convert one gramme of starch into sugar. That was equal to more than two ounces of the extract to thirty grains of starch. It would be a very small meal of starch which would be affected by a quantity of two ounces of the extract of malt, and the conclusion to which the results given in the table tended, was that as a remedy they might dismiss extract of malt altogether. As a food it might possibly have some application, and it should be remembered that Liebig's process for making extract of malt was one in which the product contained no diastase; but Liebig was doubtless fully aware of this. Perhaps the value of the extract of malt which he preposed to use was due to the maltose, the albumenoids and the phosphates which it contained, and not to diastase, of which they now heard so much. Pharmacists were very much indebted to the writers of the paper for introducing the subject to the Society; and, if the writers had not settled many questions, they might be congratulated on having raised a good many, the settlement of which would leave pharmacists in a very different state of knowledge with regard to extract of malt.

Mr. GRENISH asked whether it was a fact that diastase had no action upon ungelatinized starch. Again, Mr. Dunstan had stated that upon adding iodine at different times after the disappearance of the blue colour, no colour was produced. He (Mr. Greenish) had always perceived that the same solution of iodine which gave a blue colour to starch gave a pink colour to the solutions of dextrin and the other intermediate substances. Perhaps Mr. Dunstan did not examine the solution by the aid of a microscope. He (Mr. Greenish) had made malt extract, and evaporated it at 140° without the costly apparatus of which the authors spoke, and he had found the product extremely active. Another part of the subject had been alluded to by Mr. Moss, namely, the quantity of the malt extract which would be required to convert a certain amount of starch and render it soluble. It appeared that this starch must be gelatinized. If so, he (Mr. Greenish) could not quite see the use of the malt extract. That substance was generally understood to be useful for the conversion of starch which was not digested into a gelatinous substance capable of digestion. It seemed to him that it would be necessary for a person after taking any food substance containing starch to take about seventeen times as much malt extract, and then he would have to sit upon a hot plate till gelatinization occurred.

Professor REDWOOD said the meeting had heard from Mr. Moss, that viewed as a remedy, extract of malt could not be a substance of any great value, on account of the comparatively small quantity of starch converted by it, and he (Professor Redwood) thought that there was a considerable amount of force in the statement. Of course they must receive extract of malt for what it was worth as a remedy. But they had heard from Dr. Paul that extract of malt was also used as a medium or a menstruum, and that was a view which it was very necessary that they should bear in mind. In addition to any remedial action of which extract of malt might be capable, and in addition also to its action as food, the extract of malt had been introduced to the medical and general public in association with other and more active agents. Though he could not say it was a suitable vehicle for such a thing as strychnine, he had had an opportunity of observing its efficacy as a medium upon a member of his family. One of his sons had had occasion to take large quantities of cod-liver oil and had found that there was no medium through which he could take the oil to the same extent as that afforded by extract of malt. In fact, he (Professor Redwood) believed that it was one of the very best emulsifying agents for an oily substance like cod-liver oil. The emulsion which it formed with the cod-liver oil could be mixed with water without any separation of the oil taking place, and the agreeable flavour of the extract facilitated the administration. Thus they had not only the efficacy of the extract of malt in its action upon starchy matter, which action might be slight, but they had its action as food, and the far

more important use of it in facilitating the administration of other medicines.

Mr. LINFORD said that it had been generally accepted that evening that it required a very large quantity of malt extract to convert a very small quantity of starch into sugar. Many years ago, when he was in the habit of brewing, he always used three bushels of malt to one bushel of unmalted grain, and at the end of three hours there was very little unconverted starch left. Given the time and temperature, the amount of diastase in malt that had been boiled into an extract or altered by evaporation would convert a very large quantity of starch into sugar. A friend of his had been in the habit of using seven bushels of corn to one bushel of malt, and he had said that he found it sufficient to convert the whole of the starch into fermentable sugar.

Professor ATTFIELD said that he thought that more than one of the gentlemen who had discussed the papers had forgotten that the authors, in speaking of the large quantity of extract of malt which was necessary to convert starch, were alluding to the quantity that was necessary for the entire conversion of every particle of starch which was in the solution. The authors drew especial attention to the well known fact that a very small quantity of diastase would liquefy, though perhaps not entirely convert, very large quantities of starch. He would recommend to the authors that they should make some of their future experiments at the temperature of natural digestion—about 98° Fahrenheit. They might thus throw some light on the physiological questions which Dr. Senier had touched upon.

Mr. DUNSTAN in reply, said, with regard to the coagubility of the albumenoids in malt extract, experiments were being conducted. Dr. Senier's comparison between malt extract and bread was hardly fair. The albumenoids in one case were in a state of solution, and in the other they were in a solid state. His experiments with malt extract, pepsin and hydrochloric acid were of considerable interest. Mr. Plowman had asked as to the precautions under which the experiments were performed, and whether they took place in an atmosphere of carbonic anhydride. He (Mr. Dunstan) said that an atmosphere of carbonic acid was required in Baswitz's process to ensure a uniform proportion of maltose to dextrin. The authors' method regarded only the conversion of starch quite independently of the products. Mr. Moss had remarked that certain precautions with regard to the solutions ought to be taken. In the experiments which were described in the paper, no solutions were kept for more than six hours. With regard to the remarks of Mr. Greenish as to the colour which was produced by iodine after the blue colour had disappeared, he (Mr. Dunstan) might say that a brown colour was obtained, but he did not examine it microscopically. As to the effect of diastase upon ungelatinized starch, it was stated by O'Sullivan that there was no action. He supposed that the starchy foods which were taken—for instance, in the form of pie-crust or pudding—had been already heated to a temperature at which the starch would be gelatinized, and therefore diastase would be able to act upon them. Mr. Greenish had also mentioned that he had made extract at 140° Fahrenheit which contained diastase. It was stated in the paper that if the extract was made below 155° it would contain diastase. The diastase was destroyed at from 155° to 158°. It was very difficult to evaporate a large quantity of liquid at that low temperature without the use of vacuum apparatus. What Professor Redwood had said with regard to malt extract being a good menstruum was very true. He (Mr. Dunstan) had seen a mixture of cod liver oil and extract of malt in which it was hardly possible to distinguish the presence of the oil.

The thanks of the meeting were voted to the authors of the paper, and the President announced that on the 19th inst. Professor Bentley would deliver a lecture upon "The Life of the Plant."

EXAMINATIONS IN EDINBURGH.

February 25th and 26th, 1879.

Present on each day—Messrs. Ainslie, Borland, Gilmour, Kemp, Kinninmont, Stephenson and Young.

Professor Maclagan was also present on behalf of the Privy Council.

MINOR EXAMINATION.

25th.—*Twelve* candidates were examined. *Five* failed. The undermentioned *seven* passed, and were declared qualified to be registered as Chemists and Druggists:—

Aitken, William, jun. .....Edinburgh.
Allen, John ....Manchester.
Cormack, George ....Fochabers.
Crichton, Alexander .....Burntisland.
Dunlop, James Buchanan .....Edinburgh.
Hughes, Thomas Ignatius James.Liverpool.
Kemp, James ....Aberdeen.

26th.—*Eight* candidates were examined. *Five* failed. The undermentioned *three* passed, and were declarep qualified to be registered as Chemists and Druggists:—

Naysmith, Andrew .....Arbroath.
Newlyn, James.....Plymouth.
Smith, Henry Ewbank .....Barnard Castle.

MODIFIED EXAMINATION.

One candidate presented himself, but failed to pass the examination.

PRELIMINARY EXAMINATION.

The undermentioned certificate was received in lieu of the Society's Examination:—

Certificate of the Faculty of Physicians and Surgeons of Glasgow.

Elliot, James Francis ..... Newcastle-on-Tyne.

Proceedings of Scientific Societies.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting on Wednesday, February 26, 1879, in the room of the Association, Mr. O. Wallis, President, in the chair, a paper was read by Mr. F. J. C. Squire, entitled "Notes on New Remedies." The author did not confine his remarks to remedies which had been introduced within the last year or so but treated of many, known to the pharmacist for some time, which have recently been in much greater demand. Among them the following were mentioned, the doses and diseases in the treatment of which they are used being given:—Amyl nitrite, citrate of caffein, carbazotate of ammonium, erythroxylon coca, iodoform, chaulmoogra oil, thymol, chrysophanic acid, gelsemium, hydrobromic acid, curara, salicin, iridin, euonymin and iodide of ethyl.

The paper was followed by a lengthy discussion. A cordial vote of thanks was given to Mr. Squire for his paper.

A letter was read from Mr. C. E. Stuart resigning his office of Assistant Honorary Secretary to the Association, he being about to leave London for a time.

The President announced that the next paper, to be read on March 12, was on "Parasites" by Mr. W. Smart

---

F. W. Hollingsworth.—By application to the Secretary of the Apothecaries' Society, Blackfriars.

"*Aqua.*"—See the pharmaceutical apparatus figured and described by Mr. Corder in vol. vii., p. 349.

A.P.S.—See before, p. 718.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Brown, Reeks, Swann, Warrell, Williams, Billing, Barrett, Hornsby, Arctic Regions, Lance, Parker, Strachan, Smith, Stocks, Cox, Kershaw Parr, Woodcock, Lindford, Bennett, Thornton Evans, Wilson, Student, Squirt, Pharmaceutical Chemist, Cortex, Embryo Pharmacist, Mercury, Sub Judice, Eboracum, Scotia, G. H. L., W. F., H. S. N., F. W. H., A. P. B., W. E.

LIFE IN THE MORE RECENTLY DEVELOPED OIL FIELDS OF THE UNITED STATES.

BY BOVERTON REDWOOD, F.C.S.

Passing from the wealth and luxury of New York to the primitive life of the oil regions, one seems to enter a new world. King Oil reigns supreme. The railway track on which we travel is occupied at frequent intervals by long lines of tank cars conveying the precious fluid to the refineries, and passenger traffic being of secondary importance, we are thankful when after many vexatious delays we approach our destination, a "mushroom" town in the most recently developed district. Hither have sped numbers of operators from the older fields, together with capitalists and not a few loafers and hangers-on of both sexes, attracted by the reports of "gushers" or flowing wells, and of the scarcity of "dusters" or dry holes. For miles our noses have been greeted with the peculiar, but not altogether disagreeable, smell of the crude oil, and we have noted that the passengers whom we pick up from time to time are oilier and yet more oily.

Arrived at the *dépôt*, as our cousins delight to call the railway station, a scene of the greatest confusion presents itself. The platforms are piled with oil-well machinery, huge "bull-wheels," coils of rope, drills and pumps, steam engines and boilers, and miles of iron pipe. To make one's way from the railway car is a feat worthy of a member of the Alpine Club. Outside the station is a sea of mud, through which teams of horses are striving to drag their heavy loads, and wildly gesticulating are crowds of men with broad-brimmed hats and huge thigh boots, all apparently differing from each other in size only, so uniformly are they covered from head to foot with a coating of mud and oil. With difficulty recognizing in this disguise our friend, whom we had last seen in the usual garb of an American gentleman, we are led to the "back-board buggy" which he has kindly provided in honour of the lady who accompanies us, and our horses commence wading up to their girths in the pasty apology for a road.

The machine on which we are mounted, albeit marvellously fragile-looking to our English eyes, is strongly built of hickory and appears admirably adapted to its present purpose. Again and again a wheel will sink into a hidden hole with a shock which the thin elastic spring-board on which our seat is fixed scarcely prevents from precipitating us into the mud, and it would seem as if the struggles of the horses to extricate us must end in tearing the frail carriage to pieces. But although the roads are to-day so bad that our friend is complimented on his courage in attempting to drive, we reach our quarters without mishap. We put up perforce at a private house, for the hotel is literally full to overflowing, many being turned away who would gladly pay a handsome sum for a night's lodging on the bare boards. But a new hotel of wood, like all the rest of the buildings in this aptly-named mushroom town, is springing up as if by magic, and unless it should happen to take fire, a by no means uncommon occurrence, will soon be ready for occupation.

After a substantial meal, whereat as usual, sweet potatoes, flannel rolls, buckwheat cakes, with maple syrup, waffles, and other delicacies peculiar to the United States, figure prominently, and without attempting to remove the mud with which our short drive has covered us, we turn out for a stroll. Picking our way along the plank side-walks which are well raised above the muddy roads, and carefully avoiding the numerous holes which it seems to be nobody's business to mend, we leisurely note the characteristics of the place. Feverish energy prevails, and it is soon apparent that we are watching the victims of an epidemic. Every one is suffering from the oil fever which in this year of grace, 1878, is not one jot less infectious than in the early days of petroleum. No conversation but of oil, apparently no thought but of oil, everything (even in this short time our clothing) smells of oil and everything one touches is oily. Even hunger and thirst seem to be regarded as troublesome weaknesses of the flesh to be indulged only when the worship of oil permits. With difficulty can men be found for any work, but that which is directly conducive to oil getting, so dazzling are the prospects offered to the oil devotee, and thus it is that the roads are unmade and day by day partake more and more of the character of the muddy bed of a river, until without surprise we see a scow or flat boat employed in place of a waggon to transport a boiler to a neighbouring well.

Shelter from the weather must be had, and since the material of which the dwellings are universally constructed lends itself readily to a somewhat ornamental style, these wooden houses, partially or wholly painted, form a decidedly pleasant feature in the scene. The wooden house has this further advantage that as the town grows and the streets require widening it can be moved to a more convenient position, and more than once we come across a gang of men with jacks and rollers rearranging a block of houses. It sometimes happens too, that as an owner increases in wealth and family, he finds it convenient to bodily raise his house and add a new suite of lofty reception rooms at the bottom.

It does not astonish one to hear that the drainage of the town has not yet been provided for and that the water supply is not above suspicion, but our attention is triumphantly drawn to the arrangements for lighting the streets, which though primitive are decidedly efficacious. Mains are laid from neighbouring wells producing more gas than oil, and at frequent intervals along the streets vertical pipes are introduced, and the gas as it freely issues without burner or stop-cock is ignited. Thus great luminous flames some two or three feet in length are produced, brightly lighting the thoroughfares. These lights remain burning day and night, perhaps because nobody can find time to put them out, or possibly from a fear that the arrangements of the underground gas works might be affected by a periodical stoppage of the outflow. Efficient lighting is in such a place a matter of great importance, for the new oil town numbers among its inhabitants not a few lawless characters, who under cover of darkness might make their presence unpleasantly felt. The forms of government are scarcely matured, but the fear of lynch law is not one of the least powerful deterrents from crime. Noting with curiosity that many carry not only revolvers but also long rifles, we learn that the latter are for protection against wild beasts in the forests outside the town, where several of he wells are located. Many a lonely vigil is kept by the owner of a well in process of sinking, who fears to have his work undone by the malicious act of an enemy, or who is anxious to note, and perhaps to conceal from others, the first indications of the success of his venture.

Suitably clad by our considerate friend in waterproof boots of Brogdingnagian proportions, we pass through the outskirts of the town and prepare to make ourselves acquainted with the mysteries of drilling and pumping a well. The whole country round, almost as far as the eye can reach, is dotted with the now familiar derricks, and towards one of these on the hill side our guide directs our steps. The derrick or timber framework from which the ponderous drilling tools are suspended, towers to a height of about sixty feet, and the lower part of it being enclosed by rough boarding, forms a chamber about twenty feet square and open to the sky through the interstices of the framework. Before entering we observe the contiguous engine house and the massive timber walking beam, one end of which passes through the side of the derrick.

Inside the derrick we see a square opening, some ten inches in diameter, in the centre of the timber flooring, through which passes up and down a stout rope attached to the oscillating end of the walking beam already alluded to. At the other end of the rope, now a thousand feet beneath our feet, are the drilling tools weighing close upon a ton. Every now and then when the drill has pulverized the rock to a depth of several feet, the gigantic windlass, technically called the "bull-wheel," is set in motion by the engine which actuates the walking beam, and the tools are drawn out of the well, which it will be gathered is not a well in the ordinary acceptation of the term, but simply a narrow boring. Then, after two or three bucketfuls of water have been poured down, the "sand-pump," an iron tube with a valve at the lower end, opening inwards, is introduced by means of a smaller windlass and the particles of rock broken up by the pounding action of the drill and suspended in the water which has been added are thus removed. The drilling tools are then again allowed to run down; the bull-wheel revolving with such velocity that we are warned to stand clear, for serious and even fatal accidents have occurred from the wheel being torn to pieces by centrifugal force.

An anxious and exciting business is this oil well sinking. Not unfrequently it happens that one of the drilling tools becomes broken or otherwise detached in the hole, or perhaps the rope breaks as the well is on the eve of completion and the whole of the tools are jammed in the bore. In such case the aid of the "fishermen" is called in and has to be well paid for. These so-called fishermen are persons who have acquired reputation for their skill in the recovery of lost tools, an operation demanding all the patience of the most apt disciple of Isaak Walton. The common plan is to use an apparatus of jointed iron rods (a magnified likeness of the chimney-sweep's familiar machine), by means of which a hole is drilled and tapped in some portion of the lost tools and a firm attachment thus secured. Occasionally it happens that the tools must be cut to pieces in the hole and removed piecemeal, and more rarely it occurs that the fisherman's exertions are labour in vain and the well has to be abandoned. In addition to the accidental loss of tools in the well the unpopular "producer" has perhaps to suffer for the malicious act of some unfriendly workman who, with little fear of detection, may purposely drop a drill or "sinker bar" down the well; and then, if all goes right with the drilling, there is the uncertainty whether oil will after all be struck or whether the hole may not turn out to be dry.

As the *detritus* brought up by the sand pump shows that the drill has entered the oil-bearing sand rock, the excitement is intense. A few hours will now decide whether the past month's labour has been thrown away. The well has up to this time cost, perhaps, 3000 dollars; the owner, as is often the case, may be a poor man who has obtained his machinery on credit; if the well turns out a very productive one his fortune may be rapidly made, while if the reverse proves to be the case he is probably ruined. It may be that success appears certain; unmistakeable evidences of a rich flowing well present themselves, and the proprietor is already mentally calculating his profits, when suddenly an irresistible rush of gas and oil takes place, some underground high pressure reservoir has been tapped, the massive tools are hurled out of the well like the cork from a pop-gun, the workmen are killed or maimed, the gas takes fire at the neighbouring boiler furnace, and the derrick and engine house are burned to the ground.

Reflecting on the speculative character of the pursuit, we push on to another well which is being pumped, and we watch the green-brown oily fluid as it pours into the wooden vat at each stroke of the pump. The raising of the oil is performed by the same engine and beam which had already sufficed for the drilling, the pump rod being attached where the drilling cable was previously suspended. Beneath the end of the beam is a stout vertical balk of timber, called the Samson post, designed to take the weight of the beam in the event of any accident to the machinery. At each oscillation the mighty beam approaches within three inches of the top of the post, and in this narrow space the attendant points out to us a bird's nest in which a little bird has already reared a progeny. Not for worlds would that rough and oil-stained man have had his feathered friends disturbed. The pumping of the wells is not continuous but generally takes place twice a day; there are, however, some wells which require no pumping at all and are accordingly termed flowing wells, the flow being usually intermittent and often occurring at regular intervals.

Life in the new oil town is not without its convivial aspects; high teas are much in favour, and if the petroleum producers do not very willingly swerve from their allegiance to the oily monarch and devote themselves to frivolous topics, their wives make up for their deficiencies and are very charming hostesses. It is true that there are special difficulties in the way of hospitality where the guests can neither walk across the road by reason of the mud being so liquid nor swim across by reason of its being so thick, but these difficulties only serve to enhance the pleasure with which we gather round our friend's well covered table. Local gossip forms not unnaturally a prominent feature of the conversation, and the ladies express their sympathy with poor Jack Sinker and his young wife. Sinker it seems has just finished putting down his third well, the first two having been failures, his funds are exhausted and to-day it is given out that his last venture has turned out no more fortunately, a statement which Jack's rueful countenance seems to substantiate. But in the morning we are surprised to learn that Mr. Sinker has purchased several lots surrounding his last "failure," and by degrees it leaks out that the reports of non-success were not in accordance with the facts and evidently originated in a very natural reluctance on the gentleman's part to publish his

good fortune until he had secured a further portion of the oil-bearing territory on reasonable terms.

Returning homewards, the flaring gas-jets disclose to our view a bright red-painted high-wheeled waggon which our friend seems strangely anxious to avoid, so abruptly does he turn and lead us a circuitous way. While we are speculating on the cause of our friend's behaviour he tells us that the mysterious vehicle, which thus in the dead of night the single attendant is attempting to drive through the mud, is a torpedo waggon, conveying to the out-lying derricks the canisters of nitro-glycerine which are exploded in the wells with a view of tapping contiguous veins of oil. More than once, we learn, a torpedo waggon has suddenly disappeared from the face of the earth during one of its midnight journeys. There may be found some who are conscious that their rest was disturbed by a mighty noise and a shock as of an earthquake; or it may be that scattered fragments of blackened wood and flesh—whether of man or horse who shall say?—tell the sad tale; but perhaps the explosion has occurred far from a human habitation, and a crater-like hole in the virgin soil, over which the blackened and blasted trees stretch their naked branches, is the sole record of the work which has been wrought.

CHRYSOPHANIC ACID.

BY J. LAKER MACMILLAN.

The botanical source of "araroba" (goa powder) has, until a few months past, been a moot point among the most eminent of our Indian and home pharmacologists, the statements regarding it being as conflicting as they are various, all of them, however, deserving a certain amount of credit. Mr. Kemp (Bombay) supposed it to be prepared from *Lichen orcella*, from the fact that large quantities of this substance are imported from Africa, north of Mozambique, into India. It is reported by others to be imported direct from Brazil and from Portugal, by secret agents in Colombo, Bombay, and Calcutta, the name of a firm in Portugal, by whom it was largely exported, being known as well as that of the consignee, at Colombo. Its source, however, still remained a mystery, or at most, was a mere matter of conjecture. Mr. Holmes, after careful examination of samples taken from a lot of, I think, eight casks, imported from Bahia, was of opinion that it was a product of *Cæsalpina echinata*. He was, if I do not mistake, supported in this opinion by Professor Bentley. Mr. Holmes said that fragments of wood found in the samples examined by him showed that the substance called araroba existed in interstices in such, in which it must have been deposited during growth, and here he comes nearer to the truth than any of his predecessors who have treated on this subject, inasmuch as that he demonstrates a fact which Dr. Monteiro, an authority whom I will presently mention, has since corroborated. If Mr. Holmes had tried the action of water on his samples I do not think that he would have satisfied himself as to the relationship with *C. echinata*, for the wood of that tree yields its colouring matter to water, araroba of commerce does not; his remarks, however, are of so much value as to confirm the following.

In the *Pharm. Journ.* [3], vol. viii., p. 1048, some light is thrown on the subject, in the form of an extract from the *Journ. de Thérapeutique*, of notes by Dr. Rameiro A. Monteiro, which I cannot do better than recapitulate in this paper.

Dr. Monteiro had lately visited the district in which the tree yielding this substance is met with. This tree is known in all the places where the industry is carried on, under the name "*angelim amargosa*," or bitter angelim, and belongs to the order leguminosæ.

The powder obtained from it is invariably called "araroba."

The tree is met with in great abundance in the forests of Camamu, Igrapiuna, Santarem, Taperoa, and Valença, in the province of Bahia. It appears to prefer low and humid spots, but it is also met with in the more elevated regions when these are not very arid.

At whatever season the tree is cut, provided it be of the necessary age, araroba is found; no particular time of the year is preferred for the operation, which is carried on without regularity or method. The tree is one of the tallest in the forests of the south of the province; it is erect, smooth, and when it attains its full development it measures 1 to 2 metres in diameter and from 20 to 30 from the ground to the small branches. The tree from which Dr. Rameiro cut a section at a height of 2 metres from the ground measured 24 metres 20 centimetres up to the first branches. The tree has no other known use than to furnish araroba, the old trees being preferred because of their greater richness. The araroba is contained in clefts or cavities, more or less narrow, in the wood. The clefts traverse the wood in the direction of the diameter and are prolonged through the whole extent of the trunk. In order to extract the araroba it is the practice to hew down the tree, cut it across into small sections and split these longitudinally, which is favoured by the fibre of the wood and the large clefts, upon the surfaces of which the araroba is deposited.

The workmen employed in collecting it suffer from irritation of the conjunctiva which sometimes passes into inflammation of that membrane, and the face will remain swollen and erythematous for some time, but to produce these effects it requires that its action shall be prolonged during a day or more.

It is quite certain that araroba is not found in the medulla as has been generally supposed. It has been long employed in the treatment of ringworm (*Herpes Circinatus* and *Herpes Tropicus*) but how long is not known. It is also said to be employed in killing fish by throwing it into lakes and rivers.

Dr. Monteiro did not ascertain the exact period of the year when the bitter angelim flowers, but he learned that the flower is dark purple and the fruit is a pod. The tree is not cultivated.

Knowing the inconvenience that one is put to in searching through the necessarily scattered history of a new drug, I have quoted largely the substance of Dr. Monteiro's notes, such being the most authentic, although now the history of this product can have but a nominal value, at any rate it will not have the same commercial importance as it would had it been a few years older; for, thanks to the investigations of Mr. Balmanno Squire and others, the therapeutic value of the substance is found to be contained in the acid it yields (chrysophanic), and this acid being very widely distributed in nature, renders us in a manner independent of this source of supply, the "*angelim amargosa*," unless indeed it comes to be employed in the arts like its well known isomer,

alizarin, when we would be obliged to procure it from all available sources.

Chrysophanic acid, Rheic acid, sometimes called *Rhein*, $C_{14}H_6O_2''(OH)_2$, takes its name from two Greeka words, signifying to appear golden. It belong to the anthracene group of carbon compounds, and like alizarin is regarded as *dioxyanthraquinone*, $C_{14}H_6O_2'' \left\{ \begin{matrix} OH \\ OH \end{matrix} \right\}$. It crystallizes in six-sided prisms, is tasteless, and may be sublimed without decomposition. It is contained in araroba, to the extent of nearly 50 per cent., and in almost all the varieties of rheum to a considerable extent, as also in most varieties of dock—*Rumex patientia*, *R. palustrus*, *R. acutus*, *R. aquaticus* (*Hydrolapathum*), and *R. obtusifolius*. The *R. aquaticus* is reputed to possess antiscorbutic properties (Pereira). It is also contained in *Lichen orcella*, which fact seems to have led Mr. Kemp to conclude, and there were strong reasons for his arriving at such conclusion, that the goa powder, as met with in the bazaars of India, was prepared from this substance. The samples operated on by him yielded 42·89 per cent. of a substance, soluble in benzol and in alkalies. It is found in considerable quantities in common yellow lichen, *Parmelia parietina*, which has been used as a remedy for intermittent fevers, in several varieties of senna, and in *Cassia alata*. This latter is called by the Malabars the "ringworm bush," and is used as a remedy for psoriasis, herpes, scabies, and syphilitic eruptions, and is supposed to be a specific for the bite of the centipede, tarantula, and scorpion. A yellow powder prepared from it, and much resembling araroba, is hawked about the country by Tamil empirics, and eagerly bought up by the coolies, who regard it as a specific for all diseases, and on large estates seldom a day passes without meeting several labourers bedaubed with it, not only for the cure of skin diseases, but for fever, headache, etc. It certainly is effective in subduing eruptions of the skin, but as for its other ascribed virtues, I think such exist only in the imagination and unlimited faith of the coolie. I have found it successful in allaying the irritation produced by mosquito bites. The fact that the juice of the dock leaf allays the irritation caused by the sting of the nettle may be ascribable to the fact of its containing chrysophanic acid, as does the *Cassia alata*, which is common in the mountain province of Ceylon, as is also *C. occidentalis*, *C. Sophera*, and *C. Tora*, whose leaves and roots possess the same therapeutic properties.

Cathartin.—The active principle of senna is composed of chrysophanic acid, a dextro-rotary glucose, and chrysophanin. The acid may be separated by exhaustion with ether. It is present in but small quantity, in senna, but it is at once rendered evident by the formation of a characteristic red colour with ammonia, when added to an aqueous infusion of the leaves.

It may be prepared* from either rhubarb or senna, by treating the powdered root of the former and the leaves or petals of the latter with caustic potash, precipitating the filtrate, and dissolving the washed and dried precipitate in chloroform, which on evaporation leaves the acid in granular crystals, of pure yellow colour. The substances obtained from rhubarb root, and known in commerce as *Phœoretin* and *Erythroretin*, are, according to Batka, nothing but impure chrysophanic acid, the former in a half charred condition, the latter contaminated with tannic acid.

According to Rochleder* the acid prepared from rhubarb usually contains *Emodin*. On boiling it with carbonate of soda, and filtering at a boiling heat, the emodin dissolves with blood red colour, whilst nearly all the chrysophanic acid remains undissolved, and when further purified by further crystallization from alcohol of 90 per cent., gives by analysis numbers agreeing with the formula $C_{14}H_{10}O_4$ or $4(C_{14}H_{10}O_4)H_2O$. Dried at 100° C., he says, it retains water, which can only be expelled at 115° C., aided by a current of dry carbonic acid gas.

According to Graebe and Liebermann, being isomeric with alizarin, $C_{14}H_8O_4$, it, when treated with zinc dust, is converted into anthracene. It contains only two atoms of H replaceable by acid radicals.

A solution of the acid in benzoyl chloride, heated nearly to the boiling point of the latter, gives off HCl, and yields dibenzoyl chrysophanic acid—

$$C_{14}H_6(C_7H_5O)_2O_4 \text{ or } C_{14}H_8(C_7H_5O)_2O_4,$$

as a fibro-crystalline mass, which dissolves sparingly in alcohol, and crystallizes from benzol, or better from a mixture of benzol and alcohol, or amylic alcohol, in long irregular hexagonal prisms. Melts at 200° C., and gives off at higher temperatures yellow vapours, smelling like bitter almond oil, and is not decomposed by ammonia.

With acetyl chloride it gives acetyl chrysophanic acid, crystallizable, but difficult to purify.

Gently heated with phosphorus pentachloride it gives a body which reacts like chrysophanal chloride, being converted into chrysophanic acid by boiling with water.

With fuming nitric acid it gives a solution, in which it deposits, after a few days, large laminar crystals of *chrysammic acid*, identical in every respect with that obtained from aloes.

Liebermann† regards chrysammic acid as *tetranitrom-dioxyanthraquinone*, or tetranitro-chrysophanic acid, $C_{14}H_8N_4O_{12} = C_{14}H_6(NO_2)_4(HO)_2O_2$.

Kubly‡ says that the alcoholic extract of rhubarb yields an orange red substance, which he terms *chrysophane*, $C_{16}H_{18}O_8$, which is resolvable by acids into chrysophanic acid and sugar.

Chrysophanin may be obtained by treating the aqueous extract of senna from which the mucilaginous matter has been removed by alcohol, with lead acetate, decomposing the precipitate with hydrogen sulphide, evaporating the liquid to the consistency of a syrup, treating this with alcohol, dissolving the residue in water, reprecipitating with alcohol, and drying over H_2SO_4. Thus obtained it is almost white.

Chrysophanic acid is generally accompanied by traces of resin, which may be precipitated by the addition of ether to the alcoholic solution. The following salts of chrysammic acid are known.

Potassium chrysammate, $C_{14}H_2K_2(NO_2)_4O_4 + 3\,H_2O$.

Barium chrysammate, $C_{14}H_2O_2''(NO_2)_4O_2Ba + 2\,H_2O$, obtained by adding barium acetate and acetic acid to a solution of the potassium salt.

Lead chrysamate, $C_{14}H_2O_2''(NO_2)_4O_2Pb + 4\,H_2O$, produced in a similar way by using lead acetate, forming crystals of a bright bronze tint.

Hydrochrysamide, $C_{14}H_2O_2''(NH_2)_3NO_2(OH_2)$. When chrysaminic acid is boiled with a solution of potas-

† *Zeitsch f. Chem.* [2], iv, 503.
‡ *Bull. Soc. Chim.* [2], x, 293.

sium sulphide, it dissolves with a deep blue colour, and on cooling the salt separates out in crystals, having a deep blue colour, and copper red reflection.

Chrysophanic acid, as met with in the English market, is in the form of a light powder of turmeric yellow tint, sp. gr. (approximate) 0·847. It is soluble in benzol, chloroform, turpentine, and in the fixed and volatile oils to a large extent, sparingly soluble in ether and alcohol, and insoluble in water, glycerine and in solid paraffin. It is dissolved by sulphuric and nitric acids—in the latter to a less extent—by caustic potash and by ammonia; fuses at 123°·3 C., and boils at 232°·2 C. At the latter temperature it is decomposed into a dark green resinous like substance, which is largely soluble in ether.

Ol. jecoris dissolves twice its weight of the acid, yielding a mixture containing 70 per cent. Ol. olivæ, ol. pini sylvest., creasotum, ol. terebinth., ol. lavand., and vaseline, dissolve readily their own weight of acid, yielding mixtures containing 52 per cent. Taking advantage of its solubility in the fixed oils, a considerable saving may be effected in preparing ointments direct from araroba. Ol. olivæ thoroughly exhausts that substance, yielding the acid after removal of the oil by ether in a state of purity. The Cinghalese doctors take advantage of this fact and fry the leaves of the *Cassia alata*, *C. Tora*, *C. occidentalis*,—called by them *Penni tora*, and *C. Sophera*, called *Ooroo tora*,—in gingely oil, and in castor oil, and use the strained product as an ointment for ringworm, itch, and other skin diseases.

It is soluble in caustic potash, and in ammonia, in the former at once, and in the latter after some hours. The ammonia product on treatment with alcohol yields a beautiful pink lake, and the potassium product a subdued purple. These crude potassium and ammonia solutions yield all the shades and tints of the common and rarer seaweeds, and should, I think, be a valuable acquisition to botanical and natural history artists. The colour may be applied with the pen, as ink, with the brush, or clean impressions may be taken from blocks. I have tried the colours on fabrics of silk, wool and cotton, and find them comparable with established dyes, the tincture from the ammonia product lending to silk a tint which artists would call natural pink.

The acid dissolved in SO_4H_2 is reprecipitated by the addition of water, or alcohol. The nitric acid solution is soluble in alcohol, but after some time, the acid acting on the alcohol, heat is generated, ebullition takes place, and part of the acid in the shape of resin is deposited on the sides of the glass, the greater part, however, remaining in solution. The temperature registered during this action was 104·4° C.

Therapeutics. The action of this acid when applied in the form of an ointment is not yet distinctly known; it is certain, however, that it destroys both animal and organic parasites and that it possesses strong healing powers in cases of skin eruptions attending the presence of such. It is irritant, but not directly so, and yet it allays almost all forms of skin irritation. Children suffering from eczema have been successfully treated with it at the Victoria Hospital; and yet remedies of an irritant nature are prohibited in the treatment of this affection. Practitioners antagonistic to its introduction say that it produces eczema, and indeed it does, but in this very fact seemingly resides its virtue. About the third day after its application, vesicles may or may not appear, other than such pre-existing, and after this time whether such action is manifest or not, the cure is perceptible and almost invariably rapid.

Numbers of cases of psoriasis, herpes, eczema, impetigo, and lichen, have been successfully treated with it at this hospital, and the ointment now takes prominent place in the pharmacopœia of the institution. It has been used at strengths varying from 30–100 grains to the ounce, in cases under the care of Mr. Cowell, Dr. Ridge Jones, Dr. Grigg, Dr. Pearson Irving, Dr. Allchin, and Dr. Albert Venn. One case of psoriasis, of nine years' standing, a girl of 13, out patient, under the care of the last-named gentleman, whose body was almost entirely covered, was, after one month's treatment with the ointment of chrysophanic acid, 30-50 grains to the ounce, reported "body clean," and after a short antiphlogistic treatment was reported cured.

There is one point which I cannot pass over, and that is the discoloration of the skin accompanying this treatment, a phenomenon which often alarms the relatives of the patient. On the third day generally, after the continued use of the ointment, the surrounding parts, say four inches or thereabouts beyond the margin of parts to which the ointment is applied, becomes copper coloured, and in two or three days after the discontinuance of the treatment assumes its pristine appearance. This phenomenon is certainly worth investigating; the exact tint may be produced on paper with a dilute solution of the potassium product, before mentioned. The parts, say in cases of psoriasis, which were covered with scales or scab, on convalescence appear whiter and healthier than the surrounding parts, showing that the remedy possesses powerful detergent properties.

The acid has not to my knowledge been used internally, but the fact that it is contained in many drugs that are, appears to warrant experiment.

Those who are interested in the therapeutics of this substance will profit by perusing the papers of Mr. Balmanno Squire, to whose energy we owe its existence in the English market, and let us hope in the coming edition of the national pharmacopœia.

CHINESE PHARMACY IN THE UNITED STATES.*

BY RICH V. MATTISON, PH.G.

Sauntering along one evening with some friends in the City of the Golden Gate, discussing the pharmacy of the past and that of the immediate future, we thought a visit to the Celestials would be *àpropos*, so we dropped into the shop of Mr. Fook Sing Tong to chat about the price of drugs and the probability of an early agreement on the subject of an International Pharmacopœia.

The representatives of the oldest nation not being so communicative to our body as we desired, we soon transferred ourselves to the shop of Messrs. Chun Wo Tong and Co., who have the best arranged pharmacy, probably, among the Orientals of the coast. Here we were cordially welcomed, and, after an interchange of courtesies, which consisted on their part of the usual tea-drinking ceremony, we proceeded to inspect the pharmacy.

* From the *American Journal of Pharmacy*, Dec. 1878.

The junior partner we found engaged in the preparation of a large quantity of pills. In this case *secundum artem* means that the powders are beaten up into a mass, a mortar being used and the pestle manipulated in true occidental style. When the mass is of sufficient tenacity, it is held in one hand and with the other pulled and rolled into a pipe of about the thickness of a stick of liquorice, and then, with one hand still grasping the pipe, sufficient is pinched from the end by means of the finger nails, which are kept long for the purpose, to make a pill; this is rolled between the thumb and fore finger until quite spherical, when it is dropped into a pan, where after a sufficient number have accumulated, they are placed in a warm place to dry. The whole process is one of astonishing accuracy and dexterity. The mortars used are of brass, the usual shape and size; the pestles are of wood, with a brass "nose" at the apex firmly joined to the wood. Each mortar is furnished with a leather cover, which in its centre is pierced with a hole for the passage of the pestle.

All drugs are prepared for use or sale in the following manner:—The drug is carefully steamed, and then, while soft, is cut, usually transversely, in very thin slices, by means of a machine resembling a straw cutter or tobacco knife. Perhaps liquorice root is a good example of the preparation of similar drugs. It is first steamed, then decorticated, and then sliced and placed in the sun until perfectly dry. No artificial heat is used. It is then ready for sale. Its appearance by this time is about as unlike liquorice root as it is possible to get it. Orange and lemon rinds are treated in the same manner, and come into the market in the favourite chipped beef style.

The Oriental has no liquid preparations to trouble him, but his profession is thoroughly in the line of practical pharmacy. Think of it, pharmacists of a civilized community! Not an elixir to grace his shelves. Not even a pill except of his own manufacture. Not a sugar-coated, gelatin-coated, or even a compressed pill to be seen upon his shelves, to say nothing of his not being obliged to keep half-a-dozen marks of each of the above lines. Already we think we hear some one murmuring, "What a paradise for pharmacy!

The R is written by the physician upon rice paper, and, after being compounded, is twisted up into a little roll and returned with the medicine to the owner, *i.e.*, the patient; hence, no repetition can be made without the return of the original prescription, which is, no doubt, pleasant to the physician. The scales used are on the principle of the old-fashioned steelyard. The pan is usually about four inches in diameter, and the weighing is performed with great rapidity. Nearly all the ingredients of the prescriptions are chipped drugs or herbs, though occasionally some chemicals may be used, iron rust for instance. These are all bruised in the mortar together, and then a tea is made, either by the druggist or the patient, generally the latter.

The great tonic is ginseng. This is very highly prized, and besides being worn as an amulet, is of daily use among them. Its chief office seems to be that it "makes strong," which is about all they can or will "savey" on the subject.

Opium is largely sold, but always, we believe, in the state of aqueous extract. This is, of course, almost entirely used for smoking purposes, and is prepared exclusively, we believe, in China and imported in the state of an extract of about the consistency of honey. It comes of two grades, the finest called "first chop," and is retailed for its weight of silver, the "two bit" or "four bit" (fifty cents) pieces being placed in a basket upon one end of the steelyard, and being balanced upon the pan by the requisite weight of the extract placed in a horn cup. The second grade is sold at various prices. The smoker knows whether he is being cheated or not by the colour it gives on the earthen bowl of the opium pipe. If it burns to a light, rich brown colour, and gives the peculiar odour so grateful to the olfactory nerves of the Mongolian, it is satisfactory. Good smokers will smoke of an evening the weight of a trade dollar, perhaps more, of the "first chop" extract, but of this we may speak in a future paper.

In closing this paper, a circumstance occurring sixth mo. 9th, 1878, is brought forcibly to mind. Mr. Wong Ah Get, dying at the hospital of the Ning Young Cal, stated that he died of taking Mar Tin, which, upon investigation was found to be the bean of Strychnos Nux Vomica; the Chinese obtain the poison from the floss of the bean, as they use the meat in the preparation of a cathartic. The eminent Chinese physician, Dr. Li Po Tai, said, in his opinion strychnia was a mineral poison obtained from the ground, and that there was no antidote for it. This seems to be illustrative of the amount of pharmaceutical and medical knowledge on the subject.

WAX OF FICUS GUMMIFLUA.*

BY F. KESSEL.

This wax, which is used by the natives of certain districts of Java for illuminating purposes, is of a chocolate-brown colour, which it loses on treatment with boiling water, becoming almost white. It then consists of two bodies which are separated by taking advantage of the difference of their solubility in ether. The more difficultly soluble constitutes about $\frac{1}{10}$th of the crude material, melts at 62°, and has the empirical formula, $C_{27}H_{56}O$. It reacts with phosphorus pentachloride to form a chloride which is not decomposed by water, and with acetic chloride to form a crystalline acetate (m. p. 57°). It contains therefore an OH group, and is probably an isomeride of ceryl alcohol.

The more easily soluble, on the other hand, melts at 73°, and has the composition $C_{15}H_{30}O$. It reacts with phosphorus chloride and acetic chloride. The purified wax yields on dry distillation a crystalline body, which separates from its solution in petroleum in pearly scales; it melts at 62° and boils at 345—354°; its composition is represented by the empirical formula, $C_6H_{12}O$. It yields a crystalline acetate (m. p. 57°).

INVESTIGATION OF BALSAMUM ANTARTHRITICUM INDICUM.*

BY B. HIRSCH.

The crude balsam appears as an opaque brownish liquid, saturated with small drops of water; it has a sp. gr. of 1·010 and an unpleasant rancid taste. When heated, the balsam becomes clear, owing to the loss of water, which amounts to 5·75 per cent., and the sp. gr. then rises to 1·016; heating causes also the formation of an unpleasant odour; at a strong heat, vapours are given off, but acrolein cannot be detected, so that glycerin would seem to be absent. The ash of the balsam contains iron. The balsam heated by itself does not ignite, but will burn from a wick. On shaking it with water, valeric acid is dissolved, leaving behind a mass which is soluble in alcohol. A portion is capable of saponification, another portion consisting of oil of resin, an oil indifferent to alkalies. Basic substances, such as ammonia and lead oxide, combine readily with the balsam. If the balsam be extracted with alcohol of sp. gr. 0·892, a portion only is soluble, and this with hydrochloric acid forms a yellow oily substance, which solidifies to a plastic yellow mass soluble in ether. On comparison of these results with the reactions of gurjun balsam, it is found that the two are not identical.

The Pharmaceutical Journal.

SATURDAY, MARCH 15, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE MEDICAL ACT AMENDMENT BILLS.

SINCE the publication of the last number of this Journal we have received the third of the series of medical Bills now before Parliament, and as regards that portion of it which relates to the practice of medicine by unregistered persons, we find its provisions to be essentially the same as those contained in the Duke of RICHMOND'S Bill, as well as in the Bill introduced by Dr. LUSH. As we have already pointed out in speaking of these Bills, the fact that various persons do practise medicine without possessing legal qualification is distinctly recognized in all three of the projected measures, and to this extent there is in all of them a repudiation of the claim insisted upon by a particular section of the medical profession to use the Apothecaries Act of 1815 as a means of preventing such practice.

The only restriction upon the practice of medicine by unregistered or legally unqualified persons is the provision in the Bill introduced by Dr. LUSH that none but a legally qualified medical practitioner should have the right to give a certificate of death.

The Duke of RICHMOND'S Bill was read a second time in the House of Lords on Monday last, and it will be taken in committee upon the 20th inst. The Bill introduced by Dr. LUSH into the House of Commons came on for second reading on Wednesday, and it was urged on behalf of it by Dr. LUSH that some amendment of the law in regard to the signature of certificates of death by unqualified persons was absolutely requisite for the protection of the public. This opinion was, however, disputed by Mr. Serjeant SIMON, Mr. BURT, and other members, on the ground that restricting the right of giving certificates of death to legally qualified medical practitioners would be equivalent to saying that a man should not employ a herbalist, for instance; because if he died the herbalist could not give a certificate of death, and the man could not be buried.

Altogether the tendency of the discussion was decidedly in favour of the principle expressed in the remark of the Duke of RICHMOND, when introducing his Bill last Session, to the effect that the prevention of medical practice by persons without legal qualification was an impossibility, and therefore an object which that Bill did not contemplate providing for.

The *Times* in a leading article upon this subject finds fault with some of the speakers in the debate for having betrayed want of knowledge, by seeming to fear that any of the Bills would prevent this practice of medicine by unqualified persons, but we cannot quite concur in the censure thus conveyed, since the remarks of Dr. LUSH in moving the second reading of his Bill are unmistakeable in suggesting, if they do not actually express, the opinion that no person should be allowed to practise medicine until he had given proof to a competent body that his education in surgery and medicine was such as to justify the confidence of the public in his competent knowledge and skill. Dr. LUSH referred to the licence of the Pharmaceutical Society as being necessary for those keeping a shop to sell drugs as being an analogous provision for the protection of the public; but he omitted to state, what he can scarcely be unaware of, viz., that the necessity for such licence relates not to drugs generally but only to such as are especially poisonous, and on that account dangerous.

The obligation of drug vendors being registered is not therefore a fact that lends any weight to the argument that every one who practises medicine should be registered. The great majority of drugs are not dangerous as poisons, and strictly speaking there is no greater reason why they should not be used as medicines by any person who chooses to do so than there is for their being sold only by registered chemists and druggists.

But the parallel drawn by Dr. LUSH between the practice of medicine and the sale of drugs—or properly poisonous drugs—as being occupations which, in the interest of the public, both demand legal qualification, may perhaps, without unfairness, be taken as an index of the spirit influencing the promoters of this particular Bill, and we do not think it quite unnatural that they should have awakened some fear that a further intention was entertained than that of prescribing a standard of qualification, and preventing improper use of titles.

It seems to have been from such an impression of what the promoters of this Bill desired to aim at rather than what was specifically provided for, that Mr. Serjeant SIMON spoke of the Bill as seeking by penalties to interfere with the freedom of the public—as being, in fact, introduced, not in the interest of the public, nor because of any growing or general desire on the part of the medical profession, but only to carry out the views of a narrow section of that profession.

In the same spirit Mr. COWPER-TEMPLE argued against the propriety of the Legislature passing any medical Bill that would impede the freedom of every man to try and get medical relief in the way which best suited his own notions. He contended that the

public would not be brought by compulsion under the despotic rule even of a body so important as the medical profession. All, he thought, that could be demanded was that no persons should adopt the names or titles belonging only to those authorized by examination to use them, so that the public should be able to distinguish clearly between those having such qualifications and those who had not.

The protection accorded to the use of those titles is, as pointed out by Dr. CAMERON, of a nature somewhat equivalent to that now existing in regard to manufactures, a registration of trade marks or signs which are the property of those who register them.

It may therefore so far be inferred that the idea of enforcing restrictions in the application of drugs as remedial agents, either for oneself or for others, is one which is not likely to find favour in Parliament any more than it has done with the general press or public opinion. The natural solicitude of a particular class of medical men for the interest of the public is not without a flavour which excites suspicion, and we do not believe it will be regarded with approval in any other quarter than that where its promotion was instigated by various personal interests.

For those who share with us the opinion that the confusion of medicine and pharmacy is prejudicial to both there remains only the hope that some future period will see the practice of these two branches of the healing art more definitely separated and the mutual relations of the practitioners more generally cordial than is now the case, but until that desirable state of affairs has been realized, we may, judging from recent events, at least regard the position of chemists and druggists throughout the country as being free from such danger as was lately apprehended, provided only that they abstain from acting in such manner as to appear in any way to hold themselves out as legally qualified medical practitioners. Under these conditions we do not anticipate that the medical legislation now in progress will in any degree injuriously affect those engaged in the drug trade.

ORPHAN CHILDREN.

WE have great pleasure in directing attention to the letter from Mr. ROBBINS, printed on p. 770, asking for help in securing the election into the Royal Masonic Institution for Girls of KATHERINE ANNIE PEELE, a child who was the subject of a vote from the Benevolent Fund at the last Council meeting. No doubt there are many of our readers who are subscribers to this institution and the kindred one for boys, and if they will kindly give Mr. ROBBINS all the assistance in their power, his labour will be much lightened. We also take the opportunity of referring to the present position of the four children who were recently left destitute by the death of the late Mr. ISHERWOOD, Pharmaceutical Chemist, Old Kent Road. As will be seen by the report of the Benevolent Fund Committee last week, two of these children have been adopted as also is a third, with the aid of a grant of money from the Fund for his education. There is yet another child, a boy between four and five years old, not yet definitely provided for, and it is hoped that when this fact becomes known some benevolent member of the trade may be induced to volunteer to take charge of him.

THE ANNUAL DINNER

WE are requested to announce that a meeting will be held at 17, Bloomsbury Square, on Thursday, the 20th inst., at 12 o'clock, to appoint a Committee to make arrangements for the EIGHTH ANNUAL DINNER of the Members of the Pharmaceutical Society and their friends. The subject has already been under the consideration of a preliminary committee, which suggests that the Dinner shall take place at WILLIS'S Rooms, on Tuesday, May 20th, and that the expenses hitherto borne by Stewards be paid out of the proceeds of the sale of tickets, the price of the tickets being raised accordingly. The PRESIDENT will take the chair, and all gentlemen interested in this annual gathering are invited to attend.

PROFESSOR BENTLEY'S LECTURE.

WE would remind our readers that on Wednesday next, at a Special Evening Meeting of the Pharmaceutical Society, Professor BENTLEY will deliver a lecture on "The Life of the Plant." The chair will be taken at half-past eight o'clock.

EXAMINATIONS IN IRELAND.

IT will be seen from the report on another page that the Council of the Pharmaceutical Society of Ireland has decided that the bye-law which requires a person wishing to be examined to give proof that he has been practically engaged in compounding and dispensing for at least two years in the establishment of a pharmaceutical chemist or an apothecary keeping open shop shall be construed as including pharmaceutical chemists in Great Britain.

REGISTERED CHEMISTS' ASSOCIATION OF IRELAND.

THE Annual Dinner of this Association will take place on Thursday next. Information respecting tickets, etc., may be obtained from the Honorary Secretary, Mr. R. DICKINS, 221, West Derby Road, Liverpool.

IN reporting last week the communication made to the Secretary on behalf of the Committee of the Chemists' Ball, Mr. M. CARTEIGHE, who was the Chairman, was inadvertently spoken of as the Honorary Secretary.

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, March 5, 1879.

Present—Charles R. C. Tichborne, LL.D., Ph.D., President; Dr. Aquilla Smith, Vice-President; Sir George Owens, M.D., Dr. Collins, Dr. Whitaker (Belfast), Messrs. Bennett (Kingstown), Brunker, Goodwin, Harrington (Cork), Hayes, Hodgson, Holmes, Oldham, Pring (Belfast), Simpson.

The minutes of the meeting held on February 5 were read and signed.

Read a letter from Professor Attfield, one of the hon. secretaries of the British Pharmaceutical Conference.

The Registrar was authorized to send Professor Attfield a cheque for £1 10*s.*, being the price of the additional parts of Bentley and Trimen's work on 'Medicinal Plants.'

Read a letter from Dr. A. H. Jacob, editor of the *Medical Press and Circular*, drawing the attention of the Council to the recent action of the Prisons Board, Ireland, in dismissing the apothecaries, or other compounders, of the Irish prisons; and imposing the duties previously performed by them on the prison surgeons.

The consideration of Dr. Jacob's letter was postponed to the next meeting of the Council.

Read a letter from Mr. Robert Barklie, of Belfast, requesting the Council to recognize the instruction in practical chemistry given in the laboratory of the Working Men's Institute, Belfast.

The Registrar was instructed to write, asking for particulars as to the instruction given in the institute.

Letters were read from the Medical Registrar of Trinity College, Dublin; the Secretary of the Royal College of Science for Ireland; and the Registrar of the Carmichael College of Medicine and Surgery; acknowledging the receipt of letters informing them that their institutions had been included in the list of those at which candidates for the licence of this Society could take instruction in practical chemistry.

Read the letter from Mr. W. J. Madden, of Belfast, the consideration of which was postponed from last meeting.

Proposed by Mr. Hayes, seconded by Mr. Pring, and resolved:—

"That the term pharmaceutical chemist in paragraph 2, page 65, of Calendar,* may be accepted as pharmaceutical chemist of either Great Britain, or Ireland."

The Law Committee presented their report, which, on the motion of Mr. Brunker, seconded by Mr. Hayes, was received and adopted.

Mr. Samuel McKinney, Cookstown, Co. Tyrone, who was proposed and seconded at the February meeting by Mr. Hayes and the President, was elected a member.

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The ninth general meeting was held in the Royal Institution, February 27, 1879, the President, Mr. T. F. Abraham, in the chair. The minutes of the previous meeting were read and confirmed. Various donations to the library were duly acknowledged.

Messrs. J. Clarke, W. Danson, H. Peet and P. Smith, were unanimously elected members.

Dr. Charles Symes, Ph.D., called attention to a leading article, by the editor, in the *Canadian Pharmaceutical Journal* for February, 1879, claiming for the colonies some share of consideration in the next revision of the British Pharmacopœia. He considered the suggestion contained therein very *àpropos* at the present time, for although very little had as yet been done for the new edition it was a necessity and must force itself on the editors of the work very soon. It was important in a town like Liverpool, where medicines were being frequently shipped to the colonies, that there should be some standard formula, from which such medicines could be prepared of a uniform character, even though they were little used in this country. In the construction of a British Pharmacopœia the speaker thought it would be well to bear in mind that the empire is not limited to Great Britain, but that the subjects of this realm exist under all varieties of climate, from the tropics to the frigid zone.

The President said that whilst fully agreeing with the sentiments expressed as to the desirability of having a Pharmacopœia fully satisfying the wants of all parts of Her Majesty's dominions, he felt that there were great difficulties in the way of its accomplishment. The difficulties that he apprehended were—first, that in many colonies there were no recognized representative bodies that could be looked to to provide the necessary lists,—secondly, that the inevitable process of cutting down these lists would be a most difficult and disagreeable duty, and thirdly, that such a Pharmacopœia would contain a considerable number of articles which British pharmacists would, by reason of their being there, be obliged to keep, but which are not in demand here. He thought that if the Pharmacopœia did not contain all that the various colonies required they should themselves publish small supplements. Whilst it was very desirable that the British Pharmacopœia should contain everything of value, it was in the highest degree undesirable that it should be encumbered and its character lowered by the introduction of things of doubtful utility.

Mr. Robert Sumner said he considered the matter to which Dr. Symes had called attention worthy of special notice. He had great sympathy in the request made by our colonial friends, and would strongly advocate the addition of some of the remedies which are to them of considerable importance. British pharmacists could not but admire the desire they have to be more identified with and incorporated in a more general Pharmacopœia, and it should be a matter for consideration with the compilers of the new Pharmacopœia how far the whole of our colonies can be bound up in the bundle of British pharmacy. He did not think the next Pharmacopœia should be so restricted as to its size and its contents, and if need be, some of its present contents could be dispensed with to advantage. With regard to the additions which might be found necessary for dispensing chemists to make to their stocks by the introduction of colonial remedies in a new Pharmacopœia, these would be regulated by the probable demand. He hoped that in pharmacy as in politics the mother country would hold out a friendly hand to her colonies, so that all might be bound together in a bond of British unity.

A paper was then read entitled, "The Years 1877 and 1878 from a Scientist's Point of View," by Mr. J. T. Armstrong, F.C.S. In this paper the author, after alluding to the many striking applications of well-known scientific principles which have recently been made, and which he attributed chiefly to the great belief in facts that is characteristic of the time, said that those applications which stood foremost were the improvements in electrical science. Starting with Franklin's kite, he then traced some of the facts which had been accumulated, the practical application of the principles running through which had resulted in the telephone, the microphone, the microtaximeter, the telectroscope, the duplexing of the Anglo-American cable, the improvements in the electric

* The paragraph referred to runs as follows:—

"Candidates must also have been practically engaged in compounding and dispensing for at least two years, in the establishment of a pharmaceutical chemist or apothecary, 'keeping open shop;' and produce a certificate from such pharmaceutical chemist, or apothecary, to that effect."

light, etc. Brief sketches of the progress made with respect to each of these inventions were given, and as an instance of the work yet remaining to be done the author of the paper quoted the following account of some unexplained phenomena in connection with the telephone:—"During five evenings in the latter part of August and first part of September, 1877, performers stationed in the Western Union Building, New York, sang, or played with an Edison musical telephone actuated by a powerful battery and connected with one or more cities by a No. 8 gauge wire, with return through the ground. In Providence, on the evening of the first of these concerts (August 28), Henry W. Vaughan, late assayer, and Dr. W. F. Channing were conversing through magneto-telephones over a shunt made by grounding one of the American district telegraph wires in two places, about a quarter of a mile apart, through suitable resistance coils. At about half-past eight o'clock they were surprised by hearing singing on the line, at first faint but afterwards becoming distinct and clear. At the same moment apparently Clarina Rathbone talking with a friend through telephones over a private line in Albany was interrupted by the same sounds. Afterwards during that and subsequent concert evenings, various airs were heard sung by a tenor or softened voice, or played on the cornet. The origin of these concerts remained a mystery for some time in Providence and the lines were watched for music many evenings. The programmes heard proved to be precisely those of Edison's concerts performed in New York. The question how this passed from the New York and Albany wire to a shunt of the district wire in Providence is of scientific importance. The wire used in these concerts extended from the Western Union Buildings, corner of Broadway and Dey Street, through Park Row, Chatham Square, the Bowery, and Third Avenue to 130th Street, and thence *viâ* the Harlend Railroad to Albany. On the same poles with this Albany wire, for sixteen miles, are supported no less than four wires running to Providence, three of them being on the same cross arm and one of them being Boston wire No. 55 East, *viâ* Hartford and Providence; also for eight miles a fifth wire, Boston wire No 32 east, *viâ* New London and Providence. These wires, including the Albany wire, have a common ground connection at New York, and are strung at the usual distance apart and with the ordinary insulation. To reach Providence, electric motion had to be transferred from one wire to another, and it will 'be seen that the music from the Albany wire passed first to two or more parallels, New York, Providence and Boston wires; second from these to a parallel district wire in Providence, and third through a shunt of that district circuit before reaching the listeners there.' How this electric motion was transferred from one wire to another is not known, but the passage proves the wonderful delicacy of the magneto-telephone." Turning to the chemical world, Mr. Armstrong referred to the speculations as to the dissociation of the so-called elements, based upon Mr. Norman Lockyer's spectroscopic investigations. Considering the possible results from this work the eight "elements" which have been discovered during the last two years were mentioned dubiously. The author then urged that the study of development was a field in chemical science that would repay cultivation, and after alluding to the Davy centenary, the liquefaction of gases and one or two other subjects, brought his paper to a close.

At the close of the paper a discussion took place, in which the President, Messrs. Davies, Mason, Dr. Symes, and others took part. A vote of thanks to Mr. Armstrong was carried by acclamation.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

The usual monthly lecture was delivered in the rooms of the Aberdeen Diocesan Young Men's Association on the evening of March 3.

The chairman (Mr. A. Strachan), after a few introductory remarks, called on Mr. W. L. Howie, of Messrs. Barron, Harveys and Simpson, London, to deliver his lecture.

The lecturer, choosing for his subject, "Leaves from a Traveller's Note Book," at the outset apologized for giving what might be called a popular lecture, instead of a scientific paper, which his business engagements precluded, and gave some account of the hotel life, and the manners and customs of commercial travellers. In alluding to the institutions connected with the body, he said the commercial travellers schools at Pinnar were supported by voluntary contributions, and had last year 323 pupils—chiefly orphans—nearly 60 retiring annually after having received an excellent education. The benevolent institution last year had 129 widows and incapacitated travellers on its funds, while the Christian Association had provided libraries of about 80 volumes each to nearly 100 hotels throughout the kingdom. He also gave an account of a business visit to Canada and some of the Northern States, referring principally to matters pharmaceutical, and said in reference to his visit to the Chicago pharmacies that the shop fittings being as a rule in white and gold had a very light and elegant appearance. The Chicago College, which he went over with Professor Gray Bartlett, was, according to English notions of what a college should be, not very imposing, being accommodated in some upstairs rooms in one of the principal thoroughfares—but it accomplished a good work, had classes and published a journal, a specimen of which, as well as of the other American trade publications, was laid on the table. In conclusion he gave some graphic sketches of the fertility of invention and unscrupulousness displayed by American advertisements.

The lecture was interspersed with humorous anecdotes and altogether was of an attractive character, the different experiences being narrated with a good deal of quiet humour which kept the audience earnest listeners till the close. Some beautifully prepared specimens of roots as prepared for the American market were exhibited, as well as an interesting series of photographs, paper currency, railway tickets, weather charts, etc., which attracted considerable attention at the close of the meeting.

After hearty votes of thanks had been passed, to the lecturer, the Aberdeen Diocesan Young Men's Association (for having so kindly granted the room), and the chairman, the meeting gradually broke up.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The usual monthly meeting of this Association was held on Thursday, Feb. 27, at Britannia Chambers, Pelham Street, the chair being occupied by the President, Mr. R. FitzHugh, F.C.S.

After the transaction of some preliminary business the Hon. Secretary, Mr. R. Jackson, announced the receipt of the 'Year-Book of Pharmacy,' from the Pharmaceutical Conference, and the *Pharmaceutical Journal* regularly from the Society, and a hearty vote of thanks was awarded to the donors. The President then introduced Mr. F. H. Spenser, who delivered an interesting and instructive lecture on "Light," which was illustrated by numerous beautiful experiments, including the decomposition and recomposition of light, spectrum analysis, etc., etc. The lecturer was assisted in the experiments by Mr. G. E. Smith who presided at a lantern with the oxyhydrogen light. At the close of the lecture, which was listened to with great attention, Mr. W. H. Parker proposed a vote of thanks to Mr. Spenser, which was seconded by Mr. Frank White, supported by the President, and carried unanimously.

CHEMISTS AND DRUGGISTS' TRADE ASSOCIATION OF GREAT BRITAIN

A meeting of the Executive Committee was held at the Office of the Association, 23, Burlington Chambers, New Street, Birmingham, on March 6, 1879, at 1 p.m. Mr. S. U. Jones (Leamington), President, in the chair; Mr. Thomas Barclay (Birmingham), Vice-President.

Present—Messrs. Andrews (London), Arblaster (Birmingham), Churchill (Birmingham), Cross (Shrewsbury), Greaves (Chesterfield), Greenish (London), Hampson (London), Holdsworth (Birmingham), Jervis (Sheffield), Kerr (Dundee), Mackenzie (Edinburgh), Shaw (Liverpool), Southall (Birmingham), and the Solicitor of the Association.

Communications were read from Messrs. Abraham, Delves, Earle and Walker regretting their inability to attend.

The minutes of the previous meeting of the Executive were read and confirmed.

The report of the Law Committee was then read. The report included an announcement from the Solicitor of the Association stating that in the case of the Apothecaries' Company *v.* Shepperley he had received from plaintiffs' agents on January 27th last a notice that the plaintiffs abandoned their appeal in that action. It also referred to the appointment of a deputation to wait upon those members of Parliament who had charge of a Bill to Amend the Sale of Food and Drugs Act, 1875, to suggest certain amendments in the Act and to the very satisfactory result of the interview at the House of Commons.

It was moved by Mr. Arblaster, seconded by Mr. Cross, and unanimously resolved :—"That the report of the Law Committee be received, adopted and entered on the minutes."

The report of the Finance Committee was then read. It included particulars of the general appeal to the trade for funds made by the Secretary in November last, the response to which was prompt and liberal, the sum of £800 having been received within one month from the date of its issue.

It was moved by Mr. Greaves, seconded by Mr. Mackenzie, and unanimously resolved :—"That the report of the Finance Committee be received, adopted and entered on the minutes."

The President inquired if the costs in the case of the Apothecaries' Company *v.* Shepperley had been received by the Association.

The Solicitor said that the taxed costs in that action had not yet been paid by the plaintiffs' agents.

Mr. Hampson said he had been given to understand that there were cases in which chemists and druggists had been sued by the Apothecaries' Company for alleged infringements of the Apothecaries Act, which had been tried in the County Courts, the judgment in which cases had been withheld pending the decision in Shepperley's case. He should be glad if the solicitor could tell him if judgment had been delivered in these cases.

The solicitor said that judgment had been withheld in only one case defended by the Association; this case was tried in the Birmingham County Court on July 2 and 3, 1877, and judgment would be delivered on the 13th inst. There were other cases awaiting decision, one or two in the north of England and one in Cornwall, with which he was acquainted, and there might be others the particulars of which were unknown to him.

The report of the Sub-Committee appointed by the Executive to consider the advisability of the Association publishing a quarterly or monthly report of the proceedings of the Association for circulation among the members was then read. The report stated that the Committee, having carefully considered the whole question, was of opinion that the issue of such a report was desirable, but at present inexpedient.

It was moved by Mr. Greaves, seconded by Mr. Barclay, and unanimously resolved :—"That the report of the Sub-Committee appointed to consider the advisability of publishing a quarterly or monthly report of the proceedings of the Association for circulation among the members be received, adopted and entered on the minutes."

The report of the Sub-Committee appointed to consider the advisability of the Association taking official action in the next election of the Pharmaceutical Council was then read.

The report stated that, after mature consideration, the Sub-Committee had decided that it was desirable that official action should be taken by the Association in the forthcoming election of the Pharmaceutical Council, by selecting from the list of persons nominated fourteen names for recommendation to the members of the Association who were constituents of the Pharmaceutical Society, or by such other means as the Executive may deem expedient.

On the motion of Mr. Holdsworth, seconded by Mr. Arblaster, the report was received and ordered to be entered on the minutes.

Mr. Cross said he rose to move :—"That the report of the Sub-Committee appointed to consider the advisability of the Association taking official action in the next election of the Pharmaceutical Council be adopted." As one of the members of the Sub-Committee who had framed the report, he would impress upon the Executive the fact that they had only considered the question from a general point of view. He contended that, by keeping an active eye on the election of the Pharmaceutical Council they were rendering most valuable assistance not merely to the general trade, but to the Pharmaceutical Society itself, for what could be more important to the constituents of that Society than that its Council should really reflect the feeling of its entire body—not merely a sectional representation, but one which should embrace the feeling of the Society as a whole? It had been said that country members did not know what was good for them—possibly they did not—nevertheless it was natural that they should require to possess that knowledge, and to do so they naturally felt that they should have an opportunity of representing their condition on the Council, from which they are bound by law to receive their instructions. He hardly thought that the constituents of the Society would much longer remain satisfied to receive their instructions from men who, however worthy they might be, represented on that Council exclusively one position, and one only, of their trading condition. He thought it desirable and consonant with the constitution of the Association that they should calmly and dispassionately consider the merits of candidates for the Council, and exercise their discretion in recommending to their members such as they deemed fittest to represent the trade as a body. Was it their duty to take official action in the matter? He said, yes; because their constituents expected it. Three out of four of them knew nothing of the views of the candidates who would seek their support at the next Council election. Ought the members of the Executive to affect the same ignorance? He thought not, if they did their duty. Did the constitution of the Pharmaceutical Council affect trade interests? If they answered in the affirmative, then, as guardians of trading interests, it was their duty to watch over the election of that body. Of course, he should not like to see useful members turned out of the Council; but such was not likely to be the case. The fact that there was at present no burning question was fortunate, inasmuch as the Association would not be biassed by any party feeling. He believed there was a difficulty in finding gentlemen who would best represent them, and if the Association could not find such gentlemen they could use their influence in obtaining the services of those gentlemen to whom they were indebted for services in time past.

Mr. Jervis seconded the adoption of the report.

Mr. Shaw expressed regret at the decision arrived at

by the Sub-Committee, and that a resolution proposing the adoption of its report had been moved and seconded. As one of the members of the Pharmaceutical Council who would have to appeal to the constituents of that Society for support at the next election, they would credit him with sincerity when he stated that he wished to be relieved of any official assistance that the Executive of the Trade Association could afford him. Simply asking their friends to support certain persons whose views and public character were generally known, was a very different matter from a number of gentlemen taking official action in the election of another society. The latter course would be extremely objectionable to those persons—to himself in particular—who occupied seats on the Council. The members should be left entirely free to select whom they chose, and he should consider it most improper for the Association to take official action. He regretted very much the motion had been brought forward, and thought such a course was at the present moment very inexpedient.

Mr. Hampson said the question was a very important one. His friend, Mr. Shaw, occupied a position on the Executive of both societies, and he (Mr. Hampson) was extremely anxious that both societies should live and prosper and do their specific work in a proper and advantageous manner; at the same time, if the Executive wanted to injure the Association, they would probably pass the resolution. By taking official action at the election they would arouse the opposition of some of the members, they would certainly lose a number of friends and create many enemies, though that would not matter if there were something imminent, something burning, pressing upon them for immediate attention and requiring immediate solution. He could quite understand that there might possibly be something in the future calling for immediate, prompt and powerful action, but such was certainly not required at that time, as the mover of the resolution told them there was no "burning question" before them; besides he felt sure that the Association was already doing good in the Council of the Pharmaceutical Society. The Association, he believed, was exercising a beneficial influence amongst the members of that Council. He hoped, nevertheless, that all new candidates would give them the benefit of an address, so that the constituents might know the views of those who offered themselves for election. There had often been a difficulty at election time, and he thought it the absolute duty of every one who offered himself for election to state his views. He hoped the Executive would ask for that specifically.

Mr. Mackenzie maintained that the Pharmaceutical Society, in ignoring the interests of the trade, had brought about the necessity of the Association taking official action. The Association, he thought, would not be true to the trade if they did not carry the resolution. There were gentlemen who represented their views on the Council, but they were in the minority and were overridden by the majority.

Mr. Greenish said his opinions had been previously expressed in that room. He thought there should be no interference in the formation of the Council, and especially at the present time, as there was no question of importance before the Council. If there were some great question it might be just possible that the trade should take some course. For a member of the Council to take official action would be placing that member in a very peculiar position. He could not sit on that Executive while the Association was trying to move some gentlemen off the Council of the Pharmaceutical Society. If the resolution were carried he should consider it his first duty to resign his official connection with the Association. About the issuing of addresses, he had always held addresses extremely cheap. He placed no reliance on them, and if they had no better means, let them go to the old way of taking the antecedents of the persons proposed. He seriously hoped that any official action on the part of the Association would be negatived.

Mr. Barclay said he had given a considerable amount of thought to the matter, as no doubt the whole of the members had done, and he could not see his way to support the resolution. So far as the success of candidates who would support trade interests at the next election was concerned, they need have no fear whatever but that the candidates of the right calibre would be elected. He thought the movement which the Association had made through the influence of Mr. Radley, at Bloomsbury Square, could not fail to have a beneficial effect. There had been such a shaking of dry bones that there was no fear whatever about the success of the right candidates if they came forward with the right programmes. He was very sorry Mr. Greenish objected to the issuing of an address.

Mr. Greenish: I don't object to that. I place no reliance on it.

Mr. Barclay, continuing, said he should be very sorry indeed if any candidate put forward an address on which reliance could not be placed. It was sometimes necessary to know the opinions of old members as well as new candidates on different questions, and for this reason it would surely be better for addresses to be issued. He was, however, convinced that the right men would come to the top without the Association taking official action.

Mr. Arblaster said he came to the meeting prepared to support the proposition of his friend Mr. Cross, as he had done in sub-committee, but after the remarks of Mr. Barclay he thought official action undesirable.

Mr. Greaves thought it would be inexpedient to adopt the report, though he should certainly have agreed to its presentation; at the same time he was of opinion that the Pharmaceutical Council would show their obstinacy to such an extent that the Association would be forced to take official action sooner or later. He was thoroughly in favour of election addresses.

Mr. Kerr said the members could use other than official action. He deprecated official action.

The President thought the passing of the resolution would do the Association mischief, as an idea would probably get abroad that the Association wished to coerce the Pharmaceutical Society.

Mr. Cross said he had obtained the permission of the seconder of the resolution to be allowed to withdraw it. He found that those in its favour were considerably overweighted and it would only be a waste of time to take a division, as they were in a hopeless minority.

Some considerable discussion then took place with regard to the Medical Bills before the Houses of Parliament, when it was moved by Mr. Southall, seconded by Mr. Churchill and unanimously resolved:—"That the officers of the Association, together with the London members of the Executive, be appointed a Sub-Committee for the purpose of watching the progress of the Medical Bills now before the Legislature, with power to take such action as they may deem necessary in regard to the same."

It was moved by Mr. Arblaster, seconded by Mr. Greaves and unanimously resolved:—"That the third Annual General Meeting of the Members of the Association be held in London on the day preceding the Annual General Meeting of the Phramaceutical Society."

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, March 6th, Dr. Gladstone, President, in the chair. After the announcement of visitors, confirmation of minutes, etc., the following certificates were read for the first time:—F. A. B. Jewson, T. H. Walker, W. E. Blythe. The list of officers proposed by the Council was then read from the chair.

The President then called on Mr. G. Attwood to read a paper on—

The Quantitative Blowpipe Assay of Mercury.—The author divides compounds to be assayed into three classes. Class A, containing metallic mercury, cinnabar, tiemannite, suboxide, protoxide, and mixed sulphide; class B, calomel, corrosive sublimate and iodide of mercury; class C, amalagams of gold, silver, copper, lead, zinc, tin, etc. Class A: Ten to twenty grains of the ore, finely powdered and passed through sieve, two-thousand holes to the linear inch, are mixed with five to ten times their weight of powdered litharge and distilled over a spirit lamp in a small glass retort one and a half inches long, and one quarter of an inch in diameter; to this retort is fitted by means of a cork a glass tube slightly curved, two and a half inches long, and six-tenths of an inch in diameter. The end of this tube dips under water contained in a small porcelain crucible. The operation lasts only a few minutes. The mercury is carefully collected from the glass tube and crucible, the retort is broken up and its contents carefully powdered and examined by a lens for mercury. The globules are then united by gently warming under water and the dry mercury weighed. Class B: A quantity of the finely powdered ore equal to ten grains is mixed with three times its volume of oxalate of potash and one volume of cyanide of potassium. The apparatus closely resembles that used in class A., but the retort has a small bulb. Class C: These amalgams are sometimes powdered with difficulty, and it is often advantageous to add a known weight of pure mercury so as to render them semifluid before distilling. Ten to thirty grains of the amalgam are usually taken for assaying. A turned steel retort is used for distillation, which is effected in a small charcoal furnace heated by the blowpipe flame; the stem of the retort is accurately ground to fit over the body. The retort including the cup and cap is one inch high, the neck of the cap is two inches long. The paper contains full size illustrations of the different retorts, etc., which are made by Casella. The author has had much experience and states that most accurate results can be obtained with the above apparatus.

The next paper was read by Mr. J. W. Thomas on—

Some Points in the Analysis of Combustible Gases and in the Construction of Apparatus.—In 1874 the author noticed that when a small quantity of marsh gas was mixed with about three times its volume of oxygen and rarefied until the pressure was one hundred and sixty mm. no explosion took place. Similarly, when mixed with twice its volume of oxygen under a pressure of one hundred and thirty mm., the sparks did not ignite the mixture, it soon became evident that the cooling effect of the walls of the eudiometer was the chief agent in modifying the force of the explosion. It was also noticed that the explosion of a gas to twice its volume lessened the force of the expansion to a greater extent than the addition of an equal volume of inert gas at the initial pressure. The author accordingly made estimations with marsh gas and hydrogen, using nearly the theoretical quantities of oxygen and a pressure of 160 to 170 mm., and found that perfectly accurate results were obtained, whilst the safety of the eudiometer tube was not in the least endangered. The author then proceeds to point out the errors which creep in when the long (800–900 mm.) eudiometer tube of Frankland and Ward's or McLeod's apparatus is used, and proves that the sensitiveness of the apparatus depends on the length of the pressure tube *above* the top of the eudiometer tube. With the old method of introducing a large excess of oxygen in order to moderate the violence of the explosion, this long eudiometer tube was necessary to contain the large quantity of gas introduced; on the other hand to lengthen the pressure tube would render it unwieldy from its great length, so that with the old method of introducing a large excess of oxygen the relative lengths of the pressure and eudiometer tubes must remain unaltered; but by employing the reduced tension method proposed by the author, and in which only the theoretical quantity of oxygen required has to be introduced, the necessity for such a long eudiometer tube is obviated. The author therefore has shortened the eudiometer tube to about 500 mm., retaining the original length of the pressure tube, and finds that the apparatus has gained in delicacy and is still sufficiently large for all substances. The next modification introduced by the author is the substitution of a steel block with a three way steel tap, for the glass taps connecting the barometer tube, eudiometer tube and pressure bottle. The tubes are fixed and held tight in the steel block by india rubber rings screwed down by means of steel collars. Flexibility and absolute tightness are thus secured. As regards the steel tap the author has had no difficulty in keeping it perfectly tight, the three ways are gouged out on the surface of the tap and are not bored. The use of the steel plates connecting the eudiometer and laboratory tubes has been abandoned and a hollow glass tap substituted, which is so bored that the tubes can be washed out. The mercury trough is made movable by an ingenious mechanical arrangement. The supply of water to keep the apparatus at a constant temperature is brought in by the top of the barometer tube; the exit is at the bottom, and a syphon arrangement is added to ensure a thorough mixing of the water round the top of the eudiometer tube. The little windlass has been modified so that it can be worked with one hand. In conclusion the author gives details as to the management of a gas analysis with the modified method and apparatus. A drawing of the latter accompanies the paper.

Professor Frankland complimented the author on the ingenuity displayed and the success achieved in his paper. At the first mention of the return to a use of the steel stopcock he must confess that he had almost shuddered. Twenty-five years ago, when glass stopcocks were a luxury, these steel taps constituted a never ending source of annoyance; after a week's work a leak almost always occurred which necessitated a prolonged and careful grinding. This might be due to the fact that the tap was made of cast iron and the plug was bored. The method of exploding gases with almost theoretical quantities of oxygen was a decided step in advance. The shortening of the eudiometer tube and the increased sensitiveness thereby attained seemed to him also most important improvements. He would like to ask Mr. Thomas how the bursting of the flexible tube connected with the pressure bottle was obviated. All plans that he had tried had ultimately failed (winding tape, tubing with canvas in it, etc.).

Dr. Wright suggested that the tubing should be coiled round with bell-wire.

Professor McLeod said that a plan which answered very well was to bind the tube with tape and cover that with sheet india-rubber to prevent contact of the tape with potash, etc. He had been much struck with the success with which Mr. Thomas had used the theoretical quantity of oxygen without fracturing the eudiometer. In the old apparatus the difficulty was not so much to keep the steel tap tight, as to make a tight cement joint between the block and the glass tubes.

Mr. Hart suggested that the india-rubber tubing should be wound with tape soaked in glue containing bichromate of potash. On subsequent exposure to light a compound was formed unattacked by acids and alkalies.

Dr. Armstrong had used a gas apparatus made after Mr. Thomas's model with great success. His stopcock was bored. The leakage of the old stopcocks might be due to corrosion by resin cerate; bullocks' fat was most suitable for lubrication (Professor Frankland stated that melted india-rubber was always used, not resin cerate, for the taps). He suggested that the mechanism employed by Mr. Thomas for shifting the mercury trough caused much vibration; he had used a small hydraulic lift. If the india-rubber tube were covered with double tape sewed longitudinally, no difficulty was experienced.

Mr. Thomas in reply pointed out that his steel tap was of a much larger size than the old one. In answer to Dr.

Armstrong no vibration was caused by the turning aside of the mercury trough.

The next paper was read by Mr. J. M. THOMSON—

On the Action of Isomorphous Salts in Exciting the Crystallization of Supersaturated Solutions of each other, and some Experiments on Supersaturated Solutions of Mixed Salts.—In this paper the author communicates the results of more than four hundred observations. The following are given as the general results to be deduced from the experiments. The results of Gernez* have been confirmed and extended, showing that truly isomorphous bodies act as exciting nuclei in inducing the crystallization of supersaturated solutions; that mere form alone does not render the body active to a supersaturated solution of a salt isomorphous with the nucleus; but that it is necessary for the nucleus to possess an identical chemical structure. Thus cubes of iron pyrites and octahedral crystals of magnetite are inactive to alum solution. In the case of solutions of mixtures, two series of results were experienced in the same solution. A. When the mixtures consists of two salts not isomorphous. 1. Sudden crystallization may commence, spreading, however, gradually, through the solution, on the addition of a nucleus, causing a deposition of the body belonging to the nucleus only. 2. That when sudden crystallization takes place, causing the deposition of both salts, there is a preponderance of the salt of the same nature as the nucleus. 3. That the nucleus may remain growing slowly in the solution, becoming increased by a deposition of the salt of the same nature as the nucleus. B. When a mixture consists of two isomorphous salts. 1. Sudden crystallization may occur giving a deposition of both salts apparently in the proportions in which they exist in solution. 2. That when slow crystallization takes place, the nucleus increases by a deposition of the least soluble salt; showing that in mixed supersaturated solutions, a gradation of phenomena may be experienced, passing from those shown in the crystallization of a true supersaturated solution to those shown in the crystallization of an ordinary saturated solution. The experiments were chiefly made as follows:—The saturated solution to be used as a nucleus was placed either in a bulb tube or a tube bent, at its lower end into a double U (as used by Liversidge). The solution was then boiled and the tube plugged with cotton wool. The supersaturated solution was introduced into a small flask. The tube with nucleus solution is plugged tightly into the neck of the flask, and the solution boiled. When cold the nucleus solution is caused to crystallize, and lowered so that at first the glass only touches the solution; this produced uniformly negative results, on bringing the crystals in contact by treating the bulb or lowering the U-tube, crystallization commenced if the nucleus was active. The author is continuing his experiments and promises a further communication on the subject. The substances already experimented with include magnesium sulphate $7H_2O$, to which zinc, nickel, cobalt, iron sulphates with $7H_2O$ are all active. Sodium sulphate with 10 or $5H_2O$ being inactive; sodium sulphate and seleniate 10 H_2O are active to sodium sulphate solution 10 H_2O. Chrome and iron potassium alums with 12 H_2O are active to the ordinary potash alum, etc.

The President remarked how various were the conclusions which had been arrived at, concerning the crystallization of supersaturated solutions by different experimenters. Mr. Thomson's researches had modified the difficulties which existed as to the theory that the cause was the ntroduction of a crystal of the same salt, by pointing out that a similar salt would also act as a nucleus; the method might prove an accurate means of determining whether two bodies of similar, were really of identical chemical composition or not.

Dr. Witt, in reply to a question put by Mr. Thomson, said that supersaturated solutions were of frequent occurrence in the salts of the aromatic substances, disulpho-derivatives of benzene, the acetates of the different rosanilins; he asked whether the phenomena of superfusion were included by Mr. Thomson in the same class as those of supersaturation.

Professor Hartley suggested that the crystallization of one salt out of a mixture, by introducing a nucleus active to it, but inactive to the other salts, might be very useful for separation on the manufacturing scale.

Mr. Grosjean said that Crace Calvert had thus crystallized carbolic acid from a mixture of that substance and cresolic acid.

Mr. Thomson did not think any strict line could be drawn between superfusion and supersaturation.

The Secretary then read a paper by Mr. WATSON SMITH—

On the Isomeric Dinaphthyls.—This communication is a continuation of the author's previous work. The immediate objects of the present investigation were, 1. to prepare a quantity of the $\alpha\alpha$ dinaphthyl, m. p. 154°, by Lossen's method, in order to compare it with the body previously obtained by the author in yellowish plates, m. p. 147°. 2. To examine the crude product obtained by Lossen to see if it contains, besides the $\alpha\alpha$ dinaphthyl, an appreciable quantity of the other two dinaphthyls. 3. To prepare sufficient quantities of the three isomers in a completely pure condition, and to determine their vapour densities. 4. To discover further reactions in which dinaphthyl is formed so as to find out, if possible so much about the conditions of its formation as would lead to a method of preparation more easily carried out, and giving a larger yield of product than the present method. 1. The author prepared the $\alpha\alpha$ dinaphthyl and found that it melted at 147°, but by further boiling with animal charcoal in petroleum spirit, colourless crystals were obtained, melting at 154–155°. 2. The $\beta\beta$ and the $\alpha\beta$ dinaphthyls could not be detected. 3. The pure substances were obtained, and their vapour densities determined by V. Meyer's new apparatus with great facility, a lead bath and nitrogen atmosphere were used. $\beta\beta$ dinaphthyl, m. p. 187°, v. d. 8·73; $\alpha\alpha$ m. p. 154°, v. d. 8·67; $\alpha\beta$, m. p. 76°, v. d. 8·78; calculated v. d. 8·77. In the fourth part, the author has investigated the action of carbon tetrachloride, chloroform, carbon disulphide, and bromonaphthalene, on naphthalene. He has further investigated the reactions which take place when a mixture of bromonaphthalene and naphthalene is passed over heated soda-lime, lime, ferric oxide, and silver.

The Society then adjourned to March 20, when the following papers will be read—1. On Perplumbic Ethide, by E. Frankland and A. Laurance; 2. On the Decomposition of Water by Certain Metalloids, by C. F. Cross and A. Higgin; 3. On the Volumetric Determination of Chromium, by W. J. Sole; 4. The Production of the Higher Oxides of Iron Chromium, Manganese, and Bismuth, by W. Foster.

* *Ann. Sci. de l'Ecole norm. sup.*, 1866.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, February 27, Mr. R. H. Parker occupying the chair.

The minutes of the last meeting were read and confirmed.

A paper on "Bismuth and its Oxides" was then read by Mr. J. Davies. The metal itself was first treated of, its occurrence in nature, its extraction from the ore, and its characteristic properties being described. The preparation of the nitrate and oxynitrate was next noticed, and the methods adopted to free them from metallic impurities. The oxides of bismuth then received special attention. Having referred to the suboxide Bi_2O_2 and the normal oxide Bi_2O_3, the author proceeded to describe in detail experiments he had performed for the preparation of the highest oxide Bi_2O_5. This is obtained by passing chlorine through a strong solution of caustic potash in

which bismuthous hydrate is suspended, or by boiling together with water chlorinated lime and oxynitrate of bismuth; the resulting insoluble matter being washed with acetic acid or dilute nitric acid, or both. Specimens of bismuth and its oxides were exhibited.

The Secretary then read a short note on the "Estimation of Bismuth," describing the usual method adopted for that purpose.

A short discussion followed the reading of the above, and a vote of thanks passed to the authors of the same brought the meeting to a close.

Parliamentary and Law Proceedings.

Offence against the Food and Drugs Act.

Robert Taylor, grocer, Carnforth, was charged with an offence against the Food and Drugs Act, 1875, on the 28th January, at Carnforth, in selling an article, to wit, castor oil pills, which was not of the nature and substance demanded. Defendant pleaded not guilty. Mr. Byrom, solicitor, Wigan, appeared to defend the case on behalf of Messrs. Bell and Sons, chemists and drysalters, Liverpool, the manufacturers of the pills, and Mr. Tilly watched the case on behalf of the Lancaster Co-operative Society, the defendant being the manager of their Carnforth branch.

Superintendent Moss (having been sworn) said, I am inspector of weights and measures under the authority of the county. On the 28th January I went to the Co-operative shop, Carnforth, of which the defendant is manager. I asked him if he sold castor oil pills, and he replied, "Yes; I have plenty." I asked him to let me have a box. He supplied me with a box, containing a quantity of pills, which was wrapped in a paper on which was printed "Compound Castor Oil Pills." The paper produced is the same. I asked him how much I had to pay, and he replied "One penny." After paying him, I told him I had bought the pills for the purpose of sending them to Dr. Campbell Brown, the county analyst. I offered to divide the pills into three parts, and give him one-third, but he said he did not require any of them as he had plenty more. I made the pills into a parcel, numbered it 131, and signed and dated it. On the 30th January I sent the pills to Dr. Campbell Brown, Liverpool, by police-constable Johnson. On the 15th February I received the analyst's certificate, which I put in. The certificate is as follows:—"I am of opinion that the said sample is made up entirely of the following foreign ingredients: Rhubarb, aloes, ginger, some kind of pepper, probably cayenne, soap, saccharine matter, resinous matter, and that they contain no castor oil."

Mr. Byrom said it was a case in which it would be necessary that the analyst should be present in order that he might have the opportunity of cross-examining him. As they were aware in pills of that character, which contained no mineral substances, being composed principally of aromatic compounds, the analysis of them was one of the most difficult subjects of any in chemistry, being known under the name of organic chemistry.

The Chairman (interrupting) asked Mr. Byrom if he was going to prove that the pills contained castor oil?

Mr. Byrom said it was his case to prove it. He was merely pointing out the difficulty under which the analysis would have to be made in order to ask for an adjournment to a more convenient day. It was a case in which he would like to bring their own analyst.

The Chairman: But if we adjourn the case are you prepared to pay the expenses of the analyst?

Mr. Byrom: Certainly, if the decision is against us.

Mr. Dawson: When these pills were taken Mr. Moss offered to divide them and give defendant one-third, but he refused. How are you going to obtain any for analysis for your own analyst?

Mr. Byrom: Oh, we will take a similar box.

Mr. Dawson: No, no, that will not do.

Mr. Byrom: Will you take another box then, and divide it?

Mr. Dawson: No, no other box can be put in, because we don't know that the pills in it are made of the same material.

Mr. Byrom: I think I shall be able to prove that all the boxes defendant had were composed of the same thing.

Mr. Dawson: But how can you prove that?

Mr. Byrom: Well, sir, I think I can; but that is my case.

Mr. Garnett: We will not be satisfied unless they are the identical pills.

Mr. Byrom: Then I will ask the superintendent if he has any left. Perhaps if he has he will let me have some.

Mr. Moss said he could not do so. He had some left, because whenever anything was sent up for analysis a portion of it was always returned intact. In case the seller of the article was dissatisfied with the analysis of the county analyst, then if requested, the remaining portion could be sent up to Somerset House, London, to be analysed by the proper authorities there. That was the only condition on which he could part with the remaining portion of the pills now in his hands.

Mr. Byrom said no doubt it was a mistake on the part of defendant that he did not have them properly divided at the time, but of course they could not help that now.

Mr. Garnett said they had the certificate of Dr. Campbell Brown, the county analyst, and if defendant was not satisfied with that, they must have them analysed in a proper way and as suggested by Superintendent Moss. If another analysis was required it had better be done by an independent person altogether.

Mr. Byrom asked the Bench if they would take another box.

Mr. Dawson said they might have a box of pills supplied that had castor oil in them.

Mr. Byrom said they would take it out of the same lot.

Mr. Garnett said they would stand by Dr. Brown's analysis till it was upset.

It was then decided—in order to suit the convenience of Mr. Byrom—to adjourn the case to that day fortnight.

Alleged Adulteration of Annatto.

At the Northwich Petty Sessions, on Tuesday, Feb. 2, before Mr. C. Kay (in the chair), Rev. J. Royds, Mr. H. Neumann, and Mr. G. G. Macrae, John Clough, druggist, High Street, Northwich, was summoned for that he did, on the 3rd of January last, unlawfully sell to one Benjamin Cooper, and to his prejudice, a certain drug, purporting to be brown annatto, which was not of the nature, substance, and quality of the article demanded. Mr. A. Fletcher defended.

Superintendent Cooper said that on the 3rd January he visited Mr. Clough's shop, and purchased three ounces of brown annatto. He asked Mr. Clough if he wished to have it divided as he was going to submit it to a public analyst, and he replied that it was not necessary, as he had some by him. He sealed it up in his presence, and on the 8th January he forwarded it to the public analyst.

By Mr. Fletcher: I asked for annatto, and he wanted to know which sort I required. I inquired how many sorts there were, and he said there were three. I obtained a sample of each sort—brown flag annatto, black flag annatto, and some in a bottle, I stated that I was going to have it analysed by a public analyst. I asked Mr. Clough if he wished to keep a sample, and he said he had plenty more of it.—Now, will you tell us how you came to fix upon annatto as a subject for analysis? Do you know anybody who takes it as a physic? No; I have heard that it is used for colouring cheese.—For colouring cheese? That is what I have heard, I don't say that it

is so.—Have you ever heard of anybody using it for any other purpose? No; I cannot say that I have. You bought it for analysis—you did not buy it for use? I did not buy it for use.—Simply for analytical purposes? That is all, sir.—Have you been in any way prejudiced by the sale of it? I have paid for what I did not get.—But you have got a case out of it, haven't you? It does not matter about the case.—You get the benefit of the case, and I get the work.

Mr. J. Carter Bell, of Manchester, public analyst for the county of Chester, stated that he received a sample of brown annatto from Superintendent Cooper on the 8th January. He analysed the sample, and found it was adulterated with upwards of 40 per cent. of mineral matter, consisting chiefly of lime, iron and alumina, etc.

Cross-examined by Mr. Fletcher: Annatto is made from a certain seed which comes from South America, the West Indies, Brazil and Cayenne. I believe it comes in a pasty mass. It has never fallen to my lot to analyse one of the pasty masses as it originally came.—Then I may take it that you have never analysed annatto in its crude state? Not just as it comes over; but I know from study what the composition of annatto ought to be.—Will you tell us what you should expect to find in a sample of annatto? I should expect to find about 20 or 30 per cent., or more, of colouring matter; I could not now speak to the exact amount. I should not expect to find any mineral constituents.—And I take it that you would expect to find organic matter and nothing else in a sample? With the exception of the ash, which naturally belorgs to the sample, and which ought to be from 1 to perhaps 5 per cent.—Then, it is all organic, except from 1 to 5 per cent. That is allowing for accidental impurities.—What sort of impurities would you expect to find? I am speaking of mineral impurities.—Will you tell us, what the particulars of your analysis of this sample are? I want to know first of all how much organic matter you found? I should think about 40 per cent. of organic matter or perhaps a little more.—What other element did you find? The rest consisted chiefly of mineral matter.

Mr. Neumann: Do you mean by organic matter, vegetable matter?

Witness: Yes. Mr. Fletcher was pressing the analyst to give the exact proportions of the mineral elements; but the latter objected to the question, saying that he was not expected to give such information. What he had to say was that the substance was adulterated with upwards of 40 per cent. of mineral matter.

The Chairman said the witness could hardly be expected to give the particulars demanded by Mr. Fletcher; and—

Mr. Cheshire observed that the question was, whether the sample was adulterated or not.

Mr. Bell, on being further cross-examined, said that it would take a fortnight to find out everything that Mr. Fletcher wanted. He did not agree with Professor Redwood that annatto required the addition of another constituent to prevent it from becoming putrescent. Nor did he agree with the Professor's statement that "much of the annatto, as imported into this country, is in such an imperfectly inspissated state that it cannot be kept for many months without undergoing decomposition, often becoming filled with maggots, and rendered wholly unfit for use." His opinion as a chemist was that annatto required no addition of any description to prevent decomposition.—Now, Mr. Bell, can you tell me what annatto is used for? Yes; it is largely used, I believe, for colouring cheese and butter, and sometimes it is put in milk.—Have you had any experience which would lead you to know whether this annatto, in the form submitted to you for analysis, is used for colouring cheese or butter? I cannot say that I have.—Don't you know that annatto in the form of powder is not used in this county for colouring cheese or butter? I really don't know what they put in the cheese in this county.

Mr. Cheshire said it was not a question of what was done in that county alone.

Mr. Fletcher: My point is, that it is neither food nor a drug. He says it is used in cheese, and I ask him whether he does not know that in this form it is never used for cheese or butter.

Witness: From my own studies I know it is used for cheese and milk, but not from my own experience.—You know nothing of it, in point of fact, except what you have gathered from books? Exactly.—And you don't know the form or mode of its application? I know in what form I should use it. I know it is soluble.—In that case it would simply be used as a colouring matter. It would.—In point of fact, it is simply a dye? Well, if you like to put it so.—Is it a drug? It is a difficult thing to define. I call it an article of food myself.

Mr. Neumann: Is it used as a medicine?

Witness: I am not aware that it is.

Mr. Fletcher: It is not, sir; and that is one of the points of my case. (To witness): Is it in any pharmacopœia that has come under your notice? No.—Not in any authorized pharmacopœia? No.—Not as a drug? No.—You say it is more likely to be an article of food? That is what I define it is.—Did you suggest that these samples of annatto should be collected? I dare say I did; I saw going about large quantities of annatto, and of course it was my duty, if I thought it was adulterated, to suggest that samples should be taken.—Well, now, you say that it is only used, so far as you can gather, for colouring cheese or butter? It is used for dyeing also.—Would you pronounce it an adulteration to put it in cheese? That is another opinion.—Well, I want your opinion. If there was an addition of a large quantity of it to cheese I should pronounce it an adulteration.—So that the very use of it as an article of food constitutes adulteration? If you look at the Act you will find it is allowed to slightly colour things for sale.—Do you mean to say that there is not something necessarily added to this annatto to make it strike as a dye? We are not on the subject of dyes, please.

The Chairman thought it would be better if they kept to the analysis of the sample in question.

Mr. Cheshire remarked that the Act stated that it was an offence to sell to the prejudice of the purchaser any article of food, or any drug, that was not of the nature, substance and quality of that article demanded.

Mr. Fletcher submitted that this article was a dye, and was not adulterated with anything except what was necessary to make it strike its colour, and he therefore contended that he was entitled to put questions to the analyst upon that point. Of course, if it was not used as a drug there could be no case made out upon the summons.

Mr. Bell, in answer to the superintendent, said the article he analysed was not by any means pure annatto.

Mr. Neumann: Have you analysed other samples of annatto?

Witness: Yes, sir; at the same time I examined two more.

Mr. Neumann: Do you invariably find that there is a large mixture—as much as 40 per cent?

Witness: No: I have got one that only returns 25 per cent.

Mr. Neumann: I presume there is always some, but that this is an excessive quantity?

Witness: Very excessive, sir.

Mr. Kay: There is always more or less earthy matter in this article, but that you would include in the 10 per cent.?

Witness: If I were to speak correctly I ought to call it nearly 60 per cent., but I allow for accidental impurities.

Mr. Neumann: If you went into a shop to buy annatto, you would not expect to get a mixture?

Witness: I should not, sir.

Mr. Cheshire: Was this article sent to you of the nature, substance, and quality of annatto?

Witness: No it was not.

Mr. Fletcher said he would now direct the attention of the Bench to certain points which ought to result in the dismissal of the case. The first point was this: That according to the evidence of the last witness annatto was neither an article of food nor a drug, and consequently it did not come within the provisions of the Act of Parliament. Neither Mr. Bell nor Mr. Cooper said that annatto was used as food for man or beast, and they could not show it was a medicine for either internal or external use. The summons distinctly called it "a certain drug," and to those words the prosecution was bound; but their own witness stated that it was not in any pharmacopœia, and that it could not by any possibility be styled a drug; and medical gentlemen would tell him that it was never used for medicinal purposes. He was at a loss to know why a prosecution should be instituted for such an article as annatto. Mr. Clough had been in business many years, and he would tell them that annatto was only used for colouring purposes in a liquid form, and that the article which had been analysed was annatto peculiarly used for dyeing purposes, and for dyeing purposes only; he would also tell them that he had had a pound of it in stock since April, 1878, and during the whole of that period he had sold an ounce and a half, the purchaser being Mr. Mathews, saddler, who used it for the purpose of dyeing his leather.

The Chairman asked Mr. Fletcher if he could say whether or not annatto was used in that form for cheese-making.

Mr. Fletcher: Not now; it was used many years ago.

The Chairman: Is it used in any other parts of the country in the form in which it has now been analysed?

Mr. Fletcher: That would be impossible for us to state positively. All we know is that we never sell it in that form. What we sell is Fullwood's butter-colouring, and that is in a liquid form.

Mr. Neumann: It is not a drug, but if it were used in the making of cheese it might be called an article of food.

Mr. Fletcher: It would not be an article of food then. It is only used by way of adulteration to colour it. The prosecution have the option of laying it as a drug or an article of food; they have laid it as a drug, but it has been shown that it is not a drug, and on that ground I say the case must be dismissed.

Mr. Cheshire expressed the opinion that it had not been proved that the annatto was either an article of food or a drug.

The Bench then dismissed the case.—*Northwich and Knutsford Guardian.*

Prosecutions under the Pharmacy Act.

At Lincoln City Police Court, on Thursday, Feb. 27, George Rumble, chemist, carrying on business in High Street, Lincoln, was fined £9, including costs, for selling an arsenical compound without entering the same in the poison book required by the Pharmacy Act to be kept by him for that purpose.

The Kesteven bench of magistrates, before whom a charge of poisoning horses came some time since, directed the prosecution.

At Denton, James Morgan, farrier, was last week charged with selling one ounce of laudanum to a person, on the 8th of February, without the word "Poison" being attached to the bottle.

The defendant pleaded guilty.

Police-constable Pashley said about half-past nine on the evening in question he saw a woman named Tryner go to defendant's house, and when she came away witness asked her if she had been for laudanum, and the woman said she had, and paid four pence for that contained in the bottle. Witness went to the defendant's house, and both defendant and his daughter denied selling any laudanum or having seen the bottle. Witness thereupon called in the woman who had purchased it to substantiate what he had said.

Defendant, in reply, said he was in another part of the house when the woman was supplied with the laudanum, and was not aware of the fact. He had at times inquiries for different things, and did not know he was doing wrong in allowing them to be sold to accommodate neighbours.

The magistrates fined defendant 15*s.*, and 19*s.* expenses.

Poisoning by Spirit of Camphor.

An inquest has been held at Liverpool, before Mr. Clarke Aspinall, Borough Coroner, on the body of Harry Glendinning, aged 37. The deceased had recently been suffering from a cold, for which he sometimes took spirit of camphor. On Friday afternoon a lady in the market, to whom he had given some drops of the camphor on sugar, remarked to him that she would take no more as it was so hot. He laughed at her, remarking that it would do her good, and then drank a quantity of the spirit himself. A short time afterwards he was attacked with vomiting. He was taken in a cab to the Camden Hotel, where he died on Saturday evening. Verdict, "Died from the effects of an overdose of camphor taken by himself in the belief that it was not poisonous."—*Liverpool Mercury.*

Suicide of a Surgeon.

An inquest has been held at Millom touching the death of Mr. James Spence Spark, surgeon, of that town. It appeared from the evidence that the deceased, whilst under the influence of liquor, had drunk a mixture containing a preparation of opium and strychnine. The jury returned a verdict "that deceased committed suicide whilst in an unsound state of mind.

Obituary

Notice has been received of the death of the following:—

At Bombay, on the 25th of December, 1878, Mr. George B. Thomson, of the firm of Thomson and Taylor, chemists, etc., Bombay. Aged 38 years. Formerly of Edinburgh and Glasgow.

On the 23rd of January, 1879, Mr. Thomas James Turton, Chemist and Druggist, Howden, Yorkshire. Aged 65 years.

On the 26th of January, 1879, Mr. Emil Reichardt, Chemist and Druggist, 336, Oxford Street, London. Aged 53 years.

On the 29th of January, 1879, Mr. George Tithering-ton, Chemist and Druggist, Canning Street, Liverpool. Aged 37 years.

On the 3rd of February, 1879, Mr. William Benjamin Quarrington, Chemist and Druggist, Chapel Row, Bath. Aged 40 years.

On the 4th of February, 1879, Mr. Thomas Evans, Chemist and Druggist, Fishguard, Pembrokeshire. Aged 69 years.

On the 4th of February, 1879, Mr. John Boast, Chemist and Druggist, Kirkgate, Bradford. Aged 45 years.

On the 8th of February, 1879, Mr. James Brown, Pharmaceutical Chemist, Aldgate, London. Aged 68 years. Mr. Brown had been a Member of the Pharmaceutical Society since 1842.

On the 10th of February, 1879, Mr. Edward Farrar Schofield, Chemist and Druggist, Loughborough. Aged 52 years.

On the 11th of February, 1879, Mr. James Barrington Beech, Chemist and Druggist, Wharton, Cheshire. Aged 44 years.

On the 31st of January, 1879, Mr. Ashby Brackstone Fletcher, Chemist and Druggist, Totton, near Southampton. Aged 30 years. Mr. Fletcher had been an Associate of the Society since 1869.

On the 14th of February, 1879, Mr. William Towler, Chemist and Druggist, Bedford, Leigh, Lancs. Aged 51 years.

On the 16th of February, 1879, Mr. Richard Barber Ward, Chemist and Druggist, Dodworth Road, Barnsley. Aged 67 years.

On the 16th of February, 1879, Mr. Robert Gill, Chemist and Druggist, Fore Street, Totnes. Aged 72 years.

On the 16th of February, 1879, Mr. Robert Dodds Johnson, Chemist and Druggist, Camberwell New Road. Aged 42 years.

On the 17th of February, 1879, Mr. William Henry Ryder, Chemist and Druggist, Newhall Street, Birmingham. Aged 73 years. Mr. Ryder was one of the Associates of the Pharmaceutical Society admitted before 1842.

On the 22nd of February, 1879, Mr. John Paterson, Chemist and Druggist, Buchanan Street, Glasgow. Aged 36 years.

On the 2nd of March, 1879, Mr. Thomas Martin, Pharmaceutical Chemist, Quadrant, Liverpool. Aged 53 years. Mr. Martin had been a Member of the Pharmaceutical Society since 1871.

On the 3rd of March, 1879, Mr. James Shepherd, Chemist and Druggist, Oldham. Aged 74 years.

On the 4th of March, 1879, Mr. Matthew Darlington, Chemist and Druggist, Stretford Road, Manchester. Aged 38 years.

On the 8th of March, 1879, Mr. John Francis Boyle, Chemist and Druggist, Great Howard Street, Liverpool. Aged 38 years.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

Appeal for Votes for the Masonic Institution for Girls.

Sir,—The Council at the last meeting voted thirty guineas to be placed in my hands for the purpose of assisting to secure the admission of Katharine Annie Peele into the Masonic Institution for Girls at the next election. The father was a member of the Pharmaceutical Society, and died at the early age of 28, leaving a widow and four orphan children. Great exertions, I find, must be used in order to obtain a sufficient number of votes to ensure success, and as the candidate is nearly eleven years old this is her last chance. I therefore make this appeal to those of our members who may have votes, or sufficient interest amongst their friends to obtain them, to do what they can to assist by sending proxies to me. I shall be happy to send a printed statement of the case to any one desirous of further particulars. Proxies for the Boys' School can be made equally available by exchange.

372, *Oxford Street, W., Feb.* 11, 1879. J. Robbins.

Chemists and Druggists' Trade Association and the Election of Council of the Pharmaceutical Society.

The following has been sent to us for publication:—

"My dear Sir,—I have received your summons to a meeting of the Sub-Committee 'appointed to consider the advisability of the Association taking official action in the next election of the Pharmaceutical Council.' I beg to decline to act on the Sub-Committee, and must request you to remove my name from its members. It was with much surprise that I saw the announcement of the appointment of the Committee.

"As the matter has been made public, there can be no objection to my referring to what took place in the Executive Committee, so far back as February 1878. When the subject was brought up in relation to the coming election of that year, I expressed my opinions fully, taking the ground of expediency alone, and from this stand-point I decidedly deprecated any interference. The Executive Committee adopted this view, and the matter dropped. You are aware that in my individual capacity of an elector of the Pharmaceutical Society, and in conjunction with others holding similar opinions, I took such action as had a material effect upon the election of May, 1878.

"Without denying the possibility of an unforeseen position in which the Council of the Pharmaceutical Society might make a blunder, as grievous as it did on the Poisons Regulation question, and that this might justify extraordinary means for obtaining an expression of opinion, I am certain that the habitual interference of another society in the elections of the Pharmaceutical Society would not be tolerated, and that the society seeking to interfere at a time when no burning question could be adduced in its justification would be condemned by public opinion. I can quite suppose that no judgment was intended on the question referred to the Sub-Committee. At the same time the public announcement of its appointment seems to me to be as wanting in propriety as the act would be in loyalty were any society to appoint a committee to consider whether a republican government ought to displace our monarchical system. A *primâ facie* case is assumed when executive bodies refer questions to committees.

"I believe that the necessity for maintaining the Trade Association has not diminished, and this conviction is an additional reason why I should act in as direct and open a manner as I have always endeavoured to do when dealing with the older Society.

"I am, yours faithfully,
"Richard Reynolds.

"*W. F. Haydon, Esq., Secretary,*
"*Chemists and Druggists' Trade Association.*"

Toryism in an Unexpected Quarter.

Sir,—The "Unexpected" is what has happened of late years in the political world; is it to be so now in the world of pharmacy?

My esteemed colleague, Mr. Hampson, is reported in Saturday's Journal to have said in last week's meeting of Council, and I accept the report as a correct one:—"He knew from various matters which had dropped occasionally from him, that Mr. Frazer objected to all legislation with respect to pharmacy; that being so he could not understand how it was that Mr. Frazer accepted a seat at the Council." In connection with this allow me to quote from a speech delivered by Mr. Barclay, of Birmingham, in Manchester, in December, 1876, and reported in the *Pharmaceutical Journal* of 13th January, 1877:—"Mr. Frazer said that 'these troubles of druggists only began when we got tied neck and heel by the Act of 1868.' That," continued Mr. Barclay, "was strange language for a gentleman to use who was a member of the Council charged by Government to administer the Act; his place, one would think, should be outside endeavouring to obtain its repeal."

The fallacious character of this argument, as it seemed to me, was so transparent that I did not think it necessary to reply to it when it was first uttered by Mr. Barclay, but now that it has been repeated by one whose opinions, on whatever questions they are expressed, have ever commanded my utmost respect, I feel I can no longer remain silent on the subject.

I do not, let me say, object to "all legislation with respect to pharmacy," although since I have seen the evils introduced into our business by the carrying out of the Act of 1868 into actual practice, I have not hesitated to say, as occasion offered, that could we druggists retrace our steps in the matter, it would be in our true interests to do so. I, so far as I have mastered them, or observed their operation, approve of all the permissive legislation enacted prior to 1868, and believe that it is to the operation of these laws that is mainly due the great advance made in pharmacy as a trade, or, as some will have it, as a profession, since their introduction by Jacob Bell, and the other founders of the Pharmaceutical Society. I am of the opinion that had pharmacists been content to advance along the grooves that led up to the Act of 1868, they would have taken quite as

high a position socially, and been quite as much respected by "the public," as they are under the present compulsory Act. The affixes, "R.A.," "F.G.S.," "F.C.S.," etc., as voluntarily voted by their respective societies, bear, as I believe, a higher value in public estimation than had they been won by the stiffest examination through which their holders could have been put.

But regarding the question raised by Mr. Hampson as to my being inside, and not outside, the Council. To whose action was my presence at the table of the Council originally due? My belief has always been that it was largely due to that of my friend Mr. Hampson himself. He and Messrs. Woolley, Betty, and myself, as well as others not now in the Council, were carried into the Council some eight years ago, not because we approved, but because we were supposed to disapprove of a certain act then proposed by the Council of that time,—such, at least, is my recollection of what occurred in the pharmaceutical world in 1871. Further, had slaveholders had the power, they would have kept Wilberforce and such men out of Parliament, and slaves might still have existed in our colonies. If the Tories had had their wish, the great heroes who carried the Reform Bill of 1832 would also have been "outside" Parliament—as would Cobden, Bright, Sir Robert Peel, and Gladstone, had the opponents of Free Trade, of the disestablishment of the Irish Church, of abolition of purchase in the army, only been strong enough to keep those and crowds of other reformers out in the cold.

No, no, my friends, it is only *inside* of Parliament that real work in the interest of the nation can be effected in a *constitutional* manner. The country demanded that all these measures should be carried, and so it sent our Wilberforces, our Cobdens, our Brights, our Peels, and our Gladstones *inside* the House of Commons, and thereby these and scores of like measures were carried, and they are now bearing fruit, each of their kind, by which the nation continues to be largely benefited. So it is in our own lesser field. If there is real work to be done in the interests of pharmacy, it must be done inside, not outside the Council. When our constituents want a change of representatives, they have but to act on the advice I gave to the Trade Association, in November, 1876, when I wrote:—"A more popularly elected body never sat. You can change the face of the Council every year by turning out fourteen of the old, and by voting in fourteen new men, if you but so will it,—the law is at your back here, though it won't help you in all the directions some would seek its aid in."

But it may be asked by others as well as by Messrs. Barclay and Hampson, on what principle do I maintain my seat at the Council table? I went there, in the first instance, mainly to *restrain* the Council of the day from carrying into law further *restrictive* measures in connection with pharmacy. It was on the occasion of my first taking my seat in the Council that the *first* vote—July 1871 (?)—was carried against further action in regard to the famous "Poisons Regulation Bill."* From that day till the present hour, my votes and speeches have, I believe, been invariably used against all further restrictive measures, and in favour of removing or of lessening the oppression of existing ones; in short, I have sought to act in the pharmaceutical arena exactly as I have ever sought to do in political, ecclesiastical, and trade matters. I want all these interests to be free from "State patronage," and so also from its concomitant, "State control," believing, as I do, that it would be conducive to all their interests to be self rather than State-governed, but always within the well-recognized lines of our very noble Constitution. At the same time, I believe it will be acknowledged by my colleagues that I have never shrunk from taking my part in any action instituted by the Council to enforce the *existing* laws of our Society. I did vote against taking action in the law courts against co-operative stores, but I did so because I did not consider that the Council, as custodier of the Society's funds, was warranted to do so in opposition to the opinion of three leading counsel; but I also told Mr. Jones, its chairman, and other representatives of the Trade Association, that if they obtained an opposite opinion from other counsel than that obtained by the Pharmaceutical Society from theirs, that I, for one at least, would support a motion in our Council for raising an action against the stores.*

Perhaps, after all, the best vindication I can give for venturing to retain my seat at the Council table, so long as I am returned to it by the members of the Society, will be here to refer to my action there last week. I advocated the admission of women into the Society, because I believe that if they are able to pass the examinations now necessary to qualify for keeping "open shop," they possess all the other qualities necessary for their doing so. I further think that in this land of liberty it is tyranny on men's part to seek to hinder women entering on an honourable employment by which to earn a respectable livelihood.

I opposed the leading clauses in the proposed Pharmacy Amendments Act, because I object on principle to our forging chains to wrap round the limbs of others, at present, as I believe they are, exempt from them; and because I am of the opinion that we will most certainly fail in our attempts to do so, and that we will only aggravate the evils we seek to cure, and all this after incurring very considerable law and Parliamentary expenses. In my speech, November, 1876, I say—"If either society" (Pharmaceutical Society and Trade Association) "or both of them together, seek to advance our trade interests at the expense of those of the general public, ours will go to the wall, and those of the public will be preserved, and that by any government that may be approached on the subject."

Next, I voted with much cordiality for Mr. Gostling's motion,† because it is not only my duty as a councillor, but because it is my whole desire to give full effect to the constitution under which we act. This is just what I have done as a County Justice of Peace for about a quarter of a century. In sitting in judgment upon cases of poaching, though I do not at all approve of our existing game-laws, my aim was to enforce those laws as they stand against those who transgressed them.

Finally I spoke, vainly, but strongly, against a further restriction being put upon the character of the Preliminary Examinations. I did so first on the merits, because these examinations are, as I think, already sufficiently stringent; but I further opposed the addition as having been made by the Board of Examiners, and acted upon by the College of Preceptors, before obtaining the sanction of the Council. They had infringed our bye-laws on the subject, and then came to the Council for a vote of indemnity. That I don't like, and never have liked—and so I spoke against it.

In conclusion, a word of explanation as to what, on the surface, looks like an unexpected opposition by three present—and by one absent member of Council—to Mr. Hampson's motion. The whole discussion on the Pharmacy Amendments Act took place in Committee, and so was not reported. Had it been duly reported the whole country, as well as the editor of the *Chemist and Druggist* (who, among many others, was misled by the report), would have known that the Council was not unanimous, as the report of the proceedings bears. That in the present case, merely means that being in a hopeless minority, the members in question did not again divide the Council by a useless vote. It is, I think, to be regretted that they did not. I, for one, will in future be much less ready than I have been in the past to enter into Committee.

Glasgow, March 11, 1879. DANIEL FRAZER.

ADMISSION OF WOMEN TO THE SOCIETY.

Sir,—Following in the wake of parliamentary action the subject of woman's suffrages has once more briefly occupied the attention of our representatives at Bloomsbury Square, the gauntlet having been thrown down at the last meeting of Council by Mr. Robbins in a proposition to issue at the next election of Council a semi-official extra voting paper to the members, by which they were to record their opinions in reference to this question. Having had some little experience in this mode of canvassing our members upon a question of far more importance,—I refer to the "Poisons Regulation Bill,"—my decided opinion is that it is unsatisfactory

---

* I write entirely from memory, but feel sure the facts are correctly stated.

* Such an action is, I believe, going on at the present moment.

† "That the Pharmacy Act of 1868 be so far amended as to render it penal for any person to use any name, title, or description, implying that he is a registered chemist and druggist, unless he has been duly registered under that Act.'

in the extreme, and that the Council has acted wisely in rejecting it.

The President most fully expressed, I believe, the sentiments of most of our members who take an interest in the affairs of the Society, when he said that "he should be glad to see this lady question settled amicably and reasonably," but when he added a desire that it should be kept "out of the discussions at the general meeting, because it occupied time which might be better employed," I cannot help thinking he failed in that wisdom and judgment he is wont to exhibit. How the settlement of such questions is to be brought about without the intervention of the general meetings, which are the recognized mediums of communication between the Council and the members I know not. It is to the voice of those meetings, and to the embodiment of that voice in the Council elected thereat, that the members have a right to look for the settlement of all such questions. In order, however, that that voice should be the real exponent of the feelings of the Society, it is self-evident that two important and constitutional steps must previously be taken. In the first place, proper means must be used to nominate, and if possible, to secure the election of proper representatives upon the Council; and secondly, to secure the attendance of suitable representatives from every town at the general meeting, to support by argument or vote the views of their respective towns. By such means alone, so far as I can judge, are such questions satisfactorily to be solved, the meeting itself being, as far as possible, a representative body.

It is of course a truism that even such decisions must fail to give satisfaction to all, but we might hope and justly expect that under such circumstances the minority would, at least for some considerable time, bow to the decision then deliberately recorded.

Allow me to add that the subject having been thus prominently brought forward by the Council it must of necessity occupy the attention of the next annual meeting, and having moved the amendment to my friend Mr. Wade's resolution last year, I purpose at the forthcoming meeting moving a resolution adverse to the admission of ladies as members of the Pharmaceutical Society, the exact terms of which will be duly made known, the issue of which I hope may be so distinct that the question may henceforward be allowed to rest for some time to come.

EDWIN B. VIZER.

Belgrave House, Cliftonville, Brighton.

THE OXIDATION OF ESSENTIAL OILS.

Sir,—I observe that at a meeting of the Pharmaceutical Society on the 5th inst. some discussion took place upon the subject of the oxidation of essential oils, etc., on which occasion Mr. Robbins stated his belief that to Schönbein must be accorded the credit of having demonstrated the formation of peroxide of hydrogen by the action of oxygen upon turpentine.

Will you allow me to refer Mr. Robbins to the *Journal of the Chemical Society* for June, 1874, wherein I have given a *résumé* of all previous researches upon this question, and he will then find that Schönbein could arrive at no definite result at all but assumed the formation of ozone and ant-ozone, which latter body was regarded as something distinct from peroxide of hydrogen. The truth is, sir, that this vexed question received its solution at my hands, and it is surprising to me that Mr. Robbins should be unacquainted with this fact seeing that all my researches relevant to the inquiry have been reprinted in the *Pharmaceutical Journal* from time to time.

Then again, although Dr. Day may have worked upon the subject even longer than myself, it cannot be maintained that his experiments were sufficiently precise to enable him or anybody else to form a definite opinion as to whether turpentine and such-like bodies give rise by oxidation to peroxide of hydrogen. He may have believed the substance to have been peroxide of hydrogen, but his tests did not preclude the possibility of the reactions being due to other substances. I gave the proof which was wanted, and isolated the peroxide of hydrogen.

Further, it is not correct to say that benzene and fatty oils give rise to peroxide of hydrogen by atmospheric oxidation; if they do, the credit of the discovery is due to Dr. Day, and it is one which I gladly leave in his hands.

C. T. KINGZETT.

MALT EXTRACT.

Sir,—In the discussion of Messrs. Dunstan and Dimmock's paper last evening, there was one point in the action of malt extract that was not plainly shown. Mr. Moss was quite right in regarding the action of the extract as of no value if it required seventeen parts for the digestion of one part of starch, as the authors stated; but though that might be the quantity required for pure starch, it must be remembered that the first action of malt or its extract on corn meal, consisting of the starch with the albuminoids and all the other elements of the grain, is to convert that meal into malt, whereby fresh diastase is formed, and which then converts its own and more starch. Is it not more than probable that the use of malt extract is simply to start the action in the cereal foods, and that thus it may greatly assist the digestion of bread and biscuit puddings, etc., though it would be almost useless with a diet of arrow-root?

March 6, 1879. JOHN LINFORD.

THE PHARMACEUTICAL EXAMINATIONS.

Sir,—I think if we look again at the figures in the report we shall see that it does not bear out the serious charge of "Devon" as to "a great waste of examining power."

The total number of candidates for the year equalled six hundred and thirty-eight, and the days of examination were twenty-five, giving an average of twenty-five candidates to each day.

Now, we must bear in mind that the examination embraces six subjects, and we have two examiners for each subject (except chemistry, which usually has four); thus we get an average of 12·5 candidates to each examiner for his own particular subject (and in chemistry six).

I recollect when I went in for the Minor, I was called in first, and left the examination room about three o'clock, and for the Major, I again went in first, and left about two o'clock. Now taking these hours, how is it possible to get a general average of two candidates to each examiner in one day? No one who has experienced the waiting on the "funking form" will think there are too many examiners.

I am certain we may safely defy any one to prove that any *vivâ voce* examination (embracing so many subjects, both practical and theoretical, as those of the Pharmaceutical Society) is conducted with less waste of "examining power" than those of the Society.

F. A. B.

"*Kerosene.*"—Kerosene is a term applied to coal oil and sometimes to refined petroleum.

W. P. F.—The information may be obtained by application to the Secretary of the Chemical Society, Burlington House, Piccadilly, W.

"*Scotia.*"—The passing of an examination in Australia would not enable a person to keep an open shop as a chemist and druggist in England. By the terms of the Victoria Pharmacy Act the Board of Examiners in that colony is empowered to receive in lieu of an examination the certificates of the Pharmaceutical Society of Great Britain.

"*Dubius*" is referred to the rule respecting anonymous communications.

C. T. R.—The 'Pharmaceutical Latin Grammar' is published by Groombridge and Co.

L. T. A.—Usually a mixture of bicarbonate of soda and tartaric acid, but sometimes carbonate of ammonia.

J. S. W. is recommended to address his question to the editor of a medical contemporary.

"*Transparent Cement.*"—See vol. viii, p. 619, and other places in the present series.

A. J. Codling.—We cannot give the "official" decision for which you ask; but probably you will find the information you are seeking in Mr. Palmer's paper printed on p. 721.

"*Nobody.*"—After the promise contained in your note we shall be able to look forward to the future with complacence.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Lloyd, Brown, Schacht, White, Oldham, Petit, Lautier, Moss, Wolstencroft, Cumberland, Rubus Idæus, H. W. E.

COD LIVER OIL EMULSION.

BY WILLIAM GILMOUR.

Cod liver oil emulsions in various forms are preparations which have of late become somewhat popular. I express no opinion whatever on any of these preparations, far less do I intend to individualize any preparation by attempting to give a copy of the formula. I simply recognize the unfortunate necessity which sometimes arises of following where our inclination does not lead, and I therefore give a formula for an emulsion, believing it without prejudice equal to any of the many now bulking so largely before the profession and the public.

Of all the excipients suggested by different authorities, as well as commending themselves to one's own approval for emulsifying cod liver oil, none, I think, equals gum tragacanth. Without, therefore, ignoring other substances, such as mucilage of gum arabic, white of egg, alkaline solutions, and so on, I have principally endeavoured to ascertain the conditions most favourable to produce with tragacanth an inseparable emulsion, which at the same time would be miscible with water, contain a reasonable amount of oil, and be not particularly objectionable in appearance, taste, or smell. Of course in all these preparations much may be left to individual fancy as to combination, and I therefore make no suggestion as to all the different ingredients which may be "hotched potched" into it further than this, that if oil of bitter almonds be the flavouring agent employed the emulsion need not be spoiled by the addition of an extravagant excess of the bitter almond. Experience and experiment both have determined that a half per cent., or about two drops to each ounce of cod liver oil employed, is the proper proportion, and that of the two oils, namely, an oil deprived of its hydrocyanic acid, or an oil containing it, the latter is much to be preferred.

As to the emulsion let three drams of the finest white powder of tragacanth be rubbed up in a large mortar with three ounces of glycerine. To this add as much boiling water as will convert it into a thick transparent jelly, from eight to ten ounces probably being required. After cooling add the cod liver oil, which should first be mixed either with plain water or lime water in the proportion of one of the latter to three of the oil; or if, as is customary, the emulsion is intended to contain the hypophosphites of lime or soda, let these be added to the plain water previous to mixing with the oil, and then let this primary emulsion be gradually added to the mucilage of tragacanth with constant stirring. In the process of mixing, the emulsion not only creams, but also thickens up to a certain point, and individual taste must settle the extent to which the mixture may be carried. I have found the three drams of tragacanth emulsify from 50 to 80 ounces of what I have called the primary emulsion, the former quantity being very thick and not easily poured from the mortar, the latter quantity flowing more freely and forming what I consider the better emulsion. In mixing the oil with the mucilage of tragacanth care must be taken not to add it too hurriedly else it will not emulsify. The mixture will simply break up into a clotted mass and no amount of labour apparently will bring it back to the emulsified form. Under these circumstances the better way is at once to begin again with a small quantity of fresh mucilage, to which the clotted mass should be carefully added by degrees. In this way only can the emulsion be brought back to its proper form.

COPAIFERA LANGSDORFFII.

NOTE FROM PROFESSOR FLÜCKIGER.

This is the name which Desfontaines in the *Mémoires du Muséum d'Histoire naturelle*, tome vii. (1821), 373, gave to the copaiba tree which had been sent to him by Baron Georg Heinrich von Langsdorff, a distinguished traveller and botanist, then Consul-general of Russia at Rio de Janeiro. Desfontaines added a good figure to his description of that new species, which he lettered *Copaifera Langsdorffii*; in the same paper, however, this name is given differently, viz., *Lansdorf* and also *Lansdorff*. It is certainly of no consequence at all which way of writing be adopted, but correctness may be desirable or pardonable even in this very trifling question.

Copaifera Langsdorffii is, as far as I see, the form which used to be prevailing. But recently, Professors Bentley and Trimen, in their excellent 'Medicinal Plants,' expressly recommended to omit the *g* and to write *Copaifera Lansdorffii* as being the correct form. The same also is alluded to, but not adopted in Baillon's paper on 'Copaifera," in the *Journal de Pharmacie*, 25 (1877), 255, whereas Pritzel, in the 'Thesaurus Literaturæ Bot.,' as well as the Catalogue of scientific papers give Langsdorf.

The family of the Barons von Langsdorff being partly residents of Freiburg in the grand duchy of Baden, I was informed that there is still living one of the sons of the botanist under notice, who writes his name invariably Langsdorff. This gentleman was good enough to supply me with a pamphlet written in memory of his late father. It bears title: 'Notice nécrologique sur le Baron George-Henri de Langsdorff, conseiller d'état de S.M. l'Empereur de Russie, ancien Consul-général de Russie au Brésil, célèbre voyageur et botaniste, membre de l'académie impériale de Saint Pétersbourg, etc. . . . Mort à Fribourg en Brisgau (Gd. duché de Baden), le 29 Juin, 1852. Par E. de Saint-Maurice Cabany, directeur-rédacteur en chef du Nécrologe universel du XIX^{me} siècle.' Paris. 91, Boulevard Beaumarchais, 1853, 16 pages, 8vo., with portrait.

We may notice from this essay that Dr. G. H. von Langsdorff, born April 18, 1774, was a graduate of the medical faculty of the university of Göttingen and travelled in 1797 in Portugal as physician to the Prince Christian von Waldeck, who was fond of botany. In 1803–1806, Dr. von Langsdorff was attached to the first Russian circumnavigation under command of Krusenstern; on his return he was appointed in 1808 to the Academy of St. Petersburg and thence sent, in 1812, as Consul-general to Rio de Janeiro, from which place he explored the interior of Brazil. He was obliged, in 1830, to leave that country on account of sickness and never succeeded in recovering his health during the twenty-two subsequent years, which he spent at Freiburg.

We are consequently obliged not to alter the usual name of Copaifera Langsdorffii; the omission of the letter "g," in the original paper of Desfontaines, may be due simply to the carelessness of some Paris printer.

MEDICINAL PLANTS USED BY NORTH AMERICAN INDIANS.*

BY DR. EDWARD PALMER.

Chlorogalum pomeridianum, common soap root of California, and called by Indians and Mexicans *Amole*. It produces a large bulb which yields a great quantity of

* From the *American Journal of Pharmacy*, Dec. 1878.

saponin, very good for washing, for which purpose it is much used by poor people and the Indians of California. The rough covering of the root is formed into bunches tied up and used for hair brushes by the Indians.

Datura meteloides (Jamestown weed).—The California Indians make a decoction of this plant which is given to young females to stimulate them in dancing. After the root is bruised and boiled in water, the liquid, when cold, is taken internally to produce a stupefying effect, and is much used by California Indians.

The Pah-Utes call this plant *Main-oph-weep*.—They bruise the seeds, soak them in water and expose the mixture to the sun's rays to cause fermentation. This being effected, the liquor is drunk and has the same narcotic effect as the preparation made from the plant or root, with the alcoholic effect added.

Nicotiana trigonophylla, N. Bigelovii, N. attenuata.—The leaves of all these species of *Nicotiana* are used as tobacco by the Indians of Arizona, Utah, New Mexico and Southern California. The strength is said to be greater than that of the cultivated variety, though the leaves are smaller.

Ligusticum apiifolium, Angelica of the settlers of Utah, *Pahnet-snap* of the Pah-Utes.—It is a favourite medicine with these Indians. The root is bruised and used as a poultice for sprains and bruises. A tea is made from the roots and is taken internally for pain in the stomach. The Indians, if afraid of catching contagious diseases, fill their nostrils with pieces of the root. The strong, aromatic, carroty smell may have induced them to believe in the efficacy of this plant as a prophylactic.

Berberis aquifolium or *Oregon grape*.—From the roots of this plant a decoction is made in water, or they are steeped in liquor, and taken internally. It is a good remedy for general debility, or to create an appetite, and is considered equal to sarsaparilla in its medicinal virtues. It is a favourite medicine with the California Indians.

Anemopsis californica, Yerba Mansa of the Mexicans.—The root of this plant is a great remedy among the Indians of Arizona, and Sonora in Mexico, and Southern California. It has a strong peppery taste and odour. A tea made from the roots and a powder prepared from the same and applied to venereal sores are a great remedy. The powder is advantageously used on cuts and sores, as it is very astringent. The leaves, after being wilted by heat and applied to swellings, are a sure cure.

Achillea millefolium, Yarrow of the settlers of Utah. The Pah-Utes make a tea from this plant, and take it internally for weak and disordered stomachs. It is much used by whites in the form of bitters.

Curcurbita perennis, called Chili Cojote by Mexicans.—The pulp of the green fruit is used, with a little soap, to remove stains from clothing. The roots of this plant are large and long, and, when macerated in water, are applied to piles, generally with good effect. The seeds are ground fine and made into mush, and eaten as food by many Indians of Arizona and Southern California.

Euphorbia polycarpa, called by Mexicans Golendrina.—A strong decoction made from this plant and applied to snake bites soon produces reaction. Many cures effected in this way are reported. In fact, the Indians of Arizona and Southern California rely entirely upon it in such cases. Some years since, being in San Diego, and wading in the salt water, a fish (*Sting-Ray*) plunged the bony projection at the base of its tail into my left foot, and soon the swelling and pain became excessive. A Mexican woman made several gallons of a very strong decoction from this plant, and plunged my leg up to the knee in it while hot, and in a few hours relief came.

Eriodyction glutinosum, Yerba Santa of the Mexicans, and a great medicine among the Indians of Southern Utah, Arizona and California.—A decoction made from this plant, and taken internally for rheumatism and partial paralysis, or applied externally, is an excellent remedy. For affections of the lungs, the leaves are used by smoking or chewing dry, or a tea is made from them and drunk.

Micromeria Douglasii, Yerba Buena of the Mexicans.—This is an interesting plant, growing near the sea-coast of California, having a strong minty smell. It is a favourite medicine with the Mexican population of California. The Indians of the same section prepare a tea from it, which is used for fevers and colds. In case of headache, a quantity of the plant is bound round the head.

Artemisia tridentata, commonly called sage brush.—The Pah-Utes make a strong tea from this plant and take it internally for headache, colds, and for worms. It is also a good stimulant, prepared either with water or liquor. It yields a pungent oil, which would be a profitable article of commerce.

A. filifolia, Southern wood.—This plant on distillation yields a very penetrating oil, which is good for liniments, and the Pah-Utes make a decoction from it excellent for swellings and bruises.

A. ludoviciana, A. dracunculoides.—The seeds of these two species are gathered by the Pah-Utes, ground fine, made into mush and eaten. It is anything but a tempting dish, having a dirty look and strong taste.

A. ludoviciana.—This plant possesses medicinal virtues. The Pah-Utes make a strong tea of it and use it internally to assist child-birth, whenever assistance is required, which is seldom. In case of hæmorrhage from the nose they stuff wads of the fresh plant into the nostrils.

Oreodaphne californica.—This fine evergreen tree of California has a very strong spicy odour. By rubbing the hands and face a short time with the leaves a very distressing headache will be produced. Hahnemann is not the only discoverer of the fact that like cures like, for long before he was born the Indians of California were aware of the power which this plant had to produce a headache in those that were well, and to cure those who are afflicted with it.

Erythræa venusta, a common remedy for ague by Indians and Mexicans of Arizona and Southern California. A tea is made of the plant and drunk, and is certainly a very good substitute for quinia.

Pæonia Brownii, by Mexicans called *Pea-neo*.—The root of this plant is used by the Indians of Southern California for colds, sore throats, and for pains in the chest. It is mealy, and tastes somewhat like liquorice. After being reduced to powder, it is either taken in that form internally or made into a decoction.

Grindelia squarrosa.—A decoction made from this plant is used by Mexicans and Indians of Southern California to cure colds. It is taken internally.

Lygodesmia spinosa.—This plant produces a short, fine, silky substance just at the juncture of the roots with the branches, which is used by the Digger Indians to stop the bleeding in gun-shot wounds.

Perezia arizonica.—At the junction of the branches with the roots, and covering the greater part of the former, is a soft silky substance which is used by the Apache Indians in gun-shot and other wounds, to stop hæmorrhages, for which it is well adapted.

Glycyrrhirza lepidota, called by settlers of Utah, Desert root.—Pah-Utes eat it for its tonic effects. In taste it is much like liquorice. Whites sometimes chew this root in place of tobacco.

Ephedra antisyphilitica, called *teamster's tea*, since men travelling with teams in New Mexico, Arizona, and Southern California, camping among Indians, contract venereal diseases, and use this plant abundantly as a remedy, taken internally in the form of tea. A quantity of the plant is often taken along in case of need. This is a well-known remedy for gonorrhœa among many Indians and Mexicans. It is a strong astringent, and may prove valuable for its tonic properties.

The Pharmaceutical Journal.

SATURDAY, MARCH 22, 1879.

THE PROPORTION OF EXAMINED PERSONS ON THE REGISTER.

THE publication during the past week of the Registers of Pharmaceutical Chemists and Chemists and Druggists for 1879 enables us to comply with a wish expressed at a recent meeting of the Pharmaceutical Council, and, after an interval of two years, to take a glance at the numbers and relative proportions of examined and unexamined registered Pharmaceutical Chemists and Chemists and Druggists. The object to be served is not merely the satisfaction of a feeling of idle curiosity as to the progress which is being made towards the time when the Registers will contain only the names of examined persons; for there is a greater interest in the light which the statistics to be quoted will throw upon the proportion of registered persons who have attained the higher qualification of pharmaceutical chemist.

When this subject was last referred to in these columns, on the occasion of the publication of the Registers for the year 1877,* there were 13,178 registered chemists and druggists, of whom 3199, or 24·27 per cent., were qualified in consequence of their having passed the Minor examination. Among these 3199 there were 1281 Pharmaceutical Chemists who had passed the Major examination, constituting 55·66 per cent. of all the pharmaceutical chemists, or 9·72 per cent. of all the chemists and druggists on the respective Registers. We now find that of the 13,309 chemists and druggists on the Register at the commencement of the present year there were 3743 persons or 28·12 per cent. who had passed the Minor examination, showing a proportional increase in two years of 3·85 per cent. in the registered chemists and druggists who have been examined.

Turning to the Pharmaceutical Chemists who have passed the Major it appears that these now number 1346, being 58·84 per cent. of all the Pharmaceutical Chemists, or 10·01 per cent. of all the chemists and druggists on the Registers. This shows an increase in two years in the proportional number of Major men of 3·18 per cent. in relation to the Pharmaceutical Chemists and of 0·29 per cent in relation to the whole body of chemists and druggists.

It only now remains to show the alteration that has taken place in the relative proportions of those who have passed the Major examination and those who have passed the Minor only, in the whole body of examined men. At the commencement of 1877 out of the 3199 persons who were on the Register in consequence of having passed the Minor examination there were 1281 who had also passed the Major, these being 40·04 per cent. of the whole. In 1879 there are 3743 examined men, and of these 1346 have passed also the higher examination, or equal to 35·96 per cent. This shows a decrease in the proportion of pharmaceutical chemists relatively to the other examined men of 4·08 per cent.

Thus whilst there has been a slight increase 0·29 in the proportion of Major men to the whole body of chemists and druggists, this increase has been outstripped by the increase in those who have passed the Minor examination only, whilst the relative proportion of unexamined persons has decreased by rather over 3 per cent.

The principal of the above details may be tabulated as follows:—

	January 1, 1877.		January 1, 1879.	
	Number.	Per cent.	Number.	Per cent.
Pharmaceutical Chemists . .				
Examined . .	1281	9·72	1346	10·01
Non-examined	1040	7·87	941	7·17
	2321	17·59	2287	17·18
Chemists and Druggists who have passed the Minor only	1918	14·55	2397	18·01
Remainder, including those who have passed the Modified . .	8939	67·86	8625	64·81
Total	13,178	100·00	13,309	100·00

THE ANNUAL DINNER.

A MEETING, convened by public advertisement, was held at 17, Bloomsbury Square, on Thursday, March 20th, to make preliminary arrangements for the Eighth Annual Dinner of the members of the Pharmaceutical Society and their friends.

At this meeting it was resolved:—(1). That the dinner be held at WILLIS'S Rooms, on Tuesday, May 20th. (2). That the expenses hitherto borne by the Stewards be paid out of the proceeds of the sale of tickets. (3). That the price of the tickets be 30*s*. each, and that tickets be obtainable only from the Honorary Secretary. (4). That no Stewards be appointed.

The following were appointed a Committee to make and carry out the necessary arrangements:—The PRESIDENT, Messrs. BUTT, CARTEIGHE, ROBBINS, and Professor ATTFIELD. Mr. RICHARD BREMRIDGE was appointed Honorary Secretary.

ORPHAN CHILDREN.

BESIDES the cases mentioned in last week's Journal we would remind our readers that the Council has decided to assist in securing the election of HUGH WHITE NALDRETT into the Infant Orphan Asylum, Wanstead. The Secretary, Mr. ELIAS BREMRIDGE, will be happy to receive proxies for the May election, or to supply canvassing cards to any one taking an interest in the case.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held at 17, Bloomsbury Square, on Thursday, March 27, at 8·30 p.m. precisely, when a paper will be read by Mr. A. F. DIMMOCK on "DALTON and the Atomic Theory."

Transactions of the Pharmaceutical Society.

SPECIAL EVENING MEETING.

Wednesday, March 19th, 1879.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

At a Special Meeting of the Society on Wednesday last, a lecture was delivered by Professor Bentley on "The Life of the Plant." At the conclusion of the lecture a vote of thanks was given to the Professor by acclamation.

The lecture will be published in an early number of this Journal.

Provincial Transactions.

MIDLAND COUNTIES CHEMISTS' ASSOCIATION.

A lecture was delivered on Thursday evening, at the Great Western Hotel, Birmingham, by Mr. H. W. Jones, F.C.S., F.R.M.S., on the use of the Microscope in the Examination of Drugs. Having first briefly described the construction of the instrument, the lecturer proceeded to describe the preliminary steps and apparatus required in the examination of vegetable structures, warning at the same time beginners against spending too much time upon mounting specimens, observing that such home-mounted objects rarely were worth the time and labour spent upon them. The lecturer then went on to exhibit and explain a number of typical examples of the microscopic appearances of drugs, showing among others the structures in the seed coats of linseed, mustard seed, cassia bark, cinnamon and cinchona barks. A number of examples of the chief forms of starches were also shown, and the importance of an accurate knowledge of the appearance of starches insisted on. The lecture was well illustrated by microscopic specimens and diagrams; the microscopes being lent by Mr. Bailey, optician, Messrs. Bennett, Hill and others.

At the conclusion some remarks were made by the chairman, Mr. T. Holdsworth, on the importance of a more extended application of the microscope by pharmacists, and a warm vote of thanks to Mr. Jones for his interesting and instructive lecture was unanimously accorded.

There was a numerous and attentive audience, and a vote of thanks to the chairman concluded the proceedings.

Proceedings of Scientific Societies.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting held on Wednesday, March 12, at 32A, George Street, Hanover Square, Mr. O. Wallis, President, in the chair, a very instructive and exceedingly interesting paper was read by Mr. W. Smart, on "Parasites," it being a continuation of one read by him before the same Association last year. The author at the commencement briefly referring to the entozoa, that class of parasites to which his last paper was confined, said "The necessity of their existence was shrouded in mystery, though their presence might be an aid to digestion and assimilation by causing increased intestinal activity in the lower animals, and in the higher and civilized by inducing sanitary and cleanly habits. He then described in detail the diseases produced by the parasitic fungi, grouped under the generic term Tinea, comprising seven well marked and distinct affections.

The author then passed on to the more lively portion of his paper, that of the epizoa, the parasitic animals infesting and inhabiting the body.

A brief description of the parasites infesting fish ended the list.

On the proposal of Mr. Glover, seconded by Mr. Miller, a hearty vote of thanks was given to Mr. Smart for his excellent paper.

The following donations were thankfully received towards the funds of the Association, Messrs. Corbyn and Co., £2 2*s*. 0*d*.; Mr. W. Smart, £1 1*s*. 0*d*.; Messrs. J. Robbins and Co., 10*s*. 6*d*.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, March 13, Mr. C. H. Hutchinson, Vice-President, in the chair.

The minutes of the previous meeting were read and confirmed.

The Secretary then read a paper by Mr. C. E. Stuart, on "Fruit." The author after noticing the popular use of the term "fruit," gave what he considered to be the true definition of the same, viz., "a single ripe ovary with its contents." He then proceeded to the classification of fruits. Rejecting their division into "superior and inferior," he was of opinion that fruits could be most naturally classified under the two heads of "dry and succulent;" each of these divisions being sub-divided in "dehiscent and indehiscent." The terms used to define certain kinds of fruits should not be too narrowly limited. Thus, according to the author the term "berry" should be defined sufficiently broadly to include the date, orange and pomegranate, as well as the grape and cucumber. A compound fruit should be distinguished by the term "syncarp," while the term "pseudocarp" should be given to those fruits usually called "inferior." The paper concluded with a theory as to the origin and development of fruits. According to the author's opinion plants in their struggle for existence had been induced to adopt one of two methods to insure the propagation of their seeds. Thus they either defended them from the attack of animals by enveloping them in a hard indigestible or nauseous shell, or by covering them with a pulpy mass of tempting appearance, odour and taste, induced the same animals to assist in the dispersion of the seeds.

A lengthy discussion followed, in which Messrs. Thompson, Parker, Senier, Branson, Alcock, and the Chairman and Secretary took part, and a vote of thanks was passed to Mr. Stuart for his interesting communication.

Parliamentary and Law Proceedings.

THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN *v.* THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION, LIMITED.

This case, which has been standing over for a long time from a variety of circumstances, came on for argument on Saturday last, March 15, before the Lord Chief Justice of the Queen's Bench and Mr. Justice Mellor.

The Attorney-General and Mr. Lumley Smith appeared for the appellants, and Mr. Wills, Q.C., for the respondents.

The Attorney-General in opening the case said, this is an appeal from the judgment of the judge of the Bloomsbury County Court, and the questions that arise are these, whether, under the circumstances, which are mentioned in the special case which has been stated, the defendants, the London and Provincial Supply Association, Limited—a company, incorporated under the Joint Stock Companies Act, of a somewhat peculiar character—is liable to a penalty for selling poisons and keeping open shop for the sale of poison contrary to the provisions of the Pharmacy Act, 1868. The County Court Judge decided for the defendant. It was an action in the County Court by the Pharmaceutical Society against the London and Provincial Supply Association, for the purpose of recovering penalties under the Pharmacy Act, 1868, and the learned County Court Judge decided in

favour of the defendant; that is to say, he decided that the penalty had not been incurred.

Mr. Justice Mellor: Is it the Pharmacy Act of 1868?

The Attorney-General: The Act of 1868, my Lord, the 31 and 32 Vict. c. 121. Perhaps I had better read a portion of the preamble and the first section of the Act. In the course of the argument I shall have to address to your Lordships it will be my duty to refer your Lordships to some of the other provisions. The Act recites that "whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing or compounding of poisons, and persons known as chemists and druggists, should possess a competent practical knowledge of their business, and to that end, that from and after the day herein named all persons not already engaged in such business should before commencing such business, be duly examined as to their practical knowledge," and that such examination should be as therein provided, and also "that the Act passed in the fifteenth and sixteenth years of the reign of Her present Majesty, an Act intituled an Act for regulating the qualification of pharmaceutical chemists hereinafter described as the Pharmacy Act should be amended." The first section is, "From and after the 31st day of December, 1868, it shall be unlawful for any person to sell or keep open shop for retailing, dispensing or compounding poisons, or to assume or use the title 'chemist and druggist' or 'chemist or druggist' or pharmacist, or dispensing chemist, or druggist in any part of Great Britain," etc. The part which relates to the matter before your Lordships is the earlier part, that it shall be unlawful for any person to sell or keep open shop for retailing, dispensing or compounding poisons. This Society under the statute and its charter has a right to bring actions to recover penalties, and what is alleged by them is this, that the London and Provincial Supply Association, Limited, did keep open shop without being qualified as mentioned in this section. The contention of the defendants was this, that though the company were not qualified in any way they had in their service a qualified pharmaceutical chemist and that he sold these drugs, and that they were not therefore liable to a penalty; and they also contend that this section does not apply to a corporation, but simply applies to an individual. Perhaps I had better read to your Lordships the special case, or some portion of it at all events. This action was brought in the Bloomsbury County Court to recover a penalty under section 15 of an Act of 31 and 32 Vict. c. 121, intituled "The Pharmacy Act, 1868." The plaintiffs are a corporation duly incorporated in the year 1843 by Royal Charter (which was confirmed by the Pharmacy Act 15 and 16 Vict. c. 56), and entitled under section 12 of the said Pharmacy Act 15 and 16 Vict. c. 56, to sue for penalties in the county court. The defendants are a company registered under the Companies Acts, 1862 and 1867, as a limited company, with a nominal capital of £10,000 divided into 1000 shares of £10 each, of which one William Mackness holds 564 shares fully paid up. Six persons (one of whom was Henry Edward Longmore) hold five shares each, with £2 10*s.* paid on each share. Three persons hold one share each with £2 10*s.* paid on each share, and the remaining shares are unallotted. The register of the shareholders was put in evidence, and a copy of it may be referred to as part of this case. The said company was registered on the 29th January, 1878, and was formed, *inter alia*, "To purchase or acquire the trade or business of a wholesale and retail grocer and general warehouseman, then carried on by Mr. William Mackness at No. 113, Tottenham Court Road, Middlesex." A copy of the memorandum and articles of association of the company was put in evidence, and may be referred to as part of this case. The said William Mackness is the managing director of the said company. He is not a duly registered pharmaceutical chemist or chemist and druggist within the meaning of the said Pharmacy Act 1868. Henry Edward Longmore is the only shareholder who is a "pharmaceutical chemist," or "chemist and druggist," within the meaning of the Pharmacy Act, 1868. The business of the said company is carried on at 113, Tottenham Court Road aforesaid, and includes, amongst other departments for the sale of various goods, a chemist and druggist's shop or drug department, which is an open shop for the retailing, dispensing, and compounding poisons within the meaning of the Pharmacy Act, 1868. The said poisons are sold to the public, and not merely to members of the defendant company. The said Henry Edward Longmore is, and at the time of the sales of poisons hereinafter mentioned was, a duly registered chemist and druggist within the Pharmacy Act, 1868, and the business of the said drug department was at the several times aforesaid and is conducted by the said Henry Edward Longmore, with the aid of two qualified assistants. The said Henry Edward Longmore (with the aid aforesaid) at the times aforesaid attended and still attends regularly to the said drug department, and to nothing else, and he and his assistants were and are the servants of the defendants, the company, and paid by salary or wages. On the 4th of February, 1878, the said Henry Edward Longmore, acting on behalf of the defendants, sold at the said premises two pennyworth of oxalic acid. On the 19th of March, 1878, the said Henry Edward Longmore, acting on behalf of the defendants, sold at the said premises solution of perchloride of mercury, as an ingredient in a prescription then made up by him. On the 20th of March, 1878, the said Henry Edward Longmore, acting on behalf of the defendants, sold at the said premises a pennyworth of white precipitate. Then the case sets out the evidence of the witnesses who prove these facts; and I do not know that I need trouble your Lordships with that. The facts are very simple. Mr. Longmore, who was a servant of the defendant company—

The Lord Chief Justice: And a member, I think—a shareholder, is he not?

The Attorney-General: Yes, my Lord.

Mr. Justice Mellor: And it is found, if I read it right, that he and his assistants are servants of the company.

The Attorney-General: Yes, my Lord.

Mr. Wills: They are all three qualified persons.

The Lord Chief Justice: The question I suppose is whether a company in itself not qualified can, because it employs a qualified person, sell drugs within the Act.

The Attorney-General: That is the question.

Mr. Wills: Whether person includes company or corporation under the Act.

The Lord Chief Justice: Does the case negative, except inferentially, that other persons belonging to the company who sell other things might not sell drugs if Mr. Longmore happen to be out of the way?

The Attorney-General: My friend will correct me if I am wrong; but I do not remember that it does.

The Lord Chief Justice: It may make a very material difference. Suppose there is a large store where there is a department allotted for drugs and poisons. If the person who presides there, and who has the management of it, happen to be out of the way, is there anything to prevent a person from the next department coming and selling drugs?

Mr. Wills: These three persons attended to that and nothing else.

The Lord Chief Justice: The three are not all qualified, are they?

Mr. Wills: Yes, my Lord. All three.

The Lord Chief Justice: The assistants as well as Mr. Longmore.

Mr. Wills: Yes, and the whole three attended to that and nothing else.

The Attorney-General: I am told that the evidence which I was going to read, but I do not think it necessary to read it, shows that one of these sales was effected by a person who was not qualified.

The Lord Chief Justice: There is always that possibility.

The Attorney-General: Do not let that be taken as a fact for a moment; my client is looking for the statement. My learned friend, who always endeavours to shorten any case with which he has to do, very candidly states that the question which we have to discuss before your Lordship is whether this Act applies to a company at all; whether an incorporated company is within this Act at all. The judgment of the learned judge of the County Court proceeded upon this; his view was that although the Act applied to corporate companies, nevertheless that a company would escape all penalties supposing that company had in its service a qualified person who is employed to sell the drugs. That was the view which the learned judge took.

The Lord Chief Justice: It raises a very serious question, whether they keep in their employ a qualified person and intend honestly that that qualified person shall superintend this department; yet it may be that that qualified person may not be there. Does that exclude from the provisions of the Act the mischief intended to be prevented?

Mr. Wills: Exactly the same thing may happen with an individual, my Lord; he might be out of the way, yet he would not be liable to a penalty under this Act.

The Lord Chief Justice: That may be, but in that case he is a qualified person, he is within the Act; but you, the company, are not qualified. I reason in this way, if the company is within the Act under the term person, then the company cannot be qualified unless the whole company are.

Mr. Wills: I must honestly confess, my Lord, that if the company are within the Act, I do not see my way to support the view which was taken by the learned County Court Judge, that it makes a difference that they have employed qualified persons. If so, and your Lordship should see your way to a different conclusion, so much the better for me.

The Attorney-General: Then, my Lord, we may confine the argument to that point. I do not think it is necessary to read the judgment of the learned judge. He took the view that I am stating to your Lordship, a view which I think my friend with great candour now confesses was not strictly accurate.

Mr. Wills: I have not seen the oral judgment of the learned County Court Judge. Of course we ought to do every justice to the learned County Court Judge, especially to one so very eminent in his profession as the late Mr. George May Russell was. I have not seen the whole of the judgment, therefore there may be reasons that I know nothing of. I have seen nothing except the case. If my friend will allow me to see it, I will see if there is anything in it which I ought to call attention to.

The Attorney-General: The evidence that I alluded to a moment ago about an unqualified person who made a sale does not go to the extent I thought it did. It is the evidence of one of the persons who speaks to the sales. It says, "On the 26th of February I went to the same counter"—that is the counter he had always been to before, where Mr. Longmore had sometimes served him—"and saw not the same person. I asked for a small quantity of oxalic acid, it was served to me by a person I have never seen since or before. He said will two pennyworth be sufficient? I said, yes. He supplied it in the produced packet for which I paid him two pence. I did the same with this as with the other." Then he goes on:—"After the purchase I asked a gentleman who was walking about the shop, and said I wanted to see the register of shareholders." It is the fact, I am told, that oxalic acid which was sold was not sold legally, according to the provisions of the Act. There is nothing more than that to show that the sale was by an unqualified person; it certainly might be, or one might come to the conclusion that it was a sale by an unqualified person.

Mr. Justice Mellor: Does the judge in his judgment assume that it was or not. It was rather for him to assume one way or the other.

The Attorney-General: My Lord, the judge only states the fact, and then he says the question is—

The Lord Chief Justice: What is the penalty, Mr. Attorney-General?

The Attorney-General: It is in the 15th section, my Lord, £5 in this case.

The Lord Chief Justice: The way it strikes me at present is this:—Mr Wills, just see how you would meet this; it strikes me that this is an offence, it is made an offence by the Act of Parliament, and although it is true that it is not constituted a misdemeanor, but simply an offence subject to a penalty, nevertheless it is constituted an offence. If it is an offence in any person to sell, not being qualified, that would apply to an aggregate of persons. Members of a corporation, although in one sense one body, nevertheless are so many bodies when they commit an offence against an Act of Parliament. Now it is plainly stated here that any person—which must mean persons also—not being qualified, who sell shall be guilty of this offence and subject to this penalty. Now although it is true that this is a corporation, and no mention is here made of a corporation, yet the way it strikes me is that a corporation consists of a number of persons, that this company consists of a number of persons, and for one of these persons, as well through his assistant—

Mr. Wills: My Lord, of course when it comes to my turn I will call your Lordship's attention to other provisions in the Act, but I think it is impossible to read it in that way. It is not for me to say what to submit to your Lordships, but I think it is impossible, looking to the whole scope of the Act and the language of the Act in other places, to read it so as to include corporation. I believe this is a case of *casus omissus*. In 1868, when this Act was passed there were already a great number of these corporations and supply associations which were in the habit of dispensing medicines through duly qualified persons. I do not believe for a moment that it was the intention of the Legislature to put a stop to that.

The Lord Chief Justice: Suppose an Act says no person or persons shall do so, and if they do, they will be guilty of an offence and will be liable to a penalty; if any corporation which consists of an aggregate number of persons does something which is in contravention of the Act, do you think because they are united in one body as a corporation, that therefore they are not individually liable?

Mr. Wills: This is an action against the company, my Lord. Of course one must draw a line and sharp division between a corporation and an individual.

The Lord Chief Justice: This is an action against the company.

Mr. Wills: Yes, my Lord.

The Lord Chief Justice: An action for what?

Mr. Wills: An action to recover the penalty which is given under the Act to an informer and to any persons who shall sue for it.

The Lord Chief Justice: Still it is a penalty; if it were not for that section it would be a misdemeanor punishable by a fine or imprisonment. It is taken out of the category of misdemeanors, penalty by fine or imprisonment, because the same Act imposes a penalty, but it is an offence notwithstanding.

Mr. Wills: Yes, it is; it is an offence in respect of which an informer may sue for a penalty.

The Attorney-General: I do not think it is an informer.

The Lord Chief Justice: Any person?

Mr. Wills: Any person; I think it is.

Mr. Justice Mellor: It says "the same may be sued for in the manner provided for by the Act."

The Attorney-General: That is by the registrar of the Society.

Mr. Wills: I am only telling your Lordship the outline of my argument; that it is a *casus omissus*, and if the Legislature had thought of it they probably would have indicated that these corporations might have had their business attended to by duly qualified persons. They

never intended, I am sure, at that time in 1868, looking to the hold which these co-operative societies had already got on the country, to prevent their carrying out this department of business.

The Lord Chief Justice: I suppose at that time these societies had not so far developed themselves as to sell everything, including poisons.

Mr. Wills: They were selling drugs and making up physicians' prescriptions very largely, because although it is the sale of poisons, the real thing is the making up of physicians' prescriptions. Of course the Pharmaceutical Society, as representing the chemists of the country, would be very glad if they saw their way to get a decision that all these societies must be put an end to as far as that branch of the business is concerned.

Mr. Justice Mellor: I assume the fact must be that the person who actually dispenses the medicines or sells them would, if he had been selling them on his own account and in his own shop, have been protected.

Mr. Wills: That is essentially found.

Mr. Justice Mellor: But selling not for himself and in his own shop, but in a shop belonging to a company of persons of which he was a member, whether he carries that qualification with him or whether it be that the company of which he is a member comes within purview of the Act.

Mr. Wills: I do not see my way to saying that he carries his qualification to the company. Where I am obliged to draw a line is that the company is not—

The Lord Chief Justice: The company sells and the company is not qualified either as an aggregate body or in the individual capacities of the different individuals who compose it. Do you say person does not comprehend an aggregate of persons?

Mr. Wills: Yes, my Lord; an aggregate of persons in the sense of persons who constitute a company. It would comprehend of course any number of individuals dealing under a private partnership, but person does not always mean in construing Acts of Parliament corporation. I think when you come to follow with me some of the provisions of the Act you will see that at all events I have good grounds for argument on that point.

The Lord Chief Justice: However, we will keep our minds open.

The Attorney-General: After what has fallen from my learned friend, I will address myself to the point which he has alluded to. Now, prior to 1868, the date of the Act to which I have drawn to your Lordships' attention, any person could be a chemist and druggist, and any person could sell poison. The only restriction was that no person should assume the title of pharmaceutical chemist unless certain provisions had been observed.

The Lord Chief Justice: That is under the Pharmacy Act.

The Attorney-General: That is prior to the Act of 1868. The Pharmacy Act was an earlier Act. I do not know whether I am at liberty to refer to it, but I think you will remember that about that time there was a great deal of alarm occasioned in consequence of the easiness with which poisons were procured, and that any person could personally go to any shop and obtain any poison without any difficulty; there was a great consternation in consequence, and it was partly for that reason and partly with a view of preventing easy purchase of poisons that this Act was passed, and I say this Act does not prevent companies, or partnerships, or co-operative stores, or any other body from dealing in drugs. They may deal in drugs, the prohibition is that they shall not deal in poisons, the poisons which are mentioned in the schedule to the Act, and the object of the Legislature was to prevent anybody selling poisons or keeping a shop for the sale of poisons unless he was duly qualified as a pharmaceutical chemist. I should contend that it would not be open to a large partnership, a partnership of a great number of persons, to keep open a shop for the sale of poisons, although one of their body might be a pharmaceutical chemist. Now, just let me refer you to this section of the statute which I consider to be important. I have already read to you the preamble and I may refer particularly to the first section again: "From and after the 31st of December, 1868, it shall be unlawful for any person to sell or keep open shop for retailing, dispensing or compounding poisons, or to assume or use the title of chemist and druggist, or chemist or druggist, or pharmacist or dispensing chemist or druggist in any part of Great Britain, unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act and be registered under this Act, and conform to such regulations as to the keeping, dispensing and selling of such poisons as may from time to time be prescribed." This section points out the poisons to which the Act applies, and your Lordship will find them set out in the schedule at the end of the Act, principally the most deadly poisons. Then, section 3 provides that "Chemists and druggists within the meaning of this Act shall consist of all persons who at any time before the passing of this Act have carried on in Great Britain the business of a chemist and druggist in the keeping of open shop for the compounding of the prescriptions of duly qualified medical practitioners," and so on. Then there is a provision in section 4 as to assistants who are to be registered. Then there is a provision in section 5 for the registration of chemists and druggists. Then there are some provisions as to the examination of these persons, and I may pass over the rest until I come to the 15th section. Section 15 is the one which imposes the penalty, the section which you will observe is the one which has created the offence, and however the person who commits the offence should be proceeded against I submit with confidence that if he has disobeyed or infringed the provisions of this Act of Parliament he has committed an offence. It may be that the penalty may be recoverable in a peculiar way, but nevertheless he has committed an offence. Now we come to section 15, which imposes the penalty "From and after the 31st of December, 1868, any person who shall sell or keep an open shop for the retailing, dispensing or compounding poisons, or who shall take, use or exhibit the name or title of a chemist and druggist or chemist or druggist, not being a duly registered pharmaceutical chemist or chemist and druggist, and who shall take, use or exhibit the name or title pharmaceutical chemist, pharmaceutist or pharmacist, not being a pharmaceutical chemist, or shall fail to conform with any regulation as to the keeping or selling of poisons made in pursuance of this Act, or who shall compound any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia, shall for every such offence be liable to pay a penalty or sum of £5." Here it is distinctly described as an offence. He shall be liable to pay a penalty of £5, and the same may be sued for and recovered in the manner provided by the Pharmacy Act.

The Lord Chief Justice: I think, Mr. Wills, that if it were not for the difficulty of the word person that this is an offence. I mean that if there had not been the penalty superinduced upon the creation of the offence, it would have been a misdemeanor punishable at law.

Mr. Wills: I think so, my Lord.

The Lord Chief Justice: Just so.

The Attorney-General: I think that is very clear. This section 16 is very important. "Nothing hereinbefore contained shall extend to or interfere with the business of any member of the Royal College of Veterinary Surgeons," and a little further on the section goes on to say, "and upon the decease of any pharmaceutical chemist and druggist, or chemist or druggist actually in business at the time of his death, it shall be lawful for any executor or administrator or trustee of the estate of such pharmaceutical chemist and druggist or chemist or druggist to continue such business for and so long only as such business shall be continued to be conducted by a duly qualified assistant and a duly quali-

fied assistant within the meaning of this Act, who shall be a pharmaceutical chemist or a chemist and druggist," so that here is an express provision for what shall happen in the case of the death of a duly qualified person who keeps open a shop for the sale of poisons, and the provision is this, that in case of his death if his representatives desire to carry on the business, and it is *bonâ fide* carried on for some time, I suppose for the purpose of winding up the estate, or anything of that kind, in that case it may be carried on if there is a properly qualified pharmaceutical chemist who is a servant of the representative of the deceased man. Therefore one would assume as there is special provision inserted to meet that particular case, which might have been a case of great hardship if there had not been this provision, that the Legislature did not intend that any person who was not qualified should be at liberty to sell poisons simply because he had a qualified assistant.

The Lord Chief Justice: The widow of a deceased chemist would not be entitled to go on keeping up his business further than was necessary to the winding up of the estate; she is not to go on for the rest of her life because she employs a qualified assistant.

The Attorney-General: Unless this clause applied to the case, I say it was the intention of the Legislature that a person who was not qualified should not carry on business simply because he had a qualified assistant. Therefore that section itself I think would dispose of the view which was entertained by the learned judge of the County Court. But it does not dispose, perhaps completely, of the view which my learned friend entertains. Then my Lords, there is section 17, which I think is the only remaining section with which I need trouble your Lordships. That provides "that it shall be unlawful to sell any poison, either by wholesale or retail, unless the box, bottle, vessel, wrapper or cover in which such poison is contained be distinctly labelled with the name of the article and the word poison, and with the name and address of the seller of the poison, and it shall be unlawful to sell any poison of those which are mentioned in the first part of schedule (A) to this Act, or may thereafter be added thereto, to any person unknown to the seller, unless introduced by some person known to the seller; and on the sale of any such article the seller shall, before delivery, make or cause to be made an entry in a book kept for that purpose, stating, in the form set out in schedule (F) to this Act, the date of the sale, the name and address of the purchaser, the name and quantity of the article sold, and the purpose for which it is said by the purchaser to be required, to which entry the signature of the purchaser and of the person, if any, who introduced him shall be affixed; and any person selling poisons otherwise than as herein provided, shall, upon summary conviction, be liable to a penalty not exceeding £5 for the first offence, and for the purpose of this section the person on whose behalf any sale is made shall be deemed to be the seller." I draw your Lordships' attention to the safeguards that this section imposes on the sale of poisons. The first and most conspicuous and prominent is this, that the poisons shall not be sold to a person who is unknown to the seller unless the person to whom the sale is made and who was previously unknown to the seller is introduced to the seller by some person known to him. Now, surely, if that was done it was intended by the Legislature that the shop should be kept by a person who was a duly qualified pharmaceutical chemist and a person who would be capable of knowing the person who came to him to buy the poisons, or the person by whom the person who did buy poisons could be introduced. That would be inapplicable in the case of a company. Then if the company had an assistant, or many duly qualified assistants, the company itself could not know the customers nor could the company know the persons introduced to it. Therefore, what I want to submit to your Lordships is this, that the aim and object of the Legislature was to prevent the sale of poisons unless the sale was made under certain safeguards which would prevent the poisons being purchased by persons for improper purposes, or persons who were not entitled to have poisons supplied to them. The way in which it was attempted to accomplish that object was by indicating that nobody should sell poisons in future unless a duly qualified pharmaceutical chemist and persons who are registered and who are described in this Act of Parliament. Of course poisons may be sold in a shop, but no shop shall be kept open for the sale of poisons, nor shall any such poisons be sold, except by such a person as is described in the Act, and the Act goes on to make out an offence. I do not care whether a corporation is a person or whether it is not a person; it makes it an offence if the shop is kept open by a person who is not then duly qualified.

Mr. Justice Mellor: It would appear that the object of the Act is absolutely to prevent the sale of poisons except by persons who are duly qualified.

The Attorney-General: That is the object and that is the way in which the Legislature intended to accomplish that object. It might have accomplished its object in other ways, but that is the way in which it did it. They will not allow poisons to be sold except by certain qualified persons. My friend hinted in his observations just now that it was rather inexplicable that the Legislature should not allow poisons to be sold or prescriptions to be made up which contain poisons by such bodies as co-operative stores. I do not see myself that there is any great hardship. The provisions of the Act only apply to poisons, and to certain specified poisons, such as prussic acid, or arsenic, oxalic acid, and so on.

The Lord Chief Justice: Still, you see, Mr. Attorney-General,—I speak without full knowledge of the matter,—but I rather fancy that poisons, though in very minute doses, are used in medicine, so that there might be great difficulty in making up prescriptions if poisons could not be sold.

Mr. Wills: Such a thing as chloroform is one of the things forbidden.

The Attorney-General: I do not mean to say that persons who have to make up prescriptions might not have in the prescriptions to use, and of course to sell, the poisons mentioned in the schedule to this Act. I was only making this remark, that I do not see that there is any great hardship in preventing bodies, such as co-operative stores, civil service stores, and any bodies of that kind, from selling poisons or from making up prescriptions. They are not prevented from selling drugs; they may sell any drug they like, and the only thing they are prevented from doing is from dealing in this very dangerous trade—from selling these poisons. I have heard about the enormous variety of things in which the Civil Service Stores, for example, deal. I never had the good fortune to go into the Civil Service Stores myself, but I hear that they sell everything you can possibly conceive—from bibles down to game—everything you can conceive. Of course, there are numbers of departments, and how could it be possible to prevent this? If, for example, the person whose duty it was to attend to the sale of poisons was not about at the time, or was engaged in something else, the strong probability would be that some other clerk or servant in the store would sell the poison. But whether it is a hardship or not, the hardship is a matter of very little concern. The question is what did the Legislature intend. In fact, it has been confessed by my friend that this is an offence, and if there had been no express penalty attached to it, and it made recoverable in a particular way, the doing the act which is prohibited by the statute would have been a misdemeanor. Now, my Lords, if that be so, it seems to me that the Act of the 7 and 8 Geo. IV., cap. 28, s. 14, expressly applies to the case.

The Lord Chief Justice: Is that the Pharmacy Act?

The Attorney-General: No, my lord; it is an Act for the further administration of justice in criminal cases in

England. I will read the whole section, because I see perhaps my friend may found an argument on the language of the section, to the effect that it is not strictly applicable; but I think you will see that after all it is. Section 14 is this: "That wherever this or any other statute relating to any offence, whether punishable upon indictment or summary conviction, in describing or referring to the offence, or the subject matter on or with respect to which it shall be committed, or the offender or the party affected or intended to be affected by the offence, hath used or shall use words importing the singular number or the masculine gender only, yet the statute shall be understood to include several matters as well as one matter, and several persons as well as one person, and females as well as males, and bodies corporate as well as individuals, unless it be otherwise specially provided or there be something in the subject or context repugnant to such construction; and wherever any forfeiture or penalty is payable to a party aggrieved, it shall be payable to a body corporate in every case where such body shall be the party aggrieved." So that in this case, where there is an offence described as being an offence which is committed by a person, the word person shall include both a body corporate as well as any individual, and the only observation I think my friend could make upon this would be that this section relates to an offence punishable upon indictment or summary conviction. Perhaps my friend will say that because this is not an offence punishable by indictment or summary conviction therefore the section does not in strictness apply; but I should take it that as this is an Act which is passed as an Act for the purpose of describing the persons who may be guilty of offences, and is an Act relating to the administration of criminal justice, it throws light on this matter, and it shows your Lordship that when "person" is used in such an Act as the Act of 1868, that when an offence may be committed by a person it also includes a body corporate.

The Lord Chief Justice: The only doubt I have is as to the applicability of this statute to the case at all, because you see it says any offence punishable upon indictment or summary conviction. Now this is neither, because it must be sued for in the shape of a penalty.

The Attorney-General: No doubt the particular offence in respect of which this action was brought is not punishable upon summary conviction; at least, I think not.

The Lord Chief Justice: It is neither matter of indictment nor summary conviction.

The Attorney-General: I suppose as a particular penalty is given, it could not be punishable by indictment. It must be sued for. Although that might be so, and I admit the force of the observation, nevertheless, under section 17 of the Act of 1868 if the person keeping open the shop for the sale of poisons does not do what is prescribed by section 17, if he does not write the name of the poisons on the wrapper of the bottles, and if he does not sell to a person he knows or a person who has been introduced to him, he shall be liable upon summary conviction before two justices of the peace in England to a penalty not exceeding £5.

The Lord Chief Justice: You would be all right if you could bring it within section 17. Section 17 does not relate to selling, but to the selling in a particular way.

The Attorney-General: I know, my Lord; but assume for a moment that section 1 does not apply to a corporation, or I will leave that, if you will permit me, in doubt for a moment whether section 1 applies to a corporation or not. We will assume that a corporation keeps open a store for the sale of drugs, then that that corporation sells a poison without doing what the 17th section provides. The question would arise whether a corporation is within the meaning of the Act. If that question arose it would be said at once by those proceeding against the corporation, "Yes, a corporation is within the meaning of the Act, because the statute of Geo. IV. directly applies here; an offence has been committed, and it is an offence which is punishable not by indictment but upon summary conviction, and being an offence which is punishable upon summary conviction, then the 14th section of the statute of George applies, and the word 'person' is to include corporate bodies."

The Lord Chief Justice: That is the difference between the two. In the one case the penalty is made a matter of penalty to be recovered in a civil suit, and the other, selling otherwise than according to the prescribed regulations of the Act is a matter of summary conviction. That makes just all the difference.

The Attorney-General: But the inquiry would always be, is the corporate body included in this Act? When the Act uses the word "person" does it include corporate body?

The Lord Chief Justice: I quite agree; but you see, Mr. Attorney, if you have to call in another Act which is the Act of Geo. IV. to supplement the omission in this statute, then we are bound to see whether the case under this particular section which we are now called upon to construe comes within the Act of Geo. IV., and it very plainly does not. It is true that in that very next section by a strange legislative inconsistency, with which we are by no means unfamiliar, the offence of selling in a given way is made a matter not of penalty to be sued for by an informer, but a penalty to be recovered on summary conviction. That just makes the difference in the two cases. I would willingly help you if I could, but I do not see my way to apply the statute of Geo. IV. to a case which is neither indictment nor summary conviction.

The Attorney-General: I do not think I have succeeded in making my argument intelligible. No doubt it is my fault. The question is, did the Legislature when it passed the Act of 1868, that is, the Act amending the Pharmacy Act with which we are dealing, intend that "person" should cover a corporate body? You may say it is doubtful when you come to the first section whether the Legislature intended "person" to cover corporate body, but when we come to the 17th section, the Legislature must have intended a corporate body to be included in the word "person," because the Legislature must have known that when the owner of a shop or the person who kept open the shop sold the poison and did not fulfil the conditions of the 17th section he would be liable to be punished on summary conviction, and being liable to be punished on summary conviction, this Act of the 7th and 8th Geo. IV. would apply to him. It would make in that particular case the word "person" include corporation, and it would be very odd if when the proceedings were taken under the 17th section the word person should include, and must necessarily include by virtue of the provisions of the statute, a corporation, and when proceedings are taken under the first section against the same person or against the same body keeping open the shop, that in that case person should be held not to have included corporation. What I would submit to your Lordships is that it would be most extraordinary that the Legislature intended this, having used the word person in several sections of this Act—I point to two, section 1 and section 17—that they should have intended the keeper of a shop to be dealt with under section 1, but that the word person should not include corporations; but that when the same keeper of the open shop, the same shop, was dealt with under the 17th section, then the word person should include corporation. You would have the extraordinary consequence that a corporation might keep open a shop for the sale of drugs, but the moment a drug was sold, not having upon it, or upon the bottle containing it, the proper specified label, that then the corporation would be liable. But, my Lords, apart from this Act of the 7 and 8 Geo. IV., I submit to your Lordships that where we are dealing with an offence, the word person does include corporations. I do not know that there is much authority in the matter, but in the second Coke's 'Institutes' it is referred to.

Mr. Justice Mellor: Is there not a later Act of Parliament?

The Attorney-General: There is Lord Brougham's Act, 13 and 14 Vict. c. 21, which I think is the one Mr. Justice Mellor is referring to. That was an Act for shortening the language used in Acts of Parliament. I do not know whether it applies to this. It says, "All words importing the masculine gender shall be deemed to include females, and the singular shall include the plural."

The Lord Chief Justice: That relates to Acts of Parliament in general.

The Attorney-General: To all Acts of Parliament. "Be it enacted, that in all Acts of Parliament the words importing the masculine gender shall be deemed and taken to include females, and the singular to include the plural, and the plural to include the singular, unless the contrary as to gender or number is expressly provided." It is rather an extraordinary Act, I must say, because there would be this strange inconsistency possible to arise. Possibly you might have an Act of Parliament which said, that every person of the age of twenty-one years of the height of five feet ten inches, should be enrolled in the militia, and according to this, because it is not expressly provided to the contrary, that would include women, which would be curious.

Mr. Wills: My learned friend says that the terms of this Act were applied in the argument whether women could exercise the franchise.

The Lord Chief Justice: Was it said that they were liable to serve in the militia, and therefore were entitled to vote?

The Attorney-General: It was said, my Lord, that a man is a woman, and therefore a woman is a man, and therefore that a woman could exercise the franchise. That argument did not prevail, but why it did not prevail I do not know. I think the statute shows very clearly that although the word used in the Act of 1868 is person and the singular is used, that that would include the plural.

The Lord Chief Justice: I think I understood Mr. Wills to admit that if two partners carried on a business contrary to the Act, and sold poison, they could not say because we are partners we are not each of us individually liable. That I can quite understand, and I take it if this were not a corporation but simply a company of individuals, that their being a company is only another name for a partnership, and that each individual would be liable if he sold poisons in contravention of this Act. The only ground I understand Mr. Wills to put it upon is that a corporation is not in the same position, that they are not a person.

The Attorney-General: That they cannot be hit in any way.

The Lord Chief Justice: That, I understand, is the contention.

Mr. Wills: My Lord, Apothecaries' Hall would be liable to this penalty if it applies to corporations.

The Attorney-General: I believe not.

The Lord Chief Justice: They are all qualified persons.

Mr. Wills: But the corporation is not qualified. The corporation has not undergone examination and has not been registered.

The Lord Chief Justice: All the individuals composing it have.

Mr. Wills: Clearly that makes no difference, my Lord.

The Lord Chief Justice: Are they not examined?

Mr. Wills: No, my Lord. The apothecaries are, but not the corporation.

The Attorney-General: All the apothecaries are examined. If it is necessary I am in a position to prove that all the members of Apothecaries' Hall are apothecaries.

Mr. Wills: That I grant, and therefore they are distinctly excepted from the Act. I contend none of the individual corporators here could be proceeded against.

The Lord Chief Justice: Why not?

Mr. Wills: They do not sell. If I am a shareholder in a railway company, for instance, I have no individual liability for anything the railway does. It is merged in the corporation.

The Lord Chief Justice: Do you mean that if a corporation employ anybody to commit a crime they would not be liable.

Mr. Wills: The individual members would not be.

The Lord Chief Justice: Suppose a corporation instructed their servant in their interest to go and commit a crime. Would you not be individually liable as accessory to the fact?

Mr. Wills: Each person who concurred in it no doubt.

The Lord Chief Justice: Have not these shareholders concurred in directing a person to sell for gain on their own account? They did not individually handle the poison which is the subject matter of this action, but they employed a person, they not being qualified, who sells, not for himself, but for them.

Mr. Wills: Possibly that may be so.

The Attorney-General: This corporation was formed apparently in a great hurry. A Mr. Mackness was the original proprietor of the shop. He was proceeded against for some penalties and immediately turned his establishment into a company limited, and he has all the shares, as you will observe. I am not sure that a number of persons can associate themselves in this way for the purpose of avoiding penalties. The Companies Act of 1862 says that "Any seven or more persons associated for any lawful purpose may by subscribing their names," and so on. The intention of the Legislature was that poisons should not be sold by persons who are not qualified, and therefore I submit that the purpose would not be lawful. I draw your Lordships' attention to the 6th section of the Companies Act, 1862. Part I. is that portion of the Act which relates to the constitution of companies or associations under the Act. Section 6 is this, "Any seven or more persons associated for any lawful purpose may, by subscribing their names to a Memorandum of Association, and otherwise complying with the requisitions of this Act in respect of registration, form an incorporated company, with or without limited liability." Supposing we have a partnership consisting of seven persons, and they keep open a shop for the sale of drugs, and the partners are not qualified—none of them. I say that all ought to be qualified, but I assume that none of them are qualified. Although the statute forbids the sale of drugs, or keeping open a shop for the sale of drugs unless those who keep it open are qualified, then nevertheless by turning this into a company limited or a company under the provisions of this Act, they can go on selling these poisons with impunity. It would be a very strange conclusion. Now, my Lord, if my friend's argument is right a corporation does not come within the Act at all—it is not reached by any provisions of this Act, and therefore a corporation or a limited company might keep open a shop for the sale of poisons without having any qualified person to sell poisons there at all. There might not be any pharmaceutical chemist or any person who was qualified, and they might keep open a shop and sell poisons every day in the shop if they think proper, always provided they put on those poisons the wrapper and so on, without incurring any penalty at all. That was not the contention of these defendants before the County Court Judge. Their contention was, "It is true we do sell poisons, but then in our case all the safeguards are adopted. We do not sell poisons except through the medium of a duly qualified pharmaceutical chemist." But if my friend's contention is right they may sell any poisons they choose. My friend says the assistant can be made liable; I doubt if he can; but a company might have an assistant who was a person of no means whatever, and he would sell the poisons for them. My friend says he would be hit, but the Pharmaceutical Society would have to bring an action in the county court against him for a penalty of £5, and I suppose they would not get sixpence. But I am not sure

that he would be hit, because the sale by an assistant is said by the statute to be a sale by the person who keeps open the shop. I should think the intention was that if the shop is kept open by one person he must be qualified. If it is kept open by two persons both must be qualified. If by three all three must be qualified, or any number they must all be qualified. That is the safeguard which the Legislature intended to impose. It is very like the case of solicitors. There are statutes which relate to solicitors, and I think it is very clear that a solicitor cannot carry on his business unless he be a duly qualified solicitor. He could not take a partner uuless that partner were a duly qualified solicitor, and so on. The Legislature for the purpose of protecting the public and securing that this business shall be duly conducted in the interests of the public, has provided that persons who carry on the business shall have a qualification.

Mr. Justice Mellor: I do not suppose that a company could be incorporated for the purpose of carrying on the business of solicitors by qualified persons or the contrary. I do not see that the probability would exist, but still when you are putting the solicitor as an analogous case we cannot quite assume that that is intended.

The Attorney-General: I submit to your Lordships that neither can persons who carry on the business of selling poisons specified in this Act incorporate themselves. By incorporating themselves, if my friend's contention be right, they put themselves beyond the grasp of the law just in the same way as solicitors would.

Mr. Justice Mellor: I cannot help thinking that in a society of that character any individual member who did an act contrary to law could not plead the authority that he was a servant of the company, but must be himself individually liable for committing a breach of the Pharmacy Act, and that he could not shield himself. I think all the persons being members of a company which is incorporated would still be individually liable for their individual acts.

The Attorney-General: Perhaps that may be so, but supposing that they did not do any acts themselves, but what they did were done by a servant, then they could shield themselves, of course. They would say, "It is true a servant has sold poisons, and we keep open the shop; we have a right to keep open the shop, because we are a corporation. A person in the statute does not mean corporation." I should submit, my Lords, that even putting aside the Act of 7 and 8 Geo. IV. to which I have referred and putting aside Lord Brougham's Act, the word person includes corporation.

Mr. Justice Mellor: Lord Brougham's Act does not seem to go so far in this direction as the 7 and 8 Geo. IV.

The Attorney-General: It does not speak, I think, of bodies politic.

Mr. Justice Mellor: No, I think not.

The Attorney-General: But only that words masculine include feminine, and singular include plural. But even supposing those Acts had never been passed at all, I contend that the word person used in the way in which it is used here would include a corporation. If your Lordships would allow me to refer to the text-books, I will just quote a short passage. 'Maxwell on Interpretation of Statutes,' at page 292, says, "The law seems to be correctly stated," and references to authorities are given which bear out the statement. Speaking of the interpretation of statutes, there is this passage: "In the same way, although the word person in the abstract includes corporation, the Statute of Uses which enacts that when a person stands seized of hereditaments to the use of another person or body corporate, the latter person or body corporate shall be deemed to be seised of them, the word person in the former part of the sentence does not include body corporate." So it would appear from that that where the word person stands alone in a statute, and the words body corporate do not occur at all in the statute, then person includes corporation, and for that proposition the author of this work cites 'Coke's Second Institute,' page 722. Commenting on the provisions of the statute of Elizabeth 29, c. 25, as regards the erection of hospitals and houses of correction, Lord Coke says, "These words regularly do extend to any body politic." These words being, "all and every person or persons seised of an estate in fee simple," and so on. Then in the note on "all and every person or persons," he says, "These words regularly do extend to any public body, politic or corporate, but not such as are restrained by the Act of Parliament to aliens." The words are the same.

Mr. Justice Mellor: Then *primâ facie* any person would include a corporation.

The Attorney-General: Just so; of course, I admit that if in the statute in other parts the words body corporate, say, are used, that those words might show that person or persons were not intended to include body corporate; but if you have in the statute standing alone the word person, *primâ facie* putting all the clauses to which I have referred your Lordships, and the common law, so to speak, together, the word person includes a corporation.

Mr. Justice Mellor: You would say in a case like the present all the inferences are in favour of the construction that corporations were intended to be excluded from dealing in this way just as well as any individual person.

The Attorney-General: Certainly, they come within the mischief intended to be prevented. It would be a most alarming consequence if my friend's contention were right, because if his argument is right, to-morrow any corporation, any co-operative store, any large partnership might set up business and sell poisons either alone or joined with other business, and they might do it with impunity. They are not obliged to do it themselves, they can do it by means of servants or agents, and if the servants or agents were employed they might select such servants or agents as could not practically be made responsible. Surely the intention of the Legislature was to stop this easy sale of poisons. Great disasters arose in consequence of everybody being able, without the slightest difficulty, to get poisons, and either use them for the purpose of poisoning others or of poisoning themselves or of producing mischief of all kinds. Then what the Legislature desired to accomplish was to put a stop to this. They thought the best way was to provide that every person keeping open shop for this purpose should be a pharmaceutical chemist. I do not know, my Lords, that there is any other authority which throws much light on the matter. There is the case of Terry *v.* The Brighton Aquarium Company, in Law Reports, 10th Queen's Bench, 306. That was a proceeding under the 71st Geo. III., chapter 49, which was an Act for preventing certain abuses and profanation of the Lord's day, called Sunday. The part which it is material to draw your Lordships' attention to is this. It is enacted that on and after the passing of this present Act any house, room, or other place which shall be opened or used for public entertainment or amusement, or public debating on any subject whatsoever, upon any part of the Lord's day called Sunday, and to which persons shall be admitted by payment of money, or by tickets sold for money, shall be deemed a disorderly house or place, and the keeper of such house, room, or place shall forfeit a sum of £200 for every day that such house or room or place shall be opened or used as aforesaid on the Lord's day." Some persons in Brighton objected strongly to the Aquarium being kept open on a Sunday, and proceedings were taken against the Brighton Aquarium Company, being a company like this in form, constituted under the Joint Stock Companies Act of 1862 and 1867. Then it was alleged that the Aquarium was a place of entertainment, and that the Brighton Aquarium Company were keepers of that place of entertainment, and it was decided that they were liable. I must not be understood to convey to your Lordships' mind that this point as to whether the com-

pany would come under the word keeper was distinctly raised. It would not seem to have been so. A special case was stated, no one disputed it for a moment, and the court did not seem to entertain any doubt that the Aquarium Company would come under the term "keeper," and if you substitute the word person for keeper, the case would be exactly similar to the present. With these considerations I submit to your Lordships that the judgment of the County Court was wrong. It is perfectly clear it was wrong upon the grounds upon which the learned judge decided it, for my friend in fact admits that it was wrong; but I also submit that it is wrong for this reason, that this legislation was intended to be directed against companies and corporations, in fact against anybody, and was intended to prevent the sale of these exceedingly dangerous poisons, except by persons who were duly qualified.

Mr. Wills: My Lords, I have to submit to your Lordships, on behalf of the respondents in this case, that the word person as used in this statute does not and cannot be meant to include corporations, and I think when you review the terms of all the provisions of the statute you cannot come to any other conclusion. My Lords, it may be, and probably is, that the particular state of things which has arisen now is a *casus omissus* by the Act. It is impossible to doubt that in 1868, the practice of selling and compounding medicines, and amongst them medicines which would contain the ample list of poisons which is contained in the schedule to this Act, and which list can be added to at any moment by the Council of the Pharmaceutical Society, under section 1, with the sanction of the Privy Council—it is impossible to doubt that when the Act passed there had already grown up a great number of corporations, which were in the nature of what we may call co-operative stores and associations of that kind, which were in the habit of making up physicians' prescriptions for sale, and it matters not whether they did so to their own members or to the public generally, because if they did so to their own members they would have come within the prohibition to sell, although it might not be that in that case they could be considered as keeping open shop. They would be equally within the prohibition of selling, and the result of the construction which your Lordships are asked to put upon this statute would be to shut up that department of all these numerous institutions throughout the country. And, as I submit to your Lordships, and I think it is a very good illustration of my argument, that Apothecaries' Hall would be equally liable to the penalties of the Act; because although it be true that each one of the individual members of that corporation may be duly qualified,—and I have no doubt that they are, I do not suggest that they are not,—yet if an action were brought for this penalty against the corporation it would be urged, as I submit with perfect truth, that the corporation was a different entity in law.

The Lord Chief Justice: That is perfectly true, when you come to the question of suing, but when you come to the question of committing an offence, the corporation ceases to be a corporation. If any members of the corporation have concurred in committing an offence each is individually liable, for the criminal law knows of no corporations.

Mr. Wills: This is not a proceeding against an individual; it is a proceeding against the corporation. It is not against Mr. Mackness or any of the constituent members, but against the corporation.

The Lord Chief Justice: That is true. Therefore you may say that even granted that corporations when dissolved or disunited and resolved into their constituent elements, namely, the individuals composing them, the individuals may be liable if they have all joined and concurred in committing an offence; but that when they are treated as liable in the aggregate, then you are entitled to treat them as a corporation.

Mr. Wills: Yes, my Lord. The distinction between individual corporations and a corporation is well known in law. It lies at the foundation of a great deal of our jurisprudence.

Their Lordships consulted together a few minutes.

The Lord Chief Justice: I think, Mr. Wills, you have hit the nail on the head. You have raised a difficulty we do not see our way to get over. The statute applies to persons; but a corporation is not a person in this sense, that in its aggregate and corporate character it can be guilty of a crime or offence. I am very far from saying that if it is resolved into the persons who, in the aggregate, constitute the corporation, all those persons, although as a body they have committed an offence within the Act, every individual who has committed an offence, every member of the corporation who has been incorporated will be liable as a person, and cannot avoid the consequences of committing the offence to which they have been parties by saying, "Oh, we were members of a corporation aggregate and as such committed this offence." When you come to deal with the criminal branch of justice, the law knows no distinction between persons and corporations and all the persons constituting the corporation which has committed an offence, each of them is individually liable. It may be that each individual constituting this corporation may be liable within this statute, but here we have a case not of individuals sought to be made liable, but a corporation sought to be made liable in a suit to recover a penalty. Therefore, we have to bring them within the Act of Parliament so as to be subject to that penalty which is sought to be recovered. Therefore, we think you are well founded when you say that, as a corporation, as an aggregate corporate body, they cannot be held to be guilty of this offence within the terms of the Act of Parliament which relates to a person. I think that argument is well founded. You must resolve them into their individual character and condition before you can make them liable at all. You can only make them liable as individual persons, and a corporation is not a person for the purpose of committing an offence. I think, therefore, that though they might have been in that individual character and capacity sued for this penalty, each of them individually—it is not necessary to decide that on the present occasion, but assuming it to be the case, and I am very strongly inclined to think it is so—still they are not in their corporate capacity within the Act, and therefore are not liable to be sued in that capacity for a penalty which each of them might possibly individually have incurred. I think that position is impregnable and that you are well founded in it.

The Attorney-General: I do not know whether your Lordship would think it right in this case to give the Council of this Society leave to appeal.

The Lord Chief Justice: I think so, Mr. Attorney, if you think on consideration it is desirable.

The Attorney-General: I mention it for this reason; there seem to be several cases that have decided that a corporation may be indicted and a corporation may be sued for a tort.

The Lord Chief Justice: Sued for a tort; that is beyond all possibility of doubt, because there they employ their servants, and for negligence or nuisance or anything of that sort undoubtedly they may; but here you want to bring them under the term "person," that is the ground on which I go.

The Attorney-General: I do not wish to carry on the discussion; I only wish to mention that there are authorities which show that they are liable for a non-feasance and for a misfeasance, and that in such cases corporations are always indictable.

The Lord Chief Justice: If you wish to address us further on that point, it is not too late. You see what the point is that is in our minds, that you have to bring "corporation" within the term "person." That is the difficulty of the position.

The Attorney-General: That is so. The statute for-

bids a person doing a certain thing. Then I say the statute forbids a corporation doing the thing.

The Lord Chief Justice: Just cite those cases.

The Attorney-General: The cases to which I wish to draw your Lordships' attention are these:—The first case is Yarborough *v.* The Bank of England, 16th East, p. 6. In the case several instances are given of actions against corporations for false returns to writs of mandamus. Then there is The Queen *v.* Birmingham and Gloucester Railway Company, 3rd Queen's Bench, 223.

The Lord Chief Justice: What was that?

The Attorney-General: That was a case in which the corporation was indicted for a non-feasance. And then there is a case in which a corporation was indicted for a misfeasance. That was the Queen *v.* the Great North of England Railway. That is in the 9th Queen's Bench, 315. That case I have in my hand.

The Lord Chief Justice: What sort of misfeasance was it?

The Attorney-General: I will read it to your Lordship. This is the head note. "A corporation aggregate may be indicted for misfeasance, as an incorporated railway company for cutting through and obstructing a highway by works performed not conformable to the powers conferred on the company by Act of Parliament."

The Lord Chief Justice: Committing a nuisance.

The Attorney-General: And are indictable.

Mr. Justice Mellor: There it is a company formed for the purpose of making a railway. Of course for doing an act beyond their powers they may be indicted, but is not that because the very object of their incorporation was to make the railway?

The Attorney-General: No, my Lord; perhaps I had better read the judgment. The Lord Chief Justice delivered judgment. He said, "The question is whether an indictment will lie at common law against a corporation for a misfeasance, it being admitted, in conformity with undisputed decisions, that an indictment may be maintained against a corporation for non-feasance. All the preliminary difficulties, as to the service and execution of process, the mode of appearing and pleading and enforcing judgment, are by this admission swept away. But the argument is, that for a wrongful act a corporation is not amenable to an indictment, though for a wrongful omission it undoubtedly is; assuming in the first place that there is a plain and obvious distinction between the two species of offence. No assumption can be more unfounded. Many occurrences may be easily conceived, full of annoyance and danger to the public, and involving blame in some individual or some corporation, of which the most acute person could not clearly define the cause, or ascribe them with more correctness to mere negligence in providing safeguards or to an act rendered improper by nothing but the want of safeguards. If A is authorized to make a bridge with parapets, but makes it without them, does the offence consist in the construction of the unsecured bridge or in the neglect to secure it? But, if the distinction were always easily discoverable, why should a corporation be liable for the one species of offence and not for the other? The startling incongruity of allowing the exemption is one strong argument against it. The law is often entangled in technical embarrassments; but there is none here. It is as easy to charge one person, or a body corporate, with erecting a bar across a public road as with the non-repair of it; and they may as well be compelled to pay a fine for the act as for the omission. Some dicta occur in old cases: 'A corporation cannot be guilty of treason or of felony.' It might be added 'of perjury or offences against the person.' The Court of Common Pleas lately held that a corporation might be sued in trespass (Maund *v.* The Monmouthshire Canal Company, 4 M. and G. 452), but nobody has sought to fix them with acts of immorality. These plainly derive their character from the corrupted mind of the person committing them, and are violations of the social duties that belong to men and subjects. A corporation, which, as such, has no such duties, cannot be guilty in these cases; but they may be guilty as a body corporate of commanding acts to be done to the nuisance of the community at large. The late case of Regina *v.* Birmingham and Gloucester Railway Company (3 Queen's Bench, 223) was confined to the state of things then before the court, which amounted to non-feasance only; but was by no means intended to deny the liability of a corporation for a misfeasance." Now, my Lord, it is not because the railway company is incorporated to do an especial thing, but because outside their powers and without any sanction at all for what they are doing they commit an act which, if done by an individual, would be a nuisance. And this case clearly shows that for doing such an act, as, for example, cutting across a public road, they are guilty of an offence and can be indicted. The first difficulty my friend raised on this point is this, not that the corporation has not committed an offence; he does not say that the corporation has not kept open a shop for the purpose of selling poisons in defiance of the Act of Parliament, but that the corporation cannot be proceeded against for that offence; the members of the corporation can be proceeded against, but not the corporation. Such an argument would apply exactly in the case of a railway if a railway has committed an offence; it may be a common law offence or it may be an act which is made an offence by statute. The argument may apply in this case. It may be said that every individual member of the corporation, at all events, who was concerned or had a knowledge that the offence was committed would be liable, but the corporation cannot be liable. Then I may refer to this, that it was decided in a case not long ago that a corporation might be liable for a libel. The corporation published a libel and were held criminally liable for that.

The Lord Chief Justice: Was it held that they could be made criminally liable?

The Attorney-General: I am not quite sure.

The Lord Chief Justice: What could you do with them? Take them all to prison?

The Attorney-General: If the corporation were indicted that might be a difficulty.

The Lord Chief Justice: That is the necessary consequence of a conviction for misdemeanor.

The Attorney-General: Then would arise the impossibility of dealing with the corporation itself. One consequence of a conviction would be that the corporation might be fined. The cases I have cited to your Lordships show that the corporation may be indicted.

The Lord Chief Justice: May be indicted in certain very particular cases.

The Attorney-General: For a non-feasance or a misfeasance, and as my friend Mr. Lumley Smith reminds me very properly the 7 and 8 Geo. IV., c. 28, so far as the indictments for offences are concerned, makes the word "person" include "corporations." Then supposing an act is done by a corporation which is an indictable offence, then, according to this statute, "wherever this or any other statute relates to any offence, whether punishable upon indictment or summary conviction, in describing or referring to the offence or the subject matter on or with respect to which it shall be committed, or the offender or the party affected or intended to be affected by the offence, hath used or shall use words importing the singular number or the masculine gender only, yet the statute shall be understood to include several matters as well as one matter and several persons as well as one person and females as well as males and bodies corporate as well as individuals."

Mr. Justice Mellor: That is clear. So far as an offence is punishable upon indictment or summary conviction, there, undoubtedly the word "corporation" would be included within its purview.

The Attorney General: Then what becomes of my friend's point that a corporation cannot be proceeded against; and that if any proceedings are to be taken

they must be taken against the members of the corporation? That is my friend's point.

The Lord Chief Justice: No doubt, that is the point that struck us.

The Attorney General: That is the point my friend now makes. What I thought was going to be my friend's point was the other one. If I had thought this was his point I ought to have met it before, but what I thought my friend's point was going to be was this, that owing to some peculiar language on this statute of 1868, it was manifest the Legislature did not intend to include "corporations" under the word "person."

Mr. Justice Mellor: It is an observation on that statute 7 and 8 Geo. IV., that if your argument was right it would hardly be necessary to have provided that individuals as well as corporations should be liable, so far as it provides for that.

The Attorney General: In some Acts it might not be necessary to do it. I suppose in some Acts it would not be necessary to say that the singular includes the plural, or the plural the singular. But I use it against my friend's present contention, as well as I understand it, that although an offence may be committed by an entity, the corporation, yet, nevertheless, you cannot make the corporation liable, because you cannot subject a corporation to this liability, and if you proceed against anybody you must not proceed against the corporation, but against the members forming the corporation. With great submission I should submit to your Lordships that these cases are clear for the purpose of showing that a corporation may commit an offence unless it is an offence which depends upon the condition of mind, and a corporation has no mind. I suppose if an offence depended on the condition of the offender's mind the corporation could not be made liable.

The Lord Chief Justice: It has no conscience.

The Attorney-General: But when you have an offence which does not depend on the condition of the offender's mind, for example, such an offence I should say as publishing a libel,—I am not sure that there was a criminal proceeding in that case, but such an offence as obstructing a highway.

The Lord Chief Justice: What does your learned junior say? Have you any case, Mr. Smith, in which a corporation has been held to be indictable for a Libel?

Mr. Lumley Smith: It was an action, my Lord.

The Attorney-General: I did not obtain the information that it was a criminal proceeding from my learned friend. He rather corrected me. I thought it was, from my recollection. My friend told me that I must not state that until he had found the case. Then there is the case of Green *v.* The London General Omnibus Company, in the 29th *Law Journal*, N. S. Common Pleas, p. 13. That was the case, I admit, of an action: "In an action against a corporation who were incorporated for the purpose of driving omnibuses. They interfered with the plaintiff's business of carrying passengers by driving the omnibuses of the corporation in such a manner as to molest him in the use of the highway. The declaration set out various acts of such interference, which were all connected with the driver of such omnibuses, and were alleged to have been wrongfully and maliciously committed by the corporation. Held, on demurrer, that the action would lie against the corporation, although the acts complained of were done wilfully, since they were done within the purpose of the corporation, and in such a manner as to constitute an actionable wrong if done by an individual."

The Lord Chief Justice: No doubt a corporation is liable for the acts of its servants.

The Attorney-General: Applying that to this case, that an action would lie against a corporation, although the acts complained of were done wilfully; here there is an action against a corporation, and the acts complained of are done wilfully.

The Lord Chief Justice: Here is an action against a corporation founded on an offence. There it was simply for a civil wrong. The first question is whether a corporation can commit such an offence as that under the statute, in the second section; and whether, if it could, it is brought within the statute by the term used—"person."

The Attorney-General: No doubt, my Lord; but that is another question. My friend's contention at present is, that if this act has been done the corporation *quâ* corporation cannot be sued; if you sue anybody you must sue the members of the corporation. Whether the Legislature intended a corporation to be embraced under the term "person" is another question; but what I submit is, that what the Legislature intended was, that nobody should do this act unless he was a properly qualified pharmaceutical chemist, and if a corporation choose to do it, not being a qualified pharmaceutical chemist, the corporation is liable for the penalty, and then there could be no difficulty, unless my friend's point is right, that a corporation cannot be proceeded against for such an act. Of course, my friend might say, for example, that there are in this statute provisions for the examination of pharmaceutical chemists, and so on; he might say that a corporation cannot be well examined as to its knowledge of drugs, pharmacy, and so on. But my answer to such an observation is this, that that is the misfortune of the corporation, and if a corporation cannot be examined, then it cannot be admitted as properly qualified and registered as a pharmaceutical chemist.

Mr. Justice Mellor: You say it only applies to persons who are to be examined?

The Attorney-General: The prohibition applies to everybody, but the only persons who can come within the provisions of this Act, and keep open shops for the purpose of vending poisons, are persons who can be examined and who can be registered and who can be admitted as duly qualified to be pharmaceutical chemists. If your Lordships forgive me for one moment I think the judgment of Chief Justice Erle in this case is important.

Mr. Justice Mellor: That is against the Omnibus Company?

The Attorney-General: Yes, my Lord. My friend there, Mr. Giffard, seems to have argued very strenuously that this proceeding could not be maintained against the Omnibus Company, and my friend's argument is this. He says, "The gist of this action is the malicious intention, and it is submitted that a corporation which has no soul cannot be guilty of a malicious intention." In the case of Sutton's Hospital, it is said that corporations aggregate cannot commit treason nor be outlawed nor excommunicated, for they have no souls, and my friend's argument seems to have been based a great deal on that, that corporations could not entertain a malicious intention because they had no souls. Then the Chief Justice says, "In this case we are of opinion that judgment ought to be for the plaintiff. This was an action brought against the defendants for interfering with the rights of the plaintiff by driving their omnibuses in such a manner as to molest him in the use of the highway. The declaration sets out various grievances which fall under that general description. There is a demurrer to that declaration and on that demurrer we are called upon to give our opinion whether the action lies."

Mr. Justice Mellor: Would not the conduct there attributed to the defendant have been by itself, although not so called by name, an offence?

The Attorney-General: I think that would have been an indictable offence; it is obstructing the highway. I suppose, from the short description given in the headnote, this is the case which would be ordinarily known as a case of nursing, where one omnibus drives immediately in front of the other and waits upon it during the whole course of its journey and, in fact, prevents its using the highway in the way in which it ought to be allowed to use it, which prevents passengers getting to it, and so on. Then, Chief Justice Erle says, there is a

demurrer, and so on. "The ground of the demurrer relied upon for the defence is that the charge is a charge of wilful and intentional wrong, and that a corporation cannot be guilty of such wrong and, therefore, that an action does not lie. But I should state that the whole of the acts that are charged against the defendants are acts connected with the driving of their omnibuses, and this is a company incorporated for the purpose of driving omnibuses and, therefore, the actual things done by the defendants are acts within the purpose of their incorporation. Unless they had been wrongfully done, of course there could be no ground of complaint, but, being wrongfully done, we think clearly an action lies and that there are abundant authorities to show that, under these circumstances, the action will lie. I take the whole tenour of authorities from Yarborough *v.* The Bank of England down to the case of Whitefield *v.* The South Eastern Railway Co. to show that an action for a wrong does lie against a corporation where the thing done is within the purpose of the corporation."

Mr. Justice Mellor: You say that the purpose of this company is to sell all sorts of articles—food, medicines and so on—indiscriminately?

The Attorney-General: It is obvious it was the particular purpose of its incorporation. If I may travel a little out of the facts, when the owner of this business—

Mr. Wills: I object to your going beyond the case.

The Attorney-General: The case states that before it was incorporated it was a general grocers' business, and one of the objects with which it was incorporated was to carry on this place where poisons are to be sold. That is not the only object, but it is one of the objects. Then, says the Chief Justice, "These authorities show that an action for a wrong does lie against a corporation where the thing done is within the purposes of the incorporation, and that it has been done in such a manner as to constitute what would be an actionable wrong if done by a private individual. The doctrine that was relied upon by Mr. Giffard is of rather more quaint than substantial form, that because a corporation has no soul, therefore it is incapable of a malicious intention. We are not in the smallest degree interfering with prior decisions. On the contrary, there are numerous authorities, of which Yarborough *v.* The Bank of England, where there was a well considered and elaborate judgment going over all the previous cases, is by no means the first, in support of the principle upon which we rely; and I may add, as an additional reason for our decision, the inconvenience to the public that would arise if you were to hold that these companies, incorporated for the purpose of trade, had a restrictive limitation put upon their liability by reason of such incorporation, and were exempt from responsibility because they intentionally wronged the public. We think it extremely important where such companies admit that they have, in fact, intentionally committed a wrong, that the public should have a remedy against them, and not be driven to an action against their servants and others whom they have employed, who may be entirely incapable of giving that recompense which the law may award."

The Lord Chief Justice: Having heard Mr. Attorney on this, we shall now wish to hear you, Mr. Wills. I do not know whether you have done, Mr. Attorney.

The Attorney-General: Then there is the case of Whitefield *v.* the South Eastern Railway Company. That is a case of an action, I admit. There it was held on demurrer that a company might cause publication of a libel under such circumstances as would imply malice in law sufficient to support an action. That, no doubt, was an action for libel, an action for a publication which might either be the subject of civil proceedings or criminal proceedings.

The Lord Chief Justice: But which is made the subject there of civil proceedings.

The Attorney-General: No doubt, my Lord. So, my Lord, in this particular case with which you are dealing.

The Lord Chief Justice: You see the difference is that the right to bring a civil action is founded on an offence. It so happens that libel and one or two other things, like conspiracy, may be on the confines of the two great branches of law, civil and criminal, and make the party who published such a libel responsible in both. It is not because it is an offence that therefore he gets his civil remedy, but he gets his civil remedy quite irrespective of the criminal law.

The Attorney-General: I feel that is so.

Mr. Justice Mellor: Still—I only throw this out—a libel may have not only civil consequences, but also criminal consequences. A libel may be an offence, and yet it may be sued for in damages. It may be an offence in which, if the corporation may be guilty of it, the question would be how the corporation could be punished. That is the difficulty, and I do not see my way out of it quite. What is the course?

The Lord Chief Justice: Assault is another instance in which a person may be proceeded against civilly or criminally. Are you sure the corporation could not still commit an assault?

The Attorney-General: It could not be indicted for an assault.

The Lord Chief Justice: How could a corporation commit an assault except through its beadle, if it had one?

The Attorney-General: That difficulty would apply to every case where a corporation is indicted. Let me take it by steps. It is clear, according to the authorities, it may be indicted for a non-feasance, and also for a misfeasance, or misfeasances of a certain character. But this remark might be made in all these cases, How can you deal with a corporation when you try to indict them? If a corporation is indicted, and is found guilty by the jury, the corporation cannot be committed to prison; that is the difficulty, undoubtedly. But a corporation may be fined and the corporation's property seized and taken in execution.

Mr. Justice Mellor: The old view seems to have been consistent that a corporation cannot be indicted, and, therefore, there is no question about the punishment. You say, since the establishment of the doctrine that they can be indicted for certain offences and punished somehow—you say that it means punished by such punishment as is appropriate to a body corporate?

The Attorney-General: Suppose a corporation commit an offence, for example, the corporation obstruct a highway and they are indicted for it. I do not see what is to prevent the Court fining the corporation a large sum of money, and if the fine were imposed the corporation would be obliged to pay. Would you allow me to draw attention again to the earlier part of the judgment of Mr. Justice Denman in The Queen *v.* The Great North of England Railway. His lordship's reasoning seems to be very logical and very accurate. "The question is whether an indictment will lie at common law against a corporation for a misfeasance, it being admitted, in conformity with undisputed decisions, that an indictment may be maintained against a corporation for non-feasance. All the preliminary difficulties, as to the service and execution of process, the mode of appearing and pleading and enforcing judgment are by this admission swept away. But the argument is that, for a wrongful act, a corporation is not amenable to an indictment, though for a wrongful omission it undoubtedly is." I only wish to call your attention to that part of the judgment that Lord Denman says there might be difficulties—difficulties can be suggested no doubt. That is the meaning of what he says as to the precise execution of the process, the appearances, the pleadings, and the enforcement of the judgment. These difficulties do occur to the mind, but then the moment you get it admitted, and this admission was compelled in this case, because the authorities obliged the admission to be made—the

moment you get it admitted, that the corporation can be indicted for anything—for a non-feasance—then all these difficulties as to process, as to judgment and execution of judgment and so on, do not present themselves. I cannot myself understand if a corporation can be indicted for a non-feasance, why it cannot be indicted for a misfeasance, and if it can be indicted for such a misfeasance as obstructing a highway—that is to say, if it does that when it had no power to do it conferred upon it by charter or Act of Parliament, or in any other way—why it should not be indicted for publishing a libel. I do not say that I can cite a case to your Lordships in which a corporation has been indicted for publishing a libel, but does it not follow from the principle that if a corporation can be indicted for obstructing a highway, or such an act as that of misfeasance, publishing a libel is a wrong of the same character, and one cannot quite see why a corporation should not be indicted for the publication of a libel, or, indeed, for any offence which does not depend and depend altogether upon the state of mind of the offender.

The Lord Chief Justice: I will tell you how it occurs to me. The cases you have just been mentioning are cases in which I think the proceeding is of a criminal character, and is *in pœnam*, but, in fact, it is only a means of enforcing a civil right. A misfeasance or non-feasance by a corporation in respect of something which is a nuisance to the public, and therefore, a nuisance to each individual of the public who has a right to have the whole of the way unobstructed, or to have any way made, or any other such similar matter which is really a matter of civil remedy. The withholding a writ is a civil wrong; although the form is penal, in reality the remedy is civil. But it is a very different thing when a statute creates an offence and imposes a penalty, and then you seek to make a corporation responsible in a suit against them to recover that penalty. It strikes me that there is a substantial distinction, and it would be a very different thing to say that a company may occasion a nuisance by leaving a bridge unfinished or a road unrepaired which they were bound under the Act of Parliament to make, or creating a nuisance by the obstruction of a highway, for which they may be responsible in their aggregate capacity; but when you are dealing with a case of crime where there is no civil wrong done, where there is an offence against an Act of Parliament, it does strike me that there is a good deal of difference between the two.

The Attorney-General: There may be a difference. No doubt there is a difference in the nature of the offences. In one case it may be said that though a corporation is proceeded against for an offence by means of indictment, that is used practically for the purpose, so to speak, of enforcing a civil remedy; but do not the cases show that there is nothing to prevent a corporation being proceeded against as a corporation for a wrong, and I would submit to your Lordships that the Legislature in the 7 and 8 Geo. IV. has recognized that a corporation may commit a criminal offence, and, if a corporation does commit a criminal offence, then there is nothing to prevent the corporation being indicted or proceeded against criminally for it. My object in reading this is to show your Lordships that the Legislature has recognized that a corporation may commit an offence, and that, having committed that offence a corporation may be proceeded against by indictment or by information in its corporate name, and it is not necessary to resolve it into its constituent elements, and proceeding against the members individually. [The learned Counsel again quoted the section of the Act of Geo. IV.] Now surely that is a legislative recognition that there are statutes which create criminal offences which may be made punishable either by indictment or by proceedings of a summary character, and that corporations may commit those offences and be indicted or be proceeded against in and by summary proceedings as corporations, and it is not necessary to proceed against them for such offences individually.

The Lord Chief Justice: The statute would seem to recognize that without a statutory enactment the term person would not include a corporation, because otherwise you would not have wanted this particular provision with regard to bodies corporate. Then that being so we have to see whether the terms of this enactment are such as to comprehend a case which is neither one of indictment nor of conviction. You would not have wanted the enactment but for the inability to make a corporation criminally responsible. So far as the enactment goes it would make a corporation be included under the term person, but only so far as the enactment goes.

The Attorney-General: It may be said the Act would not have been wanted if person included corporations. But then I suggest to your Lordship that this form of Act may be merely declaratory. One would have said that Lord Brougham's Act was not wanted.

The Lord Chief Justice: It cannot be declaratory; it goes too far for it. It is a new provision. It is rather going beyond the preceding law, is it not?

The Attorney-General: Supposing in some statute, for example, it declared that if any person committed an offence of a particular description, which might well be committed by either a man or woman, could it be contended that it was not an offence if committed by a woman—the Legislature did not intend that woman should be included as well as man. Or suppose before this Act of Parliament the 7th and 8th Geo. IV. was passed, some statute had declared that it should be an offence to do so and so, and that act might be well done either by one person or by any number of persons, I should think it would hardly have been said that any express statute was necessary for the purpose of showing that the Legislature intended that provision to apply to a number of persons as well as to one person. So with regard to Lord Brougham's Act, that says masculine shall include feminine, and the singular plural, and so on. I should think that without Lord Brougham's Act it would be always a question what the intention of the Legislature was, and one would have to read through the statute and compare its various provisions carefully to see whether the Legislature had intended it to apply to both masculine and feminine, singular and plural, and so on. I should submit that, so far as this is concerned, it is not absolutely a new provision; but, supposing it were a new provision, all I want to cite it for is for the purpose of showing that where a corporation may commit an offence which is a criminal offence, and have committed that offence, it may be proceeded against *quâ* corporation. There is nothing in the fact that a corporation is an entity, so to speak, an essence, or an abstraction, to prevent it being proceeded against by indictment or by an application for summary conviction. But then supposing for a moment that the conclusion to be derived from this section of the Act of Parliament is this, that in an Act of Parliament creating a criminal offence, that is to say, an offence punishable on indictment or upon summary conviction, a corporation will not be included under the word "person," because this statute has been passed for the purpose of providing that it shall be included under the word person. But assuming for a moment it is admitted that in such a statute as that, if the word person is used corporation is not intended, that argument does not carry my friend to the extent to which it is necessary he should carry it, because in the case of the Act of 1868 the offence in respect of which or for the commission of which the proceedings against the corporation are instituted is not an offence either punishable upon indictment or summary conviction. It is an offence it is true, but it is an offence, I do not say whether it is right to use the word punishable, but it is punishable by means of proceedings in a civil court by fine, the fine being leviable by proceedings in a civil court. Then we cease to be embarrassed by any inference to be drawn from this 14th section of 7th and 8th Geo. IV.; and the only question which remains is whether the provision only applies to

statutes by which offences are created which are punishable by indictment or upon summary conviction. We get rid of any embarrassment arising from that, and we come to this, whether there was an intention in 1868, in this Pharmacy Amendment Act, to include under the term "person" a corporation. If the authority which I have cited from Lord Coke be correct, *primâ facie*, in a statute "person" does include corporation; and if of course it can be shown not to include it—if you can point to some provision in the Act which indicates an intention not to include it—well and good; but if there are no provisions indicating the intention of the Legislature not to include them, then the meaning of "person" or "persons" must be taken to embrace a corporation. Then there is this further point upon this somewhat technical contention of my learned friend, which is this. I do not know that this was at all taken in the county court; but supposing the action had been brought in the superior court instead of in the county court, then even if it were intended to make the individual corporators or members of the corporation liable to this penalty, it would have been quite open to the plaintiffs to sue them all by the name of the firm, and the name of their firm is the name of their corporation, and I believe the same provision prevails in the county court. In the county court co-partners may sue and be sued in the name of their firm. Of course, if my friend's contention is right, instead of proceeding against the corporation itself, the action ought to have been brought against the individual members, as members of a partnership. Then they would be members of a partnership and they have all combined in doing something which is illegal, and therefore they would all of them be suable; there would be nothing wrong in suing them in the name of the firm instead of using every individual name. Therefore I should submit to your Lordships that so far as this point is concerned my friend cannot succeed in showing that a corporation cannot be dealt with simply because proceedings will not lie against them for such an act as the act they have committed in the name of the corporation. Of course the question whether it was the intention of the Legislature to include a corporation or make this prohibitory provision applicable to a corporation is a question of the intention of the Legislature to be ascertained by reading the words of the Act of Parliament, and I say if your Lordships look to the manifest end the Legislature had in view, to the mischief which was to be remedied, and to the disasters or the evils which were intended to be put a stop to; and if you consider the various sections of the Act of Parliament, I think you will come to the conclusion that it is very apparent what the Legislature did clearly intend, and it was this, that everybody should be prevented—every person and every body, every company and every body corporate, every person and body, in fact, should be prevented—from keeping open shop for the sale of poisons, those poisons that are specified in the schedule, unless such persons, or company, or body corporate fulfilled the conditions specified, that is to say, unless they were pharmaceutical chemists, unless the person was a pharmaceutical chemist, unless the partnership was a pharmaceutical chemist, and unless the company was a pharmaceutical chemist. It may be said that a company cannot be a pharmaceutical chemist, but that is its misfortune. It would be then just in the same position as a person would be who could not pass the requisite examination and could not get registered, and could not get duly qualified. The Legislature would say to such a person, We are extremely sorry that you are to be prohibited from keeping open a shop for the sale of poisons because you cannot satisfy the requirements of the Act. And so the same remark might be made to the corporation, You cannot become a pharmaceutical chemist, but nevertheless, you must be prohibited from carrying on this business and keeping open shop for the sale of poisons.

Mr. Wills: There is a great deal of my friend's argument which I think is hardly directed to the proposition I ventured to submit to your Lordships, because I never ventured to submit that it was impossible for a corporation to commit an offence, or that it was impossible that a corporation could be proceeded against in some instances criminally as well as civilly The books are full of cases in which corporations may be for some purposes proceeded against criminally. But what I was venturing to call your Lordships' attention to was, that there is a sharp distinction in law between individual corporators and the corporation which is the creation either of the Legislature or of the common law, where the corporation exists at common law, and that the individuality of the particular persons who happen to be the persons making up the corporation is lost and merged in that statutory or common law entity, which either under an Act of Parliament, or under a charter, constitutes a corporation. Then I was going on afterwards to show your Lordships that there are many passages in this Act where, as it seems to me, it is impossible that the word person can be intended to comprehend a corporation. I was going to ask your Lordships to put the same interpretation on the word person in one part of the Act as will be put in the other, and I was going to submit that by that process it was impossible that the word person can have been intended in this Act to constitute, to include a corporation. My Lords, I was venturing to illustrate the great importance of the issues raised in this case by reason not merely of the numerous cases there are existing now and were existing in 1868, when this Act of Parliament passed, of co-operative stores and other similar institutions which made up medicines and do make up medicines by means of persons whom they employ for the purpose, who would be liable to the penalties of this Act, however qualified the persons whom they employ may be, if the contention of my friend is right. And I venture to push the illustration a step further, and I really think he will be unable to displace me on that proposition, that if he is right in his contention the Apothecaries' Hall itself will fall within the penalties of this Act of Parliament, because, being a corporation, it is impossible that it can comply, any more than the corporate body whom I represent here can comply, with the sections of the Act of Parliament which prescribe the various qualifications, because it cannot undergo examination; and I think I should somewhat hesitate in admitting what my friend says, that even all the individual members of the Corporation of Apothecaries' Hall, that is to say, the licentiates, are persons who would be registerable under this Act of Parliament, because when I come to look at it so far is that from being the case, that the first Act which gives their constitution to the body of the pharmaceutical chemists, and provides them with a council, and so on, actually provides that no members of the medical profession, and no person who is practising under a diploma or licence of a medical or surgical body, shall be entitled to register under this Act. I presume that the word applies to licentiates of Apothecaries' Hall, who practise medicine and surgery by reason of their qualification in that respect.

The Lord Chief Justice: They are incorporated by charter.

Mr. Wills: By an ancient charter of James I., and several successive charters. The history of those charters is contained in the recitals to the Act of 53 Geo. III., chap. 94, which is the one under which at the present moment, although it has been modified by subsequent legislation, they have the power to grant licences to practise surgery. And the individual members of the Apothecaries' Hall would no more be entitled to the benefit of this Act if they were keeping open shop for the sale of poisons than I should be, or any person who has nothing whatever to do with the matter. There is a special exemption made with regard to them in the 17th section of the Pharmacy Amendment Act, by which it is provided that they should not be liable to the penalties of

that section and that section only, and that therefore is confined to the persons who make up their own medicines for their own patients; therefore a licentiate of Apothecaries' Hall would be a person who if he kept open shop for the sale of poisons would be within the penal clauses of this Act just as much as I should be. Therefore the individual corporators who constitute the body popularly known as Apothecaries' Hall would be liable, I will not say every one of them, but most of them at all events, and I should think every one of them, would be liable.

The Attorney-General: Section 16 provides for that. It says the Act should not interfere with the business of any legally qualified apothecary.

Mr. Wills: That does not mean this business. However I will come to that presently. I do not think that exemption covers it. It certainly did not under the old Act, because under the old Act there was no exception at all. Now, my Lord, I am going to show your Lordships various passages in the Act where it seems to me impossible to read the word "person" as comprehending corporation, and I venture to observe at the outset that that is not because there may be a *casus omissus* and it is not because something you Lordships may think it is desirable for the Legislature to have intended, but which *per incuriam* the Legislature has forgotten or forborne to enact, that a strained legal interpretation is to be put upon the Act.

The Lord Chief Justice: I quite agree to that.

Mr. Wills: I had a painful illustration of that the day before yesterday when your Lordships were unable to do what you thought would have been straining the words of an Act of Parliament in a case in which I appeared before your Lordships—although you thought justice would emphatically require such a construction, but it could not be done.

The Lord Chief Justice: It is no business of ours to legislate. I wish that were always remembered.

Mr. Wills: Especially is that the case, if I may venture to say so, in respect of penal consequences of Acts of Parliament. The courts will not take upon themselves to impose penalties even on corporations or persons which the Legislature had not in terms imposed, however desirable it may be in order to complete the full round of legislation. Now, my Lord, I venture to call in aid a good deal of authority cited to your Lordships by my friend to this extent, that it does show that there is a rooted distinction in law between a corporation and an individual, because all the argument and all the decision which my friend's case embraces would not have been necessary if there had been, as he really contends, or almost contends, in legislative language no distinction to be drawn between the case of persons and corporations. And the Act he cited with respect to the interpretation of statutes, I had put down as one of the weapons I desired to draw out of my own armoury, because it seemed to me to indicate that the Legislature felt the necessity for enacting that in certain classes of cases "persons" should be taken to include corporations, and thereby indicating that unless some such provision as that existed *primâ facie*, the use of "person" without the use of bodies politic or bodies corporate would be that a body corporate was not intended to be included. If it were not so, if the *primâ facie* inference would be the other way, that enactment would be wholly unnecessary. You would have this state of things, that where you found "person" used in an enactment, you should, unless there were something in the Act itself which compelled you to the contrary, hold it to include a body corporate; but obviously that was not the state of things, because the Act of Parliament was scarcely, I think, meant to be merely declaratory. If so, the very words would have been used. And, my Lord, may I observe with regard to that enactment, the 14th section of the Act of Geo. IV., that that does not apply to individual sections, but applies to a statute, and where a statute says this or that with regard to the word "person" that in that statute persons shall be held to comprehend bodies corporate, unless there be something to the contrary. That is, as it seems to me, hardly applicable to this case, or not applicable to this case at all unless it is a declaratory enactment, because certainly this is not a case in which the offence created by section 1 is either punishable by indictment or by summary conviction, and therefore I am without the words of that section, and unless it be a declaratory Act, which I contend it is not, neither my friend nor I are entitled to make use of any of these provisions except to the extent to which I make use of it by saying that had it not been the *primâ facie* inference from the use of the word "person" is in the opposite direction that legislation would not have been necessary. Now, my Lord, that Act was followed some time afterwards by Lord Brougham's Act, but Lord Brougham's Act stopped short by saying that "person" should be universally intended to include bodies politic and bodies corporate, and I am sure I need not call to your Lordship's mind that there are innumerable Acts which contain definition clauses in which the word "person" is defined to mean in the Act bodies corporate. The latest illustration that occurs to any mind at the present moment is the rules which were enacted by the judges under the Judicature Acts, which have the force of Acts of Parliament, and in the interpretation clause of those rules it is specifically provided that persons should include and be understood to mean bodies corporate as well as individuals. Therefore that is bringing down the use of language of this kind to a very late period. Therefore I submit to your Lordships that the *primâ facie* inference, unless something was said to the contrary or unless there is something in the text which makes it clear that the word is intended to mean something more than it naturally means, is that body corporate is not included in the word "person." Now let us look at this particular legislation. My friend quite correctly said that up to 1868 there was no disability upon anybody selling poisons. I believe that is quite accurate, but if I may go a step further back in legislation, the first Act which regulated the qualifications of pharmaceutical chemists was the Act of 1852, the 15 and 16 Vict. c. 56, of which this is an amending Act. That enactment referred to a charter of incorporation already granted by the Crown, and gave it the force of an Act of Parliament, and then it constituted a Council. It directed in the 5th section that the Registrar from time to time make a complete register of all persons being members of the Society, and also of all persons being associates and apprentices or students respectively, according to the terms of the Charter of Incorporation, and keep a proper index of the register and all such other registers and books as may be required by the Council of the said Society. I have not been supplied with a copy of the Charter of Incorporation, but I asked the question and I am told that there is nothing whatever in the charter which points to the notion of corporate bodies being pharmaceutical chemists under that charter, clearly because it never did enter into anybody's mind as to include them. Therefore, this register of all persons just spoken of in the 5th section of the Act of Parliament did mean persons in the ordinary sense, and was not meant to include corporate bodies. Then it provided by the 6th section that "all such persons as should, at the time of the passing of this Act, be members, associates, apprentices or students of the said Pharmaceutical Society according to the terms of the Charter of Incorporation should be registered as pharmaceutical chemists, assistants and apprentices respectively." Then there were provisions made for enforcing the examination of persons who wished to become members, and examiners were to be appointed for England and Scotland; certificated persons were to be entitled to be registered and of course when the Act is speaking of persons who undergo examination undoubtedly that did not mean to include corporate bodies. Then it provided that no person who is a

member of the medical profession or who was practising under any licence of a medical or surgical or corporate body should be entitled to be registered under this Act; and it provided also that a pharmaceutical chemist, on obtaining a diploma from any of those bodies, should thereupon cease to be a pharmaceutical chemist and should be erased from the register. The only provision which was made there to interfere with the business carried on by any body was that by the 12th section it was provided that "from and after the passing of this Act, it shall not be lawful for any person not being duly registered as a pharmaceutical chemist according to the provisions of this Act to asssume or use the title of pharmaceutical chemist or pharmaceutist in any part of Great Britain, or to assume, use or exhibit any name, title or sign implying that he is registered under this Act, or that he is a member of the said Society; and if any person, not being duly registered under this Act, shall assume, or use the title of pharmaceutical chemist or pharmaceutist, or shall use, assume, or exhibit any name, title or sign, implying that he is a person registered under this Act," and if any person should assume such title, he should be liable to a penalty of £5. It is clear therefore that no corporate body could fall within that, because no corporate body could assume or pretend to be a pharmaceutical chemist under this Act, the Act being clearly limited to persons in the ordinary sense. No doubt my friend is correct in his history of the legislation; there came what you may call a scare in consequence of its having been discovered that there were no limitations to the facilities with which all sorts of people dealt in poisons, and this Act accordingly, which we have now to deal with, was passed. It enacts that, "Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing or compounding of poisons, and persons known as chemists and druggists, should possess a competent practical knowledge of their business, and to that end that from and after the day herein named all persons not already engaged in such business should, before commencing such business, be duly examined as to their practical knowledge, and that a register should be kept as herein provided," and that the Pharmacy Act should be amended. Then came the first clause, "It shall be unlawful for any person to sell or keep open shop for retailing, dispensing or compounding poison, or to assume or use the title 'chemist and druggist' or chemist or druggist or pharmacist or dispensing chemist or druggist in any part of Great Britain, unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act, and be registered under this Act and conform to such regulations as to the keeping, dispensing and selling of such poisons as may from time to time be prescribed by the Pharmaceutical Society with the consent of the Privy Council." Then the articles named in schedule A. to the Act were declared to be poisons within the meaning of this Act, and further than that, power was given to the Council of the Pharmaceutical Society, with the consent of the Privy Council, from time to time to extend that list, and on looking to the list it will be seen at once that it would be impossible for any person to carry on the business of a dispensing chemist without contravening this Act habitually, if he was not entitled under this Act to make up medicines, and there it does, although not in terms—although it is said to to be an Act to prevent the sale of poisons—it does indirectly entirely prevent the persons at whom the Act is aimed, whom the Act hits, from dispensing medicines, because nobody can dispense medicines unless he can dispense poisons of all sorts. A person who found that a prescription happened to contain tartar emetic, or strychnine, or aconite, which is an extremely common drug in physicians' prescriptions, would not be able to get that made up at the place where he was accustomed to get his medicines made up, and therefore indirectly it does prevent all persons carrying on the business of dispensing chemists who are not registered. Then comes section 3, which, I think, for the purpose of my argument is very important. It mentions amongst the persons who are entitled to be registered without examination or further qualification the chemists and druggists already mentioned. "Chemists and druggists within the meaning of this Act shall consist of all persons who, at any time before the passing of this Act have carried on in Great Britain the business of a chemist and druggist in the keeping of open shop for the compounding of the prescriptions of duly qualified medical practitioners, also of all assistants and associates, who, before the passing of this Act shall have been duly registered under or according to the provisions of the Pharmacy Act." In section 5 it is provided that chemists and druggists under section 3 shall be entitled to be registered as a matter of course. Therefore, my Lord, this consequence would follow from the contention of my friend, the Attorney-General, that if a corporation is within the statute, such corporations as were already existing in 1868, who were at that time actually carrying on the business of chemist and druggist, may do so for all time without coming within the provisions of this Act; they would be entitled to be registered simply because they had carried on the business. Could that have been intended? I venture to submit that omission of a provision in respect of such a matter as that, equally with the omission of proper and reasonable provisions directed to such a state of things as has arisen in the present case, is very strong to show that the framers of the Act and the Legislature, in passing the Act, when they talked of persons meant persons in the ordinary sense of the word, and never had any notion of including body corporate, incorporated or limited liability companies, or in any other way; because it would be a strange conclusion that one of these co-operative societies, we will say, which had been in the habit of selling drugs at this time might continue for all time to do so, because of course a corporation will never die so long as it is worth while to carry it on. Obviously what the Legislature meant was, we are interfering or may be interfering in a very serious way with persons getting their living in a particular way, and inasmuch as there may be many such persons to whom it would be impossible to comply with the regulations of the Act and to pass examinations and so on, we will exempt from the provisions of the Act all persons who already have gained a vested interest in the business. Of course in so far as such persons were not qualified persons, and unfit to exercise proper care in their business, the protection of the public was incomplete, but that was an incompleteness which in the very nature of things would die out, because such persons would in the natural course of things disappear as years went on, and as no more could come in under that head the Legislature had to render the protection of the public incomplete so far for the purpose of paying due regard to vested interests. But now, my Lord, did it ever enter into the head of the Legislature, did they ever mean to provide by that enactment that there should be, and to the extent to which there should be, limited companies which were carrying on a business, and amongst other things dispensing drugs, that they might continue to do so for all time without being liable to any of the penalties under this Act, and without the necessity of employing regularly qualified persons, in fact, without any of the protections which are given by the statute. It could not have been intended. The truth was, that those who framed this Act did not think of corporate bodies. The legislation which is applicable to individuals, the provisions which are made for determining that the sale of poisons should be carried on under proper precautions with regard to individuals, are inapplicable without some modification to corporations, and it never was the intention of the Act that corporations should be under no circumstances able to carry on this business. This Act I have no doubt was prepared by the Pharmaceutical Society. No doubt they must have been the moving powers in instigating the legislation, and I daresay it would be very welcome indeed

to them if they can get a decision which had directly that effect, because these co-operative stores and associations of that kind have often been pointed out as offering special advantages to the shareholders and subscribers and others in respect of this very matter, the compounding of medicines, as to which it is well known, at least, very often roundly asserted, that the profits are very large.

The further hearing of the argument was then adjourned till Tuesday, March 18th.

On Tuesday morning, at the time for the sitting of the Court it was announced that in consequence of Mr. Justice Mellor being unwell and unable to attend, no business would be taken, and the case therefore stands further adjourned.

A Reply to Mr. Frazer.

Sir,—I am somewhat surprised to read the elaborate self-vindication of my esteemed colleague, Mr. Frazer, which appeared in your last issue, and I would not trouble you with a rejoinder if I did not feel that so hearty a production richly deserved one at my hands.

The patriotic fervour pervading my friend's letter inclines me to believe it to have been penned under the impressive influence of the soul-inspiring strains of our national song, "Rule Britannia," and I would humbly suggest to him that the heading of his letter should have been taken from the chorus, viz., "Britons never never never shall be slaves." This would have been much more consistent and harmonious than the somewhat uncharitable inuendo, that I had deserted my political principles. It is just as well, too, that Mr. Frazer should remember that it is scarcely fair and generous to the Conservative members of the trade, by such a heading and by his later references to Tory politicians in the past, to indirectly cast odium upon their opinions.

There are doubtless in the trade many adherents of both great political parties who desire to have the Pharmacy Act amended, and who also do not disapprove of the pharmaceutical legislation, however imperfect it may be, so far as it has already gone.

But what are Mr. Frazer's views upon the politics of pharmacy?

He evidently most sincerely holds the opinion that the Act of 1868 was a deviation from true political wisdom, and that it has, and is, effecting incalculable mischief. Thus, he re-asserts that the "troubles of the druggist only began when he got tied neck and heel by the Act of 1868." And he opposes any amendment of this Act, because by so doing, he believes he would help to forge more chains to fetter the limbs of others. I gather from Mr. Frazer that he is sorely possessed with the remarkable notion, that in consequence of this unfortunate legislation, he and his brethren in pharmacy are suffering a species of white slavery. So direful have been the consequences, he leads us to assume, that a phalanx of new emancipationists of the type of Wilberforce is demanded inside (not outside) the Council chamber at Bloomsbury Square, not only to prevent a more odious enslavement, but to remove as far as possible from the enfeebled limbs of himself and colleagues, and likewise from the long-suffering trade, the shackles that so much oppress them.

When I read Mr. Frazer's glowing sentences describing heroic labour for the liberation of humanity, and the comparison he desires to draw from our own hypothetical bondage, I am compelled to ask myself the questions: "Is it really so?" "Is the trade 'tied neck and heel by the Act of 1868?'" My answer is simply, "No; it is not so." I cannot pose as an interesting object for the pity of mankind. Neither do I think at this particular time a pharmaceutical Wilberforce is immediately required "inside" the Council chamber of the Pharmaceutical Society to fight imaginary battles for freedom.

If I have involuntarily mis-stated Mr. Frazer's views I regret my want of accuracy, yet I am still disposed to think that the leading thought of his letter confirms, to a great extent, if not entirely, the opinion I expressed at the last meeting of the Pharmaceutical Council. My desire on that occasion was only to take another step towards amending some glaring omissions in the Act of 1868. Whilst wishing thus to amend an Act which has been of incalculable benefit to the trade, and of equal advantage to the public, I do not underestimate the great value of the Act in question, nor am I unmindful of the arduous and self-sacrificing labours of the late Jacob Bell and Mr. Sandford and their coadjutors in bringing into existence this important piece of legislation. It would certainly have been an unprecedented fact, had this initiatory endeavour to order and regulate the practice of pharmacy been perfect in results and incapable of some amendments. Pharmaceutical legislation, which is so abhorrent to Mr. Frazer's mind, like most mundane things, must pass through the grades of progression, and I have no doubt that if the trade is united, and knows its own mind, the next step will prove equally beneficial to all concerned.

205, *St. John's Street Road*, Robert Hampson.
March 19, 1879.

Oxidation of Essential Oils.

Sir,—In the last number of the Journal Mr. Kingzett wrote to complain of a statement I made at the recent evening meeting, viz., "That to Schonbein must be given the honour of having discovered the formation of peroxide of hydrogen by the oxidation of turpentine." Perhaps I ought to have been more explicit and should have said further that Schonbein was in doubt and not quite able to determine whether the new body was ozone or antozone, and also that Dr. Day in 1869 had solved the vexed question by proving it to be peroxide of hydrogen and not ozone. At the same time he also showed that not only turpentine, but nearly all the essential oils were more or less capable of oxidation with formation of peroxide of hydrogen.

Mr. Kingzett expresses his surprise that I should be unacquainted with his researches on this subject. He takes to himself the credit of having solved this question, and refers me to his paper published in the *Journal of the Chemical Society*, June, 1874, an abstract of which appears in the *Pharmaceutical Journal*, August 1, in the same year and from which I need only quote the following:—

"These experiments led the author to the conclusion that the active agent produced in the oxidation of these oils, although possessing properties similar in many respects to ozone, is not ozone nor peroxide of hydrogen, but an oxidation principle derived from terpene ($C_{10}H_{16}$), namely a monohydrated oxide of turpentine ($C_{10}H_{16}O,H_2O$.) . . . . By experiments now in hand the author hopes to be able to adduce more conclusive evidence as to the composition and constitution of the oxidized product of oil of turpentine which possesses such interesting properties; also to show more precisely the circumstances under which it is produced, and to build it up synthetically from terpene or cymene," etc., etc.

The above clearly shows that what Mr. Kingzett was in doubt about in 1874, Dr. Day had demonstrated in 1869. The experiments of the former may probably have been more elaborate, and performed with greater scientific accuracy, and he may certainly take to himself the credit of being the first to isolate peroxide of hydrogen from essential oils, but to claim as his own what clearly belongs to another must tend to depreciate rather than to heighten the merit he deserves for his able researches on this subject.

J. Robbins.

J. Kershaw.—The address of the "Throat Hospital" is Golden Square. The resident medical officer is Mr. T. M. Hovell, who would probably supply you with the other information asked for.

"THE MONTH."

The unusual inclemency of the weather has so retarded the growth of plants that it seems scarcely possible to believe the end of March is now approaching, and that "April showers" and spring flowers are close at hand. The country around London still presents a dreary and wintry appearance. The buds on the trees and shrubs are only so far advanced as to give a sprinkling of yellow points to the bare boughs, and even the willow catkins have scarcely ventured to show their golden appendages, except in sheltered situations, and further north even fewer tokens of approaching spring are likely to be seen. From the Isle of Wight we learn that the tops of the elm trees are already thickening with buds, that the daffodils have been true to their ecclesiastical title of "Lent" lilies, and that the primroses and violets are appearing here and there in the woods. Many who seek the pretty blue flowers of the sweet violet at this time of the year, especially on limestone or chalky soil, will not be a little disappointed to find they have gathered the odourless flowers of the hairy violet (*Viola hirta*), which flowers even earlier than the sweet violet, and may be known by the two minute bracts on the flower stalk being situated below the middle, by the spreading hairs on the leaf stalks, and by the absence of runners. On calcareous soils the sweet violets are more frequently white. But few medicinal plants are, however, yet to be noticed in blossom. The *Daphne Laureola*, one of the earliest, is now in full bloom in chalky woods, and the *Daphne Mezereum* in cottage gardens, and the coltsfoot is appearing sparingly on railway embankments and on clayey soil. With regard to the latter plant, it is rather curious that in the Isle of Wight its name is applied by children to the winter heliotrope (*Petasites fragrans*), which, although a naturalized plant, appears to be more common in the island than the coltsfoot.

Soon, however, there will be a supply of flowers for the students of botany to puzzle over; for the woodspurge (*Euphorbia amygdaloides*), with its purplish stems and drooping tops, and the pale green dog's mercury (*Mercurialis perennis*) will soon unfold the mysteries of the euphorbiaceæ, while the wood anemone, the green and stinking hellebores and the marsh marigold (*Caltha palustris*) will shortly illustrate the variations in the flowers of the ranunculaceæ, as the pretty little barren strawberry has already begun to represent the family of the rose. At this time of year, too, on damp declivities and near sandy railway cuttings or in corn fields, may be seen the fructification of the horsetails, forming spindle-shaped or conical spikes crowning their leafless, jointed, sheathed stems. The spores of this plant are now to be found in excellent condition for microscopical examination. It is only necessary to shake a few of the spores—which look like a pale green powder—on a glass slide and then examine them under the microscope. In the dry state the four thread-like elaters, slightly enlarged at the ends and supposed to be formed from the outer coat of the spore, will be seen to be straight, or nearly so, but if a drop of water be added their hygroscopic property will speedily be manifested, and the elaters will become so coiled round the spore that it almost ceases to be distinctly visible. Probably this property of the elaters of expanding when dry has some influence in causing the dehiscence of the mature capsules. These capsules or theca may be found arranged underneath the little round discs which form the spike of fructification, and may be observed to open by a longitudinal slit facing the short stalk supporting the disc. The epidermis and vessels in the stems of these plants are also worthy of microscopical examination. This month and April are perhaps also the best in the year for examining the structure of catkins. The poplars and alders are already covering the trees with their drooping purple tassels and the pistillate catkins of the hazel will soon be swelling sufficiently to enable their structure to be more easily made out than during last month. The little staminate catkins of the yew and various cypresses are also now in excellent condition for examining the compound pollen of the coniferæ.

In the Botanical Gardens but few medicinal plants are in blossom in the economic houses. The Maltese, mandarin and Seville oranges, and the tobacco plant are in flower, and the Winter's bark tree (*Drimys Winteri*), with its white star-like blossoms, is now in full perfection. At Kew the Cola nut is also flowering, and in the open ground the little melanthaceous plant, *Bulbocodium vernum*, which, but for its six stamens, might easily be mistaken for a crocus, is showing its pale purplish flowers, and the pretty Crimean Iris (*I. reticulata*) is blossoming as freely as if no snow were to be seen, and is perfuming the air with a delightful odour of violets. The bright flowers of the *Pyrus japonica* too are just beginning to enliven the walls with their brilliant red colour, and the delicate pink blossoms of the *Saxifraga crassifolia* are here and there brightening the rockwork.

In the *Garden* for last week, Mr. S. Piesse gives an account of the Ilang-ilang plant, and a small figure of the tree, flowers and fruit. He states that the essential oil of the Ilang-ilang (*Cananga odorata*), which is worth eighteen shillings to twenty-two shillings per ounce in Europe, is often adulterated with the oil of champaca flowers (*Michelia champaca*), which is not worth more than two shillings per ounce, and which somewhat resembles that of Ilang-ilang. In the same journal may be found a series of interesting papers on our garden destroyers or insect pests, which may interest those of our readers who have the good fortune to possess a garden in the country.

A writer in *Der deutsche Garten* states that the Imperial Library of China contains five hundred books devoted to the cultivation of the rose, and that such quantities of roses are grown in the emperor's garden that the sale of otto prepared from them yields an annual income of five thousand pounds to the imperial treasury.

The Chair of Botany at Edinburgh is now vacant through the retirement of Professor Balfour. The botanical class is, probably, the largest in the kingdom. There are, we understand, several candidates for the professorship, among whom are the son of the late professor, Dr. J. B. Balfour, Mr. W. Carruthers, F.R.S., and Professor Dickson, of Glasgow.

Early in the month the scientific world heard with regret of the great loss it had sustained in the death of Professor William Kingdom Clifford at Madeira. Just twelve years ago, being a young man of twenty-two years of age, he delivered his first lecture at the Royal Institution, on "Some of the Conditions of Mental Development."

On the 13th, a number of gentlemen assembled at the United Service Institution to hear a descrip-

tion and witness the trial of an application of the Jablochkoff electric light for facilitating surgical operations and examinations in dull weather or after dusk. A report of the proceedings, illustrated with diagrams, will probably appear in an early number of this Journal.

The "new chemical industry" which it was announced, with a certain air of mystery, would be the subject of a Friday night lecture at the Royal Institution by Professor Roscoe turns out to be that based upon the ingenious utilization of the beet-root residues by M. Camille Vincent, already referred to in this Journal in the Report on the Paris Exhibition.* It now appears that the trimethylamine there spoken of as one of the products of the distillation of concentrated *vinasse* in close retorts is converted into the hydrochlorate, and this when heated to a temperature of 260° is decomposed into ammonia, free trimethylamine and chloride of methyl. Two products having commercial value are thus obtained from the comparatively useless trimethylamine. Chloride of methyl, which has not hitherto been produced in large quantities, can be easily liquefied and then conveniently and effectively used as a refrigerating agent. But it finds also an important application in the manufacture of methylated colours. When a portion of the hydrogen in rosaniline, or aniline red, is replaced by the radicals methyl or ethyl, compounds are obtained of a fine blue, violet or green colour, the depth of the shade of violet increasing with the proportion of hydrogen replaced. Aniline green is manufactured by adding chloride of methyl to a solution of methyl aniline in methyl alcohol, and heating in a closed vessel. A soluble colourless base is produced, the salts of which are green.

Dr. E. Schunck has recently described in the *Chemical News* the results of his investigations of the colouring matter contained in *Polygonum tinctorium*, a plant long known to the Chinese as a source of indigo, and has obtained a body which seems to be identical with the indican of *Isatis tinctoria*, a plant belonging to a totally different natural order. He is inclined to think that a molecular change takes place in the chemical constituents while still in the cells of the plant, during the later stages of its development, for he obtained from some leaves gathered late in the season, when the flowers had begun to appear, a quantity of indican having the usual appearance, but giving by decomposition with acid far less indigo blue and more indirubine and other products than the indican from younger leaves.

A curious use appears to have been made in the United States within the last few years of balata, a substance resembling gutta percha and obtained in British Guiana from the *Sapota Mulleri*. When first imported it was tried as a substitute for, or addition to, india rubber, to lessen the price, but did not answer the expectations formed of it. It was then discovered that it possessed excellent properties as a masticatory, being tasteless and lasting longer in the mouth than any other substance used for that purpose. It is also remarkably ductile, since a piece half an inch square can be stretched into a thread ten feet long.

Until a short time ago the "gum" from the spruce tree was exclusively used for the purpose of chewing, when it found a rival in a substance designated "gum mastic," which is not made from the resin of that name, but is prepared from paraffin. It has a nice white appearance and is sweetened. The consumption of spruce gum is believed to reach twenty tons, and that of gum mastic thirty tons per annum, while balata has since the period of its introduction been sold to the extent of fifty tons per annum, and there are manufactories of it in New York State, New England, Ohio, Illinois and Tennessee. It is sold by druggists, grocers and confectioners. The saliva is not expectorated, as it is in chewing tobacco.

This extensive use of a chewing material seems to point to a widely felt want and is probably not without its medical bearing. The rapid manner in which food is often bolted, without sufficient mastication, by people in business and other occupations in which little time is allowed for meals, does not allow enough time for the starchy matters of the food to be rendered soluble by the action of the saliva, and the quantity of saliva secreted and swallowed under the stimulus of a masticatory probably greatly assists in the subsequent digestion of food of this character.

Before leaving the subject of balata it may be mentioned that balata softens at 120° F. and can then be welded, and thus excellent splints can be made, which speedily harden.

In the *Scientific American*, under the title of "What we find in honey," is described a microscopical examination of honey. From this point of view possibly much might be learnt concerning the cause of the difference in flavour of honey, and perhaps many suggestions as to the best plants to grow near apiaries. The author found crystals of glucose, scales from butterflies' wings, spores of fungi, hairs of insects and several different kinds of pollen, of which one kind was greatly in excess of the others, showing that it had probably been derived in great measure from one species. These objects are all illustrated in the paper referred to, but as there is no good work on the pollen of American plants, the author has not been able to identify the different species of plants to which the pollen grains belong. The value of microscopical work as applied to pharmacy here receives a fresh illustration, for the above facts suggest the possibility of not only detecting spurious from genuine honey, but also of finding out from what part of the world any sample of honey may have been obtained.

In a short note to *Nature*, Professor Church has stated that the secretion of the wasp's sting is alkaline and not acid. This curious fact he proved by causing a wasp to sting moistened turmeric paper. The domestic treatment by the use of vinegar as a remedy in such cases is therefore seen to have its foundation in fact.

Whilst speaking of Professor Church, it may be mentioned that there appears to be a probability of his having to vacate the professorial chair at Cirencester College, where he has done good service during the last sixteen years, on the slight ground of desire for non-residence in the college.

The cultivation of sponge for commercial purposes has now become an established fact. For some years past Dr. Oscar Schmidt, professor of zoology at the University of Gratz, has been studying the possibility of growing this valuable commodity artificially, and has found that if a sponge be cut into pieces and the portions fastened to a pile and immersed in the sea, each piece will grow and form a perfect sponge

* See before, p. 342.

According to his estimate the profit to be obtained in three years will amount to about 40 per cent. His system has now been adopted by the Austrian Government and is being carried out on the coast of Dalmatia, and it is believed this new industry will prove a source of considerable income to the inhabitants of the coast line of that country.

A writer in *New Remedies* has been examining under the microscope homœopathic medicines, and concludes that, contrary to the hitherto prevailing opinion, metallic and other hard insoluble substances, such as gold, mercury, carbon, silica, etc., cannot be sub-divided by continued trituration beyond a certain limit (about $\frac{1}{5000}$ mm.), and that it is not possible that any particles of the original substance could be present in any trituration higher than the third centesimal. He states that in centesimal trituration (one of substance and ninety-nine of milk sugar) the action of the pestle is mainly confined to the sugar, while the foreign substance receives but little of the power employed.

A singular action of pilocarpine has lately been made known by Dr. G. Schmitz, of Cologne. In his ophthalmic practice he met with two cases in which the patients were bald, and found that after the use of subcutaneous injections of hydrochlorate of pilocarpine—with the object of causing absorption of inflammatory residue within the eye—the scalp rapidly became covered with young downy hairs. In one of these cases a man sixty years of age had his head covered in four months, partly with grey and partly with black hairs of considerable growth, so as quite to hide his previous baldness. If this stimulant action on the hair bulbs be proved to generally follow the use of jaborandi or its alkaloid, a rapid increase in the demand for pilocarpine may soon be expected.

In the *Philadelphia Medical Times*, Mr. R. Fletcher states that he has found chloral hydrate of great use in relieving chronic bronchitis in elderly persons when used as an inhalation. For this purpose a solution of ten grains in an ounce of water is inhaled through a steam atomizer morning and evening.

M. Rabuteau, in some experiments made with sulphomethylate of sodium, finds that half an ounce taken in two wineglassfuls of water acts as a purgative and produces free evacuation. The salt is colourless and destitute of any disagreeable flavour. It, however, crystallizes only with difficulty.

Another remedy for whooping cough has recently been recommended in the *Bulletin Thérapeutique*. This consists of tincture of myrrh given in doses of fifteen drops every one or two hours in a tablespoonful of quinine wine or Vichy water.

Dr. G. L. Tucker, in the *Chicago Medical Journal and Examiner*, calls attention to the long neglected properties of *Thlaspi Bursa-pastoris*, or shepherd's purse, the tincture of which he states that he has found useful in hæmaturia, and various other urinary diseases.

In the *Dublin Medical Journal*, Dr. Vesey recommends the internal use of pyrogallic acid in grain doses for hæmoptysis, either alone or in combination with ergot, and prefers it to gallic acid as a styptic. He considers its action more rapid and certain than most of the powerful astringents in ordinary use, such as pil. plumbi c. opio, dilute sulphuric acid, perchloride of iron, etc. From a dispenser's point of view it may be welcomed as a substitute for gallic acid, since it dissolves easily in water or spirit. It would be desirable to determine, however, whether the spirituous solution would keep, if exposed to light, without blackening or otherwise deteriorating. The dose of one grain is given every half hour until the hæmorrhage is arrested, and then every four hours until the expectoration is no longer tinged with blood.

In the *Indian Medical Gazette*, Mr. Deb recommends the use of the fresh root of *Ixora Bandhucca* as an excellent remedy in dysentery. The whole root, not the bark only, is used, the slender roots being most active. He prefers the root in the fresh state. Four ounces of this in coarse powder are maceratep for a week in a pint of proof spirit, with occasional agitation. It has the advantage of not creating nausea, and of having an aromatic and agreeable taste. The root has been given in fifteen to thirty grain doses three or four times a day.

A very useful and simple means of securing rapid filtration has been pointed out by Dr. Ebermayer. This consists in placing a muslin filter underneath a paper one. This arrangement also possesses the additional advantage of ensuring the easy removal, without tearing, of filters containing precipitates.

A letter from Mr. Parr, Pharmaceutical Chemist, to the *Nottingham Daily Guardian* conveys a hint that may be of practical use in an emergency. Casting about for a ready means of dealing with such an accident as that of a dress catching fire he was led to try the effect of the release of the carbonic acid gas with which aërated water is charged. An old calico dress was suspended and set fire to in several places, and when the flames had quite surrounded it the contents of a syphon bottle of soda water were spurted directly on to the blazing fabric. The result was that the flames were extinguished in less than a minute, with a completeness that would hardly have been obtained by the use of several gallons of ordinary water.

The last number of the *Pharmacist* gives the particulars of a "surprise" which a member of the Chicago College of Pharmacy recently provided for his colleagues. Having brought forward at a meeting a substance that he had been unsuspectingly dispensing during some time as sulphuret of antimony, but which had not the slightest claim to the name, he was stung by overhearing the remark that the substance bore on its face the stamp of fraud, and that he might have known better. He went home and obtained other specimens, which he examined, the result being that he roundly asserted at the next meeting that probably he had never yet seen the substance designated antimonium sulphuretum nigrum, and that there was not a single pharmacist in Chicago who had it in stock, except in the refined form used for chemical purposes, and further that there was "not to be had a single grain of antimony from any of the seven wholesale druggists in the city." The specimens examined are reported to have consisted nearly entirely of carbon, as anthracite coal or soot, and powdered marble or glass, but not a trace of antimony was found. What a happy hunting ground Chicago would be to some of our analysts.

The necessity of excluding from the "Dispensing Memoranda" questions of "too trivial a nature" has on previous occasions been referred to, but practically it has been found extremely difficult to define the line of demarcation. To a practical dispenser some of the questions may appear to be very trivial, which, at the

same time present great difficulties to a less practised hand. "The whole need not a physician, but those that are sick," and the most casual reader must have observed that these smaller questions have called forth the most divergent opinions. It has also been repeatedly urged that efforts should in every case be made to solve the several questions previously to their being sent to the Dispensing Memoranda. Failure calls for no special sympathy unless it has been preceded by honest and intelligent effort. The object of these pages is not to store the memory of the dispenser with undigested information applicable only to the special prescriptions that call forth the remarks, but rather to train the mind to the recognition of certain principles capable of adaptation as circumstances arise. Otherwise the result will be the acquisition of information without mental training, not that sound and healthy development which deserves encouragement. For kind assistance, recognition in these pages is due to those whose communications evince considerable research and discrimination; evidently, as Burke says, "they love the little platform to which, in society, they belong," and see more to pity than to blame in the difficulties which present themselves to their less favoured *confrères*.

The symbol ℥j is frequently met with in prescription directions as the quantity that a patient is required to take for each dose, and when it applies to liquid measure and ordinary prescriptions very little if any difficulty is likely to arise if such a quantity is rendered for the guidance of the patient by one teaspoonful, since the difference between ℥j and one teaspoonful is not usually very great. But even in these instances of liquid measure if the symbol ℥j or ʒj be in the directions given by the prescriber it should in strict accuracy always be rendered one teaspoonful by measure or two tablespoonfuls by measure. This would involve the necessity of a graduated measure, the one teaspoonful and two tablespoonfuls of which correspond with the ℥j or ʒj symbols respectively. In some prescriptions it is evidently the object of the prescriber in directing ℥j for a dose that the patient should take an accurately defined quantity on each occasion, which cannot be the case if the domestic teaspoon be used as a measure. It must be obvious, however, with regard to the domestic teaspoon, that the same rule will not apply when a powder is in question, as the symbol ℥j, which signifies the measure of an eighth part of an avoirdupois ounce of water, cannot be correctly represented by the teaspoonful measure, but must be rendered one drachm or sixty grains, referring of course to weight; the principle of the Pharmacopœia that solids must be weighed and liquids measured must govern these cases, unless the dispenser possesses more precise knowledge of the prescriber's intentions than is conveyed in the direction which accompanies the prescription.

In No. 251 is given a formula for glycerine of tragacanth, an excipient to which reference has on many previous occasions been made in treating of pill masses, and this will be the formula indicated on future occasions. Of course an excipient of greater or less tenacity may be made by different relative proportions of these ingredients; but for ordinary dispensing purposes this one is all that could be desired.

The prescription No. 252 presents no special difficulties. Care should be taken to use the acid. carbolic. in crystal, and to weigh it; when the ingredients are well mixed three grains of tragacanth in powder should be added to the twelve pills. If quickly and carefully manipulated the result will be a mass capable of being rolled into pills, and satisfactorily silvered; if the carbolic acid be in a liquid condition this circumstance would make it more difficult to handle.

The pills, No. 253, of iodide of iron, phosphorus pill, and carbolic acid, may be made into pills with the addition of one grain of tragacanth to each pill; care should in this instance also be taken to use the carbolic acid in a solid condition.

If the prescription No. 254 be intentionally written as printed, it is probable that the writer was not aware that the magnes. sulph. could not be retained in solution. When this difficulty occurs, and the writer cannot be referred to, the magnes. sulph. or other salt should be powdered and diffused through the mixture; no attempt should be made to dissolve by heat a salt in such quantity or in such a combination that on cooling it will crystallize out; as it is rendered impossible to take the mixture in that condition in divided doses. This one is directed to be taken in water; it may, therefore, with some probability be assumed that the writer recognized the fact of the salt being in excess of the capability of the menstruum to hold it in solution.

Prescriptions such as No. 255 have been on previous occasions commented on. The tinct. nuc. vom. is an alcoholic tincture, and causes an opacity when mixed with water; the addition of acid. hydrochlor. dil. determines a separation of this resinous matter of the nux vomica which rises to the surface of the mixture. The separation does not take place without the presence of the acid, and it may be obviated by using a small quantity of mucilage previously, or soon after the introduction of the acid; the addition of a little mucilage entirely prevents the separation, and the mixture maintains its uniformity of character throughout.

The mixture No. 256 contains tr. guaiac. co., and mucilage was very properly used to prevent a separation, but the quantity was much in excess of that required for this purpose and therefore objectionable. ℥ij would have been quite sufficient and any further addition to that absolutely required cannot be recommended.

Dispensers must not consider trouble when necessary to compound satisfactorily a difficult prescription; the best possible result should always be aimed at. In No. 257 the question is asked if, instead of rubbing the gum and oil together in a mortar an equivalent quantity of mucilage could not be used and shaken together in a bottle "to save trouble." This course of procedure would not result satisfactorily and the saving of trouble would be at the expense of a perfect emulsion. Careful manipulation in a mortar only will in this instance secure a perfect and permanent mixture.

The mixture No. 258 must necessarily result in the decomposition of two or more of the ingredients, and this fact should be brought under the notice of the writer. It cannot be dispensed without this decomposition, although one method of mixing may retard the final result longer than another; the best mode of procedure is to add the quinine to the citric acid dissolved in a part of the water, then the potass. iodid. dissolved in another portion, then the syr. ferri iodid., and finally the tinct. iodi, previously diluted. A red precipitate will result, which is a compound of iodine and quinine, probably herapathite or hydriodate of quinine.

The formula No. 259 presents some difficulties from the fact that balsam tolu is not soluble in any one or more of the other ingredients. The best result will be obtained by dissolving the balsam in the smallest possible quantity of chloroform and adding it gradually with continual stirring to the other ingredients previously rubbed together in a mortar or just when thickening after being melted by heat. With a little stirring the chloroform is driven off and a pomade uniform in character results.

The directions given for the drying and powdering of opium for the tincture are indefinite, hence the anomaly with regard to the amount of opium contained in the tincture, as has been pointed out by "A Pharmacien."

The answer to No. 261 is very correctly given by W. Mc. N., March 1, page 730. The value of mist. ferri as a therapeutic agent is due to the protocarbonate of iron, and the sugar which forms an important part of the mixture is intended to retard the change to an oxide, a less active preparation, which ultimately takes place. The same object is aimed at in the ferri carb. sacch. B.P.

"Delta," in No. 262, requires a formula for lin. potass. iodid. c. sapon. so as to form a clear liniment. "Pulvinus" supplies this in March 1, p. 730. Reference may also be made to Tichborne's article in the *Pharmaceutical Journal* [3], vol. v., p. 185.

No. 263. Spirit of hartshorn, formerly liq. vol. cornu cervi, a name originally applied to the watery liquor obtained when hartshorn was submitted to destructive distillation. The liquid now sold is either a weak solution of ammonia or a solution of carbonate of ammonia, or a mixture of the two. Hartshorn and oil is represented in the Pharmacopœia by the lin. ammoniæ, but not being official it is more frequently made from private formulæ yielding a more perfect emulsion than that resulting from the Pharmacopœia proportions.

In reply to No. 264, when Oss is written in a prescription, the quantity is correctly rendered ten ounces, but physicians frequently write Oss when they intend the mixture to be eight ounces.

No. 265. The present excipient is a very good one for pil. hyd. subch. co. If it should be considered desirable to displace this, and substitute another, that may be done by the introduction of the glycerine and tragacanth excipient, which has been referred to as very suitable by a correspondent.

In No. 266 an inquiry is made with reference to the dose of Fleming's tincture of aconite. It is a very powerful preparation, and rarely, since the introduction of a tincture of aconite into the Pharmacopœia, used internally. In answering this question some remarks from Dr. Fleming's book, written in 1845, 'An Inquiry into the Physiological and Medicinal Properties of the *Aconitum Napellus*,' had better be quoted. After giving the formula for tinct. aconite, he says:—"As an anodyne, antineuralgic and calmative, five minims ought to be given at first, three times daily, to be increased daily to the extent of one minim each dose, until the physiological effects described under the second degree of operation have been produced. As an antiphlogistic five minims ought to be given at first, and repeated in four hours, by which means the second degree of operation will, in all likelihood, have been induced. In order to sustain the sedative action thus developed, two and a half minims are to be given every three or four hours, or less frequently, according to the effect produced. Where this mode of administration is adopted it is *absolutely necessary* that the patient should be seen and his pulse examined before the exhibition of each dose. When this cannot be done, the remedy may be given in the manner pointed out for its use as an anodyne and calmative."

In No. 268 the quantity of bromide of potassium is in excess of that usually prescribed, and the prescription bears on its surface evident marks of an error in writing. Still, some medical men give bromide of potassium in ℥j doses three times a day without inconvenience to the patient. The dose, therefore, would not be considered a dangerous one; but the quantity of fluid is not sufficient to hold the bromide in solution. Assuming the prescription to represent the intentions of the prescriber, the fluid should be doubled and the dose increased to two teaspoonfuls, or the bromide may be rubbed up and the bottle shaken before the pouring out of each dose. It is more than probable that twenty-four grains were intended, therefore, if possible, reference should be made to the writer previously to the prescription being dispensed.

There is evidently an error in prescription No. 271, and the dispenser would not be justified in sending it out as written. Most probably ℥ss of sp. am. co. was intended. Here, also, the prescriber should be consulted, and the dispenser's attention may be directed to some remarks on his responsibilities in the presence of unusual doses in prescriptions in the last "Month," page 697.

The question is asked, Should infusions and decoctions be strained through muslin, tow or cotton wool, or is it permissible to filter through paper? They are usually strained through muslin, but should never be filtered; the object in straining is to keep back solid particles from which the decoction or infusion has been made, whilst any portion dissolved in the process of decoction or infusion is allowed to pass through. With regard to the second part of the question,—whether in making infusions allowance should be made for water absorbed by the drug,—in decoctions the product should be made up to measure, but in the case of infusions merely strained. On the most important of these points the directions of the Pharmacopœia are explicit, and should be strictly followed.

A correspondent, J. B. L. M., on page 729, calls in question the correctness of the replies in the last "Month" to questions Nos. 233 and 248, whilst admitting those of Nos. 231, 235 and 245. With an official formula for pil. hyd. subchlor. co., and no formula whatever for a simple pil. hyd. subchlor., there should be no hesitation on the part of the dispenser as to using the former when pil. hyd. subchlor. is met with in a prescription and equally so with tr. chlorof. co., when tr. chlorof. is written, the co. being omitted. And the same applies to the pil. assafœtidæ; the only official pill in the Phar. Lond. containing assafœtida was pil. galban. co., and the galbanum being in excess of the assafœtida gave the name to the pill. But in the B. P. the assafœtida was increased and made equal in quantity to the galbanum and being the more powerful of the two as a stimulant and antispasmodic gave to the pill its name as pil. assaœfœt. co. instead of pil. galban. co.; one is the synonym of the other. It would then be a grievous error on the part of the dispenser to use pil. aloes et assafœtidæ, when pil. assafœtid. is ordered in a prescription, It is not a question of the

popular use of any special pill in any particular part of the country. In the retail of any article there is considerable latitude permissible, but in the dispensing of prescriptions no such latitude is allowed, the Pharmacopœia is the only safe guide of the dispenser.

DISTILLED ESSENCE OF LEMON.

BY JOHN MOSS, F.I.C., F.C.S. LOND. ET BER.

The interest attaching to this body at the present time was excited by a paper (read before the Pharmaceutical Society on the 5th of February, and published in the Society's Journal on the 8th), entitled, "An Examination of Distilled Essence of Lemon." The author, my friend Dr. Tilden, intimated to me some months ago his desire that my firm should prepare for him a small quantity, not less than eight ounces, of the essence from the peel of the fresh fruit. The essence of lemon of commerce being notoriously and skilfully adulterated, he wished to operate on an article to which no suspicion of admixture could possibly attach, and we on our side were very pleased to place the resources of our laboratory at his service to further the important researches on the composition of the essential oils, which he has been prosecuting now for some years. Curiously enough the discussion on Dr. Tilden's paper did not once refer to the more important scientific aspect of the question displayed to the meeting, the principal speakers contenting themselves with the utterance of a decorous and prolonged exclamation of surprise at what was, after all, for the occasion, of very secondary importance, namely, the author's statement that the distilled essence prepared for him "had a most deliciously fragrant odour of the peel, superior, in my opinion, to the foreign essence." At the March meeting of the Society, I placed on the table a small specimen of the distilled oil, which had been reserved from the quantity prepared for Dr. Tilden, and also, for purposes of comparison, some of the finest imported oil. Connoisseurs differed as to the respective merits of the two essences; but the majority of them agreed with Dr. Tilden's estimate of the distilled oil. Tested by smelling at the neck of the bottle, the foreign essence did perhaps produce a more favourable impression; but when rubbed in the hand, as the fashion of the expert is, the fruity fragrance of the distilled oil passed out of comparison with anything the imported one could furnish. The odour might be a little "thin," and lacking in persistence, but superior delicacy was manifest.

Seeing that so much interest was excited by the specimens, some details of the distillation will probably not be unwelcome, and will afford a means of instituting that "comparison of the operation of obtaining oil of lemons, as performed by Mr. Moss in this country, and the usual operation abroad," asked for by Mr. Giles in the discussion previously alluded to.

It was supposed that the peel of six hundred lemons would yield the weight of essence required by Dr. Tilden, viz., eight ounces, and that quantity, weighing forty-seven pounds, was accordingly operated upon as soon as received into the laboratory. It was placed in a small copper still capable of holding thirty gallons, covered with cold water, and heat applied. Twelve gallons of liquid were distilled over into an earthenware receiver, from which, when the oil was judged to have separated, the water was run off below into a similar vessel. The oil, not quite free from water, was allowed to stand in a separating funnel, and when all the water was removed, measured three and a half ounces. This result was disappointing, as it did not come up to half of the estimated yield. No more oil had appeared on the surface of the separated water, and accordingly ten pounds of salt were dissolved in it with the hope that a further slight separation might be promoted thereby. The expedient was futile, though the solution stood overnight. In the morning the liquid, salt and all, was returned to the still, from which the peel had not yet been removed, and twelve gallons were again drawn over. Not a single drop of oil was obtained from this distillate.

It was therefore necessary to operate on a further quantity of peel, and this time fifty-two pounds were taken; for practical purposes, the same quantity as before, viz., the peel of six hundred lemons. In this operation no salt was used, and only one distillate (twelve gallons) was collected. The yield was eight and a half fluid ounces, or more than twice the quantity formerly obtained. Before distilling, however, this lot of peel was well crushed, and the cellular tissue torn apart to free the oil. No doubt this had a very important influence on the yield of oil, but I cannot think that the whole of the gain was due to it, especially when it is remembered that the vertical granite runners, which came into actual contact with the peel, have a crushing surface of about twenty-four square feet, and the granite bed on which they run has a surface of thirteen square feet. The wetting of this large surface by the liquid contents of the peel no doubt occasioned a loss of oil of some importance when referred to the small quantity operated upon. Working on large quantities the absolute loss would be very little greater, and the relative loss would, of course, be very much smaller. Giving these facts due consideration, I think that the second lot of peel was naturally much richer in oil than the first.

The peel was taken from lemons which were not only ripe but old, being of the season 1877, and the distillation being made in July, 1878; they were, therefore, at least nine months old, and had not only lost oil in ripening, but also in keeping.

In 'Pharmacographia' it is stated that by the *sponge process*, as practised in Calabria and Sicily, four hundred fruits yield from nine to fourteen ounces of oil, *i.e.*, six hundred fruits yield from thirteen and a half to twenty-one ounces of oil. Taking the average yield of this number of fruits, about seventeen ounces, it will be seen that the larger product obtained as described above was exactly half this quantity. This being so, and remembering the age and condition of the peel, there are good grounds for believing that under favourable conditions distillation will yield as large results as the processes now employed; indeed from what Professor Redwood states respecting essence of limes there is reason to believe that the distillation will show an advantage in this respect.

Both Pereira and the authors of 'Pharmacographia' state that oil of lemons procured by distillation is of inferior fragrance. It is highly probable that the construction of the still may account for some portion of the difference between the subject of their remarks and the subject of this short paper. In conclusion, I may state that the still employed in these experiments was expressly constructed for the distillation of medicated waters.

300, *High Holborn, W.C.*

THE SCIENCE AND ART EXAMINATIONS.

IN a return that has just been made to the House of Commons on the motion of Sir SYDNEY WATERLOW there are disclosures which will interest every one who has taken any interest in the work attempted by the Science and Art Department during the last few years. It consists of a copy of correspondence that has passed between the Department and the Committee of the Science and Art Classes held at St. Margaret's School, Westminster, relating to the examination held on the 16th of May, 1878. As to the merits of the painful personal charge which gave rise to this correspondence no opinion will be expressed here, since the question will possibly be tried in a court of law; such allusion only will be made to it as will be necessary to draw attention to some admitted facts having a still wider public interest.

It would appear that on the morning following the examination in question, the Department received information which induced the suspicion that the teacher of the class in question, who was also head master of the day school in connection with the United Westminster Schools, had before the examination surreptitiously obtained information as to the questions to be set, and had used this information to instruct his students previous to the time fixed for the examination. An immediate investigation was made by some officials of the Department, the result being the decision of the Lords of the Committee of Council on Education to cancel all the examinations of all the pupils in the classes in the said school for the year, and to disqualify the master from ever again earning payments under the Department.

This decision being communicated to the Managers of the Schools, was taken into their consideration, and after inquiry suggested by such information as was supplied to them by the Department the conclusion to which they came was that the teacher was entirely innocent of the offence of which he was charged, and this opinion they appear to have acted upon by retaining him in his position as head master. From the correspondence between the Department and the Managers, which has not been devoid of acrimony, we shall content ourselves with reproducing a few statements made in a departmental minute that appears to owe its publication to a reference to the previous character and success of the teacher.

It appears that this teacher has been the cause of much anxiety to the Department for some years past, because of the extraordinary way in which he managed to "prepare" his candidates for examination. Whilst at one school, boys in his classes of twelve and thirteen years of age were examined in as many as twelve science subjects and even children of nine and ten years attempted to pass in six and eight subjects. Inspectors reported, the examinations were scrutinized, but it is confessed that how these children were "made to pass" was a mystery. According to the minute, however, this teacher became known to the Department as a determined and incorrigible crammer, and the success of his pupils had always been attributed to his persistence in this method of instruction.

The Minute goes on to trace the subsequent movements of this teacher and it would appear that in every place where he pursued his calling he succeeded in exercising the vigilance of the local inspectors to discover the secret of his success. Some reports are here alluded to that insinuate a possible explanation, but the statements are of the nature of those that ought not to be made except they are capable of proof or afford an opportunity of contradiction in a court of law. At any rate it is only fair to quote one report in which the inspector remarks, "I am bound to say, however, that when I "inspected his class the pupils seemed fairly up with "the subject of instruction."

After repeated attempts to check this success, the Department was compelled virtually to own its defeat, and it tried to meet the difficulty by the introduction of a new rule into the Science Directory limiting the number of subjects on which payments could be made in any one year, and the teacher, in a special minute, was threatened with a suspension of his certificate if he continued the practice objected to.

Whatever may be the outcome of the personal element in this controversy, with which we have nothing to do, we hope it will force upon the attention of the authorities the whole subject of these Science and Art examinations. Admitting the very great difficulty of testing by means of a few questions a candidate's knowledge of a particular science without asking some—and probably a large proportion—that can be anticipated, the inquiry arises whether no better plan than the arbitrary and not very logical one of limiting the number of subjects can be adopted. One has only to glance at some of the text-books which in many of these science classes are preferred to see that they deal with certain salient points, and sometimes even peculiarities, rather than with the whole subject of the science; and we venture to say that the reason for the favour in which these inferior text-books are held is not altogether without an explanation if they be compared with the Science and Art Department questions spreading over a few years. Might not a solution of the diffi-

culty possibly be found in making the written examination a sort of preliminary test to be followed by a *vivâ voce* examination of even only half a dozen questions, put in the light of the candidate's previous answers?

NEW PHASE OF THE COUNTER PRACTICE CONTROVERSY.

On Wednesday the members of the Medical Defence Association, meeting in the rooms of the Medical Society of London, were privileged to hear an address from their President, Dr. B. W. Richardson, upon the "Phases of Modern Quackery and "Medical Defence," which contained a definite suggestion for the settlement of the "counter practice" controversy. The latter part of the title was defined as including the "defence of the sick, who of all "people need protection even from themselves, their "own weaknesses and vacillations." The persons from whom, in Dr. Richardson's opinion, the sick ought to be protected,—by legislation, if necessary,—are irregular practitioners in medicine with various degrees of culpability. Some remarks upon "patent "medicines," which seem to imply that he thinks the composition of the preparations commonly so-called is made known, were followed by an utter condemnation of "counter practice" as it now exists. The necessity for its existence in some form was, however, apparently admitted. But instead of tolerating it Dr. Richardson would legalize it. This he would do by instituting a new examination, to be conducted conjointly by the Apothecaries' Company and the Pharmaceutical Society, the passing of which examination should qualify for counter practice, as distinct from out-door general practice, medical or surgical.

THE MEDICAL COUNCIL AND THE WEIGHTS AND MEASURES ACT.

Just at the time of going to press we learn that the General Medical Council, at its meeting on Wednesday, adopted the form of a letter to be sent to the Board of Trade in relation to the Memorandum of the Pharmaceutical Society, which had been handed to that Department, and a copy of which had been sent to the Medical Council. It is intended to publish the text of the letter in our next number; meanwhile we may state that the Council appears to concur in all the recommendations of the Memorandum, which has been printed before, p. 656.

EVENING MEETING.

On Wednesday next, April 2, an Evening Meeting of the Pharmaceutical Society will be held, when the following papers will be read:—"Action of "Iodine on Rhubarb," by Mr. H. G. Greenish; "Note on Plasma," by Mr. W. Willmott; "Note "on Shea Butter," by Mr. E. M. Holmes; and "On Mongumo Bark," by Professor Dragendorff. The chair will be taken at half-past eight o'clock.

Transactions of the Pharmaceutical Society.

EVENING MEETING OF THE NORTH BRITISH BRANCH.

Wednesday, March 19, 1879.

The sixth evening meeting of the session was held in the Society's rooms on the above date, Mr. J. B. Stephenson in the chair.

The minutes of the previous meeting were read and confirmed.

The Honorary Secretary intimated the following donations:—

To the Library.—'Calendar of Durham University,' from the Society in London; 'The Pharmacist and Chemist' for January and February, from the Chicago College of Pharmacy; 'The Canadian Pharmaceutical Journal,' February, from the Ontario College of Pharmacy; 'The Journal of the Chemical Society,' for December, January, and February, from Mr. Mackay.

To the Museum.—Specimens of Camphor of Peppermint and Ajwain Camphor, from Messrs. Balldon and Son, Edinburgh.

Dr. Stevenson Macadam, F.R.S.E., F.C.S., F.I.C., Lecturer on Chemistry, Edinburgh, read a paper on—

The Contamination of Potable Water in Domestic Cisterns.

The contamination of water in domestic cisterns is a subject which has forced itself upon my attention on many occasions during the last ten years, and the longer I study the matter and become practically acquainted with it, the more I become convinced of the importance in a sanitary point of view of greater attention being directed to the cleansing out of house cisterns at short intervals, and of the desirability of educating the public to the necessity for periodically attending to this cleanly measure. I am decidedly of opinion that not only is the water in cisterns rendered more or less impure from imbibing noxious gases led by waste pipes, etc., from drains, sewers, traps and cesspools, but also from contact with the sediments or deposits lying in the cisterns themselves, and that in many cases the evil effects of impure water supply are directly traceable to the contamination of the water by its being retained in domestic cisterns containing deposits which may have been lying there for lengthened periods.

It is a pity that the water for household purposes should be stored in cisterns placed in almost inaccessible places, where it requires more agility and acrobatic power than most of us possess to get at, and, when we do reach them, where the dust of years, if not of ages, lies accumulating, and where small animals, such as mice and possibly rats, not to speak of cats, delight to roam.

Of course, the cisterns must be placed high, so as to command water all over the house, but why should they be situated where they are practically out of reach of daily inspection? No housewife would ever think of storing bread or butcher's meat in such more than attic regions, undusted and unwashed from year to year, and yet the bread and the meat are not such absorbers of noxious gases as the water is. None of us would take water at table were it presented to us in decanters and glasses which were uncleansed from the day of their purchase till the day of their breakage, and yet such would be simply in detail and retail what is done in the cisterns of the majority of houses by slump quantity and wholesale.

The sediments or deposits in domestic water cisterns are primarily formed from the clayey and earthy matter carried by the water into the cisterns, and where, on settling, the suspended matter is deposited as an earthy-looking sediment. If these deposits consisted solely of earthy

matter, there might be no serious objection to their remaining in the cisterns, but the analyses of a number of the deposits have shown that the earthy matter is intermixed with lead compounds and organic matters. The examination of the sediments has been too long neglected, and the notion held by some people that the deposits tend to clarify the water and are, therefore, more beneficial than otherwise, must be reckoned both unsafe and dangerous.

In order to test the subject thoroughly, I arranged for the collection of a number of sediments taken from cisterns in different cities, towns and populous places in Scotland and England. Great care was taken in the collection that the surface of the lead lining of the cisterns was not disturbed, and, indeed, the deposits were removed with the last portions of water, so that the surface of the lead might not be scraped or injured.

The analyses of a number of these samples gave as follows:—

Dried at 100° C. Samples	Insoluble siliceous matter.	Oxide of iron, with traces of alumina and phosphates.	Carbonate of lime.	Carbonate and hydrate of lead.	Organic and volatile matter and water of combination.
No. 1	55·32	18·92	4·96	10·07	10·73

The insoluble silicious matter as well as the oxide of iron with traces of alumina and phosphates are obtained from the earthy matter carried in by the water into the cisterns—much of the oxide of iron being doubtless got from the iron mains which have either not been coated with Smith's composition or pitch, or which have lost their protective coating. The carbonate of lime or chalk is principally derived from the lime or plaster of the roofing above the cisterns, though probably also, in the case of hard water, from the precipitation of the carbonate of lime from the water, owing to the escape of the carbonic acid gas which is its solvent. Some of the carbonate of lime may also be obtained from earthy matter, suspended in the water when it enters the cistern.

The carbonate and hydrate of lead is undoubtedly derived from the lining of the cistern. The compound stated in the table is given as two equivalents of the carbonate of lead in combination with one equivalent of the hydrated oxide of lead ($2PbCO_3, PbH_2O_2$). Of course the lead was precipitated from the acid solution of the deposits by sulphuric acid, and the sulphate of lead so obtained was calculated into the carbonate and hydrate of lead, as previous trials demonstrated that the lead in the deposits existed there in that condition. The formation of the lead compound in the water cistern is easily accounted for. The carbonic acid dissolved in the water acts slowly on the metallic lining, forming a white film on the surface, especially at the point where the water and air-lines meet. In cisterns where covers are used, and especially where the cover is lined with lead, the formation of this film of lead compound is much expedited by the water vapour—practically distilled water—rising from the water in the cistern and condensing on the lid or upper part of the sides, where it readily forms the carbonate and hydrate of lead. The latter compound, becoming detatched from time to time on drying up, falls as a powder into the water, and mingles with the earthy sediment on the bottom of the cistern.

The corrosion of the lead cistern, and consequent formation of the lead compound, is also much increased by the falling of lime into the cistern, and the introduction of organic matter, such as street or house dust; insects and animals (mice, etc.), likewise facilitate the action of the water upon the lead, and the formation of the lead deposit. The result of the combined action of the water, lime, and organic matter upon the lead of the cisterns, is the formation of much carbonate and hydrate of lead which goes to make up from 5·22 to 10·07 per cent. of the dried cistern deposits, equal to 4·18 to 8·06 per cent. of metallic lead when calculated into the metal.

So long as the deposit lies in the bottom of the cistern, and is not disturbed, the minute particles of lead compound may not do much harm, but when the water is run off from the cistern in quantity, especially for baths, the rapid entrance of the fresh supply of water into the cistern must disturb the sediment, and tend to raise the deposit, including the lead compound in mechanical suspension, and as such, float on the noxious material into the pipes, from which it is drawn off for dietetic purposes. This process is much promoted by the placing of the house supply pipes leading from the cistern about an inch or two above the bottom of the cistern, so that the sediment lies accumulating from time to time on the bottom of the cistern, and hence, when disturbed by the rush of fresh water, a considerable proportion is thrown into mechanical suspension. The experience of every householder, at intervals, proves that the sediments in the cisterns are thus raised more or less in suspension and floated on with the water; and as the lead compound forms part of the sediment, it necessarily follows that lead must flow out of the cistern in suspension in the water. Indeed, I have encountered several cases of slow lead poisoning which could only be accounted for by the water becoming contaminated with the lead in the manner stated.

The noxious influence of the cistern deposits on the quality of the water does not, however, end in the impregnation of the water with lead compounds; for the organic matter of the cistern deposits or sediments gives rise to the disengagement of noxious gases, which more or less influence the sanitary condition of the water. Moreover, the decay and putrescence of the organic matter lead to the formation of soluble organic compounds, which become dissolved in the water, and thus affect its purity. The analyses of the sediments collected at my instance showed that they yielded from 0·36 to 0·81 per cent. of nitrogen as ammonia, derived, in great part at least, from the organic matters present, and proving the putrescent character of such. The best evidence of the influence of the organic matter of the deposits upon the purity of the water was obtained, however, by taking a sample of Edinburgh water direct from the main, and dividing it into two equal parts, retaining one of the portions by itself in a large open-mouthed glass vessel, whilst the other portion was placed in a similar vessel which contained about an inch of cistern deposit in the bottom. After a week the two waters were examined, taking care that in each case the waters were decanted off from the respective vessels in a clear and transparent condition. The points determined were the total saline matter and organic and volatile matter in the imperial gallon, the saline and albuminoid ammonia in the million parts, and the respective quantities and proportions of the gases in solution in the waters. The results obtained were as follows:—

	Water standing without sediment.	Water standing with sediment.
* In imperial gallon—		
Saline matter	9·36 grains.	9·88 grains.
Organic and volatile matter	0·72 „	1·94 „
	10·08 „	11·52 „
* In million parts—		
Saline ammonia	0·013 „	0·093 „
Albuminoid ammonia . .	0·020 „	0·065 „
	0·033 „	0·158 „
* In imperial gallon—		
Gases in solution	8·45 cub. in.	7·96 cub. in.
Composition of gases—		
Carbonic acid	8·43 „	13·27 „
Oxygen	30·24 „	21·14 „
Nitrogen	61·33 „	65·59 „
	100·00 „	100·00 „

These results prove that the water suffers severely in quality from being retained in vessels containing cistern deposits, there being a decided increase in the organic matter in solution and in the saline and albuminoid ammonia, whilst there is a marked decrease in the proportion of oxygen gas dissolved in the water.

The foregoing results demonstrate that the water supply of a town or populous place, which may be everything that is desired at the fountain-head, and even at the supply pipe as delivered to the householders, is liable to very serious contamination when retained in house cisterns containing deposits or sediments which are composed in part of finely-divided lead compound and decaying or putrescent organic matter; and I am confident that in many cases the water supply of both towns and mansion-houses is rendered unwholesome from being retained in dirty cisterns. The remedy for the evil lies in the periodic cleansing of the house cistern, which should be regularly done every month or two, according to its position and liabilily to become impregnated with dust and sediment. The cleansing should be carried out with a very soft brush, and every care must be taken that the natural skin of the lead be not disturbed. A wire or perforated zinc cover might be placed over the cistern to keep out mice, pieces of plaster, etc., but a tight cover, which hinders the aeration of the water, should not be used.

In ordinary cases it is seldom or never that cisterns are purposely cleaned out, unless there is occasion to run off the water in order to execute repairs, and probably not even then, unless special instructions be given to clean out the cistern. Many towns and populous places are specially favoured with water of excellent quality, as delivered into the towns and into the cisterns, and indeed each house is placed on the same footing for water supply as if the foundations rested on the hills or other country district from which the water is drawn; and it is matter of regret that gross inattention to the condition of house cisterns should lead to these receptacles being sources of contamination of the water, which otherwise is of the most wholesome and suitable quality for all domestic purposes.

———

The next paper read was on—

Liebig—his Life and Work.

BY G. CARR-ROBINSON, F.R.S.E., F.I.C.,
Demonstrator in Chemistry, University of Edinburgh.

Justus Liebig was born on the 12th May, 1803, at Darmstadt, where his father carried on business as a grocer and colour merchant. Having exhausted all the chemical books procurable from the Darmstadt library, and having, as far as he was able from the materials in his father's warehouse, repeated all the experiments he had read of, it was decided to gratify his wish to be a chemist, and at the age of fifteen he was sent to an apothecary's shop to learn chemistry. This occupation did not satisfy him, and after ten months in the apothecary's shop he returned home.

In 1819 he entered at the University of Bonn. From Bonn he went to the university town of Erlangen, and studied chemistry under Kastner; here he stayed till 1822. At both Bonn and Erlangen he founded a student's society of chemistry and physics. From the University of Erlangen, Liebig obtained the degree of Doctor of Philosophy, and it was during his two years' residence at this university that he published his first two chemical researches, the one on fulminating mercury, the other on Schweinfurth green.

At this period Germany being ill provided for giving instruction in experimental science, Liebig was able, through the liberality of the Grand Duke Louis of Hesse, to proceed to Paris and there continue his studies. He attended the lectures of Gay-Lussac, of Thénard, and of Dulong, and shortly after through the influence of Alexander von Humboldt obtained permission to work in the private laboratory of Gay-Lussac.

Liebig was profoundly and gratefully impressed with the interest taken in him by Humboldt, and with the immense advantage this interest was to him in his future career; so much so indeed, that in dedicating to Humboldt his work on 'Chemistry in its application to Agriculture and Physiology,' he says "During my stay in Paris, in the summer of 1823, I succeeded in presenting to the Royal Academy an analytical investigation of Howard's fulminating compounds of silver and mercury, my first inquiry. At the end of the meeting of July 28, I was engaged in packing up my specimens when a gentleman left the ranks of the academicians and entered into conversation with me. With the most winning affability he asked me about my studies, occupations, and plans. We separated before my embarrassment and shyness had allowed me to ask who had taken so kind an interest in me. This conversation became the corner-stone of my future. I had gained the most amiable friend, the most powerful patron of my scientific pursuits." Through the further influence of Humboldt, Liebig in 1824, being then only twenty-one, was appointed extraordinary professor of chemistry in the University of Giessen, and in 1826 to the ordinary professorship. In 1845 the title of Baron von Liebig was conferred on him by the Grand Duke of Hesse, and in 1852 the Bavarian Government appointed him to the ordinary professorship of chemistry, and the directorship of the chemical laboratory in the University of Munich. He died 18th of April, 1873, at Munich.

Let us now consider Liebig as a teacher, as an experimentalist, as an author, his lifework in pure chemistry, and the application of his discoveries to the arts and manufactures.

Liebig as a Teacher.—We have already seen that the first appointment Liebig received was that of extraordinary professor of chemistry at Giessen. It was in the university of Giessen that Liebig organized the first educational laboratory. He it was who introduced into Germany systematic practical training in laboratory work, and it has been his laboratory at Giessen that has served as a type for the many scientific laboratories of which Germany is so justly proud.

Liebig is spoken of as not being a fluent speaker in the lecture room; but he was so earnest, so enthusiastic, and so wonderful was the manner in which he drew out the reflective power of his pupils. But as a teacher in the laboratory his influence was greatest; ever ready with advice and assistance, working hard with his own hands, he had constantly around him a busy staff of workers—assistants and pupils—and it is said of him, that no

* The saline and organic and volatile matters are determined in the imperial gallon, and so are the gases in solution, as these are the ordinary modes of giving these ingredients in analyses made in Scotland, whilst the saline and albuminoid ammonia are recorded in the million parts, in order to compare directly with the determinations made by the majority of chemists, who adopt this mode of analysis.

triumphs of his own brought more sincere delight than that which he took in his pupils' success.

Liebig as an Experimentalist.—If we attempt to catalogue the analytical methods and processes devised by Liebig, and the improvements in chemical apparatus which we owe to him, we shall not fail to be deeply impressed not only with the direct bearing of his work on our own lives as chemists, but also with the great impetus given to the science of chemistry, and especially the rapid development of organic chemistry. To Liebig, perhaps more than to any other one worker, are chemists indebted for some of the most beautiful of laboratory processes and chemical apparatus. It is to Liebig we owe our present methods for determining the ultimate constitution of organic bodies, and this being one of such great interest and importance to us all, I may, I trust, be excused if I dwell on this subject here for a few moments. Before 1831, the year in which Liebig made known his methods of organic analysis, such analyses had certainly been effected, and processes were in use; but these, owing to their complexity, were only of use in the hands of highly skilled chemists, and involved, for their accurate carrying out, great labour and trouble. Gay-Lussac and Thénard were the first to make quantitative analyses of organic bodies. Their method consisted in mixing the substance to be analysed with a known weight of chlorate of potash, the mixture, in the form of pellets, was dropped through a stopcock into an upright glass tube, which was heated to redness. From this tube a lateral tube conveyed the products of the combustion, carbonic acid, water vapour, oxygen, etc., to a tube standing over mercury. The volume of the mixed gases having been read off, the carbonic acid in it was estimated by absorbing with caustic potash, and the oxygen and other gases determined eudiometrically. Berzelius, Saussure, and Prout each made some alteration in this process, but still the method of determining the carbon by measuring the volume of carbonic acid was employed, and Gay-Lussac used oxide of copper instead of chlorate of potash. It was reserved, however, for Liebig to introduce the method which (with important, but secondary improvements) we still employ. He it was who first determined the hydrogen by absorbing it in the form of water in a weighed tube of chloride of calcium, and the carbonic acid by the increase in weight of a set of bulbs containing caustic potash. Who is not familiar with the little five-bulbed apparatus always known as Liebig's potash bulbs? One of the greatest of living chemists has said that at present more organic analyses are made in a single day than were accomplished before Liebig's time in a whole year, and that if the period of a man's life has sufficed to rear the now proud structure of organic chemistry, it is by means of Liebig's apparatus that this great result has been achieved. One or two other methods introduced by Liebig, and apparatus employed by him we cannot pass over.

We have here a form of apparatus used by Liebig for drying substances for organic analysis, also used for determining the molecular weight of bases by passing through the tube apparatus, containing the substance and weighed, hydrochloric acid gas, and afterwards re-weighing. Of the so well known condensers used by Liebig what need we say? They are too well known and appreciated for any remarks here.

We have here two tubes standing on mercury, the one containing oxygen, the other air. The experiment we are about to perform will illustrate another beautiful analytical method devised by Liebig,—it is the analysis of air. To each of these tubes we add an alkaline solution of pyrogallic acid, and we observe that the oxygen in both cases is absorbed; the necessity of using an alkali here suggested to Liebig the extension of the process by absorbing—in a mixture say of oxygen and carbonic acid—the carbonic acid first by potash, then the oxygen by pyrogallic acid.

Lastly, before we finish this very brief review of Liebig's work as an experimentalist, we must glance at his method for the determination of the molecular weights of bases by the analysis of their platinum compounds. We have here solutions of hydrochlorate of cinchonine, of quinine, of morphine and of narcotine. To each of these we add platinic chloride; a yellow precipitate of the chloroplatinate of the base is thrown down in each case. These are of interest to us here not only by reason of the importance of these bases in pharmacy but more especially because they were the first organic bases whose molecular weight was fixed by the analysis of their chloroplatinates.

Liebig as an Author.—He was a most voluminous author; he published many separate books, edited others along with Kopp, etc.; whilst I find that in the Royal Society's record of scientific papers, Liebig's contributions number no less than two hundred and eighty-four in his own name, and thirty-three joint papers.

Of Liebig's work in pure chemistry a very important part was carried on in conjunction with Wöhler. Amongst the first of their researches was one on cyanic acid, whilst from this Liebig was led on to the study of the cyanates, cyanides and double cyanides, thence to the sulphocyanates; but over these we cannot linger. Of other investigations of Liebig's in conjuction with Wöhler we have their work on the benzoic compounds; this is perhaps the greatest of all his work in pure chemistry, and the theoretical views brought forward in the papers on benzoic acid and bitter almond oil were the commencement of the development of the new theory of compound radicals which soon took the place of that of Berzelius. Along with these investigations must be ranked, for the important part it played in the development of chemical theory, Wöhler and Liebig's work on 'Uric Acid and its Derivatives,' published in 1838.

The application of Liebig's discoveries to the arts and manufactures.—And it is probable that in glancing over this part of his work that we shall this evening find subject matter for the most agreeable reflection. Amongst the first of these we may consider those derived from his studies in agricultural chemistry, where he points out the absolute necessity of taking into account the mineral or saline ingredients which remain as the "ash" of plants when they are burnt. He pointed out the enormous waste of most valuable plant food from treating sewage as refuse, and it was he who first suggested that phosphoric acid should be presented to the plant in a more easily assimilable form by treating bones and other phosphates with sulphuric acid; from this has sprung the large industry of the manufacture of artificial manures.

And, as showing the importance he attached to this subject, he says in his 'Chemistry in its Application to Agriculture and Physiology' (page 176):—"A time will come when fields will be manured with a solution of glass (silicate of potash), with the ashes of burnt straw, and with salts of phosphoric acid, prepared in chemical manufactories, exactly as at present medicines are given for goître and fever."

Of his investigations into the cyanides we have already spoken, his method for preparing cyanide of potassium by fusing the ferrocyanide with carbonate of potash is that now generally employed; whilst in the process of manufacture of yellow prussiate of potash he showed that it is really cyanide that is formed during the heating in the retort and that it is by the taking up of iron from the retort or from the iron scraps added that the cyanide during the process of lixiviation is converted into ferrocyanide. He also greatly perfected the processes of manufacture of acetic acid, and did much in extending our knowledge of fatty bodies, especially oleic, margaric and stearic acids.

His work in 'Animal Chemistry' and the results it led to, viz., the preparation of his "Extract of Meat," and the importance of this latter as a commercial product, is too well known to all present to need any comment.

Nor is it necessary to remind Edinburgh pharmacists that chloroform was discovered independently by Liebig in 1832, and in the same year he discovered chloral.

Bromine, the discovery of which is generally ascribed to Balard, was first obtained by Liebig from the mother-liquor of Kreuznach brine, and though he noticed that it gave with starch a yellow coloration instead of the blue colour given with iodine and starch, he was so satisfied of its being iodine that it was put on the shelf of his laboratory, labelled "chloride of iodine." An amusing and interesting account is given of this by Liebig himself, when he warns chemists to trust only to actual facts obtained by experiments, and not to be led away by theoretical consideration.

Both gentlemen were awarded a hearty vote of thanks for their interesting communications.

The Chairman intimated that the seventh and last meeting of the session would be held on Wednesday, April 9, on which occasion Mr. Cargill Knott and Mr. D. B. Dott would give papers.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on March 20, Dr. Gladstone, President, in the chair. After the announcement of visitors, the minutes of the previous meeting were read and confirmed. The following certificates were read for the first time: W. Johnstone, W. B. Turner, C. Slater, T. Palmer, A. H. Black and W. A. Bradbury.

The President then called on Dr. Frankland to read a paper on—

Plumbic Tetrethide. By E. Frankland and A. Lawrance.—This substance was discovered by Buckton in 1859. The authors prepared the compound as follows: Plumbic chloride is added to zinc ethyl contained in a stout glass bottle as long as any reaction takes place. The product is mixed slowly with a large volume of water and distilled (from an oil-bath) in a current of steam. The distillate separates into water and a heavy layer of plumbic tetrethide. During the preparation no gas was evolved, and the authors infer that the decomposition has two stages—

$$PbCl_2 + 2ZnEt_2 = PbEt_2 + 2ZnEtCl \text{ and}$$
$$2PbEt_2 = Pb + PbEt_4$$

The following gases have no action at ordinary temperatures on plumbic tetrethide: ammonia, carbonic anhydride, carbonic oxide, cyanogen, nitric oxide, oxygen and sulphuretted hydrogen. Sulphurous anhydride is rapidly absorbed and the liquid plumbic tetrethide converted into a white amorphous solid. This product was placed in a beaker over which was inverted a second beaker, the two being luted with gummed paper. On heating the lower beaker with steam, crystals sublimed, which, after purification from a volatile lead compound by treatment with strong nitric acid, evaporation to dryness and recrystallization from alcohol, proved in chemical composition and physical properties to be identical with diethylsulphone, SO_2Et_2. The residue, after the sublimation of the diethylsulphone, consisted principally of plumbic ethylsulphinate $\left\{\begin{matrix}SO\ Et\\SO\ Et\end{matrix}\right.PbO''$. Ethylsulphinic acid may be considered as sulphurous acid, $SOHo_2$, in which a semi-molecule of ethyl has replaced one of hydroxyl, SOEtHo, or as propionic, acid in which one atom of tetrad sulphur has been substituted for one of carbon $\left\{\begin{matrix}C_2H_5\\COHo\end{matrix}\right.$ $\left\{\begin{matrix}C_2H_5\\SOHO\end{matrix}\right.$ No volatile organometallic base was detected in the product of the action of SO_2 on $PbEt_4$ similar to that produced in the corresponding reaction with stannic ethide.

In answer to a question of the President, Dr. Frankland said that plumbic tetrethide could be prepared directly without the intervention of zinc ethyl, but the product was small in quantity and impure.

Professor W. Foster then gave a verbal communication on—

The Production of the Higher Oxides of Iron, Chromium, Manganese and Bismuth.—Professor Foster said that the observations he had to make were a continuation of a paper which he had recently communicated to the Society. When a strongly alkaline solution of sodic hypobromite is heated with a solution of potassic ferrocyanide the solution rapidly becomes deep red from the formation of a ferrate. Almost any iron compound, and even freshly precipitated ferric hydrate, can be substituted for the ferrocyanide in the above reaction. The author has not attempted to isolate the potassium or sodium ferrate formed under these circumstances. Similar reactions occur if manganese, chromium or bismuth compounds be boiled with alkaline hypobromite, permanganate, chromates, etc., being formed. Oxygen is evolved during the reaction. Cobalt, nickel and copper salts also evolve oxygen. The author demonstrated this fact in the case of cupric sulphate; a considerable quantity of oxygen being collected when the sulphate was mixed with alkaline hypobromite and the mixture heated to about 20°C.

Dr. Wright said that some samples of bleaching powder when closely stoppered were apt to explode (he had always found manganese in these samples); possibly this might be accounted for by the evolution of oxygen by a reaction similar to that described by the author.

Mr. Neison asked if Professor Foster had noticed any formation of a green manganate in the oxidation of manganese compounds. Some time since he was working with ferrates and obtained once a green iron acid which he had never seen since; perhaps by these reactions it might be obtained.

Mr. Hartley had noticed that when the copper sulphate and alkaline hypobromite were first mixed the solution turned yellow, but when the evolution of oxygen ceased the liquid was quite dark. This yellow substance was probably Brodie's cupric peroxide.

Mr. Kingzett had made some experiments on the action of oxide of manganese on bleaching powder; oxygen was evolved, but the gas was not pure.

Professor Foster, in answer to a question of the President, said that he had not tested the oxygen evolved quantitatively as to its purity.

The next paper was read by the Secretary on—

The Decomposition of Water by Certain Metalloids. By C. F. Cross and A. Higgin.—The statements of chemists with respect to the action of sulphur on water are conflicting. Mulder affirms that the vapour of water reacts on sulphur at a high temperature to form pentathionic acid. Myers asserts that hydrogen sulphide and thiosulphuric acid are formed. Girard also found that hydrogen sulphide was evolved by boiling sulphur with water. Gelis ascribes this evolution to impurities in the sulphur. The authors therefore investigated the reaction of sulphur with water. Water containing "flowers of sulphur" in suspension was boiled and the vapour conducted into lead acetate; the latter was continuously decomposed with the formation of sulphide. The quantity formed under various conditions was estimated. The reaction which occurs is probably $2H_2O + S_3 = 2H_2S + SO_2$, if air be present sulphuric acid is also formed. Some experiments were also made with sealed tubes. The authors conclude that sulphur decomposes water, uniting both with its oxygen and hydrogen, the decomposition being independent of atmospheric oxygen. The authors repeated their experiments with sulphur purified by treatment with potassium permanganate and find that the reactions above described remain unaltered. Selenium and tellurium have an inappreciable action on water at 160°. Amorphous phosphorus does not decompose water at 100°. At 160° a small quantity went into solution. When lead acetate solution was substituted for water, metallic lead phosphate and phosphide were formed. With copper sulphate metallic copper was deposited with phosphide

and sulphide, phosphoric and sulphuric acids being also formed. Cupric chloride at 160° is first reduced to cuprous chloride and finally converted into a phosphide. Vitreous phosphorus does not decompose boiling water except in the presence of oxygen, it reduces metallic (lead acetate) solutions even when oxygen is excluded. Bromine and iodine when heated with excess of water dissolve in small quantity as alkaline bromides, bromates, etc. If bromine be heated with lead acetate, lead bromide and dioxide are formed.

Mr. Warington remarked that an Italian chemist had observed that gypsum was formed by the action of calcium carbonate on sulphur in the presence of moisture.

The next paper was read by the Secretary on—

The Volumetric Determination of Chromium. By W. J. Sell.—The author having discovered that chromium in ordinary chromic salts can be completely converted into chromic acid by means of potassic permanganate, endeavoured to apply this reaction directly for the estimation of chromium; he was, however, unsuccessful, owing to the separation of manganese dioxide. He has devised the following method, which yields rapid and accurate results:—The solution containing chromium acidified with sulphuric acid is boiled and a dilute solution of permanganate added to the boiling liquid until a purplish tint remains after boiling for three minutes; the solution is then rendered slightly alkaline with soda carbonate, alcohol is added, and the manganese filtered off. The chromic acid in the filtrate is estimated by titration with iodine and sodic thiosulphate. The author had successfully applied the method to the estimation of chromium in chrome iron ore; he recommends the following plan of effecting its decomposition:—The chrome iron ore is placed on the top of about ten times its weight of a mixture composed of one molecule of well fused and powdered sodium bisulphate to two molecules of sodium fluoride, and the whole is ignited for fifteen minutes; an amount of sodium bisulphate is now added equal to that of the mixture taken, and when thoroughly fused a further addition of an equal quantity of bisulphate is made, the mass fused and then rapidly cooled. The fused mass so obtained dissolves completely in boiling water acidified with sulphuric acid. In this way a determination can be made in an hour and a quarter. The author's attention has been directed to a notice by Mr. Wanklyn in the *Philosophical Magazine*, February, as to the conversion of chromic oxide into chromate by alkaline permanganate. This result the author arrived at some months ago, but has not yet succeeded in applying it quantitatively.

During the reading of the last paper Dr. Russell occupied the chair. The anniversary meeting will take place on Monday, March 31. The next ordinary meeting will be on April 3, when the following papers will be read:—On Terpin and Terpinol, by Dr. Tilden; On the Transformation of Aurin into Trimethylpararosanilin, by R. S. Dale and C. Schorlemmer; On a Gold Nugget from South America, by Mr. Attwood; On the Solution of Aluminium Hydrate by Ammonia and a Physical Isomeride of Alumina, by C. F. Cross.

Parliamentary and Law Proceedings.

Castor Oil Pills.

At the Lancaster County Petty Sessions, on Saturday, March 15, Robert Taylor, grocer, Carnforth, Manager of the Carnforth Branch of the Lancaster Co-operative Society, was charged with an offence against the Food and Drugs Act, 1875, on the 25th January, in selling castor oil pills which were not of the nature, quality, and substance demanded. The real defendants were Messrs. Bell and Sons, chemists, etc., Liverpool, the manufacturers of the pills,. The pills were puchased by Superintendent Moss, on the date named, and sent to Dr. Campbell Browne, the county analyst, Liverpool, who gave his certificate to the effect that the pills were made up entirely of "aloes, rhubarb, some kind of pepper—probably cayenne, soap, saccharine matter, resinous matter, and that they contained no castor oil." Dr. Browne was called for the prosecution, and in the course of his evidence said the pills in question were composed principally of aloes—in the proportion of one-half—which was a very powerful aperient, and in some cases would be a dangerous medicine. He could find no castor oil in the three pills analysed, though he did not mean say that if he had had a larger quantity he might not have found castor oil. The principal ingredient being aloes, it ought to be so stated on the label, and then people would know whether they dare take them or not.—It was contended for the defence that the pills were of the nature and substance demanded, inasmuch as being compounded of various drugs that acted one upon another, they produced an effect on the system similar to that produced by a dose of castor oil; and that so far from the aloes they contained having an injurious effect, it acted as a tonic, because people could only get the minimum amount in two or three pills. If they took more, the effect would be a gentle purgative, and in the British Pharmacopœia aloes entered into the constitution of all aperient pills. Evidence in support of this contention was given. The Bench decided to convict, the penalty amounting to £10 5*s.* 4*d.*—Notice of appeal was given.

Prosecutions of Grocers for Sale of Adulterated Drugs.

At Bishop Auckland Police Court, on Monday, March 17, John Booth, grocer, of Etherley, was charged with selling to Superintendent Banks as tincture of rhubarb a mixture which was not of the substance and quality demanded. The certificate of the county analyst showed that the article supplied by the defendant contained 19 per cent. of water, one ounce of the mixture containing only 7·3 grains of "extractive." Defendant pleaded guilty of selling the mixture, but said he bought it of a man at Stockton. A fine of 10*s.* and costs was imposed.

Joseph Harland (who was represented by his wife), grocer and provision dealer, of Etherley, was charged with selling adulterated sweet spirit of nitre. The county analyst's certificate in this instance showed that the mixture contained 27 per cent. of water, and was of no value as a remedy whatever. Mrs. Harland said her husband purchased the spirits of Messrs. Holmes and Richmond, of Darlington.

The Magistrates' Clerk: You had better deduct the fine and costs from the bill, then. The Chairman said that was very good advice. Defendant would have to pay a fine of 10*s.* and the costs.—*Northern Echo.*

Adulterated Cream of Tartar.

Six tradesmen of West Hartlepool have been brought before a full Bench of magistrates for selling adulterated cream of tartar. The Superintendent of Police had obtained a certificate from the county analyst in each case, and these certificates gave the following results:—William M'Cabe, Lynn Street:—Tartrate of lime, 8·29; sulphate of baryta, 0·50; sand, 1·20; total, 9·99. John Livingston, Church Street:—Tartrate of lime, 8·4. William S. Rutter, Lynn Street:—Tartrate of lime, 7·75. Francis Smith, Durham Street:—Tartrate of lime, 6·61; sand, 0·25. Robert Embleton, Stockton Street:—Tartrate of lime, 6·81. Thomas Layburn, Belle Vue:—Tartrate of lime, 7·75.

M'Cabe's case was taken as a test case; and in his certificate the analyst observed that "commercial cream of tartar generally contains a small quantity of tartrat

of lime;" and in M'Cabe's sample (two ounces) it was "present in excess."

Mr. Simpson, who appeared as the advocate of all the parties, submitted that the circumstances did not call for a conviction. The article was of the kind demanded by the purchaser, and it was impossible to keep it free from tartrate of lime.

The Chairman, after some deliberation, said the article might be considered commercially pure, and as these were the first cases of the kind before them the Bench were not disposed to convict. They, however, recommended tradesmen, for their own protection, to take a guarantee from the wholesale merchant. Nor must the present decision be cited some weeks hence as a precedent. The whole of the cases were accordingly dismissed.—*Northern Echo.*

Sale of Laudanum.

At Croydon John Wilson, a carpenter, has been charged with attempting to commit suicide, by taking a quantity of laudanum.

Mr. Hayward, chemist, was present, and said he supplied the prisoner with the laudanum. He had been in the habit of serving prisoner with laudanum for the mother of the woman he was cohabiting with, who took it medicinally.

The Chairman thought an ounce was a large amount of laudanum to serve out for a woman.

Mr. Hayward said the woman had been in the habit of taking it for five years, and chemists used their discretion as to how much they served.

Dr. Hetley asked Mr. Hayward what authority he had to serve such a quantity of poison to a woman, which was sufficient to kill any one.

Mr. Hayward said the woman produced a bottle labelled "poison" which had been supplied by another chemist, and this was sufficient authority.

Dr. Hetley advised Mr. Hayward not to supply such a quantity again without proper information, and a certificate from a qualified medical man as to the amount required by persons applying for the poison.

Prisoner's mother attended and said she would take her son home and look well after him, and he was discharged.

Poisoning by a Liniment.

The Manchester city coroner held an inquest on Monday on the body of Charles Taylor, aged 73. It was tated in the evidence that for some time the deceased had been suffering from a cough and face affection. He had a liniment with which to rub his face, and a bottle of cough mixture. On Sunday evening, his housekeeper, having to attend to him, administered to him a dose of the liniment (which was marked "Poison") in mistake for the cough mixture. Immediately perceiving her error, she called in Dr. Pettinger, who applied the usual remedies, but three hours later the old man died, having become unconscious and delirious.—Mrs. Wood swore that she had given the liniment entirely in mistake and was unable to read the label on the bottle.—A verdict of accidentally poisoned was returned.—*Manchester Evening News.*

The Sale of Violet Powder.

At the Ashburton Petty Sessions, on March 23, Abraham Hill, chemist, of Ashburton, was summoned for selling violet powder which was adulterated with sulphate of lime. Defendant pleaded not guilty.—Police-Inspector Moore proved going to the defendant's shop and purchasing a packet of violet powder, which he forwarded to Dr. Blythe, the county analyst. The certificate he returned was to the effect that it contained almost wholly sulphate of lime mixed with a very small quantity of scented starch. Pure violet powder should be scented starch, and seldom contained one per cent. of mineral matter.—Defendant stated there was no fixed standard for violet powder, and that there were over seventy different sorts; but the inspector did not ask for any particular sort, and he supplied him with that which he had. Under these circumstances, the Bench dismissed the case.—*Western Daily Mercury.*

Notes and Queries.

[563]. LEMON SYRUP.—I find the following makes an excellent lemon syrup:—

Acid, Citric or Tartaric	1¼ oz.
Ess. Lemon.	℥ xx.

Add to boiling water, Oj.

Shake thoroughly, and set aside to cool, when cold filter on to sugar 2lbs., and dissolve with a gentle heat, not above 120° Fahr., as greater heat forms grape sugar, and destroys the flavour of the ess. limon.

E. Warrell.

[578]. CURRIE POWDER:—

℞ Pulv. Curcumæ	℥iv.
Sem. Coriand.	℥ij.
„ Cymini	℥j.
Pip. Cayenne	℥j.
„ Nigre	℥j.
Rad. Zingib. Contus.	℥j.
Pulv. Sem. Cardam.	℥ss.
„ „ Carui	℥ss.
„ Macis	℥ij.

All to be well mixed, and passed through a fine sieve, and to be kept well corked.

F. W. H.

[578]. CURRIE POWDER.—The following formula was given to me by a missionary many years resident in India:—Cardamoms (freed from husk), 1 oz.; cloves, 1 oz.; caraway, 2 oz.; ginger, 2 oz.; black pepper, 2 oz.; cayenne, 1 oz; cummin, 3 oz.; turmeric, 1½ lb.; fenugreek, 4 oz. It is important that every ingredient be fresh and freshly ground. Will improve by keeping.

A. P. B.

[578]. CURRIE POWDER.—"Registered Student" will find the following to produce a very satisfactory "currie powder:"—

℞ Pulv. Coriand.	℥xij.
„ Piper. Nig.	℥vj
„ Curcumæ	℥iv
„ Cymini	℥iij.
„ Capsici	℥iss.
„ Cardam.	℥ss.
„ Caroph.	℥ij.
„ Pimento	℥j.
„ Cinnam.	℥iij
„ Zingiber	℥ij.
„ Macis	℥j.
„ Sinapis	℥j vel q.s.

The above ingredients should be in very fine powder, and after being thoroughly mixed in a mortar passed through a fine sieve.

G. H. L.

[578]. CURRIE POWDER.—Attached are two recipes for currie. Both given to me by "Old Indians." They are both excellent:—

No. 1.

Coriander Seed	℥v.
Black Pepper	℥ij.
Fenugreek	℥j.
Turmeric	℥iij.
Fennel Seed	℥iij.
Cayenne	℥iij
Cummin Seed	℥iv

No. 2.

Coriander	℥xij.
Turmeric	℥viij.
Cummin	℥ij.
Caraway	℥ij.
Cayenne	℥j.
Long Pepper	℥ij.
Cardamoms	℥ss.

In each case it is desirable to get the seeds very fresh and pound them. M. R. C. S.

---

[579]. PERFUME.—J. N. C. will find the following recipes for perfuming lime juice and glycerine, and pomade, excellent.

No. 1. For Lime Juice and Glycerine.

℞ Ess. Jasmini	℥iv.
Ol. Aurantii Cort.	℥ij.
Ol. Lavand. Ang.	℥j
Ol. Rosmarini	℥iij.
Ess. Amygd. Amar.	℥iiss.
Essence Neroli	♏xxx.
Ol. Cinnam. Ver.	♏xx.
Otto de Rose	♏xxx.

This perfume is rather expensive of manufacture, but is very powerful.

No. 2. For Pomade.

℞ Pommade de Rose	℔ij.
„ de Jasmin	℔iss.
„ de l'Orange	℔j.
„ de Tuberose	℔j.
Ol. Lavand. Anglic.	℥ij.
Ol. Cinnamomi Ver.	℥j.
Ol. Rosmarini	℥j.
Ol. Aurantii Cort.	℥vj.

M. and melt together with the aid of a gentle heat. This makes a very powerful as well as delicious perfumed pomade, concentrated. To make ordinary pomade from it, I take half a pound of it and mix it with two pounds of the ordinary ingredients (wax, lard, oil and palm oil) previously melted over a water-bath, and stir until it sets.

CHAS. STOCKS.

---

[586]. PIL. DE VALLET.—"Nil Desperandum" may be informed that the above-named pills consist of half their weight of carbonate of iron in a saccharated form. The carbonate is prepared by precipitation, and sugar is used in each step of the process so as to prevent oxidation. The drained precipitate is mixed with honey and sugar, so that the mass, after evaporation to pilular consistence, shall consist of half its weight of carbonate. The pills may be made of such size that two, three or five grains of the carbonate may be taken thrice daily.

Northallerton. HY. BROWN.

---

[586]. In answer to "Nil Desperandum's" inquiry, I beg to lay before him the formula for pil. de Vallet:—

℞ Sulfate de fer pur	100·0.
Carb. de soude crist.	120·0.
Miel fin	60·0.
Eau	q.s.

On fait dissoudre à chaud le sulfate dans l'eau privée d'air par l'ébullition et sucrée préamblement avec un seizième de son poids de sirop de sucre. On fait dissoudre de la même manière le carbonate. On filtre séparément les deux liqueurs; on les reúnit dans un flaçon, on agite, on laisse reposer; on décante le liquide qui surnage le précipité de protocarbonate de fer qui s'est formé, et on le remplace par de nouvelle eau privée d'air et sucrée.

On continue ainsi les lavages jusqu'à ce qui l'eau n'enlève plus ni sulfate de fer, ni carbonate de soude; alors on jette le magma sur une toile serrée, imprégnée de sirop de sucre. On l'exprime fortement et on le mélange au miel préablement fondu au feu.

On concentre le mélange trés-promptement au bain marie jusqu'en consistance pilulaire.

Les proportions ci-dessus (plus une poudre inert) sont pour six cent pilules que l'on enferme dans des flaçons bien fermés. Mons. Valle argente ses pilules.

Ces pilules jouissent d'une grande efficacité contrè la chlorose.

Dose 2 à 10 pilules par jour.

St. Leonards-on-Sea. H. S. N.

---

[588]. EFFERVESCING SALINE:—

℞ Pulv. Sodæ Tart.,	
„ Crem. Tart.,	
„ Acid. Tart.,	
„ Sodæ Bicarb.	ana ℥j.
„ Sacch. Alb.	℥ij.

To be kept in air-tight bottles.

The above is said to be the composition of a very popular preparation. F. W. H.

---

[588]. S. G. will find the following formula make a good "effervescent saline."—

℞ Sodæ Bicarb.	1 oz.
Pulv. Acid. Tart.	1 „
„ Crem. Tart.	1 „
„ Sacch. Alb.	3 „
Mag. Sulph.	½ „
Ess. Limonis	q.s.

M.

St. Leonards-on-Sea. H. S. N.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[219]. "Semloh" altogether fails to grasp the point in reference to the Gregory's powder question. He is now dealing in crotchets, and, as he is anxious to know something about them, I shall simply say, since he writes anonymously, that whims are crotchets or perverse fancies, adding, at the same time, my opinion that his remarks about "dogmatical notes" are very bluff, and, so far as I am concerned, wholly out of place. It would, no doubt, be better if a prescriber, in ordering such powders as are bulky, would write the directions in plain English. It is quite obvious that when a medical man uses the sign (℥j) he means a teaspoonful. I think very few, except those who have seen a good deal of compounding, would believe that ℥j of Gregory's powder, by weight, as I pointed out in the *Pharmaceutical Journal* of February 22, is equal to a large tablespoonful or thereabouts by measure. "Edinburgh" agrees with me in stating "one to two teaspoonfuls" for a dose, on labels in common use. Mr. Robert Roe and J. B. L. M. agree with me that when powders are ordered "in bulk," and ℥j is written, one teaspoonful is meant.

"Semloh" is not satisfied. He asks what would I do "suppose, for argument's sake, a prescription came in as follows: ℞ pulv. rhei co. ℥j, mitte vj?" His question is very laconic. Send a teaspoonful for the ℥j? No; because the quantity ℥j is here evidently meant to signify sixty grains, or, if "Semloh" wishes to split a hair—54·68 grains, B.P.

He adds, "If it is done in the one case it must of necessity be in the other." Decidedly and emphatically

I say, no. The intention in one case is clearly one drachm by weight, in the other, what is known as a teaspoonful by measure.

How any one can fail to see this clearly, I cannot understand, much less to raise any question as to its correctness.

I do not wish to "vanquish," as "Semloh" puts it, "all other opinions." He and his friend, Mr. Barnes, and a hundred others will fail to cast common sense aside in such matters where judgment must be exercised, even to the annihilation of crotchets and whims.

Northallerton. HY. BROWN.

---

[254]. Dissolve quina in acid. sulph. arom., and add to tinct. aurant, finely powdered mag. sulph., and suspend in the spirituous liquids; lastly add aqua. This procedure may be adopted in most cases where there is sufficient spirit to throw salts out of solution.

E. WARRELL.

---

[254]. This prescription, if dispensed as written, solidifies; the best plan, in my opinion, is to add more aqua and make it a ℥vj mixture, and label, "one tablespoonful in a wineglass of water." ADJUTOR.

---

[254]. In reply to J. B. L. M., respecting the *modus operandi* of dispensing this strange compound, I beg to say I have tried his process, and think if mixtures such as these are ordered for the convenience of patients travelling, the patient must tell his nurse to immerse the bottle in hot water before he requires the dose.

ARCTIC REGIONS.

---

[254]. I shall be glad to hear from J. B. L. M. whether the tinct. aurantii he used was made with spt. tenuior, according to the B.P., as I am aware in some parts the tinctures are made s. v. r. and aqua in equal proportions; if this is the case the result would be very different. I must confess I cannot get anything but a solid result from J. B. L. M.'s process, viz., using tinct. aurantii (strictly B.P.). A freezing mixture is the result. Doubtless, did we inhabit the tropics the mixture might be sent out in a liquid form.

I would also reply to W. Mc.N., Dublin, and say my eyes are good, and that tinct. aurantii ℥iss (not ℥iss) was ordered, and should he be in Islington, N., I shall be pleased to show him the prescription.

Islington, N. W. N. G. LANCE.

---

[256]. In answer to Mr. J. W. Barnes, I would not like to undertake to say he was justified in adding mucilage to this mixture without the sanction of the writer; at the same time will you allow me to point out to Mr. Barnes a method by which this prescription may be dispensed without the ugly result he experienced? If the tinct. guaiaci co. be placed in a strong bottle along with the spt. ammon. arom., and boiling instead of cold water added, then firmly corked, and set aside to cool, a mixture as nearly perfect as possible will be the result. The potass. iodid. may be added afterwards when cold. "Shake the bottle" label.

Shrewsbury. R. L. L.

---

[258]. This is an unsatisfactory prescription; decomposition takes place, notwithstanding the order of mixing. When heated the mixture becomes clear, but on cooling the same inelegant, brick-red precipitate falls out and adheres (partly) to the bottom of the bottle.

The following plan obviates this and makes a very presentable mixture:—Dissolve pot. iodid. in five or six ounces of aq. dest., add syr. ferri iod. and tinct. iodi, then ℥j of fresh mucil. acaciæ. Shake together and add gradually the quin. and ac. cit. (first dissolved in the remainder of the water), shaking well together. No heat is required. G. G. HORNSBY.

[259]. The balsam tolu should be dissolved by heat in about a drachm or a drachm and a half of sp. v. r., strain through muslin, add the lard while still warm, then the ol. ricini, ol. rosmar., and tinct. canthar., stirring till cold. This will make a smooth ointment of a fair consistency.

G. G. HORNSBY.

---

[259]. Digest the tolu balsam in the castor oil at the temperature of boiling water for half an hour, strain through tow or lint, and mix with the lard. When cold add the tincture and perfume.

J. B. L. M.

---

[260]. Good opium is seldom so moist that it cannot be cut with a knife, or rasped with a file into a coarse powder, a condition unfortunately not defined in the "B.P." Contusion and the heat developed by the pestle would cause aggregation of the particles.

J. B. L. M.

---

[261]. Mr. Lance, Islington, asks whether (chemically speaking) mist. ferri comp., B.P., contains saccharated carbonate of iron. I observe W. McN. says it undoubtedly contains ferri carb. sacch. I am well aware of how debatable a nature the subject is, and for years pharmacists, both at home and abroad, have tried to prevent the carbonate of protoxide of iron from undergoing conversion into the sesquioxide.

Dr. Clarke, of Aberdeen, Klauer, Becher, Vallet, and others have given their attention to the subject, and the pills of Vallet have carbonate of iron in a saccharated form as the chief ingredient.

Now, it is well known that the utmost care is requisite in the preparation of the saccharated carbonate of iron which, according to theory, should contain 46 per cent. It hardly ever consists of more than 37 per cent. of carbonate.

Klauer supposed that a regular compound was formed between the sugar and the protoxide of iron. This is now considered not to be the case. The sugar, by enveloping the particles of the carbonate, forms a protecting envelope, so to speak, and oxidation is thereby prevented or retarded.

In Griffith's mixture, the mist. ferri comp., sugar is added with the view of preventing the carbonate from undergoing change.

We all know how difficult it is to keep Griffith's mixture, and hence the judicious prescriber only orders as much as will last for a few days.

Whilst, however, Griffith's mixture recently prepared contains ferri carb., one is scarcely justified in saying the mixture contains the carbonate in exactly the same form as it exists in ferri carb. sacch., or in other words, ferri carb. sacch. is a more stable compound than Griffith's mixture, the carbonate of which speedily undergoes conversion into sesquioxide, the change being accelerated by water and exposure to air.

As the whole subject is one of great interest, I withhold any further observations, so as to give others an opportunity for expressing their opinions.

Northallerton. HY. BROWN.

---

[261]. Certainly "Griffith's mixture" contains succharated ferrous carbonate, though impregnated with proportionately more sugar than the official fer. carb. sacc., and when freshly made and unexposed to the air is a much better representation of the true carbonate than the abnormal brown powder met with in dispensing establishments. The end is best attained by adding granular sulphate of iron to the mixture immediately before corking the bottle.

J. B. L. M.

---

[262]. I send my own form for linim. potassii iodidi c. sapone, which I think will be found to be all that can be

desired if properly made. I do not think it possible to make a presentable liniment by using a hard soap such as the Pharmacopœia directs, as hard (or soda) soaps separate from saline solutions. In the following the hard soap is replaced by a potash soap, which makes a perfectly compatible mixture, and when known to prescribers will always replace the Pharmacopœia liniment. Professor Tichborne's formula has not (as far as I am aware) been published.

Take of—

Acid. Oleic. (commercial) . .	℥iss.
Liq. Potassæ	℥vij vel q.s.
Glycerini	℥ij.

Boil together until perfect saponification is effected, adding sufficient liq. potassæ to make a clear solution, and water occasionally to replace loss by evaporation (all the usual precautions necessary in making soft soap must be observed), then add—

Potass. Iodid.	℥iij.
Sp. Vini Re ct.	℥ij.
Aquæ Dest.	℥j.

Dissolve, add to the soap, and make up with water to weigh four ounces; when cold add two drops ol. limonis. Should the liniment be too thick a small quantity of sp. vini rect. must be added to thin it.

48, *Henry Street, Dublin.* WM. N. ALLEN, JUN.

---

[263]. In reply to "Jamjam" it is a general rule to sell the liq. ammoniæ, B.P., sp. gr. ·959, for spirit of hartshorn, and for hartshorn and oil the lin. ammoniæ, B.P., and to prepare the same according to the directions given in the British Pharmacopœia.

G. H. L.

---

[263]. Liquor ammoniæ is usually sold for spt. of hartshorn. Distilled water must be used, else thickening will take place; and the oil is best added (in small quantities at a time) to the ammonia, with brisk agitation.

J. B. L. M.

---

[264]. Unmistakably ten ounce capacity! I am surprised at A. P. S. asking such a simple question. This point has been often discussed and long since settled.

J. B. L. M.

---

[264]. In answer to the query of A. P. S., I beg to inform him that during my whole experience with first class dispensing establishments in London and the provinces, whenever a mixture was prescribed "aquæ ad Oss," it was dispensed "aquæ ad ℥x" the "imperial half pint."

W. E.

---

[264]. In reply to the query of A. P. S., I wish to say that it is still customary in some "few" of the old established dispensing businesses to send out for "aquæ ad Oss" an 8 oz. mixture, and not a ℥x, as they, from reasons which I have yet to learn, prefer to keep to the pint of sixteen ounces. As to which is the correct, I should decidedly say the ℥x, which is, in addition, safer and more satisfactory to the patient in general. Should be glad if the above query proves the means of convincing some of the "principals" in these establishments of the the "error of their ways" and (if not deviating from) at least admitting their present error.

G. H. L.

---

[265]. The B.P. pill is liable to get hard and crumbly when long kept, but if one-fifth of the castor oil be substituted by treacle—not golden syrup, so often confounded with the theriaca of the B.P.—and a little more if necessary, a good "rollable" mass results.

J. B. L. M.

---

[266]. On page 272 of Royle's 'Materia Medica,' third edition, the dose of Fleming's tinct. aconit. is stated to be three to five minims.

Dr. Farr, of this town, has recently had a most severe case of neuralgia, in which three minim doses every four hours had a most beneficial effect.

Andover. JOHN REEKS.

---

[266]. In reply to D. H., Dr. Neligan, in his treatise on 'Medicines, their Uses and Mode of Administration,' gives the dose of tinct. aconiti, Fleming, as being five minims, from which it may be inferred that three minims is a minimum dose.

CHAS. STOCKS.

---

[268]. W. P. should very finely powder the bromide of potassium, and dissolve in the cold as much as is possible of it (which will be nearly the whole) in the quantity of water ordered, to which has been previously added the syrupus aurantii. He should attach a "shake the bottle" label. Possibly (though he does not say so), W. P. thinks that the quantity of bromide of potassium is in excess of the usual dose. I have conferred with two members of the medical profession, who only tell me what I thought myself, that after long continuance, drachm doses are by no means unusual, although few, if any, would commence giving so large a quantity.

CHAS. STOCKS.

---

[271]. I quite agree with D. H., in only giving half drachm doses of sp. ammon. co., and syrup. aurant. ℥ss. was evidently a slip of the pen.

CHAS. STOCKS.

Questions.

[272].

℞ Ext. Elaterii	¼ gr.
Ext. Creosotonis	j „
Ext. Hyoscyam.	ij „

Ft. pil. mitte xij.

The above prescription was sent me to-day. Will any of your correspondents inform me how it should be dispensed, for upon inquiry of the medical man he informed me it was correctly written?

S. SANDFORD.

---

[273]. Would any reader kindly inform me whether the following prescription can be dispensed without, in the course of a few hours, depositing a thick cloudy precipitate?—

℞ Beberiæ Sulph.	℥ss.
Acid. Sulph. Dil.	℥ss.
Tinct. Aurantii,	
Syrupi.	āā ℥j.
Aquæ	ad ℥vj.

Sig. A tablespoonful to be taken with water twice a day.

W. F.

---

[274]. Having dispensed the following, I observed a deposit which I had before anticipated on account of the tinct. digitalis and syr. ferri phos. The medical man, however, informs the patient there should be no precipitate. Will some pharmacien oblige by giving his opinion on the subject?—

℞ Tinct. Camph. Co.	℥iv.
Tinct. Scillæ	℥ij.
Tinct. Digitalis	℥iss.
Syr. Ferri Phos.	℥iv.
Aquam.	ad ℥viij.

M. ft. mist. Capt. ℥j ter in die.

Mode of dispensing adopted:—Added to ℥vj aq. dest. tinct. camph. co., tinct. scillæ et syr. ferri phos.; after shaking added tinct. digitalis et aqua to ℥viij.

SUB JUDICE.

Pharmaceutical Examinations.

Sir,—I was much amused in perusing "Devon's" letter in your issue of the 22nd ult., to notice the very curious logic he uses to prove the existence of a needless excess of examining power at the above, and that the "terrible battery" constituting our Board of Examiners intimidates intending candidates to such an extent as to be alone sufficient explanation of the large percentage of failures.

His reasoning is easily proved fallacious, for "Devon" says, "as a matter of fact the 77 Major candidates of last year had to face 140 examiners, or nearly two examiners to one man!"

Taking another step in the same line of argument, and he would say that each individual candidate "had to face" 13·8 examiners (the average attendance). True, but we cannot assume that the examiners meet for one candidate only, or for Majors only, and, "as a matter of fact" the ratio of examiners to candidates collectively was 1 : 1·85 or nearly two men to one examiner, *i.e.*, each candidate requires half a day (about three hours) to be examined. Now, if "Devon" divide this period by the number of Minor subjects, he will find that—allowing for intermediate loss of time—only about fifteen or twenty minutes can be devoted to each; by no means "a very great waste of examining power." A candidate who is master of his subject might convince an examiner of that fact in ten minutes; but some require half an hour's sifting to find out if they really *know* anything.

The more time that is devoted to a candidate and the larger the field he is taken over, give him a greater chance of exhibiting his good points and consequently increased probability of success—here is the advantage of a *vivâ voce* examination over a written one.

Again "Devon" says, "the average attendance of examiners in London being 13·8 and in Scotland 7·2 is formidable enough, for it simply means that each candidate has on an average to face 13·8 in London and 7·2 in Scotland." Now, the ratio of examiners to men in Scotland is 1 : 1·69, which differs but little from that of London, viz:—1 : 1·85. Since at the former centre (with the greater examining power) we have fewer Minor and Modified rejections, it follows that "Devon" is totally wrong in attributing failures to *increased* examining power. As to the relation of Major failures at the two centres, it is absurd to base percentage comparisons when in one case only four candidates appeared.

A decrease in the numerical strength of the London board would only proportionally increase the number of examination days; this change would still give "Devon" precisely the same figures he seems so frightened at.

A candidate is questioned by exactly the same number of examiners at either centre, and what matters it if a score others be present who will not say a word to him? It would be somewhat inconvenient to hold the examinations in a number of small rooms, so that the brick walls might render most of the stern forms invisible; but, perhaps the same object might be accomplished if these excessively timid candidates (let us hope there are few) were provided each with a hand screen, whereby they might intercept the terrible gaze of the remaining occupants of the room.

Or—ah! happy idea—let the telephone be introduced; then even "Devon" will be "daring and venturesome" enough to present himself, knowing he will have only to face the telephonic terminal.

I trust "Devon" will not carry his anthropophobia into business, or he might be tempted to hide himself behind a large show case, if his shop were filled with customers.

As to "three examiners being considered by the University of Cambridge to be amply sufficient to conduct their mathematical examinations" "Devon" is perhaps not aware that the bulk of the work is done by their assistants and the three examiners have only to decide the finer points.

No, the cause of failures must not be looked for in an "excess of examining power" or sought after in blindly feeling for the reason of the "examination discrepancies" so lengthily discussed some months since, but in the candidates themselves, whose aim is to pass the examination with the minimum of work instead of rendering their preparation of such a character as to eliminate the possibility of rejection; a man thus educated would not "grow nervous and fail" when "waited upon" by examiners, for perfect knowledge bids fear defiance.

R. H. Parker.

Sir,—"Devon's" letter is another instance of the old truism that figures can be made to prove anything if cleverly handled. I should be inclined to think that he has had no experience of the examinations, and would advise him to present himself for any of them, and he would be practically convinced of the fallacy of his conclusion, that there is a great excess of examining power.

In answer to his inquiry, How is it that there is a smaller percentage of failures in Edinburgh than London? one (among others) reason seems to me to be this, that many men present themselves at Edinburgh after having failed in London, and of course the chances of success at either centre the second time are very great.

Embryo Pharmacist.

Sir,—Your correspondent "Devon" seems greatly alarmed at the percentage of failures in the Major, Minor and Modified examinations. Well, what about it; although it should remain at 50 per cent.? The causes for this are numerous, indeed, too numerous to mention. "Devon" ought to remember in the first place that young men when preparing for these examinations have generally got their daily work to attend too, and as a consequence imagine that they should be able to pass sooner than they really are. Second, the very idea of an examination so completely unnerves some young men as to make them totally unfit for examination, although they may manage to put on a face. Third, the number of subjects which have to be passed at once being, I believe, greater than any other examination, at least in the case of the Minor. Fourth, the gross carelessness of some young men who imagine they ought to pass when they really do not take the trouble to prepare for it, etc. I may say for the satisfaction of "Devon" that I had the misfortune from either of the foregoing causes, or perhaps a combination of them, to be rejected once myself in the Minor; I must say it was not a very comfortable position at the time. I simply said, well I have done my best and can't help it, but I will try it again, and trying again I succeeded and that not long ago. I did not think the battery of examiners too strong, just one for each subject. I do not suppose any less would do, as I believe each examiner is best ground up in his own subject. Moreover, if the number were less it would take up too much of their valuable time. As for the Major, well I do not wonder that so few go in for it now-a-days, as the inducements are not worth the extra study and expense; indeed, I see no benefit from it, the Minor qualification is quite sufficient to all intents and purposes. I am afraid if so many examiners are required for this examination as "Devon" demonstrates, it will soon become a very unprofitable one for the Pharmaceutical Society, which would not improve by raising the fees.

Nemo.

The Admission of Women to the Society.

Sir,—I venture to express the hope that Mr. Vizer will lose no time in publishing the "exact terms" of his resolution which is calculated to set the question of women's admission to the Society at "rest for some time to come." No sane man dreams of finality in these times, but to compose any burning question for a reasonable period is no small achievement. One might be pardonably Quixotic in favour of the ladies, but such fervour in opposing them requires strong justification. Doubtless Mr. Vizer will prove equal to the occasion. Your columns bear testimony to the vigour with which Professor Tyndall's "rank atheism" was attacked, and the courage which declared your pages "contaminated" by the Belfast address, which the great majority of intelligent men read with profound interest. From such a quarter we may look for energetic

dealing with the women's pharmaceutical question. It seems, however, slightly anomalous to call upon the Executive of the Society not to do that which it is not doing, and has never done. I am not acquainted with any precedent for such a proceeding, which appears to indicate some degree of nervous apprehension. Still, I would not advocate servile adherence to precedent. If a good thing is to be done, let us by all means make a precedent. Such a resolution, if carried, would be useless. Its value would lie in the opportunity of defeating it, and Mr. Vizer may, if permitted to move a negation of nothing, serve the cause he wishes to destroy. The exact terms may solve the difficulties which the vague intimation in your recent issue suggests.

Ryde. HENRY H. POLLARD.

Sir,—I have read with much interest the various expressions of opinion which have appeared in the Journal on the subject of the admission of women to membership, and although I have not hitherto ventilated my own, yet it has not been from want of sympathy with the movement on the ground of justice.

If the laws of the Pharmaceutical Society will allow ladies to enter the laboratories, pass their examinations, and thus prove themselves competent, in the name of fairness what justice can there be in refusing them admission within the arena as members?

But it may be urged they will want to go on the Council next. And if they do, what harm? Only this, that some aspiring lady might have her eye on the presidential chair, and then what would become of us all?

Depend upon it, sir, no lady would ever become president of our Society unless she showed not only talent, ability and fitness, unless she gave most unmistakable proof that she was the right person in the right place; and should that point be reached it might not be altogether unprofitable for us to remember that we live in a most privileged age, in a great country, indeed the greatest of all great countries, under a noble monarchy, and yet it is under the brilliant and unequalled government of a lady.

It is necessary with innovations of this kind to consider the surroundings, and I most heartily concur with the very careful manner in which the Council have from time to time in the interest of the Society acted in this matter, and that after thoughtful deliberation; but remembering the all but successful result at the last Annual Meeting, I really feel that the wave, or what may by some be called the whirligig, of time has turned the current in their favour, and but a few weeks can now elapse before there is every probability of the ladies' most successful return to the full enjoyment of all the privileges the Society has to confer.

Time is the best remedy for smoothing down all knotty points, but I do really think it rather unjust to allow any candidates to go through the curriculum, pass their examinations, and then politely inform them that they must remain outside the pale of communion with the Society, simply because they are ladies.

35, *Baker Street.* A. W. POSTANS.

OXIDATION OF ESSENTIAL OILS.

Sir,—I regret to be obliged to trouble you once more upon this subject, but Mr. Robbins's reply to my former letter so entirely evades the real question at issue that I am compelled to crave your further indulgence.

I must repeat that Dr. Day in 1869 had not solved the vexed question referred to by Mr. Robbins, for whatever may have been his opinions regarding the phenomena upon the observation of which he was engaged, he yet did not succeed in demonstrating the formation of peroxide of hydrogen by unequivocal tests.

Mr. Robbins is perfectly correct in his quotation from your Journal of August 1, 1874. My experiments had led me to the conclusion that "the active agent produced in the oxidation of essential oils, although possessing properties similar in many respects to ozone, is not ozone or peroxide of hydrogen, but an oxidation principle derived from terpene." At that time I conjectured that the substance in question was a hydrated oxide of turpentine. This was a mere conjecture, however, and one which I left open for further experiments to decide.

Since then,* while confirming all my previous experiments, my results indicated that the organic principle above referred to is not a hydrated oxide of turpentine, but camphoric peroxide, which is resolved by the action of water into camphoric acid and peroxide of hydrogen thus—

$$C_{10}H_{14}O_4+2H_2O=C_{10}H_{16}O_4+H_2O_2.$$

As a matter of fact, then, neither ozone nor peroxide of hydrogen is directly formed by the action of air upon essential oils, and it is only in an indirect way that peroxide of hydrogen is eventually produced. If this is not clear to Mr. Robbins I shall be very happy to demonstrate it practically to him in my laboratory.

C. T. KINGZETT.

FUTURE OF THE DRUG TRADE.

Sir,—I am surprised from the number of letters appearing to observe how few have touched upon the real question in my former letter.

Mr. Goggs thinks the public hunger and are greedy for cheapness. I cannot see they are. The public and Mr. Goggs will not spend 1*s.* 1½*d.* or 2*s.* 9*d.* in one shop for an article which can be purchased, of same quality and quantity, in another at 1*s.* or 2*s.* 6*d.*, perhaps even less, with a very little more trouble. Those acting otherwise never can be economists, and I think the saving worth the trouble.

"Fiat Justitia" is, I admit, correct in saying that our trade does not afford so much scope as others do for business experience and speculation, but the little scope that is ought to be properly taken advantage of, so as to prevent any other trade grasping at our wares, which yield them a tempting profit, even when sold below our own prices.

The purport of Mr. Goggs's letter is to show there is scope and room for improvement. However, I am not convinced that to sell cheaper we must buy cheaper, but, as I have already written, I am of opinion that the profits being so great can easily admit of reduction.

I quite admit it is no unusual thing for druggists to hold municipal and other offices in our villages, where he is in every sense of the word one of the best educated men, being adored almost as much as the pastor, for the very good reason that every man of business capacity emigrates to the larger towns and cities, where he will find room for his large idea to expand, and the druggist being seldom a native has some external experience.

I apologize very humbly to "Sexagenarian," and to the promoters and supporters of the *Pharmaceutical Journal*, for having written of our "trade organ" in inconsistent and uncomplimentary language. It is admitted that my expression was quite correct, viz., "instead of writing nervously half a dozen times to (in this instance, mark you) an almost impotent agent."

"Hampshire" innocently admits belonging to this class, As my father did, so I; as I, so my son. His prices are not tip-top nor extortionate, but are the prices recognized fair by the trade at large. Threepence an ounce for castor oil many will say is simply fabulous, while 1*s.* 6*d.* may not seem an overcharge for a bottle of medicine or one dozen powders; but compare the charge and cost, including, of course, the consumption of gas, paper, wax, and time, and ask are they proportionate?

I am sorry "Hampshire" should mistake the purport of another part of my letter, which said that by a better and fitter remuneration young men would not be tempted into business. With reduced prices the cost of opening a new shop will be about the same, while the expectation will be lessened, so that a beginner will not make as much profit, for a few years, as he would in a situation, but have a great deal more care and anxiety.

The professional part, so called, of our business, is no doubt honourable enough; but the business, including the professional and commercial, is honourable by name, but not by nature. I maintain that the only way to make it honourable in the eyes of the public and our own consciences, and to encourage the really educated class into our calling is to reduce the profits, and consequently extinguish one-third the number of shops in existence, and pay better salaries. The extinguished shop must be of the smallest turn over, and the proprietor will surely find a situation of the new class where his income

* *Journal of the Chemical Society*, March, 1875.

will be sure and stated, and equal to the drawings of fifteen hours a day drudgery. He will have less worry, more spare time, and be decidedly a happier man. Besides, the question is not one of living and letting live, but is, are we living uprightly or justified in extorting from the public the prices we do? Medicine is a necessity. Are we to tax the sick for the return to health?

A great deal has been said of the dissimilarity of trades. I fail to see it: yet there are specialities in every trade. Our profits are large over very many, our neighbours' trades have small profits over a few. Increase the profits of these others (theoretically, for practically the public will not submit to it), more will embark in them, and then their lot will be as ours. As I have said, reduce our large net profits, and the number of shops and our trade will be like our neighbours, with reasonable profits over few.

I was well pleased to see how far home my thrust had gone to "Lepo," and I have no doubt many others.

EDINBURGH.

P.S.—I may surprise "Hampshire" in another point. I have not a roaring trade, but am myself a new start here, and a very young one. I am doing very well for a beginner, and in a short time I would draw a fair competency from the present profits. I have all along kept to the usual prices, but now I intend to reduce, not for the sake of underselling; and that my neighbours may know of my intention by publicity, I give my name and address.

2, *Lauriston Street, Edinburgh.* C. BILLING.

Sir,—I think if we sift away the hard words and some of the dogmatism that have been infused into this subject and focus the matter a little we shall find that it resolves itself into the inquiry as to whether the trade shall in future be conducted strictly on commercial principles, or carried on scientifically and professionally, or shall commercial acuteness go hand in hand with scientific knowledge. Perhaps if correspondents would confine themselves to these points we should get on better with the elucidation of the difficulties that surround the whole question.

I think it is unwise as it certainly is untrue to say that the pharmaceutist is deficient in commercial capacity. It is just as easy to buy in the cheapest market as to deal in the dearest; in fact it is easier to procure a cheap article than to be a judge of a good one. The only question is, which is the best policy to adopt, to go in like the grocer and oilman for cheapness and endeavour to draw custom to our shops by attractively low prices, or to ascend the scale and go in for high quality at an additional charge; or shall we, like those nondescript animals that hover about the border lines of nature, be neither one thing nor another, neither chemist, grocer, nor oilman, but a mixture of all three?

I will only just add in conclusion that we should all bear in mind that it is impossible to live apart from the forces operating around us; that it is quite as hopeless to expect to resist the power of gravity as to remain unaffected by this modern co-operative mania, and that it does not show true wisdom to play the part of the ostrich with its head buried in the sand.

Kentish Town. MIDDLESEX.

Sir,—Will you allow me through the medium of your columns to thank "Hampshire" for the severe but well merited castigation he has given our friend "Edinburgh." I pity the chemists of the town where "Edinburgh" is located.

However, my object in writing you is not to enter the controversy so ably carried on, but to ask from you, Mr. Editor, or some of your readers for a little information and give a little of my own experience. At present in our town we are not troubled with either cut-throat chemists or grocers dealing in patents, but as one cannot tell how soon the latter may be upon us, I am trying to take the edge off his razor when he arrives.

I have done a very fair "patent" trade for the last seven or eight years, continually increasing; not that I ever pushed "patents," but I have always been willing to supply them and have kept almost all "patents" in stock. I never discouraged the sale until about twelve months ago, when I began to alter my policy, my reason for this being that in many of the large towns of Lancashire patents were being kept and sold by grocers, barbers, stationers, etc., at 10*d.*, and even less, for a 1*s.* 1½*d.* article, and so on in proportion.

During the last twelve months I have introduced several patents of my own, have pushed them on every opportunity, though never absolutely refusing others. The first, I may mention, was chlorodyne; during the last twelve months I have sold upwards of one gross of this one article. The next thing I introduced was a cough mixture. I had been in the habit of selling a certain popular "patent" cough mixture, as it saved me the trouble of putting up one; however, I now push my own instead, and have sold this last ten months upwards of two gross. My plan is to put up my article of exactly the same size as the 1*s.* 1½*d.* one I wish to push out, and sell my own at 9½*d.* However, as soon as the enemy, in the shape of the physic-selling grocer, etc., makes his appearance I shall reduce my 9½*d.* article to 7½*d.*, and still I shall get a good profit.

It is no use grumbling and praying to Jove about the matter; we have in a great measure the "patent" question in our fingers, and can almost strangle the trade if we wish. I have in three weeks persuaded eighteen of my customers to take my own cough mixture in place of the one they asked for, and with satisfactory results to both customers and myself. Perhaps my experience may be of some service; anyhow, it may indicate to others the way to solve in a great measure this question.

Now for the information I want. Is there any publication to be had which gives as near as can be ascertained by careful analysis the formulæ for making preparations that may be recommended as substitutes for the popular patents. If there is, kindly state the publisher. If no such book is published, could not one of our leading analysts publish one and sell only to registered chemists?

HELP ONE'S SELF.

Re FOWLER.

Sir,—In October, 1877, you were kind enough to give publicity to an appeal on behalf of Mrs. Fowler, whose husband was in a lunatic asylum, supposed to have arisen from a railway accident. Subsequent inquiry, however, made it quite clear that legal proceedings against the company would fail, and with the tacit consent of the subscribers, Mr. Bremridge and myself thought it advisable to give the poor woman the money as necessity indicated. Ill health followed and the money was found very useful. £20 was advanced in 1877, and in 1878, sums of £5 to the extent of another £15 were given, when in December of that year an opportunity of joining a relative in a small business occurred, and a further advance of £10 was made, and in February of this year the balance of £7 11*s.* closed the account of £52 11*s.*, which has been applied in a way calculated to give permanent relief. In her last letter Mrs. Fowler says, "I will write in a few days and tell you of my altered and improved circumstances with heartfelt and grateful thanks." On behalf of myself and colleague, I thank those kind friends who so liberally responded to the appeal and you for giving it publicity.

W. D. SAVAGE.

D. Griffith.—Your communication, with enclosure, has been forwarded to the Publishers, to whom all advertisements should be sent. See the notice usually published a the head of the editorial columns and the special paragraph as to misdirections, on p. 782.

THE ACTION OF IODINE UPON RHUBARB.*

BY HENRY G. GREENISH.

The action which a solution of iodine exercises upon rhubarb in the form of either an unstrained decoction or a cold aqueous filtered infusion has already been the subject of an investigation undertaken by M. Husson, with a view of showing that practical use could be made of this action in the determination of the relative qualities of samples of rhubarb. His results are published in the *Union Pharmaceutique*, for April, 1875, under the title of "Action de l'Iode sur les Rhubarbes." The conclusion which he draws is the following:—

"The greater the quantity of iodine absorbed without a change of colour taking place in the decoction [of the rhubarb], the more certain we can be of having before us a rhubarb of first quality. On the other hand, the less iodine required to produce a greenish tint, and leave a black residue, the worse will be the quality of the rhubarb."

Professor Dragendorff, in a paper published in the *Pharmaceutische Zeitschrift für Russland*, Feb. 1878, a translation of which will be found in the *Pharmaceutical Journal*, April 20, 1878, has shown that with a small quantity of material at disposal the analysis of various samples of rhubarb may be carried out with considerable accuracy. Five samples of rhubarb were so analysed. I have also myself made analyses of four samples of rhubarb, the method adopted being similar to, though not identical with, that of Professor Dragendorff. In these analyses the comparative value of the various samples was determined by the separation and estimation of the active principles, the most important of which are cathartic acid, the purgative principle, and chrysophan and tannin, the antiseptic and tonic principles.†

The statement of M. Husson appearing to require confirmation, the experiments I shall shortly detail were undertaken with a view of ascertaining whether the quantity of iodine absorbed by a sample of rhubarb is capable of indicating the relative quality of the specimens and of determining, if possible, to which of the constituents of the rhubarb the absorbent power is mainly due. It will be well then to notice first the more prominent points in M. Husson's paper.

The method adopted by M. Husson is as follows: A decoction is made of five grams of the sample in 150 c.c. of water, and to the unfiltered product the solution of iodine (containing twenty-five grams in the litre) is added, until a drop of the mixture produces on a drop of starch paste a blue coloration, or this process may be replaced by one of cold maceration, the filtered product being then employed for titration. As, however, M. Husson's conclusion is drawn solely from the changes of colour which take place upon the addition of the iodine solution to the decoction, the possibility of substituting the maceration process, the filtrate from which (in M. Husson's own words) undergoes no change of colour, is not easily understood.

Four samples of rhubarb were analysed.

1. Rhubarbe de Chine sorte dite Plate.
2. „ „ „ Ronde.
3. „ Muscovie.
4. „ Indigène.

and the figures obtained were—

	Decoction.		Infusion.
	Change of Colour.	Blue with Starch.	Blue with Starch.
1.	14	25	13
2.	not given.	29	14
3.	10	20	11
4.	8	20	10

In the decoction of No. 4 the deposited rhubarb was of a black colour.

Hence it appears then that of these four specimens No. 2 is the best, and is followed by No. 1, whilst Nos. 3 and 4 may be regarded in reference to capability of absorbing iodine as nearly equally inferior. It is not, unfortunately, in my power to ascertain whether the "rhubarbe de Muscovie" employed by M. Husson is identical with that which in this country (Russia) is known as *Rheum Moscovicum*, viz., the genuine Russian crown rhubarb, now no longer to be found in commerce. Should this be the case it is in all probability the finest specimen, as indeed we should conclude from Professor Dragendorff's analysis of a genuine sample. The point, however, which distinguishes this rhubarb from No. 4 is the fact that the decoction of the latter undergoes various changes of tint from "bottle-green" to "blue-green," "green-blue," and "black-blue." Evidently these changes of tint are due to the quantity of starch contained in the root. This can indeed be shown to be the case. Take a sample of rhubarb (such as *R. Mandshuricum*), the decoction of which shows no change of colour upon the addition of solution of iodine, even in considerable excess. By adding, previously to making the decoction, a suitable quantity of starch, the appearances described by M. Husson can be produced.

As by infusion in cold water the whole of the active principles are extracted, the sole advantage possessed by the method of decoction appears to be the extraction of starch from the root. To avoid this, therefore, the former method was adopted and the experiments were carried out as follows:—

5 grams of the root were macerated twenty-four hours at the ordinary room temperature (15° C.), being frequently shaken during the day and allowed to stand during the night; the fluid then filtered. The filtrate amounted, in all cases but one, to 75 c.c. or more, and was employed as follows:—

1. 25 c.c. were titrated with iodine solution of the same strength as that employed by M. Husson (viz., 25 grams in a litre). The solution was delivered from a burette graduated to tenths of a cubic centimetre, but from which twentieths of a cubic centimetre could easily be read off. The end reaction was determined by taking out a drop on a glass rod, and bringing it into contact with a drop of starch paste placed on a porcelain plate. Owing to the thick yellow state of the liquid at this point a blue tint is not easily seen. Two points were therefore noted; that at which the starch paste assumed a green tint, and that at which the reaction was strongly blue.

2. 25 c.c. were evaporated on a water-bath to the consistence of a thin syrup, mucilage and cathartic acid precipitated by 50 c.c. absolute alcohol, filtered, the alcohol removed from the filtrate by evaporation, the residue mixed with water and titrated. The titration in this and the following experiments was easier than that of the fluid itself.

3. The precipitated mucilage and cathartic acid were dissolved in water and titrated.

4. 25 c.c. were precipitated with solution of gelatine to remove tannin, the precipitate filtered off, washed, the filtrate evaporated to a small bulk, freed

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, April 2, 1879.

† The results of these analyses, which are referred to later in this paper will be given in an early number of this Journal.

from gelatine, mucilage and cathartic acid by alcohol, again filtered, evaporated to remove alcohol, diluted with water and titrated.

5. The residue of the root insoluble in cold water was washed with water, transferred to a porcelain dish and made up with water to 100 grams, boiled to one-half, cooled, and made up to 100 c.c. 25 c.c. were then filtered off and titrated.

The samples examined were eight in number as follows:—

1. *Rheum Moscovicum.* A sample of genuine Russian crown rhubarb, part of the last sending in 1860. Forwarded from the crown magazine in Moscow.

2. *Rheum Chinense.* Commercial rhubarb as delivered to the crown magazine in St. Petersburg in 1877.

3. *Rheum Palmatum Tanguticum.* A sample of the drug brought by Przewalski from Kansu in 1873.

4. *Rheum Anglicum Cultum*; purchased in Moscow in 1866. Agreeing in external characters with *Rheum Rhaponticum.*

5. *Rheum Sibiricum* (i), a rhubarb cultivated in Siberia, formerly used in the hospitals, etc., there; and forwarded by Dr. Duhonberg in Irkutsk.

6. *Rheum Sibiricum* (ii). Young roots collected by Dr. Duhonberg, of Barnoul, in the Sajan Gebirge.

7. *Rheum Mandshuricum.* Sent as a sample to the Pharmaceutische Gesellschaft in St. Petersburg. Large somewhat spongy masses, apparently from very old plants. Partly unsound in the centre. My sample was taken from a sound piece.

8. *Rheum Palmatum.* The fresh root of four to five years' growth was sent to the Dorpat Pharmaceutical Institute from the St. Petersburg Botanical Garden for examination.

Of these samples Nos. 1 to 5 had been previously analysed by Professor Dragendorff as already referred. Of the four samples analysed by myself sufficient remained of three only (6, 7, and 8) to allow of these experiments being made.

The accompanying table shows:—

(*a*). c.c. iodine required in experiment 1 to produce a green coloration.

(*b*). c.c. iodine required in experiment 1 to produce a blue coloration.

(*c*). c.c. required in titration of filtrate after removal of the cathartic acid and mucilage. (Experiment 2.)

(*d*). c.c. required in titration of the solution of the cathartic acid and mucilage. (Experiment 3.)

(*e*). Percentage of cathartic acid present in the sample. (These figures are taken from the analyses previously referred to.)

(*f*). c.c. required in titration of the filtrate after removal by gelatin of the tannin, etc. (Experiment 4.)

(*g*). c.c. due to absorption by tannin, etc. (These figures are calculated by subtracting the figures in column (*f*) from those in column (*c*).)

(*h*). Percentage of tannin and chrysophan present in the sample (from the analyses above referred to).

(*i*). c.c. used in the titration of 25 c.c. of filtered decoction as in experiment 5.

(*k*). Sum of c.c. required in the titration of the aqueous infusion and decoction of residue obtained by adding the figures in columns *b* and *i*.

	(*a.*)	(*b.*)	(*c.*)	(*d.*)	(*e.*)	(*f.*)	(*g.*)	(*h.*)	(*i.*)	(*k.*)
R. Muscovicum	3·20	2·20	1·45	0·55	5·25	1·40	0·05	17·13	0·35	2·25
„ Chinense	2·10	1·30	0·95	0·60	4·88	0·60	0·35	14·17	0·30	1·60
„ Palmatum (Przewalski)	2·30	1·60	1·30	0·15	2·03	1·10	0·20	8·22	0·20	1·80
„ Anglicum	1·80	1·30	0·85	0·30	2·50	0·60	0·25	4·83	0·35	1·65
„ Sibiricum (i)	1·20	1·00	0·55	0·55	2·26	0·50	0·05	7·84	0·50	1·50
„ Mandshuricum	2·00	1·40	1·30	0·30	0·79	1·00	0·30	9·75	0·20	1·60
„ Sibiricum (ii)	1·90	1·30	0·90	0·20	1·70	0·80	0·10	5·03	0·40	1·70
„ Palmatum(S.Petersburg,Bot.Gard.)	1·60	1·00	0·25	0·65	?	0·40	—	7·95	0·40	1·40

On carefully comparing the figures in column (*b*), the result of the titration of the infusion itself, it will be noticed that *R. Muscovicum* stands by far first with regard to the quantity of iodine it is capable of absorbing, and is followed by *Palmatum* (Przewalski), *Mandshuricum* and *Chinense.* A glance, however, at the analysis of these three samples shows at once that *Chinense* is far superior in quality to both the others, *Mandshuricum* being especially deficient in cathartic acid. As regards the remaining samples *Anglicum* and *Sibericum* (ii) are placed on a level with *Chinense*, to which they are both in reality inferior, whilst *Sibiricum* (i) and *Palmatum* (St. Petersburg Bot. Gard.) are last on the list. Hence we see that the amount of iodine the infusion of rhubarb is capable of absorbing does not necessarily indicate the quality of the sample.

The removal of the cathartic acid and mucilage does not affect the figures relatively in any remarkable manner.

The titration of the cathartic acid and mucilage (column (*d*)) places the two most inferior rhubarbs *Sibiricum* (i) and *Palmatum* (from St. Petersburg) on a level with the two best, *Muscovicum* and *Chinense.* *R. palmatum* (Przewalski) is here very low. For the purpose of ready comparison, column (*e*) shows the amount of cathartic acid as determined by analysis. Columns (*f*) and (*g*) show similar inconsistencies.

The decoctions of the root residues show no great variation in absorbing power. The inferior rhubarbs are somewhat high, the better qualities show rather lower figures; the colour assumed by most of these decoctions was blue-green to dark blue or nearly black from the amount of starch present. The decoction of *R. Mandshuricum*, however, assumed only a greenish tinge, whilst *Palmatum* (from St. Petersburg Bot. Gard.) assumed a black-brown colour.

By adding together columns (*b*) and (*i*) we obtain the amount of solution which would be absorbed by a decoction of the root itself. Five of the eight samples show tolerably uniform figures, *Muscovicum* is high, and *Palmatum* (from St. Petersburg Bot. Gard.) is low.

The conclusions to be drawn from this series of experiments are (1), that the quantity of iodine a sample of rhubarb is capable of absorbing cannot be regarded as indicating its quality, and (2), that this quantity absorbed does not depend for its absorption on the active ingredients alone.

Dorpat, Russia.

NOTE ON PLASMA.*

BY W. WILLMOTT.

Rather more than twenty years ago, Mr. G. F. Schacht, at the suggestion of Dr. William Budd of Bristol, prepared for trial as a substitute for oils and fats in ointments a combination of glycerine and starch, to which, after due consideration, he gave the name of "Plasma." In an admirable paper published in the *Pharmaceutical Journal* for February 1858, Mr. Schacht points out the advantages of this combination, and claims for it a superiority in many respects over the ordinary unguent bases. "I must, however," he states "mention one imperfection to which these preparations (plasmas) are liable—namely, a tendency after three or four months' existence to lose more or less their original fine consistence and become softer. This is an unfortunate quality, but I think it is one for which experience will be able to suggest a remedy." About nine years later we find Mr. T. B. Groves writing as follows:—"The chief objection to plasma, of which I know little, and therefore shall say little, is that it is dear. I have heard that in use it is troublesome in consequence of its proneness to deliquescence." Nevertheless, at the same date (1867), plasma had acquired a sufficiently important position to rank with preparations of a somewhat similar character in the British Pharmacopœia, and consequently it is there introduced under the name of "Glycerine of Starch," the only difference being that 54·68 grains of the latter ingredient are ordered to each fluid ounce of glycerine, instead of seventy as in the former case.

Up to the present time plasma, or glycerine of starch, has not, I believe, come largely into use, owing, no doubt, in some measure, though not entirely, to its tendency to soften by deliquescence, as already referred to; no remedy, that I am aware of, having as yet been effectually applied or suggested.† It may here be stated that it is to this point that the present note more especially refers.

If plasma be kept in an air-tight stoppered bottle it will retain its firm consistence indefinitely. It owes its softening property, therefore, to the large extent to which the glycerine it contains is capable of subtracting moisture from the atmosphere, the starch playing no part whatever in the change thus brought about. This property of glycerine is exercised exactly in relation to the two following conditions—namely, the amount of superincumbent moisture, and the extent of surface that may be exposed thereto. The behaviour of glycerine in a very moist atmosphere is both curious and interesting. The moisture in the form of water collects and floats on its surface, and taking up, or dissolving, a considerable proportion of the subjacent glycerine (probably more than half its own weight), attracts more moisture, which, in turn, exercises its solvent power and acquires a capability of still further absorption. Thus the action goes on, not necessarily, as may be thought, in a constantly decreasing ratio as the water increases in amount, but at an almost uniform rate from week to week. The mixture of glycerine and water is not so actively hygrometric as the glycerine alone, but the combination once effected the action continues with singular uniformity. The following table will serve in some measure to illustrate this:—

HYGROMETRIC ACTION OF GLYCERINE IN ATMOSPHERE CHARGED WITH EXCESS OF MOISTURE.

Surface Area.	Increase in Weight.				
	1st week	2nd week	3rd week	4th week	Total 1 Month
	grs.	grs.	grs.	grs.	grs.
3·1416 square inches . .	56	44	48	47	195
9·6211 „ „ . .	156	119	113	102	490
28·2744 „ „ . .	504	341	310	315	1470

It will be seen that in each case there is a diminution of the increase of weight during the second and following weeks as compared with the increase during the first, owing, as I have said, to a lessening of the intensity of absorption by the presence of the water. All this goes on without stirring or disturbing the fluids in any way. If, however, the water be kept stirred into the glycerine instead of being allowed to remain on its surface, there will be no appreciable difference in this increase of weight between the first and following weeks.

But at what point is there a pause in this process? Where does it end? In whatever proportionate quantity water may be added to glycerine, from a single drop upwards, absorption will take place in a moisture-laden atmosphere until the proportion reaches three parts by measure of the former to one of the latter. At this point the glycerine, so to speak, gives up the contest, and succumbs to the influence which the water exerts in the opposite direction. In this mixture, therefore, namely, three fluid ounces of water to one fluid ounce of glycerine, there will be neither attraction nor evaporation, the weight scarcely varying from week to week either in one direction or the other.

If, now, we conduct our experiments in a moderately dry atmosphere—say in the atmosphere of an ordinary working or sitting room in which a fire is kept burning during the day, the action will be the same, but to obtain similar results the proportions will be widely different, and in fact, almost reversed. Instead of three parts of water to one of glycerine, we shall require nearly three parts of glycerine to one of water to reach the neutral point. Where, in the one case, there is absorption and augmentation, in the other there is evaporation and consequent loss, so that in order to maintain a uniform condition in the mixed liquids, the proportions must be adapted to the exact state of the atmosphere in which they are intended to be kept. In a general way we may consider two and a-half parts by measure of glycerine to one of water well adapted to meet the end in view. Bearing in mind, then, that in plasma the starch has no effect in preventing the absorption of moisture (the mass being by such means gradually undermined and softened through) we take advantage, in preparing this substance, of the peculiarity herein notified and proceed accordingly:—Five fluid ounces of glycerine are mixed with three fluid ounces of distilled water in a porcelain dish; or, preferably, transferred thereto from a vessel in which they have been previously well stirred or shaken together. The

* Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, April 2, 1879.

† The glycerine of starch of the German Pharmacopœia is a step in this direction, but the water therein contained (about 1 in 12) is not nearly sufficient to rectify the hygroscopic character of the resulting mass.

starch is then added *secundum artem*, and heat gradually applied with constant stirring until a translucent jelly is formed.* In this process the loss of weight by evaporation will be from half to one ounce according to manipulation, thus leaving the desired proportions of glycerine and water in the resulting product.† In this way a plasma is obtained that will resist the action of moisture, and retain indefinitely its firm and plastic condition. The presence of the water, so far from being objectionable, will be a decided advantage, since in application, there will be less proneness to smarting and irritation.

The value of plasma as a substitute for fatty substances in ointments, etc., I do not now discuss, but it may be stated that Mr. Schacht continues to favour its use as a medium for the exhibition of such topical remedies as are soluble in glycerine.‡ This being the case after twenty years' trial, so useful a combination should scarcely be allowed to fall into desuetude, through the absence of any suggestion as regards those special properties, which may tend to preserve it at all times in a suitable condition for use.

[*The discussion on this paper is printed at p.* 828.]

THE MONGUMO BARK IMPORTED FROM MADAGASCAR.§

BY PROFESSOR DRAGENDORFF.

Through the kindness of my friend Mr. E. M. Holmes a sample of mongumo bark, said to be used in Madagascar as a remedial agent, came into my possession. As Mr. Holmes states, it resembles the bark of *Ochrosia borbonica*. Of the manner of its employment and its properties I have no information. I willingly acceded to Mr. Holmes' wish that I should make a chemical analysis of the bark, and the more so as the external appearance alone of the pieces of bark, which consist almost entirely of the suberous layer, partly of a pure orange-yellow colour, led me to expect that the chemical analysis would yield results by no means uninteresting.

As the quantity of material at my disposal was not too large, I have endeavoured to arrange my experiments so as to gain, both qualitatively and quantitatively, an insight into the composition of the bark. I will now proceed to describe the method of analysis, and the results obtained.

I. *Estimation of Moisture and Ash.*

1·3134 gram of the bark gave by long drying at 110° C. 1·0907 gram dry substance = 16·19 per cent. moisture. The same incinerated yielded 0·0383 gram ash = 2·92 per cent.

II. *Estimation of the Constituents soluble in Petroleum Ether, Benzin, Chloroform, and Ether.*

(*a*) 1 gram of the powdered bark yielded to petroleum ether, after eight days' maceration, 0·0062 gram of a soft fat, with a trace of ethereal oil = 0·62 per cent.

(*b*) The insoluble residue yielded to benzin 0·0173 gram of a waxy substance difficultly soluble in spirit, with a trace of chlorophyll = 1·73 per cent.

(*c*) From the residue of the bark chloroform removed 0·0093 gram of a resinous substance insoluble in spirit, and traces of the mongumic acid (described further on) = 0·93 per cent.

(*d*) Ether extracted from the residue from (*c*) 0·2375 gram of a yellow resinous substance almost completely soluble in spirit of 50 per cent., and to which I will give the name of mongumic acid = 23·75.

III. *Estimation of the Substances soluble in Ether, Alcohol and Water.*

(*a*) 1 gram of the powdered bark yielded to absolute ether 0·2637 gram, of which absolute alcohol dissolved the greater part; but spirit of 82 per cent. left a white waxy substance undissolved (compare II., *a*, *b*, and *c*.) The yellow resinous mass of which the major part of the substances taken up by the ether consisted is here, too, identical with mongumic acid presently to be described. After deducting the fatty and resinous substances soluble also in petroleum ether, benzin and chloroform, it would amount to 23·09 per cent. (average of II. (*d*) and III. (*a*). 23·42 per cent.).

(*b*) The residue from (*a*) insoluble in ether yielded to absolute alcohol 0·0725 gram of a dark brown completely tasteless resin which assumed, on evaporation, the form of lamellæ, soluble in a 10 per cent. solution of soda, but reprecipitated from this solution by acetic acid = 7·25 per cent.

(*c*) The residue from (*b*) on maceration with water yielded to this solvent 0·0092 gram soluble substances which gave 0 0020 gram ash = 0·72 per cent. organic substance.

IV. *Examination of the Mongumic Acid.*

This acid is certainly the constituent to which not only the yellow colour of the bark previously referred to is due, but which can alone explain the medicinal activity of the drug, if indeed we may speak of medicinal activity at all. The method of obtaining this acid has already been partly indicated. The principal manipulations to be used are the following:—Extraction of the powdered bark with ether free from alcohol, evaporation of the ethereal extract, treatment of the residue with 85 per cent. spirit, and evaporation of the solution after the removal by filtration of the undissolved colourless vegetable wax, solution again of this residue in alcohol of 50 per cent., addition of the ether to the filtered solution and then of water till the ether again separates out. Under these conditions the mongumic acid is separated with the ether. A further quantity of the acid may be obtained by again shaking with ether, especially if a few drops of acetic acid be added. After the ether has been evaporated off the mongumic acid is left as a yellow amorphous mass, soluble with difficulty in boiling water, but easily in aqueous solutions of ammonia, potassium and sodium hydrate, potassium, sodium and ammonium carbonate, and also in lime and baryta water. All these solutions are of a red-brown colour, and yield the acid to ether only when acidulated with acetic or hydrochloric acid; in the latter case easily and completely; and, *vice versâ*, the ethereal solution parts with the acid when shaken with an aqueous solution of potassium carbonate. The solution of mongumic acid in spirit of 50 per cent. is coloured black-brown with ferrous and ferric salts; with basic

* The stirring should be continued while the mass cools.

† In an unusually dry atmosphere, the proportions should be arranged, and the process conducted so that the glycerine may exist in the plasma to the extent at least of three-fourths of the *entire weight*.

‡ This statement is made on the authority of a communication very kindly forwarded by Mr. Schacht in reply to the writer's inquiries.

§ Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, April 2, 1879.

acetate of lead it gives a yellow precipitate, none with neutral acetate of lead, nitrate of silver, or perchloride of mercury; with acetate of copper a brown precipitate. Petroleum ether precipitates the mongumic acid from an ethereal solution, and if the previously mentioned vegetable wax and fat be present as an impurity, they remain in solution after the filtration from the yellow precipitate. In benzin and in chloroform the mongumic acid is almost insoluble. The alcoholic solution with iodine becomes darker coloured, with bromine gives a decomposition product difficultly soluble in alcohol. The taste of the acid is bitterish and strongly astringent. By standing several days over sulphuric acid the mongumic acid lost 8·79 per cent. moisture; at 116° C. 9·77 per cent. The analysis made by Student Leye gave:—

I. From 0·4452 gram dry substance, 1·0888 gram CO_2=66·699 per cent. C. and 0·1925 gram H_2O=4·80 per cent. H.

II. From 0·5693 gram, 1·3865 gram CO_2=66·42 per cent. and 0·249 gram H_2O=4·86 per cent. H.

Mean 66·50 per cent. C., 4·83 per cent. H.

A compound of the formula $x\ C_{12}H_{10}O_4$ would contain 66·0 per cent. C., 4·6 per cent. H, and 29·3 per cent. O. Owing to want of material I am as yet unable to make any experiments to determine the formula of the molecule. I can simply add that the substance does not melt at 120° C.

V. *Estimation of Substances soluble in Alcohol.*

(*a*) 1 gram of the powdered bark yielded to absolute alcohol 0·3421 gram=34·21 per cent., a mixture of the substances indicated in II. *a*, *b*, *c*, and *d*, III. *a* and *b*.

(*b*) The residue insoluble in alcohol yielded to ether only 0·0044 gram of a white waxy substance (remainder of the wax mentioned in II. *b*).

VI. *Estimation of the Substances soluble in Water, and of Metarabic Acid, Starch, Oxalic Acid, etc.*

(*a*) 5 grams of the powder were macerated with 100 c.c. of water for 48 hours with frequent shaking, and the infusion filtered (avoiding loss as far as possible). 10 c.c. of the filtrate yielded on evaporation 0·0077 gram residue; another 20 c.c. yielded 0·1156 gram with 0·0023 gram ash=1·33 per cent. combustible substances soluble in water. As now the bark after treatment with ether and alcohol yields 0·72 per cent. organic substances to water (III. (*c*)), the remaining 0·61 per cent. is to be reckoned as a substance soluble both in alcohol and water and to be deducted from the resin indicated in III. (*b*). Remainder=6·64 per cent.

(*b*) As substance insoluble in alcohol but soluble in water, there remains as above stated only 0·72 per cent. of the weight of the bark. As characteristic of the constituents soluble in water I can only say that the aqueous infusion has a pale yellow colour and slightly bitter taste, that it gives with neutral acetate of lead a slight cloudiness, with basic acetate somewhat more. Mixed with 5 to 6 volumes of absolute alcohol it does not become turbid and only on evaporation does it become evident that a small quantity of the residue is mucilage insoluble in absolute alcohol, and only after half-an-hour boiling (by which a yellowish-red or red resin is separated) does it reduce alkaline copper solution. Neither tannin, therefore, nor sugar or albuminous substances, but a little mucilage is to be detected in the aqueous infusion, and further a small quantity of a glucosidal substance which is also soluble in alcohol.

(*c*). After treatment with water the bark residue from VI. (*a*) yielded to alcohol 35·32 per cent. (225 c.c. of extract of which 25 c.c. left on evaporation a residue of 0·1766 gram), which agrees tolerably well with the results indicated in V.

(*d*). The part from VI. (*c*) insoluble in alcohol and water was treated in the cold with 100 c.c. of water and 1 per mille sodium hydrate during twenty-four hours, with frequent shaking, and then filtered. 50 c.c. of the filtrate gave upon the addition of acetic acid and alcohol 0·0190 gram precipitate of metarabic acid=0·76 per cent. The filtrate from this precipitate evaporated to dryness yielded 0·1081 gram dry residue. As this must include 0·1025 gram acetate of sodium, there remains for a small quantity of phlobaphen, which cannot be again dissolved in water, only 0·022 per cent.

(*e*). The residue from VI. (*d*) after being washed with water, was suspended in 4 per cent. hydrochloric acid, boiled for several hours and filtered. Of the 126 c.c. of filtrate 63 c.c. gave upon the addition of ammonia and alcohol 0·0744 gram precipitate with 0·0480 gram ash (carbonate of calcium)=0·0614 gram calcium oxalate=2·46 per cent., and 1·73 per cent. oxalic acid. For organic substance there remains after deduction of the oxalic acid 0·0130 gram=0·52 per cent. (possibly mucilage).

(*f*). The remaining half of the liquid in VI. (*e*) served for the quantitative estimation of the sugar produced from the starch and other saccharifiable substances. 10 c.c. of Fehling's solution required 15·7 c.c. of the solution, in a second estimation 15·5 c.c.=8·08 per cent.

VII. *Estimation of the Cellulose.*

5 grams of the powdered bark yielded (after exhaustion with alcohol) by the action of chlorate of potash and nitric acid sp. gr. 1·18, etc., 0·7456 gram cellulose=14·91 per cent.

VIII. *Estimation of the Nitrogen (Proteinaceous Substances) and of the Suberin.*

(*a*). Two nitrogen combustions made by Student Leye showed 0·56 per cent. and 0·55 per cent. N.=3·47 per cent. proteinaceous substances.

(*b*). As the analysis has now accounted for 83·27 per cent., the quantity of suberin and allied substances amounts to 16·73 per cent.

IX. *The Examination for Alkaloids and Bitter Principles* proved the absence of the former, and of all such bitter principles as can be removed from their aqueous solution by shaking with ether, petroleum ether, benzin or chloroform.

Recapitulation.—The analysis showed:—

	Per cent.
Moisture (I.)	16·19
Ash (I.)	2·92
Soft Fat and traces of Ethereal Oil (II. *a*.)	0·62
Waxy Substance, traces of Chlorophyll (II. *b*.)	1·73
Resin soluble in Chloroform (II. *c*.)	0·93
Mongumic Acid (II. *d* and III. *a*.)	23·42
Resin insoluble in Ether, soluble in Alcohol (III. *b*. and VI. *a*.)	6·64
Glucoside soluble in Water and Alcohol (III. *c*. and VI. *a*.)	0·61
Substance insoluble in Alcohol and soluble in Water—Mucilage (VI. *a*.)	0·72
Metarabic Acid (VI. *d*.)	0·76
Phlobaphen (VI. *d*.)	0·02
Oxalic Acid in combination with Calcium (VI. *e*.)	1·73

	Per cent.
Mucilaginous Substance (?) soluble in HCl (VI. *c.*)	0·52
Starch and other Saccharifiable Substances (VI.)	8·08
Cellulose (VII.)	14·91
Suberin, etc. (VIII. *b.*)	16·73
Proteinaceous Substances (VIII. *a.*)	3·47

NOTE ON THE ABOVE.

BY E. M. HOLMES, F.L.S.,

Curator of the Museum of the Pharmaceutical Society.

The history of the mongumo bark examined by Professor Dragendorff is as follows:—

In March, 1877, some specimens of the bark were presented to the Museum of this Society by M. Chantre. That gentleman informed me that it came from Marseilles and was entered in the London Docks under the name of mongumo bark. Upon making inquiries I found that it was in the hands of Messrs. Lewis and Peat, drug brokers. This firm kindly supplied me with a sufficient quantity for analysis, and informed me that it came originally from Madagascar, but that nothing was known of its properties except that it was supposed to be used medicinally. Its brilliant yellow colour suggested the possibility of its containing chrysophanic acid, but finding from a few preliminary experiments that such was not the case, I requested Professor Dragendorff to examine it. It seemed to me to possess some little interest, because in a note on purree in a former volume of the Society's Journal*, casual mention is made, in the following words, of a bark the description of which seems to correspond with mongumo bark:—"In the year 1787 a ship laden with timber brought the bark of a tree from the coast of Africa, yielding a beautiful yellow pigment; the tree whence this bark was derived and the colouring properties of its sap was discovered by chance, but the settler who made the discovery died, and the tree was thus lost." I may further add that I saw a sample of a bark amongst the French colonial products in the International Exhibition, at Paris last year, which was labelled *Ochrosia borbonica*, and closely resembled in appearance mongumo bark, but of this I was unable to obtain a sample, and have no certain knowledge that the two barks are identical.

[*The discussion on these papers is printed at p.* 829.]

NOTE ON SHEA BUTTER.†

BY E. M. HOLMES, F.L.S.,

Curator of the Museum of the Pharmaceutical Society.

The attention of commercial men is now being directed more and more every year towards Africa, and the products of that country will probably be gradually turned to account as new uses are found for them. Among these Shea, or Galam, butter seems to me to deserve some degree of attention. This substance is a solid fat obtained from the seeds of *Butyrospermum Parkii*, and forms an important article of commerce in Western Africa. Mungo Park, in his 'Travels', p. 202, gives the following account of it: "We passed a large town called Kabba, situated in the midst of a beautiful and highly cultivated country, bearing a greater resemblance to the centre of England than to what I should have supposed had been the middle of Africa. The people were everywhere employed in collecting the fruit of the Shea trees, from which they prepare the vegetable butter, mentioned in former parts of this work. These trees grow in great abundance all over this part of Bambarra. They are not planted by the natives, but are found growing naturally in the woods; and, in clearing wood land for cultivation, every tree is cut down but the Shea. The tree itself very much resembles the American oak; and the fruit, from the kernel of which, being first dried in the sun, the butter is prepared by boiling the kernel in water, has somewhat the appearance of a Spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind; and the butter produced from it, besides the advantage of keeping the whole year without salt, is whiter, firmer, and to my palate of a richer flavour than the best butter I ever tasted made from cow's milk. The growth and preparation of this commodity seem to be among the first objects of African industry in this and the neighbouring states, and it constitutes a main article of their inland commerce."

On p. 352, Park gives a rough figure of the leaves and seed of the tree, which is described by Oliver as attaining a height of 30 or 40 feet, with a trunk 10 feet high and 5 or 6 feet in circumference, branching like an oak and yielding on incision a copious milky juice. The branches present a somewhat bare appearance on account of the leaves being crowded together at the tips of the branches. The leaves are large and handsome, with wavy edges and parallel ribs.

By Captain Grant (who saw the tree during the Speke and Grant expedition) the wood is stated to be red like cedar and very hard and close-grained, so much so that the natives think it unfit to be cut by their hatchets. The milk which exudes when the bark is cut becomes when dry a hard white insoluble gum. He states that the flowers, which are produced in December, are of a creamy yellow, and occur in thick clusters at the end of the branches; they smell strongly of honey and are much frequented by honey bees; they soon fall off and cover the ground. The bark of the tree when growing near villages is frequently much chipped off, it is supposed for medicinal purposes.

The fruit is about the size of a pigeon's egg and is ripe in May and June. It has the appearance and somewhat the structure of an olive, having an external fleshy portion which when ripe is said to resemble in flavour an over ripe pear, and being very sweet is eaten by the natives. The endocarps after removal of the fleshy portion are dried in the sun and are then easily broken. After removal of the shells the kernels are bruised and boiled in water and the fat which floats on the surface is skimmed off and collected for use.

The tree was first discovered by Mungo Park in the kingdom of Bambarra, but has since been found abundantly in the Niger country and also in the Nile land, Niammiam country, Madi, and at Bornou in Central Africa. Further south, in the Gaboon and neighbouring countries, two other species, *Bassia Djave* and *B. Nounjou*, yield a somewhat similar fat.

A specimen of Shea butter was exhibited at the International Exhibition in 1851, by Dr. J. O. M'William, from Egga, on the Niger. A portion of

* *Pharmaceutical Journal* [1], vol. iv., p. 417.

† Read at an Evening Meeting of the Pharmaceutical Society of Great Britain, April 2, 1879.

this specimen is still in the Hanbury collection in the museum of this Society.

In the year 1867, 707 hundredweights of this substance were imported, valued at £1553. At the present time the quantity imported into this country varies from 300 to 500 tons, but larger quantities of it than of palm oil could easily be obtained. It is imported in casks containing from 10 to 15 hundredweights and has been sold in this country at prices varying from £36 to £40 per ton. The exact quantity, however, which reaches this country is difficult to ascertain, for Mr. Shaw, of Liverpool, informs me that at Liverpool, to which port all that is imported is believed to come, it is not always distinguished from palm oil and in fact often passes under that name.

Both in this country and in Belgium it appears to have come into use during the last twenty years in soap making, and specimens of products obtained from it were exhibited at the International Exhibition at Paris, last year.

In soap making it is chiefly used to add to cheap soaps to prevent their washing away too rapidly, as it seems to harden them.

Mr. W. Henderson, of Glasgow, to whom I am indebted for specimens of Shea butter, says of it: "Of all the fats with which I am acquainted, Shea butter seems to remain unaltered longest, and although it comes from a warm country, and is treated in a way to induce it to become rancid, there is not the slightest rancidity in any samples I have seen; while palm oil which comes from the same country is in a very rancid and decomposed state. It could easily be purified by boiling once or twice in water containing a small quantity of bitartrate of potash, and the mixture made of the density of 10° or 15° Twaddle, by the addition of salt, the melted fat being allowed some time to settle." The remarkable keeping property of this substance seems to indicate that it might be used with advantage as a basis for ointments and suppositories, and even perhaps for some plaisters, such as empl. cantharidis, with advantage. Mr. Henderson has also kindly presented the museum with specimens of a peculiar substance which he calls Gutta Shea, and states is present in the butter to the extent of one-half per cent. only. He thinks this substance should be removed if the butter be used for candle making, since it burns with a very smoky flame. It can be removed from the fat by dissolving it in a mixture of three parts of ether and one of alcohol, when it separates in a filmy state, but more readily if the fat be first saponified. The Gutta Shea is a hydrocarbon, soluble in oils and fats, and in strong nitric acid with oxidation and the deposit of a little flocculent matter, but is insoluble in sulphuric and muriatic acid and alkalies.

Gutta Shea burns readily, giving off a large quantity of smoke, and leaving about 0·25 per cent. of ash. It can be easily separated from soap containing only one part of the gutta in 2500. This substance as yet does not appear to have received any practical application, but deserves investigation.

In some respects it seems to resemble the balata or chicle gum obtained from an allied tree, *Achras sapota*, L., belonging to the same natural order (Sapotaceæ), but growing in British Guiana. Gutta Shea, however, presents more of a waxy consistence and appearance. It has scarcely any taste and softens without melting when chewed.

At common temperatures Shea butter is a dirty white solid, but when freshly prepared it is said to have a greyish or greenish white tint. Analysed by Oudemans it was found to yield about 70 per cent. of stearic acid and 30 of oleic acid, but no palmitic acid. Pfaff also confirms this statement. The butter is said to soften at 95° F. and to melt at 109° F., but the melting points both of the butter and the fatty acid obtained from it have been differently stated by different authors.*

The stearic acid is stated by other writers to be unsuited in the pure state for candle making, since it contracts too much in cooling and does not present a translucent or polished appearance, but that it answers well when mixed with other fatty acids, such as palmitic.

Mr. W. L. Carpenter, chemist to Messrs. Thomas's soap works, at Bristol, tells me that Shea butter may be obtained nearly white by repeated filtration in a warm closet. He believes there are two sorts of Shea butter, varying in their percentage of stearic acid, since the melting points of the two differ by about 4° C. Whether this peculiarity be due to its occasional admixture with palm oil or whether the butter be collected from more than one species of bassia tree must remain for the present an open question. My object in bringing these notes before you has been rather to elicit suggestions as to the possible practical application in pharmacy of a hitherto unused waste material, and of a fat which presents the advantage of not becoming rancid for a considerable length of time, than to contribute any new information.

[*The discussion on this paper is printed at p.* 829.]

THE ALKALOID OF PITURI.

BY A. PETIT.

Pituri is a substance chewed by the natives of some parts of Central Australia as a stimulant narcotic. For the purpose of transport it is put into pointed oval bags, but the leaves are so broken that it has been difficult hitherto to determine their origin. It is not easily procured, for the natives depend much upon their pituri (which they chew as coca is chewed in Bolivia) to sustain them when they undertake long marches, or to increase their courage for a combat. A strong dose renders them furious.

In 1872, Dr. Bancroft, of Brisbane, having procured authentic specimens of pituri, made some very interesting experiments upon animals, which led him to the conclusion that it is a most dangerous poison, acting principally upon the respiratory organs and inducing tremblings and convulsions.

Dr. Bancroft had made every effort to obtain the plant, but without success, when in February, 1877, he learnt that Mr. W. O. Hodgkinson, returning from a journey of exploration into the north west region, had brought some pituri with him. Experiments with this product gave the same results as in 1872, and a specimen having been sent to Baron Mueller, at Melbourne, he referred the plant to his *Duboisia Hopwoodii*, which he includes in the Solanaceæ. The following is Baron von Mueller's description of *Duboisia Hopwoodii*:—

"Tree or shrub; glabrous. Leaves linear, narrow, finely acuminate with the point often recurved,

* See *Dingler's Polytechnische Journal*, Jan., 1878, p. 168

entire, rather thick, 2 to 4 inches long contracted to a short petiole. Calyx small, broadly campanulate with obtuse teeth. Corolla tube campanulate, 2 to 3 lines long; lobes broad, very obtuse, shorter than the tube. Anthers unilocular. Fruit unknown. Plant very rare, extending from the river Darling to Western Australia in arid deserts."

Dr. Bancroft has since had an opportunity of seeing the seeds. They are uniform, and have their surface dotted with small pits, and it is very difficult to distinguish them from those of *Duboisia myoporoides*.

Last year, Dr. Ringer having received a very small quantity of pituri, handed it, for the purpose of chemical examination, to Mr. Gerrard. Mr. Gerrard recognized that pituri contained an alkaloid, and notwithstanding the small quantity at his disposal he has been able to determine some of the properties of this product, to which he has given the name "piturine." Dr. Bancroft having sent to me, through Messrs. Christy and Co., of London, a larger supply of pituri, about 50 grams, I have been able to take up and complete the experiments of Mr. Gerrard.

The aqueous extract dissolved in water was treated with bicarbonate of potash and ether. The ether was freely alkaline; agitated with water to which dilute sulphuric acid was gradually added, it gave up the alkaloid to the aqueous solution. Several treatments with ether are necessary to exhaust the aqueous extract. The water, containing in solution the sulphate of the alkaloid, was separated and treated afresh with the bicarbonate and ether. After three treatments there was obtained by evaporation of the ether a scarcely coloured residue, possessing energetic alkaline properties and presenting all the reactions of the better defined alkaloids. It gave off an irritating odour, especially when heated slightly and was very pungent to the tongue. Upon bringing strong hydrochloric acid close to the surface of the liquid dense fumes were formed. Placed in a watch glass upon a water-bath it volatilized rapidly. It was therefore a *volatile alkaloid*.

The properties above described raised the inquiry whether the alkaloid was not nicotine. Some pure nicotine was therefore procured, and various comparative experiments have been made with the two substances.

In order to remove any water which the alkaloid derived from pituri might contain, after careful evaporation, it was left during forty-eight hours in a vacuum over sulphuric acid. Under these conditions nicotine and the alkaloid from pituri gave exactly the same result. Only having at my disposal about 1·5 gram of alkaloid I was unable to take its boiling point.

Rotatory Power.—0·236 gram dissolved in 10 c.c. of 98° alcohol gave with the polarimeter 5·85° with a column of 20 centimetres, being for the yellow light a rotatory power of – 123·9°, whilst the rotatory power of nicotine is, according to Buignet, – 121·9°. When saturated with sulphuric acid the rotatory power of pituri passes to the right, as in the case of nicotine.

Alkalimetric Power.—2 c.c. of the preceding solution were saturated with titrated sulphuric acid. The results calculated to 10 c.c. gave: 1st experiment, 0·07 gram H_2SO_4; 2nd experiment, 0·0725 gram H_2SO_4. These figures calculated as for nicotine gave 0·2312 gram and 0·2396 gram, or a mean of 0·2359 gram, a figure practically equal to the amount of alkaloid employed.

Chloroplatinate.—Dissolved in water and saturated with hydrochloric acid in slight excess the alkaloid of pituri gave upon addition of chloride of platinum exactly the same crystals as those of the chloroplatinate of nicotine; that is to say, in dilute solution, flattened prisms with parallelogram base. This chloroplatinate, which is represented by the formula $C_{10}H_{14}N_2\,2\,HClPtCl_2$, having been dried at 115° C. during four hours, gave upon analysis, — platinum, 34 per cent.; chlorine, 36 per cent. The calculated number for chloroplatinate of nicotine are,—platinum, 34·4 per cent.; chlorine, 37 per cent.

The other reactions are absolutely the same as for nicotine. I would mention, however, particularly that relative to the formation of iodo-nicotine. Upon mixing together ethereal solutions of iodine and of the pituri alkaloid very fine crystals similar to those of iodo-nicotine are rapidly formed.

The alkaloid prepared by Mr. Gerrard has been experimented with in London by two able physiologists, Messrs. Sidney Ringer and Murrell. The phenomena observed confirmed in an evident manner those described by Claude Bernard in his memoir on nicotine:* augmentation of the number of the respirations, which became painful and diaphragmatic, an unsteady gait, convulsive contraction of the muscles, rigidity of the limbs, are all there described. A remarkable circumstance is mentioned by all three observers: the animal appears blind and the eyeball seems to be reversed so that the pupil cannot be seen. But in examining this phenomenon more closely Claude Bernard had observed, before Ringer and Murrell, that it was due to tension.

The alkaloid of pituri is therefore nicotine.

OSTRICH PEPSINE.†

M. Alfred Ébelot, in an article in the *Revue des Deux Mondes*, on the means employed in the Argentine Republic to protect settlers in the Pampas from the Indians, gives some curious statements with regard to ostrich pepsine. The soldiers never could resist an ostrich hunt when they saw a male ostrich, as is the custom of that bird, taking out its young brood for food and exercise. The parent bird generally escaped, leaving its young in the hands of its enemies. When other food was scarce, they ate the young ostriches. Some portions of the flesh of these birds when young and fat are reckoned dainty by the Indians. Whilst eating the ostrich, the Indians always carefully put aside the stomach in order to collect the pepsine which it contains. "The stomach of the ostrich," says M. Ebelot, "is celebrated for its incredible powers of digestion. The abundance of pepsine, to which it owes this faculty, has created among the Indians a curious commercial fraud. They dry it and sell it literally for its weight in gold. It is used for the purpose of restoring worn out stomachs." A London medical journal says: "We think 'ostrich pepsine' such a splendid name for business purposes that we wonder it has never been adopted. The pepsine of the pig would have no chance in competition with that of the ostrich, and no great city dinner or regimental mess would be complete without a supply of this infallible specific, '*pour refaire les estomacs délabrés.*'"

† From *New Remedies* for March, 1879.

The Pharmaceutical Journal.

SATURDAY, APRIL 5, 1879.

COUNTER PRACTICE.

At the recent annual meeting of the Medical Defence Association the subject of counter practice was refered to in connection with that of medical legislation, and with the results of recent litigation, and in the report of the Council some regret was expressed that the Apothecaries' Society had in this respect refused to administer, or allow to be administered, the powers of its own Act of Parliament. Though it is scarcely matter for surprise that the Council of the Association should express such regret there is but little ground for the belief that it will meet with very general acquiescence, and the decision of the Apothecaries' Society may be regarded as indicating on the part of that body a reasonable recognition of what is expedient under existing circumstances.

After the ordinary business of the meeting was concluded the President, Dr. Richardson, delivered an address on "Phases of Modern Quackery and Medical Defence," in which, among other subjects, he dealt with patent medicines and counter practice by chemists and druggists. In regard to this latter topic he suggested that as the practice of chemists and druggists to recommend medicines and give advice as to the use of drugs existed by necessity, in some form or other, it would be well to establish a special qualification for it by instituting a conjoint examination by the Apothecaries' Society and the Pharmaceutical Society, the passing of which should entitle chemists and druggists to practise medicine and surgery in their shops.

The *Lancet* in speaking of this proposal denounces it not only as illogical but almost absurd and takes the opportunity to condemn in still stronger terms the counter practice carried on by chemists and druggists, as being "undoubtedly a great evil."

It is not the first time that in reference to this subject we have had occasion, not only to dissent from the views of our contemporary, but also to express our strong sense of the mistaken, if not unfair, representation of the facts of the case, and we regret being again constrained to take this course by the decided manner in which the statement is repeated that counter practice by chemists and druggists is illegal. The statement of this proposition with an *ex cathedrâ* assumption of authority appears to be a routine performance on the part of the *Lancet*; but it is so totally inconsistent with fact that it cannot be allowed to pass without contradiction, though we are decidedly of opinion that the discussion of the subject in a disputatious manner is not calculated to serve any useful purpose as regards the real interests of pharmacy, or to promote satisfactory relations between those engaged in that business and medical practitioners.

Moreover, the assertion made by the *Lancet* that counter practice by chemists and druggists is contrary to the Apothecaries Act of 1815, is one that we totally dispute, and the further statement that in well selected cases many verdicts against it have been obtained is one that will not bear the test of inquiry into the details of such cases as have been tried. In the first place, they are not so numerous as is suggested by the statement now referred to and, so far as we can remember, there is no instance of a case having been decided against a chemist and druggist for counter practice in which there has not been some clear evidence brought forward to show that the person prosecuted has either visited patients or charged for attendance or in some other way directly or indirectly held himself out to be a qualified practitioner. That such a practice on the part of chemists and druggists is improper, or even illegal, we do not pretend to deny and we do not think there is any tendency among chemists and druggists generally to take a different view. But when this matter is dealt with as involving the assumption that a qualified vendor of drugs has a no legal right to recommend the articles he deals in, either in a simple or compounded form, for the relief of minor complaints, the departure from common sense considerations is too obvious to admit of our concurrence in such a view.

We frankly confess our belief that counter practice is undesirable in the interests of pharmacy, and we have always urged the propriety of its being restricted within the narrowest limits possible, with the object of counteracting that confusion of medicine and pharmacy which was introduced and made customary by the old apothecaries. But even with such views it is impossible to overlook the fact that it is at present impossible in many cases for the chemist and druggist to abstain from satisfying the demands of his customers for such recommendations as he can give concerning the use of drugs and medicine. The convenience of the public requires that he should render such service, and in the great majority of instances it is beneficially as well as wisely rendered.

The attempt to make the rendering of such service illegal has always been discountenanced when it formed a feature of proposed medical legislation, and now that it has been fairly abandoned in all the medical bills before parliament, it seems to be purely Quixotic on the part of the *Lancet* to revive the old cry of illegality, and to invoke the assistance of so impotent an agent as the Apothecaries Act of 1815.

At the same time we fully agree with the *Lancet* in thinking the proposition made by Dr. Richardson most unwise, one as little calculated to command the support of chemists and druggists as that of medical practitioners. The only interpretation we can put upon it as coming from the President of the Medical Defence Association is that the endeavours of that body to repress counter practice have resulted in the conviction that it is so general, so habitual, and so much a convenience to the public as to be in many cases a positive necessity.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, April 2, 1879.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hills, Mackay, Rimmington, Robbins, Sandford, Schacht and Shaw.

The minutes of the previous meeting were read and confirmed.

A telegram from the President was read, regretting his inability to attend an account of illness.

Mr. MACKAY wished to say a word on a matter which occurred at the last Council meeting. His name had been mentioned incidentally in connection with the proposed amendment of the Pharmacy Act, and it might be inferred from what was said that he was dead against any amendment being made. He had always held the opinion that the Act of 1852 was a mere skeleton, and scarcely worthy of the name. The Act of 1868 was certainly an improvement, and since it gave the Society certain compulsory powers it was one which ought to be received with thankfulness; but for any one to suppose that he was satisfied with it was a great mistake. His feeling with regard to the proposed amendments being formulated was that scarcely enough had been asked for, not too little. The parliamentary session was now so far advanced that there was little chance of getting a measure carried, and any steps taken in drawing a Bill would involve considerable expense. But having said this, he should certainly have voted in favour of trying to obtain those amendments which had been agreed to by the Council.

WEIGHTS AND MEASURES ACT.

Mr. SANDFORD said the Medical Council had addressed the Board of Trade on the subject of the Weights and Measures Act, entirely confirming the memorial submitted by the Council.

Mr. GREENISH said a good many chemists in his neighbourhood had been visited by the inspector of weights and measures. He should like to know in what position they really were with respect to graduated measures used for dispensing purposes.

Mr. SANDFORD had no doubt that for the present chemists and druggists were perfectly safe, as there was a provision that for six months from the commencement of the Act the old stamp on weights and measures should be sufficient. The question with regard to glass measures was now before the Board of Trade, and would no doubt be properly solved. In the memorandum sent by this Council it had been asked whether the subdivisions on glass vessels need be verified; this the Medical Council did not consider necessary. When the difficulty which had occurred in Scotland was put before Mr. Farrer, of the Board of Trade, he said that no magistrate would convict a person for having in his possession apothecaries' weights or measures, when there was a clause in the Act authorizing the use of that weight.

Mr. MACKAY said it had been determined by chemists and druggists in Edinburgh to decline allowing the inspector to examine their dispensing weights.

Mr. BETTY said he understood that the Medical Council had recommended the Board of Trade not to insist on the marking of glass measures.

The following communication from the Medical Council was read:—

"General Council of
"Medical Education and Registration
"of the United Kingdom.
"315, Oxford Street, London, W.
"*March 27th*, 1879.

"Sir,—I am directed to forward you the following Resolution passed by the General Medical Council at its Sitting on the 25th instant:—

"'That the following answer be sent to the Board of Trade in reference to the *Weights and Measures Act* (1878):—

"'In reply to your communication of February 10th [see Executive Committee's *Minutes* for March 5, 1879, Clause 8], submitting for the consideration of the Medical Council certain memoranda which had been handed to the Board of Trade by the Pharmaceutical Society respecting the *Weights and Measures Act* (1878) we beg to submit the following remarks:—

"'It appears to be certainly desirable that all weights and measures which are legalized by Act of Parliament should be distinctly described by the authorities to whose hands is entrusted the duty of carrying the law into effect, and that standards should be established in order to ensure accuracy and uniformity in such weights and measures. Those used by chemists in compounding and dealing in drugs should be no exception to this rule.

"'The 20th section of the *Weights and Measures Act* (1878) authorizes the continued use of apothecaries' weights, and we are of opinion that the denominations of those weights should be officially set forth, and standards of them prepared and preserved by the Government.

"'We concur in the opinion that it is undesirable to include the pound among apothecaries' weights. If the ounce be retained it should be distinctively termed the "apothecaries' ounce," and the drachm should also be termed the "apothecaries' drachm." These weights, as well as the "scruple," should be distinctly marked with their names, or with such abbreviations thereof as may be deemed sufficient, as well as with the symbols which have from time immemorial been used to represent those weights, the ounce being ℥, the drachm ℥, the scruple ℈.

"'We think some of the lesser weights are too small to have a Government stamp of verification in addition to the mark which is necessary to denote their value.

"'The tables given in the memoranda correctly state the apothecaries' weights, but we think it should be mentioned that the grain of that weight and the grain avoirdupois are equal.

"'We are of opinion that it would be unnecessary to have the minor subdivisions of glass measures officially verified.'

"I am, Sir,
"Your obedient servant,
"Henry E. Allen,
"Chief Clerk.

"John Williams, Esq."

NOMINATIONS FOR COUNCIL AND AUDITORS.

The Secretary reported that there had been *forty-four* nominations to fill the fourteen vacant seats on the Council, and the following *twenty* nominees had signified their willingness to accept office if elected:—

Atkins, Samuel Ralph, Market Place, Salisbury.
Bottle, Alexander, 37, Townwall Street, Dover.
Butt, Edward Northway, 13, Curzon Street, Mayfair, W.
Churchill, Walter John, 46, New Street, Birmingham.
Cracknell, Charles, 217, Edgware Road, W.
Frazer, Daniel, 113, Buchanan Street, Glasgow.
Fitch, Robert Owen, 200, Well Street, South Hackney, E.
Hampson, Robert, 205, St. John Street Road, E.C.
Horncastle, John, 17, Craven Road, W.
Owen, John, 51, Holloway Road, N.
Richardson, John George. Frederick, Houghton House, Stoneygate, Leicester.
Rimmington, Felix Marsh, 9, Bridge Street, Bradford, Yorks.
Robbins, John, 372, Oxford Street, W.
Shaw, John, 24, Great George Place, Liverpool.
Savage, William Dawson, 4, Park Road East, Brighton.
Spink, Harry Nelson Bowman, 3, Marsham Street, Westminster, S.W.
Squire, Peter Wyatt, 277, Oxford Street, W.
Symes, Charles, 14, Hardman Street, Liverpool.

Williams, John, 16, Cross Street, Hatton Garden, E.C.
Woolley, George Stephen, 69, Market Street, Manchester.

The following *twenty-four* nominees declined to accept office, if elected :—

Andrews, Frederick, 34, Leinster Terrace, Hyde Park, W.
Barker, William Robert, 143, New Bond Street, W.
Betty, Samuel Chapman, 6, Park Street, Camden Town, N.W.
Cross, William Gowen, Mardol, Shrewsbury.
Darby, Stephen, 140, Leadenhall Street, E.C.
Ekin, Charles, 8, Argyle Street, Bath.
Groves, Thomas Bennett, 80, St. Mary Street, Weymouth.
Gulliver, William, 6, Lower Belgrave Street, S.W.
Hanbury, Cornelius, Plough Court, 37, Lombard Street, E.C.
Hills, Walter, 338, Oxford Street, W.
Hodgkinson, William, 127, Aldersgate Street, E.C.
Howden, Robert, 78, Gracechurch Street, E.C.
Humpage, Benjamin, 6, Albert Place, Turnham Green, W.
Jones, Samuel Urwick, Chirton House, Leamington.
Matthews, William, 12, Wigmore Street, W.
Morson, Thomas, 124, Southampton Row, W.C.
Pound, Matthew, 60, Leather Lane, E.C.
Randall, William Brodribb, 146, High Street, Southampton.
Reynolds, Richard, 13, Briggate, Leeds.
Stacey, Samuel Lloyd, 300, High Holborn, W.C.
Roach, Pope, 8, St. James's Street, S.W.
Urwick, William Walker, 60, St. George's Road, Pimlico, S.W.
Vizer, Edwin Bennett, Church Road, Cliftonville, Brighton.
Wade, John, 174, Warwick Street, Pimlico, S.W.

Six nominations for auditors had been received, and the following *five* had signified their willingness to accept office, if elected :—

Harvey, Edward, 6, Giltspur Street, London, E.C.
Hodgkinson, William, 127, Aldersgate Street, London, E.C.
Stacey, Samuel Lloyd, 300, High Holborn, London, W.C.
Thompson, Henry Ayscough, 22, Worship Street, London, E.C.
Watts, William Manning, 32, Lower Whitecross Street, London, E.C.

The following had declined to accept office :—

Squire, William, 5, Coleman Street, London, E.C.

Mr. GOSTLING expressed his regret at the retirement of Mr. Betty, and remembering the great services that gentleman had rendered to the Society, he would move that Mr. Betty be asked to reconsider his determination.

Mr. SHAW sympathized with Mr. Gostling's proposition, but did not see how it could be carried out under the regulations.

The VICE-PRESIDENT said all must regret Mr. Betty's withdrawal, but he did not see that such a motion could be put.

Mr. BETTY expressed his sense of the kindness of his colleagues in what had been said, but assured them he had well considered the matter. It must not for a moment be supposed that he took less interest in the Society on his retiring from the honourable position of member of Council.

ELECTIONS.

MEMBERS.

Pharmaceutical Chemists.

The following having passed the Major Examination, and tendered their subscriptions for the current year were elected Members of the Society:—

Duffus, Alexander .....Jamaica.
Gravill, Edward Day .....London.
Harpham, John.....London.
Hugill, John Howden .....London.
Jackson, Henry John .....Bridlington Quay.
Stuart, Charles Edward .....Newcastle-on-Tyne.

Chemists and Druggists.

The following registered Chemists and Druggists who were in business on their own account before August 1, 1868, having tendered their subscriptions for the current year were elected Members of the Society: —

Gillespie, John .....Dornock.
Thompson, Thomas .....Middleton-in-Teesdale.
Turner, John.....Sheffield.

ASSOCIATES IN BUSINESS.

The following having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Alcock, Joseph Pitman .....Evesham.
Alderslade, William.....London.
Bathe, William.....Torquay.
Brown, Robert .....Edinburgh.
Clare, Thomas .....Scarborough.
Clifford, Richard Noon.....Bedford.
Davis, Benjamin .....Leamington.
Ewing, James Laidlaw .....Edinburgh.
Ferriday, Edwin J. Pitchford...Oakengates.
Jinks, John .....Ironbridge.
Pirie, William Rettie .....Edinburgh.
Robertson, William .....Alloa.
Tame, Thomas .....Chepstow.
Thompson, Thomas .....Edinburgh.

Modified.

Bettinson, William Thomas ...Lewisham.
Buck, Thomas.....Middlesboro-on-Tees.
Clarke, William Lane.....London.
McKenzie, William .....Crieff.

ASSOCIATES.

The following having passed their respective examinations and paid (as Apprentices or Students) or tendered their subscriptions for the current year, were elected "Associates" of the Society:—

Minor.

Brunt, Edwin .....Great Grimsby.
Cullen, Harry Harker.....Tewkesbury.
Kenny, Thomas .....Boston.
Lawton, John Dyson .....Louth.
Leach, Isaac .....London.
MacEwan, Peter .....Lochee.
Marshall, Arthur Willis .....Rusholme.
Wakefield, John .....Birmingham.
Ward, Smith.....Batley Carr.
Wimpenny, John McMillan ...Waterloo.
Brewerton, Thomas .....Manchester.
Robertson, James Dalgety .....Arbroath.

APPRENTICES OR STUDENTS.

The following having passed the Preliminary examination, and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society:—

Allen, William H.....London.
Beaulah, William .....Manchester.
Bond, Frederick Joseph .....London.
Bright, Richard Henry D. .....Peterborough.
Brown, Leonard Hackford .....Coningsby.
Chappell, John Chater.....Boston Spa.
Elbourne, William .....Grantham.
Fields, Tom William .....Beverley.
Hobson, Thomas Coultas.....Doncaster.

Holdcroft, Francis Joseph .....Coventry.
Hudson, Thomas .....Wells.
Kirkham, Frank .....Bury St. Edmunds.
Peck, Edward .....Ely.
Peggram, Albert Cole .....Kennington.
Rowland, Langshaw.....Wrexham.
Saunders, William Henry .....Bristol.
Warman, Henry Thomas.....Ramsgate.

The following person was restored to the Register of Chemists and Druggists.

Francis Dancey Hamilton, 62, Rattray Road, Brixton.

Honorary and Corresponding Members.

Mr. Greenish desired to draw the attention of the Council to the recent death of M. Dorvault, who had been an honorary member since 1856, and whose services to pharmacy were too well-known to need special reference. He was the founder and director of the Central Pharmacy of France, and member of several learned societies, and the author of a book to which pharmacists were all indebted. He would therefore suggest that a resolution be passed by the Council expressing regret at his decease, and sympathy with his family.

Mr. Sandford seconded the motion, which was carried unanimously.

The following names were unanimously approved for exhibition in the library for one month, with a view to election as Honorary and Corresponding Members in May next:—

Dr. John Tyndall, of London.
Dr. Oswald Hesse, of Stuttgart.

Mr. Greenish said the latter gentleman had contributed largely to the chemistry of pharmacy, his papers in the Catalogue of the Royal Society numbering about fifty Dr. Hesse's investigations of the cinchona and opium alkaloids had been of especial value.

Reports of Committees.

FINANCE.

The report of this Committee was received and adopted, and sundry accounts were ordered to be paid.

BENEVOLENT FUND.

The report of this Committee included a recommendation of the following grants:—

£20 to the widow of a pharmaceutical chemist, and life member of the Society. Applicant had a grant of £20 in May last.

£5 to the widow of a pharmaceutical chemist and member.

£5 to a registered chemist and druggist, with a wife and six children, who has been unfortunate in business.

£10 to the widow of a registered chemist and druggist, aged 57. Applicant had a grant of £20 in 1874, and £10 in 1876.

£5 to a registered chemist and druggist, formerly in business, suffering from deafness, and with wife in delicate health.

£10 to the daughter of a late member.

Isherwood's Children.—A letter had been received from a gentleman to whom one of the late Mr. Isherwood's children had been sent, saying that the child was in bad health, and could not remain.

The Secretary placed the following figures before the Committee:—

Benevolent Fund.

Subscriptions received.

	1878. £	s.	d.	1879. £	s.	d.
January . . .	93	9	0	83	7	6
February . .	243	19	6	98	6	10
March . . .	185	5	0	199	18	0
	£522	13	6	£381	12	4

Donations received.

	1878.			1879		
January . . .	11	11	0	6	6	0
February . .	19	8	6			
March . . .	5	5	0	8	2	0
	£36	4	6	£14	8	0

The Vice-President regretted to see that there was such a falling off in the receipts of the Benevolent Fund.

Mr. Greenish said it was like a man's own business; sometimes there would be a falling off at one time, and a recovery at another.

Mr. Shaw thought it was the natural result of the depression of trade throughout the country.

Mr. Hampson asked Mr. Robbins if he had met with a good response to his efforts to obtain the admission of Catharine Ann Peele into the Masonic Institution for girls.

Mr. Robbins was pleased to say that so far as the case had gone he was perfectly satisfied. He had received a great number of communications from chemists throughout the country, and some appeared to have taken great interest in the matter, and if they had not votes themselves, had got them from their friends. If all the promises were carried out he had good hopes of success; but time was rather pressing as the election took place on the 12th, so that he should be very glad if any gentlemen could send him more votes within the next few days.

Mr. Atkins said he was not surprised to find that the income of the Benevolent Fund had fallen off, considering how trade in general had suffered; but the members should be urged to make an effort to keep up the income in order that the Council might not have to decrease its benevolent action.

Mr. Shaw renewed the motion which he had brought forward some months age, that a list of subscribers to the Benevolent Fund, arranged under the respective towns, should be printed and circulated. The names were all now in type, having been used in the printing of the Calendar, and therefore it was an appropriate time to decide the question.

Mr. Gostling seconded the motion.

The Secretary said he recently sent a circular regarding the Benevolent Fund to every chemist and druggist on the Register, and the result was a few additional subscriptions and a large number of applications for relief from persons who had never subscribed to the Fund or to the Society.

Mr. Betty remarked that the circulation of such a list would tend to increase that bad system of canvassing which Mr. Shaw so much deplored.

Mr. Churchill said the list of subscribers in the Calendar was of great use to Local Secretaries, but he doubted the advisability of circulating it amongst the trade generally.

After some further discussion, Mr. Shaw withdrew the motion, and the report and recommendations of the Committee were received and adopted unanimously.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian to the following effect:—

Attendance, February 1 to 28, average during day, 20; evening, 11. Circulation of books, town, 151; country, 82. Carriage paid, £1 11*s.* 5½*d.*

Donations received:—

Calendar of the Pharmaceutical Society of Ireland, 1879. From the Society.

Pharmaceutical Register for 1878. From the Pharmacy Board of Victoria.

Flückiger (F. A.), Pharmacognostiche Umschau in der Pariser Ausstellung und den Londoner Sammlungen, 1879. From the Author.

Cooley (A. J.), Cyclopædia of Practical Receipts. 6 ed., 1879, pts. 10–11. From Messrs. J. and A. Churchill.

Macé (M.), Traité pratique et raisonné de pharmacie galenique, 1879. From the Author.

Index Medicus, Monthly Record of Literature, vol. 1, no. 1, 1879. One copy from the Editors. One copy from the Surgeon-General, U.S.A.

The Committee recommended the purchase of the following books for the library :—

Griffiths (W. H.), Materia Medica and Pharmacy, 1879.

König (J.), Chemische Zusammensetzung der menschlichen Nahrungs- und Genussmittel, 1879.

The Curator had reported the attendance in the Museum to have been as follows:—During the day, highest 18, lowest 4, average 13; Evening, highest 8, lowest 0; average 4.

The following is a list of donations received :—

Three very fine specimens of Chinese Opium from Sechuen, Yunan, and Laotong respectively.

Cryptopine.

Cryptopine Hydrochlorate.

Gnoscopine.

Meconoiosine.

Papaverine.

Papaverine Hydrochlorate.

Thebolactic Acid.

Nitrate of Purpurine and White Resin of Scammony, from Messrs. T. and W. Smith and Co.

Specimens of the Leaves of Cassia Obovata cultivated at Barcelona, from Messrs. A. Faber and Co.

Specimens of Bark used in Monrovia for toothache, from Mr. T. Christy.

Specimens of Kari Moer Root from Cape of Good Hope, and of Dichloride of Ethidene, from Messrs. Burgoyne, Burbidges, Cyriax and Farries.

Small Perfect Crystals of Sulphate of Iron, from Mr. A. Bird.

Specimens of an Insoluble Gum Arabic, Febrifuge Bark from the West Indies, Star Aniseed without odour, and False Senega (Viola species) recently offered in English commerce, from M. Chantre.

Specimen of Root of Hedychium Spicatum, from Messrs. Allen and Hanbury.

The Professors had attended the Committee and reported that the second course had opened very satisfactorily, the numbers being increased.

The Curator had read a portion of a letter from Dr. Dymock, of Bombay, stating that he had forwarded samples of sarcocoll, rusa oil and other things for the Museum.

The Aberdeen Society of Chemists and Druggists had applied for some duplicate specimens from the Museum, and the Librarian of the Free Library, Birmingham, had asked for a set of the *Pharmaceutical Journal*, 1870–8, to replace those burnt in the late fire, Mr. Woodward of the Midland Institute having presented the library with a set from 1841-70. It was recommended that the requests be complied with.

The Committee had also held two adjourned meetings at which the draft Annual Report was settled, and the regulations concerning the examination fees considered.

Mr. Shaw, referring to a recommendation by the Committee that the accumulation of back numbers of the Journal, which was getting rather cumbersome, be disposed of, retaining only seventy-five sets, suggested that there might be many persons who would like to make up deficiences in their sets, and that an advertisement be inserted in the Journal for one month before the old stock was disposed of. It was decided after some conversation to refer the matter to the Committee for consideration and report.

Before adopting the report of the Committee it was determined to consider a motion of which Mr. Sandford had given notice, having for its object the embodiment in the Bye-laws of the existing regulations of the Board of Examiners.

The Council went into Committee to discuss this matter, and upon resuming, the following resolution was agreed to unanimously, subject to confirmation in the ordinary way :—

"That clauses 16, 17, 18 and 19 of section X of the Bye-laws be abrogated, and that the following clauses be enacted in lieu thereof.

"16. All persons shall before registration as Apprentices or Students, pay a fee of Two Guineas and pass the First or Preliminary examination, whereupon they shall be registered as Apprentices or Students.

"17. All persons desiring registration as Assistants under the Statute, 1852, or as Chemists and Druggists under the Act, 1868, excepting those named in the next following bye-law, shall pay a fee of Three Guineas, if previously registered as Apprentices or Students, or otherwise a fee of Five Guineas, and pass the Minor Examination, whereupon they shall be registered accordingly.

"18. All persons entitled to be registered as Chemists and Druggists on passing a modified examination and desiring so to be registered, shall pay a fee of One Guinea and pass the Modified Examination, whereupon they shall be registered accordingly.

"19. All persons desiring registration as Pharmaceutical Chemists under the Statute, 1852, shall pay a fee of Five Guineas, if previously registered as Assistants, or otherwise a fee of Ten Guineas, and pass the Major Examination, whereupon they shall be registered accordingly.

"20. All persons intending to attend for examination in the First or Preliminary examination shall give to the Registrar notice in writing of their intention in that behalf not less than fourteen clear days prior to the day which has been appointed for the holding of the said examination.

"21. All persons intending to present themselves for examination in the Major, the Minor, or the Modified Examination, shall give to the Registrar notice in writing of their intention in that behalf, on or before the first day of the month in which the examination is to take place.

"22. All notices of intention to attend for examination shall be to attend on the next occasion of the examination being held, and all fees in respect of examination and registration shall be payable on the giving of notice of intention to attend for examination, and in no case shall any fee paid in accordance with the Bye Laws be remitted or returned.

"23. No person shall be admitted to the Major or the Minor Examination who shall not have attained the full age of twenty-one years, nor unless he shall satisfy the Examiners that for three years he has been registered and employed as an apprentice or student, or has otherwise for three years been practically engaged in the translation and dispensing of prescriptions. Persons who have passed the Minor Examination at least three months previously may be admitted to the Major Examination, and all other persons desirous of passing the Major Examination may make application to the Board of Examiners for special leave in that behalf.

"24. Persons who have attended and failed to pass an examination, shall not be entitled to attend on any future occasion within an interval of three months therefrom, nor unless and until they shall have given renewed notice of intention to attend an examination, and shall have paid fees as follows—

(*a*) *In respect of a Major Examination, Two Guineas*;
(*b*) *In respect of a Minor Examination, Two Guineas*;
(*c*) *In respect of a First or Preliminary Examination, One Guinea*;—

in cases of renewed notices for examinations to be held before the expiration of one year, computed from the first day of the month wherein the examination was held in respect of which the original fee was paid; and in all other cases fees of amounts corresponding with the fees paid on the original notice.

"25. Persons who have given original or renewed notices of intention to attend an examination, and have failed duly to attend at the time appointed for the same shall not be entitled to attend on any future occasion unless and until they shall have given renewed notice of intention to attend an examination, and shall have paid fees as follows, viz. :—*In cases of renewed notices for examinations to be held before the expiration of one year*, computed from the first day of the month wherein the examination was held in respect whereof the original fee was paid,—One Guinea,—or if the persons shall have proved to the satisfaction of the Council or the Board of Examiners (by production of medical certificates or otherwise) that the said failure was occasioned by unavoidable and proper causes,—One Shilling,—and in all other cases, fees of amounts corresponding with the fees paid on the original notice."

The report and recommendations of the Library, Museum and Laboratory Committee were then received and adopted.

The Annual Report.

The Council then went into Committee to discuss the draft report submitted by the Committee, and after a lengthy discussion, in the course of which various verbal amendments were introduced, the Council resumed, and the report was adopted, the resolution also requesting the Library, Museum and Laboratory Committee to add anything which might be found necessary before the date of the annual meeting.

Mr. MACKAY drew attention to an item appearing in the balance sheet of £150 standing to the credit of the Library and Museum in Edinburgh. He had thought this was much below the value, and having recently had the furniture and other things valued, it was found the real value was £571 11*s.* 10*d.* In justice to the Society he thought that figure should be substituted. This was agreed to.

HOUSE.

The report of this Committee included a recommendation to place an iron staircase in the front area. The Committee had also obtained estimates for blinds, and for putting double windows in Council room, but on the latter point it made no recommendation. The lowest estimate for new blinds it recommended for acceptance.

The report was received and adopted.

The Vice-President being here obliged to leave the chair, it was taken by Mr. Sandford for the remainder of the sitting.

GENERAL PURPOSES.

Prize Examinations.

The Committee had received reports from the Professors as to the Prize Examinations and recommended that prizes should be awarded as below:—

Professor Redwood had reported that sixteen students had competed in the chemistry and pharmacy class; in most of the papers answers were given to all the questions, and the general charater of the answers was fairly good, but five only came up to the standard entitling the authors to an award.

Professor Bentley had reported that the average was very good, and some of the candidates had obtained exceptionally high marks. He also spoke in very high terms of the good conduct and diligence of the students.

The Committee having opened the motto envelopes designated by the Professors, recommended that the following awards be made:—

Chemistry and Pharmacy.

Bronze Medal	.....	James Bunyan Lillie Mackay.
Certificate of Merit	...	Frank Harris Alcock.
,,	,,	Beresford Frederick Harold Maudson.
,,	,,	Edward Jarrett Eaton.
,,		James Henry Allan.

Botany and Materia Medica.

Bronze Medal	.....	James Bunyan Lillie Mackay.
Certificate of Merit	...	Fred. Wm. Edward Shrivell.
,,	,,	Frank Harris Alcock.
,,	,,	James Edward Williams.
,,	,,	Edward Jarrett Eaton.

The Solicitor had sent his usual monthly report giving particulars of legal matters which had been placed in his hands.

The Registrar had also made a report as to correspondence with a person who had been complained of, and who had sent in an application for registration as having been in business prior to 1868. The certificates not being altogether satisfactory, the Registrar was recommended to consult the Solicitor with regard to them. A communication had been received from the Chairman of Quarter Sessions at Boston, setting forth the danger arising from the sale of James's phosphorus paste. The Committee was of opinion that it was not desirable to add phosphorus paste to the schedule of poisons.

The report and recommendations were received and adopted, with the exception of one clause authorizing a prosecution in a certain case, which it was not deemed advisable by the Council to undertake without further information. The case was therefore referred back to the Committee for further consideration.

Mr. SHAW moved the following resolution of which he had given notice:—

"That the name and address of every person newly placed on the Register of Chemists and Druggists in virtue of having been in business as a Chemist and Druggist before August 1st, 1868, shall also be published in the *Pharmaceutical Journal*, as part of the transactions of the Pharmaceutical Society."

He mentioned an instance in which the name of a person had been improperly placed on the Register, where it remained until he was elected a member, when his name appeared in the Journal and objection was immediately taken to him and his name had now been expunged.

The resolution was unanimously agreed to.

INSTITUTE OF CHEMISTRY.

The SECRETARY said he had received a letter from the Institute of Chemistry.

Mr. SANDFORD said he believed it referred to the question of titles, and it had better be submitted to the General Purposes Committee.

BIRMINGHAM AND MIDLAND INSTITUTE.

A letter had also been received from the Secretary to the Birmingham and Midland Institute, asking if the examinations of that Institution would be accepted in lieu of those of the Pharmaceutical Society.

The Secretary was directed to reply that the Council could not accept any examinations in lieu of its own.

The SECRETARY also read a letter from the York Chemists' Association enclosing a resolution on the subject of competition by unregistered persons, advising a petition to Parliament to amend the law so as to prevent persons not possessing any qualification selling drugs and articles used in compounding medicines.

NOTICE OF MOTION FOR THE ANNUAL MEETING.

The Secretary reported that he had received the following notice of motion to be moved by Mr. Vizer at the Annual Meeting in May, 1879:—

"The Pharmaceutical Council having desired a definite expression of the feeling of the members of this Society upon the admission of females to its membership—this meeting desires to record its opinion that so complete a change in the constitution of the Society is unnecessary and undesirable."

PHARMACEUTICAL MEETING.

Wednesday, April 2, 1879.

MR. THOMAS GREENISH, TREASURER, IN THE CHAIR.

The CHAIRMAN said that the President, who was unable to attend through indisposition, a circumstance all would regret, had requested him to preside.

The minutes of the previous meeting were read and confirmed.

Mr. HOLMES, in describing the specimens on the table, said that he should like to call attention to a specimen of chlorochromic anhydride, and also to one of bismuthic oxide, which were presented by Mr. John Davies, a student in the laboratories. It was very gratifying to him to find that gentlemen in the laboratories took so much interest in the museum, and were willing to devote time and trouble to enriching it. There was also a specimen of star anise. This article did not come much into the retail trade, but it was interesting on account of having apparently no essential oil in it. It was doubtful whether it had not been exhausted of its oil. It possessed a faint juniper-like odour, but had no taste of anise. A somewhat similar specimen, but entirely odourless, had been presented to the museum some months since by Dr. Dymock, of Bombay. This differed from the ordinary star anise in having a large number of carpels. Another specimen upon the table was a spurious senega from New York, which evidently consisted of the roots of a species of violet. There was also a specimen of pituri exhibited by Mr. T. Christy, which was the finest specimen that had as yet been seen in this country. In connection with this specimen, he might remark, that in the *Journal de Pharmacie et de Chimie* of the present month there was an article upon the supposed new alkaloid, discovered by Mr. Gerrard, and which the writer, M. Petit, considered that he had proved both by chemical and physiological tests to be identical with nicotine, and not a new alkaloid.* There was also a specimen of fresh bael fruit preserved in syrup, which was exhibited by Mr. Postans. It had been stated that there was great difficulty in obtaining the fresh fruit in this country, but this specimen was evidence to the contrary.

Mr. POSTANS said that the specimen had been very kindly given to him by Dr. James M. Laing, of the colonial service. He believed that some years ago bael fruit had been used to a much larger extent in this country than it was at the present time. It had fallen, to some extent, into disuse in consequence of the belief that the ripe fruit in its fresh state could not readily be obtained. Dr. Laing, however, had assured him should a demand spring up it could be got in any quantity, and that it would keep well if sprinkled over with a little dust lump sugar occasionally. One special advantage which it possessed was, that it was extremely nice, and children, in consequence, took it readily. In India the fresh fruit was largely used as an astringent in diarrhœa and tropical dysentery.

Professor ATTFIELD said he should like to know from Mr. Holmes, or from some other gentleman, what was the derivation of the word "marmalade." He had always been assured that the English word marmalade was derived from that of this fruit, *Ægle marmelos*. On the other hand, he was given to understand that the original word was a much older one, and that both the Indian word and the English word were derived from some prior source.

Mr. PASSMORE said it had been stated that the word marmalade was derived from *marmelo*, the Portuguese name for the quince, from which fruit marmalade used to be made.

Professor ATTFIELD said that quince marmalade was a well-known preserve in some parts of England, possibly an older one than orange marmalade.

The CHAIRMAN said that he rather thought that Mr. Passmore's view was correct. The exhibition of drugs and therapeutic agents which were in use, or might come into use, was a somewhat new and very important feature in the meetings of the Society. There was no country which could possibly have the same opportunity of showing those things as was possessed by England.

Professor ATTFIELD said that if the curator would send into the laboratories a list of the preparations which he would like in order to complete his series in the museum, he (Professor Attfield) and his assistants and those of his students who had time at their disposal would be very glad to do what they possibly could to render the Society's collection still more perfect than it was at present.

A paper was then read on—

THE ACTION OF IODINE UPON RHUBARB.

BY HENRY GREENISH.

The paper is printed on p. 813.

The CHAIRMAN said that the opportunity might not be afforded to all students to indulge in original research, but a very large amount of useful work might be done by them in correcting the errors which had been made by other people. When once a statement was made and got into print, it was like a hydra-headed monster, and it required to be "scotched" again and again. Students might very usefully employ themselves in going over work which was presumed to have been done correctly by other persons. With regard to Russian crown rhubarb, when he was in St. Petersburg five years ago, a specimen of that sort of rhubarb was given to him as a great curiosity, and he had placed it in the museum of the Society.

Professor ATTFIELD said that he should be sorry that a communication by an old student, and especially one who was engaged in the laboratory of Professor Dragendorff, should be received without some expression to show how strongly the Society sympathized with such endeavours to promote pharmaceutical research. He fully endorsed what had been said by the Chairman with regard to the good work which might be done by young men in the way of correcting possible errors. Masters in research had, over and over again, given the students the watchwords "Experiment! experiment! experiment!" Almost the youngest student could at least experiment, and it might be that in so doing he would be able not only to correct error, but to discover new truths. With regard to the paper itself, no doubt the conclusions drawn by the writer were fairly deducible from the premises, but he was himself wondering what was the *locus standi* of the author's court of appeal. The writer stated that his conclusion was that the quantity of iodine which a sample of rhubarb was capable of absorbing could not be regarded as indicating the quality of the rhubarb. No doubt Mr. Greenish was right so far as the quality of the rhubarb was indicated by the stated active principles, cathartic acid, chrysophan and tannin; but were they the only active principles? And with regard to the other conclusion, that the quantity of iodine absorbed did not depend upon the active ingredients alone, he (the speaker) would add, "meaning by the active ingredients, cathartic acid, chrysophan and tannin." Those three substances might be the only active bodies present, but he did not think that up to the present time that point had been decided. In fact the writer himself qualified his statement by speaking of them as the "most important" of the active ingredients.

Mr. HOLMES said that the paper was interesting because it placed the *Rheum palmatum*, var. *tanguticum*, which was the species to which the Russian rhubarb had been lately attributed, very high in the list. If, as he supposed might possibly be the case, the *Rheum Mandshuricum* were identical botanically with the Himalayan rhubarb described by Pereira, and with which Professor Dragendorff's description seemed to tally, then it appeared to him that the iodine test did seem to indicate the respective values of the different rhubarbs. He would be glad to know whether the term Mandshuricum simply indicated the country from which it came, as he did not know any plant having such a botanical name.

* See before, p. 819.

Mr. UMNEY said that there could be no question that the superiority of the rhubarb described in the paper as *Rheum Muscovicum* was partly due, as everybody must know who had read Hanbury's account, to the way in which the traffic was carried on. Both Hanbury and Pereira gave a most elaborate account of the manner in which the rhubarb was collected, and carried in caravans, and subjected to careful inspection so that only the very finest specimens were sent into the market. There could be no question that the superiority was partly due to the care thus taken, quite apart from the botanical source of *Rheum Muscovicum*.

The next paper read was on—

PLASMA.

BY W. WILLMOTT.

The paper is printed at p. 815, and gave rise to the following discussion :—

The CHAIRMAN said that they were very much obliged to Mr. Willmott for this very practical paper. Although not unmindful of the value of purely scientific papers, he liked to see at each evening meeting at least one paper which had a practical bearing.

Mr. SCHACHT said that he was extremely obliged to Mr. Willmott for his work upon the subject, for he believed that it had resulted in a suggestion which, perhaps, might overcome the only difficulty which stood in the way of plasma being more largely used than it was at present ; for, though he believed plasma to be a very useful material as a basis in the exhibition of substances which were soluble in glycerine, yet there was a practical objection in some cases on account of the action which Mr. Willmott had spoken of as "irritation." He thought that the paper explained, simply and distinctly, the cause of that inconvenience, in drawing special attention to the extremely hygroscopic character of glycerine and its power to absorb moisture. On account of that property, glycerine would, of course, absorb moisture from the skin. It was quite true that, if plasma was mixed with a rather fluid extract, the sensation described as irritation was not so distinctly experienced as it was when the glycerine was mixed with a dry material, for, in the case of a fluid extract, the natural inclination of the glycerine for the absorption of moisture was partly satisfied. In all probability they could attain what they wanted if they followed the suggestion of Mr. Willmott to dilute the glycerine with water as a first step so as to satisfy its great craving for that liquid.

Professor ATTFIELD asked whether Mr. Schacht thought that the proportions mentioned by Mr. Willmott were such as would commend themselves to dispensers.

Mr. SCHACHT thought that very probably they were, but he had not experimented on that point.

Mr. LINFORD said that some years ago he had some experience in the use of plasma. Mr. Willmott had stated in his paper that the starch had nothing to do with the subsequent liquefaction of the plasma, but he (Mr. Linford) had experimented with various starches, and he found that there was a decided difference according to the kind of starch which was employed. Different starches of arrowroot as well as other forms of starch would retain the form of jelly for different lengths of time. It was well known that the old Bermuda arrowroot would retain that form longer than other sorts of arrow root. He also found that maize starch stood longer than any other kind, and potato starch stood for the shortest time. Whether the granular texture of the starch had anything to do with that pointhe did not know.

Mr. BUTT said that he could confirm what had been stated by Mr. Linford. A few years ago he tried various kinds of starch in making plasma and he found that that which answered best was maize starch, while wheat starch was the least successful.

Mr. UMNEY said that they would not be doing justice if they did not mention Mr. Benger, who communicated to the Conference, some ten years ago, a paper with regard to the different kinds of starch. He believed that the starch which Mr. Benger considered best was tous-les-mois starch.

Mr. CLEAVER said that he believed that in the making of plasma a great deal depended upon the person who made it. At the same time, he had always succeeded well with tous-les-mois starch. With regard to the irritating properties of glycerine, it might be stated that the absorption of water by glycerine was attended with considerable evolution of heat, and that might have something to do with the irritating effect.

Dr. SENIER said that there were two points respecting plasma or glycerine of starch, as it was called in the Pharmacopœia, to which he should like to allude. The first was with reference to some experiments which had been make by Mr. Allen. Mr. Allen had noticed that the temperature given in the Pharmacopœia of 240 degrees Fahrenheit for the making of plasma was too low. He made a few experiments on the subject. The first experiment was with glycerine which had been exposed to a temperature of 250° for two hours, and which was fairly anhydrous. Using the proportions given in the British Pharmacopœia, he found that a temperature of 280° was requisite to cause gelatinization. Using a glycerine of the specific gravity of 1·253, containing about 4 per cent. of water, he found that the temperature required was 260° to 270°. That would be the temperature which would be usually required. A glycerine with 7 per cent. of water required a temperature of from 240° to 250° and one with 16 per cent. of water required a temperature of 230°. With the proportions given in Mr. Willmott's paper, the temperature required would be 190°. The other point to which he would allude was the constitution of glycerine of starch. He (Dr. Senier) had made a few experiments, and he had found, in the first place, that glycerine of starch was miscible in water and was coloured blue with iodine. From the aqueous mixture alcohol threw down a white precipitate which might be starch in a modified form, or a compound of glycerine and starch. In order to determine that point he used one gram of starch and ten grams of glycerine. He exhausted it, after gelatinization, with 100 c.c. of alcohol, and weighed the insoluble matter, which gave him one gram approximately. The soluble matter was approximately ten grams. The insoluble powder was soluble in water, and the solution was coloured blue with iodine. The soluble part, glycerine, was not coloured by iodine, and this fact showed that separation from the starch had taken place very completely. He inferred from this experiment that glycerine of starch was a mixture. The starch used was ordinary commercial starch. He presumed that it would be wheat starch.

Mr. GERRARD said that he should like to hear what was the length of Mr. Willmott's experience with the new preparation which he had recommended. He (Mr. Gerrard) used in the establishment with which he was connected a preparation called iodide of starch, which was composed of a mixture of glycerine, water, starch, and tincture of iodine. As long as that preparation was undisturbed it remained uniform, but as soon as it was disturbed by the spatula it began to change, and the glycerine and the water percolated down the sides of the starch, leaving a granular mass. It had recently been his object to remove that objection. The physician who attended to skin diseases at his hospital had asked him whether he could improve the preparation, as it left a granular mass, which would not easily spread.

Mr. SCHACHT said he wished to indicate another advantage which attended Mr. Willmott's suggestion. They had just heard from Dr. Senier that the less water that glycerine contained, the higher was the temperature necessary to produce the desired gelatinization. He (Mr. Schacht) believed that the application of a considerable amount of temperature to glycerine resulted in the production of certain acrid principles. A very irritating vapour came up from the material while it was being

made; probably some of it was left in the preparation, and might to a certain extent invalidate its usefulness as an application to a tender surface. As it would probably be unnecessary to apply so strong a heat to a more dilute glycerine, that fact might be an additional reason why Mr. Willmott's suggestion should be subjected to further experiment.

The CHAIRMAN said that the difficulty which he had found with plasma was that when it was once made and it had to be mixed with any substance it was in the condition of a jelly which it was very difficult to bring to a smooth paste so that it would combine with the added material. The preparation would be lumpy, unless the substance was mixed while the plasma was in a fluid condition. Those who experimented with plasma ought to ascertain what starch they were using. Starch was not one uniform principle throughout, but was composed of what was called granulose and cellulose, the latter being the external coat and the former the interior portion. It was possible to separate the cellulose in such a way that it would remain as a skeleton of the starch, though without its contents. One gentleman had remarked that he found that maize starch made the best plasma. He (the Chairman) thought it probable that in maize starch the cellulose coat was a little thicker than in some other kinds, and that therefore maize starch would necessarily require a somewhat higher temperature to convert it into plasma than would potato starch. The tendency of glycerine to absorb water was probably the principle of which they availed themselves in using glycerine in a pill-mass in order to keep the mass moderately moist.

Mr. WILLMOTT, in reply, said that he had not found that the proportion of starch made the slightest difference with regard to the absorption of moisture. With reference to the different kinds of starch, no doubt, something might depend upon the kind which was used, but, as the starch ordered in the Pharmacopœia was wheaten starch, he had experimented simply with that. As one speaker had remarked, no doubt a very different preparation was produced according to whether it was made carefully or otherwise. There was only one objection to the addition of water, and that was a very slight one. He did not find that the plasma was quite so plastic or translucent when water was used as when glycerine was used alone, but that fact, he believed, was subordinate to the main point. On the other hand, if water was used the preparation was less sticky and more easily washed off. In addition to that, it was sooner made because it required a lower temperature. With reference to Mr. Gerrard's question, he might say that his specimens had been prepared for several weeks, and he found no indication whatever of change in them. He thought the inference was that no change would take place. Probably the presence of iodine in the preparation of which Mr. Gerrard had spoken had had something to do with the separation, for he (Mr. Willmott) had found no separation at all. The fluid simply dissolved the glycerine, and gradually softened down and undermined the whole mass. With regard to the quantity of starch, if water was employed, possibly the Pharmacopœia proportions of one ounce to eight would be rather better than 70 grains to the ounce, but that might not be the case when glycerine alone was employed.

Mr. J. B. L. MACKAY said that he could corroborate the observations made by Mr. Allen, that a temperature of 240° F. was not sufficient when wheaten starch was used. A temperature of from 270° to 280° gave the best result. Mr. Schacht had alluded to the dilution of glycerine as obviating any irritating effect. It was well known to the public that undiluted glycerine was much more irritating to the skin than glycerine made with rose water; no doubt the benefit depended more on the water itself than on any virtue in the rose water. About twelve months ago he (Mr. Mackay) had made an amylaceous ointment of carbolic acid according to Mr. Samson's formula; but he had found that he obtained a better result by increasing the proportion of water than he obtained when he followed the formula. The preparation did not then separate in the way that Mr. Gerrard had described, and the olive oil in the preparation made it spread more easily.

A paper was then read on—

MOGUMO BARK IMPORTED FROM MADAGASCAR.

BY PROFESSOR DRAGENDORFF.

The paper is printed on p. 816.

The CHAIRMAN said that they were much indebted to their honorary member, Professor Dragendorff, for his examination of this bark. It was much to be desired that as soon as new drugs made their appearance in the market they should be examined in order that their constituents, whether alkaloid, acid, or of any other character, might be determined.

Professor ATTFIELD said that he sympathized with Professor Dragendorff in his having performed such an enormous amount of labour to arrive at results which, apparently, were of but little practical interest, for he seemed to doubt whether mongumo bark was a drug at all. Mongumic acid appeared to have some relations to the tannin class of substances; possibly further examination of it might be interesting from a chemical point of view.

Mr. GERRARD said that the manner in which Professor Dragendorff's examination of mongumo bark had been conducted was very excellent, but he did not state upon what ground he declared mongumic acid to be an acid. It was not shown whether it formed compounds with carbonates and hydrates, and whether such compounds were neutral. The possibility of chrysophanic acid being a true acid had been questioned, because it did not form salts which were true compounds, and he (Mr. Gerrard) inferred that mongumic acid might be a body of the same class.

The CHAIRMAN said that it was of great importance to have a drug of this description analysed, even though the results which were arrived at were negative. Possibly, the chief value of mongumo bark might be in its tannin, but there were already plenty of substances in this country which yielded that principle.

Mr. GERRARD said that he had not arrived at the meeting early enough to hear Mr. Holmes's remarks with reference to the specimen of pituri, and he should be glad if Mr. Holmes would repeat the essence of those remarks.

Mr. HOLMES complied with Mr. Gerrard's request.

Mr. GERRARD said that, in working upon the subject to which reference had been made, he had only about thirty grains of the pituri leaf. He obtained from it an alkaloid, which, as he had said in his paper, might be called piturine; but it was impossible to obtain from thirty grains of the leaf a sufficient quantity of the substance for chemical examination.

Mr. HOLMES said that M. Petit did not rely entirely upon the chemical examination, but in great measure upon the physiological action, and he quoted the experiments of Professor Ringer, and stated that they agreed very closely with the symptoms produced by nicotine as described by Claude Bernard.

The last paper was—

A NOTE ON SHEA BUTTER.

BY E. M. HOLMES.

The paper is printed on p. 818.

The CHAIRMAN said that pharmacists as a rule were extremely conservative. They commenced their life using *adeps* and continued using it to the end of their lives. It was possible that some of the substances which had been described might be brought into use, and especially the shea butter, because it was less oxidizable than some other fats.

Professor ATTFIELD suggested that the gutta shea might be a product of the action of heat on the fat. In the recovery of fats in this country the oleic acid often contained some hydrocarbon, and the soap made with such fat

did not lather so freely as ordinary soap. It occurred to him that the production of gutta shea might be avoided. On the other hand, the action of such hydrocarbons was antiseptic, and perhaps that might cause the butter to keep for a considerable time.

The CHAIRMAN said that Mr. Holmes had mentioned that Mungo Park had made use of the Shea butter, instead of butter made from cow's milk. He (the Chairman) imagined that if Mungo Park ate such a specimen as was now exhibited, he must have been extremely hungry. The use of Shea butter for pessaries had been mentioned, but the melting point of 95° seemed rather too high for pessaries, unless the fat was mixed with lard.

The thanks of the Society were voted to the authors of the various papers.

The Chairman announced that that was the last meeting of the session.

Provincial Transactions.

REGISTERED CHEMISTS' ASSOCIATION OF LIVERPOOL.

The annual dinner of this Association took place on the 20th ult., at Fisk and Fairhurst's, Castle Street.

After the loyal toasts had been duly and heartily honoured, the President, Mr. A. Redford, proposed the toast of "The Registered Chemists' Association of Liverpool." He claimed that it had borne its part in the reformation of some of the blemishes of the trade, such as inordinate hours of business, want of neighbourly feeling towards each other from want of knowledge of fellow chemists, and by the issue of a price-list that might now be found in a great part of the chemists' shops throughout the country. Although very much remained to be desired he could see a very great improvement upon the habits and practice of former years, and those whose experience was the largest could best appreciate the difference. He paid a well-deserved tribute to the services of past officers of the Association, to Mr. John Abraham as President, Mr. John Shaw as Treasurer, and Mr. Wharrie, the first Hon. Secretary, upon whom had devolved the labour of the formation and foundation. He coupled with the toast the names of the Treasurer, Mr. R. Parkinson, and the Hon. Secretary, Mr. B. Dickins. The former made a statement of the numerical strength of the Association, and the latter exhorted the members not to leave all to the Committee, for that the success of the Association could only be obtained by every member doing his best to promote its objects. He expressed his strong desire for the closing of chemists' shops on Sunday, as public requirements regarding medicines were met by the answering of the door-bell, and, as proved by the experience of many who adopt it, the plan is quite practicable and very much reduces the annoyance of disturbed Sunday quietude.

Mr. J. Fingland proposed "The Liverpool Chemists' Association," coupling with it the names of its President, Mr. T. F. Abraham, and Mr. E. Davies, F.C.S.

Mr. Abraham referred to the pleasant social intercourse of the ordinary meetings, and urged this as one reason why the chemists of the town and neighbourhood should join that body, where they would also find the pleasure afforded by attention to the scientific topics to which that Association devotes itself.

Mr. Davies responded in a very happy and interesting speech showing the necessity of the adoption of the principle of division of labour in the work of the chemist, and that the dispensing, the analytical, or the manufacturing chemist can each do his work best by giving undivided attention to his particular field of labour.

The Vice-President, Mr. Chas. Symes, Ph.D., proposed "The Pharmaceutical Society" and "The British Pharmaceutical Conference." He observed that the parent society, which had enjoyed an existence of some thirty-eight years, in its growth and maturity had been identified and interwoven with the progress of pharmacy, and its history had been one of almost uninterrupted prosperity. It had acquired powers under Acts of Parliament rarely delegated to any body of men, and had reached a position of which its members and all associated with it might be justly proud. But it could not be expected that any society could occupy so important a position and exercise, as it does, such control over the conduct of the business without subjecting itself to some amount of criticism. It had a school whose teaching was excellent, examinations just and impartial, but they were told that those who go through its curriculum, pass its ordeal, and enlist under its banner were not afterwards duly cared for. It would not become him when desiring to do honour to the Society by proposing that toast, to pass judgment upon it, but as he had referred to its brilliant past and its powerful present, so he felt assured of its equally brilliant future, provided it exercised its power for the benefit of the whole trade. He reviewed the establishment of the Pharmaceutical Conference and its successful career, its roll of members embracing the eminent chemists of this and other countries. The pursuit of its objects elevated above the trivialities of every day life and tended to make its members wiser and better men. Its gatherings brought out the more kindly and genial qualities of the members, and were a great benefit in this respect to everyt own the Conference visited.

Mr. John Abraham responded on behalf of the former body, and Mr. A. H. Mason, F.C.S., for the latter.

The toast "The Chemists and Druggists' Trade Association of Great Britain" was proposed by Mr. J. Edisbury, and responded to by Mr. J. Woodcock, who referred to the contribution sent by Liverpool to the Defence Fund as heading the list. He mentioned that the Association now numbers 4300 members, upwards of 50 per cent. of the chemists and druggists in business in Great Britain, and claimed that by its action in defending such cases as the milk of sulphur one and others, frivolous and harassing prosecutions which were frequently instituted by analysts are now of comparatively rare occurrence. He referred to the successful issue of the long struggle in the Shepperley case, and urged that the Association had abundantly proved its claim to the support of the trade as a ready and available concentration to oppose any effort to unduly interfere with its rights and privileges.

The toast "The Wholesale Trade" was then proposed by Mr. J. A. Turner, and responded to by Mr. J. F. Raimes and Mr. R. Sumner.

The toast "The President," Mr. A. Redford, proposed by Mr. J. Abraham, was received with "musical honours" and a heartiness designed to convey to the occupant of the chair some expression of the esteem in which he is held by his fellow chemists.

After responding, he gave "The Vice-President," Dr. Symes, to whose energy and attention to its affairs the Association owes much.

"Last but not least" came the toast of "The Ladies," proposed by Mr. F. J. Mackinlay and received with musical honours.

Mr. A. H. Mason and party of friends added greatly to the evening's enjoyment by their contribution of music, as did Mr. H. Jackson (Messrs. W. and H. Jackson) by an admirable recitation of "Horatius."

EDINBURGH CHEMISTS' ASSISTANTS' ASSOCIATION.

The fifth monthly meeting was held in the Pharmaceutical Society's Rooms, 119A, George Street (North-British Branch), on Wednesday evening, March 26, Mr. McLaren, Vice-President, in the chair.

The Secretary read a letter of resignation from the President, Mr. John Young, owing to his removal to London.

It was unanimously agreed to award him a cordial vote of thanks for his services in the chair.

Mr. J. D. Robertson then read a paper on "Pharmacy, Past, Present and Future." This paper gave rise to some discussion on early closing.

Mr. Cairncross remarked that this matter lay a good deal in the hands of the assistants, who, when entering on businesses of their own, should observe the principles they advocated while assistants.

Mr. Welsh thought the subject of shorter hours hardly ripe yet.

At the close of the discussion a vote of thanks was awarded Mr. Robertson for his paper.

The Chairman having mentioned the subject of the annual supper, the matter was discussed, and a provisional committee appointed to arrange matters, subject to the approval of next meeting.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

The anniversary meeting of this Society was held on Monday, March 31, Dr. Gladstone, President, in the chair.

The President presented his annual report on the state of the Society. The state of the Society affords much ground for congratulation, the past year having been one of quiet prosperity. Various alterations have been made in the bye-laws, and the publication of the Society's Journal has been improved. Sixty-one fellows have been elected and 18 have died, withdrawn, etc., during the past year, the present number of fellows being 981. There are 34 foreign members and 1 associate; 28 names are awaiting election. The treasurer's report shows an increase of receipts over expenditure to the amount of £1964 9*s.* 5*d.* (including a legacy of £1000 from the late Mr. Sydney Ellis). Sixty-eight papers have been read before the Society during the past year. Lectures have been given by Messrs. H. C. Sorby and S. H. Vines. The number of papers from 1859—1869 averaged thirty-six annually, fell as low as twenty-two in 1872, and since has rapidly increased. There is an increasing disposition to illustrate the papers by experiments; this practice adds much to the interest of the meetings of the Society. On the 13th of November last Professor Wurtz delivered the Faraday lecture at the Royal Institution, "Sur la constitution de la matière à l'état gazeux." Those who were present will not readily forget the perfect lucidity, the rare manipulative skill, or the enthusiasm of the lecturer on that occasion. The Council have carefully considered the condition of the library and its rules; it has been resolved that no serial publication of which the Society does not possess a duplicate copy shall be taken away from the rooms. Duplicate copies of back numbers of Liebig's *Annalen* and the *Annales de Chimie et de Physique* have been ordered, and these works, together with other important serial publications, are now being taken in in duplicate. Many new books have also been ordered, and on this point the Council would be glad of suggestions from fellows of the Society. Arrangements have been made for fellows at a distance to have books sent to them on giving a written order and paying the cost of carriage. A new series of instructions has been drawn up for the use of abstractors. Great efforts have been made to publish the Journal within the first week of each month. The ventilation of the meeting room has been much improved by the combined investigations of Mr. Perkin and Dr. Russell and alterations suggested by them. A new plan of choosing the President has been adopted this year; as the Faraday lecture occurs only once every three years, whilst the President is elected for two years, it was suggested that it would be better to elect some fellow, who has already filled the office, as President for one year, so that the Faraday lecture should occur in the second year of the next President's tenure of office. A separate report of the research fund was submitted, the President suggesting that a portion might, with peculiar fitness, be devoted to the accurate determination of chemical constants. A short biography of each of the fellows deceased was then read, viz., of M. Malaguti (foreign member), Messrs. W. Baker, A. Bird, W. A. Lyttle, W. A. Stewart and J. Wiggin. The President concluded his address as follows:—"While there is much to encourage us in the progress of the past twelvemonth, I think I only express the general feeling when I say that we ought not to rest satisfied with present attainments. The Society exists 'for the general advancement of chemical science,' and this means both the encouragement of research and the diffusion of the knowledge of new discoveries. With regard to the promotion of research, as our members now exceed one thousand, and the laboratories of our land are growing in importance, we may surely look for a larger amount of original work in coming years, and we should also seek not only to add to previous knowledge but to increase what I may venture to term the scientific culture of the workers. In our laboratories we are isolated and are apt to look upon our own pet subject as of prime importance, but when we meet in these rooms, or turn over the pages of our Journal we are carried away to many different fields of thought in succession. This promotes largeness of view, and must react favourably upon the cultivation of our individual corner of the great field. I trust that our Society will never devote its energies too exclusively to one branch of our science, but will lay claim to its fair share of those borderlands in which the work of the chemist blends with that of the physicist, the geologist and the physiologist. Scientific culture will also lead to a perception of what are the higher aims of chemical inquiry. The formation of new compounds is valuable, but we are liable to be encumbered by the richness and quantity of our materials and to forget the necessity of grouping them together as a part of systematic knowledge. The construction of the most expressive formulæ is useful, but we must always be ready to modify these as the exigencies of further knowledge may require; we want also to know more of the chemical force itself and how it acts; we want to distinguish those properties which are so profoundly connected with the ultimate molecules of matter that they are little, if at all, affected by chemical combination, from those which are the sport of every change; we want to study all the transformations of energy involved in the phenomena of dynamical chemistry and to determine with precision how the chemical force stands related to the other great forces of nature. As to the diffusion of chemical knowledge, our Journal is the main instrument in our hands for effecting this; but the new arrangements in regard to the lending of books from the library will doubtless advance the same object. It is happily the case that a knowledge of chemistry is fast finding its way into our upper and middle class schools, and though our science is not recognized by the Government Code, many attempts are being made to introduce into our elementary schools some primary knowledge of those facts and principles of nature which lie at the foundation of chemical and physical science. Technical education is also rising into favour, and the formation of a technical college is now engaging the attention of the great city companies. The Society, as such, can perhaps do but little in this direction, although the practical applications of chemistry are directly alluded to in our charter, but its individual members may accomplish much."

Dr. Armstrong then read a list of grants from the Research Fund made during the past year:—£50 to Mr. Hartley for an investigation of the absorption of the ultra-violet rays of the spectrum by organic substances; £30 to Dr. W. Ramsay, for determining the electric conductivity and resistance of solutions of salts at

different temperatures; £50 to Dr. Tilden for an investigation into the chemical nature of the terpenes; £10 to Mr. Shenstone for an examination of certain reactions of brucine and strychnine; £20 to Mr. W. Jago for a research on the organic matter in sea water; £20 to Mr. Francis Jones for the investigation of boron hydride. £15 to Mr. F. D. Brown for the experimental study of the theory of fractional distillation; £10 to Dr. Burghardt for the investigation of the constitution of topaz; £15 to Professor Thorpe for the investigation of abietine; £30 to Dr. Dupré for the estimation of the organic carbon in atmospheric air. The following gentlemen who have received grants have communicated papers to the Society:—Messrs. Johnson, Carleton Williams, Drs. Harrow and Wright; Mr. Hartley in conjunction with Mr. Huntington has presented his first results to the Royal Society. ('Proceedings,' 28, 233.) The following gentlemen who for various reasons have not yet communicated papers have sent in reports to the committee, Drs. Crow, Carnelly, Tilden and Ramsay, Messrs. Bedson, Neison, Shenstone and Jago.

Dr. Odling then moved a vote of thanks to the President and the adoption of his report; it was very gratifying to hear such a flourishing report, and he thought the fellows might congratulate themselves on having had such a President.

Mr. Neison in seconding the motion urged that a copy of the general index should be presented to every fellow of the Society.

Dr. Wright suggested that the hours during which the library was open in the evening should be extended from 7 to 9 to 7 to 10.

The motion was then carried by acclamation.

The President felt greatly honoured by the cordial manner in which the motion had been received and the kind way in which Dr. Odling had introduced it. He had experienced much pleasure during his occupation of the chair, which any chemist would be proud to occupy; he was very grateful for the way in which the council and the Society had seconded him in every thing.

The Treasurer, Dr. Russell, then read his account of the finances of the Society. The state of the Society was very satisfactory. The income for the year was £2350, the expenditure £2300. The balance in hand of the Research Fund amounted to about £230.

Mr. Friswell then read the report of the auditors, Messrs. Spiller, Thompson and Friswell.

Dr. Thudichum had listened with great satisfaction to the statement of the Treasurer. After making a few remarks as to the present method of electing fellows, Dr. Thudichum proposed a cordial vote of thanks to the Treasurer who had performed his important duties in the most perfect manner the Society could wish.

Dr. Gilbert seconded the motion, which was carried unanimously, with much pleasure.

Dr. Russell returned thanks to the meeting.

Mr. Neison proposed a vote of thanks to the officers and Council; this was seconded by Mr. Grosjean and carried unanimously. Mr. Perkin replied.

Votes of thanks were subsequently given to the auditors, the editors, abstractors and the reporter of the Society.

The following officers were then announced from the chair as having been duly elected for the ensuing year:—President, Warren De La Rue, F.R.S.,; Vice-Presidents, F. A. Abel, Sir B. C. Brodie, E. Frankland, J. H. Gladstone, A. W. Hofmann, W. Odling, Lyon Playfair, A. W. Williamson, F. Field, J. H. Gilbert, N. S. Maskelyne, H. E. Roscoe, R. Angus Smith, J. Young; Secretaries, W. H. Perkin, H. E. Armstrong; Foreign Secretary, Hugo Müller; Treasurer, W. J. Russell. Other members of the Council, M. Carteighe, A. H. Church, W. N. Hartley, C. W. Heaton, E. Riley, W. C. Roberts, W. A. Tilden, W. Thorp, T. E. Thorpe, J. L. W. Thudichum, R. V. Tuson and R. Warington.

Parliamentary and Law Proceedings.

Poisoning by Carbolic Acid.

An inquest has been held at Liverpool on the body of Elizabeth Drusilla Roberts, aged 21. From the evidence it appeared that the deceased went into the bar parlour of a public house and called for a glass of port wine and a glass of water in separate tumblers. She was observed placing a white powder in the water, and the person who served her remarked "I hope you are not going to poison yourself." She laughed and replied "No, nor any other person," and then drank the mixture, which was supposed to be a seidlitz powder. A man who was in the bar parlour at the time also saw the deceased put some fluid from a bottle into the wine and drink it. When she went out he followed her and picked up some portions of the bottle, which she threw away in the street. The bottle was labelled "Carbolic acid." After leaving the public house the deceased went to a friend's house, where she became insensible, and was sent home in a cab. Dr. Pierce was then called in, and found her suffering from carbolic acid poisoning. She died the same evening. The jury returned a verdict to the effect that the deceased committed suicide under temporary mental derangement.—*Liverpool Mercury.*

The "Castor Oil Pill" Case.

An official intimation has been received at Lancaster that Messrs. Bell and Son, of Liverpool, the manufacturers of the pills in respect of which a co-operative store manager at Carnforth was recently fined under the 6th section of the Food and Drugs Act, have abandoned their appeal against the conviction, of which notice had been given. It will be remembered that a box of pills, purporting to be "compound castor oil pills," was purchased by Superintendent Moss and sent for analysis to Dr. Campbell Brown, the county analyst who certified that the pills "contained no castor oil."—*Lancaster Observer.*

Poisoning by Wrong Dose of Atropine.

On Monday, March 31, the Leeds coroner held an inquest upon Richard Hy. Knowles, aged 42, dispenser at the Leeds Dispensary. The deceased was suffering from acute consumption, and it was stated that, at most, he could not have lived more than two or three weeks. At a consultation between his medical adviser (Mr. McGill) and Dr. Clifford Allbutt, the former prescribed a solution of atropine, one minim to the half ounce. The prescription was taken to the dispensary, where unfortunately one minim was read as one grain, and a dose of this strength was administered to the deceased on Thursday, and he died some hours afterwards. The jury returned a verdict of died from misadventure.—*Leeds Express.*

Correspondence.

W. Dow.—See before, p. 773.

W. R.—We have no knowledge of the institution referred to.

T. B. A.—The remark of the Lord Chief Justice confirms what has been stated in this Journal on several occasions. We believe the subject received the attention of the Committee of the Council to which the amendment of the Act was recently referred.

P. B.—Hassall's 'Food: its Adulterations.'

G. E. Clarke.—We cannot give you any further information respecting the Committee than has been published in the report of Council meetings. Suggestions might be addressed to the President.

Communications, Letters, etc., have been received from Messrs. Cadman, Storey, Wright, Abraham, Smith, Robbins, Tompsett, Barnes, Reynolds, Pitchford, Lloyd, Specific Gravity, Devon, Octhai, Alpha, Ramble, Thorough, Nonpirate, Hampshire, Minor, J. K. N., H. W. D., Oϕ.

THE LIFE OF THE PLANT.*

BY PROFESSOR BENTLEY,

Honorary Member of the Pharmaceutical Society of Great Britain, and of the American Pharmaceutical Association.

Having been requested by your Council to deliver a lecture on some department of botany, which would be generally interesting and instructive, I have selected as my subject "The Life of the Plant," or the "Plant in Action." I have done so, not because the phenomena connected with plant life are capable of being demonstrated to an audience by a series of beautiful experiments, for no department of botany will admit of this, but because a knowledge of the laws which regulate the life of plants is not only one of intense interest in itself, but also one of much practical importance to pharmacists, and, moreover, one which has far higher associations, from the explanation it affords of those various interchanges which take place between the members of the inorganic and organic creations, by which alone the world is rendered habitable by man. But little can be done to elucidate this great subject in one short lecture, but I will endeavour to give prominence to the more important phenomena, and explain the whole, as I am requested to do, in such a manner as to be intelligible by all.

First, let us see how the plant is born—this is explained by the process of germination. Thus, if we take a seed, such as an almond, which is in a vital state, and place it under favourable circumstances of heat, moisture, and air, the embryo which it contains, nourished by the food stored up in its tissues, begins to grow, and soon bursts through the integuments of the seed, and becomes a young plant, capable of supporting itself; or in other words, it has passed from a dependent to an independent existence. We have now to explain how the plant thus brought into the world is enabled to continue its existence.

For this purpose it is necessary, in the first place, that it should obtain food, for no body can grow and live without the addition of new matter to its substance, and, therefore, although we see plants chained to the soil, and apparently unprovided with any special cavities for receiving, or apparatus adapted for the introduction of food into their interior, the fact that they increase in size, and in some cases, almost perceptibly so, by forming gigantic masses of wood and foliage, is, in itself, an evidence of their having obtained food.

It follows from the conditions under which plants are placed—that is, as they cannot go about in search of food—that their food must be brought to them, or, in other words, must be derived from the media by which they are surrounded. Hence, by far the majority of plants take up their food partly from the air by their leaves and other external organs, and partly from the soil or from water by their roots. But besides these ordinary plants there are two other kinds of plants called Epiphytes and Parasites, which do not grow in the earth, but which live on other plants. The former class, which includes most Orchids, derive their food essentially from the air, and are hence also termed Air Plants; while Parasites differ from both ordinary plants and Epiphytes in the fact that their food is obtained entirely or partially from the plants upon which they grow, that is, in a prepared or assimilated state, while the two former derive their food, as a general rule, from the surrounding media in an unprepared condition, and subsequently assimilate it in their own tissues. The two classes of Epiphytes and Parasites are commonly confounded together, although practically it is very important to distinguish between them; for while *epiphytes* do not directly injure the plants upon which they grow, since they derive no nourishment from them, *parasites* by being nourished in a greater or less degree by the plants upon which they are placed weaken them in a corresponding degree, and hence such plants, when growing freely upon others, as the Dodder, frequently do much injury to growing crops of Clover, Flax, and others; while the Mistletoe, by growing to a great extent on apple trees, prevents or lessens their yield of fruit.

Secondly, it follows from the structure of plants, as they have no open cavities by which food can be introduced, that no plants, whatever may be their nature, have the power of taking up nutriment, except in a state of gas or vapour by their leaves and other external organs, or in a state of solution by their roots. This may be proved by placing the roots of an actively growing plant in water in which charcoal in the finest powder is placed, when it will be found that as this charcoal is insoluble in water not a particle will enter the plant, but it will be all left on the surface of the roots.

The materials of which plants are composed, and which, as we have just stated, are usually derived from the air or the earth, or more commonly from both, or in some cases in a material degree from the plants on which they grow, and which consequently constitute their food, are of two kinds, called respectively the *organic* and the *inorganic*. The process of burning enables us to distinguish roughly the comparative proportion of these, and acquaints us with one of their distinctive peculiarities. Thus, if we take a piece of wood or any other part of a plant, and burn it as perfectly as we are able, we find that the greater portion disappears in the form of gas or vapour, or in other words, enters into new combinations, but a small portion remains in the form of ash or incombustible material. The former or combustible portion is made up of what are termed the *organic* or *volatile constituents*, and the latter of *inorganic* or *earthy constituents*. The term organic is applied because such materials especially constitute the real fabric of the plant, and are more essentially concerned in the formation of its products and secretions. The proportion of these constituents varies in different plants; but as a general rule the organic form from about ninety-two to ninety-nine parts, while the inorganic constitute from about one to eight parts in a hundred. We must now make some remarks upon the nature of the organic and inorganic constituents, their sources, and the conditions in which they are taken up.

1. *The Organic Constituents.*—The organic constituents of plants are essentially carbon, oxygen, hydrogen and nitrogen. The first three alone form the cellulose of which the cell walls are composed, and are therefore to be considered as constituting by themselves the proper fabric of the plant; while the protoplasmic contents of the cell are formed of compounds of these three elements, with the fourth organic constituent nitrogen. It would appear also that two other elements, namely, sulphur and phosphorus are

* A lecture delivered before the Pharmaceutical Society of Great Britain, March 19, 1879.

necessary constituents of these nitrogenous cell-contents.

These organic constituents are required alike by every species of plant; hence the great bulk of all plants is composed of the same elements, although their proportion varies to some extent in different species, and even in different parts of the same plant. As the organic constituents are the same for all plants, they are sometimes termed *universal constituents.* These elements are not taken up by plants in an uncombined state, but essentially in the forms of carbonic dioxide, water, ammonia, and nitrates; which compounds they derive principally from the air in a gaseous state, but also, to some extent, in the form of water in which other constituents are also dissolved, by their roots from the earth.

2. *The Inorganic Constituents.*—The amount of inorganic matter found in plants, as already observed, is very much less than that of the organic; still this portion, however small, is necessary to the life and vigorous development of most plants, and probably of all. In some plants, such as for instance the Rhubarb, the proportion of inorganic matter is very large, forming as much in some cases as 35 per cent. of the dried root; and the fact that there is usually a larger amount of inorganic matter in the official rhubarb than in that of English growth, forms one of the tests usually given to distinguish these roots. But such a test cannot be absolutely relied on, as in some case English rhubarb may be found to contain quite as much inorganic matter as that of the official rhubarb.

Analyses of plants by chemical means and by the spectrum have demonstrated the following inorganic constituents in plants:—Chlorine, bromine, iodine, fluorine, silicon, potassium, sodium, calcium, magnesium, aluminium, manganesium, iron, zinc, copper, lead, titanium, arsenic, lithium, cæsium, rubidium, strontium and barium. These elements, therefore, with oxygen, hydrogen, carbon, nitrogen, sulphur, and phosphorus, constitute all the elements that have been found in plants. All these inorganic constituents, like the organic, are not obtained in a simple form, but in various combinations soluble in water. They differ, however, from the organic constituents in the fact that they are all derived from the earth, and are hence termed earthy or mineral constituents. The inorganic constituents also differ from the organic in the following particulars:—First, they are incombustible, and hence remain as ash when the organic constituents are dissipated by burning; and, second, they are not liable to putrefaction, as is the case with them, under the influence of warmth and moisture.

Another important difference is, that while the organic constituents are the same for all plants, the inorganic constituents vary very much according to the kind of plant. These inorganic constituents are of great importance in an agricultural point of view, and also in the cultivation of medicinal plants, and in horticulture, as it is to their presence or absence, their relative quantities, and the solubility or insolubility of their compounds, in a particular soil, that it owes its fertility or adaptability of growing in it with success any particular kind of plant.

Thus the principle of the rotation of crops is founded upon the fact of different plants requiring different inorganic compounds for their growth; for it follows from this that a particular soil which is rich in materials necessary for some plants, may be wanting or deficient in those required by others. Thus wheat requires more especially for its proper growth, a full supply of silica and phosphates; hence it will only flourish in a soil containing the necessary amount of these substances. As growth proceeds, these constituents are absorbed, dissolved in water by their roots, and are applied to the requirements of the plant. When the grain is ripe, it is removed as well as the straw, and the silica and phosphates obtained from the soil will also be removed with them; the result of this is necessarily, except in fertile virgin soil, that these ingredients will not then be contained in it in sufficient quantities to support immediately the growth of the same kind of plants; but by growing in soil thus exhausted by wheat, another crop of a different kind, such as clover, beans, or peas, which require altogether different substances, or a different amount, or distinct combinations of the same substances, we may obtain a profitable crop, while at the same time certain chemical changes will go on in the soil, and other ingredients be taken up from the atmosphere and in other ways, by which the land will be again adapted for the growth of wheat.

The consideration of the above facts shows how necessary it is that those engaged in agriculture, horticulture and in the cultivation of medicinal plants, should possess a knowledge of chemistry and vegetable physiology. Thus they should know the composition of the various soils and of the plants they desire to cultivate, as well as the nature of the compounds required by them, and the modes in which they are taken up; and then they would be able to adapt particular plants to the soils proper for them, and if such soils did not contain the substances necessary for their proper development they must supply them in the form of manures.

THE PLANT IN ACTION.—The various substances required by plants as food having now been considered, we have, in the next place, to show how this food is taken up by them, distributed through their tissues, and altered and adapted for their requirements. We shall treat of these under two heads, namely, Absorption of Food, and Distribution of Fuid Matters through the Plant and their Alteration in the Leaves.

1. *Absorption.*—The root is the principal organ by which food is taken up by plants in the state of solution in water, and it is in this that the function of absorption consists. That the root does thus absorb water may be proved by a very simple experiment. Thus, if we take two glasses of the same capacity and pour water into them until it is at the same level in each, and then put the root of a vigorously growing plant in the one, and expose both, in other respects, to the same influences of light, heat, and air, it will be noticed that the water will gradually disappear from the glasses; but from that in which the root is placed far more rapidly than from the other, which has been exposed simply to the conditions favourable to evaporation, and the more rapid removal in the former must be owing, therefore, to its absorption by the root. In this way we can also roughly estimate the amount of water absorbed, which will be found to be very considerable, thus, commonly in a few days far exceeding in weight that of the plant with which the experiment has been made. It is, therefore, by this absorption of fluid by their roots that plants get a large proportion of their food, for water, as we have seen, is not only food in itself, being composed of oxygen

and hydrogen, two of the essential organic constituents of plants, but it is also the vehicle by which all the various inorganic constituents from the soil are conveyed to them.

This absorption of fluid does not, however, take place by the whole surface of roots, but is almost confined to the newly developed portions towards their extremities. This may be also proved by a simple experiment. Thus if we place the uninjured extremities of the roots of a healthy plant in water the plant will continue to live and flourish; but if the extremities be left out of the water, and the older, thicker portions of the root be immersed instead, the plant will soon begin to wither, and if not restored to its former condition it will ultimately die. Hence we see the importance of preserving such parts as far as possible in the process of transplanting, otherwise the plants thus operated upon will languish or die, according to the amount of injury they have received.

The fact that absorption of fluid takes place essentially at the extremities of the roots may also be proved on a larger scale by taking two orange trees and placing them as shown in the two diagrams before you. Thus in the one the plant is so arranged that the extremities of its roots are alone in water, the thicker portions being in the air; the plant under such circumstances, as will be noticed, is represented as in a vigorous state. In the other diagram, the plant is so placed that the thickened portions of its roots are in water, and the extremities in the air, then, as shown, it is in a withered condition. These experiments, therefore, prove that the extremities of roots absorb food from the earth in the form of water.

It might also be shown, if time allowed, that although the root is the principal organ of absorption, some fluid is also absorbed by the leaves; but that this portion bears no comparison in amount to that taken up by the roots.

The power which thus enables roots to absorb fluid is called *osmose*, and in order to explain this we must have recourse to the following experiment: Thus if we take a bladder and fill it with coloured syrup, and then attach to its upper end a glass tube, and afterwards place the bladder thus prepared in a vessel of water we shall soon see that the volume of the fluid within the bladder will be increased, as its rise in the tube will prove. This increase in the volume of the interior fluid can only have taken place by the invisible passage of the water outside through the wall of the bladder into the thick syrup in the interior. Whilst this passage of water is taking place towards the interior syrup there is also a contrary current, by which a portion of the syrup will pass outwards into the water, as is proved by the sweet taste and colour which it gradually acquires. Hence the increase in the volume of the interior fluid measures the difference in the intensity of the two currents. This double current will continue as long as there is any material difference of density between the two liquids. The stronger current, namely, that which sets from the thinner to the denser liquid, is termed *endosmose*, and the weaker, or that which acts from the thicker to the thinner, *exosmose*. The only conditions which are essentially required for osmotic action are two fluids of different densities, separated by a permeable membrane, which is capable of imbibing them. These necessary conditions are found in the nature of, and conditions under which, the young extremities of roots are placed. Thus, these extremities are composed of a number of little cells, each of which may be supposed to represent the bladder in the preceding experiment; the fluid in the interior of such cells being rendered denser than that of the surrounding soil in consequence of the vital actions which are going on in the plant, and the membrane forming their sides supplying the permeable partition. Hence as long as this difference of density is maintained between the internal and external fluids, which must necessarily be the case in the healthy conditions of plants, so long the absorption of fluid, and therefore of food from the soil, must continue, and hence we see how beautiful in its simplicity, and how perfect in its action is the process by which plants obtain their fluid food by the roots.

2. *Distribution of Fluid Matters through the Plant, and their Alteration in the Leaves.*—We have now to explain how the fluid absorbed by the roots is distributed through the plant, constituting what is commonly, (although incorrectly,) called the Circulation of the Sap, as the fluid thus passing through the plant is termed the Sap.

Ascent of the Sap.—We have first to describe the course which the sap takes. This may be readily demonstrated by placing vigorously growing plants in coloured or chemical solutions which are capable of being absorbed by them and transmitted through their tissues without injury to their substance, when it will be found that these may be first traced in the outer portion of the wood, then in the leaves, and lastly in the bark. It is evident, therefore, that so far as Dicotyledonous plants are concerned, which class of plants we can alone refer to, that the sap in its ascent passes principally through the unincrusted woody tissue and vessels forming the sap-wood or alburnum. As the fluid rises in the stem it is of a watery nature, and contains dissolved in it the various inorganic matters in nearly the same state in which they were absorbed by the root; and although in its passage upwards it becomes altered by dissolving any soluble substance it meets with in its course, when it reaches the leaves it is still unfitted for the requirements of the plant, and is therefore called the *crude sap*. In the leaves and other green parts it undergoes certain changes by the action of light and air, and it is found as the result of these changes that the sap is then adapted for the uses of the plant, and is therefore termed Elaborated Sap. These changes we must now consider.

Changes of the Crude Sap in the Leaves, etc.—These changes are of three kinds, and consist,—*first*, in the transpiration or exhalation of the superfluous fluid of the crude sap in the form of watery vapour, by which it is thickened; *second*, in the absorption and decomposition of carbonic acid, by which carbon —that most important constituent of plants—is added to the crude sap, while oxygen is evolved, which change is commonly termed respiration; and the *third* change is in the formation, out of the various inorganic matters present in the crude sap, of the numerous organic products and secretions of plants, which process is properly called *assimilation*. We must now explain briefly each of these changes; and first, therefore, as to transpiration.

1. *Transpiration, or Exhalation of Watery Vapour.* —This is influenced in a great degree by the varying

condition of the atmosphere as to moisture and dryness; thus, if two plants of the same nature, and as far as possible, of about the same degree of development, are submitted to similar conditions, except that one is placed in a dry atmosphere and the other in a moist, the former will give off more fluid than the latter. The great agent, however, which influences transpiration is light; therefore the amount of fluid transpired by leaves will be in direct proportion to the intensity of light to which a plant is exposed; hence there will be a great quantity of fluid given off when a plant is exposed directly to the sun, a moderate amount when it is put in common daylight, and almost nothing from a plant placed in total darkness.

As the fluid is thus transpired by the leaves there will be a deficiency of fluid produced below, and hence the two functions of circulation and absorption will be stimulated in a corresponding degree by the action of light. The mutual dependence of these processes of vegetation may be well illustrated by the combustion of fluid in the wick of a spirit lamp. Thus if we set fire to the spirit at the top of the wick, the combustion which then takes place creates a demand of fluid from the reservoir below in proportion to its intensity; and hence, the amount consumed, transmitted through the wick, and absorbed from below, are directly dependent upon one another. If the flame be blown out the absorption and transmission of fluid will also terminate with the cessation of combustion, because where there is no demand there can be no supply. In the same way transpiration from the leaves modifies and regulates the force of circulation and the amount of absorption. Hence we find that all agents which increase transpiration increase in like manner the force of circulation and the amount of fluid absorbed; and we see, therefore, that according to the amount of light to which a plant is exposed so will be the activity of transpiration, circulation, and absorption.

This dependency of the force of the circulation, and of the amount of fluid absorbed by the root, upon the activity of transpiration, is due, like the process of absorption already described, essentially to osmotic action, for as fluid is transpired from the cells of the leaves, the contents of these cells become thickened, and thus act by osmose on the more fluid contents of the cells within them, and these again by becoming thicker than those within and beneath them, act also by osmose upon them, and so the influence of transpiration from the leaves is communicated down the stem to the root, and then absorption takes place. This passage of fluid upwards is, however, assisted by capillary attraction, and by the intermittent pressure caused by the swaying to and fro of the branches.

Hence we see one of the important effects produced by light upon plants, and we also learn that as a general rule it is better not to transplant in the summer months, when the plants are covered with leaves, and when solar light is most intense, for as the roots are always more or less injured, and transpiration in a very active state, the fluid in the plant is very soon exhausted, and as this cannot be replaced by a corresponding activity of absorption in the root, the plant will commonly languish, and unless freely watered, probably die.

There is also another practical lesson we learn from the knowledge that transpiration is essentially dependent upon the intensity of light, and that is, that when we desire to obtain active and stable preparations from plants, we should not gather them in dull weather, or after a succession of of chilly and rainy days, because then they are gorged with water; but the proper time is after a succession of warm, dry, sunny days.

This transpiration of fluid takes place entirely through the stomata, as may be readily proved by the following experiment:—Take a piece of clean glass and hold it near to the upper surface of a vine leaf on a fine, clear day, and when the leaf is directly exposed to the sun; no change will be observed on the glass. But if the experiment be altered by placing the piece of glass against the under surface of the vine leaf under similar conditions of exposure, it will soon become bedewed with moisture, which will speedily collect and run off in drops. The explanation of this is at once evident when we find that the upper surface of the vine leaf has no stomata, whereas they are very abundant on the under surface. This simple experiment will also give a rough estimate of the amount of fluid given off by leaves; and the experiment may be varied in a very interesting manner by trying other leaves, when it will be found that succulent and evergreen leaves, as a rule, transpire much less than ordinary leaves; and much other important information in reference to the transpiration of fluid from leaves of varying structure, and placed under different conditions may also be gathered.

By a series of carefully conducted experiments it has been ascertained that the amount of fluid transpired by plants is very great. Thus a common Sunflower, $3\frac{1}{2}$ feet high and weighing 3 pounds, gives off, on an average, 20 ounces of fluid; and a Cabbage plant about 19 ounces of fluid, each day. Hence, if such a large amount of fluid be thus given off by single plants, it can readily be understood that the air of a thickly wooded district will always be in a damp condition, while that of one with scanty vegetation will be comparatively free from humidity; and hence it will be seen that one of the conditions necessary to render a country perfectly healthy is that the proportion of plants to a particular area be carefully considered, for while on the one hand, too many plants are generally prejudicial to health by the dampness they produce; on the other, a deficiency or want of them, will cause an equally injurious dryness. The same circumstances have an important bearing upon the fertility or otherwise of the soil; thus it is a well known fact that as vapour is constantly given off by plants, rain is more abundant in those regions which are well covered by forests, than in those which are free from them. It is found, therefore, that a great change may be produced in the climate of a country by clearing it of plants, for while an excessive amount of vegetation is injurious to their healthy growth, if there be a great deficiency the soil of the country will become entirely barren from want of rain; and it has been found that by inattention or ignorance of this effect of plants, which clearly indicates that open land and that furnished with large trees should be properly proportioned the one to the other, many large districts of the globe which were formerly remarkable for their fertility are now barren wastes; and, in like manner, many regions formerly noted for their salubrity, have become almost or quite uninhabitable.

By this transpiration of fluid, which is almost pure water, from the leaves of plants, the crude sap be-

comes thickened, which is the first great change it undergoes. We must now pass to consider the second change which takes place in it in the leaves, and which is commonly known as respiration.

2. *Respiration, or Absorption and Exhalation of Gases.*—This essentially consists in the absorption of carbonic acid from the atmosphere, its decomposition in the tissues of the leaf, by means of which carbon, one of its constituents, is added to the crude sap, and oxygen, the other constituent, evolved and restored to the atmosphere.

This evolution of oxygen by the leaves and also by the other green organs of plants, may be readily observed taking place in the form of bubbles, when a submerged aquatic plant or some freshly gathered leaves are placed in water exposed to the direct rays of the sun. That this evolution of oxygen is due to the absorption and decomposition of carbonic acid is proved by the fact that no such evolution takes place in freshly distilled water, or in that which has been recently boiled, or in water which has not been previously exposed for some time to the air, as such water contains no carbonic acid. It is in this way that by far the largest proportion of carbon which forms such an important constituent of plants is taken up by them.

It has been proved that this absorption of carbonic acid with fixation of carbon and evolution of oxygen is in direct proportion to the intensity of the light to which a plant is exposed, in the same way as transpiration is effected from a like cause. Hence we again see the importance of light to a plant.

Whilst this absorption of carbonic acid and evolution of oxygen is thus taking place according to the intensity of light to which a plant is exposed, it is also now commonly believed that a small, although appreciable amount of carbonic acid is continually evolved by plants—that is, both by day and night. Some, indeed, consider this as the true respiration of plants, and regard the former as one of the results of assimilation, but we use these terms according to their more commonly received acceptation.

This evolution of oxygen by plants under the action of solar light has a most important influence in nature. This will be at once evident when it is remembered that it is the only known process by which oxygen gas so essential to our existence, and which is constantly being removed from the atmosphere we breathe, by the respiration of man and other animals, by the process of combustion, by oxidation of mineral matter, and by other processes that are constantly going on upon the globe, is restored to it in a free condition.

Thus if plants had not this power of restoring oxygen to the air by their respiration, it would necessarily happen that the proportion of oxygen in it would gradually diminish, and in its place we should have a corresponding amount of poisonous carbonic acid, so that in course of time it would necessarily happen that the air we breathe would become unfit for the support of animal life, precisely as the air of a close room where charcoal is burned would, from similar changes, destroy life. But that such is not the case we know from common experience, and chemical analysis also shows that the amount of oxygen present in the air under ordinary circumstances is not liable to appreciable variation. Thus we see that "the two great organised kingdoms of nature are made to co-operate in the execution of the same design, each ministering to the other, and preserving that due balance in the constitution of the atmosphere which adapts it to the welfare and activity of every order of beings, and which would soon be destroyed were the operations of either of them to be suspended. It is impossible to contemplate so special an adjustment of opposite effects without admiring this beautiful dispensation of Providence, extending over so vast a scale of being, and demonstrating the unity of plan upon which the whole system of organised creation has been devised."

In a like manner, plants purify the water in which they grow, and render it habitable by animals. We all know by early experience, that if fish or other aquatic animals be placed in water in which no plants are grown, they will soon perish. This is the case, because as there is then nothing present in the water to destroy the noxious matters which are given off by the animals in their respiration and other processes,—they are destroyed by their own action upon the medium in which they are placed. In nature, we always find plants existing with animal life in the water, so that the injurious effect communicated by the latter to that medium is counteracted by the respiration of the former. This compensating influence of plants and animals is beautifully illustrated in our aquaria. We are also taught by these facts in reference to the respiration of plants, that it is absolutely necessary, if we desire to maintain a large town in a healthy state, to set apart large areas for recreation, and plant them freely.

There exists a widely spread notion that plants when grown in rooms where there is but little ventilation, and, hence, especially in our sleeping apartments, have an injurious influence upon the contained air. This idea has arisen from a knowledge of the fact that plants, as already noticed, are always evolving a small amount of carbonic acid, and hence, when not exposed to solar light, when evolution of oxygen is also taking place, this deteriorating influence on the atmosphere is that alone which is going on. But the amount of carbonic acid which is then given off by plants is so extremely small that it can have no sensible effect upon the atmosphere in which they are placed. It might readily be shown that it would require some thousands of plants, in this way, to vitiate the air of a room to anything like the extent of that of a single animal, and that, therefore, the idea of a few plants rendering the air of close rooms unwholesome by this action is altogether erroneous.

While carbonic acid gas has thus been proved to be essential to plants nearly all other gases are more or less injurious to them. Hence we have at once an explanation of the reason why plants growing in the air of large towns, and more especially in those where chemical processes on a large scale are going on, do not thrive. The air of an ordinary sitting room, and especially one where gas is burned, is also rendered more or less unsuitable to the healthy growth of plants, in consequence of the production of injurious gases as well as from the dryness of the atmosphere.

In order to protect plants from the injurious influences thus exerted upon them by the soot and air of large towns, the late Mr. N. B. Ward, introduced the plan of growing them in closed glass cases, which has been found to succeed admirably. These cases consist simply of a box or trough in which a suitable soil is placed; in this the plants are put, and the whole is covered by a closely

fitting glass case. It is necessary, at first, to water the plants freely. When plants are grown under such circumstances, upon exposure to light and air, transpiration takes place from their leaves, as under ordinary conditions of growth; the fluid thus transpired is, however, here condensed upon the inner surface of the glass case which encloses the plants, and ultimately returned to the soil. It is thus brought into contact again with the roots of the contained plants, to be again absorbed and exhaled by them; and these changes are continually repeated, so that the plants are always freely exposed to moisture, and do not require a further supply of water for a considerable period. Those plants, especially, which succeed best in a damp atmosphere, as is commonly the case with ferns, do exceedingly well in such cases. The very important influence which is exerted by the invention is, the protection of the plants from the immediate contact with air impregnated with soot and other injurious substances; for in consequence of the glass cover fitting closely to the trough in which the plants are placed, the external air in its passage has to pass through the very narrow crevices beneath the cover, and in so doing, becomes filtered, as it were, in a great measure, from its impurities, before it is brought into contact with them.

Besides the use of these cases in growing plants luxuriantly, in those places where, under ordinary circumstances, they would perish, or at all events grow but languidly, they have a still more important application, for they have now been most successfully employed in transporting plants from one country to another, which under ordinary circumstances would have died in their transit; and whose seeds could not have been transported without losing their vitality. The action of the Wardian cases in this mode of transporting plants is twofold: in the first place, the plants are protected from the influence of salt breezes, which are in most instances very injurious to them; and secondly, the atmosphere of such cases remains in a quiet state, and by this means the contained plants are protected from all rapid changes of temperature.

3. *Assimilation, or Formation of Products and Secretions.*—By the changes thus produced in the crude sap by the influence of transpiration and respiration from exposure to air and light, the matters which it contains are left in a state prone to change, or in a very active chemical condition, and they therefore freely combine together. It is in this way that various substances, such as starch, gum, sugar, and other products are formed which are directly concerned in the growth and nutrition of the plant; as well as others, such as resinous and colouring matters, various acids, alkalies, and other substances, which have no further active part to perform in the plant and are accordingly removed from the young and vitally active parts, and either stored up in the older tissues as *secretions*, or removed altogether from the plant as *excretions*. The formation of these substances, which are called *organic products*, as they can only be produced in living tissues, is termed *assimilation*.

In order that this function may be properly performed it is necessary that the plant should be freely exposed to light, as light effects assimilation in the same way as it does transpiration and respiration. Hence if a plant be put in the dark, or when a potato sprouts under such circumstances, it becomes blanched in consequence of the non-development of chlorophyll, and, moreover, no woody matter is then formed, and but few of its peculiar secretions. This also explains why potatoes which are reared in an orchard, or under trees, that is, with a diminished supply of light, are always what are called watery, in consequence of the small quantity of starch then formed. Hence we see the reason also, why the secretions of plants are less perfectly or more sparingly produced in cold dull summers, than in bright sunny ones, and that consequently medicinal plants are more active in such seasons as the latter.

Again, as the production of secretions depends upon the intensity of light it follows, as a general rule, that if a plant of a warmer region than our own which secretes a valuable medicinal substance, or one useful in the arts, be transported to this country, in which the intensity of the light is much less than in its native locality, it either does not form that secretion at all or in diminished quantity. Even if such plants be placed in our hot-houses, where they may be submitted to the same degree of heat as they obtain naturally in their native countries, their secretions are not produced to a corresponding extent, because light is the main agent concerned in their formation, and we cannot increase the amount of light, like heat, by artificial means. A series of experiments on medicinal plants from tropical regions, grown in artificially heated houses and exposed to the intensity of the electric light, would doubtless yield some very valuable results, and we trust that some such experiments will soon be instituted.

For the same reason the plants of warm and tropical regions, where the light is much more intense than it is in this country, or in other cold and temperate regions, are commonly more remarkable for the stronger odours of their flowers and the richer flavour of their fruits.

Another illustration of the effect of light upon the products and secretions of plants is afforded in the growth of certain vegetables for the table, as Celery, Endive, Sea Kale, and others. In these instances, when the plants are grown freely exposed to light, as in their natural conditions, they form abundance of woody matter, which renders them tough or stringy; and also peculiar secretions, which are either unpleasant to the taste, or even absolutely injurious. But when grown under circumstances so as to prevent more or less the access of light, the formation of these secretions and woody matter is checked, or even prevented, and the plants then become useful vegetables.

The above facts are of the utmost importance in their bearing upon the growth of plants and fruits for the table, as also in an economic and medicinal point of view; but it is impossible for me to pursue this subject further in this lecture. All that I can add is to say that after the changes have been thus produced in the crude sap in the leaves and other external parts of the plant, by which it has been transformed into the elaborated sap, or that containing the various products and secretions of the plant, it passes from the leaves to the inner bark and cambium layer, and afterwards descends to the root, and is carried inwards by the medullary rays, and that in its course it affords materials for the development of new tissues, and the production of flowers and fruit, and at the same time deposits its various secretions.

We have now finished our sketch of plant life, and

in so doing we have first described how the plant is born, and then having brought the plant into the world in a state capable of providing for itself, we have seen how it is enabled to get that food which is necessary for its life and growth, from the media by which it is surrounded, by absorption of fluid food from the earth by its roots, and of aeriform matters by its leaves. We have also described how the crude subtances thus absorbed by the plant are altered and adapted for its requirements in the leaves; and finally, have shown the important influences of plants in nature, and in so doing have proved that without plant life the existence of animals would have been impossible. We have thus unfolded one interesting page of the botanical volume, and given a dim view of much that remains behind. May I indulge the hope that in this way I have not only enabled you to pass pleasantly and profitably the time occupied in the delivery of this lecture, but have also given you much matter for further study and development?

NOTE UPON THE CINCHONA ALKALOIDS.

BY DR. O. HESSE.

On p. 611 of this Journal Mr. J. E. Howard sought to refer the injurious action of the "mixed alkaloids" prepared from the bark of *C. succirubra* to their containing aricine or an amorphous decomposition product from it. But since this bark contains neither aricine nor the easily decomposable cusconine, with which some authors are wont to confound aricine, and as further it does not yield amorphous substances which can be taken for decomposition products of this alkaloid, the above opinion must at any rate appear to be unfounded.

It is true that in 1862 Mr. Howard claimed to have prepared aricine from the bark in question, but in subsequent investigations of it he does not again mention this alkaloid. Probably the substance was only cinchonine, which under certain conditions crystallizes in a form that resembles aricine. The reverse of this accident almost happened to the discoverers of aricine, Pelletier and Coriol, for they say: "La ressemblance qui se trouve entre ces deux substances nous avais déja fait penser que c'était de la cinchonine que nous avions obtenue." Nevertheless the two alkaloids are readily distinguishable by their behaviour towards an excess of dilute sulphuric or oxalic acid, inasmuch as aricine is preciptitated by these acids, whilst cinchonine remains in solution. These precipitates are crystalline, and so difficultly soluble in water and in dilute acids that they might be taken for sulphate or oxalate of lime respectively. Also if cusconine be present a precipitate is formed by sulphuric and oxalic acids, but these precipitates are gelatinous and do not show the least trace of crystallization.

As a fact, at the present time the bark in question does not contain the minutest trace of aricine or cusconine. On the other hand there are found in it, besides varying quantities of quinine, cinchonidine and cinchonine, also the following alkaloids: conquinine, conquinamine, paricine and two or three other amorphous basic substances; probably also cinchotin.

One thing worthy of note in this bark is the quantity of quinamine it contains, which amounts to about 0·4 per cent. According to the experiments of Professor Falck quinamine appears to moderate the temperature of the body in a manner similar to quinine. In a rabbit to which I had administered 0·1 gram of quinamine dissolved in acid by injection into the throat I could observe no lowering of the temperature. Quinamine would therefore appear not to participate in the sometimes peculiar action of the mixed alkaloids.

I believe moreover that the before-mentioned action of the mixed alkaloids is referable to the individual better-known cinchona alkaloids, inasmuch as every person is not similarly affected by them. Under these conditions it would be the business of the physician to determine which substance should be given in a particular case.

ABSORPTION OF WATER BY THE LEAVES OF PLANTS.

Although gardeners universally maintain that growing plants have the power of absorbing water through their leaves, both in the liquid and the gaseous form, in addition to the power of suction through the root, yet the contrary theory has been in favour during recent years among vegetable physiologists.

The first recorded experiment of any value on the subject was about the year 1731, by Hales, as described in his 'Vegetable Statics;' the conclusion to which he came being that "it is very probable that rain and dew are imbibed by vegetables, especially in dry seasons." This result was confirmed by Bornet in 1753. A century later, however, in 1857, Duchartre, experimenting on the absorptive power of plants, came, after considerable wavering, to the conclusion that rain and dew are not absorbed by the leaves of plants. This opinion has been, with but little exception, held by all physiologists during the last twenty years, notably by De Candolle and Sachs; the explanation offered of the fact that withered plants revive when placed in moist air, or when the leaves are moistened, being that transpiration is thus stopped, or is more than counterbalanced by the root absorption. In his 'Text-Book of Botany' (English edition, p. 613), Sachs says, "When land plants wither on a hot day and revive again in the evening, this is the result of diminished transpiration with the decrease of temperature and increase of the moisture in the air in the evening, the activity of the roots continuing; not of any absorption of aqueous vapour or dew through the leaves. Rain again revives withered plants, not by penetrating the leaves, but by moistening them and thus hindering further transpiration, and conveying water to the roots, which they then conduct to the leaves." McNab has, however, proved that leaves do transpire, even in a moist atmosphere, provided they are exposed to the action of light. The result of recent experiments conducted by Boussingault in France, and by the Rev. George Henslow in this country, seems to force us to return to the earlier theory held before the time of Duchartre's experiments.

Boussingault's experiments relate not only to the absorption of water by leaves, but also to transpiration under various atmospheric conditions. The first experiments were as to the amount of transpiration from the Jerusalem artichoke in sunshine, in shade, and by night. This he found to be hourly, for every square metre of foliage, 65 grams in sunshine, 8 grams in the shade, and 3 grams during the night. In the vine the corresponding numbers were 35 grams in sunshine, 11 grams in shade, 0·5 gram by night. He reckoned that an acre of beet could give off, in the course of twenty-four hours the enormous amount of between 8000 and 9000 kilograms of water; and a chestnut tree thirty-five years old 60 litres of water in the same time. The next question investigated was whether the absorption of water by plants, and the ascent of the sap, are due to the force resulting from transpiration on the surface

of the leaves, or whether the roots exercise also a certain amount of force to this end. In the case of mint, a plant with root, showed an hourly evaporation per square metre of 83 grams in the sunshine, and 36 grams in the shade; without roots the evaporation was 16 grams in sunshine, 15 grams in shade. The effects of pressure on the absorption were next examined. A chestnut branch dipped in water was found to transpire hourly 16 grams per square metre; when inserted into a tube of water, and subjected to the pressure of a column of water 2½ metres high, the evaporation amounted to 55 grams per square metre per hour, and the branch, at the end of five hours, weighed more than at the commencement. As to the effect of the epidermis in restraining evaporation, he found that an apple deprived of its skin loses fifty-five times as much water in the same time as one with its skin entire; while similar experiments in the case of a cactus leaf showed a difference in the proportion of fifteen to one. Losses by rapid evaporation lessen appreciably the physiological energy of leaves. Thus an oleander leaf containing 60 per cent. of water, when introduced into an atmosphere containing carbonic acid gas, decomposed 16 c.c. of the gas; one containing 36 per cent. of water decomposed 11 c.c.; while one containing 29 per cent. of water was without action. As respects the relative power of evaporation possessed by the upper and under surfaces of leaves, he found the average proportion in a dozen different kinds to be as one in the former to 4·3 in the latter case.

Boussingault then proceeded to investigate the question of the ability of leaves to replace the roots of a plant in serving as the agent of absorption. A forked branch of lilac was so placed that one portion was immersed in water in a reversed position, while the other was exposed to the atmosphere, the superficies of foliage in both portions being the same. The transpiration from the exposed portion was found to be the same as under normal circumstances, and after the lapse of two weeks the foliage was as fresh as at the commencement, showing that the submerged leaves were fully able to replace the roots in supplying the shoot with moisture. A vine shoot half plunged in water, maintained a normal evaporation in the free foliage, and remained fresh for over a month. An oleander shoot under similar circumstances maintained its normal appearance for four months. In the case of the artichoke it was found necessary that the amount of surface of leaves beneath the water should be four times that above it. A number of experiments with regard to the power of leaves to absorb water in the state of vapour from a saturated atmosphere showed that they could do this only when they had previously lost a portion of their water of constitution, *i.e.*, that which is essential to their normal existence. Thus a wilted branch of periwinkle weighing 4 grams, after remaining for a day and a half in an atmosphere saturated with aqueous vapour, weighed 4·2 grams; after twelve hours' immersion in water, it weighed 9·4 grams. His last experiments related to the power of leaves to absorb aqueous solutions. Drops of water containing 0·2 per cent. of calcium sulphate in solution were placed on the leaves of a great variety of plants under conditions favouring absorption, and protected from evaporation by inverted watch-glasses with greased edges. In most instances the drops were entirely absorbed, leaving no trace of the mineral matter. As in the case of pure water, the under surface of the leaf absorbed much more rapidly than the upper surface. Solutions of potassium sulphate and nitrate gave corresponding results; the absorption of solutions of sodium chloride and ammonium nitrate was not so perfect. It is obvious that these results must considerably modify the view at present held by physiological botanists, that the small quantity of ammonium carbonate contained in the air, which is believed to be the sole source of the nitrogen in the tissues and secretions of plants, can only be absorbed by the roots after having been brought down to the soil by rain.

Mr. Henslow's results, as detailed in a paper read at a recent meeting of the Linnean Society, are altogether in harmony with those of the French professor. The results of a very large number of experiments, extending over several years, may be epitomized as follows:—1. The absorption of water by internodes. The experiment consisted in wrapping up one or more internodes of herbaceous plants in saturated blotting paper, and in noting the effects. As a rule, the leaves on the shoots rapidly perished, showing that transpiration was too great for the supply. The stems, however, kept fresh for different periods up to six weeks. 2. Absorption by leaves to see how far they could balance transpiration by others on the same shoot. The general result is that as long as the leaves remain green and fresh in or on water, they act as absorbents; but that the leaves in air keep fresh or wither according as the supply equals or falls short of the demand. 3. To test how far leaves on a shoot can nourish lower ones on the same. It appears that it is quite immaterial to plants whether they be supplied with water from the absorbing leaves being above or below those transpiring. Water flows in either direction equally well. 4. Leaves floating on water. This experiment showed that one part of a leaf can nourish another part for various periods, though the edges out of water died first. 5. Absorption of dew. A long series of cut leaves and shoots was gathered at 4 p.m., then exposed to sun and wind for three hours, then carefully weighed and exposed all night to dew. At 7.30 a.m., after having been dried, they were weighed again, and all had gained weight and quite recovered their freshness, proving that slightly wetted detached portions do absorb dew. 6. Imitation dew. Like results followed from using the spray, by which dew was exactly imitated. 7. Plants growing in pots, and of which the earth was not watered, were kept alive by the ends of one or more shoots being placed in water; *e.g.*, *Mimulus moschatus* not only grew vigorously and developed axillary buds into shoots, but even blossomed.

By these interesting experiments the physiological botanist is again placed in harmony with the gardener who syringes his plants, not merely for the purpose of washing off dust and insects, but in order to facilitate the actual absorption of water by the surface, and with the field botanist who sprinkles the plants in his vasculum with water to keep them fresh till he reaches home. Mr. Henslow concludes with the following hints as to preparing bouquets of cut flowers. If some of the specimens have buds upon them, let the stalks be long, and allow a few leaves to remain on and be also immersed in the water and the buds will then often be found to expand successively. The cut end, to be more absorbent than it otherwise would be, should be again cut off under water. If the blossoms be on a ligneous stem, as of lilac, then the loss of water by evaporation is greater than the woody stalk can supply, so that in this case the addition of leaves in the water will greatly aid, and retain the bunch of flowers fresh for a longer time. On the other hand, if a blossom be already about to shed its petals, then the additional supply of water furnished by the leaves on the stalk appears to hasten the coming dissolution, and the flower perishes rather sooner than it would otherwise do. The water should be changed every day, and the submerged leaves lightly wiped with a cloth, as, by endosmotic action, they soon become more or less coated with mucus. No leaves must be in water unless perfectly green and of vigorous growth.

OSTRICH PEPSINE.

A correspondent writes in reference to the note on p. 820,—"In the Argentine Republic ostrich pepsine is prescribed by medical men, and known by the public as 'pepsina nostra.' It is what you describe, the stomachs powdered. A good wine is made by digesting the stomachs in wine.

"'Pepsina nostra' figures in Murray's 'Pharmacographia,' which serves as the national pharmacopœia in the Argentine Republic in the absence of an official code.

"I consider this a useful article, but being a rough preparation our pepsine is preferable."

The Pharmaceutical Journal.

SATURDAY, APRIL 12, 1879.

SALICYLIC ACID IN CHANCERY.

Salicylic acid is a subject to which we have frequently directed the attention of our readers since the discovery of its physiological action and its efficacy as an antiseptic made it matter of interest to pharmacists, physicians and others. That discovery was made by Professor Kolbe, of Leipzic, who was led to it by consideration of the fact that salicylic acid was closely related to carbolic acid and could be produced artificially from it by adding on to carbolic acid the elements of carbonic acid. This fact was also discovered by Professor Kolbe in conjunction with another chemist named Lautemann, who is now dead. Since that time salicylic acid has passed from being merely one of the multitude of substances which possess an interest only for the chemist, into the position of an article of commerce. Its utility as an antiseptic has, we believe, led to a very extensive use of it in brewing. The medicinal virtues of the salicylate of soda have also been applied for the relief of various complaints, and altogether the useful applications of this substance furnish another striking illustration of the value of chemical science, as well as of the fact that any one of the substances which to-day are known only in laboratories or museums as objects of scientific curiosity may to-morrow take rank as important articles of manufacture, if not as absolutely indispensable necessaries.

But the recent history of salicylic acid presents another feature of development which is not quite so much a source of unalloyed satisfaction as those to which we have already referred. It has become the subject matter of a chancery suit, which has arisen in the following manner:—Early in the year 1874 a patent was taken out in this country by Mr. J. H. Johnson, the patent agent, for "improvements in the production of salicylic acid, and of the isomeric and homologous acids," as being a communication from abroad by Professor Hermann Kolbe, of Leipzig. Contrary to the more ordinary usage a complete specification was filed at the outset instead of a provisional specification, and in that document it is set forth that amongst the acids of the aromatic series originally produced synthetically, salicylic acid ($C_7H_6O_3$) was obtained by introducing carbonic acid into boiling carbolic acid (C_6H_6O) while sodium was being dissolved in it; further that this method, as well as the use of oil of wintergreen (*Gaultheria procumbens*) did not promise to yield a result either satisfactory or advantageous, and lastly that Professor Kolbe's further investigations in this direction led to results which had shown that salicylic acid or its isomeric and homologous compounds could be produced on a large scale, and was destined to occupy a prominent place in chemical technology.

The specification then proceeds to set forth that the invention which was the subject matter of the letters patent, related to the production of salicylic acid as well as other acids of the aromatic series, and that, so far as salicylic acid was concerned, it consisted in effecting its production by the action of carbonic acid upon carbolic acid in presence of alkalies or alkaline salts, or a mixture of these substances, and this in large quantities and at considerable reduction in the cost of production as compared with the methods at that time in use.

The manufacture of salicylic acid in this manner appears to have been commenced very soon after the date of the letters patent, for in July 1874, Professor Kolbe made known, in a foot note to a paper he then published on the subject, that Dr. von Heyden, of Dresden, as assignee of the patent granted to Johnson, was making salicylic acid according to his method, and was prepared to supply it in large quantity.

The growing fame of salicylic acid appears to have induced other manufacturers also to undertake its preparation, and in 1877 a patent was taken out by Max Neustadt, for "improvements in the manufacture and production of salicylic acid, and in apparatus employed therein," a communication from abroad by Emanuel Merck, of Darmstadt. The specification of this patent set forth that the invention consisted in the preparation of basic sodium salicylate by the action of carbonic acid upon dry sodium carbolate at a certain or determined temperature, and under certain conditions, as well as the use of special apparatus. Messrs. Merck appear to have then entered upon the manufacture of salicylic acid, importing it into this country for sale by their agents, M. Neustadt and Co., against whom an action has now been instituted by Dr. von Heyden, upon the ground that the sale of salicylic acid made by Messrs. Merck involves an infringement of the patent granted to Johnson on behalf of Professor Kolbe. The defence set up by the other side comprises several points, but it consists mainly in disputing, upon the ground of prior publication, the novelty of the invention which is the subject matter of Johnson's patent.

The case came on for trial before Vice-Chancellor Bacon on the 18th ult., and the hearing of it lasted for nine days. As it is still *sub judice*, it would be obviously improper to offer even the shadow of an opinion as to the merits of the question in dispute, and the utmost we can do is to state the nature of the arguments adduced by counsel on either side. For the plaintiff it was contended that the production of salicylic acid in such quantities as to be commercially available was a novelty in 1874; that in regard to the mode of production, although Professor Kolbe had in 1860 made known the fact that salicylic acid could be produced artificially from carbolic acid, he had never prior to 1874 operated with that object otherwise than by using metallic

sodium with carbolic acid and carbonic acid, and therefore never operated upon a definite dry separate carbolate of soda, while in the operation described in the specification, he first mixed carbolic acid with caustic soda and evaporated to complete dryness, thus producing a dry carbolate of soda, which was contended to be the gist of the invention, and then subjected this product to the action of carbonic acid gas and heat to convert it into salicylate of soda. It was also contended that dry carbolate of soda was before unknown as a definite separate substance, and that the production of salicylic acid substantially in the manner described in JOHNSON'S specification constituted good subject matter for a patent in 1874.

On the part of the defendants it was contended that the production of salicylic acid as an article of commerce, was merely a result of the demand caused by the discovery of its antiseptic qualities which then admitted of the practical application of KOLBE'S previous discovery.

The defence on the ground of prior publication, which was stated by counsel for the plaintiffs to touch them most nearly, was based on Professor KOLBE'S own publications in or about 1860, in which he showed that salicylate of soda was produced by the action of carbonic acid and heat upon carbolate of soda, and the fact of Professor KOLBE not being called to give evidence was strongly commentedupon.

It was also contended that the real novelty in 1874 was the discovery of the antiseptic qualities of salicylic acid; that the specification of JOHNSON'S patent did not sufficiently disclose what the alleged invention really consisted in; that as regards the production of carbolate of soda from carbolic acid and caustic soda, the same thing was produced when sodium acted upon carbolic acid as in KOLBE'S original operations, and that the carbolate of soda thus produced in those instances, whether mixed with excess of carbolic acid or not, was quite as much a definite separate individual compound as when produced from carbolic acid and caustic soda, while it was also unquestionably a dry carbolate of soda. As regards the novelty contended for by the plaintiffs in the production of dry carbolate of soda from carbolic acid and caustic soda, and the state of knowledge prior to 1874 concerning the alkaline carbolates, there was such a decided conflict of chemical evidence as to preclude further reference to it now. But one of the chief points urged by the Attorney-General was the insufficiency of the specification in that, while describing the invention to consist in effecting production of salicylic acid by the action of carbonic acid on carbolic acid in the presence of alkalies and apparently making them operate exactly as in the older operation when sodium was used, it omitted to point out that the production of a definite separate dry carbolate of soda was an essential preliminary to the formation of salicylate.

The evidence given on both sides was very lengthy, and referred to a variety of details more or less intimately connected with the real question raised in this case, which is certainly not one of the least interesting instances of the litigation which possession of a patent enables people to indulge in. The case now awaits the decision of the Vice-Chancellor.

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, April 2, 1879.

Present — Charles R. C. Tichborne, LL.D., Ph.D., President; Dr. Aquilla Smith, Vice-President; Dr. Collins, Dr. Whitaker (Belfast), Messrs. Bennett (Kingstown), Brunker, Hayes, Holmes, Oldham, Payne (Belfast).

The minutes of the meeting held on March 5, were read and signed.

Read two letters from Dr. A. H. Jacob, relative to the recent action of the Prisons Board, Ireland, in dismissing the apothecaries or other compounders of the Irish prisons. These communications were to be considered official letters from the Irish Medical Association.

Proposed by Mr. Brunker, seconded by Dr. Whitaker, and resolved:—

"That a small Committee be appointed to draw up a memorial to the Irish Prisons Board, protesting against the abolition of apothecary, or pharmaceutical chemist, to the county prisons, and requesting them to reconsider their decision in the matter. The proposer and seconder, with Mr. Oldham, to form the Committee."

Read two letters from Mr. Robert Barklie, F.C.S., Hon. Secretary to the Working Men's Institute, Belfast, in relation to his application to have the institute added to the list of chemical schools from which certificates of practical chemistry will be received.

Proposed by Mr. Brunker, seconded by Mr. Payne, and resolved:—

"That the Council reply to Mr. Barklie that they are not at present inclined to extend the list of schools of practical chemistry whose certificates will be accepted."

The Chairman of the Law Committee reported their proceedings since the last meeting.

Proposed by Dr. Whitaker, seconded by Mr. Payne, and resolved:—

"That the Law Committee be empowered to take such steps as they may think proper, and to incur reasonable expenses in finding out and prosecuting persons infringing the Pharmacy Act, and to report to the Council."

The name of Dr. Whitaker was substituted for that of Mr. Holmes on the Law Committee, Mr. Holmes having resigned.

The Pharmacy Act Committee presented their first report—when it was resolved that the report be printed and circulated amongst the members of Council.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Wednesday, April 3rd; Mr. Warren De La Rue, President, in the chair.

The minutes of the anniversary and last ordinary meetings were read and confirmed.

The following certificates were read for the first time:—J. Fletcher, W. T. Bayne.

The President then called on Dr. TILDEN to read a paper on—

Terpin and Terpinol.—(This communication is a continuation of a previous paper. *Chem. Soc. Journ.*, June, 1878.) Crystallized Terpine.—The liquid left after the deposition of the crystals has gone on some time contains terpinol and a nitrate, or the compound of terpinol with a nitrate, for after washing thoroughly with water and distilling in steam the yellowish oil obtained gives ammonia by the action of reducing agents, and when heated evolves nitrous fumes. Attempts to substitute

sulphuric, acetic, and hydrochloric acids for nitric acid failed. The turpentine hydrate $C_{10}H_{18}O$ of Deville seems to be nothing but terpinol. The author has obtained crystals of terpin hydrate from essence of lemon identical in form with those obtained from American and French turpentine; he has not prepared similar crystals from the terpene of orange oil.

Terpinol.—The author has taken the vapour density of this substance, and from it concludes that its formula is $C_{10}H_{18}O$. The alcoholic solution of terpinol dissolves one atom of sodium from sodium-amalgam, forming a white pasty substance from which terpinol is regenerated by the action of water. No ether was obtained by the action of acetic acid. Hydrochloric acid gas is absorbed by terpinol; the mixture at first turns purple, but is finally converted into a mass of colourless crystals ($C_{10}H_{18}Cl_2$) melting at 48°. From various considerations the author considers the character of terpinol to be that of an alcohol rather than that of a ketone like pinacolin. Sulphuric acid when heated with terpinol produces dehydration with partial polymerization of the resulting hydrocarbon, which is apparently identical with terpilene. When, however, terpinol is mixed gradually with nearly an equal volume of sulphuric acid diluted with half its bulk of water but little heat is evolved and no separation of the liquids takes place; on adding eight or six volumes of water the whole solidifies in a few minutes into a crystallized mass of terpin mixed with only a small quantity of liquid hydrocarbon. Oil of lemon, cajeputol, and oils of coriander and citronella apparently contain bodies either identical with terpinol, or mere physical modifications of that substance. Resin spirit does not apparently contain terpinol.

Dr. Armstrong thought that the reactions of terpinol pointed to a resemblance in constitution to pinacolin rather than to an alcohol, and suggested that terpin, terpinol, etc., should have a rational name, expressing to some extent their constitution.

Dr. Tilden, in reply, said he should be reluctant to change the name, until homologues were discovered, as it had been suggested by Berzelius; on the whole he adhered to the statement in the paper that the behaviour of terpinol resembled that of a secondary or tertiary alcohol.

Mr. G. Attwood then read a paper—

On a Gold Nugget from South America.—In the state of Guayana, Venezuela, a large area of alluvial soil has lately been found to contain gold, and nuggets up to 25 ounces have been discovered within three feet on the surface. Numerous gold-bearing quartz veins are found in the neighbouring hills. Quite one half of these nuggets are covered with a dark brown substance resembling a silicate of iron. Such a nugget was treated with hydrochloric acid (its weight diminished after treatment with HCl and NaHO from 304·7 grains to 284·33 grains). The solution contained silica 0·12 grain, ferric oxide 8·88, lime 0·15, magnesia 0·08. The nugget was then treated with caustic soda and again with HCl; the solution contained silica 4·60 grains, ferric oxide 4·60, lime 0·21. During this process much gold in a finely divided state became detached, and after the treatment the nugget was partly covered with a coating of finely divided gold of a dull colour. The nugget contained 94·54 per cent. of gold. The gold from the quartz veins contains 87·9 per cent. gold. From these experiments the author concludes that gold nuggets gradually increase in size owing to the accumulation of fresh particles of finely precipitated gold. Specimens of these nuggets showing the dark glazed coating were exhibited including one weighing over 14 ounces.

Mr. W. W. Fisher then communicated a paper on—

Lead Tetrachloride.—The existence of this compound has been for many years assumed on theoretical grounds, but direct experimental evidence has not been hitherto obtained to establish its composition. The author has therefore followed a plan similar to that already used by him to prove the existence of manganese tetrachloride. Lead dioxide dissolves in moderately strong hydrochloric acid forming a yellow solution smelling strongly of chlorine. This solution when heated evolves chlorine and lead chloride crystallizes out. This yellow solution gives a precipitate of brown hydrated peroxide of lead when treated with solutions of the fixed alkalies or alkaline carbonates, etc. The addition of water causes a similar precipitation if an excess of hydrochloric acid be avoided and the liquid carefully saturated with the dioxide. The author gives his method of analysis; he concludes that the yellow solution contains a compound of lead with chlorine containing 1 atom of lead to 4 of chlorine. If red lead be substituted for the lead dioxide a similar yellow solution is obtained; it can also be prepared by the action of chlorine on lead chloride suspended in dilute hydrochloric acid or solution of a chloride; if water alone be used lead dioxide is deposited simultaneously with the formation of the yellow solution. From his experiments the author concludes that lead tetrachloride is unstable in the presence of water alone, but may exist as a double salt in the presence of other chlorides. In conclusion the author suggests the use of chlorine or bromine, in the presence of sodium acetate, as a means of quantitatively determining lead, by precipitation as peroxide, in cases where the use of sulphuric acid is unadvisable, and gives results obtained by thus precipitating a solution of lead acetate (in the presence of sodium acetate) as peroxide, igniting the latter to protoxide and weighing. 54·71 and 54·67 per cent. Pb were obtained, theory indicating 54·67.

The President remarked on the importance of the suggestion as to the use of Br and Cl for precipitating lead from solution, as in many cases sulphuric acid did not completely precipitate lead.

After a short discussion, in which Drs. Wright and Tilden and Messrs. Hartley and Neison took part, Mr. Fisher replied.

The Secretary then read a short note by Messrs. Dale and Schorlemmer—

On the Transformation of Aurin into Trimethylpararosanilin.—This transformation was effected by the action of an aqueous solution of methylamine at 125° on aurin, a purple colour being formed, possessing all the properties of a trimethylrosanilin; intermediate compounds soluble in alkalies were simultaneously produced and are at present under investigation.

The next paper was—

On the Solution of Aluminium Hydrate by Ammonia and a Physical Isomeride of Alumina. By C. F. Cross.—The author has made quantitative experiments with solutions of ammonia of various strengths. His results indicate that ammonia dissolves to a certain extent the hydrated oxide at the moment of precipitation; the quantity dissolved bears no relation to the strength of the ammonia, but is considerably lessened by the presence of ammoniacal salts. The author has also examined the precipitate obtained by boiling the ammoniacal solution of the oxide; it is granular, and slowly dissolves in boiling hydrochloric acid. Dried at 100° it is an opaque white powder; on igniting it undergoes no apparent change, but in the anhydrous condition it is extremely hygroscopic, absorbing 35 per cent. of water. Its composition is Al_2O_3.

The last communication was entitled—

Researches in Dyeing, Part II. Note on the Emission of Colouring Matter. By Dr. Mills and Mr. Campbell.—The experiments were made as described in Part I. (*Chem. Soc. Jour.*, 1879). The colour selected was well crystallized Nicholson's blue; the vat contained 0·2780 grm. of pure silk ribbon and 0·0100 grm. of blue in 400 c.c. of water; one contained in addition 1 grm. of KCl, and a third of a grm. of NaCl. The most interesting result obtained by the authors is that the energy of combination between silk and the blue when water or potassic chloride is used is over developed at first, and the excess of colouring matter so taken up is gradually emitted by the silk during the third and fourth days; the addition of

sodic chloride completely prevents this result. The authors also affirm that a real and uniform dyeing effect can always be obtained with silk and Nicholson's blue; the heat and souring used by dyers being unadvisable. The authors recommend the addition of common salt to the vat.

The President in adjourning the meeting to April 17th said that as so many candidates were awaiting election he hoped that Fellows of the Society would make every effort to be present on that date so that a ballot might be taken.

The following papers were announced:—On the Determination of Tartaric Acid in Lees and Inferior Argol, with Some Remarks upon Filtration and Precipitation, by B. J. Grosjean. On Conditions affecting the Equilibrium of Certain Chemical Systems, by M. M. P. Muir.

Parliamentary and Law Proceedings.

THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN *v.* THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION, LIMITED.

This case was resumed on Saturday, the 5th instant, before the Lord Chief Justice and Mr. Justice Mellor.

Mr. Wills, in resuming his argument for the respondent, said, I will, with your Lordships' permission, briefly recapitulate the argument I addressed to your Lordships before, or at least the heads of it. The action was against the limited company whom I represent for a penalty which was given by the Pharmacy Act of 1868, section 15, against any person who should keep open shop for the sale of poisons, and the question was whether in the interpretation of the statute "person" would include a limited company, because my clients are a limited company and not an individual. They conducted the sale by the hands of properly qualified individuals; that is found; but the question is, whether they, being the entity which kept the shop, fell within the word person as used in that section. My Lord, my argument began with the proposition that in the language of Acts of Parliament generally person does not *primâ facie* include corporate bodies, and I relied strongly in support of that proposition upon a section which the Attorney-General quoted in his argument, which at first sight he was inclined to pray in aid, in support of the conviction in this case. But it was pointed out by the Court, and acquiesced in by my learned friend the Attorney-General, that the class of proceeding in this case was not covered by the words of that section. That was section 14 of the 7 and 8 Geo. III., c. 28, and says, "That wherever this or any other statute relating to any offence, whether punishable upon indictment or summary conviction, in describing or referring to the offence, or the subject matter on or with respect to which it shall be committed, or the offender or the party affected or intended to be affected by the offence, hath used or shall use words importing the singular number or the masculine gender only, yet the statute shall be understood to include several matters as well as one matter, and several persons as well as one person, and females as well as males, and bodies corporate as well as individuals, unless it be otherwise specially provided, or there be something in the subject or context repugnant to such construction." It was pointed out by the Court and acquiesced in by my learned friend that this is not a case falling within that Act, because it is not a case of summary conviction. It is an action given by the statute to the informer, an action brought in the County Court by civil process, and therefore it does not fall within that section of that Act of Parliament. I ventured to press on the Court, and I venture to repeat the argument, which appears to me to be sound and well founded, that the conclusion to be drawn from such a specific enactment is that "person" without the help of such enactment does not *primâ facie* import corporate body in the usual language of Acts of Parliament. There is another statute which was mentioned by the Attorney-General which I will mention in passing, because it seems to me to show that in 1850, there was no intention in the construction in general Acts of Parliament so to extend the word "person." It was an Act passed for the purpose of abbreviating the language used in Acts of Parliament, and it is enacted by the 4th section of the 13 and 14 Vict. c. 21, "That in all cases words importing the masculine gender shall be taken to include females, the singular to include the plural, and the plural the singular, unless the contrary as to gender or number is expressly provided." Then it says, month means calendar month and so on; but that interpretation clause does not go on to say that "person" in the general language of Acts of Parliament shall include a corporate body; and, my Lords, I cannot help thinking that if it had been so included it would have been so enacted, because at that time there were numerous Acts of Parliament in force, general Acts I mean, in which there were interpretation clauses which said that in that Act person should be taken to include a corporate body. I need not go further for an illustration, because it is capable of very many, than the 9 and 10 Vict. which was before this, and which is familiar. In the interpretation of that Act it is specifically provided that the word person, and words applying to any person or individual shall apply to corporations, whether aggregate or sole.

Mr. Justice Mellor: You say the person who prepared that Act for shortening Acts of Parliament must have necessarily seen numbers of Acts of Parliament in which it had been thought necessary to put in such a definition, and that, therefore, the omission affords a strong argument that there might be reason why a corporation should not be included under the word person.

Mr. Wills: As far as I know all Acts of Parliament which begin with a defining clause, or which contain defining clauses of this kind before this Act for shortening the verbiage—all Acts of Parliament used to have a clause saying that words which import the singular number shall be taken to include the plural, and that words which import the masculine shall be taken to include the feminine, and so on; and this very Act which I have before me, the 9 and 10 Vict., the Public Health Act, which is exceedingly well known (and cases of that kind must have been in the contemplation of the persons who framed this Act of Parliament for shortening Acts of Parliament), that Act begins, as so many others do, with an interpretation clause that words importing the masculine shall include the feminine, and words importing the singular shall include the plural. Well, my Lords—that being the practice of the Legislature and the habitual language used, there comes this Act to shorten future Acts of Parliament, and it says that in all future Acts words importing the masculine shall include the feminine, and the singular shall include the plural, but it does not go on to add that which was so common an accompaniment of these phrases in the interpretation clauses of Acts of Parliament,—and person shall include body corporate. And one might very well see why that should be, because there might be very many cases in which it would be inconvenient that such an Act should so apply, and it was better to leave such a matter as that to the defining clause of each particular Act than to provide for it in a general one. Anyhow the Legislature did not do it, and surely the fact that when they are making provision for the purpose of abbreviating the language necessary to be used in Acts of Parliament they should have included these two things which are found at the beginning of every interpretation clause and then stop with that which commonly and naturally follows them in the regular sequence in those Acts, and not gone on to say that the word person shall include corporate body, is very strong in favour of the proposition which I venture to put before your Lordships, that in the habitual language of Acts of Parliament "person"

does not include bodies corporate. My Lords, there are a great number of offences,—for instance, those created by the Acts consolidating the Criminal Law, Acts which were passed about the end of George IV.'s reign and those which were passed in the 20 and 21 Vict.,—there are a great number of those offences as to which a body corporate could not very well be included. For instance, where you say a person committing such and such an offence shall be hung or sent to penal servitude, it could not apply to a body corporate; but at the same time there are a great number of such offences which are created by those Acts of Parliament which are punishable with the alternative of fine or imprisonment, and as far as fine is concerned that might be enforced against bodies corporate. I do not think it has ever been attempted to put them in force against bodies corporate, and I do not think it has ever been suggested, and it would be certainly an awkward suggestion to say that in the same Act of Parliament the word person shall now mean bodies corporate as well as ordinary persons, and now should not. I venture to follow up the same line of argument with respect to the present Act that we have to deal with, and I will show your Lordships that in numerous passages the word "person" cannot have been meant to include persons corporate; and then I shall show your Lordships numerous passages in which it is impossible, I think, to come to the conclusion that it did include bodies corporate, and that surely affords a strong presumption that throughout the Act of Parliament it was intended to have the same meaning wherever it is found. Now I am aware that there are inconveniences resulting from that. I mean to say that the protection of the public is not so complete as it would be if the clauses had been properly framed to meet the case; but, my Lords, that is not a reason for giving a strained and violent construction to an Act of Parliament, but on the other hand it does appear to me, and I trust it will appear to your Lordships to be perfectly clear that if the Legislature had really meant to deal with bodies corporate in this enactment, it would certainly have made special provisions with regard to them. It would never have made a set of provisions which would have made it impossible for that to be done, to which there is no legal moral or social objection, namely, that bodies corporate should carry on this business, if they did it by properly qualified persons; it is not by issuing a set of provisions with which it is impossible for bodies corporate to comply that they really intended to show that no bodies corporate or co-operative stores should dispense medicines, for that is what it will come to and that is the real meaning of these present proceedings before your Lordships. It is all very well to say that it is directed against these present defendants; the intention and the hope is if the Pharmaceutical Society should succeed in getting their judgment here that they would shut up all the departments of co-operative stores, which undersell them very much, and probably undersell them more than they undersell any other class of tradesmen in the kingdom. This Act was no doubt framed by the Pharmaceutical Society in the interest of the public, but it is for their benefit in regulating them and gives extensive powers to them, and I venture to submit to your Lordships that if they had at that time gone to Parliament in 1868, and insisted upon putting in a clause which would prevent any limited company from availing itself of the provisions of the Act, and from employing qualified persons to dispense medicines or sell poisons, it would have had no chance whatever of getting such a clause put in. What I have shortly to submit to your Lordships on reading this Act from one end to the other is that the case of bodies corporate is omitted, and has not been dealt with. It may have been very desirable that provisions should have been made, but they are not made. There are provisions made which, even in the case of bodies corporate, will afford more or less protection to the public, because still the actual person who effects the sale will be liable to a penalty if he is not properly qualified. My friend, the Attorney-General, said very justly, and I agree with him, that that is not as effectual a protection as if the penalty applied to the body corporate itself, because the assistant might be here to-day and there to morrow; I admit it is so, and I should have said my friend's argument on that point would have been addressed with great force to the Legislature if he had asked it to put in an additional clause to meet that, but it is not a reason for asking the Court to say that the Legislature meant something which, if I am successful in my argument, I shall be able to show your Lordships could not very well have been in their contemplation. My Lords, I may perhaps be allowed to refer in a very few words to the illustration which I used last time and with respect to which I believe I am perfectly well founded—that if the contention of the learned Attorney-General in this case is right, the Apothecaries' Hall itself is within the provisions of this Act and ought to be registered under this Act, and of course it is not registered. And there would also be, as I will show your Lordships in going through the sections, this very inconvenient consequence—as all persons, who, before the passing of the Act were carrying on business as chemists and druggists, apart from any question of qualification and without qualification, were entitled to be registered under this Act, because the Act would not ruin people who were already in business, it would follow that any one of those limited companies, every body corporate which was in existence at that time, would have been able to register itself and would have been able for all time for the future to carry on business under the provisions of this Act, without of course any of the provisions applying to it to insure the qualification of persons dealing in the drugs, because bodies corporate which were registered would be on precisely the same foundation and would be privileged by exactly the same monopolies as apply to the case of my client in the present case. Of course such a body could not comply with the provisions as to examination and so on, but it would be committing no offence under this section in keeping open shop if it had not a single qualified person in its employment, and yet it would be open for it to carry on business in the future for all time to come, because of course a corporation can never die unless it is dissolved by its own act, and therefore, there would be a certain very limited set of bodies corporate who under this Act would be entitled to carry on their business without complying with any of the regulations which the Legislature thought was necessary in order to insure the protection of the public. Now, my Lords, I will shortly go through the sections of the Act of Parliament which I conceive show that the framer of the Act and the Legislature in adopting it when they put in the word "person" never thought of the case of bodies corporate.

Mr. Justice Mellor: There is a recital, I suppose you will say that is not in your favour?

Mr. Wills: Yes, my Lord. "Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing or compounding of poisons and persons known as chemists and druggists should possess a competent practical knowledge of their business." Now, my Lords, be pleased to notice, if I may venture to press it upon your Lordships in dealing with this case throughout, if persons include bodies corporate, there were or might have been a certain number of bodies corporate entitled to register as chemists and druggists, and therefore there would have been a certain number of persons under that large meaning of the word person who could not possess a practical knowledge of their business, such as is referred to in the following words of recital: "and to that end that from and after the day herein named all persons not already engaged in such business should before commencing such business be duly examined as to their practical knowledge." I quite follow the line of argument which the learned Attorney-General put forward very fairly, as he always does put everything forward. He says the way in which I make

use of that recital for my argument is this. I say the Legislature said it is desirable that there be no business of this kind carried on by anybody except by persons having a competent knowledge, and inasmuch as public companies cannot be examined, and so on, it follows by that kind of side wind that inasmuch as they cannot be examined they cannot comply with the Act, and therefore the protection is perfect. But surely it is a strong thing to say that the Legislature meant to get rid of this by that kind of side wind. I can very well understand that the Pharmaceutical Society would very much like to get rid of them by that side wind, but the question is, What did Parliament mean when it was passing this Act? The Act goes on, "and that a register shall be kept as herein provided." Then it is enacted by the first section "that it shall be unlawful for any person to sell or keep open for retailing, dispensing or compounding poisons, or to assume or use the title of chemist and druggist, or chemist, or druggist, or pharmacist, or dispensing chemist or druggist in any part of Great Britain, unless such person shall be a pharmaceutical chemist or chemist and druggist within the meaning of this Act, and is registered under this Act, and conform to such regulations as may be prescribed." Then follows a list of poisons referred to by reference to the schedule, which may be extended from time to time by the Council of the Pharmaceutical Society with the consent of the Privy Council. And, my Lords, the practical result of the thing which so far as my clients are concerned would have hit them hardest in a decision against them would be that it would shut up altogether the dispensing business, because no one can carry on the business of dispensing and making up physicians' prescriptions without being liable at any moment to have a prescription put into his hands which contains poisons. The list is tolerably inclusive and includes such things as chloroform and many other drugs which are of very frequent occurrence in prescriptions, tartar emetic, aconite and its preparations and so on, things which are habitually used in domestic medicine in more or less large or small quantities, and that is also capable of extension; therefore the result would be to shut up the dispensing chemist branch of business of these numerous co-operative associations throughout the country, which are of very great benefit to those who belong to them; at all events they procure these things at very moderate price. I would not use any observation of that kind to this Act to any extent I did not think legitimate, but I think it is legitimate when one considers that at the time this Act was passed there were a number of such institutions already in operation, and one can scarcely imagine that if Parliament meant to deal with them it would not have made some reasonable provisions applicable to their case, because it would have been so easy to say that in cases of limited or corporate bodies carrying on business of this kind there should be a responsible head, and that he should be registered, and so on; and then of course every reasonable requirement would have been fulfilled. That is in point of fact what has been done in our case, but that is neither here nor there. The question is, whether there has been an offence under this Act. Now, my Lords, the next section is No. 3, which I think affords a very cogent argument for saying that "person" was never meant to include corporate bodies. "Chemists and druggists within the meaning of this Act shall consist of all persons, who, at any time before the passing of this Act, have carried on in Great Britain the business of a chemist and druggist in the keeping of open shop for the compounding of prescriptions," and so on. Then there are other persons included in the section who could comply with the Act, who were persons simply in the ordinary sense of the word. Now, my Lords, if person includes corporate bodies in one place it is included in another. If that section is to apply to corporate bodies, all such corporate bodies as were in existence at the time that passed, will for henceforth enjoy monopoly amongst all other corporate bodies, because they will be entitled to register as people who were already carrying on business, but their successors, between whom and themselves no earthly distinction can be drawn on the ground of public policy or convenience, will not be able to so register, and therefore as amongst such bodies all who were in existence at that time will have the enviable privilege of complete monopoly. The next section refers to apprentices and assistants who may be registered, using there again the word persons, which it is clear in that section means to deal with and can deal with nothing except an ordinary person in the common sense of the word. Now, my Lords, comes section 5, which also, I think, goes a long way towards showing that person had nothing but its natural sense in this Act. "The persons who at the time of the passing of this Act shall have been duly admitted pharmaceutical chemists or shall be chemists and druggists within the meaning of the Act shall be entitled to be registered under the Act without paying any fee for such registration." I pause to say that any such corporate body as that which I now represent and such a body as the Apothecaries' Hall would, under that section, supposing that the former section includes corporate body, be entitled to be registered, and until their registration they would not have the protection of the Act. Of course, the Apothecaries' Hall has never thought of procuring itself to be registered, such a thing never entered the heads of anybody until the Pharmaceutical Society raised this present question Now comes the reference to a schedule which really is of some consequence in seeing what the intention of the Act of Parliament was—"provided that as regards any such chemist and druggist"—that would have, if the Attorney-General's contention were to prevail, to include any corporate bodies existing at the time the Act passed —"that his claim to be registered must be by notice in writing, signed by him, and given to the Registrar, with certificates according to the schedules C. and D. to this Act." Now, if your Lordships will be good enough to look at schedules C. and D., schedule C. is a declaration by a person who was in business as a chemist and druggist before the passing of the Pharmacy Act, and D. is a declaration to be signed by a duly qualified medical practitioner respecting a person who was in business as a chemist and druggist in Great Britain before the Pharmacy Act, 1868. [The learned counsel having read the schedules referred to, continued.] Looking at these schedules I do not mean to say that it is not possible to say that by a forced use of language you might not say that if the corporate seal of the body was put there that would not be a signature, or might not be for some purposes, but looking at the thing from the point of view of common sense that is not the kind of language or the kind of form which would be given if it were intended to be adopted in such cases as that, and it seems to me to point to this, that those who drew that Act never thought of the case which has arisen. Then it provides that there is a fee to be paid. Then, my Lords, comes section 6, which uses again the word person over and over again, and there it is clear that person means nothing but an ordinary person, because it is a provision for examinations, which are to lead on to the granting of a certificate of competent skill, and so on.

Mr. Justice Mellor: You must obtain a certificate of competent skill.

Mr. Wills: Yes, my Lord. It is impossible for a company to comply with that. My friend the Attorney-General says, so much the worse for them. He said that is the only way you are to understand it. Of course that would be quite right if one saw that the Act of Parliament meant that, but what I complain of in the Attorney-General's interpretation is that it is getting rid of these people by a side wind, and that that never was intended. He says, the result of it is, these people cannot get this protection because they cannot comply with the Act. That is perfectly logical. It would not the least follow that my contention is right because I showed that the

result of his contention is that my clients could not do the thing; but what I do submit to the Court is that if you find all those provisions which are clearly intended to apply to ordinary persons, without including the case of a corporate body, that if there was an intention to deal with the case of corporate bodies, it is strange that it should be done by the roundabout way of saying that corporate bodies, because they cannot be examined, shall not carry on business at all, rather than by enacting rationally what would be a safe protection for the public by subjecting them to such rules as are applicable to such institutions. Then, my Lords, we go on to section 10, which makes it the duty of the Registrar to keep a register of all registered persons, and to erase therefrom the names of the registered persons who have died. Now one would suppose that if the case of corporate bodies had been intended to be dealt with, the Act of Parliament would have gone on to state that in the case of corporate bodies which are wound up and so on, their names shall be erased, but it does nothing of the kind. It makes provisions requiring the registrars of births and deaths upon the death of a pharmaceutical chemist to send notice to the Registrar of the Society in order that he may erase the name of such person from his list; but surely it would contain the analogous provision saying that when an incorporated company was wound up and dissolved it should be the duty of the Registrar General to send some sort of a notice so that the register might be kept complete, but I need not say there is nothing of the kind. Then section 12, is "No name shall be entered in the register except of persons authorized by this Act to be registered, nor unless the Registrar be satisfied by proper evidence that the person claiming is entitled to be registered." Then, my Lords, there is an annual register which is to be evidence, and there again we have the names. It says the names shall be in alphabetical order according to the surnames. That is not applicable to a case of this kind.
