The Lord Chief Justice: The argument against you is that the Act excludes you because you cannot comply with the regulations—that in short it never was contemplated that there should be wholesale companies of this kind carrying on amongst other businesses the one business of a pharmaceutical chemist.

Mr. Wills: Yes, my Lord. All I can say is that the Limited Liability Act had been passed a long time; then it was a perfectly lawful thing to carry on business by means of a company, and the Act of Parliament surely did not mean to engraft that limitation that it should be an illegal thing for companies to carry on this business because they could not be examined, and so on. Of course the Attorney-General's argument is perfectly logical, as one might expect, if the Act of Parliament by the word "person" includes a corporate body. I quite follow the learned Attorney-General's argument, and it is perfectly sound if "person" includes these corporate bodies, and there are such a number of provisions enacted with regard to persons which it is impossible for corporate bodies to comply with, the necessary incidental result is that they are excluded from the trade, but I do think I may fairly press your Lordships on the other side with the illustration I gave.

The Lord Chief Justice: You go the length, of course, of saying that if they are excluded from the statute there is no necessity for any qualification at all. They may carry on their business by a man who never saw drugs before yesterday.

Mr. Wills: They will not be within this section, but they will be within another.

The Lord Chief Justice: Which is that?

Mr. Wills: The very person who sells is liable within another section which I will come to in one moment. The 14th section contains a provision that any registrar who shall wilfully make or cause to be made any falsification in any matter relating to the said registers, and any person who shall wilfully procure, or attempt to procure, himself to be registered by making or producing or causing to be made any false or fraudulent representation shall be deemed guilty of a misdemeanour, and in Scotland, of a crime or offence punishable by fine or imprisonment. It is true a fine might be inflicted on a corporate body, but there is a fine or imprisonment put together in one category. Then comes the section in question, under which the proceedings are taken against us now, which is "That if any person sell, or keep open shop for the retailing or compounding poisons, or who shall take, use, or exhibit the name or title of chemist and druggist, etc., or shall fail to conform with any regulation as to the keeping or selling of poisons made in pursuance of this Act, or who shall compound any medicines of the British Pharmacopœia except according to the formularies of the said pharmacopœia, shall for every such offence be liable to pay a penalty or sum of five pounds, and the same may be sued for," and so forth. And then it says "That nothing in this Act contained shall prevent any person from being liable to any other penalty, damages or punishment, to which he would be subject if this Act had not been passed." Then the next is, "Nothing herein contained shall extend to the business of a legally qualified apothecary, and on the decease of any pharmaceutical chemist it shall be lawful for his executors to wind up his business, provided it is done by the aid of a duly qualified assistant." Now, my Lords, there is a provision made for the case in which a qualified head dies; it is not reasonable that the thing should be shut up at once and then the duly qualified assistant is to be employed.

Mr. Justice Mellor: Do you say the protection to the public is the protection of the fine or penalty upon any person who is not qualified, selling?

Mr. Wills: Yes, my Lord.

Mr. Justice Mellor: And that is the protection which the Legislature may, if they thought of it at all, have thought sufficient.

Mr. Wills: Yes, my Lord, I do not think they thought of this case at all; that is my argument. Of course I submit to your Lordships that in case of a penal enactment, when the Legislature did not think of it the Court is not to import it. That, I suppose, is a well recognized principle of construction. Therefore, my Lords, the public is not entirely without protection, because the person whose hand sold, would be liable to this penalty. There is no doubt about that in section 15, and I say that under section 16 they do make provision for the recognized qualified head dying.

The Lord Chief Justice: You say they do come within the term "person" if they keep an open shop.

Mr. Wills: No, my Lord, I mean that the hand which sold—any person who should sell—that is, the person whose hand sold, whose hand did the act of selling—the servant, would be liable under that clause.

Mr. Justice Mellor: I at first thought it was "who, in an open shop shall sell," but it is not that; it is "shall sell."

Mr. Wills: Of course it is open to the other side to contend that the person who sells is the master, but I submit the language is sufficient to cover the person who effects the sale. In section 16 the Legislature does recognize that in the case of a business which is deprived of its natural head it may be carried on for a time for the purpose of winding up, and protection is given by having a duly qualified assistant put in to conduct the business, and surely if they had been meaning to deal with the case of corporate bodies they would have put in something of that kind. They never could have meant that no corporate bodies, except those already existing, for I do feel entitled to press that illustration home very hard against my friend, it seems to lead to the most unreasonable construction that if there was any corporate body then carrying on such business, and we know there were many, they would be entitled to register themselves, and to go on for all time. Therefore the protection of

the public, if it is to be read in the way my friend suggests, is very incomplete, and it is very one-sided, because it hits all the corporate bodies which come into existence after 1868, and it expressly provides an immunity for those which should come in before 1868—not an immunity, but it provides the means by which they could carry on business consistently with this Act. Then, my Lords, it goes on to say in section 17, that it shall be unlawful to sell any poison without a label, and so on, and it shall be unlawful to sell any poison under schedule A, unless the person buying it is known to the seller, and on every sale there shall be an entry made in the book, and any person who sells otherwise than under these precautions shall be guilty of an offence. "And for the purposes of this section the person on whose behalf any sale is made by any apprentice or servant shall be deemed to be the seller, but the provisions of this section which are solely applicable to poisons, in the first part of the schedule A of this Act, shall not apply to articles to be exported by wholesale dealers and so on, nor to any medicine supplied by any legally qualified apothecary to his patient, nor applied to any article when forming part of the ingredients of any medicine dispensed by a person registered under this Act." Now, my Lords, here is the section number 18, in which it is impossible to extend the meaning of the word "person" beyond its ordinary meaning. It says "Every person who at the time of the passing of this Act is or has been in business on his own account as a chemist and druggist, and who shall be registered as a chemist and druggist, shall be eligible to be elected and continue a member of the Pharmaceutical Society according to the bye-laws." That cannot possibly apply to anything except an ordinary person. The 19th is the same. It provides that no person who is not registered shall be eligible for election to the Council of the Pharmaceutical Society. In both of these sections it is impossible to extend the word to corporate bodies. Then in the next it says "every person who shall be registered as a chemist and druggist under this Act by reason of having obtained a certificate of qualification from the Board of Examiners shall be eligible to be elected an associate." There again the "person" means clearly nothing but a natural person. Then the 22nd contains certain provisions for the dispensation of a fund which belongs to the Pharmaceutical Society, to which their members contributed. It contains power for dividing that amongst distressed members or associates of the Society and their widows and orphans. Clearly there the Act has only in contemplation ordinary persons. "And the fund shall be distributed amongst all persons who may have been and who cease to be members or associates of the said Society, or who may be or have been duly registered as pharmaceutical chemists or chemists and druggists, and the widows and orphans of such persons." I do not think there is any other provision in the Act which bears on the question one way or the other. Therefore, I beg to sum up my observations on the Act by saying that it surely is plain that the framer of the Act and the Legislature in passing it never thought of the case of corporate bodies and did not intend to deal with them, and that it is much better to let an amended Act be passed which shall deal with such cases and shall use proper legislation with regard to them than by a strained construction, which I submit to your Lordships is not in accordance with the uses and interpretation put upon the language of Acts of Parliament where the word "person" is used without an interpretation clause, to extend the penal clause so as to cover societies like this I represent, and to exclude them from the business and shut them up. My Lords, I have only to make a very few remarks on the cases my friend quoted at the conclusion of his argument. It seems to me that they are mostly cases of offences at common law, and inasmuch as the common law grew up in ancient times, and was supposed to be applicable to everything, that inasmuch as there were corporations, both sole and aggregate, existing at common law, it seems to me to be according to sound principles of legal interpretation that offences at common law, such as in their nature corporations can commit, might be committed by corporations, and therefore you have instances of corporations being indicted who have to repair a road, or who have obstructed a highway, which is the more common thing. Many of these cases are against railway companies, and I daresay Mr. Justice Mellor will recollect a great case which was tried at Lincoln, where they shunted backwards and forwards across a road at the bottom of the hill, and were indicted. There was a long litigation, which resulted in the judgment of this Court that they were properly indicted. That was an offence at common law. Then my friend quoted a certain other class of cases, as to which it seems to me it is impossible to doubt that corporations would be indictable and punishable by such punishments as were applicable to them, because he quoted cases in which corporations had been embodied by statute for certain purposes and certain statutory duties were cast upon them which they violated, and there is no other means of enforcing them, except by indicting them; and when the Legislature has expressly created corporations for the purpose of doing those duties and performing those public acts, it seems to follow, as a matter of course, that the Legislature would mean them to be indictable for not doing so, and I quite feel there are cases which my friend cited instances of, in which railway companies—I think they were all railway companies—had been incorporated with powers and duties to make certain bridges, certain roads, and so on, and they had committed a violation of their public duty in not doing so, there was no other remedy, and it was held they were indictable because the statute created them a corporation for that very purpose, and therefore made it an offence when that corporation did not do it. My friend quoted no other class of cases and I am pretty sure that my friend will not be able to cite a single case in which an indictment has been maintained against a corporation where a statute has created an offence and has used the word "person." I think it is pretty clear that there is no such case in the books, and surely the fact that there is no such case in the books goes far to strengthen the view taken by the Court with respect to that very matter that where the language of the Act of Parliament does not expressly or impliedly include a corporation it is impossible to indict it. It is incapable of committing the offence because it cannot commit a statutory offence unless it is within the statutory words. And it certainly is a very strong argument in behalf of the proposition for which I am contending that you cannot find an instance in all these years during which corporations have existed and during which all sorts of offences have been created for the protection of the public, which by modern legislation have been enlarged and increased infinitely by means of all those Acts about the health of towns, police legislation, and so on; and it is a wonderful thing, if my friend's contention is right, that you cannot find throughout all the long history of English law, a single instance in the books in which a corporation has been indicted on a statute which has used the word "person" and has not had the interpretation clause which I mention. My Lords, what could be more cogent than the fact that the Legislature was habitually addicted to putting this interpretation clause in, where you find Act of Parliament after Act of Parliament cumbered with interpretation clauses saying that "person" is to include "body corporate," if by the mere use of the word *ex vi termini* simply that became extended to a body corporate? My friend has produced no authority for his proposition, and I submit to your Lordships that it is against all the principles of interpretation of Acts of Parliament which we find acted upon and which we find the Legislature does carry out by the use of this language in its own solemn instruments for years and years. I submit to your Lordships it is plain when you come to consider the whole of this Act, and reading it right through, that nobody

thought of the case of a body corporate, and that inasmuch as the Legislature did not think so, and has not said that "person" was to include it, and has used numerous sections where it is impossible so to extend it, and has used several sections where so to extend it would lead to most anomalous consequences, and would create a body of persons as to whom every one of the objections which my friend invokes against the policy of what we are doing would subsist and would apply, because it would keep them in existence for all time until they chose to depart by their own act. Looking to all these matters I submit that it is plain that the word "person" is not in this penal section to be extended beyond its natural and legitimate meaning of an ordinary physical person.

Mr. Lumley Smith: My Lords, I will say but a few words in reply, because I do not know that I can carry any further the argument of my learned friend the Attorney-General, who addressed the Court on the previous occasion. I should at once adopt the last proposition of my friend Mr. Wills in asking you to say that "person" ought to be interpreted as bearing its natural meaning. The whole question is what that natural meaning is, and according to the authority of Lord Coke the natural meaning of the word "person" when it occurs in an Act of Parliament is that it should include "corporations."

The Lord Chief Justice: You are quoting from the second Institute.

Mr. Lumley Smith: Yes, my Lord.

Mr. Wills: My Lord, I had intended to have said a word about that passage in Lord Coke.

The Lord Chief Justice: Mr. Smith will say it instead of you. What is the page, Mr. Smith?

Mr. Lumley Smith: There is a very watchful journal —the *Pharmaceutical Journal*—which takes an interest in all these matters and they have printed in the journal the shorthand notes of the last day's proceedings. I do not know whether your Lordship would care to have it, but it has all the references to the cases.

The Lord Chief Justice: Thank you.

Mr. Lumley Smith: I will not go further than that. Then my friend says this. He says we do find over and over again in Acts of Parliament an interpretation clause in which there is an express enactment that the word "person" shall include corporate bodies, and he argues from that *primâ facie* "person" does not include corporations, but that such an express enactment was necessary. But when you come to look at these Acts of Parliament and see the kind of interpretation clause that it is, it extends to a vast number of things other than corporations, to corporations English and foreign, and to companies that are not associated, and so on. I have one here, the 11 Geo. IV. and 1 Will. IV., c. 66, s. 18, which I merely give as an example of the kind of interpretation clause my friend is speaking of. It refers to various criminal proceedings and parties intended to be defrauded, and it goes on to say that "person" shall be deemed to include his Majesty or any foreign prince, or state, or any body corporate, or any company, or associated persons not incorporated, or any person, or number of persons whatsoever, who may be intended to be defrauded by such offence, whether such body corporate, company, society, person, or number of persons shall reside or carry on business in England or elsewhere, in any place or country under the dominion of his Majesty or not. I do not quote that Act as at all on the point, but only to show that the draftsman when he was going to deal with all kinds of persons and bodies puts in every conceivable description of person, body, association, and corporation, whether in England or abroad, and makes the language as wide as ever he can, and he actually says that "person" shall include a person living out of the United Kingdom, so that he actually introduces a description of the word person, so that, according to my friend it might have been said that person would be presumed not to apply to any person out of the country, unless there was a special enactment. Then, again, my friend speaks of the Act of the 7 and 8 Geo. IV. c. 28, s. 14, which was the interpretation clause which the Attorney-General brought into Court, and my friend relied on as a weapon brought from his own armoury. He said, because the word "person" there is said to include corporations, that you ought to assume that *primâ facie* corporations ought not to be included. But, my Lords, it might equally be assumed that the word "person" could not include "female," because in the very same sentence it says this, that "person" shall include several persons as well as one, and females as well as males. My friend might say from that that *primâ facie* person did not include a female.

Mr. Justice Mellor: That is in the definition of the word "person."

Mr. Lumley Smith: The very same definition, so that I do not think my friend is entitled to say that the mere fact that in certain statutes and in that general statute express enactment has been made that "person" shall include corporation, prevents it being held that the common law signification is person or corporation where it would not be absurd to give the interpretation of corporation to it. Then my friend says that in the Act of Parliament, for the purpose of shortening the language of Acts of Parliament, it does not say in terms that "person" shall include "corporation." The reason why I should submit that was not put in is this, that there must be in several Acts of Parliament a vast number of matters that can only from the nature of them apply to individuals, as, for example, personal qualification for appointments or for carrying on trade or many other cases, and when you came to legislate and said a person may do this, or may be appointed to this post, and so on, it might be necessary to say "a person, not being a corporation," and so far from its shortening the language of the Acts of Parliament it might in many ways increase the language, because wherever you were enacting something respecting a person which would not be appropriate to a corporation you would have to put in restrictive words, so that really it seems to have left the law as it was, and I submit to your Lordships that in every statute you must take the word "person" as being what I think is called *secundem subjectam materiam*, so that you would have to see in going through the particular Acts of Parliament to which I will now come whether there is anything in the context or in the sections to which these penalties are claimed which prevents it applying to the case of a corporation. There are some cases where it speaks of the widow of a person, and it is perfectly clear that that cannot apply to the widow of a corporation, but my friend asks the Court to say this, that because you find here and there in the Act the word "person" in cases where it must necessarily apply only to individuals, that it must necessarily have the same signification all through the Act; that seems to be the contention, that the moment he can point out one particular section where "person" must mean "individual" it must have the same meaning all through.

Mr. Justice Mellor: He goes further than that. He says, I show you a number of sections which pretty well exhaust the operative parts of the Act—the members of Council, they must possess competent knowledge and various things of that sort,—provisions for examination, and certificate. It is not quite as you represent it to be, only one.

Mr. Lumley Smith: No, my Lord, but that only strengthens the argument; the argument remains the same, only it strengthens it. He says he can show in several places the word "person" is used where it can only apply to individual, and, therefore, we must assume that the word "person" must throughout have the same signification. Now, that cannot be for this reason: we do find [in one clause of this Act of Parliament that a person is made liable to a penalty to be recovered by

summary conviction. Therefore, by the 7 and 8 Geo. IV., it would apply to the case of a corporation. Therefore, we do find, in one clause at least of the Act of Parliament, the word "person" used in a place where, if the offence was committed by a corporation as it well could be, it would be liable. But let us see what the mischief was which the Act had to deal with. The mischief was the selling of poisons by persons who were not properly qualified persons, the persons from whose care or custody they might have gone, into the hands of persons who were improper persons, or who might sustain mischief; and if the Legislature thought it sufficient to say that no one shall sell poison unless he is a registered chemist, they would not have thought it necessary to go on and prohibit the keeping an open shop. I apprehend that what was in the minds of the persons who drew this Act of Parliament and the Legislature when they passed it was this, it would never do to have to prove in each particular case that a certain packet of poisons was sold by a person who was not a qualified person, because it might be very difficult to prove. Let us say no man shall keep a shop, because keeping a shop is a matter which cannot be done in a concealed manner, unless he is a registered chemist. If we find a shop open, in which poisons are exposed in the window, or poisons are sold over the counter, nevertheless, although he may have fifty qualified assistants behind the counter, such shop shall not be kept, and the very fact that the Legislature has prohibited the keeping of a shop shows that it intended to do something more than trust to the mere protection which would be obtained by punishing the person who sells. So that this case, which is now before the Court, comes within the mischief intended by the recital of the Pharmacy Act. It says, "It is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing, or compounding of poisons, and persons known as chemists and druggists, should possess a competent practical knowledge." It there speaks of persons keeping a retail dispensing business, so that it required the keeper of a shop to be registered under the Act as well as the seller.

The Lord Chief Justice: That is in the recital?

Mr. Lumley Smith: Yes.

The Lord Chief Justice: Does the enactment correspond with the recital?

Mr. Lumley Smith: Yes, my Lord.

The Lord Chief Justice: Which section is that?

Mr. Lumley Smith: The first section. "From and after the 31st day of December, 1868, it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons, or to assume or use the title 'Chemist and Druggist,' or a chemist, or druggist, or pharmacist, or dispensing chemist, or druggist, in any part of Great Britain, unless such person shall be a pharmaceutical chemist, or chemist and druggist within the meaning of this Act, and be registered under this Act." The special case finds that this association do keep an open shop. So here we have a shop kept open by a company, who are not a registered chemist, so that *primâ facie* they have broken the law.

The Lord Chief Justice: You say it would not be competent to a man to keep an open shop for the sale of poisons, although he himself took no part in the dispensing of them, but employed a competent man to do it—that that would be no answer to the Act of Parliament.

Mr. Lumley Smith: That a man who keeps a grocer's shop, whose name is over the door—this company in fact was formed to take over this grocer's business of Mackness—that a grocer cannot keep a shop of this kind, because he has a servant behind the counter for the purpose of controlling the poisons. That was one of the grounds on which the County Court judge acted. My friend gives that up to-day; he does not argue that if this had been an ordinary case of a man who is a grocer, who chose to have a department in which poisons are sold, that he would escape.

The Lord Chief Justice: You must go the length that if there were two partners, A and B, who keep open a shop for the sale of groceries, and poisons, and drugs, and one man attended to the grocery, and the other man attended to the chemical part of it, and the latter was qualified, but the former was not, that would be, according to your view, within the Act of Parliament, because they would both keep open the shop.

Mr. Lumley Smith: I presume that would be so. So it is in the case of attorneys. I think an attorney in partnership with another person is illegal, and so I presume a society which was formed for the purpose of carrying on business as attorneys would be liable to punishment although they had an attorney who acted as managing clerk. They might have an attorney on the Rolls as their clerk and put up over the door that they were the Law Conducting Society, Limited, but I presume they would come within the penalty clauses?

The Lord Chief Justice: I do not say it is not so.

Mr. Lumley Smith: Then take another case. Let us see if it is right that a corporation should escape the penalties in this case. My friend says, take the case of poison having been sold in this place by a person who is a servant. My friend says it is quite evident there would be some penalty, which might be levied on the assistant who sold. I will take the case of an ordinary society like this, acting without any qualified assistant at all, who chooses, in defiance of the law, to sell poisons by unqualified assistants. My friend says that is provided for because you can punish the person who sells. But your Lordships will see how very ineffectual such a remedy would be. You get a person who has nothing to lose, who is paid, perhaps, 10*s.* or 15*s.* a week to be behind the counter, and it would be very ineffectual to punish a person of that sort who sold poisons improperly and illegally. What you want to get at is the proprietor, and to make him liable. Therefore, the Act of Parliament says, where you are imposing penalties on the person who sells poison without properly labelling it, "For the purposes of this section the person on whose behalf any sale is made by any apprentice or servant shall be deemed to be the seller." Now, my friend here would say that the association would escape all these penalties, and clearly in this case, supposing a sale of improperly labelled poison was made by a lad in the establishment, he would be the servant of this association who keeps the shop. Surely there it would have to be interpreted that the seller is the association, and they ought to be liable. So that so far as the mischief to be guarded against is concerned the whole of these sections would apply to corporations as well as to individuals. My friend's great *cheval de bataille* seems to be the Apothecaries' Society, because he says he knows the Apothecaries' Society have been selling drugs and doing it a great number of years without registration. But I am told that in point of fact every member of the Apothecaries' Society is a legally qualified apothecary and there is a distinct clause in the Act of Parliament which states that "nothing herein contained shall interfere with the business of a legally qualified apothecary," so that the mere fact that a certain number of legally qualified apothecaries choose to join themselves together to sell drugs does not affect it.

The Lord Chief Justice: Are you sure that those who dispense the drugs and so forth are all apothecaries?

Mr. Lumley Smith: I cannot tell about that, my Lord. The Act says nothing shall interfere with the business of any legally qualified apothecary, but how far it is necessary for a properly qualified apothecary to have an assistant who is qualified I have not referred to see. But as far as my friend's point is concerned, that the Society of Apothecaries sell drugs, I should meet that by saying that in that particular case, as I am informed,—it is not mentioned in the case—but I am told in fact that they are all apothecaries.

Mr. Wills: It is a corporate body.

Mr. Lumley Smith: It may be a corporate body

but the corporate body is composed entirely of apothecaries.

The Lord Chief Justice: That I believe, but whether at Apothecaries' Hall, where they sell and dispense drugs and make up prescriptions and so forth, everybody who is kept behind the counter is an apothecary, I do not know.

Mr. Lumley Smith: I do not know how that may be, but the persons keeping open shop are; we have the Society keeping open shop who could not be proceeded against. My answer is that all who keep open the shop are apothecaries. But there is nothing found in the case about Apothecaries' Hall. It is merely as an illustration that my friend introduces it. Then he goes on to say that at the time this Act was passed there must have been co-operative stores and societies carrying on business as chemists and druggists. We have no evidence of that, and I believe in point of fact it is not so, that although there were co-operative societies then recently established—I think it was the Civil Service which was first established as early as 1868, at that time they were not interfering with this business but only carrying on the business of grocers and sellers of ordinary goods, and that it was not until after these Acts were passed that these co-operative societies have grown up and have taken to selling poisons. So that it comes to this, having got an Act of Parliament which says substantially no open shop shall be kept for the sale of poisons except by the person who is registered, is the Court to allow a great corporation to come in and do what the Legislature have prohibited? Therefore I should ask the Court to say that it would allow the word "person" to be interpreted in the sense in which Lord Coke says it is to be interpreted, and to say that this offence has been committed and that the corporation is liable to pay the penalties which by the Acts are to be recovered in an action in the County Court by the Registrar of the Pharmaceutical Society.

The Lord Chief Justice (after consulting for a few minutes with Mr. Justice Mellor): This is a very important case undoubtedly. We will take time to consider our judgment.

The "Prejudice to the Purchaser" Question.

On Thursday, March 27, in Queen's Bench Division, Sittings in Banco, before Mr. Justice Mellor and Mr. Justice Lush, the case of Hoyle, appellant—Hitchman, respondent, raised a very important question. It was an appeal by an inspector of nuisances against a decision of the magistrate dismissing a complaint against a milkman for adulteration under the Sale of Food and Drugs Act of 1875, and the object of the appeal was to raise the question whether, where, as in almost all cases where officers make such complaints, they have purchased, not for their own consumption, but for the purpose of analysis and prosecution, the complaint is to be deemed to fail on the ground that he is not "prejudiced" within the terms of the Act. The Lord Chief Justice, in a case in this Court last summer (Sandess *v.* Small), was reported to have made an observation to that effect, the case being one of a sale of spirit, and the defence set up being that the officer must have known it was mixed with water to some extent, and it being answered that this was so in most cases where the officer purchased for the purpose of analysis and prosecution, and that in such cases he did not purchase for his own consumption, but for the very purpose of prosecution; on which the Lord Chief Justice was reported to have said, "But if he does not drink it, how is he prejudiced?" and in that case the Court (constituted of the Lord Chief Justice and Mr. Justice Mellor) held that the case failed. Whether or not the observation of the Lord Chief Justice had anything to do with the decision, it certainly has since received the sanction of a considerable weight of judicial authority, for in a case of Davidson *v.* M'Leod some of the judges of the High Court, after a second argument, arrived at the same conclusion—that where the officer, not purchasing for his own consumption, has not been actually prejudiced, the case must be considered to fail. In consequence of these decisions some of the magistrates have since declined to convict in such cases, and the present case was one of them, and was brought before the Court in order to determine the question on which it was said the whole operation of the Sale of Food and Drugs Act practically depends, most prosecutions under the Act being instituted by officers, and few of the poorer classes most likely to be imposed upon by adulteration being disposed to incur the necessary expenses of a prosecution. In the present case the question had arisen thus:—1. The respondent Hitchman was summoned on the complaint of Hoyle an inspector under the Sale of Food Act, 1875 (38 and 39 Vic., cap. 63), for that he, "on the 13th of September, 1878, within the Metropolitan Police District, did sell to the prejudice of the said John Hoyle a certain article of food—to wit, milk, which was not of the nature, substance and quality of the article demanded by the said John Hoyle, contrary to the statute 38 and 39 Vic., cap. 63. 2. On the 4th day of October last the case was heard by me, Sir James Ingham, the chief magistrate of the police courts of the metropolis. 3. The appellant was the inspector of nuisances of the Board of Works for the St. Giles's district, in the county of Middlesex, and was also the inspector duly appointed under the 13th section of the Sale of Food and Drugs Act, 1875. He went on the 13th of September last to the respondent's shop and asked for half-a-pint of milk, and upon being told that the price was 1½*d.*, he paid that sum out of money belonging to the said Board, for which he had to account, and took possession of the milk. Directly after the purchase was so completed he told the respondent's shopman that he was an inspector of nuisances and an inspector under the Sale of Food and Drugs Act, 1875, and that it was his intention to have the milk analysed by the public analyst, whom he named. 4. He then offered to divide the milk into three parts, and did, in fact, so divide it, and sealed up such parts as required by the Act. One part he delivered to the shopman, and the remaining two parts he took away with him and delivered one of them to Dr. Redwood, the public analyst, and produced the third part before me on the hearing of the case. 5. The milk so purchased was found by the public analyst to contain 76 parts milk and 24 parts water, which water had been added to the milk after it came from the cow. 6. On cross-examination by the respondent the appellant stated that he was not prejudiced and that no injury had been done to him personally. 7. The respondent submitted to me that no offence had been established under the 6th section of the Act, as the milk sold was not sold to the prejudice of the purchaser. 8. I found that the appellant demanded milk; that the article sold was not of the nature, substance, and quality of the article demanded, as it was, in fact, milk and water, and not milk; that the appellant at the time when he purchased the milk had no knowledge as to whether the milk which the respondent sold to him was adulterated or not; that no notice of any kind was given to him that the article sold was milk and water and not milk. Had the purchase in this case been by one of the ordinary customers of the respondent, the offence mentioned in the Act would, in my judgment, have been committed. 9. I, however, dismissed the summons, because I thought that, although the appellant did not get the article he paid for, the sale was not, in the circumstances mentioned, a sale to the prejudice of the purchaser within the meaning of the Act, as the milk was purchased by an inspector for the purpose of analysis only. 10. The appellant duly required me in writing to state a case for the opinion of this honourable Court, which I now do. The question for the opinion of this honourable Court is whether I was right in point of law in dismissing the summons. If I was wrong, I pray this honourable Court to remit the case to me with its opinion thereon, so that I may impose such a fine as, in the circumstances of the case, I may deem just."

Mr. Poland, for the appellant, argued that if a complaint otherwise well grounded could be dismissed on such a ground, the Act would be virtually nugatory, as no one but a public officer was likely to buy a pennyworth of milk for the purpose of analysis. No doubt the words were introduced into the Act "to the prejudice of the purchaser;" but the only effect was to exclude a case in which the mixture was not to the prejudice of the purchaser.

Mr. Justice Lush pointed out section 13, providing that inspectors might purchase articles for the purpose of analysis, and several subsequent sections providing for prosecutions by inspectors.

Mr. Morton Smith, in support of the magistrate's decision, said it had proceeded upon the authority of the observations of the Lord Chief Justice in the case in this Court, and also the decision of the Court of Session in Scotland in a similar case to the present, in which five out of seven judges reversed the conviction. But it appeared that there it was not alleged that it was "to the prejudice of the purchaser," nor could it be, the article purchased having been cream, and the purchaser having got cream, though of an inferior quality.

Mr. Justice Lush referred to the regular law report of the case in this Court, whence it appeared that in that case the article was known by the purchaser to be mixed.

Mr. Justice Mellor observed that the view taken by the magistrate seemed to make nothing of the provisions in the Act for purchases of articles for analysis by officers and inspectors.

It was answered that these provisions were confined to cases of adulteration not injurious to the public health; but—

Mr. Justice Lush said he could not so read the Act. The effect of the words "to the prejudice of the purchaser" was only to require that the article should be deteriorated by the mixture. According to the contrary view, any benevolent person purchasing a quantity of arrowroot or other nutritive article for the sick might be imposed upon by adulteration to any extent with impunity, for the purchaser, not himself using the article, would not be prejudiced, and those who were prejudiced were not the purchasers. That was the way in which to undermine the operation of the most useful Act of Parliament.

Mr. Poland, in reply, referred to the report of the case in this Court in the 47th *Law Journal*. He also cited the case of Sandys *v.* Markham, 41 *Justice of the Peace*, p. 52 (January 27, 1877), the "mustard case," where the objection was taken that the purchaser, an officer, purchased only for analysis, and also that mustard was known commonly to be adulterated, and the case was sent back to the magistrates to be restated on the latter point, but Mr. Justice Lush expressed an opinion adverse to the first objection. The case never came before the Court again. No case in this country had decided that if the adulteration was shown, it was a defence that the purchaser did not purchase for his own consumption. As to the Scotch case, two of the judges dissented, and the other five differed a good deal in their grounds and reasons, and that, moreover, it was not a case of adulteration, but simply a case of poor cream.

Mr. Justice Lush observed that it might be that the decision was quite right, and also quite consistent with a different decision of the present case.

Mr. Poland said that was so, and proceeded from the report to point out that at least two judges out of the five went on that ground; and as two dissented from the decision, it followed that only three out of the seven rested their decision on the words "to the prejudice of the purchaser," and the majority of the judges were adverse to the view of the words now suggested. Moreover, the decision partly rested on the ground that it was not alleged that the purchaser was prejudiced, and that he could not have been, as he asked for "cream," and got it.

Mr. Justice Mellor: You do not, therefore, contest the decision.

Mr. Poland: No; nor the opinions of the majority of the judges.

Mr. Justice Lush: There was no admixture of foreign matter in the cream in that case.

Mr. Poland: No.

Mr. Justice Lush: It was only a case of poor cream. Devonshire cream is richer than the cream furnished by the cows in other counties.

Mr. Justice Mellor said, in the Scotch case, there was no mixture of foreign matter with the cream, and he saw no ground for dissenting from the actual decision in that case, however he might dissent from the reasons given by some of the judges. However, the Court felt it was due to the Scotch judges to pay them the respect of carefully reading and considering their judgments, and, therefore, the Court would take time to consider their judgment.

On the following day judgment was delivered by Mr. Justice Mellor, who after discussing the provisions of the Act said it would be strange indeed if all these provisions were to be made nugatory by a construction which would, in effect, come to this—that proceedings could only be taken by private individuals. In the case of a private individual no one could dispute that in such a case as this the offence would have been completed, and the magistrate has so found in fact. That being so, what difference could it make as to the nature of the offence that the purchase was by an officer on behalf of the public and furnished with public money for the purpose? The offence intended to be prevented by the Act was the fraudulent sale of articles adulterated by the admixture of foreign substances which would necessarily be "to the prejudice of the purchaser;" and those words were inserted only to require that such an adulteration should be shown to have been made. Taking all these matters into consideration, he could not bring his mind to the conclusion that in such a case as this the offence was less complete merely because the money with which the purchase was made was not the money of the purchaser, which must be wholly immaterial to the seller and could not affect the offence he has committed. He came, therefore, to the conclusion that the magistrate was wrong in dismissing the case on that ground, and it must be remitted to him to be determined on the evidence as to the offence alleged to have been committed.—*Times*.

Correspondence.

"*Not Interested.*"—We do not fear that the opinion of our dental contemporary will affect the facts of the case.

G. J. Gostling.—It has some value; how much being dependent upon its physical condition.

"*Pharmacist.*"—Dr. Harley in the last edition of Royle's Materia Medica gives the dose of cyanide of mercury at one-sixteenth, gradually increased to one-half grain, in pills or in solution.

"*Peto Lucem.*"—See the answers to quinine mixture queries, before, p. 165, and vol. viii., pp. 772 and 1045.

G. H. Staunton.—See a formula in the *Pharm. Journal* for Oct. 17, 1874, p. 314.

J. H. Williams.—The exemption applies only to jury service.

W. Pitchford.—According to Stillé and Maisch's 'National Dispensatory,' just issued, *Hamamelis virginica* may be administered as a decoction made with an ounce of bark to a pint of water in wineglassful doses every three or four hours or oftener. A fluid extract is also prepared, of which the dose is a fluidrachm, diluted. According to the same authority the dose of *Bryonia dioica* is from 10 to 60 grains of the powdered root or 2 fluid ounces of an infusion made with 2 drachms of the root to 8 fluidounces of water. Each of these substances is represented in the Homœopathic Pharmacopœia by a proof spirit tincture.

FURTHER NOTES ON LIBERIAN DRUGS.

BY E. M. HOLMES, F.L.S.,

Curator of the Museum of the Pharmaceutical Society.

(*Continued from Vol. viii., p.* 564.)

During the last few months further specimens of the plants used in medicine in Liberia have been forwarded to this Museum from Dr. Roberts through the kindness of Mr. T. Christy. Several of these specimens I have been able, by the assistance kindly afforded me at Kew and the British Museum, to identify, and appear to me to be worthy of placing on record, although probably none of them are possessed of very powerful properties.

It may be here noticed as a curious fact that the majority of the remedies hitherto enumerated are equally well known in the West Indies, although not always used for the same purposes in Liberia.

Erysipelas plant.—This plant is evidently *Tiaridium indicum*, Lehm. (*Heliotropium indicum*, L.), a native also of tropical Asia and America, and is one of the plants whose medicinal use seems common wherever it grows.

According to Dr. Roberts the plant is used in Liberia in the following manner: the inflamed part is fomented with an infusion of the leaves, and some of the fresh leaves are steamed or bruised into a pulp, and are applied to the part or bound round it. This is repeated twice a day and is said soon to reduce the inflammation and heat.

In the Mauritius the leaves, bruised and mixed with common salt and applied in the form of a poultice, are said to have a diuretic effect.

In Bouton's 'Pl. Méd. de Maurice," p. 101, a case is related of a soldier who, on account of badly ulcerated wounds, was to have had his leg amputated, but who was cured by the external use of this plant in the form of a poultice and fomentation, the juice of the plant being at the same time administered internally. Ainslie, in his 'Materia Medica,' speaks of the plant being used by the native practitioners of India as an application to gum boils, and to repel pimples on the face, also in certrain forms of ophthalmia. In Cochin China it is used for similar purposes, and in Jamaica, where it is called clary, it is used for cleansing and healing wounds and ulcers. Martius also speaks highly of its medicinal properties.

"*Dysentery plant.*"—This plant is also called "Kackeis." It is a rubiaceous plant, *Oldenlandia globosa*, Hiern., apparently somewhat similar in properties to ipecacuanha. By some the heads of small pale lilac flowers are chewed or the leaves eaten like a potherb; others, however, make a strong decoction of the plant, of which two tablespoonfuls are given three times a day.

The use of other plants of this genus is somewhat similar in other countries. Thus in Brazil one species is used for colic; in the East Indies the fresh juice of another is used in diarrhœa.*

"*Abortive plant.*"—This is the *Stachytarpheta Jamaicensis*, Vahl. (*Verbena jamaicensis*, L.), a native of Jamaica. This plant is said by Dr. Roberts to be used by the natives in the form of tea for procuring abortion, but he does not corroborate this statement from personal knowledge.

The plant is a native also of Jamaica, where it is used, according to Barham, under the name of vervain, as an emmenagogue, the decoction of the root being used, while the expressed juice is administered for worms in children and as a purgative. In Brazil, according to Martius, it is used for healing ulcers and internally for rheumatic affections. In that country it is known as jarbâo, urgevâo, or orgibâo. According to St. Hilaire it is taken by some people as tea, and was at one time sent to Europe under the name of Brazilian tea. He expresses the opinion that it probably is about equal in medicinal value to the common vervain, *Verbena officinalis*; it is nevertheless largely used as a household medicine in Brazil.*

Polypodium phymatodes.—Under the name of "male fern" for the fronds bearing fructification, and "female fern" for those without sori, this plant is used in Liberia for nephritis, dysuria, and other kidney complaints. It is used either in decoction or tincture, the dose of the decoction being two tablespoonfuls three times a day, and of the tincture a teaspoonful every three hours. The female fern is used for leucorrhœa and prolapsus uteri by the native women.

Cream of Tartar plant—This is *Osbeckia rotundifolia*, Sm. (*Dissotis plumosa*, Benth.), a plant belonging to the Melastomaceæ. It is used by the natives as a diuretic and alterative in the same way that cream of tartar is used in this country.†

Curcas purgans.—The seeds of this well-known plant are used as a purgative and emetic, under the name of physic nut.

Anacardium occidentale.—This is called by the natives the caustic plant, the oily secretion in the pericarp being used for destroying warts, etc.

Icica species.—This resin was received from Liberia under the name of copal, but it is evidently a kind of elemi, possibly identical with the African elemi presented to the Museum by the late Dr. Ure.

Externally, the Liberian elemi seems of very inferior quality, presenting a dirty, blackish appearance, the white opaque porous resin only showing here and there. The odour closely resembles that of elemi; it is, however, very much drier and more friable than ordinary specimens of that substance. At my request, Mr. E. Fielding kindly examined it, and reports that its appearance belies its quality. The following results obtained by him show that it is a comparatively pure drug:—

Resin soluble in cold Alcohol	0·845.
Resin soluble in Ether	0·120.
Black insoluble residue	0 035.

The alcoholic solution is surprisingly pale in colour, no darker in fact than a solution of sandarach of equal strength, which is the more remarkable when the aspect of the crude material is considered. The black insoluble residue which, as may be seen above, forms only 3 or 4 per cent. of the elemi, on incineration and subsequent heating in the blowpipe flame, gives to the blowpipe flame the strong purplish white tint indicative of potassium, and showing almost entire freedom from sodium. When separated by filtration from the alcoholic solution and examined under the microscope the black substance is seen to be of vegetable origin and to consist almost entirely of fungoid or algal filaments.

FLUID EXTRACTS BY REPERCOLATION.*

BY EDWARD R. SQUIBB, OF BROOKLYN.

(*Concluded from page* 602.)

It now remains to give some account of the mechanical contrivances which, in the hands of the writer, seem best adapted to a uniform and practically good exhaustion of the soluble portions of drugs without the use of heat, so that the fluid extract of the drug shall bear a tolerably definite and uniform relation to the drug of minim for grain and weight for weight, for the writer now believes that both these relations can be had at once with a practical and sufficient degree of accuracy, or with accuracy enough for the present relations of pharmacy to therapeutics. It can hardly be doubted that by a competent knowledge of known physical laws, and by a fair application of this knowledge to the problem, a fluid extract can be made by repercolation, without heat, bearing the proper relation, with great accuracy, but the success or want of success with which this is done will vary much more with the degree of knowledge and skill applied to it, than with any particular form of apparatus used. That is, the measure of success will always be in the application of well known physical laws. The writer therefore desires to guard against any misleading effect of a simplicity that is not intended to be *ad captandum*, for it would be very hurtful to continue in the present to underrate a problem which has been so very much underrated in the past. If the principles involved, and the difficulties of carrying them out, be once fairly comprehended, the mechanical appliances may be easily varied ; and yet must still leave some one contrivance as the best until a better be found.

No better form of apparatus has been found by the writer than that which has now been used, upon various scales, during the past twelve years, an account of which was published in 1872, and which is reproduced with improvement and amplification at the end of this paper. To simplify this apparatus with the slightest possible sacrifice of the principles involved, with the object of getting the principles to be better and more generally understood and applied where so much needed, is the object of introducing the modified apparatus shown in the following cut.

Fig. 3.

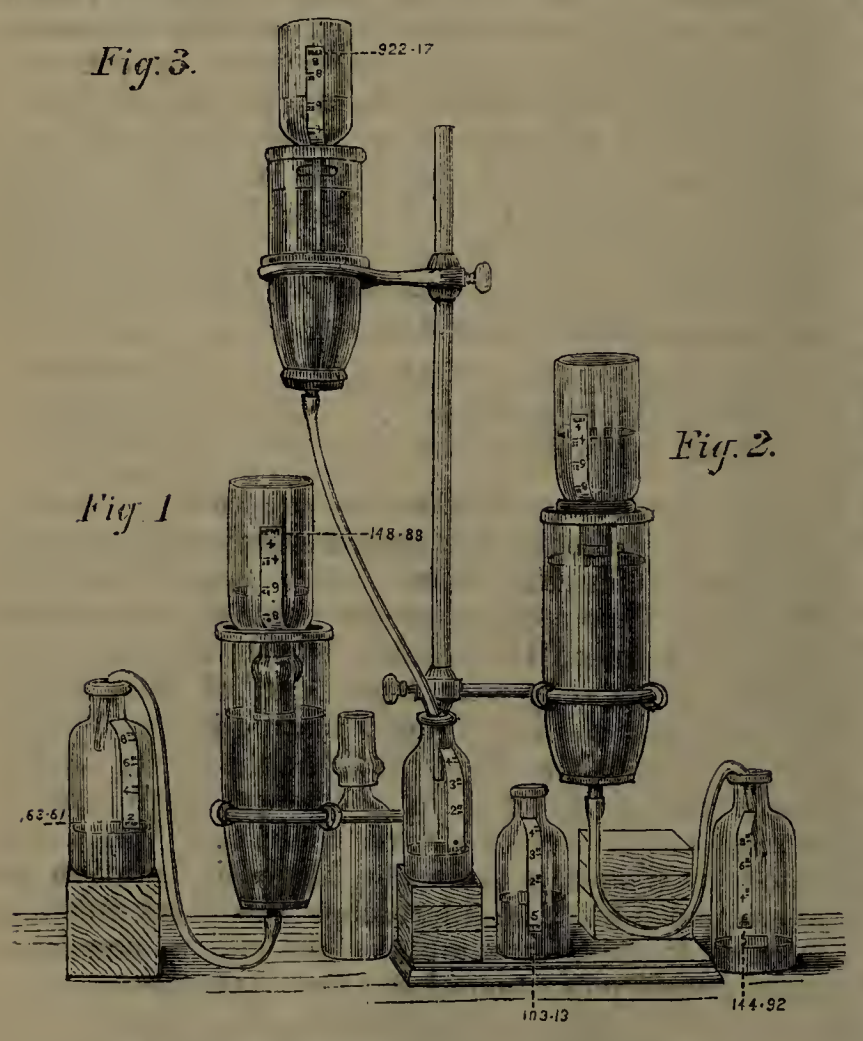

Fig. 2.

Fig. 1

Scale, one-ninth of the actual linear size.

* From the *American Journal of Pharmacy.*

The cut presents three separate groups of apparatus in positions to illustrate three stages of repercolation, and it is to be understood that all intermediate positions are often useful and necessary even in the same percolation. The support is a common apparatus stand, the rings of which are reduced to the proper size by short sections of rubber-tubing cut open and placed on the wire of the ring when needed ; or, a section of larger tubing stretched over the percolator as in fig. 3. The percolators are common lamp chimneys costing about five cents each, and are of the size and form known technically as "A" and "B" "sun chimneys." These are of very good form, though not the best, for percolators, and should be selected with as small an opening for the stopper as possible, and with the smoothest, thickest and most regular edge, since it is practicaly impossible to stop some of their irregular edges tightly. The smaller size, fig. 3, holds conveniently 4 ounces of most powders, and the larger holds 8 ounces, to the points shown in the cuts. A good soft cork, bored in the centre for a short piece of glass tube of not more than $\frac{1}{8}$th of an inch or 3 mm. bore, serves to close the small end of the chimney. A rubber cork is best, and such may be made of concentric sections of rubber tubing of different sizes ; or, the largest cork at hand may be increased to the proper size by stretching around it short sections of rubber tubing. The short piece of glass tubing should not go quite through the cork on the inside, and should project about an inch=25 mm. outside. A piece of rubber tubing of not over $\frac{1}{8}$th inch=3 mm. bore, and about 13 inches=·325 m. long, has one end slipped on to the glass tube. If this tubing be much larger than the dimensions given it fails to be filled with the liquid, and then when the percolator is in the position of fig. 3, it fails to perform the office of a Sprengel pump in exhausting the liquid and air bubbles from the lower part of the percolator. Two disks of blanket or thick flannel, and one of filtering paper cut a little larger than the inner surface of the cork, and laid upon it, complete the arrangement of the percolator. The powder, moistened with great care and uniformity, is packed loosely, firmly or very firmly, according to its nature or condition, with the square end of a stick, say ·8 inch=·02 m. diameter. As a rule the largest practicable proportion of liquid should be used in moistening the powder, because then the powder occupies the smallest space in the percolator, requires the loosest packing, and is saturated for the maceration by the smallest additional quantity of liquid, and therefore gives the most concentrated first percolate for the reserve, and secures the most rapid exhaustion by the smallest quantity of liquid. A disk of filtering paper is placed on the surface of the powder, of such size that the edge is reflected up against the glass. A disk of board, card-board, or better of thick sheet rubber with a central hole 1·5 inches=·037 m. in diameter, is used for a cover. A stratum of liquid, maintained at a uniform thickness of ·25 inch=·006 m. should cover the powder from first to last, so that it may not drain and contract, or admit air ; and this is best maintained by an inverted bottle of the supply liquid, as shown in the cut. The length of the neck and mouth of such bottle may be conveniently elongated when needed so as to regulate the depth of the stratum of liquid above the powder, by stretching over it a short section of rubber tubing in the manner shown in the first group of the cut, fig. 1. When the percolator is charged and ready for maceration the small rubber tube is turned up and fastened with a piece of thread or rubber band, so that the end is considerably above the level of the liquid in the percolator, and in so adjusting it care must be taken not to close the tube, because as the liquid descends through the powder to fill up all the interstices it is important that the interstitial air should have a free exit by the tube.

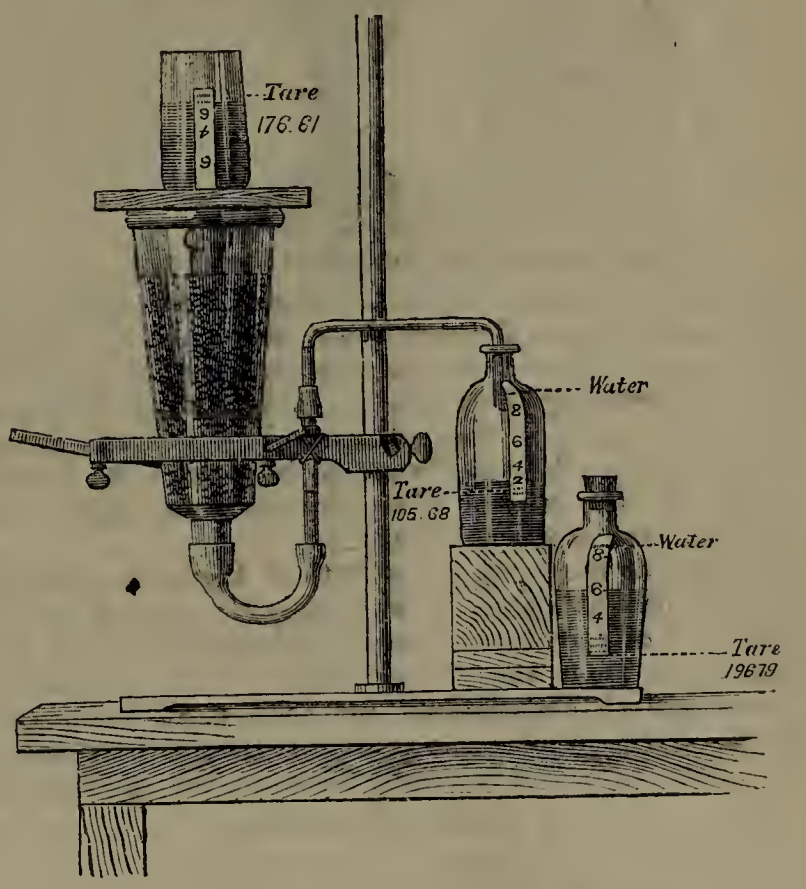
The bottles for receiving the percolate are common round-shouldered prescription bottles, 4 oz. for the small percolator, 8 oz. for the larger. A strip of paper should be pasted lengthwise of the bottle, and at the lower end of this the tare should be marked. It should then be gra-

duated to the quantities desired by weighing into it the proper quantity of water and marking at each level if more than one be desired. This graduation simply serves as a reminder to know when to try the bottle on the scale, for whether the finished fluid extract be adjusted weight for weight, or by an arbitrary weight in each case so as to get the relation of minim for grain, this must equally be done by weighing.

It is convenient to have 6 to 10 of such bottles, and then as soon as 4 are filled from one percolation another can be started, and thus relieve some of the bottles for use over again. The bottles should be numbered from 1 to 10 to keep the proper order of using them, and if more than one series is in use at the same time the second should be designated by the first letters of the alphabet instead of by numbers. The maceration should never be less than forty-eight hours; and a longer time does not seem to be of any use unless the powder be coarse and of hard particles. When the percolation is to be started the percolator is raised to the position of fig. 3, and the end of the exit tube placed in the bottle marked for the reserved percolate, for 10 to 15 minutes, in order that the bubbles of air may be driven out and the tube be filled solid with liquid. As soon as this condition is attained the percolator is lowered to the position of fig. 1, and the receiving bottle is then to be adjusted higher or lower until a rate of dropping is established of not more than one drop per minute on this small scale,—and one drop every two minutes makes a better rate for such quantities. Indeed the rule for all percolations is, the slower the rate the more perfect the exhaustion, and with a smaller quantity of menstruum.

This slow rate and the automatic supply by the inverted bottle admit the process to go on night and day, but if it be desired to go slower, that a mark may not be passed in the night, the bottle has only to be raised or the percolator lowered a little; and by a still greater change of levels the dropping may be stopped altogether. On rare occasions when dropping at a uniform rate it will stop altogether or become very slow. This is in consequence of a bubble of air getting over the orifice of the glass tube inside, and acting as an obstruction. If the tube be moved from side to side the air bubble will be started and pass down and the rate of dropping be resumed. If not thus dislodged it will most certainly be by raising the percolator for a short time into the position of fig. 3. With some powders, and some degrees of moistening and packing the proper rate of dropping will require the position of fig. 2, and in some stages of many percolations this position will be required. While if for want of skill and experience the packing be too hard the position of fig. 3 may be needed from the first. But the best percolations are those obtained by the position of fig. 1, where the whole mass is in equilibrium of maceration, and the fluid all moves downward together at a very slow rate. As the more concentrated portions of percolate get through, the rate of dropping increases for any position, and occasionally, with loose packing, the position has to be altered to check it. But after the reserved portion has been received, and the quantity required to moisten the next powder, the rate of dropping may be doubled without much harm, and thus half the time be saved. The slow and uniform rate of dropping is the important point to be attained, and the various positions are simply means of accomplishing this. It is easy to obtain complete exhaustion. That is, a percolate almost colourless and tasteless, and having the same s. g. as the menstruum, and how far short of this to stop the process cannot be indicated. But upon this small scale the percolate from the first portion should weigh from 3 to 4 times the weight of the powder; and for the repercolations from 5 to 7 times the weight of the powder. And then with fair exhaustion each time the results must continually check each other and improve until after ten or twelve repercolations, a nearly mathematical accuracy must be attained, and ever after be maintained, all the variation being in the quality of the drug used. The writer has many series of repercolations, on various scales of quantity, which were started five years ago and suspended from one season of the fresh drug to another, but never interrupted to begin anew, and such would go on indefinitely and with entire uniformity of result if the drugs could be obtained of a quality as uniform as is the process.

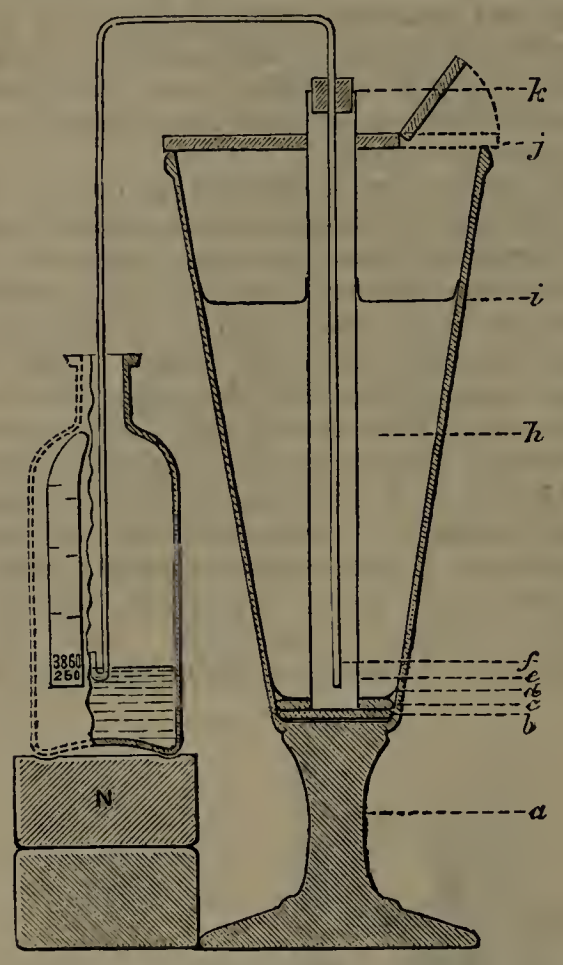
Should this method by repercolation become officinal, or come into general use, the apparatus makers would soon supply a flat-bottomed glass percolator and cover of better form than the lamp chimneys, and of all sizes at moderate prices. If so, no better form could be adopted than that shown in the following cut, if the bottom be flat or very nearly so, and the exit tube be of the proper size to receive a No. 5 vial cork. Then such a cork bored to receive a piece of glass tubing 1·6 inch=·04 m. long with about 3 mm. bore would adapt it to the small rubber tubing used with the lamp chimneys. Even with the glass percolators now in common use, a short section of small rubber tubing serves as a cork to go inside the outlet, and the short piece of glass tubing through that. Then the small rubber tubing is used exactly as with the lamp chimneys.



Scale, one-ninth of the actual linear size.

The chief object of presenting this illustration is to show a convenient way of applying the principles involved in the syphon percolator to the glass percolator in common use, in order to try to tempt those who have such percolators to use the method in percolation and repercolation. The cut is so plain and so easily understood that it needs but little explanation. The percolator is shown in the position of having been stopped for the night lest the receiving bottle should be filled beyond the proper mark. The syphon here is made in two parts, one end of the upper part being telescoped within a larger piece of glass tubing, and the junction made tight by a short section of rubber tubing through which the smaller tube is free to slide. During maceration, or when the percolation is arrested, the upper part of the syphon is drawn up until the liquid will no longer flow over into the bottle, and the height at which this column of liquid ceases to flow over is a measure of the comparative density of the liquid within and without. As seen in the cut the liquid will not flow over into the bottle although the column is several inches short of the height of the liquid in the percolator. But as exhaustion progresses, and the liquid in this column becomes less dense, its counterbalancing height becomes greater, until finally when the powder is exhausted and the liquids within and without are of the

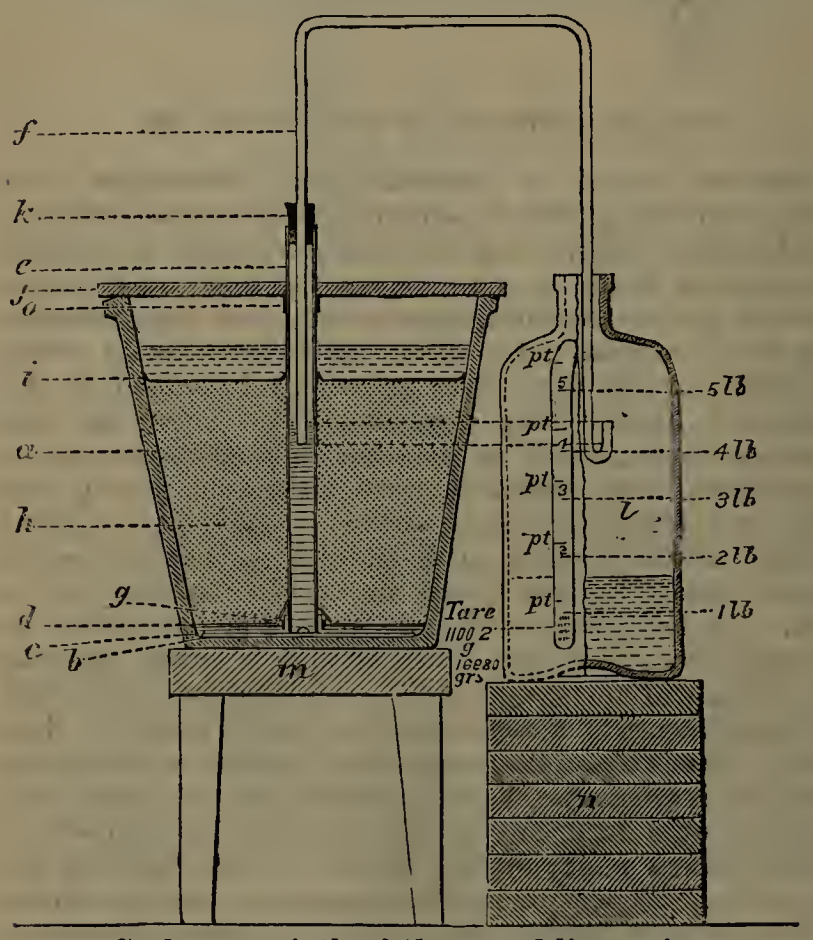
same density the column rises to the level of the liquid within the percolator minus the friction and capillarity.



Scale, one-sixth of the actual linear size.

When the percolation is to be started, the syphon is simply pushed down through the rubber until the liquid flows over, and then the rate is established by carefully raising or lowering the syphon. This sliding joint for varying the length of this column of liquid at will being understood, the other details are plain enough, whilst the charging and the general management are the same as in the smaller and larger percolators.

However attractive the simplicity of the lamp chimney arrangement may appear it does not yield so good results as the form of percolator reproduced here, with slight improvements, from the 'Proceedings of the American Pharmaceutical Association,' for 1872, p. 82, for several reasons. First, because the principles involved are not so well carried out, and secondly because the quantity of



Scale, one-ninth of the actual linear size.

substance operated upon is too small. Very good and uniform results need hardly be looked for when the quantity operated on for each percolation is less than an avoirdupois pound. That is when less than that quantity is used, great care and skill are necessary to get good results. Another percolator, applying the same principles by the same details, but having about five or six times the capacity of the first, was soon after made and put into use, and cuts of these two percolators are shown in the preceding column, one upon a scale of one-sixth of the actual linear dimensions and the other upon a scale of one-ninth, the reference letters denoting the same parts in both. Of course the principles involved when once understood can be applied to vessels of any kind and size by means of common glass tubing, and in order to have these principles tried by less prejudiced persons than the writer the mechanism will now be given as plainly as possible, as applicable to this best form of apparatus.

The percolator, *a*, is of the form of the more modern glass or tin percolators, somewhat funnel shaped to allow substances to swell without becoming impacted, but having no special angle. The smaller has a glass stem and foot like an ordinary celery glass, and the larger is an ordinary stone ware pot, neither having an opening in bottom nor sides. The smaller is about 16 inches=40 centimetres in height, of which height about 4 inches=10 centimetres is stem and foot, and is of a proper capacity for 16 to 20 ounces=500 to 600 grams of material and a proper stratum of menstruum. The bottom, internally should be about 2 inches=5 centimetres in diameter and should be flat, not cup-shaped as the glass-blowers are apt to leave it. A rim of glass is made upon the upper edge or lip, to strengthen it, and this lip is ground off so that the cover may fit accurately to prevent loss by evaporation. The height of the foot and stem is not a matter of indifference, since if too short it has to be set upon a stand in order that the receiving bottle may be conveniently charged.

The larger percolator, *a*, is a stoneware pot of about 2 gallons=7557 c.c. capacity, 10 inches=24 centimetres high and across the top, by about 6 inches=14·4 centimetres across the bottom, inside, and it will conveniently hold 4·5 to 6·5 pounds=2 to 3 kilos, and a proper stratum of menstruum. When to be used for a variety of substances in succession such pots should be well burned and well glazed, to prevent the liquids from getting into the body of the ware.

A disk of blanket, *b*, is cut of such a size and shape as to lie flat upon the bottom, and cover it entirely. Another disk of the same material, but a little larger, *c*, is made with a crucial incision in the centre, so that it may be stretched over the end of the well-tube, *e*. The central or well-tube, *e*, is a simple piece of glass tube about 12 inches=30 centimetres long, by ·5 to ·75 inch=1·5 to 2 centimetres internal diameter, irregularly notched, or gnawed off obliquely at the lower end. One end of this well-tube, *e*, is pushed through the crucial cut in the centre of the upper disk of blanket, *b*, and the blanket is pushed to the upper end of the tube so that the corners made by the crucial cut are reflected up against the outside of the tube. These corners are then tied firmly to the tube by passing twine around them, or are secured by a stout rubber band, *g*, made of a section of rubber tubing of proper size. A disk of filtering paper, *d*, larger than the upper blanket, *c*, with a crucial cut in the centre, and nicked round the edge so as to lie flat against the sides of the percolator where reflected up against them, is pushed down upon the upper blanket, the well-tube passing through the crucial cut in the centre.

If now a piece of paper be twisted round the upper end of the well-tube, or a cork be temporarily stuck into it, to keep out the moistened powder, the percolator is ready to receive its charge which is packed around the well-tube and upon the disks of paper and blanket so as to occupy the main body of the percolator, *h*, up to about the position of *i*.

When the charge, having been properly moistened, rubbed, and sifted, so as to be entirely uniform and free

from wet lumps, is packed around the well-tube loosely or firmly according to the nature of the substance and the menstruum, its surface is covered by a disk of muslin or paper, *i*, cut so as to lie flat and smoothly upon the surface. The object of this is to distribute the menstruum as it is poured on, and to prevent the stream from breaking up and deranging the surface. Should this disk show a tendency to float in the stratum of menstruum it may be weighted down by a few fragments of glass. The percolator is then ready to receive the menstruum or weak percolate, and a stratum of the liquid should be carefully kept covering the entire surface well until the whole mass of the substance to be percolated is entirely saturated. The cork is to be taken from the well-tube before the liquid is poured on, and then the liquid will pass down into the substance like a piston, pushing the interstitial air down before it to pass out through the blankets and the well-tube; and finally the liquid will rise in the well-tube until its surface is within an inch or so of the surface of the liquid outside.

The whole substance is now in a perfect condition for maceration, and the surface should be left covered with the liquid to the depth of at least ·4 inch = 1 centimetre. In the larger percolator a short section of rubber tubing, *o*, is stretched over the upper end of the well-tube, and slipped down so as to support the centre of the cover. A tightly fitting cover, *j*, made of sheet rubber ·25 inch = 6 millimetres thick, with a hole in the centre for the well-tube, is then put on. If made of sheet rubber this cover fits so closely that it will soon save its cost by preventing loss of alcohol by evaporation. Its size in the larger percolator permits one side to be bent up when liquid is to be poured in. But in the smaller percolator it is very convenient to have one side of the cover cut two-thirds through from below, as shown in the cut, the undivided portion forming a good spring hinge permitting this part of the cover to be easily raised to pour on liquid. If a self-feeding bottle be used, as is generally advisable in order to keep the level of the liquid constant and thus obtain a flow at a uniform rate, it may be easily applied by making a hole of suitable size in the cover. When thus supplied and covered the maceration should continue for forty-eight hours at least. The whole arrangement now represents a well, dug in a wet soil of a substance to be percolated, and the proposition is, to pump out this well at so slow a rate that the liquid from outside the well coming in to supply that rate, through the disks of paper and blanket, which represent the gravel stratum of the soil, may descend so very slowly as to be nearly frictionless. The object is, to give the whole liquid up as nearly as possible to gravitation, and to so diminish the rate of descent that the particles or portions of liquid which pass between and around the particles of solid matter may travel downward no faster than the portions of liquid which pass through the pores or interstices of the more solid substance whose soluble portions are to be washed out. Because, if the whole mass of liquid travelled downward at absolutely the same rate through a perfectly saturated mass of solid permeable substance partially soluble in the liquid, and if the molecules of liquid passed downward in absolutely straight lines, through some particles, but between others, and always at a uniform rate, it is easy to see that all the first portion of the liquid would come through saturated, and all the remainder would hold nothing in solution, because the substance would be absolutely exhausted by just the quantity of liquid which it was capable of saturating. The writer has on one or two occasions made percolations so slowly as to somewhat approximate this theoretical result. The dropping in one case was not over 4 drops in each twenty-four hours, or about a cubic centimetre every five days. To pump out this well at a uniform rate which can be easily controlled, is therefore the most important element in a successful percolation, and the only one which has offered much difficulty in the past. And it can only be effectually done by means of maintaining a difference of levels in the liquid inside and outside of the well-tube. The moment a drop of liquid is taken from the well-tube, the liquid outside tends to supply its place, and will supply it in a certain definite time; and if the entire mass of liquid be under the same tension, and equally free to move through the short distance required at the slow rate required, then as liquids are practically inelastic, every drop throughout the whole mass, whether in the interstices of the solid particles or between those particles, will have moved downward through the distance and at the rate required to supply its share of the drop required to replace the one taken from the well. And if the volume of the drop be compared with the total volume of liquid set in motion, and the rate of its movement as taken out be multiplied into the mean horizontal area of the percolator, a good indication is obtained of the almost infinite slowness with which the vertical columns of molecules of the liquid descend through the mass, and the physical laws which govern percolation may be better understood.

The proposition then is to keep the total mass under a uniform tension throughout, and to do this by maintaining a difference in levels between the liquid inside and outside the well; and this difference of levels, which varies with each substance, and with every stage of the percolation of the same substance, is to be maintained by drawing liquid from the well at so slow a rate as to disturb the uniformity of tension throughout the whole mass as little as possible, so as to have the whole liquid in motion at a uniform rate like a slowly descending piston. Of course the simplest way of taking the liquid from the bottom of the percolator is the old often-used stop-cock in an opening in the bottom; but this proves objectionable for several reasons. First, it is difficult though not impossible, by means of a stop-cock at the bottom, to keep the whole mass of matter at a uniform tension, or in uniform maceration. Channels of liquid in more rapid motion are more apt to form, and the packing has to be much more carefully done in order to prevent this tendency to currents in the mass. Next, in actual practice it was found that no stop-cock could be arranged to do its work automatically according to the natural requirements and varying conditions of each case. It must be arbitrarily set to run at some rate of dropping that would be decided by the judgment of the operator rather than by the natural conditions and laws of the process. Then no stop-cock could be found which would continue to run at so slow a rate of dropping with any degree of uniformity through so long a time. The smallest particle of solid matter would diminish the rate, or stop it altogether, so that it required to be continually watched or readjusted, and every change that was made disturbed the whole of the delicate balances and motions of the process. Again all the metals of which ordinary stop-cocks are made are attacked by the liquids in so long a process, and have the same objection that metallic percolators have. Glass stop-cocks were tried, but they were found equally liable to all the objections except the last. This experience led the writer directly to the well-tube, and to the use of a syphon, *f*, as best fulfilling all the conditions required, since it can easily be set lower or higher, to adjust the levels to the desired rate of motion, and having a free flow it works automatically and with certainty. This syphon, *f*, is made of glass tubing of about ·125 inch = 3 millimetres bore, bent twice at right angles, the two legs being about 12·5 inches = 31 centimetres long. The outer leg is a little longer than the inner one, and turned up upon itself for about ·750 inch = 2 centimetres, as shown in the cuts. The legs should have only such a difference in length that the inner one should reach the bottom of the well-tube when required, and when measured upon the outer one, should reach to about midway of the turned up end of the outer leg. This construction prevents the syphon from emptying itself at any time, for, when the liquid is drawn over by the syphon until the surface of liquid in the well-tube falls to a level with the

end of the turned up portion, as shown by the lines in the cut of the larger percolator, the columns of liquid in the syphon will be of equal length, and will counterbalance each other, and therefore the flow will cease without emptying the syphon. But as soon as the level of liquid in the well is raised by fresh additions of menstruum on to the substance, the flow will recommence at a rate proportionate to the difference of levels, and may be readjusted to the required rate by slipping it up or down in the cork, *k*, in the upper end of the well-tube. This cork, *k*, should be bored to fit the syphon so tightly as to hold it in any position and should have a groove filed longitudinally on its outer side so as to allow free entrance and exit of air to the well-tube. A receiving bottle, *l*, upon which a strip of paper is pasted to receive any graduation marks that may be desired, completes the apparatus. The strip of paper on the bottle should have the tare of the bottle in grains and in grains marked in ink at its lower end, and should then be varnished. Then the graduation marks may be made with pencil, and be rubbed out and replaced as different graduations may be required for different substances, the graduations merely indicating when to try the weight of the accumulating percolate. A wooden stand, *m*, is necessary for the larger percolator, to enable the receiving bottle to be conveniently removed and replaced without disturbing the syphon; and wooden blocks, *n*, are necessary to support the receiving bottles at various heights. As a general indication, the rate of dropping from the smaller percolator should be about 6 or 8 drops to the minute, and for the larger one about 10 to 12 to the minute. But it should always be borne in mind that the rate cannot be uniform without some self-feeding arrangement that will preserve a uniform stratum of liquid upon the surface of the substance, and that with such an arrangement, the slower the rate the more perfect and the more economical the exhaustion will be. With a rate of 2 or 3 drops a minute the results are practically perfect, when the conditions of fineness of powder and appropriate menstruum are properly fulfilled.

The maceration for, at least forty-eight hours is useful for many reasons, chiefly that the adjustment of temperature and solubility may take place fully and naturally:—that the particles may be thoroughly permeated by the liquid, and the liquid become saturated. And because if the maceration be omitted, the percolate, in many cases, will not be entirely bright or clear. Then as a rule, the longer the maceration within reasonable limits, the stronger will be the percolate that comes next after the maceration, no matter at what stage of the repercolation the maceration be applied.

When the maceration is completed and the percolation to be started the syphon is put in place with about three inches = 7·2 centimetres of the inner leg immersed in the liquid of the well-tube. Then the best way to start the syphon is by means of a piece of glass tubing of the same size as the syphon and any convenient length, armed at one end with a short section of rubber tubing of such size as to slip over the end of the turned up part of the syphon easily, but fitting tightly, or being tied on to the end of the piece of glass tubing. The syphon and receiving bottle being now in position to start, the rubber end of the glass tube is passed into the neck of the receiving bottle and down till the rubber slips over the end of the turned up portion of the syphon. Then by gentle slow suction with the mouth at the upper end of the glass tube the syphon is slowly filled, and when filled, the glass tube and rubber are removed. As soon as the dropping commences the syphon must raised or lowered until the desired rate of dropping is attained. If the syphon has to raised in order to attain the rate it must be done little by little in order to avoid raising the inner end out of the liquid in the well. The rate of dropping can only be established with entire uniformity when the inverted automatic feeding bottle is used for supplying menstruum, because when the menstruum is poured on from time to time the dropping will be a little faster as the outside level is raised by each addition.

When weak percolates of diminishing strength are successively used on top, the stratum of liquid should be kept thin so that each stronger weak percolate may have nearly all sunk into the substance before the next weaker one is used. In receiving the percolate the blocks, *n*, are used to support the receiving bottle in any position, and when the percolation is to be stopped, or made to go very slowly, during the night for example, this may be effected either by raising the syphon higher, or by blocking up the receiving bottle so that the outer end of the syphon is immersed in the percolate received to the necessary depth. Of course when the receiving bottle is blocked up so that the mouth, or any desired mark upon the bottle is near the level of the liquid in the percolator, the bottle can never run over nor the mark so raised be surpassed. The dropping end of the syphon should always be inside of the receiving bottle, because thus all loss by evaporation is avoided, the air inside the bottle being still, and being saturated. If the same rate of slow dropping was carried on outside in the moving air of a room, and the drops fell into a funnel, for example, about one-fourth of the menstruum would be lost by evaporation, the more volatile portions in greater proportion, and the percolate would be turbid and unfit for use.

The last weak portions of percolate may almost always be pushed through by the careful use of water on top, and in proportion as the operator acquires skill in the management, little menstruum will be lost. When exhaustion is practically complete the syphon is pushed down to the bottom of the well, and the last weak percolate drawn off rapidly.

Then if another portion of the same substance is to be put into the percolator, the exhausted residue should be so removed as not to disturb the disks of paper and blanket at the bottom.

The principles of this process once well understood, modifications of apparatus will occur to many. The simplest of those that have been tried on a scale larger than the one above shown with lamp chimneys, is to dispense with well-tube and syphon, and replace them with a piece of rubber tubing of small bore. One end of this is placed between the two disks of flannel near the centre of the percolator, and then the tubing is led up through any part of the packed substance, say near, but not against the side of the percolator, as this would leave channels for liquid, and then out over the edge of the percolator. Then a small bent portion of glass tubing is slipped into the end of the rubber so as to represent the end of the glass syphon. This end can then, by the flexibility and length of the rubber tube, be kept at any desired position. This however does not answer as well in practice as the well and syphon, nor does any other yet tried, including the simplification adopted with the lamp chimneys, answer as well when judged by the results obtained.

The writer made a conditional promise at the request of the Committee that he would give a table showing his own practice with fluid extracts in regard to the menstruum now used for each, the weight of a pint of the menstruum and the weight of a pint of the finished fluid extract in each case, as bearing upon the proposed new relation of making them weight for weight instead of minim for grain, and the work for constructing such a table has been done. But this paper has grown to such an unreasonable length that it will hardly be read, and the calculations and construction of the table would require so much additional time that the writer must beg the Committee to excuse him for not presenting it.

The writer was rather opposed to the new relation of weight for weight when this point was discussed by the Committee, but now considers it practicable if the labour be given to make it fairly accurate; and believes that it might be made far more accurate than the present relation of minim for grain, this latter having proved to be rather an ideal than a practically true relation.

BUTTER ANALYSIS.*

BY H. HAGER.

I. 20·0 parts of the butter to be analysed, together with 3·0 to 4·0 parts of pure sodium chloride, are placed in a weighed glass vessel, and the whole is weighed and heated to 50°–80° in a water-bath, when the fatty part forms a yellowish layer on the top, whilst the water, casein, and salt remain at the bottom. Two portions of 5·0 parts of the clear fat are placed in glass flasks of about 12·0 c.c. for further investigation, as described in III.

II. *Estimation of Moisture, Casein, and Salt.*—The fat is decanted as far as possible; then 10 c.c. of warm benzene are added and gently agitated with the liquid, so as to take up the rest of the fat. The vessel is then allowed to stand in a warm place for half an hour, when the benzene is poured off and 10 c.c. more are added to remove the last traces of fat. The liquid is allowed to stand for half an hour longer in a warm place to remove the last traces of benzene, and the vessel and its contents are again weighed; this, after subtracting the 3·0-4·0 NaCl added, gives the weight of the total moisture, casein, and salt. The residue is then treated with hot water and filtered. The filtrate evaporated to dryness gives, after subtracting the NaCl added, the salt in the butter. The casein remains on the filter.

III. *Saponification of the Butter Fat.*—To the 5 grams of fat in the flask, 20 c.c. of alcohol are added, and 10 c.c. of a freshly-prepared solution of 2·0 grams of pure caustic soda in 10·0 of distilled water; the whole is then agitated and heated to 50°–60°, when the flask is corked and violently shaken. The alcohol prevents frothing. After a few moments' rest, small particles of fat are observed if the saponification is not complete. When this is the case, the flask is uncorked and again heated; recorked, wrapped in a towel, and shaken; it is scarcely ever necessary to repeat the operation a third time. The author says that it takes about 6–8 minutes for complete saponification.

IV. The warm soap-solution is poured into a large beaker, and the flask washed out with 45 per cent. alcohol. The solution is then warmed without boiling, so as to evaporate as much as possible of the alcohol; 3–4 c.c. do not interfere with the following reactions. A little warm water is added, and then 20·0 of previously warmed dilute sulphuric acid (1 : 5 water), and stirred; water is then poured in until the level of the liquid is about 2 c. below the mouth of the beaker. After the fat has completely separated out in the water-bath or other warm place, 5·0 of perfectly dry white wax or paraffin are added, heated to melting, and the whole placed in a cool place to solidify, leaving the glass rod in a beaker. The evaporation of the alcohol is necessary on account of the solubility in an alcoholic solution of the fatty acids insoluble in water.

V. As the fatty acids soluble in water require a large quantity of the latter, it is better to employ 20–23 per cent. alcohol. as it dissolves them readily without acting on the insoluble acids. After cooling, the glass rod, with the cake of fat adhering to it, is carefully lifted out, the water poured off and replaced by the alcohol described above, and the fat again put into the beaker and gently boiled for about eight minutes. After cooling, the liquid is poured off and the whole operation repeated, when all the soluble fatty bodies will have been removed.

VI. The cake is now dried by means of blotting paper, and removed from the rod into a small flat-bottomed dish, previously weighed, together with the particles of fat which may have adhered to the beaker; dried at 100°–120°, and weighed, the weight of the wax added being subtracted.

VII. It is safe to assume that butter fat contains 88 per cent. of fatty acids insoluble in water. When the amount of acid found does not exceed 88 per cent., nothing but pure butter fat is present. When it is between 88 and 89, the butter fat may have been adulterated with other fats. When this is the case, a wick should be impregnated with the fat, lighted, and blown out. If the well-known smell of a tallow-candle is not distinctly perceived, the butter may be considered to be quite pure. When the weight exceeds 89 per cent., the butter is certainly adulterated.

NEW MODE OF PREPARING SOLUTION OF PERCHLORIDE OF IRON.*

BY E. B. SHUTTLEWORTH.

The preparation of solution of perchloride of iron is always a disagreeable operation, and, on the large scale, especially so. The addition of nitric acid to the acid ferrous chloride requires to be made very carefully, and the operator must give it all his attention, else the rapid disengagement of nitric oxide may cause loss by foaming. The ordinary directions require the operation to be conducted at a temperature considerably above that of boiling water, and a vessel capable of bearing the heat of a sand-bath and of withstanding the most trying of acids is requisite.

If the plan proposed some years ago by Mr. R. Rother† be followed, the operation may be performed with comparative comfort, but the introduction of a salt of potassium, or sodium, is an insuperable bar to the general application of the method.

The process may also be rendered much pleasanter, but at the sacrifice of time, by following the suggestions I made some years ago,‡ and allowing the mixture of acidified iron solution and nitric acid to stand a day or two at ordinary temperatures, or at the heat of a water-bath. In this way the use of expensive vessels may be avoided, and the whole operation conducted in earthenware. I have, however, for the past four or five months pursued another plan which was suggested to me by Mr. S. Cox, a practical chemist working under my direction, and which is so great an improvement on former methods, and which answers the purpose so admirably, that I feel justified in recommending it very strongly.

It consists in reversing the ordinary operation,—adding the iron solution to the nitric acid instead of the acid to the iron. If the specified quantity of nitric acid be placed in a dish or pan, and the iron solution mixed with the proper quantity of hydrochloric acid be allowed to trickle slowly into it, the oxidizement is instantaneous in the cold, and the frothing very slight. The change from blackish-green to reddish-brown is very marked, and any deficiency in the quantity of nitric acid can be at once seen. On the large scale the liquor may be best added with a syphon. With a bent glass tube of five-sixteenths of an inch in diameter, the liquor from ten pounds of iron may be run in safely in twenty-two minutes, and requires no attention whatever, save in getting the syphon in operation. With pharmacopœial quantities of material the process of oxidizement may be concluded in almost as many seconds.

The final concentration may be performed in a water-bath, and in this case earthenware vessels may be used, but of course the evaporation is much more rapid with the naked flame or a sand-bath; but a high degree of heat is not at all necessary in making this preparation.

I think this plan of reversing the order of mixing may be applied to many similar preparations, and shall be glad to learn the experience of others on this point.

THE GREAT GEYSERS OF CALIFORNIA.*

BY RICHARD V. MATTISON, PH.G.

Of all the wonders nature has so bountifully lavished on the Golden State, there is not one so interesting to an Eastern druggist or chemist as the great geyser region. There is something even terrifying in its indescribable grandeur in the Valley of the Yosemite, a feeling of awe overcoming us as we gaze far above us at the verdant domes of gigantic *Sequoias*, nor does the kelp-fringed shore of the Pacific lack appreciation; but all lack the soul-absorbing interest one takes in the chemical refuse of the Pluton Canon. We reach it by stage from Cloverdale, winding sixteen miles along through the canon, crossing and recrossing the *Arroyo Piscaro*, which the '49ers, or some more modern ranchmen, have rather freely translated to "Pluton Creek." Passing through the canon—one of the most beautiful we have ever seen—we reach, after a few hours' ride, the junction with Geyser Canon, which is situated in a spot of rare loveliness. Upon either side are mountains shutting off the view in any direction, while at our feet rushes the rapid stream so famous for its speckled beauties. As we cross the rustic bridge of logs and gain entrance to the Geyser trail, there flashes over us the thought that we have been there in years gone by. Yes, it is the same familiar odour with which we long ago became acquainted, while a student in the laboratory of the College of Pharmacy. The fumes of hydrogen sulphide, sulphurous acid, etc., make a combination which to become once acquainted with is to always remember. The earth beneath us is white, as if we were treading the vicinity of an ancient lime kiln, and as we pass up the canon amidst the rumbling and roaring of the escaping steam, we fancy ourselves either treading the refuse of a large chemical laboratory or surrounded by the many-coloured productions of a paint and colour mill; and such, in truth, it is, or rather was, for a legend still remains that, as the gallant brave resorted here to procure his war paint, so the coy maiden of the Digger tribe came also to touch her dusky cheek with the rouge of nature's manufacture. On either hand, the banks stretch away up the mountain side and we place a hand on the hot vermilion, which tints the face of the serpentine cliff whose cheeks are now too pale from the magnesium salts so abundantly strewn around. In front of us is a grotto lined with the long, silky, asbestos-like needles of magnesium sulphate, the floor is carpeted with the ferrous salts, the green tint of which is relieved by the yellow and brown of the ferric compounds and the cerulean of the copper salts. Alum crystals are on every hand, and as we touch our lips to the waters of the boiling stream at our feet, we think the taste as familiar as was the odour upon our first entrance; it is that of ammonio-ferric alum, though here the salt is a magnesio-ferric one. The rock formation of the whole region is a mixture of stratified and igneous varieties; the cinnabar occurs here, as it does usually, in veins among the serpentine; iron and copper, as usual, exist with it, and, as the whole undergoes decomposition, the imagination must picture the various tints. A few paces in front is a circular basin about twelve feet in diameter, where the water boils unceasingly year after year. It is called the Witch's Caldron, and we cooked eggs in it after three minutes' exposure; just beyond, the steam issues forth in a stream of some six inches diameter with the regular puff! puff!! puff!!! of an exhaust pipe from an ordinary engine. Some idea of the strength of this discharge may be had from the fact that a stout Alp-stick, weighing six pounds, was repeatedly raised from eight to twelve inches by the violence of the puff and thrown to one side, while a handkerchief was carried fully ten feet by the violence of the discharge. Under our feet, and upon every side, are numerous apertures called "blow-holes," from which the steam issues with varying force. Most of these blow-holes are lined with the most perfect crystals of the purest sulphur in needle-shaped, oblique, rhombic prisms; steam issues from every side, and, in the early morning, in many places it is scarcely possible to obtain secure footing upon the slippery rocks, so enveloped are we in clouds of steam, while the heat is intense and the ground rumbles beneath our feet, reminding us of the stamp mills of the quartz mining districts. The quartz veins here remain intact, the magnesium silicate being dissolved and the mercuric sulphide disintegrated, leaving the rock of peculiar honeycombed appearance, and by the side of the boiling stream at our feet mingles another stream of the coldest water. To our right, as we pass along, we find the fountain of "eye-water," which is of a slight astringent character, while further on a basin of ink, so-called, is discovered, consisting of a finely disseminated mixture of mercurous sulphide with the acidulated water. The water passing through the canon is so distinctly acid as to instantly remove the colour from the clothes where it splashes upon them; these spots afterwards easily develop into holes upon very slight inducement after drying. Upon either side of the canon, rising one after another, are brilliant crusts of alum tinged with ferrous and cupric salts, and the rocky basins along the sides of the stream are full to overflowing with boiling, seething, villanous chemical concoctions, their sides decked with various crystal efflorescences. Sulphur, here, is in his element; the whole family is represented, of almost every ending and colour. A few miles below, we have the remains of an extinct geyser, now the Pluton sulphur mines, while at Sulphur Banks is another, and a few miles above still in Pluton Canon, there is another small geyser, the steam from which, in the cool, brisk air of the early morning, can be seen for miles. When they become extinct, the remaining *débris* is profitably worked for both sulphur and mercury. The cause of the violent ebullition is chemical action intensified by the action of water. The ground-work of the geyser patches is an easily decomposed serpentine, holding with it mercuric, ferrous and cupric sulphides. We believe the heat is generated by their decomposition and not from any volcanic action, as seems the universal belief of the dwellers in and around the region. Crossing Temperance Creek, which seems a misnomer to the traveller in California, so almost universal is intemperance, we come upon what is perhaps the greatest wonder of all. We find here a large blow-hole, two or three hundred yards from the canon, and seemingly not connected with it, from which the steam rushes forth with astonishing violence. A bucket of water thrown into it is ejected with a roar, and stones several ounces in weight, are projected a distance of several feet. At one time a steam whistle was sunk into this blow-hole and was heard night and day for a distance of many miles, but it was impossible for guests at the hotel, half a mile or more distant, to sleep, so it was voted a nuisance and finally removed. Pages might be spent in describing the steam-baths and hot springs of the Pluton Canon, but if we have been able to interest our pharmacal friends in this wonderful region of natural curiosities situated amid the most delightful scenery and with the best hunting and fishing we have ever enjoyed, and within a short distance of the Petrified Forest, where trees of stone a dozen feet in diameter can be seen, we will be abundantly satisfied, while if the interest is such as to project a visit in person, verily great will be their reward!

* From the *American Journal of Pharmacy*, Feb., 1879.

RAPID FILTRATION.

Dr. Ebermayer reports that he has found muslin, which is folded in shape of a filter, and placed below the latter, to be an excellent promoter of rapid filtration. He had occasion to make use of such additional muslin filters, for the purpose of removing the paper-filters from the funnel, without tearing; and he thereby had occasion to notice this useful property of the additional muslin filter. —*New Remedies.*

The Pharmaceutical Journal.

SATURDAY, APRIL 19, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ANNIVERSARY MEETING AND ELECTION OF COUNCIL.

THE time is now rapidly approaching when Members of the Pharmaceutical Society will, in accordance with the charter of incorporation, have an opportunity of attending the General Meeting therein provided for being held annually in the month of May. In accordance with the provisions of the 20th section of the Pharmacy Act, 1868, Associates of the Society who are engaged in business on their own account also have the right to attend this meeting and take part in the proceedings in the same manner as Members of the Society. We have not yet heard that the Anniversary Meeting this year will present any extraordinary feature of interest calculated to attract a larger number of attendants from the provinces than is usually secured by the convenient coincidence of the anniversary meeting with a common holiday-making period and by certain other collateral inducements which are brought to bear about the same time.

This year the Society's anniversary falls as late as it well can do, and there is consequently more prospect of such an improvement in the weather as to offer people greater encouragement to set out on their spring travels than has hitherto been met with. But apart from that circumstance we do not anticipate that the meeting on the 21st prox. will be at all exceptional.

The Council will of course furnish as usual a report dealing with the past proceedings and contemplated undertakings which are of chief importance; the auditors will render their usual account of the general finances and Benevolent Fund of the Society. Mr. VIZER will again raise the "female" question which has already given rise to more talk than profit, and to prevent his having it all his own way, as we understand, Mr. WADE will be there to do battle on behalf of those who are still involuntary outsiders.

The revival of this question at the Annual Meeting is not an unnatural consequence of the course taken by the Council in 1873, or rather by the President at that time; for the votes were equal for and against, and it was by the President's casting vote that the settlement of the question was then deferred.

We need not describe how unsatisfactory has been the result of discussing the "female" question at several annual meetings, nor need we remind those who were present on such occasions of the irritation with which some members of the Society saw the time of the meeting occupied by a discussion that could not reasonably be expected to lead to any decisive settlement. But we do not at all doubt the prevailing disposition i to regard the discussion of this question at the Annual Meeting as being a great mistake, as a proceeding which, taking into account the nature of the Annual Meeting, cannot lead to any satisfactory result. That meeting is, as a rule, far too little representative of the entire body of Members and Associates to render any vote for or against admission of women influential in directing the action of the Council in deciding the matter. The only way in which such influence could be brought to bear is that not altogether desirable one of ascertaining from each individual member of the Society what may be his desire, and in the event of there being a sufficiently large majority in favour of admitting women as members of the Society it might be desirable to move the Council by petition to grant the desired concession.

It may not be amiss here to mention that in the first discussion of the question at the General Meeting of the Society an entirely false issue was raised, which is considered to have very much misled the meeting on that occasion. It is not at all a question whether or not women are to be admitted to carry on the business of a chemist and druggist; that point has been decided in their favour, inasmuch as women are engaged in the business after having passed the requisite qualifying examination, and all that now remains to be decided is whether they shall also become members of the Society. In regard to this question there are two points to be considered, that of abstract right, and that of expediency. As regards the former, the tendency of the age is certainly in favour of recognizing the claims of women to equal privileges with men; but as regards the expediency of encouraging women to undertake duties hitherto performed exclusively by men there is more difference of opinion and while some men would go the length of resigning to women figuratively, if not actually, the occupation of their nether garments, others think the denial of certain privileges enjoyed by men to be the only means of preventing women from overstepping their natural sphere of action. We do not believe there is in the motive underlying this latter view anything approaching to jealousy or want of that consideration for women which is the characteristic of all civilized communities, though it may not appear to be so favourable to them as the opposite one. At any rate as regards the Pharmaceutical Society, this question affects the constitution of the Society and it is one that should be settled in accordance with the wishes of the members generally.

Among the other subjects which are likely to be discussed at the General Meeting is that of co-operative trading. Only a few days before the Annual Meeting of last year the case which is now awaiting decision on appeal came on for hearing in the Bloomsbury County Court. Though the London and Provincial "Supply Association" (limited) is not, strictly speaking, a co-operative society, it is an organization of a similar nature and those who have followed the somewhat tedious history of the case will have had an opportunity of appreciating the difficulties to be encountered in attacking this form of encroachment on the privileges of the chemist and druggist. Possibly the decision of the Court of Appeal may be given before the time of the meeting, and whichever way that may be given it will doubtless afford material for interesting discussion.

But that which is unquestionably the most important feature of the business to be transacted at the coming anniversary remains to be mentioned. The Members of the Society and the Associates in Business will then be called upon individually to perform their part in influencing the action of the Society during the ensuing year by electing fourteen out of the twenty-one members of the Council which is to be the governing body of the pharmaceutical community during that period.

The constitution of the Society, according to the charter and bye-laws, is sufficiently liberal in its provisions for the annual election of members of Council to ensure the most ample and adequate representation of the entire body. But though it has been of late very much the practice to find fault with the action of the Council in certain matters it has also been a source of regret, no less than surprise, that the electoral right of the Members and Associates in Business is less fully exercised than it might be. Only at the last Annual Meeting attention was called to this fact by Mr. GREENISH, who showed that out of 3540 persons to whom voting papers had been issued, only 1870 or about one third of the whole number had returned them duly filled up, while in previous years the number of persons voting was considerably less.

We are aware that one of the reasons assigned for this apparent apathy or indifference is that many members of the trade are not sufficiently acquainted with the views of the candidates for election. The plan of issuing addresses has of late been resorted to by some candidates with the object of meeting this alleged inability to vote. We are not aware whether the results hitherto attained by this means have been satisfactory, but it has again been adopted by five out of the twenty candidates for election on the new Council.

It is outside our province to discuss critically the terms in which the several candidates for election to the Council recommend themselves to the suffrages of the elective body, nor is it necessary to do so, for the addresses are sufficiently explicit in themselves, and without making any invidious comparisons we may say that the inducements they hold out to voters are sufficiently varied to suit almost all tastes. But as regards the complaint which has sometimes been made that the Council does not represent the trade and the charge that the Council does not give due attention to trade interests we may repeat the remark made by one of the speakers at the late Special General Meeting in January to the effect that the question whether that was so or not was one for the electors to deal with, and for the proper decision of which they were responsible.

At the last election the number of members who voted was much larger than it had been for several years before, and it may therefore be hoped that a more general exercise of the power of returning members of Council may be in future substituted for the less rational practice of disregarding this duty and at the same time expressing dissatisfaction with the work done by the Council.

Twenty candidates now offer themselves for election as members of the new Council; out of these there are twelve who are members of the present Council. Of the other eight candidates only two are resident in the provinces, and of the remaining six candidates resident in London, one has already occupied a seat at the Council table. From among these the fourteen vacancies will have to be filled up, and we understand that by the recent resignation of Mr. FAIRLIE there will be another member to be elected by the present Council, in accordance with the provisions of the bye-laws.

THE FLOODS IN HUNGARY.

WE have received a letter from Mr. JARMAY, the President of the Pharmaceutical Society of Hungary, calling attention to the fact that among the sufferers from the inundation of Szegedin and other places in the neighbourhood of that town, many pharmacists' establishments have been totally destroyed and the proprietors have been suddenly reduced from a position of independence to utter poverty. It is suggested that in view of so dire a misfortune there may be a disposition on the part of members of the trade in this country to contribute some substantial assistance in furtherance of the efforts being made by the members of the Pharmaceutical Society of Hungary and others to enable their ruined colleagues to establish themselves in business. We readily give publicity to this suggestion as one that we trust will not fail to be generously responded to, and we may add that since receiving Mr. JARMAY'S letter a few hours since, we have already received some promises of subscriptions. Though the funds of the Pharmaceutical Society as a body cannot be applied to this purpose, it would be a graceful manifestation of British charity if through the medium of the Society's Journal some service were rendered to our unfortunate colleagues in Hungary.

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The tenth general meeting was held in the Royal Institution, March 13, the President, Mr. T. F. Abraham, in the chair. The minutes of the previous meeting were read and confirmed.

Mr. E. T. Billington was duly elected a member.

Mr. A. Watts, F.C.S., exhibited some improved apparatus for fractional distillation.

The President exhibited a phonoscope and described its construction and principle.

Mr. Edward Davies, F.C.S., read the following—

Notes on Mr. Norman Lockyer's Hypothesis of the Compound Nature of the Elements.

Of late years chemists have been led by many considerations to doubt the simple character of the so-called elements. They have been careful to define them as "bodies which have not yet been decomposed," but have been looking expectantly for such decomposition. At the same time there has been no experimental evidence of the complex nature of the elements. The reasons for thinking it probable have been almost entirely confined to deductions from the combining weights, and the similar properties of certain groups of elements. The occurrence of triad groups in which, with many similar properties, the combining weight of the middle term is exactly, or almost exactly, the mean of those of the other two, such as Li, Na, K; K, Rb, Cs; Ca, Sr, Ba; Cl, Br, I, can hardly be due to anything but a relation in the nature of the molecule. Then the fact that the elements fall into sets with progressive increase in the combining weight has rendered it possible to predict the existence of an element. Gallium has been thus foretold, and its discovery fills up a gap in one of these series. The fact that in many cases an element is almost always found associated with another, or others, to which it is closely allied, and from which it can only be separated with difficulty, tends in the same direction.

Any argument drawn from allotropism cuts both ways, for whilst it shows that the molecule of an element may be so altered as to leave scarcely a single physical property unchanged, and so leads to the idea of the possibility of chemical properties being altered also, such possibility has not yet been proved, no alteration of chemical action has been attained, and this promising road has hitherto brought us no nearer the object aimed at.

All that was done previous to Mr. Lockyer's researches did not amount to anything like demonstration, and chemists will not be satisfied until a so-called element has really been separated into its constituents or has been so altered that its chemical properties are entirely changed.

The work done by Mr. Lockyer is not of this kind, and can only be regarded as strengthening the presumption that the decomposition of the elements is an object of research which affords a prospect of success.

The introduction of the spectroscope has done much for chemistry, and its revelations have hitherto been followed by the requisite chemical confirmation, so that the state of mind which they induce is decidedly favourable to their reception.

Assuming the knowledge of the elementary facts of spectroscopy; that there are lines, dark or bright according to the conditions, which indicate the various elements strongly heated in the form of vapour, in Mr. Lockyer's paper attention is specially directed to two phenomena: 1. That there are lines common to several elements; 2. That the same element gives lines differing in character or position according to the temperature to which the vapour is heated. With regard to the first point, a table is given in which, in a comparatively small part of the spectrum, coincidences of iron lines are shown with lines of nineteen other elements; in some cases from five to six lines of one element. In the spectra of metals it is found that under ordinary conditions some lines are of much greater intensity than others, and that as the amount of the metal is diminished the fainter lines disappear before the stronger lines.

If, therefore, in the spectrum of a metal some faint lines of another metal appear in the absence of the strong lines, it is assumed that they cannot be due to the presence of that metal as an impurity in amount too small to be chemically detected.

Mr. Lockyer appears to hold that these faint lines are due to residues of simpler forms of matter than the element in question, which have in some way escaped association. If this be so, surely these residues would be present in the element as we have it, and as in iron they are related to metals differing from iron as much as platinum and osmium, chemical evidence of their presence should be obtained. On the other hand, if iron is the result of these numerous residues, the molecule must be so complex that its permanent resolution should be possible.

May not an explanation of these faint lines be found in the facts of sound produced by vibrating bodies? When a string vibrates, besides the strong loud note, there are fainter sounds or harmonies due to subsidiary vibrations. These faint notes are the strong notes of another string, and some harmonies are common to more than one string. So when a molecule vibrates so as to produce light of a certain kind, may there not be subsidiary vibrations giving rise to the fainter lines of light?

The second point relates to the change in spectra due to varying temperatures. The spectrum of chloride of calcium at a low temperature is that of the salt; at a higher, a spectrum of the metal appears. As the temperature is successively raised, successive differing spectra are obtained. No doubt the first change is due to disassociation of the salt, and Mr. Lockyer's inference is that the succeeding changes are due to disassociation of the element. The inference is a natural one, and deserves careful consideration, but it does not amount to demonstration. One remarkable fact is, that hydrogen, the simplest element with which we are acquainted, shows as much variation with increasing temperature as does the more complex calcium.

If the inference be correct, and disassociation is really brought about by high temperatures, it appears to have been too lightly assumed that as the temperature fell there must necessarily be recomposition of the original body. Water can be so decomposed by heat alone, that the resulting oxygen and hydrogen may be prevented from re-uniting. Oxide of mercury in like manner is decomposed by heat, and no difficulty is found in preventing their re-union, although in cooling the vapours must pass through the temperature at which oxygen and mercury unite. When an element is disassociated, one of the constituents must be more diffusible than the other, and advantage could be taken of this fact to bring about their isolation. Thus, in speaking of indium, Mr. Lockyer positively asserts that hydrogen was separated by the action of the jar spark. We must suppose that he means a form of matter which at a lower temperature is hydrogen as we know it. The conditions of the experiment afford the easiest possible trial of this suggestion. A current of air was passing, the separated hydrogen had the best chance of diffusing, oxygen was present, and by passing the escaping gases over heated platinum sponge, we should have water. The residue condensing in the cool part of the apparatus should be the other constituent or form of the indium. Some such experiment as this would afford the requisite chemical proof, and if at the same time indium burnt in oxygen furnished no water, the evidence of the decomposition of the indium by the jar spark would be complete.

Mr. Lockyer in his paper seems to infer from observations made on the corona that hydrogen, or a form of matter

which at a lower temperature produces hydrogen, did in the corona actually produce calcium when it was still at an enormously high temperature. The question naturally arises, How, then, does it ever come to produce hydrogen as we know it? This observation alone should produce caution in accepting Mr. Lockyer's deductions from spectrum analysis alone.

An interesting discussion followed in which several members took part. A hearty vote of thanks was given to Mr. Davies for his able paper.

The eleventh general meeting was held in the lecture theatre of the Royal Institution, March 27th, the President in the chair.

The minutes of the previous meeting were read and signed, and various donations to the library were duly acknowledged.

Mr. Charles Symes, Ph.D., said it was with extreme regret that he called the attention of the meeting to the loss just sustained, not only by pharmacy and Paris, but by science and the world, in the death of M. Dorvault, founder and director of the Central Pharmacy of France and author of the well-known volume 'L'Officine,' which bears his name, a book which has passed through eight editions, and was probably the most complete work of the kind extant. He had received the high distinction of the legion of honour, was a member of many learned societies and an honorary member of the Pharmaceutical Society of Great Britain; a man of genial spirit, affable, courteous and a thorough gentleman. His partner (Mr. Hallawell) had long his intimate friendship, and he had himself often desired to know him personally, but no opportunity occurred until the summer of last year when, in company with Mr. Greenish, he visited some of the leading pharmacies of Paris. The large establishment over which this eminent man presided was unreservedly opened to them, and every question most willingly replied to. He seemed to enjoy dilating on the pleasant hours he had spent with Jacob Bell, Thomas Morson and others of our countrymen, and—sixty-five years of age—he appeared in perfect health. Little did they then think the acquaintanceship would be of so short a duration, and that he would so soon be numbered amongst the great ones of the past. It was difficult to realize that another visit to the establishment would not find the same noble form seated in the private office or to conceive of the Central Pharmacy existing without M. Dorvault at its head.

The President also dwelt on the high attainments of the deceased author, and felt that pharmacists and the scientific world in general would mourn the loss sustained.

Mr. Charles Sharp, F.L.S., delivered a very interesting and instructive lecture, illustrated with lantern views, on "The Pursuit of Scientific Hobbies." Ladies were present on the occasion. A vote of thanks to the lecturer was carried with loud applause.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

The annual meeting of the Society was held in the Rooms, on Saturday, March 8, 1879, at which there were present—Dr. Moir, Messrs. Ritchie, Giles, J. Gordon, Presslie, J. Paterson, Coutts and Strachan. Mr. Ritchie (President) in the chair.

Minutes of former meeting having been read and confirmed, the secretary intimated that since last meeting he had received for the use of the library a copy of the Calendar of the Pharmaceutical Society, for 1878, and the Year-Book of Pharmacy, from the respective bodies; and as a nucleus of a materia medica museum he had received specimens from Messrs. Hodgkinson, Stead and Treacher, and Messrs. Langton, Eddin, Hicks and Clark, both of London, to all of whom were voted the best thanks of the Society. He also reported that he had hopes of receiving duplicate specimens from the museum of the Pharmaceutical Society, and also specimens from other of the London houses, all of which would be very acceptable, seeing that the museum was in such a rudimentary state.

The treasurer then presented his annual report which showed a sum of £16 13*s.* 1½*d.* standing to the credit of the Society.

The following were then elected office bearers for the ensuing year:—President, Mr. William Giles; Vice-President, Mr. J. Gordon; Secretary, Mr. A. Strachan; Treasurer, Mr. J. Paterson; Librarian, Mr. C. Coutts. At the same time the Library, Lecture and Price List Committees were re-appointed.

After votes of thanks had been passed to the President and office bearers of the past year the meeting separated.

The usual monthly lecture of the Society was delivered on the evening of Monday, March 7, by Mr. J. Miller, Sandilands Chemical Works, in the Rooms of the Aberdeen Diocesan Young Men's Association, on "Preventable Disease." Mr. J. Paterson presided. The attendance was meagre owing to the inclemency of the weather. Mr. Miller at the commencement alluded to the large number of persons who died yearly from preventable diseases. Impurities of water and air were fruitful sources of disease, but if better ventilation were introduced into houses and more care taken with the sewage of towns and the cleanliness of person, the mortality of Great Britain would be greatly reduced. It was pointed out that tainted milk has been the cause of great suffering and many deaths, and the lecturer's remarks on this point were well worthy of attention. The people of Aberdeen were fortunate in having a plentiful supply of pure water, but he (the lecturer) questioned whether, if the population of Ballater and Braemar were to increase very much, they would not require to purify the sewage by the means of irrigation in order to insure the safety of Aberdonians.

After the usual votes of thanks the meeting separated.

Proceedings of Scientific Societies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, March 27th, Mr. C. H. Hutchinson, Vice-President, in the chair.

After the reading of the minutes of the previous meeting, Mr. A. F. Dimmock read a paper on "Dalton and the Atomic Theory." John Dalton was born September 5th, 1766, at Eaglesfield, in Cumberland. His first contribution to pure chemistry was in 1802, when he read before the Manchester Literary and Philosophic Society an essay on "An Experimental Enquiry into the Proportions of the several Gases or Elastic Fluids constituting the Atmosphere." In this essay, in the combination of oxygen and nitrous gas, was set forth the first example of the law of multiple proportions, the starting point from which all his future discoveries emanated. In 1804, from the study of the compounds of carbon with oxygen and hydrogen, viz., CO, CO_2, C_2H_4, CH_4, Dalton proved that one element can combine with another in two different proportions. From these experiments he deduced his celebrated "Atomic Theory." The author then gave an account of the doctrines respecting chemical proportion prevalent at the close of the last century. Wenzel, by a series of elaborate experiments, proved that "the different weights of alkalies or alkaline earths which neutralize the same weight of any given acid also require for their neutralization an equal quantity of every other acid;" hence the persistence of neutrality after double decomposition of two neutral salts. Richter (1789—1802) repeated Wenzel's experiments and drew up a table of the relative weights of alkalies required for the saturation of different acids. In 1808, Proust showed that the metals combine with oxygen or sulphur in not

more than two or three fixed proportions, there being no gradual transition from one proportion to another. The author next gave a detailed description of Dalton's experiments for the determination of the atomic weights of the elements, and concluded with a consideration of the influence of the atomic theory upon chemical investigations up to the present time.

After a short discussion upon the above paper, the following note was read:—

The Saligenin Test for Salicin.

BY DR. A. SENIER, F.I.C., F.C.S.,

Demonstrator in the Laboratories of the Pharmaceutical Society.

It is stated in text-books of chemistry that when salicin is boiled with water acidulated with hydrochloric or sulphuric acid it assimilates a molecule of water and is converted into glucose and saligenin. The conversion is expressed thus:—

$$C_{13}H_{18}O_7 + H_2O = C_7H_8O_2 + C_6H_{12}O_6.$$

This reaction is usually commended as a test for salicin, the glucose to be detected by its well known reducing action on cupric potassium tartrate solution and the saligenin by neutralizing and adding solution of ferric chloride, with which it gives an intense blue or purplish blue colour.

The production of glucose and its detection as just indicated is a simple and certain analytical operation, but not so the formation of saligenin and the colour which it gives with ferric chloride. I have experimented repeatedly under what appeared to be the most favourable conditions, but have failed to obtain a colour with ferric chloride at all corresponding to that described in the text-books. Using a temperature of 80° C. instead of 100° a somewhat better result was obtained, but the colour was so indistinct and its production so uncertain as to be useless in analysis.

Upon reference to the original memoir upon this reaction, I was surprised to find my experience both anticipated and explained. Piria,* in 1845, says that although saligenin is formed together with glucose when salicin is boiled with dilute acids it is nearly as soon transformed into a resinous substance, saliretin. Saliretin is insoluble in the acid solution and is not coloured blue by ferric chloride. It is formed from saligenin by the separation of a molecule of water thus:—

$$C_7H_8O_2 = C_7H_6O + H_2O.$$

In order to obtain saligenin Piria directs salicin to be fermented with synaptase. By this method I have obtained it in beautiful white tabular crystals. These at first appeared in the fermented mixture, from which they were separated by agitation with ether and crystallization from the ethereal solution. Prepared in this way saligenin gives the colour with ferric chloride most distinctly even in dilute solution. The preparation of the synaptase and subsequent fermentation requires too much time to render this method often useful in analysis.

It appears then that the saligenin test for salicin as given in chemical text-books is untrustworthy, and that the fermentation method, though it yields saligenin, is impracticable, except when there is much time at the disposal of the analyst.

Votes of thanks were carried to Mr. Dimmock and Dr. Senier for their respective communications.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting was held on Wednesday, March 26, 1879, at 32A, George Street, W., the chair being occupied by Mr. D. Wallis, president.

After the minutes of the previous meeting had been read and confirmed, a paper was read by Mr. E. Cardwell, entitled, "Emulsions and their Preparation."

The author treated his subject in a thoroughly practical manner. After defining a perfect emulsion, he stated the chief agents used for emulsifying fixed and volatile oils, resins and gum resins. The various methods of manipulation were considered, and in most cases preference was given to the use of a mortar. Numerous prescriptions were mentioned, and the most successful method of manipulation given in each case. Several formulæ in the British Pharmacopœia were alluded to and alterations in detail suggested. The emulsifying power exerted by malt extract on cod liver oil was illustrated.

In conclusion the author suggested that medical men should, before writing prescriptions, work for twelve months at the dispensing counter of a good pharmacy, believing that a better type of prescribing would be met with than much that is in vogue at present.

The paper was followed by a discussion in which several members joined.

A vote of thanks was accorded to Mr. Cardwell, on the proposal of Mr. F. W. Branson, seconded by Mr. Maggs.

The chairman announced that the next paper would be read by Mr. W. K. Glover, on April 9, the subject being "Notes on Tobacco."

---

* *Ann. de Chim. et de Physique*, 1845, 259—260.

Parliamentary and Law Proceedings.

Supposed Poisoning by Strychnine and Laudanum.

A man named John Walter Stubbs, living at Grainthorpe, has been charged before the magistrates at the County Police Court with attempting to commit suicide. It seems that on the 1st of April Stubbs had been to Grimsby on business, and when returning home he purchased a three-penny packet of vermin killer and a one ounce bottle of laudanum at a chemist's shop. On the next evening, according to custom, he took a mixture of brimstone and treacle which was placed before him in a cup, and unobserved he placed in this cup the packet of vermin killer he had purchased at Grimsby, taking nearly the whole of the preparation before going to bed. The powder was said to contain quite a sufficient quantity of strychnine to cause the death of an adult. In addition to this he swallowed, with the exception of about half-a-teaspoonful, an ounce of laudanum. A medical gentleman was called in, and under his treatment Stubbs had entirely recovered from the effects of the poison.

Mr. C. J. Myers, of North Somercotes, said he was called in on Thursday morning the 3rd inst. He examined the prisoner and found that his face was swollen, the pupils of the eye were contracted, the joints of his legs were very stiff, and now and then there was a spasmodic working of the whole frame. He then asked the prisoner to get up and take something he wished to administer to him, and he noticed that the whole of his body became stiffened in a spasmodic manner, also that he had a difficulty in swallowing. The prisoner also appeared to be drowsy. The cup produced was shown to him before he saw the prisoner. He had not tested the substance it contained, but it had a bluish appearance. He also saw the marks on the tablecloth. He asked the prisoner what he had been taking, and he replied, "I have been taking a packet of vermin killer." He asked if it was Battle's, but the prisoner said he could not remember the name. Witness asked the prisoner if he had not been taking some laudanum, and he replied "I have." Witness asked where he had obtained it, and he said "I got it at Grimsby." He sent for the bottle from downstairs (the ounce bottle produced) and showed it to the prisoner, asking whether he had taken that full. He replied that he had, and witness asked him how long it was after he had taken the vermin killer, prisoner replied "Directly." The prisoner told him he had taken the poison before ten o'clock the previous night, and for that reason he did not give him an emetic, as it would have been of no avail. He administered to the prisoner certain remedies, which had

the proper effect, and he was now quite free from the effects of the poison. The prisoner told him that he had purchased a 3*d.* packet of vermin killer, and he considered the amount of strychnine in that quantity would be sufficient to destroy a man's life. His opinion was that the large dose of laudanum counteracted the effects of the strychnine.

The prisoner was formally committed for trial at the Lincoln Quarter Sessions.

Castor Oil Pills.

At the County Petty Sessions at Newport, on Saturday, April 5, Mr. Matthew Gawthorpe, a Licentiate of the Society of Apothecaries, practising at Ventnor, was summoned for a breach of the Sale of Food and Drugs Act by selling as "castor oil pills" an article which was not of the nature, substance and quality of the article demanded, the pills containing, in fact, no trace of castor oil whatever. Mr. T. Hamilton Urry appeared for the defendant.

Sergeant Lowe deposed that on the 10th of March he went to the defendant's place at Ventnor, called the "Medical Hall," and asked for a shilling's worth of castor oil pills. He was supplied with a box of pills, and on the lid of the box was written "Castor Oil Pills: One or two at bed time." He sent a portion of the pills to the public analyst, Mr. Otto Hehner, F.C.S., whose report he now produced. It was as follows: "I am of opinion that the same is a sample of blue pills, and is entirely devoid of castor oil. The purgative action of mercurial blue pills being very different from that of castor oil, unpleasant consequences and even injury to health might result from their use, if the person taking them were in the belief that castor oil was the active ingredient of such pills. There is in fact no such article as genuine castor oil pills."

In reply to Mr. Urry, Sergeant Lowe said he asked for castor oil pills. He had taken castor oil.

Mr. Urry: Did you really suppose that these contained castor oil?—I am not a judge.

Mr. Urry: Did you expect that these little silver globules were filled with castor oil?—I expected to receive what I asked for—castor oil pills.

Mr. Urry:—How many of these would go to a dose?—I am not a doctor.

Mr. Urry: What did you want the pills for?—I told the assistant I was going to have them analysed.

Mr. Urry: What I want to know is did you think these were receptacles full of castor oil?

The Chairman (Mr. Coape): If a person asked for castor oil pills, and there were no such thing, then he should be told so, and not supplied with an article which pretended to be what it was not.

Mr. Urry said "castor oil" was merely a name by which the pills were commonly known, and did not necessarily imply that castor oil was used in their composition. There was an article sold called "Golden syrup," which contained a proportion of treacle; but would a person buying it expect that he was going to receive a quantity of auriferous metal, and would the seller of "golden syrup" be liable to proceedings if it were proved that the treacle contained no gold? Many things bore familiar names which did not actually represent the ingredients of which they were composed, and "castor oil" was the familiar name of pills which were supposed to be a fair equivalent for castor oil. The demand for "castor oil pills" was like the demand for "pigeon's milk" or any other absurdity. They were told that there was no such thing as castor oil pills, and no one could be deceived or prejudiced in the matter. If things could only be called by names which actually indicated their composition then there would be quite a revolution in the nomenclature of medicinal compounds.

The Chairman said it was perfectly clear that there must be a conviction in this case. A person expecting to get castor oil got mercury. He repeated that if there were no such things as castor oil pills, the defendant should have said so, and should not have sold an article which purported to be what it was not.

Mr. Urry said this was one of the absurdities of the grandmotherly Government under which it was our privilege to live. "It was not of the nature of the thing asked for." Supposing a person had asked defendant for a yard of pump water?

The Chairman: He should have stated that he hadn't got it.

Mr. Snowden Henry (one of the magistrates) said he did not agree with Mr. Urry that there was anything absurd in these proceedings. It was a serious matter to be supplied with mercury when one asked for and expected to get castor oil, and the analyst himself stated that injury to health might result.

The Bench convicted the defendant, imposing a fine of 5*s.*, with 17*s.* 4*d.* costs, including the analyst's fee.

Mr. Urry: The article will be withdrawn now.

Obituary.

SURGEON-MAJOR JOSEPH DOUGALL, M.D., F.R.C.P.E.

We regret to announce the death, after twenty years of unremitting professional labour, of Dr. Dougall, who was cut off by an attack of typhoid, on February 9, 1879, the day he completed his twenty years' service.

Dr. Dougall graduated at Edinburgh in 1858, and was appointed to H.M. Madras Service 10th February, 1859. He got the Chinese war medal and clasp for Taku, 1860, and served in various parts of India and Burmah. In 1866 he was selected to investigate the febrifuge properties of the cinchona alkaloids, cinchonine, quinidine, and cinchonidine, at the most malarious places. His report gave the results of one hundred and eight cases very carefully tabulated, and showed the relative value of these alkaloids. This report, given as a thesis for graduation as M.D., 1872, Edinburgh University, gained a gold medal, and was published in the *Edinburgh Medical Journal.* At the Andaman Islands, Dr. Dougall made his famous discovery of the value of gurjun oil in the treatment of leprosy, the results in every case which came under his own care being marvellous. The authorities in India published his reports at the Government press, and ordered the treatment to be adopted all over India. The results in many places were highly successful; but the great difficulty was to get patients under strict control and management. Dr. Dougall received the special thanks of Government, and had the satisfaction to know that hundreds of loathsome wretches weary of life were restored to comparative health and prolonged days. This discovery was fully noticed in all medical journals at home and abroad, and in this Journal as well. "Even a stranger to him may appreciate his work and something of his worth, but only those who knew him personally can estimate the finer qualities of his character, and the unselfish nobleness of his life."

GEORGE B. WOOD, M.D.

Another Honorary Member of the Pharmaceutical Society of Great Britain, Professor George B. Wood, of Philadelphia, has passed away at the ripe age of 82 years. His professional work commenced in 1822 in connection with the Philadelphia College of Pharmacy, where he occupied first the chair of Chemistry and afterwards that of Materia Medica. He was also during a quarter of a century, from 1835 to 1860, a Professor in the University of Philadelphia. But his name was best known in this country in association with the 'United States Dispensatory,' of which he was one of the authors. The first edition of this work appeared in 1833.

FRANZ SONNENSCHEIN.

We have also to record the death of Professor Sonnenschein, in Berlin, after a severe illness. He was an author on toxicology, and of several papers on the vegetable alkaloids. Some time since an announcement that he had succeeded in converting strychnia into brucia attracted some attention, but Messrs. Cownley and Shenstone subsequently demonstated that he was misled by impurity in the material operated upon.

Notice has also been received of the death of the following :—

On the 17th of January, 1879, Mr. George Charles Cutler, Chemist and Druggist, High Street, Rickmansworth. Aged 50 years.

On the 8th of February, 1879, Mr. George Mussell, Chemist and Druggist, High Street, Alton. Aged 63 years.

On the 16th of February, 1879, Mr. Robert Gill, Chemist and Druggist, Fore Street, Totnes. Aged 72 years.

On the 3rd of March, 1879, Mr. James Warin, Chemist and Druggist, Blackman Street, Southwark. Aged 64 years.

On the 13th of March, 1879, Mr. Henry William Walker, Pharmaceutical Chemist, Lord Street, Southport. Aged 55 years. Mr. Walker had been a Member of the Pharmaceutical Society since 1846 and was one of its Local Secretaries.

On the 16th of March, 1879, Mr. Uriah Young, Chemist and Druggist, Monnow Street, Monmouth. Aged 55 years.

On the 17th of March, 1879, Mr. William Dunhill, Pharmaceutical Chemist, Doncaster. Aged 72 years. Mr. Dunhill had for many years held a very influential position in the town of Doncaster, having been an Alderman since 1845. In 1848 he was unanimously elected Mayor and again in 1862. Mr. Dunhill joined the Pharmaceutical Society in 1842.

On the 19th of March, 1879, Mr. William White Collins Seymour, Chemist and Druggist, Middlesborough-on-Tees. Aged 60 years.

On the 29th of March, 1879, Mr. Alfred Francis Robinson, Pharmaceutical Chemist, Northgate, Darlington. Aged 41 years. Mr. Robinson had been a member of the Pharmaceutical Society since 1870, and was one of its Local Secretaries.

On the 31st of March, 1879, Mr. George Guest, Chemist and Druggist, Fitzalan Street, Sheffield. Aged 34 years.

On the 31st of March, 1879, Mr. John Thomas Ibbs, Chemist and Druggist, Maldon, Essex. Aged 44 years.

On the 14th of April, 1879, Mr. Cuthbert Powell, Chemist and Druggist, Temple Street, Bristol. Aged 22 years.

Notes and Queries.

[590]. TINCT. SANGUINARIÆ.—Would any reader kindly inform me how to make tr. sanguinariæ, what strength, and whether proof or rect. spirit is required?

H. W. E.

[591]. CITRINE OINTMENT.—Which preparation is generally sold for "citrine" ointment, ung. hyd. nit., B.P., or ung. hyd. nit. dilut.?

MERCURY.

[592]. ANILINE INK STAINS.—Can any reader give me a form, or the name of any preparation, which will obliterate the stain of violet ink—aniline—supposed to be from "polished ivory?"

Birmingham. DISPENSER.

[593]. OLEATE OF MERCURY.—What is the best method of preparing oleate of mercury, and what appearance should the product present? A 15 per cent. oleate had the consistence of thick cream and a light yellow colour. It was made by rubbing together in a mortar mercuric oxide and oleic acid, the rubbing being occasionally repeated during twenty-four hours. A 15 per cent. mercurial oleate, as supplied by a wholesale firm, was, however, much denser and darker than the one made by the above process.

STUDENT.

[594]. GREEN COLOUR FOR PERFUMES.—Would any reader kindly tell me how to give a permanent green colour to perfumes? Chloride of copper and chlorophyll do not answer.

P. B.

[595]. COLOURING. — Can any brother chemist through the Journal give his experience as to the best way of preparing a rich, clean, almost tasteless colouring called "burnt sugar or brandy colour?"

PHILO.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[219]. I find on referring to "The Month," January 25, and March 29, that you agree, and distinctly state that this should be labelled 1 drachm, or 60 grains, and that the teaspoonful theory is not admissible in this instance. With this authority, and with all deference to Mr. Brown and other correspondents, I shall certainly label this prescription "1 drachm or 60 grains" should it again present itself to be dispensed.

J. W. BARNES.

[219]. "℥j *versus* one teaspoonful."—The writer of the article, "The Month," in the *Pharmaceutical Journal* for March 29, correctly and temperately decides this much disputed question by quoting the simple dictum of the Pharmacopœia:—"Solids by weight, liquids by measure." Doubtless the physician may have meant a teaspoonful of the powder to be given, but, as Mr. Barnes puts it, an accurate dispenser "has no alternative but to say 1 drachm or 60 grains" on the label.

Most people who had read the protracted correspondence on our complicated system of weights and measures which was carried on in the dispensing columns of the Journal some eighteen months ago, would have come to the conclusion that the value of the symbols ℥ and ℥ had been once and for all finally and definitively settled by the letter with which Professor Redwood wound up that war of words; but these settled convictions must (in a few cases, at least) have been rudely disturbed by the "hair splitting" definition of the weight of the symbol ℥j, which Mr. Henry Brown propounds in answer to "Semloh," viz.: "54·68 grains, B.P." (vide *Pharm. Journ.*, March 29, page 807). Perhaps Mr. Brown would adduce that definition as a slight further proof of the inaccuracy of Mr. Barnes's label—"1 drachm or 60 grains." The following extract from the preface to the British Pharmacopœia itself will, however, probably be a sufficient answer:—

"It is strongly urged upon all medical men to avoid the use of the terms 'ounce' and 'pound' with reference to any other than the avoirdupois or imperial standard weight; but it will be optional with the physician in prescribing to use the symbols ℈ and ℥, the former representing 20, and the latter 60 grains."

SPECIFIC GRAVITY.

---

[219]. As a dispenser of twenty-five years' experience, and M.P.S. by examination, I should like to state in the Journal under above heading that I entirely disagree with Mr. Henry Brown's view that it is quite obvious that when a medical man uses ℥j (in ordering a dose of powder) he means a teaspoonful, and that I think the dogmatic tone of his communications, and the way in which he attempts to crush all difference of opinion, appearing to think that he has a monopoly of common sense, are very objectionable.

D. C. CADMAN.

---

[219]. DRACHM OR TEASPOONFUL.—A recent issue contains a reply to this much vexed question, from the pen of Mr. Henry Brown, which I read with pleasure. There are those (judging from the unnecessary questions which are asked at times) who are ever on the look out for the proverbial molehill, out of which to manufacture some imaginary mountain.

What difficulty there can be in this present instance, I fail to perceive. Certainly where a medical man orders a powder by ℥j doses, he intends a teaspoonful to be given. Does Mr. Holmes imagine that every household is provided with a pair of grain scales with set of weights complete? Again, it has been suggested that one drachm of the powder prescribed be carefully weighed, and sent in paper, to give the patient an opportunity of judging the quantity for each administration. In that case he would be as far from obtaining a satisfactory result as he was before, for as far as my experience goes, there are few who possess the happy knack of gauging such quantities by sight.

As to Mr. H.'s question concerning the "pulv. rhei co., ℥j; mitte vj," that is a horse of a different colour, and is fully explained by Mr. Brown. If dispensers would think for themselves, they would find (speaking paradoxically) that their difficulties would vanish even before they came into existence.

Οχθαι.

---

[219]. Acknowledging the almost invariable soundness of the conclusions in "the Month," in regard to questions in "Dispensing Memoranda," you will perhaps pardon me saying that the summing up of query 219 ought to have been more in favour of the argument of Mr. Henry Brown, not from the scant examples for or against, but from its palpableness, based on established custom. The rule that the symbol ℥ relates to fluids by measure, does not always apply, and some discretion—I might say common sense in this instance—must be brought to bear in cases where the pharmacist does not possess a precise knowledge of the prescriber's intentions. In Scotland where Gregory himself flourished, there is nothing commoner in medical practice, than to say, take a teaspoonful of Gregory's powder, or a tablespoonful, as the case may be. In England it must be patent to many pharmacists that the same exception to the rule mentioned applies to such household remedies as milk of sulphur, cream of tartar, calcined magnesia, seidlitz and effervescing citrate; obviously then, to the powder in question. We would draw the line of course at such substances as pulv. jalapæ co. and p. scammon. co., remedies not commonly known, and read the symbol as 60 grains. "Semloh's" argument is illogical to a degree, for although "℥j, mitte vj" may mean six powders, it may be read also, six doses, not necessarily *partitis vicibus*; for the prescriber does not say *fiant pulveres*. We take of a compound powder so much, and so much is prescribed for a dose, palpably a teaspoonful (or may be, as much as will lie on a florin, often the *modus præscripti*). At any rate "℥j, mitte vj" may be understood, *dosis sex, more solito*. But the point has no relation whatever to Mr. Brown's argument. If the prescription run "P. rhei co., ℥j, p. r. n., cras, cras mane, omni mane, nocti, or ter die;" a teaspoonful is undoubtedly meant, and as I have said, the same rule applies to the simples mentioned. Take confection of senna, a simple remedy, but not one in common use. It would be absurd to dispense such *partitis vicibus*, when prescribed, say ℥j, omni mane. Here there can be no question as to the prescriber's meaning.

I sympathize with Mr. Barnes in his endeavours to be correct, but we cannot push our convictions in the face of prevalent custom, however haphazard and reprehensible the custom may be.

An easy way to make the prescriber's intention clear in such cases, would be to write the symbol thus:—℥j (M) or ℥j (P)—*Mensura, Pondere.*

J. LAKER MACMILLAN.

---

[244]. I should like to ask "Rex" how a satisfactory mixture can be made by pouring tinct. guaiac. ammon. into water. Perhaps he will explain how much guaiacum the patient would be taking with each dose, or whether he would simply be taking the component parts of spt. amon. arom. and water, and the whole, or nearly the whole, of the guaiacum left behind in the bottle.

J. W. BARNES.

---

[254]. In reply to "Arctic Regions" and Mr. Lance, I beg to state, with reference to this rather peculiar compound, that I described the mode of manipulation on theoretical grounds solely, not paying special attention to the exact proportions, but adhering to the principle which I have hitherto adopted in dispensing such mixtures.

After the objections raised, however, I have tried the process and found it to succeed, according to the plan of procedure advocated by me, and that without performing the experiment in the torrid zone or immersing the bottle or mortars in hot water. Neither was I favoured by a warm atmosphere, for the temperature of the room was below the mean.

It is true that at first congelation occurs, but on further trituration the whole mass liquefies to a syrupy consistence.

I may add that the tincture used was of the proper strength, as I do not sanction the "half-and-half" system.

J. B. L. M.

---

[264]. A. P. S. would be perfectly correct in sending a ten ounce mixture when Oss is ordered. I should say that the party who would send an eight ounce could have very little knowledge or experience with the dispensing counter.

J. W. BARNES.

---

[274]. The precipitate in this case is ferric tannate and its amount depends upon the quantity of ferric salt in the syr. ferri phosph. Commercially, it is impossible to produce a syrup free from ferric phosphate. Its preparation allows scope for the exercise of skill on the part of the pharmacist, as upon this depends the amount of ferric phosphate present. If hot and strong solutions are used and the ferrous phosphate precipitate washed quickly with warm water, instead of the slow B.P. process, less oxidation and a more satisfactory preparation will result.

I have made the mixture with syrup prepared in this way and observe only a very slight precipitate after it has stood for several days.

PULVINUS.

Questions.

[275]. Will some reader inform me the most suitable excipient or the best mode to dispense the following, viz.?—

℞ Ferri Sulph. . . . . ℈ij.
Pulv. Tragac. . . . . ʒj.
Ol. Sabinæ . . . . . ♏ 43.
M. ft. mass. Div. in pil. 60.

H. W. D.

---

[276]. I should like to hear the opinions of your correspondents to "Dispensing Memoranda" on the following prescription:—

℞ Tinct. Aconiti . . . . . ʒss.
Chlorodyni . . . . . ʒj.
Syrup. Scillæ . . . . . ʒss.
„ Tolutani . . . . . ʒvj.
„ Gummi . . . . . ʒj.
Aquæ . . . . . ad ʒiij.
M. cochlear. duo parv. p. r. n. sumend.

What should the colour be? I was told that it had been prepared elsewhere, and was quite of a different colour to that I had dispensed.

E. H. Storey.

---

[277]. Acid Hydrobromic.—When acid. hydrobromic. dil. is ordered, what is meant?

C. O. S.

---

[278].
℞ Pot. Chlorat. . . . . ʒj.
Acid. Mur. Dil. . . . . ʒiss.
Aqua . . . . . ad ʒviij.
Ft. gargar.

In a gargle, such as the above, is it intended to add the acid direct to the chlorate, and so generate free chlorine (?), or to dissolve the chlorate first in the water and then add the acid? I adopt the latter plan; but if acid. mur. (instead of acid. mur. dil.) were ordered, I should be inclined to adopt the former.

P. B.

---

[279].
℞ Bismuthi Carb.
Zinci Ox. Pur. . . . . ana ʒss.
P. Amyli . . . . . ʒj.
Aqua Lauro-Cerasi,
Glycerini . . . . . ana ʒss.
Acid Carbolici . . . . . ʒj.
Aqua . . . . . ad ʒiv.
M. ft. pigmentum.

How should the above be dispensed, and in this case are the simple directions, "Misce," sufficient?
Durham.

B. P. B.

---

[280]. The prescription as under was returned to me the other day with the remark that there ought to be about two ounces of precipitate in it; this I could not produce. Will some one more learned than I tell me which was right? The former dispenser is an A. P. S., F.C.S., a "chemist by appointment," and a correspondent on pill varnish to the Conference and residing at one of our fashionable watering places.

℞ Potas. Iodi. . . . . ʒj.
Spt. Ammon. Ar. . . . . ʒiij.
Tr. Cinchon. . . . . ʒss.
Aquam . . . . . ad ʒvj.
M. Ft. mist. One tablespoonful to be taken three times a day.

J. J.

---

[281]. Will any reader kindly oblige with the formula for pil. Hamilton?

J. J. P.

---

[282]. Chlorodyne.—When chlorodyne is ordered in a prescription, without maker's name, should I be justified in using a preparation made by myself?

H. H. C. Puntan.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

Phamaceutical Examination.

Sir,—I am much indebted to Messrs. F. A. B., R. H. Parker and others for their "endeavours to elucidate the examination reports, and to account for the 'waste of examining power'" referred to in my previous note.

I am glad to find that the figures quoted by these gentlemen bear out exactly what I had pointed out, viz., that there are about two candidates to one examiner, for F. A. B. says "there is an average of twenty-five candidates to each day," and the report says that the "average attendance of examiners has been 13·8;" whilst Mr. Parker says "the ratio of examiners to men in Scotland is 1 : 1·69 and in London 1 : 1·85. The facts are clear, therefore, whatever the interpretation may be. I have nothing to do with the way in which the examiners choose to divide either themselves or their subjects, or whether it "matters if a score of others be present who will not say a word."

I am sorry that Mr. Parker finds fault with my "curious logic;" the logic of facts is, I am aware, very curious, even incomprehensible, to some men, and I suppose Mr. Parker is one of the latter.

The objections I have to the present examinations are two-fold:—

1. As to the number of examiners and the length of time they hold office.

2. As to the method of examination.

My idea of the way in which the examination should be conducted is simply this. I would hold Minor examinations at least four times oftener, if found necessary, and Major twice a year; keeping the two entirely distinct. The subjects in chief to be three, viz. chemistry, pharmacy and materia medica. The essential part of the examinations should be entirely in writing, and would of course include questions in chemistry—organic and inorganic—materia medica—including botany and pharmacy. If found in any case, or at at any examination, desirable, a short *vivâ voce* examination might be added, at the discretion of the examiners. I object to the so-called practical part which takes place at the dispensing counter and which I regard as both needless and worthless. You cannot gain any real insight into a man's abilities to dispense neatly, and so-forth (for his ability to dispense accurately should be shown in other ways) by observing how he manipulates a dozen pills or a bottle or two of mixtures. A man's customers are his true examiners in practical pharmacy. If A. B. turns out a neater, better mixture or plaister, or box of pills than C. D., the public are not slow to recognize the fact. This part of our examination is too minute in its details. I conceive all that the Pharmaceutical Society is required to do under the Pharmacy Act is to be satisfied through the examiners that any given candidate is sufficiently well versed in chemistry and materia medica as to fit him for carrying on the business of a pharmacist, with safety to the public; whether he does his work neatly, tastefully or the reverse is quite beyond our province to inquire into. The mechanical details of the business do not constitute a proper subject for examination. I should just as soon think of examining a cheesemonger to discover if he could cut a wedge of cheese with mathematical precision.

The number of examiners I would limit to three, to represent respectively, chemistry, pharmacy and materia medica. The examiners to be appointed by Council for each examination, but their names not to be divulged until a few days before the examination, or, indeed, until the examination papers were issued. At least two of the three examiners should be ineligible for re-appointment for, say, twelve months. In this way you do away with a very great evil connected with examinations, you completely annihilate cram. Cram thrives most luxuriantly when the "coach" knows the examiner and his idiosyncrasies. Some of the present examiners have been in office so long that the type of question, if not the very questions themselves, or some of them, they will be sure to ask, are thoroughly well known to outsiders. I am informed on very good authority that at one school a list of questions that have been put in the examinations, tabulated under the names

of the various examiners, has been compiled, and that candidates from the school are regularly cautioned as to what Mr. So-and-so will in all probability ask, and the answers that will please him best.

The examinations, to my mind, have too much of the *tête-à-tête* character about them (owing, doubtless, to the relative number of candidates and examiners), and, by reason of there being more than one examiner to each subject; acting separately, they (the examinations) are not uniform, and consequently not fair to the candidates.

Most men, too, are more or less nervous in passing through the ordeal; why, then, intensify this natural failing by crowding your room with redundant examiners and "others who will not say a word"? Nothing can be more conducive to failure, especially in men of sensitive temperament.

I am not one of those who believe the most talented men are the boldest or "cheekiest," to use an expressive vulgarism, and notwithstanding the "inconvenience" Mr. Parker thinks a number of small rooms would be, I should infinitely prefer even this "inconvenience" (albeit quite needless) to running the risk of disconcerting, and consequently rejecting, a nervously constituted but probably well informed and clever man.

A paper examination is far more uniform and fair in its application, far more searching in its effect, far less exciting and confusing to the candidate, far more satisfactory to all concerned, than any "personally conducted" examination possibly can be.

Under such a system as I have outlined, instead of only 36 per cent.—a proportion gradually decreasing—of Minor men passing the Major, I dare venture to predict very few examinations would suffice to double the percentage, whilst the failures would be materially lessened.

Lastly, permit me to say that I have no desire to dogmatize or to appear hypercritical, or to find the least fault with the examiners personally or individually. I have not hastily formed the opinions now expressed, and, I imagine, the more the question of our examinations is looked into the more evident will become the need of some radical change.

DEVON.

THE FUTURE OF THE DRUG TRADE.

Sir,—Having been engaged for some forty years in the responsible duty of dispensing medicines, may I be allowed to offer a few remarks on a subject that has engaged no little attention in your columns?

I have been sorry to note in some of your correspondents a desire to lower our status and in fact commit a suicidal act by the lowering of prices, and entering into competition with grocers and co-operative stores.

In allusion to dispensing prices, I am reminded of an observation made by a valued friend of mine some time ago, and since gone to his rest; one who had no little experience of our business, being a valuer as well as conducting a large establishment of his own. This gentleman, when conversing with me respecting the profit on prices for dispensing, said, "Talk about profit, sir! it ought to be all profit!" Of course, he meant that when receiving a prescription to decipher, copy, and properly prepare with the best drugs, the insignificant charge of, say, one shilling for six to twelve pills, or eighteenpence for a six-ounce mixture, was no more than a bare remuneration for the required skill, time and trouble for the dispensing of the same.

Surely "Outsider" (who would do well to remain where he is) and others, too, could hardly desire a reduction on these prices. There is, of course, always room for the lowering of charges to the poor.

With regard to patent and proprietary articles, there are "cheap Jacks" in every trade, and if such men think to obtain an advantage over respectable chemists by retailing at the cost price, or nearly so, my answer is, let them do so, but do not consider them as belonging to us; outsiders let them be, and remain so.

In the long run these "cheap Jacks" find out their mistake.

It has been well noticed that the cheapening of physic will not increase its consumption, which for the public may not be desirable either.

Now as to assistants, I quite agree, as I do in other matters, with your correspondent "Hampshire."

The future of our semi-professional trade is chiefly with them. They can do much now by firmness and combination. Assistants are scarce and salaries doubled to what they were some years since. The case is in their own hands. They already stipulate for shortening hours, holidays and Sundays. Let them see to it that prices are not cut down to grocers' profits in any situation they fill. It only means for them hard extra work, and the ruin of the business they aspire themselves to conduct. The prices marked on packages and bottles are the only charges to be made in the situations they fill.

Stores and cheap Jacks will have their day, but possibly may be cut short by some catastrophe, through engaging incompetent hands.

One word about counter practice. It should not be encouraged by the legitimate and respectable chemist, but is nevertheless absolutely necessary in a proper degree for the successful conducting of his business. Should any "Death" be sent into my pharmacy for a look at his throat by the police, I fear I might be tempted to take a brush dipped in a strong solution of argent. nit., and, well brushing his fauces, say, with the Quaker, "Friend, thou hast not much the matter with thy throat, but we will take precautions against disease!" And if his throat should be as tender as the writer's he would not soon forget the operation, or again submit to be a tool of the police at the instigation of the Apothecaries' Company.

S. THORNTON.

Sir,—England no doubt is suffering from one of those periods of trade depression which occur nearly always, at least, once in every decade. Seldom, however, has its influence extended to the chemist, but now there can be no doubt that a great number of chemists are feeling the general depression, and that combined with a greater amount of competition, and a keener display of business acrimony amongst its own members, and also the public using a greater amount of medicine, has all influenced the price of drugs. The public are not to blame however, and they should be taught to look upon the chemist with some respect, to obtain which object I would disclaim any idea of reducing the prices, rather put 50 per cent. on the present charges. Once begin to reduce, and there would be no end to it.

The public, however, have certainly to do with patents, and it is difficult to suggest how we can secure a monopoly of their sale. Advertising patents has now become a branch of trade exclusively its own; outsiders, apart from chemists, embark fortunes on the success or failure of a well puffed nostrum or quack medicine, and the British public is the most easily imposed-upon-biped of the present day. To attempt to check the demand is out of the question, and it would be a work of some magnitude to purchase the rights of disposal from the legion of proprietors. Looking back forty years ago or less we do not find that patents were so exclusively used or advertised, excepting a few, such as Holloway's preparations, and the other fathers of quack medicines. No doubt the population has vastly increased since that time, and physical weakness and the passion for strong drink is probably increasing side by side with the population, so that a greater demand is certain to be the result, and in England, more so than in Scotland, their sale is not confined to the chemist. This is to be deplored, and no one deplores it more than I do. We cannot claim a special right, and it would be advisable to give way a little in some instances to meet the wants of a certain class of customers, and probably in time, as the success or failure of these patents declines, things may come round to their normal condition again; because I have seen many patents "doomed to die" soon after they make their appearance. To compete with stores, etc., would be only to encourage them to continue, and to induce the public to despise our time-honoured trade.

Referring to C. Billing's letter, I would only say the system he advocates rests on its own merits. I am confident that ninety-nine out of every one hundred chemists would scorn to entertain it. The public generally would distrust anything savouring of cheapness connected with drugs. A genius like him may consider the examinations a trifle, but others do not. They were instituted as a protection to the public, and I am sure the public recognize their value accordingly. As regards the honourableness of the trade none can doubt it, and I am not acquainted with a more highly respected set of business men. If they do not hold

high appointments in the State it is not because they could not do so. I look forward to the time when something better than being assistants under the *régime* C. Billing wishes to consummate will be in store for us, something nobler and higher than the mere slaves of the public he would have us to be. I consider he is deserving of pity, and hope the next time he puts pen to paper he may have recovered his wits.

Edinburgh. J. K. N.

Sir,—Amongst the letters which you have kindly published on the above subject, emanating from "Hampshire's" sensible communication, we have had one from an "Outsider," and some from gentlemen who have not added much lustre to the insiders; but in the Journal for March 29 we were favoured with an epistle, which for its peculiar teaching, far surpasses all the others.

The writer, who styles himself "Help-One's-Self," commences by telling us in effect he has nothing to complain of. That in the town in which he resides, they are not troubled with either "cut-throat chemists or grocers dealing in patents, etc." That he has done a fair patent trade for the last seven or eight years, continually increasing; but that about twelve months ago, he was led to alter his policy, his reason being that in many of the large towns in Lancashire, patents were being kept and sold by grocers, barbers, stationers, etc., under their proper prices.

In the next paragraph we are informed what the new policy is, and here it is, in his own words:—"My plan is to put up my article of exactly the same size as the 1*s.* 1½*d.* one I wish to push out, and sell my own at 9½*d.*" And in another place he says: "I have in three weeks persuaded eighteen of my customers to take my own cough mixture in place of the one they asked for, and with satisfactory results to both customers and myself." And then comes the concluding portion of this extraordinary effusion. He asks: "Is there any publication to be had which gives as near as can be ascertained, by careful analysis, the formulæ for making preparations that may be recommended as substitutes for the popular patents. If there is, kindly state the publisher. If no such book is published, could not one of our leading analysts publish one, and sell only to registered chemists?"

Now I would earnestly ask the inventor of this new policy, if he has seriously considered his position in the matter, and whether he conscientiously thinks he has any more right to the formulæ for the patent medicines belonging to his brother chemists or others—which are their private property,—than they have to anything in his possession?

If this acquisitive chemist desires information respecting the composition of the popular or other patent medicines, why not do the dirty work himself, and not ask a "leading analyst" to aid him? Let him call on every chemist throughout the country—from the richest to the poorest, nearly every one has his pet patent medicine—beginning at the west-end of London, and then working his way eastward. On entering the various establishments, he need not waste much time, but simply say, "I'll have your private recipes!" and then walk on to the next victim. It may be that some of the persons on whom he calls, will consider the case a hard one, and may say, Surely, after spending all my strength, and all my money in trying to make known a most valuable remedy, and for which I am hoping soon to get a little sale, and thereby to take things easier, you surely do not wish me to tell you, a stranger, the composition of my article! Or he may, perchance, in his travels meet with some poor widow whose story will be one of extreme painfulness. She may tell him of how some kind physician had given her husband a prescription for a "liver pill," which having proved so very useful in their own neighbourhood they had desired to extend to other parts its sale and usefulness. Of how they had toiled together to effect this object; with their spirits sometimes raised and sometimes terribly depressed, and that at last, just as the partner of her life saw streaks of sunshine in the horizon he was taken away from her. "Help One's Self" will meet with these and many more such cases ere his work is finished.

It is of course a well known fact that some men are never satisfied unless they are endeavouring to reap the fruits of other men's labours. A patent medicine is as much a person's private property as anything else, and our behaviour in the matter of this branch of our business is clear and well defined—we have simply to speak the truth. If our customers ask us what we think of a certain proprietary medicine, we are bound in honour to be candid in our replies, and the man who desires to carry out the sacrep injunction of "Doing unto others, as he would that others should do unto him," will never experience the slightest desire to enter on the new policy practised by your correspondent "Help One's Self."

London. Non-Private.

Sir,—There is one phase of this question, notwithstanding the many letters we have had, that has not yet been touched upon, yet one which to my mind appears all important, and therefore upon which I should like to elicit some observation. I allude to our qualification, of what it consists, with the rights, if any (legal) it confers. Now, as to the first and second of these matters, every one knows who has had to submit himself to the Society's examination, and I may also observe the same thing too of the third question, but only in so far as it pertains to those articles noticed in the schedule of poisons. That qualification then, as we all know, does not consist in an exclusive knowledge of poisons. No; it demands and recognizes a general knowledge of all the preparations, etc., of the Pharmacopœia, without regard to their being chemical or mechanical, poisonous or non-poisonous. If such then be the legal requirement of the Act, where a qualification such as this can be both legally and compulsorily demanded before we can be regarded as legally qualified chemists and druggists, how comes it to pass, I would like to know, that these very things respecting which so much knowledge is required should be so illegally (for I can use no other term) appropriated by other trades? I am here referring to such drugs, etc., as jalap, sweet spirit nitre, etc., etc. For, I contend, if such knowledge is considered to be such a necessary part of our examination, that it must in effect form a necessary part of our trade rights as recognized by law, though not made penal in common with certain described poisons, and ought on these grounds to have as great a claim to protection as these things or nothing at all. If law constitutes nothing short of such knowledge as a necessity before we can profess and exercise the calling of a chemist and druggist, it ought in all reason to defend it as such. As for the monopoly which it is said to create we have nothing to do so long as our Legislature think such a necessity to be in the interests of the community, especially if the process through which it is obtainable is a course alike honourable and open to all.

Dewsbury. Fair Play.

Sir,—I think "Edinburgh" has not much experience of other shops and other trades except his own.

"Edinburgh" states in his letter that "medicine is a necessity," and asks, Are we to tax the sick for the return to health? I say, Yes, as much as my butcher taxes me to keep me in health.

A customer of mine keeps the books of a butcher not at all in a large way of business. The absolute net profits on what they term a bad week amount to twenty pounds.

How many druggists can say this and how can this truth be reconciled with "Edinburgh's" remark:—"Reduce our large net profits and the number of shops and our trade will be like our neighbours with reasonable profits over few"?

Medicine, unlike meat, thousands do without, so with diamonds, but the dealer in medicines and the dealer in diamonds require larger profits from the scarcity of the demand. Give me a linendraper's returns and I shall be most happy to reduce my profits and no longer sign myself

An Old but Poor Druggist.

Sir,—There are one or two remarks I should like to make on Mr. Billing's somewhat vague letter.

In the first place I can't see how he can justify his statement that by reducing prices assistants can be paid higher salaries. The idea is monstrous, and purely one of his own "theoretical fancy" rather than a common sense or practical one.

Had he lived in any town where co-operation was rampant as it is in most of our large towns and cities in England, he would not be in such a hurry to reduce his prices without first trying to buy cheaper. It is a fact acknowledged by other tradesmen than ourselves that these co-operative stores can, by buying the enormous quantities they do,

afford to sell most articles having a large sale at a lower price than ordinary tradesmen can buy them at.

Mr. Billing must put medical men down as rogues of the deepest dye for requesting a guinea for a sheet of note paper. This may be touching on the ridiculous, but at the same time I maintain that inasmuch as they have a right to be compensated for their professional ability, so have we in proportion to ours. He must not forget that our responsibility is greater than theirs in one sense; and also that books, school and examination fees and incidental expenses necessitate considerable outlay on the part of students belonging to that noble, industrious and conscientious professional tradesman "the pharmacist."

London. J. O. SMITH.

FUTURE OF DRUG TRADE.—COMING ELECTION.

Sir,—I have read with interest the numerous letters on the "Future of the Drug Trade," "Co-operative Stores," and "Counter Prescribing." There is one step I think chemists as a body may take in their own defence. At the coming election of members for the Council let every one carefully ascertain the opinions of the candidates and vote for those only whose views are in favour of the "general trade," devote time and attention to the protection of our rights, and are in favour of getting legislation to assist us.

This seems to me to be the only course whereby we can maintain the privileges which at the present we are only "supposed" to hold with regard to the retailing of medicines.

DIPLOMACY.

OXIDATION OF ESSENTIAL OILS.

Sir,—I must beg the favour of an opportunity to say a few words in reply to Mr. Kingzett's second letter in your Journal of March 29.

Mr. Kingzett stated that I had entirely evaded the question at issue, and also that Dr. Day, whatever may have been his opinions regarding the phenomena upon the observation of which he was engaged, did not succeed in demonstrating the presence of peroxide of hydrogen by unequivocal tests.

The question at issue, as I understand it, is this—To whom should be given the honour of having first demonstrated that the oxidized principle found in essential oils, and generally supposed to be ozone, was not ozone but peroxide of hydrogen?—and I was under the impression that my former reply had gone straight to that point.

Thanks to Dr. Day, I have perhaps been kept better informed of his published and unpublished researches on this subject than probably any one else in this country, and as Dr. Day is not here to speak for himself, I am prepared to say that the tests which he employed in 1869 to prove the absence of ozone in oxidized essential oils were most decided and reliable.

Further testing gave all the chemical reactions that could be obtained by treating peroxide of hydrogen in a similar manner, the presence of that body was therefore considered to be unequivocally established.

The theory suggested by Mr. Kingzett in 1875, is, that the compound formed in the oils is camphoric peroxide, which by the action of water is resolved into camphoric acid and peroxide of hydrogen, but whether this theory be right or wrong I have no wish to dispute.

At the Pharmaceutical Conference held at Bristol in 1875, Mr. Kingzett read a paper on the subject in question. In the discussion which followed I made some remarks on the nature of Dr. Day's investigations and also pointed out the great value he attached to the highly oxidized essential oils as sanitary agents, recommending their use in various ways for destroying poisonous emanations and rendering innocuous all infectious diseases.

In reply Mr. Kingzett said he knew indirectly of Dr. Day's work from an English book in which the facts stated were truly astonishing.

Such an admission must, I think, have been a *lapsus linguæ*, as both before and since that time Dr. Day's name has been almost entirely ignored by Mr. Kingzett in connection with this very interesting subject.

J. ROBBINS.

[*** The facts referred to in the correspondence on this subject, are, we think, sufficiently on record to render any further expression of individual opinions respecting them unnecessary.—ED. PHARM. JOURN.]

SOURCE OF ARAROBA.

Sir,—In your issue of March 15, I notice that Mr. J. L. Macmillan states that in my opinion araroba "was a product of *Cæsalpina echinata*," and further adds "If Mr. Holmes had tried the action of water on his samples I do not think he would have satisfied himself as to the relationship with *C. echinata*, for the wood of that tree yields its colouring matter to water." If Mr. Macmillan had carefully read the paper to which he alludes, he would have seen that I did *not* say that araroba was derived from *C. echinata*, but that I concluded from the similarity of microscopical structure of the fragments of wood found in commercial araroba to the wood of *Cæsalpinia echinata*, that the araroba was probably derived from the heart wood of *a species of that genus*.

I need only add that before writing the paper alluded to (*Ph. Journ.* [3], vol. iv., p. 801), I had examined a leaf of the araroba plant, kindly supplied to me from the Botanical Gardens at Edinburgh, with authentic specimens of *Cæsalpinia echinata* at the British Museum, and had satisfied myself that they were not identical, but that in all probability the araroba was derived from an undescribed species of *Cæsaldinia*. I could therefore scarcely have come to the conclusion which Mr. Macmillan attributes to me, viz., that araroba was a product of *C. echinata*.

E. M. HOLMES.

WHAT IS THE BEST POISON FOR DOGS?

Sir,—This afternoon I was requested to poison a valuable greyhound that had been impaled whilst coursing, and had received an ugly wound. The dog being a favourite, and, moreover, having cost the modest sum of one hundred guineas (so the owner told me), he was anxious to have it dispatched as quickly as possible. Accordingly I took with me an ounce bottle of "Scheele's" prussic acid (fresh from Herrings and Co., 43, Aldersgate Street), and in the presence of a number of people assembled to witness the operation. Thirty minims of the acid was administered by means of a drop syringe; the dog instantly felt the effect, but did not show any symptoms of dying. After an interval of five minutes, during which time the breathing was very laboured, it began to revive; I gave the dog another dose of ten minims, and after waiting a short time it seemed as far off as ever. A third dose (ten minims) was again injected, and to my satisfaction the dog died: but during this time I had been subjected to a few not very dignified remarks from the onlookers. I felt extremely annoyed, but could not account for it.

One gentleman present, hailing from Sheffield, said he had a dog of his poisoned by a chemist of that town, and that it died instantaneously. Will some kind reader from Sheffield tell me what this wonderful poison is? For my part I do not believe it, but must acknowledge there is something galling in finding oneself in such a predicament, and a lot of people laughing at you.

Malton. JAMES BUCKLE.

Mr. J. Lloyd, who approves strongly of the suggestions of our correspondent "*Help One's Self*," before, p. 812, writes to say that Redwood's edition of Gray's 'Supplement to the Pharmacopœia' will supply a good deal of the information required.

C. E. Lister will find numerous communications on pill coating in the last volume (viii.) of this Journal.

W. Williams.—We have no doubt that if you would communicate with the Registrar respecting the offenders against the Pharmacy Act in your neighbourhood the subject would receive careful attention. But we would call your attention to the fact that some of the substances mentioned by you are not scheduled poisons.

De Alga Re.—(1) We do not consider it would be fair to ask for a form for a preparation to resemble one of any particular maker. (2) See before, in the present volume, pp. 338 and 462.

"*Chemist.*"—Messrs. Butler and McCulloch, Covent Garden.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Dorucci, Olive, Lloyd, Pollard, Motters, Gilmour, Gale, Stenhouse, Simpson, Bennett, Borough, Squire, Manchester Chemist, Chemicus, Maiden with Blue Eyes, T.P.B., W.S.C.

"THE MONTH."

Wintry skies and frosty air are not very propitious to the development of spring flowers, and in consequence they are appearing somewhat timidly, considering the time of year. The hedges are only now beginning to look green, while many trees are quite bare, the mountain ash and horse chestnut being perhaps the most advanced. The catkins of the birch are, however, beginning to open, and the poplar trees are already clothed, instead of leaves, with crimson catkins, which cover the ground beneath them most profusely. It is remarkable what an immense amount of pollen is produced by plants the fertilization of whose flowers is effected by the agency of the wind. Thus the flower of the ash tree, which is now to be seen in the south of England in great profusion, is really a nuisance when gathered, from the amount of pollen it scatters.

The flowers of this tree are rather puzzling to a beginner in botany, the plant being polygamous, or as Darwin* calls it in this case, trioicous ; some trees producing only male flowers, others only female flowers, and others, again, hermaphrodite flowers. Singularly enough, the female flowers include stamens, which drop off at an early period, and their anthers, which never open or dehisce, generally contain pulpy matter instead of pollen, although, rarely, an anther containing pollen may be found in the same flower. In the male trees, also, most of the flowers contain pistils which drop off at an early period.

A correspondent in the Isle of Wight writes that the ground there is fairly covered with primroses, anemones, and violets, while at almost every step among the bushes the narrow leaved lungwort (*P. angustifolia*) holds up its opening flowers, and the wood spurge is also abundant in flower. The *Pulmonaria angustifolia* is a much prettier plant than the common species, with rather larger flowers of a brighter and more blue tint. It is interesting on account of being one of the plants examined by Darwin, who found that two forms of the plant exist, and that those with a long style were absolutely sterile with their own pollen, and that a number of the pollen grains in the small anthers of the short stamens of this form were usually bad, on which account he suspects this form is tending to become female. On the other hand, the plants having a short style were fertile with their own pollen in a remarkable degree, which is not the case with similar flowers of *P. officinalis*. The long-styled flowers of *P. angustifolia* are usually the largest, and those of the short-styled form the smallest and most numerous. In *P. officinalis*, on the contrary, the short-styled plants produce the largest flowers as well as the largest number.

For these reasons, and because it was found impossible to fertilize the flowers of *P. angustifolia* with the pollen of *P. officinalis*, Darwin concludes that the two species are quite distinct, although differing little in external appearance. Among other plants already in flower in the Isle of Wight may be mentioned *Malachium aquaticum*, *Corydalis claviculata*, *Lathræa squamaria*, *Myrica Gale*, *Asperula odorata* and *Berberis vulgaris*. The last is interesting botanically on account of the peculiar sensitiveness of the stamens, for when an insect, in attempting to get at the honey situated at the base of the petals, happens to touch the lower part of the filaments, the stamens spring forward towards the pistil and not only cover the insect with pollen, but startle it away and thus ensure the cross-fertilization of the flowers.

The anthers of the Barberry are also worth examination on account of presenting an instance of valvular dehiscence, while the whole flower is remarkable for having the stamens, petals and sepals each six in number, although it is an exogenous plant. The three united spines, also, with which some portions of the stem are furnished, will be seen not to proceed from the axil of the leaves or to terminate the stem, as would be the case if they were true thorns, but to occupy the position of leaves, and hence must be regarded as the hardened veins of leaves of which the parenchyma is not developed, or perhaps, as the midrib of a trifoliate leaf, several exotic species of this genus having compound leaves. During the next month the leaves of this plant may, in damp localities, be seen occasionally dotted with yellow spots ; these are the cluster cups of a parasitic fungus to which farmers attribute the rust in wheat, and it would appear as if there were some foundation for the belief, since it has been shown that the spores of the corn blight (*Puccinia graminis*), sown upon the barberry leaves, give rise to the barberry cluster cup fungus (*Æcidium Berberidis*) and that the spores of this produce the puccinia. To such an extent has this popular (and probably correct) theory been believed that, according to a statement in Sowerby's 'English Botany,'* "The village of Rollesby, in Norfolk, where barberries abound, and wheat seldom succeeds, is known by the name of Mildew Rollesby." The bark of the barberry has long been a popular domestic remedy in jaundice, but is probably useful only in those forms dependent upon catarrh of the bile duct. The yellow colour of the bark is most likely due to the berberine which the bark contains, and to which it owes its medicinal properties. The use of the bark of *B. Lycium* and other species in India, and the administration in other countries of plants containing berberine, such as *Jateorhiza Calumba*, *Coptis Teeta*, *C. anemonæfolia*, *C. trifoliata* and *Hydrastis canadensis*, seem to point to the fact that in neglecting the berberry for calumba, the principle "that a prophet is not without honour, save in his own country" is being followed out. The use of berberine in ophthalmia or conjunctivitis does not seem to have attracted the attention it deserves in this country. In Poland the alkaline infusion of the bark of the barberry is said to be used as a yellow dye for leather.

Of strictly medicinal plants few wild species are yet to be found in blossom. The *Daphne Laureola*, with its sweet-scented green flowers and handsome tufts of glossy leaves, is still to be found in blossom in calcareous or chalky woods, and the broad leaves of the colchicum are beginning to appear in abundance in damp meadows wherever this local plant occurs ; but these are almost all. But of plants possessing a medicinal interest there are several others now in bloom ; of these may be mentioned *Anemone Pulsatilla*, sometimes called Pasque flower from its flowering at Easter-tide, *Nepeta Glechoma*, *Cochlearia officinalis*, *Tussilago Farfara*, *Ranunculus Ficaria*, and *Oxalis Acetosella*.

In the Botanical Gardens at Kew several families of plants are already well represented in the open ground and offer a good opportunity for study to those

* Darwin's 'Forms of Flowers,' p. 11.

* Vol. i., p. 72.

who are not hindered by the ungenial character of the weather. Thus the Berberidaceæ are represented by the curious *Epimedium alpinum*, and by *Jeffersonia diphylla*, with its remarkable binate leaf and pretty white flower; the Papaveraceæ by *Sanguinaria canadensis*, which is now in blossom freely, and whose flower, externally very like that of the *Jeffersonia*, appears just peeping out of the fold of its green leaf, as if half afraid of an English spring.

The Cruciferæ, Frumariaceæ, Solanaceæ, Boraginaceæ, Leguminosæ, Rosaceæ and Ranunculaceæ, and among the Endogenæ, the Liliaceæ, Amaryllidaceæ and Iridaceæ, are fairly represented, while the Orchidaceæ both at Kew and at the Regent's Park gardens are looking very beautiful and presenting species of several different genera in blossom. The true mandrake, *Mandragora officinalis*, with flowers arising on solitary stalks from a crown of leaves, should not be overlooked, and a bed devoted entirely to species and varieties of helleborus forms an instructive group. Among the recent additions to the Kew Gardens we noticed the root of *Thapsia garganica*, which furnishes the Driâs of Cyrenaica, and the Silphium of French pharmacy. A specimen of the sumbul plant is looking remarkably healthy and great care is evidently being taken of it.

In the Botanical Gardens at Regent's Park the *Nephelium Litchi*, which yields the celebrated Litchi fruits of the Chinese, is just coming into bloom; and the benzoin plant, *Styrax officinale*, is sparingly in blossom, while in the open ground the almond is in its full beauty.

The second spring exhibition of flowers took place at the Gardens of the Royal Botanical Society on Wednesday last, and there was a large and important show of flowers. The large conservatory has been during the last few weeks quite a pretty sight, from the numerous azaleas and rhododendrons, which have been in full blossom, the magnificent red coloured flowers of the *Rhododendron arboreum* and the remarkably fine crowns of delicate creamy white flowers of the *R. Nuttallii* being especially noticeable. The additional floral treasures of the exhibition render it more to be regretted that the weather prevented as large an attendance as usual. Of the auriculas there was an excellent show; one of the new seedlings from Slough was named after the Duchess of Connaught. Several new cycadaceous plants were exhibited from Borneo, Sumatra, and other East Indian islands, collected by Mr. B. S. Williams's explorer, Mr. Goldie, on his way to New Guinea. This botanist has not only sent home new plants, but discovered gold and given names to ports and bays in that island and sent home a chart of the country, and is now exploring a district whose flora is probably in great measure new. Among other objects of interest were a collection of miniature cacti of less than $\frac{1}{100}$th of their natural height, the Greig tulip, with a blotched or spotted leaf, a fine Burmese orchid with a flower of a colour approaching to blue, and fragrant Australian boronias. Pot roses, azaleas and cinerarias were also to be seen in plenty, while the show of orchids was very good.

The present number of Bentley and Trimen's 'Medicinal Plants' contains illustrations of *Pimpinella Anisum*, *Peucedanum graveolens*, *Spigelia marilandica*, *Cinnamomum Cassia*, *Pinus Pinaster*, and *Pinus Picea*. The authors have followed Bentham and Hooker in placing *Anethum graveolens* in the genus *Peucedanum*, although they consider that genus scarcely distinguishable from *Ferula* by any satisfactory definition. The minute details of the structure of flower and fruit are, as usual, excellently rendered, and the figures of the plants are unusually good.

From the *Botanische Zeitung* we learn that Mr. J. M. Hildebrandt has cleared up the source of the Socotra and Zanzibar dragon's blood, concerning which the authors of 'Pharmacographia' say:—"Species of Dracœna occur in these regions, but of the botany of Socotra itself nothing is known," thus suggesting plants of this genus as a possible source of the drug. Hildebrandt states that it is obtained from the stems of the *Dracœna schizantha*, Baker. The natives remove pieces of the bark or rind, about two inches square, and the cavity in two or three weeks' time becomes filled with the resin. Specimens of the dragon's blood gathered from the tree itself in the Somali country, by Hildebrandt, when dissolved in alcohol gave a splendid carmine red solution; but that which is exported from Zanzibar appears to be much adulterated, since the resin when dissolved in alcohol leaves an insoluble granular deposit, and the solution has a dirtier colour. In Zanzibar it is used in ophthalmia, and is said to be called "macziwa ya watu wawili," meaning the milk of two men," or "matcho ya watu wawili;" *i.e.*, the eyes of two men. In Socotra, according to Wellstedt, the dragon's blood is called by the natives "edah," and by the Arabs, "khoheil," and is taken by them to Muscat, reaching England occassionally by way of Bombay or Zanzibar.

A correspondent of the *Chemical News* points out that the *Eucalyptus globulus* is not by any means the species which yields the largest quantity of volatile oil, and therefore probably not the most powerful antiseptic of the genus. According to his statement, the quantity of oil (as ascertained by Mr. Bosisto) yielded by *E. globulus*, is only 0·719 per cent., while *E. amygdalina* yields 3·313 per cent., and *E. oleosa*, *E. leucoxylon*, and *E. goniocalyx* each yield more than *E. globulus*. This difference is, however, in some measure compensated for by the vigour of growth and early copiousness of foliage of *E. globulus*.

It may not perhaps be generally known how powerful a solvent eucalyptus oil (usually prepared from *E. oleosa*) is. The following substances are soluble in this oil, their greater solubility being indicated by their position in the list: camphor, pine resins, mastich, elemi, sandarac, kauri resin, dammar, asphalt, Botany Bay gum, dragon's blood, benzoin, copal, amber, anime, shellac, caoutchouc and wax, but not gutta percha. A ton of the fresh foliage of *E. globulus* is stated to yield 8½ lbs. of pearlash, while the fresh wood yields 2¼ lbs.

In *New Remedies* for this month an interesting account is given of the opium eating habit in Michigan. The number of opium eaters in the United States has been estimated at 82,696, and a few of these people eat daily as much as two ounces of opium, or a drachm of sulphate of morphia, but the average amount consumed by each opium eater in the State of Michigan is estimated at about one ounce avoirdupois of opium per week. Advanced eaters opium do not confine themselves to it, but add chloral or chloroform. Of course a large number of antidotes are advertised; these, when analysed have proved in every instance to contain opium or morphia.

In the *Medical and Surgical Reporter*, Dr. Cozzalino speaks of thymol as the best remedy for ozœna which he has tried. He injects it into the nostrils in the form of an emulsion made with one part of thymol to 1000 of mucilage of gum arabic.

A new action of pilocarpine has been pointed out by Dr. Chadzynke, who has found that this alkaloid, especially when injected hypodermically, has a powerful tendency to produce abortion. It cannot therefore be safely administered to pregnant women, a fact that cannot be too widely known.

Soluble gun cotton is now produced in Berlin in the convenient form of plates, which not only occupy less space but are less inflammable than the ordinary dinitrocellulin. It is supposed to be made by moistening soluble gun cotton with a mixture of alcohol and ether, so as to dissolve a portion of it, which when the whole is pressed causes it to cohere into cakes. Each cake or plate is soluble in 720 grams of ordinary ether and yields a perfectly clear solution.

According to the *Journal de Pharmacie et de Chimie* the oil of geranium has lately been found to be much adulterated with fixed oils as well as cheaper essential oils, especially oil of copaiba. Its purity may be tested according to M. Jaillard by adding 6 drops of the suspected oil to 80 minims of 70 per cent. alcohol and shaking the mixture, when if the oil be pure a clear solution will be obtained.

Calabar beans, which have lately been scarce, and for which other seeds have been offered in commerce, have recently been found to be mixed with a second species of *Physostigma*, which may account in some measure for the variable amount of eserine obtained from different samples of Calabar beans. The second kind of these beans differs slightly in shape, but sufficiently so to be recognized without much difficulty. Further particulars upon this subject will be published in an early number of this Journal.

According to Gehe and Co. both kinds of Coto bark—the true bark and the Para bark—are now in the market, and are in regular demand for the treatment of diarrhœa. The price of cotoin and paracotoin has become much lower in consequence of the freer supply of the bark. Cotoin is described as being in large light yellow crystalline scales, similar to those of iodoform.

The April circular of this firm also supplies some other interesting notes. The demand for chrysophanic acid has considerably diminished, which is attributed not only to the statement of Liebermann that the product in the market under the name, prepared from Goa powder, is not pure chrysophanic acid, but chrysarobin, but to the unsatisfactory results obtained with it. Whether pure chrysophanic acid has a different action is yet uncertain.

As another source of chrysophanic acid the wood of the Brazilian Ipé tobacco tree is suggested, as from it Dr. Peckholt reported in 1873 that he had obtained 21·8 grams of pure acid per kilo. A decoction of this wood is used in Brazil for ringworm, and a decoction of the bark internally and externally against herpetic affections and as a gargle against *angina tonsillaris*. Recently, pyrogallic acid has come into use as a substitute for chrysophanic acid, in the form of an ointment containing one part of the acid to ten of lard. Alizarine, which it will be remembered has also been experimented with as a substitute, appears to have dropped out of use.

In consequence of the abundance of the last crop of fruit the prices of the essential oils of orange, bergamot and lemon have been considerably lowered. Especially is this the case with oil of bergamot, and as this oil can be kept a considerable time without injury advantage might be taken of the circumstance. Notwithstanding the artificial preparation of vanillin the cultivation of vanilla shows no sign of diminishing; the value of the importation of this article into France having risen from 28,977 kilos in 1873 to 63,067 in 1877.

A new kind of paper has been invented, which is said to be fire-proof in an ordinary fire. In the *Pharmaceutische Centralhalle* the paper is stated to be composed of one part of vegetable fibre, two parts of asbestos, one-tenth borax and one-fifth alum. It is made into writing and wrapping paper. An ink, likewise indelible by fire, for use in writing on this paper, is said to be made by boiling in water a mixture of 90 grams of powdered graphite, 0·75 gram copal, 8 or 10 grams of ferrous sulphate, 30 or 32 grams of tincture of nutgalls and indigo-carmine. The ink certainly seems to be a curious mixture.

Attention has lately been called by Salzer to the danger of mixing sal ammoniac and bleaching powder together. When equal portions of these two chemicals in the state of powder are shaken together, copious fumes of a spontaneously inflammable gas are liberated, which appears to be hypochlorite of ammonium.

According to experiments made by Livache, and published in the *Comptes Rendus*, methyl, amyl and myricyl alcohols have the remarkable property of rendering petroleum soluble in soap, and the resulting soap soluble in water without separation of the petroleum. It is in this way that the use of Carnauba wax in making petroleum miscible with soap is explained. Carnauba wax consists of a fatty acid united with myricyl alcohol. By saponification the alcohol is set free, and causes the solubility of the petroleum.

In the *American Journal of Pharmacy* for March, the editor gives a series of formulæ for artificial fruit essences, which appears to include all those in ordinary use, Information on this subject is somewhat scattered, and the above paper will be found very useful for reference.

Since the last "Month" the preservation of iron has been the subject of two papers read before the Society of Arts. The first was by Professor Barff and reported the progress made in carrying out the process introduced by him about two years since, dependent upon the artificial production of a coating of black oxide on the surface of the iron. The process has now been applied to articles six feet in length, and numerous reports were quoted to the effect that when the film of magnetic oxide is continuous the protection is very effectual. Some difficulty has occurred, however, in consequence of the rusting that takes place where there is any breach in the continuity of the film; this Professor Barff claims to have now overcome. It appears to be essential that the oxidation should be effected by the action of superheated steam, free from moisture or atmospheric air; for when iron is submitted to oxidation by hot air, or in the presence of air or moisture, the film of oxide formed scales off after a short time.

The second paper, by Mr. Stoffell, was upon a process for the "inoxidation" of iron, invented by M. Dodé. It consists in coating by means of a brush or otherwise the iron to be preserved with a composition consisting of borate of lead, oxide of copper and spirit of turpentine; upon then heating the iron in a furnace to a cherry red the pigment is said to fuse and enter into the pores of the iron and become "homogeneously adherent" to it. It is claimed that iron so treated is "not liable to change through atmospheric, gaseous, alkaline or other influences," and that the coating does not disintegrate from the surfaces to which it has been applied. A second process, in which the pigment used is composed of borate of lead, litharge and essence of lavender is intended to supersede the enamelling of iron vessels, but does not effect the inoxidation so perfectly. Iron treated by either of these processes may be subjected to a third, in which "dry chloride of platinum dissolved in ether and held in solution by volatile oils" is applied by means of a brush, and heat subsequently applied sufficient to drive off the volatile constituents. The result is that an extremely fine film of platinum is left on the surface. Gold may be used instead of platinum at a cost, it is stated, much below that of gold leaf.

The Barbier Prize of the French Academy has been this year awarded to M. Tanret, Pharmacien, of Troyes, for his memoirs on ergotinine and pelletierine, which have already appeared in this Journal. One of his competitors was the Professor of Materia Medica and Medicine and Pharmacy at Lyons, M. Cauvet, who, although not successful in carrying off the principal prize, has been awarded a solatium of five hundred francs in recognition of his admirable work, 'Nouveaux Eléments d'Histoire Naturelle Médicale.' At a subsequent meeting of the Academy M. Tanret communicated the information that besides pelletierine he has separated from pomegranate bark another crystallizable volatile alkaloid, and two uncrystallizable ones. At present only the crystallizable alkaloid has been studied as to its chemical properties. It is described as a strong base, displacing even ammonia from its salts, and like pelletierine giving an intense green coloration with sulphuric acid and bichromate of potash. It is represented by the formula $C_{18}H_{30}N_2O_2$, $4H_2O$. Its salts are also crystalline. M. Tanret reserves the naming of this alkaloid until he has examined its liquid companions.

It is curious to note that the year in which the expectation became strong that all the elements would be resolved into one common origin has already been more than usually prolific in the discovery of new elements. "Scandium" is the latest addition to the family, reported by M. L. F. Nilson to have been met with during the preparation of ytterbine from gadolinite, a Scandinavian mineral. It is said to be a white alkaline earth, and is supposed to have an atomic weight below 90.

The question raised in the Court of Chancery as to the validity of the patent granted in 1874 to J. H. Johnson, on behalf of Professor Kolbe of Leipzig, for improvements in the production of salicylic acid, has now been decided by Vice-Chancellor Sir James Bacon, before whom it was tried, and the result is a judgment in favour of the plaintiff. The chief facts of the case and the arguments of counsel on both sides were briefly stated some weeks since in this Journal, and it is now held by the Court that the plaintiff's invention was novel at the date of the patent, that it is sufficiently described in the specification, and that, taking the evidence given in the case, the plaintiff has established his right to that invention. Consequently an injunction was granted to restrain the infringement of the patent, together with an order for an account to be rendered of the profits made by the defendant by the sale of salicylic acid and payment of the costs of the case.

As yet only a very meagre report of the judgment has been published, and the account there given of the evidence brought forward at the hearing is so incorrect that it may well be the report of the judgment is equally defective except as regards the ultimate effect of it. However that may be, the minds of chemists will perhaps still be somewhat unsatisfied as to what was really the nature of the invention for which the patent was granted to Kolbe's representative in 1874. Certainly it did not consist in the production of salicylic acid by the action of carbonic acid gas upon carbolic acid in the presence of metallic sodium, for that process—though discovered, it is true, by Professor Kolbe, and, in a certain sense new even in 1874—had been published to the world by him in 1860, and by reason of that publication it could not be good subject matter of a patent. Neither could it consist in the production of salicylic acid by making carbonic acid act upon heated carbolate of soda previously prepared by dissolving metallic sodium in heated carbolic acid, for this process whether identical with or different from that first mentioned, was also described and made known by Professor Kolbe in 1860, and it was therefore equally incapable of being made the subject matter of a valid patent.

It has never been disputed that Professor Kolbe's explanation of the artificial production of salicylic acid is correct, viz., that it results from the combination of carbonic acid gas with carbolate of soda, giving rise to a sodium salt of salicylic acid. In the two cases above mentioned, the carbolate of soda is the immediate product of the action of metallic sodium upon carbolic acid. In the process described in the specification, also, the very same carbolate of soda is the material from which salicylate of soda is produced by combination with carbonic acid gas. This part of the operation described in the specification is therefore identical with the corresponding part of the process that was previously made known. The difference, and the only difference, between them has reference not to the actual production of salicylic acid by the combination of carbonic acid gas with carbolate of soda, but only to the production of the carbolate of soda, which is afterwards to be converted into salicylate of soda by the action of carbonic acid gas. This difference consists in substituting ordinary caustic soda for metallic sodium, and the production of carbolate of soda in this way was held by the counsel for the plaintiff to be the gist of the invention.

Hence it may fairly be taken that the alleged invention consists simply in using caustic soda for the preparation of carbolate of soda relatively to the artificial production of salicylic acid. As to the novelty of this procedure in 1874, and the possibility of regarding it as an invention and as subject matter of a patent, there was wide difference of opinion between the chemists who gave evidence in this suit, but at any rate that and the production of salicylate of soda from carbolate of soda so pre ared

was all which was or could be claimed as novel in the alleged invention. Those who are conversant with the history of carbolic acid and the carbolates, as well as the fact that all carbolic acid is made directly from carbolate of soda, will be able to judge for themselves whether such a view of the matter should be accepted or whether it would not be more correct to adopt the opinion expressed by the Attorney-General that the chemists who supported the plaintiff, failing to discover any real invention, had with considerable ingenuity formulated an invention—he would not say invented one, because that would have been rude.

It must be admitted that the difficulties attending the trial of such cases as this, involving chemical questions, are very considerable, especially to existing tribunals, and their insufficiency for the purpose is too frequently apparent. In the present instance there was an amusing illustration of the false significance attributed to particular facts brought out in evidence. As stated in the *Times* report of the case, the plaintiff's evidence went to show that the separation—or regeneration as it was termed—of carbolic acid in converting carbolate of soda into salicylate of soda was a surprise to chemists and was not known until 1874. It was so, and this was stated also by the witnesses on behalf of the defendant, but that fact had nothing to with the question whether the production of salicylic acid from carbolic acid was discovered in 1874, or fourteen years before that time, nor did it in any way tend to prove that the process by which salicylic acid was produced according to the patent was a novel invention in 1874. All that it did show was that when Professor Kolbe—having found a useful application for salicylic acid—applied himself to adop this earlier discovery to the requirements of manufacture, he found that carbolate of soda was not bodily converted into salicylate by combination with carbonic acid gas, as he had formerly supposed, but that only one half of the carbolate of soda operated upon was thus converted into the desired product while the other half gave rise to regenerated carbolic acid. This is equally the case whether the carbolate of soda is prepared with sodium or with caustic soda, and as regards the fitness of the process for producing salicylic acid in large quantities, it amounts to nothing more than the discovery that the process is only half as productive as was formerly supposed.

Possibly the Vice-Chancellor's decision in this case may not be accepted as final, and there may yet be an appeal to a higher Court on legal points as well as the chemical considerations above refered to.

It may be well, before proceeding to the consideration of the prescriptions *seriatim*, again to suggest to correspondents to avoid as much as possible personal references in any remarks they may have to make, and to confine their observations to the points at issue; the more general adoption of this course would save much valuable space, and obviate the possibility of any other than a friendly feeling in the discussion of subjects of general interest.

The prescription No. 272, must have been written in ignorance of the general character of the therapeutic agent creasote. There is no such a preparation as "ext. creasotonis," and the dispenser would use creasote in lieu of it. The quantity ordered of a fluid like creasote is too great in proportion to the solid ingredients for a satisfactory pill mass; a little magnesia or lime, in addition, will assist in solidifying the creasote, which may then be mixed with the other ingredients. But some dispensers object to the use of calcined magnesia or lime for this purpose, and consider animal soap more suitable. A summary of the discussions which took place on this subject will be found in "The Month," 1878, pp. 587 and 670, and on several subsequent occasions they have been recapitulated. Mr. S. Sandford had better refer to these discussions, and use his discretion in the choice of a menstruum. These pills may be satisfactorily made by the addition of one grain of soap to each grain of creasote, and the ext. hyoscyam. should be reduced to a firm consistence before being added to the mass. The solidification of creasote and its adaptation to a pilular form have been so fully discussed in these pages that a reference to that correspondence is all that need further be suggested in connection with the subject.

In No. 273 there occurs a flocculent separation very soon after the ingredients of the mixture are put together. This subsequently rises to the surface. There is no necessity for any addition with the view of preventing this separation, and as the flocculent matter is so easily diffused through the mixture the patient will have no difficulty in taking the medicine in divided doses according to the directions. A label to shake the bottle should be attached.

The mixture according to prescription No. 274 will throw down flocculent organic matter, and the tincture to which the precipitate is due is that of digitalis. The iron in the syrup is not necessary to this result; a similar deposit will take place from the presence of phosphoric acid alone, but not with either of the other tinctures, if the digitalis be not absent. Dispensers must be prepared to hear such an opinion occasionally from medical men and sometimes conveyed through their patients, but an experienced dispenser can generally anticipate the occurrence of such a change, and if he is unable to account for it should at once by experiment determine whether it is inherent in the composition, or due to defective manipulation or to an impurity in in one or more of the ingredients; in this instance the mixture cannot be made without the occurrence of such precipitate.

The most suitable excipient for the pills No. 275 would be the substitution of ℥ss of soap in lieu of the same quantity of the pulv. tragacanth. ordered; the tragacanth possesses no medicinal value, and therefore half of it may be replaced by soap. The pills will then be of good consistence, and there will be no exudation of oil from their surfaces. H. W. D. will find the addition of a little soap very useful to a pill mass containing an excess of creasote, or essential oil.

There is no difficulty in dispensing the mixture No. 276. The presence of syr. gummi is sufficient to emulsify the chlorodyne and to retain it in that condition. No special mode of mixing is at all necessary for this prescription; the addition of the chlorodyne to the other ingredients, previously mixed, is all that is requisite; but probably a more perfect emulsion may be made by using ℥ij of mucilage, with trituration in a mortar to emulsify the chlorodyne, and then adding it to the other ingredients. The colour of the mixture when finished should be just the amount given to it by the addition of the chlorodyne; the difference in colour which has been the subject of remark may have been due to one dispenser using one maker's chlorodyne, and the

other that of another maker. Some remarks bearing on this subject will be found in query 64, page 682, and replied to in "The Month," p. 771, vol. viii. Syr. gummi is not official in the B. P., but there is a formula for it in the French Codex; some dispensers would make it extemporaneously by the mixture of mucilage and syrup, but the relative proportions of these would make no appreciable difference in colour, that difference must be sought for in the kind of chlorodyne used. Mr. Storey would have facilitated the solution of this difficulty if he had stated what chlorodyne he used, and the colour that resulted; also the colour the patient stated it presented when made at another establishment. Prepared with Collis Browne's chlorodyne, it is brown with a tinge of green, and slightly opaque.

In answer to No. 277, when acid. hydrobrom. dil. is ordered it is usually understood to be the strength of that suggested by Fothergill, 5 grs. per ℥j; but if made according to his formula, unless subsequently distilled, it contains bitartrate of potash and other impurities. C. O. S. is referred to some remarks on hydrobromic acid in "The Month," March, 1878, p. 772, and to back numbers of the Journal, where he will find the subject fully discussed.

The gargle, No. 278, should be made by dissolving the pot. chlorat. in a part of the water ordered, and adding to it the acid. mur. dil. and the remainder of the water. If the dilute acid were added directly to the pot. chlorat. there would be no decomposition, and therefore no development of chlorine, but if the undiluted acid had been written, its addition to the pot. chlorat. for the development of chlorine would not be admissible without some positive knowledge beyond what is conveyed in the prescription of that being the writer's intention. The order of mixing adopted by B.P. was therefore the correct one in making the gargle thus prescribed.

In making the pigment, No. 279, the carbolic acid should be mixed with the glycerine, and somewhat diluted with a little of the water; with this mixture the bismuth carb., zinci oxid. and pulv. amyli, previously placed in a mortar, should be rubbed into a smooth condition and poured into the bottle, to which is to be subsequently added the aq. laurocerasi, and finally the remainder of the water. It is difficult to understand the object of B.P.B.'s inquiry, "If the simple directions 'misce' are sufficient?" *Secundum artem* might have been added, but no addition to the ingredients is necessary in order to make a satisfactory mixture; it would of course require to be shaken on each occasion of its being used. The chief point is to ensure a smooth mixture of the powders with the diluted glycerine, previous to the addition of water, and this must be accomplished by the aid of a mortar. It is just possible that some dispensers may imagine that the starch and glycerine should be made, by the aid of heat, into a "plasma," but such is not the case, a simple mixtuie only is required, which, after being applied, leaves a powder on the surface of the skin.

In prescription No. 280, J. J. asks if there should be 2 oz. of precipitate in this mixture. On the addition of tr. cinchon. to water alone, there is a separation of some of the constituents of the bark, and this is increased by the addition of sp. ammon. arom.; further, a decomposition takes place on the addition of the iodide of potassium. For some remarks in reference to it see "The Month," 1878, p. 849. The flocculent matter precipitates, occupying about one-third of the bottle and becoming more dense and of course occupying less space after it has stood a time; the amount of precipitate would necessarily depend on the tr. cinchon., and the bark from which it was made, and on the care with which it was prepared. It would have been better for J. J. to have remarked that it had been previously dispensed with more precipitate than he could produce, and to request suggestions as to the cause of the difference, rather than to make so personal an allusion, without giving the dispenser an opportunity of defending himself. This subject has been already referred to and it is hoped that it may not be necessary to allude to it again. The object of these pages is to assist our less favoured brethren in their dispensing difficulties, but the apple of discord must be excluded from its columns.

282. Chlorodyne. Mr. Puntan is referred to some remarks on this preparation in a reply to Mr. E. H. Storey in prescription No. 276.

In reply to a question of H. W. E. with reference to a form for tr. sanguinariæ, its strength, and whether made with proof or rectified spirit, this preparation is official in the U.S. Pharmacopœia, and the formula for the tincture is: Blood root in moderately fine powder, 4 troy ounces; diluted alcohol a sufficient quantity. Moisten the powder with a fluid ounce of the diluted alcohol, pack it in a percolator and gradually pour diluted alcohol upon it until two pints of tincture are obtained. H. W. E. is also referred to a paper on this subject by Dr. G. D. Gibb, *Pharm. Journal*, series 2, vol. i., p. 454.

"Mercury" asks which preparation is generally sold for citrine ointment, ung. hyd. nit., B.P., or ung. hyd. nit. dil.? Citrine ointment (syn. unguentum citrinum, Edin.) is the ointment prepared according to the official formula for ung. hyd. nit., B. P., and if reduced in strength is the "diluted" citrine ointment.

In a paper on the "Citrine Ointment of the B.P.," Professor Donovan, after referring to the different methods recommended for its manufacture, adds, "The frequent occurrence of this acridity induced surgeons to prescribe the ointment in a state of dilution with lard or other ointments, so that it is now almost never otherwise prescribed than diluted. Would it not be better to reduce the strength of the ointment in the formula of the Pharmacopœia to one half, and thus put an end to the necessity of diluting it? The dilute citrine ointment as recommended in prescriptions has no definite meaning as to strength, and the difficulty of preparing it is a continual source of annoyance to the apothecary."

CONSTITUENTS OF LIGUSTRUM IBOTU.*

BY G. MARTIN.

The seeds of this plant resemble coffee in appearance, and contain a bitter, syrupy substance, which, when treated with sulphuric acid, reduces copper solution. The aqueous extract of the seeds gives a precipitate with lead acetate; and this, when decomposed with hydrogen sulphide and exhausted with alcohol, yields a solution which, when evaporated, leaves a yellowish-white powder, apparently a glucoside; sulphuric acid causes it to assume a red colour, which disappears on the addition of water. As this substance cannot be identified with syringin, it has received the name *ibotin*. The seeds contain 20 per cent. of an oil resembling olive oil, and the ash amounts to 3·422 per cent.

INFRINGEMENT OF THE PHARMACY ACT.

ON Wednesday last—somewhat earlier after the Easter recess than was expected—the law lists contained a notification that judgment would be delivered in the case of the Pharmaceutical Society *v.* The London and Provincial Supply Association, Limited. This case it will be remembered came on for trial in the Bloomsbury County Court, so long since as May, 1878, and after a long hearing, in the course of which it was contended on behalf of the defendant Company that being a corporate body it was not amenable to the provisions of the Pharmacy Act, 1868, and that so far as the safety of the public was concerned all requirements of the Act were satisfied by the employment of a registered chemist and druggist to conduct the drug department of the Company's business, judgment was eventually given in favour of the Company.

It may be well to remind our readers that it was so far back as December, 1877, that a report was made by the Secretary of the Society to the Law and Parliamentary Committee, showing that WILLIAM MACKNESS was carrying on the business of a chemist and druggist in contravention of the Pharmacy Act. Upon consideration the Committee recommended that the case should be placed in the hands of the Society's solicitor, and this was done by the Council, the result being that Mr. MACKNESS paid the penalty he had incurred under the 15th section of the Pharmacy Act, and at the same time gave an assurance that he was engaged in making arrangements to terminate any further violation of the law. A few days later a letter was received from Mr. MACKNESS's solicitors stating that he had sold his business at 113, Tottenham Court Road to the London and Provincial Supply Association, Limited, which was duly registered under the Companies Act 1862. The Society's solicitors were thereupon instructed by the Council to proceed against that Company, and as stated above the case was tried in May, 1878. When judgment was given application was at once made for leave to appeal, and this was granted by the County Court Judge, since the point raised affected the safety of the public, and he considered every facility should be given for its proper decision.

After many unavoidable delays the case came on for argument on the 15th of March last before the Lord Chief Justice and Mr. Justice MELLOR, the Attorney-General and Mr. LUMLEY SMITH appearing for the Pharmaceutical Society, and Mr. WILLS, Q.C., for the London and Provincial Supply Association. At the outset of the case, Mr. WILLS admitted that he could not see his way to support the view which was taken by the County Court Judge, to the effect that the employment of a qualified person to conduct the drug department of the business made any difference if the Company was actually within the operation of of the law. This line of defence was therefore virtually abandoned, and so far it was admitted that the judgment of the County Court was wrong. The Attorney-General also contended that it was wrong for the reason that the Pharmacy Act was intended to apply to companies and corporations as well as individuals; that in fact it was directed against anybody and was intended to prevent altogether the sale of dangerous poisons except by persons who were duly qualified.

Mr. WILLS, on behalf of the respondents, contended that the whole tenor of the Pharmacy Act was personal, and that the word "person" as used in the statute could not be held to include corporations, while he admitted that the state of things which had arisen was a *casus omissus* by the Act. He argued that the well known distinction between a corporation and the individuals of a corporation lying at the foundation of a great deal of our jurisprudence required to be considered, and that since the Pharmacy Act applies, as he held, to persons only, an aggregrate of persons forming a company could not be held guilty of an offence within the terms of an Act of Parliament relating to individual persons.

Their Lordships were disposed to adopt this view of the case, and it seemed almost to have been decided upon this ground adversely to the Society, when the Attorney-General resumed his argument in reference to the difficulty felt by their Lordships as to whether a corporation could be brought within the term "person." That he fully succeeded in removing that difficulty is now apparent from the judgment which has just been given, and the entire pharmaceutical body are greatly indebted to him for having thus brought about a satisfactory settlement of a question which has so long been a scurce of annoyance and irritation to the chemists and druggists throughout the country.

The terms of the judgment delivered by the Lord Chief Justice are very decided in their indication that the Pharmacy Act is really a means of protection to the public and that if it be not all that might be wished by chemists and druggists, it is at least some defence against those encroachments upon their business which they have lately had to contend with. The judgment of Mr. Justice MELLOR coincides with that of the Lord Chief Justice, and is the more important since it was arrived at "with considerable hesitation" and after a disposition to think

that the circumstances of the case were, as argued by Mr. WILLS, not within the contemplation of Parliament when the Pharmacy Act, 1868, was passed. On fuller consideration, however, Mr. Justice MELLOR was led to think the great object of the Legislature was to prevent the sale of poisonous or dangerous drugs by persons not qualified by skill or experience to deal in such commodities. In his judgment he sets forth the nature of the difficulties which at first mainly embarrassed him as to the extent of the prohibitive sections of the Act and gives as the reason for his final conclusion the opinion that it was the object of those sections absolutely to prevent the danger arising from the keeping open shop for retailing, dispensing or compounding poisons by persons not qualified as pharmaceutical chemists or as chemists and druggists. On these grounds he holds it to be essential that all persons, "natural or artificial," should come within the scope of the prohibitory sections of the Act, and that no association of persons should be free from liability to penalty for doing that which in their individual capacity would unquestionably be an offence.

In the judgment of the Lord Chief Justice greater prominence is given to the details of the case, and it seems clear that the true nature of the business carried on under the cover of the Companies Act is appreciated. The fact that Mr. MACKNESS holds 564 out of the 597 shares which have been allotted sufficiently shows that virtually the business is almost as much his as it was before he sold it to the London and Provincial Supply Association, Limited, and sought under cover of the Companies Act to escape from liability to penalty under the provisions of the Pharmacy Act.

The business carried on is the same as that of MACKNESS was before the formation of the company, namely, that of a wholesale and retail grocer and general warehouseman, where, as at co-operative stores, everything conceivable—from bibles down to game—may be bought, where we understand clothing, provisions, watercresses, and perhaps other kindly fruits of the earth are exposed for sale, and where probably purchases of such articles may be conveniently and advantageously effected. Mr. MACKNESS is now the managing director of the company, *vice* the individual and personal proprietor. He is not a duly registered pharmaceutical chemist or chemist and druggist within the meaning of the Pharmacy Act, but the business of the Company comprises, as co-operative stores often do now, a department for the sale of drugs, dispensing of medicines, and compounding poisons within the meaning of the Pharmacy Act. A holder of five shares in the company, a registered chemist and druggist, conducts this department of the business, with the aid of assistants, all of them being the servants of the company, paid by salary or wages.

In calling attention to this as the state of things in regard to which the question presented itself, whether the company as such be amenable to the penal enactments of the statute, the Lord Chief Justice points out that it was fully admitted and could not be contested that if that had been an ordinary partnership the individual partners, if not qualified under the statute, would have incurred the penalties it imposes; that it was clearly the intention of the Legislature every shop for the sale of poisons should be under the immediate superintendence and control of a duly qualified proprietor, and not merely managed by a qualified assistant. If a grocer and chemist might combine to carry on their business jointly there would be nothing to insure that in the absence of the qualified partner the other might not take upon himself to act in his stead and thus seriously compromise the security against fatal mistakes in the dispensing of medicines, and hence it is concluded that the case of the London and Provincial Supply Association, Limited, comes within the evil against which the statute was intended to provide a remedy.

In reference to the objection that the term person used in the Act does not apply to a corporate body, the Lord Chief Justice held that the scope and purpose of the legislation must be taken into account, and then, its provisions being universal, they must extend to all persons, whether acting in an individual or corporate capacity; and as regards the shareholders of the London and Provincial Supply Association, Limited, they were in their aggregate capacity breaking the law, and liable in that capacity, if not individually.

The judgment of the County Court Judge was also held to be wrong in reference to the management of the business by a qualified person, because he acted as a paid servant of the company, and lastly the London and Provincial Supply Association, Limited, was held liable to be sued for the penalty incurred by disobedience to the statutory prohibition of the Pharmacy Act, 1868, as the means to be resorted to for the recovery of the penalty are of a purely civil character.

Application was made by Mr. WILLS for leave to appeal and the Lord Chief Justice gave it, as he said, with reluctance, because there could be no doubt that the Company was as much within the mischief referred to by the Act as an ordinary partnership would be, and he acceded to the application for leave to carry the appeal further only on the ground of the importance of the question involved.

It remains to be seen whether this application means anything more than the gaining of time, and in any case we may congratulate our readers upon the circumstances that the decision now given is so explicit in affirming the practical utility of the Pharmacy Act and that founded as it is upon sound common sense there is little reason to anticipate its being altered.

CHEMISTS' ASSISTANTS' ASSOCIATION.

THE last meeting of this Association for the present session will be held on Wednesday evening next at 32A, George Street, Hanover Square. A number of microscopes and other objects of interest will be displayed.

Transactions of the Pharmaceutical Society.

PRELIMINARY EXAMINATION.

At a meeting of the Board of Examiners for England and Wales, held in London on Wednesday, April 23rd, 1879.

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

The report of the College of Preceptors on the examination held on April 1st was received.

Three hundred and sixty-two candidates had presented themselves for examination, of whom *one hundred and fifty-five* had failed. The following *two hundred and seven* passed, and the Registrar was authorized to place their names upon the Register of Apprentices or Students.

Young, James .....Aberdeen.
Young, Robert John .....Bideford.

The following is a list of the centres at which the examination was held, showing the number of candidates examined at each centre and the result:—

	Candidates.		
	Examined.	Passed.	Failed.
Aberdeen	11	5	6
Birmingham	23	12	11
Brighton	4	3	1
Bristol	9	4	5
Cambridge	7	3	4
Canterbury	4	1	3
Cardiff	7	3	4
Carlisle	2	2	0
Carmarthen	11	5	6
Carnarvon	9	4	5
Darlington	6	5	1
Dundee	2	2	0
Edinburgh	14	9	5
Exeter	8	5	3
Glasgow	11	9	2
Hull	13	11	2
Inverness	2	1	1
Lancaster	2	0	2
Leeds	16	6	10
Lincoln	8	4	4
Liverpool	24	15	9
London	46	28	18
Manchester	32	20	12
Newcastle-on-T.	5	2	3
Northampton	9	4	5
Norwich	7	4	3
Nottingham	11	8	3
Oxford	2	1	1
Peterborough	5	3	2
Sheffield	8	6	2
Shrewsbury	7	2	5
Southampton	19	9	10
Truro	4	2	2
Worcester	2	1	1
York	12	8	4

The questions for examination were as follows:—

FIRST OR PRELIMINARY EXAMINATION.

April 1, 1879.

Time allowed: Three hours for the three subjects.

I. LATIN.

1. Translate the following passages into English:—

A. Cæsar, *quòd* memoriâ tenebat, L. Cassium consulem occisum, exercitumque ejus ab Helvetiis pulsum et sub jugum missum, *concedendum* non putabat: neque homines inimico animo, datâ facultate per provinciam itineris faciundi, temperaturos ab injuriâ et *maleficio* existimabat.

B. Cæsar singulis legionibus singulos legatos, et quæstorem præfecit, utì eos testes suæ *quisque* virtutis *haberet;* ipse a dextro cornu, quòd eam partem *minimè* firmam hostium esse animum *adverterat*, prœlium commisit. Ita nostri acriter in hostes, signo dato, impetum fecerunt, itaque hostes repentè celeriterque procurrerunt, ut spatium pila in hostes conjiciendi non daretur.

2. Parse the words in italics.

3. Select all the prepositions in the passages above, and show what cases are governed by them.

4. Give the present, perfect, infinitive and supine of *tenebat, præfecit, commisit, procurrerunt, daretur.*

5. How does the relative agree with the antecedent? Give three examples in Latin.

II. ARITHMETIC.

[The working of these examples, as well as the answers, must be written out in full.]

6. How many ducats, each worth 4*s.* 9*d.*, are contained in £231 16*s.*?

7. If 1 oz. $2\frac{1}{2}$ dwts. of silver cost 7*s.* $10\frac{1}{2}$*d.*, find the value of 6 silver cups, each weighing 1 lb. $7\frac{1}{3}$ oz.

8. Multiply the sum of $3\frac{2}{3}$, $4\frac{3}{4}$, and $4\frac{4}{5}$ by the difference of $7\frac{6}{7}$ and $5\frac{5}{6}$, and divide the product by the sum of $94\frac{1}{8}$ and $93\frac{1}{9}$.

9. Find the value of 1·875 guineas + 1·875 crowns + 1·875 of 3·625 £.

10. If 6 horses eat 180 kilogrammes of hay in 4 days, how much hay will be required for 15 horses for 7 days?

III. ENGLISH.

11. How do you distinguish between Prepositions, Adverbs, and Conjunctions?

12. What is meant by Case, Tense, and Mood? What moods have we in English?

13. Parse fully each word in the following sentence:—

"When the noble Cæsar saw him stab,
Ingratitude, more strong than traitors' arms,
Quite vanquished him."

14. Write a short composition on one of the following subjects:—The study of the Laws of Health. The Advantages derivable from a Knowledge of Latin. The Conditions of Success in Life. The Value of a Good Character. The War in Afghanistan.

EXAMINATIONS IN EDINBURGH.

April 15, 16 and 17, 1879.

Present on each day—Messrs. Ainslie, Borland, Gilmour, Kemp, Kinninmont, Stephenson and Young.

Professor Maclagan was also present, on behalf of the Privy Council.

MAJOR EXAMINATION.

April 15.

Three candidates were examined. *All* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Fraser, Jonathan Innes .....Elgin.
McCallum, Hugh .....Berwick.
Stewart, Duncan .....Crieff.

MINOR EXAMINATION.

April 15.

Nine candidates were examined. *Six* failed. The following *three* passed, and were declared qualified to be registered as Chemists and Druggists:—

Ballingall, Peter .....King's Kettle.
Currie, Alexander.....Portsoy.
Donaghey, John Joseph .....Dundee.

April 16.

Eleven candidates were examined. *One* failed. The following *ten* passed, and were declared qualified to be registered as Chemists and Druggists:—

Hay, Henry Scott.....Aberdeen.
Heaton, John Appleyard.....Burnley.
Johnson, Edward .....Stockport.
McDerment, James .....Ayr.
Macintyre, John .....Edinburgh.
Maben, Thomas.....Hawick.
Marsden, John .....Banff.
Reeves, Alfred .....London.
Rose, George William .....Spilsby.
Russell, James Lawson .....Edinburgh.

April 17.

Seven candidates were examined. *Five* failed. The following *two* passed, and were declared qualified to be registered as Chemists and Druggists:—

Watkins, William Powell .....Blackwood.
Williams, John Thos. Creswick...Dolgelley.

MODIFIED EXAMINATION.

April 17.

Two candidates were examined. *Both* passed, and were declared qualified to be registered as Chemists and Druggists:—

Fairbairn, John.....Alnwick.
Graham, Robert .....Liverpool.

The following should have appeared on p. 538:—

PRELIMINARY EXAMINATION.

The under-mentioned certificate was received in lieu of the Society's examination:—

Certificate of the University of Glasgow.

Chisholm, John Oliver.....Glasgow.

NORTH BRITISH BRANCH.

EVENING MEETING.

The seventh and last meeting of the present Session was held in the Society's Rooms, 119A, George Street, Edinburgh, on the evening of Wednesday, April 9, Mr. J. B. Stephenson in the chair.

The minutes of previous meeting were read and confirmed.

The Honorary Secretary intimated the following donations to the library:—

'Pharmacopœia Collegii Regalis Medicorum Londinensis,' 1724. From Mr. E. N. Butt, London.
The 'Calendar of the Pharmaceutical Society of Ireland' for 1879. From the Society in London.
The 'Pharmaceutical Register of the Pharmacy Board of Victoria' for 1878.
The 'Chemist and Druggist' with Australian Supplement. From the Pharmacy Board of Victoria.

A paper was then read on—

The Meconates of Morphia.

BY D. B. DOTT.

Meconic acid is generally assumed to be tribasic, but there is some doubt as to whether this is really the case. Dittmar and Dewar have expressed the opinion ('Proc. Roy. Soc. Edin., 1867') that the acid is dibasic but triatomic, and its combinations with morphia tend to confirm the conclusions of these chemists. I have not been able to obtain, from the ordinary books of reference, any information regarding the morphia meconates, other than that "meconate of morphia is an amorphous, extremely soluble substance," or something to that effect.

I first tried to prepare the tri-morphia meconate by digesting together three equivalents of morphia with one of meconic acid (909 parts of morphia crystals to 254 parts crystallized meconic acid) in water, but even after remaining a long time on the water-bath and heating to boiling, part of the morphia remained persistently undissolved. The solution was filtered and when cold deposited crystals, which were removed from the mother-waters and dried on blotting paper by exposure to the air. 29·28 grs. were dried in the water-bath and lost 3·06 grs., equal to 10·45 per cent. The dried salt was dissolved in water and slight excess of ammonia added. After twelve hours the precipitate so obtained was collected on a tared filter, washed with cold water, dried and weighed. The yield was 19·60 grs. or 66·93 per cent.

	H_2O	$C_{17}H_{19}NO_3.H_2O$.
Found	10·45 p.c.	66·93 p.c.
$(C_{17}H_{19}NO_3)_2.C_7H_4O_7.5H_2O$ =	10·46 „	70·46 „

A portion of the morphia is of course carried away in the filtrate and washings. From these figures it is manifest that the salt formed under the above circumstances is di-morphia meconate.

It was next attempted to prepare the tri-morphia salt by dissolving three equivalents of morphia and one equivalent of meconic acid in boiling alcohol. On cooling, the solution deposited crystals, which had the appearance of, and on examination proved to be pure morphia. After some hours a further crop of crystals had formed. Of these 24·57 grs. were treated with warm water, which left undissolved 13·80 grs. After continued spontaneous evaporation of the alcoholic solution a third crop of crystals was obtained. A portion of them was dissolved in water and the morphia precipitated as formerly. 13·94 grs of the dry crystals give 10·40 grs. morphia, equal to a yield of 74·57 per cent. Di-morphia meconate gives 78·70 per cent. From these facts it is clear that when morphia and meconic acid are dissolved in the proportion of three molecules of morphia to one molecule of meconic acid, pure morphia is first deposited, then a mixture of morphia and di-morphia meconate, and lastly di-morphia meconate alone. It is therefore highly improbable that a tribasic meconate of morphia can be formed.

Di-morphia meconate is easily prepared by dissolving two equivalents of morphia and one of meconic acid in boiling water. The solution gradually deposits crystals in the form of tufts of prismatic needles radiating from a common centre. These crystals lose the whole of their water of crystallization under a bell-glass over sulphuric acid, and there is no further loss of weight by drying in the water-bath or even by exposure to a temperature of 120° C. in an air-bath. The mean of several deter-

minations gives for loss in exsiccator 10·50 per cent. and of precipitated morphia 66·80 per cent.

	H_2O	$C_{17}H_{19}NO_3.H_2O$
Found	10·50 p.c.	66·80 p.c.
$(C_{17}H_{19}NO_3)_2C_7H_4O_7.5H_2O$ =	10·46 „	70·46 „

The salt has the same composition whether crystallized from water or from 85 per cent. alcohol.

When morphia and meconic acid are dissolved in hot water in the proportion of one molecule of the former to one molecule of the latter, the solution on cooling separates into two layers, the lower syrupy and the upper mobile. From the lower layer hard rhombic crystals are chiefly deposited, while in the upper layer delicate silky crystals make their appearance. From their form it was thought probable that the rhombic crystals were meconic acid, and such on examination they proved to be. Their solution gave no precipitate with ammonia, and 4·28 grs. titrated with standard alkali neutralized 0·736 gr. NH_3 = 4·32 grs. meconic acid. The soft silky crystals obtained as above described were pressed in calico and dried by exposure to the air. 22·41 grs. lost in the exsiccator 2·70 grs., and when removed to the water-bath gave up 0·56 gr. in addition. The salt was then dissolved in water and the morphia precipitated by addition of ammonia. After drying it weighed 12·0 grs.

Loss in exsiccator = 12·04 per cent.
Total loss . . . = 14·54 „
Morphia . . . = 62·64 „

Mono-morphia meconate gives a calculated yield of 62·68 per cent. of morphia, but in practice it would be considerably less, on account of the solubility of morphia in a solution of meconate of ammonia. These facts would indicate that the crystals under examination were not mono-morphia meconate, but a mixture of di-morphia meconate and meconic acid. To make more certain, however, the salt was recrystallized from water and the crystals squeezed and dried at the ordinary temperature. 14·39 grs. lost 1·49 grs. in the exsiccator and only 0·01 further in the water-bath. 23·05 grs. of the air-dry salt gave in the usual way 15·00 grs. morphia.

Loss in exsiccator = 10·35 per cent.
Morphia . . . = 65·07 „

These figures approach very nearly those required for the dibasic meconate. Another quantity of meconate was prepared in the same way as the last, but in this case the crystalline mass was stirred up with cold water and the light crystals decanted from the heavier crystals of meconic acid which had been interspersed throughout the mass. The salt so obtained was re-crystallized and the crystals dried by pressure and exposure to the air of the laboratory. 12·88 grs. lost over sulphuric acid 1·33 grs., and when dissolved in water and excess of ammonia added gave 8·77 grs. of morphia.

	H_2O	$C_{17}H_{19}NO_3.H_2O$
Found	10·32 p.c.	68·09 p.c.
$(C_{17}H_{19}NO_3)_2.C_7H_4O_7.5H_2O$ =	10·46 „	70·46 „

Several other experiments were tried with the same general results, which lead inevitably to the conclusion that when one equivalent of morphia and one of meconic acid are dissolved together in water, either no mono-morphia meconate is formed, or if formed it is speedily decomposed into di-morphia meconate and meconic acid.

When, however, the above proportions of morphia and meconic acid are dissolved in boiling alcohol, the strong solution on cooling deposits a viscous mass, which seems to be a mono-morphia meconate. When dried at a gentle heat it presents the appearance of a yellow amorphous substance, which is deliquescent and extremely soluble in water. If exposed to the air for a few days, however, it loses its hygroscopic property and dries up to a resinoid mass, probably from formation of the dibasic salt. 34·38 grs. (dried in the water-bath) gave by precipitation 21·09 grs. morphia, equal to 61·34 per cent. Some of the same salt was rubbed up in a mortar with a little alcohol, the spirituous solution poured off and the residue desiccated as in the last instance. 21·29 grs. gave by the same method of precipitation 13·35 grs. morphia, equal to a yield of 62·70 per cent., proving that the salt is decomposed even by treatment with alcohol. A strong aqueous solution of this acid compound after a few days had become filled with crystals. These were thoroughly pressed and dried under 100° C. 11·70 grs. gave by the usual process 7·63 grs. morphia, which is equivalent to a yield of 65·12 per cent. Though much less than the proportion which would be obtained from pure di-morphia meconate, it is decidedly too high for mono-morphia meconate. It is hence manifest that the acid salt decomposes in aqueous solution into di-morphia meconate and meconic acid.

In the analysis of the foregoing compounds the meconic acid was not determined, as no ready and accurate method is known for its estimation. By precipitation with excess of hydrochloric acid, a considerable quantity is carried away in the mother-waters; while the meconates of silver and lead, though always stated to be insoluble in water and in excess of the precipitants, are not so.

From the results obtained, however, we can say with certainty that one well-defined crystalline salt of morphia and meconic acid exists, namely, the di-morphia meconate, having, when crystallized from water, the composition $(C_{17}H_{19}NO_3)_2.C_7H_4O_7.5H_2O$., and there can be little doubt that we have also an amorphous acid salt which readily decomposes into the dibasic salt and meconic acid.

The very beautiful specimen of dimorphia meconate which Mr. Dott used as an illustration to his paper, was presented to the museum by Messrs. J. F. Macfarlan and Co.

Mr. Cargill G. Knott, B.Sc., Edinburgh University, then delivered a lecture, entitled—

Transformation of Energy.*

The subject I propose to bring before your notice this evening is one, to the development of which we owe the great strides which science has taken during the last half century. Though peculiarly physical, the modern doctrine of energy has an important bearing upon all branches of science; and it is well that those whose professional duties touch in any way upon any of these many branches of science should have clear notions of what is really meant by energy. Philosophers are wont to speak of matter and mind as if they were the only things which could be reasonably assumed to exist in the universe. We believe in the existence of matter because it affects our senses; but the great argument in favour of the objective existence of matter is its indestructibility—that is, the impossibility, as far as our experience goes, of destroying matter or of creating matter. We can only shape matter, transfer or transform matter, but never has matter by pure physical means been called into existence. Now in nature there is another something, far subtler than matter, but possessing this same property of indestructibility—a something, too, which can be traced in its actions in the material universe; and this something, which we call energy, has as real and objective an existence as matter itself. The energy of a material system is usually defined as the capacity the system possesses for doing work. For example in lifting a stone I do work against its weight, and the energy required to do that work was originally stored up in my muscle. The work I do is measured by the product of the force overcome into the distance through which it is overcome —*i. e.*, by the product of the weight of the stone into the height through which it is raised. Say I raise a pound weight 20 feet, then I perform 20 foot pounds of work. In raising the stone I have suffered a certain fatigue, I have lost energy, but this energy, though lost to me is not lost to the world, it is stored up in the raised weight, which has now, because of its position above the earth's

* The lecture was successfully illustrated by electrical experiments, some of which were very beautiful and deservedly applauded.

surface, a certain capacity for doing work. This energy of position in the mass is measured by the amount of work which I originally performed on it—namely, 20 foot pounds ; but if the mass be permitted to descend, it, in its turn, will lose this stored up energy which will become transformed more and more into energy of motion as the mass, descending, gains in velocity. At the instant the mass touches the earth, the stored up 20 foot pounds of energy will be wholly transformed into energy of motion, which the mass still possesses. After the impact, however, the mass is brought to rest ; it has been unable to overcome the resistance offered to its motion by the earth's surface ; it has lost its energy, but this energy reappears in the heat and sound which are developed at the instant of impact. I have thus traced a certain portion of my muscular energy through a variety of transformations which ultimately end in the generation of heat. Throughout it all, however, the quantity of energy has been unaltered. Illustrations might be multiplied indefinitely. To-night I shall confine myself to electrical illustrations.

Let us consider a galvanic battery as our source of energy, and let us follow the transformations of part of this energy as exemplified in well known electrical experiments. The energy of the galvanic current is derived in the first place from the combustion of the zinc in the Bunsen cells which form the battery, and this combustion depends upon chemical action, which is simply a transformation of potential energy of molecular distribution. Into this we cannot enter at present, but pass on to the consideration of the electric current and the various ways in which it may be employed to do work. A current flowing along any conductor experiences a certain resistance, to overcome which it does work, and the energy which it so loses is transformed into heat. By passing the current through a thin iron wire, the heat generated is sufficient to make the wire glow till it melts. This process is familiar as a method by which mines are frequently blasted. Electrolysis or decomposition of a liquid (such as dilute acid) by the passage of a current affords another striking example. Here the energy of the current is expended in pulling the molecules asunder so as to separate them into their constituents. The hydrogen and oxygen into which acidulated water is decomposed may be collected in a vessel and exploded, when the sudden expansion of the water vapour produced by the combustion of the hydrogen in the oxygen causes a violent disturbance in the air, which is evidenced as sound. In this form we partly recover the energy which the current originally lost in effecting the decomposition. The discovery by Oersted in 1820 of the motion of a magnet by a current flowing near and parallel to it supplied the link which was wanting between electrical and magnetic phenomena. An electric current is as much the seat of magnetic action as a magnet is, and by suitable means the energy of the current may be transformed into the energy of magnetism. Wherever a current is flowing there of necessity is a magnetic field, and if any system is acted upon energetically, when placed in this field, as is the case with a magnet or a piece of iron, the current loses a certain part of its energy, which is first transformed into energy of motion, ultimately, as in all transformations, taking the form of heat. Thus, by passing a current through a wire coiled round a soft iron bar the iron acts for the time as a magnet; and, indeed, all the phenomena of magnetism can be produced by means of helices or spirals of conducting wire. But not only does a current affect a magnet in its vicinity, but a magnet moving in the vicinity of a coil generates a current in the coil. More generally, if a magnet and conductor are in relative motion, currents are induced in the conductor which, by the attraction or repulsion upon the magnet, tend to stop the relative motion. This is the explanation of the damping effect which a conductor set below a vibrating magnet has upon the vibrations of the magnet, and of Arago's famous experiment in which a magnet placed upon a rotating horizontal copper disc is dragged round after the disc. All these are special cases of induction, the nature of which was first thoroughly studied by Faraday, and all are included under the following general proposition. When the magnetic field in which a conductor is set is in any way altered, currents are induced in the conductor, which by their magnetic action tend to resist the alteration. This alteration may be effected by moving a magnet near a conductor, or a conductor near a magnet, or by mutual motion of a current-traversed coil and a conductor, or by altering the intensity of the current flowing in the vicinity of a conductor. Upon this principle depends the action of the various forms of magneto-electric machines which are now so much used in the production of the electric light, as well as of the Ruhmkorff's coil or inductorium, whose working, as affording interesting examples of transformations, we shall consider in greater detail. The induction coil consists essentially of two coils, the thicker internal one being the primary, and the thinner, but longer external one, the secondary. Inside the interior of the inner or primary is a bundle of iron wires, terminated at its extremities by discs of soft iron. When a current is passed through the circuit, the iron core becomes an electro-magnet, attracts a small iron disc, which forms the extremity of one arm of a lever, whose other extremity is consequently displaced, and by its displacement breaks the primary circuit. The current accordingly ceases to flow, the soft iron core loses its magnetism, and the lever returns to its original position, thus completing the circuit, and permitting the current anew to flow. The same cycle of operations takes place again, and thus an automatic or self-governing arrangement is produced, by which the current is made and broken in rapid succession. But at each make and break of the primary an alteration of the magnetic field results, and alternating secondary currents, rendered the more intense by the presence of the iron core, are induced. By this means a rapid series of sparks is obtained between the terminals of the secondary coil. To overcome the great resistance which the air presents to the passage of the spark, the second current must do work, and the energy so lost re-appears as light, heat, and sound, which are the invariable accompaniments of the spark. The beautiful combinations of coloured and stratified lights produced by passing the currents through Geissler vacuum tubes illustrate the same principles, and in all these varied transformations of our original source of energy, the grand conservation law holds without exception. Naturally, however, energy in whatever form it may exist tends to the ultimate form of heat, which cannot be prevented from diffusing gradually all round. But this diffusion diminishes its power of being transformed, diminishes its availability for doing work. Hence at every transformation energy becomes degraded, or as it is commonly expressed, dissipated; that is to say, though its total quantity remains constant, its entropy or availability for work is diminished. Ultimately then, unless the energy of the material universe is infinite, its entropy will become zero, and the universe be reduced to a lifeless, motionless, characterless mingling of matter, at a uniform temperature.

A vote of thanks was most cordially awarded to both gentlemen for their interesting communications.

The Chairman then closed the session with the following valedictory remarks :—

Gentlemen, I am sure that at this late hour, and after all we have already heard to night, you will not expect, as I certainly do not intend, any lengthened remarks. Indeed, my only reason, rather my apology, for addressing you at all is my feeling that the position which you have kindly assigned me as your chairman, not only gives me an authority, but imposes on me an obligation to close the session in this formal manner. In doing so I have much pleasure in remarking that it has been on the whole a

not unsuccessful one, both as regards the attendance and the nature of the papers read. We have had, to say the least, an average attendance, and when we bear in mind the remarkable severity of the past winter, and how it has continued unabated during nearly the whole of our session, I think this is very satisfactory; and I believe that a consideration of the subject matter of our meetings, as I shall endeavour in the most summary manner to bring it before you in our usual retrospective survey, will prove equally satisfactory. Our first evening was fully taken up with some desultory remarks on the pharmacopœia, and principally with a discussion thereon. Our next was well spent in listening to our worthy secretary, who had visited Homburg in the summer, and gave us his experience there, conveying much useful and interesting information about the springs there, as well as those in the surrounding country, viz., Apollinaris, Taunus, etc.; and after him Mr. Gilmour read four short notes, all of them (at least three) on very practical subjects—saffron in aromatic confection; quinine in Easton's syrup; cod liver oil emulsion and the reaction of acetic acid on perchloride of iron. I must remark in passing that this kind of paper seems to me the very type of what our papers ought mainly to be. Short, and having reference to matters of everyday experience, they secure interest and provoke criticism. The discussion that followed the reading of these notes proves this. At our third meeting Mr. Ivison Macadam, in the absence of his father, read a short paper on "The Presence of Arsenic in Soot," and the rest of the evening was taken up by Dr. Moinet with a very interesting and instructive communication on "The Use and Abuse of Tea, Coffee, etc." Next evening we had two able and interesting notes, beautifully illustrated with diagrams, the first on the "Effect of Sugar on the Composition of Gallate and Tannate of Iron," and the second on "The Action of Gallic Acid on Metallic Iron," by Dr. Inglis Clark. Mr. H. B. Baildon followed on the next occasion of our meeting together, with one of his exquisite philosophical botanical disquisitions, being the third annual contribution of the same description by that gentleman, and, as I fondly hope, by no means the last. Then at our next meeting Dr. Stevenson Macadam, our fail-us-never friend, threw a good deal of light on a somewhat dark and dirty subject by his communication on "The Contamination of Potable Waters in Domestic Cisterns," and he was followed by Mr. Carr Robinson with a very interesting paper on "The Life and Work of Liebig." To night we have been listening to Mr. Dott on "The Meconates of Morphia," and Mr. Cargill Knott on "The Transformation of Energy," with electrical experiments, concerning both of which it were superfluous for me to say anything further. To all our contributors, I am sure, I may on this occasion acknowledge our hearty obligations. I think it a highly satisfactory feature of this session's business that such a large proportion of papers have emanated from ourselves, and I would fain hail this as a token for good for future years. We have also had goodly additions made during the session both to the museum and library. Amongst the latter I note specially a magnificent copy of 'Flora of Java,' and a valuable native Japanese work on botany; both from our inexhaustible benefactor, Mr. Jamie, of Singapore. I have only further to thank you once again for the honour you have done me in placing me in the chair, and for all the kindness and support and indulgence I have received while occupying it.

Mr. Mackay, in proposing a vote of thanks to the chairman, expressed the sense of the obligations of the meeting to Mr. Stephenson for the efficient way in which he had discharged the duties of the chair during the session, and he hoped that the Branch would have the benefit of his valuable services for some time to come. Mr. G. Blanshard seconded the motion and the vote was very heartily responded to.

Pharmaceutical Society of Ireland.

SPECIAL MEETING OF THE COUNCIL.

Wednesday, April 16, 1879.

Present—Mr. Charles R. C. Tichborne, LL.D., Ph.D., President; Dr. Aquilla Smith, Vice-President; Sir George Owens, M.D., Messrs. Bennett (Kingstown), Brunker, Goodwin, Hayes, Holmes, Oldham.

The Committee appointed April 2nd to draw up a Memorial to the General Prisons Board, Ireland, on the subject of the dismissal from office of the compounders to Irish prisons, presented their report.

These appointments, which until recently have generally been filled by apothecaries, were by the 34th section of the Pharmacy Act, Ireland, 1875, thrown open to Irish pharmaceutical chemists, and, as stated in one of the paragraphs of the Memorial, such action on the part of the Prisons Board would deprive the licentiates of this Society of one of the sources of emolument thrown open to them, and would thereby neutralize a privilege conceded to them by the Legislature so recently as the year 1875.

Proposed by Dr. A. Smith, seconded by Mr. Hayes, and resolved—

"That the Memorial to the Prisons Board, submitted by the Committee, be adopted; and that it be engrossed, and the Seal of the Society be affixed thereto."

The report of the pharmaceutical examination held on April 2nd was laid on the table.

Six candidates were examined, of whom the following *three* passed, and were registered as pharmaceutical chemists:—

George Reginald Eakins, Capel Street, Dublin.
William Vernor Furlong, Pembroke Road, Dublin.
Arthur Trevor Owen, Appian Way, Dublin.

The report of the Preliminary examinations held on April 7th and 8th was laid on the table. *Fifteen* candidates presented themselves, of whom *twelve* passed, and *three* were rejected.

It is understood that the Members' Annual Dinner will be held at the Grosvenor Hotel, Westland Row, Dublin, on Wednesday, 4th June, at 7 o'clock, p.m.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on April 17; Dr. Roscoe, Vice-President, in the chair.

After the minutes of the previous meeting had been read and confirmed, the following certificates were read for the first time:—A. E. Robinson, R. Reid and H. Appleby.

During the evening the following were declared to be duly elected Fellows of the Society:—W. E. Blythe, W. A. Bradbury, A. H. Black, T. Griffiths, W. T. Gent, C. H. Hutchinson, F. A. B. Jewson, W. Johnstone, W. T. Lawson, J. L. Macmillan, W. North, J. A. Ogilvie, F. Podmore, W. Palmer, T. Palmer, G. Rait, W. Radford, W. Stone, A. W. Stokes, W. Spottiswoode, P.R.S., C. Slater, W. B. Turner, F. L. Teed, V. H. Veley, T. Whitaker and T. H. Walker.

The Secretary then read a paper—

On Heptane from Pinus Sabiana. By T. E. Thorpe.—In the *Pharmaceutical Journal*, March 30, 1872, W. Wenzell described, under the name of abietene, a new hydrocarbon obtained by distilling the exudation of the *Pinus Sabiniana*, a tree indigenous to California, known locally as the nut pine or "digger" pine. To procure the exudation the tree, during winter, is notched and guttered at a convenient height from the ground. The resin on distillation yields the liquid hydrocarbon. The crude oil is met with in San Francisco as an article of

commerce, under the names of abietene, erasine, etc., as a substitute for benzoline, for removing grease spots, etc. It is a nearly colourless mobile liquid, of a powerful aromatic smell, resembling that of oil of oranges. Wenzell contrasts its characters with those of terebene from *P. sylvestris*. Abietene, sp. gr. 0·694, boils 101°, dissolves but a small quantity of hydrochloric acid gas, and is but little attacked by cold nitric acid. Terebene, sp. gr. 0·840, boils 160°, absorbs HCl with avidity, and is violently attacked by nitric acid. From a consideration of the general properties and behaviour of this hydrocarbon, the author of the present paper concluded that it was likely to be a paraffin. The occurrence of a paraffin playing the part of oil of turpentine in the vegetable kingdom was hitherto unheard of, the only natural sources of this hydrocarbon (heptane) being petroleum and fossil fish oil. The author therefore obtained from Mr. Wenzell two gallons of the abietene, and has subjected it to a most exhaustive chemical and physical examination, the details of which are contained in the paper. The crude oil is slightly contaminated with a resinoid matter to which its smell is due. The pure oil boils at 98·42° C. at 760 mm. It has the composition of heptane, containing 83·85 per cent. C., 16·03 per cent. H. (C_7H_{16} requires C. 83·97 and H. 16·03). Vapour density found 49·94, calculated 50·07. Sp. gr. at 0°, ·70057. The rate of expansion by heat has been carefully determined. Its volume at the boiling point is 1·1411. Its specific volume, 162·54. Refractive index for D., 1·3879. Its molecular refractive energy, 56·4. Rotates in a tube 200 mm. +6·9′. Its viscosity and surface tension were also determined. The author has compared the heptane obtained from *P. Sabiniana* with the heptane from petroleum, and that obtained by treating azelaic acid with baryta. The sp. gr. of the heptane from petroleum is ·7301, that from azelaic acid has a sp. gr. of ·700. These heptanes are believed by Scholemmer to be identical. The author is at present engaged in an investigation of this point.

The Chairman said the Society was much indebted to Dr. Thorpe for this elaborate investigation, and for the extremely careful and able manner in which he had worked out the subject.

Dr. Armstrong said that he had detected in ordinary turpentines a paraffin-like substance in small quantities, ½ to 2 per cent. It was very remarkable that a paraffin should be found in such a state of purity in a plant.

Mr. Attwood said that the composition of the oil would probably vary at different seasons; sometimes the nuts of this pine tasted very strongly of turpentine, whilst at others the taste was almost imperceptible.

The next communication was on—

The Determination of Tartaric Acid in Lees and Inferior Argol, with some Remarks on Filtration and Precipitation. By B. J. Grosjean.—"Lees" is the name given to the deposit in fermenting wine vats, "argol" being the crystalline crust which forms on the sides. The first direct method for determining the tartaric acid in "lees," etc., was suggested by Warington (*Chem. Soc. Journ.*, 2, xiii., 973). It is known as the "oxalate method." It consists in treating the finely ground lees with a little water, and heating the mixture to 100°; an excess of neutral potassium oxalate is then added, and the whole digested for a quarter of an hour, the free acidity is nearly neutralized with caustic potash, the whole is filtered on a vacuum filter, and the residue washed; the filtrate and washings are concentrated, and an excess of citric acid added; the tartaric acid is thereby precipitated as potassium bitartrate; this salt is collected, washed, and the tartaric acid determined by titration with standard alkali. The author considers this process in detail, giving fullest details, and illustrating many obscure points with quantitative experiments. 1. Treatment with potassium oxalate. The amount of lime present must be roughly determined (a method for this purpose is given), and an excess of one and a half gram of the oxalate is added to ensure the decomposition of the calcium tartrate. The sample taken for analysis should contain about two grams of tartaric acid. 2. Neutralization with caustic potash. Care must be taken to add the alkali drop by drop, with constant stirring, so that the alkali is never in excess. 3. Filtration from the residue. The author uses the vacuum filter suggested by Casamajor (*Chem. News*, xxxii., 45). It consists of a perforated disc of platinum, lead, or pumice, placed in a funnel of peculiar shape; the disc is covered by a slightly larger circle of paper; the pressure keeps the paper so closely applied to the sides of the funnel that no precipitate passes, but at the same time a speedy and thorough washing is ensured. The author finds that this plan has many advantages over that proposed by Bunsen, but states that an ordinary funnel can be used instead of the special funnel proposed by Casamajor. In some cases the paper disc should be covered with a layer of roughly ground pumice, freed from air, before commencing the filtration. The author recommends that the wash water be allowed to run through until the residue presents on the surface no visible moisture, and then immediately without waiting for it to crack, to pour on a fresh portion of wash water. The vacuum most advantageous is 250 mm. mercury. By following this plan the potassium tartrate will be completely washed out of the sample of lees in ten washings of 2 – 3 c.c. each; this is proved by quantitative experiments. Various plans have to be adopted if the filtration refuse to proceed quickly. 4. Addition of potassium chloride. The author recommends the addition of 5 grams of KCl to render the precipitation of the bitartrate more complete. Thus water at 12° dissolves 1 part of bitartrate in 262, whereas a 10 per cent. solution of KCl dissolves only 1 part in 4401. 5. Quantity of citric acid required. An excess of 1 to 1·5 gram of citric acid should be added. If 2 grams of tartaric acid are present, 2 – 2·5 grams citric acid are required to effect complete precipitation. 6. The mode of precipitating the bitartrate. A 50 per cent. solution of citric acid is most convenient. The author prefers to precipitate the bitartrate in the state of minute granular crystals; this is effected by constantly stirring the liquid after adding the citric acid in the cold. 7. Complete precipitation of the bitartrate is effected by thus stirring continuously for ten minutes. The author recommends that the mixture be allowed to stand for twenty minutes after the ten minutes' stirring. 8. Filtration and washing of the bitartrate. The washing is effected by a 5 per cent. solution of potassium chloride saturated with potassium bitartrate at the temperature of the air at the time of washing. 9. The accuracy of the process. The author obtained 99·6, 99·86 instead of 100 parts of tartaric acid taken. 10. Time required. This the author gives as four hours for the complete estimation. In the course of his communication the author exhibited the method of filtering, the insolubility of bitartrate in a solution of potassium chloride, etc.

The next paper was entitled—

Conditions affecting the Equilibrium of Certain Chemical Systems. By M. M. P. Muir. The author has quantitatively studied the two reactions which may be formulated as follows:—

"*a*" $x\mathrm{BiCl_3} + x'\mathrm{HCl} + x''\mathrm{H_2O} = (x-n)\,\mathrm{BiOCl} + n\mathrm{BiCl_3} + \left\{ x' + 2(x-n) \right\} \mathrm{HCl} + \left\{ x'' - (x-n) \right\} \mathrm{H_2O}.$

"*b*" $x\mathrm{CaCl_2} + x'\mathrm{M_2CO_3} = (x-n)\,\mathrm{CaCO_3} + n\mathrm{CaCl_2} + 2x' - n'\,\mathrm{MCl} + n'\mathrm{M_2CO_3}$, when M = Na or K.

In action "*a*" it is shown that the greater the value of x'' (x and n being constant) the more rapidly will equilibrium be attained; if x'' be small n will vary at different moments and will always be somewhat large. If $n = o$ the value of x varies from 450 – 460 molecules (x and x' being each equal to 1). If n is approximately equal to x, *i.e.*, if permanent formation of BiOCl just commences, then if x' be doubled x'' must be

more than doubled, or x'' must increase in a more rapid ratio than x'. If initial equilibrium be disturbed, but without the production of a new *stable* state of equilibrium, the production of this disturbance is dependent not only on the relative, but also on the absolute number of $BiCl_3$ and H_2O molecules present. The production of a new stable equilibrium is dependent only upon the relative number of molecules. In the rush of the interacting molecules the water molecules get entangled among the hydrochloric acid molecules; the greater the number of the latter (even when the proportion of HCl to H_2O is maintained constant) the greater is the entanglement. If the system has, however, time to act and react, then the result is independent of the absolute number of the molecules, provided the proportion of the HCl to H_2O molecules be constant. If water be run very cautiously into a solution of $BiCl_3$ in HCl, until a small amount of BiOCl is formed at the junction of the two liquids, and the whole be then shaken up, a greater amount of BiOCl is produced in short times than if the water is added with constant stirring. During long periods of time the result is the same in both cases. In action "*b*" a condition of stable equilibrium is attained (x and x' being each equal to 1) before the whole of the $CaCl_2$ is decomposed; small causes tend to disturb this equilibrium. In reaction "*a*" a small amount of chemical change seems to be accompanied with but small changes in the entropy of the system, hence the chemically reacting system soon attains a condition of equilibrium; but in reaction "*b*" a small amount of chemical change is probably accompanied with considerable changes of entropy, so that, if time be given, the reaction will be nearly completed. In "*b*" the influence of temperature is marked when equal molecules of the reacting bodies are used; if two or more molecules of alkaline carbonate be used to one molecule of $CaCl_2$, the change in a given time depends but little on temperature. With equal molecules at ordinary temperatures a state of permanently stable equilibrium is attained in about sixty minutes; if the temperature be raised this point of equilibrium is passed and the change is very nearly or even quite completed. Time causes an increase in the amount of chemical change, its influence being specially marked at low temperatures, *i.e.*, when the molecular mobility of the system is small. With equal molecules of CaCl and M_2CO_3 the change formulated is complete, if somewhat high temperatures and long times be employed; if the mass of one of the reacting bodies be increased, the change is completed in a short time and at low temperatures.

Mr. M. M. P. Muir then read a paper on—

The Action of Aqueous Hydrochloric Acid upon Bismuthous Oxide.—When bismuthous oxide is added to aqueous hydrochloric acid the oxide is dissolved, but a point is soon reached after which the bismuth in solution is precipitated as bismuthyl chloride (BiOCl), while the oxide added is simultaneously transformed into the same salt. Finally the whole of the bismuth is present in the form of insoluble bismuthyl chloride. The action of aqueous hydrochloric acid upon bismuthous oxide, so far as the initial and final distributions of mass are concerned, may be thus formulated:—
$Bi_2O_3 + 2HCl + xH_2O = 2BiOCl + (x+1)H_2O$. The presence of water renders possible an action between HCl and Bi_2O_3 which action would not occur in its absence.

The three following papers were, in consequence of the lateness of the hour, taken as read:—

On the Action of Oxides on Salts, Part II. By E. J. Mills and J. W. Pratt.—This paper continues the work contained in Part I., recently communicated to the Society. The authors have examined the actions of aluminic, ferric, and stannic oxides on potassic carbonate. The weight of the carbonate was the same as in Part I. and was kept constant, the temperature was about 735° and the time three hours. The results obtained are given in a series of tables.

Examination of Substances by the Time Method. By J. B. Hannay.—In a former paper the author gave an account of his method by which the thermal dissociation of a hydrated salt may easily be followed. The results of an examination of double salts, the deportment of whose compounds in the free state was known, are contained in the present paper. The double salts examined were the sulphate of magnesium and zinc, $14H_2O$, the double sulphate of iron and magnesium, the double sulphate of copper and magnesium. Great care was taken to ensure the purity of the salts. The conclusion at which the author has arrived is as follows:—Two hydrated salts, in forming a double salt containing the normal amount of water, expend one half of the affinity of the anhydrous salt for its water of crystallization in combining with each other, showing that the formation of double salts is comparable with other forms of chemical action.

Preliminary Note on Certain Compounds of Naphthalene and Benzene with Antimony Trichloride, etc. By Watson Smith.—While distilling a mixture of antimony trichloride and naphthalene through a red hot tube, with the object of preparing dinaphthyl, this mixture was found to contain a little water accidentally admitted. On clearing out the tube long white needles were obtained; they contained antimony and carbon but no chlorine. Heated on platinum foil the crystals melted at a red heat, burnt and disappeared. The author believes this body to be trinaphthyl stibine or naphthyl oxystibine. On melting together a mixture of naphthalene and antimony trichloride and allowing to cool clinorhombic crystals were obtained crystallizing unaltered from petroleum ether. The author has obtained other crystalline compounds and thinks it probable that by the action of the antimony potassium alloy on bromonaphthalene or bromobenzene at high temperatures, trinaphthyl stibine and triphenyl stibine would be obtained.

The Society then adjourned to May 1st, when the following papers will be read:—On the Volumes of Liquids at their Boiling Points obtainable from Unit Volumes of Gases, by W. Ramsay. On a Method of Precipitating Manganese entirely as Dioxide, and its Application to the Volumetric Determination of Manganese, by J. Pattinson. On the Determination of Nitric Acid as Nitric Oxide by Means of its Action on Mercury, by R. Warington.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Tuesday, April 8, Mr. C. H. Hutchinson, F.C.S., Vice-President, in the chair.

After the reading of the minutes, Mr. F. H. Alcock read a paper on "Gay-Lussac and the Law of Volumes." The paper commenced with the life of Gay-Lussac. Louis Joseph Gay-Lussac was born December 6, 1778. In 1797 he was admitted into the Ecole Polytechnique, where he had as tutor the celebrated Berthollet, whose assistant he subsequently became. In 1804 he made two balloon ascents, during the latter of which he obtained specimens of air at different heights, which he analysed, and found it to have the same composition as that on the earth's surface. In 1805 he discovered hydrofluoric acid and phosphoric acid in bones. In 1807 he commenced the study of the expansion of gases and vapours by heat. In 1808 he established the "Law of Volumes" which bears his name. In the next year he was appointed Professor of Practical Chemistry at the Ecole Polytechnique, and Professor of Physics at the Sorbonne. In 1814 he published a paper on the then new body iodine, and in the following year he isolated cyanogen. In 1842 he patented in England an improved process for the manufacture of sulphuric acid, and introduced the volumetric method of silver estimation. He died May 9, 1850. The second part of the paper was devoted to a detailed account of the "Law of Volumes." The principal ex-

ceptions to this law were noticed, and the effects of dissociation described. The method of calculating the specific gravity of compound gases from the density of their elements was given, and the paper concluded with a notice of the relation of Gay-Lussac's law to the researches of Dalton on atomic weights.

After a discussion, a vote of thanks was passed to Mr. Alcock.

Miscellaneous business being announced,

Mr. R. J. Price drew attention to the following prescription, which he had dispensed:—

℞	Sp. Ammon. Co.	℥iss.
	Chloral Hydrat.	gr. 72.
	Pot. Bromidi	℥ij.
	Aq. Chlorof. . . . . ad	℥vj.

M.

He said that when the above mixture was kept for a few days decomposition took place, some of the chloral hydrate being converted by the action of the alkali into chloroform, which gradually separated. In some experiments he had tried he found that while hydrate or neutral carbonate of ammonium decomposed chloral hydrate within half an hour, commercial carbonate required several days to produce the same effect.

After a discussion upon the above, and upon other matters connected with the welfare of the Association, the meeting adjourned.

Parliamentary and Law Proceedings.

THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN *v.* THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION (LIMITED).

The judgment in this case, which was argued before the Lord Chief Justice of the Queen's Bench and Mr. Justice Mellor, on March 15 and April 5 last, was delivered on Wednesday, the 23rd inst., by the Lord Chief Justice.

The Lord Chief Justice first delivered his own judgment, as follows :—This was an appeal from the decision of the Judge of the Bloomsbury County Court in favour of the defendants in an action brought in that Court by the plaintiffs to recover from the defendants a penalty under the 31st and 32nd Victoria, chapter 121, for having sold poisons and kept an open shop for the sale of poisons in contravention of that Act. By the first section of the statute it is enacted that "It shall be unlawful for any person to sell, or keep open shop for retailing, dispensing or compounding poisons, or to assume or use the title chemist and druggist, or chemist or druggist, or pharmacist, or dispensing chemist or druggist in any part of Great Britain, unless such person shall be a pharmaceutical chemist, or a chemist and druggist within the meaning of this Act and be registered under this Act," and by the 15th section, "any person who shall sell or keep an open shop for the retailing, dispensing or compounding poisons, or who shall take, use or exhibit the name or title of chemist and druggist, or chemist, or druggist, not being a duly registered pharmaceutical chemist, or chemist or druggist, or who shall take, use or exhibit the name or title of pharmaceutical chemist, pharmaceutist or pharmacist, not being a pharmacist, shall for every such offence be liable to pay a penalty or sum of £5, and the same may be sued for, recovered and dealt with in the manner provided by the Pharmacy Act for the recovery of penalties under that Act." By the Pharmacy Act, sec. 12, the penalty recoverable under that Act is to be recovered in England or Wales "by plaint under the provisions of any Act in force for the more easy recovery of small debts and demands." The defendants are a company registered under the Companies Acts, 1862 and 1867, as a limited company, with a nominal capital of £10,000, divided into 1000 shares of £10 each. Of these, one William Mackness holds 564 shares fully paid up. Six persons (one of whom was Henry Edward Longmore) held five shares, with £2 10*s.* paid on each share; three persons hold one share each, with £2 10*s.* paid on each share; the remaining shares are unallotted. The defendant company was registered on the 29th of January, 1878, and was formed, "to purchase or acquire the trade or business of a wholesale and retai grocer and general warehouseman," then carried on by William Mackness at 113, Tottenham Court Road Mackness is the managing director of the company. He is not a duly registered pharmaceutical chemist or chemist and druggist within the meaning of the Pharmacy Act of 1868. Henry Edward Longmore is a pharmaceutical chemist or chemist and druggist within the meaning of the Act, but no other shareholder is so. The business of the company is carried on, as that of Mackness was before the company was formed, at 113, Tottenham Court Road, and includes, amongst other departments for the sale of various goods, a chemist and druggist's shop o drug department which is an open shop for the retailing dispensing and compounding poisons within the meaning of the Pharmacy Act, 1868. Longmore, as has been stated, is, and at the time of the sale of the poisons in question was, a duly registered chemist and druggist within the Pharmacy Act, 1868, and the business of the drug department was conducted by him with the aid of two qualified assistants. He, with the two assistants, attended regularly to the drug department and to nothing else. He and his assistants were the servants of the company and were paid by salary or wages. Upon this state of facts the question presents itself whether the defendant company as such is amenable to the penal enactments of the statute. It was fully admitted on the argument, nor could it be contested, that, if this had been an ordinary partnership, the individual partners—at all events such of them as were not qualified under the statute—would have incurred the penalties it imposes. The intention of the Legislature appears clearly to have been to prevent any shop or establishment to exist for the sale of poisons, except under the immediate superintendence and control of a duly qualified proprietor. It is not enough that the proprietor employs a qualified person to manage the business. The master must himself be duly qualified. Two parties could not combine to carry on the joint business of grocer and chemist, though the one attending to the latter department of the business might be a qualified chemist. There would be nothing to insure in such a case that, in the absence of the qualified partner, the other might not take upon himself to act in his stead, and thus the security against fatal mistakes in the dispensation of medicines which the statute was intended to insure might be seriously compromised. The defendants are, therefore within the scope of this legislation ; the case comes within the evil against which the statute was intended to provide a remedy. But they are said not to be within the statute as being an incorporated company ; the main ground on which this contention rests being that the Act in question, in its prohibitory as well as penal clauses, uses the term "person," a term which, it is contended, cannot be properly applied to a corporate body. The objection thus founded on the use of the word "person" in the pena clauses of the Act would seem at first sight to present some difficulty, but when the scope and purpose of this legislation are taken into account the difficulty does not appear to be insuperable. Reliance was placed by the Attorney-General, in his argument in support of the appeal, on the enactment of the 14th section of the 7 and 8 Geo. IV., c. 28, that whenever any statute relating to any offence, whether punishable by indictment or summary conviction, in describing the offence or the offender, uses words importing the singular number or the masculine gender only, it shall be understood to include several matters as well as one matter, several persons as well as one person, males as well as females and bodies corporate as well as individuals, unless it be otherwise specially provided, or there be something in the subject or context repugnant to such construction. But that Act is expressly confined to pro-

ceedings on indictment or summary conviction, and, therefore, cannot apply here, where the proceeding is by civil action. It shows, no doubt, the disposition of the Legislature to include corporations under the general designation of person or individual in penal statutes, but the terms of the Act will not admit of its application to the present case. To solve the question, we must, therefore confine our attention to the statute itself, on which this action is brought. That an incorporated company is within the mischief against which this legislation was directed, is, I cannot help thinking, quite obvious. If a company, by reason of its being incorporated, is not within the provisions of the Act and amenable to its penalties, and effect is to be given to the argument of Mr. Wills, it necessarily follows that such a company might openly carry on the business of chemists and druggists, and sell poisons without a single member of the company, or even the person employed to conduct this portion of their business, being qualified. The person actually selling the poisons might be amenable, and it was probably with a view to avoid this, that, in the present instance, a qualified person was employed to manage this department of the defendants' business; but the company employing him would enjoy complete immunity. A person desiring to combine the business of a chemist and druggist with that of a grocer would have only to get one or two persons to join him, providing them with a share or two, as appears to have been done in the formation of this company, and so forming an incorporated company, to set the statute at defiance. It cannot be supposed that the Legislature can have contemplated a result so entirely at variance with the policy and purpose of the Act, or intended to place incorporated companies on a different footing in this respect from that of ordinary partnerships or individuals. It is, no doubt, possible that, although joint stock companies existed at the time this statute was passed, the formation of such companies for the purpose of combining trades hitherto carried on singly, and, among other things, for that of superadding the business of the chemist to that of the grocer or provision merchant, may not have been present to the minds of those who framed and passed this statute. Still, if the case, though unforeseen, is within the mischief which the Legislature had in view, and the enactment is large enough to embrace it without any forced or strained construction being put on the language on the Act, it is our duty to advance the remedy intended to be afforded. It is true that the term used in the first section of the Act is "person," and that, ordinarily speaking, this word would not be applicable to a corporation. But when the meaning and effect of the enactment is looked at, without too close an adherence to its precise phraseology, it amounts to no less than a general prohibition to every one, not qualified according to the Act, from dealing in poisons or carrying on the business of a chemist and druggist. The fallacy of the argument urged on behalf of the defendants is that it assumes that the prohibition is addressed to individual persons; but the provision, being universal, must extend to all persons, whether acting in an individual or corporate capacity. The defendants, it is true, in thus infringing the law, are not acting in their individual capacity, and may not—but on this it is unnecessary to pronounce any opinion—be liable individually. But in their aggregate or corporate capacity they are breaking the law; and, being in the latter capacity, as well as individually, within the the prohibition, they must, if capable of being sued for it, be also amendable to the penalty, and must for this purpose be taken to be sufficiently persons within the meaning of the statute. The fact so strenuously insisted on by Mr. Wills, that, in other sections of the Act, the word "person" is applicable to individual persons only, and not to a corporate body, only tends to show that the adoption of the business of chemists and druggists by incorporated companies like the present was not contemplated when the Act was passed. It by no means shows that, the prohibition being general and the mischief clearly within the statute, the company, though as such they may be incapable of complying with some of its requirements—as, for instance, to undergo examination under section 6—ought not to be held to be within the penal clauses of the Act, or should be allowed openly to break the law under the belief that they are beyond its reach. In the present case, it so happens that a member of the company, and who manages the chemical department of its business, Mr. Henry Edward Longmore, is a qualified chemist. But it is not as a member of the company that he so acts, but as the paid servant of the company. It is clear, therefore, that his being qualified will not exonerate the other members of the company who are not so. Nor would it be otherwise even if it were as a member of the company that he so acted. So long as any of the company are disqualified, the body is disqualified; and the one who, though himself qualified, acts for the body, becomes a party to their offence, and becomes liable conjointly with them. The qualified chemist who, in partnership with a grocer, carried on the business of grocer and chemist, would be as liable to the statutory penalty as his unqualified partner. The County Court Judge was, therefore, wrong in holding that because the chemical department of the defendants' business was managed by a qualified person the defendants were not liable to the penalty. Being thus of opinion that a company, though incorporated, is none the less within the prohibition of the statute, I come to the remaining question, whether such a company is capable of being sued for the penalty provided by the 15th section. Upon this point the authorities referred to by the Attorney-General in his argument appear to me to afford a satisfactory answer. Although it is true that a corporation cannot be indicted for treason or felony, it was established by the case of Reg. *v.* The Birmingham and Gloucester Railway Company that an incorporated company might be indicted for non-feasance, in omitting to perform a duty imposed by statute—such as that of making arches to connect lands severed by the defendants' railway. It was further held, in Reg. *v.* The Great Northern of England Railway Company, that an incorporated company could be indicted for misfeasance—as in cutting through and obstructing a highway—though they could not be indicted for treason or felony or offences against the person. In the present instance we are dealing not with an indictment or information, but with an action in a civil court. Though the sum to be recovered is no doubt a penalty for the infraction of the statute, the means to be resorted to for its recovery are of a purely civil character. If a corporation can be indicted for misfeasance, I am wholly at a loss to see why it may not be proceeded against in a civil suit for the recovery of a penalty which it has incurred by disobedience to a statutory prohibition. I am, therefore, of opinion that this appeal must be allowed, the decision of the late Judge of the County Court reversed and judgment entered for the plaintiffs.

Mr. Wills: May I ask your Lordship to grant us leave to appeal?

The Lord Chief Justice: I am going to read the judgment of my brother Mellor, which agrees with mine in the result, but which proceeds not altogether on the same grounds.

His Lordship then read the judgment of Mr. Justice Mellor, as follows:—"I have come, with considerable hesitation, to the conclusion, that our judgment should be for the plaintiffs, and that both questions submitted to us must be answered in their favour. I was for some time inclined to think that the circumstances of the defendants' case were not within the contemplation of Parliament when the Pharmacy Act, 1868, was passed, and that although clearly within the mischief intended to be provided against, words sufficiently comprehensive had not been used in framing the Act to include the acts of the defendants, and that, consequently, it became a

casus omissus. A fuller consideration of the provisions of the Act 31 and 32 Vict., c. 121, has, however, brought me to the same conclusion as that expressed by my Lord Chief Justice in his judgment in this case. I think that the great object of the Legislature was to prevent the sale of poisonous or dangerous drugs by persons not qualified by skill or experience to deal in such commodities. It, therefore, proposed to form into one association all persons who for the future should alone be deemed to deal in the same, and who should be registered under the provisions of the Act which we are now considering. It accordingly provided for the interests of all chemists and druggists who had been in business as such previously to the passing of the Act, but with regard to the future it made careful provision for the examination and registration of all persons who should in future form the only qualified body of persons who should be permitted to keep open shop for the retailing or compounding of poisons, and I now think that the sections which mainly embarrassed me as to the extent of the prohibitive sections are really, when carefully considered, only the provisions regulating the steps which in future are to be taken by all persons who desire to obtain the privilege of keeping open shop and retailing, dispensing or compounding the poisonous drugs in question, and who, upon being registered as pharmaceutical chemists, or chemists and druggists, within the provisions of the Act, will become qualified so to do. To incorporate such a society, to whose members in future the sole privilege of keeping open shop as chemists, or chemists and druggists, for the sale, or dispensing or compounding poisons should be intrusted, rendered it necessary to prohibit all other persons, not so registered or qualified, from keeping open shop or retailing, dispensing or compounding such drugs for sale, and from assuming the title of pharmaceutical chemist, or chemist and druggist, and, therefore, whilst one set of sections are qualifying and intended to regulate for the future the mode in which persons should become qualified as members of the association, and to provide for the government of the body incorporated, the sections 1 and 15 of the Act which contain the prohibitory words, upon the meaning of which we have to decide, have an entirely distinct effect. The object of those sections is absolutely to prevent the danger assumed to be likely to arise to the public, by the keeping open shop for the retailing, dispensing or compounding poisons, by any persons not being qualified pharmaceutical chemists, or chemists and druggists, and the intention and scope of those sections and the general object of the Act, is absolutely to exclude, from the time of the passing of the Act, all persons other than the registered members of the Pharmaceutical Society from keeping open shop or retailing, dispensing or compounding of poisons. Now, before the passing of the Act, 1868, all persons, whether 'natural persons' or 'artificial persons' constituted by incorporation for trading purposes, might either as individuals or as corporations have kept open shops and retailed, dispensed or compounded poisons. It was essential, therefore, to the effectuating the objects of the Act, that all persons, whether natural or artificial, should for the future be prevented from dealing as before in the prohibited matters; and the cases cited by the Attorney-General in his argument show that an incorporated company may commit an offence either of non-feasance or misfeasance, and may be punished by indictment for the same as if the Act had been done by a natural person. We may well, therefore, interpret the word "person" in the 1st and 15th sections, so as to include not only any natural person, but any artificial person created by the law, which would be capable of committing the offence referred to in the 15th section, as having committed it by the course of proceeding actually adopted by the defendants; and we are authorized upon the principle of decided cases to say not only that the 'offence' has been committed by the defendants, but that they are liable to be punished for it under the provisions of the 15th section."

Mr. Wills: My Lord, looking to the importance of the question, I have to apply to your Lordship to grant us leave to appeal. You were good enough to intimate to the Attorney-General the other day that you thought it was a proper case.

The Lord Chief Justice: I think, looking to the importance of the question involved, you ought to have leave to appeal. I confess I give it to you with reluctance, because no one can doubt for a single moment that if the law is to be established by that Act of Parliament, your company are just as much within the mischief of it as an ordinary partnership; at the same time, the matter is not so free from doubt as that I think you ought to have leave to appeal.

Mr. Lumley Smith: Will your Lordship allow me, before you give absolute leave to appeal, to suggest that it ought to be conditional on two things, one is that pending the appeal the defendants should cease to offend by continuing to sell and compound poisons?

The Lord Chief Justice: That assumes that they will be defeated on the appeal.

Mr. Smith: At present we have the judgment of this Court to the effect that they are offending; unless some provision were made that they should cease to carry on this business, or that the appeal should be prosecuted without delay, they might, under this leave to appeal, for a whole year carry on this business. Of course, the Pharmaceutical Society would not desire to take fresh proceedings against them in respect of subsequent offences unless obliged.

The Lord Chief Justice: Is there a year's arrears?

Mr. Smith: No, my Lord, but they are not bound to set it down.

The Lord Chief Justice: The only thing is that I understand precedence seems to me to be given to ecclesiastical cases, and they may be innumerable.

Mr. Wills: I will give any undertaking to set it down at the earliest possible moment. We desire to have the matter settled.

The Lord Chief Justice: In the meantime, at all events, I think you may pledge yourself for your company to this extent that they will take care that nothing which comes within the Act is dispensed by anybody who is not qualified.

Mr. Wills: My Lord, there never has been any dispensation——

The Lord Chief Justice: One ground upon which we proceed is——

Mr. Wills: But there might be.

The Lord Chief Justice: That if you are out of the Act you are out of all the provisions, and you might do anything you like.

Mr. Wills: We will give that undertaking without the smallest hesitation.

Mr. Smith: And my friend also undertakes to set down the appeal without delay.

Mr. Wills: Certainly.

Conviction of a Chemist and Druggist under the Weights and Measures Act.

At the Richmond Petty Sessions, on Wednesday, April 17, before Sir Henry Parker (Chairman), E. H. Leycester Penrhyn, Esq., E. C. Dermer, Esq., G. F. Whiteley, Esq., Lieutenant-Colonel Burdett, C. Rugge-Price, Esq., and Lieutenant-Colonel Ommanney, Mr. Henry Lloyd, chemist, of George Street, Richmond, was summoned by William Cook, inspector of weights and measures for the district of Richmond, for selling to the said inspector certain quinine wine by a denomination of measure other than one of the imperial measures or some multiple or part thereof.

Mr. Cook stated that on the 24th of February he went into Mr. Lloyd's shop and asked him for half a pint of quinine wine. Mr. Lloyd told him he had not got any made up, and asked him to call again. Witness said he would—in about a quarter of an hour—and did so. He

then asked if the half pint of quinine wine was ready, when Mr. Lloyd replied, "Yes, it will be ready in a minute," and soon afterwards gave it to his assistant, who wrapped the bottle in paper and handed it to him. The bottle produced was the same. It contained eight fluid ounces, and was two ounces short of the half pint.

In cross-examination, witness said that not only was the imperial measure applied to wine, beer, and spirits, but to everything else that was retailed by measure. Chemists might not be in the habit of using imperial measures in retailing these proportions, but he thought it was high time they adopted the Act. He distinctly remembered asking for the half pint of quinine wine on his second visit to the shop.

Mr. Lloyd, in defence, said he would have it clearly understood that chemists had always been in the habit of selling not by any denomination of weight measure, but by pounds and ounces. It was given to Mr. Cook as a bottle of quinine wine, and not as a half pint bottle. He submitted that in this case he was simply following the custom of the trade, a custom adopted by all chemists, and that there was no attempt whatever to defraud.

The Chairman said he did not think Mr. Cook meant to insinuate that; Mr. Lloyd, however, must remember, that whatever might be the custom of the trade, a new law had come into force, and by that he must abide.

Mr. Penrhyn: It is perfectly easy for you to say, if a person calls for a half pint, that you do not sell half pints.

Mr. Lloyd called his assistant to deny that Mr. Cook mentioned the size of the bottle on his second visit. He simply said "Is my quinine wine ready."

The bench decided to convict, and fined the defendant 1*s.* and costs.

Mr. Thomas Hopwood was similarly summoned, but as in this case there was a doubt as to whether the word "pint" was used, the case was dismissed. Mr. Hopwood's application for costs, however, was refused.—*Richmond and Twickenham Times.*

Poisoning by Laudanum.

A gentleman named Robert McAndrew, of London, aged 49 years, who had been for a short time staying at Albany Lodge, Freshwater Gate, under a certificate from the commissioners in lunacy, escaped the vigilance of his keeper, and went to the shop of Mr. H. A. Wellington, chemist, of Freshwater, and bought four ounces of laudanum, giving the explanation that he was a medical student and required it for outward use. Having secured the poison he secreted it until the following morning, when being left alone, about ten o'clock, for a short time, he swallowed the whole of it, and when found by his attendant was partially senseless and in bed. Dr. Alfred Hollis was quickly in attendance, but the unfortunate gentleman expired in about three quarters of an hour after taking the fatal dose.—*Hants Independent*, April 19.

Correspondence.

Notes on the Deposit Found in Tincture of Quinine.

Sir,—It was with great interest that I read the paper on "Tincture of Quinine" by Mr. Martindale, and the discussion which was caused by it (*vide Pharmaceutical Journal*, No. 438, *et postea*).

As Mr. Greenish seemed to doubt the occurrence of sulphate of quinine in any quantity in the deposit found in the tincture, and as Squire (7th edition) states that "tincture of orange dissolves nearly the whole of the quinia," I was anxious to ascertain as far as possible whether the deposit did or did not contain quinine, especially as I have for some ime been of opinion that it consists almost entirely of it.

therefore collected together several deposits, and after arefully filtering off all the tincture had about half an unce by measure of the sediment left. This appeared to onsist chiefly of small crystals of sulphate of quinine, and was nearly all dissolved by diluted sulphuric acid. The small quantity remaining insoluble was then collected on a filter, but was unfortunately lost before it had been examined, although I expect it would have proved to contain whatever lime salts were in the deposit. Ammonia was then added to the filtrate, and caused a bulky, white, curdy precipitate, which I presume to be quinia. This was collected on a filter, well washed with distilled water, then placed in a small quantity of water in a water-bath, and dissolved by the aid of diluted sulphuric acid. After concentration it was set aside to crystallize. Next day the mother liquor was poured away, leaving a closely interwoven mass of silky, needle-shaped crystals. These, after well washing with distilled water, were intensely bitter, and distinctly caused the peculiar bluish tint which sulphate of quinine does in water. A small quantity was then dissolved in water by the aid of diluted sulphuric acid, and the addition of ammonia gave a white precipitate which was entirely dissolved on shaking up with ether.

From the above facts I am of opinion that the deposits found in tincture of quinine consist largely of crystals of sulphate of quinine.

The quantity of crystals recovered weighed, after drying, 25 grains; thus showing that there is frequently a great loss of quinine.

As Mr. Martindale hinted that the deposit was caused by a deficiency of spirit in the tincture of orange peel, I have been at some pains to ascertain if that is so. I may mention that I have just examined a sample containing a deposit of tufts of beautifully distinct crystals, although it had been most carefully prepared strictly according to the B. P., and though I never use "half and half" I am frequently annoyed at finding a deposit in the cold weather.

W. W. Ragg, A.P.S.

Easton's Syrup.

Sir,—Most chemists who are in the habit of making Easton's syrup will have observed the loss of quinine, as pointed out by Mr. W. Gilmour in a recent Journal. Under the ordinary methods of manipulation the percentage loss of quinine will often, I fear, amount to much more than 10 per cent.

I never make a batch of this syrup according to the recognized formula without the thought presenting itself to my mind that it would be better to simply use the ordinary sulphate of quinine, dissolving it directly in the phosphoric acid.

I am aware that this may be considered very heterodox, but if a moment's consideration be given to the matter the sin will appear a very venial one.

The amount of quinine salt in one drachm—the full dose of the syrup—should be one grain; if sulphate be used the amount of H_2SO_4 in this dose will be nearly equal to one drop of the strength of the dilute acid of the Pharmacopœia. Surely no one will contend that this small quantity of dilute sulphuric acid in the place of an equivalent quantity of dilute phosphoric acid can in any way depreciate or alter the value or character of the syrup. At any rate, it comes to this, Is it better to lose at least 10 per cent. of the quinine, or secure the whole of it, *plus* a drop of dilute sulphuric acid in the place of a drop of dilute phosphoric acid? Common sense suggests that the latter is the better alternative.

THE PLANTS AFFORDING MYRRH.

BY HENRY TRIMEN.

Additional light has lately been thrown on the source of myrrh by a specimen brought back from Eastern tropical Africa by the successful German traveller, Hildebrandt. The specimen, a unique one, is preserved in the Royal Berlin Herbarium, and has been the subject of a short note by Hildebrandt,* who refers it without doubt to *Balsamodendrum Myrrha*, Nees.

The doubt and confusion prevailing in the whole genus *Balsamodendrum* are especially the attributes of this species, which in this country, at all events, is known merely by the insufficient figure and description of Nees.† These, published in 1828, were based upon specimens collected at Gison or Gizan, on the Arabian coast of the Red Sea, by Ehrenberg in Hemprich's voyage made in the years 1820–25 ; and they have been repeatedly copied and reproduced in treatises on materia medica.‡ No additional information or further specimens have, however, since been obtained, and the source of this common drug has remained still practically unknown. It is true that Berg, in 1862,§ re-examined Ehrenberg's specimens, which had become part of the Berlin Herbarium, but the results of his investigations have unfortunately rather complicated the subject than otherwise. He found, besides *B. Myrrha*, specimens of a different species, and it was to these, and not to *B. Myrrha*, that Ehrenberg's tickets and notes as to myrrh were attached. To this second species Berg gave the complimentary name *B. Ehrenbergianum*, and he also gave an excellent figure of the plant in his fine work on the plants of the Prussian Pharmacopœia.‖

When in 1872 the lamented Hanbury turned his acute and accurate mind especially to the myrrh plants he endeavoured to obtain the sight of the very specimen labelled by Ehrenberg, and it is to be regretted that he did not succeed in his endeavour.¶ Specimens of *B. Ehrenbergianum* had in the meantime been distributed to several herbaria, and Oliver had referred** it to the common and widely-spread species *B. Opobalsamum*, Kunth (*B. gileadense*, Kunth), the product of which, balm of Gilead, is very different from myrrh. Added to all this uncertainty was the well-known fact that myrrh was scarcely obtained from the Red Sea shores, but mainly from the Somali country in Eastern tropical Africa, and it is clear that but little definite information as to the botany of myrrh was available.

The publication of Hildebrandt's note and the information which he gave me during his recent visit to London has led me to again review the existing material, and by the kindness of the authorities of the Royal Herbarium at Berlin I have been favoured with the loan of Ehrenberg's original specimens and with the unique one gathered by Hildebrandt. I have also had the opportunity of seeing the living†† plants sent to the Royal Garden, Kew, by Mr. Wykeham Perry, a most interesting and valuable series, and accompanied with notes which Mr. Thiselton Dyer has kindly permitted me to consult. Yet with all these advantages, the matter is still far from solution and the conclusions at which I have arrived are but slight advances on what was previously known.

As to Ehrenberg's type specimens. One sheet of *B. Ehrenbergianum* has attached to it the tickets of the collector relating to myrrh which Berg printed and Hanbury wished to see. They are correctly given (after Berg) in 'Pharmacographia.' I have already stated* that I agree with Oliver in referring this plant to *B. Opobalsamum*, of which it does not deserve to rank even as a variety, and this opinion is now strengthened. With reference to *B. Myrrha*, the specimens are poor ones and the actual specimen figured by Nees does not appear to be among them. There are neither flowers nor fruits (Nees figures a single fruit) and there is only one with a label of Ehrenberg's which states that it was found "*ad mar. martio*," but has no word as to its affording myrrh. Is it not possible that the labels have at some time become transposed and that those now attached to the sheet of *B. Ehrenbergianum* after all really refer to *B. Myrrha?* I see no other way out of the difficulty.

Hildebrandt's specimen was collected in March, 1873, in the Ahl mountains, which run parallel with the north Somali coast, a short distance inland. The plant was pointed out to him by the natives, who call it "Didin." It forms irregular stunted bushes, reaching at the most 9 feet in height, and grows on hot sunny declivities at an elevation of 1500 to 3000 feet. The traveller himself found myrrh exuded on the stem of the tree of which the specimen gathered was a branch ; it exudes spontaneously, without any external injury, and is called "Molmol" by the Somali, but "Mur" by the Arabs ; the former collect it in great quantity and it is brought to Aden and other Arabian ports, whence it is carried to India and Europe.

The specimen is small and imperfect, consisting only of a small branch with numerous short horizontally spreading spinous branchlets and a few tufts of leaves. These are small and trifoliolate, but the two lateral leaflets are so minute as to readily escape attention ; the main leaflet is slightly toothed. These characters agree with those of *B. Myrrha* as seen in Ehrenberg's type specimens, and, so far as they go, show that Hildebrandt has correctly referred his plant to that species.

A large branch sent over in a living state to Kew by Mr. Wykeham Perry appears to be identical with Hildebrandt's, though, as it possesses no leaves, one has merely the bark, the mode of branching and the spines as guides. It was obtained in Somali-land near the parallel of 47° E. long. Mr. Perry gives the Somali names as "Didthin" for the plant, and "Mulmul" for the product—evidently the same words as those somewhat differently spelt by Hildebrandt.

From the above I think we may conclude that myrrh is obtained from *Balsamodendrum Myrrha* and that that plant grows in Somali-land and on the Red Sea coast of tropical Arabia. Whether it also occurs in Southern Arabia is less certain. The

†† Living at least when sent, but one has failed to strike root and is dead.

* Bentley and Trimen, 'Medicinal Plants,' tab. 59 (part 8).

myrrh which is there collected is called by Hanbury Arabian myrrh* and thought by him to be the produce of probably another species. Another fine specimen at Kew from Mr. Wykeham Perry (of which there is a small portion in the museum of the Pharmaceutical Society) scarcely bears out this conjecture, though it is rather less spinous than the Somali ones. There are no leaves upon it, but some small twigs previously sent by Mr. Perry and now in the Kew Herbarium bear a few flowers.

As to the distinctness of *B. Myrrha*, Nees, as a species, there is no possibility of deciding until more complete specimens are forthcoming; meanwhile it will be well to maintain it. Though it is certainly very difficult to distinguish the leafless fragments of the different species of *Balsamodendrum*, which are often all that we have in the herbarium, travellers seem to have much less difficulty who see them growing, and the natives recognize and give them names. If kept up as a species, *B. Myrrha* will probably be found to stand intermediate between *B. Opobalsamum* and the Indian species *B. Mukul*, Hook., and *B. Berryi*, H. and A., with the latter of which it is even perhaps identical.

It is my intention to give a figure of Hildebrandt's specimen in a forthcoming number of 'Medicinal Plants.'

A MISTURA GUAIACI IN CLEAR SOLUTION.

BY BALMANNO SQUIRE, M.B. LOND.,

Surgeon to the British Hospital for Diseases of the Skin.

The unpleasant taste of guaiacum and its uninviting appearance when made into a draught are inconveniences which have long hampered a valuable remedy and are worth attempting to remove. With these impressions I paid a visit to my neighbour, Mr. Martindale, to try what could be done. The 'Companion to the British Pharmacopœia' had told me that the resin was soluble in alkaline solutions, so I asked for a mixture made by rubbing down a dose of guaiacum (ten grains) with not more than a dose of liquor potassæ (♏ xx). The resin was at once dissolved almost completely, but when the solution came to be mixed with an ounce of water I found that I was baffled by the milky precipitation of probably all of the guaiacum. I then asked for a solution of ten grains of guaiacum in a drachm of glycerine, which I was assured could not be supplied, but I pressed the experiment and so it was tried but failed completely. I next begged a mixture of tincture of guaiacum with glycerine in equal parts; I was assured that the glycerine would act to the tincture as water would do and would at once precipitate the guaiacum, and it was pointed out to me that since the glycerine had proved its incapacity for dissolving guaiacum I might take the result for granted. However, the experiment was tried. It resulted in a perfectly clear solution. More glycerine was added and the solution still remained perfectly clear. It therefore appears that it is possible to have a perfectly clear "mistura guaiaci," if glycerine be added to the tincture instead of water. But then, it may be asked, is the flavour any better? To this I am in a position to reply encouragingly. The pungent and nauseating flavour of the guaiacum is rendered considerably softer and altogether less objectionable. However, it might be urged that an ounce of glycerine is not quite such a trifle to swallow as an ounce of water, but this only leads me to point out another convenience of my device and that is, a diminution of the necessary bulk of the dose, which may conveniently be reduced within the capacity of a liqueur-glass. The spirituous sweetness of the compound suggests the allusion, and the flavour of the mixture is not very distasteful. Yet another objection may arise, namely, that even if its flavour be rendered milder the remedy must nevertheless be contained in this diminished bulk of fluid in a higher state of concentration, so that when the compound gets mixed with the fluids of the stomach this fact will become manifest. But no drawback of that kind occurs. The action of a glycerine solution on the tissues is much more gradually exerted than that of an aqueous one, as any one may know who has compared the effect on a sore throat of painting it at one time with the glycerine of tannic acid and at another with an equivalent aqueous solution of the acid, or who has tried on a patch of slightly raw skin an aqueous as against a glycerine solution of iodine of corresponding strength. I would, therefore, propose the admixture of half a drachm or a drachm of the tincture of guaiacum with one or two drachms of glycerine for a dose, and I must explain that I made use of a rectified spirit tincture and not the ammoniated tincture of the Pharmacopœia. Furthermore, I must add that the mixture of the tincture with glycerine will not bear dilution with water, which renders it turbid. If it is to be diluted it must be diluted with glycerine.

NOTES ON INDIAN DRUGS.

BY W. DYMOCK.

(*Continued from page* 146).

LAWSONIA ALBA, *Lam.* (LYTHRACEÆ). *The leaves and flowers. Vernacular.*—MEHNDEE (Hind. and Bomb.); MARUTOURI, AIVANAM (Tam.); MEHEDI (Beng.)

History, Uses, etc.—Henna is much esteemed by the Mahometans. There is a tradition that their prophet spoke of it as *Syyadu-riaheen* (the best of herbs). In Arabic it is called Hinna. Arabic and Persian works give Arkán and Fakúliyún as the Greek names; they describe it as a valuable external application in headache, combined with oil so as to form a paste, to which resin is sometimes added. It is applied to the soles of the feet in small pox and is supposed to prevent the eyes being affected by the disease. It also has the reputation of promoting the healthy growth of the hair and nails. An ointment made from the leaves is spoken of as having valuable healing properties. The bark is given in jaundice and enlargement of the spleen; also in calculous affections, and as an alterative in leprosy and obstinate skin diseases; in decoction it is applied to burns, scalds, etc. The seeds, with honey and tragacanth, are described as cephalic. An infusion of the flowers is said to cure headache, and be a good application to bruises. An ointment is also used for the latter purpose, and a perfumed oil is prepared from them, which is called in Arabic Duhn-ulfágiya, and is used as a cosmetic.

Ainslie notices the use of an extract prepared from the flowers and leaves by the Tamil physicians of

Southern India as a remedy in lepra (leprosy?), half a teaspoonful twice a day being the dose. He also says that the leaves are applied externally in cutaneous affections.

In the 'Pharmacopœia of India' attention is drawn to their use in an obscure affection called "burning of the feet," often met with in India, and the editor mentions his having himself witnessed when in Burmah a great amount of temporary relief from the remedy when numerous other means had previously failed. The fresh leaves beaten up into a paste with vinegar were applied as a poultice to the soles of the feet in most cases, but some patients obtained greater relief from using strong frictions with the bruised leaves over the part.

The use of henna for dyeing the hands and feet appears to be common among Mahometans in Asia and Africa, and was probably practised by the ancient Egyptians and Jews. The Hindus in Western India hardly ever use it. Dr. Birdwood has the following remarks upon its history in more western countries:—"Solomon is supposed by Sprengel to refer to the henna plant in his Epithalamium (1. 14): My belovered is unto me as a cluster of samphire (or cypress or camphire) in the vineyards of Engedi." It is undoubtedly the κυπρος of Dioscorides (I. 124) and "Cyprus in Egypt" of Pliny. It is mentioned by Avicenna also under the name of henna.

Description.—Leaves opposite, smooth, short petioled, oblong, or broad lanceolate, pointed at both ends, an inch or more long, and less than half an inch broad. The flowers are in terminal globular cross-armed panicles, small, greenish-yellow, and very fragrant. The fruit is round, the size of a pepper-corn, four-grooved, with the apex depressed, four-celled. The seeds are angular. The decoction of the leaves is of a deep orange colour, which is destroyed by acids, and deepened by alkalies and vegetable astringents; it stains the skin of an orange-red colour, which does not disappear until the epidermis has been renewed.

TERMINALIA CHEBULA, *Retz.* (COMBRETACEÆ). *The fruit. Vernacular*— HAR (Hind.), HIRDA (Bomb.), KADUK-KAI (Tam.), HARITAKI (Beng.).

History, Uses, etc.—Dutt ('Hindu Materia Medica') informs us that chebulic myrobalans, in Sanskrit, Haritaki, Abhaya, and Pathyá, were highly extolled by the ancient Hindus as a powerful alterative and tonic. They have received the names of pranada, or life-giver, sudha, or nectar, bhiohakpriya, or physician's favourite, and so forth. A mythological origin has also been attributed to the tree. It is said that when Indra was drinking nectar in heaven a drop of the fluid fell on the earth and produced the plant. Sanskrit writers describe seven varieties of haritaki, which, however, are nothing more than the same fruit in different stages of maturity. Very large fruit are considered particularly valuable and fetch a fancy price; chebulic myrobalans are considered to be laxative, stomachic, tonic, and alterative. They are prescribed alone or in combination with emblic and belleric myrobalans in a vast number of diseases, chiefly those affecting the chest and abdomen. The three myrobalans together are called triphalá in Sanskrit (the three fruits). Various original recipes for their administration will be found in Dutt's 'Hindu Materia Medica.' The author of the 'Makhzan-ul-adwiya' on the subject of chebulic myrobalans, says that the very young fruit about the size of cumin seeds are called Halileh-i-zira; when about the size of a grain of barley, Halileh-i-zawi; when of the size of a raisin, Halileh-i-zangi or Halileh-i-Hindi; when half arrived at maturity and yellowish, Halileh-i-Chini; when still further advanced, Halileh-i-asfar; and lastly, when quite mature, Halileh-i-Kabuli. Of these six varieties of chebulic myrobalans the third and last only are in general use, but the others are occasionally to be met with in the Bombay shops. The Mahometans, like the Hindus, attribute a great many fanciful properties to the drug; shortly, we may say the ripe fruit is chiefly used as a purgative, and is considered to remove bile and phlegm; it should be combined with aromatics, such as fennel seeds, caraways, etc. The unripe fruit (Halileh-i-Hindi) is most valued on account of its astringent and aperient properties, and is a useful medicine in dysentery and diarrhœa; it should also be given with aromatics. The first and second kind are supposed to have the same properties as the third in a less degree. The best way of administering the myrobalans is to make them into a conserve with honey or sugar; two or three of the mature fruit are a sufficient purgative for an adult. Ainslie notices their use as an application to apthæ. In the 'Pharmacopœia of India,' Dr. Waring mentions his having found six of the mature fruit an efficient and safe purgative, producing four or five copious stools, unattended by griping, nausea, or other ill effects; probably those used by him were not of the largest kind. Twining ('Diseases of Bengal,' vol. i., p. 407) speaks very favourably of the immature fruit as a tonic and aperient in enlargements of the abdominal viscera. I have found them a useful medicine in diarrhœa and dysentery given in doses of a drachm twice a day.

Description.—The mature myrobalan is of an ovoid form, from 1—1½ inches long, sometimes tapering towards the lower extremity, obscurely 5 or 6 sided, more or less furrowed longitudinally, covered with a smooth yellowish-brown epidermis, within which is an astringent pulp, enclosing a large, rough, bony, one-celled endocarp. The unripe fruits are shrivelled, black, ovoid, brittle bodies from ⅓—¾ of an inch in length, having a shining fracture, and an extremely astringent taste. On careful examination the rudiments of the nut may be distinguished.

CAREYA ARBOREA, *Roxb.* (MYRTACEÆ). *The flowers and bark. Vernacular*—KUMBHA KUMMEO (Bomb.); POOTATANNI-MARAM (Tam.).

Description, Uses, etc.—The tree has a rough bark the interior of which is red and very fibrous; it gives out much mucilage when moistened, and is used on this account for preparing emollient embrocations. The calices of the flowers are sold in the shops under the name of Wakoombha; they are clove-shaped, 4-partite, fleshy, of a greenish brown colour, and about an inch long. When placed in water they become coated with mucilage and emit a sickly odour. The natives use them as a demulcent in coughs and colds. The tree yields a gum resembling mango gum, and almost black. It forms with water a tolerably thick mucilage of a dark brown colour.

MOMORDICA CHARANTIA, *Linn.* (CUCURBITACEÆ). *The fruit. Vernacular.* KARELA (Hind.); KARLA (Bomb.); PAVA-KAI (Tam.).

Description, Uses, etc.—There are two chief varieties, differing in the form of the fruit, the one being longer and more oblong, and the other smaller, more ovate, muricated, and tubercled. There are, besides, many intermediate gradations. The fruit is bitter, but wholesome, and is eaten by the natives. It requires, however, to be steeped in salt water before being cooked. That of the smaller variety is most esteemed (Drury). From Rheede, Wight, and Gibson we learn that the Hindus use the whole plant combined with cinnamon, long pepper, rice, and the oil of *Hydrocarpus inebrians*, as an external application in scabies and other cutaneous diseases. The fruit and leaves are administered as an anthelmintic and are applied externally in leprosy. The Sanskrit name is Karavellat; the muricated variety is called Sushavi.

The author of the 'Makhzan-ul-adwiya' describes the fruit as tonic and stomachic, and says that it is useful in rheumatism and gout and in diseases of the spleen and liver; he also mentions its anthelmintic properties, and points out that some have erroneously supposed it to be identical with the Katha-ul-himar of the Arabs, which is a violent purgative. Drury has the following description of *M. Charantia*: "Climbing; stem more or less hairy, leaves palmately 5-lobed, sinuate, toothed; when young, more or less villous on the underside, particularly on the nerves; peduncles slender, with a reniform bracteole; male with the bracteole about the middle; female with it near the base; fruit oblong or ovate, more or less tubercled or muricated; seeds with a thick notched margin and red aril; flowers, middle-sized, pale yellow." In the rainy season the plant may be seen in almost every garden in Bombay. The fruit is also offered for sale in the market, and, when well cultivated attains the size of a cucumber.

LUFFA ECHINATA, *Roxb.* (CUCURBITACEÆ). *The vine and fruit. Vernacular.*—KUKAR-WEL (Bomb.). *The Seeds*, WA-UPLA-BIJ (Guz.).

Description, Uses, etc.—We have not met with any notice of the medicinal use of this plant in European works on the materia medica of India. Roxburgh describes its botanical characters. In the Bombay Presidency it is found only in Guzerat, where it has a reputation among the Hindus on account of the bitter properties of the fruit, and is an ingredient in some of their compound decoctions. The dried vine, with the ripe fruit attached, is brought to Bombay for sale along with other herbs from the province of Guzerat. The stems are herbaceous, scandent, five-sided, slightly hairy; tendrils two-cleft; leaves generally five-lobed, somewhat hairy, margins scallop-toothed; petioles as long as the leaves, ribbed. Fruit oval, the size of a nutmeg, armed with numerous long rather soft diverging bristles, obscurely divided into three cells by numerous dry fibres, and opening at the top with a perforated stopple, which falls off when the seeds are ripe; seeds about 18, ovate, compressed, black and scabrous, testa very hard, kernel white. The fibrous substance in which the seeds are enclosed is intensely bitter.

LAGENARIA VULGARIS (SERINGE *var.* AMARA) (CUCURBITACEÆ). *The fruit. Vernacular.*—TUMBI, KARWEE-TUMBI (Hind.); TIKTALAU (Beng.); KARWA-BOPLA (Bomb.), SHORA-KAI (Tam.).

Description, Uses, etc.—The bottle gourd, of which there are two varieties, a sweet or cultivated one, called in Sanskrit alábu, and a bitter wild one, known as katutumbi, is very common in India. The wild fruit grows to a very great size and varies much in shape; those which are bottle-shaped serve a variety of useful purposes, being made into guitars, bottles, floats for crossing rivers, etc. The outer rind is hard and ligneous, and encloses a spongy white flesh, very bitter, and powerfully emetic and purgative. The seeds are grey, flat, and elliptical, surrounded by a border which is inflated at the sides but notched at the apex; their kernels are white, oily, and sweet. In Bombay the pulp, in combination with other drugs, is used in native practice as a purgative; it is also applied externally as a poultice. The seeds were originally one of the four cold cucurbitaceous seeds of the ancients, but pumpkin seeds are now usually substituted for them.

The Hindus administer a decoction of the leaves in jaundice; it has a purgative action.

(*To be continued.*)

CHRYSAROBIN AND THE ALLEGED PRESENCE OF CHRYSOPHANIC ACID IN GOA POWDER.*

BY C. LIEBERMANN AND P. SEIDLER.

For some years past there has been met with in commerce, under the name of Goa or Araroba powder, also as Poh' di Bahia, a drug which has attained a reputation as a remedy in cases of parasitic skin disease. It forms a greenish grey powder, which consists of a small quantity of reddish woody substance and of a larger quantity of an organic substance that can be extracted by means of benzol, glacial acetic acid and similar solvents. Attfield,† who first examined the drug chemically, reported that he had found in it,—besides 2 per cent. of resin, 5½ per cent. of woody fibre, and 7 per cent. of a bitter principle, —80 to 84 per cent. of chrysophanic acid. This alleged occurrence of so large a proportion of chrysophanic acid led the authors to a renewed examination of the drug, the more so since they considered that Attfield's identification of chrysophanic acid left much to be desired, and the possibility of the substance before him belonging only to the same group was not excluded.

Goa powder, obtained from Messrs. Gehe, of Dresden, was treated in an extraction apparatus with boiling benzol. The residue amounted to 17·5 per cent. of woody fibre. The greater part of the dissolved organic substance (about two-thirds of the weight of the powder used) separated from the benzol as a pale yellow warty-formed crystalline powder, whilst about 10 per cent. of the same substance, but less pure, remained in solution. By evaporation of the benzol this portion also could be recovered.

The larger quantity of this substance, about 250 grams, was easily purified by repeated crystallization from glacial acetic acid, and then formed small yellow laminæ, which were insoluble in water and ammonia, but dissolved in a not too dilute solution of caustic alkali with a yellow colour and a green fluorescence.

This substance was analysed in various stages of purity by Attfield. As obtained through extraction with benzol

* Abstract of a paper read before the Berlin Chemical Society (*Berichte der deutschen chemischen Gesellschaft*, vol. xi. p. 1603).

† *Pharmaceutical Journal* [3], vol. v. p. 721.

and alcohol, he found—carbon, 75·93 per cent.; hydrogen, 7·70 per cent. After repeated purification with alcohol, by which it was freed from resin, he obtained 72·73 per cent. and 5·23 per cent. Finally, after recrystallization from ether and conversion into a potassium compound, there were obtained 69·3 and 69·8 of carbon and 4·6 and 4·8 per cent. of hydrogen. From the latter figures he concluded that the substance was chrysophanic acid (corrected—carbon, 70·87 ; hydrogen, 3·94 per cent.).

The authors state that they are satisfied that they were dealing with the same substance as Attfield, because, with the exception of the first unpurified form, which was not analysed by them, they obtained quite similar figures; they then proceed to give their reasons for believing that the substance originally contained in Goa powder is not chrysophanic acid, and that the chrysophanic acid actually obtained by Attfield was an altered product, first yielded by the preexisting compound during his last process of purification. To the substance originally formed in Goa powder the authors propose to give the name of chrysarobin, and their opinion as to its chemical individuality is based not only upon their obtaining almost the same figures as Attfield for the purified product with potash, but also on the fact that its composition was not essentially altered after repeated recrystallizations. The following figures show the results obtained with different preparations and crystallizations.

	Found.				Calculated.
	Attfield.	Liebermann and Seidler.			$C_{30}H_{26}O_7$.
C. . .	72·73	72·86	72·46	72·38	72·29
H. . .	5·23	5·60	5·36	4·86	5·22

The foregoing analyses correspond with the formula $C_{30}H_{26}O_7$.

The authors' original opinion was that the higher proportion of carbon and hydrogen in chrysarobin might be due to its not being derived, like chrysophanic acid , from methylanthracene, but from a higher homologue. The hydrocarbon was therefore prepared according to the known method, by incineration with zinc dust, when it was found to agree in every respect with methylanthracene, and the opportunity was taken of this more prolific source of the hydrocarbon to examine it more closely. The result was that the authors came definitely to the conclusion that chrysarobin, like chrysophanic acid, is a derivative of methylanthracene.

Chrysarobin dissolves in concentrated sulphuric acid with a yellow colour, and chrysophanic acid with a red colour. Chrysophanic acid dissolves in very dilute potash solution with a red colour, while chrysarobin remains in it undissolved, but in a stronger potash solution it dissolves with a yellow colour and strong green fluorescence. Fused with potash chrysophanic acid gives a blue mass, whilst chrysarobin forms a brown one. When the alkaline solution of chrysarobin is shaken with air the yellow colour passes very rapidly into the red of chrysophanic acid. This last reaction the authors look upon as the key to the nature of chrysarobin as well as to the varying results obtained by Attfield, the oxidation product of chrysarobin so obtained being chrysophanic acid.

Chrysophanic acid may be prepared from chrysarobin by pouring rather dilute potash ley over the latter in a large retort, and then passing a stream of air over the liquor, shaking so as to renew the surface, until all the chrysarobin is dissolved, and the liquor has acquired uniformly the red colour of an alkaline solution of chrysophanic acid. A much more prolonged action is not desirable for the obtaining of a pure product. The alkaline solution is precipitated by an acid, the precipitate washed, dried, and treated in an extraction apparatus with petroleum spirit from which the substance crystallizes in beautiful yellow laminæ. When benzol is used a quantity of a dirty brown product passes at the same time into solution and hinders the purification.

The substance so obtained has now lost the distinguishing characters of chrysarobin and resembles chrysophanic acid in every respect. Upon analysis the acid so obtained gave the following percentage results:—

	Dried at 125° C.	Sublimed	Calculated for $C_{15}H_{10}O_4$
C. . . .	69·50	70·19	70·87
H. . . .	4·22	4·21	3·94

Thus the unsublimed substance gave the same figures as those found by Attfield, and also as those obtained by one of the authors with chrysophanic acid from rhubarb, when this was used unsublimed.* In this way therefore a larger supply of pure chrysophanic acid can be obtained than hitherto at a more moderate price.

Adopting the formula $C_{30}H_{26}O_7$ for chrysarobin, and taking into consideration the results obtained in some experiments to ascertain the amount of oxygen absorbed by chrysarobin during its conversion into chrysophanic acid, the authors represent the reaction by the following equation:—

$$C_{30}H_{26}O_7 + 2O_2 = 3H_2O + 2C_{15}H_{10}O_4.$$
Chrysarobin. Chrysophanic Acid.

BERBERINA PHOSPHATE.†

BY HENRY B. PARSONS AND THEO. J. WRAMPELMEIER.

Some months since, one of us (Parsons) reported a process for making a soluble phosphate of berberina (*Proc. Mich. Phar. Assn.*, Oct., 1877). Since then an investigation has been conducted by Mr. Wrampelmeier, having for its object the determination of the chemical formula of the salt as made by Parsons's process. It is proposed in this article to report the work already accomplished, and show where more work may be done in the future.

The alkaloid berberina ($C_{20}H_{17}NO_4$) is quite widely distributed, both geographically and as regards the number of plants in which it is found. It is most often found in plants of the families Ranunculaceæ and Berberidaceæ. It occurs in the roots, and gives to them its own orange colour and bitter taste. Its cheapest source in the United States is the roots of *Hydrastis Canadensis*, commonly known as golden seal, tumeric root, or yellow root. Its salts, the muriate and acid sulphate, have been somewhat used by eclectic and other practitioners, both internally and externally. Their internal administration has been followed by good effects where tonic treatment was indicated. Their antiperiodic action has been asserted to be equal to that of quinia sulphate, but this statement lacks confirmation. In cases of diarrhœa they have been efficacious. As local applications, their aqueous solutions (to which glycerin is usually added) have been successfully used in treatment of gonorrhœa and similar inflammatory diseases. They have been used as gargles in sore throat with beneficial results. The great obstacle to the use of these two salts is their very sparing solubility in water. For local applications, especially, this is a great drawback. The phosphate and hypophosphite are freely soluble in water, and manufacturers have already begun to place them on the market. In several cases so-called phosphates have been found on analysis to contain no trace of phosphoric acid. To make true phosphate, freely soluble, of definite composition, and by a cheap and reliable process, was the problem presented a year since. As a partial solution of this problem this paper is presented. The common method of making berberina salts is to exhaust finely-powdered hydrastis root either with water, water slightly acidulated, or with alcohol. The large amount of percolate thus obtained is reduced to a manageable bulk by evaporation, and the solution acidulated with the proper acid. Upon standing some hours, the salt crystallizes out, owing to this peculiarity, viz. : that berberina salts are very sparingly soluble in strongly acidulated solutions.

* *Berichte d. deutsche Chem. Gesells.*, xviii. 1104, and *Annalen d. Chem. und Pharm.*, clxxxiii. 172.

† Reprinted from *New Remedies* for August, 1878.

For the preparation of such sparingly soluble salts as the sulphate, muriate, and nitrate, probably no better or cheaper process could be devised. In the case of the phosphate, there are two serious objections to this plan :

Firstly. The use of phosphoric acid is very expensive, as an excess is required.

Secondly. The greater solubility of the phosphate results in more waste than is experienced in making the less soluble salts.

To obviate these difficulties, Dr. Thos. L. A. Greve, of Cincinnati, Ohio, proposed in the *Eclectic Medical Journal*, July, 1877, to make the phosphate by boiling the ordinary berberina sulphate ($C_{20}H_{17}NO_4 \cdot H_2SO_4$) with bone ash ($Ca_3(PO_4)_2$). This process furnishes a salt more soluble than the acid sulphate, but a sample, upon careful analysis, was found to contain only a *faint trace* of phosphoric acid, and that as impurity in the form of bone ash. The quantitative analysis showed it to be a more soluble *sulphate*, agreeing closely with the formula,

$$2\ C_{20}H_{17}NO_4 \cdot H_2SO_4.$$

The idea then suggested itself, that, heating together a *soluble phosphate* of some base capable of forming an *insoluble sulphate* with berberina sulphate, must result in the formation of berberina phosphate in solution and a precipitate of the insoluble metallic sulphate.

By treating bone ash with the requisite amount of sulphuric acid, a soluble calcium phosphate was first made, and the resulting insoluble calcium sulphate removed by filtration. Thus :

$$\left.\begin{matrix}310\text{ parts} \\ Ca_3(PO_4)_2\end{matrix}\right\} + \left.\begin{matrix}196\text{ parts} \\ 2H_2SO_4\end{matrix}\right\} = \left.\begin{matrix}234\text{ parts} \\ CaH_4(PO_4)_2\end{matrix}\right\} + \left.\begin{matrix}272\text{ parts} \\ 2CaSO_4\end{matrix}\right\}$$

Due allowance must be made if the acid used is under 100 per cent. real acid and 10 per cent. allowed for impurities in the bone ash. It was found that precipitated phosphate of calcium would not answer. Probably this was due to its not being entirely tri-metallic phosphate.

By heating together a given weight of berberina sulphate with an excess of solution of calcium acid phosphate, the predicted reaction did take place. By evaporating nearly to dryness on the water-bath, and treating with hot diluted alcohol, the calcium sulphate and excess of calcium phosphates were left in residue, while the berberina phosphate was readily dissolved. They were separated by filtration.

The filtrate was evaporated nearly to dryness, and treated with cold stronger alcohol, when the berberina phosphate separated as a canary-yellow flocculent powder, which was dried on paper at a low heat.

The salt thus made was very readily and freely soluble in cold water, a little less soluble in cold diluted alcohol, more freely in hot diluted alcohol, sparingly soluble in cold stronger alcohol, more soluble when heated, not sensibly soluble in absolute ether and chloroform. In all these particulars it corresponds closely with the phosphate made by precipitation. Upon standing in loosely corked bottles, the salt absorbs water, but does not deliquesce, and changes in colour from canary to orange-yellow. It may be obtained in irregular prismatic crystals by crystallizing from a hot, concentrated, alcoholic solution. These crystals do not absorb water as readily as does the loose powder. In order to determine the composition of the salt so made when in powder, Mr. Wrampelmeier carefully prepared a sample as above explained, except that he used barium acid phosphate ($BaH_4(PO_4)_2$) in place of the calcium acid phosphate. The salt was also treated in water solution with pure animal charcoal which removed a little foreign colouring matter.

The following is the summary of his work :

I. *Loss of Weight at* 100° *C.*

It was necessary to dry the salt at 65° to 70° C., in test-tubes, to obtain a constant weight. This was a tedious operation, requiring several weeks. In weighing, it was absolutely necessary to closely cork the test-tubes, so great was the affinity of the salt for water.

Upon raising the heat above 70° C., the salt became olive-green in colour, and after heating for some time at 100° C., it ceased to lose weight.

·2803 gram lost ·0181 gram = 6·45 per cent.
·3034 „ „ ·0200 „ = 6·59 „

Loss at 100° C.—mean— = 6·52 „

II. *Estimation of Phosphoric Acid* (H_3PO_4).

The organic matter was destroyed by heating with a mixture of sulphuric and nitric acids. The phosphoric acid was estimated as magnesium pyrophosphate ($Mg_2P_2O_7$), according to Fresenius.

·3034 gram gave ·2145 gram $Mg_2P_2O_7$ = 1894 of H_3PO_4
·2803 „ „ ·2000 „ „ = 1766 „ „

These amounts of H_3PO_4 are equivalent to 62·39 and 62·96 per cent. of the phosphate taken, the mean being 62·67 per cent.

III. *Estimation of Berberina.*

A given weight of salt was dissolved in water and precipitated by platinic chloride. The precipitate was washed with water, dried at 100° C., weighed in a tared filter, then carefully ignited in a crucible, and the residual platinum weighed. The symbol for the precipitate caused by platinic chloride is, according to Perrin (*Jour. Ch. Soc.* xv., p. 345), $2C_{20}H_{17}NO_4.2HClPtCl_4$. Of this precipitate 18·22 per cent. is platinum, and 61·899 per cent. is berberina.

·2517 gram gave a prec. = ·1312 gram = ·0812 of berberina.
·1727 „ „ „ = ·0900 „ = ·0557 „
·1224 „ „ „ = ·0640 „ = ·0396 „.

By calculation from residual platinum (after deducting weight of filter ash), the amounts of berberina were ·0815, ·0526, and ·0390 respectively. The percentage of berberina in the phosphate was calculated from these results, rather than from the weights of the precipitates, for the reason that the use of tared filters introduces a source of error not present in the case of the residual platinum. Still the weights of the precipitates serve as checks upon the calculations made, and correspond quite closely. The percentages of berberina calculated from these figures are, 32·37, 30·45, and 31·86, and the mean 31·56.

IV. *Estimation of Total Nitrogen.*

This estimation was made as a check upon the estimation of berberina by the platinum process. Weighed amounts were ignited in combustion tubes with soda-lime, and the gases passed through carefully standardized freshly-made volumetric solution of oxalic acid. The amount of acid neutralized was determined by volumetric alkali.

·2945 gram neutralized ·0186 of $H_2C_2O_4.2H_2O$ = ·0041 + of N
·4028 gram neutralized ·0273 of $H_2C_2O_4.2H_2O$ = ·006 + of N.

From these amounts of N, we find the amounts of berberina to be ·09890 and ·14516.

Percentages of nitrogen 1·39 and 1·48 average 1·43.
„ berberina 33·26 and 35·41 „ 34·33.

It will be observed that one-tenth of one per cent. variation in the amount of nitrogen makes nearly 3 per cent. difference in the percentage of berberina, because of the small proportion of nitrogen in berberina. Hence the determination of nitrogen cannot give the absolute amounts of berberina, but, as above stated, may serve as checks upon other work.

V. *Summary.*

Water (H_2O) mean of 2 exp.	6·52
Phosphoric acid (H_3PO_4) mean of 2 exp. . . .	62·67
Berberina ($C_{20}H_{17}NO_4$) mean of 3 exp.	31·56
	100·75

Dividing the percentages by the molecular weights—

Water $6{\cdot}52 \div 18 = {\cdot}36 = 4$.
Phosphoric acid $62{\cdot}67 \div 98 = {\cdot}64 = 7$.
Berberina $31{\cdot}56 \div 315 = {\cdot}094 = 1$.

From these results we deduce the formula for berberina phosphate $C_{20}H_{17}NO_4.7\,H_3PO_4.4\,H_2O$.

A comparison of the percentages found by analysis with the theoretical percentages serves to confirm this formula.

	Calculated.	Found.
Water ($4\,H_2O$)	6·58	6·52
Phosphoric acid ($7\,H_3PO_4$)	62·76	62·67
Berberina ($C_{20}H_{17}NO_4$)	30·65	31·56
Total	99·99	100·75

This formula seems, at first sight, an improbable one; but any person who will take the pains to look up the formulæ for the phosphates of other alkaloids, will be surprised at their lack of uniformity, and at the fact that alkaloids exhibit no particular quantivalence when combined with phosphoric acid.

From this symbol we deduce the following equation in explanation of the formation of the salt.

$$C_{20}H_{17}NO_4.H_2SO_4 + 6[BaH_4(PO_4)_2] = C_{20}H_{17}NO_4.7\,H_3PO_4 + BaSO_4 + 5\,BaHPO_4.$$

VI. *Solubility in Water.*

The salt was first dried at 70° C., and a saturated cold water solution made. 12·3285 grams of this solution evaporated at 70° C. left a residue weighing 1·0785 gram. Hence one part of the salt is soluble in 10·43 parts of cold water. The salt previously dried at 100° C. was found to be soluble in 21·52 parts of cold water, and the sulphate in 68 parts.

An investigation of the amount of berberina precipitated by 1 c.c. Mayer's solution of potassic mercuric iodide, together with the formula for the precipitate, would be valuable. Some work has already been done by L. F. Beach in this direction (*Am. Jour. Ph.*, 1876), but work done by Mr. Wrampelmeier leads him to think the work of Mr. Beach only approximately correct. The close of the school year prevented so full an investigation as would warrant the publication of his results.

School of Pharmacy, University of Michigan.

NITRITE OF AMYL.*

BY DR. WM. H. GREENE.

A paper on nitrite of amyl by D. B. Dott, read before the British Pharmaceutical Conference and published in the *American Journal of Pharmacy*, 1878, p. 499, may give some erroneous ideas on the properties of amylic alcohol obtained from fusel oil, and the nitrite derived from it.

Theory indicates the existence of eight isomeric amylic alcohols, six of which are actually known. They are—

(1) Normal primary amylic alcohol . $CH_3 - CH_2 - CH_2 - CH_2 - CH_2.OH$

(2) Two normal secondary alcohols $CH_3 - CH_2 - CH_2 - CH.OH - CH_3$ methylpropylcarbinol.

(3) . . . . . $CH_3 - CH_2 - CH.OH - CH_2 - CH_3$ diethylcarbinol.

(4) Two primary isoamylic alcohols $\left.\begin{matrix} CH_3 \\ CH_2 \end{matrix}\right\rangle CH - CH_2 - CH_2.OH$ the ordinary alcohol of fusel oil.

(5) . . . . . $\left.\begin{matrix} CH_3. \\ CH_2.OH \end{matrix}\right\rangle CH - CH_2 - CH_3$ unknown.

(6) One secondary isoamylic alcohol $\left.\begin{matrix} CH_3 \\ CH_3 \end{matrix}\right\rangle CH - CH.OH - CH_3$ methylisopropylcarbinol.

(7) One tertiary alcohol . . . . $\left.\begin{matrix} CH_3 \\ CH_3 \end{matrix}\right\rangle C.OH - CH_2 - CH_3$ ethyldimethylcarbinol.

(8) One primary alcohol . . . . $\left.\begin{matrix} CH_3 \\ CH_3 \end{matrix}\right\rangle C \left\langle\begin{matrix} CH_3 \\ CH_2.OH \end{matrix}\right.$ unknown.

(4) represents the constitution of the amylic alcohol of fermentation. This compound is definite, and when carefully separated from fusel oil by fractional distillation, boils constantly at 132° C. Portions may be obtained which when fractionated in an imperfect apparatus may pass entirely at 128° to 129° C., but if these be subjected to several careful rectifications in a suitable fractionating apparatus, they may be entirely resolved into the alcohol boiling at 132° and into isobutylic alcohol boiling at 109°.

However, two amylic alcohols do exist in the fusel oil of commerce; one of them is levogyrate and the other is inactive or a mixture of levo- and dextrogyrate alcohols, almost impossible to separate, for their boiling points are very nearly the same. If, however, the mixture be treated with sulphuric acid, two amylsulphuric acids are obtained, of which the barium salts present different solubilities.

It has long been doubtful whether these two alcohols were of the same or different molecular structure, but inasmuch as the active alcohol yields a valerianic acid of which the quinia salt refuses to crystallize, while the quinia salt of the acid obtained from the inactive alcohol crystallizes readily, it may be fairly assumed that the difference is dependent upon chemical constitution.

The recent researches of J. A. Le Bel* have considerably elucidated the subject. By subjecting the low residues obtained in the fractionation of propylic (98° C.) and butylic (109° C.) alcohols to fractional distillation in a vacuum, he has succeeded in separating the two amylic alcohols, thanks to the greater tension of vapour of the inactive variety.

Are we to conclude that the difference in purity of different samples of nitrite of amyl is due to the mixture of the two alcohols? By no means, for the boiling points of the two isomeric nitrites would not be widely separated.

But, by whatever process nitrite of amyl be made, it is quite possible that its isomeride nitropentane may be formed at the same time, and this would raise the boiling point of the product.

The amylic alcohol which passes after two or three fractionations between 128° and 132° C. can be considered sufficiently pure for all pharmaceutical preparations, and should the nitrite of amyl made from it be of poor quality, a faulty process or carelessness in the rectification must have been the cause.

A very fair yield of nitrite of amyl may be obtained by the action of potassium nitrite and sulphuric acid on the alcohol. The potassium nitrite may be easily made by maintaining potassium nitrate for some time at a dull red heat. It is then heated with amylic alcohol in a flask on a water-bath, and sulphuric acid, diluted with its volume of water, gradually added. Nitrite of amyl distils over regularly with some vapour of water. After washing the product with a solution of potassium carbonate, and drying it with solid potassium carbonate, it is distilled and all that passes below 100° may be retained.

Perfectly pure nitrite of amyl can only be obtained by many and careful fractionations, and would be too expensive for pharmaceutical use. It boils constantly at 96°, the boiling point given by Balard, and its vapour is not disassociated at its boiling point. Mr. Tichborne's statement, made some ten years ago and subsequently contradicted by Chapman, that nitrite of amyl is decomposed by boiling, is erroneous. No gas of any description is evolved during the distillation of amyl nitrite, as can be demonstrated by most rigorous experiment.

It might naturally be expected that there would be a diminution of 5 or 6 per cent. of the portion passing

* From the *American Journal of Pharmacy*, February, 1879.

* *Comptes Rendus*, Tome lxxxvii., p. 213.

between 90° and 100° at each fractionation. Ten degrees is a very considerable range, and the very fact that Mr. Dott could not get all of his nitrite to pass between 90° and 100°, should have indicated to him that his product was not perfectly pure, but it was gradually approaching purity as shown by the residue left at 100°.

Much time may be saved in fractionating, especially such substances as nitrite of amyl which has a high tension of vapour, by the use of the Le Bel and Henninger apparatus described in the *Comptes Rendus* (vol. lxxiv., p. 480), as two or three fractionations will then effect an almost perfect separation.

I have examined specimens of nitrite of amyl from reputable houses, and have found boiling points between 70° and 180°. Such products, it is needless to say, have never been rectified. The whole result of the action has been distilled and bottled as nitrite of amyl. One specimen had not entirely distilled at 220°; another contained about 10 per cent. of water, 25 per cent. of amyl nitrite (90° to 100° C.), and the remainder was composed almost entirely of unaltered amylic alcohol.

The boiling point of the nitropentane derived from ordinary amylic acid is in the neighbourhood of 160° C. I have found traces of it in all of the commercial nitrite of amyl I have examined; and sometimes the proportion is not inconsiderable. It may be detected by subjecting that portion which passes between 150° and 170° C. to the action of nascent hydrogen. Amylamine is thus formed. Commercial amyl nitrite seems also to contain very small quantities of nitrate of amyl.

REPORT ON THE PRACTICE ADOPTED IN THE DISPENSING OF MEDICINES IN VARIOUS PARTS OF THE COUNTRY.

The following questions were sent to the local secretaries of eighty towns situated in various parts of the country, with a request that replies would be kindly furnished to the Rochdale and District Chemists' Association, who are seeking to arrange for the dispensing to be done by the chemist instead of by the medical man (as at present):—

1. Do medical men in your town dispense for their own patients?

2. If not, are prescriptions free to be taken to any *bonâ fide* chemist?

3. If so, how does it affect (1) the medical man, (2) the public as regards fees, and does the arrangement meet with general approval?

Replies have been received from seventy-two places, some containing very copious information and others simply answering the first question. These replies are as diverse in the character of their information as in its amount.

(*a*) We find in fifteen towns and cities, containing an aggregate population of more than a million and a half, that the practice of medical men dispensing their own medicines is either not known or little practised.

(*b*) In fifteen other towns, etc., the population not greatly differing from the above, the practice appears to be much more varied, but still they are found to contain a large number of non-dispensing medical men.

(*c*) In fourteen other towns, containing some 1,400,000 inhabitants, the practice of medical men dispensing for their own patients largely prevails, but is not universal.

We have thus in the forty-four places referred to a mean average population of about 100,000, whether we take them as grouped above or in the aggregate.

(*d*) The remaining twenty-eight towns contain a smaller total population than any fourteen of the other towns (viz., 1,296,481 inhabitants), showing an average of about 48,000, or less than half that of the other forty-four towns, and in these the doctors do all the dispensing, with rare exceptions; or if the dispensing is done by the chemist, it is done for the doctor rather than the patient.

The replies contain many expressions of approval, and only one of disapprobation of what we are doing. We were greatly surprised to find that any gentleman acquainted with the duties of a pharmacy should "think we are instituting an unwise agitation." We doubt whether that opinion would find an echo in many other places.

Over and over again we have testimony in favour of medical men ceasing to dispense, and are told that it affects medical men beneficially, and the reasons given are: that they take a higher status in their profession; they are not under the necessity of hastening to their dispensaries to make up the medicines for patients visited in the morning, and again in the evening finding the same irksome duty awaiting them after their afternoon visitations, but, on the other hand, pursuing the duties of their profession with more of leisure and giving their patients the benefit of that freshness of thought which is so desirable to those whose duties are so highly important and responsible, and at a busy time it sets them at liberty to attend altogether to their patients. As regards fees, we are told that it makes no difference, that the non-dispensing medical men "appear well-to-do and that therefore it suits them," and as a matter of further information we are told that the "poorest would pay them less, and all the best class patients would pay them higher fees."

In many cases our correspondents do not seem to have become acquainted with the wishes of the public, but several write to the effect that "the public prefer that the medical man shall write and the chemist dispense," and in one town, where the practice differs as much as possible, and where dispensing doctors are the largest class, the opinion is expressed that "people who get prescriptions like it better than having the medicine supplied by the doctor."

In truth, as one correspondent remarks, "there is no sound argument, except in remote country districts, in favour of the surgeons dispensing, but all the arguments are on the other side." There appears to be good evidence that where the change has been made it has met with the approval of the public and the medical man as well as the chemist, and that each are benefited in that way which proves in practice to be the greatest boon to those concerned.

(*a*) Torquay, Llandudno, Edinburgh, Cheltenham, Coventry, Hastings and St. Leonards, Chester, Bristol, Liverpool, Birmingham, Leicester, Harrogate, Carlisle, Leamington, Worcester.

(*b*) Scarborough, Oxford, Nottingham, Northampton, Bath, Tunbridge Wells, Portsmouth, Exeter, Newcastle-on-Tyne, Leeds, Buxton, Preston, Brighton, Southampton, Glasgow.

(*c*) Manchester, Shrewsbury, Hull, Sunderland, Sheffield, Lancaster, Derby, Bedford, Croydon, Swansea, Doncaster, Huddersfield, Canterbury, Lincoln.

(*d*) Ryde, Yarmouth, Rugby, Gravesend, Hereford, Aylesbury, Stoke-upon-Trent, Norwich, Devonport, Taunton, Windsor, Maidstone, Reading, Stockton-upon-Tees, Cardiff, Ipswich, Bolton, Bangor, Grantham, Dover, Wakefield, Dudley, Blackburn, Bradford, Bury St. Edmunds, Wolverhampton, Banbury.

"REVENGE IS SWEET!"

Party (*who had rung the night-bell at* 3 a.m.). "Oh, so sorry to disturb you at this hour; but this prescription" —(*beseechingly*)—"if you'll kindly—it's a matter of life ——-"

Tradesman. "Who are you?"

Party. "Oh, I live at No. 4 in the Crescent. My name is——"

Tradesman (*recognizing former Customer*). "Oh—Ah —to be sure—I know. Well—you go and knock 'em up at your Co-operative Stores!!" [*Shuts window viciously.* —*Punch.*

SATURDAY, MAY 3, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

A NEW UNIVERSITY FOR THE NORTH OF ENGLAND.

THE proceedings at a meeting of the Court of Governors of Owens College, Manchester, held last week, appear to render it probable that the difficulties that stood in the way of carrying out a scheme for the creation of a new University in the North of England have now been overcome. These difficulties were not due to any wish to oppose an attempt to meet the demand for university training that has sprung up in the great northern towns, but rather to some local and very natural susceptibilities, and now that these have received proper consideration the opposition has disappeared.

Nearly two years ago an application was made to the Government to grant to Owens College a charter raising it to the rank of a University, with power to incorporate other colleges. The University so constituted it was proposed to call after the city of Manchester. Since the establishment of Owens College it has made such honourable progress that its claim to a certain amount of pre-eminence could hardly be denied; but, on the other hand, there is at Leeds, in the Yorkshire College, a competitor which, although the commencement of its first session dates only three and a half years since, has already acquired such a position as to warrant the expectation that at no distant date it will be capable and worthy of taking a prominent part in the management of such a University as that projected. Objections were consequently raised to the charter being granted to one college in a form which would give that college a preponderating influence as compared with other colleges, and also to the adoption of a name that would at least favour such undue pre-eminence. Negotiations were opened between the committees of the two colleges. and the result has been the drawing up of a revised scheme as to the basis of a constitution for the proposed University acceptable to both colleges, and an understanding as to the name to be suggested for the University. This arrangement is based upon the understanding which has continuously obtained among the promoters of the scheme, that in the proposed University degrees should not be conferred upon any but academically trained students; and also that to every college incorporated in the proposed University should be secured a legitimate share of influence in determining its curriculum of study and conducting its examinations.

The Court of Governors of Owens College has now unanimously adopted the terms of the arrangements, and a memorial will at once be presented to the Lord President of the Council praying that a Charter constituting the new University may be granted at an early date. It is proposed that Owens College shall be named in the charter establishing the University as the first college in it, its efficiency and financial security being assumed; and that the President and the Principal of Owens College shall be the first Chancellor and Vice-Chancellor of the new University. The remainder of the executive body would, according to the suggestions, consist of representatives from each of the incorporated colleges, together with six nominees of the Government. With respect to the name, it is proposed to abandon the idea of having a local name, and to ask the permission of Her Majesty to allow the new University to be called the "Victoria University." It is understood, however, that it is to have its *locus* at Manchester.

Pharmacists as a body are so much interested in every movement that promises to favour the multiplication of centres of trustworthy education that no excuse is required for bringing this subject forward in these columns. Nothing is more remarkable in the present day than the increased importance which is ascribed to proper training—and especially scientific training—in every walk of life. Pharmacists in the provinces have been compelled to attempt to supply the want of opportunities for obtaining that literary and scientific education absolutely necessary now for those who aspire to enter their calling. But the results have not been altogether satisfactory. The class from which the students are drawn is, as a rule, insufficiently numerous, except in the larger towns, to repay the efforts made and the money expended, and the consequence has been that in many instances the experiment has languished and failed in spite of really sensational and unhealthy efforts to keep it going. Any plan, therefore, that tends to develop and consolidate such institutions as the Owens College, Manchester, the Yorkshire College, or the even more recently established West of England College, as helping to bring within the reach of every pharmaceutical student some portion at least of the educational appliances for which he craves, is to be welcomed, and the confederation of such institutions in a properly conceived University scheme must help to bring about the desired result.

One word, in closing, with respect to the Yorkshire College. Only three and a half years since it commenced its operations in temporary premises with a limited curriculum. Now, nearly two hundred students are attending its day classes, and already it has been able to make its mark upon this scheme for a northern University. Although we

understand it is hardly yet in a position financially to justify an application for incorporation with the new University, there is little doubt, if we may judge of the future by the past, that this will be only a temporary delay. And we are happy to believe that when this end has been obtained a considerable portion of the honour will be due to one whose name is well known to pharmacists, Mr. RICHARD REYNOLDS, of Leeds, who has served the College from its inception as its honorary secretary. To this gentleman's indefatigable efforts the College owes much of the success it has met with, and that circumstance goes far to justify an assertion attributed to the late JACOB BELL, that "a pharmaceutical "chemist can do anything he applies his mind to."

BOTANICAL LECTURES AND DEMONSTRATIONS AT THE GARDENS OF THE ROYAL BOTANIC SOCIETY.

IT will be seen by reference to the advertisement of the School of Pharmacy of the Pharmaceutical Society of Great Britain, that Professor BENTLEY will commence his Lectures and Demonstrations on Systematic and Practical Botany, at the Gardens of the Royal Botanic Society, in Regent's Park, on Saturday morning, May 10, at 8 o'clock. The course of lectures will be continued on the succeeding Friday and Saturday mornings till the end of July.

DESTRUCTION OF PHARMACIES IN HUNGARY.

WE take this opportunity of expressing our thanks to those gentlemen who have already forwarded contributions in aid of the numerous pharmacists who have, as we learn from the letter of Mr. JARMAY, the President of the Pharmaceutical Society of Hungary, had their establishments totally destroyed by the recent inundations in the neighbourhood of Szegedin. We shall be glad if those who are able and willing to give something in aid of their distressed colleagues in Hungary will forward contributions to the Fund, by post-office order or cheque, addressed to the care of Dr. B. H. PAUL, 17, Bloomsbury Square, for transmission to Mr. JARMAY, who has undertaken to provide for the administration of any assistance thus rendered. We purpose publishing in the next number of the Journal a list of the contributors to the Fund.

"THINGS NOT GENERALLY KNOWN."

THE *Daily Telegraph* promises to become famous for its contributions to "popular" science. On Saturday last, it gravely informed its readers, in an editorial article devoted to the future of the electric light, that "probably the time will never come when "sulphuretted hydrogen is no longer used for giving "either heat or light." As a few lines earlier the making of a hazardous prediction is deprecated it might be presumed that our contemporary means what it says, but, if so, we hope the manufacture and consumption may be limited to its own office.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held on Thursday, May 8, at 8.30 p.m. precisely, when Mr. J. GRAHAM SANGSTER will read a paper on "Santonica and Santonin," and Mr. W. R. DUNSTAN a note on "The Qualitative Separation of Nickel "and Cobalt."

Transactions of the Pharmaceutical Society.

EXAMINATIONS IN LONDON.

April 23, 1879.

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was also present on behalf of the Privy Council.

MAJOR EXAMINATION.

Seven candidates were examined. *Four* failed. The following *three* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Barrat, Reuben .....Kingston-on-Thames
Brown, Alfred Duncombe .....Halstead.
Aldridge, Joseph Henry .....Brighton.

MINOR EXAMINATION.

Fifteen candidates were examined. *Four* failed. The following *eleven* passed, and were declared qualified to be registered as Chemists and Druggists:—

Atkins, John.....Uxbridge.
Bartlett, George F. Handel ...New Wandsworth.
Beaven, Alfred George .....Southampton.
Betts, George .....Norwich.
Bloodworth, Thomas .....Bourne.
Blythe, William Graves .....Goole.
Bridger, Thomas .....Fareham.
Chapman, Joseph George .....Binfield.
Charrington, William, jun.....Lichfield.
Cook, William Richard .....Bath.
Cornwell, Thomas Chinsura ...Penzance.

MODIFIED EXAMINATION.

Eight candidates were examined. *Three* failed. The following *five* passed, and were declared qualified to be registered as Chemists and Druggists:—

Bolton, Edgar Benjamin.....Woolwich.
Dwyer, John.....Bristol.
Garnett, Richard Massie .....Nantwich.
Greaves, John .....Gloucester.
Hunneman, Augustus Fredk. ...Camberwell.

April 24, 1879.

Present—Mr. Williams, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was present on behalf of the Privy Council.

MAJOR EXAMINATION.

Seven candidates were examined. *Two* failed. The following *five* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Cox, Joseph .....Nottingham.
Exley, John, jun. .....Leeds.
Fawcett, Christopher Airey ...Windermere.
Griffith, Samuel .....Weston-super-Mare.
Harrison, Frederick.....Brighton.

MINOR EXAMINATION.

Twenty-one candidates were examined. *Eleven* failed. The following *ten* passed, and were declared qualified to be registered as Chemists and Druggists:—

Crook, Herbert .....Gravesend.
Davies, Richard .....London.
Denston, George Augustus .....Kettering.
Dutton, Hugh Odard .....Rock Ferry.
Eaton, Edward Jarrett .....Diss.
Forster, Francis Alexander.....Norwich.
Fox, Alfred .....Hull.
Freeland, Alonzo Joseph.....Angmering.
Gascoigne, Charles .....Hurworth.
Golding, John Frederick.....London.

April 25, 1879.

Present—Mr. Williams, President, Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

MINOR EXAMINATION.

Twenty-eight candidates were examined. *Sixteen* failed. The following *twelve* passed, and were declared qualified to be registered as Chemists and Druggists:—

Greaves, Edward Harrison .....Bristol.
Hawthorne, Charles Oliver .....Stafford.
Holmes, Philip .....Walham Green.
Hudson, James .....Harrogate.
Hunter, William Sisson .....London.
Jones, Charles .....Wellingborough.
Langford, William Stockdale ...Wisbeach.
Lapthorn, George .....Taunton.
Maggs, Frederic William .....St. Leonards.
Maudson, Beresford Frederic H.Brighton.
Needham, Thomas .....Manchester.
Niblett, Frederick John .....Stroud.

April 30, 1879.

Present—Mr. Savage, Vice-President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

MAJOR EXAMINATION.

Six candidates were examined. *Two* failed. The following *four* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

King, Horatio Alfred .....Norwich.
Lemmon, Eric .....East Grinstead.
Lord, William Henry .....Kennington.
Newbigin, Lesslie.....Alnwick.

MINOR EXAMINATION.

Twenty-three candidates were examined. *Ten* failed. The following *thirteen* passed, and were declared qualified to be registered as Chemists and Druggists:—

Nicholls, Samuel John Halliegy.Plymouth.
Oldham, Frank.....Wisbeach.
Pollard, Alfred.....Sherborne.
Porter, Thomas.....Fleetwood.
Powell, John Alfred.....Reading.
Powell, Septimus .....Bristol.
Raynor, Charles Thomas.....Leicester.
Remfry, Samuel Alfred .....London.
Richards, Jonah Palmer .....Cardigan.
Roper, Robert Francis.....East Stonehouse.
Rouse, Frederick William .....Clapham.
Scammell, Luther Robert .....Adelaide.
Sollitt, Arthur .....London.

May 1, 1879.

Present—Mr. Savage, Vice-President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was present on behalf of the Privy Council.

MAJOR EXAMINATION.

Six candidates were examined. *One* failed. The following *five* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Roberts, Henry.....Norwich.
Sadler, William, jun. .....Margate.
Scammell, William Joseph .....Adelaide.
Shillcock, George .....Bromley, Kent.
Stobbs, Robert .....North Shields.

MINOR EXAMINATION.

Twenty-two candidates were examined. *Thirteen* failed. The following *nine* passed, and were declared qualified to be registered as Chemists and Druggists:—

Stevens, James .....Ripon.
Thompson, Leonard ... .Richmond, Yorks.
Thornton, John.....Aldridge.
Tibbits, James Reginald .....Rugeley.
Venables, Samuel Henry.....Wellington, Salop.
Villar, Arthur .....Staplegrove.
Ward, Henry Singleton .....Preston.
Williams, David .....Swansea.
Wright, William Royle .....Southport.

PRELIMINARY EXAMINATION.

The undermentioned certificates were received in lieu of the Society's examination:—

Certificates of the College of Preceptors.

Jenkins, Thomas .....Aberdare.
Skirrow, Frederick James .....Accrington.

Certificate of the Royal College of Surgeons of England.

Davies, Michael Philip .....Reading.

Certificates of the University of Cambridge.

Arnold, Henry Richard .....Hammersmith.
Cooper, William Ecklee .....Upton-on-Severn.
Dresser, William .....Rotherham.

Certificate of the University of Oxford.

Baily, Edward .....Ramsgate.

BOTANICAL PRIZE FOR 1880.

A Silver Council Medal is offered for the best Herbarium, collected in any part of the United Kingdom, between the first day of May, 1879, and the first day of June, 1880; and should there be more than one collection possessing such an amount of merit as to entitle the collector to reward, a second prize, consisting of a Bronze Medal, and also Certificates of Merit, will be given at the discretion of the Council. In the event of none of the collections possessing sufficient merit to justify the Council in awarding medals or certificates, none will be given.

Competitors must be Associates or Apprentices or Students of the Society, and under twenty-one years of age.

The collection must consist of phanerogamous plants and ferns, arranged according to the natural system of De Candolle, or any other natural method in common use, and be accompanied by lists, arranged according to the same method, with the species numbered.

The collector must follow some work on British botany (such as that of Babington or Hooker), and state the work he adopts. The name of each plant, its habitat, and the date of collection, must be stated on the paper on which it is preserved.

Each collection must be accompanied by a note, containing a declaration signed by the collector, and certified by his employer, or a pharmaceutical chemist to whom the collector is known, to the following effect:—The plants which accompany this note were collected by myself, between the first day of May, 1879, and the first day of June, 1880, and were named and arranged without any other assistance than that derived from books.

In estimating the merits of the collections, not only will the number of specimens be taken into account, but also their rarity or otherwise, and the manner in which they are preserved, and should a specimen be wrongly named, this will be erased from the list.

The collection must be forwarded to the Secretary of the Society, 17, Bloomsbury Square, on or before the first day of July, 1880, indorsed "Herbarium for Competition for the Botanical Prize." After the Prize Distribution in October, collections will be retained one month, under the care of the Curator of the Museums, for the inspection of persons connected with the Society, and then returned to the collector, if required.

Provincial Transactions.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

A meeting of the Society (to which the assistants and apprentices were invited) was held in the rooms, St. Nicholas Lane, on the evening of Thursday, April 10, to receive reports upon the classes held during the winter, and also to consider the advisability of conducting a botany class during summer. Mr. Giles, President, occupied the chair, and after a few introductory remarks, called on Messrs. A. Strachan and J. Gordon to give their reports.

Those gentlemen read their reports which showed that being a first attempt the classes might be considered fairly successful. The class rolls showed a membership of 31, the highest attendance scored being 22, while towards the end it grew beautifully less. This was the only point upon which complaint could be founded, and formed the main stumbling block against the conducting of a botany class during the ensuing summer. Still if more interest be taken during next winter it is highly probable that a botany class will be formed during the following summer.

Mr. J. Simpson (Davidson and Kay) on behalf of the members of the classes proposed a hearty vote of thanks to Messrs. A. Strachan and J. Gordon, for the trouble, etc., they had taken in conducting the classes, and finally concluded by presenting Mr. Strachan with a copy of 'Pereira's Materia Medica,' by Bentley and Redwood, and Mr. Gordon with a copy of one of 'Sutton's Volumetric Analysis' and 'Tyndall on Heat,' all bearing suitable inscriptions.

Mr. Watson (C. Coutts) followed up Mr. Simpson's remarks, and finished by seconding Mr. Strachan's vote of thanks which was carried *nem. con.*

Messrs. Strachan and Gordon each in the course of a few remarks thanked the members of the classes for the unexpected and valuable marks of respect just handed them.

Mr. D. Ritchie then on behalf of the Society moved—"That they place on record a hearty vote of thanks to Mr. A. Strachan and Mr. J. Gordon for their very generous and laborious efforts in promoting the pharmaceutical education of their assistants and apprentices," which was seconded by the Chairman and agreed to.

After these proceedings, the company inspected some valuable specimens just presented to the Society by Messrs. Langham, Edden, Hicks and Clark, of London.

The last lecture of the course under the auspices of this Society, was delivered in the rooms, St. Nicholas Lane, on the evening of Thursday, April 24, by Dr. J. Moir, on "The Phrenology of Pride and Vanity." Mr. W. Giles, President, in the chair. The lecturer having demonstrated on a number of casts of the human head, the phrenological seat of the above mentioned mental qualities, proceeded to give a subtle analysis of their operation when in combination in different degrees of proportion with other mental qualities. His arguments were illustrated with remarkably apt illustrations from every day life, a reference to which elicited frequent applause. The concluding part of the lecture was devoted to the consideration of the means of cultivating, when too low, "the drill sergeant of society," love of approbation, and of its repression when too largely developed. The lecture which from beginning to end was an acute piece of psychological dissection was listened to with close attention, and at the close the usual votes of thanks were heartily awarded. The attendance was good.

EDINBURGH CHEMISTS' ASSISTANTS' ASSOCIATION.

The fifth and last meeting of the session was held in the Pharmaceutical Society's Rooms, 119A, George Street, on Tuesday evening, April 22; Mr. McLaren, Vice-President, in the chair.

The minutes of last meeting having been read,

The Chairman called on the Secretary to read the report of the Annual Supper Committee. This, after some criticisms from Mr. Hill, was adopted.

The annual report of the General Committee, together with the Treasurer's statement, was then read. As the Treasurer's report showed a good balance in favour of the Association, the Committee recommended a vote of £1 1*s.* from the funds as a donation to the Benevolent Fund of the Pharmaceutical Society. On the motion of Mr. Robertson, this was unanimously agreed to.

Another recommendation of the Committee was that a prize, value 10*s.* 6*d.*, should be offered to apprentices, members of the Association, for the best essay on a given subject. After some discussion it was agreed to let this matter stand over for consideration till next session.

The Association then proceeded to elect office bearers in place of those retiring, the result of which was:—Mr. McLaren, President; Mr. Robertson, Vice-President; Mr. Hutton, Treasurer; and Mr. Fisher, Secretary, with a General Committee of nine members to assist.

A hearty vote of thanks to the Pharmaceutical Society for the use of the rooms during the past session was unanimously accorded.

This closed the business for the evening.

Proceedings of Scientific Societies.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting held on Wednesday, April 16, at 32A, George Street, Hanover Square, Mr. Wallis, President, in the chair, a paper was read by Mr. A. W. Postans, F.C.S., entitled, 'The Rise and Progress of Pharmacy." The author at the commencement expressed great pleasure in finding himself before the Chemists' Assistants' Association, for the memory of the early days of which he should always entertain a kindly feeling. He then read an extract from a letter by Mr. Haselden, published twenty years ago, which to his mind showed the clearness of that gentleman's vision as to the advancement which the educational movement of the Pharmaceutical Society was destined to make. The founders of the Society were then alluded to, to whose patience, perseverance and industry, we are greatly indebted. Having briefly described the rise of pharmacy, he said "That as a rule men who are trained in the schools do not become puffed up, but they there begin to realize the fact that we are all, even the best of us, students to the end," particularly noticing that when a man has passed his examination he has only satisfied the law and his own conscience of his fitness for the future. The author then gave his opinion as to the kind and amount of knowledge necessary to make a good pharmaceutical chemist. He considered that such societies as the Society of Public Analysts, the Institute of Chemistry and others owed their existence to the growth of science brought about by and emanating from the passing of the Pharmacy Act. He then finally passed a few remarks upon the Chemists' Assistants' Association, expressing himself personally gratified at the praiseworthy and promising position it now occupied.

A vote of thanks, proposed by Mr. Branson and seconded by Mr. Snow, was accorded to Mr. Postans for his excellent paper.

At a meeting held on Wednesday, April 23, at 32A, George Street, Hanover Square, Mr. Branson, Vice-President, in the chair, a paper by Mr. Ager was read on—"The Internal Arrangements of a Chemist's Shop." The author first drew attention to the window as being the most important part in a commercial point of view, especially in main thoroughfares; recommending a raised platform in tiers, with plate looking-glass backs, as bes

adapted for showing off the window stock. He considered the formidable heraldic specie jars obsolete except in large dispensing establishments, and condemned the practice of displaying enemas, syringes, trusses, etc., as the public are generally aware that such instruments are kept in stock or are so informed by their medical men; the extensive use of dummies shared the same fate as giving a false appearance to the shop. He strongly upheld the excellent plan of dividing the shop into alphabetical sections, and keeping a catalogue of drugs, chemicals, etc., with their exact locality, as the searching for anything often begot a lack of confidence on the part of the customer. He approved of vases of flowers for giving the shop a cheerful appearance, and as useful additions to the furniture, a clock, umbrella-stand and thermometer with storm glass. After touching upon the advantages gained by chemists in obliging each other, of being satisfied with moderate profits, and the imprudence of selling patent medicines below their market value, the author finished by quoting some appropriate lines from Cowper—the poet's opinion of harassing legislation and customs. A somewhat lively discussion followed in which Messrs. Branson, Cardwell, James, Snow and Tompsett, took part.

A vote of thanks, proposed by Mr. Cardwell and seconded by Mr. Snow, was given to Mr. Ager for his excellent paper.

CARLISLE SCIENTIFIC SOCIETY.

At a meeting of this Society, on Tuesday, April 22, Dr. Barnes in the chair, Mr. J. Foster read a paper entitled "Flora Medica Cumbriæ." The lecturer described at considerable length the structure of plants and the functions of their different structural parts, explaining the difference between structural, physiological, and systematic botany. He then described a good many plants and flowers from which poisons and other medicines are obtained, and their various effects upon the animal frame. At the close a vote of thanks was given to Mr. Foster for his lecture, and it was suggested that next year he should give the second portion of his lecture over again, amplifying it, so as to give the localities of the various plants he had mentioned.

Parliamentary and Law Proceedings.

Prosecution for Sale of Adulterated Compound Spirit of Camphor.

At the Sheffield Town Hall, on Friday, April 18, before J. Hallam, Esq., and T. A. Sorby, Esq., Robert Bennett, chemist, King Street, was summoned under the 7th section of the Sale of Drugs Act, 1875, for selling an article or drug not composed of the ingredients in accordance with the demands of the purchaser.

The Town Clerk (Mr. J. Yeomans) appeared to prosecute.

Inspector Brammer, in February last, purchased from the defendant eight ounces of compound tincture of camphor, for which he paid 1*s.* 5*d.* He afterwards submitted a portion of it to Mr. A. H. Allen, the borough analyst.

Mr. Allen's report was to the effect that his analysis showed that the compound contained 34 per cent. of alcohol, instead of 48 per cent. It also contained a mere trace of benzoic acid, only a trace of oil of aniseed.

Dr. Hime, Medical Officer of Health, said that the absence of the proper proportion of ingredients would prevent the article from having the effect it should have.

Mr. Bennett said he was prepared to swear that the whole of the ingredients as required by the Pharmacopœia were in the compound in their proper proportions, with the exception of the spirit. The farriers required a weaker sort of spirit, and by mistake that spirit had been got hold of. He had been in business all his life and this was the first time he had infringed the Act.

A fine of £5 and costs was imposed.—*Sheffield Daily Telegraph.*

Review.

A Manual of Practical Chemistry. The Analysis of Foods and the Detection of Poisons. By Alexander Wynter Blyth, M.R.C.S., F.C.S., etc. London: Charles Griffin and Co. 1879.

In the preface to this volume, the author remarks that, "to the best of his knowledge there is no other work in the language covering precisely the same ground." This is certainly the fact, for though there are books devoted to the analysis of foods, and works on toxicology are not wanting, we are not aware that any single volume in the English language treats of both subjects. Further, with the exception of the publication of Hassall's 'Food and its Adulterations,' in 1876, no attempt has been made to place before chemists in a handy volume the various improved processes for the analysis of food which have been devised since the recent legislation on the adulteration of food and drugs.

The author has, however, really succeeded in giving in a readable form "a clear and concise account of the composition of the various foods and beverages with the best and most recent methods for the detection of any adulteration."

The work is divided into two distinct parts, the first of which is devoted to the consideration of foods and beverages and their adulteration, and the second to toxicology. In the first portion the foods and beverages are arranged in, as it were, natural orders; thus, milk, butter and cheese are treated in one chapter, tea, coffee and cocoa in another, beer, wines and spirits in a third, and so on. It is curious to find annatto taking a place in this volume among articles of food. Not a few chemists look upon the addition of annatto to cheese or butter as an adulteration, and though we do not offer an opinion on the point, it must seem superfluous to these chemists to consider the adulterations of an adulteration. It is the more remarkable that annatto should be treated of at some length, while such substances as lard, honey, aërated waters, jams, etc., escape notice altogether.

A considerable amount of original matter, the result of the author's own experiment and research, is to be found in this volume, and good discrimination has been exercised in the selection of processes in those cases in which several have been from time to time suggested. Occasionally, however, the author has a tendency to be somewhat diffuse upon matters not absolutely necessary in a "manual of practical chemistry," while in the description of a process there is sometimes just that want of detail which prevents the practical working of the process without further reference. Thus, though we are favoured in connection with tea with a description of boheic acid, quercitrinic acid and quercetin, we find the following given as a process for detecting alum in flour: "Mr. Carter Bell directs 50 grams of flour to be weighed out and mixed by the aid of a glass rod with 50 c.c. of distilled water, to this is added 5 c.c. of recently prepared logwood solution, alkalised by 5 c.c. of solution of ammonium carbonate." No hint is given as to the strength of either ammonium carbonate or logwood solution, although measured quantities are to be used, nor is it stated whether the latter is to be decoction, infusion or tincture. Again, in the analysis of the aqueous solution of an ash we find the following:—"For CO_2, determined volumetrically by passing the gas into a solution of chloride of lime and titrating the resulting carbonate with d. n. sulphuric acid." Apart from the absence of detail this process is certainly a remarkable one.

With regard to adulteration we are glad to see that the author discards or ignores many antiquated and sensational ideas, and we cordially agree with him in the following remark with regard to milk. "As for chalk and water, pulped up brains, infusions of seeds, and the like, popularly believed to have been used as adulterants, they are in the present day unknown; and indeed the evidence of such adulteration at a former time is either

untrustworthy or it rests upon some solitary case which has been diligently copied from one book to another."

Numerous and elaborate tables are scattered throughout every chapter, and a noticeable feature of the book is the bibliography. Nothing enhances the value of a work which is necessarily in great measure a compilation than lists of reliable references. Unfortunately the references in this case can by no means be depended upon. In the first list which appears after the article on ash, sugar and starches, the fact of a reference being made to Flückiger and Hanbury's 'Pharmaco*logia*' induced us to examine more closely the next series of references appended to the article on wheaten flour and bread. We find Cleaver's paper on the detection of alum in bread stated as being in the *Pharmaceutical Journal* (3), April, 1874, t. iii., p. 857. It is really to be found in (3) vol. iv., p. 851, although the date is correct. For Dupré's process we are referred to the *Chemical News*, 1876. His paper appeared in May 1874. Crookes published his process in the *Chemical News*, in 1861, but we are here informed that it is to be found in vol. viii, 1872, p. 383. There is a new complication here, for vol. viii. appeared in 1863, and it does not contain 383 pages. Again the report of a commission, of which Payen was a member, sur une altération extraordinaire du pain, is not to be found in *Comptes Rendus, Juillet*, 1848, as stated here, but it appeared in *Annales de Chimie*, 3me serie, ix., 1843, and Young's process for the estimation of alum in bread is to be seen in the *Analyst* of April, 1877, and not in the issue of June, 1878. Many more errors were found in other lists selected at random, and our first feeling of gratitude towards the author for his bibliography was speedily converted into one of extreme exasperation. We cannot say much in praise of the illustrations. With the exception of the large plate of Soleil's saccharimeter they are crude and lack finish. In connection with sloe leaves an illustration of the section only is given, with the remark that the microscopical appearances as seen in section are more especially different from those of tea leaves, while neither illustration nor description of the section of tea leaf is given.

The second portion of the volume presents no very special features. The poisonous and fatal dose, and in most cases the medicinal dose, of each substance is given, and accompanying the notice of each poison is as complete a list as possible of those compounds containing the poisons which are used in medicine or found in commerce. Dragendorff's method for the separation of active vegetable principles is recommended as the best and is given at length.

The author intentionally omits discussion entirely of such bodies as strong acids, caustic alkalies, etc., but we are much surprised to find no mention of carbolic acid, although deaths from this poison are very frequent, and however interesting the author's own researches on the poison of the cobra may be, still, considering their present stage of advancement, we fail to appreciate the value of the introduction of any account of them in "a manual of practical chemistry."

In the matter of nomenclature the author is peculiarly careless. Thus we find within a few pages the terms cyanide of potash, potassic cyanide and cyanide of potassium, chloride of iron (where the success of a test depends upon the condition of the iron), ferrous sulphate and sulphate of iron, and in another part of the book we have sulphate of barium, baric sulphate, sulphate of baryta, hydric sulphide, sulphurated and sulphuretted hydrogen, etc. Some remarkable formulæ are also to be found. In the case of strychnia, although the modern formula $C_{21}H_{22}N_2O_2$ is adopted, it is here made to combine with platinic chloride to form a body having the formula $C_{21}H_{22}N_2O_2$, HCl, $PtCl_2$. Now the formula, according to the old notation, $C_{42}H_{22}N_2O_4$, HCl, $PtCl_2$, would be intelligible; so would $2C_{21}H_{22}N_2O_2.2HCl.PtCl_4$ according to the new; but Mr. Blyth's formula is wholly irreconcileable with either old or new ideas. Many other errors of a similar nature exist in the book, and the formulæ of single salts are frequently wrong; thus:—"Sulphide of mercury (Hg_2S; Hg 86·21 per cent., S 13·79 per cent)." Again, "Cyanide of mercury HgC_4." As_2O_3H p. 378, is a mystery, and $Na_3S_6S_4$ completely staggers us.

Minor errors are numerous throughout the whole book. Proof spirit has a sp. gr. ·79381 assigned to it. Grains of paradise are described as a pepper. "A smell of salicylic acid" is stated to be developed on warming salicin with sulphuric acid and bichromate of potash. Amygdalin is said to split up by the action of dilute acids into sugar, volatile oil of almonds and formic acid. No mention is made of hydrocyanic acid which is so easily developed on heating amygdalin with dilute hydrochloric acid. The volatile oil of almonds itself is spoken of as hydride of benzole. The process given for detecting formic acid in hydrocyanic acid is to boil with mercurous oxide; if present, the oxide will be reduced and metallic mercury fall as a grey powder. No doubt this would take place, but we cannot conceive how it could be observed. Meconin and meconic acid are included in the alkaloids of opium, and the following is a very remarkable statement:—"Chloride of iron and *soluble iron salts generally*, give with meconic acid (even in great dilution) a lively red colour, which is not altered by heat *nor by the addition of HCl*." On page 395, a solution of arsenious sulphide in solution of ammonia is to be neutralized by ammonia.

Pharmacists will learn, perhaps with some surprise, that ordinary syrup of poppies is sweetened laudanum, and that when it is a syrup of poppy heads, it is said to contain one grain of extract of opium to the ounce. Owing to the omission of a decimal point we are astonished to read that cats recover from subcutaneous administration of six grams of sulphate of atropine. Owing also to the omission or misplacement of the sign = the equations on pages 372 and 392 appear very absurd, but that on page 361 is radically wrong, the formulæ of two of the bodies being incorrectly written, and even were they correct the equation is incomplete.

In conclusion, in spite of the numerous faults we have pointed out, the book is of considerable value. It contains in one volume a large amount of matter which would otherwise have to be laboriously searched for in a great number of publications, and with a carefully revised bibliography, occasionally a little more detail judiciously given, and with the minor errors corrected, the work would be extremely useful to every professional chemist.

BOOKS, PAMPHLETS, ETC., RECEIVED.

COMMERCIAL DEPRESSION; ITS CAUSES AND REMEDY. A Plea for Reciprocity. By S. E. ASHTON. London: Simpkin, Marshall and Co.

HOOPING COUGH. Remarks on its History, Prevalence, Symptoms and Treatment. By Dr. ROBERT J. LEE, M.A. London: Smith, Elder and Co.

ON ARTIFICIAL MANURES, their Chemical Selection and Application to Agriculture. A Series of Lectures by M. GEORGES VILLE. Translated and Edited by WILLIAM CROOKES, F.R.S. London: Longmans, Green and Co. 1879. From the Publishers.

THE NATIONAL DISPENSATORY, containing the Natural History, Chemistry, Pharmacy, Actions, and Uses of Medicines, including those recognized in the Pharmacopœias of the United States and Great Britain. By ALFRED STILLÉ, M.D., LL.D., and JOHN MAISCH, Ph.D. London: J. and A. Churchill. 1879. From the Publishers.

MODERN MEDICAL THERAPEUTICS, a Compendium of Recent Formulæ and Specific Therapeutical Directions, from the Practice of Eminent Contemporary Physicians, English, American and Foreign. By GEORGE H. NAPHEYS, A.M., M.D., etc. Sixth Edition. Enlarged and Revised. London: Balliere, Tindall and Cox. 1879. From the Publishers.

Obituary.

Notice has been received of the death of the following :—

On the 9th of March, 1879, Mr. James Edgcome Richards, Chemist and Druggist, Boscawen Street, Truro. Aged 64 years. Mr. Richards had been a Member of the Pharmaceutical Society since 1873.

On the 28th of March, 1879, Mr. Richard Henry Knowles, Chemist and Druggist, Cobourg Street, Leeds. Aged 42 years.

On the 8th of April, 1879, Mr. John Macintosh, Chemist and Druggist, Oxford Street, W. Aged 26 years. Mr. Macintosh had been an Associate of the Pharmaceutical Society since 1871.

On the 13th of April, 1879, Mr. Frederick George Hall, Chemist and Druggist, Sellwood Terrace, Brompton. Aged 46 years.

On the 23rd of April, 1879, Mr. James Wild, Chemist and Druggist, Chorlton-on-Medlock. Aged 46 years.

Notes and Queries.

[590]. TINCT. SANGUINARIÆ is an American preparation. The process of the U. S. Pharmacopœia is :—Bloodroot, bruised, four ounces ; diluted alcohol, two pints. Macerate for fourteen days, express and filter through paper. Dose ʒss to ʒss, according to the indication to be fulfilled.

HY. BROWN.

[590].

Bloodroot	. . . . .	ʒiv
Alcohol (sp. gr. ·835),		
Water	. . . . . ana	q.s.

Mix three volumes alcohol with one of water. Moisten the powder with a fluid ounce of the mixture, pack in percolator, and gradually pour menstruum on it to make fl. ʒxxxii. (From U.S.P.).

J. B. L. M.

[590]. TINCT. SANGUINARIÆ should be prepared with rectified spirit, as the herb contains a resinous substance not soluble in proof spirit. The strength equals 1:6.

H. W. LANGBECK.

[591]. CITRINE OINTMENT.—Ung. hyd. nit., B.P., should be supplied when citrine ointment is asked for. It would be wrong to give the dilute ointment unless specially requested by the customer.

HY. BROWN.

[591]. CITRINE OINTMENT is one part of ung. hydrarg. nitratis mixed with two parts of lard.

J. B. L. M.

[592]. ANILINE INK STAINS.—Strong solution of ammonia and afterwards repeated washing with distilled water will obliterate the stains.

H. W. LANGBECK.

[594]. GREEN COLOUR FOR PERFUMES.—Accto-nitrate of chromium, or salicylate of copper, or aniine green (methyl green) will do.

H. W. LANGBECK.

[595]. COLOURING.—Burnt sugar as obtained in the trade is generally made of treacle, and therefore unfit for many purposes. Benzole removes the smell. A rich, clean, almost tasteless colouring is obtained by burning refined sugar, dissolving it in a small quantity of distilled water and treating it several times with pure animal charcoal.

H. W. LANGBECK.

[596]. SELTZOGENE CHARGES.—Will some one kindly give a good formula for charges for seltzogene and gazogene, soda and seltzer and lemonade ?

W. T. OLIVE.

[597]. GURJUN BALSAM.—J. S. wishes for a good form for the external application of gurgun balsam.

[598]. CONCENTRATED ESSENCE OF SARSAPARILLA AND QUININE.—Will some reader kindly furnish a good formula for the above, or one for ess. of sarsaparilla and dandelion with quinine? This is the season when the demand for such a preparation is great, and a good formula will be very acceptable.

DE ALGA RE.

[599]. LOOCH PECTORALES.—Can any reader supply the recipe for this preparation as used in Italian pharmacy ?

E. A. T.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[219]. If dispensers would apply the same common sense to directing ʒj of a powder, which they do to directing ʒj. of a fluid, and call it a "teaspoonful," as a rule they would be acting perfectly in accordance with the intentions of the prescriber. At the same time they would be conducing to the convenience and peace of mind of the patient, instead of confusing him, which they would certainly do by writing a drachm or grains.

JAS. SWENDEN.

[219]. With reference to this and other vexed questions it seems a great pity that "Dispensing Memoranda" should now and again degenerate into an exhibition of mere carping personalities, not by any means calculated to increase the trust placed in this useful feature of the Journal. Without wishing to criticize the discretionary power of the Editor, I would suggest that any communication containing such strong expressions as used by Mr. D. C. Cadman should be left unheeded.

Strange vagaries are observable at times, but happily Mr. C.'s denunciation is followed by notes from Mr. J. L. Macmillan and an anonymous correspondent—supporting Mr. Brown's ideas.

"Doctors differ, patients die!" and will do so till the end of the chapter; but there is no need for any petty animosities springing up on that score. Questions are asked, and answers sent; but although the different views tendered are frequently very diverse, it must be remembered that the principal object of this section of "our weekly" is to remove the obstacles presenting themselves in the paths of our less experienced brethren, and in such cases of discrepant explanation let the original interrogator weigh the evidence *pro* or *con.*, and act accordingly; while as a secondary result others may profit by the controversy. In some instances the majority

will rule, whose opinion is usually accepted, *ex. gratiâ*, in consulting authorities in the pronunciation of words; in other cases, we look for the decision of "The Month," just as reference might be made to some standard work on etymology.

I think it exceedingly kind of a medical man to remember the difficulties of the "pill maker," notwithstanding his higher sphere of labour, and it would be superfluous to say that many valuable comments have emanated from the pen of Mr. Henry Brown. Therefore we are indebted to him for his exertions in clearing up mysteries, by giving the benefit of his double experience. Such contributors ought to be encouraged, instead of treated with language bordering on abuse.

I have no doubt that Mr. Brown can speak for himself, but it is rather delicate ground for him to tread; yet I have no hesitation in taking up the cudgels on his behalf, more especially as it is not the first time that he has been thus attacked.

I only wish I could hold the candlestick to this worthy gentleman who devotes so much of his time to such a good purpose, in spite of those who would detract from his merits.

J. B. L. Mackay.

---

[244]. In reply to Mr. Barnes, I have made the mixture in question several times quite satisfactorily by merely pouring the tincture directly into the water, without allowing any to run down the inside of the bottle, and agitating, when the mixture may be poured out without leaving any deposit or any of the resin adhering to the sides of the bottle. Rex.

---

[275]. Mucilage acaciæ, if used with caution, and the mass carefully dried in the sun, will be found an efficacious excipient.

C. F. Rideal.

---

[277]. Permit me to say before answering the following query that I am much obliged to Mr. D. C. Cadman, "Specific Gravity," and Mr. J. W. Barnes for their kind remarks. I am proof against attacks of such polite nature as Mr. Cadman's. I wish to instruct, and I am open to learn, but I regret to see such is not the case with some members of the Pharmaceutical Society. As an outsider, I feel deeply obliged to the courtesy of the Editor, and that on many occasions I have struck the true note of discussion is plainly evinced by the manner in which many subjects have been treated in the pages of the *Pharmaceutical Journal*. Dilute hydrobromic acid is usually prepared according to Dr. J. Milner Fothergill's formula, viz.:—

Tartaric Acid	℥xiij, ℥j, grs. 37.
Potassium Bromide . .	℥x, ℥vj, grs. 28.
Water	℥lxxx. Dose ℥ss-℥j.

or Wade's formula—

Tartaric Acid	℥xiv.
Potassium Bromide	℥xj.
Water	℥xl.

Reference may be made with advantage to the *British Medical Journal* for July 8, 1876, and June 23, 1877, and the *Pharmaceutical Journal* for June 15, 1878.

Northallerton. Hy. Brown.

---

[278]. In this case the potassic chlorate ought not to be decomposed, therefore P. B. dispensed the gargle correctly.

J. B. L. M.

---

[278]. Concerning this gargle the writer of the article on "The Month" says, "if the dilute acid were added directly to the pot. chlorat., there would be no decomposition and therefore no development of chlorine." If this were true, then my question would be a senseless and a trivial one, and should have been excluded from the column; but I maintain that chlorine, or an oxide of chlorine, is produced when ℥iss of acid. mur. dil. of ascertained B. P. strength is allowed to act upon ℥j pot. chlor. (in powder) at the normal temperature, and that its presence can be demonstrated within five seconds of the admixture; its presence in the subsequent gargle is also capable of proof.

P. B.

---

[278]. Potassium chlorate and dilute hydrochloric acid are frequently ordered as a gargle. I invariably adopt the plan of B. P., viz., to dissolve the chlorate in water and then add the acid. I do not see why B. P. should add the strong acid, if it were ordered, to the chlorate so as to generate chlorine. The formula quoted is quite strong enough, and chlorine is very pungent.

Hy. Brown.

---

[279]. I should make a jelly of the starch with a portion of the water, and add to the other ingredients previously mixed in a mortar.

J. B. L. M.

---

[279]. If the prescription bears the signature A. S. M. then the following is the way he wishes it dispensed:—

Heat the glycerine and p. amyli together with a little water until thickened, then rub the bismuth. carb. and zinci ox. down with it and finish in the ordinary way.

The directions "Misce" are not sufficient. The doctor ought to state on the prescription, "Heat glycerine and p. amyli together," so that it can always be dispensed alike.

G. E. Gibson.

---

[280]. J. J. cannot obtain the amount of precipitate indicated by tr. cinchon. flav.; but if tr. cinchon. lanc. be used he may nearly. I have tried; but as tr. cinchon. flav. is the only simple cinchona tincture officinal, I think it should be used, and the matter pointed out to the customer or medical man.

When the mixture made with the tr. cinchon lanc. stands for a few hours unshaken, the deposit diminishes very perceptibly. It becomes denser, and this also should be pointed out.

Hy. Brown.

---

[280]. A muddy precipitate would be produced in this mixture; but as to two ounces (by weight or bulk) there must be some mistake.

J. B. L. M.

---

[280]. J. J. may rest assured his prescription was rightly dispensed (if without precipitate), and I do not see how your brethren A. P. S. and F. C. S. could have obtained about two ounces of precipitate unless probably they used a cloudy tr. cinch. co. in error. The mixture is a very fair one with a reddish-brown tint. Age might have had something to do with forming the precipitate.

C. F. Rideal.

---

[281]. "Hamilton's pill" is the old aloetic pill (flavoured with caraway); but usually pil. aloes barb., B.P., is supplied. This pill must not be confounded with Dr. Hamilton's, junr., which is pil. coloc. et hyos. (5 grs. each).

J. B. L. M.

---

[281]. "Pil. Hamilton," Beasley's receipt book states, is the same as pil. coloc. et hyoscy., Edin. Ph.

C. F. Rideal.

---

[281]. In reply to question in last week's Journal, Hamilton's pills are made the same as "pil. coloc. c̄ hyoscyam.," but with extr. coloc. comp. instead of mass pil. coloc. comp., that is for "Professor or Hamilton's, junr." pills; for Dr. Hamilton's, senr. pil. aloetic are given.

W. R.

[281]. In reply to J. J. P., I may state the following as my experience regarding Hamilton's pills:—For Pil. Hamilton, senior, we send pil. coloc. et hyoscy., B.P., 5 grains. For Pil. Hamilton, junior, et Pil Christison (vide Squire, page 106), we send pil. aloes et hyoscy., 2½ grains.

N.B. The two latter are commonly rolled in charcoal powder, but French chalk is used here, and is preferred by

Rothsay. ASSISTANT.

---

[281]. Hamilton's pills are pil. coloc. et hyoscy., B.P.

ISLINGTON.

---

[281]. In reply to J. J. P. the subscriber begs to say he will find Hamilton's pills the same as Ed. Ph. form for pil. col. et hyos.

W. C. SPENCER.

---

[282]. No maker of chlorodyne has the sole right of the name. Therefore any make can be used where no particular kind is specified.

ISLINGTON.

---

[282], When chlorodyne is ordered in prescriptions, without the maker's name, Mr. Puntan, I think, would be quite justified in using his own make. Squire's liq. chloroformi comp. is a very efficient and commonly used substitute.

Rothsay, N.B. ASSISTANT.

---

[282]. When chlorodyne is ordered Dr. Collis Browne's is, I believe, always meant, and generally, as well as justly, dispensed; but if liq. chlorodynii or liquor chloroformi co. is prescribed, there would be no objection to using a preparation according to Squire's formula, or that of any one else provided it similated the genuine article.

J. B. L. M.

---

[282]. It strikes me that when chlorodyne is ordered in a prescription by a medical man, and no maker's name given, Collis Browne's is intended, or chlorodyne made as nearly as possible in imitation of it.

HY. BROWN.

Queries.

[283]. Is there any objection to the use of tragacanth and glycerine as an excipient for oxide of zinc?

L.

---

[284]. How can the following be made into a satisfactory mixture? The difficulty found is that the slightest agitation causes separation:—

℞	Tr. Lobeliæ Æther.	℥iiss.
	Tr. Bals. Tolu	℥vj.
	Ext. Bellądon.	gr. ij.
	Mist. Camph.	℥vij.

Ft. mist.

L.

---

[285]. A formula combining liq. ferri dialysat. with quinine is desired.

L.

---

[286]. The prescriber of the following states that it may be made into a very presentable mixture. H. J. Thomas would like to have the opinion of some of our readers upon it:—

℞	Potass. Bicarb.	℥iij.
	Tinct. Nucis Vom.	℥iiss.
	„ Assafœtidæ	℥iij.
	Aquæ	ad ℥viij.

M. ft. mist.

One tablespoonful three times a day.

Correspondence.

PHARMACEUTICAL EXAMINATIONS.

Sir,—I noticed in your last issue a letter from "Devon," and I tremble at my presumption in penning a few remarks on it. Surely he must be a professor, from his excellent knowledge of decimals, examinations in general—and the condition of the trade of the chemist and druggist, or, who knows? he may be an examiner *in embryo*.

I am sure the Pharmaceutical Society ought to feel extremely obliged at the proposition of changing the form of the examinations; but I think the majority of the chemists and druggists agree with the present mode. It is as true now as it was of old, that "you cannot please everybody," so that if the Society reformed there would probably be letters the next week against it.

As they now stand, students that are well up are certain to pass, with the exception, perhaps, of 2 per cent., who fail through cheekiness, illness or extreme nervousness.

"Devon" then directs his shaft against the practical part of the examination; this surprises me, as in the latter part of his letter he seems so dead against "cram." This looks like a "crammer" in disguise, as it appears to me that the practical part is the safeguard against "cram"; if this did not exist (as he proposes) "cram" would certainly "thrive most luxuriantly."

He then asserts that the public ought to be the examiners of the dispenser. This is not a compliment to the dispensing examiners, for the public see very little of the preparation, except the tying up, which is not taken notice of by them.

Next follows a comparison between the chemist and cheesemonger. I am at a loss to see the connecting link, or any sense at all in the comparison, as the cheesemonger does not make the cheese before the purchaser. "Devon" evidently does not think much of his calling; perhaps he may be able to form a mode of examination for cheesemongers.

After this cheesey subject, he speaks about the number of examiners. As I understand it, each examiner, every day of the examination, examines six candidates or more, the time for each being, on the average, between half and three quarters of an hour, so that I do not see that there are any too many examiners.

"Devon" then touches on the idiosyncrasies of the examiners. This, too, is not a compliment to them, as he infers that students are expected to answer what is not contained in the conspectus, thereby themselves encouraging "cram."

And now to this important subject itself. In mentioning "cram," he, in common with many others who use the term, implies a meaning which is not its own.

"Cram" means "to learn, as a parrot, without understanding."

This word has found a place very often in the pages of the *Pharmaceutical Journal* during the past few years, being mentioned in the articles, "Inaugural Addresses" and "Correspondence," the implied meaning seeming to refer to those students who come to London to "study" (not "cram") for their examinations for two or three months only, and the gentlemen mentioning this seem to forget that the majority of students who do this have been studying by themselves, often for a long period, and in many cases have been studying in a systematic way, and thus only require a comparatively short time in London. And those gentlemen who talk about assistants attending at a school for a ten months' course should remember that the majority of them have not the money to do this, or they willingly would; nor is this the fault of the niggardly hand of their employers, for the condition of the trade is such, that it will not warrant them giving assistants good salaries, therefore it is the condition of the trade that requires remedying, before the examinations; when that is done, and not before, should gentlemen talk of long courses of study.

This worthy gentleman finishes up by stating that if his

proposal was carried out double the number would pass; if so, I am afraid a great many gentlemen would have to emigrate.

Kettering. GEO. A. DENSTON.

TINCTURE OF QUININE.

Sir,—In the last number of the Journal, Mr. Ragg again refers to the nature of the deposit found in preparing tincture of quinine.

As my results are quite different from Mr. Ragg's, I am induced to send you a copy of the notes I made when preparing this tincture a short time after Mr. Martindale read his paper.

The best English thin cut orange peel, as usually supplied to the trade, was dried carefully, by exposing it to a temperature of 80° to 90° F. for three or four days, then coarsely powdered and macerated for seven days in ten times the quantity of proof spirit, sp. gr. ·920, strained, pressed, and sufficient proof spirit added to make up the original quantity. The resulting tincture had a density of ·939.

Six ounces of disulphate of quinine were added to 16 pints and 8 ounces of the above tincture, digested for three days, at about 85° or 90° F., allowed to stand for a week and filtered: the residue on the filter when dry (not washed) weighed 90 grains, and on analysis was found to consist entirely of sulphate of calcium.

A bottle of the tincture of quinine thus prepared was left out of doors for several days last January, at a time when the temperature was rarely above 32° F., yet it showed no disposition to crystallize, and the bulk has remained bright to the last drop.

Last summer I prepared for a customer some tincture of quinine, which contained two grains of disulphate of quinine in each fluid drachm: with gentle heat the extra quantity of quinine was easily dissolved in the ordinary tincture of quinine, and when the bottle was returned a short time since, to be replenished, the small portion still remaining in it was as bright as when first sent out.

It thus appears to me if proper care is taken in making this preparation, no alteration is required in the present Pharmacopœia process, as not only is all the quinine dissolved and held in solution, but it is capable of retaining in solution a very much larger quantity, which is sometimes a great advantage.

13, *Curzon Street, Mayfair.* E. N. BUTT.

DEPOSIT IN TINCTURE OF QUININE.

Sir,—If sufficient has not been already written on this subject, may I ask your correspondents if they have ever tried the action of rectified spirit on this mysterious crystalline deposit? If not, they will find that it is readily and immediately dissolved by that menstruum, thus confirming what I wrote in 1873 ('Year-Book,' 1873, p. 332), that with fully proof spirit the deposition of crystals did not occur. I have proved over and over again that with a weak spirit the crystals are invariably formed, but not, even during the past very cold winter, with spirit of the proper strength. It is not enough to mix the spirit and water in the correct proportions, but the rectified spirit itself should be tested for strength, remembering that the Pharmacopœia describes rectified spirit as being alcohol with sixteen per cent. of water, and as having a sp. gr. of 0·838.

South Norwood. J. H. BALDOCK.

SANTONIN POISONING.

Sir,—In common with many of your readers I should be pleased to see a thorough investigation of cases of alleged poisoning by the use of pure santonin. We all know that once and again this drug has been contaminated with strychnia (in Belgium, *Medical Times*, November 26, 1859; Canada, *Pharmaceutical Journal*, November 17, 1877, etc.).

Wood and Bache state that a child of four years old was made seriously ill by a dose of three grains. You reported, June 8, 1878, p. 996, the death of a child, five years, at Westbourne Park, in which a *post-mortem* revealed the presence of six grains of santonin in the stomach. Recently you mentioned (p. 696) severe symptoms of poisoning, lasting thirty-six hours, in a child of four years, from lozenges containing nearly four grains.

With regard to the medicinal dose of pure santonin text-books differ.

The Pharmacopœia and Tanner (1865) give two to six grains; Squire (1877) the same, but subjoins "for children," thus tacitly allowing a larger adult dose; Neligan (1864) one-half to two grains; Guy and Harley's 'Vade Mecum' (1874), one to six grains, adding that the most delicate child may take it; while Royle (1868) mentions one to three grains for a child, and five to ten grains for an adult, and Waring (1871) two to four grains for children under four years, and six to eight grains for those above twelve.

On July 14, 1877, you reprinted from the *Medical Times* an article by Mr. Boddy, in which he stated that he combined its administration with that of aperients, and had never noticed untoward symptoms. I have prescribed it in hundreds of cases for years past, giving one grain for eighteen months, four grains for over six years, five or six grains to adults for three alternate nights, following each dose by an aperient in the morning. I always examine my sample of santonin, and do not remember ever receiving the slightest complaint. In one instance, some lozenges professedly containing nearly my customary quantity, caused some disturbance, and in another instance, a mother remarked that some powders, similar to my own, from another source, had upset her child.

SCRUTATOR.

SALE OF PATENT MEDICINES.

Sir,—In your advertisement columns of recently appeared an advertisement respecting a patent medicine, which is said to be enjoying an enormous sale.

The proprietor gives, as examples of the quantity sold, names of several of his agents; among them I find the name of Charles Britten, *Chemist*, Birmingham. It is only right, I think, to let your readers know that Mr. Britten is not a chemist, but a bookseller.

A MAIDEN WITH BLUE EYES.

PRICES OF PATENTS.

Sir,—It is plain from your pages and other sources also, that chemists are very generally coming to the conclusion that it is no longer desirable to assist in or encourage the sale of secret medicines of the above description; but to discountenance these, and introduce preparations of their own, the properties of which they are well acquainted with. The so-called "patents" are now forced into the hands of drapers, grocers and all kinds of dealers, and are sold by many at cost, or nearly so, to puff off other stock and to deceive the public as to its value. Is it desirable for chemists still to be made tools of in distributing quack and lying bills and to adorn their shops with advertising cards for preparations, many of which as to any value are mere rubbish? Admitting that the public must and will have ready prepared medicines, strongly recommended for specified complaints, is it not possible to introduce and recommend a better and less objectionable class than many of those which have been imposed (unfortunately, often with our assistance) upon our customers? Some united action in this direction is loudly called for.

But the run upon prices is not confined to patents, so-called, it applies to medicines in general, and if chemists generally are so deluded as to follow the panic, it can only end in the complete degradation of the trade and in reducing it to a condition unfit for any respectable man to follow. The prices at the best obtained by us are no adequate recompense for the toil, care, risk and anxiety in connection therewith, and the amount of service and information we have night and day to render to the public. Now is the time firmly to maintain the integrity and respectability of our calling, and to convince the public by our united action that we have not been impostors and extortioners, but honest men, and intend to maintain our position by refusing to follow the senseless cry of a few to run down our calling to the lowest degree of degradation.

JOSEPH BALL.

THE NEW PHARMACOPŒIA.

Sir,—The following remarks, several of which have appeared in the *Pharmaceutical Journal* before, are offered for the consideration of the Pharmacopœia committee, and also with a view to elicit the opinions of the generality of the trade on the subject.

1. To avoid confusion of names it would be as well to regard all salts as compounds of acid radicles with metals, or basic radicles, instead of some being named as salts of the oxides, *e.g.*—

Present Name.	*Proposed Name.*
Ammoniæ Benzoas . . .	Ammonii Benzoas.
Antimonium Tartaratum .	Antimonii et Potassii Tartras.
Borax	Sodii Metaboras Acidus.
Calcis Carbonas Præcipitata.	Calcii Carbonas Præcipitata.
Calx	Calcii Oxidum.
etc.	etc.

2. The solubility of the various salts might be stated in parts per hundred of solvent.

The gums, gum-resins, resins and vegetable substances should have the best solvents of the active constituents stated.

3. The sp. gr. and percentage of extractive matter might with advantage be appended to tinctures and fluid extracts. (See paper by Mr. C. Umney on this subject, a few years since.)

4. The pharmaceutical preparations should be so arranged that they may be prepared with metrical weights and measures without requiring calculations.

5. The Pharmacopœia should be printed in Latin as a step towards the "Universal" Pharmacopœia.

6. In the "Relation of measures to weights," in the Appendix, there might be added

1 fl. oz.=1·7329 cubic inch.
1 cb. in.=0·5770 fluid ounce.

7. The formula for unguentum gallæ c. opio might be written thus:—

Take of

Ointment of Galls	93·184 parts.
Opium in Powder	6·816 ,,

and an alternative form added, thus:—

Take of

Opium in Powder	6·816 parts.
Galls in Powder	14·405 ,,
Benzoated Lard.	78·779 ,,

Mix.

The second form being very convenient for dispensers wishing to make small quantities, and also because it shows at once the percentage of opium and of galls.

8. *Ferri Sulph. Exsicc.*—In order that the dispenser may have a check upon the dryness of this preparation, it would be well to add, "The residue should weigh 1070 grains."

9. I think it advisable to state the impurities and adulterations usually met with under each drug, and the tests might, or might not be omitted, as all those chemists who have time, or will take the trouble to test their drugs, have chemical text books at hand.

10. *Liq. Sodæ.*—It might be stated that 28 ounces of Na_2CO_3, 10 H_2O will make 190·2 ounces by weight, or 182·6 ounces fluid, of liq. sodæ, containing 4·1 per cent. of NaHO.

11. In the preparation of ferri phosphas and ferri arsenias, tribasic sodic phosphate might be used, instead of the dibasic salt and sodic acetate, as ferrous phosphate and arseniate are slightly soluble in the acetic acid liberated by the acid salt.

12. The Centigrade thermometric scale might be used instead of Fahrenheit's.

13. The strength of liquor arsenicalis and liquor arsenici hydrochloricus might be altered from 0·914 per cent. to 1 per cent. of arsenious acid (or, more correctly, of arsenious anhydride).

14. *Liq. Calcis Sacch.*—Mention might be made that 33¾ minims of liq. calcis sacch. made up to a fluid ounce with water is equal in strength to liq. calcis.

15. The sp. gr. of glycerine might be raised from 1·25 to 1·26.

16. A more accurate method of valuing the cinchona barks is a desideratum.

Hockley, Birmingham. G. M. Jones, M.P.S.

"What is the Best Poison for Dogs?"

Sir,—In reply to a letter which appeared in your last issue, freshly prepared prussic acid is the most active poison that can be used, but the partial success obtained by Mr. James Buckle is attributable to the small quantity used, 30 minims being insufficient to produce instant death; as Scheele's acid only contains five per cent. of real acid, 30 minims would represent 1·5 grains of pure acid. It is exceedingly volatile, and a bottle exposed to the action of the air for a few hours rapidly loses its properties, and becomes partially inert. It is most readily absorbed by the blood, and a half-ounce syringe filled with the acid, and squirted into the mouth of any dog will produce death in two to three minutes at latest.

Herrings and Co.

Sir,—Mr. Buckle, in his description of his poisoning a favourite dog, appears to have tried how small a quantity of hydrocyanic acid would have the desired effect; in future I recommend him a more heroic course of action.

Some hundreds of canine and feline pets have been poisoned by me or my assistants during the last forty years and very few of them have required a second dose. At one time I used a vial or a minim measure to contain the acid, but this plan was at times unsatisfactory, afterwards I used a glass syringe, which suited better; but now I find a half-ounce india rubber syringe a certain weapon that never misses fire and generally brings down the game at the first shot.

I load with ℥j or ℥ij of Scheele's acid, according to the size of the animal, holding the tube between the first and second finger, with the thumb at the base; directly the mouth is open the acid is discharged to the back of the throat, and in less than half a minute the victim rolls over, giving a peculiar wail which, I find, always indicates the completion of the job. Once I was asked by a friend to poison a favourite large Newfoundland dog, and in this instance very fortunately took with me to his house 1 ounce of Scheele's acid. I gave a full dose of ℥ij, and just as I expected Nelson to roll over and give his last howl, he vomited a very copious supper, which the cook had given her favourite as a last treat, and walked about rather groggy, but a second dose from my bottle settled him. I never sell hydrocyanic acid to my best friend or customer, but send a man any reasonable distance to administer it, believing that it affords the most humane and the most effectual method of taking away animal life.

James Slipper.

Sir,— I don't hail from Sheffield, but as I have had some experience in poisoning dogs with Scheele's acid from Messrs. Herrings and Co., I may be excused for giving Mr. Buckle the result. I give 1 drachm to a small dog, such as a terrier, and 2 drachms to a large dog, such as a retriever or a bloodhound (I never poisoned a greyhound), and death has always been instantaneous.

Jas. Swenden.

Sir,—This question has had frequent ventilation in the Journal. But in reply to Mr. James Buckle, in last week's Journal, I beg to say I doubt very much whether, generally speaking, too large a dose of acid. hydrocyan. is not given. Some fifteen years since I was asked the usual question, Sir, can you poison a dog for me? Well, I supposed the all-powerful "Scheele's" infallible. (This was fresh from Baiss Bros.) I gave 20 drops, then 40 drops and finally 2 drachms —but all to no use. It was a very small dog and the owner laughed with me to see how he relished it, in fact seemed better after the dose. Thinking the acid would have effect shortly, the dog was taken home. Next day I was informed Toby was still in the land of the living. I had used all my "Scheele's"—nothing left but P.L. I used this, I gave one-half drachm and in a few minutes "the dog was dead." I agree with Mr. Buckle that the old tale is, Mr. So-and-So only put one drop of poison on Mr. So-and-So's dog or cat's tongue and it was dead (but I never saw the trick yet). My plan for destroying dogs or cats is this—I have a large box with a lid fitting closely, in which is inserted a piece of glass moving in a slide. The dog or cat is put into the box, the lid closed, a piece of sponge moistened with about two or three drachms of chloroform introduced through the glass slide into the box, and the poor unfortunate culprit left, say, for a quarter of an hour, life will be found extinct. This plan I recommend, and I believe they experience no pain. The cost of a box is trifling, and to all intents and purposes is the best way of poisoning, as they go off to sleep and there is no chance of a grip, as with pouring liquid into the mouth.

207, *Copenhagen Street, N.* W. N. G. Lance.

Sir,—Replying to Mr. Buckle's query, "What is the best poison for dogs?" I should say most decidedly "Scheele's Prussic Acid." The non-success of his late operation is due, not to the inefficacy of Messrs. Herring's preparation, but to the somewhat "homœopathic" way in which he administered it. I have administered Scheele's acid to perhaps a score or two of dogs and have never realized the undignified position in which Mr. B. found himself, as I always made it a rule to give 2 drachms (less in case of small dogs).

A dose such as the above will save one from an awkward and ludicrous predicament and furnish the *coup de grâce* before one has time to pronounce the mystic name of John Robinson or even of

Οχθαι.

Sir,—In reading the Journal of the 19th instant, I noticed a paragraph written by a Mr. James Buckle wanting to know what was the best poison for dogs.

One of the best dog poisons, in my opinion, was the article used, if it were given in proper quantities.

If Mr. Buckle had given 1 drachm of the acid at once, particularly if it was fresh acid, it would undoubtedly have caused instantaneous death. My mode of administering it is thus:—to a small dog, 1 drachm; to a large dog, 2 drachms of "Scheele's" hydrocyanic acid; the animal to be kept without food for some hours previous. By so doing I have never had the unpleasantness of renewing the doses, but the animals die instantaneously, without having to go through a prolonged agony.

Llanrwst. OWEN J. JONES, A.P.S.

Sir,—In reply to the inquiry of Mr. James Buckle, as far as I know, there is not any "wonderful poison" employed for poisoning dogs in Sheffield.

Our own practice is, after securing the dog, to inject into its throat with an ordinary glass syringe at least 2 drachms of Scheele's prussic acid. This invariably causes almost instantaneous death.

Old fat dogs seem to require more than any others, but in no case, if the 2 drachms of acid have been fairly injected, have we known it to fail.

C. P. S.

Sir,—May I venture to ask your correspondent, Mr. Buckle, "hailing" from Malton, if he were afraid of killing the dog (he needlessly tortured) "too much"?

If such were not the case, why not have given him at least half the quantity of Scheele's acid he had with him by means of a long-necked bottle? The effect would have been instantaneous. He would not then have made himself the butt of "undignified" remarks, or have incurred the ridicule of the number of "persons assembled to witness his operation," nor would he have troubled the pharmacists of Sheffield with a silly question. He should, no doubt, have quietly and with becoming "dignity," in the first place, have acted as Artemus Ward advised, and "histed in more pison."

Hounslow. AN OLD DOG.

Sir,—In reply to Mr. Buckle, of Malton, upon the poisoning of dogs, allow me to advise after fair experience. Never, for poor humanity's sake, poison a dog if you can get anyone to shoot him through the skull—the only certain way of producing instant death. But, if you must poison, use cyanide of potassium, 20 or 30 grains in, say, 2 or 3 drachms of water in a half-ounce phial; you are nearly sure to miss getting some of it down the throat, but if cleverly given death will be pretty certain in twenty or thirty seconds and not sooner. I have given 2, 3 and 4 drachm doses of Scheele's acid myself without killing in less than fifteen minutes, out of a bottle kept "inverted and in a dark place;" but dogs, particularly retrievers, are so tenacious of life that small doses produce no effect at all, and even shooting (excepting through the head or just behind the fore-leg) is cruel and uncertain. I have used 4 or 5 grains of strychnine dissolved in a drachm or two of acidulated water, but, although death takes place pretty rapidly, the convulsions are frightful and more—infinitely and terribly more—pain is produced than by shooting. I am certain shooting ought always to be practised by any one desirous of avoiding cruelty, and poisoning as seldom as possible, but with cyanide preferably to any other poison I know of.

I may add, I have known and heard of some brutal cases where dogs had to be killed any way they could after having had doses of prussic acid given them.

The cases of instant death that I, like many others of us, have heard of, I am inclined to believe are crammers, people forming, after years have elapsed, wrong estimates of the time between administration and death, although this time varies, partly from the uncertainty in the strength of the acid and still more probably from the momentary position of the act of respiration in the animal at the time. My observation leads me to suppose that if the acid fumes are inhaled in the passing of the acid through the mouth, death takes place more quickly than if simply swallowed, and the full or empty state of the dog's stomach also influences the rapidity of death; but actually instant death I have never seen but from gunshot through the brain—never from a poison.

W. R. O. C.

[***Since these letters were put in type, we have received a large number of others upon the same subject, some of them not very complimentary to Mr. Buckle. As, however, they all agree closely with the foregoing as to the use of prussic acid, we do not think it will be necessary to publish them, especially since doing so would involve giving a supplement.—ED. PH. J.]

W. P.—You will find ample information respecting gilding liquids in Cooley's 'Cyclopædia of Practical Receipts.' We take the opportunity of reminding our readers that a new edition of this useful work is now in course of issue by Messrs. Churchill in monthly parts.

"*A Dissenter.*"—We do not think any useful purpose would be served by raising a discussion upon the subject. If an intending employer chooses to limit his field for selection to a certain class he has a perfect right to do so.

J. P. S.—We must refer you to the Weights and Measures Act, a copy of which was issued as a supplement to the number of this Journal for January 4th last. According to the 15th section of that Act the only legal pint is to be the one-eighth part of a gallon, and the gallon is to contain ten pounds, or 160 ounces, of distilled water at 62° F.

B. M. Stoakes.—(1) Vin de Quinquina au Madère:—Calisaya Bark, 60 grams; Madeira Wine, 1000 grams. Macerate ten days, strain, press and filter. (2) The Codex does not contain tinct. quassiæ co., or cérat benzoin.

A. and J. Warren.—Tincture of arnica is not included in the schedule of poisons, and consequently its sale by an unregistered person is not a breach of the Pharmacy Act.

H. H.—A solution of peroxide of hydrogen is said to be used for the purpose.

J. P. R.—A licence is required for the sale of methylated spirit. Your other question shall receive attention.

Student is recommended to address his question to the editor of a medical journal.

Revenue.—The label would probably necessitate the use of a stamp as it recommends the preparation for the relief of disease. You are recommended to submit it to the Inland Revenue authorities.

Extractor is recommended to submit his case to the Registrar under the Dental Act.

"*Chemicus.*"—You cannot be admitted to the Minor examination before passing the Preliminary, or an equivalent examination.

Sac. Lac.—We know of no such treatise. See a note on the "Manufacture of Milk Sugar in Switzerland," in *Pharm. Journ.* [3], vol. ii., p. 394.

D. L.—We should think not.

W. M. Escreet.—(1) Indigo and sulphuric acid. (2) Yes.

C. W. Farmer.—We do not think the inference you draw is a correct one. It is the person or the several individuals who keep open shop who must be registered chemists and druggists, *i.e.*, the principals or proprietors of the business.

Mr. Foster and *Mr. Brown* are thanked for their communications.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Philpot, Barcham, Symons, Harris, Bennett, Bale, Abraham, Perry, Jones, Bruck, Turner, Chemicus, Statim, R. E., J. A. S., W. W., W. P., M. P. S., W. S., D. H.

NOTE ON CALABAR BEANS.

BY E. M. HOLMES, F.L.S.,

Curator of the Museum of the Pharmaceutical Society of Great Britain.

For some time past there have occurred among the Calabar beans of commerce some specimens which are longer and more cylindrical, and mostly of a redder tint than those generally met with. Only one species of this genus having been hitherto described, my attention was not further attracted by them until recently, when Mr. Carruthers, F.R.S., casually mentioned to me that in the Welwitsch collection, in the British Museum, he believed there was a second species of Calabar bean, which had been described in the 'Flora of Tropical Africa,'* under the name of *Mucuna cylindrosperma*, Welw. On examining these specimens I found them to be identical with the long cylindrical Calabar beans I had noticed in the drug of commerce. Fortunately pods of the ordinary Calabar bean, as well as of the cylindrical kind, were both to be seen in the Botanical Department of the British Museum, and leaves of the two plants in the Kew Herbarium. The pods of the two plants on comparison were evidently extremely similar, both having a smooth outer layer or epicarp marked with numerous oblique chinks or fissures, about half an inch long, a friable mesocarp, which easily decays and leaves only the veins distinctly visible, and a minutely tuberculated endocarp. The inside of the pod is lined with loose cellular tissue, which looks almost like a very thin layer of wool.

The leaves of the two plants are also very similar, being composed of three stalked leaflets of which the two lateral ones are unequal sided, the side next the centre leaflet being the narrowest. The leaf presents a strong resemblance to the ordinary French bean, except that the leaflets are more cuspidate. The flowers of the species bearing the cylindrical seeds have not been seen, and this fact, taken in conjunction with the similarity of the leaves of the whole group of the *Phaseoleæ*, probably led to the plant being placed in the genus *Mucuna*.

Welwitsch describes the plant as a climbing shrub, ascending to a considerable height, with long pendent branches, 30 or 40 feet long, hanging down from the trees which it ascends. It has smooth, herbaceous, shining, ternate leaves, sub-cylindrical pods, four to six inches long, attenuated both at base and apex, with the surface transversely marked with oblique cracks, and containing two or three or, more rarely, only one seed. The pods, which ripen in September, dehisce only some time after maturity. When it contains only one seed the pod is almost fusiform, when more than one it is slightly constricted between the seeds, in this respect resembling an ordinary French bean. He gives the native name as "maxima iâ muxito," and the habitat, in primeval forests near Sobado-Bango, Aquitamba, Mata irrgeni de Quisuculu and Golungo alto.

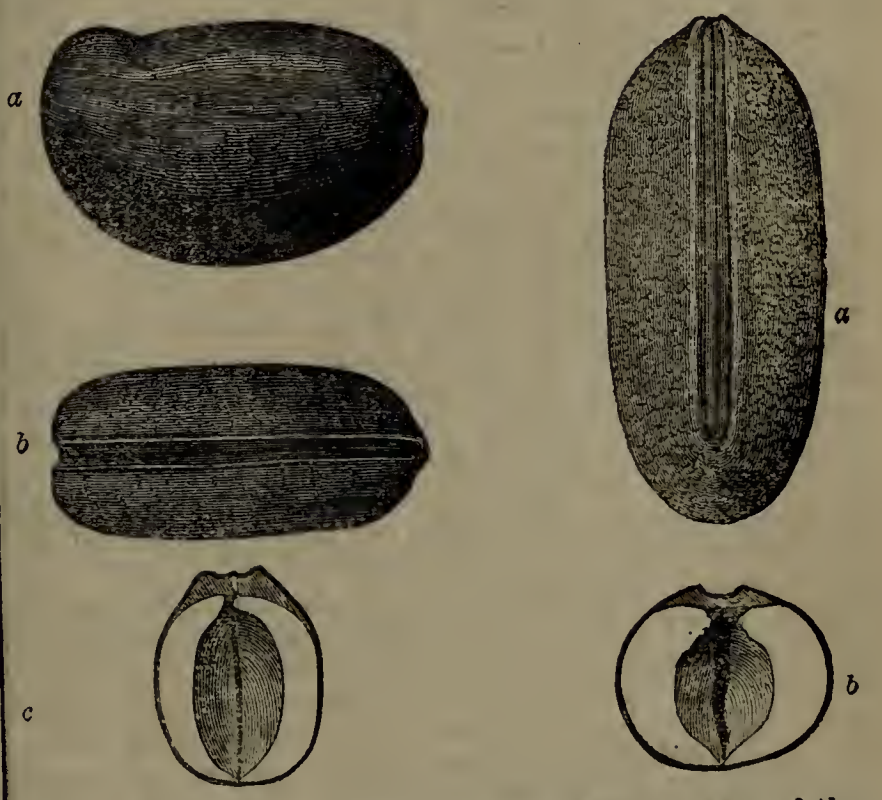
Indeed his description so closely tallies with that of the true Calabar bean, that were it not for the difference in the stipules—which in the *Mucuna cylindrosperma* are said to be reflexed and persistent, while in *Physostigma venenosum* they are stated to be deciduous—it would be impossible to distinguish between them. Until flowers and further specimens of the two plants are procurable, it would indeed seem somewhat doubtful whether the *Mucuna cylindrosperma*, Welw., is more than a variety of *Physostigma venenosum*, Balf. Until then, it should evidently be placed in the genus *Physostigma*, under the name of *P. cylindrospermum*. The question of identity is also one of some pharmaceutical interest, for the inquiry naturally arises, whether the beans differ in medicinal power?

It has been mentioned to me by Mons. A. Petit, of Paris, that he has found considerable variation in the yield of eserine from different samples of Calabar beans, and that he was puzzled to account for the fact. Knowing that eserine is easily decomposed by alkalies, with a reddish coloration, it occurred to me that a rough test of the presence of that alkaloid in the cylindrical beans might be obtained by the application of liquor potassæ. On touching the cotyledons with this alkali, I was surprised to find that while the true beans gave a permanent pale yellow tint, the cylindrical ones gave a deep almost orange colour ultimately turning to a greenish hue with the same reagent, thus apparently indicating greater activity than the ordinary kind. Exactly the same reaction takes place with the cylindrical beans collected by Welwitsch and described in the 'Flora of Tropical Africa' under the name of *Mucuna cylindrosperma*. The actual yield of eserine in the two sorts of Calabar bean is now under investigation, and will form the subject of a future communication.

For practical purposes the seeds of *P. cylindrospermum* may be thus distinguished. The seeds are longer than those of the Calabar bean, nearly cylindrical, of a reddish-brown colour, with few exceptions of a darker hue, and the hilum does not extend quite to the extremity of the bean at the end where the micropyle is visible, but forms there a slight projection, or when the projection is not marked, a portion of the bean about a quarter of an inch in length may be distinctly seen beyond it at that end.

In the Calabar bean the colour is mostly very

No. 1. No. 2.



No 1. *Physostigma venenosum*; *a*, showing shape of the seed; *b*, showing the length of the hilum; *c*, transverse section showing cavity between the cotyledons.

No. 2. *Physostigma cylindrospermum*; *a*, showing relative length of hilum; *b*, transverse section, showing different shape of bean.

* Oliver's 'Flora of Tropical Africa,' vol. ii., pp. 186 and 191.

dark purplish-brown or nearly black. The hilum extends the whole length of the bean, so that neither end of it is visible when the hilum faces the eye, and fragments of the funiculus often remain attached as a whitish line to the edges of the hilum. The seed is also broadest in the middle and tapering towards the ends, and is somewhat flattened at the sides. This character is most easily seen by transverse section, No. 1 *c*.

SULPHOCARBONATE OF POTASSIUM.*

BY JOHN M. MAISCH.

Several years ago a solution of sulphocarbonate of potassium was recommended in France for the destruction of the phylloxera, which committed serious ravages among the grape vines of Southern France and other European countries. Since then the same compound has also been used for destroying the insects which infest ornamental plants and flowers, and even a certain value as a fertilizer has been claimed for it. It seems to be attracting some attention now in North America, and it will doubtless be of interest to the readers of the Journal to become acquainted with the mode of preparation and the properties of this and allied compounds, particularly since they appear to be adapted as remedies for certain skin diseases.

The sulphocarbonates were discovered by Berzelius more than fifty years ago, and the results of his investigations remain undisturbed even at the present time. The name *sulphocarbonate* indicates that these compounds have the same chemical composition as the corresponding carbonates, except that the oxygen of the latter is completely replaced by an equal number of atoms of sulphur; the formula for sulphocarbonate of potassium is therefore K_2CS_3.

On passing carbonic acid gas into an aqueous or alcoholic solution of potassa, carbonate and finally bicarbonate of potassium is formed. A precisely analogous reaction is obtained if an aqueous solution of monosulphide of potassium is acted upon by carbon bisulphide; $K_2S + CS_2$ yields K_2CS_3. Carbon bisulphide is insoluble in water, and its solubility in this menstruum is not materially increased by the presence of a polysulphuret or of the officinal sulphuret of potassium. The preparation of sulphocarbonate involves, therefore, the previous formation of *potassium monosulphide*, and this is most conveniently obtained by passing sulphuretted hydrogen gas into a solution of caustic potassa as long as the gas is absorbed, and afterwards adding an equal bulk of the same alkaline solution. In its purest state it yields on evaporation colourless prisms of the hydrated sulphide, which are deliquescent on exposure, dissolve readily in alcohol and water, and in contact with the air become oxidized. The solution in water obtained in the manner indicated, is therefore best preserved in well filled bottles, or it is at once agitated with carbon bisulphide, as long as the latter is dissolved. The combination is effected in a stoppered bottle at a temperature of 30° C. (86° F.); as the carbon bisulphide dissolves, the liquid acquires a yellow, brown-yellow or red-brown colour, according to the concentration and purity of the solution. On careful evaporation at the temperature indicated and subsequent cooling, yellow crystals of the hydrate are obtained, which at a somewhat higher temperature part with their water and leave the anhydrous compound. *Potassium sulphocarbonate* is very deliquescent, freely soluble in water, sparingly soluble in alcohol, and has a cooling, afterwards pungent and peppery and finally somewhat sulphurous taste.

The sparing solubility in alcohol of potassium sulphocarbonate, and the free solubility in the same liquid of potassium monosulphide, suggests the preparation of the former from an alcoholic solution of the latter. On adding to such a *concentrated* solution carbon bisulphide as long as this is taken up, the liquid will gradually separate into two or three layers, the lowest of which is a syrupy solution of the compound desired. But for the purposes for which potassium sulphocarbonate is employed, it is obtained sufficiently pure by the process described before.

If a *watery* solution of caustic potassa is agitated with carbon bisulphide, the latter is gradually dissolved, yielding a brown liquid, which contains both carbonate and sulphocarbonate of potassium in solution; $6KHO + 3CS_2$ yields $K_2CO_3 + 2K_2CS_3 + 3H_2O$. Both newly formed compounds have a similar behaviour to water and alcohol, and therefore cannot be separated either by crystallization or by precipitation with alcohol, and since the application of strong solutions of alkaline carbonates is inadmissible, the process described cannot be advantageously used for the preparation of potassium sulphocarbonate. Such a solution will effervesce briskly on the addition of diluted hydrochloric or sulphuric acid, and after the neutralization of the liquid the further addition of acid will render the mixture milky from the separation of *sulphocarbonic acid*, H_2CS_3, which gradually forms a heavy red-brown oil, capable of decomposing the carbonates with the evolution of carbonic acid gas.

On treating an *alcoholic* solution of caustic potassa with carbon bisulphide, the reaction is very different from the preceding, and results in the production of *sulphcarborinate* of potassium; $KHO + C_2H_6O + CS_2$ yields $KC_2H_5OCS_2 + H_2O$. This salt gives with a solution of sulphate of copper a yellow precipitate, and the acid contained in it has also been known as *xanthonic, xanthic and xanthogenic acid;* it was discovered by Zeise in 1822.

By substituting in the above processes caustic soda or lime for the potassa, corresponding sodium and calcium compounds are obtained. The soluble sulphocarbonates yield brown precipitates with salts of copper, red ones with salts of lead, and yellow ones with mercuric, cadmium and silver salts. Many of these compounds with the heavy metals are gradually turned black.

According to Delachanal (1877) the solutions of potassium sulphocarbonates of

SOME CONSTITUENTS OF THE RHIZOME OF SANGUINARIA.*

BY FRED. W. CARPENTER, PH.G.

The rhizome, in moderately fine powder, was exhausted in a percolator with water acidulated with acetic acid. The percolate was evaporated to a convenient bulk, and ammonia added until a precipitate ceased to form. This precipitate, of a purple colour, was separated from the mother liquor by a filter, and thoroughly washed with water. The filtrate (*a*) was of a dark brown colour, having lost the deep red colour of the infusion. The precipitate (*b*) was then dried, and macerated with successive portions of ether, until no residue was left on evaporation of a small quantity of the solution. The solution thus obtained was a light yellowish-red colour, exhibiting a very handsome fluorescence. Concentrated muriatic acid was then heated, and the gas thus given off was passed into the ethereal solution by means of a glass tube, until it was saturated, when a voluminous scarlet precipitate of muriate of sanguinarina was formed. By this means all of the alkaloid was precipitated, its salts being wholly insoluble in ether, leaving the ether almost colourless, the slight colour present being due to a small quantity of resin held in solution. The muriate of sanguinarina was purified by dissolving in hot water, filtering, precipitating by ammonia, drying the precipitate, and dissolving in ether. This solution, treated with animal charcoal, and

* From the *American Journal of Pharmacy*, April, 1879.

then with hydrochloric acid gas, as before, gave the muriate pure. The precipitate (*b*) after having been exhausted with ether was dried and treated with the alcohol; a deep red tincture was obtained. This being diluted with water, a resinous matter was thrown down; the mother liquor, containing a small quantity of sanguinarina not removed by the ether of first treatment, was precipitated by Mayer's test. The filtrate (*a*) was then neutralized by acetic acid, and a strong solution of tannic acid added as long as any precipitate was formed; this was separated by a filter, and washed until the washings were tasteless, then thoroughly dried, and digested with an alcoholic solution of hydrate of potassium as long as anything was dissolved. The tannate of potash thus formed separated as a dark brown mass, it being insoluble in alcohol, which held the alkaloid in solution, together with an excess of hydrate of potash. This excess was removed by passing carbon dioxide into the solution, forming carbonate of potash, insoluble in alcohol. The solution was then decanted from any insoluble matter, and the spirit removed by distillation. The residue was then dissolved in ether, from which the so-called "porphyroxin" separated, on evaporation, as a dirty, white, crystalline mass. By solution in alcohol, and treatment with animal charcoal, it was obtained on concentrating the solution, in minute, nearly colourless, tabular crystals, of a bitter taste, and very sparingly soluble in water, more readily so in alcohol. It is wholly dissipated by heat, giving off a peculiar odour when burning, and possessing an alkaline reaction. It neutralizes acids, forming with them salts, the hydrochlorate being in the form of cauliflower-like masses, owing to the arrangement of the crystals. But a few grains of this alkaloid were obtained from a pound of root. It seems to differ decidedly from the porphyroxin of Merck, from opium, and is not coloured by nitric acid; is dissolved by dilute acids, but does not become red on boiling. Both the supposed alkaloid and its salts give a deep blue or purple colour with concentrated sulphuric acid, very much intensified by the addition of a small piece of bichromate of potassium.

In a second experiment the root was percolated and the sanguinarina precipitated as before; the alkaloid separated and the filtrate neutralized by hydrochloric acid until a slight acid reaction was obtained. A solution of iodohydrargyrate of potassium was added as long as a precipitate was formed; this was separated from the dark brown filtrate (*x*), washed and dried. It was then digested in a strong solution of carbonate of sodium to decompose, and evaporated to dryness. The residue was treated with hot stronger alcohol as long as it removed anything. This gave a deep red tincture, which was acidulated with hydrochloric acid and an equal bulk of water added; this threw down a yellow precipitate, which was separated from the liquid (*a*). The precipitate was insoluble in water and petroleum benzine, partly soluble in ether, chloroform and the caustic alkalies. It fused at a gentle heat; at a higher temperature it burned, leaving no residue, and giving off the peculiar odour noticed in burning the so-called porphyroxin. It was wholly uncrystallizable, decomposed by concentrated nitric, and not changed by muriatic acid. With sulphuric acid concentrated, it gave the same beautiful deep purple colour noticed above; and, like it, deepened by chromic acid, gradually fading, and finally disappearing. It was separated into two portions by ether, the insoluble portion of a grey brown colour, the ethereal solution of a light yellow colour in transmitted light and red in reflected light. This solution evaporated left a yellow coloured residue, of a resinous nature, which gave the purple colour reaction, as did also the insoluble portion, the two differing slightly in the shades of colour produced. On treating the original resin with chloroform, the results were almost identical with those obtained by ether in regard to solubility and reactions. The portion insoluble in chloroform was dissolved in a small quantity of alcohol, and hydrate of potassium added; this produced the separation of a yellowish-white precipitate. A crystal of bicarbonate of potassium was added to convert the hydrate into carbonate, insoluble in alcohol. The whole was then shaken with ether, the ether removed and evaporated, leaving a white crystalline residue corresponding to the supposed porphyroxin of the former experiment, and was probably carried down with the resin.

The filtrate (*a*) contained a small quantity of the supposed alkaloid, which was precipitated by Mayer's test. The filtrate was found to be free from tartaric acid, but to contain both citric and malic acids. A portion of the powder, previously exhausted with water, acidulated with acetic acid, was then percolated with alcohol, a deep red tincture being obtained. This produced a bright red precipitate with solution of protochloride of tin. A portion evaporated to dryness and treated with water gave a red solution, precipitated by ammonia and Mayer's test, the precipitate being sanguinarina. The residue was a reddish-brown resin, soluble in chloroform and ether, giving no characteristic reaction with the mineral acids.

ORANGE FLOWERS AND ORANGES FROM THE SOUTHERN STATES.*

BY W. B. RUSH.

In Florida the orange, lemon and lime grow wild and are found in abundance. In Louisiana and Mississippi they are grown from the seed. The seeds are planted in early spring or in hot-beds in January. When one year old, they are transplanted in a nursery arrangement. At the age of two and a half years they are budded, *i.e.*, the seedlings are of the sour variety, and to produce sweet oranges fully matured buds are taken from bearing trees and inserted. This is done to render the tree more hardy, since the sweet seedlings are subject to a root disease called heel, while the sour seedlings are not. Hence, orange growers resort to this means to produce sweet oranges. The trees are transplanted at the age of four years into orchards. At the age of six, flowers first appear, and at ten years the trees are called full bearers.

This beautiful evergreen is found in every civilized country where the climate is favourable, and in colder countries it is the cherished ornament of the hot-house. It flourishes in the most southern limits of the United States, largely in Florida, and to a considerable extent in Mississippi and Louisiana, south of the lakes. In Mississippi and Louisiana they are favoured by the lakes tempering the cold north winds. There seems but little difference between these States in their favourable localities. However, the tree requires delicate cultivation and studied treatment. About the year 1816, oranges were introduced as ornaments to the States by the French. In 1830 an orange tree in a box, in bloom, brought 400 francs, and about this time some attention was paid by horticulturists, and blooming trees in boxes were sold at from 50 to 100 francs in New Orleans. The beginning of the cultivation of oranges for fruit, in the South, dates back to 1848, when numbers of trees were planted, but in January, 1856, a cold wave from Texas brought the temperature down to 19° F. above zero, and a large proportion of the trees were killed. Not much attention was paid to the cultivation afterwards until 1867 and 1868, and since then orange growing has been quite successful and assumed commercial importance.

The time of flowering is from the beginning of February until the 10th of April, in healthy trees; unhealthy ones are found in bloom sooner or later. The last week of February finds most of the trees blooming. The petals remain on the flowers for about two weeks. Unfavourable conditions shorten the time. The humidity of the atmosphere materially affects the flowers—when too wet the pollen heads are injured and the secretions are imperfect. Dryness has a similar effect on the pollen and

* From a paper read at a Meeting of the Philadelphia College of Pharmacy, January 21, 1879.

nectar, but does not affect the secretion of oil. When the temperature is too low, but few flowers are fructified, the oil cells are limpid and no nectar is secreted. The most favourable temperature is about 68° to 76° F. Under 60° F. flowers are blighted. When the busy bee is found collecting the nectar, the conditions are favourable for the development of flowers and fruit, and then the flowers contain their most agreeable odour.

An ordinary tree will yield from two to ten pounds of flowers, ordinarily about seven. As soon as the petals begin to fall a canvas is spread under the tree and by brisk shaking the petals will fall, with some leaves, which are easily separated. The time when flowers are most fragrant is early in the morning, and late in the day the odour is greatly diminished. Prior to the late conflict, negroes collected and sold orange petals in New Orleans. A tea-saucer full (about 2 ozs.) was measured out, put upon a china plate and set in the room, for which the negro received about 50 cents. From two to three plates would perfume a room for a week. Orange flowers produced in the extreme southern borders are believed to possess a stronger odour and more oil. The difference is accounted for in this manner:—In the tropics and semi-tropics the trees do not begin to bear very much until about twenty years old, while in this country they begin at about seven. The development is more rapid, the tree more vigorous, and it is reasonable to suppose a better development of odour in the flower. The writer was informed by an orange grower who had made extensive observations in different countries and fully confirmed this supposition. The flowers are more fragrant and the fruit more juicy, but not so sweet as in some other countries.

The United States pharmacist buys the products of the orange from over the sea. That name *imported* always adds an imaginary value of more than 100 per cent. It is said to pay the producer of California wines to send his wine to France and, having the label changed and translated into French, bring it back here, pay freights and double duty, and then realize 100 per cent. on the transfers, because the consumer considers it far superior to our wine. Just so with our neroli and the orange flower water and fruit juices. Almost all the crude material for citric acid is imported. This need not be. There is abundance to be had in the South. Florida furnishes flowers sufficient for America for the oil of neroli, orange-flower water, citric acid, fruit juice and oils of the rind, and if no misfortune happens to the sweet orange plantations, there will soon be fruit sufficient for the United States from the 1st of November until May.

The writer made several experiments with orange flowers. When placed in the direct sunlight, in the course of two days they lose all their odour. In diffused daylight they retain it for at least three days, and in a dark humid atmosphere the odour is quite distinct after one week. When bruised, they lose their odour in half of the time stated. The writer had no means for experimenting as to amount of volatile oil, but he believes that the better plan for the pharmacist is to have the petals hermetically sealed and to make his preparations direct.

Orange-flower water is one of the most agreeable vehicles for nauseous medicines that we have, and when the pharmacist can make fresh preparations they will be fully appreciated and the expense will not be greater. The syrup of either flower or fruit has no superior, especially the syrup of the fruit. A honey collected from orange flowers is very fragrant with the orange odour. The flowers, placed in tin cans and sealed up, are known to have retained their odour unimpaired for nine months. As a perfume they have no equal. To sit under a tree when in full bloom is delightful, the fragrance intoxicating. If any one has made the syrup of orange from the fresh juice of the fruit and used it, he will not want to use any more which is made from simple syrup and a few drops of the oil of the rind.

DESTRUCTION OF PHARMACIES IN HUNGARY.

The following is a List of the Donations received for the relief of distressed pharmacists of Szegedin:

GLUCOSIDE OF BUCKTHORN BERRIES AND RHAMNODULCITE.*

BY C. LIEBERMANN AND HÖRMANN.

An examination by the authors of the glucoside extracted by alcohol from the berries of buckthorn (*Rhamnus infectorius*) has led to some results differing from those arrived at by previous experimenters. The glucoside was first prepared pure by Gellatly, who called it *xanthorhamnin*, the name adopted by the authors. It is identical with Schutzenberger's *a*-rhamnegin. The properties of the substance, as described by these chemists, agree with the observations of the authors.

Xanthorhamnin does not ferment with yeast. When boiled with dilute sulphuric acid it readily breaks up into rhamnetin and sugar (rhamnodulcite), the former of which is deposited in tufts of lemon-yellow needles, agreeing in composition with Schutzenberger's formula, $C_{12}H_{10}O_5$.

Rhamnodulcite the authors find to be (contrary to the observations of Gellatly and Schutzenberger) a crystallizable sugar. It is soluble in water and absolute alcohol, and crystallizes from the latter in hemihedral tables. The aqueous solution yields holohedral crystals, which melt at 92°—93°. Dried in the air, the sugar has the formula $C_6H_{14}O_6$. When heated, it melts, and at 108° gives off 1 molecule of water: the residual $C_6H_{12}O_5$ solidifies on cooling to a brittle glassy mass, the aqueous solution of which again yields crystalline sugar. Rhamnodulcite is very sweet and agreeable in taste. It does not ferment with yeast. Its action on polarized light is dextrorotatory. It reduces Fehling's solution on warming. Xanthorhamnin yields about 57 per cent. of the sugar.

RECOVERING ETHER IN PREPARING ETHEREAL EXTRACTS †

BY LOUIS VON COTZHAUSEN, PH.G.

Instead of recovering the ether by expressing the exhausted drug, E. Rohn mixes the drug with sufficient water to form a thin paste, and then heats the latter in a still over an open fire to about 60° C., when the ether evaporates and passes into the condenser. In this manner the author recovered more than 3 kilos of ether from 8 or 10 kilos of extracted male fern.

The Pharmaceutical Journal.

SATURDAY, MAY 10, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary,* 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ANNUAL REPORT.

As a customary precursor of the aniversary meeting in Bloomsbury Square, upon the 21st inst., the Members of the Pharmaceutical Society, as well as the Associates in Business, will this week have received with the voting paper a copy of the report of the Council which is to be presented at the Annual General Meeting. This official retrospect of the most important events of the past year has an interest also to other members of the trade, we shall, therefore, in accordance with former practice, proceed to give here a brief *résumé* of the contents of this report for the information of those who do not stand in either of the above mentioned positions of relation to the Pharmaceutical Society.

The first subject dealt with in the report is the state of agitation that has prevailed during the past year on account of the injurious suspicion that the Council was unmindful of the trade interests of pharmacy. It is stated that the evidences of this feeling of distrust have been so distinctly pronounced as to make it desirable to disabuse the minds of those by whom it has been entertained. The suspicion above referred to is declared to be no less unjust than it is injurious, inasmuch as the trade interests of pharmacy are so important to the individual members of the Council that neglect of them would be even on that ground inexplicable.

Referring to the lately vexed question of the legality of counter practice it is pointed out that having regard to the principles upon which the founders of the Pharmaceutical Society undertook the formation of that body for the advancement of pharmacy and its followers, it should be apparent to all that there never was the slightest intention on their part to embrace "medical practice," properly so-called, within the business of a chemist and druggist. Again the very words of the Pharmacy Act expressly state that the examinations of the Society "shall not include the practice of medicine, surgery "or midwifery," and the expressed desire was so to elevate the business of pharmacy that those who practised it should find it more dignified and more remunerative to confine themselves to strictly pharmaceutical pursuits. Under the conditions then existing such a result was naturally not to be attained at once; but it was hoped that by this means the business of dispensing would ultimately fall more completely into the hands of chemists and druggists. Already there are indications that this hope was not unfounded, for, as stated in the report, medical practitioners are gradually ceasing to prepare their own medicines and are often glad to do so where opportunities serve. Only last week we were enabled to publish some information tending to show that this is the case, which has been collected by the Rochdale Chemists' Association, and in regard to this change it is satisfactory to find the statement made that wherever it has been carried out it has met with the approval of the public and medical men, as well as of chemists and druggists, each being thereby benefited in the way which proves in practice to be the greatest boon to those concerned.

For the further realization of this object it is considered by the Council that any spirit of antagonism between members of the medical profession and chemists and druggists should be avoided, inasmuch as that would be calculated to defer the desired end. At the same time the Council claims to have been never unmindful of the fact that in the every-day exercise of business the chemist and druggist must to some extent give such advice over his counter as by a strained interpretation might be called "medical "practice," or, as Baron BRAMWELL well expressed it, a breach of the law for which it would be very unreasonable to prosecute him.

It was under this view of the circumstances that the course taken by the Council was determined upon, and that, while abstaining from frustrating to some extent one object of the Pharmaceutical Society by relieving men of all individual responsibility, the resolution was passed that the Council was prepared to consider the case of any chemist and druggist threatened with vexatious proceedings for alleged infringement of the Apothecaries Act, and, if circumstances warranted, to defend any one thus proceeded against. That such a mode of procedure was adequate for the protection of those whose interests were improperly attacked was soon afterwards rendered evident when a specific case of threatened prosecution was brought before the Council in August, 1877, and instructions were given to the Society's Solicitor to undertake the defence of the case, for the result was the abandonment of the prosecution by the Society of Apothecaries when the actual facts of the case were placed before the Court of that body.

The Council, as the representative body of the Pharmaceutical Society, desiring to avert vexatious prosecutions, considered it was politic to come to a fair general understanding with the governing body of the Society of Apothecaries, in whom the power of instituting or authorizing prosecutions was vested, and the adoption of this course was the more desirable since the Court of the Society as well as the members of the Society of Apothecaries were ready to admit fully and freely that "counter practice

by chemists and druggists is—as it ever has been and must be—a necessity, and not a practice to be regarded as an offence. What is the proper boundary between that practice and the functions of the medical man it may be impossible to determine absolutely, and it is unnecessary, since the communications that have taken place between the solicitors of the two societies afford good ground for the belief that the honour of the Pharmaceutical Society has been upheld and the best interests of its members have been promoted in a manner that will in due time be acknowledged even by those who have hitherto been loud in denouncing the Council.

Among other points of prominent importance referred to in the report, it is stated that out of upwards of three hundred and fifty cases of infringement of the Pharmacy Act which have been reported to the Council, the great majority of the offenders yielded to the notice of the Registrar and discontinued their illegal practices. In other instances it was necessary to have recourse to legal proceedings, and among these the case of the limited liability company, trading under the designation of the London and Provincial Supply Association, is the most important. The result of the appeal from the decision of the county court judge will be so fresh in the minds of our readers that no further mention of it is requisite now, beyond stating that the Society's solicitors have received notice of appeal and that they have been instructed to retain the Attorney-General and Mr. Lumley Smith as counsel in the event of the appeal being prosecuted.

In connection with recent legislation, the interests of chemists and druggists in regard to the practice of dentistry have been satisfactorily secured, conformably with the representations of the Council, and though some difficulty has arisen from the interpretation of the Weights and Measures Act, we are enabled to state that this difficulty has now been almost entirely removed.

As regards projected legislation it is at least satisfactory that the Medical Bills now before Parliament do not prejudicially affect chemists and druggists, and that the contemplated new scheme of medical qualification involves the abolition of the Society of Apothecaries' power to prosecute, which has of late caused so much alarm. The possible amendments of the Pharmacy Act are still under consideration, but as stated in the report of this month's Council meeting they are not yet ripe for further action.

The financial position of the Society continues to improve and great additions have been made to the museum, the library, and the arrangements for conducting the examinations; but it is a matter for regret that the additions to the class of pharmaceutical chemists are so few as to suggest the possibility of future difficulty in forming the Council and Board of Examiners.

The condition and efficacy of the Benevolent Fund has also been well maintained, though the present account is unfavourably contrasted with that of the preceding year, when a special effort was made in aid of the Fund.

In all respects, therefore, we believe that notwithstanding the depression of trade and other unfavourable circumstances the position and prospects of the Pharmaceutical Society are not less satisfactory than they have hitherto been, and we are glad to congratulate our readers on this as showing that the influence of the Society as a means of protecting and promoting their interests bids fair to be maintained if not augmented.

LOOSE LEECHES.

An amusing story comes from the continent, which *se non è vero è ben trovato*. We are told that the passengers in the night express between Vienna and Berlin were recently aroused by the loud shrieking of a lady. Upon some of them making their way to the compartment in which she was, they were puzzled by her frantic declaration that there was a murderer in the carriage, and that she was being stabbed in various places, although no assassin could be seen. When the guard arrived upon the scene she so far modified her statement as to say that needles were being stuck into her, but she resolutely refused to submit to any examination to test the truth of her statement. Whilst affairs were in this state the mystification was intensified by the epidemic spreading, a stout gentleman now declaring that he was being pricked cruelly in his thighs. The train was stopped at the next station, and upon the less squeamish sufferer rolling down his hose, there were discovered fastened to his leg six enormous leeches, which had escaped from an insufficiently secured jar brought by a passenger into the carriage. The gentleman was able to proceed by the train, but the lady was left in charge of the doctor.

THE ANNUAL DINNER.

We beg to remind those of our readers who wish to attend the Annual Dinner at Willis's Rooms, on the 20th instant, and who have not yet obtained tickets, that they should make application for them to the Honorary Secretary, Mr. Richard Bremridge, 17, Bloomsbury Square, *not later than Friday next*, the 16th inst.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association will be held on Thursday, May 15, 1879, at 8.30 p.m. precisely, when Mr. F. W. Warrick will read a paper on "Avogadro and Ampière's Law."

We are pleased to be able to state that Mr. Alexander Bottle, of Dover, Member and late Vice-President of the Council of the Pharmaceutical Society, was last week placed by the Lord Chancellor on the Commission of the Peace.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, May 7, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hanbury, Hills, Rimmington, Robbins, Sandford, Schacht, Shaw and Woolley.

Previous to reading the minutes,

The PRESIDENT said he had received a letter from the Vice-President, Mr. Savage, stating that he would be unable to be present that day.

Mr. HANBURY asked leave to say a word or two previous to commencing the business. When last year he was induced by the kind representations of his colleagues to reconsider his determination to retire from the Council, he hoped to be able to give a reasonable amount of time and attention to the business of the Society, but in this he had been disappointed, and consequently when it was again kindly proposed he felt it incumbent upon him to decline to be put in nomination. In doing so he desired to express the pleasure he had always derived from his intercourse with his brethren on the Council. He feared there were trying times before them, for the depression prevalent in the trade could not be without its influence on their Council; but he trusted that the Society would continue to hold its own as the representative of the trade recognized by the Government and the country. It required a considerable amount of self-control and self-abnegation at the present time not to be too active, but rather to maintain the dignified position which the Council had sought to do, and at the same time to lose no legitimate opportunity of promoting the interests of the trade. Although the Council had perhaps in some cases been rather too conservative in the past, on the whole, it had maintained a course which, in his opinion, had been in the true interests of those whom it represented, and he hoped a similar condition of things in this respect would be maintained in future.

The PRESIDENT said he was quite sure that all the members of the Council must exceedingly regret that Mr. Hanbury found it necessary to resign his seat. They were all very sorry that Mr. Hanbury had not been able to devote more of his time to the meetings of the Council and the business of the Society, for they wanted such men on the Council. He was sorry Mr. Hanbury had found it necessary to resign a seat which he had filled, when he could be present, so usefully.

The minutes of the previous meeting were then read and confirmed.

PROFESSOR BENTLEY'S LECTURE.

The PRESIDENT proposed a cordial vote of thanks to Professor Bentley for his admirable lecture on "The Life of the Plant," delivered March 19. He said he should have proposed it last month had he been present.

Mr. BOTTLE seconded the motion with much pleasure, and it was carried unanimously.

RESIGNATION OF MR. FAIRLIE.

The Secretary read a letter from Mr. Fairlie, dated Glasgow, April 15, intimating his resignation of office as a member of Council.

The PRESIDENT said this necessitated the Council nominating a member of the Society to fill the vacancy.

Mr. HAMPSON nominated Mr. James Slipper, of Leather Lane, Pharmaceutical Chemist, an old and respected member of the Society, to fill the vacancy.

The PRESIDENT suggested that the discussion, if any, on this matter should be in Committee, which was at once agreed to.

After a short conversation, Mr. James Slipper was without opposition nominated on the motion of Mr. HAMPSON, seconded by Mr. SANDFORD, to fill the seat vacated by Mr. Fairlie.

Mr. BOTTLE moved that Mr. Slipper's name be placed on any Committee of which Mr. Fairlie had been a member.

The PRESIDENT said this would follow as a matter of course, though it was not very material, as the Committees would probably not meet again until after the Annual Meeting when new Committees would be appointed.

HONORARY AND CORRESPONDING MEMBERS.

The following gentlemen were unanimously elected Honorary and Corresponding Members of the Society:—

Professor John Tyndall, D.C.L., L.C.D., Ph.D., F.R.S., F.G.S., London.

Julius Oswald Hesse, Ph.D., Feuerbach, near Stuttgart.

The following being duly registered as "Pharmaceutical Chemists," were respectively granted a diploma stamped with the seal of the Society:—

Aldridge, Joseph Henry.
Barrat, Reuben.
Brown, Alfred Duncombe.
Cox, Joseph.
Exley, John, jun.
Fawcett, Christopher Airey.
Frazer, Jonathan Innes.
Griffith, Samuel.
Harrison, Frederick.
King, Horatio Alfred.
Lemmon, Eric.
Lord, William Henry.
McCallum, Hugh.
Newbigin, Lesslie.
Roberts, Henry.
Sadler, William, jun.
Scammell, William Joseph.
Shillcock, George.
Stobbs, Robert.
Stewart, Duncan.

ELECTIONS.

MEMBERS.

Pharmaceutical Chemists.

Henry Roberts, of Florence, a pharmaceutical chemist, was elected a Life Member of the Society.

The following, having passed the Major Examination and tendered their subscriptions for the current year, were elected Members of the Society:—

Abraham, Alfred Clay	Liverpool.
Aldridge, Joseph Henry	Burgess Hill.
Barrat, Reuben	Kingston-on-Thames.
Brown, Alfred Duncombe	Halstead.
Exley, John, jun.	Leeds.
Fisher, John Hutchison	Edinburgh.
Flemons, Joseph	London.
Fraser, Jonathan Innes	Edinburgh.
Hall, Richard Arthur	Leigh.
Harrison, Frederick	Brighton.
King, Horatio Alfred	Norwich.
Sadler, William, jun.	London.
Scammell, William Joseph	Adelaide.
Stobbs, Robert	North Shields.

Chemist and Druggist.

Oliver, John Gerry	Holsworthy.

ASSOCIATES IN BUSINESS.

The following, having passed their respective examinations, being in business on their own account, and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Aris, George Henry	Liverpool.
Bryars, William Hudson	Attercliffe.

Careless, John .....Birmingham.
Chapman, Leonard Parker .....Barrow in-Furness.
Clarabut, Frank S. .....Peterborough.
David, Albert .....St. Davids.
Dawson, George Robert .....Southend.
Dean, Thomas William .....Accrington.
Findlay, James.....London.
Fosse, Alexander Fare.....London.
Foulsham, Harry Botwright ...London.
Hadwen, Walter Robert.....Highbridge.
Hayton, John William .....Durham.
Heaton, William Everard .....Nelson.
Holmes, Charles Newman .....London.
Humphry, Horatio .....Dartmouth.
Hunt, George .....Southsea.
Hurley, Edward William .....Lewisham.
Jones, Jabez Abraham .....Cardiff.
Kennerley, William.....Egremont.
Langham, Henry John .....London.
McBeath, John William.....W. Hartlepool.
March, Richard .....Leicester.
Martin, William Thomas .....Lewes.
Mason, William Brandwood ...Bolton.
Mills, William Hamer.....Heywood.
Morson, Thomas Pierre .....London.
Nicholson, John Hastie .....Maxwelltown.
Payne, Henry .....Market Rasen.
Peet, Henry .....Liverpool.
Pollitt, Joseph Moore .....Radcliffe.
Rippon, Edwin .....London.
Robertson, Andrew .....Markinch.
Rogers, John Maulden.....Warminster.
Rogers, Sydney.....Warminster.
Russel, Thomas Gregory.....Whittlesea.
Sanders, William Josiah .....Cardiff.
Skelton, John Hardy .....Ashwell.
Smith, Joseph .....Sneinton.
Stanley, Thomas .....Accrington.
Starkey, George Thomas.....Plymouth.
Sturton, Richard .....Cambridge.
Thomas, Archibald .....Hull
Thomason, Thomas Watson ...Birmingham.
Thomson, Robert .....Edinburgh.
Todd, Matthew James.....Sunderland.
Treweeks, Richard Harwood ...Pembroke.
Walker, Joseph.....Seacombe.
Walton, Daniel.....Manchester.
Ward, Henry Singleton .....Kirkham.
Warner, Geo. Hy. Quibell .....Messingham.
Winn, John Christopher .....West Hartlepool.
Wright, Harry .....Bradford.

Modified.

Bell, Charles Christopher .....Epworth.
Blackmore, John Joseph.....Exeter.
Bowen, John Thomas .....Kilburn.
Crookes, Joseph .....Etruria.
Holttum, Richard.....Eastbourne.
Inkley, Jesse .....Teignmouth.
Jones, Frederic.....Plymouth.
Layng, Robert Crichton .....London.
Ritchie, Andrew Wemyss .....Langholm.
Strickland, Absalom Whitehouse, Bognor.

ASSOCIATES.

The following, having passed their respective examinations and tendered or paid (as Apprentices or Students) their subscriptions for the current year, were elected "Associates" of the Society:—

Minor.

Atkins, John.....Uxbridge.
Bartlett, Geo. Fredk. Handel...New Wandsworth.
Bird, Henry .....London.
Bloodworth, Thomas .....Bourne.
Boor, Jonathan.....Manchester.
Cook, William Richard .....Bath.
Cornwell, Thomas Chinsura ...Penzance.
Boyd, John .....Durham.
Cory, Francis Albert .....Newport, I. of W.
Crook, Herbert.....Gravesend.
Davies, Richard .....London.
Dutton, Hugh Odard .....Rock Ferry.
Eaton, Edward Jarrett .....Diss.
Forster, Francis Alexander ...Norwich.
Fox, Alfred .....Hull.
Freeland, Alonzo Joseph.....Angmering.
Gifford, Richard Lord .....Blackburn.
Golding, John Frederick.....London.
Greaves, Edward Harrison.....Bristol.
Greensill, William Joseph .....Birmingham.
Hartley, John .....Bradford.
Hawthorne, Charles Oliver.....Stafford.
Higgs, Alfred .....London.
Holmes, Philip .....Walham Green.
Howard, George William .....Tunbridge Wells.
Howse, Charles Turk .....Cheltenham.
Hudson, James.....Harrogate.
Hunter, William Sisson .....London.
Jackson, David.....Manchester.
Jones, Charles .....Wellingborough.
Jones, David Edward .....New Quay.
Kemp, James .....Aberdeen.
Lapthorn, George.....Taunton.
McCrindle, Thomas.....Northampton.
McDonald, Donald Fraser .....Edinburgh.
Maben, Thomas .....Hawick.
Maggs, Frederick William .....St. Leonards.
Marrion, William .....Oakengates.
Maudson, Beresford F. Harold..Brighton.
Mushens, Robert Heslop.....Sunderland.
Needham, Thomas .....Manchester.
Niblett, Frederick John .....Stroud.
Owen, Griffith Chas. Roose.....Carnarvon.
Phillips, Alfred James .....Truro.
Phillips, John James .....Hyde.
Pollard, Alfred .....Sherborne.
Raynor, Charles Thomas.....Leicester.
Richards, Jonah Palmer .....Cardigan.
Rose, George William .....Spilsby.
Southgate, Wilfred Burnham...Hull.
Stott, Charles Thomas.....Sowerby Bridge.
Thompson, Leonard.....Richmond, Yorks.
Tibbits, James Reginald.....Rugeley.
Villar, Arthur .....Staplegrove.
Walker, William .....Aberdeen.
Weary, China Thomas.....Stoke.
Williams, Stephen .....Cardigan.
Williams, Thomas Robert .....Ipswich.
Wright, William Royle .....Southport.

Modified.

Bemrose, William .....London.
Bolton, Edgar Benjamin.....Woolwich.
Hunneman, Augustus Fredk....Camberwell.

APPRENTICES OR STUDENTS.

The following, having passed the Preliminary examination and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society:—

Arnold, Henry Richard .....Hammersmith.
Chipp, James .....Newport, I. of W.
Cocks, Horace .....Attleborough.
Cormack, John.....Kirkwall.
Crassweller, William Ellis .....Bury St. Edmunds.
Davies, Daniel Thomas .....London.
Davies, William .....Oldham.
Dewing, James Edward .....Malton.
Ellard, James .....London.
Ellis, Clement .....Tunbridge Wells.
Ellison, George.....Chorley.
Evans, John Thomas .....Bala.

Fisk, Samuel John .....Stockton-on-Tees.
Fraser, John .....Edinburgh.
Godding, James .....Southsea.
Goodfellow, Edward .....Thrapstone.
Gordon, Thomas .....Dunscar.
Guest, Edward Albert.....Silverdale.
Hadfield, Henry May .....Sheffield Moor.
Hall, John.....Sunderland.
Harris, George James .....New Cross.
Hayes, Clyde Longman .....Sheffield.
Hindle, Joseph .....York.
Humphreys, Griffith .....Corwen.
Hyatt, William Herbert.....London.
Isaac, Henry Oswald .....Bristol.
Isaac, John Percy .....London.
Ling, Arthur Robert .....Esher.
Lloyd, Isaac Thomas .....London.
Lonnon, Frederick .....Plymouth.
Lubbock, Edgar Ashley .....New Barnet.
Morgan, John Daniel .....Swansea.
Nelson, Charles.....Manchester.
Norman, Valentine .....Northampton.
Owen, Owen .....Towyn.
Peck, George Samuel .....Baldock.
Price, John Thomas.....Pontypridd.
Richards, Edwin .....Oldham.
Robinson, Herbert Edwin J. ...London.
Rudland, Francis J.....Greenwich.
Sharman, Charles R. .....Towcester.
Stott, John Edwin .....Liverpool.
Tait, Thomas Andrew .....Alnwick.
Thelwell, Fredk. Wm. Watts...Southport.
Webster, George Samuel G. ...Alfreton.
Williams, Thomas Henry .....Plymouth.
Wolstenholme, Abel Joseph ...Southport.

The following persons were restored to the Register of Chemists and Druggists:—

Maurice Shelton Reilly, Oxford Villa, Montague Road, Uxbridge.

Robert Gordon Stuart, Biggar, Lanarkshire.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

Addition to Register.

The Secretary reported that—

Robert Roberts, of King Street, Norwich,

having made the statutory declaration that he was in business before the passing of the Pharmacy Act, 1868, and this declaration having been duly supported by a medical practitioner, his name had been placed on the Register.

The Annual Report.

The Annual Report as amended was submitted to the Council and adopted after a few further verbal alterations. The financial statement was also adopted, and ordered to be issued to the members with the voting papers for the Council and Auditors.

The Bye-Laws.

Mr. Sandford moved that the alterations in the Bye-laws, as resolved upon last month, be read a second time.

This was seconded by Mr. Betty, and carried unanimously.

Minutes of Committees.

FINANCE.

The report of this Committee was received and adopted, and sundry accounts ordered to be paid.

BENEVOLENT FUND.

The report of this Committee included a recommendation of the following grants:—

£15 to the widow of a registered chemist and druggist, who emigrated to America in 1872, and died in 1878. Applicant has six children dependent upon her, the eldest being 13.

£15 to the widow of a registered chemist and druggist, formerly in business, having two children dependent upon her.

£10 to the widow of a registered chemist and druggist, who has had several previous grants.

Two other cases had been considered, but from the circumstances attending them the Committee had made no recommendation.

Mr. Robbins had reported that the thirty guineas voted towards the election of an orphan into the Freemasons' School for Girls had not been required, and he had returned the amount to the Fund; the child was elected by votes given freely.

A grant of £5 provisionally made last month, to be given if further inquiries were answered satisfactorily, was rescinded, the applicant not appearing to be deserving of assistance.

Isherwood's Orphans.—The Secretary had reported that he had heard from one of the gentlemen who had taken one of these children that the boy's health was such that he could not adopt him. Another gentleman who had adopted one of the girls wrote to say that he was perfectly satisfied with her. The Committee recommended that £20, part of some money collected at Bromley, and £10, the balance remaining of the grant made by the Council, be applied in the maintenance of two of the children for twelve months.

Mr. Robbins said he was desired by Mrs. Peele to thank the Council for the grant of thirty guineas made for the purpose of getting her child into the orphan asylum. He was very glad to be able to return it to the Fund, and he must acknowledge the great help he had received from many members of the Society. Mr. W. L. Bird—a former member of the Council—had sent him 41 votes, Mr. Commans, of Bath, 38; to Mr. Bingham, of Eton, he was indebted for 35 votes, and many other gentlemen had also greatly assisted.

On the motion for the adoption of the report,

Mr. Sandford moved an amendment, which was seconded by Mr. Hampson, that a grant of £10 be made to one of the applicants, with regard to whom the Committee had made no recommendation on the ground that he was carrying on a small business. The details of the case having been stated, the amendment was discussed, and on being put to the vote was carried by 9 votes to 4, several gentlemen not voting either way. The report and recommendations of the Committee with these additions were then adopted unanimously.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian, to the following effect:—

Attendance during the day, highest, 31, lowest, 13, average, 23; evening, highest, 23, lowest, 7, average, 14. Circulation of books, town, 164; country, 73. Carriage paid, £1 11*s.* 9*d.*

Donations received:—

Durham University Calendar, with Almanack, 1879. From the University.

Radcliffe Library, Oxford, Catalogue of Books added during 1878. From the Radcliffe Trustees.

Bengal: Indigenous Drugs of India; alphabetical list, by K. L. Dey, 1877.

Bengal: Report of the Chemical Examiner's Department for 1877–8, by K. L. Dey, to the Surgeon-General, with papers consequent thereon, 1878. From Rai Bahadoor Kanny Loll Dey.

The Committee recommended that the usual letters of thanks be forwarded.

The Committee recommended the purchase of the following books for the Library:—

Capron (J. R.), Photographed Spectra, 1877.

Huxley (T. H.) and H. N. Martin, Course of Elementary Instruction in Practical Biology, new ed. 1879.

Johnston (J. F. W.), Chemistry of Common Life, new ed., by A. H. Church, 1879.
Roscoe (H. E.), Lessons in Elementary Chemistry, new ed., 1878.
Stillé (A.) and J. M. Maisch, National Dispensatory, 1879.

The Curator had reported the attendance in the Museum to have been as follows:—During the day, highest, 22, lowest, 4, average, 12; evening, highest, 9, lowest, 0, average, 4.

The following donations to the Museum were reported:—

Specimen of False Cinchona Bark, from Messrs. Hearon, Squire and Francis.
Specimen of Japanese Pyrethrum Flowers, from Mons. Chantre.
Herbarium specimen of the Cola Nut Plant and a recent specimen of Caraccas Cocoa Fruit, from Mr. T. Christy.
Specimens of Patna Opium, Oil of Aleurites triloba, Strassburg Turpentine, Oil of Sandal Wood, and of the Root of Thapsia garganica, from Professor W. T. Thiselton Dyer.

The Committee had received an application from Mr. Gerrard for a set of labels to relabel the materia medica collection in University College Hospital and recommended that the application be acceded to.

An offer from Kanny Loll Dey, Honorary Member of the Society, Calcutta, to send specimens and information as to Indian Drugs, had been accepted with thanks.

The Professors had attended and reported favourably as to their respective classes. Professor Attfield had reported that the three ladies in his class had completed their term and expressed themselves well satisfied with all arrangements.

At an adjourned meeting, of the Committee an addition to the Annual Report had been agreed to; an application from St. George's Hospital for a set of labels had been received and was recommended to be granted, and an offer from Mr. Howden to present some United States Government reports, relating to agricultural chemistry and botany, to the library had been accepted with thanks.

Mr. SHAW said there seemed to be no report from the Committee on the question referred to it, of considering the advisability of offering an opportunity to members to make up their sets of the Journal from the surplus stock in hand before the excess was disposed of.

The SECRETARY said there had been an announcement inserted in the Journal.

Mr. GREENISH said the Committee had had the subject before it, and authorized the insertion of the advertisement.

Mr. SHAW said he was under the impression that the accumulation extended over some years, but he found from the advertisement that the surplus stock only went back as far as 1877. He should like to know if there had been any applications in response to the advertisement.

The SECRETARY said none, at present.

The report and recommendations were then received and adopted unanimously.

THE ROYAL BOTANIC GARDENS.

The President read a letter from the Secretary of the Royal Botanic Society stating that Professor Bentley's pupils would have the usual privilege awarded them of visiting the gardens.

On the motion of the PRESIDENT it was resolved unanimously that the usual subscription of twenty guineas be paid to the Royal Botanic Society, for facilities afforded to Professor Bentley's pupils to study at the gardens.

HOUSE.

The Committee reported that further estimates had been obtained for rehanging sashes of ground and first floor windows, etc.; but it recommended that for the present the work be not proceeded with. Certain defects in the sanitary arrangements had been brought under the notice of the Committee, and they were recommended to be remedied. The Committee also drew attention to the large increase in the gas bill for the present year, and recommended that the Society's officers check the meter.

Mr. SHAW said it was very important to have the meter tested by a proper authority.

The PRESIDENT said that was done.

Mr. ATKINS said dry meters were far preferable to wet. He had found a large increase in his gas bill, and on examination his meter proved to be out of order.

Mr. BOTTLE said the temperature had a deal to do with it.

The report and recommendations of the Committee were received and adopted.

PHARMACY ACT AMENDMENT.

This Committee presented a report in which was included a letter from the President of the Institute of Chemistry, suggesting that the use of the term "chemist" by persons who practised chemistry alone, apart from pharmacy, should not be henceforward illegal, and suggesting that an alteration should be made in sections 1 and 15 of the Pharmacy Act to effect this purpose. This communication had been submitted to the Society's Solicitor, whose opinion, as communicated by letter, was adverse to assenting to the change proposed. The Committee, however, considered that it would be advisable to give facilities to professional chemists to adopt that title, if it could be done without danger to the interests of chemists and druggists. The Committee considered the draft bill submitted by the Solicitor, and approved it with certain exceptions.

Mr. HAMPSON said it was impossible to consider the draft bill properly until a printed copy had been supplied to each member for careful perusal.

The PRESIDENT said if this were done it would be advisable to print along with it so much of the report of the Committee as bore upon it.

Mr. SANDFORD suggested that it would be as well to wait for the present; further information might lead to the desirability of further changes. He understood it was not intended to introduce the Bill this session, and therefore there was no hurry.

Mr. HAMPSON saw no objection to printing the draft bill at once.

Mr. BOTTLE thought it would be better to wait a short time.

The report was then received, any further action being deferred for a short time.

GENERAL PURPOSES.

The report of this Committee included the usual letter from the Solicitor, giving a report as to matters placed in his hands.

A correspondence had taken place between the Solicitor and Mr. Brearey, of Douglas, Isle of Man, with regard to the extension of the Pharmacy Acts to the Isle of Man.

Pharmaceutical Society v. *London and Provincial Supply Association.*

The Solicitor had also reported that he had received notice of appeal from the solicitors of the London and Provincial Supply Association, and the Committee recommended that he be instructed to retain the same counsel as appeared for the Society in the Court of Queen's Bench, in case of the appeal being prosecuted.

The Secretary had submitted correspondence referring to various alleged cases of infringement of the Pharmacy Act.

The Committee had considered the letter from the President of the Institute of Chemistry referred to in the report of the Pharmacy Act Amendment Committee, and recommended that the request contained in that letter be acceded to when an opportunity arose.

Mr. ATKINS referred to one of the cases, about which he had received a letter from a chemist. He was anxious i t

should appear in the report that the matter was receiving attention.

The PRESIDENT said the party referred to had just sent in a fresh certificate signed by a medical man; if it should turn out that this certificate was regular and *bonâ fide*, there would be no alternative but to place the applicant on the Register. The question was deferred while inquiries were being made.

The PRESIDENT explained that he had sent the correspondence from the Isle of Man to the Solicitor, from the idea that the letter sent to him from Mr. Brearey was an official document requiring immediate attention. This impression turned out afterwards to be erroneous.

The report and recommendations of the Committee were received and adopted.

CONVERSAZIONE.

At a meeting of this Committee a letter had been read from the refreshment contractor at South Kensington Museum, stating that the refreshment rooms would not be open on the occasion of the conversazione, because on the two previous occasions many guests objected to pay for refreshments and seemed to think they were being imposed upon. The President had reported that he had had an interview with Sir P. Cunliffe Owen, and an arrangement had been made for the opening of the refreshment rooms.

The PRESIDENT said he could hardly state in detail how the arrangement would be carried out, but the result would be that the refreshment rooms would be open for the supply of refreshments on payment.

The report was received.

THE ANNUAL MEETING.

The President read a letter from Mr. Wade referring to the notice of motion he had given with regard to the admission of women to the Society and claiming that it should have precedence over the motion of which Mr. Vizer had given notice, as that, in his opinion, was really a negative.

Mr. Vizer's motion having been read,

The PRESIDENT said it appeared to him that it was an affirmative motion, and Mr. Vizer having sent in his notice first it must take precedence.

REPORT OF EXAMINATIONS.

April, 1879.

ENGLAND AND WALES.

1 University of Oxford.

NORTH BRITISH BRANCH.

ANNUAL MEETING.

The annual meeting of the North British Branch of the Pharmaceutical Society was held in the Society's Rooms, 119A, George Street, on Wednesday, April 30, at 12 o'clock. Mr. J. B. Stephenson, President of the Branch, in the chair.

The President opened the meeting by asking the Hon. Secretary to read the—

ANNUAL REPORT, 1878-9.

The Council of the North British Branch of the Pharmaceutical Society beg to submit their usual annual report.

During the past year the various operations of the Society have been conducted with unabated efficiency and success. The library, museum, and laboratory have all been enriched by many valuable additions, chiefly aided by a grant from the Council in London for examination purposes. The Council have not yet found it expedient to take any steps to obtain increased accommodation, but they feel that the difficulty arising from the inadequacy of their present rooms to meet their requirements is one that will have to be grappled with very soon.

The museum and library continue to be largely taken advantage of. The numbers standing in the attendance book from the commencement of giving this privilege in 1873, represent 8369 visitors; while during the bygone year 1982 have visited for the purpose of studying, etc., during the day, and in the evening 1122 for similar purposes, making a total for the year of 3104. The books issued from the library were 136, but this does not include the large number used by students for study and reference while in the rooms.

The special tickets issued for chemistry, botany, and materia medica were exactly the same in number as last year, 19.

The scientific session of last winter comprised seven meetings. The papers read have, for the most part, been singularly able and interesting, a circumstance borne out by reference to the Journal, in which most of them are printed *in extenso*, while the attendance has been quite up to the average of former years. The Council take this opportunity to put on record the expression of the obligations of the Society to all their contributors.

The Scottish Board of Examiners has met at the usual intervals during the past twelve months, in all on thirteen days. There have been examined 4 Major, 111 Minor, and 6 Modified candidates, and of these 2 Major, 44 Minor, and 3 Modified were rejected, making the percentage of failures 40. The number of Preliminary candidates who presented themselves for examination in Edinburgh last year was 58, and the rate of failures was much the same as in former years, and is still distressingly high, although the questions set to the candidates by the College of Preceptors, and published in the Journal after each examination, show that the standard of proficiency has been pitched by no means too high.

The figures over the whole examination field are certainly not satisfactory, except as they indicate the pains taken to keep back unqualified candidates. But the

Council do not attach importance to a variation in the rate of failures as from one year to another, because statistics, especially when the numbers are small, must be spread over several years to afford a reliable result.

It will be in the recollection of members of the Society that on various occasions during the last few years there has been an interchange of visits between the London and Edinburgh Boards of Examiners. The most recent occasion was in last June, when a deputation from the Board here was invited by the London Council to be present at the examinations in Bloomsbury Square. These deputations were instituted in order that members of them might make it their business to watch the conduct of the examinations at both centres, with a view to trace the reasons that might exist for any variation in the rate of failures, and to promote unity of action and relations of entire harmony and friendship between the two Boards, and this Council have good reason to believe that they have been the means of effecting a very substantial measure of approximation towards the attainment of these very desirable objects.

The Weights and Measures Act of 1878 came into force in January last and at one time threatened to cause considerable inconvenience, partly with regard to our glass measures, which it apparently restricted far within what we had been accustomed to, both as to capacity and graduation, and made subject to verification and stamping—but also as to our dispensing weights ; for although there is a clause in the Act specially exempting apothecaries' weight from its provisions, yet an eccentric interpretation of it by the inspector in Edinburgh (fortunately by him alone), which he intimated his intention of carrying into action, occasioned a considerable flutter amongst the members of the trade here. However we were reassured by a full communication on the subject from the Council in London, who had been consulted in the framing of various clauses in the Bill. It appears to belong to the Board of Trade to define authoritatively the scope of the Act in its relation to our profession, and both our Council and the Medical Council are in communication with the Board urging it to do so, and it may therefore be confidently expected that the matter will be speedily and finally adjusted, either in the way of embracing all our weights up to the drachm in the schedules of the Bill, or better perhaps by exempting them in detail from its operation. It might certainly be supposed that the qualification which the statute requires in a man before he is permitted to *sell* and *dispense* "poisons" might safely be held to fit him for dealing with this very subordinate detail in the exercise of his calling.

For some years past there has been a growing feeling amongst those interested in pharmacy that the existing Act of 1868 admitted of alteration and improvement. Accordingly they were pleased to learn that a committee had recently been appointed by the London Council to take into consideration the clauses which might form the basis of an extended Act. That committee has already framed several clauses and brought them before the London Council, who have again remitted the subject to another committee of their number to put the matter in shape for the Government, in hope that such an application may be recognized. The Council here do not know the nature of the proposed Bill, but venture to hope that the claim of pharmacists in Scotland to be relieved from "jury service" will not be forgotten, as it is certainly a strange anomaly that pharmaceutical chemists on the south side of the Tweed should be exempted by statute from this service, while on the north they are still liable. Great confidence, however, is felt that this and other important alterations will not be overlooked, and while they fear that the parliamentary session is too far gone to admit of the proposed Bill being passed, it is hoped that good may accrue from the fact that evidence will be afforded by the attempts thus made to obtain a new enactment that the Society is desirous to obtain fresh legislation, not only for the purpose of making the Pharmacy Act more perfect, but also that the safety and convenience of the public may be more fully ensured.

Only a few months ago the long agitated case of counter prescribing was decided in favour of the defendant, Mr. Shepperley, of Nottingham, but this decision, although satisfactory as far as it goes, cannot be held to have at all settled the general question. The Council in London, for reasons which were no doubt sufficient, and which appear not to have been taken into account in the somewhat acrimonious discussion which has arisen on the subject, had decided not to defend the case. The Council have only to remark that, however proper it may be for our Society, in some cases, to defend the trade interests of its members, it should never be forgotten that one of its primary vocations is to maintain and raise their educational status as true pharmacists, and the Council are persuaded that in the accomplishment of this object will be found the best solution of the problem of adjusting the relations between the medical profession and our own. The Council here cannot help expressing very strongly their belief that so long as counter prescribing, so called, is kept within its true and legitimate bounds, no action can or will be taken by any medical corporation, as such a proceeding on their part would be contrary alike to common sense and the real convenience of the public generally.

The Council regret to record the loss by death, during the last year, of the two oldest members of the Society in Edinburgh, both of them ex-Presidents, Mr. James Gardner and Mr. James Robertson, who had both reached the ripe age of seventy-nine years.

Since framing this report the Council have learned with much satisfaction, the decision in the long pending case of the Pharmaceutical Society *v.* The London and Provincial Supply Association, Limited, which is in favour of our Society; and which we doubt not will have a most important bearing on the sale of medicines by similar associations.

The Council have only further to submit the results of the polling for new Council as tabulated on the sheet on the table:—

COUNCIL FOR 1879–80.

Mr. William Ainslie	Edinburgh.
Mr. H. C. Baildon	„
Mr. George Blanshard	„
Mr. George Burrell	Montrose.
Mr. Thomas Davison	Glasgow.
Mr. Daniel Frazer,	„
Mr. William Gilmour	Edinburgh.
Mr. David Kemp	Portobello.
Mr. W. R. Kermath	St. Andrews.
Mr. Alexander Kinninmont	Glasgow.
Mr. George D. Mackay	Edinburgh.
Mr. Alexander Napier	„
Mr. A. Seath	Dunfermline.
Mr. J. B. Stephenson	Edinburgh.
Mr. James R. Young	„

The number of voting papers issued was 198, and of these 97 were given effect to. Two were rejected as informal.

The adoption of the report was moved by Mr. Gilmour and seconded by Mr. Baildon, and carried unanimously.

On the motion of Mr. Seath, seconded by Mr. Frazer, Messrs. Stephenson and Napier were unanimously re-elected as President and Vice-President; Messrs. Stephenson, Napier and Young were re-appointed auditors.

Mr. Mackay was unanimously re-appointed Honorary Secretary for another term of office.

Mr. Baildon asked for a hearty vote of thanks to the President for the very efficient manner in which he had discharged the duties of the chair, and this was most cordially responded to.

Provincial Transactions.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL ASSOCIATION.

The annual meeting of the above Association was held in the lower room of the Albert Hall, on Wednesday evening, April 23. The President, Mr. W. Ward, F.C.S., in the chair.

The Hon. Secretary, Mr. J. Turner, read his report for the past year. It stated that events had transpired during the year which had not been without great interest to all. The patent medicine question being one of the foremost, the Association thought it advisable to write to the principal proprietors, asking whether something could not be done to prevent their preparations being sold under regular prices. Messrs. Kay Brothers, of Stockport, were the only firm who sent a favourable reply, in which they stated it was their intention to supply only those parties who maintained the original price. The Medical Acts Amendment Bill had been under consideration and the Borough and County Members had been written to, asking them to amend the said Bill in such a form that it would not interfere with the interests of counter prescribing, a course in which they acquiesced and promised to support. The question of inviting the British Pharmaceutical Conference to visit Sheffield next August had been decided upon, and Mr. Ward had been deputed to visit the Conference in Dublin, and give a hearty invitation, which had been accepted. The Shepperley prescribing case had several times been up for discussion and the Association had granted the sum of £15 out of its funds to the Trade Association towards defraying the legal expenses. Last year there were fifty members on the lists, now forty-six ; showing a decrease of four. There had been eleven meetings: six general, five council. More work might have been done if every member of the trade had taken an interest in the working operation of the Association, but much apathy had existed amongst its members. If each member would take an active part, the work would be very light; as it was, it rested only with a few. Several persons had been written to by the Secretary of the Pharmaceutical Society for infringement of the Pharmacy Act. The 'Year-Book of Pharmacy' had been received from the British Pharmaceutical Conference, also the Calendar from the Pharmaceutical Society, and a donation of £1 1*s.* 0*d.*, from Mr. J. H. Wilkinson, Manchester.

The President then proceeded to deliver his valedictory address. In it he referred to the work of the Association during the past year. It was to him a source of profound regret, amounting to a state of humiliation, that nothing had been done by way of lectures affecting the cause of pharmaceutical education. He deplored the apathy and indifference not only on the part of the rising generation, but also of those more matured, and he had come to the conclusion that until some means were devised compelling students to undergo a certain course of lectures, embracing all the subjects of the Minor examination, little would be effected by such an Association. He should hail the time when such a curriculum would be made compulsory, as he considered a two years' course of lectures indispensable before a candidate should be permitted to present himself for examination. Notwithstanding the lethargy into which the Association had fallen, they had, as the report stated, had several meetings of an important nature affecting the trade. The Shepperley case had excited much interest and discussion, and it was a gratifying fact to know that this much vexed question of counter prescribing had been brought to such a satisfactory issue. He had confidence to predict the day far distant ere another attempt would be made to interfere with a custom so long enjoyed and possessed by them and their predecessors. He did not at the first regard the constitution of the Trade Association as being the most politic, but he was bound to confess in simple justice, it had by its united and strenuous action rendered inestimable service to the trade at large, and he would say all honour to the Executive Committee for their untiring efforts to defend the right. He gave credit to the members of that committee, as well as to those constituting the Council of the parent Society, for having the same object at heart, and both he believed would soon be found working hand in hand towards the accomplishment of one grand and noble achievement, viz., the protection of the right and the advancement and enlightenment of the true cause of pharmacy. It was not his lot to be enumerated amongst those who were everlastingly finding fault, but he should rejoice to see gentlemen returned at the forthcoming election, who would possess the necessary ability and experience to deal more directly with the provinces than had hitherto been the case. The patent medicine question should receive serious consideration, and he should like to see something done to prevent the sale by unqualified and ignorant persons of proprietary articles which contained poisons within the meaning of the Pharmacy Act. There was another grievance which had not yet been grappled with, as far as he knew, the sale of homœopathic poisonous preparations. At the present time these were being sold by grocers and others without the slightest difficulty or interference, and it did appear high time some definite standard was arrived at by which they might grasp the "infinitesimal" and declare for or against their sale by persons outside the pale of pharmacy. They would rejoice with him on the splendid victory just gained by the Pharmaceutical Society against the London and Provincial Supply Association, a victory in his opinion morally and legally won. He heartily congratulated the members of the Association on the honour about to be conferred upon their town by a visit from the British Pharmaceutical Conference in August next, urging them to make use of every means whereby to ensure the most perfect success. There would in all probability be a numerous and brilliant gathering, attributable partly to their geographical position, Sheffield being one of the most central towns of the United Kingdom. It had afforded him no small amount of pleasure to have been deputed by them to bear an invitation to the Conference at the meeting in Dublin last year. He could assure them, and there were those present who could speak from experience, such meetings tended greatly to the pleasure and elevation of all who participated in them, by carrying their thoughts and aspirations into other fields of research and contemplation, widely differing from the sphere of labour in which they were ordinarily engaged. Members of their calling who had read and heard of, but never seen each other were brought face to face and saluted one another with a warmth and vigorous grasping of the hand not readily to be forgotten. Many too were the friendships formed, which in after life brought pleasant and happy reminiscences of the gatherings in connection with that Conference of which they had cause to be proud. In conclusion he thanked them for the confidence reposed in him during another year of office which now concluded his third year.

The Treasurer's account showed that the Association had in hand £20 18*s.* 5*d.*, after paying all liabilities.

The following officers for the ensuing year were then appointed, viz.; President, W. Ward, F.C.S.; Vice-Presidents, G. Ellinor and J. S. Burnell ; Treasurer, W. Jervis; Auditors, J. T. Dobb and T. Hudson ; Hon. Secretary, J. Turner; Council, G. A. Cubley, H. W. Maleham, H. E. Ibbitt, G. Carr, J. Otley, G. T. W. Newsholme, E. R. Learoyd and J. Watts.

YORK CHEMISTS' ASSOCIATION.

The annual meeting of the York Chemists' Association was held at the Society's rooms, at the King's Arms Hotel, on Wednesday evening, April 16, Mr. Councillor John Brown being in the chair.

The minutes and transactions of the past year were read over and confirmed, and the treasurer's accounts and balance sheet audited, showing a surplus of £3 19*s.* 11*d.* to be carried to the credit of next year's account.

Mr. Geo. Dennis, the President, Mr. Thos. Cooper, the Treasurer, and Mr. Jos. Sowray, the Hon. Secretary, were re-appointed, and Councillors J. Brown and C. Croskell and Messrs. T. W. Wilson and E. B. Kendall were elected upon the Executive Committee.

The annual dinner was arranged to take place on the 30th April.

After the transaction of the usual business a discussion arose on the patent medicine and proprietary articles question, as being one most seriously affecting the interests of the trade, when the Chairman proposed, and Mr. Saville seconded, that the following resolution and circular letter should be forwarded to the principal patent medicine proprietors, and that the same be also communicated to the Pharmaceutical Society, the Editor of the *Chemist and Druggist*, and the Birmingham Trade Association, which was unanimously agreed to:—

Resolution.

"That in consideration of the injury inflicted upon the chemists and druggists throughout the country by grocers, co-operative stores, and others selling patent medicines and proprietary articles at less than the published price, it is hereby resolved that an endeavour be made to induce the proprietors of such medicines, etc., not to supply them to any traders except under a guarantee to sell at the advertised prices. Such guarantee to be either by ordinary signature or by a stamped bond, under a penalty, as each proprietor may require."

Circular.

"York Chemists' Association.

"57, Petergate, York,

"April , 1879.

"Sir,—I beg to draw your attention to a resolution agreed to at the annual meeting of the York Chemists' Association, held on the 16th April, and hope you will give it your consideration, and adopt it or any other practicable means in order to check the evils complained of, and the consequent loss of profits and damage such proceedings entails upon the trade throughout the country.

"For some years past, owing to the system of advertising now so commonly adopted, and the liberal supply of bills freely sent to the retailers, which are daily distributed over the counter, finding their way into every household, this particular description of trade has been much on the increase and is constantly extending, the principal reason for such increase being the large profit attending on the sale, and the consequent personal interest that thousands of respectable chemists have in its extension. Those influences have no doubt been of great mutual advantage to the proprietors and the trade, and it is only by the continuance of the same course of policy that those results can be ensured in the future. It is possible that a lowering of prices may have to the present time increased the sale for the benefit of proprietors, but this cannot long continue when the trade have no interest in promoting and extending their sale in consequence of loss of profits from discreditable and dishonest competition. It appears to me that each chemist will endeavour to diminish their sale, and will recoup himself by putting up his own specialities, and sell them in lieu of those from which he is obtaining no advantage.

"In recommending, therefore, the resolution of the York chemists, I think an end may be put to this unhealthy state of things by the proprietors of patent articles themselves, as all that is requisite is for them to adopt a form to be signed by both wholesale and retail chemists, pledging themselves to sell only at the published prices, and where necessary the agreement could be on a stamp, and a penalty named, which would be recoverable in a court of law for any infringement of the agreement, or if thought necessary they could appoint agents in every town, from whom alone those medicines could be procured. If this plan could be universally adopted, the evils complained of would at once be remedied, and an end be put to that state of things which, if suffered to continue, will be the ruin of the trading community.

"I shall feel glad if you will seriously consider this question, and let me know your opinion on the subject at an early date.

"I am, yours truly,

"Joseph Sowray, *Hon. Secretary.*"

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

At the last meeting of this Association, held at Britannia Chambers, a lecture was given by Mr. Sturges Dodd, on "Sponges and other interesting Marine Animals," the chair being occupied by Mr. J. Rayner.

The lecturer commenced by stating that the subject was one intended to reveal the wondrous design and ever constant working displayed by beings most humble in the organic scale, who built up from the surrounding waters in which they dwelt an esco-skeleton or net work, beautiful, varied, most marvellously designed and most admirably adapted for their specially varied requirements. Mr. Dodd first alluded to the sponge, stating that the horny or chitinous common sponge of commence was a substance built up by a colony of excessively minute animalculcs united together in myriads, forming a soft gelatinous substance resembling the white of an egg, which surrounded or covered the sponge or skeleton frame work they erected. The numerous openings or passages running through its midst in every direction were of two kinds, termed pores and osculæ, and by means of these a sort of circulation existed. Sponges are strengthened by tiny particles of silicious or calcareous matter imbedded in their framework, called spiculæ. Sponges, according to their nature, had been divided into three great groups, viz:—The keretose, or horny sponge, of brown colour; the calcareous sponge, built up of carbonate of lime (known only in a fossil condition); and the silicious or vitreous sponge, of which the Venus' flower basket was a most interesting example. He stated that sponges were most numerous and widely diffused. Dr. Bowerbank had described upwards of two hundred British species; one kind perforated oyster shells, boring minute holes therein, and then undermining their way so considerably as to often destroy the entire shell. The sponges of commerce were most plentifully obtained from the Grecian Archipelago, and were sold by the Greeks and Syrians to the Western nations, the inferior qualities being torn from the rocks with harpoons while the finer are dived for and carefully removed. The lecturer then described and illustrated the little tree-like homes built up by those compound animals, the hydroazoa, afterwards directed attention to the shields, coverings and houses which protected the oyster and other mollusca, alluding to their reproductive power when injured. In speaking of snails, he stated that in the Pharmacopœia of former times a decoction of snails was much esteemed as a remedy in pulmonary complaints, and that in France an extract called "Helicine" is now used in similar cases.

The lecture, which was illustrated by a large number of beautiful specimens, was listened to with great attention. At the close a hearty vote of thanks was awarded to Mr. Dodd for his interesting address, on the motion of Mr. R. Jackson, seconded by Mr. W. H. Parker, both gentlemen expressing great regret that there were not a larger number of members present to hear it.

MIDLAND COUNTIES CHEMISTS' ASSOCIATION.

A lecture was delivered on the 24th ult., at the Great Western Hotel, by Alf. Hill Esq., M.D., F.I.C., Medical Officer of Health for Birmingham, upon the Sanitary Defects of House Construction and their Remedies.

Dr. Hill commenced by pointing out that the arrangements of the house were an index of the civilization of its inhabitants, and that whereas the houses of the ancients had protected too little, those of the moderns protect too much. First of all the foundation should be dry; damp soil and walls lead to rheumatism, neuralgia, etc.; if the foundation were damp, subsoil-drainage should be adopted or a "damp course" of slate or perforated tiles introduced between the bricks near the ground. The great diminution in consumption in some towns after drainage (36 to 49 per cent.) showed the importance of dry foundations. The soil being porous contained much air, and when damp contained too much water and too little air, so noxious organic matter in the soil would be insufficiently oxidized and thus infect the air and the well.

The lecturer showed that diseases such as cholera and typhoid often passed over towns situated on granite and basalt, while attacking others situated on porous soils where infiltration of noxious matter was easy.

Passing to the interior of the house, Dr. Hill condemned the practice of having a drain running under the foundation or in the cellar, as calculated to introduce into the house sewer gas from faulty trapping, or by leaking to saturated the soil with decomposing organic matter. The sink in scullery and in the kitchen was often a source of danger, the "bell trap" being imperfect and the warmer air of the lower rooms carrying up with it the effluvia from the drains; the houses of the upper classes, with their bath rooms, lavatories, urinals, etc., often offered more opportunities of entrance to the sewer gas than those of the poor, and though the amount of noxious matter in the atmosphere of the house might not be enough to cause an alarming attack of some severe disease, yet infected air could not fail to impair the health of those exposed to it. The lecturer having given some striking examples of health impaired by impure air, went on to point out some of the chief defects in the drainage of houses, and recommended that direct communication should not be allowed between the interior of the house and the drain; overflow pipes often were continuous with the sewer, and so allowed sewer gas to enter the house. The water closet should never be without water (as was sometimes the case), and the valve should be kept in repair, lest it should allow the water to run away, and leave the soil pipe unsealed. The soil pipe should always be outside the house, and be carried to the top of the building, and open into the air, so as to prevent compressed air in the soil pipe from forcing its way into the house. The overflow and scullery pipes should never open into the soil pipe, but should open outside, above ground, and should be trapped. Speaking next of drains outside the house, the lecturer explained that they were often badly built and leaked, and if made of "sanitary pipes" were often without cemented joints, and so leaked, and infected both air and water. Wet ash pits and middens the lecturer strongly condemned, citing instances of the injury done by them; much preventible disease, he said, was distinctly traceable to them. After warning people not to rely only on traps within the house, but to sever communication between them and the sewer, Dr. Hill proceeded to comment on the folly of shutting up rooms too closely, and preventing sufficient ventilation, and recommended the adoption of fire-places on the principle of Captain Galton and Mr. Chadwick. He explained how very wasteful ordinary grates are of heat and fuel, and showed that warm air ventilation could be got and fuel economized by using fire-places constructed as above. The importance of plenty of light was lastly dwelt upon, Dr. Hill remarking how few people were aware how necessary to good health was "plenty of light," urging the advisability of having large windows, and such as would open at the top, thus supplying both light and fresh air.

The lecture was well illustrated by numerous excellent diagrams, and was listened to with marked attention by a considerable audience.

A very hearty vote of thanks was accorded to the lecturer for his very instructive and interesting lecture.

A vote of thanks to the Chairman, Mr. T. Barclay, terminated the proceedings.

ANNUAL SUPPER OF EDINBURGH CHEMISTS' ASSISTANTS.

The annual supper of the Edinburgh chemists' assistants took place in the new saloon of the Waterloo Hotel, on Wednesday evening, April 30; Mr. T. Welsh in the chair, Messrs. McLaren and Aitken officiating as croupiers. About eighty gentlemen sat down to supper.

After the usual loyal and patriotic toasts,

The Chairman proposed, "Success to the Edinburgh Chemists' Assistants' Association," and in doing so gave a review of the work done by the Association during the past session. The session on the whole had been highly successful, the papers read had been of a very high class, and what was very gratifying they had all been contributed by members of the Association. Though the Association had been so successful, yet he thought in a city like Edinburgh a larger number of the assistants ought to have become members, seeing that the Association was got up for their benefit. However, he hoped to see a larger number next session. This toast having been duly honoured,

Dr. Taylor rose and made a few remarks on the harmony which ought to exist between medical men and chemists. He pointed out how much the former had to rely upon the latter, whose duty it was to see that the prescriptions were faithfully prepared; medical men, as a rule, having to trust to them on this point, their own part being to watch the action of the prescription.

Mr. McLaren proposed, "The University and Royal College of Physicians and Surgeons." In doing so he expressed a hope that the proposals for establishing a central licensing board would not be successful, as Edinburgh, which was so much famed for her medical teaching, would, if such change took place, suffer most unjustly. He begged to couple the toast with the name of Dr. Sinclair.

Dr. Sinclair, in replying, gave expression to the feeling of medical men in Scotland regarding the proposed changes, which he hoped would not take place. He also stated that he fully concurred in what Dr. Taylor had said regarding the good feeling which ought always to exist between their own body and chemists.

Mr. Aitken proposed, "The North British Branch of the Pharmaceutical Society." In doing so he said the Society had great claims upon chemists as a body from the untiring efforts it had made in the cause of pharmaceutical education. There was one matter he would like to mention, and that was the supposed neglect of trade interests by the Society; but its recent successful action against a co-operative store in London was, he thought, a sufficient answer to that charge. With regard to the North British Branch, he thought it was deserving their best thanks for the way it looked after their interests. Some of those present might not have been aware that about eight years ago the London Council thought of doing away with the Scotch branch; but by the energetic remonstrances of the then members of Council, they were successful in proving that the abolition of the Scotch Board was beyond their powers. For this reason alone he thought they should drink a bumper to the North British Branch of the Pharmaceutical Society.

Mr. Fisher, in returning thanks for this toast, said that the Society had been the means of doing much good amongst all classes of chemists and druggists. In

peaking of the new Trade Association, he strongly condemned its action in trying to create two separate factions amongst chemists. He called on all to rally round and support the Pharmaceutical Society, which was deserving of their sympathy and support. With regard to the North British Branch, he thought the chemists and druggists in Edinburgh ought to be grateful for the efforts made on their behalf by such gentlemen as Mr. Baildon, Mr. Mackay and others. He begged to thank them for the hearty manner in which they had drunk the toast.

Mr. Couper proposed "The Ladies."

Mr. Hamilton replied on their behalf.

The remaining toasts were, "The Chairman," by Mr. Hamilton, and "The Croupiers," by Mr. Fisher, replied to by Mr. Aitken.

Several excellent songs and recitations were given during the evening.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, May 1, Dr. Warren De La Rue, President, in the chair.

The minutes of the previous meeting were read and confirmed.

The following certificate was read for the first time :—J. Sakurai.

The President then called on Dr. W. Ramsay to read a paper on—

The Volumes of Liquids at their Boiling Points obtainable from Unit Volumes of their Gases.—Kopp, in 1855, pointed out that the specific gravities of organic compounds show a certain regularity with regard to each other. If the molecular weights of various compounds be divided by their respective specific gravities at their boiling points, a series of numbers is obtained which Kopp ultimately named specific volumes. Kopp's method of determining the volume of a liquid at its boiling point (the only point at which volumes are comparable, for at that point the vapour tensions of all liquids are equal) was to ascertain the boiling point with great accuracy, to determine the specific gravity at some known temperature and calculate the volume required by means of the coefficient of expansion. This process involves the use of complicated and expensive apparatus and necessitates laborious calculation. Before describing the apparatus used by himself, the author discusses the precise conceptions involved in the expressions used by Kopp, etc., "atomic volume," "molecular volume" and specific volume.

$$\text{Specific volume as used by Kopp} = \frac{\text{molecular weight}}{\text{specific gravity}}$$

By molecular weight is meant the specific gravity of the gas, hydrogen at 0° being equal to 1; for specific gravity, water = 1, so that two scales are employed, viz., one based on H_2 as unity, and one based on water. The number obtained from the above equation therefore does not give the relation between the volumes or weights of liquids at their boiling points and that of the gases obtainable from those liquids. To obtain this relation the number representing the specific gravity of the liquid must be multiplied by the number which represents the relation between the specific gravity of water and that of hydrogen, *i. e.*, 22236. By reversing Kopp's process, *i. e.*, by dividing the specific gravity of the boiling liquid by that of the gas, the amount of gas obtainable from unit volume of the liquid is calculated. Thus, specific volume of liquid hydrogen = 5·5, and its specific gravity is $\frac{1}{5\cdot5}$ or 0·1818 and $0\cdot1818 \times 22326 = 4059\cdot2$, the specific gravity of liquid hydrogen (hydrogen gas = 1). By dividing specific gravity of gaseous hydrogen by that of liquid hydrogen, or $\frac{1}{4059\cdot2}$ we get 0·00024635 as the volume of liquid obtainable from 1 volume of gas, or 2·46 from 10·000 volumes of gas, this number 2·46 the author proposes to call "ebullition volume." Kopp's numbers give the amounts of boiling liquids obtainable from 22326 volumes of gas at 0°. The apparatus used by the author consists of a thin glass bulb of about 10 c.c. capacity, in shape like a lemon ; its upper end is terminated by a hooked capillary tube, its lower end is closed and furnished with a glass hook. The capacity is accurately determined by filling with boiled distilled water and weighing. To determine the weight of a known volume of a liquid at its own boiling point the bulb is filled with the liquid and suspended by a platinum wire in a glass vessel resembling a large test tube, having a bulb blown about half an inch from the bottom. A small quantity of the liquid is placed in this glass flask and the bulb suspended by a platinum wire from the cork, which fits in the upper part of the flask. The liquid in the flask is caused to boil by a small Bunsen flame, the vapour heats the bulb, the liquid in it expands and drops are expelled from the capillary tube. As soon as the drops cease to fall, usually in about ten minutes, the bulb and its contents have assumed a temperature equal to the boiling point of the liquid. The bulb is withdrawn, allowed to cool and weighed. Various precautions must be taken with liquids which are very volatile or oxidizable. Allowance is carefully made for the expansion of the glass. The time required for one determination is about half an hour. The author has made many determinations with a great variety of substances; his results on the whole agree very closely with those obtained by Kopp. The value of some of the elements seems to vary much; thus oxygen has two values, 3·49 and 5·45, sulphur 10·27, 12·79. Nitrogen in amines is 2·3, in cyanogen compounds 17, in bodies containing NO_2, 17·4 (Kopp). The author has determined the ebullition volume of some of the pyridine series of bases, *e. g.*, in picoline value of N = 4·08 in its isomeride ; anilin N = 2·11. In pyrrol N = 9·12—from its volume it appears to belong to the cyanogen group. In conclusion the author draws attention to the enormous differences between these values of N, and suggests a connection between these values and the amounts of heat evolved in the formation of the substances.

The next paper was read by J. Pattinson on—

A Method of Precipitating Manganese entirely as Dioxide and its Application to the Volumetric Determination of Manganese.—Many methods of determining manganese volumetrically have been suggested, but none have come into general use, owing principally to the difficulty of obtaining the whole of the manganese in a definite and uniform state of oxidation. The author has examined the methods suggested by Pereño and Lenssen, but did not succeed in obtaining regular results. Wright and Luff have also been unable to obtain pure manganese dioxide by any of the ordinary methods. After numerous experiments the author found that the whole of the manganese in a solution of manganous chloride could invariably be precipitated in the condition of dioxide, if a certain amount of *ferric chloride* be present, by a sufficient excess of a solution of calcium hypochlorite or bromine water, adding, after heating the solution to from 140° to 160° F., an excess of calcium carbonate, and then well stirring the mixture. Without the ferric salt the precipitation as MnO_2 is imperfect. Zinc chloride may be substituted for ferric chloride, but neither aluminum nor barium chlorides have the same desirable effect. The author recommends the following solutions, etc.:—the clear liquid obtained by decantation from a 1·5 per cent. solution of bleaching powder ; light granular calcium carbonate, obtained by precipitating an excess of calcium chloride by sodium carbonate at 180° F. ; a 1 per cent. solution of ferrous sulphate in dilute (1 in 4) sulphuric acid ; standard solution of potassium dichromate equivalent to 1 part of iron in 100 of solution. The application of the process to manganiferous iron ores is as

follows:—10 grains of the ore dried at 212° are dissolved in a 20 ounce beaker in about 100 fluid grains of hydrochloric acid, specific gravity 1·18, calcium carbonate is then added until free acid is neutralized and the liquid turns slightly reddish; 6 or 7 drops of HCl are now added and then 1000 grains of the bleaching powder solution or 500 grains of saturated bromine water, and boiling water run in until the temperature is raised to 140°–160° F.; 25 grains of calcium carbonate are added and the whole well stirred; if the supernatant solution has a pink colour the permanganate is reduced by a few drops of alcohol. The precipitated oxides of iron and manganese are filtered off and washed; 1000 grains of the acidified ferrous sulphate solution are carefully measured into the 20 ounce beaker already used, and the filter with its washed contents added. A certain quantity of the ferrous sulphate is oxidized by the MnO_2, this quantity is estimated with the standard dichromate solution, when the quantity of MnO_2 can easily be calculated. The iron present must be at least equal in weight to the manganese during the precipitation in order to ensure the absence of lower oxides. The author gives in detail the slight modifications necessary in the analysis of spiegeleisen, ferro-manganese steel and manganese slags; also some analyses which prove the accuracy of the process.

Dr. Wright was extremely interested in the paper, especially as to the action of the ferric chloride. He asked if Mr. Pattinson had found any substances which acted in the opposite way—*i. e.*, decreased the yield of MnO_2.

Mr. Pattinson said that all his efforts had been directed to ensure the complete formation of MnO_2.

The President then called on Mr. Warington to read a paper on—

The Determination of Nitric Acid as Nitric Oxide by means of its Action on Mercury.—During the last two years the author has used this method to a considerable extent. It was first suggested by W. Crum and has been much improved by Frankland. The author has in the main carried out the process as recommended by Thorp in Sutton's 'Volumetric Analysis;' he did not, however, expel any gas which might be liberated before shaking. In the presence of some kinds of organic matter a permanent froth was sometimes produced; this could be destroyed either by the introduction of a little hot water through the stopcock or by gently warming the liquid in the inclined tube by a small flame. A considerable number of experiments are given as to the effect of chlorides on the accuracy of the results obtained in estimating nitrates, nitrites and the nitric acid in soils. The author finds that the results are quite as satisfactory even when chlorine is present in a quantity equal to eight times the equivalent of the nitrogen, and concludes that chlorides, except perhaps in extreme cases, are no hindrance to the accurate determination of nitric and nitrous acid by this method, and that it is unnecessary to remove them by previous treatment with sulphate of silver. The author then investigated the influence of organic matter, and finds that organic matter in quantities likely to be met with affect the results but little; cane sugar, however, has a remarkable action in preventing the complete evolution of the nitric oxide. In some cases a considerable quantity of gas was evolved, without shaking; this gas was found to be nitric oxide, the action taking place between the nitric acid and organic matter instead of between nitric acid and mercury. It is obvious that a considerable error would be caused by expelling any gas liberated before shaking in such cases. Commercial glucose has a considerably less injurious effect than cane sugar. It is interesting to observe that chlorides if present seem to prevent to a great extent the injurious effect of cane sugar; thus a solution containing 20·8 parts of nitrogen gave by the process after removing chlorides 12·6 and 11·5, but with chlorides not removed 18·5. In some cases the author has observed that the reaction is not completed in the shaking tube, but that bubbles of gas continue to be evolved when the liquid was transfered to the measuring tube; the reason of this defective reaction was not discovered. The author draws the following conclusions:—That in the absence of organic matter and with proper manipulation the method is one of great accuracy and is capable of determining extremely small quantities of nitrates and nitrites. The natural error of the process is a small one of deficiency. The presence of chlorides in moderate quantity is no hindrance. Quantities of organic matter, small in relation to the nitrates present, have little or no effect on the results; larger quantities, especially cane sugar, may cause a considerable deficiency, this deficiency is reduced by the presence of chlorides but is not entirely removed.

After a few remarks by Dr. Gilbert, the President called on Dr. O. N. Witt to read a paper on—

A New Class of Colouring Matters.—This is the first of a series on the simultaneous gradual oxidation of amido and methyl groups. If a mixture of metatoluylenediamine and dimethylparaphenylendiamin be oxidized in aqueous solution, or if the formation of the latter of these bases from nitrosodimethylanilin be combined with this oxidation process by acting upon metatoluylendiamine with nitrosodimethylanilin, the reaction results in either case in the formation of a new compound of an intense blue colour, for which the author proposes the name of toluylen blue, $C_{15}H_{18}N_4HCl + H_2O$. It is the neutral salt of a new triatomic base, the acid salts being reddish brown; if treated with reducing agents it absorbs two atoms of hydrogen, forming a new colourless base having the constitutional formula—

$$(NH_2)_2 - C_6H_3CH_2 - \underset{\displaystyle H}{\overset{\displaystyle |}{N}} - C_6H_4N(CH_3)_2$$

And the formula of the blue is—

$$(NH_2)_2C_6H_3 - CH = N - C_6H_4 - N(CH_3)_2.$$

This compound may be considered as the first representative of a new class of colouring matters which have the group $-\underset{\displaystyle H}{\overset{\displaystyle |}{C}}=N-$ as a chromophor, and form, from their properties and constitution a connecting link between the rosanilin and the azo series, the chromophor of the former being $-\underset{\displaystyle |}{\overset{\displaystyle H}{\overset{\displaystyle |}{N}}}-\underset{\displaystyle |}{C}-$ and of the latter $-N=N-$. One of the most remarkable properties of toluylen blue is its power of absorbing hydrogen from other amines and being reduced to its leuko-compound, the amine undergoing condensation similar to that effected by oxidizing agents and invariably resulting in the formation of new colours. Thus the blue by acting on another molecule of itself produces toluylen pink, $C_{15}H_{16}N_4$, a crystallized compound forming two series of salts, one pink the other blue. By acting with toluylen blue on metatoluylendiamin for twelve hours at 35° toluylen violet is obtained, $C_{14}H_{14}N_4$. This new compound dissolves sparingly in alcohol and ether with a pink colour, exhibiting a most brilliant fluorescence. It forms two series of salts, one violet the other green. The constitutional formula of toluylen pink is—

$$NH_2C_6H_3\begin{cases}\diagup NH \\ \diagdown \underset{\displaystyle |}{C}\end{cases} = N - C_6H_4N\begin{matrix}CH_3 \\ CH_3\end{matrix}$$

And of the violet—

$$NH_2C_6H_3\begin{cases}\diagup NH \\ \diagdown \underset{\displaystyle |}{C}\end{cases} = N - C_6H_3\begin{matrix}CH_3 \\ NH_2\end{matrix}$$

The general conclusions which may be drawn are that under the above circumstances a gradual dehydrogenization of the amido and the methyl groups takes place, the quantities of hydrogen removed from both sources being always the same; that in a great many cases the use of oxidizing agents may be avoided by using the corresponding nitroso compounds, or by utilizing the tendency

of some organic compounds for the absorption of hydrogen. The author promises further investigations in the same direction. Specimens of the above new and beautiful colouring matters were exhibited by the author.

The Society then adjourned to May 15, when the following papers will be read :—On Nitrification, Part II., by R. Warington. On Alkaloids of the Veratrums, Part III., by Dr. Wright and Mr. Luff. On Alkaloids of the Veratrums, Part IV., by Dr. Wright. On Alkaloids of the Aconites, Part IV., and on Japanese Aconite Roots, by Dr. Wright and Mr. Luff. On the Action of Hydrochloric Acid on Manganese Dioxide, by Spencer Pickering. The Composition of Milk in Health and Disease, by A. Wynter Blyth. Notes on the Effect of Alcohol on the Chemistry of Digestion, by W. H. Watson.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting held on April 9, at 32A, George Street Hanover Square, W., Mr. T. Wallis, President, in the chair, a paper by Mr. W. K. Glover was read, entitled "Notes on Tobacco." A botanical description of the plant and its mode of cultivation was given, followed by an interesting account of its history. The process of manufacture of the varieties of tobacco in the form of cigars, cigarettes, snuff and cut tobacco, and the machinery used were described. The medical application of tobacco was touched upon, and its various effects upon the system stated. The adulterants which have been used were given, and diagrams drawn of their microscopical structure.

A discussion followed, in which Messrs. Wallis, Piper, Branson, Cardwell, Snow, Bull and Glover joined.

A vote of thanks, proposed by Mr. Maggs, and seconded by Mr. Snow, was given to Mr. Glover for his interesting paper.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[219]. Will you permit me to give my reasons for the view I take of this matter? ℥j is equal to 60 grains, f℥j is equal to 60 minims, no other definition of their value can, I believe, be given. With liquids teaspoonful has been used as the equivalent of f℥j, because it has been supposed to contain very nearly 60 minims; since the teaspoons in common use have been made so much larger than formerly, this supposition is very erroneous and likely to lead to wide differences of dose. When, however, we are concerned with solids or powders no such comparison holds good; hardly in any case could a teaspoonful of such be considered the equivalent of 60 grains. If we were directed to use ℥j of calomel and ℥j of magnesia how wide would be the difference if we measured them out by teaspoonfuls.

The question is:—What does a doctor mean by ℥j? Now ℥j = 1 drachm = 60 grains. Cochl. min. j = 1 teaspoonful.

Here are two distinct things, each with its own proper name or symbol; it seems that nothing could be clearer; yet we are told by some that though the doctor says one thing he means the other. Certainly, some doctors may have done so from want of due consideration of the matter, but surely it would be better for the future to say what they mean.

It seems to me that when a doctor uses ℥j he means or should mean 60 grains, or if for liquids 60 minims; that when he uses cochl. min. he means or should mean a quantity uncertain and variable, but still convenient and sufficiently exact for his present purpose.

It is certainly of importance that the dispenser should know what the prescriber means; that end can scarcely be gained by confusing ℥j, which has the definite value of 60 grains assigned to it in the preface to the Pharmacopœia and by long usage, with another and quite different measure.

But some say ℥j or 60 grains would be so inconvenient to the patient. If so, the remedy is easy; it is simply not to use it; but if the prescriber has used it I should assume that he knows what he is doing and should believe that he means what he says.

D. C. Cadman.

---

[264]. Mr. Barnes is entirely wrong in stating that a ten ounce mixture ought always to be sent when Oss is ordered. I frequently dispense an eight ounce when they are so written, as I know the doctor intends such, particularly when he orders a sixth part for a dose. There is no strict rule to be followed in such cases, the chemist who first copies the prescription is quite justified in marking the number of ounces he sends on the prescription, so that it is always alike, avoiding any doubt as to accuracy on the part of the patient.

Croydon. G. E. Gibson.

---

[284]. The separation cannot be prevented, but the use of some mucilage of gum acacia is recommended in order to divide finely the balsam of tolu.

W. H. Langleck.

---

[285]. Liquor ferri dialysati, being slightly alkaline cannot be combined with quinine to form a clear solution. An addition of a few drops of acid or small quantity of spirit or wine will precipitate peroxide of iron.

H. W. Langbeck.

---

[285]. 3 grains of quinæ murias may be dissolved in one ounce of Wyeth's liq. ferri. dialysat. by the aid of a water-bath, the mixture heated to 90° Fahr., for 12 hours, and finally adding 1 gram of syrupus simplex to restore density. The writer has treated some liq. ferri. dialysat. in this manner for a physician, and it appears to keep very well and without depositing the peroxide of iron. But owing to the extreme delicacy of the preparation it is difficult to dissolve more than 3 grains to the ounce, which is sufficient for the majority of purposes.

C. F. Rideal.

---

[286]. Well mix the tinctures in a mortar with ℥ss mucil. acaciæ, gradually adding 5 oz. water, then add the pot. bicarb. previously dissolved in the remainder of the water. I find the above mode makes a very presentable mixture.

A. P. S.

Query.

[287]. How should the following prescription be dispensed?—

℞ Pil. Scillæ et Digitalis . . . . . xxiv.

Two pills night and morning.

Cortex.

Notes and Queries.

[590]. TINCT. SANGUINARIÆ.—Perhaps you will allow me to explain what obviously seems something like a discrepancy between J. B. L. M., Mr. Langbeck, and my answer under the above heading. I gave the formula according to Christison and Griffith; but instead of maceration, percolation is now employed, and diluted alcohol is replaced by a stronger menstruum, viz., alcohol, three measures, water, one. I may state that the term pint as used in the U. S. Pharmacopœia, means the old wine pint, or sixteen fluid ounces; and troy or apothecaries' weight is used for weighing solids. In America four alcoholic strengths are recognized: diluted alcohol, alcohol, stronger alcohol and absolute alcohol. Stronger alcohol has a sp. gr. of 0·817. Alcohol or rectified spirit varies between 87 and 84 per cent. by weight, or from 92 to 89 by volume. It is the *spiritus rectificatus* of the B. P., sp. gr. 0·838 or thereabout. Diluted alcohol is prepared according to the U. S. P. by mixing alcohol or rectified spirit with an equal quantity of distilled water. Its sp. gr. is about 0·941.

Mr. Langbeck says the tincture "should be prepared with rectified spirit, as the herb contains a resinous substance not soluble in proof spirit." The rhizome of *Sanguinaria canadensis* is the part officinal, and I find that an infusion (1 oz. to pint of boiling water) acts energetically as an emetic when given in tablespoonful doses at short intervals. Half an ounce of the tincture is an emetic dose, and the powder is also given in doses of 10 to 60 grs.

The active principle sanguinarina is freely soluble in ether and alcohol, and an acetum sanguinariæ is officinal in the U. S. P., which possesses all the active properties of the drug. The resinous matter is dark red, but it clearly is not the active constituent. I refer to the dark red resin left after the hydrochlorate of sanguinarina is separated by filtration. The pure alkaloid is white, and can be crystallized in needle-shaped crystals or those of a verrucose form. Acids form red coloured salts.

Blood-root has been much studied in America, but it has not found favour in England. It is a depressor of the heart, and acts upon the spinal cord and cardiac nerves.

Northallerton. HENRY BROWN.

---

[591]. CITRINE OINTMENT.—In all the establishments I have lived, the ung. hyd. nit. mit. of Beasley (which is one in four) has been sold for citrine ointment. Mr. Henry Brown advises the strong, but as it is generally used for the eyes, most medical men are of an opinion that it is too strong for that purpose.

RHUBARB.

---

[597]. GURJUN BALSAM.—This balsam has been strongly recommended by Dougall. It has been used in leprosy both internally and externally. Dr. Dougall recommends an emulsion made with lime-water, and he employs the same for both internal and external use.

J. S. will have no difficulty in regard to its application, if he emulsifies the balsam, and remembers its use and mode of administration are closely allied to copaiba.

HENRY BROWN.

DISPENSING MEMORANDA.

Sir,—At the request of several gentlemen, members of the Society, I write to you for the purpose of raising the question, "How far it is desirable to continue the columns with the above heading?" After close and frequent examination of the questions, we are quite at a loss to understand by whom the great majority can be asked; we ourselves do not experience, and never have experienced, the difficulties which seem to be met with by your correspondents. However, were it only the seeking and finding of information that was involved, it would not so much matter, though we cannot help thinking that such information ought to be obtained previously to a man's entering into business. But it must be borne in mind that the Journal finds its way into the hands not only of the medical profession, but also into those of many of the public, and it strikes us that either of these classes of readers would, on seeing the "Dispensing Memoranda," come to the conclusion that pharmacy was anything but an exact science. The profession will be slow to hand over their dispensing to a class of men among whom so much uncertainty prevails, and the public will conclude that they are as well off in the hands of the stores as they are in those of chemists. It seems to us either that there must be some deficiency in chemists' education (which would not be extraordinary, looking at the cheap and hurried way it is carried on at the present time), or else that there must be some defect in the practical part of the examinations which prevents the examiners from detecting the weak places in the candidates.

Having thus opened the question, I will not say more now, but should you think proper to insert this letter, I may ask you for a little space for a reply to such comments as it may elicit.

South Norwood. J. H. BALDOCK.

DISPENSING BY MEDICAL MEN.

Sir,—I notice a report in last week's issue "on the practice adopted in the dispensing of medicines in various parts of the country," in which Croydon is placed with those towns in which the dispensing by medical men is not universal, and Reading is placed with those towns in which medical men do all the dispensing but with rare exceptions. I have lived at both places within the last four years, and I found that in Croydon town itself, all medical men, without exception, dispense their own medicines (perhaps I ought to state that the dispensing of one firm of surgeons is done at a chemist's shop, but that shop happens to belong to a surgeon, therefore is little more than an open surgery), whilst at Reading there were to my knowledge three medical men who always wrote prescriptions and never dispensed their own medicines.

Bow, Middlesex. A. H.

ADMISSION OF ENGLISH PREPARATIONS INTO FRANCE.

Sir,—No doubt most of your readers are aware, through the letters and article that appeared in the *Pharmaceutical Journal* in October last, of the great difficulty English chemists in France experience in obtaining English and American patent medicines.

Some two or three months ago, I petitioned the Minister of Agriculture and Commerce, through the influence of the Mayor of this town, to allow a few of those in greatest demand to enter. I have just received the authorization, a copy of which I enclose thinking it will perhaps be interesting to the trade.

As you will plainly observe, although we have been granted this favour, we are no better off than before, for the price fixed by the "Ecole de Pharmacie" is no less than prohibition duty, for it would be quite impossible to obtain such prices as 6 frs. for Lamplough's saline, or 3 frs for a box of Cockle's pills. And why should Lamplough's

saline pay 2 frs. 50 c. duty and Eno's salt only 75 c. I think some arrangement ought to be made between the two countries.

33, *Rue de l'Ecu*, W. H. ABRAHAM.
Boulogne-sur-Mer, France. *English Chemist.*

"Ville "*April* 23, 1879.
"Boulogne-sur-Mer, "Le Maire de la Ville,
"Pas de Calais." "de Boulogne-sur-Mer."
"Objet "A Monsieur Abraham,
"Médicaments anglais "Pharmacien,
"Demande d'introduction "Rue de l'Ecu 33."
"en France.
"Autorisation."

(Translation.)

Monsieur,—Under the date of the 17th of this month, Monsieur Auguste Huget, Sénateur, Maire de Boulogne, received from the Minister of Commerce the following letter in reply to a demand which was made to the French Government through the favour of the Mayor.

"Paris, *April* 17, 1879."

"Monsieur le Sénateur.—Under date of the 10th February last my predecessor informed you that he had submitted to the examination of the School of Pharmacy the demand made by Mr. Abraham for the introduction into France of divers English medicines. The director of this school in his reply informs me that there is no restriction in authorizing the entry into France of the following medicines by payment of the duties as under:—

Lamplough's Saline . . .	2 fr. 50 c. the bottle.
Eno's Fruit Salt	75 c. "
Allcock's Plasters . . .	25 c. each.
Brown's Troches . . .	1 fr. 05 c. the box.
Keating's Lozenges . . .	75 c. "
Powell's Balsam	1 fr. 05 c. the bottle.
Cockle's Pills	1 fr. 05 c. the box.
Condy's Fluid.	80 c. bottle.
Homœopathic Medicines .	50 c. the tube.

"Concerning Davenport's chlorodyne, it being a dangerous substance, not authorized, he cannot allow it to be introduced into France.

"Monsieur Chatin having been consulted again has made known—

"1. That the authorization can be permanent for the English medicines for which Mr. Abraham has obtained permission.

"2. That all pharmaciens shall profit by the same.

"3. That all homœopathic medicines can be admitted in a diluted form, but not in the form of mother tinctures. I have the honour to bring under your knowledge these notices of the School of Pharmacy, which I have rectified accordingly with the Minister of Finances, and I request you may make them known to whom it may concern.

"Receive, Monsieur le Senateur, the assurance of my highest consideration.

"Le Ministre de l'Agriculture et du Commerce.

"P. TIVARD."

"To M. Huget, Sénateur, Maire de Boulogne-sur-Mer."

"I hasten to give you this decision according to the demand made by M. le Senateur Huget, and I have also given notice to the local press.

"Believe me your, most respectfully,
"Le Maire de Boulogne.
"Dr. Avion, Adjt."

NOTE ON LIQUOR FERRI PERCHLOR. FORT.

Sir,—In operating on a large quantity of liq. ferri perchlor. fort., I adopted the process suggested by Mr. E. B. Shuttleworth,* viz.:—that of adding gradually the acid solution of protochloride of iron to the nitric acid instead of (as prescribed in the British Pharmacopœia) adding the acid to the proto-salt.

This reversion of mixing I think, leaves nothing to be desired in the satisfactory oxidation of the proto-salt, as the change is instantaneous (even in the cold) accompanied by brisk but regular evolution of nitrous gases.

The time taken to complete the oxidation of two batches (75 gallons each) was in each case fifteen minutes, the resulting liquor possessing its characteristic rich olive-brown colour.

The process also answers well for the preparation of liq. ferri persulph., but is hardly so satisfactory as in the former preparation.

9, *Bull Ring, Birmingham.* A. E. ROBINSON.

* *Pharmaceutical Journal*, 3rd series, No. 460, p. 859.

WHAT SHOULD BE CHARGED FOR POISONING A DOG?

Sir,—Pray allow me a small space for a question in connection with this subject, although I very much fear, after the toxicological and posological letters you have published, my inquiry will be considered a descent from the high ground of science to the arena of trade.

What is the fee that is generally expected for poisoning a dog or cat? and is the honorarium to be increased if the animal is visited at its residence instead of being brought to the pharmacy? It has been my experience in this latter case to have the body left with me as a present, with a hope expressed that I would give it decent burial; and this has been considered a sufficient remuneration. Not very long since a lady sent me a rat in a trap with a polite request that I would poison it for her.

Could, also, some of your readers inform me whether co-operative stores undertake such work in their "drug department," because if they do I shall most gladly refer some of my *clientèle* to the "Civil Service" or the "Army and Navy."

13, *Baker Street, Portman Square.* JOHN TAYLOR.

A. Grist.—(1). *Veronica hederifolia.* (2). Send a specimen when in flower.

"*Sigma.*"—Consult the Secretary, who will advise you as to the proper course to take.

J. P. R.—See the paper by Mr. Stiles on Cod Liver Oil with Quinine in vol. v. of the present series, p. 641.

J. R. P.—The subject has not escaped the attention of the Council; and in the Bill of the late Government to amend the law relating to jury service it had secured the insertion of a clause exempting all registered chemists and druggists. That Bill failed to pass, and the reform of the jury laws has been postponed in favour of more urgent business, but the Council would no doubt endeavour to influence in a similar way any legislation on the subject.

W. W.—(1). For Donovan's paper, see *Pharm. Journ.*, 2nd ser., vol. vi., p. 541. (2). We cannot say exactly how much, but should think not more than a very small quantity could be used without causing some injury.

R. Roberts.—Nos. 1, 2, 4 and 5 are named correctly. (3). *Viola sylvatica*, var. *α*, *Reichenbachiana*. (6). *Primula veris*.

A. Mitchell.—(I). *Mercurialis perennis*. (2). *Adoxa Moschatellina*.

B. Dickinson.—*Mercurialis perennis*.

T. C. Maggs.—"Onycha" is considered by some to have been a kind of shell which gave off an odour when burnt, and "stacte" possibly was gum storax.

"*Socius.*"—What you have sent is a mixture of coltsfoot leaves (*Tussilago Farfara*) with lavender flowers and rose petals.

"*S. N. D.*"—The Act does not apply to the dealing in patent medicines.

"*Spinks.*"—Your first question should be addressed to the Secretary of the Apothecaries' Society. As to your second, all the legislation on the subject is contained in the 15th section of the Pharmacy Act, 1868.

J. F. R. and *Islington.*—The formula for liquor copaibæ c. cubeba et buchu has been asked for more than once in the present volume.

Buxton.—Dr. King's 'Manual of Cinchona Cultivation.'

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Haydon, White, Kemble, Hornsby, Schofield, Vizer, A. P. S., J. A. W., J. B. M., K. A., Juvenis, Nemo, Rhubarb, Modified Assistant, Sufferer, Apprentice, Pharmaceutical Chemist.

ANALYSES OF RHUBARB.

BY HENRY G. GREENISH.

In the early part of last year Professor Dragendorff undertook a series of analyses of rhubarb which had for their object the comparison of several different samples of this drug with one another, with especial regard to the quantity of active constituents contained in them. The results of these analyses were published in the *Pharmaceutische Zeitschrift für Russland*, for February, 1878, a translation of which subsequently appeared in this Journal.* The analyses of the following four samples of rhubarb were made with a similar view of ascertaining, for the purpose of comparison, the quantities of the various constituents, active or otherwise. The method adopted was similar to, though not identical with that adopted by Professor Dragendorff.

1. *Rheum Chinense.*—Commercial rhubarb. Forwarded to the Dorpat Institute from the Pharmaceutische Handelsgesellschaft in Petersburg as a fine sample.

2. *Rheum Sibiricum.*—Young roots collected by Dr. Duhmberg, of Barnoul, in the Sajan Gebirge.

3. *Rheum Mandshuricum.*—Sent as sample to the Pharmaceutische Handelsgesellschaft in St. Petersburg. Large, somewhat spongy masses, apparently from very old plants. Partly unsound in the centre. My sample was taken from a sound piece.

4. *Rheum Palmatum.*—The fresh root, of four to five years' growth, was sent from the St. Petersburg Botanical Garden to the Dorpat Pharmaceutical Institute for examination.

The quantity necessary for analysis was rasped from the root, care being taken to avoid unsound parts, and passed through a sieve containing 169 meshes to the square centimetre.

Method of Analysis.

I. *Estimation of Moisture* (*at* 110° *C.*).—

1. 0·8360 lost 0·8400 = 10·04 per cent.
2. 1·0345 „ 0·1060 = 10·24 „
3. 1·4885 „ 0·9850 = 6·63 „
4. 1·0780 „ 0·9725 = 9·02 „

II. *Estimation of Ash.*—The above estimation of moisture having been made in a platinum dish, the residue was incinerated and the ash weighed. The oxalate of calcium which is present, however, yields on incineration $CaCO_3$, not CaO. To facilitate the subsequent calculation of the oxalic acid present, the amount of carbonic anhydride (CO_2) present in the ash was calculated from the amount of oxalate of calcium found in experiment No. XV., and deducted from the ash estimation. The latter is therefore given as ash free from CO_2.

1. Yielded ash 0·0940 = 11·25 per cent., of which CO_2 = 3·19 per cent. = 8·06 per cent. ash free from CO_2.
2. Yielded ash 0·0310 = 2·99 per cent., of which CO_2 = 0·15 per cent. = 2·84 per cent. ash free from CO_2.
3. Yielded ash 0·4530 = 30·43 per cent., of which CO_2 = 15·20 per cent. = 15·23 per cent. ash free from CO_2.
4. Yielded ash 0·0520 = 4·82 per cent., of which CO_2 = 0·28 per cent. = 4·54 per cent. ash free from CO_2.

III. *Estimation of Phosphoric Acid in the Ash.*—The ash was treated with dilute hydrochloric acid in which it was almost entirely soluble, and the solution transferred without filtration to a small glass beaker; acetate of sodium was then added and the phosphoric acid present estimated by means of acetate of uranium solution (1 c.c. = 0·0040 P_2O_5).

1. Required 3.1 c.c. uranium sol. = 0·0124 P_2O_5 = 1·48 per cent.
2. Required 3·4 c.c. uranium sol. = 0·0136 P_2O_5 = 1·31 per cent.
3. Required 10·6 c.c. uranium sol. = 0·0424 P_2O_5 = 2·70 per cent.
4. Required 5·9 c.c. uranium sol. = 0·0236 P_2O_5 = 2·18 per cent.

IV. *Extraction of the Root with Water.*—Five grams of the root were macerated for two days with so much water that the mixture measured 100 c.c., frequently shaken, finally allowed to stand for several hours. The volume of the root residue was then noted.

In No. 1.	38 c.c.
„ 2.	50 c.c.
„ 3.	21 c.c.
„ 4.	25 c.c.

The liquid was then filtered off, care being taken to bring as little as possible of the solid matter on the filter. The filtrate (amounting to about 60 c.c.) was employed in experiments V., VI., VII., VIII., IX., and X. The residue of the root was washed by decantation, the wash water being filtered through the same filter. Lastly, a second filter of gauze was placed within the paper filter and the whole undissolved mass brought therein, allowed to drain, and dried at about 30° C. The filters were set aside for use in experiments XII., XIII., XIV. and XV.

V. *Estimation of Extract and Ash in Extract.*—Of the aqueous infusion obtained in experiment IV., 10 c.c. were evaporated to dryness in a platinum dish, weighed, incinerated and again weighed, the difference being the combustible organic substances present.

1. 0·1895 = 37·90 per cent. Ash 0·0120 = 2·40 per cent. Combustible substances soluble in water = 35·40 per cent.
2. (5 c.c.) 0·0795 = 31·80 per cent. Ash 0·0045 = 1·80 per cent. Combustible substances soluble in water = 30·00 per cent.
3. 0·1237 = 24·74 per cent. Ash 0·0055 = 1·10 per cent. Combustible substances soluble in water = 23·64 per cent.
4. 0·1520 = 30·40 per cent. Ash 0·0175 = 3·50 per cent. Combustible substances soluble in water = 26·90 per cent.

VI. *Estimation of Mucilaginous Matter.*—20 c.c. of the aqueous infusion (= 1 gram root) were mixed with 60 c.c. alcohol (95 per cent.), and the precipitate after twenty-four hours collected on a tared filter, washed with alcohol, dried and weighed.

1. 0·0172 = 1·72 per cent.
2. 0·0275 = 2·75 „
3. 0·0095 ash = 0·0010. Mucilage = 0·85 per cent.
4. 0·0385 „ = 0·0145. „ = 2·40 „

VII. *Estimation of Cathartic Acid.*—The filtrate from VI. was rapidly evaporated on a water-bath till the residue measured 5 c.c. 40 c.c. of absolute alcohol were then added and the precipitated cathartic acid collected on a tared filter, washed with absolute alcohol, dried and weighed.

1. Precipitate = 0·0496 = 4·96 per cent.
2. Precipitate = 0·0195, ash 0·0025, cathartic acid 1·70 per cent.
3. Precipitate = 0·0070, cathartic acid 0·70 per cent.
4. Precipitate = 0·0635, ash 0·0160, cathartic acid 4·75 per cent.

In No. 4 the amount of cathartic acid is too high and the precipitate, which differs materially in appearance from that yielded by Nos. 1, 2 and 3, contains only a small quantity of that principle.

* *Pharmaceutical Journal* [3] viii. p. 826.

To determine whether the sample really possessed high aperient properties, 1·1 gram was taken internally but produced no aperient effect whatever.

VIII. *Estimation of Chrysophan and Tannin.*—20 c.c. of the aqueous infusion were mixed with solution of acetate of copper in slight excess. The precipitate was collected with as little delay as possible on a tared filter, washed with water (care being taken not to use more than absolutely necessary), dried and weighed. It was then ignited in a porcelain crucible with nitrate of ammonia, the residuary oxide of copper weighed, the difference representing chrysophan and tannin.

1. Precipitate 0·1330, CuO = 0·0372, chrysophan, etc. = 0·0958 = 9·58 per cent.
2. Precipitate 0·0650, CuO = 0·0147, chrysophan, etc. = 0·0503 = 5·03 per cent.
3. Precipitate 0·1225, CuO = 0·0250, chrysophan, etc. = 0·0975 = 9·75 per cent.
4. Precipitate 0·1210, CuO = 0·0415, chrysophan, etc. = 0·0795 = 7·95 per cent.

IX. *Estimation of Organic Acids (Malic, etc.).*—The filtrate from experiment VIII. was precipitated with neutral acetate of lead, the precipitate collected, washed, dried, weighed, incinerated and the residual oxide (and (?) phosphate) of lead weighed, the difference giving the organic acids precipitable by neutral acetate of lead.

	Precipitate.	PbO.	Organic Acids.
1.	0·0310	0·0082	0·0228 = 2·28 per cent.
2.	0·0293	0·0065	0·0228 = 2·28 „
3.	0·0055	0·0007	0·0048 = 0·48 „
4.	0·0235	0·0170	0·0065 = 0·65 „

X. *Estimation of Sugar.*—This was attained in various ways. In No. 1 the alcoholic extract from 2 grams of rhubarb (experiment XX.) was treated with water, the filtrate mixed with basic acetate of lead and again filtered. The filtrate was freed from lead by means of sulphuretted hydrogen, boiled, filtered from sulphide of lead and evaporated to 30 c.c. The sugar was then estimated by means of Fehling's solution.

5 c.c. Fehling's solution required 16 c.c. sugar solution = 0·025 gram, grape sugar = 2·34 per cent.

In No. 2 the filtrate from experiment IX. was treated with basic acetate of lead as in No. I.

10 c.c. Fehling's solution required 18·1 c.c. sugar solution = 0·05 gram, sugar = 8·28 per cent.

In Nos. 3 and 4 the estimation was made directly in the aqueous infusion, that being precipitated with basic acetate of lead, filtered, the filtrate freed from lead by means of dilute sulphuric acid and again filtered.

No. 3. Aqueous infusion corresponding to 2 grams yielded 130 c.c. of liquid of which 45 c.c. were required to precipitate 5 c.c. Fehling's solution, sugar = 3·60 per cent.

No. 4.—Aqueous infusion corresponding to ·5 gram yielded 65 c.c. of solution of which 24 c.c. were required to precipitate 1 c.c. Fehling's solution, sugar = 2·78 per cent.

The results then are—

No. 1	2·34	per cent. sugar.
„ 2	8·28	„ „
„ 3	3·60	„ „
„ 4	2·78	„ „

XI. Of the organic substances soluble in water estimated in Experiment V., we have now accounted for in Experiments VI., VII., VIII., IX. and X.

In No. 1	18·40	per cent.	out of	35·5,	difference 17·10
„ 2	20·29	„	„	30·00,	„ 9·71
„ 3	15·53	„	„	23·64,	„ 8·11
„ 4	18·53	„	„	26·90,	„ 8·37

From Experiment No. XX. we learn that the substances insoluble in alcohol but soluble in water amount to respectively—

No. 1	10·27
„ 2	8·55
„ 3	3·90
„ 4	19·65

of which we have already taken account of mucilage and cathartic acid; the difference must be attributed to a substance soluble in water, insoluble in absolute alcohol (? arabic acid).

No. 1	3·59
„ 2	4·10
„ 3	2·45
„ 4	12·50 (? See below).

Experiment No. XI. shows the substances soluble in water unaccounted for to be—

In No. 1	17·10
„ 2	9·71
„ 3	8·11
„ 4	8·37

The difference is then to be attributed to a substance soluble in water and alcohol not further to be identified.

In No. 1	13·61
„ 2	5·61
„ 3	5·66
„ 4	——

The figure for arabic acid (?) in No. 4 being in excess of the substances unaccounted for, the filtrate from experiment No. VII. was evaporated to dryness and treated with absolute alcohol, in which 15·75 per cent. was soluble, the remaining 3·69 per cent. being soluble in water. The amount of arabic acid is then 3·69 per cent. and, subtracting this from the substances not accounted for (8·37, Ex. XI.), the substance soluble in water and alcohol not further to be identified = 4·68.

XII. After deducting the moisture, ash (free from CO_2), and substances soluble in water from the total weight of rhubarb, there remain in—

No. 1	44·00 per cent.
„ 2	55·12 „
„ 3	53·40 „
„ 4	51·04 „

still to be accounted for.

The residue of the root, after extraction with water, was digested with absolute alcohol six days, filtered through the filter previously used in experiment IV., and the residue of the root washed with alcohol until the washings were nearly free from colour. The filtrate and wash-alcohol were evaporated to dryness and the residue weighed.

No. 1	2·74 per cent.
„ 2	10·15 „
„ 3	2·38 „
„ 4	2·70 „

This residue will include resinous substances soluble in alcohol: emodin, erythroretin, phæoretin, etc.

XIII. The residue insoluble in alcohol was dried at 30° C., reduced to powder and mixed with 0·1 per cent. solution of soda till the volume amounted to 100 c.c. It was then macerated twenty-four hours with frequent shaking. 50 c.c. were filtered off (= 2·5 gram of root) through the filter previously

used in Experiments IV. and XII., neutralized with acetic acid, and mixed with 100 c.c. alcohol 95 per cent. The precipitate was collected after twenty-four hours, washed, dried, weighed, incinerated and the ash weighed. The difference is to be reckoned as metarabic acid, etc.:—

	Precipitate.	Ash.	Metarabin. Per cent.
No 1. . .	0·0740	0·0155	0·0585 = 2·34
„ 2 . .	0·0945	0·0110	0·0835 = 3·34
„ 3 . .	0·0385	0·0105	0·0280 = 1·12
„ 4 . .	0·1600	0·0155	0·1445 = 5·86

XIV. The remainder of the mixture was washed with water, brought into a flask, diluted with water to 150 c.c., brought to boiling point, cooled to 40° C., a few centigrams of a very active diastase added, and digested at 40° C. for four hours. The liquid was then filtered off, and the residue washed. The filtrate and wash-water were mixed with so much concentrated HCl that the mixture corresponded to an acid of 4 per cent. strength. This was then boiled for two hours in a flask provided with condenser-tube. The liquid, after cooling, was filtered, made up to a certain bulk, and the sugar formed determined by means of Fehling's solution. From this the quantity of starch was calculated:—

No. 1. Filtrate, 230 c.c. 5 c.c. Fehling = 25·3 c.c. Starch = 3·69 per cent.

No. 3. Filtrate, 200 c.c. 1 c.c. Fehling = 70 c.c. Starch = 0·26 per cent.

The estimations of No. 2 and 4 proving unsatisfactory, two grams of the root were exhausted with water, and the starch determined as the residue as above described.

No. 4. Filtrate, 60 c.c. 10 c.c. Fehling = 20·5 c.c. Starch = 6·92 per cent.

No. 3. Filtrate, 77 c.c. 10 c.c. Fehling = 15·2 c.c. Starch = 11·98.

It must be understood that the term "starch" is here made to include substances saccharifiable by means of diastase.

XV. The residue, after saccharification of the starch, was washed with water, brought into a graduated cylinder, and made up with 1 per cent. hydrochloric acid to 100 c.c., digested twenty-four hours with frequent shaking, then transferred to a flask, rapidly brought to boiling point, cooled and 50 c.c. filtered off. This was then made alkaline with ammonia, and 150 c.c. of alcohol, 95 per cent. added. The precipitate, consisting of oxalate of calcium and a substance resembling pararabin, was collected, washed, dried and weighed, incinerated and again weighed. From the amount of ash was calculated the amount of oxalic acid in the rhubarb, and the difference between the precipitate and the oxalate of calcium gives the amount of pararabin.

	Precipitate.	Ash ($CaCO_3$)		Per cent.	Pararabin, per cent.
No. 1.	0·3360	0·1945	whence $Ca_2C_2O_4$	7·87	3·48

	100·00	100·00	100·00	100·00

A comparison of these results with the analyses of Professor Dragendorff, previously referred to, shows—

(i). In *Rheum chinense*, in regard to active principles (cathartic acid, chrysophan, tannin, etc.), a very satisfactory agreement.

(ii). In *Rheum sibiricum* agreement in the peculiarity of this root, previously pointed out by Professor Dragendorff, viz., the large amount of free chrysophanic acid.

(iii). In regard to *Rheum mandshuricum*, that this is an inferior rhubarb, the introduction of which into Europe can only be sanctioned as a speculation on its richness in chrysophan and tannin, etc.

(iv). It would tend to show, in regard to *Rheum palmatum*, either that this plant forms the most important therapeutic constituents only in a more advanced state of growth, or that in the St. Petersburgh climate it is incapable of so doing. The sample examined characterizes itself as a young root by the large amount of proteinaceous, amylaceous and mucilaginous substances it contains.

It only remains for me now to express my sincerest thanks to Professor Dragendorff for the unfailing interest taken in this investigation.

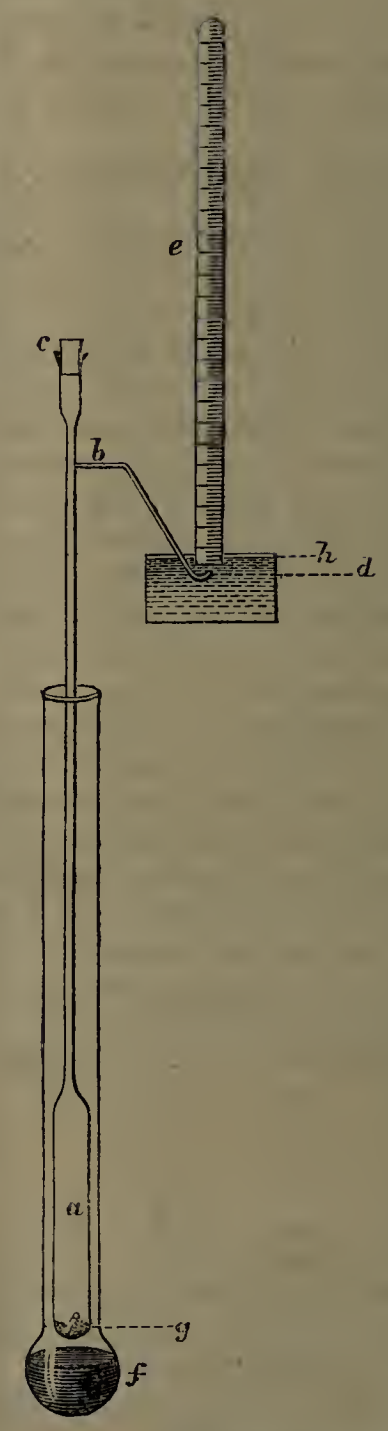
Dorpat, Russia.

NOTE ON VICTOR AND CARL MEYER'S METHOD FOR THE DETERMINATION OF VAPOUR DENSITIES.*

BY DR. A. SENIER, F.I.C., F.C.S.,

Demonstrator in the Laboratories of the Pharmaceutical Society.

It is unnecessary for me to remind the members of the Students' Association of the great importance of vapour density in the determination of molecular weights, nor need I dwell upon the methods of Gay Lussac and Dumas, with their modifications, by means of which up to the present time vapour densities have been obtained. Within the last few months a new method has been proposed, and has been received with so much favour that it will probably supersede both the older methods. For this invention chemists are indebted to Professor Victor Meyer and Herr Carl Meyer, of the Zurich Polytechnikum.† In principle the new method resembles that of Gay Lussac, inasmuch as from a given weight of substance the volume of vapour is estimated. It differs by estimating the volume of vapour by an equal volume of air which it is made to displace.



The figure represents the essential parts of the apparatus required by V. and C. Meyer's method for substances boiling below 300° C. The vapour density vessel, *a b c*, is a glass tube with an enlarged cylindrical end *a*, and an almost capillary exit tube *b*, joined to it near the rubber stopper *c*. The enlarged portion *a* is 200 millimetres (about 8 inches) long, and has a capacity of 100 cubic centimetres (about 3½ fluid ounces). The stem is about 600 millimetres long. The graduated tube *e*, filled with water, is inverted in the small pneumatic trough *d* containing water.

The vapour density apparatus, *a b c*, is surrounded by the glass vapour-bath *f* nearly up to the exit tube *b*. This bath may be furnished with water, anilin, or other substance, the vapour of which is

* A Report read and experimentally illustrated at the meeting of the School of Pharmacy Students' Association, May 8, 1879.

† *Ber. Deut. Chem. Ges.*, 1878, pp. 1867 and 2253.

sufficient to volatilize the body whose density is to be determined. In the case of bodies boiling above 300° C. iron is used in place of the glass of the bath and melted lead instead of vapour of water, anilin, etc. In this case a somewhat different shaped bath is employed and special precautions are adopted to prevent fracture of the glass vapour density apparatus. *g* shows the position of the tube, sealed at one end, containing the weighed substance when the operation is in progress, also a little asbestos previously introduced to break the fall of the little tube.

The working of the method will be best understood by an illustration taken from some results which I have obtained—not the best, but a fair average one. Commercially pure benzol, further purified by two crystallizations was employed. This would be approximately though perhaps not chemically pure. The apparatus was arranged as shown in the figure, except that the little tube was withdrawn and the mouth of the exit tube *b* was rotated horizontally from under the graduated tube. Heat was then applied to the bulb of the bath *f* containing water until a fairly constant state of ebullition was attained and no more air escaped from the exit tube. Sufficient benzol was weighed into the little tube to give a volume of vapour that would one-third or at most half fill the enlarged portion *a* of the vapour density apparatus. This can usually be ascertained nearly enough theoretically, but if not it must be made the subject of a preliminary experiment. In this experiment the weight of benzol taken (S) was ·0859 gram. The stopper at *c* was then removed and the benzol tube dropped in; the air which it displaces is not regarded. The stopper was immediately replaced and the mouth of the exit tube was rotated into position under the graduated tube. The benzol vaporized gradually in the lower part of *a*, and in a few minutes expelled a quantity of air of the same volume and temperature as the benzol vapour. When no more air was expelled the graduated tube was removed in the ordinary way to a deeper trough, in which it was measured. The volume (V) was 25·9 c.c. This corrected for temperature (temperature of trough in which it was measured = *t* = 20° C.) and for pressure (pressure of atmosphere = B = 762 5 mm. less vapour tension at *t* = W = 17·39 mm.) gives cubic centimetres of air at 0° C. and 760 mm. pressure = 23·658 c.c. Now every cubic centimetre of air at standard temperature and pressure weighs ·001293 gram, multiplying by which number gives weight of air *l* = ·030592 gram. Then—

$$\frac{\text{Weight of vapour}}{\text{Weight of equal bulk of air}} = 2{\cdot}81 = \text{v. density (air} = 1).$$

The following formulæ indicate in a condensed form the mathematical part of a determination. Their derivation may be easily understood if the calculations above indicated be made, using letters instead of actual figures :—

$$\text{V.D.} = \frac{\text{S } 760\ (1 + {\cdot}003665\ t)}{(\text{B} - \text{W})\ \text{V}\ {\cdot}001293}$$

or

$$\text{V.D.} = \frac{\text{S } (1 + {\cdot}003665\ t)\ 587780}{(\text{B} - \text{W})\ \text{V}.}$$

In certain cases nitrogen is substituted for air in the vapour density apparatus. A little reflection will suggest many apparent errors in this method, which V. and C. Meyer have reduced to a minimum by the construction of the apparatus. It is evidently a method which for simplicity leaves very little to be desired, and its great accuracy is shown by a large number of experiments made by Messrs. Meyer upon bodies of various boiling points, varying from chloroform boiling at 61° C. to perchlordiphenyl boiling at over 440° C.

PROCESS FOR THE RAPID ESTIMATION OF MORPHIA IN OPIUM.*

BY A. PETIT.

The errors and difficulties inherent to the various processes followed in the estimation of morphia in opium have frequently been pointed out, one of the best grounded objections being certainly that which is based on the length of the various processes. The following method appears to me to exclude most of the causes of the errors noticed by authors; whilst the duration of the experiment, which does not exceed two hours, will facilitate assays and the commercial transactions depending on them, which are often rendered impossible by the length of the analysis.

A comparative investigation of the process now proposed and of that of Guillermond has given results always to the advantage of the new method.

The mode of operating is as follows:—Take 15 grams of the opium to be assayed, suspend it in 75 grams of distilled water and afterwards throw it upon a filter. Take 55 grams of the filtrate, which would represent 10 grams of opium, add 3 c.c. of ammonia, and agitate. The deposit of morphia takes place rapidly under the form of a crystalline powder. The whole is allowed to stand for a quarter of an hour and then 27 grams of 95° alcohol are added. After shaking several times it is again allowed to stand for half an hour and then thrown upon a tared filter. The alkaloid is washed upon the filter with alcohol of 50°. After washing it only requires to be dried and weighed. The mother liquors left to themselves deposit after forty-eight hours only a small precipitate that need not be noticed.

With the same opium the following results have been obtained. Ten grams of opium yielded by the—

New Process.		*Guillermond's Process.*
1·09	of crystalline product.	1·16 of crystalline product containing much more narcotine.
1·08	,, ,,	0·92
1·16	,, ,,	
1·11	,, ,,	
1·06	,, ,,	
1·07	,, ,,	
1·06	,, ,,	

In exact determinations advantage has been taken of the property of narcotine of not saturating acid liquors even in the presence of morphia, the quantity of acid required for the saturation of 25 centigrams of the precipitate obtained being ascertained.

For this purpose 25 centigrams of the precipitate are dissolved in 10 c.c. of a solution of sulphuric acid titrated so as to exactly saturate 25 centigrams of pure morphia dried at 120° C. This liquor contains in a litre 4·30 grams of monohydrated sulphuric acid (SO_3, H_2O).

On the other hand a solution of sucrate of lime is prepared of a strength that 10 c.c. should saturate exactly 10 c.c. of the sulphuric solution. It remains then only to ascertain how much of the sulphuric solution would be saturated by 25 centigrams of the morphia obtained in the various assays.

If the 25 centigrams should saturate exactly the 10 c.c. of sulphuric liquid the morphia would be pure; in the contrary case the quantity of real morphia contained in the mixture would be given in hundredths by the number of tenths of cubic centimetres of the 10 c.c. of sucrate of lime solution not required, and which remain unused, for the saturation of the 10 c.c. of sulphuric solution left

* *Journal de Pharmacie et de Chimie* [4], xxix. 159.

unsaturated by the precipitate. In practice, in order to facilitate the solution of the morphia, it is preferable to employ 20 c.c. of sulphuric solution to dissolve the 25 centigrams of precipitate, bearing in mind that 10 c.c. of sulphuric solution are exactly saturated by 10 c.c. of the sucrate of lime solution.

It has been mentioned that narcotine does not in any way affect the estimation. Therefore, knowing that it required for the saturation of 10 c.c. of sulphuric liquid either 10 c.c. of the sucrate of lime solution or 25 centigrams of morphia, I dissolved 25 centigrams of morphia and 25 centigrams of narcotine in 20 c.c. of the sulphuric liquid and found that in order to saturate the excess of acid there was required exactly 10 c.c. of solution of sucrate of lime. Therefore of the 20 c.c. employed 10 c.c. had been saturated by the morphia and 10 c.c. left unsaturated by it.

Experiments made with various precipitates obtained gave the following results, 25 centigrams of precipitate being dissolved in 10 c.c. of the sulphuric liquid in each case:—

No. 1 required 0·7 c.c. of sucrate of lime solution to saturate uncombined acid.

No. 2 required 0·9 c.c. of sucrate of lime solution to saturate uncombined acid.

No. 3 required 0·6 c.c. of sucrate of lime solution to saturate uncombined acid.

No. 4 required 0·8 c.c. of sucrate of lime solution to saturate uncombined acid.

The pure morphia present is consequently expressed in the following figures:—

No. 1 . . . . . 100 − 7 = 93 per cent.
No. 2 . . . . . 100 − 9 = 91 „ „
No. 3 . . . . . 100 − 6 = 94 „ „
No. 4 . . . . . 100 − 8 = 92 „ „

I would add that by this process the extract proportion of morphia is obtained, whilst by other methods the morphia weighed contains more or less resin or foreign extractive matter.

An analysis of a mixture of morphia and narcotine is easily made by dissolving the morphia in an excess of potash and examining the solution in a polarimeter. Hitherto the coloration of the liquor has prevented me from obtaining satisfactory results in the estimation of opium. But I intend trying whether decolorization with animal charcoal will enable me to solve this problem.

THE RELATIONS BETWEEN THE ACTIVE PRINCIPLES AND THE BOTANICAL CHARACTERS OF OFFICINAL PLANTS.*

BY PROFESSOR A. HERLANDT.

Are the relations existing between the properties and the physical characters of plants, as observed since the earliest botanical studies, merely coincidental, or are they governed by the laws of natural affinity, which endeavours to systematically associate all living beings?

The only important work on this subject is A. P. De Candolle's, 'On the Medicinal Properties of Plants Compared with their External Characters and their Natural Classification.' This, like all his productions, is a masterpiece, which would obviate the necessity of again studying the question, if several circumstances did not compel it.

In the first place, his work dates from a time (1816) when chemistry had not isolated with certainty a single active principle. Very little was known of the analogy existing between families, and the latter themselves, being very deficiently limited, embraced many foreign elements. Notwithstanding that the majority of scientific men accepted the law suggested by Linnæus and extended by De Candolle, there were some who would either not recognize it at all or admit it very reluctantly. Chief among them I mention J. Chatin, he contradicting the theories of De Candolle most openly. In his work 'On the Seat of Active Principles in Plants,' he says: "Apocynaceæ.—Their properties differ greatly according to the species, consequently the celebrated theory of the similarity of the medicinal and botanical characters, which De Candolle so emphatically supports, has no solid foundation."*

It is not my intention to review the work of De Candolle, but only to investigate some parts of the above interesting question, especially in regard to the limit of comparison which should be observed between the plants and the relative properties of their natural orders.

All authors accept as limit of comparison between plants the action which they exert on the animal organism. De Candolle found this view of the question deficient, but the state of chemistry at his time warranted no other conclusion.

To establish an analogy a well-defined boundary must be fixed upon, which in this study cannot be done by examining simply the properties of plants, but rather the nature and properties of their principal constituents.

All really medicinally active plants contain substances which, in most cases, have been isolated and chemically studied. These substances do not always embrace the entire properties of the vegetable from which they are obtained. On the contrary, it frequently occurs that the greatest diversity exists in their respective actions. The cause of this seeming anomaly is generally due to the fact that the activity of a plant represents the action of several bodies possessing different properties; therefore the action exerted on the animal organism by the vegetable is the result of different, sometimes even opposite, influences. This also makes the strongest point against the too eager endeavour of modern therapeutics to replace all plants by their active principles; it is also the principal cause of the difficulty met in the systematic classification of the simple medicinal plants according to their properties.

The importance of the chemical study of plants increases daily; it is the base of rational materia medica. Analysis is the only safeguard against the flooding of pharmacy by innumerable plants, which, to maintain in or introduce into it, would interest only charlatanism or ignorance. An officinal plant, whose constituents are not known, is nothing better than an empirical remedy.

A very important fact which must be borne in mind is that the properties of the indisputably active constituents are not solely dependent upon the proportion of the elements united in their composition, but also on their molecular constitution. Bodies may be isomeric, have the same elements in the same proportions, and yet differ in their properties.

Such perplexing instances are morphia and piperina, thebaia and buxina. Then again, only the slightest difference in the chemical composition alters the properties of the bodies very materially. For example, quinia and emetia, both existing in the nat. ord. Rubiaceæ, differ only, provided the formula for the latter is correct, in the latter containing three molecules more water than the first. A still more striking example is offered by morphia and its derivative, apomorphia, the former containing only one more molecule of water than the other.

Evidently, there exists a tie between the narcotic papaveraceæ of the genus papaver and the emetic and irritant papaveraceæ of the genus *Chelidonium* and *Sanguinaria*. As known, curare prepared from *Strychnos toxifera* possesses entirely different properties than the

* Translated from *Archiv d. Pharmacie*, July (*Jour. de Méd. de Bruxelles*, 1878, March). From the *American Journal of Pharmacy*,

* Chatin makes use of the same law which he rejects, for in the same work he classes the plants in families, and then states their medicinal properties. He admits that the *malvaceæ* are mucilaginous; that the *crucifera* show "a remarkable similarity in their therapeutical properties;" that the *loganiaceæ* contain a poisonous principle: in short, a large number of facts supporting the theory of Linnæus.

alkaloids of the other species of strychnos; but, by the experiments of Crum-Brown, Fraser, Jolyet, A. Cahours and Schroff, it has been demonstrated that the ethylated and methylated derivatives of strychnia act in the same manner as curare. Here, then, chemistry enlightens us on a point which at first glance appears to contradict the theory of Linnæus, and which, if the physiological properties were taken as standard of comparison, would be incomprehensible.

We know very little in regard to the laws which regulate the formation of the proximate constituents in the vegetable organism. We know that plants, like all living beings, are chemical apparatuses in active operation; but we know only the products, not the processes to which they owe their origin.

We may infer that oils and fats are more permanent reserve-nutriments than sugar and starch; but when vegetation is again awakened they are changed to soluble nourishments. We may suppose that the ethereal oils of flowers are antiseptics, intended to shield their organs from the attacks of lower parasites. We know that the resin with which the buds are coated protects them from moisture; but what more do we know? "Of the entire long list of substances like colouring matters, acids, alkaloids, wax, tannins, pectin, etc., the relation to other processes of transformation is unknown, as well as the physiological process in the plant life" (J. Sachs' 'Handbook of Botany').

One of the principal consequences of the various reactions occurring during the life of a plant is the change of the nature and properties of the active principle according to the time at which the plant is analysed, and according to the organ which is examined. This indicates the necessity of having a specified time—a balsamic period, as the ancient writers have it—for collecting every plant and every part thereof.

We will not here consider the influence of the soil on the chemical composition of officinal plants. This influence certainly exists, but its significance has undoubtedly been over estimated; generally it only regulates the quantity of water absorbed by the plants. If the plant is of an aromatic nature, moist soil and rain will cause it to be less active. In my opinion, the influence of hybridizing and variation is of much more moment. It is very probable that a natural or artificially produced variety will exhibit a more or less marked difference from the parent type of which it arose. This is only a consequence of the principles of transmutation exemplified by our fruit trees and leguminous plants.

From these observations it follows that to form a limit of comparison between plants, their active constituents must be taken as a foundation, and not their properties. This necessitates the entire discarding of all officinal plants whose composition is not satisfactorily established, especially the exotics, whose properties are even sometimes known merely from descriptions. When chemistry shall have made more advancement, when vegetable physiology shall have explained the office of every active substance, then the principles of Linnæus will become more universal and its exceptions reduced to their actual value. The more or less diluted state of the active substances and the presence or absence of certain anatomical elements have already shown analogies where they did not appear to exist. If, therefore, the exceptions which were incomprehensible to De Candolle are viewed from this standpoint they are easily explained. Potatoes, like other Solanaceæ, contain solania; cherry-laurel is both chemically and botanically closely allied to the peach and other Amygdaleæ. There is not so great a difference, as has been shown by Endlicher and Guibourt, between the properties of colocynth and the more edible fruits of the same order, like melons and pumpkins, only that in the cultivated species the active principle is more diluted by an excess of starch and sugar. Similar is the relation of the sweet potato and jalap; here the influence of cultivation is clearly demonstrated, and to what extent this influence may alter plants is well known. It is also the case with the cultivated plum compared with the harsh sloe of our hedges. The carrot and the hemlock are also mentioned among the exceptions; but, in the first place, it must be remembered that both are situated near the boundaries of a very large order, and that they both differ materially in their organic structure. Conium and analogous plants contain a sap which is absent in the non-poisonous Umbelliferæ. J. Chatin asserts that the active substance is not distributed in the fruits of hemlock in the same manner as in the other Umbelliferæ.

If plants are viewed from the standpoint of their chemical composition a deduction of the Linnæan principle is obvious, which, when their therapeutic properties were studied, seemed inexplicable. There are analogies of the characters and compositions which exist between allied families. De Candolle says in regard to them: "We may even assume that the properties of certain families resembling each other in their organic structure are similar otherwise."

To make this part of the question explicit a truly natural botanic classification would be required, *i.e.*, one that would indicate the origin of the various species, genera and orders, as well as the many ties which connect them, and also the process of development they went through. Such a classification could not be demonstrated by a table, but instead a geographical chart, as it were, would have to be imagined, with the species, genera and families arranged in such a manner that the connecting species are bounded by the neighbouring families. In the present condition of science this is impossible; nevertheless, the relation of organization existing between certain families may be taken into consideration. Let us see, in a few examples, whether the active principles attempt to intermingle to the same extent as the physical characters of two allied families do.

We will begin with the important group of Rutaceæ. Botanically, this family is placed among the Burseraceæ, Ochnaceæ, Ranunculaceæ, and Geraniaceæ. Its relation to the Burseraceæ is established by the analogy between *Ailanthus* and *Rhus*. As we approach from this point we find that to the resinous constituents of the Burseraceæ an acrid volatile substance is added (*Rhus toxicodendron*); the bitter principle of the Rutaceæ disappears and is replaced by acrid, volatile principles (*Ailanthus glandulosa*). *Quassia* and *Picræna*, neighbours of Ochnaceæ, contain, like these, bitter substances. According to Baillon, the Ranunculaceæ are connected with Rutaceæ through the genus *Crossosoma*, which possesses the bitterness of *Quassia;* lastly, the Zygophyllaceæ, with aromatic, astringent leaves, are closely allied to the Geraniaceæ.

The Berberidaceæ, similarly examined, should be placed between the Menispermaceæ, Papaveraceæ and Ranunculaceæ. The botanic relation between the Menispermaceæ and Berberidaceæ is very close, and in both the same active principle, berberina, predominates. The tie connecting the Berberidaceæ with the Papaveraceæ is, for the former, *Podophyllum* and *Jeffersonia*, and for the latter, *Sanguinaria;* these genera nourish, too, on their coloured, acrid and emetic sap. The Ranunculaceæ are connected with the Berberidaceæ by containing berberina in common.

The Cruciferæ, Capparidaceæ and Resedaceæ, botanically allied, contain in various quantities the same active substances (acrid sulphuretted oils). The Polygalaceæ, Caryophyllaceæ and Violaceæ are related by their characters as well as by the saponin and analogous substances (polygallic acid, violin).

We may mention yet that the Leguminosæ and Rosaceæ are rich in gum and tannin; the Juglandaceæ, Balsaminaceæ and Myricaceæ, in aromatic oleo-resins; the Myristicaceæ, Monimiaceæ and Lauraceæ, all rich in aromatic oils.

Sometimes the botanical similarity is not prominent enough to support that of the chemical constitution. For instance, the Ranunculaceæ and Alismaceæ contain an

acrid, volatile body, which is dissipated by drying, but whose chemical nature is scarcely known. Though both families are placed far apart in our systems, they show certain analogies which have been recognized by Andanson and A. L. Jussieu already. Baillon says in reference to this, "Certain Alismaceæ are only to be distinguished from certain water ranunculi by the number of cotyledons contained in their embryo."

Finally, there exists, according to Claus, a similarity in the structure and composition between the lower plants and the inferior animals. Cellulose is found in the cloak of the lower molluscs (ascidia); chlorophyll in several animals (stentor, hydra, bonellia). Cholesterin and other characteristic constituents of the nerve-substance have been found in the organs of Leguminosæ. This at first glance appears strange, but it must not be forgotten that the respective organs perform a function similar to the animal organs.

These few examples, which could readily be multiplied, seem to confirm satisfactorily the natural law, the examination of which has been attempted in the foregoing. In every instance where the facts are established, and where the organic structure is known, invisible gradations become evident by which nature succeeds in the gradual differentiation of living beings, and which make our classifications appear incomplete.

Conclusions.—1. Botanic species and families which are similar in their characters are also similar in the nature and properties of their constituents.

2. The species which form the connecting link between similar groups contain constituents belonging to the allied families.

3. The botanic and natural classification of the medicaments of vegetable origin is the only scientific and rational one.

ARTIFICIAL FRUIT ESSENCES.*

BY JOHN M. MAISCH.

Fourteen years ago, Kletzinsky published formulas for fifteen different fruit essences which, in 1867, were republished by several journals (see *Am. Journ. Pharm.*, 1867, p. 238). Several of these formulas were again produced in the last volume of the *Confectioners' Journal* without any alterations except that in the essence of apple the quantity of oxalic acid was reduced from one to a quarter part, and glycerin from four to two parts; in essence of raspberry, the succinic acid was entirely omitted, and essence of peach was directed to be made of 2 oz. of oil of bitter almonds, 1 oz. of acetic ether and 2 pints of alcohol, but the latter product has evidently the flavour of peach kernels accompanied by a slight fruit odour. The flavour of peach fruit may be imitated by using 5 parts each of acetic-butyric and amylacetic ethers, half part (or less) of methyl-salicylic ether (oil of wintergreen), 2 or 3 parts of oil of bitter almonds, and 80 or 100 parts of alcohol.

Kletzinsky's formulas for the extracts of *strawberry* and *raspberry* are much improved by adding from 10 to 20 per cent. of tincture of orris root. If desired the rather acrid taste of this tincture may be removed by precipitating the resin, and if solution of acetate of lead is used for this purpose, the filtrate should be carefully freed from any excess of lead by sulphuretted hydrogen or by agitation with solution of sulphate of sodium, which salt being insoluble in the alcoholic liquid, will not impart to it its peculiar saline taste. The tincture of orris may probably be conveniently replaced by an alcoholic solution of the oil of orris, which has been an article of commerce for some years past.

Since several very important errors had crept into the formulas of Kletzinsky as published in 1867, some of which are, however, readily corrected, it has been thought best to republish all the formulas from Wittstein's 'Vierteljahresschrift,' xvi., p. 268. These formulas are given in *parts by measure* for 100 parts of alcohol, and whenever acids are used, they are to be previously dissolved in alcohol.

* From the *American Journal of Pharmacy*, March, 1879.

Essence of Apple.—Aldehyd, 2 parts; chloroform, acetic ether, nitrous ether and oxalic acid, each 1 part; glycerin, 4 parts; amyl-valerianic ether, 10 parts.

Essence of Pear.—Acetic ether, 5 parts; amly-acetic ether and glycerin, each 2 parts.

Essence of Cherry.—Benzoic ether, acetic ether, each 5 parts; glycerin, 3 parts; œnanthic ether and benzoic acid, each 1 part.

Essence of Black Cherry.—Benzoic ether, 5 parts; acetic ether, 10 parts; oil of persico (peach kernels) and benzoic acid, each 2 parts; oxalic acid, 1 part.

Essence of Peach.—Formic ether, valerianic ether, butyric ether, acetic ether, glycerin and oil of persico, each 5 parts; aldehyd and amylic alcohol, each 2 parts; sebacylic ether, 1 part.

Essence of Apricot.—Butyric ether, 10 parts; valerianic ether, 5 parts; glycerin, 4 parts; amylic alcohol, 2 parts; amyl-butyric ether, chloroform, œnanthic ether and tartaric acid, each 1 part.

Essence of Plum.—Glycerin, 8 parts; acetic ether and aldehyd, each 5 parts; oil of persico, 4 parts; butyric ether, 2 parts, and formic ether 1 part.

Essence of Grape.—Œnanthic ether, glycerin, each 10 parts; tartaric acid, 5 parts; succinic acid, 3 parts; aldehyd, chloroform and formic ether, each 2 parts, and methyl-salicylic ether, 1 part.

Essence of Currant.—Acetic ether, tartaric acid, each 5 parts; benzoic acid, succinic acid, benzoic ether, aldehyd and œnanthic acid, each 1 part.

Essence of Strawberry.—Butyric ether and acetic ether each 5 parts; amyl-acetic ether, 3 parts; amyl-butyric ether and glycerin, each 2 parts; formic ether, nitrous ether and methyl-salicylic ether, each 1 part.

Essence of Raspberry.—Acetic ether and tartaric acid, each 5 parts; glycerin, 4 parts; aldehyd, formic ether, benzoic ether, butyric ether, amyl-butyric ether, acetic ether, œnanthic ether, methyl-salicylic ether, nitrous ether, sebacylic ether and succinic acid, each 1 part.

Essence of Pineapple.—Amyl-butyric ether, 10 parts; butyric ether, 5 parts; glycerin, 3 parts; aldehyd and chloroform, each 1 part.

Essence of Melon.—Sebacylic ether, 10 parts; valerianic ether, 5 parts; glycerin, 3 parts; butyric ether, 4 parts; aldehyd, 2 parts; formic ether, 1 part.

Essence of Orange.—Oil of orange and glycerine, each 10 parts; aldehyd and chloroform, each 2 parts; acetic ether, 5 parts; benzoic ether, formic ether, butyric ether, amyl-acetic ether, methyl-salicylic ether and tartaric acid, each 1 part.

Essence of Lemon.—Oil of lemon, acetic ether and tartaric acid, each 10 parts; glycerin, 5 parts; aldehyd, 2 parts; chloroform, nitrous ether and succinic acid, each 1 part.

The different manufacturers of artificial fruit essences doubtless prepare them by formulas of their own, and this explains the difference in the flavour, which is particularly noticeable on largely diluting them with water. If the essences have been prepared with a dilute alcohol their odour is more prominent, and they are apparently stronger; but on mixing a small quantity with a large quantity of water in given proportions, the true flavouring strength may be better discerned.

A fruit essence, which is much employed in the United States, is *essence of banana*; it consists usually of butyric ether and amyl-acetic ether, equal parts, dissolved in about 5 parts of alcohol.

The red colour of strawberry and raspberry essence is produced by anilin red (fuchsin), the bluish tint of which is conveniently neutralized by a little caramel. If caramel alone is used for colouring essence a yellow or brown colour is obtained, according to the quantity used.

The *Confectioners' Journal* gives formulas also for the following essences:—

Essence of Blackberry.—Tincture of orris root (1 to 8), 1 pint; acetic ether, 30 drops; butyric ether, 60 drops.

Essence of Nectarine.—Extract of vanilla, 2 parts; essence of lemon, 2 parts; essence of pineapple, 1 part.

The Pharmaceutical Journal.

SATURDAY, MAY 17, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE PHARMACEUTICAL "MAY MEETINGS."

IN the course of the ensuing week the members of the Pharmaceutical Society and their friends will have again assisted at the series of reunions which have now become as much established institutions for the sake of entertainment and social intercourse as the anniversary meeting is for the transaction of business. The anniversary dinner this year has been arranged upon a plan somewhat different from that of preceding years, and the change has been made out of consideration for certain difficulties resulting from the former plan. To meet the requirements of providing a suitable entertainment it was found to be indispensable that a number of guests exceeding two hundred should be guaranteed, and to secure this attendance at the dinner as well as to provide for any possible deficiency of funds it was also found necessary to have a large number of stewards each of whom should undertake to be responsible for some proportion of the extra expenditure which would be incurred.

This mode of procedure is always followed to some extent in carrying out such matters as public dinners, but experience has shown that in the case of the Pharmaceutical Society's Annual Dinner its adoption entailed certain inconveniences which were incompatible with the nature of the gathering. Hence it was deemed expedient to make less effort to secure the sale of a very large number of tickets than to provide for the satisfaction of those who might be disposed to attend the dinner of their own free will and without the exercise of any special pressure or inducement held out by the individual stewards. Instead of leaving those who accepted this office to be responsible for any deficiency, and thus placing them to some extent in the position of partial hosts, it has been decided that the social nature of the meeting would be more suitably recognized if each one of the members who went to the dinner were to do so quite independently of such responsibility as had formerly been taken by the stewards.

But with the smaller number that could under these conditions be expected to go to the dinner there came the necessity of increasing the price of the dinner ticket, and this circumstance, unavoidable as it is, seems to have been the means of preventing some who formerly attended the dinner from doing the same this year. We say this seems to be the case for at the time we write there are still several days to elapse before the dinner comes off and it is still impossible to say that the number present may not in fact turn out to be as large as it was last year and in previous years. But it is certain that the number of tickets disposed of up to this time justifies some little feeling of uncertainty as to this being the case. There is of course the love of procrastination and the enticing belief in the sufficiency of the eleventh hour, to be trusted to, and it may be that we shall not see any falling off in the attendance of those who have hitherto contributed to make the Annual Dinner a success not only as an agreeable reunion of friends but an event fraught with advantage to the Society and the trade which it represents.

The next of the social gatherings connected with the Society—the Conversazione—will be held as usual at the South Kensington Museum, and it may be serviceable if we mention that on this, as upon the last occasion, refreshments are to be provided for the visitors to partake of at their own expense, and that hats will not be taken charge of on any consideration. It has been found necessary to adopt these rules from a variety of reasons that it is unnecessary to go into here; but for the more certain prevention of any such dissatisfaction as it has been stated was experienced in some instances last year, we think it will be useful to mention these facts.

At the business meeting, which is to intervene between the Dinner and the Conversazione, the discussion of the "female" question seems likely to occupy some time. Already notices of motion have been given by Mr. WADE on behalf of the ladies, and by Mr. VIZER in support of their undesirability as members of the Society. In our correspondence columns, also, communications will be found on this vexed question which suffice to show that it is not free from misconceptions which in themselves might cause unnecessary trouble. In the first place, Mr. POCOCK is in error in supposing that the "female" question can be decided by the vote of a general meeting or that a resolution carried at such a meeting can amount to anything more than an expression of the opinion held by the majority of persons at the meeting. The admission of women as members, associates, apprentices or students of the Pharmaceutical Society is possible only as an act of the Council in regard to individual cases, just as in the case of any registered pharmaceutical chemist who may—according to the provisions of the tenth section of the Pharmacy Act, 1852—be eligible to be elected as a member of the Society, and hitherto, in those instances where an objection has been raised to the election of a proposed person upon the ground that such person was a woman, the action of the Council as a body has been adverse to the election.

It is true that within the Council, as well as

outside of it, there is division upon this point and a difference of opinion, but that is in both cases so evenly balanced that the decision of the "female" question could scarcely be hoped for from any other proceeding than a general canvass of the members of the Society, and even then such a decision would not bind any particular Council in the future from resolving not to elect some registered pharmaceutical chemist to membership on the ground that the person so applying for admission into the Society was a woman.

The judgment given in the appeal against the decision of the County Court Judge in the prosecution of the London and Provincial Supply Association, Limited, for infringement of the Pharmacy Act will no doubt afford matter for some mutual congratulations between the Council and the members of the Society; but it must be remembered that the question raised in that case is not yet finally settled. Notice of further appeal has been given, and, as we understand, it is expected that the hearing cannot come on before November next, so that in the meantime, at least, the attainment of any practical result will be in abeyance.

On the morning of Tuesday, the 20th inst., the third annual general meeting of the members of the Chemists and Druggists' Trade Association will be held at the Inns of Court Hotel, Lincoln's Inn Fields, and according to information received from Mr. HAYDON, the secretary of the Association, that meeting will be preceded by a meeting of the general committee to be held in the same place at half-past 10 for 11 a.m. The chief business to be transacted at these meetings, according to the notices issued, will consist in the consideration of the report of the executive committee and the general financial statement. The general meeting is also to discuss questions affecting the interests of the trade.

THE MEDICAL BILLS.

FROM what took place in the House on Monday night it may be gathered that it is far from certain that there will be any legislation upon medical reform during the present session. It would appear that Mr. ERRINGTON and those who act with him are desirous that the whole of the Medical Bills now before Parliament should be referred to a Select Committee; whilst the Government, on the contrary, intended that only the disputed question of the constitution of the Medical Council should be so referred, it being willing, however, to promise that the Government Bill should not be proceeded with until the Committee reported. This was stated on Monday by Lord GEORGE HAMILTON in reply to a question by Mr. ERRINGTON, and his Lordship added that the Government, finding itself prevented by a motion made by Mr. ERRINGTON from following the course it originally proposed, would, as the only chance of avoiding further postponement of legislation, give way, and if the gentlemen who had amendments to the different Bills standing in their names would withdraw them he would move that the Bills be referred in their entirety to a Select Committee.

NOXIOUS GASES BILL.

THE introduction into the House of Commons by Mr. SCLATER-BOOTH of a Bill to provide for the more effectual condensation of noxious and offensive gases in alkali and other works appears to indicate that it is not the intention of the Government to ignore the late Report of the Royal Commission upon the subject. This Bill, if passed, would not only make the law more stringent in respect to places to which the Alkali Act of 1874 applies, but it would also widen the area affected by restrictive legislation.

In the first place the Bill provides definitely that alkali works and sulphuric acid works shall be so carried on as to secure the condensation of the acid gases evolved in the process of manufacturing sulphuric acid in such works to such extent that in each cubic foot of air, smoke or gas escaping into the chimney or atmosphere the acidity is not greater than is equivalent to four grains of sulphuric anhydride in each cubic foot at 60° F. and a pressure of thirty inches. This is a lower standard than the one suggested by the Commissioners.

With respect to works for manufacturing nitric acid, chemical manures, sulphate and muriate of ammonia, gas liquor and tar distilleries, the Bill would make it compulsory upon the owners to use the best practicable means for preventing the discharge of offensive gases, provided that in cases where sulphuric fumes are produced the law would be satisfied when the above standard is attained. In the case of another group,—including arsenic, cement, copper, galvanizing and tin plate, glass, lead, nickel, salt, spelter, and tar-dye works and salt glazing potteries,—it would give the Local Government Board to order owners of works to adopt means for the prevention of the escape of noxious gases on the report of an inspector that it was possible to do so at a reasonable cost; also to impose limits on the amount or proportion of any specified noxious or offensive gas to be allowed to escape from any works.

Another part of the Bill provides for the registration of works coming under its provisions and for a licence duty to defray the expenses of the execution of this and the Alkali Acts. The Bill stands for second reading on Monday next.

DESTRUCTION OF PHARMACIES IN HUNGARY.

THE following is a statement of the Donations received for the relief of the distressed pharmacists of Szegedin up to the present time:—

	£.	s.	d.
Donations previously acknowledged	18	17	0
Darby, S., London	1	1	0
Hopkin, W. R., London	1	1	0
Mackay, J., Edinburgh	1	1	0

*** Further Donations may be sent, either by post office order or by cheque, addressed to the care of Dr. B. H. PAUL, 17, Bloomsbury Square, W.C.

Number of Council Meetings during the year, 14.

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, May 7, 1879.

Present—Charles R. C. Tichborne, LL.D., Ph.D., President, Dr. Aquilla Smith, Vice-President, Dr. Collins, Messrs. Bennett (Kingstown), Brunker, Goodwin, Hayes, Hodgson, Holmes, Oldham, Payne (Belfast), Simpson.

The minutes of the meetings held on April 2nd and 16th were read and signed.

Two letters from the Chief Clerk of the General Prisons' Board, Ireland, were read. The first acknowledging the receipt of the memorial from this Council on the subject of the compounders to Irish prisons. The second stating that the memorial had been considered by the Board on April 28th, and that the Board would place itself in communication with this Council in reference thereto should necessity arise.

Letters to be marked "read."

Read a letter from M. Edward Schaer, Professor of Pharmacy at Zurich, requesting from the Council such information relative to the history of pharmacy in Ireland as it might be in their power to afford him. He stated that he required this information for publication in an 'Universal History of Pharmacy,' the writing of which he had commenced.

Proposed by Mr. Payne, seconded by Mr. Holmes, and resolved—

"That the Calendars of the Pharmaceutical Society and Apothecaries' Company, and such other papers as may be considered desirable, be sent to M. Edward Schaer in reply to his application."

The first report of the Committee on the Pharmacy Act, Ireland, 1875, a printed copy of which had been sent to each member of Council, was read.

Proposed by Mr. Holmes, seconded by Mr. Bennett, and resolved—

"That the consideration of the report of the Committee on the Pharmacy Act, Ireland, 1875, be postponed until the full report has been presented."

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The twelfth general meeting was held in the Royal Institution, April 17, 1878, the President, Mr. T. Fell Abraham, in the chair.

The minutes of the previous meeting were read and confirmed. Donations to the library were duly acknowleged.

Dr. Symes stated that at the last evening meeting of the Pharmaceutical Society, Mr. Holmes had called attention to a specimen of Shea butter and had given some particulars concerning it. Mention had been made of it some years ago at a meeting of the Association, but as there was no specimen contained in the museum he had procured one to place there. Although at present this substance commanded little interest as a drug, he deemed it desirable that the museum should possess samples of articles of the kind that are brought into the port. Shea butter arrived from the west coast of Africa during the winter months only, along with palm oil, than which it is lighter in colour and firmer in consistency. No special care appears to be taken in its collection or packing, and this might account for its inferiority to that described by Mungo Park, as being superior in flavour to butter from milk. The smaller specimen was one which he had partially refined, and was considerably improved in appearance and flavour. The crude sample had a melting point of 84°, being about 10° lower than Mr. Holmes's specimens. He had been told that the dock labourers apply it externally as a remedy for rheumatism, but he had had no opportunity of testing its merits in that respect. The Indian butter tree (*Bassia butyreaceæ*), however, yields a fat which is but little used as a food and is considered to possess medicinal value as an ointment.

Mr. A. H. Mason, F.C.S., read a paper on "The History of Anæsthesia—Ancient and Modern—The Nature and Power of Various Anæsthetic Agents and their Applications." Anæsthesia, a term used in medicine to describe a state of insensibility to external impressions, either as the result of disease or as induced artificially by the employment of certain substances known as anæsthetics, accomplished:—(1) By the inhalation of gases or vapours; (2) By mechanical means; (3) By the internal administration of drugs. The ancient history of method (3) was fully illustrated from the writings of ancient and modern authors, such as Herodotus, Homer, Pliny, Hugo of Lucca, Dioscorides, Galen, Shakspere, and others, in which the drugs Indian hemp and mandragora were chiefly employed, and of method (2) by compressing the nerves supplying the parts to be operated upon, by means of a tourniquet. The applications of various substances employed to accomplish method (1), from the year 1795 up to the present time, were fully described. The nature and properties of the more important of these anæsthetic agents were illustrated, comprising Professor Simpson's list, viz.:—nitrous oxide, chloroform, sulphuric ether, nitric ether, nitrous ether, alcohol, aldehyde, Dutch liquid, bisulphide of carbon, amylene, hydride of amyl, chloride of amyl, or benzin and benzol, and also those experimented with by the commissioners of the Scientific Grants Committee of the British Medical Association, whose investigations are now being conducted at the Andersonian University, Glasgow, viz.:—Benzine, acetone, pyrrol, bichloride of methylene, amylene, butyl chloride, ethene dichloride, methyl chloride, ethyl chloride, nitrous ethyl ether, isobutyl chloride, ethidene dichloride. The chemistry of the more important of these substances was described, as in the absence of therapeutical they had an interest from a physiological point of view as illustrating some of the experiments which have been made with these bodies. The various theories which have been advanced trying to attribute the power manifested in the physiological action of anæsthetics to some specific cause was next considered. Local anæsthesia, and the composition and properties of Richardson's compound anæsthetic ether were explained, and a deservedly high compliment was paid to the labours of the late Professor Simpson, of Edinburgh, and Dr. B. W. Richardson, of London, in this branch of research. In concluding the paper, Mr. Mason said, the importance to the science of medicine of the introduction of anæsthetics can scarcely be overestimated. By the employment of anæsthetics in surgery, the patient not only has his nervous and mental tax relieved by the apprehension and fear of an operation being allayed and by insensibility being produced, and not only is the work of the surgeon relieved of a source of embarrassment, and operations the most difficult and delicateu ndertaken which would otherwise have been impossible, but the death rate in serious cases has been universally testified to have greatly diminished.

At the conclusion of the paper a lengthy discussion took place, in which the President, Messrs. Abraham, Armstrong, Conroy, Dickens, Drs. Symes and Vanderbeck (Philadelphia), and others took part. A vote of thanks to Mr. Mason was carried by acclamation.

The thirteenth and concluding general meeting was held at the Royal Institution, May 1, 1879. The President in the chair.

The minutes of the previous meeting were read and signed.

The Honorary Secretary, Mr. Thomas Williams, F.C.S., read a first instalment of a paper on "Water—its Solvent Action and Behaviour under the Influence of

Heat and Pressure." After a short discussion on the paper, the following valedictory address was delivered by the President:—

Gentlemen.—At our last meeting Mr. Mason, my immediate predecessor in the occupancy of this chair, expressed a hope that I would not depart from what he held to be a time-honoured custom of our Society, namely, that the President should at the last meeting of the session, prior to the recess, deliver a valedictory address. I should be sorry to be guilty either of any act of discourtesy to the members or not conducive to the dignity of the office which for two years I have had the honour to fill. I therefore must beg your indulgence for the unworthy character of the observations I am about to make, and plead the recently extreme pressure on my time, arising from a cause with which many of you are no doubt acquainted.

At the commencement of the session our prospects were somewhat gloomy. I had hardly a paper promised; but as time went on things greatly improved, and I am happy to say that we have had this session what is somewhat unusual, a paper or other subject for every meeting.

Two meetings were occupied by a paper, and the discussion on the matters therein referred to, by Dr. Symes, entitled, "Suggestions for a New Edition of the British Pharmacopœia." These two, and another, occupied by Mr. Conroy's valuable paper on "Liquid Extract of Cinchona," were the only ones at which the principal business was of a pharmaceutical character. This may seem rather a small proportion of the general business, but many pharmaceutical matters have been introduced under the head of "Miscellaneous Communications."

We have had a paper by Mr. Johnson, of the substance of which I am sorry we have not in our minutes, nor in the Journal, a permanent record, on certain important improvements in what, I suppose, is in this district the chief of the chemical manufactures, viz., that of caustic soda. In that paper the whole of the processes employed in the manufacture were fully described with the aid of carefully prepared diagrams. The new process, which is the subject of a patent, depends on the fact that the caustication by lime proceeds much more energetically when under the influence of a high pressure. The inventors of the new process claim that a considerable saving of coal will be effected, and that the proportion of waste products will be considerably reduced. In this neighbourhood anything which, in however small a degree, may be expected to reduce the annoyance and injury that seem to be inseparably connected with the manufactures conducted by our friends at Widnes and St. Helen's must be cordially welcomed.

To our well-tried friend, Mr. Davies, we are indebted for two lectures. The first, on the occasion of the conversazione, was on "Phosphorescence and Fluorescence," a subject which though capable, as Mr. Davies showed, of being rendered popularly attractive, is at the same time of deep scientific interest. Mr. Davies's other communication on "Mr. Norman Lockyer's Recent Researches," was a fair and critical examination of a theory which has recently excited a vast amount of hostile criticism, and not a little ungenerous misrepresentation.

We have had two papers of a somewhat general character, one by Mr. Armstrong, on "The Scientific Advances of the last Two Years," and one by Mr. Sharp, which was really a defence of, and a plea for, the adoption by all, whether actively engaged in business pursuits or not, of some "hobby," preferably scientific, as a means of rational recreation and amusement in its truest sense.

Three other papers have been read. A short one by myself, on "The English Standards of Weight and Length," and a most interesting one by Mr. Mason, on "Anæsthesia and Anæsthetics," being an historical *résumé* of the leading facts connected with the subject.

The session opened with the usual address from the chair, and is appropriately closed by the paper to which you have just listened, a contribution from our honorary secretary.

Doubtless you will agree with me that the excellent attendances at our meetings is an encouraging sign. Members often say when asked why they don't attend, "Oh! I can read the paper in the Journal." Now that may be quite correct, but still it cannot be expected that gentlemen will be likely to display readiness in taking the trouble to prepare papers for us if they have not a good audience.

This I do not say as a reproach, but on the contrary as an inducement to those of us who do not attend quite as often as we could to mend our ways in this respect.

One matter more and I have done. I regret that so little progress has been made this session in the museum, and can only express a hope that during the recess the committee may be able to make some further progress towards putting the museum in that state of efficiency in which we should desire to see it.

And now it only remains for me to thank you for the uniform kindness I have received at your hands and to express a hope that the career of this society, now thirty years old, may be one of steady advancement.

Mr. Edward Davies, F.C.S., etc., offered some remarks on the valuable services rendered by the President, in particular the large amount of time and labour which he had given towards renovating the museum during the two years he had held office. The members would know that the work done in the museum must indeed have been a difficult matter. The Association, he thought, was much indebted to the President for all he had done, and he begged to move that a vote of thanks be given for the address just delivered. Mr. Sumner, in seconding the motion, spoke in eloquent terms of the able manner in which the President had conducted the affairs of the Association. The motion was carried by acclamation, and the proceedings terminated.

ST. HELEN'S CHEMISTS' ASSOCIATION.

This Association has been formed by the chemists of the town for carrying out the objects of the Pharmacy Act in the borough and neighbourhood, also for mutual improvement. Alderman J. Harrison was elected as President, for the first year, unanimously. The other officers chosen are:—Mr. Thomas Sherlock, Treasurer; Mr. George Webster, Secretary. The Council consists of:—Messrs. Cotton, McKenrie, Fox, Baker, Dixon, Webster, Sherlock and Harrison.

Rules for the conducting of the business of the Association were proposed and carried.

The ordinary meetings are to be held on the last Thursday of every month, for general business, experiments, lectures, etc. The annual meeting will take place October 2.

Proceedings of Scientific Societies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, the 8th inst., when Mr. R. H. Parker, Vice-President, took the chair.

After the reading of the minutes,

Mr. J. Graham Sangster read a paper on "Santonica and Santonin." After a brief historical introduction and an account of the origin of commercial santonica, the author proceeded to notice its physiological action. Santonin, when taken into the system, becomes converted, according to Falck, into xanthopsin. The latter imparts a yellow colour to the vision, and a greenish-yellow tinge to the urine, which is changed to red by caustic potash.

The constituents of santonica were next described, the chief being the volatile oil, about 1 per cent., and santonin. Santonin, $C_{15}H_{18}O_3$, is the anhydride of santoninic acid. It can be extracted either by the B.P. process, or, according to the United States Pharmacopœia, by mixing the flower heads with slaked lime, and exhausting with dilute alcohol, concentrating the tincture, and precipitating the santonin with acetic acid. It can then be purified by recrystallization from alcohol. Santonin occurs in colourless flat rhombic prisms, which turned yellow on exposure to light. It is soluble in alcohol, chloroform, strong acetic acid, and oil of turpentine, but nearly insoluble in water. It is soluble in strong sulphuric acid, and if to its solution in this liquid a few drops of dilute ferric chloride solution be added, a red coloration is produced, which gradually becomes purple and violet (Lindo). If the sulphuric acid and ferric chloride be mixed in equal volumes, and a small quantity of santonin be added to the mixture, the colour reaction is very characteristic. By warming santonin with an alcoholic solution of caustic potash a violet-red coloration is produced. Santoninic acid, santonic acid, and other derivatives of santonin were then noticed. A compound obtained by heating together with water, santonin, one part, sodium bicarbonate, four parts, dried albumen, two parts, to 60°–70° C. till dissolved, and evaporating the resulting solution, occurs in white soluble scales, and it has been proposed to administer santonin in this form. The paper was illustrated by microscopic specimens of santonin, etc., in crystals (exhibited by Mr. Branson), as well as by other specimens and experiments. A sample of santonin was shown which gave a green colour in the Bunsen flame, due to adulteration with boracic acid.

After a discussion, a vote of thanks was accorded to Mr. Sangster, and the following paper was then read:—

The Qualitative Separation of Nickel and Cobalt.

BY WYNDHAM R. DUNSTAN,

Assistant in the Laboratories of the Pharmaceutical Society.

In common with many students I have experienced a difficulty in working the method given in many text-books for the separation of nickel and cobalt. The following investigation was conducted for the purpose of ascertaining, if possible, wherein the fault lay.

When potassium cyanide is added to a solution of a salt of nickel, a precipitate of nickelous cyanide ($Ni''Cy_2$) occurs. This is soluble in excess of potassium cyanide with formation of potassium nickelous cyanide ($K_2Ni''Cy_4$). Acids precipitate from this solution nickelous cyanide which, however, is soluble in excess of the boiling acid, hydrocyanic acid being evolved, and a corresponding salt of nickel formed. From this solution potassium hydrate precipitates nickelous hydrate ($Ni''(HO)_2$). When the above solution is warmed with a solution of sodium hypochlorite or sodium hypobromite,—I have found the latter the most convenient,—made by adding sodium hydrate to bromine till the solution is nearly colourless, a black precipitate of nickelic oxide, Ni'''_2O_3 is thrown down.

When potassium cyanide is added to a solution of a salt of cobalt, cobaltous cyanide, $Co''Cy_2$, is precipitated, which is soluble in excess of potassium cyanide, forming potassium cobaltous cyanide. Acids precipitate cobaltous cyanide from this solution. If, however, the solution be boiled with excess of potassium cyanide and free hydrocyanic acid (liberated by the addition of a few drops of acid to the solution) oxygen is absorbed, the cobalt passing from the cobaltous to the cobaltic state—

$$4\,(Co''Cy_2,\ 4\,KCy) + 2\,H_2O + O_2 = 4K_6Co'''_2Cy_{12} + 4KHO.$$

potassium cobalticyanide and potassium hydrate being formed. After this change has taken place neither acid nor solution of potassium hypobromite or potassium hydrate produce any precipitate in the solution. If a mixture of solutions of cobalt and nickel salts be treated as above, on adding an acid to the solution, after ebullition with potassium cyanide, a bluish-white precipitate of nickelous cobalticyanide is thrown down, which is insoluble in boiling acids. This is decomposed on the addition of potassium hydrate, nickelous hydrate being precipitated:

$$Ni''_3Co'''_2Cy_{12} + 6\,KHO = 3\,Ni''(HO)_2 + K_6Co'''_2Cy_{12}.$$

Many methods have been suggested based upon the above reactions for the qualitative separation of nickel and cobalt. The following, as the result of many experiments, is the one which I adopt:—

To the acidified solution containing the two metals, potassium cyanide is added in excess until a clear solution is obtained. To a portion of this liquid a few drops of yellow ammonium sulphide are added; a dark red coloration indicates cobalt (Tattersall, *Chemical News*, Feb. 14, 1879). This reaction is very characteristic, and is not interfered with by the presence of nickel. I have, however, found that the solution does not give the reaction after exposure to the air or after ebullition. To another portion of the liquid some sodium hypobromite solution is added, and the solution gently warmed; a black precipitate indicates nickel. The remainder of the above solution is boiled for a few minutes, and when cool hydrochloric acid added in excess; if both metals are present a dense bluish-white precipitate occurs. The solution is boiled for some time till free from hydrocyanic acid, the precipitate remaining insoluble, which is a sure indication of the presence of both metals. To this liquid containing the precipitate, large excess of potassium hydrate is added. The precipitate of nickelous cobalticyanide disappears, and is replaced by a pale green flocculent precipitate of nickelous hydrate.

The cause of failure, I think, is found in the last reaction. The solution is strongly acid, and requires at least four times its volume of strong potassium hydrate solution to effect the decomposition of the nickelous cobalticyanide.

I have then shown the reason why failure usually results in the working of the "cyanide method" for the separation of nickel and cobalt, and have also given a modification of the same, which, in my hands, has given most satisfactory results.

A short discussion followed the reading of the above, and Mr. Dunstan received the thanks of the meeting.

The Secretary then announced that the following members had been appointed by the Committee to report on the advance of pharmacy and branches of science allied thereto, the reports made by them to be communicated at the ordinary meetings of the Association:—Mr. J. G. Sangster (pharmacy); Mr. F. W. Branson (botany); Mr. R. H. Parker (materia medica); Mr. C. H. Hutchinson (inorganic chemistry); Mr. H. Allen (organic chemistry); Mr. W. R. Dunstan (analytical chemistry); Dr. A. Senier (chemical physics).

The Chairman called upon Dr. Senier to give his report on Chemical Physics. It consisted of a note on "Victor and Carl Meyer's Method for the Determination of Vapour Densities," and is printed at p. 936.

The following report on Inorganic Chemistry was then read by Mr. C. H. Hutchinson, F.C.S.:—

Formation of Ammonium Nitrite during the Evaporation of Water.—Schönbein showed that nitrite of ammonium is formed when water evaporates from porous substances. A. von Lösecke and Mr. Hildburghausen have recently studied the subject, and give as the result of their experiments some conditions governing its formation.* In a series of five experiments, in which 100 c.c. of water were concentrated in a dish, at temperatures varying from 20° to 80° C., it was found that the amount of ammonium nitrite produced was greatest where the temperature employed was lowest, and that small quantities are formed, and escape decomposition at a tempera-

* See *Arch. Pharm.* [3], 14, 54—58; also abstract in *Journ. Chem. Soc.*, April, p. 298.

ture higher than that at which the salt is usually decomposed. This was shown in two cases where the temperatures of evaporation were respectively 70°–80 and 100°. They found that ammonia, equal to 0·5823 pts. nitric acid per 100·000 was formed during the evaporation of a litre of water to a small bulk, at a temperature of 40°–50°; and that when five litres were allowed spontaneously to evaporate, ammonia equivalent to 2·9608 nitric acid per 100·000 pts. was produced.

With regard to the production of ammonium salts in nature by this means, the authors quote some results obtained by experiments upon the leaves of *Aristolochia Sipho*, which show that no ammonia or nitrous acid is present in water in which leaves have been washed, after a rainless and dewless night; but that on moistening a leaf, and, after allowing it to dry, washing it, nitrous acid may be found in the wash-water.

Since the amount of nitrous acid in the wash-water decreases proportionately as the time increases between the drying and washing of the leaf, it has been concluded that this is a source of the nitrogen in plants, and indeed Boussingault says that the introduction of nitrogen into plants cannot take place directly.

The authors of this paper further find that finely divided rain contains more of the salt than that which has fallen in large drops, and also that the reaction for nitrous acid is stronger in water that has been collected after rain has fallen, for a time varying from half to one hour, than in that which was collected at the commencement of the rainfall.

They have also detected ammonia and nitrous acid in snow.

CHEMISTS' ASSISTANTS' ASSOCIATION.

The last evening meeting of the present session took place at 32A, George Street, Hanover Square, on Wednesday, April 30, Mr. Wallis, President, in the chair, when a very pleasant entertainment was given by the members and friends of the Association to a large audience, which thoroughly appreciated the somewhat lengthy programme.

Parliamentary and Law Proceedings.

Apothecaries' Society *v.* Harrison.

At the Birmingham County Court, on Monday, May 12, before Mr. J. Motteram, Q.C., judge, an action was referred to, brought by the Master, Wardens, and Society of Apothecaries, London, against James Harrison, chemist and druggist, 73, Stafford Street, to recover a penalty of £20, on the ground that the defendant had prescribed and furnished medicine to a person, and acted thereby as an apothecary, without having obtained a certificate, as required by the Apothecaries Act, the 55 Geo. III. Mr. Nathan (instructed by Mr. Reeves) appeared for the plaintiffs, and Mr. Jesse Herbert (instructed by Mr. Glaisher) for the defendant.

The case was investigated before his Honour on the 2nd and 3rd of July, 1877, and was then adjourned, pending a decision on a similar case in a superior court. The facts of the case were, briefly, that a young woman, named Julia Caddick, called at the defendant's shop on the 27th of November, 1876, and asked defendant if he could make up something to relieve her of the weakness from which she was suffering. Defendant asked her what the weakness arose from, and she told him that it was a weakness left on her after her confinement. Defendant, she said, felt her pulse, looked at her tongue, and asked her to describe what she felt. Defendant made her up some medicine, and said it would do her good. She took a dose of it in the shop, and paid defendant a shilling for it.

Mr. Suffield, surgeon, at the previous hearing stated that the woman's symptoms were those of anæmia, which was a dangerous complaint, if not properly treated. A preparation of iron, which the defendant had given to the woman, was a proper medicine.

Mr. Nathan now asked his Honour to give judgment on the matter, stating that he believed there was practically no dispute as to what took place at Mr. Harrison's shop.

His Honour read over his notes of the evidence given at the previous investigation, and expressed a wish to have the case re-argued, and Mr. Nathan thereupon addressed his Honour at considerable length upon the law of the case. He quoted the words of Mr. Justice Cresswell in defining an apothecary as a person who professed to judge of diseases by the symptoms, and applied himself to cure the diseases by medicines; and asked his Honour to decide whether the defendant in this case had not acted in the manner indicated. Defendant felt the woman's pulse, looked at her tongue, and put such questions as he thought necessary for a diagnosis of the case, and selected a medicine which was a proper medicine, so far as it went, for the complaint. Referring to a recent judgment by Baron Pollock in the Shepperley case, he pointed out that, according to the 28th section of the Act, the business of a chemist was that of preparing, compounding, dispensing, and vending of medicines and drugs. Mr. Nathan argued that dispensing meant weighing out or apportioning of ingredients according to quantities given, and it had nothing to do with the selection of the ingredients. For a chemist to select or prescribe medicines, he contended, was to take upon himself the duty of an apothecary. There was nothing which a regular practitioner did that the defendant did not do in this case, except that he did it in his own shop instead of at the bedside of the patient.

Mr. Herbert, in reply, pointed out in the first place, that there were certain duties which the apothecary had to perform in preparing and dispensing medicines which the chemist also had to perform, and a chemist must not be convicted for doing an act which an apothecary might do. He contended that chemists and druggists, under the words "dispensing" and "vending" had a certain amount of discretion.

His Honour said he thought it would not be denied that a chemist had to exercise discretion. If a person asked for a dose of medicine the chemist had to exercise discretion as to the quantity to be supplied, according to the person to whom it was to be given.

Mr. Herbert said his friend admitted that a chemist must exercise discretion in mixing a dose, and he was prepared to accept that, and he asked his Honour to say how far that discretion might be exercised. In the Shepperley case it was shown that the chemist examined a patient, and the judge left it to the jury to say whether the discretion used was proper. In this case he asked his Honour to say that the defendant simply exercised such discretion as belonged to him, and was ancillary to the dispensing and vending of the drugs. To prescribe was to discover or diagnose a disease, and to adapt a remedy for it. The difference between what his client did and such a course was that the patient went into his shop and told him what was the matter with her, and asked for medicine for weakness. Then came the question as to what was the proper dose of medicine to give her, and how could defendant better ascertain that than by feeling her pulse? He urged that the defendant in doing this was simply exercising discretion as to the dose of medicine which he should give. It was difficult to say how far such discretion might be exercised.

His Honour asked, if a chemist and druggist might do what the defendant had done, what part of an apothecary's business he might not do?

Mr. Herbert: He cannot visit, sir.

His Honour: I am not sure that an apothecary can do that as a right and prescribe. There are cases in which it is said he cannot recover, except on a contract.

Mr. Herbert said a chemist could not visit at the house of a patient, nor charge for advice in any way, without trespassing upon the duties of an apothecary. An apothecary might examine and discover what were the diseases of his patients, and then determine what were the proper remedies ; but a chemist might not do that. He might take the statement of any person coming to him and saying what disease he had, and he might dispense medicine to him, and for that purpose he might exercise discretion as to the dose by examining the pulse. Further than that he had no right to go.

After further discussion, his Honour stated that he should defer his judgment until a day of which he would give notice to the respective parties.—*Birmingham Daily Post.*

Sale of Laudanum as a Patent Medicine.

At the Epworth Petty Sessions, on Friday, May 2, before the Hon. and Rev. Canon Dundas, the Rev. F. W. White and Mr. S. Pulleine, summonses were heard against Ann Brears, of Haxey, and Thomas Broadbent, of Luddington, on the charge of selling poison without the name of the seller on the label.

The cases were adjourned from the last petty sessions, and Mr. Newborn now attended on behalf of the defendants.

The case against Mrs. Brears was taken, and it appeared from the evidence of P.C. Dewick that on the 5th of March he visited defendant's grocer's shop at Haxey, and asked for one ounce of laudanum, and put a bottle on the counter. Defendant said she only sold two ounce bottles, and witness received two ounces, for which he paid 8*d*. Witness produced the bottle, which did not bear the seller's name, but bore that of "Spouncer and Son." The bottle was sealed with a Government stamp. The certificate of Dr. Graham as to the contents of the bottle having been read, Mr. Newborn addressed the Bench for the defence, and submitted that the requirements of the Act under which the case was brought had been complied with, inasmuch as patent medicine, under which head the mixture in question came, did not require the name of the seller endorsed on the label, but only the name of the person by whom the medicine was prepared. The medicine in this case was prepared by Messrs. Spouncer and Son, and their name was on the label. The putting of the Government stamp on the bottle was sufficient to make it a patent medicine, and the other defendant had a licence to sell such medicine. Mr. Newborn further submitted that the defendant was the agent of Messrs. Spouncer, and that they could sell the medicine through an agent in the same way as at their own shop. Broadbent's case was similar to the above in all respects, and both were dismissed.—*Retford and Gainsborough Times.*

Obituary.

Notice has been received of the death of the following :—

On the 27th of April, 1879, Mr. Henry Bayly, Chemist and Druggist, Richmond, Surrey. Aged 39 years.

On the 2nd of May, 1879, very suddenly, Mr. Edward Bowen Jones, Pharmaceutical Chemist, Lammas Street, Carmarthen. Aged 69 years. Mr. Jones was one of the Founders of the Pharmaceutical Society, and has carried on the business in Lammas Street very successfully for a period of about fifty years, latterly in conjunction with his only surviving son, Mr. C. W. Jones. He was one of the most highly respected inhabitants of the town, had occupied a seat on the Town Council for many years, and had once been Mayor. He was also a Justice of the Peace for the borough.

On the 6th of May, 1879, Mr. John Winter Manfield, Pharmaceutical Chemist, Bury Street, Salford. Aged 76 years. Mr. Manfield had been a Member of the Pharmaceutical Society since 1842.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[279]. I do not see any difficulty in this prescription being made up satisfactorily, and without any special directions. I should mix the powders well together in a mortar, then add the glycerine (in which the carbolic acid has been previously dissolved), gradually dilute with water, and lastly add the aqua laurocerasi. The bottle should have a "shake the bottle" label on, also one indicating it is for external application only.

J. W. Barnes.

[282]. I have always used Collis Browne's chlorodyne in dispensing, and do not think Mr. H. H. C. Puntan would be justified in using any other preparation, unless a special maker's name be ordered.

J. W. Barnes.

[283]. There is no objection to the use of glycerine and tragacanth as an excipient for zinci oxyd. I have used it largely and find that it binds best if I add to the glycerine one-fourth part of water.

Ph. Ch.

[286]. To make a presentable mixture, rub the pot. bicarb. in a mortar with sufficient water to form a paste, then add the tinct. assafœtid., and with constant trituration, add very gradually the water, and lastly the tinct. nuc. vom. Of course it will be necessary to put a "shake the bottle" label on the bottle, as the pot. bicarb. will cause the tinct. nuc. vom. to precipitate.

Would some of your readers kindly acquaint me what is meant when solut. camphoræ is ordered? I used "Murray's Solutio Camphoræ Recarbo."

R. E.

---

[293]. Dose of Syrup of Buckthorn.—Will you kindly inform me through your columns, how much syrupus rhamni it would be safe to give a child nine months old? The B.P. gives the full dose one drachm, but on referring to other books I find it has been customary to give as much as an ounce. A child in this neighbourhood was taken ill and its parents went to a chemist's for some syrup of buckthorn and gave it half a teaspoonful; the same evening the child died, and consequently there was a coroner's inquest. The medical officer having heard it had had some syrup of buckthorn, in giving his evidence said he thought it unneccessary to make a *post mortem* examination as there was no doubt the child died from taking "half a teaspoonful of syrup of buckthorn."

R. Shannon.

---

[294]. What appearance should the following mixture present?—

℞ Liq. Ferri Dialysat. (Wyeth) . . . ℥ij.
Liq. Strychniæ. . . . . ♏ 36.
Inf. Calumbæ . . . . . ℥iij.
Aquæ . . . . . ad ℥vj.

It had been dispensed at a London establishment comparatively bright, and without deposit. I found a precipitate to form on the addition of the Liq. Ferri Dialysat.

J. B. M.

---

[295]. Liq. Ferri Chloroxydi. — I should be glad to know, when liq. ferri chloroxydi is ordered in a prescription, whose preparation should be used, there appearing to be some difference of opinion regarding its nature, one firm of makers labelling their "liq. ferri dialysatus," *vel* liq. ferri chloroxydi, another firm stating their liq. ferri dialysatus is *not* to be confounded with liq. ferri chloroxydi.

J. A. W.

---

[296]. Will any reader kindly inform me what decomposition takes place in preparing the following pills, and what their consistence should be?—

℞ Pulv. Permang. Pur. . . . . gr. ij.
Pulv. Ext. Aloes Soc. . . . . gr. j.
Ext. Nucis Vom. . . . . gr. ¼.
M. ft. pil. Mitte xii. j nocte maneque sum.

Rhubarb.

---

[297]. When magnes. pond. is ordered in a prescription, which should be dispensed, mag. carb. pond. or mag. calc. pond? Chemicus.

---

[298]. Having dispensed the following, I observed a deposit which I had before anticipated on account of the large amount of potassii iodid. The medical man, however, informs the patient there should be no deposit. Will some pharmacist oblige by giving his opinion on the subject?

℞ Potassic Iodid. . . . . ℥iij.
Ferri Cit. et Quinæ . . . . . ℥j.
Tinct. Valerian. . . . . ℥iv.
Tinct. Calumbæ. . . . . ℥iss.
Aquæ Puræ . . . . . ad ℥iv.
Sig. ℥j ter in die in aqua.

Mode of dispensing adopted: I dissolved the potassii iodid. and ferri citras et quinæ in separate portions of the aqua, then added the tinctures; the precipitate occurred before the addition of the tinctures.

W. S. C.

---

[299]. How should the following be dispensed and what should be its appearance?—

Camphoræ . . . . . gr. 480.
Syr. Chloral Hyd. . . . . fl. oz.
M. To be applied as directed.

W. S.

Green Extract Suppositories.—

℞ Ext. Hyoscy. . . . . gr. iij.
Gelatine,
Glycerine . . . . . āā q.s.
Ft. supposit. (gr. xv.). Mitte vj.

Lately many similar prescriptions to the above have been handed to me to dispense, and, after several experiments as to the proportion of glycerine to the gelatine, I have arrived at a formula which may prove of use to some, at least, of your readers.

In making a gelatine base two points have to be studied: firstly, it must have a melting point below 90·5; and secondly, must contain sufficient gelatine to impart the necessary firmness for use. Take any quantity of the best French gelatine (that sold in thin sheets), cover with cold water until it is thoroughly soft, drain off the excess, and to every twelve parts by weight add five parts glycerine. Dissolve by the aid of a water-bath. The medicament is to be rubbed perfectly smooth with a few drops of glycerine and added to the proper quantity of the excipient.

In this way, if care be taken not to overheat the mixture, a suppository is formed answering in every respect to the requirements above-named, elegant in appearance, and possessing the advantage of having the medicament equally distributed.

I have made in this way suppositories of opium, morphia, atropia, sulphate of copper, oxide of zinc and sulphate of zinc, and in every case they have given complete satisfaction to prescriber, dispenser and patient.

They retain their elasticity and shape for any length of time, provided they be kept excluded from the air and dusted with lycopodium.

San Remo, Italy. C. J. Mead.

Notes and Queries.

[591]. CITRINE OINTMENT.—In "Lancashire," citrine ointment is generally understood by ung. hyd. nit., B.P., but mild citrine ointment is understood in the proportions given by J. B. L. M., *i.e.* one in three.

7, Oxford Terrace, Cliftonville, Brighton. C. F. RIDEAL.

[591]. CITRINE OINTMENT.—I must say to "Rhubarb" I do not wish to controvert his opinion, nor do I desire to be dictatorial; but really dilute ointment of nitrate of mercury is not "citrine ointment." "Rhubarb" says in the four establishments in which he has been Beasley's formula (one in four) has been sold as "citrine ointment." I do not dispute the fact, but citrine ointment is, and should be, ungt. hyd. nitrat. fort. *vel* ungt. citrinum, ungt. hydrargyri citrinum, ungt. hydrargyri nitratis. The ordinary formula for the dilute ointment is one to seven. Usually I do not find the strong ointment too active; but for application to the eyes I think one to seven is quite strong enough. "Citrine ointment" is the strong undiluted ungt. hyd. nit., and is so considered by every authority on materia medica and therapeutics.

Northallerton. HY. BROWN.

[596]. CHARGES FOR GAZOGENES.—The following extract from the directions for using Fèvre's gazogenes will answer Mr. Olive's query.

Charges.—For the quart seltzogene use 13 scruples of tartaric acid (in small crystals), and 16 scruples of bicarbonate of soda (in powder). For the three-pint seltzogene use 18 scruples of tartaric acid (in small crystals), and 22 scruples of bicarbonate of soda. For the five-pint seltzogene use 26 scruples of tartaric acid (in small crystals), and 32 scruples of bicarbonate of soda. Care should be taken to let off by the tap all the carbonic acid gas before re-charging the apparatus, and the apparatus should not be washed in warm water.

To make seltzer water, add 10 grains of carbonate of magnesia and 10 grains of common salt for the 2-pint size in the lower globe; for the 3-pint size, 15 grains of each.

To make soda or Vichy water, add 25 grains of bicarbonate of soda to the water in the lower globe.

To make lemonade, put into a tumbler a sufficient quantity of lemon syrup, and fill it with the aerated water.

[596]. SELTZOGENE CHARGES. — Charge for seltzogene, capacity, 3 pints:—

Tartaric Acid in crystals	℥vj.
Bicarbonate of Soda	℥j.

Soda water.—The water should contain bicarbonate of soda, ℥ss to 1 pint.

Lemonade.—Syrupus limonis ℥iv. to 3 pints of water.

Seltzer water—

Chloride of Sodium	65 grains.
Carbonate of Soda	27 „
Sulphate of Soda, Phosphate of Soda	āā 1 „

Dissolved in 3 pints of water.

W. H. LANGBECK.

[598]. CONCENTRATED ESSENCE OF SARSAPARILLA AND QUININE.—

℞ Extracti Sarsæ Liquidi uncias decem.
Spiritus Rectificati uncias quatuor.
Misce, sepone per dies tres et decanta, tum adde—
Tincturæ Quiniæ uncias sex.

ESSENCE OF SARSAPARILLA AND DANDELION WITH QUININE:—

℞ Extracti Taraxaci uncias quatuor.
Aquæ Distillatæ,
Spiritus Rectificati, āā uncias octo.
Liquoris ammoniæ quantum satis ad perfectam neutralisationem, sepone per aliquot dies et decanta, tum adde—
Essentia Sarsæ cum Quinia eandem quantitatem.

W. H. LANGBECK.

[599]. LOOCH PECTORALE.—During my sojourn in the South of Europe, I often made the looch in the following way:—

℞ Olei Amygdalæ unciam dimidiam.
Gummi Acaciæ Pulverati drachmas duas.
Aquæ drachmas tres.
Misce ut fiat emulsio, tum adde—
Aquæ Laurocerasi drachmas tres.
Liquoris Morphiæ Hydrochloratis drachmam dimidiam.
Misturæ Amygdalæ ad uncias quatuor.

W. H. LANGBECK.

[600]. OINTMENT OF OLEATE OF ZINC.—Can any reader supply formula for ointment of oleate of zinc as used in some of the London hospitals?

J. J. P.

[601]. SULPHATE OF INDIGO.—Can you or any of your correspondents inform me how to obtain "sulphate of indigo" in the form of a paste (or nearly so), such as is used in ink manufacture?

I have repeatedly tried precipitating the sulphindylic acid from a solution of one part of indigo in four parts of fuming, or Nordhausen sulphuric acid, with water, both with and without the presence of one per cent. of sodium carbonate, as per 'Watts's Dictionary,' vol. iii. p. 258, but in vain, as all the colouring matter is lost in the decantation or filtration of the supernatant fluid in which it is freely soluble.

J. J. L.

[602]. GINGER BEER POWDER.—Will some reader kindly oblige K. with a formula for the above, a 4*d.* packet of which makes two gallons of ginger beer?

Correspondence.

THE PROPOSED ADMISSION OF WOMEN AS MEMBERS OF THE PHARMACEUTICAL SOCIETY.

Sir,—As the question of the advisability or otherwise of admitting ladies to membership is to be discussed at the forthcoming meeting, I hope you will allow me space to say a few words.

It is urged by those who deny them admission that they labour under no disadvantage, and that they therefore do them no injustice. I wonder if they themselves were blind to the privileges when they applied to be admitted? If the public were aware of the conditions on which connection is attainable that statement might hold good; but as long as they do not, or not more than about 10 per cent., words or letters implying membership decidedly tend to heighten the person in the estimation of his customers. I know in the district where I live that a great many are under the impression that all members, like those of the College of Surgeons, are examined men, and I ask if the great majority of the outside public are likely to be able to place the proper value on the titles usually appended to chemists, such as, "chemist and druggist by examination," "pharmaceutical chemist," "Member of the Pharmaceutical Society?"

If the ladies would not thereby benefit themselves, why do the Council and Journal so much deplore the fact that so many keep aloof, and become so eloquent in trying to enlist those who keep outside, to participate in the supposed privileges? Do they do so with a view to increase the

funds of the Society, or do they study the interest of those whose enrolment is desired?

I find that "every person registered as pharmaceutical chemist shall be eligible to be elected as a member of the Society." I think in fairness to all who apply they should be admitted irrespective of sex, as we have the authority of the Attorney-General that the word "person" shall include the masculine as well as the feminine, the singular as well as the plural. It might be a mistake in the first place that they were allowed to pass. I hope the electors next week will cast aside selfish feelings, and gracefully allow the "fair sex" the same advantages which we enjoy. As they have now become qualified by examination, we cannot keep them from entering business on their own account. As far as I am personally concerned I have no interest pending on the case, but am acquainted with two of them, and am convinced that their refined delicacy will prevent either of them seeking a seat at the Council table. I trust that their friends will make an effort to attend the meeting, and record their votes for them.

A WELSHMAN.

Sir,—Permit me, through the columns of the Journal, to draw the attention of the members and associates in business of the Pharmaceutical Society to the fact that in order to vote at the annual meeting, on the 21st inst., their presence is requisite, voting by proxy not being admissible.

The question respecting the "admission of females" being an important one, which will have to be decided, I trust the supporters of Mr. Wade's motion will note this, and attend the meeting *en masse* to decide in favour of those, who, having honourably braved and overcome the Society's more formidable barriers, have hitherto been prevented from enjoying its privileges.

Some misconception respecting the mode of voting appears to be held by a good many "electors," and this must be my excuse for addressing you on the subject.

Kennington, S.E. WM. POCOCK.

MODIFIED EXAMINATION.

Sir,—From circumstances which have recently occurred I am well convinced that a considerable amount of misapprehension exists regarding the privileges pertaining to, the above, and I ask the favour of submitting, through the medium of your valuable Journal, a few particulars, addressed more directly to those gentlemen who have already passed, as well as those who still intend to avail themselves of the Modified examination.

I am led to the above inference, in the first place, from the reply of a member of the Pharmaceutical Council to the query, "Whether a person who had passed the Modified examination and been elected an associate is as legally qualified to conduct the business of a chemist and druggist in one of H.M.'s colonies as a person who had passed the Minor?" the reply being as follows: "The Modified man had here in England all the privileges of any other chemist and druggist, but he doubted if such would be deemed sufficient by the authorities abroad."

Now the question was not what the authorities abroad would or would not deem, but the legality of the point.

The Act distinctly holds that the Modified examined man (having complied with all necessary demands) is entitled to be registered as a chemist and druggist, and therefore legally entitled to conduct the business and have all the privileges of a chemist and druggist, and I maintain that this is all that a Minor man can claim, either here in England or anywhere else. I say nothing of comparative quality of the two examinations, but of competency, from a legal point of view only.

The reply of the member of Council having raised doubts, the question was referred to the secretary and registrar, who replied, "That the Modified man had the same legal position as if he had passed the Minor examination [but mark the following clause] as far as being entitled to conduct the business of a chemist and druggist in Great Britain," suggesting, of course, his colonial disqualification, the question being not of Great Britain, but of the colonies; and the querist naturally taking this view of the reply, the consequence was the losing of the appointment to the Modified man, who had refused other offers to accept this.

In the face of such, I ask the question, Is there any colonial tribunal on the subject of pharmacy, whereby, in virtue of having passed the Minor examination, you are entitled to any other privileges than by passing the Modified examination? I am satisfied there is not; but there is one disability we Modified men do labour under, viz, that we possess no document to show that we really have the same position legally, and herein is contained the sequel to the whole point.

Here in Great Britain it has been scarcely considered necessary, as everyone is conversant with the position the Modified man holds, and the reason why there was a Modified examination at all; still, he has nothing to prove that he has ever been examined at all, and why such should be the case I am at a loss to understand.

Under section 21 in the Pharmaceutical Society's Bye-laws the following clause appears: "All persons examined, pursuant to Bye-laws, shall, after having passed their examinations and been registered, receive appropriate certificates."

The Major receives his certificate and seal, etc., etc.; the Minor, a certificate of having been examined and registered "chemist and druggist"; and why, I ask, have we, who have passed the examination framed by the Pharmaceutical Society and approved by the Privy Council, and have been registered chemists and druggists under such examination, not received our certificates?

The Pharmaceutical Society may tell us, "You Modified men do not belong to our Society;" my reply to which would be, "But we have complied with all legal demands and we have passed the examination required by the Act." And I contend that if the Pharmaceutical Society, with the consent of the Privy Council, was empowered to compel us to be examined, and receive our fees for such, surely we are entitled to a certificate to prove that we have been examined and registered chemists and druggists.

It is an important point to Modified men, particularly those having any intention of going abroad, and one we are clearly entitled to, and I ask the co-operation of such gentlemen, examined and unexamined, with a view to have this disability removed.

MODIFIED ASSOCIATE.

PHARMACEUTICAL EXAMINATIONS.

Sir,—I have read with interest Mr. Denston's reply to "Devon" and also note that he speaks with some knowledge of the subject, as his name appears both in the advertisment and examination sheets of the same Journal.

I cannot agree with him that "cheekiness," except in rare cases, is the cause of failures, but there is one point he touches on that requires clearing up and that is, Do the examiners question on subjects not contained in the conspectus? Take botany; there is no mention of systematic for Minor, yet candidates are often taken on it, and in chemistry many far-fetched questions are given which cannot by any stretch of imagination refer to "ordinary chemicals used in medicines."

The examiners are gentlemen; but I fear their zeal to improve the chemist will soon improve him off the face of the earth.

London. NEMO.

SANTONIN POISONING.

Sir,—The letter of "Scrutator" touches upon a subject which affects the medical man and chemist alike, and I know of no single preparation of the Pharmacopœia which has been so buffeted or lauded as santonin.

One authority prescribes it with the greatest caution, and another in what seems extravagant doses, whilst a third is ever and anon looking out for some poisonous manifestation, and ready with leeches and a host of agents to quell cerebral excitement and convulsions.

My candid opinion is that many of the cases, if not all, of supposed poisoning, are not to be attributed to santonin at all, but to convulsions. I have met with so many instances that I am obliged to question the santonin poisonous theory.

Not long since I was called to visit a child, living about three miles in the country. She had been seized with a fit, and appeared dying. When I arrived it had almost passed off. I knew the child had passed worms, one by the mouth, and several *per anum*. I gave santonin and scammony

with good effect and in large doses, and the child is now well.

Some two years ago a child, troubled with worms, died in a fit of convulsions before I reached the house; and I have seen convulsions occur by simply placing the hand on the abdomen, for the purpose of examination, in children troubled with worms.

When we know children die from convulsions without santonin, why should those cases be called cases of "santonin poisoning" when a dose happens to have been given to the unfortunate possessor of a colony of worms, numbering in some cases one hundred and sixty-six large lumbrici? May the death struggles of the worms not be the true cause of all the convulsions, unconsciousness, heat of head, and congested face so often recorded?

May the struggling of the parasites, even without a dose of santonin, not be sufficient to cause convulsions and death in delicate constitutions? I have seen most violent and prolonged convulsions after a child had eaten a handful of dried currants; and only a few days ago I spent two hours at the bedside of a fine girl, nine years of age, who had eaten a piece of raw turnip. This girl has often taken santonin, and although troubled with worms formerly, none have been seen since the last fit. The mouth was drawn to one side, and she made the bed shake owing to the violence of the convulsions in her limbs.

I can fancy some nervous practitioner, if santonin had been given, attributing all the symptoms to its poisonous effects, and writing up a case so as to form a sensational paper.

In those cases where amaurosis is said to occur, and the sight lost for some time, it is an open question as to how far santonin should be blamed.

Diarrhœa, vomiting, colic, gastric irritation, sunken condition of the eyes, pallid face, or congested condition of face and head, with fever, and hæmorrhage from the kidneys, are symptoms met with in patients troubled with worms.

Why should santonin be blamed if some of the group of symptoms enumerated should follow its administration? Have we not cause enough in the bowels for a satisfactory explanation of those supposed cases of poisoning or death from convulsions? I am satisfied we have.

The case of the child, in Westbourne Park, in whose stomach six grains of santonin were found, and whose death was attributed to it, to my mind did not die from its effect at all. I cannot believe that six grains, or eight grains, of pure santonin could cause death, much less am I inclined to believe in the mysterious train of symptoms following small doses of a grain or two.

Where poisoning has been attributed to santonin, it clearly could not have been pure, and, if pure, the irritation which occurs in the intestinal canal, on the disturbance of the settlement of worms, is sufficient to explain all the phenomena recorded, and their death struggles are surely sufficient to light up excitement of gravest magnitude.

Northallerton. HENRY BROWN.

A MISTURA GUAIACI IN CLEAR SOLUTION.

Sir,—The article by Mr. Balmanno Squire under the above heading reminds me of some experiments in the same direction, carried out by myself some ten or eleven years ago, having the same object in view as that described by him.

I then found, and subsequent experiments have confirmed it, that a considerable quantity of liq. potassæ was necessary to act as a full solvent of resin of guaiacum.

To be brief, my plan was as follows:—

℞ Pulv. Guaiaci.	ʒiv.
Liq. Potassæ	ʒx.
Sp. V. Rect. . . . . q. s. ad	ʒxx.

Macerate, filter, and make up to ʒxx. with Sp. V. R. (ammonia can be added if required).

This gives a tincture containing 12 grains of resin, and 30 minims of liq. potass. to each fluid drachm, which will bear dilution with water to any extent, and still remain clear (although dark).

Glycerine can be added to the mixture if so desired, without detriment.

An extemporized form made as follows, succeeds well:—

Tincture of Guaiacum	ʒj.
(simple or ammoniated.)	
Liq. Potassæ	ʒss.
Water to	ʒj.

Its appearance is not so bright as that prepared with glycerine only (described by Mr. S.), but is opalescent, free from deposit, and clear by transmitted light. Glycerine may be added without detriment.

Whether such a compound can be utilized; the advantage, or disadvantage in the quantity of potash used; its therapeutic value, and so forth must be left to Mr. Squire, or any other member of the faculty who may be disposed to consider the subject.

This last word only from the writer. Potash added in any less quantity, will not be successful.

Brighton. G. G. HORNSBY.

REVISION OF THE PHARMACOPŒIA.

Sir,—Now that the B.P. is under revision would not the introduction of an anodyne syrup obviate the necessity of medical men prescribing chlorodyne? Many practitioners, I am happy to say, refuse to recognize it, and others use it on the score of convenience; but surely it is very unprofessional for a medical man to order a secret remedy.

Re Tinct. Quiniæ. I use quiniæ sul. 160, rubbed down in a mortar, with ʒij s. v. r., and add ʒij tinct. aur. recent., put into a bottle, and add ʒvj tinct. aurant., and put the bottle into hot water, and stand in a warm place for two hours.

I think Mr. Whitfield suggested quiniæ hydrochlor., but I see in Stille and Maisch's 'Dispensatory' that it is not so stable a salt as the sulphate, and now that quinine is so dear the sulphate would be preferred on account of being less costly.

Sandown. GEORGE BROWN.

CO-OPERATIVE SOCIETIES AS PATENT MEDICINE VENDORS.

Sir,—In view of the fact that a considerable majority of the proprietors of patent medicines are pharmaceutical and registered chemists, may not a remedy be found for the injury inflicted on the interests of all chemists by the sale of single packages of such medicines by the stores at wholesale prices, by the said proprietors stipulating that the purchasers of their articles (in whatever quantity and at whatever price) should engage to retail only at the stamped and advertised price?

Perhaps some of your correspondents may improve upon the suggestion.

M.P.S.

T. J. W. T.—Quillaia bark (*Quillaia saponaria*).

H. A. M.—*Bryonia dioica.*

P. C.—The proper person to apply to for such information is the Registrar under the Dental Act.

"*Pharmacist.*"—Your question should be addressed to the editor of a medical journal.

THE ANNUAL DINNER OF THE MEMBERS OF THE PHARMACEUTICAL SOCIETY AND THEIR FRIENDS.

The Eighth Annual Dinner of the members and friends of the Pharmaceutical Society was held, on Tuesday evening, at Willis's Rooms, King Street, St. James's, Mr. Williams, President, in the chair. Amongst the guests were Professor Tyndall, F.R.S., Sir P. Cunliffe Owen, Dr. Richardson, F.R.S., Professor Williamson, F.R.S., the President of the Medical Society, the Master of the Society of Apothecaries, Professor Erasmus Wilson, F.R.S., Professor Dewar, F.R.S.E., Mr. Callendcr, F.R.C.S., Mr. Wyndham Cottle, F.R.C.S., Dr. Meredyth, Dr. Leared, Dr. Langdon Down, Mr. W. Sowerby, Professor Bentley, and Dr. Ramsay.

The dinner was served in first-rate style, and the whole arrangements seemed to give general satisfaction.

After grace had been sung—

The PRESIDENT proposed the usual loyal toasts of the Queen, the Prince and Princess of Wales and the rest of the Royal Family, which were received in the usual enthusiastic manner.

The PRESIDENT next proposed "The Army, Navy and Rescrve Forces," coupling with the toast the name of Professor Erasmus Wilson.

Professor ERASMUS WILSON, in responding to the toast, said the actions of Her Majesty's services would take the place of many words and that there was a moral fitness in a non-combatant being called upon to return thanks for the toast. After alluding to the prospect of peace being speedily concluded in Afghanistan, Professor Erasmus Wilson explained that his connection with the volunteer forces consistcd in his having been a subscriber to a Richmond corps; he was, however, born in the navy and therefore had some claim to respond to the toast, which he did with the most hearty good will.

The PRESIDENT next proposed "Science," coupled with the name of Professor Williamson. He remarked that although chemists followed a trade they were dependent on science for the means by which carry it on satisfactorily.

Professor WILLIAMSON said he thought this world would be very dull if all men had the same ideas of things and if they all understood words in exactly the same scnse. One illustration had occurred in the various meanings attributed to the word science. On the one hand, mcn of high authority not only attributed many of the greatest industrial results of modern times to the application of scientific principles, but really did science the unmerited honour of considering that those very results constitu'ed science. A most distinguished statesman in an after-dinner speech at the Institute of Civil Engineers complimented that distinguished body on having been the founders of all the important modern discoveries in science of this age, and certainly such an understanding of the word, however complimentary to workers in science, was one their modesty would hardly allow them to accept. Perhaps the more common use of the word science was to convey that it was the study of curious and remote, but not at all useful phenomena. The notion of a man of science was that he was an amiable little old man, not at all competent to battle with this world, very simple minded and disinterested, but living altogether amongst ideas utterly remote from that which constituted the business of this life. But if they were to go back a little in history to find an explanation of the present use of the word they might do worse than recollect the title given to the Royal Society, the Promotion of Natural Knowledge. It seemed to the founders of that body desirable to distinguish between those particular branches which thcy conceived their Society especially bound to promote and of knowledgc in general and to limit the spherc and activity of science to those departments of knowledge which had the deepest and strongest roots, in fact, the knowledge of natural phenomena and of the relations of these phenomena to one another. Most gentlemen present would probably be inclined to accept such a definition as being a practical substitute for the word science, and to consider that the business of science was to get a knowledge of the laws of nature through the study of facts, so that man by being the minister of those laws might acquire the power of directing the phenomena of nature for the benefit of his fellow men. He fancied that many of those who took this view of science have been inclined, sometimes consistently enough and yet not necessarily, to fancy that those who were engaged in pursuits require doubtless some intellectual powers, for their pursuits must be dry and hard. That, in fact, the pursuit of science must be one tending to discourage nobler and more humane emotions, which those who looked to the welfare of their fellow men would highly value, to fancy in fact that science was antisocial. But all who had looked back to late measures which had been taken for the promotion of science must have been struck with this fact, that those who were most actively engaged in it had been compelled to congregate themselves together; the formation of societies had been one of the most remarkable and extraordinary phenomena which had accompanied and no doubt favoured the work of science, and he believed this habit of associating together for the purpose of getting help and support in one's pursuit produced very beneficial results, not merely in an intellectual sense, but more particularly in that other respect in which science was supposed to be efficient. It tended to develop the more amiable and social instincts to a very great degree. If there was one branch of science which was more particularly connected with that Society than another it was the one in which hc was a humble worker, the science of chemistry; not only did those gentlemen who had studied pharmacy become to a great extent popular teachers of chemistry, for he knew there was a large amount of information and spontaneous instruction given to the public in answer to inquiries addressed to them, but he had also to acknowledge, on behalf of chemists, that pharmacy had been and was still a most excellent and efficient cradle for training chemists.

The PRESIDENT next proposed the "Honorary Members of the Pharmaceutical Society," saying that one of the most pleasant features connected with the Society was that it connected itself with some of the most eminent men both of Europe and America. Their number of honorary members was limited to sixty, and of the whole of that number they were only too proud to have their names upon the Society's list of members. There were scveral of them present that evening, but he begged to couple with the toast the name of one of the last elected, namely, Professor Tyndall.

Professor TYNDALL in responding to the toast said, I beg to offer my cordial thanks to you, sir, and to the Council over which you preside, for the distinction that you have been pleased to confer upon me in electing me an honorary member of the Pharmaceutical Society; and I thank you, gentlemen, one and all, for the cordial manner in which you have responded to this toast. Having thus thanked you, I should probably best consult my own interest and yours by sitting down and saying nothing more, for I possess little of the humour and none of the wit which constitute, so to say, the cloves and allspice of an after-dinner speech. So that, gentlemen, I must look to your tolerance if I venturc to occupy a very few minutes of your time. We livc in an age unparalleled

for inquiry and for acquirement, and there is no profession amongst us that has been and is destined to be more influenced by the spirit of the age than the medical profession. I use this term in its widest sense, looking at the physician, surgeon and pharmacist as joint members of one corporation, one and indivisible. The physician may prescribe, but he has to rely on you as to the carrying out of his prescriptions. You are bound to keep yourselves abreast of chemical discovery, and in an age when research is more active than it has ever before been you must be on the watch to avail yourselves of every new medical agent and acquaint yourselves with the preparation and purification of all materials which are every day introduced. You, better than I, know what all this implies. With regard to facts, the surgeon and the medical man have been steering by the experience of former ages; the facts on which they repose and ought to repose are empirical, and it is with regard to principles that we, now-a-day, have seen such advances made in medical science. There is a strong conservative force, gentlemen, in all large co-operations, and it is natural; indeed it belongs to the dignity and stability of a great profession, not to be wafted about by every new wind of doctrine. Hence it is perfectly natural that new views in medicine should not only be scrutinized with severity, but to some extent, regarded with suspicion and even sometimes with dislike. This conservative tendency there is no doubt has prevented the propagation of many a weed and has sent many a quack nostrum to the wall. But when the new views are true views, it is in the highest degree interesting to observe how they make their way. The progress may be slow, but it is perfectly irresistible. I would ask you to compare the state of surgery at the present moment to what it was twenty years ago; and if there is a change, gentlemen, it is a change brought about not by the accumulation of facts so much as by the grasp of principles. Passing from surgery to medicine we cannot fail to note the growing certainty of our ideas with regard to the origin and propagation of disease. I might here refer to names well known to you all. I would refer particularly to that masterly investigation recently conducted at Caterham by Dr. Thorne Thorne, where he has hunted down the cause of the epidemic with most masterly skill. Gentleman, I do not know of an investigation of this kind save one, that I should be inclined to rank by the side of that true inductive research for which we are indebted to Dr. Thorne Thorne, with the exception I make, and I do so because I deem it a duty to mention this point as referring to that memorable investigation, that perfectly conclusive investigation, conducted by Dr. William Budd at North Tawton. We may forgive and even forget, gentlemen, the opposition which sometimes encounters true views in medicine. Let us forget opposition; let us forget the assaults to which these new views are properly exposed, for if they have vitality they must outlive those assaults; but we ought never to forget those who in the face of opposition of this kind, and at their own sore personal cost, have fought the battle of humanity and have won it. It is due to the ardour, and because of the ardour, of William Budd in his profession that he, at this moment, lies a wreck mentally and physically. I was rejoiced to see a few days ago in the *Times* a leader which clearly recognized the merits of William Budd in reference to those researches that he made, and never did the *Times* perform an act of more well merited justice. It would be well if this act of honorary recognition were followed by a recognition of a more substantial kind by the government of this country, for it would have regard to a man who virtually sacrificed himself, sacrificed his income, and I fear straitened the circumstances of those near and dear to him, by the devotion he showed to the public interests and the public good. I have only again to thank you for the cordial manner with which you have drunk my health and for the patience with which you have heard my words.

The PRESIDENT next proposed "The Medical Profession," coupling with it the name of Dr. Cottle, President of the Medical Society of London, a society which had had an honoured existence for one hundred years.

Dr. COTTLE in acknowledging the toast said it seemed to him of happy significance that the medical profession should be thus honoured by the Pharmaceutical Society of Great Britain. Many professions were entirely self-dependent, requiring no extrinsic aid; but while the medical profession in its scientific aspect might be self-dependent, if it wished to get its bidding done it must receive cordial assistance at the hands of the Pharmaceutical Society. The connection between the professions was as important as it was necessary, and the links which bound them together were not only scientific but were also those of mutual respect.

The PRESIDENT next proposed "The Visitors," coupling with the toast the name of Sir Philip Cunliffe Owen.

Sir P. C. OWEN in response said that after so much good speaking he was sure the other visitors present would not expect a long speech from him. He could only say that for the last five or six years it had been his pleasure to be associated in some degree with this Society, it having kindly chosen the South Kensington Museum as the institution in which to hold its annual Conversazione. Although that had been a most agreeable evening, he was looking forward to the next evening with even greater pleasure, when the gathering would be graced with the presence of many ladies, who probably regretted their absence on that occasion.

Dr. SLAUGHTER (Master of the Society of Apothecaries) proposed "The Prosperity of the Pharmaceutical Society, and the Health of the President." He said he proposed this toast with the more pleasure because, being the representative of the ancient Society of Apothecaries, he might say that they looked on this Society as acting in a great measure in accordance with the views on which their Company had acted for many years, of suppressing as much as possible the assumption by people who had not received any fitting education of any of the duties connected with the medical profession. They hoped by that means to do away with a good deal of the empiricism then existing. He felt quite certain that with the scientific attainments which the Pharmaceutical Society demanded of its members, and by the careful watch they kept over their honourable conduct, this tendency to empiricism would be greatly discredited.

The PRESIDENT in response said, it would be no more than the truth if he said he was completely overwhelmed with gratification at the manner in which the toast had been received by the company present. They had all had an opportunity of hearing how much he failed in some of the duties of the Presidency, namely, those in which eloquence was required, and would therefore not expect him to do more than to thank them most heartily; but he could not do so without saying a word for the Pharmaceutical Society of which he had been President for three years. He had tried to do his duty as well as he could, but when he looked back to the many defects which had occurred he felt that he might have been replaced by others who could have fulfilled the duties far better. But that was a thing of the past. The future was before them, they had now to elect a new President, and he trusted that their prosperity in the future would be greater than it had been hitherto. It was very gratifying to him to find that this toast was proposed by the Master of the Apothecaries' Society, and he thought they would all agree that they were a part of the honourable profession of medicine although they might hold the humblest rank in it.

During the evening a choice selection of music was sung by Miss Annie Sinclair, Miss Damian, Mr. M. Smith and Mr. Wynn. Mr. Harradine acted as toast-master.

The Pharmaceutical Journal.

SATURDAY, MAY 24, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ANNUAL MEETINGS.

THE most important event in the annual history of the pharmaceutical republic is over, and as the apotheosis of Birmingham Mr. CHURCHILL heads the poll, closely followed by other of its prophets. *Vox populi vox deorum*; the Trade Association is now more largely represented in the Council than before by its leaders, and if we may judge from the evidence furnished by this election of the new members of Council, the hopes of the pharmaceutical community are now centred in that direction. This circumstance may to some extent account for the decidedly cautious and conservative tone which, to our surprise, characterized the speech of Mr. BARCLAY upon taking possession of the presidential chair of the Trade Association last Tuesday. From that speech—a report of which and the other business of the Annual Meeting of the Trade Association we are compelled to defer until next week—we heard for the first time of a sense of responsibility that pressed upon him; of the conviction that the Association might, by indiscreet action, do harm instead of good unless the reins were held with a firm hand and all action were regulated by extreme caution.

It is no discredit to Mr. BARCLAY to infer from these remarks that he has profited by experience, and we trust that with the advantage thus acquired he will, as President of the Trade Association, be successful in his endeavours to guide the action of the Association so as to promote the interests of his fellow tradesmen. We are also glad to take these indications as justifying in a certain degree a return to our original belief in the possible utility of the Trade Association, somewhat rudely shaken though it was by the events of a later period and even still affrighted by the reappearance of that unholy apparition—the SHEPPERLEY case. We look to the sense of responsibility and to the recognition that activity may be mischievous as furnishing a warranty that in the future efforts and undertakings of the Executive Committee of the Trade Association there will be an absence of any such antagonism to the Council of the Pharmaceutical Society as we have always urged was the thing most to be avoided and to be feared.

Whilst speaking of these two associations it will not be amiss to point out that both of them suffer from that evil of indifference which we have often had occasion to speak of as one of the most hurtful influences affecting the interests of pharmacy. In the late election of members of the Council considerably less than one-half of the voting papers sent out were returned duly filled up so as to be available in deciding which of the candidates for election were to become members of the governing body. The only possible conclusion seems to be that at least one-half of the members of the Society do not care how they are governed, or by whom. In like manner we find the officers of the Trade Association lamenting that though the attainment of its objects and the successful carrying out of its undertakings involve the united support of every member of the trade—though there were trade interests to be fought for as well as professional position to secure—still in the third year of the Association's existence, its members had not yet reached the number of 5000. Here again, we have fully one-half of the trade appearing, if not inanimate, at least in such a state of suspended vitality as to be of no use or assistance in any effort to promote or protect the interests of the trade. Besides this, there is evidence in the arrears of subscriptions that among those who have become members of the Association there is some apathy in supporting its labours. Without command of the sinews of war very little is to be done, and when any difficulty arises, it will not do always to make a spasmodic appeal and have recourse to a special effort. The acknowledgment of the necessity for having something in the bank to fall back upon when the occasion arises is an involuntary confirmation of the wisdom of the Pharmaceutical Society's Council in having taken care to secure this element of strength.

This is not the time for going into the details of what has been done either by the Council of the Pharmaceutical Society or by the Executive Committee of the Trade Association; indeed, we strongly deprecate the tendency which at the late annual meetings induced several speakers to institute comparisons and express opinions as to the respective value of the proceedings of these bodies. Even still more to be condemned is the assumption that whatever has been done by the Council of the Pharmaceutical Society has resulted from the influence of the Trade Association acting as a spur. As a pretence such a representation can only be as mischievous as it would be improper, and if it were a fact it would be unnecessary to proclaim it so constantly as some speakers sought to do. But it is in defiance of fact that this has been done in some instances, and we feel convinced that it is not for the interest of the trade that this should be done.

In regard to this point it may be well also to mention that the idea of gaining for pharmacists a position in the construction of our national pharmacopœia does not emanate from the Executive Committee of the Trade Association or from Mr. MACKENZIE, but has for years past been urged upon the

attention of readers of the Journal and has been on various occasions under consideration by the Council.

At the annual meeting of the Pharmaceutical Society, last Wednesday, an attempt was made by Mr. PASMORE to refer the prosecution of the London and Provincial Supply Association to the interference, as he termed it, of the Trade Association. There is no foundation for this statement. It is true that some two years ago the Executive of the Trade Association was desirous of making an attack upon co-operative stores, which the Council of the Pharmaceutical Society did not consider politic; but the fact that no action of the kind was taken by the Executive of the Trade Association is good evidence that that body, as well as the Council of the Society, had reasons for not doing so. The wisdom of the course taken by the Council was testified to by the remarks of Mr. RANDALL and Mr. URWICK. The strong feeling there is throughout the trade on the subject is not the only thing to be considered, and in connection with this it will be well to bear in mind Mr. BARCLAY'S suggestion that ill-advised action may do mischief.

Mr. PASMORE, however, seemed to be under the impression that his original notification of the infringement of the Pharmacy Act by Mr. MACKNESS did not receive the attention it deserved, and he made a kind of charge to that effect against the Assistant-Secretary. We have received a communication from the Assistant-Secretary, which, however, we do not think it necessary to publish, in which he positively denies that he has at any time expressed himself as regarding with favour any encroachment on the rights and privileges of chemists and druggists, and states that at the particular time when Mr. PASMORE called, he was engaged with the Council, and that he apologized to him for not being able then to discuss the subject fully.

Judging from the facts on record there does not appear to be any real foundation for Mr. PASMORE'S impression that the information he gave was disregarded, or that he was treated with any discourtesy. At the time when he communicated with the office of the Society there were reasons for not taking proceedings so rapidly as Mr. PASMORE may have thought desirable, but nevertheless the fact is that the proceedings taken in pursuance of his information in November, 1877, resulted in the payment of the penalty incurred by Mr. MACKNESS before the end of January, 1878.

The question which has now for several years assumed a prominence greatly disproportioned to its importance,—whether women shall be admitted into the Pharmaceutical Society,—was again discussed at the Annual Meeting, but without, we fear, being advanced a step towards a settlement. With the consent of Mr. VIZER, who had given notice of a negative motion, Mr. WADE moved that the meeting should express an opinion that ladies who are otherwise duly qualified should not be excluded from participation in the privileges of the Society on account of their sex. As an amendment to this, Mr. VIZER brought forward what was to have constituted the motion, expressing the opinion that as the Pharmacy Act secures to all persons registered under it full trading rights, and that these were not increased by membership of the Pharmaceutical Society, it was not necessary and was undesirable that women should be admitted. After several speeches the meeting proceeded to vote, but only once more to show how evenly balanced opinion is on the subject, at any rate so far as evidenced by the test of such a meeting. On the show of hands the Chairman thought the advocates for the admission of the ladies had a majority of one, but upon a poll being taken they proved to be in a minority of three.

With regard to the festal meetings of the week, it may be said that they were very successful. The Dinner at WILLIS'S Rooms, on Tuesday, well illustrated some of the secondary results of such gatherings in the the large number of scientific,—and especially medical,—gentlemen who accepted the invitation of the members of the Society to become their guests. The Master of the Society of Apothecaries, Dr. SLAUGHTER, was one of these, and in proposing the toast of "Prosperity to the Pharmaceutical Society" he said that he did so with the more pleasure because he looked upon it as acting in a great measure in the same direction as the Apothecaries' Society in securing as far as possible the protection of men who have acquired a special qualification to carry on a particular calling.

Finally the Conversazione at the South Kensington Museum, on Wednesday evening, was as brilliant as any of its predecessors; it was attended by about 2700 visitors.

THE FLOODS IN HUNGARY.

DURING the past week a list of the donations to this Fund has been sent to each Local Secretary and many other gentlemen, in the hope that they may be induced to use their efforts for its augmentation. In the event of their meeting with any success we should be glad to receive the amounts as soon as possible, in order that the account may be closed and the money sent to Mr. JARMAY at an early date.

The following is a list of further donations which we thankfully acknowledge as having been received in addition to those previously published:

	£	s.	d.
Donations previously acknowledged	22	0	0
Barker, W. R., London	1	1	0
Barron, F., London	1	1	0
Bevan, C. F., Harwich	0	5	0
Bishop, A., London	1	1	0
Bullock, J. L., London	1	1	0
Butt, Mr. E. N., Four Contributions per	1	1	0
Chater, E. M. and M. T., Watford .	1	1	0
Constance, E., London	0	10	6
Kay Brothers, Stockport	1	1	0
Paul, B. H., London	1	1	0
Reynolds, R., London	1	1	0
Savory and Moore, Messrs., London .	1	1	0

*** Further Donations may be sent, either by Post Office order or by cheque, addressed to the care of Dr. B. H. PAUL, 17, Bloomsbury Square, W.C.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A MEETING of the above Association will be held on Thursday, the 29th inst., at 8.30 p.m. precisely, when Mr. L. THOMPSON will read a paper on "The Food of Plants," and reports will be made on Botany and Analytical Chemistry.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, May 21, 1879.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Frazer, Gostling, Greenish, Hampson, Hanbury, Hills, Mackay, Rimmington, Robbins, Sandford, Schacht and Shaw.

Restorations to Membership.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

The Proposed New Bye-Laws.

The alterations in the Bye-Laws, as read and agreed to at the two previous meetings of the Council, were taken as read and agreed to for the third time, so as to only require the sanction of a special meeting of the members and that of the Privy Council to come into force.

The New Honorary Members.

Letters were read from Professor Tyndall and Dr. Hesse, thanking the Council for their election as Honorary Members. The letters were ordered to be entered on the minutes.

The Business of the Annual Meeting.

The President said he had heard from Mr. Vizer that Mr. Wade had informed him that he intended contesting his (Mr. Vizer's) right to move the resolution of which he had given notice, except as an amendment to his own. Mr. Vizer suggested that the matter should be decided by the Council beforehand, so as not to waste time at the meeting. He expressed himself quite willing to accept the decision of the President.

Several members of Council expressed the opinion that it would be more convenient that Mr. Wade's motion should come first, but they did not see that the alteration could be made, except by arrangement.

The President said Mr. Vizer was hardly justified perhaps in the words of his motion in saying:—"The Council having desired a definite expression of opinion." The former Council had done so, but the present Council had not expressed any such desire.

The Solicitor, on being consulted, said both motions really covered the same ground, although in a different form, one being in the affirmative, and the other a negative. As a matter of strict right, the first motion of which notice had been given should have precedence, but no doubt the meeting would take the advice of the President as to the order in which the business should be taken.

THIRTY-EIGHTH ANNUAL GENERAL MEETING.

The Thirty-Eighth Annual General Meeting of Members and Associates in Business was held on Wednesday morning at 12 o'clock, Mr. John Williams, President, in the chair.

The President's Address.

The President in opening the proceedings said it was not his intention to inflict a lengthened speech on the members, but he might perhaps with propriety say a few words on some things which had occurred since the publication of the Report of the Council. The first point he would allude to was the decision of the Court of Queen's Bench respecting the London and Provincial Supply Association, which was in favour of the Pharmaceutical Society. He understood that the defendants had nt only applied for leave for further appeal, but that notice of appeal had actually been given, and therefore it would not be possible for the Council to act on the decision come to by the Court of Queen's Bench until the further appeal had been disposed of. He was sorry to say that he understood it would be probably not until November that the question would be disposed of; and it would then be the duty of the incoming Council to act without any hesitation in carrying out to its full and proper extent all that was meant by the decision of this important case. With respect to another point alluded to in the report, the use of apothecaries' weights and measures, it would be gratifying to the meeting to know that progress had been made in the settlement of this question, and the Council had actually had before it the draft which the Board of Trade intended to submit to Her Majesty for approval and which no doubt would become an Order in Council. As far as they could see, all that could be desired with regard to the right of using apothecaries' weights for dispensing and the sale of drugs in small quantities was conceded in that measure, and any difficulty which might have arisen under the new Act would now be removed. The question of stamping weights and verifying measures was not yet settled as satisfactorily as they could desire, but they had every reason to believe that it was in course of settlement.

Another subject barely alluded to in the report, but which the Council had had during the past year to consider, was that of the Hanbury Fund. As they were aware, a fund had been raised to the honour of the memory of the late Daniel Hanbury, and the Council had accepted the trusteeship and general business management of the fund. A deed of declaration of trust had been kindly prepared by the solicitor, Mr. Flux, free of any cost to the fund, and it would be executed as soon as certain matters of detail were decided. The money would then be invested in the name of the Society, which would hold itself responsible for the interest of the money, and this would be devoted to finding the gold necessary for striking a medal to be awarded every two years, or oftener if the funds allowed, to the most eminent man who could be found in materia medica, chemistry or the allied sciences. The Society would not have the award of the medal in its own hands, but that would be made by a committee consisting of the Presidents of various learned societies, of which the President of the Pharmaceutical Society would be one. The subscriptions had not been at all confined to England or to the members of the Pharmaceutical Society, for many eminent men in botanical, chemical and other scientific departments had taken part in it in England; whilst Holland, Italy, Australia, and many other foreign countries had also largely contributed. He could not conclude without some reference to the Benevolent Fund. It was stated in the report that receipts did not quite come up to last year's, and at one time he feared he should have had to report a very great falling off, but happily in the month of April the subscriptions came in much betterf although they did not quite reach the total of the previous year. He knew that this was a time o- hardship with the trade; that they were not so prost perous as a body as they had been; but he could no at all agree that that was the time they should give up subscribing to the Benevolent Fund. It was just the time really when they ought to put their shoulders to the wheel to help those who required it. Those who had an opportunity of sitting on the Benevolent Fund Committee and seeing the cases which came forward would agree that a little money subscribed by a great many was the best way of relieving the wants of the few who were in distress. There was one way in which members might often be of great service in assisting the Benevolent Fund even without subscribing; many of them were subscribers to orphan asylums and similar institutions, and if they would remember that the Council often had one or more children waiting to be placed in some asylum, and kindly reserve their votes, they might be o

great service. Very recently they had got a child into the Masonic School, and Mr. Robbins, who had the charge of the case, received so many votes from members that the child was elected without making use of the sum of money which had been voted for the purpose, and it was paid back to the fund for the benefit of others. With one point more he would conclude. An appeal would have been noticed in the Journal for the assistance of those of their own trade who were suffering from the late floods in Hungary. A large sum of money had been raised to relieve the general distress, but they were now appealed to by Mr. Jarmay, of Pesth, President of the Pharmaceutical Society of Hungary, to do what they could to help their brother pharmacists who had been ruined by the late disaster, and give them the means of making a fresh start in life. The subscription was not confined to England, a considerable sum having been raised in Germany and Austria, and he need not add that it was a very graceful and proper thing if English pharmacists would help their brethren abroad. He would now call on the Secretary to read the Annual Report.

Mr. RANDALL (Southampton) moved that the report be taken as read, which was agreed to.

The following Report and Balance Sheet were then taken as read:—

THE ANNUAL REPORT.

Since the annual meeting of 1878, much agitation has prevailed in the Pharmaceutical Society, and the Council are quite aware that they labour under an injurious but unjust suspicion of having been unmindful of the trade interests of Pharmacy, interests so important to each individual member of Council as well as to the Society generally, that such negligence would indeed be inexplicable. Evidences of this feeling of distrust have been so distinctly and recently pronounced that it seems desirable to disabuse the minds of those by whom it has been entertained, before proceeding to report the ordinary business of the year. It is the duty of those to whom are confided in trust the interests of the body corporate, to give due consideration to the purported objects of the institution over which they preside, as well as to guard the rights and privileges pertaining thereto. Thus when individual members of the Pharmaceutical Society were threatened with prosecutions by the Society of Apothecaries, or rather by the "Medical Defence Association" acting through that Society, it behoved your Council to consider in what way they could best proceed to fulfil this twofold obligation.

Looking back to the principles enunciated by the founders of the Pharmaceutical Society it must be apparent to all that there never was the slightest intention on their part to embrace "Medical practice," properly so called, in the business of a chemist and druggist. The very words of the Pharmacy Act expressly state that the examinations of the Society "shall not include the practice of medicine, surgery, or midwifery," and the expressed desire was so to elevate the business of pharmacy that those who practised it should find it both more dignified and remunerative to confine themselves to their legitimate pursuits. By this means it was hoped the business of dispensing would ultimately fall more completely into the hands of chemists. Gradually medical practitioners are ceasing to prepare their own medicines and are but too glad to do so where opportunities serve; but this change cannot be accomplished all at once and the desired end would be considerably deferred by any spirit of antagonism between members of the medical profession and chemists. Notwithstanding this, the Council have never been unmindful of the fact, that in the everyday exercise of his business the chemist must more or less give such advice over his counter, as by a strained interpretation might be called "Medical practice," or as Baron Bramwell expressed it, a breach of the law for *which it would be very unreasonable to prosecute him.* The Council therefore determined not to stand forth to protect alleged offenders, whoever they might be, and however they might have conducted their business, relieving men of all individual responsibility and frustrating to some extent one object of this Society. On October 4th, 1876, the following resolution was passed:—

> "That this Council is prepared to consider the case of any chemist and druggist who is threatened with vexatious proceedings for alleged infringement of the Apothecaries Act, and, if circumstances warrant, to defend the same."

And on August 1st, 1877, when a specific case was brought before the Council, it was resolved—

> "That this Council authorizes its solicitor at his discretion and at the expense of the Society, to defend the gentleman referred to in the threatened prosecution by the Apothecaries' Society."

The case on which this resolution was passed was not further proceeded with by the Society of Apothecaries.

In its desire to use every effort to avert vexatious prosecutions it appeared politic for the representative body of the Pharmaceutical Society to come to a fair general understanding with the Society of Apothecaries to prevent such prosecutions. This was the more easy as, although the Society of Apothecaries might occasionally be urged to prosecute by the pressure of some Defence Association, they were themselves ready to admit as fully and freely as it was urged on them by others that what has been termed "counter-practice" by chemists has ever been and ever must be a necessity, a practice not to be regarded as an offence. Absolutely to define the boundary of this debateable land seems to be impossible, but by the communications which have taken place between the solicitors of the two societies the Council feel convinced that the best interests of the members of the Pharmaceutical Society have been promoted and the honour of the Society upheld and that in due time this will be acknowledged by those who have been loud in their denunciation.

During the past year upwards of three hundred and fifty cases of infringement of the Pharmacy Act have been reported to the Council. The great majority of the offenders yielded to the notices of the Registrar, and discontinued their illegal practices. In several instances, however, it has been found necessary to employ the Society's solicitor to enforce obedience to the law. When accused persons undertake to discontinue their offences it is the Registrar's duty, after a stated interval, to ascertain that the undertaking has been faithfully kept; it is hoped Local Secretaries will aid him by observation and information.

As may have been seen by the reports in the *Pharmaceutical Journal*, a most important judgment has lately been given.

The Journal of April 26, gives a verbatim report of the decision of the Lord Chief Justice and Mr. Justice Mellor, in the Court of Queen's Bench, on

the appeal against that of the Judge of the Bloomsbury County Court, in the case of "The Pharmaceutical Society of Great Britain *v.* The London and Provincial Supply Association, Limited."

In the lower Court it was held that inasmuch as the sale and dispensing of poisons by that Association were under the superintendence of a registered chemist and druggist no offence had been committed against the Pharmacy Act. In the appeal which the Pharmaceutical Society instituted to reverse this decision, the conduct of the case was entrusted to the Attorney-General and Mr. Lumley Smith, under the instruction of Mr. Flux, the Society's solicitor. Mr. Wills most ably defended the London and Provincial Supply Association, contending that a joint stock company being a "body corporate" could not be regarded as a "person," and therefore could not be made amenable to the law in this case, the Pharmacy Act enacting only "that it shall be unlawful for any *person* to sell or keep open shop, etc., etc." The arguments on both sides were most elaborate and protracted; and, the Judges, deeming the case of the highest importance, deferred their decision in order to consider the matter more fully, and on the 23rd of April delivered judgment. Although fully reported in the Journal it may be well here to insert two or three passages extracted therefrom.

The Lord Chief Justice says:—

"It cannot be supposed that the Legislature can have contemplated a result so entirely at variance with the policy and purposes of the Act, or intended to place incorporated companies on a different footing in this respect from that of ordinary partnerships or individuals." . . . .

"The fallacy of the argument urged on behalf of the defendants is that it assumes that the prohibition is addressed to individual persons; but the provision, being universal, must extend to all persons, whether acting in an individual or corporate capacity."

And again,

"The County Court Judge was, therefore, wrong in holding that, because the chemical department of the defendant's business was managed by a qualified person the defendants were not liable to the penalty."

Notwithstanding these and many other forcible expressions in the judgment delivered by so weighty an authority as the Lord Chief Justice, supported by Mr. Justice Mellor, Mr. Wills asked, and obtained, leave to appeal to a still higher court; therefore the question may yet find its way to the House of Lords.

The financial report shows a small increase in the subscriptions and fees received; the advance is derived from the number of associates in business, and from persons presenting themselves for the Minor examination. However gratifying that may be in itself it is certainly to be regretted that so many who might achieve a higher position are satisfied to remain in the second grade of the Society. As has been repeatedly observed, this fact may in some future time be a cause of difficulty both in forming the Council and appointing Examiners. None but pharmaceutical chemists can be Examiners, and two-thirds of the Council must always have that qualification. Exceptional expenses have been incurred, as shown by the expenditure column of the balance sheet, in maintaining the premises in Bloomsbury Square, and in other essential matters, but the balance in hand at the close of 1878 was still considerably in excess of the previous year.

The interchange of visits between the Examiners in London and Edinburgh was, the Council believe, productive of good effect. The examinations in the two centres appeared to be as nearly as possible uniform, although certain details in the arrangements and appliances of each Board were found worthy of observation and adoption. Whatever deficiencies were observed either as regards specimens or laboratory and other requirements have been amply supplied, and this department is now in a high state of efficiency.

Great activity has been exercised in enriching the Museum of the Pharmaceutical Society, and special opportunities have arisen of which the Council have taken advantage. The Paris Exhibition contained a very valuable collection of articles interesting to pharmacists, and by the kindness and courtesy of exhibitors many rare specimens have been secured. Not only were the Editors of the Journal and the Curator of the Museum authorized to proceed to Paris and place on record their observations, but the Curator was subsequently dispatched at the close of the exhibition to secure such of the exhibits as might be obtainable. Besides contributions from foreign countries, many British exhibitors have given their specimens to this Museum, and deserve the special thanks of the Society.

Due attention has been given in supplying the Library with appropriate works, and it is gratifying to observe that year by year the number of persons availing themselves of the opportunities afforded thereby has been increasing, and latterly in greater ratio than formerly. It has been found necessary to increase the accommodation for books in this department and a second room is being appropriated for that purpose. Owing to the great increase of books, it has been deemed necessary to prepare a new catalogue of the whole collection, which it is hoped will be shortly issued.

The fund raised to endow a medal in honour of the late Daniel Hanbury has been committed in trust to the Council of the Pharmaceutical Society under certain conditions as to its award which have already been published in the Journal. The Council feel confident that the Society will deem the acceptance of this trust a just tribute to the memory of so distinguished a member.

The Evening Meetings of the past session, both in London and Edinburgh, have as usual afforded opportunities for many interesting discussions. Extra evenings were appropriated at Bloomsbury Square to lectures on "Electricity as a Source of Light," by Professor Redwood, and on "The Life of the Plant," by Professor Bentley.

The School of Pharmacy is well attended in the present Session, and it is gratifying to the Council to receive from the Professors good reports of the zeal and industry displayed by the students. The number of competitors for medals and certificates at the sessional examinations bears out this commendation.

The weak points which experience has brought to light in the Pharmacy Act, 1868, have been for some time under the consideration of a Committee, and such alterations as seem desirable have been reported to, and approved by, the Council. A Special Committee has been appointed, and is now working to formulate these necessary amendments into a Bill to be submitted to Parliament.

The Dental Practitioners Act which passed through Parliament in 1878, secures the right to

EDWARD HARVEY
S. LLOYD STACEY,
HENRY AYSCOUGH THOMPSON } *Auditors.*

March 3rd, 1879.

registration as dentists for all chemists who practised dentistry prior to the passing of that Act.

On the representation of this Council, supported by the Medical Council, the Board of Trade re-introduced into the Bill for regulating Weights and Measures the clause permitting the continued use of apothecaries' weight, which had been erased by the Select Committee of the House of Commons, and the Act as it now stands renders the use of that weight legal. Certain difficulties have, however, arisen, especially in the minds of some local inspectors, owing to the absence of any authorized table of standards for apothecaries' weight, and, at the request of the Board of Trade, a description of the denominations and value thereof has been supplied by this Council, and will probably be so dealt with as to obviate further doubt or difficulty.

In the present Session three distinct Bills have been introduced for the Amendment of the Medical Acts, one in the House of Lords by the Duke of Richmond; the others in the House of Commons by Dr. Lush and Mr. Arthur Mills. The object of all these Bills is in the main to enforce a conjoint scheme of examination for all persons entering the medical profession, but the two latter also propose a change in the constitution of the Medical Council, for which the Duke of Richmond had determined to provide in a separate Bill. None of these Bills affect chemists prejudicially. On the contrary, the new scheme of qualification, by abolishing the examination and authority of the Society of Apothecaries as a separate Board, would naturally abolish their power of prosecution, which has caused so much alarm and discussion of late. Nevertheless the Council is carefully watching the progress of all these Bills, and will not fail to assert the rights and privileges of chemists should they be in any way jeopardized.

The Benevolent Fund account of 1878 contrasts unfavourably with that of the preceding year, simply because the dinner of 1877 in aid of the fund yielded a large exceptional addition to the receipts of that year; the regular subscriptions, however, were more than equal to those last reported. It was very gratifying in December last to be able to elect seven additional annuitants, making the total number of persons receiving that valuable assistance twenty-nine, dividing among them £945. The Council regret to observe that since Christmas the contributions received have fallen somewhat below those of the corresponding period of 1878. It would be painful to be compelled to refuse assistance in cases of real need, and this must of necessity be done if the income of the fund decrease. Beyond the sum *assured for life* to the respective annuitants above named, more and more is required every year for the temporary relief of others in distressed circumstances. Several special grants have been made to secure homes and education for orphan children, which may fairly be described as something far beyond casual or temporary assistance, and it should be remembered that as it becomes generally known that the fund is being more freely applied in that direction an increasing number of applications may be expected to be brought before the Council.

Mr. VIZER moved—

"That the Annual Report now presented be approved, adopted and published in the Journal and Transactions of the Society."

He said that taking it as a whole he thought that the report might be considered to be highly satisfactory, but there was one paragraph he would say a word or two upon, namely, that on the fifth page, with regard to the comparatively few young men who come forward for the Major examination. This was a point he had always felt great interest in, and he could not understand the present generation of chemists resting satisfied with merely entering the portals of pharmacy without aspiring to the top of the tree. It was said that the extra expense and sacrifice was not sufficiently remunerative in after life; but he had always held that knowledge carried power, and if the present generation of chemists wished to preserve their status in the world it must be by maintaining a higher position. He would therefore take the opportunity of urging all young men to pass the Major examination. There was another point of view in which this matter was of importance. Many years ago he remembered predicting that the Society would dwindle down in this way. At that time he looked into the matter somewhat carefully, and it was clearly evident that the feeling was gradually increasing amongst young men that they would stop short of the highest position; and when they remembered that it was only through pharmaceutical chemists that membership of the Society was to be obtained, it became of vital importance. In the present report it appeared that 257 had passed the Minor examination, but only 49 the Major; whilst in Scotland out of 67 there were only 2 successful Major candidates. He noticed that a committee was appointed to formulate the necessary amendments of the Pharmacy Act into a Bill to be submitted to Parliament. He was quite sure that every care would be taken, but it did strike his mind that at the present moment it was rather dangerous ground to step upon. They did not know but that something unsatisfactory might be introduced into any Act which they promoted, which would virtually legalize what they were now endeavouring as a Society to put down.

Mr. OWEN seconded the motion.

Mr. MACKENZIE (Edinburgh) said he wished to ask two or three questions on the financial statement. First of all whether the item for Preliminary examinations referred only to London and Edinburgh, or whether they included country districts.

The PRESIDENT said that superintendents were appointed at all the centres in which examinations occurred, for which they received a certain fee. Of course there were more centres in England than in Scotland, and therefore the amount spent on superintendence was larger. It also included the hire of rooms for the purpose. Of course that expense was not incurred in London.

Mr. MACKENZIE next asked asked how many deputations there were to and from Scotland and how many gentlemen on each deputation.

The PRESIDENT said that one deputation went from London to Scotland and one came from Scotland to London. The deputation which went from London consisted of three members of the Board of Examiners, himself, as President, Mr. Sandford and the Assistant Secretary. The deputation which came from Scotland consisted of two members of the Board of Examiners.

Mr. MACKENZIE next asked for an explanation of the expense of the Journal, £767 8*s.* 9*d.*

The PRESIDENT said that was a balance which was taken out after the expenditure and receipts had been allowed for. It would be understood that a considerable amount was received for the Journal, on account of advertisements, but at present there was a balance of £700 against the Society, including postage, but no allowance was made for the value of the Journals distributed to the members.

Mr. MACKENZIE next asked how many clerks there were in the office and what was the maximum salary.

The PRESIDENT said there were six permanent clerks, but frequently when there was a pressure of business

they were obliged to have extra help. If it was the pleasure of the meeting he would answer the other question. In his opinion they did not at all overpay their clerks, considering the work they did.

Mr. MACKENZIE said he should not press that question, but he would proceed to make a few remarks on the report. The report ought to be, in the first place, a correct report of the condition of the Society during the year, and this one contained ample evidence that the members of the Council thoroughly knew their duty. He referred to page 4, where there was a paragraph saying, "It is the duty of those to whom are confided in trust the interests of the body corporate to give due consideration to the purported objects of the institution over which they preside." He did not think there was a member present who would not endorse that, and say it was a very good epitome of their duties. Therefore, it would be well both for the Council and the members that a few remarks should be made in the best possible spirit on the report. Upon carefully reading it he could not avoid the impression that it started under a strong impression that there was something wrong somewhere. The Council seemed to be hinting at some suspicion regarding the past; he was not alluding to anything particular, but there were several paragraphs which must commend themselves to the notice of every gentleman who had read them, apart from the Council. They had reason to think that it was like a barren fig-tree, more leaves than fruit, and he was inclined to say, "Who hath bewitched you?" for he could not understand how gentlemen, with the statement in the first paragraph he had read before them, could make their actions in some respects compatible with it. He did not blame the Council altogether, the members of it had been left for many long years to the freedom of their own will. Nobody called them in question, but every one cried "Amen" to whatever they might say or do. It was contrary to human nature to expect that persons so left to themselves would not go astray in some cases, and this possibly might have accounted for some things, and it took a good while even before those parties in their earnest desire to be right were able to accomplish it. To-morrow would possibly proclaim who were to have a chance another year. It would also proclaim who were to have a new chance of making a fresh start, and he hoped many of them would be spared to attend the next annual meeting, and that there would be room for congratulation next year on the advance made. He admitted there had been an advance made, but he complained that the Council did not, as far as possible, represent their constituents. With regard to the Journal, it was said that it was their organ, but strangers would not sometimes think it was so. However, he was expecting better things, and that they would see articles in the Journal which would have some manliness about them. It was only in human nature to make a mistake, but it was like a true-hearted Briton to own it, and make the best of it. With regard to the Pharmacy Act, he differed somewhat from the remarks of Mr. Vizer. He thought a new Pharmacy Act was needed, and was delighted to find the Council had gone that length. They would all cry "Amen" to that; but he should like them to wait a bit, and, if possible, see a new Government in before the Bill was presented. He thought they would not have to wait very long. This was a very important matter. The new Pharmacy Bill ought to be liberal in spirit, but clear and concise in form, so that every one should understand what was within it and what was not. He also hoped that it would abolish that peculiar position which held them up as an exception to every society throughout the country—he referred to the distinctions which the register showed between different classes. There ought to be one standard examination, the same as the College of Surgeons or the College of Physicians had, which would admit gentlemen to the ranks. He did not want to make it too easy, but he wanted to make membership such that it would be worth having and worth knowing, and that there should be only one examination, and the terms Major and Minor should be buried in the past Membership ought to be obtained by examination and merit; but he would have fellowships, which might be possibly granted to gentlemen who had served long on the Council faithfully and well. He would also abolish the annual subscriptions, making the fee whatever they liked on entry, and he did not despair of seeing pharmacy reach such a state that they might abolish the word trade. If they aspired to the true dignity of the position they ought to hold, they would make it more a profession than a trade. Funds would be needed no doubt, but if the examinations and entrance fees were increased it would be far better than keeping on with annual subscriptions. Lastly, he hoped that they should agitate for an equal right to the drawing up and the formulating of the British Pharmacopœia. This was an idea he had long entertained. They left it to men who knew nothing about pharmacy at all to tell them what they should do. They devoted their lives to practical pharmacy, and they ought to have a voice in preparing the Pharmacopœia. They should not be afraid to take that position in the face of all the medical faculties of Great Britain, and never to rest content until they had an equal voice upon the subject. They ought also to have a larger Council so that all interests should be attended to, and that no man should ever have cause to complain. Although the Council had never admitted their mistakes, he thought they must know they had made some, or there never would have been 4000 men banded together outside to do the work they ought to have done. He hoped that for the future they would go forward in a spirit of unity and strength which would commend itself to the respect of the medical faculty, and of the public generally.

The PRESIDENT said he was informed there was a gentleman present who was a registered chemist and druggist, but who was not a member of the Society; of course he had no right to be present at the meeting or take any part in the proceedings.

Mr. KERR said he was the individual referred to; he had felt some doubt as to whether he ought to come, but on asking a friend he said he could see no harm in it. He was a pharmaceutical chemist.

The PRESIDENT said there would be no objection, he was sure, to Mr. Kerr remaining, but he could not of course take part in the proceedings.

Mr. URWICK thought the Council were rather inclined to extravagance, seeing the present balance sheet represented an expenditure of £1125 over that of last year, and he thought there would probably be an increased expenditure on account of the increase in the examiners' fees. He should like to know if there was a demand for that, because the Council seemed to have gone contrary to what was usual in commercial matters, namely as long as you can get a good article at a good price to go on, but when the article became scarce, and the demand was greater than the supply, then naturally you should increase the price.

The PRESIDENT said no demand was made by the Board of Examiners for an increase of fees. It came spontaneously from the Council, because it was conscientiously believed they were underpaying the gentlemen who undertook the duties, and that to increase the fee was simply an act of justice. They did not wish to act as mere tradesmen, buying in the cheapest market and selling in a dearer, but to do their duty in a higher sense than that.

Mr. URWICK said he did not put it in the light of buying the cheapest, because he thought they should go in always for the very best; but when you could get the very best article in the market at the price you were giving, it was unnecessary to pay more, and he thought that the gentlemen who received the remuneration were most capable of judging whether they were sufficiently paid or not. With regard to the Journal he thought the reply

given was scarcely satisfactory, and he should like to know what occasioned the increased expenditure on the Journal during the past year. The increase seemed to be something like £300, which might have have been wisely expended, and no doubt it must have been or the Council would not have sanctioned it, but on looking down he saw that the postage was increased also, in fact he found that all the money expended had been expended, not on what the Society was formed for, but more especially on what he might call their own household gods, not for education and not for defence of the trade. On that ground he did complain of excess of expenditure, unless they got a return of some kind for it.

The PRESIDENT said he would give the particulars with regard to the increased cost of the Journal at once. There was about £130 less received for advertisements this year than last, and about £150 more was paid, £100 for contributions and reporting and £50 expenses connected with the reporting of the Dublin Meeting of the British Pharmaceutical Conference and the Paris Exhibition.

Mr. URWICK said he saw no account of any grants having been made to associations throughout the country for educational purposes; perhaps none had been asked for, but he liked to see the money spent in advance of education and the defence of the trade. The report began with a flourish of trumpets over a guilty conscience; it seemed to say, we have been very good, but it is thought we have not. The resolution quoted in the fourth passage of the report showed that the Council had power to defend legal proceedings against poor chemists who had been practising, and he regretted that had not been exercised in another matter which had been fought court to court, and was proved lastly to be as simple as the one the Council was then going to take up. He joined Mr. Mackenzie in hoping that the time would come when they had one examination for membership, but he differed with him with regard to a new Pharmacy Act at the present time. He thought it was desirable, and would greatly benefit them, though he did not think that at the present moment it would be wise to pursue it. He felt that after this co-operative store question had assumed the phase it had it was the duty of the Council to go on quietly for a year or two until the excitement from that had passed away or they would incur very great danger in going to the House of Commons. A friend of his did try to exercise his influence over members nominated on the committee with regard to co-operative trading, and he told him that there were not seven members that he could find who were not dead against trade and trade interests. For that reason he should not like to see a Pharmacy Act brought forward at present. The Council had rendered valuable service with regard to the weights and measures, and he hoped they would go on until the whole matter was settled. There was a strong feeling in the country about co-operative stores. He thought the Council were on the right track, and he hoped they would strike home. He did not know how the law of the land at the present moment regarded other co-operative societies, but it would of course be for the Council to consider whether they should act in restriction of other co-operative societies, seeing the law of the land as delivered by the judges was that in carrying on their business they were going contrary to the law. In that sense they were not defending the interests of chemists only, but carrying out an Act which was passed for the protection of the public. Chemists had to comply with certain tests before they could start in business, and therefore it was for the benefit of the public that those regulations should be enforced. He advised the chemists not to go and lower their prices just because some neighbouring grocer was selling patent medicines. He had passed through several periods of bad trade, and had noticed chemists tumbling their seidlitz powders down to 9*d*. and 10*d*. a box, and other things in proportion. But where were they now? Those who had kept up the price he could still see around him in business, but those who did not were some of them on the annuity list. If chemists, as well as other men, would give their personal attention, and do their business in a proper way, they would be able to set the stores at defiance. Of course it required patience and perseverance, and in many cases a great deal of anxiety to contend against these difficulties, but he felt, having lived through so many of these periods, that if they carried on business on a straightforward principle good times would yet return.

Mr. CARTEIGHE did not think Mr. Urwick's question with regard to the Journal was quite answered in the way intended. At any rate he did not understand it. He took great interest in the Journal, and should like to know exactly how it stood. The statement in the accounts showed a balance against the Society when all the expenses on account of the Journal were paid. But did that include the postage of the Journal?

The SECRETARY said it did. The balance about represented the postage.

Mr. CARTEIGHE remarked that as a matter of fact the Journal cost nothing, but the postage did. He could not help thinking that the wording of the account might be so altered as to give that information. Of course the increased postage on the weekly over the monthly Journal was a serious item, but practically, if the postage was £700 per annum, they really paid £60 for the Journal.

The SECRETARY said the postage was £705.

Mr. SHEPPERLEY said as the report contained a somewhat pointed reference to the question of counter practice, and that being a question in which he had been unfortunately, to his discomfort, somewhat prominently associated in the pharmaceutical world, he felt constrained to say a few words, and at the same time to express his personal sense of the unkind remarks, the unjust and incorrect remarks, which certain prominent individuals connected with the Society at different times had thought fit to step out of their way to make, which he, as defendant in the cause to which he had referred, had not been able to discuss at all owing to his position as such. He wished gentlemen to bear in mind that this matter would never have been brought before the late Council at all had his own wishes and inclinations only been consulted. It was done at the instigation and recommendation of a number of chemists at Nottingham, who were convened purposely for the consideration of the case, supported as that wish was by the desire of the Birmingham Association. The visits which the detective paid to Nottingham were by no means confined to one or two isolated individuals. Had that been so it might naturally have been supposed that those one or two to whom those visits were paid had been making themselves more obnoxious and obtrusive in the conduct of their business than had the rest of their brethren. But his visits were made to a great number of the trade—some twenty-six in all—and this fact it was, together with other elements, which induced them to hope that the late Council, which it was thought would have greater influence in defending a matter of that kind than a mere juvenile association, would have stepped to the front and would make inquiries by a properly deputed person. Had they done so he was sure that the inquiry would have resulted differently to what they seemed to anticipate, and what he might almost say, without any bitterness of feeling, they even seemed to desire. The legal opinion expressed in that room by the solicitor, if he recollected rightly, was to the effect that so long as one's proper efforts were confined to the space embraced within one's own four walls, one had nothing to fear from any outward interference of the Medical Defence Association. His experience had been slightly different, for he failed to gather from the opinions expressed by judges or the press at large that that was quite reliable. As to the information which the Council said they relied on in not acting in this matter, all he wished to say was that he had reason to think that they ought to feel regret in not

having, as he had already intimated, made a special inquiry in the town instead of taking information from a source which was not reliable, and which, from obvious reasons which he could give if necessary, was much of it in sympathy with the enemies' camp. He had no wish to import into this matter any bitterness of sentiment, but he thought he should carry the meeting with him when he said that these attacks had been numerous enough throughout the country to have caused in the minds of the great majority of the trade a considerable feeling of alarmand no small amount of indignation. He might venture to say that considering the legislation which was now pending on this question, influenced as it would no doubt be by the tone the press had assumed towards it, he thought they might trust that the future would be less troublesome, and that their prosperity would be none the less secure.

Mr. ANDREWS thought they should fail in their duty to the Council if they did not express a few words of congratulation on one part of the report, namely, that which referred to the action of the Council against the London and Provincial Supply Association. He trusted the judgment already given would be confirmed on appeal.

Mr. PASMORE said that, as being the principal cause of bringing that case before the Society, he should like to give an account of the reception he met with at the office. At the opening of that establishment he sent one of his assistants down with some poison he had purchased there, to the Secretary. Hearing nothing for some time, in the early part of November he called on the Secretary to know if any action had been taken. The Council was then sitting, and the Secretary was engaged; but he saw the Assistant-Secretary, who told him that nothing could be done unless he chose to take action in the matter; that the Council could not interfere unless he could prove that they were selling certain poisons in the schedule. He then asked him what was the benefit of being a pharmaceutical chemist? to which he replied that you had the privilege of selling and dispensing poisons. He said chemists could not live on that alone, to which the Assistant-Secretary replied, he could not help that, and wound up by saying he considered co-operative stores were about the best paying things going. On that he turned and left the room; and being a member of the Trades Protection Society, he immediately wrote to the Secretary, giving him an account of the treatment he had met with, and enclosing a price list of this Supply Association. They interfered in the case, and he thought that honour ought to be given where honour was due, and they had to thank the Trade Association for having stirred up the Pharmaceutical Society to take action in the matter.

Mr. BROAD (Hornsey Rise) wished to ask a question with regard to the balance sheet. Mr. Carteighe seemed perfectly content with the explanation with regard to the Journal; but he (Mr. Broad) did not. The postage cost £705 this last year, and it only cost £471 the previous year. Therefore it paid last year, but did not pay this, and he should like to know how that was? The increase of postage was certainly not because the Journal was more interesting.

The PRESIDENT said he was mistaken in supposing that the difference represented the postage, it was only a coincidence this year that it did so.

Mr. BROAD said he could not understand why there should be so much extra expense this year on the Journal.

Mr. CARTEIGHE said the President had already explained.

Mr. BROAD asked if it would not be possible to have the Journal account printed separately next year, so that members might see how it stood. He helped to support the Society, and he presumed he had a right to know how the money was spent. The postage last year was £443 and the previous year £280.

The SECRETARY said there were a great many registered letters sent to clear the register, sometimes two to various people. The books were quite open to any member of the Society who wished to examine them at any time they liked.

Mr. BROAD said the increase in postage of £160 seemed very great, He might add a little information on one point to which reference had been made, namely, why students did not go to the Major examination. Some years ago he was secretary to the Students' Association, and thus came in contact with nearly all the students, and had a great deal of conversation with them. When he asked them this question the answer he generally got was, that they had done more already than men who passed the Modified examination, and yet the latter were entitled to stick up "chemist and druggist by examination," and they could become members of the Society, when they could not without passing the Major. He approved of Mr. Mackenzie's idea that they should have a voice in the new Pharmacopœia. Certainly if it stood on its own merits as a scientific work it would not be found in many of their pharmacies. He thought the Legislature ought to make it compulsory that drugs should be sold by pharmacists alone, and that doctors should give up making their own medicines. He believed this was the only country in which it could be said that doctors were licensed to kill.

Mr. COLE (Chippenham) suggested that next year the balance sheet should appear with an extra column, like railway statements, so that they could compare each item with that of the previous year.

Mr. WITTLE suggested if the members had not confidence in the Council sufficient to enable them to spend money in postage stamps they ought not to elect them. He had recently been at several bank meetings and there had not been a tithe of the questions asked with regard to very large amounts as had been asked that morning about a few paltry postage stamps. They did not often come there and when they did there were many questions of importance which might be usefully discussed without wasting time on such petty details. If the Council wanted 5*s*. for postage stamps and anybody was not satisfied he should be ready to give it to them.

Mr. RANDALL wished to say a word or two in favour of this much abused body of gentlemen, the Council. At one time he had the honour of being on the Council and then had to take his share of the same. He being then a young member was cautioned by the older members to let the meeting say just what they pleased, but not to attempt to reply, and that was just what the Council really did. That showed that they had an easy conscience, quite opposite to what they were told just now, for they seemed to be quite willing to let it all go and the main portion of it to be published, and then to abide by the result and the common sense of the whole of their constituency. He was surprised just now to hear a gentleman, who rather shook his liberal opinions, although he shared them, because he took this position. We have representative institutions all through the country, not elected at all hurriedly or in an unfair manner, but in the most open and reasonable way, choosing a certain number of men, and now we, a few of those in the country who happen to come here, say we have not the slightest confidence in them. We cannot depend on anything they do, and when they do a good thing it is because somebody else has pushed them on to do it. He did not believe it. He knew very well that long ago, when he was on the Council, this question of the stores was much in their minds; and they would have very glad then to have tried the question in the Law Courts if they could have been almost certain that they would succeed. But suppose they had tackled them and had not succeeded? The present case was one not on all fours with the civil service and that class of stores. He did not think when the Council found out that that was a case likely to succeed they had any hesitation in trying

i , and he was quite sure they would not have the slightest hesitation now in going on to the end; and then they were one step in advance, but only one step, and they could not be quite sure of the second step, because they had attained the first, since the cases were not on all fours, but they had a good opportunity of going in and trying. He thought the gentleman who had spoken so strongly about liberal opinions was rather too radical, for he wanted to abolish everything. He hoped the Council would not abolish everything. It was said they ought to abolish the distinction of Major and Minor, because the College of Surgeons and Physicians did so. But was it not true that the College of Surgeons had a licenciate and a membership, and was it not also true that many of those who were practically the physicians of the country had not got a physician's degree from the college, and that they had a different standing according to the degree they attained? He believed the College of Physicians did not even give the title of M.D., which must be conferred by a University, but at the same time they gave the right to practise. There was no doubt practically that those two societies did what their own society did, and he trusted that no Council to be elected would think of abolishing those two distinctions unless something stronger should be said in its favour. They could scarcely do so if they did not at least pull up the lower examinations towards the higher; and he did contend that they must for the sake of country places, where the druggists, as he knew, had a very poor remuneration for the amount of intelligence and ability they were obliged to acquire, not raise the qualification necessary for going into business more than was absolutely necessary. At the same time it would be a great pity that the public in general should not know that there was a qualification which this Society held up and endeavoured to induce all the students to attain, which gave them the rank of really scientific men. With regard to the Pharmacy Bill, there was evidently some difference of opinion about it, and he had heard differences of opinion expressed at a certain place yesterday about going on with that Bill. That morning several gentlemen who objected very much to the extremely slow pace of the Council were very much afraid that they were now going too fast. Putting the two things together, they must come to the conclusion that the Pharmacy Bill would not be brought forward by the Council unless they saw first that it would be an advantage to pass it, and secondly, that there was a very good chance of doing so. If the Council looked at these two things he did not think they would go at all too fast. When some of those gentlemen who spoke so strongly got on to the Council, as no doubt they would, they would find upon their shoulders a weight of responsibility which would make them much more deliberate, and make them feel that they must ask for a little more indulgence when they could not tell all the motives which had swayed them and the reasons which had urged them, although those motives were perfectly pure and the reasons reasonable. Counter practice was another important matter, and with regard to it his own opinion was that it was very doubtful whether their policy was not rather to support druggists, as they had been supported, who had been unfairly attacked for counter practice, and avoid intentionally having test cases and trying to draw a line. He felt satisfied that if they did draw a line they would get it drawn in the wrong place; but if they went on defending those druggists who fairly practised at the counter, when it was necessary, they might tire out their opponents; and here he might say that he thought sufficient justice had not been done to the acts of the Council, backed up by the character they had acquired for carefulness, deliberation and good judgment, arising from not going too fast, in what they had been able to do with the Society of Apothecaries, and he did believe to a great extent they had put a stop to these prosecutions. It was much better to stop the spring than to merely arrange how it should flow. One word more about the Journal. One gentleman who spoke strongly about it, said that it did not cost more postage because it was more interesting. He was one of those who was getting somewhat rusty in his pure chemistry, and he liked things pretty easy to understand; and he had been extremely pleased with the Journal lately and with what he thought was an improvement in it, viz., coming down to the smaller capacities of some of their members. He would only say this further, that, as far as his knowledge of the chemists in the country went, there was a very large amount of gratitude felt to the Council for what they did and of confidence in them, although he had not the least doubt that many thought it just as well for the Council at times to endeavour to go as fast in the way of progress as possible. He hoped the outgoing Council would not think that the chemists did not appreciate their efforts and that the incoming Council would not think that a revolution was asked for by their constituents.

The SOLICITOR said he thought perhaps it would be well for him to state the facts with regard to the prosecution of the London and Provincial Supply Association. The gentleman who had spoken was the first who had ever publicly proclaimed himself an informer.

Mr. BEER said he did the same thing.

The SOLICITOR said such merit was very rare. Those who received information of this kind always did so on an implied understanding that it was to be treated as confidential, and that the Society's officers were to take upon themselves the carrying out of the proceedings from the first. He would remind the meeting that in the month of November, which was named by Mr. Pasmore, the London and Provincial Supply Association had never been dreamt of. The case came to him as the ordinary case of a trader improperly carrying on business, the mechanism at his disposal was put in motion, and it resulted in a purchase, and in an application for a penalty, which penalty was paid by the offender before the close of the year. It was not until the beginning of the following year that this London and Provincial Supply Association came into existence, and when that took place further action on the part of Mr. Pasmore was not required, but the Society's officers followed it out, made the requisite purchase, carried the case into court, and carried the appeal on without troubling Mr. Pasmore at all, and entirely with the sanction and approbation of the Council. He did not perceive therefore that Mr. Pasmore had any cause of complaint.

Mr. PASMORE begged to say that he reported that case as soon as the place was opened by Mr. Mackness; but it was then trading under the name of the Supply Association, and when he was informed that nothing could be done in the matter he wrote to the Secretary of the Trade Protection Society.

The SOLICITOR said it was true that that gentleman did carry on the business under the name of the London and Provincial Supply Association, but it was an individual business, and the individual was made to pay the penalty. It was not until they got well into the year that the company was incorporated, which raised this important question, and gave the advantage of suing for a penalty under such circumstances as carried clearly to the minds of the judges the real mischief which would result if the construction of the Act of Parliament which the Council contended for was not adopted. He did not think that if they had gone in for devising a case they could have had one which would better illustrate what was meant by the Act of Parliament, and what would happen if any other construction were put upon it.

Mr. HOWARD HALL asked what action the Council intended to take with regard to other co-operative stores?

The PRESIDENT said that question could hardly be answered except by the incoming Council. The Assistant Secretary wished him to say that he laid the matter before the Council immediately after Mr. Pasmore had seen him. It was brought before the Law and Parlia-

mentary Committee, and discussed, and when they understood the true position of the case, authority was given to the Solicitor to at once proceed in the matter. There was no hesitation whatever on the part of the Council or of the Committee when it was brought before them.

The resolution for the adoption of the report was then put and carried unanimously.

The PRESIDENT said there were two notices of motion before the meeting. He had consulted with Mr. Vizer and with the Council as to the best mode of conducting the business, and it was thought that the better plan would be to bring this question forward rather as a positive than a negative motion. He would therefore, call upon Mr. Wade to move his resolution, upon which Mr. Vizer would move that of which he had given notice as an amendment.

The resolution of Mr. Wade was as follows :—

"That all persons duly qualified (irrespective of sex) being eligible for admission into the Society in accordance with the Bye-laws thereof, this Meeting is of opinion that ladies should not be excluded from participation in the privileges of the Society."

Mr. WADE said he accepted the position offered him with a great deal of pleasure and he thanked Mr. Vizer for his courtesy in giving way, as it had previously been ruled that he had a right of precedence. It was very desirable that that they should start with a thorough comprehension of the question which had to be discussed, and he earnestly begged every member to dismiss from his mind everything connected with the examination of women and whether it was desirable or not that they should enter the trade at all. They had nothing whatever to do with the question ; they were not there even to indulge in any sentimentality connected with them,—neither to sneer at female intellect and talent, nor to descant upon woman's mission,—but to perform an act of justice to certain registered chemists who by virtue of their examination were eligible for election, they having passed through the examination in a manner equally as creditable to them as any of the present members of the Society had done. It was for the members to-day to settle this question, to remove an injustice and to show the Council by their vote that it was their opinion that it had failed in its duty in not electing these registered members because they were women. Several ladies having conformed to the Act of Parliament, had become registered and qualified as chemists and druggists. They had repeatedly applied to be elected in their several degrees as members or associates, but had been as repeatedly refused by the Council, not because the Act prohibited their election, but because the Council considered it inexpedient and undesirable. There never had been a question raised whether ladies were not entitled to be elected. It was admitted that they were eligible, and the Journal of the 19th of last month had contained an article which set forth the case in a very clear light. It admitted that it was a question to be considered from two points of view, abstract right and expediency. Now he contended that a question of expediency was one which ought not to have been adopted ; every one who had a right to be elected ought to be accepted whether it was expedient or not ; and it was for those present to give their votes in favour of ladies and to show it was their duty to accept abstract right instead of acting on expediency. He called on them to say that it was for an educated scientific body to put aside prejudice, because this was a question of prejudice and nothing else. They had no question of law to decide, no question of expediency really to take up, but simply a duty to perform. It was of course in the power of the Council to elect ladies, but it depended very much on the way in which this resolution was received whether the question would be decided for ever or whether it would be his duty to bring it forward again ; because it would not be settled by the adverse votes of the meeting, and if the question were carried against the ladies to-day he should consider it his duty to renew it on a future occasion. It had been argued that if once ladies were admitted to membership there would be no keeping them off the Council or out of the presidential chair. That was the one principal point which was urged, and that certainly would be something very terrible. But what chance was there of its coming to pass? In 1865, when the two Pharmacy Bills were before the Committee of the House of Commons and the outsiders were trying to obtain an equal number of votes on the Council with the pharmaceutical chemists, what was the result ? The gentlemen who had charge of No. 1 Bill were so terrified, thinking that if half the seats were distributed amongst outside chemists the whole Society would be revolutionized and the Council would become radical, that only seven were given to the outside members. Yet up to the present time there had never been one outsider elected on that Council.

Mr. OWEN said he was one.

Mr. WADE said he did not call Mr. Owen an outsider. He did not know any difference between Mr. Hanbury, Mr. Owen and any other members. He knew they had been on the Council, but he never knew the difference between any of them and the pharmaceutical chemists. They were not the outsiders whom it was intended to keep off the Council, and therefore up to the present time there never had been one theoretical outsider elected on the Council. Such was the position with regard to females. The power of election was in the members, and if ladies were elected to membership it rested with the members at large whether they would be put on the Council, and judging from the spirit displayed since 1865, there was very little chance of such a thing taking place. There were three ladies now in the laboratory. The professor had stated that there was no difficulty with regard to their accommodation. He supposed they were going to educate these ladies, to examine them, to take their fees and then to tell them there was no accommodation for them in that room. Was it not time to put aside such bigotry ? He would not take up their time any longer, for there was really very little to discuss. If there were anything brought forward requiring notice he would refer to it in reply. He begged of the meeting once for all to settle the question, to put aside petty jealousies and to have no vulgar allusions either to crinoline or nether garments. They should remember that the brains which had been exercised to the satisfaction of the examiners had no sex and that they were dressed in no other garb than that of refined intelligence. Such being the case, he called upon the meeting to authorize the Council to admit these ladies to membership and to give them a hearty welcome.

Mr. POSTANS seconded the resolution. He said there was one point in the excellent speech of Mr. Vizer on the subject of the representation which seemed to him to have a special bearing on this question. He referred to that part of the report which regretted that so many who might achieve a higher position were satisfied to remain in the second grade of the Society. Now Mr. Wade had proposed the admission of ladies as members. Those ladies had obtained the higher grade, and he believed one of the best things which could be done to help on those young men who only went in for the Minor would be to admit ladies, because it might stir up the spirit of emulation. No man would like to be beaten by a woman. As an individual member, and speaking also on behalf of others, he might say they were not at all afraid of ladies being admitted. At the Conference held in Dublin, Professor Tichborne told them that some time ago in Ireland they received a great number of letters from ladies, asking to be admitted to the examinations of their Society, and they agreed to do so, but after the rule was passed not a single lady applied. He was present a few days ago at the distribution of certificates at the University of London, when there were two ladies present who had greatly distinguished themselves, and the Chancellor of the University, Lord Granville, in congratulating those

two ladies very highly on the success which they had attained, stated that one of them had not only passed her own examination in the most creditable manner, but was actually supporting one brother at the University of London and another at Cambridge by her own industry. That was a grand stroke on behalf of the ladies. They were all desirous of advancing, and if ladies could come to the Evening Meetings and give them any information, they would be the better for it. Mr. Wade had said he hoped this meeting would now decide the matter, but he would remind them that it was not in the power of the meeting to do so. All they could do was to pass the motion by a large majority, and upon sending that to the Council the members of it, with their usual gallantry, would no doubt do all they could in the matter, especially remembering the Conversazione was so near.

Mr. VIZER said he hoped he should not be put down as very ungallant because he was going to speak, not against the ladies, but rather in their favour, although apparently to some of their friends he might appear to be against them. The amendment he was going to move was to this effect:—

> "That this meeting is of opinion that inasmuch as registration under the Pharmacy Act secures all trading rights to persons so registered, and Membership of the Pharmaceutical Society in no way increases those rights, it is unnecessary, so far as females themselves are concerned, and undesirable on the part of the Society, to introduce so complete a change in its constitution as would be involved by the admission of females as Members, Associates Apprentices or Students of this Society."

He would first clear away the ground by referring to the last words, which might perhaps be misunderstood. It would not prevent a girl being apprenticed to a chemist and learning the business, but would simply prevent her becoming a registered apprentice of the Society. As Mr. Wade had eloquently said, trading rights were most amply and fully secured to any lady who wished to enter the trade; she had as full and perfect liberty to do so as he had himself, and therefore they need not waste time on that point. The main point brought forward by the advocates for the admission of ladies was that membership carried with it a certain amount of prestige, and was of great commercial value in the eyes of the public. He would ask the meeting calmly and seriously to look that question in the face, and to see what the facts proved. It was said that they were doing ladies a great injustice. Now there were two doors of entrance for members into the Society, the one being that of examination, by which those who had passed the Major examination became registered as pharmaceutical chemists, and the other was that every one in business prior to the passing of the Act of 1868 was also entitled to admission as a member. Now looking to the Registrar's report, it would be seen there that out of 2287 pharmaceutical chemists 2002 had joined the Society. This had great weight, to his mind, with reference to what he said just now with regard to passing the Major examination. It showed that when a gentleman passed that examination, having obtained the highest degree it was in their power to bestow, recognizing his indebtedness to the Society, he was very glad to unite himself with it as a member, and not in any sense with the idea that by doing so he would raise himself in the estimation of the public. He would almost venture to say that if they were to analyse the facts they would find very few pharmaceutical chemists who took the trouble to put on their labels that they were members of the Society; they looked to the title of pharmaceutical chemist as one to be desired. Now turning to the other side of the question, they were told that this position was of such great importance, and when the Pharmacy Act was passed, he argued in favour of the admission of outsiders as members. Many of them might remember that at one meeting Mr. Waugh said, referring to his own observations, "If these young men advocate the admission of outsiders, I do not see why we old men should object." Now how had these outsiders appreciated that privilege. Out of 11,022 chemists and druggists, only 827 had joined the Society, so that upwards of 10,000 had excluded themselves from this immense boon which they were now asked to believe they were depriving ladies of by shutting them out of the Society. Another difficulty raised was the free supply of the Journal; but every member subscribed one guinea a year, and for the same amount Messrs. Churchill would supply any one with it, so that there need be no difficulty on that matter. Again, admission to the museum was brought forward. He was not prepared to say how many members availed themselves of the privilege of going into the museum; it was an establishment of which they all felt proud, but it was not all who wanted to spend their time within its walls, and he was satisfied that any person outside the Society would be heartily welcome to enter that museum without any feeling of sufferance about it, on application to the Secretary. What he wanted to establish was, that as far as the females themselves were concerned, membership was unnecessary. Then with regard to the second branch of the amendment, he said it was undesirable for the Society. They were told by the advocates of the ladies that if they passed the Major examination they could not deny them the privilege of membership; but it struck him they could not shut their eyes to the fact that the Board of Examiners was a really distinct body from the Society. They were appointed by the Council to carry out the requirements of the Act of Parliament, and not as examiners in immediate connection with the Society as such. Turning to the Pharmacy Act itself it would be seen that it distinctly laid down that every person having been examined was entitled to be registered as a pharmaceutical chemist, and a little further on that every person so registered was eligible to be elected as a member; now he could not help thinking that that distinction between "entitled" and "eligible" was not accidental. He might be eligible to something to which he was not entitled. Then he was told that ladies did not aspire to a seat on the Council, but he regretted to say that such was not the case, and he predicted that if ladies were admitted not many years would elapse before they found them putting up as candidates, and no stone would be left unturned to endeavour to get them in. Would any one say that their deliberations would be conducted with more power, or force, or business tact if they were assisted by these ladies? He was almost inclined to think that men must be men, and if they saw a lady opposing them they would not like to oppose her. Those were the chief points he had to bring forward, and he commended the amendment to the attention of the meeting, and asked every one to give it calm and deliberate attention—to put away all previous feelings on the subject, and simply look at the matter as it stood, remembering the facts he had stated, which, to his mind, carried volumes of force with them. He thought they could preserve themselves as a society without the kind presence of the ladies. It was not that he did not appreciate ladies, nor was it true to say that he was acting in this matter because he had an objection to a liberal action on the part of the Society. He had advocated a liberal policy in that room over and over again and was prepared to do so still, but he acted conscientiously in this matter, because he maintained that they would injure the Society amongst themselves, and would not strengthen its position in the eyes of the public by making the proposed change, and that they were not acting unjustly to ladies by asking them to remain pharmaceutical chemists without membership.

Mr. MACKENZIE seconded the amendment, saying that it was from a conscientious conviction that he was the ladies' friend that he did so. He agreed with Mr. Wade that this question ought to be settled, apart from any sentimentality, upon its merits alone. Last year he started with this text, that it might be lawful,—although

he did not admit that it was so,—but certainly it was not expedient, and the case was in no way altered now. The question stood thus. The Council had already granted to these ladies nineteen-twentieths of what had been asked, and the remaining twentieth was the cause of dispute. Mr. Vizer had answered Mr. Wade thoroughly, that as far as popularity in the public mind was concerned, the fact of being a pharmaceutical chemist indicated a far higher standing. What could this membership then be for? He could not persuade himself but that it must be eligibility for office and office holding which must be in question, and Mr. Wade was not honest if he did not believe that to be the case. He was putting very great temptation in the way of the ladies and their friends. This was evidently a phase of the transatlantic notion of women's rights, which was not indigenous to their soil. Women had their rights, but it was a nobler right. It never would be any advantage to bring them into the wrangle of contested elections for office. They had had experience of this question in other affairs; for instance, in a scheme which had gone over the length and breadth of the land, known as Good Templarism. He did not know much about it, but he found that ladies were eligible for office, and many of them had been elected; but he was informed by a gentleman connected with the organization that it did not work well at all. Mr. Wade and his friends had a beautiful theory, but it would not work; their feelings took advantage of them and warped their judgment. Another great point in the ladies' favour was the excellent men who supported them; as had been said of a celebrated man in past times, "Their failings leaned to virtue's side." They were anxious to do their best for the ladies, but he saw no right, because they had made them no promise. In Edinburgh, when the School Board was established, several ladies were elected, but after three years' experience they lost one-third of their supporters, and after six years' experience they were at the foot of the poll. This showed that expectation and practice did not correspond. To grant this privilege would not add one atom to the true nobility and grace of womanhood which every gentleman in the room would like to see added to the ladies who were now clamouring for admission.

Mr. HAMPSON said he should only occupy five minutes. They had rambled pretty far from the question before them, and got on to school boards and good templar societies; but the position was simply this. There were three or four ladies who had passed their examinations with credit; when they paid their fees they added to one common fund, because apart from the Benevolent Fund there was but one fund to carry out the Act of Parliament. Therefore these ladies had put a little strength into the Society in that way, and when the time came and they asked the members to carry out the Act of Parliament as it was intended to be carried out, they were refused. But chemists and druggists in the country were controlled by the Society. The members had a voice in making the regulations, and in influencing Parliament; they said what lady pharmaceutical chemists should do and what they should not do in the way of carrying on business, and so on, and it was a little unfair and humiliating to ask a public meeting of men, who would scorn to do any such thing in their private capacity, to act so meanly as to refuse this privilege to their own countrywomen, of whom they ought to be proud. What would they say if a society of artists were to refuse to admit the pictures painted by ladies? They would say it was a contemptible act, and he thought it would be adding honour to the Society to do what was asked by Mr. Wade.

Mr. HUMPAGE said, had the advocates of these ladies impressed him that when they became members they were eligible to seats on the Council, and even to be in the chair, he should say that they were entitled to ask for t and have it; but it appeared to him nothing of the kind had even been thought of, and without going into the merits or demerits of the question he should be convinced that they would tend to form a better Council than the gentlemen before them when he saw female members in the House of Commons.

Mr. SANDFORD said although gentlemen present might be anxious to divide and settle this question, and he hoped to settle it, really he could not give his vote against the admission of ladies under the charge that those who voted against it did it from mere prejudice and narrow-mindedness. He knew they were eligible, but eligibility and being entitled to a thing were two different matters altogether. If you said because they were eligible they were entitled, the Council would be tied hand and foot, and would be obliged to elect any man who had passed his examination quite irrespective of other circumstances. He for one would keep out ladies from the Society, partly for the sake of the Society itself, although he had a high estimate and regard for ladies in their proper place. It would be no pleasure to him to see three or four ladies in that room attending such a meeting, although they should be glad to meet them in the evening and enjoy their society; but men must be men, and he hoped women would long remain women, and would not unsex themselves by intruding into the sphere of the other sex. They had all the privileges of trade, and he had so much respect for those who strove to get their own living that he dare not say a word against their trading; but still he thought they should not give them any extra inducement to pursue a calling which, to his mind, was not a fit one for ladies.

Mr. SAVAGE said that after one of his colleagues had spoken he thought the other side ought to have an opportunity of just saying a word or two. What were they asked to-day to do? To oppose some three or four ladies who had gone through the curriculum, and who had rendered themselves eligible. He thought it was very important they should be recognized, seeing the position that Earl Granville gave them; and whoever heard of any injury resulting to the School Board by the admission of ladies? He did not believe his friend Mr. Vizer was honest in his convictions.

Mr. VIZER protested that this was not parliamentary language and ought to be withdrawn.

Mr. SAVAGE said he knew Mr. Vizer too well as a benevolent man to believe that he would think of doing an injustice. He first said that ladies would not get increased rights by becoming members, and he afterwards said that membership had a commercial value. He (Mr. Savage) could not reconcile the two.

Mr. VIZER said that what he said was that that was the argument on the other side. His argument was that it had no commercial value whatever, as proved by the fact that only 800 chemists and druggists out of 11,000 had taken advantage of it.

Mr. SAVAGE said the admirable address of Mr. Wade and the very feeble one of Mr. Vizer showed how they ought to vote. With regard to the possibility of ladies being elected on the Council, he thought it would be productive of good results. There were several eligible bachelors there, and the presence of ladies might have a humanizing influence on the Council. He did not wonder at Mr. Sandford wincing under it, but he had a strong conviction that justice would be done to the ladies on the vote about to be taken.

Mr. WADE, in reply, said he was glad Mr. Vizer had kept away from the points they had always stumbled upon before, namely, the right of every one to enter the trade. The question was not one of trading rights at all. When they were in the Committee of the House of Commons there was a very strong desire on the part of non-pharmaceutical members to have the right to use the title of "pharmaceutical chemist" given to them. Mr. Vizer had quoted one gentleman who was formerly very much respected among them, but he could see another gentleman present who would also remember this circumstance

that when the question arose of giving outsiders the right to use the term of "pharmaceutical chemist," such was his opinion of the value of membership that he said, you may plaster your houses from top to bottom with memberships of the Pharmaceutical Society, but you shall not put up "pharmaceutical chemist." The outside body consented to that, and had never had occasion to regret it; for whatever they might think as to which was the better title, pharmaceutical chemist or member of the Society, what the public thought was another thing. They knew that "pharmaceutical chemist" was the higher qualification, but the public when they saw "Member of the Pharmaceutical Society" up thought that was something very much higher in degree. They were not there to grant anything to the ladies. They had simply to inform the Council that it was their wish that the Act of Parliament should be carried out. Mr. Vizer's strong point, which he had often alluded to on former occasions, was this, that there could be nothing in membership because there were 11,000 outside men who had the opportunity of coming in, and only 860 had taken advantage of it. But what was the reason of that? When the two Bills were amalgamated, it was an understood thing that all men in business at that time should not be eligible, but should come in as members of the Pharmaceutical Society —that they should have a right to be elected.

Mr. SANDFORD said that was not so.

Mr. WADE said he was open to correction; at any rate they were eligible, and would be elected, unless there was something against the moral character. The question was, why they did not come in? The fee which would have been charged to them for coming in, and which would have enriched the coffers of the Society, and made it by that time a powerful association, was a fine of £2 on coming in. A bye-law was passed charging £2, which made £3 for every man coming in, and they did not consider it, at that time, worth it. But they all knew what a wonderful change had taken place in the Society since then. It was no more like the same Society than anything that could be conceived. He did not mean to say they would not come in now, and that it was not worth their while to have the privilege of membership, because now it had become a valuable property, and therefore the ladies having come in since then, and taken the chance of examination in the Society, had a right to be elected the same as men. That was the substantial reason why the 10,000 chemists had not come in. With regard to what had been said by one of the speakers, he certainly had not intended to convey that that meeting could settle the question, except in so far as conveying a request to the Council, and he felt quite sure that if his resolution were carried then he would not have to ask the same question next year.

The PRESIDENT then put the amendment to the vote, and announced that the show of hands was:—

For the amendment	65
Against	66

A division was then called for, Mr. Wade and Mr. Mackenzie being appointed tellers on one side, and Mr. Vizer and Mr. Postans on the other.

The PRESIDENT announced the result of the division to be as follows:

For the amendment	81
Against	78
Majority against the admission of women	3

He said it was unnecessary to put the amendment as a substantive motion, because it only carried an opinion; it was not to be acted upon as a motion and therefore need not be carried further than the present stage. The amendment being carried, of course ladies would not be admitted.

Scrutineers were then appointed to examine the voting papers for the election of members of Council and to report at the adjourned meeting on Friday at eleven o'clock.

The following Registers were placed before the meeting by the Registrar in compliance with the provisions of the Pharmacy Acts, 1852 and 1868:—

Register of Members, Associates, and Apprentices of the Society.

Register of Pharmaceutical Chemists.

Register of Assistants.

Register of Apprentices and Students under the Pharmacy Act of 1852.

Register of Chemists and Druggists under the Pharmacy Act of 1868. Six volumes.

The meeting was then adjourned until Friday morning to receive the report of the scrutineers.

Mr. BURDEN said he had much pleasure in moving that a vote of thanks be given to the President and the Members of Council for their services during the past year. No word of his was necessary in support of this resolution because every one would agree that the services rendered by the Council had been of an eminently satisfactory kind.

Mr. ANDREWS seconded the motion, which was passed unanimously.

The PRESIDENT: On behalf of the Council I thank you very much for the kind manner in which you have proposed and carried this vote of thanks. I think it is hardly usual to pass such a vote, but it is all the more gratifying for that.

Mr. WADE said there was one thing which was usual, and if they omitted performing it they would be committing a glaring error, namely, to propose a vote of thanks to the President for the able manner in which he had filled the post of chairman that day. Considering the trouble he (Mr. Wade) had put the chairman to that day with regard to the question of the admittance of ladies, he thought the resolution would come with much better grace from him than any one else, and he had therefore much pleasure in proposing it.

Mr. OWEN in seconding the resolution said he hoped the question as to the ladies would in future be left for the Council to settle.

The resolution passed unanimously.

The PRESIDENT: Gentlemen, I am very much obliged to you.

SPECIAL GENERAL MEETING.

The SECRETARY having read the notice convening the special meeting,

It was moved by the PRESIDENT; seconded by the VICE-PRESIDENT:

"That this meeting do confirm and approve the proposed alterations in the Bye-Laws in the section numbered 10, by erasing therefrom the several portions of the said section in that behalf appearing in the First Schedule hereto, and substituting for the respective portions of section 10, so erased, clauses 16, 17, 18, 19, 20, 21, 22, 23, 24 and 25, and words in that behalf appearing in the Second Schedule hereto, and that the said alterations do take effect from the date of confirmation and approval thereof by Her Majesty's Privy Council."

He did not think it would be necessary to read the actual words which it was proposed to substitute, as they were merely formal, and had been published in the Journal. There was nothing new in the alteration proposed, it was simply carrying out in a formal manner the practice now adopted with respect to the fees payable at the examinations, as it was considered it would be more in accordance with Act of Parliament that this should be done under Bye-law than under resolution, as had hitherto been the case.

The VICE-PRESIDENT seconded the motion.

Mr. MACKENZIE asked that the clauses proposed to be abrogated and those to be inserted should be read.

The SOLICITOR read the clauses accordingly, as follows:—

[First Schedule.]

PRESENT BYE-LAWS.—(*To be abrogated*).

SECTION 10.

Clause 16.

All persons before registration as Apprentices or Students shall pass the First Examination, and shall pay a Fee of Two Guineas, whereupon they shall be registered as Apprentices or Students.—After the 31st day of December, 1874, no person shall be admitted to the Major or the Minor Examination who shall not have attained the full age of twenty-one years; and after the 31st day of December, 1876, no person shall be allowed to pass the Major or the Minor Examination unless he shall satisfy the Examiners that for three years he has been registered and employed as an Apprentice or Student, or has otherwise for three years been practically engaged in the translation and dispensing of prescriptions. Persons who have passed the Minor Examination at least three months previously may be admitted to the Major Examination, and all other persons desirous of passing the Major Examination may make application to the Board of Examiners for special leave in that behalf.

Clause 17.

All persons desiring registration as Assistants under the Statute, 1852, or as Chemists and Druggists under the Act, 1868, excepting those named in the next following Bye-law, shall pass the Minor Examination, and shall pay fees of Three Guineas if previously registered as Apprentices or Students, or otherwise fees of Five Guineas, whereupon they shall be registered accordingly.

Clause 18.

All persons entitled to be registered as Chemists and Druggists on passing a modified examination, and desiring so to be registered, shall pass the Modified Examination, and shall pay a fee of One Guinea, whereupon they shall be registered accordingly.

Clause 19.

All persons desiring registration as Pharmaceutical Chemists under the Statute, 1852, shall pass the Major Examination, and shall pay a fee of Five Guineas if previously registered as Assistants, or otherwise a fee of Ten Guineas, whereupon they shall be registered accordingly.

[Second Schedule.]

PROPOSED NEW BYE-LAWS.

SECTION 10.

Clause 16.

All persons shall before registration as Apprentices or Students, pay a fee of Two Guineas and pass the First or Preliminary Examination, whereupon they shall be registered as Apprentices or Students.

Clause 17.

All persons desiring registration as Assistants under the Statute, 1852, or as Chemists and Druggists under the Act, 1868, excepting those named in the next following Bye-law, shall pay a fee of Three Guineas, if previously registered as Apprentices or Students, or otherwise a fee of Five Guineas, and pass the Minor Examination, whereupon they shall be registered accordingly.

Clause 18.

All persons entitled to be registered as Chemists and Druggists on passing a modified examination and desiring so to be registered, shall pay a fee of One Guinea and pass the Modified Examination, whereupon they shall be registered accordingly.

Clause 19.

All persons desiring registration as Pharmaceutical Chemists under the Statute, 1852, shall pay a fee of Five Guineas, if previously registered as Assistants, or otherwise a fee of Ten Guineas, and pass the Major Examination, whereupon they shall be registered accordingly.

Clause 20.

All persons intending to attend for examination in the First or Preliminary Examination shall give to the Registrar notice in writing of their intention in that behalf not less than fourteen clear days prior to the day which has been appointed for the holding of the said examination.

Clause 21.

All persons intending to present themselves for examination in the Major, the Minor, or the Modified Examination, shall give to the Registrar notice in writing of their intention in that behalf, on or before the first day of the month in which the examination is to take place.

Clause 22.

All notices of intention to attend for examination shall be to attend on the next occasion of the examination being held, and all fees in respect of examination and registration shall be payable on the giving of notice of intention to attend for examination, and in no case shall any fee paid in accordance with the Bye-laws be remitted or returned.

Clause 23.

No person shall be admitted to the Major or the Minor Examination who shall not have attained the full age of twenty-one years, nor unless he shall satisfy the Examiners that for three years he has been registered and employed as an apprentice or student, or has otherwise for three years been practically engaged in the translation and dispensing of prescriptions. Persons who have passed the Minor Examination at least three months previously may be admitted to the Major Examination, and all other persons desirous of passing the Major Examination may make application to the Board of Examiners for special leave in that behalf.

Clause 24.

Persons who have attended and failed to pass an examination, shall not be entitled to attend on any future occasion within an interval of three months therefrom, nor unless and until they shall have given renewed notice of intention to attend an examination, and shall have paid fees as follows—

(*a*) *In respect of a Major Examination, Two Guineas;*
(*b*) *In respect of a Minor Examination, Two Guineas;*
(*c*) *In respect of a First or Preliminary Examination, One Guinea;—*

in cases of renewed notices for examinations to be held before the expiration of one year, computed from the first day of the month wherein the examination was held in respect of which the original fee was paid; and in all other cases fees of amounts corresponding with the fees paid on the original notice.

Clause 25.

Persons who have given original or renewed notices of intention to attend an examination, and have failed duly to attend at the time appointed for the same shall not be entitled to attend on any future occasion unless and until they shall have given renewed notice of intention to attend an examination, and shall have paid fees as follows, viz.:—*In cases of renewed notices for examinations to be held before the expiration of one year*, computed from the first day of the month wherein the examination was held in respect whereof the original fee was paid,—One Guinea,—or if the persons shall have proved to the satisfaction of the Council or the Board of Examiners (by production of medical certificates or otherwise) that the said failure was occasioned by unavoidable and proper causes,—One Shilling,—and in all other cases, fees of amounts corresponding with the fees paid on the original notice.

Mr. HALL inquired whether the word "person" in the Bye-laws would in future be considered to mean a male, or would it mean a male or female.

The PRESIDENT said he thought it would apply to both

The resolution was then put to the meeting and carried with one dissentient.

The General Meeting was then adjourned until Friday at 11 o'clock to receive the report of the Scrutineers.

ADJOURNED MEETING.

Friday, May 23, 1879.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

The Scrutineers brought up their report as follows:—

Scrutineers' Report.

We, the undersigned Scrutineers, appointed at the Thirty-eighth Annual General Meeting of the Pharmaceutical Society of Great Britain, do hereby certify that we have examined the voting papers committed to us, and report the following:—

Voting papers reported by the Secretary to have been issued	3586	
Voting papers received	1732	
Voting papers issued but not returned		1854
Voting papers received		1732
Voting papers disallowed:—		
Informal	10	
Received by post too late	99	
Envelopes unsigned by voters	17	
	—	126
Votes papers registered		1606

Result of the Poll.

Churchill	1288	Richardson	1015
Symes	1271	Robbins	904
Hampson	1228	Squire	798
Woolley	1217		
Shaw	1161	Cracknell	767
Savage	1158	Spink	727
Bottle	1098	Owen	726
Atkins	1078	Fitch	701
Rimmington	1058	Butt	630
Frazer	1053	Horncastle	618
Williams	1016		

W. K. Hopkin, *Chairman.*

Matthew Pound.
T. Howard Hall.
Charles J. Mead.
John F. Savory.
Walter Hills.
John H. Baldock.
Richard Lewis.
Edward L. Cleaver.
William H. Symons.
William Pickard.
Charles B. Allen.
John Morris Broad.
Alfred E. Tanner.
Frederick Tibbs.
Robert Samuel Bathe.

The New Council.

The Chairman then declared that the following gentlemen would constitute the Council for the ensuing twelve months:—

Atkins, Samuel Ralph, Market Place, Salisbury.
Bottle, Alexander, 37, Townwall Street, Dover.
Churchill, Walter John, 46, New Street, Birmingham.
Frazer, Daniel, 113, Buchanan Street, Glasgow.
Gostling, Thomas Preston, Market Hill, Diss.
Greenish, Thomas, 20, New Street, Dorset Square, N.W.
Hampson, Robert, 205, St. John Street Road, E.C.
Hills, Thomas Hyde, 338, Oxford Street, W.
Mackay, John, 119, George Street, Edinburgh.
Richardson, John George Frederick, Houghton House, Stoneygate, Leicester.
Rimmington, Felix Marsh, 9, Bridge Street, Bradford, Yorks.
Robbins, John, 372, Oxford Street, W.
Sandford, George Webb, 47, Piccadilly, W.
Savage, William Dawson, 4, Park Road East, Brighton.
Schacht, George Frederick, 7, Regent Street, Clifton.
Shaw, John, 24, Great George Place, Liverpool.
Slipper James, 86, Leather Lane, E.C.
Squire, Peter Wyatt, 277, Oxford Street, W.
Symes, Charles, 14, Hardman Street, Liverpool.
Williams, John, 16, Cross Street, Hatton Garden, E.C.
Woolley, George Stephen, 69, Market Street, Manchester.

Auditors.

There being only the requisite number of candidates (five) for the office of Auditors, the Chairman declared the following duly elected for the ensuing twelve months.

Harvey, Edward, 6, Giltspur Street, E.C.
Hodgkinson, William, 127, Aldersgate Street, E.C.
Stacey, Samuel Lloyd, 300, High Holborn, W.C.
Thompson, H. Ayscough, 22, Worship St., Finsbury, E.C.
Watts, William Manning, 32, Lower Whitecross St., E.C.

A discussion ensued on the large number of voting papers that had been issued to members, but which had not been filled up and returned. It was also observed that the total number of votes registered this year was about 100 less than that of the last year, but the percentage disallowed from informality and the other causes stated in the Scrutineers' report was lower than in 1878.

Votes of thanks were given to the Scrutineers and to the Chairman of the meeting.

Correspondence.

Note on the Cinchona Alkaloids.

Sir,—The receipt of the *American Journal of Pharmacy* containing a "Note on the Cinchona Alkaloids," by Dr. O. Hesse, recalls my attention to the necessity of taking some notice of this communication, first published in your pages April 12th of this year.

I have to complain that this article is both a misquotation and a misrepresentation.

Your readers, by turning to page 611 (Jan. 18, 1879), of your Journal may easily verify this. Dr. Hesse says, "It is true that in 1862 Mr. Howard claimed to have prepared aricine from the bark in question." Read the passage and you will see that this is a distinct misquotation, and that it is not true that I made the claim alleged to have been made. I said that "I took some pains in the investigation, without arriving at full certainty as to the properties of the two last," "quinicine (?) and aricine (?)."

Dr. Hesse asserts that the red bark "contains neither aricine nor the easily decomposable cusconine with which some authors are wont to confound aricine, and as, further, it does not yield amorphous substances which can be taken for decomposition products of this alkaloid," etc., etc. And yet further on it appears that red bark contains "paricine and two or three other amorphous basic substances." But what else is paricine than aricine altered by oxidation? The discoverer of the barbarous term "conquinia" will perhaps inform us. According to Gerhardt, 'Chimie Organique' (vol. xiv, p. 152), paricine is to aricine what quinoidine is to quinine and cinchonine.

I have many times prepared aricine for my own amusement, and have had it, beautifully crystallized from extra light ether, in my museum ever since October, 1849. This I have shown, as also varied compounds of the same alkaloid, to many of my scientific friends, including Dr. J. E. De Vrij. It is not very likely then that I should have confused this very peculiar alkaloid with cinchonine or with any other of the cinchona alkaloids. Especially is this unlikely, because I have never been able to prepare it pure except from the *C. Pelletierana*, from which bark it was obtained by the discoverer. In so far I agree with Dr. Hesse, that it does not exist pure in the *C. Succirubra*; but even he admits that paricine is there found.

Now the argument of my paper is this: that the *C. Succirubra* is a peculiar plant, and that its mixed alkaloids are a nauseous compound. I have personally examined many specimens of the old and well grown red barks of *Ecuador* and have described them in my 'Quinologia;' having been the first to recall the well adapted name given by Pavon of *Succirubra*: not that the juice of the plant is red in a state of growth, but that when the bark is gathered the very special tannin, easily oxidizable, undergoes a sort of eremacausis, involving also the alkaloids until in the end little is left but a red powder.

The arrival of a parcel of the bark of *C. Pelletierana* gives me some hope of getting the question of the properties of aricine solved by direct experiments.

Lord's Meade, May, 17, 1878 John Eliot Howard.

*** We are in receipt of numerous communications which from want of room we are unable to deal with this week.

"THE MONTH."

Although there is no lack of flowers in florists' windows, the country scarcely presents the aspect characteristic of the merry month of May. The lilac and horse chestnut only just bursting their buds, and the hawthorn blossom fully three weeks behind its usual date, while the bright yellow racemes of the laburnum are nowhere visible as yet, indicate that the botanical calendar is this year in a state by no means satisfactory. At the various botanical gardens comparatively few medicinal plants are in flower, and even these in many cases present an appearance showing the hard treatment they have undergone from the inclemency of the season. This is specially noticeable in the rosemary, the fine specimens of which at Kew were last year covered with blossoms, but this year they are only sparingly decked with flowers and many of the branches presented a blackened and dead appearance. In the open ground may now be seen in blossom at these gardens, *Laurus nobilis*, *Rheum undulatum*, *Cypripedum pubescens*, sometimes called American valerian, *Anemone Pulsatilla*, *Carum Carui* and *Polygonum Bistorta*. The caraway is always one of the earliest of the Umbelliferæ, being usually only preceded by the *Anthriscus sylvestris* among our wild plants, or perhaps sometimes by the sweet cicely (*Myrrhis odorata*). There is also the Solomon's seal, *Polygonatum officinale*, whose rhizome forms a well known application in the treatment of bruises or "blackened" eyes. This plant is much less common in the wild state than its closely allied congener, *P. multiflorum*, which is distinguished by its round stems and the downy filaments of the anthers, the stems of *P. officinale* being angular, and the filaments glabrous; the latter is also a rather smaller plant.

The lily of the valley, like the woodruff and so many other May flowers, is later than usual this month. This general favourite is not altogether without a medicinal reputation. Old Gerarde, in his 'Herball,' says, "The floures of the valley lillie distilled with wine and drunken, the quantitie of a spoonful, restoreth speech unto those that have the dum palsie and that are falne into the apoplexie, and is good against the gout and comforteth the heart. The water aforesaid doth strengthen the memorie that is weakened and diminished; it helpeth also the inflammation of the eies, being dropped thereinto." The flowers have an acrid odour when dried, and the leaves an acrid taste, and in all probability possess irritant properties which produce a purgative effect. In the province of Smolensk, in Russia, the convulsions of infants and epilepsy are treated by the peasants with an infusion prepared from the flowers by bruising them in a wooden mortar and infusing them in boiling water in a covered earthen vessel for an hour. The fresh flowers are preferred, being said to be stronger, but they are preserved in brandy for winter use. A small spoonful of the infusion is given to infants and a tumblerful to adults three times a day during nine days; or, if the time of the attack is known, a double dose is administered on the occurrence of the premonitory symptoms. The peasants state that the fits never stop suddenly, but the intervals between them gradually grow longer, and the attacks become less severe until the patient recovers.

A pink variety of the lily of the valley occurs wild on the Quantock Hills, but appears to have only been known to Gerarde as a garden plant, of which he remarks that it is thought to have the sweeter smell. Although it has now quite disappeared from that locality, the lily of the valley was abundant on Hampstead Heath in Gerarde's time. According to Trimen and Dyer's excellent 'Flora of Middlesex,' the last plant seems to have been seen in that neighbourhood in 1864.

Several of our less common wild plants may now be seen in flower in the herbaceous ground at Kew, which will already repay a visit. Among them may be mentioned *Geum rivale*, *Anthriscus Cerefolius*, several species of *Valerianella*, *Chenopodium Bonus-Henricus*, *Euphorbia hiberna* and *E. pilosa*, *Lamium maculatum* and *Geranium phæum*. A small specimen of the new rhubarb plant, *Rheum palmatum*, var. *Tanguticum*, seems in a thriving condition, and a sumbul plant is throwing out vigorous leaves, and appears to be in a remarkably healthy state. In the Economic House there is scarcely anything medicinal in flower, one of the copal plants, however, *Hymenæa verrucosa*, attracts attention by the curious way in which the binate leaves are enclosed when young in the large pale deciduous stipules.

In the Botanical Gardens, at Regent's Park, the cinnamon plant is just coming into flower, and the Litchi plant, *Nephelium Litchi*, the sweet fruits of which are so frequently to be seen in Covent Garden Market, is also in blossom. In the open ground several natural orders are in good condition for examination, of which the Amaryllidaceæ, Iridaceæ, Liliaceæ, Fumariaceæ, Boraginaceæ and Cruciferæ are more particularly noticeable.

The first summer exhibition of this Society was held on the 21st instant, and was a decided success. The weather was fine and the show of flowers very good. In the early part of the day the Empress of Germany, the Prince and Princess of Wales, and the Duke and Duchess of Edinburgh were present. The orchids were remarkably fine, and by one exhibitor they were displayed to advantage by the blossoms being made to appear upon a groundwork of maidenhair fern, pots of which were placed between them. The azaleas, as usual at this time of year, presented a blaze of colour. The roses and clematises, although very beautiful, were not largely represented. Among the exhibits might have been noticed a number of droseras of different countries, and other carnivorous plants, some of which were coming into flower.

The chair of botany at Glasgow University, left vacant by Professor Dickson, has been filled by the appointment, by the Crown, of Dr. I. B. Balfour, a gentlemen whose name is already well known in the scientific world. Glasgow may be congratulated on acquiring a professor who is likely to reflect much honour on its university.

At the meeting of the Royal Society on the 14th Dr. B. W. Richardson brought before the notice of the members two instruments that promise to render valuable service. The audiometer, for the measurement of hearing, is a modification of an instrument invented by Professor Hughes. It consists of a battery of two Leclanché's cells, a microphonic "key" connected with the cells and with two fixed primary coils, and a secondary or induction coil, the terminals of which are attached to a telephone. This induction coil moves on a bar between the two fixed coils and if these be of equal size, and the induction coil is brought exactly midway between the two there is absolute silence in the telephone when the micro-

phonic key is worked. But upon moving the induction coil from the centre the working of the "key" gives rise to a sound which, at first rather felt than heard, increases in intensity as the induction coil is brought nearer to either of the fixed primary coils. By the artifice of making one of the fixed primary coils much larger than the other the neutral or silent point is proportionally shifted out of the centre, leaving on one side an increased length of bar, which is graduated into 200 parts. The instrument is used by gradually shifting the moveable induction coil along the bar towards the neutral point until the sound produced by the working of the key is no longer audible to the person whose hearing is to be tested when the telephone is applied to the ear; the position of the induction coil on the scale graduated on the bar is then taken as representing so many degrees of hearing power.

The second instrument, the sphygmophone, is used for making the movements of the pulse audible. It consists essentially of a microphone added to a Pond's sphygmograph. The "writing needle" is arranged so that it may be made to traverse a thin plate of platinum or gas carbon supported on a slip of talc, glass or wood, with which one terminal from a Leclanché's cell is connected, the second terminal being connected with a terminal of a telephone; the other terminal of the telephone is connected with the metal rod of the sphygmograph which supports the talc. When the needle is caused to move across the platinum or carbon plate by the movement of the pulse, distinct series of sounds are emitted from the telephone, which can be made very loud by increasing the battery power. The instrument is admitted not to be so good a recorder of the pulse as the sphygmograph, but it could be utilized in demonstrations to a large number of students.

At the annual meeting of the Royal Geographical Society on the 26th inst., the Royal Patron's Medal for the encouragement of geographical science and discovery was received by Count Schouvaloff, on behalf of Colonel Przwalsky, to whom it had been awarded for his explorations in Mongolia and Thibet. It will be remembered that this traveller brought back with him from North West China one of the latest claimants to be the source of the true rhubarb in the plant now known as *Rheum palmatum*, var. *Tanguticum*.

At a recent meeting of the French Academy of Sciences, M. Dumas read a lengthy and eloquent *éloge* of the celebrated chemist and discoverer of bromine, Jerome-Antoine Balard. The discourse has an interest for pharmacists from the fact that it enforced the advantages that may be gained during a stay in the laboratory of a pharmacy. These advantages seem to have been very present to the mind of this successful investigator, for M. Dumas records that the last words spoken to him from his dying-bed by Balard were, "N'oubliez pas que j'ai été élève en pharmacie." So gratified were the members of the Paris Pharmaceutical Society with the tone of the address that at their last meeting a sum of two hundred francs was allotted to cover the expense of printing it, and it appears in the number of the *Journal de Pharmacie et de Chimie* for the present month. In this place also allusion may be made to the recent loss to French medicine of Professor Gubler, whose name is known to pharmacists through his experiments with new articles of the materia medica, as, for instance, trimethylamine and jaborandi. In this country, too, during the present month two chemists have passed away prematurely, whose names will be familiar to the readers of this Journal: Mr. W. Valentin, Senior Assistant in the Laboratory at South Kensington, and author of a well-known text-book, and Mr. Thomas Wills, Demonstrator in the Royal Naval College at Greenwich, who has on several occasions contributed to these columns.

According to *Nature* a British Guiana newspaper has been contributing to the stock of information respecting the papaw tree. Among the new "facts" is the statement that a horse tied near one of these trees rapidly loses health and, if it be a stud horse, becomes useless, whilst pressure on its body leaves an inelastic indentation. Further it is stated that the sap of the tree will soften steel, and that before the process of tempering was known in the colony blacksmiths used to drive their brittle cutting tools into the wood and leave them there for a day or two! But colonial newspaper contributions to science cannot always be depended upon. For instance, *Nature* also quotes from the *Colonies and India* a statement that an American explorer has recently discovered in the little-known district of Yucatan a valuable insect called the "neen" or "niin," "possessing properties which ought to make it a rival of the cochineal and shellac producing insects." Now it may surprise this explorer to learn that this niin insect of Yucatan is by no means a "little stranger," but that it was described and the results of a chemical investigation of the remarkable substance obtained from it were given in a paper by M. Dondé, a pharmacist living in the district, which appeared in this Journal in April, 1874. It may be remarked, however, that rediscoveries are by no means infrequent. A new reagent for carbolic acid, quoted in the *Chemical News* for the 9th inst., from the *Polytechnische Notizblatt*, is identical with the molybdic acid test published in these columns twelve months since by Dr. Davy, and more than one "novelty" recently published in the same journal has or might be the subject for reclamation.

Mr. J. E. Howard, in a letter to the *Gardeners' Chronicle*, states that a correspondent of his in the Wynaad (British India) has succeeded completely in growing there the true *Cinchona Ledgeriana* and in obtaining bark from it containing 10 per cent. of quinine of great purity. Mr. Howard believes this plant to be the true calisaya. He points out that the red calisaya bark, called "Rojo" by the natives of Yungas, and distinguished from ordinary calisaya by its heaviness, closeness of grain and darker colour, and the purple red colour of the leaves, is the male plant of the true calisaya. Mr. Howard considers that the colour of the leaves is of no botanical importance and has no reference to the production of quinine. The Bolivian *C. micrantha*, which has been found to contain a fair quantity of quinine, has, however, small drooping flowers like those of the Ledgeriana, and, so far as can be learnt, the leaves of all species rich in quinine are smaller than those yielding chiefly the other alkaloids. The importance of the success with the *C. Ledgeriana* in the Wynaad may be gathered from the fact that at the bark sales at Amsterdam this month the Ledgeriana bark realized as much as 15*s*. per lb.

According to the reports lately published on the culture of the opium poppy, by the Curator of the Botanical Gardens at Calcutta, the season 1877–1878 was one of the worst on record for the opium grower,

partly owing to the depredations of insects on young plants, and partly to climatal variations. Mr. Scott finds by experiment that the milky juice of the poppy acts as a protection against insects, which only attack the seedlings and the mature plants from which the opium has been extracted, the plants which have not been tapped enjoying an immunity from insects. He also found that the statement that the plant whose seed yields gingelly oil (*Sesamum indicum*) is protected from other insects by the ants which feed on its glandular secretion is quite correct.

Mr. A. S. Wilson, of Aberdeen, in a letter to *Nature*, makes some interesting remarks upon insect galls. He considers that all insect galls are in reality abnormally developed leaf-buds or fruit-buds, and states that the vascular lines, which would form leaves, can easily be followed up in the structure of oak-leaf galls. In cases where the egg has been deposited in the tissue of a young branch, the cap of the gall is sometimes surmounted by a leaf two or three inches long, and in the large blue Turkish galls many lacunæ occur where the fleshified leaves have not filled up the spaces between them. The analogy to leaves is also shown by the fact that various microscopic fungi are matured in the interior of imperforate galls. This statement seems to merit further examination, for if oak spangles and button galls and cherry galls are leaf-buds, they are developed in very abnormal situations.

In *Science Gossip*, for this month, is a paper on the aquatic ranunculi, which may be found useful to those who have not paid much attention as yet to this very interesting, but intricate group of plants.

In the *American Journal of Pharmacy*, Professor Maisch gives an account of a plant which he refers to *Astragalus mollissimus*, Torr., apparently possessing singular properties. The plant grows on Indian territory and makes its appearance early in the spring, when it is eagerly sought for by the Indian ponies and horses. "They will dig into the earth for it, and after eating it become intoxicated and excited, and seek for water, which they drink with avidity; they then begin to swell, soon fall over and rarely live to get away from the water, not being able after they have drunk to rise to their feet again." The plant is widely distributed west of the Mississippi and has been found from Nebraska to Western Texas, but it is not mentioned as occurring in California and is rare in Colorado. Another plant, belonging to the same natural order, occurs however in California, and is locally known as "*loco* weed" or "rattle weed." This plant has poisonous effects on sheep and horses, as indicated by the name "loco," which means insanity or madness. By Dr. Gibbons, in the *Pacific Medical and Surgical Journal*, this plant is described as a *Crotalaria*, but Professor Maisch thinks it may be *Astragalus Crotalaria*, Gray.

While speaking of *Astragalus*, one is reminded of a wonderful discovery, reported in the *Times* of May 26, which reads very much like a chapter of Bulwer Lytton's 'Strange Story' or one of the sensational discoveries with which the *Daily Telegraph* at one time abounded. The article in question is quoted from the *Brisbane Courier* of January 11, and states that a certain Signor Rotura, who is said to have paid considerable attention to the botany and natural history of South America, has discovered a South American vegetable poison allied to the well-known woolara (curari?) that has the power of perfectly suspending animation and producing a trance that continues until the application of another vegetable essence which causes the blood to resume its circulation and the heart its functions. In a warm climate decomposition is found to set in only at the extremities after a week of this living death, and it occurred to the Signor that if the body were reduced to a sufficiently low temperature to prevent decomposition the process might be applied to the exportation of animals from Australia in the trance state at a very considerable profit. An eye-witness of the process describes the appearance of a lamb which had been in a state of suspended animation for nineteen days as being rigid, quite hard and stiff, the only difference between its appearance and that of a dead animal consisting in the absence of dull glassiness about the eye, which retained its brilliant transparency, the pupil being widely dilated. The lamb was put into a warm bath for about twenty-three minutes to raise its temperature to blood heat, and a small quantity of a pale green liquid was then injected subcutaneously under the skin of the neck and artificial respiration resorted to. In ten minutes the animal struggled to free itself and shortly after became quite as lively as before treatment. The antidote which restores the animals to life is supposed to be obtained from the root of a South American "Astracharlis" by decoction. Making allowance for the usual inaccuracy of scientific names in unscientific papers, it may reasonable be presumed that the word astracharlis stands for astragalus. The story is almost too good to be true, but it is given here for what it may be worth.

A series of experiments on Persian insect powder, detailed by Mr. W. L. Carpenter in the *American Naturalist*, have given some valuable results. He finds that the odour from the powder does not produce any bad effect upon insects subjected to it, when actual contact is not possible, but when carried to the maxillæ or mandibles, complete paralysis of the motor nerves is produced, the legs being paralysed in regular order, commencing with the first pair. His experiments further show that all insects having open mouth-parts are peculiarly susceptible to this drug, while others, such as the Hemiptera, owing to their peculiarly shaped mouths, are able to vigorously resist the baleful influence. The time which elapses before the death of different insects was found to vary considerably, a flea becoming helpless in three minutes, a house fly in ten minutes, and a spider in an hour and eighteen minutes. Mosquitoes, unfortunately, were found not to become helpless under a quarter of an hour.

Dr. H. M. Kier, writing in the *Pacific Medical and Surgical Journal*, states that the leaf of *Eriodictyon Californicum*, better known as *Yerba santa*, imparts to quinine the taste of starch when chewed and held upon the tongue for a minute, and recommends its use for disguising the bitterness of that alkaloid.

M. Boyveau reports in the *Journal de Pharmacie* a new test by which the presence of oil of mirbane can be easily detected in essential oil of almonds, provided it be not present in less quantity than 25 per cent. This consists in mixing equal parts of strong sulphuric acid and the suspected oil. If pure it takes a fine "currant-red" coloration, which after several hours becomes darker, but remains perfectly clear. If adulterated with oil of mirbane it reddens, but almost immediately becomes brown, thick and turbid. Essential oil of "almonds" obtained from the kernels of peaches and apricots, when treated in the

same way gives the same reaction as that obtained from bitter almonds, but differs in very soon becoming of a darker hue and of a thicker consistence. The essential oil of cherry laurel with the above test becomes of a dark red colour without passing through the currant-red tint, and also becomes thick. M. Boyveau also points out that the sp. gr. of the pure oil, 1·043, is greater than that of the oil of mirbane, which is 1·029 to 1·030.

An American practitioner, in the *Louisville Medical News*, reports the successful treatment of the sickness of pregnancy, by bromide of potassium, after failure with the usual remedies.

Baptisia tinctoria, or wild indigo, which has for some time past fallen into disuse, has been recently tried with apparent success in typhoid fever by Dr. Laurence Johnson, of New York, who considers the results obtained sufficiently favourable to encourage further trials.

In the *Union Médicale* Professor Verneuil states that he found 15 grain doses of quinine stop a severe case of repeated dental hæmorrhage, and recommends that in all such cases quinine should be tried before severer surgical measures are adopted.

Dr. Constantine Paul, in the *Gazette Hebdomadaire* of May 2, records that out of fourteen cases in which the diuretic action of *Blatta orientalis* was carefully tried, eleven gave negative results. He justly remarks that those who obtain negative results too often remain silent, and that, therefore, new remedies often have their period of vogue to the detriment of the patients and of seekers after truth. It is pleasant to learn that so disgusting a remedy is not likely to come into general use.

In the *British Medical Journal* of May 24, Dr. J. G. Parsons describes several cases in which the application of linseed meal produced symptoms of nettle rash, and of irritation of the air passages, and remarks that this specific action of linseed upon the mucous surfaces might possibly explain its use in affections of the mucous membrane. Linseed is often adulterated with other seeds, especially those of various cruciferous plants, most of which possess the irritant properties proper to mustard in a greater or less degree, and the linseed meal made from such seed often possesses irritant properties. It would be interesting to know whether the linseed meal used in these cases was of this character, a point easily ascertained by the slightly pungent odour evolved when the meal is mixed with water, and whether the patients had that peculiar sensitiveness of skin which seems to amount to an idiosyncrasy in some temperaments.

Dr. E. W. Forster, in the same journal, calls attention to the danger of administering podophyllin to pregnant women or those suffering from uterine complaints,—miscarriage having resulted, under his observation, from taking a liver pill containing podophyllin, obtained from a druggist. Those who use this drug in their antibilious or other pills would do well to seek a substitute which does not cause such violent tenesmus and colic as podophyllin often produces; euonymin has had such high encomiums bestowed upon it by members of the medical profession that it might perhaps be suggested as a substitute for podophyllin.

Dr. S. W. Francis writes to *New Remedies* saying that he has found tincture of boldo in doses of 20 to 25 drops three times a day to relieve the pain caused by gall stones, in a remarkable manner.

In the *Medical Times and Gazette* it is stated that ingluvin is supposed to be the nearest approach to ostrich pepsine that can be obtained in Europe. It may interest some of our readers to learn that a specimen of ostrich stomach, in the dried state in which it is used in the Argentine Republic as a remedy for indigestion, has recently been presented to the museum of the Society by Dr. Symes.

At the drug sales this month, among drugs of less frequent occurrence, there have been noticed dita bark from Manila (*Alstonia scholaris*), monesia bark, boldo leaves, Japanese valerian root. Of Siam benzoin, which has lately been scarce, there has been a fair quantity offered, but not of the finest quality, while Calabar beans are still very scarce. Another drug of rare occurrence, West Indian ipecacuanha root (*Asclepias curassavica*), has also been remarked. The salep recently offered appears to consist of the roots of several species of orchis, one of the tubers having a palmate shape like that of *Orchis maculata*, and others seeming to be the product of a plant bearing one tuber only, like *Herminium monorchis*. False Calabar beans (*Entada scandens*), spurious buchu leaves (*Empleurum serrulatum*) and star anise fruits exhausted of oil, have also been offered for sale. The star anise fruits were shipped from Bombay, but said to come from Japan.

An improved kind of cotton wool, which is very absorbent, so that it sinks immediately in water, has recently been introduced from the United States. It appears to have been treated chemically, but in appearance is indistinguishable by the naked eye from the ordinary kind. The advantages which this facility of absorption in the new kind presents over the old are obvious, and will probably lead to its replacing the less absorbent kind for many surgical purposes.

Those of our readers who are interested in microscopy will find an interesting account of how best to preserve infusoria, in *Popular Science Review* for April, translated from *Comptes Rendus* for March 3, 1879. By this process the smallest details can be seen, since the animals are fixed instantaneously before they have time to retract any of their appendages.

The latest circular of Messrs. Merck, of Darmstadt, refers to a new crystalline salt of eserine, the salicylate which is now prepared by that firm. It is described as forming colourless, brilliant, acicular or short prismatic crystals, apparently rhomboid, readily soluble in 24 parts of absolute alcohol. It requires about 130 parts of water at the ordinary temperature, but it dissolves pretty freely in hot water, and a so-solution not too concentrated (1 to 50) after cooling remains clear and without separation for a week. The compound has been kept exposed to the light for three weeks without alteration; but aqueous and alcoholic solutions exposed to diffused light in well closed bottles begin to redden only after a day or two, though this coloration is said not to acquire the intensity and brown shade of the sulphate, a solution of which becomes red after a few hours. Analysis of the salt gives 66·6 per cent. of eserine and 33·4 per cent. of salicylic acid, which, adopting Hesse's formula for the alkaloid, corresponds with one molecule of eserine to one of acid—$C_{15}H_{21}N_3O_2$, $C_7H_6O_3$. Experiments as to the action of salicylate of eserine are in progress; but it has been found that a 1 per cent. solution acts very promptly and energetically upon the pupil. Among the other interesting sub-

stances mentioned in this circular are scillipicrin, scillitoxin and scillin, three compounds obtained from the squill, and recently investigated physiologically by Professor Husemann, and scoparin and sparteine and the sulphate of sparteine from the *Sarothamnus Scoparius*. A specimen of salicylate of eserine, presented by Messrs. Merck, may be seen in the Museum of the Pharmaceutical Society.

During the month Messrs. John Gosnell and Co. have been exhibiting to their friends a very handsome case of goods which is destined for the exhibition at Sydney in the autumn. The most striking objects in it are a pair of mammoth brushes that might serve the purpose of Gog or Magog, and corresponding pots of cherry tooth paste, packets of nursery powder, and bottles of perfume that might prove acceptable to the ladies of their household.

Before proceeding to the prescriptions in the usual order, reference may be made to one already commented on in the notes of the last "Month," that of No. 279, where starch and oxide of zinc are combined with glycerine in a lotion. Several correspondents have concluded that the starch and glycerine should, by the application of heat, form a glycer. amyli; but there is no indication in the prescription that the writer intended any such a result, and the dispenser, without some knowledge beyond what is conveyed in the prescription, would not be justified in doing more than mixing the ingredients in the manner suggested in "The Month's" *résumé* of this subject. The combination is by no means an unusual one and the method and order of mixing suggested is that which is generally adopted, but the conversion of the starch and glycerine into a plasma, by the aid of heat previously to the other ingredients being added, if required by any prescriber, must be exceptional and should not be adopted without special directions to that effect.

An inquiry was made in No. 281 with reference to a formula for "pil. Hamilton," and several correspondents, apparently from personal knowledge, have been good enough to furnish answers. From these replies one thing is clear, that there is one formula ascribed to Dr. Hamilton, sen., and another to Dr. Hamilton, jun., but beyond this the information is not of a very definite character. One correspondent states that it is the old aloetic pill, but that usually pil. aloes barb. is supplied; another that it is pil. coloc. et hyos. gr. v. Then as regards the pills of Dr. Hamilton, junior, one states that the formula is pil. coloc. et hyos. gr. v., another that the composition is pil. coloc. et hyos., but with ext. coloc. co., instead of pil. coloc. co., and a third that it is pil. aloetic. et hyos. gr. 2½. One rolls the pills in charcoal and another in French chalk. Some of the correspondents do not even recognize two Hamiltons in connection with the pills. It must be evident from these observations on the discrepancies existing with regard to this pill that some further and more definite information is needed. It is not clear why any one special pill of the Pharmacopœia should be honoured with the name of a particular physician, and seeing that pills so dissimilar in size, strength and character may be sent out as Dr. Hamilton's pills, the correctness of a prescription dispensed at one establishment and again at another may be called in question. These and similar difficulties called the Dispensing Memoranda into being, and so long as practice varies to such an extent as is indicated in the replies to this question it cannot reasonably be said that there is no necessity for the existence of such a medium as these columns supply.

The first of the queries is that of No. 283. The excipient of tragacanth and glycerine answers very well for oxide of zinc, and is quite unobjectionable. In this instance the usual formula may be diluted with a little glycerine.

The mixture No. 284 may be satisfactorily made by adding a little mucilage previous to the addition of the tinct. bals. tolu, and the emulsion will retain its character for any reasonable length of time; without the addition of mucilage the tolu will separate, adhering to the sides of the bottle, and the result will not be a mixture of the ingredients of the prescription, neither will it represent, from a therapeutic point of view, the medicinal value of the tolu.

Mr. C. F. Rideal supplies an answer to question No. 285. He states that liq. ferri dialys. c. quinâ may be made by using the quinæ murias in the proportion of three grains to the ounce, and that it keeps well without the deposition of peroxide of iron. "L." is recommended to try the formula, paying particular attention to the details there given.

The prescription No. 286 requires a treatment similar to that of No. 284, the addition of a little mucilage. The principle of emulsifying tinctures of gum resins by the use of a little mucilage has been so frequently laid down in these pages that it should be unnecessary to refer again to its application in particular instances. Dispensers should try and think out these subjects for themselves; many of them are only repetitions of questions asked on previous occasions, with probably a different but not dissimilar tincture.

There is no existing official formula for pil. scillæ et digit. of No. 287, but, as pointed out by Mr. Watson West, there was one in the Edinburgh Pharmacopœia, 1841. Squire's 'Pharmacopœias of the London Hospitals' also contains one formula for this pill: p. scillæ gr. ij, ext. conii gr. ij, p. digital. gr. j, ft. pil. (*Hospital for Consumption*); and two for pil. digit. comp.: p. digit. gr. ss. p. scillæ gr. j, pil. hydrarg, gr. ii (*St. George's*); p. digit. gr. ss, p. scillæ gr. iss, pil. hydrarg gr. iij, ft. pil. (*Middlesex*). The Edinburgh Pharmacopœia formula would probably be the more legitimate in the absence of definite knowledge of the prescriber's intention, especially as the style of the prescription appears to indicate a Scotch origin.

The liniment No. 288, cannot be satisfactorily dispensed if the letter of the prescription be closely adhered to, but a slight deviation, scarcely, if at all, affecting the therapeutic action of this application, will result in a miscible liniment. The proportion of iodine and iodide of potassium for half an ounce of rectified spirit to make the tinct. iodi should be dissolved in half that quantity (℥ij) of spirit and to this the camphor may be added; the ext. belladonnæ should then be rubbed down with ℥ij of water, and this mixed with the iodine and camphor will form a mixture which, on being shaken, will always be ready for use. The only deviation in the prescription is the substitution of ℥ij water for ℥ij of rectified spirit required in the tr. iodi., and a smooth and homogeneous mixture will be the result. At the same time it is not recommended to make even this alteration in the prescription, without bringing the necessity of it under the notice of the prescriber, when this course is practicable.

In reply to question No. 289, it is correct to dispense liq. chlori, B.P. when aq. chlori is ordered. The liq. chlori when made should be kept in the dark, since under the influence of light chlorine decomposes water, with the production of hydrochloric acid and evolution of oxygen. This preparation is therefore constantly undergoing change, and it is perfectly possible that the liq. chlori of one establishment may be stronger or weaker than that of another, and that its age, and manner of storage, might determine the difference.

The three prescriptions under No. 290 may represent good therapeutics, but they certainly exhibit certain peculiarities which happily for the dispenser are of comparatively rare occurrence. The ointment No. 1, is unusually mild for any purpose; the formula No. 2 would be better without the pulv. tragacanth, unless it be assumed that an emulsion be intended; if so, it is much in excess of that required for the purpose and would involve the addition of water; and No. 3 can only be mixed together and should have a "shake the bottle" label.

Prescription No. 291 contains ten grains ferri sulph. and this large dose very properly arrested the attention of the dispenser. Such doses are not usual, and they are in excess of the maximum Pharmacopœia dose; but occasionally prescriptions are met with ordering doses beyond that of the Pharmacopœia, and this would probably come under the denomination of a *large medicinal dose;* the prescriber having stated that it was correct, the dispenser was relieved of responsibility.

It is difficult to say what is meant by the solut. camphoræ of No. 292. It may refer to a private formula for the extemporaneous production of mist. camphoræ of any strength desired, or it may be Murray's Solution of Camphor. In the absence of definite information, the dispenser would be justified in using a solution of camphor about the strength of half a grain to the drachm, which would make the mixture in camphor double the strength of the aq. camph., B. P. There are some remarks on this subject in "The Month" of October, 1877, p. 324, to which the attention of "R. E." is directed.

The question No. 293 is scarcely one upon which a pharmacist should be asked to express an opinion. It involves medical knowledge. The B. P. gives the dose of syr. rhamni as ℥j, that being the dose for an adult; half that quantity would, therefore, be too much for a child. When a dose is required, reference should be made to the Pharmacopœia; but beyond this most pharmacists in business know what is customary as regards the administration of syr. rhamni and similar remedies to children, and the result of this experience will be a conclusion opposed to that of the medical officer who assumed that the death of the child was caused by taking "half a teaspoonful of syrup of buckthorn."

The mixture, No. 294, made with liq. ferri dialys. (gr. v. to the drachm) is reddish-brown, with some turbidity, and there gradually subsides a flocculent separation, leaving the supernatant liquid bright, but with a yellow tinge of colour.

Liq. ferri chloroxydi is believed to have been introduced by Squire, in whose 'Companion to the British Pharmacopœia' will be found the following remarks:—"This preparation was made at the suggestion of Mr. Spencer Wells, who had noticed the paper of M. Jeannel, of Bordeaux, describing a yellow and red peroxide of iron, the latter being soluble in very dilute hydrochloric acid." For some facts bearing on this subject reference may be made to a note by Mr. Butler, *Pharm. Journ.* [3], iii., p. 821.

The pills of prescription No. 296, if permanganate of potash in crystals be used, and the ingredients combined by the addition of spirit, may be made without any apparent decomposition, and they will be of very firm consistence.

In reply to query No. 297, "Chemicus" should have clear ideas with regard to the different magnesias of the Pharmacopœia. One formula is given for the preparation of carbonate of magnesia, and another for *light* carbonate of magnesia; the latter when prepared being, of course, the lighter of the two, the former would be mag. carb. *pond.* as compared with mag. carb. *levis.* For the preparation of magnesia, the *carbonate* is deprived of its carbonic acid by calcination, and for the magnesia levis, the *light carbonate* is used. The "magnesia" is therefore the heavier, or, according to the "characters" given in the Pharmacopœia, "the volumes corresponding to the same weights being to each other in the ratio of three and a half to one." The "magnesia" of the Pharmacopœia would correspond to magnesia pond. or the heavier of the two. Magnesia carb. pond. and magnesia calc. pond. are terms not found in the Pharmacopœia; they are heavy only by comparison with those to which the name "light" is given by the same authority.

No. 298. There should be no appreciable deposit in this mixture when the ingredients are combined, though there will be a trifling deposit on standing some days, but one that would scarcely be noticed by a patient, and not of sufficient importance to require a direction to shake the bottle. The order of mixing seems to have been quite correct, and it is difficult to account for the deposit mentioned.

The writer of prescription No. 299 must have intended the usual mixture of equal parts by weight of camphor and chloral hydrate, which, on being mixed together, liquefy, forming a useful application in neuralgic pains. The ingredients as written cannot be combined, the syrup is evidently an error on the part of the prescriber.

Mr. C. J. Mead gives a formula for green extract suppositories with a gelatine medium, which in his hands appears to have been very successful. The method adopted is that usually employed by pharmacists, but the relative proportions to form a gelatine medium may supply a desideratum, and be of service to those who have made repeated inquiries on this subject. The formula would have been more definite had Mr. Mead given the quantity of gelatine used, rather than its weight when saturated with water and swollen, which may, to some extent, vary, and consequently require a varying temperature for the solution of the pessaries when in use. Mr. Mead says:—"They retain their elasticity and shape for any length of time, provided they be kept excluded from the air and dusted with lycopodium." This may be so, but pharmacists would do well to direct their attention to gelatine as a medium for pessaries and suppositories, especially those which are usually kept in stock, as to whether a gelatine suppository in keeping does not undergo some change, requiring a higher temperature for its solution than the body supplies, or than the gelatine suppository would have required when recently made.

The Pharmaceutical Journal.

SATURDAY, MAY 31, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

CO-OPERATIVE TRADING.

THE first meeting of the Select Committee on Co-operative Stores at which evidence was taken was held last Wednesday week, in the No. 13 Committee Room of the House of Commons, over the entrance of which are the words "Co-operative Societies" to serve as a guide for inquiring visitors, and the business was commenced by Sir MASSEY LOPES, as Chairman, reading the following statement of the nature of the inquiry to be undertaken, viz., to inquire into the constitution of certain societies trading under the name of co-operative stores, and to ascertain whether they are exempted from taxes or imposts to which the trading community are liable. He further stated that the Committee desired to have an exhaustive inquiry into the subject, and thought it would be best to hear witnesses on the part of traders, in the first instance. It would then be open for any one who desired to give evidence on the part of co-operative societies to come forward and do so. For the more convenient conduct of the inquiry it was considered desirable to divide it into three parts:—First, the constitution of co-operative societies; second, their operations; and third, to consider whether they are exempt from any taxes or imposts.

The first witness called was Mr. J. JONES, who appeared in the capacity of a representative of the metropolis, or rather of those delegates sent by the various district boards and vestries—with the single exception of Kensington—to attend a meeting called for the purpose of organizing the opposition of retail traders to civil service trading. Mr. JONES explained that the reason he did not represent the district of Kensington was that it is the residence of many of the high class people who deal with the stores, and consequently have not much sympathy with the cause of the retail traders. The objections urged by Mr. JONES to the system of trading carried on by officers of Her Majesty's civil and military services were not in any remarkable degree novel or different from those which have been put forward on various other occasions, but they were expressed with the clearness and force which characterizes Mr. JONES's manner of dealing with public questions.

The great advantage enjoyed by Government officials in having a secure income from the State was instanced by Mr. JONES as being one of the circumstances that should bar them from carrying on trade at a low rate of profit to the detriment of those who have to rely solely on their trade for the means of existence. It was, he contended, only by means of that extraneous aid that they were able to sell goods at a profit of 5 per cent., a condition that would be ruinous to trade and to the trading community, inasmuch as it would not admit of any one accumulating capital. Mr. JONES would restrict Government officials almost entirely to the performance of the duties of their offices, and though he might be induced to allow a civil servant to write novels or paint pictures, he would forbid it as soon as professional artists complained. Altogether the principle he would act upon, if he had authority, would be to take out of a man in the Government service all the brains he had, every day, just as he thinks the trading community try to do with their *employés*, whether they succeed or not.

Beyond this kind of expression of opinion, however, there was not much evidence of fact contributed by Mr. JONES to the elucidation of the subject. The possibility of civil servants making improper use of the knowledge they obtain in the exercise of their ordinary duties was referred to, but no positive statement of such misconduct having occurred was offered. As regards the supply of stores to colonial regiments by the Army and Navy Stores, also, nothing was advanced except mere rumour, and the opinion given as to the impropriety of Mr. GLADSTONE's commenting upon the French war in an article in the *Quarterly Review*, rather than in a speech in the House of Commons, apparently carried the Committee so far beyond the range of the inquiry before it that Mr. JONES's examination was there terminated with an admission by the Chairman that at any rate his brains had not been exhausted.

The second witness examined was Mr. JAMES DEBAC, the Chairman of the National Chamber of Trade, who gave more specific details of the facts which are considered to show that the official position of Government traders gives them an undoubted advantage over their competitors, and makes the competition the latter have to contend with unfair. It was finally decided that Mr. DEBAC should send in a written statement of his views as to the evils of co-operative trading and the remedies he would suggest, and that subsequently he should be cross-examined upon them when the Committee sat again.

The proceedings of this meeting of the Committee cannot be regarded as doing much more than breaking the ground in this inquiry, but we think that without drawing any unfair inference as to the tendencies of the members of the Committee, much is to be recognized which bears out the remarks made by Mr. URWICK at the late annual meeting of the Pharmaceutical Society. We will not say that any of the members of this Committee are dead against trade interests, as Mr. URWICK's friend

represented the majority of members of Parliament to be, but there is at least unmistakable evidence afforded by the questions asked that the sympathy with trade interests as opposed to co-operative trading is at best but feeble. We have long felt this to be the case and it is precisely on that account that we have regarded the subject of co-operative trading as one of great difficulty to deal with, demanding the utmost caution, and perhaps offering but little prospect of any other remedy but that which it may eventually work out for itself.

DISPENSING MEMORANDA.

As a natural consequence of the publication of the letter of Mr. BALDOCK on this subject (see before, p. 931), we have received several others from correspondents in different parts of the country. Some of these have emphasized more or less the opinion expressed by Mr. BALDOCK as to the inexpediency of continuing the "Dispensing Memoranda" columns; others, on the contrary, express strongly the opinion that this part of the Journal is of great service. As our object in inserting Mr. BALDOCK's letter was to evoke a general expression of opinion for our own guidance, we do not think it necessary at present to publish more of this correspondence than the letter of Mr. BESSANT, which will be found on p. 992, and which temperately and forcibly puts the opposite side of the argument. We desire, however, to thank those gentlemen who have written to us on the subject, and shall be happy to hear from others also. In deciding upon the course to adopt we shall not lose sight of the points urged by Mr. BALDOCK and those who think with him; while at the same time those who think differently need not fear that we shall ignore the fact either that the section was established mainly for the benefit of our "junior brethren," who have not always the facilities for obtaining information attributed to them by some who are more favourably circumstanced; or that incidentally some of our "senior brethren" have been assisted to uniformity in some practices where the discussion has revealed considerable divergencies. In respect to the fear that medical men who see the notes will be unfavourably impressed as to the ability of pharmacists generally to carry out their wishes, we think that this disadvantage will be at least counterbalanced by the opportunity it will give some of them to study the weak points in medical prescribing.

Chemists & Druggists' Trade Association.

MEETING OF THE EXECUTIVE COMMITTEE.

The annual meeting of the General Committee of this Association, preparatory to the annual general meeting of the members, was held on Tuesday, May 20, at the Inns of Court Hotel, Lincoln's Inn Fields, Mr. S. U. Jones, of Leamington, President, in the chair.

The first business on the agenda was the reception of the annual report, which had been already circulated.

Mr. Whitfield moved the adoption of the report and accounts.

Mr. Pollard seconded the resolution, which was carried unanimously.

The next business was the selection of a list of names to recommend to the annual meeting for election as the Executive Committee for the ensuing year.

Mr. Throssell (Cambridge) hoped that some representative from his own part of the country would be elected. There was no one in the whole east of England on the Executive Committee.

Mr. Hampson said there would be no difficulty in carrying out this suggestion. It lay with the members in the respective districts to elect representatives.

The Secretary (having read the rules bearing on the election of the General and Executive Committee) said if there were no one in the eastern district who was willing to serve on the Executive Committee, it could not be helped.

Mr. Barclay said it was very desirable that every part of the country should be represented on the Executive.

Mr. Greenish and Mr. Lance having been appointed Scrutineers, the following gentlemen were recommended for election as the Executive Committee for the ensuing year:—

England and Wales.

Andrews, Frederick, London.
Arblaster, C. J., Birmingham.
Barclay, Thomas, Birmingham.
Bell, C. B, Hull.
Churchill, W. J., Birmingham.
Cole, F. A., Colchester.
Cross, W. G., jun., Shrewsbury.
Cubley, G. A., Sheffield.
Delves, George, Exeter.
Hampson, Robert, London.
Holdsworth, T. W., Birmingham.
Jervis, William, Sheffield.
Jones, S. U., Leamington.
Maltby, Joseph, Lincoln.
Owen, John, London.
Reynolds, Richard, Leeds.
Shaw, John, Liverpool.
Southall, William, Birmingham.
Symes, Charles, Liverpool.
Wade, John, London.
Walker, George, Coventry.

Scotland.

Davison, Thomas, Glasgow.
Kerr, Charles, Dundee.
Mackenzie, James, Edinburgh.

THE ANNUAL MEETING.

The general meeting of members was held at 12.30, Mr. Jones, President, in the chair.

The Chairman said he did not propose to detain the meeting long, but he could not rise without expressing the sense of pleasure which the members of the Executive felt in meeting the members on that occasion. They had had a great many trying and difficult questions engaging their attention, the principal one being the celebrated case of counter prescribing, the Apothecaries' Society *v.* Shepperley. That had now been brought to an end, and they trusted the matter would now rest, and that chemists would be no further harassed for carrying on simple counter prescribing. He was pleased to say that at present they had no very burning question before them and they hoped they would have a little time of peace and rest. The object of the Association was not to trespass on the rights or privileges of other bodies, but merely to protect their own rights and to prevent them being unjustly attacked. He need not say that during the long struggle connected with Mr. Shepperley's case a great deal of money had been spent, and they had hoped to be able to give an exact account of that expenditure

but unfortunately the taxed costs had not been paid. They had spent £920 in that case, but had not yet received the taxed costs, but they hoped to receive upwards of £200 back again. The question of adulteration under the Sale of Food and Drugs Act had engaged the attention of the Committee, and representations had been made to several members of Parliament respecting alterations suggested, but up to the present time no alteration had been made. The whole matter, as well as the medical Bills now before Parliament was being carefully watched by a committee appointed for the purpose. They were desirous of doing everything they could to protect the interests of the trade from any unjust attack on the part of those who attempted to interfere with what they believed to be the just privileges of chemists and druggists. He ought to add that a cheque was sent to Mr. Shepperley for his expenses of attending the trial, in London and he had very kindly returned it.

The report having been agreed to be taken as read,

Mr. Haffenden (Brighton) moved its adoption. He considered it an honour to be connected with an association which had done so much good work. For years and years they were under a cloud, and funds were very much needed, but this last year the response had been very good, and happily they now had a small balance in hand; but there was still work to do, and work which could be done without any antagonism to the Pharmaceutical Society. He was glad to see that that body had been spurred on to do something, for there was a feeling amongst chemists as a body that the Pharmaceutical Society had failed somewhat in its duty, although they had much to thank it for with regard to the status they now held; but they did not want to stand still, but to go on, for it was not in human nature to be satisfied. There was plenty of work still remaining both for the Pharmaceutical Society and for the Trade Association.

Dr. Symes (Liverpool) seconded the resolution. He had felt great satisfaction in reading this report. It seemed to him a simple statement of facts and the work of the Association during the year. They could read in that report what had been done for the benefit of the trade generally, and not only for the trade, but which personally he felt had been some service to himself. If the whole of the chemists and druggists throughout the country could read that report and feel the same personal satisfaction in doing so that he had, he did not think there would be a man but who would join the society, and feel himself honoured in doing so. The report was free from all attempt at apology, because there was nothing to apologize for. The Association had done its work in a conscientious manner. It had not assumed to itself any very special or defined right to exercise its prerogative independent of the views or wishes of its members, and therefore it opened by giving an explanation of a case many of them felt that it had very unwisely gone into, and which had not done it any very great credit. But they had in this report, in a very concise form, the facts which led to the undertaking of Wiggins's case, and he was quite sure when those facts were read every one would feel that there was not a shadow of blame cast on the executive in undertaking that case, although it did not turn out as satisfactorily as they could have wished. With regard to Shepperley's case they all felt so much satisfaction in the way it had terminated, that he could scarcely make any comment upon it, except that he should say that it would have been as well if the paragraph referring to the special fund raised for legal proceedings had followed immediately after the statement of the case. The manner in which the appeal had been responded to throughout the country was very encouraging, and showed that chemists and druggists were actuated by the same feelings now as they were in days gone by, when the nucleus of that vast fund now belonging to the senior society was formed by a number of men for their own defence. There were also some remarks on adulteration in the report and some very good advice, that all persons applied to by inspectors for samples which they proposed to have analysed should require samples to be left with the chemist, because that would put the Association in a position in which they were able to deal with the case more perfectly than they otherwise could. With regard to the Adulteration Act he thought they should endeavour to obtain some amendment of the law with regard to recovering expenses when such prosecutions fall through. They all had the feelings of Englishmen, and it was a discredit that any such law should exist which had such an oppressive bearing as this Adulteration Act. Nine-tenths of the prosecutions which were commenced were frivolous and childish, and it was most unfair that when people had to defend themselves at great expense in order to protect their own character, which even then was only done partially, they should be left to bear the expense themselves. A person might come into his shop and ask for something containing an infinitesimal quantity of what might be called adulteration. Take cream of tartar, for instance; it would cost four times the price and be no better really if it were made absolutely pure. Yet an analyst had the power to purchase a sample and get an action instituted against him for selling an adulterated article; his name was printed in the newspapers as as offender, and many persons would read the charge who did not read the further proceedings which he might take to defend his character. In this respect it would be very well if the Association could endeavour to obtain a reform of the law. They were not desirous of meddling or keeping up agitation where it was not necessary. They had had some years' hard work, and now felt a little need of repose, but it must not be supposed they were going to sleep. They need not be like public analysts, always keeping up an agitation to show that they were of some use. He was quite sure that when work came they would be always found willing and ready to do their duty, and that was all which could fairly be expected.

Mr. Elwood (Leominster) as the representative of a purely agricultural district, supported the adoption of the report, which he considered most satisfactory and thought it contrasted very favourably with that of the Pharmaceutical Society.

Mr. Hampson said he should like to follow up the line of argument suggested by Dr. Symes with reference to the oppression to which they were subjected in connection with the Adulteration Act. The national Pharmacopœia laid down the basis of purity of preparations, and he should like to elicit the opinion of the meeting as to the advisability of chemists generally having some voice in the preparation of the Pharmacopœia. As matters stood at present it rested almost solely, as it did technically, with the Medical Council. He had not a word to say against that body, and he believed the last Pharmacopœia was a vast improvement on all that had preceded it; but as chemists it was their duty to look to their own interests in this matter. When they were called upon to defend themselves in a court of law they had to appeal to the Pharmacopœia as a standard, and yet they had no voice in making it. They had an indirect voice, no doubt, by the participation of one or two individuals who were privileged to have something to do with the formulæ and methods used; but the position he took up was this, that they ought to have an equal voice in it, and that if there were a committee of twelve to frame the Pharmacopœia they ought to be represented by half a dozen on the committee. At present they were simply helpless. They would probably have to fight for that position and probably to agitate until they obtained what they desired, but he hoped the members all looked forward to the time when such should be the case. This was the third year of the Association and their numbers had not reached 5000. He did not complain of that, for they had done far better than he expected, but it was the duty of every chemist in the United Kingdom to become a member of the society. How was it possible for the Executive to carry on this work properly unless they

were backed by the full force of the trade? They did not want to appeal spasmodically when any difficulty arose, nor to defend any particular interest. They wanted something in the bank to fall back upon when the occasion arose. They had not arrived at that state of things, and unless they had the full support of every member of the trade they could not expect to continue a prosperous association. He did therefore appeal to every member of the trade in Great Britain to join the Association. They lived in an age of over-legislation and active competition, and it was certainly their duty to make the Association strong as well as useful.

Mr. Shepperley said the question with which his name had been so prominently placed before the trade for some time past, having been referred to by the President, and also in the report, he felt constrained to say a few words, and more especially to acknowledge his own personal sense of the increasing efforts which the Executive, the solicitor, and the indefatigable secretary had one and all thrown into the cause, which had been surrounded technically and in other ways with difficulties of no common order. The success which had attended their efforts had insured the position of the Association more than anything it had done in other ways, numerous and successful as its efforts had been, and he could not allow the present opportunity to pass without expressing his own personal sense of the sound judgment and generalship of those who guided the steps of this well-planted, vigorous and, he trusted, still increasing Association.

Mr. Urwick congratulated the Association on the work done in the past year. It was an Association which, when they were in trouble, was willing to investigate the case and assist them. It had done good work in Shepperley's case, and was also connected with another case, although it did not appear so prominent in it, because it was through it that the Pharmaceutical Society was urged to take steps against the co-operative stores, and so the Society was striving to do what he trusted would be a great benefit to the trade at large. It was most fortunate the case had begun at the right end; he had no doubt it would go on, and if they did appeal it, he felt it would be successful. When that wedge was fairly struck home he hoped time would not be wasted in urging further steps against other co-operative stores. He knew that some of them were now quaking in their shoes and were almost ready to throw up the drug department, and it would only require determination on their part to carry the matter through successfully. He noticed that the Pharmaceutical Society had become very active about the new Bill, but his own feeling was that if they were successful in this case they might remain quiet for a time and not attempt to do too much, because he believed there were many members in Parliament who would be willing to make the simple keeping of a qualified man in the stores a sufficient guarantee for carrying on the business. The Trade Association had done so well that it had a claim on the whole trade to support it, and he should urge on every chemist to come forward and assist. No doubt the law expenses had been very great, and he would urge the Executive Committee to look closely over the lawyer's bill; no doubt the work was well done, but he knew that solicitors' costs could sometimes be kept down by carefully looking after them.

Mr. Andrews said he had felt for many years past that chemists and druggists had an undoubted right to have a voice in the preparation of the Pharmacopœia. On the last occasion it was true that a chemist was employed, but he was employed by the physicians, and therefore, they could hardly be said to have been represented. When a new edition was prepared, he trusted chemists and druggists would be able to make their voice heard.

Mr. Fitch, referring to the fact that fourteen human lives had been lost entirely through an unqualified man being allowed to compound and mix such an article as violet powder, said that showed the necessity for further legislation requiring that the preparation of all such articles should be strictly limited to qualified men. He also wished to ask the solicitor whether, under the clauses in the present Medical Bill, providing that whoever practised physic for gain should be subject to a certain penalty, that would not be held to operate against counter prescribing? It was understood that some medical men at the East End, forming the Defence Association, intended to act on that clause if the Bill passed.

The Solicitor said that following on that clause were other things which the person who practised for gain had to do before he rendered himself liable to a penalty. He had to assume certain titles, and as he read the clause no person would be affected who did not assume a medical title.

Mr. Barclay thought it was desirable at this stage of their proceedings to take a short review of the past, and also to see what they had to do in the future. With regard to the £2000 fund, he thought it would be interesting to the meeting to know something about the finances of the Association. That fund was started at the last meeting, and during the year £1645 had been received. He then stated in detail the number of donations from one guinea upwards, and also the various places which had subscribed considerable sums from time to time, amongst which were Bolton, Liverpool, Nottingham and Sheffield. £710 had been raised by donations in this manner of over one guinea, and the remainder had been raised by the rank and file of the trade in small amounts of less than one guinea each. The members of the Association enrolled in the first year were 2280, the next year, 3940, and the present year they were 4346. But there were between seven and eight thousand in the trade, and he thoroughly indorsed Mr. Hampson's views that the Association to be thoroughly successful must embrace the whole of the trade, and they must not rest satisfied until every member virtually was brought into it. He also wished to call attention to one fact which was not a very pleasant one. In the first year there were eighty-seven outstanding unpaid subscriptions, in the second year one hundred and thirty-five, and this year three hundred and forty-five, including, of course, the losses of the two previous years; but that was a large amount for outstanding subscriptions, and he trusted that members of the General Committee would, each in his respective locality, use their best endeavours to see that the amounts were sent in to the Secretary, because it was an expensive proceeding to have to send collectors round. With regard to the Shepperley case, he did not wish to glorify the Association, but he must say a word on the question which had been raised as to whether it was a test case. The Medical Association certainly thought it was a test case, for they got an experienced detective down from London to get it up; so that, as far as they were concerned, they certainly considered it so. One of the greatest advantages the trade had received from this defence of Shepperley was the expression of public opinion which it had elicited, and he thought it was a grand thing to see a general expression of opinion in the press throughout the country in favour of chemists and druggists, and of their acting the way in which the trade had done from the earliest times in simple counter prescribing. Chemists had been congratulated on these things by the press and public, and by the medical profession, showing that they had the sympathy of the entire public, with the exception of a few ultra-medical men. He was glad Mr. Hampson had raised the question of the Pharmacopœia. Up to recently the medical profession consisted largely of apothecaries, who were not only qualified in medicine as dispensers, but also as taking an active part in compounding medicines, and therefore there was some reason for the action of the Medical Council; but he thought that body would now recognize the rights of chemists, and also the advantage

they would have in being associated with the pharmaceutical profession in compiling another Pharmacopœia. He had no doubt that the Council of the Pharmaceutical Society would look after their interests in this matter. He could not conclude without expressing his regret that they were to lose the services of Mr. Greenish on the Executive Committee; but he was not leaving for any want of sympathy with the Association, but simply because his public work had so grown upon him that he could not afford the time he would like to give the Association. With regard to the future, he thought there was plenty of work before them. There were many questions coming forward which it would be perhaps not wise to name; but he did not anticipate much rest. So long as the trade was harassed as it now was, they had plenty of work to do, and the Executive must look forward to anything but a bed of roses if they intended to do their duty.

The motion was then put and carried unanimously.

The Chairman said the next business was to elect the Executive Committee for the ensuing year.

Mr. Urwick said, before that was done, he should like to propose a vote of thanks to the Executive Committee for what they have done in the past year.

Mr. Greenish remarked that Mr. Barclay made a slight mistake in saying that he had resigned. The fact was that his year of office had expired and there being much to attend to in connection with the Pharmaceutical Society Council he had felt compelled not to let his name be put forward for re-election. He found he had made forty-eight attendances during the past year at the Pharmaceutical Society, and he calculated that about one-twelfth of his available time was required to properly attend to those duties. It must not be supposed for a moment that he left the Executive because he differed from it in any way; and he would ask gentlemen, in choosing the Executive, not to allow it to be a matter of form. The Committee had very important duties to do, and he hoped gentlemen would exercise the best judgment in the election. That Association was founded for the protection of the legitimate interests of chemists and druggists from unfair attacks and for the advancement of their common welfare, and he considered the best test of any organization was the fact whether it did or did not fulfil its object when the time of trial came. He thought that Association had attended fairly well to the interests of the trade, and he agreed with Mr. Hampson that they ought to look forward to the adhesion of every member of the trade, so that they would be able to bring the strength of the whole body to bear on any matter they might take up.

Mr. Urwick then moved that the list of names submitted by the General Committee, as given above, be appointed the Executive Committee for the following year.

Mr. Greaves seconded the motion, which was carried unanimously.

The Chairman said the next business was the election of officers. For his own part he had felt it a great honour to be elected President, which he little expected when he first went to Birmingham. He hoped that with his colleagues he had been able to assist somewhat in advancing the welfare of the business in which he had been so long interested. The time had now arrived, however, when he must ask the members to appoint his successor in the presidency. Circumstances would probably occur when he should be leaving Leamington, and he felt it necessary that the President should reside in or near Birmingham so as to be able to give full attention to the business.

Mr. Holdsworth said that he thought that it would be a good thing that the offices should rotate and not remain too long in one hand, and he therefore suggested they should appoint another hon. secretary.

Mr. Barclay said it was desirable that some of the offices should rotate, but in the case of the hon. secretary he thought it was of the utmost importance, if they had a gentleman who fulfilled the office fairly well,—and Mr. Holdsworth had done it very well indeed,—that he should remain if possible in the post.

A ballot was then taken for the officers, Mr. Andrews and Dr. Symes being appointed Scrutineers. The result was that Mr. Thomas Barclay was elected President for the ensuing year, Mr. Robert Hampson, Vice-President; Mr. Southall, Treasurer; and Mr. Holdsworth, Hon. Secretary.

The Chairman said it was a great pleasure to him to ask Mr. Barclay to take his place. He knew what an immense amount of work Mr. Barclay had done for the Association and he had no doubt that as President he would continue the same exertions.

Mr. Barclay then took the chair as President for the ensuing year. He said he felt the responsibility of the position very strongly. The Association had in their hands very great power for good or evil; they might be of great service or they might, by indiscreet action, do a very great amount of harm, and he was extremely anxious that the reins of the Association should be held with very firm power and that they should be very careful in all their actions. In the outgoing President they had had a President who was especially thoughtful and careful of every word. His every act and every word had been for the welfare of the trade, and he had done his utmost, not only to steer the Association right, but also for the interests of his fellow tradesmen. He felt some diffidence in taking the office, and some of his friends had advised him not to do so, because he knew that he was somewhat impetuous where he took a strong interest, but he succeeded one whom he should do his utmost to copy. He was very thankful that Mr. Hampson had been elected as Vice-President, and could have wished that he had been appointed to the Presidency. However, he should do his utmost to merit their confidence in the future.

Mr. Hampson also thanked the meeting for the honour they had conferred upon him. If he had consulted his own convenience and strength he should probably have declined, but he had always been active in political matters and he desired still to remain so in reference to matters connected with the trade. He hoped at the end of his year of office that he should be found to have done his duty and at any rate to have done some good service to the trade.

Mr. Holdsworth also returned thanks for his re-election as Hon. Secretary. He certainly did not think their work was over as long as they were open to the petty persecutions of analysts and licentiates of the Apothecaries' Company, and it would be necessary for them to maintain their ground in the face of all enemies. He hoped the Association would increase, but it was not a pleasant thing to think that the subscriptions in arrears represented 1200 members, each of whom had received at least three applications for a subscription. During last year the subscriptions only amounted to £800, and the ordinary work, without law expenses, cost £1200, so that this question was really a serious matter. Before sitting down, he should like to move a vote of thanks to the Secretary, for he thought it was only fair to him, although he was a paid officer, that there should be some public recognition of the services he had rendered to the Society.

Mr. Jervis (Sheffield) seconded the motion.

The Chairman said he had much pleasure in putting it to the meeting, when it was at once carried unanimously.

The Secretary thanked the meeting for their kindness and said that so long as he remained Secretary, the work of the Association, so far as it devolved on his shoulders, should in no way be neglected.

Mr. Jones then moved a cordial vote of thanks to the solicitor, Mr. Glaisyer. He had had an immense deal of very arduous work to do which he had brought to a favourable termination.

Mr. Churchill seconded the resolution, which was supported by Mr. Greenish.

The motion having been carried unanimously, Mr. Glaisyer, in acknowledging the compliment, said the work of the Association had been extremely interesting to him and it was very gratifying to him to find that his labours were appreciated.

The Chairman then invited discussion on any matters interesting to the trade.

Mr. Ward (Sheffield) said he should like to bring forward the question of confining the sale of proprietary articles containing the poisons mentioned in the Pharmacy Acts to chemists and druggists, and also the sale of homœopathic preparations containing poisons. He considered it was an injustice to the trade that any grocer or draper should be free to sell homœopathic preparations under the names of opium, aconite, arsenicum, belladonna, and so on. The question should be investigated to find out if they really did contain the poisons whose names they bore. If so, the sale ought to be restricted to qualified persons.

Dr. Symes thought there was some room for action with regard to patent medicines. In France, a formula of all patent medicines had to be given on the medicine itself, and though he should scarcely advocate going as far as that, he thought it might safely be represented to a Government which professed to legislate for the benefit of the public that, if patent medicines contained poison, the fact should be stated on the label of each packet or parcel, together with the nature and quantity of the poison so employed. If that were done he would then propose that the patent medicine stamp should not prevent the operation of the Pharmacy Act with regard to the sale of poisons; but it was first of all necessary to have a provision requiring the makers of patent medicines to state if they contained poisons. There was a case lately of a person asking for an ounce of laudanum in a grocer's shop and being informed that the shopkeeper could not sell one ounce, but that she could sell two ounces, and it was supplied in a bottle covered by a patent medicine stamp for 8*d*. The stamp in that instance appeared to relieve her from all responsibility, though he doubted if it really did so. However, when the matter came before the magistrates the case was dismissed on the ground that the patent medicine stamp protected the seller.

Mr. Hampson thought if the Pharmacy Act were looked fairly into it was strong enough to cover this question to a certain extent, and that they were somewhat under a mistake in supposing that patent medicines were without the action of the Pharmacy Act. It was a wide subject and ought to be looked at in all its bearings. If they were to bring all patent medicines under the operation of the Pharmacy Act, they would have to label almost every cough mixture "poison," and there were other strong liniments which would have to be labelled in the same way and, in fact, were done so. It would be almost impossible at that meeting to arrive at a proper conclusion on this subject. They could simply complain that they were suffering from unfair competition in a manner they did not anticipate and that the public were not protected, because aconite, chloral, morphia, prussic acid and almost every poison in the schedule could be obtained in the form of a patent medicine. He believed if they attempted to carry out the Pharmacy Act with regard to patent medicines they would be landed in a dilemma.

The Secretary said that some time ago he made a special journey with the object of obtaining from a general dealer some homœopathic preparations of poison, and he asked him for arsenicum and aconite tincture, No. 1. He told him he did not keep No. 1 or No. 2 and he was supplied with No. 3, but when this was placed in the hands of a competent analyst he reported that the tinctures contained no trace whatever of the active principle.

Mr. Pollard thought the first of Dr. Symes's propositions would obviate the second, that if patent medicines containing poison were to have the quantity of poison marked on them, he did not see how the public would be more protected by buying them of a chemist than of a grocer. If the nature of the poison and the dose were stated, the Legislature would probably think the public were sufficiently protected. The extra protection in the case of chemists selling laudanum was this, that a chemist felt a certain responsibility; but would chemists undertake the responsibility of selling patent medicines made by proprietors who might be navvies, for there was a very popular patent medicine in his neighbourhood which was made by a navvy? He thought if they were to move in that direction, the Legislature would come to see that after all there was no necessity to restrict poisons to chemists at all, and that if they made it a general rule that the dose should be stated on the label, laudanum might even be sold by the Lincolnshire village hucksters, and they would lose rather than gain.

Mr. Mackenzie suggested that it would be wise to let the matter rest a little and see what was done in the new Pharmacy Act which was in preparation.

Mr. Barnard Smith, having spoken at some length on the evils arising from co-operative stores, suggested that chemists themselves should form a co-operative institution, and moved a resolution that the Executive Committee be requested to take up this matter.

The motion was not seconded, and therefore fell to the ground.

Mr. Haffenden said that very frequently medical men put the active ingredient of a prescription under some unfamiliar name so that the patient might not recognize it, and he thought it would operate to the disadvantage of the vendors or proprietors of patent medicines if they were stated to contain poison.

Mr. Whitfield said the question of patent medicines presented itself under two aspects, the financial and the moral. They all did their best to make a living and also to satisfy their consciences that they did their duty; so long as the patent medicines brought in the orthodox 1*s*. 1½*d*. the moral consideration was in abeyance, but now that everybody was selling them at 10½*d*. the moral question revived, and they began to think whether they were doing right. He felt sure that many of them were ashamed of the whole trade and would be glad to give it up, and they all had it in their power very largely to discredit the sale of these medicines.

Dr. Symes said the question of dispensing would not be affected by what he proposed, and whatever reform was to be brought about some vested interest would suffer. He thought their interests in this matter were very small compared with the fact that the patent medicine trade was drifting largely out of their hands, and they should therefore put forward some effort to save it. The only part they could save was those containing poison, and before they could do that they must have some means of showing they did contain poison. He had only brought forward the matter for discussion to elicit the opinion of members upon it.

Mr. Urwick said at the present time they were under a cloud owing to the fearful depression of trade, but if they only had a little patience the competition amongst co-operative stores would, he believed, gradually destroy them, and the legitimate trade of the grocer and the chemist would return. Hitherto the division of labour had been demanded by civilization, and he believed that would have to be the rule in future. There had been great depression, and men had been obliged to look around and reduce their expenditure as far as possible. For this purpose they had co-operated, but he believed these stores would be found to be failures in the long run. He knew that some stores were making a loss of 10 to 11 per cent on their groceries, and they made it up by a profit on bad wines.

Mr. Mackenzie, in corroboration of this view, said he had recently had a conversation with a gentlemen connected with the Civil Service who told him that he had given up dealing at the stores, because he found there

was too great a variety of articles there and too little choice.

Mr. Windle looked on the thing as being neither the better nor the worse for being a patent medicine, and only the other day he dispensed a prescription containing two patent medicines. They should first try to get the legitimate drug trade back by preventing the stores dispensing, and after all he did not think they lost much by the patent medicines. He advised gentlemen not to sell under price, and also recommended a more friendly feeling with regard to the Pharmaceutical Society. Those who complained that it did not do all that it ought should not stand aloof, but should join the Society and attend the meetings.

The Chairman said he was very glad to have had this free expression of opinion by gentlemen present, and they might be quite sure the new Executive would give due regard to what had been put before them. Some very excellent points had been made to-day, and it was only at these large meetings that they could obtain information as to the general feeling of the trade. He was glad to have heard what had been said with regard to patent medicines, and he would remind them that one of the planks of their platform was an amended Pharmacy Act to prevent the sale of poison by unregistered men under cover of the patent medicine stamp, so that they might feel sure that that would not be neglected. They were all delighted at the resolute action of the Pharmaceutical Society, which had their hearty sympathy in the work in which it was engaged in putting down co-operative trading. They were proud of its success in that matter, and hoped it would go forward with the appeal, and that the result would be to establish firmly the exclusive right of chemists to vend medicines.

Mr. Urwick proposed a vote of thanks to the Chairman, which was seconded by Mr. Westrop, and carried unanimously.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, May 15, Mr. Warren De La Rue, President, in the chair.

The minutes of the previous meeting were read and confirmed.

The following certificates were read for the first time:—C. J. Wilson, G. S. V. Wills, W. H. Kerr, G. R. Tweedie.

The President then called on Mr. WARINGTON to read a paper on—

Nitrification. Part II.—A. Müller was the first to advance the opinion (*Chem. Soc. Jour.* 1873, 1267) that nitrification is due to the action of a ferment. Schloesing and Müntz proved this to be the case (see Part I. of the author's paper), and from recent experiments show that soils which induce nitrification have this power destroyed by exposure for one hour to 100° C., and that ordinary moulds and mycoderms injure rather than promote nitrification. The author also mentioned that the above experimenters were at present engaged in an attempt to isolate and cultivate the organism, which promised good results. The objects of the author were to ascertain the influence of light, temperature, variations in the composition and concentration of the solutions on the process of nitrification, the rate at which it progresses and the relation of the nitric acid produced to the ammonia consumed. In nearly every case exposure to light prevents nitrification, and in all cases the exposure hindered the process to a marked extent; the mould which develops in a solution containing tartrates is incapable of effecting nitrification. The presence of carbonate of calcium seems to be indispensable to the growth of the ferment. The author points out the significance of this fact as explaining the absence of nitrites and nitrates in soft peaty waters, and as bearing on the utility of applying lime, etc., to peaty soils rich in nitrogen in a form unfavourable for absorption by plants. A very small amount of organic carbon is requisite.

An extensive series of quantitative experiments is given as to the effect of temperature. The upper limit of temperature at which nitrification takes place has not been determined, 40° C. is, however, fatal to the process, which can proceed at 10° and probably at still lower temperatures. In all cases there is a period after the addition of the ferment during which no appreciable effect is produced; this period the author terms the period of incubation. This period is considerably shortened by increasing the temperature; thus in a solution containing 640 milligrammes of AmCl per litre, the period was at 10° 78 days, and at 30° 19 days. As the solutions become stronger the period increases; thus in a solution containing 80 milligrammes the period was only 31 days at 10°, and 12 at 30°, instead of as above 78 and 19. The presence of bacteria does not promote nitrification. The author discusses the interesting question why in some cases nitrites and in others nitrates are produced. When the ammonia disappears, before the nitrous acid is converted into nitric acid, the nitrites left in solution are very stable; if, however, the oxidation of nitrites sets in before the ammonia has been consumed, nitrates are formed with great rapidity. In no case is the whole of the ammonia obtained as nitric acid. Some experiments were made as to the part played by the heating effect of the sun's rays in preventing nitrification, as a temperature of 40° was proved to be fatal. It was found that a solution sheltered partially from the heat by a screen of alum solution, but fully exposed to the light of the sun, nitrified sooner than a similar solution exposed to the heat and light; in both cases nitrites were formed which were very permanent. The paper concludes with some interesting experiments on the conversion of nitrites into nitrates by the ferment; this change apparently takes place only in the dark, and a ferment which is quite competent to convert ammonia salts into nitrites is apparently not necessarily competent to convert the nitrites into nitrates; some solutions, however, which are nitrifying seem to possess this power in a high degree. The progress of nitrification is not uniform; it begins slowly, increases in rapidity and after reaching a maximum again diminishes. The strongest solutions nitrified by the author contained 180 parts of nitrogen per million.

The President said that the author had investigated the subject with great acumen. It was interesting to observe that the process might produce either nitrites or nitrates.

Dr. Wright then read a paper on—

The Alkaloids of the Veratrum Family. Part III. By C. R. A. WRIGHT and A. P. LUFF.—Alkaloids of *Veratrum album.*—The authors have examined the alkaloids extracted from 12 kilos of dried roots, by percolating with alcohol acidified by tartaric acid (1 part per 200 of roots), evaporating to a small bulk, addition of water, filtration from resin, and treating with a slight excess of caustic soda and ether. After repeated washing with ether, an insoluble precipitate was left, which seemed to consist principally of a base hitherto undescribed; this the authors name pseudojervine, $C_{29}H_{43}NO_7$. It is snow-white and melts at 299°, crystallizing anhydrous from alcohol. With sulphuric acid it gives a yellow solution, gradually turning green. The ethereal solution contains, besides small quantites of pseudojervine, several other alkaloids which can be separated by shaking the crude ethereal solution with aqueous tartaric acid and treating the mixed tartrates with soda and a smaller bulk of ether; a residue is left containing pseudojervine, an amorphous alkaloid, named by the authors veratralbine and jervine. Jervine, $C_{26}H_{37}NO_3$, forms a sulphate almost insoluble in hot and cold water; it crystallizes with two molecules of water, melts at 239° and gives with sulphuric acid the same colours as pseudojervine; the sulphate of pseudojer-

vine is, however, tolerably soluble in water. The second ethereal solution deposits on spontaneous evaporation crystals of jervine mixed with another base, which forms a readily soluble sulphate ; this base gives with sulphuric acid a red coloration, hence the authors suggest the name rubijervine. It melts at 237° and resembles in many respects pseudojervine ; forms well cystallized salts and crystallizes anhydrous as $C_{26}H_{43}NO_2$. The ethereal mother liquor of these crystals dries up to a varnish consisting chiefly of veratralbine, $C_{28}H_{43}NO_5$; a small quantity of another base is present, yielding veratric acid on saponification ; the mixture of veratralbine and this base is powerfully sternutatory, but this property is lost by boiling with alcoholic potash ; hence it is probable that the sternutatory constituent is veratrine (Couerbe). Neither jervine, pseudojervine, rubijervine nor veratralbine excite sneezing. Veratralbine gives with sulphuric acid a red coloration resembling that given by cevadin and veratrine. No evidence of saponification or other decompositions was obtained on boiling these bases with acloholic potash, the minute quantity of supposed veratrine excepted.

Dr. WRIGHT then read a paper on—

The Alkaloids of the Veratrums. Part IV. Alkaloids of Veratrum viride.—On treating about 18 kilos of dried roots precisely as described in the foregoing paper, the first treatment with ether left undissolved some pseudojervine; the tartrates obtained from the ethereal solution yielded no veratralbine, but jervine crystallized out from the second ethereal solution on standing; traces of rubijervine were observed. The ethereal mother liquors dried up to a powerfully sternutatory amorphous mass, closely resembling the "veratralbine" similarly obtained from *V. album* roots ; it gave on analysis, however, $C_{32}H_{49}NO_9$, the formula of cevadine, and on saponification it yielded about the theoretical quantity of cevadic acid with a trace of veratric acid. The following table represents the approximate yield of the different bases from the two roots per kilo:—

	V. album.	V. viride.
Jervine . . .	1·30	0·20
Pseudojervine .	0·40	0·15
Rubijervine . .	0·25	0·02
Veratralbine. .	2·20	trace
Veratrine. . .	0·05	less than 0·004
Cevadine. . .	apparently absent	0·43
	4·20	0·80

The jervine and pseudojervine from *V. viride* agreed in melting point, properties, analytical numbers, etc., with the specimens obtained from *V. album.*

Dr. Wright then read a third paper on—

The Alkaloids of the Aconites. Part IV. By C. R. A. WRIGHT and A. P. LUFF.—Japanese aconite roots.—The authors have examined two different batches of roots, treating them with alcohol acidulated with tartaric acid, evaporating, adding water, making alkaline with solution of sodium carbonate and then shaking with ether. Repeated treatments with ether failed to dissolve all the alkaloid present, some being obstinately retained by the alkaline fluid ; this appeared to be non-crystalline. The ethereal extract, after purification by shaking with aqueous tartaric acid and treatment of the crude tartrate solution with soda and fresh ether, gave by spontaneous evaporation crops of crystals; crops were fractionated and recrystallized All gave numbers indicating the formula $C_{66}H_{88}N_2O_{21}$. Treatment with hot concentrated tartaric acid failed to produce any change in the analytical numbers, whence the authors conclude that the substance is not a mixture of two bases $C_{33}H_{45}NO_{11}$ and $C_{33}H_{43}NO_{10}$. The authors have named this base japaconitine ; it melts at 185°–186° and closely resembles aconitine ; on saponification it splits into benzoic acid and a new base, japaconin. Japaconin closely resembles aconin, but on treatment with benzoic anhydride it forms a tetrabenzoylated instead of a dibenzoylated derivative ; a tetrabenzoylated body is also formed by heating japaconitine with benzoic anhydride, aconitine giving a dibenzoylated body. The authors adopt the following view as to the constitution of japaconitine, admiting the existence of a base—

$$\left\{ C_{26}H_{39}NO_7 \right\} \begin{matrix} -O(C_7H_5O) \\ -OH \\ -OH \\ -OH \end{matrix}$$

having H_4 more than aconitine and constituted like aconitine and pseudaconitine, the base $C_{66}H_{88}N_2O_{21}$ would be the triapoderivative of this hypothetical base thus—

$$\begin{matrix} (C_{26}H_{39}NO_2)-OC_7H_5O \\ | \quad \diagdown \\ O \quad\quad O \\ | \quad\quad\; O \\ C_{26}H_{39}NO_2-OC_7H_5O \end{matrix}$$

Japaconine would thus be—

$$(C_{26}H_{39}NO_7)=O \begin{matrix} \diagup OH \\ \diagdown OH \end{matrix}$$

Japanese aconite roots have already been examined by Paul and Kingzett, who isolated a crystallizable base from a small quantity of roots which gave them numbers on combustion compatible with the substance being either pseudaconitine or japaconitine. Unfortunately the small yield did not enable them to fix its molecular weight by an examination of the gold salt, and consequently they adopted the formula $C_{29}H_{43}NO_9$ from combustions and nitrogen determinations by volume. Their description of the base as not forming crystallized salts would rather indicate that it was pseudaconitin ; on the other hand, on boiling with dilute sulphuric acid a solution was obtained which reduced Fehling's solution. This reaction does not occur with pure pseudaconitine, although aconitine and japaconitine yield saponification products capable of reducing Fehling's solution.

In an appendix to the foregoing paper C. R. A Wright and A. E. Menke describe experiments made to isolate, if possible, the hypothetical parent base referred to in the previous paper. One hundredweight of roots was worked up without adding any tartaric acid to the alcohol, to prevent, if possible, dehydration. The crystallizable base obtained was separated into several fractions, but all these gave the formula $C_{66}H_{88}N_2O_{21}$, so that if the supposed parent base really exists in the roots, it must be much more easily dehydrated by heat, etc., during extraction than either aconitine or pseudaconitine. In this and the other batches of roots extracted, the authors confirm the observations of Paul and Kingzett as to the yield of alkaloids from Japanese aconite being nearly three times as great as that obtained under similar circumstances from a good commercial sample of *Aconitum napellus.* The crystallized japaconitine equals about 1 gram per kilo, and the total yield of alkaloids being about 2 grams per kilo, besides which about 1 gram of amorphous bases is retained in the alkaline liquors after repeated treatment with ether.

Mr. Kingzett said that the Japanese aconite roots examined by Dr. Paul and himself were given to them by Mr. Holmes with a view to determine what alkaloids they contained, and whether their composition agreed with that of the alkaloids from other aconite roots. As a result of their investigation they obtained a small quantity of a very pure alkaloid, quite crystalline, which had undoubtedly the formula $C_{29}H_{43}NO_9$. The nitrogen was determined by volume, a process which in his opinion was more accurate than the soda lime method. He could not agree with Dr. Wright in considering the formula wrong, though the base did not form crystallized salts. On a previous occasion, Dr. Wright had stated that their alkaloid was pseudaconitine. This statement was now withdrawn. They had obtained conclusive evidence of the existence of two alkaloids.

Dr. Wright, in reply, said that he was not convinced as to the identity or otherwise of his alkaloid and the one obtained by Paul and Kingzett. From the data given by the

above authors he had stated that the properties, etc., of their alkaloid agreed with those of pseudaconitine, and he still held to this statement; he had only withdrawn it as far as his own alkaloid was concerned which was certainly not pseudaconitine. He did not dispute the accuracy of nitrogen determinations by volume, but if only 2 per cent. of nitrogen was present, the method was not delicate enough; the only plan was to obtain gold or platinum salts.

The next paper was read by S. U. PICKERING—

On the Action of Hydrochloric Acid on Manganese Dioxide.—The principal object of this paper is to criticize the conclusions drawn by Mr. W. W. Fisher, in a paper "On Manganese Tetrachloride" (*Chem. Soc. Jour.*, September, 1878). The only conclusion at which the author arrives in common with Fisher is that when manganese dioxide is treated with cold concentrated hydrochloric acid it dissolves, forming a dark brown liquid which evolves chlorine slowly at ordinary temperature and more quickly when heated. The main points in Fisher's paper are stated by the author to be:—that from the liquid obtained as above, water always precipitates a definite substance which is manganese dioxide; that the ratio which the precipitated manganese bears to the loosely combined chlorine of the higher chloride from which it is precipitated is as 1 : 2 atoms; and that this higher chloride is $MnCl_4$. The experiments, details of which are given in the present paper of forty-two pages, prove in the author's opinion conclusively, that from a solution of manganese dioxide in cold hydrochloric acid water does not precipitate a definite substance; that the substance precipitated is not manganese dioxide, but a mixture of the dioxide with the sesquioxide in variable proportions; that the ratio which the precipitated manganese bears to the available chlorine of the chloride from which it is precipitated is not 1 : 2 atoms; that the higher chloride produced in not $MnCl_4$ but Mn_2Cl_6. The author in conclusion sums up briefly the main points proved in his paper as follows:—When a solution of manganese dioxide in strong hydrochloric acid is diluted with water, a mixture of oxides is precipitated which is indefinite in composition, varying between $30MnO_2,5MnO$ and $36MnO_2,5MnO$. The manganese contained in this precipitate as dioxide bears to the loosely combined chlorine of the higher chloride from which it is precipitated, the ratio 1 : 2 atoms. The total manganese precipitated therefore bears to this chlorine the ratio of about 1 : 1·74 atoms. When the solution of the dioxide is performed in weaker acids the amount of the higher chloride formed is not appreciably diminished; an increase in the actual amount of the aqueous acid employed for the solution is prejudicial to the stability of the higher chloride formed. The solution of the dioxide and sesquioxide by hydrochloric acid and the subsequent decomposition of the sesquichloride being represented by the following equations—

$$(1)\quad Mn_2O_3 + 6HCl = Mn_2Cl_6 + 3H_2O$$

$$(2.)\quad 2MnO_2 + 8HCl = Mn_2Cl_6 + Cl_2 + 4H_2O$$

$$x \left\{ Mn_2Cl_6 + 2H_2O = MnO_2 + MnCl_2 + 4HCl \right\}$$

$$y \left\{ Mn_2Cl_6 + 3H_2O = Mn_2O_3 + 6HCl \right\}$$

$x : y$ being usually as 6 to 1.

The Secretary then read—

A Preliminary Note on some Reactions of the Ammonio-Chloride of Magnesium known as Magnesia Mixture. By H. D'ARCY POWER.—The author has observed that most potassium and some sodium salts precipitate magnesium hydrate from a solution of ammoniochloride of magnesium. Potassium iodide possesses this property in a marked degree. Thus the addition of 15 c.c. of a 10 per cent. solution of potassium iodide with 10 c.c. of ammonia to 5 c.c. of magnesia mixture (prepared by dissolving 5 grams of magnesium oxide in 40 c.c. of hydrochloric acid and then adding 60 c.c. of ammonia and filtering), after standing twenty-four hours gave a precipitate which when washed and ignited weighed 0·046 gram; it was pure MgO; so that 46 per cent. of the total MgO was precipitated. Potassium bromide gave under similar circumstances a precipitate weighing 0·002 gram. Further results are promised.

The two following papers were taken as read:—

The Composition of Cow's Milk in Health and Disease. By A. WYNTER BLYTH.—The results of this research are the separation of two alkaloidal bodies as normal constituents of milk; the separation of a substance, probably a glucoside derived from plants, etc., eaten by the cow; a quantitative estimation of the different constituents of milk; analyses of samples of milk derived from cattle in an unhealthy tate. In the separation of the milk alkaloids, a litre of milk is divided into three equal parts, to one of which a litre of water is added; the caseine is precipitated in a flocculent condition by the cautious addition of acetic acid and finally by passing carbonic acid; a clear yellow whey is thus obtained, which is separated by decantation and filtration, and used to precipitate the second portion. The whey from this is similarly used to precipitate the third portion of milk. The yellow whey is boiled and filtered to get rid of albumen, and to the filtrate an excess of the solution of nitrate of mercury used for urea estimation is added. The precipitate which falls contains the two alkaloids, with albumen and urea, as mercury compounds. It is washed and decomposed with sulphuretted hydrogen, etc. The first alkaloid, which the author proposes to call galactine, is thrown down by acetate of lead. Galactine is a white, brittle, neutral, tasteless, non-crystalline mass, soluble in water, insoluble in alcohol; it is precipitated by Sonnenschein's and Scheibler's reagents. Excess of lead used to precipitate the galactine is removed and nitrate of mercury added, which throws down an alkaloidal colouring matter, lactochrome; the empirical formula of the mercury salt is $HgOC_6H_{18}NO_6$. Lactochrome is a bright red-orange resinous body softening at 100°, soluble in water and hot alcohol. In addition to these alkaloids the author has separated two substances CH_3O_5 and $C_3H_3O_4$ reducing copper solution which he regards as decomposition products of one substance and as derived from food eaten by the cow; they are obtained by precipitation with ammonia and tannin after separating the above alkaloids. The author gives the following as the average composition of healthy cow's milk:—Milk fat, 3·50 per cent. (oleine, 1·477; stearin and palmitin, 1·75; butryrin, ·270; caproin, caprylin and rutin, ·003); casein, 3·93; albumen, ·77; milk sugar, 4·00; galactine, ·17; lactochrome, not determined; bitter principle, 0·01; urea, trace; ash, ·70; (K_2O ·1228, Na_2O ·0868, CaO ·1608, Fe_2O_3 ·0005, P_2O_5 ·1922, Cl ·1146, MgO ·0243); water, 86·87. As regards milk from diseased cows the author concludes that a cow suffering from even very acute disease may give milk differing in no essential feature from normal milk, whilst local affections of the udder may often be easily recognized. Analyses of milk from cows suffering from mammitis, pneumonia, phthisis, etc., are given.

Notes on the Effect of Alcohol on Saliva, and on the Chemistry of Digestion.—By W. C. WATSON. The author finds that ptyalin is more rapidly or effectually precipitated from simple aqueous solutions than from saliva. The separation is aided by heating to 100° F. 18 grams of absolute alcohol added to 200 grams of saliva and 10 grains of starch, produced in an hour less extractive matter by about one-quarter than a similar mixture containing no alcohol; a similar reduction in the quantity of sugar produced was also effected by the addition of alcohol. The author made some experiments as to the effect of slightly acidulating the mixture of starch and saliva with hydrochloric acid. He arrived at the following conclusions:—By the addition of a small amount of acid the action of the saliva is decidedly increased, while the retarding influence of alcohol is not lessened by the

presence of the acid. He points out the bearing of these experiments on the process of digestion in the stomach where the starchy matters and saliva are mixed with the gastric juice. During the reading of the last three papers, Dr. Gilbert took the chair.

The Society adjourned to June 5, when the following papers will be read:—On Gardenine, by Dr. Stenhouse and Mr. Groves. On the Theory of Fractional Distillation, by F. D. Brown. On the Action of Organic Zinc Compounds on Quinones, by F. R. Japp. On Chlorotannic Acid, by J. W. Mallett. On Indigopurpurin and Indirubin, by E. Schunck. Third report to the Chemical Society on some Points in Chemical Dynamics, by Dr. Wright and Messrs. Luff and Rennie.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, May 15, Mr. R. H. Parker, Vice-President, in the chair.

After the reading of the minutes,

Mr. F. W. Warrick read a paper on "Avogadro and Ampère's Law."—This law or theory was first brought forward by Amedeo Avogadro, an Italian chemist, in 1811, when discussing the law of Gay-Lussac, in the following words:—"The simplest hypothesis that can be made regarding this matter consists in supposing that all gases contain equal numbers of integrant molecules," the term "integrant molecules" being used in contradistinction to "elementary molecules" or atoms. This hypothesis was revived by Ampère in 1814, who in a letter to Count Berthollet, thus writes:—"I set out on the supposition that in the case where bodies pass to the state of a gas, their particles alone are separated and removed from each other by the expansive force of caloric to distances much greater than those at which the forces of affinity and attraction have an appreciable action, so that those distances depend only on the temperature and pressure which the gas supports, and, at equal temperatures and equal pressures, the particles of all gases simple or compound are placed at the same distance from each other. The number of particles is on this supposition proportional to the volume of the gases." Ampère's particles are the "integrant molecules" of Avogadro. The author then gave a *résumé* of Clerk Maxwell's mathematical proof of this law in connection with the dynamical theory of gases. After this, abnormal densities both of simple and compound gases were noticed, and the latter were shown to be due to the phenomenon of dissociation, and an experiment demonstrating the dissociation of the vapour of sal-ammoniac was successfully performed.

A vote of thanks was passed to Mr. Warrick.

The Chairman then called upon Mr. H. Allen to give his report on organic chemistry:—

The Action of Glycerin upon some Metallic Oxides.

BY H. ALLEN.

The action exerted by glycerine upon the oxides or hydrates of the metals is of two kinds. It has, in the first place, a solvent action, especially in the presence of alkalies, and in some cases it acts as a reducing agent. Some special instances in which its action admits of use in analysis have been noticed in a paper,* an abstract of which appeared in the *Journal of the Chemical Society* for February. Thus, cadmium and copper may be separated in a solution by adding a mixture of caustic soda and glycerine. The hydrate of copper is precipitated, but redissolves in excess of the reagent, forming a deep-blue solution, while the cadmium hydrate remains undissolved. Again, in the presence of sufficient glycerin, ammonia fails to produce a permanent precipitate with solutions of iron, aluminum or chromium. With salts of the last-named metal, it is remarkable that while excess of potash produces a green solution, excess of ammonia and glycerine gives a violet solution.

The reducing power of glycerin is shown by its action on a solution of nitrate of silver in the presence of a small quantity of ammonia; on gentle warming the silver forms a bright mirror-like coating on the side of the vessel, identical with that produced by a tartrate. Indeed, glycerin and tartaric acid, as might be expected from their similarity of constitution, behave very like one another in many instances.

The action of glycerin on the peroxides of nickel and cobalt has been turned to practical account in a method given in the above-mentioned paper for the separation of these metals. When a strong alkaline solution of chlorinated or brominated soda is added to a solution of nickel or cobalt, a black precipitate of nickelic or cobaltic hydrate falls. If glycerin be now added to the precipitate without the removal of the supernatant liquid, the nickelic hydrate ($Ni_2'''Ho_6$) is at once reduced to green nickelous hydrate ($Ni''Ho_2$), while the cobaltic hydrate suffers no such reduction. To separate nickel and cobalt from a mixed solution of their salts, brominated soda is added, the solution boiled and filtered; the black precipitate is washed, and then treated with a mixture of solution of ammonia, ammonium chloride and glycerin, the whole warmed and again filtered. Any black precipitate left on the filter indicates the presence of cobalt, while nickel if present is detected in the filtrate by the addition of ammonium sulphide.

The above report was fully illustrated by experiments.

After a short discussion, Mr. W. R. Dunstan took the chair while following report on materia medica was read—

Euonymin, Iridin and Leptandrin.

BY R. H. PARKER.

The medicinal use of these substances in England is not new, but has been lately revived. They are resinous bodies, similar in composition and properties to podophyllin, and they are prepared in a similar manner, viz., by pouring the alcoholic tincture into water. They act as powerful hepatic alteratives without being such powerful intestinal stimulents as podophyllin. The dose of iridin is 4 grains, that of euonymin 2 grains, to be taken at bed-time, followed in the morning by a mild saline aperient. Their continued use produces a depressing effect upon the system.

Euonymin is obtained from the bark of *Euonymus atropurpureus* (Nat. Order Celastraceæ), which grows in the Northern and Western parts of the United States, and is known under the name of Wahoo. A neutral bitter uncrystallizable body, to which the name of euonymin may be perhaps more correctly applied, is obtained by treating the dilute alcoholic tincture of the bark with chloroform, separating the latter and evaporating. The residue is washed with ether, dissolved in alcohol, acetate of lead added, the solution filtered, excess of lead removed, and the filtrate evaporated to dryness.

Iridin is obtained from the fresh rhizome of *Iris versicolor*. It is usually mixed with liquorice, or some other absorbent powder.

Leptandrin is derived from the rhizome of *Veronica* (Leptandra) *Virginica*. A crystalline body of the same name is obtained by precipitating the aqueous infusion with subacetate of lead, filtering and absorbing the leptandrin by animal charcoal; the latter is washed with water, and then boiled with alcohol; the alcoholic residue is treated with ether, which leaves the leptandrin on evaporation.

This report, which was illustrated by numerous specimens, elicited a lively discussion.

The meeting then adjourned.

* *Dingl. polyt. J.*, 229, 542-4.

Parliamentary and Law Proceedings.

A Chemist Poisoned by Prussic Acid.

On Wednesday, May 21, Mr. Laughan, deputy coroner for Westminster, held an inquest on the body of a man named Frederick Edwards, of 58, Lambeth Walk, chemist, who met with his death under the following circumstances :—It appeared from a letter produced by his father from his wife, that the deceased had been neglecting his business for some time past, and that he left his home on Saturday evening for the purpose of committing suicide.

Police-constable 478 A stated that he found the deceased sitting on one of the seats on the Victoria Embankment in a dying state. He called a cab and had him conveyed to the Westminster Hospital, where he was attended by Mr. W. Arthur, M.R.C.S., the house surgeon, who pronounced life extinct. The *post mortem* showed that he had taken a large quantity of prussic acid which had caused his death. The chief witness in the case would have been the wife, but she also is supposed to have poisoned herself since her husband's death.

Poisoning by Chlorodyne.

On Friday, the 23rd inst., the Manchester city coroner, Mr. E. Herford, held an inquest on the body of Margaret Ann Ridings, aged 19 years. On the previous Thursday night the deceased went to the shop of a medicine vendor named Butters, in Jackson Street, Hulme, and purchased two bottles of chlorodyne, each containing an ounce and a half of the mixture. She afterwards sent a little girl for a third bottle, and it was supposed that she drank the contents of them all. Between 10 and 11 o'clock she went to the house of a friend in Clayburn Street and asked for a drink of water. Soon afterwards she became unconscious, and, although emetics were administered, she died about 11 o'clock. The chlorodyne was manufactured by Mr. H. Wilson, chemist, 19, Rusholme Road, Ardwick, and the dose was from 5 to 30 drops, according to the age of the patient and the character of the ailment.

The jury returned a verdict of "Suicide while in an unsound state of mind," and censured the husband of the deceased for his cruel treatment of his wife, and Mrs. Butters for carelessness in selling so many bottles of chlorodyne to one person.

Mr. Butters, who is not on the Register of Chemists and Druggists, has since written to the *Manchester Courier* explaining how the sales were made, and unwittingly adds to the irony of the situation by saying, "I should like to say here there ought to be greater restriction upon selling cough medicines, the same as other poisons, that the vendors and others who have to do with them may be better protected. Any child can purchase them, and be instructed what to say, as in this case."

Reviews.

Our Domestic Poisons, or the Poisonous Effects of Certain Dyes and Colours used in Domestic Fabrics. By H. Carr, M. Inst. C.E. London: Ridgeway.

This little book of some fifty pages is a part of the recent agitation of the question of domestic poisons which has occupied the columns of the daily press, and to some extent those of scientific journals. It is addressed to the public and advocates legislative interference.

After a few references to papers relating to the subject, the author commences, "That the national health is suffering from the use of arsenic and other poisons in the manufacture of domestic fabrics, to an extent little appreciated by the public." Then follows a miscellaneous discussion upon the action of poisons; persons competent to test for arsenic; its occurrence in colours other than green; how it enters the system; arsenical wall papers, distemper, lamp shades, "aniline dyes;" the symptoms of arsenical poisoning, etc. A large part of the book is next devoted to illustrative cases. A study of these cannot fail to impress the reader with the importance of idiosyncrasy in the consideration of this question. A series of replies from chemical and medical men follow, and the author concludes with the urgency of parliamentary action, and with some advice addressed to manufacturers respecting an enticing advertisement.

There are few subjects so productive of sensation as the one dealt with in this book. The public, still largely unaccustomed to balancing evidence by the quantitative method, lends itself readily to the adventurer who seeks notoriety by such agitation. The individual opinions of Stenhouse, Roscoe, C. E. Groves, A. S. Taylor, Lauder Brunton, Simon and others, will be read with interest, but it is not apparent what qualification the author posseses entitling him to address the public on this question, and we must add perusal of the book fails to reveal any. Those who have seriously thought upon the matter will not be inclined to disagree with him respecting the desirability of a thorough investigation, though they may wish to withhold their judgment as to the efficacy or necessity of governmental interference. We notice an inclination on the part of the author to make important statements without sufficient quality or quantity of evidence, which the public will doubtless magnify and extend.

For example it is said "there is frequently arsenic in distemper," and that it forms a "direct combination" with the size "liable to give off arsenic under any circumstances." Now we believe that arsenic is never used in distemper, except as a colouring agent in the form of Scheele's green. Moreover, what evidence is there that combination other than mixture takes place? and even if it did it is more than doubtful if arsenic would be liable to be given off under any circumstances, even i an allowance be made for only approximate wording. A previous agitation about arsenical wall papers practically banished all green from the walls of most houses. Is it intended in the same way to stop the use of all distemper? Indeed, if all the colouring materials alluded to in this book as likely to contain poisonous substances are to be similarly abandoned, our colours would be restricted almost to the green of non-poisonous plants and the azure of the sky. Again, we notice among the cases quoted in evidence one which was effectually dealt with in these columns at the time. We refer to the case of Halley, who was supposed to be suffering from arsenical poisoning caused by Scheele's green derived from a flock wall-paper. It was, however, pointed out in this Journal by B. H. Paul that the flock of wall-paper is woollen and is dyed and therefore does not contain the arsenical pigment.

The Medical Society of London is taking action, we believe, in regard to this subject, and it is to be hoped that other bodies may do the same. Why not a joint commission under the auspices of a prominent medical corporation or society, and say, the Institute of Chemistry? The public cannot judge in this matter, but desires to be instructed by those in whom it can place reliance. Experience teaches us that if this desire is neglected by competent men it will not be neglected by quacks. It will probably be found when such an investigation is made that instead of dividing articles into those which contain arsenic, lead, etc., and those which do not, it will be expedient to approve those which are practically harmless and to condemn those which are practically poisonous, though both may contain poison.

Harmozein: A New Chemical Round Game. Manchester: J. Woolley, Sons and Co. 1879.

"Ridentem dicere verum quid vetat?" asked the old poet, and we are sure that in the present day of hard

grinding study, a good reason could hardly be found. "Round games" have before now been put forward for the teaching of geography, history, grammar and other subjects; but we believe that to Messrs. Woolley is due the credit of opening to them the field of chemistry, or, at least, so much of it as includes the subject of chemical formulæ. Unfortunately, too much of the present teaching already tends this way; but if the pupil is to stay long with these dry bones of the science, Messrs. Woolley at any rate attempt to make the time pass pleasantly. The materials for the game consist of 210 round counters on each of which is the symbol of an element. These are dealt out in the usual way, and each player in turn endeavours to construct a graphic formula from the counters falling to his share, and if possible to enlarge one already formed. The hand is won by the player who first uses up all his counters, or who has the smallest number left, when no more formulæ can be constructed. It is evident that the player's chance of playing out his counters depends upon the counters that fall to his share representing the constituents of chemical compounds in the average proportion. This we think would be more nearly the case if even a larger number of counters for some of the more common elements were given, especially of oxygen.

Notes and Queries.

[600]. OINTMENT OF OLEATE OF LIME.—The following is a formula for the above as used in some of the London hospitals:—

℞ Oxide of Lime . . . . . ℥j.
Oleic Acid . . . . . ℥viij.

Rub them together for a short time, and then allow the mixture to stand for two hours; afterwards apply a gentle heat until all the oxide of lime has dissolved. On cooling it generally acquires a stiff consistence which is prevented by the addition of one ounce of vaseline.

Norwich. W. Watson Will.

[603]. LOCOCK'S LOTION FOR THE COMPLEXION.—Would any one kindly give me the receipt for "Locock's Lotion for the Complexion?"

W.

[604]. MASTIC SOLUTION.—I lately received an order from a surgeon-dentist to make him a quantity of mastic solution, which I accordingly did in the proportion of mastic 2, chloroform, by weight, 1. My customer returned it in a few days, stating that it was useless for the purpose of tooth-stopping, that he could not manipulate with it, as it clung to the instruments, etc., like bird-lime, and informed me that certain wholesale houses send out a mastic solution of about the same consistence, but which is quite free from that objection. Would some reader kindly suggest a remedy? Statim.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[286]. With respect to this prescription, I may say that I have had to dispense one very similar to it, signed H. A. L. at foot, but it did not turn it out to my satisfaction, owing to the gum separating when the aqua was added, and as I did not consider myself justified in adding mucil. acaciæ (as A. P. S. suggests in the last number of the *Pharmaceutical Journal*), I put on a "shake the bottle" label.

I hear, though, that a chemist at Swansea dispenses it in a presentable manner and to the satisfaction of the prescriber.

Perhaps the dispenser may cast his eye upon this paragraph and may give us the benefit of his experience. Certain it is, if the chemist uses mucilage of any gum, the medical man should be informed of it, so that in future he might add to his prescription the quantity required to emulsify the gum assafœtida.

Punjaub.

[287]. In reply to "Cortex," in the Journal of the 10th, I should have dispensed the pil. digitalis et scillæ of the Edin. Ph., 1841, which is the following:—

℞ Digitalis,
Squill . . . . . āā 1 part.
Aromatic Electuary* . . . . . 2 parts.

Heat into a proper mass with conserve of roses, and divide the mass into four-grain pills.

Dose one to two pills.

Norwich. W. Watson Will.

[290]. J. F.'s prescription No 2.—I am not surprised that a girl of twelve years swallowing one drachm of ext. fil. mas. and two ounces of castor oil should be nearly killed.

The dose of castor oil was clearly too much, but the male fern was not excessive.

Prescription No. 3 is not an elegant one; but wine of iron is often ordered with cod liver oil, and the dose is moderate. Certainly there is a striking contrast between a teaspoonful or so of cod liver oil, and two ounces of castor oil for a dose; but I am at a loss to know how any prescriber can reconcile the homœopathic ointment (1 gr. of hyd. ox. rub. to ℥j of lard) with the very large dose of castor oil.

Hy. Brown.

[291]. R. E. is justified in asking, Is it usual to prescribe 10 grains of ferrous sulphate? It is not; and, besides, such a large dose is certain to disagree with the patient. The excessive doses of 20 to 30 grains of potassium iodide are equally injurious and uncalled for. The human system cannot assimilate, so to speak, such excessive quantities, and when repeated three times a day they do harm, and the object of the physician or surgeon is defeated. But when such doses are not actually poisonous, although excessive, the dispenser is absolved from blame in calling attention thereto.

Hy. Brown.

[292]. R. E. asks what is meant when solution of camphor is ordered in a prescription? The prescription given orders ℥ij solut. camphor., ℥vj water, ♏ x spt. chloroform. and grs. x potassium bromide, for each dose. It is quite clear spirit of camphor is not meant or intended, and as the B.P. calls the aqua camphoræ by the name "solution" it should have been employed. Murray's fluid camphor is camphor dissolved in solution of magnesia, and it is not entitled to be used, as was done. Again, if the prescription was an American one,

* *Edin Ph.*, 1841:
Electuarum Aromaticus—
℞ Pulv. Aromat. . . . . 1 part.
Syrup. Cort. Aurantis . . . . . 2 parts.
Misce.

Edin. Ph., 1841:
Pulvis Aromaticus—
℞ Cinnamomi Pulv.,
Sem. Cardamomi Pulv.
Zingiberis Pulv. . . . . equal parts.
Misce.

R. E. should have made the solution of camphor about four times the strength of the B.P. The U. S. Pharmacopœia contains about 2 grams to the ounce, whilst the B.P. solution only contains half a grain.

HY. BROWN.

---

[292]. In my opinion, there is every probability that the prescriber meant aqua camph., when ordering solution of camphor in ℥ij doses, and to be taken three times a day. I think R. E. was certainly not justified in using Murray's Solution of Camphor, a preparation which is not official, and which is not ordered in the prescription.

J. W. BARNES.

---

[293]. Mr. Shannon puts a rather strange case, and asks, how much syrupus rhamni would be safe to give to a child nine months old? Half a teaspoonful is supposed to have killed an infant, and the coroner's jury, on the evidence of a medical man, returned a verdict that the child died from taking half a teaspoonful of the syrup.

The dose of syrup of buckthorn is 1 drachm, according to the B.P., for an adult, a quantity clearly at variance with all we know about its action. It may be given in half ounce to ounce doses, and our forefathers were in the habit of prescribing it in doses of three to four tablespoonfuls. I have failed to find any authentic case of poisoning by the syrup. That it may cause death I do not deny; but it is singular we have not one word, in any author of repute, about its poisonous action, supported by cases. Certain effects are recorded, but no deaths. I am, therefore, inclined to think the case of the child poisoned, or supposed to have been, might be explained in another way if we had all the facts before us. I should not be afraid to give half a teaspoonful to a child nine months old.

Northallerton HY. BROWN.

---

[294]. I have dispensed this prescription two or three times with particular care, knowing of the result produced by the London house, but find that in whatever way the ingredients were mixed, a very abundant precipitate is soon formed which settles very slowly. I tried both fresh and concentrated inf. calumb., but find scarcely any difference in the result.

W. W.

---

[297]. If "Chemicus" will refer to his Pharmacopœia, he will find little difficulty in knowing what to dispense when mag. pond. is ordered. Magnesia (MgO) B. P. should certainly be used, and not mag. carb. (3Mg CO_3 Mg2HO) B.P.

J. W. BARNES.

---

[298]. If W. S. C. puts the tinct. valerian. and tinct. calumb. into the bottle first, then adds the potass. iodid. dissolved in about ℥iv. of the aqua, and lastly the ferri cit. et quinæ dissolved in the remainder of the aqua, he will have a moderately bright and clear mixture free from deposit.

G. W. H.

---

[299]. It is quite evident that the prescriber has erroneously written syrup. chloral. hydrat. instead of chloral. hydrat., equal parts of which and camphor form an excellent application for rheumatic and odontalgic pains.

SUB UMBRA FLORESCO.

---

[300].

℞ Liq. Hydrarg. Pernit. . . . . ♏ xx.
Glycerini Opt. . . . . ℥j.
Aq. . . . . ad ℥x.

M. fiat gargarisma sæpe utend.

After using the above gargle twice the patient sent in great alarm to know if it had been dispensed correctly, as it took off the skin from his tongue and caused bleeding from the throat. Did any chemical action take place, and if so, what was formed?

D. H.

---

[301].

℞ Liq. Ammon. Acet. . . . . ℥j.
Sp. Æth. Nit. . . . . ℥iv.
Tinct. Camph. Co. . . . . ℥j.
Tinct. Digitalis . . . . . ℥iss.
Oxymel Scillæ . . . . . ℥j.
Aq. . . . . ad ℥vj.

Ft. mist. Take a teaspoonful every two hours.

The above when first dispensed was tolerably clear, but last time it became quite black. Will any reader kindly state the cause of the change?

D. H.

---

[302]. Can the following be dispensed without a separation of the quinine?—

℞ Tinct. Quinæ Am. . . . . ℥vij.
Sp. Chlor. . . . . ℥iss.
Tinct. Quassiæ . . . . . ℥vj.
Syr. Aurant. . . . . ℥iv.
Aq. . . . . ad ℥vj.

M. ft. mist.

APPRENTICE.

---

[303]. The following prescription was brought to me to-day from a London doctor with whom communication was not applicable. I would like to ask the opinion of my brother druggists and dispensers through the columns of the Journal whether I did right or not in refusing to dispense it as it stood:—

℞ Chloroform . . . . . ℥ss.
Liq. Opii Sed. . . . . ♏xvj.

Mist. camph. q. s. ut ft. haust. ℥j. Sumat p. r. n. si necesse sit.

Mitte vj.—O. D. G.?

N. M. GROSE.

---

[304]. As the following prescription is written, would it be right to divide the 2 grains of opium and ℈j of sugar into eight powders, or to send eight powders, each containing two grains opium and ℈j sugar? I do not want to get at the intention of the prescriber, but to what he has actually written. Personally, I have no doubt but that the former reading is correct, but one or two others here do not agree with me.

℞ Pulv. Opii . . . . . gr. ij.
Sacchar. . . . . ℈j.

Ft. pulv. No. 8. 1 omn. 3^{tis} horis.

Liverpool. R. H. M.

---

[305].

℞ Extracti Belladonnæ . . . . . ℥ss.
Extracti Gentianæ . . . . . ℥j.

M. et divide in pilulas xxx et sign. Sumat unamomne nocte.

I had this prescription handed me to dispense the other day, and I used ext. gentian. ℥ss, pulv. gentian, q. s. (about gr. xl was required). Was I justified in doing so, or should I have adhered faithfully to the prescription by using the full quantity of ext. gentian., and adding a sufficient amount of a suitable but innocent powder to form a mass, which would have resulted in pills of a large size?

SUB UMBRA FLORESCO.

---

[306]. In making Tinct. Opii B.P., ought the percentage of morphia contained in the opium be taken into account? The Pharmacopœia gives opium as containing from 6 to 8 per cent. of morphia. Is it correct to use the same amount of opium which on analysis yields from 12 to 14 per cent.?

F. J. B.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

"Dispensing Memoranda."

Sir,—I notice in a recent issue a letter from Mr. J. H. Baldock, with the above heading, and having been a subscriber to your Journal for over twelve years, I should like to be allowed to say a few words upon this subject. With all due deference to the experienced opinion of Mr. Baldock and his friends, I have no hesitation in stating mine, that to those for whom the Journal was originally intended, and by whom perhaps it is chiefly supported, its value has been more than doubled by the recent addition of the "Dispensing Memoranda" columns, and I believe this opinion will be endorsed far and wide.

I beg leave to be allowed to think that instead of medical men being shocked at the uncertainty prevailing, they will on the contrary rather find abundant opportunity for learning facts which apparently they have little other means of becoming acquainted with, as I venture to think the columns abundantly testify. I therefore, sir, express a hope that the great boon of the "Dispensing Memoranda" columns may long be continued.

4, *Wellington Square, Oxford.* F. R. Bessant.

Modified Examination.

Sir,—In answer to "Modified Associate," I think he will find that one reason why he lost the appointment was his age.

From the various advertisements for dispensers in H.M. colonies I have noticed a limit to the age (I think twenty-five years). Now, sir, "Modified" must have been twenty-one in July, 1868, therefore he will be about thirty-two now, if not more.

Going in for the "legality of the point" would be waste of your time and space.

Having passed the Modified myself, I know that the Society gives a certificate; at the same time, I grant that it is not one to boast about.

Major.

Etymology and Meaning of Dispense.

Sir,—From your impression of to-day, "Apothecaries' Society *v.* Harrison" I quote as follows: "Mr. Nathan argued that dispensing meant weighing out or apportioning of ingredients according to quantities given, and it had nothing to do with the selection of ingredients."

This is unquestionably the etymology of the word, and its etymology only; had this been its whole intent, the term, so far as we are concerned, would never have come into use. In such case the 28th section of the Act would have been, that the business of a chemist was that of buying, preparing, compounding, weighing or apportioning, and vending medicines and drugs.

You might as well confound a man with his ancestors as the meaning of a word with its etymology.

In the perusal of Mr. Nathan's argument I am forcefully reminded of one of the memorable relations of Emanuel Swedenborg, in which a company of deceased physicians and apothecaries on finding themselves desembodied and in the spiritual world are questioned as to what they know about conscience. Poor souls! after discanting largely and learnedly on the etymology of the word and expatiating themselves into cacochymia and cardialgia (indigestion and heartburn) they are nevertheless found to be absolutely ignorant of the thing itself, and apparently incapable of anything like a comprehension of its meaning.

York, May 17, 1879. Ictus Equi.

Santonin Poisoning.

Sir,—Some time ago I had occasion to administer a full dose of santonin to my dog "Twig" for worms. In about half an hour afterwards he had a fit and was quite prostrated from noon until next morning. His eyesight seemed affected and he took no notice of any one.

Some time afterwards I thought a dose for worms necessary and without attributing the last fit to santonin, I give "Twig" another dose, when he had a more violent fit than before, which however passed off without affecting his eyesight or faculties. Since then I need hardly say he has not had any more.

My object in writing is because Mr. Henry Brown seems to uphold santonin. My idea is if it produces such irritation in the intestinal canal as to cause fits it is not a good and safe vermifuge.

It may not be right for me to say this with respect to children, but for dogs I shall certainly not use it again. I have found areca nut powder in small doses (15 grains) to answer better in every way.

Middlesborough. Thomas Buck.

Good Templarism.

Sir,—Will you allow me to correct a statement made by Mr. Mackenzie in relation to the admission of ladies as members? Referring to the I. O. G. T., he says he "knows little about templary, but is informed by a gentleman connected with it that ladies filling its offices has not proved a success."

Mr. Mackenzie's informant, like himself, must know very little indeed about templary.

Why, sir, I am sure I am not overstating the case when I say to the ladies in office, to their indomitable perseverance, that the whole order owes nearly half its members.

No, Mr. Mackenzie; learn from a templar that no society is in perfect moral health that is afraid of ladies in its council chamber. An I. G. T.

R. Roberts.—(1). *Ranunculus bulbosus*; (5). *Endymion nutans*. Nos. 2, 3, 4 and 6 are correctly named.

F. Gail.—The specimen is *Claytonia perfoliata*.

T. Booley.—*Cotyledon Umbilicus*.

W. H. Lord.—Your communication has been handed to the Secretary.

J. H. Wilson is thanked for his communication.

F. J. B.—Several inquiries for the recipe have already been inserted, but have remained without an answer.

"*Blue Vitriol.*"—For some remarks on a prescription containing iodide of potassium and spirit of nitrous ether, see the "Month" in the Journal for March 30, 1878, p. 771. See also the present volume, p. 245.

"*Sub Umbra Floresco.*"—We think the subject of Dispensing Memoranda No. 219 has now been sufficiently discussed, With respect to one of the instances forwarded by you, see some remarks of the late Mr. Coulson, quoted by Mr. Wright, before p. 461, in answer to Dispensing Memoranda No. 187.

"*Fiat Justitia.*"—We do not think any useful purpose will be served by a continuation of the discussion on the admission of women to the Society. The subject may be fairly deemed to have been dealt with for the present by the vote at the meeting of last week.

G. H. E.—The Acts regulating the sale of poisons are the Pharmacy Act, 1868 (31 and 32 Vict. c. 121) and the Act to Amend the Pharmacy Act, 1868 (32 and 33 Vict. c. 117). These, together with the Additions to the Schedule of Poisons made under their authority, are printed in the Calendar of the Pharmaceutical Society and may be had of the Secretary, or the Acts may be obtained from Her Majesty's printers, Messrs. Eyre and Spottiswoode.

G. H. B.—We notice that a new work on the Aquarium, by the Editor of *Science Gossip*, is announced by Hardwick and Bogue, of Piccadilly.

PARICINE AND ARICINE.

BY DR. O. HESSE.

In reference to the recent letter from Mr. J. E. Howard, upon the Cinchona Alkaloids (p. 972), I desire to make the following detailed communication upon Paricine, with the remark that an abstract of it has already been published in 1877, in the *Berichte der deutschen chemischen Gesellschaft*, vol. x., p. 2160.

In obtaining of paricine in 1873* I commenced with its nitrate, which, as is known, is precipitated by nitric acid from the sulphuric acid solution of the cinchona alkaloids yielded by *C. succirubra*. But the preparation of the pure alkaloid from the nitrate presents great difficulty, owing to the facility with which it oxidizes. On this account I have abandoned this method of preparing the alkaloid in favour of one based upon another of its properties, namely, that paricine does not neutralize sulphuric acid. If, therefore, a moderately dilute solution of the entire alkaloids of *C. succirubra* in sulphuric acid be so far neutralized with a concentrated aqueous solution of sodium carbonate that red litmus paper is only just turned blue by it, the paricine is almost entirely precipitated. In order to free the paricine from the last traces of the other alkaloids which adhere to the amorphous precipitate it is digested at a gentle heat with excess of dilute sulphuric acid, when the paricine is left almost undissolved in the form of sulphate as a yellow mass. After the cooling of the solution this is collected and digested with soda solution, and then the alkaloid is taken up with the smallest possible quantity of ether in which it is very readily soluble.

The ethereal solution is dark reddish-brown coloured and to it is added small quantities of *pure* light petroleum spirit, which causes the formation of a dark brown flocculent precipitate, that eventually aggregates to a black brown resinous layer covering the bottom of the vessel. The addition of the petroleum spirit is continued until the solution has only a light yellow colour. After this solution has become clear it is poured drop by drop into a larger quantity of light petroleum spirit, when a yellowish white flocculent precipitate is formed, which is removed by filtration and washed with pure light petroleum spirit.

This mass is next spread out in the air in order to free it from adhering petroleum spirit, then again dissolved in a little ether and the solution once more mixed with a little light petroleum spirit, by which, as a rule, some dark coloured alkaloid is still separated. The resulting ethereal solution is again dropped into pure light petroleum spirit, when the alkaloid is obtained pure and only has to be collected.

My attempts to separate the brown resinous substance following the paricine into solution by means of animal charcoal turned out completely unfavourable, because the animal charcoal not only takes up this substance, which is a decomposition product of paricine, but also the paricine itself.

The paricine obtained in the above manner is a light, pale yellow anhydrous powder which melts at 136°. It dissolves readily in ether, true benzine, alcohol, acetone and chloroform; but is nearly insoluble in pure petroleum spirit, as well as in water.

* Liebig's 'Annalen,' vol. clxvi, p. 263.

Its composition corresponds with the formula— $C_{16}H_{18}N_2O$. It gave upon analysis as follows:—

I. 0·2778 gram, dried at 100°C., gave 0·770 CO_2 and 0·1765 H_2O.

II. 0·2538 gram, dried at 100°C., gave 0·7045 CO_2 and 0·1625 H_2O.

III. 0·2540 gram, dried at 105°C., gave 0·7000 CO_2 and 0·1595 H_2O.

IV. 0·2769 gram, dried at 100°C., gave 0·029737 N.

	The formula $C_{16}H_{18}N_2O$ requires		Found. I.	II.	III.	IV.
C_{16}	192	75·59	75·60	75·70	75·15	—
H_{18}	18	7·08	7·08	7·11	6·98	—
N_2	28	11·02	—	—	—	10·83
O	16	6·31	—	—	—	—

The material used in analysis III. had been precipitated from an acetic acid solution, then dried in the air and finally at 105° C. 0·2623 gram of the air-dried substance gave at this temperature 0·008 H_2O = 3 per cent. The formula $C_{16}H_{18}N_2O + \frac{1}{2}H_2O$ requires 3·4 per cent. H_2O.

The alcoholic solution, which as well as the other solutions of paricine is yellow coloured, shows, with $p=1$, no action upon the beam of polarized light. The alcohol used was 97 per cent. This solution had a bitter taste and a weak basic reaction.

Paricine, however, is not capable of neutralizing strong acids, as, for instance, sulphuric or hydrochloric acid. With many acids it forms amorphous salts, difficultly soluble in excess of the acid, to which I shall refer subsequently in another place.

With platinum chloride a solution of paricine in hydrochloric or acetic acid gives a yellow amorphous precipitate. This forms after drying in the air a pale yellow powder, having the composition represented by $(C_{16}H_{18}N_2O,HCl)_2 + PtCl_4 + 4H_2O$. This salt is anhydrous at 100° C.

I. 0·4055 gram of this substance, dried first in an exsiccator and then at 100° C., gave 0·0302 H_2O and upon combustion 0·0800 Pt.

II. 0·6903 gram dried at 130° gave 0·0530 H_2O and upon combustion 0·1363 Pt.

	Calculated.	Found. I.	II.
Pt	19·68	19·72	19·61
$4H_2O$	7·26	7·44	7·67

Paricine, as above mentioned, readily undergoes change, leaving a resinous decomposition product. If such a preparation be dissolved in acid and then after treatment with a little animal charcoal precipitated with excess of ammonia, it is then obtained, as a rule, as an earthy grey powder. The paricine exhibited in 1877 at Amsterdam, by the firm of Jobst, of Stuttgart, had been purified and prepared in this manner. At that time 0·2863 of this preparation, dried at 100° C., gave 0·7815 CO_2 and 0·183 H_2O, or 74·44 per cent. C and 7·10 per cent. H; consequently almost the same figures which the alkaloid purified by the above method requires.

As to the occurrence of paricine, I found it first in the bark of *C. succirubra* from Darjeeling, afterwards in almost all the barks of this cinchona cultivated in the East Indies. According to my observations it is contained in the largest quantity in the bark of the most slender branches. The further downwards the bark is collected the less of this alkaloid it contains. In the root bark from Darjeeling I could detect only traces of paricine.

I have besides found paricine in a Columbia bark and *another South American cinchona bark*, which would be placed between the Columbia and Pitayo

barks. This second bark contains, besides amorphous alkaloid and some cinchonine and cinchonidine, a large quantity of paricine.

Howard cites an opinion of Gerhardt, according to which paricine would stand in the same relation to aricine as quinoidine does to quinine and cinchonine. This opinion rests upon some experiments made by Weidenbusch, which were manifestly carried out with impure material. At all events the results obtained by Weidenbusch are all erroneous, from beginning to end, and the speculations connected with them by Gerhardt are worthless.

During my investigations I have not been able to recognize any relation between paricine and aricine. Aricine* has a composition essentially different from that of paricine, it corresponding with the formula $C_{23}H_{26}N_2O_4$. It is isomeric with cusconine and probably also with cusconidine. Under the influence of heat and strong acids aricine is indeed changed into an amorphous alkaloid, though with some difficulty, but this amorphous transformation-product possesses other properties and another composition than paricine.

Howard recalls the fact that I have mentioned as being contained in succirubra, besides paricine, two or three basic substances, and he appears to wish to connect these with aricine. These two or three basic substances, however, are derived from the diacid cinchona alkaloids, to which conquinine, cinchonine, etc., belong. Aricine, cusconine, cusconidine, paytine, quinamine, conquinamine, and paricine are mono-acid alkaloids.

Howard asserts that paricine may be an oxidation product of aricine. This opinion is based, however, only upon a misunderstanding that apparently had its origin in the fact that the substance which Howard has in his collection under the name "aricine," and which, together with its combinations, he has shown to his friends, no doubt contained already formed paricine. The investigation of this preparation carried out by his nephew, Mr. David Howard,† allows me to get a glance—and indeed a chemical glance—at it, which tells me that this aricine may be anything else, but not the alkaloid discovered by Pelletier and Corriol. In this, of course, I make the assumption that the alkaloid prepared by D. Howard is, as this chemist states, identical with that prepared by J. E. Howard. This chemist says that the sulphate of his alkaloid did not crystallize from alcohol like the sulphate actually described by Pelletier and that it probably contained paricine. I have shown that the hydriodate of aricine crystallizes with extraordinary ease, whilst the hydriodate of the alkaloid prepared and described as aricine by D. Howard does not possess this property.

For several years past "aricine" and its compounds have been shown in many private collections, partly under this name and partly under the name of cinchovatine. All these preparations which I have had the good fortune to be able to examine were as a rule mixtures, with homocinchonidine and cinchonidine as the preponderating constituents. The cinchovatine prepared by Winckler, for which I have to thank De Vrij, consisted on the other hand almost entirely of homocinchonidine. This alkaloid prepared by Winckler, to which D. Howard also refers in the before-mentioned communication, forms very fine white prisms, but contains, like all specimens of "aricine" examined by me up to the year 1876, no trace of that alkaloid.

In 1877 De. Vrij placed at my disposal his whole stock of aricine preparations which he had obtained up to that time, adding that they had not been examined by him. With the exception of two, these preparations fell into the above-named category; *i.e.* they contained homocinchonidine, etc., but no aricine.

One preparation was, on the other hand, actually aricine sulphate. The glass vessel bears the description "Sulfate d'Aricine," and therefore this preparation probably originates from a French manufactory. De Vrij added the remark that at the time (1877) he did not accurately know from whence he had obtained it.

A second preparation corresponded, on the contrary, with the alkaloid described by D. Howard. I have reason to believe that it is a specimen of the substance formerly prepared by Mr. J. E. Howard. De Vrij did not mention his name but only said that he received this aricine about thirty years ago from a friend who had prepared it by precipitation from an aqueous solution of a gelatinous sulphate. This preparation is nothing more than impure paricine.

I have formerly shown that quinamine, of which the *C. succirubra* yields a considerable quantity, passes upon treatment with one molecule of SO_3 into protoquinamicine, $C_{17}H_{20}N_2O_2$, and have suggested that probably paricine results from this decomposition product, according to the following equation:—

$$\underset{\text{Protoquinamicine.}}{C_{17}H_{20}N_2O_2} + O = \underset{\text{Paricine.}}{C_{16}H_{18}N_2O} + \underset{\text{Formic Acid.}}{CH_2O_2}.$$

This change consequently presupposes oxidation. Mr. Howard appears to consider the formation of paricine as being dependent upon a special tannin, which oxidizes to a red powder and simultaneously draws the crystallizable alkaloids within the sphere of this decomposition. That this hypothesis, put forward by Howard, does not correspond with the facts observed in India, is apparent by the examination of the bark of the slenderest branches of *C. succirubra*, since this does indeed contain besides quinamine considerable quantities of paricine, but, on the other hand, no trace of the supposed red decomposition product.

With respect to aricine, moreover, Howard thinks that it occurs not pure but impure in *C. succirubra*. Apart from the consideration that this opinion is unintelligible to a chemist, I have no hesitation in stating that I meet with no difficulty in the separation of aricine from a bark that contains it in the so-called impure condition. The fact is that *C. succirubra* does not contain the smallest trace of aricine, even in the impure condition, and that paricine is not a derivative of aricine.

Finally, as Mr. Howard expresses at the close of his communication the hope that shortly he will be able to make a communication upon the properties of aricine through an investigation of the substance, it may also be mentioned that several years ago I published a thorough investigation of aricine and its companion, cusconine, in Liebig's 'Annalen,' vol. clxxxv., pp. 296—323, where all the points were

* A specimen of bark containing aricine was about three years since imported into Frankfort. Herr Jobst obtained for me 5 kilos of this bark, the rest came to England. This bark contains 0·62 per cent. of aricine, 0·93 per cent. of cusconine, and 0·16 per cent. of cusconidine.

† *Pharmaceutical Journal* [3], v., 908.

discussed that are requisite for the recognition and characterization of both alkaloids. I do not, therefore, require to make a further investigation of these alkaloids, but I would suggest the carrying out of experiments having for their object the preparation of paricine from quinamine.

CORK, CORKS AND CORKSCREWS.

BY H. G. GLASSPOOLE.

Of all the various productions of the vegetable kingdom which man appropriates to his own use and convenience there is hardly one so universal as the bark from the cork tree, for not only is it employed in the arts and manufactures, but articles for domestic purposes, such as stoppers to bottles, etc., are to be found in all parts of civilized countries. The trees from which this substance is obtained are a species of oak, *Quercus suber*, and its variety *Q. occidentalis*, the first of which grows plentifully in the south of France, Spain, Algeria, and in some parts of Italy, the second is a native of the Atlantic side of France and Portugal, where this tree grows to the greatest perfection, and from which country we are indebted for the major part of our supply.

The cork tree bears a general resemblance to the broad leaved kind of *Q. ilex*, or evergreen oak, of which species some authors consider it only a variety, but when full grown it forms a much handsomer tree. The wood of the cork tree is of little value for constructive purposes, as it is liable to decay, and it also is said to contain an acid which destroys nails driven into it, but it makes an excellent fuel in the countries where it is grown. The value of the bark fully compensates for the inferiority of the wood. When the tree has arrived at a certain state of maturity, or twenty years,—some say earlier,—it periodically throws off its bark after it has grown a prodigious thickness and begins to clothe itself with a new one. The bark thus cast off is very indifferent and of little commercial value; to prevent this the tree is not allowed to have its own way, but the bark is artificially removed by the following process:—

In the months of July and August, when the sap flows plentifully, a circular incision is first made, a few inches above the surface of the ground, then a similar circular cut round the trunk immediately under the main branches, care being taken not to penetrate the inner bark. The portion intervening between the two cuts is then slit down longitudinally in three or four places, which divides the bark into broad sheets or planks. The tree is now left for a time so that the moisture from the sap may dry. The bark is then removed from the stem, more or less curved according to the breadth and diameter of the trees from which it has been taken. The instrument used for cutting and removing the bark from the stem is a sort of axe, the handle of which is flattened into a wedge-like shape at the extremity, which serves to raise the bark. This axe is not unlike that used in Britain for taking off the bark from the common oak. The bark grows again, and as this tree exists, according to Dr. Hamel, a hundred and fifty years or more, its disbarking takes place regularly every eight, nine, or ten years, the quality of the bark improving with the increasing age of the tree, which is not in the slightest degree injured by the process. At the first and second gathering the bark is only fit for floats for fishermen's nets and other inferior uses, it is not until the third disbarking that the substance has attained the desired perfection for the manufacture of corks. The sheets, layers or tables of cork as they are called, are now scraped on the outer surface to remove the coarser parts of the epidermis and any epiphytes or other extraneous substance. They are then thrown into deep pits, and covered with water to soften them in order to be flattened by pressure under heavy stones, after which they are dried over a fire, being frequently turned during the process to prevent their returning to their original shape.

There is also another method by which the moist pressure in pits is dispensed with and the bark is drawn flat by the sheets having their convex side placed towards the fire. In time they are considerably charred by the heat; they are then turned and charred on the other side, though in a less degree. This charring gives the material what the cork cutters call nerve, and has also the effect of closing the pores of the cork which otherwise would absorb moisture and render it useless for the purpose of stoppers, bungs, etc. Too much burning destroys its elasticity, but if not sufficiently burnt it will not be firm enough for the operations of the corkcutter's knife. The bark now undergoes a rough cleansing; it is then built up into large stacks until it is bought for exportation by the cork merchants and dealers.

The manufacture of corks into stoppers is thus described. The cork, after being pressed into square pieces, is received by the cork cutters, and if not sufficiently flat for their purpose they lay it again over the fire in their "burning yard," turning the convex part to the flame; the heat, by twisting the edges of the bark, counteracts the natural bend and flattens it out. During this operation, attention is paid to smoothing it and covering its defects with clay, soot, etc. It is next cut into slips, by means of a gauge set narrow or wide according to the size of the intended cork, bung, or tap, as the varieties are called, the last being used for stopping the tap-holes of barrels. These slips are again cut into squares of the required length. This operation is performed by one man, from whom they are handed forward to several others. The corks are further divided, according to their lengths, into short, long, and full long. The cork maker is seated before the table or plank, on which is fastened a board about 3 inches thick, 4 broad, and 12 long; immediately on a line with his left hand is a piece of wood rising about 4 inches from the board, and fixed about the middle, on which the cork is laid after being cut as above. This wood not only supports the cork and serves as a guide to the workman, but by its elevation above the board gives room for the knife to cut a part of the cork in a smooth and circular manner, without striking the table below, The piece is then turned to the point where the last cut ended, and this is continued until the knife has gone completely round; the top and bottom are then pared level, and the cork is thrown into a box or basket with others of the same length. As the bark is not of the same quality throughout each piece, the corks are sorted into superfine, fine, common, and coarse (*vide* Tomlinson's 'Cyclopædia of Useful Arts,' etc.). Of late years, however, corks have been made in vast numbers by a machine of American invention, with which a man will make more in a day than he would by hand in twenty days. The hand-made corks, however, are the best. The manufacture of bottle corks is a considerable source of wealth in the province of Gironde, which produces annually about 125,000 quintals of corks. In the district of Catalonia the annual manufacture of bottle corks, as

stated by MacCulloch, varies from 15,000 to 20,000 bales containing 25,000 to 30,000 corks each. The principal provinces in Portugal from which we receive our largest supply are Alemtejo and Algarva, from whence it is generally imported as dunnage in ships laden with wine. The best white cork is grown in France. There are large forests of cork in the French colony of Algeria, particularly on an estate granted some time back by the Emperor Napoleon III. to M. le duc de Montebello. The cork tree has been introduced successfully in the Southern States of America and might probably be grown there with profit.

The British import duty on unmanufactured cork was abolished in the year 1845, and in 1860 the duties on cork ready made and cork squared for rounding, which had been fixed in 1853 at 6*d.* per pound and 8*s.* per cwt. respectively, were repealed.

The imports of cork into the United Kingdom in 1876 were:—

Cork Unmanufactured	Tons.	Value.
From Portugal . .	6,267	£172,666
From Spain . . .	395	11,413
From Algeria . .	351	7,045
Other Countries . .	195	6,391
Total	7208	£197,515

Cork Manufactured.	Pounds.	Value.
From France .	3,174,431	£267,624
From Portugal.	2,537,175	147,975
From Spain .	927,793	72,354
Other Countries .	21,804	1,586
Total . . .	6,661,203	£489,539

Ancient Use of Corks, etc.—The cork tree, and the application of its bark to useful purposes, was well known to the Egyptians, Greeks, and Romans. The former used to construct their coffins of this material. Theophrastus, the Greek philosopher, who wrote on botany, etc., four centuries B.C., mentions this tree amongst the oaks, under the name of *phellus*, and says that it has a thick fleshy bark, which must be stripped off every three years to prevent it from perishing. He adds that it was so light as never to sink in water, and on that account might be used for many purposes. Pliny describes the tree under the name of *suber*, and relates everything said by Theophrastus of *phellus*. From his account we learn that the Roman fishermen used it as floats to their nets and fishing tackle, and as buoys to their anchors. The use of these buoys in saving life appears to have been well known to the ancients, for Lucian ('Epist. 1,' 17) mentions that when two men, one of whom had fallen into the sea, and another who jumped after to afford him assistance, both were saved by means of an anchor buoy. The use of this substance in assisting swimmers was not unknown to the Romans. By Plutarchus, in 'Vita Camilli," we are told that when the imperial city was besieged by the Gauls, Camillus sent a Roman to the Capitol, who to avoid the enemy swam the Tiber with corks under him, his clothes being bound upon his head, and was fortunate enough to succeed in the attempt. The use of cork for stoppers was not entirely unknown to the Romans, and instances of its being thus employed may be seen in Cato's 'De Re Rusticâ,' cap. 120; but its application to this purpose seems not to have been very common, or cork stoppers would have been oftener mentioned by authors who have written on agriculture and cookery, and also in the works of ancient poets. The convivial customs of those days had no connection with the bottle, glass bottles being of a much later invention. Instead of having dozens of sparkling champagne or hock, to be liberated from the bottle by the corkscrew, at their feasts, the guests filled their drinking cups of gold, silver, crystal, or beechwood from a two-handled amphora, a kind of earthenware pitcher in which their choice wines used to be kept. The mouths of these vessels were stopped with wood, and covered with a mastic, composed of pitch, chalk, and oil, to prevent air spoiling the wine or evaporation taking place. Columella, who wrote one of the earliest works on agriculture gives directions for preparing this cement. Pliny, in describing the cork tree, says it is smaller than the oak, and its acorns are of the very worst quality. He tells us the cork tree did not grow throughout Italy, and in no part whatever of Gaul. At the present day it is abundant in France, and Fee states that the acorns of *Q. suber* are of an agreeable flavour, and the hams of Bayonne are said to owe their high reputation from the pigs having fed on the acorns of the cork tree. Some ancient authors speak of the cork tree as the female of the holm oak (*Q. ilex*), and in countries where the holm does not grow, they used to substitute the wood of the cork tree, more particularly in cartwrights' works in the neighbourhood of Lacedæmon, etc.

The employment of corks for stoppers of bottles appears to have come into use about the seventeenth century, when glass bottles, of which no mention is made before the fifteenth century, began to be generally introduced. Before that period apothecaries used stoppers of wax, which were not only much more expensive, but far more troublesome.

In 1553, when C. Stephanus wrote his 'Prædium Rusticum,' cork stoppers appear to have been very little known in France, for he states that this material was used principally for soles in that country. Another author, writing about the same time, tells us that thin glass flasks, covered with rushes and straw and with tin mouths, which could be stopped sufficiently close without a cork, were used by the higher classes of that period.

We do not know when cork and corks began to be generally used in this country, but I find in that very amusing and instructive diary of Mr. Samuel Pepys the following entry:—14 July, 1666, he states, after having written to the Duke of York for money for the fleet, he went down Thames Street and there agreed for four or five tons of cork to be sent to the fleet, being a new device to make barricados with instead of junts (old cable),—but he does not inform us how the device answered. In Evelyn's time (1664), cork was much used by old persons for linings to the soles of their shoes, whence the German name for it, "pantoffelholtz," or slipper wood. The Venetian dames, Evelyn says, used it for their choppings, or high heeled shoes, to make them appear taller than nature intended they should be. The poor in Spain lay planks of cork by their bed side, to tread on instead of carpets. Sometimes they line the inside of their houses, built with stone, with this bark, which renders them very warm, and corrects the moisture of the air. Loudon relates that in the celebrated convent at Cintra (Portugal), several articles of furniture are made of this tree, which strangers who visit the convent are requested to lift in order that surprise may be excited at their extraordinary lightness. The various uses for the common purposes of every day life to which this substance is

applied are well known. Burnt cork supplies our artists and colourmen with Spanish black. It is largely used for lifeboats, for stuffing life belts, mattresses, etc., to be used at sea in the preservation of life.

Virgin cork, or the outer bark of this tree, is now very much used for window flower boxes, grottoes, etc. Very thin sections of cork are employed in the manufactory of hats; these sections are cut by steam machinery 50 to 120 plates to the inch. The shreds and parings of this substance are not wasted, but being ground into powder and mixed with melted India-rubber form the basis of many floor coverings, such as kamptulicon—the soft unresounding material which covers the floor of the reading room of the British Museum, the floors of the Houses of Parliament, and various other public and private institutions, to prevent the noise occasioned by footsteps, etc.

Cork was formerly employed in medicine even as far back as the time of Pliny, as he tells us that the bark of the cork tree, pulverized and taken in warm water, arrests hæmorrhage at the mouth and nostrils, and the ashes of it taken in warm wine are highly extolled as a cure for spitting blood. (See Plin., 'Nat. Hist.,' b. 24.) In more modern time powdered cork has been applied as a styptic, and hung about the necks of nurses; it was thought to possess the power of stopping the secretion of milk. Burnt cork mixed with sugar of lead and lard has been used as an application to piles. (See Pereira's 'Materia Medica.')

When rasped or powdered cork is subjected to chemical solvents, such as alcohol, etc., it leaves 70 per cent. of an insoluble substance called suberine. This, treated with nitric acid, yields the following products:—White fibrous matter 0·18, resin 14·72, oxalic acid 16·00, suberic acid (peculiar acid of cork) 14·2, in 100 parts.

Cork contains tannic acid, which makes it an improper substance for closing vessels containing chalybeate liquids, as the iron is in part absorbed by the cork and blackens it by forming in its substance tannate of iron. The whole of the water may thus become discoloured.

Cork is a nitrogenous substance which next to cellulose is the most important constituent of the cell wall. Cellulose, corky substance and fatty matters seem to be found in the same cell, and when the cellulose has been absorbed, the corky substance alone remains. It forms the outermost part of the cell wall, and unites the cells together. (See Balfour's 'Class Book of Botany.')

The bark of many trees resembles cork. There is a variety of *Ulmus campestris suberosa*, the cork-bark elm, which grows in our hedgerows, whose bark assumes something of the external appearance of cork in its softness and elasticity, as well as in its chemical properties; but as it does not grow to any great thickness, it is not of any value for economic purposes.

The cork tree, *Q. suber*, and its varieties, are to be found growing in many of the botanical, horticultural, and private gardens of England. It was introduced in or before 1699 by the Duchess of Beaufort, and is readily propagated by acorns.

In 'Notes and Queries,' series 4, vol. v., it is stated that in some parts of Lincolnshire it is believed that cork has the power of keeping off cramp. It is placed between the bed and mattress, or even between the sheets. Cork garters are made by sewing together a series of thin disks of this material between two silk ribbons and worn for the same purpose.

Where the bark of *Quercus suber* cannot be obtained many substitutes have been found to supply its place among the spongy bark or wood substances of other trees. The wood of *Anona palustris*, growing in the West Indies, called the alligator's apple, is of such a soft nature that it is frequently used by the negroes, instead of corks, to stop their jugs and calabashes.

The word cork is said to be derived from the Spanish *corcho*, from the Latin *cortex*.

The Corkscrew.

That useful instrument, the corkscrew, was unknown to our forefathers two hundred years ago, and was not in common use even at a later date. The mode of extracting a cork in those days was by winding a cloth or handkerchief tightly round it and with a peculiar jerk pulling the stopper out of the bottle. Other ways no doubt were also used—the teeth, for instance. There is no record that I can find as to who first invented this instrument. It came into use about the beginning of the last century, and was for many years called a "bottle screw." The earliest mention of the corkscrew is in an amusing poem, entitled "The Tale of the Bottle Scrue," in a collection of poems by Nicholas Amhurst, published in 1723 (*vide* 'Notes and Queries,' 1856, p. 466), in which the poet gives the legendary origin of the invention. Bacchus is described in the poem, and among other things it is said of him—

> "This hand a corkscrew did contain,
> And that a bottle of champagne."

Yet the bottle screw at that time appears to have been the common name of this useful article, for the poet concludes his tale with the following lines:—

> "By me shall Birmingham become
> In future days more famed than Rome;
> Shall owe to me her reputation
> And serve with bottle screws the nation."

Corkscrews, like corks, are to be found in some shape or other in all parts of the civilized world.

MICROSCOPIC EXAMINATION OF TRITURATED METALLIC AND OTHER HARD SUBSTANCES.*

BY C. WESSELHOFT.

The practically unlimited divisibility of material substances, by continued trituration, especially in presence of an inert substance, such as milk-sugar, has always been one of the fundamental claims of the homœopathic school of physicians. Starting from this hypothesis, the dilution of matter was carried to such a degree that the mind becomes incapable of conceiving the smallness of the particles which may be supposed to be present in the higher triturations. Experiments have heretofore been made by several investigators to arrive at a definite knowledge of the degree of the division of some of the remedies used in homœopathic practice, among which the observations of Dr. Mayrhofer† have perhaps the most merit. But all these experiments are more or less fallacious, either from inaccurate observations, or from the unsuspected interference of other substances, or else from the want of an unbiased judgment. The theory that the higher triturations, even of difficultly soluble or practically insoluble substances, facilitate or actually *effect* their *solubility*, had been assumed by Hahnemann to be a fact without dispute, so that even teachers of

* From *New Remedies*, March, 1879.

† 'Oesterr. Zeitsch. f. Homœop.,' i., 1844, p. 152.

authority establish the rule that dilutions (or dilute solutions) should be made from the third trituration.

In view of this state of affairs, exact experiments, free from bias and prejudice, are extremely welcome, and it is with satisfaction that we have read a pamphlet on this subject from the pen of Dr. C. Wesselhöft, in Boston,* whose statement should have all the more weight as he is a follower of the homœopathic school himself. This author arrives at results which are totally at variance with the theory, as will be seen hereafter. We abstract the most interesting portions of his pamphlet in the following:—

The chief obstacle in the examination of homœopathic triturations is the sugar of milk. It can only be removed with the greatest difficulty. Being but little and only slowly soluble in water, and very prone to crystallization, its presence often causes doubt to the untrained eye, whether a certain shining particle observed under the miscroscope is a metallic speck or a fragment of milk-sugar. The best way to conquer this enemy is to study it thoroughly, so as to be able to recognize it under all possible conditions. If we have a trituration of heavy metallic substances, as lead, gold, copper, etc., the milk-sugar may be removed by washing and elutriation. For this purpose one grain of the trituration is dissolved in a watch glass half full of water by very careful warming. The metallic particles are then deposited at the bottom and the solution may be removed with a pipette, or better, with thick filtering paper. This process must be continued from twenty-five to thirty times, but, nevertheless, small crystals of milk-sugar often still remain, while at the same time some of the metallic particles are lost.

In examining specifically light substances, such as carbon, this method of washing is useless. The best way to make the particles of such bodies visible is to place a fraction of a grain of the trituration on an object glass, to add a drop or two of water, and to warm the glass gently over a flame until a clear solution has resulted, which is to be gradually dried. This gradual drying brings the sugar of milk into a vitreous, perfectly transparent condition, which lasts as long as the water of crystallization remains in the mass. During this period a good view may be obtained of the foreign opaque particles imbedded in it. This glassy condition may continue for several days, after which the sugar crystallizes in white generally opaque bundles.

Another very good method to examine opaque particles consists in the use of ordinary good white filter paper. The fibres of this appear under the microscope white and semi-transparent, and although much interlaced, they still permit the ready passage of light. Any carbonaceous or metallic particles absorbed by it may thus be readily seen, while the sugar of milk is in this manner completely gotten rid of. If more light is wanted, a small piece of the paper is placed on an object-glass, and saturated with Canada balsam, which makes the fibres completely transparent. Canada balsam is altogether indispensable in these examinations. A crystalline mass of milk-sugar mixed with opaque particles may, by its aid, in most cases be made transparent, and the gloss of the sugar crystals at the same time destroyed, so that any foreign fragments are easily distinguished. The balsam also serves to prevent the caking and adhering together of minute particles, which is unavoidable when making aqueous solutions of metallic triturations, and thereby interferes with the correct measurement of the particles. Earlier investigations have suffered much from this error. The best method of using the balsam is to mix it with the pure substance itself, in form of precipitate or fine powder, without the presence of milk-sugar. The latter, if originally present, must be removed by washing, and the remaining powder dried. A small quantity of this powder is then transferred to an object glass, a drop of balsam placed on it, the whole well rubbed with the rounded end of a glass-rod, covered with thin glass, and examined. The particles will then be seen evenly distributed, and will appear singly, with fine metallic lustre by reflected light.

The use of the microscope in these investigations requires no modification from the usual methods. High powers are not at all necessary, as a *magnifying power of* 100 *is already sufficient to recognize the minutest particles which may be produced by trituration.* Higher powers, however, are required for making measurements, or to obtain proof of the identity of a substance. It may appear surprising that comparatively low powers are sufficient for this purpose, in view of the commonly prevailing theory of the extraordinary comminution and dissociation ("Vergeistigung") produced by protracted trituration. Experienced microscopists recognize the value of medium powers with transmitted light in examining transparent substances. The same is the case, in still higher degree, when examining opaque objects. Much smaller particles of the latter may be recognized with reflected (superior) than with transmitted (inferior) light.

The author of the paper proposed to examine chiefly the following questions:—

1. Does continued trituration of hard insoluble substances produce a progressively finer comminution and division, taking in consideration the proportion of the milk-sugar and the time consumed in triturating them?

2. Do these triturated particles become soluble, as it has been supposed hitherto; and can they be recognized in solution prepared from the third trituration?

3. May the pathogenetic, as well as the curative effects of these substances be explained, considering the attaining limits of comminution?

The author now gives the details of his experiments on various substances, the results of which are summarized in the following:—

Carbo. Wood-charcoal.

a. First Centesimal Trituration.*—It was found that the smallest particles could be recognized with a power of 100 diam. The largest had a diameter of about $\frac{1}{40}$ mm.,† the smallest $\frac{1}{1000}$ to $\frac{1}{1200}$ mm.

b. The Second Centesimal Trituration exhibited a much smaller number of particles. Still they were easily recognizable, but were found to differ much more in size. The largest measured $\frac{1}{300}$ mm., but none were found smaller than $\frac{1}{1200}$ mm. This fact was established by several repeated observations, with various modifications.

c. The Third Centesimal offered more difficulties. A large number of samples had to be examined before a single carbon particle could be found. After many futile trials, and only by careful and patient search, it was ascertained that carbon particles *are* present in this

* 'Mikroskopische Untersuchungen verriebener Metalle und anderer harter unlöslicher Substanzen.' Von Dr. C. Wesselhöft, in Boston. In: 'Sammlung wissenchaftl. Abhandl. aus d. Geb. d. Homœopathie,' 1, No. 3, Leipzig, 1878.

* One part of a substance triturated with 99 parts milk-sugar, under the observancies of certain rules, constitutes the first centesimal trituration (sometimes called the second decimal). One hundred parts of this contain 1 part of the substance.

One part of the first centesimal triturated with 99 parts of milk-sugar produces the second centesimal (or fourth decimal) trituration. 10,000 parts of this contain I part of the substance.

One part of the second centesimal triturated with 99 parts of milk-sugar produces the third centesimal (or sixth decimal) trituration. 1,000,000 parts of this contain 1 part of the substance, and so forth.

Hahnemann teaches that "*all* remedial substances triturated (according to his directions) up to the third centesimal, become soluble in water and in alcohol, a fact which is unknown to chemistry," etc. See 'Pharmac. homœop. polygl.,' p. 38.

† 1 millimetre=0·039 inches. 1 inch=25·5 mm.

trituration, perhaps *one* or *two* in the field of vision. They are imbedded in milk-sugar crystals, in which they may be plainly recognized by examining them alternately with transmitted and reflected light. The largest were found to be $\frac{1}{600}$ mm. in diameter, and none were found smaller than $\frac{1}{2000}$ mm.

As this result was somewhat unexpected, about a drachm of ordinary wood-charcoal was triturated, without milk-sugar, for three-quarters of an hour. A small quantity of this, mixed with balsam, and examined under the microscope, showed that the largest particles measured $\frac{1}{150}$ mm., the smallest $\frac{1}{2000}$ mm.

In order to see if further trituration would diminish the size of the particles, a quantity of charcoal was triturated with an equal quantity of milk-sugar with a triturating machine for *thirty* hours. Samples of this on examination showed that the largest particles measured $\frac{1}{25}$ mm., the smallest $\frac{3}{2000}$ or nearly $\frac{1}{700}$ mm.

Gold.—Triturations of *gold-leaf* of the third centesimal were found to contain particles of gold not smaller than $\frac{1}{50}$ mm. A special mixture of 1 part of gold-leaf and 4 parts of milk-sugar on trituration was found to contain particles of gold not larger than $\frac{1}{25}$ mm., nor smaller than $\frac{1}{400}$ mm. Five further triturations were then prepared from this, and even in the sixth the particles of gold were still found to vary between $\frac{1}{25}$ and $\frac{1}{400}$ mm., none smaller being observed.

Precipitated gold admits of a higher division. In the first, and even in the second centesimal the diameter of the gold particles varied equally between $\frac{1}{600}$ and $\frac{1}{1800}$ mm.

Iron and *silica* exhibit the same characteristics after trituration as the above-mentioned substances.

Copper.—Samples of precipitated copper, examined in the same manner, were found to contain particles varying in diameter between $\frac{1}{100}$ and $\frac{1}{1500}$ mm. The author here calls special attention to a possible objection which might be made, namely, that some particles may have been triturated so finely that its atoms may not be recognizable under the lens. This objection is answered by the fact that the same samples being examined in the intervals between repeated triturations, exhibited metallic particles of the same size and of the same average number as before.

Lead.—This is capable of further division than the previously mentioned metals. The largest particles measured $\frac{1}{250}$, the smallest $\frac{1}{3000}$ mm. But it was also noticed that the limit of divisibility is reached already in the first trituration.

Mercury.—On triturating this metal with much milk-sugar, no matter how long, the product will be found to contain comparatively large globules of mercury. On making a solution of such a trituration, the metal unites into larger drops. But if a minute drop of mercury, about the size of a pin's head, be rubbed for a few minutes in a watch glass with Canada balsam, and a small sample placed on an object glass be further stirred for some time, the particles of mercury will be found to be extremely small. They will appear under a low power of the microscope like a whitish cloud, almost appearing like the milky way in a starlit night. By higher powers the particles may be separately recognized, and when measured, will be found to vary in diameter from $\frac{1}{3000}$ to $\frac{1}{4000}$ mm. Oil and glycerin are likewise good vehicles, but none is as good as the balsam.

The result of all these experiments and observations is, that, contrary to the hitherto prevailing opinion, metallic and other hard insoluble substances cannot be subdivided by continued trituration beyond a certain limit. If these bodies were originally in the state of fine powder, rubbing with milk-sugar does not further divide them. In most other cases, the subdivision of particles ceases after the first trituration. The limit of divisibility depends on the proportion of the milk-sugar. The smaller a quantity of the latter is used the further may the comminution be carried. In centesimal triturations (1 of substance and 99 of milk-sugar) the effort of the pestle is mainly confined to the sugar, while the foreign substance receives but little of the power employed.

It has formerly been held that in high triturations, owing to the excessively fine state in which these bodies are present, they become completely soluble in alcohol or water. This theory must evidently be abandoned in view of the results above obtained. The author of the paper, who himself makes this announcement, further concludes that no particles of the original substance could be present in any trituration higher than the third centesimal. Hence it is impossible to make "dilutions" from such higher triturations.

As to the alleged pathogenetic or curative effects of the latter, the author acknowledges that there is great uncertainty. While it is perfectly certain that neither copper nor gold could be present in *any* dilution beyond the fifth, it is equally certain, says the author, that he obtained in sixteen healthy persons, *without any medicinal agent*, nine hundred and ninety different symptoms which certainly would have been recorded as "proofings" in the materia medica, if the experiments had been conducted in the usual manner. He advocates the total cancellation of all so-called "proofings" made with such dilutions as the 12th and over (up to the 200th) as not being based on the presence of a material substance, without which no effects can be expected.

TOMATO PRESERVING IN AMERICA.*

To the already enormous quantities of fruits preserved in tins in America for shipment to this and other countries may now be added the tomato, and it is said that in one factory alone in Connecticut as many as 1000 bushels of tomatos are used in one day. The farmers or owners of gardens seem to have undertaken the cultivation of the plant on a very large scale, and have pledged themselves to produce a certain quantity to be supplied to the packing companies. The first season's sowing of the plant was regarded quite as an experiment, many of the farmers doubting whether the contract price of 30 cents per bushel would be remunerative. The result of this experiment in cultivation proved quite satisfactory, the packing company not only taking all the fruits grown in the neighbourhood, but large quantities were also brought from New Jersey by steamer and rail. The yield on good land well cultivated has reached 400 bushels per acre, which pays fairly for a rather bulky crop. The company supply crates for the transmission of the fruits to the factory. These crates hold 1 bushel each, are open at the top, and furnished with projecting posts at the corners, so that they can be packed one crate on the top of another without damaging the fruit.

The first operation in the canning process is to scald the fruits, so as to loosen the skin. This scalding is done in a tank 6 feet long, 3 feet wide, and 2 feet deep. The water with which it is filled is kept near boiling point by steam. A sieve of iron wire fits into the top of the tank, and receives 2 bushels of tomatos for a charge. A jet of steam is turned into the water, and the tomatos remain in half a minute, when they are raised by the sieve, which turns on a hinge, and are dropped into two boxes at the lower end of the tank. The scalding tank is attended by two men and a boy distributes the fruit among the peelers within. A large number of women and girls are employed in this department. They are arranged at the sides of troughs sufficiently elevated for convenience in working; each woman has a pail and a box for the deposit of the skins and refuse; each tomato is peeled and cleaned of all decay and green around the stem. The price paid for this work is $3\frac{1}{2}$ cents per pail, and the day's work ranges, according to the skill and activity of the workwoman, from thirty to forty pails each.

* From the *Gardeners' Chronicle*, May 31, 1879.

The pails are carried by boys to the steamer, which is upon an elevated platform, and discharges into the hopper for packing. The overseer of the steamer carefully examines each pailful as it is spread out for any neglect among the peelers, and removes the unripe portion, if any is found. She also gives a check for each pailful, which the boy returns to the operative, and these checks are the certificates of the amount of labour performed. The tomatos fall from the steamer into a hopper, and into the stuffer, which is a cylinder worked by a treadle. The cans, which are quart and gallon sizes, are passed on to the packer by a trough, which is kept constantly full. The cans are filled through a hole in the top of each; measuring from 1 inch to 1½ inch in diameter; this hole is placed over the end of the stuffer, and with a slight pressure of the foot upon the treadle the can is filled, and nearly all the air and water is at the same time excluded. As some of the cans may be rather too full, while others are not quite full enough, they have to be finally regulated, which is done by girls. For the purpose of soldering, a boy fits the tin caps over the holes, the cans are placed in a tray, and these are delivered to a band of boys for final soldering: this is done at a machine, known as "Gulden's capping machine," which is described as being exceedingly ingenious and saving a great deal of labour. The following is a description of the operation :—"The can to be capped is put upon the platform of the machine. The soldering iron, a semicircular piece of iron, adjusted to the size of the cap, is immediately lowered upon the edge of the cap, which the workman turns with one hand, while he holds the strip of solder in the other, a stream of gas made from naphtha is thrown from the burner upon the soldering iron, which melts the solder and seals the can as fast as it can be turned upon the platform. Two cans are sealed every minute, when everything is ready. A boy will seal from 700 to 1000 cans in a day, and the pay is 7 cents per 100." After soldering the cans are placed in large cooking tanks and the contents cooked by steam for two hours; they are afterwards cooled and vent given to the air generated within by piercing the can with a pin, which is immediately sealed up again.

The cans are then removed outside the building to complete the cooling; this is followed by a careful examination of every can, so that there may not be the smallest defect in the soldering, the occurrence of which would soon cause the contents to become utterly spoilt. If found secure the cans are cleaned and labelled and lastly packed in stout pine-wood boxes, to be sent to their final destination.

From the skins and other rejected parts of the fruits large quantities of catsup is made. The whole mass is passed through a mill which separates the pulp from the skins. This pulp is pumped into a reservoir, and when a sufficient quantity has accumulated it is drawn off into a tank and cooked for three hours, after which it is run into barrels and allowed to ferment for one week. The pulp settles at the bottom free from impurities, the water is poured off and the barrel again filled with the tomato pulp. "It is then returned to the cooking tank and heated, the spices are added, and the catsup is barrelled and sent to market, where it is bottled and labelled and sent to the retailers."

From the foregoing it will be seen to what importance the tomato has in a short time risen.

THE VOLATILE ACID OF CROTON OIL*

BY E. SCHMITT.

Schlippe (*Annalen*, 105, 1) states that besides crotonol, $C_9H_{14}O_2$, stearic, palmitic, lauric, myristic, and oleic acids, also crotonic, angelic, and other higher acids of the acrylic-acid series, are to be found in croton oil, combined with glycerin: whereas Geuther and Fröhlich (*Zeits. Chem.*, 1870, 26 and 549) state that a liquid acid of the formula $C_4H_6O_2$ is to be found in the oil, nor can the solid acids therein contained be identified with angelic acid, but that the liquid volatile acids are acetic, butyric, and valeric acids, also a small proportion of œnanthylic acid, and perhaps other higher members of the oleic acid series. Although the solid acid has the composition of angelic acid, it is not identical therewith, but merely isomeric, as it melts at 64°, whereas angelic acid melts at 45°. Geuther and Fröhlich have named this acid *tiglic acid*, and consider that it is probably identical with Frankland and Duppa's methylcrotonic acid, as the ethylic ethers of both acids boil at 156°, and the melting-points differ by only 2°; they find, however, that the odours of the two acids are different, and that the barium salt of methylcrotonic acid crystallizes in a vacuum anhydrous, whereas the barium salt of tiglic acid has the formula $C_5H_7O_2Ba + 5Aq$. To ascertain the cause of these discrepancies the author saponified 20 pounds of croton oil, and after separating the solid soap, decomposed the brown mother-liquid with sulphuric acid, and distilled to separate the volatile acids. The distillate was then neutralized with soda, and after evaporation decomposed by sulphuric acid, and the separated acids dissolved in ether. The acids dried and submitted to fractional distillation gave distillates at 160°, 160—190°, 190—205°, 205—270°.

The tiglic acid which was contained in the fraction 190—205° was then crystallized out by the aid of a freezing mixture. Compared with that obtained by Geuther the yield of this acid was small, whereas that of the acids of lower boiling-point was larger; in fact it was found that, although the yield of volatile acids was nearly constant in all cases, the amount of the different acids present was in no constant proportion. To separate the remaining acids, the distillates were dried with anhydrous phosphoric acid, and re-distilled. The fractions collected at 115—125°, 150—160°, 168—178°, in all amounting to 15—20 grams, were the only important fractions, the remainder being insufficient for examination; propionic acid therefore was absent, or at any rate only traces were present. On applying Liebig's method of partial neutralization to each of the above fractions, the author was enabled further to separate by distillation the acids contained in those fractions. In the first, formic and acetic acids were found; in fraction 150—160°, isobutyric acid; in the third fraction 168—170°, valeric acid, contaminated with a small quantity of tiglic acid. Methylcrotonic acid, prepared according to Frankland's method, was compared with tiglic acid, and the two were found to be identical; they both crystallize in well-formed tables, having a benzoïn-like odour; in crystalline form, angles, and optical properties identical; soluble with difficulty in cold, but easily in hot water; they melt at 64°, and boil at 196—197°. The ethylic ethers of both acids boil at 154—156°, and the barium salt has the formula

$$(C_5H_7O_2)Ba_2 + 4Aq.$$

Like methylcrontonic acid, tiglic acid is decomposed when fused with potash into acetic and propionic acids with evolution of hydrogen, but nascent hydrogen has no effect on these acids. By treatment with fuming hydriodic acid, a solid acid melting at 86·5° is obtained, which appears to be isomeric with iodovaleric acid—

$$CH_3.C_2H_4C.COOH + HI = CH_3.C_2H_5CI.COOH.$$

In the same manner as angelic acid is converted into valeric acid by the action of hydriodic acid and amorphous phosphorus (Ascher, *Ber.*, 2, 685), methylcrotonic acid yields valeric acid. With bromine also it yields a dibrominated addition-product ($CH_3.C_2H_4Br.CBr.COOH$), which melts at 82—83°.

Concerning the substances contained in the fractions boiling above 200° nothing definite has been ascertained, as the amount was small, but they are probably members of the oleic series.

The Pharmaceutical Journal.

SATURDAY, JUNE 7, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary, 17, Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ELECTION OF OFFICERS BY THE COUNCIL.

THE period at which the leadership of the Pharmaceutical Society is transferred from one individual to another naturally presents a favourable and fitting opportunity for expressing appreciation of the services that have been rendered by the retiring President during his term of office. It is, therefore, with no surprise we learn from the report of the proceedings at the last Council meeting, that when Mr. WILLIAMS gave up the presidential chair to his successor a hearty vote of thanks was unanimously accorded to him upon the motion of Mr. MACKAY, seconded by Mr. SAVAGE. It has been a kind of fashion of late to make the Council of the Society a target upon which to expend the superabundant energies of enthusiastic reformers. It has been charged by some with doing the things it ought not to do and by others with not doing the things that it ought to do, and these charges have not been qualified in either case by the admission that the alleged inaction was masterly or the action necessary. Of course the President of the Society for the time being, as the head and front of the offending body, is regarded as being especially amenable to the censure of dissentient spectators, and he must accept these critical contributions as constituting, together with such laurels as he can acquire, a part of the burden of eminent official position. But after the fogs of declamation have cleared off sufficiently to admit of a retrospect of the ground travelled over during the past three years, no one who has followed the course of pharmaceutical events will be surprised that Mr. WILLIAMS should have received from his colleagues a tribute of graceful appreciation of his services. We do not doubt that expression of feeling will be shared by the great majority if not by all of the members of the Society, or that they will fail to accord him an honorable place in the roll of past Presidents of the Society.

In speaking of the conclusion of the presidency of Mr. WILLIAMS, we speak, however, of only half an event; the setting sun of the past President is attended by the first rays of his successor's; *Le roi est mort; vive le roi*; and with very many the choice of Mr. SANDFORD as a successor to the office of President will give an additional zest to the acclamation. He takes office, not as a novice, who has to be tried and proved, but, as he has said of himself, as one of the "old men" of the Society, bearing the honours of past services upon him, with a large personal experience of the Society's history and endeavours, and as one of the chief actors in the struggle to achieve what has so far been done to advance pharmacy.

There is, we think, this year a peculiar significance in the proceedings that constituted the first business of the New Council of the Pharmaceutical Society last Wednesday, which is well worthy of consideration in several respects, by all who take an interest in the future of pharmacy and hopefully watch the gradual development of the principles upon which, nearly forty years ago, it was determined that the advancement of pharmacy in this country should be worked out.

The election of Mr. SANDFORD to fill again the office of President of the Society is especially remarkable at a time when extreme radical tendencies prevail, when there is declared to be such a burning desire to abolish some things, to reform others, and generally to go a-head at any price. It shows that amidst the somewhat turbulent aspirations to make the condition of things pharmaceutical better or other than they are, there are still sober and kindly considerations of the good work that has been done, of the labourers who have devoted themselves to the task, and have, by their success no less than by their loyalty and zeal, acquired a claim to the gratitude of the entire body.

It is so superfluous to enlarge upon the services that Mr. SANDFORD has rendered to the cause of pharmaceutical progress that it would be almost an impertinence to attempt doing so; but we cannot miss the opportunity afforded by his election, of congratulating the members of the Society upon having again, for the eighth time, the benefit of his services as President. It may be that the course of events during the ensuing presidential term of office will be less troubled than of late has been the case, and that in the absence of vexatious conflicts as to class interests, there may be opportunity for introducing internal improvements, and for advancing the material well-being as well as the educational qualification of the followers of pharmacy. But however that may be, the guidance of pharmaceutical affairs will be in tried and trusty hands.

The election of Mr. SCHACHT to the office of Vice-President will, we are confident, be received with especial satisfaction, if it be only on the ground of the endeavours he has made to promote the cause of provincial education. But his election is significant inasmuch as it also indicates a disposition to look back to the past history of the Society, and practically to recognize the wisdom of the course it has pursued. Mr. SCHACHT is not, like Mr. SANDFORD, one of the fathers of the Society, but one of its children. He was, perhaps, the first to enter as a student in the School of Practical Pharmacy, where he distinguished himself in every desirable way, and gave promise of

contributing substantial material to the backbone of British pharmacy. That such promise has been amply fulfilled we have no need to insist upon more particularly. It will, however, be of interest to say that Mr. SCAHCHT is the first of the pupils of the School of Pharmacy who has occupied the position of Vice-President. In this capacity he inaugurates the establishment of a new connection between the government of the pharmaceutical body and the educational efforts by which the Society has in past times sought to raise the condition of the individual members of that body. That his ardent desire to carry forward and extend those efforts will be made manifest in every possible way during his term of office we do not doubt, and that it may be productive of beneficial results is our sincere hope.

There is also another aspect in which the election of Mr. SCHACHT to the office of Vice-President of the Society is matter for satisfaction. It is the first time that the President of the Pharmaceutical Conference has held one of the chief offices in connection with the Pharmaceutical Society. The cordiality of the relation between these bodies has of late years augmented very considerably, and we may venture to affirm that it is not in any way tinctured with the slightest shade of jealousy or misgiving. The present union of the offices of President of the Conference and Vice-President of the Society in the person of a pharmacist so highly esteemed and possessing such competency for the fulfilment of their duties as Mr. SCHACHT, will set a seal upon their union which we trust may never be broken.

In the other very important office connected with the finances of the Society no change has been made and they will still remain under the safe guardianship of Mr. GREENISH.

So far the auguries of the pharmaceutical future are encouraging and hopeful, and we would rejoice to be able to say that there were no dark spots to mar the prospect. But it is unwise to seek the safety in which the ostrich believes, and it so happens that a correspondent in this week's Journal calls attention to a matter that is by no means insignificant as regards the guardianship of pharmaceutical interests. It is a strange anomaly, which we have often pointed out, that while there is every now and again a vehement outcry about certain details of pharmaceutical affairs, there should be such extraordinary disregard of the duties no less than the privileges which members of the Society possess. In regard to the election of members of Council, for instance, Mr. HOWARD HALL points out that no less than 1200 or 1500 members either abstain from voting or negligently fail to fulfil the requirements of the Bye-Laws as to voting papers. This is a matter that demands the careful consideration of every member of the Society, and we therefore call especial attention to Mr. HALL'S letter in the hope that it will be seriously pondered over. We trust also that it will help to convince members of the Society that the duty of exercising their right to vote is one they ought not to disregard.

The Local Secretaries of the Society are also officers who ought to render considerable assistance towards the removal of some at least of the evils by which the members of the trade are prejudiced. Among the number there are some who zealously perform the duties of their office; but there is a strange amount of indifference exhibited in other cases. This is evidenced by the report made at the last Council meeting, showing that no less than 119 towns which are eligible to have Local Secretaries have not yet sent up any nominations for the office of Local Secretary. There are so many ways in which an active Local Secretary could be of service in furnishing information as to the illegal sale of poisons and other infringements of the Pharmacy Act, which prejudice the interests of chemists and druggists, but cannot be ascertained without such local action and assistance, that it is matter for astonishment this work is so much neglected.

THE MEETING OF THE BRITISH ASSOCIATION.

THE Executive of the British Association has issued a Programme of the Arrangements for the Forty-Ninth Meeting which is to be held in Sheffield in August. From this it appears that the first General Meeting will be held on the 20th of August, when Mr. SPOTTISWOODE will resign the chair to Prosessor ALLMAN, who will assume the Presidency and deliver an Address. On the following evening there will be a *Soirée*, and another will be held on Tuesday the 26th. The evening "Discourses," which have now become a prominent feature of these meetings, are to be three in number. One, on "Radiant Matter," is to be delivered on Friday the 22nd, by Mr. WILLIAM CROOKES; another, by the Rev. W. H. DALLINGER, on "The Life Histories of the Minutest Organic Forms and their Bearing on the Doctrine of the Origin of Species," is fixed for Monday, the 25th. The "Lecture to the Operative Classes" will be delivered by Mr. W. E. AYRTON, on Saturday the 23rd, the subject being "Electricity as a Motive Power." The Reception Room will be opened on Monday, August 18th, at 1 p.m.; the Sections will meet day by day, except Sunday, from Thursday the 21st to Tuesday the 26th inclusive; the Concluding General Meeting will be held on Wednesday the 27th; and Excursions to places of interest in the neighbourhood of Sheffield will take place on the following day. Professor DEWAR is to preside over Section B., Chemical Science, and the Secretaries are Messrs. H. S. BELL, W. CHANDLER ROBERTS and J. M. THOMSON.

THE FLOODS IN HUNGARY.

THE amount of the subscriptions received up to the present is only £36 19*s.*, far short of what we hoped to be able to forward to Mr. JARMAY for the aid of the distressed pharmacists in Hungary. Many of the subscription lists which we sent out some weeks ago have not yet been returned, and we still hope to make up a larger sum before the subscription list is finally closed at the end of this month.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, June 4, 1879.

Present—Messrs Atkins, Bottle, Churchill, Frazer, Gostling, Greenish, Hampson, Hills, Mackay, Richardson, Robbins, Sandford, Savage, Schacht, Shaw, Squire, Symes, Williams and Woolley.

Mr. WILLIAMS having taken the chair, the minutes of the Council Meetings of May 7th and 21st, were read and confirmed.

Mr. WILLIAMS read a letter from Mr. Slipper, thanking the Council for his recent election as a member of the Council, and stating that he was prevented by ill health from attending the present meeting.

ELECTION OF PRESIDENT.

The first business was the election of President for the ensuing year. A ballot being taken in the usual way—

MR. GEORGE WEBB SANDFORD

was elected President.

Mr. SANDFORD, in taking the chair, thanked the Council for the honour done him in again electing him to that post. Although he might be proud to think that in time gone by he had in some small way helped the Society in that position, he felt that at the present time a much better man might have been found; things were altered, and he was sure that a better man might have been found.

VOTE OF THANKS TO THE LATE PRESIDENT.

Mr. MACKAY asked the Council before proceeding to the next business to convey to Mr. Williams a hearty vote of thanks for his conduct in the chair during his presidential term. Some time ago the world was startled by a wonderful picture in the Royal Academy, called the "Roll Call;" the members of Council would all agree with him that a roll call was not confined to the army, and he was quite certain that when the roll call of the Presidents of the Pharmaceutical Society should be called, the work gone through so earnestly and efficiently by Mr. Williams would bulk very largely. One thing he felt very much gratified at was that though Mr. Williams had left the presidential chair he would still remain one of the Council. All present, both old and new members, would agree with him that they owed Mr. Williams a debt of gratitude for the efficient manner in which he had conducted the affairs of the Society.

Mr. SAVAGE seconded the motion. He had been brought very much into contact with Mr. Williams during the last three years, and he could endorse everything which had fallen from Mr. Mackay.

The motion having been carried unanimously,

Mr. WILLIAMS said it was very gratifying to him to find that his services had been appreciated.

ELECTION OF VICE-PRESIDENT.

On a ballot being taken—

MR. GEORGE FREDERICK SCHACHT

was elected Vice-President. He said he was extremely obliged for the compliment paid him. He felt that the qualifications for this office were somewhat different from those of an ordinary Councillor, and he feared the Council would not find it had been so fortunate in this selection as in that of the President. He felt at considerable disadvantage in following the late Vice-President, but nevertheless he would do his best.

VOTE OF THANKS TO THE LATE VICE-PRESIDENT.

Mr. BOTTLE said it would be only right for the Council to place on record its sense of the way in which Mr. Savage had performed the duties of Vice-President during the last three years. He knew something of what the duties were; they were both honourable and onerous, and he was sure he carried with him the sense of the entire Council in saying that Mr. Savage had been most able and efficient in the performance of those duties.

Mr. WILLIAMS asked leave to second the motion, having known more of the facts perhaps than any one else. He had found on all occasions that Mr. Savage had been most courteous to him, and had met his wishes in every possible way.

The resolution having been carried unanimously,

Mr. SAVAGE said he felt very thankful to Mr. Bottle for his kind expressions, and it was very satisfactory to know that what he had done had received the approbation of his colleagues.

ELECTION OF TREASURER.

The PRESIDENT said it had been usual to elect the Treasurer by acclamation, and he would propose that Mr. Greenish be asked to continue in office.

Mr. GREENISH said he had a strong feeling that the office of Treasurer, being a complimentary one, should be passed on to some other member, and he would much rather some other gentleman were elected.

The PRESIDENT said he must differ from Mr. Greenish on this point. Mr. Hanbury was Treasurer for sixteen years, and in fact the office had almost been looked upon as a permanent one.

MR. THOMAS GREENISH

was thereupon re-elected Treasurer. He said he could only bow to the decision of the Council, and would discharge his duties to the best of his ability.

STANDING ORDERS.

The Standing Orders of the Council were re-affirmed for the ensuing year, on the motion of Mr. Shaw, seconded by Mr. Savage.

APPOINTMENT OF SECRETARY AND REGISTRAR.

On the motion of Mr. GREENISH, seconded by Mr HILLS,

MR. ELIAS BREMRIDGE

was unanimously re-elected Secretary and Registrar.

ASSISTANT-SECRETARY AND DEPUTY-REGISTRAR.

Mr. MACKAY moved the re-election of Mr. Richard Bremridge to this office. He said the Council had had ample evidence that his heart was really in the work, and that he grudged neither time nor labour to perform it effectively.

Mr. GREENISH seconded the motion, which was carried unanimously.

THE WEIGHTS AND MEASURES ACT.

The PRESIDENT read the following letter from the Board of Trade on the subject of weights and measures.

"$\frac{H}{St}$551 "Board of Trade,
"(Standards Department),
"7, Old Palace Yard, S.W.
"7th May, 1879.

"Sir,—With further reference to your communication of the 30th January last, I am directed by the Board of Trade to transmit to you herewith copy of a draft schedule of standard apothecaries' weights and measures which it is proposed to submit to Her Majesty to be legalized by Order in Council, under section 8 of the Weights and Measures Act, 1878, and I am to request that the Pharmaceutical Society will favour the Board of Trade with any observations which they may desire to offer thereon as early as practicable.

"I am, Sir,
"Your obedient servant,
"(Signed) C. CECIL TREVOR.

"John Williams, Esq.,
"President of the Pharmaceutical Society of
"Great Britain, 17, Bloomsbury Square, W.C."

SCHEDULE.

DENOMINATIONS OF STANDARDS OF APOTHECARIES' WEIGHT AND MEASURE.

1. *Apothecaries' Weight.*

Denomination.		Weight in grains in terms of the Imperial Standard Pound, which contains 7000 such grains.
Ounces.	10 ounces	4800 grains.
	8 ,,	3840 ,,
	6 ,,	2880 ,,
	4 ,,	1920 ,,
	2 ,,	960 ,,
	1 ounce	480 ,,
Drachms.	4 drachms, or half ounce	240 ,,
	2 drachms	120 ,,
	1 drachm	60 ,,
Scruples.	2 scruples	40 ,,
	1½ ,, or half a drachm	30 ,,
	1 scruple	20 ,,
	6 grains	6 ,,
	5 ,,	5 ,,
	4 ,,	4 ,,
	3 ,,	3 ,,
	2 ,,	2 ,,
	1 grain	1 grain.
	half a grain	0·5 ,,

2. *Apothecaries' Measure.*

Denomination.	Containing the following weight of distilled water. Temperature = 62° Fah. Barometer = 30° inches. Imperial pound = 7000 grains.
A fluid ounce and the multiples thereof from 1 to 40 fluid ounces, half a fluid ounce.	One fluid ounce contains 437·5 grains weight, or $\frac{1}{160}$ imperial gallon.
A fluid drachm and the multiples thereof from 1 to 16 fluid drachms, half a fluid drachm.	One fluid drachm equals $\frac{1}{8}$ fluid ounce.
A minim and the multiples thereof from 1 to 60 minims.	One minim equals $\frac{1}{60}$ fluid drachm.

The PRESIDENT said the only observation he had to make on the schedule was that the half scruple was omitted.

Mr. WILLIAMS said that in the original list of weights sent from the Council to the Board of Trade the half scruple was included.

Mr. BOTTLE said 17 grains could not be weighed with one set of weights without the half scruple.

Mr. WILLIAMS said it was very important to have these weights and measures legalized.

Mr. BOTTLE said the trade must bear in mind that these weights and measures would now be brought under the jurisdiction of the inspectors.

Mr. SHAW asked if they would require to be stamped.

The PRESIDENT said it was a question how low in the scale the stamping should be carried. He then read the following letter which had been addressed to the Board of Trade in reply:—

"Pharmaceutical Society of Great Britain,
"17, Bloomsbury Square,
"May 9, 1879.

"Sir,—I have the honour to acknowledge the receipt of your letter of the 7th inst., enclosing a copy of a draft Schedule of Standard Apothecaries "Weights and Measures," which it is proposed to legalize under section 8 of the Weights and Measures Act, 1878.

"On behalf of the Pharmaceutical Society, I beg to express entire approval of the draft schedules, which correctly and clearly describe the weights and measures used in the sale and dispensing of drugs, and the proposed Order in Council will, I feel assured, remove any difficulty which may have been anticipated.

"I venture to add that the question of stamping the small weights and sub-divisions of glass measures, which this Society brought under your notice in a memorandum of the 30th of January, is a matter of some anxiety; but I presume the arrangements for carrying out such matters will be provided for without so formal a proceeding as an Order in Council.

"Thanking you for the great kindness and consideration shown to the Pharmaceutical Society during the progress of this business,

"I have the honour to be, Sir,
"Your obedient servant,
"JOHN WILLIAMS,
"*President.*"

"C. Cecil Trevor, Esq.,
"Board of Trade."

Mr. HAMPSON thought it would be as well to write again asking for the insertion of the half scruple weight.

The PRESIDENT said if the Council authorized him he would address a letter to Mr. Trevor on the subject. So far as the present schedule went it was perfectly satisfactory.

It was understood that such a lettter should be sent.

ELECTIONS.

MEMBERS.

Pharmaceutical Chemists.

The following, having passed the Major examination and tendered their subscriptions for the current year were elected "Members" of the Society:—

Pain, Edwin .....Great Malvern.
Sandell, Thomas Oliver .....Wood Green.
Stewart, Duncan .....Kirkwall.

ASSOCIATES IN BUSINESS.

The following, having passed their respective examinations, being in business on their own account and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Bishop, Henry .....London.
Dobson, George .....Leicester.
Lambie, Hugh .....Glasgow.
Mackie, George .....Brechin.
Pattinson, William .....Corbridge-on-Tyne.

Modified.

Garnett, Richard Massie.....Nantwich.
Smith, Robert George.....Liverpool.

ASSOCIATES.

The following, having passed their respective examinations and tendered or paid (as Apprentices or Students) their subscriptions for the current year, were elected "Associates" of the Society:—

Minor.

Beaven, Alfred George .....Southampton
Betts, George .....Norwich.
Butters, Robert.....Leeds.
Charrington, William, jun.....Lichfield
Gascoigne, Charles .....London.
Ritson, Fletcher .....Carlisle.
Williams, Jno. Thos. Creswick..Dolgelley

Modified.

Wilkinson, Robert Beeson .....London.

APPRENTICES OR STUDENTS.

The following, having passed the Preliminary examinations and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society:—

Baily, Edward .....Ramsgate.
Botham, Frank John .....London.
Carter, Francis.....London.
Collins, Herbert Sleight .....Bradford.
Gieve, Albert James A. .....Southsea.
Hassall, Stephen .....Eton.
Hessell, James .....Rye.
Hoad, Frank.....Rye.
Hopkins, William Richards ...Aberystwith.
Morris, David .....Cardigan.
Ridley, Henry .....Ipswich.
Thornton, Charles Hopkinson London.
Woods, John.....Southampton.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

Addition to Register.

The Secretary reported that

Henry Charlton, 21, Dock Street, Sunderland,

having made the statutory declaration that he was in business before the passing of the Pharmacy Act, 1868, and this declaration having been duly supported by a medical practitioner, his name had been placed on the Register.

APPOINTMENT OF COMMITTEES.

The Council next proceeded to appoint the committees.

Mr. SHAW said that two years ago a movement was made for placing some of the country members on the Library, Museum and Laboratory Committee, and two such members were appointed, but as far as he remembered neither of them had been able to attend, as the committee had met in the middle of the month. A motion had been afterwards brought forward that the travelling expenses of country members attending committee meetings in the middle of the month should be paid, but it was not carried. During the last year, however, he found that one of the country members of that committee had not attended at all, and the other only twice, and it was not reasonable to expect gentlemen to be at the expense of coming up from a distance. Still, owing to the change in the constitution of the Council it was necessary that country members should take a larger share in the work of committees and he would therefore again move—

"That the members of Council resident in the provinces be re-imbursed their travelling expenses incurred in attending meetings of the committees other than those on the day preceding the Council meeting."

Mr. GREENISH suggested that Mr. Shaw should give a notice of motion, so that members might have an opportunity of considering the matter.

Mr. SHAW thought it was desirable to settle this matter before appointing the committees.

Mr. HILLS seconded the motion, which was supported by Mr. Hampson and Mr. Atkins, and carried unanimously.

Mr. FRAZER asked if the General Purposes Committee had been found to be an improvement on the old Law and Parliamentary Committee.

The PRESIDENT said there were occasions when it was desirable to call together a committee, such as the Law and Parliamentary Committee, on an emergency when the whole of the General Purposes Committee could not well be summoned.

Mr. RICHARDSON suggested that a sub-committee might be appointed to attend to any special business of that sort.

Mr. WILLIAMS said he had suggested that, but it was not agreed to. He had sometimes found it necessary to act by himself, or with the assistance of one or two gentlemen whom he could readily consult.

The PRESIDENT said if it were understood that the General Purposes Committee should appoint a sub-committee it could be done without a formal resolution.

Mr. CHURCHILL thought it was most important that every member, as far as possible, should have brought under his notice these delicate matters which came before this committee, whether it were called the General Purposes or the Law and Parliamentary. If it were necessary to call a few members together occasionally, it should be done as seldom as possible. He should not oppose the appointment of a sub-committee if it were perfectly understood that that sub-committee should act for the whole committee as seldom as possible.

Mr. RICHARDSON said that was his idea. He did not mean that the sub-committee should have absolute power.

Mr. ATKINS did not quite realize the difficulty which seemed to exist, unless it were a difficulty in getting a quorum. He would remind those who belonged to provincial councils, that it was the invariable rule when any important question arose, not to appoint a sub-committee but a committee of the whole Council. If, as he believed, the work now done by the General Purposes Committtce was about the most delicate and critical, it was highly important that the whole body of members should belong to it, and should be present, if possible.

Mr. SAVAGE remarked that in provincial councils the whole of the members resided in the town, which was not the case here. He thought the appointment of a sub-committee would much facilitate these matters.

The PRESIDENT said there had been a sub-committee appointed to watch the Medical Act Amendment Bill now in the House of Commons.

Mr. HAMPSON said it had been usual when a special subject required watching, to appoint a special committee, and this plan had been found to work very well indeed.

Mr. ROBBINS said it was his suggestion that the Law and Parliamentary and General Purposes Committee should be merged in one, and he thought nothing could be more satisfactory than that change. Before that, the General Purposes Committee hardly ever met. The most important and interesting part of the Society's work was done in the General Purposes Committee, and it was desirable that all members of the Council should attend it.

The SECRETARY hoped it would be found practicable for the Benevolent Fund Committee to meet earlier, as it often had not time to sufficiently consider the cases brought before it.

Mr. WILLIAMS thought it would be well if this Committee could meet at 11 o'clock in the morning, so as to have ample time.

Mr. GREENISH thought there was time enough if the cases were properly systematized before they came to the Committee.

Mr. WILLIAMS said the Committee could only get through the work in an hour or an hour and a half by simply accepting the view of the office without the members looking into the details of cases for themselves.

The VICE-PRESIDENT said the work done in the Committees was the most important work of the Council, and he would venture to repeat a suggestion he had before made, that the work should be divided and that certain members devote themselves to certain branches, so that the work might proceed simultaneously.

After some further conversation, the following Committees were appointed:—

General Purposes.—The whole of the Council, four to form a quorum, to meet at six o'clock on the evening before the Council Meeting, and at such other times as may be required.

Finance.—Messrs. Gostling, Richardson, Savage, Slipper, Squire and Symes. To meet at four o'clock on the day previous to the Council.

Library, Museum, and Laboratory.—Messrs. Bottle, Gostling, Greenish, Hampson, Hills, Robbins, Squire and Williams. To meet at eleven o'clock on the second Wednesday in the month, excepting in August and September.

House.—The same as the Library, Museum and Laboratory Committee, and to meet on the same days, or as occasion may require.

Benevolent Fund.—Messrs. Bottle, Churchill, Greenish, Hampson, Mackay, Robbins, Shaw, Williams and Woolley. To meet at 3.30 o'clock on the day preceding the Council Meeting.

Mr. BOTTLE wished to state his impression, having been a pretty constant attendant at this Committee, that no application had ever been deferred from want of time to consider it. Cases had stood over because the papers were not complete, or to make further inquiries, but never for want of time.

Evening Meetings.—The Professors, the Editor and the Curator of the museum, were appointed an Evening Meetings Committee. To meet at twelve o'clock on the Wednesday previous to the Evening Meeting, and at such other times as might be found desirable.

The President and Vice-President are *ex officio* members of all Committees.

PHARMACY ACT AMENDMENT COMMITTEE.

Mr. HAMPSON proposed—

"That a Pharmacy Act Amendment Committee should be appointed, consisting of Messrs. Bottle, Gostling, Greenish, Hampson, Mackay, Symes, Williams and Woolley, to meet as occasion required."

Mr. WOOLLEY seconded the motion.

Mr. ATKINS asked if the appointment of this Committee would in any way interfere with the work of the General Purposes Committee.

Mr. WILLIAMS said he thought not.

The PRESIDENT said it would be quite competent in his opinion for this Committee to bring the results of its deliberations before the General Purposes Committee for consideration before laying them before the Council.

Mr. HAMPSON said the Committee would naturally report to the Council, not to another Committee.

The PRESIDENT said it would certainly not report to the Committee, but still its conclusions might be considered by the Committee, and that would greatly facilitate the work of the Council.

Mr. ATKINS did not at all object to the appointment of this Committee. He believed it would be a very important one, but the General Purposes Committee was the successor of the Law and Parliamentary Committee, and surely if anything were fairly within its scope it was a Pharmacy Act Amendment Bill.

Mr. SHAW said two years ago, when this Committee was appointed, it was discussed how the Committee should report, and it was contended by some gentlemen that the Parliamentary Committee should appoint a sub-committee which should report to the Parliamentary Committee, and that the latter should report to the Council, and it was settled in that way. It might be a question now whether this Committee should not be appointed as a sub-committee by the General Purposes Committee. It was certainly the right method to discuss such matters in Committee.

Mr. HAMPSON thought it would be much better that this Committee should be appointed direct from the Council, and that it should feel responsible for its work. If it had to lay its report before another Committee, it would, to a certain extent be relieved of its responsibility. When the report came before the Council, it could, if necessary, be discussed in Committee, and the report of the Committee would also be printed and circulated for private use amongst the members, and this would, he thought, remove the objection which had been raised.

Mr. BOTTLE agreed with Mr. Hampson. This Pharmacy Act Amendment Committee was originally a sub-committee, but inconvenience was found to exist, and it was therefore appointed direct by the Council.

The motion was then carried.

APPOINTMENT OF THE EDITOR AND SUB-EDITOR OF THE JOURNAL.

Dr. Paul was re-appointed Editor of the Society's Journal for the ensuing year, and Mr. F. Passmore the Sub-Editor.

LOCAL SECRETARIES.

The appointment of Local Secretaries was deferred for a month, in order that the Library, Museum and Laboratory Committee might recommend a list of names.

The SECRETARY said there were 323 towns eligible to have Local Secretaries, from 204 of which nominations had been received, 119 not having sent up any nominations. There were many towns having large populations in which there was no chemist and druggist connected with the Society.

REPORTS OF COMMITTEES.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the usual report from the Librarian, to the following effect:—

Attendance during the day: highest, 32; lowest, 11; average, 23. Evening: highest, 17; lowest, 5; average, 12. Circulation of books: town, 147; country, 72; carriage paid, £1 6*s.* 5*d.* He had also reported the following donations to the Library:—

Year-Book of Pharmacy, 1870-71, 1875-8; 6 vols. Second copy.
From the British Pharmaceutical Conference.

U. S. Department of Agriculture, Reports of the Commissioner, 1872-8; 7 vols. Report upon Forestry, by F. B. Hough, 1878; 1 vol.
From Mr. Robert Howden.

London University Calendar, 1879.
From H. M. Government.

Hooker (J. D.), Flora of British India; part 6.
From the India Office.

Cooley (A. J.), Cyclopœdia of Practical Receipts; 6 ed., pt. 12. From Messrs. J. and A. Churchill.

Calendar of King's College, London, 1878.
From the College.

Papers read before the School of Pharmacy Students' Association, 1877-8; vol. 4, ms.
From the Association.

Hogg (J.), Inflammation of the Eye and Injuries to Health by Arsenical Wall-Paper Poisoning, 1879.
From the Author.

Third Annual Report of the Chemists and Druggists' Trade Association, 1879. From the Association.

Catalogue of the Library of the Chemical Society, 1874. From the Society.

22nd Annual Report; *and* Constitution and Laws of the Pharmaceutical Society of Victoria, 1879.
From the Society.

The Committee recommended that the usual letters of thanks be forwarded.

The Committee recommended the purchase of the following books for the Library:—

Botanischer Jahresbericht from the commencement, and to be continued.

Beale (L. S.), Kidney Diseases, Urinary Deposits, and Calculous Disorders; 3 ed., 1869.

U. S. Report on Libraries; part 2, 1876.

Wiegleb (J. C.), General System of Chemistry, by C. R. Hopson, 1789.

Lewis (W.), Experimental History of Materia Medica, 2 ed., 1768.

Murray (J.), Elements of Materia Medica and Pharmacy, 1804.

Coles (W.), Adam in Eden, or Nature's Paradise; the History of Plants, *etc.*, 1657.

The Curator had reported the attendance in the Museum to have been as follows:—During the day, average, 16; evening, average, 3. He had also reported the following donations to the Museum:—

Specimens of the Roots of Iris Versicolor and Euonymus Atropurpureus, from Messrs. Morson and Son.

Specimen of the Stem of the Somali Myrrh tree, from Professor W. T. Thistleton Dyer.

Specimen of Salicylate of Eserine, from Messrs. Merck, of Darmstadt, presented through Dr. B. H. Paul.

The following specimens from Messrs. C. Low and Co.:—

Naphthalene, sublimed.
Naphthalene Tetrachloride.
Cresylic Acid.
Picric Acid, crude.
Picric Acid, pure crystallized.
Sulphophenates of Sodium, Zinc and Iron.
Pure Carbolic Acid crystallized at 42·25° C., boiling point 182° C., and Rosolic Acid prepared from it by Kolbe's process.
Pure Carbolic Acid crystallized at 35° C., and Carbolic Acid prepared from it by Kolbe's process.
Carbolic Acid, crude.
Specimen of Opium from Mozambique, from Messrs. T. and H. Smith and Co.

The last specimen was an historically interesting one, being a portion of the first crop of opium collected there, which amounted only to a few pounds.

The Committee recommended that the usual letters of thanks be forwarded.

A list of desiderata had been forwarded to the Rai Bahadoor Kanny Loll Dey and a letter of thanks in reply to his letter offering specimens of Indian materia medica. Sets of labels for the materia medica collections of the University College and St. George's Hospitals had been supplied as directed at the last meeting.

A letter had been received from the President of the Leeds Chemists' Association (Mr. Jefferson) asking for any duplicate specimens that could be spared from the Museum department for the collection of materia medica belonging to that Association. The Curator had been directed to inquire of Mr. Jefferson what specimens would be useful, and make a selection accordingly.

The Curator had reported that a list of duplicate specimens was now in course of preparation.

A collection of about 200 specimens of drugs used at Singapore had been offered for sale by Mr. Collins for £20, together with a catalogue of the same and translation of a work in the Malay language, on their uses.

Professor Bentley had reported that the lectures at the Botanic Garden had commenced with a large class.

Professors Redwood and Attfield had reported that the progress of their respective classes was satisfactory.

The report was received and adopted; and it was also resolved to refer the question of purchasing Mr. Collins's collection to the Committee for further report.

HOUSE.

The report of this Committee was received and adopted.

FINANCE.

Mr. Robbins and Mr. Churchill, having acted *pro tem.* as a Financial Committee, recommended certain accounts for payment, which recommendation was adopted by the Council.

Mr. ATKINS said it was very satisfactory to find the reduction in the cost of the Conversazione, and he thought the abolition of refreshments at the expense of the Society had been a great improvement.

Mr. FRAZER moved—

"That the House Committee be requested to consider the desirability of putting double windows to the Council room."

Mr. HILLS seconded the motion, which was agreed to.

Mr. MACKAY said he believed an estimate had been obtained on a former occasion, which was thought rather high, and he hoped another one would be obtained.

The VICE-PRESIDENT remarked that double windows, although they kept out noise, also kept out air, and if any influence could be brought to bear on the Vestry, leading it to paving the street with wood, it might remove the annoyance without any expense to the Society.

THE ACTION AGAINST THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION.

The PRESIDENT read a letter from the Society's Solicitor, stating that he had received the taxed costs of the recent trial in the Queen's Bench and in the County Court, also the penalty of £5.

Proceedings of Scientific Societies.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

ANIMAL INTELLIGENCE.*

BY GEORGE J. ROMANES, M.A., F.L.S.

(*Concluded from page* 460.)

The other instance I have to narrate occurred with the same terrier. Only once in his life was he ever known to steal; and on this occasion, when very hungry, he took a cutlet from a table and carried it under a sofa. I saw him perform this act of larceny, but pretended not to have done so, and for a number of minutes he remained under the sofa with his feelings of hunger struggling against his feelings of duty. At last the latter triumphed, for he brought the stolen cutlet and laid it at my feet. Immediately after doing so he again ran under the sofa, and from this retreat no coaxing could draw him. Moreover, when I patted his head he turned away his face in a ludicrously conscience-stricken manner. Now I regard this instance as particularly valuable from the fact that the terrier in question had never been beaten, and hence that it cannot have been fear of bodily pain which prompted these actions. On the whole, therefore, I can only suppose that we have in these actions evidence of as high a development of the ethical faculty as is attainable by the logic of feelings when unassisted by the logic of signs—that is to say, a grade very nearly, if not quite, as high as that with which we meet in low savages, young children, many idiots, and uneducated deaf-mutes.

This allusion to savages, children, idiots, and deaf-mutes, leads me to the next division of my subject.

St. George Mivart has said that an interesting book might be written on the stupidity of animals. I am inclined to think that a still more interesting book might be written on the stupidity of savages. For it is a matter of not the least interest how much stupidity any number of animals may present, so long as some animals present sufficient sagacity to supply data for the general theory of evolution; while, on the other hand, it is of the utmost importance for the science of this century to ascertain the lowest depths in which the mind of man is known to exist as human. Now there is no doubt that the interval which separates the most degraded savage from the most intelligent animal is, psychologically considered, enormous; but, enormous as it is, I cannot see any evidence to show that the gulf may not have been bridged over during the countless ages of the past. Abstract ideas among savages are mostly confined to such as may be formed by the logic of the feelings; so that, for instance, according to the observations and the judgment of Mr. Francis Galton,

* Lecture delivered before the British Association at Dublin, August 16, 1878.

the ideas of number which are presented by the lowest savages are certainly in no degree superior to those which are presented by the higher animals. Such ideas as savages possess seem to be mainly those which, as in animals, are due to special associations. On this account there is in them, as in animals, a remarkable tendency to act in accordance with preformed habits, rather than to strike out improved modes of action. On this account, also, there is, as in animals, a strong tendency to imitation as distinguished from origination. Again, as in animals, so in savages, the reflective power is of an extremely undeveloped character, and quite incapable of sustained application. And, lastly, the emotions of savages, as of animals, are vivid, although, as contrasted with the emotions of civilized man, they are in a marked degree more fitful, impetuous, shallow, and transitory. So that altogether I think the lowest savages supply us with a most valuable transition stage between mind as we know it in ourselves, and mind as we see it manifested by the higher animals.

With regard to children, it is to be expected, on the general theory of evolution by inheritance, that if we were attentively to study the order in which their mental faculties develop, we should find that the historical sequence is, as it were, a condensed epitome of the order in which these faculties were developed during the evolution of the human species. And this expectation is fairly well realized. Very young children present only those lower faculties of mind which in animals we call instincts. With advancing age, the first indication of true intelligence seems to consist in the power of forming special associations. Memory thus appears early in life; and long before a child is able to speak, it links together in thought ideas of objects which it finds to be associated in fact. Again, the emotions begin to assert their presence at a very early period, and attain a high degree of development before any of the characteristically human faculties can be said to have appeared. Moreover, in young children we meet with nearly all the emotions which I have named as occurring in animals, and their general character is much of the same kind. In more advanced childhood the emotional life of children more resembles that of savages. With regard to the more purely intellectual faculties, language is largely intelligible to a child long before it is itself able to articulate; but soon after it is able to articulate, the faculty of abstracting qualities and classifying objects by the aid of signs begins its course of development. Thus, for instance, I have lately seen a child who belongs to one of the best of living observers, and who is just beginning to speak. This child called a duck "quack," and by special association it also called water "quack." By an appreciation of the resemblance of qualities, it next extended the term "quack" to denote all birds and insects on the one hand, and all fluid substances on the other. Lastly, by a still more delicate appreciation of resemblance, the child eventually called all coins "quack," because on the back of a French sou it had once seen the representation of an eagle. Hence to this child the sign "quack," from having originally had a very specialized meaning, became more and more extended in its signification, until it now serves to designate such apparently different objects as "fly," "wine," and "shilling." And as in this process we have the initiation of the logic of signs, so we have in it the potentiality of the most abstract thought. Accordingly, soon after a child begins to speak, we find that reason of a properly human kind begins to be developed.

Upon the whole, then, the study of infant psychology yields just the kind of results which the general theory of evolution would lead us to expect. But in comparing the intelligence of a young child with that of an adult animal we are met with this difficulty—that as the bodily powers of children at so immature an age are so insufficiently developed, the mind is not able, as in the case of animals, to accumulate experiences of life. In order, therefore, to obtain a fair parallel, we should require a human being whose mental powers have become arrested in their development at an early age, while the bodily powers have continued to develop to mature age, so serving to supply the aborted human intelligence with ful experiences of life. Now the nearest approach that we have to these conditions is to be found in the case of idiots. Accordingly, in anticipation of this lecture, I have sent a table of questions to all the leading authorities on idiocy, and the answers which I have obtained display a very substantial agreement. Through the kindness of those gentlemen I have also been able to examine personally a number of the patients who are under their charge. In particular I have to express my obligations to Drs. Beech, Crichton Browne, Langdon Down, Ireland, Maudsley, Savage, and Shuttleworth. On the present occasion I can only pause to state the leading facts which have been elicited by this inquiry.

As there are all degrees of idiocy, the object of my inquiry was to determine the order in which the various mental faculties become enfeebled and disappear as we descend from the higher to the lower grades of imbecility. On the general theory of evolution we should expect that in such a descending scale the characteristically human, or the more recently developed, faculties should be the first to disappear, while those faculties which man shares with the lower animals should be the more persistent. And this expectation I have found to be fairly well realized. Beginning from below, the first dawn of intelligence in the ascending scale of idiots, as in the ascending scale of animals, is invariably to be found in the power of associating simple concrete ideas. Thus there are very few idiots so destitute of intelligence that the appearance of food does not arouse in their minds the idea of eating; and as we ascend in the scale idiotic we find the principle of association progressively extending its influence, so that the mind is able, not only to establish a greater and greater number of special associations, but also to retain these associations with an ever increasing power of memory. In the case of the higher idiots, as in the case of the higher animals, it is surprising in how considerable a degree the faculty of special association is developed, notwithstanding the dwarfed condition of all the higher faculties. Thus, for instance, it is not a difficult matter to teach a clever idiot to play dominoes, in the same way as a clever dog has been taught to play dominoes, viz., by teaching special associations between the optical appearance of the facets which the game requires to be brought together. But the idiot may be quite as unable as the dog to play at any game which involves the understanding of a simple *rationale*, such, for instance, as draughts. And similarly many of the higher idiots have been taught to recognize, by special association, the time on a watch; but it is remarkable that the high power of forming special associations which this fact implies occurs in the same minds which are unable to perform so simple a calculation as this—If it is ten minutes to three, how many minutes is it past two? Thus it will be seen that among idiots, as among animals, the faculty of forming special associations between concrete ideas attains a comparatively high degree of development. Let us then next turn to the faculties of abstraction and reason. Prepared as I was to expect these faculties to be the most deficient, I have been greatly surprised at the degree in which they are so. As regards the power of forming abstract ideas which depend on the logic of signs, it is only among the very highest class of idiots that any such power is apparent at all; and even here it is astonishing in how very small a degree this power is exhibited. There seems, for instance, to be an almost total absence of the idea of right or wrong as such, so that the faculty of conscience, properly so called, can rarely be said to be present. Most of the higher idiots, indeed, experience a feeling of remorse on offending the sympathies of those whom they love, just as did my dog on tearing the window-curtains; but I have been able to obtain very little evidence of any

true idiot whose action is prompted by any idea of right and wrong in the abstract, or as apart from the idea of approbation and disapprobation of those whose good feeling he values.

Again, the faculty of reason is dwarfed to the utmost—so much so that the investigator is most of all astonished at the poverty of rational power which may be displayed by a human mind that in most other respects seems well developed. I can only wait to give you one example, but it may be taken as typical. A boy fourteen years of age, belonging to the highest class of undoubted idiots, could scarcely be called feeble-minded as regarded many of his faculties. Thus, for instance, his powers of memory were above the average, so that he had no difficulty in learning Latin, French, etc. Moreover, he could tell you by mental calculation the product of two numbers into two numbers, such as 35 by 35, or of one number into three numbers, such as the number of days in nine years. His powers of mental calculation were therefore quite equal to those of any average boy of his age. Yet he was not able to answer any question that involved the simplest act of reason. Thus, when I asked him how many sixpences there are in a sovereign, he was quite unable to answer. Although he knew that there are two sixpences in a shilling, and twenty shillings in a sovereign, and could immediately have said that twice twenty are forty, yet he could not perform the simple act of inference which the question involved. Again, I asked him, if he could buy oranges at a farthing each, how many could he buy for twopence? He thought long and hard, saying, "I know that four farthings make a penny, and the oranges cost a farthing each; then how many could I buy for twopence? Ah! that's the question, and there's just the puzzle." Nor was he able by the utmost effort to solve the puzzle. This boy had a very just appreciation of his own psychological character. Alluding to his powers of forming special associations and retaining them in his excellent memory, he observed, "Once put any thing into my head and you don't get it out again very easily; but there's no use in asking me to do puzzles."

Lastly, the emotional life of all the higher idiots, as of all the higher animals, is remarkably vivid as compared with their intellectual life. All the emotions are present (except, perhaps, that of the sublime and the religious emotions), and they occur for the most part in the same order as to strength as that which I have already named in the case of animals. But, more than this, just as in animals, children, and savages, so in idiots, the emotions, although vivid and keen, are not profound. A trivial event will make the higher idiots laugh or cry, and it is easy to hurt their feelings with a slight offence; but the death of a dear relative is very soon forgotten, while the stronger passions, such as love, hate, ambition, etc., do not occur with that force and persistency which properly entitle them to be called by these names.

Upon the whole, then, with regard to idiots, it may be said that we have in them a natural experiment wherein the development of a human mind is arrested at some particular stage, while the body is allowed to continue its growth. Therefore, by arranging idiots in a descending grade, we obtain, as it were, an inclined plane of human intelligence, which indicates the probable order in which the human faculties have appeared during the history of their development; and on examining this inclined plane of human intelligence, we find that it runs suggestively parallel with the inclined plane of animal intelligence, as we descend from the higher to the lower forms of psychical life.

I have only time to treat of one other branch of my subject. Believing, as I have said, that language, or the logic of signs, plays so essential a part in developing the higher intellectual life of man, it occurred to me that a valuable test of the truth of this view was to be found in the mental condition of uneducated deaf-mutes. It often happens that deaf and dumb children of poor parents are so far neglected that they are never taught finger language or any other system of signs whereby to converse with their fellow creatures. The consequence, of course, is that these unfortunate children grow up in a state of intellectual isolation, which is almost as complete as that of any of the lower animals. Now when such a child grows up and falls into the hands of some competent teacher, it may of course be educated, and is then in a position to record its experiences when in its state of intellectual isolation. I have therefore obtained all the evidence I can as to the mental condition of such persons, and I find that their testimony is perfectly uniform. In the absence of language the mind is able to think in the logic of feelings, but can never rise to any ideas of higher abstraction than those which the logic of feelings supplies. The uneducated deaf-mutes have the same notions of right and wrong, cause and effect, and so on, as we have already seen that animals and idiots possess. They always think in the most concrete forms, as shown by their telling us when educated that so long as they were uneducated they always thought in pictures. Moreover, that they cannot attain to ideas of even the lowest degree of abstraction is shown by the fact that in no one instance have I been able to find evidence of a deaf-mute who, prior to education, had evolved for himself any form of supernaturalism. And this, I think, is remarkable, not only because we might fairly suppose that some rude form of fetishism, or ghost-worship, would not be too abstract a system for the unaided mind of a civilized man to elaborate, but also because the mind in this case is not wholly unaided. On the contrary, the friends of the deaf-mute usually do their utmost to communicate to his mind some idea of whatever form of religion they may happen to possess. Yet it is uniformly found that, in the absence of language, no idea of this kind can be communicated. For instance, the Rev. Mr. S. Smith tells me that one of his pupils, previous to education, supposed the Bible to have been printed by a printing-press in the sky, which was worked by printers of enormous strength—this being the only interpretation the deaf-mute could assign to the gestures whereby his parents sought to make him understand that they believed the Bible to contain a revelation from a God of power who lives in heaven. Similarly, Mr. Graham Bell informs me of another, though similar case, in which the deaf-mute supposed the object of going to church to be that of doing obeisance to the clergy.

On the whole, then, from the mental condition of uneducated deaf-mutes we learn the important lesson that, in the absence of language, the mind of a man is almost on a level with the mind of a brute in respect of its power of forming abstract ideas. So that all our lines of evidence converge to one conclusion:—the only difference which analysis can show to obtain between the mind of man and the mind of the lower animals consists in this, that the mind of man has been able to develop the germ of rational thought which is undeveloped in the mind of animals, and that the development of this germ has been due to the power of abstraction which is rendered possible by the faculty of speech. I have, therefore, no hesitation in giving it as my opinion that the faculty of speech is alone the ultimate source of that enormous difference which now obtains between the mind of man and the mind of the lower animals. Is this source of difference adequate to distinguish the mind of man from the mind of the lower animals in kind? I leave you all to answer this question for yourselves. I am satisfied with my work if I have made it clear to you that the question whether human intelligence differs from animal intelligence in kind or in degree, hinges entirely on the question whether the faculty of speech has been of an origin natural or supernatural. Still, to be candid, when the question occurs to me:—Seeing that language is of such prodigious importance as a psychological instrument, does not the presence of language serve to distinguish us in kind from all other forms of life? How is it that no

mere brute has ever learned to communicate with its fellows by words? Why has man alone of animals been gifted with the Logos? I say when this question occurs to me, I feel that although from the absence of pre-historical knowledge I am not able to answer it, still when I reflect on the delicacy of the conditions which, on the naturalistic hypotheses, must first have led to the beginning of articulate language—conditions not only anatomical and physiological, but also psychological and sociological—when I thus reflect, I cease to wonder that the complicated faculty of speech should only have become developed in *Homo sapiens*.

Ladies and gentlemen, I have now given you an organized epitome of the leading results which have been obtained by a study of the facts and the principles of comparative psychology; and as in doing so I have chiefly sought to address those among you who are interested in science, I fear that to some of you I must in many places have been very hard to follow. But as a general outcome of the whole lecture—as the great and vivifying principle by which all the facts are more or less connected, and made to spring into a living body of philosophic truth—I will ask you to retain in your memories one cardinal conclusion. We are living in a generation which has witnessed a revolution of thought unparalleled in the history of our race. I do not merely allude to the fact that this is a generation in which all the sciences, without exception, have made a leap of progress such as widely to surpass all previous eras of intellectual activity; but I allude to the fact that in the special science of biology it has been reserved for us to see the first rational enunciation, the first practical demonstration, and the first universal acceptance of the doctrine of evolution. And I allude to this fact as to a fact of unparalleled importance in the history of thought, not only because I know how completely it has transformed the study of life from a mere grouping of disconnected observations to a rational tracing of fundamental principles, but also because it is now plainly to be foreseen that what the philosophy of evolution has already accomplished is but an earnest of what it is destined to achieve. We know the results which have followed in the science of astronomy by the mathematical proof of the law of gravitation; and can we doubt that even more important results will follow in the much more complex science of biology from the practical proof of the law of evolution? I, at least, can entertain no doubt on this head; and forasmuch as this enormous change in our means of knowledge and our modes of thought has been so largely due to the almost unaided labours of a single man, I do not hesitate to say, even before so critical an audience as this, that in all the history of science there is no single name worthy of a veneration more profound than the now immortal name of Charles Darwin.

Do you ask me why I close this lecture with such a panegyric on the philosophy of evolution? My answer is—If we have found that in the study of life the theory of descent is the keynote by which all the facts of our science are brought into harmonious relation, we cannot doubt that in our study of mind the theory of descent must be of an importance no less fundamental. And, indeed, even in this our time, which is marked by the first opening dawn of the science of psychology, we have but to look with eyes unprejudiced to see that the philosophy of evolution is here like a rising sun of truth, eclipsing all the lesser lights of previous philosophies, dispelling superstitions like vapours born of darkness, and revealing to our gladdened gaze the wonders of a world till now unseen. So that the cardinal conclusion which I desire you to take away, and to retain in your memories long after all the lesser features of this discourse shall have faded from your thoughts, is the conclusion that mind is everywhere one; and that the study of comparative psychology, no less than the study of comparative anatomy, has hitherto yielded results in full agreement with that great transformation in our view of things, which, as I have said, is without a parallel in the history of thought, and which it has been the great, the individual glory of this age and nation to achieve.

Obituary.

Notice has been received of the death of the following:—

On the 6th of May, 1879, Mr. Bennett Carr, Chemist and Druggist, Eckington, Derbyshire. Aged 69 years.

On the 10th of May, 1879, Mr. William John Pank, Pharmaceutical Chemist, City Road, N. Aged 50 years. Mr. Pank had been a Member of the Pharmaceutical Society since 1853.

On the 17th of May, 1879, Mr. Frederick Hezekiah Edwards, Chemist and Druggist, Lambeth Walk, S.E. Aged 32 years.

On the 18th of May, 1879, Mr. Ananiah Job, Chemist and Druggist, Treville Street, Plymouth. Aged 38 years.

On the 23rd of May, 1879, Mr. William Bennett Gladding, Chemist and Druggist, Brook Street, E. Aged 51 years.

On the 25th of May, 1879, Mr. William Walkinton, Chemist and Druggist, Tenby. Aged 79 years.

Review.

MEDICINISCH-PHARMACEUTISCHE BOTANIK, ZUGLEICH ALS HANDBUCH DER SYSTEMATISCHEN BOTANIK; FÜR BOTANIKER, AERZTE UND APOTHEKER. Bearbeitet von Dr. CHR. LUERSSEN. 1 Band, Kryptogamen. Leipzig: Haessel, 1879.

Few more important works than this have proceeded of late years even from the prolific scientific press of Germany. It is intended to serve the double purpose of a handbook of pharmaceutical botany and a handbook of systematic botany for the general student. The present volume is concerned with cryptogams only, and the name of the author will at once command respect as that of one of the best and most trustworthy workers in this field. The number of cryptogamic pharmaceutical products is of course comparatively very small, and entire orders and classes are destitute of interest in this respect. These orders and classes are, however, not neglected by the author; and the volume therefore assumes the character of a complete handbook of cryptogamic botany brought down to the present state of our knowledge, a work of which every botanist has long felt the need, and which the English reader still feels as one of his greatest desiderata. On the point of classification, Dr. Luerssen has followed the last edition of Sachs's 'Lehrbuch' in its main outlines; dividing Thallophytes into the four classes, Protophyta, Zygosporcæ, Oosporeæ, and Carposporæ, characterized by their mode of fecundation only; and Vascular Cryptogams into the three classes Filicineæ, Equisetineæ, and Lycopodineæ, neglecting as a primary distinction, the division into Isosporous and Heterosporous Vascular Cryptogams insisted on by other authors. Although writers, since the publication of the fourth edition of Sachs's 'Lehrbuch,' have criticized several features of this classification, and have pointed out one or tw defects that must certainly be rectified, no other satisfactory working system has yet been proposed in its place, and the author is therefore justified in adopting it. Here and there he has corrected one or two obvious oversights of Sachs's, as, for example by transferring *Volvox* from the Zygosporeæ to the Oosporeæ. In all cases a full and excellent description is given of the class, the order, and the family; the development and life-history are traced, and the most important points of structure clearly pointed out. In a large number of cases also the genera receive a separate share of attention. The work is illustrated by

a large number of admirable woodcuts, many of them new to the English reader. Where the genus is of interest from a pharmacological point of view, a still more minute description is given. We may take as an illustration the genus *Claviceps*, to which more than seven pages are devoted, illustrated by nine woodcuts; a complete account of the life-history of the fungus is followed by a reference to the mode of preparation of the drug in the various European pharmacopœias. Again, under the Hymenomycetes not only every genus, but every species receives special attention, to which active properties belong, or have at any time been attributed. Until a translation appears—should English readers ever be so fortunate—this work of Luerssen's will occupy an indispensable place in every pharmacologist's and botanist's library.

BOOKS, PAMPHLETS, ETC., RECEIVED.

A Manual of Organic Chemisty, Practical and Theoretical, for Colleges and Schools, Medical and Civil Service Examinations, and especially for Elementary, Advanced and Honours Students at the Classes of the Science and Art Department, By Hugh Clements. London: Blackie and Son. 1879. From the Publishers.

Pharmacopœia of the British Hospital for Diseases of the Skin. Edited by Balmanno Squire. London: J. and A. Churchill. 1879.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

The Evil of Indifference.

Sir,—I desire to ask your kindly insertion of the following remarks anent the recent election of members to the Council of the Pharmaceutical Society.

First, I notice the extraordinary apathy or indifference of some 1200 or 1500 members of the Society, who either refuse to vote or negligently fail to fulfil the requirements of the Bye-Laws of the Society in the erasing the names of candidates and in the return of their voting papers within the prescribed limit of time allowed for so doing, or are guilty of other informalities besides the grave one of making use of old and obsolete voting papers.

As regards those elected; it cannot be a very gratifying fact to those gentlemen who head the list with some 1100 to nearly 1300 votes, that they have not even secured the votes of one-half of the entire constituency for whom they profess to act and legislate. Let them think of this when they contemplate changes and improvements which may affect the interests of some 10,000 non-electors and non-voters.

Looking at the quality of the names, I find the country element, as it is called, is wonderfully strong. Whether this is really an element of strength or weakness in the Council of a Society which is not merely provincial or metropolitan, but is essentially national and also cosmopolitan, I leave it for members to judge. Will the preponderance of the provincial element add weight to the deliberations of the Council, or shall we see its acts and decisions descend to the level of municipal concerns, or rise to the height of the amenities of vestry existence?

While dwelling thus on the fact of the triumphant return of the country members, I would respectfully ask those voters who in their wisdom and hearty desire for independence were pleased to restrict their votes to one, or at most, two, of the candidates,—strictly country ones, be it said,—whether such electors were really fulfilling the aim or furthering the object for which our Society was established?

The work of the Society cannot be done efficiently by one man or two men, or even a committee of six or seven country councillors; we must have town, or rather London, members on the Council.

What are we (and the outside public, as well) to think when they see a Council elected and constituted as ours is, not one of whose members really enjoys the suffrages of so much as one half of the electoral body?

Further, what shall we say of the 1500 to 1700 electors professing (or abstaining) to vote, giving their votes in such an absurd manner as to leave the London members absolutely at the bottom of the poll?

Are country voters aware that the office of member of the Council entails a sacrifice of from one to two whole days in every sessional week to the business and work of the Council alone? whilst as regards other work of the Society, such as evening meetings, parliamentary work, petitions, deputations, etc., the country contingent is too often conspicuous by its absence?

How are country members of the Council prepared to conform to our just requirements? Let their presence at all our meetings show this. I leave out of account the weight of travelling expenses, which are allowed to country members; already no small item (£242 14*s*. 3*d*. in 1878) and one that will in future be augmented considerably.

In conclusion, sir, I would wish to say this to my fellow members:—Vote for your pet candidate if you must, because of certain reasons known only to yourself, but be pleased to remember you have the privilege and the power of voting for fourteen candidates, neither more nor less; therefore do not nullify your other votes by voting for only one or two candidates, but so record your votes that when your voting paper comes under the eyes of the scrutineers they may see your good work and appreciate the spirit in which you weigh the merits of each candidate; see also that you retain a grateful recollection of the services and sacrifices of men who in their time and generation have borne the burden of many a care and many a sorrow to achieve what we all desire—the success of our Society.

88, *Silchester Road, W.* T. Howard Hall.

The Pharmaceutical Examinations.

Sir,—In reply to Mr. Denston's remarks in the Journal of the 31d ult., will you allow me to point out an error into which he, in common with many others, appears to have fallen, viz., in overlooking the fact that it is the interest of the Pharmaceutical Society, as well as its duty to the public, to examine and certify only those men who are likely, in their future career, to fulfil the duties of their profession in a manner satisfactory to the public and with credit to themselves and to the Society which has granted them their diploma.

I do not deny that the examiners might perhaps pass a larger proportion of the candidates than they do, as is evidenced by the case of more than one unfortunate individual to my personal knowledge, but, on the whole, I cannot think there is sufficient ground for the wholesale condemnation which students, as a rule, heap upon the heads of the examiners, who I am sure use every endeavour to pass the apprehensive wight who stands quivering before them, and I am convinced that no candidate, who possesses the requisite amount of knowledge, is allowed to lose an opportunity of displaying it; but here, the "excessive nervousness" referred to by Mr. Denston must be admitted as an exception.

The complaints respecting the alleged stringency of the examination are, I think, scarcely justifiable; in my own case it was much less severe than I had been led to anticipate. The examiners were models of courtesy, their questions well directed and in every way calculated to educe whatever knowledge of the subject the candidate happened to possess. The examiners may be assured that with the self-consciousness of my own deficiencies I was enabled to fully appreciate their lenity.

If, as some appear to desire, the examinations were made less searching than they are, the result would not be difficult to predict; the Society's old friends would desert it; its medical supporters would lose confidence in it, and I would almost go the length of asserting that, even then, the aspirants for its certificate would respect it far less than they do now.

To ensure the advancement of our interests we must be unanimous; it is in the power of each to do something for the benefit of the community; let him do so, and in the absence of internal dissensions, pharmacy will be everything that can be desired.

London, N. A. Sollitt.

The British Pharmacopœia.

Sir,—As a new edition of the British Pharmacopœia will be due at no distant period, allow me in the interests of the poorer classes of the community, as well as that of the provincial chemist, to point out to the committee that may be engaged upon the work the great desirability of not ordering the preparations to be made of unnecessarily expensive materials.

For instance, why insist upon ung. resinæ and some other ointments being made with almond oil, when olive oil would answer every purpose and possess the additional recommendation of being less than half the value of almond oil? At any rate, it would be wise to give the pharmacist the choice of either, whichever might best suit the locality where he pursues his calling. Lard, too, would be an economical substitute for unguentum simplex in several ointments, and as a general rule more satisfactory.

Again, there is essence of peppermint, of the strength of one to four, when country consumers have for generations been accustomed to the strength and price of one to nine.

I might also refer to syrups with a considerable amount of spirit in them, when a well-made article without it would keep much better, and some other unwisely expensive preparations.

The West End chemists, and, I am sorry to say, the members of the Council of the Pharmaceutical Society generally, hence the unpopularity, have not had the remotest idea of the difficulties that the well-intentioned provincial chemist has to contend with in adapting his business to the modern requirements of better localities.

The compilers of the Pharmacopœia should ever bear in mind that they are at work in the interests of the poor as well as the rich.

To ensure the universal adoption of the Pharmacopœia, it is imperatively necessary that all the formulæ should be as uncostly as possible.

A Country Chemist.

Santonin Poisoning.

Sir,—The following may serve as another caution to those who are inclined to give large doses of santonin. Some time ago I supplied five grain powders of santonin for a child of eight years, who was infested with worms, and as a rule every powder had the effect of bringing away a few, but it seemed as though that dose would never quite dispel them. I therefore gave the mother a drachm of the santonin and told her to give the child as much as would lie on a sixpence twice a week. This she did several times without any ill results, and then she ventured to give another half more, thinking there would be no danger, and that the increased dose might the sooner put an end to the worms. In half an hour, however, after this last dose was given, the child showed symptoms that alarmed the parents; its face grew pale, and it began to talk in a delirious way. One of the family was despatched for the nearest chemist, another for a doctor, and the child was meanwhile undressed and put into a hot bath, as its extremities had begun to get deathly cold. The chemist was the first to arrive, and he wisely brought with him an ounce of ipecac. wine, a tablespoonful of which was with difficulty given to the child, whose teeth were by this time getting so clenched that they could scarcely be opened. In a few minutes vomiting was produced, and after that the child gradually rallied, much to the delight of all, the mother in particular, who thought she had poisoned her child. Since then, I have prescribed santonin more cautiously, never giving more than from two to four grains to any child.

A Scot.

Sir,—I beg to make a remark in regard to "santonin poisoning," the bad effect of which I have noticed your correspondents speak of from time to time. It seems to me that it may result from the santonin remaining in the system too long, as I have given it frequently in combination with hyd. c. creta during the last eight years for worms, with none but the best of results.

W. L.

Barbery as a Source of Mildew.

Sir,—In reading the botanical portion of your Journal for the present month, I was rather surprised at the statement about the barberry growing in such abundance in the village of Rollesby, Norfolk, that it seriously affected the wheat crop in that place.

Having lived nearly forty years in the adjoining parish of Ormsby, and also botanizing for several years in the neighbourhood, I never saw the barberry growing in the hedges, and never heard the expression, "Mildewed Rollesby;" but finding the same statement in the 'English Botany,' I wrote to an old gentleman, between sixty and seventy, who for many years had a large farm in this parish. The following is an extract from his letter:—He says, "The information I can supply you with respecting the barberry abounding at Rollesby is mostly traditional. When my grandfather first lived there, there was a great deal of it growing in the hedges, more particularly round his garden; but it soon began to be considered injurious, on account of its tendency to mildew the wheat crop; consequently, it was rooted up everywhere excepting in his garden, in which it was considered ornamental. But one year, the field adjoining being sown with wheat and the wind blowing from the garden across the field, there was a distinct line the breadth of the fence mildewed; consequently, it was all cut down, and I have never heard of any growing in the fences since."

From this it appears that the barberry does produce a fungi which is injurious to corn, and therefore the statement referred to in the *Pharmaceutical Journal* is perfectly correct.

34, *Bernard Street*, *Russell Square, W.C.* Hampden G. Glasspoobe.

J. Rees.—Your letter is so obscure that we are unable to understand the circumstances it refers to, but if you will send the particulars of the matter which you think requires explanation we will endeavour to furnish one, or perhaps it would be more suitable that you should submit full details to the consideration of the Council.

J. T. H., Dublin.—An advertisement of the preparation in question will be found in the 'Advertiser' to the *Pharmaceutical Journal* for May 24, p. viii.

J. A. S.—Picric acid is formed when phenol and some other bodies are heated with nitric acid. See Watt's 'Dictionary,' under "Trinitrophenic Acid," vol. iv., p. 400.

"*Derfla.*"—Section 12 of the Pharmacy Act, 1868, provides that it shall not be lawful for any person not being duly registered as a pharmaceutical chemist to assume or use any name, title, or sign implying that he is registered.

C. H. J. Saunders.—We presume that what you call a circular, informing a man that he has passed, is what our other correspondent calls a certificate. In fact, it is quite sufficient for the purposes of registration.

"*Kino.*"—Apply to the Registrar under the Dental Act, 315, Oxford Street, W.

"*Zasolks.*"—Similar mixtures have been the subject of comment in the "Month" on the "Dispensing Memoranda' several times in the present volume.

L. B.—A summary of the Trade Marks Registration Act and the Rules under which it is administered will be found in the Calendar of the Pharmaceutical Society for 1879 and in the *Pharm. Journ.* for January 8, 1876.

H. F.—A recipe for a solution for soap bubbles will be found in vol. v. of the present series, p. 78.

G. Fritz.—The preparation is a proprietary one, and we do not think its formula has been published.

W. Pearson.—So many preparations might be included under the name that it is difficult to know exactly which you mean unless you describe specifically the purpose for which it is intended.

M. P. S.—In a paper by Mr. Gerrard, on the Dispensing of Copaiba Resin (*Pharm. Journ.* [3], vol. iv. p. 63), the use of compound powder of almonds as an emulsifying agent is recommended. See also a paper by Mr. Greenish (*Pharm. Journ.* [3] vii. p. 369).

Communications, Letters, etc., have been received from Messrs. Craig, Squibb, Collier, Saunders, Martindale, Baldock, Catford, Brown, Bonne Guerre, Investigator, Chemist and Druggist, Gulielmus, Ardens, Lavandula, Aloysius, Ictus Equi, A.P.S., S.B.G., M.P.S., J.L.W., J.H.

BIDARA LAUT.

BY HENRY G. GREENISH.

Bidara Laut has already been the subject of several communications to the *Pharmaceutisch Weekblad* during the past two years. In a critique on the 'Plantkundig Woordenbook voor Nederlandsch Indië' which appeared in the issue of that journal for January 14, 1877, the botanical source of Bidara Laut is referred to a species of *Sisyphus*, of the natural order Rhamnaceæ, plants of which order are characterized by their tonic properties.

Dr. E. A. Van der Burg, in the same journal for January 28, 1877, remarks that the wood, according to his analysis, contained brucia in quantity apparently considerable (though not estimated), and that strychnia and other alkaloids were absent. From information received from Mr. J. D. Vrijdag Zijnen he believes the source of the wood to be *Strychnos Ligustrina*. On the other hand, a short note in the issue for August 26, 1877, refers the wood to *Eurycoma longifolia*, Jack., a Simarubaceous plant.

Messrs. Wattez and Bakhoven appear, from a communication made by the latter on March 18, 1878, to have had occasion to examine this wood, and to have come to the conclusion that brucia, or at least an alkaloid agreeing with brucia in all re-actions, was present, but that strychnia was absent.

Mr. Vrijdag Zijnen, junr., of the Hague, however, informs us that, according to analyses of various samples of Bidara Laut made by his father in conjunction with Dr. E. A. Van der Burg, brucia principally is present, but that some sorts contain strychnia also. To this Dr. Van der Burg, replies in the issue for April 21, 1878, and points to a misinterpretation by Mr. V. Zijnen of his father's analyses, and stating that Bidara Laut had been examined in his laboratory without a trace of strychnia being found.

A few days ago an opportunity of analysing a sample of this drug obtained from Mr. Vrijdag Zijnen presented itself to me, the results of which form the subject of this communication.

Without going deeply into its history, it may be here stated that Bidara Laut is largely used in India as a popular remedy for dysentery, the people being in the habit, according to Mr. Vrijdag Zijnen, of scraping a spoonful and taking it in a glass of water. The sample which I had given me consisted of part of the trunk or branch of a small tree about 2½ inches in diameter, with small eccentric pith, exceedingly hard wood and thin dark grey bark, in some places exfoliating, but in others adhering to the wood with considerable tenacity.

Professor Russow, of this University, has been kind enough to undertake the microscopical examination with a view to ascertaining the botanical source of the wood. From him I learn the development of phleom in the pith, well shown in the "Bidara Laut," is a peculiar characteristic of plants belonging to the group Contortæ, which includes the orders Gentianaceæ, Loganiaceæ, Apocynaceæ, and Asclepiadaceæ. The size of the sample, Bidara Laut however, excludes Gentianaceæ and Asclepiadaceæ, which orders produce herbaceous, or at most shrubby plants. The presence of brucia and the absence of laticiferous tissue prove without doubt that the plant yielding Bidara Laut belongs to the natural order Loganiaceæ, and the suppositions previously quoted that the source of the wood was a Rhamnaceous or Simarubaceous plant are incorrect.

The qualitative analysis of the drug for strychnia and brucia was carried out as follows :—

4·6 grams of the bark, carefully separated from the hard wood and powdered, were macerated in 100 c c. of water acidulated with 20 drops of dilute sulphuric acid (1 in 5) at a temperature of about 50°—60° C. for twenty-four hours and the fluid then filtered off ; the maceration was repeated for a shorter period of four hours and again filtered, and the filtrates and wash-water united. This liquid, amounting in all to about 250 c.c., was shaken with freshly rectified benzin (about 50 c.c.) and after the mixture had separated into two layers, the lower aqueous still acid layer was removed, made alkaline with ammonia and again shaken with benzin. This benzin solution, after separation and filtration, yielded on evaporation in watch-glasses alkaloid in considerable quantity, in very nearly colourless amorphous transparent drops, perfectly soluble in acidulated water. A portion of the alkaloid was dissolved in sulphuric acid (of the constitution $H_2SO_4H_2O$) and a small quantity of nitric acid added, when the characteristic brucia reaction made its appearance. After the orange colour so produced had faded to a pale yellow the strychnia was tested for by means of oxide of cerium (Ce_3O_4). No trace could be found. The experiment was repeated with like result. A control experiment with commercial brucia impure from the presence of strychnia yielded at once a splendid strychnia reaction. All brucia reactions succeeded perfectly.

The wood was tested in precisely similar manner with similar results. The quantity of alkaloid present, however, was notably less.

The quantity of brucia in the bark appearing considerable, it was thought an estimation of the amount present in it and in the wood might prove interesting. This was made as follows :—

2·0463 grams of the scraped and finely powdered wood were boiled with successive portions of water acidulated with sulphuric acid until the residue was free from bitterness. This was effected by three boilings with 75 c.c. and one with 25 c.c. The united filtrates were nearly neutralized with solution of soda and evaporated on a water-bath to a small bulk (25 c.c.) The liquid having deposited resinous matter, it was filtered off, the precipitate washed and tested free from alkaloid. The liquid being now still slightly acid, the estimation was made by means of titration by Mayer's solution (potassiomercuric iodide), 1 c.c. of which corresponds to 0·0197 gram anhydrous brucia.* 2·2 c.c. of solution were required, indicating 0·04334 gram brucia, or 2·11 per cent. An estimation of the moisture in the wood showed 6·67 per cent. The percentage of anhydrous brucia present in the dry wood is, therefore, 2·26.

The estimation of alkaloid in the bark was made in precisely similar manner.

1·8908 gram yielded liquid required 6·3 c.c. Mayer's solution = 0·12411 gram brucia, or 6·56 per cent. The estimation of moisture in the bark showed 11·23 per cent. The percentage of anhydrous brucia present in the dry bark was then no less than 7·38.

The quantity of brucia present in the wood and bark and its freedom from strychnia would point to this drug as a source of pure brucia free from strychnia in cases in which such may be required.

Since the conclusion of the above experiments, I have been enabled to examine in a similar manner

* Dragendorff, 'Chemische Werthbestimmung.'

the wood and bark of *Strychnos Colubrinum*. The specimen, which was formerly in the Martiny Collection of Drugs, consisted of a large portion of the tree trunk about 12 inches long and 3 inches in diameter. The wood was not so compact as that of *Strychnos Ligustrina* (Bidara Laut), hollow in the centre, the wood bordering on this hollow part being black, extremely hard and entirely destitute of the bitter taste which characterized the remainder of the drug.

The qualitative analysis showed the presence of brucia and strychnia, the reaction of the latter being especially well marked in the alkaloid from the bark.

The quantitative analysis gave—

In the wood, moisture, 9·02 per cent; alkaloid in dry wood, 0·96 per cent.

In the bark, moisture, 9·19 per cent.; alkaloid in dry bark, 5·54 per cent.

The alkaloid was estimated in the first instance volumetrically,* in the second gravimetrically.* The results are in both instances calculated to anhydrous brucia.

It is more than possible that the intermixture of this wood with the Bidara Laut has given rise to the variations in the latter found by Mr. Vrijdag Zijnen.

Two samples of the bark of *Strychnos Nux Vomica*, formerly known as false Angustura bark, were also examined. The samples selected consisted in the one case of young and comparatively thin bark, in the other of old and thick. They yielded respectively—

Young bark, moisture, 7·79 per cent.; alkaloid in dry bark,† 3·10 per cent.

Old bark, moisture, 7·83 per cent.; alkaloid in dry bark 1·68 per cent.

Dragendorff,‡ in a sample which would occupy, in regard to age and thickness, an intermediate position, found 2·4 of brucia in addition to a small amount of strychnia.

The percentage of alkaloid would seem then to diminish as the age and apparently also the thickness of the bark increases. This perhaps offers us an explanation of the fact that the alkaloids are present in *Strychnos Colubrina* in smaller quantity than in *Strychnos Ligustrina* (Bidara Laut), the bark of the latter being thin and papery in comparison with that of the former.

Dorpat, Russia.

NOTE ON LUNGE'S NITROMETER.§

BY WYNDHAM R. DUNSTAN,

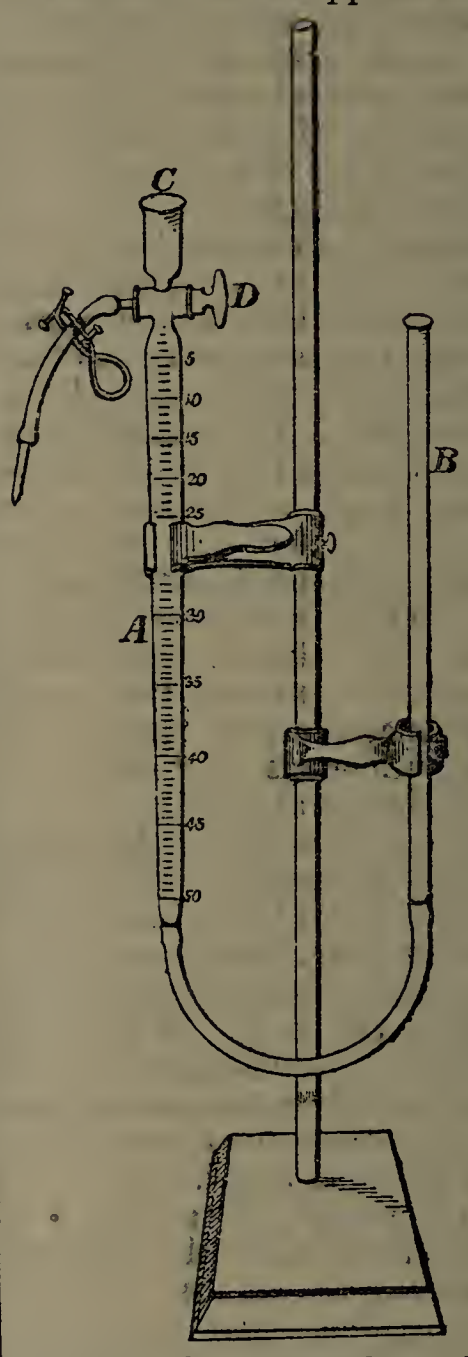
Assistant in the Laboratories of the Pharmaceutical Society.

§ Read at a meeting of the School of Pharmacy Students' Association, May 29.

The first apparatus for the estimation of nitric acid in nitrates, etc., the principle of which depended upon the reducing action of mercury upon nitric acid, was proposed by Crum.‖ It consisted of a graduated tube which was filled with mercury; the solution of the nitrate and some strong sulphuric acid were then introduced, the tube shaken, and the nitric oxide produced was absorbed by a solution of ferrous sulphate. Many modifications of this method have been proposed, notably that of Frankland and Armstrong,* which is specially applied to the estimation of nitrates in potable waters.

‖ *Ann. Chem. Pharm.*, lxii., 233.

The nitrometer devised by Dr. Lunge† is a modification of Crum's apparatus. It consists of a tube A holding fifty cubic centimetres, graduated in fiftieths of a cubic centimetre, provided with a funnel C and a two-bore glass tap D, on the end of which is fitted a waste pipe. By means of this tap communication can be established between the waste pipe and A, between the waste pipe and C, and between A and C. The tube A is connected with a plain tube B by a caoutchouc tube sufficiently strong to sustain the pressure of the mercury. Such a tube may be conveniently made by introducing a smaller rubber tube into ordinary gas tubing containing a coil of wire.



The method of working the apparatus is as follows:—The tube B is placed so that the open end at the top is a little higher than the tap D. D is then turned so that communication is established between A and C. Mercury is then poured into B until it fills A and some has entered C. D is now turned so that C communicates with the waste pipe. The excess of mercury is then run out of C by means of the waste pipe. The tap D is turned forty-five degrees, taking care that no air be allowed to enter and that all communications through D are closed. B is now lowered in the clamp and the solution of the nitrate is introduced into C; the tap D is then turned so that communication is established between C and A. When nearly all the solution of nitrate has entered A the tap is again closed. Excess of strong sulphuric acid, which of course must be free from nitrous compounds, is diluted with water, cooled, and then run in through C into A. If the substance under analysis be nitrous vitriol then the pure sulphuric acid need not be diluted, and at least five cubic centimetres, or more, of sulphuric acid should be employed, otherwise sulphate of mercury is formed, which renders the tube dirty. After the pure sulphuric acid has been nearly all run in D is turned so that C communicates with the waste pipe. The small quantity of acid remaining in C and the waste pipe is removed by means of a little water. A is now taken out of the clamp and agitated for a few minutes by repeatedly bringing it rather sharply from a nearly horizontal to a vertical position. A is

* *Journ. Chem. Soc.*, xxi., 77.

† *Ber. der Deutsch. Chem. Gesellsch.*, 1878, 434.

then replaced in the clamp and allowed to stand for one hour. B is taken out of the clamp and placed by the side of A, so that the levels of the mercury in both tubes are equal. When the tubes are in this position the number of cubic centimetres of gas are read off. The height of liquid above the mercury in A is accurately measured, the number of millimetres found divided by seven, mercury being seven times heavier than sulphuric acid, and then deducted from the barometrical pressure. The temperature of the room at the time of reading is also noted.

An example will illustrate the mode of calculation and show the degree of accuracy obtainable with the nitrometer. A solution of potassium nitrate was made by dissolving the dried commercial salt in water so that one cubic centimetre contained 0·0147 grm. of potassium nitrate. Four cubic centimetres were taken for analysis. The volume of gas in the tube after standing an hour was 10·9 cubic centimetres; the temperature of the room, 20° C.; barometric pressure, 749·8 millimetres; column of liquid above the mercury, 116·2 millimetres; the volume 10·9 cubic centimetres corrected for temperature (temperature of room, 20° C.), 10·15 cubic centimetres. Corrected for pressure (barometric pressure minus one-seventh of the height of the column of liquid over mercury, 749·8 mm. $-\frac{116\cdot2}{7}$ mm.), 9·8 c.c. Or the same result may be obtained by the following formula:—

$$\frac{V\left(\frac{L}{7}-B\right)}{760(1+003665\,t)} = \text{volume at 0° C. 760 mm.}$$

In the above formula V = volume of gas at t and B; B = barometric pressure in millimetres of mercury; t = temperature of room in degrees centigrade; L = column of liquid above the mercury expressed in millimetres.

Referring the corrected volume to the table below, which was published by Dr. Lunge,—*

Equivalents of Gas in Tube measured at 0° C. 760 mm.

No. of Cubic Cents. 0° C. 760 mm.	N. mgrm.	NO mgrm.	N_2O_3 mgrm.	N_2O_5 mgrm.	HNO_3 mgrm.	KNO_3 mgrm.	$NaNO_3$ mgrm.
1 . .	0·627	1·343	1·701	2·417	2·820	4·521	3·805
2 . .	1·254	2·686	3·402	4·834	5·640	9·042	7·610
3 . .	1·881	4·029	5·103	7·251	8·460	13·563	11·415
4 . .	2·508	5·372	6·804	9·668	11·280	18·084	15·220
5 . .	3·135	6·715	8·505	12·085	14·100	22·605	19·025
6 . .	3·762	8·058	10·206	14·502	16·920	27·126	22·830
7 . .	4·389	9·401	11·907	16·919	19·740	31·647	26·635
8 . .	5·016	10·744	13·608	19·336	22·560	36·168	30·440
9 . .	5·643	12·087	15·309	21·753	25·380	40·689	34·245

9·8 c.c. at 0° C. and 760 mm. = 0·0443 milligrams of potassium nitrate. The amount of solution employed contained 0·0456 gram of potassium nitrate.

Some experimental numbers are published by Dr. Lunge† almost exactly concordant with the amount of nitric acid present.

If it be desired to know the amount of nitrous and nitric acids in a mixture, the original solution is titrated with a solution of potassium permanganate which has previously been standardized with argentic nitrite. The total nitric oxide is then estimated by the nitrometer, and the amount represented by the nitrous acid found by the potassium permanganate subtracted.

The nitrometer may be used for the estimation of nitrates in potable waters. In this case the water is evaporated nearly to dryness, a few drops of sulphuric acid added, the solution warmed to expel carbonic anhydride and then treated in the usual manner.

Dr. Lunge* has found that neither arsenious acid or glucose interfere with the estimation.

In conclusion, I have to express my thanks to Messrs. Mawson and Swan, of Newcastle-on-Tyne, the makers of the nitrometer, which has been placed by them at my disposal to illustrate this note.

NOTES ON INDIAN DRUGS.

BY W. DYMOCK.

(*Continued from page* 896).

CITRULLUS VULGARIS, *Schrad.*, CUCURBITACEÆ. *The seeds. Vernacular.*—TURBUZ (Hind.); TARMUJ (Beng.); TURBUJ, KALINGAR (Bomb.); PITCHAPULLUM (Tam.).

History, Uses, etc.—The seeds of the water melon are of interest as being one of the four cold cucurbitaceous seeds of the ancients, which, according to Guibourt, were originally those of—

Cucumis sativus, L.	*Cucumis citrullus*, DC.
Cucumis melo, L.	*Lagenaria vulgaris*, var. *clavata*, DC.

But he remarks that in Paris the seeds of *Cucurbita pepo*, Duch., and *Cucurbita maxima* (the potiron of the French) are now substituted for those of *Cucumis citrullus* and *Lagenaria vulgaris*.

In Bombay the four cold cucurbitaceous seeds sold in the bazaars are those of—

Cucumis utilissimus.	*Cucumis melo.*
Benincasa cerifera.	*Citrullus vulgaris.*

These seeds are in great demand, and are kept decorticated and ready for use. The natives always use them together, and consider them to be cooling, diuretic, and strengthening. They fetch Rs. $\frac{3}{4}$ per pound.

ECBALIUM ELATERIUM, *A. Richard*, CUCURBITACEÆ.

Under the name of Kateri-indrayan the fruit of this plant in a dried state is sold in the Bombay shops. It is imported from Persia, and has evidently been gathered while immature, as the contents of the cucumber have not been discharged. Elaterium does not appear to be known in Hindu medicine, but the Arabs and Persians are well acquainted with it. The former called the fruit Katha-ul-himar and the latter Khiyar-i-khar (asses' cucumber). The author of the 'Makhzan-ul-adwiya' describes it, and also the method of preparing elaterium. To prepare this he directs the fruit to be sliced, thrown upon a strainer and pressed; the pulp is then to be twice washed with water and the deposit which is thrown down from the water collected and dried. It is then to be finely powdered and made into lozenges with an equal weight of gum arabic or calamine, or half its weight of starch. The Mahometan writers attach considerable importance to elaterium as a purgative

* *Ber. der Deuts. Chem. Gesellsch*, 1878, p. 434.

of the diseased humours, which they suppose to be the cause of a great number of diseases. They also use poultices made with the fruit, leaves, and root of the plant and direct the juice of the fruit to be snuffed up the nose to purge the brain and to be dropped into the ears in otitis. It is worthy of remark that the Hindus use their bitter and purgative cucurbitaceous fruits in the same manner. For an account of the chemistry of elaterium, which still requires further examination, I must refer the reader to Gmelin's 'Chemistry' and other standard works. The active principle, elaterin, $C_{20}H_{28}O_5$, is best obtained by exhausting elaterium with chloroform. From this solution a white crystalline deposit of elaterin is immediately separated by addition of ether. It should be washed with a little ether and recrystallized from chloroform. The bazaar fruit treated in this manner gave about 5 per cent. of elaterin.

APIUM GRAVEOLENS, *Linn.*, UMBELLIFERÆ. *The fruit. Vernacular.*—KARAFS, BOREE-AJMUD (Arab, Hind. and Bomb.).

History, Uses, etc.—Wild celery does not appear to have been known to the ancient Hindus. The Arabians probably obtained their knowledge of it from the Greeks. Meer Muhammod Husain, who wrote in India about one hundred years ago, informs us that karafs is the celery of the Europeans and the oodasaliyun of the Greeks. He describes three other kinds, viz., Sakhree, in Greek Fiturasáliyun ; Nabti in Greek Akoosaliyun; and Tari, in Greek Shamareeniyun ; what all of these may be it is difficult to decide. Fiturasáliyun is now the Bazaar name in Bombay for the fruits of *Prangos pabularia*, but it is evidently a corruption of the Greek *Petrose linon*, and had once a different meaning, being described in Arabic works as like Ajowan. The fruits imported into Bombay from Persia under the name of karafs, and sold in the bazaars as boree-ajmud, agree in structure with those of *A. graveolens*, L. (the ache des marais of the French). Mahometan writers describe karafs as deobstruent and resolvent, and use it in the form of a poultice with barley meal ; they recommend it internally as a pectoral and as a tonic and carminative adjunct to purgatives, also as a diuretic, emmenagogue, lithontriptic, and alexipharmic.

Description.—Karafs, or boree ajmud, as imported into Bombay from Persia, is a very small fruit, which, when the two mericarps are united, as is often the case, is almost globular ; it is quite smooth and remarkable for the size and prominence of its ridges ; the vittæ are 11—12 in number ; two of these are on the commissural side. The taste is at first like anise, but afterwards bitter. The odour like anise, but faint.

Commerce.—Value, Rs. 6 per Surat maund of 37½ pounds.

PASTINACA GRANDIS, *Dalz. and Gibs*, UMBELLIFERÆ. *The fruit. Vernacular.*—BAPHULLEC (Bomb.) ; DOOKOO (Hind.).

History, Uses, etc.—From the description of dookoo in Arabic and Persian works we gather that it was a kind of wild carrot with small fruit and a finely divided leaf. The name itself is evidently a corruption of daucus. In India this term has been transferred to quite a different plant. In Royle's 'Materia Medica' Falconer is quoted as describing dookoo as a fruit resembling that of asafœtida, and as probably derived from some species of *Ferula*. The dookoo of the Mahometan druggists of Bombay answers to this description, but the same fruit is called by the Hindus baphullee. Three years ago Dr. S. Arjun, of Bombay, planted some of it, and this year it has produced a flowering stem and proves to be the *Pastinaca grandis* of Dalzell and Gibson, a native of the Ghauts, near Bombay. The fruit is carminative and stimulant, and is said to be diuretic.

Description.—Plant three feet high, having very much the appearance of a garden parsnip which has run to seed. Root large, perennial, all quite smooth. Leaves mostly radical, long-petioled, bipinnate ; leaflets trilobate ; lobes large rounded ; margins crenate-serrate, shining on both sides ; cauline leaves 1—2 biternate. Stem as thick as the little finger at the base, round, smooth, striated. Involucre and involucral leaves oblong or obovate obtuse. Partial rays numerous, many flowered ; flowers yellow. Fruit large, broadly elliptical, varying in size, the largest are five-eighths of an inch long and three-eighths broad ; foliaceous, convex in the middle, with a dilated border consisting of coarse cellular tissue ; colour reddish yellow over the seed, margin pale yellow ; dorsal ridges seven, the three central filiform ; vittæ in dorsal furrows ten to thirteen ; vittæ of commissure six. The fruit has a powerful lemon odour.

Chemical Composition.—By distillation a light yellow essential oil was obtained, with an odour like oil of orange leaf.

Commerce.—The fruit is worth about Rs. 6 per pharrah (about 25 pounds).

FERULA GALBANIFLUA, *Boiss.*, UMBELLIFERÆ. *The gum resin.*—*Vernacular.*—No Indian names. JAWISHIR, GAOSHIR, BIREEZ (Pers.).

History, Uses, etc.—Besides the plant which is placed at the head of this article Boissier makes another species, *F. rubricaulis*, to grow in Persia. Berszczow, however, regards it as only a variety of *F. galbaniflua*. He states, though not from personal observation, that its gum resin, which constitutes Persian galbanum, is collected for commercial purposes round Hamadan (*confer.* 'Pharmacogr.'). Persian brokers in Bombay state that the galbanum plant is very abundant between Shiraz and Kirman, and there would seem to be no reason to doubt that this market is supplied from that district. The stems, fruits, and flowers, which often come here mixed with the drug appear to me to answer to the description of either plant. The old Hindu writers make no mention of galbanum ; Ainslie found that the Tamil physicians were unacquainted with it. In many Mahometan works the notices of galbanum appear to have been copied from Greek writers, the synonyms given being generally Barzad and Kinneh. The author of the 'Makhzan-ul-adwiya,' speaking of Barzad, says it is called Kinneh in Arabic, Khalbani in Greek, and Bireja or Ganda-biroza in Hindu, and is the produce of an umbelliferous plant like that which produces sagapenum, but he adds that the drug which he has met with in India under these names is the produce of a tree called deodar, growing in the north of India. His experience accords with that of the present day, the only ganda-biroza obtainable being the turpentine of *Pinus longifolia*. In Bombay Persian galbanum is known as Jawashir. On referring to the 'Makhzan' I find this word ex-

plained as an Arabic corruption of the Persian gaoshir. The author says that it is a fœtid gum resin, and describes its collection from an umbelliferous plant, its appearance, etc., and with regard to its properties informs us that it is attenuant, detergent, antispasmodic, and expectorant, and prescribed in paralytic affections, hysteria, and chronic bronchitis, also on account of its stimulant action upon the uterus. Externally it is used as a plaster. In short, he enumerates the uses to which galbanum is generally applied. It is then clear that the Arabs and Persians have not identified the Persian gaoshir with the galbanum of Greek writers. To the native practitioners of India galbanum may be said to be an unknown drug, the bulk of what is imported into Bombay being sent to Egypt and Turkey as jáwashir. It is hardly necessary to add that those writers who have identified jawashir with opoponax can never have seen the latter drug. I have never met with opoponax in Bombay.

Description.—Jowashir is a yellow or greenish-yellow fluid of the consistence of thick honey, and having an odour between that of Levant galbanum and sagapenum. It generally arrives mixed with portions of the stem, flowers, and fruit of the plant; the root is rarely to be met with. I have never seen this gum resin quite dry, but in some samples the consistence has been sufficient to enable me to trace the outline of separate tears in the sticky mass. The fragments of the plant found in Jawashir agree with the botanical characters of *F. galbaniflua.*

Chemical Composition.—For an account of the chemistry of Levant galbanum, which is the ordinary galbanum of commerce, the reader is referred to the 'Pharmacographia' and other standard works on materia medica. According to Hirschsohn, good Persian galbanum should yield to petroleum spirit not less than 65 per cent., consisting of volatile oil and resin, the average yield of Levant galbanum being between 60 and 63 per cent.

The amount of ash in Persian galbanum should not exceed 4 per cent., being less than the ash of ordinary lump Levant galbanum by 2 per cent. The best Levant in tears gives the same ash as clean Persian. As a qualitative reaction to distinguish the varieties of galbanum, hydrochloric acid can be used, as it colours the Persian resin yellow-red, passing into red, and the Levant different shades of violet. The petroleum spirit extracts from the Persian sorts give with nitric acid a rose-red colour; those from the Levant sorts different shades of violet bromine vapour colours; the Persian weakly or intensely violet, but the Levant yellow.

The ether-resin from both kinds of galbanum upon boiling with water gives indications of umbelliferon.

As to the origin of galbanum, Hirschsohn believes from its varied behaviour with reagents, the different action of the volatile oils upon polarized light, and the different proportions of volatile oil to the gum resin, that it is derived from different plants. He also points out that the Levant galbanum occurring in commerce contains no fruit and seldom stalks, but always slices of root, whilst the Persian galbanum always contains fruit and stalks.

Commerce.—Jawashir is imported from Persia, where it is said to be collected between Shiraz and Kirman. The imports are irregular; sometimes large quantities arrive; most of it is re-exported to Egypt and Turkey.

ALANGIUM LAMARCKII, *Thwaites*, ALANGIACEÆ. *The root bark. Vernacular.*—DHERA, AKOLA, ANKOOL (Hind. and Bomb.); AZHINJI-MARAM (Tam.); DHALAKURA (Beng.).

Description, Uses, etc.—The root bark of this tree, mentioned in Sanskrit works as ankota, has a reputation in leprosy and skin diseases. Mr. Moideen Sheriff has recently drawn attention to its emetic action in his 'Supplement to the Pharmacopœia of India.' He says it has proved itself an efficient and safe emetic in doses of fifty grains; in smaller doses it is nauseant and febrifuge. The bark is very bitter, and its repute in skin diseases is not without foundation. If it is continued for a sufficient period its influence over them is greater than that of *Calotropis gigantea.*

The tree is not uncommon in the Concons and Deccan; it may be seen at Elephanta, near Bombay; also at Tanna. I have not seen it used medicinally.

Syn. A. decapetalum, hexapetalum, and *tomentosum,* Lam.

(*To be continued.*)

INFLUENCE OF LIGHT UPON THE DECOMPOSITION OF IODIDES.*

BY ALBERT R. LEEDS.

As long ago as 1845, a sharp controversy arose between Schönbein and Professor Fischer, of Breslau, as to whether dilute solutions of potassium iodide would undergo decomposition in the presence of free acid. The latter had stated that all hydrous acids would turn paper, moistened with potassium iodide solution, brown. Schönbein, in reply,† pointed out the numerous sources of error from impurities in the iodide, and asserted that had Fischer employed a pure salt, he would have obtained quite different results; moreover, that atmospheric air, even when mingled with half its volume of carbonic acid, and enclosed in a flask, would not turn a piece of iodide-potassium-starch-paper, exposed to its action, blue, however long the exposure might be continued.

It will appear probable, I think, after examination of the experiments detailed below, that Professor Fischer's results were not due to the cause assigned them, and that both investigators might have legitimately arrived at discordant conclusions from sources of chemical perturbations at that time unsuspected.

A similar remark, perhaps, would apply to the dispute between M. Houzeau and M. L. Sauvage.‡ The former stated that the decomposition noted by M. Sauvage, when he agitated dilute solution of potassium iodide with dilute sulphuric acid, was due to the ether employed to collect the iodine, this ether producing oxygenated water; and that when chloroform was substituted, no evidences of decomposition could be detected.

Without further anticipating, however, it will be better first to relate the experiments themselves, beginning at the point arrived at in the conclusion of paper in the first number of the current volume, and afterwards deduce certain conclusions, having an important bearing on numerous operations performed in the laboratory.

I.—To determine whether a change of base influenced the rate of decomposition in the sunlight, when the same acid was employed; or, with the same base, when different acids were used. Ten per cent. solutions of the iodides were employed:

Decompositions effected January 18. 12—1 p.m.

100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. H_2SO_4 = 2·25 mgrm. I.

* From the *Journal of the American Chemical Society,* vol. i., Nos. 1–3.

† *Jour. für prakt. Chem.,* 1845, xxxiv., p. 492.

‡ *Compt. Rend.,* 1868, lxvii., pp., 633, 714, 1138.

20 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. H_2SO_4 = 1·35 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. H_2SO_4 = 2·20 mgrm. I.
20 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HNO_3 = 0·90 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HNO_3 = 2·00 mgrm. I.
20 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HNO_3 = 1·00 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HNO_3 = 2·00 mgrm. I.
20 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HCl = 0·30 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HCl = 1·00 mgrm. I.

The above experiments were performed with acids whose specific gravities were as follows: Sulphuric acid, 1·84; hydrochloric acid, 1·202, and nitric acid, 1·4. In the subsequent experiments, the acids employed were some manufactured in the laboratory with especial care, and of such strength that 1 c.c. of the sulphuric acid corresponded to 25 c.c. of a normal soda solution; 1 c.c. of the hydrochloric to 10·7 c.c., and 1 c.c. of the nitric acid to 12·6 c.c. of the normal soda solution.

(Strong sun-light) Feb. 4, 1879. 1 p.m.—3.30 p.m.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. H_2SO_4 = 16·0 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HNO_3 = 17·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HCl = 16·0 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. H_2SO_4 = 14·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HNO_3 = 16·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. NH_4I + 1 c.c. HCl = 13·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. H_2SO_4 = 11·0 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HNO_3 = 14·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HCl = 11·0 mgrm. I.

It will be noted that this series shows less of a definite character than the foregoing. The only constant feature being the greater amount of decomposition occurring in presence of the free nitric acid. One phenomenon made strikingly evident in this experiment was, that a great amount of decomposition took place after all the starch present had been precipitated, the supernatant liquid in every comparison-tube being dark yellow. It appeared, therefore, important to keep the starch in excess in each experiment. Repeated:—

February 10, 1879. Feeble sunlight for 2½ hours.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. H_2SO_4 = 7·15 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HNO_3 = 5·2 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HCl = 2·0 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. H_2SO_4 = 6·5 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HNO_3 = 5·0 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HCl = 2·1 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HNO_3 = 6·4 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. KI + 1 c.c. HCl = 2·2 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HNO_3 = 5·3 mgrm. I.
100 c.c. H_2O + 5 c.c. starch + 1 c.c. CdI_2 + 1 c.c. HCl = 2·9 mrgm. I.

In this series, though at the close of the experiment, the supernatant liquids were yellow, yet the amounts of liberated iodine were not so greatly in excess of the required amounts of starch, and more agreement will be found in the results. The experiments were therefore twice repeated, the times of exposure being made so short that the liquids remained bright blue to the end. Any shade of greenish blue, arising from the admixture of the blue of the starch iodide with the yellow of free iodine, was avoided.

Starch in Excess.—February 12, 1879.

I, from 1—1.35 p.m. (sunlight).—II, 3.30—5 p.m. (cloudy).

c.c.		Starch.	c.c.		c.c.		I. Mgrm. I.	II. Mgrm. I.
100	H_2O	+ 5 c.c.	+ 1	KI	+ 1	H_2SO_4	= 0·45	0·25
100	„	+ 5 „	+ 1	„	+ 1	HNO_3	= 0·40	0·30
100	„	+ 5 „	+ 1	„	+ 1	HCl	= 0·15	0·10
100	„	+ 5 „	+ 1	CdI_2	+ 1	H_2SO_4	= 0·45	0·24
100	„	+ 5 „	+ 1	„	+ 1	HNO_3	= 0·45	0·30
100	„	+ 5 „	+ 1	„	+ 1	HCl	= 0·15	0·10
100	„	+ 5 „	+ 1	KI	+ 1	HNO_3	= 0·55	0·30
100	„	+ 5 „	+ 1	„	+ 1	HCl	= 0·15	0·10
100	„	+ 5 „	+ 1	CdI_2	+ 1	HNO_3	= 0·50	0·30
100	„	+ 5 „	+ 1	„	+ 1	HCl	= 0·15	0·10

This double series brought out strikingly the fact, which was confirmed in all subsequent trials *with sunlight*, that the amount of iodine liberated in presence of free sulphuric acid, bore a nearly constant ratio, when the same base was combined with iodine, to that occurring in case of hydrochloric acid. The deportment in presence of nitric acid was at variance with that anticipated, on account of a secondary action not investigated until later.

II.—As to the part played by the starch itself in these reactions, the supposition had been, that its affinity for the liberated iodine, though feeble, had nevertheless been one of the agencies at work in determining the fact of a decomposition.

To what extent its influence was exerted, was the object of the next experiment, in which to the contents of four comparison tubes each containing 100 c.c. H_2O, 5 c.c. starch were added (column I.), and to four other similarly prepared, no starch (column II.)

February 13, 1879. 1.15—2.15 p.m. (cloudy).

			I.	II.
1 c.c.	KI + 1 c.c.	H_2SO_4 =	Lost	1·15 mgrm. I.
1 „	„ + 1 „	HCl =	0·45 mgrm. I.	0·90 „
1 „	CdI_2 + 1 „	H_2SO_4 =	0·55 „	1·15 „
1 „	„ + 1 „	HCl =	0·45 „	0·90 „

That omission of starch should have increased, and in fact have doubled, the amount of iodine set free under these circumstances, was so opposite a result to what was anticipated, that the experiment was repeated in the expectation of finding the former figures incorrect; they were confirmed.

Repeated February 15, 1879. 10.30 a.m.—12.45.

			I.	II.
1 c.c.	KI + 1 c.c.	H_2SO_4 =	3·70 mgrms. I.	7·5 mgrms. I.
1 „	CdI_2 + 1 „	=	4·00 „	8·2 „
1 „	LiI + 1 „	=	3·75 „	5·8 „

Further proof was obtained when each of the iodides was exposed with each of the acids, both being employed of same strengths and amounts as stated above, and the solutions made up to 100 c.c.

February 19, time 20 minutes. (Without starch.)
1 c.c. H_2SO_4 + 1 c.c. KI = 2·85 mgrm. I; CdI_2 = 3·85 mgrm. I; LiI = 2·35 mgrm. I.
1 c.c. HNO_3 + 1 c.c. KI = 2·85 mgrm. I; CdI_2 = 3·15 mgrm. I; LiI = 2·30 mgrm. I.
1 c.c. HCl + 1 c.c. KI = 2·00 mgrm. I; CdI_2 = 2·45 mgrm. I; LiI = 1·35 mgrm. I.

The decomposition as will be seen on comparing these results with the foregoing, was so much greater, that

after the two following experiments, the use of starch was abandoned in most cases.

III.—Decomposition in Presence of Organic Acids.

To 1 c.c. of the potassium iodide solution, acetic, tartaric and oxalic acids were added, and the liquids made up to 100 c.c. Three of the tubes contained starch—three without. At the end of two hours' exposure to the sunlight, only the oxalic acid had effected decomposition; after eight hours all had changed; they were left for two days, and titrated at the end of forty-eight hours.

February 22; 2 days. (Organic acids)

	With starch.	Without.
Oxalic Acid	= 6·15 mgrm. I.	8·25 mgrm. I.
Tartaric „	= 0·85 „	0·30 „
Acetic „	= 0·35 „	0·50 „

IV.—Decompositions Effected by the Electric Light.

A cylindrical stand was made of such dimensions that the centre of the axis of the 100 c.c. column contained in each comparison tube, should be at a distance of 6 inches from the focus of the electric light. The electric arc was taken between carbon points, and was produced by electricity generated with a dynamo-electric machine run by steam power, its illuminating capacity varying during the course of the experiment, according to the photometric measurements made by Professor Morton and Mr. Beckmayer, between 7000 and 7500 candles. In the first experiment the first nine solutions contained 5 c.c. starch water, the last two none, and it will be noted that in the latter decompositions were twice as great.

Electric Light.

c.c.	c.c.	15 min. Mgrm. I.	20 min. Mgrm. I.	7½ min. Mgrm. I.
1 H_2SO_4 + 1	KI	= 1·65;	same = 3·90;	same = 3·00
1 HNO_3 + 1	„	= 1·80;	1 c.c. HCl = 3·15;	——
1 HCl + 1	„	= 1·05;	same = 3·40;	same = 2·00
1 H_2SO_4 + 1	CdI_2	= 1·80;	„ = 3·15;	„ = 2·25
1 HNO_3 + 1	„	= 1·40;	1 c.c. HCl = 2·30;	——
1 HCl + 1	„	= 1·25;	same = 2·50;	same = 1·35
1 H_2SO_4 + 1	LiI	= 0·90;	„ = 3·00;	„ = 2·10
1 HNO_3 + 1	„	= 0·95;	——	——
1 HCl + 1	„	= 0·60;	same = 1·70;	same = 1·00
1 H_2SO_4 + 1	KI	= 2·35;		
1 „ + 1	CdI_2	= 2·30;		
1 „ + 1	NH_4I	= — ;	= 2·50;	= 2·30
1 HCl + 1	„	= — ;	= 1·50;	= 1·50
1 „ + 1	„	= — ;	= 1·85;	= —

The potassium iodide solution in the first two trials was of 10 per cent., in the third twice this amount. The other iodides were of a strength equivalent to the 10 per cent. KI solution in each trial.

The highly actinic nature of the electric beam is made strikingly manifest by the large amounts of iodine set free. Moreover, its chemical energy is not the same in the three experiments, twice the amount of decomposition having been effected in the third, as in the second experiment, during the same interval of time. The reason of this variation is not quite clear, for while the light was remarkably uniform during the third experiment, there was no such corresponding difference in the apparent luminous effect.

V.—Comparison of Effects of Sunlight and Electric Light after passing through Absorbing Media.

1 c.c. of a 20 per cent. solution of potassium iodide solution was used in these experiments, with the acids and water. The comparison-tubes were supported in the centres of tall, wide-mouth bottles, so as to be surrounded by an equal thickness (3 cm.) of the absorbing medium on every side. Their tops and those of the bottles were closed in with tin foil, so as entirely to prevent the access of light from that quarter. The blue medium was ammoniacal solution of copper; the yellow, neutral potassium chromate; the red, fuchsine. They were made of such strength that the outlines of an object could be seen through them with equal distinctness, though in each case feebly.

		Sunlight. March 3, '12 m.—3 p.m.	Electric Light. 20 min.
Blue	1 c.c. H_2SO_4	= 7·15 mgrm. I.	= 2·00 mgrm. I.
	1 „ HCl	= 6·65 „	= 1·50 „
Yellow	1 „ H_2SO_4	= 2·00 „	= 0·165 „
	1 „ HCl	= 1·35 „	= 0·15 „
Red	1 „ H_2SO_4	= 4·60 „	= 1·65 „
	1 „ HCl	= 2·50 „	= 1·00 „

Computed for equal intervals they would be:—

		Sunlight (1 hour).	Electric Light (1 hour).
Blue	1 c.c. H_2SO_4	= 2·38 mgrm. I.	= 6·00 mgrm. I.
	1 „ HCl	= 2·22 „	= 4·50 „
Yellow	1 „ H_2SO_4	= 0·67 „	= 0·50 „
	1 „ HCl	= 0·45 „	= 0·45 „
Red	1 „ H_2SO_4	= 1·53 „	= 4·95 „
	1 „ HCl	= 0·83 „	= 3·00 „

Now, while in the preceding experiments, the action in the electric light had been approximately three times the maximum of that in the sunlight, this ratio, when absorbing media were used, was approached only in case of the blue and red solutions. In other words, the yellow medium absorbed a much larger relative proportion of the actinic rays of the electric, than of the sunlight. Better to understand what occurs in this instance, a study of the absorption-spectra (chemical) of the media, and of the decomposition of the various iodides in the several portions of the spectra of the sun and electric light, has been entered upon.

VI.—Decomposition Effected by the Magnesium Light.

The light was furnished by a single-ribbon magnesium lamp, run by clock-work. The reason for repeating the experiment *three* times was that the ratio of decomposition in presence of free hydrochloric acid was greater instead of less (as when sun and electric light were employed), than in the presence of free sulphuric acid, the acids being of strength before given. This difference is probably connected with the fact, long since recognized in photography, that the maximum of sensitiveness for certain sensitive salts is located in different parts of the spectrum. The potassium iodide was of 20 per cent., the other iodides were equivalent to a 10 per cent. KI solution.

Magnesium Light.

c.c.		I.	II. (1 hour.) Mgrm. I.	III. (½ hour.) Mgrm. I.
1 H_2SO_4 + 1 c.c.	KI	= lost;	same = 0·050;	same = 0·015
1 HCl + „		= 0·225;	„ = 0·075;	„ = 0·050
1 H_2SO_4 + 1 c.c.	CdI_2	= 0·080;	„ = 0·035;	„ = 0·010
1 HCl + „		= 0·150;	„ = 0·050;	„ = 0·050
1 H_2SO_4 + 1 c.c.	LiI	= 0·075;	„ = 0·040;	„ = indet
1 HCl + „		= 0·165;	„ = 0·050;	„ = 0·060
1 H_2SO_4 + 1 c.c.	NH_4I	= 0·115;	„ = 0·060;	
1 HCl + „		= 0·200;	„ = 0·070;	

VII.—Actinometric Determination of Sunlight.

In order to compare the decomposition effected by the sunlight, after passing through various thicknesses of the earth's atmosphere, and to compare the relative amounts of iodine set free under these circumstances, when different salts were employed, the determinations summarized in the accompanying table were made. The day was unusually brilliant and unclouded, from beginning to close. The potassium iodide was 20 per cent.; the other iodides were equivalent to one-half this quantity; the acids were of same strength as before given.

ACTINOMETRIC DETERMINATIONS, FEBRUARY 27, 1879.

	A.M.					M.		P.M.							
	9 to 9.30	9.30 to 10	10 to 10.30	10.30 to 11	11 to 11.30	11.30 to 12	12 to 12.30	12.30 to 1	1 to 1.30	1.30 to 2	2 to 2.30	2.30 to 3	3 to 3.30	3.30 to 4	4 to 4.30	4.30 to 5

VIII.—Comparison of Actinic Intensities for Equal Times.

The foregoing results are brought together in the following table. The numbers found for the magnesium light have been multiplied by ten, in order that the corresponding curve may be brought into the same illustration with the others.

Decomposition during Equal Times (1 *hour*).

	Electric Light.	Sun.	Magnesium.
H_2SO_4 + KI	= 19·5 mgrm. I.	6·5 mgrm. I.	0·05 mgrm. I.
HCl + „	= 13·0 „	4·0 „	0·075 „
H_2SO_4 + CdI_2	= 14·6 „	4·4 „	0·035 „
HCl + „	= 8·8 „	3·0 „	0·050 „
H_2SO_4 + LiI	= 13·7 „	3·1 „	0·04 „
HCl + „	= 6·5 „	2·4 „	0·05 „
H_2SO_4 + NH_4I	= 15·0 „	3·9 „	0·06 „
HCl + „	= 9·8 „	2·3 „	0·07 „

IX.—Influence of Heat upon the Decomposition of the Iodides.

These experiments were made at that period in the investigation when the effect of light had been recognized, but the concurrent action of oxygen was unknown. The first experiment was made in comparison-tubes, each containing 1 c.c. KI (of 10 per cent.), 5 c.c. starch water, and 1 c.c. H_2SO_4. But I was made up to 20 c.c. with water II to 60 c.c. and III to 100 c.c. The times given in the upper line are those at which the change of colour first occurred; those in the second line, when the same tint appeared on further heating. The change is quite gradual, running through the scale of colours indicated.

I. (20 c.c.).

Very Faint Rose. Faint Rose. Rose. Violet. Blue.
(30° C.) 5 m. (33°) 10 m. (36°) 16 m. (38°) 20 m. (45°) ½ h.
(95°) 95 m. (86°) 1½ h. (65°) 50 m. (56°) 40 m.

At boiling point, slowly became colourless.

II. (60 c.c.).

(32°) 7 m. (34°) 12 m. (39°) 24 m.
(61°) 44 m. (50°) 39 m.

Became colourless at 85°, at the expiration of 1 h. 25 m.

III. (100 c.c.).

(34°) 11 m. (41°) 27 m.
(50°) 35 m.

Became colourless at 59°.

In other experiments different figures were obtained, and since the starch is converted into dextrin on heating with dilute acid, its use as an indicator under these circumstances was abandoned.

Effect of Heat in Closed Flasks.—To three flasks, each containing 60 c.c. H_2O and 1 c.c. H_2SO_4, were added ½ c.c., 1 c.c. and 2 c.c. of a 10 per cent. KI solution respectively. They were closed with valve-stoppers, so as to exclude the air, and heated to 93° C. for six hours. After cooling, starch was added and they were titrated. The first contained no free iodine, the second gave a very faint rose colour to the starch, but too little to titrate, the third contained 0·1 mgrm. I. In other words, when the potassium iodide was diluted 600 times, and heated nearly to the boiling point in a closed flask for six hours, the amount of iodide set free was so small that it could not be estimated, and when diluted 1200 times, no change whatever took place.

Effect of Heat in Flasks Entirely Deprived of Air.—Three comparison-tubes were connected in the manner of wash-bottles. Each contained 100 c.c. water and 1 c.c. KI solution of 20 per cent., but the first had 1 c.c. H_2SO_4, the third 1 c.c. HCl as well. After passing a stream of carbonic anhydride, previously washed with KI solution, through them for half a hour, they were immersed in a salt-bath, and the temperature raised to 105° C. After two hours' exposure, a current of carbonic anhydride constantly flowing, no iodine had been liberated in either of the three vessels. Similar acidified solutions, heated to the same temperature, in contact with air, turned yellow immediately.

X. Reactions Involved in the Decomposition of Iodides.

The fact of the decomposition of the dilute iodides in presence of free acid having been established, it was essential to explain the accompanying reactions. The following might be legitimately conceived of:—

[1.] $2KI + 2H_2SO_4 = K_2SO_4 + 2H_2O + SO_2 + I_2$
[2.] $4KI + 2H_2SO_4 + O_2 = 2K_2SO_4 + 2H_2O + 2I_2$
[3.] $4KI + 4HNO_3 + O_2 = 4KNO_3 + 2H_2O + 2I_2$
[4.] $2HNO_3$ (in sun-light) $= N_2O_3 + H_2O + O_2$
[5.] $2KI + 2HNO_3 + N_2O_3 = 2KNO_3 + H_2O + N_2O_2 + I_2$
[6.] $4KI + 4HCl + O_2 = 4KCl + 2H_2O + 2I_2$.

It was evident the equation [1], which is true of concentrated solutions, could not apply to these very dilute ones, for two reasons:—1st. Because, as a fact, no sulphurous acid was given off. 2nd. Because free sulphurous acid and free iodine could not co-exist in the same solution. It was, therefore, necessary to adopt the supposition contained in the second equation, the required oxygen being supplied by the air. No such alternative was possible in the case of hydrochloric acid. And with nitric acid, since it had been found (see preceding paper) that nitric acid contained in hermetically sealed flasks and exposed to sunlight, contained much nitrous acid, besides a primary decomposition, similar to the foregoing, a secondary reaction was not only possible, but probable. To this secondary reaction, the amount of which could be readily foretold, the high results obtained with nitric acid were attributed.

Effect of Oxygen in Sunlight.—To test the above hypothesis, two opposed methods were desirable—a negative, when the iodides in the entire absence of oxygen, should undergo no change, and a positive, when

the iodides in presence of excess of oxygen, should change at a correspondingly accelerated rate. No method of carrying into execution the first method was found very feasible, except that of replacing the air held in solution and the atmosphere itself, by another gas. In this case, carbonic acid, which was employed for the purpose, appeared especially suitable, since it was in the presence of free acid that the experiments were to be performed. Three comparison-tubes were filled up in the manner of wash-bottles, the joints being perfectly air-tight. 100 c.c. water and 100 c.c. potassium was put in each. The first contained as well, 1 c.c. sulphuric acid, the third, 1 c.c. hydrochloric acid, the middle tube no acid. After displacing air in solution by a current of washed carbonic acid continued for three hours, the tubes were exposed at a sun-window, and kept there during forty-eight hours, the sun shining upon them during the whole of two days. At the end of this time, a slow current of the gas having been kept flowing through the solutions, they were found to have experienced no change. Without changing the contents of the tubes, or any of the arrangements further than replacing the stream of carbonic acid by a current of oxygen, the exposure was continued, when a change quickly began, and at the expiration of two and a quarter hours, during much of which time the sun was overclouded, the two solutions containing free acid had become deep yellow, the one without was entirely colourless. On titration, the first was found to contain 12·1 mgrms. of free iodine, the third 9·5 mgrms., the middle tube none.

These experiments put in a striking light the *rôle* which oxygen plays in the decomposition of iodides in presence of certain free acids. But two other points which they likewise render conspicuous should not be overlooked—that solution of pure potassium iodide, even when exposed to sun-light, is permanent not only in presence of excess of oxygen, but likewise in presence of excess of carbonic acid. These two points are important in their bearing upon ozonometry.

Effect of Air or Oxygen in the Dark.—When air had been completely replaced by carbonic acid, no decomposition occurred. Otherwise, not only did the rate of decomposition increase with the concentration (as shown in a preceding paper), but did not fall off to zero, even when the acid had been diluted four thousand, and the iodide forty thousand times. At the expiration of five days, with solutions one-half so dilute as those above (1 c.c. acid and 1 c.c. KI solution, in two litres), the iodine set free amounted to 0·25 mgrm.

Conclusion.—It is evident that the above results necessitate the use of corresponding precautions and modifications, in cases where potassium iodide is employed in titration, more especially in the determination of nitrates in potable waters, acid solutions, etc.; but the work instituted in this direction has not as yet been completed.

CONSTITUTION OF ROMAN CHAMOMILE OIL.

A series of papers upon this subject has recently appeared in *Liebig's Annalen*, and the following is taken from the abstracts that have been given in the *Journal of the Chemical Society* for June:—

H. Kopp (*Liebig's Annalen*, 195, 81-92) saponified the oil by boiling it with alcoholic potash. After distilling off the alcohol the soap was boiled, first with water and then with dilute sulphuric acid, until nothing but water passed over. The distillate was neutralized with sodium carbonate and evaporated to dryness, and the residue decomposed by sulphuric acid. The oily mixture of acids thereby set free was finally submitted to fractional distillation. In this way the author found angelic and tiglic acids in about equal quantities, isobutyric acid in much smaller amount, and a fourth acid, most probably methacrylic acid, but this was not isolated. No other acid was present in appreciable quantity.

Angelic acid, $C_5H_8O_2$, melts at 45—45·5°, and boils at 185° (not at 191°, as formerly stated). Its *calcium salt* $(C_5H_7O_2)_2Ca + 2H_2O$, is much more freely soluble in cold than in hot water. On heating a cold saturated solution, the salt crystallizes in long brilliant needles, which disappear as the liquid cools. The *barium salt* $(C_5H_7O_2)_2Ba + 4\frac{1}{2}H_2O$, is very freely soluble in water, and crystallizes with difficulty. The *silver salt*, $C_5H_7O_2Ag$, is a white precipitate, which crystallizes from boiling water in colourless feathery crystals. The *potassium salt* is crystalline, very soluble, and deliquescent.

Tiglic acid, $C_5H_8O_2$, melts at 64·5°, and boils at 198·5°. The *calcium salt* $(C_5H_7O_2)_2Ca + 3H_2O$, crystallizes in white laminæ, which dissolve sparingly in cold and freely in boiling water. The *barium salt* $(C_5H_7O_2)_2Ba + 4H_2O$, is more soluble than the calcium salt, but much less soluble than the corresponding salt of angelic acid. It forms small hard prismatic crystals. The *silver salt* is less soluble than that of angelic acid, but may be crystallized from boiling water in small white feathery groups. The *potassium salt* crystallizes readily in tufts of small needles, which are not deliquescent.

The transformation of angelic acid into the isomeric tiglic acid by the action of heat or of concentrated sulphuric acid was observed by Demrçaay (*Compt. rend.*, 83, 906), whose statements are fully confirmed by Kopp. A quantity of pure angelic acid, after being kept in a state of gentle ebullition for forty hours, was found to be almost entirely transformed into tiglic acid.

Köbig (*Liebig's Annalen*, 195, 92—108) submitted the oil to very careful fractional distillation, whereby he succeeded in separating it into five distinct portions, boiling at the following temperatures:—(1), 147—148°; (2), 177—177·5°; (3), 220—201°; (4), 204—205°; 5, above 220°, with decomposition. Each of these portions was analysed and saponified with aqueous potash, and the products of saponification were examined. The first portion was found to consist mainly of an ethereal salt of isobutyric acid, most probably ethyl isobutyrate. The second portion consisted of the isobutyl salt of angelic acid, $C_5H_7O.O.C_4H_9$. The third and fourth portions were found to be the amyl salts of angelic and tiglic acids, angelic acid predominating in the former portion and tiglic acid in the latter. The fifth portion yielded by saponification angelic and tiglic acids and the two following bodies:—(*a*). A hexyl alcohol of sp. gr. 0·8295 at 15°, boiling at 152—153°, insoluble in water, and yielding a capronic acid by oxidation. This is believed by the author to be one of the eight theoretically possible primary hexyl alcohols, of which normal hexyl alcohol is the only one previously known. (*b*). A thick colourless liquid boiling at 213·5 to 214·5°, of peculiar camphor-like odour, isomeric with ordinary camphor, and termed *anthemol* by the author. This body was found to be the hydroxyl-derivative of terpene. It exists in chamomile oil as an ethereal salt of angelic and tiglic acids. It reacts with acetic anhydride to form an ethereal salt, $C_{10}H_{15}O.C_2H_3O$, from which it is recovered unaltered by saponification.

According to these results, Roman chamomile oil consists of a mixture of isobutyl isobutyrate, isobutyl angelate, amyl angelate and tiglate, and the angelic and tiglic ethers of a new hexyl-alcohol and of terpene-alcohol (anthemol). Other substances, if present at all, can only exist in very small quantities.

To separate angelic and tiglic acids, A. Pagenstecher (*Liebig's Annalen*, 195, 108—128) takes advantage of the peculiar behaviour of their calcium salts. Calcium angelate is more soluble in cold water than in hot; calcium tiglate, on the contrary, is more soluble in hot water than in cold. When, therefore, a concentrated cold solution of the two salts is heated to 60° or 70°, calcium angelate is thrown down, whilst calcium tiglate remains in solution. By appropriate application of these facts it is possible to separate nearly the whole of a mixture of the two acids in the form of pure calcium salts, from which the acids are liberated by addition of hydrochloric acid.

THE RESIN AND GUM OF GAMBOGE.*

BY DAVID COSTELO, PH.G.

Gamboge consists of resin and gum, in variable proportions. The amount of resin represents its value both medicinally and as a pigment. Thinking it would be of interest to ascertain the value of the present commercial varieties, specimens of pipe, lump and powdered gamboge were procured.

Ten grams of each were treated with alcohol until the colour was entirely removed. The gum, which is insoluble in alcohol, was dissolved in cold water and the solution filtered, to remove insoluble matter. The results are given in the following:—

In 10 grams of	Resin. grams.	Gum. grams.	Impurities. gram.	Total. grams.
Lump,	6·76	2·74	·38	9·88
Pipe,	7·93	1·945	·015	9·89
Powder,	7·66	2·25	·07	9·98

As there is a small quantity of water contained in gamboge, the discrepancy, in the above total, is attributed to this cause.

The resin was found to be of a bright reddish-brown colour, translucent, very brittle, and easily rubbed into a bright yellow powder. This is the so-called gambogic acid, $C_{20}H_{23}O_4$. Its solution in alcohol or ether has an acid reaction to test paper, and it unites with bases to form salts.

It is soluble in alcohol, ether, chloroform, bisulphide of carbon, solutions of ammonia and potassa, and partially soluble in petroleum benzine. To form the salts of this acid the experiments of Johnston and Büchner were followed with slight modifications.

The resin dissolves very readily in warm ammonia water, forming a dark red solution of gambogiate of ammonium. The potassium salt is made by dissolving the resin in solution of potassa, the solution being also dark reddish-brown. On standing for some time, a gelatinous deposit is formed in each of the above solutions. The ammonia deposit was exposed until dry; the residue left was hard and brittle, insoluble in water, soluble in alcohol and ether, and in appearance resembled the resin.

To form the sodium salt, a portion of the ammonia solution was treated with a solution of chloride of sodium, when a yellow precipitate was thrown down. When the solutions are heated before mixing, the precipitate is much more dense.

Another portion of the ammonia solution was treated with a solution of chloride of barium, when a dark brick-red precipitate of gambogiate of barium was thrown down. The calcium salt is formed by using a solution of chloride of calcium as the precipitant; the precipitate is of a brownish-yellow colour. Both these salts are soluble in alcohol and ether; on the evaporation of the solutions the salts are left in the form of a fine powder.

The lead salt was made in a like manner by precipitating with solutions of neutral and basic acetate of lead; with the former the precipitate is yellow, while with the latter it is of an orange-yellow colour. These are also soluble in alcohol and ether, and are likewise left in the form of fine powder on evaporation of the solution.

When to an alcoholic solution of the resin an alcoholic solution of nitrate of silver is added, no precipitate is formed until after the addition of a small amount of ammonia, when the gambogiate of silver is thrown down as a yellow precipitate; on exposure to the air this precipitate changes very rapidly, becoming of a dark blackish-green colour.

The gambogic acid also forms salts with copper, iron, strontium, etc., by precipitating its solution with a solution of a salt of these metals.

The resin was boiled with strong nitric acid until red fumes ceased to be given off, and the solution became of a thick syrupy consistence; on cooling it solidified. This mass was washed with water to remove any free nitric acid, portions of it were then dissolved in alcohol, ether and chloroform, and on the evaporation of the solutions it was left as a light yellow coloured powder.

The aqueous solution of the gum was boiled with nitric acid, evaporated to dryness, redissolved in distilled water and concentrated. On standing for some time small crystals were deposited, together with an amorphous reddish-brown colouring matter. The mother liquor was drained off and the colouring matter dissolved out with alcohol, leaving the crystals colourless and transparent. As the number obtained was quite small, no satisfactory results could be obtained, other than that they were very soluble in water, insoluble in alcohol, were not entirely volatilized when heated on platinum foil, and had an acid reaction to test paper. The colouring matter, on the evaporation of the alcohol, was of a drab colour, quite bitter, sparingly soluble in water, but quite soluble in alcohol and ether.

* *American Journal of Pharmacy*, April, 1879. From a thesis presented to the Philadelphia College of Pharmacy.

PREPARATION OF IMITATION KUMYS.*

Fill into a strong champagne bottle good, fresh, unboiled cow's milk to such a height that after the addition of 30 grams (1 oz.) of granulated or powdered sugar, and after corking, there would still be left at least an inch of empty space below the cork. Before corking, add a piece of fresh compressed yeast, about the size of two peas, then cork and tie the cork firmly down. In place of compressed yeast, a teaspoonful of good beer yeast may be taken. The contents of the bottle are well shaken, repeatedly, then the bottles are placed in the cellar, where they are turned up and down a few times during the day. From and after the fifth day the mixture is ready, and may be drunk to about the twentieth day, It is best to prepare about six bottles full at a time, refilling each after it has been emptied and cleaned, so that the treatment, after being begun, may not be interrupted. On opening the bottles, the contents are very apt to foam over, hence the bottle should be opened while being held over a plate. It should never be opened where there may be any furniture or dresses about, which might be soiled by spattering.

A good milk-wine or kumys should have a homogeneous appearance, of the consistence of thin cream, should be effervescent when poured out, of an acidulous, agreeably vinous odour and taste, and should not be full of lumps, or taste like butter-milk.

On first using kumys it produces loose bowels, but this effect soon passes off.

INVESTIGATION OF THE SEEDS OF CAMELLIA JAPONICA.†

BY KATZUJAMA.

The seeds, after being freed from their oil by pressure, are exhausted with alcohol, the alcoholic solution precipitated by lead acetate, and the yellow precipitate thus produced decomposed by sulphuretted hydrogen; on evaporation, a bluish-white powder of bitter taste is obtained, which the author calls *camellin*. This substance is almost insoluble in water, and, when boiled with sulphuric acid, reduces alkaline copper solutions; it appears by other reactions to resemble digitalin, and has the molecular formula $C_{53}H_{84}O_{19}$. Boiled with dilute sulphuric acid, it yields only a small amount of sugar, showing that it is decomposed only with great difficulty, or else that other substances are produced. The alcoholic filtrate, after separation of the precipitate produced by lead acetate, leaves, when evaporated, a residue of a yellow colour, and bitter taste, which contains sugar and tannin, and perhaps another glucoside. The Japanese consider the seeds to be a poison, and the oil was formerly used to oil the swords of Japanese warriors.

The Pharmaceutical Journal.

SATURDAY, JUNE 14, 1879.

DISPENSING MEMORANDA.

SINCE the question was raised by Mr. BALDOCK as to the propriety of discontinuing the publication of "Dispensing Memoranda," we have given this matter full consideration, and think it desirable now to refer more in detail to some of the objections urged against this section. Mr. BALDOCK'S letter (p. 931) states the general nature of the arguments urged by those who disapprove of the "Dispensing Memoranda" sufficiently to render the publication of the other letters unnecessary, and the letter of Mr. BESSANT will likewise serve to represent the opinions on the opposite side.

One of our correspondents, expressing approval of Mr. BALDOCK'S views, remarks that for some time past he, like almost every one of his acquaintance, has been greatly amused with the simplicity of the questions and the grave manner in which they have been answered. He also expresses his opinion that the questions are such as an apprentice of two years' standing ought to have been able to answer, and he infers from the general nature of the questions that the inquirers have only a theoretical knowledge of dispensing and are sadly deficient in practice. Another takes for granted that a great part of the questions are such as must be asked either by apprentices or minor assistants, having had little or no experience in dispensing, and he thinks that they ought to have been able to obtain from their employers the information they required.

Granting that in many instances the queries have been sent by apprentices, junior assistants, or even others who have not extensive practical experience in dispensing, we fail to perceive that this circumstance should be regarded as a sufficient reason for not making the *Pharmaceutical Journal* useful as a means of supplying the information required. This was one of the main objects in view when the "Dispensing Memoranda" section was established, and it was considered to be an object worth devoting some space to because there was such a large number of inquiries relating to dispensing constantly being addressed to the Editor. In adopting this course it was specifically mentioned that it was done in order to assist our younger brethren as much as possible. For this same reason also it was stated considerable latitude would be given to the definition of what may be considered a difficulty. This seems to have been overlooked by some of the censors of "Dispensing Memoranda" who apprehend that the public as well as medical men may be impressed with unfavourable ideas of the average competence of chemists and druggists for dispensing prescriptions.

In reply to the objections of this nature we would urge our correspondents to remember that the instruction of apprentices and junior assistants is a task that is not unfitting for the Journal of the Society to take some part in, and we would add that there is scarcely any branch of the pharmacist's ordinary duties in regard to which such instruction is more desirable than that of dispensing. Those who know anything of the nature of a chemist and druggist's business as it is carried on in many parts of the country must be aware that dispensing is that part of the business which a young man has least opportunity of becoming thoroughly acquainted with. To those who are placed in such circumstances we can readily imagine that matters which a practised dispenser would at once be able to deal with satisfactorily, would appear as difficulties, and that this might also be the case to some extent with their principals.

But it may be asked, Is there any department of the chemist and druggist's business which it is at the present time more desirable to cultivate than dispensing? Is it not the deficiency of occupation in this branch of pharmacy which justifies the complaint that the business is such a poor one? There is no doubt for this very reason a deficiency of practical training of apprentices in the art of dispensing which schools of pharmacy cannot make up for, and we have been disposed to regard the interest taken in the "Dispensing Memoranda" section as evidence of a wholesome desire to acquire knowledge in connection with this most important part of practical pharmacy.

It is, we think, under a totally mistaken idea of what is the general condition of pharmacy in this country that some of our correspondents have suggested the fear that their own qualifications may be gauged by the indications afforded by the "Dispensing Memoranda." It is not the question whether the information sought, or the discussion of moot points in "Dispensing Memoranda," have been of such a nature as to reflect credit upon a body of men who are generally supposed to be thoroughly qualified for the work of dispensing. The qualification of those who enjoy this credit is sufficiently well established not to be in danger, or to be discredited, even by the disclosure of the fact that some of their *confrères* in business have not been so fortunate as to acquire altogether such equal competence in the work of dispensing as to have no need of asking for assistance in a journal specially devoted to the instruction of pharmacists.

But is it the case that most of the questions betray, as some of our correspondents maintain, such an amount of ignorance as would shake the confidence of medical men and of the public in the ability of chemists and druggists to dispense medicine properly? In dealing with this question we are desirous of avoiding any assumption of an *ex cathedrâ* tone, and would rather be chargeable with the fault of considering gravely a very simple question, because we think this state of mind more appropriate to the

matter in hand than the extra-positive utterances of some of our correspondents. The writing of prescriptions is not yet as unalterable as the laws of the Medes and Persians, nor is it any more distinguished for perfection than for uniformity. May it not be permitted that a chemist and druggist—perhaps seldom called upon to carry out the directions of a physician, but anxious when the occasion arises to do so conscientiously—should take a somewhat exaggerated view of a difficulty that might not even be apparent to a more practised hand?

Taking for this purpose the cases referred to by Mr. BALDOCK in a recent letter, as illustrating the superfluity of the "Dispensing Memoranda," he says in reference to No. 299 that not only the reply at page 991, but also the writer in the "Month" err in assuming that the prescriber meant hydrate of chloral to be used and not the syrup. Mr. BALDOCK'S reason for this decision is that the prescription can be dispensed as written and he directs how this is to be done, viz., by rubbing the powdered camphor with eight grains of chloral hydrate till a paste is formed and then adding one ounce of simple syrup. He says, "Here is no mystery, no difficulty and no departing from the formula." Well, we will not say there is—at least for Mr. BALDOCK, who is evidently an adroit circumventor of difficulties; but we would not be disposed to denounce as an ignoramus a pharmacist to whom this device did not occur.

Again, in reference to No. 291, which Mr. BALDOCK thinks an unnecessary inquiry, he says he has dispensed without hesitation prescriptions in which twenty to thirty grain doses of potassic iodide have been ordered, and he refers to TANNER'S 'Index of Diseases' for confirmation as opposed to the opinion of Mr. H. BROWN. Here it is evident Mr. BALDOCK has more extensive experience than R. E.; however, there is conflict of opinion, not only between dispensers, but also between doctors.

Mr. BALDOCK'S almost daily experience of the prescription in No. 279 leads him to think it curious that it should have been made the subject of a query at all; but he overlooks the insufficiency of the simple direction, misce, as indicated by G. E. GIBSON, page 908, if heat is to be applied in making the lotion. The experience of Mr. J. W. BARNES, page 948, as well as that of several other correspondents, agrees with that of the writer in "The Month"; whilst one correspondent informs us that when the prescription bears a certain signature the intention is that the starch should be liquefied by heat.

Mr. BALDOCK is still less happy in his objection to the inquiry, No. 304, p. 991, where R. H. M. pointedly asks what is to be understood by the written direction of the prescriber. Mr. BALDOCK apparently fails to perceive this, and with, we presume, the aid of extraneous knowledge he furnishes the comment that "if any one formula were less open to doubt "than another surely this is the one, where the "dispenser is distinctly and unequivocally told to "'divide the quantities named into eight powders.' A reference to the prescription will show that the assumption in the latter part of the passage quoted is quite unfounded; there is no direction to divide the ingredients ordered, and the bare possibility that this omission in such a case might be attended with serious consequences, if the prescription were literally followed, makes this prescription worth the notice called for by R. H. M. from both prescriber and dispenser.

Mr. MARTINDALE is another of those who agree with Mr. BALDOCK in objecting to the "Dispensing Memoranda," and in a letter received from him on the subject, he supports his views by reference, first to what he justly terms the "unfaithful dispensing," in No. 305, p. 991. Mr. MARTINDALE also states that the doubts as to excessive doses of iodide of potassium, etc., expressed by R. E. in No. 291, do not exist in the minds of those much used to dispensing. We fully admit this, but we do not recognize the fact as a reason that such a doubt should not be removed from those minds in which it does exist, any more than we can recognize the "unfaithfulness" of using powdered gentian for making extract of gentian into pills as a reason for not giving the information of a better way of doing what was required.

We are told authoritatively by Mr. MARTINDALE that in spite of what the writer in the "Month" has said in answer to W. S. C., No. 298, beautiful crystals of herapathite will separate from such a mixture as that referred to. If that be the case Mr. LOCKYER should be informed of it, for to our apprehension it can only be the chemistry of the future that will account for where the sulphuric acid of the herepathite is to come from. Mr. MARTINDALE appears to take a different ground from Mr. BALDOCK, in regard to 299, and treats it, as well as No. 303, as a "slip of the pen" which leaves the intention of the prescriber so evident that it is the dispenser's duty not to betray him or to refuse to dispense such prescriptions as they were intended to have been written. This remark introduces, however, a nice question of pharmaceutical ethics which is somewhat wide of the immediate subject under consideration.

Altogether there seems to be so much discrepancy between those who object to the "Dispensing Memoranda" that we are rather encouraged than otherwise to think the continuance of this section will still be useful. Moreover, we have received so many assurances of the satisfaction and assistance it has afforded in those quarters where it was intended to be of use that we cannot adopt the recommendations for its discontinuance. We quite agree with Mr. BALDOCK that a knowledge of much that is asked ought to be common to all; but we cannot shut our eyes to the fact that it is not so, and while this is the case we feel it our duty to aid as far as possible in making things as they ought to be. It must not be supposed that all the inquiries sent to us for "Dispensing Memoranda" are inserted indiscriminately and we would suggest that those who do not think them necessary should have regard to the motives by which we were induced to establish this section in the Journal as stated at page 1046 of volume vii.

Pharmaceutical Society of Ireland.

MEETING OF THE COUNCIL.

Wednesday, June 4, 1879.

Present—C. R. C. Tichborne, Ph.D., LL.D., President; Dr. Aquilla Smith, Vice-President; Sir George Owens, M.D., Dr. Collins, Dr. Ryan, Dr. Whitaker (Belfast), Messrs. Bennett (Kingstown), Brunker, Harrington (Cork), Hayes, Holmes, Oldham, Simpson.

The minutes of the meeting held on May 7 were read and confirmed.

Read a letter from Mr. H. Patton, of Omagh, requesting to be informed whether on the termination of his apprenticeship, he could go into business as a chemist and druggist, and sell poisons (but not compound prescriptions) without passing an examination.

The Registrar was directed to refer him to the Pharmacy (Ireland) Act, and to state that his proposed course would be illegal.

The first and second reports from the Committee on the Pharmacy (Ireland) Act, 1875 (of which copies had previously been sent to each member of Council), were now taken into consideration, clause by clause.

The reports were amended by the Council as follows:—

Report of the Committee on the Pharmacy Act, Ireland, 1875.

The Committee appointed to consider the Pharmacy Act for Ireland, and to report whether any, and if so what, changes should be made therein, having carefully considered the matter, and also having had before them the opinion given by Mr. Purcell, Q.C., on the questions submitted to him, are of opinion that it would be judicious for the Council at an early date to have the Act amended, in order to give power to them as follows:—

1st. The Council of this Society having decided to have but the one grade for the compounding of prescriptions, viz., that of pharmaceutical chemist, this Committee are of opinion that clauses 15 and 18 should be repealed, and all other clauses relating to the title of chemists and druggists be altered to agree therewith.

2nd. That all sellers (not otherwise qualified) of poisons, or poisonous drugs, as contained in schedules 1 and 2 of the "Sale of Poisons Act," be duly registered as druggists.

3rd. To allow all persons at present actually engaged in the sale of poisons, or poisonous drugs, on making a declaration to that effect, and giving reasonable proof thereof, to be registered on payment of a fee not exceeding £3 3*s*., and that such persons shall be styled "registered druggists."

4th. That the Council shall have power to institute an examination for those wishing to sell poisons or poisonous drugs, and a fee, not to exceed £3 3*s*., to be charged therefor, and that the names of the persons so examined shall be placed on the list of registered druggists.

5th. That a list of "registered druggists" for the sale of poisons, shall be published from time to time by the Council of the Pharmaceutical Society, of all persons entitled to be placed thereon.

6th. That it shall be illegal for any person to sell poisons or poisonous drugs, or to style himself a "druggist," except he shall be so registered, save and except he be a qualified medical practitioner, or duly registered by the Pharmaceutical Society of Ireland, or otherwise exempt by the Pharmacy Act.

7th. That it shall be unlawful for any registered druggist to keep open shop for retailing, dispensing, or compounding medical prescriptions.

8th. That the penalties for infringement of this Act and modes of recovering them shall be the same as provided in the Pharmacy Act.

9th. That all bye-laws or rules for registration and examination shall be approved of by the Privy Council prior to their being put into force.

10th. Be it enacted, that in reference to the Pharmacy (Ireland) Act (38 and 39 Vict., chap. 57), and more especially in reference to sec. 30 of said Act, that the word *person* shall be held to mean and imply any association of persons, whether as a partnership, society, or company (limited, or otherwise), of which one, or more, members shall not be qualified under the provisions of the said Act.

11th. In clause XI., line 4, after "Society" read—

(Such day not to be later than the next monthly meeting after such vacancy has been signified to the said President.)

12th. In clause 34, line 4, after "prison" insert "or Poor Law Board."

Proposed by Mr. Brunker, seconded by Mr. Hayes, and resolved:—

"That the amendments to the Pharmacy Act, adopted by the Council, be drawn up in the form of an Act, to be submitted for consideration to the Society at the annual meeting to be held in October next, a copy being previously sent to each member."

Mr. Thomas Martin Keown, Dublin Street, Monaghan, who was duly propesed and seconded at the May meeting, was elected a member of the Seciety.

ANNUAL DINNER OF THE PHARMACEUTICAL SOCIETY OF IRELAND.

The members of the above Society held their first annual dinner, at the Grosvenor Hotel, on Wednesday evening, Dr. Tichborne, President, in the chair; Mr. J. G. Boileau occupied the vice-chair. There was a good attendance, including members from Belfast, Cork, Newry, etc.

After the usual loyal toasts,

The President, in proposing "Success to the Pharmaceutical Society of Ireland," paid a high tribute to the aid given by Sir Dominic Corrigan in the formation of the Society, and to the exceedingly prosperous condition it was now in.

Mr. Boileau responded, and congratulated the Society on being presided over by so able a man as Dr. Tichborne.

The other toasts were "The Medical Profession," responded to by Dr. Whitaker, of Belfast; "The Pharmaceutical Society of Great Britain," responded to by Mr. J. T. Holmes and Mr. Simpson; "The Younger Members," responded to by Mr. Froedman; "Our Provincial Brethren," responded to by Mr. Harrington, of Cork. Songs and recitations were interpersed with the toasts, the last toast being given at eleven o'clock, being "To our next merry meeting," The onerous duties of making all arrangements were ably fulfilled by Mr. William Hayes.

Provincial Transactions.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The annual meeting of this Association was held at the Flying Horse Hotel, on May 28. There was a good attendance of the members and the chair was occupied by the President, Mr. R. FitzHugh, F.C.S. The minutes of the last meeting were read and confirmed and the Hon. Secretary, Mr. R. Jackson, then read the following annual report of the Council:—

Annual Report.

The Council have pleasure in presenting their annual report to the members of the Nottingham and Notts Chemists' Association and in congratulating them on the general and financial position of the Society. There are now 59 members and 26 associates, which is a slight

increase from last year and the Treasurer has in hand the splendid balance of £51 4*s.* 11*d.*

Five general meetings of the Association have been held during the past session; at the first, the President delivered his inaugural address and the prizes were presented to the successful associates in last session's classes, Mr. Bown and Mr. Young taking prizes in chemistry, and Messrs. Young, Clower, Savage and Shaw, in botany.

The second meeting was of members only and was called to consider an application from the Chemists' Trade Association for a grant from the funds towards the great expenses they were incurring in defending counter prescribing, and other legal questions affecting the trade. It was decided that our funds were not available for such purposes, but it was thought desirable to help the Trade Association, and a subscription list was opened in the room and those members not present were afterwards waited on, with the result that the handsome sum of £54 0*s.* 6*d.* was forwarded to Birmingham as a donation from the chemists of Nottingham.

At the other meetings interesting lectures were delivered, one by Mr. H. Major, B.A., F.R.G.S., on "The Deep Sea," another by Mr. F. H. Spenser, on "Light," and another by Mr. B. Sturges Dodd, on "Sponges and other Marine Animals." Each lecture was illustrated by numerous beautiful specimens and drawings.

The attendance of members at the earlier meetings was fairly good, but the later ones, and especially the last, were very thinly attended, and the Council would earnestly urge on members the necessity of taking a greater personal interest in the work of the Association if it is to go on and prosper. The subscriptions are cheerfully paid and a goodly number attend when any trade question is discussed, but at the ordinary meetings the majority of members are conspicuous by their absence and it is very discouraging to the officers and Council to find their efforts so lukewarmly supported. Besides the ordinary meetings of the Association, an open one of the whole trade was called, on a requisition signed by six members, to deliberate on a question of prices, at which the attendance was good, and the Council would here impress upon the members their readiness to call a trade meeting at any time to discuss any question affecting trade which is not within the legal limits of the Association.

The annual supper was held at the George Hotel, in January, and was as usual a success.

During the summer months, Mr. William Widdowson kindly took a class of students on a botanizing excursion every other week, and the Council are pleased that several availed themselves of so favourable an opportunity of gaining a practical knowledge of botany. An examination was held at the close of the season and prizes were awarded to Mr. Bown (kindly given by Mr. Smith) and to Mr. Shaw (given by the Council).

The Council arranged with Mr. William Widdowson to give a course of lectures on materia medica, at our own rooms, during the winter; 21 associates joined the class and 12 kept up a regular attendance, the average number present during the course being 11, and the Council learn with pleasure from the teacher that the general conduct and attention of the class has been very good. An examination has recently been held, but only the small number of six presented themselves. Four prizes were offered (one by Mr. Wilford, another by Mr. Ward and two by the Council), which will be presented to the successful students (Messrs. Talbot, Gill, Hare and Granger), at the opening meeting of next session. The Council were prepared to give more prizes if the attendance had been greater and they regret that so few competed. The Council have pleasure in announcing that Mr. J. H. Atherton has kindly offered an annual prize of the value of 10*s.* 6*d.* for the best original essay on any subject named by the Council and it will be for the incoming Council to decide on the terms of competition.

The library has been moderately used during the year and the books are in fair condition.

Your Council would recommend to their successors to make early application for a room in the New University buildings, where meetings and classes can be held and where the museum and library can be permanently located; these can then be increased and developed according to the funds available, but they have not thought it advisable to spend any money this year on cases and specimens which would probably be almost, if not entirely, useless in a new and more convenient home, where they hope eventually to be.

The honorary treasurer, Mr. Rayner, then presented his balance sheet, which had been audited by Mr. Humphreys and Mr. S. Parr, and which showed a balance in hand of £54 4*s.* 11*d.*

Mr. Reuben Widdowson proposed that both reports be received and adopted, which was seconded by Mr. T. Fletcher, and after some discussion, carried unanimously.

The following officers were then elected for the ensuing year:—President, Mr. R. FitzHugh (re-elected); Vice-President, Mr. F. White (re-elected); Treasurer, Mr. J. Rayner (re-elected); Honorary Secretary, Mr. R. Jackson (re-elected); Council: Messrs. C. A. Bolton, T. B. Fletcher, M. H. Humphreys, W. H. Parker, W. Smith, C. W. Warriner, William Widdowson and J. Wilford.

Mr. Rayner then proposed, pursuant to notice, that Rule 5 be altered to read "The Annual General Meeting shall be held in the last week in May," instead of "the last Friday in May," which was seconded by Mr. Warriner and supported by several gentlemen, and carried unanimously.

A discussion then ensued about carrying on the work of the Association during next session and many suggestions were made, the principal being that more social meetings be held and that short papers on trade subjects might be obtained from members to read at the meetings. It was ultimately left in hands of the Council to make such arrangements as they could to carry out those suggestions.

Mr. W. H. Parker then proposed a vote of thanks to the officers and Council for their past services, which was seconded by Mr. Beverley and carried unanimously.

The President suitably responded for himself and colleagues and the meeting terminated.

GLASGOW CHEMISTS AND DRUGGISTS' ASSOCIATION.

The last business meeting of the Association for the session was held in Anderson's College, 204, George Street, on Wednesday, June 4, at 9 p.m. Mr. Alexander Kinninmont, F.C.S., President, in the chair.

After the Secretary, Mr. Hicks, had read the minutes of previous meeting, which were approved of, the Treasurer, Mr. J. A. Clarke, gave his financial statement, which showed a balance of cash on hand from the session 1878-79, now ended.

The President then reviewed the past session which he said was none of the brightest; that Association, however, was not alone in this condition, for throughout the country general depression had been the rule; therefore it was extremely satisfactory to know that although the membership had fallen off considerably, yet by economy the Association had a surplus over expenditure, and as the library fund had also increased by donations, it would be possible to add, by next session, those books chosen by the members.

After the President's remarks, the following gentlemen were elected office-bearers for session 1879-80:—Mr. Alexander Kinninmont, F.C.S., President; Mr. Robert Brodie, Vice-President (*vice* Mr. J. M. Fairlie, resigned); Mr. John C. Hunter, Secretary (*vice* Mr. Hicks, resigned); Mr. Hicks, Treasurer (*vice* Mr. Jos. A. Clarke, resigned); Mr. Walker, Librarian. Members of Council—Messrs. Daniel Frazer, Thomas Davidson, John Currie, sen., R. C. Rait, J. C. Steel, Jos. A Clarke, William

Weir, Simpson, John Foster, J. W. Pettigrew, Paul, John Fenwick. Auditors—Mr. Robert M'Adam and Mr. Archibald Paterson.

Mr. John Currie, sen., moved a vote of thanks, which was heartily awarded, to the President, Secretary and Treasurer for their services during the session.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, June 5, Mr. Warren De La Rue, President, in the chair.

After the transaction of the usual business, the following certificates were read for the first time:—E. Buckney, R. E. Holloway, T. Blackburn, E. F. Mondy and E. Francis.

It was announced that a ballot for the election of Fellows would take place at the next meeting of the Society, June 19.

The following papers were read:—

A Contribution to the Theory of Fractional Distillation. By J. E. Thorpe.—Wanklyn some years ago found that when two liquids of different boiling points were mixed together in equal quantities by weight and distilled, the proportion of each constituent in the distillate was the product of its vapour density and vapour tension at the temperature of ebullition of the fraction. Hence under certain circumstances the less volatile of the two substances may pass over most rapidly, while if the vapour tensions and vapour densities of the two liquids are inversely proportional the mixture will distil unchanged. Berthelot observed that a mixture of 90·9 parts of carbon disulphide with 9·1 parts of ethylalcohol boiled and distilled as a homogeneous liquid. An instance of this phenomenon has been noticed by the author. A mixture of equal volumes of carbon tetrochloride, boiling at 76·6°, and of methylalcohol, boiling at 65·2°, was distilled. It was found that 46·5 per cent. of the whole boiled constantly between 55·5° and 55·9°, 10° lower than the boiling point of the most volatile constituent. This mixture contained 78·1 per cent. carbon tetrachloride and 21·9 per cent. methylalcohol; this proportion, 3·6 to 1, is almost identical with that obtained by multiplying the vapour tensions of the two liquids at the temperature of the boiling point of the mixture (55·7°) by their respective vapour densities, $487{\cdot}4 \times 15{\cdot}97 : 372{\cdot}4 \times 76{\cdot}69 :: 1 : 3{\cdot}67$. The distillation of the residue in the flask was continued by Mr. C. C. Starling. At first, principally carbon tetrachloride, finally, pure methylalcohol passed over. The author suggests as a striking lecture experiment the following:—Three barometer tubes are filled with mercury; into one some methyalcohol is passed, into the second some carbon tetrachloride, into the third a mixture containing by volume three parts of methylalcohol to five of carbon tetrachloride; the depressions of the mercury column are 80, 70 and 130 mm. respectively. The author promises a further research on the physical peculiarities of this mixture.

Preliminary Note on the Action of Organo-zinc Compounds on Quinones. By F. R. Japp.—When finely powdered phenanthrene quinone is gradually added to zincethyl, diluted with ether so as not to be spontaneously inflammable, a reaction takes place with evolution of gas. The orange colour of the quinone disappears, a whitish powder is formed, which sinks to the bottom of the liquid. On decomposing this product with an excess of alcohol, boiling, and filtering hot, transparent, faintly yellowish rectangular plates were obtained, fusing at 77°, and having the formula $C_{18}H_{20}O_3$. This formula can be resolved into $C_{16}H_{14}O_2.C_2H_6O$. The compound, $C_{16}H_{14}O_2$ has not yet been obtained pure; but the monacetyl derivative, $C_{16}H_{13}O_2(C_2H_3O)$, has been prepared and analysed; it fuses at 103°. The author refrains at present from discussing the constitution of the compound $C_{16}H_{14}O_2$, but suggests that these reactions may serve to distinguish quinones from double ketones. He intends also to study the action of organo-zinc compounds on other quinones and allied substances as dibenzoyl.

After some remarks by Dr. Armstrong on the interest and probable bearing of the above reaction,

Dr. Wright read a paper entitled—

Third Report to the Chemical Society on Researches on some Points in Chemical Dynamics: On the Curved Surfaces Expressing the Relations between Time, Temperature and Amount of Deoxidation of Copper Oxide by Hydrogen and Carbon Oxide. By C. R. A. Wright, A. P. Luff and E. H. Rennie.—This is a continuation of the previous reports by the authors on the subject. In the present paper a large number of observations have been made by reducing a uniform weight (1·15 gram) of copper oxide (prepared by igniting pure copper nitrate) in narrow glass U-tubes heated to known and constant temperatures in vapour-baths; in some cases water and paraffin baths were employed fitted with Page's gas regulator. Equable streams of hydrogen and carbonic oxide were obtained by bubbling the gas through a wash bottle, the stream being adjusted by a screw clamp and counting the bubbles. The average rate was 12·5 c.c. per minute. By plotting out the results thus obtained in space with reference to three planes mutually at right angles, so that the distance from each plane represents respectively, the time of exposure, the temperature, and the percentage loss of oxygen, points are marked on curved surfaces, the sections of which parallel to the three primary planes represent respectively the amounts of oxidation produced in given times at a constant temperature, the time required to produce given amounts of deoxidation at constant temperatures, and the amount of deoxidation produced at given temperatures in a constant period of time. The paper was illustrated by tables, diagrams and models of the curves thus produced. The mode of experimentation adopted being to determine for a constant temperature the amounts of deoxidation produced in varying times. At and above 160° in the case of hydrogen and 130° in the case of carbonic oxide, the curious result was arrived at that, the same mean curve is obtained, whether the exposure be made all at once to a temperature for a time, T, or in periods of time, t_1, t_2, t_3, etc., which are together equal to T, provided that the interval between the periods is not too long (ten minutes). Below the above temperatures the deoxidation in an hour is greater than that produced in two consecutive heatings of half an hour each, with an interval between. The curves obtained with hydrogen and carbonic oxide resemble each other in certain respects; their general character is that of a sigmoid. For a certain time there is no perceptible action; this time is the longer the lower the temperature; reduction then commences languidly, quickly accelerating until a maximum of activity is reached, after which it diminishes until almost perfect deoxidation is effected. The maximum rate of action with hydrogen lies about 10 per cent. (out of 19·74 per cent. of oxygen originally contained in the copper oxide), and about 7–8 per cent. in the case of carbonic oxide. This apparently indicates that hydrogen passes through the outer and partially reduced surface of particles to the interior more readily than carbonic oxide. The following numbers illustrate the maximum rate of reduction attained, the gaseous currents being competent to remove 0·7791 per cent. of oxygen (out of 19·74) per minute.

Temperature.	Maximum rate with H.	Maximum rate with CO.
100	—	0·135 per cent. per minute
118	—	0·380
130	—	0·480
160	0·118 per cent. per minute.	0·570
175	0·220	—
184·5	0·270	0·70
210	0·490	—
256·5	0·700	—

The higher the temperature the nearer does each curve approximate towards a limiting straight line which would be attained did deoxidation commence immediately and go on at such a rate that all the hydrogen was converted into water and the carbonic oxide into carbonic acid; the highest rates of reduction attained corresponded to a conversion of about nine-tenths of the H into H_2O, etc., of CO into CO_2. From the curves it is evident that, *cæteris paribus*, to perform a given amount of deoxidation with hydrogen requires either a higher temperature or a longer time than with carbonic oxide. The existence of a "period of incubation" during which no action takes place, and the acceleration in the rate of action to a maximum, etc., shows that what has been termed "chemical induction" by Bunsen and Roscoe takes place in these cases, to a large extent, dependent in amount on the temperature; from experiments now in progress this does not appear to be the case when copper is oxidized by hot air. A number of observations were made on the effect of varying the speed of the current of reducing gas and the weight of copper oxide used; with the general result that a more rapid stream or a smaller weight of copper oxide corresponds to an increased percentage of deoxidation and *vice versâ*. Heating the copper oxide just before use causes great irregularities in the action. A large number of observations were made by enclosing the copper oxide in sealed tubes filled with the respective gases, heating for different periods and determining whether reduction had taken place or not: thus the following numbers were obtained; the times are perceptibly longer than those found in the corresponding U-tube experiments, in every case the time at any given temperature is less with CO than with H:—

Temperature.	With CO, period of incubation=	With H, period of incubation=
160°	about 12 minutes	about 80 minutes.
130°	„ 35 „	„ 6 hours.
118°	„ 6¼ hours	„ 12 „
100°	„ 7½ „	„ 28 „
83·84°	„ 11 „	„ 180 „

Attempts were made to trace out curves illustrating the rate of reduction at various temperatures in atmospheres containing more reducing gas than would suffice to deoxidize completely the CuO. The results were not very concordant, but indicated that the action here is still of the same kind, *i.e.*, a period of incubation exists, after which action commences, reaches a maximum and then falls off; in other words chemical induction takes place whether the metallic oxide or the reducing gas be at any given moment in excess. In these experiments too, either the time requisite to produce a given amount of action is less or the temperature is lower with carbonic oxide than with hydrogen. The paper, of which the above is but a brief extract, contains about 70 pages.

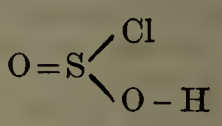
On Fractional Distillation. By F. D. Brown.—The author considers the theory and formulæ involved in the process of distillation. He sums up as follows:—"The equation which represents the relation between the composition of the liquid and that of the vapour given off by it at a given pressure, together with that which represents the relation between the composition of the liquid and its boiling point at the same pressure, contain all the experimental data which can be derived from the distillation and form together with the above formulæ a complete history of it; if we can refer these relations to known laws we shall have arrived at an explanation of fractional distillation." The consideration of the distillation of mixtures divides itself into four heads: substances which are not miscible, substances which mix in all proportions, but do not combine, substances which are soluble to a limited extent and do not combine, and substances which are mutually soluble and combine. The author then considers the researches of Magnus, Regnault, Pierre and Puchot and A. Naumann as regards substances which do not mix; from these researches it was proved that the ratio of the molecules of the two liquids in the distillate is constant and equal to that of their vapour tensions at the temperature of distillation. The author has taken up the study of substances which mix in all proportions, but which do not combine. The substances chosen were benzene and carbon disulphide; the composition of the mixture was ascertained by taking its density. These liquids expand on mixing, the greatest expansion occurs when the molecules of each are present in about equal numbers. In a series of thirteen tables the author gives the results of the fractional distillation of mixtures containing 61·95 per cent., 61·76 per cent., 70·86 per cent., 40·81 per cent. and 18·33 per cent. of carbon disulphide, respectively, the temperatures at which the fractions distilled, their weights and composition, and the composition of the liquid remaining in the still are given. The author exhibited some of the apparatus used in his researches.

In the discussion which followed, in which the President, Dr. Wright, Dr. Armstrong and Mr. Friswell joined, there seemed some slight uncertainty as to the exact conclusions to be deduced from the author's experiments.

Mr. Howard pointed out that substances might dissolve in the liquid condition, but not when in a state of vapour. Amylic alcohol would distil at 96° in the vapour of water but the presence of a small quantity of ethylic alcohol would completely alter the composition of the vapour.

The two following papers were then read by the Secretary—

On Chlorstannic Acid. By J. W. Mallet.—A bottle containing a strong aqueous solution of stannous chloride after standing for a year or two deposited a transparent jelly-like substance of yellowish colour. This was washed and dried on a glass plate at the temperature of the atmosphere; it shrank up, cracked and dried in fragments resembling gum arabic. Heated in a glass tube it evolved hydrochloric acid leaving a white residue of stannic oxide free from chlorine. Its composition wa $sSnO_2HCl$; its constitution



It formed salts with soda and ammonia. The author has not been able to reproduce this substance.

On Indigo Purpurin and Indirubin. By E. Schunck.—Baeyer and Emmerling* described some years ago the formation of a red colouring matter with indigo blue by the action of acetyl chloride, phosphorus trichloride and phosphorus on isatin. This they named indigopurpurin. Recently Baeyer† describes another method of preparing this colouring matter and gives its properties. In 1856 the author read a paper ('Manchester Memoirs,' series 2, xiv., 181-237,) and gave an account of a red colouring matter formed by the action of acids on indican, indigo blue being also formed. This colouring matter he named indirubin; indigopurpurin has all the properties of indirubin and is in fact identical with it. The author therefore considers that the name indigopurpurin should be abolished and the original name indirubin retained.

The Society then adjourned to June 19. when a ballot for the election of Fellows will be taken and the following papers will be read:—On Gardenine, Dr. Stenhouse and Mr. Groves; On the Action of Sulphuric Acid on the Hydrocarbons of the Formula $C_{10}H_{16}$, by Drs. Armstrong and Tilden; Researches on the Terpenes, Camphor and Allied Compounds, Parts I. and II., by Dr. Armstrong; Contributions to the History of Starch and its Transformations, by Horace T. Brown; On the Boiling Points of certain Metals and Metallic Salts, by Dr. Carnelly and W. Carleton Williams; On the Determination of Nitric Acid by Means of Indigo, by R. Warington; On Dry Copper-Zinc Couples and Analagous Agents, by Dr. Gladstone and Mr. Tribe; Notes on the Purple of the Ancients, by R. Schunck.

† *Deut. Chem. Ges. Ber.*, 12, 457.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, May 29, Mr. C. H. Hutchinson, F.C.S., in the chair.

The minutes having been read,

Mr. L. Thompson read a paper on "The Food of Plants." The first part of the paper was devoted to an account of the manner in which plants derive their nourishment from the air and soil. Next followed a description of the nature of the nourishment so derived. Carbon, oxygen and hydrogen are taken up as carbonic dioxide and water; the former principally from the air, the latter from the soil. Nitrogen is assimilated as ammonia or nitrates, not in the free state. Sulphur is taken up by the roots as calcium sulphate, this salt being subsequently converted into oxalate. The last part of the paper comprised an account of the habits of certain plants, called carnivorous, which present peculiarities, both in the nature of their food, and in the manner of obtaining the same. The author described some experiments made by himself on a specimen of *Dionœa muscipula* (Venus's fly-trap). He found that raw beef and flies were readily consumed by it, while a piece of cooked beef was rejected. A piece of gelatine placed on one of the sensitive leaves underwent no change, while a morsel of cheese produced such a serious effect as to endanger the life of the plant. A minute drop of chloroform caused the leaf to close very suddenly, and to remain so for a fortnight, while its colour was changed to a dark brown.

After a discussion and a vote of thanks to Mr. Thompson,

Mr. A. F. Dimmock read a note on "The Detection of Carbonates in the Presence of Sulphites and Thiosulphates." This method, originally proposed by Polacci, consists in the use of hydrogen potassium tartrate (cream of tartar), which, in the presence of water, completely decomposes carbonates, but has no effect upon sulphites or hyposulphites. To detect a carbonate when mixed with either of the latter, the powder, etc., is mixed with water and cream of tartar, and any gas that escapes is conducted into lime water, when of course, a precipitate of calcium carbonate falls. The method may be applied quantitatively in the usual manner. It is worthy of note that tartaric acid cannot be used in place of the cream of tartar, as it decomposes sulphites, etc., even in the cold, with evolution of sulphur dioxide.

Mr. F. W. Branson then read the following report on Botany:—

Note on Teratology and Hybridization.

A. Malformation in plants is frequently the effect of cultivation, as in the case of the cauliflower, etc.; in other cases it is due to poverty of soil, in which case branches may degenerate into spines, and so on. A very prominent kind of malformation is that of "doubling" of flowers. It is usually due to a retrogressive change in one or more whorls of organs. In many cases, *e. g.*, the garden columbine, the transition can be traced through every stage. The shepherd's purse sometimes furnishes an example of progressive metamorphosis, ten stamens being developed, but no petals.

B. The subject of hybridization, although but scantily noticed in many text-books, is of much importance to agriculturists, and of great interest to practical botanists. Hybrids rarely or never occur in the Cruciferæ and seldom amongst the Cryptogamia; they occur frequently in the Primulaceæ, and it is worthy of note that those between annuals and perennials tend to become perennial. Hybrids, though luxuriant in growth, are usually difficult of propagation by seed. The two specimens on the table are clearly hybrids. The first is a cross between *Primula veris* and (probably) *P. vulgaris*; it has also undergone a further change. The calyx is exactly like the corolla, the true corolla remaining normal. The second is a cross between *Ribes nigrum* and *R. rubrum*. The plant in habit, foliage, and inflorescence agrees more closely with the former; the berries, though having the taste of black currants, are white, but in other respects resemble red currants.

Mr. W. R. Dunstan then gave his report on Analytical Chemistry, in which he called attention to Dr. Lunge's Nitrometer. This paper is printed on p. 1014. After a short discussion the meeting adjourned.

Parliamentary and Law Proceedings.

Explosion of Fulminate of Mercury.

The magazine known as the Home Office Magazine, built for the reception of explosive articles seized by the police of the metropolis and suburbs under the Act for the storage and carriage of explosives, situate in the Government Marshes adjoining the Royal Arsenal, Woolwich, was the scene of a possibly fatal accident on Friday afternoon, the 6th inst. The building, which was erected in 1875, consisted of three fire-proof compartments with separate entrances from the outside. Last January a case containing 60 pounds of detonators in the shape of small tubes was seized by the Custom House officials on board a steamship called the Holmrook. The tubes had been manufactured in Hamburg, were consigned from some unknown person in that city to Messrs. Elkan and Co., of 199, Upper Thames Street, London, and had been deposited in this magazine, which is in charge of Superintendent Hindes, of the Royal Arsenal and Dockyard Police. From an examination of samples by the Chemical Department it was found that the detonators were charged with fulminate of mercury and an order was issued that they should be destroyed by the Royal Laboratory. The simple expedient of throwing them into the river does not appear to have suggested itself, and somewhat elaborate measures were taken to accomplish the desired end. In accordance with instructions, a party of men from the Royal Laboratory Department, under the direction of Mr. Charles Dibblin, foreman of the cartridge factories, proceeded to the magazine to carry out the operations. The detonators were carried outside the building, and a large pan having been filled with water, the detonators were removed from the boxes in which they were stored and thrown into it, Mr. Dibblin at the same time adding a quantity of nitric acid to the water for the purpose of destroying the copper cases or tubes. The effervescence which then commenced was so great that some of the men became alarmed and withdrew to a distance; but Mr. Dibblin said there was no danger, and, with some others, remained. It appears certain, however, than an excessive quantity of the acid had been used, causing such rapid decomposition of the metal as to engender a fierce heat; and almost immediately a tremendous explosion occurred. Mr. Dibblin, Inspector M'Elligot, and a man named Cornelius Burke were thrown to the ground and more or less injured. Mr. Dibblin was seriously injured about the head, body, and legs, and, even should his life be preserved, it is feared that he will lose his sight. Inspector M'Elligot sustained a serious wound on the right cheek and other injuries, and Burke was also seriously hurt. Assistance was at once procured, and the injured men were removed in a van to the infirmary in the Royal Arsenal. Mr. Dibblin remains in a precarious state, but the inspector has since been removed to his home. The building and fence around it are considerably damaged, and a large hole made in the ground proves the severity of the explosion. One of the wooden platforms was also torn up, and fragments were scattered for a distance of twenty or thirty yards.—*Times.*

Suicide by Cyanide of Potassium.

On June 9, an inquest was held before Mr. Malcolm, Leeds Borough Coroner, concerning the death of Frederick Wentworth, 22. Deceased was an assistant at the Yorkshire College. On Saturday evening he went home as usual, and at night was left by his aunt reading before the fire whilst she went out. When she returned she ascertained that he had gone to bed. On the following morning he was found lying dead on the floor of his bedroom.

It appeared from the evidence that the deceased was very reticent and somewhat eccentric in his manner, and that about five years ago an uncle of his died insane in an asylum. Deceased left a letter stating that he had taken some solution of cyanide of potassium and making disposition of his effects.

The jury returned a verdict of suicide whilst in a state of temporary insanity.

Obituary.

It is announced that on Saturday last, the 7th inst., Dr. Tilbury Fox, the well known Physician of the Skin Department of University College Hospital, died suddenly of heart disease, while on a visit to Paris.

On Monday, the 9th instant, also, Dr. Moore, the distinguished botanist, died at the Botanic Gardens, Glasnevin, of which he had been Curator for upwards of forty years.

Notice has also been received of the death of the following :—

On the 1st of June, 1879, Mr. James Mills Woolfenden Duncalf, Pharmaceutical Chemist. Aged 27 years. Mr. Duncalf became a Member of the Pharmaceutical Society in 1878.

On the 3rd of June, 1879, Mr. Cornelius John Clarke, Chemist and Druggist, Buttermarket, Ipswich. Aged 30 years. Mr. Clarke had been an Associate of the Society since 1870.

On the 4th of June, 1879, Mr. Robert Banks, Chemist and Druggist, Porter Street, Hull. Aged 55 years.

On the 5th of June, 1879, Mr. James Mace, Chemist and Druggist, St. James Street, Bacup. Aged 48 years.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[281]. There were two Drs. Hamilton in Edinburgh. The first was Dr. Hamilton, senior, and he always ordered the aloetic pill of the Edinburgh Pharmacopœia, composed of Socotrine aloes and soap in equal proportions, and these came to be associated with his name, as Dr. Hamilton, senior's, pills.

The second was the professor of midwifery in the University, and the recipe which he invariably wrote was :—

℞ Ext. Coloc. Co. . . . . ʒj.
Ext. Hyoscyami . . . . . ʒss.
M. et divide in pil. 24 ;

and these in like manner came to be sent out as Professor or Dr. Hamilton, junior's, pills, and I believe are still sent out as such by all who know how the case stands. I may add that for many years the first pills have been nearly obsolete, but that the latter are still in great demand, and are always given as Hamilton's, unless the word "senior" is expressly mentioned.

Edinburgh. S. B. J.

---

[291]. In reference to this prescription, I would advise R. E. not to take Mr. Henry Brown's advice on doses of ferrous sulphate or iodide of potassium. Ferrous sulphate may be given in 10 grain doses with perfect safety, it may be an unusual dose, but certainly not excessive ; as to iodide of potassium, I have seen it given in 30 grain doses three times a day for weeks, and instead of being injurious to the patient, or defeating the object of the physician it was the reverse, proving of the utmost advantage to the patient and therefore procuring the object desired. As to medicine agreeing or not with patients that is entirely outside the sphere of the chemist. R. E. ought to have been satisfied with the physician's authority to make up the prescription as written, without taking up your valuable space and eliciting such rash and ambiguous theories.

J. L. W.

---

[299]. I do not think it by any means certain that this is an error on the part of the prescriber. I had a similar prescription to dispense a short time ago, written by a physician of eminence in North Devon, the result being a preparation of semi-fluid consistence.

Gulielmus.

---

[301]. I am of opinion that D. H. must have used either a dirty measure or bottle, probably one that had some preparation of iron in, which would to some extent account for the blackness.

Lavandula.

---

[302]. In answer to "Apprentice," this prescription cannot be dispensed so as to form a clear mixture, but if he will adopt the following method it will have a presentable appearance. Add the sp. chloroform. to the tinct. quinæ ammon., then the tinct. quassiæ, next syr. aurant., then dilute with water very slowly, gently shaking after each addition, the last two ounces or so of water precipitates the quinine very finely.

Lavandula.

---

[303]. In my opinion N. M. G. did quite right in refusing to dispense a draught containing ♏xxx chloroform (a palpable error). I think that spt. chloroformi was intended and I should have dispensed it.

A. P. S.

---

[303]. Mr. N. M. Grose was perfectly right in refusing to dispense this prescription as it stands, as the dose is excessive and dangerous. Personally I am inclined to think that the prescriber meant spirit of chloroform, but unfortunately the dispenser has only to deal with what the prescriber has written down.

Lavandula.

---

[303]. With regard to Mr. N. M. Grose's query of last week, I think he was wrong in refusing to dispense the prescription. I presume it was the dose of chloroform that alarmed him, being in excess of that indicated in the B.P. We know, however, that medical men do not always confine themselves to that guide; in certain cases and under peculiar circumstances larger doses are very frequently given, and as the dose ordered in this case was not likely to be a fatal one, and the repetition of it to be guided by circumstances for which we may infer the doctor had given full directions either to the patient or attendant, the prescription might have been (in my humble opinion) safely made up. My reason for saying so, is that some years ago, I had to make up some draughts, each containing chloroform ʒj, with other in-

gredients, which I cannot now recall to memory. I hesitated to prepare it and waited upon the prescriber to know whether it was correct. He courteously complimented me upon my caution and said that he fully intended the dose as ordered; he knew that it was a large dose, but as it was for a case of delirium tremens it was necessary to use strong measures.

I should not have troubled you in this matter, only that I think Mr. Grose's case and the one I mention serve to show the advantage it would be to prescribers, patients and dispensers, if the former, when they order unusual doses, would attach some sign or mark to show they really intended them as written. M. P. S.

---

[304]. In reply to the question of R. H. M. as to whether eight powders, each containing 2 grains of opium and a scruple of sugar should be sent, or the 2 grains of opium and scruple of sugar divided into eight parts, I am inclined to think the prescriber meant the division into eight parts of the 2 grains of opium. R. H. M. says he does not want to get at "the intention of the prescriber, but what he has written." I confess I do not understand such a position, as the intention is the principal and certainly paramount object in all prescribing and compounding. A man may make a mistake, or by unnecessary abbreviation cause doubt, as in the instance under consideration. A compounder must then act according to his judgment and not give in a doubtful case what certainly would be a dangerous quantity of such a drug as opium. I do not say a dose of 2 grains of opium is excessive, but I think 16 grains of opium divided into eight powders, one of which is to be taken every three hours, is a quantity which should not be dispensed without misgiving, and if possible, the prescriber should be communicated with. I have no doubt the prescriber intended a ¼ grain for each dose, although the direction, "ft. pulv. No. 8," might be interpreted, eight such; but in the case of a potent remedy, such as opium, I hardly think it was the intention of the prescriber that eight powders, each containing 2 grains, should be sent.

Northallerton. HENRY BROWN.

---

[304]. I should have sent eight powders as directed (dividing the two grains opii and ℈j sacchari into eight). Each powder containing the ¼ grain opium.

A. P. S.

---

[304]. In answer to R. H. M., I think that if this prescription was prepared with two grains of opium in each powder, the dose would be dangerous.

I should read, fiat pulv. No. 8, as meaning, let eight powders be made; but if it was written fiat pulv. divid. No 8, it would read, let the powders be made divide in number eight, which I take to have been the intention of prescriber. BONNE GUERRE.

---

[304]. I should have dispensed this prescription by dividing the 2 grains of opium into eight powders, ¼ of a grain for a dose and repeated every three hours.

LAVANDULA.

---

[304]. In reply to R. H. M., according to my experience, the prescription might be read in two ways, and I do think in cases of the kind where poisonous medicines are ordered there should be no doubt, because to the experienced dispenser 2 grains of opium taken every three hours would appear to be a dangerous quantity. If written as below there could be no doubt of it:—

℞ Pulv. Opii . . . . . gr. ij.
Sacchr. . . . . ℈j.
Fiat pulv. Div. No. 8. 1 omn. 3tiis horis.

M. P. S.

[*** Most of the writers on this subject appear to forget that it is only the strict rendering of the Latin that is in question.—ED. PH. J.]

[305]. "Sub Umbra Floresco" had no business to take upon himself to alter a prescription; by so doing he breaks faith with the prescriber and patient. Why not evaporate the extracts, if too soft, to a peculiar consistence?

LAVANDULA.

---

[305]. If "Sub Umbra Floresco" will refer to his Pharmacopœia, he will find both the extracts prescribed are directed to be evaporated until of a suitable consistence for forming pills. I think the proper way of dispensing this prescription would be, if the extracts were too soft (and as received from the wholesale druggists they frequently are), to evaporate at a gentle heat to good pilular consistence in preference to adding powdered gentian.

GULIELMUS.

Queries.

[307]. Will some reader inform me a method of dispensing the following, which will not separate nor throw down but very little deposit? I used pulv. tragac. co. to help the combination and faithfully put in the ingredients as ordered:—

℞ Sp. Æther. Sulph.,
Sp. Ammon. Arom.,
Sp. Camphoræ . . . . . āā ℥ss.
Chlorodyne (Davenport's) . . . . ℥ij.

Clifton. E. B.

---

[308]. Can any reader inform me if a presentable mixture can be made of the following, and how?—

℞ Camphoræ . . . . . ℥j.
Boracis . . . . . ℥iij.
Tr. Canthar.,
Glycerin. . . . . āā ℥j.
Sp. Vini Rect. . . . . ℥ij.
Ol Rosmar. . . . . ♏xv.
Aq. Rosæ . . . . . ad ℥xxiv.

M.

G. W. H.

---

[309]. Will any of the readers of the *Pharmaceutical Journal* be kind enough to inform me what would be the best thing to make ergotine suppositories with? I got a prescription for two dozen 4 grain ergotine suppositories and made them with cacao butter, but when warm the ergotine separated from the butter and would only mix properly when about cold, and then was too hard to pour into the mould.

ROBT. CRAIG.

---

[310]. I enclose copies of prescriptions which have been dispensed by me within the last four months. I would like to hear the opinions of some of your readers as to the way in which the most satisfactory results may be obtained.

No. I.

℞ Potass. Bromid. . . . . ℥iss.
Tr. Cannab. Ind. . . . . ℥v.
Tr. Ergotæ . . . . . ℥ss.
Spt. Ammon. Arom. . . . . ℥ij.
Aquæ . . . . . ad ℥viij.

Sig. A tablespoonful when required.

No. II.

℞ Camphoræ . . . . . gr. j.
Spt. Rectificat. . . . . gr. j.
Tere et adde—
Ex. Aloes Socotrinæ,
Sulph. Ferri (exsicc.),
Sulph. Quinæ . . . . . āā gr. j.
Ol. Juniperi Sabinæ . . . . . gtt. ij.

M. ft. pilula, mitte tales xii. Sig. One to be taken twice or three times a day. T. M.

[311]. Should I be justified in dispensing aq. menth. pip. when aq. menth. p. is ordered in a prescription?

CHEMICUS.

---

[312].

℞ Fel. Bovini . . . . . ℥ij.
Tr. Castor. . . . . ʒj.
Ol. Amygd. Dulc. . . . . ad ℥j.
M. ft. gutt. acoust.

I shall be glad to learn by what method (if there be any) the above ingredients can be mixed permanently or brought to such a state that they will readily unite temporarily on being shaken together.

Should the "inspissated gall" be used, or the "purified?"

A. W. M.

---

[313].

℞ Benzole Rect. . . . . gr. j.
Pil. Scillæ Co. . . . . gr. ij.
Pulv. Glycyrrh. . . . . q. s.
Ut fiat pil. i. Mitte xii.

Could any readers of the Journal inform me what is benzole rect. and what are its properties? I looked through Beasley's Formulæ, but could not find any such name mentioned there.

ARDENS.

---

[314]. How ought the following to be dispensed, the quantity of oil of cajeput being too much to get in one pill?—

℞ Camphor . . . . . gr. ½.
Asafœtid. . . . . gr. j.
Ol. Cajeput. . . . . ♏ ij.
Ext. Aloes Aq. . . . . gr. iij.
M. ft. pil. One every night. Mitte xij.

J. WATSON.

Correspondence.

THE NEW COUNCIL.

Sir,—The cry of *peccavi* in your leader of the 24th ult., coupled with the mournful cry of despair from Mr. Howard Hall in the current number of the Journal, convince me that the "superabundant energies of enthusiastic reformers" have not been expended in vain.

Following your advice, I seriously pondered over the letter from Mr. Hall, on "The Evil of Indifference," and for a time scarcely knew whether to "weep with them that weep," or to "rejoice with them that do rejoice," but as I am one of those perfidious chemists who for "certain reasons" chose to vote for "pet candidates" I finally decided to rejoice in the "triumphant return of the country candidates." I firmly believe that the newly elected members will prove valuable additions to the Pharmaceutical Council, and that fired with "a desire to abolish some things, to reform others and generally to go-a-head," they will by their deliberations and knowledge of provincial pharmacy bring about a "condition of things pharmaceutical" better than we have experienced before. The drowsy and aristocratic conservatism of the past must give way to a cautious, yet determined liberalism in the future, and the Council, keeping pace with the changing conditions of the chemist and druggist, must be made to feel that a harmonious working with its constituents is now demanded. Attendance to trade interests does not necessarily mean a neglect of the higher branches of our business, nor that our Council need descend in its deliberations "to the level of municipal concerns."

In conclusion I may add that retaining a grateful recollection of the services and sacrifices of men who have served us in the past, I look forward with hope to equally faithful services from the newly fledged Council men in the future, sincerely trusting however, that "many a care and many a sorrow" may not be their lot, and that the grey hairs of our worthy ex-Presidents have not been induced by the "burdens" which Mr. Hall so dolefully tells us they have had to bear.

Leominster, June 7, 1879. M. J. ELLWOOD.

REVISION OF THE BRITISH PHARMACOPŒIA.

Sir,—Is there any chance of there being added to the B.P. a formula for "vinum pepsinæ?"

Occasionally one meets with a prescription containing it, and although there are plenty preparations bearing that name, still it would be the right thing to have one in the B.P., then there would be no doubt as to the article meant, or at any rate there would be no doubt as to the right preparation to supply.

Perhaps this slight notice may be the means of bringing the subject forward; if so, then I may be excused for having troubled you on the subject.

CHEMIST AND DRUGGIST.

J. Goodrick.—(1). *Euphorbia amygdaloides*; (2). *Claytonia perfoliata.*

"*Inquirer.*"—*Petasites vulgaris*, a female plant.

"*Gulielmus.*"—(1). *Geranium lucidum*; (2). *Vicia sativa*; (3). *Lotus corniculatus*; (4). *Euphorbium amygdaloides*; (5). *Linaria Cymbalaria*; (6). *Lysimachia nemorum.*

B. A.—*Inseparable "Lime Juice and Glycerine."*—Recipes for this preparation have already been given on several occasions in this Journal. In addition we now quote the following from Canning's handy little volume, 'Select Practical Notes and Formulæ':—Lime juice, ½ pint (10 oz.); rose water, ¼ pint; spt. vin. rect. (added gradually), 2 oz. Shake well together, after twenty-four hours strain through muslin, and add ol. limonis, ½ drm.: ol. lavand., 15 drops; dissolved in spt. vin. rect., 4 drms. Lastly add glycerine (Price's), 2½ fluid oz. Shake well for some time (Cooley). This makes a semi-transparent liquid. If it be desired to make the thick, opaque, white liquid, sold under the name of "Limes and glycerine," take equal parts of liq. calcis. (recently prepared) and ol. amygdal. Shake well together, and add perfume to taste."

C. H. Freke.—We do not know.

"*Labor Omnia Vincit.*"—Gather the specimens on a dry day; use *plenty* of drying paper, at least six sheets for each specimen, and change the paper frequently, using moderate pressure at first. Most flowers retain their colour if wrapped in cotton wool and not bruised.

C. T.—Yes.

R. Roberts.—Nos. 1, 2, and 3 are correct. (4) *Veronica Chamædrys.* (5) *Carum* (*Bunium*) *flexuosum.* (6) *Lithospermum officinale.*

Errata.—On p. 952, col. iii. in the letter from Mr. Brown, 3rd line of 2nd paragraph, *for* "add ℥vj tinct. aurant.," *read* "add ℥xvj tinct. aurant." On p. 990, Note and Query, No. 600, *for* "Oleate of Lime" and "Oxide of Lime" *read* "Oleate of Zinc" and "Oxide of Zinc."

G. H.—The formula for Lister's Boracic Acid Ointment, will be found in vol. viii. p. 743 (March 16, 1878), and some remarks upon the manipulation on pp. 782 and 822 of the same volume.

B. S.—See the present series of *Pharm. Journal*, vol. i., p. 667.

C. T. Brooks.—We do not understand your question.

K. A.—For a recipe for dark brown hair dye see vol. iv., p. 747 of present series.

Pharmaceutical Examinations.—Mr. Denston wishes to call attention to the fact that in his letter (p. 109) on this subject there was not a single word against either the examinations or the examiners, but that Mr. Sollitt in his letter last week (p. 1011) appears to have confounded him with "Devon."

"*Derfla.*"—We have no authority to decide the point; we could only furnish you with the materials for forming an opinion.

COMMUNICATIONS, LETTERS, etc., have been received from Hesse, Messrs. Will, Bedford. Howard, Reynolds, Rogers, Rouw, Saunders, Apprentice.

ARICINE AND PARICINE.

BY DAVID HOWARD.

Dr. Hesse in his note on paricine in the Journal of June 7, makes the statement that the alkaloid I obtained from a small sample of cusco bark in 1875, "may have been anything else, but not the alkaloid discovered by Pelletier and Carriol."

I had hoped that his own researches in 1877 had dispelled his doubts expressed in 1873, that other chemists had been more fortunate than himself in obtaining aricine. Those who operated on undoubted cusco bark, as was the case with my uncle, J. E. Howard, F.R.S., and myself, obtained the same alkaloids as Pelletier, in 1829, and Dr. Hesse, in 1877, though no doubt in different degrees of purity.

Dr. Hesse's difficulty about my alkaloid is easily removed. I stated that "I failed to obtain the sulphate crystallized from spirit." I have repeated the experiment with the alkaloid from a new sample of cusco bark, and find that the unpurified alkaloid containing Dr. Hesse's cusconin and aricine, which together must have constituted the alkaloid Pelletier worked upon, does not readily give a crystalline sulphate from spirit. Those who have worked with alkaloids know how capricious the crystallization of impure salts is, and how unsafe it is to judge of an alkaloid merely from a failure to crystallize some salt while still impure; this explains my failure to obtain a crystalline iodide.

My only object in publishing results obtained with a most insufficient quantity of material at my disposal, was to show that, contrary to Dr. Hesse's doubt, cusco bark did contain an alkaloid or alkaloids utterly different from the well known cinchona alkaloids; that I was right Dr. Hesse has himself shown by his more recent researches.

With regard to paricine, the presence of which I suggested as possible, the amorphous alkaloid of cusco bark certainly gives a precipitate with nitric acid closely answering the description of Winckler's paricine; it may indeed be very different from Dr. Hesse's paricine. There is, however, strong evidence of a close relation, if not identity, if Dr. Hesse is right in thinking that the precipitate he found to be impure paricine was supposed by my uncle to be impure aricine, as in that case it was from undoubted cusco bark, *C. Pelletierana*, and consisted of all the alkaloids obtained precipitated together in an impure state.

LINIMENTUM TEREBINTHINÆ ACETICUM.

BY H. COLLIER,

Teacher of Pharmacy, Guy's Hospital.

Linimentum terebinthinæ aceticum cannot be regarded as a perfect preparation. It is composed of equal parts of a fixed oil holding camphor in solution, a volatile oil, and a watery acid fluid, and the imperfection of this mixture is, that separation begins as soon as shaking has ceased. Of course, no other result could be expected from such ingredients, and in the original formula for St. John Long's celebrated liniment, of which the British Pharmacopœia preparation is an imitation, the yolk of egg was used to form an emulsion. There would, however, be some objection to this emulsifying agent in an application which is intended to be rubbed on to the skin, and gum or mucilage, the ordinary means of forming emulsions, would also not be suitable on account of their stickiness. It is, however, possible to render this liniment perfectly smooth and creamy, and one which, upon evaporation, leaves no solid matter like the yolk of an egg or mucilage. The agent employed is a tincture prepared from the bark of the *Quillaia saponaria*. The use of this tincture in the formation of emulsions of oils and resins is by no means a new one; for in *L'Union Médicale* for 1851 is an article by Le Beuf on the use of this tincture for making emulsions, and Le Beuf made and advertized coal tar saponine, émulsion de baume de tolu and émulsion de goudron végétal. It does not appear to me to have come into use in English pharmacy, but it is really a valuable agent worthy of a place in it. It is in constant use at Guy's Hospital for the preparation of emulsions, and in the new Pharmacopœia of that Hospital, which will appear in a few weeks' time, a formula is inserted for preparing the tincture, which is an ingredient in some of the hospital mixtures. In the "Rapport sur les Médicaments Nouveaux,"* published by the Paris Society of Pharmacy, tincture of quillaia is introduced for the "émulsion des médicaments insolubles dans l'eau." I make the tincture by digesting 4 ounces of quillaia bark, coarsely powdered, in spt. vini rect. Oj for four days, and then filtering. ℥ss of this tincture emulsifies perfectly ʒss of a fixed oil such as ol. morrhuæ with ℥ss of water. It appears to me from the results of my experiments that it is more suited for fixed and volatile oils than for resins. I hope, however, at some future time, to be able to state precisely the use of tinct. quillaiæ as an emulsifying agent.

To return to linimentum terebinthinæ aceticum. The following formula gives a creamy emulsion, which is permanent for at least six minutes after shaking, and which slowly separates into three layers, a watery one below, a cream in the centre, and an oily stratum at the top. After the lapse of several hours this resolves itself into two layers.

℞ Ol. Terebinth.,
Acid. Acetic.,
Lin. Camph.,
Tinct. Quillaiæ . . . āā partes æquales.

Shake together the tincture, camphor liniment and oil of turpentine, and then add the acetic acid and again shake.

NOTES ON INDIAN DRUGS.

BY W. DYMOCK.

(*Continued from page* 1017.)

RUBIA CORDIFOLIA, *Linn.*, RUBIACEÆ. *The root.*

Vernacular.—MAJITH, MANJIT (Hind., Bomb., and Beng.), MANJITTI SHEVVELLI (Tam.).

History, Uses, etc.—Madder is used in Hindu medicine as a colouring agent; medicated oils are boiled with it to give them colour. It is also a useful external astringent, and is applied to inflamed parts, ulcers, fractures, etc. Chakradatta recommends madder rubbed with honey as an application to the brown spots of pityriasis versicolor. The Sanskrit name for madder is Manjishtha. Under the names of tuvvah and runas, Arabic and Persian writers treat of madder, probably the produce of *R. tinctorium*, as the roots which come from Affghanistan appear to be identical with those of the Euro-

* See *Pharmaceutical Journal*, [3], vol. viii., p. 26.

pean species. They do not, however, make any distinction between the species, but simply mention a wild and a cultivated variety. The Mahometans consider the drug to be deobstruent, and prescribe it in paralytic affections, jaundice, obstructions in the urinary passages, and amenorrhœa. They mention the fruit as useful in hepatic obstruction, and a paste made from the roots with honey as a good application to freckles and other discolorations of the skin. The whole plant is reputed to be alexipharmic; it is also hung up in houses to avert the evil eye, and tied to the necks of animals with the same object.

Ainslie observes that the Hakeems are in the habit of prescribing an infusion of madder root as a grateful and deobstruent drink in cases of scanty lochial discharge after lying in ('Mat. Ind.' II., p. 182). In another notice of the article (Op. cit. i., p. 202), he remarks that it would appear to be chiefly produced in Kachar, and the root is in great demand in the adjacent countries for dyeing their coarse cloths and stuffs red; the Nepaulese are in the habit of bartering it for rock salt and borax. Kinneir and Tavernier notice the abundance of madder in Persia and Makran. Dr. G. Playfair, in a note appended to his translation of the 'Taleef-i-shareefee' (p. 150), states that if taken to the extent of about three drachms several times daily, it powerfully affects the nervous system, inducing temporary delirium, etc., with evident determination to the uterine system. The plant is common on the higher ghauts in the Bombay Presidency, but the Bombay market draws its supplies chiefly from Kelat through Sind. The imported article fetches a higher price than that grown in India.

Description.—Madder root consists of a short stock from which numerous cylindrical roots, about the size of a quill, diverge; these are covered by a thin brownish suber, which peels off in flakes, disclosing a red-brown bark, marked by longitudinal furrows. The taste is sweetish at first, afterwards acrid and bitter.

Microscopic Structure.—A tranverse section shows the suber, within which is a parenchyme composed of tangentially extended cells, which are arranged in radiating lines, and gradually decrease in size until they become almost square where they join the cambium layer. These cells contain granular colouring matter and a few crystals of oxalate of lime.

The wood is provided with numerous and large vessels.

Chemical Composition.—According to Bucholz, the constituents of madder are as follows:—Resinous red colouring matter, 1·2; extractive ditto, 39·0; reddish brown substance, soluble in alcohol, 1·9; pungent extractive, 0·6; gummy matter, 9·0; woody fibre, 22·5; matter soluble in potash, 4·6; salts of lime with colouring matter, 1·8; water, 12·0; loss, 7·4. The medicinal action of madder, if any, is probably due to the small quantity of acrid and resinous matter contained in it. For an account of the colouring materials, which are of great importance to the dyer, Ure's 'Dictionary of Arts and Manufactures,' and Watt's 'Chemical Dictionary,' may be consulted.

Commerce.—Madder is brought into India from the west as well as from Nepaul. It is imported into Bombay from Persia and Affghanistan, that from the latter country appears to be the same as the madder grown in Europe. It is shipped from Kurrachee to the extent of about 1500 tons annually, and is worth about 17 R's. per cwt., nearly double the price of Persian madder.

NARDOSTACHYS JATAMANSI, D.C., VALERIANACEÆ.

The rhizome. Vernacular.—BALCHAR (Hind.), JATAMASI (Bomb., Beng., Tam.).

History, Uses, etc.—This plant, in Sanskrit jatamansi, has from a very remote period been in use among the Hindus as a perfume and medicine. It is mentioned by Susruta, and is prescribed by Hindu physicians as a nervine tonic and aromatic adjunct in the preparation of medicinal oils and ghritas (butters).

In the Pharmacopœia of India it is stated that jatamansi enters into the composition of a nostrum, highly recommended in the treatment of epilepsy by Susruta. Dutt, in his Hindu 'Materia Medica' (p. 180), says: "I do not find in Susruta's work any prescription for epilepsy, containing jatamansi, except the following, in which, however, it can hardly be said to be an active ingredient.—Take of the pulse of *Phaseolus Roxburghii*, barley, jujube fruit, seeds of *Crotalaria juncea*, bdellium, jatamansi root, the ten drugs collectively called dasamula, and chebulic myrobalans, equal parts; and prepare a decoction in the usual manner. This decoction is recommended to be administered with the addition of clarified butter and goat's urine." Arabic and Persian writers describe jatamansi under the name of sumbul and sumbul-i-hindi, the latter term being used to distinguish it from valerian, which is sometimes called sumbul. The author of the 'Makhzan-ul-adwiya' says that it is the nardeen of the Greeks, and compares the root to the tail of a sable. He considers it to be deobstruent and stimulant, diuretic and emmenagogue, and recommends it in various disorders of the digestive and respiratory organs, and as a nervine tonic in hysteria. He also notices the popular opinion that it promotes the growth and blackness of the hair.

Ainslie notices that the Vytians in lower India prepare a fragrant and cooling liniment for the head from this drug, and also prescribe it internally as a purifier of the blood. Sir W. Jones thought that the spikenard ointment of the ancients might have been made from *N. jatamansi* ('Asiat. Res.,' II., p. 405, and IV., p. 109). However this may be, there can be no doubt that jatamansi has been used in India for a similar purpose from a very early date, and that the principal use of the drug at the present time is for making hair washes and ointments. Sir W. O'Shaughnessy states, as the result of his experience with jatamansi, that it is a perfect representative for valerian ('Bengal Disp.,' p. 404). It is very desirable that further trials should be instituted with this promising drug, which can be procured at a small cost in almost all the bazaars throughout India. Care should be taken to select good specimens for trial, as the central portion of the root is often destroyed by insects.

Description.—The drug consists of a short portion of rhizome, about as thick as the little finger, of a dark grey colour, surmounted by a bundle of fine reddish-brown fibres, the whole forming an object not unlike the tail of a sable or martin. The fibres are produced by an accumulation of the skeletons of the leaves, and are matted together, forming a kind of network; amongst them the remains of flower-stalks may be found. The odour of the drug is heavy and peculiar, like a mixture of valerian and

patchouli; the taste bitter and aromatic. When the central portion is removed, and cut across, it is seen to consist of a thin cortical portion, connected with the central woody column by four medullary bands, between which are situated large canals, which contain the fibrovascular bundles.

The central woody column is of a red-brown colour, angular and jointed, having a certain amount of resemblance to the vertebræ in the tail of an animal.

Commerce.—Jatamansi is brought from the mountainous districts of Northern India. Value Re. ½ per pound.

Blumea aurita, D.C., Compositæ. *The plant. Vernacular.*—Jangli muli (Bom.), Narak-karandai (Tam.).

Description, Uses, etc.—Mr. Modeen Sheriff has the following account of the plant: "This is an annual herbaceous or somewhat shrubby plant, found in every creek and corner, particularly along the walls of old ruinous buildings and in graveyards. The appearance of the young plant is so different from that of the old that some people, who are not acquainted with this fact, have thought them to be two distinct species. The size of the leaves is the chief cause of the difference; these are very large when the plant is young, and resemble those of the radish. From this fact, and from the plant being generally found along the walls, it is often named in Tamil, shevuru-mullangi, in Telugu, goda-mullangi, and in Hindustani, diwarimuli. These names, however, properly belong to another plant of the same natural order, which generally grows on the tops of walls. When baurita is in flower, the leaves, except a few old ones near the root, become very small and quite sessile, with auricles or leafy appendages near their base, and the plant itself is much altered in appearance from numerous branches. As this blumea if often called by the Telugu name, karu-pógáku, in Madras, it is probably the one alluded to by that name in the 'Flora Andhrica,' but to which no botanical name is assigned. Sir W. Elliot says: that "it is a composite plant not found in flower." The karu-pogaku, of Madras, is also a composite plant, and found here in flower after the rainy season. It quite corresponds with the characters of the *Conyza aurita*, of Roxburgh ('Flora Indica,' iii., 428), and of *Blumea aurita*, in Dr. Wight's 'Contributions to the Botany of India' (p. 16). The flowers are generally about the size of a large pea, and of a white colour." ('App. Phar. of India,' p. 73). Mr. M. Sheriff has identified this plant with the kumafitus of Arabian writers, and the kakronda of Hindustan; but the author of the 'Makhzan' says that "kumafitus and kakronda are not identical," and his description of the latter article does not agree with Mr. Sheriff's *B. aurita*, the colour of the flowers being given as yellow. I am inclined to identify kakronde with *Tylophora asthmatica*, or some other asclepiad. The medicinal properties of the different species of blumea appear to differ little; they are probably all more or less deobstruent and stimulant. One of the genus yields a large quantity of camphor, which is known as Ngai camphor (Confer. articles on "Blumea Camphor," in *Pharmaceutical Journal* for 1875--76). *Blumea balsamifera*, D.C., inhabits the Moluccas and Ceylon as well as India. It possesses a strong camphoraceous odour and pungent taste. A warm infusion of the plant (Horsf., As. Journ. viii., 272) acts as a powerful sudorific, and is in very general use among the Javanese and Chinese as an expectorant. It has also been repeatedly employed in catarrhal affections. Loureiro ('Flor. Coch.,' p. 603) mentions its use in Cochin China as a stomachic, antispasmodic and emmenagogue ('Phar. of India,' p. 128). A strongly camphoraceous blumea is common in the neighbourhood of Bombay, and is used by the country people to drive away fleas. It appears to be the *B. holosericea*, D.C.

The local name is bhamburda.

Guizotia oleifera, D.C., Compositæ. *Expressed oil of the seeds. Vernacular.*—Ramteel, Kalateel (Hind., Beng., Bomb.); Valesuloo (Tel.).

Description, Uses, etc.—This is an annual, herbaceous, erect plant; leaves opposite, long, lanceolate, coarsely serrated; peduncles elongated, sub-corymbose; flowers large, bright yellow. It is commonly cultivated in the neighbourhood of Bombay and in the Deccan as a monsoon crop. The oil is sweet, and may be used for the same pharmaceutical purposes as sesamum oil. In the Concan it is much esteemed for culinary purposes and for making sweetmeats. According to Drury an acre will produce about two bushels of seed, worth in Mysore about Rs. 3½ per maund. In Bombay it sells for Rs. 6½ per pharrah (about 35 lbs.).

The achenes are of greyish-black colour about $\frac{2}{10}$ of an inch long, somewhat angular from lateral compression, tapering towards the base, quite smooth. Taste oily and nutty.

Glossocardia Bosvallea. D.C., Compositæ. The plant is known in Bombay by the name of Phatara-Suva, which means rock anethum. In the Poonah and Sholapore districts it is called Pitta-papada, a name also given to Fumaria. Dr. S. Arjun, of Bombay, informs me that he has found it growing on rocky ground towards Chinchpoogly, in the island of Bombay, during the rains. It is not sold in the Bombay shops, but is the Pitta-papada of the Poonah druggists, and according to Dalzell and Gibson is much used in female complaints, the nature of which they do not specify. *G. glossocardia* is a small annual, with many stems, diffuse; leaves alternate, much divided, linear at the base; heads of flowers solitary, yellow, on short naked peduncles. *Syn. Verbesina bosvallea*, Linn. Suppl. p. 379; Willd. sp. iii., p. 2223; Roxb. Fl. Ind. iii., p. 443; *G. linearifolia*, Cass. Dict. xix., p. 62 (Bombay Flora, p. 129). It has a bitter taste.

(To be continued.)

NOTES ON THE ANALYTICAL EXAMINATION OF TINCTURES.*

BY ALFRED H. ALLEN, F.C.S.

Read before the Society of Public Analysts, on April 30th, 1879.

I have had occasion lately to make some experiments on the "tinctures" of the British Pharmacopœia, and as some of my experiences are of a rather novel character they appear worth recording.

I may premise that the so-called "tinctures" or "spirits" of pharmacy, are of two distinct alcoholic strengths. "Rectified spirit, B.P." (sp. gr. ·838=84 per cent. by weight of absolute alcohol=155½ per cent. of proof spirit) is directed to be employed in the preparation

* From the *Analyst*, June, 1879.

of the tinctures and spirits of chloroform, ether, aconite, ferric chloride, ferric acetate, iodine, myrrh, nux vomica, camphor, ginger, etc. On the other hand, "proof spirit, B.P." (sp. gr. ·920=49 per cent. by weight of absolute alcohol), is directed to be used in making the tinctures of orange-peel, belladonna, cantharides, catechu, digitalis, ergot, opium, rhubarb, squills, etc.

In many instances, the alcohol is the chief element of cost in the preparation of tinctures, and there is consequently a strong inducement to economize it as much as possible. Hence, it is not unusual to find proof spirit substituted for rectified spirit, and a mixture of equal measures of rectified spirit and water for proof spirit. Of course, alcohol so deficient in strength is apt not to dissolve the active constituents of the drugs employed.

On the other hand, some of the leading firms prepare their tinctures with alcohol of 60° O.P., and yet use it in the same proportion as if it were merely 55° O.P., as required by the Pharmacopœia.

In many of the official tinctures, the determination of the alcohol presents no difficulty. Mere distillation will suffice to separate it in a state of approximate purity from the tinctures of aconite, arnica, belladonna, calumba, capsicum, catechu, jalap, nux vomica, opium, quinia, etc.; and the same is true of the tinctures of iodine, ferric acetate, etc., if they be first rendered distinctly alkaline with caustic soda. On the other hand, the tinctures of benzoin, myrrh, ginger, camphor, rhubarb, etc., give a distillate contaminated with essential oils or similar volatile matters in quantity sufficient to affect, more or less seriously, the determination of alcohol by the density. The same is true of the "aromatic spirit of ammonia," and tinctures prepared with it, with the additional objection that the distillate will contain ammonia, unless the alkaline reaction of the spirit be previously carefully neutralized by hydrochloric acid.

If any of the tinctures to which the distillation process is not directly applicable be diluted considerably with water, the essential oil is precipitated more or less completely, but usually in so fine a state of division that filtration is completely useless. I find, however, that this difficulty may be got over very simply by operating in the following manner:—50 c.c. of the sample are taken and diluted with water to about 350 c.c. This causes the precipitation of the greater part of the essential oil or resinous matter. A few drops of a strong solution of calcium chloride are next added, and this is followed by some solution of sodium phosphate, the liquid being vigorously stirred. The flocculent precipitate of calcium phosphate effectually entangles the finely divided essential oil and clarifies the liquid. The liquid is next diluted to a definite volume, 400 c.c. being sufficient if the tincture were prepared with proof spirit, but 500 is preferable if rectified spirit should have been originally employed. The solution is then thoroughly agitated and passed through a dry filter. A known measure is then carefully distilled at a low temperature, and the distillate made up exactly to the volume occupied by the liquid before distillation. The density of the distilled spirit is then taken, and the corresponding percentage of proof spirit learnt by reference to a table. Evidently the proportion of proof spirit in the original tincture will be either eight or ten times the amount found in the distillate, according to the extent of dilution practised.

It is convenient to state the strength of the tincture in percentages of proof spirit, as any deficiency in strength is then at once apparent, and the extent of dilution is readily calculated.

With a view of testing the accuracy of this mode of assaying tinctures, I have made various experiments. The following data indicate the extent to which the process may be relied on.

A sample of tincture of myrrh was prepared according to the directions of the Pharmacopœia, and on examination gave the following results:—

	Sp. Gravity	Proof Spirit=Absolute Alcohol. by volume	by weight.
Spirit used for preparing tincture	·8378	156·7	84·1
Tincture	·8549	146·0	77·3
Spirit in tincture calculated from results of distillation		150·7	80·8
		151·0	80·9

It would appear from these results that about 6 per cent. less of proof spirit was obtained than was present in the alcohol used in preparing the tincture, and, therefore, that the method is in error to this extent. This conclusion is not justified, for in the above calculation it is assumed that no increase in the bulk of the spirit occurs on saturating it with myrrh; but the following data show that this assumption is not warranted:—5 grams of myrrh previously dried at 100° C. were added to 40 c.c. of rectified spirit of ·8280 specific gravity. After standing forty-eight hours, the tincture was filtered, the residue washed with a little spirit, dried, and weighed. Its weight was 3·142 grams, so that 1·858 grams had dissolved in the spirit. The density of the tincture was found to be ·8432. The weight of alcohol used was ·828 × 40 = 33·120 grams, which, added to the weight of the dissolved myrrh, gives 34·978 as the weight of the tincture. This, divided by the observed density, gives 41·4 c.c., as the measure of the tincture. Hence 100 c.c. would have increased to 103·5 c.c. In another experiment the volume was found to be 103 c.c., and in a third experiment, on double quantities, it came to 104·6. The mean of these estimations is 103·7. Thus the percentage of alcohol *found* in tincture of myrrh ought to be multiplied by 1·037 to get the true strength of that *employed* in its preparation. Applying this correction to the alcohol found by distillation of the tincture of myrrh, we obtain 156·3 and 156·6 per cent. of proof spirit, against 156·7 employed in preparing the tincture, a result which leaves nothing to be desired.

A very striking example of expansion of the fluid occurs in the preparation of the "spirit of camphor, B.P." In one experiment I placed 10 grams of camphor in a graduated cylinder, and added 90 c.c. of rectified spirit of ·830 specific gravity. The tincture produced measured exactly 100 c.c., so that, as camphor has a density of ·996, 10 grams would measure 9 96 c.c., and hence camphor dissolves in alcohol without sensible change of volume. The tincture was found by experiment to have a density of ·8446, the theoretical density, assuming no change of volume, being ·8466. Therefore the action of alcohol on camphor appears not to be strictly that of a solvent. It seems to act rather by causing liquefaction of the camphor, subsequently mixing with the resultant liquid without notable change of volume. Its action may be compared to that of chloral hydrate on camphor.

In consequence of this peculiarity, the proportion by volume of proof spirit contained in spirit of camphor will be $\frac{9}{10}$ of that present in the alcohol used in its preparation, and there is no doubt that a similar correction ought to be applied in certain other cases.

When the modified distillation process already described is applied to spirit of camphor, the determination of the alcohol can only be affected approximately. Even when the spirit is previously diluted with nine times its volume of water, the distillate has a distinct smell and taste of camphor. This is doubtless a consequence of the solubility of camphor in water, for the distillate obtained from tincture of myrrh retains no trace of its origin.

It is very probable that Monell's colorimetric method* might be advantageously utilized for the estimation of alcohol in spirit of camphor, but I have not been able to try the experiment.

I have not made any attempt to determine the camphor in a spirit or tincture containing it, but may suggest that

* *Journ. Chem. Soc.*, 1878, II., 246.

its action on polarized light would probably afford a fairly accurate means of estimating it. The specific rotatory power of common or dextro-camphor, in alcoholic solution, is +47·4 for the transition tint.

My attention has been recently called to the analysis of the official "compound tincture of camphor," owing to the following circumstances. A medical practitioner in Sheffield had reason to suspect some compound tincture of camphor supplied him by a well-known local pharmacist, and so submitted it to a wholesale firm in London, whose chemist reported it to be deficient in alcohol and some other constituents. The medical man thereupon, through the agency of a brother practitioner, called the attention of the inspector to the matter, and supplied him with a signed written order (in Latin) for 8 oz. of the tincture. In due course, the sample was procured and submitted to me, and I certified that it contained only about 34 per cent. of absolute alcohol (=71·4 per cent. of proof spirit), instead of being made with proof spirit, and was nearly destitute of benzoic acid and oil of anise. The proportion of opium was not found to be deficient, and I expressed no opinion on the proportion of camphor. In the sequel, the vendor was prosecuted and fined £5 and costs.

From a consideration of the facts, it seems probable that the proportion of alcohol was cut down from motives of economy. The deficiency of alcohol compels a considerable reduction in the proportion of the oil of anise, as the weaker spirit used will not dissolve the half-drachm to the pint prescribed by the Pharmacopœia.

In devising a method for examining such a complex preparation as the compound tincture of camphor, it appeared desirable to analyse a number of samples of known purity. In this I have been assisted by Mr. L. Siebold, of Manchester, to whom I am indebted for the analytical results obtained by the examination of three samples of the tincture, and for a check-analysis of the adulterated sample.

In the following description, A and B are specimens of the tincture purchased by Mr. Siebold in Manchester, and probably prepared with spirit at 60° O.P. C is a sample prepared by Mr. Siebold himself. C 1 S and C 1 A are the adulterated samples as examined by Mr. Siebold and myself respectively; and C 2, C 3, C 4, and C 5 are samples purchased from well-known Sheffield pharmacists; C 5 being prepared specially for me.

The following are the densities of the original samples, without distillation or any other manipulation:—

A	B	C	C 1 S	C 1 A	C 2	C 3	C 4	C 5
·9147	·9150	·9205	*·9508	·9533	·9231	·9321	·9212	·9240

From these figures it is evident that the small proportions of solid constituents present in compound tincture of camphor do not very materially affect the density, and hence that the specific gravity affords a very good approximate indication of the strength of the alcohol by which it was prepared.

However, the modified distillation process already described admits of the determination of the alcohol with all desirable accuracy, provided that a slight excess of alkali be added prior to distillation to prevent volatilization of benzoic acid. By proceeding in this manner, the alcohol is obtained unmixed with anything except the $1\frac{1}{2}$ grains per ounce of camphor, an amount which I have proved experimentally has no appreciable influence on the density. The clarification of the liquid with chloride of calcium and phosphate of sodium is really superfluous in the case of the compound tincture of camphor, for the small proportion of the oil of anise does not affect the density of the distillate, though it renders it milky. A useful modification of the process is to employ chloride of calcium, but to precipitate it with carbonate of sodium instead of the phosphate, and thus clarify the diluted tincture and render it alkaline at the same time.

The experiments made on the samples of compound tincture of camphor already mentioned have shown that the true percentage of proof spirit, as determined by distillation, is never more than two degrees in excess of that deduced from the density of the original tincture.

The alkaline liquid which remains in the retort after distilling off the spirit is of service for the determination of the benzoic acid. If concentrated to one-half of the volume of the original tincture employed, it should give an immediate and copious precipitate of benzoic acid on being strongly acidified by concentrated hydrochloric acid. If the acid liquid be then shaken with ether, and the upper layer of liquid removed with a pipette, the benzoic acid is readily obtained in a state of approximate purity. If the ethereal layer be transferred to a small beaker, and the ether evaporated spontaneously by a current of dry air from an aspirator or bellows, the benzoic acid remains as a crystalline residue, which may be further examined. If the shaking of ether be repeated the extraction of the benzoic acid is perfect, a very fair approximate determination of its quantity may be obtained, even on as small a quantity as 5 c.c. of the tincture. Chloroform may be substituted for the ether with some little advantage. In the adulterated sample, neither Mr. Siebold nor I could detect any trace of benzoic acid; the ethereal extract was but faintly acid, a reaction which proved to be due to the presence of a trace of meconic acid.

A very fair idea of the proportion of opium present in compound tincture of camphor may be obtained by diluting the sample with proof spirit and adding ferric chloride. By comparing the depth of red colour produced with that given by a standard tincture, in a manner similar to Eggertz' colorimetric method of determining carbon in steel, a good approximation to the proportion of opium can be obtained. Of course, the percentage of meconic acid contained in different samples of opium is somewhat variable, and hence the determination is but approximate. A useful check is obtained by drying up a known measure of the tincture until the residue ceases to lose weight; but such a process is quite invalid if the tincture has been artificially coloured by caramel or similar material, a practice which is extremely common.

I have recently examined several samples of "paregoric elixir," which were found to be wholly destitute of opium. As the name "paregoric elixir" was formerly official, and has never been applied to any other preparation than that now represented by the compound tincture of camphor, this omission appears to be a distinct infringement of the Sale of Food and Drugs Act.*

The proportion of oil of anise present in a sample of compound tincture of camphor may be judged of by the readiness with which the liquid is precipitated on dilution with water. With a proper proportion of oil, hardly any dilution can be effected without a milky precipitate being formed. In the case of the adulterated sample already described no precipitation occurred, no matter how much water was added. It was also proved by experiment that the proportion of oil of anise which could be dissolved in spirit of 30° O.P. was but a mere fraction of that taken up by proof spirit. Mr. Siebold found that samples A, B and C were precipitated by water even when mixed with seven volumes of proof spirit, and from this fact he estimated the proportion of oil of anise in C 1 S at less than one-eighth of the normal amount.

In addition to assistance afforded me by Mr. Siebold, I have to acknowledge my indebtedness to Mr. W. F. Cocker, who has made most of the test experiments in trial of the processes described in this paper.

* The quantity of tincture at Mr. Siebold's disposal was very small, and the density was determined by noting the weight of 10 c.c.

* Since this paper was read, two convictions have taken place at Dewsbury for selling "paregoric elixir" which was destitute of opium.

VALUATION OF BLISTERING BEETLES.*

BY LEVI FAHNESTOCK, PH.G.

(*Abstract from an Inaugural Essay.*)

In undertaking a series of experiments on this subject, old Chinese blistering beetles were first treated by the process of Professor Procter, as modified by Fumouze. 200 grains of powdered *Mylabris cichorii* were exhausted with chloroform by maceration and expression; from the solution thus obtained most of the chloroform was distilled off, the residue was poured into a dish, and the retort rinsed out with a small quantity of chloroform and this added to the balance. This solution was allowed to evaporate spontaneously to the consistency of a thick extract, which was treated with bisulphide of carbon; a large quantity of fatty matter was taken up by the solvent, but a considerable quantity of foreign matter was left behind with the cantharidin. This impure cantharidin was then dissolved in a small portion of alcohol, the solution passed through a filter, in order to remove a little dust, and allowed to evaporate spontaneously; the cantharidin was obtained in slightly purer crystals, but still of a dark brown colour, and weighed 2·8 grains.

This strange insolubility of a portion of the fatty matter in bisulphide of carbon is entirely at variance with the experiments of Professor Maisch, conducted by the same process and on the same lot of beetles about six years ago, at which time he obtained the cantharidin almost white without purification. It was concluded, therefore, that the solubility of the fatty matter had become impaired by the age of the beetles, as no particular precaution had been taken to preserve them. 200 grains of the powder were now exhausted with acetic ether by displacement, about six fluid ounces of percolate being obtained. The greater part of the acetic ether was distilled off and the balance allowed to evaporate spontaneously. The residue was treated with bisulphide of carbon, which dissolved a portion of the fatty matter, but a considerable quantity remained undissolved, as in the former case. The residue was dissolved in hot alcohol, from which on cooling, 1·3 grain of much purer cantharidin crystallized, while that remaining in the alcohol could not be freed by simple solvents from the contaminating foreign matter.

200 grains of the powder were, according to Dragendorff's process, digested in hydrate of potassium for about fifteen minutes, the mixture treated with hydrochloric acid in excess, dried and treated by displacement with petroleum benzin, with the view of removing, if possible, the fatty matter beforehand. A dark-coloured solution was obtained, from a portion of which the benzin was evaporated off, leaving the oil of a dark brown colour and of a butyraceous consistence. This was tested for cantharidin by applying a small quantity to the arm, but no effect was produced, proving the insolubility of cantharidin in petroleum benzin. The powder was then exhausted with chloroform and treated in the same manner as in the first experiment. The cantharidin obtained by this process was of a much purer form, crystalline and of a light yellow colour, and weighed 2·5 grains.

The yield and purity of the product being most satisfactory by this last process, it was adopted in the following experiments:

Cantharis vittata, the potato bug, was next examined, 150 grains of the powder being used, yielding two grains of almost pure cantharidin in rather large crystals, which when obtained, along with the fatty matter, were long and needle-shaped, but after purification assumed a square and tabular form. This leads to the conclusion that the presence of the fatty matter changed the shape of the crystals.

Three specimens, 200 grains each, of *Cantharis vesicatoria*, were next examined. The first was a sample of the fresh, two of old beetles, one consisting of the soft, the other of the hard parts of worm-eaten cantharides, the portions being separated by a sieve of ten meshes to the inch. The result was less successful, as a considerable amount of fatty matter could not be removed by the petroleum benzin, but remained intimately associated with the cantharidin, being insoluble in bisulphide of carbon and other solvents, except those which also dissolved the cantharidin. Filtering through animal charcoal also failed to separate it. In fact the presence of cantharidin was at first doubted altogether, as there was no appearance of crystallization. It was, however, tested by applying a small quantity to the arm, and although vesication was produced, it took a much longer time to produce the effect. It was evidently very impure.

The portion obtained from the soft parts of the worm-eaten variety weighed 5·9 grains, and that from the hard parts of same sample 2·9 grains. The fresh cantharides did not yield crystallized cantharidin, either by this or by Procter's process, and it was, therefore, concluded that the insects were really old, notwithstanding their fresh and undamaged appearance.

In summing up the results, the following points are presented:—

1. Old Mylabris cichorii yield 1·25 per cent., and fresh Cantharis vittata 1·3 per cent. of cantharidin.
2. By age the virtues of the beetles are impaired and less effectual for vesication, and a portion of what appears to be fatty matter becomes insoluble in bisulphide of carbon, petroleum benzin, etc., rendering the isolation of cantharidin much more difficult.
3. By the treatment with hydrate of potassium and hydrochloric acid the yield of cantharidin is increased, probably from the decomposition of ammonium and magnesium compounds of cantharidin contained in the beetles.
4. By exhaustion with petroleum benzin a large quantity of the fatty matter, but no cantharidin, is removed thus facilitating the subsequent operations.

* From the *American Journal o Pharmacy*, June, 1879.

PREPARATIONS FROM THE SQUILL.

BY E. MERCK.

In consideration of the unsatisfactory nature of the so-called "scillitin," which has been looked upon as the quintessence of squill extract, although not perhaps as the pure active principle, and induced by the wish to present the diuretic portion of the squill as the purest possible body and in convenient form, the author has carried out a new examination of the *Scilla maritima*. Up to the present time this has yielded him three substances, which upon the suggestion of Professor Huseman of Gottingen, who has made some physiological experiments with them, and Dr. C. Moeller, he has named scillipicrin, scillitoxin and scillin. Some therapeutic experiments are being made under the care of Dr. Fronmüller.

Scillipicrin is a yellowish white amorphous powder, very hygroscopic and very soluble in water, and having a bitter taste. Its solubility in water allows of its subcutaneous injection. It has a definite action upon the heart: a slackening of the heart-beats and eventual cessation in diastole is the result of an excessive dose, which with frogs amounts to 0·01 to 0·02 gram.

Scillitoxin is a cinnamon brown powder, insoluble in water and ether, soluble in alcohol. The solution in alcohol has a lasting bitter and burning taste. The dry substance has a powerfully irritating action upon the mucous membrane of the nose. In aqueous solutions of the alkalies it is readily, but not absolutely completely dissolved; upon heating the solution in soda ley a peculiar koussin-like odour is developed. Acids produce in these alkaline solutions a flocculent precipitate. When concentrated sulphuric acid is poured upon scillitoxin, first a red and then a brown colour result: nitric acid produces first a light red and finally an orange yellow to yellowish green colour. The use of scillitoxin in subcutaneous

injection is rendered difficult by its insolubility in water, and this necessitated, in the experiments with frogs, the introduction of the preparation under the skin in the solid state or mixed with sugar, when the curious observation was made that this substance—insoluble in water—was easily and rapidly dissolved and absorbed.

Scillitoxin also acts upon the heart: it is a decided heart poison, but far more intense in its action than scillipicrin. Whilst, as above mentioned, the minimum lethal dose of the latter for frogs is 0·01 gram, one-eighth of a milligram of scillitoxin suffices to bring the heart to a standstill; but, contrary to scillipicrin, scillitoxin causes the stoppage of the heart in systole. The author thinks that it is probably in scillitoxin that the peculiar active principle of the squill is to be looked for.

Scillin is a light yellow crystalline tasteless powder. It is difficultly soluble in water, but soluble in alcohol and boiling ether, from which it again separates in the crystalline condition. Concentrated sulphuric acid colours it red brown; nitric acid colours it first yellow and then green to dark green, especially when heated. It is contained in the squill in small quantity.

Scillin has of the three substances the least activity. It does not approach the action on the heart of the other two; on the other hand it appears to produce the subsidiary actions of the squill, such as numbness, vomiting, etc.

The author infers from the foregoing that the first-mentioned two preparations,—scillipicrin and scillitoxin—are those worthy of attention, though which will have the advantage as a diuretic in practice must be decided by experiment. But he considers their noteworthy antagonism in paralysing the heart,—the one causing cessation in diastole and the other in systole,—proves without doubt that neither the extractum scillæ, the so-called scillitin, nor the squill itself, presents the best means of administration, which can only be obtained by the separation of the active constituents and the simultaneous removal of scillin, the cause of the injurious subsidiary actions.

FLUID EXTRACTS BY REPERCOLATION.

BY EDWARD R. SQUIBB.

(*Continued from p.* 858.)

[We have been favoured by Dr. Squibb, of Brooklyn, with the following communication, with a request that it might be published in continuation and completion of the paper that has already appeared in this Journal.]

The foregoing part of this paper was originally published in the *American Journal of Pharmacy*, for May, 1878, but for want of time it was not in a complete condition. It was afterwards reprinted from the Journal by the author, in pamphlet form, with some additions and corrections, and with some of the tables and other details completed; but still the subject and the original design of the writer were left incomplete for want of a table of the details of practice by repercolation, which could be supplied from the writer's experience, with a large number of the fluid extracts in common use during the twelve years embraced by the paper.

As these details embrace the fineness of powders, the menstrua used, the tension of packing, and the weight of the finished fluid extracts; and as these details had furnished throughout a number of years a series of the most important fluid extracts, many thousands of pounds of which had been successfully used by the medical profession throughout the United States; and as the writer had no objection to publishing the results of his experience and labour for the general good of pharmacy and medicine, it was thought to be worth while to complete the paper referred to and offer it to the Association, for the benefit of whose Committee on Revision of the Pharmacopœia the work was originally undertaken. The Association may now, at its pleasure, place the whole or any part of the now completed paper on its records in the Proceedings.

In the following table the first column gives the drugs repercolated.

The second column gives the fineness of powder used; the number indicating the number of the sieve through which all the powder would pass, coarse and fine together. And the number of the sieve indicates the number of meshes to the linear inch. For example, No. 20 gives a mesh $\frac{1}{20}$ of an inch square less the diameter of the wire, leaving the opening to be, say $\frac{1}{30}$ of an inch. In three cases two numbers are given to indicate that the difference between the coarser and finer particles is much greater than common. The first number indicates the sieve through which the whole would pass. The second that through which the finer portion would pass. In the two articles of Cotton-root bark and Stillingia the "C.C." of the table means cut and crushed, or torn into short shreds.

The third column gives the menstrua used. All these give good, efficient fluid extracts, but they are not all the best that could be devised through the proper research. Many are results of frequent trials and changes, and many are used in deference to pharmacopœial authority where these are necessary to obtain pharmacopœial results. But where pharmacopœial results are not reached by the menstrua directed, and where they are better reached by different menstrua, those directed by the Pharmacopœia are not used. It is very doubtful whether all those which consist of "stronger alcohol," or "alcohol," would not be better if alcohol of lower strength was used. The many and great advantages of weak menstrua render a thorough investigation of this point very important before the next formulas are adopted.

The "Str. Alcohol" of the table is the U. S. P. officinal, sp. gr. ·817. The "Alcohol" is the U. S. P. officinal, sp. gr. ·835. The "Dil. Alcohol" is the U. S. P. officinal, sp. gr. ·941. The "Glycerin" is the U. S. P. officinal, sp. gr. 1·25. The "Acetic Acid" is the U. S. P. officinal, 36 per cent., sp. gr. 1·047. And the "Water of Ammonia" is the U. S. P. officinal, 10 per cent., sp. gr. ·960.

All the menstrua are made by weight, and not by measure.

The fifth column gives the proportion of menstruum or of weak percolate which has been found best to moisten the powder properly before sifting and packing. For example, the officinal portion of 16 troy ounces of aconite root takes, by the table, 6 troy ounces of menstruum or of weak percolate to moisten it properly before sifting to pack.

The sixth column indicates approximately the pressure to be used in packing the moistened and sifted powder. To make the terms used in the table a little more definite, the following definitions may be useful. "Loosely" means that the moistened powder is put in layer by layer and uniformly distributed with the least pressure upon each layer that will secure entire uniformity throughout, the slight pressure increasing toward the last or upper layer. "Moderately" is intended to indicate a pressure upon each layer that would be about equal to 45 pounds if both hands be pressed upon a scale. "Firmly" is to indicate a pressure of about 60 pounds; and "Hard" means 75 pounds or more.

The last heading of the table, consisting of two columns, gives the maximum and minimum weights of the pint of finished fluid extract through an experience of many years of actual practice. The difference between the maximum and minimum—the menstruum and other conditions being equal, and the exhaustions complete—indicates approximately the quality of the drug used. The average experience of the last three or four years, from greater knowledge, pains and care in selecting, and better facilities for obtaining good materials, give results which are

* From the *American Journal of Pharmacy*.

considerably above the mean of the extreme weights as given in the table, and approximate much more nearly to the maximum weights. Hence this maximum column may be received as the fairest and clearest expression of the practice at the present time. It should not, however, be forgotten for a moment that the weight or specific gravity of a fluid extract is not by itself any evidence either of the quality of the preparation or of the drug from which it is made. Nor, even if the menstruum be accurately known, is the difference between the specific gravity of the menstruum and that of the finished fluid extract an accurate measure either of the quality of the drug used or the completeness of the exhaustion, for it may be very easily seen, by a close scrutiny of the tables given in the first part of this paper, that in repercolation the amount of solid matters dissolved out of any drug by a properly adjusted menstruum does not increase arithmetically with each repercolation, although the active and desirable portions generally do increase arithmetically or nearly so. That is, the weak percolates are none of them as medicinally strong as they seem to be if judged by appearance and by specific gravity. Or, in other words, the weak percolate is a better solvent for the active principles of a new portion of the same drug, than is the new menstruum, even though the specific gravities of the two are greatly different.

TABLE OF DETAILS.

DRUG REPERCOLATED.	Fineness of Powder, Sieve Number.	MENSTRUUM USED.	Weight in grains of one pint of menstruum at 25° C.= 77° F.	Parts of menstruum or of Weak Percolate to moisten sixteen parts of powder.	How Packed.	Weight in grains of a pint of finished Fluid Extract at 25° C.=77° F.	
						Maximum.	Minimum.
Aconite Root	80	Alcohol.	6023	6	Moderately.	6843	6620
Arnica Root.	20	Dil. Alcohol.	6824	16	Hard.	7460	7170

The complete paper can now be had in pamphlet form entirely free of expense by simple application to the author by postal card; and the author will be very much obliged to any one who will thoroughly and carefully try the process.

Brooklyn.

EXPERIMENTS ON DISINFECTION.*

Two sets of important researches on disinfection have been lately going on at Berlin. In both, the test of the efficacy of the particular disinfectant used has been the effect produced by it either in destroying bacteria and vibriones in putrid fluids exposed to its action, or in preventing their development in a form of "Pasteur's fluid," in which the objects that had undergone disinfection in various degrees were immersed.

The first experiments, those of Dr. Mehlhausen, Director of the Charité Hospital, refer chiefly to the disinfection of rooms in which scarlet fever and other infectious cases have been. The result arrived at is that the most energetic and the cheapest disinfectant is sulphurous acid. Chlorine gas has the disadvantage of destroying clothes and furniture exposed to it, while it is less easy to

* From the *Medical Times and Gazette*, June 7, 1879.

manipulate, and four or five times as expensive as sulphurous acid. Twenty grams of sulphur per cubic metre of space destroy, when burnt in a closed room, all bacterial life in sixteen hours. Besides blocking up the doors and windows, Mehlhausen advises that the room shall be previously warmed, if the weather is cold, in order to prevent the gas finding its way into the neighbouring apartments. It is also advisable to damp the floor before lighting the sulphur, so as to profit by the great solubility of sulphurous acid in water. Eight hours is long enough to keep the room shut up after the sulphur begins to burn, and at the end of that time any clothes or bedding in it will be effectually disinfected. Mere free exposure of an infected room to the air by allowing the windows to stay open several days is not enough to disinfect it. This has been practically proved at the Charité Hospital after scarlet fever and measles in several instances.

The second series of experiments was made by Dr. Wernich of Breslau, in the chemical laboratory of the Berlin Pathological Institute* upon the disinfecting power of sulphurous acid and of dry heat. The method adopted consisted in preparing an "infecting material" by steeping woollen threads, pieces of linen-rag and cotton-wool, previously proved to be free from atmospheric organisms, in putrid solutions of fæces or meat, and gently drying them. These substances were then tested for their capability of producing bacteria by the means of the modified Pasteur's fluid above mentioned, which consisted of distilled water 100 parts, cane-sugar 10 parts, ammonium tartrate 0·5 part, and 0·1 part potassium phosphate. This solution was freshly prepared before each set of experiments, filtered, boiled for half an hour, and immediately poured into the test-glasses and preserved with the usual precautions. To test the effect of disinfection, the wool or wadding, after exposure for a definite time to a definite degree of heat in an oven, or to a measurable volume of sulphurous acid in a bell-glass, was immediately transferred to the Pasteur's fluid, and the efficacy of the disinfectant was estimated by the rapidity of development of bacteria if such appeared, or by their complete absence, as indicated by the fluid remaining perfectly cloudless. It was thus found that 3·3 per cent. of sulphurous acid by volume failed even after many hours to prevent the development of bacteria, but that if the amount of gas reached from 4·0 to 7·15 per cent. by volume of the contents of the bell-jar, and the process had gone on for at least six hours, no bacteria at all developed. On the other hand, while exposure to a temperature of 110° to 118° C. even for twenty-four hours failed to destroy the bacterial germs, five minutes' exposure to one of 125° to 150° C. invariably succeeded, and the test fluid remained clear even for eleven days or longer. Dr. Wernich specially reminds us that his results must not be be taken as applicable to all forms of bacteria, some of which probably require severer measures for their complete destruction. He also points out that it is easier to disinfect wool than linen, and that cotton wadding is the most difficult of all to free from infectious germs.

CALIFORNIAN HONEY.†

The report that Californian strained honey has been largly adulterated with glucose, and accordingly condemned in English markets, naturally causes some unpleasant feeling among the bee-keepers of the Pacific coast. A producer, writing to the *Pacific Rural Press*, offers the following test for detecting adulterations :—

"Take a quantity of honey and add one part water, dissolving the honey thoroughly by stirring. Then add alcohol of 80° until a turbidness is formed, which does not disappear on shaking. If glucose syrup is present in the honey, soon a heavy deposit of a gummy, milky mass will form, while with pure honey there will be only a very slight milky appearance observed."

The same writer says that Californian honey taken in May generally candies in a few days after it is extracted. Later in the season, when the air is less humid, the honey gathered is white, very thick and heavy, weighing 12 to 12½ pounds per gallon of 231 cubic inches, and does not candy so readily, as some samples have been kept three years without any symptom of change. A different class of pasturage comes on in August and continues through the fall months; the air becomes more humid as the rainy season approaches, and the honey gathered is thinner, has more colour and candies very soon, differing from April and May honey in flavour. In the Atlantic States all honey made through the entire season candies upon the approach of winter; and a large dealer in Cincinnati says all the good honey becomes candied during the winter in that climate.

The San Francisco dealers rule that candied honey is reduced in value from 1 to 3 cents a pound; yet of samples of Californian honey sent to France, complaint was made that it was not candied, as no other could be readily sold there. The magnitude of the Californian honey trade may be judged from the circumstance that over 300 tons of extracted honey was produced last year in Ventura county alone. A large part of this crop was shipped direct to Liverpool for the English market. Of this shipment the writer above quoted says :—

"Knowing our honey to be pure and good, and knowing the character of the shipping merchants who are transacting our business, we have an abiding faith that our product will be allowed to fairly compete in these markets with like products from other parts of the civilized world. We wait with patience the results. We have the climate, the pasturage is abundant, our bee-keepers are energetic, industrious and economical men; are determined to push our products into all the markets of the world, and we warn all men who are engaged in the production of honey elsewhere that if they cannot produce large quantities of the article that is first class, and do not put it up in an attractive form, more so than we do, they had better stand aside and admit that 'the survival of the fittest' is a fixed fact."*

THE MIXTURE OF CHLOROFORM AND ETHER.†

BY WM. H. GREENE, M.D.

A mixture of chloroform and ether has long been employed as an anæsthetic, and discussion has frequently arisen as to the proportions which should be employed and the properties of the mixture. The second of these questions may be decided by experiment.

When ether and chloroform are mixed there is an elevation of temperature, and the greatest heat is produced when the mixture is made in equi-molecular proportions. 43 grams of ether at 20° C. being mixed with 60 grams of chloroform at the same temperature, the temperature of the mixture rises to 35°. The ether should be anhydrous, otherwise the mixture will be turbid. There is but little contraction in volume, and it may be supposed that molecular combination takes place between the ether and chloroform.

The mixture may, however, be separated into its constituents by fractional distillation. It begins to boil at 50 to 51°, and several fractionations are necessary. When it is allowed to evaporate spontaneously, both substances pass into vapour together, and the composition of the mixture does not sensibly change. It burns with a smoky flame, the chloroform burning with the ether. These facts seem to show that an unstable molecular compound is formed, as suggested by the late Dr. Atlee, who preferred the mixture to all other anæsthetics in his practice.

* *Centralblatt Med. Wiss.*, No. 13, 1877.

† From the *Scientific American*.

* It may be mentioned, however, that notwithstanding this flourish of trumpets, there is on another page of the very number of the *Scientific American* from which the foregoing is taken, an admission that "dishonest men are striving to spoil the honey market by selling imitation [California] honey made of glucose and artificial flavourings."—ED. CO-OPERATIVE TRADING.

WITHIN the last three weeks there have been three meetings of the Select Committee on Co-operative Stores, and among the witnesses examined are Mr BERRY, the Chairman of the Conference of Delegates from the district boards and vestries of the metropolis, Mr. DANIEL, of Wigmore Street, Mr. C. WEBB, perfumer, of Cranbourn Street, Mr. H. B. SPINK, chemist and druggist, and Mr. COOK, umbrella maker, all of whom were of opinion that the trade carried on by the stores managed by civil servants placed regular traders at an unfair disadvantage. Much importance was attached to the use of State titles by these stores in giving them considerable prestige with the general public, and inducing people to think they were better supplied by large associations, conducted by Government officials, than by independent tradesmen.

The success of stores was chiefly attributed to this circumstance and to the fact that they were conducted by paid Government officials, so as to be in fact subsidized traders, and the failure of the stores unconnected with the civil service was considered to be a proof of the correctness of these views. Several of the witnesses also pointed out that the principles involved in the system of trading carried on by stores are not properly speaking those of co-operation. The stores are in fact simply joint-stock shops upon a large and comprehensive scale, and the cheapness of the commodities sold is the chief attraction for customers. To some extent the possibility of offering that attraction may be due, as some of the witnesses considered, to the fact that the managers, being civil servants, and receiving good salaries from Government, were able to conduct the business at less cost than if they were entirely dependent upon that occupation for their income. This advantage, however, is not offered to the general public to participate in, but is restricted to the upper classes who purchase and consume luxuries to a large extent.

It was also asserted by some of the witnesses that even the cheapness, which constitutes the chief attraction of the stores, is in great measure delusive, and only apparent, inasmuch as it is the custom to sell some articles at prices lower than their real value for the sake of making competition impossible in regard to them, and of inducing a belief that such low prices were the rule for other commodities.

The *Times*, in commenting upon the evidence given before the Committee, pointedly disputes this view, and while admitting that there is a wide difference between true co-operation and the system of trading carried on by the "stores," says it is impossible to believe that the success of the stores, excepting perhaps during the very earliest period of their existence, has been at all due to the fact that they are the property of Government servants. On the contrary it is asserted that the success must be attributed partly to the fact that the public has come to the conclusion that it has been for a long time paying for the work of distribution a higher price than the service was worth, and partly also to the recognition of the stores as an agency for bringing this payment within more reasonable limits.

According to this view the stores provided satisfaction for a public want, and that in the opinion of the *Times* has been the cause of their success. But it is also maintained that they did this under disadvantages as compared with the conduct of business by independent traders, inasmuch as the stores were carried on with the divided responsibility and diluted personal interest attaching to all kinds of joint-stock undertakings. Hence the *Times* concludes that they could not hold their own in the face of any competition directed by the proprietors of similar establishments worked with sufficient capital to leave them content with equally small returns.

Attempts to meet the influence of the stores in this way have already been made and it is probable that in some cases they may be effectual. The *Times* does not hesitate to declare its belief in this result of "co-operative stores," as being the form which retail business will ultimately assume, and in the necessity of those engaged in it adapting themselves to new conditions, and giving the public the advantage of those "better modes of transacting business" which Mr. GLADSTONE regards as having been a good deal departed from.

Consistently with the belief here disclosed the *Times* considers that in regard to retail trade generally a revolution is unquestionably impending and though what are known as the co-operative stores may be very far from being its final outcome, they are at all events the most significant indication of its tendency. It suggests that the defects of the existing system are due rather to a superabundance of tradesmen than to the want of sources of supply, and that the most wholesome form of competition both for the vendor and purchaser is that which involves a knowledge of the actual value of commodities.

One of the evident results of establishing such "better modes of transacting business" would be the absorption of small shops by large ones, and the *Times* thinks that the "industrial displacement" brought about by such a change would be in most instances rather apparent than real; that the small

shopkeepers would seldom be prejudiced by conversion into the *employés* of a large establishment, for even if the determination of the public not to pay more than is necessary for the work of distribution should seriously diminish the total amount divisible among retail traders, it might still be found that an assured income would afford compensation for the loss of possibly precarious profits.

The views here expressed are worthy of consideration, as showing that the tendency of public opinion and practice does not appear so favourable to the interests of traders as it has been in past times. The necessities of persons with small incomes have compelled them to devise means of providing themselves with commodities of every day consumption in a manner more advantageous than through ordinary retail dealers, and the discovery that this can be done has induced others, not under the same obligation, to avail themselves of the same plan for the sake of having more money to spare for other things. If this system extends and develops as the *Times* anticipates it will do, the future of purely trade interests does not appear promising, and for those engaged in the business with which this Journal is concerned, it becomes more than ever important to meet the present tendency by directing attention to its professional interests rather than those of mere trade. In this respect the business of pharmacy has an advantage over most others, since it is not limited to the sale of goods across the counter; but involves in its exercise special skill and knowledge, the possession of which commands the consideration of the public, and will always be the best security for adequate remuneration.

BREACH OF THE PHARMACY ACT.

An action for a breach of the Pharmacy Act, instituted by order of the Council of the Pharmaceutical Society against a person named Mumby, carrying on business in Little Parliament Street, Derby, has just been brought to a satisfactory termination. Information had been given to the Registrar that the defendant, not being a registered person, was in the habit of selling scheduled poisons. In reply to a warning letter he stated that he had acted as an assistant in two or three places, and having purchased a business and stock he was preparing to pass an examination. A sale of poison having been made subsequently an action was commenced for the penalty of £5, and the amount has been paid into Court just before the case would have been heard, together with the sum allowed for Solicitor and witnesess.

POISONING BY FALSE ANGUSTURA BARK IN FRANCE AND A QUESTION OF CULPABILITY.

The *Journal de Pharmacie d'Alsace-Lorraine* mentions a case of fatal poisoning by a decoction of false angustura bark in which the bark had been supplied by a pharmacien in mistake for pomegranate root bark, and the decoction had been prepared from it, and administered by a physician without noticing the error. Both physician and pharmacien were prosecuted for *homicide par imprudence*, and the question was raised at the trial whether the pharmacien, who committed the first error, ought not to be made solely responsible. The local court, however, held that both defendants were culpable, since the dootor's professional duty could not be limited to a superficial examination, and the fact that the doctor had administered the medicine after he had noticed that it had an unusual appearance and odour, weighed against him. The local court sentenced the pharmacien to pay a fine of 200 francs, and the physician one of 25 francs; but this being appealed against, the Superior Court at Paris increased the physician's fine to the same amount as the pharmacien's, and in addition sentenced the latter to a fortnight's imprisonment.

It is worth mentioning that throughout the proceedings it appears to have been assumed that the death had resulted from poisoning by brucia. It will be remembered, however, that Mr. Shenstone, in a paper read at an Evening Meeting in December, 1877, announced that he had found strychnia to be present in false angustura bark. In consequence of the imperfect methods of separating these two alkaloids previous to Mr. Shenstone's investigation, that gentleman considers it very doubtful if the physiological effects of pure brucia have ever been studied, and he thinks it not impossible the supposition that it strongly resembles strychnia in its action may be due to the brucia under observation having always contained some strychnia as an admixture.

THE BRITISH MEDICAL ASSOCIATION.

The Forty-Seventh Annual Meeting of the British Medical Association is announced to be held in Cork on the 5th, 6th, 7th and 8th of August. The President Elect is Denis C. O'Conor, A.B., M.B., Professor of the Practice of Medicine in Queen's College, Cork. The Address in Medicine will be given by Professor Alfred Hudson, of Dublin; the Address in Surgery by Mr. William S. Savory, of London; and the Address in Public Medicine by Dr. Andrew Fergus, of Glasgow. On the day following the close of the Meeting (Saturday, the 9th) there will be excursions to the Lakes of Killarney, the Blackwater Valley, and the River and Harbour.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association will be held on June 26, at 8.30 p.m. precisely, when Mr. R. H. Parker will read a paper on "Myrrh" and Mr. J. G. Sangster will make a report on Pharmacy.

Transactions of the Pharmaceutical Society.

EXAMINATIONS IN LONDON.

June 18, 1879.

Present—Mr. Sandford, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

Dr. Greenhow was present on behalf of the Privy Council.

MAJOR EXAMINATION.

Seven candidates were examined. *Three* failed. The following *four* passed, and were declared qualified to be registered as Pharmaceutical Chemists:—

Gibbs, Robert Darton .....Wolverhampton.
Howard, George William .....Tunbridge Wells.
Hoyle, Richard Ashworth .....Rawtenstall.
Mann, George Frederick.....Wells, Norfolk.

MINOR EXAMINATION.

Sixteen candidates were examined. *Eight* failed. The following *eight* passed, and were declared qualified to be registered as Chemists and Druggists:—

Bridges, Ernest Claude Tenney.Kingsdown.
Bucher, William Henry .....Crediton.
Dobson, George Turner .....Holsworthy.
Gamble, Arthur Gompertz .....Grantham.
Gordelier, Frank Heward .....Sittingbourne.
Holmes, William Albert .....Kendal.
Hugill, Arthur Major .....Leeds.
Jelley, George William .....Coventry.

MODIFIED EXAMINATION.

Two candidates were examined. *One* failed. The under-mentioned was declared qualified to be registered as a Chemist and Druggist:—

Hills, William John.....Cheltenham.

June 19, 1879.

Present—Mr. Sandford, President; Messrs. Allchin, Barnes, Benger, Carteighe, Corder, Gale, Greenish, Linford, Martindale, Moss, Plowman, Southall and Taylor.

MINOR EXAMINATION.

Twenty-five candidates were examined. *Ten* failed. The following *fifteen* passed, and were declared qualified to be registered as Chemists and Druggists:—

Isaac, John Percy .....London.
Jenner, William Edward .....Sandgate.
Kirk, William Peele .....Retford.
Lindewald, Wilhelm Edvard ...London.
Logsdail, Henry .....Lincoln.
Milner, Thomas .....Thirsk.
Parker, Benjamin .....Leeds.
Pearson, Henry .....Nottingham.
Quick, William Thomas .....Brompton.
Richardson, William Henry ...Boston Spa.
Shawyer, John James.....Clevedon.
Thomas, John .....Aberystwith.
Williams, James Edward .....Louth.
Williams, Thomas Henry .....Plymouth.
Williamson, Edward Field .....Grimsby.

PRELIMINARY EXAMINATION.

The undermentioned certificates were received in lieu of the Society's Examination:—

Certificates of the College of Preceptors.

Lane, Frederic John .....Hampstead.
Taylor, James .....Bayswater.
Todd, Charles ....Carlisle.

Certificates of the University of Cambridge.

Barrass, Thomas Edward ...Peterborough.
Gee, William Henry .....Old Basford,
Jordan, Alfred Howe .....Wolverhampton.
Kerridge, Herbert Malster...Ipswich.

Proceedings of Scientific Societies.

AMERICAN CHEMICAL SOCIETY.

At the Meeting of this Society, on Thursday, March 6th, the following paper was read:—

Notes upon Chicle.

BY GEO. A. PROCHAZKA, PH.D., AND H. ENDEMANN, PH.D.

The great interest in the search of substitutes for india-rubber and gutta percha, which for some time past has been manifested by technical men, has led us to an examination of a Mexican product, known in the United States for a number of years under the names of *Chicle* or *Sapota*. The latter name would imply that the product was derived from one of the many species of Sapotaceæ, one of which is pointed out as the tree furnishing Balata. With the latter product it shares in fact many qualities; the general description given of Balata seeming to apply directly to the product under examination.

Balata is the concrete juice of a tree variously called by botanists *Mimusops balata*, Gærtn., *Achras balata*, *Achras dissecta* and *Sapota Muelleri*, a Sapotaceæ which grows in British Guiana, while Chicle is said to be the product of a tree of the same class from Mexico. The difference in the manner of obtaining the material is evident from the chemical composition. While Balata is an almost pure hydrocarbon, with its various products of oxidation, Chicle contains, also, the various impurities of the juice from which it is derived.

The only reference to Chicle that could be found was by J. R. Jackson (*Ph. J. Tr.* [3] vii. 409). He gives a general description of the material, stating that it resembles gutta percha in appearance, being, however, more friable and brittle. He further mentions that it is probably derived from *Chrysophyllum glycyplacum* of the family Sapotaceæ, and that it is also known under the names of *Mexican gum* and *rubber juice*.

In the course of the examination it became frequently necessary to consult the literature of caoutchouc, gutta percha and balata. In the following we give the sources from which our information has been obtained.

On caoutchouc. Jahresber., 1847 and 1848. 742; Payen, Journ. pr. Ch., 55. 273 and 56. 196; S. Cloez and A: Girard, Jahresb., 1868. 494; J. Spiller, Jahresber., 1865. 576; A. Girard, Jahresber., 1868. 771; 1871. 800; 1873. 1127; Bouchardat, Jahresber., 1875.

On gutta percha. Soubeiran, Jahresber., 1847 and 1848. 743; E. N. Kent, Jahresber., 1847 and 1848. 744; Arppe, J. pr. Ch., 53. 171; Payen, J. pr. Ch., 57. 152, and Jahresber., 1859; Bleekrode, Jahresber., 1859. 517; A. C. Oudemans, Jahresber., 1859. 517; E. H. von Baumhauer, J. p. Ch., 78. 277; A. W. Hofmann, Ann. Chem. Pharm., 115. 297.

On caoutchouc and gutta percha. Adriani, Jahresber., 1850. 519 and Chem. News, 2. 277, 289, 313; C. G. Williams, Jour. Chem. Soc., 15. 110, 121; A. W. Miller, J. pr. Ch., 97. 380; Berthellot, Jahresb., 1869. 334.

On balata. Bleekrode, Jahresb., 1859. 517; Sperlich, Wien. Akad. Ber., 59. (2) 107; O. Buchner, Dingl. Journ., 172. 146.

The material examined was in the shape of rectangular cakes, of light chocolate or flesh colour, which was more pronounced on the surface, where atmospheric influences had acted more powerfully. The substance can be crumbled between the fingers; it has, however, a certain degree of softness and tenacity, which is more perceptible after the material has been heated. Taken in the mouth it disintegrates; unites again, however, after chewing, then forming a soft, plastic mass. This latter quality has probably made it a favourite material for chewing-gum. On heating, it first evolves a sweet, caramel odour; after this has disappeared the peculiar smell becomes perceptible which is generated when caoutchouc or gutta percha are treated in like manner. The material disintegrates if it is boiled with dilute acids; the brown solution con-

tains oxalic acid and saccharine matter. The residue subsequently boiled with dilute solutions of caustic alkalies unites again, and then forms a doughy mass.

The following constituents have been found :—

Chicle resin or gum, forming 75 per cent. of the crude material ; oxalate of lime (with small quantities of sulphate and phosphate), 9 per cent. ; arabin, about 10 per cent. ; sugar, about 5 per cent. ; salts, soluble in water (chloride and sulphate of magnesia, small quantity of potash salts), 0·5 per cent. All these figures are, of course, only approximate.

Chicle Resin or Chicle Gum.—The resin, in the crude material, can be completely separated from the other constituents by bisulphide of carbon. If the finely divided material be shaken with about twice its weight of bisulphide of carbon, it will swell and assume a dark chocolate colour. After standing for from two to three days the insoluble residue will settle, leaving the yellow supernatant liquid perfectly clear. By carefully siphoning off the solution, and treating the residue with fresh portions of the solvent about ten times in the same manner, the resin will be completely removed from the insoluble residue, and obtained free from the other constituents of the crude product. Towards the end, when the solvent contains only little in solution, the insoluble residue will settle only very slowly. After distilling off the larger portion of the bisulphide of carbon, and pouring the residue into boiling water, the resin is obtained as a very light, flesh-coloured doughy, tolerably fluid mass, which is heavier than water. On cooling it becomes hard, and then assumes a wax-like consistence, retaining, however, a certain degree of elasticity as long as it contains water or bisulphide of carbon. Dried at 100° C. it presents lumps of somewhat granular appearance, which are light yellow inside, darker on the surface. They are brittle. Vulcanized at low temperature and with little sulphur the resin becomes elastic, at higher temperatures and with more sulphur it becomes hard and brittle. The dry resin dissolves easily in bisulphide of carbon and cold ether, only partially in boiling alcohol. For reasons which will appear hereafter, the above method of obtaining the resin is objectionable if its further examination is contemplated. Another method for obtaining the resin, at least free from arabin, the soluble salts, and the larger part of oxalate of lime, is by boiling the crude material with water. It then presents chocolate-coloured lumps, with properties similar to those described in the resin arrived at by the other method.

Arabin.—If the residue of the bisulphide of carbon treatment, or the crude material, is boiled with water for some time, milky, chocolate-coloured liquids are obtained which contain the arabin, saccharine matter and soluble salts in solution, and the oxalate of lime in fine suspension. A clear liquid can be obtained only by repeated filtrations. The clear solution is dark brown, almost opaque. In it the arabin can be separated from the other constituents, either by dialysis or precipitation with four volumes of 97 per cent. alcohol. The floccular precipitate formed is light, chocolate-brown. Dried at 100° it is dark-brown, and then contains 1·68 per cent. CaO, 1·68 per cent. MgO, and 0·2 per cent. K_2O, and 0·34 per cent. of sulphate of lime. A purer material was obtained by re-dissolving the precipitate in water, acidulating the solution strongly by hydrochloric acid, and effecting a partial precipitation by the addition of an equal volume of 97 per cent. alcohol. The larger quantity of the colouring matter remains in solution. The jelly-like transparent arabin precipitate, was washed by 97 per cent. alcohol; it became opaque and floccular, and by re-dissolving yielded a light brown solution. This solution when kept hot may be almost completely decolorized by prolonged treatment with bone-black. Eventually a filtrate is obtained, which is turbid and grey by bone-black suspended in it. Addition of an equal bulk of 90 per cent. alcohol to the solution will precipitate a portion of the arabin, together with the bone-black and the rest of the colouring matter. By filtration, a clear, light yellow filtrate is obtained, which, on repeated treatment by the method described by Neubauer (*Ann. Chem. Phar.*, 102, 105), will yield arabin as a floccular, almost white precipitate. By dissolving this precipitate in water, evaporating the solution in the water-bath, and drying the residue at 100° C. the arabin was obtained in the form of a light brown, very brittle glass, which shows all the properties generally ascribed to it. It is soluble in water.

A rough determination of the action on polarized light gave a rotation to the left of about 37°.

Results of combustion in boat in current of oxygen :—

I. 0·2530 gram gave 0·3968 CO_2, 0·1384 H_2O, and 0·0015 ash ;

II. 0·2388 gram gave 0·378 CO_2, 0·1335 H_2O, and 0·0012 ash.

making the percentage of C and H, after the deduction of the ash—

	I.	II.	$C_6H_{10}O_5$ Calculated.	$C_{12}H_{22}O_{11}$ Calculated.
C.	43·03	43·39	44·44	42·10
H.	6·11	6·24	6·17	6·43
O.	50·86	50·37	49·39	51·47
	100·00	100·00	100·00	100·00

The substance analysed may be looked upon as a mixture of the two compounds $C_6H_{10}O_5$ and $C_{12}H_{22}O_{11}$. The filtrate of the precipitate that had been the source of the above mentioned purer material yielded a further quantity of arabin on addition of an excess of alcohol in the form of a chocolate-coloured powder, which, after drying at 100°, was insoluble in water. It dissolved, however, on the addition of a small quantity of alkali. The residual alcoholic liquid contained the bases as chlorides, produced by the addition of hydrochloric acid and colouring matter ; the latter separates in the form of a dark-brown powder on removal of the alcohol by distillation.

Saccharine Matter and Soluble Salts.—It has been stated above that arabin can be separated from the other constituents of the original aqueous solution either by dialysis or by precipitation with alcohol. In the first case the sugar and the salts are found in the crystalloid liquids, in the latter they are contained in the alcoholic solution. From the latter solution they are obtained in a purer condition by dialysis. The solutions, on concentration, will yield liquids of caramel odour and colour, and bitter sweetish taste. On evaporation to dryness, brown, hard, transparent residues are obtained. The aqueous solution reduces Fehling's solution. Attempts in different directions to further the character of the sugar were unsuccessful. No definite product could be obtained, owing, perhaps, to the large proportion of salts, which form one-tenth of the total quantity of solids in solution. The sugar may possibly be arabinose, derived from the arabin, in the alteration of the raw material.

The soluble salts are inorganic, being mainly chloride and sulphate of magnesium, potassium salts and sulphate of lime.

Oxalate of Lime is easily identified. It remains in the form of a light brown, very fine powder, which runs through the filter easily on filtration of the aqueous extracts mentioned under arabin. By dissolving it in hydrochloric acid and re-precipitating by neutralization with ammonia or carbonate of soda, added till the liquid was only very slightly acid, the oxalate of lime was obtained in the form of a slightly grey powder.

A portion of this was dried at 100° and then ignited ; 0·7972 grams gave CaO 0·3127, or 39·2 per cent.

CaC_2O_4 + aq contains CaO 38·36 per cent.

The discrepancy is easily explained, as the material examined contained small quantities of sulphate and phosphate of lime, and silica. Oxalic acid in its pure crystallized form and various oxalates were also prepared.

Examination of the Chicle Resin.

An examination of the resin, as obtained by either of the methods above mentioned, showed it to consist notably of four different compounds. All of these, when heated, show a similarity in their behaviour; they evolve a peculiar, not disagreeable gutta odour, become soft and transparent, increasingly so as the temperature rises. A distinct melting point, therefore, cannot be assigned to them.

Two of the compounds, forming 75 per cent. of the resin, contain oxygen and correspond in their formulas, $C_{10}H_{16}O$ and $C_{20}H_{32}O$, as well as in their properties, to those described by Payen and Oudemans as obtained from gutta percha, and termed by the former alban and fluavil.

The first of these oxygen compounds, while being only slightly soluble in cold water, dissolves easily and in large quantity on boiling; the latter dissolves easily in cold alcohol.

The other two constituents of the resin are hydrocarbons, $C_{10}H_{16}$. They are insoluble in boiling alcohol.

By protracted action of boiling alcohol on the chicle gum, only the oxygen compounds go in solution, while the hydrocarbons remain undissolved. A ready means for separation is thus offered.

(*To be continued.*)

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday, the 12th inst., when Mr. C. H. Hutchinson, F.C.S., presided.

After reading the minutes,

Mr. W. E. Bush read a paper on "Essential Oils, with reference to the Arts and Manufactures."—After a few introductory remarks as to the chemical composition of essential oils, the author proceeded to notice the several methods used for their extraction; the chief being distillation, pressure, and maceration with ether or other solvents. After this followed a detailed description of the source, characters and composition of the essential oils most commonly met with in commerce. The oils obtained from oleo-resins, fruits, seeds and flowers were successively described. In connection with the last mentioned, the process of extraction, known under the name of *enfleurage*, was given. It consists in laying flowers between plates of glass, coated with lard or suet, to absorb the essential oil. The latter is afterwards dissolved out by means of alcohol. In conclusion, oils from roots, barks, etc., were described. The paper was illustrated by numerous specimens of essential oils.

A lengthy discussion followed the reading of the above.

For want of time the Report on Pharmacy was postponed to the next meeting.

CHEMISTS' ASSISTANTS' ASSOCIATION.

The annual general meeting of the above Association was held at 32A, George Street, Hanover Square, on Wednesday evening, May 14.

Mr. E. Marshall was voted to the chair, and the report of the Council for the session was read and adopted.

The report stated that the session had proved very successful, twenty-one scientific and fifteen social meetings having been held. Several additions had also been made to the library.

The Treasurer then read the balance sheet, which showed that after all expenses, the cash in hand amounted to £18 11*s*.

The election of Council for the new session then took place, and two new rules were ordered to be added to the roll.

The meeting closed with a vote of thanks to the chairman.

The next meeting will be held on July 9, when a paper will be read by Mr. Naylor.

The following is a list of officers for the session:—President, Mr. F. W. Branson; Vice-Presidents, Messrs. Glover and Snow; Treasurer, Mr. E. Marshall; Council, Messrs. Bull, E. Cardwell, O. Cardwell, Fryer, Hartridge, James, McKnight, Naylor, Parkinson, Robinson, Squire, Tharle and Wright; Secretaries, Messrs. Maggs and Miller.

Parliamentary and Law Proceedings.

THE PARLIAMENTARY COMMITTEE ON CO-OPERATIVE TRADING.

Evidence of a Chemist and Druggist.

The Select Committee of the House of Commons appointed to inquire into the subject of co-operative stores met to receive evidence on Wednesday last, Sir Massey Lopes in the chair. The first witness examined was—

Mr. B. R. Spinks, chemist and druggist, 3, Marsham Street, Westminster. In reply to the Chairman, he said he had been engaged nearly twenty years in business, and he came to give evidence in his individual capacity as a chemist on the effect of the stores on his business. He was also one of the delegates who had held meetings to consider the grievance of Crown traders carrying on large stores in London. He wished particularly to draw the attention of the Committee to the fact that he had no desire to interfere with the principle of co-operation when it was co-operation. He contended, however, that the civil service trading was not co-operation; it was a gigantic alliance between the civil servants and the upper classes for the injury of the traders or middle classes, a necessary element in our social system. He knew a great number of chemists, and practically they thought as he thought on this question. Besides traders had certain duties, municipal and otherwise, to perform—serving on juries, for instance - from which civil servants were exempt. It appeared to him that the distributor or tradesman was a necessary element in the State; and he was also of opinion that if these stores were allowed to go on there would be great difficulty in obtaining in the future educated pharmacists or chemists, as men would not be induced to apprentice their sons, and give them an expensive education, unless they felt that there were means for their sons earning a respectable, independent and honest livelihood. He had two sons whom he had intended to bring up to his present business, but unless there was some change for the better he certainly should not do so. He would also say that whenever one looked round the West-End of London one would now find a large number of shops to be let, which a few years ago would have been occupied. The work of decorating buildings, etc., in the metropolis was not anything like so general as it used to be, and thus the question of labour was greatly affected by the competition of these stores. He had no objection to co-operative societies being enrolled under the Friendly Society Act, as the Civil Service Supply Association was at its commencement, but they had no right to enjoy the privileges thus conferred and engage largely in trade with the outside public. As co-operative societies pure and simple they had an undoubted right to demand all the privileges accorded by the Act of Parliament. The question of educated pharmacists was one of great importance to the general public; but he thought that a few years would see a great change with regard to their supply. The stores sold certain articles well known to the public—patent medicines, etc.—which paid a stamp to Government, at a lower rate than the ordinary chemist could sell them. Liebig's extract of beef was quoted in the Army and Navy list at 14*d*., and it cost 15*s*. 3½*d*. per dozen nett. Several other articles were sold in the same way, while

on some goods there was a considerable profit. Some goods he could sell as cheaply as the stores. The civil servants were provided for by salaries and pensions; they were subsidized traders, and the ordinary traders must fall to the ground in attempting to meet such competition.

The Chairman: You do not object to co-operation, pure and simple?—Not at all, nor do I object to civil servants co-operating amongst themselves. My objection is that the outside public are supplied with goods.

Is it true that many of these co-operative societies, especially in London, have a chemist in the building?—Yes, they have, I believe, only qualified assistants to carry on the business of pharmacy. A case bearing on the subject had been lately tried in the Court of Queen's Bench, and the Lord Chief Justice and his colleagues came to the unanimous decision that in this respect the stores were acting illegally, and that every member of the co-operative societies thus trading should be legally qualified under the Act of 1868. An appeal had been made and would come off in a few days, endeavouring to reverse the decision of the justices. A chemist dying, his widow would be only allowed to carry on the business with qualified assistants for one year, and she must then sell it.

The Chairman: Is it not a fact that recipes are made up at these co-operative stores at a much lower price than at the ordinary chemist's?—Undoubtedly.

Are you aware that those managing these associations, being civil servants, are able to carry them on at a less expense than the ordinary trader, and to that extent you conceive you are heavily handicapped?—Yes, I think that no Crown servant, whether in receipt of pension or pay for absolute services, should be allowed to embark in trade unless he commuted his pension, and invested the money in business as traders do. He would be thus subject to the same risks, and would be no longer subsidized. If civil servants were not allowed to be managers or directors of these associations they would have to pay larger sums to managers, and this would, in my opinion, make a great difference. I believe that the effect of these stores if extended will be to do away with the smaller traders, the consequence being that those who remain will have to pay higher imperial and local taxes.

Do you think as a rule that goods are very much cheaper at the co-operative stores than at an ordinary shop?—Some things, yes; other things, no. Liebig's extract is usually sold at 1*s.* 6*d.* Of some things we cannot judge, as they are described at per bottle, while we sell them perhaps by the ounce; besides, they do not say what size the bottle is.

Mr. Mills: You could go and find out?—No, I have no ticket.

To Mr. Forsyth: On Sundays when the stores are shut I get prescriptions from their customers to make up, from which I infer that generally I lose business in consequence of them. If retail traders sold goods at the same prices as the civil service stores, they would not be able to pay for the goods, as there would be no profit in many cases. I give very little credit. I make no difference between ready money and credit customers, because the amount of credit I give is small.

To Mr. Baxter: It has been the practice amongst traders to give extensive credit, and this practice may have had something to do with the establishment of stores. In some businesses it may be that the people who pay have to pay for those who don't. The present class of people who go to the stores and pay ready money will go to tradesmen and demand credit. If traders gave no credit they could not compete against the stores. I think there are too many shops in many cases. But still the greater the competition the better it is for the general community. A line should be drawn between co-operation and trading. They are different in principle and practice.

Mr. James: Do you agree with the statement in the *Standard* that "the more the question is faced the more distinctly will it become apparent to the tradesmen themselves that the battle is to be fought not in the Committee Room of the House of Commons nor on the hustings, nor yet on the platform, but simply over the counter?"—I do not agree with that. The question cannot thus be settled when people have gone to the stores. I do not think civil servants by virtue of their position should be allowed to drive other people out of the market.

Can you tell me whether it is true that shopkeepers themselves trade with the stores?—I cannot say. I never go to the stores.

To Mr. Ripley: The civil servants have the right to buy where they like.

To Mr. Macdonald: My argument consists of this—that the civil servants should not be allowed to do anything (receiving pay from the State) which will injuriously interfere with other people.

With regard to your statement as to a possible want of educated chemists, would they not be plentiful so long as they can earn a living in this way?—My contention is that they will not be able to live if things go on as they are. The public can get tickets largely to deal at these stores, therefore it is correct to say that they trade with the outside public.

Do the stores buy better than the ordinary trader?—No, I do not think that makes much difference. They have a large turn-over, and they sell some things at a large profit—others at a smaller.

Do you not think it is possible that the cause of shops being to let and other things you have spoken of is the general depression in trade?—I think it would be accelerated at least by the action of the stores.

The Chairman mentioned with regard to civil servants being exempt from serving on juries that the exemption only referred to the Post Office, Customs, and Inland Revenue.

Mr. Ridley: You mentioned the case against a co-operative society for selling drugs, etc. Do you think they should be all similarly treated?—I think so.

It has been suggested that as they do not "sell or keep open shop" they are not under the Sale of Food and Drugs Act. Is that inconsistent with your idea?—Some of these stores keep open shop for a certain portion of the community. I do not know whether the 2*s.* 6*d.* ticket would protect them. I think they ought to be under the Medical Act, if they are not.

You said you objected to "injurious competitions." What do you mean by that?—The injury would be in preventing a man earning his livelihood in consequence of the competition of men whom he is assessed to provide for.

Have you considered the position of the clergy in regard to trade?—I think they have made a very great mistake. I object that people receiving pay from the country should engage directly or indirectly in trade.

Is it the case that bankruptcies have lately increased?—Yes, I believe nearly two-fold, according to the Controller in Bankruptcy's report.

Have you lowered your prices since the co-operative stores have started?—No, they remain the same, subject to changes in the market. Living in a somewhat poor neighbourhood my prices are not so high as in more distinguished neighbourhoods.

By Viscount Macduff: I do not think the civil service stores would have flourished were it not for the prestige attaching to them. We should not object to them if the outside public were not admitted.

Mr. Callan: Do you draw any distinction between Crown servants active and Crown servants retired?—No, Crown servants in receipt of money from the State should not be allowed to trade. I object to the titles used by the civil service associations; I think these State titles have helped to make them a great success.

What would you consider a fair profit in business?—That would depend entirely on the amount of turn-over.

The sales of grocer, baker, or butcher being large their turn-over is large, and their profits smaller.

Do you consider 12 per cent. on the turn-over a fair profit?—Yes, on those articles.

What do you consider a fair profit in your business?—30 or 40 per cent. Many chemists are engaged in business from half-past seven in the morning until half-past ten at night, their turn-over is small, they are required to have a special education and their expenses are heavy.

Mr. Callan handed witness two prescriptions and asked how much he should charge for making them up? The reply was 2*s*. The witness said he should not be surprised to learn that at the stores they would be made up for 60 per cent. less.

Do you think an attempt is being made by the higher classes to stamp out the middle classes?—That will be the effect whatever the intention may be.

What prices do you sell, say, hair-wash at?—I sell Mrs. Allen's at 6*s*.

Do you know that the civil service stores sell it at 3*s*. 6*d*.?—Yes, but to pay my expenses I cannot do so. We sell the article at the price marked on the bottle by the proprietor or manufacturer.

Mr. Blake: Do you feel it a hardship as regards prescriptions, etc., that the stores are not open on Sundays or during the night?—My shop is always open on Sunday. I feel it necessary that it should be thus open for the convenience of the public. I do not think the stores are open then, and their customers are necessitated to come to me for the supply of drugs, etc. Such customers very often come. Many traders in the country complain of the badness of trade in consequence of supplies being received from the large stores in London. I have a great objection to the clergy trading; they would be competing injuriously with other traders, and ought to be restricted from doing so.

Mr. Mills: Do you think the civil service traders possess any exceptional advantages in dealing with patent medicines?—By buying in large quantities they might get them for a trifle less.

With regard to patent medicines is it a fact that anyone can get stamps for any compound he may choose to make up, whatever rubbish it may contain, and without designating the contents?—That is so unfortunately.

In reference to the people who come on Sundays or at night, to get medicines made up, do store customers come to you in that way?—Yes.

And you tell them to go to the stores?—No, I make up the medicine.

The difference in the wholesale and retail price of drugs is justified by the circumstance that you must have a larger rate of profit by reason of selling smaller quantities?—Yes.

Sir C. Russell: You have been asked about the sale of drugs or articles with fixed prices attached to them. I presume you would sell them at the prices at which they are sold to you to be sold at?—Just so; there are some manufacturers who will not allow their goods to be sold under that price. I do not think it is fair for the manufacturers of an article to stamp it at a particular price and then sell it to certain parties at a low price, so that they can afford to undersell smaller men.

Are many of the drugs you are compelled to keep for the convenience of your customers very perishable?—Yes, and therefore in the prescriptions we have to take that into consideration, as well as the small turn-over and our special knowledge. Besides we have to send goods home to people. I estimate this in my business at 12*s*. a week. The customers at the stores are mostly the upper classes of society.

Poisoning by Home-made Soothing Syrup.

An inquest was held on Wednesday at Liverpool on the body of Anne Agnes Smith, six months old, daughter of a compositor. The mother said that on Monday the child was rather cross, and she administered a teaspoonful of soothing cordial, which seemed to choke the child, and it died almost instantly. The cordial was prepared at home, and consisted of a pennyworth of laudanum, a pennyworth of oil of aniseed, and also syrup of rhubarb, to which was added half a pint of sweetened water. The child had take the soothing mixture for three nights, and the receipt was obtained from a neighbour. Dr. Carmichael considered the child had died from exhaustion, the result of non-assimilation of food, consequent upon repeated doses of the narcotic mixture or "soothing syrup." He thought the mixture was extremely deleterious. The deputy coroner said the fatality showed the danger of people receiving prescriptions from neighbours, and administering doses to children in ignorance as to the nature of the contents. All such mixtures for "soothing" children were nothing but poison, and must, even when given to adult persons, ultimately result in death. The jury returned a verdict to the effect that the child died from exhaustion consequent upon adminstering a narcotic. The duputy coroner told the parents of the child there was no doubt death was the result of slow poison, though they were quite free from blame, as they had administered the mixture quite innocently, though mistakenly.—*Times*.

Review.

A Manual of Organic Chemistry, Practical and Theoretical, for Colleges and Schools, etc. By Hugh Clements. London: Blackie and Son. 1879.

The character of the contents of this book by no means justifies the use of such an ambitious title. The nature of the little volume is sufficiently explained by the following paragraph taken from the preface:—"The original idea was to adapt the work to suit the requirements of the elementary and advanced syllabus of the Science and Art Department; but the author hopes that by the extra matter appended, and the answers to the questions given at the May examinations during the last ten years on the elementary, advanced and honours stages, that the work will enable students to pass in honours, and also form a text-book for students at public schools and colleges and candidates preparing for medical, civil service, or other examinations." Of the whole 274 pages no less than 86 are devoted to the questions set in organic chemistry at the examinations of the Science and Art Department from 1868 to 1878, with their answers. A large proportion of the book is taken up by the description of the properties, or as the author puts it the identification of organic substances, leaving, if we omit the isolated chapter on oils, only some 98 small 8vo pages for the systematic consideration of the manufacture, classification, etc., of organic bodies. The result can easily be imagined. The limited space is filled with the largest possible number of statements of fact with the smallest amount of explanatory matter, and many pages seem to be mere lists of names and formulæ.

A student endeavouring to gain some knowledge of organic chemistry from this book alone would, we think, be somewhat confused by the following statement in connection with organic substitution:—"A very important class of substitution products is obtained by replacing 1, 2, or 3 atoms of H in NH_3 by an organic radical. *Thus* we have the amines divided into monamines, diamines, triamines, and tetramines. The monamines are divided into primary, secondary and tertiary." Then follow names and formulæ of some amines, and not until two pages further on is any explanation to be found of what the term diamine really means. We do not think the student's ideas would be rendered much clearer by the following examples of primary, secondary and tertiary diamines respectively—

$\left\{\begin{matrix}NH_2\\Et''\\NH_2\end{matrix}\right.$ $\left\{\begin{matrix}NH\\Et_2\\NH\end{matrix}\right.$ $\left\{\begin{matrix}NEt''\\Et'\\NEt''\end{matrix}\right.$

nor by attempting to reconcile terms and formulæ in the next line, "Ethyl diamine Et" $(NH_2)_2$, ethylene diethyl diamine Et" $(NH\ Et)_2$." We have not been able to discover in the book any explanation of the difference between Et′ and Et″. The term homologous series is not mentioned in the book, and no explanation of isomerism, metamerism and polymerism is met with until it is given as an answer to a question set in an examination.

In any book on organic chemistry one naturally expects that the processes of ultimate analysis should be clearly described. It was never our misfortune to read a more incomplete or hopelessly confused account than that given by Mr. Clements for the estimation of carbon and hydrogen. For example, cupric oxide and sugar are introduced in the usual manner into the tailed combustion tube either previously mixed or mixed in the tube with a wire. Then "the remainder of the tube is filled with oxide; or the sugar may be put in a platinum boat that will pass into the tube." After leaving us the choice of either plan the *only* method given for applying heat begins thus:—"When commencing, heat the combustion tube and pass a current of dry air through it," and no account whatever is given of the arrangement in the tube of the cupric oxide and the platinum boat. We may observe that the illustration is ingeniously drawn so that no gas could pass through the potash bulbs. The illustrations generally are very poor, fig. 26 being we believe the worst we ever saw in a scientific volume, and in fig. 16 it is very doubtful whether the thermometer could pass through the tubulure of the retort or not.

Mr. Clements is generally fairly correct in his statements of facts, but we notice a few contradictions. Thus on page 71 it is stated that all acetates are soluble in water, and further on that argentic nitrate produces in neutral solution (of acetates) a white precipitate of argentic acetate. Again on page 133 it is stated that milk sugar is not susceptible of fermentation, and on page 143 that when milk is allowed to stand at the ordinary temperature for some days lactic acid is formed from the milk sugar by fermentation. Mr. Clements is very sanguine in supposing that absolute alcohol would be produced by allowing the first distillate from a fermented saccharine solution to stand on fragments of quicklime and by again distilling, though on the next page he certainly does say that it is difficult to obtain absolute alcohol. We are surprised to read that alcohol "forms the characteristic ingredient of fermented liquors of which an extraordinary quantity is consumed to produce a state of temporary insanity and curtail the natural length of life." We cannot think that the most confirmed tippler drinks with such an object, but we are inclined to agree with the author in his remark that "real bear's grease is scarce." Mr. Clements is not quite correct in saying that glycerine is uncrystallizable, and that *all* acids contain one or more semi-molecules of oxatyl (page 10). The graphic formula of benzol on page 32 is unintelligible and the following statement is a remarkable one:—"Oil of turpentine $C_{10}H_{15}$ is a resin obtained from pines and some other trees when cut."

Many of the questions given as exercises by the author are puerile in the extreme, thus "What organic substances produce a sweet solution with water?" "What organic substances produce a bitter solution with water?" and on the next page "What organic substances taste sweet?" "What organic substances taste bitter?" "What organic substances taste *peculiar*?" and it is rather too bad to give such an exercise as the following, when we take into account the fact that the author up to this point has not even mentioned many of the substances. Make a qualitative analysis "of beef, or mutton, or pork, or blood, or milk, or flour, or oatmeal, or potatoes, or rice, or apples, or oranges, or tea, or coffee, or snuff, or opium," etc. Mr. Clements adopts a peculiar style of writing; thus he says, "it appears from some experiments that the caffeine in tea causes the disintegration of the bodily tissues to be less than they otherwise would be;" and again in speaking of benzoates he states that "calcic chloride gives no precipitate, being soluble."

Altogether the book may be useful to candidates about to present themselves for examination in the Science and Art Department, but we entirely fail to see how it can serve any other practical purpose. It is essentially a made book, and it contains no information that is not given far better in many existing publications.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

Replies.

[291]. With regard to pot. iodid., I have dispensed gradually increased quantities until the amount reached gr. 60 three times a day, but such cases are not common.

Birmingham. G. M. Jones, Ph.C.

[291]. Permit me to say with regard to the remarks respecting this prescription, and for the information of Mr. H. Brown (to whom, as a rule, chemists are indebted for his information), that I have constantly dispensed a prescription at the Poultry, containing as one dose:—

Potas. Iodid. . . . . 120 grs.,

which is the largest dose that I have met with in nearly fifty years' experience.

It was taken as an occasional remedy for acute pain in the stomach, which it always relieved.

103, *Borough High Street.* G. H. Wright.

[291]. In the last issue of the *Pharmaceutical Journal* J. L. W. advises me not to take the advice of Mr. Henry Brown. I think Mr. Brown's reply was most satisfactory, and I certainly agree with him that 10 grains of ferrous sulphate three times a day is an excessive dose and likely to be injurious.

The patient for whom it was prescribed took four doses and then complained of pain at the epigastrium and sickness; the medical man at once changed the medicine. This case I think proves that the dose was too large.

In a town where there is no chemists' association to discuss matters over, the "Dispensing Memoranda" proves a great boon to assistants so situated. I for one have picked up many useful hints since it commenced, and should be sorry to see it a thing of the past.

R. E.

[298]. I think if, without Mr. Norman Lockyer's aid, you add a little solution of chloride of barium to a solution in water of any sample of citrate of iron and quinine in the market, you will find it will give a precipitate insoluble in nitric acid, showing that the citrate contains enough sulphuric acid to form the herepathite I mentioned in my communication to you respecting the above.

In the Pharmacopœia process for making citrate of iron and quinine this impurity is winked at, as it orders the precipitated quinia from one ounce of the sulphate dissolved in water, by means of sulphuric acid and ammonia added in slight excess, to be washed with only "a pint

and a half of distilled water." This is very much too little to remove all the sulphate of ammonia from the quinia. If more be used there will be a loss and waste of quinia, and the resulting product would not contain 16 per cent. of the alkaloid. My statement was founded on experiment, which I have repeated with the same results.

WM. MARTINDALE.

---

[303]. The chloroform (℥ss) is above the B. P. dose by three times, but I have myself taken ℥ss fluid at one dose; it had a scarcely perceptible effect, which entirely passed off in the course of three or four hours.

Birmingham. G. M. JONES, PH.C.

---

[309]. ERGOTINE SUPPOSITORIES.—In reply to Mr. Craig these may be prepared as follows:—

To make one dozen four grain suppositories, take

Ergotin	48 grains.
Soft Gelatine	2 drachms.
Glycerine	½ fluid drachm.

Dissolve the gelatine by a gentle heat, and add the ergotin, previously mixed with the glycerine on a slab; stir well together and pour into a cold and dry mould.

Soft gelatine is prepared by soaking Nelson's opaque gelatine, in shreds, for six hours in water, and pouring off the superfluous water.

The gelatine absorbs about twice its weight of water, and this may be kept ready for use by adding 2 gr. acid. benzoic., dissolved in 20 minims s. v. r. to each ounce.

Mr. Mead's letter in Journal, May 17, contains some useful information on gelatine suppositories.

Sandown, I. W. G. BROWN.

---

[311]. In my opinion "Chemicus" is certainly justified in dispensing aq. menth. pip. when aq. m. p. is ordered, as it is the most common, and the only B.P. preparation which could be thus rendered.

NEMO.

Queries.

[315]. The following prescription was brought me by a customer, saying he wanted a clear solution; can anyone inform me how I am to get one? I have tried several different ways with a sediment.

Sal Ammoniac	℥iss.
Sp. of Nitric Æther	♏vj.
Sp. of Wine, Opodeldoc	āā ℥iss.

"A NORFOLK ONE."

---

[316]. Can any reader inform me if a presentable mixture can be made of the following, and how?

℞ Tinct. Ferri Perchloridi	℥iij.
Liq. Ammon. Acetat.	♏iss.
Spt. Chlorof.	♏ss.
Misce bene simul et adde	
Mucilago	ad ℥vj.

I dispensed it in the manner directed, and, as I expected, it formed a thick unsightly jelly. Was I justified in diluting the spirit with water prior to adding the mucilage?

MILO.

---

[317]. I had the following prescriptions sent me a few days ago to dispense for a child nine months old:—

℞ Hydrarg. Submur.	gr. ¼.
Pulv. Opii	gr. 1/12.

M. ft. pulvis, mitte iij tales. St. j., 4tis horis.

℞ Acet. Plumbi	gr. xij.
Liq. Morphiæ	gtts. iv.
Aquæ Lauroceras	♏ss.
Syrupi	℥j.
Aquæ Destil.	ad ℥ij.

M. St. coch. parvum secundis horis.

The powders were so small that they could scarcely be seen, being only ⅓ of a grain each. Can any better mode of dispensing it be suggested.

Was not the dose of lead and morphia in the mixture, considering the frequency and the age of the child, too large?

MILO.

---

[318] In dispensing the following prescription would it be correct to make six draughts or a six ounce mixture?—

℞ Liq. Ammon. Acet.	℥ss.
Tr. Opii	♏x.
Sp. Æther. Nit.	gtt. xx.
Aq. Cinnam.	ad ℥j.

M. Ft. haust. quart. quaque horâ sumend.

J. T. S.

---

[319]. Would any of your readers kindly inform me what colour the following ung. diachylon hebr. should be, when made?—

℞ Plumbi Oxyd.	℥iij and ℥v.
Ol. Olivæ.	fl. ℥xv.

Boil to a proper consistence.

It has been obtained from different establishments, varying in colour from a pale yellow to a black brown.

A. Y.

---

[320]. In making ung. plumbi. co., can any reader suggest a good method of procedure? I rubbed the plumbi acet. in a mortar very fine and then again on a slab with a little of the oil, before adding it to the melted ingredients, but still there was a little grittiness perceptible.

MINOR.

---

[321]. We should be glad if any of your readers can inform us whether the following mixture can be made so that a precipitate is not thrown down after standing twenty-four hours.

We have made it up two or three times with that result.

The customer tells us that two other chemists have made it up without having a precipitate after standing:—

℞ Sodæ Sesquicarb.	♏j.
Æther. Chloric.	♏ij.
Liq. Bismuthi (Schacht's), Tinct. Aurant.	āā ♏ss.
Tinct. Nucis Vom.	♏iss.
Aq.	ad ℥viij

M. S. G. and S.

Notes and Queries.

[605]. TANNIN FROM TEA.—Would any reader be so good as to inform me how to get the pure tannin or tannic acid from tea, by some chemical process?

FERRI CIT.

---

[606]. UNGT. HYDR. IODID. VIRID.—Will some kind reader give me a formula for making ungt. hydrarg. iodid. virid.?

NIGHTSHADE.

---

[607]. REMOVAL OF LEECHES.—Having met with very great difficulty in what I was always wont to consider a very simple operation, viz., to take off a leech, perhaps some of your numerous readers will be able to explain the proper *modus operandi*. I was rather nonplussed the other day, having applied a leech, to find that my every effort failed to detach it. As a last resource, I had to cut off its head with a pair of scissors. As it was rather a nasty method I should not care to have to repeat

it too often, and should feel obliged by having the views of some of your numerous correspondents on the subject.

ALOYSIUS.

LOCAL ANÆSTHETIC IN DENTISTRY.

℞ Pulv. Camphor . . . . . ℥vj.
Æther. Sulphur. . . . . ℥j.

Apply this to the gum surrounding the tooth to be removed, until the gum turns white, when the tooth can be extracted with scarcely any pain.—*Medical Times and Gazette* from *Dental Cosmos*.

MANUFACTURE OF CELLULOID.

Celluloid is made by dissolving pyroxylin in camphor instead of ether or alcohol. A solution of one part of camphor in 8 of alcohol is made; pyroxylin is ground in water, the desired colours added and all water removed from the mixture by pressure; the camphor solution is then added in the proportion of one part to two parts of pyroxylin, the mixture is stirred and allowed to stand in a closed vessel until the solvent has penetrated all parts, when the mass is expressed and formed into the desired shape by means of a hydraulic press, being heated at the same time from 65° to 130°C., when a solid, uniform piece of celluloid is obtained.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

NEMESIS AND THE NOSTRUM TRADE.

Sir,—That the credulity of the public in the matter of patent medicines has in the past been the very laughing stock of our trade, will, I think, be generally admitted.

In thousands of instances has not each fresh batch of nostrum letter-press (counter bills, etc.), been welcomed with a chuckle from the master and a titter from the apprentice?

Therefore, I cannot but think something of retribution to be the interior cause of the deplorable outcries that from time to time issue from our ranks, and find partial utterance in your correspondence columns.

Has not the time fully arrived when each member of our trade should seriously consider these four questions?—

1. Whether the patent medicine licence be or be not a mere licence to lie?

2. Are not patent medicines in reality as much out of place in a pharmacy as they would be in any surgery or in any dispensary?

3. Might you not as well license palmistry or other modes of fortune-telling as the certainty of cure? Yet the one is prohibited while the other is protected.

4. Might not the trade in medicines be altogether conducted with immense advantage, both to buyers and sellers, outside the provisions of this licence, which instead of being protective should be prohibitory? One happy result would certainly follow,—in the cleansing of periodical literature from the blatant medical advertisements with which it is disfigured. Even those pious portions of it, which claim to be exponents of what they call evangelical principles, would, one would think, gain considerably in influence by the suppression of features in their case repulsively mercenary, because utterly inconsistent with their assumed disinterestedness.

To such of us as are opposed to the sale of "patents," I would suggest placing a small label on all objectionable articles with—

"Take Notice.—I do not recommend this"—succeeded of course by inimical vendor's name and address. Should the wrapper bid, "beware of worthless imitations," that would, to me, suggest itself as the very ironical spot for affixing an asphyxiating postscription, such as this label might well and worthily furnish.

So far as I can learn the conditions of the drug trade during the last forty years have been eminently favourable to, and fully account for, the present expansion of the patent medicine trade.

During that time a considerable number of retail chemists have corrupted their business into that of wholesale hucksters.

All leading preparations which (together with counter practice) constituted the business of chemists and druggists a generation ago, such as antibilious pills, tincture rhubarb, paregoric, sweet nitre, castor oil, etc., have become lowered in price, in quality, and in the public estimation, since their arrival into the bull's eye windows of small shops, where you may at any time see half pound bottles of them, sweltering in the sun, cheek by jowl with old pickle bottles containing thimbles and confectionery, acids drops, perhaps; crisp and translucent are they? Oh dear no; deadly white, evidently corroding themselves into that opacity of the cornea which blinds and bedevils six of our trade to the excruciating bewilderment of the remaining half dozen.

Were some purely retail chemist in such a locality to lower his price for castor oil, say from 3*d*. to 1*d*. per ounce, the other chemist who supplies these shops would in all probability be the first to raise an outcry.

I write this all the more freely, well knowing that it is impossible to blame individuals for conditions into which they were initiated, perhaps during apprenticeship, but which at any rate began in our trade before existing chemists came into it.

True it is we all have much to learn, and many of us much to unlearn in view of the new departures into which pharmacy, considered either as a science or as a trade, is being very evidently impelled. Impelled by whom, or by what? Ah! that's the rub.

York. ICTUS EQUI.

INCREASED DIFFICULTIES IN PHARMACEUTICAL PROCESSES.

Sir,—In a journal devoted to brewing interests I observe a statement to the effect that successful brewing is becoming a greater difficulty every year; that, whatever may be the cause, the fact remains that microscopical investigation is necessary now in cases where it was never necessary before, and the use of preservative agents is fast becoming the rule instead of the exception.

I should feel greatly obliged to any of your readers who would inform me whether they have experienced a similar necessity for increased precaution of late years in any chemical or pharmaceutical process or processes.

COMMUNICATIONS, LETTERS, etc., have been received from Dr. Davy, Mr. Pitman, Mr. Dingle, Mr. Meyers, Mr. Davidson, Mr. Brown, Mr. Jones, Mr. Williams, Mr. Smith, Mr. Warrell, Mescio, F.C.

NOTICE.—Inconvenience and delay is frequently caused through communications intended for the Editor being sent to the Publishers. All such letters or papers should be directed to the "Journal Department," 17, Bloomsbury Square.

"THE MONTH."

Our humorous contemporary, *Funny Folks*, makes a city man say to his wife on midsummer day—

> "Fetch my warmest overcoat
> Here without delay,
> * * * * *
> Respirator now, and my
> Stoutest umbrellay.
> Thus defended, I defy
> Our midsummer day!"

and although rather extravagant, it must be admitted there is some foundation for the complaint. What with snow in Scotland and hail in London, the weather is scarcely such as one would expect to promote the growth of flowers. Our Isle of Wight correspondent, who has kindly forwarded a list of plants in blossom during the first twenty-two days of June, as compared with May and June last year, points out that even in that favoured locality many plants, such as *Digitalis*, *Sarothamnus Scoparius*, *Solanum Dulcamara* and *Sambucus nigra*, are from three weeks to a month behindhand. Of the latter, which is usually in full bloom early in June, not a flower has yet been noticed to the best of our knowledge at the botanical gardens around London. The bright green tints of "leafy June" are already giving way to the dingy and dull hue which the leaves assume in July. Nevertheless, the abundant rain has caused a more rapid growth of plants within the last week or so, and at Kew Gardens there are plants enough in blossom to occupy the pharmaceutical visitor or amateur British botanist several hours in observing them.

On one of the walls may be seen a handsome specimen of *Zanthoxylum alatum* in flower. The plant is a vigorous climber and has handsome shining pinnated leaves, is well furnished with stout prickles, and would make an excellent garden fence. The flowers, however, are small, green and inconspicuous, but are succeeded by small reddish fruits having a very pleasant flavour, somewhat resembling that of lemons. These are used in Chinese medicine, as well as those of *Z. piperitum*, as a stimulant, emmenagogue, and anthelmintic remedy. The fruit consists of two valves, each of which exhibits the peculiar feature so frequent in the rutaceæ, of the separation when ripe of the inner layer (endocarp) of the pericarp, which in drying becomes rolled together and apparently thus ejects the small black polished seed. A similar means of distributing the seed occurs in that curious little portulaceous plant, *Claytonia perfoliata*, a wild specimen of which, drying on a desk, a few days ago ejected its seeds two or three feet from the place where it lay, the action being preceded by a sharp click. On examining the seed-vessel it was observed that the seeds were attached at the bottom of the carpels, which, in rolling their sides in drying, squeezed out the seeds with considerable force, the ease with which they were propelled being apparently increased by the fact that the seeds, as in *Zanthoxylum*, are polished and have a smooth rounded surface.

In *Zanthoxylum alatum*, Dr. Stenhouse found an essential oil and a stearoptene; the former when pure is a hydrocarbon isomeric with oil of turpentine. This oil resides in small prominent glands in the husk or pericarp. In *Z. piperitum* these glands are scarcely visible without a lens, being sunk in the pericarp. According to Dr. Porter Smith the leaves of *Zanthoxylum alatum* are largely used for feeding silkworms, a statement which at first sight seems strangely at variance with the supposed anthelmintic properties of the plant. At all events it might be worth a trial as a change of diet for silkworms which suffer from fungus disease. Dr. Porter Smith suggests that the fruits are worth a trial in catarrh, quinsy and rheumatism.

Rhamnus utilis, growing on a wall not far from the *Zanthoxylum*, is also in flower. From this plant and *R. chlorophorus*, the Chinese prepare the green dye called Lo-kao or Luh-kaou,* which has been imported into Lyons in considerable quantities for imparting very beautiful green tints to silk. When dry it has a dark blue appearance like indigo and doubtless bears some relation to the less carefully prepared sap-green made in this country.

Among medicinal plants in bloom there may now be noticed in the Herbaceous Ground at Kew, *Veratrum album*, *Trigonella fœnum-græcum*, *Anchusa tinctoria*, Dulcamara, Belladonna, Bistort, *Astragalus verus*, *Iris versicolor*, *Sarracenia purpurea*, *Vinca major*, *Parietaria officinalis*, *Pyrethrum roseum* and *P. carneum*, and many others. Conspicuous above all other plants in this portion of the Kew Gardens, the handsome *Rheum officinale* (for some time the supposed source of East Indian rhubarb) rears aloft its handsome spikes of flowers in gracefully drooping panicles, its gigantic foliage, of a delicate pale green, giving it a most ornamental appearance. Contrasted with this plant, *Rheum palmatum* raises its inflorescence erect and rigid, with very few deeply cut leaves. This plant rarely flowers in the London Botanical Gardens, and appears to be of very slow and by no means vigorous growth. Although there is also a plant of the var. *Tanguticum*, the *Rheum* which is now credited with being the source of East Indian and Turkey rhubarb, it is quite young and shows no sign of flowering. At first sight it might be passed for *R. palmatum*, but on closer inspection it is seen to be covered with minute, short, stout hairs.

Those who desire to increase their practical acquaintance with British plants could not do better than pay Kew Gardens a visit during the coming month. The *Carex* genusis represented by a large number of species just coming into fruit. Among these the rare *C. Boenninghauseniana* may be observed. In the water tanks close by may be seen *Cicuta virosa*, *Lysimachia thyrsiflora*, and *Pinguicula grandiflora* in blossom, while the *Hieracia*, a most difficult group of plants, present the following species in blossom: — *H. aurantiacum*, *alpinum*, *cæsium*, *Gibsoni*, *maculatum*, *pallidum*, *stoloniferum* and *villosum*; *H. Gibsoni* and *H. maculatum* being conspicuous by the dingy blotches on their leaves. The Caryophyllaceæ also furnish the following rare species :—*Silene Otites*, *italica* and *nutans*, and *Dianthus cæsius*. Other rare British plants now in blossom are *Sisyrinchum anceps*, *Potentilla fruticosa*, *P. rupestris*, *Mertensia maritima*, remarkable for the oyster-like flavour of its leaves and the glaucous hue of the foliage, *Scrophularia vernalis* and *Campanula Rapunculus*. The Umbelliferæ are also worth a visit, for many curious species of the abnormal genera *Bupleurum* and *Eryngium* are now bursting into blossom.

At Edinburgh Botanical Gardens there are several specimens of the new rhubarb plant, *Rheum palmatum*, var. *Tanguticum*, now in flower, a specimen of

* Hanbury, 'Science Papers,' p. 126.

which has kindly been promised for the Herbarium of the Society by Professor Balfour.

Several interesting specimens have been forwarded during the past month, one of these consisting of a raceme of laburnum flowers of a pinky-brown tint, almost white towards the base of the petals, all the rest of the flowers on the tree being of the ordinary yellow colour. Another specimen of a somewhat similar character was one in which a portion of a corymb of pink hawthorn consisted of pure white flowers, the remainder being of the usual deep pink tint. A third was the fruit of a sycamore tree in which three samaras instead of two were formed, apparently by the duplication of the parts of the flower, the stamens also being more numerous than usual.

Mr. Thomas Hanbury, writing to the *Gardeners' Chronicle*, from near Mentone, at the end of last month, mentions the following medicinal plants as being then in flower in his garden :—*Cistus ladaniferus, Drimys Winteri, Catha edulis* (Abyssinian tea), *Eucalyptus globulus, Laurus Camphora, Lavandula Stœchas, Punica Granatum, Styrax officinale,* and *Melianthus major.*

Two of the prettiest of our wild flowers are just coming into blossom this month, one, *Spiræa Filipendula,* or Dropwort, so called from its curious nodulose roots, of which hogs are said to be very fond, may be found on chalky and limestone downs, in tolerable abundance where it does occur, although somewhat local. Its remarkably pretty foliage and the neatness and compactness of its flowers, especially when double, have obtained it a place in flower gardens. It wants, however, the delightful fragrance of the other, *Spiræa Ulmaria,* whose elegant foliage and corymbs of whitish flowers, looking like those of the elder in miniature, enable it to be readily recognized in the damp pastures and by sides of streams, where it delights to grow.

Gerarde says of this plant, "Camerarius of Noremburg saith it is called of the Germanes his countrimen Worme-kraut, because the roots, saith he, seem to be eaten with worms. I rather suppose they call it so because the antient hackny men and horsleaches do give the decoction thereof to their horses and asses, against the bots and wormes, for the which it is greatly commended." At the present day it is occasionally used in rural districts as a remedy for diarrhœa in calves, and by herbalists as a remedy for the same complaint in human beings. In common with most of the Rosaceæ it appears to possess astringent properties. In a recent article in the *Lancet,* on the treatment of acute rheumatism by salicin and salicylic acid, Dr. T. J. Maclagan draws attention to this plant, and says, "From the few observations I have made, I am disposed to think that an infusion of the flowers of the meadow-sweet may prove a serviceable remedy in rheumatism." The suggestion which is thus thrown out appears to be founded on the fact that the essential oil (salicylous acid) to which the fragrance is supposed to be due, bears a relation to salicin, from which, indeed, it can be made artificially by oxidation with sulphuric acid and bichromate of potassium. It is rather singular, however, that this substance does not exist ready formed in the flowers, since it cannot be extracted by alcohol from them, but appears to be formed by the action of water. According to Dr. Prior in his 'Popular Names of British Plants,' the name meadowsweet is a corruption of meadwort, the mead or honey wine herb. Hill in his 'Herbal,' tells us that the flowers mixed with mead give it the flavour of the Greek wines. It is quite possible that such might be the derivation, since Gerarde in his old 'Herbal,' describes it under the name of mede-sweet or queene of the meadows. Possibly its use might have a beneficial effect in enhancing the keeping properties of the mead as well as in imparting a flavour to it.

The writer remembers reading an account of some persons who had gathered a quantity of the flowers and placed them out of the way under their bed during the night, and who in the morning were found insensible, a result attributed to the flowers giving off the vapour of hydrocyanic acid. This seems to be a point worth investigating, since Gerarde speaks thus, "The leaves and flowers farre excell all other strowing herbes for to deck up houses, to straw in chambers, halls and banqueting houses, in the sommer time; for the smell thereof makes the heart merrie, delighteth the senses; neither does it causes headache or loathsomeness to meat, as some other sweet-smelling herbes do." On the other hands he remarks, "The distilled water of the flowers dropped into the eies, taketh away the burning and itching therof, and cleareth the sight," an effect which forcibly reminds one of the results produced by a lotion containing hydrocyanic acid.

Those who are interested in botanical teaching will be glad to learn that a new series of botanical diagrams, under the title of 'Anatomisch-Physiologische Atlas der Botanik,' is now being issued by Dr. Arnold and Carolina Dodel-Port of Zurich, and can be obtained, we believe, through Messrs. Williams and Norgate or other foreign booksellers. The number of series of botanical diagrams in this country is so limited that any addition, especially one consisting of such valuable illustrations as these appear to be, must be gladly welcomed. Specimens of these diagrams have been presented, it appears, to the Linnean Society of London.

Those who are studying botany for science examinations or university degrees are sometimes at a loss where to obtain specimens of the schizomycetes for microscopical examination. Mr. Butlin, in a paper read before the Royal Society, states that in every case in which there is "fur" on the tongue, fungi of this group are present. On cultivating portions of fur on a warm stage *Micrococcus* and *Bacillus* were found to be constantly present, the latter, however, though always in the fur put under cultivation, seldom or never develops, although it evidently thrives on the tongue, being constantly found there. In some specimens of fur *Sarcina* and *Spirilla* were found and were readily cultivated, and in one case a rapid formation of *Bacterium termo* took place, so much so as to obscure the development of *Micrococcus,* which, as a rule, is not interfered with by the presence of other fungi. This development of fungi on the tongue has one point of interest for the pharmacist or dentist in that it points to the value of antiseptics in tooth powders and mouth lotions.

The present number (39) of 'Medicinal Plants' contains figures of the following plants:—*Cuminum Cyminum, Cinchona officinalis, C. Calisaya, C. succirubra, C. cordifolia, Gentiana lutea* and a double plate of *Aloe succotrina.* The authors allude to the curious fact that the cummin plant is rarely to be seen in the London Botanical Gardens, although it is

easy to cultivate. The cummin of Scripture is here spoken of as though it were *Cuminum cyminum*, although by many writers it is referred to *Nigella sativa*. The subject of cinchonas has such a vast literature, and the space that can be devoted to it in a work of this kind is so limited, that the authors have perhaps wisely confined themselves to the description of such barks as are official in the Pharmacopœia; it is unfortunate, however, that such a limitation prevents the description of the Indian barks which now enter so largely into commerce. One important fact in connection with cinchona barks appears to have been overlooked, viz., that the thicker and older specimens, which from their appearance often obtain a high price in commerce, contain as a rule but little alkaloid. The botanical relationships of the various forms and species are summed up in as lucid and succinct a manner as is possible considering the intricacy of the subject. The name of the plant yielding socotrine aloes is changed to *Aloe succotrina*, Lam., as being the earliest name of the species. In a footnote the authors remark that C. Bauhin derives the name "succotrinum," which was given to the drug in the 10th century, from succus citrinus, the powder being yellow; but they consider it more probable that it is a corruption of socotorina or socotrina, from the island whence it was chiefly obtained. The plates are unusually good in the present number.

In the third report on the action of anæsthetics, made to the Scientific Grant Committee, of the British Medical Association, the following interesting conclusions have been arrived at: That chloroform reduces the blood pressure much more rapidly and to a greater extent than ethidene and has sometimes an unexpected and apparently capricious effect on the heart's action, which in some cases occurs more than a minute after the administration of chloroform has ceased. That artificial respiration is very effective in restoring animals in danger of dying from the use of chloroform, in some instances even when the heart has ceased beating. Ethidene, on the other hand, on no occasion caused absolute cessation either of the heart's action or respiration, and although they were sometimes very much reduced, it was always by regular gradations and not, so far as observed, by sudden and unexpected depressions. It is therefore considered that, though not altogether free from danger on the side of the heart and respiration, it is in a very high degree safer than chloroform. The only drawback it possesses is that in some cases it produces vomiting; but it has not been shown that this is more frequently the case than with chloroform, over which it also has the further advantage of producing less excitement and being more agreeable to the patients. Isobutyl chloride has been found to be an imperfect anæsthetic and to produce considerable excitement.

M. Bensch, in *Les Mondes*, has shown that benzol, which has been proposed as an anæsthetic, acts as a poison when introduced into the circulation, or by inhalation in the form of vapour.

In a work recently published by Drs. Dujardin-Beaumetz and Audigé, the authors give the results obtained from nearly three hundred experiments upon the toxic action of various alcohols. They have found that the poisonous properties of the different alcohols are more energetic in proportion as the atomic constitution of the alcohol is more complex; a fact of considerable importance, seeing that the majority of these alcohols, propylic, butylic, amylic, œnanthic and caprylic, enter more or less into the alcohols sold as cheap brandy.

The curious fact that pure ethylic alcohol does not produce the same symptoms or the same effects, such as violent trembling, etc., that accompany drunkenness or delirium tremens, taken in conjunction with the conclusion arrived at by these authors, should lead to Government interference with a view to reduce the dangerous results of drinking to as low a figure as possible, by permitting only those spirits to be sold which are as free as possible from the more complex alcohols. M. Bergeron has already expressed his belief that the impurity of the spirit obtained from beet-root, grain and potatoes, is responsible for the violent and brutal forms of modern drunkenness observed in a more marked form in the present day.

All these alcohols appear to cause a gradual and persistent lowering of the temperature of the body, and in connection with this an interesting point for determination seems to present itself, viz., how far the lowering of the temperature is connected with the diminution of waste of tissue which is believed to be caused by the use of alcohol, and at what point the diminution of temperature is likely to cease to have a mere restraining action, and to cause an actual stoppage of vital functions.

Professor Haeckel of Marseilles, in investigating the action of the solanaceous alkaloids upon the rodents, has found that immunity from poisonous action is possessed by several varieties of rats, not only from belladonna but also the alkaloids of *Datura Stramonium* and *D. Tatula*. His results show that guinea-pigs and rabbits may be fed upon the leaves and even the roots of the poisonous Solanaceæ without detriment; so much so, that he was able to bring up several generations in the summer on this food, on the leaves exclusively, and in winter by mixing equal parts of dried powdered leaves and roots with other kinds of food. The question whether these active principles are destroyed immediately they enter the blood or whether they remain for some time in the system and are gradually excreted is one of some interest, since in the latter case rabbits which have fed on belladonna might prove poisonous to human beings.

The Quebracho tree of South America, used for tanning purposes, appears to be attracting some attention in France and Germany. Like many other names used in that botanically rich quarter of the globe, "quebracho" is not confined to one plant, there being a white and a red quebracho, *Quebracho blanco* and *Quebracho colorado*. The botanical source of the former is *Aspidosperma Quebracho*, Lor., belonging to the natural order Bignoniaceæ, and of the latter *Loxopterygium Lorentzii*, Gris., an anacardiaceous plant. According to the *Berichte d. deutsch. chem. Gesellschaft*, Schickendarz, learning that the bark is used in South America as a febrifuge like that of cinchona, examined the bark and found in it a crystallizable alkaloid which he has called "aspidospermine." It is only slightly soluble in water, but very soluble in alcohol and ether. Its hydrochlorate and sulphate are very soluble in water and possess an intensely bitter taste.

Baron von Mueller announces (*Zeits. Öst. Apot.-Verein*, June 10) that he has isolated an alkaloid from another Australian solanaceous plant, the *Anthocercis viscosa*. This body, which he calls

"anthocercine," forms a yellowish oily liquid, heavier than water, having a bitter taste and a peculiar rather agreeable smell; it dissolves extremely readily in water, and is soluble in alcohol and in ether. The alkaloid is volatile, and during the manipulations attending its preparation it had upon the operator a very marked and almost stupefying effect. It was obtained by treatment of the aqueous extract of the twigs and leaves with alcohol, evaporation of the tincture, redissolving the residue in water, supersaturating with caustic alkali, and removal by means of ether. The results of some physiological and toxicological experiments that have been commenced are promised in a future communication.

In the *British Medical Journal* for June 14, Dr. H. Dobell gives a formula for tincture of podophyllin, which he states is quite free from the inconvenience or accidents sometimes attending the administration of the drug in the form of pills, and he states that he considers it in this form one of the most satisfactory and reliable of medicines. The formula is as follows:—Podophyllin, gr. ij; essentiæ zingiberis, ℥ij; spiritus vini rect. ad ℥ij. Fiant guttæ. A teaspoonful to be taken in a wineglassful of water at bedtime every night or every second, third, or fourth night as required.

Dr. D. Maclagan, in the same journal, speaks of the value of hydrochlorate of pilocarpine injected subcutaneously in severe cases of itching, the profuse perspiration induced giving great relief to the patient.

In the *Bulletin de Thérapeutique*, Dr. Ortille reports a cure of a very obstinate case of hiccough which had lasted seven months, by the use of jaborandi. It was administered in the form of a decoction of 4 grams of the leaves and stalks in two doses taken at an interval of fifteen minutes. In two hours the hiccough ceased and did not return.

Dr. James, in the *New York Medical Record*, states that apomorphia has proved very valuable in his hands as an emetic in croup, in the form of subcutaneous injection, one-twentieth of a grain of the hydrochlorate giving almost magical relief to a child two years old in less than three minutes.

In a short note on the Anda seed (*Anda Gomesii*, Juss.) of Brazil, the editor of *New Remedies* states that the oil has remarkable drying properties, exceeding in this respect even that of linseed, a property which is more likely to bring the oil into demand than its purgative action, although the oil is said to be almost tasteless.

In the *Moniteur Scientifique*, M. Serullas reports having discovered in oat-bran a substance, which if dissolved in water and subjected to the action of oxidizing agents acquires the odour of vanilla. The substance so produced can be extracted by ether and purified.

In a short note on the antiseptic properties of menthol, the stearoptene of Japanese peppermint oil, which have been investigated by Mr. A. Duncan, a student of the University of Edinburgh, the *Lancet* speaks of the drug as being hardly to be regarded as a commercial article. It is, however, not unfrequently offered in the London market, and could probably be obtained by ordering it of any wholesale drug house. Mr. Duncan believes it to be possessed of similar properties to thymol.

In a paper published in the *American Journal of Pharmacy*, quoted in this Journal last week, Mr. L. Fahnestock reports obtaining 1·25 per cent. of cantharidin from old *Mylabris Cichorii* (Chinese cantharides) and 1·3 per cent. of cantharidin from *Cantharis vittata* (the potato fly). Large quantities of the Chinese cantharides come into the London market, and are used for veterinary purposes and in the preparation of the active principle. The percentage of cantharidin is, however, very variable in these insects, some specimens yielding much more than *Cantharis vesicatoria* and others scarcely any; hence the difference in price, the Chinese cantharides being much the cheaper.

The latter drug does not usually, however, consist only of *M. Cichorii*, but in large proportion of *M. phalerata* and a variety of that species, both of which are much larger than the *M. Cichorii*. It would therefore be interesting to determine whether these species differ in amount of cantharidin, and if so, how far this fact may influence the yield obtained. One interesting point in Mr. Fahnestock's paper is the fact that although he operated on the same lot of beetles used by Professor Maisch six years ago, he found that instead of the whole of the fatty matter being soluble in bisulphide of carbon, a considerable quantity remained insoluble and rendered it difficult to obtain the cantharidin free from colour.

It has long been a puzzle how the "Japanese isinglass" is obtained in the form of square prisms and strips, as it is met with in commerce. The way in which this is done is as follows:—The seaweed, usually *Gelidium corneum*, after being collected and bleached by exposure to sun and air is carefully freed from impurities, boiled in water to a stiff jelly and poured into a box. In this state it is exposed to the cold air during the night and freezes or becomes sufficiently hard to be cut into strips. These are then exposed during the day to the action of the sun, when the surplus water gradually runs off and evaporates, leaving the seaweed in the peculiar porous strips and prisms in which it is met with in commerce. The gentleman from whom this information was derived, the Japanese commissioner at the Paris Exhibition, states that this industry is chiefly carried on in the northern and colder districts of the island. Although apparently quite free from impurity, beautiful diatoms may occasionally be found upon commercial specimens, one of the prettiest which have been found upon it being the *Arachnoidiscus Ehrenbergianum*.

In the *Berichte d. deutsch. chem. Gesellschaft*, E. Schering calls attention to the fact that iodide of potassium is liable to be contaminated with iodide of lead, derived from the commercial iodine which is used on the large scale for making the potassium iodide. When containing lead iodide the crystals differ in shape from the pure salt.

In the *Chemische Zeitung*, Ficinus proposes a new process for preparing pure tartaric acid. It is prepared from tartrate of zinc, a scarcely soluble salt, by decomposing it with sulphuretted hydrogen. The zinc sulphide is made to serve as a source of hydrogen sulphide by heating it with hydrochloric acid, and the resulting zinc chloride is used for obtaining the tartrate of zinc by double decomposition.

Peroxide of hydrogen in the form of a shower is a phenomenon probably unrecorded hitherto. Mr. E. Solly, in a letter to *Nature*, states that on the morning of June 12 last, at half-past eleven o'clock, a shower of rain fell, the drops of which appeared transparent in falling, but on striking against any

solid surface they became milky owing to the effervescence of some gas in the form of minute bubbles. These bubbles, from the bleaching power the rain possessed, he believed to have been nascent oxygen.

The art of surgery has recently been enriched by a most ingenious piece of apparatus devised by Dr. Nitze of Vienna, and called a cystoscope. By means of this instrument the bladder and urethra can be illuminated and examined in all their parts. The light proceeds from a white-hot platinum wire, and is developed by means of a very powerful constant Bunsen's battery. In order to prevent the heated wire from coming into contact with the mucous membrane, the tube containing it is kept cool by means of a continuous stream of water which circulates in two separate channels in the tube containing the wire. Instruments for examining the stomach, etc., in the same way are in course of being constructed.

In the *Philadelphia Medical and Surgical Reporter*, Dr. M. W. Keen calls attention to a preparation which he calls waterproof paper, and which he considers to be superior to oiled silk in being more impervious and to gutta percha tissue in the sheets being less liable to adhere to each other in use, as it requires a temperature of over 140° F. to become sticky, while gutta percha adheres to itself at 100° to 110° F. It is, however, less tough than oiled silk, but is very supple and can be easily washed. Its calculated cost is 1*d.* per square yard. It is made by dressing paper with a combination of india-rubber and paraffin.

Mr. Norman Lockyer appears to be following up his researches upon the nature of the "elements," and if he can satisfactorily demonstrate all that is suggested in a brief note read before the Royal Society on the 29th ult., there will no longer remain any doubt as to their complexity. In it he states that the spectrum of the vapour given off from sodium after slow distillation in a vacuum for some time shows the red and green lines without any signs of the yellow one; also that "*hydrogen is given off in large quantities*," and that at times the C line and the red "structure" are seen alone. Time was when the scientific man had to trust to posterity for recognition, but Mr. Lockyer has been already included among the giants of science in the following lines from a pæan that appeared a few days since in the *Glasgow Weekly Herald*:—

"Age of discovery, hail! Hail, harmony, mystery, marvel!
Metals and metaloids, gaseous, liquid and solid!
Atoms and molecules, monad and diad, triad and tetrad!
Hail, all ye sages of science, Faraday, Laplace, and Dalton!
Thou, Norman Lockyer, work on, is not seven the sum perfection?
Are not our three score originals so many forms allotropic?
Penetrate the deepest profound, resolve the mystic confusion
Into the prime seven factors that glow in the form of the rainbow,
Then shall the wreath of the rainbow garland thy forehead for ever."

Among the honours that have been distributed by the Government during the last few weeks some few have fallen to the share of scientific men. Mr. Henry Bessemer has been made a Knight; Mr. George Bentham, the indefatigable botanist, has been made a Companion of the Order of St. Michael and St. George; and his colleague in the compilation of the recently completed 'Flora Australiensis,' Baron Ferdinand von Mueller, has been made a Knight Commander of the same order. With respect to the first-named gentleman, it is satisfactory to learn on his own authority that he has not been lacking a more substantial reward, derived from the payment of royalties. Perhaps no other instance of applied science could furnish statistics so marvellous as those recently quoted by the *Times* in respect to the Bessemer process for making steel. Before its invention (the first paper concerning it was read in 1856) the entire production of steel in Great Britain was only about 50,000 tons annually, ranging in price from £50 to £60 per ton. By 1877, however, the production in this country had increased fifteenfold, to 750,600 tons, whilst the price had been reduced to £10 per ton. It is estimated that the coal consumed in making this quantity was three and a half millions of tons less than would have been required by the old process. In the same year the Bessemer steel manufactured in the United States, Belgium, Germany, France, and Sweden raised the total output to 1,874,278 tons, with a net selling value of about £20,000,000. The works in which these operations were carried out were eighty-four in number, and represented a capital of more than three millions.

Prescriptions bring with them their usual difficulties. The first requiring notice is that of No. 300 where liq. hydrarg. pernit. is prescribed in a gargle. This is a caustic preparation and one not often ordered; the usual strength for a gargle is one to two minims for each ounce of fluid. It may possibly exercise a caustic influence on a tender mucous surface, and being persevered in may even cause bleeding.

The prescription No. 301 most probably owes the dark colour in question to contamination with some preparation of iron, in all probability due to the use of an imperfectly cleaned graduated measure. The cause of the change should have been determined at the time that it was observed. The prescription is very simple, and one that should have been repeated without the slightest variation in taste or appearance.

The next prescription, No. 302, requires no further notice here than a reference to the remarks on combinations of a similar character in previous "Months." There will be a separation of quinine, but if a little mucilage be added to the mixture previous to the addition of the tr. quinæ ammon., this will be obviated; see remarks on quinine preparations and their difficulties in dispensing, which may be discovered by referring to the Index.

No. 303 is a prescription containing ℥ss chloroform for each dose and to be taken occasionally when required. This may be an error on the part of the prescriber in writing chloroform when spirit of chloroform was intended, but it is by no means certain that such is the case. The letter of M. P. S. on this subject, p. 1030, may be read with advantage, together with the remarks of Ch. Jones, Birmingham, p. 1051. Chloroform has been given in doses of ℥ss, but in exceptional cases, and the dispenser should when possible apply to the writer of the prescription; if that be not practicable he should endeavour to learn whether the case is an exceptional one. In presence of a difficulty of this description, the dispenser should aim at strengthening

his position by reference to some standard work on the subject. His first reference should be the Brit. Pharmacopœia, where the dose is given as from 3—10 minims, the maximum dose there indicated being only one-third the dose ordered in this prescription; but he will find in other authorities that chloroform is given in doses even larger than that of this prescription. Hager, in his 'Practice of Pharmacy,' says "Chloroform is given in doses of 5—20 drops in spirit or emulsified, but in special cases this may be increased to 30 or 40 minims, and among these special cases he enumerates cholera, lead colic, stoppage of urine, etc. But he cautions the pharmacist when the dose is even 20 minims to take care that the physician has attached the usual (!) indicating a special dose. If chloroform be intended in that prescription, the dispenser should take care that it is emulsified. The prescription being one written by a London physician it may have been previously dispensed; if so, the patient might have been able to afford some information for the dispenser's guidance. It is impossible, without being fully aware of all the surrounding circumstances, to answer the question whether N. W. Grose exercised a sound discretion in *refusing* to dispense the prescription as it stood. It is much to be regretted that the practice of initialing excessive doses is not more generally adopted by the medical profession.

The directions of the prescription No. 304 are those which are quite usual and generally understood by dispensers. The full directions are "fiant pulveres no. octo," and this in ordinary practice is rendered, let eight powders result from the quantities and ingredients of the prescription. Pereira, in 'Selecta e Prescriptis' gives more than one instance of similar "Latinity."

A close literal acquaintance with the B.P. would render unnecessary such questions as that of No. 305. The two extracts in this prescription should be of a pilular consistence, and if so they would not require the addition of any powder. It has been stated before and may be repeated here as an axiom of dispensing that there should be no "substitution." If an extract, by the absorption of moisture, has become a little softer than desirable for pills such as these to retain their shape, it should be carefully evaporated over a water-bath, or in some other more convenient manner, to drive off excessive moisture; but the powder of the root cannot be substituted for extract when the latter is ordered in a prescription.

In reply to No. 306, in making tr. opii, B.P., care must be taken that the quantity of morphia in the opium be not less than 6 to 8 per cent; but no provision is made for an opium that may contain 12 or 14 per cent. of morphia. Some remarks on the condition of opium for a tincture will be found in a previous "Month."

The mixture, No. 307, cannot be made as written without the mucilage of the chlorodyne being thrown out of solution on its addition to the spirit; the only way in which it can be done involves a deviation to a certain extent from the letter, if not from the "spirit," of the prescription, and is inadmissible without the writer's sanction. Put the sp. ammon. arom. in a bottle with the proportion of camphor for ℥ss spirit of camphor, add to it an equivalent of ether. sulph. for the sp. ether. sulph., then rub the chlorodyne in a mortar with ℥j mucilage and sufficient glycerine in lieu of the spirit omitted; the result will be a uniform mixture with the active ingredients, but minus a certain quantity of spirit.

If G. W. H. will adopt the following method of mixing the lotion, No. 308, he will have no difficulty in making a perfect mixture. The camphor and oil of rosemary should be dissolved in the smallest possible quantity of spirit in a mortar and a little mucilage added to divide and suspend the camphor. To these should be added the other ingredients, in which the borax has been previously dissolved. The only difficulty that presents itself is with the camphor, and this is surmounted by its being suspended with the aid of mucilage.

Ergotine suppositories may be made with gelatine, and a reference to the letters lately written on this subject will furnish Robert Craig with the necessary proportions for making gelatine suppositories with which the ergotine may be combined. They may also be made with cacao butter, care being taken that they are moulded at the proper moment. This also will be found in back numbers of the "Dispensing Memoranda."

The prescription No. 1 of No. 310 should be treated as directed for mixtures containing tinctures of resins or gum resins by the use of a little mucilage previous to the addition of the tr. cannab. ind. The principle has been so frequently urged that there should be no necessity for its repetition here. See "Month," Dec., 1878, pp. 528 and 529.

With reference to No. 2 prescription, the writer must be referred to back numbers of this Journal where the subject of excess of essential oils in pills has been on more than one occasion fully discussed.

The question No. 311, with regard to aq. menthæ p. has been answered by "Nemo." The only other water to which the "p." could apply being aq. menthæ pul., which is not official, and, as compared with the aq. menth. pip., very rarely prescribed.

The ingredients of No. 312 must be shaken together before being used. If A. W. M. reads the instructions in the B.P. for the preparation of fel bovin. purif. he will see that fresh gall is ordered; this is fel. bovin. The further process is for the purification of this crude article. Being drops for the ear the dispenser may assume that a permanent mixture is not necessary, and the addition of anything for that purpose may be objectionable.

Benzole rect. of No. 313 is a very volatile hydrocarbon, not adapted for administration in the form of pills. A formula for its use in the form of vapour will be found in the back numbers. Probably the writer of the prescription may not be practically acquainted with the characters of benzole.

No. 314. A reference to preceding "Months" will supply information with reference to the treatment of pill masses containing excess of essential oils, and render it unnecessary to repeat the observations with the recurrence of each prescription where this difficulty present itself.

The recipe No. 315 can scarcely be called a prescription. If sal ammoniac be used that salt will remain for the most part insoluble; but if what is usually termed spirit of sal ammoniac be used, the result will be different; if the recipe be strictly adhered to and without any addition, alteration or subtraction, a clear solution cannot result from this combination.

If tr. ferri perchlor., as in prescription No. 316, be added to mucilage of acacia there will result a semi-transparent gelatinous compound; but mucilage of

acacia is not ordered, and there are three mucilages in the Pharmacopœia. With mucilage of acacia and mucilage of tragacanth the result will be much the same, but if mucilage of starch be used with the other ingredients, a mixture will result unobjectionable in appearance.

The only remark that need be made on prescription No. 317 is that it would have been better had some simple powder such as starch or sugar been ordered with the calomel and opium, and very probably the writer would do it on a future occasion if its necessity or desirableness were brought under his notice. It is not for the pharmacist to say that the dose of acet. plumbi and morphia is too large. The Pharmacopœia dose is 1 to 4 grains of acet. plumbi; but exceptional cases occur in medical practice which require exceptional treatment.

In dispensing No. 318 the number of draughts ordered or considered desirable to send may, so far as the directions are concerned, be sent in separate draughts or in one bottle; unfortunately for the pharmacist, the separate draughts of former periods are now very rarely prescribed.

The ung. diachylon Hebræ does not differ at all in its composition, and very little in its relative proportions, from the emplast. plumbi of the B.P.; but in the official emp. plumbi water is used, which is not put in this formula, and the water would prevent that decomposition taking place from which the dark colour results. Its colour should be very much that of emp. plumbi.

No. 320. "Minor" must be in some error with regard to ung. plumbi co. That preparation has no acetate of lead in its composition. If the ung. plumbi acet. be meant, the plumbi acet. may be dissolved in a very small quantity of water in a warm mortar and the benzoated lard added to it and stirred till cold.

There will be a separation from the combinations of ingredients in No. 321, most probably due to mutual decomposition of the soda and bismuth. If a solution of sodæ bicarb. co. be added to liq. bismuthi "Schacht," there will be a flocculent separation which ultimately subsides as a thin light grey powder; the precipitation may be retarded, but could not otherwise be influenced by the addition of the other ingredients of the prescription.

THE ALKALOIDS OF ALSTONIA CONSTRICTA.

The bark of the Australian *Alstonia constricta*, F. Muell., which is reputed to possess the properties of cinchona bark and to be used with success in the treatment of intermittent fevers, has recently been the subject of examination by several investigators, who have obtained somewhat discordant results. Mueller and Rummel* first reported that by treating the alcoholic extract with water and a little hydrochloric acid, adding to the filtered solution a slight excess of ammonia, dissolving the separated flocks in ether and evaporating, and purifying the residue by again dissolving in acid and repeating the process, they had obtained an orange-yellow brittle pellucid mass, possessing the properties of an alkaloid, and to which they gave the name "alstonine." It melted below 100° C. and carbonized at a higher temperature, dissolved easily in alcohol, ether and dilute acids, but only sparingly in water. All its solutions in the dilute state exhibited a strong blue fluorescence, not affected by acids or alkalies, and its alcoholic solution had a slightly alkaline reaction. It combined with acids without completely neutralizing them. Strong acids and alkalies partially decomposed it on evaporation in a water-bath to a dark-coloured acid substance. The compound with hydrochloric acid was precipitated by the chlorides of platinum and mercury, potassio-mercuric and potassio-bismuthic iodides, biniodide of potassium, phosphomolybdate and phosphotungstate of sodium, potassium bichromate, picric acid, and the alkalies and alkaline carbonates. Concentrated nitric acid dissolved it with a crimson colour, turning yellow on warming; and sulphuric acid with a reddish brown, that became afterwards dirty green; while hydrochloric acid only formed a yellowish solution.

The correctness of these results was disputed by Hesse (who with Jobst not long since isolated two alkaloids, ditamine* and echitamine, from the allied *Alstonia scholaris* bark), and in a paper read before the Berlin Chemical Society† he expressed the opinion that the supposed alkaloid was a mixture of chlorogenine and porphyrine.

Still more recently Oberlin and Schlagdenhauffen have announced the isolation of two alkaloids,—one crystallizable and the other amorphous,—from *A. constricta* bark. The following details are taken from a rather lengthy paper on the subject published in the *Journal de Pharmacie et de Chimie* for June.

The bark was first extracted in a displacement apparatus with warm ether as long as the ether took up colouring matter (72 hours); as a mean of three experiments the amount of apparently crystalline orange substance taken up by the ether was only 1·038 per cent. The bark was then exhausted with boiling alcohol during several days, which took up 27·74 per cent. more, and it had then lost all its bitterness. It was next boiled with water which removed 1·375 per cent. of substance containing principally salts and a small quantity only of organic principles. The composition of the bark is represented as follows:—

Principles soluble in Ether . .	1·038
Principles soluble in Alcohol . .	27·740
Principles soluble in Water . .	1·375
Hygrometric Moisture	8·932
Saline Matter	9·748
Ligneous Substance (by difference)	51·167
	100·000

No examination was made of the alcoholic extract, the authors' operations being confined to the much smaller quantity (1·038 per cent.) of ethereal extract. This was treated with dilute hydrochloric acid (1 in 200) to remove fatty matters, about one-half its weight, when the hydrochloric solution presented a very decided green dichroism. Upon filtering through animal charcoal the greater part of the colouring matter was taken up by the charcoal, but the nearly colourless filtrate presented a very pronounced blue fluorescence. This hydrochloric solution gave to reagents distinct indications of an alkaloid, to separate which in a definite crystalline form several methods were tried unsuccessfully. Eventually the solution was precipitated by ammonia, the precipitate dried under a glass over sulphuric acid and then exhausted by ether, which separated a brownish resinous substance. The ethereal solution was evaporated, the residue again dissolved in dilute hydrochloric acid, precipitated with ammonia and the precipitate treated with ether, until all coloured matter was removed, when the ethereal solution being enclosed in a perfectly closed test tube yielded a crystallization of the alkaloid, which the authors propose to call "alstonine."

The alstonine of Oberlin and Schlagdenhauffen is described as crystallizing in silky tufts of brilliant colourless isolated or stellate crystals. It is soluble in ether, alcohol, chloroform, benzine, acetone and petroleum. In cold water it is insoluble, but it is rather soluble in boiling water, to which it imparts a bitter taste. The aqueous solution colours red litmus paper blue. Weak acids dissolve it completely and it is precipitated from solution by

* Wittstein's 'Organic Constituents of Plants.'

* *Pharmaceutical Journal* [3], vi. p. 142.

† *Berichte d. Deutsch. Chem. Gesells.*, 1878, p. 2175.

all the alkaloidal reagents. Heated upon platinum foil it first melts, then at a higher temperature gives off an aromatic odour, disengages an abundance of yellow vapour, carbonizes and finally disappears without leaving any residue. The yield of this alkaloid is extremely small. In contact with concentrated sulphuric, nitric, or hydrochloric acid the crystals dissolve quickly with scarcely any colour, a yellowish tint being scarcely perceptible. Upon adding water to these acid solutions a superb blue fluorescence is immediately produced. Concentrated sulphuric acid containing bichromate of potash colours the crystals an intense blue-green, passing to violet and then to purple ; upon adding water a crimson liquid is immediately produced.

The mother liquor from which the above crystalline body was obtained left upon spontaneous evaporation an amorphous nitrogenous residue, possessing alkaloidal properties. It resembled alstonine among other points in solubility, except that it was only slightly soluble in boiling water, to which it imparted a strongly alkaline reaction. It differed also in its behaviour with the concentrated mineral acids. Sulphuric and hydrochloric acids dissolved it with a greenish brown tint ; whilst with nitric acid it gave a splendid crimson red, in this resembling more closely the substance obtained by Mueller and Rummel. But the acid solutions of the amorphous alkaloid gave no fluorescence.

In considering the question whether the amorphous body might not be identical with the crystalline, differing only in being less pure, Oberlin and Schlagdenhauffen are of opinion that they are two bodies, but possibly related to each other in a manner similar to quinine and quinicine, and they are engaged in experiments to clear up this point. Meanwhile they propose for the amorphous alkaloidal substance the name of "alstonicine."

SCOPARIN AND SPARTEINE.

BY E. MERCK.

Increased attention having been recently directed in Germany to the diuretic properties of an old popular remedy, the broom (*Sarothamnus Scoparius*) the author was induced to prepare a quantity of the two bodies, scoparin and sparteine, discovered in the plant by Stenhouse in 1851 and described him as its active principles, and to submit them to Dr. Fronmüller for therapeutic experiment. The results obtained are described in a paper in the 'Heilbronner Memorabilien,' 1878, Heft 12.

Scoparin occurs in the form of a fine yellow powder, in which under the microscope isolated acicular crystals can be seen. It is sparingly soluble in cold water, more freely in boiling water, whilst it disolves readily in alcohol and glycerine. With alkalies, on account of the weak acid properties of scoparin, no constant neutral compound can be obtained. The best form for its administration is as a subcutaneous injection in doses of 0·03 to 0·06 gram. For this purpose it is dissolved in water either with the aid of an addition of glycerine or a trace of ammonia. 0·03 gram of scoparin, 1 gram of water and a small addition of ammonia give a suitable solution for one application. For a glycerine solution the proportions are—0·06 gram scoparin ; 0·75 gram water and 0·25 gram glycerine. The ammoniacal solution causes the least pain.

Whilst the above doses administered subcutaneously produced a strong diuretic action, when administered by the mouth to produce equal results the doses require to be increased to 0·5 and even 1·0 gram. This is possibly due to the sparing solubility, and may indicate the necessity of experiments in the direction of an ammoniacal solution for internal administration. No injurious effects upon the digestion have been observed.

The second body, sparteine, occurs in the broom in much smaller and very variable quantites. In the pure condition and freshly prepared it is an almost colourless oily liquid, which when exposed to light and air rapidly becomes coloured yellow to brown. It possesses a peculiar smell, recalling that of hyoscyamine, and a very bitter taste. It has no action on the pupil of the eye. In water it is insoluble, but dissolves in alcohol. It gives the characteristic alkaloid reactions, has strongly basic properties and forms with acids crystallizable salts, readily soluble in water. Of these the author has principally prepared the sulphate, in the form of a white powder showing crystals distinctly under the microscope. There is no difficulty in preparing larger crystals, since the author has obtained them one centimetre in length ; but he considers the small crystalline form presents advantages in the preparation of a pure compound and in dispensing. The crystals belong, so far as can be determined, to the monoclinic system. The pure sparteine being, as above mentioned, a very sensitive and alterable body, the author thinks the sulphate will be found more suitable for administration, its ready solubility in water also favouring its subcutaneous injection.

Although the experiments with this salt have not been numerous they have shown that neither its internal nor subcutaneous administration produces unpleasant accidents or smarting, whilst its diuretic action was considerable. An aqueous solution was used, of the strength of 1 part of sulphate of sparteine to 50 of water and of this the internal dose was 30 drops (=0·04 gram of the salt) and the subcutaneous 1 gram (=0·02 gram).

PREPARATION OF CRAYONS OF SULPHATE OF COPPER.*

Mr. W. Weber describes in the *Archiv der Pharmacie* (February, 1879, p. 160) a very simple and ingenious method for making pencils of sulphate of copper, which might perhaps also answer for alum and other substances. Instead of attempting, as some direct, to fuse the sulphate in its water of crystallization, which succeeds only with very large quantities, and then but partially, he directs the preparation first of anhydrous sulphate of copper, by allowing the commercial crystals to effloresce in a warm place, then to transfer the nearly dry salt to a capsule, and to heat this over an alcohol lamp until every trace of water is driven off. The pulverulent salt thereby loses its bulkiness, and on stirring collapses to a heavy, almost white powder, which is admirably adapted for making handsome pencils. Good blotting paper is wrapped three or four times around a lead pencil or glass rod of the thickness the crayons are intended to be, the lower end is twisted together, and the upper edge of the paper held together by a little resin. It is not advisable to paste the whole lateral edge of the blotting paper, because the crayons would subsequently absorb unequal quantities of water and curve to one side. The dry sulphate is now introduced into the form or mould, and made to settle by repeated taps of the mould on the table. It must not be pressed in, as this is apt to result in differences in packing at various points of the crayon, which result in fracture after solidification. The topmost layer only is somewhat pressed down, and the paper-mould closed by twisting. The filled mould is now rolled very carefully, so as not to break it, in a correspondingly large piece of old linen (or muslin) which has been previously saturated with water and wrung out. The dehydrated sulphate of copper absorbs the water through the filtering paper with great avidity, and thereby becomes hard and solid. The moulds are allowed to remain in the damp cloth for three or four hours, or over night, at the end of which time the salt will have re-absorbed all its water of crystallization. The crayons are now removed, and in case they have become too soft, are allowed to lie in a warm place until they have lost the excess of moisture. They may then be cut in pieces and pointed with a knife.

The Pharmaceutical Journal.

SATURDAY, JUNE 28, 1879.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary,* 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

TRE METRIC SYSTEM IN MEDICINE AND PHARMACY.

A STEP has lately been taken in America towards promoting the use of the metric system of weights and measures by which the introduction of this system into medicine and pharmacy may eventually be brought about. At the meeting of the American Medical Association, at Atlanta, last month, it was resolved that the Association should adopt the international metric system and use it in its transactions; that those who present papers at future meetings should be requested to employ the system, and that physicians as well as the medical boards of hospitals and dispensaries should assist in this direction by using the metric system in prescribing and in recording cases and by all other means in their power.

The *British Medical Journal* earnestly recommends these resolutions to the notice of members of the British Medical Association, and it is mentioned that at the next annual meeting Mr. ERNEST HART will probably bring forward a motion for the appointment of a committee to discuss the question of the advisability of the introduction of the metric system into prescriptions and medical formulæ in this country. This would afford an opportunity for considering how far and in what manner the introduction of this system can be aided by the British Medical Association.

According to existing legislation in this country, the use of the metric system is not allowed for any purpose of trade or business, and the weights and measures of this system may only be used for other than trade purposes. Great Britain is the only country in the world where this is the case. In other European states the metric system is universally adopted, and in America it is rapidly coming into use, though held back to some extent by the resistance offered on the part of Great Britain. If, however, the example now set by the American Medical Association should be followed by the medical men in this country the practical introduction of the metric system may before long be realized here as in other countries, and thus a great advance in securing uniformity in medical formulæ will have been gained.

Not long since objections were raised against the practice of introducing the metric system into the Preliminary examination of the Pharmaceutical Society, on the ground that it was not taught in schools generally, and was not required in the Oxford or Cambridge examinations, or those of the College of Preceptors. At the time it was shown that this objection was not in fact well founded, and it was admitted that since the metric system is included in the Pharmacopœia a knowledge of it should constitute part of the qualification for passing the pharmaceutical examinations at one stage or other.

It is not a matter of any difficulty to acquire a knowledge of the metric system sufficient to satisfy the requirements of the Board of Examiners, and having regard to the circumstance that in pharmacy there is especial probability of this system coming into use it seems quite fitting that it should be included among the subjects of the Preliminary examination.

THE CONSUMPTION OF GAS.

FOR some months past it has been a very general experience among consumers of gas that the quantity of gas charged for has been unaccountably augmented. In many instances the increase of the bill for gas has had reference to periods when there was no corresponding increase in the need for light and during which demands for gas either for lighting or heating purposes had not been any greater than usual. But still the quantity charged for has been very considerably in excess of that charged for during corresponding periods of the previous year. In some instances it has been the case that the need for using gas has been actually less than ordinary, and that owing to limited business care has been taken to limit the consumption of gas, and still the consumer has been surprised by finding his gas bill some fifty per cent. or more in excess of what it had been before.

The subject has given rise to much correspondence in the columns of some daily papers; but this has not been productive of any better result than that of showing how general the influence has been to which the apparent increase in the consumption of gas is referable. Many applications have been made to the Gas Companies, and inspectors have been sent to examine the meters of the consumers with the general result of stating that the quantity of gas charged for had passed the meter, and must therefore be paid for. In the *Pall Mall Gazette* of last month it was pointed out that complaints were numerous of the extraordinary rise which seemed to have taken place in the charge for gas in some districts of the metropolis, the bills being heavier than ever without any known increase of consumption, and the idea of an increased pressure having been applied in order to provide for the supply of the improved gas lamps set up in some parts of the town was started to account for the increased quantity charged for to private consumers. This idea, however, was too absurd to bear examination, and any one conversant with the condition of gas burning

would know that any considerably increased pressure would soon make itself apparent by a roaring disturbed flame, which would at once call for a remedy by turning off the supply tap sufficiently to counteract the excess of pressure.

Whatever the explanation of the mysterious increase in the consumption of gas may be it certainly cannot be sought for in the augmented pressure under which the gas is supplied. A correspondent of the *Brewers' Guardian* gives as illustration the case of an establishment in the city where the gas bills for the first quarter of four consecutive years have been gradually increased until in 1879 the charge for gas was nearly double what it was in 1876, although meanwhile there have not been any additional lights or any extension of working hours. Here then is a case apparently showing that the gas companies have been able to make consumers burn more gas than they wanted.

Such a difference, even in isolated instances, is not to be accounted for by leakage from gas fittings, for it is far in excess of anything referable to such a cause. The gas companies do not satisfactorily explain the matter when they state that the improvement in the supply pipes, by obviating underground leakage, has also made the supply to consumers' burners more copious than it was heretofore, for if that were the cause of the greater quantity consumed it might be expected there would have been an obvious increase in the light produced and rather a reduced consumption than a larger one. We do not think consumers of gas are generally if at all disposed to think that they have lately had some fifty per cent. more light from their burners than formerly.

A more natural conclusion from the general experience is that suggested by Mr. DALLAS in the *Brewers' Guardian*, to the effect that the gas supplted lately has been of inferior quality in such a way that for the production of a given effect a larger quantity was required to be burnt. It is true that there is an elaborate system of gas examination by which the quality and purity of the gas supplied to the metropolis is supposed to be regulated; but there are other reasons besides the late surprising increase of gas bills which justify doubt whether that system is as adequate to protect the interests of gas consumers as it should be. Mr. DALLAS suggests that probably the truth could only be learnt by means of a parliamentary inquiry, and that the interests of the public certainly demand it. We cannot dispute the justice of this opinion and we think the matter one worth the consideration of chemists and druggists who are large consumers of gas for heating as well as illumination. In many instances, too, they might be of especial service in helping to keep up an examination of the gas supplied to different quarters and make observations as to its purity, composition and illuminating power that would be a useful check upon the results arrived at in other ways.

RAILWAY PHARMACY.

AFTER the denunciations that have been launched from certain quarters against the practice of counter prescribing, it will be consoling, perhaps, to some of those who have been thus attacked to find the *Pall Mall Gazette* referring to this practice in a more approving manner. In a recent number of that paper we are informed that nothing, perhaps, more pleasingly illustrates what may be called the "helpfulness of civilization" than the promptitude with which new wants of the community find themselves supplied. This remark has reference to a letter which appeared in the *Times*, from a traveller on the Metropolitan Railway between Edgware Road and King's Cross, describing the want of proper ventilation and the consequently obnoxious character of the atmosphere in the tunnel. The writer appears to have suffered rather more acutely than usual from the asphyxia with which travellers on that line are so familiar, and he stated that the condition of the atmosphere was so poisonous that, although himself a mining engineer, he was almost suffocated and was obliged to be assisted out of the train at an intermediate station. On reaching the open air he requested to be taken to a chemist close at hand and to him he explained as well as he could that he desired to have some restorative.

Thereupon, without a moment's hesitation, the chemist, apparently familiar with the symptoms, said "Oh! I see—Metropolitan Railway," and at once poured out a wineglassful of a preparation, which the sufferer concluded to be designated "Metropolitan mixture." Although very unwell he was amused at the promptness of the chemist, and was induced to ask him whether he often had such cases, to which he rejoined, "Why bless you, sir, we often have twenty cases a day."

The testimony to the convenience of the chemist's counter practice afforded by this case is almost as striking as that of the elephant in Mr. WOMBWELL'S menagerie, though it was not, perhaps, a cause of so much embarrassment as the grateful and affectionate demonstrations in acknowledgment of the services rendered by Mr. TARLEY to that intelligent monster.

BETTER LATE THAN NEVER.

THE *Répertoire de Pharmacie* mentions, under the heading "An Inexplicable Forgetfulness," that the French Minister of Public Instruction has but just transmitted to the Library of the Academy a copy of the *Codex Medicamentarius*, or official Pharmacopœia, edited by order of the Government thirteen years ago.

COLCHICUM PLANT.

WE are requested by the Curator of the Society's Museum, Mr. E. M. HOLMES, to say that he would be glad to receive specimens of the leaves and fruit of the Colchicum plant.

Provincial Transactions.

LEEDS CHEMISTS' ASSOCIATION.

The annual meeting was held in the library at the Church Institute, May 30, the President, Mr. P. Jefferson, in the chair.

The minutes of the last meeting having been read and confirmed—

Mr. E. O. Brown was elected a member and the following were elected associates:—L. Eland, W. D. Mason, R. F. Reynolds and E. F. Bacon.

The Honorary Secretary (Mr. Hallowell) read the reports, in which it was stated that in consequence of the small attendance at the monthly meetings held during the previous year, only two evening meetings had been held the last session. Through the kindness of the Council of the Yorkshire College, the first was held in the Lecture Theatre of that Institution, when Mr. L. Siebold gave a lecture on "Potable Waters, their Constituents and Impurities." The second was the annual social meeting, which assumed the character of a conversazione, when the members and associates joined the Yorkshire Naturalists' Union, at the Mechanics' Institute. Mr. H. C. Sorby, F.I.S., F.G.S., etc., delivered an address, after which the company inspected the various interesting objects which were to be found in the rooms, occupied for the purpose of a temporary exhibition, consisting of a large and beautiful collection of specimens illustrative of zoology, conchology, entomology, botany and geology. There was a large number of microscopes shown; also the phonograph, duplex and triplex telephone, microphone and several other objects of interest to students, their uses and construction being practically illustrated.

The Committee regret that so few members and associates availed themselves of the opportunity thus afforded of enjoying a very pleasant evening.

In consequence of ill health, the paper promised by Mr. Pocklington, F.R.M.S., has been deferred.

The library has been regularly supplied with the various periodicals as heretofore, and by the addition of a new bookcase considerably more room has been obtained for the bound volumes.

A collection of duplicate materia medica specimens has been kindly forwarded from the Pharmaceutical Society and will shortly be placed in the cabinet.

Though the number of members and associates is less than it has been for some years, the financial condition of the Society is in a most satisfactory state, due no doubt to the fact that the apathy of the members has prevented the Committee from expending the funds of the Society in providing lectures for the evening meetings.

Several important questions affecting the interests of the retail trade have had the attention of the Committee during the past year, and it is satisfactory to be able to state that in each case the old established usages of the trade have been upheld and the right to give advice respecting the uses and doses of medicine admitted.

The balance sheet showed that there were 36 members and 26 associates, with cash in the hands of the Treasurer £26, and of the Secretary £8 11*s*.

Mr. Wm. Smeeton proposed "The adoption of the report," which was seconded by Mr. F. Reynolds, and passed unanimously.

Mr. Yewdall proposed that the best thanks of the Association be given to the Pharmaceutical Council for the donation of the *Pharmaceutical Journal* (weekly), which was seconded by Mr. Councillor Stead and carried.

Mr. Jefferson proposed that the best thanks of the Society be given to the Committee of the Pharmaceutical Conference for the 'Year-Book of Pharmacy,' which was seconded by Mr. S. Taylor and carried.

Mr. S. Taylor and Mr. Chadwick being appointed scrutineers, a ballot was taken for officers for the ensuing year and they reported as follows. President, Mr. Councillor T. B. Stead; Vice-President, Mr. S. Taylor; Honorary Secretary, Mr. J. Hallowell; Committee, Messrs. R. Reynolds, Wm. Smeeton, E. Yewdall, P. Jefferson, G. N. Chadwick, G. Exley.

Mr. Jefferson proposed that Mr. George Exley, junior be appointed librarian and curator.

A vote of thanks to the retiring officers was passed, and the meeting terminated.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on June 19, Dr. Roscoe, Vice-President, in the chair. The minutes of the last meeting were read and confirmed; the following certificates were read for the first time:—J. W. Smith, W. R. Eaton Hodgkins, J. R. Ashwell, J. Bemrose. During the evening the following gentlemen were balloted for and declared by the scrutators, Messrs. Carteighe and Tribe, to be duly elected Fellows of the Society—E. J. Wilson, R. Reid, G. R. Tweedie, W. T. Bayne, J. Fletcher, H. Appleby, J. Sakurai, A. E. Robinson.

The following papers were read—

On Gardenin. By J. Stenhouse and C. E. Groves.—A short note on this substance was published in the Society's journal some time ago, by the authors, in which they described the method of extracting this substance from the so-called "Dekamali gum," which is the resinous exudation from *Gardenia lucida;* they also obtained a red compound by the action of nitric acid. In the present paper the authors continue the above investigation. The resin of the *Gardenia lucida* has a peculiar and unpleasant alliaceous odour which is undoubtedly due to some volatile compound. By distilling the resin in a current of steam a volatile oil came over; the bulk of this distilled at 170° and after rectification over sodium yielded a terpene boiling at 160°, having the formula $C_{10}H_{16}$; a small quantity of the oil boiled about 250°. The residue consisted of a dark brown liquid having an aromatic and slightly alliaceous odour and containing a trace of sulphur. Details of the methods employed for extracting and purifying the gardenin are given in the paper. The pure substance has the formula $C_{14}H_{12}O_6$. On treating one part of finely divided gardenin with ten of nitric acid sp. gr. 1·24, keeping the mixture cool, the whole turns of an orange colour and finally solidifies in a few minutes to a paste of bright red needles, which are collected and washed rapidly to prevent further decomposition, dried and crystallized from boiling chloroform. This substance has been provisionally named gardenic acid, though the authors have no evidence that it is really an organic acid, its behaviour with reducing agents pointing rather to a quinone grouping. It is insoluble in water, light petroleum and carbon bisulphide, and almost insoluble in ether and benzene; dissolves readily in cold dilute alkaline solutions with a deep yellow colour, being reprecipitated on the addition of acids. Its formula is $C_{11}H_{10}O_6$; it melts with decomposition at 223°. When a small quantity of strong nitric acid is added to a cold supersaturated solution of gardenin in glacial acetic acid, a mass of crystals of gardenic acid is obtained; if, however, this product after being washed and dried is boiled for some time with glacial acetic acid and recrystallized from that solvent it becomes more orange coloured and melts at 243°. It dissolves in alkaline solutions only sparingly in the cold, yielding a purple solution, turning pale red on boiling. This acetyl compound dissolves readily in boiling alkaline solutions, from which it is precipitated by acids. It has the formula $C_{14}H_8O_6(C_2H_3O)_2$. When gardenin is left in contact with dilute nitric acid sp. gr. 1·24 for a considerable time gas is evolved and a bright orange coloured substance is formed which is seen by the microscope to consist of colourless crystals mixed with an orange amorphous substance. The crystals are soluble, the amorphous substance insoluble in water. In

contact with an aqueous solution of sulphurous acid, gardenic acid acquires a bright yellow colour and is converted into hydrogardenic acid, $C_{14}H_{14}O_6$. It forms flat lustrous needles resembling lead iodide. It melts at 190° and is insoluble in water, light petroleum and carbon bisulphide, sparingly soluble in ether, easily soluble in hot benzene, spirit or glacial acetic acid; it dissolves in dilute alkaline solutions, from which it is precipitated by acids; oxidizing agents reconvert it into gardenic acid. Further researches as to the constitution of gardenic acid and gardenin are promised.

On Dry Copper-Zinc Couples and Analogous Agents. By J. H. Gladstone and A. Tribe.—The authors in order to avoid the time, trouble and the use of alcohol and ether necessary for the formation of the ordinary zinc couple, prepared by immersing zinc foil in a 2 per cent. solution of copper sulphate, etc., have turned their attention to the production of a dry couple as active as the moist couple. After numerous experiments the following method was found to be most satisfactory:—nine parts by weight of coarse zinc filings are placed in a dry flask with one part of finely divided copper; the mouth of the flask is then closed by a cork through which passes a tube having a capillary termination. The metals are mixed and heated in a Bunsen flame with continuous shaking until the filings begin to lose their shape and acquire a yellowish tinge; the mixture is then somewhat rapidly shaken, first in and then out of the flame. If the operation has been successful a number of small dark grey granular masses are obtained. The state of division of the copper is of great importance; the authors recommend the copper obtained by reducing the protoxide, at the lowest possible temperature, in hydrogen and sifting the product through fine muslin; 10 grams of a dry couple prepared as above convert 5 c.c. of ethyliodide into zinc ethiodide in about six minutes when heated to 90° C. The authors in one experiment employed 87 grams of ethyliodide with a proportionate quantity of couple. In fifteen minutes a conversion equal to 90·4 per cent. of the theoretical amount had taken place. The authors have in the second portion of the paper investigated the action of other couples. Zinc and platinum form a couple which decomposes water more energetically than the copper-zinc couple. In the preparation of dry couples no combination was found to be superior to the copper-zinc combination, probably because the copper sticks better to the zinc than either platinum, silver or gold; it is also less liable to form alloys with zinc than these three metals. Magnesium and platinum form an exceedingly active wet couple, but an effective dry couple could not be obtained; zinc with either cuprous or cupric oxide forms a dry couple almost equal in activity to that formed by zinc and metallic copper. The authors conclude that for practical purposes no combination is superior to that formed with zinc and copper prepared as above described.

In answer to Mr. Groves, Dr. Gladstone did not think that any difficulty would be found in preparing zinc ethyl on a manufacturing scale with the aid of the copper-zinc couple.

Mr. Wanklyn had been much struck with the statement of the authors that when the copper and zinc were alloyed, the couple so formed was inactive; it seemed to him that some slight alteration of the surface of the zinc was at the bottom of these reactions. Some long time ago he had left some ethyl iodide in contact with ordinary zinc dust for some time in sealed tubes at the ordinary temperature; on opening them the conversion was found to be almost complete. The late Mr. Chapman and himself had observed that magnesium amalgam decomposed water, whereas sodium amalgam was comparatively inactive.

Dr. Gladstone suggested that the cause of the decomposition referred to by Mr. Wanklyn was the metallic impurities present in ordinary zinc dust, lead, etc.

Dr. Armstrong then read a paper by Dr. Tilden and himself—

On the Action of Sulphuric Acid on the Hydrocarbons of the Formula $C_{10}H_{16}$.—The authors describe many experiments on the action of sulphuric acid of various strengths and at various temperatures, chiefly on the terpenes of American and French turpentines. The so-called terebene can be best prepared by using concentrated acid at about 80°–90°, at lower temperatures much polymerization takes place. The distillate obtained by passing steam through the product of the above action, is not, as Ribau has stated, a mixture of cymene with an optically inactive liquid isomeride of terpene, the so-called terebene being really inactive camphene. By long fractional distillation it is obtained as a crystalline solid, melting after crystallization from alcohol at 47°. The distillate contains also much of a $C_{10}H_{16}$ hydrocarbon boiling at 176°, which is terpilene. The product of the action of dilute sulphuric acid on terpene is terpilene without camphene. The crude colophene which is not carried over by steam yields on distillation 10–30 per cent. of substances volatile in steam, principally inactive camphene and terpilene, also cymene, a small quantity of a paraffin-like body, an optically inactive camphol (borneol) $C_{10}H_{17}OH$, etc.

Researches on the Terpenes, Camphor and Allied Compounds. Part I. By Dr. Armstrong. *On Hydrocarbons Associated with the Terpenes and on the Formation of Cymene from Terpenes and Allied Compounds.*—A sample of terebene given to the author by Dr. Hugo Müller consisted almost entirely of cymene and of a paraffin-like body, boiling at 170°, but having the composition $C_{10}H_{20}$. On treating various terpenes with sulphuric acid similar results were obtained, in most cases 3·5 per cent. of cymene and 0·5 per cent. of the hydrocarbon, insoluble in concentrated sulphuric acid. Russian turpentine contains 8 per cent. cymene and 2 per cent. of the hydrocarbon; terpilene, resin spirit, the distillate from indiarubber, and that from colophene contain much cymene with this insoluble (in sulphuric acid) hydrocarbon. The author believes the reaction $3C_{10}H_{16} = 2C_{10}H_{14} + C_{10}H_{20}$ takes place under these circumstances.

Part II. On the Action of Iodine on Terpenes.—The product obtained by distilling turpentine with one-fourth its weight of iodine is not merely cymene, or so complex as the product of Preis and Raymann (*Ber. d. deutsch. ch. Ges.*, xii., 219). It contains 33 per cent. of hydrocarbons, insoluble in sulphuric acid—apparently a mixture of two hydrides of the formula $C_{10}H_{20}$, boiling at 160° and at 170°. The portion soluble in acid contains no appreciable amount of lower homologues of cymene, but consists of camphene, cymene and higher homologues. A small quantity of what appears to be a mixture of methyl and ethyl iodides is also produced in the reaction.

Part III. Camphor Derivatives. By Dr. Armstrong and Mr. Matthews.—The body previously described as formed with camphoric acid by heating bromocamphor with nitric acid, is a nitro-derivative. Dibromocamphor yields no camphoric acid on oxidation with nitric acid, but is slowly and completely decomposed; alcoholic potash reduces it to monobromcamphor. Chlorine at 100° converts camphor into mono- and dichlorcamphor; the former resembles bromocamphor in its behaviour with nitric acid. Heated with alcoholic potash it retains its chlorine, and exchanges its hydrogen for hydroxyl. With bromine, chlorocamphor yields a magnificently crystalline bromochlorcamphor; these bodies resist oxidation. The above nitro-derivatives with alcoholic potash give potassic nitrite and hydroxy derivatives. Iodocamphor is readily prepared by the action of iodine chloride on camphor; mixed iodo-derivatives are also obtained in the same way.

After a few remarks by Dr. Wright,

Mr. H. F. Brown read an abstract of a lengthy paper by Mr. Heron and himself, entitled—

Contributions to the History of Starch, and its Trans-

formations.—The experiments were conducted with well washed and purified potato starch. The transforming agent used was a cold filtered aqueous infusion of malt, made by acting upon 100 grams of finely divided pale malt with 250 c.c. of water. The total solid matter is deduced from the specific gravity, a constant divisor, 3·86 being used. The starch granule consists of granulose and starch cellulose, the latter preponderating in the outer layers. Starch cellulose can be obtained by acting upon starch paste in the cold with unheated normal malt extract. The granulose rapidly dissolves, leaving most of the starch cellulose behind. When once separated in the insoluble form this substance cannot again be brought into aqueous solution without decomposition; it is also unattacked by malt extract. On boiling with water it is chiefly converted into soluble starch, which has probably no action on polarized light. The viscosity of starch paste varies very much with the previous treatment of the starch. The specific rotatory power of starch paste =201·1°–202·1°. The sp. rot. power of granulose and soluble starch are identical. With potash, sp. rot. power of granulose is 169·4° to 174·2°, and of soluble starch 182·6°. The maltose used was prepared by acting on starch with malt extract and crystallization from alcohol. Its sp. rot. power was 150·4°; its cupric oxide reducing power was 61·0°. By the action of dilute sulphuric acid a dextrose identical with that of invert sugar was obtained; the end product of the reaction had a sp. rot. power of 58·6°, and a cupric oxide reducing power of 100·2. Maltose is unacted upon by continued digestion with malt extract at 50°–65° C. As the outer layer of the starch granule consists of insoluble starch cellulose, the granulose cannot be dissolved by any converting agent which is not diffusible, and which does not at the same time transform it into diffusible products; so the intact starch granule can be digested with the malt extract, the transforming agent of which is colloidal, at ordinary temperature, without action. If, however, the granules are ruptured by trituration with sharp quartz sand, a rapid action is set up; starch cellulose at first enters into solution, afterwards maltose and dextrin are formed. The action of malt extract on starch paste is very rapid. In about three hours the sp. rot. power attains a maximum of 161·6°; the cupric oxide reducing power also reaches a maximum at the same time =49·7. The modifications of this reaction at elevated temperatures depend much more on the previous treatment of the malt extract than upon the actual degree of temperature at which the transformation is made; this fact is noticed by O'Sullivan. The authors state in general terms that "if two different transformations of equal quantities of starch are brought about at different temperatures by equal quantities of a malt extract, which has been heated for a few minutes to a point identical with or higher than the more elevated of the two temperatures of transformation, then the conversions will be similar in every respect." To investigate the various stages of the action more thoroughly it was necessary to be able to arrest the reaction at any desired moment. This was done by pouring the sample into a small flask containing a few centigrams of salicylic acid. The authors then give tables and curves illustrating the action of malt extract upon starch paste at various temperatures and under varying conditions. Throughout these transformations the specific rotatory power and the cupric oxide reducing power of the products agree closely with the supposition that maltose and dextrin are the only substances formed in the reaction. When the products of a transformation of starch having a united optical activity higher than 162·5° are treated with a little unheated malt extract at 50–60° the specific rotatory power falls at once to 162·5°, this change takes place *per saltum* and not gradually. The most probable formula of soluble starch is $10(C_{12}H_{20}O_{10})$. The first action of the transforming agent of malt extract is the hydration of one (of the ten) $C_{12}H_{20}O_{10}$ and the consequent production of maltose, the nine left forming erythrodextrin. The remaining changes are given in the following table:—

	Sp. Rot. Power.	Copper Oxido Reducing Power.	Resulting Dextrin.
Soluble Starch .	216·0°	0	——
1	209·0°	6·4	Erythrodextrin α.
2	202·2°	12·7	,, β.
3	195·4°	18·9	Achroodextrin α.
4	188·7°	25·2	,, β.
5	182·1°	31·3	,, γ.
6	175·6°	37·3	,, δ.
7	169·0°	43·3	,, ε.
8	162·6°	49·3	,, ζ.
9	156·3°	55·1	,, η.
Maltose . . .	150·0°	61·0	——

The authors have established the existence of Nos. 2 3, 4 and 8, and have indications of 5 and 6. No. 8 is the most stable. Dextrose is not a product of the action of malt extract upon starch, the hydration ceasing with the complete conversion into maltose. Diastase is a function of the coagulable albuminoids of malt extract and does not consist of any particular principle. The albuminoids of barley resemble those of malt, but are less active. The albuminoids of barley precipitated above 66 are inactive as regards diastatic action. During germination the comparatively inactive albuminoids of barley have conferred upon them a large amount of potential energy. The growing yeast cell is capable to a certain extent of imitating the modifications induced by the living vegetable cell in the ordinary process of germination.

The next paper was read by R. WARINGTON—

On the Determination of Nitric Acid by means of Indigo, with especial reference to Water Analysis.—The indigo method possesses the advantages of great simplicity, speed and delicacy. The results are, however, conditioned by many circumstances, which must be known before the method can be applied with accuracy. A solution of pure indigotin is much superior to the sulphindigotate of sodium usually employed, the former giving a pale colour when oxidized by nitric acid and thus allowing a small excess of indigo to be readily seen. The estimation is made as follows: 20 c.c. of the water are mixed with the indigo solution and pure oil of vitriol equal in volume to the united water and indigo suddenly added; the whole is then placed in a chloride of calcium bath at 140° till the reaction is completed; the quantity of indigo corresponding to the nitrate present is found by a series of approximating experiments. In weak solutions the quantity of indigo oxidized is not strictly proportional to the nitrate present. If a solution of nitre requires 10 c.c. of the indigo solution recommended in the paper, a nitre solution of one-eighth of the strength will require only 1 c.c. The indigo must therefore be standardized with nitre solutions of graduated strengths and a table of the value of the indigo scale constructed by which subsequent analyses can be calculated. Some attention must be paid to the initial temperature of the solutions; a rise from 10° to 22° is attended with a diminution of 5 per cent. in the indigo oxidized. Chlorides have some influence; a water containing 17·8 per million of nitrogen would yield 17·5 in the presence of much chloride, while a water containing 4·3 would give 4·5; the error is thus in opposite directions for weak and strong solutions. Nitrites cannot be determined by indigo; they oxidize less indigo than nitrates and give no sharp reaction; they must be converted into nitrates by permanganate before employing indigo. Some kinds of organic matter greatly diminish the amount of indigo oxidized, and the soluble organic matter of soils affects the results in this manner. Analyses of waters by Frankland's method and the indigo process give closely concordant results.

The following papers were taken as read:—

Notes on the Purple of the Ancients. By EDWARD SCHUNCK.—This colour, which was extracted by the ancients from various kinds of shellfish and applied to the dyeing of linen and woollen fabrics, has excited much interest from time to time. The author gives a *résumé* of previous work on the subject. Cole ('Phil. Trans.,' 1685) discovered a shellfish in Somersetshire which yielded a purple dye. Reaumur discovered a similar species in 1810 (*Purpura lapillus*). Dutramel in 1736 and Bancroft in 1803 also worked at the subject. Their results may be summarized as follows: (1) The colour producing secretion resembles pus, and is contained in a small whitish cyst under the shell close to the head of the animal. This pus-like matter when applied to white linen and exposed to sunlight changes from yellow through light green, dark green, blue to purplish-red or crimson, a strong odour resembling garlic or assafœtida being evolved. Daylight is essential; if kept in the dark the secretion remains unchanged for years and then on exposure to light becomes coloured. Heat does not promote the change which proceeds *in vacuo* or in hydrogen or nitrogen gas. The colour resists the action of soap, alkalies and most acids; it is destroyed by nitric acid and chlorine. A. and G. de Negri have recently obtained two colouring matters from a species of *Murex*; one is blue and presents the characters of indigotin, the other is red but its nature is not certain. The author has made many experiments with *Purpura lapillus*, which he obtained on rocks at low water near Hastings, live animals alone being used. The pale yellow secretion turns purple when exposed to light without being applied to linen. Boiling does not hinder the production of the colour. The author observed the change of colour under the microscope. The chromogen can be completely extracted by alcohol and ether from the pounded cysts, a golden solution being obtained which becomes purple on exposure to light, a purple powder being ultimately precipitated which is granular and crystalline. Hydrochloric acid produces a decomposition somewhat similar to that effected by sunlight, a purple colour being formed. The author worked up the cysts or veins from 400 animals and obtained 7 milligrams of the purplish powder by exposure to sunlight. It was insoluble in water, alcohol and ether, slightly soluble in boiling benzol and boiling glacial acetic acid, easily soluble in boiling anilin, the solution giving a broad absorption band between C and D. Heated between watch glasses a sublimate formed of crystals with metallic lustre showing at their edges a deep indigo blue colour. The colouring matter dissolves in strong sulphuric acid to a purplish solution showing a band between D and E. From these reactions the author concludes that the colouring matter belongs to an unknown member of the indigo-blue group, and proposes to call it "punicin." The liquid from which the action of sunlight had precipitated the purple powder contained no glucose.

On the Heat of Formation of Aniline, Picoline, Toluidine, Lutidine, Pyridine, Dipicoline, Pyrrol, Glycerine and Furfurol. By W. RAMSAY.—In a recent paper on the volumes of liquids at their boiling points, the author remarked that some connection might exist between the ebullition volume of a liquid and the amount of heat evolved during its formation. The present paper contains an account of the method used to determine the heat evolved and the results obtained. The method employed was an indirect one, the amount of heat evolved by the elements of a substance was calculated, the amount of heat evolved by the combustion of the substance was estimated. The difference between these numbers gives the heat absorbed in decomposing the compound; this difference is assumed to be equal to that evolved during its formation. Lewis Thompson's apparatus for determining the heating power of fuel was tried. An oxidizing mixture of three parts of potassium chlorate and one of potassium nitrate was used with some sulphur added to promote combustion; the author discusses the probable errors of the estimation; the following table gives the principal results obtained:—

	Calories evolved.
Anilin	2747
Picolin	5753
Dipicolin	8084
Glycerine	−1364
Furfurol	5985
Toluidin	1281
Lutidin	7184
Pyridin	7117
Pyrrol	4056

On Ethylenic Chlorosulphocyanide and its Oxidation into Ethylenic Chlorosulphonic Acid. By J. W. JAMES.—66 grams of potassium sulphocyanide were placed in a flask with about 250 c.c. of 98 per cent. alcohol; after shaking, 100 grams of chlorobromide of ethylene prepared by Lössner's method were introduced, and the mixture heated on a water-bath. Decomposition rapidly ensued. Potassium bromide and chlorosulphocyanide of ethylene were formed. The latter substance after purification was obtained as a colourless oil, of a disagreeable smell resembling that of oil of mustard; it affects the eyes, does not excite sneezing; it boils at 202-206° C., its vapour burns with a violet coloured flame; analysis gave the formula $C_2H_4Cl(CNS)$. By oxidation with fuming nitric acid, chloroethylenesulphonic acid is obtained, $C_2H_4Cl(SO_3H)$. The author has prepared and analysed the barium and silver salts. By heating the silver salt with ammonia in sealed tubes to 100-120° C. about ·7 grams of pure taurin was obtained according to the following equation—

$$C_2H_4ClSO_3Ag + NH_3 = C_2H_4\begin{matrix}NH_2\\SO_3H\end{matrix} + AgCl$$

On the Boiling Points of certain Metals and Metallic Salts. By T. CARNELLY and W. CARLETON WILLIAMS.—In a previous communication the authors described a simple method of measuring the temperature of ebullition of those bodies whose boiling points are beyond the range of the mercurial thermometer, by observing whether certain salts whose melting points are known melt on exposure to the vapour of the boiling substance. In the present paper they give results thus obtained:—

Palmitic acid 339°–359°; stearic acid, 359°–383°; selenium, 676°–683°; tellurium dichloride, 327°; tellurium tetrachloride, 414°; tellurium tetrabromide, 414°–427°; stannous chloride, 617°–628°; bromide, 618°–634°. By using pure metals instead of salts of known melting points the following numbers were obtained. Lead chloride, 861°-1000°; cadmium chloride, 861°–1000°. Glass tubes are rapidly corroded by molten potassium and sodium, iron tubes were therefore used. Sodium, 861°–1000°; potassium, 719°–731°; bismuth, 1090°–1600°; lead, 1600°–1800°; tin, 1600°–1800°; antimony, 1090°–1600°. The authors point out a curious relation between the melting and boiling point of Cl, Br and I, and those of S, Se and Te; for the melting points of the S, Se and Te are respectively twice and the boiling points three times as high as those of Cl, Br and I, all being reckoned from the absolute zero − 273° C. Thus:—

Melting point of chlorine 198° × 2 = 396°. Sulphur melts 388°.

Melting point of bromine 251° × 2 = 502°. Selenium melts 490°.

Melting point of iodine 380° × 2 = 760°. Tellurium melts 755°–773°.

Boiling point of chlorine 240° × 3 = 720°. Sulphur boils 720°.

Boiling point of bromine 318° × 3 = 954°. Selenium boils 953°.

Boiling point of iodine 473° × 3 = 1419°. Tellurium boils (?).

AMERICAN CHEMICAL SOCIETY.

At the Meeting of this Society, on Thursday, March 6th, the following paper was read :—

Notes upon Chicle.

BY GEO. A. PROCHAZKA, PH.D., AND H. ENDEMANN, PH.D.

(*Concluded from p.* 1045.)

Oxygen Compounds.—If an excess of 94 per cent. (vol.) or even more dilute alcohol is added to the chicle gum, and its temperature raised to the boiling point, and maintained at or near this point for several hours, it assumes a yellow colour. The liquid obtained by decanting or rapidly filtering off the boiling yellow solution, on cooling soon becomes turbid, and after standing twenty-four hours an ample, verrucose crystallization will be deposited, both on the bottom and in more distinct crystals on the sides of the vessel containing the solution. The supernatant liquid was light yellow and perfectly clear.

Chicle Alban.—$C_{10}H_{16}O$. The warts, measuring from 1 to 2 mm. in diameter, were either obtained of a milky opalescence or pure white and opaque. Dried at the air and over sulphuric acid they all become perfectly white and opaque. Some of the opalescent crystals were carefully selected from the sides of the vessel, thrown on a filter, washed repeatedly with 94 per cent. alcohol, dried over sulphuric acid, and reduced to a fine powder, which was first dried again over sulphuric acid, and eventually at 100°. Thus a light yellow powder was obtained, which baked together slightly at the temperature at which the drying was performed.

Combustion yielded the following results :—

I. 0·305 grm. gave 0·8925 CO_2 and 0·2995 grm. H_2O.
II. 0·2601 „ „ 0·762 „ „ 0·2525 „ „

	I.	II.
C.	79·81 per cent.	79·90 per cent.
H.	10·91 „ „	10·78 „ „
O.	9·28 „ „	9·32 „ „
	100·00	100·00

These analyses do not represent the pure alban.

The bulk of the substance prepared for analysis was, therefore, re-dissolved in a small quantity of 94 per cent. (vol.) alcohol by the aid of heat. On cooling the whole liquid gelatinized. The gelatinous precipitate, which resembles gelatinous silica in appearance, was thrown on a filter, washed thoroughly by cold alcohol, re-dissolved, re-crystallized, and thus obtained pure. The pure substance, after drying over sulphuric acid, presents a perfectly white, very bulky powder. 100 pts. (wt.) of watery alcohol (0·82 sp. gr. at 13°), dissolve of it 0·66 pts. at 14° and 0·71 at 17°. Boiling alcohol dissolves it easily, and in considerable quantity, and it is deposited, on cooling, either as a gelatinous mass or in the form of milky opalescent or white warts. It is very easily soluble in ether, chloroform, naphtha, benzol, and bisulphide of carbon.

When heated, it bakes together slightly at 100°, without changing its external appearance ; at 106° it unites in a transparent mass, becoming softer as the temperature rises ; at 145° it forms a syrupy light brown mass, which, on cooling, solidifies to a light brown transparent, very brittle glass.

A portion of it, heated in a boat in a current of dry carbon dioxide to 100° unto constant weight, on combustion yielded the following result :—

III.—0·2351 grm. gave 0·6810 CO_2 and 0·2148 H_2O, and no ash.

	III.	$C_{10}H_{16}O$. Calculated.
C.	79·00 per cent.	78·96 per cent.
H.	10·15 „	10·52 „
O.	10·85 „	10·52 „

The result of the analysis corresponds closely to the empiric formula, $C_{10}H_{16}O$.

Chicle Fluavil ($C_{20}H_{32}O$?).—The substance represented in the analyses I and II may be looked upon as a mixture of between 2·5 to 3 pts. of pure alban, with 1 pt. of a lower oxygen compound, $C_{20}H_{32}O$ (fluavil?). This assumption is further confirmed by the determination of the total quantity of solids in the solution obtained by digesting the substance for some time with a small amount of alcohol. The figures arrived at are much higher than would correspond to the solubility of pure alban, as represented by analysis III, in alcohol of the same strength. Thus 0·953 grm. digested for some time with 25 gms of alcohol (0·82 sp. gr.) gave a solution which at 17° contained 1·57 pts. of resin to 100 pts. of alcohol (0·82 sp. gr.). Assuming that the whole quantity of fluavil contained in the substance has gone in solution, together with as much alban as corresponds to its solubility in a pure condition, a similar quantitative ratio, in regard to the supposed constituents, is reached.

The application of the difference in solubility in alcohol to the separation of alban and fluavil, while it admits the preparation of the former in a perfectly pure condition, will yield the latter only in a very approximate state of purity.

The clear, light yellow, supernatant liquid of the alban crystallization, mentioned in an earlier part of this paper, on concentration and standing will give an additional yield of alban, less pure, however, than the first. The mother-liquor thus obtained, on concentrating, cooling and standing, will deposit a slightly yellow, translucent, viscid mass, which contains a large proportion of alcohol. The deposit melts at a very low temperature ; it spread and covered the plate to which it was transferred in an even, thin layer. By protracted heating most of the alcohol can be removed. On cooling, the substance then presents a transparent, brittle glass, of light lemon-yellow colour.

The last traces of alcohol offer some difficulty in their removal. A portion of the glassy mass was reduced to a very fine powder; this was very thoroughly mixed, spread out in a very thin layer on a plate, dried at ordinary temperature for some time, and finally for a number of days at 100°. The powder unites and melts much below this temperature. The mass on cooling solidifies again to a light yellow, brittle glass. Pieces of this were directly used for analysis. The combustion was performed in oxygen. Constant results, however, could not be obtained.

I. 0·2462 grm. gave 0·739 CO_2 and 0·2465 H_2O ; no ash.
II. 0·2483 „ „ 0·3333 „ „ 0·2430 „ „
III. 0·2579 „ „ 0·7565 „ „ 0·245 „ „
IV. 0·2866 „ „ 0.8335 „ „ 0·2710 „ „

	I.	II.	III.	IV.	$C_{20}H_{32}O$. Calculated.
	per cent.	per cent.	per cent.	per cent	per cent.
C.	81·86	80·54	80·00	79·32	83·33
H.	11·13	10·75	10·55	10·51	11·11
O.	7·01	8·71	9·45	10·17	5·56
	100·00	100·00	100·00	100·00	100·00

The glassy mass dissolves easily and completely in boiling alcohol. The light yellow solution on cooling and standing deposits, besides amorphous viscid fluavil, a very ample verrucose crystallization of alban. By the latter fact, and by the above quoted analyses, it would appear that fluavil is capable of further oxidation to alban.

It is to be presumed that the analysis would have yielded a lower percentage of oxygen if the substance had, at once, after obtaining it, been dried in a current of dry carbon dioxide. The compound, however, possesses only few very characteristic properties, and for the present, at least, does not appear of sufficient interest to warrant any further attempts at obtaining it in a perfectly pure condition.

100 pts. (wt.) of alcohol of (0·82 sp. gr.) dissolve at 13·5°, 2·6 pts. of fluavil.

Hydrocarbons $C_{10}H_{16}$.—By long and repeated digestions of the chicle gum with fresh quantities of alcohol the

larger portion of the oxygen compounds may be removed; ultimately, a tolerably liquid residue is obtained, which resists the further action of the solvent. On cooling, this residue assumes a more wax-like consistence. It is of light grey colour if prepared from the resin obtained by bisulphide of carbon. The gum resulting from boiling the crude material with water yields it in the form of a dark chocolate-coloured mass, which contains oxalate of lime. In both cases the residue consists mainly of two hydrocarbons of the empiric formula $C_{10}H_{16}$, and alban and fluavil, which boiling alcohol has failed to remove.

The difference in the behaviour of the two hydrocarbons to the solvent action of ether offers a ready means for their separation. One of them, while it is altogether insoluble in cold ether, dissolves easily and in very considerable quantity on boiling. From this solution it separates completely, and in a crystalline form, on cooling. The other hydrocarbon seems to be amorphous, and is readily soluble in co'd ether.

The complete separation of the hydrocarbons from the oxygen compounds presents some difficulty. The hydrocarbons themselves oxidize very easily. Although they were not obtained in a perfectly pure condition, owing principally to the smallness of their quantity in the raw material, yet certain features in behaviour, alike prominent in their different stages of purity, and the steady decrease of the percentage of oxygen in the course of their purification, allowed definite conclusions to be drawn as to their properties and composition in a pure state.

Hydrocarbon $C_{10}H_{16}$, *Soluble in Cold Ether.*—If the previously mentioned chocolate-coloured residue, from which most of the alban and fluavil had been removed by repeated treatment with boiling alcohol, is digested for some time with an excess of boiling ether, the hydrocarbons and remaining oxygen compounds will completely dissolve; the liquid obtained is, however, turbid by suspended oxalate of lime and colouring matter. Upon standing for twenty-four hours at very low temperature the insoluble hydrocarbon will have separated completely in a crystalline form; the clear light yellow liquid then obtained by filtration yields no further crystallization on concentration.

In the manner indicated a solution was arrived at which contained only the soluble hydrocarbon, besides alban and fluavil. This, after concentration, was poured into about four times its bulk of 94 per cent. (vol.) alcohol. A white, partly powdery and partly flaky precipitate forms. The mixed liquids were at once heated and distilled to about two-thirds of their original bulk. In this operation most of the precipitate unites in a light flesh-coloured, doughy mass, which attaches itself to the bottom of the vessel; a portion, however, remains finely suspended in the liquid, giving it a milky appearance.

After the liquid had been distilled to the required bulk, it was decanted off, boiling. The residue was subjected to repeated and prolonged treatment with fresh portions of boiling alcohol, which were always decanted off, boiling. Thus, eventually, a light flesh-coloured, soft and very tenacious mass was obtained. A portion of this was dried at 100° in a dry current of carbon dioxide. On combustion the following results were obtained:—

0·2365 gram gave 0·7378 CO_2 and 0·2437 H_2O; no ash.

C = 85·08 p.c. H = 11·45 p.c. O = 3·47 p.c.

The remaining portion was dissolved in ether, and the solution subjected again to the previously described treatment with alcohol.

The same operations (re-dissolving in ether, etc.) were repeated with the residue obtained. The substance eventually obtained was not very different in its general properties from the one represented in the above analysis. It was soft, very tenacious, of light grey colour and somewhat translucent. Its total yield was about one-tenth of the original portion. A quantity prepared for analysis in the same manner as before, on combustion gave the following results:—

0·2967 gram gave 0·9435 CO_2 and 0·3043 H_2O; ash visible, has no appreciable weight.

		$C_{10}H_{16}$. Calculated.
C	86·73	88·23
H	11·40	11·77
O	1·87	

Further purification, without doubt, would have eventually yielded the pure hydrocarbon. This, however, had to be abandoned in consequence of the small yield of the substance from the raw material, still further reduced by the various above mentioned operations. The two analyses given, the constant ratio of carbon and hydrogen in both allows the inference of the empiric formula $C_{10}H_{16}$ for the pure hydrocarbon. The constant properties of the substance in its different stages of purity allow the assumption of these same properties for the hydrocarbon in a pure condition.

The principal properties have already been given. The substance is soft, very tenacious and translucent at ordinary temperature. When boiled with alcohol it becomes softer, but retains its tenacity. On heating it becomes softer, but even at 135° it is still gelatinous. It dissolves very easily in naphtha, chloroform and bisulphide of carbon. Cold ether first converts it into a limpid, perfectly colourless mass, which it is very difficult to distinguish in glass vessels, and then rapidly dissolves it. Warm ether dissolves it even more rapidly. From these solutions it could not be obtained in a crystallized or powdery form.

Hydrocarbon $C_{10}H_{16}$, *Insoluble in Cold Ether.*—The crystalline residue of the solution that had originally yielded the hydrocarbon contains the entire quantity of the insoluble compound, together with small quantities of oxalate of lime and colouring matter. This residue was thoroughly washed by cold ether and pressed between blotting paper. By re-dissolving in warm ether and filtration, oxalate of lime and colouring matter were completely removed. A solution was thus obtained which was perfectly colourless and clear when warm. The filtration of the boiling liquid presents some difficulty; as the ether evaporates, the crystallization begins already on the filter, thus retarding or altogether interrupting further filtration.

The clear colourless liquid crystallizes on cooling; after standing twenty-four hours it has become one mass of white microscopic crystals. These were thrown on a filter, thoroughly washed by cold ether and pressed between filtering paper. A portion of the substance thus obtained was dried in the air-bath at 110°; it melts, becomes transparent, and on cooling presents a light brown, not a very homogeneous mass, of a consistence somewhat harder than wax. Pieces of this mass were transferred to a boat and subjected to combustion. The following results were obtained:—

I. 0·3022 gram gave 0·9215 CO_2 and 0·29 H_2O; 0·0004 white, amorphous ash.

II. 0·3036 gram gave 0·934 CO_2 and —— H_2O; 0·0006 white, amorphous ash.

Calculated percentages after the deduction of the ash:—

I. C = 83·27 p.c. H = 10·68 p.c. O = 6·05 p.c.
II. C = 84·07 p.c.

The bulk of the brown mass was re-dissolved in boiling ether. A portion of the white crystalline powder obtained from the filtrate on cooling was at once transferred to a boat and dried at 100° in a dry current of carbon dioxide. On analysis the following results were obtained:—

III. 0·3030 gram. gave 0·93 g. CO_2 and 0·2955 H_2O; no ash.

C = 83·55 p.c. H = 10·81 p.c. O = 5·64 p.c.

The rest of the crystalline powder, when re-dissolved in boiling ether, re-crystallized and otherwise treated in the same manner as before, on combustion yielded the following results:—

IV. 0·3148 gm. gave 0·3773 gm. CO_2 and 0·3108 H_2O no ash.

C = 84·67 p.c. H = 10·97 p.c. O = 4·36 p.c.

The remaining bulk of the substance obtained from the original etheric solution was re-dissolved in ether, and an equal bulk of 94 per cent. alcohol added. A white powdery precipitate forms, which unites to a white liquid mass; a portion of it, however, remains in milky emulsion, even after long continued boiling. The subsequent treatment is essentially a repetition of the method applied for the purification of the soluble hydrocarbon. The residue eventually obtained, on cooling, presents a white brittle mass, which is harder than wax. This was digested for a number of days with renewed portions of ether. It swells, disintegrates to white floccular masses, but does not dissolve. These floccular masses were heated again with alcohol. They unite, melt, and on cooling are obtained in the original white wax-like brittle form. A portion of the substance thus obtained was dried in a current of carbon dioxide. Combustion yielded the following results:—

IV. 0·2043 grm. gave 0·9459 CO_2 and 0·2123 H_2O; 0·0003 ash. Calculated after deduction of the ash:

C = 86·37 p.c. H = 11·57 p.c. O = 2·06 p.c.

The bulk of the substance was again subjected to the same purifying method, with the only exception that the floccular masses obtained by digestion with cold ether, were at once dried in a current of dry carbon dioxide. The results of the analysis were as follows:—

V. 0·2061 grm. gave 0·6560 CO_2 and 0·2152 H_2O; 0·0002 ash.

		$C_{10}H_{16}$. Calculated.	
C . . .	86·89	C . . .	88·23
H . . .	11·61	H . . .	11·77
O . . .	1·50		

The results are not materially different if the drying has been performed in hydrogen.

What has been said about the further purification of the soluble hydrocarbon might be justly repeated here. The analyses permit the same inferences to be drawn. In the present case the purification is even more difficult. The substance is very oxidizable. An analysis of the same material represented in analysis V., which was made on the day following, yielded the following results:—

0·3689 gm. gave 1·158 CO_2 and 0·3742 H_2O; 0·001 ash, or—

C = 85·84 p.c. H = 11·3 p.c. O = 2·86 p.c.

In this case the drying of the substance was done in hydrogen. The analysis shows that it is absolutely necessary to perform the analysis directly after obtaining the substance. The substance approaches very closely, or is, perhaps, identical with the gutta examined and obtained from gutta percha by V. Baumhauer. The crystalline substance, as obtained from the warm ether solution, on cooling presents a white powder, on drying at ordinary temperature; in this form it oxidizes even more rapidly. The air in the bottles in which it was kept contained ozone in considerable quantity. Occasionally the hydrocarbon was also obtained in the form of white verrucose masses, about 0·2 mm. in diameter. The substance represented in analysis V. is a white, slightly translucent mass, which is brittle at ordinary temperature. At 45° it becomes soft and transparent, and evolves a very strong and agreeable gutta odour; it is syrupy at 125°. At no temperature does it show the tenacity peculiar to the soluble hydrocarbon. It dissolves easily in benzole and chloroform. In cold ether and naphtha it swells, and dissolves on boiling, and is deposited again in a crystalline form on cooling.

It may not be amiss, in this place, to mention again that the chicle resin dissolves easily in cold ether, which shows that the hydrocarbon is readily soluble in cold ether in the presence of an excess of the oxygen compounds.

Vulcanized Products.—The chicle resin obtained by bisulphide of carbon, yields, on exhaustive treatment with boiling alcohol, a light grey residue which dissolves readily on digestion with boiling ether. Only a very slight floccular precipitate remains. The clear light yellow solution thus obtained gelatinizes to a mass of white crystals upon cooling and standing. Evaporation of the mother liquid, obtained by filtration, yielded a residue which, on drying at 100°, presented a light brown, slightly transparent, elastic mass. This residue was almost utterly insoluble in ether, naphtha, bisulphide of carbon and chloroform, even on boiling. It becomes gelatinous, translucent and light yellow on digestion with ether, and swells to about twenty times its original bulk, and only very little is dissolved. This peculiar behaviour at once suggests that the residue may be a vulcanized product, which was fully confirmed on further examination. A portion of the substance, which had been repeatedly treated with boiling ether and alcohol, and then dried at 100°, proved to contain 1·77 per cent. of sulphur and about 8 per cent. of oxygen.

The waxy mass obtained by drying the previously mentioned white crystals at 100°, after they had been thoroughly washed by cold ether and pressed between blotting paper, consists largely of the insoluble hydrocarbon, but contains also a similar vulcanized product, which remains behind undissolved on digestion with boiling ether.

The source of the sulphur in the vulcanized products is readily comprehensible. It is a well known fact that bisulphide of carbon will alter on standing exposure to light and air, and then contain free sulphur. (Compare, alson, Gmelin, 'Handbuch der anorg. Ch.,' 6te Aufl., vol. i. [2], p. 224.) The complete extraction of the chicle resin from the raw material is naturally a lengthy operation, and atmospheric influences on the bisulphide have ample time to exert themselves. Hence the hydrocarbons were obtained first contaminated with sulphur, and finally in a vulcanized condition.

The descriptions given of gutta are somewhat conflicting, and it has been assumed that gutta percha may exist in different modifications. The presence of these two modifications in the same sample has never been proven.

The properties given to gutta by various authors are such that they seem to describe as gutta either a hydrocarbon soluble in cold ether or a hydrocarbon soluble in warm, but insoluble in cold ether.

From the manner in which these investigations were made, it remains doubtful whether the authors, after finding one, really looked for another hydrocarbon.

The hydrocarbons found by us in chicle correspond in many respects to these different guttas, and must be classed in the same group with them, if they are not actually identical—a fact the proof of which would have necessitated a direct comparative examination of guttas from various sources.

Similar comparative examinations are also necessary to establish the identity or difference of the alban and fluavil found by us with or from those described by others.

While we found the melting point of chicle alban at about 145° C., Oudemans gives the melting point of gutta percha alban at 140° C., and Payen at 160° C.

The authors who have described and examined gutta percha have looked upon the compounds containing oxygen as secondarily derived from the hydrocarbons, and have assumed that the original juice contained only these. From the properties of the hydrocarbons and from observations made by us, we have come to similar conclusions as regards chicle.

The chicle resin which we have examined contains the above described constituents in about the following proportions:—

Alban	45 per cent.
Fluavil	30 ,,
Insoluble hydrocarbon	17 ,,
Soluble hydrocarbon	8 ,,

From the above it is evident that but little of the original hydrocarbon has escaped oxidation; and the difference in the properties of the resin from the properties of the original hydrocarbon is readily comprehensible.

The crude chicle contains besides 75 per cent. of chicle resin of the above given composition:—

Arabin	10 per cent.
Sugar	5 ,,
Soluble inorganic salts	0·5 ,,
Oxalate of lime (sulphate and phosphate)	9 ,,

From this it is evident that chicle is merely the product of direct evaporation of the juice, without attempt of separation, as is practised in the case of gutta percha and india rubber.

There is no doubt in our minds that by proper treatment of the raw juice a far more valuable product would be obtained than the chicle gum which is now in the market.

Whether the product then obtained will be one similar to gutta percha, balata, or india rubber, must be left to future examination of the raw juice, which so far we have been unable to obtain.

Dispensing Memoranda.

In order to assist as much as possible our younger brethren, for whose sake partly this column was established, considerable latitude is allowed, according to promise, in the propounding of supposed difficulties. But the right will be exercised of excluding too trivial questions, or repetitions of those that have been previously discussed in principle. And we would suggest that those who meet with difficulties should before sending them search previous numbers of the Journal to see if they can obtain the required information.

[291]. My note on p. 990 was not intended to indicate that 10 grain doses of ferrous sulphate or 20 to 30 of potassium iodide should not be dispensed. I stated advisedly that I thought R. E. was justified in asking the question, "Is it usual to prescribe such doses?"

I am obliged to Mr. Wright and Mr. Jones for the information conveyed in their notes; but I may state I was fully aware of the practice of giving large doses of potassium iodide. What I contend for is this, that excessive doses are in the majority of cases hurtful, and when a pharmacist is in doubt he is justified in calling the attention of the prescriber to what may not be an actually poisonous dose, but an excessive one, so as to free himself from blame.

No medical man who understands the art of prescribing would be offended at such caution, and if he cannot readily be communicated with, I hold it is the duty of the dispenser to intimate to the patient or his friends that a certain amount of caution is requisite in all cases of excessive dosage. I view it as an act of ingratitude if a medical man is offended by having his attention drawn to a prescription ordering an unusual dose.

I look to your "Dispensing Memoranda" columns as a boon, not only to my profession, but as the best medium through which posological information can be at present obtained. The teaching of materia medica is lamentably deficient at all our medical schools, and the newly fledged medical man only finds out after he gets into harness how little he knows and how ignorant he is concerning matters well known to a dispenser. The doing away with the old apprenticeship was, and ever will be, a mistake in the medical curriculum.

In regard to potassium iodide many may not be aware that 60 grains or 120 grains, as recorded by Mr. Wright as taken at a dose, fall far short of the quantity given by M. Puche, the colleague of Ricord of the Hôpital du Midi. Puche has given as much as an ounce and a half in the twenty-four hours, and we are told "with no bad result." Now this is just probable in a few cases; but it is impossible for the human organism to remain uninjured, except, perhaps, in a rare instance, owing to some strange idiosyncrasy, with such a quantity of potassium iodide in free and uncombided circulation, for more than a short period of time. Some, I know, possess great tolerance in regard to drugs; but we prescribe for "the many."

M. Ricord, whose experience as regards potasssium iodide stands in the first rank, rarely gave more than a drachm and a half in the twenty-four hours. Fifteen grains was the usual quantity at first, and this was gradually increased, according to the tolerance of the system.

I can assure those who appear to disapprove of the "Dispensing Memoranda" that medical men are only too glad to learn, but it looks as if some custodians of our honour and fame heartily believed we had arrived at the acme of knowledge, and ignorance upon materia medica questions was a thing of the past.

With the greatest respect for those who would shut up the stream of information in your columns upon prescribing and dispensing, I humbly beg to say their good intentions are at least a mistake. We all want to learn. I shall at present only add that I hope the "Dispensing Memoranda" columns of your Journal may prosper, and if one is to judge by appearance there is little doubt that they will. It is a wholesome sign where the mind is inquisitive, and we should ever be willing to assist progress in whatever shape or form it assumes, and to thirst after true and enduring knowledge.

Northallerton. HENRY BROWN.

[313]. "Ardens" will find a short description of benzol in the B.P., 1867, at page 380. Further particulars may be obtained from Bentley and Redwood's 'Elements of Materia Medica,' p. 123.

GULIELMUS.

[315]. This appears to be one of the "unscientific veterinary" class of prescriptions. If it was meant for a liniment, "liq. ammoniæ" would be likely meant, or if for a lotion probably the user added the water requisite to dissolve the sal ammoniac.

W. B.

[316]. I do not think it is possible to obtain a fluid mixture of these ingredients. If the mucilage be put into a mortar, and the other ingredients, first mixed together, gradually stirred in, a smooth paste about the consistence of a confection will result. Probably this was the intention of the prescriber, an opinion in which I am confirmed by noticing that the styptic taste of the iron is covered by this form of administration. "Milo" has omitted the directions for use, thus making it difficult to decide this point.

GULIELMUS.

[317]. If I had to dispense this prescription I should add sacch. lactis to make the powders a reasonable weight, as under:—

℞	Hydrarg. Submur.	gr. ¾.
	Pulv. Opii	gr. ¼.
	Sacch. Lactis	gr. v.

M. Ft. pulv. iij, making two grain powders.

The sugar of milk being a perfectly harmless addition, would also assist the perfect mixing and diffusion of the active ingredients.

The second is a medical question. The dose of lead appears large, but I shou'd not think it would be dangerous. GULIELMUS.

[317]. As the powders are inconveniently small for dispensing and administering, I should recommend "Milo" to add two grains sacch. alb. thus making each powder to weigh one grain.

I do not consider the dose of lead or morphia in the mixture at all excessive.

J. A. W.

---

[318]. As it is now somewhat old fashioned to send medicine out in draughts, it would be more correct to send a sixth part mixture. Either way would be correct.

J. A. W.

---

[319]. UNGUENTUM DIACHYLON HEBRÆ should be of a yellowish-white colour. A black-brown one indicates a careless preparation and ought to be rejected. A good ointment will always be obtained by heating the oxide of lead and olive oil with a little water, replacing the latter if evaporated, and stirring constantly.

W. H. LANGBECK.

---

[319]. A. Y. has omitted the water from the original formula for ung. diachyli (Hebra); about a pint will be required.

Equal parts of vaseline and lead plaster—the formula adopted in the Pharmacopœia of the British Hospital for Skin Diseases—are now used as a substitute for the above in Vienna.

WM. MARTINDALE.

---

[319]. In reply to A. Y., I beg to enclose correct formula for ung. diachylon (Hebra):—

℞ Plumbi Oxidi	℥iij, ℥v.
Olei Olivæ	f. ℥xv (15).
Aquæ	lb. ij.

Deinde adde olei lavandulæ ℈ij. M. ft. ung.

Boil water and oil together for one hour, then add the oxide of lead, and boil by means of a water or steam bath with constant stirring till the oxide unites with the oil and sinks to the bottom of the pot. This with a water-bath usually happens in about six hours. The compound thus formed should present the appearance of freshly prepared lead plaster.

W. KENNEDY.

---

[321]. I am frequently dispensing prescriptions similar to this, without obtaining a precipitate after standing.

I have now prepared this form, using distilled water and adding the liq. bismuthi (Schacht), diluted, last, and find no appearance of a precipitate after standing over twenty-four hours.

J. A. W.

Notes and Queries.

[605]. TANNIN FROM TEA.—Exhaust the leaves with alcohol, dilute the latter with water, heat to the boiling point, filter and add acetate of lead. Decompose the precipitate formed with sulphuretted hydrogen, filter and evaporate at a gentle heat to dryness.

H. W. LANGBECK.

---

[606]. UNGUENTUM HYDRARGYRI IODIDI VIRID. Ung. Hydrargyri Iodidi; Pharm. Lond., 1836.—Take of—

Iodide of Mercury	1 ounce.
White Wax	2 ounces.
Lard	6 „

Add the iodide in fine powder to the wax and lard melted together and rub them together.

There are several other formulæ for ung. hydrargyri iodid. virid., but, unless otherwise specified, that which has once been ought always to be dispensed.

Norwich. W. WATSON WILL.

A similar answer has been received from W. H. N. and "Gulielmus." In another form, sent by "Milo" and H. P. S., the wax is replaced by an increased quantity of lard.

---

[607]. REMOVAL OF LEECHES.—The most simple and easy way of detaching leeches is to drop a few drops of camphor julep (mist. camph.) on the part and they will soon relinquish their hold.

Northampton. W. B. SAUL.

---

[607]. In reply to "Aloysius" respecting the difficulty he seems to have had in removing a leech, next time he has to apply one, let him remember to have a "pinch of salt" ready to his hand, as the slightest touch on the head of the leech will instantly cause it to detach itself.

G. H. DUNMORE.

Similar answers have been received from "Observer," "Milo," H. W. Langbeck, J. A. W.

---

[608]. VIRGIN OIL.—In overhauling some old stock, a bottle labelled "virgin oil" was found. Its contents, about ℥ij, of a brown, rather viscid oil, with an odour resembling ol. rhodii. Can you afford any information of its source, nature, use, etc.?

T. WILLIAMS.

---

[609]. COLOURS FOR LAMPS.—Can any reader oblige by giving forms for green and ruby colours for bottle lenses in outside lamps; forms that he has tested himself or has good reason to believe reliable?—Y. Z.

---

[610]. FURNITURE CREAM.—Would some reader kindly oblige me with a good receipt for furniture cream?

A. P. S

Review.

THE PHARMACOPŒIA OF THE BRITISH HOSPITAL FOR DISEASES OF THE SKIN, LONDON.—Great Marlborough Street (West Branch); Finsbury Square (East Branch); Newington Butts (South Branch). Edited by BALMANNO SQUIRE, M.B. Lond., Senior Surgeon to the Hospital. London: J. and A. Churchill. 1879.

A specialist, or one who pays a special attention to one class of diseases, must necessarily employ special remedies. Many of these will be such as are not recognized in a national Pharmacopœia, and he will make combinations of various kinds to suit his specific cases. To avoid quackery or the appearance of it, he must be perfectly open in his treatment, and fearlessly submit his diagnosis and remedies to the judgment of his compeers. The mode generally adopted is the publication of interesting cases in the medical journals. Another means is that of attaching himself to a special hospital for the treatment of his class of diseases, where the medical staff are always ready to demonstrate to students and medical visitors their modes of treatment. For the convenience of the dispenser of the hospital and pharmacists generally, who may have to compound the formulæ, as well as for the purpose of giving information to those visitors and others of their profession, a hospital pharmacopœia of the remedies and formulæ used by the staff will be compiled. According to the title page of the one before us it is edited by Balmanno Squire, M.B. Lond., senior surgeon to the hospital. Who the other members of the staff are we are not informed.

The formulæ are in Latin, with the old-fashioned signs for the scruple, drachm and ounce; but what quantity is intended when ℥j is written is not defined—whether the tory or avoirdupois ounce. The Latinity is sometimes

questionable, *e.g.*, chloralis and thymolis occur. We think the British Pharmacopœia should be followed in regard to these. In it chloral and amyl are indeclinable. Again we have Olei *Bergamot* (this might have been Latinized) and ℞ Sodæ Chloratæ *Liquor*, ℥ss.

The formulæ have been made as simple as possible. We notice a number of very indefinite drugs are ordered in the formulæ without any definition being given of them. We quote zinci oleatis, hydrargryri oleatis, 10 p. c., olei betulæ albæ, glutinis præparati, vaselini, calamini præparati, bismuthi nitratis (meaning the crystalline true nitrate), olei picis rectificati and calcis sulphuratæ. The last occurs in a powder for causticum depilatorium. If the proto-sulphide of calcium be intended its action as a depilatory will be almost *nil*.

The medicated waters may be all made by adding 6 minims of the essential oil to 16 ounces of water and shake, etc. According to Mr. Squire, "this plan yields as good a result as the official method by distillation." There are a gargle and a lotion each containing chlorate of potash ℥ss in an ounce of water. The chlorate of potash if pure will not be dissolved, at ordinary temperatures, to this extent. In some of the formulæ the editor reminds one of the conjuror who describes his trick to his audience and says, "This is how it's done," and makes them none the wiser; as pigmentum plumbi is stated to be "the plumbi subacetatis liquor made with glycerine in place of water," and in making tannin pessaries from tannic acid, gelatine and water, we are merely told to "mix." Without further definition and instruction how to proceed, the pessaries will in most cases be as insoluble as leather, which they chemically will very much resemble.

The formula for pulvis zinci oxidi et aluminis is mysterious. We cannot perceive any alum in it. A good formula is given for black wash: 10 grains of calomel to 1 ounce of lime water, with a drachm of mucilage of tragacanth added. The pigmenta are a good and active class of remedies. The ointments are poor. Unguentum acidi boracici is as follows:—"℞ acidi boracici, ℥j; adipis, ℥j. Mix." Given an apprentice this to dispense, what will he produce? The acid is not even ordered to be in fine powder. This ointment is generally preferred with a hardened vaseline basis. Medically the formulæ may prove useful, pharmaceutically they possess not much interest, and as we have shown from this point of view are far from perfection.

Correspondence.

Increased Difficulties in Pharmaceutical Processes.

Sir,—Increased difficulties in pharmaceutical processes is the superscription of a question in last number of the Journal. Increased demand created increased manufacture, and the latter in order to influence the market had to be lowered in price and cheaper processes to make the different chemical and pharmaceutical preparations had to be found, and the precautions necessary to prevent loss had also to be increased. So it came that a manufacturer made a speciality of a certain preparation, devoted most of his time to it, and succeeded in producing it more perfect and yet cheaper than others. Not satisfied with limited profit they derived, some manufacturers tried and succeeded in giving to an inferior produce a finer aspect, and this new art soon found followers. *Mundus vult decipi, ergo decipiatur.*

Did the practical education in the laboratory of chemisst and pharmacists also increase? Looking at the state of pharmacy, at least in my country, Germany, about twenty years ago, and comparing it with its actual condition, I must hesitate to affirm the question.

"Investigator" refers to a statement of a journal representing brewing interests; the same condition prevails here as in other trades. Where beer is made entirely of malt and hops and the fermentation of the malt liquor allowed to end by itself, neither salicylic acid nor mono- or bisulphite of lime is required to make the beer keep; the soluble protein substances and phosphates contained in the malt liquor give a sound nourishment to the yeast plant, and cool, dry cellars prevent the spreading of bacteria.

H. W. Langbeck.

British Pharmacopœia.

Sir,—Following up the remarks of your correspondents on the subject of a new edition of the British Pharmacopœia, will you allow me to suggest the desirability of including in a future issue, official formulæ for medicated pessaries and bougies, as they are coming much into use, and it is most desirable that medicines requiring such delicate manipulation, and used very often on most critical occasions, should be prepared as far as possible exactly the same wherever the British Pharmacopœia is known?

Tincture and syrup of Virginian prune should be included; lime juice also should have a place and an official preparation, probably a syrup might be useful.

35, *Baker Street, W.* A. W. Postans.

Easton's Syrup.

Sir,—The communication of Edward Smith in *Pharmaceutical Journal*, April 26, p. 892, in relation to Easton's syrup was of interest to me, as it has been my custom to dissolve the quinia salt in the dilute acid.

The sugar used in the preparation of this syrup should be free from colouring matters, especially ultramarine that is decomposed by the phosphoric acid. The presence of this "handsome blue tint" is best indicated by the presence of sulphuretted hydrogen after the syrup has been prepared, and the deposit is not the quinine or the strychnia, but various salts from the decomposition of the ultramarine as oxide of iron, sand, etc. A syrup from the dilute phosphoric acid and sugar should be prepared, which after filtering will not deposit, and can be added to the alkaloids and ferrous phosphate, dissolved in a reserved portion of dilute phosphoric acid, furnishing an elegant preparation that will not deposit.

Boston, Mass. Frank A. Davidson.

Erratum.—In Mr. Allen's paper on Tinctures, page 1037, line 10 from end, *read*, "The proportion of oil of anise which could be dissolved by spirit of 30° U.P. (*instead* of *O. P.*), was a mere fraction of that taken up by proof spirit."

J. G. H.—Cement for India Rubber Bicycle Tyres.—The following has already appeared in this Journal (vol. vii., p. 448):—One part of shellac and ten parts of liq. ammon. fort. (·880) placed in a wide-mouthed bottle in a warm place and frequently shaken for three or four weeks. It first forms a transparent mass, but afterwards becomes liquid.

J. H. Edward.—(1.) Several recipes for mending mortars will be found in vol. v., pp. 859, 901, 922. (2) We cannot assist you in getting the information.

T. Reece.—It is not intended to continue the discussion further for the present.

"*Eureca.*"—We think the "family recipe" forwarded by you is so absurb, and has evidently so outlived its reputation, that no good will result from its publication.

T. Williams.—Rubini's Tincture of Camphor is said to be a saturated solution, obtained by dissolving camphor in an equal weight of rectified spirit. See vol. i., pp. 377 and 397.

J. H. Dingle.—(1) *Festuca ovina.* (2) *Cardamine practensis.*

R. Roberts.—(1) *Geranium dissectum.* (2 and 3) Correct. (4) *Lathyrus pratensis.* (5) *Iris Pseudacorus* (6) *Apargia hispida.*

J. Thompson.—Your letter and enclosure have been handed to the publishers, to whom all advertisements should be sent.

G. Shillcock.—It is illegal for an unregistered person to use the title "chemist" or to sell scheduled poisons in any quantity.

"*Dispenser.*"—We are not aware that the passing of the examination in question would affect your right to use any initials one way or the other.

Communications, Letters, etc., have been received from Messrs. Abraham, Dunmore, Kennedy, Baldock, Calvert, Maleham, Rogers, W. H. M., Y. Z., F. C., H. P. S., E. K. C., D. H., W., J. A. W., Nature, Fraxinus, Viator.

INDEX TO VOL. IX.

(THIRD SERIES.)

THE END.

PRINTED BY STEVENS AND RICHARDSON,
5, GREAT QUEEN STREET, LINCOLN'S INN FIELDS, LONDON, W.C.

AN ACT TO CONSOLIDATE THE LAW RELATING TO WEIGHTS AND MEASURES.

Be it enacted by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows :—

Preliminary.

1. This Act may be cited as the Weights and Measures Act, 1878.

2. This Act shall not come into operation until the first day of January one thousand eight hundred and seventy-nine, which day is hereinafter referred to as the commencement of this Act.

I.—LAW OF WEIGHTS AND MEASURES.

Uniformity of Weights and Measures.

3. The same weights and measures shall be used throughout the United Kingdom.

Standards of Measure and Weight.

4. The bronze bar and the platinum weight, more particularly described in the first part of the First Schedule to this Act, and at the passing of this Act deposited in the Standards Department of the Board of Trade in the custody of the Warden of the Standards, shall continue to be the imperial standards of measure and weight, and the said bronze bar shall continue to be the imperial standard for determining the imperial standard yard for the United Kingdom, and the said platinum weight shall continue to be the imperial standard for determining the imperial standard pound for the United Kingdom.

5. The four copies of the imperial standards of measure and weight, described in the second part of the First Schedule to this Act, and deposited as therein mentioned, shall be deemed to be parliamentary copies of the said imperial standards.

The Board of Trade shall as soon as may be after the commencement of this Act cause an accurate copy of the imperial standard of measure and an accurate copy of the imperial standard of weight to be made of the same form and material as the said standards, and it shall be lawful for Her Majesty in Council, on the representation of the Board of Trade, to approve the copies so made, and the copies when so approved shall be of the same effect as the said parliamentary copies, and are in this Act included under the name parliamentary copies of the imperial standards of measure and weight.

6. If at any time either of the imperial standards of measure and weight is lost or in any manner destroyed, defaced, or otherwise injured, the Board of Trade may cause the same to be restored by reference to or adoption of any of the parliamentary copies of that standard, or of such of them as may remain available for that purpose.

7. If at any time any of the parliamentary copies of either of the imperial standards is lost or in any manner destroyed, defaced, or otherwise injured, the Board of Trade may cause the same to be restored by reference either to the corresponding imperial standard, or to one of the other parliamentary copies of that standard.

8. The secondary standards of measure and weight which, having been derived from the imperial standards, are at the commencement of this Act in use under the direction of the Board of Trade, and are mentioned in the Second Schedule to this Act, and no others (save as hereinafter mentioned), shall be secondary standards of measure and weight, and shall be called Board of Trade standards.

If at any time any of such standards is lost or in any manner destroyed, defaced, or otherwise injured, the Board of Trade may cause the same to be restored by reference either to one of the imperial standards or to one of the parliamentary copies of those standards.

The Board of Trade shall from time to time cause such new denominations of standards, being either equivalent to or multiples or aliquot parts of the imperial weights and measures ascertained by this Act, or being equivalent to or multiples of each coin of the realm for the time being, as appear to them to be required, in addition to those mentioned in the Second Schedule to this Act, to be made and duly verified, and those new denominations of standards when approved by Her Majesty in Council shall be Board of Trade standards in like manner as if they were mentioned in the said schedule.

It shall be lawful for Her Majesty by Order in Council to declare that a Board of Trade standard for the time being of any denomination, whether mentioned in the said schedule or approved by Order in Council, shall cease to be such a standard.

Such standards of the Board of Trade as are equivalent to or multiples of any coin of the realm for the time being shall be standard weights for determining the justness of the weight of and for weighing such coin.

9. The standards of measure and weight which are at the commencement of this Act legally in use by inspectors of weights and measures for the purpose of verification or inspection, and all copies of the Board of Trade standards which after the commencement of this Act are compared with those standards and verified by the Board of Trade for the purpose of being used by inspectors of weights and measures under this Act as standards for the verification or inspection of weights and measures, shall be called local standards.

Imperial Measures of Length.

10. The straight line or distance between the centres of the two gold plugs or pins (as mentioned in the First Schedule to this Act) in the bronze bar by this Act declared to be the imperial standard for determining the imperial standard yard measured when the bar is at the temperature of sixty-two degrees of Fahrenheit's thermometer, and when it is supported on bronze rollers placed under it in such manner as best to avoid flexure of the bar, and to facilitate its free expansion and contraction from variations of temperature, shall be the legal standard measure of length, and shall be called the imperial standard yard, and shall be the only unit or standard measure of extension from which all other measures of extension, whether linear, superficial or solid, shall be ascertained.

11. One third part of the imperial standard yard shall be a foot, and the twelfth part of such foot shall be an inch, and the rod, pole, or perch in length shall contain five such yards and a half, and the chain shall contain twenty-two such yards, the furlong two hundred and twenty such yards, and the mile one thousand seven hundred and sixty such yards.

12. The rood of land shall contain one thousand two hundred and ten square yards according to the imperial standard yard, and the acre of land shall contain four

thousand eight hundred and forty such square yards, being one hundred and sixty square rods, poles, or perches.

Imperial Measures of Weight and Capacity.

13. The weight in vacuo of the platinum weight (mentioned in the First Schedule to this Act), and by this Act declared to be the imperial standard for determining the imperial standard pound, shall be the legal standard measure of weight, and of measure having reference to weight, and shall be called the imperial standard pound, and shall be the only unit or standard measure of weight from which all other weights and all measures having reference to weight shall be ascertained.

14. One sixteenth part of the imperial standard pound shall be an ounce, and one sixteenth part of such ounce shall be a dram, and one seven thousandth part of the imperial standard pound shall be a grain.

A stone shall consist of fourteen imperial standard pounds, and a hundredweight shall consist of eight such stones, and a ton shall consist of twenty such hundredweights.

Four hundred and eighty grains shall be an ounce troy.

All the foregoing weights except the ounce troy shall be deemed to be avoirdupois weights.

15. The unit or standard measure of capacity from which all other measures of capacity, as well for liquids as for dry goods, shall be derived, shall be the gallon containing ten imperial standard pounds weight of distilled water weighed in air against brass weights, with the water and the air at the temperature of sixty-two degrees of Fahrenheit's thermometer, and with the barometer at thirty inches.

The quart shall be one fourth part of the gallon, and the pint shall be one-eighth part of the gallon.

Two gallons shall be a peck, and eight gallons shall be a bushel, and eight such bushels shall be a quarter, and thirty-six such bushels shall be a chaldron.

16. A bushel for the sale of any of the following articles, namely, lime, fish, potatoes, fruit, or any other goods and things which before (the passing of the Weights and Measures Act, 1835, that is to say) the ninth day of September one thousand eight hundred and thirty-five, were commonly sold by heaped measure, shall be a hollow cylinder having a plane base, the internal diameter of which shall be double the internal depth, and every measure used for the sale of any of the above-mentioned articles which is a multiple of a bushel, or is a half bushel or a peck, shall be made of the same shape and proportion as the above-mentioned bushel.

17. In using an imperial measure of capacity, the same shall not be heaped, but either shall be stricken with a round stick or roller, straight and of the same diameter from end to end, or if the article sold cannot from its size or shape be conveniently stricken shall be filled in all parts as nearly to the level of the brim as the size and shape of the article will admit.

Metric Equivalents of Imperial Weights and Measures.

18. The table in the Third Schedule to this Act shall be deemed to set forth the equivalents of imperial weights and measures and of the weights and measures therein expressed in terms of the metric system, and such table may be lawfully used for computing and expressing, in weights and measures, weights and measures of the metric system.

Use of Imperial Weights and Measures.

19. Every contract, bargain, sale, or dealing, made or had in the United Kingdom for any work goods wares or merchandise or other thing which has been or is to be done, sold, delivered, carried, or agreed for by weight or measure, shall be deemed to be made and had according to one of the imperial weights or measures ascertained by this Act, or to some multiple or part thereof, and if not so made or had shall be void; and all tolls and duties charged or collected according to weight or measure shall be charged and collected according to one of the imperial weights or measures ascertained by this Act, or to some multiple or part thereof.

Such contract, bargain, sale, dealing, and collection of tolls and duties as is in this section mentioned is in this Act referred to under the term "trade."

No local or customary measures, nor the use of the heaped measure, shall be lawful.

Any person who sells by any denomination of weight or measure other than one of the imperial weights or measures, or some multiple or part thereof, shall be liable to a fine not exceeding forty shillings for every such sale.

20. All articles sold by weight shall be sold by avoirdupois weight; except that—

(1). Gold and silver, and articles made thereof, including gold and silver thread, lace, or fringe, also platinum, diamonds, and other precious metals or stones, may be sold by the ounce troy or by any decimal parts of such ounce; and all contracts, bargains, sales, and dealings in relation thereto shall be deemed to be made and had by such weight, and when so made or had shall be valid; and

(2). Drugs, when sold by retail, may be sold by apothecaries' weight.

Every person who acts in contravention of this section shall be liable to a fine not exceeding five pounds.

21. A contract or dealing shall not be invalid or open to objection on the ground that the weights or measures expressed or referred to therein are weights or measures of the metric system, or on the ground that decimal subdivisions of imperial weights and measures, whether metric or otherwise, are used in such contract or dealing.

22. Nothing in this Act shall prevent the sale, or subject a person to a fine under this Act for the sale, of an article in any vessel, where such vessel is not represented as containing any amount of imperial measure, nor subject a person to a fine under this Act for the possession of a vessel where it is shown that such vessel is not used nor intended for use as a measure.

23. Any person who prints, and any clerk of a market or other person who makes, any return, price list, price current, or any journal or other paper containing price list or price current, in which the denomination of weights and measures quoted or referred to denotes or implies a greater or less weight or measure than is denoted or implied by the same denomination of the imperial weights and measures under this Act, shall be liable to a fine not exceeding ten shillings for every copy of every such return, price list, price current, journal, or other paper which he publishes.

24. Every person who uses or has in his possession for use for trade a weight or measure which is not of the denomination of some Board of Trade standard, shall be liable to a fine not exceeding five pounds, or in the case of a second offence ten pounds, and the weight or measure shall be liable to be forfeited.

Unjust Weights and Measures.

25. Every person who uses or has in his possession for use for trade any weight measure scale balance steelyard or weighing machine which is false or unjust, shall be liable to a fine not exceeding five pounds, or in the case of a second offence ten pounds, and any contract bargain sale or dealing made by the same shall be void, and the weight measure scale balance or steelyard shall be liable to be forfeited.

26. Where any fraud is wilfully committed in the using of any weight measure scale balance steelyard or weighing machine, the person committing such fraud, and every person party to the fraud, shall be liable to a fine not exceeding five pounds, or in the case of a second offence ten pounds, and the weight measure scale balance or steelyard shall be liable to be forfeited.

27. A person shall not wilfully or knowingly make or

sell, or cause to be made or sold, any false or unjust weight measure scale balance steelyard or weighing machine.

Every person who acts in contravention of this section shall be liable to a fine not exceeding ten pounds, or in the case of a second offence fifty pounds.

Stamping and Verification of Weights and Measures.

28. Every weight, except where the small size of the weight renders it impracticable, shall have the denomination of such weight stamped on the top or side thereof in legible figures and letters.

Every measure of capacity shall have the denomination thereof stamped on the outside of such measure in legible figures and letters.

A weight or measure not in conformity with this section shall not be stamped with such stamp of verification under this Act as is hereinafter mentioned.

29. Every measure and weight whatsoever used for trade shall be verified and stamped by an inspector with a stamp of verification under this Act.

Every person who uses or has in his possession for use for trade any measure or weight not stamped as required by this section shall be liable to a fine not exceeding five pounds, or in the case of a second offence ten pounds, and shall be liable to forfeit the said measure or weight, and any contract bargain sale or dealing made by such measure or weight shall be void.

30. A weight made of lead or pewter, or of any mixture thereof, shall not be stamped with a stamp of verification or used for trade, unless it be wholly and substantially cased with brass copper or iron, and legibly stamped or marked "cased":

Provided that nothing in this section shall prevent the insertion into a weight of such a plug of lead or pewter as is *bonâ fide* necessary for the purpose of adjusting it and of affixing thereon the stamp of verification.

A person guilty of any offence against or disobedience to the provisions of this section shall be liable to a penalty not exceeding five pounds, or in case of a second offence ten pounds.

31. Every coin weight, not less in weight than the weight of the lightest coin for the time being current, shall be verified and stamped by the Board of Trade with a mark of verification under this Act, and otherwise shall not be deemed a just weight for determining the weight of gold and silver coin of the realm.

Every person who uses any weight declared by this section not to be a just weight shall be liable to a fine not exceeding fifty pounds.

32. If any person forges or counterfeits any stamp used for the stamping under this Act of any measure or weight, or used before the commencement of this Act for the stamping of any measure or weight, under any enactment repealed by this Act, or wilfully increases or diminishes a weight so stamped, he shall be liable to a fine not exceeding fifty pounds.

Any person who knowingly uses, sells, utters, disposes of, or exposes for sale any measure or weight with such forged or counterfeit stamp thereon, or a weight so increased or diminished, shall be liable to a fine not exceeding ten pounds.

All measures and weights with any such forged or counterfeit stamp shall be forfeited.

II.—ADMINISTRATION.

(a). *Central.*

Board of Trade.

33. The Board of Trade shall have all such powers and perform all such duties relative to standards of measure and weight, and to weights and measures, as are by any Act or otherwise vested in or imposed on the Treasury, or the Comptroller-General of the Exchequer, or the Warden of the Standards; and all things done by the Board of Trade, or any of their officers, or at their office, in relation to standards of weights and measures in pursuance of this Act shall be as valid, and have the like effect and consequences, as if the same had been done by the Treasury, or by the Comptroller-General or other officer of the Exchequer, or by the Warden of the Standards, or at the office of the Exchequer.

It shall be the duty of the Board of Trade to conduct all such comparisons, verifications, and other operations with reference to standards of measure and weight, in aid of scientific researches or otherwise, as the Board of Trade from time to time thinks expedient, and to make from time to time a report to Parliament on their proceedings and business under this Act.

Custody and Verification of Standards and Copies.

34. The imperial standards of measure and weight, the Board of Trade standards of measure and weight, and all balances, apparatus, books, documents, and things used in connection therewith or relating thereto, deposited at the passing of this Act in the Standards Department, or in any other office of the Board of Trade, shall remain and be in the custody of the Board of Trade.

35. The parliamentary copies of the imperial standards of measure and weight mentioned in part two of the First Schedule to this Act shall continue to be deposited as therein mentioned.

The copies of the imperial standards of measure and weight made in pursuance of this Act, when approved by Her Majesty in Council, shall be deposited at some office of the Board of Trade, and be in the custody of the Board of Trade.

The Board of Trade shall cause the parliamentary copies of the imperial standards of measure and weight, except the copy immured in the new palace at Westminster, to be compared once in every ten years with each other, and once in every twenty years with the imperial standards of measure and weight.

36. Once at least in every five years the Board of Trade shall cause the Board of Trade standards for the time being to be compared with the parliamentary copies of the imperial standards of measure and weight made and approved in pursuance of this Act and with each other, and to be adjusted or renewed, if requisite.

37. The Board of Trade shall cause to be compared with the Board of Trade standards and verified at such place as the Board of Trade in each case direct all copies of any of those standards which are submitted for the purpose by any local authority, and have been used or are intended to be used as local standards, and if they find the same fit for the purpose of being used by inspectors of weights and measures under this Act as standards for the verification and inspection of weights and measures, shall cause them to be stamped as verified or re-verified in such manner as to show the date of such verification or re-verification, and every such verification shall be evidenced by an indenture, and every such re-verification shall be evidenced by an indorsement upon the original indenture of verification, or by a new indenture of verification.

Any such indenture or indorsement, if purporting to be signed (either before or after the passing of this Act) by an officer of the Board of Trade, shall be evidence of the verification or re-verification of the weights and measures therein referred to.

Any such indenture or indorsement shall not be liable to stamp duty, nor shall any fee be payable on the verification or re-verification of any local standard.

An account shall be kept by the Board of Trade of all local standards verified or re-verified.

38. Whereas the Board of Trade have obtained accurate copies of the metric standards mentioned in part two of the Third Schedule to this Act, and it is expedient to make the provision hereinafter mentioned for the verification of metric weights and measures, be it therefore enacted as follows:—

The Board of Trade may, if they think fit, cause to be

compared with the metric standards in their custody and verified all metric weights and measures which are submitted to them for the purpose, and are of such shape and construction as may be from time to time in that behalf directed by the Board of Trade, and which the Board of Trade are satisfied are intended to be used for the purpose of science or of manufacture, or for any lawful purpose not being for the purpose of trade within the meaning of this Act.

39. The Board of Trade, on payment of such fee, not exceeding five shillings, as they from time to time prescribe, shall cause all coin weights required by this Act to be verified, to be compared with the standard weights for weighing coin, and if found to be just, stamped with a mark approved of by the Board, and notified in the *London Gazette.*

All fees under this section shall be paid into the Exchequer.

(b). *Local Administration.*

Local Standards.

40. The local authority (mentioned in the Fourth Schedule to this Act) of every county and borough from time to time shall provide such local standards of measure and weight as they deem requisite for the purpose of the comparison by way of verification or inspection, in accordance with this Act, of all weights and measures in use in their county or borough, and shall fix the places at which such standards are to be deposited.

The said local authority shall also provide from time to time proper means for verifying weights and measures by comparison with the local standards of such authority and for stamping the weights and measures so verified.

41. A local standard of weight shall not be deemed legal nor be used for the purposes of this Act unless it has been verified or re-verified within five years before the time at which it is used.

A local standard of measure shall not be deemed legal nor be used for the purposes of this Act unless it has been verified or re-verified within ten years before the time at which it is used.

A local standard of weight or measure which has become defective in consequence of any wear or accident, or has been mended, shall not be legal nor be used for the purpose of this Act until it has been re-verified by the Board of Trade.

A local standard may, save as aforesaid, be re-verified, for the purpose of this section, by such local comparison thereof as is hereinafter mentioned, if on that local comparison it is found correct, but otherwise shall be, and in any case may be, re-verified by the Board of Trade.

A local comparison of a local standard shall be made by an inspector of weights and measures for the county or borough in which such standard is used comparing the same, in the presence of a justice of the peace, with some other local standard which has been verified or re-verified by the Board of Trade, in the case of a weight within the previous five years, and in the case of a measure within the previous ten years.

Upon a local comparison where the local standard is found correct the justice shall sign an indorsement upon the indenture of verification of that standard, stating such local comparision and verification, and the error, if any, found thereon, and the indorsement so signed shall be transmitted to the Board of Trade to be recorded in the account of the verification of local standards. The indorsement when so recorded shall be evidence of the local comparison and verification, and a statement of the record thereof, if purporting to be signed by an officer of the Board of Trade, shall be evidence of the same having been so recorded.

It shall be lawful for Her Majesty from time to time, by Order in Council, to define the amount of error to be tolerated in local standards when verified or re-verified by the Board of Trade, or when re-verified by such a local comparison as is authorized by this section.

42. The local standards shall be produced by the person having the custody thereof, upon reasonable notice, at such reasonable time and place within the county, borough, or place for which the same have been provided, as any person by writing under his hand requires, upon payment by the person requiring such production of the reasonable charges of producing the same.

Local Verification and Inspection of Weights and Measures.

43. Every local authority shall from time to time appoint a sufficient number of inspectors of weights and measures for safely keeping the local standards provided by such authority, and for the discharge of the other duties of inspectors under this Act; and where they appoint more than one such inspector, shall allot to each inspector (subject to any arrangement made for a chief inspector or inspectors) a separate district, to be distinguished by some name, number, or mark; and the local authority may suspend or dismiss any inspector appointed by them or appoint additional inspectors, as occasion may require, and shall assign reasonable remuneration to each inspector for his duties.

A local authority may, if they think fit, appoint different persons to be inspectors for verification and for inspection respectively of weights and measures under this Act.

A maker or seller of weights or measures, or a person employed in the making or selling thereof, shall not be an inspector of weights and measures under this Act.

An inspector of weights and measures shall forthwith on his appointment enter into a recognizance to the Crown (to be sued for in any court of record) in the sum of two hundred pounds for the due performance of the duties of his office, and for the due payment, at the times fixed by the local authority appointing him, of all fees received by him under this Act, and for the safety of the local standards and the stamps and appliances for verification committed to his charge, and for their due surrender immediately on his removal or other cessation from office to the person appointed by the local authority to receive them.

44. The local authority shall from time to time fix the times and places within their jurisdiction at which each inspector appointed by them is to attend for the purpose of the verification of weights and measures; and the inspector shall attend, with the local standards in his custody, at each time and place fixed, and shall examine every measure or weight which is of the same denomination as one of such standards and is brought to him for the purpose of verification, and compare the same with that standard, and if he find the same correct shall stamp it with a stamp of verification in such manner as best to prevent fraud; and in the case of a measure or of a weight of a quarter of a pound or upwards, shall further stamp thereon a name, number, or mark distinguishing the district for which he acts.

He shall also enter in a book kept by him minutes of every such verification, and give, if required, a certificate under his hand of every such stamping.

An inspector appointed by the local authority for a county may enter a place within the district of an inspector appointed by any other local authority, and there verify and stamp the weights and measures of any person residing within his own district, but if he knowingly stamp a weight or measure of any person residing in the district of an inspector legally appointed by another local authority, he shall be liable to a fine not exceeding twenty shillings for every weight or measure which he so stamps.

45. A weight or measure duly stamped by an inspector under this Act shall be a legal weight or measure throughout the United Kingdom, unless found to be false or unjust, and shall not be liable to be re-stamped because used in any place other than that in which it was originally stamped.

46. Where a measure for liquids is constructed with a

small window or transparent part through which the contents, whether to the brim or to any other index thereof, may be seen without impediment, such measure may be verified and stamped by inspectors under this Act, although such measure is made partly of metal and partly of glass or other transparent medium, and that whether such measure corresponds exactly to a Board of Trade standard, or whether it exceeds such standard, but has the capacity of such standard indicated by a level line drawn through the centre of the window or transparent part.

47. An inspector under this Act may take in respect of the verification and stamping of weights and measures such fees not exceeding those specified in the Fifth Schedule to this Act as the authority appointing him from time to time fix, and shall at such times not less often than once a quarter as the said authority direct, account for and pay over to the treasurer of the local rate or such person as the said authority direct all fees taken by him.

Where the Board of Trade, upon the application of any local authority from time to time represent to Her Majesty that it would be expedient to alter the fees taken by the inspectors of such authority under this Act (whether specified in the said schedule or in any order previously made under this section) or, for the purpose of adapting these fees to the local standards provided by such authority, to add to the said fees, it shall be lawful for Her Majesty by Order in Council from time to time to alter or add to the said fees.

48. Every inspector under this Act authorized in writing under the hand of a justice of the peace, also every justice of the peace, may at all reasonable times inspect all weights measures scales balances steelyards and weighing machines within his jurisdiction which are used or in the possession of any person or on any premises for use for trade, and may compare every such weight and measure with some local standard, and may seize and detain any weight measure scale balance or steelyard which is liable to be forfeited in pursuance of this Act, and may for the purpose of such inspection enter any place, whether a building or in the open air, whether open or enclosed, where he has reasonable cause to believe that there is any weight measure scale balance steelyard or weighing machine which he is authorized by this Act to inspect.

Any person who neglects or refuses to produce for such inspection all weights measures scales balances steelyards and weighing machines in his possession or on his premises, or refuses to permit the justice or inspector to examine the same or any of them, or obstructs the entry of the justice or inspector under this section, or otherwise obstructs or hinders a justice or inspector acting under this section, shall be liable to a fine not exceeding five, or, in the case of a second offence, ten pounds.

49. If an inspector under this Act stamps a weight or measure in contravention of any provision of this Act, or without duly verifying the same by comparison with a local standard, or is guilty of a breach of any duty imposed on him by this Act, or otherwise misconducts himself in the execution of his office, he shall be liable to a fine not exceeding five pounds for each offence.

Local Authorities.

50. For the purposes of this Act "the local authority" and the "local rate" shall mean in each of the different areas mentioned in the first column of the Fourth Schedule to this Act the authority and the rate or fund mentioned in that schedule in connection with that area:

Provided that in England the council of a borough which has not a separate court of quarter sessions shall not, unless they so resolve, be the local authority for the purposes of this Act, and if they so resolve and provide local standards and appoint inspectors after the commencement of this Act, they shall forthwith give notice of such resolution and appointment, under the corporate seal of the borough, to the clerk of the peace of the county in which the borough is situate, and after the expiration of one month from the day on which that notice of the said appointment is given the powers of inspectors of weights and measures appointed by the justices of the county shall, as to such borough and the weights and measures of persons residing therein, cease; but until such notice is given the borough shall be deemed to form part of the said county in like manner as if the same were not a borough.

Where at the commencement of this Act legal local standards are provided and inspectors are appointed by the council of a borough not having a separate court of quarter sessions, that council shall continue to be the local authority until they otherwise resolve.

51. The expense of providing and re-verifying local standards, the salaries of the inspectors, and all other expenses incurred by the local authority under this Act shall be paid out of the local rate.

The treasurer of the county in which a borough in England having a separate court of quarter sessions is situate shall exclude from the account kept by him of all sums expended out of the county rate to which the borough is liable to contribute all sums expended in pursuance of this Act.

52. Any two or more local authorities may combine, as regards either the whole or any part of the areas within their jurisdiction, for all or any of the purposes of this Act, upon such terms and in such manner as may be from time to time mutually agreed upon.

An inspector appointed in pursuance of an agreement for such combination shall, subject to the terms of his appointment, have the same authority jurisdiction and duties as if he had been appointed by each of the authorities who are parties to such agreement.

53. Any local authority from time to time, with the approval of the Board of Trade, may make, and when made, revoke, alter, and add to, the byelaws for regulating the comparison with the local standards of such authority, and the verification and stamping of weights and measures in use in their county or borough, and for regulating the local comparison of the local standards of such authority, and generally for regulating the duties under this Act of the inspectors appointed by the local authority or of any of those inspectors. Such byelaws may impose fines not exceeding twenty shillings for the breach of any byelaw, to be recovered on summary conviction. The Board of Trade before appproving any such byelaws shall cause them to be published in such manner as they think sufficient for giving notice thereof to all persons interested.

54. Where a town or other place has been or may hereafter be authorized under any Act, whether local or otherwise, to appoint inspectors or examiners of weights and measures, or where any other place has been or may hereafter be, by charter Act of Parliament or otherwise, possessed of legal jurisdiction, and such town or place is for the time being provided with legal local standards, the magistrates of such town or place, or other persons authorized as aforesaid, may appoint inspectors of weights and measures within the limits of their jurisdiction, and suspend and dismiss such inspectors, and such inspectors shall within such limits exclusively have the same power and discharge the same duties as inspectors of weights and measures appointed under this Act by the local authority for the county, and shall pay over and account for the fees received by them under this Act, to such persons as may be duly authorized by the magistrates or other persons appointing them.

55. Where in any place in the Metropolis—that is to say, in the parishes and places in which the Metropolitan Board of Works have power to levy the consolidated rate—any vestry commissioners or other body have any duties or powers, under any Local Act charter or otherwise, in relation to the appointment of inspectors or examiners of weights and measures, such vestry commis

sioners or body may, at a meeting specially convened for the purpose of which not less than fourteen days notice has been given, resolve that it is expedient that their said duties and powers should cease in such place.

The clerk or other like officer of such vestry commissioners or body shall give notice of such resolution to the clerk of the peace for the county in which such place is situate, and the clerk of the peace shall lay such notice before the next practicable court of quarter sessions for the county, and after the receipt of such notice by the court of quarter sessions the appointment, and all powers of appointment, of any inspector or examiner appointed under such Local Act charter or otherwise, shall cease in the said place, without prejudice to any proceedings then pending for penalties or otherwise.

Legal Proceedings.

56. All offences under this Act may be prosecuted and all fines and forfeitures under this Act may be recovered on summary conviction before a court of summary jurisdiction in manner provided by the Summary Jurisdiction Act.

The court when hearing and determining an information or complaint under this Act shall be constituted either of two or more justices of the peace in petty sessions sitting at a place appointed for holding petty sessions, or of some magistrate or officer sitting alone or with others at some court or other place appointed for the administration of justice and for the time being empowered by law to do alone any act authorized to be done by more than one justice of the peace.

57. The following enactments shall apply to proceedings under this Act before a court of summary jurisdiction; (that is to say,)

1. The description of any offence in the words of this Act, or in similar words, shall be sufficient in law; and
2. Any exception, exemption, proviso, excuse, or qualification, whether it does or does not accompany in the same section the description of the offence, may be proved by the defendant but need not be specified or negatived in the information or complaint, and, if so specified or negatived, no proof in relation to the matter so specified or negatived shall be required on the part of the informant or complainant; and
3. A warrant of commitment shall not be held void by reason of any defect therein, if it be therein alleged that the offender has been convicted, and there is a good and valid conviction to sustain the same.
4. Such portion of any fine under this Act, not exceeding a moiety, as the court of summary jurisdiction before whom a person is convicted think fit to direct, may, if the court in their discretion so order, be paid to the informer.
5. All weights measures scales balances and steelyards forfeited under this Act shall be broken up, and the materials thereof may be sold or otherwise disposed of as a court of summary jurisdiction direct, and the proceeds of such sale shall be applied in like manner as fines under this Act.

58. A person shall not be liable to any increased penalty for a second offence under any section of this Act unless that offence was committed after a conviction within five years previously for an offence under the same section.

59. Where any weight measure scale balance steelyard or weighing machine is found in the possession of any person carrying on trade within the meaning of this Act, or on the premises of any person which, whether a building or in the open air, whether open or enclosed, are used for trade within the meaning of this Act, such person shall be deemed for the purposes of this Act, until the contrary is proved, to have such weight measure scale balance steelyard or weighing machine in his possession for use for trade.

60. Any person who feels himself aggrieved by a conviction or order of a court of summary jurisdiction under this Act may appeal therefrom, subject in England to the conditions following; (that is to say,)

(1). The appeal shall be made to the next practicable court of general or quarter sessions having jurisdiction in the county or place in which the decision of the court was given, and holden not less than twenty-one days after the day on which such decision was given; and

(2). The appellant shall, within ten days after the day on which the decision was given, serve notice on the other party and on the clerk of the court of summary jurisdiction of his intention to appeal, and of the general grounds of such appeal; and

(3). The appellant shall, within three days after the day on which he gave notice of appeal, enter into a recognizance before a court of summary jurisdiction, with or without a surety or sureties as the court may direct, conditioned to appear at the said sessions and to try such appeal, and to abide the judgment of the court thereon, and to pay such costs as may be awarded by the court, or the appellant may, if the court of summary jurisdiction thinks it expedient, instead of entering into a recognizance, give such other security, by deposit of money with the clerk of the court of summary jurisdiction or otherwise, as the court deems sufficient; and

(4). Where the appellant is in custody a court of summary jurisdiction may, if it seem fit, on the appellant entering into such recognizance or giving such other security as aforesaid, release him from custody; and

(5). The court of appeal may adjourn the hearing of the appeal, and upon the hearing thereof may confirm, reverse, or modify the decision of the court of summary jurisdiction, or remit the matter to the court of summary jurisdiction with the opinion of the court of appeal thereon, or make such other order in the matter as the court thinks just. The court of appeal may also make such order as to costs to be paid by either party as the court thinks just; and

(6). Whenever a decision is reversed by the court of appeal the clerk of the peace shall indorse on the conviction or order appealed against a memorandum that such conviction or order has been quashed, and whenever any copy or certificate of such conviction or order is made, a copy of such memorandum shall be added thereto, and shall be sufficient evidence that the conviction or order has been quashed in every case where such copy or certificate would be sufficient evidence of such conviction or order; and

(7). Every notice in writing required by this section to be given by an appellant may be signed by him, or by his agent on his behalf, and may be transmitted in a registered letter by the post in the ordinary way, and shall be deemed to have been served at the time when it would be delivered in the ordinary course of the post.

61. In an action for any act done in pursuance or execution or intended execution of this Act, or in respect of any alleged neglect or default in the execution of this Act, tender of amends before the action is commenced may in lieu of or in addition to any other plea be pleaded, if the action was commenced after such tender, or is proceeded with after payment into court of any money in satisfaction of the plaintiff's claim. If the action is commenced after such tender, or is proceeded with after such payment, and the plaintiff does not recover more than the sum tendered or paid respectively, the plaintiff shall

not recover any costs incurred after such tender or payment, and the defendant shall be entitled to his costs, to be taxed as between solicitor and client, as from the time of such tender or payment; but this provision shall not affect costs on any injunction in the action.

III.—MISCELLANEOUS.

62. Every inquisition which, in pursuance of any Act hereby repealed, has been taken for ascertaining the amount of contracts to be performed or rents to be paid in grain or malt, or in any other commodity or thing, or with reference to the measure or weight of any grain malt or other commodity or thing, and the amount of any toll rate or duty payable according to any weight or measure in use before the passing of the said Act, and has been enrolled of record in Her Majesty's Court of Exchequer, shall continue in force, and may be given in evidence in any legal proceeding, and the amount ascertained by such inquisition shall, when converted into imperial weights and measures, continue to be the rule of payment in regard to all such contracts rents tolls rates or duties.

63. It shall be lawful for Her Majesty in Council from time to time to make Orders for the purposes of this Act, and to revoke and vary any such Order.

All Orders in Council made under this Act shall be published in the London Edinburgh and Dublin Gazettes, and shall be forthwith laid before both Houses of Parliament, and shall have full effect as part of this Act.

64. The schedules to this Act, with the notes thereto, shall be construed and have effect as part of this Act.

65. Where an enactment refers to any Act repealed by this Act, or to any enactment thereof, the same shall be construed to refer to this Act or to the corresponding enactment of this Act.

Standards and Definitions.

66. Nothing in this Act shall affect the validity of the models of gas holders verified and deposited in the standards department of the Board of Trade in pursuance of the Act of the session of the twenty-second and twenty-third years of the reign of Her present Majesty, chapter sixty-six, intituled "An Act for regulating measures used in sales of gas," and of the Acts amending the same, and the provisions of this Act with respect to Board of Trade standards shall apply to such models; and the provisions of this Act with respect to defining the amount of error to be tolerated in local standards when verified or re-verified, shall apply to defining the amount of error to be tolerated in such copies of the said models of gas holders as are provided by any justices council commissioners or other local authority in pursuance of the said Acts.

67. Nothing in this Act shall extend to prohibit, defeat, injure, or lessen the rights granted by charter to the master, wardens, and commonalty of the mystery of Founders of the city of London.

68. Nothing in this Act shall prohibit, defeat, injure, or lessen the right of the mayor and commonalty and citizens of the city of London, or of the Lord Mayor of the city of London for the time being, with respect to the stamping or sealing of weights and measures, or with respect to the gauging of wine or oil, or other gaugeable liquors.

69. Nothing in this Act shall extend to supersede, limit, take away, lessen, or prevent the authority which any person or body politic or corporate, or any person appointed at any court leet for any hundred or manor, or any jury or ward inquest, may have or possess for the examining, regulating, seizing, breaking, or destroying any weights, balances, or measures within their respective jurisdictions, and for the purposes of this section the court of burgesses of the city of Westminster shall be deemed to be a body politic, and nothing in this Act shall be deemed to repeal or supersede the Acts relating to that court, or lessen, diminish, or alter the powers of the same.

70. In this Act, unless the context otherwise requires,—

The expression "the Summary Jurisdiction Act" means the Act of the session of the eleventh and twelfth years of the reign of Her present Majesty, chapter forty-three, intituled "An Act to facilitate the performance of the duties of justices of the peace out of sessions within England and Wales with respect to summary convictions and orders," inclusive of any Acts amending the same.

The expression "court of summary jurisdiction" means any justice or justices of the peace, metropolitan police magistrate, stipendiary or other magistrate or officer, by whatever name called, to whom jurisdiction is given by the Summary Jurisdiction Act or any Acts therein referred to:

The expression "quarter sessions" includes general sessions:

The expression "Treasury" means the Commissioners of Her Majesty's Treasury:

The expression "person" includes a body corporate:

The expression "stamping" includes casting, engraving, etching, branding, or otherwise marking, in such manner as to be so far as practicable indelible, and the expression "stamp" and other expressions relating thereto shall be construed accordingly:

The expression "coin weight" means a weight used or intended to be used for weighing coin:

The expression "Weights and Measures Act, 1835," means the Act of the fifth and sixth years of the reign of King William the Fourth, chapter sixty-three, intituled "An Act to repeal an Act of the fourth and fifth year of His present Majesty relating to weights and measures, and to make other provisions instead thereof."

IV.—APPLICATION OF ACT TO SCOTLAND.

This Act shall apply to Scotland with the following modifications:

71. In the application of this Act to Scotland, the expression "rents and tolls" includes all stipends, feu duties, customs, casualties, and other demands whatsoever payable in grain, malt, or meal, or any other commodity or thing.

The fiars prices of all grain in every county shall be struck by the imperial quarter, and all other returns of the prices of grain shall be set forth by the same, without reference to any other measure whatsoever.

Any person who acts in contravention of this provision shall be liable to a fine not exceeding five pounds.

72. All offences under this Act which may be prosecuted, and all fines and forfeitures under this Act which may be recovered on summary conviction, may in Scotland be prosecuted or recovered, with expenses, before the sheriff or sheriff substitute or two or more justices of the peace of the county, or the magistrates of the burgh wherein the offence was committed or the offender resides, at the instance either of the procurator fiscal or of any person who prosecutes.

Every person found liable in Scotland in any fine recoverable summarily under this Act shall, failing payment thereof immediate or within a specified time, as the case may be, and expenses, be liable to be imprisoned for a term not exceeding sixty days, and the conviction and warrant may be in the form number three of Schedule K. of the Summary Procedure Act, 1864.

All fines and forfeitures so recovered, subject to any payment made to the informer, shall be paid as follows:

(*a*). To the Queen's and Lord Treasurer's Remembrancer, on behalf of Her Majesty, when the court is the sheriff court:

(*b*). To the collector of county rates, in aid of the county general assessment, when the court is the justice of the peace court:

(*c*). To the treasurer of the burgh, in aid of the funds of the burgh, when the court is a burgh court:

(*d*). To the treasurer of the board of police, or commissioners of police, in aid of the police funds, when the court is a police court.

73. An appeal against a conviction under this Act in Scotland shall be to the Court of Justiciary at the next circuit court, or where there are no circuit courts, to the High Court of Justiciary at Edinburgh, and not otherwise, and such appeal may be made in the manner and under the rules, limitations, and conditions contained in the Act of the twentieth year of the reign of King George the Second, chapter forty-three, intituled "An Act for taking away and abolishing heritable jurisdictions in Scotland," or as near thereto as circumstances admit; with this variation, that the appellant shall find caution to pay the fine and expenses awarded against him by the conviction or order appealed from, together with any additional expenses awarded by the court dismissing the appeal.

74. In the application of this Act to Scotland,—

The expression "enter into a recognizance" means grant a bond of caution:

The expression "any court of record" includes the Court of Session and the ordinary sheriff court:

The expression "burgh" shall include royal burgh and parliamentary burgh:

The expression "plaintiff" means pursuer, and the expression "defendant" means defender:

The expression "solicitor" means writer or agent:

The expression "Summary Jurisdiction Act" means the Summary Procedure Act, 1864, inclusive of any Act amending the same.

75. A sheriff or sheriff substitute shall have the same power in relation to a local comparison of standards, and to the inspection comparison seizure and detention of weights and measures, and to entry for that purpose, as is given by this Act to a justice of the peace.

V.—APPLICATION OF ACT TO IRELAND.

This Act shall apply to Ireland with the following modifications:

76. In Ireland every contract bargain sale or dealing—

For any quantity of corn, grain, pulses, potatoes, hay, straw, flax, roots, carcases of beef or mutton, butter, wool, or dead pigs, sold, delivered, or agreed for:

Or for any quantity of any other commodity sold, delivered, or agreed for by weight (not being a commodity which may by law be sold by the troy ounce or by apothecaries weight),

shall be made or had by one of the following denominations of imperial weight; namely,

the ounce avoirdupois;
the imperial pound of sixteen ounces;
the stone of fourteen pounds;
the quarter hundred of twenty-eight pounds;
the half hundred of fifty-six pounds;
the hundredweight of one hundred and twelve pounds; or
the ton of twenty hundredweight;

and not by any local or customary denomination of weight whatsoever, otherwise such contract bargain sale or dealing shall be void:

Provided always, that nothing in the present section shall be deemed to prevent the use in any contract bargain sale or dealing of the denomination of the quarter, half, or other aliquot part of the ounce pound or other denomination aforesaid, or shall be deemed to extend to any contract bargain sale or dealing relating to standing or growing crops.

77. In Ireland every article sold by weight shall, if weighed, be weighed in full net standing beam; and for the purposes of every contract bargain sale or dealing the weight so ascertained shall be deemed the true weight of the article, and no deduction or allowance for tret or beamage, or on any other account, or under any other name whatsoever, the weight of any sack vessel or other covering in which such article may be contained alone excepted, shall be claimed or made by any purchaser on any pretext whatever under a penalty not exceeding five pounds.

A proceeding for the recovery of a penalty under this section shall be begun within three months after the offence is committed.

78. (1). The local authority in Ireland shall provide one complete set of local standards for their county or borough; also so many copies in iron or other sufficient material of the local standards.

(2). The said copies of the local standards when duly verified as hereinafter mentioned shall be the local sub-standards, and shall be used for the verification of weights and measures brought by the public for verification as if they were local standards.

(3). Not less than one set of local sub-standards, and one set of accurate scales, shall be provided for each petty sessions district in a county, and not less than two such sets shall be provided for a borough.

(4). The local authority shall have the local standards from time to time duly compared and re-verified in manner directed by this Act.

(5). The Commissioners of the Dublin Metropolitan Police shall not be under any obligation to provide local standards, but they may, with the assent of the chief secretary or under secretary to the Lord Lieutenant, procure such sub-standards scales and stamps as they think necessary for the purposes of this Act in the district for which they are the local authority.

79. In Ireland, in every year—

(*a*). in the case of a county, the judge of assize at the first assizes held for the county by inquiry of the foreman of the grand jury; and

(*b*). in the case of every borough in a county, the recorder of the borough, or, if there be no recorder, the chairman of the quarter sessions for that county, at the quarter sessions held next after the twenty-fifth day of March,

shall inquire whether one complete set of local standards, and a sufficient number of local sub-standards of weights and measures, and a sufficient number of scales and stamps (for verification), have been provided in such county or in such borough.

If it appear to the judge or chairman upon such inquiry that the same have not been so provided, he shall forthwith order the proper officer to provide a complete set of local standards and such sub-standards scales and stamps as appear to the judge or chairman making the order to be sufficient for the purposes of this Act, and that order shall have the effect in the case of a county of a presentment on the county for, and in the case of a borough, of an order on the council of the borough to raise by way of rate, the sum necessary to execute the order, and the said officer shall within three months after he receives the order fully execute the same, and in default shall be liable to a fine not exceeding twenty pounds.

The proper officer shall, in the case of a county, be the treasurer of the county, and in the case of a borough, the town clerk or other proper officer of the borough.

80. Expenses incurred by any member of the Royal Irish Constabulary as an ex-officio inspector of weights and measures in the execution of this Act shall be payable to such inspector by the person acting as treasurer of the local authority of the district on presentation of accounts of such expenses, to be furnished quarterly certified to be correct by the county inspector of the county.

The secretary of every grand jury being a local authority under this Act shall, at each assizes or presenting term, and the clerk of every other local authority shall once in every year lay before each such grand jury or other local authority an estimate of the sum which may appear to be necessary to meet such expenses until the

next assizes or presenting term, or for the ensuing year ; and every such grand jury or other local authority shall, without previous application to presentment sessions or other preliminary proceedings, present in advance to the person acting as treasurer the sum specified in such estimate, to be raised and paid out of the local rate ; and if the sum so raised proves more than sufficient for the purpose, the balance shall be carried to the credit of the local rate by the person acting as treasurer, and if the sum so raised proves insufficient, the person acting as treasurer shall apply for payment of such expenses any other available funds in his hands.

81. Nothing in this Act shall authorize the local authority in Ireland, except the local authority of the borough of Dublin, to appoint inspectors of weights and measures, but such head or other constables in each petty sessions district as may be from time to time selected by the inspector general of constabulary, with the approval of the Lord Lieutenant, shall be ex-officio inspectors of weights and measures under this Act within that district, and shall perform their duties under this Act under the direction of the justices of petty sessions, without fee or reward, and notwithstanding any manorial jurisdiction or claim of jurisdiction within such district:

Provided that if within one month from the date of such selection the justices signify their disapproval of the selection of any head or other constable, another selection shall be made by the same authority, subject to the same conditions, and the inspector general of constabulary shall within three days after any selection has been made in a petty sessions district, give or cause to be given to the clerk of that district notice of such selection, and the clerk shall immediately make known the said selection to the justices of the district.

An ex-officio inspector of weights and measures may exercise, without any authority from a justice of the peace, the powers given by this Act to an inspector of weights and measures having such authority.

In the district in which the commissioners of the Dublin metropolitan police are the local authority under this Act, such of the superintendents inspectors or acting inspectors of the said police as may be selected by the local authority with the approval of the Lord Lieutenant shall be ex-officio inspectors of weights and measures within the said district.

82. The local standards of every county or borough in Ireland shall be in the custody of such sub-inspector of constabulary as may be from time to time appointed for that county or borough by the inspector general of constabulary, with the approval of the Lord Lieutenant.

Such sub-inspector shall, subject to such regulations as the inspector general of constabulary, with the approval of the Lord Lieutenant, from time to time makes, compare with the local standards in his custody, and adjust and verify the local sub-standards sent to him for the purpose, and when the same are correct shall stamp the same with a stamp of verification, and for the purpose of such verification, and stamping, and of the verification of local standards, such sub-inspector of constabulary shall be deemed to be an inspector of weights and measures appointed under this Act.

83. The local sub-standards shall be deposited in the custody of the ex-officio inspector of weights and measures, and shall at least once in every year, and also at other times when required by the county inspector of constabulary of the county, or by the justices in petty sessions of the county, be compared with the local standards of the county and verified, and when so verified shall until the expiration of one year or any shorter period at which the next comparison of the same under this section is made be deemed to be local sub-standards and be valid local standards for the purpose of the comparison by way of verification or inspection of weights and measures under this Act.

The sub-standards provided by the commissioners of the Dublin metropolitan police shall be verified by comparison with the local standards of the city of Dublin, as directed by this section, with this qualification, that the said commissioners, and not the county inspector or the justices, shall have authority to require the same to be verified oftener than once a year.

Any person who uses any sub-standard for any purpose other than that authorized by this Act shall be liable to a fine not exceeding five pounds.

84. For the purpose of the prosecution of offences and the recovery of fines under this Act, in Ireland,—

(1). The expression "Summary Jurisdiction Acts" in this Act means, within the police district of Dublin metropolis, the Acts regulating the powers and duties of justices of the peace for such district, or of the police of such district, and elsewhere in Ireland the Petty Sessions (Ireland) Act, 1851, and any Act amending or affecting the same; and

(2). A court of summary jurisdiction when hearing and determining an information or complaint in any matter arising under this Act shall be constituted within the police district of Dublin metropolis of one of the divisional justices of that district sitting at a police court within the district, and elsewhere of a stipendiary magistrate sitting alone, or with others, or of two or more justices of the peace sitting in petty sessions at a place appointed for holding petty sessions; and

(3.) Appeals from a court of summary jurisdiction shall lie in the manner and subject to the conditions and regulations prescribed in the twenty-fourth section of the Petty Sessions (Ireland) Act, 1851, and any Acts amending the same.

85. In this Act, unless the context otherwise requires,

The expression "Lord Lieutenant" means the lieutenant or other chief governor or governors of Ireland for the time being:

The expression "treasurer" includes the finance committee and the secretary of the grand jury for the county of Dublin.

VI.—REPEAL.

86. The Acts mentioned in the first part of the Sixth Schedule to this Act are hereby repealed to the extent in the third column of that schedule mentioned; subject to the following qualification, that is to say, that so much of the said Acts as is set forth in the second part of that schedule shall be re-enacted in manner therein appearing, and shall be in force as if enacted in the body of this Act.

Provided that,—

(1). Every inspector appointed in pursuance of any enactment hereby repealed shall continue in office as if he had been appointed in pursuance of this Act; and

(2). Any person holding office as examiner of weights and measures under any enactment repealed by this Act, and not being an inspector of weights and measures within the meaning of this Act, shall continue in office and receive the same remuneration, and have the same same powers and duties and be subject to the liabilities and to the same power of dismissal as if this Act had not passed.

(3.) Every notice published in a Gazette in relation to coin weights in pursuance of any enactment hereby repealed shall continue in force.

(4). All weights and measures duly verified and stamped in pursuance of any enactment hereby repealed, shall continue and be as valid as if they had been verified and stamped in pursuance of this Act, and that although such weights or measures could not have been verified and stamped in pursuance of this Act; and all weights and measures which at the commencement of this Act may lawfully be used without being stamped

with a stamp of verification or a stamp of their denomination, and which are required by this Act to be stamped with such a stamp, may, notwithstanding they are not so stamped, be used until the expiration of six months after the commencement of this Act, without being subject to be seized or forfeited, and without rendering the person using or having possession of the same subject to any fine.

(5). This repeal shall not affect—

(*a*). The past operation of any enactment hereby repealed, nor anything duly done or suffered under any enactment hereby repealed; nor

(*b*). Any right, privilege, obligation, or liability acquired, accrued, or incurred under any enactment hereby repealed; nor

(*c*). Any penalty, forfeiture, or punishment incurred in respect of any offence committed against any enactment hereby repealed; nor

(*d*). Any investigation, legal proceeding, or remedy in respect of any such right, privilege, obligation, liability, penalty, forfeiture, or punishment as aforesaid; and any such investigation, legal proceeding, and remedy may be carried on as if this Act had not passed; and

(6). This repeal shall not revive any enactment, right, office, privilege, matter, or thing not in force or existing at the commencement of this Act.

SCHEDULES.

First Schedule.

Part I.

IMPERIAL STANDARDS.

The following standards were constructed under the direction of the Commissioners of Her Majesty's Treasury, after the destruction of the former imperial standards in the fire at the Houses of Parliament.

The imperial standard for determining the length of the imperial standard yard is a solid square bar, thirty-eight inches long and one inch square in transverse section, the bar being of bronze or gun-metal; near to each end a cylindrical hole is sunk (the distance between the centres of the two holes being thirty-six inches) to the depth of half an inch, at the bottom of this hole is inserted in a smaller hole a gold plug or pin, about one tenth of an inch in diameter, and upon the surface of this pin there are cut three fine lines at intervals of about the one hundredth part of an inch transverse to the axis of the bar, and two lines at nearly the same interval parallel to the axis of the bar; the measure of length of the imperial standard yard is given by the interval between the middle transversal line at one end and the middle transversal line at the other end, the part of each line which is employed being the point midway between the longitudinal lines; and the said points are in this Act referred to as the centres of the said gold plugs or pins; and such bar is marked "copper 16 oz., tin 2½, zinc 1. Mr. Baily's metal. No. 1 standard yard at 62°·00 Fahrenheit. Cast in 1845. Troughton and Simms, London."

The imperial standard for determining the weight of the imperial standard pound is of platinum, the form being that of a cylinder nearly 1·35 inch in height and 1·15 inch in diameter, with a groove or channel round it, whose middle is about 0·34 inch below the top of the cylinder, for insertion of the points of the ivory fork by which it is to be lifted; the edges are carefully rounded off, and such standard pound is marked, P.S. 1844, 1 lb.

Part II.

PARLIAMENTARY COPIES OF IMPERIAL STANDARDS.

The following copies of the standards above mentioned in part one of this Schedule were constructed at the same time as the above standards. They are of the same construction and form as the above standards, and they are respectively marked and deposited as following:—

(1). One of the copies of the imperial standard for determining the imperial standard yard, being a bronze bar, marked "copper 16 oz., tin 2½, zinc 1. Mr. Baily's metal. No. 2. Standard yard at 61°·94 Fahrenheit. Cast in 1845. Troughton and Simms, London;" and one of the copies of the imperial standard for determining the imperial standard pound marked No. 1, P.C. 1844, 1 lb., have been deposited at the Royal Mint;

(2). One other of the copies of the imperial standard for determining the imperial standard yard, being a bronze bar, marked "copper 16 oz., tin 2½, zinc 1. Mr. Baily's metal. No. 3. Standard yard at 62°·10 Fahrenheit. Cast in 1845. Troughton and Simms, London," and one other of the copies of the imperial standard for determining the imperial standard pound marked No. 2, P.C. 1844, 1 lb., have been delivered to the Royal Society of London:

(3). One other of the copies of the imperial standard for determining the imperial standard yard, being a bronze bar, marked "copper 16 oz., tin 2½, zinc 1. Mr. Baily's metal. No. 5. Standard yard at 62°·16 Fahrenheit. Cast in 1845. Troughton and Simms, London," and one other of the copies of the imperial standard for determining the imperial standard pound marked No. 3, P.C. 1844, 1 lb., have been deposited in the Royal Observatory of Greenwich;

(4). The other of the copies of the imperial standard for determining the imperial standard yard, being a bronze bar, marked "copper 16 oz., tin 2½, zinc 1. Mr. Baily's metal. No. 4. Standard yard at 61°·98 Fahrenheit. Cast in 1845. Troughton and Simms, London," and the other of the copies of the imperial standard for determining the imperial standard pound marked No. 4, P.C. 1844, 1 lb., have been immured in the New Palace at Westminster.

Second Schedule.

Board of Trade Standards.

Standards of the measures and weights following are at the commencement of this Act in use under the direction of the Board of Trade.

Measures of Length.	Measures of Capacity.
Denomination of Standard.	Denomination of Standard.
MEASURE OF LENGTH.	MEASURES OF CAPACITY.
100 feet.	Bushel.
66 feet or a chain of 100 links.	Half-bushel.
	Peck.
Rod, pole, or perch.	
10 feet	Gallon.
6 ,, or 2 yards.	Half-gallon.
5 ,,	Quart.
4 ,,	Pint.
3 ,, or 1 yard.	Half-pint.
2 ,,	Gill.
1 foot.	Half-gill.
1 inch divided into 12 duodecimal, 10 decimal, and 16 binary equal parts.	Quarter-gill.
	MEASURES USED IN THE SALE OF DRUGS.
	Fluid ounces:— 4, 3, 2, 1.
	Fluid drachms:— 4, 3, 2, 1.
	Minims:— 30, 20, 10, 5, 4, 3, 2, 1.

Note.—The brass gallon marked "Imperial Standar Gallon, Anno Domini MDCCCXXIV., Anno V G^{iv} Regis,"

which has a diameter equal to its height, and was made in pursuance of 5 Geo. 4, c. 74, s. 6, and is at the passing of this Act in the custody of the Warden of the Standards, shall be deemed to be a Board of Trade standard for the gallon.

Weights.

Denomination of Standard.	Denomination of Standard.	Denomination of Standard.
AVOIRDUPOIS WEIGHTS.	TROY BULLION WEIGHTS.	DECIMAL GRAIN WEIGHTS.
56 pounds.	500 ounces.	4,000 grains.
28 ,,	400 ,,	2,000 ,,
14 ,,	300 ,,	1,000 ,,
7 ,,	200 ,,	500 ,,
4 ,,	100 ,,	300 ,,
2 ,,	50 ,,	200 ,,
1 pound.	40 ,,	100 ,,
8 ounces.	30 ,,	50 ,,
4 ,,	20 ,,	30 ,,
2 ,,	10 ,,	20 ,,
1 ounce.	5 ,,	10 ,,
8 drams.	4 ,,	5 ,,
4 ,,	3 ,,	3 ,,
2 ,,	2 ,,	2 ,,
1 dram.	1 ounce.	1 grain.
½ ,,	0·5 ,,	0·5 ,,
240 grains, commonly called 10 pennyweights.	0·4 ,,	0·3 ,,
	0·3 ,,	0·2 ,,
	0·2 ,,	0·1 ,,
120 grains, commonly called 5 pennyweights.	0·1 ,,	0·05 ,,
	0·05 ,,	0·03 ,,
	0·04 ,,	0·02 ,,
72 grains, commonly called 3 pennyweights.	0 03 ,,	0·01 ,,
	0·02 ,,	
	0·01 ,,	
48 grains, commonly called 2 pennyweights.	0·005 ,,	
	0·004 ,,	
	0·003 ,,	
24 grains, commonly called 1 pennyweight.	0·002 ,,	
	0·001 ,,	

Coin Weights.

Denomination of Coin.	Standard Weight.	
	Imperial Weight.	Metric Weight.
	Grains.	Grams.
GOLD :		
Five pound	616·37239	39·94028
Two pound	246·54895	15·97611
Sovereign	123·27447	7·98805
Half-sovereign	61·63723	3·99402
SILVER :		
Crown	436·36363	28·27590
Half-crown	218·18181	14·13795
Florin	174·54545	11·31036
Shilling	87·27272	5·65518
Sixpence	43·63636	2·82759
Groat, or fourpence	29·09090	1·88506
Threepence	21·81818	1·41379
Twopence	14·54545	0·94253
Penny	7·27272	0·47126
BRONZE :		
Penny	145·83333	9·44984
Halfpenny	87·50000	5·66990
Farthing	43·75000	2·83495

Third Schedule.

Part I.

Metric Equivalents.

Table of the values of the principal denominations of measures and weights on the metric system expressed by means of denominations of imperial measures and weights, and of the values of the principal denominations of measures and weights of the imperial system expressed by means of metric weights and measures.

Measures of Length.

Metric Denominations and Values.		Equivalents in Imperial Denominations.				
	Metres.	Miles.	Yards.	Feet.	Ins.	Decimals.
Myriametre	10,000	6 or 10,936	376	0	11·9	11·9
Kilometre	1,000		1,093	1	10·79	
Hectometre	100		109	1	1·079	
Dekametre	10		10	2	9·7079	
Metre	1		1	0	3·3708	
Decimetre	$\frac{1}{10}$				3·9371	
Centimetre	$\frac{1}{100}$				0·3937	
Millimetre	$\frac{1}{1000}$				0·0394	

Measure of Surface.

Metric Denominations and Values.		Equivalents in Imperial Denominations.		
	Square Metres.	Acres.	Square Yards.	Decimals.
Hectare, i.e., 100 Ares	10,000	2 or	2230·3326	11,960·3326
Dekare, i.e., 10 Ares	1,000		1196·0333	
Are	100		119·6033	
Centiare, i.e., $\frac{1}{100}$ Are	1		1·1960	

Measures of Capacity.

PART II.

METRIC STANDARDS.

List of metric standards in the custody of the Board of Trade at the passing of this Act:—

Measures of Length.

Double metre or 2 metres.
METRE or 1 metre.
Decimetre or 0·1 „
Centimetre or 0·01 „
Millimetre or 0·001 „

Weights.

20, 10, 5, 2 kilograms.
KILOGRAM.
500, 200, 100, 50, 20, 10, 5, 2, 1 grams.
5, 2, 1 decigrams.
5, 2, 1, 0·5 milligrams.

Measures of Capacity.

20, 10, 5, 2 litres.
LITRE.
0·5 litre or 500 cubic centimetres.
0·2 „ 200 „
0·1 „ 100 „
0·05 „ 50 „
0·02 „ 20 „
0·01 „ 10 „
0·005 „ 5 „
0·002 „ 2 „
0·001 „ 1 „

Fourth Schedule.

LOCAL AUTHORITIES.

England.

Area.	Local Authority.	Local Rate.
County	The justices in general or quarter sessions assembled.	The county rate.
County of the city of London	The court of the Lord Mayor and aldermen of the city.	The consolidated rate.
Borough	The mayor, aldermen, and burgesses acting by the council.	The borough fund and borough rate

Scotland.

Area.	Local Authority.	Local Rate.
County	The justices in general or quarter sessions assembled.	The county general assessment.
Burgh	The magistrates.	The police assessment.

Ireland.

Area.	Local authority.	Local Rate.
County	The grand jury acting at any assizes or presenting term	The presentments to be made by the grand jury.
Such portion of the police district of Dublin metropolis as is without the municipal boundary of the borough of Dublin.	The Commissioners of the Dublin metropolitan police.	The funds applicable to defray the expenses of the Dublin metropolitan police.
Borough	Town Council . .	Rate to be levied by the council, or if the borough is liable to county cess and no rate is levied in the borough, the county cess of the county in which the borough or the larger part thereof is situate.

Notes.

For the purposes of this schedule—

The expression "county," as regards England, does not include a county of a city or a county of a town, but includes every riding, division, or parts of a county having a separate court of quarter sessions. The Soke of Peterborough shall be deemed to be a county, but every other liberty of a county not forming part of the City of London shall be deemed to form part of the county in which the same is situate or which it adjoins, and if it adjoins more than one county, then of the county with which it has the longest common boundary.

The expression "borough," as regards England, means any place for the time being subject to the Municipal Corporation Act, 1835, and any Act amending the same, which has a separate commission of the peace.

The expression "county," as regards Ireland, includes a riding and a county of a city and a county of a town.

The county of Dublin shall be deemed not to include any portion of the police district of Dublin metropolis.

The two constabulary districts of the county of Galway shall respectively be deemed to be counties for the purposes of this Act.

The expression "borough," as regards Ireland, means any borough or town corporate.

In the borough of Dublin the rate to be levied by the council shall mean the improvement rate.

Fifth Schedule.

FEES OF INSPECTORS.

The following fees are the maximum fees which, unless altered as authorized by this Act, may be taken by any inspector of weights and measures appointed under this Act.

For comparing and stamping all brass weights :—

	s.	*d.*
Each half hundredweight	0	9
Each quarter of a hundredweight	0	6
Each stone	0	4
Each weight under a stone to a pound inclusive	0	1
Each weight under a pound	0	0½
Each set of weights of a pound and under .	0	2

For comparing and stamping all iron weights, or weights of other descriptions not made of brass :—

Each half hundredweight	0	3
Each quarter of a hundredweight	0	2
Each stone	0	1
Each weight under a stone	0	0½
Each set of weights of a pound and under .	0	2

For comparing and stamping all wooden measures :—

Each bushel	0	3
Each half bushel	0	2
Each peck, and all under	0	1
Each yard	0	0½

For comparing and stamping all measures of capacity of liquids made of copper or other metal :—

Each four gallon	0	9
Each two gallon	0	4
Each gallon	0	2
Each half gallon	0	1
Each quarter and under	0	0½

Sixth Schedule.

FIRST PART.

Enactments repealed.

A description or citation of a portion of an Act is inclusive of the word, section, or other part first or last mentioned, or otherwise referred to as forming the beginning or as forming the end of the portion described in the description or citation.

Portions of Acts which have already been specifically repealed are in some instances included in the repeal in this schedule, in order to preclude henceforth the necessity of looking back to previous Acts.

Session and Chapter.	Title or short title of Act.	Extent of repeal.
31 Edw. 3. st. 1.	The statute made at Westminster on the Monday next after the feast of Easter, in the thirty-first year, statute the first.	Chapter two.
6 Anne, c. 11.	An Act for the union of the two kingdoms of England and Scotland.	Article seventeen.
5 & 6 Anne, c. 8. in Ruffhead.		
15 Geo. 2. c. 20.	An Act to prevent the counfeiting of gold and silver lace, and for settling and adjusting the proportions of fine silver and silk, and for the better making of gold and silver thread.	Section five.
35 Geo. 3. c. 102.	An Act for the more effectual prevention of the use of defective weights, and of false and unequal balances.	The whole Act.
36 Geo. 3. c. 85.	An Act for the better regulation of mills.	Section 1 from "and any person or persons appointed" down to "with respect to weights and balances," and from "and every miller or other person as aforesaid, in whose mill shall be found any weight or weights" to the end of the section.
37 Geo. 3. c. 143.	An Act to explain and amend an Act made in the thirty-fifth year of the reign of His present Majesty, intituled "An Act for the more effectual prevention of the use of defective weights and of false and unequal balances."	The whole Act.
55 Geo. 3. c. 43.	An Act for the more effectual prevention of the use of false and deficient measures.	The whole Act.
5 Geo. 4. c. 74.	An Act for ascertaining and establishing uniformity of weights and measures.	The whole Act, except section twenty-five.
6 Geo. 4. c. 12.	An Act to prolong the time of the commencement of an Act of the last session of Parliament for ascertaining and establishing uniformity of weights and measures, and to amend the said Act.	The whole Act.
5 & 6 Will. 4. c. 63.	An Act to repeal an Act of the fourth and fifth year of His present Majesty relating to weights and measures, and to make other provisions instead thereof.	The whole Act.
16 & 17 Vict. c. 29.	An Act for regulating the weights used in sales of bullion.	The whole Act.
16 & 17 Vict. c. 79.	An Act for making sundry provisions with respect to municipal corporations in England.	Section 5.
18 & 19 Vict. c. 72.	An Act for legalizing and preserving the restored standards of weight and measures.	The whole Act.
22 & 23 Vict. c. 56.	An Act to amend the Act of the fifth and sixth years of King William the Fourth, chapter sixty-three, relating to weights and measures.	The whole Act.
23 & 24 Vict. c. 119.	An Act to amend the law relating to weights and measures in Ireland.	The whole Act.
24 & 25 Vict. c. 75.	An Act for amending the Municipal Corporations Act.	Section 6.
25 & 26 Vict. c. 76.	The Weights and Measures (Ireland) Amendment Act, 1862.	The whole Act, except section two, and Part three and so much of Part four as relates to Part three.
25 & 26 Vict. c. 102.	The Metropolis Management Amendment Act, 1862.	Section 101.
27 & 28 Vict. c. 117.	The Metric Weights and Measures Act, 1864.	The whole Act.
29 & 30 Vict. c. 82.	An Act to amend the Acts relating to the standard weights and measures, and to the standard trial pieces of the coin of the realm.	The whole Act.
30 & 31 Vict. c. 94.	An Act to provide for the inspection of weights and measures and to regulate the law relating thereto, in certain parts of the police district of Dublin metropolis.	The whole Act.
33 & 34 Vict. c. 10.	The Coinage Act, 1870.	Section seventeen from the beginning of the section down to "weight of and for weighing such coin," and from "all weights which are not less in weight" to the end of the section.

Second Part.

Enactments re-enacted.

5 & 6 Will. 4, c. 63, s. 9.

All coals, slack, culm, and cannel of every description shall be sold by weight, and not by measure. Every person who sells any coals, slack, culm, or cannel of any description by measure, and not by weight, shall be liable on summary conviction to a fine not exceeding forty shillings for every such sale.

5 & 6 Will. 4, c. 63, s. 26.

In Ireland, in every city or town, not being a county of itself, every person, persons, or body corporate exercising the privilege of appointing a weigh-master, shall supply him with accurate scales, and with an accurate set of copies of the local standards, and in default shall be liable on summary conviction to a fine of twenty pounds, and the accuracy of such set of copies shall be certified under the hand of some inspector of weights and measures. They shall also, once at least in every five years, cause such copies to be readjusted by comparison with some local standards which have been verified by the Board of Trade, and in default shall be liable on summary conviction to a fine of five pounds.

Such set of copies shall for the purpose of comparison and verification be considered local standards, and shall

be used for no other purpose whatever, and if they are so used the person using the same shall be liable on summary conviction to a fine of five pounds.

22 & 23 Vict. c. 56, ss. 6, 8, 12.

The owners or managers of any public market in Great Britain where goods are exposed or kept for sale shall provide proper scales and balances and weights and measures or other machines, for the purpose of weighing or measuring all goods sold, offered, or exposed for sale in any such market, and shall deposit the same at the office of the clerk or toll collector of such market, or some other convenient place, and shall have the accuracy of all such scales and balances and weights and measures or other machines tested at least twice in every year by the inspector of weights and measures of and for the county, borough, or place where the market is situate;

All expenses attending the purchase, adjusting, and testing thereof shall be paid out of the moneys collected for tolls in the market;

Such clerk or toll collector shall at all reasonable times, whenever called upon so to do, weigh or measure all goods which have been sold, offered, or exposed for sale in any such market, upon payment of such reasonable sum as may from time to time be decided upon by the said owners or managers, subject to the approval and revision of the justices in general or quarter sessions assembled if such market be in England, or of the sheriff if it be in Scotland;

For every contravention of this section the offender shall be liable, on summary conviction, to a fine not exceeding five pounds.

22 & 23 Vict. c. 56, ss. 7, 8, 12.

Every clerk or toll collector of any public market in Great Britain, at all reasonable times, may weigh or measure all goods sold, offered, or exposed for sale in any such market; and if upon such weighing or measuring any such goods are found deficient in weight or measure or otherwise contrary to the provisions of this Act, such clerk or toll collector shall take the necessary proceedings for recovering any fine, to which the person selling, offering, or exposing for sale, or causing to be sold, offered, or exposed for sale, such goods, is liable, and the court convicting the offender may award out of the fine to such clerk or toll collector such reasonable remuneration as to the court seems fit.

For every offence against or disobedience to this section the offender shall be liable on summary conviction to a fine not exceeding five pounds.
