V. The third, or *Black Oak Fern*, is both Male and Female: the Male has a Root made up of many Strings, not much unlike the first Male Fern, but lesser. From the Head of this spring forth several Stalks of winged Leaves, which are diversly, but not so finely indented: the Stalks and the Ribs of the Leaves are blackish, but the Leaves themselves of a deep green color. The Female black Oak Fern is almost like to the Male, saving that its Leaves are not so sharp at the Points, and are more white and broad than the Male, in which consists the chief Differences.

VI. *An Observation.* The first of these described at sect. 3. above, some Authors say, 1. does fold its Roots among themselves, like the Roots of *Polypodium*, but they are not above the Bigness of a Wheat Straw, coal black without, white within, and about six or seven inches long, having an innumerable company of small Fibres like Hairs growing thereto, and is of an astringent Taste, enclining to Sweetness. 2. That the Stalks spring from the Roots in several places, variable in number, according to the Length and Encrease of the Root: some Plants have but one or two Stalks of Leaves, others again have six, eight, ten, fourteen or fifteen, &c. 3. That the Stalk has a twofold Division, first the Stalk growing from the Root six or seven inches high and no higher, (and yet some Authors say it is about a foot high:) secondly, the Nerve bearing the Leaves: the main Stalk is no bigger than a Grass Stalk or Bent, flat on the one side and round on the other, smooth and green. 4. That the first pair of Nerves

groto

grow about three inches from the Root, and all the rest following grow by couples, almost exactly one against another, in number about eight, nine or ten pairs, the longest seldom exceeding an inch in Length. 5. That the Leaves grow also on the Nerves by couples, eight or nine couples on a Nerve, of a yellowish green color, and without any Dents on the edges: yet some other Authors say, that the Leaves are like those of the Female Fern, but much lesser, and more finely indented or jagged, so finely cut in, that in shew they resemble Feathers, set round about a small Rib or Sinew. 6. That the back-sides of the Leaves are sprinkled, not with russet or brown Spots or Specks, as the other Ferns are, but as it were painted with white Spots or Marks, not standing out of the Leaves in Scales, as the Spots in the Male Fern, but smooth or flat, and double in each Leaf, close unto the middle Rib or Sinew.

VII. The Places. These do indeed grow in shadowy thick Woods on Mountains, and sometimes in the open Vallies near them; as also among the Mosses growing on old Trees, chiefly Oaks, whence came the Name *Filix Muscosa*, which is a kind of Moss Fern, growing amongst the Moss on Oaks and other Trees, and in the tops of their Trunks when they begin to rot.

VIII. The Times. Neither these nor any of the other Ferns (except Water Fern) have any manifest Flower or Seed, so that their Seasons are not to be specified. As for the Leaves, they perish in Winter, and put forth afresh in the Spring.

IX. The Qualities. The first is hot in the first Degree and dry in the fourth; Astringent, biting and very styptic in Taste, and, as *Rondeletius* thinks, of a deleterious or mortiferous Quality. The other three kinds are like in all their Qualities to English Maiden-hair; and therefore, as to their Specification, Preparations and Virtues, we shall refer you thither.

X. The Specification. The first of these kills Worms, and destroys the Roots of the Hair.

XI. The Preparations. You may have therefrom, 1. A Powder of the Root. 2. A Cataplasim.

The Virtues.

XII. The Powder of the Root. *Matthiolus* says, that if it is mixed with Salt and Bran, and given to Horses, that it kills Worms in them: but I suppose it must be repeated Morning and Night for several days.

XIII. The Cataplasim. It is made of the Roots and Leaves bruised and beaten together. *Dioscorides* says, that if it is applied to places troubled with Hair after Sweating, (because then the Pores are open, and so give a more ready inlet to the Virtue of the Medicament) it is a Depilatory, or a good Remedy to destroy the Roots of Hairs.

C H A P. CCLXI.

OF FERN Rock or Stone.

THE Names. It is called in Greek, *Πτερυγίαιος*, *Πτερυγία*; in Latin, *Filix Saxatilis*, *Chamaefilix*: in English, Rock or Stone Fern; also Dwarf or Small Fern.

II. The Kinds. Authors make many kinds hereof, as, 1. *Filix pumila saxatilis prima Classi*, The first Small or Stone Fern of *Clusius*. 2. *Filix pumila saxatilis altera Classi*, The second Stone Fern of *Clusius*. 3. *Filix saxatilis foliis non serratis*, Small Stone Fern, with Leaves not dented. 4. *Filix saxatilis crispata*, Small curled Stone Fern. 5. *Elencula fontana*, Small Rock Fern. 6. *Chamaefilix Anglica*, English Dwarf Fern, or Sea Fern. 7. *Filix saxatilis Tragi*, Naked Stone Fern.

III. The Descriptions. The first small Stone Fern of *Clusius*, has a long, black and slender Root, creeping under the upper Crust of the Earth, and spreading afloat, with a few slender hard Fibres adjoining thereto. From this Radicle spring forth several Stalks of winged Leaves, about a foot high, which is branched out into several Wings of Leaves, very like unto the Female Fern, but much less, much tenderer and delicate than they, and more finely dented on the edges, and spotted also on the Backs of them, like to the other Ferns.

IV. The second, or Second Stone Fern of *Clusius*, has a thick Head of a Root, much like to that of the first Male Fern. From which spring forth many small Knobs, with a vast number of black Fibres or Threads. From this Head of the Root spring up several strait round Stalks of Leaves, green at first, but blackish when full grown, about four or five inches high, shooting forth winged Leaves from the main Stalk upwards, with Dentings in on both sides, like unto the Male Fern, but much less, and finer, and spotted on the back of them, as the former.

V. The third, or Small Stone Fern with Leave not dented, has a Root like to the Male Fern, and grows very like it, with Stalks of winged Leave d having that they are very much less, (as is the whole Plant) and not indented on the edges, but whole or smooth, like unto the Water Fern.

VI. The fourth, or Small curled Stone Fern, has a Root composed of many blackish Fibres, springing out from the thick Head of a Root: from which Head spring up small Stalks, scarcely four or five inches high, which are set on both sides with tender soft Strings of very small Leaves, so finely divided and dented, that they seem curled; of a dark green color upwards, and paler below towards the bottom, having brownish or reddish Dust like Spots on the back-sides, as *Spleen-wort* has.

VII. The fifth, or Small Rock Fern, is a small Dwarf Fern, resembling in its Root, Stalks and Leaves the Common Fern, but very much less, yet much less than any of the last described: tho' it grows low, yet it bushes out with many small and dark green Leaves, resembling the Ordinary Ferns.

VIII. The sixth, or English Dwarf Fern, has a thick brownish Root, composed of a multitude of Fibres or small Strings. From the Head of this Root spring up several bright, shining, blackish Stalks, two or three inches high, on which are placed many rough, thick, shining, blackish Leaves, with some brownish Spots on them, as other Ferns have, and are finely stript about the edges.

IX. The seventh, or Naked Stone Fern, has a thick tufted Root, composed of a multitude of small Fibres: from the Head of which spring forth many hard and rough Stalks, naked or bare, without Leaves, having some Spots on them, as the Ferns have: these Stalks are only forked at the tops, divided into two, and sometimes into three short parts, bowing or bending down their Heads, having the Smell and Taste of Fern. In my Opinion, as this has not the least Resemblance in its Form of Fern, but rather of *Gramen* or *Grass*; so it ought to be accounted

accounted one of the Species thereof; but for Company sake with other Authors, I have not contended the Point, but have let it pass among the Ferns: it is the *Holostium alterum* Lobelii.

X. *The Places.* They all grow in Rocky and Stony places: the fifth, sixth and seventh, *Lobel* says, grow near the Sea in *Cornwall*, in moist Rocky places.

XI. *The Times.* They spring up and flourish at the times when the other Ferns do, and perish in the like Seasons.

XII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Male and Female Ferns; and therefore to Chap. 259. foregoing, I refer you.

C H A P. CCLXII.

of FERN Water,

O R,

OSMUND Royal.

THE Names. It was unknown to the Greeks, and therefore can have no Greek Name; but it is called in Latin, *Filix florida*, *Filix aquatica*, *Osmunda Regalis*, *Filix palustris*, *Filix Lunaria* Gesnerii, *Filix latifolia* Cordi, *Filicestrum*: in English, Water Fern and Osmund Royal.

II. *The Kinds.* It is the fifth Species of Ferns, and a singular Plant of the kind.

III. *The Descriptions.* It has a great and thick Root, folded, and covered over with many Scales, and interlacing Roots, having in the middle of the great and hard woody part thereof a small white Pith, which by some is called the Heart of Osmund the

Water-man: from this Root shoot forth in the Winter time several hard rough Stalks, half round, and hollowish or flat on the other side, which grow up to the height of two feet, havingundry Branches of winged yellowish green Leaves, spread out on all sides, and set one against another, longer, narrower, and not indented on the edges, as the Common Ferns Male and Female. From the tops of some of these Stalks grow forth a long Bush of small scaly Spikes, as it were, of a more yellowish green color, set on the same manner on the Stalks as the Leaves are, which by some Authors are accounted the Flowers and Seed, tho' others again as much deny it.

IV. *The Places.* It grows in Moors, Bogs and Watery places in many parts of England: it did grow in the midst of a Bog, at the farther end of *Hampstead Heath* near *London*, at the bottom of a Hill adjoining to a small Cottage; also in divers Bogs on a Heath or Common near unto *Burnt Wood* in *Essex*, especially near unto a place formerly digged in search of a Gold Mine, but now it is said to be rooted out of those places: it grows in wondrous plenty in boggy places, Swamps and low moist Grounds thro' almost all *Carolina*: I found it in great plenty in moist and boggy Grounds, bordering upon *Wadmalaw River* in *South Carolina*, where Cart Loads of it might be had, as also in divers places adjacent to *Ashly*, *Cooper* and *Wando* Rivers, and in several other parts of the same Colony.

V. *The Times.* It is green and flourishes all the Summer, as do the other Ferns; and the Spikes of Flowers and Seed are in Perfection in *June*, *July* and *August*; the Leaves decay and die away in Winter, but the Root continues good, and lives for many Years. *Gerard* says, That if it is transplanted into Gardens, it prospers full as well as in its native Soil.

VI. *The Qualities, Specifications, Preparations and Virtues,* are the same with those of the Male and Female Fern in Chap. 259. foregoing, excepting that this is more effectual than they, both for inward and outward Diseases, and therefore rather to be chosen than either of them, or any of them all: also over and above what has been there said, the following Observations have been experimentally made.

VII. *The Decoction in Wine.* It is a singular good Wound-drink, and therefore of excellent Use in curing green Wounds, running Sores, old Ulcers, Fistula's, and the like. It gives ease in the Colick, and all Diseases proceeding from Obstructions of the Spleen, Womb, Reins, &c. and it also prevails against Ruptures or Burstiness. If the Decoction is made in White Wine, it provokes Urine exceedingly, cleansing the Reins, Ureters and Bladder.

VIII. *The Balsam, Oil or Ointment of the Root.* They cure any simple Contusion, heal Wounds, running Sores and old Ulcers; and are singularly good against the Gout, broken Bones, and Bones out of Joint.

C H A P. CCLXIII.

of FIGWORT Great Common.

THE Names. It does not seem to be known to the Greeks, for it has no Greek Name; but it is called in Latin by many Names, as *Ficaria*, *Mille Morbia*, *Ferraria*, *Castrangula*, *Chrysippea* Plinij, as some think, *Galeopsis Diofcoridis*, as *Fuchsius*, *Cordus* and *Dodonæus* think, also *Scrophularia major*: in English Figwort.

II. The Kinds. We make two Generical Kinds of this Plant, viz. 1. *Scrophularia major vulgaris*, The Common Great Figwort, of which in this Chapter. 2. *Scrophularia major peregrina*, Foreign Great Figwort, of which in the next Chapter.

III. Of the first of these sorts there are two Kinds, viz. 1. *Scrophularia major vulgarior*, *Ocimeastrum alterum Tragi*, *Clymenum Mas Gesneri in Hortis*, *Galeopsis Fuchsi*, & *Cordi*, The more Common Great Figwort. It is called *Scrophularia* in most Authors, because it is available ad *Scrophulas*; and *major*, to distinguish it from *Scrophularia minor*, which is *Pilewort*, of which in its place. 2. *Scrophularia major altera Elegans*, The Noble or Beautiful Great Figwort.

Great
Figwort

IV. The Descriptions. The first, or more Common Great Figwort, has a Root which is great, white and thick, with several Knobs or Tubers growing at it, and running a slope under the upper Crust of the Earth, which abides many Years, the Green Herb dying away in the Winter. From this Root spring forth sundry great, strong, hard, square, brown Stalks, three or four Feet high, on which grow large, hard, and dark green Leaves, two at a Joint, which are larger and harder than any Nettle Leaves, but not stinging, and not much unlike in form to

the Leaves of *Water Betony*, so that they are sometimes mistaken the one for the other, being difficult to be known asunder, without a narrow view of them; but these Leaves are not so round dented about the edges, and are also smaller at the ends. At the tops of the Stalks come forth many Purple Flowers, set in Husks, which are something gaping and open, but not so much as any of the *Galeopsis* or *Dead Nettles*, but closer and smaller, somewhat like those of *Water Betony* aforementioned; which being past away, hard, round Heads come in their places, having a small point in the middle, in which is contained small brownish Seed.

Figwort.

Noble.

V. The Second, or Elegant Great Figwort, has a great, thick, white, and knotted Root, like the former, which sends forth from it one or more great, hard, strong, brown Stalks, with Leaves at the Joints, very like the other, but they are fairer, and more sometimes standing at a Joint, especially at the lower Joints. The Flowers are not gaping as the first, but made of four reddish Leaves, which commonly stand at the Joints with the Leaves; which being past, there comes in their places hard round Heads of Seed Vessels, but without any point in the middle, in which are contained a small kind of Seed.

VI. The Places. They are very frequent, especially the first, in most places through the Kingdom, growing in moist and shadowy Woods, and in the lower parts of Fields and Meadows: it may be found in great abundance in *Hornsey Wood*, near *London*, as also in *Store Wood*, and *Snotover*, near *Oxford*.

VII. The Times. They Flower in *June* and *July*, and the Seed will be ripe in a Month after the Flowers are past.

VIII. The Qualities. Figwort is hot and dry in the Third Degree, Anodyne, Discussive, and Vulnerary.

IX. The Specification. It is peculiar for Curing the *Scrophula* or *Kings-Evil*, as also the *Hæmorrhoids* or *Piles*, *Scabs*, *Leprosie*.

X. The Preparations. You may have therefrom

1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Distilled Water. 5. An Ointment. 6. A Cataplasm. 7. A Spirituous Tincture. 8. An Acid Tincture.

* The Virtues.

XI. *The Liquid Juice of Herb and Root.* It is a most admirable Vulnerary; taken to two Spoonfuls, or more, in the Distilled Water of the Plant, it is effectual to dissolve clotted or congealed Blood within the Body, which happens by means of any Wound, or by any Bruise or Fall; and is very powerful to waste away, consume, or destroy that Humor which is the Cause of Struma's, Scrophula's, Leprosies, Scabs, and other like Breakings out.

XII. *The Essence.* It has the same Virtues, but is more powerful to the Intentions above named, being outwardly applied, by bathing it upon Scrophulous Tumors, Hemorrhoids, Scabs, Scurf, Morpew, Leprosie, it is of singular good use, because it relists the protrusion of the Humors which cause them, and also wastes away what is contained in the parts affected; it also cleanses, dries, and induces the healing of running Sores, old Ulcers, Fistula's, and the like; and may be taken inwardly as a Diet, in order to facilitate those Cures.

XIII. *The Decoction of the Roots and Herbs in Wine.* It is a singular good Wound Drink, and of great efficacy (being constantly taken Morning, Noon, and Night to the quantity of half a Pint for a Dose, for some considerable time) to cure inveterate and malign Fistula's, or which yield a malign Jchor, known by its putrid substance, ill color, and fetiditv. The same is also no less effectual against the Kings-Evil, or any other Knots, Kernels, Bunches, or Wens, growing in the Flesh, in what part of the Body soever. It is also of very good use to be applied to the Hemorrhoids or Piles when they grow painful and fall down, and for such other Knots, Tumors, or bunchings out, (as *Ficus in Ano*) which sometimes happens to the Fundament.

XIV. *The Distilled Water from the whole Plant.* It is used for the same purposes, either to take inwardly, or apply outwardly, by bathing, &c. It is of good use for foul and putrid Ulcers, which are hollow or corroding, to stay the malignity, and to dry up the superfluous virulent moisture of them. It also takes away all Redness, Spots, Freckles, Scurf, &c. in the Face and Skin, or any other foul Deformity thereof, tho' inveterate, as the Leprosie, &c. but it will be more effectual if you dissolve therein a proportional quantity of Nitre, Salt of Tartar, or *Saccharum Saturni*, according to the nature of the Disaffection you apply it to.

XV. *The Ointment of Herb and Roots.* but more especially of the fresh Roots. It is made according to the usual Rule of making Ointments, but Authors have left this Prescription. Take the Roots, wash them clean, bruise them, and put them into a Jar Glass, or Earthen Pot, with a sufficient quantity of Butter, or Hogs Lard, or Beef Suet, mixt with an equal quantity of Oil Olive, which is the better of the three, tie over the Jar Glass or Pot with a Bladder, or Leather and brown Paper, and let it so stand in the hottest Sun for 15 or 20 days, then afterwards upon a gentle Fire boil softly for almost an hour, and whilst hot strain it forth, and keep it in a Jar Glass or Gally-pot close covered for use. You may also make it by boiling the bruised Roots and Leaves in Hogs Lard, or in Oil and Wax, and then straining it out as aforesaid. It is exceeding good to anoint with, in order to cure Scrophulous Tumors, or Swellings in the Neck, as also *Ficus in Ano*, and the Hemorrhoids or Piles, it eases the pains, and

many times dissolves the Tumors, and if any of them are Ulcerated, it is of extraordinary use to heal all those kinds of Ulcers, as also Scabs, Leprosie, &c.

XVI. *The Cataplasm.* It is made of the Herb, or of the Root, or of Herb and Root, being beaten in a Mortar till they are soft; being applied it cures Simple Contusions, caused by any Blow or Fall, dissolves the coagulated Blood, and soon heals the Hurt or Wounded part; and it is also no less effectual against Struma's, or the Kings-Evil, and to dissolve any bunchings out, Wens, or Kernels in the Throat or other parts.

XVII. *The Spirituous Tincture.* It stops inward Bleedings, and expels Wind out of the Stomach and Bowels, corrects the cold pituitous Humor which breeds the Kings-Evil Kernels, and other like Tumors, in any part of the Body; and is very efficacious against the Colick, the pain of the Spleen, and Hypochondriack Disaffections. Dose from two drams to four in the Distilled Water, or in Wine, or other proper Vehicle, Morning and Night.

XVIII. *The Acid Tincture.* It strengthens and fortifies the Stomach, and rectifies the Juices in their first Concoction, preventing the generating and concreting of that Matter, or those Humors which breed Struma, or the Disease called the Kings-Evil. It causes a good Appetite, and a strong Digestion, and powerfully opens the Obstructions of the Stomach, Liver, and Spleen, and therefore absolutely cures the Rickets in Children, of which I have had a particular Experience several times. Dose for many drops as to make the Ale, Beer, or Wine grateful.

C H A P. CCLXIV.

Of FIGWORT Great Foreign.

I. *THE Names.* It is called in Latin *Scrophularia major Peregrina*, and by reason the Roots are without Tubers, or Knots, it is called by some *Scrophularia major absque Tuberculis*: in English *Foreign Great Figwort*.

II. *The Kinds.* Authors have given us many Kinds of this Plant, divers of which we can never come at, but so many of them as may be found growing in the Gardens of the Curious here in England, or may possibly grow in some of our Plantations beyond Sea in America, we shall here give you the Description of; and those are, 1. *Scrophularia major Americana*, *Scrophularia Cretica prima Class*, American or Cretick Great Figwort. 2. *Scrophularia major Americana altera*, vel *Indica altera*, *Scrophularia major Hispanica*, *Scrophularia solis Laciniatis Baubini*, The Second Indian or American Great Figwort. 3. *Scrophularia Flore lutea*, *Baubini*, *Scrophularia maxima Montana Columne*, Great Figwort yellow Flowered.

III. *The Descriptions.* The First, or American or Cretick Great Figwort, has a Root which is of about a Fingers thickness, which spreads it self out into several Branches, running under the Superficies of the Earth not very deep, and having many Fibres springing from the same. From this Root rises up a square corner'd green Stalk, brownish on the side next the Sun, at the bottom of which grow several large and long Winged Leaves, set upon pretty long Footstalks, made of many parts, and almost in fashion like the Common Thistle, but without Prickles. The Leaf is large, and much cut in on the edges, making

making every Leaf look almost like to the Leaf of the Red Rattle. From the middle of the Stalk upwards it spreads it self out into other Branches, almost to the very top, those Branches growing smaller and smaller as they grow higher and nearer to the top, having on all sides such like Leaves, but lesser than those growing below. At the tops of the Stalks and Branches are many small Flowers, set almost like unto the first Common Figwort, but part of a deeper, and part of a paler Purple Color, with some yellow Threads rising out of the middle.

IV. *The Second, or Indian or American Great Figwort, has a Root which is thick and bushy, which perishes in the Winter, if it comes up to Flowering, but if it Flowers not, it continues all the Year.* From this Root spring up divers thick, but weak, Stalks or Branches, all lying round about upon the Ground, full of Joints, with large and long dark green Leaves, cut in on the edges into five long Divisions, all of them dented about the edges; and from the same Joints come forth also other lesser Leaves, divided and dented, and with them, towards the tops of the Stalks, several large Flowers of a yellowish color on the outside and lower parts, but of a reddish color, mixt with yellow within. The Flowers being past away, larger and harder Heads succeed than in the Common Kinds, and pointed at the end as the rest, which contain within them small blackish Seed.

V. *The Third, or Yellow Flowered Great Figwort, has a Root which is thick and blackish, with many Fibres or Strings thereat, but without any Tubers or Knobs at all.* From the Head of this Root spring forth several square brown Stalks, a little hairy and soft, above two Feet high, at the Joints of which grow two large, broad, roundish, hairy, soft, green Leaves, deeply indented about the edges, and standing upon very long Footstalks, those at the lower parts of the Stalks being largest, which in Winter lye in a compass upon the Ground about the Root, and those which grow on the Stalks lesser, growing lesser and lesser till they come to the tops; at each Joint with the Leaves comes forth, even almost from the bottom, one small naked Branch, bearing many Flowers in Tufts at the ends of them, which are round and yellow, somewhat like unto the Ordinary or Common sort, parted or cut in at the brims into divers pieces, having some long yellowish Threads in the middle. After the Flowers are past, larger round Heads come than in the Common Kind, but not so large as those in the last described, which have at the end a long point, a little crooked, and contain within them small black Seed.

VI. *The Places.* The two first I have found growing in several parts of Florida, in the South of Carolina, and in those parts leading to the Cape of Florida. The first also has been found growing in Candia, being Clusius his first Cretick Species. The second has been found growing in Spain likewise, but as I am informed was Transplanted thither from America. The third is a Native of Germany and Hungary, from the former of which places it was brought to us; but here in England they are all nursed up in the Gardens of the Curious.

VII. *The Times.* They Flower in July, and the Heads of Seed will be ripe in August or September.

VIII. *The Qualities, Specification, Preparations and Virtues* are the same with those of the Common Kind in the former Chapter, and therefore I shall say no more of them in this place.

C H A P. CCLXV.

Of F L A G Sweet Smelling,

O R,

True A C O R U S.

I. *THE Names.* It is called in Greek *Ἀσπερ*, & *Ἀσπερ*, in Latin *Acorus* or *Acorum*, *Acorus verus*, and *Acorum verum*: Clusius says it is taken to be *Butomos* Theophrasti: and in English *The true sweet smelling Flag*.

II. *The Kinds.* Authors make but one Kind thereof, which *Camerarius*, *Clusius*, *Cordus*, *Gesner*, *Lugdunensis*, *Lobel*, *Matthiolus*, *Monardus*, and others, call *Acorus*, or *Acorum*, which is the vulgar *Calamus Aromaticus Officinarum*, according to *Amatus*, *Brassavolus*, *Casalpinus*, and *Fuchsius*, but it is not the true *Calamus Aromaticus* of the Ancients, for that was really a Reed, whereas this is really and truly a Flag, (but *sweet smelling*) and the Root here intended the Root only of a Flag, as for the True and Ancient *Calamus Aromaticus*, I am apt to believe it is not to be found thro' all Europe, that is to say, not in the Shops; but of this we shall have occasion to speak more in our III. Book.

Sweet Smelling Flag.

III. *The Description.* It has a Root like to the Common Water Flag in the next Chapter, but smaller, and not so red, of a sweet smell and somewhat bitter taste; it is thick and long, lying under the upper Face of the Earth, shooting forwards, and with small Roots, as Suckers on all sides, not much unlike to Garden Valerian, whitish on the outside, or greenish if it lyes above Ground, and more pale or whitish on the inside, consisting of many Joints, from which it shoots forth underneath many long thick Fibres, by which it takes hold in the Ground, the thick part of the

the Root is of a firm or soft substance, yet not woody, but *rather to cut*. From this Root rise up several flaggy Leaves, like unto the *Water flag*, or *Flower-de-luce* in the following Chapter, but narrower, and two or three Feet in length, of a fresh green Color, and Aromatick Smell; yet sometimes they are brownish at bottom, the one Leaf growing out of the side of the other, after the same manner that other *Flags* or *Flower-de-luces* grow, which are thin on both sides, and riged or thick in the midst, the longest for the most part standing in the midst, and some of them curled or plaited towards the ends or tops of them, smelling very sweet as well when they are dry, and kept a long time, as when they are fresh and green. These Leaves abide a long time in the Garden, as tho' they never did, or never would bear any Flowers, they every Year dying down to the Ground, and shooting out fresh every Spring; but after two, three, or four Years continuance in a place without removing, it shoots forth Leaves as formerly, (but no Stalk, as other *Flags* or *Flower-de-luces* do) besides which it shoots forth a long narrow Leaf by it self, flat, like unto the other Leaves, especially from the middle thereof upwards; but from the said middle downwards it is thicker, narrower, and rounder, or rather almost triangular. From the middle of this lone Leaf comes forth one long round Head, very seldom two, in form and bigness like almost unto the *Aglet* or *Catkin* of the *Hulle Nut Tree*; it grows upright, an Inch and half, two Inches, or more in length, as thick as a large Reed, or ones little Finger, set with several small Lines and Divisions, like unto a green *Pine Apple*, or for the most part of a Purplish Green Color, or as *Gerard* says, of a Greenish Yellow Color, curiously Chequered, as if it were Wrought with a Needle, with green and yellow Silk intermixt; out of its Bunches small pale whitish Flowers shoot forth, consisting of four small Leaves apiece, (without any great smell) which quickly fall away, without giving any Seed, so far as any Author has observed.

IV. *The Places*. It is a Foreigner, and grows with us only in Gardens, but bears very rarely its Tuft or Head in our cold Country, for which reason some have said that it is barren, but that doubtless is a mistake, for *Cusius* says that he had seen it bear its Flower or Head in that place where it grows naturally, tho' in *England* it sometimes may be barren. Its Native places are in several parts of *Turkey*, where it grows in moist Grounds, and in such like places it flourishes with us, where are found the largest Roots, the fairest, firmest, whitest, and sweetest, which being dried are a little shrivelled. It grows in *Candia*, as *Pliny* says, as also in *Galatia*, and other adjacent places, and naturally at the Foot of a Hill near to *Prusa*, a City of *Bithynia*, not far from a great Lake. It also grows in great plenty in some parts of *Russia*, but its Roots when dried are more lank or small, not so firm nor white, nor of so choice an Aromatick Smell.

V. *The Times*. It springs up with its Leaves in *March* and *April*, and bears its *Catkin* (in those Countries where it does bear, or is not barren) in the beginning or middle of *July* and *August*. *Johnson* upon *Gerard* says, that in *May* 1632. he received the *Julus* or *Catkin* from Mr. *Thomas Glynn*, of *Glynthoven*, in *Carnarvonshire*, from which it is manifest, that with careful looking after, it may with us be made to bear its Head of Flowers; yet here about *London*, tho' it grows well, and in great plenty in many Gardens, it has scarcely ever been seen to bring forth any thing of that kind.

VI. *The Qualities*. It is hot and dry in the se-

cond degree, Aperitive, Absterfve, Aftringent, Carminative, Diuretick, Cephalick, Neurotick, Stomack, Cordial, Sudorick, and Alexipharmick.

VII. *The Specification*. It is a peculiar thing against Poyson, the Plague, and all contagious Diseases.

VIII. *The Preparations*. The Root is only of use, and you may have therefrom, 1. *A Liquid Juice*. 2. *An Essence*. 3. *An Infusion in Wine*. 4. *A Decoction in Wine*. 5. *A Powder*. 6. *A Cataplasme*. 7. *A Spirituous Tincture*. 8. *An Acid Tincture*. 9. *An Oily Tincture*. 10. *A Spirit*. 11. *A Chymical Oil*. 12. *Potestates or Powers*. 13. *An Elixir*. 14. *A Collyrium*. 15. *A Preserve*. 16. *A Syrup*.

The Virtues.

IX. *The Liquid Juice*. Taken to a Spoonful or two in a Glas of Generous Wine it provokes Urine, eases Pains and Stitches of the Sides, and prevails against the Bittings of Mad Dogs, and other Venomous Creatures, but it ought often to be repeated, at due intervals of time.

X. *The Essence*. It has the Virtues of the Juice, and eases pains of the Stomach and Bowels, eases the Colick, and Gripings of the Guts, prevails against Convulsions, and is an Antidote against all sorts of Poyson, and the Infection of the Plague it self, and is a singular good thing to help a Stinking Breath: it is also commended as an excellent thing against Ruptures or Burstennesses. Dose one Spoonful, or more, Morning and Night, in a Glas of Generous Wine, or some other fit Vehicle.

XI. *The Infusion in Wine*. It has the Virtues of the Juice and Essence, but not all out so powerful; it waxes the Spleen, helps those who have the Strangury, and frees those from danger who are Bitten by any Venomous Serpent: it warms and comforts the Stomach, and causes a good Appetite and Digestion, expels Wind, dries up Rheums, and clears the Sight. Dose five or six Ounces Morning and Night.

XII. *The Decoction in Wine*. It has the Virtues of the Infusion, and being mixed with a little Wormwood Wine, and so drunk, it is of good use to comfort and strengthen a cold and weak Stomach.

XIII. *The Powder*. It is given to one Dram in the Morning fasting, and last at Night going to Bed, in a Glas of the Infusion, against Poyson, the Bittings of Mad Dogs, or other Venomous Creatures, to prevent, and also to cure the Infection of the Plague, or any Pestilential Disease; it comforts a cold and weak Stomach, restoring the Tone thereof where depraved or hurt, and has all the Virtues of the Essence and the other Preparations aforementioned: it heals also inward Bruises.

XIV. *The Cataplasme*. The Root being boiled in Wine to softness, stamped, and then applied as a Cataplasme to the Testicles, it wonderfully abates their Swelling, dissolving all hardness and collections of Humors: it also mollifies hard Tumors in any other part of the Body.

XV. *The Spirituous Tincture*. It is good against Coldness, pains and weakness of the Head, Brain, and Nerves, strengthens the Sight, stops Distillations of Rheum into the Eyes, and is excellent against the Megrin from a cold Cause, Vertigo, Carus, Lethargy, Palsie, Convulsions, and other like Disaffections of the Nerves, Brain, and Womb; it warms and strengthens the Stomach, causes a good Appetite, expels Wind, and gives ease in Cramps, Gripings of the Bowels, Colicks, and the Disease called *Tenasmus*. Dose half a Spoonful in a Glas of Wine Morning, Noon, and Night.

XVI. *The*

XVI. *The Acid Tincture.* There are but few things more excellent against the Infection of the Plague, whether it is taken as a Prophylactick, or a Curative; indeed in all Pestilential Distempers it does Wonders, for it destroys the Poyson and Malignity in its Root, and for the same reason it is good against the Bitings of Mad Dogs, Serpents, or any other Venomous Creature; it is good against Nauseousness of the Stomach, and stops Vomittings, when scarcely any thing else will prevail. Dose so many drops as may make the Vehicle pleasantly sharp, to be often repeated in the day.

XVII. *The Oily Tincture.* Taken inwardly to ten, twelve, or fifteen drops, or more, in a Glass of White Port Wine, it provokes Urine, expels Stones, Sand, Gravel, or other Tartarous Matter in the Reins, Ureters and Bladder; and cures also all cold, moist, sleepy, and Paralytick Diseases of the Head, Brain, and Nerves. Outwardly anointed upon the Joints it cures the Gout, and well anointed upon the Back Bone twice a day, viz. Morning and Evening, as also upon the parts affected, it cures Cramps, Convulsions, and Palfies, and those kind of troublesome Pains, vulgarly called a Rheumatism.

XVIII. *The Spirit.* It is a Noble and Generous Cordial, clears the Heart, revives the Spirits, and strengthens Universal Nature; it is good against Fainting and Swooning Fits, Hypochondriack Melancholy, and other Diseases of like kind. Dose a Spoonful, now and then upon occasion.

XIX. *The Oil Distilled.* Being given from six drops to twelve in any proper Vehicle, it cures the Colick almost to a Miracle; it strengthens the Stomach and all the other Viscera, expels Wind, and prevails against a *Tenasmus*; it is an excellent thing to be taken Morning and Night for some time, by those who are affected with the Palfie, or any inward Convulsions, and is of singular use, being outwardly applied to the parts affected with the same Diseases, and gives ease in the Gout proceeding from a cold Cause; anointed likewise upon parts affected with a Rheumatism, proceeding from cold, it cures it.

XX. *The Potestates or Powers.* They have all the Virtues of the Juice, Essence, Infusion, Pouder, Tinctures, Spirit, and Oil, and are more subtil than any of them; being inwardly taken they diffuse themselves thro' the whole Body immediately, and being outwardly bathed upon any part, they immediately penetrate, even to the Bone it self; yet they are so safe, tho' very hot and subtil, that they will cause no Contractions of the Nerves, but on the contrary, if they be applied to any thing of a Contracture, they will in a few times using it cure the same. Dose inwardly from Forty to Eighty, or a Hundred drops, Morning and Night, in any Generous Wine.

XXI. *The Elixir.* This being the Powers exalted, and brought to their utmost perfection, may be said to have all the same Virtues in transcendency. They are more Stomatick than any of the former Preparations, and therefore more proper to restore the Tone of the Viscera, being hurt, and this more especially upon the Cure of a Dropfie. Dose Sixty or Eighty drops at a time, (several times in a day) in a Glass of strong and fragrant Wine.

XXII. *The Collyrium.* Take of the Liquid Juice, clarified Honey, of each equal parts, mix them. It is good against Dimness of the Sight, Films, Cloudiness, Pearls, Bloodshot, and the like, being put into the Eyes Morning and Evening. Being taken inwardly it is good against Coughs, Colds, Hoarseness, shortness of Breath, difficulty of Breathing, Poyson, pains of the Spleen, and stoppage of Urine.

XXIII. *The Preserver.* The Roots are taken

green and cleansed, then the whole Roots are to be boiled soft in White Port Wine, and so put into double refined Sugar, or clarified Honey, and boiled till the Sugar or Honey has penetrated them, and that they are brought to a consistence. The dried Roots may be preserved also in the same manner, being first steeped till they are soft in White Wine; but yet the Preserve of the Green Roots is most to be desired. It is good to remove the coldness of the Viscera, to warm and comfort a cold and moist Stomach, and cause Expectoration where Flegm is lodged in the Lungs.

XXIV. *The Syrup.* Take of the fresh Roots a Pound, being well cleansed bruise them, and steep them three or four days in Vinegar, then extract the Juice and Vinegar with a Press, to every Pound of which add a Pound and half of clarified Honey, which by gentle boiling bring into a Syrup. It is an excellent Pectoral, cleanses the Breast and Lungs of tough Flegm, causing an easie Expectoration; opens Obstructions of the Stomach, Spleen, and other Bowels, causes a good Appetite and a strong Digestion, and repels a Flux of Humors to the Glandulous parts of the Neck, Throat, and Mesentery.

C H A P. CCLXVI.

Of F L A G Water,

O R,

Water F L O W E R D E L U C E.

I. *THE Names.* It is called in Greek *Ἰουβόνη*, *ἡ Ρωδία*, in Latin *Acorus palustris*, *Pseudodorus Dodonæi*, *Iris lutea palustris*, *Acorus antierinus Tragæ*, *Acorus falsus Cordi*, *Gesneri*, & *Muttholi*, *Acorus palustris Lobelij*, *Gladialis luteus*: in English *Water flag*, *Water Flowerdeluce*, *Segg*, and *Seeg*.

II. *The Kinds.* Some will have it that there are two Kinds of this Plant, because sometimes it is found so exceeding large, as four Feet or more high, and sometimes again it is found not to be above a Foot and half high, or two Feet at most; but this difference in my Opinion arises only from the differing Qualities and Goodness of the Soil, it growing so exceeding large where the Soil is best, and more diminutive where it is worse, there being otherwise no difference in the Roots, Blades or Leaves, Stalks, Flowers, Cods and Seed, nor yet in the manner and form of its growing.

III. *The Description.* It has a Root which is tuberose, but longer and slenderer than those of the Garden Flowerdeluces, of a pale brownish Color on the outside, and of an Horse Flesh Color on the inside, with many hard Fibres springing therefrom; the whole Root is very Styptick, and harsh in taste. From this Root spring up Sword like Leaves, like to those of the Garden Kind, (the whole Plant growing almost exactly like to those of the Garden) but that this has much longer and narrower sad green Leaves, joined together in the same fashion; sometimes the Stalk grows to be between four and five feet high, sometimes not above two Feet high, or a little more, according to the Richness or Poorness of the Soil; at the tops of the Stalks come forth Flowers of a perfect yellow Color, and shaped somewhat like unto those of the *Flowerdeluce*, with three falling Leaves, and other three arched which cover their

A a

bot-

bottoms, but instead of the three upright Leaves, as the *Flowerdeluces* have, this has only three short pieces standing in their places, after which succeed thick and long three square Cods or Heads, containing in each part somewhat large and flat Seed, very like to those of the *Garden Flowerdeluces*, which are sometimes reddish, purplish, and blackish.

IV. *The Places.* It grows usually in watery Ditches, Ponds, Lakes, and Moorish Grounds, which are often overflowed, or kept wet with Water, as at *Lambeth*, on the *Bank Side of the Thames*, and *Ditch Sides* thereabouts, also in moist Meadows, low Grounds, Banks of Rivers, and the like: it grows in vast plenty in the Fens in *Cambridgeshire*, *Isle of Ely*, *Bedfordshire*, *Lincolnshire*, &c. And altho' it is by nature a Watery Plant, yet it will grow and prosper very well if planted in Gardens.

V. *The Times.* It grows up in the Spring, in March and April, Flowers in July, and the Seed is ripe in August.

VI. *The Qualities.* The Root is chiefly used, and is cold and dry in the second degree, Astringent, Repercussive, Traumatick, Anodyne, and Arthritic.

VII. *The Specification.* It is known to bind the Bowels, and stop all Fluxes of Blood or Humors.

VIII. *The Preparations.* You may have therefrom, 1. A Juice. 2. An Essence. 3. An Infusion or Decoction in Wine. 4. A Powder. 5. A Collyrium. 6. A Cataplasm. 7. An Ointment or Balsam. 8. A Distilled Water.

The Virtues.

IX. *The Juice.* Inwardly taken to a Spoonful or two in a Glass of Red Port Wine it is very astringent, and stops all Fluxes of the Bowels, whether of Blood or Humors, as also Pissing of Blood, overflowing of the Terms, and other Fluxes of Blood at Mouth, Nose, or other parts, in external Hemorrhages it must be applied with Stupes to the part.

X. *The Essence.* It has all the Virtues of the Liquid Juice, but is more effectual, being inwardly

given, one or two Spoonfuls at a time, in any proper Vehicle, but it is to be repeated so often at due intervals of time as need shall require: It presently stops the overflowing of the Loches of Women in Child-Bed, and strengthens the Womb, and all the weakened parts.

XI. *The Infusion or Decoction in Wine.* It has the same Virtues with the Juice and Essence, but is weaker, and therefore must be given in larger quantities, as five or six Ounces twice a day.

XII. *The Powder.* Given to one Dram, or more, in Wine, it stops all internal Fluxes of Blood, whether in the Lungs, Stomach, Guts, Reins, Bladder, or Womb: outwardly applied also it stops Bleeding, and being strewed upon old, moist, and running Sores, it cleanses, dries up the moisture, and induces their healing: strewed upon a foul Bone it is said to cleanse it and cover it with Flesh.

XIII. *The Collyrium.* Take of the Distilled Water four Ounces, Red Port Wine two Ounces, of the clarified Juice of the Root one Ounce, mix them. Dropt into fore and watering Eyes it stops the Flux of Rheum, dries and heals them; Cloths or Spunges may also be wetted therein and applied upon the Forehead, it takes away also Clouds, Dimness, Films, Pearls, and the like.

XIV. *The Cataplasm.* Applied to the Joints in the Gout it eases the Pain, and strengthens the part afflicted, so that the Disease seldom or never returns any more upon that Foot; it also stops any Flux of Humors upon the part.

XV. *The Ointment or Balsam.* It is used after cleansing of Wounds or Ulcers, to dry, incarnate, and heal, for as it breeds Flesh, so it stops any defluxion of Humors thereupon, hindring the growing of proud Flesh.

XVI. *The Distilled Water.* Dropt into the Eyes it is good against the watering of them, applied to the Forehead in wet Spunges it stops Defluxions, and fomented on hot Tumors and Inflammations of Womens Breasts, as also upon Cancers, and *noli me tangere*, it cools and gives much ease, and this more especially if it is mixed with a little *Saccharum Saturni*, and then it prevails against foul and putrid Ulcers happening in the Privy Parts of Man or Woman, or in any other part of the Body.

C H A P. CCLXVII.

Of F L A X Manured or Common.

I. *THE Names.* It is called by the *Arabians* *Bazaribichen*, or *Bezerchetan*, in *Greek* *Alva*, in *Latin* *Linum*, and in *English* *Flax*, and *Line*, which last Name some will have from making Lines of it; but I take it to be derived from the *Greek* Name.

II. *The Kinds.* Of *Flax* there are two principal Kinds, viz. 1. *The Manured*; of which we shall Treat in this Chapter. 2. *The Wild Kind*, of which in the next. *The Manured*, *Garden*, or *Common Kind*, is a singular Plant, (of the Peelings of which they make fine Cloths) and is described as followeth.

III. *The Description.* It has a small fibrous Root, which perishes every Year, from whence rises up a round pliant Stalk, about a yard high, beset with narrow, long, and soft Leaves, without any order, and is branched on the top into three or four small Branches, each of them bearing two or three fair Blue Flowers, made of five round pointed Leaves apiece, with some

some threads in the middle, which being past away, round Buttons succeed, which are pointed above, and in which are contained flattish, smooth, shining, brown Seed.

Common Garden Flax

IV. *The Places.* It grows in *England, France, Germany, Italy*, and in most Countries of *Europe*, the Seed being Sown every Year; it grows in *America* also, as in *Carolina*, where I have known it to grow and flourish very well: it prospers best as Co-

lumella says, in a fat, moist, and fruitful Soil. Some, says *Palladius*, Sow it thick in a lein Ground, and so have a fine sort of *Flax*. *Pliny* says that it is to be Sown in Gravelly places, especially in Furrows. Experience has taught us that it grows admirably well in Light, Sandy and Gravelly Grounds, such as *France* abounds with, where it grows in vast plenty, and in other Countries where the Ground is Sandy and Light, as in *Florida*.

V. *The Times.* *Flax* is Sown in the Spring, and Flowers in *June* and *July*, the Seed ripening in the mean Season; after it is plucked up, or cut down, as *Pliny Lib. 19. Cap. 1.* says, the Stalks being bound up in small Bundles, are put into Water subject to the heat of the Sun, and have some weighty things laid thereon, that they may the better steep, and they are so long to lye in the Water, till the Rind or Peeling seems to be loosened so as it may easily peel off, then it is taken up and dried in the Sun; after which the Peelings are prepared for the Block and Hackle, to make the Fibres thereof very fine, in order for Spinning and Making Cloth.

VI. *The Qualities.* There is nothing of this Plant used in a Physical way but the Seed only, and that seems to be temperate in respect to heat or coldness, and is Emollient and Laxative, Pectoral and Anti-pleuritick.

VII. *The Specification.* It is peculiar against Pleurifies, the Piles, and all Contractures of the Nerves and Muscles.

VIII. *The Preparations.* You may have therefrom, 1. *The Seed prepared.* 2. *A Powder of the Seed.* 3. *A Decolion.* 4. *A Balsam.* 5. *A Cataplasm.* 6. *An Oil by Expression.* 7. *A Fumigation.*

The Virtues.

IX. *The Seed prepared.* *Galen* says that some parched the Seed, and eat it with Honey for Food, and that others put it into their Bread, but says he *primo Alimentorum*, it troubles the Stomach, is hard of Digestion, and gives not much Nourishment to the Body; but as to the moving of the Belly downwards (says he) I will neither commend nor discommend it, but it in some small measure provokes Urine, which it does best being parched.

X. *The Powder of the Seed.* If it is mixt with an eighth part of Pepper in fine Powder, and made into an Electuary with Honey, and taken to the quantity of a large Nutmeg every Morning fasting, and Night going to Bed, it prevails against Coughs, Colds, Hoarseness, Wheezing, Obstructions of the Lungs, and vehement Catarrhs.

XI. *The Decolion in Wine.* Sweetned with Honey and drunk it eases the Bellyach and Colick, Stitches, and all Inflammations of the Viscera; if Raisins are boiled in it it opens (says *Pliny*) the Obstructions of the Liver; and if it is applied to any fretting or running Sore it dries it, and stays it from spreading farther.

XII. *The Balsam.* If it is made into a Balsam with Rosin, Powder of Myrrh, and some of the Oil by Expression, and applied to Ruptures, or Swellings of the *Scrotum* or Testicles, it cures the one and discusses the other; it also discusses Tumors in any other part of the Body.

XIII. *The Cataplasm.* If it is made with equal parts of Line Seed, Fenugreek Seed, and Mallows, and applied, it is of good use to mollify and discuss any Tumor or Hardness in any part of the Body. If it is made with *Sal Nitre* and Fig-Tree Alices it eases the Pains, and takes away the hardness of the Nerves, Tendons, and Muscles. If it is made with Figs and Wild Cucumber Roots, and applied, it draws forth Splinters, Thorns, Nails, Prickles, Splinters

Solinters of Broken Bones, or any other thing sticking in the Flesh. If it is made with Cressies it takes away the ruggedness of the Nails. If it is made with Olibanum, Myrrh, and Wine, and applied to the forehead, it helps the Watering of the Eyes. If it is made with Honey, Suet, and Bees Wax, and applied, it helps Struma's, hard Kernels and Swellings under the Ears or Throat; it takes away also Spots and Blemishes of the Skin, Sunburnings, and other Discolorings.

XIV. *The Oil by Expression.* It is said to be a Specifick for curing a Pleurisie, as also Stitches, Peripneumonia's, and other exquisite pains of the Thorax, giving it to six or eight Ounces at a time, or more, and repeating the same at due intervals of time so long as need requires; it is an excellent thing to anoint with, to mollifie the shrinking and hardness of the Nerves, Tendons, or Muscles, soften any hard Swelling, and to give ease, and cure the Piles, Chaps of the Fundament; to soften the hardness thereof, and ease the pain; it also softens the hardness of the Mother; if it is beaten with Red Rose Water, or rather with Water, in which Nitre, or *Saccharum Saturni* has been dissolved, and then be applied to Burnings and Scaldings, it cures them; it is good to burn in Lamps, and will burn longer than Oil Olive will, yet it makes much more Smoak and Soot: besides all these things, it is of excellent use for Painters to make their Drying Oil of, and to mix their Colors with to be applied to Cloth, or Wood, or Stone, Iron, Copper, or Glass, &c.

XV. *The Fumigation.* If a Woman sits over the Fumes of the Decoction of the Seed in Water, or in Water and Vinegar, it softens the hardness of the Womb, and eases the pains of the Mother.

C H A P. CCLXVIII.

of F L A X Wild.

I. *THE Names.* It is called in Greek, *Λίνον ἄγρον*; in Latin, *Linum sylvestre*, *Linum agreste*; and in English, *Wild Flax*.

II. *The Kinds.* There are several kinds of this Plant, as, 1. *Linum sylvestre Catharticum*, *Linum Anglicum*, Our English Wild Flax, or Purging Wild Flax, called by the Country People, *Mil-Mountain*. 2. *Linum sylvestre angustifolium floribus albis, vel Ceruleis*, White Wild Flax. 3. *Linum sylvestre tenuifolium*, Thin or Narrow-leav'd Wild Flax. 4. *Linum sylvestre latifolium floribus Ceruleis*, Broad-leav'd Wild Flax, blew-flowered. 5. *Linum sylvestre latifolium floribus Luteis*, Broad-leav'd Wild Flax yellow-flowered. 6. *Chamaelimum perpusillum*, *Linum sylvestre pumilum*, Dwarf Wild Flax. 7. *Linum sylvestre vulgatum*, The more common Wild Flax.

III. *The Descriptions.* The first, or Purging Wild Flax, has a crooked Root, which is small, white and fibrous, which sends forth sometimes one, but most commonly five, six or more round Stalks, about eight, ten, or twelve inches high, of a brown or reddish color; every Stalk dividing it self near the top, or from the middle upwards into many Branches, of a greener color than the lower part of the Stalk. The Leaves are small, smooth, and of a green color, of the bigness of *Lentil* Leaves, and have in the middle one Rib or Nerve, and no more that may be perceived, and grow along on the Stalk, in very

good Order, by couples, one opposite against another. At the tops of the small Branches the Flowers grow, of a white color, consisting of five small Leaves apiece, the Nails whereof are yellow. In the inside are placed small short Chives also of a yellow color; after which come up little Knobs or Buttons, the tops of which, when the Seed is ripe, divide themselves into five parts, in which is contained small, smooth, flat, slippery yellow Seed. When the Seed is ripe, the whole Herb perishes. The Plant is of a bitter Taste and herby Smell.

IV. *The second, or White Wild Flax, has a Root which is tough and small, and grows like, and has Leaves like unto the Manured Flax, but narrower, and growing upon round, bright and shining Stalks, a foot long, having Flowers like the Manured Flax, but of a white color.* But this Plant is sometimes found with deep blew Flowers, with Violet colored Flowers, and sometimes with white Flowers, streaked with purple Lines.

V. *The third, or Thin or Narrow leav'd Wild Flax, has a tough slender Root, with several Fibres adjoining to it, which sends forth many Stalks, furnished with narrow thin Leaves: the Flowers consist of five Leaves apiece, of a light Purple or Flesh color, which do soon fade and fall away. The Stalks are of about a Cubit in height, beset with small Leaves, yea lesser than those of *Linaria purpurea*. The whole Plant is very like to the Common Manured Flax, but in every respect lesser.*

VI. *The fourth, or Broad-leav'd blew-flowered, has a Root which is great, and lives after Seed-time, shooting forth new Stalks, with woolly Leaves on them, and so abides all the Winter.* This Root, says Gerard, does continue many Years without Sowing, encreasing by its Root into many other Stalks, rising up with many thick, stiff and hairy Branches, sometimes with but one, and sometimes with more, a foot, or foot and half high, and beset with many rough and hairy broad Leaves, (broader than in any of the other sorts.) The Stalks towards their tops branch themselves out, and are beset with smaller Leaves than those below. At the tops of the Stalks

do grow many blew flowers, much greater and larger than those of the Common manured Flax, even as great almost and large as Mallows, sometimes of a deeper, and sometimes of a Paler blew; consisting of five Leaves a piece; which being past away, there succeeds small sharp pointed heads (in the green husk which held the flowers) which are full of Seed; and being ripe, open and shew the same, which is flat, and of a blackish shining Colour, like Line Seed.

VII. *The Fifth, or Broad leav'd yellow flower'd, has a Root which is thick and crooked, with many Fibres thereat, which perishes not, but abides many Years. It springs forth with many Stalks, about a Cubit high, somewhat red and stiff, also round and of a brownish Colour, set with pretty large and thick Leaves, not rough and hairy, but smooth and hard. The Flowers grow plentifully on the tops of the Stalks, being composed of five Leaves apiece, and are large, of a fair, shining, yellow Color, with five threads, coming forth in their middle, having also as many smaller and shorter hairs. The Seed is contained in Heads, flatter than in any of the other, and is of a blacker Color, but not shining like them.*

VIII. *The Sixth, or Dwarf Wild Flax, has a Root which is small and threddy, which sends forth many slender Stalks, of about five, six, seven, eight, or nine Inches high, furnished with several small, long Leaves, and growing on them by Couples. At the tops of the Branches grow the Flowers, which are White, or of a pale yellow, lesser than those of the manured Flax, with yellow Threads in the middle. The Seed is contained in little round heads, and is small. The whole plant is in all things like unto Flax; but in its Stalks, Leaves and Flowers, and all other parts thereof, it is four times lesser.*

IX. *The Seventh, or more Common Wild Flax, has a Root like the manured Kind, and grows also like it, but has greater and higher Stalks, more branched at the Tops, and bearing a greater flock of blew Flowers on them, with Seed also like to the same: But the Seed Vessels will hold or contain the same, and not break open, when ripe, with the heat of the Sun, as the manured kind will do.*

X. *The Places. The first grows plentifully in the unmanured Inclosures of Hampshire, on Chalky Downs, and on Purfleet Hills, in Essex, as also in many other places of this Kingdom: Gesner would have it to be the Helleborine of the Ancients. All the rest grow in Gravelly Grounds: The second and seventh, in well manured Places, as also in Gardens and other the like Soils. The fourth and sixth, grow upon Rocks and Cliffs near the Sea-side, Gerard saw them grow upon the Sea-banks by Lee in Essex, and in many places in the Isle of Sheppy: They grow also between Queenborough and Sherland House. The third and fifth, in Borders of Fields, in uncultivated places, and Hilly Grounds.*

XI. *The Times. The first springs out of the Ground at the beginning of the Spring, and flowers all the Summer. All the rest flower thro' all June, July, and August; the Seed ripening in the mean time.*

XII. *The Qualities, Specifications, Preparations, and Virtues of the six latter described Plants, are the same with those of the manured Flax in Chap. 267. foregoing, and therefore we shall say no more of them here; but come directly to consider the first, or Cathartick kind, which is the most useful.*

XIII. *The Qualities. It is hot and dry, suppos'd in the second Degree: Stomackick, and Cathartick. How this Herb came to be so known, as to be taken notice of, Mr. Goodyer (in Johnson upon*

Gerard's Herbal) has given us an account of going to an *Apothecaries Shop at Winchester in Hampshire, I saw (says he) this Herb lying upon the Stall, which I had seen long before, I desired of him to know the Name of it, he told me, it was called Mill Mountain, and that Doctor Lake's Man had given him the name of it, as also the Way how his Master the Doctor (who was afterwards Bishop of Bath and Wells) did use it.*

XIV. *The Virtues and Use. Take a Handful of Mill Mountain, the whole Plant, Leaves, Seeds, Flowers and all, bruise it, and put it into a Pipkin, with a Pint of White Wine, and set it on hot Embers to Infuse all Night, then pour off the clean Wine, and drink it the next Morning fasting. This will give eight or ten Stools, and purges and cleanses the Stomach and Bowels admirably well. And this was the thing, which the said Doctor Lake always used for his Purge.*

C H A P. CCLXIX.

Of FLAXWEED Narrow leav'd,

O R,

TOAD-FLAX Narrow leav'd.

I. **T**HE Names. It is not known to have any Greek Name, and yet Authors have called it *Ψευδαλινον* and *Ὀνεις*: in Latin, *Pseudolinum*, and *Linaria*: in English, *Flaxweed* and *Toad Flax*.

Flax weed or Toad flax

II. *The Kinds. There are three General Kinds of this Plant, viz. 1. Ψευδαλινον στενδολλον, Linaria, angustifolia, narrow leaved Flaxweed, or Toad Flax, of which in this Chapter. 2. Pseudolinum, vel Linaria latifolia, broad leaved Flaxweed, of which, in the next Chapter. 3. Chamalinarium, Linaria pumila,*

mits, *Linaria repens*, creeping Flaxweed, or Toad Flax, of which in *Chapter. 271.* following.

III. Of the first of these General Kinds, there are these Species following. 1. *Linaria Vulgaris nostras*, *Pseudolinum Brunfelsii*, *Linceri*, and *Dodonai*, *Osyris*, *Muthioli*, *Fuchsi*, *Cordi*, and *Lobelii*: Our Common Flaxweed, or Toad Flax. 2. *Linaria Valentina Clusii*, *Hispanica tertia Clusii*, Spanish Flaxweed of *Clusius*. 3. *Linaria Pannonica major*, vel *Osyris alba*, White Flaxweed or Toad Flax. 4. *Linofyris Nuperorum Lobelij*, Golden Star fashioned Flaxweed, or Toad Flax. 5. *Linaria aurea Tragi*, Golden Flaxweed, or Toad Flax. 6. *Linaria sive Osyris*, vel *Scoparia Italorum*, Befom Flaxweed, or Toad Flax. 7. *Pseudolinaria montana alba*, *Anonymus Clusii*, *Anthylli Montana Lugdunensis*, *Linaria adultiorina alba*, Bastard Flaxweed, or Toad Flax. 8. *Linaria purpurea*, Purple Flaxweed, or Toad Flax, variable Flaxweed.

IV. The Descriptions. The first, or our Common Flaxweed, has a Root which is somewhat Woody, and White, especially the main down right one, with many Fibres, abiding many Years, shooting forth Roots, every way about, and new Branches every Year, which sends forth divers small, slender, blackish Stalks, full set with long and narrow Flax like, blew or ascolor-ed Leaves, and from the middle of them upwards, replenished with a number of pale yellow Flowers (of a strong unpleasent Scent) having Spurs hanging to them like Larks spurs; and having a Mouth like to a Frogs Mouth, such as are to be seen in Common *Antirrhinum*, or *Snopdragon* (of which Flaxweed is said to be a Kind) which are deeper and yellow withall. After the Flowers are past away, round Heads come forth, having blackish flat Seeds. The whole Plant before it comes to Flower, is so very like to *Esula minor*, that the one is scarcely known from the other, but by this Old Verse: *Esula latitescit; sine latte Linaria crescit.*

V. The second, or Spanish Flaxweed, has a Root like the other, which perishes not in Winter, but abides for a long time, and by which the Plant multiplies itself and is increased. From the Root spring up many small Stalks, about a Foot high or more, on which grow very plentifully many narrow Leaves of a greyish or Ashcolor, and at the tops of them, store of small Flowers, which are of a Whitish color on the out side, and more purplish inwardly; but about the gaping Mouth, being of a more yellow color, but yet pale also; the spur behind being of a purplish color; the Seed which succeeds (when it has any, for it seldom bears) is like to the former.

VI. The third, or White Flaxweed, has a great, thick and long Root with some Fibres or Strings adjoining to it, from which rise up many Branches or Stalks very large and pliant, beset towards the top with Flowers, but of a pale, whitish color, and the inner part of the Mouth is somewhat more wide and open than the first, and the Leaves like to the Common sort. Indeed this is in many things like to our Common kind, but the Leaves hereof are larger, and the Flowers greater, and fewer of a pale yellow, but of a deeper yellow in the Mouth, with some hairiness therein.

VII. The fourth, or Golden Starfashioned, has a Root compait of many Strings, intangled one within another; from whence rise up Stalks very stiff and Woolly, beset with Leaves like the Common *Linaria* at Sect. IV. above, with Flowers at the tops of the Stalks, of a faint shining, yellow color, in form and shape somewhat like unto *Conyza major*. This Herb is stalked and leaved like Common Flax, and thought by some to be the true *Osyris*; for which reason latter Writers have called it by a Compounded

Name *Linofyris*, it grows to be three Feet or more high, and is in taste sharp and bitter, having a Clamminess or Glutinosity with all.

VIII. The fifth, or Golden Flaxweed, has a great tufted Fibrous Root, from whence rise up many Stalks a Foot and a half high; which are divided towards the tops into many small Branches: On the several Tops grow Tufts of small Flowers, each little flower being parted into five parts, with a little thread or pebble in the middle; so that it seems full of many golden Hairs or Thrums. The Seed is long and blackish, and is carried away with the Wind. *Fabius Columna* has proved this to be the *Chryso-come* described by *Dioscorides*, Lib. 4. Cap. 55.

Befom
Flaxweed

IX. The Sixth, or Befom Flaxweed, has a Root consisting of a great number of blackish Strings set together, which, with the whole Plant perishes every Year. From this Root springs up most usually but one straight upright square Stalk, three foot and a half or more high, (as it grows in our Gardens) branching it self out divers ways; bearing thereon, many long, narrow Leaves like our Garden or Matured Flax, very thick set together, like unto a Bush, or rather like unto a fair green *Cypress-tree*, growing broad below, and Spire fashion upwards, of a very fair green Colour. At the several joints of the Branches towards the Tops, and among the Leaves, come forth small reddish Flowers, not easily seen, nor much regarded, which turn into small round blackish grey Seed. This *Broom Flaxweed*, tho' it has no beautiful Flowers; yet the Curious Plant it in their Gardens, because the green Plant full of Leaves, is very delightful to behold; being in Italy and other places, planted not only in their Gardens, but also in Pots, to furnish and adorn their Windows; and even with us it grows to be so delectable a green Bush, that it is thought to be worthy to be enumerated among our Hortary rarities and delights.

X. Gerard says that this Befom, or Bushy Flaxweed, from one small Stalk, has many Shoots or Branches, making the whole Plant to resemble a *Cypress-tree*, the Branches growing so handsomely; very thick and Bushy,

Bathy, so that in some places where it naturally grows, they make Besoms of it, from whence came the name Scoparia. The Leaves are small and narrow, almost like to the Leaves of Flax. The Flowers are small, and of an Herby color, growing among the Leaves; it keeps Green to Winter, or till the Frosty weather comes, the hardship of which it never out lives.

Bastard Toad Flax.

XI. *The Seventh, or Bastard Flaxweed, has a Root which is White, divided into several Branches, and lives long, every Year sending up many Stalks, which are hard, pale, green and striated; growing to be a Foot high or more; and upon these, without any order, grow many hard, narrow, long Leaves, like those of Flax; at first of a very tart, but afterwards of a bitterish Taste. The tops of the Stalks are branched out into several Foot stalks, which carry little white Flowers, consisting of five small leaves apiece, lying Star fashion, with some threads in the middle. These being past away, a single five cornered Seed comes forth, containing a white Pith, in a hard Film or Skin.*

XII. *The Eighth, or Purple Flaxweed, has a Root which is small and thready, perishing for the most part every Year, and springing again of its own sowing, if it is suffered to shed its Seed, except the hardness of the Winter kills it. From this Root rise up several small, thick, long, and somewhat narrow leaves, of a whitish green Color; among which rise up divers Stalks of a Cubit height, beset with long narrow Leaves, like unto those of our Common Flaxweed at Sect. IV. foregoing: These Stalks towards the Tops are replenished with many small Flowers of a Purple Color, growing together one above another, spike fashion, which are small and somewhat sweet, whilst they are fresh, and formed much like unto our First or Common Flaxweed, with a gaping mouth, but they are much smaller, and*

want that crooked Spur behind. Sometimes they are of a sad Purple, near unto a Violet Color, and sometimes of a Palet blew Color, having a yellow spot in the middle, or gaping place. The Flowers being past small, hard, round heads come forth, in which are contained small, flat, and greyish Seed.

XIII. *The Places.* The first grows almost every where thro' the whole Kingdom, both by the Way sides, as in Meadows, and also by Hedge sides, and upon the sides of Banks and borders of Fields. The seventh grows on Mountainous places in Germany, and it has been found growing Wild in England, on the side of a Chalky Hill, in an Inclosure, on the right hand of the Way as you go from Droxford to Poppie Hill in Hampshire; all the rest are only nursed up with us in Gardens.

XIV. *The Times.* They all flower in the Summer Months, from May to August, and the Seed is ripe soon after. The eighth, tho' it often sows it self, yet by reason a hard frosty Winter may kill the Seed, it ought to be sown anew every Spring.

XV. *The Qualities.* They are hot and dry in the second Degree; *Aperitive, Absterfive, and Diuretick, Hepatick, Splenetick, and Nephretick, Cathartick, Emmenagogick, Sudorifick, and Alexipharmick.*

XVI. *The Specification.* They are peculiar against the Strangury, Dropie, Jaundice, and Poyson.

XVII. *The Preparations.* You may have therefrom, 1. A Juice, 2. An Essence, 3. An Infusion or Decoction in Wine. 4. A Powder of the Seed. 5. A distilled Water from the whole Plant. Of all these kinds, the first is the most effectual, and most used.

The Virtues.

XVIII. *The Liquid Juice.* Given to three or four spoonfuls Morning, Noon, and Night in a Glas of White Lisbon or Port Wine, it gives ease in the Strangury, powerfully provokes Urine when it is stopped by Sand, Gravel or Tartarous matter, and carries off by Pissing the Water in Dropies. It effectually provokes the Terms in Women, and drives forth the Dead Child and After-birth. Put into Foul Ulcers, whether they be Cancerous or Fistulous, with Tents rowled therein, or the patts washed therewith, or it being injected into them, cleanses them thoroughly from the bottom, and in a short time heals them up safely. It also cleanses the Skin wonderfully from all sorts of filthiness and deformities, as Spots, Marks, Freckles, Lentils, Yellowness, tawminess, Wheals, pimples Scabs, Scurfs, Morpew, Leprosie, and other the like Defeciations.

XIX. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, it washes and cleanses the Reins and Uretory parts from Stones, Gravel, Sand, and Tartarous Mucilage heaped up in those parts; and taken from two to four Spoonfuls in White Lisbon or Port Wine, it moves the Belly downwards, and prevails both against the Dropie and Yellow Jaundice. Drop into the Eyes, it is a certain remedy against all Heat, Inflammations, and Redness therein. It opens obstructions of the Liver and Spleen, purifies the Blood, and is good against Hypochondriack Melancholy.

XX. *The Infusion, or Decoction in Wine.* It has all the Virtues of the Juice and Essence, but weaker in Operation, and therefore must be given in larger Doses, as to six, seven or eight Ounces. It expels Poyson, and is good against the Bittings of Mad Dogs, Serpents, or other venomous Beasts.

XXI. *The Powder of the Seed.* Given to One Dram with the Liquid Juice, or Essence, or Intusion or Decoction as aforesaid, and continued for several days together, it is held to be a singular Remedy

medly against the Dropfie, by reason it powerfully evacuates Watry Humors. It operates so much the more effectually, if the Pouder of the Bark of Dwarf Elder, be mixed therewith in equal quantities, and it be aromatiz'd with a little Cinnamon.

XXII. *The Distilled Water.* It has the Virtues of Juice, Essence and Decoction, but acts in a much weaker manner. It cools Inflammations in any part, and may serve as a Vehicle to convey the other preparations in.

C H A P. CCLXX.

of FLAX WEED. Broad leav'd,

Q. R,

TOAD-FLAX, Broad leav'd.

I. **T**HE Names. It is called in *Greek*, (if what some Modern Writers say, may be admitted) *Παραχρησάριον*: in *Latin* *Pseudolinum latifolium*, *Linaria latifolia*, *Oxyris latifolia*, also *Urinalis*, and *Urinaria*; from the Effects: in *English*, Broad-leaved Flax-weed, or Toad-flax.

II. *The Kinds.* Some have taken this to be the *Antirrhinum Plinij*; but it may possibly be the *Oxyris Dioscoridis*, *Galen*, & *Plinij*: Authors make five Kinds of this Broad leaved, viz. 1. *Linaria latifolia*, *Sive Oxyris latifolia*, *alba Lobelii*, White flowered broad leaved Flaxweed. 2. *Linaria Americana flore parvo*, American Flaxweed. 3. *Linaria latifolia Dalmatica*, The Great Dalmatian Flaxweed. 4. *Linaria latifolia Cretica Major*, The great broad leaved Candy Flaxweed. 5. *Linaria triphylla Carulea Apula Fabii Columna*, The blew three leaved Flaxweed of Naples.

III. *The Descriptions.* The first or white flowered broad leaved, has a Root which is white, long, thick, and great, enduring several Years, and not decaying; from which Root rise up many tough, pliant Stalks, with many Leaves thereon, some broad, cut into many narrow long slips, and some of them long and narrow, without any cut or division, somewhat like those of our Common narrow leaved Flaxweed in Chap. 269. Sect. 4. Set sometimes upon a middle Rib, after a Winged fashion, yet commonly at the end of the rib, broad, and divided into two or three, or more parts. At the tops of the Stalks grow several pale, whitish Flowers, resembling the aforementioned common kind, but with a wider and more open mouth. The Seed is not unlike the other, being very smooth.

IV. *The second, or American kind, has a Root like the former, which shoots forth several small slender, reddish Stalks, spread into many branches, on which grow on both sides of them (but without any order) many dark green Leaves, which are broad, in respect to the narrow leaved kinds, but narrower than those of Dalmatia or Candy next following, tho' not much shorter, and end in a sharp Point. The Flowers grow at tops of the Stalks, in the same manner which the Common narrow leaved kind do, at Chap. 269. Sect. 4. and are of a gold yellow color, but much lesser than they.*

V. *The third, or Great Dalmatian, has a Root which is white, and spreads it self by several ramifications under Ground, not perishing as the Wild kind does, but abiding in the Winter with both Root and Stalks, shooting forth fresh Leaves every Spring.*

These Leaves are fair, large, and green, spreading upon the Ground, being about 2 inches long, and an Inch broad, ending very sharp pointed, without any foot-stalks at them, but rising up with the Stalk, which is firm, hard and round, about 2 or 3 Feet high, and has like Leaves set thereon, without any order, up to the top, but lesser and lesser, as they grow higher. The Stalk is branched at the top, having at every one of the branches such like spikes of deep, or gold-yellow Flowers as are in the Common Wild Kind at Chap. 269. Sect. 4. with Spurs behind them; but each of them are three or four times larger than the Common aforementioned; and the Seed is also like the same, and enclosed in like heads, but larger.

VI. *The fourth, or Great broad leaved Candy, has a Root which is hard and white, bigger at the head, and small below, with some Fibres adjoining to it. This Root sends forth a round thick Stalk, two or three feet high, spreading into many branches, on which are set sometimes two, and sometimes three Leaves together, on a small foot-stalk on each side of them, sometimes one against another, and sometimes not, without keeping any order, each of which is larger and longer than those of the Dalmatian kind, and of a greyish green color, with three veins or ribs in every one of them. At the tops of the branches grow Flowers made for the Form, like the other kinds, but of a differing color, for the gaping Mouth is of a pale blew, and more yellow underneath, with a pale or blewish, and sometimes more purplish Spur behind; the Heads and Seed, are also like those of our Common Wild kind at Cap. 269. Sect. 4. aforementioned.*

VII. *The fifth, or Blew three leaved, has a Root which is small and white, which sends forth sometimes but one Stalk, sometimes more than one, which are White: At whose joints is sometimes but one, and sometimes three Leaves set together, divided almost like Rue leaves, but larger, and cut deeper in, and pointed at the ends of a greyish green, or Ash color. The tops of the Stalks are replenished with such like Flowers, but smaller, and wholly of a blew color, excepting the Mouth which is yellow. They being past away, small round Heads follow, containing large, flat, and blackish Seed.*

VIII. *The Places.* Their Names or Title shew their Original, or in what places they are Natives; but being brought to us are Nurst uponly in Gardens: and the first is a peculiar Garden Plant.

IX. *The Times.* They all flower in the Summer Months, from the end of May to the end of August, but with us, scarcely give any ripe Seed; The American kind flowers very late, as about the end of August.

X. *The Qualities, Specifications, Preparations and Virtues,* are the same with those of the narrow leaved kind, and in especial with the first of that Species in the last Chapter, that being the most efficacious of them all; after which, these of the broad leaved kind come next in place.

XI. *An Observation.* The broad leaved Flaxweed is by much the more powerful opener of Obstructions of the Reins, Ureters, and Bladder, and the greater provoker of Urine; from which eminent faculty it was, that it obtained the Names of *Urinalis* and *Urinaria*: It gives present ease in the Strangury, heat, pain, sharpnels and scalding of Urine, and expels Stones, Gravel, Sand, and Tartarous Mucilage from the Urinary parts, being given the Juice, Essence, Infusion, Decoction, Syrup or Pouder, &c.

C H A P. CCLXXI.

of FLAXWEED Creeping,

O R,

TOAD-FLAX Dwarf.

I. **THE Names.** It may be called in *Greek* *Ψευδώνω ἔραρον*, in *Latin* *Pseudolinum repens*, *Linaria pumila*: and in *English* Dwarf or Creeping Flaxweed, or Toad Flax.

II. **The Kinds.** Authors make fix or more kinds, most of them strangers to us in *England*; the chief which we shall take notice of in this place, are the three following, viz. 1. *Linaria carulea repens*, The Creeping, or Dwarf, blew, or purple Flaxweed, or Toad Flax. 2. *Linaria pumila Hispanica*, Spanish Dwarf Flaxweed, or Toad Flax. This is *Osyris flavo Sytostris Baubini*, and the *Osyris minor Tabern montani*. 3. *Linaria quadrifolia supina*, or *quadrifolia Alpina*; *Linaria Alpina Gefneri*; *Linaria tertia Styriaca Clusii*, Four leav'd Creeping Flaxweed, or blew Mountain Toad Flax.

III. **The Descriptions.** The first, or Creeping Dwarf, blew, or purple Flaxweed, has a Root which is made up of many Fibres, and abides, not perishing in the Winter; this Root sends forth a number of small weak Stalks, leaning down to the Ground, scarcely being able to stand upright; set very full and without order, with little Leaves like those of manured Flax, which are very narrow, and Ashcolored, and are continued up to the tops of the Stalks, where they divide themselves into several other Branches, which have all of them long Heads or Spikes of Flowers, very small, and of a fine blewish purple color, with a yellow Spot in the Mouths of them. The Seed is much like to that of our Common narrow leav'd kind, in Chap. 369. *Setl.* 4. foregoing.

IV. **The second, or Spanish Dwarf Flaxweed**, has a Root small, fibrous and white, creeping under Ground, and perishing every Year; from which shoot up many weak Branches, not able to stand upright, rising to be about six Inches or more high: on which do grow many long and narrow Leaves, very like unto our Common narrow leav'd kind, as well for form as color; so also the Flowers at tops of the Stalks, and the Heads and Seed are like the same, the Flowers being yellow, and the Seed flat and blackish; only in this the Leaves, Flowers and Seed, are all of them much less than the said Common narrow leaved kind, in which consists the difference.

V. **The third, or four leaved creeping Flaxweed**, has a Root which is small, or slender, and white, spreading it self under Ground several ways, and perishes not in Winter, but endures many Years. From this Root shoot forth several small weak Stalks, of the length of those last described, lying almost upon the Ground, and severally divided into many smaller branches, even from the bottom; upon which are set a great many small, short, whitish green Leaves, very orderly one above another, that is, at some but two Leaves, at some three, and at others four, not keeping always exactly to the same number, especially below, they growing more exactly upwards: These Leaves are lesser than those of our Common narrow leaved Flaxweed in Chap. 269. *Setl.* 4. being thick and juicy, growing upon the Stalks at certain spaces, sometimes three, but most usually

four together. The Flowers grow at the tops of the Stalks and Branches, and are in form like those of the Common narrow leaved kind aforementioned, but of a most perfect Violet color: They are somewhat great, and stand not so thick clustering together; the lower lip where it gapes, is of a gold yellow color, to wit, the Spot in the Mouth, the rest of the Flower being of a delicate purple blew. After the Flowers are past, come round Heads, which are somewhat great and thick, and contain within them a flat blackish Seed, in two partitions or Cells.

IV. **The Places.** The first grows Wild in many places, as upon Stone Walls, gravelly Grounds, barren Fields, and along by Hedge sides. The second is a Native of *Spain*. The third grows upon the higher *Alps*: with us they are only Nurst up in Gardens of the Curious.

VII. **The Times.** They all Flower from the end of *May*, to the end of *August*: The Seed ripening in the mean Season.

VIII. **The Qualities.** Specifications, Preparations, and Virtues are the same with our Common narrow leav'd Flax-weed in Chap. 269. to which we refer you, and therefore shall say no more of them here.

C H A P. CCLXXII.

of FLEBANE Greater.

I. **THE Names.** It is called in *Greek* *Κονίζα*: in *Latin* *Conyza*; and in *English* Flebane.

II. **The Kinds.** We divide it into four kinds, viz. 1. *Conyza major*, The greater Flebane. 2. *Conyza minor*, The lesser Flebane. 3. *Conyza pumila*, Dwarf Flebane. 4. *Conyza palustris*, Water Flebane.

lebane true Great

III. Of the greater kinds of Flebane, these offer themselves, viz. 1. *Conyza Major vera Dioscoridis*. The true greater Flebane of Dioscoridis. 2. *Conyza major Montana Germanica*, great Mountain Flebane of Germany. 3. *Conyza Helenitis mellita incana*, Hoary mullet Flebane, with Elecampane Leaves. 4. *Conyza Helenitis foliis laciniatis*, Great jagged Flebane. 5. *Conyza Helenitis pilosa*, Hairy Mullet Flebane. 6. *Conyza media*, The middle kind of Flebane.

IV The Descriptions. The first, or true greater Flebane, has a thick, long, durable and Fibrous Root, which sends forth many Stalks, two or three Feet or more high, which are hard, woody, rough, hairy, fat, and of an overgrown color. The Leaves grow without order, alternately embrace the Stalks, and are many, long, somewhat narrow, and of a yellowish green color, dented a little about the edges, twice as large as those of the Olive-tree, which are rough or hairy, and very fat or clammy, being as it were besmeared with a fattiness or gumminess, which is much more in hot Countries than it is in this of ours; these Leaves are something like unto those of the Italian Star Wort, but larger, and more pointed at the ends. Towards the tops of the Stalks come forth the flowers, at every joint with the leaves a yellow flower, which is somewhat large, and round, almost like the flower of Hawkweed or Groundsel, which when it is full ripe, turns into Down, and flies away with the Wind. The smell hereof is somewhat strong, but sweet withal, and not unpleasant: it is so glutinous and clammy, that what small thing soever, as Flies, Fleas, &c. shall happen to fall or light thereon, are held fast and caught; and for this reason it was called *Flebane*, not for that it has any quality, of otherwise poisoning or killing them.

Flebane Common

V. The second, or Great Mountain, has a Fibrous Root which sends forth several round green Stalks, two feet or more high, but not near so clammy as the former, having many long pointed Leaves

set thereon without order, of a sad, or dark green color, each of which is four or five Inches long, and an Inch and half broad. The Flowers are yellow, somewhat larger than the other, every one standing at the tops of the Branches, upon a long Stalk, in the same manner as the former do, viz. with a Pale or Border of Leaves, and many small thrums in the middle, which pass into Down, and are carried away with the Wind, as the former are. Note. There is another of this sort with longer leaves, and lesser flowers.

VI. The third, or Hoary Mullet Flebane, with Elecampane Leaves, has a Root which is composed of many black Strings or Fibres, by which it takes fast hold of the Ground, which sends up several long, and somewhat broad Leaves, almost in fashion like to Foxglove Leaves, but that these are hoary or grey on the upper side, and of a brownish green on the under side, herein somewhat like to the Leaves of Rha Helenii folio, or Bastard Rouburb with Elecampane Leaves. The Leaves are very Hoary also, the Plant rising to be two or three Feet high, set with the like Leaves as grow below, but smaller and smaller as they grow towards the tops, where many Flowers stand together, like unto the former Flebanes, and much greater than those of Gromwel, which run into Down, and fly away with the Wind. The whole Plant is somewhat clammy, yet much less than the first, and much sweeter than it, smelling much like Honey.

Flebane great Jagged.

VII. The fourth or Great Jagged Flebane, has a bushy Fibrous Root, from which arise thick, crested, and hollow Stalks, divided towards the tops, into several Branches. The Leaves which encompass the Stalk, are deeply galler or cut in on the edges, being of a very considerable length, and broad in respect to that length, all of them extended to a sharp point. The Flowers are Star fashion, of a yellow color, turn into Down, and fly away with the Wind.

The

The whole Plant is covered over with a soft and tender Down, and finells fomerling like Honey.

VIII. The fifth, or Hairy Muller Fleabane, has a bushy Fibrous Root like to the last; but in its Stalks, Leaves and Flowers is so like the third foregoing, that there is no other difference to be found, but that in both Leaves and Stalks, besides the hoariness, this is much more hairy and rough than it, which causes it to be a differing kind from it.

IX. The sixth, or Middle kind, has a Root which is pretty large and Fibrous, from whence arises a branched Stalk of about a Foot and half high; encompassed at certain spaces, with thick, rough, greyish, green Leaves. At the tops of the Branches grow pretty fair yellow Flowers, of the largeness of a little Marigold, which being faded away, turn into Down, and are carried away with the Wind.

X. The Places. The first grows in Syria; Clusius found it near Lisbon, and in divers parts of Spain; but with us it grows only in Gardens. The second on Mountainous places in Germany, England, &c. as also in Gardens: Johannes Thalins found it in Hareynia Sylva in Saxony, and we in many places of our own Country, as near Hampstead, &c. The third, fourth, and fifth, are found upon the Hills in Artois, and some Hilly places in our own Land. The sixth is found growing in moist places about Rivers and Ponds sides, &c. and has been found in St. James's Park, Tuttle Fields, &c.

XI. The Times. They all flower in the Months of June, July, and August, some earlier, and some later than others; the Seed ripening in the mean season.

XII. The Qualities. Fleabane is hot and dry in the third Degree: it is Aperitive, Absterfve, Diuretick, Nephritick, Hyfterick, and Alexipharmick.

XIII. The Specification. It is singular against the Strangury, jaundice, griping of the Guts, Epilepsy, green Wounds, bitings of Mad Dogs, and all sorts of Venemous Creatures, &c.

XIV. The Preparations. You may prepare therefrom, 1. A Liquid Juice. 2. An Essence. 3. An

Infusion or Decoction in Wine. 4. An Oil by Infolation. 5. A Balsam. 6. A Cataplasm. 7. A Spirituous Tincture. 8. An Oily Tincture.

The Virtues.

XV. The Liquid Juice of Leaves and Flowers. It provokes the Terms in Women, and expels the Dead Child and Afterbirth; it cures the Strangury, for it provokes Urine admirably when it is made by drops, by opening the Passages, and expelling the Morbifick Matter, be it what it will. Dose two or three Spoonfuls, Morning and Night, taken in a Glass of fragrant Wine, or other fit Vehicle.

XVI. The Essence. It has all the former Virtues, besides which it opens all Obstructions of Gall, Liver, Spleen, Reins, and Womb; it is good against the Yellow Jaundice, and the Gripping pains of the Belly, and being taken to three or four Spoonfuls in Vinegar or Wine, it prevails against the Epilepsy or Falling-Sickness; injected up the Womb it brings away both Birth and Afterbirth, being also at the same time taken inwardly: given in Red Port Wine it stops any Flux of the Belly.

XVII. The Infusion or Decoction in Wine. It has all the Virtues of the Juice and Essence, but must be given in larger quantities, as to four, six, or eight Ounces: being given Morning and Evening it admirably warms and strengthens a cold, moist, and weak Stomach, provokes Urine powerfully, and prevails against all sorts of Pains and Griets of the Womb: if the Decoction is made in Water, it is good for Women to Bath in whose Courses are stopt, as also to ease all sorts of Pains and Griets of those parts.

XVIII. The Oil by Infusion. Anointed on the Head it eases the Headach and Megrin, coming from a cold Cause; anointed all along the Back Bone, on the Stomach, and on the Pulsies, it is very effectual to take away the shaking Fits of Agues, and those Tremblings which come from cold.

XIX. The Balsam. It is an extraordinary thing for curing simple green Wounds, it brings to Digestion, cleanses, dries, and heals after a singular manner; anointed on the Hemorrhoids it gives ease in the extremity of Anguish, and in a little time cures them.

XX. The Cataplasm. The green Leaves made into a Pulvice, by beating in a Mortar, &c. and applied to any simple green Wound, or Cut, being first well washed or cleansed, heals it in a very short space of time, warms and comforts parts chilled with cold, and applied to the Forehead is a good expedient to cure the Frenzy; so also being applied to the Soles of the Feet; and so applied, it is said to stop any Flux of the Bowels.

XXI. The Spirituous Tincture. It is good against Vomiting and Nauouseousness, expels Wind, and comforts and warms a cold, moist, and weak Stomach, it is good against Poysons, the Bitings of Mad Dogs, Serpents, and all sorts of other Venemous Creatures; it cures all sorts of Fluxes of the Bowels, whether they be of Blood or Humors, and is an extraordinary thing to be taken two, three, or four times a day in any fit Vehicle, (from two to four, or six Drams) by such as are affected with the Palsie.

XXII. The Oily Tincture. This used as the Infolated Oil foregoing, is much more powerful to warm those parts which are chilled with cold, and to take away the cold and shaking Fits of Agues, as also to cure Tremblings, Numbness of any part, Palsies, Convulsions, Cramps, and the like; anointed on the Piles which are not broken, it presently eases the Pain, dissolves the Tumor, and in two or three times anointing cures them; it is an effectual thing against Punctures, Hurts, and Bruises of the

Nerves and Tendons; and given inwardly from ten to twenty or thirty drops, (drope first into fine White Sugar) mixed with a Glas of White Port Wine, it facilitates the Birth, brings away the Afterbirth, or Dead Child, opens Obstructions of the Reins, Ureters, and Bladder, and brings present Relief in the Strangury, caused by small Stones, Sand, Gravel, or Tartarous Matter lodged in those parts.

C H A P. CCLXXXIII.

OF FLEABANE the Lesser.

I. THE Names. It is called in *Greek* Κωϊζα μικρά, in *Latin* *Conyza minor*, and in *English* *Fleabane the lesser*.

II. The Kinds. It is the second Species of *Fleabane*, and is twofold, viz. 1. *Conyza serotina* Theophrasti, *Conyza minor* vera Dioscoridis, Penn. Clusii, Gesneri, & aliorum, The true lesser Fleabane of Dioscoridis. 2. *Conyza caerulea acris*, Tinctorius flos alter Tragi, *Conyza odorata caerulea*, Erigeron quartum Dodonæi, Dentelaria Gesneri, *Conyza muralis*, & *Conyzoides caerulea* Gesneri, *Conyza caerulea Tabernamontani*, *Anellus Montanus Columnæ*; Blew flowered Fleabane. There are some others of this lesser kind, but they are not at all to be met with in *England*.

III. The Descriptions. The first, or true small Fleabane, has a Root which is single, small and slender, with a few Fibres thereat, which perishes every Year. This Root sends forth seldom more than one Stalk, which is about a foot and half high, sometimes not above a Foot, and sometimes not a Foot high, according to the goodness of the Soil it is planted in: It is somewhat hairy and glutinous, or clammy, as the true greater Fleabane, but greener than that great kind. This Stalk is divided into many branches, which are also rough and glutinous. The Leaves are long and narrow; somewhat like those of *Linaria*, or *Flaxweed*, but three times less than those of the greater Fleabane in Chap. 272. Sect. 4. foregoing, and are hairy and unctuous or clammy also. With the small Leaves, at the tops of the Branches come forth small pale yellow Flowers, which are lesser, and less shining than in the said greater Fleabane, which passing away, the Heads are turned into Down, and are carried away with the Wind, as the others are. This whole Plant smells sweeter than most of the others do, and dies every Year, and raises it self of its own Sowings, or else must be new Sown every Year.

IV. The second, or Blew flowered Fleabane, has a small Fibrous and yellow Root, of a very hot and biting taste, which from its Head sends up several longish Leaves, somewhat like those of the Garden Basilic, but a little writhed: The Stalk is about half a yard high, and set alternately with twined longish, narrow, and somewhat rough Leaves, of an overcorn green colour. Some Authors say, the Stalk grows sometimes to be about two Feet high, brownish at the bottom, and is set here and there up to the top, with longer and narrower Leaves, where it is divided into small and short Branches; on which grow many Flowers one above another, in small, longish, scaly green Heads or Husks, compoed of many small and narrow, blewish purple Leaves, something white at the ends or tips, with a small yellow flat Thrum in the middle; in

which middle, there arises up several white threads, whereby each flower, consisting of three colors, White, Purple, and Yellow; makes it seem the more delectable to behold. After these Flowers pass away, there comes in those Husks or Heads which held them, small, long Seed, lying in the Down, each having some thereof at its Head, which together there (when ripe) is blown away with the Wind, if not gathered. The whole Plant is of a sharp taste, but the Root much more, and is nearly as hot as Pepper, of a strong, but not unpleasant smell.

V. The Places. The first grows in *Syria* and *Greece*, also in *Spain* near *Madrid* as *Clusius* says; and in the Woods at *Gramants* near *Mompelier*, as both he and *Lobel* say. The second was found in divers places of the Kingdom of *Naples*, in moist Fields which are in the Mountains, as *Columna* says, as also in Sandy places near the River *Rhone* by *Lions* in *France*, and upon the Alps in *Austria* as *Clusius* says. It grows upon many Chalky Hills in *England*; and *Gerard* says, that he in the Company of *George Bowles* and some others, found it near *Farningham* in *Kent*; and one *William Broad* found it growing at the Black-house at *Gravesend*. The first grows with us only in Gardens.

VI. The Times. The first Flowers in *June* and *July*: the second in *August*, whose Flowers turn quickly into Down, and are carried away with the Wind.

VII. The Qualities, Specification, Preparations, and Virtues are the same with the True greater Fleabane in the former Chapter, to which we now refer you; but with this Observation, that these lesser Fleabanes, are much more efficacious to all the purposes aforementioned; and are much more powerful and effectual to help any Flux, or bloody Flux of the Bowels.

VIII. Nota. The Root of the Blew flowered, being held in the Mouth, absolutely Cures the Tooth-ach.

C H A P. CCLXXXIV.

OF FLEABANE Dwarf.

I. THE Names. It is called in *Greek*, Κωϊζα νάνη, & παρὰ δὲ τὴν Κωνσταντινῆα: in *Latin* *Conyza Pumila*, *Chamaconyza*: in *English* *Dwarf Fleabane*.

II. The Kinds. This is the third Species of Fleabane: And it is two fold, viz. 1. *Conyza Pumila*, *Conyza minor* Tragi, *Matthioli*, *Conyza minima* *Lobelii* & *Dodonæi*; Our vulgar Dwarf Fleabane. 2. *Conyza minor* *Rauwolfii*, *Conyza minor* *Syrriaca*, *Syrian* small Fleabane.

III. The Descriptions. The first, or vulgar Dwarf Fleabane, has a small and Fibrous Root, from whence arises a branched Stalk, about a foot high, set with small longish Leaves, somewhat roundish pointed, soft also and woolly, with a small net unpleasant as some of those going before. The Flowers are replenished with many yellow Threads, like to the middle part of Camomil Flowers, or those of Tansie; and as the former turn into Down, and are carried away with the Wind.

IV. The

IV. The second, or Small Syrian Fleabane, has a small Fibrous Root like the former, whence spring forth many small low Stalks or Branches, about a Foot or more high, whereof but few stand upright, the most of them leaning or lying down upon the Ground, and taking Root again in several places as they lie. The Leaves which grow thereon, are small and long, somewhat like unto the Leaves of the Olive-tree: They are Hairy, Fat, and Clammy, of a strong Smell, yet something sweet withall. At the Tops of the Stalks, grow the Flowers, which are small and yellow like unto those of the first kind in Chap. 273. Sect. 3. aforegoing; which when they are ripe, turn into Down, and fly away with the Wind, as the others do.

V. The Places. The first grows plentifully in such Places as are Plashy, or Wet in Winter. The second *Rauwolfius* found growing about Tripoly in Syria; and here is only Nurst up in Gardens.

VI The Times. The first flowers in July and August, the Seed ripening in the mean Season: The second flowers in August, and with us something alter, if carefully lookt after.

VII. The Qualities, Specification, Preparations, and Virtues of these are the same with those of the Greater Fleabane in Chap. 272. aforegoing; so that no more need be said thereof.

for, *Conyza aquatica* Gesneri, *Conyza maxima* Jerrati folia Thalii; *Lingua major* Dalechampii, & *Lugdunensis*; *Consolida palustris* Tabernamontani, The Greater, Water or Marsh Fleabane. 2. *Conyza aquatica minor* Thalii & Bubbini, *Conyza palustris minor*, The lesser Water or Marsh Fleabane.

Water Fleabane

III. The Descriptions. The first, or greater Water Fleabane, has a large Root, replenished with a vast number of Fibres, which send forth hollow and crested Stalks, a Yard or more high, having several joints as it were, and branched out towards the top. It bears its leaves in an unordered manner, which are long and narrow, sharp pointed, and snipt about the edges like a Saw; hairy, and green on the upper side, and grey or woolly underneath. At the tops of the Stalks and Branches grow many yellow Flowers, pretty large, very like to those of Ragwort, which, when they are ripe, turn into Down, and are quickly carried away with the Wind.

IV. The second, or lesser Water Fleabane, in its Root, Stalks and Flowers, is much like the former, as also in its manner of growing, saving that it is smaller and lower than that is; and the Leaves are sometimes much less denred or jagged on the edges; and the Flowers likewise stand not, but One on a Stalk for the most part; which are like the former, also yellow.

V. The Places. They both grow near Water sides, and in Plashy and Wet Grounds, which are not often dry; but being planted in Gardens where there is a rich Mould, they prosper very well.

VI. The Times. They both of them flower in August and September, and their Seed is ripe not long after, and is suddenly carried away with the Wind.

VII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Great Fleabane in Chap. 272. aforegoing, to which I refer you;

C H A P. CCLXXV.

Of FLEABANE Water.

I. The Names. It is called in Greek *Κοιζα Ένεα, & Ένεδος*: in Latin *Conyza palustris*, *Conyza aquatica*, *Consolida palustris*; and in English Water Fleabane.

II. The Kinds. This is the fourth Species of Fleabane, and is twofold, viz. *Conyza palustris* ma-

Yor. Authors say, that this *Water Fleabane* is as effectual and admirable a Wound Herb, as any of those the most admired.

CHAP. CCLXXVI.

of FLEAWORT.

I. **THE Names.** It is called in *Arabic* Bazarah Cathona, Bezer Cathume : in *Greek* Ψύλλον : in *Latin* *Psyllium*, *Pulicaria*, & *Pulicaris herba* : in *English* Fleawort. This Name is given to it, not because when it is brought green into the House, that it drives away Fleas; but because the Seed thereof is very like to them.

II. **The Kinds.** Authors make four kinds of this Plant; but because seldom more than three come to our hands, we shall only describe them. 1. The first of these is called *Ψύλλον κύνδιον*, *Psyllium Vulgare*, *Pulicaria Vulgaris*, *Gynops Theophrasti*, Common or ordinary Fleawort. 2. *Psyllium majus semper Virens*; *Psyllium alterum Gesneri*; *Psyllium perenne Gesneri* & *Camerarii*; *Psyllium Plinianum forte majus radice perenne Lobelii*; The great evergreen Fleawort. 3. *Psyllium Indicum foliis Crenatis*, *Psyllium Americanum*, vel *floridianum foliis crenatis*, The Indian or American Fleawort with dented Leaves. This is *Psyllium primum Anguillare*, and the *Psyllium verum Dioscoridis* as *Bauhinus* thinks.

Fleawort.

III. **The Descriptions.** The first, or Common Fleawort, has a Root which is not long, but white, hard and Woody, perishing every Year, and raising it self again of its own Seed for many Years, if it is suffered to shed it. From this Root comes forth a Stalk about two Feet high or more, full of Joints, and spreading it self out on all sides into many branches, almost from the bottom to the top; and at

every Joint stand two small, long, and narrow whitish green Leaves, something hairy. At the tops of the Stalks and Branches, stand several small, short, scaly or chaffy Heads, out of which come forth, small whitish, yellow Threads, such as Plantane Heads do give, which are the bloomings of flowers. The Seed is enclosed in those Heads, and is small, and shining whilst it is fresh, very like unto Fleas, both for its color and bigness, (from whence came the Name) but turning black when it is old. The whole Plant is somewhat whitish, and hairy, smelling a little like Rosin.

IV. **The second, or Great evergreen Fleawort,** has a long, hard and Woody Root, which perishes not, but lives in Winter, keeping its Leaves Green all that Season, whence came its Epithite of *semper virens*, or never dying. From this Root spring forth several long and tough Branches, of a Woody substance like the former, but that they, as also their Branches are somewhat greater, longer, and harder, and do a little more bow down to the Ground. The Leaves which grows forth at the joints, resemble the former, but are much longer and much narrower. At the tops of the Stalks and Branches, and at the Joints come forth chaffy Tufts, standing upon long foot-stalks, which are very like to the Ear of the *Alpisti Phalaris*, or *Canary Seed*; in which Heads or Tufts is contained the Seed, which is like the former.

V. **The third, or American Fleawort,** has a long Woody Root with some Fibres adjoining, which sends forth a Woody, reddish, rough Stalk, next to the Ground, growing to be about a Foot high, and spreading it self out into divers Branches. The Leaves stand at the joints thereof, and are somewhat long, narrow pointed at the end, and a little dented in, or rather torn on the edges, and hairy also like the former. The tops of the Branches are more stored with Heads than the former, but of the same bigness and fashion, with Flowers growing in the same manner, containing within them shining Seed like to the others.

VI. **The Places.** The first grows in Italy and Spain, in Fields, and untilld places, but with us only in Gardens. The second grows plentifully in Fields, near the Sea-shoar or Coast, as also in many of our Gardens. The third is a native of the Indies, and has been found growing in Florida, and in the Southern parts of Carolina: From some parts of which Continent it was brought into the European parts of the World.

VII. **The Times.** They all flower with us in June and July, but in their native places all the Summer long.

VIII. **The Qualities.** The Seed of these Plants is that which is chiefly used in Medicine, and that both *Galen* and *Scapio* say, is cold in the second Degree, but temperate in respect to moisture or dryness. It is Emollient, Lubrificative, Anodyne, Pectoral, and a little Cathartick. Some Authors have written that the frequent inward use of this Seed is very dangerous, but it is no otherwise true, than as it falls out in other great cooling Herbs, as *Houfseek*, *Henbane*, *Lettice*, *Nightshade*, and the like, which are all safe enough, if Wisely and fitly applied: but Ignorance, Rashness, and Indiscretion, in the application of Medicaments, has oftentimes done harm, and brought discredit to those Medicaments which (having been free from any dangerous effects) were in all appearance to Wife Physicians of the greatest Use in the Art of Medicine: The same is to be said in the uses of this Plant, as to its Virtues and Effects. It is an excellent thing, and without any evil Qualities, if applied and used by a Wife and skillful Physician.

IX. **The**

IX. *The Specification.* It is good against burning Fevers, Inflammations, Hoarseness, Pleurisy, Hemorrhoids or Piles; causes Expectoration, and quenches the most vehement Thirst.

X. *The Preparations.* You may have therefrom, 1. *A Mucilage of the Seed.* 2. *An Ointment.* 3. *The Seed fried.* 4. *A Cataplasm of the Seed.* 5. *A liquid Juice of the Herb.*

The Virtues.

XI. *The Mucilage of the Seed.* It is made with Barley Water, or Damask Rose Water, or with pure Spring Water, by a bare Infusion of the Seed in the Water, without bruising of it, just as you make a Mucilage of Clary Seed. If it is made with Barley Water, and is dulcified with Syrup of Damask Roses or Violets, and is drunk to four, six or eight Ounces, it opens the Stomach and Bowels, and evacuates downwards gross Flegm and Melancholy, with other viscous Humors: but withal it heals the Corrosion of the Bowels caused by hot, sharp and choleric Humors, or from the over-working of violent Medicines, such as Scammony, Resin of Gallap, Colocynthis, Esula, &c. If it is made with Spring Water, and dulcified with Syrup of Violets, or Syrup of Corn Poppies, it is good against all hot, burning and malign Fevers and Inflammations of the Viscera: it cools the Heat, quenches Thirst, and lenifies the Dryness of the Mouth, Tongue and Throat. It helps also the Hoarseness of the Voice, and other Diseases of the Breast and Lungs, caused by Heat or salt sharp Humors; and the Pleurisy or Peripneumony, if given in time. If it is made with Damask Rose Water, and sweetened with Syrup of Red Roses, it is good against Heat, Pain and Fluxes of the Bowels; and is a singular Remedy in a Tenasmus.

XII. *The Ointment.* Take the Yolk of one Egg, Unguentum Populeon one Ounce, Mucilage of Fleawort Seed a sufficient quantity; mix and make all into an Ointment. It is an extraordinary thing if it is applied to the Hemorrhoids or Piles, laying it on a Cloth, and binding it on them. It helps also all Inflammations in any part of the Body, and eases the Pains which are caused thereby. Applied to the Head and Forehead, it is good against the Head-ach and Megrim; and it is good against all hot Tumors or Breakings out in the Skin, as Blains, Wheals, Pimples, red Pustles in the Face, Pusles, and the like.

XIII. *The fried or parched Seed.* If it is either eaten, or otherwise reduced to powder, and is taken, it is of excellent Use to stop all sorts of Fluxes of the Belly, and heals the Corrosions of the Bowels, caused by acrid or sharp and malign Humors, or the Corrosiveness of violent and sharp Purgers.

XIV. *The Cataplasm.* Made of the Mucilage with the bruised Seed, Oil of Roses and Vinegar, with a sufficient quantity of Rice or Bean Flower, it is good against Pains of the Joints, and Weakness of the same caused by the Gout, Sciatica, &c. which Pains it eases, as also Ruptures in young Children, and the Swelling out of the Navel, being applied: it heals also sore Nipples and sore Breasts of Women giving Suck.

XV. *The Juice of the Herb.* If it is mixt with a little Honey, and put into the Ears, it helps the Running of them, and kills Worms breeding therein. The same mixt with Hogs Lard, and applied to corrupt and filthy Ulcers, cools them, removes their Inflammation, eases the Pain, cleanses and heals them, by repressing the sharp Humors flowing to them.

C H A P. CCLXXVII.

OF FLIX WEED.

I. *THE Names.* It is called in Latin, *Sophia*, and *Sophia Chirurgorum*, by Gerard; also *Pseudonasturtium sylvestre*, and by some *Thalictum* or *Thalidrum*, (tho' these two last are Names which more properly belong to Meadow Rue:) some will have it to be *Sophia Paracelsi*, by which, it is said, he did such Wonders: also *Scrophium Germanicum Tragi*, *Accipitrina Castalpini*, *Nasturtium sylvestre tenuifolium diversum Bauhini*, *Eruca Gelatina Italorum Lobelii*: in English, *Flixweed*.

II. *The Kinds.* Authors make two sorts hereof, viz. 1. *Sophia angustifolia*, Narrow-leav'd Flixweed. 2. *Sophia latifolia*, Broad-leav'd Flixweed; which yet Gerard thinks may be both but one kind, the Leaf thereof growing fairer and larger according to the Richness or Goodness of the Soil. Their Descriptions follow.

Flixweed.

III. *The Descriptions.* The first, or Narrow-leav'd Flixweed, has a Root which is long and woody, perishing every Year; yet if it be suffered to seed, and shed its Seed, it will be wonderfully increased the next Year. From this Root it rises up with a round, smooth, hard, upright Stalk, half a yard or two feet high, seldom more, and spreads it self into several Branches, by which it becomes a beautiful (considering the Plant) or pleasant kind of Bush; on which Stalk and Branches do grow many Leaves, of an over-worn greyish green color, finely cut and divided into a number of fine Jaggs, like unto those of Roman Wormwood, or smallest Leaves of Coriander. The Flowers grow upon the Stalk and Branches, Spike fashion, which are very small, and of a dark yellow color; which being past away, small, long Pods succeed, containing much Seed, which when ripe, is of a yellow color.

IV. *The*

IV. *The second, or Broad-leav'd Flixweed, differs not from the former in its Root, Stalk, Branches, Leaves, Flowers, Cods or Seed, or in its Height or Manner of Growing, saving, that the Leaves of this are broader, in which consists the only Difference.* This was found out by *Tabernmontanus*, or first taken notice of by him; but some Botanists are of Opinion, that the former and this are but one and the same Plant, and have this Difference in the Leaves only accidentally, by growing in some more fertile place: however, *Parkinson* seems to admit of the Difference. They are both of them of a strong and unpleasing Smell, and of a drying Taste.

V. *The Places.* Flixweed grows in moist places of England, almost every where, upon Ash-dunghills, in the Ruins of old Buildings, by Highways, and in filthy, obscure, bare and barren places, also amongst Rubbish.

VI. *The Times.* It flowers and seeds from the beginning of June to the end of September, the Seed ripening in the mean Season.

VII. *The Qualities.* It is temperate in respect of Heat or Cold, and dry in the first Degree; Anodyne, Astringent, Vulnerary, Arthritic and Analeptick.

VIII. *The Specification.* It stops Fluxes of all sorts, eases Pains of the Joints, consolidates broken Bones, kills Worms, and heals Ulcers.

IX. *The Preparations.* You may have therefrom, 1. A liquid Juice of the Herb. 2. An Effence of the same. 3. A Decoction in Wine or Smiths-forge Water. 4. An Ointment or Balsam. 5. A Cataplasim. 6. A distilled Water. 7. The Seed, or Powder of the Seed.

The Virtues.

X. *The liquid Juice.* Drunk to two or three Ounces in Wine, it kills Worms in the Stomach or Belly; and outwardly applied, it kills the Worms, which sometimes breed in filthy and putrid Ulcers.

XI. *The Effence.* Drunk to two or three Ounces mixed with Red Wine, it has the Virtues of the liquid Juice; besides which, it stops the Bloody-flux, and all other Fluxes of Blood; and Fluxes of the Belly, and is no less powerful than *Plantane* or *Comfrey* in the aforesaid Cases, as also to consolidate Bones which are broken or out of Joint.

XII. *The Decoction in Smiths-forge Water, or in Wine.* It has all the Virtues of the Juice and Effence, and performs the same Effects; but ought to be given Morning and Evening for some considerable time, and that to the quantity of six or eight Ounces. It may be used as a Diet-drink by all such as have inveterate and putrid Ulcers, running and ill-conditioned Fistula's; for it alters the Habit of the Body, thickens the Juices, and so induces the healing. Fomented upon the Piles, it eases the Pain, and dissolves them.

XIII. *The Ointment or Balsam.* It may be made either of the green Herb or the Juice; and is very beneficial to digest, cleanse, incarnate, dry and heal old fretting and eating Ulcers, how foul and malignant soever they be; and is a good thing to be kept always in a Readiness by rich and able People in the Country, for the Use of their poor Neighbours whenever there may be an occasion.

XIV. *The Cataplasim.* Being applied to green Wounds or recent Ulcers, it performs all that the Ointment or Balsam can do. It is good to be applied to Fractures and Joints lately dislocated; for it eases the Pain, abates the Inflammation, prevents the Flux of Humors, and strengthens the Part afflicted.

XV. *The distilled Water.* It participates of the Virtues of the Plant, but in a much meaner degree, having the Virtues of the Juice, Effence and Decoction: but its chief Use is for a Vehicle, to convey those Internals into the Body. It is cooling, drying, binding and healing.

XVI. *The Seed, or Powder thereof.* Given to a Dram in Red Port Wine, or in Smiths-forge Water, it has been found by Experience to be of excellent Use to stop the Bloody-flux, Spitting, Vomiting or Pissing of Blood; as also other Fluxes of the Belly. It is also good against Naufragating and Vomiting.

C H A P. CCLXXXVIII.

Of FLOWERGENTLE Great.

O R,

Great VELVET-FLOWER.

THE Names. It is called in Greek, *'Audegr-* $\tau\theta$; in Latin, *Amaranthus*: in English, *Flowergentle*, or *Velvet Flower*. The Greek is derived from *'Amaesimv*, *non marcescens, vel non senescens*, from its never fading or waxing old.

II. *The Kinds.* It is divided into two principal kinds, viz. 1. *'Audegrv* & $\omega\lambda\alpha\varsigma$, *Amaranthus magnus*, The great Flowergentle, of which in this Chapter. 2. *'Audegrv* & $\mu\iota\kappa\epsilon\iota\varsigma$, *Amaranthus parvus*, Flowergentle the less, of which in the following Chapter.

III. Of the greater Flowergentle, there are two sorts, viz. 1. *Amaranthus purpureus major*, & *major panniculis sparsis*, The greater Flowergentle, or Velvet-flower. 2. *Amaranthus maximus, coccineus elegans maximus*. The greatest Scarlet Flowergentle, or Velvet-flower.

III. The

IV. The Descriptions. *The first, or Greater kind, has a Root which is a great Bush of Strings, spreading in the Ground, whereby it is strongly rooted, yet perishes every Year after it has given its Seed. From this Root springs forth one thick, tall, crested, brown, red Stalk, four or five feet high; from whence spring many great broad Leaves, like to some of the other following kinds for the Form, but much larger, and redder for the most part, especially the lowest, which branches forth into several parts: from between these Leaves and the Stalks or Branches, as also at the tops of them, stand long spiky, round, and somewhat flat Tufts, of a more reddish purple color than the first of the following Chapter; and divided also into divers parts, wherein, when they are full ripe, are to be seen an innumerable company of white Seeds, standing out among the short Thrums, and do easily fall away with a little touching. Every one of these white Seeds has, as it were, a hole half bored thro' therein.*

V. *The second, or Greatest Scarlet Flowergentle, has a pretty thick long Root, with some Fibres adjoining to it, which sends up one or more very great, thick, round, tall Stalk, rather higher and greater than the most ordinary great red Flowergentle, with as large great Leaves on it, or rather greater; but both the Stalks and they are of a fresh yellowish pale green color, with little or no Redness in them at all, (and this is one proper Mark to know this sort from others, before it comes to flower.) The Flowers stand at the tops of the Stalks and Branches, more spread at the bottom into several parts, the middle being longest; and commonly when it is in the Perfection, hanging down like a Tassel; the other parts, like shorter Spikes, compassing it round, which even for the Proportion, is very beautiful, but much more for the color, which is of a more excellent bright, scarlet red; and which being gathered in the prime, will hold the color a great while before it decays, especially if it is kept from*

the Sun and Wind. The Seed enclosed in these Tufts, is almost as white and small as the former, yet a little redder, whereby the Difference may be known.

VI. *The Places.* Both these were brought to us first out of the *West Indies*, the latter from *Brazil*, or some other parts of *America*, where they both are much used, especially the Seed. They are all nurs'd up with us in Gardens; but in backward or cold Years they do not so well thrive, because they love much Heat; yet for the most part they give us every Year ripe Seed.

VII. *The Times.* They bear their spiky Flowers in *July* and *August*, and yield their ripe Seed in *August* or *September*.

VIII. *The Qualities.* They are temperate in respect to Heat or Cold, and dry in the first Degree; Astringent, Repercussive, Hysterick, Arthritic and Antemenagogick.

IX. *The Specification.* They are peculiar for stopping all sorts of Fluxes, especially Fluxes of Blood.

X. *The Preparations.* You may have therefrom, 1. A Juice or Essence. 2. A Decoction in Red Port Wine. 3. The Seed, or Powder thereof. 4. A Cataplasm of the Leaves.

The Virtues.

XI. *The liquid Juice of the Leaves, or Essence of the same.* I have made many Experiments of the Virtues of this Plant upon several of my Patients, who have been troubled with Fluxes of the Bowels, Bloody-Fluxes, Spitting and Pissing of Blood, as also the overflowing of the Terms: I have given the Juice or Essence of the same to three or four Spoonfuls at a time in a Glass of Red Port, or some other proper Vehicle, as Smiths-forge Water, &c. and have found it abundantly to answer my Expectation in the Cure of the aforementioned Diseases; and I am satisfied, that sometimes, and upon some Patients, it has done as much as any Vegetable can do: but I gave it Morning and Night, and sometimes also at Noon, and continued the Use thereof for several days.

XII. *The Decoction in Red Port Wine.* It has all the Virtues of the liquid Juice and Essence, but is not full out so efficacious; yet it is somewhat more pleasant to be taken, and may be given from three to six Ounces at a time, Morning, Noon and Night. Given Clysterwise in any vehement Flux of the Belly, as also in a Bloody-flux, and in a Tenasmus, it stops the same, heals the Guts, and strengthens the Parr afflicted: but it ought to be several times repeated, according as the Necessary or Occasion may require.

XIII. *The Seed, or Powder thereof.* It may be given from half a Dram to a Dram at a time, in a Glass of Wine, Morning and Night, against Nauseousness or Vomiting, Weakness of the Bowels, Bloody-flux, Hepatick-flux, and all other sorts of Fluxes. If there is any Corrosion of the Guts, it heals it, stops the Flux of Humors to the Part, and restores the Tone thereof, if hurt or depraved.

XIV. *The Cataplasm of the Leaves.* It repulses Humors, stops Fluxions to any Part, eases Pains, and prevails much against the Gout: but in this last Case it will be so much the better, if an equal quantity of green *Comfrey* Roots be added and beaten up with it.

C H A P. COLXXXIX.

Of FLOWER GENTLE Small,

O R,

The Lesser VELVET-FLOWER.

THE Names. It is called in Greek, *Ἀμάραντος* : in Latin, *Amaranthus parvus* ; and in English, The lesser Flower gentle, or Lesser Velvet-Flower.

II. The Kinds. Authors make four sorts of this lesser kind, viz. 1. *Amaranthus purpureus minor*, The lesser purple Flower gentle, or Velvet-flower : some do think this to be *Phlox*, vel *Flamma Theophrasti*. 2. *Amaranthus Coccineus minor*, The lesser scarlet Flowergentle. 3. *Amaranthus Tricolor*, *Geleia*, vel *Celestia Tragi*, Variable Flowergentle : this some, as *Spigellius*, think to be *Sophonia Plinii* ; others that it is *Theombraton Plinii* ; but these Suppositions are doubtful. 4. *Amaranthus Spica Carna*, Carnation Flower gentle, or Velvet-flower.

III. The Descriptions. The first, or Lesser purple Flower gentle, has a Root consisting of a few *thready Strings*, which soon perish, as the whole Plant does, at the first approach of Winter. From this Root a *crested Stalk* rises up, two feet or more high, purplish at the bottom, but green to the top, which spreads it self forth into many Branches. The Leaves on the Stalk and Branches are somewhat broad at bottom, and sharp-pointed, of a full green color, and oftentimes a little reddish withal, like in Form unto the Leaves of *Blues* (of which this and the rest are accounted Species) or *Small Beets*. The Flowers are long, growing in *Spike* fashion, soft, and as it were gentle Tufts of Hairs, many growing in a manner together, broad at the bottom, and small up at the top, Pyramis or Steeple fashion, of

so excellent a shining deep purple color, tending to a Murry, that in the most excellent colored Velvet a more orient or bright color cannot be seen ; and I suppose from this Respect it is that the French give it the Name of out-passing Velvet. It has no Smell at all, but being bruised, gives the same admirable purple color on Paper ; and being gathered in its full Strength and Beauty, will abide a great while (if it is kept in a dry place, out of Wind and Sun) in its full Beauty and Fineness. In these Tufts lye the Seed, scattered up and down, which is small, very black and shining.

Lesser Scarlet Flower gentle.

IV. The second, or Lesser scarlet Flower gentle, has a slender or small fibrous Root, which perishes the sooner, because it is the more tender. The Leaves of this Plant are longer, and somewhat narrower than the former : the Stalk grows something higher, bearing its long Tufts at several Leaves, as also at the tops of the Stalk and Branches, many being set together, but separate one from another, and each bowing or bending down its Head, like unto a Feather, such as are worn in Gentlemens Caps and Hats, of an excellent Blood-scarlet color. In these Tufts or Heads is contained the Seed, which is black and bright, like the former.

V. The third, or Variable Flower gentle, has a slender, knobby, fibrous and perishing Root, like the foregoing, which sends up a Stalk, but it is nothing so high as the former, which spreads it self out into many Branches, even from the Root up to the top thereof. The chiefest Beauty of this Plant consists not in the Flowers, but in the Leaves, the Flowers being small Tufts, growing all along the Stalk, and at the Joints with the Leaves. The Leaves hereof are of the same fashion with the former, and pointed also ; but every Leaf is to be seen, parted into green, red and yellow, very orient and fresh, (especially if it comes to its full Perfection, which is in hot and dry Weather) yet not divided all alike, but

in some Leaves where the red or yellow is, there will be green, and so varving, that it becomes pleasant to behold; the Seed hercof is black and shining, and not to be distinguished from the former.

VI. Gerard said that it far exceeded his Skill to describe the Beauty and Excellency of this Plant, and that a Painter would be at a stay to depict it in its lively Colors; in few Words (says he) every Leaf resembles in color the most fair and beautiful Feathers of a Parrot, having a stripe of Red, a line of Yellow, a dash of White, and a Rib of green color, not easily in Words to be set forth, the several mixtures of the Colors, which Nature has bestowed hereon, being so excellent and admirable. Johnson says the Leaves are commonly of three colors, the lower part next the Stalk is green, the middle red, and the end yellow; or else, the bottom being green, the middle part is yellow, and the end red.

VII. The fourth, or Carnation Flower Gentle, (which is more rare than all the rest) has a Root consisting of a great many Fibres or Strings, from which rise up very thick fat Stalks, crested and streaked, exceeding smooth, and of a shining red color, which begin at the Ground to divide themselves into Branches; upon which do grow many great large Leaves, of a dark green color, tending to redness, in shew like to those of the Red Beet, streaked and dashed here and there with red, mixed with green; the Flowers grow along the Stalks, from the midst thereof, even to the top, in form like Pannicum, that is, a great number of Chaffie confused Ears thrust hard together, of a deep purple, or rather of a deep bluish, tending to a Carnation color: the form or shape of this cannot be so fitly compared to any thing as to the Velvet Head of a Stag, compact of such like soft feeling substance, in which is contained the Seed, which is white, round, and bored thro' the middle.

VIII. The Places. All these Plants are Natives of the Eastern Countries, as Persia, Arabia, Syria, Turkey, &c. from whence they have been brought to us, and here are only nursed up in Gardens.

IX. The Times. They Flower, or bear their gallant Tufts or Spikes in August, and continue Flowering until September, keeping in some measure their vigor, till Frost overtakes them, at what time they perish. As for the third, or Variable Flower gentle, it ought to be Sown in a hot Bed of Horse Dung, with some Earth strewd thereon, in the end of March, and so ordered as you do Musk Melons, and the like.

X. The Qualities, Specification, Preparations and Virtues, are the same with those in the former Chapter, to which you are referred.

CHAP. CCLXXX.

Of FLOWER of Constantinople,

OR,

FLOWER of Bristol.

I. THE Names. It is called in Greek *Λυχνίς Βυζαντινή*, and *τὴν Κωνσταντινουπόλεως*, & *Λυχνίς Χαλκηδονική*, in Latin *Lychnis Chalcedonica*, *Lychnis Byzantina*, vel *Constantinopolitana*, in English Flower of Constantinople, or Bristol Flower.

II. The Kinds. It is one of the Kinds of *Lychnis*, or *Campions*, and is twofold, viz: 1. *Lychnis Chalcedonica Flore simpliciter miniato*, Single Nonesuch, or Flower of Constantinople, or Bristol Flower. 2. *Lychnis Chalcedonica Flore pleno miniato*, Double Nonesuch, or Double Flower of Constantinople, or Bristol Flower.

Flower of Constantinople

III. The Descriptions. The first, or Single Nonesuch, has a Root which is very Fibrous or Stringy, fastning it self very strongly in the Ground, whereby it much increases it self, from whence spring up many broad and long green Leaves, among which rise up several stiff, round, hairy, jointed Stalks, three Feet high, with two Leaves at every Joint; the Flowers stand at the tops of them, very many together, in a large Tuft or Umbel, consisting of five small long Leaves, broad pointed, and notched in the middle, of a bright red Orange color; which being past, there come in their places small hard whitish Heads, or Seed Vessels, containing black Seed, like to the Seed of Sweet Williams, and having but a small finell.

IV. Of this Single Species there are three other sorts, which differ chiefly in the Colors of the Flowers, viz: 1. *Lychnis Chalcedonica Flore simpliciter albo*, Single Bristol Flower with a White Flower. 2. *Lychnis Chalcedonica Flore simpliciter Carneis*, Single Nonesuch with a Blush or Flesh Color, without variability. 3. *Lychnis Chalcedonica Flore simpliciter Versicolor*, Single Nonesuch Variable. This at first is of a pale Red, after a while it grows paler, and at last it becomes wholly white; and all these diversities of Flowers it will have to be seen at one and the same time upon the Stalks.

V. The second, or Double Nonesuch, has a Root Fibrous, like the former, and increases in like manner, the Leaves and Stalks being hairy and high, and the Flowers growing in Tufts, altogether like the first Single Kind; but in this consists the chief difference, that this bears a larger Umbel or Tuft of Flowers at top of the Stalk, each Flower consisting of three or

four rows of Leaves, of a deeper Orange Color than it, which adds the more Grace to it, but passes away without bearing Seed, as most other double Flowers do; it is a Glorious Flower, being as Magnificent as it is Beautiful.

VI. *The Places.* They were first brought to us out of *Turky*, and are now Planted in our Gardens, almost every where.

VII. *The Times.* They Flower all *June* and *July*, but not till the second Year after Planted, and continue Flowering for many Years, having a Root full of Life, and endures long, being able to sustain the cold of our Country.

VIII. *The Qualities, Specification, Preparations and Virtues* of these Flowers have never been mentioned by any Author, and therefore we have the less to say of them; but doubtless being Kinds of the *Lychnis*, or *Campion*, they may have the same Virtues, and therefore to *Chap. 90.* foregoing we refer you for the same.

C H A P. CCLXXXI.

OF FLOWERDELUCE Bulbous Unmatchable.

I. *THE Names.* The general Name of all the Plants of this kind is in *Arabick* *Asmeni juni*, & *Aierfa*, in *Greek* *Iris*, in *Latin* *Iris*, and in *English* *Flowerdeluce*.

II. *The Kinds.* Of this Plant there are two principal Kinds, viz. 1. *Iris bulbosa*, The bulbous or Onion like Flowerdeluce. 2. *Iris tuberosa*, The tuberous or buncy Flowerdeluce.

III. *Of the Bulbous Kind* there are several Species, as 1. *Iris bulbosa impar*, five incomparabilis, The unmatchable bulbous Flowerdeluce, of which in this Chapter. 2. *Iris bulbosa Anglica*, The English bulbous Flowerdeluce, of which in *Chap. 282*. 3. *Iris bulbosa latifolia*, The broad Leaved bulbous Flowerdeluce, of which in *Chap. 283*. 4. *Iris bulbosa angustifolia major*, The greater narrow Leav'd bulbous Flowerdeluce, of which in *Chap. 284*. 5. *Iris bulbosa angustifolia minor*, The lesser narrow Leav'd bulbous Flowerdeluce, of which in *Chap. 285*.

IV. *Of the Tuberous Kind* there are these following Species, viz. 1. *Iris tuberosa Chalcedonia*, The Turkey tuberous Orrice or Flowerdeluce, of which in *Chap. 286*. 2. *Iris tuberosa alba Florentina*, The Florentine white tuberous Orrice or Flowerdeluce, of which in *Chap. 287*. 3. *Iris tuberosa latifolia*, The broad Leav'd tuberous Orrice or Flowerdeluce, of which in *Chap. 288*. 4. *Iris tuberosa angustifolia*, The narrow Leav'd tuberous Orrice or Flowerdeluce, of which in *Chap. 289*. 5. *Iris tuberosa pumila major*, *Chamaeiris major*, The greater Dwarf Orrice or Flowerdeluce, of which in *Chap. 291*. 6. *Iris tuberosa pumila minor*, *Chamaeiris minor*, The lesser Dwarf Orrice or Flowerdeluce, of which in *Chap. 292*. 7. *Iris Graminea*, The Grass Flowerdeluce, of which in *Chap. 293*. 8. *Iris argia*, *Ayris*, Wild Flowerdeluce, or Stinking Gladdon, of which in *Chap. 294*. 9. *Iris Palustris*, Water Flowerdeluce, or Water Flag, of which we have already Treated in *Chap. 266.* foregoing.

V. *Of the unmatchable Species* there are two kinds, viz. 1. *Iris bulbosa prima latifolia Clusij*, Clusius his first great bulbous Flowerdeluce. 2. *Iris bulbosa Persica*, The Persian bulbous Flowerdeluce.

VI. *The Descriptions.* The first, or Great bulbous Flowerdeluce, has a reasonable great, round, or Onion like Root, black on its outward Coats, and white within, having many long, thick, white Roots instead of Fibres, which make them look like Asphodel Roots. From this Root spring several long and broad Leaves, not stiff, like as all the other, but soft, and greenish on the upper side and whitish underneath, from among which rise up sometimes several small, short, slender Stalks, and sometimes but one, about half a Foot high, bearing at the top one Flower apiece, something like unto a Flowerdeluce, consisting of nine Leaves, of which, those three which stand upright are shorter, and more closed together than in the other kinds of Flowerdeluces, the other three which fall down turn up their ends a little, and those three which in other Flowerdeluces do cover them at the bottom, stand like the upright Leaves of the other kinds, but are parted into two ends, like unto two small Ears; the whole Flower is of a fair Blew, or pale Sky Color in moist, with a long stripe in the middle of each of the falling Leaves, and in some white, but more seldom; these Flowers are very sweet of smell.

VII. *The second, or Persian Flowerdeluce*, has a bulbous, or round Onion like Root, with Leaves somewhat like to the former, but that they are shorter, and a little narrower; the Flower is much of the same fashion with the other, and is of a pale blew ruffetish Color, each of the three lower falling Leaves are almost wholly of a brown Purple, with a yellow spot in the midst of them; this is a rare Plant, and does not often bear Flowers with us, unless planted in a good Soil, and in a warm place, where it may have much of the presence of the Sun, and be shelter'd from Storms and cold Winds, which always keep it back.

VIII. *The Places.* The first is a Native of *Spain* and *Portugal*, the second of *Persia*, but with us they are only nurst up in Gardens, and being very tender Plants, ought to be Houed in Winter.

IX. *The Times.* The first Flowers with us in *May*, and sometimes sooner, but in *Spain* and *Portugal* it Flowers, as *Clusius* says, in *January* and *February*; the second when it Flowers with us, Flowers also in *April* or *May*.

X. *As to the Qualities, Specification, Preparations and Virtues* of these, and all the several Kinds of Bulbous Flowerdeluces, Authors have said nothing, nor is any thing extant concerning the same; and therefore in the four next Chapters we shall take no further notice of them, this being said here once for all; their chief use has been, and yet is, to deck up and adorn the Gardens of the Curious.

C H A P. CCLXXXII.

OF FLOWERDELUCE Bulbous English.

I. *THE Names.* It may be called in *Greek* *Iris cordata heterophylla*, in *Latin* *Iris bulbosa Anglica*, *Iris bulbosa major*, *Iris bulbosa Anglica cerulea*, in *English* *Blue English bulbous Flowerdeluce*.

II. *The Kinds.* It is one of the greater Kinds of the broad Leav'd bulbous Rooted Plants.

III. *The Description.* The Root of this Kind is greater and longer than any of the smaller Kinds which

which have narrow Leaves, it is round, or Onion like, covered with divers brown Skins, which seem to be repleat with long Threads, like Hairs, especially at the small, or upper end of the Root, which thing you will not find in any of the smaller Kinds. From this Root the Plant springs up early, sometimes in January, with five or six long Leaves, which are broad, yet narrow in comparison of their length, and in respect to the other Kinds, also of a whitish green color, crested or straked on the backside, and half round, being hollow, like a Trough or Gutter, white all along the inside of the Leaf, and blunt at the end; from among which rises up a thick round Stalk, a Foot and half, or two Feet high, at the top whereof, out of a skinny husk, comes forth one, and sometimes two Flowers, consisting of nine Leaves apiece, three of which that are turned downwards are larger and broader than the other, having in each of them a yellow spot, about the middle of the Leaf; other three are small, hollow, ridged, or arched, covering the lower part next the Stalk of those falling Leaves turning up their ends, which are divided into two parts; the other three stand upright, and are very small at the bottom of them, and broader towards the top; the whole Flower is of a fair blew Color: after the Flowers are past, Heads three square come up, which are somewhat long and lank, or loose, containing within them round yellowish Seed, which when it is ripe, will rattle by the shaking of the Wind in the dry Husks.

IV. *The Places.* Lobel says that this Blew broad Leav'd bulbous Flowerdeluce grows naturally in the West of England, whether this be true or no, I know not, but of this I am certain, that it grows admirably well in our Climate, and as it is a beautiful Flower, so by much Planting it, it is very much increased; and it grows common in most Country Folks Gardens: it has also been found growing in Spain, and in France, by such as have Travelled thro' those Countries.

V. *The Times.* It Flowers usually in the end of May, or beginning of June, and the Seed is ripe in the end of July, or in August.

VI. *Nota.* Lobel calls this Plant *Hyacinthus Potentiarum Flore Iridis*, because of its Hyacinth Color, but I think without any reason for the same; it is truly an *Iris* or Flowerdeluce, and is called by some *Iris bulbosa major*, five *latifolia*, to difference it from the lesser with narrow Leaves.

C H A P. CCLXXXIII.

OF FLOWERDELUCE
Bulbed broad Leav'd.

I. *THE Names.* It is called in Greek *Ἰρις κορυμβώδης πλατύφυλλος*, in Latin *Iris bulbosa latifolia*, in English Broad Leav'd bulbous Flowerdeluce.

II. *The Kinds.* There are various sorts hereof, viz. 1. *Iris bulbosa major purpurea* & *purpureo Violacea*, The paler or deeper purple great bulbous Flowerdeluce. 2. *Iris bulbosa major purpurea variegata*, five *striata*, The great purple striped bulbous Flowerdeluce. 3. *Iris bulbosa major Flore ru-bente*, The great Peach colored bulbous Flowerdeluce. 4. *Iris bulbosa major*, five *latifolia alba*, The great white bulbous Flowerdeluce. 5. *Iris bulbosa major alba variegata*, The great white striped bulbous Flowerdeluce. 6. *Iris bulbosa major*, five *la-*

tifolia versicolor, The great party colored bulbous Flowerdeluce.

III. *The Descriptions.* The first, or paler or deeper purple great Bulb, has a Root like the English in the former Chapter, nor differs from it in the Leaf; the chiefest difference is in the Flowers, which in this are somewhat larger, and in the one of a deep Blew, or Violet Purple Color, in the other of a deep Purple Color, in all other respects it is like to the former English: there is also another, in all things like to this, saving, that the Flower is of a pale Blew, or an Ash Color.

IV. The second, or Great Purple Striped, has a purple Flower, but with some Veins or Stripes of a deeper Violet Color, variously running thro' the whole Leaves of the Flower. There is another of this sort, which is of a pale Blew or Ash Color, streaked with Lines and Veins of Purple in the Leaves of the Flowers, some more, some less than other. Another also of a Purple Color, like to the first, but that round about the yellow spot in the middle of each of the three falling Leaves is of a pale Blue or Ash Color, the rest of the Leaf remaining Purple, as the other parts of the Flower are.

V. The third, or Great Peach Colored, is more rare than any of the former, and not differing from them in Root, Leaf, or Flower, but only that the Flower in this is of a pale reddish Purple Color, coming something near to the Color of a Peach Blossom.

VI. The fourth, or Great White, has a Root not differing from the others, but only greater, it springs not up so early out of the Ground as the Blew and Purple do, but about a Month or more after; the Leaves are something larger and broader than the others; the Stalk is thicker and shorter, bearing usually two very large and great Flowers, one opening a little before the other, yet oftentimes both in Flower together in the end, and of a pale blewish white Color, which is called a Silver Color while they are in the Bud, and before they are blown open, but then of a purer white, yet with an eye or show of the Silver Color remaining in them; the three falling Leaves are very large, having that yellow spot in the middle of them; after the Flowers are past, Heads come forth like unto the Blew or Purple Kinds, but larger, containing Seed of a reddish yellow color like them.

VII. The fifth, or Great White Striped, is in Root, Leaf, and Flower, also in its manner of growing, like unto the last Great White Flowerdeluce, it differs only in the marking of the Flower, being various from it, for this has in the White Flower great Veins, Stripes, or Marks, of a Violet Blew, dispersed thro' the Leaves of the Flower variously, which adds a superexcellant beauty thereto.

VIII. The sixth, or Great Party Colored, differs not from the last, but in the Flower, which is of a whitish color in the three falling Leaves, having a circle of Ash Color about the yellow spot, the three ridged Leaves being whitish, but ridged and edged with that Ash Color, and the three upright Leaves of a pale blewish white Color, with some Veins therein of a blewish Purple: there are some of this last sort, in which more Varieties are to be seen than can easily be express, or remembered, which variety, it is very probable, might come from the Sowing of the Seed in differing Soils, as has been truly observed in other Plants.

IX. *The Places.* They are all planted, and grow in our English Gardens, where they thrive very well.

X. *The Times.* They all Flower in the end of May, and in June, and the Seed is ripe in July and August.

C H A P. CCLXXXIV.

OF FLOWER DELUCE

Bulbous narrow Leav'd Greater.

THE Names. It is called in 'Greek *Ἰρις ἁγία* *Cōdus σινδριακή* *ισγάνη*, in Latin *Iris bulbosa angustifolia major*, and in English *The greater narrow Leav'd bulbous Flowerdeluce*.

I. The Kinds. There are Twenty Five several Species, whose Names and Descriptions follow in order.

III. The Descriptions. **1.** *Iris bulbosa angustifolia alba Flore majore*, The greater white narrow Leav'd bulbous Flowerdeluce. This has a Root like to the other Kinds, which is a little bigger and rounder in the middle, and in its springing up and manner of growing is much like to the first described in the next Chapter in all its parts, saving, that it is a little larger and higher, both in Leaf, Stalk, and Flower, and much whiter than any of the mixed Kinds which follow, yet not so white as the small Kind in the next Chapter: in these which follow we shall not make a several and large Description to every Kind, for that would be to make often and many repetitions of one and the same thing, for the first of them being once described, (which we have already done) we will to all the following add only the especial differences, either in Leaf or Flower, in Magnitude, Color, or Form, wherein they may vary from that first, or one from another, these being all of the greater Kind.

IV. **2.** *Iris bulbosa angustifolia albescens*, The Milk white narrow Leav'd bulbous Flowerdeluce. Its falling Leaves have a little shew of yellowness, and so are the middle ridges of the arched Leaves, but the upright Leaves are more white; in Root and Leaf it differs not from the first White.

V. **3.** *Argentea*, The Silver Colored narrow Leav'd bulbous Flowerdeluce. Its falling Leaves are of a yellowish white, like the last, the arched Leaves are whiter, and the upright Leaves of a blewish white, which we call Silver Color, like that of *Silver Weed*, or *Wild Tanfic*.

VI. **4.** *Albida*, Whitish. The falling Leaves are yellowish, and sometimes with a little edge of white about them, and sometimes without; the upright Leaves are whitish, as the arched Leaves are, the ridge yellower.

VII. **5.** *Albida labris luteis*, White with yellow Falls. The falls are yellow, the upright Leaves white; all these Flowers are of the same bigness with the first.

VIII. **6.** *Albida angustior*, The more narrow White. The Flower is smaller, and almost as white as the first, the lower Leaves are small, and do as it were stand outright, not having scarcely any fall at all, so that the yellow spot seems to be the whole Leaf; the arched Leaves are not half so large as in the former, and the upright Leaves bow themselves in the middle, so that the tops do as it were meet together.

IX. **7.** *Lutea*, The Yellow. It is like the former, saving, that its falling Leaves are a little more eminent and yellow, with a yellow spot.

X. **8.** *Aurea*, *sive Lutea Hispanica*, The Golden, or Spanish Yellow. It rises not up so high as commonly most of the rest do, and is wholly of a Gold yellow Color.

XI. **9.** *Pallida Lutea*, The pale Yellow. It usually rises higher than the former yellow, and is wholly of a pale yellow, but deeper at the top.

XII. **10.** *Albida lutea*, Pale Straw Color. It is like unto the last pale yellow, but that the falling Leaves are whiter than all the rest of the Flower.

XIII. **11.** *Versicolor Hispanica cerulea labris albis*, The Spanish partly colored Blew. Its falling Leaves are white, the arched Leaves of a whitish Silver color, and the upright Leaves of a fine blewish purple.

XIV. **12.** *Labris Caruleis*, The Blew edged. The falling Leaves will have either an edge of blew, circling the white Leaves, the arched Leaves being a little blewier, and the upright Leaves more purple, or the falls will be almost wholly blew, edged with a blewier color, the arched Leaves pale blew, and the upright Leaves of a purplish blew Violet color.

XV. **13.** *Alba pallida*, A pale White. The falls are white, the arched Leaves pale white, so also the upright Leaves; some are a fair blewish purple: some of them will also have larger Flowers than others, and bear more; for the first sort, which is the most ordinary, seldom bears above one Flower on a Stalk, yet sometimes two: and of the others, some will bear two, and three Flowers, others again but one.

XVI. **14.** *Cerulea*, *sive Purpurea major*, The greater Purple. The Stalk is higher, Flower purple, and larger the Stalk of a very reddish purple color, a little above the Ground, at the foot or bottom of the Leaves and Stalk; this Flowers with the latter sort of Flowerdeluces.

XVII. **15.** *Purpurea serotina*, The late Purple. The Flower is wholly purple, except the yellow spot, and Flowers later than any of the other Purples.

XVIII. **16.** *Purpurea rubescens labris caruleis*, The reddish Purple with blew falls. Its upright Leaves are of a reddish purple, and the falling Leaves of a blew color.

XIX. **17.** *Purpurea rubescens labris albidis caruleis*, The reddish Purple with whitish blew falls. It is of a reddish purple, and its falling Leaves of a whitish blew color, in nothing else differing from the last.

XX. **18.** *Purpurea labris luteis*, The Purple with yellow falls. Its falling Leaves are of a fair Gold yellow, without any stripe, yet in some there are Veins running thro' the yellow Leaves, and some have an edge of a sad dark color about them; the upright Leaves in every of these are of a Violet Purple.

XXI. **19.** *Purpurea labris ex albidis ceruleis, & luteo mixtis*, Partly colored Purple with striped yellow falls. This is like the last, but that the falling Leaves are of a pale blew and yellow, traversing one the other, and the arched Leaves of a pale purplish color.

XXII. **20.** *Subpurpurea labris luteis*, The pale Purple with yellow falls. Its upright Leaves are of a paler purple, and the falling Leaves yellow. There is another Species of this, a little differing from it, in that the arched Leaves are whitish.

XXIII. **21.** *Subcerulea labris luteis*, The Partly colored blew and yellow. Its upright Leaves are of a pale blew, and the falling Leaves yellow. There is another of this sort, but of a little paler blew.

XXIV. **22.** *Crinis coloris elegantiores*, The fair Hair colored. Its upright Leaves are of a fair brownish yellow, or Hair color, and the falling Leaves yellow.

XXV. **23.** *Altera obsoletior*, The dull Hair colored. It is of the same color with the former, but somewhat deader.

XXVI. **24.** *Iris bulbosa Africana*, The Purple or Murry Barbary bulbous Flowerdeluce. As to Root, Leaf,

Leaf, and Flower, and for its form, it is in all respects like unto the middle sort of these *Flowerdeluces*, only the lowest part of the Leaves and Stalk, for about an Inch next the Ground, are of a reddish color, spotted with many spots, and the whole Flower being of a mean size, is of a deep purplish Red, or Murry color, excepting the yellow spot in the midst of the three falling Leaves; it is a Flower of much beauty.

XXVII. 25. *Purpurea carulea obsoleta labris fuscis*, The dusky Party colored Purple. This is the greatest of all these narrow Leav'd Flowerdeluces: in all the parts of it, the Root is greater than any of the other, being thick and short, the Leaves are broader and longer, but of the same color, the Stalk is higher and stronger than any of them, bearing two or three Flowers, which are larger than any of the rest, the falling Leaves are of a dusky yellow, sometimes with Veins and Borders about the Brims of another dun color, having the yellow spot in the middle; the arch'd Leaves are of a sad pale purplish yellow, the upright Leaves are of a dull or dusky bluish Purple, and the Heads or Horns for Seed are also greater, as is likewise the Seed.

XXVIII. *The Places.* All these Flowerdeluces came originally out of Spain and Portugal, and with us they are nourish't up in Gardens, where they prosper very well.

XXIX. *The Times.* They Flower in June, and sometimes continue Flowering until July, but Flower not commonly so early as the *Latifolia*, or broad Leav'd Kinds; they are soon spoiled with Wet in Flowering.

C H A P. CCLXXXV.

OF FLOWERDELUCE Bulbous narrow Leav'd Small.

I. THE Names. It is called in Greek *Ἰρις κοκκαία* *Iris coccinea*, in Latin *Iris bulbosa angustifolia minor*, in English *The lesser narrow Leav'd bulbous Flowerdeluce*.

II. The Kinds. There are but three several Species of this sort taken notice of by Authors, viz. 1. *Iris bulbosa angustifolia alba minor*, The small white narrow Leav'd bulbous Flowerdeluce. 2. *Iris bulbosa angustifolia mauritanica serotina flava minor*, The lesser yellow late narrow Leav'd bulbous Flowerdeluce of Barbary. 3. *Iris bulbosa angustifolia carulea*, sive *Purpurea praecox minor Lusitanica*, The Portugal small early Purple, or Blew narrow Leav'd bulbous Flowerdeluce.

III. The Descriptions. The first, or small white narrow Leav'd bulbous Flowerdeluce, has a Root which is smaller and shorter than those of the *Latifolia*, and without any Hairs or Threads, covered with brown thin Skins, and more plentiful in yielding an increase; its Flower is smaller than the first Kind of the former Chapter; it springs out of the Earth always before Winter, which afterwards breaks forth into four or five small and narrow Leaves, a Foot or more long, of a whitish green on the inside, which is hollow and channelled, and of a bluish green color on the outside, and round withal; the Stalk is longer and slenderer than those of the *Latifolia*, with some shorter Leaves upon it, at the top whereof,

out of short skinny Leaves, come forth one or two Flowers, smaller, shorter, and rounder than the Flowers of the last of the broad Leav'd, yet made after the same proportion, with nine Leaves, three falling downwards, with a yellow spot in the middle, other three made long; made like a long arch, which cover the lower part, next the Stalk of those falling Leaves, and turn up at the ends of them, where they are divided into two parts; the other three stand upright, between each of the three falling Leaves, being somewhat long and narrow; the Flower is wholly of a pure white color, (saving the yellow spots) yet in some having a show of some hlewness throughout, and in others towards the bottom of the three upright Leaves: after the Flowers are past, so many long Cods or Seed Vessels rise up, as there were Flowers, which are longer and smaller than in the last of the broad Leav'd, and a little bending, like a Coronet, with three round squares, and round pointed also, which dividing it self (when the Seed is ripe) into three parts, do shew fix several Cells or places, wherein is contained such like round reddish yellow Seeds as those of the last *Latifolia*, but something smaller.

IV. The second, or lesser yellow late narrow Leav'd, is a smaller Plant, or Dwarf Kind, brought from the farther parts of Barbary, near the Sea, like unto the yellow greater narrow Leav'd, viz. the Ninth and Tenth of the former Chapter, but that this is smaller and lower, and instead of upright Leaves, has small short Leaves like Hairs; its Flowers very late, after all others have yielded their ripe Seed.

V. The third, or small early Purple Portugal, is smaller in all its parts than the *alba pallida* at Sect. XIII. of the former Chapter, the Stalk is slenderer, and not so high, bearing at the top one or two small Flowers, all wholly of a fair bluish Purple, with a yellow spot in the middle of every one of the falling Leaves.

VI. The Places. These, also all of them, came first to us from Spain and Portugal, but are here nurst up in Gardens, where they thrive very well.

VII. The Times. The first Flowers in June, and sometimes in July, but not so early as the former broad Leav'd Kinds. The second Flowers very late, after most of the others, and the third usually Flowers very early, even with the first bulbous Flowerdeluces.

VIII. Nota. It is possible that there may be many more Kinds or Differences of these bulbous Flowerdeluces, which may arise from the different goodness of the Seed, also from the Soil, and the time and manner of Sowing it, as many have observed from their own experience, every Year shewing forth some variety which was never seen before.

C H A P. CCLXXXVI.

OF FLOWERDELUCE Tuberous Great Turkey,

O R,

FLAG FLOWERDELUCE.

I. THE Names. It is called in Greek *Ἰρις χυμαίνουσα* *Iris chymaina*, in Latin *Iris tuberosa Chalcidonica major*, in English *The great Turkey tuberous Flowerdeluce*.

II. The

II. *The Kinds.* This is the first of the *Tuberos* sorts, of which there are two special Kinds, viz. 1. *Iris Chalcædonica*, *five Saffiana major*, The great Turkey Flowerdeluce. 2. *Iris Chalcædonica*, *five Saffiana minor*, The lesser Turkey Flowerdeluce. This latter, tho' it is called *minor*, or *lesser*, yet it is only so in respect to the first great Kind, but it is *major* or *major*, in respect of the little Kinds, which hereafter follow.

III. *The Descriptions.* The first, or Great Turkey Flowerdeluce, has a Root which is brown on the outside, and is very thick and tuberos, as all others of this sort of Garden Kinds are. From this Root spring forth several Heads of long and broad fresh green Leaves, yet not so broad as many others of those which follow, one folded within another at the bottom, as all others of these Flowerdeluces are; from the middle of some one of these Heads, (for every Head of Leaves bears not a Flower) rises up a round stiff Stalk, about two Feet high, at the top whereof stands one Flower, (it has not yet been observed to bear two) the largest almost, but the most excellent of all the rest, consisting of nine Leaves, like the others which follow, but of the color almost of a Snakes Skin, it is so variously spotted; the three lower falling Leaves are very large, of a deep or dark purple color, almost black, full of greyish spots, streaks and lines thro' the whole Leaves, with a black Thrum or Freez in the midst of each of them; the three arched Leaves which cover them are of the same dark purple color, yet a little paler at the sides; the three upper Leaves are very large, and of the same color with the lower Leaves, but a little more lively and fresh, being speckled and streaked with whiter spots and lines, which Leaves being laid in Water, will tinge the Water of a Violet color, and if a little Alum be put therein, and then they be wrung or pressed out, and the Juice of these Leaves is dyed in the shade, it will become a color almost as deep as Indico, and may serve for Shadows in the Art of Limning; the Flower has no smell which can be perceived, but is only commendable for its beauty and the rarity thereof; it seldom bears Seed in our Climate, but when it does, it is contained in great Heads or Cods, being brownish and round, but not so flat as in the other Kinds which follow.

IV. *The second, or Lesser Turkey Kind, differs little from the former, the Leaf is of a more yellowish green color, the Flowers are neither so large nor so fair, nor the spots and marks so perspicuous, nor the Color of that lively lustre.*

V. *The Places.* By some part of the Name, it seems that they might first come from *Susis* in *Persia* into *Turky*, but from *Turky* they were first brought to us; they grow and thrive very well in our Gardens.

VI. *The Times.* They flower most commonly in *May*, before any of the other Species.

VII. As to their *Qualities, Specification, Preparations and Virtues*, see them declared at large in *Chap. 288.* following: And here is to be noted that all the *Tuberosa Flowerdeluces* (except the *Florentine*, commonly called *Florentine Orrice*) more especially those which have the *Blew or Purple Flower*, have one and the same *Virtues*; and that our *English Blew Flowerdeluce* exceeds them all.

C H A P. CCLXXXVII.

OF FLOWER DELUCE White Florentine,

O R,

FLORENTINE ORRICE.

I. *THE Names.* It is called in *Greek* *ἰρις κυανώδης λευκή*: in *Latin* *Iris Tuberosa alba*, *Iris tuberosa Florentina*, *Iris alba Florentina*: in *English* *White Flowerdeluce*, *Florentine Flowerdeluce*, *Florentine White Flowerdeluce*, *White Orrice*, and *Florentine Orrice*.

II. *The Kinds.* It is threefold. viz. 1. *Iris alba Florentina*, The White Flowerdeluce, or Florentine Orrice, which is the principal kind, and that of which the *sweet Orrice Powder* is made. 2. *Iris Flore Pallida Florentina*, The yellowish White, or Straw colored Florentine Orrice. 3. *Iris alba major Versicolor*, The White party colored Flowerdeluce.

III. *The Descriptions.* The first, or Great White Florentine Flowerdeluce, has a Root which is *Tuberos* or *Knobby*, thick, irregular, and shooting out from every side such like *Tuberos* Heads, lying for the most part upon, or above the Ground, and fastened within the Ground with long white Fibres or Strings. From this Root rise up many Heads of very broad, and flat long Leaves, enclosing or folding one within another at the bottom, and after a little space divided one from another towards the top, thin edged on both sides, like a two edged Sword, and thicker in the middle. From the middle of some of these Heads of Leaves, rises up a round stiff Stalk, two or three Feet high, bearing at the top one, two, or three large Flowers, which break out of several Husks or Skins, consisting of nine Leaves apiece, as all the other Flowerdeluces do, and of a fair white color; having in the middle of each of the three falling Leaves a small long yellow Freez or Thrum, as is most usual in all the kinds of the following Flowerdeluces, both of the greater and smaller sorts. After the Flowers are past, thick short Cods or Pods come forth filled full with the Seed, which is red, roundish, and flat.

IV. *The second, or yellowish White, is in its Roots, Leaves, Stalks, Flowers, Seed, and manner of growing very like unto the former, or true Florentine Orrice; and differs in nothing from it, but in the color of the Flowers, this being indeed of a more yellowish White, commonly called a Straw color.*

V. *The third, or White party colored, has a Root not so great as the former White Florentine, but a little slenderer and browner. The Leaves are not so large and broad, but the Flower hereof is nearly as large, and as White as the first Florentine; yet it has a fair Lift or Line, of a blewish purple, down the back of every one of the three upright Leaves, and likewise round about the edges, both of the upper and lower Leaves; and also a little more purplish upon the ridge of the arched Leaves, which cover the falling Leaves. In all other respects this variable Flowerdeluce is like to the former.*

VI. *The Places.* The Name shews the Original place from whence it came to us, but the best comes

now, when Physicians write *Iris*, the Common Blew or Purple Flowerdeluce is intended; but when *Ireos*, they mean and intend the Florentine Orrice.

II. *The Kinds.* There are fourteen several kinds of this Broad leaved Tubertous, blew or purple Flowerdeluce, viz. 1. *Iris purpurea, five vulgaris*, The Common blew, or purple Flowerdeluce. 2. *Iris purpurea pallidior versicolor*, The various colored paler purple Flowerdeluce. 3. *Iris carulea labris purpureis*, The blew Flowerdeluce with purple stalks. 4. *Iris Dalmatica major*, The great Dalmatian Flowerdeluce. 5. *Iris Asiatica Carulea*, The Blew Asian. 6. *Iris Asiatica purpurea*, The Purple Asian. 7. *Iris Damascena*, The Damasco Iris. 8. *Iris biflora Lusitanica*, The Portugal double Flowering. 9. *Iris purpurea versicolor major Camerarii*, The great variable Purple. 10. *Iris purpurea versicolor minor*, The lesser variable Purple. 11. *Iris purpurea altera minus fuliginea*, Another Purple less smoaky. 12. *Iris Carulea versicolor*, The Blew variable. 13. *Iris lutea variegata*, The Yellow variable. 14. *Iris lutea labris purpureis pallidis*, The Yellow with pale purple Lips, or falls.

Blew Flower de luce

III. *The Descriptions.* The first, or Common blew or purple Flowerdeluce, has a Tubertous Root, and differs little or nothing from the Great Turkey kind, neither in its Root, Leaf or Flower, nor in its manner or form of growing, only that the Leaves of this are not so large as some of the kinds are; and the Flower itself is of a deep purple, or violet Color, and sometimes a little declining to redness, in some particular places.

IV. *The second, or Various colored, paler Purple*, has Flowers of such a pale Purple color, as that they come near unto a Blew; and sometimes it will have Veins or Stripes of a deeper blew or purple, and sometimes of an Ashcolor, running thro' all the higher and lower Leaves.

V. *The third, or Blew with Purple falls*, is another kind much like unto the former; but this is more purple in the falls, and more pale in the upright Leaves.

VI. *The fourth, or Great Dalmatian, has its Roots and Leaves as large and broad as any of the Flowerdeluces whatsoever*: Its Stalk and Flower do equal its other parts in proportion; saving that the color of the Flowers is differing, this being of a fair Watchet or pale blew color wholly, with the yellow Thrum down the middle of the Flower or falling Leaves, as before is said to be Common to all Flowerdeluces. In all its other parts, it differs little, save only, that it is observed to have a small shew of a purplish red about the bottom of the green Leaves.

VII. *The fifth, or Blew Asian, is in largeness of Leaves like unto the Dalmatian, but bears a greater store of Flowers on several Branches*, which are of a deeper blew color, and the arched Leaves, whitish on the side, and purplish on the Ridges, but in other parts like unto it.

VIII. *The sixth, or Purple Asian, is nearly like to the former*, but that the Leaves of this are a little narrower, and its Flowers a little more Purple, especially the upper Leaves.

IX. *The seventh, or Damasco Flowerdeluce*, is altogether like to the Flowerdeluce of Asia, excepting that it has some white Veins in its upright Leaves.

X. *The eighth, or Portugal double flowering, is very like the first kind of this Chapter, but that it is not so large in its Leaves, nor in its Flowers*: It sometimes flowers twice in a Year, viz. in the Spring, and in the Autumn; but this double flowering is not often, unless the Soil in which it grows is very good, the Scituation proper, and the Seasons warm and productive: But the Flowers of this have a better and sweeter Smell than the first kind; and they are of a Purple or Violet Color, and come out of a purplish Skin or Husk.

XI. *The ninth, or Great variable Purple, has very broad Leaves, like unto the Leaves of the first kind in this Chapter, and so is the Flower also, but differing in Color*: For the three lower Leaves, are of a deep Purple, tending to redness: The three arched Leaves, are of the color of the upper Leaves, and the three upper Leaves, are of a pale color, tending to yellowness, shadowed over with a Smoaky purplish color, except the ridges of the arched Leaves, which are of a more lively Purple.

XII. *The tenth, or Lesser variable Purple, differs not in any thing from the last, but only that it has narrower green Leaves, and smaller and narrower Flowers, otherwise if they be both compared together, the Colors will not seem to varie at all one from another.*

XIII. *The eleventh, or other Purple less smoaky, comes something near unto the two last Kinds, whose Husks, from whence the Flowers do shoot forth, have purple Veins in them, and so have the falling purplish Leaves; and the three upright Leaves are not so dull or smoaky, yet of a dull purple Color.*

XIV. *The twelfth, or Blew variable, has its Leaves of the same largeness with the lesser Variable, at Sect. 12. above, and its Flowers are as diversly marked*: for some have the falling Leaves blew at the edges, and whitish at the bottom of the arched Leaves, which are of a yellowish white; and the upright Leaves are of a whitish blew, with yellowish edges. Some again are of a darker blew, with brownish Spots in them. And some are of a pale a Blew, that it may well be called an Ashcolor. Some also there are whose upright Leaves are of a fair pale blew, with yellowish edges, and the falling Leaves are parted into two colors, sometimes equally in halves, each side differing from the other in color; and sometimes one Leaf

Leaf only is in that manner, and sometimes with a various colored List in them; in the other parts both of Flower and Leaf, it is like to the said lesser variable Purple.

XV. *The thirteenth, or Yellow Variable, has a Root which grows somewhat more slender and long, under ground, and of a darker color than many of the others: This Plant loses its Leaves in Winter, which is contrary to all the former Flowerdeluces, so that its Root remains under Ground, without any appearance of Leaves upon it: But in the beginning of the Spring, it shoots out fair broad Leaves, falling downwards at their points or ends, but shorter many times than any of the former, and so is the Stalk in like manner, not rising much above a Foot or fifteen Inches high, on which are set two or three large flowers, whose three falling Leaves are of a reddish purple color: The three Leaves which stand upright are of a smoaky yellow; the three arched Leaves, having their Ridges of a pale color, inclining to purple, have their sides or edges of the former smoaky yellow color, with some purplish Veins at the feet or bottoms of all the Leaves.*

XVI. *The fourteenth, or Yellow, with pale purple lips, or falls, has its three upright Leaves of a pretty fair yellow, and stand more upright, not bowing down, as most of the others do, the three falling Leaves are purple with pale edges. Some of these have their green Leaves partly colored, white and green, more or less, and so are the husks of the Flowers. The three arched Leaves are yellow, as the upright Leaves are, with purplish Veins at bottom. Some have both upright and arched Leaves, of so pale a yellow, that we may in a manner call it a Straw color, but yellower at the bottom with purple Veins; and the falling Leaves are purple, with two purple Spots in them.*

XVII. *The Places. They are all Nurst up, and grow in the Gardens of Florists with us in England, but grow also in many other Nations and Countries, according as their several Titles declare; as in Turkey, Hungaria, Dalmatia, Illyria, Spain, Portugal, France, &c.*

XVIII. *The Times. They flower, some in April, some in May, some in June, and the Seed ripens not many Weeks after.*

XIX. *The Qualities. These with the Turkey a foregoing, and all the rest following are said to be of one and the same Quality, Property and Effect; when green and full of Juice, they are hot and dry almost in the fourth Degree: but when they are dry, they are then hot and dry in the third Degree, and will yet in some measure burn the mouth and throat of such as Chew them. They are Aperitive, Inciding, Digestive, Absterfive, and Diuretick, Stomack, Pectoral and Hysterick, Cathartick, Emetick and Emmenagogick. They are said to offend the Stomach, and to cause Blood to be voided, if given in too great a Dose, and to weak Persons. Of all these Plants, the first in this Chapter is thought to be most effectual, and of the same Root is that which is chiefly used. It is not safe to be given to Women with Child, because it forcibly brings down the Courses, and is apt to cause Miscarriage. And when exhibited, it ought to be given with good Correctives, as Mastic, Juice of Liquorice, Extract of Juniper Berries, &c.*

XX. *The Specification. It is famous in Curing the Scurvy, Dropfie, Jaundice and Gout.*

XXI. *The Preparations. You may prepare therefrom, viz. from the Root, 1. A Liquid Juice. 2. An Essence. 3. An Infusion. 4. A Decoction. 5. A Syrup. 6. A Powder. 7. An Electuary Simple. 8. An Electuary Compound. 9. An Oil, viz. Oleum Irinum. 10. A Balsam. 11. A Cataplasim. 12. A Pessary. 13. A Spirituous Tincture. 14. An Acid Tincture. 15. An Oily Tincture. 16. A Saline Tincture.*

The Virtues.

XXII. *The Liquid Juice. Taken from one to three Spoonfuls (according to Age and Strength) mixt with a little Honey, and a Glass of Ale or Wine, it purges and cleanses the Stomach of thick and tough Flegm, and sharp Choler; which are said by Authors to be the causes of Agues and Fevers. It Cures the Jaundice and Dropfie also (for which it is a famous thing) by evacuating the Humors which cause those Diseases, both upwards and downwards. And because it does somewhat bite upon the Stomach, it is not to be given without being corrected with Honey, Spicknard, and aromatick Spices; applied to the Piles, it eases them.*

XXIII. *The Essence. Being taken from one, to three or four Spoonfuls in any proper Vehicle, it performs all the Liquid Juice can do, besides which, it eases the pains and torments of the Bowels, or gripings of the Belly and Hypochonders, evacuates Melancholy, and takes away the shaking Fits of Agues; opens obstructions of the Liver, Spleen, and Womb, kills Worms in the Stomach and Intestines, expels the Stone, Gravel, Sand, or Tartarous matter out of the Reins and Bladder, gives ease and restores in Cramps, Convulsions, and Palxies, which come from cold and moist Humors, by its Anodyne and healing property, whereby it warms and comforts the parts affected, and prevails against a simple Ghonorrhea: It provokes the Terms in Women, and brings away both Birth and After-Birth.*

XXIV. *The Infusion in Wine. It has the Virtues of the Juice and Essence, but much inferior in Efficacy: it prevails against the bitings and stings of Venemous Creatures, represses Vapors in Women, and is good against Fits of the Mother: It opens obstructions of the Viscera, and cleanses the Stomach.*

XXV. *The Decoction in Wine.* If it is taken to six Ounces, it provokes Urine, gives ease in the Colick, produces the Terms; used as an Erhine, adding to one part of the Decoction three parts of the liquid Juice, it purges the Head admirably of Flegm, and tough viscous Humors; and bathed upon the Hemorrhoids or Piles, it gives much ease and dissolves them. The Decoction made with Water and Vinegar, and so drank it is a remedy against the bitings of Mad Dogs and Serpents, and the stings of Venemous Creatures.

XXVI. *The Syrup.* It has the Virtues of the Juice, Effence, Infusion and Decoction, but acts more weakly by reason of its being so loaded with Sugar, and therefore may be given from one Ounce to two Ounces or more; but as a Pectoral and Bechick, it is more proper, because it causes a better expectoration, cleansing the Lungs of the Tartarous matter lodging in them. If an Ounce of the Syrup is mixed with four Ounces of the Decoction in Wine, and it be used as a Gargle for the Mouth, it eases the Toothach, cures Ulcers in the Mouth and Throat, and abolishes a stinking Breath.

XXVII. *The Powder.* It has the Virtues of the Juice, Effence, Decoction and Syrup, but acts not with so much facility and speed. Used as an Erhine up the Nostrils, it purges and cleanses the Head of Cold, gross and viscous Humors, and cures vehement and inveterate Headachs, tho' of many Years standing. Taken inwardly from a Scruple to a Dram or more, according to Age and Strength, it purges Pituitous and Watery humors out of the Body, both by Vomit and Stool, expels the Jaundice, and powerfully evacuates the Morbifick cause of the Dropfie, Scurvy and Gout. Applied to Ulcers or Wounds, it cleanses, incarnates, dries, and heals them; and where eating Ulcers have been, which have made the Bone bare of Flesh, it breeds Flesh there, covers the Bone therewith, and causes it so to grow up, as to fill the hollowness of the Ulcer again. It is also very good, to cleanse, resolve the Callus, incarnate, fill up with Flesh, and heal Fistula's, old malign Ulcers and Cankers, which are difficult and hard to be Cured.

XXVIII. *The Eleluary Simple.* Take Powder of Blew Flowerdeluce Roots, three Ounces: Juice of the Roots, Clarified Honey, of each two Ounces, mix them. Dose, from two Drams to five or more in the Morning fasting; it works both upwards and downward, and evacuates Flegm, Choler, Melancholy and Watery Humors, and by that means prevails against the Dropfie in an especial manner, as also against the Jaundice, Scurvy, Green-sickness, Kings Evil and Gout. It also kills Worms in Stomach and Belly.

XXIX. *The Eleluary Compound.* It is thus made. Take Powder of the Root four Ounces: Powder of Galanga, Soldanella, or Sea bindweed, two Ounces: Powders of Galanga and Zedoary, of each one Ounce, Cloves and Cinnamon, of each half an Ounce: Juice of the Roots, Clarified Honey, of each twelve Ounces; mix them for an Eleluary. It is made for the Cure of the Dropfie, being taken to half an Ounce or more every Morning fasting, or according as the strength of the Patient can bear it. It works also upwards and downwards, cleansing the whole Man of all superfluous Humors.

XXX. *Oleum Irinum, or the Oil.* I do not mean here the Compound Oil, called *Oleum Irinum* in our *Pharmacopœia Londinensis*, Lib. 5. Chap. 2. Sect. 49. for that is the Oil of the Florentine Orrise Root; but I mean an Oil made of the Flowers and Roots of the Blew Flowerdeluce in this Chapter, which is thus done. Take Roots of the

Blew Flowerdeluce three Pounds, bruise them well: Choice Oil Olive, Pound twelve, Juice of the Roots, Pound three: mix and boil them till they are Crisp, then press out; repeat the boiling with fresh Roots in like manner, and repeat it the third time: Strain all out, and add to the Oil Flowers of the Blew Flowerdeluce a Pound and half, mix and infuse, or digest in a warm Sand Furnace for six or eight Weeks, stirring all with a Spatula once a day; after which, strain out the clear Oil, by a gentle Expression, and keep it for use. It is an effectual thing to warm and comfort feeble and weakened parts, Joints, Nerves, Tendons, and Muscles afflicted with Cold and moist Humors; softens hard Tumors, and gives ease in the Gout and Sciatica: It dissolves, dissolves and wastes hard and Kernels swellings in any part of the Body tho' Scrophulous, or proceeding from the Kings Evil: It softens the hardness of the Spleen and Womb; resolves Cramps and Convulsions of the Nerves and Tendons, warming, comforting and helping their Extension: The hinder parts of the Head and Vertebrae of the Neck being anointed therewith; it prevails against Catarrhs: and the forehead and Temples of the Head being anointed therewith, it eases Megrims and Pains of the Head proceeding from a cold Cause. And dropt into the Ears, it helps against pains and noise in them; and anointed two, three or four times a day upon the Fundament and Hemorrhoidal Veins, it gives present ease and relief as to the Piles.

XXXI. *The Balsam.* It has all the Virtues of the Oil, but is more powerful in Curing green Wounds, old Ulcers and Fistula's: For it powerfully digests, cleanses, incarnates, dries and heals, and raises up Flesh after a very admirable manner in Ulcers that are very hollow. Applied to the Gout, it presently gives ease, and in a short time after Cures it; and after a singular manner softens hard Tumors which happen in the fleshy parts.

XXXII. *The Cataplasim.* If it is made of the green Roots (being beaten, and applied) it gives ease in the Gout and Sciatica, and in some few applications is said to Cure them. Another Cataplasim, Take of the Powder of the Root, two Ounces, Nutmegs, Dill Seed in Powder, of each one Ounce: Saffron two Drams: Extract of Juniper Berries, enough to make it into a Cataplasim. This applied to the Scrotum or Testicles, tho' vehemently Tumified or swelled by a defluxion of Humors, gives present ease to the Pain, and in a short time dissolves the Tumor. A Cataplasim of the simple green Root, being applied to the Face or other parts of the Skin, as Neck, Arms, Hands, &c. which are Tanned or Sun burnt, or are affected with Scurff, Morpew, black or blew Marks, or Scars, or other deformities, it takes them away, and clears the Skin: but they who use it had need to take heed, that they use it not too strong, nor let it lie on too long, but rather wash it off again with fair Water, within two or three hours after it is applied: But it is better after the Root is beaten to a Pulp, to tie it up in a fine thin Linnen Cloth, and to lay it for a day and a night in fair Water, or Damask Rose Water; and then with this Water, you may wet or moisten the Skin of the Face, Neck, Breasts and Hands, which are deformed as aforesaid, which is to be applied so long as need requires; but this Water you must also take heed of, that you use it not too strong, &c.

XXXIII. *The Pessary.* It is made either of the solid green Root, or the Root beaten to a Mass, and so made up with Honey. This being put up into the Womb or Body, brings forth the Dead Child, much more does it facilitate the Birth, and forcibly draws forth the Afterbirth.

XXXIV. *The*

XXXIV. *The Spirituous Tincture.* It expels Wind and is good against the Colick, gripings of the Guts, and obstructions of the Viscera. It provokes the Terms in Women, strengthens the Stomach and Womb, and Corrects those cold and crude Juices which breed the Scurvy, Gout, Jaundice, and King's Evil: Dose, one spoonful or two, first in the Morning fasting, and last at Night, in a Glass of White Port Wine.

XXXV. *The Acid Tincture.* It strengthens the Stomach, causes a good Appetite and Digestion, and powerfully opens all manner of Obstructions whatsoever. It Cures the Scurvy radically; and as it opens in a special manner the Urinary Passages, so it carries off the Morbifick Cause of the Dropic by Urine: Dose, so much as to make the Liquor pleasantly sharp, three, four, or more times a day.

XXXVI. *The Oily Tincture.* Given to thirty or forty Drops in a large Glass of White Port or Lisbon Wine, to a Woman in Labour, it not only hastens, but facilitates the Delivery. Outwardly anointed Morning and Night upon any parts affected with Rheumatick Pains from a cold Cause, or with a Numbness, Trembling, Palsie, Cramps, or Convulsion, it gives relief in a short time, and in some reasonable time afterwards a Cure. It is also good against the Itch, Tetters, Ring-worms and the like.

XXXVII. *The Saline Tincture.* Its use is wholly External, and is applied to Scurffs, Morpew, Leprosie, Sunburnings, Tannings, Freckles, Lentills, Pimples, yellowness of the Skin, and other like defecations thereof, being applied Morning and Evening for some considerable time.

it a *Narrow-leav'd Flowerdeluce*; and yet, as it is broader than some of the aforesaid *Broad-leav'd*, and broader than any of the following *Narrow-leav'd*, the Length of them makes them seem narrow; for which Reason I thought good to let its place be in the first of this *Classis*.

Flowerdeluce Tuberous narrow-leav'd Greater.

IV. *The second, or Greater blew Narrow-leav'd,* has a small tuberous Root, blackish and hard, spreading into many long Heads, and more closely growing or matting together: from which rise up Leaves which are very long and narrow, of a whitish green color, but neither so long nor so broad as the last, yet broader, thicker and stiffer than any of the rest with narrow Leaves which follow. The Stalk rises sometimes no higher than the Leaves, and sometimes a little higher, bearing at its top divers Flowers, successively flowering one after another, and are like unto the Flowers of the *Bulbous Flowerdeluces*, but of a lighter blew color, and sometimes deeper. After the Flowers are past, six cornered Heads rise up, which open into three parts, in which is contained almost round brown Seed.

V. *The third, or Sea purple Narrow-leav'd,* has its Root and Seed like the former: from which spring up many narrow hard Leaves, as long as the last, and of a dark green color, which smell a little strong. The Stalk bears two or three Flowers, like the former, but somewhat less, and of a dark purple or Violet color.

VI. *The fourth, or Variable purple Narrow-leav'd,* has Roots and Seed not differing from the former Sea purple. The Leaves of this are also like those of that Sea kind, and do smell a little strong, like them. The Flowers are differing, in that the upper Leaves are wholly Purple or Violet, and the lower Leaves have white Veins and purple, running one among another.

VII. *The Places.* The Titles shew their several places of Growth, but with us they are only nurs'd up in Gardens: the Sea kind is found originally in Spain.

VIII. *The Times.* They flower in April and May

C H A P. CCLXXXIX.

OF FLOWERDELUCE
Tuberous Narrow-leav'd, Greater.

I. *THE Names.* It is called in Greek, *Ἰρις ὀφθαλμοειδὴς*: in Latin, *Iris tuberosa angustifolia major*: in English, *The greater narrow-leav'd tuberous Flowerdeluce*.

II. *The Kinds.* There are four kinds hereof, viz. 1. *Iris angustifolia aurea Tripolitana*, The Tripoli golden or yellow narrow-leav'd Flowerdeluce. 2. *Iris angustifolia cerulea major*, The greater blew narrow-leav'd. 3. *Iris angustifolia purpurea marina*, The Sea purple narrow-leav'd. 4. *Iris angustifolia purpurea versicolor*, The variable purple narrow-leav'd.

III. *The Descriptions.* *The first, or Tripoli golden narrow-leav'd,* has a Root which is long and blackish, like unto the rest which follow, but greater and fuller: from whence spring up Leaves a Yard long, or thereabouts, and an Inch or more broad, of a sad green color, but not shining. The Stalk rises up to be four or five Feet high, being round and strong, but not very thick, bearing at the top two or three long and narrow Gold-yellow colored Flowers, of the fashion of the *Bulbous Flowerdeluces*, as the next to be described is, without any Mixture or Variation therein. The Heads for Seed are three-square, containing within them many flat cornered Seeds. The Length of the Leaves of this Plant, compared with their Breadth, makes me call

May, and the Seed ripens some Months afterwards.

IX. The Qualities, Specification, Preparations and Virtues, are the same with those of the Broad-leav'd tuberous Flowerdeluces in Chap. 288. foregoing.

C H A P. CCXC.

of FLOWERDELUCE
Tuberous Narrow-leav'd, Smaller.

I. THE Names. It is called in Greek, *Ἰρις ἐνυμνήδης* : in Latin, *Iris tuberosa angustifolia minor* : in English, The lesser narrow-leav'd tuberous Flowerdeluce.

II. The Kinds. There are three several Species hereof, viz. 1. *Iris angustifolia minor Pannonica, versicolor Clusii*, The Hungarian small variable Flowerdeluce of Clusius. 2. *Iris angustifolia flore duplici Cerealea*, The blew double-flowered narrow-leav'd Flowerdeluce. 3. *Iris angustifolia alba minor Clusii*, The Hungarian small white Flowerdeluce.

III. The Descriptions. The first, or Hungarian small Variable, has a Root which is black and small, growing thicker and closer together than any other, and strongly fastened in the Ground, with a number of hard fibrous Roots. It springs up with several small Tufts of Leaves, very long, narrow and green, growing thick together, especially if it abides any time in a place : among which rise up many long round Stalks, higher than the Leaves, bearing two, three or four small Flowers, one above another, like the former, but smaller, and of great Beauty. The lower Leaves are variably striped with white and purple, without any Thrum or Fringe at all. The upper Leaves are of a fine blewish purple or Violet color : and of the same color are the arched Leaves, yet having the edges a little paler. The Heads for Seed are smaller, and not so cornered as others, but contains Seed much like to them, which are also smaller.

IV. The second, or Blew double-flowered, differs not in Root or Leaf from the Greater blew Narrow-leav'd in cap. 289. sect. 4. just foregoing, but only in this, that the Leaves of this grow thicker together, and that the Flowers of this kind are as it were double, with many Leaves confusedly set together, without any distinct parts of a Flowerdeluce, and of a fair blew color, with many white Veins and Lines or Streaks running in the Leaves. Oftentimes the Stalk of Flowers has but two or three small Flowers, distinctly set together, rising as it were out of one Husk.

V. The third, or Hungarian small White, differs but little from the first of this Chapter, save, that the Leaf is of a little paler green, and the Flower is of a fair whitish color, with some purple, which thews it self only at the bottom of the Leaves.

VI. The Places. The original Place of these is Hungary : with us, they are only nurst up in Gardens.

VII. The Times. They all flower in the Spring, and their Seed is ripe in the Summer Months.

VIII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the Broad-leav'd tuberous Flowerdeluce in Chap. 288. a-

foregoing ; but these are not so efficacious as those be.

C H A P. CCXCI.

of FLOWERDELUCE
Dwarf Greater.

I. THE Names. It is called in Greek, *Χαυδαίρις*, *Ἰρις ὀνύχης* : in Latin, *Chameiris major, Iris pumila major* : in English, Dwarf Flowerdeluce the Greater.

II. The Kinds. Of the Dwarf Flowerdeluces there are three principal kinds, viz. 1. The Greater, of which we shall speak in this Chapter. 2. The Lesser, of which we shall discourse in the Chapter following.

III. Of the Greater Dwarf Kind, there are three Species, viz. 1. *Chameiris latifolia alba major*, The greater white Dwarf Flowerdeluce. 2. *Chameiris latifolia purpurea major*, The greater purple Dwarf Flowerdeluce. 3. *Chameiris latifolia purpurea major altera*, Another greater purple Flowerdeluce.

IV. The Descriptions. The first, or Greater white Dwarf, has a Root which is small, according to the Proportion of the Plant above Ground, but made after the fashion of the Greater kinds, with tuberous pieces spreading from the sides, and strong Fibres or Strings, whereby they are fastened in the Ground. This Dwarf Flowerdeluce has its Leaves as broad as some of the Lesser kinds foregoing, but not shorter : the Stalk is very short, not above six or seven Inches high, bearing most commonly but one Flower, seldom two, which are in some of a pure white color, in others paler, or somewhat yellowish thro' the whole Flower, except the yellow Freez or Thrum in the middle of every one of the falling Leaves. After the Flowers are past, come forth great Heads, containing round pale Seed.

V. The second, or Greater purple Dwarf, has no Difference either in Root, Leaf or Form of the Flower from the former Dwarf kind, but only in the Color of the Flower, which in some is of a very deep purple or black Violet purple, both the Tops and the Falls. In others the Violet purple is more lively ; and in some the upper Leaves are blew, and the lower Leaves purple, yet all of them have that yellow Freez or Thrum in the middle of the falling Leaves, which the other kinds have.

VI. The third, or Other great purple dwarf Flowerdeluce, has the Flowers purple, like the former almost, and may be reckoned, for the Smallness and Shortness of the Stalk, the very next Species to the last ; but in this the Flowers and Leaves are as large as any of the former kinds of Flowerdeluces.

VII. The Places. Authors have said nothing of their native places ; but without doubt they may grow in Greece, else Dioscorides had not discoursed of them : with us they are nurst up in Gardens.

VIII. The Times. They come up in February and March, flower in the Spring Months, and the Seed is ripe in August.

IX. The Qualities, Specification, Preparations and Virtues, are the same with those of the Common blew Flowerdeluce in Chap. 288. foregoing, as *Doneus*, *Pempt. 2. lib. 3. cap. 3.* in these words seems to inculcate : *Facultate autem & Viribus, hæc quoque Iris acris & impensa calida est, aliisque Iridibus similis.*

C H A P.

C H A P. CCXCII.

OF FLOWER DELUCE
Dwarf Lesser.

I. THE Names. It is called in Greek, *Χαμείρις μικρότης*, & *ἰρις νάνη ἁπλῆ*; in Latin, *Iris pumila minor*, *Chameiris minor*: in English, Dwarf Flowerdeluce the lesser.

II. The Kinds. There are seven kinds of these lesser Dwarfs, viz. 1. *Chameiris latifolia alba minor*, The lesser white broad-leav'd Dwarf Flowerdeluce. 2. *Chameiris latifolia minor straminea*, The lesser Straw-colored Dwarf. 3. *Chameiris latifolia minor purpurea*, The lesser purple Dwarf. 4. *Chameiris latifolia minor suave rubens*, The lesser bluish-colored Dwarf. 5. *Chameiris latifolia minor lutea variegata*, The lesser yellow variable Dwarf. 6. *Chameiris latifolia minor carulea variegata*, The lesser blew variable Dwarf. 7. *Chameiris Marina purpurea*, The purple Sea Dwarf Flowerdeluce.

III. The Descriptions. The first, or Lesser white Dwarf, has a small tuberous Root; from which Leaves, for the most part somewhat smaller, narrower and shorter than the former, spring forth. The Stalk with its Flowers upon it scarcely rises up above the Leaves, so that in most of them it may rather be called a Foot-stalk, (such as the Saffron-Flowers have) and therefore may be said to be without Stalks. The Flowers are like unto the first described in the last Chapter, of a whitish color, with a few purplish Lines at the bottom of the upper Leaves, with a List of Green in the falling Leaves.

IV. The second, or Lesser Straw-colored Dwarf, is in Roots, Leaves, Stalks, Flowers, and Manner of Growing very like the last, excepting, that the Flowers thereof are of a pale yellow, called a Straw color, with whitish Stripes and Veins in the falling Leaves, and purplish Lines at the bottom of the upper Leaves.

V. The third, or Lesser purple, differs not much from the last in its Form, Substance and Manner of Growing; the chief Difference consists mostly in the Color of the Flower, which is of a deep Violet purple, sometimes paler, and sometimes so deep, that it seems almost black: and sometimes the falling Leaves are purplish, and the upper Leaves blew; and some of these have a sweet Smell, and some have none: also some of them are of a fine pale blew color throughout the whole Flower.

VI. The fourth, or Lesser bluish-colored, has its falling Leaves of a reddish color, and the Thrums blew: the upper and arched Leaves, of a fine pale red, or Flesh color, called a bluish color: in all other things it differs nothing, and smells very little, or not at all.

VII. The fifth, or Lesser yellow Variable, has its falling Leaves yellowish, with purple Lines from the middle downwards; sometimes of a deeper, and sometimes of a paler color, and white Thrums in the middle: the upper Leaves are also of a yellowish color, with purple Lines in them: sometimes the yellow color is paler, and the Lines in both the upper and lower Leaves of a dull or dead purple color.

VIII. The sixth, or Lesser blew Variable, has the upper Leaves of its Flower of a blewish yellow, spotted with purple in the broad part, and at the bottom very narrow. The falling Leaves are spread over

with pale purplish Lines, and a small shew of blew about the brims or edges. The Thrum is yellow at the bottom, and blewish above. The arched Leaves are of a blewish white, being a little deeper on the ridge: sometimes the upper Leaves are of a paler blew, rather whitish, with the yellow; and both these have no Smell at all.

IX. The seventh, or Purple Sea Dwarf, is like unto the Narrow-leav'd Sea Flowerdeluce in Chap. 289. Sect. 5. foregoing, in its Root, Leaf and Flower, having no other Difference, but in the Smallness and Lowness of its Growth, being of the same purple color with it.

X. The Places. They are only nurs'd up with us in Gardens. The Sea kind have been found originally in Spain, France and other Southern Shoars.

XI. The Times. They flower in April and May, and the Seed is ripe in July.

XII. The Qualities, Specification, Preparations and Virtues, are the same with the Blew Flowerdeluce in Chap. 288. foregoing.

C H A P. CCXCIII.

OF FLOWER DELUCE
Grass, or Narrow-leav'd.

I. THE Names. It is called in Greek, *Χαμείρις στενὸν*: in Latin, *Chameiris angustifolia*, and *Iris pumila angustifolia*: in English, Narrow-leav'd Dwarf Flowerdeluce, or Grass Flowerdeluce.

II. The Kinds. There are two special kinds hereof, viz. 1. *Chameiris angustifolia major*, The greater Narrow-leav'd or Grass Flowerdeluce. 2. *Chameiris angustifolia minor*, The lesser Narrow-leav'd or Grass Flowerdeluce.

III. The Descriptions. The first, or Greater Grass or Narrow-leav'd, has Roots small, black and hard, growing thick together, fastned in the Ground with small blackish hard Fibres or Strings, which scarcely shoot again, if the Root is removed. From this Root spring forth many long and narrow dark green Leaves, not so stiff as some of the former Smaller Dwarfs in the last Chapter, but pliant, and bending their ends down again: from among which rise up several Stalks, bearing at the top two or three sweet Flowers, as small as any of them set down before, of a reddish purple color, with whitish yellow and purple Strakes down the middle of the falling Leaves. The arched Leaves are of a Horse Flesh color all along the edges, and purple on the ridges and tips which turn up again. Under these appear three brown Aglets, like unto Birds Tongues. The three upper Leaves are small and narrow, of a perfect Purple or Violet color. The Heads for Seed have sharper and harder cornered edges than the former; and the Seeds are something greyish, like those in the last Chapter.

IV. The second, or Lesser Grass or Narrow-leav'd, is in Roots, Leaves and Flowers so like the last described, that it is not to be distinguished therefrom, but only by its Smallness and Lowness; in which it is considerably less, and by which it only differs.

V. The Places. These grow in several Southern Climates of the World, but are only Garden Plants with us.

VI. The Times. They flower sometimes in April, and

and sometimes in May, according to the Warmth or Coldness of the Season.

VII. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Blue Flowerdeluce* in Chap. 288. foregoing, to which you are referred.

C H A P. CCXCIV.

of FLOWERDELUCE Wild,

O R,

Stinking GLADWIN.

I. *THE Names*. It is called in Greek, *Ἰρις*, & *Ἰριδίνη*, & *Ἰρις*: in Latin, *Iris*, *Iris agrestis*, *Spatula*, or *Spatula Fœtida*, (for *Spatba* is taken for *Gladwin*, a Sword:) in English, *Gladwin*, *Gladwin*, and *Stinking Gladwin* and *Stinking Gladwin*.

II. *The Kinds*. It is the last kind of the *Flowerdeluce*, being the *Wild sort*, and a singular Species, called by the *Arabians*, *Caforas*, by *Theophrastus*, *Ἰρις ἀγρία*, *Iris agria*, and is the *Gladwin* Tragi; but so called by a Mistake, unless he had said *Gladwin Fœtidus*.

Flowerdeluce Wild, or Stinking Gladwin

III. *The Description*. The Root, while it is young, is but small, and full of Strings, but being grown older, it grows greater, and in Form like unto a *Flowerdeluce Root*, but reddish without, and whitish within, very sharp and hot in Taste, and of as ill a Smell as the Leaves. From this Root rise up several Leaves, very like those of an *Iris* or *Flower-*

deluce, but that they are sharp-edged on both sides, and thicker in the middle, of a deeper green color, narrower, sharper-pointed, and of a strong ill Scent; if they are bruised between the Fingers. In the middle rises up a pretty strong Stalk, three Feet high at least, bearing three or four Flowers at the top, made somewhat like the Flowers of the *Iris* or *Flowerdeluce*, with three upright Leaves, of a dead purplish Ash color, having some Veins discolored in them; tho' other three do not fall down, nor are the other three small ones so arched, nor do they cover the lower Leaves as those of the *Garden Flowerdeluce* do, but stand loose or asunder from them. The Flowers being past, there come up hard Cods or Husks, three-square, opening wide into three parts when they are ripe; in which are contained reddish Seed, which being perfectly ripe and dry, become black.

IV. *The Places*. It grows in up-land Grounds, as well as in moist places, in Woods and shadowy Groves, as also by the Sea side in many places of this Land; and it is also nursed up in many Countries in Gardens.

V. *The Times*. It flowers not until July, and sometimes in August, and the Seed is ripe in August or September; yet the Husks, after they are ripe, and do open themselves, will hold their Seeds within them for two or three Months, and not shed them.

VI. *The Qualities*. The Root is chiefly used, and it is hot and dry in the third Degree: it is Aperitive, Absterfative and Astringent; Hystrick, Par-mick, Emmenagogick and Cathartick.

VII. *The Specification*. It is peculiarly effectual against the Strangury, Obstruction of the Courses, and Kings-eil.

VIII. *The Preparations*. You may have therefrom, 1. A Juice of the Roots. 2. An Essence. 3. A Decoction in Wine. 4. An Infusion in Ale or Wine. 5. A Vinegar. 6. A Powder of the Root. 7. A Powder of the Seed. 8. A Cataplasm. 9. A Juice of the Leaves. 10. A Pessary.

The Virtues.

IX. *The Juice of the Root*. It purges Cholera and Flegm, both upwards and downwards in weak Stomachs and ill Habits of Body, cleansing those Parts very well. Snuffed up the Nose, it causeth Sneezing, and clears the Head from much viscous Water, Flegm and Puffs. Rubbed upon places troubled with the Itch, it is said to cure it.

X. *The Essence*. It has the Virtues of the liquid Juice, but more powerful; and given inwardly two or three Spoonfuls in a Glass of White Lisbon Wine, it provokes the Terms in Women; but it ought not to be given to such as are with Child, for fear of causing Abortion or Miscarriage.

XI. *The Decoction in Wine*. It purges Cholera and Flegm, as the Juice and Essence do, provokes the Terms, and has all the other Properties, but operates much more weakly, and therefore is more fit for the weaker Constitutions. It is good for such as are troubled with Cramps or Convulsions, Gout, Sciatica, and the like; and gives ease to such as are troubled with the Colick, Gripping of the Guts, &c.

XII. *The Infusion in White Port Wine or Ale*. It has the Virtues of the Juice and Essence, but works much more weakly. It is good against Gripings of the Bowels, Colick, Strangury, and all sorts of Obstructions of Urine, occasioned from Sand, Gravel, tartarous Matter obstructing the Reins and Bladder.

XIII. *The Vinegar*. Taken to four or six Ounces

or

or more, it is gently Emetick; and cures Agues, Fevers, Spleen, &c.

XIV. *The Powder of the Root.* Snuffed up the Nostrils, it is a very good Errhine to purge the Head and Brain of cold, moist and pituitous Humors, drawing them from thence in great quantities. Taken inwardly to one Dram in White Port or Lisbon Wine, it helps such as are troubled with Cramps and Convulsions, Gouts, Sciatica's, griping Pains in the Belly, Strangury, Heat, Pain and Stoppage of Urine. It is given with much profit to such as have had long Fluxes thro' the Acrimony of ill Humors, which it stays, after it has first purged and cleaned the Bowels.

XV. *The Powder of the Seed.* Given from half a Dram to a Dram in White Port Wine, it helps the Strangury, and causes them to piss presently, which before could not. If it is taken with Vinegar, it dissolves the Hardness and Swelling of the Spleen, and prevails against Hypochondriack Melancholy.

XVI. *The Cataplasim.* If it is made up into a Pultise with Great Centory Root, Honey and Verdigrise, and applied, it is good against all Wounds of the Head, and draws forth Splinters, Thorns, broken Bones, or any other thing sticking in the Flesh, and that without pain. If the Root is made into a Cataplasim by boiling in Vinegar, and be laid upon any Tumor or Swelling, it very effectually dissolves or consumes it, yea even those Tumors of the Neck and Throat called the King's Evil.

XVII. *The Juice of the Leaves.* It is good against Scabs, Itch, Tettars, Ringworms, Scurf, Morpew, Tanning, Sunburning, Yellowness of the Skin, Leprosie, and other like deformities thereof.

XVIII. *The Pessary.* Being made of the Root, or of the Juice and Powder of the Root; and put up into the Womb, it brings down the Terms in Women where they have been long stopt; but you must have a care that it be not used to a Woman with Child, because it may cause Abortion.

CHAP. CCXCV.

of FLUELLIN,

O R,

Female SPEEDWELL.

I. *THE Names.* It is called in Greek *Ἐλατίνη*: by the Arabians, *Arbin*: in Latin, *Elatine*, *Veronica*, *Femina*, *Fuchsi*, *Matthioli*, *Camerarii*, *Dodonæi*, *Lobellii*, *Loniceri*: in English, *Fluellin*, or *Female Speedwell*.

II. *The Kinds.* It is one of the sorts of *Speedwell*, and the *Female Species* thereof, of which there are these three following kinds, viz. 1. *Elatine folio subrotundo*, *Veronica femina folio subrotundo*, Round leaved *Fluellin*. 2. *Elatine five Veronica femina folio acuminate*, *Fluellin* with corner'd Leaves. 3. *Elatine five Veronica femina flore carnuloso folioque acuminate*, Cornered *Fluellin* with Blew Flowers.

III. *The Descriptions.* *The first, or round leav'd Fluellin*, has a Root which is small and Thready, dying every Year, and raises it self again of its own Sowing. From whence shoot forth many long

Branches, partly lying upon the Ground, and partly standing upright, set with almost round Leaves, yet a little pointed at the ends, and sometimes more long than round, without order thereon, being somewhat hoary, and of an ill greenish white color. At the joints all along the Stalks, and with the Leaves, come forth small Flowers, one at a place, upon a very small Footstalk, gaping something like those of *Snapdragon*, or rather *Flaxweed*, whose upper jaw is of a yellow color, and the lower of a purplish, with a small heel or spur behind, as the *Linaria* has. The Flowers being gone, small round Heads come forth, which contain small black Seed.

Fluellin round Leav'd.

IV. *The second, or Cornered leaved Fluellin*, has a Root which is small and Thready like the other, perishing every Year; from which comes forth longer Branches, wholly trailing upon the Ground two or three Feet in length, and sometimes more fully, sometimes more thinly set with Leaves thereon, upon small or short footstalks, which are a little larger, and somewhat round, and cut in or cornered for the most part on the edges in some places: But the lower end or bottom of them, being the broadest part of the Leaf, has on each side a small production, making it seem as if they were Ears, a little hairy withall, but not hoary, and of a better green color than the former. The Flowers come forth at the Joints with the Leaves, upon little long Footstalks; every one by it self, one above another, in form very like unto the other, but the Colors therein are more white than yellow, and the purple is not so fair. It is a larger Flower, and so is the Seed, and Seed Vessels.

V. *The third, or Cornered Fluellin with blew Flowers*, has a Root which is small and thready, taking hold of the upper surface of the Earth, where it spreads it self; from whence rise Stalks or Branches, with Leaves thereon which differ but little from the last, but that the Leaves are not so much cornered about the edges, and less pointed

E e e alfo,

also, at the foot or lowest part of them : The Flowers are almost all Blew, with some small matter of White in them, which being past away, small pouches or Seed Vessels succeed, not unlike the former.

Fluellin with cornered leaves

Fluellin cornered with blew Flowers.

VI. *The Places.* They grow upon Banks and Borders of Fields, in Sandy Grounds and Woods almost every where; as also in Cornfields, and in Borders about them, and in other fertile Grounds, as about *Southfleet* in *Kent*, in great abundance; at *Backworth* also, *Hamerton* and *Richwaersworth*, in *Huntingtonshire*, and in several other places, both there and elsewhere.

VII. *The Times.* They all flower about *May*, *June* and *July*, and the whole Plant is Withered by the beginning of *September*.

VIII. *The Qualities.* *Fluellin* is Temperate in respect to heat or coldness, dryness or moisture : is Cleansing, Astringent, Incarnative, Vulnerary, Stomatick, Hepatick, Alexipharmick and Restorative.

IX. *The Specification.* It stops Fluxes of all sorts, whether of the Blood or Humors, whether of the Bowels, or defluxions upon any part; it heals also old Ulcers, eating Cankers, Pocky eruptions and the like.

X. *The Preparations.* You may prepare from this Herb, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Water or Wine.* 4. *A Balsam.* 5. *A Cataplasim.*

The Virtues.

XI. *The Liquid Juice.* Given to three or four Spoonfuls at a time Morning and Evening in a Glass of Red Port Wine, it stops defluxions from the Head, also other defluxions upon any particular part, all fluxes of Blood or Humors, as a *Diarrhoea*, *Dysenteria*, *Lienteria*, *Hepatick Flux*, and the overflowing of the Courses in Women.

XII. *The Essence.* It has all the former Virtues, but more efficacious : It stops all sorts of Bleeding, whether at the Nose, or Spitting, Vomitting or Pissing of Blood; also fluxes of Blood from any other parts, caused by the cutting or breaking of a Vein; and is a singular good thing against Contusions whether inward or outward, strengthening and consolidating the parts which are hurt; and it is no less effectual being used Dietetically to cleanse, dry, and heal old Ulcers which are foul, fretting and eating; and outwardly being applied to dry, conglutinate and heal any simple green Wound. It is of singular use against the *French Pox*, and all fretting and eating Cankers proceeding from the same; so that scarcely any other Vegetable comes up to the height of its excellency in this Case. *Pena* gives a relation of one whose Nose was almost consumed with an eating Canker (I suppose proceeding from the *French Pox*) which was by the Physicians order to have been cut off, to preserve the rest of his Face and Body, now ready to fall into a [*Pocky*] Leprosie; a simple Barber being in Company, and hearing of it, desired that he might first make tryal of an Herb which he had seen his Master use in like Case; it was granted, and he used only the Juice and Decoction of this Herb, giving of them inwardly, and applied the Herb outwardly: By this only means he recovered the Patient, and not only Cured the [*Pocky*] eating Ulcer of his Nose, but also the [*Pocky*] Scabbiness or Leprosie of his whole Body, which he was now fallen into; and by this alone means became perfectly well.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice and Essence, but less efficacious, and therefore ought to be given in treble or quadruple quantity, two or three times a day.

XIV. *The Balsam.* It is no ways inferior to any Balsam made of any of the Vulnerary Herbs; it digests, cleanses, incarnates, dries, and heals old Ulcers, putrid, fretting and eating Sores, and Cures at once or twice dressing any simple green Wound, in what part of the Body so ever.

XV. *The Cataplasim.* It is made of the green Herb, bruised and mixed with Barly Flower; being applied to watering Eyes, occasioned by defluxions from the Heads, where there is Heat and Inflammation withal, it very much helps them, and stops all other Defluxions of Humors, upon any other part whatsoever, wherethere is Pain, Dislocation, Weakness, Wound, or Ulcer, &c.

XVI. *An*

XVI. *An Observation.* The notable use of this Plant in curing some inveterate, malign, and almost suppos'd incurable Diseases, as is before hinted; makes me believe, that not only this Herb, but many other simple Herbs have been used by the *Ancients*, in curing many deplorable infirmities, of which we have at this day no particular account; by which it appears that they preferred *Simples* before *Compounds*: And were we now, but as industrious in the investigation of the *Virtues* and *Powers* of Herbs, as those of Ancient times were, and made but as many tryals of them as they did; I doubt not but we might be as happy in our pursuit of the same as they were, and do greater things with even simple Medicaments, than even the Learned profess to do with their most pompous *Compounds*. But of this enough.

C H A P. CCXCVI.

of FLIE STONES,

O R,

FLIE ORCHIS, or Bee Flower.

I. *THE Names.* It is called in Greek *ὄρχις τῆς μύας*, ἢ *ὄρχις τῆς μέλισσας*; in Latin, *Orchis muscaria*: and in English *Fly Stones*, *Fly Orchis*, and *Bee Flower*.

II. *The Kinds.* There are four kinds hereof, viz. 1. *Orchis Hermaphrodita Candida*, The White Butterfly Orchis. 2. *Orchis Melittias*, *sive apifera*, Bee Orchis, or Bee Flower. 3. *Orchis Sphegodes*, Gnat Orchis, or Gnat Satyrion. 4. *Orchis Myodes*, Fly Orchis, or Fly Stones.

III. *The Descriptions.* The first, or White Butterfly, has a Root taking part of both Orchis and Palma Christi, being not altogether round, nor fully banded, from whence it took the Name Hermaphrodita, to signify both Kinds. The Leaves are two in number, seldom more, being fair and broad, like unto the Leaves of Lillies, without any Spot at all in them. At the Top of the Stalk stands many White Flowers, not so thick set as the *Palmeta*, and every one of them being shaped like unto a White Butterfly, with the Wings spread abroad, with a spur behind it full of a honied Liquor.

IV. *The second, or Bee Orchis or Stones*, has Roots which are two together, round and white, having a certain Mucilaginity or Clamminess within them, without any taste almost at all, as all or most part of these Kinds have. This is a small and low Plant for the most part, with three or four small Leaves at the bottom. The Stalk is seldom above six Inches high, with four or five Flowers thereon, one above another, having round Bodies, and somewhat flat, of a kind of yellowish color, with purple Wings above them, so like unto an Honey Bee, that it might soon deceive one who had never seen such a Flower before.

V. *The third, or Gnat Orchis or Stones*, has Roots which are two round Bulbs or Tubers, like as the others are. The Leaves of this Plant are somewhat larger than of the Beeflower. The Stalk also is somewhat higher. The Flowers are fewer on the Top, but somewhat larger than of the former, or Bee Orchis, and shaped to the resemblance of a Gnat, or great long Fly.

VI. *The fourth, or Fly Orchis or Fly Stones*, is in its Root and Leaf like to the last described, the difference is chiefly in its Flower, which is neither so long as the *Gnat Orchis*, nor so great as the *Bee Orchis*; but the lower part of the Fly is black, with a list of Ashcolor crossing the Back, with a shew of Legs hanging at it. The natural Fly seems to be so in love with it, that you shall seldom come in the heat of the day, but you shall find one fitting thereon.

VII. *The Places.* All these grow in many places of England, some in Woods, as the Butterfly, others on dry Banks and barren Places in Kent, and several other Shires.

VIII. *The Times.* They Flower for the most part in the beginning or middle of May, seldom later.

IX. *The Qualities, Specification, Preparations, and Virtues*, are the same with those of the *Cynorchis* or *Dog-stones* in Chap. 226. foregoing, so that we shall say no more thereof in this place.

C H A P. CCLXXXVII.

of FOOL STONES.

I. *THE Names.* It is called in *ὄρχις μωρῆς*: in Latin *Orchis morio*, *Orchis morionis*, *Telliculus morionis*: in English *Fool-stones*.

II. *The Kinds.* There are many Kinds hereof, as, 1. *Orchis morio mas foliis maculatis*, The greater Male Fool-stones. 2. *Orchis morio altera maculata*, Other Fool-stones with spotted Leaves. 3. *Orchis morio mas foliis non maculatis*, Male Fool-stones not spotted. 4. *Orchis morio femina*, Female Fool-stones. 5. *Orchis morio minor foliis maculatis*, small Fool-stones with spotted Leaves. 6. *Orchis Anthropopodora creder mas*, The Male Neopolitan Fool-stones.

E e 2

III. The

III. The Descriptions. *The first, or greater Male Fool-stones, has a double round Tuberous Root like a pair of Man's stones, from whence rise up five or six broad and smooth long Leaves, like to those of Lillies, having black Spots on their upper sides. The Stalk also has some thereon, which compass it at bottom, but smaller: The Flowers grow in a Spike, which are small and purple, each of them having an open hood, or helmet highest, with two small Leaves like Ears, standing upright at the sides of them; the Belly which is lowest is whiter, having on the backside a crooked heel or Horn. The whole Flower is Sweet, and very pleasant to behold.*

IV. *The second, or Other Fool-stones with spotted Leaves, has testicles like the other, but not so large, nor so round, from which spring up five, six, or more Leaves, not altogether so large as the former, but lying on the Ground, and spotted in the same manner, but somewhat rounder pointed. The Stalk of this grows bigger than the other; and the Flowers are not unlike the same for the form, but of a more blewish purple color, with a spur behind.*

V. *The third, or Male Fool-stones not spotted, has a pair of Testicles like those beforegoing, from whence spring up a Stalk and Leaves which are large, and very like the last, but not spotted. The Flowers are either of a deeper, or of a paler purple color, or somewhat Bluish, or altogether White. The Belly which hangs down, is sometimes spotted with purple Spots, and sometimes it has none, more especially in these Flowers which are all White.*

VI. *The fourth, or Female Fool-stones, has a double Testiculous Root, from whence spring up six or seven Leaves, which are lesser and narrower than those of the Male kind, and Ribbed almost like unto Ribwort Plantane, lying on the Ground, and some of them lifting themselves up higher, encompassing the Stalk, which is shorter than those of the Male sort. The Flowers at top of the Stalk, have gaping or open hoods like the former, but the Ears on each side stand not upright, but lie so close thereon, that they are hardly discerned, with a heel behind them as the others have. This is either of a dark Violet purple color, the middle part whiter and spotted, or of a pale Red, whose Stalk is shorter, and Leaves lesser, or else of a scarlet Red; the scarlet Head being thick and short, and the Flowers smaller.*

VII. *The fifth, or Small Fool-stones with spotted Leaves, has a double Testiculous Root like the others, from whence spring up two or three small, long spotted Leaves, with a Stalk in the middle of them, which they seem to encompass, those up higher being much smaller than they. The Flowers are purple, spotted, and very finely striped.*

VIII. *The sixth, or Male Neapolitan Fool-stones, has a pair of Testicles which are round, but much longer than the other kinds, from which spring up six, seven or more Leaves, the length of ones Hand, and an Inch broad, of a pale fresh green Color, waved about the edges, and at their bottoms encompassing the Stalk. The Stalk is about a Foot high, more or less, and at its top has a spiked bush of Flowers, which are Red before they open, and of a fair bluish color being blown. They are in form like to the others before the hood or helmet opens; having small Leaves like Ears on the sides, with short Arms as it were hanging down by the Body, the lower parts of which are furnished as it were with Thighs and Legs, the Feet being cut off: From this form of the Flowers being so much in the shape of a Man, came the Name *Anthrophora*.*

IX. *Of this last sort there is also a Female kind,*

which has a like Root and Stalk, save that it is higher. The Leaves are larger but not broader than the last, spread on the Ground, with some smaller on the Stalk. The spike of Flowers is not so great, nor so thick; but the Flower it self is like the last in shape, but of a pale color, spotted very thick, as small as Sand, having the hood greenish with purple edges.

X. *The Places.* The first five grow for the most part in Fields, and by Wood sides in many places of England; but the two last are Natives of Italy: however they are all of them nursed up here with us in Gardens.

XI. *The Times.* The all flower in May, as the rest of the Orchides do.

XII. *The Qualities, Specification, Preparations, and Virtues,* are the same with those of *Cynorchis* or *Dog-stones* in Chap. 226. aforegoing, to which we shall refer you.

C H. A P. CCXCVIII.

OF FOX STONES.

I. *THE Names.* This Plant is called in Greek *Orge Saegias*, in Latin *Orchis Serapias*, *Testiculus Vulpinus*, and in English *Fox Stones*.

II. *The Kinds.* There are many sorts of Fox Stones, as 1. *Orchis Serapias Bifolia latissima*, The greatest Twablade Fox Stones. 2. *Orchis Serapias latifolia altera*, Hungarian Twablade Fox Stones. 3. *Orchis Sphegodes major*, The great Bumble Bee Orchis or Fox Stones. 4. *Orchis Myodes major*, The greater Flesh Fly Flower. 5. *Orchis Batrachites*, Frog Orchis or Frog Flower. 6. *Orchis Arachnitis*, The Spider Flower. 7. *Orchis Psycodes Herbacei coloris*, The green Butterfly Orchis. 8. *Orchis Ornithophora folio maculoso*, The White or Purple Birds Flower. 9. *Orchis Macrophyllus Columnae*, Long Leaved Fox Stones of Columna. There are many other Kinds of Fox Stones, but these are the chief.

III. *The Descriptions.* *The first, or Greatest Twablade Fox Stones, has Roots or Testicles which are great and somewhat long, like unto longish Turneps, from whence two very large Leaves only spring up, not much less than those of the White Hellebor, with several Veins running through them, green on the upper side and paler underneath, but shining withal; the Stalk rises to be a Foot and half high, five square, with a few Leaves or Skins thereon, closing it as it were about; the Flowers grow in a spiked Head, like unto others, but great and large, being either Purple, spotted with White, or wholly White.*

IV. *The second, or Hungarian Twablade Fox Stones, this in its Roots, Stalks, Leaves, and Flower, is very like the former, but somewhat lower, and lesser, both in Leaves, Stalks, and Flowers, the which are sometimes both Purple and spotted, and sometimes White, as the former is.*

V. *The third, or Great Bumble Bee Orchis or Fox Stones. This has Testicles less than the former, and rounder, from whence spring five or six long narrow Leaves, Ribbed, like Ribwort Plantane, yet a little less; the Stalk is about Nine or Ten Inches high, bearing five or six Flowers at the head thereof, the form of which is somewhat like to a Bumble Bee, or Drone Bee, as it is commonly called, having*

ving some few small whitish Purple Leaves, like Wings, above, and a brownish Belly or Body below.

Bumble Bee.
Fox Stones

VI. *The fourth, or Greater Flesh Fly Fox Stones, has Testicles like the other Kinds, from whence spring up three or four somewhat broad and long smooth green Leaves next the Ground, the Stalk rises about five or six Inches high, with a few large Flowers set at top, resembling a great Flesh Fly, made of four Leaves, three above, and one long one below.*

VII. *The fifth, or Frog Orchis, or Fox Stones, has a pair of Testicles large, and something long, with a String or Strings at the bottom part thereof; from this Root spring two or more broad and short Leaves below, but narrower and longer as they grow up higher on the Stalk, at the top of which grow several yellowish Flowers, resembling the Bodies of Frogs, with the Head and fore parts greenish, from whence it took the Appellation.*

VIII. *Johnson on Gerard gives us another of the Frog Kind, which he calls Scirpiaz Batrachitis altera, or another Frog Orchis; this has a Root shaped between the Orchis rotunda and Palmata, it grows to the height of the former, with short Leaves encompassing the Stalk at their setting on; the Flowers grow on a Spiked Head, and resemble a Frogs with their long Leaves; but if you look upon them in another manner, they will then something resemble little Flies, for which reason Lobel calls it as well Myodes as Batrachites.*

IX. *The sixth, or Spider Flower, has for its Root a pair of round Testicles, from whence springs forth a Stalk much about the height of the Frog Orchis; upon which grow six, eight or more Leaves, being more in number than grow upon the Stalk of the Frog Kind, they are also narrower and longer. At the top of the Stalk come forth three or four Flowers, resembling a Spider in the round Belly, and the small Neck or partition, between it and the top Wings.*

X. *The seventh, or Green Butter-fly, has bulbed Testicles a little pointed at Bottom; from whence spring up several large, smooth, green Leaves next the Ground; and others smaller and longer upon the Stalk. The Flowers are many and great, resembling Butter-flies, with their Wings spread abroad, of a kind of Grass green color, with a Spur behind.*

White purple Birds Flower, or

*Greater-
Fox stones.*

XI. *The eighth, or White or Purple Birds Flower, has a large pair of round Testicles, but a little pointed at Bottom; from whence spring up four, six or more Leaves, which are something large, and for the most part Chequered or Spotted (for there is much diversity herein; some having broad, large and pointed; others narrower, lesser, and rounder pointed Leaves:) there are several other Leaves which grow upon the Stalk, which seem to enclose or embrace it; being long, spotted also and sharp pointed. The Flowers grow towards the top of the Stalk, Spike fashion; which are large, and like the last, with a Spur also behind them; some of them are all White, others are Purple, and some between both, of a purplish White.*

XII. *The ninth, or Long leav'd Fox-stones, has usually but one sound Testicle (the other as it may seem, being decayed and gone) with some Fibres both at head, and on the sides, which is not usual in any of the other Orchides. From this Root rises up a Stalk about three Feet high, having two very long Leaves at bottom, but of an unequal length; those which grow next on the Stalk are much longer, some being a Foot and half long, and very narrow; but those up higher are shorter and broader. At the top of the Stalk grow the Flowers spike fashion for a Foot in length, each of which stands like a cross hollow Pipe, having a broad and long beard thereat, of a fine bluish Color, with a more purplish Leaf like a Tongue, hanging down, broad above, and small below.*

XIII. *The Places. These grow not all of them in one kind of Soil or Ground, for some are found*

Wood Lands, some in Clay Grounds, some in Fertile Fields, other some in Barren places, dry and Sandy Soils, and some of them in a low, humid or moist Earth.

XIV. *The Times.* These all Flower from almost the middle of April, until the end of May.

XV. *The Qualities, Specification, Preparations, and Virtues* of these Fox-stones, see in Chap. 226. before past, these having the same properties with those Cynosorchis or Dog-stones there treated of.

C H A P. CCLXXXIX.

OF FOXGLOVE Garden,

O R,

FOX FINGER, Garden.

I. *THE Names.* This Plant was wholly unknown to the Ancient Greeks and Latins, so far as we know, for which reason it has no Greek Name, nor yet any Latin Name but what is very Modern and novel. Some of the latter Writers have called it *Digitalis*, which is the most common Name, and first so called as some think by *Fuchsius*; others call it *Alcina*, and *Damasonium*; *Tragus* calls it *Campanula Sylvestris*: *Dalechampius* upon *Pliny*, thinks it to be *Viola Calathiana Plinii*: in English it is called Fox Glove, and Fox Finger; also Finger Wort.

II. *The Kinds.* There are two general kinds, viz. 1. *Digitalis Hortensis, Digitalis Sativa*, Garden Fox Glove, of which we treat (God willing) in this Chapter. 2. *Digitalis Sylvestris, Digitalis agrestis, Digitalis vulgaris*, Common Field Fox Glove, or Finger Wort, of which in the next Chapter.

III. Of the Garden kind there are seven (properly but fix) several Species, viz. 1. *Digitalis maxima Ferruginea*, Dun or Rust colored Fox-glove, or Finger-wort. 2. *Digitalis major flore carneo*, Blush-colored Fox-glove. 3. *Digitalis media flore luteo rubente*, Orange-tawney Fox-glove. 4. *Digitalis major alba*, The greater white Fox-glove. 5. *Digitalis minor alba*, The lesser white Fox-glove. 6. *Digitalis major lutea flore amplo*, The great yellow Fox-glove. 7. *Digitalis minor lutea palida*, The small pale yellow Fox-glove.

IV. *The Descriptions.* The first, or Dun or Rust colored Fox-glove, has a Root which is fibrous or stringy, (like that of the Common or Field kind) which does usually perish, or seldom out-live its giving Seed. From this Root spring up Leaves which are long and large, of a greyish green color, finely cut or dented about the edges. Among which comes up a tall strong Stalk, which, when it is full grown, and with ripe Seed thereon, has been found to be seven Feet at least in height; on which grow almost an innumerable company (respecting the great abundance) of Flowers, nothing so large as the Common or Field kind, and of a brown or yellowish dun color, with a long Lip at every Flower. They being passed away, then comes the Seed, much like the Common kind, but in smaller Heads.

V. The second, or Blush-colored, has Roots, Stalks, Leaves and Flowers, much like to the Common Field kind, but all less. The Leaves are reasonable large, but not full out so large as the Common. The

Flowers are also considerably smaller than the Field sort, and of a bluish color.

VI. The third, or Orange Tawney, has a fibrous Root, which perishes always after bearing Seed, which is usually the second Year of its springing up. This Fox-glove is none of the Greatest kinds, nor yet is it any of the Smallest, but a Medium between both. Its Leaves are in some Proportion correspondent to the Lesser yellow, but not so large as the Lesser white. The Flowers are long and narrow, almost as large as the last White, but nothing so large as the first White, and of a fair yellowish brown color, as if the yellow was over-shadowed with a reddish color, and is that we usually call an Orange-tawney color. The Seed of this is very like the former.

VII. The fourth, or Greater White Fox-Glove, is in Root, Stalk, Leaves, Flowers, and Seed, as also in the manner of growing, so like to the Common Field Kind, that it can scarcely be distinguished from it, except in the fresher greenness and largeness of the Leaves; the Flowers are as large as those of the said Common Kind, but they differ in Color, for as those are Purple, these are wholly White, without any spot in them; in the Seed and all other things they agree.

VIII. The fifth, or Lesser White, has a Fibrous Root, enduring as the others do, the Leaves are like unto the last described, but not altogether so long or large, and of a darker green Color; the Stalk grows not so high, not being full three Feet; the Flowers are pure white, fashioned like unto the former, but not so great or large, in all other things alike; the Seed is also like the former.

IX. The sixth, or Greater Yellow, has a Root which is greater at the Head, and more Woody than any of the rest, with many smaller Fibres, spreading themselves in the Ground, and abides almost as well as our Common Purple Kind; the Leaves of this are in form somewhat like unto the Common Kind, but not altogether so large; the Stalk grows to be three or four Feet high, on which grow many long, hollow, pendulous Flowers, in shape like unto the Common Field Purple, but somewhat shorter, and more large and open at the brims, of a fair yellow Color, in which are long Threads, as in the others.

X. The seventh, or Small pale Yellow, has a Root which is fibrous, or Stringy, but durable, and seldom perishes with the hardness of the extremeest Frost; it has somewhat short, broad, smooth, and dark green Leaves, snipt or dented about the edges very finely; the Stalk is two Feet high, beset with such like Leaves, but lesser; the Flowers are more in number than in any of the rest, except the first and greatest, and grow along the upper part of the Stalk, being long and hollow, like the other, but very small, and of a pale yellow Color, almost white.

XI. *The Places.* All these, except the fourth, or Greater White, are Strangers to us, but are all of them cherished in our Gardens; the said Greater White Kind has been often found growing wild in many places of England, and generally among, or hard by the Common Field Purple Kind in the next Chapter.

XII. *The Times.* They flower in June and July, and some in August; the Seed becoming ripe quickly after.

XIII. *The Qualities, Specification, Preparations and Virtues*, are the same with the Common Field purple kind in Chap. 300. next following, to which you are referred.

C H A P. CCC.

of FOX GLOVE Common,
or Field.

O R,

FINGER-WORT Wild or Ordinary.

I. **THE Names.** It has no Greek Name as aforesaid; nor any ancient Latin Name, as being unknown to any of the ancient Greeks or Latins: But our modern Authors have called it *Digitalis*; which we render in English, Fox Glove, or Fox Finger, or Finger Wort.

II. **The Kinds.** This is the second Species, being the common ordinary, or Field kind. *Casalpini* calls it *Virga Regia major flore purpureo*, also *Alisma* and *Damasonium*, and *Eristula Pastoris*. *Tragus* calls it *Campanula Sylvestris flore purpureo*. *Columna* thinks it to be the *Ephemerum* of *Dioscorides*. And *Dalechampius* upon *Pliny* will have it to be *Viola Calathiana Plinii*, as is said before in the former Chapter; but it is generally called *Digitalis purpurea Vulgaris*, Common purple Fox Glove.

III. **The Description.** Its Root consists of many small, husky Fibres, and some greater Strings among them; from whence spring up many long and broad Leaves, lying upon the Ground, dented about the edges, a little soft or Woolly, and of a kind of a ivory green color: Among which rise up several Stalks sometimes, and very often but one; bearing such Leaves thereon from the bottom to the middle; from whence to the top it is replenished with large, and long, hollow, reddish purple Flowers, a little more long and eminent at the lower Edge, with some white Spots within them, one above another

and with some small green Leaves at every one; but all of them turning their Heads one way, and hanging downwards, having some Threads also in the middle; from whence rise round Heads, pointed sharp at the ends, which contain within them small brown Seed. The Flower has no smell, but the Leaves have a bitter hot taste.

IV. **The Places.** It grows in dry Sandy Ground for the most part, and as well on the higher as lower places, under hedge sides, almost in every County of this Kingdom. There is also a *White Wild sort*, described in the former Chapter at *Self*. VII. which does grow naturally about *Land/dale* and *Craven*, in a Field called *Crage Close* in the North of England; also by *Colchester* in *Essex*; and near *Exeter* in the West of England, and in several other places: Yet this Wild *White kind* is also nurt up in Gardens, as in the former Chapter we have declared.

V. **The Times.** They Flower and Flourish in June and July, but seldom before July; and the Seed is Ripe in August.

VI. **The Qualities.** Fox Glove is hot and dry at least in the second Degree, Sulphureous and Saline; Aperitive, Absterfive, Astringent, Digestive and Vulnerary: Pectoral, Hepatick and Arthritic, Emetick, Cathartic, and Analeptick.

VII. **The Specification.** It Cures Consumptions, King's Evil, Green-sickness and Falling-sickness; also Wounds, old Sores and running Ulcers.

VIII. **The Preparations.** You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Syrup. 4. A Decoction or Infusion. 5. An Ointment or Balsam. 6. A Cataplasm.

The Virtues.

IX. **The Liquid Juice.** It purges and cleanses the Lungs, Stomach and Bowels; but ought to be given not in too great a quantity, because of its violent Operation. It may be given from three Spoonfuls to Six, in Mead or White Port Wine, according to Age and Strength; it works strongly both upwards and downwards, and prevails against the Scurvy, Dropsie, Jaundice, Gout, and Rheumatism; and is found by experience to be an excellent thing against the King's Evil. Outwardly applied, it heals any fresh or green Wound, the Leaves being bruised and applied thereto also. It is frequently used in old and putrid Sores to cleanse them, dry up their moisture, and cause a speedy healing.

X. **The Essence.** It has all the Virtues of the Juice, and more excellent for the same purposes and intentions; besides which it rarifies or attenuates thick tough Flegm, and viscous Humors, affecting the Lungs, Breast and Stomach: It cleanses and purges the Body both upwards and downwards, freeing it both from Viscous and Watery humors: It opens Obstructions of Liver, Spleen, Gall and Womb, and relieves those Diseases occasioned thereby. And by late Experience, it has been found effectual against the Falling-sickness, for that divers have been absolutely Cured thereby. Dose from two to six Spoonfuls or more, according to Age and Strength in the Morning fasting, to be given in any proper Vehicle.

XI. **The Syrup, or Rob of the Juice of the Herb and Flowers made with Honey.** It is a Specifick which transcends all other Vegetable Medicaments for the Cure of Consumptions; cleansing and healing after an admirable manner Ulcers of the Lungs. It opens the Obstructions of all the Viscera, cleanses, carries off, or expels the recrements of the Humors, by which means the daily Nutriment may be conveyed

veyed to all the Parts of the Body. It may be given Morning and Night, four or five Spoonfuls at a time, according to Age and Strength: some advise three Spoonfuls to be given in the Morning fasting in Mead, as much at Ten in the Morning, three Spoonfuls at Four in the Afternoon, and lastly, as much at going to Bed. This Medicine has restored (where the Patient has not been past Cure) beyond all Expectation. It cures a Phthisick or Ulceration of the Lungs, when all other Medicines have failed, and the Sick esteemed past Cure. It opens the Breſt and Lungs, frees them from tough Flegm, cleanses the Ulcer, and heals it, when all other Remedies act without Effect. I have known it do Wonders, and speak here from a long Experience. Persons in deep Consumptions, and given over by all Physicians, have by the Use of this Syrup or Rob been strangely recovered, and so perfectly restored as to grow fat again. I commend it as a Secret, and it ought to be kept as a Treasure. These few Lines concerning this Medicament alone are worth ten times the Price of the whole Book. I am very confident of it, the deplorable wasted Patient, who has been long languishing in an inveterate and tedious Consumption, or a Phthisis, if they make use hereof, will give me Thanks for this Notice, whilst they may have Reason enough to Curse even the Memories of Quacking Blood-suckers, Issue-makers, and Blister-drawers, who, as they may have possibly drained them of a fair part of their Estate and Treasures, would, by a Continuance under their Hands, (for all their specious Methods of Cure) have fool'd them out of their Lives too. But here is to be noted, That this Syrup ought chiefly or only to be made of the Flowers.

XII. *The Infusion or Decoction.* They have the Virtues of the Juice, Effence and Syrup, but much less efficacious, and therefore are to be given in a larger Dose. They powerfully open Obstructions of the Viscera; and may be given Dietetically in the Cure of Consumptions, Kings-evil, Ulcers, Fistula's, &c.

XIII. *The Ointment or Balsam.* The Ointment is said to be one of the best Remedies for a scabby Head that is: it is also good against Pimples, Tetters, Ringworms, Scurf, Morpew, or other Scabbiness and Breakings out in any Part of the Body. The Balsam is an excellent Vulnerary, curing simple Wounds at once or twice dressing: it also digests, cleanses, incarnates, dries and heals old and putrid Ulcers, fretting and eating Sores, and such as proceed from the Kings-evil.

XIV. *The Cataplasim.* The Flowers being stamp'd together with fresh Butter or Hogs-Lard, and so made into a Pultise, and applied to any Part affected with the Kings-evil, it has been found by manifold Experience to be very available for the Cure of that Disease. If the Flowers cannot be had, you may use the Leaves in like manner, or make them into an Ointment with Hogs-Lard and Beef-Suet; this will work the same, tho' not altogether so powerfully as that made with the Flowers.

XV. *The discussive Cataplasim.* Take Fox-glove Flowers, or Leaves, if the Flowers are not to be had, a pound, Oat-meal a pint; boil the Oat-meal soft in a sufficient quantity of running Water, then add the Fox-glove, and boil to a Consistence. This applied warm Morning and Evening to a Contusion in a Womans Leg, where the Tumor made it four times as big as the sound Leg, being also in great Anguish, and full of Pain; it eased the Pain, dissolved the Tumor, and in a little time did the Cure; but afterwards a strengthening Cerecloth was applied, to perfect it.

C H A P. CCCI.

of FOXTAIL,

O R,

FOXTAIL-GRASS.

I. *THE Names.* It is called in Greek, *Αροῖον*; in Latin, *Alopecurus*, *Cauda vulpis*, *Lugdunensis* calls it *Gramen tomentosum Alopecurus vera Plinii* and *Theophrasti*: in English, *Foxtail-grass*.

II. *The Kinds.* Authors make three several sorts hereof, viz. 1. *Σταφύλιον*, *Stelephuros Plinii*, *Gramen Alopecurus vera Plinii*, *Alopecurus genuina*, and *genuina Theophrasti*, The true Foxtail-grass. 2. *Alopecurus Dodonæi*, *Alopecurus altera Anglica & Flandrica*, Another Foxtail-grass English and Flemish, so called by *Lobel*, because he found it both in England and Flanders. 3. *Alopecurus maxima Anglica Lobelii*, The greatest English Foxtail-grass.

True Foxtail-Grass.

III. *The Descriptions.* The first, or True Foxtail-grass, has a small Root made of a few Fibres, which perishes every Year. This Root sends up two or three, or more, soft hoary Stalks, about a Foot high, with small, long and narrow soft Leaves on them, as hoary as the Stalks; on which stand soft, woolly or hoary Heads, somewhat long and round, beset round with soft Hairs, of a pale straw color, resembling a Foxes Tail, from whence it took its Name.

IV. *The second, or Other Foxtail-grass, has much alike fibrous Root, with Stalks and Leaves much like to the former, saving, that they are longer, the Stalks growing higher. The Heads also are shorter and*

and rounder, and nothing so woolly or hoary as the other are.

*Great English Fox tail
Grass*

V. *The third, or Greatest English Foxtail-grass*, has a fibrous Root, from whence spring up Stalks about half a Yard or two Feet high, having sometimes fair large Leaves, like unto *Wheat*, but larger, set at the joints, and bearing at their tops great, large, full, soft and woolly Heads, like the first, but that they are much greater and longer, and this is, whether the Stalk is higher or lower.

VI. *The Places.* The first grows naturally in several places about *Mompelier*; but we have it in our Gardens only for Curiosity. The second *Lobel* found growing Wild in both *England* and *Flanders*. The third *Lobel* found in the *West of England*, between *Portsmouth* and the *Ile of Wight*.

VII. *The Times.* They flourish with their Heads in *June*, *July* and *August*.

VIII. As to their *Qualities*, &c. this is said by Authors, That no Medical Property or Virtue has been found in any of them; but they are many times used to be worn as an Ornament or Toy on Womens Hats, Hair, or Heads.

II. *The Kindr.* It is a singular Plant, and the very least of the *White Water Lillies*. Some would have it to be one of the Kinds of *Pondweed*, but it is no such thing, but of the Kind of *Water Lillies*.

III. *The Description.* Frog-bit has a Root which is long and creeping, full of joints, sending down from the said joints several long fibres or strings, and by the encreasing of these joints, it multiplies itself. From the joints of this Root, or Heads of those strings, spring forth several small round Leaves, thick and full of Juice, very like to the *Lesser White Water Lilly*, but much lesser, or the Leaves of *Wall Pennywort*: from among which rise other Stalks, bearing on each Head one small white Flower, consisting of three small and round pointed Leaves, with a certain yellow Thrum or Threads in the middle. This in all its parts more nearly resembles the *Lesser White Water Lilly* than any *Pondweed*, of which some have made it a Species.

IV. *The Places.* Gerard says it is found floating or swimming almost in every Ditch, Pond, Pool, or standing Water; in all the Ditches about *St. George's Fields*, and in the Ditches by the *Thames side* near *Lambeth Marsh*, and in ten thousand other places of this Land.

V. *The Times.* It flourishes and flowers the most part of all the Year; but it commonly begins to flower in *May*, and so continues on for some Months; and the Seed is ripening in the mean Season.

VI. *The Qualities.* It is cold and moist in the second Degree; Anodyne, Relaxive and Arthritic.

VII. *The Specification.* It is peculiar against *Anthonyes-fire*, Inflammations, and the Gout in a hot Constitution of Body.

VIII. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. An Ointment. 4. A Cataplasme.

The Virtues.

IX. *The liquid Juice.* It is very cooling, and abates Inflammations. Bathed upon an *Erysipelas*,
F f f and

C H A P. CCCII.

OF FROG-BIT,

OR,

Smallest Water LILLY.

I. *THE Names.* It is called in *Greek*, Νουαία, νωδισον: in *Latin*, *Morsus Ranae*, and *Nymphaea minima*, and *alba minima*: in *English*, *Frog-bit*, and *Smallest Water Lilly*.

... wet Cloths dipt in the same, it takes away the Sharpness and Heat thereof, and in a little time cures it. It is also good against sharp Humors breaking out in the Head, and prevails against Scabbiness, Scurff, Morpew, Pimples, Sun-burning, Tanning, Yellowness of the Skin, and other like Deformities.

X. *The Effence.* It has all the Virtues of the liquid Juice; besides which, it may be given inwardly two or three Spoonfulls at a time in a Glass of Wine and Water against any malign or burning Fever. The Whey or Posset-drink made by turning Milk with it, has the same Effect. This Effence bathed upon the Head, for an extream Head-ach, arising from a hot Cause, gives Relief, and by continuing the Use thereof for some time, effects the Cure.

XI. *The Ointment.* Being anointed upon any Part afflicted with vehement Pain, from a violent hot Cause, it eases it. It also allays Inflammations in any Part of the Body; and anointed upon the Back-bone, it eases the Pain, tho' never so extream. I have applied it to Parts extreamly affected with the Gout, and it has given present ease, and in a short time after abated the Tumor.

XII. *The Cataplasim.* Applied to any simple and recent Bruise, it dissolves the Tumor, hinders the Afflux of Humors to the Part, and in a little time after cures it: also applied to any old and running Ulcer, and bound to also above the Ulcer, it hinders the Defluxion, cleanses and dries, and in a great measure contributes to its healing. It also gives present Relief in the Gout, being duly applied Morning and Evening for some considerable time. Applied to the Forehead, it hinders Defluxions upon the Eyes, and eases the Megrin, and other Pains of the Head.

C H A P. CCCIII.

OF FRIERS COWLE,

O R,

WAKE ROBIN Hooded.

THE Names. It is called in Greek, *'Aetruen*, & *dekraes*: in Latin, *Arisarum*, *Arisaris*, and *Aris*: in English, *Friers Cowle*, *Hooded Aron*, or *Hooded Cuckoepoint*, or *Wake Robin*.

II. *The Kinds.* It is of the Family or Stock of the *Arons*, and is twofold, viz. 1. *Arisarum latifolium*, Broad-leav'd *Friers Cowle*. 2. *Arisarum longifolium*, vel *angustifolium*, Long-leav'd or Narrow-leav'd *Friers Cowle*. *Dalechampius* upon *Pliny* calls the *Latifolium*, *Calla alterum genus Plinii*; but *Tragus* thinks it to be rather the *Arum Dioscoridis*, which is indeed a Mistake.

III. *The Descriptions.* The first, or Broad-leav'd, has a Root which is somewhat round and white, and is increased mostly by Off-sets. It grows in all things like unto the *Aron*, having divers fair green Leaves, whose middle Rib on the upper side, as also some other of the Veins, are sometimes white, and somewhat thicker and rounder-pointed than those of *Aron*. The middle Stalk bearing the Flower (which is a crooked or bending Hoie at the top, with a small crooked whitish Pettle in the middle, rising out of it) is spotted with red Spots, and rises

not fully so high as the Leaves, which are nothing so sharp in Taste as those of *Aron* or *Wake Robin*, and do always spring up in the end of *Autumn*, abiding green all the *Winter*. After the Husk or Flower is past, and the green Leaves withered and gone, which will be in the *Summer*, then the Berries do appear on the tops of the Stalks, green at the first, and of a yellowish red when they are ripe, which abide until the Frosts cause them to wither, and the green Leaves begin again to appear.

Friers Cowle,

Friers Cowle Longleaved

IV. *The second, or Narrow-leav'd, has a Root which is round and white, smaller than the former, and increasing by Off-sets, tho' not in so plentiful a manner. The Leaves of this Plant are very long, and*

and very narrow, not rising so high as the former, but rather lying on the Ground. It seldom bears any Fruit or Hole; but when it does, it is whitish, shrill and long, with a very long and small reddish Pistle in the middle, like unto a long Worm, scarce rising above the Ground; and the Berries which follow are white, and not red.

V. *The Places.* These Plants are Natives of Italy, and are found especially in *Tuscany*, about *Rome*, and in *Dalmatia*, as *Anguillara* says: they also grow in *Spain* and *Portugal*: but in *England* they are only nurst up in *Gardens*, where they thrive very well.

VI. *The Times.* They both shoot forth their green Leaves in *Autumn*, presently after the first have pulled down the Stalks with the Fruit, and abide green all the *Winter*, withering in *Summer*, before which their Husks appear.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the *Dragons* or *Dragon-worts* in *Chap. 229.* foregoing, so that we need say no more thereof here.

C H A P. CCCIV.

of FUMITORY Common.

I. *THE Names.* It is called in *Greek*, *Καρδός*, *καρδίου*, *Fumulus*, *καρδίου*, quasi, *Fumus*, *Vapor*, *Nidor*; from whence the *Latins* called it, *Fumaria* and *Fumus Terra*: in *English*, *Fumitory* and *Fumitory*. The *Arabians* call it, *Scheiteregi*. This Herb being of a whitish blew color, as *Smoak* is, it appears to those who behold it at a distance, as if the Earth was all in a *Fume* or *Smoak*; and from hence (as it is supposed) came the Name.

Broad-leav'd Common Fumitory.

II. *The Kinds.* There are three principal kinds hereof, (if the last sort may be accounted a kind thereof) viz. 1. *Fumaria Anglica*, English Fumitory, of which in this Chapter. 2. *Fumaria Indica*, vel *Virginiana*, American or Virginian Fumitory, of which in the next Chapter. 3. *Fumaria bulbosa* vel *tuberosa*, *Radix cava*, Hollow-root, of which in its place.

III. Of Our English Fumitory, there are these following Species, viz. 1. *Fumaria vulgaris*, *Capnos vulgaris* *Lobelia*, *Fumaria purpurea*, Common or Purple Fumitory. 2. *Fumaria tenuifolia*, *Fumaria minor*, The fine-leav'd, or lesser Fumitory. 3. *Fumaria latifolia* *alba*, & *alba claviculata*, *Capnos* *Lobelia*, *Fumaria altera* *Dodonci*, *Capnos phragmites* *Gesneri*, *Corydalis*, & *Corydation alborum*, White broad-leav'd Fumitory, or Climbing Fumitory. 4. *Fumaria lutea*, & *lutea Montana* *Lobelia*, *Fumaria Coridalis* *Matthioli*, *Fumaria Montana* *Gesneri* & *Tahernmontani*, *Corydalis Anguillare* & *Camerarii*, *Split vulgo* *Casalpini*, *Split Ulyrica*, & *Herba Sclavonica aliorum*, Yellow or Mountain Fumitory.

Common Purple Fumitory.

IV. *The Descriptions.* The first, or Common purple Fumitory, has a Root which is yellow, small, and not very long, full of Juice while it is green, but quickly perishing after it has given ripe Seed. This Plant is a tender sappy Herb, having Stalks which are square, slender and weak, with many little Knots or Joints, from whence many Branches spring forth, two or three Feet long, leaning downwards on all sides, so that they scarcely grow up from the Ground, without propping, but for the most part grow sidelong. The Leaves grow from the Branches upon long Foot-stalks, which are tender and brittle, and are finely cut or jagged, somewhat like to those of *Coriander*, being of a whitish, or rather blewish Sea green color. At the tops of the Branches stand many small Flowers, as it were, in a long Spike, one above another, as it were, in Clusters, made like little Birds, of a reddish purplish color, with white Bellies: after which come small round Husks, containing small blackish Seed. Note,

That in the Corn-fields of *Cornwall* this bears white Flowers. And *Johnson* upon *Gerard* says, That it is sometimes found with purple *Violet*-colored Flowers. There is also a *Broader-leav'd* of this kind, not differing from the former Description. See the first Figure in this Chapter.

Points : after which come small Seed, contained in small broad Husks or Cods.

*Fumitory
narrow leav'd*

V. The second, or *Fine-leav'd Fumitory*, has a Root small and white, but like the former; from whence spring forth Stalks or Branches, not so long as the first, but standing more upright, being slender and square. The lower Leaves are very like to those of the other *Fumitory*, and of the same color, but smaller; but those which grow above upon the Stalk are smaller, and finer cut in; and the higher, the finer and smaller, the highest being as small as *Fennel*, or *Southernwood*, or *Camomil* Leaves. The Flowers grow in the same manner which the other do, but rather in greater plenty, or more together, of a deeper reddish purple, mixed with white and yellow; which being passed away, Husks or Cods succeed, containing the Seed, which is much like that of the *Common* or *Purple* kind.

VI. The third, or *White Broad-leav'd*, has a Root which is small and long, white, and growing deep into the Ground, abiding all the Winter, and shooting forth new Branches (after the old are perished) every Year. From this Root rise up small slender Stalks, not strong enough to sustain themselves, but catching hold by certain Tendrels which it sends forth at the ends of the smaller Branches of any thing which stands nigh unto it, whether Hedges, Shrubs or large strong Herbs, it climbs up, and spreads it self out many ways, with several Stalks of small Leaves, set two or three, or more together, not dented or divided on the edges at all, but sharp-pointed at their ends, of a blewish green color, very like unto the *Common Fumitory*. At the tops likewise of the small Branches come forth many small whitish Flowers, tipped with bluish, set together, but nothing like the former, made like small, long, hollow Husks or Bell-flowers, ending in six small

*White Broad-
leaved
Fumitory.*

Fumitory yellow.

VII. The fourth, or *Yellow or Mountain Fumitory*, has a Root which is composed of many white, slender, long Fibres or Strings, bushing thick together, which perishes not as the Roots of the *Common Fumitory* do, but abides many Years, shooting forth new Stalks every Season, after the old ones are perished. This *Yellow* kind grows like the other *Fumitories*,

mitories, about a Foot and half high, with many Leaves, like unto the *Common purple kind*, or like to those of *Eumaria bulbosa*, or *Radix cava*, or *Holcus-root*, but smaller, and of the same blewish green color with them. The Flowers are yellow, and in some places white, and grow at the tops of the Branches, like the other, in form of little Birds, as *Alutholus* sets them forth, both by his Description and Figure: but *Lobel* and *Lugdunenſis* ſay they are Star-fashion, like unto the *Chetidonium minus*, or *Pile-wort*; and yet both of them give *Matthiolus* his Figure, with the Flowers of *Common Fumitory*, like little Birds, and not Star-fashion, like those of *Pile-wort*. After the Flowers are paſt, ſmall Horns come forth, or long Pods or Cods, like to the *Chetidonium majus* or *Radix cava*, but leſſer; in which are contained ſmall, whitith green Seed, ſomewhat round and flatthiſh.

VIII. *The Places.* The firſt grows as well in Corn-fields, almoſt every where, as in Gardens alſo; and that with white Flowers in the Corn-fields in *Cornwall*: it grows in *Barley-fields*, and among other Grain; alſo in Vineyards, and other manured places. The ſecond grows in many places in *Spain*, and about *Mompelier*, and other places of *France*. The third grows by Hedge-fides, and among Buſhes in ſeveral places of *Brabant* in the Low Countries, and about *Frontignana* and *Mompelier* in *France*; it is found about *Naples* with a yellow Flower, as ſome report: and *Gerard* ſays theſe ſecond and third kinds grow Wild in a Corn-field between *Charleton* and *Greenwich*; and very probably may be found in ſeveral other parts of this Kingdom. The fourth grows in hilly and mountainous places in *Italy*, as on the Hills of *Apulia* and *Calabria*, in the Kingdom of *Naples*, and in *Ilyria*, and ſeveral other places; but with us it grows in Gardens.

IX. *The Times.* The firſt three flower from the beginning of *May*, and continue flowering thro' all the Summer Months; and their Seed ripens in the mean Seſſon. But the fourth or *Yellow kind* begins to flower much later, viz. not till *Auguſt*, and its Seed ripens quickly after. This is alſo to be noted, That if you would gather *Fumitory* to dry or diſtil, it ought to be done whilſt it is in flowering, and alſo in the prime of that time.

X. *The Qualities.* *Fumitory* is cold and dry in the firſt Degree; Aperitive, Abſterſive, Coſmetick and Diuretick; Peſtoral, Hepatick, Splenetick and Nephritic; a little Cathartick and Alexipharmick.

XI. *The Specification.* It is ſingular againſt all ſorts of Scabs, Itch, Wheals, Pimples, Puſhes, Scurff, Morpew, Tettars, Ringworms, Herpes and other Deſecations of the Skin, ariſing from ſalt and ſharp Humors. It provokes Urine, helps the Strangury, and opens all Obſtructions of the Viſcera.

XII. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Eſſence. 3. A Syrup. 4. A Decoction in Water or Wine. 5. A Powder of the dried Herb. 6. A Collyrium. 7. A Cataplaſm. 8. A diſtilled Water. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. A Saline Tincture. 12. A Powder of the Seed.

The Virtues.

XIII. *The liquid Juice.* It opens, cleanſes and ſtrengthens, being taken four or five Spoonfuls at a time in the Morning taſting, mixt with a Glaſs of White Port Wine. It purges a little downwards, but more eſpecially if mixt with an Infuſion of *Sena* in Wine. It opens all Obſtructions of the

Stomach, Liver, Spleen, Reins and Womb; purifies the Blood from ſalt, cholerick or viſcous Humors, which are the cauſe of Pimples, Wheals, Puſhes, Tettars, Ringworms, Scurff, Morpew, Scabs, Itch, Leproſy, and the like Breakings out. After purging, it ſtrengthens all the Viſcera, not leaving any evil Quality behind it.

XIV. *The Eſſence.* It has all the former Virtues, but more efficacious, and is accounted a moſt ſafe Remedy againſt all the Diſeaſes ariſing from the aforeſaid Humors, as alſo from adult Choler and Melancholy, or from Obſtructions, which are the cauſe of cholerick and putrid Fevers, the Jaundice, Strangury or Stoppage of Urine thro' Gravel, Sand or viſcous Matter, all which it expels in abundance. Doſe five or fix Spoonfuls in White Wine or clarified Whey.

XV. *The Syrup.* Whether made of the Juice or green Herb, has all the Virtues of the Juice and Eſſence, but is weaker in Operation, and therefore ought to be given mixt with a ſufficient quantity of Syrup of *Damaſk Roſe*, or Syrup of *Peach Bloſſoms*, or Tincture of *Sena*, &c. ſo given, it not only opens all Obſtructions, but is very effectual againſt the Jaundice, Dropſy and Gout; and is a moſt ſingular thing againſt Hypochondriack Melancholy in any Perſon whatſoever.

XVI. *The Decoction in Water or Wine.* It has the Virtues of all the former Preparations, but is much weaker, and may be given in a Morning faſting to fix or eight Ounces. If the Stomach is cold and weak, the Decoction ought to be made in Wine. It is an excellent thing againſt the Strangury, whether in Old or Young, and effectually cleanſes the Reins and Urinary Parts.

XVII. *The Powder of the dried Herb.* A Dram of it being mixt with half a Dram of the Powder of *Eſula Root*, and given in five or fix Spoonfuls of the Eſſence or Juice, cauſes Vomiting and cleanſes the Stomach and Bowels, both upwards and downwards, of cold, viſcous and rough Humors; and effectually carries off watery Humors from all Parts of the Body; and has been found very effectual againſt the Dropſy, Scurvy, Jaundice, Gout and Rheumatism: but becauſe this Medicine ſtirrs up much Wind, it may be good to correct it with a few drops of Oil of *Aniſe* or *Fennel Seed*, or with the Powder of the ſame.

XVIII. *The Collyrium.* Take of the Juice or Eſſence of *Fumitory* three Ounces, diſtilled Water of *Fumitory*, Honey, of each one Ounce, mix them. It is an excellent thing againſt ſore, inflamed, running and watery Eyes. A ſore Mouth and Throat alſo being gargled therewith, it heals them. Dropt into the Eyes, it clears the Sight, and takes away the Redneſs and other Defects in them. If the Juice is mixt in equal parts with Juice of *Sharp-pointed Docks* and Wine Vinegar, and a contaminated Skin be waſhed therewith, it cures it of all ſorts of Scabs, Itch, Wheals, Pimples, Puſhes, Scurff, Morpew, &c. whether in the Face or Hands, or in any other Part of the Body.

XIX. *The Cataplaſm.* It is an excellent thing being applied to ſimple and recent Contuſions, diſcuſſing the Tumor, and hindering a farther Afflux of Humors to the Part: and being applied to any Deſecation of the Skin, it cleanſes it, removes it, and quickly cures the ſame. Applied to the Gout in Hands or Feet, it eaſes the Pain, and hinders the farther Afflux of Humors to the Part.

XX. *The diſtilled Water.* It has the Virtues of the Juice, &c. but very much weaker, and may be uſed as a *Vehiculum*, to convey any of the other Preparations in, down into the Body. *Tragus* ſays it conduces much againſt the Plague, being taken with

with good Venice Treacle, driving forth the Malignity by Sweat. If the distilled Water be thus good in this Case, doubtless the Effence must much transcend it.

XXI. *The Spirituous Tincture.* It is good against the Plague or Pestilence, as also against all malignant and Pestilential Fevers, as Spotted Fever, Purples, Calenture, &c. and is an excellent thing against the Colick and Gripping of the Guts, whether in Young or Old. Dose two or three Drams in Canary or other fit Vehicle.

XXII. *The Acid Tincture.* It is an excellent Antiscorbutick, good against Vapors, Fits of the Mother, Hypochondriack Melancholy, and all those salt and sharp Humors which cause fiery Eruptions in the Skin. It corrects Crudities, strengthens the Stomach, causes a good Appetite and a strong Digestion. It is to be given in all the Patient drinks, whether Ale, Beer or Wine, so many drops at a time as may give the Liquor a grateful or pleasant Acidity; and so to be continued for some time.

XXIII. *The Saline Tincture.* It cures Scabs, Itch, Pimples, Scurff, Morpew, Leprosy, and other like Breakings out in the Skin, only by bathing or well washing the Parts affected therewith, as hot as can be conveniently endured, and continuing the Lotion for some considerable time.

XXIV. *The Powder of the Seed.* It is stronger than the Powder of the Herb, and is prevalent against the Dropsy, being given daily with about ten or twelve Grains of Scammony in Powder: but the simple Powder of the Seed being given to a Dram at a time for a Month together, every Morning fasting, and last at Night going to Bed, (in any fit Vehicle) it is said to cure such as are Melancholy: I believe, being given in an Infusion of Sena, it may do Wonders of that kind.

Stalk, which spreads it self out into several winged Leaves, two set together at a Joint, and variously divided, and so finally, that they almost resemble Juniper Leaves, of a blewish green color. The Flowers have several colors in them, but supposed of some to be but white: and the whole Plant is almost without either Taste or Smell.

CHAP. CCCV.

of FUMITORY American.

I. **THE Names.** It is called in Greek, *Καννίς* *Indus*: in Latin, *Fumaria Indica*, *Fumaria Americana*: in English, *American Fumitory*.

II. *The Kinds.* It is the second general Species of Fumitory, and contains the two following kinds, viz. 1. *Fumaria filiquosa Americana*, *Fumaria semper virens Americana*, Indian or American Fumitory Coddled. 2. *Fumaria tuberosa Americana*, Indian or American tuberous Fumitory.

III. *The Descriptions.* The first, or Coddled Indian, has a Root which is thick and fibrous, from whence rises up a Stalk to be about a Foot high or more: the Leaves are like the Common purple kind in the former Chapter, but larger, and enduring green all the Winter. The Flowers grow Spike-fashion on to the top of the Stalk, formed like to those of the *Radix cava* or *Hollow-root*, whose Bellies are Bluish, and Mouths of a Gold color or paler yellow; which being passed away, long Pods or Cods come forth, which are almost round, and in which is contained the Seed, which is round, flat-tish and yellowish.

IV. *The second, or Tuberous American, has a Root which consists of two solid round parts, like Testicles, with several small Fibres springing therefrom, as well from their tops as sides and bottoms. From between these Tubers or Testicles rises up a*

V. *The Places.* The first grows in Virginia, and the back-parts thereof, called *Canada*: I found it also in several parts of *South Carolina*. The second grows in *America*, in the Southern Provinces of *Carolina*, in the up-land Country towards the Mountains.

VI. *The Times.* They flower from May during most of the Summer Months, and the Seed ripens in the mean Season.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common purple Fumitory in the former Chapter, to which I refer you: but this is to be noted, That of these *American kinds*, the first is by much the more powerful; and as the whole Plant of this first *American sort* is much bitterer than the first or Common purple kind in the former Chapter, or indeed than any of the other sorts there described, so it is also by much the more effectual.

CHAP. CCCVI.

of FUSS-BALLS,

OR,

PUCK-FISTS.

I. **THE Names.** It is called in Greek, *Κεφαλή*, *pl. κεφαλαί τῆς γαίης, ἢ οὐρα, pl. οὐραὶ γῆινος*: in Latin, *Caput*, *pl. Capita Terra*, *Tuber*, *pl. Tubera Terra*,

Terre, Fungus Ovatus, Pezice Plinii, Lupi Crepitus : in *English, Fists-balls*, and *Puck-fists*, and *Fist-balls*, taken from the German Word, *Fist*, quod *Crepitum* significat.

II. *The Kinds.* This is a singular Plant of the kind, and differs from the *Earth-balls* in Chap. 238. foregoing very much ; for they have a solid Substance or Pulp ; whereas these are stuffed with nothing but Dust.

III. *The Description.* They are round Balls, growing in the Ground, without any Appearance of Root or Stem, and are of several sizes, some of the Bigness of a Ball or Balloon, some as big as a large Cannon Shot, or a young Child's Head, more or less ; they seem to be very round, smooth and whitish at their first rising, but grow in time to be of a dusky color, cracking in several places on the outside. These, while they are young and white, Children and School-boys, commonly in Sport, ring one at another ; but when they come to their full Bigness and Ripeness, they contain within their Skin nothing but a fine, soft, brown, dry Dust or Powder, which, upon breaking of the Ball, is apt to fly all about.

IV. *The Places.* They grow in Vineyards plentifully, and in many dry Meadows and Fields, in several parts of this Kingdom : I have formerly found them in several Fields between White Chappel and Bromly, also in Fields near to Stepney, and other places adjacent.

V. *The Times.* Their growing time is in March, April and May, and they come to their just Magnitude and Maturity in June, July and August ; after which, with much Wet, they rot and decay.

VI. *The Qualities.* It seems to be temperate in respect to Heat or Coldness, and dry in the second Degree.

VII. *The Specification.* It stanches Blood, dries up Fluxions and the Humidities of running Ulcers.

VIII. *The Preparations.* You may have therefrom, 1. A Powder. 2. Pledgets made of the Balls.

The Virtues.

IX. *The Powder.* Being strewed thick and in good quantity upon any bleeding Wound, it stops the Blood presently : and being strewed upon any old moist Sore or running Ulcer, it dries up the Humidities of the said Sore or Ulcer ; and being used for some time, it stops the Defluxion. If any of it should get into the Eyes, it would vehemently molest them, and possibly endanger the making the Party Blind : it cures also Gallings and Kibed Heels.

X. *Pledgets made of the Balls.* It is to be tyed round with Thread, and then pressed hard together in a Screw-Press, letting it lye there for some few days. This, when it comes to be imposed upon a Wound, it again dilates it self, and puts a stop to the Hemorrhage or Flux of Blood. Than this, there is scarcely any thing to be named which can more powerfully and certainly do it ; for it being of a Nature extremely dry and drying, as it will no way admit of the flowing forth of the Blood, (which those Medicaments do which are naturally moist, and therefore are less useful in stanching of Blood) so it will likewise subside and stick fast in the Vessels. Applied also to moist and running Sores, and to Ulcers with an Afflux of Humors, it dries up the Humidity, and in a short time puts a stop to the Fluxion.

C H A P. CCCVII.

Of GARLICK Garden.

I. *THE Names.* It is called by the Arabians, *Chaum*, and *Cairix* : in *Greek, Zuberor* : in *Latin Allium* ; and in *English Garlick*.

II. *The Kinds.* There are several Kinds of this Plant, viz. *Allium Hortense*, Garden Garlick, of which in this Chapter. 2. *Allium Anguinum*, seu *Viperinum*, Vipers Garlick, of which in Chap. 308. 3. *Scorodoprassum*, Turkey, Mountain or Leek Garlick, of which in Chap. 309. 4. *Allium Sylvestre*, Wild or Crow Garlick, of which in Chap. 310. 5. *Moly*, Onion Garlick. 6. *Allium Latifolium Ursinum*, & *Anguinum*, Ramsons, or Bears and Snakes Garlick ; of which two last in their proper places.

III. *Of the Garden sort.* There are two Species, viz. *Allium Hortense commune*, Common Garden Garlick. 2. *Allium Hortense minus*, The lesser Garden Garlick.

IV. *The Descriptions.* The first, Greater or Common Garden kind, has a bulbous Root, which is covered with very thin Skins or Films, of a White and Purplish color, and consists of many Cloves, separated one from another, under which in the ground below, grows a Tassel of Thready Fibres ; these Cloves are of a very strong Smell and Taste, very much exceeding Onions or Leeks, and serve to set again for a new encrease. From this Root spring up long green Leaves, almost like unto Onions, but much larger or broader, not hollow at all, as those of Onions are, but solid like those of Leeks. Among these Leaves rises up a Stalk, at the end of the second or third Year, about three Feet high, on the top

top of which does grow, a Tuft of purplish Flowers, not much unlike those of Onions or Leeks, covered with a white Skin; in which being broken, when it is Ripe, there is found round, black Seed, like to that of Leeks.

V. *The second, or lesser Garden kind, in its Root, as to its Cloves and its Stalk, Leaves, and manner of growing, it much resembles the former greater kind: But the Cloves of the Roots are smaller and redder; and the Flower is of a more dark or dusky Color than the first above described.*

VI. *The Places.* They both grow in Gardens with us in England: But the lesser has been found to grow Wild in some places of France and Germany.

VII. *The Times.* They are seldom sown of Seed, but the Cloves are planted in November and December, and sometimes in February and March. They Flower in the Summer Months, as June and July; and the Seed is ripe in August, or some short time after the flowering.

VIII. *The Qualities.* It is hot and dry in the fourth Degree: Aperitive, Absterive, Attractive, Carminative, Digestive, Discussive, Anodyn, and Suppurative. It is Stomackick, Pectoral, Nephritick and Arthritick: Purgick, Emmenagogick, Sudorifick, and Alexipharmick.

IX. *The Specification.* It is good against Plague, Poyson, and biting of all sorts of venomous Creatures; it Cures Coughs, Asthma's, Strangury, Dropsie, and Gout, and powerfully provokes the Terms in Women.

X. *The Preparations.* You may prepare therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Infusion or Decoction. 4. An Oil by Collion or Infolation. 5. An Ointment. 6. A Cataplasm. 7. A distilled Water. 8. An Acid Tincture. 9. A saline Tincture. 10. An Oily Tincture. 11. A Spirit. 12. An Elixir.

The Vertues.

XI. *The Liquid Juice.* Being snufft up the Nostrils, it is an excellent Errhine, and purges the Head and Brain admirably; freeing it from cold, raw, pituitous and viscous Humors; is good against the Lethargy, and eases all pains of the Head proceeding from a cold and moist Cause. A Spoonful or two, being taken inwardly in a Glas of White Port Wine, it kills Worms in the Bodies of Man, Woman or Child, Dropt into the Ears, it eases their Pains, and ripens and breaks Apoftemations therein.

XII. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, it provokes Urine, and the Terms in Women; and being given to two or three Spoonfuls in a Glas of Wine, or some of its own distilled Water, it prevails against the bitings of Mad Dogs, Rattle Snakes, Vipers, Spiders, the stinging of Scorpions, &c. fortifying the Heart against the Poyson, and expelling it by Sweating. It expels gross, raw, rough and viscous Humors out of the Stomach, Lungs, Bowels and other Viscera: It expels Wind, opens all Obstructions of Lungs, Liver, Spleen, Womb and Reins; provokes Urine powerfully, helps against the Strangury, carries of the Watery Humors which cause them. It expels Poyson which has been taken inwardly in Meat, Drink or Wine, for in its own nature, it resists all manner of Poysons. It clears the Voice, takes away Hoarseness, Cures an old Cough, and is of excellent use against Asthma's, shortness of Breath, difficulty of breathing, causing an expectoration of the Morbifick Matter. Held in the Mouth, it is good against the Toothach, and dropt into the Ears, it helps against Deafness, and difficulty of hearing. It is good against the Plague or Pestilence, Spotted, and all other Malign or Pestilential Diseases: Facilitates the delivery of Women in Child-birth, forces away the Dead Child, and drives forth the After-birth.

XIII. *The Infusion or Decoction, in Wine, Water, Broth or Milk.* It has all the former Virtues both of Juice and Essence, but less efficacious or powerful, and therefore ought to be given to five, six, or eight Ounces at a time, and that two or three times a day, according as you see the occasion may require.

XIV. *The Oil by Collion.* It is healing and comforting, and therefore may be applied to all cold and moist affections of any part, as Pains, Aches, Lameness, Numbness, besides which, it corroborates or strengthens the Tone of the part, making it able to resist any Fluxion of humors: Anointed on the Head in a Megrim or Cephalaea, from a cold Cause, it gives much relief.

XV. *The Ointment.* It has all the Virtues of the former Oil, and being mixed with Sulphur and Rosin in fine Powder, and applied to putrid and corrupt Ulcers which breed Worms, it kills them, it dissolves strumous Swellings, draws forth the evil humors in Fistula's, and causes them to heal; and anointed upon Loufie Heads, it kills Lice and Nits; and if affected with a Scab or Scald, it dries up the moist Humors, and in a little time heals it: It is also good against Scurf, Dandriff, and falling of the Hair; eases Pains from a cold Cause, and gives relief in the Gout.

XVI. *The Cataplasm made of the green Root.* Being immediately applied to the biting of a Mad Dog or of a Rattle Snake, Viper, Slow Worm, or other Serpent, the stinging of Scorpions, or of any Venomous Creature, it infallibly attracts to, and draws forth all the Poyson or Venom; and this it

does

does so powerfully by reason of its Vehement attractive force, that it perfectly frees the Patient from all manner of Danger. But this will be the more effectually done, if at the same time, the Patient being laid in his Bed takes also a large Dose of the Juice or Essence; and so Sweats upon it. Laid upon a Gout or Sciatica, from what Cause soever, and often renewed, as occasion requires, it draws forth the whole Morbifick Cause and Essence of the Disease; in which Distempers it performs more than most other Vegetables, reputed the most efficacious; it not only eases the Pain at present, but if it has made any steps to the Stomach, or has indeed affected it, it recalls back the Humor, and draws it forth thro' the Pores of the Skin. Applied to any place in which there is any Prick, Splinter, Thorn, Bullet, Shot, bits of broken Bones, it powerfully loosens them, attracts and draws them forth. Being applied to any Plague Sore, Bubo, Phlegmon, or other Tumor which is possible to come to Suppuration, it adds Heat, bringing on the Maturation, to Admiration; and after it is broken, being yet applied, it draws forth all the Malignity and Poison of the Plague in a Pestilential Bubo, and in other Apoplems, the putrid and other offending Matter which replenis them.

XVII. The distilled Water. It has the Virtues of the Juice, Essence and Decoction, but in a much inferior degree, and therefore may be used as a *Vehiculum* to convey those Medicines in, to such Persons, and in such Constitutions where Wine would be too hot. But as this Water is drawn off from a very hot, subtil and spirituous Root, full of a volatile Salt, so it contains more of Life, Flame and Spirit in it, than is in most other simple and cold distilled Waters.

XVIII. The Acid Tincture. This is more powerfully against the Plague and all pestilential and contagious Distempers than any of the former internal Preparations; for this destroys the Essence of the Poison and Malignity in its Root; and is of great Force and Efficacy against the Bittings of Serpents, mad Dogs, and other venomous Creatures. Dose sixty Drops at a time, two or three times a day, in any proper Vehicle.

XIX. The Oily Tincture. Anointed upon any Part full of Aches or Pains from a cold and moist Cause, it gives present ease: it is also good against the Wounds or Punctures of the Nerves and Tendons, for it presently eases the Pain, prevents Convulsions, and induces a speedy Cure. Anointed down the Back-bone, and upon the Parts affected with Trembling, Numbness, Palsies and Convulsions, it suddenly gives Relief, and in a short time after a perfect Cure, if the Medicine is well rubbed into the Parts afflicted for almost half an hour, twice a day, and is continued in like manner for some considerable time, provided the Inveteracy of the Disease, Weakness, and great Age of the Patient hinders not.

XX. The Saline Tincture. It is good against Worms in the Skin, Lentils, Freckles, Pimples, and other Breakings out: it kills Lice and Nits in the Head and Hair; and is singular against Tetters, Ringworms, Herpes, Scabbiness, Scurf, Morpew, Black and Blewness of the Skin left after Contusions, the Leprosy, running Ulcers of the Head, commonly called a Scald Head, and all other Manginess whatsoever, the Parts affected being well bathed therewith twice a day.

XXI. The Spirit. It is very subtil and full of volatile Particles; of extraordinary Use against fainting and swooning Hysterick Fits, Vapors, Obstructions of the Lungs, Coughs, Colds, Surfeitings, Colicks and Convulsions of the Bowels: it expels

Wind, eases Gripping, heals Excoiations of the Guts, and very much facilitates the Delivery of Women in Labor, forcing away both Birth and After-birth. Dose from two Drams to four in any fit Vehicle.

XXII. The Elixir. It has all the Virtues of the Spirit, but more subtil and powerful to all the same Intentions; and may be given twice a day, viz. Morning and Night, or thrice a day, according as the Case may require. Dose half an Ounce, more or less, in any proper Vehicle. It is said to be a Specifick against Jaundice and Dropsy; as also against an inveterate Wheezing and Hoarseness.

C H A P. CCCVIII.

of GARLICK Vipers.

I. THE Names. It is called in Greek, *ὄψιον* *εσθρ*, & *ὄψιον* *εσθρ*: in Latin, *Ophioscorodum*, *Allium Anguinum*, *Allium Viperinum*: in English, *Vipers Garlick*.

II. The Kinds. It is the second Species of *Garlick*, and is a singular Plant of the kind; called by some Authors, *Scorodoprasum convolato Capite*, *Leek Garlick*, with a bulbed and twining Head.

III. The Description. It has a great and white Root, consisting of many Cloves, much like to Garden Garlick, which smell less strong than Garlick, or partaking somewhat of Leeks, whence came the latter Name of *Scorodoprasum*, as Dioscorides says. From this Root springs up a Stalk, three or four Feet high, and sometimes higher, according as the Soil is in Goodness: it has also many Leaves, larger much than those of *Common Garden Garlick*, and almost like those of *Leeks*, which grow from the bottom of the Stalk to the middle thereof, having a Smell between that of *Leeks* and that of *Garlick*. The rest of the Stalk is naked, green, smooth and almost shining, having at the top thereof a large Head, composed of many Bulbs, (not much unlike to the *Indian Moly*) covered with a whitish thin Skin, ending in a long green Point, which grows above it, growing smaller and smaller to the end: which Skin, by the Growth of the Bulbs, being broken, they shew themselves at the first of a purplish color, but afterwards, as they grow riper, of a whitish color; among which are also some Flowers. The Head, with the top of the Stalk, at the first, does wind or twine it self so, that in some sort it represents a Viper, Snake or Serpent; which, when the Bulbs grow to Ripeness, does by little and little untwine it self again, and bears its Head upright.

IV. The Places. It grows with us only in Gardens, and is the *Allium Sativum vel Hortense* *Dioscoridis*, and the *Scorodoprasum secundum Clusii*: it is more ready to part into Cloves than the *Common Garden Garlick*; and by planting the same, it is encreased.

V. The Times. It flowers in June and July, and the Seed ripens not long after.

VI. The Qualities, Specification, Preparations and Virtues, are the same with those of the *Common Garlick*.

C H A P. CCCIX.

Of GARLICK Leek,

O R,

Turkey or Mountain GARLICK.

I. **THE Names.** It is called in Greek, *Σκородον*; in Latin, *Scorodrasum*; and in English, Leek Garlick, Turkey Garlick, and Mountain Garlick.

II. **The Kinds.** There are three sorts hereof, viz. 1. *Scorodrasum majus*, Greater Leek Garlick, or Turkey Garlick. 2. *Scorodrasum magnum, seu primum Clusii, vel alterum Lobelii*, The Great Leek Garlick, or Turkey Garlick. 3. *Scorodrasum minus*, The lesser Leek-leav'd Garlick; but this is called by *Purkinson*, Great Turkey Garlick.

Greater Leek-Garlick,

III. **The Descriptions.** The first, or Greater Leek Garlick, has a bulbous Root, of the Bigness of a great Onion; from whence rise long and broad Leaves, like those of Leeks, but much greater and longer, embracing or clasping about a great thick Stalk, soft and full of Juice, bigger than a Man's Finger, and bare towards the top; upon which is set a great Head, larger than a Tennis-Ball, covered with a Skin, after the manner of an Onion. This Skin, when it comes to Perfection, breaks and discovers a great multitude of Flowers, which are whitish: they being past, black Seeds follow, inclosed in a triangular Husk. The whole Plant smells very strong, like unto Garlick, and is in shew a Leek, upon which it was called *Scorodrasum*, Garlick Leek, or Leek Garlick, participating both of the Garlick and Leek, or rather a degenerate Garlick, grown out of Form.

IV. The second, or Great Leek Garlick, has a great white bulbous Root, and almost transparent, at least shining, seldom giving Offsets for Encrease. From this Root shoot forth several great long Leaves, much bigger than the Common Garlick, and after several Years abiding, there springs up a great long Stalk, three or four Feet high, with some lesser Leaves thereon, and is naked from the middle up to the top, where it bears a large Tuft of Flowers, inclosed at first in a thin Skin, and of a paler color than those of *Homer's Moly*, or rather whitish: which being passed away, three-square Husks, with blackish Seed, like the other, succeed.

V. The third, or Lesser Leek Garlick, has a Root which is set about with longer and slenderer Bulbs, which are inclosed in brownish Skins, lesser and more scaly. The Leaves and Flowers are alike, yet smaller than Garlick: and the whole Plant is lesser in all the parts than the former.

VI. **The Places.** They are Natives of Turkey, and grow about *Constantinople*; but with us they grow and are nursed up in Gardens only.

VII. **The Times.** They flower in June and July, and perfect their Seed not long after, or in August.

VIII. **The Qualities, Specification, Preparations and Virtues** of these Plants, are the same with those of Garlick in Chap. 307. foregoing; but they are much less efficacious than Garlick, as being in a middle degree between Garlick and Leeks, and so partake of both their Tempers and Qualities: they attenuate and incide gross and rough Flegm, and other viscous Humors, and thereby cause easy Expectoration.

C H A P. CCCX.

Of GARLICK Crows,

O R,

Wild GARLICK.

I. **THE Names.** It is called in Greek, *Σκородον ἴκνον*, or *σκόροδον ἰκνόν*; in Latin, *Allium sylvestre*, *Allium sylvestre tenuifolium*; in English, Wild Garlick, and Crows Garlick.

II. **The Kinds.** It is the fourth Species of Garlick afore-mentioned in Chap. 307. Sect. 2. *Purkinson* makes two several kinds hereof, viz. 1. *Allium sylvestre durifolium*, Hard-leav'd Crow Garlick. 2. *Allium sylvestre levifolium*, Soft-leav'd Crow Garlick.

III. **The Descriptions.** The first, or Hard-leav'd, has a Root with a small Bulb or round Head, long withal, and covered with three several Coats or Peelings, being white on the outside, not bigger than a small Hatle-Nut, without any Cloves at all, having at the bottom thereof a Knot of Fibres or Strings. From this Root spring up small, hard, tough Leaves, almost like unto *Rushees*, smooth, and hollow within; among which grows up a naked Stalk, round, solid, hard and slippery or smooth, bearing on the top thereof a Tuft of purplish Flowers, which being gone, small blackish Seed follows, made up in a round Cluster, like small Kernels, having the Small and Taste of Garlick.

IV. The second, or Soft-leav'd, has a long round Root;

Root, in shape like the former, but of the three several Coats, the outwardmost is reddish, and is increased by Off-sets, yet is not parted into Cloves, as the Garden Garlick is. The Plant is of such a strong Garlick Smell, that the Milk of Cows which feed thereof will taste of it. From this Root spring up several narrow Leaves, and long, like *Grass*, softer than the former, and nothing near so stiff; and among these Leaves rise up one or two slender bare Stalks, not so hard and stiff as the first, but bearing at their tops, like Tufts of purplish Flowers, and blackish Seed.

V. The Places. Crow Garlick grows in fertile Pastures thro' all England: Gerard found it plentifully in Fields on the backside of *Islington* near London: and I found it in several places by the Way-side, in those Fields or Pastures beyond *Islington*, leading to the *Boarded-River*, or *Hornsey-Wood*.

VI. The Times. They spring up in April and May; flower in June and July, and their Seed is ripe in August.

VII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the Common Garden Garlick in Chap. 307. foregoing: but *Galen* says, That Crow Garlick is stronger, and of more Force than the Garden. I can say little to this Opinion of *Galen's*; but this I know, That being bruised and infused in White *Lisbon* or *Port* Wine, and being drank, it provokes Urine powerfully, gives present Ease in the Strangury, and is said to break the Stone, and drive it out; but this is to be understood when it is made of a friable gritty Substance, not when it is hard and solid, like a Flint. The Leaves of both sorts are gathered and cut or stamp and eaten by several People for Sawce, as we eat green Sawce made with *Sorrel*: and some People, which love Garlick or strong Onions, will eat their Roots in April and May, with fresh Butter and Bread, or new Cheefe, just as we eat young Onions in the Spring.

major *Concova*, Great Concave or Hollow Gentian, or English Gentian. There are three other Species of Great Gentians, as, *Flore albo*, White-flowered; *Flore pallido punctato*, Pale yellow-spotted; *Flore caruleo*, Blew-flowered; all which differ nothing in Root, Stalk, Leaf, Magnitude or Manner of Growing from the first Purple kind, but only in the Color of the Flowers; but by reason they are not so usually found in our Gardens as the other kinds, we shall say no more of them in this place.

Greater Purple Gentian,
AND
Greater Yellow Gentian.

C H A P. CCCXI.

Of GENTIAN Great,
OR,
Great FELWORT.

I. THE Names. This Plant is called in *Arabick*, *Gentiana seu Genthiana*: in *Greek*, *Γεντιανή*: in *Latin*, *Gentiana*; and in *English*, *Baldmoney*, *Baldmoyn*, *Bitterwort*, *Felwort*, and *Gentian*. It was called *Gentian* from *Gentius*, King of *Illyria*, who was the first Finder of it out, and the first who used it in Physick, and so called it *Gentiana*, after his own Name.

II. The Kinds. There are two generick Species of this Plant, viz. 1. *Γεντιανή μεγάλη*, *Gentiana magnus vel major*, The great or Greater Gentian, of which in this Chapter. 2. *Γεντιανή μικρή*, *Gentiana parva vel minor*, The lesser Gentian, of which in the next Chapter.

III. The Kinds of the Greater. It is, 1. *Gentiana major flore purpureo*, Great purple Gentian. 2. *Gentiana major flore flavo*, Great Gentian with a yellow Flower. 3. *Gentiana major folio Asclepiadis*, Great Swallow-wort Gentian. 4. *Gentiana*

IV. The Descriptions. The first, or Great purple Gentian, is very like to the next Great yellow Gentian in most things, having a great, thick, brownish yellow Root, divided into two or three great Branches, with great Fibres adjoining to them, but a little more hard and woody, of a very bitter Taste, like the other Gentians, which sends forth at the several Heads thereof many fair, broad, three-ribbed, dark, green, shining Leaves, so like unto the following, that it is somewhat hard to distinguish them: many of these Heads among the Leaves shoot forth thick and strong Stalks, three or four Feet high, with several Joints on them, and two Leaves at them, one against another: towards the tops whereof come forth the Flowers, encompassing the Stalks at two or three of the uppermost Joints, with two Leaves apiece under them, like as in the following, which are not laid open Star-fashion, like the *Yellow*, but keep close and hollow, the brims being only divided into six or more round parts, of a purple color, but paler at the bottom, where they are spotted with purple Spots on the inside, having six many yellowish Threads in the middle as the Flower has corners, standing about a long, green, forked Head, which growing ripe, is the Seed-Vessel, and contains therein such like flat brownish Seed as in the *Yellow* kind, but somewhat less.

G g 2

V. The

V. *The second, or Great Gentian with a yellow Flower, has a Root which is great, thick and long, yellow, and very bitter. From this Root rises up at first a long, round and pointed Head of Leaves, closing one another, which, after opening themselves, lye upon the Ground, and are fair, long and broad, somewhat plaited or ribbed, like unto the Leaves of White Hellebor, but not so fairly or eminently plaited, nor so stiff, but rather resembling the Leaves of a Great Plantane: from among which rises up a stiff round Stalk, three Feet or more high, and full of Joints, having two such Leaves, but narrower, and smaller at every Joint, so encompassing the Stalk at their lower ends, that they will almost hold Water, if it falls upon them. From the middle of the Stalk to the top it is garnished with many Coronets or Rundles of Flowers, with two such green Leaves likewise at every Joint, and wherein the Flowers do stand, which are yellow, and when laid open like Stars, rising out of small greenish Husks, with some Threads in their middle, but having no Smell at all, yet stately to behold, as well for the Order as for the Height and Proportion of the Plant. The Seed is brown and flat, contained in round Heads, somewhat like unto the Seed of the Eritillary or Chequered Diffodil, but browner.*

Swallow-wort Gentian.

VI. *The third, or Great Swallow-wort Gentian, has Roots, but they are nothing so large as the former, but are yellow, small and long, of the Bigness of a Man's Thumb: from this Root spring forth many Stalks, about two Feet high; on which grow many fair, pale, green Leaves, set by couples, with three Ribs in every one of them, resembling somewhat the Leaves of Aclepias or Swallow-wort, which is broad at bottom and sharp at the point. The Flowers grow at the several Joints of the Stalks from the middle upwards, two or three together, which are long and hollow, like unto a Bell-flower, ending in five Corners, or pointed Leaves, and folded before they are open, as the Flowers of the Bindweeds are, of a fair blew color, sometimes deeper, and sometimes paler. The Heads or Seed-Vessels have two Points*

or Horns at the top, and contain within them flat greyish Seed, like unto the former, but lesser.

VII. *The fourth, or Great Concave Gentian, or English Gentian, has many long tough Roots, dispersed hither and thither under the upper Crust of the Earth, with some few Fibres adjoining thereto: from which spring immediately a fat thick Stalk, jointed or kneed by certain Distances, set at every Knot or Joint with one Leaf, and sometimes more, keeping no certain number: which Leaves do at the first enclose the Stalk round about, being one whole and entire Leaf, without any Incisure at all, as it were a hollow Trunk; which, after it is come to its full Growth, breaks on one side or other, where it is thinnest, tenderest and weakest, and becomes a flat ribbed Leaf, like unto the Great yellow Gentian or Plantane aforesaid. The Flowers come forth from the Bosoms of the upper Leaves, set upon tender Foot-stalks, in shape like those of the Small Bindweed, or rather the Flowers of Soapwort, of a whitish color, and touch about the brims with a little light Carnation; which being past away, the Seed follows, contained in little Cods or Seed-Vessels.*

VIII. *The Places.* The first three grow on mountainous places in Germany; but with us, are only nurst up in Gardens; of which the second or Yellow-flowered is the most usual or common. The fourth or English kind, Gerard says he found in a small Grove of a Wood, called the Spinie, near to Lickbarrow, a small Village in Northamptonshire.

IX. *The Times.* All the first three flower for the most part in June, and in part of July, bringing forth their Seed in August. The fourth springs out of the Ground in April; flowers in the end of July and beginning of August, and perfects its Seed in the end of that Month, or beginning of September.

X. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Small Gentians in the next Chapter, and thither we refer you.

C H A P. CCCXII.

of GENTIAN Small,

O R,

Small FELWORT.

I. *THE Names.* It is called in Greek, *Γεντιανή*; in Latin, *Gentiana minor*, *seu Gentianella*; and in English, *Small or Lesser Gentian*, or the *Lesser Felwort*.

II. *The Kinds.* There are three generick kinds hereof, viz. 1. *Gentiana minor*, *seu Gentianella vernalis*, The Spring Gentian. 2. *Gentiana minor*, *seu Gentianella aestiva*, Small Summer Gentian. 3. *Gentiana minor*, *seu Gentianella autumnalis*, Small Autumn Gentian. Of each of these three generick kinds, there are several Species; all of which, it is not our Business to declare in this Work, and therefore we shall only discourse of so many of them as either grow Wild with us, or are to be met withal in our Gardens, and that in the following order.

III. *The various Species.* Of the first or Spring kind, we have these, viz. 1. *Gentianella verna latifolia*, Broad-leav'd Gentian of the Spring. 2. *Gentiana verna angustifolia*, Narrow-leav'd Gentian of the

the Spring. 3. *Gentiana minor Verna*, The final-
ler Spring Gentian. Of the Summer Kind we have
these, viz. 4. *Gentiana minor Crucata*, also *Cruci-
ata*, Croswort, also the lesser Croswort Gentian.
5. *Gentiana minor, seu Gentianella carulea punctata
Pennæ*, Pennys blew spotted Gentian. 6. *Gentiana
Anglica pallida punctis distincta*, An English Gentian,
which we here place among the smaller Gentians,
tho' *Clusius* has enumerated it among the Greater
Gentians, but according to its magnitude, it cannot
be said to be either a Great or a Small Gentian, but
a medium between them both, as is that also of *Pe-
na*, but being both Summer Gentians, we thought
good to put them both in this Classis. Of the Au-
tumn Kinds we have these, viz. 7. *Pneumonanthe,
Gentiana Autumnalis*, Calathian Violet, or Autumn
Gentian. 8. *Gentianella Autumnalis Centaureæ mi-
noris folijs*, *Gentianella fugax minor Gerardi*, Au-
tumn Gentian with Small Centory Leaves, Baltard
or Dwarf Autumn Gentian of Gerard. 9. *Gentiana
fugax Clusij*, *Gentiana decima Clusij*, Small Autumn
Gentian, simply so called.

IV. The Descriptions. The first, or Broad Leav'd
Gentian of the Spring, has a small yellowish creeping
Fibrous Root, from which spring up Leaves pretty
large and green, broader than those of the Third Kind
following, being about two Inches long, and one
Inch broad, and somewhat round pointed, with three
Veins or Ribs running through them, as the others
have; the Stalk rising from the middle of these Leaves
grows about four Inches high, or something better,
with a small Leaf or two thereon, bearing at the head
or top thereof a large Husk, sustained by two small
and long Leaves, from the middle of which shoots
forth a very large and great hollow blew Flower,
ending in five small points.

V. The second, or Narrow Leav'd Spring Gentian,
has a Root which is long and slender, spreading it self
much under the Ground, and of a yellowish color, from
which spring many Heads of several small, long, and
narrow Leaves set together, somewhat longer than the
next which follows; from some of these Heads, which
Flower not in one and the same Year, those Flower-
ing the Year following which Flowered not the Year
before, and those which Flowered the Year before
not Flowering again the next Year after) rises up a
small slender Stalk, somewhat higher than the for-
mer, bearing thereon two such like small Leaves at
a Joint, and at the top one Flower, for the most
part, (seldom more, unless the Stalk is branched)
much smaller than the last, narrow, long, and hol-
low, like a Hose or Husk, of one entire Leaf at the
lower part, but ending above in five Corners, or
small pointed Leaves, laid open like a Star, having
small pieces of Leaves, like, as it were, Ears, set at
the bottom of the divisions of them, both of them
of a perfect blew color, but not so deep as the for-
mer, having a white Line in the middle of each of
them, and the Ground, or bottom of the Flower,
whitish also, with a few threads standing about a
small head, not to be seen until the Flower be almost
or fully past, unless one open it, which, after it is
ripe, or full blown, is small and long, containing
very small brownish Seed.

VI. The third, or Smaller Spring Gentian, has a
Root consisting of small, long, pale, yellow Strings,
which shoot forth here and there divers heads of
Leaves, and thereby increases reasonably well, if it
grows in a fit place, or is nurs'd up in good Ground,
(otherwise it will scarcely grow with all the Care and
Diligence imaginable.) From this Root spring several
small hard green Leaves, lying upon the Ground, as
it were in Heads or Tufts, somewhat broad below,
and pointed at the end, with five Veins or Ribs

therein, as conspicuous as in the former Gentians;
among which rises up a small short Stalk, with some
smaller Leaves thereon, at the top whereof stands
one fair, large, hollow Flower, made Bell fashion,
with wide open Brims, and ending in five Corners
or Divisions, of the most excellent deep blew color
that can be seen in any Flower, with some white
spots in the bottom on the inside; after the Flower
is past, long and round Pods or Cods do appear, in
which are contained small blackish Seed; the whole
Plant is bitter, but not so strong by much as the for-
mer.

Croswort Gentian.

VII. The fourth, or Croswort Gentian, has Roots
which are small and whitish, dispersing themselves
many ways in the Ground, of as bitter a taste almost
as the rest. From this Root rises up many Branches,
which lye upon the Earth, scarcely lifting themselves
upright, and are full of Joints, at which grow usu-
ally two Leaves, one opposite unto another, in man-
ner of a Cross, from whence it took its Name, in
shape very like unto *Saponaria*, or *Soapwort*, but
shorter, and of a darker green color; at the tops of
the Stalks stand many Flowers thick thrust to-
gether, almost like *Sweet Williams*, and likewise
at the next Joint underneath, every one of them stand-
ing in a dark green Husk, and consisting of five small
Leaves, the points or ends of which only appear a-
bove the Husks in which they stand, and are hardly
to be seen, but that they are of a fine pale blew
color, and that many grow together; the Seed is
small and brown, hard, and somewhat like unto
the Seed of the *Marian Violet*, or *Coventry Bells*.

VIII. The fifth, or Pennys blew spotted Gentian,
has a Root which is small and yellow, with many Fibres
adjoining to it, from which springs up a jointed Stalk
about half a yard high, somewhat reddish towards the
bottom next to the Root, with two Leaves, like to the
Great Gentian, set at each Joint, but much smaller,
and with more Veins or Ribs therein than it, standing
each upon a reddish Footstalk, greater below than
those above, where they do in a manner encompass
the Stalk. From the middle of the Stalk upwards
come forth the Flowers at the Joints, with the Leaves,

on both sides of the Stalk, three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short Footstalk under them, consisting of five small sharp pointed Leaves, spread like a Star, of a pale blew color, finely spotted, with many small black specks on the inside, having a small umbone in the middle, and five small Threads tip with yellow standing about it; the Seed, which follows the Flowers, is small, and enclosed in such Heads or Husks as the *Gentians* usually have.

English Gentian Small.

IX. The sixth, or English Gentian, has, according to Clusius, a small Root, replenished with a few Fibres or Strings, of a yellowish color, from which rises up a round stiff Stalk, or Stalks, firm and solid, somewhat reddish at bottom, and jointed or kneed somewhat like unto Crosswort Gentian; the Leaves are broad, smooth, and full of Ribs or Sinews, set about the Stalk by couples, one opposite against another; the Flowers grow upon small slender Stalks, composed of five slender blewish Leaves, very curiously spotted, with many black Spots and small little Lines, having in the midst five small Chives, which passing away, give Seed small like Sand.

X. The seventh, or Autumn Gentian, called the Calathian Violet, has a Root which is small, long, and manifold, running down for the most part deeper into the Ground than most of the former, which Gerard says perishes after it has perfected its Seed, springing up again from the falling of its Seed, which is a mistake, and is rectified by Parkinson, for the Root is truly a stringy, and somewhat creeping, (tho' deep in the Earth) and living Root, abiding after Seed time, and not perishing as the rest; it rises up sometimes with more and sometimes with fewer Stalks, sometimes they also rise higher, as to be two Feet high, and sometimes not above a Foot high, according to the Fertility of the Soil, of a brownish green color, having many long and narrow dark green Leaves, set by couples on them up to the tops, which seldom branch forth, but bear every

one of them a reasonable large Flower, which is hollow, and larger than any other of the *Autumnal*, and is in most of a very deep blewish purple color, but in some a little paler, and ending in five points or corners.

Small Autumn Gentian,
Calathian Violet,
Or
Autumn Bell Flower.

XI. The eighth, or Autumn Gentian with small Century Leaves, has a Root which is small, striking down into the Ground, with several Fibres adjoining to it, from which spring up several Stalks, not a Foot high, divided into several small Branches, on which stand two small Leaves together, as is usual in all the *Gentians*, very like unto those of the Lesser Century, which are not so long as the former, a little broader, and of a whiter green color; at the tops of the Stalks and Branches grow several Orient Blew Flowers, not so large as those of the last described, but set in small long Husks, half way rising up above the tops of them; after which comes small Seed in long horned Cods or Vessels.

XII. The ninth, or Small Autumn Gentian, simply so called, has a Root like the former, but a little larger, which sends up a pretty stiff round Stalk, of a Span high, or something more, which at certain spaces is set with such Leaves as the last described, but larger, and out of the bosoms of these Leaves, from the bottom to the top of the Stalk, spring forth little Footstalks, which usually carry three Flowers apiece, two set one against another, and the third upon a Stalk somewhat higher, and sometimes there comes forth a single Flower at the Root of these Footstalks; the Flowers in their shape or form, magnitude, and color, are like to those in the last described, as also their Seed and Seed Vessels; the manner of the growing of this is very well represented by the *Gentiana major Flore caruleo*, mentioned in Chap. III. Sect. 2. foregoing, having, that that is very large, and this is very small, and of the perishing Kind.

XIII. The

XIII. *The Places.* The first grows upon the *Alps*, near *Switzerland*, as *Baubinns* says, the second grows on the Mountains of *Savoy*, but neither of them grow wild in *England*, being only nurst up in Gardens; the third grows upon the Hills of *Austria* and *Hungary*, *Gerard* says he found it on *Silsbury* Plane, as also in some places in *Suffex*, and likewise near *St. Albans*: The fourth, or *Crosswort Gentian*, grows in a Pasture at the West End of *Little Rayne* in *Essex*, on the North side of the way leading from *Braintree* to *March-Dunmow*, and in the Horse way by the same Close: The fifth, *Pana* says, grows upon *Bockmet*, a Hill of *Switzerland*, and in several places on the *Alps*, with us only in Gardens: The sixth is an *English Plant*, which was found by *Mr. Hesketh*, (a Gentleman very skillful in Botonology) in the North parts of *England*, viz. in *Lancashire*, but the exact place where he met with it is not named: The seventh, or *Calabrian Violet*, grows in many places of *Germany*, and other parts beyond the Seas; it grows also in several places of *England*, as near *Longfield*, by *Gravefend*, near *Greenhubb* and *Cobham* in *Kent*, and in the Fields belonging to the House formerly *Sir Percival Harts*, at *Lellingstone* in *Kent*, and in a Chalk Pit, hard by a Paper Mill, not far from *Dartford* in *Kent*; in the West Country also in several places, and that as well in wet Grounds as dry; *Johnson* upon *Gerard* says, that he found it once on a Wet Moorish Ground, two or three Miles on this side *Caster*, in a place called *Nettleton More*, in *Lincolnshire*: The eighth, or *Autumn Gentian* with *Small Centory* Leaves, grows in *Kent* in several places, as about *Southfleet* and *Longfield*, upon the Downs, as also upon *Barton Hills* in *Bedfordshire*, upon a piece of waste Chalky Ground, as you go out of *Dunstable* way towards *Gorkambury*, and not far from the Ruines of the old City *Verulam*, near *St. Albans*: The ninth is found at the Chalk Dale near *Dartford* in *Kent*, in *Waterdown* Forest in *Suffex*, in the way leading from *Charlewood's* Lodge to the Lord *Abergavenny's* House, called *E-ridge House*, by a Brook side there, also on a Heath by *Colebrook*, near *London*, and in the way turning off from *Salisbury* Plane to the Earl of *Pembroke's* House at *Wilton*, and upon a Chalky Bank between *Gorkambury* and *St. Albans*.

XIV. *The Times.* As to the times of Flowering, they are in part declared in the Section of the Kinds, the two first Flower in *April*, and the third in *May*, if they Flower at any other time it is but casual, and their Leaves abiding green all the Winter, they increase at the Root, and may be easily parted; the fourth Flowers in *June* and *July*, the fifth Flowers in *July* and *August*, and not before, the Seed growing ripe soon after, which shedding themselves continue their Kinds, but will scarcely endure Transplantation, or rise of the Seed sown in the Garden, as *Camerarius* and others have observed; the seventh Flowers not until about the end of *August*, and in *September*, in which time this Noble Flower is in all its bravery: The eighth and ninth Flower also from the end of *August*, and continue Flowering to the latter end of *October*.

XV. *The Qualities.* All the *Gentians*, both the Greater and the Smaller, are said to be of one Property, and to have the same Qualities and Virtues, but the Greater are more used with us in Physick than the Smaller; but in places where the Greater are not to be gotten, and where the Smaller are in plenty, the Lesser may very well be used in their stead. *Gentian* is hot and dry in the end of the second degree, Aperitive, Absterfive, Astringent, Carminative, Diuretick, and Traumatick, Stomatick, Hepatick, Splenetick, Nephritick, and Hystrick, Sudorifick, Alexipharmick, and Analeptick.

XVI. *The Specification.* It is a peculiar thing against the Plague, Poyson, malign Diseases, and all sorts of Agues and Fevers whatsoever, and is a famous thing for the Cure of Wounds and Ulcers of all kinds.

XVII. *The Preparations.* You may have therefrom 1. A Juice of the Herb, and also of the Root. 2. An Essence of the Herb, or rather Root. 3. An Infusion of the Herb. 4. A Decoction of the Root. 5. A Powder of the Root. 6. A Pessary of the Root. 7. A Distilled Water of the Herb and Root. 8. A Spirituous Tincture of the Root. 9. An Acid Tincture of the Root. 10. An Oily Tincture of the Root. 11. A Saline Tincture of the Root. 12. An Ointment or Balsam of the Root.

The Virtues.

XVIII. *The Liquid Juice of the Root.* It is good against the Stringing or Bitings of Hornets, Scorpions, Vipers, Rattle-Snakes, Mad Dogs, or other Venomous Creatures, taken Morning and Evening, two Ounces at a time, in a Glass of Wine, for a Week together, but in case of the Bitings of Mad Dogs, it ought to be taken for a whole Month round, till the Moon has perfected her revolution, at what time the Poyson for the most part exerts it self, and commonly kills the Patient, and therefore for security sake, it ought to be taken one whole Lunar revolution; the Wound also ought to be kept open all that time, and for the three or four first days nothing but Cloves of raw Garlick a little bruised ought to be applied to it, the Wound it self being wash'd every time with the Juice of *Gentian*, because by this means the Poyson of the Mad Dog, or of any Viper or Serpent will be drawn forth.

XIX. *The Juice of the Herb.* It is given very often to Cattel to drink, to free them from the Bots and Worms, and many other Diseases; as also when they begin to swell, being Poysoned by any Venomous thing, which they often lick up with the Grass; as also when any poysonous or hurtful Creature has bitten a Cow by the Udder, or any other tender part, which presently thereupon swells, and puts the Creature to pain, making them forbear their Meat; with this Juice the place bitten is then to be bathed several times, and five or six Spoonfuls of the Juice to be given inwardly, mixed with a Pint of Ale, by this means the poor Beast is quickly cured, and restored to its Health.

XX. *The Essence of the Root.* It has all the Virtues of the Juices before going, being used in the same manner; besides which, being taken from one Ounce to two Ounces, or more, Morning and Night in Generous Wine, it opens all sorts of Obstructions of Liver, Spleen, Gall, Reins, and Womb, and is profitable for such as are Liver-grown, as the Vulgar call it, or have any Scirrhus breeding there, because the long and constant taking hereof wastes away those Humors which cause the same; it gives ease in the most vehement pains of the Stomach, is good for such who cannot relish their Meat, have a dejected Appetite, and a bad Digestion; it is good likewise against piercing pains of the Sides, Stitches, or the like; it is good for such who are bruised by Blows or Falls, dissolving the congealed Blood, and easing the pain; the same is also very effectual against all sorts of Agues, being taken to three or four Ounces, three Hours before the coming of the Fit, in a Decoction of the same Root; it opens Obstructions of the Womb, provokes the Terms, facilitates the Delivery of Women in Travail, and brings away the Afterbirth; it is effectual against the Strangury, and brings away Sand, Gravel, or Tartarous Matter obstructing the Urinary Passages, and is said

to be very good for such as have a Rupture, or are Burthened; it is good against Coughs, Colds, Hoarseness, Wheezing, shortness of Breath, or any difficulty of Breathing, being made into a Syrup with Honey, and so taken; it is good against the Yellow Jaundice, expels Wind, and is available against all Diseases proceeding of Cold, whether inward or outward, and as *Galen* says, it is most effectual where there is any need to attenuate or make thin thick Flegm, or gross and tartarous Humors; it cleanses filthy running Sores, and putrid Ulcers, carrying off the peccant Humors, and freeing the parts affected from any Diseases affecting them; dropt into the Eyes it takes away inflammation and redness, and clears them from Films growing on them.

XXI. *The Infusion of the Herb or Root.* It has the former Virtues, but much weaker, and may be given Morning and Night for the same purposes from four Ounces to eight, sweetened with Sugar or Honey; it is a very good thing for those sorts of Agues which come by obstructions of Humors, or putrefaction of the Blood.

XXII. *The Decoction of the Root in Wine or Water.* It has all the Virtues of the Juice and Essence, but much less effectual, and may be given from three Ounces to six Morning and Night, being used Di-
etetically for some time, in the Cure of old running Sores, putrid Ulcers, and inveterate or rebellious Fistula's, &c. It is more powerful for the Cure of Agues than the Infusion of the Herb, tho' less powerful than the Essence; it heals all Wounds which are fresh, by washing them therewith, and this more especially, if it is made with Wine; it is good also to wash therewith all sorts of foul, putrid or rotten Ulcers, yea, tho' they be hollow, or Fistulous, running, and fletting, or Cancrous, for it mightily cleanses and dries, and heals also; and taken inwardly for some time, it very much prevails against the Kings-Evil, speedily and certainly healing those Ulcers up.

XXIII. *The Powder of the Root.* It has all the Virtues of Juice, Essence, and Decoction, but operates not with that celerity or speed which they do; it may be given from half a Dram to a Dram every Morning fasting, and every Night at Bed time, in some convenient Vehicle, and to be continued for some considerable time, as the reason of the thing, or occasion may require; if it is taken, with a small addition of Myrrh, or Rue, or Pepper, it is the more powerful against the Stinging of Scorpions, or Bittings of Serpents or Mad Dogs, the Wound being kept open with Vinegar and Salt Water, and dress'd with the application of *Garlick*, which draws the Venom or Poyson out the most powerfully of all Vegetables: Outwardly applied to foul, putrid, or rotten Sores and Ulcers, it powerfully deterges, or cleanses, and dries them, causing them speedily to heal: Mixt with Honey, and taken in the Morning fasting, and at the usual Medical Hours, it opens Obstructions of the Lungs, and causes easie expectoration of thick tough Flegm, and other gross Humors; it provokes the Terms, and expels the Dead Child and Afterbirth, and is indeed a singular thing for killing Worms in the Belly and Stomach.

XXIV. *The Pessary.* It is made of the solid Root, either green or dry. Being put up into the Womb, and kept there, it induces a flux of the Terms, by opening the Mouth of the Womb; it also attracts in the Birth, and brings away the Child, whether alive or Dead, and also clears the Womb of the Afterbirth.

XXV. *The Distilled Water of Herb and Root.* It has the Virtues of the Infusion or Decoction, but not so efficacious or powerful: Authors say, that being drunk, it has been often proved to cure in a won-

derful manner all sorts of Agues generated of the putrefaction of the Blood and Humors, to kill Worms in the Belly, and to cleanse the Skin from all sorts of Spots, Freckles, Morpew, and other Defecations whatsoever, it being often, viz. five or six times a day bathed therewith.

XXVI. *The Spirituous Tincture of the Root:* It is profitable against the Yellow Jaundice, strengthens and fortifies the Stomach, prevails against the Colick, and other grievous and vehement pains of the Stomach and Belly; it warms, comforts, and strengthens a cold and moist Liver, occasioned by long Sickness, or bad Diet, and is of good use for such who are in a pining Consumption; the Hemorrhoids or Piles being bathed herewith it comforts the part, gives ease in the pain, and dissolves the Tumor or Swelling; it is good against Cramps and Convulsions, being often bathed upon the part affected, and prevails against Fainting and Swooning Fits, being inwardly given in any fit Vehicle from one Dram to three, at time of the Paroxysm.

XXVII. *The Acid Tincture.* It is one of the greatest Stomaticks in *Remedia Natura*, for it opens the Obstructions of the Stomach, incides and dissolves Flegm, and all sorts of thick, tough, viscid and tartarous Humors adhering to the Tunics thereof, cleanses it of all its Faculencies, warms and comforts it, restores its Tone, being hurt or depraved, and after a singular manner causes a good Appetite and a strong Digestion, and being constantly taken, it is one of the most absolute Cures that is for the Rickets in Children; it cures Asthma's, causing a free respiration or breathing, and takes away Hoarseness, Wheezings, &c. Dose is so many drops as to make the Vehicle pleasantly sharp, and it is to be given in all that the Patient drinks, whether Ale, Beer, or Wine, and that while they use it they ought to drink nothing without it.

XXVIII. *The Oily Tincture.* Inwardly taken from ten drops to twenty or thirty, first dropt into Sugar, and then mixt with any fit Vehicle, it is of excellent use against the Colick, and pains in the Stomach, proceeding from Wind; it opens Obstructions of the Reins and Ureters, and expels small Stones, Gravel, Sand, and other Tartarous Substances, which cause the Strangury: It is a singular thing against the Palsy and convulsions of the Viscera, being inwardly taken as aforesaid, and morning and night anointed well upon the parts affected, as also along down the Back Bone: It is good also against numbness of Limbs, Trembling of any of the parts of the Body, weakness of the Joints, and the Gout it self proceeding from a cold Cause.

XXIX. *The Saline Tincture.* Being bathed upon the place, it is good against the bittings and stinging of Venomous creatures, for it attracts the Poyson out of the Part: it eases the pain of the Gout after a singular manner; opens the Pores of the Skin, dissolves contusions, being applied very hot, by way of Fomentation, and cleanses the face, hands and other parts from spots, freckles, Tanning, Sun burning, yellowness, black and blueness occasioned by Blows, as also scurf, morpew, and other like defecations of the *Cutis* and *Cuticula*.

XXX. *The Ointment or Balsam.* It is an extraordinary Vulnerary, healing simple Wounds at once or twice Dressing. It also heals Wounds and Punctures of the Nerves and Tendons. It is likewise an excellent thing against all running Sores, old and inveterate Ulcers, putrid or malign Fistula's, for in the one it potently digests, cleanses, incarnates if need be, dries and admirably heals; and in the other it takes away the Callous, &c. and in both strengthens the part, being much weakened through length or continuance of the Disease.

C H A P. CCCXIII.

Of GERMANDER Garden.

I. **THE Names.** It is called in *Arabick*, *Chamedrius*, *Damedrius* and *Kemadriut*: in *Greek*, *Χαμαδρις*, & *Χαμαδρις*, as *Dioscorides* says: in *Latin*, *Trixago*, *Trixago*, *Herba Februm*, *Febrifuga*, (from the Effects) and *Chamedrys*, *Quercula minor*; *quasi humilis aut parva quercus*, a *foliorum similitudine*: in *English*, *Germander*.

II. **The Kinds.** There are many Varieties of this Plant, most of which grow in other Countries, and are unknown in *England*: we make only four generic kinds, viz. 1. *Χαμαδρις ἡμεσῶν*, *Chamedrys sativa*, Garden Germander, of which in this Chapter. 2. *Χαμαδρις ὕλη*, *Chamedrys sylvestris*, Wild Germander, of which in Chap. 314. 3. *Χαμαδρις ὀρεῶν*, *Teucrium*, *Quercula major*, Tree Germander, of which in Chap. 315. 4. *Χαμαδρις ἁλῶδης*, & *ἁλῶδης*, *Scordium*, *Chamedrys aquatica*, Water Germander, of which in Chap. 316. following.

III. **The Garden kinds.** Of this there are many Species described in Authors; we shall only enumerate two, which are common with us in our Gardens, viz. 1. *Chamedrys sativa vulgaris*, *Chamedrys vulgaris*, and *Chamedrys mas*, *Febrifuga*, *Trixago*, and *Trixago minor*, The common Germander, or Lesser Garden Germander. 2. *Chamedrys major*, *Trixago*, and *Trixago major*, The greater Germander.

IV. **The Descriptions.** The first, or Small Garden Germander, has a Root composed of divers Sprigs, and variously dispersed with many Strings, shooting forth a great way round about, and quickly overspreading a Ground, springing up again in many places. From this Root rises up a little straight Stalk, about a Span long, and sometimes longer, nearly a Foot in Height; (but *Parkinson* says it

springs up with several Stalks) which are woody and hard, like unto a little *Shrub*, which is afterwards divided into very many little small Branches. Upon these Stalks and Branches grow small Leaves, almost round, and a little indented about the edges, lesser than the Leaves of the following *Great Germander*. The Flowers grow at the tops, and also near the Leaves on the upper parts of the Sprigs, of a deeper purple color than the following, and oftentimes tending to *Blewness*.

V. **An Observation.** This Herb was in former times much used, and is yet still used in several Places, to hedge up, or border Beds in Gardens, because it will grow thick, and may be also kept in some Form and Proportion with cutting, and that the Cuttings are much used as a strewing Herb for Houses, Flores and Chimney-hearths, being pretty, and sweet withal; for which Reason it is much affected: but this is to be taken notice of, That it will often die, and grow out of Form; and besides that, the Stalks will grow too great and hard, and stubby; and the Roots, by far shooting under Ground, will, upon a little continuance thereof, spread into many places within the Knot, which, if they be not continually pluckt up, will spoil the whole Knot it self; and therefore once in three or four Years at most, it must be taken up and new Set, or else it will grow too rank and cumberfom.

VI. **The second, or Greater Germander**, has a Root which is more bushy with Fibres, and creeps less than the former: from this Root rises up greater and harder square Stalks, twelve, fifteen or eighteen Inches high, spreading into several Branches from the very bottom; on which grow two Leaves at a Joint, somewhat larger than those of the Ordinary or Common kind just before described, and more indented about the edges, green above, and somewhat greyish underneath. The Flowers stand in a long spiky Head, and are larger than the former, gaping like them, and of a paler purple color.

VII. **The Places.** They are both found growing Wild in *Germany*, and in many other Countries, as *Cusius* saith; but with us, they are only found in Gardens.

VIII. **The Times.** They flower in *June* or *July*, and the Seed is ripened in some little time after.

IX. **The Qualities.** Germander is hot and dry in the third Degree, and more sharp and bitter than *Teucrium*, as *Dioscorides* says: it is highly Aperitive, Incisive, Absterfitive, Astringent, Cephalick, Neurotick, Stomatick, Pectoral, Hepatick, Splenetick, Arthritick, Alexipharmick and Analeptick.

X. **The Specification.** It cures all sorts of Agues and Fevers, and is principal against the Plague or Pestilence: it is good against Diseases of the Lungs, stops all sorts of Fluxes of the Bowels, and is a certain Remedy for the Gout.

XI. **The Preparations.** You may have herefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion. 4. A Decoction. 5. A Syrup. 6. A Powder of the Herb. 7. An Ointment or Balsam. 8. A Cataplasm. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture. 12. A Saline Tincture. 13. A Spirit of the Herb. 14. A Powder of the Seed.

The Virtues.

XII. **The liquid Juice.** If it is mixt with Honey and so taken, it is good against Coughs and Colds, Hoarseness, Wheezings, Shortness of Breath, and Pains of the Spleen. It is profitable for such whose Spleens are become hard, and such as have the Strangury, or make their Water difficultly; and helps

H h h helps

helps those who are falling into a Dropsy, being taken in the beginning of the Disease. Dose two, three or four Spoonfuls Morning and Night.

XIII. The Effence. It has all the former Virtues; besides which, it opens Obstructions of the Stomach, Liver, Spleen, Reins and Womb; provokes the Terms in Women, and helps to expel the dead Child, and the After-birth. If it is mixt with Vinegar, and so taken, it does waste or consume the Spleen, and is very effectual against all sorts of Poison, chiefly the Bittings of Serpents and mad Dogs. Used outwardly with Honey, it cleanses old and running Sores and putrid Ulcers, hindering their spreading and eating: and so mixed with Honey and put into the Eyes, it helps their running and watering, and removes the Dimness of Sight. Taken inwardly, three or four Spoonfuls at a time, it is good against Pains and Stiches of the Side, Colicks, and other the like Disaffections. It cures also *Tertian* and *Quartan* Agues, being taken every day in the Morning fasting, and on the day of the Fit, three hours before the Fit comes; and Experience has found it a most effectual Remedy against the Plague it self.

XIV. The Infusion. It has the Virtues of the Juice and Effence, but not full out so effectual: it prevails against Diseases of the Brain, continual Pains of the Head, Melancholy, Epilepsy, Carus, Lethargy and Dulness of Spirits, Palsies, Convulsions, &c. Dose fix Ounces Morning, Noon and Night.

XV. The Decoction. It has the Virtues of the Juice, Effence and Infusion, but is something more efficacious than the Infusion, but not so pleasant to be drank by the Patient, because it tastes stronger; yet it may be given to fix Ounces or more, as the Infusion aforesaid is given. Put into the Ears, it kills Worms in them, and also kills Worms in the Belly, so also the Juice and Effence. A Decoction of the Herb or Root rather, made in Wine, and taken for sixty days continually, four hours before Meat, it is a certain Remedy for the Gout.

XVI. The Syrup. *Durantes* makes a Syrup for the Spleen after this manner: Take *Germander*, *Ground Pine*, *Ceterach*, *Madder*, of each a Handful; *Raisins stoned* an Ounce; *Bark of Caper-roots*, *Roots of Smalage*, *Elecampane*, *Blew Flowerdeluce*, *Orrice*, *Liquorice*, of each half an Ounce; *Bark of Tamarisk*, *Cyperus*, *Seeds of Anise*, *Kennel*, *Smalage*, of each two Drams: boil all in a sufficient quantity of a Mixture of equal parts of Water and Vinegar: then strain, and with a sufficient quantity of Honey, make a Syrup, aromatizing it with five or six Ounces of strong Cinnamon-water. The Dose is four Ounces every Morning fasting. It is good also against Coughs, Colds, Asthmas and other Distempers of the Lungs; as also against the Colick, Stiches in the Side, &c.

XVII. The Powder of the Herb. It has the Virtues of the Juice, but more astringent, being very good to stop all manner of Fluxes, whether of the Belly or of Blood; as also the Courses in Women, and to stop Vomiting, being given from half a Dram to a Dram and half, in Vinegar or any other proper Vehicle.

XVIII. The Powder of the Seed. It may be given from half a Dram to a Dram and half in a Glass of White Port Wine, for some days; and so taken, it expels Choler by the Urinary Passages, and is profitable against the Yellow Jaundice; it also comforts the Stomach, and strengthens all the Viscera, though under long Weaknesses.

XIX. The Ointment or Balsam. It heals simple green Wounds in a short time; and being applied to foul running Sores, and old putrid Ulcers, it di-

gest them, cleanses, incarnates, dries, and quickly heals them up. Applied to the Gout, it eases the Pain in twenty four hours time; and by the constant Use of it afterwards, in a short time cures it, and that so perfectly, as to return no more again upon that Basis.

XX. The Cataplasim. Being beaten and boiled in Vinegar, and brought to a Consistence with a little Leaven, and so applied to the Stomach, it stops and cures all those Vomiting which arise from hot and choleric Causes; and applied to the Forehead and Temples in case of an Hemorrhage or Bleeding at Nose, it presently stops it.

XXI. The Spirituous Tincture. It warms and comforts a cold Stomach, and so strengthens it, as to cause a good Appetite and a strong Digestion. It is cordial and excellent good against fainting and swooning Fits, Fits of the Mother, and a vehement Sickness at Heart, which it eases almost in a moment. It expels Wind powerfully, and gives ease in the Colick; and is a singular thing in resisting even the Violence of Convulsions. Dose two Drams.

XXII. The Acid Tincture. It is so powerful an Opener of all Obstructions of the Stomach and other Viscera, that there are but few other things which equal it. It cures and prevents the Rickets in Children; is powerful against a Cachexia in Virgins and other young People; and a singular thing against the Green-sickness in young Women. It excites a good Appetite where it is languid or is wanting; incides, dissolves and expels thick, tough, viscid Flegm, and other tartarous Humors lodged in the Stomach and Bowels, causing Tortions, Gripings, Colicks, &c. let it be given Dietetically in all that the Patient drinks, whether Ale, Beer or Wine, for many Drops at a time as may give the Vehicle a pleasant Acidity, continuing its Use as long as need requires.

XXIII. The Oily Tincture. Outwardly bathed upon any Part, or Parts affected with Lameness, Numbness, Trembling, Palsy, Convulsions, Cramps, from a cold Cause; as also upon Punctures of the Nerves or Tendons, in a short time gives ease, and by Continuation of the same, (doing it Morning and Night) in no long time a perfect Cure. It eases Pains upon the Shin-bones, as also Pains in the Joints, the Gout and Rheumatism; and is an excellent thing to be bathed upon any Part which has contracted any Weakness by the long Continuance of any Disease: But in Palsies and Convulsions it is to be noted, that the Back-bone must also be anointed with the same in like manner, twice a day, rubbing it very well in.

XXIV. The Saline Tincture. Inwardly given from one Dram to two in a Glass of White Port Wine, it opens Obstructions of the Urinary Passages, and provokes Urine powerfully, expelling Gravel, Sand, and slimy or viscid Matter, which stops the Urine and causes Pain. Bathed upon a recent and simple Contusion, it hinders the Aggregation of Humors, dissolves those which are present, and quickly cures the same, taking away also the Blackness and Blewness thereof. It is also good against Pimples, Freckles, Sun-burning, Tanning, Yellowness, Scurf, Morpew, and other like Breakings out of the Skin.

XXV. The Spirit from the Herb. It is highly Stomachick and Cordial, good against all Diseases of the Head, Brain, Nerves, Heart and Vitals, comforting the Parts affected, resisting the malign Vapors which oppresses the Spirits, and reviving the universal Man. Dose from one to two Drams, either alone or in a Glass of choice and generous Wine, as oft as occasion requires, viz. in fainting, swooning, &c. CHAP.

C H A P. CCCIV.

of GERMANDER Wild.

I *THE Names.* It is called in Greek, Χαμαιδρύς ὤρεα; in Latin, *Chamadrys sylvestris*: in English, Wild Germander.

II. *The Kinds.* This is twofold, viz. 1. *Chamadrys sylvestris Clusii*, *Chamadrys spuria sylvestris*, *Chamadrys vulgaris semina Fuchsi*, *Turneri*, *Loniceri*, *Lugdunensis*, *Pseudochamadrys Thalii*, *Teucrium pratense Lobelii*, Common Wild Germander. 2. *Chamadrys angustifolia*; *Chamadrys spuria minor angustifolia Baubini*, who takes it to be the third Variety of the fourth kind of *Clusius* his *Teucrium*, Narrow-leav'd Wild Germander.

Wild-Germander.

III. *The Descriptions.* The first, or Common Wild Germander, has a Root which is small and thready, which sends forth several square upright Stalks, yet sometimes a little bending, having two Leaves set at each Joint, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller as they grow up higher. The tops of the Stalks are spiked with several blew Flowers, set about them, made of four small round Leaves apiece, with a little white Eye in the middle, small-pointed, and some Threads also; after which succeed small flat Pouches, containing small Seed.

IV. *The second, or Narrow-leav'd Wild Germander*, has a Root which is blackish, hard and fibrous or stringy; from which spring several round reddish Stalks, somewhat rough, hard and hairy, about an Hand Breadth or something more high, and bending downwards, whose lower Leaves are somewhat long and broad, round at the ends, and not dented at all about the edges; but those which grow up higher

upon the Stalks, are shorter and narrower pointed also at the ends, and snipt about the edges. The Flowers grow towards the tops of the Stalks, Spike-fashion, being either of a pale blew color or bluish, made of four Leaves, like the other; having also like Heads and Seed.

V. *The Places.* The first grows almost in every Meadow thro' the Land, as also by Ditches and Hedge sides: Gerard says it grows in many places about London, in Meadows and fertile Fields, and in every place wheresoever I have travelled (says he) in England. The other grows in like places, but is nothing near so common.

VI. *The Times.* They flower and flourish from the end of May to the latter end of August.

VII. *The Qualities, Specification, Preparations, and Virtues*, are the same with those of the Common Garden Germander in the former Chapter, and thither I refer you.

C H A P. CCCV.

of GERMANDER Tree.

I *THE Names.* It is called in Greek, Τεύκρον; in Latin, *Teucrium*, (à *Teucro* inventore, teste Plinio) also *Quercula major*; and in English, Tree Germander.

Tree Germander

II. *The Kinds.* There are three kinds hereof which grow in our Gardens, viz. 1. *Teucrium majus vulgare*, *Teucrium Matthioli*, *Lobelii*, & *altorum*, *Teucrium vulgare fruticans Clusii*, *Chamadrys alterum*, seu *assurgens Dodonæi*, Common or vulgar Tree Germander. 2. *Teucrium Creticum Clusii*, *Teucrium Creticum incanum Baubini*, Tree Germander

der of Candia. 3. *Teucrium Baticum*, *Teucrium fruticosum*, *Beticum Clusii*, *Lugdunensis*, *Tabernmontani*, & *aliorum*, *Teucrium Pergrinum folio sinuato Babilini*, Spanish Tree Germander.

III. The Descriptions. The first, or Common Tree Germander, has a Root which is somewhat woody, spreading it self about, with many Strings and blackish Fibres adjoining to them. From this Root spring up hard, woody, brittle Stalks, (growing much like a little Shrub) a Foot or two, and sometimes a Yard high, where Care is taken of it, and it is preserved and defended from the Injuries of the Winters. These Stalks branch themselves forth on all sides, from the very bottom, bearing always Leaves by couples, smaller, smoother and thicker than those of Germander, of a dark shining green color on the upper side, and greyish underneath, and dented also about the edges, like them. The Flowers which are gaping, stand about the tops of the Branches, Spike-fashion, one above another, of a pale whitish color, as *Clusius* says, but of a purple, as *Lobel* says, of both which colors it has been oft seen bearing; but the Flowers are somewhat larger than those of Germander, and without any Hood above, having a few Threads standing forth. The Seed is small, blackish and round, contained in small round, but pointed Husks. The whole Plant is of a fine, pleasant, but weak Smell, yet somewhat stronger, if it is a little bruised, holding the Stalks and green Leaves continually, if it is not exposed to the Sharpness of the Winter Season.

IV. The second, or Cretian Tree Germander, has a Root like the former, and springs up and grows like a little Shrub; it rises up with such like woody Stalks, and brittle, as the other, but something smaller and robiter; on which do grow such like Leaves, and in the same manner, but something lesser, less green and shining above, and more hoary underneath, two always set at a Joint, one opposite to the other: with the Leaves towards the tops, come forth five or six Flowers, standing in a Husk, like unto the other, but a little less, and of a purple color, which being past away, small round seed follows like to the former. The whole Plant is a little sweeter than that first described.

V. The third, or Spanish Tree Germander, has a woody Root, branching it self forth under Ground, with many Fibres adjoining to it, from whence rises up a shrubby Plant, growing sometimes to be three or four Feet high, and many times lower. It rises up for the most part but with one woody Stalk, which is of a greyish color, and divides it self into several Arms or Branches, but fewer than that of Candy, two always set at a Joint. The Leaves likewise stand two together, something greater, and waved a little at the edges, of a sad green color above, but not shining, and more hoary underneath. The Flowers stand at the Joints with the Leaves, towards the tops of the Stalks, of a white color, without any Hood above, and with several Threads in the middle, the lower Leaves hanging downwards. The Scent hereof is less odoriferous or sweet, and the Taste is more bitter than the former, but abides with its Stalks and Leaves thereon, green, like the rest, but requires a little more Care for its Winter-Security in our Country.

VI. The Places. They all grow with us in Gardens, where they flourish very well, and delight to grow in rough stoney places, which are mountainous and exposed to the Air and Sun. The second was brought to us from Candia; the third from Spain; and therefore are not so hardy Plants as the first of them.

VII. The Times. These Tree Germanders flower somewhat later than the other Germanders do, viz. in July and August; and the Seed is ripe in some little time after.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Common Germander in Chap. 313. foregoing, to which we refer you.

IX. An Observation. It is to be noted, That *Galen* makes Tree Germander to be hot in the second Degree, and dry in the third, to be of thin parts, and inciding also, whereby, he says, it is helpful for the Spleen. *Dioscorides* says it is used either green or dry, and is good to consume the Spleen, being inwardly and outwardly applied; it is also used against the Stinging or Biting of poisonous Creatures.

CHAP. CCCXVI.

Of GERMANDER Water,

OR,

SCORDIUM.

I. THE Names. It is called in Greek, *Σκώδιον*, some call it *Διόσκορον*, (from the strong Smell;) and it may also be called *Νεφελίσις* *ῥόδον*: in Latin, *Scordium*, *Trixago palustris*, and *Trixago palustris*, *Chamadrys aquatica*: in English, Water Germander, Garlick Germander, and *Scordium*.

The True Scordium, or Water Germander.

II. The Kinds. *Tabernmontanus* makes two kinds hereof, viz. a Lesser and a Greater. 1. *Scordium legitimum*, *Scordium minus*, *Scordium verum*, *Trixago palustris minor*, The lesser Scordium, The true Scordium, or Water Germander. 2. *Scordium majus*,

majus, *Scordotis* Plinii, *Scordium alterum*, *Scordotis leguimium* Plinii; The Greater Scordium, having Leaves almost as large as *Batm*. I know that *Johnson* and *Parkinson* will scarcely allow of this Greater kind, and make no Difference between them, but only in respect to the place of its Growth, making it to be either Greater or Lesser, according as the Soil is either richer and fatter, or poorer and more lean; but doubtless they were mistaken, for the two differing Species are manifest.

III. The Descriptions. The first, which is the Smaller kind, and is the True Scordium or Water Germander, has a small Root, full of white Strings or Fibres, spreading in the Ground, and creeping round about; from whence shoot forth several weak, square, hairy Branches, which take Root in several places, as they lye, and spread; by which means it much encreases. Upon these Stalks or Branches grow many Leaves, two always at a Joint, which are something larger and longer than the Leaves of Garden Germander, of a sad or dark green color, whereon there is yet a shew of Hoariness, somewhat soft in handling, full of Veins, and dented about the edges, of a Scent somewhat strong, and resembling *Garlick*, whence came the Greek and Latin Name. The Flowers are small, red and gaping, or of a purple color, like the Flowers of dead *Nettles*, and stand at the Joints with the Leaves, towards the tops of the Branches.

Water Germander the Greater.

IV. The second, or Greater Scordium, or Water Germander, has a small long Root, and very fibrous, creeping deep into the Ground, and far about, abiding long, and not perishing every Year; from which many square, white, hairy Stalks or Branches spring forth, some rising up higher, and others dwarf like, keeping nearer the Ground. Upon these Stalks or Branches grow Leaves, two at a Joint, broader and rounder than the former Scordium, and all of a hoary white, being somewhat like unto the Leaves of

Horehound or Water Mint, and almost as large as those of *Batm*. From the middle of the Stalks upwards, towards their tops, come forth the Flowers, standing as it were in a long spiky Head, with Leaves at the bottoms of Husks or short Foot-stalks. These Flowers are of a pale purplish color, almost white, like unto Horehound, gaping, and very like to those of dead *Nettles*, which being passed away, there follows small, round, black Seed. The whole Plant smells of *Garlick* as much as the former, or True Scordium, and thereby it is known to be of the kind, tho' the Leaves, by being larger, do somewhat differ.

V. The Places. The first grows in many wet Grounds, and by Water-sides in many places of England. *Dioscorides* says, That it grows as well on Hills as by Water-sides; and it will flourish well, if it is transplanted into a Garden: *Camerarius* says, That it is found to be stronger and sharper which grows on high Grounds, than that which grows on low and moist places. It grows near to *Oxenford*, by *Ruley*, on both sides of the Water; and in a Meadow by *Abington*, called *Neitford*: also in great plenty in the Isle of *Ely*, and in a Meadow by *Harwood* in *Lancashire*, and in several other places. The other grows also in low and moist places, but is not so generally to be found as the first is: in *Candia* the People gather it promiscuously with the first sort.

VI. The Times. They flower in June, July and August, in which Months it is best to gather it and keep it dry: it perishes not in Winter, but only looses the Stalks, the Root sending up fresh again in Summer.

VII. The Qualities. Germander is hot and dry in the second Degree: it is Aperitive, Abiterfive, Astringent, Carminative, Digestive, Diuretick, Anodyne and Traumatick; Cephalick, Neurotick, Stomatick, Cordial, Heparick, Nephritick, Sudorifick and Alexipharmick.

VIII. The Specification. It is a counter Poison against all Poisons and Infections of Contagious and Epidemick Diseases, as Stingings or Bitings of Serpents, mad Dogs, &c. all sorts of malign Fevers, the Measles, Small-Pox, Purples, Spotted Fever and Calenture, as also the Plague or Pestilence it self: it is an especial Help against the Strangury, and provokes the Terms in Women.

IX. The Preparations. You may prepare hereof, viz. 1. A liquid Juice. 2. An Essence. 3. An Infusion in Wine, or Decoction. 4. A Syrup. 5. A Pouder. 6. An Electuary. 7. Diacordium. 8. An Ointment or Balsam. 9. A Cataplasm. 10. A distilled Water. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture. 14. A Spirit. 15. An Elixir. The Herb is only used.

The Virtues.

X. The liquid Juice. It is a little sharp and penetrating, and so is effectual to provoke Urine, and give ease in the Strangury. It opens Obstructions of the Womb, and provokes the Terms in Women, facilitates the Birth, and brings away the After-birth. It is good against the Bitings or Stingings of Vipers, Rattle Snakes, and other Serpents, mad Dogs, Scorpions, Hornets, &c. and resists all other deadly Poisons. Dose two, three or four Spoonfuls in the distilled Water of the same, or in any other fit or proper Vehicle, Morning and Night, to be continued for some time.

XI. The Essence. It has all the former Virtues, and may be given in like manner in the same Dose: and as it is a counter Poison, so it resists all contagious

gious and infectious Diseases, even when Epidemical, as Measles, Small-Pox, Spotted Fever, Purples, the Plague also, and all Pestilential Distempers. It is given with good Success before the Fits of Agues, to divert or hinder the Access, and to drive them away: in this Case it may be given to four, five or six Ounces. It is a most certain Remedy to kill Worms in Old or Young, whether in the Stomach or Belly. And by reason of its Absterfive and Sanative Properties, it is an excellent thing to be used Dietetically against the Poison and Malignity of the French-Pox, and to clear the Patient of the Reliques of the same. It powerfully provokes Sweat, and therefore is good against the Plague, digests Humors, dissolves and dissolves Swellings, and is an excellent thing for such who are hurt by Blows, Falls or Bruises, where some inward Vessel may be broken, to dissolve, disperse and expel the congealed Blood, and to consolidate the Vein; and because of its Conglutinating Property, it is good for such as are troubled with any Rupture or Burstiness, this being daily drunk inwardly, and the Herb applied outwardly.

XII. *The Infusion in Wine, or Decoction.* These have both of them the Virtues of the Juice and Essence, but in a much less degree, for which Reason they ought to be taken in a much larger Dose, and to be oftener repeated. They are good against the gnawing Pains of the Stomach, as also Pains of the Sides and Pleura: and if they are made in Red Wine, are very profitable against the Bloody-flux, and all other Fluxes of the Belly.

XIII. *The Syrup.* It has the Virtues of the Infusion and Decoction, and is available against an old Cough, Hoarseness, Wheezing and Shortness of Breath: it opens Obstructions of the Lungs, and helps to expectorate tough Flegm and other viscous Humors out of those Parts. Mixt with the Powder of *Scordium*, and applied to foul and putrid Ulcers, it absterges them, dries, and very much contributes to their healing.

XIV. *The Powder.* It has the Virtues of the Juice, Essence, Infusion and Decoction, but operates not so speedily, and may be given in any convenient Vehicle, as in the distilled Water, Infusion, Decoction or Syrup of the same Herb, from half a Dram to a Dram. It facilitates the Labor, provokes the Terms, opens Obstructions of the Urinary Vessels, is good against Ruptures, is an excellent counter-Poison, kills Worms, and prevails powerfully against the Bloody-flux, more especially if it is mixt with Powder of *Tormentil*-Roots a third part. It is very good for moist running Sores and Ulcers in the Legs or other Parts, to cleanse and dry them, and cause them speedily to heal.

XV. *The Electuary.* It is made of the Powder of *Scordium* a Pound, mixed with three Pounds of the Rob of Juice of Cressies made with Honey, adding at the end, Resin in fine Powder half a Pound. It is a noble Electuary for the Lungs; it not only cures Asthma's, Coughs, Colds, Wheezing, &c. but also heals Ulcers of the Lungs, helping to expectorate the rotten and putrid Matter from thence. Dose one Ounce Morning and Night.

XVI. *Discordium.* It is a compound Confect or Fleatuary in our *Pharmacopœia Londinensis*, lib. 4. cap. 22. sect. 19. It was composed by *Tracastorius*, and inserted there for its great Virtues and general Use. It is given against Plague, Poison, malign Fevers, Fluxes of all sorts, Catarrhs, Vomiting, Coughs, Watchings, Asthma's, Pleuritis, Consumptions, Whites and Reds in Women, &c. Dose from one to two Drams at Night going to Bed, and as much in the Morning fasting, as the Occasion may require: and it may be given to Children from a

Scruple to half a Dram, in any convenient Vehicle. It is thus made: Take *Scordium* in fine powder one Ounce; fine Bole an Ounce and half; Terra Lemnia, Bistort, Cinnamon, Cassia Lignea, Bitany of Crete, Gentian, Tormentil, (all these in fine powder) Gum Arabick, Galbanum, Storax Calumita, of each half an Ounce; Ginger, long Pepper, Seeds of Sorrel, of each two Drams in fine powder; Opium a Dram and half; Canary eight Ounces; Sugar of Roses a Pound, clarified Honey two Pounds and half: mix and make an Electuary according to Art. The Opium in this Prescript is much too little, being to the whole Composition only as 1. to 210. which is an inconsiderable Proportion. Should Opium one Ounce be the Proportion, it would yet be but as 1. to 58. which is still considerably too little, where any Effects from the Opium are expected.

XVII. *The Ointment or Balsam.* They are excellent Wound-Medicaments, and cure simple green Wounds at two or three times dressing. If to every Pound of the Balsam three Ounces of the Powder of *Scordium* be added, and one Ounce of Powder of Tobacco, it will be one of the best Topicks for digesting, cleansing, incarnating, drying and healing any running old Sore, putrid Ulcer or Fistula, in what Part of the Body soever.

XVIII. *The Cataplasim.* If it is made of the dried Herb mixed with Honey, and applied to simple green Wounds, it heals them. If it is applied to foul and putrid Ulcers, it cleanses, dries and heals them. If it is applied to Excrecencies in the Flesh, as Wens, and the like, it repercusses the Matter, hinders them from encreasing, and prevails against them so as to discuss or disperse them. Applied to the Gout, it eases the Pains thereof.

XIX. *The distilled Water.* It is Cordial and Alexipharmick, and is good against fainting and swooning Fits, Sickness at Heart, caused by any malign or pestilential Miasmata or Vapors, &c. but it is chiefly used as a Vehicle, to convey the other Preparations of this Herb into the Body.

XX. *The Spirituous Tincture.* It is highly Cordial, good against all the Deliquiums of the Spirits, Faintings, cold Sweats, Weakness, Poisons and poisonous Vapors, Sickness at Heart, Agues, &c. and has all the Virtues of the Juice and Essence, but is to be given in a much lesser Dose, viz. from one to three Drams, in some fit Vehicle.

XXI. *The Acid Tincture.* There are but few things in the whole Republic of Medicine, which are so powerful against the Plague and all Pestilential Poison, as this Medicament is, because it strikes at the Root of the Malignity and Venom, undoing it in its Principle and Essence. It not only cures the Plague and all Pestilential Diseases, but it is also a noble Prophylactic, or Preserver from the Contagion and Infection. I commend it against the Spotted Fever, the Purples, Calenture, all burning and malign Fevers, the Bittings of mad Dogs, Serpents, Vipers, Rattle Snakes, Stinging of Scorpions, because, if wisely given, and in a due or fit Dose, it will do more in an Hour than many other Medicines will do in a Week: it is to be given in all that the Patient drinks, whether Ale, Beer, Wine, Posset-drink, Grewel or Broth, and so many Drops at a time as to make it pleasantly sharp, resembling the Acidity of a Limon. It is a noble Medicine, and ought to be kept always in a Readiness by one.

XXII. *The Oily Tincture.* Anointed on the Back-Bone, and upon the Parts affected, Morning and Night, it is an excellent thing against Numbness, Trembling of the Limbs, Palsies, Convulsions, &c. it is also of extraordinary Use, being applied to Punctures of the Nerves or Tendons, for it presently eases the Pain, abates the Tumor, prevents Convulsions,

vulſions, and induces the Cure almoſt to a Miracle. Inwardly given from twelve to thirty Drops, being drop'd into Sugar, and ſo mixt with any proper Vehicle, it has not only all the Virtues of the Juice and Eſſence, but after a ſingular manner opens Obſtructions of the Reins and Womb, provokes Urine, eaſes the Strangury, and forces away Stones, Gravel, Sand, Tartar, or any other Fœcality reſiding in thoſe Parts. It alſo provokes the Terms in Women, facilitates the Labor, but brings away alſo the After-birth, and prevents After-pains, &c.

XXIII. *The Spirit.* It is one of the greateſt Cordials in the World, it cheers the Heart, revives the Spirits, ſtrengthens the *Archeus*, and prevails againſt fainting Fits, Swooning, Vapors, Fits of the Mother, Convulſions, Palfies, Lethargies, and all other like Diſeaſes proceeding from Cold and Moiſture, or from any poiſonous or venene Cauſe. It is alſo a Prefervative from the Infection of the Plague. The Doſe is from one Dram to two or three, in any fit Vehicle.

XXIV. *The Elixir.* It has all the Virtues of the liquid Juice, Eſſence, Tinctures and Spirit exalted, and may be given from one Dram to two, either in a Glaſs of genetous Wine in a Morning faſting, as a Prophylactick againſt the Plague, or at any other time, when need requires it, as in any fainting Fit, or Paroxyſm, to Women in Labor, and to ſuch as labor under any preſent Sickneſs at Heart. 'Tis an excellent Cordial, and an Antidote againſt all manner of Poiſon and Infection.

C H A P. CCCXVII.

Of GILLIFLOWER the Greateſt,

O R,

Carnation GILLIFLOWER.

I. THE Names. This Plant, as it was unknown to the *Greeks*, ſo it has no *Greek* Name allotted it; but it is called in *Latin*, *Caryophyllus hortensis*; the *Epithite* is added, to diſtinguiſh it from *Caryophyllus Indicus*, the *Indian Spice* called *Cloves*; theſe in the Garden being ſo called in ſome reſpect from their *Smell*, it in ſome meaſure being like to that of the *Indian Spice*; and in another reſpect from the *Form*, the Flower it ſelf, in its lower part, being very like to the *Indian Clove*: in *English* we call it, *Gilliflower*, (*quasi July-flower*, from its flowering in the Month of *July*;) but if we will aſſign it a *Greek* Name, we may call it *Καρυόφυλλον Ἰνδικόν*, *Caryophyllus hortensis*, and ſo it is diſtinguiſhed from *Καρυόφυλλον Ἰνδικόν*, *The Indian Clove or Spice*.

II. The Kinds. Of the *Gilliflowers* there are three generic kinds, viz. 1. *Caryophyllus hortensis rubrum*, The deep Blood-red Clove-Gilliflower, of which we have already treated in Chap. 139. aforegoing. 2. *Caryophyllus hortensis maximus*, The greateſt Gilliflower or Carnation Plant, of which in this Chapter. 3. *Caryophyllus hortensis major*, The greater Gilliflower, called ſimply by the Name of *Gilliflower*, of which there are ſeveral Species, which ſhall be treated of (God willing) in Chap. 318. following. The generic Deſcription of theſe two latter, ſee in Chap. 139. ſect. 5 and 6.

III. The Kinds of Carnations. Of the *Greatest Gilliflower* or *Carnations*, there are many kinds:

Authors account about twenty ſeveral Species, which, becauſe of the immediate Repetition, we ſhall forbear to name here, but give you them each in their own order, as we ſhall now deſcribe them.

Gilliflower Greateſt.

IV. The Deſcriptions. 1. *Caryophyllus maximus, dictus, Hulo rubro varius, The grey Hulo.* It has as great Leaves as the *Old Carnation*, (deſcribed in Chap. 139. ſect. 5.) and as deeply jagged on the edges; it has a great high Stalk, wheteon ſtand the Flowers, of a deep red color, ſtriped and ſpeckled very cloſe together, with a darkiſh white color.

V. 2. *Caryophyllus maximus, i. e. Hulo ruber non variatus, The red Hulo.* It is a fair large Flower, of a *Stamel* color, deeply jagged, as the former, and grows very gallantly, without any ſpot at all in it, ſo that it ſeems to be but a *Stamel Gilliflower*, ſaving, that it is much greater.

VI. 3. *Caryophyllus maximus dictus Hulo ceruleo purpureus, The blew Hulo.* It is a goodly fair Flower, being of a fair purpliſh Murry color, admirably Marbled with White, but ſo finally to be diſcerned, that it ſeems only Purple, it has ſo much the Maſtery in it; it reſembles the *Brazil*, but that it is much bigger.

VII. 4. *Caryophyllus maximus dictus Grimelo, ſive Princeps, The Grimelo, or Prince.* It is a fair Flower alſo, as large as any *Cryſtal*, or larger, being of a fair Crimſon Color, equally for the moſt part ſtriped with White, or rather more White than Red, tho' every Leaf from the bottom, and grows beautifully.

VIII. 5. *Caryophyllus maximus Incarnadinus Albus, The White Carnation, or Delicate.* It is a goodly delightful fair Flower when in its Pride and Perfection, that is, when it is both Marbled and Flaked, or ſtriped and ſpeckled with White, upon an Incarnate Crimſon Color, being a very ſweet and delicate Flower, but abides not conſtant, changing oftentimes to have no Flakes or Strakes of White, but Marbled or Speckled wholly.

IX. 6.

IX. 6. *Caryophyllus moscinus Incarnadinus Gal- lani, The French Carnation.* It is very like to the *White Carnation*, but that it has more Specks or Spots, and fewer Stripes or Flakes of White in the Red, which has the Mastery of the White.

X. 7. *Caryophyllus maximus Incarnadinus Grandis, The Ground Carnation.* "It is almost like to the *Grand* or *Old English Carnation* described in Chap. 139. Sect. 5. foregoing, it is a thick Flower, but spreads not its Leaves abroad as others do, having the middle standing higher than the outward Leaves, and turning up their brims or edges, and is a sad Flower, with few Specks or Stripes in it; it is very subject to break its Husk or Pods, so that the Flower seldom comes fair and right; the green Leaves are as great as the *Hulo*, or *Lumbard Red*.

XI. 8. *Caryophyllus maximus Crystallinus, The Crystal, or Crystalline.* It is a very delicate Flower when it is well marked, but it is inconstant in the marks, being sometimes more striped with White and Crimson Red, and sometimes less, or little or nothing at all, and changing sometimes to be wholly red, or wholly bluish.

XII. 9. *Caryophyllus maximus Flore Rubro, The Red Crystal.* The Red hereof, which is changed, is the most Orient Flower of all other *Red Gilliflowers*, because it is both the greatest, as coming from the Crystal, as also, that the Red hereof is a most excellent Crimson.

XIII. 10. *Caryophyllus maximus dictus fragrans, The fragrant.* It is a fair Flower, and thought to come from the Crystal, being as large, but of a bluish red color, spotted with small specks, no bigger than Pin points, but not so thick as in the *Pageant*.

XIV. 11. *Caryophyllus maximus Subaudicus varius, The Striped Savoy.* It is for form and bigness equal with the Crystal, or *White Carnation*, but as inconstant as either of them, changing into Red or Blush; so that few Branches with Flowers contain their true mixtures, which are a whitish bluish, fairly striped with a Crimson Red Color, thick and short, with some spots also among them.

XV. 12. *Caryophyllus maximus Subaudicus Carneus, The Blush, or Flesh Colored Savoy.* It is the same with the former, the same Root of the *striped Savoy*, as aforesaid, yielding one side or part, whose Flowers will be wholly bluish, or having some small spots, or sometimes few or none in them.

XVI. 13. *Caryophyllus maximus Subaudicus ruber, The red Savoy.* It is like the bluish when the color of the Flower is wholly red, without the mixture of any Stripes or Spots, and so abides long, yet it is sometimes seen, that the same side or part, or Root, being separate from the first or Mother Plant, will give striped and well marked Flowers again.

XVII. 14. *Caryophyllus maximus Oxoniensis, The Oxford Carnation.* It is very like to the *French Carnation*, as well for form as largeness and color, but that this is of a sadder red color, so finely marked with White thereon, that the Red having the Mastery, it shews it like a very sad Flower, not having any Flakes or Stripes at all in it.

XVIII. 15. *Caryophyllus maximus Regius, sive Britannensis major, The Kings Carnation, or Ordinary Bristol.* It is a reasonable great Flower, deeply jagged, of a sad red color, very finely striped and speckled with White; some of the Leaves of the Flower on the one side will turn up their brims or edges; the green Leaf in this is very large.

XIX. 16. *Caryophyllus maximus Granatensis, The greatest Granado.* It is a very fair large Flower, bigger than the Crystal, and almost as big as the *Bleu Hulo*, it is almost equally divided, and striped with Purple and White, but the Purple is sadder than in the *Ordinary Granado Gilliflower*, else it

might be said to be the same, but greater, several have taken this Flower to be the *Grand Pere*, but the difference will manifestly appear in the description of the next Flower.

XX. 17. *Caryophyllus maximus dictus Cambersine, The Cambersine.* It is a fair great Flower, red colored, and well marked or striped with White, somewhat like unto a *Savoy*, as some say, but that the Red is not Crimson, as the *Savoy* is; or something like to the *Dainty*, as others say, but not so gallant and sweet a form; the Leaves of the Flowers are many, clustering together, without any due form of spreading.

XXI. 18. *Caryophyllus maximus dictus Gran Pere, The Grand Pere.* It is a fair great Flower, and sweet enough for the form, but of no great beauty for Color, because, although it is striped Red and White, like the *Queens Gilliflower*, yet the Red is so sad, that it takes away all the pleasantness of the Flower.

XXII. 19. *Caryophyllus maximus Longobardicus ruber, The great Lombard red.* It is a great sad red Flower, so double and thick of Leaves, that it most commonly breaks its Husk or Pod, and seldom shews or gives one Flower of twenty perfect; the Blades or green Leaves are as large as the *Hulo*.

XXIII. 20. *Caryophyllus maximus Anglicus, The greatest English Carnation, or Old Carnation.* It is already described at large in Chap. 139. Sect. 5. foregoing of this Book, and is the very Head and Principal, as well as the greatest and largest of all the *Carnations* that are yet known, and to the place now cited I refer you; the Description of this is general, and serves to all the nineteen afore enumerated.

XXIV. *The Places.* These all of them are only Garden Plants, and therefore are under the constant care of Curious and Diligent Florists; they are many times nursed up in Pots, that they may be removed out of the cold.

XXV. *The Times.* They Flower about the end of *June*, and through all *July*, unless the Season is very hot, but if the Weather is temperate, they sometimes continue Flowering till the end of *August*, or later.

XXVI. *The Qualities, Specification, Preparations, and Virtues,* are the same with those of the *Clove-gilliflower*, of which we have Treated at large in Chap. 139. from Sect. 9. to Sect. 20. and to that we refer you.

C H A P. CCCXVIII.

Of GILLIFLOWER the greater,
O R,
GILLIFLOWER simply so called.

I. **T**HE Names. As we said of the *Great Carnation Gilliflower* in the last Chapter, so we say of this, that it was a Plant wholly unknown to the *Greeks*, though from the *Latin* Name a *Greek* Name, (and very proper in the Language) may easily be derived; we call it in *Latin* *Caryophyllus Hortensis major*, I know that in Chap. 139. Sect. 3. foregoing we have called this *Gilliflower* *Caryophyllus minor*, that is, accounting the *Great Carnation* in the last Chapter to be the *Greater Gilliflower*, viz. *Caryophyllus Hortensis major*, it follows from the reason of the Name, that this being a lesser *Gilliflower*

liflower than that, that it may very well be called *Caryophyllus Hortensis minor*; but if we allow the *Carnation* in the former Chapter to be *Caryophyllus Hortensis maximus*, then it follows from the same reason, that this must be called *Caryophyllus Hortensis major*, as aforementioned; and in Greek it may be called *Καρυόφυλλον ἡμεσὴ μέγαν*, *The Greater Garden Clove*, or *Greater Gilliflower*.

II. *The Kinds.* Of the *Gilliflower* there are also many Kinds, Authors account about Thirty Four several Species, which, because of their great number, and the immediate after repetition of their Names, we shall forbear to enumerate them here, and give you their several Appellations, just going before their singular Descriptions, and that in the following order.

The

Gilliflower.

III. *The Descriptions.* I. *Caryophyllus Hortensis major Flore pleno minato*, *The yellowish red Gilliflower*, called also *Caryophyllus Silesiacus*, *The Silesian Gilliflower*, but it has been now so long Planted in England, that it is become perfectly a Native of our own Country, see its Description at large in Chap. 139. Sect. 6. foregoing, which is also a general Description to all the following enumerated in this Chapter.

IV. 2. *Caryophyllus major Westmonasteriensis*, *The Gallant*, or *Westminster*. Some would make this Flower to be two, one bigger than the other, others again make it but one, it shews at first blowing open of the Flower, to be of a reasonable Size and Beauty, but after it has stood blown some time it shews smaller and thinner, it is of a bright red Color, much striped and speckled with White.

V. 3. *Caryophyllus major Bristolensis Purpureus*, *The Bristol Blew or Purple*. It has large green Leaves, so large, that it would seem to bring forth a greater Flower than it doth, yet the Flower is of an indifferent Size, and very like unto the *Ordinary Granada Gilliflower*, striped and flaked in the same manner, but that the White of this is purer than that, and the Purple is more light, and tending to a Blew; this Flower does not abide constant, but changes into a Purple or Blush.

VI. 4. *Caryophyllus major Bristolensis Carneus*, *The Bristol Blush*. It is very like the last both in Leaf and Flower, the Color only shews the difference, which seldom varies, to be spotted, or to change its Color.

VII. 5. *Caryophyllus major Cantij*, *The fair one of Kent*, or *Ruffling Robin*. It is a very beautiful Flower, and almost as large as the *White Carnation*, the Flower is white, thick powdered with Purple, in which the White has the Mastery by much, which makes it so much the more pleasant and delectable.

VIII. 6. *Caryophyllus Silesiacus magnus*, *Caryophyllus fulvus magnus*, *The great Tawney*. It is for form of growing, in Leaf and Flower altogether like unto the *Ordinary Tawney*, the Flower only, because it is the fairest and greatest, makes the difference, as also that it is of a deep Scarlet Color.

IX. 7. *Caryophyllus fulvus variabilis*, *The variable Tawney*. There are several Tawnies, some lighter some sadder, either less or more double, so as they are scarcely to be numbred, all rising from sowing the Seed of some of them, besides the diversity of other Colors, both simple and mixed, every Year and place yielding some variety not seen before, which I leave to curious Spectators to give proper Names to, as they shall see fit.

X. 8. *Caryophyllus major Carneus variabilis*, *The variable Blush colored*. Of this there are many sorts, as the deep Blush, the pale Blush, the Infants Blush, the great Blush, and the Blush inclining to a Red; but the great Blush is the fairest and most double of all the other Blushes, of which there are many, both single and double.

XI. 9. *Caryophyllus Ruber variabilis*, *The variable Red*. Of Reds there are some varieties, but not so many as of the other Colors, for as they are molt dead or deep Reds, and very few of a bright Red, or Stamel Color, so neither Purple nor White rise from this Seed, that any one has observed; they are either single, like Pinks, either striped or speckled, or more double, striped and speckled variably.

XII. 10. *Caryophyllus Heroica, dictus Elegans*, *The Lady*, called the *Beautiful* or *Noble*. This may compare for Beauty with most of the *Gilliflowers*, the Flower is very neat and small, tho' small, with a fine small jag, and of a fine white color on the under side of all the Leaves, as also all the whole jag for a pretty compass, and the bottom or middle part of the Flower on the upper side also, but each Leaf is of a fine bright pale red color on the upper side, from the edge to the middle, which mixture is wonderfully delectable.

XIII. 11. *Caryophyllus major Regineus*, *The Queens Gilliflower*. It is a reasonable fair Flower, altho' very common, and is striped Red and White, some great and some small, with long stripes.

XIV. 12. *Caryophyllus major Carneus*, *The Blush Gilliflower*. It differs not much from the Red colored, or Stamel, as to its magnitude or form, but only in the color of the Flower, which is Blush.

XV. 13. *Caryophyllus Albus Londinensis optimus major*, *The greater and best London White Gilliflower*. It is admirable to look upon, grows upright, and very double; the blades grow upright also, not crawling on the Ground.

XVI. 14. *Caryophyllus Albus Londinensis vulgaris*, *The common White London Gilliflower*. This is greater and whiter than the *Common White Gilliflower*, and is indeed wholly of one color.

XVII. 15. *Caryophyllus major Doroborniensis Ruber*, *The Red Dover*. It is a reasonable large *Gilliflower*, and constant, being of a fair Red, thick powdered with white spots, and shews something like the *Ground Carnation*.

XVIII. 16. *Caryophyllus major Doroborniensis Dilutus*.

l. lutea, and Albus, The Light, or White Dower. It is for form and all other things more beautiful or delectable than the former; the color of the Flower is Bluish, thick spotted with very small spots, that it seems all grey, and is very delightful to look on.

XXIX. 17. *Caryophyllus major Brasiliensis, The Brasil Gillflower.* It is but of a middle size, being of a sad purple color, thick powdered and speckled with White, the Purple therein is the chief, which makes it shew the Sadder, it is unconstant, varying much, and often to be all purple; the green Leaves lie matting on the Ground.

XXX. 18. *Caryophyllus Rosus rotundus, The round Gillflower.* It is of the Kindred of the Tawnies, being raised from the Seed of some of them, yet it is a different sort from all others, in that its Leaves are round, without any jag at all upon the edges, of a fine Stamel full color, without any spot or stroke therein, very like unto a small Rose, or rather much like unto the *Red Rose Campion*, both for form, color, and roundness, but larger for its size.

XXXI. 19. *Caryophyllus Silesiacus striatus, The striped Tawney.* It is either greater or lesser, deeper or lighter in its Flowers, there being above twenty varieties of them, all striped with smaller or larger stripes, or equally divided, of a deeper or lighter color; and some also for the shape or form will be more near, close and round, others more loose and unequal.

XXXII. 20. *Caryophyllus Silesiacus punctatus, The speckled Tawney.* It is of divers sorts, some bigger some less, some more and some less spotted than others, usually it is of a deep Scarlet, speckled or spotted with White, having also some stripes among the Leaves, and some more striped than others.

XXXIII. 21. *Caryophyllus major Elegans, The Delicate or Delectable.* It is a noble fine Flower, altho' it be not great, and for the smallness and thinness of the Flower, being red, so finely marked, striped and speckled, that for the liveliness of the Colors, it becomes delectable to the Eye, and much to be desired, being inferior to very few *Gillflowers*.

XXXIV. 22. *Caryophyllus major Grandensis, The Grand Gillflower.* It is Purple and White, flaked and striped very much, this is also much subject to change Purple: there is of this Kind a greater and a lesser, besides the greatest, which is formerly described.

XXXV. 23. *Caryophyllus Silesiacus Plumatus, The Feathered Tawney.* This is more rare to meet with than many of the others, it is most usually a fair large Flower, and double, equalling the *Lumhard Red* in its perfection, the Color hereof is commonly a Scarlet, a little deeper or paler, very curiously Feathered, and Streamed with White thro' the whole Leaf.

XXXVI. 24. *Caryophyllus Silesiacus Marmor amulans, The Marbled Tawney.* This has not so many varieties as the Striped, but is of as great beauty, and as delectable as it, or more, the Flowers are greater or smaller, deeper or lighter colored one than another, and the Veins or Marks more conspicuous, or more frequent in some than in others, but the most beautiful of all is the *Princess* following.

XXXVII. 25. *Herona Florum Rudolphi Imperatoris, The Princess.* This is the greatest and fairest of all these sorts of Variable Tawnies, or Seed Flowers, being as large fully as the *Prince* or *Crystal*, or something greater, standing comely and round, not loose or flaken, or breaking the Pod or Husk, as some other sorts will; the marking of the Flowers is in this manner, it is of a Stamel Color, striped and marked, with white Stripes and Veins quite thro' every Leaf, which are as deeply jagged as the *Hale*, sometimes it has more Red than White, and

sometimes more White than Red, and sometimes so equally matched or marked, that you cannot discern which is most; yet which of these has the predominance, the Flower is still very beautiful and delightful to behold.

XXXVIII. 26. *Caryophyllus Silesiacus cristatus, The flaked Tawney.* This is another diversity of these variable or mixt colored Flowers, being of a pale reddish color, flaked with White, not always down right, but oftentimes athwart the Leaves, some more or less than others, the marking of them is much like the *Crystal*; these also, as well as the others, will be greater or smaller, and of greater or lesser beauty than others.

XXXIX. 27. *Caryophyllus Turcicus, The Turkey Gillflower.* This is but a small Flower, but of great delight, by reason of the well marking of the Flower, being most equally striped with Red and White.

XXX. 28. *Caryophyllus purpureo ceruleus, The blew Gillflower.* This is neither very double nor very great, yet round and handsome, with a deep jag at the edge, and is of an exceeding deep Purple Color, tending to a Tawney, it differs from all other sorts, in that the Leaf is as green as Grass, and the Stalks many times Red or Purple; by the green Leaves it may be known in the Winter as well as in the Summer.

XXXI. 29. *Caryophyllus Cambrensis Poole, The Cambrey, or Poole Flower.* It grows naturally upon the Rocks, near *Coghol Castle*, in the *Ile of Wight*, is a small Flower, but very delectable to the Eye, because of the sweet and beautiful proportion thereof; it is of a bright pale Red, thick speckled, and very small, with White, so that it seems to be but one color; the Leaves of the Flower are but finally jagged about, and it keeps constant to its form.

XXXII. 30. *Caryophyllus Persico Violaceus, The Gredeline Gillflower.* It is a very neat and handsome Flower, of the bigness of the *Red Clove-Gillflower*; of a fine pale reddish Purple, or Peach Color, inclining to a Blew or Violet, which is that Color which is usually called a Gredeline Color; it has no affinity with either Purple, *Granado*, or *Pageant*.

XXXIII. 31. *Caryophyllus Pegma dilutor, The light or pale Pageant.* It is a Flower of a middle size, very pleasant to behold, and is both constant and beautiful, if it was not so common, it would be much more valued than it is; the Flower is of a pale bright Purple, thick powdered, and very equally, with White, which has the Mastery, and makes it much the more pleasant and graceful.

XXXIV. 32. *Caryophyllus Purpureus major & minor, The Purple Gillflower greater and lesser.* The Stalk of it is so slender, and the Leaves upon it so many and thick, that it lies and trails on the Ground, the greatest is almost as large as the *Crystal*, but not so double; the lesser has a smaller Flower.

XXXV. 33. *Caryophyllus Pegma saturator, The sad or deep colored Pageant.* It is the same with the former in Sect. 33. foregoing as to its form and bigness, the difference is chiefly in the Color, for the Purple in this is the chief, which makes it so sad, that it resembles the *Brasil* for color, but not so large as it by half.

XXXVI. 34. *Caryophyllus ruber major & minor, The Stamel Gillflower greater and lesser.* It is well known, almost to every Body, and differs little from the *Common Red Clovegillflower*, but only in its being of a brighter or light red color; of this Kind there is both a greater and a lesser.

XXXVII. *The Places.* These all grow in the Gardens of Industrious Florists in many parts of this Kingdom,

Kingdom, and are to be found in the Flower Gardens of most other parts of *Europe*.

XXXVIII. *The Times*. They begin to Flower about the end of *June*, and keep on Flowering thro' all *July* and *August*, and many times thro' all *September*, even almost to the latter end of *October*, if the Weather is mild.

XXXIX. *The Qualities, Specification, Preparations and Virtues*, are the same with those of the *Clovegillflower* in Chap. 139. from Sect. 9. to Sect. 20. to which I refer you; but these wanting that wonderful deep Red, cannot give so admittable a Tincture to a Syrup, as the *Clovegillflower* can do, and therefore (tho' full as Cordial, yet) are less used in Physick.

XL. *Nota*. It is said by our Moderns, that none of these Flowers were in the least known to the Ancients, and yet some will have them to be the *Cantabrica Plinij*, others to be the *Iphium Theophrasti*, mentioned in *Lib. 6. Cap. 6.* and 7. among his Garden and Summer Flowers; others to be his *Dios Anthos*, or *Flos Jovis*, mentioned in the former and other places; we will not determine the Controversie, but leave every one to his Conjectures.

GLADDON Stinking. See FLOWER-DELUCE Wild Chap. 294.
GLADIOLUS. See CORN-FLAG Chap. 154.

CHAP. CCCXIX.

OF GOATS-BEARD,

OR,

NOON-FLOWER.

THE Names. It is called in *Greek* Τραγοπόδιον, & Τραγοπόδιον, in *Latin* *Tragopogon*, *Barba Hirci*, *Barbula Hirci*, also Τραγοπόδιον, *Barba Senis*, in *English* *Goats-Beard*, *Noon-Flower*, *Noon-Tide*, *Josephs Flower*, and *Star of Jerusalem*.

II. *The Kinds*. There are several Kinds hereof, viz. 1. *Tragopogon luteum*, *Garden Yellow Goats-Beard*. 2. *Tragopogon purpureum*, *Purple Goats-Beard*. 3. *Tragopogon luteum angustifolium*, *Common Goats-Beard with narrow Leaves*. 4. *Tragopogon flore cerulco*, *Blew Goats-Beard*. 5. *Tragopogon Apulum suave rubens*, *Tragopogon Americanum*, *American or Rose colored Goats-Beard*. There are five or six other Kinds, but not being found growing in our Country, or in our Gardens, nor in any of our *American Plantations*, we shall here pass them by.

III. *The Descriptions*. *The first, or Garden Yellow Goats-Beard*, has a Root which is long and round, somewhat like unto a *Parship*, but far smaller, blackish on the outside and white within, which being broken yields a milky Juice, as all the rest of the Plant does, and of a very good and pleasant taste; from which Root rises up a Stalk, or Stalks, of two or three Feet high, smooth and hollow, bearing many long and narrow Leaves, broader at the bottom, and sharper at the end, with a ridge down the back of the Leaf, and of a pale green color, the higher these Leaves grow on the Stalks, the smaller and shorter they are, and at the tops on every Branch grows a great double yellow Flower, like almost to the Flower of a *Dandelion*, which turns into a head,

stored with Down, and long whitish Seed therein having on the head of every one some part of the Down, which (if neglected) is carried away with the Wind.

Goats-Beard Yellow.

IV. *The second, or Purple Goats-Beard*, has a Root which is long and single, (much like to the former) with some few Threads thereto adjoining, which perishes when it has perfected its Seed, yielding a great quantity of a milky Juice when it is cut or broken, as does all the rest of the Plant; from whence rises a hollow Stalk, or Stalks, smooth, and of a whitish green color, which spreads it self out into other Branches, on which Stalks and Branches do grow long Leaves, crested down the middle with a swelling Rib, and sharp pointed, yielding a milky Juice when it is broken, and are in shape like those of *Garlick*; from the bottom of which Leaves small tender Stalks spring forth, set with the like Leaves, but lesser; the Flowers grow at the tops of the Stalks, consisting of a number of Purple Leaves, dashed over, as it were, with a little yellow dust, set about with nine or ten sharp pointed green Leaves; the whole Flower resembles a Star when it is spread abroad, for it shuts its self at Twelve of the Clock, and shews not its open face until the next days Sun doth make it spread its self, or open again, for which reason it was called *Noon-Flower*, and by some go to Bed at Noon: when these Flowers are come to their full maturity, they grow into a Downy Head, like those of *Dandelion*, which is carried away with the Wind; the Seed is long, having at its upper end some small portion of that downy matter fastned to it.

V. *The third, or Common Goats-Beard with narrow Leaves*, is very much like to the first Yellow Kind, it has a thick Root full of a milky Sap, from which rises up many Leaves spread upon the Ground, very long, narrow, thin, and like unto those of *Grass*, saving, that they are thicker and grosser; from among which rise up tender Stalks, on the tops of

which do raise ten double yellow Flowers, like to the first above described, but lesser; the whole Plant yields a milky Juice, as the others do; it perishes also as the others do, after it has perfected its Seed; indeed it is very much like to the former *Yellow Kind*, but that it is not so great, nor rises so high, has much narrower Leaves, even like to *Grass*, and almost as long, but not so manifold, the Flower only differing in its magnitude, as aforesaid.

VI. *The fourth, or Blew Goats-Beard, has a Root which is long, and not very great, perishing as soon as it has born Seed, springing up again of the falling Seed, and so remaining green all Winter, and Flowering the next Year following.* From this Root rises up a Stalk greater and stronger than that of *Scorzonera*, or *Vipers-Grass*, it is replenished with long, narrow, and somewhat hollow, whitish green Leaves, with a white Line down the middle of every one, on the upper side; at the top of the Stalk grows a great long Head or Husk, composed of nine or ten long narrow Leaves, the sharp points or ends of which rise up above the Flower in the middle, which is thick and double, somewhat broad and large spread, of a blewish Ash Color, with some whitish Threads among them, shutting or closing it self within the green Husk every day at Noon, (for so long time as the Flowers continue) and not opening again until the next Morning; after the Flower is past, the Head or Husk, the Seed being near ripe, opens it self, the long Leaves thereof, which closed not before now, falling down round about the Stalk, and shewing the Seed, standing at the first close together, and the Down at the top of them, but after a while it spreads it self round, and if not gathered, will be carried away with the Wind; the Seed is long, round, and rough, like the Seed of *Vipers-Grass*, but greater and blacker.

VII. *The fifth, or American, or Rose colored Goats-Beard, has a Root which is long and slender, and is the smallest Root of all the Goats-Beards, white downwards, and somewhat hard, but more reddish at the top, which sends forth many long and narrow Leaves, like unto Grass, with a white Line in the middle of them, smooth and soft if you stroak them upwards, but as rough as Barley Leaves stroaking them downwards, and broadest at their joining to the Stalk; the Stalk is about two Feet high, scarcely dividing it self into any Branches, but bears at the top one great and large head, (which is great in respect to the Plant) parted into eight long Leaves or Beards, in the middle of which is the Flower, consisting of ten or twelve Leaves, of a pale purple, or rather of a bluish color, near unto a Damask Rose, having several blackish blew Threads in the middle, with a mealy dust upon them, which being past, the Head or Husk grows somewhat narrow, with a long Neck, containing within it the Seed, which is not fashioned into a round Globe like form, with Down at the heads of the several Seeds, as in all the former, but it has five longer and greater Seeds on the outside, with little or no Down at the ends of them, and some lesser Seeds in the middle, which have a little Down on their heads, being yellowish and smooth, but the least of all others.*

VIII. *An Observation.* These Goats-Beards are very like to the *Scorzonera's*, or *Vipers-Grasses*, in their outward form and manner of growing, and therefore are *Species ejusdem generis*, but the *Tragepogon*, or Goats-Beard, is the Genus or Standard, and the *Scorzonera's* are *Species of the General Kind*, but herein they chiefly differ, that whereas all the sorts of *Tragepogon's* are Annual Plants, perishing every Year, after they have born their Seed; it is certain that all the sorts of *Scorzonera's* are Perenni-

al Plants, enduring after Seed time for many Years, as in their proper place we shall hereafter at large declare.

IX. *The Places.* The first and third grow in Gardens with us, but are also found wild in many places of this Land, Gerard says they grow in Meadows and Fertile Pastures in most places of England, they grow plentifully in most of the Fields about London, as at *Islington*, and in the Meadows by *Redriff*, *Depisford*, and *Putney*, and in divers other places; the third is found in Meadows (as aforesaid) about London, and many other places of the Kingdom, but not so plentifully as the first Kind; the second, or Purple Kind, came to us from Italy, where it is said to grow wild; it has also been found growing wild in some parts of Lancashire, on the Banks of the River *Chalder*, near to the House formerly the Lady *Heskiths*, two Miles from *Whaley*, but it is now Sown in Gardens almost every where, for the beauty of the Flowers; the fourth, or Blew Kind, came to us also out of Italy, where it is supposed to grow wild, but with us is only nursed up in Gardens, for its pleasant Flowers; the fifth Kind is found growing on the Hills in Naples, as *Columna* reports, and I have found it growing wild in several parts of Florida, but with us in England it is purely a Garden Plant.

X. *The Times.* They all of them Flower from the latter end of May thro' all June and July, and the Seed comes to perfection in the mean time, being ripe in July and August.

XI. *The Qualities.* Goats-Beard is temperate in respect of heat or cold, driness or moisture, a little Astringent, Stomack, Hepatick, Alexipharmick, and Analeptick.

XII. *The Specification.* They are all Restoratives in Consumptions, and expel Gravel from the Reins and Bladder.

XIII. *The Preparations.* You may have thereof, 1. The boiled Root, or Roots raw. 2. A Decoction. 3. A distilled Water from the Root. 4. Sanguis, or Blood of the Root, there being no other part of the Plant used.

The Virtues.

XIV. *The Root it self.* The Roots of any of the Kinds being boiled, but more especially of the first *Yellow Kind*, and of the third also, and dressed as *Parfneps*, are much more delicate and pleasant to the Taste in eating, they comfort the Stomach, are good against Heart-burnings, strengthen the whole Body, and restore in Consumptions; the Roots of the *Yellow Kind* are many times eaten raw, as a Sallet, being sliced, and so eaten with Pepper, Salt, and Vinegar, by which means the Stomach is also strengthened, and they are restored which are going into a Consumption, or are become Spare and Lean by long Sickness; the *Yellow Kinds* are chiefly used as *Parfneps*, and for Salleting; the other Kinds are not altogether so fit for that purpose, being more bitter, astringent, and absterive, having a more cleansing and binding quality than the others have, and therefore are mostly used in a Medicinal way; the *Yellow Kinds* make a pleasant Dish of Food, far surpassing the *Parfnep*.

XV. *The Decoction.* It is good against the pain of the Stomach, and to expel the malignity of the Plague, and all sorts of Pestilential Diseases; it prevails against Heartburnings, and a dejected Appetite, inciting and stirring it up; and it is good also against Affects of the Breast, Liver, Reins, Ureters and Bladder, expelling Sand, Gravel, Stones, and Tartarous Matter from those parts, for which reason the Italians call it *Sassi Frica*, Break-Stone.

XVI. *The*

XVI. *The Distilled Water.* *Tragus* says it is the most present Remedy that is, to help or break inward Apoplems, and to give Relief in the Pleurisie, and other Pains and Stitches in the Sides, to help the Heartburn, strengthen the Stomach, and stir up Appetite.

XVII. *Sanguis, or, The Blood of the Roots.* It is made as that of *Satyriion, Parsnep, Comfrey, &c.* and has all the Virtues of the boiled Root, Decoction, or Distilled Water; it is indeed a most excellent thing to restore such as are in deep Consumptions, being constantly taken Morning, Noon, and Night, for some considerable time, with Milk warm from the Cow, and sometimes with a Glass of Generous Wine.

C H A P. CCCXX.
OF GOATS-RUE,
OR,
GOATS-HERB.

THE Names. It is an Herb which was unknown to the *Greeks*, but is called by the *Latins* *Galega*, and *Ruta Capraria*, some have erroneously called it *Gralega*, and *Fracastorius* called it *Herba Gallica*, and some only *Capraria*, (from the Goats eating it) some call it *Thorina*, or *Taurina*, *Sarracena*, and *Capragina*, also *Giarga*, as *Brassavolus* saith, and by us in *English* *Goats-Rue*.

II. *The Kinds.* There are two Kinds of this Plant, viz. 1. *Galega vulgaris*, *Ruta Capraria vulgaris*, Our Common Goats-Rue. 2. *Galega Montana Dalechampij Lugdunensis*, Mountain Goats-Rue.

III. *The Descriptions.* The first, or Common Goats-Rue, has a Root which is white and Woolly,

spreading well in the Ground, and abiding several Years; from this Root come forth many round hard Stalks, four or five Feet high, on which grow one above another at several Joints, long winged Leaves, viz. many smaller Leaves set on each side of a middle Rib, which Leaves are small, yet somewhat broad and long, and sharp pointed at the ends, and smooth on the edges, without any dents, something like unto the Leaves of *Vetches* or *Tares*, and of a faint green color; at the tops of the Stalks stand many small Leguminous Flowers, one above another, of a pale blewish purple color, and in some Plants purely white, which being past away, small round Pods or Cods come in their places, about an Inch and half long, a little bunched out in some places, but nothing so much as the *Orobis*, or *Bitter Vetch*, in which lye three, four, or five pale Seeds, like unto those of the *Vetch* or *Tare*.

IV. *The second, or Mountain Kind, has a Root which is somewhat great and black, sending forth very long Strings, whereby it Roots its self deep in the Ground; from which several round hard Stalks shoot forth, but nothing so high as the former, on which grow such like winged Leaves at every Joint, but broader, and thicker set together, smooth also on the edges, but having the middle Rib of every Leaf raised up a little high; at the tops of the Stalks stand divers such like Flowers as the former, but all on one side, of a pale color, tending to yellow, which afterwards yield small long blackish Pods, in which lye small flatish Seed, like to *Lentils*.*

V. *The Places.* The first grows commonly wild by the Way sides of moist fields and Meadows in *Italy, Savoy*, and other Southern Climates; it is also found growing wild in *England*, as in the Meadows by *Linton* in *Cambridgeshire*: the second grows on the tops of Mountains, where any Planes are found; and I am informed by a very good Botanist, that he has met with it upon some of the Mountains in *Wales*.

VI. *The Times.* They Flower about the latter end of *June*, and thro' all *July*, and the Seed is ripe in *August*.

VII. *The Qualities.* It is temperate in respect of heat and cold, driness and moisture; it is Aperitive, Absterfive, and Carminative, Cephalick, Neurotick, Stomatick, and Cardiack, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It cures all sorts of Poysons, whether inwardly taken, or outwardly received, by the Bitings of Serpents, as Vipers, Rattle-Snakes, or other venomous Creatures; or imprinted by Contagion, as that of the Plague, Spotted Fever, or any other kind of Pestilential Distemper.

IX. *The Preparations.* You may have therefrom, 1. A Sallet of the Herb. 2. A Liquid Juice. 3. An Essence. 4. An Infusion or Decoction in Wine or Water. 5. An Electuary. 6. A Cataplasim. 7. A Distilled Water. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Spirituous Tincture.

The Virtues.

X. *The Sallet.* The Herb it self is eaten, being boiled with Fleish, as we use to boil and eat *Cabbage* and *Coleworts*; it is also eaten as boiled *Spinage*, and other Sallets, with Pepper, Salt, Vinegar and Oil; and being so eaten, it is said to be excellent against all sorts of Poysons, and the malignity or infection of the Plague or Pestilence, or the Bitings of venomous Creatures, &c.

XI. *The Liquid Juice.* It is effectual against the Biting of Vipers, Rattle-Snakes, or other Serpents, Bitings of Mad Dogs, the Stinging of Scorpions,

or

or the Poyſon of other venomous Creatures, it is alſo effectual againſt Vegetable Poyſons, as alſo the malignity of the Plague, or Peſtilence it ſelf, and the infection of other Peſtilential or Contagious Diſeaſes, as Purples, Meaſles, Small Pox, Spotted Fever, and Calenture; againſt all theſe Diſeaſes it is admirable, for it both preſerves from the infection, and perfectly cures ſuch as are infected; Doſe two or three Spoonfuls every Morning faſting in a Glaſs of Generous Wine, and as much at Night going to Bed, by way of prevention; but for Cure, it ought to be given in *Angelica* Water, in the ſame, or larger Doſe, according to the Age and Condition of the Patient, and to be repeated as often as the exigency or vehemency of the Diſeaſe requires. This Juice given alſo in a Morning faſting, kills Worms in Children, or Elder People, and cures the Falling-Sickneſs if given before it grows too old and ſtrong upon the Patient: when it is given in the Plague, &c. Bitings of Mad Dogs, Vipers, &c. the Patients ought to be in their Naked Bed, and made to Sweat thereupon for two or three Hours or more together.

XII. *The Eſſence.* It has all the Virtues of the Liquid Juice, but acts more ſpeedily and powerfully, it expels the Poyſon and Malignity by Perſpiration, and ſo defends the Heart and Vital Powers; it is an extraordinary thing to cleanſe, dry, and heal green Wounds, as alſo old and running Ulcers, putrid Sores, and virulent Fiſtula's, deſtroying the malignity, hindring their eating and ſpreading, and defending the Principal Parts and Vital Powers from danger; it is a ſingular good Cordial, ſuppreſſes Vapors, reſiſts Melancholy, is good againſt Tremblings and Conviuſions, prevails againſt Swooning Fits, revives the Spirits, and cheers the Heart, preſerving it from Palpitations, and other illneſſes which oppreſs it, Doſe one or two Spoonfuls in a Glaſs of Canary, or other ſit Vehicle.

XIII. *The Infuſion or Decoction in Wine or Water.* Either of them may be given in all the Caſes in which the Juice or Eſſence are given in, but as they are much weaker in their Effects, ſo they muſt be given in much greater Doſe, as from a Quarter of a Pint to Half a Pint, and alſo to be oftener repeated, as the neceſſity may require.

XIV. *The Electuary.* Take Powder of Goats-Rue four Ounces, Zedoary in Powder, Contra-yerva, Virginia Snake-root, all in fine Powder, of each one Ounce, Saffron, Cochenile, of each two Drams, Rob of Goats-Rue twenty Ounces, mix and make an Electuary. It is good againſt all ſorts of Poyſons, both Vegetable and Animal, as alſo againſt the Plague, and all other infectious Diſeaſes, and has indeed all the Virtues of the Liquid Eſſence and Juice; Doſe from one Dram to two Drams, in any proper Vehicle.

XV. *The Cataplaſm.* It is made of the bruifed Herb, fryed or made hot with Vinegar, and then brought to a conſiſtence with Mithridate and Powder of Bly Berries, adding alſo a little Aloes in fine Powder; applied to the Region of the Heart, it is good againſt the infection of the Plague, and other malign Diſeaſes; applied to the Navel, and over the whole Abdomen, it eaſes the Cholick, and is very effectual to kill Worms in Children; applied ro, and bound pretty hard upon the Pulſes of the Wrifls, it is good againſt remitting Fevers, and cures Agues of all ſorts, hindring their return; applied to putrid and malign Ulcers, it cleanſes them, deſtroys the malignity, ſtops the flux of Humors, dries them, and in a very great meaſure induces their healing; applied to Gangreens it ſtops their proceeding.

XVI. *The Diſtilled Water.* It has the Virtues of the Juice and Eſſence, but in a much lower degree, and therefore muſt be given in a much larger Doſe; however it is uſed as a *Vehicle* to convey the for-

mer Preparation in, where the Phyſician ſhall judge Wine to be too hot, to nice and delicate Palates the Diſtilled Water is oftner given than either Juice or Eſſence.

XVII. *The Acid Tincture.* It has all the Virtues of the Juice and Eſſence, whether inwardly taken, or outwardly applied, it is a Specifick againſt the Plague, as alſo againſt all other Malign and Peſtilential Diſeaſes, and cures the moſt violent burning Fevers in a very ſhort time, taking away the violence of their burning heat in the ſpace of an Hour, Doſe ſo many drops as to make the Vehicle pleaſantly ſharp, and to be given in all that the Patient drinks.

XVIII. *The Oily Tincture.* It is good againſt the Bitings of Venomous Creatures, being taken from ten to twenty drops in any proper Vehicle; it is alſo good againſt Conviuſions, Palfies, Lameneſs, Numbneſs, Tremblings, weakneſs of the extreame parts, Gripings of the Bowels, Wind, Stone, Gravel, Sand, and Tartarous Matter obſtructing the Urinary parts, as alſo againſt the Colick, Gout in Hands, Arms, Hips, Knees, or Feet, being inwardly taken, and outwardly applied to the parts affected, as the Skillful Phyſician ſhall direct; in the Palfie, beſides giving it inwardly, and applying it to the afflicted parts, it ought alſo to be anointed upon the Back Bone every Morning and Evening.

XIX. *The Spirituous Tincture.* It has all the Virtues of the Juice, Eſſence, and Electuary, and as it is finer and more Spirituous, ſo it is more ſubtil and penetrating, and when dulcified with double refined Sugar, more pleaſant to be taken, and a more delicate Cordial, and therefore more ſit to be given to the more curious and nice Palates, it may be taken a Spoonful or more at a time, (as you may ſee convenient) either alone by it ſelf, or mixt with ſome other Vehicle, as Canary, White Liſbon, or other like Generous Wines, it is indeed an excellent thing againſt Sickneſs at Heart, as alſo againſt Fainting and Swooning Fits, it is indeed good againſt all cold and moiſt Diſeaſes of the Head, Brain, Nerves, Joints, Bowels, Reins, and Womb; it reſtiſies and enlivens the depauperated Juices, revives the Spirits, tho' never ſo much oppreſt, and gives relief in the moſt profound Melancholy; it is good againſt a Vertigo, and Megrim, and is excellent againſt a Coma, Carus, and Lethargy, or where the Patient is inclined to Sleepineſs and Drowfineſs; and if it is given with a few drops of the Acid Tincture, it reſſes Vapors, and effectually cures Fits of the Mother.

C H A P. CCCXXI.

of GOATS--STONES, OR, HARES--STONES.

THE Names. This Plant is called in Greek, *Testiculus*; in Latin, *Tragorchis*, *Testiculus Hircinus*, *Scincophora*, and *Orchis ſauvales*: in Engliſh, Goats-ſtones, and Hares-ſtones.

II. *The Kinds.* There are two principal kinds hereof, viz. 1. *Tragorchis* *mar*, *Testiculus Hircinus* *mar*, *Scincophora* *mar*, The Male Goats-ſtones. 2. *Tragorchis* *famina*, *Scincophora* *famina*, The Female Goats-ſtones. Theſe *Orchides* are thus named, not only

only because they have a foul strong Scent, like that of the Goat, but also that most of them have long Tails, like Beards, hanging down from them.

III. Of the *Male kind*, which is the *Greater Goats-stones*, there are two Species, viz. 1. *Tragorchis mas maxima*, The greatest Male Goats-stones. 2. *Tragorchis mas magna*, *Tragorchis vulgaris magna*, The common great Goats-stones.

IV. Of the *Female kind*, which is the *Lesser Goats-stones*, there are three Species, viz. 1. *Tragorchis samina minor*, *Tragorchis minor verior*, The true lesser Goats-stones. 2. *Tragorchis Batavica Clusii*, *Tragorchis minor Batavica*, The Dutch Goats-stones, or Hares-stones. 3. *Tragorchis minor Austriaca*, *Tragorchis altera purpurea*, Aultrian Goats-stones, Goats-stones with purple Flowers.

V. The Descriptions. The first, or Greatest Male Goats-stones, has Roots consisting of two Testicles, like to other Orchides, but greater, from whence rise up Leaves, lying upon the Ground, which are broad, large, and ribbed in some sort like to our Plantane, but somewhat shorter. From among these Leaves grows up a Stalk, about half a yard high, set with such like great Leaves, but growing a little narrower as they grow higher, growing up even to the top of the Stalk by equal Distances. The Bush of Flowers grows at top of the Stalk in Spike-fashion: the Flowers are small and flat, open, and wholly of a purple color, set in a Row, and in an excellent Order; each Flower has a long crooked Thread or String proceeding from its middle part, and hanging down, which twine themselves one in another, like to the small Tendrils of the *Vine*, or rather the Laces or Strings which grow upon the Herb *Savory*: both the Hood and the Tail are spotted, and have a strong Scent.

Great Common Goats-stones.

VI. The second, or Common great Goats-stones, has a double tuberos or testicular Root, like the for-

mer, saving that the Testicles are something less, from whence spring up Leaves, like to those of the Garden Lilly, with a Stalk a foot or more long, wrapped about, even to the Tuft of the Flowers with these kinds of Leaves: the Flowers which grow in this Bush, shoot forth in a Spike Form, and are very small, in Form like to a Lizard, because of the twisted or writhen Tails, and spotted Heads. Every one of these small Flowers is at first like a round close Husk, of the Bigness of a *Pea*, which, when it opens, there comes out of it a little, long and tender Spur or Tail, white towards the setting of it to the Flower; the rest spotted with red Dashes, having upon each side a small thing adjoining unto it, like to a Leg or Foot: the rest of the said Tail is twisted crookedly about, and hangs downwards. The Leaves of this sort are indeed longer and narrower than the former; the Flowers are smaller, whiter, and spotted with reddish Spots, and the Tails are more rwining. The whole Plant is as strong as the first, and has a rank, stinking Smell or Savor, like the Smell of a Goat, from whence this, as well as the former and all the following, have derived their Names.

VII. The third, or True lesser Goats-stones, has its Root or Testicles much less than either of the former, with several narrower and long Leaves (a little ribbed) rising from the same, which do as it were enclose a single Stalk, which is also enclosed about with like but smaller Leaves, to the beginning of the spiked Head of Flowers. These Leaves are much less than those of the two first described, and the Flowers are without Spurs or Tails, and somewhat like in Shape to those Insects called Sows or Wood Lice for their Proportion; and they are somewhat of a brownish color. Gerard says, That the Flowers much resemble our common Fleth Flies. The Smell of the whole Plant does much more resemble the rank Smell of a Goat, than any of the other kinds.

VIII. The

VIII. *The fourth, or Dutch Goats-stones, is a very small Plant, not much above a Span long or in Height, having a small testicular Root, like the last: from which rises up a Stalk eight or nine Inches high, having three or four Leaves encompassing it. The top of the Stalk ends in a small spiked Head of Flowers, of a fine purplish red color on the inside, and paler without, having a Belly or Lip hanging down, which is terminated in three short and equal parts.*

IX. *The fifth, or Austrian Goats-stones, has, like all the former, a testicular Root, which sends forth Lilly like Leaves, of a pale green color, with some smaller about the Stalk, which is about a Span high: towards the top it has a spiked Head of Flowers, which are either of a whitish or pale color, without any Spots, or else purple, with some purple Leaves under them, each of which is hooded and eared, with a hanging Belly, notched as it were at the bottom. The whole Plant smells of a rank Goat like Smell, for which Reason it is brought into the Classis or Rank with the four former.*

X. *The Places.* All the sorts grow chiefly in fat Clay Grounds, and are seldom to be found in any other Soil. The fourth has been found not only in England, but also in Holland, about the Hague; as also in other Parts, about their Sea-Coasts. The last is a Native of Austria, and not to be found with us, except in Gardens of the most exact Florists.

XI. *The Times.* They flower in May and June, when other kinds of Orchides flower.

XII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Cynosorchides or Dogs-stones in Chap. 226. foregoing, so that no more need be said thereof in this place: but Lugdunensis from Dodonæus says, That the Roots of these Orchides are preferable to all others.

C H A P. CCCXXII.
of GOLD-LOCKS,
O R,
GOLDEN-TUFTS.

I. *THE Names.* It is called in Greek, Χρυσοκόμης: in Latin, Chrysocome, and Coma aurea; and in English, Gold-locks, or Golden-tufts.

II. *The Kinds.* Authors make several sorts hereof, but the following three are chief, viz. 1. *Chrysocome verior, Coma aurea Dioscoridis,* The true Gold-locks of Dioscorides. 2. *Chrysocome lutea, Coma aurea, & Amaranthus luteus Lobelii & Fuchsi,* Yellow Tufts, or Cassidony. 3. *Chrysocome peregrina secunda Clusii, Chrysocome Cretica altera, Wild Gold-tufts.* The first of these is doubtless the True Chrysocome of Dioscorides and Pliny; but is called by several other Names by later Authors, as, *Linaria aurea Vrogi, Linaria austriaca Camerarii, Oxyris austriaca Clusii, Linosyris nupercorum Lobelii, &c.*

III. *The Descriptions.* The first, or True Gold-locks of Dioscorides, has a Root which is hard and woody, at its Head shooting forth many blackish Fibres into the Ground. From this Root spring forth many hard round Stalks, half a Yard high, somewhat thick set, but unorderly, with narrow, long, green Leaves up to the tops, where they branch forth into

divers small Sprigs, with smaller and shorter Leaves thereon than on those below, and bearing round Heads of Flowers, composed of Gold-yellow Threads, rising from the middle of a few green Leaves, which are as a Husk to each of them, and abiding a long time in Flower, and also in their full Beauty; but Columna says these Flowers last not full out a Month, at the end of which time, fading, they turn into Down, which, with the small yellow Seed, of a greyish color, flies away with the Wind. The Stalks die and perish yearly, and new ones rise up again in the Spring.

True Gold-locks of Dioscorides.

IV. *The second, or Yellow Tufts, or Cassidony, has a small and black Root, with some fibres adjoining to it; from which spring up one or more Stalks, eight or nine Inches in Height, spread out into several hoary Branches, with long and narrow whitish Leaves, dispersedly growing thereon, up to their tops, where the Flowers appear in Umbles, each Branch bearing a large Tuft of scaly, yellow Flowers, like a loose or sparfed Umble, keeping their color long before they wither; and being gathered in a fit dry time, when they are in their Perfection, will so abide, and be kept a long time after. The Seed is red, smaller than that of Marjoram, and sharper. The whole Plant is of a strong sweet Smell, and very pleasant.*

V. *The third, or Wild Gold-tufts, has a long, small, slender Root, black and woody, with a pretty many Fibres adjoining thereto; from whence springs up sometimes but one Stalk, and sometimes more, growing up to be about half a Yard high, covered over with an hoary Down, having several long and narrow Leaves on them, sometimes dispersedly set, and sometimes more near together, green on the upper side, and hoary underneath; at the tops grow small Branches, bearing one or two scaly long Heads of yellow Flowers, somewhat like to those of Maudlin, and consisting of many Threads or Thrums. The woolly*

woolly Leaf of this Plant resembles *Gnaphalium vulgare*, but that it is somewhat broader in the middle. The Flowers grow clustering together upon the tops of the Branches, of a yellow color, and almost like those of *Maudlin*, as aforesaid.

VI. Note 1. These Plants are known also by the Name of *Golden Flower Gentle*; and by reason of the long continuance of its Flower in Perfection, they are also called (but more especially the first and second,) *Yellow Everlasting*, and *Flower Everlasting*, also *Flower Never-fading*, because it scarcely seems to die.

VII. Note 2. *Johnson* upon *Gerard* has another sort of our second kind, having a long slender Root, very full of small Fibres: from the Head of which Root spring forth three, four, or more Stalks, a Foot or more in Height, which are all of them (almost up to the tops) very well replenished with long, white, downy Leaves, like the former, saving that they are somewhat broader. The Flowers are longer, but in larger Umbles, every ways greater, and seem to be of a more shining Gold color. These Flowers being gathered also in their Beauty and Perfection, will be of as long Continuance, and carry their Glory to as late a Date as those at Sect. 4. aforesgoing. Whether this be any differing Species from that second kind aforementioned, I can hardly determine, they being so very much like one another, and seem to me to differ chiefly in their Magnitude, which may probably be from the differing Goodness of the Soil in which they may be found growing; which self-same Difference (from the same Reason) may be observed in many other Plants, which Authors will never admit to be various Species or Kinds of the same Plant.

VIII. The Places. They grow in most untilld places of *Greece*, *Spain* and *Italy*; in Meadows where the Soil is barren; as also about the Banks of Rivers. The first grows not only in *Greece* and

Italy, but also in several places of *Germany*, in moist, sandy Borders of unmanured Fields, as *Tragus* says. They are all Strangers in *England*, and only grow with us in Gardens, being nursd up by the Curious. The second and fourth grow in *Candy* and *Spain*. The third *Clusius* found in *Spain* and *Portugal*, and *Lobel* about *Mompelien* in *France*.

IX. The Times. Tho' these Plants in their native Countries may flower earlier than in our colder Climes, as in *April* or *May*; with us in our Gardens they flower much later, viz. not till *July* and *August*, and sometimes later still.

X. The Qualities. They are hot and dry in the latter end of the second Degree, or beginning of the third; are both Aperitive and Astringent; Pectoral, Hysterick and Nephritick, and also Alexipharmick.

XI. The Specification. They provoke the Terms, and force away the After-birth; resist Poyson, and prevail against Convulsions.

XII. The Preparations. You may have therefrom, 1. The Herb it self. 2. A Decoction of the Herb and Flowers in Wine. 3. A Powder of the dried Flowers. 4. A Bath of the Herb and Flowers.

The Virtues.

XIII. The Herb it self. It is used to be laid in Chests and Wardrobes, to preserve Garments from Moths and Worms.

XIV. The Decoction of the Herb and Flowers in Wine. Being drunk to six or eight Ounces once or twice a day, it is said to expel all sorts of Poysons, help Cramps, Convulsions and Ruptures, dissolve congealed Blood in the Thorax and Bowels, provoke the Terms in Women, and expel the After-birth.

XV. The Powder of the Flowers. It may be given to two Drams in any convenient Vehicle, as in the Tincture of *Catechu* made in Water, or in Red Port Wine, or in a Mixture of Wine and Water. This being taken first in the Morning fasting, and last at Night going to Bed, it thickens a thin Rheum, prevails against Coughs and Colds, and stops Catarrhs, or Distillations of Rheum down the Throat, which sometimes is said to fall upon the Lungs.

XVI. The Bath made of the Herb and Flowers, either in Water or Wine. It is good to sit over the warm Fumes thereof, for so it opens Obstructions of the Womb, and eases Pains thereof: it gives ease also in the Piles, causing them to be dissolved: it eases them also who are afflicted with Pain in the Reins; gives ease in the Sciatica, and is very effectual to draw down Vapors, and prevent Fits of the Mother.

C H A P. CCCXXIII.

of GOLDEN-ROD.

I. THE Names. This is that which is supposed to be the *Ammurgesole*, *Plinii*: and is called in *Latin*, *Virga aurea*, (because the Stalks being reddish, make the bushy tops of Flowers seem as if they were of a Gold-yellow,) and in *English* it is called, *Golden-Rod*.

II. The Kinds. There are three several sorts of this Plant, viz. 1. *Virga aurea vulgaris*, *Virga aurea angustifolia*, Our common ordinary Golden Rod, which is the *Virga aurea Villanovani*, and is with
K k k Leaves

Leaves unshipt or smooth on the edges. 2. *Virga aurea foliis serratis Cameraria*, Golden-Rod with dented Leaves. 3. *Virga aurea Americana*, Golden-Rod of America, which is not very much unlike to the second kind.

Common Golden-Rod.

III. The Descriptions. The first, or Common Golden-Rod, has a Root consisting of a Bunch of very small Fibres, which run not deep into the Ground, but abide all the Year therein. From this Root spring up several small, round, brownish Stalks, half a Yard or two Feet high, (but higher, if it grows in a fat Soil, or in a Garden well manured) having upon them many narrow and long dark green Leaves, very seldom with any dents about the edges, and as seldom with any Strakes or white Spots upon them; and yet sometimes, and in some places, they are so to be found, divided at the tops into some small Branches, with several small yellow Flowers on every one of them, which are turned one way, and not looking sundry ways at once; which being ripe, do turn into Down, and are carried away with the Wind: the old Stalks die away and perish every Year, and new ones spring up every Spring following.

IV. The second, or Golden-Rod with dented Leaves, has a Root like the other, small, and composed of many Strings or Threads; from which rise up Stalks, as in the other, not so high as the former, but full as great. The Leaves are small and thin, but broader and shorter than those of the foregoing, smooth, sharp-pointed, and dented about the edges, like a Saw, of a hot and harsh Taste in the Throat, being chewed in the Mouth; which Leaves grow upon a fair reddish Foot-stalk. The Branches bear such like Flowers as the first, facing one side of their Stalks, as the former does. These growing at the tops, are of a Gold-yellow color, from whence the Plant took its Name. The Flowers being passed away, the Heads turn into Down, and are carried away with the Wind, as the other are.

V. The third, or American Golden-Rod, has a Root not much unlike to the former, composed of a

Bunch of Fibres or Strings, which abide under Ground all Winter in the same manner, losing all its old Stalks. From this Root spring up Leaves as large as those of the last, before it runs up to Stalk, being long, but not very broad, yet broadest in the middle, and very sharp-pointed at the ends, and a little dented about the edges, yet not so much as the second; they grow upon Foot-stalks, and are of a dark green color. The Stalk or Stalks are a little hairy, rising higher than the last, not above a Foot and half high at most, bearing on their various tops yellow Flowers, of a Gold-yellow color, facing all on one side, as the others do; which being passed away, turn into Downy Heads, and are carried away with the Wind, as all the others are. This Plant is so like to the second, that the Figure of that may very well serve for this, without any considerable Error.

Golden-Rod with dented Leaves.

VI. The Places. The first grows plentifully enough in several places of England, in open places of Woods and Copses, both in moist and dry Grounds. It grows plentifully in Hampsted-Wood, near unto the Gate which leads out of the Wood to Kentish-Town, not far from London; in a Wood by Rayleigh in Essex, near to a House formerly Mr Leonard's, dwelling upon Daws-Heath; also in Southfleet, and in Swainscomb-Wood near to Gravesend. The second also grows in many places of this Land, but not so plentifully as the former: it is to be found in some places in Hampsted-Wood, but more sparingly than the former. The last has been brought to us from America, but from what parts of the Continent, is not known. It grows with us in Gardens.

VII. The Times. The first flowers later than the second, but they both flower and flourish in July and August. The American kind flowers indeed very late in the Year.

VIII. The Qualities. Golden-Rod is hot and dry in the second Degree; Aperitive, Absterfve, Aftringent, Diuretick and Traumatick or Vulnerary, Neurotick,

Neurotick, Stomack, Nephritick and Analp-tick.

IX. *The Specification.* It is one of the most noble Wound-Herbs, cures Wounds and Ulcers after an admirable manner, provokes Urine, prevails against the Stone and Gravel in the Reins and Bladder; stops Fluxes of Blood in the Lungs, Bowels, Reins or Womb, and is prevalent in curing all sorts of Ruptures.

X. *The Preparations.* You may have therefrom, 1. *A Juice.* 2. *An Essence.* 3. *A Decoction in Wine.* 4. *A Pouder.* 5. *An Ointment.* 6. *A Balsam.* 7. *A Cataplasim.*

The Virtues.

XI. *The liquid Juice.* It is of good Use to be given against Sand, Gravel, Stone or tartarous Matter in the Reins, Ureters or Bladder, for it provokes Urine in abundance, and so forces away that tartarous Matter which engenders the Stone or Gravel in the Urinary Parts, and causes Sand and Gravel to be voided with the Urine. Dose from two to four Spoonfuls, Morning, Noon and Night, in a Glass of White Port Wine, or other fit Vehicle.

XII. *The Essence.* It has all the Virtues of the liquid Juice; it also evacuates all raw and tough viscous or flegmatick Humors, carrying them off by Urine. It is very effectual against all inward Bruises, as also to be outwardly applied to the same. It stops Bleeding in any Part of the Body; and is an excellent thing for the Cure of Wounds. It stops the overflowing of the Terms in Women, the Flux of the Whites, and heals the Bowels in a Diarrhæa, Dysentery, Lienteria or Heparick Flux: It stops Catarrhs, and a Flux of Humors falling down upon any Part of the Body; and it is prevalent in curing all sorts of Ruptures in Man or Woman, this being drunk inwardly, and the Cataplasim outwardly applied. It is one of the most sovereign of all Wound-Herbs; and therefore the Essence thereof, for the curing of Wounds inward or outward, will do as much as any other can: green Wounds, it quickly cures them; and old Sores and Ulcers, it digests, cleanses, dries, and speedily induces their healing; drying up, stopping, or removing that Moisture and Flux of Humors which hinders their Cure. Dose two, three or four Spoonfuls in Wine, or any other proper Liquor.

XIII. *The Decoction in Wine.* It is made of either green or dried Herb: it has all the Virtues of the Juice and Essence, saving that it is not so powerful; and therefore may be given from four to eight Ounces, dulcified with a little white Sugar, and that Morning and Night. It is an excellent thing to wash filthy, foul and running Sores or Ulcers with; and makes a good Lotion for Sores and Ulcers in the Mouth and Throat, or Privy Parts of Man or Woman: and being often used, it is said to loosen loose Teeth.

XIV. *The Pouder of the Herb.* Given to one or two Drams in Red Wine, it stops all inward Bleedings; as also all sorts of Fluxes of the Bowels. Strewed upon old, moist Ulcers and running Sores, it cleanses and dries them, strengthens the Part, and if need be, incarnates them, and heals them.

XV. *The Ointment.* It is made as all other Ointments are made, but before it is quite cold, you are to mix with every Pound of the Ointment, two Ounces of the Pouder of the Herb, or an Ounce and half of Tobacco in fine Pouder. It is a famous Vulnerary, curing green Wounds in a very short time: and as for Fittula's, old and inveterate Ulcers, and malign running Sores, it brings them (if need be) to Digestion, cleanses, incarnates, dries and heals

them after an admirable manner, and so strengthens the Part, as to hinder the future Afflux of Humors. It is not inferior to any other Vulnerary Ointment.

XVI. *The Balsam.* It has all the Virtues of the Ointment, but more powerfully cleanses and heals: it ripens Apostems; and is effectual against Ruptures, being externally applied, and renewed as often as need requires. It is also a very excellent thing to heal Wounds and Ulcers of the Head, being applied.

XVII. *The Cataplasim.* It is made of the green Herb, with some Pouder of the same, and a little Red Wine. Outwardly applied, it stops Bleeding, as also the Afflux of Humors upon any Part. It strengthens weak Limbs; and is profitable, being applied to Ruptures.

C H A P. CCCXXIV.

Of GOLD of PLEASURE,

O R,

OILY--SEED.

THE Names. It is called in *Greek*, *Μάραρον*, and *μαρυειν*, also *μαρυειν*, as *Dioscorides* says: in *Latin*, *Myogrum*, *Myogrium* and *Melampyrum*; and in *English*, *Gold of Pleasure*, and *Oily Seed*.

Garden Gold of Pleasure.

II. *The Kinds.* Authors make about seven kinds hereof, but four of them not being to be met with in *England*, or in any of our *American English Plantations*, that I know of, I shall say nothing of them in this place: of the other three which grow with

us, two of them only are properly called by this Name: the third is called, *Camelina* and *English Wormseed*, and under the Title of *Wormseed English* you may meet with it, which is its proper place. The two which we shall handle in this Chapter, are, 1. *Myagrum Sativum*, Garden Gold of Pleasure, and this is said to be the *Myagrum verum* Dioscoridis. 2. *Myagrum sylvestre*, *Pseudomyagrum*, Wild Gold of Pleasure, or Wild Oily-seed. There is a great Contest in Authors about the Names of these Plants, which is both troublesome and unprofitable to be read; and therefore, being of no Use to us, I shall wholly decline it.

III. The Descriptions. *The first*, or Garden Gold, has a Root which is small and long, perishing every Year after Seed-time: from this Root rises up one or more upright round Stalks, about two Feet high, set with several long and somewhat narrow Leaves, of a robbish green color, and something deeply dented about the edges, or deeply waved, compassing them at the bottom. The Stalk or Stalks are spread from the middle upwards into several Branches, bearing at their tops very small yellow Flowers; which being fallen, there succeed in their places small flat Seed-Vessels, containing within them Seed, which, when ripe, is of a Gold-yellow color, somewhat long in Form, small, and very fat or oily.

IV. *The second*, or Wild Gold, has a small long Root, with some Fibres or Strings adjoining to it; from whence springs up but one Stalk, which is round, and nearly half a Yard high, and is set about with long and somewhat narrow Leaves, much resembling those of Wood, but longer and smaller pointed, broad at the bottom, where they compass the Stalk about, with a point end sticking out on each side, shooting forth many Branches from the very bottom almost: at the tops of the Stalk and Branches come forth divers whitish Flowers, very like unto those of Flax; which being passed away, small round Heads rise up, with a small Point at the top, very like in Fashion to the former, and full of small yellowish Seed, like unto that of Cresser, exceeding bitter when it is green or fresh, (as the green Herb also is) but when dry, sweet in Taste, without any Acrimony, and very fat and oily.

V. *The Places*. The first grows in some places of Italy Wild, but yet both they and we do sow it in Gardens for Pleasure, and in Fields for the Seeds sake, out of which is pressed an Oil, which serves the Poor to Eat, and the Rich for Lamps; and serves also, with strong Lye of Pot Ashes, to make Soap withal; for which last Purpose, in Germany they sow many whole Fields therewith. The second is frequent in Germany, most usually in all their Flax Grounds, which being in Stalk like it, (tho' not of that Use) is accounted a Weed, and cast away, except of such as save the Seed, to give to small Birds, when it is ripe. This Seed, whilst green, is bitter beyond Expression; but being ripe and dry, it looses its Bitterness, and becomes very sweet and pleasant, and is very acceptable to small Birds, as Larks, Linnets, Finches, &c. to feed on: also by Expression, it yields as sweet an Oil as the former.

VI. *The Times*. They flower in the latter end of May, and thro' June and July, and in August; and the Seed is ripe in August and September.

VII. *The Qualities*. These Plants are hot and dry in the third Degree; the Oil is only hot in the first, and rather moist than dry. The Oil is also Discurfice, Emollient and Emplastick; Anodyn, Arthritick and Analgetick.

VIII. *The Specification*. It is peculiar to cure the Colick, and help the Contraction of the Nerves.

IX. *The Preparations*. You may have therefrom, 1. The Decoction of the Herb and Seed. 2. The Seed it self. 3. The Oil of the Seed by Expression.

The Virtues.

X. *The Decoction of the Herb or Seed, or both, in Wine or Water*. Sweetned with Honey, it is good for those who are troubled with the Cough, Shortness of Breath, Wheezing, Difficulty of Breathing, the Pleurisy or hard Scirrhous Swellings of the Liver. It lenities the Roughness or Hoarseness of the Throat and Voice, making it clear and easy. The Decoction in Water is good for Women to sit in, whose Wombs are hard or swollen, and to bring down their Courses when stop'd; as also to wash their Heads with, who are troubled with Scurf, Dandriff, Morpew or dry Scabs.

XI. *The Seed it self*. If it is bruised and taken in an Egg, it stops Vomiting, and encreases Seed: so also the Powder of the Herb. If the Seed is used in Bread, it makes it sweet and pleasant, and gives it a good Relish.

XII. *The Oil of the Seed by Expression*. Used in Clysters, it loosens the Belly, and is good against the Colick: taken in by the Mouth, it is very fat, and not very easy of Digestion, (being eaten as Oil Olive) except by Rusticks, and such as are accustomed to it. It yields a gross Nourishment, restores in Consumptions, and quickly makes fat and fleshy. It is good against Coughs, Hoarseness, Shortness of Breath, and Pleurifies or Stitches in the Side, being given from one or two Ounces, to four, six or eight. It breeds Flesh and encreases Seed; and is of great Use to anoint the Face or Hands, or any other Part of the Body, to cleanse the Skin, and to take away Sun-burnings, Morpew, Freckles, Spots, Scars, or any other Defecation of the Skin. It is good also against Burnings with Fire, or Scalding with Water, and causes an Extension or Relaxation of those Nerves or Sinews which are hard, contracted, or shrunk up.

C H A P. CCCXXV.

of GOOSE-FOOT,

O R,

A R A C H Wild, Broad-leav'd.

I. *THE Names*. It is called in Greek, *Αρεόλας* *αεινή πλατύφυλλο*, *ἡ Χυβάς*; in Latin, *Atriplex sylvestris latifolia*, *Pes Anseris* & *anserinus*, *Chenopodium Gerardi* & *Tabernamontani*; and in English, Broad-leav'd Wild Arach, or Goose-foot.

II. *The Kinds*. Gerard makes two sorts of this Plant, viz. 1. *Pes anserinus vulgaris*, The common Goose-foot. 2. *Pes anserinus laciniatus*, The more jagged or divided Goose-foot.

III. *The Descriptions*. *The first*, or Common Goose-foot, has a pretty long Root, divided into several Arms or Branches, besides a great many small Fibres or Strings; from whence rises up a Stalk, a Cubit high or more, somewhat chancre'd, and branched out on every side. The Leaves are broad, smooth, sharp-pointed and shining, having several deep Cuts about the edges, not much unlike to a Goose-foot: at the tops of the Branches are long Spikes of Flowers,

ers, which are small, and sometimes enclining to a reddish color. The Seed is small, and grows in Clusters, according to the Disposition of the Spikes, being very like the Seed of other *Wild Araches*.

Common Goose-foot.

IV. *The second, or more jagged Goose-foot, has a Root almost like the other, but more fibrous, from whence rises up a Stalk, replenished with Branches and Leaves, not much differing from the Common, saving that the Leaves are sharper cut, and more divided; and the Flowers and Seed (which grow in a spiked Form) are much smaller: the whole Color also of the Plant, is of a darker green.*

V. *The Places.* They grow plentifully in fat, moist and stinking places, as upon Dung-hills, and by Highway-sides.

VI. *The Times.* They spring up and flourish in the Spring Months; flower in June and July, and their Seed is ripe soon after.

VII. *The Qualities.* They are cold and moist in the third Degree: Anodyne or something Narcotick, Repetitive, Arthritick, and (as some Authors think) Deleterious, or Venefick, I suppose, because it is found certainly (as they say) to kill Swine.

VIII. *The Specification.* It certainly cures *Ignis sacer* or *Anthionies-fire*, and gives ease in the Gout.

IX. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Ointment. 3. A Cataplasin.

The Virtues.

X. *The Liquid Juice.* Bathed upon the parts afflicted it cools Inflammations, and cures *Anthionies Fire*; if it is mixed with Vinegar and Nitre, and parts affected with the Gout be bathed therewith warm, it eases the pains thereof, and is very prevalent against Bloody Falls, and Kibed Heels.

XI. *The Ointment.* It has the Virtues of the Liquid Juice, but not so fit for *Ignis Sacer* as the Juice

is, because of its unctuous body, which that Disease agrees not withal; it eases all Aches or Pains proceeding from a hot and dry cause, and is very beneficial to be applied to hot Apoplexies, and Discaises of the Joints, chiefly the Gout and Oedema.

XII. *The Cataplasin.* If it is made with a little Vinegar, and Nitre dissolved therein, it is an excellent thing to be applied to recent Contusions, to prevent the afflux of Humors, as also to any other part where a Fluxion is present; it stops the spreading of *Anthionies Fire*, cools the inflammation, and disposes it to healing; it is also an excellent thing to give ease in the pains of the Gout, and also to cure it, Universals being first premised.

C H A P. CCCXXVI.

of GOUTWORT;

OR,

HERB GERARD.

THE Names. It does not appear to have any Greek Name, unless *Παραχρυσον* *Dioscoridis* be it, *Brunfelsius* called it *Pycnomos*, Gesner *Corchorus quibusdam*, Cordus on *Dioscorides Elaphobosco similis*, Tabernaemontanus *Egopolium*, Tragus *Osseritium Sylvestre*, & *Angelica Vitium*, Camerarius *Angelica Sylvestris Communis*, Thallus *Angelica Erratica*, Bauhinus *Angelica Sylvestris minor, sive Erratica*, Dodonæus *Herba Gerardi*, because in the Low Countries it is called *Gerarnt*, Lobel *Podagraria Germanorum*, & *Herba Podagraria*; in English it is called *Ashweed*, *Axweed*, *Gout-Wort*, and *Herb Gerard*, from the Low Country Name.

II. *The Kinds.* There are two several sorts hereof, viz. 1. *Herba Gerardi, Podagraria vulgaris*, The Comon

Common Herb Gerard, or Goutwort. 2. *Podagraria Hypota*, *Herba Podagraria Cognata*, *Angelica Sylvestris Hirsuta inodora*, Hairy Herb Gerard, or Goutwort.

III. The Descriptions. *The first*, or Common Herb Gerard, has a Root which runs and creeps in the Ground like Quitchgrafs, soon spreading over a great deal of room; this is but a low Plant, seldom rising half a yard high, having several like Leaves standing upon broadish green Stalks by threes, as in *Masterwort*, but they are smaller and narrower, and not cut deep in, but only snipped about, and of a strong unpleasant Savour; at the tops of the Stalks and Branches grow Umbles of Flowers, which are white, which being past away yields blackish Seed, something like to, but less than that of *Masterwort*.

IV. *The second*, or Hairy Herb Gerard, has a thick Fibrous Root, of a blackish brown Color on the outside, but white within, enduring many Years, and of a good Smell, from whence springs up a Stalk about a Cubit high, blackish at the bottom, and a little Hairy, spreading into several short Branches, bearing Leaves thereon, much divided, like to *Wild Angelica*, or the former *Herb Gerard*, saying, that they are more deeply gashed, and of a green Color, and Hairy all over; the Footstalks, as also the Umbles of Flowers, are small and white, and followed with blackish Seed.

V. *The Places*. The first grows by Hedges and Walls sides, and oftentimes in the Borders or Corners of Fields, and sometimes also in Gardens, if it is not plucked up, or Weeded out, it is so fruitful in its increase, that where it has once taken Root, it will hardly be gotten out again, spoiling the Ground every Year more than other; the other grows in some parts of Germany, and it has been found also upon the Borders of Wales, and other places.

VI. *The Times*. They both Flower from the beginning of June to the end of August, the Seed ripening in the mean Season.

VII. *The Qualities*. It is temperate in respect to heat or cold, and drying in the first degree; it is Anodyne, Alstringent, Vulnerary, Disculive, a little Repercussive, Neurotick, Arthritic, and Analeptick.

VIII. *The Specification*. It is said to cure the Gout and Sciatica, Weaknesses, and all other Distresses of the Nerves and Joints.

IX. *The Preparations*. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Acid Tincture. 4. An Oily Tincture. 5. An Ointment or Balsam. 6. A Cataplasm.

The Virtues.

X. *The Liquid Juice*. It may be given inwardly as a Wound Drink, for it mightily contributes to the curing of ill conditioned Wounds, old Ulcers, running Sores, and Fistula's; also outwardly washing them therewith it contributes to the same purposes, for it cleanses, incarnates, dries, and heals; Gouty parts also bathed therewith warm two or three times a day it eases the pain, but more especially if it is taken inwardly from three to six Spoonfuls Morning and Night, in any proper Vehicle; Ulcers in the Lungs, Guts, or other Bowels, it likewise cures.

XI. *The Essence*. It has all the Virtues of the Liquid Juice, but more efficacious, and better to be taken than it, because of its fineness; it cures Diarrhoea's, Dysenteria's, Lienteria's, as also the Hepatic Flux, being timely given in a Glass of Spirit of

Angelica, the greater Composition. Dose three or four Spoonfuls Morning and Night.

XII. *The Acid Tincture*. It rectifies the Juices in the Stomach and inferior Viscera, destroying their Tartar and Viscosity, which being thrust forth into the Joints, breeds the Gout and Sciatica; it comforts the Stomach, causing a good Digestion, opens Obstructions, cleanses, and evacuates the slimy matter by Urine. Dose from twenty to forty drops in a Glass of Ale or Wine, as often as the Patient has an occasion of Drinking.

XIII. *The Oily Tincture*. Inwardly taken from ten drops to twenty five, according to Age and Necessity, in a Glass of White Port Wine, or other fit Vehicle, it powerfully opens the Obstructions of the Urinary parts, causing a free Pissing, and thereby carries off the tartarous, viscous, or slimy matter which breeds the Gout, Sciatica, Stone, and Gravel, bathed upon the Puncture of a Nerve, it eases the pain and soon cures it; it is good also against Convulsions, Cramps, Palsies, numbness of any Member, &c. being well bathed upon the Back Bone Morning and Evening, and likewise upon the part affected, rubbing it well in before a good Fire.

XIV. *The Ointment or Balsam*. It cures Simple Green Wounds, and old Ulcers, of what kind soever, it absterges, incarnates, and heals them after an admirable manner, it draws Splinters out of Wounds, and Thorns or Prickles gotten into any part of the Flesh; applied to any part afflicted with vehement pain it presently gives ease, and being continued upon Joints afflicted with the Gout it cures it, and strengthens the part afflicted.

XV. *The Cataplasm*. Applied to Simple Contusions it dissolves them, and prevents their Apostematizing, gives ease in the Gout, abates Inflammations, dissolves the present matter, and prevents Defluxions of Humors; it is an extraordinary thing to be applied to the Forehead, to cure sore, running and watery Eyes, &c.

C H A P. CCCXXVII.

Of GRASS, or HERBAGE.

I. *The Names*. It is called in Greek *ἄγριον*, & *ἄγριον*, in Latin *Gramen*, *Agrostis*, in English *Grass*; it is true that *Xivon Omne Genus Herbe comprehendit*, yet *Xivon* signifies *Gramineus*, a Grassy place, or Ground over spread with Grass, from whence *Grass* is also called with us *Herbage*.

II. *The Kinds*. They are manifold, and the several sorts of each Species are almost infinite, so that it will be difficult to decipher or describe them all, the chief of the principal Kinds are the thirty five following, viz. 1. *Bent-Grass*. 2. *Canary-Grass*. 3. *Cat-tail-Grass*. 4. *Corn-Grass*. 5. *Cocksfoot-Grass*. 6. *Capon-tail-Grass*. 7. *Cotton-Grass*. 8. *Crested-Grass*. 9. *Cyperus-Grass*. 10. *Darnel-Grass*. 11. *Dogs-Grass*. 12. *Dwarf-Grass*. 13. *Feather-Grass*. 14. *Fox-tail-Grass*. 15. *Fern-Grass*. 16. *Hairy-Grass*. 17. *Hay-Grass*. 18. *Hedgehog-Grass*. 19. *Knead-Grass*. 20. *Meadow-Grass*. 21. *Mountain-Grass*. 22. *Millet-Grass*. 23. *Oat-Grass*. 24. *Pannick-Grass*. 25. *Quaking-Grass*. 26. *Rush-Grass*. 27. *Reed-Grass*. 28. *Sea-Grass*. 29. *Silver-Grass*. 30. *Spiked-Grass*. 31. *Toad-Grass*. 32. *Water-Grass*. 33. *Wood-Grass*. 34. *Way or Wall-Grass*. 35. *Woolly-Grass*. The Descriptions

criptions of all which Species, with their various sorts, you shall have in the following Sections.

Gramen Arvorum venti Spica, Gramen Scopula, vel Scopularium, Bent-Grass, or Bents

III. The Descriptions. *This is a singular Plant of its kind, and called by Gerard Harundinaceum, because its bushy top has Pannicles resembling those of Common Reed, it has a small and Fibrous Root, and grows up to be a Yard or an Ell high, with many thin Grassy Leaves here and there jointed, and its tufted Heads or Pannicles, spread almost like unto the Sprigs of Feathers, standing for the most part all one way, and hanging down their Heads, of a fine brown shining green Color, which are, being fine and slender, easily shaken with the Wind, from whence some call this in English Windgrafs; this is that Grass which the vulgar commonly call Bents, of which many Country People make Befoms, and is many times ty'd in rows together, and serves in Summer time to be set against the backs of Chimneys, to deck up, cool, and refresh the Room; it is Gramen Pratenfe tertium Dodonæi, and Gramen Arundinaceum arvenfe Tabernamontani.*

Phalaris, Canary-Grass, seven Species, three true and four bastard.

Canary Seed

IV. 1. *Phalaris vulgaris, Common Canary-Grass*, has a Fibrous Root, dying with us every Winter, and therefore is but an Annual Plant, to be new Sown every Year; it has jointed Stalks half a Yard high, with Grassie Leaves on them like Barley, and at the top a long round Chaffie Head, somewhat pointed above, whose Bloomings are yellowish, wherein lies flat, round, shining Seed, bigger than *Miller*, and less than *Linsed*, of a yellowish Color, and somewhat like to the Seed of *Sesamum*.

V. 2. *Phalaris Semine nigro, Canary-Grass with blackish Seed*. The Root hereof is like, and perishes as the other, it differs not from the former, but in being somewhat lesser, both in Stalk, Leaf, and Head, but chiefly in the Seed, which is of a pale, blackish, shining Color.

VI. 3. *Phalaris bulbosa Semine Albo, White bulb-ed Canary-Grass*, has a Root consisting of many small white Bulbs, or rather Tubers, growing in Tufts together, with long Fibres descending from them, whereby they are fastned strongly in the Ground, and die not every Year, as the others do, but encrease into great Tufts; the Grass grows very like the former, but with smaller, renderer, and taller jointed Stalks and Leaves on them, and at the Roots are more soft and gentle; the spiked Heads are smaller, and a little longer, and grow not full out so close together, but are softer in handling, and bring forth smaller and whiter Seed than the others.

Bastard Canary Grass

VII. 4. *Phalaroides majus, Gramen Phalaroides, vel Alopecuroides, five Italicum majus, The greater Bastard Canary-Grass*, has a Root small and Fibrous, perishing every Year, and grows up very like to the true *Phalaris*, or *Canary-Grass*, both in Stalk, Leaf, and Head, but that the Stalks are single, and with fewer Leaves on them; the Head also or Ear is smaller, hoary, and softer, and the Seed not much unlike.

VIII. 5. *Phalaroides minus, The lesser Bastard Canary-Grass*, is in all things like to the last, but the Ear or Head is smaller and longer, and the Leaves do so encompass the Stalk at bottom, that it seems to run thro' them, as thro' a Trunk.

IX. 6. *Phalaroides Spica molli, Gramen Phalaroides Germanicum, Soft headed Bastard Canary-Grass*, has a Fibrous Root, from which springs a Stalk, or Stalks, of a Foot and half high, somewhat larger than the last, with a Joint or two thereon, and short Leaves at them, encompassing the Stalk at the lower end; the Head is shorter and smaller than the last, of a shining Ash Color, and soft to the feeling.

X. 7. *Phalaroides Spica Hirsutiore, Bastard Canary-Grass with a more hairy Spike or Ear*. It has a Perennial Fibrous Root, from whence spring up Stalks and Leaves like the last, but furnished with a greater store of Leaves and Stalks; the Spiked Head

is also longer and narrower, and set with short Hairs.

XI. *The Places.* All the three first sorts have been found growing in *Spain*, and brought to us by *Boel*, with some of the *Bistard* sorts; the first has been known many Years, and was brought from the *Canary Islands* with those sweet Singing Birds called *Canary Birds*, which feed upon this Seed; *Lobel* says that it grows in *Provence* in *France*; the second *Bauhinus* says came to us from *Malta*, where those Birds feed on it; all the first three grow with us in our Gardens; the fourth grows as well in our Fields in *England*, as in other Countries; the fifth and sixth grow about *Ulm*s, where they are frequent, and call them *Onocordon*, from their color: where the seventh grows is uncertain.

XII. *The Times.* They all of them flourish in the Summer Months, and their Seeds are ripe in *July* and *August*.

XIII. *The Virtues.* *Canary Seed* in some Places and Islands is made into Bread, which nourishes much like that of *Millet*, or rather less, and therefore to mend it, some mix it with *Wheat*, that the Bread may be the faster, which otherwise would be apt to crumble and dry. *The Liquid Juice, or Essence of the Herb*, are good to ease the pains of the Stone and Gravel, open Obstructions of the Urinary parts, and abate the scalding heat thereof. *The Cataplasm of the Seed* has the Virtues of that of *Millet*, and is good to dry and repress the flux of Humors upon any part.

Gramen Typhinum, Catstail-Grass, three sorts.

Cats raise

Grass

XIV. 1. *Gramen Typhoides, vel Typhinum maximum, The greatest Catstail-Grass*, has very small Roots, compacted of many small Skins or Threads, which may be easily taken from the whole Root, from which rise up very fair large Leaves, like *Wheat*, and triangular Stalks two Feet high, or more, on which grow long, round, spiked Heads, four times

larger than those of the following Kind, and almost of an equal bigness and roundness from the bottom of the Spike to the top; this Plant is sometimes found with Stalks four or five Feet high, and the Spike somewhat shorter, and smaller at the top.

Small common Catstail Grass

XV. 2. *Gramen Typhinum minus vulgatissimum, The lesser most common Catstail-Grass*, has Roots which have small round Heads, like Tubers or Bulbs, from the Heads of which spring forth the Leaves and Stalks; this is the most common with us, and differs not from the former but in the Roots, this being bulbed, as aforesaid, and in magnitude, the Stalks in this rising not above a Foot high, and the round Spike not being above two or three Inches long.

XVI. 3. *Gramen Typhinum minus, The small Catstail-Grass*, has for its Root a little Bulb, or Bulbs, from whence rises up the Stalk, about two Feet high, set at each Joint with long Grassie Leaves, with a Spike or Ear four or five inches long, closely and handsomely made, like the former; it differs not from the last, but in having a greater store of narrow green Leaves, a longer Stalk, and larger spiked Heads.

XVII. *The Places.* They are all of them found in many places of *England*, but mostly in watery places, and near Water; the third is found growing plentifully in many places about *London*, as by the Bridge entering into *Chelsea Field*, as you go from *St. James's* to little *Chelsea*.

XVIII. *The Times.* They Flourish and Seed in *June* and *July*, keeping the same time with other Grasses.

Gramen Segetum, vel Segetale, Gramen Triticeum, Corn-Grass, or Wheat-Grass, six Kinds.

XIX. 1. *Gramen Segetum vel Triticeum latifolium Spica compalla, Broad Leav'd Wheat-Grass close Ear'd*, has from a Fibrous Root a Stalk, or Stalks spring up, about half a yard high, having two or three

three Joints, and fair Wheat-like Leaves at them a Foot long, bearing at the tops a longer Spike or Ear than *Wheat*, and broader, made of several parts, like the Husks of Corn, but separated more asunder, thereby shewing it to be a *Grafs*, and no true Corn, yet the Spike grows closer than the next, and without any shew of Awnes or Beard thereon.

XX. 2. *Gramen segetale, vel Triticum latifolium Spica divissa, Broad-leav'd thin-eard red Wheat Grafs.* It differs little from the former, but in the Spike, which has the small parts thereof more separated, and set on both sides of the Stalk, and armed every one with a small short Awne or Beard.

XXI. 3. *Gramen segetale, vel Triticum angustifolium Spica compatta, Broad-leav'd close-eard red Wheat Grafs.* It has a Stalk which is smooth and round, two Feet high, set with long narrower white Leaves, rough and pointed. The Spike is about a Span long, somewhat like unto *Red Wheat*, closely set, but each of the Husks has a sharp rough Awne thereat.

XXII. 4. *Gramen segetum, vel Triticum angustifolium spica mutica, Narrow-leav'd or Rush-leav'd white-eard Wheat Grafs, without Awnes.* It has a Root which is white, knotty and creeping, from whence spring up Leaves which are long and round, like *Rushes*, and pointed at the ends, set on round Stalks, a Foot and half high, whose spiked tops are long and slender, without any Awnes at the tops of the Husks, and somewhat like unto *White Wheat* without Beards.

XXIII. 5. *Gramen segetum, vel Triticum majus spica Brizæ, The greater Spelt Wheat Grafs.* Its Roots and Stalks are like unto *Corn*, four or five Feet high, or more, set with narrow Leaves: the tops of the Stalks have several long Spikes, about a Hand breadth long, set on both side of them, one above another, each whereof is very like a small Ear of *Wheat*, armed with small Awnes, but very short.

XXIV. 6. *Gramen segetum, vel Triticum minus spica Brizæ, The lesser Spelt Wheat Grafs.* It grows not above an Hand breadth high, with small, short, soft and hoary Leaves; and at top of the Stalk there is sometimes but one, and sometimes two or three Spikes or Ears, of an Inch long, and bearded.

XXV. *The Places and Times.* They grow in many parts of *England*, in Pastures and Corn Grounds in *Kent*, not far from the *Thames*; and flourish and feed in the Summer Months, when other *Grafses* do.

V. *Ἰσχυμ, Ischemon & Gramen Ischemon, sive Dactyloides, Cocks-foot or Finger Grafs, Six kinds.*

XXVI. 1. *Ischemon sylvestre folio latiore, Common Cocks-foot Grafs.* It is called, *Galli Crus Apuleii*, and has a Root consisting of a great many small Fibres; from whence spring forth several clear, reddish, jointed Stalks, with fair Grassy Leaves on them, a little dented on the edges, broad at the bottom, and small at the end, of a harsh or binding Taste. At the tops of the Stalks grow divers long, slender, rough Spikes, of a glittering purple, or rather *Violet* color, but of a brownish color when they are ripe, and are divided into four or five Spikes, which are spread or stretched out abroad, like a Cock's Foot, when it is set down upon the Ground, or the Fingers of a Man's Hand, when they are spread abroad.

XXVII. 2. *Ischemon sylvestre spicis Villosis, Wild Cocks-foot Grafs, with a bearded or hairy Spike or Ear.* Its Root is a Bush of Fibres, like the other: it has purplish Stalks, a Cubit high, with fewer

and much narrower Leaves on them. The spiked Heads are more in number than the former, and more hairy, having, as it were, short yellow Beards, set on both sides of the Panicles, in which lye the Seed.

XXVIII. 3. *Ischemon sativum, sive Gramen marne Esculentum, Gramen aculeatum Thalii, Frumentum Germanicum Cordi, (upon Dioscorides) because they account it Oryza Species; Sanguinaria, Sanguinella, and Capriola Italica, Dew Grafs.* It has a Root greater and more bulky than any of the former, the whole Plant differing from the two foregoing no otherwise almost, than a Manured Plant from a Wild. It has fair jointed purplish Stalks, and large Grassy or Reed like Leaves on them, somewhat hairy or woolly at their bottoms; and about the Joints at the tops of the Stalks stand larger Spikes or Panicles, and more also set together than in the former, which are made of many small, chaffy Husks, with long white Seeds in them, somewhat greater than *Millet*, and lesser than *Rice*, standing all, as it were, on one side.

XXIX. 4. *Gramen scoparium Ischemi panicula, Besom or Brush Grafs.* It has a Root consisting of many very long hard Fibres or Threads, a Foot and half long, or more, (whereof are made, in *France*, where it grows naturally, those kinds of *Brushes* with which we usually brush our Heads, &c.) the Stalks are hard, slender, and jointed, about a Cubit high, with small long Leaves on them, like unto the second *Ischemon* aforesaid, but sweeter in taste; at the tops of the Stalks stand five or six, or more, bright long Panicles, like unto the *Cocksfoot*, but larger, flatter, and less dented.

XXX. 5. *Gramen Ischemon Canarium, Dogs-Grafs like Cocksfoot.* It has running jointed Roots, like to the *Common Quitch-Grafs*, and so both Stalks and Leaves somewhat resemble it, so that it might have as well been enumerated among the *Quitch-Grafses*, or *Dogs-Grafses*, as among the *Cocksfoot-Grafses*, because it is, as it were, indifferent between them both; but the Head is dispersed or spread into such like slender long Panicles as the *Cocksfoot-Grafs* is, the small Chaffie Husks whereof contain the Seed.

XXXI. 6. *Gramen Dactylon repens, Creeping Cocksfoot-Grafs.* It has a sparfed thready Root, which sends forth many long, slender, and weak Branches, trailing or creeping upon the Ground, and shooting forth Roots at the Joints, the Leaves which grow at the Joints are small and Grassie, long and narrow, and at the tops of the Stalks, which rise not much above a Span high, four or five small, slender, blackish Spikes or Ears come forth, within the Husks whereof the Seed is found to lye.

XXXII. *The Place and Time.* The two first Kinds are found growing naturally in several places of *Italy*, as also at *Narbonne* in *France*, and in divers places of *England*, but the third is usually Sown in Fields, as *Corn*, in many places of *Germany*, where with the Seed thereof they make Pottage or Broth, as we here in *England* do with *Rice* and *Oatmeal*, and it is sent into *Middleburgh*, and other Towns of the Low Countries in great Quantities for the same purpose, as *Label* has affirmed, but with us it only grows in Gardens, tho' should we Sow it as the *Germans* do, in Fields, it is probable that it might thrive full as well with us as it does with them; the fourth, fifth and sixth grow in *France*, but with us chiefly in Gardens; the fifth has been found growing in *Spain*, and the first *Gerard* says he found growing upon the Hilly Banks near *Greenbith* in *Kent*, and that it grows upon the rough Banks of Fields, &c. They all Flourish and Seed in the Summer Months when the other *Grafses* do.

The Virtues.

XXXIII. 1. *The Liquid Juice.* Put into the Eyes which run and water, or where is a Defluxion of Rheum, causing redness or blearedness, and drunk, chiefly the Juice of the *Dew-Grafs*, it discusses the hardness of Womens Breasts, especially being also bathed thereon. 2. *The Cocksfoot Quitch-Grafs*, has all the Virtues of *Quitch-Grafs*, to be discoursed of in some of the following Chapters of this Book. 3. *The Decoction.* It is of use (made of the Roots in White Port) to expel the Terms, and it drives forth the Measles, Small Pox, and is good in the Purples, Spotted, and other Peftilential Fevers. 4. *The Ointment or Balsam of the Roots and green Grafs*, is good for the Bittings of Mad Dogs, dissolves hard Tumors, and not only heals green Wounds, but also old Ulcers. 5. *The Cataplasim of Herb and Roots* applied to any place which bleeds, stops the Blood presently, whether it be from the Nose, or a Wound.

VI. Ἀλεξάνδριος, *Gramen murorum Spica longissima*, *Gramen Spica nutante longissima*, Caponstail-Grafs, or Grafs with a long bending Spike, a single Species.

XXXIV. This *Gramen murorum Spica nutante* is a singular Plant, which has a fibrous or stringy Root, from which arises Leaves long and narrow, like other Grafs Leaves, which by Time and Age growing old, grow somewhat rounder, as those of Spartum, or Matweed; from among these Grassie Leaves there grows up a slender Stalk about two Feet high, scarcely standing upright, but oftentimes hanging down its Head, or top of its Ear, after the manner of a Capons Tail; this Stalk has two or three small Leaves at the Joints up to its top, where grows a very long Spike, bending a little downwards, composed of small and hairy Tufts, which grow of a greyish or whitish Color being ripe, containing within them small whitish Seed. This was found out by Mr. Good-yere.

XXXV. *The Place and Time.* This Elegant Grafs Mt. Goodyere found growing upon the Walls of the Ancient City of Winchester, and was not described by any Author before him, he gave it the Name; Gerard had some of the Seed thereof, which he did Sow, which grew up, took root, and flourished, Seeding in the Summer Months.

VII. Καλαμύρις quorundam, *Gramen Tomentosum*, vel *Tomentarium*, Cotton-Grafs, or Cotton Reed-Grafs.

XXXVI. It is a singular Plant of the Kind, having a Root somewhat hard and rough, very tough, small and thready, with many long Fibres issuing from it. This *Cotton Reed-Grafs* is in roughness, dryness, and form of the Leaves, not much unlike ro *Cocktail-Grafs*, called *Pseudoschœnanthum*, but much greater, and not Downy; the Stalks rise up to be three, four, or more Feet high, and but with few Joints, which are rough, garnished with many hard Grassie Leaves, bearing at the top Heads, which are Spiked, set all along a Panicle, reddish for some time, but growing to ripeness, are of a shining Silver like whiteness, and as soft as Wool in handling, from whence it took the Name. This Description is according to the Dutch Copy, translated by Lobel himself.

XXXVII. *The Places.* It grows in the borders of dry Fields, and by Hedge sides, in many Coun-

ties of England, especially in Dorsetshire; Gerard says it grows upon Boggy and such like Moorish places, and is to be seen in Bogs upon *Hampsted Heath*; it grows likewise in *Highgate Park*, near London. This with long spiked Heads is doubtless the *Gramen Tomentosum Arundinaceum* of Gerard, described in Lib. 1. Cap. 9.

VIII. Εὐαλεφύρις, ἢ ἄγροσις ὕληος, *Gramen Cristatum*, Crested-Grafs, or Cockscomb-Grafs, four Species.

XXXVIII. 1. *Gramen Cristatum lene*, Smooth, Crested, or Cockscomb-Grafs, has white Roots, which Mat themselves in the Ground very much, from whence spring up divers smooth slender Stalks, two Feet or more high, with few, or no Joints on them, and with small short green Leaves at them; the tops of the Stalks have slender long spiked Heads, divided into many parts, each whereof is like unto the Crest of a Bird: this Ear, says Gerard, is small, long, of a pale green Color, somewhat bending, so that in some sort it resembles the Comb of a Cock, (whence the Name) or the Seed Vessel of that Plant which is called *Caput Gallinaceum*: the Spike or Ear is of a pale yellowish green, and sometimes of a reddish Color, which made Bauhinus to compare it to *Crista Galli*, or Cocks-Comb. This is *Gramen Pratenſe Cristatum*, *Gramen Spica Cristata* Bauhini.

XXXIX. 2. *Gramen Cristatum Sabbiriatum*, Hairy Crested-Grafs. This seems to be a Species of the former, and differs from it only in these particulars, the Roots are of a reddish yellow color, the Stalks are lower and smaller, and a little Hairy or Woolly at the bottoms, with longer Leaves, and a more sparsely white Head, not so finely set together, and grows rather among Hedges and Bulshes.

XL. 3. *Gramen Cristatum Anglicum*, English Crested-Grafs. This has fewer and longer Roots, not matting and increasing in the former manner, the Stalks are straight, with longer and narrower Leaves on them; the Spiked Head differs from the former, in being longer and closer set, and not spread

into

into Tufts, but as it were into close short Husks, the whole Spike somewhat resembling a small long Foxtail-Grass.

XLII. 4. *Gramen Cristatum Spica multiplici*, Double English Crested-Grass. This is very like the last in its Roots, Stalks, and Leaves, and seems to be a variety of the same, but it differs in this, that it is spread out in its top, and parted or divided into several smaller Spikes from the greater main one, otherwise very little differing from it in any thing else.

XLIII. The Places and Times. The first of these is ordinarily to be found in Meadows about Midsummer time, that, as also the second, usually growing in Fields and Pastures, and near Hedges and Bushes, and places near them; the third grows plentifully in many By-places near Hackney, not far from London; the fourth being a variety of the last, is found growing always not far from the places where the third grows.

IX. *Kυμινοςχυειρις, & αχρειρις κυμινωδης, Gramen Cyperoides*, Cyperus-Grass, twenty two Species.

Cyperus Grass

XLIII. 1. *Cyperus Typhinus Gerardi*, *Gramen Typhinum Tabernamontani*, *Gramen Typhoides Spica multiplici Baubini*, Catstail Cyperus-Grass. It has a Bulky Root, from whence spring forth many long, narrow, three square, hard, green Leaves, among which rise up stiff green Stalks, half a yard, or two Feet high, or better, with some Joints and Leaves at them, not much unlike to the Common Reed; at and towards the tops of these Stalks grow two or more long slender rough Heads, growing one above another, Spike fashion, almost resembling a Cats Tail, very chaffie, rough and rugged, of a dark Green, tending to Purple.

XLIV. 2. *Gramen Cyperoides angustifolium majus*, The greater narrow Leav'd Cyperus-Grass. It has a reasonable strong Fibrous Root, from whence stiff, long, and narrow Leaves, like those of other Cype-

rus-Grasses spring; the Stalks also, (as it is proper to all the Plants of this Kindred) are three square, bearing at their tops three brownish Ears, soft and chaffie, like the rest of this Kind, standing upright, and not hanging down, as some others do.

XLV. 3. *Gramen Cyperoides Spicatum Tenius*, *Spicatum*, Slender Ear'd Wood Cyperus-Grass. It has a great yellowish and fibrous bulky Root, from whence spring three square Stalks, a Foot or more high, with fair, but hard and rough Grassie Leaves, four or five Inches long; the Spiked Heads which grow at the tops are many, one above another, slender and long, yet some more than others, some one Inch, some two Inches, or less, of a yellowish green color, with long yellowish Seeds in them.

XLVI. 4. *Gramen Cyperoides elegans Spica multifera*, A fine or beautiful Cyperus-Grass with many Heads. It has a thick fibrous Root, which sends up slender triangular Stalks, about two Feet high; the Leaves are long and narrow, with a long pointed Spiked Head, made of many small ones, so close set together, that they seem to be but one Spike or Head.

XLVII. 5. *Gramen Cyperoides ebinatum Montanum*, Mountain prickly Cyperus-Grass. It has a thick bulky fibrous Root, as the former, which sends up three square Stalks, about a Span long, or not much more, the Leaves below and on them are very long and narrow, the Heads are short, with many rough Burs on them, some separated and some close.

XLVIII. 6. *Gramen Cyperoides sparsa Panicula*, Land Cyperus-Grass with a dispersed Tuft. It has a Root which is full of Fibres, which sends forth long Leaves, of a brown green color, and somewhat flat, between a Rush and a Grass; the Stalk is also somewhat more flat than square, sometimes but half a yard high, sometimes three, four, or five Feet high, the top whereof is furnished with a large round spread Panicle, made of many parts, and each small prickly Head standing on a slender Footstalk, which is oftentimes bent down with the weight of the Heads.

XLIX. 7. *Gramen Cyperoides parum Lanosum*, Cyperus-Grass a little Woolly. It has a Fibrous Root, which sends forth slender Stalks, about two Spans high, the bottoms of them being a little Woolly, and having at the middle only a Joint with a Leaf; the lower Leaves are set close upon the Ground, three or four Inches long, somewhat like those of the Grass-Crostfoot; the heads of the Stalks have small round shining Spikes or Ears on them, of a pale brown Color, with a small long Leaf under every head: This is *Gramen Cyperoides parvum*.

L. 8. *Gramen Cyperoides Norwegicum*, Norway Cyperus-Grass. It has a number of long narrow Leaves, some three or four Inches, others six or seven Inches long; the Stalks are clear and smooth, half a yard high, bearing at the top many Cone like Heads, set close together.

LI. 9. *Gramen Cyperoides Spicatum Latifolium*, Broad Leav'd Cyperus-Grass. It has long black creeping Roots, with many Fibres at them, very like unto the sweet long Cyperus, and has broad Leaves, almost a Foot long, among which come forth the Stalks, being about a Foot high, which bear three chaffie Spiked Heads at the top, of an Inch, or Inch and half long, of which the middlemost is the longest, each of them like unto the small Catstail-Grass.

LII. 10. *Gramen Cyperoides latifolium alterum*, The higher broad Leav'd Cyperus-Grass. It has a Root which is somewhat long, but scaly, with many long Fibres adjoining thereto; the Leaves are as long as the last, but the Stalks are much higher; bearing at the tops four or five small long Ears of

Spikes one above another, an Inch or two long, with a small Leaf at the foot of each of them.

LIII. 11. *Gramen Cyperoides Palustre, Great Water Cyperus-Grafs.* The Root is compact of many long and tough Strings, or Threads, the Leaves are long and broad, like unto the *Sedge*, called *Carex*, from among which rise up several long three-square Stalks, at the top of each of which there is a Spike or Ear, like to a *Plantane* Head, commonly of a yellowish green color, and very prickly.

LIV. 12. *Gramen Cyperoides Miliaceum, Cyperus Gramineus Miliaceus, Pseudocyperus Gramineus Miliaceus, Millet Cyperus-Grafs,* or *Bastard Cyperus-Grafs Tufted.* It has a thick fibrous black bushy Root, from whence rises divers fair, long, and somewhat broad, also shorter green Leaves, paler than those at Sect. 42. above, from among which arise three-square Stalks, like those of *Cyperus*, about half a yard high, set with Leaves from the bottom to about six or seven Inches high of the Stalk, and encompassing the Stalk also at their bottoms; the tops are furnished with a large Tufted Head, (almost like the *True Cyperus*) and greater than is proportional to the Plant, where two or three pretty large Leaves come forth, between which rise up many small Footstalks, very much Branched, which bear many black Seeds, somewhat like *Millet*, or *Rushes*.

LV. 13. *Gramen Cyperoides Palustre Panicula sparsa, Aquaticum vulgatus Lobelij, Marsh Cyperus-Grafs with sparsed Heads.* It has a Root which spreads somewhat like the *True Cyperus*, but harder, fuller of blackish Fibres, and without smell; the Leaves are long, and somewhat narrow, hard, and cutting on both edges; the Stalk is triangular, tall, without any Leaves thereon to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.

LVI. 14. *Gramen Cyperoides Palustre majus, Gramen junceum triquetrum Thalij, The greater Marsh Cyperus-Grafs.* The Root is a bush of many blackish Fibres, like unto *Grafs* Roots, it has several long and narrow hard cutting Leaves like the last, and among them divers upright Stalks, without any Leaves at all on them, each of them bearing a long, round, and somewhat large prickly head, in which lies the Seed.

LVII. 15. *Gramen Cyperoides Palustre minus, The lesser Marsh Cyperus-Grafs.* The Root of this is like unto the former, but is lesser, as is the whole Plant; the Stalk bears sharp, rough, spiked heads, four or five together, one above another, on both sides thereof, with a long Leaf at the foot of them.

LVIII. 16. *Gramen Cyperoides Palustre spicis minus compactis, The lesser Marsh Cyperus with more open heads.* Its Root is somewhat hard or woody, and full of Fibres, bearing many long and narrow Leaves, like to *Grafs*, among which rises up a rough three-square Stalk, bare of Leaves for the most part up to the top, where stand several small rough Heads or Spikes, more loose or open than the former, having sharp pricking Seed within them.

LIX. 17. *Gramen Cyperoides Palustre Subflavescens Panicula sparsa, Carex minus Lonicerus, Yellowish Marsh Cyperus-Grafs open headed.* The Root is great at the head, with several Fibres thereat, it has smaller and shorter Leaves than any of the former, and naked Stalks, bearing at the tops of the Stalks, between two small long Leaves, a head feathered into many small parts or spikes, of a yellowish color. Of this sort there is another, differing very little from it, but in the color of the small Spikes, which are blackish.

LX. 18. *Gramen Cyperoides Palustre majus lati-*

folium Lobelij & Camerarij, Carex Tragi & Lugdunensis, The greater broad Leav'd Cyperus-Grafs. It has a brownish Root, and folding it self one within another, with many Fibres adjoining, it has several large and long Leaves, like unto those of *Reeds*, among which rise up several three-square Stalks, bearing three or four close spiked brownish heads thereon, one above another. There is another of this great broad Leav'd kind, called by *Bauhinus Gramen Cyperoides majus latifolium, spica Spodicea viridi*, whose Roots are more bushy and fibrous, and the spiked heads more green, having a long narrow Leaf under the lowest Spike or Head.

LXI. 19. *Gramen Cyperoides Palustre majus angustifolium, The greater Cyperus-Grafs with narrow Leaves.* This differs little from the last, but in its growing lower, with narrower Leaves, and spiked heads, which are thinner and longer, but of the same brown greenish color with it.

LXII. 20. *Gramen Cyperoides Palustre minus angustifolium, The lesser narrow Leav'd Cyperus-Grafs.* It has a Root with long Strings and Fibres thereat, shooting forth like *Cyperus*, has narrower Leaves, and three-square Stalks, bearing smaller and more spiked long heads, three usually set together, one a little from the other, more stiff also and upright.

LXIII. 21. *Pseudo Cyperus spica brevis pendula, Lobelij, Gesneri, Dodonai, Bastard Cyperus-Grafs with short pendulous heads.* The Roots of this do somewhat resemble the *True sweet long Cyperus*, but looser, and not so firm, fuller also of Fibres, and not smelling sweet at all; it grows also somewhat like unto the *True long Cyperus*, having large and long grassie Leaves, in a manner three-square, and so is the Stalk also, at the top whereof, among divers Leaves, come forth great spiked, thick and short heads, hanging downwards, every one by a short Footstalk.

LXIV. 22. *Pseudo-Cyperus, sive Gramen Cyperoides Palustre spica pendula longiore, Another Bastard Cyperus-Grafs with longer heads.* It has a Root like the former, with a triangular striped Stalk, about a yard high, bearing long and narrow Leaves thereon, which encompass the Stalk at bottom with a Skin, or hollow Sheath, having at top several long and narrow pendulous heads, five or six Inches long each, with a long Leaf under each head.

LXV. *The Places and Times.* They all grow in low, moist, and Moorish Grounds, in many places of this Kingdom, as also in several other Countries, as their Names express, and do all Flourish and Seed in the end of Summer.

X. *Phœnix graminæus, Phœnix Graminea, Darnel-Grafs,* six kinds.

LXVI. 1. *Phœnix simplicis, & rarissima Gluma, The smallest single Darnel-Grafs.* It is very like to *Red Darnel*, but that it has very few slenderer and shorter Stalks than it, and the Leaves also narrower; the spiked head has a few single Husks set very sparsely.

LXVII. 2. *Phœnix altera brevioribus densioribusque spicis, The greater single Darnel-Grafs.* The Roots and Leaves hereof are like the *Red Darnel*, the Stalks grow a yard high, jointed and straked, and the Spike is thinly set with chaffie heads, but they are bigger, rounder, and thicker.

LXVIII. 3. *Phœnix acerosa aculeata, Small prickly Darnel-Grafs.* It has a Root consisting of small white Threads or Fibres, the Stalks hereof are about five, six, or seven Inches high, being rough, hard, full of joints, pointed or prickly at the ends, and with a few short Leaves on them, and have withal small,

small, short, rough, and chiffe like Tongues, sharp at their ends, set at the Joints.

LXIX. 4. *Phœnix multiplici spicata Panicula*, Branched Darnel-Grass. It has slender jointed Stalks, half a yard or more high, with narrow Leaves; the spiked head is as it were branched into others, in which consists the chiefest difference.

LXX. 5. *Phœnix multiplici spica nutante*, Double Darnel-Grass with a bowing top. It differs little or nothing from the last, but in the spiked heads, which are thicker set together, and the tops of them bow down, or turn a little round.

LXXI. 6. *Phœnix Palustris & longius spicata*, Branched Marsh Darnel-Grass. It has a Root which is creeping, white, and jointed, with many Fibres adjoining thereto, from which shoot forth two or three jointed Stalks, two Feet or more high; the spiked head is a Foot long, branched as the fourth is, each Branch four or five Inches long, with winged Husks, like unto Oats.

LXXII. *The Places and Times.* All these grow either in Fields of Corn, or in the Borders or Pathways of other Fields which are Fallow, and the last sometimes in Marsh and Wet Grounds, as well as in the edges of Ploughed Grounds.

XI. *Αγροεις κωνιδ, Κονιγροεις, *Gramen Caninum*, Dogs-Grass, fourteen kinds, nine Land kinds, five Water.

LXXIII. 1. Κονιγροεις, *Gramen Caninum vulgatum*, Common Dogs-Grass. It creeps far about under Ground, with long white jointed Roots, and small Fibres at every Joint, very sweet in taste, as the rest of the Herb is, and interlacing one another, from whence shoot forth many fair and long grassie Leaves, small at the ends, and sharp or cutting on the edges; the Stalks are jointed like Corn, with the like Leaves on them, and a long spiked head, with long husks on it, and hard rough Seed in them.

Dogs Grass upright.

LXXIV. 2. *Gramen Caninum longius Radicatum & Paniculatum*, Dogs-Grass with a longer Root and more sparfed Panicles. The Root is fuller, larger, longer, and farther spread, the whole Plant differs but very little from the former, but in the Tuft or Panicle, which is more spread into Branches, with shorter and broader husks.

LXXV. 3. *Gramen Caninum latiore Panicula minus*, The lesser Dogs-Grass with a sparfed Tuft. The Root is small, and jointed, but creeps not so much as the former, and has many more Fibres among them than the others have, and is a little browner, and not so white, but more sweet; it is a small sort of Grass, and has slender Stalks, about six or seven Inches high, with many very narrow Leaves, both below and on the Stalks; the Tuft or Panicle at the top is small, according to magnitude of the Plant; and spreads into several parts or branches.

Dogs-Grass low bending.

LXXVI. 4. *Grass*

LXXVI. 2. *Gramen Caninum supinum arvense*, Low bending Dogs-Grass. It has a Root which creeps much under Ground, but in a differing manner, the Stalks taking Root in several places, and scarcely raising themselves up a Foot high, with such like green Leaves as the first kind, but shorter; the spiked head is bright and spiced, or spread a-broad, much like to the *Field-Grass*.

Dogs-Grass lying along.

LXXVII. 5. *Gramen Murorum Radice repente*, Wall-Grass with a creeping Root. Its Root is blackish, and spreading abroad, from which spring forth many small Stalks, a Foot high, bending or crooking, with a few narrow short Leaves on them, at whose tops stand small white Panicles, of an Inch and half long, consisting of many small chaffie husks.

LXXVIII. 6. *Gramen Caninum bulbosum vel nodosum vulgare*, Common bulbed or knobbed Dogs-Grass. It has for its Roots three, or four, or more round white Bulbs or Knobs, one set upon the head of another, with several Fibres underneath them, from the uppermost of which spring forth several long hard grassie Leaves, sharp at the edges, and in the middle of them a jointed Stalk, with three or four such like Leaves upon them, at the top of which is a long Panicle, spread into many parts, like to that of *Oats*, whereunto some have compared it. *Lobel* has another sort hereof, differing little in any part but the Roots, which are small and round, and set at distances all along the Roots, and full as sweet as the other. The first of these is the *Gramen nodosum avenacea pluma Bauhini*, who questions whether it be not the *Agilops Plinij*, which has a kind of bulbous or tuberous Root.

LXXIX. 7. *Gramen Caninum nodosum spica parva*, Tuberous or Knobbed Grass with a small round spike. It has a small whitish round Bulb or Knob for the Root, with small Fibres under it, shooting forth from the head thereof another, something like unto a Bulb, but much smaller, and like a slender knob, with a small jointed Stalk above it, and a long narrow pointed Leaf at each of them, being

four or five Inches long, and at the top one short soft spiked head, something like to the head of *Cuttail-Grass*.

LXXX. 8. *Gramen Caninum Geniculatum majus*, The greater Knead Grass. It has a large fibrous bushy Root, from whence spring many long trailing Branches upon the Ground, with several great Joints on them, and shooting out Fibres from those Joints which lye next the Ground, so that it does sometimes run twenty Foot in length, with one long Leaf at each Joint, small at the end, but broadest below, from which, as well as at the top, come forth divers small long spikes of chaffie husks, of an over worn color, which Stalks and Joints are so full of a most pleasant Juice, that it feeds Cattel much better than any other Hay, and therefore those Husbandmen who have it growing in their Grounds do keep the Hay thereof for their chief Winter store, and instead of Provender, this is that which is commonly called *Dutch Grass*, and grows very plentifully in Plantations in *Florida*, and other parts of the *West Indies*.

LXXXI. 9. *Gramen Geniculatum minus*, The lesser Knead Grass. The Root is fibrous or thready, like the former, this Grass creeps not so much on the Ground as the greater does, but spreads more upright with its Stalks, whose Joints are not altogether so great as the other, and have at their tops spiked heads, which are somewhat larger than those of the greater Kind, and of a sadder overworn color.

LXXXII. 10. *Gramen Caninum Geniculatum Maritimum spicatum*, Sea spiked Dogs-Grass. It has a long creeping Root, full of Joints, with many small Fibres running from the Joints, and creeping much under Ground, from several of the Joints of this Root spring up several jointed Stalks, about a Foot high,

high, with hard Leaves thereon a Span long, and like to the other *Dogs-Grass*; the spiked heads are shorter by much, and harder than the *Common Kind* at Sect. 72. foregoing.

LXXXIII. 11. *Græmen Caninum Maritimum vulgatio Canario simile, Sea Dogs-Grass.* This is a slenderer, harder, and lankner *Grass* than the *Common Kind*, and of a more blewish green color, and differs not in any thing else; but there are two other sorts hereof, the one differing in the Roots, which at the several Joins as it runs does shoot up the like Stalks, Leaves, and Spiked Tufts, and will be sometimes twenty Foot in length, with a number of those Stalks and Leaves at them; the other differing in the spikes, which have two orders or rows in them.

LXXXIV. 12. *Græmen Caninum alterum Maritimum longius Radicatum, Sea Dogs-Grass with long Roots.* It has a very long Root, and differs little from the former, either in the hard Leaves or in the running Roots, but that they spread more, and instead of spiked heads at the tops of the Stalks, this has chaffie heads among the Leaves.

LXXXV. 13. *Græmen Caninum Maritimum spicatum Americanum, American Sea Spiked Dogs-Grass.* It has slender woody Roots, with but few Fibres adjoining thereto, from whence spring up several trailing Stalks, a Foot or more high, with several Joins and Branches at them, and short narrow Reed like Leaves on them, at the tops whereof grow spiked heads, three Inches long, of a dark Ash color.

LXXXVI. 14. *Græmen Caninum Maritimum asperum, Rough Sea Dogs-Grass.* It has a Root which is a bulb of long white Fibres, from whence spring many reddish round small Stalks, about a Foot high, which at first lean downwards; they are encompassed with hard, short, and sharp pointed Leaves, standing as it were in a Tuft together, with hard rough dents about the edges; the spiked heads are somewhat like unto small rough hard Burs, breaking out of a Skin, in which they were first enclosed.

LXXXVII. *The Places and Times.* The first of these is common to be found throughout all England in Ploughed Fields, and other like Grounds; the second and third are nothing so frequent as the former, but are more natural to Sandy and Chalky Grounds; the fourth is likewise found in Fields which have been Plowed and do lye Fallow; the fifth is often found growing on old decayed Stone or Brick Walls in several places; the sixth grows not so common as the first kind, or *Creeping Rooted-Grass*, yet sufficiently plentiful in many Plowed Fields of this Kingdom; the seventh is also found in Plowed Fields, and borders of moist Meadows, near Copfes, Hedges, or Thickets of Wood, and in some places near *Basil*; the eighth and ninth grow in moist Meadows in several places of this Land, but have been especially observed the eighth to grow about *Wilton*, in a great Meadow lying among the Bridges, at the Towns end, belonging to the Earl of *Pembroke*; and the ninth at *Warminster*, both of them in *Wiltshire*; the tenth, eleventh and twelfth have been observed on our Sea Coasts, especially upon the *Kentish* Shoar; the thirteenth upon our Southern Coasts, in *Florida* also, likewise about *Mompelien* and *Narbone* in *France*; the fourteenth on some of our Shoars, as also on the *Venetian* and *French* Shoars, about *Mompelien*, &c. The first nine Flower and Seed in the beginning and height of the Summer, the last five flourish and perfect their Seed at the latter end of Summer.

The Virtues.

LXXXVIII. The first five of these *Grasses* have all one and the same Virtues, but the first of them,

as it is most common, so it is esteemed to be of greatest effect; the Essence, or Decoction of its Roots, opens obstructions of the Liver, Spleen, Gall, Bladder, and Reins, eases Gripings of the Belly, and waxes the Morbick or Tartarous Matter which breeds the Stone in the Bladder, and heals Ulcers there; being bruised and applied it consolidates Wounds; the Decoction provokes Urine, strengthens the Stomach, and stops Vomitings; the Roots are cold in the first degree, and temperate in respect of moisture and dryness; the Distilled Water is given to Children for the Worms, but it is much more effectual if Worm-Seed be added to it.

LXXXIX. *The Bulbous, Tuberos, or Knobbed Dogs-Grass, viz. the sixth and seventh,* are found by experience to be very effectual to provoke Urine, and more powerful than the first *Dogs-Grass* for the same purpose, as also to break the Stone, and ease those torments of the Belly which come by Fluxes, Bloody Fluxes, crudity of Humors, and obstructions of the Viscera; and may be used in any case to which the other may be applied.

XC. *The Kneed Dogs-Grasses, as also all the Sea Dogs-Grasses,* are generally held to be as effectual as the first, or *Common Kind*, but this is to be observed, that the *Sea Kinds* are more effectual for such as live by the Sea side, and Marlin, or Maritime places, and the *Land kinds* for such as live in the Midland, or far from the Sea Shoar, or Salt Water sides.

XII. **Agrostis vavov, Græmen Pumilum vel nanum, Dwarf-Grass, three Kinds.*

XCI. 1. *Agrostis vavov, Græmen Xerampelinum, Græmen Pratense rubrum minimum, Red Dwarf-Grass.* It has a Root consisting of many little Bulbs, covered with a reddish Film or Skin, with very many small, hairy, and white Fibres or Threads; the Stalk is short and round, and the Ear is of a reddish color, not much differing from the *Grass* called *Ischemon*, but the Ear is softer, broader, and more beautiful.

XCII. 2. *Græmen minimum Pratense album, White Dwarf-Grass.* This has many Fibrous or Hairy Roots, the Leaves are small and short, as also the Stalk, the top of which bears a Panicle, not much unlike the *Small Meadow-Grass*, but lesser, the color thereof is sometimes white, and sometimes reddish.

XCIII. 3. *Græmen minus duriusculum, Small hard Grass.* It has small Roots, compact of little Springs or Threads, from which spring forth many harsh, sowre, or Rusty Leaves, about an Inch and half long; the Tuft or Ear is compact of many Panicles, or very little Ears, which in feeling are very hard or harsh; the *Grass* is unpleasant, and not good Food for Cattel.

XCIV. *The Places and Times.* These all grow in Fields and Meadows, more especially on Heathy, rough, and dry barren Grounds, in most places of England; they grow, flourish, and come to perfection in the Summer Months, as other *Meadow-Grasses* do.

XIII. **Agrostis mollior, Græmen Plumosum, Feather-Grass, two Species or Kinds.*

XC. 1. *Græmen Plumosum, Græmen Tomentosum, vel Arundinaceum, Feather-Grass.* It has a Root which is tough and hard, from whence arises a long benty Stalk, three Feet high, or more, naked, without any Blades or Leaves for the most part, at the tops of which grow long spiky Heads or Ears, replenished with Chaffie and Downie Tufts, which make a very pretty show.

XCVI. 2. *Spartum*

XCVI. 2. *Spartum Asfriacum Clusij*, *Gramen Pinnatum Dalechampij*, *Gramen Plumosum Hispanicum*, *Spanish Feather-Grass*. It has a Root consisting of many small grassie Fibres, from whence spring small Leaves, a Foot high, round, green, and sharp pointed, and among these Leaves rise up many small Stalks, not exceeding the height of the Leaves, which bear a Spike, having three or four Seeds, ending in, or sending up very fine white Feathers, resembling the smaller sort of Feathers of the Wings of the Bird of Paradise; it is a Native of Spain, but grows with us in our Gardens.

XCVII. *The Places and Times*. The first grows in very Fertile Fields and Pastures, and by their borders near Hedges, and flourishes in Summer.

XIV. *Ἀγροεις πολυανθε*, *Gramen Polyanthum*, *Grass many Flowered*, *Gramen Filiceum*, *Fern-Grass*.

XCVIII. It is also called *Hieroglossis Græcæ*, *Gramen Paniculatum*, *Gramen Paniculosum Phalaroides Lobelij*, and is a singular Plant. It has Roots and Leaves not much unlike the Common Meadow-Grass, the Stalk rises to be about a Foot high, and at top thereof it bears a beautiful Panicle, (for which reason the Spaniards and French call it the *Lovely-Grass*.) This Head consists of many little Ears, shaped much like those of the *Ordinary Quaking-Grass*, but longer and flatter, being composed of more Scales, so that each of them somewhat resembles the Leaf of a *Small Fern*, whence the Name. These tops when they are ripe and white, are gathered where they naturally grow, to beautify and adorn Garlands.

XCIX. *The Places and Times*. It grows wild in Spain and France, but with us in Gardens, and Flowers in the Summer Months.

XV. *Ἀλοπεκουρος*, *Alopecurus*, *Cauda Vulpis*, *Gramen Tomentosum Alopecurus vera Plinij*, *Foxtail-Grass*, three Kinds.

Ἀγροεις ἀλοπεκουροειδης, *Gramen Alopecuroides*, *Bastard Foxtail-Grass*, nine Kinds.

Foxtail Grass true.

C. 1. *Σπάρτος*, *Gramen Alopecurus vera Plinij*, *Alopecurus genuina Theophrasti*, *Stelephurus Plinij*,

The true Foxtail-Grass, has a pettishing Fibrous Root, grows up with two or three soft hoary Stalks, a Foot high, with small, long, narrow, soft Leaves, as hoary as the Stalks, on the tops of which grow somewhat long, round, soft, woolly or hoary heads, set with soft hairs, of a pale Straw Color, resembling a Fox Tail.

Cl. 2. *Alopecurus altera Anglica & Flandrica*, *Another English and Flemish Foxtail-Grass*. In Roots and Leaves it is much like the former, but the Stalks grow not so high, the heads are also shorter and rounder, and not so woolly or hoary.

Great English Fox tail Grass

Cl. 3. *Alopecurus maxima Anglica*, *The greatest English Foxtail Grass*. From a like Fibrous Root the Stalks grow up to be half a Yard, or two Feet high, having fair large Wheat like Leaves set at the Joints, and at the tops great, large, full, soft, and woolly heads, like the former, saving that they are much greater and longer, and this whether the Stalk is higher or lower.

Cl. 4. *Gramen Alopecuroides majus*, *The greater Bastard Foxtail-Grass*. It has a Fibrous Root, and rises up with a Stalk three Feet high, with a few Leaves long and narrow thereon, the Spike is somewhat great and long, but not so soft and woolly as the former.

CIV. 5. *Gramen Alopecuroides Cuspidatum maximum Anglicum*, *Our greatest Bastard Foxtail-Grass*. From a bushy fibrous Root spring up many long narrow Leaves, and among them Stalks three Feet high, with few Joints and Leaves on them, at top of which stands the longest spiked head of any other, somewhat pointed at the top, and broad at bottom, with white Hairs on the Husks, somewhat like those of Oats.

CV. 6. *Gramen Alopecuroides Cuspidatum majus*, *The great Spiring or Spiked Bastard Foxtail-Grass*. This is like that at Sect. 103. N°. 4. above, but that

that the spiked head is longer, and spiring upwards, is small at the top, but something broad below, with Oaten like Husks set on them; the Leaves also are more, and much shorter.

CVI. 7. *Gramen Alopecuroides spica asperis brevius*, Short rough Ear'd Bastard Foxtail-Grass. It has a small white perishing Root, from whence spring up two or three upright small Stalks, with somewhat narrow and soft Leaves on them, at whose tops stand thick short rough heads, an Inch and half long, not fully, but as it were half round the Stalk, the backside being as it were bare, so that they seem to stand but on one side; in these heads is contained the Seed, which is small and white.

CVII. 8. *Gramen Alopecuroides spica longa majus & minus*, Bastard Foxtail-Grass long Ear'd great and small. These Grasses are much like one another, one being greater, the other smaller, both in Stalk and Leaf; the spiked heads are long and slender, and of a whitish color.

CVIII. 9. *Gramen Alopecuroides minus spica aspera longa*, Small Bastard Foxtail-Grass long rough Ear'd. It differs from the last, in being greener, more replenished with Stalks and Leaves, the spiked heads being more slender, long also, and rougher.

CIX. 10. *Gramen Alopecuroides cuspidatum minus*, Bastard Foxtail-Grass small sharp pointed. It grows about a Foot high, stored but with few Joints, and short narrow Leaves on them, having a Spike or Ear almost as big as the last, but sharper pointed, with some pieces growing out of the sides.

CX. 11. *Gramen Alopecuroides cuspidatum minimum*, Smallest Bastard Foxtail-Grass pointed. This is lesser than any of those going before, in Stalks and Leaves, but longer in both, as is also the Spike or Ear, which is very small, slender, and pointed at the end.

CXI. 12. *Gramen Alopecuroides alterum Radice repente*, five *Pseudochananthum*, Another Bastard Foxtail-Grass with a creeping Root, called also Bastard Schœnant. It has a creeping Root, which spreads it self under Ground, shooting forth Leaves and Stalks in several places; the Plant somewhat resembles the greatest English Foxtail-Grass (at Sect. 102. N°. 3. above) having that this has thicker, harder and stiffer Leaves, like unto Rushes; the Head or Spike is long and clofe, five or six Inches long, of a Silver like shining color, but the Blooms are of a pale red, and the Husks redder, which when it has stood long, begins to open it self, exposing its Downy substance to the Wind.

CXII. *The Places and Times*. The first and twelfth grow with us only in Gardens, the other ten grow in Fields and Meadows in many places of England, some of them about Hackney, near London, and several others of them in Kent; I have found them all in Fields, Pastures, and Meadows in many parts of Norfolk; and they all keep the times of Flourishing and Seeding with other Meadow-Grasses.

XVI. *Ἀγρὸς τοῦ ἀλάου*, *Gramen Hirsutum*, & *Hirsutum Nemorosum*, Hairy-Grass, and Hairy Wood-Grass, nine Kinds.

CXIII. 1. *Gramen Hirsutum latifolium Nemorum majus*, The greater Hairy Wood-Grass broad Leav'd. It has a Root consisting of a tuft of many small long Fibres or Threads, and has several long and somewhat broad Leaves rising from the Root, smaller to the end, greyish underneath, and green above, set about the edges with whitish small long Hairs; the Stalk rises up from among them, and comes to be about two Feet high, with Leaves at the Joints,

having at the top several small greenish Flowers in little Husks, containing within them small Seed.

Hairy Wood-Grass broad Leav'd greater.

Hairy Wood-Grass narrow Leav'd lesser.

CXIV. 2. *Gramen Hirsutum Nemorum minus angustifolium*, The lesser narrow Leav'd Hairy Wood-Grass. It has a Root somewhat long, like a Cyperus Root, with a bush of small long Fibres or Threads; the Plant is lesser than the sixth following,

M m m

ing,

ing, having many long and narrow Leaves growing at the Root, as hairy as any; the Stalk has two or three Joints, and short Leaves on them, and at the top several small heads standing upright on a small hairy Footstalk.

CXV. 3. *Gramen hirsutum Nemorum præcor majus tuberosa Radice*, A greater early hairy Wood-Grass with a tuberos Root. The Root is thick, somewhat short and brown, almost like a *Tormentil* Root, with a great number of small brownish hairs covering it very thick; the Leaves are larger than the first, of a deeper green color, and as hairy also; at the joints of the Stalks are Leaves, as in the other, and such like heads or knops of Flowers as in the first.

CXVI. 4. *Gramen hirsutum Nemorum latifolium minus Juncea Panicula*, The lesser broad Leav'd hairy Wood-Grass with Rush like Panicles. It is very like in its growing to the first, but that the Leaves hereof are narrower, and the Panicle or tufted head at top of the small Stalks is smaller, and something resembling the tops of *Rushes*.

CXVII. 5. *Gramen hirsutum Nemorum majus angustifolium*, The greater narrow Leav'd hairy Wood-Grass. The Root is small and long, with small Fibres adjoined thereto; this Plant is very like in its manner of growing unto the first broad Leav'd Kind, but that the Leaves are much narrower, shorter, and turning downwards at first; the Stalk is bare, without Joint or Leaf, having at the top three small, rough, and almost round scaly heads set together.

CXVIII. 6. *Gramen hirsutum Nemorum majus angustifolium alterum*, Another great narrow Leav'd hairy Wood-Grass. It has a small reddish fibrous Root, from whence rises up a Stalk, about two Feet high, and smooth, bearing commonly at top a soft white Panicle, somewhat spread abroad, and composed of several small Scales as it were, in every one of which lies a small round blackish Seed; the Leaves are few, a little hairy, and some of them encompassing the Stalk; the whole Panicle has two small Leaves set at bottom thereof, the one rising higher than it, the other lower.

CXIX. 7. *Gramen hirsutum Nemorum minimum*, The smallest hairy Wood-Grass. This has a greater store of long hairy Leaves than the second, but in all things else, as in its Heads and Flowers, it agrees therewith, but is indeed whiter than the rest.

CXX. 8. *Gramen hirsutum Nemorum, sive exile ferrugineum*, Small brown hairy Wood-Grass. It has a Root which is small and fibrous, and the Grass itself is as small as the last, but with lesser store of Leaves; the heads on the Stalks are woolly, and not fully round, but a little flat, and of a yellowish brown color, and the Stalks themselves are about four or five Inches high.

CXXI. 9. *Gramen hirsutum capitulis Globosis*, Globe headed hairy Wood-Grass. The Root is small and thready, from whence rises long Leaves, as broad as the fourth Kind aforesaid, with some small soft hairs about the edges; the Stalks are about a Foot high, with Joints and Leaves on them, the tops being furnished with two or three round, soft, white woolly heads, composed of many small Silver like Threads.

CXXII. The Places and Times. All these grow in many Woods throughout England, some about Highgate, and in Hornsey Wood, and other places, and Flower all of them in the Summer Months, or near the end of Summer, except the third, which Flowers a Month or two earlier than the rest.

XVII. *Agrostis, Festuca, Oculis Caprinus*, Haver-Grass, or Peter-Corn, two Kinds.

CXXIII. 1. *Agilops Italica, Agilops Narbonensis, Festuca Italica, Agilops Dioscoridis, Frumentum Sylvestre Sicilie, Italian Havergrass, or Peter-Corn*. It has a Root composed of a small head, with many long Fibres growing from it, from which spring several Grass-like Leaves, of a pale green color; the Stalk is jointed in three or four places, with Leaves at them, and at the tops two or three heads, set one above another, which are round, and somewhat long, hard and striped, having several Beards at the ends of them; the Seeds are a little smaller than Barley, each Seed wrapped up in a crested Skin, out of which the Awnes put themselves forth.

CXXIV. 2. *Agilops Bromoides Belgarum Lobelij, Festuca prior Dodonæi, Avena Sylvestris, sive nigra Thalij, Dutch Havergrass, or Peter-Corn*. It has a Root which is somewhat like the former, but the head from whence the Fibres proceed is not so conspicuous, and indeed the Grass is very like the last both in Stalk and Leaf, the top only is in part like to the Naked Oat, and in part to the former Havergrass, having some Beards set at every husk, within which lye long rough brown Seed.

CXXV. The Places and Times. The first is frequent in Italy and France, where it is found among their Corn, being a degenerate kind of Barley, and in some places the Poorer People use it to make Bread of, with us it is only Sown in Gardens; the second is found as plentifully in England as the Low Countries, and they are both ripe in July and August.

The Virtues.

CXXVI. Lobel says that he had often tried the *Agilops* to be effectual in curing that hollow Ulcer in the Eyes called *Agilops*, or *Fistula Lachrymalis*, for it has a drying quality without sharpness; he also says that the Seed put into Drink causes a kind of Drunkenness, and that the burnt Ashes of the Stalks

Stalks are good against Pituitous Tumors, and the Gout, bathing with the Lye made thereof; and that it dissolves hard Tumors and Kernels in the Flesh, discharging Swellings of the Joints. For the Fistula Lachrymalis. Take the whole Plant, Root and green Seed three parts, Roots of Wild Oats one part, boil in a sufficient quantity of Water till a third part is consumed, strain, and add an equal quantity of Honey, and boil to the thickness of a Syrup, to every Quart of which add fine Aloe in fine Powder one Ounce, mix and dissolve, in which wet Tents, and put them up the Nostrils. Dodonæus. Also the Juice of the Plant mixed with Barley Meal to a soft Paste and inspissated, is good for the same purpose; mix a little of it with Damask Rose Water to a thickness, and apply it Plaisterwise to the Agilops or Fistula, and it will cure it; it also softens and discharges hard Tumors in other parts of the Body.

XVIII. *Ἀγρίσις ἐχινάτη*, *Gramen Echinatum*, Hedge-Hog-Grass, or prickly headed Grass, four kinds:
Hedge-Hog-Grass.

CXXVII. 1. *Gramen Echinatum vulgare*, Common Hedge-Hog, or prickly headed Grass, *Gramen Palustre Echinatum Lobelij*, *Gramen aculeatum Dalechampij*. It has a fibrous or thready Root, which sends up divers Grassie Leaves, and among them several slender Stalks, leaning this way and that way, on which are set short spiked heads, very rough and sharp, made of many husks, in which lies the Seed.

CXXVIII. 2. *Gramen Echinatum italicum aculeatum Matthioli*, Matthiolus his Hedge-Hog, or prickly headed Grass. It has a fibrous Root, which sends up small Grass Leaves and Stalks, much like the Small common Grass; but at the Joints with the Leaves come forth small prickly heads, folded in husks, and ending in three points, in which lye small long pointed Seed.

CXXIX. 3. *Gramen Echinatum planum*, *Gramen Spica plana Echinata Bauhini*, Flat Hedge-Hog, or prickly headed Grass. It rises up not much higher than a Palm or Hand breadth, and from a white Root, made of many Fibres, it sends forth a few small hairy Leaves, an Inch long, as also a fine and small Stalk, with a flat spiked head, and very sharp Awnes at the ends of the Husks.

CXXX. 4. *Gramen Echinatum Montanum Tribuloides Echinata Bauhini*, *Gramen Spica subrotunda*

Echinata Colam &, *Gramen Echinato Capitulo*, vel *Capitulato*, Hedge-Hog, or round prickly headed Grass. It has a Root composed of many white Theats, sending forth some few narrow rough Leaves, two or three Inches long, among which rise up slender Stalks, some higher some lower, with one or two Joints, and Leaves at them, each having at the top a small round head, set with very sharp prickles, within the husks whereof lyes clear white Seed.

CXXXI. The Places and Times. The first grows in Watery Meadows and Fields, as in St. George's Fields, near London, and such other like places; the other three grow in dry places, and old Mud Walls, they all flourish and Seeding at the usual times with other Grasses:

XIX. *Ἀγρίσις γονατωδὴς*, *ἑμπληγία*, *Gramen Geniculatum*, Kneel-Grass, two Kinds.

CXXXII. 1. *Gramen Geniculatum Pratense* has a fibrous and hairy Root, from whence come straight upright strawy Stalks, with manifold Joints, like to those of Corn, which are very large and conspicuous, having thereat many small Grassie Leaves, and bearing at their tops spiky rough Panicles, of a dark brown color.

CXXXIII. 2. *Gramen Geniculatum Aquaticum*, Water Kneel-Grass. It has a thready Root like the former, from which rise many long and slender Stalks, jointed with many large, knobbed and gouty Knees, almost like unto Reed, set with broad flaggy Leaves, something sharp pointed, bearing at their tops Tufts or Panicles, divided into several small Branches, of a dusky color.

CXXXIV. The Places and Times: The first grows in fertile and moist Meadows, the other in moist and plashy Fields, and places apt to retain much Wet, also at the bottoms of Banks, by Ditch and Hedge side, and flourish when the other Grasses do.

XX. *Ἀγρίσις πρανέσις*, *Gramen Pratense*, Meadow-Grass, five kinds.

CXXXV. 1. *Gramen Pratense vulgatus majus*, The greater common Meadow-Grass. It has a bushy
M m m 2 fibrous

fibrous Root, from whence rise up many Grassie Leaves, and among them several Stalks, half a yard high, bearing a sparfed Tuft at the top of them, somewhat resembling the Feather like heads of the *Water Reed*.

Large tufted Meadow Grass

CXXXVI. 2. *Gramen Pratense minus*, The small Meadow-Grass. This in its Roots, Leaves and Stalks is not much unlike the former, saving that it is every way something less, and its spiked Panicles are manifold, growing upon the Stalk less and less, till they come to the very top. Of this kind there are two other sorts, both smaller than this, the one with white tufted tops, and the other with reddish tufted tops, the first more sparfed, the last more close together.

CXXXVII. 3. *Gramen multiplici Panicula Pratense*, Meadow-Grass with manifold Tufts. The Root is a thick bush of white Fibres, from whence rise up divers Stalks, a Span long, jointed, and a little bending downwards; the Leaves are small Grass Leaves, and the Tufted Head or Panicle is manifold, and much divided, which when ripe grows hard, and is of a sad reddish color.

CXXXVIII. 4. *Gramen Pratense Paniculatum molle*, Soft Tufted Meadow-Grass. It has a short bushy fibrous Root, from whence several long and somewhat broad, soft, or woolly Grass Leaves spring, from among these Leaves rise up two or three Stalks, a Cubit high, with some Leaves upon it, and at top comes forth a soft woolly spiked head, much divided, whose Bloomings are reddish.

CXXXIX. 5. *Gramen odoratum Paniculatum Germanicum*, Sweet Dutch-Grass with tufted heads. It has a Root which creeps in the Ground, which is white, and full of Joints, shooting out Fibres at every one of them; the Stalks are two or three Feet high, with but few Joints on them, whose Leaves are almost as long, and some of them exceed the height of the Stalks, being narrow, and small at the ends; at the top of each Stalk grows a Panicle, but nothing near so much spread as the for-

mer, the which for their sweetness some use to lay among Garments, or Linnen, to perfume it.

XXI. *Ἀγρωίς ὄσχυρ, ὄσχυρως, Gramen Paniculatum Montanum*, Mountain Tufted-Grass, five Kinds.

CXL. 1. *Gramen Montanum Panicula spadicea delicatior*, Soft Mountain-Grass with a reddish or bright bay Panicle. It has a small white Root, with short Fibres, which sends up three or four jointed Stalks, a Foot high, having a few small and short Leaves on them, and such likewise at the foot of the Stalks, but few in number; at the top stands a brownish or bay colored Panicle, three inches long, composed of many very small husks: this is sometimes found growing higher, and with larger Panicles.

CXLI. 2. *Gramen Montanum Paniculatum altissimum*, Tall Tufted Mountain-Grass. It has a Root which creeps in the Ground, and furnished with several Fibres, whence rise two or three very tall Reed like Stalks, two or three Feet or more high, bearing fair broad green Leaves on them, like unto *Cyperus*, and at the tops of the Stalks many small tufted Panicles; both Stalks and Leaves are so tough, that some Country People make them Coats or Garments thereof, to defend them against the Weather, and Husbandmen make Ropes and Traces thereof for their Horses, wherewith to draw their Ploughs.

CXLII. 3. *Gramen Montanum avenaceum*, Mountain Havergrass, or oat Grass. It has small creeping Roots: the Stalks are about a Foot and half high, slender, jointed, and set with short narrow Leaves. At the tops of the Stalks grow the Ears, which are long, slender and bending, composed of Downy Husks, containing a Seed like to a naked oat.

CXLIII. 4. *Gramen Montanum spicatum Clusii*, Mountain spiked Grass. It has a Root of about a Fingers thickness, parted sometimes into two or three Strings, with many Fibres thereat, and somewhat hairy at top, which shoots forth several Heads of Leaves, each containing five or six, somewhat long, thick, and half hollow, like a Gutter, very like to those of the greater Thrift, compassing one another at the bottom, a little bitter and sharp in Taste; from the middle of which spring up stiff, smooth, bare and knotless Stalks, about a Foot high, bearing at the tops several small Flowers, set Spike-fashion, and of a greenish color.

CXLIV. 5. *Gramen Montanum spicatum angustifolium*, Spiked Mountain Grass with narrow Leaves. It has a Root which runs under the upper Crust of the Ground, full of small brownish Fibres, running one within another: its Leaves are long and narrow, and its Stalks long and slender; at the tops of which are spiked Heads, not much unlike the former.

CXLV. The Places and Times. They all grow upon Hills and Mountains in many places of England, as also in other Countries; and they flourish and feed when other Grasses do. The Seed of the third is ripe in July.

XXII. *Ἀγρωίς ἀρχαία, Gramen Miliare, vel Miliarium, vel Miliaceum*; Millet-Grass, six Kinds.

CXLVI. 1. *Gramen Miliaceum vulgare*, Common Millet Grass. It has a bushy and fibrous Root; from whence rise up slender jointed Stalks, with two or three somewhat large Leaves thereon: at the top of each Stalk is a bushy spreading Tuft, of many

many long Feather-like Sprigs, consisting of many small chaffy Husks; within which is contained small Seed, which Birds greedily eat.

CXLVII. 2. *Gramen Miliaceum Panicula speciosa*, *Gramen segetum Panicula sparsa*, *Millet Grass* with a fair Panicle, or *Corn Grass* with a sparsed Panicle. It has a bushy fibrous Root, like the former; and grows up with a few long, soft, green Leaves, like to those of *Millet*, some below, and others upon a stiff, tall, round, smooth, green, jointed Stalk, a Yard and half high, bearing on its top a bushy, large, spreading Tuft, spread round into many slender Branches, very like in its Form, Parts and manner of Growing to the former *Millet Grass*, saving that it is not only larger, but also more beautiful.

CXLVIII. 3. *Gramen Miliaceum alterum*, *Another Millet Grass*. The Root is fibrous and reddish; it has but a small weak Stalk, not much above a Foot and half high, with a few narrow Leaves, four or five Inches long, growing at the bottom, and two or three thereon at the Joints. The Feather-like Tuft at the top is spread abroad, like the former, but the chaffy Husks are much smaller and finer.

CXLIX. 4. *Gramen Miliacea Panicula arundinaceum*, *A Reedy Grass* with *Millet like Panicles*. It has a white fibrous Root, which sends forth several Reed like Leaves, yet shorter than the last; among which rises up a Stalk or two, about a Foot and half high, with two Joints thereon towards the tops, and narrower and longer Leaves growing at them: at the top spreads forth a Feather like Tuft, not much unlike the first, and of about three Inches long.

CL. 5. *Gramen Miliaceum Indicum*, vel *Gramen Sorghinum*, *Indian Millet Grass*, or *Pipe Grass*. It has a fibrous Root; from whence spring up Reed like Stalks, half a Yard high, or something more, with fair long Lilly like Leaves thereon, and a spread

spiked Top, consisting of many Panicles or Parts above, somewhat like unto the *Indian Millet*, but with larger Seeds therein than in the *Millet*. *Lobel* calls it *Gramen sonarum Flandrorum*, because Boys there make Pipes of its Stalks.

CLI. 6. *Gramen Miliaceum Indicum alterum*, vel *Gramen sorghinum alterum*, *Another Indian Millet Grass*. It has hollow Stalks, like the last, but they are weak, bending down to the Ground, and shoot out Fibres at their Joints, whereby it roots it self afresh; having narrow long Leaves on them, the Stalk seeming, as it were, to run thro' them, like to a Pipe; and at the top such alike spread spiked Head as the former, whose Husks in the several parts of it are smaller.

CLII. *The Places and Times*. The second grows in the Borders of Corn-fields, and Grounds which have been Plowed, and flourishes chiefly in the beginning of Summer. All the other grow also in Fields, and by Hedge-sides, as well in *England* as in other Countries, tho' observed but by few who are curious in Herbarism, and flourish in *June*, *July* and *August*.

XXIII. **Avena* is *Bejaria*, & *Cesquidne*, *Gramen Avenaceum*, *Oat Grass*. Twenty two Kinds.

great hairy
Oate Grass

CLIII. 1. *Gramen Bromoides maximum hirsutum*, *The greatest hairy Oat Grass*. It has a bushy fibrous Root, and the Plant is all hairy: the Stalks and Leaves are greater than those of *Oats*, being four, five, six or seven Feet high sometimes, whose Panicle at top spreads into many chaffy bearded Ears, hanging down their Heads. It is found in Pastures about *London*, as also in *Essex*.

CLIV. 2. *Gramen Bromoides segetum Panicula latiore*, *Great Corn Oat Grass*. It has Oat like Stalks, four,

four, five or six Feet long; the Leaves are shorter and narrower; the top is much spread, having divers Ramifications, with many branched chaffy Ears coming forth at a Joint, broadest below, and springing small upwards.

Great Corn Oat-Grafs.

CLV. 3. *Gramen Avenaceum incanum*, Great hoary Oat Grass. It has short narrow Leaves, somewhat hairy, and a little hoary withal. The Stalk has but few Joints. The Panicle is spread, like the last, but lesser, and is somewhat hoary. This is sometimes found lesser; and grow both of them in the Borders of Corn-fields, both in *Essex* and *Kent*.

CLVI. 4. *Gramen Avenaceum Pratenfe*, Meadow Oaten Grass. It has many Leaves growing next the Root, which are long and narrow; and the Stalk is lesser and lower than any of the former, but the Panicles or Ears stand at top, lesser spread, and not hoary, every one upon its own Foot-stalk.

CLVII. 5. *Gramen Avenaceum squamosa gluma*, Scaly-eared Oaten Grass. It has narrow Leaves, eight or nine Inches long, a little hairy. The Stalk is slender, and has such alike Panicle as the last; but that the scaly Ears stand single, every one upon its own Thread like Foot-stalk.

CLVIII. 6. *Gramen Avenaceum pinnata longiuscula spica*, Winged Oaten Grass. It has a slender Stalk, higher or lower, according to the Place and Goodness of the Soil. The Leaves are narrower than the last. The Panicle is somewhat long, but small, and not much spread, each Part being, as it were, winged or divided into several pieces, upon one Rib or Foot-stalk.

CLIX. 7. *Gramen Avenaceum filicea Panicula Xerampelina*, Red Fern like Grass. It has red shining Stalks, a Foot high. The Leaves are soft and narrow. The Panicle at the top is three or four Inches long, of a whitish green color, divided into many winged Branches, many Parts being set on both sides the Branch, and each Part divided, like a Fern leaf.

CLX. 8. *Gramen Avenaceum murorum erectum*, Upright Wall Oat Grass. It grows upright, sometimes a Span, and sometimes a Foot high. It has

as many Leaves almost as any Grass. The spiked Head is three or four Inches long, and sparsely or divided, each small Ear being bearded. It is often found upon old Mud-walls which commonly enclose Fields.

CLXI. 9. *Gramen Avenaceum supinum Arvense*, Low Meadow Oat Grass. Its Leaves are as small as the last, an Inch or Inch and half long. The Stalks are slender and weak, leaning downwards, with a few bearded Husks, and Spike-fashioned at top.

CLXII. 10. *Gramen Avenaceum supinum flosculis secalinis*, Long-winged Oat Grass with Ric like Flowers. It springs with many Stalks, but they seldom rise up to be a Foot and half high; are full of Joints, and have small short Leaves on them, of a whitish green color. The tops are replenished with four or five Oat like Heads, but more winged, and with short Awnes, somewhat hard, and flowering like Ric.

CLXIII. 11. *Gramen Avenaceum exile, foliis mollicillis*, Small soft-leav'd Oat Grass. It is very like the *Gramen exile durum*, so that it may be easily mistaken for it, and differs therefrom only in the Leaves, these being longer, and soft, as the whole Plant is, and not above half a Foot high, and spiked at its top, its parts being also winged.

CLXIV. 12. *Gramen Avenaceum altero alteri innatum*, Small Oat-Grass one head set on another. It is a fine small Grass, and much resembles the *Gramen Britannicum Maritimum*, having divers hard Hair like Leaves, with very small Stalks, a Span, or eight or nine Inches high, some of which bear their small sharp Husks at their tops only, as some others do, and others of them out of a Tuft of Leaves in the middle of the Stalk send forth another short Stalk, with such like sharp Husks on them as on the other.

CLXV. 13. *Gramen Avenaceum Montanum Clusij*, Mountain Oat-Grass with hoary husks. It has a Root consisting of several long Fibres, the Stalks are slender and jointed, a Foot and half high, with very narrow and long Leaves, and at the tops a long spiked head, bowing the head close, with woolly short husks, containing Seed like to those of Naked Oats.

CLXVI. 14. *Gramen Avenaceum Montanum alterum*, Another Mountain Oat-Grass without hoary husks. It differs not in any thing from the former, but in the spiked head, whose husks are not hoary, as those others are.

CLXVII. 15. *Gramen Avenaceum gluma rariore spicatum*, Spiked Oat-Grass with a sparsely, loose, chaffy Ear. It has a fibrous or stringy Root, and hairy, running under Ground, it has slender, weak, clear Stalks, a Foot high, with long Leaves on them, and at their tops weak, bending, spiky heads, thinly or sparsely set with small husks, containing Oat-like Seed or Grain.

CLXVIII. 16. *Gramen Avenaceum Xerampelinum*, Red Oat-Grass. This is somewhat like the last, but with much lower Stalks, clear and reddish, the husks at the top of them are more upright and longer, having the like Oat Seed in them. A lesser sort hereof has been found about *Greenwich*, in a hungry Soil.

CLXIX. 17. *Gramen Avenaceum locustis rubris*, Oat-Grass with red husks. It has a Root which is long and white, like unto *Dogs-Grass*, or *Quitch-Grass*, creeping in the Ground, having next to the Earth narrow short Leaves, where the Stalk is reddish, but they are longer up higher; the husks are set sparsely at the tops, all on one side for the most part, and are of a dark reddish Purple color, but white within, with small Grains within them.

CLXX. 18. *Gramen*

CLXX. 18. *Gramen Avenaceum glumis varijs*, *Oat-Grass* with partly colored husks. It has a Root which is thick, and is covered with a rough white Bark, the Leaves are green, long and narrow, from among which rise up two or three smooth and brittle naked Stalks, a Foot high, bearing a short spike of small husks, of divers colors.

CLXXI. 19. *Gramen Bromoides*, five *Avenaceum pauci Granum Coma nutante spicata*, *Oat-Grass* with few Seeds. It is somewhat hairy all over, the Leaves are of a sad green color, set on Stalks three, four, or five Feet high, at whose tops is a spiked bending head, having seven or eight small long husks, with few Seeds in them: this grows near Woods sides in many places.

CLXXII. 20. *Gramen Avenaceum Sylvorum*, *Wood Oat-Grass*. It has a Root which runs creeping under the Earth, the Stalks are small in all the parts, and weak, being not above half a Yard high, with long, narrow, soft Leaves on them, and at their tops a few short husks, and open, like unto some of the *Oat-Grasses* before.

CLXXIII. 21. *Gramen Avenaceum exile*, *Small Wood Oat-Grass*. This has a fibrous Root, and the Stalks are slender and smaller in all their parts, yet notwithstanding stand a little more upright, the husky tops are like the former.

CLXXIV. 22. *Gramen Avenaceum gluma villosa Sylvestre*, *Hairy Wood Oat-Grass*. It has fibrous and yellowish Roots, the Stalks hereof are three Feet high, with small narrow Leaves, four or five inches long, the spiked heads have somewhat long and hairy husks, distinctly set one above another, and is often found less by the half than the other.

CLXXV. *The Places and Times*. The first twelve of these grow in many Fields throughout *England*, some in one place, some in another, some in Meadow Land, some in Plowed Grounds, and some in Fallow; the thirteenth, fourteenth, fifteenth, sixteenth, seventeenth and eighteenth grow upon Mountains, and on Hilly Grounds, the fifteenth and sixteenth have also been found growing in *Denmark*; the last four grow in Woods, and by Wood sides, in Mountainous Woods, and other Woody places: they all flourish in the Summer Months.

XXIV. *Ἀγροειδὲς μελινώδης*, *Gramen Melinoides*, *Gramen Panicum*, *Panick-Grass*, six Kinds.

CLXXVI. 1. *Gramen Panicum*, *Panicum Sylvestre Herbariorum*, *Wild Panick*, or *Panick-Grass*. It has a fibrous Root, like unto *Panick*, it has some near resemblance also unto *Millet* in the spreading of the tufted head, being composed of several parts, each part by it self near resembling a *Panick* head; the jointed Stalk, with the Leaves thereon, are very like unto *Panick*, yet much less in all, for which reason it is rather referred to *Panick* than to *Millet*.

CLXXVII. 2. *Gramen Panicum Spica simplicis*, *Panick-Grass* with single Ears. It has weaker and smaller Stalks than the former, and scarcely rising upright, with shorter Leaves on them; the tops of the Stalks are severally furnished with a spiked rough head, sticking to any Garment it touches; it is small at the top, and full of small whitish Seed.

CLXXVIII. 3. *Gramen Panicum Sylvestre*, *Panicum Sylvestre Dalechampij*, *Wild Panick-Grass* of *Dalechampius*. This differs from the last, in that it grows more upright, and about two Feet high, the Stalks have several *Grass* like Leaves on them, but longer and broader, with one usually under the hairy spiked head, which sticks so fast to their Garments which touch it, that it is difficultly plucked off.

There is another of this sort, which is found with us in *England*, which is smaller, else but very little differing.

CLXXIX. 4. *Gramen Panicum aristis longis armatum*, *Panick-Grass* bearded. It has a Root consisting of many long Fibres, the Stalks and Leaves are not much unlike to the second sort of *Panick-Grass* foregoing, but larger and taller, having divers brown heads at the tops, one above another, armed with long and sharp Beards or Awnes, like unto *Wheat* or *Barley*.

CLXXX. 5. *Gramen Panicum minus*, *Panick-Grass* the lesser. This is lesser than any of the others going before, having low bending Stalks, eight, nine, or ten Inches long, and sharp long Leaves thereon, with small, long, chaffie Ears, like *Cocksfoot-Grass*, set sparsely at the tops.

CLXXXI. 6. *Gramen Panicum Sylvestre Anglicum & Africanum*, *Panick-Grass* Wild of *England* and *Barbary*. It is a kind of *Wild Panick Grass*, growing in several Woods with us, whose Spike resembles *Panick*: the like hereof has been brought to us out of *Barbary*, having like Leaf and Head, and differs from ours only in largeness.

CLXXXII. *The Places and Times*. These *Grasses* grow all of them in *England*, and the first of them in *France*, usually among Rubbish, and in waste Grounds, as also in good and Manured Fields, and bear their Heads and Spikes in the Summer Months, as other *Grasses* do:

XXV. *Ἀγροειδὲς φάλαροδης, ἢ φάλακροδης*, *Gramen Phalaroides*, *ἄγροειδὲς ἰντέριον, ἢ πνεύστηρον*, *Gramen Tremulum*, vel *Tremulentum*, *Quaking-Grass*, *Maiden hair-Grass*, five Kinds.

Quaking-Grass Greater.

CLXXXIII. 1. *Gramen Tremulum maximum*, *Phalaris Pratenfis major*, *Gramen Phalaroides Paniculifolium*, *Gramen Paniculis Elegantissimis*, vel *ἄγροειδὲς μάγος Βαυβινί*, *The greatest Quaking-Grass*, or *Maidenhair-Grass*. It has many narrow *Grass* like

like Leaves both below and upon the jointed Stalks, which are a Foot high and better; on the tops of the Stalks grow a number of small, flat, and long scaly like heads, greater than the following, and each of them on a fine hairy Footstalk, and pendulous, which are sometimes of a whitish color when they are ripe, and sometimes of a brownish green color, and are to be shaken with the least Wind imaginable.

Quaking-Grass Lesser.

CLXXXIV. 2. *Gramen Tremulum medium*, *Phalaris Pratenfis minor* Lobelij, *Aegilops Tragi* & *Gesneri* in *Hortis*, *Gramen Polyanthos Lugdunensis*, *The middle or lesser Maidenhair, or Quaking-Grass*. It has a fibrous Root like the other, and grows something like it in form, but with fewer Leaves and Stalks, and a large Panicle or tufted head of greener, shorter, and rounder Scale like pointed Ears, standing on smaller or finer hairy Footstalks than the former, which are in such continual motion, that the most steady Hand cannot hold them still, or from stirring. Of this sort Boet has another, which is somewhat larger, and of a dull or brown black color.

CLXXXV. 3. *Gramen Tremulum parvum*, *Small Maidenhair, or Quaking-Grass*. Of this there are two sorts, little differing in Leaves or Stalks from the last, the heads only are a little lesser, and so is the whole Panicle also, the one of which is Party Colored, of Purplish and Green, the other is of a Straw Color and White.

CLXXXVI. 4. *Gramen Tremulum minus, vel minimum* *Panicula parva* Baubini, *The small or smallest Maidenhair, or Quaking Grass*. The Roots are reddish, creeping here and there, from whence rise up two or three short Stalks, with few joints and smooth, narrow, green Leaves at them, as the many which grow below are, but out of the uppermost joint and the Leaf, as it were out of a Hose, breaks forth a small, long, single Spike of small scaly heads, of a brownish color, with yellowish Bloomings, at their Season.

CLXXXVII. 5. *Gramen Tremulum maximum album* Baubini, *Gramen elegans* Lupuli *glumis* Clusij, *The robite greatest Maidenhair, or Quaking-Grass*. It has a small and fibrous Root, perishing every Year with us, it is a small *Grass*, with slender Stalks, and a few soft green Leaves on them, at the tops whereof stand flattish, soft, scaly heads, greater by much than any of the foregoing, and of a Silver shining white color, very beautiful to behold, each of them much like to the head of an Hop, hanging upon a small Thread-like Footstalk, as the others do, and are almost as moving and stirring as they are.

CLXXXVIII. *The Places and Times*. All these sorts of *Grasses* grow in Corn Fields, and in Lay Grounds, which have been formerly Plowed, and some of them in dry Meadows and Pastures, the first, second, third, and fourth kinds grow not only in *England*, but also in *Spain*, *Italy*, *West Indies*, and other Countries; the third sort is found growing in Upland Corn Fields, as at *Hatfield*, &c. on the Grassie Banks there; the fifth kind is a Native of *Spain*, and grows with us only in Gardens, which tho' it perishes every Year, yet seldom rises again of its own Sowing, but of the Sowing thereof in the Spring; but in *Spain* it Sows it self, and abides all Winter, in regard they have there no Frosts, the fourth sort flourishes, and is in Bloom with us in *May* and *June*.

XXVI. Καλαμώγρησις, *Calamogrostis*, "Αγροεις καλαμώδης, *Gramen Arundinaceum*, *Reed-Grass*, thirteen Kinds, of which seven are of the *Land Kind*, three of the *Marsh kind*, and three of the *Water Kinds*.

CLXXXIX. 1. *Calamogrostis*, sive *Gramen Arundinaceum majus*, *Gramen Arundinaceum Spica multiplici* Baubini, *The greater Reed-Grass*. It has a Root full of white Strings or Threads, and some jointed ones, which spread in the Ground, from whence rise up many jointed Stalks, also large, sharp, cutting Leaves on them, like to those of the *Water- Reed*, but lesser, the tops of the Stalks are furnished with several hard long Spikes or Heads, somewhat like to the *Common Reed*, which when they have stood long do open, and having a flocky substance in them, are carried away with the Wind. Another Kind is lesser, and not having above one or two Spikes thereon.

CXC. 2. *Calamogrostis altera minor*, sive *Gramen Arundinaceum minus* *Norwegicum*, *The lesser Reed-Grass*. The Root consists of many long Strings, from which rise up Stalks, not so high as the former, which, as well as the Leaves, are somewhat harder or rougher than the former, (which yet in *Norway* are much more hard and rough) the spokie Tuft at the top is larger, more spread into several Panicles, sharper also, and a little rougher in handling.

CXCI. 3. *Calamogrostis nostras* *Sylvæ Joannis*, *Reed-Grass of John's Wood*. It has a white Root, with thick Strings, which sometimes spread under the Ground, it is in its Stalks and Leaves a little like the next *Woolly Reed Grass*, but the Stalks are jointed in two or three places to the height of three or four Feet, or more, with narrower Leaves, sharper, and almost three Feet long, being a little striped withal, the top Panicles are sometimes a Foot or more long, parted into many long Spikes, which are as soft as Silk, and of a shining, overworn, Murry color.

CXCII. 4. *Calamogrostis*, sive *Gramen Tonentosum*, *Woolly Reed-Grass*. It has a Root which is somewhat

somewhat hard and rough at top, with several long Fibres proceeding from it; the Stalks are three or four Feet high, or more, having but few Joints; these Stalks are rough, and bear large spiked heads, set up a long Panicle, which are reddish for some time, but growing to ripeness are of a shining Silver like whiteness, and as soft as Wooll in handling; this Plant in its roughness, dryness, and form of Leaves, is not much unlike to that *Bastard Foxtail-Grass* called *Pseudoscleranthum*, or *Bastard Squinanth*, at Sect. 111. foregoing, but much greater.

CXCIII. 5. *Calamagrostis Panicula Torosa*, Large, round, Tufted Reed-Grass. Its Root is small and stringy, it has narrow Leaves, something softer and gentler in handling than the others before, yet not eaten by any Cattel except Goats, the Tuft or Panicle it self is more round and thicker, with shorter heads, set close together like small Knots or Knobs, but somewhat flat on one side; its Bloomings are of a yellowish purple color, and some of its Panicles are found to be more long than round.

CXCIV. 6. *Calamagrostis Montana Enodis*, *Scirpus primus Tragi*, The greater Mountain Reed-Grass. It has a Root of some small substance, hard, and having many Fibres adjoining to it, it grows up with strong Stalks as high as a Man, without any Joints on them, or having but one at the most, having thereat not hard, but soft long Leaves; at the tops of the Stalks are many long, slender, chaffie Spikes, growing more sparsely than the others, each of which is of a bright reddish yellow color, and standing upright.

CXCV. 7. *Calamagrostis Montana Enodis minor*, The lesser Mountain Reed-Grass. The Root is like the former, but the rest of the Plant is much lower and smaller; the Spikes are also smaller and shorter, and not standing so upright.

CXCVI. 8. *Calamagrostis Palustris maxima*, *Gramen Arundinaceum Palustre maximum*, Great Marsh Reed-Grass. It has a Root which creeps far about in Wet Marshy places, from which it shoots forth great, thick, and very tall Stalks, four, five, or six Feet high, jointed up to the tops, with long and somewhat broad, hard, rough, and straked Leaves set thereon, but less than those below; towards the tops of the Stalks with the Leaves come forth many sparsely Tufts of chaffie heads, standing on small long Footstalks, the whole Panicle being at least a Foot long, and sometimes more.

CXCVII. 9. *Calamagrostis nostras gluma Acerosa Palustris*, Our great Marsh Reed-Grass with chaffie heads. It has a jointed reddish Root, from whence spring many fair large Reed like Leaves, not much unlike to those of *Millet-Grass*, but harder, rougher, and straked all the length of them, having great Reed like Stalks, three, four, or five Feet high, jointed also and branched, and towards the tops having large and somewhat hard Panicles of spiky chaffie heads, each of them about seven, eight, or nine Inches long, of a whitish color in some places, and reddish in others, in which chaffie or husky Heads there lyes small Seed.

CXCVIII. 10. *Calamagrostis, vel Gramen Arundinaceum Palustre Sericea molliore spica*, Soft headed Marsh Reed-Grass. The Root is composed of several small Fibres or Springs set together at a head, it grows something like the last, but lesser, with narrower and shorter Leaves, and lower Stalks, having but few Joints and Leaves on them; the tufted Heads which stand at the tops are something like to the *Rush* which is called *Bastard Schenanthum*, and turn into Down, which is carried away with the Wind.

CXCIX. 11. *Calamagrostis Aquatica major*, *Gramen Arundinaceum Aquaticum majus*, Great Water

Reed-Grass. It has Roots which run and spread themselves far, shooting up in several places, the Stalks are great and tall, full of Joints, with large Reed like Leaves at them, striped with White and Green, like Ladies Laces, but not so evidently to be seen, up to the top almost, where stands a large and soft tufted Panicle, consisting of many Branches and parts, almost like to the *Vulgar* or *Common Reed*.

CC. 12. *Calamagrostis, seu Gramen Arundinaceum Aquaticum magnum*, The great Water Reed-Grass. The Root is almost like, but creeps not so much as the former, the Stalks are great and high, having broader and longer Leaves than the former, and something harder also; the Joints likewise are fewer, and the tufted Panicle is much more spread, and soft in handling, and of a purplish green color, and its Bloomings are white.

CCI. 13. *Calamagrostis, five Gramen Arundinaceum Aquaticum Panicula speciosa*, Fair headed Water Reed-Grass. It rises to be three Feet or more high, the Leaves are broad, and a Foot long, but slenderly set on the Stalks, a little rough on the edges, some of which will be hollow, like a Trunk, that the Stalk will go thro' it half way; the top Panicle is made of many fine, soft, scaly Tufts, very beautiful to behold.

CCII. The Places and Times. The first and second grow in moist Meadows, which are Sandy, and rather Barren than Fertile; the second also is found growing in some moist Fields near *Hackney*; the third is expressed in its Title; the fourth in the borders of dry Fields, and by Hedge sides, in many Countries of this Kingdom, especially in *Dorsetshire*; the fifth grows in the like places; the sixth and seventh grow in moist Woods which are on Mountains and Hills; the eighth grows in Marshy places, and Ditches overflowed with the Tide, I have found it growing in some parts of *Carolina*; the ninth and tenth grow in low moist Grounds by *Rutcliff*, near *London*; the eleventh, twelfth, and thirteenth grow in Ditches, Ponds, and Lakes in several places of *England*, as also in other Countries; the first seven, as also the other six, flourish in the Summer Months, and their Stalks perish before Winter.

XXVII. *Σχιστοσπείρις*, *Schizogrostis*, **Άρκεσι σπείρις*, **σπείρις*, *Gramen Junceum*, Rush-Grass, seventeen Kinds, viz. seven of the Land, six Marsh Kinds, and four Water Kinds, of all which in order.

CCIII. 1. *Schizogrostis communis, vel Gramen Junceum vulgare*, The common Rush-Grass. Its Root consists of brownish yellow Fibres or Threads, the Leaves are almost round, seven or eight Inches long, from among which spring up the Stalks, which are about eight or nine Inches high, which bear at their heads several small Panicles Spike fashion, one above another.

CCIV. 2. *Schizogrostis Montanum spica Suberulea Cambro Britannicum*, Welsh Mountain Rush-Grass. From a fibrous or stringy Root spring up a great many fine, slender, *Rush* like Leaves, nearly a Foot and half long, from among which rise up two or three slender small Stalks, eight or nine Inches long, and much lower than the Leaves, bearing at their tops, from between two Leaves, which are rather like Skins, being broad below and small towards their ends, yet always the one longer than the other, a small, spiked, scaly head, of a fine bluish color.

CCV. 3. *Schizogrostis, seu Gramen Junceum Speciosum minus*, Another Noble or Excellent small Rush-

Rush-Grass. It is very like the former, but has much smaller *Rush* like Leaves, not above three or four Inches long, rising out of a hard brown Husk or Hufe, set at the top of a small Fibrous Root, from among which spring up several jointed Stalks, with such like Leaves on them, and a small head at the top, like unto the former, but of a brown, clear, Chestnut color, and smaller, as the whole Plant is, having two small Leaves thereat, as in the second foregoing.

CCVI. 4. *Schænegroftis, five Gramen Junceum Dalechampij, Dalechampius his Rush-Grass*. It has a very long, white, and fibrous Root, from which rise up a very great number of small, round, *Rush* like green Leaves, and among which spring up divers jointed Stalks, with some few Leaves on them, and at the top a sparfed spiked head, something like unto the *Holosticum Salamanticum Clusij*, or *Spanish Sea Plantane*, consisting of many purplish Husks.

Wood Rush-Grass with jointed Leaves.

CCVII. 5. *Schænegroftis Sylvarum, seu Gramen Junceum Sylvestre articulato folio majus, The greater jointed Wood Rush-Grass*. It has a Root which creeps a little, repleat with many small Fibres, the Stalks are somewhat flat, and very green, the Leaves are almost round, with many several crosf Joints on them, the tufted heads at the tops of the Stalks, which are near three Feet high, are spread into many *Rush* like Panicles, and also somewhat flat.

CCVIII. 6. *Schænegroftis Sylvarum, five Gramen Junceum Sylvarum articulato folio minus, The lesser jointed Wood Rush-Grass*. It has a Root which is hard, spreading abroad, with many Fibres adjoining to it, from whence spring up many Stalks, which take Root again in the Ground, and bear such like jointed Leaves (as in the last) at the tops of the Stalks are small, spread, Panicle Heads, very like to the former, but smaller by half in each: there is another of this kind which is yet smaller, whose Leaves are small and slender, but not jointed, the

Panicle of which is smaller, and sparfed in like manner.

CCIX. 7. *Schænegroftis, seu Gramen Juncoides sparsa Junci Panicula, Rush-Grass with Rush like sparfed heads*. It has a Root which is yellowish, spreading it self under the Ground, with long Fibres; the Stalks are slender, something flat, and near two Feet high; the Leaves are smaller than the common fort, being about fifteen or sixteen Inches long; the tops are also smaller, and spread with whitish heads.

CCX. 8. *Schænegroftis, five Gramen Junceum Palustre racemoso Semine, Marsh Rush-Grass with Seeds in clusters*. It has a blackish thready Root, from which rise a few small *Rush* like Leaves, and from among them spring up several Stalks, a Foot and half high, bearing at their tops, between small long Leaves, a small head, much like to a Bunch of Grapes, in which the Seed lies.

CCXI. 9. *Schænegroftis, seu Gramen Junceum Maritimum majus, The greater Sea Rush-Grass*. It has a tufted fibrous Root, from which spring many hard smooth Leaves, something like *Rushes*, and from among them several slender naked Stalks, about a Foot high, with *Rush* like heads growing at their tops, but much smaller.

CCXII. 10. *Schænegroftis, vel Gramen Junceum Maritimum dense stipatum, Sea Rush-Grass thick set*. It has a *Rush* like Root, and long hard Leaves, like *Rushes*, growing thick and close together; the Stalks are slender, and not much longer than the Leaves, every one of them bearing at their tops a small Head, something like to those of *Rushes*.

CCXIII. 11. *Schænegroftis, five Gramen Junceum Maritimum minimum Zelandicum, The least Sea Rush-Grass of Zeland*. It has a fibrous Root, from whence rises a small bush of Leaves; the whole Plant scarcely exceeds eight or nine Inches in height; from among this well spread bush of Leaves rises up the Stalks, with small hairy like Leaves, and a small thick head at its top.

CCXIV. 12. *Schænegroftis, seu Gramen Junceum Maritimum exile Plimothij, Small Sea Rush-Grass of Plimouth*. It has a Root consisting of many small long Fibres, coming from one Head; the Leaves are many, growing thick together, and as fine almost as Hairs or Threads, from among which rise up several slender unjointed Stalks, bearing exceeding small sharp pointed heads thereon, the Stalks being continued, and appearing above them, and pointed. This *Grass* has been found as well at Dover as Plimouth, in their Wet Marsh Grounds.

CCXV. 13. *Schænegroftis, seu Gramen Junceum Maritimum magis exile pauci folium, A lesser Marsh Rush-Grass with fewer Leaves*. It has a small and slender Root, and fewer and shorter Stalks and Leaves than the last, more soft and delicate in feeling, and whose Heads are a little bigger, and prickly, the Stalk rising above them, as in the other.

CCXVI. 14. *Schænegroftis, five Gramen Junceum Aquaticum minimum capitulo squamoso, A very small Water Rush-Grass*. It has as few, but smaller Leaves than the Eighth Kind foregoing, being about two Inches long; the Stalks are about four or five Inches high, each of them bearing a small, reddish, scaly head, with the top of the Stalk growing up above it.

CCXVII. 15. *Schænegroftis, vel Gramen Junceum Aquaticum magis sparsa Panicula, Water Rush-Grass with a more sparfed Panicle*. It is very like the last in growing, the chiefest differences are in the Stalks, for they are greater and rise higher; and in the Leaves, for they are Jointed, like to the *Wood Rush-Grass*; and in the Heads, these being smaller, and more dispersed.

CCXVIII. 16. *Sclæ-*

CCXVIII. 16. *Schœnogroffis*, seu *Græmen Junceum Aquaticum Bauhini*, Bauhin his *Water Rush-Grafs*. It has jointed Leaves, from among which rise up Stalks, a Hand high, or more, with certain chaffie Heads, parted into many Threads.

Rushy Water-Grafs

CCXIX. 17. *Schœnogroffis*, seu *Græmen Junceum Aquaticum vulgare*, The common *Water Rush-Grafs*. It has a long, thick, spreading Root, which sends up several jointed Stalks, and at each Joint a narrow *Rush* like Leaf; at the tops of the Stalks stand several, somewhat like unto those of *Rushes*.

CCXX. The Places and Times. The first seven of these *Graffes* grow upon dry Land, and in dry places, some of them upon Hills, some on Mountains, and others in Woods; the second grows on a high Hill in *Wales* called *Berwin*, continually covered with Clouds and Mists, and Watered with Showers, whilst at the same time the Sun shines fait in the Valleys below it; others of them grow in the Woods near *Highgate*, in *Hornsey Wood*, and in many other Woods of this Kingdom, as also in Meadows adjacent to the same, and do all of them flourish in the Summer Months, viz. in *June* and *July*; the next six *Marsh Rush-Graffes* grow in Salt Marshes, and near the Sea side, and other like places, in many parts of this Kingdom; the last four grow in Watery places, and in or near Waters, whether standing or running, and flourish in the Summer time, as all the rest do.

XXVIII. Θαλασσιόγρασις, Ἀγρωσις ἑλαδῆς, *Græmen Marinum*, vel *Maritimum*, Sea-Grafs, Eight Kinds.

CCXXI. 1. Ὀξύαγρωσις ἑλαδῆς, *Oxyagrostis Marina Dalechampij*, Sharp pointed Sea-Grafs. The Stalks are bushy, and about two Feet long, full of Joints, and narrow *Grafs* like Leaves at every one of them, of a dark green color, and so sharp at the points, that they are ready to prick their Legs who pass by them unawares.

CCXXII. 2. *Græmen Marinum asperum*, *Rough Sea-Grafs*. Its Root is a bush of long white Fibres, which sends up several reddish, round, small Stalks, a Foot or more high, leaning at first downwards, encompassed with hard, short, and sharp pointed Leaves, standing as it were in a Tuft together, with hard rough dents about the edges; the spiked heads are like rough hard Burs, breaking out of a Skin which enclosed them.

CCXXIII. 3. *Græmen Marinum*, vel *Marinum exile vicinorum aggerum*, A very small Sea Down-Grafs. It has a Root which is small and thready, which shoots forth divers short Stalks, two Inches long, full of small long Leaves like Hairs set close together, and among them at the tops small Heads, like to the Catkins of the Dwarf Willow.

CCXXIV. 4. *Græmen Marinum*, vel *Marinum spicatum*, Spiked Sea-Grafs. It has a Root composed of a bush of many long Fibres or Strings, from whence rise up many long, hollowed, or Gutter Leaves, encompassing one another at the bottom, from among which spring up two or three Stalks, bare of Leaves unto their tops, where they bear long spiked Heads of greenish Flowers, set close together.

CCXXV. 5. *Græmen Marinum spicatum alterum*, Another Spiked Sea-Grafs. It has long, slender, narrow, hard, and sharp pointed Leaves, growing often on low places so near the Sea, that sometimes it washes over it, the Stalks are many and low, with small, long, and round Heads thereon.

CCXXVI. 6. *Græmen Marinum majus Statice quibusdam*, Great Sea-Grafs, or Sea-Thrift. called by some Στατική. It has a pretty large long Root, with some Fibres adjoined, which sends up many fair, long, and somewhat broad, and whitish green Leaves, lying close together upon the Ground, from which rise up slender Stalks, naked to their tops, except in one place towards their middle, where they have two small Leaves turning downwards; contrary to almost all other Herbs, and at their tops a Tuft of bluish colored Flowers, opening by degrees.

CCXXVII. 7. *Græmen Marinum Americanum*, Στατική Statice Americana major, Great Sea Thrift of America. It has a long Root, with but few Fibres thereat, from whence spring up a vast number of Leaves, almost like the last, but they are narrower, of a sadder green color, and somewhat thinning, with two Ribs in each, and blunt at the ends; it has slender Stalks, which bear also such a Tuft of Flowers, but of a white color, and break out of a Skin, which falls down about the Stalk.

CCXXVIII. 8. *Græmen Marinum minus*, Small Sea-Grafs, Sea-Thrift, or Sea-Cushion. It has many small, hard, short, green Leaves, growing thick together, and spreading on the Ground; the Stalks are many, of a Span high, without any Leaves on them, but at their tops, where grow small round Tufts of bluish colored Flowers.

CCXXIX. The Places and Times. They all of them have been observed to grow upon our Sea Coasts, especially on the *Kentish* and *Sussex* Shoars; the sixth grows on the *Mediterranean* Shoars, the seventh on the *American*; and they all Flower and Seed in the end of Summer.

XXIX. Ἀγρωσις ἀργυρεῖα, *Græmen Argenteum*, Silver-Grafs, three Kinds.

CCXXX. 1. *Græmen Argenteum capitalis globosæ*, Silver-Grafs round headed. It is the *Græmen Lucidum Tabernamontani*, and is thought to be the Com-

bractum Plinij, it has a small, bushy, and fibrous Root, which sends up long Leaves, like those of *Wheat*, which have some small, long, white Hairs upon them, and about their edges; from among these Leaves rise up several Stalks, about a Foot high, with Joints and Leaves on them; at the tops of these Stalks on each Stalk grow two or three round Heads, which are soft, white, and woolly, consisting of many small Silver like Threads, which are said to shine in the Night, and therefore called by the *Italians Luciola*.

CCXXXI. 2. *Græmen Argenteum striatum, Silver-Grafs streaked*, called by some *Lady-Laces, Lady-Lace-Grafs*, and *Painted-Grafs*. Its Root is small and hairy, and of a white color, like unto *Meadow-Grafs*; it has Leaves like to *Miller* in form, and rough or sharp pointed, like to the *Reed*, with many white Veins or Ribs, and Silver Streaks running along thro' the middle of the Leaves, fashioning them like to Ribbons or Laces made of white and green Silk, very beautiful and delectable to behold; it grows to the height of *Wild Panick*, with a spoky top, not very much unlike, but more compact, soft, and chaffie.

CCXXXII. 3. *Græmen Argenteum spicis Tomentosis, Silver-Grafs with Cotton Spikes or Heads*. It has a hard, long, thready Root, from whence proceed many soft, downy, grassie Leaves, of a mean length, seldom exceeding two Feet, or two Feet and half in height, from among which rise up several Stalks, a Yard or Yard and half high, having but few Joints on them, not above one or two, with like grassie Leaves growing up from them; at the tops of these Stalks are long spiky Heads, set upon a long Panicle, which are a kind of chaffie and downy Tufts, regularly placed, from the bottom to the top, commonly at first of a reddish, or Murry like color, which when they come to ripeness are of a shining Silver like whiteness, and as soft as Cotton or Wool in handling.

CCXXXIII. *The Places and Times*. The first of these grows in Woods, Copfes, Groves, and other like Woody places, in many places of this Land; the second grows in borders of Woods, and upon Woody and Hilly places in *Savoy*, but with us only in Gardens; the third in borders of dry Fields, and by Hedge sides, in many parts of *England*, and all flourish with the *Common Meadow-Grafs*, or in the middle and end of Summer.

XXX. *Ἀγροσὶς σαχυρεὶς, ἑσαχυρὸς, Græmen Spicatum, Spiked or Eared Grafs*, eleven Kinds.

CCXXXIV. 1. *Græmen spicatum purpureum Pratense Dalechampij, Purple Spiked Meadow-Grafs*. Its Root is a bush of white Fibres, from whence rise many *Grafs* like Leaves, but narrower, softer, and greener, having several short Stalks, not a Foot high, with two or three Joints on them, set with Leaves, at the tops of which, out of a round Skin or Husk, picked at the end, being the uppermost Leaf, breaks forth a thick, short, and somewhat flat Spike, of a delicate reddish purple color.

CCXXXV. 2. *Ἀβρίζανθ' Ἀγροσὶς, Græmen Anthoxanthion Lugdunensis, (i. e. Yellow Flowered) Græmen spicatum flavescens Pratense, Yellow Spiked Meadow-Grafs*. It differs little from the last, either in Roots, Leaves, Taste, or Quality, so that some Authors have called the one the Male, the other the Female, the only difference is, that the Head or Spike of this is of a pale yellow color, and in some higher Grounds of a more reddish and shining color, and not enclosed in any Skin or Leaf, as the

other, but standing naked or bare, being also slender and longer.

CCXXXVI. 3. *Græmen spicatum, Spica multiplici rubra Pratense, Red Spiked Meadow-Grafs*. It has a small Root, made of a few Hair like Fibres, whence rise long and narrow Leaves, Ribbed thro' their whole length, and so composed as is scarcely to be seen in any other Herb, for some of them are so jointed, as if one Leaf grew out of another; on the top of the Stalk stands a very long Head, consisting of a good number of reddish Spikes set together one above another, which are somewhat rough in handling.

CCXXXVII. 4. *Græmen spicatum folijs Caryophyllis Pratense, Spiked Meadow-Grafs with Gilliflower Leaves*. Its Roots run under the upper Crust of the Ground, folding one within and over another, its Leaves are somewhat hard, thick and short, and greener than those of *Gilliflowers* or *Pinks*, but so hard and Sapsless, that Cattel will not eat thereof; the Stalks are six Inches high, at the tops of which stand small Spikes, sometimes more, sometimes fewer, brownish at first, and afterwards somewhat reddish, with many yellow Threads mixt among them.

CCXXXVIII. 5. *Græmen spicatum folijs Caryophyllis spica squamata, Spiked-Grafs with Gilliflower Leaves and a scaly Spike*. Its Roots are small blackish Threads, it has small long Leaves, narrow, and bowing, the Stalks are small, about eight or nine Inches high, bearing a short scaly Head.

CCXXXIX. 6. *Græmen spicatum album angustifolium Sylvaticum, White Spiked narrow Leaved Wood-Grafs*. This differs from the foregoing, in that its Root is yellowish, with small Fibres, growing aloope in the Ground, the Leaves are many, but very short and narrow, scarcely four or five Inches long; the Stalks many times exceed not the length of the Leaves, having small spiked Heads, beset with short Hairs, scarcely an Inch long.

CCXL. 7. *Græmen spicatum Caryophylleum Spica multiplici, Double Spiked-Grafs with Gilliflower Leaves*. Its Root is a bush of many reddish hairy Fibres, whence rise several short narrow Leaves, like those of *Gilliflowers*, among which spring up very many slender Stalks, naked, without Joints or Leaves, scarcely growing higher than the Leaves, which bear short reddish Spikes, many set together.

CCXLI. 8. *Græmen spicatum Caryophylleum Spica varia, Variable Spiked-Grafs*. Its Roots are small, long, and fibrous, bushing thick together, whence spring long, narrow, *Gilliflower* like Leaves, from among which grow up several small naked Stalks, bearing a slender, long, spiked Head, sometimes single, and sometimes divided or branched into several long parts, made of many Husks.

CCXLII. 9. *Græmen spicatum Caryophylleum Rabinum Baubini, Græmen Rabinum Gesneri, The chief or principal Gilliflower-Grafs*. It has a fibrous Root, proceeding from one Head, from which rise up many thick, firm, or fleshy, and long pointed Leaves, like to those of *Gilliflowers*, lying in a round compass at the head of the Root, not having any Nerves or Veins in them to be seen, and of which Cattel will very well feed.

CCXLIII. 10. *Græmen spicatum, Spica Gemina Columnæ, Double Spiked-Grafs of Columnæ*. It has a small, whitish, fibrous Root, which sends up several weak and leaning jointed Stalks, with small *Grafs* like Leaves upon them; at the top of each Stalk grows two several Spikes, jointed together at their Feet, dented on their edges, with a middle Rib between, and consisting of three or four rows of Leaves like Scales, containing small, brown, cornered Seed.

CCXLIV. 11. *Gra-*

CCXLIV. 11. *Græmen Spicatum Virginianum Spica articulata*, Spiked Virginia-Grass having a jointed Spike. It has a bushy Root, which lives long, and is a goodly Grass, growing great, with many fair, large, and broad Grassie Leaves, very small pointed, and something hard in handling; the Stalk is also great and tall, bearing a long Spike at the top, jointed in several parts, each of them almost half an Inch a piece, being almost round, yet a little flat.

CCXLV. *The Places and Times.* The first five grow in Fields, Meadows, or Pastures, or near to them; the next five grow on Hills, Mountains, Woods, and Woody places, in many parts of England, as also in other Foreign Countries; the eleventh grows particularly in Virginia, and they all Flourish much about the same times when other Grasses do.

XXXI. *Μυζέζυγωςις*, *Græmen Bufonium, vel Bufonis Flandrorum, Græmen Funceum parvum, Holoistum Matthioli*, Toad-Grass, three Kinds.

Toad Grass

CCXLVI. 1. *Græmen Bufonium, vel Græmen Funceum parvum*, The greater Toad-Grass. It has a fibrous reddish Root, and grows not to be above eight or nine Inches high, the Leaves are very small, and those on the slender Stalks and Branches from the Joints lesser, whereat, and likewise at the tops, come forth small, yellowish, chaffie Heads or Husks, with short Awnes at the ends, each upon a short Footstalk, one above another.

CCXLVII. 2. *Græmen Bufonium medium*, The middle sized Toad-Grass. It differs from the former only in its magnitude, this being of a middle size between the former and the least; there is also one something smaller than this, whose Heads are closer or thicker set together.

CCXLVIII. 3. *Græmen Bufonium minimum, Græmen Funceum minimum Holoistum Matthioli* Congener, The smallest Toad-Grass, or smallest Rush-Grass, like the former Toad-Grass at Sect. 246 above. It has a very small and fibrous Root, and grows with several small and Thread like Leaves, scarcely an Inch and half long, with yet smaller Leaves on the Stalks, which are not above three or four Inches high, at whose tops stand two or three small Heads, like to those of Rushes, but with rounder Grains or Seeds therein, and set closer together.

CCXLIX. *The Places and Times.* The first grows in moist and wet Grounds, the second in moist or wet places near Highgate, the third in low, moist, and Marthy Land; they all Flourish and Seed in the Summer Months, viz. in June and July.

XXXII. *Ἀρρωςις ἑνδύει, ἢ ὑπερόδης*, *Græmen Aquaticum*, Water-Grass, seven Kinds.

CCL. 1. *Græmen Aquaticum Paniculatum minus*, Small Bearded Water-Grass. It has a thick, hard, fibrous Root, which sends forth a round straked Stalk, about two Feet high, encompassed with several broad, rough, pale green Leaves, nearly a Foot long, the top Panicle is a Span long, sparsely or thinly placed, composed of many whitish Heads, having long Awnes or Beards.

CCLI. 2. *Græmen Aquaticum aculeatum majus*, The greater prickly headed Water-Grass. It has a small Root, which runs deep into the Mud, and sends up a Stalk or Stalks two Feet high or more above the Water in Ditches where it grows; the Leaves are long and narrow, bearing at the tops of the Stalks several small prickly Heads, with long Leaves at them.

CCLII. 3. *Græmen Aquaticum aculeatum minus*, The lesser prickly headed Water-Grass. This is like to the last both in Stalks, Leaves, and prickly heads, but smaller, nor has it any Leaves growing with them as the others have.

CCLIII. 4. *Græmen Aquaticum aculeatum alterum*, Another prickly headed or Bar headed Water-Grass. It has long, smooth, and tender Leaves, among which rises up a Stalk, about half a Yard high, with a few Leaves set thereon, and at the top many small rough Heads like Burs.

CCLIV. 5. *Græmen Aquaticum, vel Fluvatile Cornutum*, Horned Water-Grass. It has a small and fibrous Root, which sends up a slender Stalk, about two Feet high, jointed at several places, and two small Rushy Leaves for the most part set at each of them, growing something broad, and compassing it at the bottom with a large Skin, from whence also rise one or two Stalks, ending in a skinny Head, which has at the end three or four narrow Leaves, turning downwards, and seeming like Horns.

CCLV. 6. *Græmen Fluvatile Spicatum, vel Aquaticum Spicatum*, Spiked Water or Float-Grass. It has a Root compact and Tufted, or bushy in the Mud, composed of many Strings and Fibres, it has several weak Stalks, leaning every way, full of crooked Joints, which are knobby, or round, taking Root again in divers places, having long and narrow Leaves upon them, which lye floating under and upon the Water; that part which grows up has some Leaves likewise thereon, and a long, slender, brown spiked Head at the top.

CCLVI. 7. *Græmen Fluvatile, vel Aquaticum Spica multiplici*, Many Spiked Water or Float-Grass. It has a long and round Root, somewhat thick, like unto Dogs-Grass, set on even Joints, with small Strings and Fibres, from which rise up long and crooked Stalks, crossing and winding, and folding one within another, with many flaggy Leaves on them, more in number than the former, which Horses and other Cattel eat greedily; at the tops of these Stalks, and somewhat lower down upon them, come forth very many little Spikes or Ears, of a whitish color, composed of two ranks of small chaffie Seeds, set alternately on the Stalks, each of these small Ears being almost an Inch in length.

CCLVII. *The Places and Times.* They all grow in watery Ditches and Ponds in many parts of this Land,

Land, but the two last grow mostly in shallow Rivers, Brooks, and Rills, where the Water runs softly, smoothly and easily; they are also found sometimes growing in standing Waters, and many times by fresh Rivers sides; they all Flourish and Seed in June, July, and August, according to the kindnes of the Season.

XXXIII. Ὀδύγρασις, ἄγριος τριγυλῖς, ἄγριος τῆς ὁδοῦ ἔρις, *Haleus Plinij, Gramen de via, Gramen Muriale, Gramen Semite, vel Semitale, Way or Wall-Grafs, four Kinds.*

Way or Wall-Grafs Greater.

CCLVIII. 1. *Gramen Semitale, vel Muriale majus, Gramen Hordeium, vel magis Secalinum majus, The greater Way Grafs or Wall-Grafs, Barley-like-Grafs, or rather Rye-Grafs.* It has a bushy and fibrous Root, which perishes not in Winter, tho' never so cold, from which spring up many Grafs Leaves, but somewhat harder in feeling, and not altogether so juicy; from among these green Leaves spring up several Benty Stalks, a Foot or more high, having some few joints on them, with Leaves thereat, every one of which bears at the top a small, long, whitish, yellow Ear, an Inch and half, two or three Inches long, having some Awnes or Beards, within which are contained small, long, lank Seeds or Grain: This Ear Authors think has some resemblance of Barley, but it much more resembles Rye, and therefore may not improperly be called Rye-Grafs.

CCLIX. 2. *Gramen Semitale, vel Muriale minus, Gramen Hordeium, vel Secalinum minus, The lesser Way or Wall, Barley or Rye-Grafs.* It is in its Roots, Stalks, Leaves, Ears, and manner of growing very like the former, but it is shorter and lower, and looks as if it was a Dwarf-Grafs of the same kind; I know many have taken it to be the same, but it does really differ, the Stalk is seldom above nine or

ten Inches high, whereas the former comes to be sometimes sixteen or seventeen Inches, if in good Ground, the Ear is also much less, and shorter, and almost without Awnes, or else they are very short ones.

Way or Wall-Grafs Lesser.

CCLIX. 3. *Gramen Semitale maximum, vel Gramen Secalinum maximum, The greatest Way or Rye-Grafs.* It has a running and jointed Root, with many Fibres adjoining, the Stalks rise up to be sometimes two Feet high, and better, having but few and short Leaves thereon; the Spike is sometimes two, three, or four Inches long, bearded, and very like unto an Ear of Rye.

CCLXI. 4. *Gramen Semitale magnum, vel Gramen Secalinum minus, The great, or rather lesser Rye-Grafs.* The Root in this is wholly Fibrous, but otherwise it differs not from the former, saving that it is every ways less, and the Ear (very like to Rye) is many times not above half the length of the former.

CCLXII. *The Places and Times.* They grow upon waste and untilled Grounds, by Ways and Path sides, and the second of them by Walls sides, and upon Walls, especially upon Mud Walls, in almost all places of this Kingdom; they Flourish and Seed in the Summer Months, viz. in June, July, and August.

XXXIV. Ἀγριος ἰσίδας, *Gramen Nemorale, vel Nemorosum, Wood-Grafs, four Kinds.*

CCLXIII. 1. *Gramen Nemorale, vel Nemorosum majus Spica rufescente, The greater brown Wood-Grafs.* The Root is a bush of very small Strings or Fibres, from whence spring up many narrow grassie Leaves, and among which rise up many smooth round Stalks, without any Joint or Leaf on them, at the tops whereof stand loose, smooth, brownish

brownish spiked Heads, separated a little one from another, and as it were a little Bearded.

Wood-Grass Greater.

CCLXIV. 2. *Gramen Nemorosum, vel Sylvaticum Capillaceum Panicula alba, White Tufted Wood-Grass.* It has a tufted or bushy fibrous Root, as small as Hairs, from the head of which bush of Fibres spring small *Grass* Leaves, which grow thick and close together in a Tuft in a great number, and rising to be about a Foot long; the Stalks come up from among the Leaves, about a Foot and half or more high, smooth, and bare, almost without Joint or Leaf on them, the tops of which end in a white Panicle, two or three Inches long, composed of small Husks with Beards.

CCLXV. 3. *Gramen Sylvaticum, vel Nemorale minus, The lesser Wood-Grass.* This differs not from the first or greater, but that it is in all its parts lesser and lower, the small, chaffie, bearded Ears being smaller, and nothing so soft, but rather hard, and a little more sparfed.

CCLXVI. 4. *Gramen Nemorosum, vel Sylvaticum exile durum, Small hard Wood-Grass.* The Roots are small and fibrous, being in a bush, from whence rise up many small hard Leaves, about a Span long, or a Span and half, the Stalks are slender, with very few Joints and Leaves on them, at which Joints, and at the tops also, come forth small, long, chaffie Spiked Heads.

CCLXVII. *The Places and Times.* These all grow in Woods, almost every where throughout *England*, and they flourish when other *Grasses* do, viz. in the Summer Months; they are never used in Physick, nor are they good Fodder for Cattel, but Goats will grow fat therewith.

XXXV. *Ἐλεφάντις, Ἀγρίστις λεωφόρος, ὁ ἰακίδης, Gramen Lanatum, vel Bombycinum, Woolly-Grass, two Kinds.*

CCLXVIII. 1. *Gramen Lanatum, seu Bombycinum, Gramen Juncoides Lanatum vulgaris, Common Woolly or Cotton-Grass.* It has a Root very bushy, small, and fibrous, thrusting its Fibres somewhat deep into the Moorish Ground in which it grows,

from whence rise up many long, slender, and Grassie Leaves, almost like unto *Rushes*, whence the Name *Juncoides Lanatum*, or *Juncus Bombycinus*, from among these Leaves rise up a small, slender, hard Rushy Stalk, about a Foot high, sometimes with a few Grassie Leaves thereon, and sometimes without either Leaf or Joint, bearing at their tops a Bush or Tuft, sometimes one, sometimes two, three, four, or more, of most pleasant, fine, soft white Down, Wooll, or Cotton, as fine and soft and white as fine White Silk, so that they seem to be rather fine soft White Silk like Heads, finer than the finest whitest Wooll that is, and usually about the bigness of a Walnut, with its outward green Husk, which are so eminent in ones Eye a far off, that they give much Delight and Admiration to the Beholders; these being full ripe pass away with the Wind.

CCLXIX. 2. *Gramen Lanatum, seu Bombycinum minus, Gramen Juncum Lanatum minus, Small Woolly or Cotton-Grass.* The Root is somewhat black, and not much unlike the former, but this has many more Rushy Leaves than that, but the Stalks rise not much higher, they bear at their Heads Tufts of Woolly or Cottony Heads, not so large as the former, but are small, and somewhat long, which being ripe fly away with the Wind, leaving a small Head of Seed, like a *Crowfoot* Head, behind it.

CCLXX. *The Places and Times.* They grow in moist, wet, Boggy, and Moorish places, the first on the Bog on *Hampstead Heath*, near *London*, as also in *Highgate Park*, not far from the same; the second has been found about *Mompelien* in *France*; they Flower in *July*.

The Virtues.

CCLXXI. *Cordus* says, that the Decoctiō of the first in Wine, being taken warm, gives ease in the griping pains of the Belly. The Woolly Heads are gathered by some to stuff Pillows, Bolsters, and Cushions with, far excelling in softness and goodness any *Thistle* Down. Thus have we given you a short History of *Grasses*, which we think is enough,

tho' possibly not the halt of what are known, and yet in this Chapter we have Named and Described Two Hundred Twenty Six.

C H A P. CCCXXVIII.

of G R O M E L the Great er.

I. THE Names. It is called in *Arabick* Kilb, *Cult*, *Colt*, and *Calub*, in *Greek* *Λιθοσπερμ*, i. e. *Lopsem Semen obduritum*, in *Latin* *Lithospermum*, & *Milium Solis*, also *Granum Solis*, but *Scrapio* says, from the Authority of *Aben Julia*, that it should be called *Milium Soler*, from the form of the Seed, being small, as *Milium*, and the *Mountain Soler*, upon which it grew; it is the *Gorgoniu* *Aeginochos*, & *Heraclea Plinij*, in *English* it is called *Gromel*, also *Pear-Plant*, and *Litchwale*.

II. The Kinds. It is twofold, viz. greater, of which we shall Treat in this Chapter, and lesser, of which in the next.

III. The greater Kind. Of this there are two singular Species, viz. 1. *Lithospermum majus erectum*, vel *majus Legitimum*, *Lithospermum Hortense*, Great Garden Gromel, or Great upright Gromel. *Saxifraga tertia Brunfelsij*, *Milium Solis Sativum Tragi*, vel *Legitimum Clusij*, *Lithospermum alterum Fraticosum Johannis Tbolij*. 2. *Lithospermum majus repens*, *Lithospermum majus vulgare*, The Greater creeping Gromel, or Greater common Gromel.

Greater Grommel.

Garden

Gromel.

IV. The Descriptions. The first, or Great upright Garden Gromel, has a Root which is long and hard, or something Woody, with divers Branches and Fibres thereat, which perishes not, altho' the Stalks die away and perish every Year; from this Root rise up several upright, slender, woody, hairy, brown, and crested Stalks, very little, or not branched at all, on which do grow, without order, long, hard,

rough, and dark green Leaves, sharper pointed, and somewhat longer and narrower than the next; at the tops of the Stalks grow several small white Flowers, in rough brown Husks, wherein, after they are past, is contained a white, hard, round, stony, shining Seed, greater than that of the following, and almost like unto Pearls.

Great
Creeping
Gromel.

V. The second, or Greater creeping Gromel. It has a Root like the foregoing, abiding all the Winter, and shooting forth Stalks fresh in the Spring, which Stalks grow up slender, hard, and hairy, trailing, and taking Root in the Ground as they lye thereon, being also divided or parted into many other smaller Branches, with such like hairy, dark, green Leaves, but shorter and broader than the former, at the joints with the Leaves come forth very small blew Flowers, and after them such like hard, roundish, stony Seed, but smaller, and not fully so white and shining.

VI. The Places. The first grows with us in Gardens only, but Wild in some places of *Italy*, and *France* next to it; the second grows Wild in many places of *England*, in barren or untilld places, and by the Way sides.

VII. The Times. They Flower from the beginning or middle of *June* until *September*, the Seed ripening in the mean while.

VIII. The Qualities. They are hot and dry in the second Degree, Incisive, Diuretick, Absterfiv, and Nephritick.

IX. The Specification. They are peculiar in curing the Strangury, provoking of Urine, and in breaking and expelling the Stone.

X. The Preparations. You may have therefrom, 1. A Liquid Juice of the Herb. 2. An Essence of the Herb. 3. A Decoction of the Seed. 4. A Powder of the Seed. 5. A Compositum of the Seed.

The Virtues.

XI. The Liquid Juice of the Herb. It provokes Urine, helps the Strangury, and is good against the Stone

Stone and Gravel in Reins or Bladder, but is not so effectual as the Seed; you may give it Morning and Night, two or three Ounces for a Dose, in a Glass of White Port Wine.

XII. *The Effence.* It has all the Virtues of the Juice, and of the Seed, being used in the same manner and Dose, but is not so powerful or speedy in its Effects as the Powder of the Seed is.

XIII. *The Decoction of the Seed.* It is to be bruised, and then to be boiled in Broth, or Posset-Drink, or rather in White Wine: Dose from four to eight, or ten Ounces, according to the Age of the Patient, two or three times a day, against Strangury, Stone, Gravel, and Tartarous Mucilage impacted in the Reins, Ureters, and Bladder; where note, it is to be used for some considerable time.

XIV. *The Powder of the Seed.* It is found to be of singular force to break the Stone and expel it, whether it be in the Reins or Bladder, it also provokes Urine being stoppt, and helps the Strangury, or making Water by drops, caused by Sand, Slime, or Tartarous Mucilage obstructing those parts; it is indeed a pleasant, safe, and effectual Medicine for the Stone and Gravel, being taken every Night going to Bed, and every Morning fasting, for several days together; when the Patient is troubled with a Paroxysm of the Stone it quickly gives relief, *probatum est.* Dose from two Scruples to a Dram and half in White Port Wine, or in Broth, or in Barley Cream, or in Almond Milk, or in an Emulsion of the four greater cold Seeds; if it is given to two Drams in Womens Breast Milk, or in White Wine, or in Parsly Water, it is very effectual to cause speedy Delivery to Women in Travail, who are not eafie to be delivered.

XV. *The Compositum.* Take Powder of the Seed three Drams, White Amber in Powder one Dram, Ceterach or Spleenwort in Powder half a Dram, mix them. This being taken a Dram at a time, or more, in the Morning fasting, and last at Night going to Bed, in the Juices of Plantane, Purslane, and Lettice, and that for several days together, it certainly cleanses, heals, and cures a Gonorrhœa, or running of the Reins.

C H A P. CCCXXIX.

of G R O M E L the Lesser.

I. *THE Names.* It is called in Greek *Λιθοσπερμον*, *λίθος, σπέρμα*, in Latine *Lithospermum minus*, or *Milium Solis minus*, and in English *Gromel the lesser*, and *Wild Gromel*.

II. *The Kinds.* Of this there are six Kinds, viz. 1. *Lithospermum minus vulgare* Matthioli, Dodonæi, Camerarij, Gesneri, Lobelij, & aliorum, Our common small Wild Gromel. 2. *Lithospermum angustifolium Umbellatum* Bauhini, vel *angustifolium frutescens* Matthioli, Narrow Leav'd Umbelliferous Gromel. 3. *Lithospermum Anchuse facie* Lobelij, *Lithospermum erectum minus* Bauhini, Small Gromel with tufted tops, or Alkanet like Gromel. 4. *Lithospermum Arvensæ Radice rubente*, *Lithospermum Sylvæstre* Tragi, Fuchsj, & Camerarij, & tertium Dodonæi, Echium minus *Lithospermum congener* Gesneri, *Anchusa degener facie* Milij Solis Lobelij, *Anchusa Arvensis alba* Thalij, *Lithospermum Arvensæ Radice rubra* Bauhini, The small red Rooted Corn Gromel. 5. *Lithospermum minimum* Germanicum, Passerina Tragi & Camerarij, *Lingua Passerina* Tabernamontani, *Lithospermum Quærtan* Lo-

nei, Passerina Linaria Gerardi, *Lithospermum Linaria folio* Germanicum Bauhini, Small German Gromel, or Sparrow Wort. 6. *Lithospermum Linaria folio* Monspeliense Lobelij & Lugdunensis, Small French Gromel with Flax Leaves.

III. *The Descriptions.* The first, or Common small Wild Gromel, has a Root which is not very long, but is replenished with many Fibres or small Strings, which sends forth several upright, hard, branched Stalks, full of Joints, two or three Feet high, at every of which Joints grow small, long, hard, and rough Leaves, lesser than the second of the former, and of a dark green color, among which Leaves come forth small white Flowers, and in their places, when they are past, greyish round Seed, like the other.

IV. *The second, or Narrow Leav'd Umbelliferous Gromel,* has a Root which is hard and woolly, covered with a brownish red Bark, from which rise up several woody rough Stalks, yet eafie to break, spread into several Branches, about six, seven, or eight Inches high, with very many narrow rough Leaves growing on them, without any order, the middle Rib in them being something great; the Flowers stand at the tops of the Branches, and sometimes from the upper Joints, divers being set together, as it were in an Umbel, which consist of five small round pointed Leaves, of a blew color; or rather, being long and hollow, are parted, and cut into five parts, set in rough green Husks, in which, after the Flowers are past, there usually grow two white and hard long pointed Seeds, set together.

V. *The third, or Small Gromel with Tufted tops, or Alkanet like Gromel.* Its Root is long and woolly, spreading under Ground, and covered with a rough brownish red Bark, from which rise many hard, brittle, woody, low, and hairy Stalks, rising little above six, seven, or eight Inches high, dividing themselves, even from the Ground, into many smaller Branches, on which are set dispersedly small, long, and narrow, rough green Leaves, whose mid-

the Rib rises up somewhat high; the Flowers for the most part stand at the tops of the Branches in a Tuft or Umbel, many making a Tuft together, and sometimes also at the Joints with the Leaves, standing in rough Husks, which are somewhat larger than any of the other, and of a fine blew color in some, and white or reddish in others, which being pult away, small, and something long, pointed, hard and white Seed follows, two for the most part joined together.

VI. The fourth, or Small red Rooted Corn Gromel. It has a Root which is somewhat reddish, but little or nothing coloring the Fingers of such who touch it; from this Root shoot forth three or four rough Branches or Stalks, divided into other smaller ones, having many small, long, narrow, hairy, dark green Leaves growing on them, very like those of the former Gromels, but not so hard or long, but set without order in like manner; the Flowers grow at the tops, with many small Leaves among them, consisting of five small white Leaves, which being pult away, small blackish Seed succeeds, two, three, or four, set together in the same Husk.

VII. The fifth, or Small German Gromel, or Sparrow Wort, has a Root which is small and thready, and perishes every Year; from this Root rises up for the most part but one slender Stalk, spreading it self out into one, or two Branches at the most, scarcely a Foot high, and set here and there with small, long, and narrow Leaves, something like unto *Line* or *Flax*, upon which, up towards the top, stand small white Flowers, which being pult away, there comes in their places small, smooth, round, blackish Seed, very like unto Gromel Seed.

VIII. The sixth, or Small French Gromel. It has a Root which is small and fibrous, or stringy, from which rises up but one Stalk, branched out into two or three parts at the top thereof, on which grow

long and narrow Leaves, somewhat larger than the former, and not rough, as the other Gromels are; the Flowers are small, of a pale whitish yellow color, like unto the former, but stand many together at the tops of the Branches, where, after they are pult, small round Heads, like *Coriander Seed* arise, in which are contained round, hard, blackish Seed, like unto that of Gromel.

IX. The Places. The four first grow Wild in many places of England, in barren or untilld places, and by the Way sides, the two first of them are said to grow upon the Sea Shoar and Beeches in the Isle of Thanet, near *Reculoers*, among the Kinds of Wild Bugloss there growing; the fourth has been found growing in Corn Grounds, as also in the way from Bristol to Bath, as *Lobel* says.

X. The Times. They all Flower from Midsummer to September, the Seed ripening in the mean while.

XI. The Qualities, Specification, Preparations, and Virtues of these are the same with those in the foregoing Chapter, saving that those in the former Chapter are much the more effectual; and of those in this Chapter the first is only used in Phyllick.

CHAP. CCCXXX.

of GROUND-PINE,

OR,

GOUT-IVY,

OR,

FIELD CYPRESS.

I. THE Names. It is called by the Arabians *Hamastees*, & *Chamastibios*, in Greek *Χαμαστειος*, in Latine *Chamepitys*, (quasi *Humi Pinus*, vel *Picea*;) it is called also *Ajaga*, & *Abiga*, (ab *Abietis* odore, as *Pena* thinks, but as most think, ab *Abigenda partu* & *procurando Abortu*; *Pliny* says, *dicitur propter Abortus*, & ab alijs *Thus Terra*.) Some call it *Iva Arthritica*, (because of its Virtues in curing the Gout, and other Joint Diseases.) We in English call it *Ground Pine*, also *Gout Ivy*, and *Field Cypress*.

II. The Kinds. There are several Species, as 1. Of the Field Kind, of which in this Chapter. 2. Of the Heath Kind, of which in Chap. 331. 3. The Sea Kind, of which in Chap. 332. of all which in order, as follows.

III. The vulgar Field Kinds. Of these we make five several Species, viz. 1. *Chamepitys vulgaris*, which *Matthiolus* takes to be the first of *Dioscorides*, Our Common Ground Pine. 2. *Chamepitys odoratior*, *Chamepitys minor*, The lesser Ground Pine. 3. *Chamepitys Mas*, which I take to be the third of *Dioscorides*, and is his Male Ground Pine. 4. *Chamepitys Austriaca Clusij*, *Chamepitys carulea Baubini*, The Austrian Ground Pine. 5. *Chamepitys Adulterina*, *Pseudochamepitys Lobelij* & *Clusij*, *Chamepitys Spuria Dodonæi*, Bastard Ground Pine.

IV. The Descriptions. The first, or Common Ground Pine, has a Root which is woody, and perishing every Year, the Herb grows low, and seldom rises above an Hand breadth high, shooting forth several small Branches, set with slender, small, long, narrow,

narrow, greyish, or whitish Leaves, somewhat hairy, and divided into three parts oftentimes, many bushing together at a Joint, and some of them growing sometimes also scatteredly upon the Stalks, smelling something strong, like unto Rosin, or the smell of the Pine Tree; the Flowers are very small, and of a pale yellow color, growing from the Joints of the Stalks all along among the Leaves, after which come small, long, and round Husks.

Common Ground Pine.

V. The second, or Lesser Ground Pine, has a Root which is somewhat long and fleshy, like the Root of Succory, or Dandelion, with many Fibres thereat, but smaller; it is also a small Herb, growing up with many hairy and hoary white slender Branches, not above a Hand breadth high, on which are set many small long Leaves, yet shorter than the former, hairy also and hoary white, not in Tufts or Bushes, but growing by couples, close together all along the Stalks, cut in, or divided into some parts, of a strong but sweet scent, much sweeter than the former; at the tops of the Branches grow the Flowers, many together, of a pale yellowish white color.

VI. The third, or Austrian Ground Pine, has a Root composed of many black Strings, and hard, growing deep into the Ground, and springing again fresh every Year; from this Root rise up several square, strong, hairy Stalks, a Foot long, with many Joints on them, at which grow two something long and hard Leaves, a little like unto the first, but broader, green, and shining on the upper side, but somewhat hoary and full of Veins on the under side, divided into three or four parts, and sometimes into more, a little hot in taste, but not unpleasant, nor of any displeasing scent; from the Joints spring forth smaller Branches, with the like Leaves on them, but lesser divided, and towards the tops nothing at all, but smooth and long, like unto Rosemary Leaves; from the upper Joints, and ends of the Stalks and Branches, grow several gaping Flowers, like unto Germander, of a deep Purple or Violet Color for the most part, but sometimes of a lively Red Color, and sometimes of a bleaker Blue, or Sky Color, the lower Leaves or Chaps of the Flowers being whi-

tish, spotted with red Spots; after which come black, shining, longish, and cornered Seed, four for the most part enclosed in every of those rough Husks, in which the Flowers stood before.

Small Ground Pine.*Male Ground Pine.*

VII. The fourth, or Male Ground Pine, has a small single Root, of a woody substance, which strikes pretty deep into the Ground, with some few Fibres shooting from it. It is a small Herb, and very ten-

de, creasing upon the Ground, having small and crooked Branches, full of Joins; at every Joint from the bottom comes forth two long Leaves, one on each side the Joint, which are long, narrow, and slender at the bottom, but as they proceed in length are hairy, and cut or jagged deeply, almost to the middle Rib, into two, three, or four deep Jags, not much unlike to a Bucks Horn, saying that the ends of these Jags are rounder pointed, or broader; at every of these Joins, with the Leaves, at their bottoms grow the Flowers, without any Footstalk, one at the foot of each Leaf, and spring out of a little rough Husk, being small, and of a pale yellow color, and sometimes also white; the Leaves growing on the upper Joins, as they approach the top, are for the most part divided into three long parts, not very much unlike to *Rosemary* Leaves.

VIII. *The fifth, or Bastard Ground Pine, has a Root which is somewhat thick and white, abiding all the Winter.* It grows like a small bushy Herb, very like unto the *Common Kind*, having small hairy Stalks, set full of long hairy Leaves all along them, parted into three long parts, of almost no scent, but an unpleasant Herby one; the Flowers stand at the Joins with the Leaves at the tops of the Branches, very like to those of the *Common Ground Pine*, but somewhat greater, and of a white color; after the Flower the Seed follows, which is greyish, greater and rounder than the *Common Kind*, four for the most part contained in every one of those brownish rough Husks.

IX. *The Places.* The first grows Wild in *England*, chiefly in *Kent*, (not growing in many other Shires that we know of) very much about *Dartford*, along to *Southfleet*, *Gravesend*, *Cobham*, *Rochester*, *Horton*, and *Sutton*, and upon *Chatham Down*, hard by the *Beacon*, and half a Mile from *Rochester*, nigh a House called *Selfey*; the other four are chiefly nursed up in Gardens, but grow Wild in *Italy*, *Savoy*, *Genoa*, *Spain*, and *Austria*.

X. *The Times.* They all Flower in *June*, *July*, and sometimes in *August*, and give their ripe Seed in the mean time, or not long after.

XI. *The Qualities.* *Ground Pine* is hot in the second degree, and dry in the first, it is Inciding, Aperitive, Absterive, Diuretick, Hepatick, Splenetic, Nephritic, Hysterick, and Arthritic, Emmenagogick, a little Sudorific, Chylific, Spermatogenic, and Alexipharmick.

XII. *The Specification.* It is peculiar against the Strangury, and Hysterick Fits, provokes the Terms, facilitates the Labour, and expels the Dead Child and Afterbirth.

XIII. *The Preparations.* You may prepare therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction. 4. A Diet Drink. 5. A Conserve of the Tops and Flowers. 6. Pills. 7. An Ointment or Balsam. 8. A Cataplasim. 9. A Lotion. 10. A Distilled Water. 11. A Spirit. 12. An Acid Tincture. 13. A Spirituous Tincture. 14. An Oily Tincture.

The Virtues.

XIV. *The Liquid Juice.* It does admirably prevail against the Strangury, and all stoppages of Urine, or any inward pain arising from those Diseases of the Reins, Ureters, and Bladder; it may be given Morning and Night, from two to four Spoonfuls, in a Glass of White Port Wine.

XV. *The Essence.* It has all the former Virtues, besides which it singularly opens obstructions of Liver and Spleen, clarifies the Blood, removing its grossness and impurities, it expels that which is

congealed in the Stomach, or other Bowels, and gently opens the Body; it also wonderfully helps all Diseases of the Mother, taken inwardly, and outwardly used, by injection; it provokes the Terms, facilitates the Delivery of Women in Travail, and expels the Dead Child and Afterbirth; yea, it is so powerful upon those parts, that it is forbidden to Women with Child, for that it is apt to induce Abortion, or Delivery before the time; it is powerful and effectual also in all Pains and Diseases of the Joins, as Gouts, Sciatica, Rheumatism, Cramps, Convulsions of the Nerves, Palfies, Falling-Sickness, and other Distempers of like kind, being used both inwardly, and outwardly applied, or bathed upon the parts affected; it is also an especial good help against the Jaundice, griping pains of the Belly, or any pains in the other Viscera, proceeding from Cold and Flegmatick Humors. Dose four, five, or six Spoonfuls, mixt with some Generous Wine, Morning, Noon, and Night, according as the weakness of the Patient, and necessity of the occasion may require.

XVI. *The Decoction in Wine.* It has all the Virtues of the Liquid Juice and Essence, and may be given Morning, Noon, and Night, half a Pint at a time; it ought to be made of the Plant or Herb, when it is in Flower chiefly, for then it is strongest and most powerful; it provokes Sweat, if taken when the Patient is in a naked Bed, and covered warm down upon it; it prevails also against the Poyson of the *Aconites* of all sorts, and of other Poysonous Herbs, as also against the Biting of Mad Dogs, and other Venomous Creatures, the Stinging of Scorpions, Hornets, Wasps, Bees, &c. and is a singular good thing against a Cough, especially in the beginning, before it is grown inveterate.

XVII. *The Diet Drink.* It is made by Tunning it up in new Ale or Beer when it is first set on working, four Handfuls to a Gallon, and may be drunk after four or five days, Dietetically, against all those Diseases for which the Juice, Essence, or Decoction are given, and is more pleasant for queasie Stomachs.

XVIII. *The Conserve.* The Conserve of the Flowers participates of all the former Virtues, but in a much weaker degree, however *Matthiolus* commends it against the Palfie; it may be taken to the quantity of a Walnut every Morning fasting, and last at Night going to Bed, for some time.

XIX. *The Pills.* There are three sorts of Pills made with this Herb. 1. *Pilule Chamapityos Simplicis*, Simple Pills of Ground Pine. They are made of the Powder of the Herb, and Mucilage or Pulp of Figs, and have the Virtues of the Juice, Essence, and Decoction, given Morning and Night, from one Dram to two Drams, washing them down with a Draught of the Decoction of Ground Pine in Wine aforementioned. 2. *Pilule Chamapityos Compositae*, Pills of Ground Pine Compound. Take Powder of Ground Pine five Ounces, fine Powder of *Hemodactyl* three Ounces, *Sal Nitre* two Ounces, *Scammony* in fine Powder one Ounce, *Venice* or *Strasbourg Turpentine* a sufficient quantity, mix, and make a Mass of Pills. Dose one Dram, or more, in the Morning fasting. They cure the Dropsie, Jaundice, Gout, Sciatica, Kings-Evil, Strangury, and all stoppages and heat of Urine. 3. *Pilule Chamapityos Matthioli*, *Matthiolus* his Pills of Ground Pine. Take Ground Pine, Betony, *Rosemary* Flowers, *Stachas*, all in fine Powder, of each one Ounce, of *Agarick* in Powder two Ounces, of *Rhubarb*, *Turbit* in Powder, of each an Ounce and half, *Colocythis* in Powder half an Ounce, *Diagredium*, or rather *Scammony* in Powder, one Ounce, *Hiera Picra* in *Complex* four Ounces, *Ginger*, *Spicknard*, *Sal Gem*, of each

in Powder two Drams, mix them, and with Juice, or rather Syrup of Ground Pine, make a Mass of Pills. Dose one Dram, or Dram and half, at Bed time. These Pills he commends against the Palsie, and says they will give a present and speedy help; I have several times used them against the Scurvy, Dropfie, Jaundice, Gout, Rheumatism, Kings-Evil, Obstructions of the Lungs, and in malignant and putrid Ulcers, Fistula's, &c. with admirable success.

XX. *The Ointment or Balsam.* Anointed on the Fundament it prevails against the Piles, tho' ulcerated, it dissolves hard Tumors, as well in Womens Breasts as in other parts of the Body, but for this purpose the Ointment is only to be used; the Ointment or Balsam do not only cleanse putrid, stinking, foul, malignant and virulent Sores and Ulcers of all sorts, but they also conglutinate the Lips of Green Simple Wounds in any part; and quickly heal the same; the Balsam is an excellent thing against the Gout and Sciatica, being often and long applied.

XXI. *The Cataplasim.* Made of the Green Herb, with Pulp of Figs, or Honey, and being applied to Womens Breasts, it dissolves the hardness of them, as also other hard Tumors in any other part of the Body; it cleanses also putrid, malign, and virulent Ulcers and old Sores in what part soever.

XXII. *The Distilled Water.* It is a good thing against Sand and Gravel, the Strangury, and other Distempers of the Urinary parts and Womb, but it is much more effectual if it is drank fix Ounces at a time, mixt with one or two Ounces of the Liquid Juice or Essence of the Herb.

XXIII. *The Lotion.* Take of the Juice or Essence four Ounces, of the Distilled Water six Ounces, Madder in fine Powder three Drams, Alum two Drams, Honey four Ounces, mix, digest over a simmering heat for an Hour, then use it as a Gargarism; it cures a sore Mouth or a sore Throat in a very little time, after an admirable manner, and that when many other things have failed.

XXIV. *The Spirit.* It comforts the Head, Brain, and Nerves admirably, and is prevalent against Lethargies, Palsies, Convulsions, Numbness, and other like Distempers, given from one to two, three, or four Drams, either alone dulcified, or mixt with any other proper Vehicle; it also is singularly good against Sickness at Heart, Fainting and Swooning Fits, and other Disaffections of like kind.

XXV. *The Acid Tincture.* It powerfully opens Obstructions of the Reins and Bladder, represses Vapours from the Spleen and Womb, is good against Sand, Gravel, and Stone, and of excellent use against the Scurvy; it rectifies the obliquity of the Stomach, causes a good Appetite and Digestion and opens Obstructions of the Lungs, helps Wheezings, Hoarseness, difficulty of breathing, shortness of Breath, Coughs, Colds, and the like. Dose so many drops as to give the Vehicle a pleasing acidity, and to be used in all that the Patient drinks.

XXVI. *The Spirituous Tincture.* It is good against Heart Qualms, Palsies, Convulsions, Lethargies, and other Diseases of the Nerves; it strengthens the Stomach, and being given to three or four Drams it provokes Sweating, and is good against the Bittings of Mad Dogs, Serpents, and other Venomous Creatures. Dose ordinarily two Drams, in a Glas of Wine, or any other convenient Vehicle, twice or thrice a day.

XXVII. *The Oily Tincture.* Inwardly taken it prevails against the Stone and Gravel, or Tartarous Matter in the Reins or Bladder, and by fortifying the Stomach and Head, as also the Original of the Nerves, it is found by experience powerfully to restore in the Palsie; outwardly applied, (by well anointing upon the part) it cures all Pains and Aches

proceeding from Cold, strengthens weak Limbs and Joints, gives ease in the Gout and Sciatica proceeding from a cold Cause, prevails against Cramps and Convulsions of the Nerves, and is a singular thing against the Palsie, the *Spina Dorsi* being well anointed therewith Morning and Night, together with the parts affected.

C H A P. CCCXXXI.

Of GROUND-PINE Sea,

O R,

Sea GOUT-IVY.

I. *THE Names.* It is called in Greek *Χαμαίπυτος* *χαμαίπυτος*, *Ἀνθύλλος ἐλάσθεος*, in Latin *Chamaepitys* *Maritima*, *Anthyllis Herbariorum*, *Anthyllis altera* *Dioscoridis*, *Anthyllis Chamaepityoides*, also *Iva Moschata* by some, in English *Sea Ground Pine*.

II. *The Kinds.* It is the second generick Species of *Ground Pine*, mentioned in Chap. 226. Sect. 2. a foregoing, and a singular Plant of the Kind; it is the *Anthyllis altera Clusij*, who says it is very like unto *Chamaepitys*; but *Busbinus* refuses to Name this with the *Anthyllides* in his *Pinax*, and therefore puts it among his *Chamaepityoides*.

III. *The Description.* It has a Root which is somewhat thick and white, which sends forth several hard hairy Stalks, without Branches upon them, upon which do grow many somewhat long and narrow Leaves, without order, one above another, bushing thick at the top, somewhat like unto those of *Chamaepitys*, or *Ajuga*, but dented about the edges, and hairy also, something of a warming hot taste, and strong unpleasant savour; the Flowers grow among the Leaves upon the Branches, like unto the Flowers of *Chamaepitys*, or *Ground Pine*, but of a purple reddish color, after which come small greyish, rough Seed, a little long, and four for the most part in every Husk.

IV. *The Places.* It grows upon the Sea Coast in several Countries and Kingdoms, I found it in several places on the Sea Coast of *Florida*.

V. *The Times.* It Flowers in *July* and *August*, and the Seed is ripe in *September*.

VI. *The Qualities.* It is hot and dry in the second degree, Aperitive, Absterfiv, and Diuretick, Nephritick, Hysterick, and Alexipharmick.

VII. *The Specification.* It is prevalent against Sand, Gravel, and Tartarous Matter in the Reins and Bladder, and to cure the Scurvy.

VIII. *The Preparations.* You may have therefrom, 1. A Liquid Juice, or Essence. 2. An Oil by Collion in Oil Olive.

IX. *The Liquid Juice, or Essence.* It powerfully provokes Urine, and cleanses the Reins and Bladder of small Stones, Gravel, Sand, and Tartarous Matter, thereby giving a Cure in the Strangury; if it is given to one or two Ounces, according to Age and Strength, in the Morning fasting, and last at Night going to Bed, in a Glas of *Oxymel*, or White Port Wine, it does much good against the Falling-Sickness, and taken daily for some time, a Spoonful at a time, in a Glas of Wine, it represses Vapors, and Fits of the Mother.

X. *The Oil by Infolation or Collion in Oil Olive.* Injected

Injected into the Womb it softens the hardness thereof, and by anointing dissolves hard Tumors in other parts of the Body.

C H A P. CCCXXXII.

of GROUND-PINE Heath,
O R,
GOUT-IVY Wild.

I. THE Names. It is called in *Greek* *Koen, ob pulchritudinem, verum Hippocrates & Antiqui Koen, i. e. Pupillam, vocarunt propter Semen, Oculi Pupille, seu anteriori Humeri Crystallino, ambitu Spherico, haud obfcurum cernitur, in Latine Coris, and in English Heath Ground-Pine, and Fair Heath Ground-Pine.*

II. The Kinds. It is the third Generick Species of Ground-Pine mentioned in *Cap. 330. Sect. 2.* and of this Species Authors have enumerated three several Kinds, viz. 1. *Coris Matthioli*, so called by *Camerarius, Gesner, Lacuna, Lonicerus, Lobel, Lugdunensis, Tabernamontanus, & alij*; *Coris lutea Baubini*, The Common, or most vulgar Fair Heath Ground-Pine. 2. *Coris Legitima Erica similis Belli, Coris Legitima Cretica Belli*, Fair Heath Ground-Pine of Candia. 3. *Coris Monspelienfium, Coris Monspelica Pena & Lobelij, Camerarij & Tabernamontani, Coris quorundam Clusij, Coris cerulea Maritima Baubini, Coris Purpurea*, Purple Fair Heath Ground-Pine.

Heath Ground-Pine.

III. The Descriptions. The first, or Common Heath Ground-Pine, has a Root which is somewhat long and woody, with many fibrous Threads thereto adjoining, from which spring up several hard, woody, reddish Stalks, full of Joints, rising up to the height of a Foot, or more, and having also on them many small and long, thick and fat Leaves, set together

at every Joint, something like unto *Spergula*, or *Frank Spurry*; at the tops of the Stalks grow several Flowers, each of them upon a short footstalk, consisting of five or six Leaves, not much unlike to *Hypericon*, or *Ornithogalum, Star of Bethlem*, as *Lobel* compares them, but of a whitish red color, with yellow Threads in the middle, yet *Matthiolas* and others say the Flowers are all yellow, like *Hypericon*, smelling a little sweet, which being past away, the Seed is found enclosed in round Heads. This Plant keeps its green Leaves all the Winter, but turn of a somewhat yellowish red color towards Autumn.

IV. The second, or Fair Heath Ground-Pine of Candy, has a Root which is long, spreading, and woody, abiding with green Leaves thereon all the Winter. This Plant, as *Bellus* saith, grows in good Ground to be a Cubit and half high, Branching forth many ways, and bearing many small Leaves, like unto Heath, on woody Stalks and Branches; the Flowers grow at the tops of the Branches, and are much like to those of *Hypericon*, and of a yellow color, which being past away the Seed follows, being enclosed in Husks like the former.

V. The third, or Purple fair Heath Ground-Pine, has a Root which is reddish, hard, and woody, greater than the proportion of the Plant should seem to require, giving a Dye or Color, not only to the Fingers of them which touch it, but serves also to Dye Linen Cloth withal, among those People where it grows naturally, it abides all Winter, altho' the Leaves are then more reddish than in Summer, but requires some care to preserve it with us. From this Root rise up many round, woody, and reddish Stalks, not so high as the former, having many small, long, thick, and roundish Leaves set thereon, most commonly without order, and yet sometimes conformable one to another, somewhat like unto the greater Kind of Heath; the tops of the Stalks are furnished with a great Spiked Tuft or Bush of Purplish Blew Flowers, (but of a pale Red with us) smelling something sweet, each consisting of four Leaves apiece, double forked as it were at the ends, two whereof which stand uppermost are greater than the other two which are lower, which will continue long in their perfect color, being gathered in their prime, and each of them standing in a brownish Husk, parted at their tops into five points, and spotted with five blackish spots on the outside, wherein afterwards grows the Seed, which is small, round, and blackish, wrapped up as it were in many Coats or Films, whose Husks then do grow somewhat hard, and sharp at the ends, when as before, while the Flower lasted, they were not so.

VI. The Places. The first *Matthiolas* says grows in many places in Italy in dry and Hilly Grounds, which *Pena* confirms; it grows by *Carara*, a Village in *Liguria*; the second grows in Candy, the last, as *Pena* says, about *Mompelier*, also near the Sea in *Valentia*, and in dry Grounds about *Salamanca* in Spain, as *Clusius* says; with us in England they only grow in Gardens, but I have found them all growing in dry Hilly Ground in several parts of Florida.

VII. The Times. They Flower early in all those hot Countries, even in March in some places, and in others in April and May, but with us in England later, as in June and July, but do seldom perfect their Seed with us.

VIII. The Qualities, Specification, Preparations, Virtues and Uses, are fully the same with the Common Ground-Pine in *Chap. 330. Sect. 11. to Sect. 26.* and therefore to the same we refer you.

IX. Note, 1. The Seed of Heath Ground-Pine, either bruised and drunk, or made into a Decoction in

in White Port Wine, powerfully provokes Urine, and the Terms in Women where they are stopped, and also cures the Strangury, if the Bladder is not exulcerated; it is also a Remedy for those who are bitten with the *Phalangium*, and for those troubled with the Gout and Sciatica, if barbed therewith; and taken with Pepper in subltance, it represses the shaking Fits of Agues: the same things do the Juice, Effence, or Decoction of the Herb.

X. *Note.* 2. An Oil, Ointment, or Balsum, made of the Seed or Herb, ease the Gout and Sciatica, anointing therewith; they also heal any old or running Sore or Ulcer, and dry up that superfluous moisture, which by an afflux upon the part, hinders the Cure.

C H A P. CCCXXXIII.

of GROUNDSEL Common.

I. *THE Names.* It is called in Greek *Ἐρίγωνα*, *Erigeron*, quia vere Senescit, in Latine *Erigerum*, *Senecio*, & *Senescio*, quia cito Senescit, and in English *Groundsel*, and *Gransel*.

II. *The Kinds.* There are two several sorts of *Groundsel*. 1. The Common Kind, of which in this Chapter. 2. The Cotton *Groundsel*, of which in Chap. 334. following. Of the Common Kind there are also two sorts, 1. *Senescio*, vel *Senecio vulgaris*, (called by some Authors *Senecio minor*, because they call *Jacobea*, or *Ragwort*, *Senecio major*) and *Erigerum*, from the Greek Name, Common or Vulgar *Groundsel*. 2. *Senecio*, vel *Erigerum Montanum*, *Senecio Montanus*, *Senecio secundus Tabernamontani*, Mountain *Groundsel*.

Groundsel

III. *The Descriptions.* The first, or Common *Groundsel*, has a Root which is small and thready, and soon perishes, from whence rises a round, green,

and somewhat brownish Stalk, spreading it self towards the top into some Branches, set with long, and somewhat narrow green Leaves, very much jagged, or cut in on the edges, something like unto Rocket, or rather an Oaken Leaf, but lesser, and round at the ends; at the tops of the Stalks and Branches grow many small green Heads, out of which grow small yellow Threads or Thrums, which are the Flowers, which continue many days blown in that manner before they pass away into Down, and with the Seed, (which is long) is carried away with the Wind; but from this Seed which is thus shed it soon rises again, so that it may be seen many Months in the Year young and green, and in Flower, and in Seed, for it will spring up and Seed twice in a Year at least, if it is suffered to grow in a Garden.

IV. *The second*, or Mountain *Groundsel*, has a Root like unto the former, and rises up with a like round and green Stalk, which is branched in the same manner; it is almost wholly like the other, but it grows not altogether so high, and its Leaves are greater, and more cut in on the edges.

V. *The Places.* The first is found every where almost, as well on the tops of Walls as on the Ground amongst Rubbish, and in untill'd Grounds, but more especially in Gardens; the other grows upon Hills and Mountains, both in England and places beyond the Sea.

VI. *The Times.* The first is found to Flower almost in every Month of the Year, perfecting its Seed in the mean season; the second comes somewhat near unto the first, but its Flowers do not so suddenly decay.

VII. *The Qualities.* It is cold and moist in the first degree, is Digestive, Absterfive, Diuretick, and Emetick.

VIII. *The Specification.* It is a peculiar Remedy against the Yellow Jaundice, stoppage of Urine, Diseases of the Eyes, and the Falling-Sickness.

IX. *The Preparations.* You may make therefrom, 1. A Liquid Juice. 2. An Effence. 3. A Decoction in Ale, Beer, Wine, or Water. 4. A Powder of the Herb. 5. A Balsam or Ointment. 6. A Cataplasim. 7. A Distilled Water.

The Virtues.

X. *The Liquid Juice.* If it is drunk from one Ounce to two Ounces, mixed in any proper Vehicle, it cleanses the Stomach from all corrupt and crude Humors by Vomiting, whereby it eases the Pains of the Stomach caused from the abounding of Choler; it is also good against the Jaundice and Falling-Sickness, in which two Cases it ought to be several times repeated; it also takes away the heat, scalding, sharpness, and stoppage of Urine, and the pain in making Water, expelling Sand, Gravel, Stones, and Tartarous Matter from the Reins and Bladder.

XI. *The Effence.* It has all the former Virtues, and is much more pleasant to take; it prevails against the Colick, and Gripping of the Guts, as also the Gout, Sciatica, and Rheumatism, it purges the Liver of its Recrements, and provokes the Terms in Women, giving it from two Spoonfuls to four in White Port Wine; it Vomits as the Juice does, and therefore must be given with the same caution.

XII. *The Decoction in Ale, Beer, Wine, or Water.* It has all the Virtues of the Juice and Effence, and works in the same manner, but not all out so strongly, and therefore may be given from four to eight, or ten Ounces, according to Age and Strength.

XIII. *The Powder of the Herb.* It may be given to a Dram or more in Oxytel, proportioning the Dose

Dose according to Age and Strength of the Patient; it effectually cleanses the Stomach, and prevails against Gout, Sciatica, Rheumatism, Jaundice, Dropsie, and Epilepsie; it is also said to expel Sand and Gravel from the Urinary parts; it dries up also Humidities in Wounds and Ulcers.

XIV. *The Balsam or Ointment.* It may be made with the green Herb, or with the juice of the Leaves, adding some fine Frankincense, or Olibanum in Powder; it cleanses and heals Ulcers and old Sores, and cures Wounds, whether in the Flethy or Nervous parts, strengthens the Joints, gives ease in the Gout, dissolves hard Tumors, and prevails against the Hemorrhoids or Piles in Man or Woman.

XV. *The Cataplasm.* Made of the fresh Herb by boiling, &c. and applied to Womens Breasts which are swollen with heat and pain, as also to the Privy Parts of Man or Woman, and to the Hemorrhoids, or *Ficus in Ano*, tho' much swelled and inflamed, it gives present relief; if Salt is added to it it dissolves Knots or Kernels in any part of the Body, yea tho' proceeding from the Kings-Evil.

XVI. *The Distilled Water.* It is said to be effectual against all the aforementioned Diseases, besides which it is especially good against Inflammations of the Eyes, and to help the watering of them, proceeding from a deluxion of Rheum, and weakness of the part.

XVII. *Note.* Pliny has a Relation for the Cure of the Toothach, which, tho' it seems Fabulous, we shall here relate. You must dig up the Plant without any Iron Tool, and then touch the aking Tooth therewith five times, Spitting three times after every such touch, which done, Plant or Set the Herb again in the same place, so that it may grow, and the Toothach shall presently cease and be perfectly cured.

C H A P. CCCXXXIV.

of GROUNDSEL Cotton.

I. *THE Names.* It is called in Greek *'Helyson*, *γρᾶνδσελ*, in Latine *Erigeron Tomentosum*, *Senecio Tomentosus*, *Senecio Tragi*, and in English Cotton Groundsel, or Woolly Groundsel, also Clammy Groundsel, from the Leaves sticking as it were unto ones Fingers.

II. *The Kinds.* There are three several Species of this Kind, viz. 1. *Sentio incanus*, *Erigerum Tomentosum*, *Senecio Tragi*, Cotton Groundsel. 2. *Erigerum Tomentosum alterum*, *Senecio satidus*, *Erigerum satidum* Thalijs, *Senecio incanus pinguis* Bauhins, *Jacobaea Pannonica prima* Clusij, Stinking Cotton Groundsel. 3. *Senecio odoratus*, *Senecio Flore colorata* Camerarij, Sweet smelling Cotton Groundsel.

III. *The Descriptions.* The first, or Common Cotton Groundsel, has a Root which is small, and full of Fibres; it has much larger Leaves, and more jagged or torn in on the edges than the former Common sort, and of a greyish or Ash Color, soft and hairy, or rather hoary all over; the Stalks are higher and greater, but with such like yellow Flowers upon them, and as soon fading and turning into Down as the other: this differs chiefly from the for-

mer Common sort in the hoariness and largeness, as well of the whole Plant as of the Leaves.

Cotton-Groundsel.

IV. *The second, or Stinking Cotton Groundsel,* has a Root which is very fibrous, yet lasteth not after Seed time, but perishes as the Common does, and springs again of the shed or fallen Seed: It has many fair, large and long Leaves lying next the Ground, very much jagged or torn in on the edges, whereby they consist of many divisions, somewhat like unto those of *Mugwort*, for which reason some have called it *Arthemisia fetida*, but it is soft, and in handling very hairy, being also bedewed with a fatty clamminess, so much that the Leaves will stick to the Fingers of those that touch them, and one Leaf will also stick unto another, so as with some difficulty to be taken asunder; it smells somewhat strong, and of an ill scent, (tho' not unpleasantly to some) as *Clusius* says, but like *Scrophularia*, or *Ebulus*, as others say, from among which Leaves rise up hairy crested Stalks, half a Yard high, spread out into several Ramifications or Branches, but bearing at their tops fewer Flowers, lesser, and of a paler yellow color than the Common Groundsel, and upon longer Footstalks, which quickly fade, and turn into Down, as the others do.

V. *The third, or Sweet smelling Cotton Groundsel,* has a fibrous perishing Root, as the others have, from which rise up Leaves and Stalks, like the others; and indeed this Groundsel is somewhat like the last kind in the soft and woolly Leaves, but not so much jagged or torn on the edges as it; its smell is sweet, something like unto *Ambrosia*, or *Oak of Cappadocia*, or the middle *Coniza*, or *Fleabane*; the Flowers are like the rest, and as soon growing old and Downy, as the others do.

VI. *The Places.* The first grows by Wood sides, and borders of Fields, as also upon old Walls, in many

many places; the second grows also in woody, barren, and mottled places; the third was sent by *Josephus de Casabona*, Herbarist to the Great Duke of Tuscany, to *Camerarius* out of Italy.

VII. *The Times.* The first Flowers almost every Month, as the Common Kind does, the two last Flower in May, June, July, and August.

VIII. *The Qualities, Specification, Preparations and Virtues* of these are the same with those of the Common Kind, delivered in the former Chapter from Sect. 7. to Sect. 18. and therefore we shall say no more thereof in this place.

C H A P. CCCXXXV.

Of HARES--BELLS English,

O R,

English HYACINTH.

I. *THE Names.* It has no known Greek Name, but in *Latine* it is called *Hyacinthus Anglicus*, *Hyacinthus Belgicus*, and *Hyacinthus Hispanicus*, in *English* Hares-Bells, or *English Hyacinth*.

II. *The Kinds.* Of this Plant there are four Kinds, viz. 1. *Hyacinthus Anglicus Caruleus*, *Hyacinthus non scriptus Dodonæi*, (because none wrote of it before him) *Blew English Hares-Bell*, and *Blew English Hyacinth*; but it is as well called *Belgicus*, and *Hispanicus*. 2. *Hyacinthus Anglicus Albus*, *Hyacinthus Belgicus Candidus*, *White English* or *Dutch Hares-Bells*, or *White English* or *Dutch Hyacinth*. 3. *Hyacinthus Anglicus*, aut *Belgicus Flore Incarnato*, *Carnation English* or *Dutch Hares-Bells*, or *Hyacinth*. 4. *Hyacinthus Hispanicus major*, *Flore Campanule infiar*, The greater Spanish Hares-Bells, or *Bell-Flowered Hyacinth*.

Blew English Hares Bell

III. *The Descriptions.* The first, or *Blew English Hares-Bells.* The Roots of all these sorts agree, and are alike, being robute, and very slimy, some of which will be great and round, others longer and slender, and those which lye near the top of the Earth bare, will be of a green color. From this Root rises up several long and narrow green Leaves, not standing upright, nor yet fully lying upon the Ground, among which springs up the Stalk, bearing at the top many long and hollow Flowers, hanging down their Heads, all forwards for the most part, and divided at the btims into six Leaves or Divisions, turning up their points a little again, of a sweetish but heady scent, somewhat like unto the Grassie Flower; the Heads for Seed are long and square, in which are contained much black Seed; the color of the Flowers are in some a deeper Blew, tending to a Purple, in others of a paler Blew, or of a bleak Blew, tending to an Ash Color; and some are Partly Colored.

IV. *The second, or White English Hares-Bells, has Roots, Leaves, Stalks and Flowers very like the former,* saving, that the Leaves in this are somewhat broader, and the Flowers more open, and of a very white color, yet sometimes they are White and Blew mixt together.

V. *The third, or Carnation English Hares-Bells. These in their bulbous Roots, Leaves, Stalks, Flowers, and Seed, as also in their magnitude and form of growing, are very like to the first and second Kinds,* saving that the Flowers in this are of a fine Carnation Color for the most part, or of a fine delayed purplish Red, or bluish Color, which some call a Peach Color.

VI. *The fourth, or Greater Spanish Hares-Bells. It has a bulbous Root, from whence spring up several long and narrow green Leaves, which have not strength enough in themselves to stand upright, but a little incline or bend downwards.* This Plant is very like to the first foregoing, but that it is greater in all its parts, as well of Leaves as Flowers, many growing together at the top of the Stalk, with many short green Leaves among them, hanging down their Heads, with larger, greater, and wider open Mouths, like unto Bells, of a dark Blew Color, and of no pleasing smell.

VII. *The Places.* The first *Parkinson* says is so common every where, that it scarcely needed any Description, and that it is more frequent in *England* than in the Low Countries, or in *Spain*; it grows in Woods, Copse, and in the borders of Fields, every where throughout *England*; the second and third are not so common, but they grow in the Woods by *Colchester*, in *Essex*, in the Fields and Woods by *Southfleet*, near unto *Gravesend*, in *Kent*, as also in a piece of Ground by *Canterbury* called the *Clapper*, also in the Fields by *Bath*, and in the Woods by *Warrington*, in *Lancashire*, and in other places.

VIII. *The Times.* They Flower from the beginning of May to the end of June, and the Seed ripens in the mean Season, and in some little time after.

IX. *As to their Qualities, Specification, Preparations and Virtues* Authors have said nothing, nor do we know any thing by Experience concerning the same, saving, that an Ointment being made of the Roots hereof, is of singular use to strengthen weak Joints.

X. *Note.* The Root of *Hares-Bells*, as it is generally bulbous, so it is full of a thick, slimy, Emplastick Juice, which is of so strong a body, that it will serve to set Feathers upon Arrows, instead of Glue, or to paste Books with; and hereof was formerly made the best Starch, next to that of *Arum*, or *Wake-Robin* Roots.

C H A P. CCCXXXVI.

Of H A R E S--E A R S.

THE Names. This Plant is called in Greek *Βεπλευρον*, *Bupleurum* Plinij, *ισχυλλας* Cordi, in Latine *Bupleurum*, *Auricula Leporis*, *Herba Vulneraria* Tragi, who takes it to be *Panax Chironium* Theophrasti, in English Hares-Ears. It is doubtless the *Bupleurum Hippocratis*, mentioned by Pliny Lib. 22. Cap. 22. and by Nicander in *Theriakis*. Gesner says that the French call it *Elaphoboscum*, and *Gratia Dei*. Some take it to be *Panax Chironium Dioscoridis*, but falsely. Some will have it to be *Ammi vulgatus*, others to be *Sanamunda*. Cordus in his History of Plants calls it *Isophyllum*, so that there is great difference of Opinions among Herbarists in judging to what Plant of the Ancients it ought to be assigned; however, as long as we know what Plant it is to which we give the present Names it is sufficient.

II. The Kinds. There are three Kinds hereof, viz. 1. *Bupleurum Angustifolium*, *Auricula Leporis Angustifolia*, Hares-Ears narrow Leav'd. 2. *Bupleurum Latifolium*, *Auricula Leporis*, *Herba Vulneraria*, *Isophyllum*, Hares-Ears broad Leav'd. 3. *Bupleurum Angustifolium Montanum*, *Sedum petreum Bupleuri Folio*, vel potius *Bupleurum petreum Gramineo Folio Pens.* *Perfoliata Alpina Gramineo Folio*, sive *Bupleurum Angustifolium Alpinum*, *Bupleurum Angustifolium Folio Baubini*, Narrow Leav'd Mountain Hares-Ears.

Hares Ears narrow
leaved

III. The Descriptions. The first, or Common narrow Leav'd Hares-Ears, has a Root which is somewhat long, but small, and white on the outside, much like to a Parsly Root, with divers Fibres adjoining, which with us in England perishes every Year. This Plant rises up with a round, stiff, green Stalk, two

Feet high, at the several Joints whereof grow several long and narrow, very dark, green, smooth, shining Leaves, broadest at the bottom, and narrower gradatim unto the ends, with divers Ribs running thro' them, the middlemost whereof is greatest, yet nothing so narrow as Grass Leaves, tho' some Authors do compare them with them; these Leaves stand one above another up to the top, growing smaller and smaller, being placed likewise at the Joints, from the middle of the Stalks, at the least, upwards (if it grows in any good Ground) come forth small Branches, (and sometimes with few or no Branches at all) at the tops whereof stand many small Tufts or Umbles of yellowish Flowers, which turn into small Seed, not much unlike to Parsly Seed, but of a darker color, and somewhat longer.

Hares
Ears
broad
Leaved.

IV. The second, or Broad Leav'd Hares-Ears, has a Root like the former, and grows in the same manner, with like Stalks, Branches, Flowers, and Seed; but herein this chiefly differs from that, viz. that this bears broader but shorter Leaves, smallest at the foot, broadest in the middle, and ending in a small sharp point, somewhat hollow, and bowing downwards, with several long Nerves or Ribs therein, as in the former, and the middle Ribs most eminent, or raised highest.

V. The third, or Narrow Leav'd Mountain Hares-Ears, has a round thick Root, about a Foot long, set with Knobs or Bunches instead of Branches, which has a thick Bark, of a dark red on the outside, and pale within, and divided at the head into many parts; from these Knobs or Heads arise several long and narrow green Leaves, lying on the Ground, compassing one another at the bottom, like a Star, for the form of them like to the first Hares-Ears, but narrower, from divers of these Tufts of Leaves rise up dark round Stalks, about an Hand breadth high, bearing at the tops many pale yellow Flowers, made of seven pointed Leaves apiece, and in the middle of them several small Seeds set thick together, something like unto Thoreto-Wax, or as the former Hares-Ears,

Lepus-Hares, which smell very strong, the whole Plant else tastes like an *Arishoke*.

VI. *The Places.* The two first *Lobel* says grew about *Mompelher* in *France*, and *Tragus* says in dry stony places in *Germany*, and are both of them found in several places of *England*; the third *Penn* says grows upon *Mount Baldus*, and has been found upon Mountainous places in *Florida*, near the *English* Plantations.

VII. *The Times.* They all Flower late, *viz.* not until the end of *July*, and in *August*, and their Seed is ripe in *September*.

VIII. *The Qualities.* They are temperate in respect to the first Qualities, as to heat and cold; dryness and moisture, are Absterfiv, Vulnerary, Diuretick, Cardiack, Nephritick, Hysterick, and Alexipharmick.

IX. *The Specification.* They are peculiar for healing of Wounds in any part, whether inward or outward.

X. *The Preparations.* You may have therefrom, 1. A Juice or Essence of the Leaves. 2. A Decoction in Wine. 3. A Powder of the Root or Seed. 4. An Ointment or Balsam. 5. A Cataplasm.

The Virtues.

XI. *The Juice or Essence.* Taken to three or four Spoonfuls, either alone, or mixt with Wine, it is good against the Bittings or Stinging of Serpents, or other Venomous Creatures, the place also outwardly bathed with the same; it also provokes Urine, and prevails against the Strangury, and is of good use to bring down Womens Courses when stoppt, being taken Morning and Night in White Port Wine; taken also inwardly Dietetically it singularly contributes to the Curing of Wounds, old running Sores, and rebellious Ulcers.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice or Essence, but not full out so powerful, yet it more excellently cheers the Heart and revives the Spirits, and is prevalent against Fainting and Swooning Fits in Men or Women.

XIII. *The Powder of the Seed.* Being given to one Dram in a Glas of White Port Wine, it resists the Poyson of Vipers, Rattle-Snakes, and other Venomous Beasts, is also Diuretick, cleanses the Reins and Bladder of Tartarous Matter, and prevails against the Strangury.

XIV. *The Ointment or Balsam.* It heals simple Wounds at once or twice dressing, and is good against all sorts of Sores, whether they be fresh and green, or old and malign, when rebellious and difficult to be Cured.

XV. *The Cataplasm.* Applied to the Biting of Serpents, Mad Dogs, and other Poysonous Animals, it attracts and draws forth the Venom.

ris burjato Pede, from the hairy foot of an Hare, also *Lagopylon*, by *Hippocrates*, *quasi Triticum Leporinum*, because it grew among Corn, and in *English* it is called *Hares-foot*, *Spike Trefoil*, and *Corn Trefoil*.

II. *The Kinds.* Authors make six several Species of this Plant, but we shall take notice only of three, as being those chiefly which are to be found with us, or in some of our Plantations beyond the Seas. They are, 1. *Lagopus vulgaris*, *Lagopus minor*, *Lotus Campestris* *Tragi*, Our common Hares-Foot. 2. *Lagopus maximus flore rubro* *Lobelij* & *Clusij*, *Lagopus major folio trifolij* *Lobelij* & *Dodonaei*, The greatest Hares-Foot. 3. *Lagopus major folio pinnato*, *Lagopus altera folio pinnato* *Lobelij*, *Trifolium majus tertium* *Clusij*, *Trifolium magnum* *Loniceri* & *Cor-di*, *Cytisus* *Tragi* & *Columella*, *Trifolium Spicatum* *Thalij*, The longer headed Hares-Foot.

Haresfoot Common

III. *The Descriptions.* The first, or Our Common Hares-Foot. It has a small, long, stringy Root, which sends forth Stalks, with small, whitish, woolly, Trefoil Leaves set upon them, with short Footstalks; the Heads at the tops are with their roundness somewhat long, and composed, as it were, all of a hairy or hoary Downiness, whose Flowers in some are of a White, in others of a Blush Color; it is an Annual Plant, as are the two following, but this is especially to be noted in this Stock of Hares-Foot, or Spiked Trefoil, that these perish Yearly, whereas most of the other sorts of Trefoils do not: This Common Hares-Foot is well known to be a small Plant, but it grows greater and higher in some places, and smaller and lower in others, according to the goodness of the Soil or Ground it is found in.

IV. *The second, or Greatest Hares-Foot, has an Annual, small, long, thready Root also, which sends forth several Trefoil Leaves, each standing on a long Footstalk, being almost round, and dented about the edges, very like to the Meadow Trefoil, as well in bigness as form, very soft, and of a pale green color; from among these rise up weak bending Stalks, a Foot or more high, branched out, and bearing the like, but somewhat longer Leaves on them, and at their tops close Spiked Heads, with many small Flowers round about them, each in a five cornered Cup, of a delicate Crimson Color, in which Husks,*

P p p 2 after

C H A P. CCCXXXVII.

of HARES--FOOT,

O R,

TREFOIL Spiked.

I. *THE Names.* It is called in *Greek* *αγριανθος*, in *Latine* *Lagopus*, *Lagopodium*, *Trifolium Humile*, *Leporis Cuminum*, & *Pes Leporis*, a *Lepo-*

after the Flowers are past, grow small yellowish round Seed, one only in a Husk, whose brims or corners then stand displayed, something like unto a Star.

V. *The third, or Longer headed Hares-Foot, has a Root much like the former, its Leaves are hoary, large, and longer than the former, with several conspicuous Veins in them, making them shew like Wings, the middle Rib on the back of them being somewhat great also; the Flowers are like the second above, both in form and color, but the whole Head is longer and larger.*

VI. *The Places.* The first grows with us almost every where throughout England in dry Grounds; the two latter grow chiefly with us in Gardens, but are found growing wild in many places of Italy, France, and Germany.

VII. *The Times.* They Flourish and Flower in the Summer Months only, and their Seed is ripe in August and September.

VIII. *The Qualities.* They are temperate in respect to heat or cold, and dry in the first degree, Astringent, Vulnerary, and Stomachick.

IX. *The Specification.* They are peculiar against Fluxes of the Bowels, chiefly the Bloody Flux, and other Fluxes of Blood, as Spitting Blood.

X. *The Preparations.* You may have therefrom, 1. An Essence. 2. A Decoction of the Herb in Wine. 3. A Powder of the Heads and Seed. 4. Ashes of the Heads. 5. An Ointment or Balsam.

The Virtues.

XI. *The Essence of Leaves, Stalks, Spiked Heads.* It dries and binds admirably, and it is known by most certain Experience to stop a Looseness, and other Fluxes of the Bowels, chiefly the Bloody Flux, being taken two, three, or four Spoonfuls at a time

in a Glass of Red Port Wine; but if a Fever is present, it may be given in a Decoction of the Herb in Water; it is good against Cholerick Belchings of the Stomach, and griping pains of the Belly, and is profitable to be given to such as have foul and hollow Ulcers, which are stubborn and of difficult Cure.

XII. *The Decoction in Wine.* It has all the former Virtues, but not full out so powerful; being mixt and taken with Juice or Essence of Mallows, or Marsh Mallows, it eases the pains of the Bladder and Urethra, and abates the scalding and heat of Urine; and this Decoction, as also the Essence, is said to be admirably good against the Running of the Reins in Men or Women, and may be used as a Vulnerary Diet-Drink.

XIII. *The Powder of the Heads and Seed.* Taken to one Dram Morning and Night in a Glass of Red Port Wine, or in a Decoction of the Plant in Wine or Water, (according as the Nature of the Distemper and Habit of the Patient may require) it helps Spitting or Pissing Blood, prevails against the Bloody Flux, and is singular good in the Cure of a Gonorrhœa, (Universals being premised) it is an Absterfise, and not only cleanses foul and hollow Ulcers, but also incarnates, or fills them up with Flesh, and Cicatrizes them.

XIV. *The Ashes of the Heads, &c.* Being applied to the Hemorrhoids or Piles, it stops their bleeding, eases their pain, and heals them.

XV. *The Ointment or Balsam.* It is Vulnerary, cleanses, incarnates, dries, and heals old running Sores, and rebellious Ulcers, &c.

Chap. 321. foregoing.

CHAP. CCCXXXVIII.

Of HARTICHOKE Garden, OR, ARTICHOKE.

THE Names. It is called in Greek *Koveta*, also *Kaveto*, in Latine *Cinara*, and *Cynara*, (from *Cinur*, as being of an Ash Color) and in English *Artichoke*, and *Hartichoke*.

II. *The Kinds.* There are three principal Kinds, viz. 1. *Cinara Hortensis*, Garden Hartichokes, of which in this Chapter. 2. *Cinara Sylvestris*, vel *Spinosa*, Wild Hartichokes, of which in the next Chapter. 3. *Helianthum Canadense*, Jerusalem Hartichokes, of which in Chap. 340. following.

III. *The Garden Kinds.* They are manifold, as 1. *Cinara Rubra*, The Common Great Red Hartichoke. 2. *Alba*, The White Hartichoke. 3. *Viridis*, The Green Hartichoke. 4. *Procera*, The Tall Hartichoke. 5. *Pumila*, The Dwarf or Low Hartichoke. 6. *Gallica*, The French Hartichoke. 7. *Moschata*, The Musk'd Hartichoke. 8. *Spinosa*, The

The Thistle like Hartichoke. 9. *Aculeata*, The Prickly Hartichoke, of all which in order.

not being so closely compacted together, in which it also differs from the first Kind.

An
Hartichoke

Hartichoke: common.

IV. The Descriptions. The first, or Common Great Red Kind, has a Root which spreads it self in the Ground pretty largely, whereby it yields divers heads of Leaves, or rather Suckers, by which it is multiplied or increased; from this Root spring up several great, large, and long hollowed Leaves, much cut in or torn on both edges, without any great shew of prickles on them, of a kind of whitish green, like unto an Ash Color, from whence it took the Latin Name *Cinara*; the Stalk is thick, round, and strong, with some Skins as it were down all the length of them, bearing at the top one scaly Head, made at first like a Pine-Apple, but after, growing greater, the said Scales are more separate, yet in the best Kinds lying close, and not flaring, as some other Kinds do, which are either of a reddish brown, whitish, or greenish color, and in some broad at the ends, and in others sharp or prickly; the Stalk, Leaves, and Skins which inclose the Stalk, are extremely bitter in taste, beyond expression; after the Head has stood a great while, if it is suffered, and the Summer proves hot and kindly, in some there will break forth at top a Tuft of blewish purple Thrums, or Threads, under which grow the Seed, wrapped in a great deal of Downy substance, but that Root which yields Flowers will hardly abide the next Winter, but else, being cut off when it is well grown, that Downy substance abides close in the middle of the Head, having the bottom thereof flat and round, which is that matter or part which is usually eaten.

V. The second, or Great White Hartichoke, is in all things like to the former Red Kind, but that the head thereof is of a whitish Ash color, like the Leaves, whereas the former is reddish. The head of this is more apt to dilate or spread it self farther abroad,

VI. The third, or Green Kind. It is not much unlike the two former Kinds, saving, that the head of this is green, and very sharp upwards, and is found very common in many places; nor does it differ much in goodness from the former Kinds, but it is not altogether so sweet in taste.

VII. The fourth, or Tall Kind. It grows to a Mans height, and is branched into divers Stalks or Arms, every one bearing a head thereon, almost as large as those of the first Kind. This, though common formerly, is more rare to be met withal now.

VIII. The fifth, or Dwarf or Low Hartichoke. This is a French Kind, and grows much about Paris, and which the French esteem more than any other. It is lower than the following French Kind, the head of which, as well as the Leaves, are of a lighter green Color, almost yellowish.

IX. The sixth, or French Hartichoke. It has a white head, the scales of which stand flaring far asunder one from another at the ends, which are sharp: it is well known by this Quality, that whilst it is hot, after it is boiled, it smells so strong, that one would verily think that it had been boiled in stinking Water: this Kind was brought over to us in England after a great Frost, which had almost destroyed our best Kinds, but we have now almost lost them again, not being willing they should take up the room or place of better.

X. The seventh, or Muskied Hartichoke. It is a Kind which grows much like the former French, but it is much better in spending, though it has a lesser bottom.

XI. The eighth, or Thistle like Hartichoke. It is almost like the Wild Kind in its manner of growing, but it grows smaller, and with a more open and prickly head than any of the former.

XII. The ninth, or Prickly Hartichoke, which the French call Chardon, or Cardon, because it is almost of the form and nature of a Thistle, or Wild Hartichoke; it grows high, and full of sharp prickles, of

a greyish color; John Traucant said that he saw Three Acres of Land about Brussels Planted with this Kind, which the owner whited like *Endive*, and then sold them in Winter for Winter Salleting.

XIII. *The Places.* These all grow in Gardens, but the first two or three are the most common with us; we find by daily experience that our *English Red Hartichoke* is the most delicious of them all; they have been sent from us to *France, Holland, Italy,* and other Countries, where they have grown well for a Season, but they have not in these places retained their excellency and goodness for above Two Years, but have much degenerated; whereas with us they daily improve, so that it seems our Soil and Climate has the preeminence, and is the most natural to this Plant in exalting it to its highest perfection.

XIV. *The Times.* All these Kinds are increased by slipping the young Shoots from the Roots, which being replanted in *February, March, or April*, have many times the same Year, but the next at furthest, born very good Heads: The *Hartichoke* is to be Planted in a very fat and fruitful Soil, and they love Water, and a moist Ground; it is a great Error to cut away the side, or superfluous Leaves which grow by the sides, thinking thereby to increase the greatness of the Heads, when as in truth they deprive the Root of much Water by that means, which would nourish it, to the feeding and enlarging of the Heads; for if you mark the Trough or hollow Channel which is in every Leaf, it will appear very evidently, that those Furrows were designed, even from the extrem point of the Leaf to the Ground, where it is fastned to the Root, for no other purpose, but to guide that Water which falls far off unto the Root, for that without such store of Water the whole Plant would wither, and the Heads pine away and come to nothing; they are Planted for the most part about *October*, or somewhat sooner, the Plant must be set, and nourished with good store of Ashes, for that kind of Manure is thought to be best for the Planting thereof, and every Year the Slips must be taken or slip off from the Root, and are to be set in *April*, as aforesaid, which will be fruitful about *August* following, as *Columella, Palladius*, and others, as also daily experience teaches.

XV. *The Qualities.* They are, viz. the nails or bottoms of the Scales or Flakes, as also the bottoms, on which Down and Seed stand, hot and moist in the first degree, Diuretick, Analeptick, and Spermatogenetick.

XVI. *The Specification.* Being much eaten, they are said to be singular in stopping the involuntary course of the Seed in Man or Woman.

XVII. *The Preparations.* You may have therefrom, 1. An Essence, or Blood of the Heads. 2. A Decolion of the Root in Wine, the Pith being first taken away. 3. A Powder of the Seed. 4. The Sallet.

The Virtues.

XVIII. *The Essence, Sanguis, or Blood.* It is made of the bottoms, as the Blood of *Pursneps*; it is Diuretick, nourishes much, and restores in Consumptions, tho' of the Lungs; and being taken from two to four Drams in Red Wine Morning, Noon, and Night, it stops the involuntary flux of Seed, commonly called *Gonorrhoea simplex*, yet it provokes Lust extremely, for it strengthens the whole Body.

XIX. *The Decolion of the Root in Wine.* Being drank liberally, it takes away the rank smell of the Arm Holes, for it sends forth plenty of stinking Urine, whereby the rank and rammish favour of not

only the Armpits, but of the whole Body is much amended.

XX. *The Powder of the Seed.* It opens obstructions of the Urinary parts, provokes Urine, and cleanses those Vessels from Sand, Gravel, small Stones, and other Tartarous Matter, and much amends the evil smell of the Body, carrying off the foetidness by Urine.

XXI. *The Sallet.* It is manifold, 1. Made of the Heads, by boiling them soft, after which they are eaten with melted Butter, Vinegar, Salt, and Pepper; this being much and often eaten nourishes very much, and restores in deep Consumptions; it also very much increases Seed, and stirs up Bodily Lust. 2. The Leaves of the heads and their bottoms pickled, eaten with Meat they are very pleasing and grateful to the Stomach. 3. The raw Sallet. It is made of the Ninth Kind, being whited like *Endive*, and so used as a Winter Sallet, being eaten raw, with Pepper, Salt, Vinegar, and Oil, as you dress whited *Endive, Sallary*, &c.

C H A P. CCCXXXIX.

Of HARTICHOKE Wild,

O R,

Wild ARTICHOKE.

THE Names. It is called in Greek *Ξανθή* & *Δισκορίdis*, and is doubtless *Βακκία* & *Θεοφραστis*, in Latine *Cynara*, and *Cinara Sylvestris*, and *Scolymus*, in English Wild Artichoke, or *Hartichoke*.

Wild Artichoke.

II. The Kinds. There are two several Kinds, viz. 1. *Scolymus Discoridis*, *Cynara Sylvestris Lobelii*, (because it so nearly resembles the *Cinara aculeata*, *Scolymus*

Scolymus Sylvestris, *Cynara Sylvestris Latifolia Bauhini*, The Wild Hartichoke, or Artichoke Thistle. 2. *Cynara Sylvestris Cretica Honorij Belli*, *Agriocinarum* by the Cretians, *Agriocinarum Cretica Pena*, in his *Italian Baldus*, The Candy Wild Hartichoke. To which Authors add. 2. *Scolymus Theophrasti*, *Eryngium luteum*, *Carduus Chrysanthemus*, The Golden Thistle.

III. The Descriptions. The first, or Wild Hartichoke, has a great Root, which spreads much, and sends forth several thick, long, hard, but narrow Leaves, ending in long points, very considerably scoloped in on the edges, set with strong great prickles, and very sharp, which growing on the Stalks encompasses them at the bottom, and are of a dark green color; at the tops of each Stalk and Branch grows one scaly and prickly Head, lesser than those of the Ninth Kind in the former Chapter, which are kept to be eaten, from the middle of which put forth several light, purplish, Crimson Threads, which compose the Flower, which, after they have stood some time, pass away, the Seed in their Heads being flat, and like other Thistles.

IV. The second, or Candy Wild Hartichoke. It has a very long Root, which grows deep, which sends up long and hoary white Leaves, something broader than the former, very much indented or cut in on the edges, and thick armed with long and sharp prickles; from among which Leaves rise up several round Stalks, set with but few Leaves, and branched sometimes into two or three parts, bearing at their tops small, scaly, sharp, prickly Heads, which are eaten by the Peasants of the Country both green and boiled, with Pepper, Salt, Vinegar, and Oil, and are as pleasant to them as the best Hartichoke is to us.

V. The third, or Golden Thistle, has a Root which is long, of the bigness of a Finger, very sweet and pleasant to eat, like unto *Eryngium*, or Sea-Holly, which sends forth several skinny and prickly Stalks, which in some Countries, as in Spain, Italy, &c. stand upright, but in other Countries, as in France and England, bends with them unto the Ground, bearing at every Joint both a Branch and a Leaf, which is long, and somewhat narrow, smaller at bottom than any where else, much cut in on the edges, and set with small white prickles, in some places marked with white spots on the deep green Leaves, but in other places none at all; at the joints, between the Leaves and the Stalks, and at the tops also, come forth several small Heads, smaller than any of the former, composed of small Scales, with very sharp prickles at the ends, out of the middle of which come forth many Gold yellow Threads, which abide not long, and are the Flower, in which, when they are past, is contained the Seed, being small and thin Scales lying close together.

VI. The Places. The first grows in France, Germany, and Italy, the second is natural to Candy, the third is a native of Spain and Italy, but they all grow with us here in England in Gardens.

VII. The Times. They all Flower in July and August, or in the end of Summer, and their Seed ripens in September, or quickly after.

VIII. The Qualities. They are temperate in respect to heat or cold, dryness or moisture, are Appetitive, Absterfitive, and Diuretick.

IX. The Specification. The Wild Hartichoke is found to be of singular use to take away the stinking or rank smell of the Armpits.

X. The Preparations. You may have thereof, 1. A Juice or Essence. 2. A Decolion in Wine. 3. A Milky Juice. 4. The Flowers. 5. A Sallet.

The Virtues.

XI. The Juice or Essence. It opens the obstructions of the Reins, Ureters, and Bladder, and is very Diuretick, thereby expelling much strong and stinking Urine, and by that means amends the strong, rank, or stinking smell of the Armpits, and of the whole Body. Dose three or four Spoonfuls Morning, Noon, and Night, in a Glis of Generous Wine, or other fit Vehicle.

XII. The Decolion in Wine. It has the same Virtues, but not altogether so powerful; if it is made in Red Port Wine, it is a singular good thing to prevent Abortion, and so to strengthen the Womb, as to cause a Woman to go out her time.

XIII. The Milky Juice. *Clusius* says, that with this the People in some parts of Spain do coagulate or curdle their Milk, in order to the making of Cheese, but this is to be understood chiefly of the Juice of the third Kind.

XIV. The Flowers of the first Kind. They are used by the Italians, as *Pena* and *Lohel* say, to curdle Milk, of which they make Cheese; and that the said Flowers, being given to Women with Child, in their Broth, or Drink, do hinder Abortion, and cause them to go out well their whole time; they are also very good for such Women as are barren, and to cause Fruitfulness.

XV. The Sallet. The young Shoots of the first are eaten like *Asparagus*, as also the young Heads, (in Spain) before they Flower, but they use to raise the Earth over the young Shoots till they are risen a good height, which are then white, and very tender and delicate to be eaten raw with Pepper, Salt, Vinegar, and Oil, or else boiled, as you eat *Asparagus*. *Theophrastus* says, that his *Scolymus*, viz. the Golden Thistle, is very pleasant eaten raw, or boiled, but chiefly when in Flower, and that the inner substance of the Heads is eaten; and with the Flowers they counterfeit Saffron, as we do with the *Bajard Saffron*, or *Safflower*.

C H A P. CCCXL.

Of HARTICHOKE Jerusalem,

O R,

Canada P O T A T O.

THE Names. It was unknown to the Greeks, but has variety of Names given to it by the Latine Writers: *Pelleterius* calls it *Heliotropium Indicum Tuberosum*, *Columna* in the second Part of his *Phytobasanos* calls it *Elos Solis Varnefianus*, (because growing in the Cardinal's Garden) also *Aster Peruanus Tuberosus*; *Baubinus* in his *Prodromus* calls it *Chrysanthemum Latifolium Brasilianum*, but in his *Pinax*, *Helianthemum Indicum Tuberosum*; but our *Parkinson* in his *Paradise*, as also in his *Theater of Plants*, calls it *Battatas de Canada*, which he Englishes, *Potato's of Canada*, but our usual English Name is *Jerusalem Hartichoke*. *Baubinus* also in his *Pinax* calls it *Aristochi sub Terra*.

II. The Kinds. It is a singular Plant of the Kind, but how it should be accounted among the Species of Hartichoke is difficult to conceive, because it has no resemblance to any of these Plants in any of its parts, but the vulgar seldom give Names to Plants according to Judgment, and therefore it is not to be wonder'd

wondered at; all that can be said for the Name is, that when it is boiled and dress'd, it has a little likeness in taste to the bottom of an *Hartichoke*; but why it should be called *Jerusalem*, is more to be admitted at, for that it came not out of *Asia*, or *Europe*, but from *America* to us, with whom it grows as well and as naturally and plentifully as ever it grew in its Original Native Clime.

III. The Description. *This admirable Plant has at first but one small Tuberous Root, which sends up sometimes one or more stiff round Stalks, which grow in our Country to be eight or ten Feet high, but scarcely blow or shew their Flowers, whereas the Head of Flowers in their Native Countries, (as Columna says) being of a Pyramid or Sugar-Loaf fashion, spreading broad below, and growing smaller upwards, almost to a point, is nearly of the same length, on which are set large and broad, rough, green Leaves, very like unto the Leaves of the Sun-Flower, but smaller, and growing in the very same manner round about the Stalks; at the very latter end of Summer, or beginning of Autumn, if the Root is well planed and defended, it will give a shew of a few small yellow Flowers at the tops, like to the Flowers of Aster, or Starwort, and much smaller than any Sun-Flower, which come to no perfection with us; the Root, while the Plant is growing above Ground, increases not to its full growth, but when the Summer is well spent, and the springing of the Stalks is past, which is about the end of August, or in September, then the Root is perceived to be increased in the Earth, and will (before Autumn is spent) in October, swell like a Mountain or Hillock round about the feet of the Stalks, and will not have its Roots fit to be taken up, until the Stalks be half withered at footest, but after they are withered, and so all the Winter long, until the Spring again, they are good and fit to be taken up and used, which are a number of almost roundish Tuberous Roots, growing close together, so that it has been observed, that from one Root, being set in the Spring, there has been forty or more taken up again, and so have done more than to have filled a Peck Measure, which Roots are of a pleasant good taste, much like to the bottoms of the Heads of the Common Red Hartichokes.*

IV. Another Description from Gerard. *Flos Solis Pyramidalis parvo Flore, Radice Tuberosa.* This wonderful Plant has growing up from one Root one, sometimes two, three, or more round, green, rough, hairy, striated Stalks, commonly about twelve Feet high, sometimes sixteen Feet, or higher, as big as a Childs Arm, full of a white spongy Pith within; the Leaves grow all along the Stalks, out of order, of a light green color, rough, sharp pointed, about eight Inches broad, and ten or eleven Inches long, deeply notched or indented about the edges, very like the Leaves of *Flos Solis Peruanus*, but nothing crumpled, nor so broad as they; the Stalks divide themselves into many long Branches, even from the Roots to their very tops, bearing smaller Leaves and smaller towards the tops of the Plant, making the Plant appear like a little Tree, narrower and slenderer towards the top, in fashion of a Steeple or Pyramid; the Flowers with us grow only at the tops of the Stalks and Branches, like those of the said *Flos Solis*, but no bigger than *Our Common single Marigold*, consisting of twelve or thirteen striated, sharp pointed, bright, yellow, bordering Leaves, growing forth of a scaly, small, hairy Head, with a small yellow thrummy substance within; these Flowers, by reason of their late Flowering, which is commonly two or three Weeks after *Michaelmas*, never with us bring their Seed to perfection, and it makes

a shew of abundance of small Heads near the tops of the Stalks and Branches, forth of the bosoms of the Leaves, which never open and Flower in our Clime, by reason they are prevented with the Frosts, which otherwise might possibly be a noble Sight; the Stalks send forth many small creeping Roots, by which the nourishment is received, which are full of hairy Threads, even from the upper part of the Earth, spreading far abroad, among which, from the main Root, grow forth many Tuberous Roots, clustering together, sometimes fastned to the great Root itself, sometimes growing on long Strings, a Foot or more from the main Root, raising or heaving up the Earth above them, and sometimes appearing above the Earth, producing from the increase of one Root thirty, forty, or fifty in number, or more, making in all commonly about a Peck, and many times near half a Bushel, if the Soil or Earth be good; these Tuberous Roots are of a dirty reddish color without, and of a soft white substance within, bunching out many ways, sometimes as large as a Mans Fist, or not so big, with white protuberances, whence they will sprout out or grow up again the next Year; the Stalks are bowed down, and sometimes some part of them covered over with Earth, and send forth small creeping thready Roots, and also Tuberous Roots, like the former, as by experience has been found; these Tuberous Roots will abide and live in the Earth all Winter, tho' the Stalks and Roots by which they were nourished do absolutely rot and perish away, and will begin to spring up again at the beginning of May following, seldom sooner.

V. The Places. It is a native of *Brazil, Canada*, and *Peru*, and several other parts of *America*, and now it grows as plentifully with us in *England* as in any of the places where it grew naturally; Mr. Goodyer says that he received two small Roots of this Plant from one *Franguevill of London*, no bigger than Hens Eggs, the one he gave to a Friend, and the other he Planted, and it brought him forth a Peck of Roots, wherewith he stored *Hampshire*; and now it grows in great plenty in many other parts of this Kingdom.

VI. The Times. It Flowers generally in *October*, but Seeds not with us, and its Roots are in perfection all the Winter Months.

VII. The Qualities, Specification, Preparation, Virtues and Uses, are the same with those of *Hartichokes* in Chap. 338. foregoing, save, that whereas in these the Heads of the *Hartichoke* were only used and eaten, in these the Tuberous Roots only are taken.

VIII. Note. They are boiled in Water till they are tender, after which they are peeled, sliced, and Stewed with Butter, Salt, Pepper, and a little Red Port Wine, by which means they become an Excellent Dish, and more pleasant than the bottom of an *Hartichoke*; being now very plentiful and cheap, they may become good Food for Poor People, and keep Thousands from Starving, which might otherwise perish.

HARTSHORN, See BUCKSHORN,
Chap. 91. foregoing.

C H A P. CCCXLI.

OF HARTS-TONGUE True,

O R,

DEERS--TONGUE.

THE Names. It is called in Greek *φύλλιν*, *Phyllitis quasi foliosa*, in Latine also *Phyllitis*, and *Lingua Cervina*, in English *Deers-Tongue*, and *Harts-Tongue*, I suppose from the form of the Leaf.

II. The Kinds. It is either, 1. *Phyllitis vera*, of which in this Chapter, or 2. *Phyllitis Notha*, *Bastard Harts-Tongue*, of which in the next. The *Phyllitis vera*, or *True Harts-Tongue*, is also three-fold, viz. 1. *Phyllitis*, five *Lingua Cervina vulgaris*, Our Common or Ordinary Harts-Tongue. 2. *Phyllitis laciniata* Jagged Harts-Tongue, or Finger Harts-Tongue. 3. *Phyllitis ramosa Alpini*, Branched Harts-Tongue of *Alpinus*, which he has notified in *Libro de Exoticis*.

III. The Descriptions. The first, or Common True Harts-Tongue. It has a Root which is a bunch of many black Fibres or Threads, folded or interlaced together, which sends up several Leaves, every one of them rising up singly from the same Root, which, as other Ferns, fold themselves in their first springing and spreading; these Leaves when they are full grown are about a Foot long, smooth and green above, but hard, or with little Sap in them, and fraked on the back athwart on both sides of the middle Rib with small and somewhat brownish marks; the bottoms of the Leaves are a little bowed on each side of the middle Rib, somewhat narrow with the length, and something small at the end. Some do make two sorts hereof, and distinguish them by the Epithets of *Latifolia* and *Angustifolia*.

Finger Harts tongue

IV. The second, or Jagged Harts-Tongue, differs nothing from the former neither in Root, Leaf, nor manner of growing, but only in the division of the tops of the Leaves, which in this are diversly torn or jagged, some Leaves much and some little, according to the place of growing and time of abiding: Now it is to be observed, that neither of these Plants have either Stalk, Flower, or Seed.

V. The third, or Branched Harts-Tongue. It has a Root which is something woolly, with black Fibres thereat, shooting forth many slender broad Stalks of Leaves, of two or three Feet long, a little Downy at bottom, divided into many long and narrow Leaves, dented about the edges, and set one against another, with an odd one at the end, each resembling the Head of a Javelin, marked thick with straight Lines on both sides unto the middle Rib; the whole Plant is without smell, but of an austere taste, containing some heat, which is not presently felt, but continues long.

VI. The Places. The first, or Common Harts-Tongue, grows by the way sides in great plenty as you go from *London* to *Exeter*, in shady places, and in moist stony Vallies and Wells, and is much planted in Gardens; the second grew in the Garden formerly one *Cranwich's*, a Chirurgeon, living at *Much Dunmow* in *Essex*; the third is purely a stranger with us.

VII. The Times. They are green all the Year long, but less green in Winter, and in Spring and Summer they sometimes bring forth new Leaves.

VIII. The Qualities. They are drying and binding in the first degree, Aperitive, Altringent, Hepatick, Splenetick, and Alexipharmick.

IX. The Specification. They ease the Spleen, stop Fluxes of the Bowels, and Bloody Fluxes, and wonderfully strengthen the *Viscera*.

The Virtues.

X. The Preparations. You may have therewith, 1. A Decoction in Wine or Water. 2. An Acid Tincture. 3. A Spirituous Tincture. 4. A Distilled Water.

XI. The Decoction in Wine or Water. It opens obstructions of Liver and Spleen, taking away also the pain and hardness of the Spleen, and it is a singular good thing against the Rickets in Children, and the Cachexia in Virgins and Young Women; it stops all sorts of Fluxes of the Belly, more especially the Bloody Flux, strengthens the Stomach, and restores the Tone of the Bowels, being decayed or hurt, made in Water it abates the heat of the Liver and Stomach, and is good against the falling of the Pallate. Dose four or six Ounces.

XII. The Acid Tincture. It more powerfully opens obstructions of Stomach, Liver and Spleen than the former, and therefore is a singular thing to cure the Cachexia and Green-Sickness in Virgins; and being continued to be given to Children troubled with the Rickets, it perfectly cures them; give it to them in all that they drink, so many drops at a time as may make their Drink be gratefully pleasant; it opens the obstructions of the Lungs and Stomach in little Ones, and makes them breath freely; it is good against the bleeding of the Gums, and a singular thing against the Bittings of Serpents, or other Venomous Beasts.

XIII. The Spirituous Tincture. It strengthens the Stomach, Liver, and Spleen, and more powerfully stops Fluxes of the Belly, and in especial Bloody Fluxes, than the Decoction in Wine, or any other Preparation of the Herb; it is good to resist the force of Poyson, and restores the Tone of the Bowels being hurt, strengthening them to admiration. Dose from one Dram to three Drams, in any

Q q q proper

proper Vehicle, Morning, Noon, and Night, for some time.

XIV. *The Distilled Water.* Taken with some of the Spirituous Tincture it is good against Faintings, Swoonings, and other Passions of the Heart; and so mixed it stops the bleeding of the Gums, and fastens the Teeth if loose.

C H A P. CCCXLII.

Of HARTS-TONGUE Bastard,

OR,

MULES-FERN.

THE Names. It is called in Greek *Huonins*, *Ἡμιονίτις*, in Latine *Hemionitis*, and *Splenium*, the former quasi *Malaria*, the latter *Splenium*, ex *Splen*, a *Splenis* figura; in English it is called *Bastard Harts-Tongue*, *Mules-Fern*, and *Moon-Fern*.

II. *The Kinds.* It is threefold, viz. 1. *Hemionitis major*, *Hemionitis vulgaris* *Baubini*, *Hemionitis vera* *Chusij*, The Common, True, or Greater Bastard Harts-Tongue. 2. *Hemionitis minor* *Pena*, seu *altera*, *Hemionitis sterilis* *Lobelij*, The lesser, or barren Harts-Tongue. 3. *Hemionitis peregrina* *Chusij*, *Lobelij*, *Dodonaei*, Strange Bastard Harts-Tongue.

Bastard Harts-tongue

III. *The Descriptions.* The first, or Common Bastard Harts-Tongue, in its Roots, Leaves, and manner of growing, does very much resemble the former first, or True Harts-Tongue, both in form and color, but that the Leaf is somewhat broader or larger, and that the Leaves, being broadest below, have a large hollow bowing, like unto an Half Moon, on each side of the middle Rib, and the strokes on the backs of them are more sloping.

IV. *The second, lesser, or Barren Bastard Harts-*

Tongue, has a small thready Root like the former, quickly withering; its Leaves exceed not the breadth of three Fingers, not hard, nor rough, but smooth and gentle, and without any marks on the back sides of them, yet with a hollow roundness at the bottom of them, as in the former, and besides somewhat unevenly-dented about the edges: *Clusius* says, that *Lobel* having sent him some Plants of this Species, after that he had kept them in a Pot, because of their tenderness, in two Years time they changed their form into the jagged Harts-horn, at which he much wonder'd, for afterwards, (as he says) when he came into England, he gathered with his own Hands in the same place the like Plants, which there held the form of *Hemionitis*, or *Bastard Harts-Tongue*.

V. *The third, or Strange Bastard Harts-Tongue*, differs in nothing from the first of these three kinds, but in the bottoms of the Leaves, which have a small Ear, or piece of Leaf, set on each side of the arched or hollowed bottoms.

VI. *The Places.* These all grow upon shadowy Rocks, and moist hollow places, where little heat of the Sun comes, and are green all the Year, as is the True Harts-Tongue in the former Chapter: The second of these *Lobel* says he found on St. Vincent's Rock, not far from Bristol, in a hollow Cave or Hole.

VII. *The Times.* They are in their perfection in the advance of the Spring, but keep their greenness all the Year long.

VIII. *Their Qualities, Specification, Preparations and Virtues*, are the same with the True Harts-Tongue in the former Chapter; they are especially good against Diseases of the Spleen, and may be used instead of the true *Lingua*, *Cervina* to all Intentions and Purposes.

C H A P. CCCXLIII.

Of HARTWORT.

THE Names. It is called in Greek *Σέσέλις*, in Latine *Seseli*, and of some *Sile*, and in English *Hartwort*.

II. *The Kinds.* Authors make many Kinds hereof, but the following fourteen are chief, viz. 1. *Seseli verum*, quod *Dioscoridis* censetur, *Seseli Massiliense* *Folio Fenicolo* *Lobelij* & *Chusij*, The True Seseli or Hartwort of *Dioscorides*. 2. *Seseli Creticum*, *Seseli Massiliense* *Lobelij* *Ferule* aut *Dauci Cretici* facie, *Seseli Massiliense* *Matthioli*, *Seseli Massiliense* *nonnullorum Camerarii*, Candy Hartwort, or another Hartwort of *Matthioli*. 3. *Seseli Massiliense* *Pratenfe*, *Seseli* *Pratenfe* *Montspeliensium*, *Hippomarathrum* *Tabernamontani*, Meadow Hartwort of *Matthioli* or *Mompelier*. This *Gesner* in *Horto* thinks to be *Ligusticum* *Matthioli*. *Dodonaeus* calls it *Siler alterum* *Pratenfe*; and *Bauhinus* thinks it to be *Silvaus* *Plinij*, in *Lib.* 26. *Cap.* 8. and says it is *Pastinaca nigra* *Cordi*, but that of *Cordus* has divided Leaves, like Wild Carrots, and has yellow Flowers, whereas this is more like Fennel, and has white Flowers. 4. *Seseli Peloponnesiacum* *recentiorum*, *Seseli Peloponnesiacum* *verum*, *Seseli Peloponnesiacum* *folio Cicuta* *Dioscoridis*, as *Lobel* says, The Common or True Hartwort of *Peloponnesus* of *Dioscoridis*. 5. *Seseli Pratenfe* *tenuifolium* *Baubini*, seu *Daucoides* *Pratenfe* *tenuifolius*, which is the true *Pastinaca nigra* *Cordi*, Nar-

row Leav'd Meadow Hartwort of Germany. 6. *Seseli Palustre Ladefcens Camerarij & Bauhini*, Milky Marsh Hartwort. 7. *Seseli Creticum majus Lobelij & Lugdunensis*, & *Camerarij*, Tordylion Lobelij, Pimpinelle Romane alterum genus Syfoestire Casalpini, The Greater Candy Hartwort. 8. *Seseli Creticum minus, Ordilion Nicandri*, Tordylion Dioscoridis, as *Angularia* says, Tordylion and Gordilion Dodonæi, Gesneri, & aliorum, *Caucalis Cretica*, & *Græcorum Belli*, Pimpinella Romana, *Cascaltira Belonij*, The small Candy Hartwort. 9. *Seseli Creticum majus luteum*, Tordylion majus alterum luteum Columnæ, Great yellow Hartwort of Candy. 10. *Seseli Apulum Creticum minimum*, Tordylion minimum Apulum alterum Columnæ, The smallest Candy Hartwort. 11. *Seseli Montanum Folio Cicute glabrum*, *Seseli primum Montanum Clusij*, Mountain Hartwort with smooth Hemlock like Leaves. This *Bauhinus* thought to be *Levisiticum alterum Lobelij & Lugdunensis*, and *Ligusticum secundum Herbariorum Tabernamontani*, also the *Seseli Peloponnetiacum Dioscoridis*. 12. *Seseli Montanum Folio Cicute sub hirsutum*, Hairy Mountain Hemlock Leav'd Hartwort. 13. *Seseli Æthiopicum frutex*, *Seseli Æthiopicum verum Dioscoridis*, as *Lobel* says, Shrub Ethiopian Hartwort. 14. *Seseli cretense nodosum*, Great jointed Hartwort of Candy.

Fingers thickness, crested, jointed, and spread forth into several Branches, and other smaller parts, the Leaves are Fennel like, but thicker, and shorter divided, green, and hard, with white points, its winged Stalks or Branches are large, and more spread out than Fennel; at the top of each Stalk and Branch is an Umbel of white Flowers, which turn into flat Seed, not much unlike to *Angelica* Seed, but larger than *Dill* Seed, hot, and very Aromaticall.

The true Hartwort

III. The Descriptions. The first, or True Hartwort of Dioscorides, has a very white, long, slender Root, like unto Fennel, but smelling better, and tasting hotter and sharper, having a few Fibres adjoining thereto; from whence rise one or more Stalks, having but few Leaves, thinly set thereon, which are thicker and shorter and harder than Fennel Leaves, turning downwards, of a greyish Ash color, as all the rest of the Plant is, more especially in the hotter Countries, for in some places they are thicker, or longer, or shorter than they are in others, as *Bauhinus* has observed. the middle Stalk seldom rises up above a Foot high, bowing to and fro sometimes, having many Branches from its bottom, with the like Leaves on them, and each bearing Umbels of white Flowers, but sometimes purplish, though seldom; after the Flowers are gone, small long Seed follows, more like to Aniseed than Fennel Seed, pretty pleasing in taste, yet sharp and hot.

IV. The second, or Candy Hartwort, being another Hartwort of Marfelles. It has a thick, long, and white Root, with several Strings and Fibres adjoining thereto, from whence rise up several Stalks, the middlemost of which is about a Yard or more high, of a

Hartwort of Candia

Massilien Hartwort.

V. *The third, or Meadow Hartwort, has a Root which is black without and white within, divided into several Branches, with Fibres adjoining to them; from this Root rise several Stalks of Leaves, as also one main Stalk, two or three Feet high, with several large spread Stalks of winged Leaves, very finely cut into many parts, each being like unto Fennel, but larger, harder, and of a dark green color, set at the Joints, and branching forth towards the tops, bearing Umbles of white Flowers, which being past, small, long, and somewhat flat Seed comes in their place, which is larger and blacker than Fennel Seed, and near unto Meum, or Spignel, of little smell, and a small sharp taste.*

VI. *The fourth, or Common or True Hartwort of Peloponessus of Dioscorides. This Grecian Hartwort has a great Root, blackish on the outside, and white within, growing deep into the Ground, like Ferula, or Thapsia, something sweet in smell, and hot in taste; the Stalk grows to be about two Feet high, or more, as thick as ones Finger, with several large spread Leaves at the bottom, as great as Hemlock, but crumpled, rough, and hairy; the Stalk and Branches bear large Tufts or Umbles of yellow Flowers, which being past away yield broad, flat, winged Seed, of a pale yellow color, somewhat like unto Angelica, but greater, and nothing so thick, of a very sweet smell, as sweet as the Seseli Ethiopicum; this, says Lobel, the most Learned and Judicious Herbarists of Montpellier acknowledge to be the true Seseli Peloponese Dioscoridis, though formerly they took it to be a kind of Thapsia, but the true Thapsia is much differing from it both in form and color, as those who please to observe may find.*

VII. *The fifth, or Narrow Leaved Meadow Hartwort of Germany, has a Root as thick as ones Finger, and very long, black without, and white within, of a sharp and somewhat bitter taste; from this Root springs up a round, crested, or fraked Stalk, three Feet or more high, with several Joints and Leaves at them, very like for their form and divisions unto Wild Carrot Leaves, but smooth, and not rough, and of a deep green color, spreading it self forth in-*

to several Branches, bearing at their tops Umbles of whitish yellow Flowers, after which follow small long Seed, somewhat like to those of Fennel or Caraway, or between them both, and a little Aromatic in taste.

VIII. *The sixth, or Milky Marsh Hartwort. It has a long Root, which is brown on the outside, white within, and of an unpleasant taste, joined with much heat, by which it inflames the Throat; but being Planted in a Garden it looses much of that evil taste and burning quality, becoming much more mild; this Root sends up a Stem or Stalk four or five Feet high, with Joints, and long Stalks, or Branches of well spread Leaves set at them, the divisions of which are small, and much cut in, almost like to those of Caraways, or between them and Fennel; at the top of the Stalks it spreads forth into Branches, which bears at their tops small Umbles of white Flowers, which being past away, flat, thin, winged Seed follows; the whole Plant, or any part thereof being broken, there flows from it a certain Milk like Juice, as there likewise does from many other Umbelliferous Plants.*

IX. *The seventh, or Greater Candy Hartwort. It has a Root which is white, somewhat long, and woody after it has Seeded, and then perishes, rising again plentifully from the Sowing of its own Seed: This Root sends forth rough, hairy, round Stalks, about two or three Feet high, set with long Stalks of winged Leaves, much resembling Parsnep Leaves, both in form and magnitude, yet somewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewise, and turning themselves a little backwards to the Stalk, towards the tops of the Stalks they spread themselves forth into Branches, and have smaller Leaves set at the Joints than grow below, bearing Heads or Umbles of purplish white Flowers, whereon, after they are gone, grow whitish, flat, round Seed, circled about, as it were, with a border, and cut in round about it also with round dents, of little or no smell or taste.*

X. *The eighth, or Small Candy Hartwort. It has a Root which is unprofitable, and as perishing as the last, which sends up such like Stalks of winged Leaves as the former, but smaller, rounder, and shorter, a little hairy, and whitish; the Stalks are lesser and lower, fuller of Branches, bearing paler purplish Flowers in Umbles, and Seed after them, of the same form or shape, but quicker, as the Herb also is, and therefore the more accepted, and used as a Sallet Herb in Italy, and other Southern and hot Climates.*

XI. *The ninth, or Great yellow Candy Hartwort. This has a like Root, and grows very like the seventh, or Greater Candy Hartwort, having the like Leaves on the Stalks, but somewhat broader and shorter, a little sharp in taste, and not above two or three pairs together, set on the like Stalks, but smaller on the Branches, and bearing Umbles of yellow Flowers, like Dill, without any Leaves under them, as the others have, which being past away the like whitish, flat, round, Buckler like Seeds, ringed and dented about the edges follow, but they are larger and smoother, and divided in the middle, with a brownish stroke or line, making the Seed seem like unto a kind of Thlapsi, or Treacle Mustard Seed: Columna says that this Flowers and Seeds at Naples in May, and grows only in Gardens there.*

XII. *The tenth, or Smallest Candy Hartwort. It has a Root which is small, white, hard, and a little hot in taste; this Plant is very like unto the Lesser Candy foregoing at Sect. X. above, but it has Leaves like to the lower Leaves of Coriander, soft, but a little hairy, the first Leaves being of an Inch and half*

half long, and an Inch broad, and dented about the edges with round dents; the second Leaf is of two Inches long, the third has a longer Stalk, with two Leaves set thereon, smaller and rounder than the other, about half an Inch broad, and a bigger Leaf at the end, yet smaller and longer than the first Leaf; the next are lesser and longer, and the Stalk is naked of Leaves below, being small, hairy, hard, and straked, and carrying thick Umbles of white Flowers, with yellow Threads in the middle, and underlet with long hairy Leaves, the outward Flowers being larger than the inner, thereby making the Umbel resemble that of the *Wild Carrot*; after which come such like Seed as the former, but not half so large, the middle part being of a darker color; before they are ripe they look of a purplish green, but when they are full ripe white, of an aromatick taste, somewhat bitter, and a little sweet in smell.

XIII. *The elevenb,* or Mountain Hartwort with smooth Hemlock like Leaves. It has a long Root, divided into two or three Arms or Branches, of a brownish black on the outside, and white within, from whence springs up a Stalk, which is hollow, and rises up to the height of two Feet, or two Feet and a half, from which Stalk comes forth (at Joints) large spread Leaves, divided into many smaller parts, like unto Hemlock, or *Seseli Peloponese*, the higher up the Stalk the smaller and longer the Leaves, which are smooth, and more finely divided, at the top of the Stalk comes forth larger Umbles of white Flowers, which turn into yellowish crested Seed, two joined together, of a hot and aromatick taste.

XIV. *The twelfth,* or Mountain Hartwort with hairy Hemlock Leaves. It has a long, thick, dark colored Root, which sends forth broad Hemlock like Leaves, or like to the *Greater Sweet Chervil*, of a dark green color, and something rough and hairy, especially the footstalks of the Leaves, from the midst of which rises up a thick, hollow, crested, hairy, and jointed Stalks, about two Feet high, divided into several Branches, with some few Leaves thereon, but much lesser, and in like manner divided; near the top of the Stalk it shoots it self forth into many Arms or Branches, at the tops of every one of which grows a pretty large Umbel of white Flowers, succeeded by long sharp pointed Seed, two joined together.

XV. *The thirteenth,* or Shrub *Æthiopian* Hartwort. It has a Root which is great and woody, spreading it self out into several Arms or Branches, with several Fibres issuing therefrom, and which abides many Years, if it is defended from the cold; from this Root shoot forth several woody rough Stems, covered with a blackish Bark, divided into many Branches, two, three, or four Feet, or more long, beset with many fair, large, thick, hard, smooth, pale green Leaves, being long, and somewhat like unto *Woodbind* Leaves, but not so broad, smooth or even on the edges, and not snipt or dented at all; on the tops of the Branches stand small Tufts of yellow Flowers, which afterwards bear brownish, round, and long Seed, bigger than *Sweet Fennel* Seed; the whole Plant smells very fragrant, and the Seed best, being of an Aromatick taste, somewhat bitter, and sharp withal: This is commended by *Dioscorides* to be the best of all the *Hartworts*, beyond that of *Candy* or *Marfelles*.

XVI. *The fourteenth,* or Great Jointed Hartwort of *Candy*. It has a Root which is composed of several slender, long, white, woody Strings, which perishes yearly, which Root sends up four or five hard, round, rough, or rather prickly Stalks, about two Feet high, whose joints are great, and bunched out like Knees, with a rough, large, winged Leaf or two at each of them, some consisting of three, and

some of five parts, and every one of them also divided into several parts, of a sad green color, changing reddish at Seed time; the Stalk is rough and crested, and the several Branches hereof do carry several small Tufts or Umbles of white Flowers, which being past away, there comes in their places great, long, round, and rough Seed.

XVII. *The Places.* Most of these *Seseli's* or *Hartworts* grow about *Mompelier*, *Marfelles*, and *Narbone* in *France*, as also in *Italy* and *Candy*, some in the *Morea* in *Greece*, and some in *Æthiopia*, and some of them in *Germany*, and almost all of them grow with us in *England*, where they thrive well, but are with us nifted up only in Gardens.

XVIII. *The Times.* They Flower most of them in *June* and *July* in their native places, but with us in *July* and *August*, and do bear ripe Seed in *September*, or before the end of *Summer*, if care be had in ordering and keeping them, so as they be Planted in the warmest places, and in a Southern Sun.

XIX. *The Qualities.* They are all of them hot and dry in the second degree, Aperitive, Absterive, Carminative, and Diuretick, Stomack, Pectoral, Nephritick, Neurotick, and Hysterick, Antiemetic, and Alexipharmick.

XX. *The Specification.* Hartwort opens Obstructions of the Lungs and Urinary parts, helps Coughs, and the Strangury, Asthma's, Colick, obstruction of the Terms, and Hysterick Fits, and facilitates the Delivery of Women in Travail.

XXI. *The Preparations.* Of all these Kinds the four first are chiefly used in Physick, (tho' it is possible all the rest may have as excellent Virtues, and be fully as efficacious) but the *Æthiopian* is preferred for its singular Virtues beyond all the other sorts, and is doubtless that which ought to be put into the Compositions of *Mithridate* and *Venice Treacle*; and this *Lobel* gathered in great plenty about *Mompelier* in *France*: As to the parts of the Plant, the Roots, the Herb, and the Seed, are all used, and from them the following Preparations are made, viz. 1. A Juice of the Herb. 2. An Essence of the Herb and Root. 3. A Decoction in Wine or Water of the Herb, Root, and Seed. 4. A Powder of the Seed. 5. A Cataplasm of Root, Herb, or Seed. 6. An Acid Tincture of Root or Seed. 7. A Spirituous Tincture of Root or Seed. 8. An Oily Tincture of Root or Seed. 9. A Distilled Water from Root, Herb, or Seed, or from all of them.

The Virtues.

XXII. *The Juice of the Herb.* It is commended by *Dioscorides* to help the Strangury, and difficulty of breathing, as also the Suffocation of the Womb, to provoke the Terms, and expel the dead Child; it is prevalent also against the Falling-Sickness, and pains of the Kidnies. Dose three or four Spoonfuls, twice or thrice a day, mixed with a Glas of White Port Wine; mixed with Honey and taken, it is good against Coughs, Colds, Wheezings, and Obstructions of the Lungs.

XXIII. *The Essence.* It has all the former Virtues, being given in like manner and Dose, besides which it facilitates the Delivery of Women in Travail; the Essence or Juice taken with the Powder of the Seed for ten days together in White Wine, gives ease in the pains of the Reins, and is said to expel the Stone lodged in those parts; if the Stone is great I am confident it can do nothing at all, but it is Tartarous Matter, Sand, Gravel, or small Stones; then possibly it may expel them, and clear the parts of those Recrements: The Essence made of the Root is powerful in heating, and opening Obstructions,

by reason of its thin parts, for which reason it powerfully provokes Urine, and helps the Epilepsie, and this *Galen* speaks of all the *Hartworts* in general; and *Dioscorides* says they have the same Faculties and Operations.

XXIV. *The Decoction of Root, Herb, or Seed, in Wine or Water.* It has the Virtues of both the former Preparations, but in a much lower degree, however it is often given against the Strangury, stoppage of Courses, and to facilitate the Delivery of Women, &c.

XXV. *The Powder of the Seed.* It is said to prevail against the Stone, Gravel, Strangury, Colick, obstructions of the *Viscera*, &c. Made into an Electuary with Honey, it is good against Asthma's, Coughs, Colds, obstructions of Flegm, and causes easie Expectoration. Dose of the Powder is one Dram, Morning, Noon, and Night, in any proper Vehicle, as White Wine, Parsly Water, *Arsmart* Water, &c.

XXVI. *The Cataplasm of the Root.* If it is beaten into a Pulp, or boiled soft, and then beaten, and brought into a consistence with *Terra Samia*, or to two parts of the Root, one part of *Terra Samia*, and an eighth part of Honey, being then applied, it is of good use to discuss simple Contusions, or Bruises, and to take away the black and blew marks or spots of the same, coming by Blows, Pinching, or otherwise.

XXVII. *The Acid Tincture of Root or Seed.* It is good against all sorts of malign and burning Fevers, the Small Pox, Spotted Fever, Calenture, and the Plague or Pestilence it self; it is also prevalent against the Bittings of Serpents, or Mad Dogs, or the Stinging of Scorpions, Hornets, or other Venomous Creatures; it cleanses powerfully the Urinary passages, is good against Stone and Strangury, as also shortness of Breath, difficulty of breathing, Hoarseness, Wheezing, and the like. Dose twenty, thirty, or forty drops at a time, (more or less, according to the quantity of the Vehicle) in Ale, Wine, or other Liqueur, three or four times a day.

XXVIII. *The Spirituous Tincture.* It powerfully provokes the Terms, resists Vapors, and gives ease in the Colick, and is good against the Poison of any Venomous Creature; it is good against the Epilepsie, and other Diseases of the Nerves, Head, and Brain, proceeding from cold and moisture; it strengthens the Stomach, causes a good Appetite and a strong Digestion, cleanses and strengthens the Womb, and causes Conception. Dose from one Dram to three, Morning and Night, in Ale, Beer, or Wine, or in any other fit Vehicle, as Decoction, Distilled Water, &c.

XXIX. *The Oily Tincture.* It is good against weakness of the Nerves, Palsies, numbness of any part, Pains or Aches, whether external or internal, proceeding from cold and moisture, or any over straining of the part; it facilitates the Birth, and causes a speedy and safe Delivery; it gives ease in the Gout, alleviating the pain in a short time; it causes an evacuation of Sand, Gravel, and Tartarous Matter from the Reins, and other Urinary parts, and prevents the breeding of the Stone; it also gives ease in the Colick. Dose from twelve to thirty drops in any fit Vehicle, or in the Distilled Water of the same Plant; it allays itching in any place, by allaying the ferment of the Humors.

XXX. *The Distilled Water.* It is good for all Diffempers abovenamed, but is much weaker, and is therefore used as a Vehicle; outwardly applied to the Skin, it takes away its discolorings, as yellowness, Tanning, Sunburning, black and blew spots, redness from Pimples, &c.

C H A P. CCCXLIV.

Of *H A W K W E E D* Common.

I. *THE Names.* It is called in *Greek* *Ἱεράκων*, ab *Ἱερά*, Accipiter. An Hawk, (sic dictum volunt quod Accipitres sibi hujus succo aciem Oculorum acuerentur) in *Latine* *Hieracium*, and by some Authors *Accipitrina*, in *English* *Hawkweed*.

II. *The Kinds.* Authors make a vast number of the Kinds of this Plant, many of which grow not with us in *England*; *Parkinson* divides so many as he Treats of into nine general Heads, making them in all Fifty Five several Species, viz. 1. *Sharp pointed Dandelion like Hawkweeds*, Seven Kinds. 2. *Blunt pointed Dandelion like Hawkweeds*, Ten Kinds. 3. *Gum Succory like Hawkweeds*, Four Kinds. 4. *Garden Succory like Hawkweeds*, Three Kinds. 5. *Wild Succory like Hawkweeds*, Four Kinds. 6. *Smooth Mountain Hawkweeds*, Five Kinds. 7. *Hairy Mountain Hawkweeds*, Thirteen Kinds. 8. *Meadow Hawkweeds*, Three Kinds. 9. *Bushy Hawkweeds*, Six Kinds. We shall not follow this Division, nor yet Treat of all those several Species, but only of so many as are to be found growing in *England*, and therefore we divide them but into two principal Kinds, viz. 1. *Of the more common Kinds of Hawkweed*, of which in this Chapter. 2. *Of the less common Kinds*, of which in Chapter 345 following.

III. *The more common Kinds.* These are in number Eleven, viz. 1. *Hieracium majus Sonchites*, *Hieracium majus Matthioli*, *Fuchsj*, *Dodonai*, *Lobelij*, & aliorum; *Taraxacum majus Loniceri*, *Intibus secundus Tragi*, *Hieracium Sonchii Folio variorum*, *Hieracium minus Lugdunensis*, (because he makes the *Chondrilla prior Dioscoridis* to be his *Hieracium magnum*) Common Great Hawkweed with Sow-Thistle Leaves. 2. *Hieracium Dentis Leonis Folio asperum*, and *hirsute asperum*, and *magis laciniatum Lobelij*, *Hieracium alterum Saxatile Montanum Columnæ*, Rough Dandelion like Hawkweed. 3. *Hieracium Dentis Leonis Folio obtuso minus Flore magne*, Dandelion like Hawkweed. 4. *Hieracium Dentis Leonis Folio Floribus parvis*, Dandelion Hawkweed with small Flowers. 5. *Hieracium asperum Hypocheris*, sive *Porcellia dictum Tabernamontani*, *Hieracium minus Dentis Leonis Folio sub aspero*, Swines Hawkweed with rough Leaves. 6. *Hieracium Folijs*, & *facia Chondrilla Lobelij*, Gum Succory like Hawkweed of Lobel. 7. *Hieracium Chondrilla Folio glabrum*, Smooth deep jagged Hawkweed. 8. *Hieracium minus Radice prænorsa Lobelij*, *Hieracium minus Matthioli*, *Tragi*, *Fuchsj*, *Gesneri*, *Tabernamontani*, *Gerardi*, & aliorum, *Hieracium Leporinum*, *Succisa Tertia Tragi*, & *Lactuca Leporina*, *Picris Dalechampijs* & *Lugdunensis*, (because of its bitterness) *Hieracium Chondrilla Folio Radice Succisa Bauhini*, Hares Hawkweed, or Yellow Devils-bit. 9. *Hieracium sinuatum profunde Pratense*, Meadow Hawkweed with deep cut Leaves. 10. *Hieracium Pratense non sinuatum majus*, Greater undented Meadow Hawkweed. 11. *Hieracium Pratense non sinuatum minus*, The lesser undented Meadow Hawkweed. This being said, it is to be understood, that the *Hawkweeds* stand as in a medium between the *Succories* and the *Sow-Thistles*, as in some measure partaking of them both.

IV. *The Descriptions.* The first, or Great Hawkweed, has a Root which is long, and somewhat great, with many small fibres thereat, from whence spring

up many large hairy Leaves, lying on the Ground, much rent or torn on the sides into several gashes and jags, somewhat like unto *Dandelion*, but with greater parts, more like unto those of the *Smooth Sow-Thistle*, the whole Plant being full of a bitter Milk; from among which rises up a hollow rough Stalk, two or three Feet high, Branched forth from the middle upwards, on which are set, at every Joint where it Brancheth, longer Leaves, little or nothing rent or cut in, bearing at their tops several pale yellow Flowers, consisting of many small narrow Leaves, broad pointed, and notched in at the ends, set in a double row, or more, the outermost being larger than the inner, which form most of the *Hawkweeds* do keep in all their Sorts or Varieties, which being past away turn into Down, and with its small brownish Seed is blown away with the Wind.

Great
Hawkweed

V. The second, or Rough *Dandelion* like Hawkweed. It has a Root which is small, somewhat like a Finger, with a few Fibres adjoining thereto, from whence spring up several long and narrow hairy Leaves, reddish at the bottom next the Root, deeply waved or torn in on the edges, being about two Inches long, from among which rise up one, or two, or more bare or naked Stalks, rough or hairy, bearing each of them a double yellow Flower, like unto the *Hawkweeds*; which being past away turns into Down, as the former does.

VI. The third, or *Dandelion* like Hawkweed, has a small and fibrous Root, which sends forth six or seven thick rough Leaves; lying on the Ground, about two Inches long, and half an Inch broad, round pointed, and jagged about the edges, as other *Hawkweeds* are; the Stalk is hoary also, and Branched, about a Span, or eight or nine Inches high, having smaller Leaves thereon, with smaller divisions; at the tops stand very yellow Flowers on very short Footstalks, shooting out very fine hoary Husks, pointed at the brims with many points.

VII. The fourth, or *Dandelion* Hawkweed with small Flowers, has a Root which is small, white, woody, and fibrous, the Stalk is round, a Foot high,

and somewhat hoary, at the bottom of which grow a few rough Leaves, bitten in (as it were) about the edges, and about three Inches long, and half an Inch broad, having but few Leaves thereon, and those about the middle, which are but only dented, and encompass it at the bottom, bearing very many small yellow Flowers together at the tops thereof, which grow upon very short Footstalks.

VIII. The fifth, or Swines Hawkweed with rough Leaves. It has a small and long Root, and is but a small Plant, having several somewhat long and rough Leaves lying on the Ground, smaller at the bottoms, and broader towards their ends, unevenly waved about the edges; the Stalks are a little rough, slender, and bare of Leaves, Branching into several long Stalks, about half a Foot in length, bearing every one a large yellow Flower, like unto the *Hawkweeds*. There is another Plant of this sort; whose Leaves are smooth and narrower, but differing little in any thing else.

IX. The sixth, or Gum Succory like Hawkweed. This grows not so high as some others, and has its Leaves thicker jagged, but not so large, each jag something dented also, and something hairy; the Flowers are yellow, but not so thick or double, but growing in a Tuft together, which being ripe, and turned into Down, are, with its Seed at bottom, blown away with the Wind, as the Down of other *Hawkweeds* are.

X. The seventh, or Smooth deep jagged Hawkweed. This differs not much from the last, but that the Leaves hereof are smooth, and very much and very deeply jagged, even to the middle Rib, each jag being small, narrow, and pointed; its Stalks, Flowers, Down, and Seeds are like unto the former.

Small Hares Hawkweed.

XI. The eighth, or Hares Hawkweed, or Yellow Devils-Bit. Its Root is made up of many Strings, like a Plantane Root, but the middlemost part, which is greatest, is short, as if it had been bitten off, like the Root of Devils-Bit: This Root sends up many Leaves, of which those which lye next the Ground are somewhat long and narrow, cut in on the edges into small
and

and short pointed galhes; the Stalks are small, and scarcely grow to be a Foot high, spread out into a few Branches, with some Leaves here and there upon them, which have no division or dents on the sides; at the tops of the Branches stand the Flowers, which are much separated one from another, each upon a long Footstalk, consisting of fewer Leaves, or being less double, of a Gold yellow Color, which being past away, are succeeded with Down, like the other *Hawkweeds*; the whole Plant, and every part thereof is very bitter, rather more bitter than any of the others.

XII. *The ninth, or Meadow Hawkweed* with deep cut Leaves. *The Root is blackish and woody*; the Leaves lying next the Ground are many, long, and narrow, and deeply cut or torn in on the edges, and pointed at the ends, each Leaf standing upon a long Footstalk, and covered with a Downy hairiness, as the whole Plant besides is; the Stalk is hollow, round, and about a Yard high, having a few such like deep cut Leaves thereon; it is spread forth into several Branches, at the tops of which stand Gold yellow Flowers on several long Footstalks, succeeded by Down, as the others are.

XIII. *The tenth, or Greater undented Meadow Hawkweed*, has a small and black Root, with several long Strings adjoining to it, from whence rise up several rough Leaves, lying upon the Ground, each about five Inches long, and an Inch and half broad, without any gash or dent on the edges, being very green, and ending in a round point, from among which rises up one single, straight, and crested Stalk, about a Foot and half high, wholly naked, or destitute of Leaves, bearing at the top a number of small yellow Flowers, set close together, as it were in a Tuft, every one upon a short Footstalk, which being past away, do, like the rest, turn into Down, and pass away with the Wind.

XIV. *The eleventh, or Lesser undented Meadow Hawkweed*. Its Root is something long, and of a mean thickness; the Plant is lesser than the former, and has many lesser Leaves undented lying upon the Ground, of an Inch and half long, and an Inch broad, being almost round, and rough; the Stalk which rises from the middle of them stands upright, and is crested, bearing at the top a few such like Flowers as the former, which being past away turn into Down, which is also carried away with the Wind.

XV. *The Places*. The first and second grow in several places about Fields and Pathways in dry Grounds; the third, fourth and fifth grow also in Fields, waste Grounds, Lanes, and By-Ways in many places of England; the sixth, seventh and eighth grow also plentifully enough in many places of our Land, and sometimes in Gardens; the ninth, tenth and eleventh grow in Fields and Meadows, and by Wood sides which lye open to the Sun.

XVI. *The Times*. They all Flower, and the Down flies away in the Summer Months, viz. in June, July, and August, and rise again of their own Sowing.

XVII. *The Qualities*. They are all cold and dry in the first degree, Absterive, Astringent, Anodyn, Diuretick, Pectoral, Stomack, and Alexipharmick.

XVIII. *The Specification*. It eases pains of Liver and Spleen, and opens obstructions of the Lungs.

XIX. *The Preparations*. You may have therefrom, 1. *An Infusate Juice*. 2. *An Essence*. 3. *A Decoction in Wine*. 4. *A Collyrium*. 5. *A Cataplasim*. 6. *A Distilled Water*. 7. *An Acid Tincture*. 8. *A Saline Tincture*.

The Virtues.

XX. *The Infusate Juice*. A Dram thereof dissolved in White Port Wine, adding a little Vinegar when it is given, opens the obstructions of the Reins, Ureters, and Bladder, provokes Urine, and prevails against the Dropsie; it is also good against the Stinging of Scorpions, and Biting of Serpents, or other Venomous Beasts; it is also good against the pain and hardness of the Spleen, and procures Rest and Sleep.

XXI. *The Essence and Liquid Juice*. It is cooling, drying, and binding, and therefore good for the heat of the Stomach, and gnawing thereof, for Inflammations, and the hot Fits of Agues; the Juice given to two or three Spoonfuls in Wine helps Digestion, dissolves Wind, hinders Crudities, helps the depraved Tone of the Stomach, is good against the Strangury, or stoppage of Urine, and prevails against all the Diseases for which the Infusate Juice is given.

XXII. *The Decoction in Wine*. It has the Virtues of the Juice and Essence, but not full out so powerful; made with Wild Saccary and taken, it helps the Wind Colick, pains and hardness of the Spleen, procures Rest and Sleep, hinders Venery, and Nocturnal Pollutions, cools and purifies the Blood, opens obstructions, and cleanses the Stomach, Reins, and Bladder: The Decoction mixed with Honey and taken, it digests thin Flegm in the Thorax or Lungs, helps the Cough, Hoarseness, Wheezings, obstructions of the Viscera, and causes Expectoration. Dose six or eight Ounces twice a day, viz. Morning and Night.

XXIII. *The Collyrium*. It is thus made. Take clarified juice of Hawkweed eight Ounces, Honey four Ounces, Roch Alum six Drams, mix, melt, and make a Collyrium. It is singular good for all Defects and Diseases of the Eyes, in tender Sighted People it may be mixed with Womens Breast Milk, or with Cows Milk, and so used; it is also used with good success in curing fretting and eating Ulcers in any part, especially in their beginning.

XXIV. *The Cataplasim*. Outwardly applied it is good for hot Distempers of the Eyes; if it is made of the green Herb bruised, and with a little Salt applied to any place burn'd with Fire, before Blisters do arise, it takes out the Fire, and gives ease; it also allays Inflammations, and St. Antonies-Fire, cures Pustles and Eruptions in the Skin, abates heat, and draws forth salt virulent Humors; if it is made by boiling with a little Milk and Barley Flower, or White Bread, and applied to any place affected with Convulsions, or the Cramp, or where there is a simple Contusion, it resolves the Tumor, and eases the pain.

XXV. *The Distilled Water*. It is said to cleanse the Skin, and take away Freckles, Spots, Morpew, or Wrinkles in the Face and Skin.

XXVI. *The Acid Tincture*. It removes the preternatural heat of the Stomach, cools the heat of Fevers, and helps a hot and dry Liver. Dose so many drops as to make the Ale, Beer, or Wine pleasantly acid, and to be drunk in all that the Patient drinks; it cures also a hot Scurvy.

XXVII. *The Saline Tincture*. It is good against the Gout, whether in Hands or Feet, the parts affected being well bathed therewith as hot as can be endured; it is also good against Tanning, Sunburning, yellowness of the Skin, black and blue spots thro' Blows, or Bruises, Freckles, Lentils, Scurff, Morpew, Pimples, and other hot, salt, and fiery breakings out of the Skin, in what part of the Body soever, being skilfully applied.

C H A P. CCCXLV.

of HAWKWEED less Common.

THE Names. It is called in Greek *Ἱεράκιον* *ἱεράκιον* *αἰθέριον*, in Latine *Hieracium* incommune, vel rariū, *Hieracium minus commune*, in English *Hawkweed less common*, or not so easie to be met with, as being either rare, or otherwise; Exotics, and so only Garden Plants with us.

II. The Kinds. All the various Kinds enumerated in Authors, as aforementioned, we shall not trouble you withal here, many of them being absolutely Foreign, and so never to be seen with us, some of them only various, or degenerated, or otherwise altered, from the poorness or richness of the Soil, or other qualifications of the Ground, and so never to be met withal again in Nature; those which we shall now describe are the twenty following, viz. 1. *Hieracium asperum*, *Hieracium Intybaceum asperum* *Tabernamontani*, Sharp, or Sharp pointed Hawkweed. 2. *Hieracium majus alterum*, The other Great Hawkweed. 3. *Hieracium longius Radicatum* *Lobelij*, and *Microphyllum Tabernamontani*, *Hieracium minus primum Dodonæi*, *Apargia Dalechampij*, of which *Theophrastus* speaks Lib. 7. Cap. 9. *Hieracium Dentis Leonis Folio obtuso majus Bauhini*, Long Rooted Hawkweed. 4. *Hieracium Intybaceum Flore luteo Bauhini*, Garden Succory like Hawkweed with yellow Flowers. 5. *Hieracium Intybaceum Flore magno albedo*, Garden Succory like Hawkweed with white Flowers. 6. *Hieracium Intybaceum Flore Carneæ*, *Hieracium Ramosum Penæ*, *Hieracium Apulum Flore suave rubente Columne*, Garden Succory like Hawkweed with bluish Flowers. 7. *Hieracium Folio Hedypnoidis*, Wild Succory like Hawkweed with yellow Flowers, it is called *Rhagadiolus* by *Cæsalpinus*. 8. *Hieracium Montanum Latifolium glabrum majus Tabernamontani*, Great broad Leav'd smooth Mountain Hawkweed. 9. *Hieracium Montanum Latifolium glabrum minus Tabernamontani*, Small broad Leav'd smooth Mountain Hawkweed. 10. *Hieracium Montanum Rapifolium*, Turnep Leav'd Hawkweed. 11. *Hieracium Montanum Folij densatis Flore magno*, Dented Mountain Hawkweed with a great Flower. 12. *Hieracium Ramosum Flore magno*, Great Flowered Hawkweed. 13. *Hieracium Montanum Latifolium villosum magno Flore Clusij*, Hairy broad Leav'd Mountain Hawkweed with a large Flower. 14. *Hieracium Montanum Dentis Leonis Folio incano*, *Hieracium Folio Hedypnoidis Clusij*, *Hieracium Montanum Angustifolium Folij Cichoraceis Tabernamontani*, Mountain hoary Dandelion like Hawkweed. 15. *Hieracium Britannicum Conyze Folio Clusij*, English Fleabane like Hawkweed. 16. *Hieracium Latifolium Clusij*, *Hieracium Phlomisoides Tabernamontani*, *Hieracium Latifolium Pannonicum Camerarij Flore magno luteo*, Broad Leav'd Hawkweed with a great yellow Flower, which is the *Primum Clusij*. 17. *Hieracium fruticosum Folio sub rotundo Bauhini*, Round Leav'd bushy Hawkweed. 18. *Hieracium fruticosum Latifolium hirsutum*, Rough broad Leav'd bushy Hawkweed. 19. *Hieracium fruticosum Angustifolium majus*, The Greater narrow Leav'd bushy Hawkweed. 20. *Hieracium fruticosum minus*, The Lesser bushy Hawkweed.

III. The Descriptions. The first, or Sharp pointed Hawkweed. It has a Root which is tough, and fibrous, or thready, from whence rise up many Leaves, which are long and narrow, like those of

Languebeef, or *Ox-Tongue*, but much narrower, which are sharp about the edges, rough in the middle, and withal sharp pointed; the Stalks are long and slender, set with the like Leaves, but lesser; the Flowers grow at the tops, which are yellow colored and double, which being past, are succeeded by Down, which is carried away with the Wind.

Sharp Hawkweed

IV. The second, or other Great Hawkweed. The whole Plant is bitter, and perishes at the first approach of Winter, being but Annual, and to be new Sown every Year; its first Leaves are little or nothing dented, but something like *Endive*, yet those which follow are cut in on the sides, not so much as the *Sow-Thistle*, else not much unlike, which are more tender, yet larger than the first in the former Chapter, as the Stalks are likewise, bearing on the Branches greater Husks, wherein the Flowers grow, which pass into Down, with rough crooked Seed lying therein, and are both dispersed and blown away with the Wind.

V. The third, or Long Rooted Hawkweed. Its Root is white, small, and long, running down as deep into the Ground says *Lobel* as the Stalk is high, yet some of it has been observed with more and shorter Roots; the Leaves which lye upon the Ground are long and narrow, much torn and jagged on the edges, somewhat like unto *Dandelion*, but cut into many short round pointed pieces, of a dark green color; the Stalks which arise from among the Leaves are smooth and blackish, scarcely a Foot high, bare, or without Leaves on them unto the tops, but at the upper Joint, from whence spring several Flowers; each standing upon a long Foot-stalk, which are of a yellow color, like unto other Hawkweeds, and being once past away, the Heads are filled with Seeds covered with Down, which is carried away with the Wind.

VI. The fourth, or Garden Succory like Hawkweed with yellow Flowers. It has a long down right Root, of a mean size for thickness, and some Fibres adjoining to it; which sends forth a slender smooth Stalk, about a Foot high, yet somewhat leaning

N E T down

downwards, spread into many Branches, at the foot of which grow long, smooth, dark green Leaves, about four Inches in length, and an Inch and half in breadth, some of them without divisions, and others very much rent, torn, or jagged, very irregularly, almost (in some places) to the middle Rib, as are all those especially which grow higher and upward on the Stalk and Branches, each of the Branches and Stalk being about an Hand breadth below the tops, bare of Leaves, and at the tops of each of which grows a yellow Flower, of a middle size, which turns into Down, and is carried away with the Wind.

VII. *The fifth, or Garden Succory like Hawkweed* with White Flowers. This Plant in its Root, Stalk, Branches, Leaves, and Flowers, is very like unto the former fourth Kind, but that the Leaves in this are something larger and broader, and more cut in, or jagged and torn on the sides, even to the middle Rib, (tho' they can hardly be more irregularly torn or jagged than the former) the Flowers also in this Plant are of a whitish color, and more yellow in the middle, also somewhat reddish underneath, which passing away turn into Down.

VIII. *The sixth, or Garden Succory like Hawkweed* with bluish Flowers. It has a Root which is composed of a down right Stem, with several Fibres adjoining thereto, which always perish after Seed time; from this Root spring up several long and somewhat narrow rough Leaves, lying next the Ground, very much rent or torn in on the edges, and from among these Leaves rise five, or six, or more, slender, short, brown, and hairy Stalks, about a Foot or more high, shooting forth into one or two Branches, with lesser Leaves, and less divided, up to the tops, where are several large Flowers, consisting of two or three rows of Leaves, of a deep bluish color, and of a somewhat strong *Opium* like smell, which Leaves of Flowers are broad pointed, and nicked at the ends, the outwardmost row being larger than the inner, standing in rough scaly Husks, in which afterwards the slender, long, brown Seed is contained, which lying among much Down, are carried away together with the Wind.

IX. *The seventh, or Wild Succory like Hawkweed* with yellow Flowers. It has a Root which is long and white, with some small Fibres adjoining thereto, which sends up some few Leaves, lying next the Ground, something long and narrow, waved, or unevenly dented about the edges, in some more, in others less, and sometimes hairy withal, yet when Planted in Gardens has little or none at all; it also sends forth many slender Stalks, with a few Leaves set disorderly upon them, which are smaller than those below, and sharp pointed; these Stalks branch forth at their tops, on which stand several green scaly Husks, with yellow Flowers in them, a little bending their Heads before they are blown, in which grow crooked Seed, lying in the Down, which after the Flowers are past away, are both carried away with the Wind.

X. *The eighth, or Great broad Leav'd smooth Mountain Hawkweed.* It has a bushy Root, wholly made up of a great number of Fibres or Strings, which sends forth several fair great Leaves, something narrow at the lower ends, and broader to the middle, where they are broadest, then declining in their breadth, and ending in a point, being unevenly dented or waved about the edges, and encompassing the Stalk or Branches as they rise up, the Stalk and Branches bear every one of them three or four Flowers, yet not in an Umbel like manner, these Flowers seldom appear open, but when they do they are yellow, like unto others, which afterwards pass into Down, and are also carried away with the Wind.

XI. *The ninth, or Small broad Leav'd smooth Mountain Hawkweed.* This Plant in its Roots, Stalks, Leaves, Branches, Flowers, and Seed, as also in its manner of growing, differs not from the former great Kind, but only in its magnitude, this being in all respects smaller, and the whole Plant lower and lesser.

XII. *The tenth, or Turnep Leav'd Hawkweed.* The Root is something long and stringy, of a reddish yellow color, which sends forth a few Leaves, standing upon long and rough reddish Footstalks next the Ground, something like unto Turnep Leaves, being rough, and torn in on the sides into round pointed jags, from among which rises up a rough, reddish, striated Stalk a Foot and half or more high, with one or two small short Leaves thereon, divided towards the top into many small Branches, on each whereof stands one Flower for the most part, and sometimes two, of a middle size, and a yellow color, which being past away turn into Down, which, (as the rest) is carried away with the Wind.

XIII. *The eleventh, or Dented Hawkweed* with a great Flower. The Root is much like the former, which sends forth Leaves, lying for the most part all on the Ground, being four or five Inches long, and an Inch broad, a little woolly or hoary, and finely dented about the edges, of a sad green color, the Stalk rises up to be about a Foot high, and is in a manner bare of Leaves, rough, and hollow, bearing one reasonable large deep yellow Flower at the top, standing in a fine scaly Husk, which turns into Down, as the rest do, and is blown away with the Wind.

XIV. *The twelfth, or Great Flowered Hawkweed.* This is a large Hawkweed, and has a round rough Stalk, three Feet high, spread out into many Branches, on every one of which stands a large Gold yellow Flower, like unto *Dandelion*, the Leaves are three or four Inches long, and two or three Inches broad, with a great Rib in the middle, and many Veins running thro' them, of a pale green color, something rough, waved about the edges, and set about with small Hairs, and many Veins running from the said Rib.

XV. *The thirteenth, or Hairy broad Leav'd Mountain Hawkweed* with a large Flower. It has a pretty thick Root, with many Fibres springing from it, and tho' it is a *Broad Leav'd Hawkweed*, yet its lower Leaves are long, and something narrow, covered with a long hairy Down, almost hoary, but those which grow up higher upon the hairy Stalk, which is about a Foot high, are something shorter, but three times broader, pointed at the ends, and less hairy; the Stalk spreads it self out into two or three Branches, every one bearing commonly one Flower, and sometimes two or three, out of woolly or very hoary Husks, of the form and color of other Hawkweeds, turning also in like manner into Down.

XVI. *The fourteenth, or Mountain hoary Dandelion like Hawkweed.* The Roots of this Plant lie spreading themselves under the upper Crust of the Earth, sending forth several Fibres, shooting downwards; from this Root come up divers heads of Leaves, which are not all of an equal length, but some longer, and some shorter than others, as being one, two, or more Inches long, and half an Inch broad, with a great or thick middle Rib, covered over with a soft hairy Down or Cotton, the lower parts of them being narrower, and much torn in on the sides, and the upper part broader, and but only dented, from among which rise up two or three Stalks of a Foot long without any Leaves, and bearing at top one large Flower, of a deeper yellow color than in many others.

XVII. *The fifteenth, or English Fleabane like Hawkweed.* It has a Root which is composed of many

many black Strings, which perish not, but abide many Years; this Plant rises up with round, straked, reddish, green Stalks, a Foot and half high, set with somewhat large rough Leaves, like unto those of *Elebante*, without any order, but not so fat or thick, and dented about the edges, encompassing them at the bottom, and pointed at the ends; the Flowers are yellow, like to other *Hawkweeds*, set in hairy Husks upon long Footstalks, which turn into Down, and with the whitish long Seed is blown away with the Wind.

XXVIII. *The sixteenth, or Broad Leav'd Hawkweed*. It has divers large hoary Leaves lying next the Ground, sometimes a little waved, sometimes again rom on the edges, sometimes with black spots on them, and sometimes without any, from among which rises up an hairy Stalk, with very few Leaves thereon, spread out at the top into two or three other Branches, at the tops of each of which is a large yellow Flower, like to the *Great Hawkweeds*.

XIX. *The seventeenth, or Round Leav'd bushy Hawkweed*. It grows about a Foot and half high, the Stalk being straked, round, and somewhat rough, spread out at top into several Branches, three or four Inches long apiece, every one having at its head a pale yellow Flower, the Leaves encompass the Stalk at their lower ends, and are somewhat round, about an Inch and half broad, yet ending in a little point, dented about the edges, hoary, and of a light green color.

XX. *The eighteenth, or Rough broad Leav'd bushy Hawkweed*. has a Root wholly composed of Strings and small Fibres, which being cut or broken yield a Milk like Juice, as most of the *Hawkweeds* do; it has broad and something long, hard, rough, dark green Leaves lying on the Ground, without any incisions or dents on the edges; the Stalk which rises up among them is two or three Feet high, thick set with such Leaves unto the top, but less, and growing lesser and lesser; at the tops stand a few yellow Flowers, composed of fewer Leaves than the Flower of the other Kinds, consisting but of one row, which are as the border to the middle Thrum, and being past away turn into Down; sometimes this is found to vary, with less rough, or rather with soft Leaves, sometimes broader and shorter.

XXI. *The nineteenth, or Greater narrow Leav'd bushy Hawkweed*. It has a Root which is whitish, very long, and deeply spreading into the Earth; quickly over running a great deal of Ground, for every little piece being broken off will grow, and so is not easie to be rooted out of that place where it has once taken possession; this *Hawkweed* grows very like the last, but has longer and narrower Leaves, somewhat rough, and dented or waved about the edges; the Stalk is more Branched at the top, where the Flowers are more and thicker, the Leaves of which are of a fair yellow color.

XXII. *The twentieth, or Lesser bushy Hawkweed*. It has a Root which is short, and as it were bitten off, without any Fibres at it; this lesser bushy Kind rises up with a single Stalk, about a Foot and half high, set about with several short and smooth Leaves in some places, and with almost round rough Leaves in others, dented about the edges, and at the top bearing several yellow Flowers upon short Footstalks, much like the last.

XXIII. *The Places*. The first six are Planted for the most part in Gardens, having been first brought to us out of *Italy*, yet the second of them has been found growing Wild in *England*, the seventh is a native of *France*, but transplanted hither; the eighth and ninth only grow with us in Gardens; the tenth,

eleventh, twelfth, thirteenth, fourteenth, fifteenth, and sixteenth, grow upon Mountains and Hills in several parts of *England*, are also Natives of *Italy* and *Germany*, and are many of them transplanted also into our Gardens; the four last Kinds grow with us in Gardens, as also naturally Wild in several places of *England* and *Germany*; the eighteenth and nineteenth have been found growing in the way going from *London* to *Hampsted Heath*, as also in several other places.

XXIV. *The Times*. They all Flower, and their Down flies away in the Summer Months, and rise again of their own Seed, but some of them will abide until the cold of *Autumn* causes them to perish; but the most tender of them will Flower with us till the end of *August*, the Seed ripening in the mean time.

XXV. *The Qualities, Specification, Preparations and Virtues* of all these are the very same with the *Common Kinds* in the former Chapter, and are thought to be no less effectual than they in all the Effects and Properties pertaining to them, to which you are referred.

XXVI. *An Observation*. It is to be noted, that tho' the properties and force of all these Plants may be said to be one and the same with the former *Common Kinds*, both from their form and their bitter taste, which indicates in a great measure their Qualities and Virtues, yet the *sixteenth, or Broad Leav'd Hawkweed* aforegoing, is particularly commended by *Camerarius* as a thing singularly good for the Phthisick, or Consumption of the Lungs, being made into a Conserve or Syrup, or the Powder of the Herb being taken with Honey, he says that in *Alysa* they put it into their Sallers, Broth, and Meats, for the same purpose; and that it is available for the Pleurisie also, being so affirmed by several Authorities, and that without any help of Blood letting: If the Powder, Conserve, or Syrup, be so effectual as *Camerarius* says, then without doubt the Liquid Juice or Essence must very much transcend any of those Preparations: The Essence may be given three or four Spoonfuls at a time, Morning, Noon, and Night, either alone, or else mixed with any proper Vehicle, and so to be continued till the Ulceration of the Lungs is digested, cleansed, and healed, which you may easily know by the fresh Countenance of the Diseased Patient, and by his getting a new production of Flesh upon his Back, as also by his ceasing to spit Matter and Corruption.

C H A P. CCCXLVI.

Of HEARTS--EASE Garden;

O R,

P A N S I E.

THE Names. It is called in *Greek* *ῥοζα* *ῥοζα*, it seems to be the *Viola flavina*, which *Gaza* will have to be *ῥοζα*, or *ῥοζα*, in *Theophrastus* Lib. 6. Cap. 6. in *Latine* *Viola Tricolor*, *Herba Trinitatis*, *Herba Clavellata*, and of some *Fuchs*, but this last Name is most proper to *Knapweed*, of which in its place; in *English* *Hearts-Ease*, *Herb Trinity*, and *Pansie*.

II. The Kinds. It is of three principal Kinds; viz. 1. *Viola Tricolor*, *Viola Trinitatis*, or *Eles Trinitatis Hortensis*; Garden Hearts-Ease, of which in

R r 2

this

this Chapter. 2. *Flos Trinitatis Syloestris*, Wild Hearts-Ease, of which in Chap. 347.

III. The Garden Kinds. There are three sorts of the Garden Kinds, viz. 1. *Flos*, seu *Viola Tricolor Hortensis communis*, *Viola Flammæ major & minor*, The Greater, or Common Garden Hearts-Ease. 2. *Flos*, seu *Viola Tricolor Hortensis*, *Viola Flammæ Hortensis flore duplici*, Hearts-Ease with double Flowers. 3. *Viola Flammæ latea maxima*, The Great yellow Hearts-Ease.

IV. The Descriptions. The first Greater or Common Garden Hearts-Ease. It has a Root composed of

nothing else but a bunch or knot of fibrous Strings, and perishes every Year, the Plant raising it self up plentifully by its own Sowing, where it is suffered; its Leaves are longer, and more indented or cut in on the edges than those of the Violet; the Stalks are upright, yet weak, and ready to fall down and lye upon the Ground, set here and there with the like Leaves, from whence come forth the Flowers, having little or no smell, and made in form like unto a Violet, yet more open, and with larger Leaves, but so variably mixed with Blew, or Purple, White and Yellow, that it is difficult to set down all the varieties; for some Flowers will be more White, and but some spots of Purple or Blew in the two upper Leaves, and the lower Leaves with some stripes of yellow in the middle, others will have more Purple in them than any other color, both in the upright and lower Leaves, the side Leaves Blew, and the middle Yellow, and others White and Blew, with yellow stripes, as Nature is pleased to vary the Colors: The Seed is small, whitish, and round, and contained in small round Heads. The lesser is like to this.

V. The second, or Hearts-Ease with double Flowers. This is a very pleasing Plant, and bears Flowers with more Leaves than the former, making it seem to be twice double, and that only in Autumn, for the first Flowers, which come in Summer, are single; this is of that sort which bears Purple Flowers, and it is to be noted, that the Seed of this Kind will not all bring double Flowers, but only some of them, where the Ground is fit, and the Plant thrives and takes a liking to it; so that if you have once had of this Double Kind, you shall seldom miss to have double Flowers again every Year of its own growing or sowing.

VI. The third, or Great yellow Hearts-Ease. This is another Species which decks and adorns our Gardens, and therefore is not to be left out; its Leaves and Flowers are like the former, but more plentiful in Stalks and Branches, and better abides our Winters; the Flowers are larger than any of the former, of a fair pale yellow color, with some yellow stripes now and then about the middle, for it is sometimes without any stripes, and also of a little deeper yellow color; this Plant is to be encreased by slips, which will soon multiply in a fertile and moist Ground, for it has scarcely ever been observed to bear Seed.

VII. The Places. All these Plants were first Wild, and by being brought into the Garden, and Manuring, they have been brought to a very great fairness of color, and the beauty which they now possess, and also to a better smell than when they were Wild; and in the same manner I believe many other Wild Plants might have been improved, even to a kind of perfection.

VIII. The Times. Hearts-Ease seldom Flowers until May, but then some will abide to Flower until the end of Autumn almost, if Frosts, by their being too early, hinder not, as those of the Double Kind.

IX. The Qualities. Hearts-Ease seems to be temperate as to its first Qualities, it is Emollient and Glutinous, in all its Parts and Qualities like unto Violets, but in its glutinous quality more like to Mallows; it is Cosmectick, Vulnerary, Pectoral, and Alexipharmick.

X. The Specification. It is said to be good against Ulcers of the Lungs, and the Epilepsie.

XI. The Preparations. You may have therefrom, 1. A Juice or Essence. 2. A Decoction in Water or Wine. 3. A Syrup. 4. A Cataplasme. 5. An Ointment or Balsam. 6. A Powder of the Herb and Flowers.

Flowers. 7. A Distilled Water. 8. An Acid Tincture.

The Virtues.

XII. *The Juice or Essence.* They are very viscous, and emollient, good against hot Diseases of the Breast and Lungs, and against Agues, being taken three Hours before the coming of the Fit, as also against Convulsions, and the Falling-Sickness in Children; it is also good to bath the places troubled with the Itch, Tettars, Scabs, or other breakings out in the Skin, and to cleanse old Sores and foetid Ulcers, being washed therewith: You may take from three to six Spoonfuls at a time in the Morning fasting, and last at Night going to Bed, either alone by it self, or mixed with some fit Vehicle.

XIII. *The Decoction in Water or Wine.* It has all the Virtues of the Juice or Essence, but not altogether so powerful, but is something better to wash old Sores and Ulcers withal, because it cleanses more, dries and heals; inwardly it may be given from four to eight, or ten Ounces, according to the Age and Condition of the Patient. *Lugdunensis* says that many Sacks full of the Herb and Flowers are Yearly Transported from *Marseilles* in France unto *Alexandria*, and other parts of *Aegypt*, where they use them boiled in Water, which only (by their Religion) they are enjoined to drink, and this they do, not only thereby to make the Water the more wholsom to be drunk, but are also persuaded that it helps against Diseases of the Breast and Lungs.

XIV. *The Syrup.* It may be made of the Juice or Essence, with Honey, or of the Flowers, exactly in the same manner as you make Syrup of Violets. They are both admirable Pectorals, cause easie Expectoration, and cleanse the Thorax, or Breast, Lungs, and Stomach, from crude salt Flegm, frothy and viscous Humors, and other like Tartarous Matter, which causes Coughs, Wheezing, Hoarseness, shortness of Breath, difficulty of Breathing, and other like Diseases of those parts; it is also said to heal a *Phthisis*, or Ulceration of the Lungs, being timely and assiduously taken. The Syrup of the Flowers mixed with fair Water, and the Juice of Limons, and so made as it may be freely potable, being largely drank, it quenches Thirst, abates praternatural heat, and extinguishes burning Fevers.

XV. *The Cataplasm.* It is good to be applied to simple Contusions, as also to places broken out with the Itch, Scabs, Tettars, Pimples, Scurff, Morpew, &c. for it dissolves, opens the Pores, cleanses, and absorbs the sharpness of the Humor.

XVI. *The Ointment or Balsam.* They may be made of the Liquid Juice, or Green Herb, according to the usual Method; they digest, cleanse, dry and heal Wounds, and ill conditioned Ulcers; the Balsam many times heals a simple green Wound at once or twice dressing; it is also a very good thing to be applied in the extremities of the Gout, giving ease in a very short time.

XVII. *The Powder of Herb and Flowers.* It is Vulnerary, being applied dry upon Ulcers, it sucks up their moisture, cleanses, incarnates, and dries, thereby inducing a speedy healing, more especially if the Sore or Ulcer be every time, before it is applied, well washed with the Juice or Essence.

XVIII. *The Distilled Water.* *Costeus* in his Book of the Nature of Plants says, that the Distilled Water of *Hearts-Ease* is commended in the French Disease to be profitable, being taken for nine days, or more, and Sweating upon it; how true this is I will not say, but with that by Experience, it might be confirmed; if the Distilled Water can have such Virtues, what may the Liquid Juice or Essence be able

to do in the same Case? I doubt not but they exceed the Distilled Water ten times at least in their Power and Effects; but the Distilled Water mixed with the Juice Liquid, or Inspissate, becomes an excellent thing for the conglutinating and healing of simple green Wounds.

XIX. *The Acid Tincture.* It is a singular thing to abate the burning Fit of Agues, and extinguish the most vehement heat, even of malign Fevers; it is good against all malign Diseases, and resists the Plague or Pestilence it self. Dose so many drops as to make the Vehicle gratefully sharp and pleasant, and to be taken in all that the Patient drinks; it also quenches Thirst admirably.

C H A P. CCCXLVII.

OF HEARTS-EASE Wild,

OR,

HERB TRINITY Wild.

THE Names. It is called in Greek *ἡ ἑρτά*, *her-ta*, in Latine *Viola Flammea Sylvestris*, *Herba Trinitatis Nemoralis*, *Flos Trinitatis Nemorosus*, vel *Sylvestris*, and in English *Wild Hearts-Ease*, *Wild Pansies*.

II. The Kinds. There are four Species of this Plant, viz. 1. *Viola Tricolor Sylvestris communis*, The Common Wild Hearts-Ease. 2. *Viola Tricolor affurgens*, Upright Wild Hearts-Ease. 3. *Viola Tricolor lutea Sylvestris*, Wild yellow Hearts-Ease. 4. *Viola Tricolor Petrea*, Stoney Hearts-Ease.

Hearts-Ease Wild.

III. The Descriptions. The first, or Common Wild Hearts-Ease. It has a fibrous Root, which sends

4th
1816
H. n

W. n

at first many round Leaves, afterwards they grow something longer, and are slightly cut about the edges, and by their weakness lye upon the Earth; the Stalks are weak and tender, and tho' they seem to grow a little upright, yet they seem to trail, or lean towards the Ground, upon which grow several like Leaves, as also Flowers, like to *Violets*, upon long Footstalks; the chief difference between these *Wild* and the former first *Garden Kind* is in the color, and largeness of the Flowers, (for in the Leaves and form of growing there is but little variation) the Flowers in this being for the most part smaller than those of the *Garden*, and of as little smell; but as to the Colors they are various, yet there is scarcely a Flower among many which has three colors, for they are chiefly White, and pale Blue, more or less marked or spotted, and sometimes yellow in the bottom; the Flowers being past away, little round Heads succeed, something less than a *Tare*, about the bigness of a large great Pins head, which being ripe, do open themselves, and in a little time after let their Seed fall forth.

IV. The second, or Upright Wild Hearts-Ease. It has a Root composed of Fibres or Strings, which perish after Seed time, the Plant rising again of the fallen Seed: This *Hearts-Ease* grows to be about a Foot high, or more, with hard upright Stalks, which yet at their tops bend a little again, they have two Leaves set at each Joint, but longer, and more dented about the edges than the first *Garden Kind* in the former Chapter; at these Joints with the Leaves, on both sides of the Stalks, comes forth a larger Flower, and more spread open than those of the first *Garden Kind*, yet very like to them, of a pale purplish color, and almost as sweet as a *Violet*, as *Matthiæus* says, but without smell, as *Lobel* says; *Dodonæus* describes this Kind with variety of Colors, and therefore calls it *Viola affurgens Tricolor*, whereas *Matthiæus* declares his to be only Purple; after the Flowers are past, longer Seed Vessels follow than those of the *Garden Kind*, in which is contained small whitish Seed.

V. Gerard has this Description of it. The upright *Pansie*, or *Hearts-Ease*, brings forth long Leaves, deeply cut in on the edges, sharp pointed, of a bleak or pale green Color, set upon slender upright Stalks, cornered, jointed, or kneed, about a Foot high, or higher, upon which grow very fair Flowers, of three colors, viz. Purple, Blue, and Yellow, in form or shape like unto the first *Common Garden Hearts-Ease*, but greater and fairer, which Colors are so excellently and orderly placed, that they bring great delight to the beholders, tho' at the same time they have little or no smell at all in them; for it happens oftentimes that the uppermost Flowers are differing from those which grow upon the middle of the Plant, and those again vary from the lowermost, as Nature is pleased to play with things of such beauty.

VI. The third, or Wild Yellow Hearts-Ease. This in its Root, Stalk, Leaves, and manner of growing, is much like to the first foregoing, and has been taken by some young Herbarists to be the *Yellow Violet*; the Flowers are of a faint yellow color, without mixture of any other color, yet having a deeper yellow spot in the lowest Leaf, with four or five blackish purple Lines, in which it differs from the first *Wild Kind*.

VII. The fourth, or Stoney Hearts-Ease, is a mean and low Plant, the Leaves are rounder, and not so much cut about the edges as the first is; the Stalks or Branches are weak and feeble, trailing upon the Ground; the Flowers are likewise of three Colors, viz. White, Blue, and Yellow, but void of smell; and the Root perishes having perfected the Seed.

VIII. The Places. They grow in waste and Corn Fields, about their borders, and in Fallow Grounds, and borders of Groves and Forests; the first and second, tho' they grow Wild in the Fields, yet they sometimes also grow in Gardens; the second, or Upright Kind, grows on Mount *Baldus* in Italy; *Lobel* says it grows in *Languedock* in France, and on the tops of some Hills in England; the third, with yellow Flowers, has been found by a Village in *Lancashire* called *Latham*, about four Miles from *Kircham*; the last grows only in Rocky, Stoney, Gravelly, and barren Grounds, and other like places.

IX. The Times. They Flower not only in the Spring, but for the most part all Summer long, thro' April, May, June, and July, even to August.

X. The Qualities, Specification, Preparations, and Virtues, are the same with those of the *Garden Kind* in the former Chapter, so that no more need be said concerning the same in this place.

CHAP. CCCXLVIII.

Of HELLEBOR BLACK True,

O R,

CHRISTMAS FLOWER.

I. THE Names. It is called in Arabick *Cherbachem*, and *Charbach asud*, in Greek *Ἑλεβορος*, and sometimes without the Asperate *Ἑλεβος*, in Latine *Elleborus*, and *Helleborus*, also *Helleborum*, and *Veratrum*, quod Mentem vertat, in English also *Hellebor*, and *Christmas Flower*.

II. The Kinds. There are two principal Kinds, viz. 1. *Ἑλεβορος niger*, & *Ἑλεβορος purpureus*, *Helleborum nigrum*, *Veratrum nigrum*, Black Hellebor, of which we shall Treat in this Chapter, and in Chap. 349. and 350. *Ἑλεβορος albus*, *Helleborus albus*, vel *Helleborum album*, *Veratrum album*, *Sanguis Hercules*, *Consilijo vegetij*, *Absyrti Columelle* & *Phymij*, White Hellebor, and Sneeze-Root, of which we shall (God willing) Discourse in Chap. 351. and 352. following.

III. The Kinds of Black Hellebor. There are several Kinds of this Plant, as 1. *Helleborus niger verus*, The true Black Hellebor, called also *Veratrum nigrum verum*, of which in this Chapter. 2. *Helleborus niger nebus maximus*, *Helleboraster maximus*, *Consilijo*, *Battard Black Hellebor*, or *Bears-Foot*, called by some Country People *Setterwort*, *quasi Setonwort*, being applied to the Ears, Neck, and other parts, after the manner, or in place of a *Seton*. 3. *Helleborus niger nebus minor*, *Helleboraster minor*, The lesser Battard Black Hellebor, which is also called *The lesser Bears-Foot*, of both these we shall Treat in Chap. 349. 4. *Elleborine*, vel *Helleborine nigra Sanicula Folio major*, Wild Black Hellebor with Sanicle Leaves the Greater; it is called also *Afrantia nigra* by *Lobel* and *Gesner*, *Osteritium Montanum Tragi*, *Imperatoria nigra Tabernamontani*, but *Dodonæus* takes it to be *Elleborus niger*, or *Veratrum nigrum Dioscoridis*, and *Barbanius* calls it *Elleborus niger Sanicula Folio major*. 5. *Elleborine nigra Sanicula Folio minor*, *Helleborus niger Sanicula Folio minor*, Wild Black Hellebor with Sanicle Leaves the Lesser, or *The Lesser Sanicle like Hellebor*. 6. *Elleborine ferulacea*, *Helleborus niger ferulaceus*, *Pseudohelleborum Matthioli*, *Euphybalmum majus Anguillare Clusij*, & *aliorum*, Wild Ba-

ttard

hard Black Hellebor Fennel Leav'd, of which three last in Chap. 350. following.

IV. The Description. *The first, or True Black Hellebor, called Christmas Flower. It has a Root which consists of a great number of brownish black Strings, which run down deep into the Ground, and are fastned to a thick bed, of the bigness of ones Finger, growing smaller from its top or head downwards; from this Root rise several fair green Leaves, each of them standing up a thick, round, stiff, green Stalk, about a Half breadth high from the Ground, divided into seven, eight, or nine parts, or Leaves, and each of them naked or dented from the middle of the Leaf to the pintward on both sides, abiding green all the Winter, at which time the Flowers rise on the like short Stalks as the Leaves grow on, without any Leaf thereon for the most part, yet sometimes having small, short, pale green Leaf, resembling rather a Skin than a Leaf, a little under the Flower, and grow but little higher than the Leaves; each Stalk also bears usually but one Flower, very rarely two, consisting of five large, round, white Leaves apiece, like unto a great single White Rose, chancing sometimes to be either dashed with a Purple about the edges, or the wholly Purple, without any White in them, as the Season, Weather, or time of continuance doe contribute to effect the same; this Flower has many pale yellow Thumbs in the middle, standing about a green Head, which afterwards grows to be the Sea Vessel, divided into several Cells or Pods, like unto a Columbine Head, or Aconitum Hymale, but greater and thicker, in which is contained somewhat long and round blackish Seed, like to the Seeds of the Bastard Kinds, or Bears-Eeots.*

V. The Places. It grows in Greece, Italy, England, France, and Germany, in many places: those Countries, as also in Anticyra, an Island over against the Hill Oeta in Thessaly, where it is said to grow in an extraordinary plenty, whence came the proverb (speaking to a Melancholy or Mad Man, to

his Cure) *Naviga ad Anticyras*, but with us in England it only grows in Gardens.

VI. The Times. It Flowers in December, and January, if the Season or Weather be any thing temperate, if the Air is mild and warm, it generally Flowers about Christmas time, from whence with us came the Name of Christmas Flower.

VII. The Qualities. It is hot and dry in the third degree, Aperitive, Absterfitive, Costmetick, Hepatick, Splenetick, Arthritick, Cathartick, Emetick, and it given by an unskillful Hand *Snawrie*; or Venetick.

VIII. The Specification. It is peculiar against Madnes and Melancholy, Quartan Agues, Scabbiness, and Leprosie, kills Worms, and cures the Kings-Evil, Dropisie, Yellow Jaundice, and Gout.

IX. The Preparations. You may have therefrom,

1. The Liquid Juice of the Leaves.
2. An Essence of the same.
3. An Infusion or Decoction of the green Leaves.
4. An Infusion or Decoction of the Root.
5. A Syrup.
6. A Powder of the Leaves or Root.
7. A Seton of the Root.
8. An Extract of the Root.
9. A Pessary of the Root.
10. A Lotion of Herb or Root.
11. An Ointment of the Herb.
12. A Distilled Water of the Green Herb.
13. An Acid Tincture of Herb or Root.
14. A Spirituous Tincture.
15. An Oily Tincture.
16. A Saline Tincture.

The Virtues.

X. The Liquid Juice of the Leaves. It is used for most Diseases in which White Hellebor is available, but it is nothing so violent or dangerous; the Juice of the Leaves made up with Flower into small Cakes and baked, has been used to good purpose against the Dropisie, Jaundice, Cachexia, and other evil dispositions of Liver, Spleen, and Gall; it may be given from half a Dram to two Drams, according to Strength and Age.

XI. The Essence. It is used to open and purge the Body in several Cases (as well as the Extract of the Roots) and is of great use and effects against all Melancholy Diseases, long and tedious Agues, as the Quartan, and the like; it eases the Megrims, and Cephalica, or old inveterate Headach, Yellow and Black Jaundice, Leprosie, Falling-Sickness, Consumption, either of the Lungs or whole Body, pains of the Belly, Sciatica, Cramps, Convulsions, or shrinking of the Nerves, as also all other Griels and Pains of the Joints or Nerves, as Gout, Inflammation, and the like; it being taken Morning and Evening, half a Dram at a time, in any convenient Vehicle, always increasing or diminishing the Dose, according to the Age and Strength of the Patient, and as you find it by observation to work.

XII. The Infusion or Decoction. It may be made with Water (if for hot Diseases) or Wine (if for cold Distempers) but Authors advise, that the Herb or Root be first corrected, by steeping it in Vinegar, (because of its dangerous and obnoxious Qualities) a day and a night, and then dried again; yet our English Kind seems not to be so violent as that which grows in hotter Countries, nor has it such a violent operation in working, for which reason that previous correction of it may be forborn; these have all the Virtues of the Juice and Essence, but work with more moderation, and are much safer to be taken, and may be used in all the Cases aforementioned. Dose from half an Ounce to two, three, or four Ounces, according to Age, &c.

XIII. An Infusion or Decoction of the Root. It has all the Virtues of those of the Leaves, but it yet operates more moderately, and therefore is the more safe to be taken; Country People give the Infusion or Decoction of either Leaves or Roots to kill Worms in Children, I confess they may be given to each

such as are come to Mans strength and growth, but to Children it ought to be given with a great deal of caution, or else foiborn, since there are many other things which will do the same safely, and fully as effectually as these can.

XIV. *A Syrup.* It is made of the Infusion or Decoction of Herb or Root, boiled up to a consistency with Honey, or as some will have it, with Honey and Vinegar, which is indeed better; it is both Emetick and Cathartick, and evacuates Tartarous Matter from the Lungs; it cleanses also the Tunicles of the Stomach and Guts from evil juices adhering to the fime. Dose from one Spoonful to two, or three.

XV. *The Powder of the Leaves or Root.* It has all the Virtues of the Liquid Juice, Essence, Infusion, Decoction, or Extract, but it works much more churlishly, causing Gripings, Fainting, vehement Sicknes at Heart, and sometimes Swooning away; it kills Worms, and is good to give in Madnes, and to such as are troubled with a Hypochondriack Melancholy; if an Issue is cut in any fleshy part, yea, in the Neck, or upon the Shoulder, or brawn of the Arm, or Thigh, or Leg, and a Pea be put into it for a day or two, and then the hole of the Issue be stopp'd up with the Powder of *Hellebor* Leaves, and left there for one, two, three, or more days, it will make a Tumor nearly as large as an Egg, and draw all the ill Humors from all, yea, the most remote parts of the Body to that place, and expel them there, and by this means the Kings-Evil, Leprosie, Gout, Sciatica, and Pocky Symptoms, have been cured, yea, after that a number of Purgings, Vomiting, Bleedings, and Salivations, have all been used in vain, and had no effect upon the Patient.

XVI. *The Seton of the Root.* It is used to Rowel Cattel withal, as Country People call it. *Pliny Lib. 25. Cap. 5.* says, that a piece of the Root of *Black Hellebor* being drawn through a hole made in the Ear of a Beast troubled with the Cough, or having taken any poysonous thing, cures it, if it be taken out the next day at the same Hour: *Abysyrtes* and *Hierocles* say the same thing, as also *Columella*. This manner of Curing is used with us, but the place is changed from the Ear to the Dew-lap in Oxen, and to the fore Leg or hinder Leg of an Horse above the Pastern.

XVII. *The Pessary.* Being applied to the Womb, it mightily prevails to bring down Womens Courses, and if there is any callous or hard flesh grown in the *Vagina*, leading to the Womb, or in a *Fistula*, the Root being left therein for two or three days, it will totally consume it; *Galen Lib. 6. de Simp. Med.* affirms this, and *Julius Alexandrinus* says he often tried it to be true.

XVIII. *The Extract of the Root.* This has all the Virtues of the Juice, Essence, Infusion, Decoction, and Syrup aforegoing, and is more mild and fit to be taken than any of them, and as it may be always ready at Hand, so it may be given in all those Distempers for which those Preparations are to be exhibited. Dose from a Scruple to a Dram, or Dram and half, in the Morning fasting.

XIX. *The Lotion of Herb or Root.* It is made by Infusion or Decoction in Wine Vinegar, or in half Vinegar half Wine; it is good to wash any place troubled with Scabs, Wheals, or Pustles, Leprosie, or any other like breaking out, yea, altho' it be a Gangrenous or Phagedenick Sore or Ulcer, it stays their spreading or eating, and preserves the Flesh from putrifaction; this same Lotion helps also the Toothach, if the Mouth be gargled therewith, and it be held some small time therein; also dropped into the Ears, it eases the pain, helps against the noise of the Ears, and removes the deafnes; if any

foul or callous Ulcer or *Fistula* he washed with this Lotion, and then the Powder of the Root be strewed thereupon, it dries, heals, and suddenly cures them.

XX. *The Ointment of the Herb.* If People afflicted with Lice be often washed with the Decoction of *Hellebor* hot, and then the Head or other parts anointed with this Ointment, it kills them, and perfectly destroys the breed.

XXI. *The Distilled Water.* It is of good use to remove black and blew spots or marks from the Skin, and to take away the yellowness thereof, as also Tanning by the Air, Sunburning, Pimples, Morpew, and other like deformities of the same.

XXII. *The Acid Tincture.* Given to a grateful acidity in any proper Vehicle, it kills Worms in Old or Young, it gently Purges, and prevails against all the Diseases the Herb or its Root is good for; it also overcomes Poyson, if the Patient takes it soon after the receiving of the Poyson; mixed with *Damask Rose Water*, it is good to wash Pimples in the Face and Skin, as also Lentils, Freckles, &c. it soon takes them away, and restores the Skin to its true and natural color.

XXIII. *The Spirituous Tincture.* It is an extraordinary thing to bath soe withal in a Gangreen, preventing and curing the same; it may be given inwardly from half a Dram to two Drams, and more, according to Age and Strength, against the Kings-Evil, Jaundice Drophie, Gout, Leprosie, French Pox, and other Diseases of like kind; it something troubles de Stomach, otherwise it works well enough.

XXIV. *The Oily Tincture.* It is very good against the Sciatica, Iout, and weaknes and pains of the Joints and Nerves, it resolves Convulsions, and yet strengthen the Nerves, and restores in a Palsie; it is good also to anoint withal upon any straining of the Nerves, or when the Bones are out of Joint, because it warms and comforts the part, and restores the Tone thereof being hurt.

XXV. *The Salve Tincture.* It is to be used as hot as can be endured upon the part or parts afflicted with Scabbiness, Tetters, Ringworms, Pimples, or other breakings out, also against yellowness, blackness and blewness of the Skin, Lentils, Freckles, Sunburning, Tanning, Surff, Morpew, Leprosie, or any other like detraction; if it is constantly used two or three times a day for some time, it certainly cures those deformities and leaves behind it a pleasing smoothness and beauty.

C H A P. CCCXLIX.

Of HELLBOR BLACK Bastard.

OR,

B E A R S - F O O T.

THE Names. It is called in Greek *Ἑλλάβορος* in Latine *Helleborus noltus*, and *Helleborum nolum*, in English *Bastard Black Hellebor*, and *Bear-foot*.

II. The Kinds. There are two Kinds hereof, viz. 1. *Hellebraster*, *Hellebrastrium maximum*, *Helleborus noltus maximus*, *Confligo*, The Greater Bastard Black Hellebor, or Bears-Foot, called also *Seres* or *Sterwort*. 2. *Hellebraster*, *Hellebrastrium minus*, *Helleborus niger noltus minor*, The Lesser Bastard Black Hellebor, or Lesser Bears-Foot. *Fuchs*

ius calls this *Helleborus adulterinus Hortensis*, and *Confiligo minor Lugdunensis*, but the *Helleborus niger vulgaris Gesneri*.

Bears-foot

III. The Descriptions. *The first, or Greater Bastard Black Hellebor. It has a single Root, with nothing so many Strings growing to it as the True in the former Chapter has and oftentimes perishes after it has given Seed, yet not always, nor in all places; from this Root proceed several sad green Leaves, each upon a long Footstalk, which are divided into seven or nine Leaves, each of which are narrower than those of the Lesser Bastard Hellebor in the next Section, a little dented about the edges; but not so deeply as the Lesser, and biding above Ground green all the Winter, whereas the following perishes every Year, and rises again in the Spring; from among these Leaves shoots a reasonable large and tall Stalk, higher by half than the Small following, with such like Leaves there as grow below, but smaller up to the top, where it spreads it self out into divers Branches, bearing many hollow Cup-like Flowers, divided at the brim into five parts, but do seldom spread themselves open, of a whitish yellow green color, somewhat like the next Bastard Kind, and sometimes purplish about the brims or edges, with a green Head in the middle, and a few white Threads about it, by which it seems to be *Veratrum nigrum quartum peregrinum Clusij*: This green Head growing to be the Vial, wherein the black Seed is contained, shoots forth into four, five, or six Horns, fashioned like the flowing Bastard Kind, saying, that it is smaller, as the Seed also is for the most part, the whole Plant, and every part thereof, is of a worse smell than the flowing; the Root of this, with the lower part of the Stalk next to it, is of that Bears-Foot, or Setterwort, which Country People use to Rowel their Calf with.*

IV. *The second, or Lesser Bastard Black Hellebor. It has Roots which are more stringy, black and hard than the former in Chap. 348. It is in itself things like unto that True Black Hellebor, for it has also many Leaves, as seven, eight, or nine, upon short*

Stalks, divided into many parts, but each of them are longer and narrower, of a darker green color, and dented on both sides, feeling something hard, these perish every Year, but rise again the next Spring; the Flowers hereof stand on higher Stalks than the True, with some Leaves on them also, yet very few, and are of a pale green color, like the True in the former Chapter, but smaller by half at least, having likewise many greenish yellow Threads or Thrums in the middle, and such like Seed Vessels, and blackish Seed in them.

V. *The Places.* The first grows, as *Tragus* says, in the borders of Stoney Fields and Grounds, also on Rocky Hills, as by the *Mosella* and *Rhine*, also in *Sylva Harynia*, and as *Pena* says, in *Aquitane* in *France*, and by the River *Lanus* at *Montpelier*; it grows Wild in many Woods and shadowy places in *England*, as also in almost all our Gardens about *London*, and several other parts of the Kingdom; the second has been found in some Woods in *Northamptonshire*, and in other places of this Land, as also in some places within Eight or Ten Miles of *London*.

VI. *The Times.* They both Flower in *February* or *March*, according as the preceding Winter and Spring Season are in mildness, and their Seed is ripe in *May*, or towards *June*.

VII. *The Qualities, Specification, Preparations and Virtues* of these Bastard Black Hellebors are the same with those of the True in the former Chapter, so that no other declaration need be made thereof.

VIII. *Observat. 1.* That the Greater Bastard Black Hellebor, Bears-Foot, or Setterwort, was held by *Dodonaeus* to be a kind of venomous *Aconite*, or *Woolfs-bane*, not to be used, and that it would kill *Woolves*, *Foxes*, *Dogs*, &c. I have known it used in Decoction to kill Worms in the Belly, which it would effectually do, but it had a deleterious or poisonous quality, which some Bodies could not overcome, where it killed not the Patient, it would indeed kill the Worms; but it is so dangerous a Medicine, that it ought not to be internally used, but by a very Skilful and Prudent Hand, and yet nothing scarcely is more common to be used by Women in the Country than the Decoction of this Herb for the purpose aforesaid; I knew a little Youth take it to kill Worms, but it killed him first; also a Woman between Forty and Fifty Years of Age, whom it killed in about three Hours time; at the same time, by a Woman's Advice, the Decoction was given to my self, being then about Eight Years of Age, but I met with a better Fate in the use thereof, yet my danger was great, it vehemently Vomited me, and made me Heart-sick; so swooning away; the Vomiting being over, I revived, but it had such an effect upon me, that it made me loose my Hair, and Nails both of Fingers and Toes, and all the Skin of my whole Body peeled off, from Head to Foot; whether my good hap was from the strength of my Constitution, or the small Dose of the Medicine, I leave others to determine, but from these bad effects it is manifest that it is not very safe to be given, no not to very strong Bodies, but outwardly applied it may be of good use.

IX. *Observat. 2.* That the Powder of the Leaves of this is much more effectual than the Powder of the Leaves of the True in Chap. 348. Sect. 15. to all the external Intentions and Purposes there mentioned; and that the Leaves of this ought rather to be chosen than the Leaves of that, especially being applied or put into the hole of an Issue; as is there directed; it is a wonderful thing to see what a vast quantity

at Humor it will draw away from all parts of the Body for many days together, doing therein what a Salivation it self could never be able to perform, and that in the most deplorable, stubborn and rebellious Diseases; indeed it is beyond what Words can speak. The Root also of this used as a Pessary, is much more effectual than the Root of the *True*, especially being put into a Fistula, or part where there is any callosity, because it so admirably dissolves the same.

X. *Observat.* 3. That the *second Kind*, or *Lesser Bullard Black Hellebor*, or *Smaller Bears-Foot*, (from the great Experience which I have had thereof) is much more violent and churlish in working, whether by Vomit or Stool, than the *True Black Hellebor* described in the former Chapter, you may adventure to give the Infusion of a Dram of the Root, being infused all Night in Powder in White Wine or Canary, to be drunk the next Morning fasting, to exhibit it powerfully prevails against all the Diseases which the *True Hellebor* is said to be good against, for which reason there is no need in this place to repeat those things again; and the use of the Powder of the Leaves or Root are in like manner useful in all outward Cases for Scabs, old running Sores, foul Ulcers, Fistula's, &c.

C H A P. CCCL.

Of HELLEBOR BLACK Wild.

I. **THE Names.** It is called in Greek *Ἑλληβορις* *ἡλιδας ἄνετος*, in Latine *Helleborine nigra*, *Helleborus niger* *Sylvestris*, and in English *Wild Black Hellebor*.

II. **The Kinds.** There are three Kinds of *Helleborine nigra*, viz. 1. *Helleborine nigra Sanicula Folio major*, *Helleborus niger Sanicula Folio major Sylvestris*, *Sanicula scabina Fuchsij*, *Astrantia nigra Gesneri*, *Oserivium Montanum Tragi*, *Imperatoria Tabernamontani*, *Elleborus niger*, vel *Vernaculum nigrum Dioscoridis*, as *Dodonæus* thinks, The Greater Wild Black Hellebor, or The Greater Helleborine with Sanicle Leaves. 2. *Elleborine nigra minor*, *Helleborus niger Sanicula Folio minor Sylvestris*, The Lesser Sanicle Leav'd Wild Black Hellebor, The Lesser Black Helleborine, or Wild Black Hellebor. 3. *Helleborine nigra Ferulacea*, *Baptisalmum majus Anguillare Clusij*, & aliorum, *Helleborum nigrum Fenicula Folio*, *Pseudohelleborus niger Matthioli*, *Fennel Leav'd Wild Black Hellebor*.

III. **The Descriptions.** The first, or Greater Wild Black Hellebor Sanicle Leav'd. It has a Root composed of small black Strings, shooting forth from a top head, like unto the Root of Bears-Foot; from this head of a Root come forth several broad dark green Leaves, each of them growing upon a long Footstalk, which are cut in on the edges into five divisions for the most part, and dented about besides, something resembling the Leaves of the Common Sanicle, but more truly the Leaves of the Field *Ranunculus*, or *Crowfoot*, or *Geranium Batrachoides*, or *Crowfoot Cranes-bill*, from among which rise up several slender, smooth, green Stalks, having some Leaves upon them, and at the tops of them two, or three, or more Flowers together, each of them consisting of many small, hard, whitish Leaves, as a pale border, encompassing many Threads in the middle, which being fallen, then rise up many flat, whitish, and

long Seed, somewhat like unto *Sweet Fennel Seed*, but not altogether so big, nor so yellow.

IV. **The second, or The Lesser Wild Black Hellebor Sanicle Leav'd.** It has a small black fibrous Root, like the former, from the head of which rise up several small and somewhat round Leaves, every one of them upon a long Footstalk, being not much broader than the Nail of a Mans Thumb, yet divided, even to the middle Rib, into seven parts, every one of them being short, narrow, and dented about the edges; the Stalks are many, and small, not above an Hand breadth high, with one or two Leaves on them, more cut in and divided than the lower are, at the tops of them stand several small Flowers, very thick set together in Tufts or Umbles, like unto the last, but smaller, after which come small flat Seed, something like the former, but lesser by much, as it is also in all the other parts thereof.

V. **The third, or Fennel Leav'd Wild Black Hellebor.** Its Root consists of many long and blackish Strings set together, and proceeding from one head, very like unto the Lesser Black Hellebor, or Bears-Foot, in Chap. 349. Sect. 4. foregoing, but harder, stiffer, or more brittle, and seeming to be without any moisture in them, to abide and encrease every Year, tho' the Stalks with green Leaves do Annually perish: This Kind of Wild Black Hellebor shoots forth many green Stalks, sometimes lying or leaning to the Ground, and sometimes standing a little upright, beset very thick with small Leaves, finer and shorter than Fennel, &c. of them ending in a Tuft of such like fine green leaves, and some having at their tops one large Flow'r apiece, somewhat reddish or brownish on the outside while they are in bud, and a while after, which when open consist of twelve or fourteen long and narrow Leaves, of a fair shining yellow color, set in order round about a green Head, with yellow Turns in the middle, laying themselves open in the Sun, or a fair day, but else remaining close; at the Flower is past, the Head growing greater, & it self, compact of many round whitish

rith Seed, very like unto the Head of *Adonis Flower*, but much greater.

VI. *The Places.* The first and second grow upon Hills in *Germany*, and Mountains in *Italy*, on the *Alps*, and *Pyrenean Hills*; the third grows, as *Clusius* says, near *Vienna* in *Austria*, and in both the Upper and Lower *Hungary*; but they all three grow with us here in *England* only in Gardens, where they flourish very well.

VII. *The Times.* The two first flower not in Winter, but in Summer Months, as in *May* and *June*, and they abide green all the Year through; the third Flowers in *April*, if the Weather is warm, and its Seed ripens in the Month following.

VIII. *The Qualities, Specification, Preparations and Virtues* agree exactly with those of the True *Black Hellebor* in Chap. 348. aforegoing, and therefore need not be repeated again in this place.

IX. *Observat.* 1. *Astrantia nigra*, the first of the aforegoing, is doubtless no *Mustardwort*, as the purging faculty does shew, and it is certain, and several Experienced Physicians can testify, that the Roots hereof do purge Melancholy, and other Humors, and that they have perfectly cured Melancholy Mad People therewith; and that it has this Purging Faculty, *Gesner* does likewise testify in a certain Epistle written to *Adolphus Voco*, in which he shews that *Astrantia nigra*, or Greater Wild Black Hellebor with *Sanicle Leaves*, is almost as strong as *White Hellebor*, and that he himself had made Experiment of the Purging Faculty thereof by Stool, which thing bespeaks it to be a *Black Hellebor*, if not the True of *Dioscorides*.

X. *Observat.* 2. *Dodonaeus* supposes this Greater *Sanicle* Leav'd Black Hellebor to be *Helleborus verus* *Dioscoridis*, (in which I am of Opinion he was deceived) and therefore ascribes all the Virtues of the True *Black Hellebor* which grows in *Anticyra* to it; but in a word, this may be said of it, that it has been found by often and good Experience to open and Purge the Body of Melancholy Humors, and that safely, without such perturbation and trouble as is said to be in the use of the other *Black Hellebors*.

Common White Hellebor. 2. *Helleborus albus praecox*, *Elleborum flore atro rubente*, *Veratrum album praecox purpura nigricante*, The early Flowering White Hellebor, or Early Sneezeroot with dark red Flowers.

IV. *The Descriptions.* The first, or Common White Hellebor. It has a Root which is great, and reasonable thick at the head, having a number of great white Strings, running down deep into the Ground, by which it is strongly fastened; this Plant rises first out of the Ground with a great, round, whitish green Head, which growing up opens itself into many goodly, fair, large, green Leaves, plaited as it were with eminent Ribs all along the Leaves, compassing one another at the bottom, from the middle whereof rises up a strong round Stalk, with several such like Leaves, but smaller, to the middle thereof, from whence to the top it is divided into many Branches, having many small yellowish or whitish green Star like Flowers all along upon them, which being past away turn into small, long, three-square, whitish Seed, standing naked, without any Head or Husk to contain them, tho' some Authors have wrote to the contrary.

V. *The second, or Early Flowering White Hellebor.* It has no such tuberous beaded Root as the former, but as it were a long bulbous scaly head, from whence shoot as many long white Strings as the other: This Hellebor is very like that just now described, but that it springs up a Month at least before it, and that the Leaves are broader, longer, thinner, and no less plaited, folding themselves backwards oftentimes, and sooner perish, falling away from the Plant, the Stalk hereof is higher than the other, with fewer Leaves thereon, bearing such like Stern Flowers, but of so dark or blackish a red color, that they are scarcely discernable, but at a near distance, after which come small Seed, very like the former; both these Plants lose their Leaves wholly, fresh springing up again every Year.

CHAP. CCCLI.

OF HELLEBOR White,

O R,

SNEEZE-ROOT.

I. *THE Names.* It is called in *Arabic* Charbachem, in *Greek* *ΕΛΛΕΒΟΡ*, in *Latin* *Helleborus albus*, *Veratrum album*, and *Sanguis Herculeus*, in *English* *White Hellebor*, and *Sneezeroot*.

II. *The Kinds.* It is twofold, viz. 1. Garden or True, called simply *Helleborus albus*, *Elleborum album*, and *Veratrum album*, of which in this Chapter. 2. *Helleborine*, vel *Elleborine alba*, Wild White Hellebor, of which in Chap. 352.

III. *The Kinds of the Garden or True.* Its twofold, viz. 1. *Helleborus albus*, *Helleborus albus verus*, *Helleborus albus vulgaris*, *Veratrum album vulgaris*, *Helleborus Candidus*, and *Baibinus* adds for distinction sake *Flore sub viridi*; and it is certainly the *Consilgio Vegetii*, *Alyrri*, *Columella* & *Plinij*, The

VI. *The Places.* Both these grow in several places of Germany and Austria, as *Cladius* says, as also in some of the Islands about *Russia*, where a large Ship might be freighted with the Roots of the first or vulgar sort, as *Tradescant* the Elder affirmed; it also is said to grow on the Alps, and such like Mountains where *Gentian* grows: *Gerard* says that the Bishop of *Norwich* told him that *White Hellebor* grows in a Wood of his own, near to his House at *Norwich*: Some say likewise (says he) that it grows upon the Mountains in *Wales*; this, tho' he said it upon report, yet he thought it might be true, but they both are generally nursed up in Gardens in *England*.

VII. *The Times.* The first Flowers before the second, tho' the second springs earlier out of the Ground; the first Flowers in *May*, the second in *June*.

VIII. *The Qualities.* It is hot and dry in the third degree, Aperitive, Absterfive, Splenetick, Arthritic, Cathartick, Emetick, and Venetick.

IX. *The Specification.* *White Hellebor* is peculiar for curing the Kings Evil, Dropfie, Scurvy, Jaundice, Gout, Sciatica, Rheumatism, Frenzy, Melancholy, Madnefs, Falling-Sicknefs, old running Sores, Ulcers, and Fistula's.

X. *The Preparations.* Neither Leaves, Flowers, nor Seed of this Plant have been in use at any time, but the Root only, so far as ever I could learn by Reading of Authors, or from the Practices of other Men; and from the Root the following Preparations may be made. 1. *A Powder of the Root unprepared.* 2. *A Powder of the Root prepared.* 3. *The Juice of the Root.* 4. *Mel Elleboratum.* 5. *Oxymel Elleboratum.* 6. *Elleborismus.* 7. *A Lotion.* 8. *A Venetick.* 9. *A Spirituous Tincture.* 10. *An Oily Tincture.* 11. *A Spirituous Tincture.* 12. *A Pessary, or Tent.* 13. *A Sternutatory.*

The Virtues.

XI. *The simple Powder of the Root.* It works very strongly and churlishly with any that shall take it, provoking strong Vomiting, not much inferior to Poyson, yet being given to very strong Constitutions, and with convenient preparations of the Body before hand, and Dieted by advice, as *Dioscorides* directs, it may do much good; it causes an evacuation of much tough, viscous, clammy, and corrupt Humors which offend the Stomach, it provokes Womens Courses, but is to be forborn by Women with Child, for it will kill the Fetus; it removes a deep Melancholy, even Fury, or Madnefs, abating the peccant Humors, and giving ease to the Patient; it prevails also against the Falling-Sicknefs, Lethargy, Megrim, Cephalaea, or old Headach, Scabs, Itch, Tetters, Ringworms, Pustles, Herpes, Leprosie, Scurf, Morpew, or any other deformities of the Skin, Quartan Agues, Phtisicks, old Coughs, Dropfies, Jaundice, Sciatica, Gout, Rheumatism, Vertigo, and other Diseases of like kind. Dose from eight Grains to twelve, or sixteen, in Syrup of Quinces, or Juice of the same mixed with White Wine; it is not to be given fasting, but a little after eating, and always to robust and very strong Bodies, with direction to drink five, six, or more Quarts of Posset-Drink, Water-Gruel, or Mutton Broth in the time of its working, and after Vomiting still to drink a hearty draught of Posset-Drink, &c. thereby to keep the Stomach always full, for by this means it works so much the easier; but because of the extraordinary danger of it, I should never advise the unskillful or unlearned to give it thus crude and unprepared, but rather to make use of the following Pre-

paration, which will do full as well, and operate much more safely.

XII. *The Powder of the Root prepared.* It is done by infusion of Water, impregnated with Spirit or Oil of Vitriol, (after the dissolution of Coral) upon the Root reduced to Powder, digesting for twenty four Hours, and drying it, and repeating the Work the second and third time. Dose from half a Scruple to half a Dram. It is the nature of Acids to destroy the power of any mixture whatsoever, and if they will do it in Antimonial Preparations, as in the correction of Flowers of Antimony, Vitrum Antimonij, Mercurius Vita, &c. much more may it be supposed to be done in Vegetable productions, and therefore as Vegetables are more porous and apt for penetration than Metals or Minerals, so a weaker Acid may be employed in the performance of that Work; for if the strongest Acids, as Oils of Vitriol, Salt, Sulphur, &c. were made use of, they would totally enervate and destroy all the faculties and operation of the Vegetable they should be applied to or mixed withal. This Preparation is safe enough, and in many will work only downwards, but in weak Stomachs, and where the Tone of the Viscera is debilitated or much weakened it will (notwithstanding all this Preparation) work upwards; in this case the Dose ought to be a little larger, for the former Dose will only make Sick, and scarcely induce Vomiting, whereby the Patient will truly be made more Sick and out of order (for want of its due operation) than if a larger Dose had been given; it is designed against Melancholy, and all the efforts of a Manical disposition of the Mind; it removes Vapors, and helps obstructions of the Spleen and Hypochonders, restoring the Imagination and Reason to their right stations and habitudes; in a word, it has all the Virtues of the crude Powder mentioned in the last Section, and may be given to all those purposes and intentions, but with much more safety.

XIII. *If you give it only as Cathartick*, you may give it thus. Take *Fullop*, *Scammony*, of each six Grains, of this prepared Hellebor from ten Grains to twenty, mix them for a Dose. Or thus. Make an Infusion of *Sena* half an Ounce in half a Pint of White Wine, strain out, then add the prepared Powder of Hellebor from half a Scruple to half a Dram, (according to Age and Strength) and let it be taken in the Morning fasting, against Melancholy, Madnefs, Gout, Sciatica, &c.

XIV. *If you design it for a Vomit*, you may give it either per se in any proper Vehicle, from fifteen Grains to two Scruples, or you may compound it as follows. Take the prepared Powder of Hellebor foregoing from half a Scruple to half a Dram, Tartar Emetick from one Grain to two, mix for a Dose, to be given in the Morning fasting, with all the precautions of a Vomit.

XV. *Another Preparation of the Root.* Most Authors prepare it by slicing it very thin, or beating it into Powder, and infusing it in juice of Quinces, (which is said to be a true corrector of its venene quality) for twenty four Hours, drying of it, and repeating the Infusion again the second or third time; being thus prepared, it may be given from ten Grains to twenty Grains in any proper Vehicle to all the purposes and intentions before specified: You may also prepare it by steeping it twenty four Hours in Wine Vinegar, it will be pretty well corrected by a single Infusion, and may be given from half a Scruple to half a Dram.

XVI. *The Juice of the Root.* If it is mixed with Juice of Quinces, or with Wine Vinegar, it may be inspissated, and afterwards given inwardly to all the intentions and purposes aforesaid. The Liquid Juice mixed with Flower and Honey, and set where Flies,

Gnats, &c. come, it kills them upon the spot; mixed with Crumbs of Bread, Cheese, and Butter, and set in proper places, it kills Rats, Mice, and the like; if Hens, Ducks, or Geese should chance to eat it, it would quickly kill them; being made up into a Mass with Meal and Butter, and put into Mole Holes, or their Burrows, it will quickly destroy them: The Liquid Juice dropt into the Ears takes away the noise and singing in them, and kills Worms in that Organ, if any be, which is known by their extraordinary itching, and sometimes by a pain in the Ear; mixed with White Wine in equal quantities it is good to cleanse the Hands, or other parts of the Skin troubled with Scurf, Morpew, Leprosie, Tetters, Ringworms, Herpes, Scabs, Itch, Freckles, Lentils, and other like deformities thereof.

XVII. *Mel Elleboratum.* Honey Helleborated, or impregnated with the Virtues of Hellebor. Take Roots of White Hellebor dried and cut a Pound, fair Water fourteen Ounces, digest three days; then boil gently till the half be consumed, strain it carefully out, and with clarified Honey three Pounds boil again to the consistence of Honey. It is a strong Medicament, and to be given but in a small Dose, viz. from one Dram to two, or but three at most; it is prevalent against Melancholy, Dotage, Frenzy, Madness, Gout, Sciatica, Rheumatism, Dropsie, Lethargy, Vertigo, Palsie, Apoplexy, Epilepsie, and such like desperate disaffections; you may mix it with clarified Whey, or Decoction of *Sena*, or *Epithymum*.

XVIII. *Oxymel Elleboratum.* Honey and Vinegar impregnated with Hellebor. Take Leaves of Rue, tops of Tyme, Dittany of Crete, tops of Hyssop, Pennyroyal, Horchound, Carduus, Roots of Celrick Nard, of each a handful, Calamint two Pugils, Seeds of Anise, Basil, Dill, Fennel, Roman Nettles, of each two Drams, Roots of Angelica, Aron, Squills prepared, Birthwort long, round, and climbing, Costus, Flowerdeluce, Polypody, Turbith, Limon Peels, of each an Ounce, Strings of Black Hellebor, Spurge Agrick, (added towards the end of the boiling) of each two Drams, Strings of the Roots of White Hellebor four Drams, all being dried and bruised digest in a Glass or glazed Vessel close stopp'd in the heat of the Sun, or of a Furnace, in Posca, (which is a mixture made of equal parts of Wine Vinegar and Water) eight Pounds, Rob ar Sapa two Ounces, three days digestion being past, boil it gently till it is wasted a little more than half away, strain it, pressing it gently, and to the strained Liquor add Honey of Roses, (in which Citran Peels two Ounces have been infused) a Pound and half, boil to the thickness of Honey, and with Cloves, Saffron, Ginger, Galangal, Mace, of each a Dram, aromatize it according to Art. It is Emetick, and ought to be given after other general Remedies, being then profitable against Madness, Frenzy, Epilepsie, Apoplexy, Convulsions, Melancholy, Vertigo, Lethargy, Megrim, obstructions of the Stomach, Liver, Spleen, Mesentery, Reins, and Womb, it provokes Urine and the Courses, and is prevalent against Agues. Dose four or six Drams to an Ounce in a Glass of White Wine.

XIX. Another *Oxymel Helleboratum.* Take Strings of Black Hellebor well bruised half an Ounce, Strings of White Hellebor well bruised an Ounce, Wine Vinegar, Juice of Quinces, Parsly Water, of each three Pints and half, Winters Cinnamon, Jamaica Pepper, both in Powder, of each two Ounces, mix, digest in a Glass Vessel in a gentle Sand heat for four days, then boil gently in Balneo till almost half is wasted away, strain out, and to the Liquor add clarified Honey three Pounds, Cream Tartar in fine Powder one Pound, boil to the consistence of Honey, being cold add Chymical Oil of Limons one Ounce, mix

well, and keep it in a Vessel close stopp'd for use. This Preparation has not the tenth part of the trouble and difficulty of the former, yet is double in its effects and operations, having all the Virtues ascribed to the former; you may give it from half an Ounce to an Ounce, or more, according to Age and Strength.

XX. *Elleborismus*, or an Electuary of White Hellebor. Take White Hellebor Root cut thin one Pound, Spring Water twelve Pounds, digest warm three whole days, then boil to the consumption of the half, strain out, pressing it strongly, adding Honey three Pounds, boil it again to the consistence of Honey; this Electuary put into a Glass or glazed Vessel and keep it for use. This is no Electuary, but rather a Lohoch; it cures Melancholy, Frenzy, and Madness, and is appropriated to all the Diseases the two former Preparations are applied to; it may be given from two Drams to four, or more, in a Glass of White Port Wine.

XXI. *The Lotion.* The Root very thinly sliced, or in gross Powder boiled in Vinegar, or in Juice of Quinces, or in an equal mixture of both, makes an excellent Gargle for a Canker in the Mouth, as also to ease the pains of the Toothach; it is also good against Tanning of the Skin, Sunburning, yellowness of the Skin, Scurf, Morpew, Scabs, Itch, Leprosie, Freckles, Lentils, and other like defecations of the Cutis; it also cleanses and dries old running Sores, foul Ulcers, callous Fistula's, and the like, in the Legs, Thighs, Feet, Arms, Hands, &c. and is also of good use against Kings-Evil Sores; if it is boiled in Lye made of Pot Ashes it kills Lice in the Head, being washed therewith Morning and Evening, and heals running Sores and Scabs of the Head, Scald Heads, Kings-Evil Sores, &c. being often washed therewith, and a little kind of Cataplasm be also laid thereon made in this manner. Take fine Powder of White Hellebor Root two Ounces, Wheat or Barley Flower six Ounces, Honey enough to make it up into a Cataplasm, mix and apply it; some instead of the Honey use fresh Butter, some Hogs Lard, others White Bread softened with Milk, &c.

XXII. *The Venesick.* Take the Juice of White Hellebor Roots, put it into a Horn, or some wooden Cup, and let it ferment for some little time. Take a Needle and Thread and wet them therein, and draw it thro' a Frog, or Chicken, and if it die presently it is good and ready, if not, you must ferment it for some little time longer, till it will upon tryal exquisitely perform that Work. This is the Poyson the Spaniards use in poysoning their Arrow heads, they dip their Arrow heads therein, and then what Beast soever shall be Wounded therewith shall suddenly die. This thing *Matthioli* says he tried on Dogs and on Chickens, which died presently after they were Wounded. This Poyson is only used while it is fresh, for if the juice dries upon the Arrow head it loses its strength, and therefore to keep them the better they use to keep them in a Case, the Iron heads being wrapped in Wool, and Cloths dipt therein. But this is very admirable, as it is related, that this Poyson being drank gives almost no harm to them that drink it, unless they take too much; and it is said that Hunters often take it themselves, to purge them from evil Humors, and preserve their Healths. This is also remarkable, that the Flesh of those Beasts killed by this Poyson is not in the least hurtful, but is more tender and pleasant in eating than the Flesh of other Beasts not killed therewith, more especially that part about the Wound.

XXIII. *The Spirituous Tincture.* It ought to be corrected with Vinegar, or Juice of Quinces, added in equal quantity after the Tincture is made, and kept in Digestion in a gentle Sand heat for one whole Month.

Month or more. Being thus prepared, it may be given inwardly for all those Diseases the Powder it self is good for; it works much gentler, and may be given from half a Dram to two, three or four Drams, mixt with any convenient Vehicle, as sharp Wine mixt with Water, &c. Outwardly, it is good against Freckles, Lentils, Pimples, Scurff, Morpew, and other Breakings out in the Skin.

XXIV. *The Oily Tincture.* It is good against Contractures of the Nerves, Pains of the Joints, Gout, Sciatica, &c. being anointed upon the Parts afflicted Morning and Night for some time. Anointed upon the Reins, it gives Ease in Pains of the Back, proceeding either from Weakness or Obstructions of those Parts. It digests and hastens the Maturation of Tumors which Nature determines to break.

XXV. *The Saline Tincture.* It is a peculiar thing against Scurff, Morpew, Dropsy, Elephantiasis, Puthes, Pimples, Tetters, Ring-worms, Kings-evil Sores, Pocky-eruptions, Herpes, Itch, Scabbiness, Freckles, Lentils, Yellowness and other Vices of the Skin. It may be used either simply of it self, or mixt with Vinegar, sharp Wine or Water, according to the Nature and Condition of the Part to which it is applied. It also eases the Gout and Sciatica, being bathed hot upon the Parts affected Morning and Night for some time.

XXVI. *The Pessary or Tent.* Being put into any Callous Fistula, or up the Womb, where the Vagina is Callous, it softens and resolves the Callosity, mundifies the Fistula or Ulcer, and takes away the Callous Matter which hinders Curation; after which the Ulcer may be healed with some incarnative Balsam or Ointment fit for the purpose. I have been told, that if it is put up the Womb as a Pessary, it provokes the Terms, and brings away the dead Child; but it ought to be used with Caution and good Advice.

XXVII. *The Sternutatory.* 1. Some make it of the fine Powder or Flower of the Root alone; but so used, it is much too strong. 2. Some make it thus: \mathcal{R} fine Flower or Powder of White Hellebor Roots, Powder of Rosemary, of Sweet Marjoram, and of Winter Savory, of each equal parts; mix them. 3. Some make it thus: \mathcal{R} fine Powder of Tobacco, or rather of Tobacco Stalks, three Ounces; Powder of Rosemary flowers an Ounce and half; Powder of Cloves one Ounce; fine Powder of White Hellebor Root six Drams; mix and keep them for Use. Being snufft up the Nostrils, it causes much Sneezing, and evacuates the Head and Brain of cold, moist, viscous Humors and Ferulencies, and is very good against Vertigo's, Megrims, Head-aches, Lethargies, Apoplexies, Falling-sickness, and other cold and moist Diseases of those Parts.

XXVIII. *Conradus his Vomit.* Take Roots of White Hellebor one Ounce, wash dry and powder them; Roots of Bryony and Sowbread in powder, of each two Drams; add Spirit of Wine so much as to overtop them two Inches or more: digest in Balneo for twenty four hours, then distil by an Alembick, take out the Feces, beat them, and add the Spirit drawn off: digest a Week in a close Vessel, then decant the clear, filter and keep it for Use. Dip a Feather in it, and put it into a Glass of Sack, and drink it; repeating it as you see occasion.

XXIX. *Heurnius his Vomiting-Wine.* Take gross Powder of White Hellebor Roots a Scruple; Canary one Pint: mix, and infuse in the Sun for a Week. One Spoonful of it will Vomit; but half a Spoonful, with other Luxatives, will purge downwards, and evacuate cold, viscous, slimy and griping Humors out of the Bowels, Hypochonders and Parts adjacent.

XXX. *An Observation.* That the Black and White Hellebors much sympathize together, with relation to their Virtues; and what the one will do, the other will do also; but the latter much more powerfully, and with far greater Violence, inasmuch that by reason of its Violence, and dangerous Use, the Internal Practice with the Root of White Hellebor uncorrected, is wholly almost given over, and left off: otherwise, as to the Virtues and several Preparations of the True black Hellebor in Chap. 348. foregoing, the same things in a manner may be said of the True White, with Advantage.

C H A P. CCLII.

Of HELLEBOR White Wild.

I. **T**HE Names. It is called in Greek, *Ἑλεβορος λευκός* *ἄγρος*: in Latin, *Helleborus albus sylvestris*, *Elleborine alba agrestis*; and in English, *Wild White Hellebor*.

II. The Kinds. 1. *Elleborine recentiorum Clusii*; *Elleborine alba major*, *Calceolus maris*, *Calceolus Marianus*; *Elleborine ferruginea Lugdunensis*, *Dalechampi*; *Alismatis Species Gesneri & Thalij*; *Damasonium noribum*, and *Pseudodamasonium aliorum*; The great wild white Hellebor, called also Ladies Slipper. 2. *Elleborine minor flore albo*, *Elleborine alba minor*; *Alisma*; *Damasonium*, and *Epipattis aliorum*; The lesser wild white Hellebor with a white Flower. 3. *Elleborine alba minor purpurante flore*, The lesser wild white Hellebor with bluish Flowers. 4. *Elleborine alba flore viridante*, Wild white Hellebor with whitish-green Flowers. 5. *Elleborine alba Americana*, American wild white Hellebor.

III. The Descriptions. The first, or Great wild white Hellebor, or Ladies Slipper. It has a Root composed of a number of Strings, interlacing themselves one within another, lying within the upper Crust of the Earth, and not spreading deep, of a dark brownish color. This Root sends up one, two, or more Stalks, a Foot and half high, bearing broad green Leaves on each side, one by one, somewhat like those of the Vulgar true white Hellebor, but smaller, and not so ribbed, and each compassing the Stalk at the lower end. At the top of the Stalks stands sometimes but one Flower, and sometimes two, or but three at most, one above another, upon small short Foot-stalks, with a small Leaf at the foot of every one. Each of these Flowers are of a long oval Form, and hollow withal, especially at the upper part, the lower being round, and swelling like a Belly: at the hollow part there are pieces like Ears or Flippets, which at first do cover that hollow place, and afterwards stand apart one from another, all which are of a fine pale yellow color in most Plants; but some have been found of a brownish color, as tending to purple. There are also four long, narrow and dark colored Leaves, at the setting on of the Flower upon the Stalk, wherein the Flower, as it were, at the first was enclosed. The whole Flower is of a pretty sweet Smell: the Seed is very small, and like unto that of the Orchides or Dog-stones, and is contained in the like kind of Pods.

IV. The second, or Lesser wild white Hellebor with a white Flower. It has Roots like the former, but smaller: and this small Plant grows up in like manner,

manner, and not much lower, bearing the like Leaves, but smaller, and of a white green color, much like those of *Lilly Convally*. The top of the Stalk has many more Flowers, but lesser, growing together Spike-fashion, with small short Leaves at the Stalk of each Flower, which consists of five small white Leaves, with a small close Hood in the middle, without any Smell, and having also like Seed.

V. The third, or Small wild white Hellebor with bluish Flowers. The Roots, Stalk, Leaves, Flowers and Seed, as also its Manner of Growing, are all much like the last; but herein this differs from that, that the Leaves hereof are narrower than those, and the Stalk and Flowers are smaller, the Flowers in this being of a pale purplish or bluish color, with very small dusty Seed.

VI. The fourth, or Wild white Hellebor with whitish green Flowers. This is also one of the small kinds of the Wild white, and differs not much from the last, either in its Root, Stalk, Leaves, Flowers or Seed, but only in the Color of its Flower; for whereas that was of a bluish color, this is greenish-colored on the outside, and of a whitish color within, with like small Seed.

VII. The fifth, or American wild white Hellebor. This is a Species of the first Great kind of Wild white Hellebor, or Ladies Slipper, which fort has been brought to us from the Northern parts of America, and differs in this only, that it is greater in its Stalks, Leaves and Flowers, which are not yellow, but white, with reddish Strakes thro' their Bellies.

VIII. The Places. The first four grow not only beyond Sea, as in Germany, Austria, Hungary; but also are found Wild in many places of England. The fourth particularly in a Wood called the *Helks* in Lancashire, near the Borders of Yorkshire. The fifth grows in the Northern parts of America, as New-England, New-York, Maryland. The second

was found in the Woods by Digwel-Patures, half a Mile from Welton in Hertfordshire; it grows also in a Wood five Miles from London, near a Bridge called Lock-bridge; and by Robin Hood's Well; in the Woods by Dunmore in Essex; by Southfleet in Kent, in a little Grove of Juniper; and in a Wood by Clare in Essex.

IX. The Times. The first flowers about the middle of June; the other four in the Month of May, and if the Weather proves cold, in the beginning of June: some earlier and some later than others, according to the Richness of the Soil, and Warmth of the Situation; and perfect their Seed in August.

X. The Qualities, Specification, Preparations and Virtues of these, are the very same with those of the True black and True white Hellebors in Chap. 348. and Chap. 351. foregoing, tho' possibly not full out so strong, and therefore the more fit, and the rather to be chosen for the more vulgar Use.

XI. An Observation. The second of these is supposed to be the *Epipactis* of *Dioscorides*; but if either that or any of the two following be it, he says it is good against the Distempers of the Liver, and against Poison, and to procure Vomiting, which *Theophrastus* also affirms: and *Gerard* says, that the Decoction of Wild white Hellebor being drunk, opens the Obstructions of the Liver, and helps any Imperfections of the same. This is certain, That the Juice, or a very strong Decoction of any of them is good to wash and bathe the Skin withal, in order to the taking away of Scurf, Morphev, Scabs, Itch, Leprosy, Herpes, Pimples, Freckles, Lentils, Yellowness of the Skin, or any other Defecation thereof.

C H A P. CCCLIII.

Of HELMET-FLOWER,

O R,

MONKS-HOOD.

I. THE Names. It may be called in Greek, *ῥωγα*; in Latin, *Napellus*, *Thora*, and *Cappa*; also *Cappa Monachi*, and *Luparia*: in English, *Helmet-flower* and *Monks-hood*.

II. The Kinds. It is a Species, or of the Stock of the *Aconita* or *Wolfsbane*, and is manifold; but those which we shall take notice of, are only the three following, viz. 1. *Napellus Verus*, (*Verus* is added because it is the True *Napellus* of the Ancients, which they so termed from the Form of a long Turnep, called *Napus* in Latin:) *Cappa*, & *Cappa Monachi*, The true *Helmet-flower*, or *Monks-hood*.

2. *Napellus minor*, *Lycotomum ceruleum parvum facie Napelli* *Lobely*, *Thora Italica* *Gesneri* & *Baubini*; *Aconitum Lycotomum tertium ceruleum parvum Dodonaei*, *Aconitum decimum Clusij*, The small blew *Helmet-flower*, or *Monks-hood*. 3. *Napellus tertius Baubini*, *Napellus purpureus*; *Aconitum neubergense Clusij*, The purple *Helmet-flower*, or *Monks-hood*.

III. The Descriptions. The first, or True *Helmet-flower*, or *Monks-hood*: its Roots are brownish on the outside, and white within, somewhat big, and round above, and small downwards, something like

to a small Carrot Root, or not much unlike to a long Turnep; and sometimes two of them are joined at the Head together. This Root sends forth divers Leaves of a fresh green color on the upper side, and greyish underneath, much spread abroad, and cut into many Slices and Notches, more than any of the *Wolfs-bane*. The Stalk rises up two or three Feet high, beset to the top with the like Leaves, but smaller. The top is sometimes divided into two or three Branches, but more usually without, on which stand many large Flowers, one above another, in Form very like unto a Hood or open Helmet, being composed of five Leaves, the uppermost of which, and the greatest below is like unto an Helmet or Head-piece; two other small Leaves are at the sides of the Helmet, cloving it like Cheeks, and come somewhat under; and two others, which are the smallest, hang down like Labels, or as if a close Helmet was opened, and some pieces hung by, of a perfect or fair blew color, (but grow darker, having stood long) which causes it to be nursed up in Gardens, that their Flowers, as was usual in former Times, and yet is in many Country Places, may be laid up among green Herbs in Windows, and put in Pots to stand in Chimneys, in the Summer time. But tho' they may be thus entertained for their Beauty, and put to the Uses aforesaid, yet you must beware that they come not near your Tongue or Lips, lest they discover, to your Cost and Peril, their virulent, poisonous and dangerous Qualities. In the middle of the Flower, when it is open, and gapes wide, are seen certain small Threads, like Beards, standing about a middle Head; which, when the Flower is past, grows into three or four or more small blackish Pods, containing black Seed within them.

Helmet-Flower.

IV. The second, or Small blew Helmet-flower, has a kind of round bulbous Root, big below, and small above, and encreases thereby, giving such like Roots, with smaller Fibres thereat than at the greater Roots. From this Root rises up a round green Stalk, two or three Feet high, whereon grow several dark,

green, shining Leaves, cut into five Partitions very deeply, each of them somewhat cut in on the edges, very like unto the Leaves of the Greater or True Helmet-flower, but that these are not so finely divided, and the Divisions are somewhat broader. The top of the Stalk is divided into two or three Branches, each whereof bears one Flower, and sometimes (tho' seldom) two or three, of a very fair deep blewish purple color, very like in Form unto the former Helmet-flower, but that this is smaller, and the Crest of the Helmet rises higher than in that; after which come small Pods, much like to the other, giving also such like Seed.

V. The third, or Purple Helmet-flower. It has Roots much like to the first, or True kind: it has larger Leaves than the other, of a sadder green color, and shining withal, incised or cut in after the same manner: the Stalk also grows very high, and often spreads it self out into several Branches, bearing large purple blew Flowers, in longer Spikes than the first; which being passed away, like Seed comes in their places, not much differing from the former.

VI. The Places. They all grow naturally Wild on Mountains, and in Woods and shadowy places in Italy, Germany and other places: and it is said, that they grow upon some Hills in England: however, with us they are chiefly nursed up in Gardens, where they flourish extraordinarily well.

VII. The Times. They all flower in the principal Summer Months, viz. in June and July; and their Seed is generally ripe in August.

VIII. The Qualities. They are hot and dry in the Ultimate of the fourth Degree; Deleterious, and a most mortal Poison both to Man and Beast; and therefore they are called *Wolfs-bane*, because they kill Wolves, Dogs, Rats, Mice, &c. whether the Juice of the Herb or Root, or the Herb or Root it self, being mixed with their Food or Flesh, and so given them to eat. And that this *Monks-hood* as well as *Wolfs-bane* is as destructive to Mankind also, is manifest from that accidental Tryal had thereof at Antwerp, at a Treat there, where certain ignorant Persons gathering of a Sallet in the Garden, among the Variety of Herbs, gathered also *Napellus* or *Luparia*, which with the other things was served up at Table; where all who did eat thereof, were taken with most cruel Symtoms; and after the violent Tortures which they endured for some considerable time, died miserably.

IX. The Specification. Helmet-flower (as also *Wolfs-bane*) is a peculiar thing to kill Lice and Nits in the Head, and to cure the same of Scurf, Dandriff, Scabs, &c. to cleanse old and fretting Sores, running Ulcers, take away dead Flesh, (provided these Sores, Ulcers, &c. be not in the Mouth, Nose, Eyes or Privy Parts, by reason of their Vicinity to the principal or more noble Parts;) as also to cure Diseases of the Eyes by a special Application.

X. The Preparations. You may have therefrom, 1. A liquid Juice. 2. A Powder of the Herb or Root. 3. An Oil or Ointment of the Juice, green Herb or Root. 4. A Decoction or Lye of Roots, Leaves or Seed. 5. A distilled Water.

The Virtues.

XI. The Juice. It is a deadly Poison taken inwardly any way: it is also as deadly to Wolves, Dogs or other Creatures who shall take thereof, or eat in any manner of ways of the Herb or Root. The Juice of the Roots especially Hunters of Wild Beasts do use, dipping the Heads of their Arrows into the same; by which means they quickly kill the Beast.

Beast which is wounded with the same: yet it is certain, that the Flesh of the Beast so killed is not at all poisonous, but very safe, and eats more tender than if it had been otherwise killed, more especially if it be kept for a Day and Night.

XII. *The Powder of the Herb or Root.* Mixt with Cheese or Bacon-fat, and put in proper places for Rats and Mice, it kills them, if they eat it. Mixt with Powder of *Liquorice*, and strewed upon foul filthy Ulcers, it cleanses them, dries in some measure, (if skilfully applied) and disposes them for healing, which may afterwards with proper Incarnatives and Ulceratives, be perfected.

XIII. *The Oil or Ointment of the Juice, or green Herb, or Root.* It kills Lice and Vermine, if the Head or any part of the Body, in which Lice and Vermine breed, be anointed therewith, it quickly kills them, and frees the Patient from the same.

XIV. *The Decoction or Lye of the Roots, Leaves or Seed.* If it is a simple Decoction, it is then made in simple fair Water only: but if it is a Lye, it is made in a small *Lixivium* of Pot-ashes. It cleanses the Head and other Parts from Morpewh, Scurf, Dandriff, Scabs, Itch, Pimples, Tetters, Ringworms, Leprosy, and other like Breakings out, the Parts affected being bathed therewith.

XV. *The distilled Water.* Being dropped into the Eyes, it takes away the Inflammation or Redness in them; also clears them from any Haw, or Pin and Web, growing in or upon them. The same thing is said of the Juice; but I fear it is dangerous, and if it is used to the Eyes, it must be done with much Caution, and by such as have Judgment and Skill, and not by Fools. It ought to be mixt with a sufficient quantity of *Damask-Rose Water*, both to allay its Heat, and to take off the Violence of its Operation.

XVI. *To Cure such as are Poisoned herewith.* The first thing you are to do, is to give an Emetick, as two, three, four, five or six Grains of *Emetick Tartar*; from half an Ounce to an Ounce or Ounce and half of *Infusion of Crocus Metallorum*, or *Vinum Benedictum*, or *Vinum Antimoniale*, or a Dose of any other proper Emetick which you have at hand, proportioning the Dose according to Age and Strength. The next thing you are to do, is to exhibit *Cathartick Clysters*; or this following, if the Patient is weak: Take *Posset-drink* or *Mutton-broth* a Pint, brown Sugar four Ounces: mix, melt or dissolve, and exhibit it warm. This is to be done, that the Body be effectually, and as soon as may be, discharged of the Poison: which being performed, *Cordials* and *Antidotes* are to be given, the one to defend the Heart, preserve and keep up the Vital and Animal Spirits; the other to enervate and destroy the force and power of the Poison; for the first of these, we commend our *Aqua Bezoartica*, *Tinctura Bezoartica*, or some other like Cordial Water, Spirit or Tincture, to be mixt and given with some noble and generous Wine. The Antidotes we commend in this Case, are, *Mithridate*, *Venice Treacle*, the Antidote in our *Phylaxa*; or for want of them, to drink a Decoction in Wine of *Origanum*, *Pennyroyal*, *Savory*, *Sage*, *Southernwood*, *Wormwood*, *Gentian*, *Winters Cinnamon*; *Eleli*. *Diatessaron* is good, so also is a mixture of *Castoreum*, *Pepper*, *Cubebs* and *Rue*, of each a like quantity, being in fine Powder, and mixt up with Honey into a Bolus. *Petrus Aponensis* commends a Dram or two of *Terra Lemnia* to be taken in warm Drink or Wine; but above all he says, that *Aristolochia longa* is the most especial Antidote or Remedy against all *Aconites*. *Avicenna* has an Antidote against this Poison, which is made of the Fly which feeds upon this Poisonous Plant, which he found to be very effectual, not on-

ly against other Poisons, but chiefly against that of *Napellus* or *Helmet-flower*, and Poison of the *Tarantula*. It is thus made: Take *Aristolochia longa*, fine Bole, each in fine powder, a Dram; Flies which feed upon the *Napellus* number twenty: make a fine Powder, and mix them: Dose a Dram at a time in a Glass of Wine. *Guainerius* his Antidote is this: Take *Bay-berries*, *Terra Lemnia*, both in fine powder, *Mithridate*, of each two Ounces; Flies which have fed upon *Napellus* number twenty four in powder: mix them, and with a sufficient quantity of Honey and Oil, make an Eleduary. Dose from a Dram to two Drams at a time, with a Glass of generous Wine. But the true Antidote against this Poison is the *Antibora* or *Antithora* in the Chapter following; of which we shall there speak more largely.

C H A P. CCCLIV.

OF HELMET-FLOWER *Alexipharmick*,

O R,

M O N K S--H O O D Antidotal.

I. *THE Names.* It is called in Greek, *Αντιθώρα*; in Latin, *Antithora* or *Antibora*, but most commonly, for Shortness sake, *Antibora*, (as being the Opposite or Antidote to *θώρα*, *Helmet-flower* of *Woolfs-bane*:) in English, *Helmet-flower Alexipharmick*.

II. *The Kinds.* It is a singular Plant of the Kind, and is called by the *Piemontoise*, *Antibora*, quasi *Antithora*, that is, the Remedy against the Poisonful Herb *Thora*: *Avicenna*, the *Arabian* calls it *Napellus Moyses* in lib. 2. cap. 500. and in cap. 745: calls it *Zedoaria*, by which it is manifest that this *Zedoaria Avicenna* is not our Common *Zedoaria* of

T t c

Zerumbet

Zerumbeth of the Shops: it is also called *Aconitum Solutiferum*, *Napellus Alexipharmicus*, and *Antora*. *Thora* and *Anibora*, or *Tura* and *Antura*, seem to be new Words, and yet they are used in *Marcellus Empiricus*, an old Writer, who teaches us a Medicine to be made of *Tura* and *Antura* against the Pin and Web in the Eyes.

III. The Description. *The Roots hereof are small and tuberos, round, and somewhat long, ending for the most part in a long Fibre, and with some other small Threads from the Head downwards: from the Head whereof rise up several green Leaves, every one severally upon a Stalk, which Leaves are very much divided, as finely almost as the Leaves of Larks heels or Larks-spurs: among which rises up a hard round Stalk, a Foot or more high, with some such Leaves thereon as grow below: at the top of which stand many small yellowish Flowers, formed very like unto the Whitish Wolfs-bane; bearing many black Seeds in Pods afterwards in like manner.*

IV. The Places. It grows on the *Alps*, and on Mountains and Hills near the Lake *Lemane*, and in some places in *Germany*: with us it is nursed up only in Gardens.

V. The Times. It flowers at the latter end of *June*, thro' all *July*, also in *August*, and the Seed is ripe in *August* and *September*.

VI. The Qualities. It is hot and dry in the third Degree, and is *Cardiack*, *Emetic*, *Cathartick* and *Alexipharmick*.

VII. The Specification. Its chief Designation is for the enervating or destroying and expelling of Poysons of all sorts, chiefly those of *Helmet-flower* or *Monks-hood*, *Wolfs-bane* and *Leopards-bane*.

VIII. The Preparations. You may have thereof, 1. A Powder of the Root. 2. A Decoction thereof in Wine. 3. A Spirituous Tincture. 4. An Acid Tincture.

The Virtues.

IX. The Powder of the Root. *Hugo Solerius* says, that it will purge the Body very strongly of vicious and watery Humours, both by Vomit and Stool, the quantity of a Bean being taken in Broth or Wine. And by reason of the exceeding Bitterness of the Root, it kills all sorts of Worms in the Body. *Guainerius* says, that by his own Experience and Sight, he found it to be as effectual as *Dittamnus* unto all the Purposes unto which that serves. The Powder of the Root taken in Wine, (from half a Dram to a Dram) is a speedy and special Remedy against the Wind-Colick, which the *Savoyards* about *Diam* (where it grows in great plenty) familiarly use with great Success, and call it the *Wind-Colick Herb*. This same Root also used inwardly, is not only the chief and principal Antidote or Remedy against the Poison of *Monks-hood* or *Helmet-flower*, and *Wolfs-bane*, but also of *Leopards-bane*, or any other Poisonous Herb whatsoever, being given first and last Morning and Night.

X. The Decoction in Wine. It has all the former Virtues, but not full out so efficacious as the Root in Substance. If you so please, the Powder of the Root may be given in this Vehicle for the same Purposes.

XI. The Spirituous Tincture. It has the Virtues of the Powder and Decoction; besides which, it is good against Surfeits, the Measles and Small-Pox; for by gently provoking Sweat, it expels the Malignity to the Surface of the Skin, and so defends the Heart and Vital Spirits from the Poison and Force

of those Diseases, causing them orderly to come forth: you may give from one Dram to two Drams, (according to Age and Strength) in any proper Vehicle. It defends the Heart, and strengthens the Spirits as a most Sovereign Cordial.

XII. The Acid Tincture. It has the Virtues of the Root, Decoction and Spirit; besides which, it is more effectual than any of them against the Plague or Pestilence, and all sorts of Malign or Pestilential Diseases, as also against all malign and burning Fevers, destroying the Malignity, and extinguishing the burning Heat of the Disease. It is also good against the Venom and Poison of Mad Dogs, Serpents of all kinds, as Viper, Rattle-snake, Slow-worm, &c. and the Stinging of Scorpions, Hornets, Wasps, Bees, &c. Let the Patient take it in all that they drink, so many Drops at a time as may make the Vehicle pleasant, and continuing the Use of it for some days. The Figure which we have given you in this place, is from *Matthiolus* his *Epitome*.

C H A P. CCCLV.

Of HEMLOCK Common.

THE Names. It is called in *Arabic*, *Sucaram*: in *Greek*, *Kalyon*, *μαχον καλυν*, à circum vertendo, quod Vertiginem, & imaginem earum rerum quæ asspiciuntur, tanquam circumagantur ac in tenebras inducat ipsæ quæ eam biberunt: in *Latine*, *Cicuta*; and in *English*, *Hemlock*.

II. The Kinds. There are three principal kinds, viz. 1. *Cicuta vulgaris*, The Common Hemlock. 2. *Cicuta minor*, *Cicuta fatua*, *Cicuta Apifolia*, The lesser or Parsley-leav'd Hemlock, in Cap. 356. 3. *Cicuta palustris*, *Cicuta aquatica*, Water or Marsh Hemlock, in Cap. 357. following.

Common Hemlock.

III. The

III. *The Common Kinds.* Of this there are two several sorts, viz. 1. *Κόκκυς κοινόη*, *Cicuta vulgaris*, *Cicuta major*, (by almost all Writers) *Cicutaria Clusij*, Our Common Hemlock. 2. *Κόκκυς μέγα*, *Cicuta magna*, vel *maxima*, *Cicutaria latifolia sedatissima*, *Cicutaria maxima Brancionis* by Lobel, *Cicutaria Myrrhis Thalij*, *Seseli Peloponense Matthioli*, *Gesneri* and *Lugdunensis*, which Lobel contradicts; The great or greatest Hemlock. That this is a Hemlock, and no *Seseli* or *Hartwort*, no doubt is to be made of it.

IV. *The Descriptions.* The first, or Common Hemlock, has a Root which is long, white, and sometimes crooked, and hollow within: from the Head of which Root it grows up with a hollow green Stalk, three or four Feet high or more, full of red Spots sometimes, and having at the Joints very large winged Leaves, one set against another, dented about the edges, of a sad green color, branched towards the top, where it is full of Umbles of white Flowers; which being passed away, give white, flatish, long Seed. The whole Plant and every part has a strong, heady, ill-conditioned Smell, offending the Senses.

Hemlock Greatest

V. *The second, or Great or greatest Hemlock.* It has a Root which is very great and white, growing as well deep into the Ground, as spreading many great Branches therein, which sometimes dies after it has given Seed, and sometimes not, abiding all Winter in some Seasons, and in some Places. This Hemlock has much larger winged Leaves than the former, thicker set, more spread, and of a sadder green color, having a Smell which Lobel calls *Fetidissima*: yet Parkinson says, that tho' he had it growing many Years in his Garden, he never found any offensive Smell it had. The Stalk is great, but rises not so high as the Common sort does; but bears as large Umbles of white Flowers; where, afterwards grow large and thick white crooked Seed, of no evil Smell.

VI. *The Places.* The first grows in all Countries throughout England by Walls and Hedge-fides, and in waste Grounds and untilld Places, as also in Gardens of a fat and rich Soil. The second I have found in moist and fertil Meadows abounding with other Weeds near their Borders, but grows with us mostly in Gardens, where it is generally weeded out.

VII. *The Times.* They both flower in July and August, and seed in August and September.

VIII. *The Qualities.* Hemlock is cold in the fourth Degree, and dry in the second; Repercussive, Anodyne, Altringent, Arthritick and Venefick.

IX. *The Specification.* It is chiefly of External Use, for the Cure of the Gout, Scirrhus Tumors, Erythelas, Inflammations, Wheals, Pusles, creeping Ulcers.

X. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. A Cataplasm of the Leaves. 3. A Cataplasm of the Root. 4. A Venefick. 5. An Emplaster.

The Virtues.

XI. *The liquid Juice.* It is applied outwardly to the Testicles of such as have Venereous Dreams, or the like, to suppress them: also to Maidens and Womens Breasts, to repress their Swellings, and repel their Milk: yet by reason those places are so principal, and full of Vital Spirits, it sometimes happens that the Remedy is worse than the Disease. It may safely be applied to an Inflammation, an Erythelas, Pains of the Gout, arising from hot or fiery Humors; and to Wheals, Pusles and creeping Ulcers, accompanied with a hot and sharp Matter, for by cooling and repelling the Heat, it puts a stop to the Humor.

XII. *The Cataplasm of the Leaves.* A Cataplasm being made of the raw Leaves by only bruising, and so laid to the Brows and Forehead, is good to stop Defluxions of Rheums falling into swollen and red Eyes, so as quickly to ease the Pain, and take away the Swelling and Redness. And being applied with a mixture of Bay Salt in fine powder to the Wrists, (renewing it twice a day for three or four days) it takes away a Pin and Web growing in the Eye; but it ought to be applied (as they say) to the contrary Wrist. Applied in Pains of the joints, it eases them.

XIII. *The Cataplasm of the Root.* It is to be roasted under the Embers, wrapped in double wet Papers, until it becomes soft and tender; then to be beaten in a Mortar to a Pulp, and applied: it prevails admirably against the Gout in Hands or Fingers, as also in other Parts, quickly easing the Pain.

XIV. *The Venefick.* The Juice mixed with Wine, if it is given to any one, is present Death, as *Tragus* says. And this possibly might be the Venefick which the Athenians adjudged the Wife *Socrates* to die by, for not thinking respectfully of their Gods, or rather Devils, being accused by *Aristus* and *Melitus*. The Cure. If any one has taken the Juice of Hemlock, or this Venefick, or by mischance has eaten this Herb instead of Parsley, or its Root instead of Parsneps, which causes a Frensy, or Perturbation of the Senses, as if stupified or drunk: the first thing I say in this Case which is to be done, (if it is soon enough) is to give the Patient a Vomit of *Vinum Benedictum*, *Vinum Antimoniale*, or *Tartar Emetick*: which being effected, a good Draught of Wine (in which *Gentian* has been infused) is to be drunk, as *Pliny* advises. *Tragus* says, he cured a Woman who had eaten the Root, by giving her a Draught of good Vinegar: and this may be probable,

ble, because, for that it the Vinegar was given in a good large quantity it would cause plentiful Vomiting, to evacuate the poysonous matter, and withal, by reason of its acidity, it would enervate and destroy the force of the Poyson, making it of no effect.

XV. *The Emplaster, called Emplastrum à Cicuta cum Ammoniaco.* Take Juice of Hemlock four Ounces, Vinegar of Squills, Gum Ammoniacum, of each eight Ounces, dissolve the Gum in the Juice and Vinegar, by a gentle infusion in a warm Sand heat, then strain, and reduce it to the consistence of an Emplaster. Here note, that if the quantity of the Juice was doubled it would be so much the better; it was invented to ease pains, chiefly of the Spleen and Gout, my Experience has confirmed it, and such as shall use it upon my Word may have cause to return me Thanks for this Recommendation; it is also an excellent thing to dissolve Scirrhus, and other like hard Tumors in any part of the Body, chiefly Tumors of the Liver, Spleen, Hypochonders, and Joints.

XVI. *Nota.* It has been found by observation that some Countries bring it forth in greater strength than other some do, and where it is produced in greater strength it is a greater Poyson, and tho' it is a kind of Poyson with us here in England, yet it seems not to be so great a Poyson as in Greece, and other hot Countries, nor attended with such violent effects.

C H A P. CCCLVI.

Of HEMLOCK the Lesser,

O R,

HEMLOCK Parsly Leav'd:

THE Names. It is called in Greek *Κάκιστος ὀκρῖς*, in Latine *Cicuta parva*, vel *minor*, and in English *The Small or Lesser Hemlock*.

II. *The Kinds.* This is the second general Species of this Plant, and tho' it is a singular one of its Kind, yet Authors have given it a plurality of Names, as *Cicuta minor Cordi & Camerarij*, *Cicutaria Fatua Lobelij*, *Cicuta Fatua*, *Apium Cicutarium Thalij*, *Petroselinum Caninum Tabernanontani*, *Petroselinum vitium Tragi*, and *Apij Comes Cicutarium Gesneri in Hortis*, *Fools Hemlock*, *Parsly Leav'd Hemlock*, &c.

III. *The Description.* This Smaller Hemlock has a small, tough, white Root, which perishes every Year, from which rise up divers stiff Stalks, scarcely a Yard high, hollow, somewhat reddish towards the Sun, otherwise they are whiter than the former, smaller, and not spotted at all, and jointed or kneed at certain distances, from which Joints spring forth long Leaves, very green, and finely jagged, like the Common Chervil, or Parsly; indeed as the Leaves are much smaller than the Common Hemlock, so they come so near unto Parsly, that many are mistaken, in gathering one for another, being often found (tho' a Wild Weed) in Gardens, of a paler green color, and with few Branches; the Flowers are white, and grow at the tops of the Stalks in small spiky Umbles, with small, longish, green Leaves about them; the Seed follows, like that of the Common Hemlock, of a white color, or as they grow together on the

tops of the Stalks, resembling Coriander Seed, but lesser, the whole Plant seems not to me to be of any evil smell.

Hemlock Parsly Leav'd.

IV. *The Places.* It grows amongst Stones and Rubbish by old Walls and ruinous places, by the Walls of Cities and Towns, and on Banks sides, and by Hedges, almost every where, as also in Gardens very plentifully.

V. *The Times.* It Flowers in July and August, and its Seed is ripe in August and September, and in warm and seasonable Years much sooner.

VI. *The Qualities, Specification, Preparations and Virtues* of this are the same with those of the Common Kinds, saving, that it is found by experience that this is not full out so Venefick as they are, yet doubtless is dangerous to be taken inwardly.

C H A P. CCCLVII.

Of HEMLOCK Water or Marsh.

THE Names. It is called in Greek *Κάκιστος ὕδωρ*, *ἢ ἰάσος*, in Latine *Cicuta Aquatica*, vel *Palustris*, in English *Water or Marsh Hemlock*.

II. *The Kinds.* There are three Kinds hereof, viz. 1. *Cicutaria Palustris alba*, *Cicutaria Palustris Flore albo*, *Cicutaria albo Lugdunensis*, White Water Hemlock. 2. *Cicutaria Palustris rubra*, *Cicutaria rubra*, *Cicutaria Palustris Flore purpureo*, *Baulhini & Camerarij*, Red Water Hemlock. 3. *Cicutaria Palustris Tenuifolia Lobelij*, *Cicuta Palustris & Aquatica Cordi*, *Gesneri*, & *Thalij*, Marsh or Water Hemlock.

III. *The Descriptions.* The first, or White Water

ter

ter Hemlock. It has a white, thick, long Root, like that of Fennel, but divided into many parts, being of a sweet scent, and an hot sharp taste; from this Root rise up several Stalks of winged Leaves, much cut in on the edges, from among which rises up a slender crumpled Stalk, and Branched a Foot and half or more high, bearing Umbles of white Flowers, and long, black, well smelling Seed, and when ripe tasting sharp, two always joined together, with a small Thread between them.

IV. The second, or Red Water Hemlock. It has a thick, black, and jointed Root, with several fibres thereat; the Leaves are in form like the former, but larger, and not so much cut into parts, and paler of color; the Stalk is round, and jointed, about a Foot in height, bearing at its tops flat Umbles, with pale red, or bluish Flowers, and long black Seed after them, sweet in smell, and sharp in taste.

Hemlock
Water or
Marsh

V. The third, or Marsh or Water Hemlock. It has a long and blackish Root, with several Joints and Fibres growing from them; from this Root springs up a great, thick, and hollow Stalk, three, four, and sometimes almost five Feet high, full of Joints, and Leaves at them; at the Joints with the Leayes, which are cut into divers parts, somewhat like unto Parsly, but smaller, come forth the Branches up to the top, bearing small Umbles of White Flowers; the Seed is sweet in smell, and black, somewhat greater than Aniseed: This is that Plant which Dodonæus and Lugdunensis take to be Phellandrium Plinij, and they make it to be Sium, or Laver, the Ligusticum Sylvestre Thalij, which Cesalpinus and others think to be the Silaus Plinij.

VI. The Places. They all grow in moist and watery places in several Countries of Europe, the third, or last of them, grows by many Rivers sides in many parts of England, in several places by the Thames side, also in the midst of Water Ditches, and standing Pools and Ponds, in moist places of this Land; it grows very plentifully in the Ditches by a Causey

going from Redriff to Deptford, near London, and in many other places.

VII. The Times. They Flower thro' all July and August, and perfect their Seed in August and September, as other Hemlocks do.

VIII. The Qualities, Specification, Preparations, Virtues and Uses are the same (as Authors think) with the Common Hemlock in Chap. 355. foregoing, but of this I confess I very much doubt, seeing the seeds are cold in the fourth degree, and these on the contrary are hot, at least in the second degree, and aromatick, as the hot and spicy taste of the Seed seems to indicate, however, since Authors have said nothing in particular of the matter, nor we have had any experience of our own concerning the same, we shall cease any farther declaration thereof.

C H A P. CCCLVIII.

Of H E M P Manured.

THE Names. It is called in Arabick *Cannab*, and *Schehedeneji*, in Greek *Kanabos*, in Latine *Cannabis*, and in English *Hemp*.

II. The Kinds. It is twofold, viz. 1. *kavracis scbeun*, *Cannabis Sativa*, Manured Hemp. 2. *kavracis vncan*, *Cannabis Sylvestris*, *Cannabis Spuria*, Wild or Bastard Hemp.

III. The Manured Kinds. The Manured is also twofold, viz. 1. *Cannabis Mas*, The Male Hemp, or that which bears Seed. 2. *Cannabis Femina*, The Female Hemp, or that which bears Flowers and no Seed.

Hemp

Male.

IV. The Descriptions. The first, or Male Kind, has generally one downright Root, six or seven Inches long, with many strong Strings, which take fast hold in the Ground, but die and perish every Year; from this Root rises up one Stalk, four, five, six, or seven Feet

Feet high, according to the goodness of the Soil, with many Leaves set thereon at distances; this Stalk is rough and bushy, with many Leaves also on the Branches, every one of them standing upon a long Footstalk, and divided into five, six, or seven several Leaves, joined together at the bottom of them, and dented about the edges, something like unto the form of the Leaves *Palma Christi*, or *Bastard Black Hellebor*, of a dark green color, and of a strong smell, but not unpleasant; towards the tops, from the bottoms of the Wings and Leaves, comes forth the Seed on long Branches, without any show of Flowers, which is round, somewhat hard, and full of an oily Nut like white substance, and contained in round Heads; every particular Leaf is narrow, long, and sharp pointed, finely notched in about the edges; this is called *Winter Hemp*.

V. The second, or Female Kind, has like Root and Stalk as the former, but the Leaves are lesser, and of a lighter green color, yet like in form and shape; the Stalk is single for the most part, with few or no Branches, having a like strong smell as the other, it bears a great number of Flowers, which are small, and of a whitish yellow color, standing many together upon long Branches, which turn into dust, and are carried away with the Wind, not leaving any Seed after them, for which reason it is called *Barren Hemp*, and by reason of its bearing no Seed it comes to ripeness sooner than the other by a Month, or more, being the tenderer and weaker Plant, the Stalk being hollower, and not so strong, for which reason it is usually called *Summer Hemp*.

VI. An Observation. These two sorts *Male* and *Female* are not originally two differing Kinds; but both rise from one and the self same Seed, that is, they both spring from the Seed, growing upon one and the same Stalk or Plant, being herein somewhat like unto the *French Mercury*; but how this change in Nature should be, or how it is brought to pass, is very hard to determine: The *Summer Hemp*, as it is the tenderer and weaker Plant, so it makes the finer Stuff or Tare, and that makes the finer Thread,

and by consequence the finer and softer Linnen Cloth. The *Winter Hemp*, as it is the stronger Plant, and harder peeling, so it makes the courser and harder Thread and Cloth, and of this sort it is they usually make their Cordage. As for the way and manner of steeping or watering of *Hemp*, and how it is dried, picked, cleansed, and beaten, &c. so as to be made into Cloth or Cordage, as it is not pertinent to, or the business of this Work, so it is pretermitted, and you are referred to the proper place in my *Agriculture*, which, if it shall please God to Bless me with Life, shall in due season be emitted into the World, for the general Benefit of Mankind.

VII. There is also a third Kind of *Hemp* growing in *Virginia*, and other of our *Floridian* Plantations, which in Roots, Stalks, Leaves and Seed differ not much from our *Manured Kind*, saving, that the whole Plant is much bigger, the Stalks are greater, and the Leaves and Flowers much larger.

VIII. The Places. *Pliny Lib. 20. Chap. 23.* says that *Hemp* was formerly found growing Wild, but we in our days can find no such thing, for in all places of the World it is now Sown in enclosed Fields chosen on purpose for the same; *Columellâ* says it delights to grow in a Fat, Dunged, and Watery Soil, or in plain and moist Grounds deeply Ploughed.

IX. The Times. It is Sown in the end of *March*, or beginning of *April*, and is ripe in *August* or *September*, according as the two sorts grow ripe and fit to be gathered; the second of these, or *Summer Hemp* is ripe and fit to be gathered in the end of *July*, and beginning of *August*; the first, or *Winter Hemp*, is gathered a full Month after, viz. in the end of *August*, or beginning of *September*.

X. The Qualities. It is hot and dry in the end of the first degree, it is Astringent, Carminative, Diffusive, opening Obstructions of the Gall Bladder, and is Anodyne, Neurotick, and Arthritick.

XI. The Specification. It is a peculiar thing in curing the Jaundice and Colick, in killing Worms, and easing pains of the Gout.

XII. The Preparations. You may prepare therefrom, 1. A Liquid Juice of the Leaves. 2. A Decoction of the Leaves. 3. A Decoction of the Root. 4. A Decoction or Emulsion of the Seed. 5. A Distilled Water of Root and Herb. 6. An Oil by Infusion. 7. The Leaves fried.

The Virtues.

XIII. The Liquid Juice of the Leaves. Taken to an Ounce or two in a Glass of Wine it is an extraordinary thing to kill Worms, whether in Man or Beast; dropt into the Ears it kills Worms in the Ears, and draws forth any other living Creature which has crept into them: And to shew the strength hereof for this purpose, *Mathiolus* says, that if it is poured, (yea but the Decoction of the Herb) into the holes of Earth-Worms, it will drive them forth, and that Fishermen and Anglers have used this Feat to get Worms to bait their Hooks.

XIV. The Decoction of the Leaves. It has the former Virtues, but not altogether so strong, and may be given from three to eight Ounces, according to Age and Strength, but is no very agreeable thing for the Stomach.

XV. The Decoction of the Root. It has the same Virtues also, but this in especial it is said to be good against, viz. to allay Inflammations in the Head, or any other part, to ease the pains of the Gout, to help hard Tumors or Knors in the Joints, Cramps, and shrinking of the Sinews, and to ease the pains of the Hip, or Sciatica, being applied thereto by Fomentation.

tation, and afterwards mixed applied made up into a Cataplasm with Barley Flower, renewing of it every day.

XVI. *A Decoction or Emulsion of the Seed.* The Decoction in Water or Wine is hot and dry, and consumes Wind, and by the much use thereof it does disperse it so much, that it consumes and dries up the Natural Seed of Generation. The Emulsion of the Seed in Water or Milk stops continual Fluxes of the Bowels, and is good against a Gonorrhœa, it eases the pains of the Colick, and quiets and allays troublefom and griping Humors in Stomach and Belly, it is good against a Bloody Flux, and stops bleedings, whether at Mouth, Nose, Yard, or Womb. The Emulsion made in Milk, by boiling the Seed so long in it till it is perfectly broken, and then strained out, as *Sylvius de Le Boe Prax. Med. Lib. 1. Cap. 47. Sect. 74. Pag. 306. b. quarto Edition Printed 1680.* has taught, if it is taken five or six Ounces at a time twice or thrice in a day, it will, as he says (from great Experience) cure the Jaundice; it is also good for such as have a hot and dry Cough, opens obstructions of the Lungs, and obstructions of the Gall Bladder, and causes a digestion of Choler.

XVII. *The Distilled Water of the Herb.* It allays Inflammations, and has all the Virtues of the Juice and Decoction of the Leaves, and may be used to be mixed with some other Preparations, as a Vehicle.

XVIII. *The Oil by Infolation, Infusion, or Decoction.* It is good to be applied to any place which is burn'd with Fire, and to remove inflammations in any part, so also if an Oil or Ointment is made, by mixing the fresh Juice with Oil Olive, or Hogs Lard, or fresh Butter, it heals Burnings or Scaldings after an admirable manner.

XIX. *The Leaves fried.* In a Hemorrhage if some of the Blood which comes from the Patient be taken, and the fresh Leaves of *Hemp* be fried therein, and then given to the Sick to eat, it stops the bleeding presently, and if they be so fried as that the Leaves may be crumbled into Powder, this Powder blowed up the Nostrils, or put upon any Wound where there is a Flux of Blood, it presently stops it, and given to a Dram or more inwardly in a Spitting of Blood, Vomiting Blood, Pissing Blood, Bloody Flux, or flux of the Terms, it quickly stops it, and by repeating the exhibition quickly cures it, and given to such as are troubled with Worms in the Bowels it kills them.

XX. *Nota.* *Matthioli* says that *Hempseed* given to Hens in the Winter, when they lay fewest Eggs, will make them lay more plentifully.

Urtica serratis altera Bauhini, who thinks it to be the *Sideritis Cordi*, The second *Bastard* or Wild Hemp, 3. *Cannabis Spuria tertia*, *Cannabis Spuria facie Urtica Lobelij*, *Urtica aculeata Folijs non serratis Bauhini*, *Sideritis altera Matthioli*, The third *Bastard* or Wild Hemp.

III. The Descriptions. *The first, or First Bastard Hemp*, has a Root which is hard and white, and a little spreading, but dying before Winter, from the head of which rises up a reasonable great, hairy, square Stalk, not very strong, nor upright, but as it were leaning down, with several Joints bunching out like Knees, and two Leaves set at every one of them, somewhat long, hairy, and pointed, of a fresher green color than the Leaves of the Matured Kind, and dented about the edges; at the Joints also come forth several Branches, jointed and set with Leaves in like manner, whereabout, towards the tops, grow several hooded and gaping Flowers, like those of the *Dead Nettle*, but larger and greater, of a pale purplish color, standing in small, green, prickly Husks, in which, after the Flowers are past, grows the Seed, which is small and round, three or four growing together.

IV. *The second, or Second Bastard Hemp*, differs not much in Root or Stalk from the former, but the Leaves are shorter and rounder; the Flowers hercof are of the same fashion, but not so great as they, the uppermost part or hood whereof is of a pale color, tending to yellow, and the lower part of a deeper Red, or Purple Color; the Husks of the Flowers are somewhat more prickly also than the other.

V. *The Third, or Third Bastard Hemp*, is in its growing much like the last, but its Root is a bush of fibres and Strings, from whose head comes forth one short body of a Stalk, which quickly divides it self into two, three, or four others, which growing up with several Joints, spread themselves out into many Arms or Branches, two and two at every Joint, but

C H A P. CCCLIX.

Of H E M P Bastard or Wild.

THE Names. It is called in Greek *KannaCis* *ὑπὸ κατὰ*, *ὑπό*, in Latine *Cannabis Spuria*, vel *Notha*, and *Cannabis Sylvestris*, in English *Bastard Hemp*, and *Wild Hemp*.

II. The Kinds. Authors make three several sorts hereof, viz. 1. *Cannabis Spuria prima*, *Cannabis Sylvestris Tragi & Lugdunensis*, & *Spuria altera Lobelij*, *Cannabina alba Tabernamontani*, *Urtica aculeata Folijs serratis Bauhini*, The first *Bastard Hemp*, or *White Bastard Hemp*. 2. *Cannabis Spuria secunda*, *Cannabis Sylvestris Spuria tertia Lobelij*, *Alyssum Arvense album Tabernamontani*, *Urtica aculeata Fo-*

but the Leaves at the Joints are somewhat long and narrow, a little fadder, and not dented about the edges in most of them; the Flowers hereof are hooded and gaping, but they are wholly of a pale yellowish color, with little or no shadow or spot in them, and stand thicker about the Joints, whose Husks have longer and sharper points than the rest.

VI. *Nota.* You are to take notice that there is another variety of the first of these Kinds, whose Flower is for the most part of a perfect white color, or a little pale whitish, which does manifestly express the difference, and therefore is called in *Latine Cannabis Spuria prima Flore albo*, Bastard Hemp of the first sort with a white Flower.

VII. *The Places.* These Kinds of Bastard or Wild Hemp do all grow as well in moist Grounds as dry, by Ditch sides, and by Pathways, and under Walls, and some of them will be found in Gardenis, whence they are continually plucked up as Weeds, the first Kind with a white Flower mentioned at Sect. VI. above has been found by the Pathways near *Chapman*, and in the Ditches by *Redriff*, or *Rotherhithe*, as it was formerly written; they all grow also upon barren Hills and Mountains, as *Gerard* says, and especially on Earable Land, and they have been oftentimes found in the Corn Fields of *Kent*, near *GraveSEND* and *Southfleet*, and in all the way from thence to *Canterbury*, and in many places about *London*.

VIII. *The Times.* They all Flower for the most part in *July*, and from *July* to the end of *August*, the Seed ripening in the mean time.

IX. *As to their Qualities, Specification, Preparations and Virtues,* they are thought to be nearly the same with those of the Common Hemp in the former Chapter, as some Authors are of Opinion, but they are seldom used in Physick, either inwardly or outwardly, when and where the others are to be had.

X. But *Lobel* says they are used as an assured Remedy against Nodes and Wens, and other like hard Tumors in the Flesh, and that after other things have

failed and done no good, 'tis very possible that they may be of extraordinary use in curing the Kings-Evil, if prudently prepared and applied, and by a Wise and Skillful Hand.

HEMP Water. See AGRIMONY Water.

CHAP. CCCLX.

Of HENBANE Common or Black.

I. *THE Names.* It is called in *Arabick* *Altercum*, and *Altercangenum*, and by the *Arabian* Physicians *Bengi*, which differs but little from the *Indian* and *Persian* Name *Bangue*, as *Garcias* ab *Orto*, and *Christopher Acolia* declare, in *Greek* *Τοξωδ. μ.* & quasi *Faba Porcina*, in *Latine* also *Hyoscyamus*, and corruptly *Jusquiamus*, also *Apollinaris*, ab *Apolline* *Medicine* inventore, vel quia opplet *Cerebrum* vitioso & fetido halitu, eoque *Mentem* percellit, quasi *Apollinis* *Astro*. *Scribonius* says that the *Latines* also call it *Altercum*, ab *Altercando*, quia cum *Verborum* *Altercatione* rixaque se torquent *Hyosciano* *dementati*. *Camerarius* saith it is also called *Priapeia*, quia *Itali* *Semine* utuntur ad *Priapismum* sedandum.

II. *The Kinds.* There are several sorts of this Plant, but the principal Kinds are, 1. *Hyoscyamus niger*, called also *Hyoscyamus vulgaris*, and by *Fuchsius* *Hyoscyamus flavus*, Our Common Henbane, which is the Black Henbane, and is a singular Plant, of which in this Chapter. 2. *Hyoscyamus albus*, so called by all Authors, White Henbane, of which in Chap. 361. following.

III. *The Description.* It has a Root which is great, white, and thick, branching or spreading it self several

ral ways under Ground, so like unto a Parsnep Root, (but that it is not so white) that it has deceived several; from this Root spring up several very large, thick, soft, woolly Leaves, lying upon the Ground, much cut in or torn on the edges, of a dark or very dull grayish green color; among these Leaves rise up divers thick and soft Stalks, two or three Feet high, and sometimes higher, which spread themselves out into several smaller Branches, with some smaller Leaves on them, and many hollow Flowers Bell fashion scarcely appearing above the Husks, and commonly torn on the one side, ending in five round points, growing one above another, of a deadish, faint, yellow, white color, somewhat paler towards the edges, with many purplish Veins therein, and of a brownish color, or dark yellowish purple in the bottom of the Flower, with a small Pointel of the same color in the middle, each of them standing in a hard close Husk, which, after the Flower is past, grows very like the Husk of a Pomgranet Flower, or the Flower or Husk of *Asarabacca*, and somewhat sharp at the top points, in which is contained much small Seed, very like unto Poppy Seed, but of a dusky grayish color, almost inclining unto black, whence came the Name *Black Henbane*.

IV. *The Egyptian Henbane.* I shall put this Plant into this Chapter, and describe it here, tho' an Exotick, because Parkinson says it is, or will have it to be, a Species of the Black, and whilal it is not a very great stranger in some of our English Gardens, it has a small white Root, with some Fibres adjoining to it, which perishes every Year; this Root sends up a strong woolly Stalk, about two Feet high, on which are growing lesser Leaves than those of the Common Kind afore described, and almost as much torn on the edges, especially those towards the bottom, but those which grow up higher towards the top are little or nothing indented on the edges, and the higher the smoother edged, all of them being very white and hoary; the Flowers stand every one of them at the Joins with the Leaves, and at the tops likewise, in such like Husks as the Common does, and of the same pale yellow color, with purple Veins therein, at the first blowing of them, but afterwards, as they grow larger, so the color changes to be of a dark reddish color, with Veins of a deeper Dye, and a whitish bottom, with a Purple Pointel, encompassed with yellow Threads in the middle, which being past away, there succeeds such like prickly Heads as the Common Kind has, and also such like Seed.

V. *The Places.* The first is commonly found growing by the Way sides, and under Hedge sides, and old Walls, about the borders of Fields, on old Dunghills which have lain long, and in other rude and untilld places; the other is an Exotick, common to be had in *Ægypt*, as the first is with us, but by transportation of the Seed to us, is now to be found in several of our Gardens.

VI. *The Times.* They spring out of the Ground all April, and in May, and do both Flower in July, and in August, the Seed being perfected in October, when growing ripe, if it is suffered to shed or fall, it springs up again every Year.

VII. *The Qualities.* They are cold in the fourth degree, and dry in the second or third, they are Anodyne, Astringent, Emphractive, Repercussive, Arthritic, and Venefick.

VIII. *The Specification.* They are good against inflammations of the Eyes, Sciatica, Gout, Rheumatism, Kings-Evil, hot Tumors of the Cods, and of Womens Breasts, noise, deafness, and pains in the Ears; it prevails against Coughs, and Fits of the Mother.

IX. *The Preparations.* You may have, 1. The Leaves whole and in substance. 2. A Juice of the Leaves and Roots. 3. An Essence of the same. 4. A Juice or Emulsion of the Seed. 5. An Oil of the Seed by Infolation or Expression. 6. The Seed in substance. 7. A Decoctio of Root, Herb, and Seed. 8. A Vinegar of the Root or Herb, or green Husks of the Flowers. 9. An Extract of the Juice of the Roots and Leaves. 10. An Oil or Ointment of the Root, or Leaves, or of their Juice. 11. A Cataplasm of the Roots or Leaves boiled in Red Port Wine. 12. A Fomentation. 13. Fumes of the Herb or Seed. 14. A Distilled Water of Root, Herb, Flowers. 15. A Venefick. 16. The Cure of the Poison of Henbane. 17. A History.

The Virtues.

X. *The green Leaves in substance.* Applied they cool all inflammations, either in the Eyes, or in any other part of the Body, and are good to affuage all manner of swellings, whether of the Cods, or of Womens Breasts, or in any other part; the same applied to the Joins give ease in pains of the Gout, and Sciatica, and to the Forehead and Temples they ease a vehement Headach, proceeding from a hot cause, or for want of Sleep in Fevers, and are very good against simple Contusions while recent.

XI. *The Liquid Juice of the Leaves.* It has all the former Virtues, being bathed warm or fomented upon the parts affected, and seems to me to be the more powerful of the two, but after bathing it will be necessary to lay Linnen Cloths four, six, or eight times doubled dipped in the same Juice upon the disaffection, dropped into the Ears it takes away any noise therein, deafness, thickness of hearing, or pain there; held often in the Mouth of one who has the Toothach it gives relief and ease, and if there is Worms in the Teeth or Gums it kills them.

XII. *The Essence of the Roots and Leaves.* It has all the Virtues of the green Leaves and Juice aforegoing, and for the excellent use which may be made hereof it ought always to be kept in a readiness in the House, if it is mixed with Wine, or Wine and Water in equal quantities, and a lousie Head bathed therewith, it will kill Nits and Lice, and this it will do in Man and Beast; the same thing the Liquid Juice will do also.

XIII. *The Juice or Emulsion of the Seed.* An Ounce of the Seed will make twenty or twenty four Doses for a Man or Woman, it is an excellent thing against hot, salt, and sharp defluxions of Rheum falling upon the Lungs, eases Coughs, tho' never so extreme, and is good against pains of the Spleen, and Womb, and Hysterick Fits, or Fits of the Mother; it stops all sorts of Fluxes of the Bowels, as Diarrhoea's, Disenteria's, Lienteria's, and Hepatick Flux, as also the overflowing of the Terns, and the Whites in Women.

XIV. *The Oil of the Seed by Infolation or Expression.* Dropped into the Ears it is good against noise and pain there, as also against thickness of hearing, and kills Worms in the Ears, anointed on the Joins of Gouty People, it gives ease to the pain and affuages the swelling of the part: The Oil by Infolation is good for all the aforementioned things, but the Expresed Oil is five times more powerful and efficacious, and therefore the rather to be chosen.

XV. *The Seed in substance.* It has all the Virtues of the Juice or Emulsion of the Seed at Sect. XIII. above, besides which it is a most excellent thing to be given about ten or fifteen Grains at a time (according to the Age of the Person) so such as Pitts a Bed, or cannot hold their Water, being continued for some time, and by this Remedy alone I have

U u u cured

against several Young Persons, (even Women kind, which are the most difficult) who had been troubled with the same many Years, the Cure succeeding beyond expectation: The Emulsion of the Seed will also do the same thing, but whether it is so powerful as the Seed in substance I will not determine, because a great Virtue may reside in the Hulls or Husks of the Seed, which in the Emulsion are all cast away; but if the Emulsion be made with all the Husks of the Seed in it, I know not but then it may do as well as the Seed in substance it self; if the Seed is given in substance, it ought first to be all bruised in a Stone or Glass Mortar, and then mixed with the pulp of a roasted Apple, or other proper Vehicle, and so given (for some time) every Night going to Bed.

XVI. *The Decoction of Roots, Herb, or Seed.* If the Feet are washed herewith it causes Sleep, and given in a Clyster it does the same, so also bathed upon the Temples and Forehead, and a little snuffed up the Nostrils also; it has all the Virtues of the green Leaves, Liquid Juice and Essence at Sect. X. XI. XII. if in like manner applied, but the Decoction is much the weaker Preparation, and ought therefore to be the oftner used: The Decoction of the green Husks of the Flowers has also the same Virtues.

XVII. *The Vinegar of the Root, green Herb, or green Husks.* It is made by Infusion in sharp White Wine Vinegar, either by Infusion, Digestion in a Sand heat, or gentle boiling, or digesting in a boiling Balneo; if it is held in the Mouth it eases the pains of the Teeth, given inwardly in a small Dose, as from half a Dram to a Dram, or more, in some fit Vehicle, it causes Rest and Sleep, more especially if it is also bathed upon the Nostrils, Forehead, and Temples, and a Rose Cake dipped in the same be applied to the Temples; bathed upon places inflamed, tumified, or pained, or affected with the Gout, it eases them; it also allwages the swelling of the Spleen, and eases its pain.

XVIII. *The Extract of the Juice of the Roots and Leaves.* The Juice being produced by expression is to be inspissated in a gentle Sand heat, or in the Sun, till it comes to perfect dryness of a Gum, which done, it is to be reduced, by beating in a Mortar, to a gross Powder, and then it is fit for extraction; this is done two ways, viz. either with fair Water, or with Spirit of Wine; you must dissolve it in either the one or the other Menstruum in a gentle Balneo, or in a gentle Sand heat, and keep it in that digestion forty eight Hours, shaking it two or three times a day; then being settled till it is perfectly fine, decant off the clear Tincture, which reserve, put more, either fair Water, or Spirit of Wine, and extract again as before, till no more Tincture will arise; decant this clear Tincture, casting the feces away; this Tincture, whether Aqueous or Vinous, put into a proper Vessel, if it is an Aqueous Tincture, you may put it into a Glass Bason, or well glazed Earthen Bason, and in a gentle Sand heat evaporate to dryness, and then it is done; but if it is a Spirituous Tincture, put it into a Glass Body or Vesica, which fit with a Glass Head, and in a gentle Sand heat, or in Balneo, draw off the Spirit, till the Magma remaining is of the thickness of new Honey, or something thicker; the Spirit you may keep for the like use again, the Extract you may take out, (by breaking the Glass Body) and keep it in a Pot or Box close covered from the Air. It is Soporiferous and Narcotick, dissolved in Water or Vinegar, and used outwardly, it will do all that the green Leaves, Liquid Juice, Essence, or Decoction can do; if it is dissolved in Canary, or other Wine, it is good a-

gainst Deafness, or dulness of hearing, noise and pains in the Ears, and held in the Mouth it gives ease in the Toothach; and so dissolved in Wine, or otherwise in Spirit of Wine, it may be given from twenty to thirty, or forty drops, or more, in any convenient Vehicle, to cause Rest and Sleep, and to ease the pains of the Spleen and Bowels, or pains in other parts of the Body, it operating not much different from an Opiate; and this Extract is that Juice of *Herbane* which you ought to put into the Composition when you Confect the *Laudanum Opiatum Paracelsi*.

XIX. *The Oil or Ointment of the Roots, or green Leaves, or of their Juice.* It is made by a treble addition of the Vegetable matter to the Oil Olive, or Hogs Lard, or mixture of Oil and Sheeps Suet, every time insulating and boiling till the aqueous particles are all consumed. It is good to cool inflammations, and ease pain proceeding from a hot cause; if it is made (instead of the Hogs Lard, or mixture, &c.) with *Unguentum Populcon*, it will give admirable ease in the Gout, allwage the pain and swelling of the Testicles, and the Inflammations and Tumors in Womens Breasts; it eases all pains of the Joints, and in any other part, and will perform what the Leaves, Juice or Essence can do.

XX. *The Cataplasim of the Roots or Leaves.* If applied to simple recent Contusions it dissipates the Tumor, or prevents its rising, and quickly cures it; if made by boiling them soft in Red Port Wine, and applied to Womens Breasts, or to the Testicles, or other like painful Tumors, it eases the pain and allwages the swelling; applied to the Temples and Forehead it eases the Headach, gives Rest, and induces Sleep; that made without Wine is good to be applied to pains in the Reins, and to the bawny parts of the Arms and Legs, but it ought to be applied hot; that made with Wine is an excellent thing against the Sciarica, and the Gout in Hands or Feet.

XXI. *The Fomentation.* It is made of the Wine in which the former Cataplasim was boiled, adding to every Pint thereof a Dram or two of *Oleum Tartari per deliquion*; it allays Inflammations, dissolves Tumors or Swellings proceeding from heat, and eases any pain proceeding from a hot cause, or hot and sharp Humors; it is good also to bath therewith Hands and Feet which are apt to be hard and dry; it is also good to hold in the Mouth for the Toothach, and to foment that side of the Cheek and Jaw therewith, it giving present ease to the pain.

XXII. *The Fumes of the dried Root, Herb, or Seed.* The Fume of dried Root, Herb, Stalks, or Seed, being burned, and the Hands held over the Fume thereof, will quickly cure such as are troubled with Swellings or Chilblains in the Winter, the same done to such as have Kibes in their Heels it will quickly heal them, tho' inveterate and very bad; it also cures the Toothach.

XXIII. *The Distilled Water of the Root, Herb, Flowers.* It is effectual to all the purposes for which the green Leaves, Juice, Essence, Infusion, Decoction, &c. are used, but is much weaker than they; it clears the Skin, being washed with it, of heat, Pimples, hot eruptions, or breakings out, Herpes, Scurf, Morpew, Yellowness, and other Deformities, &c.

XXIV. *The Venesick.* It is made of the expressed Juice of Root or Herb, digested in a Glass Body in a very gentle Sand heat for a Week, mixed with any proper matter, as Paste, Bread, Meat, &c. it kills Rats and Mice, or other Vermine: this Venesick mixed with some of the Distilled Water kills Nits and Lice, the Head and parts affected being washed therewith; it also allwages Tumors, cools inflama-

inflammations, alleviates pain, and gives ease in the Gout, the parts affected being often bathed therewith.

XXV. *The Cure of such as are Poisoned with Henbane.* If it is recent, the first and only thing which is to be done is, to give an Emetick, which may be *Tartar Emetick*, *Vinum Antimoniale*, *Vinum Benedictum*, or some such Antimonial Vomit, which, when it has almost done working, its force downwards ought to be encouraged, by giving this Clyster. *Take Mutton Broth or Posset-Drink a Pint, brown Sugar four Ounces, mix, melt, and exhibit it warm;* by this means all the Viscera or Bowels will be effectually cleared of the Poison, then give to the Patient Goats Milk, or Mead, or Honeyed Water, or Pine Kernels with sweet Wine, or if these be not at Hand, give *Fennel*, or *Dill*, or *Caraway Seed* in Powder, *Nettle Seed*, or Seed of *Mustard* or *Radishes* in Wine; also Onions or Garlick taken in Wine do all help to free them from the danger, and restore them to their due Temper again; lastly, being put to Bed give two or three Drams of *Althbrndate* or *Venice Treacle* in a Glas of Canary; cover them down warm, and let them rest upon it.

XXVI. *A History.* *Parkinson* gives a Relation of one who digging up some *Parfnep* Roots in a Garden, by chance also dug up some *Henbane* Roots which grew among them, they being both very like one another, as is before related, these *Henbane* Roots were boiled with the *Parfneps*, and dressed with them, and they were eaten at Supper, the Person who gave the relation hereof said that he eat of them, and was presently after very dry, and the drought was so great, that nothing he could take would quench it, his Taste was depraved, and his relish of things was taken away; suddenly also his Sight was troubled, so that he could not discern things as they were, but as if they were three or four fold; his Urine was also quite stopped, so that notwithstanding he had a great desire to make Water, yet it was wholly obstructed; in this sad Condition he continued for most part of the Night, neither could he rest or sleep being in Bed, but his Urine, by the stoppage thereof, grew so hot within him, that it added much to his Grief; at length he bethought himself of a Medicine, which was good against the Stone, it was a Powder, he presently took it, and it caused him to make Water, and thereby he felt incredible ease in his whole Body, for all things which he had taken before did him no good; but by this means he quickly recovered his Sight, and the other Symptoms vanish'd, and by Morning he was very well: The Servants also who did eat of this Mef were Distemper'd, some more, some less, according to their feeding, and the strength of their habit of Body, or Constitution, operating together.

XXVII. *An Observation.* Mountebanks and Quack-Salers pretend to cure the Toothach with the Fumes of the burned Seed, and to bring many Worms out of the Teeth and Gums therewith, it is true that the Fumes of the Seed will give ease in that pain, but the pretence of Worms falling out of the Teeth is a Cheat which they put upon the bystanders, for these Vile Fellows, to deceive those from whom they would get Money, cause the Patients to hold their Mouths over a Basin or Bowl of fair warm Water, they receive the Fumes of the burning Seeds up a Funnel; these Seeds are stuck fast upon a stick, with a great many small bits of very fine Lute String, which being mixed with the Rosin, and fixed on the stick, with the Seeds afterwards, while the Rosin is hot, as the Rosin stick is then kindled and burns, melting the Rosin, and as

the Rosin burns the Fumes go up the Funnel into the Mouth, and the Seeds burst, and the very small bits of the Lute String fall into the Water, which seem to move or stir themselves, whereby the lookers on think them to be live Worms come out from the Teeth and Gums, whereas in truth they are nothing but these bits of Lute String mixed and blended with the Rosin just fallen down by means of the Fire, for it is the property of those Lute Strings, that feeling the heat of the Fire, and also falling into warm Water, to seem to stir and to move about in the Water as if they were alive.

C H A P. CCCLXI.

Of HENBANE White.

THE Names. It is called in Greek, *Ἰοσυάμω* *λευκός*; in Latin, *Hyoscyamus albus*; and in English, *White Henbane*.

Henbane White.

11. *The Kinds.* There are several sorts, as 1. *Hyoscyamus albus*, (so called by all Authors) *White Henbane*, and this is *major*, the greater kind, for *Bauhinus* makes two of them. 2. *Hyoscyamus albus minor*, The lesser white Henbane: whether they be one and the same Plant (as *Parkinson* says they are) is hard to determine, since difference in Soil may make a very sensible difference both in Growth and Magnitude: however with *Bauhinus* we shall here admit them to be two; and so *Johnson* upon *Gerard* allows them. 3. *Hyoscyamus Creticus*, *Hyoscyamus albus Creticus*, *White Henbane of Candy*; and this *Clusius* makes to be twofold, as also does *Bauhinus*, which are a greater and a lesser, tho' *Parkinson* will have them to be but one, and this larger sort is that which he thinks to be the *Hyoscyamus Luteus* *Dioscoridis*: but these in their Figure and

U u u 2 Description

Description are much different. 4. *Hyoscyamus albus* *Creticus* *Classi*, *Hyoscyamus albus* *Creticus* *alter*, The other white Henbane of Candy; and this is that which is described by *Johnson* in his *Gerard*.

III. The Descriptions. The first, or White Henbane, (which is the greater kind) has a Root which is not much unlike to that of the Common Henbane, but lesser, and perishes every Year after it has given Seed: this has divers large Leaves, but not so large as the Common, yet more soft and woolly; and tho' very much torn in or jagged on the edges, yet not so much as the former, something rounder also, and of a paler green color: the Stalks grow higher, and with fewer Branches on them. The Flowers are in Form like to the *Vulgar*, but smaller, and of a pale color, encining to a whitish yellow: the Seed likewise grows in such like hard Husks, but less prickly, and is whiter; but the Smell of the whole Plant is nothing so soporiferous, offensive and heady as the first kind in the former Chapter.

IV. The second, or Lesser white Henbane. This differs not much in the Root, Stalk, Branches, or manner of Growing from the former White Henbane, but that it seems to be every ways less: the Leaves also, as they are smaller, so they are much rounder, having indented Scallops upon them, and hanging upon pretty long Foot-stalks. The Flowers and Seed-Vessels are very like to those last described in the former Section.

V. The third, or White Henbane of Candy, has a Root which is somewhat thick and short, like a Navew Root, dying with us every Year. It has lesser and thinner Leaves than the first White, more white and woolly, and much more cut in on the edges, dented also, and standing upon longer Foot-stalks. The Stalks are more tender and short, having such like Flowers, ending in full round Leaves, standing higher above the Husks, of a fair yellow, and sometimes of a pale yellow color, and purple at the bottom. After which (being passed away) there comes forth Heads of Seed much like the Common kind, but somewhat yellower, or of a lighter color, and in rounder Heads or Husks.

VI. The fourth, or Other white Henbane of Candy. It has a Root which is sufficiently thick and large, with many Fibres or Strings adjoining to it. This is a softer and tenderer Plant than the second or third before described; the Leaves also hang upon long Foot-stalks, and are covered over with a soft Downiness, and they are somewhat broader than the second above, and more sinuated, and somewhat resemble the Form of a Vine Leaf, being also snipped or notched about the edges. The Stalks are also covered with a white color. The Flowers are of a Gold yellow, with a Velvet kind of Circle in their middle. This is the Description of that which *Clusius* had from his Friend *Jagues Plateau*, who had the Plant in his Garden, growing from the Seed which he received from Candy.

VII. The Places. The first of these grow in *Narbonne* in *France*, near the Sea side. The second grows also in hot Climes, and where the first of these grows. The third and fourth are Natives of Candy, and grow also in *Spain*: but all these kinds grow with us here in *England* only in Gardens.

VIII. The Times. They all flower towards the latter part of *July*, and also in *August*; and their Seed is ripe in *October*; but it does not often come to Perfection with us, by reason of the Coldness of our Climate.

IX. The Qualities, Specification, Preparations and Virtues of these are exactly the same with those of

the Black Henbane, saving that these are not so cold as those, as not exceeding the third Degree.

X. *Nota*. The Black Henbanes are both accounted to be more dangerous than the White, and therefore to be avoided as much in inward Medicines as may be, unless administered by a skilful Hand, or except in the case of Necessity, when the White is not to be had. The White is chiefly to be used in internal Physick; and is very available for all the good Intentions which the Black are said to be useful for, and therefore to be chosen.

CHAP. CCCLXII.

OF HENBIT,

OR,

CHICKWEED Ivy-leaved.

THE Names. It has no known Greek Name; but it is called in Latin, *Hederacea*, *Alfine* *Hederula*, *Morsus Gallinae*; and in English, *Henbit*, or *Ivy-leaved Chickweed*.

II. The Kinds. There are two Kinds hereof, viz.
1. *Hederacea* major, *Alfine* *Hederula* major, *Alfine* *Hederula* folio major, *Alfine* folio *Hederula* major *Lobelij*, *Morsus Gallinae* major, The greater Henbit.
2. *Hederacea* minor, *Alfine* folio *Hederula* minor, *Elatine* prior *Tbalij* & *Lugdunensis*, *Alfine* spuria prior *Dodonaei*, *Alfine* *Hirsuta* *Camerarii*, *Centunculus* *hirsutus* *Casalpini*, *Alfine* *Hederacea* minor, *Morsus Gallinae* minor, and *Morsus Gallinae* *Hederulae* folio *Lobelij*, The lesser Henbit.

Hen bit or Ground Ivy leaved Chickweed

III. The Descriptions. The first, or Great Henbit. It has a bunched fibrous Root, which is tough, striking

Striking first into the Ground, and perishes every Year. From this Root spring forth several feeble Stalks, growing almost upright, or a little inclining towards the Ground, having at certain distances several joints thereon. The Leaves are of an *Aleba* or *Ground Ivy* Form, almost round, and not much unlike those of the *Dead Nettle*, they are a little dented in on the edges, of a dull green color, and somewhat hairy, as the Stalks also are, which have at every joint such round dented Leaves as grow below; but whereas those which grow below, grow upon pretty long Foot-stalks, these which grow higher at the Joints of the Leaves, are without foot-stalks, and encompass the Stalk at their bottoms. From the Bosoms of these Leaves, from the middle of the Stalk upwards, come forth slender blew Flowers, tending to purple, and hooded, not much unlike to those of *Germander*, or like those of the *Small Dead Nettle*, which being past away small Seed follows after them in their places.

IV. *The second, or Small Henbit.* It has a Root which is small, and fibrous or thready: This Plant grows lower, and more leaning upon the Ground with its Stalks and Branches, which are somewhat hairy, also small, and more tender than the former, with several joints thereon; the Leaves are thin and hairy, something broad, yet nothing so large as those of the *Greater*, which very much resemble a *Dead Nettle*, or *Ground-Ivy Leaf*, whereas the Leaves of these are dented in with two gashes in the sides, which makes them a little represent the *Climbing Ivy*, whence the Name in both of them, and in some sort these Leaves resemble the back of a Bee when the flies, the Joints of the Stalks and Branches are set also with two Leaves of like form at a joint, even up to the tops of the same; the Flowers grow at the tops, and come forth also from the bottoms of the Leaves, at the joints, upon long Foot-stalks, consisting of five small, blew, round pointed Leaves; and the Seed is small, contained in little round Heads.

V. *The Places.* These Plants grow upon Hills and Mountains in several parts of *Italy, Spain, France, and England*, and I have found them growing also in the hilly and Mountainous parts of *Florida*; they grow in Fields also after the Corn is off, and in some Gardens.

VI. *The Times.* They both Flower in *June* and *July*, and the Seed ripens in *August*.

VII. *The Qualities, Specification, Preparations and Virtues* of these are probably the same with the other *Chickweeds* in Chap. 127. foregoing, but otherwise Authors have said nothing of them from Experience of what they may possibly perform, but it is very likely, that being in taste very much agreeing unto the common sorts of *Chickweed*, their Qualities and Virtues may not be much differing.

C H A P. CCCLXIII.

OF HERB CHRISTOPHER.

THE Names. It has no known *Greek* Name, nor scarce any good *Latine* Name, but it is called by most Authors *Christophoriana*, also *Herba Christophori*, & *Sancti Christophori*, but for what cause or respect is not known, and in *English* *Herb Christopher*.

II. *The Kinds.* Gerard says, that tho' this Plant be none of the *Bindweeds*, or of those which have need of supporting, so as it might climb up upon any thing, yet because it bears Grapes, or clusters of Berries, it might have been numbred among the *Aumants*, or Vine like Plants: There are two Kinds of this Herb, viz. 1. *Christophoriana vulgaris*, Our Common Herb Christopher. *Lugdunensis* calls it *Napellus Leucanthemos*, some *Aconitum Bacciferum*, others *Napellus Racemosus*, some call it *Costus niger*, but that is a vain Name; *Pena* and *Lobel* almost make it *Altea* *Plinij* Lib. 7. Cap. 7. because his *Altea* bears black Berries, but doubtless *Pliny's Altea* is *Ebulus*, which has a rough Stalk, whereas this has a smooth; but *Paulus Aegineta* interprets the Root of *Altea* to be the Root of *Sambucus*: *Bauhinus* calls it *Aconitum Racemosum*; some call it *Scriphularia Christophori*: *Camerarius* calls it *Luparia*, which is a kind of *Wolfsbane*, but *Parkinson* not finding therein by the taste any pernicious quality, could not judge it to be any of these dangerous and pernicious Herbs. 2. *Christophoriana Americana*, *Christophoriana Canadensis*, *Christophoriana Americana vel Floridiana* *Baccis niveis & rubris*; *Jacobus Cornutus* in his *Canadensium Plantarum Historia* calls it by the Name *Panaces canadense*, sive *Racemosum Canadense*;

nadenje; but why he calls it *Panax* is very obscure, since it is not manifest that it is any Wound Herb; we in *English* call it *Herb Christopher of America*.

III. The Descriptions. The first, or Our Common Herb Christopher, has a thick long Root, black without and yellowish within, like Box, with several great Fibres or blackish Strings adjoining thereunto, trailing and creeping far abroad in the Earth, by which it greatly increases, not perishing in the Winter, altho' the Stalks and Leaves die away every Year, fresh springing up again from the same Root the next Spring; it first shoots forth divers green Stalks of Leaves half a Foot long, which are divided or made into three parts, and sometimes into five, the lower parts standing for the most part one against another, or not much distant, and the other at the end of the Stalk, each of these parts consists of three Leaves, separate asunder, standing upon small Footstalks, which Leaves are something broad, and ending in a point, some of them cut in on the edges more deeply, and all of them dented about the edges, of a faded green color; from among these Leaves rise up several somewhat weak, smooth, and round Stalks, half a Yard or two Feet high, yet not bending, but standing upright, having three or four such like Leaves thereon as grew below, but with shorter Footstalks; at the tops of the Stalks stand a Tuft or Bush of white Flowers, every one consisting of five small Leaves, with many whitish Threads in the middle, after which, when fallen, come small round Berries, green at the first, and afterwards black when they are ripe, having upon one side a streaked furrow or hollowness, and growing near together, after the manner of a Cluster or Bunch of Grapes: where note, that Gerard in his Description says, 1. That the Stalks are not much above a Foot long or high. 2. That the Leaves are of a light green color. 3. That the Flowers growing at the tops of the Stalks in spokie Tufts, consist but of four little white Leaves apiece. 4. That the Berries, or Fruit, tho' they are round, yet they are also somewhat long withal.

IV. The second, or Herb Christopher of America. It has a thick, short, crooked, black Root, not growing downwards, nor creeping, but having many Fibres adjoining to it; it shoots forth in the Spring many reddish Stalks, about a Foot high, with several Leaves thereon, divided into many parts, somewhat resembling the former, but larger, rougher, and of a sadder green color, at the tops whereof stand a large Tuft of white Flowers, composed in a manner wholly of Threads, yet if they be more nearly viewed, there will appear for every Flower six small white Leaves, with their Threads in the middle, encompassing a round green Button, which coming to maturity is either white, with a purplish tip, standing on a short Footstalk, or wholly reddish; I found many of them in *Carolina*, but the Berries were of so deep a red as they seem'd to be black, and when dead ripe were indeed perfectly black.

V. The Places. The first grows generally in the Woods or Mountains which are somewhat open, and not too much shadowed, and other like places, as well in *England* as other Countries; it grows in the North parts of this Land, near unto the House formerly Sir William Browes, also Gerard says he had it growing and flourishing in his Garden, being Plants which he received from *Robinus of Paris*; I also once found it growing near Forty Years ago in *Hornsey-Wood*: The second grows both in ours and the French Plantations in *Florida*, as those of *Carolina*, and *Canada*, and that in much plenty.

VI. The Times. They flourish and flower in the end of *May*, also in *June* and *July*, and the Fruit is ripe in *July* and *August*.

VII. As to the Qualities, Specification, Preparations or Virtues of the first we can say little or nothing, having had no experience thereof; and Authors are not agreed about them, some, as *Camerarius*, *Lugdunensis*, and *Gerard*, taking it to be a kind of *Aconitum*, or *Wolfsbane*, will have it to be of a pernicious, poisonous, and deadly quality, whereas *Pena* and *Lobel* seem to think otherwise; and *Parkinson* says, that tho' many good Authors held it dangerous, yet he in his Judgment could not think so, not finding therein by the taste any pernicious quality, as is before noted; and whereas it is reported that the Inhabitants of the Mountains and places where it grows do generally hold it to be a most dangerous and deadly Poyson, both to Man and Beast, and that they use to kill Wolves herewith, yet *Parkinson* does think that the Herb which those Inhabitants do think to be so dangerous and Mortal, is the *Aconitum Lycolotum*, or *Lapidea*, which grows in those places, and that it is not this Our Herb Christopher, but that these dangerous Qualities are put upon it purely by a mistake.

VIII. As to the Qualities and Virtues of the second, or American Herb Christopher, the said *Jacobus Cornutus* says that it is eaten familiarly both by the Natives and by the French which inhabit in those parts as a Sallet Herb, and I my self who have been in those parts for some Years, have several times eaten of the Fruit without any danger.

C H A P. CCCLXIV.

Of HERB FRANKINCENSE Narrow Leav'd,

OR,

ALLHEAL Fennel Leav'd.

I. THE Names. It is called in Greek *Λιβανός* *Libanotis*, in Latine *Libanotis Angustifolia*, in *English* *Herb Frankincense narrow Leav'd*, or *Fennel Leav'd Allheal*. The Arabians call it *Xair Almariani*, *Asphaltheis*, *Calebata*, or *Cacholia*.

II. The Kinds. There are many Kinds of *Herb Frankincense* in Authors, we shall only describe the following principal Kinds, viz. 1. *Libanotis Angustifolia*, *Narrow Leav'd Herb Frankincense*, of which in this present Chapter. 2. *Libanotis Latifolia*, *Broad Leav'd Herb Frankincense*, or *Frankincense Allheal*, of which in the next Chapter.

III. The Kinds of the *Narrow Leav'd Herb Frankincense*, or *Fennel Leav'd Frankincense Allheal*. Authors make several varieties of this Plant, we shall only Treat of the following Seven Kinds, as being chief, viz. 1. *Libanotis Ferule Folio Dioscoridis*, *Theophrasti*, *Galen*, (whose Seed is called *Cachrys*, or *Canebrys*, as it is in some Copies, because of its fiery taste) It is the *Libanotis Cachryfera Camerarii*, *Cachrys vera vel verior Lobelij*, *Libanotis Galeni*, *Libanotis Candida Cesalpini*, *Fennel Leav'd Herb Frankincense*. As for *καρυς*, vel *καρυς*, it is said by *Dioscorides* Lib. 3. Cap. 87. to be *Fructus vel Semen Libanotidis*, and so we take it, see *Theophrastus* Lib. 9. Cap. 12. 2. *Libanotis Ferule Folio & Semine Baulini*, *Panax Asclepium Ferule facie Lobelij*, *Panaces Asclepium Dodonei*, *Lobel* his *Fennel Leav'd Herb Frankincense*, *Allheal*, or *Wound-Wort of Esclapius*. 3. *Panax Asclepium Matthioli*, *Panaces Asclepium Lugdunensis*, & aliorum, *Panax Asclepium*

Asclepium primum Libanotidi secunde similis Bauhin, Matthioli his Esculapius Allheal, or Woundwort. 4. *Panax Asclepium Apulum Columnæ*, *Panax Semine Foliofo Bauhini*, Columna his Esculapius Allheal, or Woundwort of Naples. 5. *Panax Asclepium Anguilare & Camerarij*, *Libanotis secunda Tabernamontani*, *Libanotis nigra Cesalpini*, Camerarius his Herb Frankincense Fennel Leav'd, or Esculapius his Allheal of Candy. 6. *Libanotis minor Umbella candida*, *Libanotis Septentrionalium Herbariorum Lobelij*, *Libanotis minima Lugdunensis*, Small Fennel Leav'd Herb Frankincense, or Allheal. 7. *Libanotis Fernacea Germanica*, *Thalium* in his *Harvynia Sylva* calls it *Libanotis vagabunda*, Getman Fennel Leav'd Herb Frankincense, or Allheal.

Herb Frankincense,
fennel Leaved

IV. The Descriptions. The first, or Fennel Leav'd Herb Frankincense. It has a Root which grows deep, and spreads much, and with many Branches fixes it self in the Ground, larger than a great Parsnip at the top, and white both on the outside and on the inside, with a Pith in the middle, but it is so brittle, that you must handle it very tenderly if you desire not to break it, and when cut or broken it sends forth a clammy pale Juice, of an odoriferous, sharp, piercing smell, not much unlike to that of Limons, and endures in the Earth many Years; from the head of this Root shoot several bushy, great, reddish Stalks of Leaves, of a fresh green color, being something thicker and longer than those of the *Ferula*, and shorter than those of *Peucedunum*, or *Hog-Fennel*, yet often and in many places set three together, of a quick aromatick smell, coming somewhat near to that of a *Limon*; from among these Leaves rises up (sometimes, but not every Year with us in England) a good large Stalk, but neither so great nor half so high as the *Ferula*, not much exceeding a Yard in height, nor much higher than the Stalks with Leaves, spreading it self out into very many Ramifications or Branches, which at their tops bear Umbles of yellow Flowers, which being past away are followed by a good large fort of whitish yellow Seed, round, and a little long withal, somewhat crested on the outside, being join-

ed two and two together, as is very usual in most Ferulous Plants, which makes one side flat, the final Footstalk of the Leaves running up between, and is said to be Cautick, or burning, for which reason the Name *Kalyzema*, *Canchrys*, is given to it: This, as it is a rare, so it is a most excellent, goodly, and noble Plant, of a vast value in many Cases.

V. The second, or Lobel his Fennel Leav'd Herb Frankincense. It has a Root which is small, and not growing deep into the Ground, nor abides after it has given Seed, its smell and taste not being much resinous or sharp; this Plant grows nothing so high or great as the *Ferula*, but with fine Leaves like unto it, and at the tops of all the Branches Umbles of yellow Flowers, but the Seed which follows is broad, not so small as *Fennel*, but more like to that of the *Ferula*, of a little quick or brisk taste and smell.

VI. The third, or Matthioli his Esculapius Allheal. Its Root like to the last is small, but no ways answerable to a *Ferula*, the whole Plant is less than *Ferula*, the Stalks are not so large nor so tall, the Leaves are finer, smaller, and shorter than those of that Plant, the Umble of Flowers is smaller also, and the Seed lesser in proportion to all the rest of its parts.

VII. The fourth, or Columna his Esculapius or Woundwort of Naples. It has a small slender Root, with a bush of hairs at the top, of the bigness of ones Thumb, with a thick rugged Bark, of a whitish yellow color on the outside, and a spongy, white, and woody Pith within, full of a clammy white Milk, hardning quickly into a Gum, which is bitter and sharp in taste, and unpleasant, but yet aromatick; the Stalks of Leaves which are spread next the Ground in a round form at head of the Root are cut into several long hairs, as it were thick set together, somewhat like unto Common Tarrow, and hairy withal, which is not seen in the other Kinds, or rather like unto *Fennel* Leaves, but bigger, having seven winged Leaves set on a pretty large Stalk, five bigger and two smaller, which are next the hairy Stalk, being green at the first, but changing yellow when it grows towards Flowering, which with the Leaves is about half a Yard long; from among these Stalks of Leaves rises up but one main Stalk, which is slender, and about two or three Feet high sometimes, having some Joints, but no Leaves thereon to the very top, where usually grow but one or two small Tufts or Umbles of yellow Flowers, but spread a little largely, and growing closer and rounder as it turns to Seed, which are flat, and winged on both sides, two growing together, as is usual in all other Umbelliferous Plants, whereon, as also on the Stalk, is often found a sweet smelling Gum, as clear as Turpentine, or Gum *Ara-bick*, which will scarcely dissolve in Water without heat; the like also is taken from the Root cut in pieces, but it is yellower, because it must be forced out by the Fire. Columna says that this *Panax Asclepium* is the truest of any which has been described by any other Author, and that it grows frequently in *Apulia*, answering in every part the Descriptions thereof in *Dioscorides* and *Theophrastus*.

VIII. The fifth, or Camerarius his Herb Frankincense Fennel Leav'd, or Esculapius his Allheal of Candy. It has Roots like the former, and rises up with a round Fennel like Stalk six or seven Feet high, or more, with several Joints thereon, divided into Branches of Leaves, larger than *Fennel*, and smaller than *Ferula*, of a dark green color on the upper side, and of a blewish green underneath, with large Umbles of yellow Flowers at the tops, which being past away will turn into broad, flat, winged Seed, of a resinous smell and taste, the Leaves being much more mild, and yielding a whitish Milk, nothing so hot or strong in smell as *Ferula*.

IX. The

IX. *The sixth, or Small Fennel Leav'd Herb* Frankincense, or Allheal. It has a great and white Root, divided into several Branches, and with a bush of hairs above; it is a small Herb, and has divers Leaves lying upon the Ground, much cut and divided into longer parts than *Peucedanum*, or *Hogs-Fennel*, and narrower than *Our green English Saxifrage*; the Stalk has but few Joints, and Leaves on them, bearing small Umbles of white Flowers, like *Meum*, or *Spiguel*, which being past away leave small Seed after them; almost like the Seed of *Ammi*, or *Bishopsweed*.

X. *The seventh, or German Fennel Leav'd Herb* Frankincense. It has a blackish long Root, as thick as ones Finger, full of a resinous Juice, sharp, and well smelling, set with a bush of hairs at the top, from whence spring Stalks of fine Fennel like Leaves, but shorter than they, the Stalk rises to be a Foot and half high, on the tops of which stand bowing white sweet smelling Flowers. There is of this a lesser sort also, differing nothing from it but in its universal smallness.

XI. *The Places.* The first six Kinds have been found growing in many Countries, as *Italy, Sicily, Conly, France, Florida, &c.* the seventh in some places in *Germany*; I know not that they grow wild in *England*, but with us are only nurst up in Gardens.

XII. *The Times.* They all Flower in *July* and *August* if the Year is seasonable, and their Seed comes to ripeness in *August* and *September*.

XIII. *The Qualities.* They are said to be hot and dry in the second degree, Aperitive, Absterfive, Digestive, Disculfive, Diuretick, Traumatick, Cephalick, Neurotick, Stomatick, Arthritick, Sudorifick, and Alexipharmick.

XIV. *The Specification.* They conglutinate simple green Wounds, digest, cleanse, incarnate, and heal old Ulcers and running Sores, and ease pain in any part, proceeding from Blows, Falls, Strains, or cold and moist Humors.

XV. *The Preparations.* You may have herefrom, 1. *The green Leaves bruised.* 2. *Green Root bruised.* 3. *Juice of the Herb and Root.* 4. *An Essence of the same.* 5. *A Decolion or Infusion in Wine of Herb and Root.* 6. *A Vinegar of the Seed.* 7. *A Powder of the Root.* 8. *A Powder of the Seed.* 9. *A Powder of the Seed Canchrys.* 10. *An Electuary.* 11. *An Oil of the Seed by Infusion.* 12. *An Ointment of Root and Herb.* 13. *A Balsam of Root and Herb.* 14. *A Cataplasm of the Seed.* 15. *A Distilled Water.* 16. *An Acid Tincture of Root and Herb.* 17. *An Acid Tincture of the Seed Canchrys.* 18. *A Spirituous Tincture of Root and Herb.* 19. *An Oily Tincture of Root and Herb.* 20. *A Saline Tincture of the same.*

The Virtues.

XVI. *The green Leaves bruised.* Being applied *Dioscorides* says that they stay the bleedings of the Hemorrhoidal Veins, and ease the heat and inflammation and swelling of the Fundament; they do also digest the Kernels of the Kings-Evil, and Apostems in any part of the Body, tho' hard to be cured.

XVII. *The green Root bruised.* If it is applied to Wounds of any kind, especially to simple green Wounds, it quickly heals them; if it is not presently applied it then causes digestion, then cleanses and heals.

XVIII. *The Juice of the Herb or Root.* Taken inwardly to two, three, or four Spoonfuls in Wine or other proper Vehicle twice a day, it heals all inward Wounds and Bruises; mixed with Honey and

anointed on the Eyes, it clears and sharpens the Sight, takes away Mists, Clouds, or any thing which is growing over the Eyes, and heals Wounds and Ulcers in the same.

XIX. *The Essence of the same.* It has all the Virtues of the Juice, besides which, being taken inwardly, it disposes ill conditioned Wounds, old Ulcers and Fistula's to a speedy healing, let them be in what part of the Body soever; Wounds and old Ulcers being also outwardly wash'd with the same it cleanses, incarnates, dries, and heals them.

XX. *The Decolion.* It has the Virtues of the Juice and Essence, if it is made in Wine and sweeten'd with Honey, it makes a good Gargle to heal a sore or ulcerated Mouth and Throat, also sore and ulcerated Eyes.

XXI. *The Vinegar of the Seed.* Used as a Lotion it cleanses the Skin from Pimples, Freckles, Scurf, Morpew, Leprosie, Tetters, Ringworms, Scabbiness, and other like deformities of the same.

XXII. *The Powder of the Root.* If it is mixed with Honey and applied, or anointed, or put into the Eyes, it clears from any thing which may grow on them or offend them, heals Wounds or Ulcers in them, and quickens or sharpens the Sight; being taken also inwardly in a Glass of Wine from half a Dram to a Dram, Morning and Night for some considerable time, it does the same thing, it provokes Urine and Womens Courses, and it helps also those who have the Falling-Sickness, or have an old pain in the Stomach, Liver, or Spleen, and if it is given with an equal quantity of Pepper in Wine, it is found profitable against the Kings-Evil.

XXIII. *The Powder of the Seed.* Given to a Dram in White Port Wine it opens obstructions of the Reins and Ureters, and provokes Urine and the Terms, it expels Wind, strengthens and fortifies the Stomach, resists Poyson, and is good against the deleterious quality of the Biting of Mad Dogs, Serpents, &c. being put into Ulcers it cleanses, dries, and heals them.

XXIV. *The Powder of the Seed Canchrys or Canchrys.* By reason of its burning property Authors do not advise to give it inwardly, for they say it is too sharp, and will exasperate the Throat: *Dioscorides* says it is of a heating and mighty drying faculty, and therefore is good to be put into Waihballs, or such things as cleanse the Skin; but if the whole Seed is infused twenty four Hours in Vinegar, and dried again, and then beaten into Powder, it then may be given inwardly, and has all the Virtues of the former, exhibited in the same Dose and manner.

XXV. *The Electuary.* It is made of equal parts of the Powder of the Root and Seed, mixed with a half part of Nutmegs in Powder, and eighth part of Cloves, and a sixteenth part of Pepper in fine Powder, and made up with a treble proportion of clarified Honey. It is a good Stomatick, prevalent against the Scurvy in a cold habit of Body, strengthens the Tone of the Stomach, causes a good Appetite and Digestion, strengthens the Head and Brain, clears and sharpens the Eyesight, and provokes the Terms in Women. Dose one or two Drams in a Glass of Wine Morning and Night.

XXVI. *The Oil of the Seed by infusion or boiling.* Being anointed upon the parts affected it is said to help such as are Bursten, and to cure Cramps, Convulsions, Pains, Aches, Lameness, and the Gout.

XXVII. *The Ointment of the Root and Herb.* It digests and ripens Tumors, cleanses, incarnates, dries, and heals Wounds and Ulcers, consolidates Fractures, and strengthens the Nerves, Tendons, and Ligaments in Dislocations; it also eases pain in any part being anointed on the place.

XXVIII. *The*

XXVIII. *The Balsam of Root and Herb.* It is a most admirable Vulnerary, not inferior to any made of *Prinella*, or *Self-heal*, *All-heal*, or any of the *Woundworts*, it digests contused or otherwise complicated green Wounds and Phagedenick or eating Ulcers, and cleanses them, and if there is a want of Flesh it admirably incarnates, dries, and heals them; it is good also against fretting and running Cankers, Wheals, Pustles, and the like breakings out of the Skin.

XXIX. *The Cataplasm of the Seed.* Take Powder of the Seed, Dandel Flower, of each a like quantity; Vinegar a sufficient quantity, to make it into a Cataplasm. Being applied it dissolves simple Contusions, and prevails against Scabs, Pimples, Wheals, Herpes, Scurf, Morpew, Leprosie, discolorings of the Skin, and other defecations.

XXX. *The Distilled Water.* It has the Virtues of the Juice, Essence, Decoction, or Infusion of the Herb and Root, but much less efficacious, and is chiefly used as a Vehicle to convey some of the foregoing or following internal Preparations down into the Body.

XXXI. *The Acid Tincture of Root and Herb.* It resists Poyson, and the Plague, and all sorts of Malign and Pestilential Diseases, it prevails against the bitings of Spiders, as the *Tarantula*, of Mad Dogs, Vipers, Rattle-Snakes, and other Serpents, as also the biting or stinging of any venomous Creature; it is prevalent also against all hot and burning Fevers, it quenches Thirst, extinguishes the heat, and destroys the Febrick Ferment. Dose from ten drops to forty, fifty, or sixty, in any proper Vehicle, and according to the quantity of the Liquor it is taken in.

XXXII. *The Acid Tincture of the Seed Canbrys.* It is Stomachick, causes good Appetite and Digestion, resists Plague and Poyson, opens obstructions of Stomach and Lungs, takes away Hoarseness and Wheezing, and thereby causes free respiration or breathing, it has all the Virtues of the Tincture in the former Section, and is to be taken in the same Dose and manner.

XXXIII. *The Spirituous Tincture of Root and Herb.* It is prevalent against Poyson, expels Wind, and gives present ease in the Colick and Gripings of the Guts from cold, crude, and sharp Humors, it provokes Sweat, and is good against the Plague or Pestilence, expelling the malignity thro' the Pores of the Skin; being taken in Wine it is good against the bitings of poysonous Serpents, provokes Urine, and facilitates the Birth of Women in Labor. Dose from one Dram to two or three Drams in Wine.

XXXIV. *The Oily Tincture of Root and Herb.* Outwardly applied it eases the Gout, and all external pains proceeding from cold, straining of the part, Blows, Falls, or the like; it gives ease in Cramps and Convulsions, and very much strengthens the parts weaken'd by those Diseases; it is also prevalent against the Palsie, being anointed upon the Vertebra of the Back, and also upon the part afflicted.

XXXV. *The Saline Tincture.* It is of great use against Freckles, Lentils, Sunburning, Tanning of the Skin, black and blew Marks, Scurf, Morpew, and other like defilements thereof.

C H A P. CCCLXV.

Of HERB FRANKINCENSE
Broad Leav'd;

O R,

Frankincense ALL HEAL.

I. *THE Names.* It is called in Greek *Λιβανός*, in Latin *Libanotis* *Latifolia*, and in English Broad Leav'd Herb Frankincense, or Broad Leav'd Frankincense Allheal.

II. *The Kinds.* This is the second Species of the Generick Kind, and is fourfold, viz. 1. *Libanotis major Theophrasti*, *Libanotis ferulis prima Theophrasti* Lib. 9. Cap. 2. *Seseli Aethiopicum Herba Dodonaei*, *Seseli prima Tragi*, *Danci alterum genus Buchsi*, *Turneri*, *Lugdunensis*; The Greater White Herb Frankincense. 2. *Libanotis Theophrasti minor*, *Libanotis fertilis secunda Theophrasti*, The Lesser White Herb Frankincense. 3. *Libanotis Apij Folia Critica Theophrasti*, *Siler Creticum*, & *Libanotis vera Theophrasti*, *Camerarij*, The truest Herb Frankincense of Theophrastus. 4. *Libanotis Aquilegia Folia Latifolia*, *Seseli Aethiopicum alterum*, Columbine Leav'd Herb Frankincense.

III. *The Descriptions.* The first, or Greater White Herb Frankincense, has a Root which grows great and long; whitish on the outside, with a Tuft of hair at the top, abiding long, and having a strong smell and taste, like the Roots of many other Umbelliferous Plants; from this Root spring forth many great long Stalks, with wings of large broad Leaves, some eight Inches long apiece, and almost four Inches broad, five being set together, two and two, one against another, and one at the end, three or four Inches broad below, and smaller to the end, being somewhat hard in handling, of an overworn greenish color, and a little dented about the edges, among which rises up a round strong Stalk, oftentimes four or five Feet high, having such like Leaves on the Joins, but fewer, and lesser than grow below, and a few Branches rising from the upper Joins, bearing large spread Umbles of whitish Flowers, after which comes somewhat flat and round light Seed, two of them joined together, white on that side where it is joined, and straked with rough crumpled stokes on the back or round side, and of a pale brown color when it is ripe, but a little purplish below.

IV. *The second, or Lesser White Herb Frankincense*, has a Root not much unlike the former, white, but more bitter than it; this agrees with the former in the shape or form of the Leaves, Flowers, Seeds, and shape of the Root, but that they are all less, and the number of the Leaves are more, set together on every Stalk, being also more deeply dented about the edges: There is another sort of this Plant, which Bauhinus calls *Libanotis Latifolia minor Semine crispis*, which differs only in having fewer Leaves on the Stalks, altho' as small, and but one or two deep cuts on the edges.

V. *The third, or truest Herb Frankincense* of Theophrastus, has a Root which is covered with a blackish Bark; and very white underneath, smelling strong, like Frankincense, from which springs up a Stalk about a Foot and half high, divided into some Branches, with Leaves set sparingly both below and above, something resembling *Smalage* for the largeness of the Leaves, and dented about the edges, bearing

X x x

ing

ing white Flowers, and large, rough, crooked, brownish Seed, having a pretty strong smell.

VI. *The fourth*, or Columbine Leav'd Herb Franchinense, has a thick, rough, fibrous, brown Root; with a white, Ruffling the middle; smelling somewhat sweet, but bitter in taste, having a Taste of blackish Hairs at the top; from this rise several Leaves upon long Footstalks, broad and hollow at the bottom, like a skinny Husk, compassing one another, as those do also on the upper Stalks, they are hard in handling, yet of a shining dark green colour above, and whitish underneath, with several purplish Veins running thro' them, not all of them divided like unto Columbine Leaves, some many of them parted into five Leaves, with three divisions apiece, others into three Leaves, each standing on a Stalk, streaked with purple, rising up above four, or almost five Feet high, with several Joints thereon, and branched towards the tops, bearing every one a large Umbel of small white Flowers, and after them long and broad striped Seed, of a purplish color, a little bitter, hot, and drawing Water into the Mouth if it is a little chewed therein, being also somewhat sweet of smell.

VII. *The Places*. The first two sorts are found in many places in Germany, and parts near adjoining, the third is a Native of Candia, and the last is said to come out of Ethiopia; but they are all of them now made free Denizens of England, by being planted and nurs'd up in our British Gardens.

VIII. *The Times*. The two first Seed with us Yearly after they are well grown, viz. about July and August, but the two last very seldom, unless the Year proves hot and very kindly.

IX. *The Qualities, Specification, Preparations and Virtues* of these are the same with those of the *Agrostifolia*, or *Narrow Leav'd* in the former Chapter, to which we refer you, yet these being extraordinary Traumaticks or Vulneraries, and of an extremely mollifying and digesting power, we shall make these following farther Observations concerning the same.

X. *The Liquid Juice or Essence*. They are good against Chronick Diseases of the Breast and Lungs, and prevail against the Epilepsie and Jaundice, more especially if a little Pepper in fine Powder is added, and so given in Wine; given in Posset-Drink they increase Milk in Nurles Breasts, and ease pains in the Stomach and Belly proceeding from sharp Humors, or Wind; they are also good against Poyson, and the bitings of Mad Dogs, Venomous Beasts, and Serpents, or the stinging of Scorpions, they provoke Urine powerfully, and the Courses, being stop't; the juice of the Leaves and Roots clears the Eyesight, and sharpens it, and diverts the Rheum which falls into the Eyes, and Cloths dipt therein and applied over the Forehead and Eyebrows.

XI. *The Decoction in Wine*. It has all the Virtues of the Juice and Essence, but much weaker, and therefore may be given in a greater Dose, as from four to six Ounces; it is highly Traumatick or Vulnerary, and may be used Dietetically, as well as outwardly to wash any Sore, Wound, or Ulcer therewith.

XII. *The Balsam or Ointment*. They cure Wounds and Ulcers after an admirable manner, and if a little Powder of Birthwort Root, or of Tobacco be added to them, they do wonders in these kinds of Cures, beyond expression.

XIII. *The Cataplasim of the bruised Leaves*. Being applied it stops bleeding in any part, and cures the Hamorrhoids, or Piles, removes the heat, and dissolves the tumor or swelling of the Fundament, bringing the same (if Nature intends it) to a speedy maturity or ripeness, the Cataplasim being made

with *Durhel* Meal and a little Vinegar, and applied, gives ease in the Gout, Cramps, and Convulsions, and takes away Scurf or Morpew, Leprosie, and any discoloring of the Skin.

XIV. *The Powder of the Root*. Used either alone by it self, or mixed with Honey and applied, it thoroughly cleanses foul Ulcers, and heals them, and is of extraordinary use in curing Fistulas, more especially if Powder of Tobacco about a third part be added thereto.

C H A P. C C C L X V I

OF HERB MASTICH.

M A R U M.

THE Names. It is called in Greek *Maedi*, in Latine *Marum*, from *Maron*, a certain King of *Thracia*, who is said to have found it out, *vel ab Amaraco per Apocopen, atque cum Amaraci Species videatur Marum*, in English *Herb Mastich*, or *Mastich*, also *Marum*.

Herb Mastich.

II. *The Kinds*. Some Authors will have it to be a Species of *Marjoram*, others a Species of *Thyme*, others again make it a middle Plant between them both, it seems to me to be rather a particular of its own Kind; there are three Species hereof, viz. 1. *Marum vulgare*, *Cinopodium Camerarij*, *Dodonei*, *Gesneri*, *Tragoriganum primum Clusij*, *Sampsuchus Dioscoridis Clusij*, *Helanium odorum Theophrasti*, Common Herb Mastich. 2. *Marum supinum Lobelij*, *Marum ex Sicilia allatum Casalpini*, *Marum repens verticillatum Bauhini*, *Amaracus serpens*, Creeping

ing Herb Mastick. 3. *Marum Syriacum* Lobelij, *Donei*, *Tabernamontani*, *Marum Cretenfe Alpini*, *Majorana Syriaca*, vel *Cretica Bauhini*, Syrian or Candy Marum, or Herb Mastick.

III. The Descriptions. The first, or Common Herb Mastick, has a fibrous or thready Root, which sends up greater and more woody Stalks than any of the Marjorams, it rises up to be two Feet or more high in some places, where the Ground is agreeable to it, and the Air warm and clear, it branches it self out on all sides towards the upper parts, leaving the Stem bare below, if it is old, otherwise if it is young, thinly furnishing the Branches from the bottom with small green Leaves, larger than the Leaves of any Thyme, and near to the largeness of the Leaves of *Marjoram Gentile*, at the tops of the Branches stand small Flowers on a Head, which afterwards run into a loose Tuft of a long, white, hoary substance, like unto soft down, with some Leaves under and about them, which abide not long on the Stalks, but are blown away with the Wind; the Seed is so very small, that it is scarcely to be observed, the whole Plant is of a sweet resinous smell, stronger than *Marjoram*, and abides our Winters if it is carefully planted and look'd after.

IV. The second, or Creeping Herb Mastick, has a long slender Root, and fibrous withal, from whence spring up several slender weak Stalks, not standing upright, but lying upon the Ground, therein resembling Wild Thyme rather than Sweet Marjoram or Herb Mastick; the Leaves are many, and smaller than those of Mother of Thyme, growing at several distances upon the Branches; the Flowers are small and purplish, growing at the tops, with Leaves among them, the smell of which is very sweet and strong, coming nearest unto Sweet Marjoram, and of a hot and bitter taste.

V. The third, or Syrian, or Candy Herb Mastick, has a very fibrous or thready Root, like unto the first, from whence spring up several upright Stalks, about half a Yard high, not so woody as the first Herb

Mastick, but more tender and slender, on which grow many small whitish green Leaves, very like to the Small fine Sweet Marjoram, but somewhat rougher up to the very tops, which bear smaller Heads or Knots than those of Sweet Marjoram, and white Flowers out of them; all the Herb is of a most fragrant sweet smell, which endures a long time after it has been dried; it is very tender to keep, and will not endure our cold Nights, which come in August, or September, but is quickly destroyed by them.

VI. The Places. They all grow Wild on the Mountains of Spain, Candia, and Syria, but with us they are all nurs'd up in Gardens, the last indeed with some difficulty.

VII. The Times. They Flower about August with us, and sometimes later, if the Summer Season proves cold, and the Seed is perfected not long after.

VIII. The Qualities. Herb Mastick is hot and dry in the beginning of the fourth degree, it attenuates, opens, is Absterive, Astringent, Anodyn, Carminative, Digestive, Discussive, and Strengthening; it is Cephalick, Neurotick, Stomatick, Hyfterick, Arthritick, Emmenagogick, and Alexipharmick.

IX. The Specification. It is good against Poyson, the bitings of Mad Dogs, Serpents, and other Venomous Beasts, Convulsions, Cramps, Lethargies, Palsies, Epilepsies, Hyfterick Fits, Vapors, and other Distempers of the Womb.

X. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Infusion or Decoction in Wine. 4. A Decolled or Infused Oil. 5. A Distilled Water. 6. A Spirit. 7. A Chymical Oil. 8. An Acid Tincture. 9. A Spirituous Tincture. 10. An Oily Tincture. 11. A Powder. 12. A Compound Decoction.

The Virtues.

XI. The Liquid Juice. Given from one Spoonful to two in a Glass of Wine, or other proper Vehicle, it prevails against Convulsions, Epilepsies, Lethargies, Headachs, Palsies, and dissections of the Womb, it attenuates tough Flegm, opens obstructions of the Womb and Reins, provokes Urine and the Terms, and digests crude Humors.

XII. The Essence. It is good against Coughs, Colds, Wheezings, Hoarseness, shortness of Breath, difficulty of breathing, and other Diseases of the Thorax, it opens obstructions of Liver and Spleen, and frees them from the morbid matter which offends them, it has indeed all the Virtues of the Liquid Juice aforesaid, besides which it opens, cleanses, strengthens, and confirms the Womb, corrects the windiness thereof, or of any other part, which are commonly called Vapors, and is beneficial for such as are falling into a Droptic, and helps the loss of Speech, by the resolution of the Tongue; it provokes Urine, and eases the Colick.

XIII. The Infusion or Decoction in Wine. It has all the Virtues of the Liquid Juice and Essence, it is very Stomatick, powerfully provokes Urine, eases the Strangury, and all pains and torments of the Belly. Dose to six Ounces.

XIV. The Oil by Infusion or Decoction. It warms and comforts the outward parts, being Morning and Evening anointed upon the same, it is good against the Gout, eases pains of the Joints, Nerves, Tendons, and Muscles, discusses Tumors, is good against Convulsions, Cramps, Lameness, Numbness, and the Palsie, and anointed upon the lower Region of the Belly it helps cold griefs of the Womb, and gives ease to pains of those parts.

X x x 2

XV. The

XV. *The Distilled Water.* It has the Virtues of the Juice and Essence, but very much weaker in all respects, but it may be used as a Vehicle, to convey some of the other Preparations in; sweetned with Sugar and given to Children troubled with Convulsions it cures them.

XVI. *The Spirit.* It is Cephalick, Neurotick, Hyfterick, and Cordial, and therefore is good against Apoplexies, Epilepsies, Lethargies, Convulsions, Palsies, Vapors, Fits of the Mother, palpitation of the Heart, Fainting and Swooning Fits, sickness at Stomach, Colick, and other like disaffections of those parts. Dose from one Dram to four Drams, either in the Distilled Water, or in Wine, or some Neurotick, Cordial, or Hyfterick Syrup, it may be given in the Morning fasting, and last at Night going to Bed, and also two or three times besides in the day time if need requires.

XVII. *The Chymical Oil.* It has all the Virtues of the Juice, Essence, and Spirit foregoing, but operates in a more ample and powerful manner; inwardly it may be given from five drops to ten, or twelve, and that Morning and Evening, you must first drop it into White Sugar, or into Honey, or some proper Syrup, and mix them well together, then mix it with the Vehicle you intend to take it in, for all cold and moist Diseases, as Palsies, Cramps, Gouts, Numbness, Trembling, weakness of the Nerves, &c. it ought to be taken in a Glass of Generous Wine; in Vapors, Fits of the Mother, &c. it may be given in the Distilled Water, or Barley Water, or Black Cherry Water; in the Colick it may be given in Juniper Water; outwardly for the Palsie it is to be anointed on the Back Bone, as also the parts affected; so also for Convulsions, Cramps, defluxions of Humors, &c.

XVIII. *The Acid Tincture.* It is a powerful Medicament against the Plague, and all sorts of Malign and Pettilential Fevers, it destroys the putrefactive ferment in the Blood and Juices, allays Vapors, and rising up of the Mother, cools preternatural heats, and resists malignity in its Root, &c. Dose from fifteen drops to thirty, forty, or more, according to the quantity of the Vehiculum in which it is taken.

XIX. *The Spirituous Tincture.* It is a kind of Heavenly Medicament, and a Noble Cordial, it cheers the Heart, revives the Spirits, strengthens Nature, resists Vapors, Faintings, Swoonings, sickness at Heart, and other Diseases of like kind, it takes away sickness at Stomach, pains there, restores its Tone being hurt or depraved, and admirably strengthens it. Dose from one Dram to two, or three Drams, in the Morning fasting, an Hour before Noon, and at Bed time, in a Glass of Generous Wine, or in Syrup, or other proper Vehicle, it causes a good Appetite and a strong Digestion.

XX. *The Oily Tincture.* Inwardly given from ten drops to twenty, or more, in some proper Vehicle, it prevails against the Palsie, Convulsions, pains and weaknesses of the Back, the Stone, Sand, Gravel, and Tartarous matter in the Reins, Ureters, and Bladder, &c. for Palsies it ought also to be anointed on the Back Bone and parts affected twice a day, and to be applied upon the part and well rubbed in in Convulsions, Cramps, &c.

XXI. *The Powder of the Herb.* If it is snuffed up the Nose it provokes sneezing, and thereby purges the Head and Brain of cold pituitous Humors; the Herb being chewed in the Mouth it draws forth much Rheum and Flegm, causing pains and aches in the Head, Jaws, Throat, &c. given inwardly from half a Dram to a Dram in any proper Vehicle it strengthens the Stomach, expels Wind, eases the Colick, and facilitates the Birth of Women

in Labor, bringing away also the Afterbirth.

XXII. *The Compound Decoction.* Take Herb *Marick* two Ounces, *Origanum*, *Pellitory of Spain*, of each six Drams, *Acorus*, *Long Pepper*, of each three Drams, *White Port Wine* twenty Ounces, put all into a *Vinid Copper Vessica*, or *Glass Body*, which cover with a *Blind Head*, and let it simmer over a gentle Fire for an Hour, then let it cool, and decant the clear for use. Dose two or three Ounces at a time for the Palsie, Epilepsie, Lethargy, &c. two or three times a day; it is good also to gargle the Mouth for a Palsie of the Tongue, when it is taken inwardly it may be dulcified with Syrup of Clovegillitow-ers, or other proper Syrup.

C H A P. CCCLXVII.

of HERB ROBERT,

O R,

Robin's CRANESBILL.

THE Names. We cannot learn that it has any Greek Name, the Latines call it *Herba Roberti*, and *Geranium Robertianum*, and we in England, *Herb Robert*, and *Robin's Cranesbill*.

II. *The Kinds.* It is certainly a Species of *Geranium* or *Cranesbill*, and hereof there is two special Kinds, viz. 1. *Geranium Robertianum vulgare*, *Geranium Rupertianum commune*, *Herba Roberti*, vel *Ruperti communis*, *Panax Heracleum Anguillare*, *Sideritis tertia Dioscoridis*, which most of our modern Authors take it to be, and it is easily to be perceived that they are both one, for *Dioscorides* has three sorts of *Sideritis*, viz. one with a *Heracleum* Leaf,

Leaf, one with a Fern Leaf, and one with a Chervil or Coriander Leaf, which is this present Herb; it is also called *Herba Roberti*, vel *Ruperti minor*, *Geranium Robertianum minus*, The Vulgar, Common, or Lesser Herb Robert. 2. *Geranium Robertianum majus*, *Herba Roberti*, vel *Ruperti altera*, *Herba Roberta major*, *Gerani Robertiani altera Species Lobelij*, *Geranium Gruinale Dodonci*, *Geranium Violaceum Tabernamontani*, *Sanguinaria Radix Germanorum*, The Greater Herb Robert.

III. The Descriptions. The first, Common, or Small Herb Robert, has a small and thready Root, which smells as the whole Plant does, very strong, and almost stinking, which sends up a reddish Stalk, commonly two Feet high, having several Leaves thereon, upon very long and reddish Footstalks, divided at the ends into three or five divisions, and each of them cut in on the edges, some with deeper cuts than others, and all dented likewise about the edges, which oftentimes turn reddish; at the tops of the Stalks come forth several Flowers made of five Leaves, much less than those of *Musk Cranesbill*, or *Dovesfoot*, these Flowers *Lobel* says are larger in some than in others, and of a more reddish color, which being past away, there come in their places Beakheads, as in other *Cranesbills*, which are not very small nor very great; the Stalks are slender, weak, and brittle, somewhat hairy, and reddish; the Leaves are also jagged, reddish, stalked, and deeply cut, like to those of *Chervil*, and the Flowers are many times of a bright purple color.

Herb Robert.

IV. The second, or Greater Herb Robert, has a Root which is wholly red, both within and without, not smelling so strong as the former, and it sends up several slender hairy Stalks, three Feet high, at the Joins of which stand Leaves upon shorter yet redder Footstalks, divided at the ends most commonly but into three parts, as large or rather larger than the former, and turning red likewise; the Flowers are purplish red, and of the same magnitude, and so also are the Beakheads and Seed.

V. The Places. They both grow almost every where by Way sides, upon Ditch Banks, and waste Ground, wheresoever one goes, but the second is not so frequent as the other, yet often seen and found; the first grows also upon old Walls, as well those made of Brick and Stone, as those made of Mud or Earth; it grows too among Rubbish, and in the bodies of Trees sometimes which are cut down, and other like ruined places.

VI. The Times. They Flower all May, June, July, and August, and the Seed is ripe soon after; they are hardy Plants, being green generally all Winter, nor are they easily hurt by cold.

VII. Their Qualities, Specification, Preparations and Virtues are the same with *Field Cranesbill* in Chap. 162. foregoing, and to that you are referred.

VIII. Note. *Herb Robert* is not only commended against the Stone, but also to stay Blood, where or howsoever flowing, as also speedily to heal all green Wounds; it cures likewise Wounds and Ulcers of the Dugs, or Womens Breasts, and in the secret parts.

C H A P. CCCLXVIII.

Of HERB TERRIBLE,

O R,

GUTWORT.

I. THE Names. It is called in Greek *Αλυνον*, ab α, privative, and λυνω, Tristitia, quasi indolens inoffensumque Remedium, but this seems to be spoken vel adversum, per contrarium, some think it may be derived from αλυνω, Salsum, vel Maritimum, because it grows near the Sea; in Latine it is called *Alypum*, and *Herba Terribilis*, also *Alypius* by *Athanasius*; the Root hereof is called by the same *Athanasius* *Turpetum album*; as the Root of *Efula minor* is called *Turpetum nigrum*; and in English *Herb Terrible*, or *Gutwort*, because *Dioscorides* says it lightly exulcerates the Guts.

II. The Kinds. Some Authors will have this Plant to be of the Kind of *Tithymalis*, because of its most violent purging and sharp exulcerating quality, but without doubt it is rather a Plant of its own Kind, there are three several sorts hereof, viz. 1. *Alypum*, *Alypum Mompeliensium*, *Herba Terribilis*, *Thymoclea Folijs acutis*, *Capitulo Succise*, Herb Terrible of Mompelier. 2. *Tartonnairre*, *Herba Terribilis Maffiliensis Lobelij & Lugdunensis*, Gutwort, or Herb Terrible of Maffilles, *Alphonfus Pontius* of Ferraria took it to be *Cnicorum Theophrasti*, the Root of which, as *Pena* says, is like unto the Turbith of Alexandria, not having so much heat and bitterness therein, nor other evil tastes, as the others have; *Bauhinus* calls it *Thymoclea Folijs canentibus Serici instar mollibus*. 3. *Alypum Montis Ceti*, which the People of Valentia call *Hippoglossum*, and is *Hippoglossum Valentinum Clusij*, Herb Terrible, or Gutwort of Valentia.

III. The Descriptions. The first, or Herb Terrible of Mompelier, has a Root which is of a Fingers thickness, long, woody, and of a brownish color, somewhat Salt if it grows near the Sea Shore, where it may receive at its Pabulum some of the Sea Water, or else not salt at all, but bitter, if it grows farther off; the Leaves tasting also after the same manner; from

from this Root rises up many woody Stalks, two or three Feet high, dividing themselves into smaller Branches, covered with a thin Bark, the elder Branches being of a dark purplish color, and the younger more red, thick set with small, hard, dry Leaves, without order from the bottom to the top, which are somewhat long, and small at the setting on, broader in the middle, and sharp pointed, somewhat like unto *Small Myrtle Leaves*, of a greenish color on the upper side, and whitish underneath; at the top of every Branch stands a round Flower in a scaly Head, consisting of many purplish Thrums or Threads, paler in the middle than round about, something like unto the Head of a *Scabious*, or rather *Knopweed*.

Herb
Terrible

IV. The second, or Gutwort, or Herb Terrible of Marfeilles, has a Root which is also small, long, and woody, with many fibres at it, it is yellowish on the outside and white within, nothing so hot, bitter, or unpleasant as the Leaves or Seed, yet leaving a small hot taste at the end, without any smell, and not giving any Milk, it is, as *Pena* says, very like unto the Turbith of Alexandria, or of the Shops, and in the form thereof; from this Root spring forth very many hoaty, or Silver white, slender, and very tough Branches, two Feet high, divided into many other smaller, on which grow many small, white, hoaty Leaves round about them, smaller than those of the former; the Flowers are white and small, set close together in a long Tuft, but so covered with the white wooliness, that they can scarcely be perceived, which being past away, small black Seed come in their places, bitter and unpleasant, and so fiery hot, that if any one should chew the same, or the Leaves of the Plant in their Mouth, they will so heat the Mouth, Lips, and Jaws, that no washing will for a long time remove it or take it away.

V. The third, or Herb Terrible of Valentia, is a small Shrub, three or four Feet or more high, its Root is two Fingers thick, brown of color, and of a woody substance; from this Root springs forth one or more Stalks, which spread themselves forth into

many other small Branches, having a thin Rind, which is first brown, then purple, with many little and thin Leaves thereon, not much unlike to those of the *Myrtle*; the Flowers grow at the tops of the Stalk and Branches, and are as it were scaly and tough, like *Scabious Flowers*, of a blew purple color; the whole Plant is very bitter, and of an unpleasant taste, like *Chamaelea*, but somewhat stronger.

VI. The Places. The first grows on the Mountain or Hill *Cestius*, called *Cap de Ceste*, and on other Rocky and Stony places in *France*; the second grows near *Marfeilles*, by the Sea side, on a small Hill near thereunto called *Mondrond*, as *Pena* says, and all along the Coast of *Liguria*, and the Isles of *Corsica* and *Sardinia*; the third grows about *Valentia* in *Spain*, as *Clusius* declares; they all grow on Mountains and Hills, as also in other places which are Gravelly Grounds; with us they are only nurs'd up in Gardens.

VII. The Times. They Flower not until it is late with us, as in *August* and *September*; *Clusius* found some of them in *Spain* Floweting in the Months of *February* and *March*.

VIII. The Qualities. They are all of them hot and dry in the fourth degree, Attractive, almost Pyrotick, and vehemently Cathartick, its purging faculty being much like the *Tulymals*; but the second of these is far more powetful or violent than the others, and comes nearly to the quality of *Mezereon*, so that by reason of its great heat and violence it is very dangerous.

IX. The Specification. They expel Watery, Flegmatick, and Cholerick Humors in abundance, and *Clusius* says that the Landlopers in *Spain* do exhibit it with good success for the Cure of the French Pox.

X. The Preparations. You may have thetrefroni, 1. A Powder of the dried Leaves or Root. 2. A Decoction of Leaves or Root. 3. A Powder of the Seed.

The Virtues.

XI. The Powder of the dried Leaves or Root. It is given in Broth to purge Choler and Flegm, also watery Humors in Dropics, which it evacuates in abundance, and prevails also against the French Disease: *Pena* says that Empericks, tho' they find it to purge with such violence, do often give it with Wine or Broth: *Pliny* says the smallest quantity to be taken at a time in Chicken Broth is two Drams, a mean quantity is four Drams, and the greatest Dose to be given at once is six Drams; but in proportioning the Doses the Physician ought to act wntily, and to begin with a smaller Dose at first, as half a Dram, to see the operation, and then to increase it to larger proportions as he shall see needful, to perfect its operation.

XII. The Decoction. *Clusius* says the *Spaniards* give the Decoction of the Root, Leaves, Flowers and Seed, to those who are troubled with the French Disease, and that with great success.

XIII. The Powder of the Seed. It purges downwards black Choler or Melancholy if taken with a little Salt and Vinegar, and in like quantity with *Epithymum*, but it is said a little to exulcerate the Bowels; it prevails against the Dropick, Pox, Kings-Evil, and Gout. These Preparations of this Plant, if skillfully corrected, and given in a fit Dose, agreeing with the strength of the Patient and violence of the Disease, (the Body being before hand prepar'd) may be admitted of, where better and safer things are not at hand to be had.

C H A P. CCCLXIX.

of HOLLIHOCK,

O R,

TREE MALLOW.

I. THE Names. It is called in *Greek* Διδευαδίζου in *Latine* *Malva Arborea*, *Malva Rosea*, *Malva Hortensis*, *Malva major*, in *English* *Hollihock*, or *Garden Mallow*, also *Tree Mallow*; this is the *ιδευαδίζου*, *Moscaton* *Plinij* *Lib. 21. Cap. 4.* so called I suppose *à* suavitate odoris, or from *ιδευαδίζου*, quod avulsis surculis plantetur.

II. The Kinds. There are two principal Kinds hereof, viz. 1. Διδευαδίζου κοινή, *Malva Hortensis vulgaris*, The Common Hollihock. 2. Διδευαδίζου μεγάλη, *Malva Rosea magna*, *Malva Rosea Arborea*, The Great or Tree Hollihock.

III. Of the Common Garden Kind there are two Species, viz. 1. *Malva Hortensis vulgaris simplex*, *Malva Rosea Hortensis simplex*, Single Flowered Hollihock. 2. *Malva Hortensis vulgaris multiplex*, *Malva Rosea communis multiplex*, The Double Flowered Hollihock. Of the Great or Tree Hollihock there are likewise two Species, viz. 3. *Malva Arborea*, *Malva Rosea magna Arborea*, *Malva Arborea magna peregrina*, The Outlandish Tree Hollihock. 4. *Malva Arborea Marina nostras*, *Malva Rosea Arborea Marina nostras*, Our English Sea Tree Hollihock.

Hollihocks.

IV. The Descriptions. The first, or Common single Flowered Hollihock. It has a long, white, tough Root, easily bowed, and grows deep into the Ground, not much unlike to the Root of the Common Mallow, but greater, and generally abides all the Winter, rising up again the next Spring; the Stalk grows up straight, almost like a Tree, of five, six, seven, or eight Feet high, according as the Ground is in good-

ness, the lower Leaves growing upon which are almost round, and somewhat large, with many corners, but not cut in or divided, and soft in handling; the those which grow up higher are much more produced into corners; from the middle of this Stalk upwards to the top grow the Flowers upon slender Footstalks, where they stand and make as it were a long Spike of small Leaves and Buds for Flowers together; the Flowers are single; and consist of five broad and round Leaves, standing round, like unto single Roses, with a middle long Stile, and some Chives about them; these Flowers are of divers Colors, as pure White, or Reddish, some are of a pale Blush, almost like a White; some are more bluish, fresh and lively, of a Rose Color, some are Scarlet, and of a deeper Red, like Crimson, some of a dark Red, like black Blood, some of a deep Purple, varying in their Colors, as Nature is pleased to play with them; after the Flowers are past, there grows up round Knobs or Heads, but flattish withal, being round about the bottoms, and compact or made up with a multitude of round, flat, whitish Seed, in form of a Cheese.

V. The second, or Double Flowered Hollihock, in its Roots, Stalks, Leaves, magnitude, manner and form of growing, and Seed, is exactly like the former, so that those parts need no other description than what we have already just now given; the difference between the former and this is only in the Flower, for whereas the former are single, these are manifoldly double, and are like unto double Roses, set very thick with Leaves, so that no Stile or Pointel is seen in the middle, the outwardmost row of Leaves in the Flowers are largest, the innermost being smaller, and thick set together, the Colors of which are manifold and various, according as we have described them in the former Section.

VI. The third, or Outlandish Tree Hollihock. It has a pretty large long Root, with some Fibres adjoining to it, which, tho' the Stalk perishes every Year, yet endures with us for about two Winters, and then decays: This Tree Hollihock grows with us to be a great tall Tree, more likely than an Herb, having its Stalk or Body something woody, and oftentimes so great in compass, that no Man can grasp it round with both his Hands, the Leaves are twice as large as any Common Mallow, and as soft and woolly in handling as the Marsh Mallow, but not so white and downy, and many times crumpled about the edges; its Flowers not in the first Year of its springing up with us, but in the second Summer, if a preceding sharp Winter has not killed its Stalk in the first Year, (not then being grown to its full strength) being then more tender than afterwards; this main Stalk spreads in self out into several Branches, with Leaves on them, but smaller, among which stand fair, great, and large deep purple Flowers, with Stripes and Veins in them, like to the Common Mallow; after which come forth such like round Cases, with blackish Seed in them, but larger, according to the proportion of the Plant, which seldom comes to maturity in our Country.

VII. The fourth, or English Sea Tree Hollihock. It has a Root which is white, great, and woody, with many long Fibres or Strings adjoined to it, and in its Stem, Leaves, and manner of growing, is very like to the last described; its Stalk is woody, and as great as a Mans Arm, of a rustier or hoary Color, upon which grow soft, whitish, woolly Leaves, almost as large as the other, and as soft and smooth as Velvet; the Flowers hereof are large, and of a whitish or diluted purple color, like in form to the Flower of a Wild Mallow, but much larger, yet not so large as the last.

VIII. The

VIII. *The Places.* The first two grow only in Gardens, and are almost every where to be met with; the third grows near *Venice*, all along the *Tyrrhene* Shoar, as also on the *African* Shoar, where the Root lives many Years, tho' with us it scarcely ever out lives two Years; the fourth and last grows in an Island called *Dinnie*, three Miles from *Kings-Road*, and five Miles from *Bristol*, as also about the Cottages near *Hurst Castle*, over against the *Ile of Wight*.

IX. *The Times.* The two first Flower thro' all the Summer Months, even till the approach of Winter, but the *Tree Hollibocks* begin to Flower later, so that the first of them does not often perfect its Seed with us, but the last of them brings forth its ripe Seed in a little time after its Flowering.

X. *The Qualities, Specification, Preparations and Virtues of Hollibocks* are the same with those of *Common Mallow*, *Marsh Mallow*, and *Pervain Mallow*, hereafter in their proper places to be declared, and to which we refer you.

C H A P. CCCLXX.

of HOLLOW ROOT,

O R,

Caveous FUMITERRY.

THE Names. It is called in Greek *Κάβως καύη*, *Πίζα καύη*, in Latine *Radix cava*, *Fumaria Radice cavata*, in English *Hollow Root*, *Caveous Fumiterry*, and *Hollow Rooted Fumiterry*.

Fumiterry hollowrooted

II. *The Kinds.* It is the third general Species of *Fumiterry* Cap. 304. *Señ.* 2. of which we have three

Special Kinds, viz. 1. *Radix cava major Flore albo*, Great White Flowered Hollow Root. 2. *Radix cava major Flore Carneis*, Great Blush Flowered Hollow Root. 3. *Radix Cava minor*, *Capnos Radice Fabacea*, Small Hollow Root, Bean fashioned Hollow Root.

III. *The Descriptions.* The first, or Great White Flowered Hollow Root, has a Root which is round and great, of a yellowish brown color on the outside, and more yellow within, and hollow underneath, so that it seems but a Shell, yet being broken every part of it will grow; this Root sends forth Leaves, but they break not out of the Ground until the end of March, very seldom before, and are, both for proportion and color, somewhat like unto the Leaves of *Columbines*, divided into five parts, indented about the edges, standing on small long Footstalks, of a whitish green color, among which rise up the Stalks, without any Leaves from the bottom to the middle, where the Flowers shoot forth one above another, with every one a small short Leaf at the foot thereof, which are long and hollow, with a spur behind it, somewhat like unto the Flowers of *Larkspurs*, but having their bellies somewhat bigger, and the mouth not so open, being all of a pure white color; when the Flowers are past small, long, and round Cods spring forth, containing round blackish Seed.

IV. The second, or Great Blush Flowered Hollow Root. The Root is said to be bulbous, or rather tuberous, and hollow within, or underneath, on the upper part pressed down somewhat flat, covered over with a dark yellow Skin or Bark, with several strings adjoining thereto, and of a bitter and austere taste; the Leaves hereof are jagged, and cut asunder, almost like those of *Coriander*, of a light greenish color, like the gray color of *Columbine* Leaves, to which they are also something like in form, but lesser; the Stalks are smooth, round and slender, about which on the upper part stand little Flowers, orderly placed, long, with a little Horn at the end, like the Flowers of *Toad-Flax*, of a light red, tending to a purple color; the Seed lies in flat Cods, very soft and greenish when it is ready to yield forth its ripe black shining Seed; this Plant is very much like to the former almost in all respects, saving that the Flowers are of a light red, tending to a purplish color; both these Plants abide above Ground but a very small time.

V. The third, or Small Hollow Root. It has a Root which is solid or firm, round, and a little long withal, two being usually joined together, after the manner of a Bean, being yellowish both within and without; the Leaves are of a blewish green color, yet greener and smaller than any of the former, and growing more thick together, the Flowers are like in proportion to the foregoing in all respects, but lesser, having purplish backs, and white bellies, standing closer and thicker together upon short Footstalks: But *Gerard* describes his *Small Purple Hollow Root*, that it has Roots, Stalks, Leaves, Flowers, and Seed, altogether like the first described, the especial difference being, that this Plant is every ways somewhat less.

VI. To the former three Kinds add a fourth, which is a Small Hollow Root with a green Flower, called *Radix Cava minima Flore viridi*, described by *Johnson* upon *Gerard*; the Root hereof is small and toothed, made of little bulbs, resembling Teeth, and ending in white hairy Fibres; it sends up several little Branches, about three Inches high, and the Leaves are somewhat like those of the *Yellow Fumiterry* or of the *Radix Cava*, but much lesser; the Flowers grow clustering on the top of the Stalk, commonly five or seven together, each of them composed of four

four yellowish green Leaves, with some Threads in them.

VII. *The Places.* These Plants grow about Hedges among Brambles and Briers, and in the borders of Fields and Vineyards in low and fertile Grounds in Germany and the Low Countries, but the three first of them grow with us only in Gardens; the fourth is found in its times of flourishing among Bushes in several parts of England, as about Chislehurst in Kent, especially in a Wood formerly belonging to one Pitts, and at the farther end of Cray Heath on the Left Hand under a Hedge among Briers and Brambles, which is its proper seat.

VIII. *The Times.* The three first, as also the fourth, may be accounted Vernal Plants, for they rise not out of the Ground till the Spring comes in, and are gone likewise before it is past, remaining under Ground all the rest of the Year, yet the lesser abides longer above Ground than the greater; the fourth Flowers in April, the other three Flower in March, and their Seed is ripe in April, and the Leaves and Stalks are gone in May, nothing remaining save only the Roots, so small a time do they continue.

IX. *The Qualities.* Hollow Root is hot in the second degree and dry in the third, Aperitive, Absterfiv, Astringent, and Diuretick, Pectoral, Hepatick, Arthritic, and Alexipharmick.

X. *Their Specification, Preparations and Virtues* are the same with those of *Fumitory* in Chap. 304. *Set.* 11. ad 24. to which for the particulars you are referred, there being little or no difference in their operations and effects; but with them you may take these following Notes.

XI. *Nota.* 1. *The Powder of the Roots.* Given to a Dram or more in Wine, or any Alexipharmick Vehicle, it is very effectual against Poyson, the bitings of Mad Dogs, and of venomous Serpents, as also against the Plague or Pestilence, the Patient being laid down to sweat upon the same; it also provokes Urine, and helps against the Jaundice, and being strewed upon putrid and running Ulcers it cleanses, dries up, and heals the same.

XII. *Nota.* 2. *The Powder of the Seed.* Drunk from one to two Drams in Red Port Wine, or in our *Agua Bezoartica*, it stops Vomiting, stops all sorts of Lasks or Fluxes of the Belly, and strengthens all the Viscera.

XIII. *Nota.* 3. *The Decoction of the Roots in Wine.* It is good against Tumors in the Throat, and the long continued swellings of the Almonds, it prevails against stumous productions, and the pain of the Jaws with an afflux of Humors.

XIV. *Nota.* 4. *The Oil or Ointment of the Roots.* Anointed on the Fundament it is good against the swelling and pain of the Hemorrhoids, or Piles, dissolving the one and easing the other; it dissolves also scrophulous Tumors of the Throat.

is called in *Latine Selinum Segetale*, *Goodier* called it first *Sium Terrestre*, afterwards it was called *Apium Sij Folij*; and from the compofure of the Leaves *Sium odoratum Tragi*; *Gerard* called it *Sium Segetum*, and *Sium Agrorum*, but at length the first *Latine* Name *Selinum Segetale* obtained above the rest, from whence it is Named in *English* Corn Parsly, but the Country People call it *Honewort*.

II. *The Kinds.* It is accounted among the Umbelliferous Plants, for such it is, and is certainly one of the Stock of *Selina*, or *Apia*, for which reason it was called *Apium Sij Folij*, but with us Corn Parsly, as aforesaid.

Hone wort

III. *The Description.* It has a Root which is small, long, and white, which perishes every Year after it has Seeded, and rises again of its own Sowing; it is a small low Herb, having several long winged Leaves lying on the Ground, many being set one against another, finely dented about the edges, with one single Leaf at the end, which are each of them longer than Burnet Leaves, and pointed at the ends, from among which rise up several round Stalks, half a Yard high, with the like, but lesser Leaves on them, branching forth likewise from the Joints, and all of them bearing small Umbles of white Flowers, which turn into small blackish Seed, less than Parsly Seed, but as hot and sharp in taste as it. *Gerard* has a more ample Description of this Plant, which take in the following Words.

IV. *Gerard's Description.* The Root is small, and whitish, with many Threads adjoining to it, but not so big as Parsly Roots; the Herb comes up at first from Seed, like Parsly, with two small, long, narrow Leaves, the next which spring up are two small round Leaves, smooth, but nick'd about the edges, and so for two or three couples of Leaves of the next growth there are such round Leaves, growing on a middle Rib by couples, and one round one also at the top or end of the Wing; afterwards, as more Leaves spring up, so the fashion of them also change,

C H A P. CCCLXXI.

OF HONEWORT,

O R,

Corn PARSLY.

THE Names. It is an English Plant, and has no known Greek Name belonging to it, but

Y y y change,

change, that is to say, every winged Leaf has about eight or nine small, smooth, green Leaves, finely snipt or indented about the edges, growing on each side of a middle Rib, one opposite to another, and one growing by it self at the top or end, in form resembling those of *Sium odoratum Tragi*, but not so large or long, or at all brownish, from among which rise up many small, round, straked Stalks or Branches, about two Feet in height, sometimes above twenty Stalks from one Root, sometimes growing upright, sometimes creeping not far from the Ground, jointed or kneed, and dividing themselves into very many Branches; at every Joint grows one Leaf, smaller than the former, which, together with the lowermost, perish betimes, so that seldom one green Leaf is to be seen on this Plant when the Seed is ripe; the Flowers are white, and grow most commonly at the tops of the Stalks and Branches, sometimes at most of the Joints, even from the Ground, in uneven or unorderly Umbles, every Flower having five exceeding small Leaves, flat and broad at the top, and in the middle very small Chives with purple tops, the whole Flower not much exceeding the bigness of a small Pins head, which being putt away, there comes up in the place of each Flower two small, grey, crooked, straked Seeds, like *Parssly* Seed, but larger, in taste hot and aromatical.

V. *The Places.* It grows in Corn Fields among Corn, or where Corn has been Sown, in several places of *England*; it grows in Clay Grounds, and has been found in Wheat Lands about *Maple Durham* in *Hampshire*, and several other places.

VI. *The Times.* It begins to Flower about the beginning of *July*, and so continues Flowering a long time; *Parkinson* says it Flowered not with him till *August*, and that the Seed ripened about a Month after, but part of the Seed is many times ripe in *August*, and some other parts of it scarcely in the beginning of *October*, in the mean season some of it falls, whereby it renews it self, and grows with flourishing green Leaves all the Winter.

VII. *As to the Qualities, Specification, Preparations and Virtues,* they come very near, or are the same with those of Our Common *Parssly*, for the Seed is in form and taste almost like *Parssly* Seed, and therefore to that you are referred.

VIII. *Nota. The Liquid Juice.* *Goodyere* related that the juice of a Handful of the Leaves being drunk in a draught of Ale or Beer every Morning fasting for a Fortnight, did cure one that had a swelling in her Cheek, Yearly there arising, but its original cause was unknown, yet it was attended with great heat, redness, and itching, by the use of this Herb it was perfectly cured, and rose no more; it is possible it may be an excellent thing against Itumorous Tumors, or the Kings-Evil in any part of the Body.

II. *The Kinds.* Some will have it to be *Telephium maculosum*, or *Telephium Dioscoridis*; and as such they nurse it up in their Gardens in *Paris*, *Dodonæus* and *Clusius* say that many took it to be *Maru*, or *Almara Avicenne*, in *Cap. 464.* of which he makes five sorts, but *Clusius* takes *Avicenne* to mean either our *Borage* or *Bugloss*, and that this Plant is rather the *Leucographis Plinij* in *Lib. 27. Cap. 11.* because of the white spots of the Leaves, *Gesner* says it was called by some *Cynoglossum Montana*, and *Baubin* thereupon calls it *Cynoglossum Montanum*; *Dalechampius* took *Calendula* to be *Cerintbe*, a *Cercosiphus Flore sic appellata*, but *Clusius* refers it rather to the Kinds of *Borage* or *Bugloss*, to which in temperature he says it is nearest. Authors make at least six Kinds thereof, but we shall describe no more than grow in our Gardens, which are the following, viz. 1. *Cerintbe major Flore luteo & rubro Lobelij & Camerarij*, *Cerintbe quorundam major Flore versicolore Clusij*, *Cerintbe*, seu *Cynoglossum Montanum majus Baubini*, The Greater Yellow and Red Honeywort. 2. *Cerintbe minor Flore luteo & rubro*, *Cerintbe quinta Clusij*, *Cerintbe folia non maculato viridi Baubini*, The Lesser Yellow and Red Honeywort. 3. *Cerintbe major flavo Flore*, *Cerintbe Flore flavo asperior Baubini*, *Cerintbe quorundam major flavo Flore Clusij*, The Greater Yellow Honeywort. 4. *Cerintbe minor flavo Flore*, *Cerintbe quorundam minor flavo Flore*, *Cerintbe minor Lobelij, Camerarij, & Tabernamontani*, *Cerintbe Plinij*, The Lesser Yellow Honeywort. 5. *Cerintbe major Flore purpurante*, *Cerintbe tertia Clusij*, *Cerintbe Flore rubro purpurascente Baubini*, Purple Honeywort.

III. *The Descriptions.* The first, or Greater Yellow and Red Honeywort, has a Root which is somewhat great and thick, sending therefrom many Fibres within the Earth, but perishes every Year after Seed time; this partly colored Plant rises up with divers thick hairy Stalks, almost two Feet high, on which are set long large Leaves, of a blewish green color, spotted with great white spots, round at their farther ends, and so much encompassing the Stalk at the lower ends, that it seems to go thro' them, set with some small Pricks or Thorns thereon, and a little hairy withal; the Stalks are branched toward the tops in other smaller ones, and full of Leaves, but much lesser, whose ends do turn inwards, like the *Turnsole* Heads, at every Leaf whereof comes forth a long hollow Flower, like unto a *Consfrey* Flower, and as large, which in some are all yellow, with a reddish circle about the middle thereof, but in others from the middle forwards is of a yellow color, the other part next the Stalk being of a purplish red color, with some Threads in the middle, tasting sweet like Honey, wherewith Bees are much delighted, each Flower standing in a green Husk, divided into five parts at the tops, in which, after they are past, grow the Seed, which is blackish, a little cornered, and flat at bottom, where it is joined to the Husk.

IV. *Gerard* describes it thus. The Root perishes at the first approach of Winter, it rises forth of the Ground after the falling of its Seed, with two small Leaves, like those of *Basil*, between the which Leaves comes forth a thick, fat, smooth, tender, and brittle Stalk, full of Juice, dividing it self into many other Arms, which are also divided into many other Branches, bowing or leaning towards the Ground, being not able without props to sustain it self, by reason of the great weight of Leaves, Branches, and much Juice, with which the whole Plant is furcharged; upon these Arms or Branches are placed many thick rough Leaves, set with very sharp prickles, like the rough Skin of a Thornback,

C H A P. CCCLXXII.

OF HONEYWORT,

O R,

WAX--FLOWER.

THE Names. It is called in *Greek* *Κνέινθος* by *Theophrastus Lib. 6. Cap. 7.* in *Latine* *Cerintbe*, and in *English* *Honeywort*, and *Wax Flower*.

of a blewish green color, spotted very notably with white strakes and spots, like the Leaves of the *True Pulmonaria*, or *Cowslip of Jerusalem*, and in shape like those of the *Coddled Thoroughax*, which Leaves do embrace or encompass the Stalk round about, from the bottom whereof comes forth small clusters of yellow Flowers, with a circle or band of bright Purple round about the midst of the yellow Flower; the Flower is hollow fashioned, like a little Box, and of a sweet or Honey taste when it is suck'd, in the hollowies whereof are many small Chives or Threads, which being past away, round black Seed does come in place, contained in soft skinny Husks; the Flowers are very various in color, which are of yellow or purple, and sometimes of both mixed together.

V. *The second, or Lesser Red and Yellow Honeywort*, has a long Root, full of Fibres, perishing every Year; its Branches are both shorter and leaning downwards, not standing upright, on which grow long green Leaves, without any spots on them, and lesser than the former; the tops of the Branches are as full of Leaves and Flowers as the foregoing, but turn not in the same manner; the Stalks which sustain the Flowers, and so likewise the small Leaves at the foot of every Stalk, are somewhat purplish, but the Husk in which the Flower grows is green, and cut into five divisions; the Flower is long and hollow, like the former, and almost as great, of a Gold yellow color, dented at the ends, and with a Red or deep Crimson circle about the middle thereof; and the Seed which follows is like the other, but somewhat lesser.

VI. *The third, or Greater Yellow Honeywort*. It has a Root like the others, which perishes after Seed time in the same manner; it rises up with a reasonable great Stalk, Branched on all sides from the bottom to the top, many of the lowermost lying upon the Ground, and the other standing more upright, on which grow long and large blewish green Leaves, spotted as the first is, but not so large at bottom, where they encompass the Stalks, and having some prickles thereon in the middle, as the first has, and a little hoary about the brim or edges; the tops of the Branches do bend downwards, set with small Leaves, and Flowers at them, as the first, and as large as they, but without any circle or bottom of Purple, being wholly of a fair yellow color, with such like Threads as the rest have, and Seed also much the same, the Leaves of this seem to be rougher than the Leaves of the first, but narrower at their setting on, as aforesaid.

VII. *The fourth, or Lesser Yellow Honeywort*. It has a Root which is white also, and long, and abides in more Southern Climes all the Year long, but with us perishes in Winter; it has a slender Stalk than the former, near two Feet high, set with smaller, narrower, and spotted Leaves thereon, without order, one above another, on both sides the Stalks, which spreads it self out into many small but longer Branches, from the middle thereof, thick set with Leaves and Flowers, which are like the last, all yellow, but smaller, and dented about their brims, after which come such like Seed as the last, but smaller.

VIII. *The fifth, or Purple Honeywort*, has a white long Root, which perishes every Year, and therefore must be new sown every Spring; it grows very like the Great Yellow Kind, with low bending Branches, and somewhat large blewish green spotted Leaves, like as the rest have; the Flowers grow in the same manner as the others do, and as large, wholly of a dark purplish color, on the superficies whereof a little whiteness is perceived; the Seed which follows is like the others, but greater than any of them, and

two for the most part standing together in a Husk.

IX. *The Places*. The first, third, and fifth, grow wild in Spain, the first in *Barica* and *Portugal*, the third in *Valentia*, also in *Monte Palatino* at *Rome*; and in *Germany* in *Austria*, *Stiria*, *Bohemia*, and *Hungary*: the Originals of the second and fourth are unknown, they none of them grow wild in *England*, but are only nurt up in Gardens.

X. *The Times*. They Flower all *June*, *July*, and *August*, and sometimes so late, that we do not gather good Seed from any of them, but from the Red, if the Year proves not warm enough, and wet withal to ripen them, or if they be not well watered when it is a dry Summer, to bring them the faster forward; they perish at the first approach of Winter, and must be sown the next Spring.

XI. *The Qualities*. They are temperate in respect to heat or cold, and dry in the first degree, *Astringent* and *Vulnerary*.

XII. *The Specification*. They are peculiar to stop Bleedings of all sorts, the overflowing of the Terms, *Bloody Flux*, *Hepatick Flux*, &c.

XIII. *The Preparations*. You may have therefrom, 1. *A Liquid Juice or Essence of the Herb*. 2. *A Decoction thereof in Wine*. 3. *A Powder*.

The Virtues.

XIV. *The Juice or Essence of the Herb*. Taken inwardly from one Ounce to two, or three, it is good to stop inward bleeding, whether of any Vessel broken in the Lungs, or Pissing Blood, or the *Bloody Flux*; it stops also bleeding at Mouth and Nose, the overflowing of the Terms in Women, and other Fluxes of the Bowels; if it is mixed with a little Saffron, it is good for bleared and watering Eyes, and being used in foul Ulcers after they are cleansed, it helps to incarnate them, especially such as are in the more nice and tender parts of the Body.

XV. *The Decoction in Wine*. It has all the Virtues of the Juice or Essence before related, and does the same things, but not so effectually, nor so speedily, and therefore is to be given or used oftner, and in a greater quantity or Dose.

XVI. *The Powder*. It stops inward Bleedings and Fluxes, as the Juice, &c. does, and being applied outwardly to any flux of Blood, it presently stops it, strewed also upon moist and running Sores, or putrid Ulcers, it cleanses and dries them, and disposes them to healing.

XVII. *Nota*. *Pliny* and *Virgil* affirm, that Bees are much delighted with the Flowers of these Plants, being sweet, or abounding with Honey, and that they gather from them more Honey and Wax than from many other Flowers; and from thence doubtless it obtained the Name of *Cerinth*.

C H A P. CCCLXXXIII.

Of H O P S Garden and Wild.

I. *THE Names*. *Dioscorides*, *Galen*, nor any of the Ancient Greek Writers make any mention of this Plant, nor yet any of the Ancient Latine Authors, except *Pliny* only, who *Lib. 21. Cap. 15.* does but only name it, and number it among those Herbs which grow of themselves, and are used for Meat with divers Nations. The *Arabians* have not

only remembered it, but commended it highly for many Diseases. The Greeks at this day call it *Bryon*, *Bryonia*, *Bryon* and *Bryonia*, it is likely for the form of the Leaves, and running of the Branches. The Latines call it *Lupulus*, *Lupus Salictarius*, *Lupulus Salictarius* (qui ad Salices assurgit, vel qui Salictum curat, vel quia salit & reptat per Arbores, aut quia scandit Salices) Mesue makes it his third kind of *Volubilis*, Lobel calls it *Vitis Septentrionalis*, (The Northern Vine) and *Tragus Smilax aspera*, which it is not; we in English call it Hop, or Hops.

II. The Kinds. It is twofold, viz. 1. *Lupulus Hortensis*, The Garden or Manured Hop. 2. *Lupulus Sylvestris*, *Lupulus Femina*, The Wild Hop.

III. The Descriptions. The first, or Garden Hop, has a Root which is great at the head, shooting forth many blackish strings, taking fast hold of the Ground; it rises up at first with several great brown heads, like unto *Asparagus*, but larger, which afterwards spreading it self out into rough Branches, climb up upon great, long, or high Poles, which are set on purpose for them to run upon; it has many hard and rough dark green Leaves, cut into three or five divisions, somewhat like unto *Bramble* Leaves, and dented also about the edges; at the tops of the Branches, which hang down again for the most part, come forth many icaly heads, being as it were a number of small yellowish green Leaves growing thick together, from among which come forth the Flowers, of a whitish yellow color, which being past, and the heads changing their color to a more brownish yellow, they are then fit to be gathered to keep; in this Flower at the bottom thereof is contained the Seed, which is brown, or of a reddish brown color, small and round.

IV. Gerard describes the Hop thus. The Roots are slender, and diversly folded one within another; it lives and flourishes by embracing and taking hold of Poles, Pearches, and other things upon which it may climb, it brings forth very long Stalks, rough and

hairy, also rugged Leaves, like those of the Vine, or rather of *Briony*, but yet blacker, and with fewer dented divisions; the Flowers hang down by clutters from the tops of the Branches, puffed up, and set as it were with Scales, like little Canes, or Scaled Pine Apples, of a whitish color, tending to yellowness, and of a strong smell.

V. The second, Wild, or Female Hop, has a Root like the former, and grows up in the same manner, form, or fashion, climbing upon Trees or Hedges, or what stands next unto it, with rough Branches and Leaves like the former, but this bears much smaller Heads, and in far less plenty or number than the Manured does, and sometimes in some Years there are but few Heads to be seen upon some Plants, and herein consists the especial difference.

VI. The Places. These Plants grow more frequently in our colder Climates, than in the hotter or more Southern, they delight to grow in low moist Grounds, where they may have moisture enough, and yet not too much, for which cause they are planted on Hillocks as it were, and Trenches are made to receive or carry off any great quantity of Water, that the Plants may not stand drowned, by which it appears they delight to grow in a fat and fruitful Soil: The Wild Kind grows among Briers and Thorns about the borders of Fields; these by being transplanted into Gardens, and being manured as the Garden Kind is, much alters it self, and becomes little inferior to that of the Garden, and in process of time comes to the same goodness and perfection.

VII. The Times. They spring not up till April, when from the old Roots, which remain all the Winter, new Shoots or Buds come forth; they flower not till the latter end of June, and the Hops themselves are not gathered till the middle of August, and the beginning and middle of September, when they are dried, and so kept all the Year for use.

VIII. The Qualities. They are hot and dry in the third degree, Inciding, Aperitive, Astringent, Subastringent, Digestive, Diffusive, and Diuretick, Neurotick,

Neurotick, Stomack, Hepatick, Nephritic, Hyfterick, and Arthritic, Emmenagogick, Sudorick, Alexipharmick, and Lithontriprick.

IX. *The Specification.* They are of special use to cleanse the Blood, provoke Urine, help the Strangury, break and expel the Stone, Gravel, Sand, and Tartarous Mucilage from the Reins, Ureters, and Bladder, kill Worms, expel Poyson, and provoke the Terms in Women: The *Garden* and *Wild* are equal in virtue.

X. *The Preparations.* You may have therefrom, 1. *A Sallet.* 2. *A Liquid Juice of the Leaves, Roots, and green Hops.* 3. *An Essence of the same.* 4. *An Infusion in Wine or Water.* 5. *A Syrup of the Juice.* 6. *A Decoction of the Roots.* 7. *A Powder of the Seed.* 8. *A Spirituous Tincture of the Flowers or Hops.* 9. *An Acid Tincture.* 10. *An Oily Tincture of the same.* 11. *A Saline Tincture.* 12. *A Spirit from the Hops.* 13. *The Bath.*

The Virtues.

XI. *The Sallet.* The first Buds of the *Hops* being laid a while in Sand will make them render, and being boiled are used to be eaten after the same manner as the Buds of *Asparagus* are, and with as great delight to the taste; they open the obstructions of Liver and Spleen, cleanse the Blood, loosen the Belly, expel Gravel and Sand from the Reins, and give ease in the Strangury.

XII. *The Liquid Juice of the tops of Hops.* It has all the former Virtues, but much more powerful, it effectually cleanses the Blood, and is a good expedient for the cure of the *French Disease*, as also all sorts of Scabs, Itch, Pimples, Herpes, Tetters, Ringworms, Morpew, Scurf, spreading Sores, and all sorts of discolorings of the Skin, being taken daily Morning and Night, from two Ounces to four, in any fit Vehicle; it is found by experience to expel Poyson.

XIII. *The Essence.* It has all the Virtues of the Liquid Juice, but much more powerful to the Intentions, besides which, being taken two or three Hours before the coming of the Fit of an Ague, it is said to cure it at some few times taking; it kills Worms in the Body, provokes the Terms, and powerfully expels Urine; dropt into fore and ulcerated Ears, cleanses them from their Corruption, takes away their stinking smell, and heals them; it purges Choler, but more effectually if given in Whey of Goats Milk; if the use of it is continued for some time, Spring and Fall, it has been found to cure the Kings-Evil, and the Scurvy.

XIV. *The Infusion of Hops in Wine or Water.* It cures the Strangury, or such as make their Water with heat and difficulty, and brings away Stones, Sand, Gravel, or Tartarous Mucilage, obstructing the passages of the Reins, Ureters, and Bladder; if Decoction of *Hops* is used in making of Bread, it is said to make the Dough to rise better, and the Bread to be the lighter; it has all the Virtues of the Juice and Essence, but not full out so powerful, and therefore may be given to fix or eight Ounces Morning and Night.

XV. *The Decoction of the Roots.* *Clusius* says, that the Women in *Spain* use it to cure the falling of the Hair, caused by the *French Disease*. Take fair Water a Gallon, *Hop* Roots cleansed and bruised a Pound, or more, boil them together to the consumption of a third part, or better, strain out, and give half a Pint of it to drink every Morning fasting, letting the Patient sweat upon it; some add to the Decoction Roots of *Parley* and *Quitchgrass*, with a few Raisins of the Sun.

XVI. *The Syrup of the Juice.* It has all the Vir-

tues of Juice, Essence, and Infusion, but must be given in three times a larger quantity, because the Medicament is so much clogged with Sugar; it cures such as have the Yellow Jaundice, eases the Headach which comes of heat, attenuates the calidity of Stomach and Liver, and is very profitably given in long and hot Agues, arising from inflamed Blood and Choler; it loosens the Belly, and effectually cures the Scurvy, Dropfie, Gout, and Kings-Evil.

XVII. *The Powder of the Seed.* Being given to the quantity of a Dram in the Morning fasting, and last at Night going to Bed, it kills Worms in Children, or elder People, provokes Urine powerfully, and brings down Womens Courses.

XVIII. *The Spirituous Tincture of Hops.* It is not inferior to any Diet-Drink which can be given to such as labour under the Scurvy, Gout, Dropfie, Pox, and Kings-Evil; it singularly purifies the Blood after a Salivation, but it is best to be given to such as are of a cold and moist habit of Body, fat and corpulent, and not to such as are thin, hollow, and seem to be emaciated or consumed; it may be given from a Dram to two Drams, or more, in Ale, Beer, Wine, or other proper Vehicle.

XIX. *The Acid Tincture of Hops.* It has the Virtues of the Spirituous Tincture, but much more fit to be given to such as are of hot habits of Body, because it cools and refreshes; it extenuates all malignity of the Pox, Plague, or Poyson, and is singularly good against the Bittings of Mad Dogs, Vipers, and other venomous Serpents, &c. it cures the Scurvy, Gout, and Kings-Evil, and after an admirable manner cures Agues and Fevers, and kills Worms in Old or Young.

XX. *The Oily Tincture of Hops.* As a Topick it gives ease in the Gout and Sciatica, and eases all pains of the Joints and Limbs coming of cold and moisture; it is an excellent thing against the Palfie, being anointed upon the Back Bone, and upon the parts affected, giving it inwardly also at the same time; you may give from ten to twenty, or thirty drops for a dose, being dropt into White Sugar, and then mixed with a Glass of White Wine, and so taken it gives ease in the Strangury, provokes Urine and the Terms, and effectually cures the Colick, and cleanses the Reins, Ureters and Bladder from small Stones, Gravel, Sand, and Tartarous Matter lodging therein; if the Dose is doubled or trebled, and given two hours before the Fit of an Ague, it commonly cures it at three or four times taking.

XXI. *The Saline Tincture of Hops.* It cures by bathing therewith Scurf, Morpew, Leprosie, Tetters, Ringworms, Herpes, and other like breakings out, and clears the Skin of Tanning, Sunburning, black and blew Spots, Yellowness, and other like discolorings thereof.

XXII. *The Spirit of Hops.* It is truly Cordial, cheers the Heart, and retrefhes the Animal and Vital Spirits; it is good in Fainting and Swooning Fits, represses Vapors, and other Hyfterick Distakes, and after a singular manner prevails against Convulsions, whether in Old or Young, and is helpful against Paralytick Distempers.

XXIII. *The Bath.* It is made of the *Hops*, lay boiling in fair Water; if Women sit in it, and continue the use of it for some time, it brings down the Terms, tho' long stop, provokes Urine, eases pains of the Joints and Limbs, as also the exquisite tortures of the Strangury, and takes away the swelling and hardness of the Womb.

XXIV. *Nota.* *Hops* are now very much used to put into Ale, for thereby it not only makes it keep longer, and makes it finer, but also more wholesome, and gratefuller to the Stomach and Palate; but this

is to be observed, that because *Hops* have an admirable fragrant and subtil odor, and abound wonderfully with volatile parts, they are never to be boiled in making of Beer, (for so all their volatile parts will be lost) but only scalded and infused in the same, by which means you will extract into the Liquor all their volatile and excellent substance, leaving the earthy or devilish parts behind, which the way by boiling only extracts, and this Truth all such as are accustomed to make Tea can demonstrate, who, if they boil their Tea, always spoil their Liquor, for which reason they only scald, and infuse it in the same, if they would have it admirable: The same thing is to be understood of *Hops*, and of all other Vegetable substances, which consist of fragrant, odoriferous, and volatile parts, if so be you would prefer them.

C H A P. CCCLXXIV.

of HOREHOUND White.

I. THE Names. This kind of Plant is called in Greek *ῥαβδαν*, in Latine *Prasum*, and *Marrubium*, in English *Horehound*.

II. The Kinds. There are four generick Kinds hereof, viz. 1. *Prasum roseum*, *Prasum*, vel *Marrubium Album*, White Horehound. 2. *Prasum Nigrum*, Black Horehound. 3. *Prasum Aquaticum*, Water Horehound. 4. *Prasum Fatidum*, *Prasum Silvestre*, Wild Horehound, or *Stachys*.

III. The Kinds of the White. Of this there are five Species, viz. 1. *Marrubium Album Vulgare*, *Prasum Album Commune*, *Prasum Angulare*, Our Common White Horehound. 2. *Marrubium Candidum alterum*, *Marrubium Candidum Hispanicum*, vel *Pannonicum Lobelij & Clusij*, *Marrubium Candidum Gerardi*, *Marrubium Creticum Camerarij*, *Marrubium Album Latifolium Peregrinum Bauhini*, White Spanish Horehound. 3. *Marrubium Creticum Angustifolium Lobelij*, *Marrubium Creticum Camerarij*, *Dodonaei*, *Lugdunensis*, & *aliorum*, *Marrubium Album Angustifolium Peregrinum Bauhini*, Sweet Candy Horehound. There is another Species of this, which is unflavory, or without smell, called *Marrubium Creticum Angustifolium inodorum* by *Elytenensis*, which is *Marrubium Album Peregrinum brevius & obtusis folijs Bauhini*. 4. *Marrubium Album Vilosum Bauhini*, thought to be *Prasum Dioscoridis*, White Hairy Horehound, called by some French Horehound. 5. *Marrubium Crispum*, and *Marrubium Album Crispum*, White Curled Horehound.

IV. The Descriptions. The first, or Common White Horehound, has a Root which is blackish, hard, and woody, with many Fibres or Strings thereat, which dies not every Winter, but abides many Years, from this Root spring up several square hoary Stalks, half a Yard or two Feet high, set at the Joints with two crumpled, or as it were rough Leaves, of a dull, hoary, green color, and of an agreeable good smell, but of a very bitter taste; the Flowers are small, white, and gaping, set in rough, hard, prickly Husks round about the Joints with the Leaves, from the middle of the Stalk upwards, in which afterwards is found small, round, blackish Seed.

V. The second, or White Spanish Horehound, has Roots like the former Common Kind, which sends forth several foursquare Stalks, more white and ho-

ry than it, on which Stalks are set by couples Leaves somewhat longer, thicker, whiter, and more woolly than it, and somewhat dented about the edges; the Flowers grow at the tops of the Stalks in rundles, at the several Joints with the Leaves, which are of a pale purplish color, like the Common sort, and standing in the like rough Husks: Gerard calls this *Snow white Horehound*.

Horehound White Common.

VI. The third, or Sweet Candy Horehound. It has a long slender Root, furnished with a great bush of Fibres, from which spring up several crooked, or not very straight Stalks, which are round, and not square, and slenderer than the last, on these Stalks grow sometimes broader, and at some times and in some places smaller, longer, and narrower Leaves than those of the second Kind, (of which in my opinion this is a Species) these Leaves are set by couples at the Joints, more dented about the edges, and more white or hoary than the former Horebonds, as the Stalks also are, which branch forth into many slender Branches, having Flowers at the Joints like the former, but smaller, and purplish, and set in smaller and sharper Husks, the Seed being also like it: The Unflavory or smell less Kind has only these differences, that the Leaves are shorter, narrower, and rounder pointed, and in a manner without any smell.

VII. The fourth, or White Hairy Horehound, called by some French Horehound. It has a woody fibrous Root, which sends forth Stalks, rising up not above a foot high, round, and of a hard woody substance, white and hoary, spreading into divers Branches, on which grow thick Leaves, in the same manner as the former, but smaller and rounder, and a little dented at the edges, and so white, smooth, and woolly underneath, as no Cottonweed is more, but somewhat blackish and rugged on the upper side; the Flowers stand at distances at the tops of the Branches, of a pale purplish color, and in the like rough Husks.

VIII. The

VIII. *The fifth, or White Curled Horehound.* It has hard, round, white, woolly, or downy Stalks; the Leaves are smaller than the last, and a little crumpled and curled at the edges, and a little dented also; they are of a greyish color on both sides, but not so woolly as the last; the Flowers stand in the same manner as the rest, in prickly Husks, but whiter than any of the former.

IX. *The Places.* The first, being the Common Kind, grows plentifully in all places of England, in dry Grounds, and waste Greens, also near unto old Walls, Banks, Ditch sides, High Ways, and beaten Paths, in untrilled places; it grows in all other Countries also, where it alters something, according to the situation and nature of the Countries, for commonly that which grows in *Candia* and *Hungaria* is much whiter, and of a sweeter smell, and the Leaves oftentimes narrower and lesser than that which grows in *England*, and other Northern Countries; the second grows naturally in *Spain*, the third in *Candia*, the fourth about *Paris* in *France*, the fifth in *Germany*, all which four latter grow with us only in Gardens, being first raised of Seed brought from those places.

X. *The Times.* They all Flower in *July* and *August*, (and that in the second Year after the sowing of them) and their Seed is ripe not long after.

XI. *The Qualities.* *White Horehound* is hot in the second degree, and dry in the third, bitter in taste, Aperitive, Digestive, Absterfve, Pectoral, Hepatick, Splenetick, Hyfterick, Sudorifick, Emmenagogick, Alexipharmick, and Analeptic.

XII. *The Specification.* It is good against Coughs and shortness of Breath, cures Ulcers of the Lungs, eases pains of Liver and Spleen, expels Poyson, and heals old filthy Ulcers.

XIII. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. Praefimel. 4. A Decoction. 5. A Syrup. 6. A Wine. 7. A Vinegar. 8. A Powder. 9. An Ointment or Balsam. 10. A Cataplasim. 11. An Acid Tincture. 12. A Spirituous Tincture. 13. An Oily Tincture. 14. A Saline Tincture. 15. A Decoction Compound.

The Virtues.

XIV. *The Liquid Juice.* Being given to two or three Spoonfuls, and repeated twice a day, in a Glass of White Port Wine, to Women whose Courses are obstructed, it brings them down; being dropt into the Ears it eases their pain, and taken in a Glass of Wine it helps Stitches and Pains in the Sides; thrust up the Nostrils it is a good Errhine to purge the Head and Brain of mucous Humors and filthiness obstructing that Ventricle; it opens obstructions of Liver and Spleen, as *Galen* says: *Matthiolus* says it is available for such as have bad Livers, and have an Itch, or running Tetters upon them.

XV. *The Essence.* It has all the Virtues of the Liquid Juice, besides which it is good for such as are purrle and wheaze, or are short winded, for such as are weakened by long Sicknes, and are wasted and fallen into a Consumption; it brings forth both Birth and Afterbirth, and is good to facilitate the Birth of such who have long and hard Labor; it expels Poyson of any Vegetable, and cures such as are bitten by mad Dogs, Serpents, or other venomous Beasts; it kills Worms in Children, and prevails against the Yellow Jaundice. Dose two or three Spoonfuls Morning and Night in a Glass of Wine.

XVI. *Praefimel, or Honey of Horehound.* It is made by mixing a Quart of the Juice with a Pint of Honey, and clarifying it with the White of Eggs. It is good for Coughs, Colds, Consumptions, or Ul-

cers of the Lungs, Hoarseness, Wheezing, shortness of Breath; it expectorates tough Flegm out of the Thorax, but all this it does more effectually if it is mixt with a proportionable quantity of the Powder of *Florentine Orrice Root*; if old, foul, and running Ulcers be dressd with it, it cleanses and heals them; dropt into the Eyes it mightily clears the Eyesight, and dropt into the Ears kills Worms, and heals Ulcers therein; thrust up the Nostrils it purges the Head admirably; taken ordinarily Morning, Noon, and Night, it is excellent good for Old Men, and others, whose Lungs are afflicted with thin, salt, cold Rheum, causing it to be expectorated, for which reason it is singularly good against Asthma's.

XVII. *The Decoction.* It has all the Virtues of the Liquid Juice, Essence, and Praefimel, but nothing near so powerful, for which reason it may be given in double or treble quantity, Morning, Noon, and Night; it is an excellent Lotion to wash old Sores withal, and to make an Injection of to cleanse the Womb.

XVIII. *The Syrup.* It is an extraordinary Pectoral, very good for old Coughs, and to ripen tough Flegm; it is also good for such as are Asthmatick, or short Winded, and breath difficultly, it has all the Virtues of the Praefimel, and nearly as good as it to all those Intentions. Dose one or two Spoonfuls Morning and Night, to be given alone by it self.

XIX. *The Wine.* It has the Virtues of all the former Preparations, but not so powerful as the Essence; it is good against the Plague or Pestilence, as also for old People, and cold Constitutions.

XX. *The Vinegar.* It is good against the Plague, given a Spoonful or two at a time in any proper Vehicle, and prevails against any Vegetable or Animal Poyson; outwardly used it clears the Skin of Morpew, Scurf, Pimples, Redness, Tetters, Kingworms, Herpes, and other like salt eruptions.

XXI. *The Powder.* Given to a Dram in the Morning fasting, and last at Night going to Bed, it kills Worms in Children, strengthens the Stomach, and provokes Sweat in elder People, resists Poyson, provokes the Terms, and educeth the Birth; used as an Errhine it purges the Head and Brain of cold, moist, viscous and pituitous Humors; if it is strewd thick upon old, rotten, putrid, and filthy Ulcers, it cleanses them, dries up the humidity, and induces their healing.

XXII. *The Ointment or Balsam.* It is a singular Vulnerary, curing green Wounds in a short time; it is good also for running Sores, old Ulcers, and the like, for if need be it digests, cleanses, incarnates, dries, and heals; it is good against Pusles, Pimples, Boils, Scabs, and other like breakings out, being applied.

XXIII. *The Cataplasim.* The Leaves being made into a Cataplasim with Honey do cleanse foul Ulcers, and put a stop to running and spreading Sores, which are earing and rebellious; if the Cataplasim is made of the green Leaves boiled with Hogs Lard, and applied to the bitings of mad Dogs presently, it draws forth the Venom or Poyson, it dissolves the swellings of Womens Breasts, eases pains, and draws forth Thorns, or any other thing out of the Flesh; it heals also any sort of Scab, whether dry or moist.

XXIV. *The Acid Tincture.* It is a singular Antidote against the Plague or Pestilence, and all sorts of peffilential and malign Diseases, it opens all sorts of obstructions of the Viscera, chiefly of the Lungs, strengthens and fortifies the Stomach, causes a good Appetite and a strong Digestion, and possibly it may be one of the best things against the Rickets in Children in the World; let it be given in all that the Patient drinks, for many drops at a time, to make the Vehicle pleasantly sharp.

XXV. *The*

XXV. *The Spirituous Tincture.* It is Cordial and Hyfterick, it provokes the Terms, refits Payfon, warms and comforts the Stomach, ftops Fluxes, and gives eafe in the Colick, and gripings of the Guts; as it expels Wind, fo it refits Vapors; and being fweetned well with Honey, is an extraordinary reftorative in Consumptions. Dofe half a Spoonful Morning, Noon, and Night, in any convenient Vehicle.

XXVI. The Oily Tincture. It provokes the Terms as powerfully as any of the former Preparations, gives ease to pains in the Back, and opens obstructions of the Reins and Bladder; it is good against pain and sickness of Stomach, and any external pain of the Nerves in any part of the Body; it is a singular thing against the Palfie, being inwardly taken, and outwardly applied to the parts affected, being also bathed along down the Back Bone Mornings and Evenings; anointed upon hurts or punctures of the Nerves; it eases the pain and cures them; it gives ease also in fitches and pains of the Side, and in the Colick, as also in pains of the Gout, proceeding from what cause soever. Dose from ten drops to twenty, or more, dropping them first into Sugar, and then mixing the Sugar with a Glaſs of White Port Wine, and so drinking it Morning and Night as long as need requires.

XVII. *The Saline Tincture.* It is good against the Itch, and all sorts of itching of the Body, prevails against Ringworms, Tetters, Herpes, Scurf, Morpueh, Pimples, Scabs, and all other breakings out of the Body; it is also said to clear the Skin of Yellownefs, Rednefs, Tanning, Sunburning, Freckles, Lentils, and the like, in what place soever they happen in, by washing the parts affected therewith Morning and Evening, and letting it dry in.

XXVIII. The Decoction Compound. Take fresh Horse-radish two Ounces, Roots of Agrimony, of Bugles, and of Elecampane, of each half an Ounce, Lignum Aloe, Rhubarb, of each three Drams, choice White Port Wine three Pints, or two Quarts, boil covered till half be consumed, then strain out, and dilute it with White Sugar. It is an excellent Medicine to open obstructions of the Lungs, Liver, Spleen, Gall, and Womb. Dose two Ounces every Morning fasting, as much at Two after Noon, and the like at Bed time, for fourteen or twenty days together, for the Cure of the Yellow Jaundice.

Horehound Black.

III. The Descriptions. *It has a Root which is small, and without any long Fibres or Strings, and sends up square hairy Stalks, about a Foot high; the Leaves grow on the Stalks by pairs or couples at the Joints, which are somewhat long, and round pointed, thinner, and fuller of Veins than the Wild Black Horehound, like unto the middle sort of Basil, as Chusius says, but longer, and of no scent at all, as Chusius says, but Lobel says it has the smell of Stechar, or Cassidony; the Flowers grow at the tops of the Stalks in prickly Husks, in Wharls or Rundles, of a white color, as Chusius says, but of a purplish color according to Lobel, after which comes black Seed, like the other Kinds, and growing in like prickly Husks.*

IV. *The second, or Long Leav'd Black Horehound.* It has a thick Root, which spreads it self with many blackish Strings, by which it takes hold and fixes it self in the Earth, and keeps it self alive from Year to Year, shooting out fresh Stalks every Spring; these Stalks are square, and rough, rising up a Foot and half, or two Feet, and spreading themselves into divers Branches, set with two long and somewhat broad Leaves at every Joint, longer and broader than Sage Leaves, and longer pointed, dented about the edges, and of a sad overworn green color, which in the Winter time remaining withered on the Branches, without falling off, are to be seen full of holes, as if they had been eaten with Worms, all the Ribs and Veins abiding as they grew, till Frost comes and causes their Stalks to fall away; the Flowers are of a purplish color, greater than any of the Horebonds, and more gaping, after which, (being past away) comes the Seed in hard prickly Husks, like unto Horeboud: This Plant has no smell, good or bad, to be found in it, but is as it were smell-less.

V. *Nota.* These two Plants some Authors will have to be no *Horchounds*, but yet for their likeness sake they are referred by others to this Stock, nor

C H A P. CCCLXXV.

of H O R E H O U N D Black.

I. **T**HE Names. It is called in Greek *πράσιον μέλαν*, Plinij Lib. 27. Cap. 8. in Latine *Prafrum*, vel *Marrubium Nigrum*, and in English *Black Horebound*.

II. *The Kinds.* It is the second of the Generic Kinds, and comprehends these following Species, viz. 1. *Marrubium Nigrum Latifolium* Bauhin, *Marrubium Hispanicum Tabernamontani* & Gerard, *Marrubium Nigrum Hispanicum Parkinsoni*, *Marrubium Hispanicum odore Stachadis Lobelij*, *Ocimum Valentinum Clusij*, (because so called at *Valencia* in Spain) *Black Horehound*, and *Spanish Horehound*. 2. *Marrubium Nigrum Longifolium* Bauhin, *Sideritis Monspelienfium*, & *Parietaria Monspelienfium Cordi* & *Lugdunenfis*, *Herba Venti* & *Rondeletij aliorum*, *Long Leav'd Black Horehound*, and *Black French Horehound*. This *Lobel* questions

can I tell to what other Family they can be so well joined, for as much as they have the very same Virtues with the former *White Horebonds*.

VI. The Places. The first of them is a native of *Spain*, the second of *France*, and grows about *Mompelien* in fat Grounds, and sometimes in *Wheat Fields*, with us they grow in *Gardens*, being produced from Seed brought to us from thence.

VII. The Times. They both Flower in *July* and *August*, and their Seed is ripe within a Month after.

VIII. The Qualities, Specification, Preparations, and Virtues, are the same with those of the *White Horehound*, declared in the former Chapter, so that no more need be said of them in this place.

IX. A Cataplasma. *Dioscorides* says, that the Leaves being stamped with Salt and applied, it cures the biting of a mad Dog, against which it is of great efficacy; a Cataplasma being made also of the Leaves roasted in hot Embers, and applied, does waste or consume away hard lumps or knots (*Vici*) in the Fundament; it also cleanses foul and filthy Ulcers, as the same Author affirms.

C H A P. CCCLXXVI.

OF HOREHOUND Water.

THE Names. It is called in *Greek* Πενανθιον, in *Latine* *Prasium Aquaticum*, *Marrubium Aquatile*, in *English* *Water Horehound*, and *Marsh Horehound*.

Horebound Water.

II. The Kinds. There are several sorts hereof, viz. 1. *Marrubium Aquaticum Vulgare Lobelij*, *Lugdunensis*, *Dodonai*, & *Tragi*; *Lobel* and *Lonicera*

put it also for *Sideritis secunda Dioscoridis*, but *Anguilara*, *Gesner*, *Camerarius*, *Lacina*, *Lugdunensis*, *Thalys*, and *Mattibolus*, puts it for *Sideritis prima Dioscoridis*; it is also *Lancea Christi Gesneri*, *Marrubium Palustre glabrum Bauhini*, *Marrubium Palustre alterum*, Our Common or Ordinary *Water Horehound*. 2. *Berzavus*, *Ballote*, *Marrubium Nigrum Fetidum Bauhini*, Πενανθιον μύδαν λευδαν. *Black Water Horehound*, or *Stinking Water Horehound*, also *Marrubium Nigrum*, as most Authors call it; but some call it *Marrubastrum*, and *Lobel Marrubium Sparium*. 3. *Marrubium Aquaticum Hirsutum Bauhini*, *Marrubium Aquaticum alterum*, *Hoary or Hairy Marsh or Water Horehound*. 4. *Marrubium Nigrum*, *Marrubium Nigrum Creticum Alpini*, *Candy Black Horehound*.

III. The Descriptions. The first, or Common *Water Horehound*, has a Root which consists of a bush of blackish Fibres or Strings, which sends forth Stalks which are something great and high, square and strong, having two somewhat large and long Leaves set at every Joint, deeply dented or cut in about the edges, not hairy or rough at all, but smooth and green; at the Joints with the Leaves, towards the tops, grow small whitish Flowers in rough green Husks, encompassing the Stalk about, which being past away the Seed follows, which is round, and of a blackish color, four usually set together in the Husk.

Black Water Horebound.

IV. The second, or Black Water Horehound, has a black thready Root, from whence rise up several square, blackish, hairy, green Stalks, on which grow upon long footstalks somewhat roundish dark green Leaves, full of veins, a little hairy, and indented about the edges, two always at a Joint, and of a strong smell; the Flowers are gaping, and of a purplish

Z z z

plish color, somewhat like the Red Archangel, or Deal Nerle, growing in greenish Husks, and encompassing the Stalk, as the others do; the Seed also is black and round, four set together, as in the other: This Plant Parkinson says he has found sometimes with white Flowers.

V. The third, or Hairy Marsh or Water Horehound. It has square hoary Stalks, a little hairy and rough, on which grow Leaves by pairs or couples, as in the former, which are hairy, hard, and hoary, much more cut in on the edges than the first at Sect. 2. above, cut in so deep, as to reach sometimes even to the middle Rib, making them seem like the Leaves of the Great Mountain Scabious, the ends being pointed and sharp; the Flowers are small and whitish, standing in rough green Husks, encompassing the Stalk about, which being past away the Seed follows, which is blackish and round at the bottom of the Husk.

VI. The fourth, or Candy Black Horehound, has a fibrous or stringy Root, which sends forth its first Leaves somewhat like to those of a Primrose, being many, larger and longer than those of the White Horehound, dented about the edges, and sharp pointed, as large as those of Barum, and of so black a color, as it may seem to be so colored or dyed by Art; from among these Leaves springs up a square Stalk, or Stalks, upon which, as it were at Joints, grow many such like Leaves together, but lesser, up to the tops, where the Flowers stand encompassing them, being in form like to those of Horehound, but blackish also, the Plant being wholly without smell or taste.

VII. The Places. They all grow in moist and wet Grounds, the two first in several places of England, the second has been found in the way to Rochester, about half a Mile from Gravesend, the third grows in Austria, the fourth in Candy, but the two last not with us, unless planted in Gardens.

VIII. The Times. They all Flower in the Summer Months, as in the latter end of June, in July, and August, and give their Seed soon after.

IX. The Qualities, Specification, Preparations and Virtues of the three last are the same with those of White Horehound in Chap. 374. foregoing, and the second of these are said to have the Virtues of the Black Horebonds in Chap. 375. Sect. 9. being used and applied in the same manner.

X. As to the Qualities and Virtues of the first of these in this Chapter Authors have said nothing, but this I have found by experience, that it is an excellent Vulnerary, whether inwardly taken in Juice, Essence, Decoction, Wine, or Tincture, or outwardly applied in Oil, Balsam, Ointment, Cerate, or Cataplasm, &c.

England, we shall only treat of the three following, viz. 1. *Stachys Gerardi*, *Dodonei*, *Lugdunensis*, *Tavernamontani*, *Matthioli*, *Stachys minor Camerarii*, *Stachys Floribus gratioris odoris Gesneri*, *Stachys Lychnitis*, *Stachys Spuria Flandrorum Lobelij*, *Stachys Italica minor Bauhini*, *Salvia Syloestris tercia Cesalpini*, Wild Horehound, Base Horehound, Lesser Horehound, and Italian Horehound. 2. *Stachys Fuchsij*, *Stachys Germanica Gesneri*, *Stachys Germanica major Camerarii*, *Pseudostachys Matthioli*, & *Lugdunensis*, *Stachys minor Germanica Bauhini*, *Marrubium Momianum Thalij*, *Sideritis Heraclea Columna*, *Fabij*, *Salvia Syloestris Cesalpini*, Great Wild Horehound, or Great Base Horehound. 3. *Stachys Palustris Gesneri* & *Camerarii*, *Marrubium Aquaticum acutum Gerardi*, *Betonica fetida Gesneri*, in *Collatione Stirpium*, *Sideritis prima gravis odoris Dalechampij* & *Thalij*, *Clymenum minus Lugdunensis*, *Terziola Cesalpini*, (because it cures Tertian Agues) *Lyfimachia Galericulata Adulterina Bessleri* in his *Hortus Eystetensis*, Marsh Wild Horehound, or Base Horehound.

III. The Descriptions. The first, or Wild Horehound, which is thought to be the *Stachys vera Dioscoridis*, has a Root which is woody and durable, made of divers blackish Strings, which perishes not after it has given Seed; from this Root rise up several soft, woolly, green Leaves, lying upon the Ground, and abiding all the Winter, somewhat broad and long, of about two Inches in breadth, and three in length, smooth, and not dented at all, or very little about the edges; from the middle of these Leaves arises sometimes but one Stalk, and sometimes divers Stalks, bearing divers such like Leaves thereon, but lesser, and set by pairs or couples one opposite to another at the Joints, somewhat hard, and a little longer and whiter than those of Common Horehound, (to which the whole Plant is very like) the Stalks also are high and jointed, and set with soft hairs; from the middle of the Stalks, and so upwards, come forth several Flowers, of a yellow color, as Lobel, Camerarius, and Gerard say, but of a purplish color as Parkinson says, (he having never seen

CHAP. CCCLXXVII.

OF HOREHOUND Wild,

OR,

STACHYS.

THE Names. It is called in Greek *Σταχύς*, in Latine also *Stachys*, and in English Wild Horehound, Base Horehound, and *Stachys*.

II. The Kinds. Authors make about seven Kinds, but by reason the most of them are not to be had in

teen any of the *Yellow* these Flowers stand in softer Husks than those of the former, or *Common Horebonds*, and with a narrower Wharle encompass the Stalk, after which come blackish round Seed; the tops are small and long, and end as it were in a Spike, being of a sweet smell, as *Gerard* says; but *Parkinson* says the smell is small with us, and not so pleasant as others say it is, for any thing that ever he could observe.

IV. *The second, or Great Wild Horehound, (which is the Great Dutch Bafe Horehound.) It has a Root which is hard, and somewhat yellow, the Stalks hereof are thick, four-square, and hoary, sometimes two or three Feet high; the Leaves are broad, long, hoary, nicked in the edges, and hairy, as also are the Stalks; these Leaves are indeed somewhat like unto great Sage Leaves for the color on both sides, but larger, and much broader than those of the Common Horehound, and a little dented about the edges; the joints of the Stalks are set with such like Leaves, but somewhat lesser than those below, two at each Joint, encompassing the Stalk; the Flowers grow at the Joints also in Wharls, which encompass the Stalk likewise about with Flowers of a purplish color towards the tops of the Stalks, which are greater than those of the Common Horebonds, as indeed all the rest of the Plant is, and which has a much stronger smell than the others have; the Flowers being past away, the Seed follows at the bottoms of the Husks, which is round, and of a blackish color.*

V. *The third, or Marsh Wild Horehound. It has a Root which is somewhat long and thick, jointed at several spaces, with Fibres at them, which sends up square, round, and hairy Stalk or Stalks, about two feet high, with two somewhat long and narrow dark green Leaves, but grey underneath, and pointed at the ends, dented about the edges with round dents, like to *Betony*, set at every Joint, and having somewhat a strong unfavoury smell; at the upper Joints with the Leaves come forth several pale reddish Flowers, set in ranks, like unto *Betony*; after which comes small, roundish, blackish, or brown Seed.*

VI. *The Places.* The first grows plentifully in Italy, in the Fields about Rome, as *Matthiolus* and *Castor Durantes* say, and also in Germany, as others affirm, with us it grows only in Gardens; the second is a native of Germany, as *Camerarius*, *Lonicerus*, *Thaluis* and *Gesner* set down; it is also a native of England, and has been found growing wild in Oxfordshire, in the Field adjoining to *Whirney Park*, about a Mile from the Town: the third grows in plashy places in low Grounds in several Countries, and in divers places in England.

VII. *The Times.* They all of them flower in the Month of July, from the beginning to the end, and the Seed is ripe in August, or not many Weeks after the flowering.

VIII. *The Qualities.* The two first are hot and dry in the third degree, a little bitter, opening, digesting, and cleansing, Pectoral, Heparick, Splenick, Hyfterick, Sudorifick, Emmenagogick, Alexipharmick, and Analeptick.

IX. *The Specification, Preparations, and Virtues,* are the same with those of the *White Horehound* in Chap. 374. *Setl.* 12. ad 28. foregoing, so that no more need be said thereof.

X. *Nota.* But these things in particular has been observed of these *Wild Kinds*, that their Juice, Essence, Decoction, Wine or Tincture, have been powerful in provoking Womens Courses, and to expel both Birth and Afterbirth, for which reason they are dangerous to be given to Women with Child, because they are apt to cause Abortion, or Miscarriage; they also provoke Urine being stopped, given inwardly,

and the parts also being fomented with the Decoction in Water, and the Patient sitting over the warm fumes of the same.

XI. *The third, or Marsh Wild Horehound, is a singular good Wound Herb, serving both to heal green Wounds, running Sores, and old filthy Ulcers, the Juice, Essence, Decoction, or Wine thereof being given inwardly, and an Oil, Ointment, Balfam, Cataplasin, or Pouder thereof being also outwardly applied.*

CHAP. CCCLXXVIII.

Of HORSEFOOT,

OR,

COLTSFOOT Strange.

I. *THE Names.* It is called in Greek *Kardana*, & *Assonada* *Dioscoridis*, *Ragena* *Galenii*, in Latine *Cacalia*, and *Cacanum*, (not *Cancanum*, as some write it) in English *Horsefoot*, and *Strange Coltsfoot*.

II. *The Kinds.* Authors make three Species hereof, viz. 1. *Cacalia incana Folio rotundo*, Hoary Horsefoot. 2. *Cacalia folio glabro acuminato*, *Tussilago Alpina vel Montana Dalechampi*, Smooth Leav'd sharp pointed Horsefoot. 3. *Cacalia Americana, vel Virginiana*, Horsefoot of Virginia.

III. *The Descriptions.* The first, or Hoary Horsefoot, has a long white Root, divided into many heads, with many long Strings and Fibres thereat, of a glutinous or clammy taste, like unto Gum *Tragacanth*, encreasing thereby very much; from these Heads shoot up striped reddish Stalks, with large round Leaves on them, larger and thicker than *Coltsfoot*, and more woolly also on the upper side, yet with a greenness to be seen in them, but very woolly and white underneath, with some Ribs and Veins in them, of a little bitterish unpleasant taste; from among these Leaves rise up striped, woolly, and reddish Stalks, two or three Feet high, having several lesser Leaves on them, and all of them dented about the edges, branching forth at the top into several small Sprigs of pale purplish Flowers, made of four small Leaves apiece, with some Threads in the middle, which after they have been a while blown do turn into Down, which is carried away with the Wind: *Dalechampus* says, that in the middle of the Flowers are found hanging down small white Grains like Pearls, to make it answer *Pliny's* Description.

IV. *The second, or Smooth Horsefoot, has a Root like the former, and has Leaves as large, but thicker, harder, smoother, and greener, not hoary or woolly at all, but dented or waved about the edges, and pointed also with the roundness, but not open at the Stalks, as the other is; the Stalks are in like manner striped, but smooth, bearing the like Flowers at the tops, but somewhat paler.*

V. *The third, or Horsefoot of Virginia, has a Root consisting of a bush of blackish Fibres or Threads, which abides the extremity of Winter, the Stalks and Leaves both perishing yearly, but growing brownish towards the end; it rises up with many round Stalks, about a yard high, and two somewhat round, but pointed Leaves, a little dented about the edges, at each joint of them, the upper Leaves being smaller, and little or nothing dented; at the tops of the Stalks come forth several Branches, with pure white Flowers,*

Z z z 2

Flowers, divers small ones growing almost together, and consisting of five Leaves apiece, each Flower rising out of a small Husk, which being past small Seed follows, each sticking to a little Down, which are carried away together with the Wind; this Plant has no smell neither in its Root, Leaf, nor Flower, tho' *Cornutus* seems to affirm it.

Horse foot
Smooth.

VI. *The Places.* The first and second Kinds grow in the Vallies of Mountains, by Baths, and places abounding with moisture, in many Countries of Europe, but very rarely in England, unless planted in Gardens; the third grows in America, as in Canada, Virginia, New-England, Maryland, and Carolina, in which last place I have found much of it.

VII. *The Times.* They all Flower and Seed in the Summer Months, much about the time (as Authors suppose) when Coltsfoot Flowers and Seeds.

VIII. *The Qualities, Specification, Preparations, and Virtues,* are the same with Coltsfoot foregoing, to which you are referred; I have had experience of that which grows in America, and I found it to have the same Qualities and Virtues with our English Coltsfoot, and to be fully as effectual.

IX. *Nota.* 1. Authors say, that the Root steeped in Wine and eaten prevails against Coughs and Hoarseness, (for that it is a Plant without any sharpness) and the same things *Galen* affirms of his *Cucanum*; the Root moderately dried, is without any biting quality, and is of a gross and emplatick substance; being beaten raw, and applied as a Cataplasim to the Gout, it eases the pain thereof, stops the afflux of Humors, and strengthens the parts: *Gerard* says, that if you chew the Root and swallow down the juice, it is no less available than the Juice of Liquorice in all the Cases to which that Root and Juice is ordinarily applied.

X. *Nota.* 2. *Dioscorides* says, that the Pearl like Grains which are found in his *Cecalia* being made into a Poudre, and mixed with some proper Ointment or Cerate, will make the Skin smooth, and as *Pliny* says, will stay the falling of the Hair.

CHAP. CCCLXXIX.

Of HORSETAIL Meadow,

OR,

SHAVEGRASS.

I. *THE Names.* It is called in Arabick *Dhenben Alcaul*, *Dhemb Alchi*, and *Dhaneb Alcaul*, in Greek *ἵππων*, & *ἵππων*, in Latine *Hippuris*, *Equisetum*, *Cauda Equina*, *Equinalis*, (from the form of a Horse Tail) and by *Pliny* *Equisetis*, by some *Salix Equina*, and *Sanguinalis*, from its effects of stopping of Blood; in English *Horsetail*.

II. *The Kinds.* Authors have made several sorts hereof, and very much multiplied the Species, we shall in this Work divide them into three principal Kinds, and under each give you the chief of those sorts which are useful in Physick, and commonly grow with us in England; you shall have then, 1. *Equisetum Palustre*, Marsh or Water Horsetail, of which in this Chapter. 2. *Equisetum Pratense*, Meadow Horsetail, of which in Chap. 380. 3. *Equisetum Nudum*, Naked Horsetail, of which in Chap. 381. following.

Greater
Marsh
Horsetail

III. *The Kinds of the Marsh or Water Horsetail.* It is fivefold, viz. 1. *Equisetum majus Palustre Lobelij*, *Hippuris major Dodonaei*, which *Anguilara* thought to be *Caucan Plinij*, The Greater Marsh Horsetail. 2. *Equisetum Palustre Linariae Scopariae Folia*, Broad Leav'd Marsh Horsetail. 3. *Equisetum Palustre minus*, *Equisetum Palustre Lobelij*, The Lesser Marsh Horsetail. 4. *Equisetum Palustre alterum*, *Equisetum alterum brevioribus Folijs*, *Cauda Equina Famina Gerardi*, which is taken by many to be the *Polygonum Famina Dioscoridis*, and *Polygonum tertium*.

terium Plinij (from the many joints it has) of *Matthiolum*, *Gesner*, and others, *Polygonum Femina Semine Vidua* Lobelij, *Sanguinalis Femina Cordi*, Barren Marsh Horsetail, Marsh Horsetail with shorter Leaves. 5. *Equisetum minus tenuifolium*, which is the smallest and finest Leav'd Horsetail, and is very like to *Equisetum tenuissimum* & *longissimum* Folij *Bauhini*. 6. *Equisetum Furcudum*, Stinking Horsetail.

IV. The Descriptions. The first, or Greater Marsh Horsetail. It has a pretty thick Root, which creeps under Ground, having Joints at several places, and Fibres springing therefrom; at its first springing up it has Heads, something like to those of *Asparagus*, which afterwards grow to be hard, rough, hollow Stalks, jointed at several places up to the top, growing to be a foot high, so made as if the lower part were put into the upper, at which grow on each side a bush of small, long, hard, Rush-like Leaves, each part resembling a Horse Tail, (from which it came to be so called, (as is above hinted) at the tops of the Stalks come forth small Catkins, like to those of Trees.

V. The second, or Broad Leav'd Marsh Horsetail, has a Root which is creeping, and jointed, like the former; the Stalks are about a Foot and half high, hollow, and jointed in the same manner, set with Leaves after the same fashion, but that they are broader than those of *Toad-Flax*, green, rough, long, and easie to break; what Julie or Catkin it bears has not been observed.

VI. The third, or Lesser Marsh Horsetail. It has a very long Root, according to the depth of the Water, gross, thick, and jointed, with some few Fibres or Threads adjoining thereto; from the heads of this Root rise up great, thick, jointed Stalks, on which grow long, rough, Rushy Leaves, Pyramid or Steeple fashion; the whole Plant is also rough, hard,

and fit to rub, shave or smooth wooden things, as some of the others; it differs not much in the manner of growing from the former, the chiefest difference is, in that it is smaller, and the Leaves or Bristles, (as some call them) which are set at the Joints, are fewer and shorter.

VII. The fourth, or Barren Marsh Horsetail. It has a long Root, like that of Couch, or Quitch-Grass, from which, as from a kind of Joints, come forth many Fibres or Threads; and from which Root at certain distances rise up several hollow Stalks, which at several spaces are set with small Leaves in bundles, like to those of *Woodroof*, altogether barren of Flowers and Seed, for which reason *Lobel* called it *Polygonum Femina Semine Vidua*; but *Johnson* says, that it is sometimes found with ten or more Seeds at each joint, for which reason *Bauhin* called it *Equisetum Palustre brevioribus Folij Polyspermon*; this differs little from the last, saving that it is often found to bear no Seed, as the others do.

VIII. The fifth, or Smallest and finest Leav'd Horsetail. It has a kind of jointed and fibrous Root, from whence rises up one pretty thick Stalk, and very full of Joints, spreading it self out into many long Branches; and making of the whole a kind of Bush, every of which Branches are repleat with very small and fine Leaves, and growing much after the same manner as the others do.

IX. The sixth, or Stinking Horsetail. It has a long jointed Root, set with Fibres, and the Stalk grows to be many times about a yard long, growing sometimes wholly under Water, and sometimes both in and out of the Water; the Stalks are replenished with several Branches, but striped athwart, and set with short Leaves at every joint, as in the other Horsetails, but they are somewhat jagged or divided towards the tops, and at the joints under Water come forth several small Fibres or Threads; the Plant is green whilst it is in the Water, but taken forth and dried it becomes grey and brittle, easily to be rubbed into powder with ones Fingers, and falling also into powder of its self by lying; it smells somewhat like to *Brimstone*, whence came the Epithet *fetidum*.

X. The Places. They all grow in wet and moist places, and some of them in standing Waters, in many parts of this Kingdom; the first and second in moist or wet Grounds, the third and fourth in standing Waters, the fifth in low wet Grounds in Woods, as near *Highgate*, not far from *London*, &c. the sixth *Gerard* says may be found towards the latter end of the Year in several Ditches on the back side of *Southwark*, near *St. George's Fields*, covered over with Water, as also in the standing Waters of *St. James's Park*; and this is that which is taken to be *Bauhinus's Equisetum fetidum sub Aqua repens*.

XI. The Times. They spring up with their blackish Heads in *April*, their blooming Catkins appear in *July*, and their Seeding time is for the most part in *August*, after which they perish and fall to the Earth, springing up afresh again the next Spring.

XII. The Qualities. It is temperate in respect to heat or coldness, and dry in the third degree, it has some bitterness, and mightily dries without biting, it is Astringent, Diuretick, and Traumatick, Ne-phritick, Arthritick, and Pectoral.

XIII. The Specification. It stops all sorts of Fluxes, and fluxes of Blood, whether inward or outward, heals Ulcers and Excoriations, and cures Catarrhs, Coughs, and Colds, and prevails against the Strangury.

XIV. The Preparations. You may prepare thereof from, 1. A Liquid Juice. 2. An Effence. 3. A Decoction

Decoction in Water. 4. A Decoction in Wine. 5. A Powder. 6. A Distilled Water. 7. A Sallet.

The Virtues.

XV. *The Liquid Juice.* It is of a binding quality, and dries without sharpness, and is very powerful to stop bleeding in any part, inward or outward, being drank from one Ounce to two, or three, or outwardly applied, if the bleeding is external.

XVI. *The Essence.* It has all the former Virtues, besides which it stops all fluxes of the Bowels whatsoever, Fluxes of Seed in Man or Woman, and also spitting, vomiting, or pissing of Blood; it heals also not only the inward Excoriations and Ulcers of the Guts, Reins, Ureters, and Bladder, &c. but all other kinds of inveterate, moist, running, and foul Ulcers, whether internal or external; it is also an extraordinary good Vulnerary, for it quickly and easily conglutinates the lips of simple green Wounds, not suffering them to come to digestion; it is an excellent thing to cure Ruptures in Children, for by insinuating it self into the Mass of Blood and other Juices, it disposes them for conglutination, and by circulation the edges of the Peritonæum become consolidated; it is said to cure Ruptures in elder Persons, being used with a long *continuando*, according as the Habit of the Patient may be, the Disease being recent; being drank to one, two, or three Ounces, mixed in a Glass of White Port Wine, it gives ease in the Strangury, Stone, and Gravel, opens the obstructions of the Urinary parts, provoking the Urine, and expelling the tartarous Mucilage; it ought in this Case to be given Morning, Noon, and Night; it gives ease in the Colick, and mixed with Honey into a Lohoch, it is effectual against Coughs, Colds, and Catarrhs; being externally used warm to hot Pustules, red Wheals, inflammations of the Skin, and other like Eruptions, it eases the pain, dissolves the tumor, and allays the inflammation.

XVII. *The Decoction in Water.* Outwardly used in Baths it abates the heat of inflammations, and being fomented upon excoriations in the privy parts of Man or Woman, or used as an Injection in a Gonorrhœa, it cleanses, dries, and heals the same.

XVIII. *The Decoction in Wine.* It has all the Virtues of the Liquid Juice and Essence, but ought to be used in a larger Dose, as from two Ounces to four, or six; it strengthens the Stomach wonderfully, and is good against Vomiting, soreness of the Ventricle, and other disaffections of the same.

XIX. *The Paster.* Given inwardly to one Dram in any proper Vehicle, it has all the Virtues of the Juice and Essence, but operates not altogether so effectually, nor so speedily; outwardly applied to any Hamorrhage, it presently stops it, it cleanses, dries up the humidity, and heals old Ulcers, and causes the lips of green Wounds to consolidate, &c.

XX. *The Distilled Water.* It has the same Virtues with the Juice, Essence, and Decoctions, but is much inferior to them, yet it is very good to wash foul Ulcers with to cleanse them, and to be used as a Vehicle for the other Preparations, as also to make an Eye Water with, and Injections for the Yard, Womb, Fistula's, &c.

XXI. *The Sallet.* It is made of the young buds or heads a while after they are sprung out of the Ground, you are to boil them as *Asparagus*, and to dress them up in like manner, or being first boiled, they may then be strowed with Flower, then fried, and so eaten.

XXII. *Nota.* Many Country Women make use of the rough sorts of *Horsetail* for to rub and scour their Pewter and wooden Vessels, and sometimes to polish and smooth things which are rough and uneven,

but the Leaved and smoother Kinds are rather to be chosen for Medicinal uses, and are most commonly used in Physick.

C H A P. CCCLXXX.

of HORSETAIL Meadow,

O R,

Meadow SHAVEGRASS.

I. **T**HE Names. It is called in Greek *ἵππου ὄστρον*, in Latine *Equisetum Pratense*, and in English *Meadow Horsetail*, or *Meadow Shavegrass*.
II. *The Kinds.* It is twofold, viz. 1. *Equisetum Pratense majus*, *Equisetum alterum Matthioli*, *Lugdunensis*, *alorumque*, *Hippuris altera Tragi*, *Hippuris Fontalis Lobelij*, *Equisetum Pratense setis longissimis Bauhini*, The Greater Meadow Horsetail. 2. *Equisetum Pratense minus*, The Lesser Meadow Horsetail.

III. *The Descriptions.* The first, or Great Meadow Horsetail, has a small Root, and single, with some few fibres or strings adjoining to it, from which rises up a rough chamfered Stalk, jointed at certain spaces, having at each joint two husks of rough bristly Leaves, set one against another, in the form and manner of growing it differs but little from some of the former, have that it grows greater, and bushy, with more store and longer Leaves than any at the joints, each Leaf for the most part being jointed also with little, but scarcely discernable joints.

IV. *The second, or Lesser Meadow Horsetail, has a Root not much unlike to the Greater Marsh Horsetail, with several Fibres or Strings adjoining to it, creeping under Ground, with joints as it were, from which Root first spring up scaly heads, like those*

of Broom Rape, or rather *Asparagus* heads, which afterwards grow up to be hollow, rough, jointed Stalks, eight or ten Inches high, these Stalks are jointed up to the top, and at those joints come forth as it were a bush of small, long, hard Leaves, much longer and more in number than those of the *Greater Marsh Horsetail* aforementioned, with Catkins not much differing therefrom.

Horse-tail Meadow

V. *The Places.* They both grow in Meadows, near Hedges, and Groves, and by Wood sides in moist Grounds, in many places of this Land; they are also oftentimes to be found in dry Lands, and by the borders of Land Ground where it adjoins to Fenny Ground.

VI. *The Times.* Their Heads spring up early in the Spring, and grow up in the Summer Months, the Catkins blooming in July, and Seeding for the most part in August.

VII. *The Qualities, Specification, Preparations, and Virtues,* are the same with those in Chap. 379. last foregoing, so that we shall say no more of them in this place.

C H A P. CCCLXXXI.

OF HORSETAIL Naked,

O R,

Naked SHAVEGRASS.

THE Names. It is called in Greek *ἵππουρος*, in Latine *Hippuris Nuda*, *Equisetum Nudum*, and in English *Naked Horsetail*, or *Naked Shavegrass*.

II. *The Kinds.* There are three Kinds hereof, viz. 1. *Hippuris Tragi*, *Equisetum Funceum Tragi*,

Lugdunensis, *Sanguinalis semine similis Cordi*, *Veris æqualis*, five *Equisetum Folij Nudum non ramosum*, five *Funceum Bauhini*, *Equisetum Nudum*, *Naked Horsetail*. 2. *Equisetum Funceum ramosum*, *Equisetum Matthioli* & *Lugdunensis*, *Hippuris minor Lobelij* & *Dodonæi*, *Branched Horsetail*, and *Branched Naked Horsetail*. 3. *Equisetum Nudum minus variegatum Eashini*, *Small Naked Horsetail* variegated or party colored.

Naked-Horsetale.

III. *The Descriptions.* The first, or *Naked Horsetail*, has a Root which is jointed, and creeps, like the others, from whence rise up many straight naked Stalks, jointed, but without any Leaves at the joints; sometimes the Stalks are single, and sometimes with one or two other like Stalks springing out of their sides, which are likewise jointed, naked, and growing straight upright; these Stalks are of a rough and Rush like substance, growing to be a Foot or more high, sometimes to two or three Feet high, according to the goodness of the Ground; by its nakedness of Leaves it is known from all the other Kinds of *Horsetail*, and is more used by several Workmen to smooth and polish their Works of Wood, Bone, Varnish, and Japan, than any of the others.

IV. *The second*, or *Branched Rush Horsetail*, has Roots like the former, and differs only from it in its growing with many Stalks from the top of one that first rises out of the Ground, and that many of those Stalks do branch themselves forth into others, all of them full of joints, and without Leaves, so that the whole seems to be a kind of Bush.

V. *The third*, or *Small Naked Horsetail* variegated. It has a small, blackish, creeping Root, from which spring up several small, hollow, pale green Stalks, of a Foot high, and sometimes not so much, and full of joints, the lower joints of which are blackish, and the upper whitish, without Leaves, (which is probable to be the same which *Johnson* on *Gerard* says he found with small Leaves, and called *Horsetail Coralline*, tho' this may sometimes seem to differ both from his and that of *Gesner*) at the tops whereof

whereof stand small red Heads, resembling a small Catkin, the Crown of which, being white, has eight or ten very small sharp pointed Leaves under it, which being trodden on will crack and make a noise.

VI. *The Places.* They grow in moist Grounds, in the furtows and borders of Corn Lands, near Ditch sides in Woods, and in the Fens, in several places of *England, Holland, and Flanders.*

VII. *The Times.* They come out of the Ground early in the Spring Time, and flourish all the Summer Months to Autumn.

VIII. *The Qualities, Specification, Preparations and Virtues* of these are the same with those of the *Marsh Kinds* Treated of in Chap. 379. foregoing, to which you are referred.

IX. *Nota. The Powder.* It is one of the most powerful driers that is, and being strewed upon old, moist, and running Sores and Ulcers, it presently dries them up and heals them.

C H A P. • CCCLXXXII.
OF HORSETONGUE,
OR,
DOUBLETONGUE.

THE Names. It is called in *Greek* ἵππου γλῶσση, and ὑπογλῶσση, in *Latine* Hippoglossum, i. e. *Lingua Equina, Lingua magna, also Hypoglossum, i. e. Bilingual, Tongue upon Tongue; Vitoriola Apuleij, Lingua Pagana aliorum, Bonifacia Angulura, Cantaria Branselsij, Loniceri, Tabernamontagii, aliorumque; in English* Horsetongue, and Doubletongue, also Tongue upon Tongue.

II. *The Kinds.* Authors make but two Kinds hereof, viz. 1. Hippoglossum, Hypoglossum, Bilingual, *Cauda Equina minor.* The Lesser Horsetongue, or Doubletongue. 2. Hippoglossum, Bilingual major, The Greater Horsetongue, &c.

Horse-Tongue small.

III. *The Descriptions.* The first, or Lesser Horsetongue, has a Root which is white and tough, and of

a sweet and pleasant smell, which consists of many long, hard, whitish strings, growing from a Head: The Plant is very like unto the *Chamedaphne vera Dioscoridis* for the manner of its growing, for this from the head of the Root aforementioned shoots forth several hard Stalks, with Leaves on them, one above another, as that Plant does, and much about the same length; the Leaves are long, narrow at the lower part next the Stalk, broad in the middle, like a Belly, and very sharp pointed; having Ribs running thro' their whole length, sometimes three or four, and sometimes five Ribs; upon each Leaf grows another smaller Leaf or Tongue, which grows out of the greater Leaf from the middle Rib, on the upper side, and about the middle of the Leaf, which makes it to differ from all other Plants which grow upon the Earth, from which double Leaf came the Name of *Doubletongue*; under the smaller Leaf, at the bottom where it joins unto the greater, comes forth one small, whitish, green Flower, and sometimes two, standing upon short footstalks, where afterwards stand the Berries, which when they are ripe are very red, very like unto the Yew Tree Berries, and in which is contained a white hard Seed.

IV. *The second, or Greater Horsetongue.* It is in all respects very like to the former, saving that the Stalks are somewhat higher, the Leaves longer, and having longer Tongues upon them than the former; but this says *Fabius Columna* is much more rare to find.

V. *The Places.* They both grow upon Hills and in Woods in several places of *Italy and Germany*, the first more common to be met withal, and with us is only nurs'd up in Gardens.

VI. *The Times.* They flower in *June* in the natural places where they grow, viz. in warm Countries, and the Berries are ripe in *September*, or fall of the Leaf.

VII. *The Qualities.* Horsetongue is hot and dry in the second degree, it is Aperitive, Hysterick, Emmenagogick, and Traumatick.

VIII. *The Specification.* It is an absolute thing against the suffocation of the Womb, provokes the Terms,

Terms, causes a speedy delivery to Women in Labor, drives forth the Afterbirth, helps the Strangury, and expels Stones, Sand, Gravel, and Tartarous Matter out of the Reins and Bladder, and opens all obstructions of the Viscera.

IX. *The Preparations.* You may have therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine.* 4. *A Powder of Leaves or Roots.* 5. *An Acid Tincture.* 6. *A Spirituous Tincture.* 7. *An Oily Tincture.*

The Virtues.

X. *The Liquid Juice.* It is one of the most powerful things against Hysterick Fits, or the suffocation of the Womb, and other Diseases of that Bowel, it suppresses Vapors, represses the Fits, and gives sudden ease; it provokes Urine, opens the obstructions of the Reins, Ureters, and Bladders, gives ease in the Strangury, provokes the Terms, facilitates the delivery of Women in Labor, and forces away the Afterbirth. Dose two or three Spoonfuls at a time in a Glass of Wine, or other fit Vehicle, in the Morning fasting, and last at Night going to Bed; as also at the time of a Paroxysm, or when the Patient is in extremity.

XI. *The Essence.* It has all the former Virtues of the Liquid Juice, and is very good to expel the Stone, Gravel, Sand, or Tartarous Mucilage, out of the Urinary parts, being given two or three Spoonfuls at a time in any proper Vehicle for several days together; it is said also to be good for such as have a Rupture, for which Disease it is thought that there is no better Remedy, for that by the continuance of its use it will knit and heal the part, provided also that the Patient be accommodated with a convenient Truss for a good while after as well as during the whole time of the Cure.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but much less powerful in its operation or effects, for which reason it is the oftner to be given, and that from four to six Ounces at a time; it is good for such as have an imperfection in their Speech, it not being natural, or from the conformation of the parts; it is profitable also against Sores and Ulcers in the Mouth and Throat, and so strengthens the Uvula, as to confirm and fix it in its natural state, drying up the humidities, which many times relax it, and hurt its Tone.

XIII. *The Powder of the Leaves or Roots.* It has all the Virtues of the Liquid Juice, Essence, and Decoction, and may be given from a Dram to two Drams, repeating a Dram at a time till three or four Drams are given, if need so require, being given to a Woman in Labor; it may be given in Canary, Malaga, or Tent, or any other proper Wine or Vehicle, as the Physician shall think most fit, &c. it cures old and filthy Ulcers in any part of the Body.

XIV. *The Acid Tincture.* It opens obstructions powerfully, suppresses Vapors, cures Fits of the Mother, and is one of the best things in the World to cure the Rickets in Children, kill Worms in their Stomach and Bowels, cause in them a good Appetite, and restore them in Consumptions. Dose so many drops (in any Ale, Beer, or Wine) as to make it pleasantly and gratefully sharp.

XV. *The Spirituous Tincture.* It has the Virtues of the Juice, Essence, and Powder, but is much more Cordial and refreshing; it is good against Convulsions, Palsies, Fainting and Swooning Fits, strengthens the Stomach, eases pains and gripings in the Bowels, as also after pains of Women in Childbed, and is a good thing to be given with a *continuando* to Childbed Women, to cause a compleat cleansing,

and to restore the Tone of the Womb. Dose from one Dram to two, or three, Morning and Night in any proper Vehicle; it may also be given at any other time upon an exigency, or in any extremity of pain, or fainting.

XVI. *The Oily Tincture.* This is a powerful thing against the Colick, or any oppression of Wind in any of the Bowels, it opens powerfully the Urinary passages, and gives ease in the Strangury, Stone, or suppression of Urine by reason of Gravel, or any Tartarous Matter lodged in any of the Urinary parts; it is an excellent thing also against the Palsie, being inwardly given, and also outwardly anointed along upon the *Spina Dorsi*, and the parts affected with the same; outwardly anointed with in any Ach or Pain, in what part of the Body soever, as also upon parts affected with the Gout from a cold cause, it gives ease and relief. Dose from ten drops to thirty drops, first dropt into Sugar, and then mixt with any fit Vehicle for the purpose you intend it; it may be given Morning and Night so long as need requires.

C H A P. CCCLXXXIII.
of HOUNDSTONGUE,
- O R,
DOGSTONGUE.

I. *THE Names.* It is called in Greek *Κυνόγλωσσος*, or, *Κυνόγλωσσος*, in Latine *Cynoglossum*, and *Cynoglossus*, i.e. *Canina Lingua*, a *Canis* *Caninam Linguam imitantibus*, in English *Houndstongue*, and *Dogstongue*; but Gerard says it is rather to be called *Hounds-Piss*, because there is nothing in the World which smells so like to *Dogs Piss* as the Leaves of this Plant.

Common Houndstongue

II. *The Kinds.* Authors make many Kinds of this Herb, but we shall in this Discourse take notice of no more than the six following Kinds, viz. 1. *Cynoglossum, Cynoglossum vulgare, Cynoglossum majus vulgare, Cynoglossa vulgaris,* Our Common Houndstongue, and Common Great Houndstongue. 2. *Cynoglossum maximum Lobelij,* The Greatest Houndstongue. 3. *Cynoglossum maximum Montanum, Cynoglossa maxima Montana Regionum frigidarum Pabij Colonne, Cynoglossum Sylvaticum Caule rubente Bauhini,* which he thinks to be the same with the *Cynoglossum Sylvaticum Herynicum Thalij,* and the *Cynoglossum Montanum Cesalpini,* The Great Mountain Houndstongue. 4. *Cynoglossum semper virens Bauhini, Cynoglossa media folio virente Colonne,* Ever green Houndstongue. 5. *Cynoglossum minus, sive pusillum, Cynoglossum pusillum Narbonense Lobelij,* Small Houndstongue. 6. *Cynoglossum minus Flore ceruleo, Cynoglossa minor Cordi, Cynoglossum italicum Cimerarii, Cynoglossum pusillum Narbonense Lugdunensis & Eystecensis,* Small Houndstongue with blue Flowers.

Houndstongue th flowers.

III. *The Descriptions.* The first, or Common Houndstongue. It has a black, thick, and long Root, which is tough, or difficult to break, and full of a viscidous or clammy juice, smelling of a strong ill scent, much like to Dogs Piss, as the Leaves also do, which some call a soporiferous smell, from this Root spring up many long and something narrow, soft, and as it were hairy, darkish green Leaves, lying on the Ground, somewhat like unto the Leaves of Bagles, but not altogether so harsh in feeling to, from among which rises up a rough hairy Stalk, about two Feet high, with some smaller Leaves thereon than those which grow below, and branched at the top into several parts, with a small Leaf at the foot of every Branch, which is something long, with many Flowers set along those Branches, which are crooked, or

turn inwards, before it flowers, and gradually opens as the Flowers blow, which Flowers consist of four small, purplish, red Leaves, something of a fid or dead color, scarcely rising or shewing themselves out of the rough green Husks in which they stand, with some Threads in their middle; this Plant has sometimes been found with a white Flower; after the Flowers are past, flat rough Seed come in their places, which has a small Thread or Pointed in the middle, and by reason of its roughness easily cleaves to any Garment which it touches, not being readily pulled off again.

IV. *The second, or Greatest Houndstongue.* This differs not either in its Root, Stalk, Branches, Leaves, Flowers, Seed, smell, or manner of growing, from the first Common Kind but now described, but only in its magnitude, this being twice as large, which is indeed the only difference.

Houndstong com: th out flow.

V. *The third, or Great Mountain Houndstongue.* The Root is blackish on the outside, and whitish within, being something like the former; it has also springing from the Root many large, but hairy and soft Leaves, lying on the Ground, above a Foot long, and an Hand breadth broad, of a whitish green color, having in every one of them the middle Rib reddish, with many green Veins running thro' them, and reddish Footstalks to sustain them, those which are in the middle of them standing more upright, from among which rises up a thick, hollow, crested, reddish, woolly, or hairy Stalk, two Feet or more high, replenished on all sides with such like Leaves, but lesser and lesser up to the top, where it spreads it self out into four or five branches of Flowers, standing all on one side, yet forming at first a round Head, very pleasant to behold for the variety of colors therein, the hairy stalks of the Flowers being green, and ending in five points, the Flowers being also hollow and long, and consisting of five purplish

red Leaves, somewhat sweet, standing above the Husks and green Leaves which grow among them, with red Ribs in them, which in the shadow, where it delights to grow, is the more conspicuous and beautiful; after which in the said Husks come longer Seed than in the *Common Kind*, four usually together, which on the upper side are flat, and circled about with a few short prickles, whereby it commonly cleaves fast to Peoples Garments if it touches them.

Ever green Houndstongue the lesser.

VI. *The fourth, or Ever green Houndstongue.* It has a Root which is thick, and blackish on the outside, like the others going before; nor does it much differ from the *Common* or *Ordinary* sort of *Houndstongue* first described, but that the Leaves are always fresh and green, somewhat long and narrow, with a great whitish green Rib in the middle, smooth on the upper side, and more hoary underneath; the Stalk at first is but low, with many narrow long Leaves compassing it about, but more thinly than in some other Kinds; the Flowers are red, but somewhat larger than the *Ordinary*, standing in like manner upon small Branches, which are writhed or turned like the *Heliotropium*, or the first Kind; the Seed which follows stands all on the one side, and is smaller, and less rough, but the Stalk will then be grown much higher; this has no manner of hoariness, nor has it so strong or rank a smell as the former have; it does also spring forth with fresh Leaves, before the old Stalk with its Seed is quite dry and wither'd away.

VII. *The fifth, or Small Houndstongue.* It has a small black Root, not much differing from Our *Common Kind*, but it is every ways smaller in all its particulars, having such like Leaves, but smaller and shorter, yet greener, and more shining, the Flowers being small, are also of a pale red color, the whole Plant has not so strong or rank a smell as have some of the former, but this smallness may be thought by

some to be from the barrenness of the Soil in which it grows, which is not so, because it is oftentimes found in the same Ground where the greater grows, and besides, being either transplanted, or the Seed sown in Gardens, it will continue much smaller than the other.

VIII. *The sixth, or Small Houndstongue with blew Flowers.* It has a small long Root, but annual, which sends forth one round, small, hairy Stalk, sometimes but a Foot, and sometimes two Feet high, brownish below, and green above, on which are set on both sides without order several small, and something long, but narrow Leaves, of a blewish green color, covered with a long hairy down, which is tough and sticking, the middle Rib is somewhat great and eminent, and the whole Plant of a hot bitter taste; from the bottom of these Leaves, especially upwards, come forth sometimes other smaller Leaves in a Tuft together, and is parted into divers Branches; the tops of which are bended, as in several other sorts, bringing forth very small Flowers, of a fair blew color, with a yellow Star in the bottom, standing in such like Husks, in which after they are past is contained very small roundish Seed, without any prick in the middle; as some others have, but very rough or prickly, and ready to stick upon Garments or Cloaths, as the others will.

IX. *An Observation.* There has been a great Controversie amongst Botanists whether the *Cynoglossum* here first described, which is our *Ordinary* and *Common*, and is the most common in all Countries, be the *Cynoglossum verum Dioscoridis*, because he says it bears neither Stalk nor Flowers, which this does, which Plant, wanting Stalks and Flowers, *Matthioli* says he found in some sandy Grounds in Rome, behind or beyond *Mount Adrianus*, but both *Pena* and *Lobel* tax him with want of knowledge, for say they it will in the same and other places bear both Stalk and Flowers, altho' in divers Years and places it does not bear, yet will after some respite of time in any place, as not only they, but several other good Authors have acknowledged, as well in this as in other Plants, I confess I my self have oftentimes found the first described Plant, viz. Our *Common Houndstongue*, in several parts of England without either Flowers or Stalk, and that at the same time, and near the same places, where other Plants of the same Species have had both, and therefore without all doubt Our *Common Kind* is the true Plant which *Dioscoridis* has described under that Name so defectively.

X. *The Places.* The first grows in most places of England, in waste and untill'd Grounds, also by high Ways, Lanes, and Hedge sides; the second grows in the Low Countries, but chiefly in their and our Gardens; the third grows on Mountains near Naples, with us only as it is manured in Gardens; the fourth in shadowy Woods in Germany, &c. the fifth grows in many places of England, as also in Germany, discoursed of by *Cordus* upon *Dioscorides*, and possibly is that same Kind, which in the *Adversaria* is said to grow about Mompelier, and called *Pussillum Narbonense*, the sixth grows in Austria, as *Clusius* says, and in other parts of Germany, as *Tragus* says, and at Naples, as *Columna* says, also very plentifully in England, by high Way sides, as you go from London towards Colchester, between *Esterford* and *Wittam* in Essex, as *Gerard* says.

XI. *The Times.* They all Flower about May and June, and some in July, if the Season and place be cold, and the Seed is ripe not long after.

XII. *The Qualities.* *Houndstongue* is temperate in respect to heat and cold, and dry in the first de-

A a a 2 gree,

gree, Astringent, Anodyne, Emphractive or Obstru-
ctive, (and yet some Authors will have it to have
an Emollient property) Traumatick or Vulnerary,
Arthritick, Hyfterick, and Alexipharmick.

XIII. *The Specification.* It is prevalent against
Catarrhs, Coughs, Asthma's, green Wounds, old
Ulcers, and Sores arising from the French Pox.

XIV. *The Preparations.* You may have there-
from, 1. *The green Leaves.* 2. *The Root.* 3. *A*
Juice. 4. *An Essence.* 5. *A Decoction in Water*
or Wine. 6. *A Powder.* 7. *Pills.* 8. *A Balsam.*
9. *An Ointment.* 10. *A Cataplasim.* 11. *A Lotion.*
12. *A Distilled Water.*

The Virtues.

XV. *The green Leaves.* Bruised and applied
they cure the falling away of the Hair, which comes
of hot and sharp Humors, they are good also to be
applied to any place scalded, or burn'd with Fire,
and laid to any green Wound they heal it quickly;
the same is profitable also against *Anthones* Fire,
and other Inflammations.

XVI. *The Root.* Being roasted under Embers,
wrapped up either in Paste, or double wet Papers,
and then a Suppository made thereof, and applied
to, or put up the Fundament, it is effectually good
against the Hemorrhoids, or Piles; and applied as
a Cataplasim to the Gout it eases the same.

XVII. *The Juice of Roots or Leaves.* Made into
a Syrup with Honey it is good against vehement salt
Catarrhs, old Coughs, Colds, Asthma's, and all
sharp and thin distillations of Rheum which fall up-
on the Eyes, Nose, Ears, Stomach, or Lungs, cau-
sing wheezing, shortness of Breath, &c. Dose one
or two Spoonfuls, (according to Age, &c.) Morn-
ing and Night.

XVIII. *The Essence.* It has all the Virtues of the
Juice, and more powerful, and may be given in the
same Dose in a Glass of generous Wine; it is good
also (inwardly taken and outwardly applied) against
the bitings of mad Dogs.

XIX. *The Powder of Roots or Leaves.* It has all
the Virtues of the Juice and Essence, and may be gi-
ven from a Scruple to a Dram, or Dram and half,
in any convenient Vehicle; outwardly applied to
green Wounds it quickly heals them, and strewed
very thick upon old moist Sores and running Ulcers,
it admirably cleanses them, dries up the flux of hu-
mors, and disposes them to healing.

XX. *The Decoction in Wine or Water.* It has all
the Virtues of the Juice, Essence, and Powder, but
must be given in larger quantities, as from an Ounce
to two, three, or four, as the Patient is in Age and
Condition; it cleanses, dries, and heals Wounds and
Ulcers; if the Patient is of a hot Constitution, the
Decoction ought to be made in Water, after which,
(if you think fit) a little Wine may be added.

XXI. *Pilule de Cynoglossa, Pills of Houndstongue.*
Take the dried Bark of Houndstongue Roots; White
Henbane Seed, Opium prepared, (i. e. extracted with
fair Water, and reduced to powder) of each one Ounce,
Myrrh an Ounce and half, Olibanum ten Drams, Saf-
fron, Castoreum, Storax Calamita, of each three
Drams; let the Roots of Houndstongue and Henbane
Seeds be powdered together, the Myrrh, Olibanum,
and Saffron, each by themselves, then mix altogether,
and with Syrup of Stechas, (or any other proper Sy-
rup) make a Mass for Pills. They were designed
to stop Catarrhs, or distillations of Rheum upon the
Lungs, Stomach, or other parts, to alleviate Coughs,
cure Asthma's and Pleuritis, which they perform
beyond other Medicines; they stop Loosnesses, all
sorts of Fluxes of the Bowels, and fluxes of Blood
or Humors in what part of the Body soever; they

cure the overflowing of the Terms in Women, as al-
so fluxes of the Whites, and a Gonorrhoea in Men,
(Universals being premised) they give ease in and
cure pains and stitches of the Side, Pleuritis, the
Colick, and all manner of internal pains; ease and
cure the Toothach, and are one of the most absolute
things against the Gout in the World. Dose from
six Grains to fifteen Grains, every Night going to
Bed.

XXII. *The Balsam.* The green Leaves and Roots,
or Juice, made into a Balsam with Beef Suet and
Turpentine, and applied, is good against an *Alopecia*,
draws out the fire in any place which is burn'd, and
applied to the biting of a mad Dog, draws out the
poison, and heals it; it digests and cleanses old Ul-
cers, and is profitably applied to Venereal Sores, as
also the Gout in Hands or Feet.

XXIII. *The Ointment.* It has the Virtues of the
Balsam, but does not draw nor cleanse so powerfully;
it is excellent for such Ulcers as are old, and
deep, or spread much in the Legs, or other parts of
the Body, and takes away the inflammation, which
may any ways by accident happen to them.

XXIV. *The Cataplasim.* Applied to the Piles,
whether broken or not, it gives ease to the pain, and
in a short time dissolves the Tumor; it eases also
the Gout arising from a hot cause, and allays infla-
mmations in what part of the Body soever.

XXV. *The Lotion.* It is the same with the Sa-
line Tincture, and is of excellent use against Scabs,
Scurf, Morpew, Dandriff, Pimples, or other break-
ings out in the Head and other parts of the Body;
it also takes away Tanning, Sunburning, Yellowness,
black and blew spots, and other discolorings of the
Skin.

XXVI. *The Distilled Water of Herb and Roots.* It
is good for all the purposes aforesaid, to be used as
well inwardly to drink, as outwardly to wash any
fore place, for it heals all manner of Wounds and
Punctures, as also foul Ulcers arising from the
French Pox.

CHAP. CCCLXXXIV.

of HOUSLEEK,

OR,

SENGREEN.

I. **THE Names.** It is called in *Arabic* *Bejaha-*
lalem, and *Hajalalez*, in *Greek* *'Askon*, in
Latine *Sedum*, *Sempervivum*, and as *Pliny* says,
Buphtalmum, *Zocophthalmum*, *Steigethron*, and *Hy-*
pogeson; some call it *Oculus*, and *Dignellus*; and
Apuleius calls it *Vitalis*, and *Jovis Barba*, but *Sedum*
and *Sempervivum* are the usual *Latine* Names; in
English *Housleek*, and *Sengreen*, or *Evergreen*.

II. **The Kinds.** It is divided into three principal
sorts, viz. 1. *'Askon* or *Alizon*, *Alizon magnum*, or
majus, *Sedum majus*, The Great or Greater Housleek.
2. *Sedum minimum*, The Smallest Housleek. 3. *Ai-*
zoon, vel *Sedum minus*, The Smaller Housleek,
which is *Prickmadam*, and *Stonecrop*, of which we
shall Treat (God willing) hereafter in their proper
places.

III. **The Kinds of the Greater Housleek.** There
are three sorts hereof, viz. 1. *Sedum majus vulgare*,
Sempervivum Theophrasti, *Alizon magnum*, *Rivularia*
altera *Dioscorides*, as *Clusius* has it, *Sempervivum*
majus,

majus, & *minus* vulgare, *Umbilici Veneris Species altera Angulana*, Our Common or Vulgar Houleek.
 2. *Sedum majus legitimum Clusij*, *Aizoon magnum verum* *Discoloris*, *Semprevivum majus*, *Semprevivum Arborefcens Matthioli*, *Sedum Arborefcens*, *Aizoon Arborefcens*, The True Great Houleek, or Tree Houleek. 3. *Sedum majus Marinum Anglicum*, *Sedum Portuladicum Lobelij*, Great English Sea Houleek. This *Lobel* makes to be a fort or kind of the second abovenamed, or Tree Houleek.

IV. The Descriptions. The first, or Our-Common Houleek, has a small fibrous Root, creeping all about, and from small strings multiplies into many heads of Leaves, round the original Root, taking up thereby a large compass of Earib; and as this Root sends forth on all sides several heads of pale, green, thick, fat, broad Leaves, pointed at the ends, lying circlewise one unto, and as it were upon another, and upon the Ground, from the middle of each head of Leaves rises up a straight Stalk, two Feet high, all covered with smaller and longer green, thick, fat Leaves, (than those below) which often dry and fall away before the top thereof has perfected its Flowers, which grow on long Branches, bending their ends or tops downwards, with a single Leaf at the foot of every one of them, which consist of many Leaves, Star fashion, of a dark reddish color, after which come Heads, with small blackish Seed in them.

V. The second, or True Great Houleek. It has a Root consisting of strings, like the former, which divides it self into several off-springs; this Herb grows great, to the form of a Shrub, or woody Plant, of two or three Feet, or more high, in its native places, which are warm, and its Stem or Trunk below is of the bigness of four Fingers, and the other Branches are the thickness of ones Thumb, of a greyish color on the outside, and spotted as it were round about, but they are the marks of the old Leaves which are fallen, the like of which may be seen in Wood Spurge, and some other Plants; it spreads it self out into several limber smaller Branches on all sides, and Leaves at the ends of them, standing in a

compass, like the Heads of the former Common Houleek, but nothing so close, every Leaf being formed somewhat like a Tongue, small at the bottom, and broader towards the end, where it is broadest, roundish at each side of the end, and a little dented in about the middle of the said end, not much unlike the form of a Heart, they are also finely dented about the edges, and as it were a little hollow, like a Spoon, and full of juice, and of a pale green color; from the tops of some of the Branches thrusts forth a long Stalk, divided into many lesser Branches or Twigs, with some few small Leaves on them, and at the ends of them several Star like Flowers, consisting of many small Leaves, of a pale yellowish color, with sundry small Threads in their middles, the greater Stalk becomes dry and smooth, as the Heads, which have small black Seed in them, which being ripe they utterly perish after Seed time, but the other Heads of green Leaves abide fresh all the Year, which send forth Flowers the next Year after, and may be taken before hand from the main Stock to be planted, and will take root being put into the Ground; in the warmer Climates it spreads it self much more into Branches than in these our colder Countries.

VI. Gerard describes it thus. It rises up with a Stalk a Foot and half, and sometimes three Feet high, which is thick, hard, woody, and so tough, that it can hardly be broken, parted into divers Branches, and covered with a thick gross Bark, which in the lower part resembles certain prints, or impressed marks of the Leaves which are fallen away; the Leaves are fat, well bodied, full of juice, an inch long, and somewhat more, almost like little Tongues, very curiously minced or nipt on the edges, standing upon the tops of the Branches, having in them the shape of an Eye, the Flowers grow out of the Branches, which are divided into many Sprigs, which Flowers are slender, yellow, and spread like a Star, which being past away, there comes up in their places very fine Seed, the Sprigs withering away; the Root is parted into many off-springs, and the Plant is always green, nor in its native Soil is it hurt by the cold of Winter, for which reason it obtained the Name of *Semprevivum*.

VII. The third, or Great English Sea Houleek. It has a long slender Root, or Roots, with some few Fibres adjoining, from whence spring up one or two, or more Heads, which at length become Leaves and Stalks; the Leaves imitate *Laureola*, growing among the *Thymals*, but thicker, shorter, more fat, and tender; the Stalk is of a woody substance, like *Laureola*, participating of the Kinds of *Semprevivum*, *Cassula*, and *Thymal*, of which last some Authors have thought it to be a Kind; others have thought it to be a Shrub, degenerating from all those Plants: *Pena* and *Lobel*, who first discovered it and set it forth, knew not what to think of it; others since them have been as uncertain; however, its something like to our second Kind, or Tree Houleek, above described, its Stem is woody, but it grows neither so high, nor with so many Branches, the Leaves also, although something like to them, yet are not so thick or sappy, in its other parts it differs not much from the said Tree Houleek.

VIII. The Places. The first grows naturally both in England and Germany, as also in the Low Countries, France, &c. it grows upon Stones or Mountains, upon old Walls and ancient Buildings, as also upon the tops of Houses, and more especially being planted in Clay, or in Clay Ground; its form does sometimes differ, according to the nature of the Soil, for in some places the Leaves are narrower and lesser, but more in number, and have one only circle; in some places they are fewer, thicker,

and

and broader, they are green, and of a deeper green in some places than in others, in some places of a lighter green, &c. the second grows in Greece, Italy, Portugal, Spain, France, Illyria, Slavonia, Sicily, Sardinia, Corsica, England, &c. in divers places of Italy, Spain, and Portugal, it is kept in Pots, as *Clusius* says, and carefully preserved in Winter; and in Lisbon it grows on the tops of Houses, as our Common Kind does with us, but it does not very well endure the cold of the more Northern Countries of Europe, with all the care that can be, unless kept in a Room with a Stove in it; yet *Lobel* says he found it growing in the Island of *Holmes*, near Bristol; it grows in the Islands of the Mediterranean Sea, as aforementioned, as also in *Zant*, *Rhodes*, *Candia*, and in many Provinces of the East, and of Greece, &c. the third grows by the Sea side in many places of England, and in the Island of *Holmes*, not far from Bristol; it grows also in the Isle of *Portland*, for which reason it has obtained the Name of *Sedum Portlandicum*.

IX. *The Times*. The first Flowers in the Summer Solstice, which is in June, about the eleventh day, and generally Flowers from that time thro' all June and July, and now and then in the Month of August; it spreads it self into Heads from several Sprigs of the Root in April, which Sprigs or Strings of the Root are the Ground Work of the great Circle, and of other Circles, by which it multiplies it self, and by which, being at length full grown, it spreads it self into many other Circles; the second Flowers, as *Clusius* says, in the warmest Climes, as Spain, Portugal, &c. in November and December, but scarcely ever with us; the third, or *Sedum Portlandicum*, which grows by the Sea side, Flowers in July and August, whilst the Weather is warm.

X. *The Qualities*. *Housleek* is cold in the third degree, and drying in the first, it is Anodyn, Astringent, Reperculive, and Arithrick.

XI. *The Specification*. It cures an Erysipelas, or *Anthionies* Fire, so called, and allays the heat of all Inflammations, Burnings, Scaldings, &c.

XII. *The Preparations*. You may have therefrom,
1. The green Leaves. 2. A Juice. 3. A Posset.
4. An Oil. 5. A Cataplasim. 6. A Distilled Water.

The Virtues.

XIII. *The green Leaves*. Applied twice a day upon Corns and Warts in the Hands and Feet, it dissolves or consumes them, and takes them away; the Leaves bruised and laid upon the Crown or fore part of the Head, stops the bleeding at Nose very quickly; and being applied to the Temples and Forehead it eases the Headach, and allays the heat and distemper of the Brain thro' Fevers, Frenzies, or want of Sleep.

XIV. *The Liquid Juice*. It is good against all heats and inflammations, as well inward as outward; dropped into the Ears or Eyes, stops all hot defluxions of sharp salt Rheum into those parts, and being taken inwardly it is good to stop all fluxes of humors upon the Viscera, and the immoderate flux of the Terms in Women; it kills also Worms in Young or Old, and is profitable against the biting of the *Phalangium*; being often bathed upon Warts and Corns, it is said to take them away, the more especially if the green Leaves be applied also over the same; outwardly it abates and allays all sorts of inflammations in any part of the Body, as in an Erysipelas, or *Anthionies* Fire, and all other hot Eruptions of the Flesh and Skin, Shingles, Pimples, Ringworms, Tetters, Pusches, Cankers, fretting Ulcers, Burning, Scalding, Morpew, Scurf, and other the like defecations of the Flesh and Skin; and bathed upon the part

warm it eases the pain, and is very profitable against the Gout.

XV. *The Posset*. It is made with the Juice, and has all the Virtues of the Juice, being inwardly given; it is also singularly good against the hot Fits of Agues, for it cools and attenuates the Blood, and Spirits, quenches thirst, and stops Catarrhs; it may be given in a fourfold quantity to the Juice, for as the Juice may be given from a Spoonful to two Spoonfuls in a Glass of Wine, or other fit Vehicle, so the Posset may be given from four Spoonfuls to eight, a little sweetened with Sugar, for all the aforementioned Intentions.

XVI. *The Oil*. It is thus made. Take juice of *Housleek*, choice thick Cream, of each a Quart, boil them over a gentle Fire till a separation is made, and the Oil swims on the top, of a yellow or greenish color, which when cold take off, and keep it for use. In all external Cases, (excepting an Erysipelas) it has the Virtues of the Juice, and is good to anoint Pimples, Shingles, Tetters, Ringworms, Scurf, Morpew, &c. with, as also places pained with the Gout; given inwardly from half an Ounce to an Ounce in any convenient Vehicle it gives ease in the Strangury, Stone, Gravel, heat and scalding of Urine, and cleanses the Urinary passages from tartarous mucilage.

XVII. *The Cataplasim*. Being made with Hogs Lard and Barley Flower it is good against all the Diseases the Liquid Juice is used against, except an Erysipelas, because experience has taught us that all greasy or oily bodies rather exasperate than abate that Disease; applied in the Gout it gives sudden ease and cure.

XVIII. *The Distilled Water*. It is profitable for all the purposes aforesaid, being in outward Distempers bathed upon the parts affected, and in inward Diseases given from two to four Ounces, sweetened with Syrup of Clovegilliflowers; if it is bathed upon any place stung with Nettles or Bees it presently takes away the pain, so also the Juice, being used in like manner, as also the green Leaves, being rubbed upon the parts wounded or affected.

XIX. *Nota*. If the Cataplasim of the Leaves is made with Vinegar and Barley Flower (instead of Hogs Lard) it may profitably be applied to an Erysipelas, or *Anthionies* Fire.

C H A P. CCCLXXXV.

OF HOUSLEEK Small.

I. *THE Names*. It has no Greek Name that we know of, but it is called by *Clusius* in *Latine* *Sedum Alpinum ajuga Folio*, and in his *History of Plants* *Sedum decimum tertium*, also *Sedum laciniatis Folijs*, in *English* *Jagged Housleek*, *Housleek with jagged Leaves*, and *Small Mountain Housleek with jagged Leaves*.

II. *The Kinds*. Authors make two Kinds hereof, viz. *Sedum Alpinum laciniatis ajuga Folijs*, *Small Mountain Housleek with jagged Leaves*, of which in this Chapter. 2. *Sedum Monspeliense* & *Pyreneum laciniatum*, French jagged Mountain Housleek, the which not growing in England we shall say nothing of it in this Work.

III. *The Description*. It has a small blackish Root, which spreads much, from which Root it shoots forth

on all sides with many small heads of Leaves from small Strings, as is usual with the *Houfleeke*, each Leaf whereof is long and narrow, cut in deeply into three divisions, one on each side, and the end longest, something like to the Leaves of the *Sweet Groundpine*, but smaller and greener, not having any hoariness on them, astringent and drying also in taste, as much as any of the others; the Stalks are reddish, very slender, and not above two Inches high, as *Clusius* says, but they grow three Inches or more high with us, which is spread out at top into some few Branches, bearing every one of them one small Flower, (but with us it is large, with respect to the bigness of the Plant) which consists of five Leaves apiece, of a pale green color, says *Clusius*, but with us as on that Plant which came from one Mr. *Hesket* out of *Lancashire*, of a pale whitish color, with some yellow threads encompassing a middle round Head.

IV. *The Places.* *Clusius* says it grows on the Mountains called *Sneberg*, or *Snowhill*, among the Stones, with us it grows on Mountains in *Lancashire*, as the aforementioned *Hesket* reported.

V. *The Times.* *Clusius* says that it Flowers in those Months which are presently after the Snow is dissolved, but with us towards the latter end of April, or in May, but yet somewhat later on those Mountains before named.

VI. *As for the Qualities, Specification, Preparations; and Virtues,* they are much the same with those of Our Common *Houfleeke* in the former Chapter, so that no more need be said of them in this place.

HYACINTH *English*, See *Hares-Bells*, Ch. 335.

C H A P. CCCLXXXVI.

Of HYSSOP Common.

I. *THE Names.* It is called in *Arabicke* *Cyfe faves*, *Jufa*, in Greek *ῥοσμή*, in *Latine* *Hyssopus*, in *English* *Hyssop*.

II. *The Kinds.* There are two principal Kinds hereof, viz. 1. *ῥοσμή κοινή*, & *διήμβρη*, *Hyssopus Vulgaris*, Our Common *Hyssop*. 2. *ῥοσμή σπάνια*, *Hyssopus infrequens*, *Hyssopus incelebris*, vel *insolitus*, *Hyssop Strange*, and not *Vulgar* or *Common*, of which in the next Chapter.

III. *The Kinds.* Of Our Common Garden *Hyssop* there are only two Kinds, viz. 1. *Hyssopus Vulgaris*, *Hyssopus Arabum*, Our *Vulgar* or *Ordinary* *Hyssop*. This *Hyssop* is not the *Hyssop* of *Dioscorides* and other *Greek* Authors, as all our modern *Botanists* do acknowledge, except *Matthiolus*, who earnestly contends that Our Garden *Hyssop* is it against all reason; nor do any of our *Herbarists* know (as far as I can find) what the true *Hyssop* of the *Greeks* was. As for Our Common Garden *Hyssop*, it is certainly the true *Hyssop* of the *Arabians*, and so we take it. 2. *Hyssopus Arabum Floribus rubris vel albis*, *White* or *Red Flowered* *Hyssop*.

IV. *The Descriptions.* The first, or Our *Vulgar* Ordinary *Hyssop*, has a Root which is somewhat woody, with many thready strings thereat; it is a small bushy Plant, which rises up with many woody but tender Branches, something more than a Foot high, on the Stalks and Branches whereof are set at certain distances several small, narrow, and long green Leaves, not dented at all on the edges; at

the tops of the Stalks and Branches grow blewish purple gaping Flowers in spiked Heads, one row above another, after which follows the Seed, which is small and blackish; the whole Plant is of a vigorous or strong, sweet, pleasant smell.

V. *The second, or White or Red Flowered Hyssop:* They have a Root like the former, but are scarcely to be distinguished in their form and manner of growing from the Common Garden Kind, (of which this is a sort) the chief difference is, that they do both usually bear white or red Flowers, all on one side of the Spike, yet continue not constant in that form, but change into the form of the former Common Kind, and so become (as it were) the same Plant, and after that change not to be discerned therefrom.

VI. *The Places.* They grow with us only in Gardens, and that thro' the whole Kingdoms of *England* and *Ireland*, but they grow wild in *Arabia*, and other hot Countries, as also on the Hills of *Romania*, about *Verona*, and near unto *Mount Baldus*.

VII. *The Times.* They Flower in the Summer Months, viz. in *June* and *July*, and their Seed is ripe in the beginning or middle of *August*.

VIII. *The Qualities.* It is hot and dry in the third degree, *Aperitive*, *Absterfive*, *Astringent*, *Anodyn*, *Carminative*, *Digestive*, *Diuretick*, it incides, rarifies, and makes thin; it is *Stomack*, *Pectoral*, *Cordial*, *Splenetick*, *Nephritick*, and *Arthritick*, *Emmenagogick*, *Alexipharmick*, and *Analeptick*.

IX. *The Specification.* It is peculiar against *Asthma's*, *Coughs*, *Colds*, *Catarrhs*, *Wheezing*, *Hoarseness*, *Shortness of Breath*, *difficulty of breathing*, cures *Consumptions*, *Strangury*, *Falling-Sickness*, and green Wounds.

X. *The Preparations.* You may prepare therefrom, 1. A *Liquid Juice*. 2. An *Essence*. 3. A *Decoction in Wine or Water*. 4. A *Loboch*, or *Syrup*. 5. A *Powder*. 6. *Pills*. 7. A *Lotion* or *Gargarism*. 8. An *Oil by Decoction*. 9. A *Balsam* or *Ointment*. 10. A *Cataplasim*. 11. A *Distilled Water*. 12. A *Spirituuous Tincture*. 13. An *Acid Tincture*. 14. An *Oily Tincture*. 15. A *Saline Tincture*. 16. A *Spiris*.

Spirit. 17. *An Oil Distilled.* 18. *Powers.* 19. *An Elixir.* 20. *A fixed and volatile Salt.* 21. *A Wine.*

The Virtues.

XI. The Liquid Juice. Mixed with Honey and taken it kills Worms in the Belly, and helps Asthma's, Coughs, Colds, Wheezing, Shortness of Breath, and other Distempers of the Lungs, caused by a plenitude of Humors. Dose from one Spoonful to three, Morning and Night.

XII. The Essence. It has all the Virtues of the Juice, besides which it is excellent against the Falling-Sickness, Agues, Catarrhs, or distillations of Rheum upon the Lungs, and other parts; it amends and cherishes the native-heat, and color of the Body, &c. and is a powerful Remedy against the Colick, Strangury, obstruction of the Terms in Women, Poyson, the bitings of mad Dogs, Serpents, and other venomous Creatures; it cuts tough Flegm, and causes expectoration. Dose two or three Spoonfuls in the Distilled Water, or some other proper Vehicle.

XIII. The Decoction in Wine or Water. It has all the Virtues of the Juice and Essence, but nothing near so powerful, and therefore may be given Morning, Noon, and Night to six or eight Ounces, sweetened with new Honey; if Rue and Honey is boiled with it, and so drunk, it stops Catarrhs upon the Lungs, and has the other Virtues of the Juice and Essence; if the Decoction, Juice, or Essence, is mixed with *Oxymel* it purges gross Humors by Stool, and kills Worms in Children; if any of these three Preparations are mixed with pulp of Figs and *Sal Nitre* it loosens the Belly, and works downwards also; if either of them are mixed with juice of *Garden Cress* and *Blew Flowerdeluce* Roots, or powder of the said *Flowerdeluce* Roots, in a fit proportion, this mixture will purge the Bowels yet more forcibly, carry off the causes of the Colick, cure the Yellow Jaundice, Dropie, obstructions of Liver, Spleen, and Womb, and restore the true color of the Skin, this more especially if it is taken twice or thrice a Week, as the Body can bear it.

XIV. The Lohoch or Syrup. Take of the clarified Juice two Pounds, of choice Honey four Pounds, mix, and boil to the consistence of a Rob or Quiddity. It has the Virtues of the Juice, Essence, and Decoction, and may be taken three, four, five, or six times a day, or more, as the nature and reason of the Disease requires; it causes an admirable expectoration of the morbinick matter out of the *Bronchia* of the Lungs; take a little of it at a time with a small little Spoon, and let it distill down the Throat gradually.

XV. The Powder. It is made of the Leaves, Heads, and Flowers; strewed upon green Wounds it presently heals them, upon old running Ulcers it cleanses, dries, and heals them also; applied with powder of *Cumin Seed*, Salt, and Honey, it is good against the bitings of Vipers, Rattle-Snakes, mad Dogs, and other venomous Creatures; given inwardly to one Dram, or Dram and half, it gives ease in the Colick, provokes the Terms, and opens the obstructions of the Urinary parts; it causes to break Wind, and prevails against the cold fits of Agues.

XVI. The Pills. Take Hyssop in powder, Mole Peony Roots in powder, of each two Drams, Castoreum in powder one Dram, Horehound in powder, *Asa fetida*, of each half a Dram, Crystals of Luna in powder a Scruple, with Rob of Hyssop (made per se without Honey) q. s. mix, and make a mass of Pills, for seven Doses, to be given every Night at Bed time: This is said to be a specific and effectual Remedy against the Falling-Sickness, to be repeated every

New and Full Moon so long till the Cure is completed: These Pills cure also a vehement Headach, tho' of very long standing, and are prevalent against a Vertigo.

XVII. The Lotion or Gargarism. Take Hyssop four good handfuls, White or Red Port Wine three Pints, *Sal Nitre* an Ounce, mix, and boil for a quarter of an hour, then strain off the clear. It is a singular good thing against the Quinsie, or any soreness of Throat or Mouth, it abates the inflammation of the Throat, and dissolves the swelling thereof, being often gargled therewith; it takes away inflammations in other parts of the Body, as also black and blew spots and marks, which are occasioned by Falls, Blows, or Bruises; if Wine Vinegar is used to make the Lotion with instead of the Wine, it will ease the Toothach, and the fumes thereof being received thro' a Funnel into the Ears eases their pains, and abates an inflammation if any is present, and also takes away their ringing noise.

XVIII. The Oil by Decoction or Insolation. Being anointed upon the Head it is said to kill Lice and Nits therein, and take away the itching; taken inwardly to one or two Ounces mixed with Honey it opens obstructions of Stomach and Lungs, and causes the pituitous matter to pass off thro' the Guts; anointed upon any part swollen and pained thro' cold, it eases the pain and dissolves the swelling.

XIX. The Balsam or Ointment. Being applied they quickly heal any simple green Wound in the Hand, or other parts of the Body; applied also to old running Sores and foul Ulcers they cleanse, dry, and heal them quickly, more especially if the Powder of the Herb afore named be also strewed upon the same; the Balsam applied upon any part pained with the Gout gives ease in the pain, and by continuing the application in a short time cures it.

XX. The Cataplasim. Made of the green Herb by bruising, adding also thereto Sugar and Salt, with a few Crumbs of White Bread, and applied, it is admirable to discuss any recent simple Contusion, or heal any simple green Wound, in what part of the Body soever.

XXI. The Distilled Water. It has the Virtues of the Juice, Essence, and Decoction, sweetened with Sugar or Honey, and so taken from two Ounces to four Ounces, but it is mostly used as a Vehicle to convey the other Preparations down in; outwardly used sweetened with Honey it is of good use to cure sore and running Eyes.

XXII. The Spirituous Tincture. It is Cephalick, Neurotick, Stomack, and Pectoral, it is good against Wind in the Stomach, gives ease in the Colick and gripings of the Guts, and sweetened with Honey it eases the vehemency of the Cough, and causes expectoration; it is good against Vapors from the Womb, Fits of the Mother, and the Falling-Sickness. Dose one Spoonful in the Morning fasting, another an Hour before Dinner, and the like at Night going to Bed, in the Distilled Water.

XXIII. The Acid Tincture. It is good against the Plague, all sorts of malign and pestilential Diseases, it resists Poyson, and is efficacious against the bitings of mad Dogs, Vipers, and all other kinds of venomous Creatures; it cleanses the Stomach, strengthens it, and causes a good Appetite and Digestion, suppresses Vapors, and resists Hysterick Fits; it powerfully opens obstructions, and attenuates thick and gross Humors which clog and stuff the Viscera, causing the same to be carried off by Stool and Urine. Dose so many drops as to make the Vehicle pleasantly sharp.

XXIV. The Oily Tincture. It opens the obstructions of the Urinary parts, as also of the Womb, provokes Urine and the Terms, expels Wind powerfully,

erfully, and gives ease in the Colick, gripings of the Guts, Stone, Gravel, Strangury, &c. Dose from ten to twenty drops in any proper Vehicle Morning and Night; it gives ease in the vehement pains of the Back, and outwardly used is good against Convulsions, Cramps in any particular part of the Body, as also the Palfie and Gout, &c.

XXV. *The Saline Tincture.* Inwardly taken in a Glass of White Port Wine from half a Dram to a Dram, or Dram and half, it is prevalent against the Strangury, and causes a Pissing freely; outwardly used it is good against Scabs, Pimples, breakings out, Tetters, Ringworms, Scurf, Morpew, Tanning of the Skin, Sunburning, Yellowness, and other deformities thereof, the Skin (after being first wash'd clean with warm Water) being well bathed therewith Morning, Noon, and Night.

XXVI. *The Spirit.* Being dulcified with double refined Sugar it is a most excellent Stomack and Cordial, it expels Wind, gives ease in the Colick and gripings of the Guts, it prevails against fainting and swooning Fits, sickness at Heart, and other Distempers of the Stomach and *Præcordia*. Dose from half to one Spoonful in Canary, or some other Wine or proper Vehicle.

XXVII. *The Distilled Oil.* It is a Specifick against an old inveterate Cough, Catarrh, and Asthma, it cures the Colick to a Miracle, expels Wind powerfully, and cures Convulsions, Lethargies, Vertigo, and the Palfie after a singular manner; it admirably strengthens the Nerves and Brain, and is good against all cold and moist Diseases affecting those parts, let them come from what cause soever; it eases the Headach coming by reason of cold, and is a singular Antidote against the Gout, being both inwardly taken and outwardly applied; it is powerful against Agues, as also against the Headach, Megrim, Vertigo, Carus, Lethargy, and other Diseases proceeding from cold and moisture, but more especially it is said to be a peculiar Remedy for the Falling-Sickness, tho' in Persons past their Minority, and who are advancing towards their middle Age; in the Palfie the Back Bone is to be anointed therewith Morning and Night, rubbing it well in, and inwardly it is to be given from four drops to ten, fifteen, or twenty, according as the Patient is in Age and Strength, and the Dose to be repeated Morning and Evening so long as need requires, let it be dropp'd into White Sugar, with which it is to be well mixed, then add to it the Vehicle you design to give it in, and so let the Patient drink it.

XXVIII. *The Potestates or Powers.* They have all the Virtues of the Distilled Oil, and are much more thin and penetrating, sinking into the Flesh as fast as they are put on, they are to be outwardly used in the same manner as the Oil, and to the same parts in the same cases, and likewise to be inwardly given Morning, Noon, and Night, from thirty to eighty, or an hundred drops, in a Glass of Wine, or other proper Vehicle.

XXIX. *The Elixir.* The Virtues hereof are just the same with the Distilled Oil and Powers, and to be used also outwardly and inwardly in the same manner, saying that the Dose of the Elixir is only from twenty drops to sixty in Wine, or some fit Vehicle, given in Sherry or Madera Wine to sixty drops or more in a Pleurisie it gives present ease, and in a little time after a perfect cure; in particular also it is a very excellent thing to kill Worms in Children.

XXX. *The Salt Fixed and Volatile.* They are both Alcalies, and so absorb Acids, infallibly cure the pain of the Stomach, tho' inveterate and never so vehement, they have been given with good success in all sorts of Colicks, they open obstructions

of all the Viscera, but more particularly of the Spleen, Reins, and Womb; they suppress Vapors, prevail against Hyfterick Fits, conquer Hypochondriack Melancholly, deobstruct the Urinary passages, and give present ease in the Strangury, causing the Patient to piss plentifully and easily; and being continued for some convenient time cure the Yellow Jaundice. Dose from ten to twenty grains, or more, in a Glass of generous White Port Wine Morning and Night, or oftner, in the day time, if need so require.

XXXI. *The Wine.* Take Hyssop chopped small a handful, choice ripe Figs slit three Ounces, White Sugarcandy an Ounce and half, Muscadine a Quart, boil all together till half a Pint is consumed, then strain out and keep it for use. Dose three Spoonfuls Morning and Evening against an old Cough, it causes the tough Flegm to be the more easily expectorated, gives ease in the Strangury, by opening the passages of the Urine when they are stopped; it is also Cauminative, helps to break Wind, and provokes the Terms in Women when preternaturally stopped.

C H A P. CCCLXXXVII.

Of HYSSOP Rare or Strange.

I. *THE Names.* It is called in Greek *ἵσσοπος*, in Latine *Hyssopus In-frequens*, *Hyssopus Incelebris*, vel *Insolita*, in English *Strange*, or *Rare*, or *Uncommon Hyssop*.

II. *The Kinds.* There are no less than Thirteen Kinds of this *Strange Hyssop*, viz. 1. *Hyssopus Folij Niveis*, White Leav'd Hyssop. 2. *Hyssopus Folij Aureis*, Yellow Hyssop. 3. *Hyssopus Folij Cinerijs*, Ruffet Leav'd Hyssop. 4. *Hyssopus Surculus Densis*, Double Hyssop. 5. *Hyssopus Latifolia*, Broad Leav'd Hyssop. 6. *Hyssopus Folij Crenatis*, Jagged or Dented Hyssop. 7. *Hyssopus Moschata*, vel *de Clissa*, Musk'd Hyssop. 8. *Hyssopus Coronata*, vel *Comosa Clusij*, Tufted Hyssop. 9. *Hyssopus Folij Crispis*, Curled Hyssop. 10. *Hyssopus Angustifolia Spicata*, Narrow Leav'd Spiked Hyssop. 11. *Hyssopus Folij Origani*, Round Leav'd Hyssop. 12. *Hyssopus minor*, sive *Hispanica*, Dwarf Spanish Hyssop. 13. *Hyssopus Montana*, Mountain Wild Hyssop.

III. *The Descriptions.* The first, or White Leav'd Hyssop, seems to me to be one of the sorts of the first Common Kind in the former Chapter, and to differ only in the party coloring of the Leaves, this having several Leaves parted white and green in the midst, and some or all for the most part white, and some wholly green, or with some stripes in the green.

IV. *The second*, or Yellow Hyssop, is without doubt one of the sorts also of the first Kind in the former Chapter, it has several Leaves parted yellow and green in the midst, and come all or most part yellow; the uppermost Leaves are usually wholly yellow in the Summer time, parted with green, but the lower Leaves often abide without discoloring.

V. *The third*, or Ruffet Leav'd Hyssop. This also differs from the former scarcely in any thing else but in the color of the Leaves, which are of a greyish or Ash color, called by some Ruffet; and this seems to be that very sort which *Baubin* says was sent him from England, it growing very freely in some of our Gardens.

B b b b

VI. The

VI. *The fourth, or Double Hyssop.* This Hyssop grows lower and thicker than the former Kinds, being thicker set with slender and not so woody Branches, bending their Heads somewhat downwards, and much more thick set with Leaves of a dark green color; in the Flower and other particulars it differs not from the first Kind described in the former Chapter.

VII. *The fifth, or Broad Leav'd Hyssop.* This differs very little from the first Common Hyssop in the former Chapter, neither in Root, Stalk, Leaves, nor Flowers, saving that in this the green Leaves are larger and broader, and the Stalks are more woody than it, keeping the same form and substance.

VIII. *The sixth, or Jagged or Dented Hyssop.* In its tops and top Branches it differs not much from Our Common Garden Hyssop, but otherwise the Stalks are somewhat bigger and higher, and the Leaves a pretty deal larger and longer, and regularly cut in or dented on the edges, which makes it another or differing Species of the same Plant.

IX. *The seventh, or Musk'd Hyssop.* This differs scarcely any thing from Our Common Garden Hyssop, as Gesner in Hortis Germaniae has declared, but in the smell, which is so fragrant, grateful and pleasant, that it comes very near to the smell of Musk.

X. *The eighth, or Tufted Hyssop.* It is in Roots, Stalks, Leaves, Flowers, and manner of growing, something like unto the Garden Kind first described in the former Chapter, but a little smaller and lower, the Leaves being of a paler green color, and the top Branches spreading a little broader, having shorter Spikes of Leaves and Flowers, growing as it were in Tufts, which has caus'd the Name, and is indeed the principal difference.

XI. *The ninth, or Curled Hyssop.* In its Roots, Stalks, Branches, and manner of growing, it differs not much from the Common Garden Kind, having also much the same smell; but herein consists the chief difference, that the Leaves thereof are curled or crumpled at or about the edges, and that each Leaf seems to be compos'd of many.

XII. *The tenth, or Narrow Leav'd Spiked Hyssop.* Its Root is like that of the Common Hyssop, it is a fine sort, and has many slender hard Stalks, on which are set at distances, (as in the Common Hyssop) many small green Leaves, but longer and narrower than they, and ending in a longer point; the Flowers likewise grow at several distances, as it were in Roundles, almost from the middle of the Stalks up to the tops, of a blewish purple color, like the Common Kind, but much smaller, and so is the Seed also; the Branches hereof will take root and grow being laid into the Ground, the Root spreading much in the Earth.

XIII. *The eleventh, or Round Leav'd Hyssop.* It has a hard, woody, and fibrous Root, also hard woody Stalks, on which grow several small and almost round Leaves, one against another, but pointed at the ends; the Heads or Spikes of Flowers are like unto Our Ordinary Garden Sort in the former Chapter, and the Flowers themselves are of a blewish purple color; the smell is also much the same with the Common Kind.

XIV. *The twelfth, or Dwarf Spanish Hyssop,* which Lobel calls Hyssopus Parva Angustis Folijs. This has a small, woody, fibrous Root, which sends forth Stalks smaller and lower than the Common Kind, nor do its Branches rise so high as the Vulgar Garden Sort, but bend a little downwards, the Leaves also being smaller and thicker, and of a fader green color, and the Heads or Spikes shorter; but the Flowers are purple, like the Garden Kind.

XV. *The thirteenth, or Mountain Wild Hyssop.*

Its Root is small, woody, and with many fibres or strings; in its manner of growing it is very like unto the Common Garden Sort, but the Leaves are not so many at a joint, and are somewhat harder and rougher, and a little hairy, and something narrower withal, which, as Matthioli says, being brought into Gardens, and there nurs'd up, will in length of time put off that roughness, and become more smooth and soft; the taste of this is much more bitter, and nothing so hot or sweet as the Common Kind; the Flowers and Seed are like to the Garden Sort both for form and color.

XVI. *The Places.* They are all of them nurs'd up with us only in the Gardens of the Curious, and grow as well as the Common Kind, but the Dwarf or Spanish Hyssop, as also the Mountain Hyssop, grow naturally on the Hills in many places of Spain and Germany, and on the Hill Sabatin in the County of Goritia.

XVII. *The Times.* They all Flower in the Summer Months, viz. thro' June and July, and beginning of August, and their Seed is ripe in the beginning or middle of August.

XVIII. *The Qualities, Specification, Preparations, and Virtues,* are fully and exactly the same with those of the Garden Kind declared at large in the former Chapter, so that nothing more need be said thereof in this place.

C H A P. CCCLXXXVIII.

Of HYSSOP Hedge True,

OR,

HYSSOP Marsh.

I. **THE Names.** It was unknown to the Ancient Greeks, the Arabians call the Seed thereof *Gelbenech*, the Latines call the Plant *Gratiola*, so it is named by Dodonaus, Gesner, Lobel, Lugdunensis, Matthioli, and others; by some it is called *Gratia Dei*, and some call it *Gratia Dei altera*, because there is another Herb among the *Gerania* so called; Cordus calls it *Limnesium*, or *Centauroides*, because many for the bitterness thereof did think it a Species of *Centaureum minus*; Gesner calls it *Gratiola*, five *Centaureum Aquaticum*, also *Sesamoides*, Columna says that it is usually called *Gratiola*, yet says it is thought of some more truly to be taken for a Common Hyssop; Bauhinus in his *Pinax* calls it *Gratiola Centauroides*, and we in English call it *Hedge Hyssop*, for distinction sake, not that it grows by any Hedge side, but usually in moist and watery places, for which reason it might more properly be called *Marsh Hyssop*.

II. *The Kinds.* It is twofold, viz. 1. *Gratiola Vera*, The True Hedge Hyssop, which is a singular Plant, and of which we treat in this Chapter. 2. *Gratiola Notha*, Bastard Hedge Hyssop, of which we shall treat in the next Chapter following.

III. *The Description.* It has a Root which shoots forth to and fro under Ground very much, with many joints and small fibres at them, thereby increasing and quickly spreading very far about, especially if it stands in any moist place, because it will scarcely endure long in any dry Grounds; it is but a small low Plant, seldom growing above a Foot high, its Branches

Branches are slender, bending, and foursquare, having several small Leaves set thereon, very like to those of the *Ordinary Garden Hyssop*, but a little shorter and broader, and of a pale green color, of a very bitter unpleasant taste; from about the middle of these Branches, at the joints of the Leaves, up to the tops of them, come forth the Flowers every one at a place, standing upon very short footstalks, which are somewhat long and hollow, ending in four Leaves, two of the lowest standing out, as it were Lips, and the other two above, shorter by the half, of a whitish yellow color, tending to a black blew, and sometimes more blewish or purple; after which come small round Heads, in which is contained small Seed.

IV. *Nota.* *Camerarius* says that (not far from *Geneva*) he has found another Kind of this Plant, viz. *Gratiola Flore luteo*, Hedge Hyssop with a yellow Flower, but not differing from the former in any other particular.

V. *The Places.* It delights to grow in moist, watery, and Marsh Grounds, if you would have it to live and flourish, it grows naturally in many places of *Italy*, and near *Padua* plentifully, but with us it is only nursed up in Gardens.

VI. *The Times.* It Flowers in *June* and *July*, and its Seed is ripe not long after, but it seldom gives ripe Seed in *England*.

VII. *The Qualities.* It is hot and dry probably in the third degree, Incisive, Attractive, Absterfve, Aperitive, Traumatick, Hepatick, Splenetick, Arthritic, and Cathartick.

VIII. *The Specification.* It is a good Antifebricitick, and peculiar for the curing of the Dropfie, Scurvy, and Gout, kill Worms, and heal all simple green Wounds, running Sores, and putrid Ulcers.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice of the Herb. 2. An Essence. 3. A Decoction in Water or Wine. 4. A Powder. 5. An Extract. 6. A Balsam or Ointment.

The Virtues.

X. *The Liquid Juice.* It works very strongly and churlishly both upwards and downwards, expelling much viscous and gross Flegm, also Choler, and watery Humors, for which reason it is profitable for such as are troubled with a *Sweates*, or Dropfie *Anasarca*, as also the *Ascites* or *Tympanites* in beginning, and for such as are affected with the Gout or *Sciatica*; it cures both Tertian and Quartan Agues, and kills Worms in the Belly, whether in Old or Young, but by reason of its churlishness it ought to be corrected with Aniseeds, Caraways, Cloves, Cinnamon, &c. Dose half a Spoonful, increasing it according to Age and Strength gradually to two, three, or four Spoonfuls; it may be given mixed with Posset-drink, Sack-Whey, or Mutton Broth, &c.

XI. *The Essence.* It has all the Virtues of the former, but nothing near so churlish, but ought to be corrected with Powers of Angelica, Pennyroyal, Aniseeds, Caraways, &c. it cures Quotidian and Tertian Agues, opens obstructions of Liver and Spleen, refits putrilaction, kills Worms, and evacuates peccant Humors; the Dose is the same with the Liquid Juice, and to be given in the same manner.

XII. *The Decoction or Infusion in Water or Wine.* It has all the Virtues of the Juice and Essence, but is to be given in a greater quantity, it cleanses the Stomach and other Viscera, opening their obstructions, it also induces old running Sores and filthy Ulcers to a speedy healing, it works both upwards and downwards, but much more gently than either Juice or Essence.

XIII. *The Powder.* It has all the Virtues of Liquid Juice, Essence, or Decoction, but operates not so speedily, it kills Worms effectually in Old or Young, and prevails wonderfully against the Scurvy and Jaundice, as also obstructions of the Womb, but it ought to be corrected with Camphir, Powder of Aniseeds, &c. Dose from a Scruple to a Dram, or more, according to the Age of the Patient, Strength, and other Circumstances; outwardly flewed upon old running Sores, or putrid Ulcers, it cleanses and dries them, and induces their speedy healing; it also admirably consolidates green Wounds, &c.

XIV. *The Extract.* It may be made into Pills with Powders of Aniseed, or Cinnamon; *Camerarius* commends it not only to be available against the Dropfie, but against all sorts of Agues, and so much the more if a little of the Infusate Juice of Calamint be added; it has all the Virtues of Juice, Essence, Decoction, and Powder, but works with much more safety and gentleness. Dose from a Scruple to a Dram in any fit Vehicle.

XV. *The Balsam or Ointment.* It is excellent good against the Gout or *Sciatica* being applied to the parts affected, it also digests green Wounds, or malign Ulcers, cleanses, dries, and heals them in a very short time, but this more especially if the powder of Tobacco, be mixed with the same.

C H A P. CCCLXXXIX.

Of HYSSOP Hedge Bastard.

THE Names. This can have no Greek Name, any more than the former, in *Latine* it is called

B b b 2

called *Gratiola Notha*, and in English *Bastard Hedge Hyssop*.

II. The Kinds. There are three sorts hereof, viz.
 1. *Gratiola Angustifolia*, and *Angustifolia minor*, *Gratiola minor* Gesneri, also *Hyssopoides* by Camerarius, *Hyssopi Folia Cordi & Baubini*, Small Hedge Hyssop, also Small Narrow Leav'd Hedge Hyssop.
 2. *Gratiola Cerulea*, *Gratiola Dei Cefalpini*, *Ternaria Tabernamontani*, *Herba Judaica altera Dodonaei*, *Sideritis Cerulea Thalij*, *Lysimachia flore Ceruleo Comerarii*, *Lysimachia Galericalata Lobelij*, *Gratiola Latifolia*, and *Latifolia major*, The Greater Broad Leav'd, or Blew Flowered Hedge Hyssop.
 3. *Gratiola Latifolia minor*, and *Latifolia nostras minor Parkinsoni*, The Lesser Broad-Leav'd Hedge Hyssop.

Hedge Hyssop narrow leaved

III. The Descriptions. The first, or Small Narrow Leav'd Hedge Hyssop. It has a Root which is white, and shoots forth many Fibres, whereby it takes good rooting and hold in the Earth; from this Root shoot forth sometimes many, and sometimes but one or two round reddish Stalks, half a Yard high, which are branched towards the tops, on which are set one above another, and sometimes one against another, divers small and somewhat long Leaves, something smaller than those in the former Chapter, and nearly resembling *Hyssop* Leaves, of a pale green color, and joining close to the Stalks and Branches, without any Footstalk at all; at the Joints with the Leaves come forth Flowers, every one by it self, standing in a long Husk, and consisting of four Leaves, of an excellent blew color, after which comes in their places small brown Seed, contained in long round Pods; the Herb and every part thereof is without any the least smell, and almost without any taste, tho' some will have it to be of a little nitrous, others of a little sweetish taste; sometimes in the moister Grounds this is found with larger Leaves, and growing higher, and sometimes in dry Grounds with smaller and longer Leaves, scarcely growing a Span high.

IV. The second, or Greater Broad Leav'd Hedge Hyssop. It has a Root which spreads much, and

with many Branches under Ground, quickly thereby possessing a large circuit or compass; it is a smooth low Plant, rising about a Foot high, with many square Stalks variously branched from the bottom to the top, having thereon several Joints, and two small Leaves at every one, which stand upon short Footstalks, being broad at the bottom, and smaller towards the end, a little dented about the edges, and full of Veins, of a fadder green color than the former, longer also, and broader; the Flowers are gaping, something like unto those of *Dead Nettles*, of a fair blewish purple color, with some white spots in them, every one standing at the Joints with the Leaves, up to the tops, after which come forth small Seed Vessels, formed something like unto the top of the Thigh Bone of a Man or Beast, in which the small Nut or Huckle Bone is placed, the upper part of which does first open when the Seed is ripe, and falls away when it is touched, thereby shewing within it small yellow Seed: There is a lesser sort hereof, differing only in the smallness of the Plant, which I am apt to believe arises only from the different goodness of the Soil; this Herb is referred to *Gratiola*, not only from its place and manner of growing, but especially for its bitterness, in which it is so like to it.

V. The third, or Lesser Broad Leav'd Hedge Hyssop. It has a Root which is small, long, and white, spreading it self under Ground several ways, which perishes not in Winter, nor runs like the last, but spreads forth new Branches every Year; from this Root springs up one or more small Stalks, about half a Foot high, round, but crested as it were all the length, which spread forth other smaller Branches, on which do grow many small Leaves, set by couples one against another, being something broad, but very short withal, seeming almost round, and ending in a sharp point, a little dented about the edges; at the Joints with the Leaves come forth the Flowers, every one by it self, on a small Footstalk, being in form somewhat like unto the last, a gaping Flower, but shorter, of a pale reddish color, spotted in the middle of the lower Leaf with many small white spots; after the Flowers are fallen come in their places Seed Vessels, in shape something like unto the Nut of a Cross-Bow, in which is contained small yellowish Seed; the taste of this Plant is as extremely bitter as the last; this Herb is also referred to the *Gratiola Latifolia*, as well for the resemblance of the Flower to the last before described, as for the bitterness thereof.

VI. The Places. The first has been found growing naturally in several places of England in moist and wet Grounds, as at *Dorchester* in *Oxfordshire*, at the back side of the enclosed Grounds, on the Left Hand of the Town, as you go from thence to *Oxford*, in the Grassie places of the *Champion Corn Fields*; the second grows likewise in several places of this Land, in wet low Grounds, and by Water sides; the third is not known to grow in any other Country but in England, so far as we can yet hear or learn; and it was first found out by *Gerard*, who called it simply *Gratiola Latifolia*, in wet boggy Grounds among the Grass; I found it (says he) growing on the Bog or Marsh Ground at the farther end of *Hampstead Heath*, and upon the same Heath towards *London*, near unto the Head of the Springs that were digged Anno 1590. for Water to be conveyed to that City.

VII. The Times. The two first Flower in June and July, the third in July and August, their Seeds ripening in a short time after their Flowers are past.

VIII. As to their Qualities, Specification, Preparations, and Virtues, Authors have said nothing; the

the first of these has never yet been applied to any Medicinal use by any Author that I could ever yet see, nor yet the second or third Kinds, but their bitterness coming so near to that of the *Gratiola Vera*, or *True Hedge Hyssop*, induces me to think that they must have some of the Virtues of the *True Hedge Hyssop*, and if they be not full out so effectual to Purge, yet by their bitterness they may be Aperitive, and have a virtue to open the obstructions of the Viscera, and cleanse them from their pituitous and viscous Excrements; they may also by the same bitterness be Analeptick, and so strengthen the Stomach, and other Bowels, restoring their depraved Tone, &c.

C H A P. CCCXC.

of JACK-by-HEDGE,

O R,

SAWCE-ALONE.

THE Names. This seems to be a Novel Plant, not known to the Greeks, and therefore has no Greek Name, the Latines call it *Alliaria*, *Gesner* in *Hortis Alliastrum*, and *Ericus Cordus Rima Marina*, which is the *Rima Marina Anguilare*, and *Alectorolophus Plinij*, as *Dalechampius* and *Lobel* thought; some take it to be *Thlaspidium Cratæve*, as also *Thlaspidium Cornutum Tragi*, because they answer to its description; we in English call it *Jack-by-Hedge*, and *Sawce-alone*, because it serves of it self for Sawce, instead of many others.

II. The Kinds. Some would have it to be *Scordium*, but that it is not, others *Scordij Species*, a Kind of *Scordium*, or *Water Germander*, but indeed it has no relation to any of those Plants, that being a real mistake of former Authors; it is a singular Plant of its Kind, which *Gerard* says is Named of some *Pes Asininus*, All's Foot, and may be called (says he) in Latine *Allium non bulbosum*, a Kind of *Garlick*, so esteemed from its smell, it seems to be, 1. *Alliaria Communis, vel minor*, The Common Jack-by-Hedge. 2. *Alliaria major*, The Greater Kind.

III. The Descriptions. The first, or Common Jack-by-Hedge. It has a long slender Root, which is fibrous or stringy, and thready, perishing every Year after it has given Seed; from this Root rise up several slender Stalks, about a Foot and half high, the Leaves are broad, of a light green color, nicked round about, and sharp pointed; the lower Leaves are rounder than those which grow upward towards the tops of the Stalks, and are set singly one at a Joint, being longish round the higher they grow, and also pointed at the ends, and dented about the edges, tho' somewhat less dented than those growing below, they somewhat resemble Nettle Leaves for the form, but are of a fresher green color, and not rough or pricking; upon the Branches of the Stalks near the tops grow very small white Flowers, one above another, like *Rocket*, which being past come small, slender, and round long Pods, not very much unlike to those of *Elizeweed*, saving that these are rougher, and grow somewhat closer to the Stalk, in these Pods are contained small, round, and somewhat blackish Seed; this Plant raises it self every Year again of its own sowing, and it has affinity to

Garlick in its Name, yet not in Name only, but in its smell, for any part of it being bruised smells of *Garlick*, but more pleasantly, and tastes something hot, sharp, and biting, almost like unto *Rocket*, for which reason it becomes an admirable Sawce, to such as love that taste.

IV. The second, or Greater Kind of Jack-by-Hedge, has like Roots, Stalks, Leaves, Branches, Flowers, and Seed, and the same manner of growing, and differs only in this, that the Leaves grow larger and rounder.

V. The Places. It grows of it self by Garden Hedges, by old Walls, by high Way sides, and sometimes in the borders of Fields, in most places of this Kingdom.

VI. The Times. It Flowers chiefly in June and July, and the Seed grows ripe in the mean season, or not long after the Flowers are gone; the Leaves are used for Sawce in March and April.

VII. The Qualities. It is hot and dry in the third degree, and is repleat with much Salt, Sulphur, and Mercury, it is Incisive, Aperitive, Attractive, Absterfitive, Carminative, Digestive, Dissolutive, and Diuretick, Neurotick, Stomatick, Pectoral, Nephritick, and Hyfterick, Ptarmick, Emmenagogick, and Alexipharmick.

VIII. The Specification. It is peculiar against the Scurvy, Coughs, Colds, Wheezing, shortness of Breath, Stone, Strangury, Colick, and Fits of the Mother.

IX. The Preparations. You may have therefrom, 1. A Juice of the Leaves and Roots. 2. An Essence of the same. 3. An Infusion or Decoction in Water or Wine. 4. A Syrup. 5. The Root. 6. The Seed bruised, or infused in Wine. 7. A Cataplasim. 8. An Acid Tincture. 9. A Spirituous Tincture. 10. An Oily Tincture. 11. A Saline Tincture. 12. A Spirit. 13. A Sawce.

The Virtues.

X. The Liquid Juice. Taken from a Spoonful to two or three Spoonfuls in a Glass of White Port, Madera,

Madera, or Canary Wines, it provokes Urine, helps the Strangury, expels Gravel, Sand, Tartarous Mucilage, eases the Colick, and suppresses Vapors and Fits of the Mother.

XI. *The Effence.* It has all the former Virtues, besides which it potently resists the Scurvy, Dropfie, Jaundice, and Gout, resists Vomiting, strengthens the Stomach, causes a good Appetite and a strong Digestion; it admirably corrects Crudities, warms the Stomach, and restores the Tone thereof being hurt or weakened. Dose one, two, or three Spoonfuls Morning and Night, (and sometimes at Noon) in a Glass of generous Wine.

XII. *The Infusion or Decoction.* It has all the Virtues of the Juice and Effence, but much weaker, and therefore may be given to six or eight Ounces Morning and Night; but the Infusion is better than the Decoction, because consisting mostly of volatile parts, those by boiling will evaporate away in a great measure, whereas by a close infusion they may be all preserved.

XIII. *The Syrup.* It ought to be made with clarified Honey, and then it will be as good as *Erysimum*, or *Hedge-Mustard*, to warm the Stomach, and ease Coughs, Colds, help Wheezings, shortness of Breath, and difficulty of breathing, as also to help Catarrhs, and to cause expectoration of thick tough Flegm and putrid Humors out of the Breast and Lungs.

XIV. *The Root.* It tastes sharp, like unto *Radish* Roots, and therefore may be used in the same manner and to the same purposes; if it is scraped thin, and the scrapings are put into Wine Vinegar, with a little Salt, it makes a very good Sawce for Meat: The Juice of the Root given in White Wine is excellent against the Colick, Strangury, Stone, &c. it gives ease also in all those Cases if exhibited in a Clyster, &c.

XV. *The Seed bruised, or infused in Wine.* It is a present Remedy for a vehement pain in the Stomach, as also for the Colick, Strangury, Stone, Gravel, or any Tartarous Matter obstructing the Urinary passages; it suppresses Vapors, abates Melancholy, and cures Hystrick Fits. Dose of the Seed from half a Dram to a Dram and half, either in substance (mixed with Honey) or in infusion in Wine.

XVI. *The Cataplasm.* Made of the green Leaves, or of Leaves and Root, and applied to old running Sores and foul Ulcers, whether in the Legs, Arms, or other parts, it abates the pain (if any) cleanses the Sore or Ulcer, dries them, and induces a speedy healing.

XVII. *The Acid Tincture.* It is possibly one of the greatest Medicines in the World against the Scurvy, it restores the Tone of the Stomach, strengthens it, causes a good Appetite and Digestion, suppresses Vapors, and has all the Virtues of the Liquid Juice and Effence above declared; it is also Antifebrile, and Alexipharmick, it cures all sorts of hot, burning, and putrid Fevers, and all such as are pestilential, and is powerful even against the Plague it self; it resists Poyson internally taken, or otherwise given by the bitings of mad Dogs, Vipers, or other Serpents, or other venomous Creatures, being inwardly taken, and outwardly applied to the parts wounded, by bathing. Dose so many drops as may make a Glass of generous Wine, or other proper Vehicle, pleasantly acid or sharp, and to be repeated three or four times a day, or as oft as need requires.

XVIII. *The Spirituous Tincture.* It is Cephalick, Neurotick, Stomack, Cardiack, and Hystrick; it warms and comforts the Head, Brain, Nerves, and Stomach, cheers the Heart, revives the Spirits, and is powerful against fainting and swooning Fits, Convulsions, Palsies, Vertigo, Lethargy, Carus, Coma,

Epilepsie, Hystrick Passion, and other Diseases of like kind affecting any of those parts; it causes a good Appetite and Digestion, gives present ease in the Colick, and alleviates pains of the Stomach and gripings of the Guts arising from cold, crude, and undigested Humors. Dose from half a Spoonful to a Spoonful, or more, two or three times a day, in a Glass of generous Wine.

XIX. *The Oily Tincture.* It has all the Virtues of the Juice, Effence, Infusion, and Tinctures, and may be given from eight drops to twenty drops, or more, being first dropped into and mixed with White Sugar, and then mixed with a Glass of Wine, or other proper Vehicle; it is a potent thing against the Stone, Gravel, Sand, or Tartarous Matter obstructing the Reins or Urinary passages, it gives ease in the Colick and Strangury, and is a present Remedy against the Pleurisie, Stitches in the Side, and other like pains of the Thorax and Stomach; it cures Cramps by anointing therewith, and is of excellent use against Convulsion Fits in Elder Persons, as also against Vapors, and obstructions of the Womb; it provokes the Terms, and facilitates the Birth of Women in Labor, bringing away the Afterbirth or dead Child; it gives present ease in after pains anointed upon the lower parts of the Belly, and taken inwardly in a Glass of Canary; it prevails against the Palsie taken daily in Wine, bathing the Back Bone therewith, together with the parts affected, and continuing the use thereof for some considerable time; it also gives ease in the Gout.

XX. *The Saline Tincture.* It seems to be a Specifick against Arthritic pains, proceeding either from a hot or cold cause; it is good against Spots, Marks, Tanning, Sunburning, black and blewness, and other discolorings of the Skin, it removes yellowness of the Scurf Skin, Freckles, Lentils, Scurf, Morpew, and other like deformities of the *Cair*, but it must be made pretty strong, and applied two or three times a day, and suffered to dry on, for by that means the fuliginous matter will be drawn forth, and the Skin will peel off in manner of Scurf, leaving a fine, young, tender, pure, clear Skin underneath.

XXI. *The Spirit.* It is truly Cordial, Neurotick, Cephalick, and Hystrick, it revives the Spirits, cheers the Heart, and refreshes the whole Universal Man; it is good against Convulsions in Children and Elder People, prevails against Palsies, Apoplexies, Lethargies, Epilepsies, and Pleurisies, giving in those Diseases present relief; it is singular against Vapors and Fits of the Mother, and wonderfully resists and restores out of Fainting and Swooning Fits; it is strongly Aperitive, and removes the obstructions of the Lungs, Liver, Spleen, Reins, and Womb, dissolving the congelation of Humors causing the same. Dose from one Dram to two or three Drams in Wine, or any other fit Vehicle.

XXII. *The Sawce.* It is made of the Leaves shred small, or of the Root scraped, or of their Juice expressed, adding a proportional quantity of White Sugar, Wine Vinegar, and Salt. Being thus compounded it is eaten in the Spring Time with Meat, as Mutton, Lamb, Beef, Veal, &c. either boiled or roasted; it corrects Crudities, expels Wind, strengthens the Stomach, creates a good Appetite, and causes a good Digestion.

JACINTH English, See Haresbells English Ch. 335.

C H A P. CCCXCI.

of JACINTH American.

THE Names. This Plant its general Name is called in Greek *ῥάκισ*, in Latine *Hyacinthus*, in English *Jacinth*, and *Hyacinth*; the Spaniards call it *Maio Flores*.

II. The Kinds. There are various Species of this Plant, and several sorts of each generick Kind, viz. 1. *Hyacinthus Anglicus*, English *Hyacinth*, of which there are four Species, viz. 1. *Hyacinthus Anglicus Ceruleus*, Blew English *Jacinth*. 2. *Hyacinthus Anglicus Albus*, White English *Jacinth*. 3. *Hyacinthus Anglicus Incarnato Flore*, Carnation English *Jacinth*. 4. *Hyacinthus Anglicus vel Hispanicus major Flore Campanule instar*, Greater English or Spanish *Jacinth*; all these growing in England are commonly called *Haresbells*, and of which we have already treated in the foregoing part of this Book, viz. in Chap. 335. and therefore shall now overpass them in this succinct Discourse of *Jacinths*. 2. *Hyacinthus Americanus*, American or West Indian *Jacinth*, of which there are two Kinds, which are the peculiar Subject of this present Chapter. 3. *Hyacinthus Botroides*, Grape Flowered *Jacinth*, of which there are six Species, Treated of in Chap. 392. 4. *Hyacinthus Botroides Muscatus*, Musked Grape Flowered *Jacinth*, of which there are four Species, which are Treated of in Chap. 393. 5. *Hyacinthus Comosus*, The Haired *Jacinth*, of which there are five Species, which are Treated of in Chap. 394. 6. *Hyacinthus Orientalis*, The Oriental *Jacinth*, of which there are eight Species, which are Treated of in Chap. 395. 7. *Hyacinthus Orientalis Flore duplici*, Double Oriental *Jacinth*, of which there are three Species, and are Treated of in Chap. 396. 8. *Hyacinthus Estivus*, The Summer *Jacinth*, of which there are five Species, and are Treated of in Chap. 397. 9. *Hyacinthus Eufus*, The Brown or Dun Colored *Jacinth*, of which there are three Species, and are Treated of in Chap. 398. 10. *Hyacinthus Stellatus Peruanus*, West Indian Starry *Jacinth*, of which are four Species, and are Treated of in Chap. 399. 11. *Hyacinthus Stellatus Vulgaris*, The Common Starry *Jacinth*, of which there are seven Kinds, and are Treated of in Chap. 400. 12. *Hyacinthus Stellatus Byzantinus*, The Turkey Starry *Jacinth*, of which are four Species, and are Treated of in Chap. 401. 13. *Hyacinthus Stellatus Autumnalis*, The Autumn *Jacinth*, of which there are three Species, and are Treated of in Chap. 402. 14. *Hyacinthus Stellatus Lilifolius*, The Lilly Leav'd Starry *Jacinth*, of which there are three Species, and are Treated of in Chap. 403. I know some Authors account the *Squill* or *Sea Onion* in the Classis of *Jacinths*, making it a Marsh or Sea Kind, but I am of a contrary Opinion, and therefore shall not rank it with those foregoing, but Treat of it hereafter in its proper place of the Alphabet.

III. The Kinds of the American *Jacinth*. There are only two Species of this, viz. 1. *Hyacinthus Indicus vel Americanus major Radice Tuberosa*, The Greater American Tuberos Rooted or Knobbed *Jacinth*. 2. *Hyacinthus Indicus vel Americanus minor Radice Tuberosa*, The Lesser American Tuberos Rooted or Knobbed *Jacinth*. *Cusius* leaves out the Word *minor* in the Name of the second, because, as it is thought, he never knew or heard of the first; some would have these *Hyacinths* to be *Hyacinthi Eriophori Indici*, The Indian Woolly *Jacinth*, be-

cause when they are broken they have much Wool in them, which I think to be a mistake; and some think that these two Plants are not two severals, as greater and lesser, but that the greatness of the one is caused by the goodness or richness of the Soil where it grows, but who so shall consider the particular Description of each, and compare them, will soon become of another Mind.

IV. The Descriptions. The first, or Greater American Tuberos Rooted *Jacinth*. It has a thick knobbed Root, (yet formed into several Heads, somewhat like unto bulbous Roots) with many thick Fibres at the bottoms of them; from the divers Heads of which Root rise up several strong and very tall Stalks, beset with divers fair, long, and broad Leaves, joined at the bottom close unto the Stalk, where they are greatest, and grow smaller to the very end, and those which grow higher to the top being smaller and smaller, which being broken many fine Threads appear like Wool in them; the tops of the Stalks are beautified with many fair, large, white Flowers, each of which does consist of six Leaves, lying spread open, as the Flowers of the *White Daffodil*, with some short Threads in the middle, and of a very sweet smell, so sweet as some account it strong and heady; this is the greatest and tallest of all the *Jacinths*, and the Flowers are something near in resemblance unto those of the *Daffodil*, but its Root is tuberos, as aforesaid, and not bulbous, as all the rest are.

V. The second, or Lesser American Tuberos Rooted *Jacinth*. The Root of this *Jacinth* is knobbed, like the Root of Arum, or Wake-Robin, or like the Root of the Carolina Eddo, from whence many Fibres spring forth; from this Root come forth many Leaves, lying upon the Ground, and encompassing one another at bottom, being long and narrow, and hollow guttered to the ends, which are small and pointed, and no less woolly and full of Threads than the former; from the middle of these Leaves rises up a Stalk, which is very long and slender, three or four Feet in height, which, unless it is propped up, will bend down, and lie upon the Ground, on which are set at certain distances many short Leaves, being broad at the bottom, where they do almost encompass the Stalk, and are smaller towards the end, where it is sharp pointed; at the top of the Stalk stand many Flowers, with a small piece of a green Leaf at the bottom of every footstalk, which seem to be so many *White Oriental Jacinths*, being composed of six Leaves, which are much thicker than the former, with six Chives or Threads in the middle, tipped with pale yellow Pendants.

VI. The Places. They both grow naturally in the West Indies, from whence they were first brought into Spain, and from thence have been brought to us, and into several other parts of Europe.

VII. The Times. They Flower not in England and other like cold Countries till the middle of August, and sometimes not at all, unless they be carefully preserved from the injuries of our cold Winters, and then if the precedent Summer has been hot they may Flower a Month sooner.

VIII. The Qualities. They are cold and drying in the first degree, or beginning of the second, Astringent and Diuretick.

IX. The Specification. They stop fluxes of the Bowels, give ease and relief in the Strangury, and are profitable against the Jaundice and Kings-Evil; the Roots are only of use in Medicine, but being often used are thought to cause Barrenness; but 'tis certain, that being taken inwardly by Young Persons it keeps them from growing ripe too soon.

X. The

X. *The Preparations.* There are but few Preparations from these Plants, viz. about five, 1. A *Liquid Juice.* 2. An *Essence.* 3. A *Decoction or Infusion.* 4. A *Powder.* 5. An *Ointment.*

The Virtues.

XI. *The Liquid Juice.* It cools and abates Fevers, and given in Red *Florence* or *Port Wine* stops Fluxes of the Bowels, given in *White Port Wine*, or *Parfly*, or *Arsmart Water*, it cleanses all the Urinary passages, provokes Urine, and cures the Strangury; given in *Milk of Hempseed* made with *Parfly Water* it prevails against the Jaundice, and daily taken in Mutton Broth, or a gentle Infusion of *Sena*, it eradicates the Kings-Evil. Dose from one Spoonful to two, or more, increasing the Dose gradually, as you find the Patients Body does agree with it.

XII. *The Essence.* It has all the Virtues of the Juice, and is something more prevalent than it, for which reason it is to be given in a lesser Dose, but in the same manner, and in the same Vehicles, and may be given twice a day, as you see need requires, or the Constitution of Body will bear it.

XIII. *The Decoction or Infusion.* It may be made in *Arsmart Water*, or *Parfly Water*, in which a Scruple or half a Dram of Salt of Tartar is dissolved, or in *White* or *Red Port Wine*, (according to the Intention) or in a mixture of the former Waters with those Wines, as the Physician in Prudence shall direct; they have all the Virtues of the Juice and Essence, but must be given in a much larger Dose, viz. from three Ounces to eight Ounces, according to Age, &c.

XIV. *The Powder.* It may be given for all the Purposes that any of the foregoing Preparations are given for. Dose from half a Dram to a Dram, or Dram and half, once or twice a day in any proper Vehicle, it does not so speedily pass off as those liquid things do, but commonly lies longer in the Stomach, and if the Stomach is weak, or foul, will be apt sometimes to make it sick; outwardly applied to old running Sores, or putrid Ulcers, also Ulcers of the Kings-Evil, it cleanses them and dries up their humidities, and induces them to a speedy healing.

XV. *The Ointment.* It is good to heal old Sores and Ulcers, but is chiefly good against Tumors and Ulcers of the Kings-Evil, for by anointing them first therewith Morning and Evening, chafing the Ointment well in, it insensibly consumes those Kernels or Swellings, and in time perfectly dissolves them; and if you mix therewith Powders of Scammony and Tobacco, ana, and apply it to strumous Ulcers, it cleanses, takes away dead or proud Flesh, dries them up, and quickly heals them.

XVI. *Nota.* What we have said of the Qualities, Specification, Preparations and Virtues of these *Tuberose Jacinths*, the same is to be understood of all the *Bulbous Jacinths* hereafter following, (excepting only the *Musk Grape Flowered Jacinth* in Chap. 393. which is said to be the *Bulbus Vomitorius Dioscoridis*, and the *Lilly Leav'd Starry Jacinth* in Chap. 403.) and this I thought good to give notice of here once for all, that in the following Chapters of this Plant we might not often repeat the same in vain.

C H A P. CCCXCII.

Of JACINTH Grape Flowered.

I. *THE Names.* It is called in Greek *ῥάναβος* *Corvudus*, in *Latine Hyacinthus Botroides*, and in *English Grape Flowered Jacinth*.

II. *The Kinds.* The *Grape Flowered Jacinth* has two principal or generick Kinds, viz. 1. *Hyacinthus Botroides vel Racematus non Moschatus*, The *Grape Flowered Jacinth* not Musked, of which in this Chapter. 2. *Hyacinthus Botroides vel Racematus Moschatus*, The *Musked Grape Flowered Jacinth*, of which in the Chapter following.

III. *The Kinds of the Grape Flowered Jacinth not Musked.* Of this there are these six varieties, 1. *Hyacinthus Botroides vel Racematus minor Caruleus obscurus*, The *Lesser dark Blew Colored Grape Flowered Jacinth*. 2. *Hyacinthus Racematus major Caruleus*, The *Greater dark Blew Colored Grape Flowered Jacinth*. 3. *Hyacinthus Botroides Caruleus Amanus*, The *Pleasant Sky Colored Grape Flowered Jacinth*. 4. *Hyacinthus Botroides Ramosus*, The *Branched Grape Flowered Jacinth*. 5. *Hyacinthus Botroides Flore albo*, The *White Grape Flowered Jacinth*. 6. *Hyacinthus Botroides Flore albo rubente*, The *Blush Grape Flowered Jacinth*.

IV. *The Descriptions.* The *first*, or *Lesser dark Blew Colored Grape Flowered Jacinth*. It has a Root which is round, and blackish without, being encompassed with a number of small Roots or Offsets round about it, so that it will quickly choke a Ground if it is suffered long in it, for which cause many do cast it out into some by corner, if they intend to preserve it, or else cast it out of the Garden quite; it has many small and fat weak Leaves, lying upon the Ground, which are somewhat brownish at their first coming

coming up, and of a sad green afterwards, hollow on the upper side and round underneath, from among which rise up round, smooth, weak Stalks, bearing at the top many small, heavy, Bottle-like Flowers, in shape like to the *Muscari* (in the following Chapter) but very thick thrust together, smaller, and of a very dark or blackish blew color, of a very strong smell, like unto *Starch* when it is new made and hot.

Jacinth Grape
= flowered great.

V. The second, or Greater dark Blew Colored Grape Flowered Jacinth. This Plant in its Root, Leaves, Stalk, Flowers, Color, and manner of growing, is in all respects like unto the Lesser before described, and differs nothing from it but in the magnitude, this in its Stalk, Leaves, and Flowers, being greater than them.

VI. The third, or Sky Colored Grape Flowered Jacinth. The Root of this is whiter than the former, but does not increase so much as it, yet produces plenty enough of Plants; it springs up with fewer Leaves than the first, and not reddish, but green at its first appearing; the Leaves when they are full grown are long and hollow, like the first, but greener, shorter, and broader, standing upright, and not lying along upon the Ground as they do; the Flowers grow at the top of the Stalk, more sparsely set thereon, and not so thick together, but like a thin Bunch of Grapes, and Bottle like, as the former, of a perfect Blew, or Sky Color, every Flower having some white spots about their brims, this has a very sweet smell, yet nothing like the foregoing.

VII. The fourth, or Branched Grape Flowered Jacinth. This is a true Species of the former Kinds, and is found to grow with many Branches of Flowers, breaking out from the sides of the greater Stalks or Branches; the Leaves, as is all the rest of this Plant, are greater than the former.

VIII. The fifth, or White Grape Flowered Jacinth. It has a bulbous Root, as the others, its Leaves are green, but a little whiter than the Blew or Sky Colored Jacinth; its Flowers are purely white, and

alike sparsely set on the Stalks, but a little lower and smaller than it; in all other things there is no difference.

IX. The sixth, or Blush Grape Flowered Jacinth. The bulbous Root of this Grape Flower is greater than either of the Roots of the Sky Colored or White foregoing, and has seldom any small Roots or Off-sets as the others have; its Leaves also are larger, and somewhat broader, the Flowers are of a pale, or bleak bluish Color out of a white, and are a little larger, and grow a little higher, and fuller of Flowers than the White.

X. The Places. They are Natives of many places of Germany and Hungary, and grow also in Spain, and on Mount Baldus in Italy, and near Narbone in France, about the borders of Fields, with us they grow only in Gardens.

XI. The Times. They Flower from the beginning of March, and sometimes sooner if the Weather is mild, and continue Flowering till the beginning of May.

C H A P. CCCXIII.

Of JACINTH Grape Flower Musked.

I. THE Names. It is called in Arabick *Zir*, in the Turkish Language *Dipcadi*, and *Moschoroni*, by which Names they were sent to us from Turkey, in Greek *ῥακινθὸν κορυμβώδες*, in Latine *Hyacinthus Botroides Moschatus*, and in English The Musked Grape Flowered Jacinth.

II. The Kinds. There are four several sorts of this Musked Plant, viz. 1. *Bischoffiana*, Bulbus Emeticus, *Hyacinthus Botroides Moschatus major*, *Hyacinthus Moschatus Baubini*, *Muscari*, and *Muscari Flore flavo*, The Greater Yellow Musked Grape Flowered Jacinth, or Yellow Muscari. 2. *Hyacinthus Botroides Moschatus major*, seu *Muscari Flore Cineritio*, The Great Ash Colored Musked Grape Flowered Jacinth. 3. *Hyacinthus Botroides Moschatus major*, seu *Muscari Flore rubro*, The Great Red Musked Grape Flowered Jacinth. 4. *Hyacinthus Botroides Moschatus major*, seu *Muscari Flore albo*, The Great White Musked Grape Flowered Jacinth.

III. The Descriptions. The first, or Greater Yellow Musked Grape Flowered Jacinth. It has a Root which is long, round, and very thick, and white on the outside, with a little woolliness thereon when broken, and full of a slimy juice, to which are adjoined thick, fat, and long Fibres, which perish not, as in most of the other Jacinths, and therefore need not to be often removed, as some of the other sorts are: This Musked Jacinth, or Grape Flower, has five or six leaves spread upon the Ground in two or three Heads, which at the first budding or shooting forth out of the Ground are of a reddish purple color, and afterwards become long, thick, hollow, or guttered on the upper side, of a whitish green color, and round, and dark colored underneath; in the middle of these Heads of Leaves rise up one or two hollow, weak, brownish Stalks, sometimes lying on the Ground with the weight of the Flowers, (but especially of the Seed) yet for the most part standing upright when they are laden towards the top with many Bottle like Flowers, which at their first appearing, and until the Flowers begin to blow open, are of a brown red color, and when they are blown of a

fair yellow, flowering first below, and so upwards by degrees; every one of these Flowers is made like unto a little Pitcher or Bottle, being big in the belly and small at the mouth, which is round, and a little turned up, very sweet in smell, like unto Musk, from whence it took the Name *Muscari*, after the Flowers are past there come three-square thick Heads, puffed up, like as it were Bladders, made of a spongy substance, in which are here and there placed black round Seed.

IV. *The second, or Great Ash Colored Musk'd Grape Flowered Jacinth.* It has a Root like the former, but yields more increase, and will better endure our cold Climate, altho' it does more seldom give ripe Seed. This *Muscari* differs not in Roots or form of Leaves or Flowers from the former, excepting in these following particulars, the Leaves do not appear so fed at first budding out of the Ground, nor are so dark when they are fully grown, the Stalk also has commonly more store of Flowers thereon, the color of which at their first budding is a little dusky, and when they are full blown are of a bleak, yet bright Ash color, with a little shew of purple in them, and by long standing change a little more grey, being still as sweet, or sweeter, as some think, than the former.

V. *The third, or Great Red Musk'd Grape Flowered Jacinth.* This Plant in its Root, Leaves, Stalk, Pedicels, Seed, and manner of growing, is absolutely like to the first, excepting only in the color of the Flowers, for that this when its Flowers are blown are of a red color, tending to a yellow.

VI. *The fourth, or Great White Musk'd Grape Flowered Jacinth.* The Root of this (as well as the Root of the third foregoing) does not usually grow so large as the Root of either of the first two, in all other respects it is like to them, the Leaves are like unto the second kind, but they are of a little whiter green, the Flowers also are like in form and manner of growing, but of a pale color, tending to a white.

VII. *The Places.* The Roots of the two first have often been brought from Constantinople to us, and possibly may come thither from beyond the Bosphorus in Asia, but with us they are nursed up only in Gardens, the latter two sorts are thought to be degenerated from the first two Kinds, to wit, from their Seed coming to ripeness in our Country, and so down here.

VIII. *The Times.* They Flower in March and April, according to the warmth or temperature of the Season, but the first of them springs first out of the Ground.

IX. *The Qualities and Virtues.* Galen Lib. 8. Simp. Med. says its temperature is hotter than that of the *Bellus Esculentus*, or *Ornithogalum luteum*, and *Dioscorides* says that the Root eaten, or the Decoction thereof drunk, cures Diseases of the Bladder, but that it causes Vomiting, without doubt it ought to be applied by a Wife and Prudent Hand; outwardly, made into an Ointment, it is good against the Kings-Evil, for by daily anointing therewith it dissolves and consumes those scrophulous Tumors, Kernels, or Swellings.

C H A P. CCCXCIV.

OF JACINTH Haired.

THE Names. It is called in Greek *Ἰακίνθος*, in Latine *Hyacinthus Comosus*, in English The Haired Jacinth.

11. *The Kinds.* There are five several sorts of the Haired Kind, viz. 1. *Hyacinthus Comosus albus*, The White Haired Jacinth. 2. *Hyacinthus Comosus Byzantinus*, The Turkey Fair Haired Jacinth. 3. *Hyacinthus Comosus major purpureus*, of some its called only *Hyacinthus major*, and of others *Hyacinthus Comosus major*, but we in English call it The Purple, or Great Purple Fair Haired Jacinth, because of its Tufts or Tassels of purple Threads like Hairs at the top. 4. *Hyacinthus Comosus Ramosus purpureus*, some call it only *Hyacinthus Comosus Ramosus*, others *Hyacinthus Calamistratus*, others *Hyacinthus Comosus Parnassi*, The Fair Haired Branched Jacinth. 5. *Hyacinthus Comosus Elegantior*, *Hyacinthus Comosus Ramosus Elegantior*, *Hyacinthus Pennatus*, and *Hyacinthus Comosus Parnassi*, Fair Curled Haired Jacinth; some will have it to be called also *Hyacinthus Calamistratus*, others think *Cinnatus* more fit and proper, for that the curled Threads which seem like Hairs are better expressed by the Word *Cinnus*, which signifies the curled bush of Hair it self, than by the Word *Calamistrum*, which signifies only the Crisping-Pin or Instrument, wherewith of Old they used to trizze or curl the Hair.

III. *The Descriptions.* The first, or White Haired Jacinth. It has a bulbous blackish Root, a little long and round, from whence rise up three or four Leaves, smooth and whitish, long, narrow, and hollow, like a Trough or Gutter on the upper side, from among which springs up the Stalk, about a Foot or more high, bearing at the top several Flowers, small, and somewhat like to the Grape Flower, but not so thick set together, being a little longer and larger, and wider at the mouth, and as it were divided into six edges, of a dark whitish color, with some blacker spots about the brims on the inside; the Heads or Seed Vessels are three-square, and somewhat larger than the Heads of any of the former Lesser Grape Flowers in Chap. 392. in which are contained round black Seed; this Jacinth does more nearly resemble

femble the *Grape Flowered Jacinth* juſt above named than the *Hair Flowered Jacinth* which follow, and which Name it bears for that it has no Hairs or Threads at the top of the Stalk, or ſides, as they have; but becauſe Authors have given it this Name we thought not fit to change it, and therefore have put it into the Claſſis of *Haired Jacinth*, as ſome others have done.

Jacinth Haired Fair White, or Turkey.

IV. *The ſecond, or Turkey Fair Haired Jacinth.* It has a bulbous Root, like the former, but it is bigger, and larger alſo in its Leaf and Flower, and bears greater ſtore of Flowers on the head of the Stalk; the lower Flowers, altho' they have ſhort Stalks at their firſt flowering, yet afterwards the Stalks grow longer, and thoſe which are lower ſtand out farther than thoſe which are higheſt, whoſe footſtalks are ſhort, and almoſt cloſe to the Stem, and of a more perfect Purple than any below, which are of a duſky, greeniſh, Purple Color; the whole Stalk of Flowers does ſometimes ſeem like a *Pyramis*, broad below and ſmall above, yet neither of theſe *Jacinths* have any Threads at the tops of the Stalks, as the others following have; this *Jacinth* came from *Conſtantinople*, and is ſomething like to that before deſcribed, ſaving that it is every way bigger.

V. *The third, or Great Purple Fair Haired Jacinth.* It has a great bulbous white Root, with ſome redneſs on the outside; it is a Fair Haired *Jacinth*, whoſe Leaves are ſofter, longer, broader, and leſs hollow than the former, lying for the moſt part upon the Ground; the Stalk riſes up from amidſt the Leaves, being ſtronger, higher, and bearing a greater and longer Head of Flowers alſo than they; the Flowers of this ſtand not upon ſuch very long Footſtalks, but are ſhorter below, and cloſe almoſt to the Stalk above, having many bright, purpliſh, blew Threads, growing higheſt above the Flowers, as it were in a buſh together, every one of theſe Threads having a little Head at its end, ſomewhat like unto one of the Flowers, but much ſmaller; the reſt of the Flowers below this Buſh are of a ſadder or deader Purple, and not of ſo bright a Color, and the loweſt worſt of all, rather inclining to a green, like unto the laſt *Turky Kind*; the whole Stalk with the Flowers up-

on it does ſomewhat reſemble a long Purple Taſſel, and therefore ſeveral Perſons have ſo Named it; the Heads and Seeds are like to that juſt aforegoing, but greater.

VI. *The fourth, or Fair Haired Branched Jacinth.* Its Root is greater and ſhorter than that of the next, and encreaſes ſaſter; the Leaves hereof are broader, ſhorter, and greener than of the laſt, not lying ſo weakly on the Ground, but ſtanding ſomething more upright; the Stalk riſes up as high as the former, but branched out on every ſide into many Tufts of Threads, with Knops, as it were Heads of Flowers, at the ends of them, like unto the Head of Threads at the top of the former *Jacinth*, but of a little darker, and not ſo fair a blew with purple color; this *Jacinth* does ſometimes reſemble the next *Curl'd Hair'd Jacinth*, but that the Branches are not ſo fairly compoſed altogether of curled Threads, nor of ſo excellent a fair Purple, or Dove Color, but of a much more duſky hue.

VII. *The fifth, or Fair Curl'd Hair'd Jacinth.* It has a bulbous Root, not ſo great as the laſt, but white on the outside; it is an admirable *Jacinth*, and riſes up with three or four Leaves, ſomething like unto the Leaves of the *Musked Grape Flowered Jacinth*, but leſſer, from between which Leaves riſes up the Stalk, about a Foot high, or ſomewhat more, bearing at the top a Buſh or Tuft of Flowers, which at the firſt appearing is like unto a *Cone*, or *Pine-Apple*, and afterwards opening it ſelf ſpreads into many Branches, yet ſtill retaining the form of a *Pyramis*, being broad ſpread below and narrow above; each of theſe Branches are again divided into many Tufts of Threads or Strings, twiſted or curled at the ends, and of an excellent Purple or Dove Color, both Stalks and Hairs; this continues a great while in its beauty, but afterwards all theſe Flowers (it you will ſo call them) do fall away without any Seed at all, ſpending it ſelf as it were in its abundance of Flowers.

VIII. *The Places.* The two firſt have been ſent to us from *Conſtantinople*, the third is found wild in many places of *Europe*, as well in *Germany* as in *Italy*; the native places of the two laſt are as yet unknown; they all grow and are nurſed up with us in Gardens only.

IX. *The Times.* The three firſt Species do Flower in *April*, the two laſt Kinds in *May*.

CHAP. CCCXCV.

OF JACINTH Oriental Single.

I. *THE Names.* It is called in *Greek* *ῥάδιον*, in *Latine* *Hyacinthus Orientalis*, in *Engliſh* *The Oriental Jacinth*.

II. *The Kinds.* Of this there are eight ſeveral Species, viz. 1. *Hyacinthus Orientalis Brumalis*, ſive *Præcox Flore albo*, The White Winter Oriental Jacinth. 2. *Hyacinthus Orientalis Brumalis*, ſive *Præcox Flore Purpureo vel Caruleo*, The Purple Winter Oriental Jacinth. 3. *Hyacinthus Orientalis vulgaris præcox*, diſtius *Zumbul Indi*, & *Indicum*, alſo corruptly *Simboline*; the *Turks* call all *Jacinths Zumbul*, and by adding the Title of *Arabi*, or *Indi*, ſhew from what place they originally came, The Greateſt Oriental Jacinth. 4. *Hyacinthus Orientalis vulgaris diverſorum Colorum*, The Ordinary Oriental Jacinth. 5. *Hyacinthus Orientalis Flore Purpureo Violaceo Lineis albicantis in dorſo*, The Purpliſh Violet Oriental Jacinth. 6. *Hyacinthus Orientalis Floribus antrorſum reſpicientibus*, The Oriental Jacinth whoſe Flow-

ers open all one way. 7. *Hyacinthus Orientalis serotinus Floribus erectis diversorum colorum*. The late Flowering Oriental Jacinth. 8. *Hyacinthus Orientalis Folioso Caule*. The Bushy or Leafy Stalked Oriental Jacinth.

Jacinth Oriental Winter White.

Jacinth Oriental Winter Purple or Blew.

III. The Descriptions. The first, or White Winter Oriental Jacinth. It has a bulbous Root, which

sends forth green Leaves, (which are in all respects like to the Ordinary Oriental Jacinths, but something narrower) before Winter, and sometimes is in its Flower also in the middle or beginning of Winter, and is in form and color a plain White Oriental Jacinth, but somewhat lesser, differing in no other particulars, but in the time of its Flowering, which is always certain to be long before the other Kinds.

IV. The second, or Purple Winter Oriental Jacinth. In its Root, Stalk, Leaf, and Flower, it is like to, and shews it self to be of the Stock or Kindred of Oriental Jacinths; the difference of color in this Flower makes it to be distinguished chiefly, and it is, as the former, more early than the rest which follow, this seems to be the very self same Kind with the former, saving that this has fine blewish purple Flowers, whereas that has white.

V. The third, or Greatest Oriental Jacinth. The Root of this Jacinth is usually greater than any other of its Kind, and most commonly white on the outside, from which rise up one or two great round Stalks, spotted from within the Ground, with the lower part of the Leaves also upward to the middle of the Stalks, or rather higher, like unto the Stalks of Dragons, but darker, being set among a number of broad, long, and somewhat hollow green Leaves, almost as large as the Leaves of the White Lilly; at the tops of the Stalks stand more Rote of Flowers than in any other of this Kind, every Flower being as great as the greatest sort of Oriental Jacinths, ending in six Leaves, which turn at the points, of a fair blewish purple color, and all standing many times on one side of the Stalks, and many times on both sides.

VI. The fourth, or Ordinary Oriental Jacinth. It has a Root which is great, and white on the outside, and oftentimes purplish also, flat at the bottom and small at the head; it has many green Leaves, long, somewhat broad, and hollow, from among which rises up a long, green, round Stalk, beset from the middle thereof almost with several Flowers, standing on both sides of the Stalks one above another unto the top, each of which next unto the Footstalk is long, hollow, round, and close, ending in six small Leaves, laid open, and a little turning at the points, of a very sweet smell, the Colors of these Flowers are divers, for some are pure white, without a shew of any other color in them, another is almost white, having a shew of blewness, especially at the brims and bottoms of the Flowers, others are again of a very faint blush, tending towards a white, some are of as deep a purple as a Violet, others of a purple, tending to redness, and some so pale a blew, as it were more white than blew; after the Flowers are past three square Heads appear, bearing round black Seed, great and shining; this is called the Common Oriental Jacinth, because it is now so plentifully to be found in all Gardens, that it is not very much esteemed; of this Species are the three next following sorts.

VII. The fifth, or Purple Violet Oriental Jacinth. It is very much like the fourth Kind, but its Flowers are of a deep purplish Violet color, having whitish lines down the back of every Leaf of the Flower, which turn themselves a little backwards at the points.

VIII. The sixth, or Oriental Jacinth whose Flowers open all one way. This in its Root, Stalk, and Leaves, is like the fourth Species foregoing, but in this it differs, viz. that its Flowers stand and open all one way, and not on all sides, as several other Jacinths do, and are therefore herein like to the Great Zumbul Indi before described.

IX. The seventh, or Late Flowering Oriental Jacinth. This, which seems to be a Species also of the fourth Kind, Flowers later than all the rest of them, and

and the Flowers are smaller, and stand more upright, and they are either white or blew, or mix'd with white and purple.

X. *The eighth, or Bushy or Leafy Stalked Oriental Jacinth.* This *strange Jacinth has its Roots, Leaves, and Flowers, like unto the former Oriental Jacinths, but the chief difference is in this*, that its Stalk is not bare or naked, but has very narrow long Leaves, growing upon it dispersedly and without order, with the Flowers thereon, which are blew, and having for the most part one Leaf, and sometimes two at the foot, or setting on of every Flower, yet sometimes it chances some Flowers to be without any Leaf at the bottom, as it pleases Nature, which in this Plant is very variable; the Heads and Seed are black and round, like to those of the other *Jacinths*.

XI. *The Places.* All these Plants have been brought to us out of *Turky*, and from *Constantinople*, but the place of their true original is scarcely known, with us they grow only in Gardens.

XII. *The Times.* The two first Flower the earliest, sometimes before *Christmas*, but more usually after, and thro' the whole Month of *January*, and later sometimes, they abide a great while in Flower, and in great beauty, more especially if the Weather is mild, when few or scarcely any other Flowers are able to appear; the third Kind Flowers also earlier than any of those which follow; the other *Ordinary Kinds* Flower some from the middle to the end of *February*, some in *March*, and some in *April*.

C H A P. CCCXCVI.

Of JACINTH Oriental Double.

I. *THE Names.* It is called in Greek *ῥάκωθος*, *ῥακωθὸς*, in Latine *Hyacinthus Orientalis duplex*, *Hyacinthus Orientalis Flore duplici*, in English *The Double Oriental Jacinth*.

II. *The Kinds.* This Double Kind is threefold, viz. 1. *Hyacinthus Orientalis Flore duplici*, The Once Double Bleak Oriental Jacinth. 2. *Hyacinthus Orientalis Flore pleno Ceruleo vel Purpureo Violaceo*, The Fair Double Blew or Purple Oriental Jacinth. 3. *Hyacinthus Orientalis Flore pleno candidissimis*, The Pure White Double Oriental Jacinth.

III. *The Descriptions.* The first, or Once Double Oriental Jacinth, has a bulbous Root, like the former Single Kinds, it has several long Leaves, like unto the other Oriental Jacinths almost, standing upright, among which rises up a Stalk, brownish at first, but growing green afterwards, bearing many Flowers at the top, made like the Flowers of the former Jacinths, and ending in six Leaves, green at the first, and of a blewish white when they are open, yet retaining some shew of greenness in them, the brims of the Leaves being white, from the midst of each Flower stands forth another small Flower, consisting of three Leaves, of the same color with the other Flower, but with a green line on the back of each of these inner Leaves; in the middle of this little Flower some Threads stand, which are tipped with black, the smell of this Flower is not so sweet as those of the former Single Kinds, but the Heads and Seed are very like to them.

IV. *The second, or Fair Double Blew or Purple Oriental Jacinth.* The Leaves of these Jacinths are

smaller than the Leaves of most of the other Oriental Sorts, whether Single or Double, the Stalks are shorter and smaller, bearing but three or four Flowers on the Heads of them for the most part, which are not composed like the last, but are more fair, full, and double of Leaves, where they shew out their full beauties, and of a fair blew color in some, and purple in others, smelling pretty sweet, but these do seldom hear out their Flowers fair, and besides have several other Flowers, which will be either single or very little double upon the very same Stalk.

V. *The third, or Pure White Double Oriental Jacinth.* This Double White Flower or Plant has its Leaves like unto the Single White Oriental Jacinth in the former Chapter, its Stalk is likewise long, slender, and green, bearing at the top two or three Flowers at most, very double, and full of Leaves, of a pure white color, without any other mixture therein, hanging down their Heads a little, and of a reasonable sweet smell.

VI. *The Places.* They came hither from *Constantinople*, but which is their native place of growth is uncertain, with us they are only nursed up in Gardens.

VII. *The Times.* Some of them Flower in *March*, and some in *April*, and some sooner, like as some of the latter Single Kinds do.

C H A P. CCCXCVII.

Of JACINTH Summer.

I. *THE Names.* It is called in Greek *ῥάκωθος*, *ῥακωθὸς*, in Latine *Hyacinthus Aëstris*, and in English *Summer Jacinth*.

II. *The Kinds.* There are five Kinds of the Summer Jacinth, viz. three Small Oriental Summer Jacinths, and two Starry Summer Jacinths. 1. *Hyacinthus Hispanicus minor Orientalis facie*, *Hyacinthus Orientalis serotinus minor*, The Little Summer Oriental Jacinth. 2. *Hyacinthus Hispanicus minor Flore albo*, The Small White Summer Oriental Jacinth. 3. *Hyacinthus Hispanicus minor Flore rubente*, The Small reddish Colored Oriental Jacinth. 4. *Hyacinthus Stellatus Aëstris major*, *Hyacinthus Lusitanicus major*, The Greater Summer Starry Jacinth. 5. *Hyacinthus Stellatus Aëstris minor*, *Hyacinthus Lusitanicus minor*, The Lesser Summer Starry Jacinth.

III. *The Descriptions.* The first, or Little Summer Oriental Jacinth. It has a bulbous Root, which is small and white; from which rises up four or five long, narrow, green Leaves, lying upon the Ground, among which rises up a slender smooth Stalk, about a Span high, or more, bearing at the top many slender bleak blew Flowers, with some white stripes and edges to be seen in most of them, fashioned very like unto the Flowers of the Oriental Jacinth, but much smaller, the Flowers have no smell at all, and the Seed is like the Seed of the English Jacinth, or Haresbells.

IV. *The second, or Small White Summer Oriental Jacinth.* This seems to be of the same Kind with the former, being in Root, Leaf, Stalk, Flower, and manner of growing, the same with it, and differs nothing therefrom but in the color of the Flower, which is purely white.

V. *The*

V. *The third, or Small reddish Colored Oriental Jacinth.* It is another of the same Kind, whose Flowers are of a fine delayed color, with some deeper colored Veins running along the three outward Leaves of the Flower, and differing in no other particulars from the first of these Summer Jacinths.

VI. *The fourth, or Greater Summer Starry Jacinth.* It has a Root which is round and white, having some long thick Roots under it, besides the Fibres, as is usual in many other Jacinths; from this Root rises up several narrow green Leaves, lying upon the Ground, somewhat like the Leaves of the English Jacinth, or Haresbells, but stiffer and stronger, among which rises up a round stiff Stalk, bearing many Flowers at the top thereof, and at every footstalk of the Flowers a small short Leaf, of a purplish color; the Flowers are Star-like, of a fine delayed purplish color, tending to a pale Blew, or Ash Color, striped on the back of every Leaf, and having a pointed Umbone in the middle, with some whitish purple Threads about it tipped with blew; the Seed is black, round, and thinning, like unto the Seed of the English Jacinth, or Haresbells, but not full out so big.

VII. *The fifth, or Lesser Summer Starry Jacinth.* It has a small bulbous Root, and white, covered with a brown Coat, and having some such thick Roots among the Fibres as are among the others; this Lesser Jacinth has several very long, narrow, and shining green Leaves, spread upon the Ground round about the Root, from among which rises a very short round Stalk, not above two or three Inches high, bearing six or seven small Flowers thereon on each side of the Stalk, like both in form and color unto the Greater Summer Jacinth before described, but lesser by far; the Seed is black, and contained in three cornered Heads or Husks.

VIII. *The Places.* The first three have been gathered on the Pyrenean Mountains, on those sides next to Spain, from whence they have been brought to us; the fourth and fifth grow naturally in Portugal, and from thence have been transplanted into our Gardens.

IX. *The Times.* The first three Flower very late in respect to the Early Flowering Jacinths, viz. in May or June for the most part; the two latter Flower also in May, towards the latter end of it, and sometimes also in June, and their Seed is ripe in July.

is reasonable great, and white on the outside, with many strong white Fibres at it; which perish not Yearly as the Fibres of many other Jacinths do; it springs late out of the Ground, bearing four or five short, hollow, and soft, whitish green Leaves, with a white line in the middle of every one of them, from among which rise up one or more Stalks, bearing several Flowers at their tops, all looking one way, or standing on one side, hanging down their heads, consisting of six Leaves, three of which, being the outwardmost, lay open their Leaves and turn back their ends a little, the other three Leaves, which are innermost, do as it were close together in the middle of the Flower, without laying themselves open at all, being a little whitish on the edges; the whole Flower is of a purplish yellow color, with some white and green as it were mixed amongst it, of no smell at all; after the Flowers are past great three cornered and bunched out Heads or Husks come in their places, which contain black and flat Seed; this Plant as it springs up late, so it keeps its green Leaves almost until Winter.

IV. *The second, or Barbary Brown Colored Jacinth.* This Plant in its Root, Leaves, Stalks, Flowers, Seed, and manner of its growing, and in all other respects (except its magnitude) is very like the former, nor does it differ at all from it, but that this is every ways much greater.

V. *The third, or Ethiopian Dun or Dusky Colored Jacinth.* Its Root is bulbous, and like the former, its Leaves are stronger and greener than it, and the Stalk also thicker, bearing divers Flowers, confusedly standing upon longer footstalks, yet made after the same fashion, but that the three inner Leaves are whitish, and dented about the edges, otherwise the Flowers are greenish on the inside.

VI. *The Places.* The native Country of the first of these is Spain, the second is a native of Barbary, growing about Fez and Morocco, the third is a native of Ethiopia, and was brought hither from the Cape of Goodhope; with us they are only nursed up in Gardens.

VII. *The Times.* The first Flowers not until June, because it springs late out of the Ground, as aforesaid, holding its green Leaves all September, the Seed ripening in the mean season; and much about the same times the other two Flower and Seed.

C H A P. CCCXCVIII.

Of JACINTH Dun or Brown.

I. *THE Names.* It is called in Greek *ῥάκινθος*, in Latine *Hyacinthus fuscus vel obsolatus*, in English *The Dun or Brown Colored Jacinth*.

II. *The Kinds.* There are three Species of this Plant, viz. 1. *Hyacinthus Hispanicus Coloris obsolatoris*, *Hyacinthus Hispanicus obsolatus vel fuscus*, The Spanish Dun or Brown Colored Jacinth. 2. *Hyacinthus Mauritanicus fuscus vel obsolatus*, The Barbary Brown Colored Jacinth. 3. *Hyacinthus Aethiopicus fuscus vel obsolatus*, *Hyacinthus Aethiopicus maximus*, The Ethiopian Dun or Dusky Colored Jacinth.

III. *The Descriptions.* The first, or Spanish Dun or Brown Colored Jacinth, has a bulbous Root, which

C H A P. CCCXCIX.

Of JACINTH Starry Common.

I. *THE Names.* It is called in Greek *ῥάκινθος*, in Latine *Hyacinthus Stellatus*, and in English *The Starry Jacinth*.

II. *The Kinds.* There are six generic Species of the Starry Jacinths, viz. 1. *Hyacinthus Stellatus Aethiops*, three Species of which we have already Treated of among the Summer Jacinths in Chap. 397. aforesaid. 2. *Hyacinthus Stellatus Communis*, The Common Starry Jacinth, of which in this Chapter. 3. *Hyacinthus Stellatus Americanus*, The American Starry Jacinth, of which in Chap. 400. 4. *Hyacinthus Stellatus Byzantinus*, The Turkey Starry Jacinth, of which in Chap. 401. 5. *Hyacinthus Stellatus Autumnalis*, The Autumn Starry Jacinth, of which in Chap. 402. 6. *Hyacinthus Stellatus Lilifolius*, The Lilly Leav'd Starry Jacinth, of which we shall Treat in Chap. 403. following.

III. *The*

III. *The Kinds of the Common Starry Jacinth.* Of this there are seven Species or Sorts, viz. 1. *Hyacinthus stellatus communis*, sive *Bisfolius Fuchsi*, *Hyacinthus stellatus Fuchsi*, *Hyacinthus stellatus Germanicus*, The Common Blew Starry Jacinth. 2. *Hyacinthus stellatus flore albo*, The White Flowered Starry Jacinth. 3. *Hyacinthus stellatus flore rubente*, The Blush Colored Starry Jacinth. 4. *Hyacinthus stellatus Martius*, sive *Præcox Ceruleus*, The Early Blew Starry Jacinth. 5. *Hyacinthus stellatus præcox flore albo*, The White Early Starry Jacinth. 6. *Hyacinthus stellatus flore niveo, vel albissimo*, The Purely White Starry Jacinth. 7. *Hyacinthus stellatus præcox flore suave rubente*, The Early Blush Colored Starry Jacinth.

Starry Jacinth Common

IV. *The Descriptions.* The first, or Common Blew Starry Jacinth. Its Root is bulbous, somewhat long, and covered with a yellowish Coat; it rises out of the Ground commonly with but two brown Leaves, yet sometimes with three, inclosing within them the Stalk of Flowers, the Buds appearing of a dark whitish color as soon as the Leaves open themselves, which Leaves being grown are long and hollow, of a whitish green on the upper side, and brown on the under side, and half round, the brown Stalk rising up higher, bearing five or six small Star like Flowers, consisting of six Leaves, of a fair deep blew, tending to a purple; the Seed is yellowish and round, contained in round pointed Heads or Husks, which by reason of their heaviness and the weakness of the Stalk lie upon the Ground, and often perish with Wet and Frost; this Starry Jacinth has been longest known, and is the most common.

V. *The second, or White Flowered Starry Jacinth.* This White Kind has its Leaves like the former, but green and fresh, not brown, and also a little narrower; the Buds for the Flowers appear at first a little bluish, but when they are blown they are white, but yet retain in them a small shew of that bluish color.

VI. *The third, or Blush Colored Starry Jacinth.* This in its Root, Leaves, and Stalk, is exactly like the former, and differs nothing therefrom but in the Flowers, which are of a fair bluish color, much more eminent than in the others, in all other particulars it is exactly alike.

VII. *The fourth, or Early Blew Starry Jacinth.* Its Root is bulbous, and a little whiter than the others on the outside; its Leaves are also a little broader, of a fresher green, and not brown at all, as the first Blew Jacinth aforegoing is; the Buds of the Flowers while they are inclosed within the Leaves, and after when the Stalk is grown up, do remain more blew than the Buds of the former; the Flowers when they are blown open are like the former, but something larger, and of a more lively blew color; this Kind of Jacinth does more seldom bear Seed than the others aforegoing.

VIII. *The fifth, or White Early Starry Jacinth.* This is also one other of the fourth Kind, the green Leaves whereof are a little narrower than the former, and its Flowers are purely white, in any other respect there is no difference from it at all.

IX. *The sixth, or Purely White Starry Jacinth.* This seems to be a Species of the second Kind aforegoing, its Leaves are of a pale fresh green, and a little narrower than those, and its Flowers are smaller than them, and of a pure Snow white color.

X. *The seventh, or Early Blush Colored Starry Jacinth.* The Root is bulbous, and like to the other Starry Jacinths; the Leaves differ not from the fifth Kind, or White Early Starry Jacinth, and its Flowers are bluish colored, and as large as those of the fifth Kind, and somewhat larger than the Flowers of the fourth Kind; this Blush Colored Jacinth is very rare, but it is very pleasant.

XI. *The Places.* All these Jacinths have been found in the Woods and Mountains of Austria, Bohemia, Germany, &c. as Fuchsius and Gesner affirm, and in Italy, near Naples, as Imperatus and others say, but with us they are all of them nursed up in Gardens, more especially the White and Blush Kinds, for that they are more tender, and therefore require the more care to keep them from perishing.

XII. *The Times.* The first, second, and sixth Kinds Flower much about the middle of February, if the Weather is mild and gentle, the other Kinds about fourteen or twenty days after, viz. in March, but many times as early as the first three.

C H A P. CCCC.

Of JACINTH Starry Peruvian.

THE Names. It is called in Greek *Ἰακίνθος*, sive *ἰακίνθος*, in Latine *Hyacinthus Eriophorus*, vel *Hyacinthus Laniferus*, *Eriophorus Peruanus*, *Hyacinthus Stellatus Peruanus* vel *Americanus*, *Hyacinthus Peruanus*, *Hyacinthus Stellatus Beticus*, in English The American or Peruvian Starry Jacinth, and The Spanish Starry Jacinth.

II. *The Kinds.* We make four several Species of this Plant, viz. 1. *Hyacinthus stellatus Ceruleus Peruanus major*, *Hyacinthus Ceruleus stellatus Beticus major*, *Hyacinthus Ceruleus Americanus major*, The Greater Blew Starry American or Peruvian Jacinth, The Greater Blew Starry Spanish Jacinth. 2. *Hyacinthus stellatus Peruanus flore albo*, *Hyacinthus stellatus Albus Beticus*, The Great White Peruvian

uvian Starry Jacinth, The Great Spanish White Starry Jacinth. 2. *Hyacinthus Stellatus Peruanus* Flore Carneo, *Hyacinthus Stellatus Baticus Flore Carneo*, The Great Bluff Colored Starry American or Peruvian Jacinth, The Great Bluff Colored Starry Spanish Jacinth. 4. *Hyacinthus Eriophorus*, sive *Laniferus*, *Bulbus Eriophorus* vel *Laniferus*, The Woolly Jacinth.

Great Blew Starry Jacinth of Peru.

III. The Descriptions. The first, or Greater Blew Starry American or Peruvian or Spanish Jacinth. It has a great bulbous Root, and somewhat yellowish on the outside, with a knob or bunch at the lower end of the Root, (which is called the seat of the Root) like unto that of the Muscari, or Scylla, and many other bulbous Roots, from which hang down several white, thick, and long Fibres, by which it is fastened into the Ground, which perish not every Year, but abide continually, and therefore does not desire much removing, from this Root spring up five or six or more very broad and very long green Leaves, spread upon the Ground round about the Root, which being broken are woolly, or full of very fine Fibres, (whence came part of the Greek Name) from the middle of these Leaves rises up a round short Stalk, (in comparison of the greatness of the Plant, for the Stalk of the Oriental Jacinth is sometimes twice as high, whose Root is not so great) bearing at the top a great Head or Bush of Flowers, fashioned in the beginning, before they are blown or separated, very like to a Cone, or Pine-Apple; they begin to Flower below, and so upwards by degrees, every Flower standing upon a long blackish blew footstalk, which when they are blown open are of a perfect blew color, tending to a Violet, and made of six small Leaves laid open like a Star; the Threads likewise are blewish, tipped with yellow Pendants, standing about the middle Head, which is of a deep blew, not having any pleasant smell to be perceived in it, but commendable only for the beauty of the Flowers; after the Flowers are past threefourth or cornered Heads come in their places, containing round black Seed; this Jacinth is the greatest of those whose Flowers are spread like a Star, except the

two first American ones described in Chap. 391. foregoing.

IV. The second, or Great White Peruvian Jacinth. The Roots and Seed of this are like unto the former, so it is also in most of its other parts, but that its Leaves are not so large, nor of so deep a green, the Stalks of Flowers likewise have not such thick Heads or Bushes on it, but the Flowers are fewer and thinner set, the Flowers themselves also are whitish, yet having a small dash of bluish in them, and the Threads are whitish, tipped with yellow Pendants, these are the chief particulars in which it differs from the former.

V. The third, or Great Bluff Colored Starry American or Peruvian Jacinth. This is found growing among the other, and differs but little from the two former, but only in the color of the Flowers, for this has its Head of Flowers as great and large as the first, but the Buds of its Flowers before they are open are of a deep bluish color, which being completely opened are more delayed, and of a pleasant pale purple or bluish color, standing upon purplish Footstalks; the Heads in the middle are whitish, and so are the Threads encompassing it, tipped with yellow.

VI. The fourth, or Woolly Jacinth. Its Root is bulbous and white, somewhat like to the Root of a Muscari, which is as full of Wool or fine fibres as the Leaves, or rather more than they, or any other part of it; this Woolly Jacinth has many broad, long, and fair green Leaves, very like unto some of the Jacinths, but stiffer, or standing more upright, which being broken do yield a multitude of small, fine, soft Fibres, as if a little fine Cotton Wool was drawn out, from among these Leaves rises up a long, round, green Stalk, a Foot and half high, or more, on which is set a great long Bush of Flowers, which blowing open by degrees, first below, and so upwards, are very long in flowering; the top of the Stalk with the Flowers, and their little small Footstalks, are all blew, every Flower standing outright with its Stalk, and spreading like a Star, divided into six Leaves, having many small blew Threads standing about the middle Head, which, as far as is yet discovered, never yet gave ripe Seed.

VII. The Places. The first has been formerly Named *Eriophorus Peruanus*, and *Hyacinthus Stellatus Peruanus*, The Starry Jacinth of Peru, and the three first are generally known and received by the Name of *Hyacinthus Peruanus*, for which reason we also have retained it; but all the first three grow naturally in Spain, in the Meadows not far from the Sea, as also in the Island of Gades, commonly called Cales, as likewise in other parts along the Sea side going from thence to Port St. Maria, which when they are in Flower grow so thick together, that they seem to cover the Ground, as Guil. Boel affirms, who says that himself gathered these and many others in the places named with his own Hands, but saying withal that the White and Bluff Colored are far more rare than the Blew, or first Kind; yet notwithstanding all that has been hitherto said, it is very probable that they have been found growing also in Peru, otherwise they could never have so generally obtained that Name, with us they are only nursed up in Gardens, the fourth has many times been sent out of Turkey into England, where in our Gardens it has flourished for a long time, as well as several others; 'tis possible that that in Theophrastus Lib. 7. Cap. 13. is this very Plant, where he declares that Garments were made of the woolly substance of a bulbous Root taken from between the Core or Heart of the Root and the outermost Coats or Peelings; but Cuspus will have this *Bulbus Eriophorus*,

phorus, or *Luniferus*, or *Woolly Jacinth*, to be a Species of the first Kind in this Chapter, for which reason we have put it in this place among the *Peruvian* Kinds, it being a *Jacinth* both in its Root, Leaf, and Flower.

VIII. *The Times.* The first three Flower in *May*, and the Seed is ripe in *July*; the fourth Flowers not often, and is rare to be seen Flowering with us, but when it does Flower it Flowers also in the Month of *May*, as the others do.

C H A P. CCCC I.

of JACINTH Starry Turkey.

I. *THE Names.* It is called in *Greek* *Ἰακίνθος*, in *Latine* *Hyacinthus Stellatus Byzantinus*, and in *English* *The Turkey Starry Jacinth*, *The Starry Jacinth of Constantinople*.

II. *The Kinds.* There are four Species of this Plant, viz. 1. *Hyacinthus Stellatus Byzantinus Radice nigra*, *The Turkey Starry Jacinth with a black Root*. 2. *Hyacinthus Stellatus Byzantinus major*, *The Greater Starry Jacinth of Constantinople*. 3. *Hyacinthus Stellatus Byzantinus alter*, *Hyacinthus Flore Boraginis*, *The other Turkey Starry Jacinth*, or *Starry Jacinth of Constantinople*. 4. *Hyacinthus Stellatus Constantinopolitanus Flore Cinereo*, *Hyacinthus Stellaris Someri*, *The Turkey Ash Colored Starry Jacinth*, or *Somer's Starry Jacinth*.

III. *The Descriptions.* The first, or *Turkey Starry Jacinth* with a black Root. It has a Root which for the most part does run downwards, something deep into the Ground, from which rise up several fresh, green, thin, and long Leaves, of the bigness of the *English Jacinth*, but not so long, between which rises up a slender low Stalk, bearing five or six Flowers, dispersedly set thereon, spreading open like a Star, of a pale or bleak blew color; the Leaves of the Flowers are somewhat long, and stand as it were somewhat loosely, one off from another, and not so compactly together as the Flowers of other Kinds; it seldom bears with us ripe Seed, because the Heads

are so heavy, that lying upon the Ground they rot with the Wet, or are bitten with the Frosts, or both, so that they seldom come to good; the Root is small in some, and reasonable big in others, round and long, white within, but covered with deep reddish or purplish peelings next unto it, and darker and blacker purple on the outside, with some long and thick white Fibres like Fingers hanging at the bottom of them, as is to be seen in many other *Jacinths*.

IV. *The second, or Greater Starry Jacinth of Constantinople.* The Root of this is like the former, saving that it is not black on the outside, as the other, but three times bigger; this *Jacinth* may truly be referred to the former *Jacinth of Constantinople*, and called the *Greater*, it is so very like thereunto, that any one who knows that cannot but know or think that this is another of that sort, but greater, as it is in all its parts, bearing larger Leaves by much, and more store, lying upon the Ground round about the Root; it bears many low Stalks of Flowers, as bleak and standing as loosely as the former.

V. *The third, or Other Turkey Starry Jacinth, or Starry Jacinth of Constantinople.* Its Root is of a dark whitish color on the outside, and sometimes a little reddish within; it has for the most part only four Leaves, broader and greener than the first, but not so large or so long as the second; the Stalk has five or six Flowers upon it, bigger and rounder set, like other *Starry Jacinths*, of a more perfect or deeper blew than either of the former, having a whitish green Umbone or Head in the middle, beset with six blew Chives or Threads tipped with black, so closely encompassing the Umbone or Head, that the Threads seem to be so many pricks stuck into a Club or Head, some have therefore liken'd it to a *Borage* Flower, and so have called it; after the Flowers are past come up round white Heads, in which is contained round and white Seed.

VI. *The fourth, or Turkey Ash Colored Starry Jacinth, or Somer's Starry Jacinth.* Its Root is like to that of the *English Jacinth*, or *Haresbells*, being great, round, and white, so like that it is hard to know the one from the other; its Leaves are also very like to the Leaves of the *English Jacinth*, and spread themselves upon the Ground in the same manner, from among which rise up one or two Stalks, replenished at top with a number of small Star like Flowers, bushing out more below than above, of a very pale or white Blew, tending to an Ash Color, and very sweet in smell; the Seed is black and round, like unto the Seed of the *English Jacinth*, or *Haresbells*.

VII. *The Places.* The Titles of the three first shew you their native places, the third of them, as *Lobel* says, was brought to *England* from *Constantinople* by the Lord *Zouch*; the fourth *Somer's* brought from *Constantinople*, or out of *Italy*, as *Lobel* says, into the Low Countries, from whence it has been brought to us, but they all flourish admirably well in our Gardens.

VIII. *The Times.* The first of these Flower earlier than the other three, and presently after the *Early Starry Jacinth*; the three last Flower all of them in *April*.

C H A P. CCCCII.

Of JACINTH Starry Autumn.

I. **THE Names.** It is called in Greek *Ἰακίνθος ἀρκαδικός*, in Latine *Hyacinthus Stellatus Autumnalis*, and in English *The Autumn Starry Jacinth*.

II. **The Kinds.** There are three Species of this Plant, viz. 1. *Hyacinthus Stellatus Autumnalis major*, The Greater Autumn Starry Jacinth. 2. *Hyacinthus Stellatus Autumnalis minor*, The Lesser Autumn Starry Jacinth. 3. *Hyacinthus Stellatus Autumnalis Flore albo minor*, The Lesser Autumn Starry Jacinth with white Flowers.

III. **An Observation.** Dalechampius with many Words would have us to believe that these Plants can be no *Jacintus*, because their Flowers appear before their Leaves in *Autumn*, contrary to the true *Jacintus*, as he says, and therefore will have it to be the *Bulbus* of *Theophrastus Lib. 1. Cap. 12.* which he calls his *Tiphium* (there mentioned) as also *Bulbus Æstivus Dalechampij*; this may carry some probability with it, yet the likeness of both Roots, Leaves, and Flowers, have persuaded very Learned Botanists to believe them to be true *Jacintus*, and so we take them in this place.

IV. **The Descriptions.** The first, or Greater Autumn Starry Jacinth. It has a Root which is great, bulbous, and white on the outside; from this Root spring up five or six or more very long and narrow green Leaves, lying upon the Ground; the Stalks are furnished at top with many Star like Flowers, of a pale blewish purple color, with some pale colored Threads tipped with blew standing about the

Head in the middle, which in time growing ripe contain therein small, black, and roundish Seed.

V. **The second, or Lesser Autumn Starry Jacinth.** This Lesser Jacinth has a bulbous Root like others, which sends forth such like long and small Leaves as the former, but narrower, the Stalk is not full out so high, but bears as many Flowers on it as the other, which are of a pale or bleak purple color, very like to it also, as is the Seed too, but that it is smaller, both these for the most part bear their Flowers and Seed before the green Leaves rise up much above the Ground.

VI. **The third, or Lesser Autumn Starry Jacinth with white Flowers.** This in its Root, Stalk, Flowers, and Seed, as also in its manner of growing, differs nothing from the former Lesser Purple Kind last described, excepting in the color of the Flowers, which in this Plant are always white.

VII. **The Places.** The native places of the first and third are as yet unknown to us, where possibly they may grow wild, here they are only nursed up in Gardens; the second grows wild in many places of England, as on the foot of a high Bank by the Thames side at the hither end of Chelsea, before you come at the Barge-House, and other places, from whence Plants have been taken for Gardens.

VIII. **The Times.** The first or greatest Flowers in the end of July, and in August, the other two in August and September; you shall rarely see any of these Plants with Flowers and green Leaves together at one time.

C H A P. CCCCIII.

Of JACINTH Starry Lilly Leaved.

I. **THE Names.** It is called in Greek *Ἰακίνθος ἀρκαδικός λιλιοφύλλος*, in Latine *Hyacinthus Stellatus Lilifolius*, and in English *Lilly Leaved Starry Jacinth*.

II. **The Kinds.** There are three several Species of this Plant, viz. 1. *Hyacinthus Stellatus Lilifolius Flore Ceruleo*, *Hyacinthus Stellatus Ceruleus Lilifolius* & *Radice*, The Blew Flowered Lilly Leaved and Lilly Rooted Starry Jacinth, (its Root being as like to a Lilly Root as its Leaves to Lilly Leaves.) 2. *Hyacinthus Stellatus Lilifolius albus, vel Lilifolius Flore albo*, The White Flowered Lilly Leaved Starry Jacinth. 3. *Hyacinthus Stellatus Lilifolius Flore Carneis*, The Blush Colored Lilly Leaved Starry Jacinth. Now because the Roots of these Plants as well as the Leaves are so very like to a Lilly, they have been called *Hyacinthus Stellatus Lilifolius* & *Radice*, but for brevity sake *Hyacinthus Stellatus Lilifolius*, The Lilly Leaved Starry Jacinth. *Clusius* says that the People who Dwell near its native place of growth call it *Sarabug*.

III. **The Descriptions.** The first, or Blew Flowered Lilly Leaved Starry Jacinth. It has a Root which is bulbous, longish, big below and small above, like unto the small Root of a Lilly, and composed of yellow Scales, as a Lilly, but the Scales are greater and fewer in number; from this Root rise up six or seven broad green Leaves, somewhat like unto Lilly Leaves, (from whence it took part of its Name, as well as from the Root) spread upon the Ground, and

and lying close and round; before the Stalk rises out from the middle of these Leaves there does appear a deep hollow place, like a hole, to be seen a good while, which at length is filled up with the Stalk, rising up to a Foot or more in height, bearing many Star like Flowers at top, of a perfect blew color, near unto a Violet, and sometimes of a paler or bleak blew color, having as it were a small Cup in the middle, divided into fix pieces, without any Threads therein; the Seed is black and round, but not shining.

IV. *The second, or White Flowered Lilly Leaved Starry Jacinth.* This Plant in its Root, Leaves, Stalk, Flower, Seed, and manner of growing, is wholly like the former, (so that all the aforesaid description may here be avoided) that we may not say the same thing over again; but there is something in which it varies, and that is in the color of the Flowers, which in this is white, whereas the former is blew, and that is all the difference.

V. *The third, or Blush Colored Lilly Leaved Starry Jacinth.* This Plant is like also to the first and second before described in all the parts of the same, and in the magnitude and manner of its growing, varying only in the color of the Flowers, for whereas they are blew in the first and white in the second, these are of a bluish color, which is the whole of the observed difference.

VI. *The Places.* These *Jacints* have been found Natives of the *Pyrenean Hills*, in that part of *France* called *Aquitane*, and in several other places; I have found them to grow plentifully in many Plantations in *Carolina*, and other parts of the *West Indies*; but that with the white Flower is most usual or common.

VII. *The Times.* They Flower in *April*, and sometimes later, I have found them Flowering in *Carolina* in *March*, and in *April*, as also in *May*, and sometimes later if the Weather prove hard or cold.

VIII. *The Virtues.* Authors have assigned to them no Medical Virtues, but account them rather as Poysons, for that by Experience it has been found, that Cattel who have eaten of the Leaves hereof have presently swelled and so died; this I know, that in *Carolina* if their Calves, young Bullocks, or Cows eat thereof they are presently taken with a swimming, and in a short time turn round with a Vertigo, and then in a little time after it die, and all this without Remedy, this I have seen; nor could I find that they had any Cure for it, their Death being so sudden: An Ointment or Balsam made of the Roots is an excellent thing against scrophulous Sores and Ulcers, and being duly applied cures them to a Wonder.

III. *The Description.* It is an Excrecence, which is soft, blackish, covered with a Skin, or otherwise like a thick Skin, somewhat like now and then to a Mans Ear, which being plucked off and dried shrinks together and becomes hard.

IV. *The Places.* It is found growing only upon Elder Trees, and generally such as are old, in moist places of this Kingdom.

V. *The Times.* They ought to be gathered when they are come to their largeness, or perfection, in the fore part of the day, in a fair and dry Season, and in the Months of *August* or *September*, when they have participated of the full ascending Virtues and Juices of the Tree.

VI. *The Qualities.* They are temperate in respect of heat or cold, and dry in the beginning of the second degree, they are Anodyn, Altringent, and Diffusive, a little Repercussive, and Vulnerary.

VII. *The Specification.* They are peculiar for curing the Quinsie, and other Tumors of the Throat, Almonds, and Jaws.

VIII. *The Preparations.* You may have therefrom 1. A Decoction in Wine or Water. 2. A Compound Decoction. 3. A Cataplasim.

The Virtues.

IX. *The Decoction in Wine or Water.* It is used as a Gargle to heal all Tumors or Swellings, and Sores or Ulcers in the Mouth, Gums, Throat, Almonds, &c. those parts being washed or gargled therewith three, four, five, or six times a day as hot as can be endured, by this means exquisite Quinsies have been cured therewith, but in case of a Quinsie the Decoction will be best to be made in Vinegar, adding thereto after it is boiled a fitting proportion of Wine.

X. *The Compound Decoction in Wine or Water.* Take Wine or Water three Pints, Jewsears, Elm Bark bruised, of each six Drains, Columbine Leaves half an Ounce, Madder three Drains, Cremor Tartari in powder five Drains, Black Pepper in powder
D d d d 2 half

JAMES WORT, See Ragwort.

C H A P. CCCCIV.

of JEWSEARS.

THE Names. This Plant is called in *Greek* *Μύκκινος Ἀκνίς*, & *ἰώβινος ἄκνις*, in *Latine* *Fungus Sambuci*, and *Fungus Sambucinus*, *Gummi Sambuci*, and of some *Auricule Jude*, in *English* *Jewsears*, also *Mushroom of the Elder Tree*.

II. *The Kinds.* It may well be accounted of the Stock of Mushrooms, as is also *Agarick*, but this growing upon the Alder Tree is a singular Species.

half a Dram, boil to the consumption of three quarters of a Pint, strain out, and keep the Decoction for a Gargle, which you may dulcify, or not, as the occasion requires. It is an excellent Remedy for the cure of a Quinsie, being used as hot as can be endured, as also for any other Tumor of the Almonds, or parts adjacent, and cures all sorts of Sores and Ulcers of the Mouth, Jaws, Gums, Throat, or Almonds of the Ears; it so strengthens the *Uvula*, or Palate of the Mouth, that when it is down it restores it to its proper tone and state; it also takes away vehement inflammations of those parts, they being often gargled therewith.

XI. The Cataplasma. It is made by cutting the Auricular or Fungi into very small bits, and then boiling them in Wine, or in Vinegar, adding a little Barley Flower to bring it to a consistency. Applied outwardly to the Throat as hot as can be endured in a Quinsie, (whilst the Decoctions are used inwardly as a Gargarisma) it much contributes to the abating of the Inflammation and dissolving of the Tumor; applied to any other recent Inflammation or Tumor whilst in beginning, in what part of the Body soever, it cools, abates the inflammation, alleviates the pain, and dissolves the swelling.

C H A P. CCCC.

OF JOHNSWORT Great Common,

O R,

HYPERICON.

THE Names. It is called in Greek *Ἰμεριον*, in Latine *Hypericon*, in English *Hypericon* also, and *Johnswort*; the Arabians call it *Reasfricon*, *Reisfricon*, *Hensfricon*, *Nelisfricon*.

II. The Kinds. There are two generic Kinds of *Hypericon*, or *Johnswort*, viz. 1. *Hypericon vulgare*, which some have called *Fuga Demonum*, i. e. Drive Devil, and some *Androsenum*, because the Flowers yield a bloody color, and others *Chamepytis*, because of the refinous smell of the Seed, but these are the proper Names of other Plants, this our *Hypericon* (Treated of in this Chapter) is the True *Hypericon* of *Dioscorides*, or Common Great *Johnswort*, as both the bloody color of the Flowers and refinous smell of the Heads and Seed do declare, which are two principal Notes thereof. 2. *Hypericum minus*, The Lesser *Hypericon*, or *Johnswort*, of which in Chap. 406. following.

III. The Description. Common Great *Johnswort*, or Common *Hypericon*, has a Root which is hard and woody, with divers Strings and Fibres at it, and of a brownish color, which abides in the Ground many Years, shooting forth afresh every Spring; from this Root shoots forth brownish, hard, upright, round Stalks, about two Feet high, spreading many Branches from the sides up to their tops, having two small Leaves set one against another at every place, which are of a deep green color, something like to the Leaves of the Lesser Centory, but narrower, and full of small holes in every Leaf, which cannot be so well perceived as when they are held up to the light; at the tops of the Stalks and Branches stand yellow Flowers, consisting of five Leaves apiece, with many yellow Threads in the middle, which being bruised do yield a reddish Juice, like Blood,

after which do come small round Heads, in which is contained small blackish Seed, smelling like Rosin,

Johnswort the Greater.

IV. The Places. It grows in Woods, Groves, and Copses, as well in shady places as in such as are open to the Sun, in many parts of this Kingdom.

V. The Times. It Flowers about the latter end of June, as also in July, and the Seed is ripe towards the end of the same Month, or the beginning of August.

VI. The Qualities. It is hot and dry in the first degree, thin, and of subtil parts, Anodyn, Digestive, Aperitive, Absterfive, Diuretick, Dissolutive, Traumatick or Vulnerary, Neurotick, Stomatick, Nephritick, Hysterick, Arthritick, and Alexipharmick.

VII. The Specification. It is peculiar for curing Wounds and Ulcers, Spitting, Vomiting, and Pissing Blood, Bittings of Venomous Creatures, Stone and Gravel in the Reins, Strangury, and heat of Urine, stoppage of the Terms in Women, Tertian and Quartan Agues, the Sciatica, Palfie, Epilepsie, and other Diseases of like kind.

VIII. The Preparations. You may have therefrom these following Medicaments, viz. 1. A Juice of Leaves and Flowers. 2. An Essence. 3. An Infusion or Decoction in Wine of Herb, Flowers, and Seed. 4. A Powder of Herb or Flowers. 5. A Powder of the Seed. 6. An Oil Simple. 7. An Oil Compound. 8. An Oil Magistral. 9. A Distilled Water. 10. An Acid Tincture. 11. A Spirituous Tincture. 12. An Oily Tincture.

The Virtues.

IX. The Juice. It is a good Vulnerary, whether inwardly taken or outwardly applied, and given to two, three, or four Spoonfuls at a time mixed with a Glass of Wine it heals inward Wounds, Hurts, or Bruises; it is of subtil parts, opens obstructions of the Viscera, dissolves Tumors, consolidates the lips,

of

of Wounds, strengthening the parts which are weak and feeble.

X. *The Essence.* This is yet more effectual to all the aforesaid Intentions, besides which it is good against all manner of Spitting and Vomiting Blood, occasioned by the rupture of any Vein, or by Bruises, Falls, or any other means whatsoever, it is an Antidote against Poyson, and prevails against the stinging or biting of any Venomous Creature; it has been found effectual by experience to give ease in the Strangury, to expel Sand, Gravel, and small Stones out of the Reins and Bladder, and to provoke the Terms in Women, taken to three or four Spoonfuls, (according to Age) warm, mixed with a Glass of Wine, before the Fits of Agues, for some days, it helps them and alters the Fits, whether they be *Tertian* or *Quartan*, and by continuing the use of it for some time perfectly cures them.

XI. *The Infusion or Decoction in Wine of Herb and Flowers, as also of the Seed.* They have the Virtues of the Juice and Essence, but must be given two or three times a day, and in a much larger Dose, viz. from four Ounces to eight Ounces, according to Age and Necessity; they open obstructions of Reins and Womb, and kill Worms in the Belly or Stomach.

XII. *The Powder of Herb and Flowers.* It is an effectual thing for Wounds and Sores, to cleanse dry, conglutinate, and heal them, being strewed thick upon the same, and dressed therewith Morning and Evening.

XIII. *The Powder of the Seed.* It has the Virtues of Juice, Essence, and Decoction, but not altogether so effectual, if it is taken to a Dram in Juice or Essence of *Knotgrass* it cures Spitting, Vomiting, and Pissing of Blood, as also Bloody Fluxes, and consolidates any Vein which is inwardly broken; if it is taken to the quantity of two Drams in some Broth it does gently purge Choler, cleanses the Vessels of the Mesentery, and expels congealed Blood out of the Stomach; it is also much commended, being drank for forty days together, for the Cure of the Epilepsie, Palsie, Gout, and Sciatica, as also to remove and ease Rheumatick Pains in any part of the Body.

XIV. *The Simple Oil.* Take Expressed Oil of the Seeds of *Hypericon*, or for want thereof Expressed Oil of *Ben*, or choice Oil of Olive, a Gallon, Red Port or Lisbon Wine a Pint and half, Flowers of *Hypericon* thirty two Ounces, infuse, or digest in an equivalent Sand heat for fourteen days, then boil in Balneo to the consumption of the Wine, strain out by Expression, and repeat the Infusion with like quantity of Flowers, Boiling and Expressing, as aforesaid, adding also more fresh Wine, repeating the same Work the third time with fresh Flowers, then straining out, keep it for use; some add to the aforesaid Oil Venice, Strasburgh, or rather Scio Turpentine, one Pound, dissolving it therein, and so keep it for use. Or thus. Take Oil of Olive eight Pounds, Leaves, Flowers, and Seeds of *Hypericon* bruised, of each four Ounces, infuse, or digest in an equivalent Sand heat fourteen days, boil a little in Balneo, and strain out, which Work repeat the second and third times with fresh Herbs, Flowers, &c. till the Oil becomes of a blood red color. Gerard makes it thus. Take Oil of Olive six Pounds, fine Turpentine, White Wine, of each three Pounds, Leaves, Flowers, and Seeds of *Hypericon* bruised, of each twenty four Ounces, infuse, or digest in a Sand heat ten days, boil in Balneo, and strain out, and with fresh Herbs, Flowers, &c. repeat this Work the second and third times, which at last being hot strain out, and keep it for use. This Oil being used hot cures Punctures of the Nerves, and Contusions of the same, as also Burnings, Scald-

ings, all Wounds and Ulcers, tho' made with poysoned Weapons, Gout, Sciatica, and Rheumatick Pains; it is said to heal green and deep Wounds which run into the Body, it strengthens and refreshes the Joints, comforts the Nerves and Tendons, helps Tremblings, Cramps, Convulsions, and Palsies; is Emollient, Digestive, and Disscussive; I have found it by Experience to be an excellent thing to dissolve Strumous Tumors, and to digest, cleanse, dry up, and heal Kings-Evil Sores and Ulcers.

XV. *The Compound Oil.* Take White, or rather Red Port, or Lisbon Wine, three Pints, fresh Flowers of *Hypericon*, with the Seeds or Heads, four handfuls, beat or bruise them, and digest in a Glass Vessel close stopped for two days, boil them in Balneo, and press them out strongly, to this straining put new Flowers and Tops of the Herb, as before, and repeat it the third time, and then strongly press out by straining; to every Pound hereof add of pure Florence Oil four Pounds, of choice Venice or Scio Turpentine six Ounces, Oil of Wormwood three Ounces, Dittany, Gentian, Carduus, Tormentil, Calamus Aromaticus, Carline, or *Carduus Mariae*, all of them in powder, of each two Drams, Earth Worms slit and often washed in White Wine two Ounces, set them to infuse for five or six Weeks, or else digest as long in a moderate Sand heat, and keep the Oil for use. Or thus. Take of either of the Simple Oils in the former Section four Pounds, Oil of Juniper Berries rectified half a Pound, Chymical Oil of Nutmegs a quarter of a Pound, Balsam Copaybe two Ounces and half, Camphir one Ounce, mix, dissolve, and keep it for use. This has all the Virtues of the Simple Oil with advantage, being more comfortable to the Nerves, drawing and cleansing than it, is a most excellent Vulnerary, dissolves Tumors, eases Pain, heals Contusions, Punctures, or other Hurts and Wounds of the Nerves and Tendons, and is admirable for old Aches, Rheumatism, Bruises, Strains, Palsies, Numbness, Cramps, Convulsions, Headach, Megrim, Lethargy, Burnings, Scaldings, &c.

XVI. *The Magistral Oil.* Take of the Simple Oil of *Hypericon* made with Oil of *Ben* at Sect. 14. aforesaid four Pounds, Balsam of Peru a Pound and half, Balsam of Tolu, Storax Calamita strained, Tincture of Saffron and Cochenile abstracted to the thickness of new Honey, of each half a Pound, Chymical Oils of Angelica, Lavender, Limons, Mint, Nutmegs, Oranges, and Sassafras, of each three Ounces, mix, digest in a warm Balneo or Sand heat for a Week, shaking altogether once a day, and keep it for use. This has all the Virtues of the Simple and Compound Oils aforesaid, but for any extrem or inveterate Pain in any part of the Body, or for any Contusion, Puncture, or any other Wound or Hurt of the Nerves or Tendons, there is nothing superior to it in the World; esteem it as a Jewel.

XVII. *The Distilled Water.* Take the Flowers, Leaves, and Tops of *Hypericon* twelve good handfuls, White Port Wine three Quarts, mix, digest two days in a warm Balneo, then in Balneo draw off the Water to dryness. It may serve as a Vehicle to convey the Juice or Essence in, being good for all the same purposes; if it is dulcified with White Sugar and drank, it is thought to be as effectual as the Infusion or Decoction, besides it is said to kill Worms in the Stomach and Belly.

XVIII. *The Acid Tincture.* It is good against Poyson inwardly or outwardly received, being given from twenty to sixty drops at a time in any proper Vehicle, as the Distilled Water, &c. it is Aperitive, Absterive, and Stomachical, comforts and fortifies the Ventricle, and restores its Tone being hurt or depraved; it causes a good Appetite and strong Digestion, and allays the fermentation of the Humors

or Juices in the Body; it prevails also against the Plague or Pestilence, and all sorts of malign and putrid Diseases.

XIX. *The Spirituous Tincture.* It warms and comforts the Stomach, is good against Crudities, and expels Wind; a green Wound washed with it it cleanses it, comforts it, restores its heat, and presently consolidates or heals it, and is profitable for such as are affected with a *Vertigo*, Lethargy, Epilepsy, Palsie, Convulsions, or other like Diseases of the Head, Brain, and Nerves. Dose from one to two Drams in any fit Vehicle.

XX. *The Oily Tincture.* It opens obstructions of the Reins, Ureters, and Bladder, expels Sand, Gravel, small Stones, or other Tartarous Mucilage out of those parts, and gives present ease in the Strangury; it gives instant relief in the Colick, and gripings of the Guts, alleviates the pain in the Back, tho' never so extream, and restores and strengthens the Tone of any or all the *Viscera*, tho' very much hurt and depraved; outwardly it eases Aches and Pains in the Limbs, proceeding from a cold Cause, and gives present help to Contusions and Punctures of the Nerves and Tendons, tho' the extremity is so great as to cause Convulsions, performing the Cure in a short time after. Dose of this Oily Tincture is from eight to twenty drops, according to Age and Strength, first dropped into Sugar, and then mixed with the Vehicle you intend to give it in.

C H A P. CCCCVI.

of JOHNSWORT Small,

O R,

Lesser HYPERICON.

I. *THE Names.* It is called in Greek *ῥιανδρὸν μικρόν*, in Latine *Hypericum minus*, and in English *The Smaller Johnswort*, or *Lesser Hypericon*.

II. *The Kinds.* We shall take notice but of five Species of this Plant, being all that are yet known to grow in our Countries, viz. 1. *Hypericum minus erectum* Bauhini, *Hypericum pulchrum* Tragi, (as it is thought) *Hypericum minus* Thalij, *Hypericum Syriacum* Lobelij, Small Upright Hypericon, or Johnswort. 2. *Hypericum minus Supinum*, vel *Supinum glabrum* Bauhini, *Hypericum Exiguum* Tragi, *Hypericum minus* Dodonaei & Gesneri, *Hypericum minimum* Supinum Septentrionale Lobelij, *Hypericum Supinum tertium minimum* Clusij, Small Creeping Hypericon, or Johnswort. 3. *Hypericum Nummularia folio*, *Hypericum tertium* Tragi, *Hypericum minus secundi* Bauhini, Round Leav'd Hypericon, or Johnswort. 4. *Hypericum minus Supinum Tomentosum* Bauhini, *Hypericum alterum Tomentosum* Lobelij, *Hypericum minus Supinum Monspeliacum*, *Androsænum album* Dalechampij, The Small Creeping Woolly Hypericon, or Johnswort. 5. *Hypericum Americanum*, *Hypericum Frutescens Americanum* Flore albo, American Hypericon, or Johnswort, White Flowered American Johnswort.

III. *An Observation.* Altho' what I have to say here ought to have been put in the former Chapter, yet it is better to have a place out of its order than no where; it is the Opinion of some Authors concerning the Generick Kinds of *Hypericon* that they are fourfold, viz. 1. *Hypericon vulgare*, Hypericon,

or Johnswort, properly so called, of which we discourse in the former and this present Chapter. 2. *ῥιανδρὸν*, and *ῥιανδρὸν ἄσχυρον*, and *Ἀσχυροειδές*, *Hypericon magnum*, Peterswort. 3. *Ἀνδρῶν*, *Androsænum*, *Hypericum maximum*, Tutstan, or Parkleaves, of both which we shall speak (God willing) in their proper places of the Alphabet or Book. 4. *Kēss*, *Koris* and *Coris*, Heath Groundpine, of which we have already spoken Chap. 332. foregoing. It is true that the second, or *Peterswort*, may very well be admitted to be a great or large Kind of *Hypericon*, because not only the Flowers, but the whole form of the Plant bespeak it, but how far *Tutstan* or *Parkleaves* will admit of being a Kind we shall leave to the Readers Judgment, I confess one of the Species thereof, viz. *Androsænum Matthioli*, very much resembles *Hypericon* in its manner of growing, Leaves, and Flowers, but that it is very much larger, and so may be accounted the greatest Kind of *Johnswort*; but the chief thing which enforces the Argument of *Tutstan* to be a Species of *Hypericon* is the form of the Flowers, and their yielding a bloody Juice: As to *Coris*, or *Heath Groundpine*, I cannot see how it has any relation to *Johnswort*, farther than what the form and color of its Flowers may induce.

Johnswort Lesser.

IV. *The Descriptions.* The first, or Small Upright Hypericon, or Johnswort. It has a small and long Root, and fibrous rootlet, enduring all the Winter in the Ground; this Plant is very rare to meet with, but it is very like that in the former Chapter, saving that it is smaller, yet the Leaves do not fully answer the form of the other, but are a little broader, and not so sharp pointed; the Stalks are reddish, and the Flowers lesser, not fully so yellow, nor do they give full out so bloody a Color when they are bruised between the Fingers, and sometimes they stand in Circles at the joints of the Stalks as well as at the tops; the Seed is also resinous, as the former.

V. *The*

V. *The second, or Small Creeping Hypericon, or Johnswort.* Its Root is very like the former, nor does the whole Plant differ much from it, its Stalks are reddish, and not much above an Hand breadth high, yet stand not fully upright, but leaning downwards; the Leaves are small, narrow, and smooth, and the small Flowers are yellow.

VI. *The third, or Round Leav'd Hypericon, or Johnswort.* The Root is small and long, and fibrous, as the others foregoing; this Plant is as small as the last, and its small, reddish, square Stalks or Branches rise no higher than it, having two Leaves set one against another at every Joint up to the tops, and are almost round, like unto *Moneywort*, or *Herb Twopenny*, of a dark or fad green on the upper side, and whitish underneath, spotted sometimes with reddish spots, and strakes; the Flowers are of a pale yellow color than the former, but somewhat large in comparison to the smallness of the Plant, with several yellow Threads in the middle.

VII. *The fourth, or Small Creeping Woolly Hypericon, or Johnswort.* It has a small, slender, long, woody, and fibrous Root, from which spring up several hairy, whitish, small, woolly Branches, lying upon the Ground and shooting forth Fibres, set with woolly Leaves, but not very close together, much like to those of the *Common Hypericon* in the former Chapter, but hoary and white, and a little rounder; at the joints towards the tops stand the Flowers, which are smaller than those of the *Common Hypericon*, and of a paler yellow; the Seed Vessels are like unto the other Kinds, as is also the Seed it self.

VIII. *The fifth, or White Flowered American Hypericon, or Johnswort.* It has a long, slender, woody, fibrous Root, which abides all the Winter, from this Root arise Yearly several woody Stalks, almost to a Mans height, covered with a whitish Bark, from whence are thrust forth on all sides various Branches set with thick green Leaves, narrow below, broad about the middle, and round at ends, sometimes two or three at a place, from which joints also arise divers white Flowers, consisting of four Leaves apiece, the Leaves fall away every Year, and appear again in the Spring.

IX. *The Places.* The three first Kinds grow in Woods and Copes as well in those which are shady as those which are open to the Sun; the fourth grows in Moorish and Wet Fields, as also on dry barren Ground; the last grows with us, but is nourished up in Gardens, being brought hither from the North West parts of *America*.

X. *The Times.* They all Flower about the middle or latter end of *June*, and in *July*, and the Seed is ripe in the end of *July*, or in the beginning of *August*.

XI. *The Qualities, Specification, Preparations, and Virtues* of the first four are the same with those of the *Common Hypericon* in the former Chapter, but scarcely or not altogether so powerful and effectual to all those Intentions: The Qualities and Virtues of the *American* are not yet well known, or but only gueft at.

C H A P. CCCCVII.

Of IRONWORT,

O R,

SOLDIERS HERB.

THE Names. It is called in *Arabicke* *Sidrachis*, in *Greek* *Σιδραχίς*, *Σιδραχίς*, *Dioscoridis* Lib. 4. Cap. 102. in *Latine* *Sideritis*, five *Ferrum inatrix*, sic dicto à Ferro, quod *Vulneribus Ferro factis* fuit *Medela*, for that it did cure Wounds made by the Sword, or with Iron; it was also called *Stratiotes*, as *Dioscorides* and *Pliny* say, and *Militaris*, because *Milites*, Soldiers, had usually great need of the same; in *English* *Ironwort*, and *Soldiers Herb*.

II. *The Kinds.* Authors make many Species of this Plant, viz. 1. *Sideritis vulgaris Clusij*, *Sideritis prima Clusij*; this is without doubt *Sideritis secunda Matthioli*, others that of *Dioscoridis*, which some Authors, as *Anguillare*, *Columna*, *Tragus*, and *Parkinson*, will have to be *Burnet*, tho' it is plainly manifest by the Descriptions of each Plant and by their Heads of Flowers that they are differing Plants, Vulgar or Common Ironwort. 2. *Sideritis Arvensis rubra*, *Tetrahiti Angustifolium*, *Sideritis Arvensis Flore rubro Camerarij* & *Thalij*, *Sideritis alia* in *Vineis Casalpini*, *Alyssum Galeni Flore purpureo*, *Sideritis Arvensis Latifolia glabra Bauhini*, Meadow Ironwort with red Flowers. 3. *Sideritis prima vel Herculea*, *Herba Judaica*, *Tetrahiti*, *Tetrahiti*, *Sideritis procumbens Ramosa Gerardi*, Creeping Branched Ironwort, called also *Jews Ironwort*, because the *Jews* which Practised *Physick* in *Italy* made much use of it. 4. *Sideritis parva procumbens*, *Sideritis quarta Clusij*, *Sideritis procumbens non Ramosa*, Small Creeping Ironwort not Branched, or Small *Jews Ironwort*. 5. *Sideritis altera parva*, vel *Sideritis quinta Clusij*, Another Small *Jews Ironwort*. 6. *Sideritis Montana parva Flore nigro purpureo Columnae*, *Sideritis Montana Apula versicolor*, Mountain Ironwort with a small black purple Flower, or Mountain Ironwort of *Naples*. 7. *Sideritis Folijs Alpinis Triisaginis Bauhini*, Ironwort with Germanander Chickweed Leaves. 8. *Sideritis Germanica parva*, *Sideritis sexta Clusij*, Small Germany Ironwort, this says *Clusius* is common at *Vienna* in *Austria*. 9. *Sideritis Hedercule Folia*, *Sideritis Anglica*, English Ironwort, or Ironwort with Alehoof Leaves. 10. *Sideritis Folia splendente oblongo glabra*, Ironwort with smooth long Leaves. 11. *Sideritis Arvensis Latifolia glabra Bauhini*, *Sideritis Herculea altera Casalpini*, *Sideritis Arvensis Flore palido Camerarij*, *Sideritis Arvensis Species altera Thalij*, *Alyssum Germanicum aliorum*, Broad Leav'd Meadow Ironwort, this *Bauhinus* would have to be *Sideritis secunda Matthioli*, which it is not, and *Lobel* would have it to be a Species of *Cannabis Spuria*, others that it is *Marrubium Pannonicum Clusij*, all which are much to be doubted. To the former Eleven Kinds may be added the two following, viz. 12. *Sideritis Anglica Radice strumosa*, *Panax Coloni Gerardi*, *Sideritis primi Thalij*, *Betonica fatida Gesneri*, *Clowns Woundwort*, or English Ironwort with strumous Roots, of which we have Treated at large in Chap. 9. foregoing. 13. *Sideritis Arvensis gravis odoris*, *Pimpinella Sanguisorba*, Ironwort having a pleasant smell, or Our Common *Burnet*, whether greater or lesser, and this we have here added to the number,

number, because several Authors will have it to be a Species of the *Sideritis*, or *Ironworts*, of which we have Treated also at large in Chap. 101. foregoing of this Work.

or harsh binding taste, without smell, and perishes every Year.

Ironwort

III. The Descriptions. The first, or Vulgar or Common Ironwort. It has a Root which is white and woody, continuing all Winter, and shooting forth new Stalks every Year; it grows greater and higher than the other Ironworts, as *Clusius* says, with larger hairy rough pointed Leaves set by couples one against another at the joints of the square hairy Stalks, dented about the edges, but set at somewhat farther distances, which branching themselves forth are set from the middle upwards with many Whorls of gaping white Flowers at the joints with the Leaves, spotted with Blood red spots in the upper parts of them, ending in a long Spike; the Seed which follows is small, uneven and black, contained in fine square Heads.

IV. Nota. This our first *Sideritis* I take to be truly the *Sideritis secunda Matthioli*, which very much appears from his description of it, tho' it is very short, in his Epitome, and is in these Words, *Exit in hoc Caule quadrato, dodrantali, aut majori, Ramisque, Folijs Marrubio longioribus, ad Salviae speciem accedentibus, crispis, albicantibus, & per ambitum laciniatis, sapore haud ingrato, Floribus verticillatis in Caule, & Ramis prodeuntibus Marrubij modo.*

V. The second, or Meadow Ironwort with red Flowers. The Root of this Herb is very fibrous, or full of Threads, from whence rises up a square brown Stalk, full of Branches, and thereon several narrow, long, and pointed, rough Leaves, somewhat dented about the edges, set by pairs or couples, at the tops of which stand the Flowers, encompassing them, as the others do, of a dark red color, and sometimes of a white color; the whole Plant is of an austere

Ironwort Meadow Red Flowered.

VI. The third, or Creeping Branched Ironwort, called also Jews Ironwort. It has a Root which is small and woody, yet living all Winter, and shooting forth afresh every Spring; it is a small low Herb, neither wholly standing upright, nor wholly leaning down to the Ground, but has several weak, rough, hoary, square Stalks, not much above a Foot high, full of joints, at the several distances whereof grow two small Leaves, somewhat long, rough, or as it were crumpled, hard and hairy, not half so broad as *Horeboud* Leaves, dented about the edges, smelling and tasting somewhat strong, which spread abroad into divers Branches, the upper parts whereof are replenished with many rough small Whorls of pale purplish gaping Flowers, with hoary Leaves at the joints under them also, where after they are past come small blackish Seed, contained in those Husks wherein the Flowers stood before.

VII. The fourth, or Small Creeping Ironwort not Branched, or Small Jews Ironwort. The Root of this Plant is small, and perishes every Year; the Herb is also small, and somewhat like the former in the hairy square Branches, but more trailing or leaning; the Leaves also are hairy, somewhat larger, and less snipt about the edges, that is, they are dented only from the middle to their ends; the Flowers grow in the bottoms of those Leaves, and encompass the Stalks or Branches of the Plant in Rundles at certain distances, as the others do, from their bottoms to their very tops, being of a whitish color, and shaped like the other Kinds.

VIII. The fifth, or Other Small Jews Ironwort. The Root is much like the foregoing, and perishes every Year; it is a small Ironwort, and has the middle Stalk upright, square, and something hairy, spreading it self into many smaller Branches, even from

from the bottom upwards, which in a manner lye upon the Ground, with two such like Leaves at the Joints as in the last, but little or nothing dented at all; the Flowers are white, without spots, but gaping in like manner.

IX. *The sixth, or Mountain Ironwort* with a small black purple Flower. It has a Root which is small, hard, and yellowish, from which rises up a reddish, hoary, hard, hairy, square Stalk, about half a Yard high, divided into two Branches, about the middle thereof, on which are set at the joints two small and long pale green Leaves one against another, covered with an hoary Down, and having three dents or notches on each side at the ends of them, which at the lower end of the Stalk next the Ground stand upon long footstalks, but up higher towards the top are without any; the Flowers stand in sharp pointed Husks, and are gaping, or hooded, as the rest are, but very small, whose head and jaws are of a dark purplish color, the middle of the Flower is yellow, and the long neck of the Flower which rises out of the Husk is whitish; after the Flowers are past there come four blackish Ash Colored Seed, somewhat cornered, which are contained in the hairy or hoary Husks.

X. *The seventh, or Ironwort with Germaner Chickweed Leaves.* It has a Root which is small and thready, which sends forth a Stalk a Foot long, spread out into Branches from the bottom, and those again sending forth other smaller ones, all of them inclining to the Ground, like the Germaner Chickweed, but much greater, on which stand a few hairy Leaves by pairs or couples, in form like unto that Chickweed, but larger, and dented about the edges, the Flowers grow at the joints with the Leaves towards the tops, and like unto the others in fashion, but somewhat longer, and of a blewish color, standing in sharp and rough Husks, in which is contained small round Seed.

XI. *The eighth, or Small Germany Ironwort.* The Root is white and woody, and perishes every Year; it is a small Plant, and has low square Stalks, of about a Foot high, Branched out almost from the very Ground, being soft and hoary, as the Leaves also are, which stand at the joints by couples, being long, and somewhat narrow, without any dents at all about the edges, yet larger at or near the bottom of the Stalks and Branches than towards their tops; the Branches have Flowers growing about them upwards as soon almost as they shoot out, in shape as the other sorts are, but they are so small that they scarcely appear out of the Husks, of a dusky color, the jaws and lower parts on the inside being whitish, after which follows blackish Seed, smaller than in the others.

XII. *The ninth, or English Ironwort, or Ironwort with Alehoof Leaves.* It has a Root which is small and thready, perishing every Year, but abundantly raising it self from its own sowing, in any Garden where it has once taken possession; it is a small Herb, not much above an Hand breadth, or four or five Inches high, having small, broad, and roundish green Leaves, with round dents about the edges, like to Alehoof; or rather like to Red Archangel Leaves; the Flowers are hooded, small, and purplish, and the Seed small and blackish.

XIII. *The tenth, or Ironwort with smooth long Leaves.* Its Root is whitish, fibrous, woody, and perishing every Year, from whence rise up square and jointed Stalks, smooth below, but with some small kind of hairiness at their tops; the Leaves are smooth and thin, set by couples, the lowermost three Inches long, and one broad, not dented at all about the edges; the Flowers are hooded, like the Common sort, but white, larger than they, and longer also,

standing in rough Husks about the Stalks, even from the bottom almost, after which come small, blackish, uneven Seed, in Heads like those of Plantane, but shorter.

XIV. *The eleventh, or Broad Leaved Meadow Ironwort.* The Root of this is like the second Kind aforesaid, and it has larger smooth green Leaves below than those above, a little dented about the edges; the Stalks are square, about a Foot and half in height, and Branched out; the Flowers grow in Roundles at the tops of the Branches, being hooded, and of a pale yellow color, and in some purplish, tending to white, without any smell at all.

XV. *The Places.* Some of these grow wild in England, in Meadows, and on Mountains, in many places, being most of them natural to our Country; the second of these Gerard says grows frequently in the Corn Fields in Kent, and by Pursfleet in Essex; the seventh Gerard also found in Flower and Seed among Corn in a Field joining to a Wood side not far from Greenhove in Kent; the ninth Parkinson says he found growing wild in the Fields, from whence he transplanted it into his Garden, where it continued to encrease and flourish.

XVI. *The Times.* They all Flower in June and July, and their Seed is ripe soon after.

XVII. *The Qualities.* Ironwort is temperate in respect to heat or cold, and dry in the first degree, or beginning of the second; it is Anodyn, Astringent, Incarnative, and Vulnerary.

XVIII. *The Specification.* It is very powerful to stop all fluxes of Blood, Catarrhs, the Reds and Whites in Women, and speedily to heal all simple green Wounds, and that, (as Authors say) without suppuration; it dries up also fluxes of Humors in old fretting Ulcers, cleanses the Ulcer, incarnates, and quickly heals it.

XIX. *The Preparations.* You may prepare therefore, 1. A Liquid Juice. 2. An Essence. 3. A Syrup. 4. A Decoction. 5. A Powder of the Herb. 6. A Balsam or Ointment. 7. A Cataplasim.

The Virtues.

XX. *The Liquid Juice.* Given inwardly two, three, four, or five Spoonfuls at a time, either alone by it self, or mixed with rough Red Wine, it is prevalent against all internal fluxes of Blood, as Spitting or Vomiting Blood, Pissing Blood, the Bloody or Hepatick Flux, and the overflowing of the Terms in Women.

XXI. *The Essence.* It has all the Virtues of the Liquid Juice, besides which it is powerful against Catarrhs, or fluxes of Rheum falling down the Throat upon the Lungs; it prevails against four and Cholerick Belchings of the Stomach, is said to cure Ruptures or Buriennes, and the Whites in Women, as also a simple Gonorrhoea in Men, being taken inwardly, and outwardly injected into those parts with a Syringe, for being very drying and binding, and strengthening withal, it not only restores those parts, but preserves their Tone intire; it is admirably good also to wash all green Wounds and old running Sores or Ulcers, healing the first, (if simple) without suppuration, and cleansing, stopping the defluxion of Humors, and drying the other, in order to its speedy healing; and if there be any Inflammation, or beginning of a Gangreen about the parts, it prevents it, and soon secures it against any dangerous Accident. Dose two, three, or four Spoonfuls in any convenient Vehicle Morning and Night.

XXII. *The Syrup.* It helps Coughs, Colds, Catarrhs, and Asthma's, prevails against obstructions

of the Lungs, thickens the pituitous matter, and causes expectoration; mixed with Gargarifins it heals Sores and Ulcers of the Mouth and Throat.

XXIII. *The Decoction in Wine, or Wine and Water.* It has all the Virtues of the Liquid Juice and Essence, but ought to be given in a greater quantity, and that Morning, Noon, and Night: *Gerard* says it is no less available in the stopping a Flux of Blood, or flux of Humors, than the Herb or Juice.

XXIV. *The Powder of the Herb.* Given inwardly to a Dram, or more, it stops inward fluxes of Blood, whether by the Mouth, *Anus*, or Bladder; it cures fluxes of the Bowels, and is good against Catarrhs; outwardly applied to any green or fresh simple Wound it presently conglutinates the lips thereof, and heals it, and applied to any inveterate running Sore, or old Ulcer, it (in some little time) stops the fluxion, cleanses it from its *sordes*, incarnates where Flesh is wanting, dries, and in a little time heals it.

XXV. *The Balsam or Ointment.* If to every Pound of the Ointment or Balsam three or four Ounces of the Powder of Tobacco be added, they will become most admirable Medicaments or Topicks for the curing of old running Sores, inveterate and putrid Ulcers, and malign Fistula's, being first wash'd by injection or otherwise with the Juice, Essence, or Decoction, and then (twice a day) dressed up with one of these Preparations; they are also profitable against the Gout, or other Aches and Pains in any part of the Body.

XXVI. *The Cataplasim.* It may be made of the Herb alone, or of the Juice mixed with the Powder of the Herb, or with Barley Flower, &c. applied to fluxes of Blood in Wounds it stops the bleeding, it strengthens parts weakened by any Disease, as the Joints by the Gout, the Nerves by Palsies, &c. and hinders the afflux of any Humor to the weakened parts; applied also to a simple recent Contusion it dissolves the Tumor, and restores the part hurt.

CHAP. CCCCVIII.

Of I V Y Tree or Wall.

THE Names. It is called in *Arabick* *Cissus*, in *Greek* *Kissos*, & *Kissis*, in *Latine* *Cissus*, and *Cittus*, and *Hedera*; the first of these Names some have thought to be derived from *Rosaces*, *Pumex*, *stoe Lapis porosus*, *quia ut ille Aquam, ita hoc Lignum textura porosa, & spiraculis innumeris pervia Vinum transmittit*, unde *Catonis & Varroni Cissimbon Poculum Hederaceum est*. And probably it might be that from this *Costus* might say, *That a Cup made of Ivy Wood will not hold any Wine therein*. The latter Name, *Hederam vero Pompeius dictum censuit, quod haret, vel potius edita petat, vel quia id cui adhaeserit edit & enecat*; and in *English* it is called *Ivy*.

II. *The Kinds.* There are five several sorts of *Ivy*, viz. 1. *Hedera Arborea, sive Scandens, Hedera Corymbosa nigra, Orthocissos, Hedera rella, Hedera rigens Plinij*, Common *Ivy*, Tree *Ivy*, or Wall *Ivy*, and this is that which all Authors call *Hedera* simply, which is *Our Vulgar Tree Ivy*, called also *Hedera nigra*, Black *Ivy*, because it bears black Berries. 2. *Hedera Corymbosa alba, Hedera Corymbia*, White Berry bearing *Ivy*. 3. *Hedera Helix, Hedera Sterilis, Hedera Helix provoluta*, which is thought to be the *Helix Dioecoridis, Theophrasti & Plinij*, which

they make to be the third Species of their *Climbing Kinds*, yet it is seldom seen to climb up in the manner of the former, but lyes for the most part on the Ground; but *Johannes Thalius* in his *Hercynia Sylva* says he found it climbing as well upon Trees as creeping upon old Walls and Stones; this some say is barren, as not bringing forth any Fruit, yet others say this is rather for want of Age, for that in time it would bear, and change into the other sort, as *Theophrastus* and *Pliny* say; this is that we call *Barren Ivy*. 4. *Hedera Virginiana, Hedera Trifolia Virginienfis*, Three Leav'd Virginian *Ivy*. 5. *Hedera Quinquifolia Virginiana, vel Virginienfis*, Five Leav'd Virginian *Ivy*.

III. *Hederula Tragi, Bauhinus* makes to be a differing sort from *Hedera Helix, vel Sterilis*, Our third sort, or Barren *Ivy* above mentioned, and calls it *Hedera Humi repens*, which yet *Tragus* himself distinguishes not, but says, that that *Ivy*, which whilst it is young brings forth no Fruit, when it is grown older does, and that there is no difference in his two Kinds of *Hedera* and *Hederula* but in the Age; this Barren Kind, says *Parkinson*, which creeps upon the Ground, will yet with its clasping Branches take hold of whatever is next unto it.

Ivy Tree or Wall.

IV. *The Descriptions.* The first, or Our Common *Ivy*, Tree *Ivy*, or Wall *Ivy*. The Root hereof is woody and fibrous, running under the upper Crust of the Earth, from this Root it grows up with a thick woody Trunk or Body, which is sometimes, (tho' rarely) found as big as ones Arm, shooting forth on all sides many woody Branches, and grows sometimes alone by it self into a pretty Bush, as *Lobel* says he saw in our Country, but it usually climbs up upon Trees or Walls, and as the Branches rise it sends forth several small Roots into the Body or Branches of the Tree upon which it clambers, whereby it climbs up almost into all parts of the Tree, or if it clambers upon a Wall it climbs up and lays it self in the Chinks or Joints of the said Wall, whether

ther Brick or Stone, on which Trees it runs up so strongly, fastning its Claws or Roots therein, that it draws the nourishment out of the Tree, and thereby in time kills it, by confining the life and moisture thereof, and by choking it with the abundance of shadow and humidity of its Leaves and Branches, which are ever green, (and serves as an Ornament thereto when it is Leafless, but in the end is its destruction and utter ruin) these Branches having thus fastned themselves by their Claws or Roots in a Tree or Wall will live thereby upwards, tho' the Trunk or Body of the Shrub is cut off from the Root below, and it will live as well as if it was not cut away from its said Root at all, only by the fastning of its little Claws or *Radicule* into the said Tree or Wall, and there growing great they will oftentimes so crack it, that it will in time utterly ruin it, as is said before; while the Plant is young the Leaves of most of it will be cornered, but when it grows older it has no corners on the sides, but grows only round, or somewhat long, and pointed at the end, the young Leaves which spring forth from the Branches keeping oftentimes the same order, and are of a dark shining green color above, and somewhat of a yellowish green underneath, striped with white, and sometimes with red spots, abiding fresh and green Winter and Summer; from the joints of the Stalks and tops of the Branches grow forth upon short Stalks small mossie yellow Flowers, standing in an Umbel, or close round Tuft; after the Flowers are past small round Berries come in their places, which are green until they grow ripe, and then turn black, with a small point at the end of each Berry, in each of which are usually contained four Seeds, three-square in a manner, but round on the one side; this Shrub or Bush yields either voluntarily or by being bruised in hot Countries a kind of reddish hard Gum, called *Kassé akquy*, *Hederæ Gummi*, The Gum of Ivy, which is said by Authors to be dangerous being inwardly used in Physick, because say they it has a caustick or burning faculty.

Tree Ivy, or Wall.

V. The second, or White Berry bearing Ivy. This in its Roots, Stalks, Branches, Claws, or *Radicule*;

Leaves, Flowers, Berries, and manner of growing, differs very little from the former, and is chiefly distinguished in these things, viz. that the Leaves are thinner and finer, and of a lighter green color, and that the Berries are of a whitish or greyish color when they are ripe, and not black, as the Berries of the Common Sort are.

VI. The third, or Barren Ivy. From a woody stringy Root, as the former, it sends forth several slender and woody Branches, trailing upon the Ground, and for the most part lying thereon, but sometimes it is found to wind it self and climb up the Trees, Bushes and Hedges under which it grows; with the small Tendrels or Claws it shoots forth at the several joints of the Branches, where the Leaves come forth, being somewhat lesser than the first Common Kind, and of a dark shining green color, usually formed into three corners, and sometimes into five; at the Joints with the Leaves there thrusts forth underneath small white Fibres, Claws, or *Radicule*, by which it takes hold as it creeps; this very rarely has been seen to bear either Seed or Flowers.

VII. The fourth, or Three Leav'd Virginian Ivy. The Roots of this Plant do shoot under Ground, and send forth young woody Stalks, some whereof will stand upright, others lye down, and take root again as they spread, as also on any Wall they stand high unto, like unto our former Barren Ivy; the Leaves are broad and large, three always set together upon a long footstalk; at the Joints with the Leaves come forth pale Flowers in a loose Tuft or Clufter, which turn into pale yellow Berties, with small, hard, round, Ash Colored Seed in the dry-wrinkled Skins or Husks, without any moisture at all in them; this Plant yields a white Milk, without any taste in it, being broken in any part thereof, which Milk after it has lain a while will change to be as black as Ink, and therefore is thought to be a good Material to color Hair or any other thing Black.

VIII. The fifth, or Five Leav'd Virginian Ivy. This Slender, but Tall Climbing Virginian Ivy, has a Root which spreads here and there under the Ground, but not very deep, from whence rise up several Stems or Stalks, none much bigger than a Mans Thumb, many less, from whence shoot forth several and many long weak Branches, not able to stand upright unless they be sustained, yet being planted near unto a Wall or Pale, or House side, the Branches at several distances of the Leaves will shoot forth small short Tendrels or Claws, not twining themselves about any thing, but ending in four, five, or six, or more, short and somewhat broad Claws, which will fasten like a Hand with Fingers so close thereunto, that it will bring part of the Wall, Mortar, Board, Glass, Brick, or Stone, away with it if it is pulled from it; and by these Claws it stays it self, and climbs up to the top of the highest Tree, Wall, House, or Chimney, being planted by them: the Leaves are crumpled, or rather folded together, at their first coming forth, and very red, which afterwards growing forth are very fair, large, and green, divided into four, five, six, or seven Leaves, (not regular to a certain number) standing or growing together upon a small footstalk, and set without order on the Branches, at the ends whereof, as also at other places sometimes, come forth several short Tufts of Buds for Flowers, which here in England never come to that perfection, as to open themselves and shew what kind of form they would be of, much less what Berries or Seed would follow; the use of this is chiefly to furnish a Garden, and to be an Ornament to the place it is planted in.

IX. Or thus, according to Gerard. There is kept for Novelties sake in divers Gardens a Virginian Vine, but which is indeed an Ivy; the Stalks hereof

grow to a great height if they be planted nigh any thing which may sustain them, or bear them up, and they take fast hold by certain small Tendrels, (or Clavos) upon what Body soever they grow near, whether Trees, Wood, Brick, Stone, or Glass, and that so firmly, that oftentimes when you pluck them off from the same they will bring pieces of the matter they cling to off with their Clavos, (or Radicula) it puts forth its Leaves in April, which are large, and consisting of four, five, or more particular Leaves, each of them being long, and deeply cut, so that they somewhat resemble the Leaves of the Chestnut Tree; the Stalks with the Rudiments of Flowers are to be seen in August, which Flowers grow clustering together after the manner of Ivy, but never with us shew themselves open, so that we can say little or nothing of their Color or Fruit which succeeds them.

X. *The Places.* The first is known almost to every Child to grow and climb up upon Trees, Hedges, Bushes, Brick or Stone Walls, Houses, Churches, &c. in most parts of this Kingdom; the second has been brought to us out of *Turky, Italy, and France*; the third grows almost as common as the first, in woody, shady, and moist places, under Hedges, and in corners of waste Grounds, Lanes, and the like; the fourth and fifth are Natives of *Florida*, and North West parts of *America*, where our *English* Colonies are planted, as in *New England, Maryland, Pensilvania, New York, Virginia, and Carolina*, but being transplanted grow very well with us in *England*.

XI. *The Times.* Our Ivy Flowers not till *July*, and the Berries are not ripe till about the latter end of *December*, after they have felt the Winter Frosts, and the *American* sorts Flower very late with us, if at all.

XII. *The Qualities.* Ivy is hot and dry in the end of the second degree, Astringent, Biting, Cosmetick, Vulnerary, and Parnick, as the juice of the Leaves, &c. The Berries are also hot and dry in the second degree, Astringent, Diuretick, and Alexipharmick.

XIII. *The Specification.* It stops Fluxes, and heals Bloody Fluxes, Jaundice, provokes the Terms, resists Poyson, and the Bittings of Venomous Creatures, cures the Plague, and heals running Sores and old Ulcers, in what part of the Body, and of what kind soever.

XIV. *The Preparations.* You may have therefrom the following things, 1. *The Leaves.* 2. *The Wood.* 3. *A Gum.* 4. *A Liquid Juice of Roots, Leaves, and Berries.* 5. *An Essence of the same.* 6. *A Decoction of Leaves and Berries.* 7. *A Powder of the Flowers.* 8. *A Powder of the Berries.* 9. *A Bath of the Leaves and Berries.* 10. *A Pessary of Leaves and Berries.* 11. *A Fume of the Branches.* 12. *An Acid Tincture of the Berries.* 13. *A Spirituous Tincture of the Berries.* 14. *An Oily Tincture of the Berries.*

The Virtues.

XV. *The Leaves.* The fresh Leaves are commonly used to be laid upon Issues wheresoever, in Arms, Legs, &c. to keep them open, and to draw forth the Humors which fall upon the same parts.

XVI. *The Wood.* It is of use to make little round Balls of, about the bigness of high Swan Shot, or white or grey Pease, which are used for Issues instead of Pease, drawing forth the Humor easier, and keeping the Sore better open, and this they do by reason of their sponginess or porosity, being much more porous than Pease, and so more apt to be filled with the serofities of the Issue; if the Wood is made into a Cup, and Ale, Beer, or Wine be put into it,

so as to stand in it for some time, and then drank off, and this continually done for some days, it is said to help such as are troubled with the Spleen, and to give ease in the pains thereof. *Cato* says that the Deceits of Vinniers may be found out by one of these Cups, if they mix any Water with their Wine, for the said mix'd Wine being put into one of these Cups of Ivy Wood, the Wine will soak thro' the Wood and leave the Water behind; for *Cato* and *Varro* both say it is the nature of Ivy Wood not to hold any Wine, so great an Antipathy there is between them.

XVII. *The Gum.* That which is gathered in hot Countries from the Body and Branches of the Ivy, (either by a voluntary issuing therefrom, or by bruising thereof) is exceeding sharp and hot, burning and exulcerating the Skin, yet is used, being dissolved, to take away superfluous Hair in any place, and to destroy Nits and Lice, also Crab-Lice, in what parts soever; being dissolved in Vinegar and put into a hollow aking Tooth eases the pain, and being often used will cause it to fall out; some use this Gum with other things as a Bait to kill Fish; see more hereof in my *Sepsisium*, or *Druggists Shop, Lib. 9. Cap. 23.* where you may find the farther Uses thereof, and also the Signs how to know it, and to distinguish the true from the false, that sold in the Druggists Shops being for the most part counterfeit, having neither the form or appearance, nor the Virtues of the true Gum, the false being for the most part full of sticks, dross, and filth, brittle, and of an insipid taste, whereas the true is of a yellowish red color, clean, of a strong smell, and of a sharp, biting, and exulcerating taste.

XVIII. *The Liquid Juice of Roots, Leaves, and Berries.* If it is much taken inwardly it is apt to cause Barrenness in Man or Woman, it also causes a weakness and trouble in the Brain or Understanding, and affects the other Senses, for which reason Authors say used much inwardly it is an Enemy to the Nerves, but much strengthens them being outwardly applied; the juice of the Root is said to be good against the biting of the *Phalangium*, or poisonous Spider; the juice of the Leaves or Berries taken inwardly provoke the Terms in Women, facilitate the Birth, and bring away the Afterbirth; the juice of Leaves or Berries used as an Errhine, by stuffing it up the Nose, purges the Head and Brain of thin Rheum, which causes Catarrhs or Defluxions into the Glandules of the Throat, Jaws, Eyes, Nose, or other parts adjacent, and cures stinking Ulcers in the same; dropped also into the Ears it cures old and running Sores and Ulcers in them. Dose one or two Spoonfuls inwardly in a Glass of Wine, or other fit Vehicle.

XIX. *The Essence of Roots, Leaves, or Berries.* It has all the Virtues of the Liquid Juice, but is more powerful as being depurated, and so is to be given in lesser quantity, as from three quarters of a Spoonful to a Spoonful and half, increasing the Dose as the Age and Strength of the Patient will bear; it is very good against the Yellow Jaundice, provokes Urine, and is said to be good to break the Stone, and expel Sand, Gravel, and small Stones from the Urinary parts; taken also Morning, Noon, and Night in a Glass of Wine it is a good preservative against the Plague, or any other infectious Disease, and is of singular use to cure the same after infection.

XX. *The Decoction of Leaves or Berries.* It has all the Virtues of the Juice and Essence, but nothing near so powerful, and therefore may be given from three to six Spoonfuls sweetened with White Sugar; a Decoction in Vinegar mixed with Damask Rose Water and Oil of Roses, and applied to the Forehead

head and Temples gives ease in the Headach, tho' it be of long continuance, and applied warm to the Sides of such as are troubled with the Spleen, Aches, or Stitches in the Side, resolves the *Coagulum* if any be, and gives present ease; the Decoction of Leaves or Berries in Wine is of excellent use to cure old running Sores and filthy Ulcers, which are difficult to be healed, it admirably cleanses, dries, and heals them; and it is also effectual for the speedy cure of green simple Wounds, by uniting the Flesh and consolidating their lips; the same is good to heal Scaldings with Water and Butnings with Fire, and the Exulcerations which happen thereby, occasioned by the saltness, heat, or sharpness of Humors flowing thereto.

XXI. *The Powder of the Flowers.* A Dram of the Flowers (being dried carefully and reduced to powder) being drank twice a day in Red Wine cures a Diarrhea, or Looseness, year a Bloody Flux, as *Diocorides* saith.

XXII. *The Powder of the Berries.* It is good against the Jaundice, kills Worms in Old or Young, and prevails against the biting of the *Phalangium*; it is a singular Remedy both to prevent the Plague or Pestilence before infection, and to cure the same after it has seized the Patient, by drinking the Powder from half a Dram to a Dram, (according to Age and Strength) in any fit Prophylactick Vehicle, or proper Antidotal Liquor, Morning, Noon, and Night, for two, three, or four days together; and being taken in White Port Wine for some certain time it opens the obstructions of the Reins, Ureters, and Bladder, gives ease in the Strangury, provokes Urine, and breaks the Stone, expelling Sand, Gravel, and Tartarous Mucilage from the Urinary parts and passages: *Tragus* says that it provokes the Terms in Women, and is so powerful in its operation on those parts, in driving forth the dead Child and Afterbirth, that it ought to be cautiously used, and not but upon necessity.

XXIII. *The Bath of the Leaves and Berries.* It is a strong Decoction of them made in Water; if a Woman which has a dead Child fit therein as hot as she can conveniently bear it, it forces away the Child and Afterbirth, and being once or twice repeated causes a due cleansing; if a Woman whose Courses are stopp'd fit therein, and repeat it for some few times, it effectually brings them down, but a Woman with Child ought cautiously to forbear the use thereof, because it will endanger Abortion.

XXIV. *A Pessary of Leaves and Berries.* It has all the Virtues and Operations of the Bath in the former Section, but not altogether so powerful, yet it very much prevails to bring down the Terms when stopp'd, and being often repeated forces away the dead Child, &c. as is before expressed.

XXV. *The Fume made of the Branches being burnt.* It expels pestilential and infectious Vapors, corrects a putrid Air, which causes malignity and putrefaction, and drives away Bats, Gnats, and other troublesome Insects of that kind.

XXVI. *The Acid Tincture of the Berries.* It opens all obstructions of the Urinary parts, breaks and expels the Stone, resists Vomiting, strengthens the Stomach, and is a good Prophylactick and Curative of the Plague or Pestilence; it destroys the malignity and putrefactive heat of all Fevers, cools, and allays Thirst. Dose so many drops as to give the *Vehiculum* a pleasing acidity, which may be repeated two, three, or four times a day, or more, as need requires.

XXVII. *The Spirituous Tincture of the Berries.* It has the Virtues of the Juice, Essence, Decoction, and Powder, but a much more pleasing Medicament,

because finer, purer, consisting of more subtil parts, and given in a much smaller Dose, and by reason of its preparation with Spirit of Wine is also more Cordial and Stomack. Dose fifty or sixty drops Morning and Night in a Glass of Wine, but it is not long to be continued lest it induces Barrenness, outwardly bathed upon Nervous and Tendonous parts it comforts and strengthens them, and alleviates aches and pains coming from a cold and moist cause.

XXVIII. *The Oily Tincture.* Inwardly given it prevails against the Palsie and Lethargy, gives ease in the Strangury, provokes Urine, breaks and expels the Stone and Gravel in Reins or Bladder, and alleviates the pains of the Colick; outwardly applied in the Gout, (a little Camphir being dissolved therein) it gives ease in pains and stitches of the Side and Spleen, dissolves cold Tumors, and gives relief in a Gout proceeding from a cold cause. Dose inwardly from ten to twenty, or twenty five drops, dropp'd first into Sugar, and then the Sugar mixed with the *Vehiculum* you design to give it in.

C H A P. CCCCIX.

Of I V Y Water,

O R

Ivy Leav'd CROWFOOT.

I. *THE Names.* I know not of any Greek Name it has, but it is called in *Latine* *Hederula Aquatica* by Gerard and Label, also *Ranunculus Hederaceus Dalechampij* & *Lugdunensis*, *Lenticula Aquatica* *trisulca Bauhini*, *Ranunculus Hederaceus Aquaticus*, in English *Water Ivy*, or *Ivy Leav'd Crowfoot*.

II. *The Kinds.* It is certain it is no Species of Ivy, properly so called, but a singular Plant of its Kind, obtaining the Name *Hederula* merely from the form of its Leaf, and seems from the nature and qualities of the Herb to be more allied to the Stock of the *Crowfoot* than any other Plant.

Water-Ivy.

III. *The Description.* This *Hederula Aquatica*, or *Water Ivy*, has small thready Strings instead of Roots

*Roots or Stalks, which spread themselves very much under the Water; from this stringy Root grow forth several slender trailing Stalks, rising from the bottom of the Water to the top; these Stalks shoot forth at the lower joints and with the Leaves under the Water several other small Fibres, which serve as Roots also with the former: from the Stalks likewise at the Joints come forth divers triangular Leaves, in form of an Ivy Leaf, which Leaves, those which grow near the tops of the Stalks, float upon the top of the Water, and are many, each of their three parts, formed also in a triangular or three cornered manner, like those of *Barren Ivy*, or *Noble Liverwort*, and are sometimes marked with a black spot; and with these Leaves from the Joints come forth small knots of yellow Flowers, standing upon indifferently long footstalks, but *Gerard* says it is barren of Flowers or Seed.*

IV. *The Places.* *Gerard* says it is very rare to find, and that he found it once in a Ditch by *Bermondsey House*, near *London*, and never elsewhere; but *Parkinson* says it is found plentifully enough in divers places of this Land; I have found it in Ditches, Pools of standing Water, and other like wet and plashy Grounds in several places of *Cambridgeshire*; but it always grows in Water.

V. *The Times.* It Flowers in *May* and *June*, and gives its Seed in some small time after.

VI. *The Qualities, Specification, Preparations and Virtues* are exactly the same with those of *Common Crowfoot*, and therefore I refer you thither, where they are handled at large in *Chap. 176. Sect. 24. ad 24. 10* that no more need be said thereof in this place.

C H A P. CCCCX.

OF KATHERINE-FLOWER,

OR :

Roman NIGELLA.

I. *The Names.* It is called in *Arabick* *Xanim*, *Sunis*, *Sunici*, seu *Sunizi*, in *Greek* *Mandragora*, and *Mandragora*, in *Latine* *Melanthium*, and *Nigella*, in *English* *Katherine-Flower*, *Fennel-Flower*, and *Roman Nigella*.

II. *The Kinds.* There are several sorts of *Nigella*, *Gith*, or *Fennel-Flower*, viz. 1. *Melanthium*, five *Nigella Romana*, *Roman Nigella*, or *Katherine-Flower*, properly so called, of which in this Chapter. 2. *Nigella Greca*, *Gith*, *Fennel-Flower*, or *Nigella* of *Candia*. 3. *Nigella Hispanica* & *Damausca* *Flora simplici* & *multipli*, *Spanish Gith*, *Fennel-Flower*, or *Nigella Single* and *Double*, of which we Treat under the Title of *Nigella* in some of the following Chapters of this Book.

III. *The Kinds of Roman Nigella, or Katherine-Flower.* Of this there are the three following sorts, 1. *Nigella Romana*, five *Sativa*, *Roman Nigella*, *Sweet smelling Nigella*, or *Sweet scented Katherine-Flower*. 2. *Nigella Romana Silvestris inodora*,

Wild Fennel-Flower, or Katherine-Flower. 3. *Nigella Romana Aroensis*, *Field Fennel-Flower*, or *Field Katherine-Flower*.

IV. *The Descriptions.* The first, or *Roman sweet smelling Nigella*, or *Katherine-Flower*, has a Root which is small, thready, yellow, and perishing every Year; this sweet Plant grows up to be two Feet high, more or less, with several slender Branches, and many finely cut and divided Leaves on them, nearly as fine or small as *Fennel*, (whence one of the Names) and very like unto those of the *Larksbeels*; at the top of every Branch stands one Flower, made of five blew Leaves, laid abroad like a Star, without any green Leaves under the Flower, as in some *Single*, and another *Double blew fort*, with a green Head in the middle, compassed with some few Threads, which Head grows to be the Seed Vessel, being a little long and round, with five small short Tops, like Horns, standing at the tops of the Heads, in which lye in several Cells small, black, and very sharp, sweet, strong smelling Seed.

V. *The second, or Wild Fennel-Flower, or Katherine-Flower.* This grows very like the former for its green Leaves, but a little smaller and shorter; the Flowers are blew, and like the former, but the Head with its Seed is larger, and the Horns longer; the Seed within is usually black, sometimes a little whitish; and sometimes yellowish, without any smell at all: there is another likewise of this sort, differing in nothing from this, but only that its single Flowers are white, and its black Seed without scent.

VI. *The third, or Field Fennel-Flower, or Katherine-Flower.* This Field Sort is very like the last, but it grows thinner of Branches and Leaves, and they also shorter; the Heads are smaller and longer, as the Flowers also are, but of a pale blew color, the Seed being black likewise, and without scent: there is another of this sort, differing little from that now described, but in the Flowers, which being single and blew like it, have green Leaves under them, and the Seed being black is somewhat sweet.

VII. *The*

VII. *The Places.* The first is usually Sown in Gardens, even in *Italy*, and other Countries, the others grow wild, and in Corn Fields of *Italy*, and other Southern Countries, with us they all grow in Gardens only.

VIII. *The Times.* They are all Annually to be Sown in the Spring, if they do not Sow themselves, and they Flower in *June* and *July*, giving their ripe Seed in *July* and *August*.

IX. *The Qualities.* The Seed, (which is chiefly used) is hot and dry in the third degree, it is Appetitive, Absterive, Carminative, Digestive, Diuretick, Pectoral, Nephritick, Alexipharmick, and of thin and subtil parts; where note, the first Kind is only used in Physick.

X. *The Specification.* It wonderfully prevails against thin and salt Catarrhs, expels Wind, kills Worms, helps shortness of Breath, provokes the Terms, eases the Strangury, expels Stone and Gravel, and is an Antidote against Poyson.

XI. *The Preparations.* You may have therefrom
1. *A Liquid Juice of the Herb.* 2. *An Essence of the same.* 3. *An Infusion of Herb or Seed in Wine.*
4. *The Seed whole.* 5. *A Powder of the Seed.* 6. *An Oil of the Seed by Expression.* 7. *An Acid Tincture of Leaves or Seed.* 8. *A Spirituous Tincture.*
9. *An Oily Tincture.* 10. *A Decoction of the Seed in Vinegar.* 11. *A Fume of Herb or Seed.* 12. *A Spirit from Herb or Seed.*

The Virtues.

XII. *The Liquid Juice.* It opens obstructions of the *Viscera*, chiefly of the Lungs, Reins, and Womb; mix'd with equal parts of Honey, and so taken, it helps against Asthma's, causes free breathing, removes Hoarseness and Wheezing, provokes Urine, eases the Strangury, expels Sand, Gravel, and Tartarous Matter out of the Urinary parts, gives ease in the Colick, and forces down the Terms in Women, kills Worms, and dries up Catarrhs. Dose one Spoonful to two Morning and Night for some considerable time; it may also be mix'd with White Port Wine, and so taken.

XIII. *The Essence of the Herb.* It has all the Virtues of the Liquid Juice, is something more pleasant to be taken, and more powerful in its operation, and therefore ought to be given in somewhat a lesser quantity; taken with Honey it is a Remedy against Poyson, the Stinging of Scorpions, and the Biting of the Spider *Phalangium*; given mixed with a simple distilled Water of *Angelica*, *Aniseeds*, or *Fennel*, it is said to increase Milk in Nurses Breasts.

XIV. *The Infusion of Herb or Seed in Wine.* It has all the Virtues of the Juice and Essence, but must be given in larger quantities, viz. from four to six, or eight Ounces; it helps shortness of Breath, provokes Urine, and is good against the Bitings of Venomous Creatures, &c.

XV. *The whole Seed.* It is said that it was eaten familiarly in former Times, being strewed upon their Bread, or rather put into their Bread in making, and so put in as *Poppy* Seed was; tied in a Cloth and smelted to, being of hot, dry, and thin parts, it helps to dry up Rheums and Distillations from the Head, as *Galen* says, and being put into a Cap among other things for that purpose it does much good; being often smelted to it is said to restore the Sense of Smelling to those who have lost it; it serves well to put into odoriferous Powders and sweet Bags among other sweet things.

XVI. *The Powder of the Seed.* Being taken from half a Dram to a Dram in Wine it is a Remedy against shortness of Breath, and difficulty of breathing, dissolves and expels Wind, provokes Urine and

the Terms in Women, increases Milk in the Breasts of Nurses, not being too much taken; it kills and drives forth Worms in the Stomach and Belly, whether taken in Wine or Water, and this it does the more effectually if it is applied Plasterwise, or in a Cataplasin, to Stomach and Navel; it is an excellent Remedy (as *Galen* says) where there is need of heating, cleaning, and drying.

XVII. *The Oil of the Seed by Expression.* It has all the self same Virtues of the Seed, expressed in the former Section, and may be given from twenty to forty drops, first mixed with Honey, or Syrup of Clovegillflowers, or other proper Syrup, and then taken in a Glass of Wine, Sack-Whey, Barley-Broth, or other proper Vehicle, Morning, Noon, and Night.

XVIII. *The Acid Tincture.* It is good against burning and malign Fevers, the Plague or Pestilence, and other contagious Diseases, it refits Poyson, is good against the Stinging of Scorpions, the Biting of Mad Dogs, and other Venomous Creatures, and has all the Virtues of the Juice, Essence, Decoction, or Infusion and Powder of the Seed foregoing. Dose so many drops as to give the Vehicle a pleasing acidity, several times a day.

XIX. *The Spirituous Tincture.* It cheers the Heart, revives the Spirits, refits Fainting and Swooning Fits, prevails against palpitation of the Heart, dries up Catarrhs and Rheums, dissolves and expels Wind, strengthens the Stomach, causes a good Digestion, provokes Urine, and is profitable against Gravel and Stone; given to a Woman in Labor from one to three Drams in a proper Vehicle it facilitates the Delivery, and brings away the Afterbirth.

XX. *The Oily Tincture.* It is good against the Colick and inward Convulsions of the Bowels, opens obstructions of the Womb, Reins, Ureters, and Bladder, gives ease in the Strangury, and expels Sand, Gravel, Stones, and other Calculous or Tartarous Mucilage out of the Urinary parts. Dose from ten to twenty, or thirty drops, first dropped into White Sugar, and well mixed therewith, and then given in a Glass of White Port Wine; it gives ease in the Gout outwardly applied, is excellent against the Wounds or Punctures of Nerves and Tendons, and hastens the Birth of Women in Labor.

XXI. *The Decoction of the Seed in Vinegar.* If it is held in the Mouth of such as are troubled with the Toothach it eases the pain, bathed upon hard Swellings it softens and dissolves them, it cleanses the Eyes of filth, and being daily applied to the deformities of the Skin, as Tettars, Ringworms, Scurf, Morpew, Yellowness, Spots, Freckles, &c. it is said to cure them.

XXII. *The Fume from the Herb or Seed being burnt.* It drives away Flies, Gnats, Musketoes, &c. out of the Room in which it is used in Summer time.

XXIII. *The Spirit from Herb or Seed.* It is Cordial, expels Wind, eases the Colick, prevails against Convulsions in Children or Elder People, and cures Fainting and Swooning Fits.

C H A P. CCCCXI.

of KALI, or GLASSWORT,
Called also SALTWORT.

THE Names. It is called in *Arabick* Kali, it knows no *Greek* Name, but in *Latine* it is called

called *Kali* also, and *Salicornia*, *Salsicornia*, and *Salsola* genus, in English *Kali*, *Glaswort*, and *Saltwort*. The *Athes* hereof are called *Sola*, and *Rochetta*, and the Salt *Alkali*, or *Sal Alkali*, the Salt of *Kali*, or *Glaswort*; *Kal* is an *Arabick* Word, and in that Language signifies Salt.

II. *The Kinds*. There are four Kinds of *Kali*, or *Glaswort*, viz. 1. *Kali Geniculatum*, *Salicornia*, *Salsola* genus aliud *Cesalpini*, *Salsicornia*, Jointed *Glaswort*, or *Saltwort*. 2. *Kali majus Cochleatum*, *Kali magnum Sedi medij Folij Semine Cochleato Lobelij*, *Kali Cochleatum majus Camerarij*, *Anthyllis Salsae majoris*, *Kali majus Cochleato Semine*, *Salsola* genus *Cesalpini*, Great *Glaswort*, or *Kali* with Snail like Seed. 3. *Kali minus album*, *Kali minus villosum Baubini*, *Anthyllodes Thalij*, Small White *Glaswort*. 4. *Kali Aegyptiacum Folij valde longis birsutis Baubini*, *Kali Aegyptium Alpini*, Egyptian *Kali*, *Glaswort*, or *Saltwort*.

III. *The Descriptions*. The first, or Jointed *Kali*, *Glaswort*, or *Saltwort*, has a Root which is small, long, and thready; it rises up usually with but one Stalk, upright, round, thick, and almost transparent, a Foot, or Foot and half high, thick set, and full of Joints, or Knots, without any Leaves at all on them, but shooting forth Joints one out of another, or one at the end of another, with short Cods at the heads of them, and also such like smaller Branches on all sides, and they are also divided into other smaller ones; this is thought to bear neither Flower nor Seed: there are some other Kinds hereof, as *Kali Geniculatum breve*, differing a little in the form of the Joints one from another, and *Kali Geniculatum rubrum*, one which is wholly reddish, not differing in any thing else from any of the other Jointed ones.

IV. *The second*, or Great *Glaswort*, or *Kali* with Snail like Seed. It has a Root which is somewhat long, with many fibres adjoining to it, and perishes every Year for the most part after it has given Seed; it rises up with a big, round, reddish, fleshy Stalk, very like unto *Purslain*, about two Feet high, divided into many Branches, on which do grow many thick, long, round, fleshy Leaves, pointed at the ends, growing without order, sometimes but one or two, and oftentimes more standing at a place; here and there dispersed upon the Branches come forth also small yellowish Flowers, and after them small brownish Heads, turned round like Snails, in which lye small round Seed; this Plant has an ill taste, but saltrish.

V. *The third*, or Small White *Glaswort*, or *Kali*. It has a Root likewise which is small and woody, which perishes after it has given Seed; it springs up from the Root with several whitish green Stalks, or Branches, nothing so high as the former, and bending or leaning down to the Ground, spreading it self into other smaller Branches full of Joints, whereon grow more store of smaller and shorter, round and pointed Leaves, nothing so fleshy as the former, and of the same pale green color with the Stalks, the Flowers are white, and stand singly on the tops of the Branches, after which come small Husks, in which lies the Seed, which is small, black, and shining, like unto *Sorrel* Seed.

VI. *The fourth*, or Egyptian *Kali*, *Glaswort*, or *Saltwort*. It has a Root like the others, and grows up with one slender Stalk, bending it self downwards, and branching forth at the Joints into other small ones, which for the most part stand more upright, and at every of the joints two very long and somewhat hairy Leaves, bowing themselves downwards because of their length; the small Branches are bare, without Leaves unto the tops or ends of them, where grow many small and long Leaves, hairy, like to the for-

mer, but nothing so long, from among which grow small, whitish, purple Flowers, with many small Threads in their middle; of this sort there are some with shorter Leaves, differing in little else.

VII. *The Places*. The first as well as the fourth grows in *Aegypt*, and it generally grows among other Sea Plants on the Sea Coasts in all Countries; I found it growing plentifully in the Salt Marshes in South Carolina, as up *Wadmalaw* River, and on the Sands and Marshes of *Wando* River, not far from the Sea side, and in other Salt Marshes of the time Country; it grows also on our Coasts of *England*, &c. in many places, in *Saxony*, and other parts of *Germany*, where there are Lakes of Salt Water; the second grows by the Sea sides in several places of *Syria*, *Africa*, *Italy*, and *Spain*, as also in *Provence* and *Aquitane*, where they Sow large Fields thereof, for the Profit they make of the Salt or *Athes* of the Plant in making *Glas* and *Soap*; the third grows not only in the aforementioned places, but in other colder Climates likewise, not by the Sea only, but by the Salt Pits in *Saxony*, as *Camerarius* says, and is found also on the Sea Coasts of *England* and *Ireland*; the fourth, as *Alpinus* says, is more peculiar to *Aegypt*, but *Columna* says it is frequent on the Western *Neapolitan* Shoar.

VIII. *The Times*. They all flourish in the Summer, and they which perish give their Seed in *August*, or something later; the first of them abides all the Winter.

IX. *An Observation*. Out of this Herb is made the *Alkali* of the *Arabians*, *Levant*, *Aegypt*, &c. or Pot *Athes*, as we in *England* call them, called also by other Names, as *Pelverine*, *Pulverine*, *Rochetta*, and *Sola*, which are all the same thing, made of the same Matter, but do each differ in goodness, according to the place the Matter comes from, and the Method or Order of making of it; the Matter is the Herb *Kali*, *Alga*, or *Kelp*, which is *Sea-Girdles*, *Sea-Weed*, *Sea-Thongs*, or *Sea-Laces* the goodness of the Herb is taken from the places of its growth, that which grows on the Coasts and Banks of *Syria*, *Aegypt*, the *Levant*, &c. is the best, that which grows on the Coasts of *Spain*, *Italy*, and *Venice*, is the next best, that which grows on the Coasts of *France* is worse, but that which grows on the mouth of the *Thames*, and other Maritime places of *England*, is the worst of all, as making *Athes*, which yield the least Salt, or *Sal Alkali*, or any of them.

X. *The Qualities*. The Herb is hot and dry in the end of the first degree, the *Athes* or Salt is hot and dry in the fourth degree, *Aperitive*, *Absterive*, *Digestive*, *Diuretick*, *Pyrotick*, or *Cautick*, *Nephritick*, *Hysterick*, *Arthritick*, *Emmenagogick*, *Sudorifick*, and *Alexipharmick*.

XI. *The Specification*. *Kali* purges pituitous, watery, and melancholy Humors, provokes Urine, is good against the Dropfie, opens obstructions of Liver and Spleen, brings down the Terms, and expels the dead Child.

XII. *The Preparations*. You may have therefrom 1. A Liquid Juice. 2. A Powder of the Herb. 3. The *Athes*, called Pot *Athes*. 4. A Salt called *Sal Alkali*. 5. *Soap*. 6. *Sandriwer*.

The Virtues.

XIII. *The Liquid Juice*. Taken in Drink or Wine from one Spoonful to two, or more, it purges downwards superfluous Humors, and therefore is often used for the Dropfie, to provoke Urine and the Terms, facilitate the Birth, and to expel a dead Child;

Child; it opens obstructions of the Liver and Spleen, and dissolves the hardness thereof; it gives ease in the Strangury, and expels Sand, Gravel, Stones, &c.

XIV. *The Powder of the Herb.* It has all the former Virtues of the Juice, but not full out so effectual as it, and may be given from half a Dram to a Dram and half in White Port Wine, or other proper Vehicle, it is sometimes mixed with those things which are used as Corrosives, to consume superfluous, proud, or spongy Flesh, which grows in foul and virulent Ulcers, if it is taken in too great a quantity it is mischievous and deadly, as *Gerard* says.

XV. *Pot Ashes.* They have all the Virtues of the Juice and Powder, and are equivalent in operation to the Ashes of Tartar, they are powerfully aperient, provoke Urine in the last degree, and carry off a Dropisie by Urine, being made into a *Lixivium* with Water, and given in Wine; they are very sharp and biting, like a Caustick, and the Lye which is made thereof is so strong, that it will fetch off the Skin from the Hands, or any other parts of the Body it is applied to, and therefore if any use it to cleanse the Skin from Spots, Freckles, Lentils, Yellowness, Sunburning, Tanning, Scurf, or Morpew, or other like Defilements, they ought to be cautious in using of it, and apply it very sparingly, or use it not made too strong, and so it may do much good. How these Ashes are made see in our *Seplafium*, or *Druggists Shop*, Lib. 2. Cap. 4. *Sett.* 11. and 12. where, and in the other Sections of the same Chapter, you may find abundant satisfaction, and you may also see to what Mechanick Uses they are to be applied, as also in *Sett.* 22. of the same the rest of their Medical Uses; so also our *Polygraphice* Lib. 10. Cap. 1. of the Eighth Edition.

XVI. *The Salt, or Sul Alkali.* This Salt is made out of the Pot Ashes, and has all the Virtues of Salt of Tartar, and almost in the same degree of goodness: how this Salt is made in perfection see in our *Polygraphice* Lib. 10. Cap. 1. *Sett.* 12, 13, 14, 15, 16. Those Ashes which come from *Spain* and the *Levant* are good, where, by reason of the heat of the Climate, *Kali* grows in great quantities, and is green all the Winter; but those Ashes which come from *Egypt*, where there is never any Rain, are the strongest, and make the strongest and sharpest Salt. The Ashes coming from the *Levant* are called *Pulverine*, because they are in Powder, and have no such Preparation as *Soda* and *Roebetta* have, for the Herb is only burn'd on Iron Grates, and afterwards when cold the Ashes are gathered up and kept in proper Vessels for use; these Ashes have indeed less Salt than *Roebetta* and *Soda*, but for the quantity it is nothing inferior in virtue and goodness. Our *Dutch* Pot Ashes, which are purely white, and in great hard lumps, are the best in the World, yield most and purest Salt, and of the strongest kind, and therefore of excellent use in making Soap, Glass, &c. This Salt prevails against the Jaundice, Dropisie, Scurvy, and Gout. Dose a Scruple or half a Dram in a Glass of White Port Wine.

XVII. *The Soap.* If it is spread upon a piece of course thick brown Paper and applied to the Soles of the Feet of those who are taken Speechless, it brings them to their Speech again in a little time, if there be any hopes of restoration; anointed over the Face of one who has Lentils or Freckles thereon it obliterates or takes them away, but it is by a gentle taking away of the Skin, after the manner of a Scurf as it were, spread upon Leather and applied to the Hips in a Sciatica it cures it, being renewed as need requires; the same it does being applied to places pained with the Gout, and repeated accordingly.

XVIII. *The Sandiver, or Gliss-Salt.* It is used often being made into Powder to be blown into the Eyes thro' a Quill, or being dissolved in Water and squirted into them, to rake away the Skin which grows over the Sight; it takes away also Scabs and Manginess, if the parts affected be often bathed therewith, and serves to dry up running Sores and Scabs, helps against the Itch, and kill Tettars, Ringworms, and the like, being often washed therewith, and suffered to dry on; it serves to make Merals run, and a little thereof put into Antimony and Nitre for making *Crocus Metallorum*, increases the quantity of the *Crocus*, and it will therewith the better separate from the *Scoria*. Glass being made with Pot Ashes and other Materials, as Sand, Crystal, &c. this *Sandiver* is that Salt which is foamed off from the top of the Glass in the making thereof; see more of it in my *Seplafium*, or *Druggists Shop*, Lib. 2. Cap. 15. where you may have further satisfaction.

XIX. To find out the quantity of Sal Alkali which is contained in any quantity of Pot Ashes. Take a Pound of Pot Ashes, dissolve them, by boiling in eight or ten Pounds of fair Water, more or less, then being well settled decant off the clear Lixivium from the Feces, the Feces dry either in the Sun or before a Fire, or in an Oven, or over a Sand heat, and then weigh them, for so much as they want of a Pound, so much Salt is contained in each Pound of Ashes, and so many Ounces of Salt you have in your Lixivium. In some of your Oriental Pot Ashes coming from *Syria*, *Egypt*, &c. you may have about ten Ounces in a Pound, and in some again not above nine, or eight Ounces, and some of the worse sorts of Ashes do not contain above seven or six Ounces in a Pound, so great a difference is there in the goodness of the Ashes, but out of a Pound of the best, strongest, and whitest *Dutch* Pot Ashes we have obtained several times thirteen and fourteen Ounces of pure Salt, very rarely so little as twelve Ounces; the strongest and best Ashes are those which are in greatest lumps, very hard, and white, as it were of a bluish white, (which color arises from the well burning) and such contain the greatest plenty of Salt.

C H A P. CCCCXII.

OF KELP, SEALACES,

O R,

SEATHONGS.

I. *THE Names.* It is called in Greek *θαλασσίαν*, and *θαλάσσιον*, in Latine *Alga*, and *Alga Marina*, also *Alga Maris*, and *Phycor*, or *Phycus*, or *Eucus Marinus*, *Marinus* being added thereto to distinguish it from *Eucus Herba*, which is *Anchusa*, in English *Kelp*, and *Seaweed*.

II. *The Kinds.* Of Seaweeds there are several Kinds, viz. I. *Alga Marina*, *Eucus Marinus*, *Kelp*, *Sea-Laces*, *Sea-Thongs*, or *Sea-Girdles*, of which in this Chapter. II. *Muscus Marinus*, *Lichen Marinus*, *Sea Liverwort*, and this is twofold, viz. 1. *Lactuca Marina*, *Lichen Marinus*, *Oyster green*. 2. *Opuntia Marina*, *Lichen Marinus rotundifolius*, *Round Leaved Oyster green*, or *Round Leaved Sea Liverwort*. III. *Alga Quercina*, *Eucus Quercinus*, *Sea-Wrack*, and this is sixfold, viz. 1. *Quercus Marina major*, *The Greater Sea-Oak*, or *Sea-Wrack*.
FFFF 2. *Quercus*

2. *Quercus Marina minor*, The Lesser Sea-Oak, or Sea-Wrack. 3. *Quercus Marina Tertia*, The Third Kind of Sea-Oak, or Sea-Wrack. 4. *Quercus Marina quarta*, Jagged Sea-Wrack. 5. *Fucus*, five *Alga intubacea*, Sea Curled Endive. 6. *Fucus spongiosus nodosus*, Sea Raggedstaff. These two last generic Species see in their proper places under the Titles *Oyster green*, and *Sea-Wrack*.

III. The Kinds of the first of the three foregoing Heads. *Alga Marina*, *Fucus Marinus*, or *Kelp*, called also *Sea-Girdles*, *Sea-Laces*, and *Sea-Thongs*, is sevenfold, viz. 1. *Alga Marina*, (properly so called) *Fucus Marinus*, *Alga Marina Gramnea Lugdunensis*, *Fucus Marinus alter Dodonæi*, *Alga Angustifolia Varrariorum Bauhini*, the broader sort of which is called *Imperatus*, *Fucus Giganteus*, and *Palmifolium Giganteum*, *Kelp*, peculiarly so called, *Sea-Girdles*, *Sea-Laces*, *Sea-Thongs*. 2. *Fucus Marinus crassus Latifolius*, Thick Broad Leaved *Alga*, *Kelp*, or *Sea-Girdles*. 3. *Fucus Marinus Latissimus Tenaisfolio*, Broad and Thin Leaved *Alga*, *Kelp*, or *Sea-Thongs*. 4. *Fucus Alatus*, five *Phosganoides*, Winged *Alga*, *Kelp*, or *Sea-Girdles*. 5. *Alga*, seu *Fucus maximus Polyschides*, Great *Alga*, or *Kelp*, or *Sea-Girdles* with many Labels, or *Sea-Girdles* with Hangers. 6. *Fucus Marinus secundus Dodonæi*, *Fucus longo, angusto, & crasso Folio*, Long, Narrow, and Thick *Alga*, *Kelp*, or *Sea-Girdles*. 7. *Fucus Membranaceus Ceranoides*, *Alga Marina Membranacea*, *Kelp*, or *Seaweed* with skinny Horns.

IV. The Descriptions. The first, or *Kelp* peculiarly so called, *Sea-Girdles*, *Sea-Laces*, or *Sea-Thongs*. It has roundish Roots, which are hairy and blackish on the outside, from whence rise up small, round, long, white, hairy Heads, breaking out at the sides as it were into Branches, on the tops whereof stand or grow three or four very long and narrow soft green Leaves, some being an Ell or more long, and about an Inch broad; this has neither Seed nor Stalk, but lies on the Ground, until the Tide raise it to float on the Water, which being broken by the force of the Waves is carried to the Shoar, where it is gathered and kept for many uses.

V. The second, or Thick Broad Leaved *Alga*, *Kelp*, or *Sea-Girdles*. This differs from the former, in that the Root is wholly fibrous, the Stalk rising from thence thick and round, two or three Inches high, and the Leaf, which is sometimes but one, and seldom two, of a very great length, even divers Feet, or rather Yards or Ells long, and above four Inches broad, equal from a little above the setting on to the end, but somewhat waved and crumpled on the edges, being thick, and of a deep green color, so soft and moist while it is fresh, that it is like unto moist Glew or Gelly, and will hardly dry, unless it lies long in the Sun, and will not be fit to be kept without rotting until after it has been many days dried.

VI. The third, or Broad and Thin Leaved *Alga*, *Kelp*, or *Sea-Thongs*. This is in all respects like unto the last, but that the Leaves are thinner, broader, and shorter, yet crumpled on the edges, and of a paler green color, and like unto thin Parchment.

VII. The fourth, or Winged *Alga*, *Kelp*, or *Sea-Girdle*. This grows fast upon Stones, and Shells of fishes, both in the deeper and shallower places of the Sea, having a round, dark, reddish Stalk, of the bigness of a Goose Quill, which being grown to the full length is very weak, lying on the Ground, unless the Water raise it, and about four Feet long, on each side of which grows a Wing all the whole length of it, like unto a Skin or Parchment, with Veins therein, which being like the Feathers of an Arrow, is small below and broader above, equally to the top,

of two or three Inches breadth; the Leaves which grow next the Ground are many, (and some grow also on the Stalk) of a yellowish greenish color, and of an Hand breadth, being four, six, or eight Inches long, tough and pliable, or of a skinny substance, like unto the other *Girdles*; the Stalk does very well resemble a two edged Sword: this Kind of *Alga* or *Kelp* is used to be dressed and eaten by the Inhabitants of the Sea Coasts where it grows, after it is cleared from the skinny Wings, and has a little sweet taste with its saltness, which makes it the more acceptable to the Palate.

VIII. The fifth, or Great *Alga*, or *Kelp*, or *Sea-Girdles* with Labels or Hangers on. The manner of growing of this with its use is like the last; but this is the greatest of all these Seaweeds, having a Stalk as thick as that of Angelica, of a brown Chestnut Color on the outside, and so are the round Leaves likewise, which are sometimes four, five, or six Feet long, not being so thick as ones little Finger, and ending in several broad and short skinny Labels, in like manner as the lower part of the Sword Hangers, which are of a yellowish color.

IX. The fourth and fifth Kinds Johnson upon Gerard has thus described. This Seaweed has a various Face, for sometimes from a fibrous Root, which commonly grows to a Pibble Stone, or is fastned to a Rock, it sends forth a round Stalk, seldom so thick as ones little Finger, and about half a Foot in length, at the top of which grows out a single Leaf, sometimes an Ell long, and then it is about the breadth of ones Hand, ending in a sharp point, so that it very well resembles a two edged Sword; sometimes from the same Root come forth two such fashioned Leaves, but then commonly they are lesser; sometimes at the top of the Stalk it divides it self into eight, nine, ten, or twelve parts, more or less, and that just at the top of the Stalk, which lesser divisions never come to that length which the single Leaves do; this I judge to be the *Fucus Polyschides Bauhini*: now that these two Varieties are not several Kinds I am certain; at Margate in Kent, where they grow, they call them *Sea-Girdles*, which Name well befits the single one, and the divided they call *Sea-Hangers*, for if you hang the tops downwards they do reasonably well resemble the old fashioned Sword Hangers; thus much for their Shape: now for their Color, which is not the same in all, some are more green, and these can scarcely be dried, others are whitish, and they do quickly dry, and then both in Color and Substance are so like Parchment, that such as know them not would at the first view take them to be nothing else; this is of a glutinous substance, and of a little saltrish taste, and are said to be good Meat being boiled tender, and so eaten with Butter, Vinegar, and Pepper.

X. The sixth, or Long, Narrow, and Thick *Alga*, *Kelp*, or *Sea-Girdles*. The Root hereof is round and flat, from whence spring two or three narrow thick Leaves, about a Foot and half long, divided into several flat thick Thongs, like Leather, some long, and some shorter, and they again divided into smaller ones, with no swollen Knots or Bladders thereon; but there is another sort of this, which has shorter and narrower Leaves, the Stalks ending all in swollen points. Johnson upon Gerard has a better Description hereof, viz. This grows to the length of five or six Feet, is smooth and membranous, being about half a Fingers breadth, and variously divided, like to wet Parchment, or Leather cut into Thongs, without any swollen Knots or Bladders; but the other sort has long and flat Stalks, like the other, but the Stalks are thick, and set with swollen Knots or Bladders, out of which grow sometimes little Leaves, but in other respects it is not unlike the former; these

these two Kinds are the *Eucus Marinus secundus* & *tertius* *Dodonæi*.

XI. The seventh, or Kelp, or Seaweed with skinny Horns. It has a Stalk a little above an Hand breadth long, an Inch and half broad, divided into several Branches, some broader, and others narrower, varying wonderfully, each of which ends in short parts, like unto small Horns; of this there are divers sorts, differing somewhat, tho' not much one from another: these are said to cure the longing of Women with Child.

XII. The eighth, or Dying Red Sea Alga, Kelp, or Moss. It grows unto some Rock or Stone, without any appearance of a Root, unless it is a flat kind of Skin, from whence rise up several Stalks, which are soft, and not above four or five Inches high, from each Stalk of which shoot forth several Branches on both sides, and some of them again divided into lesser, all of them stored with fine small Leaves, as small as Camomil Leaves, or rather like unto Fennel Leaves, of a substance much like to that of the Stalks, soft in handling at first, easie to be bended, and almost transparent, if they be interposed to the Light, of a reddish or purplish Color, but with some whiteness mixed together; this is not so brittle as Coralline when it is dried, but grows more tough thereby, and being put into Water and steeped a while therein it grows soft again; it is used by several Mechanicks to strike a deep Crimson, or reddish Purple Color, which will last long; and out of this a Red Lake may be made, as well as out of Kermes Berries, Brasil, Madder, Corn Poppies, Red Roses, Carnations, Sun-Flower, Saffron, Broom-Flowers, and other things of like kind.

XIII. The Places. These are all of them found on many of our English, Scottish, and Irish Shoars, on the Coasts of Holland and France, as also on the Shoars of warmer Countries; the fourth and fifth were found at Margate.

XIV. The Times. They flourish in the Summer, and end of Summer, those being the chief times of their beauty and use.

XV. Their Qualities, Specification, Preparations and Virtues are much the same with those of Kali in the foregoing Chapter, and out of these as good Pot Athes are made as out of any of the Kali's, or Glassworts.

KIDNEYWORT, See Navelwort Chap.

KIK, See Spurge Great Indian Chap.

KINGCOB, See Crowfoot Chap. 172.

KINGSCROWN, See Melilot Chap.

CHAP. CCCCXIII.

Of KINGSSPEAR,

OR,

Small Yellow ASPHODIL.

THE Names. It has no known Greek Name, the Latines call it *Asphodelus luteus minor*, *Hastula Regia*, and *Femini Dionysij Dodonæi*, in English *Kings-Spear*, or *Small Yellow Asphodil*.

II. The Kinds. It is the fourth Species of the *Asphodil* Treated of in Chap. 35. Sect. 2. foregoing, and a singular Plant of the Species.

III. The Description. It has Roots proceeding from one Head, which are many, long and slender, smaller than those of the other Yellow sort, and by its long slender Strings spreading in the Ground it does much increase: This Small Yellow *Asphodil*, or *Kings-Spear*, has many long, narrow, edged Leaves, which are chamfered, or furrowed, which makes them seem three-square, of a blewish or whitish green color; the Stalk is round, and rises up to be sometimes two or three Feet high, beset with small long Leaves up unto the very Flowers; the Flowers which grow thereon from the middle to the top are very many, in shape like to the Flowers of the other Kinds, they grow thick together, and Spike fashion, one above another, for a great length, and wholly yellow, laid open like a Star, somewhat smaller than the *Great White Asphodil*, and somewhat greater than the *Lesser Asphodil*, which when they are past small round Heads or Seed Vessels come in their places, in which is contained small, black, cornered Seed, almost three-square.

IV. The Cut which we have exhibited in the third place in Chap. 35. Sect. 6. foregoing is that which Gerard has given us for *Kings-Spear*, and the Cut for Gerard's fourth Kind of *Asphodil* is that which Parkinson has exhibited for *Kings-Spear* in his *Theatrum Botanicum* Pag. 1218. but that which *Matthioli* has set forth in his *Compendium* Pag. 342. is much more like the true Plant, excepting in its Head of Flowers, which is the true form of the Head before it shoots up into its long Spike, for afterwards when it grows up and dilates it self it differs not much from the spikedness of the other *Asphodils*, and this Figure of *Matthioli* is that which we have given you in this place.

V. The Places. It grows naturally in Italy, Spain, Southern parts of France, and other hot Countries, from whence it has been brought to us, and is only nursed up in our Gardens.

VI. The Times. It Flowers in the latter part of Summer, as in July, and August, and the Seed is ripe about a Month after.

F f f f 2

VII. As

VII. As to the *Qualities, Specification, Preparations and Virtues* hereof, they are much the same with those of the Common *Asphodil* in Chap. 35. Sect. 9. ad 23. aforegoing.

C H A P. CCCCXIV.

of KNAPWEED Common,

OR

MATFELLON.

THE *Names*. It has no *Greek Name*, nor any ancient *Latine Name* that I know of, but by the modern *Latines* it is called *Jacea*, and in *English* *Knapweed*, or *Matfellow*.

II. *The Kinds*. *Knapweed* is agreed upon by all Authors to be a kind of *Scabious*, and therefore *Tragus* makes it to be *Scabiosa Quarta*, *Gesner* in *Hortus* takes it for a Kind of *Great Centory* of the *Meado*, and thinks it to be that Plant which *Sealiger* calls *Gethya nigra*, *Thalys* in *Hercynia* calls it *Cyanus Sylvestris Angustifolius*, but generally it is called *Jacea*, (*à lantano Colore Florum*) We have divided the Productions hereof into three Species, viz.

1. *Jacea vulgaris*, Our *Vulgar* or *Common Knapweed*, of which in this Chapter. 2. *Stebe*, *Silver Knapweed*, of which in Chap. 415. next following. 3. *Jacea spinosa*, *Thorny Knapweed*, which third Species, because it is not found growing in *England*, nor in any of our *Foreign* or *West Indian* Plantations beyond *Sea*, we shall say no more of it in this Work.

Knapweed black common

III. *The Kinds of the first or Common Knapweed*. Authors make sixteen or eighteen Kinds or Varieties

hereof, of which not above five or six grow in *England*, of which we shall only speak in this Chapter, letting the others alone for a more general Work.

1. *Jacea nigra vulgaris*, *Jacea nigra Pratenfis Latifolia Bauhini*, Our *Common Knapweed*, or *Matfellow*; this *Bauhin* doubts whether it may not be *Solidago Saracenicæ Loniceri*. 2. *Jacea nigra vulgaris laciniata Bauhini*, *Jacea major Lobelij*, *Jacea sexta Clusij*, *Jacea hirsuta capite Camerarij*, Our other *Common Wild Knapweed*, or *Great Knapweed*. 3. *Jacea laciniata alba*, *White Jagged Knapweed*. 4. *Jacea nigra Angustifolia Bauhini*, *Jacea nigra Lithospermæ Arvensis Kôljs*, *Narrow Leaved Knapweed*. 5. *Jacea Montana Narbonensis Lobelij*, *Jacea Muscata*, & quinta *Tabernamontani*, *Jacea Montana incana odora Bauhini*, *Narbone* or *French Mountain Knapweed*. 6. *Jacea Montana candidissima Bauhini*, *Jacea Montana laciniata*, *Hairy White Mountain Knapweed*.

IV. *The Descriptions*. The first, or Our *Common Knapweed*, has a *Root* which is *white*, *hard*, and *woody*, with several *Fibres* annexed thereto, which *perishes* not, but *abides* with *Leaves* thereon all the *Winter*, and *shoots* out *fresh* again every *Spring*; from this *Root* rise up many long and somewhat broad dark green *Leaves*, something deeply dented about the edges, and sometimes a little rent or torn as it were on both sides in two or three places, and a little hairy withal, from among which rises up a strong round *Stalk*, four or five Feet high, divided into many small *Branches*, at the tops whereof stand great scaly green *Heads*, from whose middle there is thrust forth a great number of dark, purplish, red *Thrums* or *Threads*, (and sometimes, tho' but rarely, *white*) in which after they are withered and past away several black *Seeds* are found, lying in a great deal of *Down*, somewhat like unto *Thistle Seed*, but smaller.

Great Knapweed

V. *The second*, or Our other *Common Wild Knapweed*, or *Great Knapweed*. The *Roots* are like

like the former, blackish, and hard, with many Fibres; this Other Wild Knapweed grows with us among Corn very much, as well as in Meadows, and it grows with greater and taller Stalks than the former; the Leaves both below and above upon them are much divided on both sides, even to the middle Rib, almost like the Great Scabious of Matthioli, but of a dark green color, and as tough, or rougher than the former, or first Common Kind, the scaly Heads on the tops of the Branches are greater, and the Flowers larger, and of a deeper red color; the Seed is also like to the first foregoing.

Knapweed white flowered

VI. *The third, or White Jagged Knapweed.* It has long creeping Roots, which are fibrous, or thready, and spread themselves somewhat under Ground; from this Root rise up several Stalks, furnished with pretty large whitish green Leaves, very much jagged, divided or cut in on each side to the middle Rib; these Stalks rise up to be sometimes about two Feet high, replenished with like Leaves from the bottom almost to their tops, and they likewise branch out almost from the Ground on all sides with lesser Branches, which are also beset with like Leaves, but lesser and less jagged as they approach near the tops; at the tops of the Stalks and Branches grow such like scaly Heads as on the former, and with the like pleasant Flowers, made of fine Threads, as the others are, rising out of them, saying that these are purely of a white color.

VII. *The fourth, or Narrow Leaved Knapweed.* Its Root is long, hard, and blackish, and repleat with many small Fibres; from this rises up a round, rough, green Stalk, about a Foot and half high, on each side of which are set narrow, rough, short, and somewhat hoary green Leaves, compassing it at the bottom, and divided into some other Branches above, on the top of each of which stands a scaly, whitish, green Head, out of the middle of which rise many small long Threads, like unto the former, but smaller, and of a pale reddish color, after which follows small black

Seed, like the other; of this sort also there is one whose Stalk and Leaves are longer, and smooth, all over hairy, soft, and woolly.

VIII. *The fifth, or French Mountain Knapweed.* It has a Root which is long, slender, with some Fibres adjoining to it, and of a bitter taste, from which Root spring forth several long winged Leaves, very much divided on both sides into other small, long, and narrower ones, but they little or nothing again divided, of a light green color on the upper side, and hoary white underneath, and a little rough or hard withal, somewhat like unto the Yellow Knapweed with prickly Heads; from among these Leaves rises up a round Stalk, something rough also, and about a Foot high, without many Branches, but bearing three or four scaly Heads at the tops, with each of them a long, narrow, divided Leaf at the foot, and thrusting forth for a Flower many purple Threads in the middle, smelling sweet, after which comes the Seed, not unlike the other Knapweeds, but lesser.

IX. *The sixth, or Hoary White Mountain Knapweed.* It has a thick woody Root, which sends forth divers winged Leaves, lying upon the Ground round about it, very much jagged, rent or torn on both sides into many small Leaves, which are each of them deeply dented on the edges, somewhat like unto the Leaves of the false Scabie in the next Chapter, all covered over with a hoary white Cotton or Wool, or as it were sprinkled with fine Wheat Flower, or Meal, from among which rises up a crested, white, hoary Stalk, a Foot, or Foot and half high, scarcely having any Leaves thereon to the top, where it bears only two or three scaly Heads of Flowers, like the others, with purple Threads rising out of their middle, which being past away leave Seed like the rest.

X. *The Places.* The first grows with us in most Fields and Meadows, and about their borders, and near Hedge sides, and in many waste Grounds, almost every where; the second grows in many places of this Land, also among Corn, as well as in other Fields, and grows in an especial manner about Coventry; the third is also found growing wild in several places of England, Johnson says he found it growing wild in a Field near Martin Abby in Surry, as also in the Isle of Tence; the fourth grows about Padua in Italy, and Mompelier in France, and other like warm Countries; the fifth upon the Hills of Castrum novum, near Mompelier; the sixth about Capua in Italy, but with us these three last grow only in Gardens.

XI. *The Times.* They all Flower in June and July, and their Seed is ripe in July, or August, or September, according as their Flowering is, either early or late.

XII. *The Qualities.* Knapweed is temperate in respect of heat, and dry in the beginning of the second degree, Astringent, Absterfiv, Traumatick or Vulnerary, Antiemmenagogick, and Analeptick.

XIII. *The Specification.* It is a peculiar Cure for all fluxes of Blood, whether internal or external, whether in the Stomach or other Bowels, whether by ruptures of any Blood Vessel or opening of their Mouths; it is good also to stop the flux of Humors to any Wound, Sore, Ulcer, or Fistula, to dry up the moisture, and gently to heal the same, without any sharpness or biting.

XIV. *The Preparations.* You may have therefrom 1. A Liquid Juice. 2. An Essence. 3. A Decolion or Infusion in Wine or Water of Herb and Roots. 4. A Powder of Herb and Roots. 5. A Gar-garism. 6. A Balsam. 7. A Cataplasm.

The

The Virtues.

XV. *The Liquid Juice.* It is a very good astringent, and helps to stay fluxes both of Blood and Matter, as spitting or vomiting Blood, bleeding at Nose, and other outward parts, pissing of Blood, also the violent overflowing of the Courses in Women; it heals inward Wounds, also those Veins which are inwardly broken, and cures fluxes of the Bowels, as Diarrhoea's, Lienteria's, and Dysenteria's, or Bloody Fluxes. Dose three, or four, or more Spoonfuls in Red Port Wine two or three times a day, or as off as need requires.

XVI. *The Essence.* It has all the Virtues of the Juice, but is much more powerful for Fluxes of the Belly; it strengthens the Stomach, and stops Vomiting, it prevails against Catarrhs, or distillations of thin and sharp Humors falling upon the Lungs, and is good for such as are bruised by Falls, Blows, or other Accidents. Dose two or three Spoonfuls in a Glas of Wine Morning, Noon, and Night.

XVII. *The Decoction of Herb and Roots in Wine or Water.* It has all the Virtues of Juice and Essence, but much less powerful; it is good to wash green Wounds, old running Sores, putrid Ulcers, Fistula's, and the like, for it washes off, and cleanses them of their putrid matter and sanies, dries and heals them, without any sharpness or biting; it does the like in running Sores and Scabs of the Head and other parts. Dose inwardly is five, six, or eight Ounces, sweetened with a little Sugar.

XVIII. *The Powder of Herb and Roots.* It is admirably drying and astringent, for being strewed thick upon any bleeding part it presently stops the afflux of Blood, and conglutinates the lips of a simple green Wound; strewed thick upon old and putrid running Sores and Ulcers it cleanses them, dries up the Humors flowing, and disposes them to healing; a Dram of the Powder given inwardly in Red Port Wine Morning and Evening stops all inward fluxes of the Bowels.

XIX. *The Gargarism.* Take of the Essence two Ounces, of the Decoction four Ounces, Alum two Drams, Honey an Ounce, mix and dissolve. It heals soreness of Mouth, Gums, and Throat, and assuages the swellings of the Uvula and Jaws; it is also good for green Wounds, to stop the bleeding, and conglutinate the lips of the Wound.

XX. *The Balsam.* It digests, cleanses, incarnates, dries, and heals all sorts of Wounds, Ulcers, and putrid running Sores in what part of the Body soever, and put scalding hot into Fistula's it dissolves the callous, and causes them in a short time to be cured.

XXI. *The Cataplasim.* Made of the Herb and Roots boiled soft, and brought to a thickness with Powder of Camfrey Roots, and applied, it is said to be available for the Cure of Ruptures, the Decoction in Wine being also taken inwardly for some considerable time.

XXII. Lastly, it is to be noted, that the *Qualities, Specifications and Virtues* of this Herb are in a manner the same with those of *Scabious*, this being a Species thereof, and therefore for a more full account thereof we shall refer you thither.

C H A P. CCCCXV.

of K N A P W E E D Silver,

O R

False S T O E B E.

THE Names. This Plant was doubtless unknown to the Ancient Greeks, as also to the Ancient Latines, but the Moderns call it *Stabe*, which is not the true *Stabe* of *Dioscorides* and *Theophrastus*, that being the *Pimpinella Spinosia*, or *Thorney Burnet*, whereas this *False Stabe* seems truly to be of the Stock of the *Knapweeds*, and therefore may more properly be called in Latine *Stabe Notba vel Spuria*, and in English *Bastard or False Stabe*, or *Silver Knapweed*.

II. *The Kinds.* Authors have made many sorts of this *Silver Knapweed*, but the chief which we shall take notice of are these following, viz. 1. *Stabe Salamantica prima Clusij*, *Aphyllanthus prima Dodonæi*, *Stabe major Folij Cichoraceis mollibus languinosis Bauhini*, Clusius his first Spanish *Silver Knapweed*. 2. *Stabe Salamantica secunda Clusij*, also *Stabes Salamantica primæ altera Species ejusdem Authoris*, *Stabe Argentea incana Lobelij*, *Aphyllanthus tertia Dodonæi*, *Stabe major Folij Erucæ mollibus languinosis Bauhini*, Clusius his second Spanish *Silver Knapweed*. 3. *Stabe Salamantica Argentea Lobelij*, also *Stabe Salamantica Argentea minor*, *Stabe Salamantica tertia Clusij*, *Aphyllanthus quarta Dodonæi*, *Stabe Calyculis Argenteis Bauhini*, Lobel's *Silver Headed Knapweed*. 4. *Stabe Austriaca elatior Clusij*, *Stabe Gallica*, *Stabe Calyculis Argenteis major Bauhini*, The Greater *Silver Knapweed* of Austria. 5. *Stabe Austriaca humilior & humilis Clusij*, *Centaurij majoris Species minor Gesneri in Collectione Stirpium*, *Stabe incana Cyano similis tenuifolia Bauhini*, *Silver Knapweed* of Austria the Lesser. 6. *Stabe Argentea Flore albo minor*, *Stabe Calyculis Argenteis minor Bauhini*, *Jacea Flore albo Gerardi & Tabernamontani*, The Lesser *Silver Knapweed* with a white Flower. 7. *Stabe Plantaginifolia Alpini* (in *Lib. de Plantis exoticis*) *Narrow Leaved Silver Knapweed* of Candy.

III. *The Descriptions.* The first, or Clusius his first Spanish *Silver Knapweed*. It has a Root which is white, long, and woody, when it is grown above two Years old, and then oftentimes perishes in the Winter, otherwise it abides well, and will usually Flower and Seed two Winters, if they be not too extremely cold, or do not stand too much in the Weather, from this Root rise up several large winged Leaves, lying on the Ground, very much cut in on both sides into large pieces, but each of them set closer together than the next, of a sad green Color on the upper side, and somewhat whitish underneath, very hairy all over, as also the strait strong Stalks, which rise up to be three or four Feet high, or more, with several such like divided Leaves on them as grow below, but much lesser, and every one sharp at the points, divided in the top into divers Branches, bearing upon long, bare, or naked Stalks, and somewhat long, small, scaly, smooth, round, green Heads, but seeming more neatly contrived together than any of the Heads of the former *Knapweeds*, from the small tops whereof rise many fine Purplish or Crimson Threads or Thrums, or of a Color between both, standing round together, and something whiter

whiter at the bottoms of them, which so stand in the Flower near a Month before they fade, in the mean season the Seed ripens in the Heads, which is small, not much bigger than the *Cyanus*, but not so great as the *Ordinary Knapweed*.

IV. *The second, or Clusius his second Silver Knapweed.* It has a Root which is white and long, not enduring after Seed time; it has many divided hairy and somewhat hoary Leaves, lying on the Ground, divided into several parts on both sides, but more separate one from another than the former; the Stalks are somewhat hairy or hoary also, but stand not so upright as the former, rather leaning downwards, by reason of their weakness; these Stalks are divided into many Branches, bearing at their tops scaly Heads, a little larger, from whence shoot forth larger Flowers also than the former, whose outward Leaves are made like those of the *Cyanus*, or *Cornflower*, of a fair purplish red Color, with such like colored Threads or Thrums in their middles as are in that just foregoing, with whitish and yellowish bottoms; the Seed ripens in the time of Flowering, and is like the former.

V. *The third, or Lobel's Silver Headed Knapweed, which is the third Kind of Clusius.* The Root is something thick and long, and abides sometimes after Seed time, it has many Leaves rising from the Root, but they are much more divided, and into smaller parts than either of the foregoing, being more hoary, or of a whiter green Color than they, the Stalks are in the same manner hoary, and rises up as high as the first, with thin, cut, or divided Leaves upon them, sharp at the points, but smaller and smaller up to the tops, where they are much divided into Branches, and bearing at their ends scaly green Heads, but more white edged Leaves, seeming as if they were Silvered, out of which come forth small purple Flowers, like the rest, but smaller, the Seed hereof lying in the Downy Heads, as the others do, but are something blacker than they, each having an hairy top on them.

VI. *The fourth, or Greater Silver Knapweed of Austria.* This does not much differ from the last neither in its manner of growing, nor in its form of the Leaves, nor in its height, nor in its Stalk, but only in its scaly Heads, which are not of such a shining white Silver like Color, and in this consists the whole difference.

VII. *The fifth, or Silver Knapweed of Austria the lesser.* There is likewise but very little difference in any particulars between this and the last, its chief variation is in the lowness of its growing and slenderness of the Stalk, by which it is made a diminutive Plant of the kind.

VIII. *The sixth, or Lesser Silver Knapweed with a white Flower.* Nor is there much difference or variety between this and the last, but only in the Flower, which consists wholly of white Threads or Thrums, without having any other Color joined or mixed with it.

IX. *The seventh, or Narrow Leav'd Silver Knapweed of Candy.* It has a white Root, and of a Fingers thickness in magnitude, it is but a small Plant, and has divers long, soft, fat, and narrow Leaves, lying next the Ground, a little dented on the edges, but those which grow up upon slender Stalks, of about a handful long, are not dented at all, but resemble Ribwort Plantane Leaves, and are of a yellowish green Color, the tops of the Stalks are replenished with small long Husks or Heads, out of which grow yellow Flowers, and after them small long Seed, like unto that of Scabious.

X. *Nota.* Clusius says that the Spaniards call the first by the Name of *Cabesiela*, id est *Capitulum*,

a little Head, and they usually make Brooms or Besoms thereof to sweep their Houses, and that the Learned Physicians there do use the third Kind instead of Scabious for all the Purposes thereof.

XI. *The Places.* The first three Kinds do grow in several places of Spain, especially about *Salamanca*, as Clusius says, the fourth, fifth and sixth grow in *Austria*, and the seventh, (as its Title testifies) in *Candy*, but by transplantation they are nursed up in several Gardens of the Curious here in *England*.

XII. *The Times.* The first six do all Flower in the Summer Months of *June* and *July*, that of *Candy* Flowers something later, viz. in *August*, if any early Frost takes them they immediately wither, altho' in their own natural places, which are the warm Countries, and where they continue many Years.

XIII. *The Qualities, Specification, Preparations and Virtues* are the same with those of the *Vulgar* or *Common Knapweeds* in the former Chapter, and to that I refer you, Authors say that all the sorts of *Knapweed* come somewhat nigh unto the Qualities of *Scabious*, to which for their full Virtues you ought to be directed, and know that what Remedies may be had from and what Diseases *Scabious* may be applied to, the same the *Knapweeds* are productive of and equally efficacious in.

C H A P. CCCCXVI.

of K N A W E L,

O R,

German K N O T G R A S S.

I. *THE Names.* It has neither Greek nor Ancient Latine Names that I know of, our Moderns call it *Polygonum Germanicum*, and we in *English* *Knaewel*, or *German Knotgrass*.

II. *The Kinds.* We have two Kinds hereof, viz. 1. *Polygonum Germanicum*, *Knaewel Germanorum*, *Polygoni Species Tragi*, *Polycarpon*, (from the abundance of Seed) and *Polycnemum*, (from its many Virtues) *Polycarpon Lugdunensis*, *Polygonum exiguum Dodonci*, in his *Pemptades*, *Polygonum Selinoides Gerardi*, but this is an improper Name, for it has no Leaves like *Selinum*, or *Parfly*, *Common Knaewel*, or *German Knotgrass*; I know some would have this Plant to be *Saxifraga Anglicana Lobelij*, but I think it may be a Species thereof, the form and strong sweet smell which *Tragus* says it has inducing me to think so, (this being the *Knaewel Tragi*) but the small green Flowers and Seed in them are much differing from the Pink-like white Flowers in that. 2. *Polygonum Germanicum alterum*, *Polygonum Litoreum minus Flosculis spadicis albicantibus*. The second *Knaewel*, or other *German Knotgrass*; *Bauhinus* says that there is several Varieties of this *German Knaewel*, of which this second Kind is one of them, and the two following are also thought to be Species of the same Plant, viz. 3. *Polygonum Montanum Niveum Lobelij*, *Polygonum Montanum minus Niveum & Sericeum*, *Polygoni Hispanici genus Clusij*, *Paronychia Hispanica Clusij*, *Polygonum Montanum Tabernamontani & Gerardi*, *Polygonum minus candicans Bauhini*, *White Mountain Knotgrass*, or *Knaewel*. 4. *Polygonum Valentinum*, *Polygonum Montanum*, *Anthyllidis Species*, *Anthyllis Valentina Clusij*, *Spanish Mountain Knotgrass*, or *Knaewel*, tho'

tho' this may be accounted a Kind of *Anthyllis*, (*Bauhinus* accounting it among his *Anthyllides*) yet it cannot be the *Anthyllis quinta Dioecoris*, because that has upright Stalks, which this has not.

III. The Descriptions. The first, or Common Knapwell, or German Knotgrafs. It has a Root which is small, slender, and fibrous or thready, from whence come forth several small Branches, not fully lying down on the Ground, half a Foot long, or more, and full of Joints, thickly set together, at every one of which stand many very small and long pointed Leaves, of a greyish green, or Ash Color, which are of an unequal length, two for the most part longer than the other; at these Joints with the Leaves come forth divers small, Herby, or green Star-like Flowers, thick set together, which being fallen away there appears in very small Husks, no bigger than Millet Seed, a great store of very small Seed, like Dust, of the Seed of *Herniaria*, or *Rupturewort*, which are of a quick hot smell, and somewhat sweet.

IV. The second Knapwell, or other German Knotgrafs. It has a Root which is small, long, and white, the whole Plant very much resembling the former, both in its manner of growing and in its slender trailing Branches, which have small, long, hoary or greyish green Leaves, many set together at a Joint, but that they are longer than they, some of these being two Inches long, especially of those next the Root; the Flowers hereof stand or grow not at the Joints with the Leaves, but at the tops of the Stalks and Branches, many clustering together, which are very small, and white on the inside, but of a brownish red Color on the outside, which afterwards turn into a plentiful Crop of very small Seed.

V. The third, or White Mountain Knotgrafs, or Knapwell. It has a Root which is small, long, and white, not perishing in Winter in its native Chime or place of growth, no not so much as its Branches or Leaves, but it will not endure our cold Nights and piercing Blasts, and therefore dies with us, unless preserved with great Care and Circumspection. This Herb is a fine, white, and Silver like Plant, especially growing in the hotter Climates, and when it is grown old, so that it gives much delight to the beholders; it spreads many weak trailing Branches upon the Ground, in some places not past a Hands breadth, in others a Foot long, as full or fuller of Joints than any of the Kinds of Knotgrafs in Chap. 418. following, which are thick set also with smaller Branches, on which are placed very small long Leaves, lying almost like Scales upon the whitish hard Stalks; these Leaves are green at the first, and tender, but when they are grown old they will be of a shining Silver Color, and hard, like Skins or Parchment; the tops of the Stalks and Branches are thick set with small, white, Silver like Leaves, and at the Joints come forth very small white Flowers, scarcely to be discerned, which being past away are followed by exceeding small Seed.

VI. The fourth, or Spanish Mountain Knotgrafs, or Knapwell. Its Root is small, long, and blackish on the outside, it is a small Plant, and by some referred to the *Anthyllides*, but by others accounted a small Kind of Knotgrafs, or Knapwell, it shoots forth many small, weak, reddish Branches, lying upon the Ground, and not able to stand upright, about a Foot long, parted into many other smaller Branches, on which grow at several joints and spaces many small Leaves together, like unto those of *Time Spurge*, on which, as well as on the Stalk, there appears a shew of mealiness, as many Sea Plants have; with the Leaves come forth small, purplish, white Flowers, consisting of four Leaves apiece.

VII. The Places. The two first grow in several places of England, the first of them about *Clipsbury* in the West Country, and the second in dry, Sandy, and Rocky places; the third grows in Spain, and the Southern parts of France, and the fourth about the Castle of *Valencia* in Spain, and other places, with us they are only nursed up in Gardens.

VIII. The Times. They all flourish and are fresh and green in the Summer Months, and continue their verdure till cold Weather comes in, which causes them to wither and dry, in the mean season they Flower and perfect their Seed.

IX. The Qualities. They are Aperitive, Absterfive, Vulnerary, Diuretick, Nephritick, and Lithontriptick.

X. The Specification. They are powerful to break the Stone, and give ease in the Strangury, especially the first and second Kinds.

XI. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decolition in Wine. 4. A Powder. 5. A Mixture.

The Virtues.

XII. The Liquid Juice. *Tragus* says that *Knapwell* has the same Properties which *Knotgrafs* has, and may serve to all Intentions instead thereof, as well for inward as outward Remedies; it opens obstructions of the Reins, Ureters, and Bladder, gives ease in the Strangury, and is said to be very powerful to break the Stone. Dose three, four, or six Spoonfuls, mix'd with any proper Wine, or other Vehicle.

XIII. The Essence. It has all the Virtues of the Juice, but much more powerful to the Intentions. Dose three or four Spoonfuls in some fit Vehicle in the Morning fasting, and at Night; outwardly used to Wounds and Ulcers it cleanses, dries, and heals them admirably, by only washing therewith, and applying *Staphis* dipt therein, it conglutinates the lips of green Wounds in a very short time.

XIV. The Decolition in Wine. It has the Virtues of the Juice and Essence, but not altogether so powerful, it cleanses the Reins, Bladder, and Womb very forcibly, and is a good Lotion for the cleansing and drying of foul and running Ulcers.

XV. The Powder. It provokes Urine, expels Sand, Gravel, and Tartarous Matter from the Urinary parts, and strewn upon simple Wounds it conglutinates and heals them, it stops a flux of Blood in green Wounds, and a flux of Humors in Ulcers, being strewn thick thereon. Dose inwardly a Dram at a time, Morning and Night, in a Glass of White Port Wine.

XVI. The Mixture. By washing a simple green Wound herewith it conglutinates the lips thereof upon the spot, it cleanses Ulcers, repulses fluxions of Humors upon the same, the part and parts adjacent being fomented warm therewith, it dries up their humidities, and disposes them to a speedy healing. This Mixture is made by mixing the Li-
quid

quid Juice or Essence three parts, with choice Brandy one part, and digesting them together twenty four Hours.

C H A P. CCCCXVII.

of KNEEHOLM,

O R

BUTCHERS-BROOM.

I. THE Names. It is called in Greek *Ὀξυμύρτιν*, *Oxymyr sine*, i. e. *Myrtus acuta*, *Μυρτιν ἀγέλα*, *Myrtus Sylvestris*, (but there is another *Myrtus Sylvestris* among the Ancients, which is like the Tame or Manured Kind, which *Pliny Lib. 15. Cap. 7.* confounds together) *Μυρτιάκανθα*, *Myrtacantha*, *Myrtus Spinosā*, *Μυρτιάκανθα*, *Murina Spina*, and by *Theophrastus Kετρεμυρτίων*, *Centromyrrhine*, in *Latine Ruscus*, and *Ruscum*, and by the Apothecaries *Bruscus*, and of some, as *Marcellus* says, *Scopa Regia*; *Pliny* says it is called *Chamemyrsine*, and *Acaron*, or rather *Aceron*, which is one of their bastard Names, in *English Kneeholm*, and *Butchers-Broom*.

II. The Kinds. Authors have not yet found out more than one singular Species of this Plant.

*Kneeholm or Butchers
Broom*

III. The Description. It has a Root which is thick, white, and great at the head, and from which spring forth several thick, long, and tough white strings; the first Shoots which sprout from the Root are thick, whirish, and short, somewhat like unto those of *Asparagus*, but greater, which in some places are eaten in the same manner as we eat *Asparagus*; these rising up to be a Foot and half high are spread into divers Branches, green, and somewhat crested

with the roundness, which are tough, pliant, and flexible, on which are set somewhat broad and almost round hard Leaves, sharp and prickly pointed at their ends, of a dark green Color, and somewhat like unto *Myrtle* Leaves, two for the most part set at a place, very close or near together; about the middle of the Leaf, on the back or lower side, from the middle Rib, comes forth a small whitish green Flower, consisting of four small round pointed Leaves, standing upon a very short or no footstalk, in whose place, (being past away) comes a small round Berry, green at the first, but when it is ripe red, much like to an *Asparagus* Berry, but greater, in which are contained two or three white, hard, round Seeds.

IV. The Places. It grows generally in moist places throughout *England*, in *Copses*, and upon *Heaths*, and on rough, barren, and waste Grounds, and oft times under or near *Holly* Bushes; it grows upon *Hampsted Heath*, not far from *London*, and in many places in *Kent*, *Essex*, and *Buckshire*, almost in every *Copse* and low Wood.

V. The Times. It shoots forth its young Buds in the beginning of the Spring, which are eaten in some places (as aforesaid) as our young *Asparagus*; the Berries are ripe in *August* and *September*, the Branches and Leaves abiding green all the Winter.

VI. The Qualities. The whole Plant, Roots, Leaves, and Berries are powerfully *Aperitive*, *Absterfitive*, *Diuretick*, and *Vulnerary*, *Pectoral*, *Nephritick*, *Hysterick*, and *Arthritick*.

VII. The Specification. It is a peculiar thing against the *Dropsie*, especially that called an *Aster*, opens *Obstructions* of the *Urinary* passages, and consolidates broken Bones.

VIII. The Preparations. The Root is chiefly made use of to all the Intentions for which the Plant is used, and the same is accounted one of the five opening Roots; therefrom you may make, 1. A Juice or Essence. 2. A Decoction in Wine. 3. Of the young Sprouts a Sallet. 4. Of the Branches, Brooms or Besoms. 5. A Decoction of Leaves and Berries.

The Virtues.

IX. The Juice or Essence. It powerfully opens *Obstructions* of *Liver*, *Spleen*, *Gall Bladder*, *Reins*, *Ureters*, and *Bladder*, provokes *Urine*, and amends the ill smell thereof, it helps to expel *Gravel* and the *Stone*, gives ease in the *Strangury*, and provokes *Womens Monthly Courses*, it helps the *Yellow Jaundice*, and the *Headach*, and made into a *Lohoch* with *Honey* it expectorates *Flegm*, and cleanses the *Thorax*, or *Lungs*, and *Stomach* of *Flegm* and clammy *Humors* gathered together therein. Dose from one Spoonful to two, three, or four, in a Glass of *White Port Wine* twice a day.

X. The Decoction in Wine. It has all the former Virtues, tho' not altogether so powerful, and may be given Morning and Evening from four to eight Ounces, or ten in Dose, besides which it is effectual in knitting and consolidating of broken Bones, and strengthening parts out of joint, and other weak Limbs, for which it is not much inferior to *Comfrey*, or *Solomon's Seal*, drinking this Decoction, and applying the said Roots Pultice-wise unto the parts affected. *Riverius* in his *Observations* says, that a *Beggar-Man* was affected with the *Dropsie* three Months, whereby his *Belly* grew exceeding big, and because his *Poverty* would not afford him the choicer Medicaments, he used, by the Advice of a Country Woman, a Decoction of the Roots of *Kneeholm*, or *Butchers-Broom*, and was purged twice or thrice with an Infusion of *Sena*, and with these Remedies

G g g g alone

alone he was perfectly cured, a strong Decoction or Infusion also of it in Water having been plentifully used Morning and Night by it self, also boiled in Wine or Broth, and eaten as Food with the Wine or Broth for a Month or five Weeks space, has been found by Experience to cure an *Aster*, and it cured this kind of Dropfie in two Young Maidens, the one of which lived in good Health many Years after it; another Woman was cured of a Dropfie of the Womb, as was supposed, with this Medicament, from whom it brought away with a kind of *impetus* or violence about ten Gallons of Water, a Decoction of this Root, Roots of the *Blue Flowerdeluce*, and *Fennel* Roots in Water or Wine being used for some time has been found of admirable use for the cure of these kind of Dropfies of the Belly, and *Dodoneus* is not sparing in its Praises for this purpose.

XI. *The Sallet made of the young Sprouts.* It is prepared as are those of *Asparagus*, and eaten in the same manner, and so eaten the said Sprouts open Obstructions of Liver, Spleen, Reins, Ureters, and Bladder, cleansing those parts of Fæculencies, but they are nothing near so effectual as are the Juice, Essence, or Decoction of the Roots in Sect. 9. and 10. foregoing.

XII. *Brooms or Besoms.* Formerly Huswives made use of this Plant to make Besoms of to sweep the Houfe, from whence came the Name *Scopa Regia*, as being used also in Kings Chambers, but now thro' the Revolution of Times they are changed to Brushes, for cleansing Butchers Stalls, from whence came the Name of *Butchers-Broom*.

XIII. *The Decoction of Leaves and Berries in Wine.* This, according to *Dioscorides*, has all the same Effects with the Decoction of the Roots, but in my Opinion the Preparation of the Roots is much the more powerful.

CHAP. CCCCXVIII.

Of KNOTGRASS,

OR,

SWINESGRASS.

I. *THE Names.* It is called in Greek *Πολύγονον*, *quod multis genibus crescit*, in Arabick *Basia Trachelis*, in Latine *Polygonum*, *Sanguinaria*, *Sanguinalis*, *Seminalis*, *Proserpinaca*, in English Knotgrafs, Swinesgrafs, and Birdstongue.

II. *The Kinds.* Authors make seven several sorts of this Plant, viz. 1. *Πολύγονον διπλόν*, *Polygonum Mas*, *Polygonum vulgare majus*, *Polygonum Masculum*, Our Greater or Common Knotgrafs. 2. *Polygonum vulgare minus*, The Lesser Common Knotgrafs. 3. *Polygonum minus brevioris Folio*, Small short Leaved Knotgrafs, this *Bauhinus* in his *Pinax* takes to be *Polygonum Masculum Fruticosum* *Tbalis* in his *Har-cyma Sylva*, also the *Sedum minimum Arborescens Vermiculatum Lobelij*. 4. *Polygonum Saxatile Bauhini*, Stone or Rock Knotgrafs. 5. *Polygonum Alarinum majus & maximum Lobelij*, *Polygonum Marinum primum Lugdunensis & Dalechampi*, *Polygonum Marinum Latifolium Bauhini*, The Greater or Broad Leaved Sea Knotgrafs. 6. *Polygonum Marinum minus*, *Polygonum Marinum alterum Dalechampi*, *Polygonum Maritimum Angustifolium Bauhini*, The Lesser or Narrow Leaved Sea Knotgrafs. 7. Poly-

gonum Germanicum Bauhini, Knawel, of which we have already discoursed in Chap. 416. foregoing.

III. *The Descriptions.* The first, or Common Knotgrafs. It has a Root which is reddish, small, short, and round, abiding all Winter, and putting forth anew every Year; it comes up with many long slender Branches, full of Joints; lying upon the Ground, with many long and narrow Leaves set thereon, one for the most part at a Joint, on which come forth Flowers, which are so small, that for the most part they are not seen or discerned, but in some they are white, in others of a whitish Purple Color, which afterwards turn into very small square Seed, like unto *Sorrel* Seed, where note, that the Joints have commonly a small white Skin, which covers them.

IV. *The second, or Lesser Common Knotgrafs.* This in its Roots, Stalks, Joints, Leaves, Flowers, and Seed, grows like the former, saving that they are less, chiefly the Leaves, being neither so broad nor so long, and the Flowers hereof are always white.

V. *The third, or Small short Leaved Knotgrafs.* It has a Root like to the former, from whence rise up many slender jointed Branches, but more woody than the other, spread also into some other smaller ones, on which grow small short Leaves, lesser than those of the Small *Johnswort*, the Flowers are small and white, like the other.

VI. *The fourth, or Stone or Rock Knotgrafs.* It has small, white, fibrous Roots, from whence spring up many weak trailing Branches, lying upon the Ground round about it, on which grow Leaves which are somewhat round, being an Inch in length, and about half an Inch in breadth, but growing smaller to the Stalkward, green on the upper side, and of a whitish mealy Color underneath, at the Joints come forth small, pale, reddish Flowers, like unto the other, and after them follow such like small Seed.

VII. *The fifth, or Greater broad Leaved Sea Knotgrafs.* It has a Root which is somewhat great, thick, black, long, and something woody; it runs out into many and much larger Branches than the first, full of Joints, and lying on the Ground, the Joints set very close

close together, with Leaves thereon, something like to the Common Kind, but thicker, a little shorter, and broader, and of a dark green color above, and whiter underneath; the Flowers stand at the Joints in the same manner, having small white Skins, which cover the Joints, which in some are also of a white, in others of a purplish color, after which come small Seed, inclosed in whitish shining Skins; the taste of the Plant, and of every part thereof, is astringent, but somewhat salt without.

VIII. *The sixth, or Lesser or Narrow Leaved Sea Knotgrafs.* It has a Root which is long, black, and woody, with a few Fibres adjoining thereto: This lesser Kind has longer Stalks than the last, and covered with a reddish Bark, also more divided into smaller Branches, having fewer Joints on the greater Stalks, but the Branches are thick, and set with smaller Leaves than the former, which are something fat, and thick, long, and narrow, like the first Common Kind; the Flowers are small and whitish, and the Seed is much like that of the fifth Kind.

IX. *Nota.* Whereas the first great sort is called before in this Chapter *Mas*, or the *Male Kind*, that seems to bespeak a *Female Kind* also, but there is indeed no *Female Species* of *Knotgrafs*, for that which some Authors call *Polygonum Famina*, or *Femineum*, is one of the Kinds of *Equiseta*, or *Horse-tails*, as being likeliest unto them, although not rough, but differing totally in form from *Polygonum*, or *Knotgrafs*, for which reason we take no farther notice of it in this Chapter.

X. *The Places.* The first, or great Kind, as also the second, or lesser, grow almost every where, and in every County in *England*, as well by the Foot Ways in Fields as on the sides of High Ways which are green, by the sides of old Walls, and on the borders of Fields, where in some places it even overpreads them; the third and fourth grow on higher Grounds, on Gravelly, Stony, and Rocky places, upon Hills and Mountains; the two last grow in Salt Marshy Grounds, and by the Sea side in many places.

XI. *The Times.* They come forth late in the Spring, and continue all the Summer, Flowering and Seeding in the mean season, and so endure till Winter, in which Season all their Branches perish.

XII. *The Qualities.* They are cold in the first degree, and dry in the second, Astringent, Absterfiv, Diuretick, Traumatick, Nephritick, and Alexipharmick.

XIII. *The Specification.* *Knotgrafs* is a peculiar thing against spitting of Blood, and all fluxes of Blood in any part, Bloody Flux, and other Fluxes of the Bowels, the Gonorrhœa in Men and Whites in Women, (Universals being premised) heat and sharpness of Urine, also the Strangury, or stoppage of Urine, cools Inflammations, cures Wounds, and cleanses and heals old and filthy Ulcers, &c.

XIV. *The Preparations.* You may have therefrom 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water. 4. A Powder of the Herb. 5. A Distilled Water. 6. A Balsam.

The Virtues.

XV. *The Liquid Juice.* It is cooling, drying, and binding, and is very effectual to stay any bleeding at Mouth or Nose being drank in Steeled or Red Port Wine, and being applied to the Forehead or Temples, as also squirted up the Nostrils with a Syringe; it is no less effectual to cool and temper the heat of Blood, or of the Stomach, and to stop any flux of Blood or Humors, either of the Belly,

as Lasks, or Bloody Fluxes, fluxes of cholerick and sharp Humors, or of the Womb, as the overflowing of the Terms in Women, and the Whites, or of the Spermatick parts, as the running of the Reins, &c. Dose four Spoonfuls; it cures running Ulcers of the Ears.

XVI. *The Essence.* It has all the Virtues of the Liquid Juice, besides which, if it is given before the Fit of an Ague comes, whether Tertian or Quartan, it is said to determine it, and cure the same; it is also singular good to provoke Urine when it is stopped, as also when it passes away by drops and with pain, which is called the Strangury, it takes away the heat and sharpness thereof, and is said powerfully to expel the Stone, Gravel, Sand, Urine, and other Tartarous Matter from the Reins, Ureters, and Bladder; it is a Sovereign Remedy to cool all manner of Inflammations, to stop the progress of *Anthomy-Fire*, or any other breakings forth of heat, and gives ease in all hot Swellings and Apoptems, and prevents the future burning, fretting and eating of dangerous, old, running and gangrenous Sores and Ulcers, yea, tho' in the Privy parts of Men or Women, resisting the Humors for falling into them, cooling them, and drying up the hot, sharp, and moist matter which causes them to be inflamed. Dose two or three Spoonfuls in some proper Vehicle Morning and Night.

XVII. *The Decoction in Water or Wine.* It has the Virtues of the Juice and Essence, but not altogether so strong or effectual, and therefore is to be given in larger Doses, as from a quarter of a Pint to half a Pint, or more. The Vinous Decoction is good for those who are stung or bitten by Scorpions, Serpents, or other Venomous Creatures; and the same is very effectual to stop all defluxions of Rheum falling upon the Stomach or Lungs; it kills also Worms in Stomach or Belly, and eases all inward pains of the Bowels arising from heat, sharpness, and corruption of Humors, as the Colick, &c.

XVIII. *The Powder of the Herb or Seed.* It is good against the Stone, Gravel, Sand, and Tartarous Matter in the Urinary parts, being drank to a Dram or more Morning and Night in Wine for many days together; applied outwardly to bleeding Wounds, or other fluxes of Blood, it presently stops it, and if it is a simple Wound conduces to its speedy healing.

XIX. *The Distilled Water.* It has the Virtues of the Juice, Essence, and Decoction, but nothing near so powerful as either of them; being taken by it self to four or five Ounces it is effectual to all the Purposes aforesaid, and is a very excellent thing to cool all sorts of Inflammations, proceeding from what cause or in what part of the Body soever.

XX. *The Balsam.* It speedily cures all simple green Wounds, by resisting the flux of Blood, and consolidating their Lips; it strengthens weak Joints, comforts the Nerves and Tendons, and is prevalent against the Gout, being duly and rightly applied Morning and Evening.

XXI. *Nota.* It has been observed that the Sea Kinds of *Knotgrafs* have not been so cooling and operative in the above enumerated Diseases as the Common Kinds, by reason of their abundant saline substance, yet effectual in several Cases where there is need of greater penetration, and therefore a Cataplasin made thereof and applied has been found much more effectual against the Gout.

C H A P. CCCCXIX.

OF LADIES-BEDSTRAW,

OR,

CHEESERENNET.

I. THE Names. It is called in Greek *Taxion*, and *Taxion*, and, as *Dioscorides* says, of some *parietum*, and *parietum*, and was so called from *para*, Milk, from the effect, which was to make Milk turn into a Curd when they set it to make Cheese, for which it serves very well; in Latine *Galium*, and in English *Ladies-Bedstraw*, *Cheese-Rennet*, and *Moltshair*.

II. The Kinds. Authors make six or seven Kinds of this Plant, or more, but because several of them are not to be met withal in England or our Plantations abroad, we shall only describe the five following, viz. 1. *Galium*, & *Galium luteum*, Our Common *Ladies-Bedstraw*. 2. *Galium album Camerarii* & *Pene*, *Mollugo*, *Mollugo vulgarior* *Lobelij*, *Galium tertium Tragi*, *Mollugo prima Dodonci*, *Lugdunensis*, & *Tabernamontani*, Our Common white Flowered *Ladies-Bedstraw*. 3. *Mollugo Montana Dodonci*, *Clusij*, *Lobelij*, *Lugdunensis*, *Thalij*, & *Tabernamontani*, *Rubia Sylvatica altera Gesneri*, White Flowered Mountain *Ladies-Bedstraw*. 4. *Galium flore rubra*, *Galium flore nigro purpureum Montanum tenuifolium Clusij* & *Columnæ*, Red Flowered *Ladies-Bedstraw*. 5. *Galium Montanum Creticum*, *Galium Americanum vel Floridianum*, *Candia* or American *Ladies-Bedstraw*.

Ladies Bedstraw

III. The Descriptions. The first, or Our Common *Ladies-Bedstraw*. It has a Root which is reddish, having many small Fibres or Threads fastened to it, which take strong hold of the Ground, and ereep a little also; from this Root rise up several

small, broken, square, upright Stalks, three Feet or more high, sometimes branched forth into divers parts, full of Joints, and with several very fine small Leaves at every one of them, little or nothing rough at all, at the tops of the Branches grow many long Tufts of yellow Flowers, very thick set together, one above another, from the several Joints, which consist of four small Leaves apiece, and smell somewhat strong or resinous, but not unpleasant; the Seed is small and black, like Poppy Seed, two for the most part joined together; some of the Branches leaning down to the Ground take root at their Joints, whereby it much increases.

IV. Gerard thus describes it. It has a small and thready Root, from which come forth small, round, even Stalks, weak and tender, creeping hither and thither upon the Ground, on which do grow very fine Leaves, cut into small parts, finer than those of Dill, set at certain spaces, as those of Woodrooff, among which come forth Flowers of a yellow color in clusters or bunches, thick thrust together, of a strong sweet smell, but not unpleasant.

V. The second, or Our Common white Flowered *Ladies-Bedstraw*. It has a Root which is fibrous or thready, and abiding all Winter, and the whole Plant is in all things like to that next to be described, saving, that the Branches are so weak, that unless they be sustained by Trees, Bushes, Hedges, or other things near which it grows, it will lie down upon the Ground, and the Leaves are smaller and narrower, yet not so small as the first with yellow Flowers; the Flowers are also small and white, but not plentifully abounding; Some Authors make a smaller sort hereof, which is not a proper Species, for upon transplanting it will grow as great as the other.

VI. Gerard describes this second sort thus. *Ladies-Bedstraw* with white Flowers is like unto *Cleavers* or *Goosegrass* in Leaves, Stalks, and manner of growing, yet nothing at all rough, but smooth and soft; the Flowers are white, the Seed round, the Roots slender, creeping within the Ground, the whole Plant climbs upon Bushes, Shrubs, and all other like things which are near unto it, otherwise it grows not upright, but falls to the Ground.

VII. The third, or White Flowered Mountain *Ladies-Bedstraw*. It has a Root which is black, and very fibrous or thready, from whence shoot forth a number of slender and weak Stalks, which yet stand upright of themselves, directly branching forth into many parts, so that it seems to be a pretty well spread Bush, having many shorter and broader smooth green Leaves set at the Joints than any of the former, or the next which follows; the Flowers are very small and white, standing at the tops of the Branches, more thick or plentifully set than the following with red Flowers, which being past away turn into small, black, round Seed.

VIII. This Gerard says that it is called *Mollugo*, and has Stalks which need not be propped up, but of it self stands upright, and is like unto our second Species, or Common White Flowered *Ladies-Bedstraw*, but that it has a smoother Leaf.

IX. The fourth, or Red Flowered *Ladies-Bedstraw*. Its Root is of a reddish color, but greater than the first Common Kind, creeps not, abiding many Years and not perishing: The Plant is small, and has slenderer and lower Stalks than the first Kind, yet divided into many Branches, at whose joints stand four, five, or six long Leaves, and not of so dark a green Color as the first; the Flowers are of a red color, not so thick clustering or set together as those of the first Kind, and consist of four small pointed Leaves, with a yellow Pointel in the middle, but five or six or more growing together at the tops of the Branches, which afterwards turn into small

small black Seed, like the first. *Columna* will have *Gallium nigra purpureum Montanum*, &c. to be a differing Species from this now described, but they seem to me to be all one Kind, the Flower being in some places only a little darker, but in all other particulars alike.

X. Gerard says this fourth or Red Flowered Ladies-Bedstraw has been taken for a Kind of Wild Madder, but it is truly a Kind or Species of Ladies-Bedstraw, or Cheese-Rennet, as appears both by its Qualities of turning Milk into Curds, as also by its form, being in each respect like unto the *Gallium luteum*, or Our Common Ladies-Bedstraw, and differs in the color of the Flowers, which are of a dark red color, with a yellow Pointel in the middle consisting of four small Leaves.

XI. The fifth, or Candy or American Ladies-Bedstraw. It grows like the first, or Common, or Yellow Ladies-Bedstraw, but much lesser, yet with greater Roots and Branches. It is a more effectual Rennet than any of the former, hot and astringent, stopping Fluxes of Blood.

XII. The Places. The first and second grow frequently in many places in this Land, in Meadows and Pastures both wet and dry, as also by Hedge sides; the first grows also upon Sunnie Banks near the borders of Fields, in fruitful Soils almost every where; the second grows in Marsh Grounds, and other moist places; the third grows on Hills and Mountains and in Hedges among Bushes in moist places; the fourth grows on Mountainous and Hilly places in Germany, and was sent to us from Strasburgh, since which it is nursed up with us in Gardens; the fifth grows in Candy, and in several parts of America upon the Floridian Continent, in several places of which I have often found it.

XIII. The Times. They all Flower early, viz. in May, except the Red Flowered, which Flowers in June, and the Seeds are ripe in June, July, and August; but Gerard says they Flower most of the Summer Months.

XIV. The Qualities. They are hot and dry in the first degree, Astringent, Absterfive, and Traumatick or Vulnerary; they are also Nephritick, Lithontriprick, and Arthritick.

XV. The Specification. Ladies-Bedstraw is a peculiar thing to stop bleeding inwardly, or at Nose, to heal inward or outward Wounds, to help burning with Fire and scalding with Water, to strengthen the Nerves, Tendons, and Joints, give ease in the Gout, to help the Strangury, and to fter and break the Stone.

XVI. The Preparations. You may have therefrom, 1. A liquid Juice. 2. A Decoction. 3. A Powder of the Root. 4. A Nefale of Herb and Flowers. 5. An Ointment. 6. Cheese Rennet.

The Virtues.

XVII. The liquid Juice. It is powerful to provoke Urine, to help the Strangury, to break the Stone, and to expel Gravel, Sand and Tartarous Matter from the Reins, Ureters and Bladder, being taken two or three Ounces at a time, two or three times a Day, in a Glas of pure White Port Wine. The same drank helps to stop inward Bleeding and the overflowing of the Terms in Women, as also to heal inward Wounds, by its heating and drying Qualities.

XVIII. The Decoction of Herb and Flowers in Wine or Water. It has all the Virtues of the liquid Juice, but is much weaker. It is good to bathe the Feet of Travellers in, who are wearied and tired with Travel, and whose Feet are swollen, or bruised,

or galled thereby; and for such whose much and long Running causes not only Weariness, but Stiffness in the Nerves and Joints; for all which things this Decoction used as hot as it can be well endured, is very available. It is also good against Scurff, Morpew, Dandriff, dry Scabs, Itchings, and other like Defecations of the Skin, chiefly in Infants.

XIX. The Powder of the Root. It may be taken to one Dram in choice Canary, Madera, or other like generous Wines; and as Dioscorides writes, it provokes Venery or Bodily Lust, as do also the Powder of the Flowers, taken in the same Dole and Manner Morning and Night, or two or three times a Day.

XX. The Nefale of the Herb and Flowers. They being bruised, and put up the Noltills, are said to stop a vehement Hemorrhage in those Parts; and it may be so much the better, if some of their Juice be first snuff up, or syringed in.

XXI. The Ointment. It is made by boiling the bruised Herb and Flowers in Oil Olive to Crispness; and straining out, and so repeating this Work three or four times, then adding a little Bees-wax to bring it to a Consistency. But some advise it to be made with Hogs-Lard. Or you may make an Oil thus: Put the bruised Herb and Flowers into pure Oil Olive, and insolate till the Oil becomes white: press all out, and repeat this Work three or four times, and strain out for Use: but it is sooner done by boiling the bruised Herbs and Flowers in the Oil to Crispness, straining out by pressing, and repeating the Work three times more; then straining out the clear Oil, keep it for Use. It is good against Burnings with Fire, and Scalding with Water, and is good to be anointed upon Limbs and Joints, which are weak, and become stiff with Walking, for it strengthens the Nerves, Tendons and Joints. It prevails also against Scurff, Morpew, Mange, dry Scabs, and the Itchings and Gallings of Children; and other Deformities of the Skin. Applied also to the Parts affected, it gives Ease in the Gout, and other like Pains; and by Continuation of the Application, cures the same.

XXII. The Cheese-Rennet. It is made of the bruised Herb, by squeezing out its Juice, being first moistened with a little choice Canary or Sherry, to which a quarter part of Spirit of Wine is first added. Or thus: Take the expressed Juice, defecate it by settling, or clarify it with Whites of Eggs: to a quart of this prepared Juice, put Sherry Wine four ounces, first mixt with Spirit of Wine two ounces: mix them, digest some Days, then decant the clear, and keep it for Use. But many Country People make use of the simple Juice only. Matthiolus says, That the People of Tuscany do use to Turn their Milk with it, that the Cheese which they make of Sheep and Goats Milk, may be the sweeter, and the more pleasant in Taste, and also more wholesome, as to break the Stone, &c. And the Cheshire Women, especially those about Nantwich, where the best Cheese is made, do use it in their Rennet, (viz. by putting the bruised Herb into their Rennet-bags;) much more esteeming of that Cheese which is made with it, than of that which is made without it.

XXIII. Nota. The Ancients thought the *Gallium album*, or White-flowered Ladies Bedstraw, to have no Virtues, or to be of no Use. But Celsus says, That in Austria, Hungaria, and other places of Germany, the People have found it by Experience to be good to strengthen the Arteries, Nerves, Tendons and Joints, those Parts being bathed either with the Juice, Decoction or Rennet made thereof; and that it takes away Weariness and Weakness after Traveling, and eases Pains cause by Cold, Over-walking, Blows;

Blows, or Over-straining. Parts affected with the Gout, being well bathed with the Rennet made thereof, Morning and Night, as hot as it can be endured, cures the Pain, and in a short time eases the Disease; but it is much more effectual, if after Bathing, a Cataplasin be applied, made of the Juice or Rennet, (of any of the Kinds of *Ladies Bed-straw*) by bringing it to a Confluence with fine Barley-flower, or Crums of White-bread, mixed with a little Oil of Poppy-seed, or Oil of *Ben*, the Application being made as hot as the Patient can well endure.

C H A P. CCCCXX.

OF LADIES--BOWER,

O R,

CLIMERS.

THE Names. It is called in Greek, *Κλημας*; in Latin, *Clematis*; and in English, *Ladies-Bower*, *Virgins-Bower*, and *Climer*.

II. The Kinds. Authors make many sorts hereof, some of which grow not in England, nor in any of our English Plantations: those which are to be had with us, are the following. 1. *Clematis urens*, *Clematis altera flore albo*, *Clematis altera Dioscoridis*, *Clematis peregrina*; *Ladies-Bower*, or *Virgins-Bower Burning*, *Burning Climer*, or *Cautick Climer*. 2. *Clematis peregrina*, vel *Clematis altera Dioscoridis flore simplici rubro*; *Red Ladies-Bower*, or *Virgins-Bower*, or *Single red-flowered Climer*. 3. *Clematis peregrina flore simplici purpureo*; *Single purple Ladies-Bower*, or *Single purple-flowered Climer*. 4. *Clematis peregrina flore purpureo pleno*; *Double purple-flowered Ladies*, or *Virgins Bower*, *Double purple-flowered Climer*. 5. *Clematis Maritima repens Bauhini*, *Creeping fiery Sea Climer*. 6. *Clematis Virginiana*; *The Virginian Ladies-Bower*, or *Climer*, which the Natives call *Maracoe*. 7. *Flammula Jovis surrecta* or *erecta*, *Flammula frutex*, *Clematis erecta* or *surrecta*; *Upright Ladies-Bower*, or *Virgins Bower*. Here is to be noted, That the *Sixth* or *Virginian Kind*, is called by the *Spaniards* in the *West Indies*, *Granadillus*, or *Granadillo*, because the Fruit is in some sort like a small *Pomgranate* on the outside, yet the Seed within is flatish, round and blackish.

III. The Descriptions. The first, or *Ladies-Bower*, or *Virgins-Bower Burning*, or *Burning Climer*. The Root is white and thick, fleshy and tender, or easy to be broken, insomuch that one can scarcely handle it (tho' very tenderly) without danger of breaking it. This *Cautick* or *Burning Climer*, has very long and tender climbing Branches, yet something woody below, which wind about those things which stand near it, covered with a brownish green Bark; from the Joints of which shoot forth many winged Leaves, consisting for the most part of five single Leaves, viz. two and two together, and one at the end, which are a little cut in, or notched on the edges here and there; but every part of them is lesser than the Leaves of the next following *Climer*, without any clasping Tendrels, to wind about any next adjacent thing. Towards the upper part of the Branches, with the said Leaves, come forth long Stalks, on which stand many white Flowers cluster-

ing together, opening the Brims into six or eight small Leaves, spreading like a Star, very sweet of Smell, or rather of a strong heady Scent, which after turn in blackish flatish Seed, plumed at the Head, which Plume or Feather flies away with the Wind, after it has stood long, and leaves the Seed naked or bare.

IV. The second, or *Red Ladies* or *Virgins Bower*, or *Single red-flowered Climer*. Its Roots are a Bundle of strong brownish yellow Strings, running down deep into the Earth from a large Head above. This *Climer* has many limber and weak climbing Branches, like the former, covered with a brown thin outward Bark, and green underneath. The Leaves stand at the Joints, consisting but of three Leaves or Parts, whereof some are notched on one side, and some on both, without any clasping Tendrel, as the former, but winding with its Branches about any thing which stands next it. The Flowers in like manner come from the same Joints with the Leaves, but not so many together as the former, upon long Foot-stalks, consisting of four Leaves apiece, standing like a Cross, of a dark red Colour. The Seed is flat and round, and pointed at the end; three or four or more standing close together upon one Stalk, without any down upon them at all, as in the former.

V. The third, or *Single purple Ladies-Bower*, or *Single purple-flowered Climer*. This is like to the former in its Roots, Stalks, Branches, Leaves, Flowers and Seed, and differs from the former in this only, that the Color hereof is of a sad bluish purple: So that the one is not possible to be known from the other, till they come to the Season of Flowering.

VI. The fourth, or *Double purple-flowered Ladies* or *Virgins Bower*, or *Double purple-flowered Climer*. This in its Root, Branches and Leaves, does so near resemble the Single Kinds, that no Difference can be known between them, but in their Particulars, viz. that this grows more bold and

great

great, and yields both more store of Branches from the Ground, and more spreading above: also that the Flower in this is very thick and double, consisting of a number of smaller Leaves, set close together, in order, in the middle, the four outermost Leaves which encompass them, being much broader and larger than any of the inward, but all of a dull or sad bluish purple Color; the Points or Ends of the Leaves seeming a little darker than the middle of them. This bears no Seed, so far as has yet been seen or heard of from any Person of Credit, notwithstanding the Affirmations of some false and ignorant Gardeners, which affirm the contrary.

VII. *The fifth, or Creeping fiery Sea Climer.* It spreads abroad many creeping, plant, jointed and crested Branches, about two Feet long, covered with a very dark green Bark; from whence shoot forth many winged Leaves, a little dented about the edges, very like unto the *Flammula Jovis erecta* in Sect. 9. following, consisting of five Leaves, but most commonly of three upon a Stalk, being narrower, shorter and longer pointed: at the ends whereof comes forth a small clasping Tendril; but those which grow up higher upon the Stalks, and nearer unto the tops, where the Flowers do stand, are much smaller and narrower. The Flowers come forth many together, as in the other, set upon long Foot-stalks, which are white and with many hairy Threads in their middle. After they are passed away, many round, flat, reddish Seed are produced, smaller than in some others, three or four upon a Stalk together, plumed with a white Feather at the Head of each of them. The whole Plant is hot and sharp, like unto the others.

VIII. *The sixth, or The Virginian Ladies-Bower or Climer.* Its Root is composed of a number of exceeding long and round, yellowish brown Strings, spreading far abroad under the Ground, sometimes as long as any Roots of Sarsaparilla, and a great deal bigger, which to be conveniently and cleverly laid in the Ground, must be coiled up like a Cable: and these Roots, by shooting up in several places, a good distance one from another, make a great Encrease of the Species. This noble and much desired Plant rises out of the Ground very late in the Year, about the beginning of May, if it is a Plant which has sprung up from the Seed of our own Sowing; but if it is an old one, such as has been brought to us from Virginia, not till the end of May. It springs up with a round Stalk, not above a Yard and half high, or thereabouts with us, but in hotter Countries, as some Authors say, much higher; bearing one Leaf at every Joint, which from the Ground to the middle thereof, has no Claspers; but from thence upwards, has at the same Joint with the Leaf, both a small twining Clasper, like unto a Vine, and a Flower also. Every Leaf is broad at the Stalk thereof, and divided about the middle on both sides, making it somewhat resemble a Fig-Leaf, ending in three Points, of which the middlemost is longest. The Bud of the Flower, before it does open, is very like unto the Head or Seed-Vessel of the Ordinary single *Nigella*, having at the Head or Top five small crooked Horns, which when this Bud opens, are the Ends or Points of five Leaves, which are white on the inside, and lay themselves flat, like unto an *Anemone* or *Wind-flower*, and are a little hollow, like a Scoop, at the end, with five other smaller Leaves, and whiter than they, lying between them, which were hid in the Bud before it opened; so that this Flower, being full blown open, consists of ten white Leaves, laid in order, round, one by another: from the bottom of these Leaves on the inside, rise up several twined Threads, which spread and lay themselves all over these white Leaves, reaching beyond

the Points of them a little, and are of a reddish Peach Color: towards the bottoms likewise of these white Leaves, there are two red Circles, about the Breadth of an *Oaten* Straw, one something distant from another, which add a great Grace to the Flower; (but in some Flowers there is but one of these Circles seen.) By their means the white Leaves shew their Color thro' the Peach-colored Threads; and these red Circles or Rings upon them being perspicuous, make a tripartite Shew of Colors very delightful. The middle part of this Flower is hollow, and yellowish; in the bottom of which rises up an Umbone, or round Stile, somewhat big, of a whitish green Color, spotted with reddish Spots, like the Stalks of *Dragons*, with five round Threads or Chives, spotted in like manner, and tipped at the ends with yellow Pendants, standing about the middle part of the said Umbone or Stile, and from thence rising higher, ends in three long crooked Horns most usually, (and sometimes in four, as *Al-dinus* in his *Earnesian Garden* observed at *Rome*) spotted like the rest, having three round Buttons at their ends. These Flowers are of a comfortable, pleasant, sweet Smell, and very acceptable, but perish without yielding Fruit with us, because of the so late Flowering: but in the natural place, and in hot Countries, it bears a small round whitish Fruit, with a Crown at the top thereof, in which is contained (whilst it is fresh, or not over-dried) a sweet Liquor; but when it is dry, the Seed within it is small, flat, black, and somewhat rough, and will make a rattling Noise.

*Ladies.
Bower
Upright*

IX. *The seventh, or Upright Ladies-Bower, or Virgins-Bower.* Its Root spreads in the Ground from a thick Head, into many long Strings, and fastens it self strongly in the Earth. From this Head of Roots spring more upright Stalks than in any of the former, which grow to be sometimes four or five Feet high or more, yet leaning or bending a little, so that it has some need of sustaining, which are covered with a brownish Bark; from whence come forth

forth on all sides, divers winged Leaves, consisting of five or seven Leaves, set on both sides of a middle Rib, of which the odd one is always at the end. The tops of the Stalks are divided into many Branches, bearing many white, sweet-smelling Flowers on them, like in Fashion to the *White Virgins-Bower*: after which come such like Feather-topt Seed, which remain and shew themselves, being flat like the other, when the Plumes or Down is blown abroad. The Stalks die away every Year, and spring again afresh in the beginning of the next.

X. *The Places.* These Plants delight to grow in the Sun, and prosper better in a fruitful Soil than in a barren. The first four grow in our English Gardens, where they flourish much. The fifth, *Bauhine* says, grows in many places of the *Adriatick Sea Shore*, and in Islands thereabouts belonging to the *Venetians*. The sixth grows not wild in *England*, but flourishes well in our Gardens. The seventh, which is the surpassing Delight of all Flowers, came to us from *Virginia*, and now is become a free Denizen of *England*, by being planted in our Nurseries or Gardens.

XI. *The Times.* They all flower in the end of *June* or *July*, and sometimes in *August*, and perfect their Seed in *September*. The *Virginian Climber* flowers in *August*, yet sometimes, tho' not often in *July*, but perfects no Seed here.

XII. *The Qualities.* They are all hot and dry in the fourth Degree; Cautick and Burning, or Blistering the Skin.

XIII. *The Specification.* Authors say they are peculiar against Scurff, Morphew, Scabs, Leprosy, and other Defections of the Skin, but are not safe to be taken inwardly, unless to purge Water in Dropsies.

XIV. *The Preparations.* Altho' these Plants are never or very seldom used in Physick, unless in outward Application; yet these following Preparations have been made of them, viz. 1. A Powder of the Seed of the first or Burning Ladies-Bower, and of the seventh or Upright Ladies-Bower. 2. An Oil by Infolation or Boiling of the same Plants. 3. A

distilled Water of the same. 4. The Liquor of the *Virginian Climber*. 5. A Cataplasm of the Climbers.

The Virtues.

XV. *The Powder of the Seed.* Given to a Scruple or half a Dram, more or less, in fair Water or in Mead, it is said to purge Choler, Flegm, and watery Humors.

XVI. *The Oil by Infolation or Boiling.* It cures Aches and Cramps, Sciatica's, and other Pains coming of Cold: it is also good against the Stone, and provokes Urine, some small quantity of it being taken inwardly in any proper Vehicle. It also takes away Scurff, Morphew, Scabs, Leprosy, and other Deformities of the Skin, by anointing therewith.

XVII. *The distilled Water of the Upright Ladies-Bower.* It clears the Skin of Defections, and is effectual against any cold Grievs in any part of the Body.

XVIII. *The Liquor of the Virginian Climber.* This Liquor within the Fruit, is very pleasant to the Taste, as if *Musk* or *Ambergise* were mixed with it: and having a little Acidity with it, it does not cloy the Stomach, tho' it be taken in large quantity, nor gives any bad Symptom, but is said rather to move the Belly downwards, and make it soluble. *Aldinus* gives us many Virtues of it, which seem to me to be spoken Hyperbolically, for by Experience nothing has yet been observed thereof. But he says, that the Leaves of the Plant have a fonniferous Property, and smell like to *Nightshade*, having (as he thinks) some deleterious or deadly Quality in them, because it kills Flies which rest thereon.

XIX. *The Cataplasm of the Leaves of the other Burning Climbers.* Being applied to the Sciatica or Gout, or any Pain in other Parts proceeding from Cold, it cures them, being cautiously used; for it quickly Blisters.

XX. *Nota.* *Matthiolus* says, that the Powder of the Leaves of the Upright Ladies-Bower, being prepared and given, helps against a Quartan Ague. However, all the other Climbers may serve very well to make Arbors in Gardens and Orchards, or other like places for Pleasure; for so those Purposes they are most fit, if any please to Plant them.

LADIES--COMB, see Shepherds-Needle, Chap.

LADIES--GLASS, see Violet Corn, Chap.

CHAP. CCCCXXI.

of LADIES--MANTLE,

OR,

LIONS--FOOT.

Called also, Great SANICLE.

THE Names. It does not appear that this was known to the ancient Greeks: but *Brusellius* says it is *Leontopodium*, Lions-Foot: yet others say it is not that which *Disfordi*:

des speaks of. It is called in *Latine*, *Alchimilla*, by most Writers; *Stellaria Matthioli*, *Lugdunensis*, &c. *Pes Leonis*, and *Pata Leonis*; *Drosera*, and *Drosum Cerdi*; *Sanicula major*, (as much resembling *Sanicle*;) and in *English*, *Ladies-Mantle*, *Lions-Foot*, and *Great Sanicle*.

II. *The Kinds*. Authors make two sorts heteof, viz. 1. *Alchimilla major vulgaris*, *Stellaria, Sanicula major*, Common Ladies-Mantle. 2. *Alchimilla minor*, vel *Alpina quinquifolia*, Five-leaved Ladies-Mantle, or Ladies-Mantle cinkfoil-leaved.

Ladies= Mantle.

III. *The Descriptions*. The first, or Common Ladies-Mantle, has a Root which is somewhat long and black, with many Fibres, and Strings thereat. It is something like to our Common *Sanicle*, having many Leaves rising from the Root, standing upon long hairy Foot-stalks, being almost round, but a little cut in on the edges into eight or ten parts, more or less, making it seem like a Star, (whence the Name *Stellaria*) with so many Cornets and Points, and dented round about, of a light green Color; something hard in handling, and as if it was folded or plaited at first, and then crumpled in divers places, and a little hairy, as the Stalk is also, which rises up among them, which grows to the Height of two or three Feet, with a few such Leaves thereon, but smaller, and being weak, is not able to stand upright, but bends sometimes down to the Ground, divided at the top into two or three small Branches, with small yellowish green Heads, and Flowers of a whitish green Color, breaking out of them, which being past, there comes small yellowish Seed, like unto *Poppay* Seed.

IV. *The second*, or Five-leaved Ladies-Mantle. It has a small black fibrous Root, from which spring a few smaller and smoother green Leaves, set upon long Foot-stalks, but divided at the edges into five Corners or Points, and something more deeply dented about the Brims than the former: from among which come forth two or three small weak bending

Stalks, about six or seven Inches high. The Flowers which grow at tops, are smaller, but like to the other, according to the Bigness of the Plant, and of the same Herby or green Color.

V. *The Places*. The first grows naturally in many Pastures and Wood-sides, both in *Hartfordshire* and *Wiltshire*; as also in *Kent*, as in *Kingwood* near *Faversham*, in the Pastures nigh *Tidnam* and *Chepstow*, and in other places of this Land. *Gerard* says it grows of it self Wild in divers places, in the Pastures at *Andover*, and in other parts of *Hampshire* and *Barkshire*, in their Clofes and Coppes, or low Woods; as also upon the Bank of a Moat which encloses a House in *Bulby*, called *Bourn-Hall*, fourteen Miles from *London*; and in the Highway from thence to *Watford*, a small Mile distant from it. The second grows on *Bernards Hill* in *Switzerland*, but is to be found with us only in Gardens.

VI. *The Times*. The first flowers in *May* and *June*. The second not till *August*: but they both abide after Seed-time, and flourish and keep green all Winter after, as well as in Summer.

VII. *The Qualities*. It is hot and dry in the second Degree; Absterfive, Astringent, Strengthening and Vulnerary.

VIII. *The Specification*. It is peculiar to stop Bleeding, whether inward or outward, all Fluxes of the Bowels in Man or Woman; and the Whites, or Weakness of the Womb. It cures Wounds after a most singular manner, being one of the most notable Wound-Herbs, being extolled by the *Germans* with exceeding great Praise, who never cure any Wound, whether inward or outward, but they give of the Decoction hereof to drink.

IX. *The Preparations*. You may make hereof, 1. A liquid Juice. 2. An Essence. 3. A Decoction or Infusion. 4. A Powder of the Leaves. 5. A Balsam or Ointment. 6. A Cataplasim. 7. A distilled Water. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture.

The Virtues.

X. *The liquid Juice*. It is not so hot as that of *Sanicle*, and therefore more fit for those Wounds, which are accompanied with Inflammation, and so is more drying, astringent, or binding and cleansing. It is effectual against all sorts of Bleedings both inward and outward, stops the Over-flowing of the Terms in Women, and cures the Bloody-flux, as also all other Fluxes of the Bowels. Dose from two to four or six Spoonfuls Morning and Night in a Glass of the distilled Water, or in Ale or Wine.

XI. *The Essence*. It has all the Virtues of the former; besides which, it cures Bruises by Falls or otherwise, whether inwards or outwards: it heals Ruptures of the *Peritonæum*, as also Ruptures of the Blood-Vessels, which cause Spitting or Pissing of Blood; and is a peculiar thing to stop the Whites in Women, being esteemed more powerful for this Purpose than most other things; for which Intention it is not only to be given inwardly by the Mouth, but is also outwardly to be applied as an Injection up the Womb, with a Womb-Syringe. Dose three or four Spoonfuls in Red Port Wine, or some other proper Vehicle, two or three times a Day. Inwardly also taken, and outwardly applied to Womens Breasts, which are great and over-much flag, it causes them to grow lesser and hard. This Essence being taken for twenty or thirty Days together, by such Women as are Barren, or have a Slipperiness of the Womb, it is said to cause them to Conceive, and to retain the Birth after Conception; for that it dries up the too great Humidity; and stops

H h h

the Flux of Humors to the Matrix, and so strengthens the Womb, as to prevent Abortion, reducing it to a perfect State of Health: but the Patient ought as well as to take it inwardly by the Mouth, to fit in a strong Decoction thereof Bathwise.

XII. *The Decoction or Infusion.* This has all the Virtues of the Liquid Juice and Essence, but weaker in its Effects: however, it may serve as a Vehicle to convey other Preparations of this Herb in, and may be given from four Ounces to eight Ounces or half a Pint. It makes a good Injection for hollow Wounds and Ulcers, cleanses them, makes them breed Flesh, and brings them to a speedy Healing.

XIII. *The Powder of the Leaves or Root.* It is an excellent Sycplick, and stops Bleeding in any Part it is applied to. Inwardly given from half a Dram to a Dram and half, in the Decoction, Infusion, or distilled Water, or in Red Port Wine, it has all the Virtues of the liquid Juice, Essence, &c. provided it is given Morning and Night for some considerable time. Tents may be dipt into the Juice or Infusion, and then rouled in this Powder, and so put into any hollow Sore or Ulcer; by which means it wonderfully dries up all Humidities of the Ulcer, incarnates it, and induces a speedy Healing, yea, altho' it be fistulous, with a Flux of Humors appending; and abates also Inflammations, if any be present.

XIV. *The Balsam or Ointment.* It is one of the best of Vulneraries, for it digests if need be, absterges or cleanses, incarnates, dries and heals, almost to a Miracle: and in simple green Wounds or Cuts, it has such an exquisite Faculty of speedy Healing, that it cures it at the first Intention, consolidating the Lips thereof, without the breeding Matter, or any Danger of breaking out again, by suffering any Corruption to remain behind. Outwardly applied to the Gout, Sciatica, or other like Pains of the Joints, proceeding from Blows, Over-straining, or the like, it gives Ease, and speedily cures them, adding also Strength to the Part.

XV. *The Cataplasim.* It is an excellent thing to be presently applied to a simple green Wound; for it stops the Afflux of Blood, and consolidates the Lips thereof by the first Intention of Curing. It also allays Inflammations coming upon the Joints in the Gout, and gives Ease in the Pain. Applied to a recent simple Contusion, it prevents the Afflux of Humors; dissolves those which are present, if any be, and safely restores the Part.

XVI. *The distilled Water.* Authors say, that if it is taken continually for twenty Days together, that it cures Barrenness in Women, viz. such as cannot Conceive, or such as cannot retain the Conception. But doubtless the liquid Juice or Essence is much better than this, and therefore either of them may be given in this as a Vehicle, for which it is very proper, and may be given Morning and Night, from four to eight Ounces.

XVII. *The Spirituous Tincture.* Inwardly taken, it warms and comforts the Bowels, strengthens the inward Parts, expels Wind, and is an excellent Traumatick, is drying and astringent, and therefore good against all Fluxes of the Bowels, Over-flowing of the Terms, and other Weaknesses of the Generative Parts. It is good to be used Dietetically in the Cure of Wounds, old Sores, running Ulcers, and Fistula's accompanied with Fluxion of Humors: it has all the Virtues of the Juice and Essence, and may be given Morning and Night, from two Drams to three or four, in the distilled Water, or in Red Wine.

XVIII. *The Acid Tincture.* It has all the Virtues of the Spirituous Tincture, but is more Traumatick or Vulnerary, and more Stomackick, whereby it ef-

fectually stops Vomiting, strengthens the Stomach, and causes a good Appetite and a strong Digestion: but it stops not Fluxes of the Bowels so well as some of the former Preparations; but it therefore opens the more, and removes Obstructions of Stomach, Liver, Spleen, and other Bowels. It is a most excellent thing against a virulent Gonorrhea in Men, being taken every Day in all that the Patient drinks, whether Ale, Beer, Wine or Water, so much at a time as to give the Vehicle a pleasing Acidity; and it ought to be so often taken in a Day that the whole quantity taken may amount to at least four or five Spoonfuls.

XIX. *The Oily Tincture.* It is a famous thing against a cold Gout, and all Pains or Aches proceeding from a cold Cause in any Part of the Body, being twice a Day anointed upon the Part for some time. It is an excellent thing also against Bruises, Cuts or Punctures of the Nerves and Tendons; for it suddenly eases the Pain, and alleviates the Inflammation, and thereby induces the Cure, a Plaster of the Balsam being also laid thereon. Inwardly given, it gives Ease in the Colick, expels Wind; and opens Obstructions of the Reins, Ureters and Bladder, expelling Gravel, Stones and Sand from those Parts, and cleansing them from any Tartarous Mucilage lodged therein.

C H A P. CCCCXXII.

OF LARKS--SPUR,

O R,

LARKS--HEEL.

Called also, KNIGHTS--SPUR.

I. *THE Names.* It is called in Latine, *Delphinium*, but whether it be the *Delphinium Dioscoridis*, is very doubtful: it is also called, *Flos Regius*; *Buccinum*, *Buccinum Romanorum*; *Caminum Sylvestre alterum Matthioli*; *Caminum Sylvestre alterum Dioscoridis*; *Calcaris Flos*; *Consolida Regalis Sylvestris*; *Consolida Regalis peregrina parva flore Bauhini*: in English, *Larks-Spurs*, *Larks-Heels*, *Knights-Spurs*; and *Monks-Hood*. It has no Greek Name yet known.

II. *The Kinds.* Authors make six Kinds of this Plant, viz. 1. *Delphinium majus, sive vulgare*, Ordinary or Common Larks Heels or Spurs. 2. *Delphinium vulgare flore pleno*, Double Common Larks-Spur. 3. *Delphinium avense*, Wild Larks-Spur. 4. *Delphinium Hispanicum parvum*, *Delphinium latifolium trigonum*, (so called from the Division of the Leaves, or from the Pods, which usually come three together) Spanish Wild Larks-Spur. 5. *Delphinium elatius flore simplici diversorum Colorum*, Single upright bearing Larks-Heel of many Colors. 6. *Delphinium elatius flore pleno diversorum Colorum*, Double upright Larks-Spur of many Colors.

III. The

Larks-Spur Common.

III. The Descriptions. The first, or Ordinary or Common Larks Heel or Spur, has a Root which is hard after it is run up to Seed, spreading both abroad and deep, yet perishes every Year, raising it self usually from its own Sowing, as well as from the Seed sown in the Spring time. From this Root rise many Branches, which spread much more Ground than the others, rather leaning or bending down to the Ground, than standing upright; on which are set many long green Leaves, finely cut, almost like to Fennel Leaves. The Branches end in a long Spike of hollow Flowers, with a long Spur or Heel behind them, (whence the Name) very like unto the Flowers of *Hollow-Root*, (before described) and are of several and various Colours, as of a blewish purple Color, or white, or Ash color, or red, paler or deeper, as also party-colored, of two Colors in a Flower. After the Flowers are past, (which in this Kind abide longer than in the other) long round Cods come forth, containing very black Seed.

IV. The second, or Double Common Larks-Spur. Of this Common Kind, there is some Difference in the Flower, altho' in nothing else: the Flowers grow many upon a Stalk, like the former, but every one of them are as if three or four small Flowers were joined together, with every one his Spur behind, the greatest Flower being outermost, and as it were containing the rest, which are of a pale red or deep bluish Color. Another of the Kind will bear its Flowers with three or four Rows of Leaves in the middle, making a double Flower, with one Spur only behind: and of this Kind there is with purple, blew, bluish and white Flowers, as also party-colored. And these all bear Seed like the *Single*, whereby they are increased every Year.

V. The third, or Wild Larks-Spur. Its Root is much like the former, whence rise up smaller and lower Branches, with smaller and shorter Leaves, and more speedily or thinly growing upon them, than upon any of the former. The Flowers likewise are neither so large as any of the foregoing, nor so many growing together: the Cods likewise have smaller Seed, and is harder to grow in Gardens

than any of the others. The most usual Color hereof, is a pale reddish or bluish Color, yet sometimes they are found both white and blew, and sometimes mixt of blew and bluish, variably disposed, as Nature sometimes pleases; but these are much more rare.

VI. The fourth, or Spanish Wild Larks-Spur. It has a Root which is small and thready, suddenly perishing with the first Cold which overtakes the Plant. It has several long and broad Leaves next the Ground, cut in on both sides, something like to a *Scabious* Leaf, but it is smooth on the edges, and not indented besides the Cuts; it is of a whitish green Color, and something smooth and soft in handling. From among the Leaves rises up a whitish green Stalk, having many smaller Leaves upon it, which grow below, and not divided; branching out into many small Stalks or Arms, bearing Flowers like unto the *Wild Larks-Spur*, but smaller, and of a bleak blewish Color; which being past, there comes forth two or three small Cods, joined together, in which is black Seed, and smaller and rounder than any of the former.

VII. The fifth, or Single upright bearing Larks-Spur of many Colors. The Difference between this and the third, or *Wild Larks-Spur* foregoing, is, that the Leaves of this are not fully so green, nor so large: the Stalks grow upright to the Height of a Man, and sometimes higher, having some Branches thereon, but fewer than the former, and standing likewise upright, and not leaning down as the others. The tops of the Stalks are better stored with Flowers than the other, being sometimes two Feet long, and above, of the same Fashion, but not altogether so large, and of several and more various Colors, as white, pale, bluish, red, deeper and paler, ash-colored, purple or violet, and of an over-worn blewish purple, or Iron Color. For all these we have simple without any Mixture or Spot. We have also other sorts among the simple Colors, which rise from the same Seed, and will have

Flowers which will be half white, and half bluish or purple; or one Leaf white, and another bluish or purple, or else variably mixt and spotted. The Seed and Seed-Vessels are like those of the three first Kinds, but larger and harder.

VIII. *The sixth, or Double upright Larks-Spur* of many Colors. *These Double Larks-Spurs cannot be known from the Single of the same Kind just afore described, until they come towards Flowering; for there appear many Flowers upon the Stalks, in the same manner, and of as many Colors almost as the Single, except the party-colored, which stand like little Double Roses, laid or spread open, as the Rose Columbine, without any Spurs or Heels behind them. very delightful to behold, consisting of many small Leaves growing together; which after they are fallen, three or four small Cods set together come up in their places, wherein is contained here and there (for all are not full of Seed as the Single Kinds) black Seed, like unto all the rest, but smaller, which being sown, will bring Plants, which will bear both single and double Flowers again. And it often happens, that it variably alters in Colors from its own Sowing; for none of them hold constantly its own Color, (so far as has yet been observed) but change into others as Nature pleases.*

IX. *An Observation.* This last Plant Mr. Rea, in his *Ceres* Chap. 10. says is only worth the preserving; and he describes it thus. *Double upright Larks-Heel, from a Root which perishes in Winter sends forth small jagged Leaves, tall upright Stalks, branched at top, and bearing many fine double Flowers, in form like to the Rose Columbine, in several Plants of as many several entire Colors, as Blew, Purple, Ash, White, pale Blush, Rose-color; these are the most usual Colors, yet sometimes some Roots will bring Flowers which are striped, and variegated with blew and white, and often with some Leaves blew, and others purple; after the Flowers are past, come forth small horned Pods, which contain Seed black and round, and which being sowed, will bring some Plants with single, but most with double Flowers.*

X. *The Places.* The first, or *Greatest Wild Kind*, grow among Corn in many Countries beyond Sea, but for its Beauty, is brought to us, and nourished in our Gardens. The third, or *Lesser Wild Kind*, grows in several Fields of our own Country. The *Spanish Kind* was brought to us in Seeds, and grow also in our Gardens. The first *Double* and *Single* have been common for many Years in all Counties of *England*; but the tall *Upright single Kinds* have been made Natives but of late Years; and of them all, the *Double Kinds* are the most rare.

XI. *The Times.* The *Spanish Kind* flowers very late, so that many times in *England* the Winter takes it before it can give ripe Seed. The other Kinds flower in the Summer Months only. The *Double Kinds*, as well as the *Upright*, as the *Wild* or *Common*, are very choice and tender, many times not yielding good Seed. The sixth Kind flowers according to the time of sowing it, sooner or later, in *July* or *August*; and many times Plants come up of themselves from the Seeds fallen out of the Pods before Winter, which have continued and born fair double Flowers in *June* following, which have brought again much good Seed. The usual time to sow these Seeds in, is the beginning of *April*: but to get good Seed, (which is a chief Consideration in these Plants) you ought to sow them as soon as they are ripe, in some place where they may be defended from long Frosts in Winter; and one of these Winter Plants is worth ten of those raised in the Spring, and will yield more good Seed; yet in some kindly

Summers those of the Spring will seed reasonably well.

XII. *Yellow Larks-Heels*, called *Delphinium luteum*, which is *Nasturtium Indicum*, Mr. Rea, in his *Ceres*, puts into the Class of *Larks-Spurs*, and describes them in the following Words. *The Root, which perishes in Winter, sends forth many spreading long trailing Branches, four or five Feet long, which unless supported, lye on the Ground, and take up much Room. The Leaves are smooth, and round; the Flowers of a fair yellow Color, in fashion something like to a Single Larks-Heel, but the Leaves stand plainer, and some of them are streaked with red. The Flower is so well known, that it is needless to be over-curious in describing it, for few Gardens of any Note are without it. The Seeds are rough and uneven, falling of themselves, which are gathered off the Ground and preserved.*

XIII. *Place and Time.* They were first brought by *Monardus* from the *West Indies*; now they grow in almost all our Gardens throughout *England*. It flowers in *July*, and the Plant continues flowering till it is checked by Frosts. The Seed is sown in *April*, and if it is ripe and good, will be apt enough to come up; and the trailing Branches, as they grow, may be laid upon a Pack-thread fastned upon Sticks, into what Form you please; or they may be bound unto Rods stuck in the Earth, that they may not lye upon the Ground. But we shall say no more of this *Indian Plant*, because we have already discoursed of it in a Chapter by it self, viz. Chap. 164. foregoing.

XIV. To these Mr. Rea, in the place cited, adds another *Larks-Spur*, which is *Balsamina femina*, and describes it in these Words. *It has a Root which dies at the first approach of Winter. The Stalks are thick and reddish, like Pustlane, bunched, and set with Leaves, like those of the Peach-Tree. About the Stalk, from the middle upwards, come the Flowers on short Foot-stalks, which are of two or three Shadows of Purples, with Spurs behind, like Single Larks-Heels, but bending downwards. These Flowers are succeeded by round rough Heads, pointed at the end, in which are contained small round blackish Seeds. The Flowers come forth in *July* and *August*, but rarely yield any good Seed in *England*. The Plant is tender, and must be sowed in a hot Bed, and removed into good Ground, and carefully attended with Watering in the Heat of Summer, else it will quickly perish. Of this we have also wrote before, in a Chapter by it self, viz. Chap. 52. Self. 2. where there is a Discourse of it at large, so that we shall say no more of it in this place.*

XV. *As to the Qualities, Specification, Preparations, and Virtues* of Larks-Spur, those six first Plants which are properly so called, Authors have said nothing. But *Gerard* says, they are temperate and warm of Nature: and he says, that the Seed of *Larks-Spur* drank, (I suppose he means it to be in Ponder) is good against the Stinging of Scorpions: and that some make it to be one of the Kinds of *Confounders* or *Confrisers*.

XVI. It is also to be noted, That tho' some have given to *Larks-Spur*, the Name of *Monks-Hood*; yet it is not that poisonous *Monks-Hood* or *Helmet-Flower*, of which we fully discoursed in its place, in Chap. 353. foregoing.

XVII. *Flowers of Larks-Spur.* *Crolius* says, That three or more of the Flowers eaten, are good against Pains and Stitches of the Side. And *Brinsellus* says, That the Flowers help the Redness of the Eyes, Heat of the Body, Coughs, Strangury, Stoppage of Urine by Gravel and Sand, and give Ease in the Sciatica.

CHAP.

C H A P. CCCCXXIII.

of LAVENDER,
OR,
LAVENDER Spike.

I *THE Names.* This is a Plant unknown (as far as I can learn) to the ancient *Arabians* and *Greeks*: the *Latines* call it *Lavendula* and *Spica*; and we in *English*, *Lavender*, also *Spike*.

II. The Kinds. There are three Kinds of this Plant, viz. 1. *Lavendula major sive vulgaris*; *Nardus Italica Matthioli*; *Lavendula mas*, *Pseudonardus mas*, vel *major*; *Spica Trogi*; *Cassia albi Dalechampii* upon *Pliny*; some will have it to be the *Ispium Theophrasti*; and it is thought by many to be the *Cneorum* which *Pliny* saith *Higinus* called *Cassia*, which is a sweet Herb, frequently planted in the Gardens of *Italy*, for the Use of their Bees. This first Kind is our *Common Great Lavender*. 2. *Lavendula minor*, *Lavendula femina*, *Spica*, and *Spica minor*, *Pseudonardus femina*, & *minor*, *Small Lavender*, or the *Lesser Spike*. Of these Greater and Lesser Kinds, there are also two sorts, the one having a purplish blew Flower, the other a white flower; which latter is the more rare. 3. *Lavendula folio multifido*, (which *Gerard* calls *Stachas multifida*, but erroneously) *Jagged Lavender*.

Common Male Lavender.

III. The Descriptions. The first, or *Common Garden Lavender*. It has a Root which is woody, and spreads much under Ground, not dying in the Winter time. It springs up with a hard woody Stalk, parted into many small Branches, on which grow long, narrow and whitish Leaves, set by couples, one against another, from among which rise up naked square Stalks, with two Leaves at a Joint, and at the tops several small Husks standing round about them, formed in long round Heads or Spikes, with purple gaping Flowers springing out of each of them. The whole Plant is of a strong sweet Smell, but the Spikes of Flowers much more, and more piercing the Senses.

IV. The first, or Common Garden Kind, white-

flowered, called *Lavendula major flore albo*. This differs nothing from the former, but in the Flowers, which are always white, and in the Leaves, which are somewhat broader. It is a very rare Plant, and preserved with us in our Gardens on y as a Rarity, being more tender than the former, and not so able to endure our cold Winters.

Common female Lavender

V. The second, or Small Lavender or the Lesser Spike. Its Root is woody and spreading, and the whole Plant is very like unto the former, but grows not so high, nor is the Spike or Head so long, but shorter and smaller, and the Flowers of a deeper purplish blew Color. The Leaves also are a little harder, whiter and shorter than the former; and the Smell is likewise somewhat sharper and stronger: this is not so frequent with us as the first Common is, but is nursed up in Gardens in a warmer place.

VI. The second, or Small Lavender, or Lesser Spike, with a white Flower, called, *Lavendula minor flore albo*. This Small Lavender differs nothing from the former Small Kind, but is in all things like it, saving that the Flowers are white, and the whole Plant is yet a little smaller, and is generally planted in very warm places.

VII. The third, or Jagged Lavender. Its Root is hard and woody, like unto the others. It is a small Plant, and rises up with square, rough and hoary Branches, to a Foot and half high, bearing thereon many hoary whitish Leaves, very much jagged or torn on the edges, into many parts, even to the middle Rib, and each part cut or jagged; of a sharp Taste, and of a pleasant Smell, yet much weaker than the other Small Lavender. From among these Leaves rise up four square hoary Stalks, without any Leaves on them up to the tops, where they bear small Spikes of purple Flowers, like unto the first Lavender or Spike, but that the Flowers seem to stand square, or in four Parts or Corners.

VIII. The Places. The four first are found naturally in many places of *Spain*, and about *Narbonne* in *France*, where the last also grows; but both the sorts with white Flowers, are much more rare than the first or Common Kind. The fifth was found by *Cusius* about *Malaga* in *Spain*, and *Murcia* in the Kingdom

Kingdom of *Granado* : but with us they all of them grow only in our Gardens ; of which, the first is by much the more common.

IX. *The Times.* They all flower in *England* about the end of *June*, or beginning of *July* : but *Clusius* says, that he found the fifth about *Malaca* in *Spain* to flower in *February* ; and about *Murcia* to flower in *March* ; yet in these our colder Climates, it flowers not until *June* at the soonest, or in the Month of *July*.

X. *The Qualities.* *Lavender* is hot and dry in the third Degree : it is Absterfve, Aperitive, Astringent, Disculfve, Diuretick and Incifive. It is Cephalick, Neurotick, Stomatick, Cordial, Nephritick, and Hyfterick. It is Alexipharmick, Analeptick, and Antiparalitick, being of very fubtil and thin parts.

XI. *The Specification.* It is a peculiar thing for the Cure of Convulfions, Epilepfies, Palfies, Tremblings, Verrigo's, Lethargies, Swoonings, Hyfterick Fits, and other like Difaffections of the Head, Brain, Nerves and Womb.

XII. *The Preparations.* You may have herefrom, 1. *A liquid Juice.* 2. *An Effence.* 3. *An Infufion.* 4. *A Powder.* 5. *A Water diftilled.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.* 9. *A Spirit.* 10. *An Oil diftilled.* 11. *Powers.* 12. *An Elixir.*

The Virtues.

XIII. *The liquid Juice.* It is of good Ufe againft Pains of the Head, and other Difaffes of that Part, as alfo of the Brain and Nerves, proceeding from Cold and Moisture, or the Afflux of cold Humors, as the Apoplexy, Convulfions, Cramps, Cephalaxa, Epilepfy, Fainting, Lethargy, Palfy, Tremblings, Verrigo, and other like Difaffections. It is good againft Swooning, ftrengthens the Stomach, opens Obftructions of Liver and Spleen, provokes the Terms, facilitates the Birth, and expels the dead Child and After-birth. Dofe one, two or three Spoonfuls in a Glafs of Wine.

XIV. *The Effence.* It has all the Virtues of the liquid Juice, befides which, gargled in the Mouth, it eafes the Tooth-ach proceeding from a cold Caufe, provokes Urine, and gives Eafe in the Colick : it prevails againft Palpitation, and Paffions of the Heart, Strangling, Vapors and Suffocation of the Mother. Dofe one or two Spoonfuls in a Glafs of Wine, or of the diftilled Water.

XV. *The Infufion in Wine.* It has all the Virtues of the liquid Juice and Effence, helps the Strangury, and Scalding of Urine, expels Wind, and eafes the Gripping of the Guts, being given inwardly from two to fix Ounces, according to Age and Extremity of the Difafe. But it is to be noted, that tho' this Infufion may be made of the green Leaves, yet it is much more powerful being made of the Spikes of Flowers, which is moft ufual.

XVI. *The Powder.* It ftrengthens the Stomach, expels Wind, and is good againft the Colick. Outwardly applied to old running Sores and Ulcers, it dries up the Humidity, repreffes the Virulency and Putridity, and difpofes them to healing : where note, That it ought to be made of the fpike Heads of Flowers. Mixed with Powder of *Euphorbium* it is good to fcale foul and corrupted Bones. Given to one Dram in White Port Wine to Women in Travel, it facilitates the Birth, and expels the Secundine.

XVII. *The diftilled Water.* This may be made of Leaves and Flowers together. It has the Virtues of the Juice, Effence and Infufion, but in a much lower degree, fo that it is to be ufed in a greater quantity, as from three to fix Ounces, a little dul-

cified with double-refined Sugar : but it is moft commonly ufed as a Vehicle to convey down into the Stomach the other Preparations of this Herb. Two Spoonfuls thereof does help fuch as have loft their Speech or Voice by Convulfions, Palfies, Lethargies, or otherwife, reftoring it them again. It helps alfo the Tremblings and Paffions of the Heart, fainting and fwooning Fits, not only drunk, but even applied to the Temples, or to the Noftils ro be fmelt unto. That which is made of the Flowers alone, is much the beft.

XVIII. *The Spirituous Tincture.* It is made of the fpike Leaves of Flowers, (as are alfo all the following Preparations) and is a noble Cephalick, Neurotick, and Stomatick. It very much ftrengthens the Head, Brain and Nerves, and refits all Difaffes thereof proceeding from Cold and Moisture of thofe Parts. It gives Eafe in an inveterate or old Head-ach, called *Cephalaxa*, as alfo in an accidental Head-ach, called *Cephalalgia*, and in a half Head-ach, called the *Megrim* : it ftrengthens the Stomach to a Miracle, is good againft Coldnefs, and Waterinefs thereof, Wind and Over-turnings of the Stomach, fainting and fwooning Fits, Sicknefs at Heart, and indeed all thofe Difaffes for which the Juice, Effence, Infufion and diftilled Water are prefcribed. Dofe from one Dram to three or more alone, if dulcified : or otherwife mixed with fome generous Wine, or with a fit quantity of the diftilled Water.

XIX. *The Acid Tincture.* This is a great Stomatick, and very fir for a hot Stomach, becaufe by reafon of the Acidity it allays the Heat thereof, acuates it, ftrengthens it, and caufes a fingular good Appetite and Digeffion ; fuppreffes Vapors, as alfo a *Flatus*, or Hypochondriack Melancholly, and Fits of the Mother. It prevails againft the Scurvy in a cold and moift Habit of Body, and all the Symptoms of that pernicious Difafe ; carrying off the Morbifick Matter or Caufe by Urine, which it caufes a plentiful Evacuation of ; and therefore is good againft Stones, Gravel, Sand and Tartarous Matter or Slime in the Reins, Ureters or Bladder. It is to be taken daily, in all that the Patient drinks, whether Ale, Beer or Wine, fo much at a time as to give it a pleafing Acidity. Outwardly bathed upon places affected with the Gout, it gives Eafe in the Pain, and in a fhort time cures it.

XX. *The Oily Tincture.* It is powerful againft Palfies, being anointed upon the *Spina dorsi*, according to Conjugations of Nerves replenifhing the Parts affected, as alfo upon the Paralytick Part it felf : it prevails againft Convulfions, a Catalepfis, Cramps, Lethargies, Falling-ficknefs, Trembling, Vertigo, and other Difaffections of the Nerves, being anointed upon the grieved places, and alfo taken inwardly from ten to thirty Drops in any proper Vehicle : and fo given Morning and Night, it is good againft the Stone, Gravel, Sand, and any Tartarous Mucilage in the Urinary Parts : it powerfully provokes Urine, gives Eafe in the Strangury, and takes away the Pain, Heat and Scalding thereof : outwardly, it is good to cure Hurts and Punctures of the Nerves and Tendons, to difcufs Flarencies, and eafe Pains of the Joints and other Parts, proceeding from Cold and Moisture.

XXI. *The Spirit.* It is one of the greateft of Vegetable Cephalicks and Cordials : it comports the Head, Brain, Nerves and Womb, fuppreffes Vapors, and refits Hyfterick Fits. It powerfully prevails againft Palpitation of the Heart, Sicknefs at Heart, Fainting and Swooning, and all other Diftempers of that Part. It revives the Spiritus, cheers the Heart, and ftrengthens all the Faculties of the Body : it is prevalent againft a fevere Cold, and cures a Lethargy in a fhort time. It may be taken two or three times

times a Day, or in a Paroxysm, either alone, if alloyed, and dulcified with fine white Sugar, or mixt with any proper Vehicle. The Patient troubled with any of the aforesaid Diseases, shall not take it in vain, especially such as are Paralytick. Dose from one Dram to two or three Dams or more, according as the Age of the Patient will admit, and Extremity of the Disease may require.

XXII. *The distilled Oil.* It has all the Virtues of the Juice, Essence, Infusion, Tinctures and Spirit; and almost an hundred times more powerful than them all, so that the Virtues hereof need not now be again repeated in vain: but this in particular, it is one of the greatest Antiparalyticks, Antepilepticks and Anrisparmaticks in the World; and besides, being given to Women in Travel, it facilitates the Birth, and expels the After-birth, and gives Ease in After-pains, beyond any other Medicine I know in the World. The Dose is from four Drops to twelve, sixteen or twenty, (in Extremity) in any proper Vehicle. First drop it into Sugar, mixing them well together with the Point of a Knife; then put it into the Wine, distilled Water, or other fit Vehiculum, and so give it the Patient to drink, repeating the Dose as oft as you see convenient.

XXIII. *The Powers.* This Preparation has all the Virtues of the Oil aforesaid, and may be given in the same Vehicle: but as it is a more diluted Substance, it may be given in a much larger quantity, viz. from half a Dram to two Drams or more, as the Exigency may require. It is very subtil and penetrative, and pierces more than the Oil does. Outwardly applied, it is admirable against the Sciatica, as also against the Gout from a cold Cause: and is good against a Lethargy, being bathed upon the Forehead and Temples, snuffed up the Nostrils, and taken also inwardly, as is before directed.

XXIV. *The Elixir.* This is the Powers elixirated, has all the Virtues of the Powers exalted, and so operates in a less Dose, viz. from a Scruple to a Dram, or from twenty Drops to sixty Drops, which may be given Morning, Noon and Night in such proper Vehicle as the Physician shall assign. It is peculiarly commended against Palsies, and Diseases of the Womb, as Suffocation; as also the Epilepsy in younger Persons. It gives Ease in and cures the Strangury, inwardly taken; and prevails against the Colick even by bathing the outward Parts therewith. An Ounce of the Elixir being mixed with six Ounces of the distilled Water, makes an excellent Lotion for the Head in Pains thereof; as also in Lethargies, and to strengthen the same.

C H A P. CCCCXXIV.

Of LAVENDER-COTTON,

O R,

SANTOLINE.

I. *The Names.* It is called in Greek, *Χαμαίανθος*, *Chamaeyparissos*; and *Ἀβροτον Θύαμα*, *Abrotonon Theleia*: in Latine, *Chamaeyparissus*, *Abrotonum semina*, and *Santolina*; and in English, *Lavender-Cotton*, and *Santoline*.

II. *The Kinds.* Authors make nine or ten Kinds of this Plant; we shall be contented with six of them, which we find growing in our Gardens, or in some of our Plantations beyond Sea, viz. 1. *Abrotonum*

semina vulgare, *Santolina communis* *Anguillane*; *Cressolina Cefalpini*; *Chamaeyparissus Herba Plinii*; Our Common Garden Lavender-Cotton. 2. *Abrotonum semina magnum*; *Abrotonum semina secundum Clusij*; *Abrotonum semina solis magis viridibus Camerarij*; *Pollia aliud Columne*; Great Lavender-Cotton. 3. *Abrotonum semina narbonense magno flore*; *Santonicum majus Codi*; *Abstinibium maritimum primum Tabernamontani*; *Scriphtium verum Dioscoridis*, according to Penn and Lobel, who says it has the Form of *Abrotonum semina*; *Santolina prima Dolonci*; *Abrotonum semina tertium Clusij Narbonense*; *Pollia altera Species majore Columne*; *Abrotonum semina flore majore Baudini*; French Lavender-Cotton. 4. *Abrotonum semina Ericae foliis Baudini*; *Santolina tertia Dodonaei*; *Unguentaria Lutetianorum*; *Chamaeyparissus Dalechampij*, (as Bauhine thinks) Heath-leaved Lavender-Cotton; Fine leaved Lavender-Cotton. 5. *Abrotonum semina solis Rosmarini majus & minus Baudini*; *Abrotonum semina quartum Clusij*, (which is his first Spanish Kind) *Abrotonum semina Rosmarini solis minus Baudini*, (which is the lesser Species) and is the Second Spanish of *Abrotonum semina Clusij*; Rosemary-leaved Lavender-Cotton, both Greater and Lesser. 6. *Abrotonum semina viridis minor Baudini*, (so called in respect to the second green Kind above-named) and is the third Spanish of *Clusius*, called, *Abrotonum semina Salamanticensis*; Small green Lavender-Cotton.

III. *The Descriptions.* The first, or Our Common Garden Lavender-Cotton. It has a Root which is woody, and spreads it self under Ground with several hard Fibres. From this Root rise up several woody, brittle, hoary Branches, on which grow many long, four-square, hoary, or whitish Leaves, dented about the edges. At the tops of the Branches grow up naked Stalks, bearing every one a large yellow Head or Flower, like unto *Tansy* or *Mundlin*, but greater, of a Gold-yellow Color; abiding a long time upon the Stalks, if kept but very dry: after which comes small dark-colored Seed. The whole Plant is of a very strong sweet Smell, but not unpleasant, nor much unlike *Southernwood*.

IV. *The second, or Great Lavender-Cotton.* It has a Root which spreads it self in the Ground, with hard woody Branches, like the other, and endures the Extremity of Winter, as well as the other doth. This is very like to the former Ordinary Garden Kind, but not bushing out so thick with Stalks, growing to have a great height, and a thick Stem or Stalk, not set with so many Branches thereon, but somewhat bigger than the other, on which grow four-square dented Leaves, like thereunto, but somewhat larger, thicker and greener; the Flowers stand in the same manner, every one upon its long Stalk, being as yellow and large as the former, and which being past away give the like Seed. The smell of the whole Plant and every part thereof is strong, but not so pleasant to a great many as the other; this will be propagated by slipping as well as the former.

V. *The third, or French Lavender-Cotton.* It has a Root which is as great and as woody as either of the aforesaid, and spreads as much in the Ground. This *Stem* grows not to be so high as the first or Common Kind, but has many woody, short, litle and round, not above half a Yard high, variegated into many other small ones; on which as by us like the others; but somewhat smaller, and less perfectly or thinly set on the Branches, of a yellowish white Color, neither so green as the last or second, nor fully so white as the first or Common Kind, of a strong Smell; something like to our first.

The

The Flowers stand upon the tops of the smaller Sprigs or Stems, each bearing one alone by it self, upon a bare or naked Stalk, void of Leaves for a good space, which are of a paler yellow Color than the others, and much larger, and giving Seed of somewhat a darker Color.

Lavender-Cotton French.

VI. *The fourth, or Heath-leaved Lavender-Cotton.* This has a Root much like for Form and Substance to the others: but the Plant it self grows not so great or high as the French Kind does; but has many short woody Branches, on which do spersedly grow smaller, shorter and finer whitish green Leaves, very like to the Leaves of our Common Heath. The Flowers are yellow, standing in like manner as all the former do. And the whole Herb has a very pleasing (but not strong) Smell to commend it, somewhat resinous, and not very faintish or weak.

VII. *The fifth, or Rosemary-leaved Lavender-Cotton* both Greater and Lesser. The Greater Kind has a woody spreading Root, like to the others foregoing: and it shoots forth from this Root many slender hoary Stalks, something above a Foot long; about which grow many very narrow, small and flat Leaves, like unto the Leaves of Rosemary, which while they are young, are of a more hoary white, and have but a small Shew of denting about the edges; but when they are grown old, they are more green, and the denting about the edges is more apparent, of a sweet Smell and bitter Taste. From these Stalks come forth several short Stems, with very few Leaves on them, on the tops of which stand several yellow Flowers, like to Common Lavender-Cotton, but much larger, which die down to the main Stalks every Year, after perfecting of the Seed as the others do. The Lesser Rosemary-leaved Kind, differs not from the Greater in its Leaves and Flowers, but in their Smallness, this is weaker, more slender and small in every part, is not by reason of the place, its being more barren, (as some have thought) but it has been found, that growing in the same place with the for-

mer or Greater Kind, and the Seed being sown in the same places, that it still retains the Form and Magnitude it had, as growing in its natural place.

VIII. *The sixth, or Small green Lavender-Cotton.* The Root is woody, like the former, and replenished with small Fibres. This Plant is very like to the last Small Kind, but that it grows somewhat greater and higher, having green, and not hoary Stalks at all; as the Leaves also are, being a little longer, and as bitter in Taste as the others, but not of so sweet a Smell, having rather an Oily Scent. The Flowers grow in the same manner upon slender Stalks, and of the same Fashion, but of a paler yellow Color.

IX. *The Places.* The first grows naturally in Germany. The second in the Low-Countries. The third about Narbonne in France. The fourth and fifth Clusius found growing about Salamanca in Spain. The sixth is unknown, as in what place it is a Native: but they all grow well with us, being nursed up in Gardens.

X. *The Times.* They all of them flower in July and August, and the Seed is ripe in some little time after.

XI. *The Qualities.* Lavender-Cotton, but more especially the Flowers and Seed, are hot and dry in the third Degree. It is Afringent, Discussive, Neurotick, Hystrick, and Alexipharmick.

XII. *The Specification.* It stops the Whites, resists the Poyson of Serpents and other Venomous Creatures, kills Worms in Children, and cures Itch and Scabs of all sorts in whomsoever. Dioscorides, and so all other Writers generally after him, say, that the Virtues of Lavender-Cotton, and of Southernwood, are the same, and of like Effects, and that the Medicines made from this Plant are applied to all the Diseases to which Southernwood is appropriate.

XIII. *The Preparations.* You may make all the same Preparations hereof as we teach you to make from Southernwood, which see hereafter in its proper Chapter. But these following Preparations are more particular and special, viz. 1. A Powder of the dried Leaves. 2. An Infusion of the Leaves. 3. A Powder of the Seed. 4. A Spirituous Tincture of the dried Leaves or Seed.

The Virtues.

XIV. *The Powder of the Seed.* It kills Worms, (as will also the green Seed, being bruised and drank.) It is thought to be equal, if not superior to our Usual or Common Wormseed, and has the same Virtues against Worms, avoiding them with greater Force. Dose from half a Dram to a Dram in the Morning fasting, and at Night going to Bed, in any proper Vehicle. It is good also against the Bittings of Serpents, Mad Dogs, or any other Venomous Creatures, being inwardly given as aforesaid, and applied Pulveris-wise to the Part wounded.

XV. *The Powder of the Leaves.* Matthiolus says, that being given to half a Dram (it may be given to a Dram) in Featherfew-Water, every Morning fasting for ten Days at least together, and afterwards every other Day, for some time. It is a very profitable Medicine to stop the Whites in Women, and to cure them. Pliny says it is also good against the Poyson of all Venomous Serpents and Scorpions, being taken in Wine. It kills Worms also, and has all the Virtues of the Seed, but not altogether so powerful; and therefore may very well be used, when the Seed cannot be gotten, but in somewhat a greater Dose.

XVI. *The*

XVI. *The Infusion of the Leaves in Wine.* It has all the Virtues of the Powder of Seeds and Leaves, but not full out so effectual as the Powder in Substance, and may be given from three Ounces to six, every Night going to Bed, and every Morning fasting. *Clusius* says, that in *Spain* they use the Infusion or Decoction thereof to cure all sorts of Itch and Scabs in whomsoever, but he advises, that there should be Caution used in giving it. This is certain, that in all the Diseases afore-named, for which these Plants may be proper, it will be yet more effectual, that the Powder of Leaves or Seed be given in the Infusion now spoken of.

XVII. *The Spirituous Tincture of the dried Leaves or Seed.* This Preparation has all the Virtues of the former, and is much better to be given than they, because it is given in a smaller Dose, and in some other proper Vehicle more pleasant, as in *Angelica*, or *Penny-Royal*, or *Mint-Waters*, or in *Red Port Wine*, or some other proper Astringent Wine. It strengthens the Womb, and all those Parts belonging to Generation, powerfully resists Vapors, and if prudently given, cures Hysterick Fits, tho' vehement and of long standing. But in many Cases, in the Exhibition of Medicaments, the Judgment of a Learned and Experienced Physician ought to be taken along with them: for such a one, by his discreet and prudent Administration, shall do Wonders with that Medicament, with which an unlearned and unskilful Man can do nothing at all. There is a great Matter in the true Dose of a Medicine, according to Age, Strength, Temperature, Sex, and Stubbornness of the Disease. There is something in the Choice of the Preparation to the intended Purpose. There is more yet to be observed as to the right time of Administ'ring; and a great deal as to the Continuance of it, or Alteration of the same, as the Stomach, or Nature and State of the Disease is found to change or alter, &c.

LEAD-WORT, see Scar-Wort, Chap.
LAVENDER-SEA, see Limonade, Chap.

C H A P. CCCCXXV.

Of LAUREL Dwarf or Ground.

I. *THE Names.* It is called in *Greek*, *Χαμαδωρον*: in *Latine*, *Chamaedaphne*; *Chamaedaphne vera* *Dioscoridis*, *Laureola*, *Laurus Alexandrina altera* *Matthioli*, *Laurus Alexandrina Columne*, *Lugdunensis*, *Tabernamontani*, *Clusii*, & *Bauhini*; *Rusco affinis altera* *Cesalpini*: in *English*, *Ground or Dwarf Laurel*.

II. *The Kinds.* It is a singular Plant of the Kind, tho' some would make it to be a second sort of *Laurel* of *Alexandria*, which I can no ways believe it to be.

III. *The Description.* It has hard Root, and very fibrous; from whence rises up one Stem or Stalk, and sometimes two or more, which seem to be covered with Leaves set thereon, one above another, on both sides thereof, the lower being larger than the upper, which Leaves are long and narrow, also sharp pointed, very like to a Common Bay Leaf, having many Ribs therein of a deep green Color on the upper side, and paler underneath, full of Ribs or Veins also, not much unlike to *Horse-tongue*, saving that

they are without any second small Leaf or Tongue, such as *Horse-tongue* has, but as hard in handling. This has Flowers, and red Berries in the middle of the Leaf, (and upon so short a Stalk, that it seems to have none) growing out of the middle Rib; but these grow on the under side for the most part, which may make it to be thought a Species of the *Laurus Alexandrina*, but indeed is not.

Dwarf or Ground Laurel.

IV. *The Places.* It grows naturally on several Hills in *Italy*, which for its Rarity was brought into their Gardens; and by the means of *John Trudefant*, it was brought into our Country and Climate, where it flourishes very well.

V. *The Times.* It flowers in *June*, and the Berries are ripe in *September*, in its native Country; but here in *England* its Fruit comes not to Perfection.

VI. *The Qualities.* It is hot and dry in the end of the second Degree; Aperitive, Vulnerary and Diuretick.

VII. *The Specification.* It eases the Belly-ach, powerfully provokes Urine and the Courses, and is good against Heart-burnings.

VIII. *The Preparations.* You may have therefrom, 1. A Decoction or Infusion of Herb and Roots in Wine. 2. A Powder of the Herb and Roots. 3. A Bath or Fumigation.

The Virtues.

IX. *The Infusion or Decoction of Herb or Roots in Wine.* It powerfully provokes Urine and the Terms in Women, cleanses the Womb of Feculencies, and the Reins and Bladder of Sand or Gravel, Mucilaginous or Tartarous Matter, and gives Ease in the Strangury. *Dioscorides* says it hastens and facilitates the Birth of Women in Labor: and it is of singular Use to dry up the Moisture of old running Sores and Ulcers, tho' rebellious and inveterate, it cleanses them, and induces a speedy Healing, and this by washing the Sores or Ulcers herewith twice a Day. Dose from three Ounces to six twice a Day, viz. Morning and Evening. The Head being also bathed herewith, it is said to ease the Pain thereof.

X. *The Powder of Herb or Root.* It has all the Virtues of the Infusion beforegoing: besides which, it eases and cures the Heart-burning, and gives Ease in the Colick, Gripings of the Guts, and other Distempers of the Bowels, being taken Morning and Night in a Glass of generous Wine, from half a Dram to a Dram and half.

XI. *The Bath or Fumigation made with Water.* It is very good for Women to sit over, to receive the hot Fumes up the Womb, or to sit in as a Bath, or to have it injected up the Womb, in case of falling down of the Womb, and to fettle it in its right place again.

CHAP. CCCCXXVI.

OF LEEKS.

THE Names. This Plant is called in *Arabic*, *Carot* seu *Kurat*: in *Greek*, *Πεζον*: in *Latin*, *Porrum*; and by *Palladius*, *Porrus*: in *English*, *Leek*.

II. *The Kinds.* Of *Leeks* there are several sorts, as, 1. *Πεζον κεφαλον*, *Porrum Capitatum*, Common headed or set Leek. 2. *Πεζον τριτον*, *Porrum Scellivum*, *Porrum Scellive* aut *Tonsile*, Common cut or unset Leek. 3. *Αμπελοπρασον*, *Ampeloprasum*, *Porrum Vitium*, *Porrum Virgineum*, The Vine-Leek; and this *Parkinson* says is the best of all the Kinds. 4. *Πεζον μελαν*, *Porrum Sylvestris*, The Wild Leek.

Common headed or set Leek.

III. *The Descriptions.* The first, or Common headed or set Leek. The Root is a kind of bearded Bulb, white, long and slender, that growing in some to a considerable Thickness. From this Root rises up broad flat Leaves or Blades, which grow out

long, and very many of them, having a Crest or Ridge on the back-side; in Smell and Taste very strong, not much unlike *Onions*, or between *Onions* and *Garlick*. The Stalks (if the Blades are not cut often, but are suffered to grow uncut) will in the second or third Year after Sowing, send forth a round and slender Stalk, of an Evenness quite throughout, and not swoln, or bigger in the middle, as is that of an *Onion*; which bears at the top a round Head or Ball, like to that of the *Onion*, consisting of purplish Flowers and black Seed after them, so very like unto *Onion-Seed*, that it is hard to distinguish them.

Leeks Unset, or Cut Leeks.

IV. *The second, or Common cut or unset Leek,* has a Root which is also white, long, and slenderer than the former, with a great Bush of Fibres hanging at it, like a Beard; but this being transplanted, grows thicker and greater. The Stalk, Blade, Heads, Flowers and Seed, are much like the other above. Now, tho' most Writers distinguish the Common Leek in two Kinds, viz. *Porrum Capitatum*, & *Scellivum*, the Headed and Cut Leek, yet *Gerard* says, they both grow of the same Seed, and that they differ only in Culture: for that which is often cut for the Use of the Kitchen, is called, *Scellivum*: the other which is headed, is not cut, but sowed, and removed in Autumn. *Matthioli* says, *Non differt à Capitate, nisi quod Capite sit tenuiore, ac etiam Cervice.*

V. *The third, or Vine-Leek, which some call the French-Leek.* Its Root or Bulb is headed or round, hard and sound, and is quickly multiplied by sending forth many Bulbs; and it will encrease altogether by the Root, as *Garlick* does. It grows up with Blades like those of Common Leeks: the Stalk is a Cubit high, on the top of which stands a round Head or Button, covered at the first with a thin Skin, which being broken: the Flowers and Seed come forth like those of the *Onion*.

Vine.

Vine-Leek.

Wild Leek.

VI. The fourth, or Wild Leek. The Root is a bearded Bulb, of a longish or oval Form. Its Leaves and Stalk are much like unto those of Crow-Garlick, but much larger, and more acide, or sharp and strong. The Flowers and Seed also resemble those of the Crow-Garlick in Chap. 310. afore-described: the Seeds being about the Bigness of Grains of Wheat, with small Strings coming forth at their ends.

VII. The Places. The first three grow with us in Gardens only, which ought to be a good Earth,

fat, well dunded and digged, and are common to be had in all Countries, as well as in England. The Vine-Leek grows of it self in Vineyards, and near unto Vines, in hor Countries, from whence came the Name. The Wild Leek grows wild in several Regions, and is many times nurfed up in our Gardens.

VIII. The Times. Leeks may be sown in March or April, and removed in September or October. The Vine-Leek bears its green Leaves in Winter, and withers away in Summer.

IX. The Qualities. They are all of them hot and dry in the fourth Degree. They are Appetitive, Absterfivè, Anodyne, Attractive, Digestive, Diuretick, Emollient, Incisive, Attenuating and Suppurative; Stomatick, Pectoral, Nephritick, Emmenagogick, Alexipharmick, Analeptick and Spermatogenetick.

X. The Specification. They cure the Scurvy in a cold habit of Body, help a dejected Appetite, ease the Strangury, and other Diseases of the Reins and Bladder, as also Ulcers of the Lungs.

XI. The Preparations. You may have from Leeks
1. A liquid Juice. 2. An Essence. 3. An Infusion.
4. A Broth. 5. A Loboc. 6. A boiled Sallet. 7. A distilled Water. 8. A Spirit. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture. 12. A Powder of the Seed. 13. A Cataplasm of Root and Blades.

The Virtues.

XII. The liquid Juice of Roots and Blades. A Spoonful of it being mixed with Honey, and drunk, it is good against the Bitings of Venomous Beasts and Serpents, the Roots or Leaves being also beaten to a Pulp, and laid thereon. It wonderfully provokes Urine, eases the Strangury, and brings down the Terms in Women; cures the Bitings of Mad Dogs and other Poysonous Creatures; but these things the Juice of the Vine-Leek more especially performs.

XIII. The Essence. It has all the Virtues of the liquid Juice, and may be given in any proper Vehicle from half a Spoonful to a Spoonful and half: mixt with Vinegar, or Milk, or Oil of Roses, and dropt into the Ears, it eases their Pain, and takes away any Noise in them.

XIV. The Infusion in Wine. It has all the Virtues of the Juice and Essence; and being given from three Spoonfuls to six or more, it facilitates the Birth of Women in Labor, brings away the After-birth, eases After-pains, and causes a due cleansing.

XV. The Broth. It is made by boiling them in Barly Broth, or Barly Cream, till they are soft or dissolved, and so they are eaten with it, and may be called Leek Pottage. It concocts, and causes Expectoration of crude and undigested Flegm, and other Humors lodged in the Thorax, or Lungs and Stomach, and Parts adjacent: besides, it nourishes much, and is good to be eaten by such as are in Consumptions.

XVI. The Loboc. Lobel prepares it thus: Take blanched Almonds three Ounces, Juice of Liquorice two Ounces, choice Eggs one Ounce, soft Bellinum half an Ounce, Sugar-Candy in fine Powder two Ounces, dissolved in Juice of Leeks, a sufficient quantity: boil all in Balneo till they come into the Form of an Eclegma. Lobel commends it as very effectual against a flegmatick Quinsy, and cold Catarrhs, which are in danger to cause Suffocation. It is an excellent thing against Coughs, Colds, Hoariness, Difficulty of Breathing, Wheezing, &c.

XVII. The boiled Sallet. It is made by boiling them in Water or Broth to Softness, then dressing them up with Butter, Vinegar or Lime-Juice, Salt

and Pepper. It is a very grateful rhing to the Stomach and Bowels. We find in Scripture, in ancient Times, as in the time of the Children of *Israel's* being in *Egypt*, and probably a long time before, those *Eastern Nations* fed much upon *Leeks*, and *Onions*, and *Garlick*, which possibly they might either eat alone, or baked, or roasted, or boiled, in Water or in Broth with Flesh; and this same manner of Feeding on them, seems to be in all Nations alike: in *Macedonia* and *Russia* they are commonly eaten, and the *Turks* (as *Bellonius* says) have them served up, in their Dishes at Table, yea, to their Greatest Lords or *Bassas*. They are eaten also much in *Spain*, and thro' all the *West Indies*, in all the *Spanish*, *French*, *Dutch* and *English* Plantations. We in *England* likewise universally eat them, and they are a great and general Feeding in *Wales*, even among the Gentry there; and in *Lent-time* we almost every where make Potage of them, and it is a profitable Food for poor People in hard Times.

XVIII. *The distilled Water.* It is a singular Diuretick, good against Gravel, Sand, Mucilaginous and Tartarous Matter in the Reins, Ureters and Bladder. It has the Virtues of the Juice, Essence and Infusion; but being much weaker, is to be given in greater quantity, and may serve as a general Vehicle to give other Preparations of *Leeks* in. Dose from four to eight Ounces.

XIX. *The Spirit.* It is good to free the *Thorax* or Stomach, Lungs, &c. from putrid or rotten Flegm, and prevails against Coughs, Colds, Catarrhs, or Distillations of Rheum, by which many have been brought into a Consumption. It invigorates the Instruments of Generation, warms and comforts the Womb, provokes Urine and the Terms, and is profitable against Barrenness in both Sexes. Dose two or three Drams, two or three times a Day.

XX. *The Spirituous Tincture.* It has all the Virtues of the Spirit, but much more powerful to all the Intentions, being given from one Dram to three in any convenient Vehicle; two, three or four times a Day, but chiefly every Morning fasting, and every Night going to Bed.

XXI. *The Acid Tincture.* It attenuates, cuts and incises rough Flegm which sticks fast in the *Bronchia* of the Lungs, and loosens them and the Parts adjacent from putrid or rotten humors lodged therein, which is otherwise difficult to be avoided. It restores their Voice which has been lost thro' Hoarseness; and after an admirable manner strengthens the Stomach and Bowels: and cures such as have been poisoned, or surfeited by eating of Mushrooms. Dose to many Drops as to make the Wine or other Vehicle pleasantly acid.

XXII. *The Oily Tincture.* It is good against Lameness and Weakness of the Nerves, Joints and Limbs, and therefore is of singular Use against the Palsy, and Gout from a cold Cause, being anointed upon the Parts affected. Inwardly taken from eight to twenty Drops, being first dropt into White Sugar, and mixed well with it, and so given in White Port Wine, or in the distilled Water, or some other proper Vehicle, it gives present Ease in the Strangury, opens Obstructions of the Urinary Parts, and expels Gravel, Sand, Mucilage or Tartarous and Slimy Matter affecting those Parts. Given to a Woman in Labor, it facilitates the Birth, brings away the After-birth, and causes a due Cleansing.

XXIII. *The Powder of the Seed.* Take *Leek-Seed* three Drams, *Mistle-Berries* two Drams, make each into a fine Powder, and mix them. This Mixture given from one Dram to two in Red Port, or Red *Barcelona* Wine, or other proper Vehicle, will stop any Spitting of Blood, tho' it has been of long Continuance. It is said, that if these Ingredients

be put into Wine, they will keep it from Sorweing; and if it be already Sower, it will amend the same. This Powder will cut gross and tough Humors, and cure Fluxes of the Bowels, yea, the Bloody-flux it self.

XXIV. *The Cataplasme.* The Roots and Blades being boiled soft in Water, or Milk, or Wine, and so made into a Pultice, and applied to swollen *Hæmorrhoids* or Piles, it dissolves the Tumor, gives Ease in the Pain, and in a short time after cures them. If the Cataplasme is made of the raw Roots, by beating them in a Mortar, adding a few Crumbs of White Bread, as you see occasion, and be applied to any place bitten by a Mad Dog, Viper, Rattle-Snake, or other Venomous Creature; it infallibly attracts to, and draws out all the Poison; and this it does by reason of its vehement attractive Force, by which means it perfectly frees the Patient from all manner of Danger.

CHAP. CCCCXXVII.

OF LENTILS.

I. *THE Names.* This Plant is called in *Arabic*, *Hades*: in *Greek*, *Λαός* and *Λαός*, *Phacos* and *Phace*: in *Latine*, *Lens* and *Lenticula*: in *English*, *Lentil* and *Lentils*.

II. *The Kinds.* There are three Kinds hereof, viz. 1. *Lens major*, The greater Lentil. 2. *Lens minor*, The lesser Lentil. 3. *Lens maculata*, The spotted Lentil.

Great and Small Lentils.

III. *The Descriptions.* The first, or Greater Lentil, has a Root which is fibrous, and perishes every Year. From this Root rise up several weak Branches, somewhat hard, about two Feet long; from whence

shoot forth at several places long Stalks of small winged Leaves, that is, having many smaller Leaves on each side of a middle Rib, without any odd one at the end; for the middle Rib of each Stalk of Leaves, ends in a small Clasper. The Flowers are small, and rise up from between the Leaves and the Stalks, two for the most part at the end of a long Foot-stalk, of a sad purplish Color, somewhat like to those of *Vetches*; after which come small short, and somewhat flat Cods, within which are contained two or three flat, round, smooth Seed, of a pale yellowish Ash-color.

IV. *The second, or Lesser Lentil.* It has a small slender fibrous Root, perishing every Year: from whence proceed small, tender and pliant Branches, a Foot and half high, on which do grow winged Leaves, like the former, divided or consisting of other smaller Leaves, growing aloope from both sides of the Rib or middle Stalk, narrow, and many in number, like to those of *Tares*, or those of the *Wild Vetch*, saying that they are narrower and lesser, and ending at the middle Rib with some clasping Tendrel, wherewith it takes hold of such things as are near to it. From among these come forth small brownish Flowers, mixed with White, which turn into small flat Cods, containing little flat brown Seed, and sometimes white. *Parkinson* says, that this is lesser in Stalks, Leaves and Seed; the Flowers are more pale, and the Seed in the Cods is whiter, in which consists the whole Difference.

V. *The third, or Spotted Lentil.* This differs little or nothing from the last, but in the Seed, which in this Plant is blackish, and spotted with blacker Spots.

VI. *The Places.* The two first, even beyond Sea, are only sown in Fields, as other manured Pulses are, and so are they in some Counties of England, especially the second or smaller sort, which is every where the more pleasant and acceptable; but the greater does with very great Difficulty come to Maturity with us, if the Season or Weather is not kindly and dry. *Gerard* says, that it had been told him by Persons of good Credit, that Husband-men about *Watford* in *Middlesex*, and other places in England, do sow them for their Cattel, even as others do *Tares*. The third grows wild in *Portugal*, with us only in Gardens.

VII. *The Times.* They all flower, and their Seed grows ripe in *July* and *August*, and sometimes later.

VIII. *The Qualities.* The Lentil is temperate in respect to Heat or Cold, and dry in the second Degree: Astringent, Stomackic, Hystrick and Vulnerary.

IX. *The Specification.* The Fruit or Grain stops Fluxes, and the Terms in Women, cleanses and heals old Sores, Kibes, Ulcers, &c.

X. *The Preparations.* You may have therefrom, 1. A Decoction of the Grains, or of the whole Cods and Grains, in Wine or Water. 2. A Compound Decoction of the same. 3. A Meal or Flower. 4. Pottage. 5. A Mixture with Honey. 6. A Cataplasm with Vinegar. 7. A compounded Cataplasm. 8. A Cataplasm made with Sea-water.

The Virtues.

XI. *The Decoction of the Cods or Grains in Wine or Water.* Made with the Cods and Grains, it is Astringent or Binding; it stops the Terms, Fluxes and Vomiting, and strengthens the Bowels. If it is made with the Grains alone, it is said to loosen the Belly; but their second Decoction binds the Belly, and stops Fluxes.

XII. *The compound Decoction.* It is made by

joining a half quantity of *Catechu*, of *Red Beet Roots*, *Pomgranate Peels*, *Myrtle Berries*, *Service Berries*, *Unripe Pears*, *Quinces*, *Galls*, *Sunach Berries*, *Medlars*, *Unripe*, *Red Rose Leaves*, and *Plantane Leaves*, and boiling them all in rough Red Wine. It has all the Virtues of the former, and much more powerful, good against the Overflowing of the Terms in Women, and the Bloody-flux, also Spitting and Pissing Blood, and any other Flux of Blood, whether inward or outward. It allays Inflammations, and dries up great and deep Ulcers.

XIII. *The Meal or Flower.* It strengthens the Stomach, being taken from half a Dram to a Dram, in any convenient Vehicle. Strewed very thick upon old moist or running Sores or Ulcers, it dries up the putrid Humidity, and disposes them to Healing.

XIV. *The Pottage.* It nourishes, but is said to breed a thick and heavy Juice, which passes slowly thro' the Vessels; and therefore is a very bad Food for such as have the Leprosy, or are subject to the Scab, Cankers, Tetters, Ring-worms, Scirrhus, Melancholy, &c. also for such as have dry and withered Bodies, are consumptive, or are fallen into a Pining, or have a Dimness of Sight. But for such as have a Dropsy, or are in danger of a Dropsy, or abound with waterish Humors, it is very good to feed upon.

XV. *The Mixture of the Meal made with Honey.* It cleanses corrupt and rotten Sores and old Ulcers, filling them up with Flesh again; and is a most singular thing to be put into the common Digestives which are used for green Wounds: and applied to Apostems, it maturates and breaks them.

XVI. *The Cataplasm with Vinegar or sour Wine.* It (being applied) eases the Pains of the Gout, softens Womens Breasts which are made hard, with curdled Milk; waxes away Wens and other hard and scrophulous Tumors of the Throat.

XVII. *The compounded Cataplasm.* It is made of the Meal, with Pulp of raw Quinces, adding a little Juice of Melilot and Oil of Roses. Applied, it helps the Hemorrhoids or Piles, giving present Ease: all Inflammations of the Fundament, as also Inflammations of the Eyes. Note, That it will be so much the stronger, if Powder of Pomgranate Peels, and of Red Roses, be added, with a little Honey.

XVIII. *The Cataplasm made with Sea Water.* Made by boiling the Flower in Sea Water, and afterwards adding a little Vinegar to it when it is used: it is good against Wheals, Pustles, watery or running Sores, Tetters, Ring-worms, Kibes, Anthones-Fire, Womens Breasts swelled hard with curdled Milk, the Gout, &c.

CHAP. CCCCXXVIII.

of LENTIL Sea.

THE Names. It has no Greek Name, because, I suppose, unknown to the Greeks: but it is called in Latine, *Lenticula Marina*, *Uva Marina*: in English, *Sea Lentil*.

II. *The Kinds.* Authors make two Kinds thereof, viz. 1. *Lenticula Marina vulgaris*, *Lenticula Marina Angustifolia*, Common Sea Lentil, or Narrow-leaved Sea Lentil. And this *Lobel* calls *Lenticula Marina Scapionis*; and also do *Tabernaemontanus* and *Lugdunensis*: and this is the *Fucus folliculaceus*

Solliculeaeus Linariae folio Baubini; and the *Acinaria Marina altera Species Imperati*. 2. *Lenticula Marina Serratis foliis*, *Eucus foliaceus Serrato folio Baubini*, *Acinaria Marina tertia Species Imperati*, The Jagged or Saw-leaved Sea Lentil. This Broad-leaved or Saw-leaved Sea Lentil, *Clusius* in his *Sebottia* on the last Chapter of *Acosta*, his Book of Simples, puts it to the Question, whether this with the *demed Leaves* be not that Herb which is called *Sarguazo* or *Sargazo*? but *Baubinus*, in his *Pinax*, determines it as certain.

Common narrow-leaved Sea Lentil.

III. The Descriptions. The first, or Common narrow-leaved Sea Lentil. It has many winding Stalks, on which grow short Branches, set thick with narrow Leaves, like those of *Belvidere* or *Besomflax*, and among these grow many skinny, hollow, empty, round Berries, of the Bigness and Shape of *Lentils*, from whence it takes its Name: they are sometimes of a pale Amber-color, and sometimes that Color is specked with Red.

IV. The second, or Jagged or Saw-leaved Sea Lentil. This Description you shall have from *Acosta*. In that famous and no less to be feared Navigation del *Sergazo*, (for so they that sail into the Indies call that Space of the Ocean from the 18th to the 34th Degree of North Latitude) is seen a deep and spacious Sea, covered with an Herb called *Serguazo*, being a Span long, wrapped with the tender Branches, as it were into Balls, having narrow and tender Leaves, about half an Inch long, or somewhat longer, a little broad, and snipt about the edges, of Color reddish, of Taste insipid, or without any sensible Biting, but what is rather drawn from the Salt Water, than naturally inherent to the Plant. At the setting on of each Leaf grows a Seed, round, like a *Pepper Corn*, of a whitish Color, and sometimes of White and Red mixt: it is very tender when it is first drawn forth of the Water, yet hard when it is dried; but by reason of its Thinness,

very fragil and full of salt Water. There is no Root to be observed in this Plant, but only the Marks of the Breakings off appear. And it is likely it grows in the deep and sandy Bottom of the Sea, and there may have small Roots. Yet some are of Opinion, That this Herb is plucked up and carried away by the rapid Course of the Waters which fall out of many Islands into the Ocean. Now, the Master of the Ship in which I was, did stiffly maintain this Opinion: and in sailing here, we were becalmed; but as far as ever we could see, we saw the Sea wholly covered with this Plant. And sending down some young Sailors, to drive the Weeds from the Ship, and clear the Water, we plainly saw round heaps thereof to rise up from the bottom of the Sea, where, by foundling, we could find no bottom.

Jagged or Saw-leaved Sea Lentil.

V. The Places and Times. The first is found in many places of the *Mediterranean* and *Adriatick Seas*, as also in other Southern Seas. The second is found in many places of the *Athlantic Ocean* toward the South, in the Latitude and place aforementioned, as also in several other parts of that Sea. They are to be found, by Report of Sailors, all the Year long, their Growth and Cause of Appearance being the same.

The Virtues.

VI. They are as yet unknown: but *Acosta* says, That if this Plant is pickled with Salt and Vinegar, it will have the same Taste as *Sampire* has, and may be used instead thereof; and is also eaten by such as sail instead of *Copers*. *Acosta* cautions it to be given, when it was fresh taken forth of the Sea, to Goats which they carried in the Ship, and they fed upon it greedily: He confesses himself ignorant of its Qualities: but one of the Sailors, troubled with a Difficulty of making Water, by reason of Grave!

Gravel or Sand and grofs Humors, eat thereof by chance, both raw and boiled, only for that the Tuffe thereof pleased him: after a few Days he told me, that he found great Good by the eating thereof, and he took some of it with him, that fo he might use it when he came ashore.

some of five round pointed Leaves, with a small greenish Head in the middle, which when the Flower is fallen, grows to be a small Head, confisting of many small Seeds fet together, like unto the Heads of several sorts of *Ranunculi* or *Crowfeet*.

C H A P. CCCCXXIX.

Of LEOPARDS--BANE,

O R,

Round-leaved WOLFS--BANE.

THE Names. It is called in Greek, *Ἀκόνιτον*, by *Dioscorides*, because the Herb used to kill Leopards, Wolves, and other like Creatures very speedily. It is also called, *Θόρα*, i.e. *Corruptio*, *Venenum*, *Mors*; and *Θυλακίον*, (quod *radix genitibus fœminæ sexus animalium, eodem die inferat mortem*) as *Theophrastus*, lib. 9. cap. 9. has named and described it: in Latine it is called, *Thora*, and *Aconitum Pardalianches*, also *Thelyphoton* *Theophrasti*. *Gesner* and others take it to be the *Limeum* *Plinij* in lib. 17. cap. 10. which he says is an Herb so called by the *Gauls*, wherewith they do make a Medicine, to dip their Arrow-heads in when they Hunt Wild Beasts, and which they also call *Cervaria*. *Gesner* says, that some called it *Lunaria*, because the Leaves were round, like to a full Moon; but he himself called it *Thora Venenata*, and *Toxicum Valdensium*. *Label* calls it *Phthorâ* *Valdensium*; and *Chusius* makes it to be *Ranunculus grumosa radice tertius*: in English, *Leopards-bane*, or *Round-leaved Wolfs-bane*.

II. The Kinds. Authors make two or three Kinds hereof, viz. 1. *Aconitum Pardalianches*, seu *Thora minor*, The lesser Leopards-bane. 2. *Aconitum Pardalianches*, seu *Thora major*, The greater Leopards-bane. 3. *Aconitum Pardalianches commutatum* *Matthioli*, *Matthiolus* his fained Leopards-bane.

III. The Descriptions. The first, or Small Leopards-bane, has a Root which is composed of seven, eight or ten small, long, round, very white, shining Roots, somewhat uneven, as it were branched out like Knots or Joints in several places, plainly to be discerned in some, but in others not, being plain and smooth, ending in a small long Fibre, and all of them fastned at the Head thereof, like unto *Asphodil* Roots, of the most peyssonous Quality, which has been found in any other Vegetable. It is a small low Herb, rising up with a small, slender, round Stalk, little more than half a Foot high, bearing about the middle thereof but one small stiff or hard Leaf, for the most part; but sometimes two or three, one above another, and sometimes two together, which are round, and something like the Leaf of *Asarum*, but lesser, smooth, and of a blewish green Color, and full of Veins, something unevenly dented about the edges, not compassing the Stalk, but standing a little from it, upon short Foot-stalks. The top of the Stalk is oftentimes divided into two or three Branches, with a small narrow Leaf at the Joint, and one smooth pale yellow Flower at the top thereof, somewhat like to those of *Cinkfoil* or *Five-leaved Grass*, consisting in many of four, and in

Small Leopards-bane.

IV. The second, or Greater Leopards-bane. Its Root is much like the former; and it is in all things like unto the Lesser before described, but that it is greater, and rises up higher, having larger Leaves, and finely dented about the edges, and two or three standing together about the middle of the Stalk, some smaller than others, and sometimes one above another, and some small long and narrow ones at the Joints, branched forth into two or three parts or more, bearing every one of them its small yellow Flower, like to the former, with like Seed contained therein. These two sorts differ chiefly in the Magnitude of the Plants, and that this latter bears more Leaves than the former; which *Parkinson* thinks may rather be attributed to the Fertility or Sterility of the Soil wherein they grow, than to any differing Species, they being so very like one another.

V. The third, or Matthioli's fained Leopards-bane. It has a Root which consists of many Knots and Joints, like unto a Scorpion's Tail, in the same manner as *Matthiolus* has set forth in his Figure. It rises up early in the Year, if the Spring be mild, with its Stalk, before any of the lower Leaves appear, as the *Coltsfoot* and *Butter-bur* do, having four small, round, hairy Leaves upon the Stalk, set by couples at distances. The Flowers are many, growing in a Tuft or round Head together at the top thereof, of a pale yellow Color, with many yellowish Threads in the middle. When the Flowers are past, then come up the Leaves, which are four for the most part, and are almost round, hairy, and green on the upper side, and of a hoary White underneath, full of Veins running thro' them, and full of small Spots.

VI. Note;

Matthiolus his fained Leopards-bane.

VI. *Nota.* Matthiolus indeed, desirous to exprefs this laft described Plant with fome near Refemblance to *Dioscorides* his Description of *Aconitum Pardalanches*, has fet it forth with four round rough Leaves, and one long crooked Root, bunched out in divers places, like unto the Tail of a Scorpion, which Figure bred a great Contentment between *Gefner* and him; *Gefner* laying to his Charge, that he had but fained it, and that there was no fuch Herb in *verum natura*, becaufe it was made fo artificially, and wanted Fibres, which almoft all other Roots have, by which they draw Nourifhment out of the Earth. Matthiolus, in his Defence, alledges, That *Dentaria*, which we call *Lung-root*, has no Fibres, being a Root confifting only of Scales, as it were fet together; and that the other Root, called *Dentaria Bulbifera*, which the Germans call *Sanicula alba*, is without Fibres alfo: but *Dalechampius*, whom moft Authors call *Lugdunensis*, in his great Herbal Printed at *Lyons*, defends Matthiolus his Sincerity, and gives, the fame Figure, with a Stalk of Leaves and Flowers added to it, and withal the former Defcription. This he faith he faw with his own Eyes; and that an Apothecary of *Trevers* had divers Plants thereof growing in his own Garden, and abiding many Years, from whom he obtained the whole Plant to fet forth, to end the Controversy between two fuch worthy Men. And yet fome other Authors, as alfo *Baubin* and *Fabius Columna*, in his *Minus Cognitarium Stirpium*, pag. 44. do much fufpect, even this of *Dalechampius* or *Lugdunensis* to be counterfeit alfo. Others will have it to be the *Doronicum brachiata radice*, which has round Leaves, and fuch a like Root: but the Matter is yet in Controversy. The Figure is from *Dalechampius*.

VII. *The Places.* Thefe poyfonous Plants do grow on the Alps and the Mountains of *Savoy* and *Switzerland*. The fecond grows plentifully in the Country of the *Valdens*, who inhabit part of thofe Mountains towards *Italy*, called *Underflamen* and *Engronia*, from whence came the Surname *Valdensis*. The firft on *Mount Baldus*, a Mountain of *Italy*, as

alfo in shadowy places, on the Snowy Hills in *Savoy*, near unto *Aura*, and on the top of *Jura*, where there is fcarcely any Cruff of Earth for the Roots to grow in: both which are now nufed up in our *Engliſh* Gardens. The third *Dalechampius* fays grows on the Alps of *Savoy*, nor far from the chief Monaftery of the *Carthusians*, in a rough rocky place, which they call *Les Eſcheles*, i. e. the Ladder, becaufe the way of the Rock is cut out into Steps, to get up unto the top thereof.

VIII. *The Times.* The firft and fecond, *Gerard* fays, flower in *March* and *April*, and that their Seed is ripe in *June*: but *Parkinfon* fays they flower in *June* and *July*, which are the Spring Months of the Alps, and that their Seed is ripe in *Auguſt*.

IX. *The Qualities.* Leopards-bane is hot and dry in the Ultimate of the fourth Degree. It is reported by all Authors to be a deadly Poyſon, and that the Natives of the place where it grows, do very much uſe it to Poyſon their Arrow-heads, the more Speedily and fatally to deſtroy Wild Beaſts, which greatly infeſt thoſe Mountains of the Alps: for which Purpoſe it is alfo brought into their *Mart-Towns* near thoſe places, to be fold unto the Hunters; the Juice of which is prepared by preſſing forth, and ſo kept in Horns for ready Uſe, being the moſt vehement Poyſon of all Vegetables: for an Arrow-head touched therewith, leaves the Wound incurable, (if it but ſo pierces the Skin as to fetch Blood) unleſs that round about the Wound the Fleſh be ſpeedily cut away in good Quantity. This Plant may therefore be well accounted the firſt and chief of all the *Aconites* or *Wolf-banes*, by reaſon of its deleterious and poyſonous Qualities aforeſaid: and without doubt there is no worſe, nor any more ſpeedy Vegetable Venom in the World, nor any other *Aconite* or *Toxicum* comparable hereunto. It is reported, that if any Beaſt or Man be wounded with an Arrow, Dart, or other Inſtrument poyſoned with the Juice hereof, that remedyleſs they will die in half an Hour after. *Gefner* in *Libro de Lunariis* fays, that if Man or Beaſt be wounded with Sword, Dart, or Arrow, touched with the Juice hereof, that the Malignity ſo ſoon pierces inwardly, that it preſently kills, by congealing all the Blood, unleſs the Fleſh round about be inſtantly cut away, as aforeſaid: and yet (which is admirable) he ſays, that the Fleſh of that Beaſt ſo killed, is not dangerous or hurtful to any who ſhall eat thereof. *Pliny* ſaith, that being given to Fiſh in a Bait, it kills them preſently, which ſhews, ſays he, that this Poyſon is an Enemy to the Blood. It is ſaid to be ſo pernicious, that if it is but held in the Hand for ſome little time, that it will almoſt take away the Senſes: and alſo that one ſmelling thereto, after he had gathered it, fell down as Dead, and with ſome Difficulty was recovered again.

The Virtues.

X. *Dioscorides* ſays, That being mixed with other Medicines for the Eyes, it gives Eaſe in their Pains. And *Theophrastus*, and *Pliny* after him, ſay, that it is a Remedy againſt the Scorpion, being taken in warmed Wine: but that it deſtroys Nature, if it finds not an Enemy in Nature to conteſt withal, and deſtroy: but if it finds ſuch an Enemy, that then it ſpends its Strength and Force upon that, to overcome it, and ſo ſaves Nature from the Danger. Thus *Pliny*. All the other Preparations and Virtues of Leopards-bane are the ſame with *Helmet-flower* or *Monks-hood*, and the Cure of the Poyſon of this, the ſame with that; of which we have at large treated in *Chap. 353.* aforegoing in this Book: ſo that we need ſpeak no more thereof in this place.

But however, after all that we have said of the Virtues of these deleterious or poysonous Plants, it is in my Opinion, much better to let them wholly alone, than to run any Hazard in making use of them, by reason of their dangerous Qualities; besides, many times the Folly and Ignorance of such as may adventure the making of such dubious Tryals; forasmuch as there are other Herbs and Plants enough, proper for all such Purposes and Intents, and possibly more effectual for the Cure of the same Diseases, which are free from any ill Effects, of what kind soever; and by reason of their innocent Properties, may be safely adventured upon by such as but very indifferently understand Physick.

C H A P. CCCCXXX.

Of LETTICE Garden.

I. **THE Names.** It is called of the *Arabians*, *Chas*, and *Cherbas*: in *Greek*, *Θεισέ*, *Thridax*; *Εννίον* *Pythagoriorum*: in *Latine*, *Lactuca*, *Lactis copia*; and in *English*, *Lettice*.

II. **The Kinds.** There are two principal Kinds, viz. 1. *Θεισέ ὁρτανή*, *Lactuca hortensis*, vel *Sativa*, Garden Lettice. 2. *Θεισέ ἀγρία*, *Lactuca sylvestris*, Wild Lettice, of which in the Chapter following.

Common Lettice, which does not Cabbage.

III. **The Garden Kinds.** Authors make many Kinds of this Lettice; but we shall content our selves with the chief of them, which are the following, viz. 1. *Lactuca communis*, Our common Lettice, which does not Cabbage or Head. 2. *Lactuca Capitata*, *Lactuca sessilis*, called by *Pliny*, *Lactuca Laconica*, Cabbage Lettice. 3. *Lactuca Crispa* *Plinij*, *Lactuca Cesticiana Columelle*, 'Curled or

Crumpled Lettice. 4. *Lactuca Romana Petri Crescentij*, Roman Lettice. 5. *Lactuca Belgica*, Flanders Lettice. 6. *Lactuca Cypria Columella*, Red Lettice. 7. *Lactuca Hyemalis*, Our Winter Lettice. 8. *Lactuca Virginiana*, Virginia Lettice. 9. *Lactuca Sabaudica*, Savoy's, or Savoy Lettice. 10. *Lactuca Venetia*, Venice Lettice.

IV. **The Description.** The first, or Common Lettice, which does not Cabbage. It has a Root which is somewhat long and white, with white Fibres adjoining, which perishes immediately after Seed-time. It rises up with several Leaves, full of a milky Juice, of a light green Color, smooth, and little or nothing dented on the edges, broad, and somewhat long withal, and ending in a sharp Point, almost round in some of them. From among the middle of these Leaves comes forth a round Stalk, (in some greater, in others lesser, according to the Kind, and also the Goodness of the Ground) full of Leaves, like unto the lower, but much less, narrower also, and sharper pointed. This Stalk towards the top, branches it self forth into several parts, on which grow several small Star-like Flowers, of a pale yellowish Color; after which comes Seed, either whitish or blackish, according as the Plant yields; at which hangs some small matter of a Cottony Down, with which the whole Head is stored, and which is carried away with the Wind, if not gathered in time.

Cabbage Lettice.

V. **The second, or Cabbage Lettice.** This has a Root like the former, and springs up in like manner, with plain smooth Leaves, which after a time closes it self, and becomes a kind of Cabbage Head, and hard; after which, from the middle thereof, springs up a Stalk, which for Substance, Branching out, Flowering and Seeding, is like the former, but bears black Seed.

K k k k

Cabbage

Cabbage Lettice.

VI. *The third, or Curled or Crisped Lettice.* It has a Root like the former, and it has great and large Leaves, deeply cut or gasht on both sides, not plain or smooth, as the former, but intricately curled, and cut into many parts. The Flowers are small, of a bleak Color, the which do turn into Down, which is carried away with the Wind. The Seed is like the former, save that it sometimes becomes black. There is a lesser sort of this Curled Kind, which has many Leaves, hackt and torn in pieces, very confusedly, and withal curled in such an admirable sort, that every great Leaf seems to be made of many small Leaves, set upon one middle Rib, resembling a Fan of curled Feathers, which Gentlewomen have sometimes used. The Roots, Flowers and Seeds agree with the former.

VII. *The fourth, or Roman Lettice.* It is three-fold, 1. *The green Roman, which is of a dark green Color, growing as low as most Kinds: it is an excellent sort of Lettice, and bears black Seed.* 2. *The white Roman Lettice.* It has long Leaves, like to a Teasell, and is in Goodness next unto the Red, but must be whited, that it may eat kindly: the Seed hereof is white. 3. *The Red Roman Lettice.* This is the best and the greatest of all the rest. John Tradescant was the first which brought it into England, and sowed it; and he said, that after one of them had been bound and whited, after the Refuse was cut away, the rest weighed seventeen Ounces. This has black Seed.

VIII. *The fifth, or Flanders Lettice.* This is a sort of Curled Lettice, which does Cabbage, and is called Flanders Croppers. This grows lowest, and has the lowest Head, but it is very hard and round, and white whilst it grows; and bears black Seed.

IX. *The sixth, or Red Lettice.* It is a large Lettice, with larger Leaves, of a red or reddish Color, and an excellent sort of Salletting: it grows up with a smooth Stalk, and has Branches, Flowers, Seed, and Down, like other Lettices.

X. *The seventh, or Our Winter Lettice.* It is a very hardy Plant, and able to endure our Cold; but it is single, and must be sown at Michaelmas, but will be very good before any other of the more excellent sorts, sown in the Spring, will be ready to be used. It bears white Seed.

XI. *The eighth, or Virginian Lettice.* It is of the Single Kind, and has very broad reddish Leaves, which by good Husbandry and Transplanting, may be very much improved, and be made an excellent Lettice. It bears black Seed.

Lettice Savoy Winter.

Lettice Savoy Sommer.

XII. *The ninth, or Savoy's, or Savoy Lettice.* It has very large Leaves, which spread themselves upon

upon the Ground; at the first coming up, broad, cut or gasht about the edges, crisping or curling lightly this or that way, like in some measure to the Leaves of *Garden Endive*, with Stalks, Flowers and Seeds; like the former, as well in form as yielding that milky Juice, with which they do all abound. Of these *Lettices* some are open, with very curled Leaves, of a green Color; and some of a yellow or yellowish green Color. Others are Headed or Cabbaged, and sometimes grow so large, even to resemble a small *Cabbage*, of a yellow or yellowish green Color. This *Lettice* is seldom eaten raw, but is for the most part boiled like a *Cabbage*, and makes indeed the best boiled Sallet.

XIII. *The tenth, or Venice Lettice.* It is an excellent *Cabbage Lettice*, and is best to be sown at the latter end of June, or beginning of July; it grows sometimes to be as large as the Crown of a Man's Hat: it rises to a moderate Height, and the Seed is white. There is another sort which does a little *Cabbage*, and the Seed is white: and another sort which does not *Cabbage*, but is loose; this has many great Leaves spread upon the Ground, like unto those of *Garden Endive*, but lesser; it rises up to be about three Feet high; its Flowers are yellowish, which turning into Down, fly away with the Wind, and its Seed is white as Snow. These two last some call *Lambard Lettices*.

XIV. *How to gather the Seed, that it may be good.* Mark out those Plants which you intend shall run up for Seed, which let be the best and most flourishing; and after they have begun to shoot forth Stalks, strip away the lower Leaves for two or three Hands breadth above the Ground; for thereby, in taking away the lowest Leaves, the Stalk shall not rot, nor the Seed be hindered from ripening.

XV. *The Way and Manner of Whitening Lettice, to make it eat the more tender.* It is done two ways. The one is by raising up Earth like *Mole-Hills* round about the Plants, while they are growing, which will make them grow white. The other is, by tying up all the loose Leaves round about together while it grows; for so the close-growing thereof will make it white, and be thereby the more tender and pleasant.

XVI. *The Places.* The several Names tell you whence they came to us; but here are now nurled up in many of our Gardens. *Palladius* says, that *Lettice* delights to grow in manured, fat, moist and dunged Ground, and in places where there is plenty of Water: and *Columnella* says it prospers best, if it is sown very thin.

XVII. *The Times.* *Palladius* says, that it is certain that *Lettice* may be sown at any time of the Year, but especially at Spring time, and afterwards till Summer is nigh spent; and after that again as soon as Winter is done: however, it ought to be sown in fair Weather.

XVIII. *The Qualities.* *Lettice* is cold and moist in the second Degree: Anodyne, Digestive, Emollient, Relaxive, and Galectogenetic.

XIX. *The Specification.* It allays Inflammations, gives Ease in the Strangury, induces Sleep, and represses Bodily Lust.

XX. *The Preparations.* You may have therefrom, 1. A Juice. 2. An Essence. 3. An Oil or Ointment. 4. A Cataplasma. 5. A distilled Water. 6. A Sallet. 7. The Seed.

The Virtues.

XXI. *The liquid Juice.* Inwardly taken from one Spoonful to two or more, (according to Age and other Accidents) it breeds Milk in Nurfes,

quenches Thirst, cools the inward Heat of Fevers, abates Inflammations of the Lungs, cools the Heat of Urine, and represses Bodily Lust. Mixed with a little *Camphir* dissolved in Oil of *Ben*, and a little Vinegar being also added, and applied by anointing or bathing to the Cods, it eases Pain, and abates an Inflammation in those Parts, abates Lust and represses Venereal Dreams, which cause Nocturnal Poillutions.

XXII. *The Essence.* It has all the Virtues of the Juice, and is rather to be chosen to be administered to cold Constitutions: it also induces Sleep and Rest, being taken at Bed-time in any convenient Vehicle. The Essence, as also the former Mixture of the liquid Juice, being anointed or bathed upon the Reins, cools any burning Heat there, and eases the Pain of the Back.

XXIII. *The Oil or Ointment.* It is made either of the Juice or green Herb, by boiling them in Oil of *Olive*, *Hogs Lard*, or *Mutton Suet*, mixed with Oil. Anointed on the Forehead and Temples, it eases the Head-ach proceeding from an hot Cause, and procures Sleep and Rest. Anointed also on other Parts which are Inflamed, or are full of Pain, it cools the Part and gives Ease.

XXIV. *The Cataplasma.* Applied to the Gout, it eases the Pain; and mixt with *Camphir*, and applied to the Region of the Heart, Liver, or Reins, it represses their Heat and Inflammation, comforts and strengthens those Parts, and allays the Heat of Urine. Applied to the Head in a vehement Head-ach, it eases the Pain, and gives great Relief, causing the Patient to rest and sleep.

XXV. *The distilled Water.* It allays great Inflammations, encreases Milk in Nurfes, quenches Thirst, abates the burning Heat of Fevers, represses Lust, takes away Nocturnal Poillutions, and has all the other Virtues of the Juice and Essence, but must be taken in a much larger quantity, as from two Ounces to four or six, a little dulcified with double-refined Sugar.

XXVI. *The Sallet.* The best is that which is made of the *Cabbage Lettice*, and is generally eaten raw, with Vinegar, Salt, Onions, or Pepper, and good Oil. *Galen* advises Old Men to use it with Spices; and where Spices are wanting, to add *Mint*, *Rocket*, *Cresses*, *Tarragon*, and such like hot Herbs, as Correctives thereof. It is very grateful to the Stomach, comforts and strengthens it, and causes a good Appetite. Some make a Sallet of *Lettices* by boiling them: so eaten, they are agreeable enough, are cooling and grateful to the Stomach, help Digestion, cleanse the Stomach, and loosen the Belly; and this *Galen* says he found by Experience: for by moistening the Belly, it becomes the more slippery. This boiled Sallet is said to be sooner digested, and to nourish more. It eases all the griping Pains of the Stomach or Belly which come from Cholera.

XXVII. *The Seed.* It is said to have all the Virtues of the Herb, being given in Powder from a Dram to a Dram and half, in any proper Vehicle, Morning and Night.

C H A P. CCCCXXXI.

OF LETTICE Wild.

I. **T**HE Names. It is called in Greek, *Θάλακη*, *Thradacine*, and *Θειάκη* by *Dioscorides*: in Latine, *Lactuca agrestis*, *Lactuca Sylvestris*; *Eunuchus*.

K k k 2

nuchion Plini, lib. 19. cap. 8. and it is called, *Lactuca*, à *lacte succo* : in *Engliff*, *Wild Lettice*.

II. *The Kinds*. It is the second generic Species of *Lettice*, and has the three following Varieties, viz. 1. *Lactuca fylvestris*, *Endivia foliis odore virofo*; *Lactuca fylvestris major odore Opii Gerardi*; *Endivia major Tragi*, which he also calls, *Lactuca fylvestris altera*; *Lactuca fylvestris scariola borten-sis folio*, *Lactuca flore Opii odore vehementi Soporifero & Viroso*; *Lugdunensis* sets it down for *Lactuca fylvestris vera Dalechampi*, and in the 14th Chapter of the same Book calls it *Theſion Dalechampi*, of which *Pliny*, out of *Theophrastus*, makes mention. *Lactuca fylvestris Anglica odore Opii*, Broad-leaved Wild Lettice. 2. *Lactuca fylvestris laciniata*, *Lactuca fylvestris Matthioli*, *Fuchsij*, *Dodonei*, *Cesalpini*, *Thalii* & *aliorum*, *Endivia Vulgaris Tragi* (because that generally in all the German Apothecaries-Shops it was so accounted and used) *Seris domestica lactucina Dioscoridis*; *Scariola Ericij Cordi*, Jagged-leaved Wild Lettice. 3. *Lactuca fylvestris flore purpureo Gesneri in hortis*; also *Sonchus oleraceus puniceo flore*, *Eryngium Thalii*; *Sonchus Montanus purpureus*, *maximiliani Columne*; *Sonchus ictius Tabernamontani*, *Lactuca Montana purpureo caerulea major Baulini*, (his minor being the *Lansjana Austriaca* of *Parkinson*) Wild Lettice with purple Flowers.

Wild Lettice broad leaved

The Descriptions.

III. *The first, or Broad-leaved Wild Lettice*. It has a Root which is white, long, and woody, when it bears Seed, and perishes presently after. It rises up with four or five somewhat long and large Leaves, smaller at the bottom, and broader at the ends, being round-pointed, unevenly dented about the edges, but not cut in or torn at all, of a pale or whitish green Color, and very like unto the *Garden Lettice*, or *Garden Endive* Leaves, so that it will soon deceive one that never saw it before, which do to abide the first Winter after the Sowing, whether in the Spring or Autumn, of the shed Seed: but in May following it begins to rise up to a Stalk, and then those lower Leaves will have the middle Rib on the backside grown full of small sharp Prickles. The Stalk has risen to be sometimes seven or eight Feet high at least, and as big as the Thumb of any Man's Hand at the lower Joint, something brown, and spreading it self into several very long Branches, on which grow large Leaves, like the others, but more crumpled, the lower, and so to the middle of

the Stalk, set with Prickles in the manner of the bottom Leaves, but lesser and higher, and something jagged or divided on the edges, all and every part yielding plenty of a Milk Juice and Clammy, being broken, which smells strong, and very like unto *Opium*, being of a bitter Taste. The Flowers are very small and single, something like unto *Lettice*, but smaller, and of a paler yellow, scarcely opening themselves, and hardly abiding half a Day open, but turn into Down, with small black Seed, very like unto *Black Lettice* Seed, and is carried away with the Wind.

Lettice Wild jag'd Leaved:

IV. *The second, or Jagged-leaved Wild Lettice*. It has a Root which abides after the Seeding-time, when as the other does not. This Wild Lettice grows like the last, but not so high or great: the first Leaves are of a greyer green Color, smaller and narrower than the other, which so abide, and afterwards has Prickles growing on its backside, as the other has. Those which follow, are much more jagged than the others, and set with sharp Prickles also, and being broken, yields Milk as plentifully as the former, and as bitter as it; and smells also as strongly of *Poppy* or *Opium*. The Flowers and Seed are like it too, and fly likewise away with the Wind.

V. *The third, or Wild Lettice with purple Flowers*. It has a Root which is thick set with Nodes in several places, not growing downwards, but spreading forwards, and having long Fibres shooting from it, which perish not. It is a great Plant, and rises up sometimes (in moist Ground) to be six, seven or eight Feet high, but usually three, four or five Feet, with a strong great Stalk, set on each side with Leaves, smallest at the bottom, and larger as they rise up higher, being largest about the middle of the Stalk, and then grow smaller again up to the top; all of them unevenly waved about the edges, and encompassing the Stalk at the bottom; of a dark, bluish green Color, on the upper side, and greyish underneath, yielding a Milky Juice when it

is broken. The Flowers stand upon small long Stalks, coming forth from the Joints, with the Leaves from the middle upwards, with many Flowers on them; consisting of four dark purple-colored Leaves, with divers Threads in the middle, tipped with a yellow Dust, and a three-forked Stile in the midst, which stands in long purplish green Husks, hanging down their Heads, and turn into Down, with smooth greyish Seed among it, which flies away with the Wind.

VI. *The Places.* The two first grow in several places of *England*, as well as beyond Sea: the first in the Borders of Fields, and by Hedges and Lane sides in *Buckinghamshire* and *Cambridgeshire*. The second on the Bank-side by the Foot-way going from *Grays-Inn-Lane* to *Bradford-Bridge* or *Pancridge-Church*, and in many other places. The third is found upon Mountains and Hills in divers parts of *Germany*, as *Gesner*, *Thalius*, and others say; also about *Naples*, as *Columna*: I have also been told by an *English* Gentleman, and a good Herbarist, who has been a great Traveller in many parts of *England*, that he had found it growing upon several Mountains and Hills in *Wales*, and in some other parts of the Kingdom.

VII. *The Times.* They come up in the *Spring*, and sometimes sooner; and they all flower about *July* and *August*, and their Seed ripens in the mean Season, and is blown away whilst it is in Flower, and has young Buds of Flowers upon it.

VIII. *The Qualities.* *Wild Lettice* is cold in the end of the second Degree, and moist in the end of the first. It has nearly the same Properties of Cooling which the *Garden Kind* has: but the Bitterness of this makes it the more Aperitive; and yet it is more fomisiferous than the manured sorts, and comes up, as it is thought by some, almost to the Degree of *Opium*: but this Opinion I can never assent to, my Experience having proved the contrary.

IX. *The Specification.* Some Authors are of Opinion also, that it may be used, instead of the *Garden*, for any of the Intentions or Purposes for which that is used. However, it is said to be a peculiar thing against Dropsies, to provoke the Terms, and to resist the Poyson of the Spider, *Phalangium*, *Scorpion*, &c.

X. *The Preparations.* You may make all the same Preparations from this as from the *Manured*: but these are particularly taken notice of, viz. 1. *A liquid Juice.* 2. *A Milky Juice inspissated.* 3. *A Decoction.* 4. *A distilled Water.* 5. *A Powder of the Seed.* 6. *A Cataplasma.*

The Virtues.

XI. *The liquid Juice.* Given inwardly to one Spoonful, more or less, according to Age and other Accidents, in Syrup of *Violets*, *Clove-gillflowers*, Wine, or other proper Vehicle, at Bed-time, it causes Rest and Sleep, eases Internal Pains of the Bowels, opens Obstructions of Liver, Spleen, Reins, Bowels and Womb, provokes the Terms, expels watery Humors out of the Body, prevails against the Dropsy, and resists Poyson, chiefly the Stinging of *Scorpions*, the Biting of the *Phalangium*, of Mad Dogs, and of other Venomous Creatures. Outwardly applied, or bathed upon any place pained, over-trained or inflamed, it eases the Pain, abates the Inflammation, and strengthens the Part grieved.

XII. *The Milky Juice inspissated.* It may be inspissated either in the Sun or in a Sand Furnace. If it is given from one Dram to two or more, according to the Judgment of the Physician, dissolved in

distilled Vinegar, it is said to evacuate Water in Dropsies, to provoke Womens Courses, and resist Poyson, and has indeed all the Virtues of the liquid Juice aforegoing. This Juice, dissolved in White Port Wine, or White Lisbon, and a little Honey mixt therewith, being dropt into the Eyes, it does wonderfully strengthen the Sight, and clears them from Mists, Clouds, Films or Skins growing over them, and removes any thing which obfuscates the Sight.

XIII. *The Decoction.* It may be made in Wine or Water. It has the Virtues of the liquid and inspissated Juice; but as it is much weaker, so the Dose must be much larger, as from three Ounces to four, five or six; and it is also the easier to be repeated, as Morning and Night at least.

XIV. *The distilled Water of the whole Herb.* It is singular good to quench Thirst in any Burning or Pestilential Fever: and this it will do more effectually, if a few Drops of Oil of Sulphur, or Vitriol, or Spirit of Salt, is dropt into it, and very well mixt therewith. This Water may be given from four Ounces to eight Ounces: if you please, you may sweeten it with a little double-refined Sugar.

XV. *The Powder of the Seed.* It has the Virtues of the Juice and Decoction, but it cools not so powerfully. It is very grateful to a hot Stomach, troubled with Heart-burnings and Vapors ascending from the Womb. If it is given at Night from half a Dram to a Dram in the distilled Water, or in any other Vehicle, it causes Rest, and induces Sleep, and therefore is profitable for such as are subject to much Watching.

XVI. *The Cataplasma.* It is made of the green Herb beaten in a Mortar, and brought to a Consistence either with Barly-flower, or Crumbs of Barly or Wheaten Bread. Applied to Inflammations in their beginning, it abates their Heat, and diffuses them. Applied immediately upon a simple Contusion, where the Skin is not broken, it hinders the Aggregation of Humors, abates the Swelling, and cures it: being applied to the Head in a Megrim, or other Head-ach, it presently gives Ease of the Pain, more especially if it proceeds from a hot Cause. Applied to Parts pained with the Gout, whether Hands, Arms, Knees or Feet, it presently gives Ease to the Pain, and diffuses the Tumor; and being continued for some time, does cure it, provided Universals and other proper Internals be used in the mean time. Applied to the Forehead and Temples in a Frenzy, it abates the Symptoms, and restores in a great measure the Patient to his Senses again.

C H A P. CCCCXXXII.

of LIGUSTICK,

OR,

Bastard LOVAGE.

I. *THE Names.* It is called in *Greek* by *Dioscorides*, *Αρυσικόν*; by *Galen*, *Λιγυστικόν*; taking its Name from *Liguria*, the Country where the best of it, and the most store of it grew, and there they call it, *Sier Montano*: in *Latine*, it is called, *Ligusticum*, and *Libusticum*, as *Matthiols*, *Lugdunensis*, *Castor Duraster*, and others have it; *Siler Montanum*, as *Tragus*, *Loëli*, *Dodonæus* and *Clusius*.

Chelidius have it : formerly in Shops, *Seselias*, but fallily ; for the true *Seseli* or *Hartwort* is another Plant, as we have declared Chap. 343. foregoing, for it is like none of the *Seselias* : *Ser Montanum*, and *Ser Peloponense*, as *Cesalpinus* has it : *Pliny* says, that *Crataevus* called it *Cunila bubalis* ; and some called it *Panaces* : we in *English* call it *Ligustick*, *Libustick*, *Siler Mountain*, and *Bastard Lovage*.

II. *The Kind.* There are two sorts of this Plant, viz. 1. *Ligusticum verum* ; *Ligusticum latifolium* ; *Ligusticum commune* ; *Siler montanum vulgo Sifchios*, *Ligusticum liguricense* ; The true *Ligustick*, or *Bastard Lovage*. 2. *Ligusticum Austriacum* ; *Siler Montanum Austriacum*, *Siler Montanum Angustifolium* ; *Ligustick*, or *Bastard Lovage* of *Austria*.

Ligustick True or Common.

The Descriptions.

III. *The first*, or True *Ligustick*, or *Bastard Lovage*. It has a Root which is long, great, and whitish on the outside, of a hot sharp Smell and Taste, and abiding long in the Earth. This True *Ligustick* of *Liguria* rises up with a round jointed Stalk, two or three Feet high, bearing both at the bottom and at the Joints, large, spread, winged Leaves, divided into many small Leaves, whose small Footstalks bear usually two Leaves, and sometimes four, set one against another, and three always at the end, each being much broader and shorter than *Sero Fennel* Leaves, almost equal to those of *Melilot*, for which Reason it is called also *Latifolium*, or Broad-leaved, respect being had to the Breadth of the Leaves of the next following. These Leaves, if they be a little rubbed, have a sweet Smell. The Stalk spreads at top into a few Branches, bearing very large Umbels of white Flowers, and after them, long, thick, full, brownish, yellow Seed, larger by half than *Cumin* Seed, two always joined together ; striped on both sides, and winged with

yellow shining Wings at the edges, and of a quick, sharp, hot Smell and Taste.

IV. *The second*, or *Austrian Ligustick*, or *Bastard Lovage*. This differs not much from the former, but that it is much lesser, and comes not up to half the Height thereof, being not above a Foot and half high ; whose Stalk is also divided towards the top into Branches, which bear small Umbels of white Flowers. It bears winged Leaves, (being but few) which are composed of many other Stalks of Leaves, growing not much unlike to the other, or like *Sero Fennel*, two Leaves, and sometimes four or more, set one against another, and three generally at the end. These Leaves are much shorter than those of the former, and also narrower, for which Reason it is called by some Authors *Angustifolium*, or Narrow-leaved, respect being had to the Breadth of the Leaves of that just foregoing. These Leaves, as they grow nearer the top, are yet more finely cut, being narrower and lesser.

Ligustick Austrian.

V. *The Places.* The first is found growing Wild upon the *Appenine* Mountains or Hills in *Liguria*, within the Dominions of *Genova*. The second grows upon the Hills in *Austria* ; but with us they both grow in Gardens, but do not often bear ripe Seed, unless the Season be very kindly and warm.

VI. *The Times.* They flower from *June* to the end of *August* ; and the Seed is found to ripen in the mean Season.

VII. *The Qualities.* The Herb, Root and Seed are hot and dry in the third Degree. It is Aperitive, Afrstringent, Absterfive, Carminative, Digestive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hyterick, Emmenagogick, Sudorifick and Alexipharmick.

VIII. *The Specification.* It expels Wind, eases the Colick, provokes Urine and the Terms, is good against Poyson and the Bittings of Venomous Beasts.

IX. *The Preparations.* You may prepare therefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion.

Infusion or Decoction. 4. *A Powder of Leaves or Seed.* 5. *An insolated Oil.* 6. *A distilled Water.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.* 11. *An Oil distilled.* 12. *An Elixir.* 13. *A Cataplasm.*

The Virtues.

X. *The liquid Juice.* Taken in any proper Vehicle, it gives Ease in the Colick, expels Wind, provokes Urine and the Terms, and helps the Suffocation of the Womb. Dose two or three Spoonfuls or more in the distilled Water, or in Wine; or any other fit Vehicle.

XI. *The Essence.* It has all the Virtues of the liquid Juice, but more powerful to all those Intentions: it is of a warming and digesting Quality, gives Ease in the Gripings of the Guts, Pains of the Stomach, and Swellings proceeding from Wind. It prevails against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, and suppresses Vapors and Hysterick Fits in Women-kind. Dose two Spoonfuls or more.

XII. *The Infusion or Decoction of Herb, or Seed, or both.* It has all the Properties, Qualities and Virtues of the Juice and Essence, and may be given from two Ounces to four, Morning, Noon and Night, as occasion may require.

XIII. *The Powder of the Seed.* If it is taken from half a Dram to a Dram and half, (according to Age) in a Glass of *Wormwood-Wine*, Morning and Evening, for some few Days before the expected time, it produces the Terms in Women in great abundance: it precipitates Vapors, and cures Hysterick Fits, causing the Womb to settle in its right place again. So drunk, it provokes Urine powerfully, and eases the Colick and Gripings of the Guts proceeding from Grossness and Crudity of Humors: it strengthens the Stomach, and causes a good Appetite and Digestion: it expels Wind, and dissolves the Swelling of the Stomach.

XIV. *The insolated Oil.* It is made of the bruised Seed, by *Insolation*, or *Cottion*, or *Digestion in a Sand Heat*; one Pound of the bruised Seed being mixed with two Pounds of Oil of *Ben*, or choice Oil of *Olive*. It is Anodyne, and eases Pains and Aches proceeding from a cold Cause. It eases the Gout, and strengthens the Nerves, Tendons, and Parts afflicted.

XV. *The distilled Water.* It may be made either from the whole Plant, being green, or from the Seed, according to the usual manner. It has the same Virtues with the Juice, Essence, Decoction and Seed, but in a much lower Degree of Strength; and therefore is to be given in a much greater quantity: however, it may well serve as a Vehicle for to convey down into the Stomach some of the other Preparations.

XVI. *The Spirituous Tincture of the Seed.* It gives Ease in Colick Pains, strengthens the Stomach and other Bowels, expels Wind, and has all the Virtues of the Juice, Essence, Decoction, and Seed afore expressed, but this warms and strengthens more, and therefore is more profitable for cold Stomachs, and such as have a cold Constitution or Habit of Body. Dose two or three Drams in the Morning fasting, in a Glass of generous Wine.

XVII. *The Acid Tincture of the Seed.* It is good against Vomiting, represses Vapors and Fits of the Mother, provokes the Terms and Urine, facilitates the Birth, and brings away the After-birth. Dose so many Drops in a Glass of Wine as to make it pleasantly sharp.

XVIII. *The Oily Tincture of the Seed.* It eases the Strangury after an admirable manner, provokes

Urine, and opens all Obstructions of the Urinary Parts, has all the Virtues of the Juice, Essence, Powder, Spirituous and Acid Tinctures, brings away the After-birth, and gives Ease in the After-pains, tho' never so vehement. Dose from ten to twenty Drops in any proper Vehicle, Morning and Night, or at any time of Extremity.

XIX. *The Spirit of the Seed or Root.* It is Cordial, good against fainting and swooning Fits, Convulsions, Sickness at Heart, Coldness of the Stomach, want of Appetite, Wind in the Bowels, Colick, Pleurisy, Palsy, Lethargy, and the like cold and moist Distempers of the Head, Brain, Nerves and Bowels. Dose two or three Drams in a Morning fasting, also half an Hour before Dinner, or at time of any Paroxysm, either alone, (being dulcified) or mixt in a Glass of some Stomachick or Cordial Wine.

XX. *The Oil of the Seed by Distillation.* It has all the Virtues of Juice, Essence, Tinctures, Spirit, and is very powerful against the Palsy, so that there is scarcely a better Vegetable Medicament in the World: it is to be taken inwardly from eight Drops to sixteen, Morning, Noon and Night; first drop it into white Sugar, and mix it well with that, and then mix it with a Draught of choice White *Lisbon*, or other Stomachick Wine, and so let the Patient drink it. Outwardly you must also anoint it along the Back-bone, chiefly upon those *Vertebrae*, from whence those Conjugations of Nerves proceed, which replenish the Parts afflicted; if all the Limbs are affected, then it will be necessary to anoint the whole Back-bone, from the very Nape of the Neck, almost to the *Anus*, which is to be done twice a Day, and to be very well rubbed in, for almost a quarter of an Hour at a time; and besides the *Spina dorsa*, the Parts or Limbs afflicted are also to be anointed therewith in like manner. This Oil is very hot, and therefore some tender Constitutions may not be able to bear it, being used alone: in this Case, it will be necessary to mix it with some other Chymical Oil less hot, which may be also penetrating and efficacious to the same Intention, as Oils of *Turpentine*, of *Anise*, of *Fennel*, or *Sassafras*, &c.

XXI. *The Elixir of the Seed.* It is efficacious to all the Purposes afore-mentioned, but is not so strong as the distilled Oil; but in Lethargies, Palsies, Convulsions, Faintings, Swoonings, Sickness at Heart, Colicks, Gripings of the Guts, Pleurisy, Stitches, Hystericks, Hypochondriacks, Strangury Vomiting, Weakness of the Stomach, want of Appetite and Digestion, you may give it Morning and Night, or in time of the Paroxysm, from twenty to fifty Drops, in a Glass of Wine, or other fit Vehicle.

XXII. *The Cataplasm of the Root.* It is excellent against the Bitings of Mad Dogs, Vipers, Rattle-Snakes, and other Venomous Creatures, being beaten raw in a Mortar, and applied warm to the Part hurt: if it is made with equal parts of *Garlick*, it will be so much the more effectual.

C H A P. CCCCXXXIII.

Of the L I L L Y White.

I. **T**HE Names. Of the *Lilly* there are many Species or Kinds: the Names of all which in general, are, in *Arabic*, *Sufen*: in *Greek*, *Καλον*: in *Latine*, *Lilium*; and in *English*, *Lilly*.

II. *The*

II. *The Kinds.* There are several generic Species of Lillies, viz. 1. *Κεῖνον λευκόν*, *Lilium album*, The White Lilly. 2. *Κεῖνον κλασέον, ῥιζοειδὲν*, *Lilium luteum & rubrum*, The Yellow and Red Lilly: of which in Chap. 434. 3. *Κεῖνον βουνὸν*, *Lilium Montanum Martagon*, The Mountain Lilly, or Martagon: of which in Chap. 435. 4. *Κεῖνον Βουλγαρικόν*, *Lilium Turcicum, vel Byzantinum*, The Turkey Lilly: of which in Chap. 436. 5. *Κεῖνον περσικόν*, *Lilium Persicum*, The Persian Lilly: of which in Chap. 437. 6. *Κεῖνον πομπωνικόν*, *Lilium Præcox, vel Pomponicum*, The Pomponian or Early Lilly: of which in Chap. 438. 7. *Κεῖνον Κασιανόν*, *Lilium Imperiale, Corona Imperialis*, The Imperial Lilly, or Crown Imperial: of which in Chap. 439. 8. *Lilium Americanum vel Floridianum*, The American or Floridian Lilly: of which in Chap. 440. 9. *Ψευδοβουβόλη*, *Lilium non bulbosum, Liliastrium, Liliosphodelus*, The Bastard or Day Lilly: of which in Chap. 441. 10. *Κεῖνον ὑποδερὸν λευκόν*, *Lilium aquaticum album*, The White Water Lilly: of which in Chap. 442. 11. *Κεῖνον ὑποδερὸν κλασέον*, *Lilium aquaticum luteum*, The Yellow Water Lilly: of which in Chap. 443. 12. *Κεῖνον τῆς συνδράμεως ἢ τῶν γυναιχικῶν*, *Lilium Convallium*, Lilly of the Vallies: of which in Chap. 444. following.

III. *The Kinds of the White Lilly.* Authors have taken notice of three several sorts of this Plant, viz. 1. *Lilium album vulgare, Rosa Junonis*, The Common White Lilly. 2. *Lilium album flore pleno*, The Double White Lilly. 3. *Lilium album Byzantinum*, The Constantinople White Lilly.

Common White Lilly.

The Descriptions.

IV. *The first, or Common White Lilly.* It has a cloved scaly Root, larger and yellower than any of the Red Lillies. The Stalk is of a blackish green Color, tall, and rises as high as most of the Lillies, having many fair, broad, and long green Leaves thereon, larger and longer beneath, and smaller upon the Stalk upwards: the Flowers are many or

few, according to the Age of the Plant, Fertility of the Soil, and Time of standing where it grows: they stand upon long green Foot stalks, of a fair white Color, with a long Pointel in the middle, and white Chives, tipped with yellow Pendants about it. The Smell is very pleasant and sweet.

V. *The second, or Double White Lilly.* It is in all things like the before described White Lilly, the Flowers only excepted, to which in this are usually five or six on one Stalk, and all of them constantly double, consisting of many small, long, white Leaves, which grow on their Foot stalks, one above another, forming a double Hower: their Leaves are long, green before they open, and afterwards turn white; but unless the Season is very fair, they never open at all. This is esteemed for the Rarity of the double Flowers, more than for any Beauty which is in them.

VI. *The third, or Constantinople White Lilly.* This other White Lilly differs but little from the first of these, either in Root, Leaf or Flower; saving only that this grows with a greater number of Flowers than ever was seen in the Common White Lilly: the Stalk of this Lilly many times turns flat, of the Breadth of an Hand, bearing sometimes near two hundred Flowers upon an Head; but most commonly it bears not above a dozen or twenty Flowers, which are smaller than the ordinary, as the green Leaves also are.

VII. *The Places.* They all grow in Gardens with us: but the third was sent hither first from Constantinople, and they flourish here as well as in the places of their natural Growth.

VIII. *The Times.* They flower in June and July; but shoot forth green Leaves in Autumn, which abide green all the Winter, the Stalk springing up between the lower Leaves in the Spring.

IX. *The Qualities.* 'Tis the Roots of Lillies which are chiefly used; but both Roots and Flowers are hot and moist in the first Degree, Emollient, Suppurative, and Alexipharmick.

X. *The Specification.* It is of great Use to ripen and digest Tumors and break Apoptems, resists the Plague or Pestilence, and prevails against the Dropsy.

XI. *The Preparations.* You may have therefore, 1. A liquid Juice of the Root. 2. Bread made with the Juice. 3. A Cataplasim of the Roots with Honey. 4. A Cataplasim of the Roots with Henbane Leaves. 5. A Cataplasim of the Roots roasted or boiled. 6. A Decolion of the Leaves in Red Wine. 7. A Cataplasim of the Leaves boiled. 8. An Oil of the Flowers by Infolation. 9. A distilled Water of the Flowers.

The Virtues.

XII. *The liquid Juice of the Root.* If it is stamped and strained out with Wine, (for it is of too stinky a Substance of it self) and given to drink for some few Days together, it expels the Poyson and Malignity of the Plague or Pestilence, and causes it to break forth into Blisters on the outward parts of the Skin, as has been found by Experience.

XIII. *The Bread made with the Juice.* Take Barly-Flower, and with Juice of White Lilly-Roots, make it into Paste or Dough, of which make Cakes, and bake them. The Bread ordinarily eaten (as Gerard says) for six Weeks or some Months together with Meat, (abstaining from all other Meat the mean while) does cure the Dropsy; and that it had cured many of that Disease.

XIV. *The Cataplasim of the Roots with Honey.* The Roots being beaten in a Mortar with Honey,

and

and applied to simple green Wounds, or Sinews cut asunder, is said to conglutinate them, or join them together again. It cleanses those Ulcers of the Head called *Achors*, or Scald-head, and the Manginess or Scabbiness of the Beard and Face, called *Mentagra*.

XV. *The Cataplasm of the Roots with Henbane Leaves.* It is made by stamping the Roots with *Henbane Leaves* and *Barley Flower*. Being applied, it cures Tumors and Apoplems of the privy Parts: it brings Hair again upon bald places, and places which have been burned or scalded, being mixt with Bears Oil or Grease, and so applied to the place.

XVI. *The Cataplasm of the Roots roasted, baked, or boiled.* The Roots so prepared, are to be beaten into a Cataplasm with Crums of Rye-Bread, or Hogs-Lard, or Oil of Lilly-Roots. Being applied to any Pestilential Bubo or Sore, it ripens and breaks it: it also ripens and breaks other Tumors or Apoplems in the Groin, or in other Parts, proceeding from the Venereal Disease, or any other Cause.

XVII. *The Decoction of the Leaves.* It is made by boiling them in Red Wine. If old running Sores, or putrid Ulcers, be often washed herewith, it cleanses and dries them, and induces a speedy Cure.

XVIII. *The Cataplasm of the Leaves.* It is made of the former Leaves, boiled in Red Wine, as aforesaid. Applied to rotten putrid Ulcers, or to Ulcers, or Wounds undigested, it causes Digestion, cleanses them from their Filth, and causes them suddenly to heal.

XIX. *The Oil of the Flowers by Infusion or Boiling.* It is made with Oil Olive, or rather Oil of Ben, which will not grow rank, by Infusion in the Sun, or in a boiling *Balneo*, or in a Sand Heat, repeating the Infusion or Digestion two, or three, or more times. It is emollient, and softens the Hardness of the Nerves, and extends Sinews shrunk: it also softens the Hardness of the Womb. You may make an Oil also of the Roots, after the same manner, and for the same Purposes: it is good to bring to Digestion and Suppuration, Tumors and Apoplems, and to soften hard Swellings.

XX. *The distilled Water of the Flowers.* According to *Julius Alexandrinus*, being drank from four Ounces to eight, it causes a speedy and easy Delivery to Women in Labor, and expels the Secundine and After-birth with much Facility, as *Mattbiolus* and *Camerarius* report. It is used also outwardly as a Cosmectick to cleanse the Face and Skin, and make them fresh, white and clear.

C H A P. CCCCXXXIV.

Of L I L L Y Yellow or Red.

THE Names. It is called in Greek, *Κελευ* κλεβη, *κλεβη*: in Latine, *Lilium Auteum*, vel *Rubrum*; and in English, *The Yellow, or Red, or Orange-tawney Lilly*.

II. *The Kinds.* The following Sorts offer themselves to our View. 1. *Lilium Aureum*, The Golden, or Orange-tawney, Yellow or Red Lilly: This is *Lilium Aureum majus Tabernemontani*, *Hemerocallis Matthioli*, *Martagon Chymistarum Lobelij*, and *Porta* thought it to be the *Hyacinthus* and *Cosmosandalos* of the Poets. 2. *Lilium pumilum cruentum*; *Lilium purpureum minus*, The Dwarf Red Lilly. 3. *Lilium rubrum flore multiplici*, The double-flowered Red Lilly: 4. *Lilium majus bul-*

biferum, The greater bulbed Red Lilly. 5. *Lilium minus bulbiferum*, The Dwarf or lesser bulbed Red Lilly. 6. *Lilium cruentum bulbiferum*, *Martagon bulbiferum Chasij*, The Fiery-red bulbed Lilly. 7. *Lilium cruentum flore pleno*, The Fiery-red double Lilly not bulbed.

Orange-tawney, Yellow or Red Lilly.

The Descriptions.

III. *The first, or Golden, or Orange-tawney, Yellow or Red Lilly.* It has a Root which is white and scaly; it grows much higher than the next following, and nearly as high as the Common White Lilly, or any other Lilly. The Leaves are somewhat longer, and very much narrower, of a dark or sad green Color: the Flowers are many and large, standing upright, as all these Sorts of Red Lillies do, of a paler red Color, tending to an Orange on the inside, with many black Spots and Lines on them, as in the following, and more yellow on the outside. The Seed-Vessels are like unto the roundish Heads of other Lillies, and so are the Seeds in them likewise.

IV. *The second, or Dwarf or low Red Lilly.* This has a scaly Root, like unto other Lillies, but white, and not yellow at all, and the Cloves or Scales thicker, shorter, and fewer in number than in most other Lillies. The Stalk is seldom above half a Yard high, unless it grows in extraordinary Ground suited to the Nature of the Plant; it is round and green, set confusedly with many fair and short green Leaves, on the top of which do stand sometimes but a few Flowers, and sometimes many, of a fair purplish red Color, and a little paler in the middle, every Flower standing upright, and not hanging down: on the Leaves whereof, here and there, are some black Spots, Lines or Marks; and in the middle of the Flower, a long Pointel, with some Chives about it, as is in the rest of these Lillies.

V. *The third, or Double-flowered Red Lilly.* This Kind is sometimes found to yield double Flowers, as if all the single Flowers should grow into one, and to make it to consist of many Leaves, which notwithstanding

withstanding its so continuing for several Years, will yet upon Transplanting redire ad ingenium, viz. quickly come or return to its old Form again.

VI. *The fourth, or Greater bulbed Red Lilly.* It rises up with a strong high Stalk, and is the most common Kind of the Lillies bearing Bulbs. It has many Leaves about the Stalk, but not of so sad a green Color as the following, or some others. The Flowers are of as pale reddish yellow Color as any of the following, and come nearest to the Color of the first, or *Golden or Orange-tawney Lilly*. This is more plentiful in Bulbs among the uppermost Leaves, than any of the others; as also in shooting forth Fibres or Strings, to encrease the Roots under Ground.

VII. *The fifth, or Dwarf or Lesser bulbed Lilly.* It has a white bulbed scaly Root, like other Lillies, and bears Bulbs on its Stalk, which rises up small and round, not much higher than the second, or Dwarf Lilly afore-described, seeming to be edged, and having many Leaves thereon, of a sad green Color, set about it, thrust close together. The green Heads for Flowers have a kind of Wooliness on them, before the Flowers begin to open, and between these Heads of Flowers, as also under them, and among the uppermost Leaves, appear small Bulbs or Heads, which being ripe, if put into the Ground, or if they fall of themselves, will shoot forth Leaves, and bear Flowers, within two or three Years, like the Maternal or Mother Plant; and so will the Bulbs of that just before-described, and of these other which immediately follow. The Flowers of this Lilly are of a fair Gold-yellow Color, shadowed over with a shew of Purple, but not so red as the first, or the next to be described. This Lilly shoots Strings under Ground, like as the last Red Lilly will do also, at which will grow white bulbed Roots, like the Roots of the Maternal or Mother Plant, and so thereby, in a short time, encreases it self.

VIII. *The sixth, or Fiery-red bulbed Lilly.* This third Bulbed Lilly rises up with its Stalk as high as any of these Lillies, carrying many long and narrow dark green Leaves about it, and at the top many fair red Flowers, as large or larger than any of the former, and of a deeper red Color, with Spots on them likewise, having greater Bulbs growing about the top of the Stalk, and among the Flowers, than any else.

IX. Mr. Rea describes it thus: *The Fiery-red bulbed Lilly rises up from a great scaly Root, (as all the Lillies have) with a strong tall Stalk, set with many strong dark green Leaves, and at the top adorned with many large Flowers, each composed of six broad thick Leaves, of a fiery-red Color at the tops, and towards the bottoms of an Orange Color, with small black Specks, bearing among the Flowers, and along the Stalk, divers Bulbs, like little Roots, which being set, in time, will bring forth Flowers, like unto those of the Original.*

X. *The seventh, or Fiery-red double Lilly* not bulbed. This Lilly is without Bulbs; and the chief Difference thereof does consist in the Flower, which is composed of many Leaves, as if many Flowers went to make one, when it thus beareth, which is but accidental, as the former double Lilly is said to be.

XI. Mr. Rea thus describes it: *This Double Red Lilly is like unto the former in Root, Stalk and Leaves, but without Bulbs, not so big, nor of so dark a green Color. It commonly bears many Orange-colored single Flowers on one Stalk, with many small brown Specks on the insides thereof, and sometimes but one fair double Flower, as if the Leaves of many Flowers were united in one, which altho' it be but*

accidental, yet it happens in this Kind more frequently than in any other Red Lilly; for if you have many Roots of this sort, you will always have some double Flowers, and many more in some Years than in others.

XII. *The Places.* The Native places of the Growth of these Lillies, are on the Mountains, and in the Vallies near them in Italy, as Matthiolus says, and in many Countries of Germany, as Austria, Bohemia, Hungaria, Stiria, as Clusius and others report; and with us they grow almost in all Gardens, where they admirably thrive.

XIII. *The Times.* These Red or Yellow Lillies flower a little before the White Lillies, and sometimes together with them; but they flower for the most part in June; but the second of them, or Dwarf Red Lilly, is the earliest of all the rest.

XIV. *The Qualities.* The Flowers of the Red Lilly are hot in the first Degree, and temperate in respect to Dryness or Moisture, of a thin and subtil Substance. The Roots and Leaves are hot and dry in the first Degree, Discussive, Digestive, and Absterive, Vulnerary, and Alexipharmick; and indeed these Plants have almost all the same Qualities and Virtues of the White Lilly, but not all out so efficacious or powerful.

XV. *The Specification.* The Red Lilly is a peculiar thing for the Cure of Burnings, Scaldings, green Wounds, and Wounds made by Venomous Beasts.

XVI. *The Preparations.* You may make therefrom all the same Preparations which you make from White Lillies; but these following are usual, viz. 1. A Cataplasme of the Leaves. 2. A boiled Cataplasme of the Leaves. 3. A Cataplasme of the Root with Oil of Roses. 4. A Cataplasme of the Root with Honey. 5. A Cataplasme of the Root with Vinegar and Henbane-Leaves. 6. A Cataplasme of the Roots boiled in Wine. 7. A Decoction of the Roots in Wine or Honied-Water. 8. A Juice of the Roots in Mead or Honied-Water.

The Virtues.

XVII. *The Cataplasme of the Leaves.* It is made by bruising them raw in a Mortar. Applied to places bitten by Serpents or Mad Dogs, it is said to draw out the Venom and heal them.

XVIII. *The boiled Cataplasme of the Leaves.* It is made by boiling them in Vinegar. It is good against Burnings and Scaldings, and to heal green Wounds; also to cleanse, dry, and heal old Ulcers.

XIX. *The Cataplasme of the Root with Oil of Roses.* It is made by roasting it in the Embers, and bearing it up with Oil of Roses. Applied, it cures Burnings and Scaldings, and softens a Scirrhus, or Hardness of the Womb.

XX. *The Cataplasme of the Root with Honey.* It is made of the roasted Root, beaten up with Honey. It strengthens and confirms Parts out of Joint, or Joints new Set, heals wounded Nerves, and takes away Scurf, Morpew, Discolorings, and other Deformities of the Skin.

XXI. *The Cataplasme with Vinegar.* It is made with the roasted Root, (or raw, as some use it) beaten up with Vinegar, Henbane-Leaves, and Crumbs of white Bread. Applied, it discusses and cools hot Tumors of the Groin, Testicles, Yard, and Womb.

XXII. *The Cataplasme of the Roots boiled in Wine.* Being beaten up, and applied to Corns of the Feet and Toes, it is said to take them away in a few Days time, renewing the Application Morning and Night till the Cure is effected.

XXIII. *The*

XXIII. *The Decolion of the Roots in Wine or Honied-Water.* Being drunk to six, eight or ten Ounces, according to Age and other Circumstances, it is said to help the Bloody-flux, and expel clotted Blood out of the Bowels.

XXIV. *The Juice of the Root extratted with Mead or Honied-Water.* It purges gently, eases the Colick, and cleanses the Bowels of sharp, acrid and putrid Humors, and carries off the Morbifick Cause of a Bloody-flux.

C H A P. CCCCXXXV.

Of the LILLY Mountain,

O R,

MARTAGON.

THE Names. It is called in *Greek*, *Κελύς* *Κελύς*; in *Latine*, *Lilium Montanum*, and *Martagon*; in *English*, *The Mountain Lilly*, and *Martagon*, also *Martagon Lilly*.

II. *The Kinds.* There are many sorts of these *Martagons* or *Mountain Lillies*, viz. 1. *Martagon flore albo majus*, *Lilium Montanum majus flore albo*, of some *Martagon Imperiale flore albo*, The great white *Martagon*, or Great white *Mountain Lilly*. 2. *Martagon flore albo maculato*, The white spotted *Martagon*, or *Mountain Lilly*. 3. *Martagon flore Carneo*, The Blush or Flesh-colored *Martagon*, or *Mountain Lilly*. 4. *Lilium Montanum minus*, *Lilium sylvestre minus*, *Hemerocallis Dodonei*, The lesser *Mountain Lilly*. 5. *Martagon luteum punctatum*, The yellow spotted *Martagon*. 6. *Martagon luteum non maculatum*, The yellow spotless *Martagon*. 7. *Martagon luteum serotinum*, The late-flowering yellow *Martagon*. 8. *Lilium Montanum non maculatum*, The small *Mountain Lilly* not spotted.

The Descriptions.

III. *The first, or Great white Martagon, or Great white Mountain Lilly.* The Root of this, as also of the two next which follow, are of a pure yellow Color, the Cloves or Scales of them being brittle, and not closely compact, yet so as if two, and sometimes three Scales or Cloves grew one upon the Head or upper part of another; which Difference is a special Note to know these three Kinds, from any other Kind of *Mountain Lilly*, as in all old Roots are to be seen, as also in those which are reasonably well grown, which in young Roots is not yet so evident. This has its Stalk and green Leaf greater than those of the *Martagon Imperial* in Chap. 439. following; the Stalk is a little higher, but not bearing so thick a Head of Flowers, altho' much more plentiful than in the *Lesser Mountain Lilly* at Sect. 6. following; being altogether of a fine white Color, without any Spots, or but very few, and those but sometimes also. The Pendants in the middle of this Flower are not red, as the *Martagon Imperial*, but yellow.

IV. *The second, or White spotted Martagon, or Mountain Lilly.* Its Root is variously cloved, like the former, as aforesaid; and the Plant it self is like unto it in all things, excepting in this, that the Flowers hereof are not altogether so white, and besides, it has many reddish Spots on the inside of the

Leaves of the Flower: the Stalk likewise is not so green, but brownish.

V. *The third, or Blush or Flesh-colored Martagon, or Mountain Lilly.* The Root of this, as is said, is like the first, and in all its other parts it is like to that, saving, that the Flowers of this are wholly of a decayed or pale Flesh Color, with many Spots upon them, and in this it only or chiefly differs from the former.

VI. *The fourth, or Lesser Mountain Lilly.* This Lilly is so like in Root to the *Martagon Imperial*, or Greater *Mountain Lilly*, in Chap. 439. following, that it is difficult to distinguish them asunder; but when this is sprung up out of the Earth, which is about a Month after the said *Imperial*. It also bears its Leaves in Rundles about the Stalk, altho' not altogether so great and so many. The Flowers are more thickly set on the Stalks, one above another, with more distance between each Flower, than the former, and are of a little deeper Flesh or Purple Color, spotted in the same manner. The Buds or Heads of Flowers in some of these, before they are blown, are hoary, white or hairy, whereas in others there is no Hoariness at all; but the Buds are smooth and purplish; in other Particulars this differs not from the former.

VII. *The eighth, or Small Mountain Lilly* not spotted. This differs not from the last, neither in Roots, Stalks, Leaves, Flowers, or manner of Growing, saving, that the Color of the Flower in this is paler, and that it has no Spots upon it, or if it has any, they are but very few.

VIII. *The fifth, or Yellow spotted Martagon.* It has a great scaly or cloved Root, and yellow, like unto all these sorts of turning Lillies, from whence springs up a round, green, strong Stalk, three Feet high at least, confusedly set with long, narrow, green Leaves, white on the edges, up to the very top thereof almost, having several Flowers on the Head, turning up again, as other *Martagons* do, of a faint yellowish, or greenish yellow Color, with many black Spots or Strakes about the middle of the Leaf of every Flower, and a forked Pointel, with six Chives about it, tipped with reddish Pendants, of a strong sweet Smell, very pleasant to some, tho' not to others, who love not the best Smells, if they be strong and pungent. It bears a great plenty of Seed, in great Heads, like unto other Lillies, but a little paler.

IX. *The sixth, or Yellow spotless Martagon.* This Plant, in its Root, Stalk, Leaves, Flowers, Seed, and manner of its Growing, differs not from the Lilly last described, excepting only that the Flowers of this have no Spots at all upon any of their Leaves; in all things else it is exactly alike.

X. *The seventh, or Late-flowering yellow Martagon.* This is the third Yellow *Martagon*, which is a Species of the fifth Kind at Sect. 8. above; but there is no other Difference betwixt this and that, saving only in its time of Flowering, which is not until July, and that its Color is of a deeper Yellow.

XI. *The Places.* The first, second, third, fourth, and eighth Sorts have been found in several Countries of Germany, as Austria, Hungary, Stiria, &c. but are all made Denizens of our Gardens near London, where they are now become Natives, and flourish as well here as in the places of their natural Growth. The fifth, sixth, and seventh, have been found to grow on the Pyrenean Mountains, as also on Mountains in the Kingdom of Naples, from whence they have been brought home to us, with whom they thrive also very well.

XII. *The Times.* The first, second, third, fourth,

and eight, flower about the latter end of June, for the molt part, and flower sooner than the *Martagon Imperial* in Chap. 439. following, tho' that springs out of the Ground a Month before these at the least, it being the more early up, yet never the nearer. The fifth and sixth *Yellow Martagons* flower something more early than the *Red Martagons*, and sometimes at the same time with them. The seventh, or *Late-flowering yellow Martagon*, flowers a Month later or more, and is in Flower when the *Red Martagon* of *Constantinople* flowers, which is in July.

XIII. As to the *Qualities, Specification, Preparations and Virtues* of these, as also of those in the five following Chapters, Authors have said nothing at all, so that we have not much to write concerning them, as having had no Experience of them; but if one may be allowed to judge of them, by the usual *Criteria*, then we must allow them to be much of the Nature and Quality of the *White and Orange Lillies* before-described, whose *Virtues* in their respective Chapters foregoing are at large laid down.

CHAP. CCCCXXXVI.

Of the LILLY Turkey,

OR,

Byzantine MARTAGON.

I. **THE Names.** It is called in *Greek*, *Κελύ Colamiv*: in *Latine*, *Lilium Turcicum*, *Lilium Byzantinum*, *Lilium vel Martagon Constantinopolitanum*: in *English*, *The Turkey Lilly*.

II. **The Kinds.** There are no great Varieties of this Plant; yet as few as there are, Authors deliver them confusedly, these following are the chief or most observed, viz. 1. *Lilium rubrum Byzantinum*, *Hemerocallis Chalcedonica*, *Martagon Constantinopolitanum rubrum*, *The Red Turkey Lilly*, or *Red Martagon* of *Constantinople*. 2. *Lilium rubrum Byzantinum maculatum*, *Martagon rubrum Constantinopolitanum maculatum*, *The Red spotted Turkey Lilly*, or *Red spotted Martagon* of *Constantinople*. 3. *Lilium Byzantinum flore purpureo sanguineo*, *The purplish sanguine colored Turkey Lilly*. 4. *Lilium Byzantinum flore dilute rubente*, *The light Red Turkey* or *Byzantine Lilly*. 5. *Lilium Byzantinum miniatum Polyanthos*, *The Vermilion many-flowered Turkey* or *Byzantine Lilly*. The *Turks* call these *Lillies*, *Zuffiniare* or *Zuffinare*. 6. *Martagon flore spadiceo Pannonicum*, *The bright Red Martagon* of *Hungary*.

The Descriptions.

III. *The first*, or *Red Turkey Lilly*, or *Red Martagon* of *Constantinople*. It has a great, thick, yellow, scaly Root, which sends out early in the Spring, before many other *Lillies*, a round brownish Stalk, beset with many fair green Leaves confusedly thereon, but not so broad as the *Common White Lilly*; upon the top of which stands one, two, or three, or more Flowers, which hang down their Heads, and turn up their Leaves again, of an excellent Red Crimfon Color, and sometimes paler, having a long Pointel in the middle, compassed with six whitish Chives, tipt with loose yellow

Pendents, of a pretty good Smell, but something faint. After the Flowers, come Heads or Cods of Seed, like to other *Lillies*, but greater. It is a fair beautiful Flower, and was at first very much esteemed with us, and yet notwithstanding its Increase and Plenty, deserves its Commendations; for its being so common every where, and so well known, does not at all diminish from its Excellency.

IV. *The second*, or *Red-spotted Turkey Lilly*, or *Red-spotted Martagon* of *Constantinople*. This is another of the former Kind, and grows something greater and higher, with a larger Flower, and of a deeper Color, spotted with several black Spots or Strakes and Lines, as are to be seen in the *Mountain Lillies*, and in some other Kinds, which is not so in the former but just now described, that having no shew of Spots at all. This whole Plant is rare, and of much more Beauty than the former.

V. *The third*, or *Purplish Sanguine-colored Turkey Lilly*. It has a large Lilly like Root, from which arises a Stalk a Foot and half or two Feet high, set confusedly with Leaves, like the first above: the Flowers also resemble those before described in *Self*. 3. but are usually more in Number, and of a purplish Sanguine Color.

VI. *The fourth*, or *Light Red Turkey* or *Byzantine Lilly*. This is very like the last in Root, Stalk, Leaves, Flowers, and Seed, saving, that in the Color of the Flowers, these are of a lighter Red than those first described in *Self*. 3. foregoing: the Leaves and Stalks also, as *Clusius* observes, are of a lighter green Color.

VII. *The fifth*, or *Vermilion many-flowered Turkey* or *Byzantine Lilly*. This is also a Variety of the first, but according to *Clusius*, the Difference is in these things, that the Flowers grow equally from the top of the Stalk, and the middle Flower rises higher than any of the rest, and sometimes consists of twelve Leaves, as it were a Twin, which those who observe it, will find.

VIII. *The sixth*, or *Bright Red Martagon* of *Hungary*. This seems to be a Species of the first, (tho' it may grow in *Hungary*) by reason of the Likeness both of Leaf and Flower thereunto. Its Root is very like the same, but the Leaves are something larger, and more perfectly set upon the Stalks, else not much unlike. The Flowers bend down, and turn up their Leaves again, but somewhat larger, and of a bright Red, tending to an Orange Color, viz. somewhat yellowish, and not Crimfon, like the other.

IX. *The Places.* The first, second, third, fourth, and fifth, grow naturally in *Turkey*, at or near *Constantinople*, formerly called *Byzantinum*: the last on the Mountains or Hills of *Hungary*, but now they are made free Denizons in our *English* Gardens.

X. *The Times.* They generally flower in June, when other *Lillies* do, some earlier, others later, and continue flowering till the beginning of July.

XI. *Their Qualities, Specification, Preparations, and Virtues*, have not been observed in any Author, yet they all seem to be of the Nature and Properties of the *Common White and Red Lilly*.

CHAP. CCCCXXXVII.

Of the LILLY Persian.

I. **THE Names.** It is called by the *Persians* or *Turks*, or some coming from thence, *Pennaco*;

naco, or Pennacio, or Pennachio Persiano : in Greek, *Κεῖον πεννικόν* : in Latine, *Lilium Persicum*, *Lilium Sufianum*, (as coming from the City *Susa*, or the Province *Sufiana*, in Persia :) in English, *The Persian Lilly*.

II. *The Kinds.* It is a singular Plant of its Kind, but the fifth of the generick Species of *Lillies*. *Clusius* says it was sent into the *Low Countries* under the Name of *Sufam Guil*, for which Reason he thought it might come from *Susa*, the chief City of *Sufiana*, in Persia.

The Description.

III. *Its Root is very like unto the Root of the Crown Imperial described in Chap. 177. aforegoing, and loosing its Fibres in like manner every Year, having a Hole therein likewise, where the old Stalk grew, but whiter, rounder, a little longer, smaller, and not stinking at all like it.* From whence springs up a round, whitish green Stalk, not much lower than the *Crown Imperial*, but much smaller, beset from the bottom to the middle thereof, with many long and narrow Leaves, of a whitish or blewish green Color, almost like to the Leaf of a Tulip. From the middle upwards, to the top of the Stalk, grow many Flowers, one above another, round about it, with Leaves at the foot of every one of them, each whereof is pendulous, or hanging down the Head, like unto the *Crown Imperial*, not turning up any of the Flowers again, but smaller than in any other Kind of Lilly, not altogether so large as the Flower of a *Fritillaria*, consisting of six Leaves a piece, of a dead or over-worn purplish Color, having in the midst a small long Pointel, with several Chives, having yellow Pendants adjoined to them. After the Flowers are past, (which abide open for a long time, and for the most part flower by degrees, the lowest first, and so upwards) if the Weather is seasonable and temperate, come forth Heads of Seed-Vessels, six-square, yet seeming to be but three-square, by reason of the Wings, very like to the Heads of the *Crown Imperial* in Chap. 177. aforegoing, but smaller, and shorter; in which are contained such like flat Seed, but smaller also, and of a darker Color.

IV. *Nota.* Gerard has this short Description hereof. *The Persian Lilly has (says he) for its Root, a great white Bulb, differing in Shape from the other Lillies, having one great Bulb, firm or solid, and full of Juice, which commonly each Year sets off or increases one other Bulb, and sometimes more, which the next Year after is taken from the Mother-Root, and so brings forth such Flowers as the old Plant did.* From this Root rises up a fat, thick, and strait Stem, of two Cubits or three Feet high, whereon is placed long narrow Leaves, of a green Color, declining to Blowness, as do those of Wood. The Flowers grow along the naked part of the Stalk, like little Bells, of an over-worn purple Color, hanging down their Heads, every one having his own Foot-stalk, which is about two Inches long; as also its Pestel or Clapper from the middle part of the Flower: which being past and withered, there is not found any Seed at all, as in other Plants, but it is increased by its Root.

V. *The Places.* It is said to be first brought from Persia to Constantinople, and from thence sent to us, by means of several *Turky Merchants*, or their Factors, which Dwelt and Traded there: but now it is become a Native of England, and flourishes as well in our Gardens, as in the places where it first grew.

VI. *The Times.* It springs out of the Ground nearly a Month before the *Crown Imperial*, but does

not flower till the latter end of April, or beginning of May. The Seed (when it comes to Perfection, which it does not often) is not perfectly ripe till July.

VII. *As to its Qualities, Nature or Virtues, &c.* of this *Persian Lilly*, esteemed for its Rareness and fine Figure it makes, there is not any thing written by any Author, only it is thought to participate of the Qualities, &c. of the other Lillies.

C H A P. CCCCXXXVIII.

Of the LILLY Early,

O R,

LILLY Pompony.

I. *THE Names.* It is called in Greek, *Κεῖον πεννικόν* : in Latine, *Lilium rubrum Præcox*, *Lilium Pomponium*, *Lilium rubrum Macedonicum*; *Martagon rubrum Præcox*, *Martagon Pomponium*, *Martagon rubrum Macedonicum* : in English, *The Early Red Lilly*; *Early Red Martagon*; *Martagon Pompony*, and *Early Red Macedonian Martagon*.

II. *The Kinds.* Authors make four Kinds hereof, viz. 1. *Lilium rubrum Præcox angustifolium folio Clusij*, *Martagon Pomponium vel Macedonicum rubrum angustifolium*, The narrow-leaved early Red Lilly, Narrow-leaved Red Pompony or Macedonian Martagon. 2. *Lilium rubrum Præcox angustifolium aliud*, Another narrow-leaved Early Red Lilly, or Red Martagon Pompony. 3. *Lilium rubrum Præcox latiore folio Clusij*, *Martagon Pomponium vel Macedonicum rubrum latifolium*, The broad-leaved Early Red Lilly, or Broad-leaved Red Pompony or Macedonian Martagon. 4. *Lilium rubrum Præcox flore Phæniceo*, *Martagon flore Phæniceo*, The Lilly or Martagon of Macedonia, with Golden-red Flowers.

The Descriptions.

III. *The first, or Narrow-leaved Early Red Lilly, or Narrow-leaved Red Pompony or Macedonian Martagon.* This rare Martagon has a scaly Root, closely compact, with broader and thinner Scales than others, growing in time very great, and of a more deep yellow Color than in the former Martagon's, from whence springs up a round green Stalk in some Plants, and flat in others, growing to be two or three Feet high, bearing a number of small, long, narrow, green Leaves, very like unto the Leaves of Pinks, but greener, set very thick together, and without Order, about the Stalk, up almost unto the top, and lesser by degrees upwards, where stand many Flowers, according to the Age of the Plant, and its thriving in the place where it grows: in those which are young, but a few, and more sparsely; and in others, which are old, many more, and thicker set; threecore Flowers, yea, fourcore and more have been counted, growing thick together upon one Plant, and an hundred Flowers upon another. These Flowers are of a pale or yellowish red Color, not of so deep a Red as the Red Martagon of Constantinople in Cap. 436. Sect. 3. and 4. nor fully so large, yet of the same fashion, viz. every Flower hanging down, and turning up his Leaves again. This is not so plentiful in bearing of Seed, as the other Lillies; but when it does, it differs not, but in being less:

IV. *Mf.*

Pomponéan Lilly.

IV. Mr. Rea, in his *Flora*, Cap. 6. thus describes the former Plant. The Martagon of Pompony has a great yellowish, brown, scaly Root, from whence springs up a green Stalk, two or three Feet high, promiscuously thick set, with many small, long, green Leaves, almost to the top, where stand many Flowers, in number according to the Age of the Plant: for in some which have stood long unremoved, I have had fourscore or an hundred Flowers upon one Stalk, which are of a yellowish Orange Color, with small black Specks on the inside thereof, in fashion like to the Red Martagon of Constantinople, but smaller.

V. The second, or Other narrow-leaved Early Red Lilly, or Red Martagon Pompony. This differs from the former only in two things, viz. 1. That the narrow Leaves are not so thick set upon the Stalk. 2. That when it flowers, it is a Fortnight later. In other Particulars it differs not.

VI. The third, or Broad-leaved Early Red Lilly, or Broad-leaved Red Pomponéan or Macedonian Martagon. This is so like to the former in Root, Stalk, Flower, Seed, and manner of Growing, that the Difference is scarcely to be discerned; but it consists chiefly in these two things: 1. That the Leaves of this are a little broader, and shorter than the former. 2. That it bears its Flowers a Fortnight earlier than the first. In the Color or Form of the Flower, there is no Difference to be discerned, nor yet in any other thing else.

VII. The fourth, or Lilly or Martagon of Macedonia, with Golden-red Flowers. This has come to our Knowledge later than the former Kinds: its Leaves are broader and shorter than the last, and the Flowers of a paler red, tending to yellow, of some called a Golden-red Color.

VIII. The Places. The Knowledge of these Early Martagons came first to us from Italy, from whence they were sent into the Low-Countries, and into England; but it seems by their Name, that their original or native place should be upon the Mountains in Macedonia: with us they grow only in Gardens.

IX. The Times. All these Lillies do spring very late out of the Ground, even as the Yellow Martagon's do; but are sooner in Flower than any other. They flower in the end of May, or beginning of June, and that is a Month at least before those of Turkey or Constantinople, in Cap. 436. Sect. 3. and 4. foregoing.

X. Of the Qualities, Natures and Virtues of these, Authors have also said nothing; but doubtless they are much of the Properties of our Common Lillies.

C H A P. CCCCXXXIX.

Of the L I L L Y Imperial.

I. THE Names. It is called in Greek, *Κελευθ* *Καυκασικὴ*: in Latine, *Lilium Imperiale*: in English, The Imperial Lilly.

II. The Kinds. There are several Species of this Plant, as, 1. *Corona Imperialis*, called also *Lilium Byzantinum*; the Turks call it *Caudle lile*, and *Tajai*, *Toujai*, *Tayschiachi*, *Turfani*, and *Turjanda*; and Clusius judges it to be the *Hemerocallis Diefforidis*, The Crown Imperial: of which we have discoursed at large in Chap. 177. foregoing; but in this Chapter we shall give you another Description thereof from Gerard. 2. *Corona Imperialis flore multiplici*, The double Crown Imperial. 3. *Corona Imperialis flore luteo*, The yellow Crown Imperial. 4. *Corona Imperialis angustifolia flore rubente*, The narrow-leaved Crown Imperial, with a reddish Flower. 5. *Lilium Imperiale, Martagon Imperiale, Lilium Montanum majus*, (because it is the greatest Mountain Lilly) and by some, *Lilium Saragenticum*, but not very fitly; The Imperial Martagon. 6. *Lilium Imperiale non Maculatum, Martagon Imperiale flore non punctato*, The Imperial Martagon not spotted.

The Descriptions.

III. The first, or Single Crown Imperial, has for its Root a thick, firm and solid Bulb, covered with a yellowish Film or Skin; from the which rises up a great, thick, fat Stalk, two Cubits high, in the bare and naked part, of a dark, over-worn, dusky purple Color. The Leaves grow confusedly about the Stalk, encompassing it round, in form of an Imperial Crown, (from whence it took its Name) hanging their Heads downwards, as it were Bells: in Color, it is yellowish; or to give you the true Color, which by Words cannot otherwise be expressed, if you lay Sap-Berries in steep in fair Water, for the space of two Hours, and mix a little Saffron in that Infusion, and lay it upon Paper, it shews the perfect Color to Linn or Illuminate the Flower withal. The back side of the said Flower is streaked with purplish Lines, which do greatly set forth the Beauty thereof. In the Bottom of each of these Bells, there is placed six Drops of most clear, shining, sweet Water, in Taste like Sugar, resembling in shew, clear Orient Pearls; the which Drops, if you take away, there do immediately appear the like Drops again. Notwithstanding, if they may be suffered to stand still in the Flower, according to their own Position, they will never fall away; no, if you strike the Plant till it is broken. Among these Drops there stands forth a Pestle, as also sundry small Chives, tipped with small Pendants, like those of the Lilly. Above the whole Bundle of Flowers,

Flowers, there grows a Tuft of green Leaves, like those upon the Stalk, but smaller. After the Flowers are faded, there follow Cods or Seed-Vessels, fix-square, wherein is contained flat Seeds, tough and limber, of the Color of *Mace*. The whole Plant, as well Roots as Flowers, do smell very like a Fox. As the Plant grows old, so does it wax rich, bringing forth a Crown of Flowers among the uppermost green Leaves, which some make a second Kind, altho' in Truth they are but one and the self same, which in time is thought to grow to a triple Crown, which comes to pass from the Age of the Root, and Fertility of the Soil. The Figure we have thought good to subjoin here.

Single Crown Imperial.

IV. Mr. Rea, in his *Flora*, Cap. 7. gives this following short Description thereof. It has a great round Fox-scented Root, from whence springs up a tall and strong Stalk, garnished from the Ground unto the middle thereof, with many long shining green Leaves, from whence it is naked upwards, bearing at the top a Tuft of small green Leaves, and under them eight or ten Flowers, according to the Age of the Plant, hanging down round about the Stalk, in Fashion like unto a Lilly, consisting of six Leaves of an Orange Color, with many Veins of a deeper Color on the back sides of the Flowers. Next the Stalks every Leaf thereof has a Bunch or Eminence of a fadder Orange Color than the rest of the Flowers, and on the inside those Bunches are filled with fifteen-tasted clear Drops of Water, like unto Pearls, each Flower having in the middle a Stile, compassed with fix white Chives, tipt with yellow Pendants.

V. The second, or Double Crown Imperial. This is of a late Discovery, and in much more Esteem than the former, and it is indeed a gallant Plant, and deserving Esteem, which in some measure makes the other to be the less regarded. It chiefly differs

from it in the Flowers, which in this are constantly double, each Flower containing fifteen or sixteen Leaves, whereas those of the other Common Kind have but six. The Leaves of those double Flowers are narrower, with a Drop or Pearl at the Head of each of them, of the same Color with those of the Common Kind, and as many Flowers on one Stalk. The Plant at first coming up, is redder, and continues longer so than the Ordinary, the green Leaves are of a darker Color, and the Tuft on the top above the Flowers, bigger, and consisting commonly of more Leaves.

VI. The third, or Yellow Crown Imperial. It in its Root, Stalk, Leaves, Flowers, Seed, and manner of Growing, differs not from the first Common Kind, but only in this, that the Flowers are of a fair yellow Color. This is more rare than that with the double Flowers.

VII. The fourth, or Narrow-leaved Crown Imperial with a reddish Flower. This likewise in its Root, Stalk, and manner of Growing, differs not from the other Single Kinds, but in this the Leaves are much narrower, and the Flowers of a light Red, or of a pale Rose Color.

Imperial Martagon.

VIII. The fifth, or Imperial Martagon. This Imperial Lilly has a scaly Root, like unto all the rest of the Lillies, but of a paler yellow Color, closely compact or set together, being short and small sometimes in respect of the Greatness of the Stem growing from it. This Root is very apt to increase or set off, as it is called, whereby the Plant seldom comes to so great a Head of Flowers, but rises up with many Stalks, and so then bears the fewer Flowers. The Stalk is brownish, and round at the bottom, and sometimes flat from the middle upwards, three Feet high or more, beset at certain distances with Rundles or Circles of many broad Leaves, larger and broader for the most part than any other of this Kind, and of a dark green Color: it has two or three, and sometimes four, of these Rundles or Circles of Leaves, and bare, without any Leaf between: but above, towards the tops of the Stalks, it has here and there some Leaves upon it,

it, but smaller than any of the other Leaves. At the top of the Stalk come forth many Flowers, sometimes three or four score, thick thrust, or confusedly set together, and not thin or sparsely one above another, as in the lesser of this Kind of *Mountain Lilly*, in *Cap. 435. Sect. 6.* It has been sometimes also observed in this Kind, that it has born many Flowers at three several places of the Stalk, one above another, which has made an excellent Shew; each Flower whereof is pendulous, or hanging down, and each Leaf of the Flower turning up again, being thick or fleshy, of a fine delayed purple Color, spotted with many blackish or brownish Spots, of a very pleasant sweet Smell, which makes it the more acceptable. In the middle of the Flower hangs down a Stile or Pointel, knobbed at the end with six yellow Chives, tipped with loose Pendants, of an Orient Red or Vermilion Color, which will easily stick like Dust upon anything that touches them. The Heads or Seed-Vessels are small and round, with small Edges about them, wherein is contained flat brown Seed, like as in other *Lillies*, but lesser.

IX. The sixth, or Imperial Martagon not spotted. This is a Species of the last Kind, which is found in some Gardens. It is in its Root, Stalk, Leaves, Flowers, Seed, and Form of Growing, very like that, but its Flowers are without any Spots: the Leaves thereof, and Stalk likewise, are of a paler Color; but otherwise not differing.

X. The Places. The first four were brought to us without doubt out of *Turkey*, and places near about *Constantinople*; but some think them, especially the first, to be Natives of *Persia*. The two last come from several Countries of *Germany*, as *Austria*, *Hungaria*, *Stiria*, *Tirol*, &c. but now are free Denizens of *England*, and Natives in our Gardens.

XI. The Times. The first four spring out of the Ground about the end of *February* or beginning of *March*, and the Heads with the Seed are ripe in the end of *May* or beginning of *June*. The two last flower about the latter end of *June* for the most part, and yet they spring out of the Ground before the other *Martagon's* or *Mountain Lillies* in *Chap. 435.* foregoing.

XII. As to their Qualities, Natures, and Properties, Authors have said nothing; but by their Tastes and other Criteria, they seem to have the Virtues of Our Common *White* and *Orange-tawny Lillies*.

C H A P. CCCCXL.

Of the LILLY American or Floridian.

THE Names. This Plant being but of late Invention or Discovery, can have no Greek Name: but modern Authors call it in *Latine*, *Lilium Americanum*, *Lilium Indicum*, and *Lilium Floridianum*; and in *English* it is called, *The American* or *Floridian Lilly*.

II. The Kinds. Mr. *Rea*, in his *Flora*, *Cap. 7.* gives us two several sorts of the *American Lilly*, viz. 1. *Martagon Canadense maculatum*, *Lilium Canadense punctatum*, *Lilium Floridianum maculatum*. The spotted Lilly, or *Martagon* of *Canada*. 2. *Lilium Americanum*, *Martagon Americanum*, *Martagon Virginianum*, and *Lilium Virginianum*,

The *Virginian Lilly* or *Martagon*, The *American Lilly* or *Martagon*.

The Descriptions.

III. The first, or Spotted Lilly or *Martagon* of *Canada*. It has a small scaly Root, with many long small Fibres thereat, from whence rises up a reasonable great Stalk, almost as high as any of the former Kinds, bearing at three or four Distances many long and narrow green Leaves, but not so many nor so broad as some others, having divers Ribs in them; from among the uppermost Bundle of Leaves, break forth four or five Flowers together, each one standing on a long slender Foot-stalk, being almost as large as a *Red Lilly*, but a little bending downwards, of a fair yellow Color, spotted on the inside with several blackish purple Spots or Strakes, having a middle Pointel and six Chives, with Pendants on them.

IV. Mr. *Rea*, in his *Flora*, describes it thus: The Root of this *Stranger* is smaller, and the Stalk lower than any of the former *Martagon's*: the green Leaves grow on the Stalk in Rundles; and the Stalk bears four or five Flowers on long Foot-stalks, in Form like a *Red Lilly*, hanging down their Heads, of a fair yellow Color, with many black Spots on the inside, a Pointel, and six Chives tipped with red Pendants.

V. The second, or *Virginian Lilly* or *Martagon*. It has a close compacted, round, scaly, pale yellow Root, from the sides whereof, more frequently than the top, come forth the Stalks, about three Feet high, set with small, sharp-pointed, whitish green Leaves in Rundles, bearing at the Head three, four, or more something large Flowers, turning back like that of *Constantinople*, of a Gold-yellow Color, with many brown Spots about the bottoms of the Flowers, with the Points or Ends of the Leaves that turn up, of a Scarlet or Red Color, and without Spots. It is a tender Plant, and must be defended from Frost in Winter. There is another of this Kind, which bears more Flowers on a Stalk, and differs from the former, in that these are of pale Colors, but spotted as the others are.

VI. The Places. The first was brought into *France* from *Canada*, and from thence to us. The second was brought by some of our Merchants and Captains of Ships from some of our Plantations in *Virginia*.

VII. The Times. They flower about the end of *June*, and the Cods of Seed come to Ripeness towards the end of *July*, or in *August*.

VIII. The Qualities, Specification, Natures, Properties and Virtues, are unknown as to us; so that no more can be said of them.

C H A P. CCCCXLI.

Of the LILLY Bastard,

O R,

DAY-LILLY.

THE Names. It is called in *Greek*, *Ψευδαλίς* by *Theophrastus*, *Ψευδαλλίς* by *Dioscorides*, *Ψευδαλλίς ἁίκα* by *Galen*; *Hemerocallis* by *Pliny*, and *Hemerocallis* by others; *Lilium est agreste*, quod

Et in hortis serebant ad Coronamenta, vide Plin. lib. 21. cap. 10. in Latine it is called, Hemerocallis, and it is doubtless the true Plant which ought to be called by that Name; also Lilium non bulbosum, Liliaphodelus, Liliage, and Liliastrium: in English, The Bastard Lilly, or Day Lilly.

II. The Kinds. Authors make mention but of four sorts of this Lilly, viz. 1. *Liliago Pharnicea, Liliastrium Pharniceum, Liliaphodelus Pharniceus, Lilium non bulbosum puniceum, Hemerocallis, ab una die, & pulchritudo, a floris fugacitate, quia uno tantum die pulchritudinem suam tuetur; i. e. flor, utro die vigens;* The Gold-red Bastard Lilly, or Gold-red Day Lilly. 2. *Liliastrium luteum, Lilium non bulbosum luteum, Liliaphodelus luteus,* The Yellow Bastard Lilly, or Yellow Day Lilly. 3. *Liliaphodelus flore albo,* The Lilly Asphodil with a white Flower. 4. *Liliaphodelus flore carneo,* The Lilly Asphodil with a Blush-colored Flower.

The Descriptions.

III. The first, or Gold-red Bastard Lilly, or Gold-red Day Lilly. It has for its Root many thick and long knobbed Strings, like unto the Small yellow Asphodil-Roots, but somewhat greater, running under Ground in like sort, and shooting out young Heads round about. From this Root spring up divers broad and long fresh green Leaves, folded at the first, as it were double, which after open and remain a little hollow in the middle; among which rises up a naked Stalk, three Feet high, bearing at the top many Flowers, one not much distant from another, and flowering one after another, not having commonly above one Flower blown open in a Day, and that but for a Day, not lasting longer, but closing at Night, and not opening again, whereupon it obtained the English Name of Day Lilly, or Lilly for a Day. These Flowers are almost as large as the Flowers of the White Lilly, and made after the same fashion, but of a fair Gold-red or Orange-rainy Color. Seed is very seldom seen to follow these Flowers, for they seem the next Day after they have flowered, (except the Season is very fair and dry) to be so rotten, as if they had been laid in Wet to rot them.

IV. Nota. Gerard says, That this Plant brings forth its Bud in the Morning, which at Noon is full blown or spread abroad, and the same Day in the Evening it shuts it self; and in a short time after becomes as rotten and stinking as if it had been trodden in a Dunghil a Month together, in foul and rainy Weather; which is the Cause that the Seed seldom follows, as in the other Kind, scarcely ever bringing forth any at all.

V. The second, or Yellow Bastard Lilly, or Yellow Day Lilly. It has a Root consisting of many Knobs or tuberous Bunchings out, proceeding from one Head, like those of the White Asphodil or Peony. From this Root proceed long Haggy Leaves, chamfered or channelled, hollow in the midst like a Gutter; among which rises up a naked or bare Stalk, about three Feet high, branched towards the top, with several brittle Arms or Branches, on which do grow many fair Flowers, like unto those of the Common White Lilly in Shape and Proportion, and of a shining yellow Color; which being past, three-cornered Cods or Husks succeed, full of black shining Seed, like those of Peony.

VI. Mr. Rea, in his Flora, Cap. 14. says, That this Yellow Day Lilly, or Lilly Asphodil, rises up with many long sedge Leaves, out of the middle of which comes up a naked Stalk, bearing at the top thereof four or five small Lilly-like yellow Flowers,

blowing one after another, like the first Gold-red Day Lilly, but continuing many Days before they fade. The Leaves die to the Ground before Winter, and the Roots are many, long, yellow Strings, very much increasing.

VII. The third, or Lilly Asphodil with white Flowers. This Lilly is in all the parts thereof, as Roots, Leaves, Stalk, Cods, Seed, and in its manner of Growing, like the former, saving, that the Leaves are of a firther green Color, and the Flowers of a Snow white, like unto the Savoy Spiderwort, but that the Stalk is higher, and the Flowers larger.

VIII. The fourth, or Lilly Asphodil with a Blush or Flesh colored Flower. This is very like to the White in every of its parts, and in the manner of its Growing: the greatest Difference is in the Flowers, which in this are of a fine bright Blush or Flesh Color.

IX. The Places. They are all of them of German Production, and are found in many Gardens in Germany; from whence they have been brought into our Gardens in England, where they thrive very well, if the Earth or Soil is moist.

X. The Times. They all of them flower about the latter end of May, and almost throughout all June, as the Season proves.

XI. The Qualities, Specification, Preparations and Virtues of the Lilly Asphodil or Day Lilly, are said to be the same with Our Common Asphodil, which you may see at large in Cap. 35. Sect. 9. ad 23. of the same Chapter foregoing. Some make a Cataplasin of them, and apply in the Cases following.

XII. The Cataplasin. The Roots and Leaves beaten in a Mortar to a Pultice, and applied to hot Swellings in Womens Breasts, in their Lying-in, cools, diffuses and eases the Pain: applied also to Inflammations of the Eyes, it cools and takes them away. Applied to Butnings and Scaldings, it draws forth the Fire, and heals them. If it is made into a Pessary with a little Honey and Wooll, and put up the Womb, it provokes the Terms, bringing forth both Water and Blood.

C H A P. CCCCXLII.

Of LILLY Water White.

THE Names. This Plant is called in Greek, *Νυμφαία*: in Latine, *Nymphaea*, quod loca aquosa amet, as Dioscorides saith; it is also called by Apuleius, *Mater Erculana*, *Alga palustris*, *Papaver palustre*, *Clavus Veneris*, *Digitus Veneris*; and Marcellus, an old Writer, saith, that it was called *Clava Herculis*: in the Shops, *Nenuphar*. The Arabians call it, *Nilafur*, and *Ninfar*: and we in English, *Water Lilly*.

II. The Kinds. There are two principal Kinds hereof, viz. 1. *Νυμφαία λευκή, Nymphaea alba*, The White Water Lilly. 2. *Νυμφαία ζαυρή ἢ ἀγρία, Nymphaea lutea*, The Yellow Water Lilly: of which we shall speak in the next Chapter.

III. The Kinds of the White Water Lilly. Of this there are two sorts, viz. 1. *Nymphaea alba major*, The greater White Water Lilly. 2. *Nymphaea alba minor*, The lesser White Water Lilly. 3. To these we may add a third, which is an Exotick, and not to be found in our Country; but I have been told by a Gentleman well skilled in Botany, that he

had met with it in several Marshy places in *Florida*. It is *Nymphaea alba major Aegyptia*, five *Lotus Aegyptia*, The great White Water Lilly of *Agypt*. Some add a fourth Kind, viz. *Nymphaea alba minima*, which is, *Morfas Rane*, or *Frogbit*: of which we have already discoursed in Chap. 302. aforegoing.

Greater White Water Lilly.

The Descriptions.

IV. The first, or Greater White Water Lilly, has a great, thick, round, long, tuberous Root, spongy or loose, and with many Knobs thereon, like Eyes, and whitish within: from whence proceed very large and very round, thick, dark, green Leaves, lying upon the Water, (like unto those of *Faba Aegyptia*, as Dioscorides says, and that very truly) sustained by long and thick Foot-stalks: from the middle also, and other places of this Root, rise other the like thick and great Stalks, sustaining one large and white Flower thereon; green on the outside, but exceeding white on the inside, white as pure Snow, consisting of several Rows of long, and somewhat thick and narrow Leaves, smaller and thinner, the more inward they grow, encompassing a Head within, with many yellow Threads or Threads in the middle; where after they are past, stand round Poppy like Heads, full of broad, oily, bitter, blackish and glutinous Seed.

V. The second, or Lesser White Water Lilly. It has a single Root, with some few Fibres adjoined thereto; from whence rise up many long round Foot-stalks of Leaves, which Leaves float also upon the Water, as the other does; being fair, of a light green Color, broad, smooth, soft, round, and Buckler-like in Form: and from the same Root rise up also several long, round, smooth, soft, lightish green Stalks (but lesser than those of the Greater Lilly) of Flowers, bearing at their tops fine small white

Flowers, standing upon Foot-stalks, some longer, some shorter, each Flower consisting of five small Leaves apiece, having a little yellow in the middle thereof.

Lesser White Water Lilly.

Lesser White Water Lilly.

VI. Parkinson says, That this Lesser Water Lilly differs not from the former, or Greater, but in the Smallness both of Root and Leaf, and in the Singleness of the Flower, which consists but of five small pointed Leaves, spread open and laid abroad, (as you may see by one of the Figures) with yellow Threads

Threads in the middle, and small Heads, with small Seed in them.

VII. *The third, or Great White Water Lilly of Egypt.* It has a Root in Form not like any of the former, but small, round, and almost Pear-furnished, of the Bigness of a Hens Egg, black on the outside, and yellowish within, with many small Fibres thereat; the inner Substance is fleshy, firm and hard, somewhat sweet and astringent within, which when it is boiled, or roasted under Embers, becomes as yellow as the Yolk of an Egg. The Egyptians familiarly eat it with Broth, and oftentimes raw, as well as roasted. This Root sends up out of the Water several fair broad Leaves, like those of the Greater afore-described, but that these are somewhat less, more waved about the edges, and with more Veins in them, lying on the Superficies of the Water, as they do upon several Foot-stalks also. The Flowers are fair, large and double, that is, consisting of many Rows of Leaves in like manner, inclosed in a Husk, consisting of four Leaves, green on the outside, and white within. The middle Leaves of the Flowers are often, upon the first opening, somewhat folded inwards at the ends, but growing to their Perfection, they grow strait forth; all of them being white in the middle part, and yellowish toward the edges, of a sweet Violet like Smell: in the middle of which, when they begin to decay, a small Head rises up, which growing greater, becomes the Seed-vessel, not much unlike to the first Greater aforegoing, and is as large as a good Medlar; parted on the inside into Cells longwise, containing round Seed, like unto that of Coleworts. This Herb loses both its Leaves and Stalks after Seed-time, especially upon the decay of the Water wherein it grew, and in which it delights, and the Root abides all the Year; for which Reason it may be accounted among the Number of the Perennial Plants.

VIII. *The Places.* The two first are found growing with us throughout all England, in fenny and watery Grounds, in great Pools, in large Ditches of Water, and other standing Waters, in flow running Brooks and Rivers, especially near those Brooks and Rivets sides, and sometimes in their very middle, if the Water is not deep, and the Current soft and smooth. The third grows in Egypt, as also in Florida, and other Southern Climes, agreeing with the Latitudes of those Countries, or lying in the same Parallels.

IX. *The Times.* They commonly flower about the end of May, or soon after in June; and their Seed is ripe in August.

X. *The Qualities.* The Leaves and Flowers of Water Lillies are cold and moist in the end of the first Degree; but the Root and Seed are cold and dry in the first Degree. They are Astringent, Costmetic, Repercussive, Emphractive, and Antispermagenetic.

XI. *The Specification.* White Water Lilly cools Inflammations, abates the Heat of Fevers, procures Rest, stops Fluxes of Blood or Humors, whether of Wounds or of the Belly; cures the Heat of Urine, helps in a Gonorrhoea, stops the Overflowing of the Terms, and extinguishes Venereal Heats and Desires.

XII. *The Preparations.* You may have therefrom, 1. A liquid Juice of the Flowers or Root. 2. A Decoction of the Root. 3. A Syrup of the Flowers or Root, or of their Juice. 4. A Conserve of the Flowers. 5. A Powder of the Seed. 6. An Oil of the Flowers. 7. An Ointment of the Root. 8. A Cataplasm of Leaves or Roots. 9. A distilled Water of the Flowers.

The Virtues.

XIII. *The liquid Juice of Flowers or Root.* That of the Flowers is the finer Juice; but that of the Root is the stronger. It stops Fluxes of the Belly and Womb, and the Overflowing of the Seed in Nocturnal Pollutions. Prevails against Spitting, Vomiting, or Pissing Blood, or the Bloody-flux: and being constantly used for some time inwardly, it is said to extinguish the Seed, and thereby Lust and all Venereal Desires. It cools the Head and Brain, is profitable in Frenzies, and helps the Distemperature of those Parts. And as it cools and binds, so it stops Catarrhs, and cures a Gonorrhoea, or Running of the Reins, and is also profitable against the Whites in Women. Dose one, two, or three Spoonfuls, mixt with a little Red Port Wine, according to Age, Sex, and other Accidents, Morning and Night.

XIV. *The Decoction of the Root in Red Port Wine.* It has all the Virtues of the Juice, but not full out so powerful. It may be taken inwardly from three to eight Ounces, Morning and Night. It is peculiar against Spitting and Pissing Blood, and other Diseases of the Reins and Bladder. If the Decoction is made in Water, it helps against the Strangury, powerfully refills Lust, and abates hot burning Fevers.

XV. *The Syrup of the Flowers or Root, or of their Juices.* It is good against burning Fevers, and Ravings in malign Fevers; and indeed has all the Virtues of the liquid Juice or Decoction, but may be given in double the quantity the Juice is given in. It procures Rest, settles the Brain, and stops Defluxions of Humors upon Wounds, Ulcers, Fistula's, &c.

XVI. *The Conserve of the Flowers.* It has the Virtues of the Syrup, and may be given Morning and Night against Coughs, Catarrhs, Watchings, Pinings, Wastings, and Consumptions, as also to abate Lust. Dose as much as a Chestnut or Wall-nut at a time, washing it down with a little of the distilled Water, sweetned with white Sugar.

XVII. *The Powder of the Seed.* It has all the Virtues of the Root, and may be given Morning and Night, from half a Dram to a Dram and half, in any convenient Vehicle, as Conserve of Sloes, or of Hips, Conserve of Barberries, or in Syrup of the Juice of the Root, &c. It is good against Venereal or Fleishly Desires, destroys Lust, cools the Reins, dries up the Seed, and hinders its Generation, thereby causing Chastity in Man or Woman. Some give it in Water-gruel or Mutton-Broth.

XVIII. *The Oil of the Flowers.* It is made by Infusion or Boiling, with a treble or fourfold Repetition, just as we make Oil of Roses, &c. It is profitable to cool Inflammations and hot Tumors, as also the Inflammations of Wounds and Ulcers, to ease Pains and heal running Sores. It causes Rest and quiet Sleep, represses Venerous Dreams and Nocturnal Pollutions: anoint therewith the Temples, Forehead, Nostrils, Reins of the Back, and Testicles, Evening and Morning. It is good also against black and blew Spots, Yellowness of the Skin, Sunburnings, &c.

XIX. *The Ointment of the Root.* It is made by boiling the bruised Root in Tar till it is crisp, straining it out, and repeating it three times more, adding a little Oil Olive, if it is too thick. It is good against Scurfi, Morpew, Tetters, Ringworms, Serpigo, Mentagra, Scabbiness, Leuce, Leprosy, and such other like Defecations of the Skin. It is said also to be a kind of Depilatory for taking off of Hair: but of this I can say nothing by Experience.

XX. *The Cataplasm of Leaves or Roots.* It is made by beating in a Mortar. Laid upon a Wound, it stops the Bleeding, and if it is burning or hot, it abates the Inflammation: Laid upon the Region of the Back, over the Reins, it gives Ease in Pains thereof, takes away the Preternatural Heat thereof, stops the involuntary Flowing of the Seed, hinders Nocturnal Potutions, and abates Lust, being repeated fresh three or four times in twenty four Hours. It does the same thing, being applied to the Testicles.

XXI. *The distilled Water of the Flowers.* At such times as the Flowers cannot be gotten, a Water may be distilled both from the Herb and Root. It is very effectual against all the Diseases aforementioned, but it cannot have the Strength of the Juice, for which Reason it is to be given in greater quantities, as from three to six Ounces, sweetened with double-refined Sugar, and the often to be repeated, as three or four times a Day, as the Physician shall see fit. Outwardly applied, it cools all sorts of Inflammations, is good against *Anthony's* site, eases Pain proceeding from Heat, as Head-ach, Megrim, Gout, &c. and is much commended against Lentils, Freckles, Sun-burning, Tanning, Yellowness of the Face, black and blew Spots, Scurf, Morpew, or other Delicacies of the Skin, being applied three or four times a Day or more: but it will be much more powerful, if it is mixed in equal quantities with the liquid Juice of the Root.

C H A P. CCCCXLIII.

of LILLY Water Yellow.

I. **T**HE Names. It is called in Greek, *Νουφαλα* *Νουφαλα* *Νουφαλα*: in Latine, *Nymphaea lutea*; and in English, *Yellow Water Lilly*.

Greater Yellow Water Lilly.

II. *The Kinds.* There are three Species of the *Yellow Kind*, viz. 1. *Nouphala* *Νουφαλα* *Νουφαλα*, *Nymphaea lutea major*, The greater Yellow Water Lilly. 2. *Nouphala* *Νουφαλα* *Νουφαλα*, *Nymphaea lutea minor*, The lesser Yellow Water Lilly. 3. *Nouphala* *Νουφαλα* *Νουφαλα*, *Nymphaea lutea minima*, The least Yellow Water Lilly, or Yellow Water Lilly with a lesser Flower.

The Descriptions.

III. *The first, or Greater Yellow Water Lilly.* It has a Root which is great, thick and long, very like unto the Root of the Greater White Water Lilly, set with certain Dents, not blackish on the outside, but whitish, and also white within, of a loose or spongy Substance, and somewhat sweet in Taste, as is that also of the White Kind. This grows likewise much like the Great White, with Leaves almost as large as they, but somewhat longer, and standing on cornered Stalks: the Flowers also which grow upon the tops of the crested Stalks, are not so thick of Leaves as the White, but consist only of five large round or short Leaves, of a shining yellow Color, with a round green Head in the middle, compassed with yellow Threads; which Head, when it is ripe, contains within it greater Seed than those of the White, and more shining; but lesser than Grains of Wheat.

Lesser Yellow Water Lilly.

IV. *The second, or Lesser Yellow Water Lilly.* This has a large Head, but a single Root, with some few Fibres adjoining to it, creeping in the bottom of the Water, and dispersing it self far abroad: from which rise up many long, round, smooth and soft Foot-stalks, some of which do bring forth at their ends, small, fair, round, Buckler-like Leaves, like to the former, but lesser, yet larger than those of the Lesser White sort: on other some of those Foot-stalks, grow pretty Tufts of small yellow Flowers, floating on the Waters as the others do, but yet larger than the Flowers of the small White Water Lilly before described.

V. *The third, or Yellow Water Lilly with a lesser Flower.* which is said to be the Least Water Lilly.

ly. This differs not much from what last described: the Root in this abounds with long Strings, which are strongly fastned in the Mud. The Leaves are smaller than the former, and grow with a sharper Point, and the Flowers are also much less than those, for which Reason, and for Distinction sake, it is called by some, *Nymphaea lutea minor flore parva*.

VI. The Places. They do all of them grow in Pools and standing Waters, well watered broad Ditches, drowned fenny Grounds, sides of shallow Rivers, and in Rivolets having a soft or almost no Stream, and in such other like places in most parts of this Kingdom; and indeed in most places where the *White Water Lilly* grows.

VII. The Times. They all flower commonly in the two last Weeks of May, or beginning of June, and in some places hold on to the end of June; and their Seed is ripe towards the latter end of July, or beginning of August, according as the Seasons may prove.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with those of the *White Water Lilly*, declared in the last Chapter, which having respect to, no more need be said of them in this place.

C H A P. CCCCXLIV.

Of LILLY Convally,

O R,

MAY--LILLY.

I. THE Names. This is an Herb not known to the Greeks, but may well enough be called by this Greek Name, *Κεϊνον των ζυμακων*: in Latine, *Lilium Convallium*: some will have it to be *Lilium Vernum Theophrasti*; others *Oenanthe Theophrasti*, *Callionymus Gesneri*, *Cacalia Loniceri*, and *Ephemerum non Leibale Fuchsj*; but they all of them, for the most part, are mistaken in those Names. In English we call it, *Lilly Convally*, *Lilly of the Valley*, and *May-Lilly*.

II. The Kinds. Authors have given us two special Kinds hereof, viz. 1. *Lilium Convallium flore albo*, The *White Conval Lilly*, or *Lilly of the Valley*, with white Flowers. 2. *Lilium Convallium flore rubente*, The *Red Lilly Convally*, or *Lilly of the Valley*, with red Flowers.

The Descriptions.

III. The first, or *White Conval Lilly*, or *Lilly of the Valley*, with white Flowers. It has a small, slender, stringy Root, which runs far abroad under the Ground, creeping every way, with many small white Fibres, and springing up again in divers places. From this Root rise up together three or four Leaves, one inclosed within another, each of which, when it is open, is long and broad, of a greyish green Color, something resembling the Leaves of the *Small Elleborine*, or *Small Wild White Hellebor*, at the sides whereof, and sometimes from the middle of them, rises up a small, short, naked Footstalk, an Hand breadth high, or somewhat more, bearing at its top, one above another, many small white Flowers, like little hollow Bottles, with o-

pen Mouths, nickt or cut into five or six Notches, running all downwards one way, or on one side of the Stalk, of a very strong sweet Smell, and comfortable to the Memory and Senses; which being past away, turn into small Berries, of a red Color, something like unto *Asparagus*, in which is contained white hard Seed.

• White Conval Lilly.

IV. The second, or *Red Lilly Convally*, or *Lilly of the Valley*, with red Flowers. This in its Root, Leaves, Stalk, Flowers, Seed and manner of Growing, is exactly like the other, and differs from that only in the Color of the Flowers; for whereas those are of a white Color, these are of a fine pale red Color, of a sweet Smell, but not altogether so sweet as the former.

V. The Places. The first grows abundantly Wild in many places of England. Gerard says it grows on *Hampstead-Heath*, not far from London, in great plenty: also near to *Lee in Essex*, and upon *Bushy-Heath*, about thirteen Miles from London; and in many other places. The second is a Stranger in England as to its Original; but both of them (for their excellent Virtues) are nursed up in our English Gardens.

VI. The Times. They both flower in May, and their Berries are ripe in August and September.

VII. Nota. These Plants increase wonderfully, even too fast for the Bigness of some Gardens: they flourish best in the Shade, and in a Soil which is not too fat, or in a mean between rich and poor: if the Earth is too rich, they many times rot and die, and so come to nothing: in a meaner Ground they do better.

VIII. The Qualities. This Lilly is hot and dry in the beginning of the second Degree; strongly Aperitive and Absterive; Cephalick, Neurotick, Stomatick, Antepileptick, Antapoplectick, Antiparalitick and Alexipharmick.

IX. The Specification. It is a peculiar thing against

gainst the Head-ach, Megrim, Lethargy, Vertigo, Epilepsy, Apoplexy, Palsy and Gout.

X. *The Preparations.* Of this Plant the Root is most efficacious; the Flowers next; then the Leaves, which are the meanest part thereof. You may have, 1. *A Juice of the Root or Flowers, or of the whole Plant.* 2. *An Essence of the same.* 3. *An Infusion of Root or Flowers in Wine.* 4. *A Powder of the Root, or Flowers, or Leaves.* 5. *An Oil by Infusion or Insolation.* 6. *A Liquor of the Flowers.* 7. *A distilled Water of Roots or Flowers.* 8. *A Spirit of Roots or Flowers.* 9. *An Errhine.*

The Virtues.

XI. *The Juice of Roots or Flowers, or of the whole Plant.* It strengthens the Brain and Nervous Parts, is good against the Lethargy, Vertigo, Megrim, Falling-sickness, Apoplexy and Palsy, revives the Animal and Vital Spirits, strengthens a weak Memory, and is profitable against the Gout. Dose a Spoonful or two Morning and Night in a Glass of Canary or White Lisbon, snuffing some of it also (as a liquid Errhine) up the Nostrils, every Evening, an Hour before Bed-time.

XII. *The Essence of Flowers or Roots, or both.* It has all the Virtues of the liquid Juice, but of greater Strength, and pleasanter to be taken, and may be given in the same quantity with that, and used in both the same Methods. 'Tis doubtless a Specifick against the Epilepsy and Palsy, and for which Purposes it is not to be despised. If places affected with the Gout be bathed therewith, as hot as can be endured, it gives Ease, and in a short time removes the Disease. Dropt into the Eyes, it eases their Pain, abates their Inflammation, and cures an Ophthalmy, as also that Disease called the Pin and Web.

XIII. *The Infusion of the Root or Flowers in Wine.* It has all the Virtues of the Juice and Essence, but less powerful, and therefore may be given from three to six Ounces, in the Morning fasting, an Hour before Dinner, and last at Night going to Bed. It comforts the Heart and Vital Spirits, strengthens the Brain, and makes a strong Memory. It is good against the Palpitation or Trembling of the Heart or other Members, opens Obstructions of the Bowels, and prevails against Hypochondriack Melancholly, Dullness, Drowsiness, Lethargy, and other cold and moist Diseases of the Head, Brain and Nerves. It so opens Obstructions of the Nervous Parts, and of the Brain, that being taken for some time, it prevents the coming of an Apoplexy, or the Induction of that Disease, by strengthening the Parts, and preventing the Cause.

XIV. *The Powder of the Root, or Flowers, or Leaves.* Inwardly taken, it has all the Virtues of the Juice, Essence and Infusion, but operates not so speedily nor so powerfully as the two first, because the Force or Power thereof is first to be extracted out of the Substance of the Powder, by the Stomach; the which, if the Stomach is weak, will be but very faintly performed. It may be given from half a Dram to a Dram, or more, every Night at Bed-time, in Wine or some other convenient Vehicle; and the same Dose every Morning fasting, in like manner. If it is snufft up the Nostrils, it purges the Head and Brain of superfluous Humors, which proceed from Cold and Moisture, and prevails against all those Diseases of the Head and Brain which proceed from the same. It is an excellent Medicine, and not to be despised.

XV. *The Oil by Infusion or Insolation.* It is made by Infusion of the Flowers or Roots in choice Essence Oil, or rather in Oil of *Benz*, because this lat-

ter Oil never grows ranc. It is made either by Insolation, or Digestion in *Balneo*, or a Sand Heat, for fourteen Days or more, then pressed out, and the Insolation or Digestion repeated thrice more, for the completing thereof. Anointing herewith, it hinders the spreading of the Leprosy, and takes away Scabs and Ringworms, Scurf, Morpew, Yellowness, Tanning, Sun-burning, and other Deformities thereof; and this it does so much the more effectually, if the Parts affected be first well bathed with either Juice or Essence, as hot as the Patient can endure, every time before the Anointing. It gives Ease in the Gout, being anointed upon the Part.

XVI. *The Liquor of the Flowers.* It is thus made according to *Gerard*. Take a Glass, which fill with Flowers of *May-Lillies* or *Lilly Convally*, stop it close with a Cork dipt into Wax, or with a Glass Stopper, and set it in an Ant-hill for a Months space or longer, and then take it out: so will you find a Liquor in the Glass, which decant from the Flowers, and keep it for Use in another Glass close stoppt with a Glass Stopper. Outwardly applied, it gives Relief in the Gout, and other Pains of the Nerves and Joints. Inwardly taken Morning and Night, a Spoonful at a time in a Glass of Wine, or of the Infusion at *Sett. 12.* foregoing, it is an excellent thing against the Epilepsy, Palsy, Lethargy, and other cold and moist Diseases of the Head and Brain.

XVII. *The distilled Water of Roots or Flowers.* Authors ascribe the same Virtues to it which is given to the Juice, Essence and Powder, but as it is much weaker than those Preparations, so it ought to be given oftener, and in larger Doses, as from two Ounces to four or six Ounces, either alone by its self, dulcified with double-refined Sugar, or mixt with some of the Infusion in Wine. If it is dropt into the Eyes, it is said to help their Inflammations, Pin and Web, Cloudiness, Dimness of Sight, but this it more excellently performs, if you dulcify it a little with choice Honey. It is good against Scurf, Morpew, Scabs, Tetters, Ringworms, and other Deformities of like kind, by washing the Parts affected therewith; but it will do it more effectually, if it is mixed with a proportional part of *Oleum Tartari per deliquium*. The Water also eases the Pain and affvages the Swellings coming by the Stinging of Bees, Wasps and Hornets, being applied to the Part. Taken to the quantity of six Ounces, it helps those who are poisoned by the Biting of a Mad Dog; but I am confident that the Juice or Essence being taken instead of it, will be much more effectual: and being drunk for forty Days together, it cures the Epilepsy or Falling-sickness. The same Water drank, is said to help the Strangury, as also the Pain at Heart, the Inflammation of the Liver, and to stop the Overflowing of the Courtes.

XVIII. *The Spirit of the Roots or Flowers.* It may be distilled from new Wine, or from Brandy, after some small time of the Flowers Digestion therein. A Spoonful of this Spirit being drunk, restores Speech to such as have lost it thro' the Dead Palsy: it comforts the Heart, strengthens the Brain, revives the Spirits, fortifies the Memory, and refreshes the whole Human Frame; is good against Faintings, Swoonings, and Palpitation, or Trembling and Beating of the Heart: it is also good against the Epilepsy, Vertigo, Lethargy and Apoplexy; for being drunk with a few Grains of *Pepper*, and two Drams of the Powers of *Lavender*, it is said to prevail against the Apoplexy, cure the Colick, and defend the Heart against the Biting of Mad Dogs, or the Poyson of other Venomous Beasts.

XIX. The

XIX. The Errhine. Take Powder of the Flowers of Lilly Convally half an Ounce, Powder of the Leaves of Asarabacca one Ounce : mix them. It is to be snuffed up the Nostrils every Night, an Hour or Hour and half before Bed-time, because it wonderfully purges the Head, Brain, Original of the Nerves and Ventricles, of the Recrements of those Parts, and of all cold and moist Humors, so it wonderfully opens all the Parts adjacent, whereby the Patient is made apt to get Cold upon the least occasion ; for which Reason the Use of it is ordered by the Physician, to be a little before Bed-time, that the Patient going to Bed may prevent the same. It is used in the Cure of Rheumatisms, Megrim, inveterate Head-ach, Epilepsy, Apoplexy, Palsy of the Head, Lethargy, Vertigo, Obstructions of the Brain, being daily applied with a *Continuando*, for so long time as the Physician shall see fit.

LILLY-LEEK. See Moly, Chap.

LILLY-ROYAL. See Penny-Royal, Chap.

LIME-WORT. See Catchfly, Chap. 112.

C H A P. CCCCXLV.

Of LIMONADE,

OR,

Sea Marsh BUGLOSS.

I. **T**HE Names. It is called in Greek, *Λευκάνθη* & *Νεγκεδής* *Dioscoridis*, because it grows in *λεκανίαι*, in pratis riguis, vel palustribus : in Latine, *Limonium*, I suppose from the Greek Name, tho' some will have it to be from *Malus Limonia*, the Limon-Tree, because the Leaf of this Plant is something like to the Leaf of the Limon-Tree. In English, *Limonade*, and *Sea Marsh Bugloss*. Gerard calls it *Sea Lavender*, which is an improper Name, for that it has no Resemblance to *Lavender* of what Kind soever.

II. The Kinds. Mr. Ray makes eleven Species of this Plant, Parkinson seven, Gerard but four ; yet in our late Times, a greater Number has been found out, as appears from Mr. Ray's *Historia Plantarum*. But many of them grow neither upon our British Shores, or in our British Marshes, nor yet in any of our Plantations in the West Indies ; and some of them seem to differ in their Effects from the more common and usual, so that no Virtues have been assigned them : of all these we have nothing to say in this Work ; those which we intend, are, 1. *Limonium majus vulgatum*, *Valeriane rubre similis* *Dodonæi*, Our Common Limonade, or Sea Marsh Bugloss, (which some Apothecaries formerly mistook for *Ben* or *Behen rubrum*, whereas it is no such thing.) 2. *Limonium Medium Anglicum*, Colchester Limonade, or Marsh Bugloss. 3. *Limonio congener* *Clusii*, The hollow-leaved Plant of Clusius, or Limonade of Virginia : of which three Kinds we have already treated at large in Chap. 97. foregoing ; but some few following, which we omitted in that Chapter, we shall treat of here, viz. 4. *Limonium parvum*, Small Limonade, or Small Rock Bugloss. 5. *Limonium folio sinuato*, *Limonium Peregrinum*, *Rauwolfii*, Limonade with indented Leaves, or Spanish Sea Marsh Bugloss.

Common Limonade.

The Descriptions.

III. The first, or Common Limonade, or Sea Marsh Bugloss. We have already largely described this Plant in Chap. 97. but some few Observations more offer themselves to Consideration, and therewith a more elegant Cut of the Plant. The Root then is thick and long, somewhat like unto a Small Red Beet Root, or Small Dock Root. From this spring up several fair, long, thick, flat, green Leaves, like to those of the Limon or Orange Tree, but of a darker green, and sometimes a little crumpled, or not much unlike to those of the Small Beet. From among these Leaves spring up several naked, hard, brittle Stalks, of a Foot or Foot and half high, divided towards the top into sundry other small Branches, which Branches grow for the most part upon one side of the Stalk, and are replenished with many small blewish purple Flowets, somewhat like unto Bugloss Flowers, but that they are less, or as some Authors say, in shew like to *Lavender* Flowers, which Flowers grow also, all of them for the most part, on one side of the said Branches ; which being passed away, long red Seed follows, contained in the Husks which the Flowers stood in before. See the Figure annexed.

IV. The fourth, or Small Limonade, or Small Rock Bugloss. This differs but little from the first, saving that it grows much lower : It has a small long reddish Root, parted at the top into several Points ; from whence come forth in a kind of Tuft, a number of small, thick, fat, smooth, and somewhat roundish Leaves next the Ground, in form and manner of a small *House-Leek*, some of the Leaves being not pointed at all. It grows not above six Inches high, the Stalks being some higher, and some lower than others, bare, and without Leaves to the tops, where they spread into several small Branches, bending a little backwards, bear-

ing a number of small Flowers, of a reddish or faint reddish blew Color.

V. *The fifth, or Limonade with indented Leaves, or Spanish Sea Marth Buglofs.* It has a long slender Root, with some few Fibres adjoining. From the Head of which Root spring forth long green Leaves, lying spread upon the Ground, being also deeply finuated or indented on both sides, and somewhat rough. From among these Leaves grow up the Stalks, welved with slender indented Skins: towards their tops they are divided into several Branches, after the manner of the Ordinary Kind; but these Branches are also winged, and at the tops they carry Flowers, some four, five, six, or more clustering together, consisting of one thin, crisp, or crumpled Leaf, of a light blew Color, (which continues long, if you gather them in their perfect Vigor, and to dry them) and in the midst of this blew, comes up little white Flowers, consisting of five little round Leaves, with some white Threads in the middle.

VI. Or thus, as *Parkinson* describes it. This Limonade of *Rauwolfius*, has a Root which is small and long, and blackish on the outside, perishing at the first approach of Winter. From this Root spring forth many long, narrow, and somewhat rough Leaves, lying upon the Ground, waved or cut in on both sides like an Indenture, something like the Leaves of Ceterach or Spleen-wort: among which rise up two or three Stalks, somewhat rough also, and with thin Skins like Wings, indented on both sides thereof also, like the Leaves, having three small, long, rough, and three-square Leaves at every Joint, where it branches forth; at the tops whereof stand many Flowers, upon their Foot-stalks, in such a manner as is not seen in any other Plant: for altho' that some of the small winged Foot-stalks, are shorter and some longer, standing as it were flat-wise, or all on one side, and not round like an Umbel, yet are they even at the top, and not one higher than another; each of which small Foot-stalks do bear four or five greenish Heads or Husks, joined together; out of each of which do arise other pale or bleak blew stiff Husks, as if they were Flowers, made as it were of Parchment, which hold their Color after they are dry, a long time. And out of these Husks likewise do come (at several times one after another, and not all at one time, or together) white Flowers, consisting of five small round Leaves, with some white Threads in the middle. After these Flowers are past, there come in their places small long Seed, enclosed in many Husks, many of those Heads being unfruitful, or not yielding any good Seed, but Chaff, especially in our Country, for want of a sufficient Heat of the Sun.

VII. *The Places.* The first grows in several Mathes and moist places in *Kent*, as is related in *Cap. 97. Sect. 8.* foregoing. The fourth grows upon the Chalky Cliff going from the Town of *Margate* in *Kent*, down to the Sea side, on the left Hand. The fifth was first observed by *Rauwolfius* at *Joppa* in *Syria*: it grows also on the Coasts of *Babry*, and *Cadix* in *Spain*, from whence it has been brought to us, and is now nursed up in our Gardens.

VIII. *The Times.* They most usually flower in *June* and *July*, and yield their ripe Seed the next Month after.

IX. *The Qualities, Specification, Preparations, and Virtues,* are much the same with those of the first Kind, which we have declared at large in *Cap. 97. Sect. 10. ad 17.* foregoing.

C H A P. CCCCXLVI.

of LIONS-FOOT,

OR,

LIONS--CUDWEED.

Called also,

Mountain COTTON-WEED.

THE Names. It is called in *Greek*, *Λεοντόπους*, *δὲ Κηφῶ*: in *Latine*, *Leontopodium*, and *Cemos* or *Camos*; and in *English*, *Lions-foot*, *Lions Cudweed*, and *Mountain Cotton-weed*, or *Cudweed*. Some affirm, That the Title of *Leontopodium* is not found in some Copies of *Dioscorides*, but only *Cemos* or *Camos*; but by that it may appear, that *Leontopodium* and *Cemos* are one and the same thing; which latter Name you may also find in *Pliny*, *lib. 27. cap. 8.* where he speaks of *Cutenance*, which was only used about Love Matters.

II. *The Kinds.* This Plant is certainly a Species of the *Cudweeds* or *Cotton-weeds*; tho' various Authors speak variously of the Plant to which the Name *Leontopodium* properly belongs, or which should be the right; some accounting one Plant, and some another, and some none, to which it has been yet applied. *Lonicerus* has his *Leontopodium*, which is the *Echium scorpioides palustre Bauhini*, or the *Myosotis scorpioides Lobelij*. *Apuleius*, *Ætius*, and *Oribasius*, will have it to be *Leontopetalon*, or *Lion-leaf*; but that it is not, however for Satisfaction sake, we will describe that Plant in the third place of this Chapter. *Cusius* (from *Josephus de Casabona*) applied it to some of the *Hololeucums* or *Sea Plantanes*, by the Name of *Leontopodium Creticum*, which is also far from the true thing. *Bauhinus* fixes the Herb for the true *Leontopodium Dioscorides*, but with *Lugdunensis*, thinks *Pliny* his *Leontopodium* to be much differing from that of *Dioscorides*, and that those of *Matthioli*, *Lobel*, and others, are only Kinds of *Gnaphalium* or *Cudweed*, as we here determine them. *Brunsellius* makes our *Achymilla* or *Ladies-Mantle* to be it, as is hinted in *Cap. 421.* foregoing, but that is not the *Leontopodium Dioscorides*, nor any ways agrees with his Description of the Plant.

III. *The Kinds of this our Lions-foot.* There are two sorts which Authors have taken notice of, *viz.* 1. *Leontopodium majus*, *Pes Leoninus major*, The greater Lions-foot, or Mountain Cotton-weed. 2. *Leontopodium minus*, *Pes Leoninus minor*, *Pes Leonis minor*, The lesser Lions-foot, or Mountain Cudweed. 3. To these we add, (tho' not of the Stock or Kindred) for the Name sake, *Λεοντοπέταλον*, *folium Leonis*, *Lions-Leaf*, *Lion-leaved Turnep*, and *Black Turnep*. This *Apuleius* and *Ætius* calls *Leontopodium*, but how truly, may be seen, if compared with the Description of the first Kind of that Name. It is also called in *Latine*, *Rapicium*, *Papaverculum*, *Brumaria*, *Semen Leoninum*, *Pes Leoninus*, and *Pata Leonis*, but very improperly these three latter; the last save one, belonging to the first and second foregoing, and the last of all, to the Plant called *Achymilla*, or *Our Ladies-Mantle*.

The Descriptions.

IV. *The first, or Greater Lions-foot, or Mountain Cotton-weed.* It has a Root which is small and long, and

and something woody, with several Strings and Fibres adjoining to it. From this Root spring forth several small and something narrow Leaves, lying upon the Ground, hoary or woolly all over, yet more hairy white underneath than above: the Stalks rise up above half a Foot or more high, set with such like Leaves thereon unto the tops, where stands one great brown Head apiece, compassed about with many woolly or hoary white Leaves, representing the hairy Foot of a Lion, Hare, or Dove, or such like Creature, from whence came the Name. Out of this Head comes forth many short Threads, which make the Flowers seem to have Holes therein, in which lies afterwards small brownish Seed, wrapped up in so much Down, that it is hardly to be found or seen.

V. The second, or Lesser Lions-foot, or Mountain Cudweed. The Root is small, long, a little woody, with several Strings or Fibres adjoining to it. It rises up with one Stalk for the most part, with several Leaves thereon, somewhat longer, but not broader than the former: at the tops whereof stand divers woolly Leaves, and in the middle of them, three or four or more Heads of Flowers, like unto the other Small Cudweeds, consisting of Thrums, of a pale yellow Color, with some black Hairs among them; after which follows the Down, as also the Seed like the other.

Lions-Leaf.

VI. Lions-Leaf, Lions-leaved Turnep, or Black Turnep. The Root of this Plant is tuberos, somewhat like to a Turnep, or Sow-Bread, or Great Ground-Nut, being of a blackish grey Color, with several small Bunches or Knobs on the sides; from whence spring up several large and long Leaves, much divided or cut into divers parts, (like unto Coleworts or Poppies, as Dioscorides says, or more like unto Peony Leaves, as Pena and Lobel say, but we find they are more jagged or cut in) of a dark yellowish green Color, as it grows with us, but of a darker yellow Color in those places where it is a Native, coming nearly unto the Color of a Lion's

Skin or Hair; from whence it is supposed came the Name of Lions-Leaf, more than from the Form. From among these Leaves spring up a straked Stalk, spotted with pale purplish Lines and Strakes, divided into many Branches, set at the Joints with smaller Leaves, and lesser cut in: on the tops of which stand several small Flowers, made of five Leaves apiece, of a dark or brownish yellow Color, red like an Anemone on the outside; and therefore called by some *Artemisa*, as Dioscorides says, and yellow on the inside: after which come small Pods, thicker and shorter than those of Hollow-Root or Radix Cava, in which is contained small round Seed.

VII. Gerard thus describes it. The Root is great, roundish like a Turnep, and black without: From which spring forth broad Leaves, like unto Coleworts, or rather like unto Peony, cut and divided into several great Gashes. The Stalk is two Feet long, thick, and full of Juice, dividing it self into divers Branches or Wings; in the tops whereof there stand red Flowers, which being passed away, red Cods come in their places, in which lies the Seed, like unto Tares or Wild Chiches.

VIII. The Places. The first has been found growing on the Alps of Germany, and on Mount Baldus in Italy. The second on divers Mountains in Germany and Italy also. The Lions-Leaf is a Native of Syria, Grecia, Candia, Naples, &c. but they are all of them nursed up with us in Gardens.

IX. The Times. The two first flower in July, and sometimes in August. The last in Winter-time in Candy, as Bellonius says; but with us very late.

X. The Qualities, Specification, Preparations and Virtues of Lions-Foot or Mountain Cudweed, are the same with those of our Common Cudweed, which we have expressed at large in Cap. 180. Sect. 8. ad 15. foregoing. Parkinson says, that the Taste hereof being astringent and drying, with some Bitterness in it also, does signify, that it is very available against all Fluxes of Blood or Humors; as also very effectual for all Sores, either green Wounds or old Ulcers, and conducive for whatsoever Cures the other Cudweeds may be applied to.

XI. A Decoction in a Lixivium of Pot Ashes. It cleanses the Hair from Nits and Lice: and being made not too strong, it is good against Scurf, Morpew, Leuca, Leprosy, Yellowness, and other Deformities of the Skin.

XII. A Decoction in Wine. Being drunken, it kills Worms, and expels them; and is prevalent against the Bitings and Stinging of Serpents, and other Venomous Creatures.

XIII. The Fume of the Herb. Being taken as Tobacco, in a Tobacco-pipe, it is good against the Cough of the Lungs, cleanses the Thorax of pituitous Matter, and eases vehement Pains of the Head.

OF Lions-Leaf.

XIV. The Qualities. It is hot and dry in the third Degree; Absterfiv, Digestive, Vulnerary and Alexipharmick.

XV. The Specification. It cleanses old and filthy Ulcers; is profitable against the Sciatia, and is an Antidote against Poyson, the Bitings of Serpents and other Venomous Creatures.

XVI. The Preparations. You may make therefrom, 1. A liquid Juice or Essence of the Root. 2. A Decoction of the same in Wine. 3. A Powder of the older and greater Roots. 4. A Clyster. 5. A Cataplasm of the Root.

The Virtues.

XVII. *The liquid Juice or Essence of the Root.* Taken from three to six Spoonfuls in a Glass of generous Wine, it refits and expels Poyson, and is prevalent against the Bitings of Vipets and other Serpents, &c. It presently profligates the Poyson, and eases the Pain. It is also good to wash old Sores and Ulcers, to cleanse, dry, and induce their Healing.

XVIII. *The Decolion in Wine.* It has all the Virtues of the liquid Juice or Essence, but less efficacious, and therefore may be given from four to eight Ounces, *pro re nata*, Morning and Evening. It is singularly good against Obstructions of the Lungs.

XIX. *The Powder of the Root.* *Rauwolfius*, in his *Heedoporico* or *Journal*, says, that the Inhabitants in and about *Aleppo*, do use the Powder of the older and greater Roots, to take away Spots out of their Garments, by rubbing them therewith: by this it appears, that it is of a very absterfve Nature.

XX. *The Clyster.* It is made by mixing the Juice with Mutton-Broth, in equal quantities. It is exhibited to give Ease in the Sciatica: it moves the Bowels, and cleanses them of putrid Excrements.

XXI. *The Cataplasma of the Root.* Applied to indigested Wounds, Sores, and Ulcers, it causes Digestion, then cleanses and dries them, and so induces their Healing.

ny thick and short Leaves on them, sharp at the ends, having sometimes Branches rising therefrom, and sometimes two or three Stalks from the Root; which at the tops are set with longer Flowers than those of *Broom Rape*, and on longer Foot-stalks, each standing in a Husk, with a long Thread as it were growing out of the Flower, which turns up again. The whole Stalk, Leaves, and Flowers, are of a blewish purple Color.

V. *The third, or Branched Lions-Tail.* It has a stringy fibrous Root, like the former; from whence springs up a Stalk, which is branched forth several ways, (and yet many of these Herbs are found with single and unbranched Stalks, those with branched Stalks being or growing for the most part lower than the others, which are unbranched:) they are of differing Colors, some whitish, some more yellow, some brownish yellow, and some blewish or purplish, for so they are found in several places. *Bauhinus* takes notice of a small sort hereof, which grows lower, under Fir-Trees, Pine-Trees, and Pitch-Trees, differing in nothing else but in being of a darker Color, and the Flowers whiter.

VI. *Nota.* These Kinds of Plants are Excrefcencies of the Earth, of which the Ancients knew but one or two sorts, viz. *Hypocissis* from *Cissus*, and *Orobanche* or *Broom-Rape* from *Broom*: but latter Times have discovered more, of which these three above-described are chief: some (because they are Excrefcencies of the Earth) would have them to be *Mushromes*; but such they are not: some a Species of *Orchides*, because their Flowers and Seed do more near resemble some of the Kinds; but from these they also manifestly differ: for which Reasons I judge them to be Plants of their own Kinds.

VII. *The Places.* They grow many times from the Roots of several Herbs, and by their Juiciness, draw forth their Nourishment, thereby spoiling them: they are sometimes found in Corn-Fields, also among *Pulse*, *Hemp*, &c. and sometimes also among Grass and Herbs by the sides of Hedges, and under the Shadow of Trees, and many times also in places which are not shadowed, where the Earth has a natural kind of Moisture in it.

VIII. *The Times.* They flourish in May and June; but some have been found to flower in July and August.

IX. *The Qualities, Specification, Preparations, and Virtues,* are the same with those of *Broom-Rape* in Chap. 86. *Sett. 6. ad 14.* to which you are referred. *Galen* says this Plant is cold and dry in the first Degree. And *Dioscorides* says, that in his time it was used to be eaten as other Herbs are, either raw or boiled with *Pulse*, which would help their Digestion.

C H A P. CCCCXLVII.

of LIONS--TAIL,

O R,

KILL--HERB,

O R,

HERB--BANE.

I. *THE Names.* It is called in Greek, *Ἀγρίων*, and by *Dioscorides* *Οὐσβαρυς*: in Latine, *Hemodorum*, *Limodorum*, *Orobanche*, and *Cauda Leonis*: in English, *Lions-Tail*, *Kill-Herb*, and *Herb-Bane*.

II. *The Kinds.* There are three sorts of this Plant, viz. 1. *Hemodorum vel Limodorum majus*, *Cauda Leonis major*, Great Lions-Tail of Mompelier. 2. *Hemodorum vel Limodorum majus, vel Cauda Leonis flore majore purpurascens*, Great purple Lions-Tail. 3. *Hemodorum vel Cauda Leonis, vel Orobanche ramosa*, Branched Lions-Tail.

The Descriptions.

III. *The first, or Great Lions-Tail of Mompelier,* has a long and round small Root, without Scales, and with some Fibres under it. The Stalk is great and thick, with very short Leaves thereon, from the bottom unto the middle thereof, where the Flowers begin to grow; and with every one of them a larger and longer Leaf. The Flowers are long, and of a brownish Color.

IV. *The second, or Great purple Lions-Tail.* This has such a like Root, with Fibres thereat, as the former; which sends forth several Stalks, with ma-

C H A P. CCCCXLVIII.

of LIQUORICE Garden and Wild.

I. *THE Names.* It is called in Arabick, *Sus*: in Greek, *Γλυκύριζα*: in Latine, *Glycyrrhiza*: in English, *Liquorice*.

II. *The Kinds.* It is twofold, viz. 1. *Γλυκύριζα κωνιακή*, *Glycyrrhiza hortenstis*, Garden Liquorice. 2. *Γλυκύριζα ἀγρία*, *Glycyrrhiza sylvestris*, Wild Liquorice. Of the Garden Liquorice, there are two Kinds, viz. 1. *Glycyrrhiza hortenstis*; *Liquiritia officinarum*; *Dulcis radix Tragi* and *Cordi*; *Glycyrrhiza*

Glycyrrhiza siliquosa Lobelij; *Glycyrrhiza levis* & non *echinata* & *Germanica aliorum*; Our Common English Liquorice. 2. *Glycyrrhiza Dioscoridis*; *Glycyrrhiza echinata Dioscoridis*, *Lobelij*, & *Lugdunensis*; *Glycyrrhiza Italica Gesneri* & *Podonci*; *Herba Scythica Theophrasti*; *Glycyrrhiza Matthioli*, & *Glycyrrhiza aliorum*; *Dioscorides* his Liquorice. The Wild Liquorice is also twofold, viz. 3. *Glycyrrhiza sylvestris Gesneri in hortis*, *Camerarij* & *Dalechampij*; *Polygonum Cordi* apud *Dioscoridem*; *Polygonum Cordi*, by *Ibalius*; *Glaux*, & *Glaux vulgaris Lobelij* & *Clusius*; *Fanum Gracum sylvestre Tragi* & *Podonci*; *Glycyrrhiza sylvestris floribus luteis pallescentibus Bauhini*; *Hedysarum Glycyrrhizatun Gerardi*; *Glaux vulgaris leguminosa Parkinsoni*; The most Common Liquorice Vetch. 4. *Glycyrrhiza sylvestris Ibaliij*, *Glycyrrhiza sylvestris alia Camerarij in horto*; *Glaux Lobelij*, & *Glaux quadam Leguminosa herbariorum Lobelij*; *Glycyrrhiza sylvestris altera floribus punctatis foliis Arabi Bauhini*; *Glaux altera Leguminosa*, The other Liquorice Vetch.

Common English Liquorice.

The Descriptions.

III. The first, or Our Common English Liquorice. It has a Root which grows deep into the Ground, as large as a Man's Thumb, or larger, at the Head thereof, and spreads it self out into divers other long Roots, downwards and sideways, by which it much increases; of a brown Color on the outside, and yellowish within, of a very sweet Taste. From the Head of this Root rises up many round woody Stalks, set at several distances with many winged Leaves, made of many small long ones set on both sides of a middle Rib, very well resembling the Leaves of a young Ash sprung up from the Seed; and having an odd Leaf at the end. This Plant, by many Years continuance in a place, without remo-

ving it, and not else, will bring forth Flowers, many standing together, Spike-fashion, one above another upon the Stalks, of the Form of Pease-Blossoms, but of a very pale or bleak blew Color, which convert into long and somewhat flat and smooth Cods, containing three or four small, round, hard Grains or Seed within them. The sweet Taste of this our English Liquorice Root, is much more pleasing to us, than that of the Out-landish or Spanish Liquorice, (which we shall describe in the next place) because that being of a stronger sweet Taste, has a kind of Bitterness joined with it, which makes it something less acceptable and pleasing.

Liquorice of Dioscorides.

IV. The second, or Dioscorides his Liquorice, (which is indeed the Italian and Spanish Liquorice. The Root of this grows as deep or deeper than the other, but branches not under Ground like it, but is of one smooth continued Length, and of a stronger sweet Taste, with a little Tang of Bitterness at last. This Spanish Liquorice grows in the same manner which the other does, with the like Leaves and Flowers. It rises up to two or three Cubits in Height, and is beset with Leaves of an over-worn green Color, consisting of many small Leaves, set upon a middle Rib, like the Leaves of *Colutea* or the *Mastick Tree*, somewhat glutinous in handling: from among which come up small Knobs or brown Heads, like to the Burs of the *Platanus*, or *Plane-Tree*, as *Dioscorides* compares them, which grow upon short Stems or Foot-stalks, between the Leaves and the Branches, clustering together, and making a round Form or Shape; out of which grow small blew Flowers, of the Color of an English *Hyacinth*, after which succeed round prickly Heads, consisting of many rough scaly Husks or Cods, closely and thick compact together, being rough like those of *Lentils*; in every of which Cods is contained one black Seed. This Liquorice grows in the same manner which the former does, with the like Leaves and Flowers, saving that these are of a deeper blew Color, and growing for the most part at the tops

of the Branches, in round rough Heads, as before described.

V. *The third, or Most Common Liquorice Vetch.* It has a Root which is thick and long, dividing it self into two or three long Strings, running very deep into the Ground, sweet in Taste, like unto Liquorice Root, which dies not, but abides long, shooting forth new Branches every Year in the Spring. From the Head of this Root spring forth many weak, round, hard Stalks, trailing on the Ground, branched upwards, set somewhat thick with winged Leaves, made of many small ones, set on both sides a middle Rib, something like to a Vetch or Tare, but much larger and pointed. The Flowers come forth at the Joints, at the end of a long Stalk, many together, of a bleak white Color, tending to yellow; which being passed away, crooked Cods come in their places, containing two Rows of Seed, cornered and greyish, of the Taste of other Pulses.

VI. *The fourth, or Other Liquorice Vetch.* Its Root is like the last foregoing, growing deep and spreading, and as sweet as the former, inasmuch that Thallus says, that this Plant is very like to the True Liquorice, excepting in some few things. This Wild Liquorice rises up also with such like Stalks and Leaves as the last, but spreads not so far, nor leans down so much, nor are the winged Leaves altogether so large; but they are of a darker green on the upper side, and grey underneath. The Flowers are of a purplish Color, and the Cods are of a brownish Color, long and round; and the Seed within them more round.

VII. *The Places.* The first sort of Liquorice grows plentifully in Germany, about Nuremberg, and is planted with us in England in Gardens: in the Northern parts of this Kingdom, it is manured with great Care and Diligence, where it is produced in very great plenty, replanting it once in three or four Years. The second grows plentifully in Spain, Italy, and France; but with us only in Gardens. The third grows in many places of Cambridgeshire, in Clarendon Park by Salisbury, and at Thrapston in Northamptonshire; and in many other places of our Land. Gerard says he found it growing in Suffolk, in the Highway on the right Hand as you go from Sudbury to Corner Church, about an hundred Paces from the end of the Town, and in several other places of the same County; and in Essex, about Dunmow; and in the Towns called Ware and Hemmingham: it grows also by Purfleet, about the foot of the Hill on which the Wind-Mill stands, and in several parts of Kent. The fourth grows Wild in Germany, but has not been found in England, except nursed up in Gardens.

VIII. *The Times.* Gerard says, that the two first flower in July, and their Seed is ripe in September: the other in June, and that their Seed is ripe in August; but Parkinson says they flower with us late, and seed as late, if at all.

IX. *The Qualities.* Liquorice (the Root which is chiefly used in Physick) is temperate in respect to Heat, Coldness, Dryness or Moisture: if there is any thing of Intemperature in it, it is something hot and moist. It is a little Absterfivè, Diuretick, Relaxivè and Traumatick; Pectoral, Nephritick, and Analeptick.

X. *The Specification.* It is prevalent against Coughs, Colds, Wheezing, Hoarseness, Obstructions of the Lungs, Catarrhs, Consumptions, Strangury, Obstructions of the Reins and Bladder, Ulcers of the Bladder, &c.

XI. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Inspissate Juice. 3. A Decoction. 4. A Pissum. 5. A Lohoch. 6.

An Electuary Compound. 7. A Powder. 8. A Spirituous Tincture. 9. An Acid Tincture.

The Virtues.

XII. *The liquid Juice.* It may be given from a Spoonful to two, every Morning fasting, an Hour before Dinner, and at Bed-time, in a Glass of soft Wine, against Coughs, Colds, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and all sorts of Obstructions of the Lungs, causing easy Expectoration: it also provokes Urine, cleanses the Reins, Ureters and Bladder, takes away the Heat of Urine, and gives Ease in the Strangury.

XIII. *The Inspissate Juice.* It comes from Spain, and ought to be sliced very thin, or bruised in a Mortar into gross bits. Take of this Juice thus prepared an Ounce, fair Water a Quart, boiling hot, or White Lisbon Wine, spring Water, of each a Pint: mix, and put this on boiling hot upon the sliced or bruised Liquorice: let them stand two, three or four Days without the least stirring them, so will all the Tincture or fine Juice of Liquorice rise up into the Body of the Water, or Water and Wine, leaving only unprofitable Feces at bottom: decant this clear Tincture into another Vessel, without the least disturbing the Feces or Bottom, which keep for Use, casting the Feces away as a thing of no worth. It has all the Virtues of the liquid Juice, but is vastly finer and purer than it. It may be given from two to four or six Spoonfuls, in all the Cases or Distempers before-named. It is a singular good thing against Catarrhs, Consumptions, Ulcers of the Lungs, Ulcers of the Reins and Bladder, &c. being frequently taken according to the Direction of the Physician.

XIV. *The Decoction.* It has the Virtues both of the Liquid and Inspissate Juice, but is much weaker, and therefore must be given in larger quantities. It may be made by boiling bruised Liquorice in Wine, or in Water and Wine, or in Water alone, in which last, if it is boiled with a little Cinnamon added to it, it serves instead of Drink in many places, especially if it is set to work with Yeast, as Ale or Beer is, and then Tun'd up, which in a small time will become clear, strong and heady, as Ale and Beer do.

XV. *The Pissum.* Take Liquorice well bruised four Ounces, Maiden-hair three Ounces, Figs six three Ounces, spring Water three Quarts: boil till half is consumed, strain out, and keep it for Use. It is good for such as have a dry Cough, digests Flegm and corrupt Humors in the Lungs, and causes Expectoration: it helps Catarrhs and salt Distillations, also Consumptions, and is prevalent against all the Diseases for which the Liquid and Inspissate Juices are applied to. Dose four or six Spoonfuls.

XVI. *The Lohoch.* It is made of the Spanish Juice, by extracting its Tincture with Rose Water, and making it thick with Gum Tragacanth, evaporating away the Water to a due Consistency. It is good against Hoarseness, Wheezing, and all manner of Roughness of Mouth or Throat: it helps to expectorate tough Flegm, and to condense thin Humors falling into Throat and Mouth.

XVII. *The Electuary Compound.* Take five Powder of Liquorice twelve Ounces, fine Powder of Elecampane eight Ounces, Ginger in fine Powder four Ounces, Black Pepper in fine Powder two Ounces: mix them, and with Honey a sufficient quantity make an Electuary. Dose from half a Dram to a Dram every Night at Bed-time, every Morning fasting, and an Hour before Dinner, washing it down with a Glass of generous Wine, or Wine mixt with Water.

ter. It comforts and warms a cold Stomach, causes a good Appetite and Digestion, and is one of the best things in the World against a vehement Cough, an inveterate Catarrh, prevails against Wheezing, Hearnels, and Shortness of Breath, and a singular Remedy against Consumptions and Ulcers of the Lungs. I commend it to all Consumptive People, and such as are troubled with Catarrhs, Coughs, and Shortness of Breath, as a Jewel.

XVIII. *The Powder.* It may be given to a Dram or more: it has all the Virtues of the liquid and insipid Juices, Decoction and Pissane. The fine Powder blown thro' a Quill into the Eyes which have a Pin and Web, as they call it, or are troubled with a Diffillation or Rheum, does cleanse, clear, and heal them.

XIX. *The Spirituous Tincture.* It has all the Virtues of the liquid and insipid Juices; but it is said to be a Specifick for curing Ulcers of the Stomach, Lungs, Bowels, Reins, Ureters and Bladder. Dose Morning, Noon and Night, from one Ounce to two. It is made of the Extract of the *Spanish Juice*, made with Water and insipidated again to the Thickness of new Honey, by digesting it in a gentle Sand Heat, mixt with very good Brandy.

XX. *The Acid Tincture.* It is more Stomachick than the former, and more Absterfive or Cleansing; and if the Tincture is made very strong, so as the Body of the *Menstruum* is full of it, it will be of an extraordinary Force to heal internal Ulcers, more especially if as much pure or clarified Honey is mixed with it, till it becomes thick like a Balsam. This being often lickt of, does Wonders in curing Ulcers of the Lungs, as also Ulcers of the Reins and Bladder. A Wise Physician well knows what extraordinary Uses this Medicament will serve for.

XXI. *Nota.* The two last *Wild Kinds*, tho' they may possibly have the same Virtues with the *True Liquorice*, of which we have hitherto spoken; yet they have not been used in Physick, In Husbandry, as they increase much, so they make Ground rich, and may be made very profitable to the Husbandman, because they become an admirable sort of Food for Cattel of all sorts.

CHAP. CCCCXLIX.

Of LIVER--WORT Common or Great.

Called also

Ground LIVER--WORT.

THE Names. It is called in *Arabic*, *Azer* and *Alfachel*; in *Greek*, *Aschyr*; in *Latine*, *Lichen*, *Lutium* of some, *Hepatica*, and *Jecoraria*: in *English*, *Liver-wort*.

II. *The Kinds.* There are two principal sorts thereof, viz. 1. *Lichen*, five *Hepatica vulgaris*, *Hepatica major*, The Greater or Common Liver-wort, Great or Common Ground Liver-wort: of which in this Chapter. 2. *Lichen*, five *Hepatica minor*, Small Liver-wort: of which in the following Chapter.

The Descriptions.

III. *The Common or Great Ground Liver-wort,* *Its Roots which are very fine and small, whereby it*

lives, and with which it draws its Nourishment. It grows close, and spreads much upon the Ground in moist and shadowy places, with many sad green Leaves, lying, or rather as it were sticking flat one upon another, very unevenly cut in on the edges, and crumpled; from among which rise up small slender Stalks, an Inch or two high at the most, bearing small Star like Flowers at the tops.

Common or Great Ground Liver-wort.

IV. *The Places.* It is often found in moist and shadowy places upon the Surface of the Ground, and in moist places near Highways, and other common Paths, where the Beams of the Sun seldom come, and in places not often frequented by Travellers, as also on shadowy and moist places on Rocks and Rocky Grounds, &c.

V. *The Times.* It brings forth its blazing Stars and Leaves oftentimes in *June* and *July*.

VI. *The Qualities.* It is cold and dry in the first Degree, and somewhat Astringent or Binding.

VII. *The Specification.* It is a peculiar thing against the Rickets in Children, to allay Inflammations, cure the Yellow Jaundice, to help the Gonorrhoea in Men, and the Whites in Women.

VIII. *The Preparations.* You may have therefrom, 1. A liquid Juice or Essence. 2. A Decoction. 3. A Syrup. 4. An Ointment. 5. A Cataplasm.

The Virtues.

IX. *The Juice or Essence.* It is singular good against the Inflammation or Heat of the Liver, being taken from two Spoonfuls to four in clarified Whey or Barley Broth: it cures the sharp Fits of Agues, and Tertians which proceed of Choler. I have known several Children which have been troubled with the Rickets, (which the Vulgar call Liver-grown) to be cured by the constant taking thereof for some time. It cools the Inflammation of the Tongue, as also the Yellow Jaundice, which proceeds from an Inflammation of the Liver. It cools also the Heat of the Reins and Bladder, and cures a Gonorrhoea in Men, and the Whites in Women: and

and bathed often upon Tertars and Ringworms, and other running Sores and spreading Scabs, it is said to dry and heal them.

X. *The Decolition.* It may be made in Water or Wine, according to the Nature of the Disease. It has all the Virtues of the Juice or Essence, but much weaker, and therefore is to be given in a greater quantity, as from a quarter of a Pint to half a Pint, and that Morning and Evening.

XI. *The Syrup.* It is made of the Juice with Honey or Sugar. It has all the Virtues of the Juice, but is chiefly made for Children which have the Rickets, by reason it is pleaster to take, and then they generally add to it *Maiden-hair*, *Raisins of the Sun stoned*, and *Eggs slit*, and so give it to the Child, a Spoonful at a time, five or six times a Day.

XII. *The Ointment.* It is made of the Juice, or rather of the green Herb boiled in Hogs Lard, or in Beef Suet mixt with Oil Olive, of each equal parts, till the Herb is crisp; then strained out, and repeated three times in like manner. It is good against Scabs, running Sores, old Ulcers, Tertars, the Ringworm, called in *Greek*, *Λαχυν*, *Lichen*, (whence the Name of the Plant for curing this Disease) and other like Deformities of this kind.

XIII. *The Cataplasm.* It cools and allays Inflammations, and is prevalent against an *Erysipelas* or *Anthones* Fire, and has all the Virtues of the Ointment, and may be used when that cannot be had. It is made by beating the green Plant in a Mortar, and applying it. *Dioscorides* says, that being applied to a *Hemorrhage*, or Flux of Blood, (I suppose he means in a Wound) that it will stop the Bleeding: but *Galen* doubts of this, tho' to great a Man as *Dioscorides* reports it.

C H A P. CCCCXL.

of LIVER-WORT Small.

THE Names. It is called in *Greek*, *Λαχυν* *Λαχυν*; in *Latine*, *Lichen* *five* *Hepatica minor*, *Jecoraria minor*; and in *English*, *The small or smaller Liver-wort*.

II. *The Kinds.* Of this Small Kind there are several sorts, as, 1. *Lichen* *five* *Hepatica minor Umbellatus*, Small Ground Liver-wort with round Heads. 2. *Lichen* *five* *Hepatica minor Stellaris*, Small Ground Liver-wort Starry-flowered. 3. *Lichen* *five* *Hepatica Petrea*, Stone Liver-wort. 4. *Lichen marinus pileatus*, *Lichen petreus pileatus*, Liver-wort with a hooded Head. 5. *Lichen marinus alter minor folio calceato*, Small Liver-wort with skinny Heels. 6. *Lichen petreus minimus acaulis*, The smallest Liver-wort without Stalks. 7. *Lichen petreus purpureus Derbionsis*, Purple Liver-wort, called Cork or Archal.

Small Ground Liver-wort with round Heads.

The Descriptions.

III. *The first, or Small Ground Liver-wort with round Heads.* This differs not from the Great Kind in the former Chapter, but in its Stature, this being altogether less, and more smooth or even: the Flowers on the tops of the slender Stems, are not so much laid open like a Star; but the especial Difference consists in this one chief thing, viz. that this Kind being planted in a Pot, and set in a Garden above the Ground, yet will it spread its self round about, and increases in great plenty, where never any did grow before.

Small Ground Liver-wort Starry-flowered.

IV. *The second, or Small Ground Liver-wort Starry-flowered.* This Small Liver-wort grows in like manner as the former, and sends forth such like Starry Flowers as the Great Kind in the former Chapter, but is smaller for the most part in all places where it grows; for so as it grows in the Shadow, it will live in Pots, as well as on the Ground, if the place is not stirred or turned up. The Difference between this and the former is, that that has little tender Stalks about an Inch long, with round Heads at their several tops; whereas this Small Kind has like Stalks, of an Inch in Length, with a Star-fashioned Flower or Head at top.

Stone Liver-wort.

V. *The third, or Stone Liver-wort.* It grows flat upon the Stones, and creeps not far abroad, as the Ground

Ground Liver-wort *does* : it only refts it felf in Spots and Tufts, fet here and there, of a dufty ruſſet Color above, and blackiſh underneath : among the crumpled Leaves riſe up ſeveral ſmall Stems or Stalks, on which do grow little Star like Flowers, of the Color of the Leaves. The Leaves are leſſer than the former, of a lighter green Color, and a little hairy : the Stalks are ſlender, naked, and about two laches high.

VI. *The fourth, or Liver-wort with a hooded Head.* It has a Root conſiſting of ſmall Fibres, fine and white. Its Leaves lie one upon another, of a yellowiſh green Color, daſht over with an Aſh-color, and ſpotted a little in their middle. The Stalk grows to be about three or four Inches high, being white, ſmooth, clear or transparent, and of the thickneſs of a *Ruſh*, on which grows a ſmall Head, ſomething like unto an Hat, divided underneath into five parts, of a ſpongy Subſtance, green at the fiſt, then yellow, and laſtly reddiſh ; under which are growing the Fruit, which are of a dark purple Color, and juicy while they are freſh ; but being dry, have a ſmoaky Powder within them, inſtead of Seed.

VII. *The fifth, or Liver-wort with ſkinny Heels.* Its Root is compoſed of Fibres as ſmall as Silk. Its Leaves are ſmooth and transparent, more tender and ſmall than any of the former, growing in time to be of a blackiſh purple Color, and not lying or ſticking one to another, as the others do ; from the back whereof grows forth a Skin or Sheath, ſhaped like a Shoe, whoſe brims or edges are a little crumpled, and raiſed higher than the reſt ; from whence riſe up about four little, dark, green, ſhining Heads, of the Bigneſs of the ſmalleſt Peaſe, which afterwards open into yellow Flowers, having four Leaves apiece, ſtanding on yellowiſh Stalks four Inches high, with divers impalpable Threads in the middle.

VIII. *The ſixth, or Smalleſt Liver-wort without Stalks.* Its Root conſiſts of very fine ſhort white Fibres, which cleave to the Leaves, by which the Plant is nourished and lives. This is the ſmalleſt of all the Liver-worts, and its Leaves are no larger than the Nails of ones Finger, green and rough, with white Spots. It has alſo certain ſad purpliſh Skins, ſet on both ſides of the lower part of the Leaf, before any Flower appears ; but when the Leaf grows greater, it becomes of a ſad purpliſh Color, like the Skins, and ſwells at the end, ſending forth a ſmall Fruit, as big as a ſmall Pea, being of the ſame Color with the Leaf, ſappy, or full of a whitith watery Juice, which afterwards, as the Fruit grows ripe, changes yellow, and being broken, has then a yellow Powder, which will color the Fingers which touch it.

IX. *The ſeventh, or Purple Liver-wort, called Cork or Archal.* It is a kind of Herb or Plant much reſembling Liver-wort, of a ſad purpliſh Color, which the poor People in *Derbyſhire* gather, and grinding it, make it into a moiſt Maſs, which they keep in Barrels, and therewith they make a kind of Murry or purpliſh Dye, which, tho' it will not hold Color long in Cloth, but will ſtarve and change, yet it ſerves poor People for their Wearing very well.

X. *The Places.* The fiſt and ſecond grow in moiſt ſhadowy places in Gardens, and other like Grounds, and ſometimes they are planted in Pots, which ſet in ſhady moiſt places, thrive very well. The third grows upon Stones by Wells and Springs, and is found upon Rocks and Stony places, as well near unto the Sea, as farther on the Land ; and it is often found at the bottoms of high Trees, growing upon high Mountains, eſpecially in ſhadowy places. The fourth, fifth and ſixth grow alſo in the like

moiſt Stony and Rocky places. The ſeventh grows in *Derbyſhire*, on the Mountains there, and is found in great plenty.

XI. *The Times.* They bring forth their Flowers for the moſt part in *June* and *July*, and are in a flouriſhing Condition all the Summer Months.

XII. *The Qualities, Specification, Preparations, and Virtues,* are the ſame with thoſe of the Great Liver-wort in the former Chapter, ſo that no more need be ſaid thereof in this place.

C H A P. CCCCLI.

Of L I V E R - W O R T Noble,

O R,

Golden T R E F O I L.

THE Names. It does not appear that this Plant was ever known to the *Greeks*, and therefore has no *Greek* Name ; but it is called in *Latine*, *Hepatica*, *Hepatica nobilis*, *Hepatica aurea*, *Hepatica trifolia*, *Hepaticum trifolium*, *Hepatica Trinitatis*, alſo *Herba Trinitatis* ; (but there is another Plant, which is the proper or true *Herb Trinitaty*, viz. *Hearts-eaſe*, of which we have already treated in Chap. 346 and 347 aforegoing.) It is alſo called *Trifolia aurea*, *Trifolium aureum*, *Trifolium nobile*, *Trifolia nobilis*, and *Trinitas* : in *Engliſh*, *Noble Liver-wort*, *Golden Liver-wort*, *Noble Trefoil*, and *Golden Trefoil*, and *Hepatica*.

II. *The Kinds.* There are various ſorts of this Plant, viz. 1. *Hepatica flore ceruleo ſimplici major*, *Hepaticum Trifolium*, The great ſingle blew *Hepatica*, or *Noble Liver-wort*. 2. *Hepatica minor flore palido ceruleo*, The ſmall blew *Noble Liver-wort* or *Hepatica*. 3. *Hepatica flore purpureo*, *Purple Noble Liver-wort*. 4. *Hepatica flore albo minor*, The leſſer *White Hepatica*. 5. *Hepatica alba magno flore*, The great *White Hepatica*. 6. *Hepatica albidia five argentea*, *Aſh-colored Noble Liver-wort*, or that of a *Wild Tanſy-color*. 7. *Hepatica alba ſtraminibus rubris*, *White Hepatica* or *Noble Liver-wort* with red Threads. 8. *Hepatica flore rubro*, *Hepatica trifolia rubra*, *Red Noble Liver-wort* or *Hepatica*. 9. *Hepatica Americana, vel Virginiana*, The *American* or *Virginian Noble Liver-wort* or *Hepatica*. 10. *Hepatica flore purpureo multiplici five pleno*, *Hepatica multiflora Lobelij*, *Double-flowered purple Hepatica*, or *Noble Liver-wort*. 11. *Hepatica flore ceruleo pleno*, *Double-flowered blew Noble Liver-wort*.

The Deſcriptions.

III. *The fiſt, or Great ſingle blew Hepatica, or Noble Liver-wort.* The Roots are compoſed of a Buſh of blackiſh Strings or Fibres : from the ſeveral Buttons or Heads whereof the Flowers ſpring up, blow open, and ſometimes ſhed and fall away, before any Leaves appear or ſpread open. Theſe Flowers ſtand every one upon their own Foot-ſtalks, of the ſame Height with the Leaves for the moſt part, which is much about four Inches high, and ſometimes a little more, which uſually conſiſt of fix Leaves, (but ſometimes they have ſeven or eight) of a fair blew Color, with many white Chives or Threads in the middle, ſtanding about a middle green Umbone or Head, which after the Flowers

are fullen, grows greater, and shews many small Grains or Seeds set close together, (with three small green Leaves compassing them underneath, as they did the Flower at the bottom) very like to the Heads of Seed of many of the *Crowfeet*. After the Flowers are risen and blown, spring up many fresh Leaves, of a green Color, each severally standing upon its own proper Foot-stalk, folded together, and somewhat brown and hairy at their first coming forth, which afterwards are broad, and divided at the edges into three parts, as is fully demonstrated by the Figure.

Great Blew Noble Liver-wort.

Double Noble Liver-wort.

IV. *The second, or Small blew Noble Liver-wort or Hepatica.* The Roots or fibrous Strings of this, are like the former: the Leaves of it are also like to those, but smaller by half, and grow more abundantly or bushing thick together. The Flowers are of a pale or bleak blew Color, and not so large as the foregoing. It very seldom bears Flowers, for *Parkinson* says he had the Plant half a score Years in his Garden, and yet never saw it bear Flowers above twice in all that time.

V. *The third, or Purple Noble Liver-wort.* This Plant in its fibrous Roots, Stalks, Flowers, Seed, Leaves, and manner of Growing, is wholly like unto the first described; so that there is no need to reiterate the former Description at Sect. 2. above: but the only Difference in this is, that the Flowers are of a deeper blew, tending to a Violet purple Color.

VI. *The fourth, or Lesser White Hepatica, or Noble Liver-wort.* The Flowers of this Noble Trefoil, are wholly white, of the Largeness of the Red or Purple-colored; and the Leaves of the Plant are somewhat smaller, and of a little whiter or paler green Color; in all things else it is wholly agreeing with the first.

VII. *The fifth, or Great White Hepatica, or Noble Liver-wort.* There is no Difference between this and the last described, neither in its Root, Stalks, Leaves, Flowers nor Seed, saying that the Flowers of this being full as white as the former, are as large as those which we shall describe in the next Section.

VIII. *The sixth, or Ash-colored Noble Liver-wort, or that of a Wild Tansy Color.* Both the Leaves and the Flowers of this Hepatica, are larger than any of the former, except the last: the Flowers hereof, at first opening, seem to be of a bluish Ash-color: which so abide for three or four Days, decaying still, until they turn almost white; having yet still a shew of that bluish Ash-color in them, till the very last.

IX. *The seventh, or White Hepatica, or Noble Liver-wort with red Threads.* There is very little Difference between this Noble Liver-wort, and the first White One at Sect. 6. foregoing, saving that the Threads in the middle of the Flower are purely white, as in the last they are tipped at the ends of a pale reddish Color, which adds a great Beauty to the Flower.

X. *The eighth, or Red Noble Liver-wort, or Hepatica.* The Leaves of this Trefoil are of a little browner red Color, both at their first coming up, and afterwards, especially in the middle of the Leaf, more than any of the former: the Flowers are in Form like unto the rest, but of a bright bluish or pale red Color, very pleasant to behold, with white Threads or Chives in the middle of them.

XI. *The ninth, or American or Virginian Noble Liver-wort or Hepatica.* This differs somewhat from the other sorts already described: it bears very dark green Leaves, much of the Form of the other Kinds. The Flower is small and white, with white Threads in the middle: in other Respects the Difference is very small.

XII. *The tenth, or Double-flowered Hepatica, or Noble Liver-wort.* This Double Hepatica is in all things like unto the Single purple Kind, saving only, that the Leaves are larger, and stand upon longer Foot-stalks; and that the Flowers are small Buttons, but very thick of Leaves, and as double as a Flower can be, like unto the Double White Crowfoot, but not so big, of a deep blew or purple Color, without any Threads or Head in the middle, which fall away without giving any Seed.

XIII. *The eleventh, or Double-flowered blew Noble*

Noble Liver-wort. *This differs but very little from the last*: the whole Plant is a little less; the Flower is not full out so large, but altogether as double or manifold in the Leaves.

XIV. *The Places.* The ninth is a Native of *Virgima*, and was brought from thence by *John Tradescant*. Most of the rest grow naturally in the Woods in *Germany*, and some of them in *Italy*, as those with the blew Flowers, and the double-flowered, as *Clusius* says; but with us they only grow in Gardens, nursed up for the Flowers sake, which are beautiful in their Kind, more especially being considered as to their early Appearance.

XV. *The Times.* These Plants do flower very early, and are some of the first Flowers which appear after the hard Frosts in *January* or *February*: so that next unto the *Winter Woofs-bane*, these shew themselves towards the latter end of *Winter*, which because they are so early in the Year, are so much the more to be valued. The *Double Kinds* flower not altogether so early, sometimes in *March* and *April*, yet they continue when the others are past. The Seeding Kinds perfect their Seed in *April* and *May*.

XVI. *The Qualities.* All these Kinds of *Noble Liver-wort*, are cold and dry in the first Degree, *Astringent*, *Traumatick* or *Vulnerary*, *Stomackick*, *Hepatick* and *Analeptick*.

XVII. *The Preparations.* You may have, 1. *A liquid Juice* or *Essence* of the whole Plant. 2. *A Decoction* of the whole Plant. 3. *A Powder* of the Root.

The Virtues.

XVIII. *The liquid Juice* or *Essence.* Either of these Preparations admirably comforts and strengthens the Liver, refrigerates it, and takes away any preternatural Heat of the Bowels: being given in *Red Port Wine*, it cleanses and strengthens the Ventricle, cures Fluxes and Bloody-fluxes, helps Pissing Blood, and the Over-flowing of the Courfes in Women, and is of very good Use in Spitting Blood, restoring such as are in Consumptions. Being taken as a Diet, they are of excellent Effects in curing of Wounds, old Sores, Ulcers, and the like: and outwardly used as a Wash in those Cases, they dispose the same to a speedy Healing. Dose two, three or four Spoonfuls at a time Morning and Evening, in any fit Vehicle.

XIX. *The Decoction.* It has all the Virtues of the liquid Juice and Essence; and may be made in Wine or Water, according as the Occasion may require. It may be given Morning, Noon and Night, from three Ounces to six or eight: and outwardly it may also be used as a Lotion for Sores and Ulcers, which are of difficult or hard Cure. It is an excellent thing for the Hepatick Flux.

XX. *The Powder of the Roots.* The Powder has possibly the Virtues of the Juice and Essence. *Baptista Sardus* commends it, and writes, that if a Spoonful thereof is given at a time in Wine, for several Days together; or in Broth, it is very beneficial against the Disease called *Enterocoele* or *Burthenness*.

LIVE-LONG, see Orpin-Spanish.

C H A P. CCCCLII.

Of LOOSE--STRIFE Yellow or Common.

O R,

Yellow WILLOW--HERB.

I. *THE Names.* It is called in *Greek*, *Λυσιμάχια*, & *Λυσιμάχων*: in *Latine*, *Lyfimachia*, and *Lyfimachion*, (so called from *Lyfimachus*, King of *Illyria*, (as I suppose) who was the first Finder of it out;) it is also called *Salicaria*, aut quod inter *Salices* oritur, aut quod *Salicis* folio habet, viz. *Willow-Herb*, either because it grows among *Willows*, or that it has *Willow* like Leaves. In *English*, *Loose-Strife*, or *Willow-Herb*.

II. *The Kinds.* We make four principal Kinds of this Plant, viz. 1. *Λυσιμάχια* & *κλαυστή*, μίλλον, & *κονία*, *Lyfimachia lutea*, major & communis, The Yellow, or Greater, or Common Loose-strife: of which in this Chapter. 2. *Lyfimachia spicata*, Spiked Loose-strife, or that with spiked Heads of Flowers: of which in Chap. 453. 3. *Lyfimachia non spicata*, Loose-strife not spiked: of which in Chap. 454. 4. *Lyfimachia siliquosa*, Codded Loose-strife: of which in Chap. 455. following.

Common Yellow Loose-Strife.

III. *The Kinds of the Common or Yellow Loose-Strife.* We have, 1. *Lyfimachia lutea* & vera, *Lyfimachia verum* & *Legitimum* Cordi apud *Dioscoridem*, *Lyfimachia lutea* major, quæ est *Dioscoridis* *Bauhini*; *Salicaria* *Tragi* & *Gesneri*; *Corneola* *Leoniceri*, The Common Yellow Loose-strife, or Willow-Herb. 2. *Lyfimachia lutea altera* *Clusij*, *Lyfimachia lutea* in *alis foliorum* *florens* *Cesalpini*, *Lyfimachia lutea* in *solis* *nigris* *punctis* *notatis* *Bauhini*, The lesser Yellow Loose-strife, or Willow-Herb. To these

O o o o

Authors

Authors add a third, viz. 3. *Lyfimachia lutea tertia Clusii*, *Lyfimachia lutea altera Lobelij*, *Lyfimachia aquatilis Dodonci*, *Lyfimachia lutea flore globosa*, Yellow Loofe-strife round headed.

The Descriptions.

IV. *The first, or Common Yellow Loofe-strife, or Willow-Herb.* It has a Root which creeps under Ground much like to Quitch-Grass or Dogs-Grass, but greater, which shoots up every Spring with brownish Heads, that afterwards grow up into Stalks. This is the most common Kind, which grows in rank moist Ground, to be four or five Feet high or more, with great round Stalks, a little crested, and diversly branched from the middle of them to the tops into great and long Branches; on all which, at the Joints, there grow long and narrow Leaves, but greater and broader below, most commonly two at a Joint, yet sometimes three or four, something like unto Willow Leaves, without Nicks or Dents on the edges, and of a faint green Color, from the upper Joints of the Branches, and at the tops of them also, stand many yellow Flowers of five Leaves apiece, with several yellow Threads in the middle, which turn into small round Heads, in which are contained small cornered Seed.

V. *The second, or Lesser Yellow Loofe-strife, or Willow-Herb.* It has a Root which creeps under Ground, and shoots up again in the same manner as the former. This Plant rises not up so high as the first, with its round jointed Stalks, which are somewhat woolly or hairy; the Leaves being also woolly, and something like them, are narrower and shorter than they, four for the most part, and sometimes but three set together at a Joint, spotted with blackish Spots on their under sides, not compassing it at the bottom, but every one standing upon a short Foot-stalk, and not at all dented about the edges. From the middle of the Stalk almost, upwards at every Joint come forth the Branches, which are short, nothing so long as the former, and standing closer together, on which grow a few Leaves, lesser than those below. At the tops of the Branches, and at some of the upper Joints also, grow a few Flowers, lesser than those in the before-described, which are of a yellow Color, and consisting of five Leaves as they do, with many yellow Threads in them, of a strong sweet Smell, which so join together at the bottom, that the whole Flower falls away together, and not any Leaf apart. The former Plant has no Smell or Taste, but only Styptic, or Astringent and Drying; whereas this Smaller now described, has a little Acrimony in it, which will cause one to spit, after chewing it a while in the Mouth.

VI. *The third, or Yellow Loofe-strife round headed.* Its Roots are long, creeping under Ground with many Joints therein, and shooting forth Vines at every one of them. The Stalks of this Plant rise not up to be above a Foot in Height, bearing only two Leaves, and no more at a Joint, which are shorter and narrower, yet very like to those of the Common sort, and of a pale green Color. At the Joints of the Stalks, which are crested and hollow, with the Leaves come forth long Stalks of Flowers, without any Leaves on them, which are close set together, almost round, or rather of an oval Form, but yet shewing the small yellow Flowers, consisting of five Leaves apiece.

VII. *The Places.* The first grows in many places of England, in moist Meadows, and by Water-sides, especially along the Meadows as you go from Lambeth to Battersey, near London, &c. The second

grows also near still Rivers and Water-sides, and in Valleys and moist Fields, it is a Native of the Hills in Austria, and of the moist Fields on the Alps. The third Lobel found in the Ditches near Gaunt in Flanders, and among Reeds near Amsterdam in Holland; and Clusius says, that it was also found in places near the Alps. With us the two last are only nursed up in Gardens.

VIII. *The Times.* All these Plants flower in June and July to August, and the Seed is perfected some time after.

IX. *The Qualities.* Loofe-strife is cold and dry in the end of the first Degree; Astringent, Traumatick, and Cosmectick.

X. *The Specification.* It is an excellent thing for curing Wounds in any Part, to stop Bleeding inward or outward, also to cure sore Throats, and help Diseases of the Eyes.

XI. *The Preparations.* The Plant most used in Physick, is the first or Common great yellow Kind, from which you may have, 1. A liquid Juice or Essence. 2. A Decoction. 3. A Clyster. 4. A Fumigation. 5. An Ointment. 6. A Cataplasm of the green Herb bruised. 7. A distilled Water. 8. An Acid Tincture.

The Virtues.

XII. *The liquid Juice or Essence.* It is of an exceeding binding Quality, and therefore Dioscorides says it is good to stay all manner of Bleedings at Mouth or Nose, or of Wounds, or any other Bleeding whatsoever: it stops all Fluxes of the Belly, even the Bloody-flux it self, given either to drink, or taken as a Clyster; it stops also the Over-flowing of the Terms in Women. It is of good Use for green Wounds, to stop their Hemorrhage, and to conglutinate their Lips, being applied to them. It is often used as a Gargle for sore Mouths, and to cure Sores and Ulcers in the secret Parts. It is beneficial for the Eye-sight, and of good Use to clear the Eyes of any thing gotten into them. Dose two, three, or four Spoonfuls.

XIII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice or Essence, but much weaker, and may be given in any of the Cases aforementioned, from three Ounces to eight Morning and Night. It makes an excellent Gargle for sore Mouths and Throats, as also old Sores and running Ulcers in other Parts of the Body.

XIV. *The Clyster.* It is made of the liquid Juice or Essence two parts, Chicken-Broth one part: mix them for a Clyster. It is good against a Diarrhea, Dysentery and Lienteria, and other Weaknesses of the Bowels.

XV. *The Fumigation.* It is found by Experience, that the Smoak of Loofe-strife being burned, drives away Flies and Gnats, and other such like troublesome Insects, which abound near Fens, Marshes, Water-sides and Pools, which are troublesome by biting and sucking the Blood in the Night Season, leaving Marks and Spots upon the Skin. It is said also to drive away Serpents and other Venomous Creatures, being made where they usually haunt.

XVI. *The Ointment.* Take Bees-Wax, Sugar, Oil Olive, Beef-Suet, of each an Ounce; Juice of Loofe-strife four Ounces: mix and boil all together in Balneo to the Consistence of an Ointment. I know some, instead of Oil and Suet, use May Butter, but that I avoid, because the Butter will quickly make the Ointment grow rancid. It is an excellent thing against Wounds and Punctures of the Muscles, Nerves and Tendons: let Tents be dipt in it, and put into the Wound, and the place covered with a Linnen Cloth doubled, and spread with the Ointment.

ment. This was experimented on a Captain, who was Shot in two places with Bullets, the one thro' his Breast, the other thro' his Thigh, who was perfectly cured of both Wounds without any Scar, only by applying them as aforesaid, after he could not be cured by other Medicines. It also cleanses and heals all foul Ulcers and Sores wheresoever, and abates their Inflammations, they being also washed with the distilled Water.

XVII. *The Cataplasim.* It is made of the green Herb, being beaten in a Mortar. It is good to stop the Bleeding in green Wounds, and to conglutinate the Lips of simple Wounds and heal them, being applied. Used to the Inflammations of Wounds or Ulcers, it abates the Inflammation, and eases the Pain.

XVIII. *The distilled Water.* It is a present Remedy for Hurts and Blows on the Eyes, as also for Blindness, provided the Crystalline Humor is not let out, or the Sight it self perished. This Experiment was found true upon a Boy, whose Eye by Chance was prickt, who was restored to his Sight thereby. There was also another who was hurt in the Eye by a Dart, and was cured by applying this Water only to the same. This Cure has been performed by this Water upon several Persons, by one who kept it as a Secret for a long time. It is of good Use to clear the Eyes from Dust, external things fallen into them, as also from Mists, Clouds, Inflammations, Blood-shot, and other Distempers which obfuscate the Sight. It abates Inflammations in any Part, being bathed therewith, laying over the same a green Leaf or two. This Water used as a Gargle very warm, and also sometimes drunk, cures the Quinsey in the Throat, and is helpful against Tumors and Ulcers of the Kings-Evil. The said Water applied warm, is said to take away all Spots and Marks, Discolorings and Scars in the Skin, caused by the Small-Pox, Measles, or the like.

XIX. *The Acid Tincture.* Given constantly in some proper Vehicle, so much at a time as to make it gratefully sharp, it will abate and exterminate the Humors which cause the Kings-Evil: it is profitable against the Scurvy in all its Appearances: it prevails against all sorts of hot, burning, malign and pestilential Fevers, yea; and cures the Plague or Pestilence it self. It powerfully quenches Thirst, opens Obstructions of the Viscera, strengthens the Stomach, and causes a good Appetite and Digestion.

C H A P. CCCCLIII.

of LOOSE-STRIFE Spiked,

O R,

WILLOW-HERB with spiked Heads of Flowers.

I. *THE Names.* It is called in Greek, *Λουσιμαχία*; in Latine, *Lyfimachia spicata*; and in English, *Spiked Loose-strife*, or *Willow-Herb*, or *Loose-strife with spiked Heads of Flowers*.

II. *The Kinds.* There are two sorts of this Plant, viz. 1. *Lyfimachia spicata purpurea*, *Lyfimachia altera Matthioli*, *Lyfimachia Pliniana Lobelij*, *Lyfimachia purpurea Communis major Clusij*; *Pseudolyfimachium purpureum alterum Dodonaei*;

Solidaginis Sarafenicae alia species Tragi; Purple spiked Loose-strife. 2. *Lyfimachia spicata cerulea*, *Lyfimachia flore ceruleo Clusij*, *Lyfimachia cerulea bortenensis Lobelij*; *Pseudolyfimachium Ceruleum Dodonaei* & *Ludgunensis*; Blew spiked Loose-strife.

Purple spiked Loose-strife.

The Descriptions.

III. *The first, or Purple spiked Loose-strife, has a Root which creeps under Ground like unto the Yellow, but is greater than it, and so are the Heads of Leaves, when they first appear out of the Ground, and are more brown than those of the Yellow.* It grows up with many woody square Stalks, full of Joints, about three Feet high or more; at every one whereof stand two long Leaves, not altogether so great and large as those of the Common Yellow, but shorter, narrower, and of a deeper green Color, and some brownish: the Stalks are spread out into many long Branches or Stems of spiked Flowers, half a Foot long or longer, growing in Rundles one above another, out of small Husks, very like unto the spiked Heads of Lavender; each of which Flowers have five round pointed Leaves, of a Purple Violet Color, or somewhat inclining to Redness: in which Husks stand small round Heads, after the Flowers are fallen, in which is contained small Seed.

IV. *The second, or Blew spiked Loose-strife. Its Root creeps not as the first does, but shoots forth many Sprouts round about it, by which it does much increase.* This Plant grows somewhat lower than the former, with some Branches in like manner at the tops of the square Stalks, and with dark green and narrower Leaves, set by Couples at the Joints towards the tops, but with three or four at a Joint lower, somewhat more deeply snipt or dented about the edges. The Flowers grow in the same manner as the former do, in long Spiked Heads, set round about with blew Flowers, of four Leaves apiece, which turn into small flat Heads, with brownish Seed therein.

O o o o

V. The

V. *The Places.* The first grows usually by Rivers and Ditch-sides in wet Grounds, as upon *Lambeth* side, about the Ditches there in many places; as also under the Bishop's House-Wall at *Lambeth*, by the *Thames* side. It grows in places of great Moisture, yea, almost in running Streams, as well as in standing Waters hard by them, and in moist Ditches in most places of *England*. The second grows in *Austria* and other places of *Germany* plentifully. *Gerard* says, that it grows Wild in many places of this Kingdom; but it is usually nursed up with us in Gardens.

VI. *The Times.* They both flower in the Months of *June* and *July*, and sometimes longer; and the Seed is ripe not long after.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are the same with those of the first *Yellow Kind* in the foregoing Chapter; and the first of these is not inferior to that; but in the Opinion of some Physicians, superior thereto: and therefore to the former Chapter you are referred.

C H A P. CCCCLIV.

Of **LOOSE--STRIPE** not spiked,

O R,

WILLOW--HERB with dispersed Flowers.

I. *THE Names.* It is called in *Greek*, *Λυσιμάχη* *ἡ σαρκώδης*: in *Latine*, *Lyfimachia non spicata*; and in *English*, *Loose-stripe not spiked*, or *Willow-Herb with dispersed Flowers*.

II. *The Kinds.* There are two sorts of this Plant also, viz. 1. *Lyfimachia purpurea non spicata, vel rubra minor*, *Lyfimachia purpurea secunda five minor Clusii*, *Lyfimachia rubra non filiquosa Bauhini*. The small purple-flowered Loose-stripe not spiked, or Lesser purple Willow-Herb. 2. *Lyfimachia purpurea non spicata minima, five rubra minima*, *Lyfimachia rubra minima Clusii*, *Lyfimachia linifolia purpurea cerulea Bauhini*. The least purple-flowered Loose-stripe not spiked, or Least purple Willow-Herb.

The Descriptions.

III. *The first, or Small purple-flowered Loose-stripe not spiked, or Lesser purple Willow-Herb.* Its Root creeps not as the others do, but is hard and somewhat woody, with many small Fibres springing from the sides thereof. This small Herb is much lower than that of the *Purple spiked Head*, or first Kind described in the former Chapter, being but about a Foot and half high, with smooth and square Stalks, whose tops are parted into many Branches: on the lower part thereof stand long Leaves, smaller and narrower than the other purple spiked Head in the last Chapter; two always set together at a Joint, one against another; but those which grow towards the tops of the Stalks, are smaller than the lowermost, and keep not that Order, but stand confusedly thereon, one above another; near unto which, at the Joints with the Leaves, come forth several Flowers, but not Spike-fashion, usually in six square Heads, whose tops are not so pointed, nor laid so open as in the other, but being more close, thrust forth their Flowers out of them, which

consist of six small reddish purple Leaves, with some Threads in the middle.

IV. *The second, or Least purple-flowered Loose-stripe not spiked, or Least purple Willow-Herb.* It has a small, long and brown Root, from whence it rises up (being the least Kind) to be about a Foot high. The Stalks branch forth themselves from the very bottom, and are set thick with small, long and narrow Leaves, almost like those of *Line* or *Flax*, but shorter; with whom, at the Joints, come forth the Flowers, sometimes two at a place, but more usually one, standing in green Husks, like unto the last, composed of five small blewish purple Leaves, inclining to red: in which Husks, after the Flowers are fallen, stand small skinny Heads, wherein is contained small whitish Seed.

V. *The Places.* The first grows in moist Meadows and Grounds near unto Water-Courses, as also in wet places about Ditches and moist Woods. The second grows in the like wet places also. The first is a Native of *Hungary*, as we gather from *Clusius*. The second grows in *Italy* and *Germany*: but with us they are only nursed up in Gardens.

VI. *The Times.* They both flower in *June* and *July*, as the former do, and perfect their Seed in some small time after.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are said to be the same with those in the two former Chapters: and it is not to be doubted, they being so like in Face and outward Form unto them, as also in Smell and Taste, and other Properties, and as being a Specie of the same; and therefore we refer you to *Chap. 452*, where they are handled at large.

C H A P. CCCCLV.

Of **LOOSE--STRIPE** Codded,

O R,

Codded **WILLOW--HERB**.

I. *THE Names.* It is called in *Greek*, *Λυσιμάχη ἡ κοδωδης*: in *Latine*, *Lyfimachia filiquosa*; and in *English*, *Codded Loose-stripe*, or *Codded Willow-Herb*.

II. *The Kinds.* Of this Plant Authors have recounted the following Species, viz. 1. *Lyfimachia filiquosa angustifolia*, *Chamenerium Gesneri dicta*, (but this latter Name more properly belongs to the seventh Species following; and *Gesner* himself rather calls this first Kind, *ἡ ἰσχυρὴ*, *Epilobium*, a Word made of three, i. e. *ἐν, ἰσχυρὴ, ὅτι, quia violæ, id est flos super filiqua nascitur*, of which he accounts six several sorts, at the end of *Cordus* his History of Plants.) The narrow-leaved Codded Loose-stripe. 2. *Lyfimachia Chamenerium dicta Alpina*, The Mountain Codded Loose-stripe. 3. *Lyfimachia filiquosa major*, *Onagra genus alterum Cesalpini*, The greater Codded Loose-stripe. 4. *Lyfimachia filiquosa minor vulgaris sylvestris*, The Wild lesser Codded Loose-stripe. 5. *Lyfimachia filiquosa sylvestris hirsuta*, The hairy Wild Codded Loose-stripe. 6. *Lyfimachia filiquosa Virginiana*, The Virginian Codded Loose-stripe, or Tree Primrose of Virginia. 7. *Onagra Cesalpini*, *Pseudolyfimachium purpureum minus Dodonæi*, *Chamenerium Gesneri*, *Chamenerium flore Delphinij*, *Delphinium Buccinum Lobelij*, as it is thought, which yet *Parkinson* will hardly

hardly allow of; Willow-Flower, or Lesser purple Bistard Loose-strife. 8. *Lyfimachia carulea galericulata*, Hooded Loose-strife. This is taken to be a Kind of *Gratiola*, and which we have already described in Chap. 389. *Sell.* 4. foregoing; and it seems that it is rather a Kind of *Hedge-Hyslop*, than any of the sorts of *Loose-strife*, because of its extreme Bitterness, and that it has hooded Flowers; both which are proper to the *Gratiola*, and not to the *Lyfimachia*: and some have properly enough called it *Gratiola carulea*, Blew Hedge-Hyslop, with other Names, as you may see in *Sell.* 2. of the aforesaid Chapter: However, in this Chapter we shall give you the proper Cut or Figure of the said Plant, which was omitted there.

The Descriptions.

III. The first, or Narrow-leaved Codded Loose-strife. It has a Root which creeps after the same manner which the Yellow and Blew do. It rises up with hard Stalks, sometimes two, and sometimes three Feet high, with many very narrow long green Leaves thereon, something like unto Rosemary Leaves, set very thick, two at a Joint, those below being shorter than those higher up. At the tops of the Stalks come forth many Flowers, made of four small round pointed Leaves, of a fine reddish Color, and some Threads in the middle, every one standing on the top of a small, long, almost square Cod, whitish on the outside, and stuffed with fine Cotton or Down; within which does lie bright red Seeds. These Cods with Seeds therein appear before the Flowers break forth at end of them, upon which some have called it *Filius ante Patrem*. This Codded Loose-strife we have put in the first place, for its Rarity and Beauty, as well as for its special Qualities and Virtues. *Gesner*, *Clusius* and *Thalins* say, that there is another of this Species, *flore albo*, with white Flowers, not differing in any thing else from that even now described.

IV. The second, or Mountain Codded Loose-strife. It has a Root which creeps not, but is composed of many Fibres, which whether it be Annual or Perennial has not yet been observed. It has very short Stalks, seldom exceeding a Foot in Height, on which grow very narrow Leaves, like unto the former, yet some longer than others, and set without Order; for the smaller come sometimes from the middle of the longer, and sometimes stand at the Joints. At the tops of the Stalks stand the Flowers, upon slender long purplish Stalks, and sometimes whitish, of a purplish or reddish blew Color, and in some of a whitish blew Color, consisting of four pretty large Leaves, even as great as the former, which the Smallness of the Plant does scarcely admit of, with some Threads in the middle, every one of them standing in a small Husk, composed of four short green Leaves, in which, after the Flowers are fallen, grow up small long Pods or Cods, with small Seed in them, enclosed in Down like the other.

V. The third, or Greater Codded Loose-strife. It has a Root which is somewhat great and white, creeping every way under the Earth, and quickly possessing a good quantity of Ground, which (tho' the Stalks die away every Year) abides all the Winter. This Greater Loose-strife shoots forth several round green Stalks, a Yard high at the least, bearing thereon at the several Joints, two Leaves apiece, which are somewhat like to the Common yellow Loose-strife, but smaller and smoother, green on the upper side, and of a yellowish green underneath, and dented about the edges. The Stalks send out from the middle upwards, many Branches; at the tops whereof come forth many small long Pods or Cods, of a

whitish green purple Color, wherein the reddish Seed lying in its Down, is contained. And at their ends, after they have appeared a good while, come forth the Flowers, consisting of four round pointed Leaves apiece, with some Threads in the middle, of a faint reddish or purplish Color. Of this Kind there is another sort found, *flore albo*, with white Flowers, but it is very rare.

Greater Codded Loose-strife.

Wild lesser Codded Loose-strife.

VI. *The fourth, or Wild lesser Codded Loose-strife.* Its Root is but small and fibrous, dying away every Year. This lesser sort grows Wild in many places, and rises up nearly two Feet high, but in some places not above a Foot high, with smaller Stalks and narrower Leaves, not so green, but rather of a greyish dusty green Color, spread out into several Branches, bearing its Flowers, of four Leaves apiece, at the ends of long Pods or Cods, of a deeper red Color, as the former does, and has like Seed involved in Down, but smaller.

VII. *The fifth, or Hairy Wild Codded Loose-strife.* This in its Leaves, Cods and Flowers, manner of Growing, Height, and yearly Dying away, is like unto the last described; the only Difference between them, is, that the Leaves are more hairy, and as it were woolly, and the Flowers also small and paler.

VIII. *The sixth, or Virginian Codded Loose-strife.* Its Root is longish, white, and about the thickness of ones Thumb; from whence grows up a tall Stalk, divided into many Branches, of an over-worn Color, and a little hairy. The Leaves are like those of the Globe-headed yellow Kind, but somewhat sinuated along the edges, and having their middle Veins of a whitish Color. Towards the tops of the Branches, among the Leaves, come forth very pretty thick Cods, which growing smaller on their tops, sustain very fine large Flowers, consisting of four Leaves apiece, with a Pettle in the middle, upon which stand four yellowish Thrums in fashion of a Cross. And there are also eight Threads, with their Pointels in the middle of them. These Flowers have something of the Smell of a Primrose, whence Parkinson gave it the Name of Tree Primrose of Virginia. After the Flowers are fallen, the Cods grow to be about two Inches long; being thicker below, and sharper on the top or end, and something twined, which at length open themselves into four parts, to scatter their Seed, which is black and small: this being-sown, grows not the first Year into a Stalk, but sends up many large Leaves, lying handfomely one upon another, Rose-fashion.

IX. *The seventh, or Willow-Flower, or Lesser purple Bastard Loose-strife, called also by Gerard, Rose-hay Willow-Herb.* Its Roots are like the Roots of Lyfimachia, or Common yellow Loose-strife, but greater, running and spreading under Ground, and shooting up in many places, whereby it quickly fills a Ground which it is pleased to grow in: the Root is perennial, but the Stalks die away every Year, springing up afresh in many places far asunder. This Root sends up many thong, woody, round, brownish great Stalks, three or four Feet high, hether here and there without Order, with one broad and long whitish-green Leaf at each Joint, something like unto Loose-strife or Willow-Herb, as also unto a Peach Leaf, but larger and longer. At the tops of the Branches stand many Flowers, one above another, of a pale, reddish, purple Color, consisting of five Leaves, spread open, with an Heel or Spur behind them, and many yellow Threads in the middle, much larger than any Larkspur Flower, and smelling something sweet withal. It bears a shew of long Pods or Cods with Seed, but the Seed has never been observable.

X. *The eighth, or Hooded Loose-strife.* It has a Root which is small and fibrous, dispersing it self under the Earth far abroad, by which it much increases. It has many small tender Stalks trailing upon the Ground, beset with divers Leaves, somewhat sharp about the edges, of a deep green Color, like to the Leaves of Scordium or Water Germander, among which are placed several small Bell-Flowers, fashioned like a little Hood, in shape resembling

those of Ale-hoof. Thus Gerard. But esteeming this Plant to be rather a Kind of Gratiola than a Lyfimachia, we have given a more ample Description thereof in Chap. 289. Sect. 4. foregoing, to which you are referred; but whereas the Figure is wanting in that place, we have caused it to be put in here.

Hooded Loose-strife.

XI. *The Places.* The first grows more often in moist Grounds, than in dry; but Gesner and others say, that it grows in such places as are open to the Sun all Day, yet it will scarcely live in our Gardens, unless it be put in some shady place. The second is a Native of the Alps, with us it is nursed in Gardens. The third grows in several moist places; and in the Shade. The fourth, fifth and sixth grow Wild in dry Grounds, as by the Way-sides, and in Lanes and Borders of Fields. But the Virginian grows with us only in Gardens. The seventh grows in Yorkshire in a place, called the Hook, near to a Close called the Cow-Pasture, from whence it has been transplanted into Gardens, it being a very goodly Plant to behold for Ornament sake, and it generally grows in the out Corners of Gardens, to augment the Number of pleasant Flowers. The eighth grows by Ponds and Water sides, also in St. James's Park, and in Tutbil-Fields, and many other places, in wet low Grounds, and by Water-sides. The first is also found growing in moist Meadows, especially in the Grounds as you go from Lambeth to Battersey, and in many other places throughout the Kingdom. The third grows near Water, and in Watery places, and sometimes in the Water it self for the most part. The fourth grows near the Thames side, near Redriffe, and upon the Bank of the Thames, among the Planks which hold up the same Bank. The eighth grows near to the Banks of Rivers and Water-Courses, and it has been found growing in a watery Lane leading from Theobalds to the backside of formerly the Lord Treasurer's House. The seventh is accounted a Bastard Kind of Loose-strife, but it is the most

most goodly and stately Plant of all the rest, having Leaves like the Greatest or Largest Willow: the Branches come out of the Ground in great Numbers, growing to the height of about six Feet, adorned with brave Flowers, of great Beauty, consisting of four Leaves apiece (as aforesaid) of an Orient purple Color, having some Threads in the middle, of a yellow Color; after which are Cods, long and full of Down, which when opened, flies away with the Wind.

XII. *The Times.* Most of these Herbs flower thro' all June and July, and sometimes till August; but the seventh, or Willow-Flower, flowers in May, and continues a long time in flowering.

XIII. *The Qualities, Specification, Preparations, and Virtues* of these Coddled Loose-strifes, are the same with those of the Common yellow Loose-strife in Chap. 452. aforesaid: but the Virtues, &c. of the Hooded Loose-strife, being the same with *Gratiola* or *Hedge-Hyssop*, you may see them in Chap. 388. and 389. aforesaid of this Work.

C H A P. CCCCLVI.

of LOVAGE Common and German.

I. *THE Names.* This is a Plant which was unknown to the Greeks, and therefore can have no Greek Name; but it is called in *Latine*, *Levisticum*, *Libysticum* & *Smyrniun Fuchsj*, *Laserpitium tertium Dodonæi*, *Hippocelinum Dioscoridis*, according to *Lugdunensis*, but this I believe is a Mistake, for I cannot find that those Ancients knew any thing of it; it is also by *Bauhinus* accounted among the *Libanotides*, and is thought to be the *Libanotis fertilis Theophrasti*: in *English*, *Lovage*.

II. *The Kinds.* We have only two Species of this Plant, viz. 1. *Levisticum vulgare*, *Levisticum hortense vel sativum*, Our Common Garden Lovage. 2. *Levisticum Germanicum*, *Levisticum vulgare Germanicum*, German Lovage.

The Descriptions.

III. *The first, or Our Common Garden Lovage.* It has a Root which grows great and deep, spreading much, and enduring long, of a brownish Color on the outside, and whitish within. It has many long and great Stalks of winged Leaves, divided into many parts, somewhat like unto Smalage, but much larger and greater, every Leaf being cut about the edges, broadest at or towards the end, and smallest at the Stalk, of a sad green Color, smooth and shining. From among which rise up several strong and hollow green Stalks, five or six Feet high, and sometimes seven or eight Feet high, according to the Goodness of the Soil, full of Joints and such like, but lesser Leaves set at them than those which grow below. And with the Leaves come forth towards the tops, long Branches, bearing at their tops large Umbels of yellow Flowers, like unto those of the *Wild Parsnep*; and after them flat brownish Seed, larger by much than *Dill*, but lesser than that of *Parsnep*, and thicker also.

Common Lovage.

German Lovage.

IV. *The second, or German Lovage.* It differs not much from the aforesaid, but chiefly in the following things. Whereas the Roots of the former are great and thick, and not at all fibrous, in this they are small and very full of fibrous Strings: and the Flowers of the former are yellowish, but in this they are white, as *Dodonæus* says, and of the same Mag-
nitude

nitude and Form. The whole Plant, and every part thereof, both in the former and in this, have a somewhat strong and aromatick Smell, as also a hot and sharp biting Taste. The Figure of this latter we have given you from *Camerarius* his Epitome of *Matthiolus*.

V. *The Places.* They grow no where Wild in Europe, but are only planted in Gardens, where they generally prosper very well, and will grow large and great, if suffered.

VI. *The Times.* They flower for the most part in July and August, and the Seed is ripe in August or September, or in some short time after their Flowering.

VII. *The Qualities.* *Loosge* is hot and dry in the third Degree, of subtile and thin parts, Aperitive, Digestive, Absterfitive, Carminative, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hyfterick, and Alexipharmick.

VIII. *The Specification.* It powerfully provokes Urine and the Courtes, as much as any of the Kinds of *Parsley*; powerfully resists Poyson, gives Ease in the Colick, and prevails against Agues, Quinsies, Pleurisies, &c.

IX. *The Preparations.* You may have therefrom, 1. A Juice of the Root. 2. An Essence of the Root. 3. A Decoction or Infusion of Herb, or Root, or Seed, or of all of them. 4. A Powder of the Root. 5. A Powder of the Seed. 6. A Preserve of the Root. 7. A Pickle of the Root. 8. A Cataplasim of the Herb. 9. A distilled Water of Herb, Root, or Seed, or of all of them. 10. A Spirit of the Seed. 11. An Oil of the Seed. 12. An Elixir of the Seed. 13. A Spirituous Tincture of the Seed. 14. An Acid Tincture of the Seed. 15. An Oily Tincture of the Seed.

The Virtues.

X. *The Juice of the Root.* It is made by beating it in a Mortar, and washing it out with Water or Wine, &c. It digests and cuts crude and tough Humors, causes Expectoration, wonderfully provokes Urine and the Terms, consumes superfluous Moisture, and therefore is good against the Dropsy, eases Gripings of the Bowels and the Colick, and resists Poyson, and the Infection of the Plague. Dose two, three or four Spoonfuls at a time, as the Physician shall think fit.

XI. *The Essence of the Root.* It has all the Virtues of the Juice; besides which, it admirably quenches Thirst, whether in a Fever, or out of a Fever, or from what Cause soever. It is prevalent against all sorts of Agues Quotidian, Tertian or Quartan, simple or compound, expels Wind, and eases all Pains of the Viscera proceeding from a cold Cause. Dose from two Spoonfuls to four.

XII. *The Decoction or Infusion of Herb, Root, or Seed.* They have all the Virtues of the Juice and Essence, but must be given in much larger quantities, as from a quarter of a Pint to half a Pint; it quenches Thirst much, is good against Poyson, and resists the Force of malignant Fevers: and used as a Gargle, it is good against a sore Mouth and Throat: and drunk down, it is profitable against the Pleurisy, Pains and Stitches in the side.

XIII. *The Powder of the Root.* It may be given from half a Dram to a Dram in Wine, to warm and comfort the Stomach, expel Wind, ease the Colick, provoke the Appetite, and help Digestion.

XIV. *The Powder of the Seed.* If it is taken to a Dram for several times, in a Glass of Wine or other fit Vehicle, it is good against the Pleurisy and

Colick, provokes Urine and the Terms powerfully, and prevails against Sand, Gravel, Stone or Tartarous Matter in the Reins, Ureters and Bladder, and has indeed all the Virtues of the Juice, Essence, Decoction and Powder of the Root; but as it is in the gross Body, so it is longer before it comes into Act, and therefore Allowances must be given for the time of its Operation.

XV. *The Preserve of the Root.* It is cordial and stomatick, expels Wind, comforts the Viscera, warms the Stomach, and causes Digestion: it may be eaten as other sweet Meats are.

XVI. *The Pickle of the Root.* It is an admirable thing to provoke Appetite, warm a cold Stomach, and cause a good Digestion.

XVII. *The Cataplasim of the Herb.* The Leaves being bruised, are Fried in a Frying-pan, or other proper Vessel, with Hogs Lard, and so made into a Poulrice. Applied hot to any Borch or Boil, it quickly brings it to Suppuration, and breaks it.

XVIII. *The distilled Water of the Herb, Root, or Seed, or of all of them.* It is said by Authors to be good against the Quinsie in the Throat, by gargling the Mouth and Throat therewith. It is said also to help the Pleurisy, if it is drunk three or four times or oftner. The said Water dropt also into the Eyes, takes away their Redness and Dimness. And used as a Lotion to the Face or Skin, it takes away Spots and Pimples in the Face, and other Discolorings, as Yellowness, Tawiness, &c. of the Skin.

XIX. *The Spirit of the Seed.* Mixt with some few Drops of Spirit of Harts-horn, or Volatile Spirit of Man's Blood, or of other Blood, it eases the Pain of the Stomach, gives present Relief in a Pleurisy and Quinsie, and cures the Colick. Dose from one Dram to two, three or four, according to the Age of the Patient and Force of the Disease.

XX. *The Oil of the Seed.* It has all the Virtues of the Juice, Essence, Decoction, Powder, Water and Spirit, and may be given in all the Cases for which those things are given, from three Drops to ten or twelve Drops: first drop it into fine Sugar, mixing them well together; then mix them with a Glass of Wine, or other Vehicle, and so let the Patient drink it up. It gives present Ease in the Colick.

XXI. *The Elixir of the Seed.* It has all the Virtues of the Oil, but is much more subtil and penetrating: it may be given from a Dram to two Drams or more, in choice generous Wine, or in any other proper Vehicle. It is a most excellent thing against the Spotted Fever, and all other malignant and pestilential Fevers; as also against the Plague it self.

XXII. *The Spirituous Tincture of the Seed.* It provokes Urine and the Terms in Women, facilitates the Birth, and brings away the After-birth, prevails against the Colick, Strangury, Stone, Sand, Gravel, or Tartarous Matter in the Urinary Parts, and eases the After-pains of Women in Child-bed. Dose one Spoonful at a time, in a Glass of Wine.

XXIII. *The Acid Tincture of the Seed.* It may be given to a grateful Acidity against all sorts of burning, malignant and pestilential Fevers, against which it cannot be given without Success; and destroys even the Poyson and Essence of the Plague it self. It stops Vomiting, admirably strengthens the Stomach, and causes a good Appetite.

XXIV. *The Oily Tincture.* It cures the Colick upon the spot, gives Ease in the Strangury, provokes Urine and the Terms, facilitates the Birth, and brings away the dead Child, giving Ease in all After-pains of Women in Child-bed. It is good against Sand, Gravel and Stone, or Tartarous Mat-

ter in the Reins, Ureters and Bladder; and an excellent thing against the Palsy in Old or Young, taken inwardly in some proper Vehicle from eight to twenty Drops, and outwardly anointed upon the Back-bone and other Parts affected, Morning and Night, for many Days together.

LUNG-WORT, (*the Herb*) *see* Cowslip spotted, Chap. 158.

C H A P. CCCCLVII.

of LUNG-WORT Golden.

I. THE Names. It has no Greek Name that we know of; but is called in *Latine*, *Pulmonaria*, *Pulmonaria aurea*, *Pulmonaria Gallorum*, *Corchorus Dalechampii*; in *English*, *Lung-wort Golden*, and *French Lung-wort*.

II. The Kinds. There are two Kinds hereof, *viz.*

1. *Pulmonaria Gallorum*, *Pulmonaria Gallica*, *Pulmonaria aurea latifolia*, *Pulmonaria Gallorum Hieracii facie*, *Pulmonaria vera Tragi*, (as the French take it to be) *Hieracium flore aureo*, *Pilosella major*, *Pilosella vel Auricula Muris major flore aureo*, *Chondrilla flore aureo*, *Corchorus Dalechampii*, *Golden Lung-wort*, or *Golden Mouse-Ear broad leaved*.
2. *Pulmonaria Gallorum angustifolia Lobelij*, *Pulmonaria Gallica Angustifolia*, *Hieracium Murorum Baubini*, *Pulmonaria aurea angustifolia*, *Pulmonaria Gallorum flore Hieracii*, *Golden Lung-wort*, or *Golden Mouse-Ear*, or *French Lung-wort narrow-leaved*.

Golden Lung-wort.

The Descriptions.

III. The first, or Golden Lung-wort, or Golden Mouse-Ear broad-leaved. It has a Root which is fibrous and stringy, which spreads under Ground, and shoots up in divers other places, by which it much increases, more especially if it grows in any moist or shady place. From this Root rise up many longish broad green Leaves, spread upon the Ground, spotted with pale Spots, yet more conspicuous at one time than at another, somewhat hairy, both on the upper and under side, soft and unequally divided, and commonly cut in the deepest the nearer the Stalk. These Leaves are of a dark green Color, sometimes broader and shorter, and sometimes narrower and longer, (whence *Tabernamontanus* makes three sorts of this, which yet are nothing but different Appearances of the same Species.) From the midst of these Leaves rise up one, two or more blackish hairy Stalks, about a Foot and half or two Feet high, bare or naked up to the top, or having at most no more than one Leaf apiece, and that about the middle of the Stalk. These Stalks are divided at their tops into several Branches, which bear double yellow Flowers of an indifferent Bigness, in Form or Fashion almost of the *Hawkweeds*, or *Common Mouse-Ear*, of a deep Gold or Orange Tawney Color, with some Threads in the middle, and of little or no Smell at all. After the Flowers are faded, the Heads turn into Down, which contain small short black Seed, which are commonly carried away with the Wind when fully ripe. The whole Plant is milky, as the *Hawkweeds* are.

IV. The second, or Golden Lung-wort, or Mouse-Ear narrow-leaved. Its Root is small and fibrous. The Leaves are small, of the Bigness, and sometimes of the Shape (but yet withal a little indented or sinuated) of Daisy Leaves, whitish, and hairy or hoary. The Stalk is about an handful high, crested, hoary, and set with many longish narrow Leaves, and at the top one short Foot-stalk; it bears four or five Flowers, of a bright yellow Color, and pretty large, considering the Smallness of the Plant. The Flowers, like as others of this Kind, fly away in Down, and carry their Seed with them.

V. The Places. *Lobel* says the first grows in the shady Woods of France near *Lions* and *Mompelien*; but with us it is only nursed up in Gardens, in shady rather than in sunny places. Yet *Mr. John Goodyer* found it in May 1632, in a Copse in *Godlyman in Surry*, adjoining to the Orchard of an Inn-keeper there, whose Sign was the *Antelope*. The second was found growing in England by one *William Coot*, on a Hill in the then *Lady Bridget King'smill's* Ground at *Sidmonton*, not far from *Newbury*, in an old Roman Camp, close by the *Decuman Port*, towards the West, South West, upon the Skirts of the Hill.

VI. The Times. The first Flowers in Summer, and sometimes again in September. *Mr. Goodyer* found it flowering in May 1631, in the place, I suppose, afore-mentioned, and is said to flower from May to August and longer. The second flowers in June, July and August, about the latter part of which Month, they both ripen their Seed.

VII. Nota. It is to be taken notice of, That there is another Plant which is called *Pulmonaria*, or *Lung-wort*, as well as this, which Name I think not to be so proper to that, as to this. That is, the *Spotted Cowslip*, which some call *Sage of Jerusalem*, the Descriptions of the chief Kinds of which you may see in Chap. 158. foregoing, which Names are more fit for it than this of *Lung-wort*, which truly

truly belongs to the Plants described in this Chapter: in that, Chap. 158. you have three of these Plants described. The Cut or Figure there inserted, belongs to the second of them, viz. the *Bugloss-leaved Jerusalem Cowslip*; but the Figure of the first or Common Kind, was there overlit by the Printer, which that it might not be wholly lost or forgotten, (since in this Chapter we treat of *Lung-wort*) we have caused to be placed here.

Spotted Lung-wort, or Jerusalem Cowslip.

VIII. *The Qualities.* These Plants are temperate in respect to Heat or Cold, and probably dry in the first Degree. They are Absterfitive, Astringent, Vulnerary, Analeptick, and Pectoral.

IX. *The Specification.* They are peculiar for healing of green Wounds, as also of Ulcers, and other Distempers of the Lungs.

X. *The Preparations.* You may have therefrom, 1. A Juice or Essence. 2. A Decoction. 3. A Syrup. 4. A Poudre. 5. A Conserve. 6. A Cataplasm. 7. An Ointment or Balsam. 8. A distilled Water.

The Virtues.

XI. *The Juice or Essence.* Given inwardly to two or three Spoonfuls, it is profitable against a *Phtisis* or Ulceration of the Lungs: being also inwardly taken, and outwardly applied, it conduces much to the cleansing and healing of green Wounds. If it is dropt also into the Ears, it takes away any Noise, and eases any pricking or shooting Pain with which they may be troubled.

XII. *The Decoction in Wine.* It has the former Virtues, but must be given in a larger Dose. It is an extraordinary Vulnerary, and good to be given to wounded Patients inwardly (as the Physician shall direct) as well as outwardly to be applied.

XIII. *The Syrup.* It is Pectoral, good against Coughs, Colds, Hoarseness, Wheezing, Ulcers of the Lungs, Excoriations of the Viscera, and other the like Diseases of those Parts.

XIV. *The Poudre.* It has the Virtues of the Syrup and Juice, and is peculiarly good against an Excoriation of the Stomach. Dose from half a Dram to a Dram, mixt with a little Honey, and so swallowed. Outwardly applied to Ulcers and running Sores, it cleanses, dries, and induces their healing.

XV. *The Conserve.* It is peculiar for the curing of ulcerated Lungs and deep Consumptions, but where it is not come to the degree of a *Marasmus*, it ought to be taken four or five times a Day, drinking after it half a Pint of watm Milk or more, and to be continued for some considerable time.

XVI. *The Cataplasm.* It is made of the Herb by boiling in Wine. It is good against foul and running Sores and Ulcers, being applied to the Parts affected: it stops the Afflux of Humors, strengthens the Part, and induces the healing.

XVII. *The Ointment or Balsam.* It is a singular Digestive, cleanses, dries, heals: but if it is immediately applied to a simple green Wound, it commonly conglutinates it, and heals it at one Intention. It is an admirable thing for curing of Whitloes.

XVIII. *The distilled Water.* It has the Virtues of the Juice, Essence and Decoction, and may be taken for Distempers of the Lungs, sweetned with fine Honey, or double-refined Sugar. Simple of it self, it is good against internal Inflammations, and hot Distempers of the Stomach, Heart, Liver and Lungs.

C H A P. CCCCLVIII.

Of LUNG--WORT Tree.

I. *THE Names.* This Plant was unknown to the Greeks, but is called in Latine, *Lichen arborum*, *Pulmonaria*, and *Pulmonaria fungosa*, *Muscus Pulmonarius*, *Lichenis genus*: in English, *Tree Lung-wort*, and by some *Tree Liver-wort*. It is called *Pulmonaria* or *Lung-wort*, from the Likeness it has to Lungs or Lights; and by some called *Oak Kinds*.

II. *The Kinds.* It is a singular Plant of the Kind; but by some Authors is taken to be a Species of the Mosses, and therefore is by them called *Muscus*: by others it is taken to be a Species of the Mushrooms, and therefore to the Name *Pulmonaria*, *Lobel* has added the Epithite *Fungosa*, which I think is proper enough.

The Descriptions.

III. *The Leaves herof are pretty large, and diversly folded one in another, not so smooth as Liver-wort, but more wrinkled, rough and thick, almost like to a Fell or Hide, and tough withal.* On the upper side it is whitish, and on the neather side blackish or dusky, so that it seems after a sort to resemble Lungs or Lights.

IV. *Parkinson says it grows with broad Ash-colored Leaves, or of a greyish Color and tough, variously folded, crumpled and gashed in on the edges, and spotted also in some places, with many small Spots on the upper side.* It is only a *Foliofa*, for it was never seen to bear any Stalk or Flower at any time.

V. *The Places.* It grows upon the Bodies of old Oaks, Beeches, and other Forrest Trees in dark and thick

thick Woods; and it is sometimes found also growing upon Rocks, and in other shady places. That which grows upon *Oak* is most valuable, and most in Use, and is by many called for that Reason, *Oak-Lungs*, as is before hinted.

VI. The Times. It is said to be in its flourishing Condition thro' all the Summer Months.

VII. The Qualities. It is temperate in respect to Heat or Cold, and dry in the first Degree. It is Absterfivè, Astringent, Traumatick or Vulnerary, Pectoral and Analeptick.

VIII. The Specification. It is peculiar for curing of Consumptions, more especially those which proceed from an Ulceration of the Lungs.

IX. The Preparations. You may have therefrom, 1. *A Powder.* 2. *A Decoction in Wine.* 3. *A Syrup.*

The Virtues.

X. The Powder. Given from half a Dram to a Dram Morning and Evening, mixt with Honey, or in some proper Syrup, it cleanses, dries and heals Ulcers of the Lungs, and thereby restores such as are in Consumptions. It is good against Inflammations of the Lungs, being drunk in Water. Shepherds and Farriers give it mixt with Salt, to their Sheep and other Cattel with good Success, which are troubled with the Cough, or are short or broken Winded. Applied to bloody and green Wounds, as also Ulcers in the secret Parts, it heals them: and helps Women who are troubled with the Overflowing of the Terms. It is also a very excellent thing against the Bloody-flux, and all other Fluxes of the Bowels, given for some little time in generous Wine, or given Clysterwise. Given in Red Wine, it is also profitable against Vomiting.

XI. The Decoction in Wine. It has all the Virtues of the Powder, and may be given Morning, Noon and Night with some of the Syrup of the same. Used as a Gargarism for a sore Mouth and Throat, it quickly cures it. And is a good Lotion for Ulcers in any part.

XII. The Syrup. It is a thing of excellent Use for such as are in Consumptions, or have an Ulcer of the Lungs, cleansing the same, drying and inducing the Healing. It is good against the Rickets in Children, as also Coughs, Colds, Wheezing, Hoarseness, Shortness of Breath, Difficulty of Breathing, vehement Catarrhs, Spitting of Blood, &c.

The smallest Blew Lupine. Where note, That the Grains of the first or *Garden Lupine*, are generally called *Lupini*: and *Plautus* calls them *Aurum Cemicum*, because they were used in Comedies instead of Money, when in any Scene thereof there was a shew of Payment.

White Garden Lupine.

The Descriptions.

III. The first, or White Garden Lupine. It has a Root which is not very great, but woody, and full of small Fibres, by which it fastens it self strongly in the Ground, yet perishes every Year, as all the rest of these Kinds do. It rises up with a great round Stalk, hollow, and somewhat woolly, with several Branches, on which grow, on long Foot-stalks, many Leaves, consisting of five, six or seven distinct parts, or other smaller Leaves, equally standing round about as it were in a Circle, much like those of the *Chast-Tree*, of a whitish green Color on the upper side, and white and downy on the under side, which in the Evening, about the setting of the Sun, hang a little flagging downwards, as if they were a going to wither. Among these, at several Joints, come forth Tufts of Flowers, standing many together, like unto *Beans*, of a white Color in some places, and in others of a very bleak Blew, tending to white, and in others a pale or light bluish Color, (as *Gerard* has it.) After the Flowers are past, there come in their places great, long, broad, flat and rough Cods, in which are contained round and flat Seed, like a Cake, covered with a tough white Skin, but yellowish on the inside, and of a very bitter Taste; where they cleave unto the Cods in that part, they have a certain Dent, like a little Navel.

IV. The second, or Spotted White Lupine. This in its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of Growing, is altogether like to the former, save in the Magnitude, this Plant being less than that; and in the Flower, this being spotted with Blew on the Heads of the innermost Leaves, and in the Hollows of the uppermost.

P p p p 2

V. The

CHAP. CCCCLIX.

Of the LUPINE,

OR,

FLAT--BEAN.

I. THE Names. It is called in *Arabic*, *Tarmus* and *Tormus*: in *Greek*, *Θισμῶς*: in *Latine*, *Lupinus*; and in *English*, *Lupine* and *Flat-Bean*.

II. The Kinds. There are several Kinds of this Plant, viz. 1. *Θισμῶς ἄλβος*, *Lupinus sativus*, *Lupinus sativus albus*, The White Garden Lupine. 2. *Lupinus albus*, The spotted White Lupine. 3. *Lupinus luteus*, *Lupinus flore luteo*, The Yellow Lupine. 4. *Lupinus ceruleus maximus*, The greater Blew Lupine. 5. *Lupinus ceruleus minor*, The lesser Blew Lupine. 6. *Lupinus ceruleus minimus*,

V. *The third, or Yellow Lupine.* It is like to the first Garden One in Stalks and Flowers, which are both lesser and shorter, but the Leaves are larger than those of the Small Blew Lupine. The Flowers grow in two or three Rundles or Tufts round about the Stalk and the Branches, of a beautiful, delicate, and exceeding fair Gold-yellow Color, in Fashion and Form like unto the other Kinds, being larger than those of the Lesser Blew Lupine, but nothing so large as those of the Greater Kinds. They are sweet of Smell, and made up into an Ear, of the Color of the Yellow Violet, and something of the Smell. The Cods are small, hard, and somewhat hairy. The Seeds are little, flat, and round, ill-favoured, much about the Form and Bigness of the Small Blew, or somewhat bigger, but far less than those of the White Garden Kind, of an extreme bitter Taste, of several Colors, or rather of a whitish Color on the outside, spotted with many Spots.

VI. *The fourth, or Greater Blew Lupine.* The Stalk of this Lupine is greater than that of the first or White Garden Kind, and the Leaves are more soft and woolly than those. The Flowers are of a most perfect blew Color, with some white Spots in the middle. The Cods are long, rough, greenish, and very large or great, in which are contained hard, flat and round Seed, not so white on the outside as the first or Garden Kind, but somewhat yellower, greater also, and more rough or hard in handling.

VII. *The fifth, or Lesser Blew Lupine.* This Kind of Wild Lupine differs not in the Form of Leaf or Flower from the former, but only that it is much smaller; the Leaves are greener, and have fewer Divisions in them: the Flower is of as deep a blew Color as the last. The Cods are small and long, containing small round Seed, not so flat as the former, but more discolored or spotted on the outside, than the Greater Blew sort is.

VIII. *The sixth, or Smallest Blew Lupine.* This small Plant is very like unto the last described in its form and manner of its Growing: it is little or nothing woolly, but is smaller both in its Stalks and Leaves. The Flowers likewise are wholly blew, as they are, or very seldom with a white Spot in them. The Seed is smaller also, and a little spotted.

IX. *The Places.* The first is accounted the only Garden or Tame Kind, the others are said to be Wild in the places where they are Natives. They all require, as *Theophrastus* says, a sandy and poor Soil, and difficultly grow in tilled or rich Land, because they are naturally Wild Plants. The first is a Native in many places of Greece, and the Eastern Countries beyond it, where it was anciently sown for their Food, being often watered to take away the Bitterness. The Yellow Lupine is a Native of Spain, from whence it was brought to us. The Great Blew Lupine is thought to come from beyond Persia, and to be a Native of *Carmania*. The Lesser Blew is found plentifully Wild in many places both of Spain and Italy. The last or Smallest Blew Lupine was brought by *Deel* out of Africa: but they all grow now in our Gardens, with such as are great Lovers of Flowers.

X. *The Times.* They are planted in April, and they bring forth their Fruit at two or three several times, seeming as if they did flower often, and bring forth as many Crops. The first flowers in May; the third in July, and so also the fourth and fifth; the sixth in September, but that seldom comes to Ripeness; but the others, after the times of their Flowering, soon bring their Seed to Perfection.

XI. *The Qualities.* Lupines, i. e. the Grain or Meal, is hot and dry in the first Degree; Aperitive, Digestive, Dissolutive and Absterive, so long as the Bitterness remains in them; but if that is taken away by steeping in Water, they become of an Earthy, clammy Substance, Emplastick, and hard of Digestion.

XII. *The Specification.* They are peculiar to open Obstructions of the Viscera, provoke Urine and the Terms, facilitate the Birth, expel the dead Child, and kill Worms; but these things they do as not divested of their Bitterness.

XIII. *The Preparations.* You may have therefrom, 1. A Meal. 2. A Paste. 3. A Decoction. 4. A Cataplasm. 5. An Ointment.

The Virtues.

XIV. *The Meal.* Screwed upon old rotten Sores and Ulcers, it is said to digest, cleanse, dry and heal them. Mixt with Honey and Vinegar, and given to drink, it kills Worms in the Belly. Boiled in Lye, it cleanses the Head and other Parts from Ulcers, Scurf, Morpew, and other like Defilements.

XV. *The Paste.* It is made of the Meal of Lupines after they have been so often or long steeped in Water, as to be divested of all their Bitterness, whether it is made into Puddings or into Bread, it seems to be hard of Digestion, and to breed no very good Nourishment, engendering grofs and clammy Humors.

XVI. *The Decoction in Wine or Water.* It is good against the loathing of Meat, and provokes Appetite. Drank sweetened with Honey, it cures Worms in the Belly, and if a little Rue and Pepper are added to it, it will be so much the more effectual. Taken three or four Ounces Morning and Night, it opens Obstructions of the Liver and Spleen, provokes Urine and the Terms, expels the Birth and dead Child, as also the After-birth, and being used as a Lotion or Wash, it is good against Spots, Freckles, Tanning, Sun-burning, Discolorings of the Skin, Pimples, Scurf, Morpew, and other Defectations of the Cutis: it also cleanses, dries and heals Scabs, running Sores, old Ulcers, and is said to take away the Marks of the Small-Pox, which are left after healing; as also all other black, blew, red and yellow Spots of the Skin. The Decoction of the Root in Water being drunk, provokes Urine. If the Decoction of Lupines in Wine be made with the Addition of Wormwood, Centory, and Bay Salt, it is good to stop the running or spreading of a Gangrene, being applied thereto very hot; and corrects spreading Ulcers, being applied very hot thereto with Stuphs of Tow or Flannel.

XVII. *The Cataplasm.* It is made of the bitter Meal with Vinegar by boiling. Being applied, it takes away Pimples, and dissolves Nodes or Kernels arising in several parts from the King's-Evil, or other Causes. It ripens and breaks hard Tumors and Abscesses, and is said also to break Carbuncles, if used by a skilful Hand. Applied to the Stomach and Belly, it helps to kill Worms in the Body, the Decoction being also given inwardly at the same time. It likewise cures Clefts, Bunchings out, Ulcers, and *Ficus in Ano*, being for some time applied to the Part.

XVIII. *The Ointment.* It is made of the bitter Meal by mixing it either with Honey, or with the Gall of an Ox, Sheep or Goat, or with both of them. Externally applied, it has the Virtues of the Decoction and Cataplasm: some add also the Juice of Limons to it, and so it cleanses the Face and Skin of all Deformities accruing thereto, as Freckles,

kles, Discolorings, Scuffs, Morpew, Pimples, and other Breakings out, &c. It is good against Scabs, malign Ulcers, Ragades, *Ficus in Ano*, &c. being duly applied.

XIX. *Nota.* Here is to be observed, that the *Wild Lupine* is said to be much the stronger, and to exceed the *Manured or Garden Kind*, for all the Purposes aforementioned.

yellow Husks with Seed of *Bolbonoch*, or *Lunaria major*, which is the *White Sattin*, but that these are smaller, rougher and harder, and in which lies small, flat, reddish Seed, in a double order, on both sides of the thin middle Skin, which in this is not white, like that of the *Sattin*, but else very like.

Greater Mad-wort of Dioscorides.

Mad-wort of Dioscorides the Lesser.

IV. The

C. H. A. P. CCCCLX.

Of MAD-WORT.

THE Names. It is called in Greek, *Ἀνίσκος* and *Ἀνίσκος*; in Latine, *Alyssum*; and in English, *Mad-wort*; so called because it is a present Remedy for the Biting of a Mad Dog, as *Galen de Antidotis*, lib. 2. writes, being an Herb very like to *Horehound*, but rougher, and more full of Prickles about the Flowers, which are of a Color tending to blew.

II. The Kinds. Authors have found out five several sorts of this Herb; but by Reason the most of them are not to be found in England, we shall only describe that of *Dioscorides* his *Greater* and *Lesser*, viz. 1. *Alyssum* & *Alyssos* *Dioscoridis major*, as *Dodonæus*, *Camerarius*, *Cusius*, *Lugdunensis* and *Lobel* think; and *Lobel* says farther, That there is no Herb to be found which better agrees with *Dioscorides* his *Alyssum* in all things, than this doth. Some will have it to be *Lunaria Græca*, and call it *Lunaria major*, and *Lunaria lutea*, *Cesalpinus* calls it *Lunaria Græca tertia*, and *Gesner*, *Lunaria aspera*, making it a Kind of *Moon-wort*; but is doubtless the *Greater Mad-wort of Dioscorides*. 2. *Alyssum* *Dioscoridis alterum* & *minus*, *Leucoium Alyssoides clypeatum minus* *Baubini*, (for he calls the first *Leucoium Alyssoides clypeatum majus*) The lesser *Mad-wort of Dioscorides*.

The Descriptions.

III. The first, or *Greater Mad-wort of Dioscorides*. It has a Root which is small and woody, dying every Year after it has given Seed, but seldom perishes the first Year before it runs up to a Stalk. It has many hoary, hard and rough Leaves lying on the Ground, somewhat broad and round for the first Year of their Springing; but the next Year, when the Stalk begins to grow up, they grow thereon both greater and longer, and a little torn in on the edges in some places, which Stalk is hoary, and about a Foot and half high, spreading it self into two or three Branches; at the tops of which come forth several pale, yellow, and very small Flowers, standing one above another severally, on both sides of the Stalks, which convert into somewhat large and round, flat, thin, hoary, hard, rough Husks, resembling little Bucklers; or rather most like the

IV. *The second, or Lesser Mad-wort of Dioscorides.* It has a Root which is small and long, with divers Fibres adjoining, which abides and shoots forth anew, and is more sharp in Taste than the Leaves, which are drying and astringent. From this Root spring forth several long Leaves, lying on the Ground, a little waved on the edges, of a pale or bluish green Color, about three Inches long, and one broad, rough and hairy, but softer than the former. From among which Leaves rise up slender, weak, rough Stalks, scarce able to stand upright, parted into several Branches, on which grow the Leaves by Couples, one opposite to another, smaller, but not less hairy and rough than the foregoing. The Flowers first begin to break forth at the tops, and afterwards on the sides or Wings, which are many set together in Tufts, consisting of four white Leaves, notched in the middle, which makes every Leaf seem like a Heart, with divers yellowish Threads in the middle of them, and each standing in a green Husk, the outides whereof have longer Foot-stalks than those more inward; and each Flower larger than the inner ones; which being past, round Seed-Vessels succeed, in Form like Bucklers, a little smaller than the former, hard and rough on the outside, in which are contained flat Seed, in four round reddish Cells or Partitions, divided by a certain thin shining Skin, two Seeds lying in each Cell or Division.

V. *The Places.* They grow in Gardens both with us and in Italy, France, and the Low-Countries, but their original or native place is scarcely or not well known.

VI. *The Times.* They flower in the Summer Months, as in May, June, July and August, the second year after their sowing, and their Seed is ripe not long after.

VII. *The Qualities.* It is hot and dry in the first Degree. Digestive, moderately Absterive, Expulsive, and Alexipharmick.

VIII. *The Specification.* It is peculiar for curing the Bittings of Mad Dogs, as also of Green Wounds, and of old running Sores, and filthy rotten Ulcers.

IX. *The Preparations.* From the Green Herb you may have, 1. A liquid Juice or Essence. 2. A Decoction in Wine. 3. A Powder. 4. An Ointment or Balsam. 5. A Cataplasim.

The Virtues.

X. *The liquid Juice or Essence.* Being taken in Broth or Wine, it cures the Bittings of Mad Dogs, and perfectly takes away the Venom or Poyson thereof, which Galen affirms *Simplicium Medicamentorum*, l. 6. and this some think to be manifest from the signature of the Plant, or likeness of its whole substance, and that this is the Virtues thereof, had been found from great Experience; and that it would perform many other Cures, from its drying, digesting, and moderately cleansing faculties: and therefore Galen and Dioscorides both say of each of these Plants, that they cleanse the Skin from Wheals and Pimples, from Spots and other discolorings, as Morphew, Sunburnings, &c. which is presumed to be done by the Juice or Essence.

XI. *The Decoction.* It may be made with Water or Wine, but the latter is the better. It has the Virtues of the Juice or Essence but much weaker, and therefore may be taken to half a Pint or more, according to Age, &c. It is good for the Cure of Wounds either inward or outward, to digest congealed or clotted Blood which is gathered together by any fall, blow or bruise, and to cleanse and heal old rotten and filthy Ulcers, and other creeping Sores.

XII. *The Powder of the Herb.* It has the Virtues of the Juice and Decoction, and particularly it has a virtue to stop the Hicough, and this it will do if the Powder, or green Herb it self is but held in the Mouth, and also smelt to. Dose one Dram at a time twice a day, in Ale, Beer, Wine, or Posset Drink, &c. Outwardly strewed upon running and putrid Ulcers, it dries up the moisture, and contributes much to their healing.

XIII. *The Ointment or Balsam.* It is of singular use to be applied to the Bittings of Mad Dogs, because it recalls, or draws forth the Venom or Poyson out of the Wounds; and some are of Opinion, that it might have the same Operation, if it was applied to the Biting of a Viper or Rattle-Snake: however outwardly applied to running Sores, inveterate Ulcers, Fistulae, &c. it has been found to digest, cleanse powerfully, then to dry, and induce a speedy healing, and this so much the more if the Powder of the Herb be strewed thick upon the Sore or Ulcer.

XIV. *The Cataplasim.* It is of great use, being immediately applied to attract or draw the Poyson or Venom out of the Bittings of Mad Dogs, and to disengage Tumors or Swellings caused by simple Contusions; as also to open the Pores so as to cause an eduction of the Morbifick cause of the Scurf, or Morphew, &c.

XV. Note, That the second Figure, which is that of the Lesser Madwort of Dioscorides, is taken from Matthioli's Epitome; in this Cut, the Seed Vessels are very exact, but the position of the Leaves are not just, for they ought to stand by Couples, and be of three times that length.

C H A P. CCCCLXI

of M A D D E R Great.

I. **T**HE Names. It is called in the Arabick *Pave*, and *Fève alsa bagin*: in Greek *Eruthrodanon* & *Eruthrodanon*, *Eruthrodanon* and *Eruthrodanon*: *Nicander* in *Theriakis*, calls it *Syriacum*: in Latine, *Rubea*, and *Rubia*, (from the color of the Root, and from its Dying Cloth or Leather into a Red color:) and in English, *Madder*. *Paulus Aegineta* says, it is called *Thapsion*: and in the Shops it is called *Rubia Tinctorum*.

II. *The*

II. *The Kinds.* It is either *Great*, of which in this Chapter: or *Small*, of which we shall Treat in the next. The great Kind of Madder, is, 1. *Rubia, Rubia Sativa, Rubia Tinctorum*, Garden Madder or Red Madder, which some call *Dyers Madder*, and *Crop-Madder*. 2. *Rubia Sylvestris*, Wild Madder. 3. *Rubia Sylvestris foliis longioribus*, Wild Madder with long Leaves. 4. *Rubia Marina*, Sea Madder. 5. *Synanchia Dalechampi*, Quinsley-wort or Quinsley Madder of Dalechampius. 6. *Mollugo Montano*, *Rubia Sylvestris altera Gesneri*, Great Bastard or Mountain Madder. There are other Herbs which some Authors will have to be kinds hereof, as *Aparine*, *Asperula*, *Cruciata*, *Gallium*, which we can scarcely admit of, and therefore you will find them in other Parts of this Book, in their proper places of the Alphabet.

The Descriptions.

III. *The first, or Garden Madder.* Its Root is fat and full of substance, yet not very great, but very long, running down half a mans depth into the ground, red in color, and very clear whilest it is

Garden Madder.

fresh, spreading several ways. From this Root shoot forth many very long, four square, reddish stalks, trailing on the ground a great way, very rough or hairy, (which therefore *Pliny* terms *Spinosus* prickly) and full of Joints. At every of these Joyns come forth several long and somewhat narrow Leaves, standing like a Star, or the Rowel of a Spur, about the Stalks, rough also and hairy: towards the Tops whereof come forth many small, pale, yellow Flowers; after which come small round Heads, green at the first, and reddish afterwards, but black when they are thorough ripe, in in which are contained the Seed.

IV. *The second, or Wild Madder.* In this the Root grows greater, but not fully so red nor clear as that of the Garden Kind. It grows up in

Wild or Field Madder.

form, very like to the Garden Madder before described, but the Stalks are smaller, not spreading so far; nor are the Leaves so rough and hairy, but rather (as *Gerrard* says) smooth and shining; and lesser also, and the Flowers white.

V. *The third, or Wild Madder with long Leaves.* Its Root is smaller, but red like the former, from whence spring up divers round jointed Stalks, two or three feet long, and sometimes longer, something smooth, or at least nothing so rough as the other Wild sort. The Leaves which stand at the Joints are a little rough, narrower, and longer than the other, seven or eight at a distance: at the tops of the Stalks, stand many white Flowers, made of four small Leaves a piece, which turn into small round Seed like the former.

VI. *The fourth, or Sea Madder.* Its Root is more red on the outside than within, harder and more Woody than the other: from this Root spring forth many square, hard, and something rough Stalks, round about it, which are full of Joints, and from whence grow many small, long Leaves, a little rough, broadest at the bottom, and pointed at the end; more white in the natural Places, than when Transplanted: from among which, (growing lesser at the Tops,) come forth small whitish Flowers Star fashion, like the other, but longer.

VII. *The fifth, or Quinsley Wort, or Quinsley Madder of Dalechampius.* It has a Root which is crooked, blackish without, yellow underneath the Skin, and white within and Woody, which is about five or six Inches long, with many hairy strings: From this Root arise many four square Branches, trailing upon the Ground, and sometimes reddish, towards the Root. The Leaves are small and sharp pointed, like those of *Gallium*, or *Ladies Bed Straw*, and grow along the Stalk on certain Knees

Knees or Joints, four or five together, and sometimes fewer. From these Joints the Stalk divides it self towards the Top into many parts, on which grow many Flowers, each Flower having four Leaves, sometimes white, sometimes of a flesh color, and every Leaf of these flesh colored Leaves is artificially streaked in the middle, and near the sides with three lines of a deeper red, but of no pleasant smell. After which comes the Seed, something round, growing two together like Bones, or as it is seen in Goose Grass.

VIII. *The sixth, or Great Bastard or Mountain Madder.* The Root is black without, fibrous, and abiding all Winter. From this Root shoot forth a

Great Bastard or Mountain MADDER.

number of slender and weak Stalks, but yet such as have so much strength in them, as that they need no propping, but will stand upright of themselves, which diversly branch forth themselves into many parts, so that it seems to be a pleasant bushy Plant, well spread; and having many shorter and broader smooth green Leaves set at the Joints, than either the Common, or red, or white Flowered Ladies Bed Straw. The Flowers are very small and white, standing at the tops of the Branches, pretty thick or plentifully, which being past away, turn into small, black, round Seed.

IX. *The Places.* The first is only Manured either in Gardens or Fields in many Countys of Europe for the profit which is made thereof: and is very Common, in most places of England. The second grows in moist Meadows and Moorish grounds, and under Bushes almost every where: it is said to grow also in Fields and Hedge sides near to Spire, and in many other places of Germany. The third also grows in many places in England, as at a place called *Hod-bill* in Dorsetshire, on the side which is next the River, in the Parish of *Stompaine*, two miles from *Blanford*, and at *Warham* likewise in the same Shire, on a Mud-wall in the same Town, and at a place called *Sommerpill* near to a Chapel by the Landing place, coming from *Astferry* to *Cheffell*,

in great abundance. The fourth grows by the Sea side in moist places; as also by the Sea side in *Provence*, and near *Mompelier* in France, and in Spain also as *Clusius* says. The fifth grows in dry chalkie Grounds abundantly, being found Wild in many places; it has been found in great plenty on the Hill beyond *Chartam* in, the way to *Canterbury*. The sixth is found on divers Hills in Germany; and grows in Hedges and among Bushes in many places.

X. *The Times.* The first, second, and third, Flower towards the end of Summer, and the Seed is ripe quickly after; but *Gerard* says, they flourish from May unto the end of August; and that the Roots of the first are gathered in Autumn for the use of the Dyers, and for Physical purposes. The fourth or Sea Kind, seldom gives ripe Seed in our Climate. The fifth Flowers all the Summer long. The sixth Flowers in May, June, and July, and the Seed is ripe in July and August.

XI. *The Qualities.* Madder is Temperate in respect to heat or cold, but is manifestly dry in the end of the first, or beginning of the second Degree: it is Aperitive, and also Astringent, and admirably Traumatick or Vulnerary.

XII. *The Preparations.* The first Kind is most in use, and of that the Root, chiefly; and also the Seed: From the Root are prepared, 1. A Decoction in Water or Wine. 2. A Decoction in Mead or Honied Water. 3. A Bath, or Fume, or Fomentation. 4. A Powder. 5. An Eclegma or Elestuary. 6. A Cataplasim of the Roots and Leaver. 7. A Powder of the Seed. 8. A Decoction in Wine of Quinsy Madder. 9. A Powder and Cataplasim of the same.

The Virtues.

XIII. *The Decoction in Water or Wine.* It opens obstructions of the Viscera, and cleanses the body of tough Flegm and gross Humors; it provokes Urine plentifully, as also the Courses in Women, and expels the dead Child and After-birth. It makes the Urine red like Blood, but it is from the Tincture of the Root, like as Rhubarb makes it yellow by virtue of its Tincture: and opens and astringes, as Rubarb purges and binds: inso much that it is said to be good against Ruptures, and to stop the flux of the Whites in Women: It is profitable against the Hemorrhoids or Piles by Fomentation: and taken inwardly to fix or eight ounces, it is said to stop a Diarrhæa.

XIV. *The Decoction in Mead or Honied Water.* It opens obstructions of the Gall, Liver and Spleen, and is profitable against the yellow Jaundice, Hypochondriack Melancholy; and is good for such as have the Palsie, numbness, and trembling of the Limbs: being also often taken it is effectual for the healing of inward Wounds.

XV. *The Bath, Fomentation or Fume.* It is made by boiling a great quantity of the Green Herb, Stalks, and Roots in Water. Being sat in, as hot as it can well be endured, it is good against the Palsie, Gout, Sciatica and Rheumatick Pains: It is a good Fomentation for Women to sit in, to provoke their Courses, and to cleanse the Womb from filth, or any putrid Matter.

XVI. *The Powder of the Root.* Given inwardly to one Dram it stops Fluxes of the Belly. The Gross Powder is often times used in Vulnerary Diet Drinks, for the curing of Wounded Persons, and such as are afflicted with running Sores, old Ulcers, Fistula's, and the like; and is of excellent use for such

such as have had outward or inward Bruises by falls or blows, or any internal flux of Blood, which it effectually stops.

XVII. *The Eclegma or Electuary.* Take choise Honey clarified twelve Ounces: Madder Roots in very fine Powder six Ounces: Rock Alum in fine Powder three Ounces: mix them and let them simmer over a gentle Fire, till the mixture is of a good scarlet color, which being cold put into a Gally-pot, and keep it close covered for use. It quickly cures all Sores and Ulcers in the Gums, Mouth, Throat or Gullet, and Wind-pipe, and eases the pain and strengthens a weak Back. It may be taken Morning and Night, and several times a day, as much as a small Cheltnut upon a Knives point, letting it distil down the Throat very leisurely, and for the pain and weakness of the Back, a Spoonful of it may be given at a time in a Glass of strong Ale, Tent, or Alicant.

XVIII. *The Cataplasin of Roots and Leaves.* Being beaten and applied to any part which is discolored with Sunburnings, Tanning, Freckles, black and blew Spots, Scurf, Morpew, or any other like deformity of the Skin, it cleanses it, and cures all those defecations.

XIX. *The Powder of the Seed.* Taken from half a Dram to a Dram with Vinegar and Honey, it prevails against the swelling and hardness of the Spleen, opens its obstructions, and removes Hypochondriack Melancholy.

XX. *The Decoction in Wine of Quinsy Madder.* It dries without biting, and is excellent against the Quinsy, being inwardly taken twice a day to six or eight Ounces, and outwardly applied, both as a Catgarism, and a Fomentation.

XXI. *A Powder and Cataplasin of the same.* A Cataplasin is to be made of the Root and Herb green, and to be brought to a Consistency with the Powder of the Herb or Root, and then it is to be applied to the Neck and Throat of such as are affected with a Quinsy, renewing it twice or thrice a day, as often as it grows to be absolutely cold.

C H A P. CCCCLXII.

of Madder Small.

I. **T**HE Names. It is called in Greek, *Ερubes* *δανυ* *υπερ*: in Latine, *Rubia minor*, & *Rubia parva*, and in English, *Small Madder*.

II. *The Kinds.* There are 1. *Rubia spicata* *Cretica*, *Clusij*, Candia Madder with spiked Heads. 2. *Rubia minor pratensis carulea*, small creeping Madder with purplish blew Flowers. 3. *Rubia minima Saxatilis*, small Rock Madder. There are about five other Kinds of these small Field or Wild Madders, but not being Natives or Inhabitants of our Country, and of little use in Physick, we shall say nothing more of them here.

The Descriptions.

III. *The first, or Candia Madder with spiked Heads.* It has a Root which is small, hard, woody, crooked or scragged, with many little Strings or Threads, red with out, and white with in, which always perishes when the Seed is ripe. From this Root spring up many knotty four square rough little Stalks, about a foot high, divided immediately from the Root into many Branches, having but one side Branch growing forth at one Joint: about which Joints grow and spread abroad four or five, and sometimes six narrow short sharp pointed Leaves, somewhat rough. The tops of the Stalks and Branches are nothing but long, small, four square spikes or ears, made of three Leaved green husks. Out of the Top of each husk grows a very small greenish yellow Flower, having four exceeding small Leaves, scarcely to be seen: after which follows in each husk, one small blackish Seed, something long, round on the one side, with a dent or hollowness on the other.

IV. *The second, or small Creeping Madder with purplish blew Flowers.* Its Root is small and of a reddish yellow color, abiding all the Winter with green Leaves thereon, and will encrease plentifully from the Seed it sheds every Year. This small Plant creeps upon the Ground, with many small, square, smooth Branches, much divided or spread out into other smaller ones, full Joints, and at every of them, five or six small, round, and very fresh green Leaves, smooth also, or but very little rough. From these Joints, and roundles of Leaves, as well as from the Tops of the Branches, come several small Flowers, made of five, blewish purple round pointed Leaves, with some small Threads in the middle. The Seed is small and long pointed, two for the most part standing together.

V. *The third, or small Rock Madder.* Its Root is small and reddish, as all the other sorts are. This smallest Madder grows not much above an hand breath high, with a square Stalk, spreading small Branches from the Joints, at which grow seven or eight small long pointed Leaves, even the smallest and narrowest of any before mentioned, being somewhat rough also. The Flowers are small, and of a pale red or bluish color, standing in Tufts or Umbles at the Tops of the Branches.

VI. *The Places.* The first is a Native of Candia, but with us grows in Gardens only. The second grows plentifully in many places of England. The third grow also in many places of our British Continent, as upon the Chalky Hills near Drayton, over against the Isle of Wight. It grows also upon Vincents Rocks not far from Bristol.

VII. *Nota.* Lobel says this last very small Kind has its Leaves of the bigness of Rapture-Wort, sharp pointed, and growing after the manner of those of Madder, upon little creeping Stalks, an Inch and half high, on which grows yellowish small Flowers: and that the Root is small and of the color of Corall.

VIII. *The Times.* They all Flower in the Summer Months, as May, June, and July, and their Seed is ripe soon after.

IX. *The Qualities, Preparations, Virtues and Uses,* of these are all the same with those of the Great Madder, in the former Chapter, and therefore I referre you thither: but neither any of these

Q q q q small

small *Madders*, nor yet any of the other five last Kinds in the said foregoing Chapter, are any ways equal or to be compared to those of the first great Garden Kind, for which special reason, that is only or chiefly in Use.

C H A P. CCCCLXIII.

OF MAIDEN-HAIR English.

I. **T**HE Names. It is called in Greek, *Ἀδίατρον* Anglicum: in Latine, *Capillus Veneris* Anglicus: and in English, English Maiden-Hair.

II. The Kinds. There are four several sorts of it, viz. 1. *Teloxares*, Greece: *Trichomanes* Latine, also *Capillaris*, and *Ficula*, as *Gaza* has it: in English, English Maiden-Hair, and Common Maiden-Hair. 2. *Ἀδίατρον ἀγυρρον*, Thalsij, *Polytricum aureum majus* Bauhini: and of some, *Adiantum aureum majus*, muscus *Capillaris*, *Polytrichum Apulei* Fuchsj, the greater Golden Maiden-Hair. 3. *Polytricum aureum minus* Bauhini, *Adiantum aureum minus*, the lesser Golden Maiden-Hair. 4. *Capillus Veneris* Tragi, *Adiantum album* Cordi, *Saxifraga major* Brunfelsij, & Fuchsj, *Ruta muraria* Matthioli, who afterwards took it be *Paronychia Diofcoridis*, *Salvia Vite* Lobelij & *Lugdunensis*, in English, Common White Maiden-Hair, or Wall-Rue.

The Descriptions.

Common English Maidenhair.

III. The first, or English Maiden-Hair. Its Roots are small, hard, black, and Fibrous or Thready, from whence come forth a great many blackish

shining little Stalks, scarcely a Span in length, and in many Plants not half so long; on each side set very thick with small round dark green Leaves, and spotted on their backs like *Ceterach*, and other small Ferns.

IV. The second, or Greater Golden Maiden-Hair. It has a small and thready Root, whose Fibres are wonderful fine. It is a kind of Moss, and its Stalks are not above a handful high, covered with short hairs standing very thick together, of an obscure yellow green color, out of which Stalks, spring up sometimes very fine naked Stems somewhat black; upon the tops of which hang as it were little Grains like Wheat Corns.

V. *Parkinson* says it has a very small and Thready Root: and that it has a company of small brownish red Hairs to make up the form of Leaves, growing about the Ground from the Root: and in the middle of them in Summer time, rise up small Stalks of the same color, set with very fine yellowish green Hairs on them, and bearing a small gold yellow Head, lesser than a Wheat Corn, standing in a great Husk.

VI. The third, or Lesser Golden Maiden-Hair, of this there are two Kinds, viz. the Lesser, and the Least, both of which are very like the former, but that the Stalks grow not to much more than half the height of the greater.

VII. The fourth, or Common white Maiden-Hair, commonly called Wall Rue, but is generally accounted one of the Capillary Herbs or Maiden-Hairs, and that not of the least account. It has a Root which is black and full of strings, from whence spring forth many Leaves almost round and slender standing upon short foot Stalks. It has rising up from among those Ground Leaves fine pale green Stalks, almost as fine as Hairs, set confusedly, with divers pale green Leaves, on very short foot Stalks, somewhat near unto the color of Garden Rue, and not differing much in form, but somewhat more like unto the true *Adiantum* in the next Chapter, being more and more diversely cut in on the edges, and thicker, smooth on the upper part, and spotted finely on the under.

VIII. The Places. The first grows upon old Stone Walls in the West of England, and in Wales; in Kent, and in several other places of this Land: it delights also to grow by Springs and Wells, and in Rocky, moist and shadowy places, and Mr. Goodyer said, that in January 1624, he saw enough to lade a Horse, growing on the Banks in a Lane, as he rode between *Rake* and *Headly* in Hampshire, near *Woolmer Forrest*. It was also found growing in a shady sandy Lane in *Betsome*, in the Parish of *Southfleet* in Kent: as also upon Stone Walls at her Majesties Palace of *Richmond*. The second is seldom found but upon Bogs and Moorish places, yet sometimes also in shady dry Ditches, where the Sun does not come: *Gerard* found it in great abundance in a shadowy Ditch upon the left hand, near unto a Gate which leads from *Hampstead Heath* towards *Highgate*. The third is found in or near the same places where the second is said to grow. The fourth is found in many places of England, as at *Dartford*, and the bridge at *Ashford* in Kent, at *Beckonsfield* in Buckinghamshire; at *Woolly* in Huntingdonshire: on *Framlingham Castle* in Suffolk: on the Church Walls at *Mayfield* in Sussex, and on the Rocks near *Weston super Mare* in Somersetshire: on the Walls of the Church-yard at *Sittingburn* in Kent, in the middle of the Town near a Lake of Water, and upon the Church Walls of *Railly* in Essex, and other places.

IX. The

IX. *The Times.* These Plants are always green both *Summer* and *Winter*, but have neither Flowers, nor Seed.

X. *The Qualities.* All these several sorts of *Maiden-Hair* are temperate in respect to heat or cold, but dry in the first Degree. They are Aperitive, and Diuretick, Pectoral, Hepatick, Nephritic, and Alexipharmick.

XI. *The Preparations.* They are almost equally in Use; but if there is any difference, the first and fourth are most in Vogue. And from any of them, or all of them, you may have 1. A Decoction in Wine or Water. 2. An Infusion or Tincture in Wine. 3. A Powder of the Herbs.

The Virtues.

XII. *The Decoction in Water or Wine.* It is very effectual against Coughs, Colds, Catarrhs, and other Distempers of the Breast and Lungs, causing an easy expectoration; it opens the obstructions of the Liver, Spleen and Reins, and is available to break the Stone, especially in the Reins, expel Sand, Gravel, and other Tartarous Matters, to provoke Urine, and give ease in the Strangury. It is also of good use for such as are troubled with the Spleen, or affected with the Falling-sickness. The Head washed therewith, it strengthens the Roots of the Hair, stays it from shedding or falling, and causes it to grow thick where it is thin.

XIII. *The Infusion or Tincture in Wine.* It has all the former Virtues, but much more pleasant to be taken, for it has less of the Styptick, Terrene or Earthy parts, than the Decoction, the which are extracted by boiling; and more of the fine, subtil, and volatile parts, most of which in the former are lost, but in this retained, because not tortured with the violence of the Fire. Dose from 4. to 6 Ounces, Morning, Noon, and Night, as the Physician, shall think fit, of the former also; as well as of this. But this is to be noted, That they may be both sweetened with Clarified Honey, which also contributes to the same ends.

XIV. *The Powder.* It has all the Virtues of the Decoction, or Infusion or Tincture: and being mixed with Clarified Honey and made into an Electuary, it causes Expectoration, and is a singular Experiment against the Asthma, or shortness of Breath, and difficulty of Breathing, as also against all Tartarous Mucilage in the Urinary parts, Stone and Gravel, Ulcers in the Reins and the like. The Powder may be given from half a Dram to a Dram, in Wine or other Vehicle; but seems to me to be best made up into an Electuary with Clarified Honey, and so taken. These *Maiden-Hairs* treated of in this Chapter have been found by Experience, to be of the same Nature, Qualities and Virtues, and to have as good Effects, as the *True Maiden-Hair*, of which we shall treat in the next Chapter; and because easier to be come by, the oftener made use of.

C H A P. CCCCLXIV.

Of MAIDEN-HAIR True.

I. *THE Names.* It is called in *Greek*, *Ἀδαντρί* (because the Rain rests not on it, but slides off; and *Πολύτριχον* *Dioscoridis*, quasi *multicomum*, quod *Capillos multos* & *densos* faciat; & *Καλλότριχον* *Apuleij*, quasi *Pulchricomum*, quod *Capillos tingit pulchriorisque reddit*: in *Latine*, *Adiantum*, *Polytrichum*, *Callitrichum*, *Capillus Veneris*, (*à speciosis reddendis Capillis*;) *Capillus Terræ*, *Supercilium Terræ*, & *Crimta*: and in *English*, *Maiden-Hair*.

II. *The Kinds.* The *True Maiden-Hair* is but twofold, viz. 1. *Adiantum minus* (which is *verus*) *Capillus Veneris verus*, The *True Maiden-Hair*. 2. *Adiantum majus* (which is also a kind of the *Verus*, and grows only larger according to the Region it grows in) *Adiantum Syriacum*, *Capillus Veneris Syriacus*, the *True Syrian Maiden-Hair*. To these we may add, 3. *Adiantum nigrum Vulgare*, *Onopteris nigra Dodonæi*; *Adiantum pulchrum Lugdunensi simile Thalij*, Common black *Maiden-Hair*. 4. *Adiantum album Plinij*, *Adiantum filicis folio Bauhini*, *Δρυοφύλλος λευκή*, *Dryopteris alba*, *Dryopteris Candida Dodonæi*, of which we have already written in Chap. 260. *Self*. 4. and 9. foregoing. 5. *Adiantum Fruticosum Americanum*. The *American Maiden-Hair*.

The Descriptions.

The true Maiden hair.

III. *The First or True Maiden-Hair*, has a Root which consists of a number of blackish brown Fibres, or Threads; from whence springs up a small low Herb, not above a Span high, whose Stalks are smaller,

Q q q q 2

smaller, finer, redder, and more shining than those of *Trichomanes*, or our Common *English Maiden-Hair*, on which are placed delicate fine Leaves on both sides, without order, one above another, somewhat like unto the lower Leaves of *Coriander*, or like the Leaves of *Anise*, but larger, cut in unequally on the edges, and spotted on the back with very small brown Marks scarce to be discerned.

IV. *The second, or True Syrian Maiden-Hair.* Its Root is tough, and thready like the first; and the whole is an humble or low Plant, having Leaves

True Syrian MAIDEN-HAIR.

flat, smooth, and plain, set upon a blackish middle rib, like unto that of the other true *Maiden-Hair*, cut or notched on the edges, Nature keeping no certain form, but making one Leaf of this fashion, and another of another, far different from it. But yet in the main, this *Syriacum* is but one and the same Herb and Species with the former, tho' somewhat larger, which is from the Country, and nature of the Soil; for which reason, *Lobel* calls it, *Capillus Veneris Vetus*.

V. *The Third, or Common black Maiden-Hair.* This differs little or nothing from the *Dryopteris Candia Dodonæi*, which is the fourth Species next following, as is declared in the Kinds, and of which we have already written in the place aforesaid; but that the Stalks of this are blacker, and the Leaves of a sadder green, whereas that is greener and paler, so that that aforesaid to come in the fourth place here, may very well be accounted a Species of this: There are many Stalks of winged Leaves, not much higher than the aforesaid, scarcely exceeding 6, 7, or 8, Inches in height, but the Leaves on the Wings are broader, shorter, and more deeply cut in on the edges.

VI. *The fifth, or American Maiden-Hair.* It has a Fibrous Root, and grows up like unto a Fern, with a slender blackish brown Stalk, branched forth into others, about which on each side, stand from 12 to 20 fresh green Leaves, small and somewhat long, joined together by small foot Stalks, somewhat like unto the first true *Maiden-Hair*, but cut in on the out side at the tops of the Leaves only, and not at the bottom.

VII. *The Places.* All these sorts grow on Stone Walls, and by the sides of Rocks, or Gravelly Springs, and other shady and moist places. The first plentifully, as *Pena* and *Lobel* say, about *Mompelier* in *Narbonne* in *France*; as also in some parts of *Gloucestershire*, and in divers parts of the West of *England*. The second grows in *Syria*, and is not to be found with us unless in *Gardens*. The third in many Barren, Rocky, and Untilled places, especially where Springs are near. The fourth upon Oaks and among Oak Moss. The fifth in *Virginia*, *Carolina*, *New-York*, *Mary-land*, *Pennsylvania*, and other parts of *Florida*.

VIII. *The Times.* They all abide green through the whole year but have not any of them, either Flower or Seed.

IX. *The Qualities.* *Maiden-Hair* is temperate in respect of Heat or Cold, and dry in the first Degree, Aperitive, Diuretick, Traumatick, Pectoral, Splenetick, and Nephritick.

X. *The Specification.* It opens Obstructions of the Lungs, Liver and Spleen, prevails against Ulcers of the Lungs, Coughs and Asthma's, and cures the Rickets in Children.

XI. *The Preparations.* The Preparations are much the same with those in the former Chapter, viz. 1. A simple Decoction in Water or Wine. 2. A Compound Decoction. 3. A Powder. 4. A Tincture in Wine. 5. A Lye.

The Virtues.

XII. *The simple Decoction in Wine and Water.* It prevails against the Cough, shortness of Breath, difficulty of breathing, the yellow Jaundice and diseases of the Spleen: it is said to break the Stone, open obstructions of the Reins and Ureters, and provoke Urine: it provokes the Terms in Women, rectifies the Blood, and cleanses the Lungs of Tartarous and putrid matter, by Expectoration. Dose four Ounces four or five times a day.

XIII. *The Compound Decoction.* Take *Maiden Hair* 12 Handfuls, *Ceterach*, or *Spleen-wort*, *Liver-wort*, *Osmond Royal*, of each 4 Handfuls; *Liquorice bruised* 2 Ounces; *Fennel Seeds bruised* 1 Ounce; *Raisins of the Sun Stoned*, blew *Currants*, of each half a Pound; blew *Figs slit* 4 Ounces; *Spring Water* 3 Quarts; mix and Boil, then strain out and keep it for Use. Let it be taken in the Morning fasting, an hour before Dinner; at 5 in the Afternoon, and at Bed-time; always squeezing into it, at the time of taking it the Juice of an Orange, or some of the Juice of a Limon. It not only opens Obstructions of Lungs, Liver, Spleen Reins and Womb, having all the Virtues of the simple Decoction, but cleanses the Lungs of Ulcerated or putrid Matter, heals Ulcers of the Lungs, and cures the Rickets in Children. It provokes Urine, gives ease in the Strangury, prevails against inveterate Asthma's; and being long taken, profligates the Gout and Rheumatick pains to a Miracle.

Dose

Dose four Ounces or more at a time, as often as before directed.

XIV. *The Powder of the Herb.* Being taken a Dram at a time in Red *Barcelona* Wine, or other like Styptick Wine, Morning and Night for 40 or 50 days together, it is said to cure Ruptures. It is profitable against the Bitings of Vipers or other Serpents and Venomous Creatures, and has indeed all the Virtues of the Decoction and Tincture; but for the other Diseases, it is best to be made up into an Electuary with twice or thrice its weight of Clarified Honey, and the Electuary to be given from 2 to 4 Drams.

XV. *The Lye.* It is made of the Ashes by Elxiviation in fair Water. It is singular good to cleanse the Head of Scurff, Morpew, Dandriff, and to heal a Scald Head, whether it be a dry or running Sore: It stays the falling of the Hair, and is said to make it grow thick, fair, and well colored, for which purpose some make the Lixivium in Wine, and others use the Decoction of the Herb in Wine. And some boil the Ashes in Oil, and anoint therewith to cure Baldness, Scurff, Dandriff, Scald-Heads, &c.

CHAP. CCCCLXV.

of MALLOW Common.

I. **T**HE Names. It is called in *Arabick*, Chubeze and Chubes, and the Seed thereof *Bizeri Chubeir*: in *Greek*, Μαλάν, *ab emolendo Venire*, but in the Coppies of *Epichames* and *Antiphones* it is written Μαλάν: in *Latine*, *Malva*, quasi *Malva*, quod alvum *Molliat*: in *English*, *Mallow*.

II. *The Kinds.* There are several principal sorts of *Mallows*, as 1. *The Common Kind*, of which in this Chapter. 2. *The Marsh Mallow*, of which in the next Chapter. 3. *The Vervain Mallow*, of which in Chapter 467. 4. *The Tree or Shrub mallow or Marsh Mallow*, of which in Chapter 468 following.

III. *The Kinds of the Common Mallow.* Of this there are these Species following. 1. *Malva vulgaris Flore purpureo*, The Common Mallow with Purplish Flowers. 2. *Malva vulgaris Flore albo*, The Common Mallow with white Flowers. 3. *Malva Sylvestris minor*, *Malva Sylvestris repens pumila*, The Small, or Dwarf Wild Mallow. 4. *Malva Montana*, The Mountain Mallow. 5. *Malva Hispanica Flore carneo amplo*, The Spanish Blush Mallow.

The Descriptions.

IV. *The first, or Common purplish Mallow.* It has a Root which is long and white, rough and somewhat Woody, and running deep into the Ground. From this Root spring forth many large, soft,

green, roundish Leaves, yet somewhat cornered and dented about the edges, standing upon long foot Stalks next the Ground; from among which rise up several round, green Stalks, growing in time to be 3 or 4 feet high, especially when growing in good Soil, and to be more hard and almost Woody, especially at the bottom; divided into many Branches, towards the tops, and with many lesser Leaves, and more divided upwards; where it brings forth many Flowers, standing in soft husks; which Flowers twine themselves, at their first shooting forth, before they open themselves into five, large, broad pointed Leaves of a fine delayed purplish red color, with many stripes or Veins running through every Leaf, of a deeper color, which makes the Flower seem very beautiful: after which come round flat Cakes, with many blackish Seeds set in order round about them.

Common Purplish MALLOW.

V. *The second, or Common white Mallow.* The Roots of this are like to those of the former: and in its Springing up, Stalks, Leaves, Flowers and Seeds, height, and manner of growing, it is so like to the first that it cannot be discerned from it, till it is in Flower, in which consists the whole difference: These Flowers being not full out so large as they, and of a pure white color, without any stripe or Vein of any other color running through them.

VI. *The third, or Small, or Dwarf Wild Mallow.* The Roots are like those of the two former: so also its Stalks, Branches, Leaves, Flowers, and Seeds: saving that this Kind lies with its Branches more upon the Ground, and that it has many smaller and rounder Leaves, not so much cut in, or very seldom, and less dented on the Edges than the first Common; the Flowers are also smaller and more white, otherwise it is in all respects like the Vulgar Mallow.

M A L

MALLOW Dwarf.

VII. *The fourth, or Mountain Mallow. The Root is like to that of the Common Mallow: Its lower Leaves are as large as those of the first or Common Kind, but a little longer, with some round divisions or cuts in them, but not deep, and not much unlike in shape to an Ivy Leaf: the Stalk grows not so great and high as the first Common, and with something smaller Leaves thereon, and upwards they are somewhat rounder and lesser: the Flowers and Seed are wholly like to those of the first.*

VIII. *The fifth, or Spanish Blush Mallow. It has a Root which is small and long, and perishes every Year: This Spanish Mallow, is in form and manner of Growing, very like unto our first or Common Field Mallow, having upright Stalks two or three feet high, spread into divers Branches, and from the bottom to the Top, beset with round Leaves, like unto our Mallows, but somewhat smaller and rounder, and less divided, yet larger below than above: the Flowers plentifully grow upon the small Branches, folding or writhing their Leaves, one above another, before they be blown, and being open consists of five Leaves, with a forked Clapper therein, of the same color with the Flower: the chiefest difference from the first Common Kind, consist in this, that the Leaves of these Flowers are larger and more wide, open at the brims (almost like a Bell Flower) and of a fair blush or light Carnation color, opening all the day time, and closing at night. After the Flowers are past, there come such like round heads, with small black Seed like to those of the first Common Kind, but something smaller.*

IX. *The sixth, or Curled Mallow, or French Crisped Mallow. It has a Root like to the first Common Kind, which perishes when it has perfected its Seed. This Crisped or Curled Mallow, (which*

is called by the common People *French Mallow*, tho' it grows as frequently and naturally in England in our Gardens) has many small upright Stalks growing a foot and a half or two feet high, and sometimes higher, as I have seen it, which is according to the goodness of the Soil; on these Stalks and Branches do grow broad Leaves somewhat round and smooth, of a light green color; which are Crumpled or Curled about the Edges, and also into the substance of the Leaf like a Ruff, very admirable and pleasant to behold. The Flowers are small and white, much like the former Kinds.

X. *This Kind Parkinson thus describes. The Root usually abides the first year, and the second year it runs up to Flower and Seed, but soon after the Seed is perfected it perishes: from this Root shoots up an upright green round Stalk, as high sometimes as a Man, on which from all sides grow forth round whitish green Leaves, Curled or Crumpled about the Edges like a Ruff, else very like to our first or Common great Mallow Leaf. The Flowers grow both upon the Stalk, and on the other Branches, which spring from it, being small and white, after which come small Cafes, with black Seed like the other Mallows. This Kind is much used as a Pot-herb, especially when there is cause to move the Belly downwards, which by its slippery quality it helps forward. It has formerly, and is at this time in some places, used to be boiled or stewed, either by it self, or with Butter, or with Spinage, or other Herbs, and so eaten.*

XI. *The seventh, or Summer Mallow (called Malva trimestris, & Malva xiliva.) It has a small Root which perishes with the first Cold or Frost which comes; but sometimes if the Summer is kindly, it gives its ripe Seed before the coming of Frosty Nights. It has soft, round, green Leaves, without divisions, yet dented about the Edges, and something pale underneath. The Stalk rises up to be about a Foot and a half high, and sometimes higher, bearing smaller Leaves, and a little divided, somewhat like unto those of Marsh Mallows. The Flowers are of a paler purplish color, than the Common and Lesser, the bottom of whose Leaves are of a deeper color, standing upon longer foot Stalks, and not so many together; after which comes small Seed.*

XII. *The Places. The three first grow commonly by Ways, and Hedges, and Ditch sides in Fields, and untilled places, almost every where thro' the whole Land; but the second Kind with white Flowers is not so plentiful, it has been found at Ashford in Kent, and at Thrapston in Northamptonshire, and in several other places. The fourth is found on Hills and Mountainous Grounds. The fifth, and seventh are Natives of Spain, from whence they have been brought to us and are nourished up in our Gardens. The sixth grows plentifully both in England and France, in Gardens, for it grows not Wild, that ever I heard of.*

XIII. *The Times. They all Flower all the Summer Months, from May, even to August, or later, till the Coldness of the Weather nips them; and the Seed comes to ripeness in the mean season.*

XIV. *The Qualities. These Plants are all temperate in respect of Heat and Cold; and moist in the first Degree. They are Deobstructive, Emollient and Traumatick; Pectoral, Nephritick and Hystrick.*

XV. *The Specification. They expel Tartarous Mucilage out of the Breest and Lungs, as also from the Guts, Reins, and Womb: are profitable against the*

the Bloody Flux; and prevails against the Stone and Gravel, whether in the Reins, Ureters or Bladder.

XVI. *The Preparations.* You may prepare therefrom 1. *A Liquid or Inspissate Juice.* 2. *An Essence.* 3. *A Decoction in Water or Wine.* 4. *A Syrup.* 5. *A Powder.* 6. *An Ointment or Balsam.* 7. *A Cataplasm.* 8. *A Distilled Water.* And all these Preparations may be made either of the Leaves or Roots alone, or of both together.

The Virtues

XVII. *The Liquid or Inspissate Juice.* The fift taken to 2 or 4 Ounces, or the latter to half an Ounce dissolved in Barly Water, opens the Body, and causes an Evacuation of Hot, Choleric, and other offensive Humours; eases the Pains and Torments which come by Obstructions of the Bowels and Constipation of the Belly; and therefore is good to be used in Clysters conducing to those purposes: Taken by Nurses which give Suck to Children, it encreases their Milk, and helps to expectorate pituitous and tough Humours from the Breast and Lungs, heals exoriation of the Stomach and Guts, prevails against the Phtisick, the Pleurisy and other like Diseases. Given in Wine, it causes speedy and easy delivery to Women in Travel, is profitable against the Bloody Flux, as also other Fluxes of the Bowels.

XVIII. *The Essence.* It has all the Virtues of the *Liquid or Inspissate Juices*, and being take to an Ounce or two in a Glas of Generous Wine, it is profitable against inward Convulsions of the Stomach, and Torsions of the Guts. It is also profitable against Poison, so as the Poison be presently voided by a Vomit. Bathed upon the affected parts, it is good against Scurfs, Morpew, Dandriff, or dry Scabs, whether in the Head or other places, and is profitable against Scalding with Water, or Burning by fire, and to help an Erysipelas or *Anthionies Fire*, and to discuss all other hot, red and painful Swellings in any part of the Body.

XIX. *The Decoction in Wine or Water.* It has the Virtues of the *Juice and Essence*, but not full out so powerful; but prevalent against most external Decoctions. The Feet being Bathed therewith, it helps much against Defluxions of Rheum from the Head, rising from the Stomach; and if the Head is washed therewith, it prevents the shedding or falling of the Hair: if a little Honey and Roch Alum be dissolved in it, it makes an excellent gargle for any sore Mouth or Throat, for it cleanses and heals them in a very short time.

XX. *The Syrup.* It may be made of the *Juice, Essence* or *Decoction*, with Honey. It is effectual against all the Diseases before Specified, but is an admirable Pectoral and Nephritic. It loosens the Belly gently, and is effectual in Clysters for to ease all pains of the Bowels, opening the obstructed passages and making them slippery: given inwardly by the Mouth, it causes Expectoration, and helps most Diseases of the Breast and Lungs, as Coughs, Colds, Hoarseness, Wheezing, shortness of Breath, difficulty of Breathing: It is profitable also against Excoriation of the Guts, Bloody Fluxes, and other Fluxes of the Bowels, by qualifying the sharpness and acrimony of the Choleric Humour: and by its Mucilaginous property, it eases the Pains and heals the Ulcera-

tion or Soreness. It may be given from an Ounce to 3 Ounces, in Partly Water, against the Stone, Gravel, Sand, and other Tattarous Matter in the Reins, Ureters and Bladder, it eases the Pain and causes small Stones and Gravel the more easily to descend and to be expelled, for which thing it is a most celebrated Remedy. But tho' for all these purposes *Common Mallow* may be used, yet we generally take the *Marsh Mallow* first described in the next Chapter, which is the chiefest *Mallow* of all others, and is called *Bismalva*, for that it is twice as powerful in its effects as the others, and you may make use either of the Leaves or Roots, or of both.

XXI. *The Powder.* It may be made either of the Leaves or Roots, or of both, and that either of the *Common Mallow*, or of the *Althea* or *Marsh Mallow*. Given to a Dram, more or less, it has the Virtues of the former Preparations, and is peculiarly good against the Strangury. It is good to be given to such as are troubled with Ruprures, given in red *Barcelona Wine*, or other Stryptick Wine, and is profitable against Scrophulous or Strumous Tumors in the Neck and Throat called the Evil: it discusses Swellings in Womens Breasts: and being given with Milk and Honey, it is special good against the Chin-Cough: and given in a strong bodied Wine, induces the healing of Wounds and Ulcers, and restores such as are ready to faint thro' the loss of Blood, or are otherwise hurt by falls or blows, or Stripes, or have any Ach, Pain, or Swelling in the Nerves, Tendons or Muscles in any part of the Body. Applied to green Wounds it presently conglutinates and heals them.

XXII. *The Ointment or Balsam.* If made of the Mucilage, chiefly of the Roots, and rather of the *Althea*, than of any other, it takes away the roughness of the Skin, discusses Inflammations; and strengthens Fractures and Dislocations; mollifies and digests hard Tumors, or such as will Apostemate; digests and cleanses putrid Wounds and Eating Ulcers, making them fit for a Cure.

XXIII. *The Cataplasm.* Made of the green Herb and Root it is good against hardness and shrinking of the Sinews: laid to the Eyes with a little Honey, discusses their Inflammations, and if apostemated, prevents the coming of a Fistula. The *Cataplasm* made of the bruised Leaves applied to the Stinging of Bees, Wasps, Hornets, yea of the Scorpion, and the biting of that poisonous Spider the *Phalangium*, is said presently to take away the Pain, redness and swelling arising thereupon, and keeps them from putrifaction. If it is made of the Leaves boiled and beaten, with Bean or Barly Flower, and Oil of Roses, it is an especial remedy against Inflammations, and hard Tumors, Apostemata, and swellings of the Testicles and other parts, and eases their Pain, as also the pain and hardness of the Liver and Spleen, being put upon the place grieved. The *Cataplasm* made of the green Leaves beaten up with Nitre, and applied, draws Splinters, and Thorns out of the Flesh. If made of the mucilage of the Roots with the flower or powders of *Lin-Seed* and *Kenagreek-Seed* and applied, it gives ease to pains in any part of the Body.

XXIV. *The Distilled Water.* This being made when the Plant is in Flower, is good for all those Diseases the *Juice, Essence*, or *Decoction* are applied to, but acts more weakly; yet it is much commended to be used in Burning Fevers, and the hot Fits of Agues.

XXV. *The Flowers of Mallows.* A *Decoction* of them in water sweetned with Honey, and in which a little Alum is dissolved, is good against Rheum

Rheum in the Eyes, and Inflammations of those parts, as also makes a good Gargle for sore Mouths and Throats, cleansing and healing them in a very little time.

XXVII. *The Seed.* If green it is bruised, and Infused in Vinegar, or being dry, it is made into Powder, and so Infused, it will cleanse the Skin from Freckles, Tanning, Sunburning, Scuff, Morpew, and all other demerits thereof, being well bathed therewith. And being made into Powder (more especially the Seed of the *Althea* or *Marsh-Mallow*) and given to a Dram, or a Dram and half at a time, it gives ease in the Stone, Gravel and Strangury, and provokes Urine, and this more especially if it be several times repeated, where note, that it is best to be given in *Parsley*, or *Asparagus*, or *Onion Water*, or some other proper Diuretick.

C H A P. CCCCLXVI.

of M A L L O W Marsh.

THE Names. It is called in *Arabic*, *Chitini*, *Chateni*, and *Rosa Zameni*, and by *Serapio*, in one place *Alsam*: in *Greek*, *'Aðala*, *Althaea*, & *'Ictea*, *Ibiscus*, *'Ictea*, *Hibiscus*, & *'Ectea*, *Ebiscus*: in *Latine*, *Althea*, *Malva* *Murina*, *Aristalthea* (from the excellency of its effects:) of some *Olus Judaicum*, the *Jew's Pot-herb*: and by some Authors, *Bismalva*, and *Malva-viscus* (as it were from *Malva* and *Ibiscus*;) in *English*, *Marsh-Mallow*.

II. *The Kinds.* Authors make many sorts of this Plant: but we shall describe only these five varieties following, viz. 1. *Althea vulgaris*, *Bismalva*, *Malva palustris* *Cordi*, *Malva agrestis* *genus Gesneri*: *Malva-viscus* *Angulare*, *Althea* *Ibiscus* *Lobelij*, Our Common *Marsh-Mallow*. 2. *Althea palustris* *Cytini* *Flora*, *Water-Mallow*. 3. *Althea semper virens* *Bryonia* *folia*, *Althea frutescens* *Bryonia* *folia* *Baubini*, *Evergreen Marsh-Mallow*. 4. *Althea lutea*, *Althea floribus luteis* *Lobelij*, *Althea peregrina* *Gesneri* *in hortis*, *Althea Theophrasti*, *Althea floribus luteis palustris* *Pene*, *yellow Marsh-Mallow*. 5. *Althea rosea peregrina*, *vel Americana*, *Rose Marsh-Mallow of America*.

The Descriptions.

III. *The first*, or Common *Marsh-Mallow*, It has a Root which is long, spreading it self into manifold parts from one Head, of the bigness of a Thumb or finger, very pliant, tough and bending like *Liquorice*, of a whitish yellow color on the out side, and more white within, full of a viscous or slimy Juice, which being laid in Water, will so thicken it, as if it were *Gelly*. From this Root spring forth several soft hoary white Stalks, rising to be three or four Foot high, spreading forth many Branches, the Leaves of which are soft and hoary or woolly, somewhat lesser than

MARSH-MALLOW.

those of the Common *Mallows*, but longer pointed, cut for the most part into some few Divisions, but not deep, the Flowers are many, but smaller than those of the *Vulgar Mallow*, and white, or tending to a bluish color; after which come such like round cases and Seed, as in the *Mallows* first described.

WATER-MALLOW.

IV. *The second, or Water Mallow, (or Marsh Mallow red flowered.)* It has a Root which is long, white, and tough, somewhat like the former, but nothing so great or mucilaginous. From which come forth many soft Leaves, somewhat like unto those just before described, but not so soft or whitish, but of a pale green color on the upper side, and whiter underneath, longer also, and denser something deeper about the edges, standing upon long Foot Stalks; among which rise up divers round green Stalks, 3 or 4 feet high, bearing the like Leaves on them, at several distances: from the Joints of the Leaves, towards the tops of the Stalks, and at the tops of them likewise come forth the Flowers, consisting of five Leaves, longer and narrower than in other *Mallows*; not broad but pointed at the Ends, of a deep reddish purple color, tending to an Orange, and sometimes paler or more diluted, and in some Plants of a white color, with divers threads standing in the middle, about a small green head, which in time becomes the Seed Vessel, or round Bladder, in shape like the Fruit or Seed Vessel of round *Aristolochia*, or *Birch-wort*, of a sad brownish color, in which is contained (in five divisions) small blackish or brownish Seed.

V. *The third, or Evergreen Marsh Mallow.* Its Roots are dispersed into several parts under Ground, and die not, but retain some of the Leaves upon them all the Winter, altho the Stalks die and perish away. This *Evergreen Althea* has many fair large, whitish green Leaves, somewhat thick, full of Veins, and rough or hairy, but whitish or hoary underneath, cut in or divided usually into five parts somewhat like to a *Bryonie* Leaf. The Stalks are hoary, white, and round, rising to be two or three Feet high, having such like large Leaves upon them, and smaller also among them, standing all of them upon long Foot Stalks. The Flowers are like unto those of the *Mallows*, and much about the same color, consisting of five broad pointed Leaves, having many red threads in the middle: after which come flat Leaf'd Heads, such as other *Mallows* have, wherein is contained such like small Seed.

VI. *The fourth, or Yellow Marsh-Mallow.* Its Root is not great or long, but with divers Fibres at it, and perishes every year. This *Althea* rises up with one soft, woolly, green, round Stalk for the most part, seldom with more; divided oftentimes even from the bottom into divers Branches. At every Joint stand several large round Leaves, as soft as Velvet, pointed at the Ends, and deared about the Edges, hanging down at the end of long Stalks which stand forth right. The Flowers stand singly but one at a Joint with the Leaf, which is small and yellow, composed of five small pointed Leaves, standing in a small green Husk; which being past, there succeed soft green Pods or Seed Vessels, turning black when they are ripe, composed of many small Horns or Pods set together, like unto an Head, or Seed Vessel of *Fraxinella*, in every one of which is contained small, black, roundish Seed.

VII. *The fifth, or Rose Marsh-Mallow of America.* It has a Root which is thick, white, and fleshy, which abides safe in the Earth all the Winter, tho the Stalks die away, and perish every year. This Plant shoots forth about May, several round greenish, soft, branched Stalks like to the first *Althea* or *Marsh-Mallow*, beset with several soft green Leaves, which are grey underneath, resembling the first *Althea* but longer pointed: at the tops of the Stalks and Branches stand several white Flowers, made of five large

Leaves apiece, somewhat like a *Hollibock*, with a tuft of white threads, compassing a middle Umbone or Pointel, issuing out of a great Button or Husk, which is as it were Ribbed, and broad at the bottom, narrowing to the top, before the Flower blows, and without any smell.

VIII. *The Places.* The first grows in most of the Salt Marshes from *Woolwich* down to the Sea, both on the *Kentish*, and *Essex* Shore, and may be found near *Woolwich*, *Eriib*, *Green-bith*, *Gravesend*, *Tilbury*, *Lee*, *Colchester*, *Harwich*, and in most Marshes about *London*: being Planted in *Gardens*, it prospers well, and continues long. The second *Camerarius* says, he found in *Italy*, and in abundance, about the River *Amefis* hard by *Anguilars*, where men pass over that River; and in the moist and Marshy places of *Ferraria* between *Padua* in *Italy* and the River *Eridanas*. The third is not known in what place it is a Native. The fourth, its Seed is brought to us from *Italy* and *Spain*, where it grows in wet Grounds near Lakes, Rivers, and Ponds; we yearly Sow it in our *Gardens*, the which does seldom or never bring forth Seed to ripeness, for which cause sake, we are forced to have fresh Seed from the afore named places. The fifth was brought (as *Cornutus* says) out of *Africa*, but now, this, as all the other four Kinds, are Nurst up with us in *Gardens*.

IX. *The Times.* They all Flower in the *Summer* Months, from *May* to the end of *August*, and the Seed ripens in the mean Season, saving that the yellow and red Flowered, do Flower in the latter end of *Summer*, but so, that if the Season is not fair and warm, they never yield ripe Seed.

X. *The Qualities, Specification, Preparations, Virtues, and Uses* of these, are the same with those of the *Common Mallow* in the last Chapter, saving that the first *Althea*, or *Common Marsh-Mallow* in this Chapter, is of more than double Virtue to any of them, or any other in this or in the following Chapters; and therefore ought to be chosen, and have the preference before them all, for all the purposes and uses before expressed, and to which they are intended.

C H A P. CCCCLXVII.

OF MALLOW Vervain.

I. *THE Names.* It is called in *Greek*, Ἀλκα: ab ἀλκή, robur, praesidium, quasi ceteris robustior & efficacior foret, as *Lobel* says: in *Latine*, *Alcea*, and by some *Malva Salvatica*: in *English*, *Vervain Mallow*.

II. *The Kinds.* Authors make many Kinds of this Plant, as 1. *Alcea Vulgaris*, *Malva Verbenaca*, *Alcea major*, *Herba Ungarica* *Anguilars*, Our *Common Vervain Mallow*. 2. *Alcea Vulgaris Flore Corneo*, *Common Vervain Mallow* with bluish Flowers. 3. *Alcea Vulgaris Flore albo*, *Common Vervain Mallow* with white Flowers. 4. *Alcea minor Matthioli*, *Tragi*, & *aliorum*, small *Vervain Mallow*.

Mallow. 5. *Alcea minor*, *Alcea Villosa Dalecham-pij* & *Lugdunensis*, small hairy rough Vervain Mallow. 6. *Alcea Vescaria*, *Alcea Peregrina*, *Alcea Veneta*, Venice Vervain Mallow, Venice Mal-low, and good Night at Noon. 7. *Alcea pentaphylla*, *Alcea fruticosa Cannabina*, *Alcea fruticosa pentaphylla*, *Alcea Cannabini folio*, & *pentaphylli folio*, Cinkfoil or Hemp like Vervain Mallow. 8. *Alcea Americana*, *Sabdariffa* or *sabdarifa*, American Vervain Mallow, or Thorney Mal-low.

The Descriptions.

III. The first, or Common Vervain Mallow. *It has a Root which is long, tough, and white, but somewhat more Woody within. The lower Leaves of this Plant are soft and green, something like to the Wild-Common Mallow Leaves, but lesser, and more cut in on the Edges, besides the denting: but those which grow up higher upon the Stalk, (whose Bark may be broken into herds or threads like Hemp, and sometimes as high as the ordinary Wild Kind is) are more cut in and divided, something like unto Vervain: The Flowers are of a paler purple color than those of the Common Mallow; but in most, not so much divided into several Leaves, and laid so open, but abiding more close, or less spread, and oftentimes without those Stripes, being smooth and a little shining, the Seed and Seed Vessels, are like those of the Common Mal-low.*

IV. The second, or Common Vervain Mallow with bluish Flowers. *Its Root is much like, and lives as the Root of the Common Mallow does. This has long Stalks, and Flowers like unto the Common Wild Kind, and of the same deep color; so that*

Vervain MALLOW.

you can scarcely know it from that ordinary Kind, (and is found growing Wild together with it,) but only by the Leaf, which is as round and as large as the former, but cut into many fine Divisions, even to the Stalk which upholds it; so that it seems to consist only of Rags, or pieces of Leaves, there is also another Plant of this Kind growing in all respects, like to this just now described, but differing only in the color of the Flowers, which are of the same bluish or light Carnation color, not much differing, but with some Veins therein, of a deeper color.

V. The third, or Common Vervain Mallow with white Flowers. *The Roots of this are like the first; from which it differs something in its Leaves, for that these are more finely cut in on the edges than that is: but in the Flower consist the chief difference, for that this is white, yet tending to a little bluish: the Seeds are also like the first.*

VI. The fourth, or Small Vervain Mallow. *This is a lesser Kind, never growing so great or high as the others, but is lower like as the Small Mal-low: The Leaves hereof, are more divided, and cut in on the Edges, and most usually into five parts, being deeply dented also. The Flowers are purple, like the Common Vervain Mallow, but lesser, in which consists the difference.*

VII. The fifth, or Small, hairy, rough, Vervain Mallow. *Its Root is of a pale brown color, about the length of a Mans Hand, with small Fibres adjoining to it. It has many very low and hairy Stalks, not above a foot high, divided into lesser Branches, set with several small hoary hairy Leaves, cut into three or more divisions. At the top of the Stalks and Branches come forth several large purple Flowers, like unto the first Kind, but every one standing in a hairy Husk, so as it is almost prickly: after which comes black Seed, contained in those hairy Husks, but more closely inclosed in them, than in the others.*

VIII. The sixth, or Venice Vervain Mallow. *It has a Root, which is long and small perishing every Year. It has long and weak Stalks, most usually lying or leaning upon the Ground: having here and there upon them long Leaves and somewhat broad, cut in or galhed very deeply on both edges, so that it seems as if it were divers Leaves set together, every one standing upon a long foot Stalk; at the Joins of these Stalks where the Leaves are set, come forth several Flowers, standing upon long foot Stalks, which are some what larger than any of the former Flowers, consisting of five Leaves, small at the bottom, and wide at the brims, of a whitish color tending to a bluish, and sometimes all white, with spots at the bottoms of the Leaves on the insides, of a very deep purple or murrey color, which adds a pleasing grace to the Flower, which has a long pointel or pettel in the middle as yellow as Gold. These Flowers are so quickly faded and gone, that you can scarcely see any of them blown open, unless it be betimes in the Morning, before the Sun shines warm upon them; for as soon as they feel the heat of the Sun they close up, and never open again; so that you shall very seldom see a Flower blown open in the day time, after nine a Clock in the Morning. After these Flowers are past, there come up in their places, thin, round, shining, or transparent Bladders, pointed at the top, and ribbed down all along, in which are contained small, round, blackish Seed.*

IX. The seventh, or Cinkfoil or Hemp-like Vervain-Mallow. *It has Roots which are great and long, spreading in the Ground like unto the Roots of Marsh-Mallow, and springing up a fresh every year*

year from the same Root. Its Stalks are very long, hard, or Woody, more than any of the other *Mallows*: at the lower part whereof; and up to the middle, stand several Leaves upon long Foot-Stalks, parted or divided into five Parts or Leaves, and dented about the edges. But upwards from the middle to the top, the Leaves have but three Divisions. Among these Leaves stand large wide open Flowers, of the color of the Common-Mallow, after which follows the Seed, which is smaller than in any other Mallow.

X. *The eighth, or American Mallow, or Thorney Mallow.* It has a Root which is fibrous or stringy, and quickly perishes; for it will scarcely endure in our cold Country to yield Flowers, much less Seed, unless it happens in a kindly year, and be planted in a good warm place, and well tended. It has green Leaves, which ly next the Ground, which are almost round, but pointed at the end, and dented very much about the edges. The other Leaves which grow upon the Stalk, are divided into three parts like unto *Trefoil*, and some of them into five Divisions, all of them dented about the edges. The Stalk is reddish, with some harmless prickles in several places upon it, and in a good Soil rises up to be 3 or 4 feet high, especially if the place is warm, and the year kindly, bearing plenty of Flowers upon the Stalks, one at the foot of every Leaf, the top it self ending in a long Spike, as it were of Buds and Leaves together. The Flowers are of a very pale yellow, tending to a white color, spotted in the bottom of each of the five Leaves with a deep purple spot, broad at the lower part, and ending in a point about the middle of the Leaf, which are quickly fading, and not abiding above one day, with a long Pointel in the middle, divided at the top. After the Flower is past, there comes forth a short prickly Pod, set within a small green Husk or Cup, which bore the Flower, in which is contained whitish, or rather brownish yellow Seed, flat and somewhat round like unto the Seed of the *Hollibock*.

XI. *The Places.* The first grows very commonly in Kent, and in many other Counties of England, being in some places more frequent than the first Common Mallow is: It grows in a Field as you go to *Hampsted Church* from the Town. The second grows also in many places of England. The third has been found at *Westerham* in Kent. The fourth has also been found in some places in Kent. The fifth has likewise been found Wild in several parts of England. The sixth grows in Italy and Venice in Gardens, as also with us, being more plentiful in these colder Climes, than in those hotter. The seventh grows, as *Clusius* says, in many places of Germany, with us only in Gardens. The eighth was first brought to us out of the *West-Indies*, but by reason it has an *Arabick* Name adjoynd to it, I am apt to believe it may also be a Native of Africa also, and has been found in some parts of Arabia.

XII. *The Times.* They all Flower from the beginning of June, to the beginning of August, in which times, and not long after, the Seed is said to ripen.

XIII. *The Qualities, Specification, Preparations, Virtues and Uses,* are much the same with those of the Common Mallow, in Chap. 465. foregoing, to which we refer you,

C H A P. CCCCLXVIII.

Of MALLOW Tree or Shrub.

I. *THE Names.* I know no Greek Name that this Plant has, but you may call it *Μαλὸν θερμίδος ἢ ἀνθεῶν*, or *Ἀλθαία θερμίδος ἢ ἀνθεῶν*: in Latine, *Malva*, vel *Althea arborea*, vel *fruticosa*: in English, Tree or Shrub Mallow.

II. *The Kinds.* There are several sorts of this Plant, as 1. *Malva arborea marina nostras*, vel *Anglica*; our English Sea Tree Mallow. 2. *Malva Rosea arborea Indica*, *Rosea Sinenfis Ferrarij*; *Malva Japonica arborea*; Indian Tree Mallow. 3. *Althea Frutex flore albo vel purpureo*, *Althea arborea*, Shrub Mallow with white or purple Flowers.

The Descriptions.

III. *The first or English Sea Tree Mallow.* It has a white great and Woody Root, having many long strings annexed to it. Its Stalk is Ligneous or Woody, 5 or 6 Inches in Diameter, and of a brown hoary color, whereon grow whitish and hoary or woolly Leaves, which are soft in feeling,

English Sea Tree MALLOW.

and almost as large as the Leaves of the *Tree Hollibock*, being as smooth as Velvet. The Flowers are of a considerable largeness, and of a Diluted purple color, not much unlike to the form of the Common Wild Mallow Flower.

IV. *The second, or Indian Tree Mallow.* It has a Root which is long, white, and Woody, diversly spread under Ground, with some small fibres coming from those Ramifications. In two or three years time, in a warm Country, this Plant rises up to be a pretty

pretty great Shrub, or small Tree, whose Stem or Trunk, being somewhat white and woody, and 5 or 6 Inches thick, covered with a smooth whitish Bark, whose lower Branches being Prun'd, the upper Ramifications spread into a round Compass, on which grow several broad rough Leaves something like to Vine Leaves, cut into several parts, and dented about the edges, of a fair green color on the upper side, and greyish underneath, on thick, long and rough reddish foot Stalks, sometimes but one, and oftentimes two or three at a Joynt, which abide all the Winter without falling away. At the tops of the Branches come forth the Flowers standing in green Husks, divided at the tops into five parts: in some of these Plants, the Flowers will be single, consisting of five, six, eight or ten large crumpled Leaves, all white, or a little bluish about the edges: in others the Flowers will be very double, and as large as a *Province Rose*, of the same colors; but after they have abided awhile blown open, they change more bluish, and on the fading, deeper: these changes are often seen in one and the same day, yet many times not in two or three days continuance: in the middle of the Flowers, stands a green Head, encompassed with many yellow threads as the *Rose* has: which Head growing to Maturity has several ridges and furrows on the out side, and full of Seed within, distinguished by several Partitions; and are of a reddish color, somewhat small, long, round, crooked, and a little hairy on the back side. An Hundred sixty and three Seeds have been taken out of one Seed Vessel.

V. *The third, or Shrub Mallow with white or purple Flowers.* This Kind of Shrub Mallow has somewhat large, long, and divided Leaves, of a whitish green color, soft also, and as it were woolly in handling, set disorderly on the whitish, hard and woolly Stalks. The Flowers are large like unto a single *Rose*, or *Hollibock*, in the one, being white, with purple spots in the bottom: in the other of a deep red color, or else of a pale purple with a deeper bottom, and with Veins running in every Leaf, they are somewhat tender, and will not suffer to be uncovered in the Winter time, or abide abroad in the Garden; but in a Pot or Tub to be preserved in a House or warm Cellar, if you would have them live.

VI. *The Places.* The first grows in *England*, in an Island called *Dinnie*, three miles from *King-road*, and five miles from *Bristol*; as also about the Cottages, near *Hurst Castle*, over against the *Isle of Wight*. The second was first brought from *Japan* in Seed unto *Rome*, or some parts of *Italy*, where it was Sown, from whence it was Communicated to several Countrys of *Europe*, and in particular to *England*. The third, grows both in *France* and *Spain*, and with us in *England* in Gardens, as the second also does.

VII. *The Times.* They all Flower late in the year, or in the latter end of *Summer*, sometimes in *August* and *September*.

VIII. *The Qualities, Specification, Preparations, Virtues, and Uses,* are the same with those of the *Common Mallow*, of which we have written in *Chap. 465.* foregoing.

C H A P. CCCCLXIX.

OF MANDRAKE.

I. *THE Names.* It is called in *Arabic*, *Jaboru* and *Tabrobach*: in *Greek*, *Mandragora*; in *Latin*, *Mandragoras*: and in *English*, *Mandrake*. *Dioscorides* says, that in his time some called it *Arriuanon*, and *Sipala*, *Circea*, (from *Circe* the great Enchantress:) *Pythagoras* called it *Anthropomorphos*, a *forma humana*, because the Root has in some Measure the likeness of an Human Body, with a kind of Breast and Belly (as it were) and two Legs.

II. *The Kinds.* It is twofold, viz. 1. *Mandragora*, *Candidus*, *Morion*, The Male *Mandrake*. 2. *Mandragora*, *viridis*, *Tethynas*: *Mandragoras* *femina*, *Tri-dacis* (of the Lettice like Leaves) and *Mandragoras* *femineus* & *niger*: The Female *Mandrake*.

The Descriptions.

III. *The first, or Male Mandrake.* It has a Root which is long and thick, Blackish on the out side and white within, consisting many times but of one long Root, and sometimes divided below its Head or Belly,

MANDRAKE Male.

into two main Roots running down right into the Ground, like to a Mans Thighs and Legs; and sometimes (tho not often) three of those Roots have been observed, which some by Transplanting have Occasionally cut off for humor or admiration sake, and to amuse Fools, to which are annexed usually several small Fibres. From this Root springs up many Leaves together, which being full grown, are fair, large and green, lying round about the said Root, and are larger and longer than the Leaves of any Beet, to which it is likened by some. From the middle among these Leaves rise up many Flowers, each one upon a long, slender foot Stalk, standing in a whitish green Husk, consisting of five pretty large round pointed Leaves, of a greenish white color, which turn into small round Apples, being green at first, and afterwards when they are through ripe, as yellow as Gold, very smooth and shining, and as big as a reasonable Pippin, of a strong suffocative or heady Smell, in which are contained several whitish, round, flat Seeds.

IV. *Manbragoras mas alter*; another Male Mandrake. This was formerly found growing in the Lord Wotton's Garden at Canterbury. Its Leaves were of a more greyish green color, and somewhat folded together, differing in these particulars, from the before described Plant, which grew there hard by it also: but as to its Fruit it is unknown for at that time the Plant had not born any.

V. *The second, or Female Mandrake.* It has a Root like the former, blackish without, and white with in, near unto the same form with the Male, but sometimes with more, and sometimes with fewer Parts, or Legs. This has likewise many Leaves,

MANDRAKE Female.

lying on the Ground, but smaller, narrower, more crumpled, and of a darker green color, resembling

those of Lettice, as Dioscorides compares them, being more thinning, and of a stronger smell. The Flowers also rise up from among the Leaves, each upon a slender foot Stalk as in the former, but of a blewish purple color. The Fruit which follows, is much smaller than that of the Male, but round like it, (and not Pear fashion, as some have thought and said, and which Clusius, who saw several of them growing, also denies) of a paler yellow color when ripe, and of a more pleasing, or rather of a less heady smell, than those of the Male, in which are contained such like Seed, but smaller and blacker.

VI. *The Places.* They grow in Woods and shady places in many places beyond the Alps, and in many places in Italy, especially on Mount Garganus in Apulia, in Græcia, Candia, and other parts of the Mediterranean Sea, and in Spain, and other hot Regions, but not naturally on this side the Alps. Clusius says he found the Female in many wet Grounds in Spain, as also in the Borders of those Meadows which ly near unto Rivers and Water Courses. But with us they are only Nursed up in Gardens, for pleasure, as well as for use: And the Female, as it is the more Tender, so it is the more Rare, and only kept by such as are very Curious.

VII. *The Times.* The Male Kind Flowers in March, and the Fruit is ripe in July: Gerard says it Flowers in the end of April, and the Fruit is ripe in August. Clusius says, he found the Female in Spain, in Flower in February, and that in several places of Spain, he had ripe Fruit in the same Month. But with us, where it is best preserved and taken care of, it Flowers not untill August or September; but without extraordinary Care, (as by its Situation, help of Glasses, Coverings and the like) the Fruit seldom or never ripens or comes to perfection.

VIII. *The Qualities.* The Herb, Flower and Fruit, are said to be cold in the third Degree: but the Root in the fourth Degree, and moist in the second. It is Stupéfactive or Soporiferous; has a Cathartick or Emetick quality withall; and if taken in too great a quantity, Deleterious.

IX. *The Specification.* It cools Inflammations, helps against Anthonic Fire, softens the hardest of Tumors, and induces Sleep.

X. *The Preparations.* You may make therefrom, 1. A Liquid Juice of the Root. 2. An Inspissate Juice of the same. 3. A Decolion in Wine. 4. An Ophthalmick. 5. A Juice from the Apples. 6. The Seed. 7. A Suppositary. 8. A Pessary. 9. A Cataplasm of the Leaves. 10. A Cataplasm of the Root. 11. An Oil. 12. A Distilled Water.

The Virtues.

XI. *The liquid Juice of the Root.* It is good in all cooling Ointments, and is profitably put into the Ointment Populeon; and applied outwardly in an Erysipelas, it helps on the Cure. And mixed with Honey or Oil, and applied, it cures the Stinging of Scorpions, Hornets, Wasps, Bees, &c.

XII. *The*

XII. *The Infusate Juice.* Given to a Setuple in sweet Wine, it purges Flegm and Melancholy by Vomit, like unto *Hellebor*; but taken in a greater quantity, it Kills: but for ordinary use to Grains is enough to be taken at a time.

XIII. *The Decoffion of the Root or Bark in Wine.* It may be given from half an Ounce to an Ounce or two, according to Age and Strength. It is Soporiferous, or causing Sleep, and eases extream Pains in any part: and it is sometimes given to such, where an Amputation is to be performed, or have a Limb or Member to be cut off, to take away in great measure the Sence of Pain.

XIV. *The Ophthalmick.* It is made either of the *Liquid Juice*, or of the *Infusate Juice*, being dissolved in *Fennel* or *White Rose Water*, and sweetened with a little *Honey*. Being often put into the Eyes, it cures their Inflammations and eases the Pain.

XV. *The Juice of the Apples.* It is not so cold as that of the Root, and may be used in all the same cases: mixt with *Fennel*, *Eyebright*, or other proper Water, it makes a good Collyrium for Sore, Inflamed, and pained Eyes. Bathed upon the Head, Temples, Fore-head and Nostrils, it induces Sleep and Rest.

XVI. *The Seed.* Taken to half a Dram in any proper Vehicle, it is said to cleanse and cool the Womb; and to give ease to such as have any Cancer, or other Humour in those parts; the Dose being often repeated.

XVII. *The Suppository.* It may be made of the *Liquid* or *Infusate Juice of the Root*; or of the Root it self in substance, which being put up the Fundament, will cause Sleep and Rest.

XVIII. *The Pessary.* This may likewise be made of the *Juices*, or of the Root it self in Substance, being put up the Womb, at the Season, it provokes the Courfes; it also brings away the dead Child, and the Afterbirth.

XIX. *The Cataplasmi of the Leaves.* Being beaten up into form with Hogs Lard, or Barley Flower, and applied, it will help all hot Tumours and Inflammations; disperse all Hardness, Knots, and Knots in the Flesh, otherwise if Apottemated, it will maturate and cause suppuration, and is good to ease the Pain of hot and Inflamed Ulcers.

XX. *The Cataplasmi of the Roots.* Applied to the Head it eases the Megrim and other vehement pains thereof; It cools the heat of *Anthoies* Fire, being beaten up into form with the best *Dutch* white Wine Vinegar, and so applied it eases any hot pain in any part of the Body, and performs all that the *Cataplasmi* of the Leaves can do.

XXI. *Oleum Mandragore,* Oil of Mandrakes. The Composition you have in our *Pharmacopæia Londinensis*, lib. V. chap. II. sect. 52. which because every one has not that Book in their Hands, we will insert here. It is thus made, Take Oil Olive 2 Pounds, Juice of *Mandrake* Apples, or Juice of the Leaves, 4 Ounces, Juice of white *Hernbane* 2 Ounces, Juice of black *Poppy* Heads 3 Ounces, Juice of *Violets*,

and young *Hemlock*, of each 1 Ounce; *Opium*, *Storax Calamita*, of each half an Ounce; mix all together, except the *Opium* and *Storax*; and Infuse for ten days; after which boil to the Consumption of the *Juices* and strain out; then put in the *Opium* in fine Powder; and after that the *Storax* dissolved in half an Ounce of fine *Strasburg Turpentine*, and mix them according to Art. It is very Cold, and may be anointed upon the Temples and Noses of such as have a Frenzy; if the Patient Sleep too long, dip a Sponge in Vinegar and hold it to the Nose. It eases vehement pains of the Head, as also the Toothach, anointed on the Fore-head, Temples, Nostrils Cheeks and Jaws; and for Watchfulness and Restlessness, upon the Pulses and Soles of the Feet. It is good also against the Gout, running Gout, and other Inveterate Pains.

XXII. *The distilled Water.* If a little Honey be dissolved in it, it is an excellent thing for Hor, Inflamed and Sore Eyes, and bathed upon Womens Breasts, which are hard, or pained, or are Cancerated, it softens the hardness, and eases the Pain.

XXIII. *The Antidote.* If any one is Poysoned herewith, if but just done, the only remedy is a Vomit made of *Vinum Benedictum*, *Tartar Emetic*, &c. but if it has been of continuance, the Antidotes are *Castoreum*, *Contrayerva*, *Mustard*, *Origanum*, *Rue*, *Scordium*, *Virginia Snake Root*, and *Wine*: and Preparations made from them.

C H A P. CCCCLXX.

of MARIGOLD Garden.

I. **T**HE Names. It is called in Greek, (if it has any ancient Greek Name) *Χρυσάνθεμος* *χρυσός*; in Latine, *Chrysanthemum hortense*, *Caltha hortensis*, & *Calendula hortensis*; in English, *Garden Marigold*.

II. *The Kinds of Marigolds.* There are a great Variety of this Plant, which to describe all would be very troublesome; those which we shall take notice of in this Work are the following, viz. 1. *Caltha*, vel *Calendula hortensis*, the *Garden Marigold*: of which in this Chapter. 2. *Flos Africanus*, The *African* or *French Marigold*, of which in Chap. 471. 3. *Chrysanthemum segetum*, the *Corn Marigold*, of which in Chap. 472. 4. *Chrysanthemum vel Caltha Palustris*, the *Marsh-Marigold*, of which in Chap. 473. following.

III. *The Kinds of the Garden Marigold.* There are also several Kinds of this Plant, as 1. *Calendula simplex vel simpliciflora*, the *Single Marigold*: where note, that the Name *Calendula* comes from the *Calends* or first days of the Months, wherein they were thought chiefly to Flower. 2. *Chrysanthemum* (from its golden color) *Polyanthum*, *Caltha* vel *Calendula major* *Polyanthos*, the greater double

double Marigold. 3. *Caltha vel Calendula Polyanthina vulgaris*, the common double Marigold. 4. *Calendula Polyanthina minor*, the lesser double Marigold. 5. *Calendula multiflora Orbiculata*, the double Globe Flowering Marigold. 6. *Calendula Prostrata*, the many headed Marigold, called by some *Jack an Apes on Horse-back*, and this is also two-fold.

The Descriptions.

IV. *The first, or Common single Marigold.* It has a white Root which spreads it self under Ground, sometimes abides after Seeding and sometimes perishes, rising again of its own Seed; there is little or no difference between this and the following Kind, but in the Flowers, this consisting only of one single row of gold colored or yellow Leaves, and some of a paler, and some of a deeper yellow, standing about a great brownish yellow Thrum in the Middle; the Seed also, is alike, but for the most part, greater than that of the double Kind.

MARIGOLD.

V. *The second, or Greater double Flowred Marigold.* The Root of this is also white, and spreads in the Ground, abiding in some places after the Seeding time, tho' for the most part it perishes, and rises again of its own Seed. It has pretty large, round, green Stalks, branching out from the Ground, into many parts, on which are set long, flat, green Leaves, broader and rounder at the point than any where else, and smaller also at the setting to of the Stalks, where it encompasses it about. The Flowers are sometimes very thick and double

(breaking out of a Scaly, clammy, green head) composed of many rows of Leaves, set so close together, one within another, that no middle Thrum can be seen: and sometimes less double, having a small brown spot of a Thrum in the middle, and sometimes but of two or three rows of Leaves, with a large brown Thrum in the middle, every one of which is somewhat broader at the point, and nicked into two or three corners, of an excellent fair, gold yellow colour in some, and paler in others, and of a pretty strong and resinous smell. After the Flowers are past, Heads of crooked Seed follow turning inwards, of which the outward most are the biggest, and the innermost least.

VI. *The third, or Common double Marigold.* The Root of this thick is and hard with some Fibres or Threads adjoining thereto. From this Root spring up many fat thick crumpled Leaves, set upon a gross and spongy Stalk: upon which do grow fair, double, yellow Flowers, having for the most part in the middle, a bunch of Threads, thick set together; which being past, Heads of crooked Seed follow, such like as are described in the former.

VII. *The fourth, or Lesser double Marigold.* The Root of this is like the former; It is a smaller, and finer double Leaved Plant, and grows upright, having for the most part one Stem, or spongy Stalk, pleated with thick and fat Leaves confusedly. The Flowers grow at the tops of the small Branches, very double, but lesser than any of the former, consisting of a more fine Jaggedness, and of a fair, yellow, gold color.

VIII. *The fifth, or Double Globe Flowering Marigold.* It has a Root much like the others, from which rise up many large broad Leaves (immediately out of the Ground) and from among which rises up also a Stalk about a foot and a half high, dividing it self towards the top into other smaller Branches, pleated and set with the like Leaves, but confusedly, or without any order. The Flowers grow at the Tops of the Stalks very Double; the small Leaves of which are set in a very regular order, by certain Ranks or Rows, as several lines are in a Globe, traversing the whole Compass of the same; whereupon it took the Name *Orbiculata*. There is another of this Kind, which differs nothing in its Description from it, excepting in the color of the Flowers, these being Flowers of a very light yellow or Straw color, in which consists the only difference.

IX. *The sixth, or Many Headed Marigold.* Its Roots, Stalks, and Leaves, are like to the Common sort of Marigold, differing only in the shape of the Flowers; for this Plant does bring forth at the top of the Stalk, one Flower like the other Marigolds, from the which come forth several other small Flowers, yellow likewise, and of the same fashion; This is thought by some Authors to be *per accidens*, or *lusus Naturæ*, which sometimes comes to pass in several other Flowers also, as some Children are born with two Thumbs on one Hand or with two great Toes, or with six or seven Fingers, and sometimes two Arms or Hands on one side, &c. And such is the Seed of this Marigold, which yet, if it be sown, it brings forth not one Flower in a thousand, like the Plant from whence it was taken. There is another prolific, or many Headed Marigold, coming from the Seed of the Double Marigold, and is doubtless a Degenerate Kind: whereas the former many Headed, always springs from the Seed of the single Kind, and produces the diminutive Flowers upon very much the longer foot Stalks.

X. *The*

X. *The Places.* We know of no Native place whence these Plants should come, with us they never grow Wild, but always in Gardens, where they prosper admirably; but the first single Kind is said to grow Wild in Spain.

XI. *The Times.* The Flower from April and May, thro' all the Summer Months, even till Winter; and sometimes even in Winter time if the Season be warm.

XII. *The Qualities.* The Flowers are hot in the first Degree, and temperate in respect of dryness or moisture. The Herb is hot almost in the second Degree, and moist in the first. They are Emollient, Cardiack, and Alexipharmick.

XIII. *The Specification.* They resist Poyson, as also Malign and Pestilential Feavers, provoke the Terms and bring away both Birth, and After-birth.

XIV. *The Preparations.* You may have therefrom, 1. A Juice of the Leaves. 2. A Juice of the Flowers. 3. A Conserve of the Flowers. 4. A distilled Water of the Leaves and Flowers.

The Virtues.

XV. *The Juice of the Leaves.* Given from one Ounce to three it loosens the Belly, and Purges by Stool: and used as a Gargarism in the Tooth-ach, it eases the Pain.

XVI. *The Juice of the Flowers.* It is Cordial, comforts and strengthens the Heart very much, resists Poyson, and is prevalent against Pestilential Fevers. Dose from half an Ounce to an Ounce in a Glass of Generous Wine.

XVII. *The Conserve of the Flowers.* Taken in the Morning Fasting, it Cures the Palpitation or Trembling of the Heart; and is given as a Prophylactick or Preservative in time of Plague or Pestilence.

XVIII. *The Distilled Water of Leaves and Flowers.* Dropt into Red and Rheumatick Eyes, it cools the Inflammation, stops the Rheum, and eases the Pain.

II. *The Kinds.* There are several Kinds of this Plant, as, 1. *Flos Africanus major simplex, vel simplicis Flore,* the Great single African Marigold. 2. *Flos Africanus minor simplex, vel simplicis Flore,* the Lesser single African Marigold. 3. *Flos Africanus major multiplex, Flos Africanus marianus multiplex vel Polyanthos,* the Great or Greater double African Marigold. 4. *Flos Africanus minor multiplex,* the Lesser double African Marigold. 5. *Flos Africanus Flore Fistuloso simplex & multiplex,* the Hollow or Fistulous African Marigold, both single and double, as *Fabius Columna* calls it.

The Descriptions.

III. *The first, or Greater single African Marigold.* It has a Root spreading much in the Ground and full of small strings: and it is in all things so like to the double greater Kind, that it is hard to distinguish it from it, but by the Flowers, only the Stalk of this is browner than that of the double, and it has been observed that this single Kind does every year rise from the Seed of the double Flower: So that when they are in Flower, you may see the difference (or not much before, viz. when they are in Bud:) this single Flower ever appearing with a Head of Thrums in the middle, and the Leaves, which are the border standing about them, shewing hollow or fistulose, which afterwards lay themselves flat and open (the double Flower appearing with all its Leaves folded close together, without any Thrums at all:) and are of a deeper or paler color, as in the double.

MARIGOLD African single small.

IV. The

C H A P. CCCCLXXI.

of MARIGOLD African.

I. *THE Names.* It has no Arabick nor Greek Name that I know of; in Latine, it is called *Flos Indicus, Caryophyllus Indicus, & Flos Africanus, Caltha Africana, Flos Tunitenfis, Pedna Panorum*: in English, *African Marigold*, and by some French *Marigold*, (tho it is no more French than English.) Where note, that some, as *Lacuna* think it to be *Orbona Plinij*: others *Lycopersicum Galeni*, but with what truth is uncertain.

IV. The second, or Lesser single African Marigold. This very much resembles the Lesser double in every proportion, in the Roots, Stalks, Leaves, and Seeds: Only the Flowers of this are single, having five or six broad Leaves, of a deep yellow crimson color, with deep yellow Thrums in the middle, and of a strong stinking smell, more than those of the lesser double.

V. The third, Great, or Greater double African Marigold. It has a Root which is small and full of strings, spreading much under Ground. It is

contained; set thick and close together upright, of a black color, and something flat and long. The Flower of this, as well as of the single, is of the very smell of New Wax, or of an Honey Comb, and not of that Poysonous Scent of the smaller Kinds.

VI. The fourth, or Lesser double African Marigold. The Roots are like the former but lesser. Its Leaves also are in all things like unto the former, but smaller, which are set upon rownd brown Stalks, not so stiff or upright, but bowing and bending several ways, and sometimes leaning, or lying upon the Ground. The Stalks are branched

MARIGOLD African double great.

MARIGOLD African double lesser.

a Noble Double Flower, which is the Grace and Glory of the Garden in the time of its Flowering and Beauty: The Plant rises up with a straight and hard, round, green Stalk, having some crests or edges all along the Stalk, beset with long winged Leaves; every one whereof is like to an Ash Leaf, being composed of many long and narrow Leaves, snipt or dented about the edges, standing by couples one against another, with an odd one at the end, of a dark or full green color. The Stalk rises to be three or four feet high, and divides it self from its middle upwards, into many Branches, set with such like Leaves to the Tops of them, every one bearing one double Flower, of a gold, yellow color above, and paler underneath: yet some are of a pale yellow, and some between both, and all these rising from the Seed of one and the same Plant. The Flower before it is blown open, has all its Leaves hollow: but when it is full blown, it spreads it self larger than any Damask or Province Rose, or equal to it at the least, if it grows in good Soil, and rises out of a long green Husk striped or furrowed; in which after the Flower is past (which stands in its full Beauty a Month, and sometimes more; and being gathered, may be preserved in its full Beauty for two Months after, if set in Water) the Seed is

out variously, on which grow fair double Flowers, like the former, and in the like green Husks, but lesser; and in some, the outwardmost Leaves will be larger than any of the rest, and of a deeper orange color, almost crimson, the innermost being of a deep gold yellow color, tending to crimson. The whole Flower is smaller, and of a stranger and more unpleasant smell: but for its doubleness, beautiful color, and pleasantness to the Eye, it surpasses almost all other Flowers which grow. The Seeds are like to the former.

VII. The fifth, or Single and Double African Marigold, with hollow or pipe Leaves. As the former greatest sorts of Africans single and double, have risen from the Seed of one and the same Pod or Husk of double Flowers, so is it in this Pipe Kind, the single and double Kinds rising both of them from the Seeds of one and the same Plant; nor does it differ in any thing from them, but that these are lower, and have smaller green Leaves; and that the Flower being smaller, has every Leaf abiding hollow, like unto a hollow Pipe, broad open at the Mouth, and is of as deep a yellow color for the most part, as the deepest of the former; and yet sometimes it is also pale.

Sift

VIII. The

VIII. *The Places.* They grow naturally in *Africa*, about *Tunis*, and where old *Carthage* stood; from whence long ago, they were brought into *Europe*; where with us, they are only kept in *Gardens*, and flourish wondrous well, being Sown for the most part every year, unless in some mild *Winters*. But that Kind with hollow or Pipe-Leaves, comes not from *Africa*, but from *Mexico* in *America*, and is so denominated according to *Pabius Columna*.

IX. *The Times.* They are to be Sown in the beginning of *April*, if the Season falls out to be warm, otherwise they must be Sown in a Bed of Dung, or in very good Earth, and in a warm place. They bring forth their pleasant Flowers very late, not till towards the end of *Summer*, especially the greater Kinds; but the lesser, if they abide all the *Winter*, do Flower more early; for this reason those which are of the later flowering, ought to be Sown the more early, that they may Flower and Seed so early, as not to be overtaken with the Frost, before the Seed is ripe.

X. *As to the Qualities.* They are unknown farther than that have been found by experience to be of a deleterious nature: and therefore no other Observations have been made of them as to their Virtues and Uses in Physical Practice: their chief design in this Book, being to bring them in Course, for the Ornament of our *English Gardens*, where they already appear so Beautiful and desirable to the Eye.

C H A P. CCCCLXXII.

of MARIGOLD Corn.

I. **T**HE Names. It is called in *Greek*, *Χρυσοθέουον*: in *Latine*, *Chrysanthemum*; ab *aureo Floris colore sic Dictum*: and in *English*, *Corn Marigold*.

II. *The Kinds.* There are many sorts of this Plant, but not above two or three varieties grow in *England*; one in our *Cornfields*, the other in our *Gardens*; yet because several others of them are found in some of our Plantations in the *West-Indies*, we shall describe the following, viz. 1. *Chrysanthemum segetum nostras*, *Bellis lutea Bauhini*, the *Corn Marigold* of our Country. 2. *Chrysanthemum Creticum*, the *Candy Corn Marigold*. 3. *Chrysanthemum segetum Batium*, the *Spanish Corn Marigold*. 4. *Chrysanthemum latifolium Americanum*, vel *Brasilianum*, *Broad Leaved American* or *Brasilian Corn Marigold*. Authors make five or six Kinds more of this Plant, but being wholly strangers with us, we shall say no more of them in this place.

The Descriptions.

III. *The first*, or *Corn Marigold* of our Country. Its Root perishes every year, and the Plant rises again of its own Sowing. It rises up with several tender, pale, green, Herby Stalks, breaking forth into some few Branches, with several long, blewish, green Leaves, set without order on them, being narrow at the Bottom, and broader

CORN-MARIGOLD.

at the end, cut in a little on both edges: the Flowers grow singly at the top of every Branch, being large, growing out of green scaly heads, and of a shining yellow color, both the Thrums, and the borders of the Leaves about it: each Leaf being broad or flat pointed, and cut into three or four parts, smelling a little sweet.

IV. *The second*, or *Candia Corn Marigold*. It has a Root which perishes every year, and rises again (as the other does) of its own Sowing or Seed. It is a fair Flower, and has for the most part one upright Stalk, two feet high, on which are set many winged Leaves, at every Joint one; divided and cut into several parts; and they again parted into several pieces or Leaves. The Flowers grow at the tops of the Stalks, rising out of a scaly Head, composed of ten or twelve large Leaves, of a fair, but pale yellow color; and more pale, almost white at the bottom of the Leaves, round about the yellow Thrum in the middle, being

MARIGOLD Corn of Crece.

OR,

Mathiolus his Corn MARIGOLD.

being both larger and sweeter than any of the the other *Corn Marigolds*. After which follows the Seed which is whitish and Chaffie.

V. *The third, or Spanish Corn Marigold.* The Stalks hereof are harder and browner than those of the first, and stand more upright: the Leaves are greener and not so much divided or cut in on the edges as they are: the Flowers are not of so shining a yellow color, but of somewhat a deeper yellow: and the Seed is small and whitish, and is bitter as the first is; tho' the Herb is sweet and eaten as a Sallet Herb: and in these things consist the difference.

VI. *The fourth, or Broad Leav'd American or Brasilian Corn Marigold.* Its Root perishes every year in like manner as the others do. It is a *Marigold* which is sweet, and springs up with a Stalk about half a yard high, something rough and crested, having several Leaves set thereon, of four or five Inches long, and two broad, encompassing it at the bottom, and growing smaller to the end, something dented about the edges, with sharp dents: from the Bosom of whom, come forth somewhat long foot Stalks, sustaining each of them a fair yellow Flower, set in a green Husk or Cup; having seven or eight Leaves for a Border, dented at the ends, and encompassing a middle Thrum, consisting of long Threads, in which afterwards lies the Seed, very like unto the *Spanish Kind*.

VII. *The Places.* The first of these grows commonly in *Corn-fields*, and about their Borders, or where *Corn* has been formerly Sown, both in *England* and beyond the Sea: The others grow also in Tilled and *Corn Lands* in Foreign Countries; but with us are Nurst up only in *Gardens*.

VIII. *The Times.* The first Flowers in *August*; the second in *June*; the others in the end of *Summer*; and sometimes so late, that the early Frosts taking it, never suffers its Seed to come to its ripeness.

IX. *The Qualities.* They are said to be temperate in respect to heat, or coldness; dryness or moisture.

X. *The Preparations.* You may have therefrom,
1. A Liquid Juice. 2. A Balsam or Cerote. 3. A Sallet.

The Virtues.

XI. *The Liquid Juice*, being drank by such as have the yellow Jaundice, after coming out of a Bath, or from Bathing, it quickly restores them to their natural color.

XII. *The Balsam or Cerote.* It is made of the Flowers boiled in Oil to crispness, then strained, and made up with Wax, Frankincense, and Rosin: or, beaten up with Oil and Wax; applied it cures that Tumor called *Steatoma*, which contains in it a Substance like Fat or Tallow, and dissipates other cold and hard Swellings.

XIII. *The Sallet.* The Stalks and Leaves of the *Corn Marigold* are eaten (as *Dioscorides* says) in the manner of a Sallet, as other Sallet Herbs are: But I suppose this is meant of the Candy Kind; tho' I know not, but that ours when very young may be so eaten also.

CHAP. CCCCLXXIII.

OF MARIGOLD Marsh.

I. *THE Names.* I know no *Greek Name* that it has; but it is called in *Latine*, *Caltha Palustris* by *Gesner*; and *Caltha Virgillij* by *Tragus*: Some call it *Ferraria*, from the likeness of its Leaf to a Horse Shoe: *Cordus* calls it *Chelidonia Palustris*: and *Tabernaemontanus*, *Populago*, tho' its Leaf is not like either to the Leaf of the *Poplar Tree*, nor of *Colts-Foot*: in *English* we call it *Marsh Marigold*.

II. *The Kinds.* Some Authors make three several sorts hereof, viz. 1. *Caltha palustris Vulgaris simplex major*, the Greater single *Marsh Marigold*: 2. *Caltha palustris simplex minor*, the Lesser single *Marsh Marigold*. 3. *Caltha palustris multiplex, vel flore pleno*, the Double *Marsh Marigold*.

The Descriptions.

III. *The first, or Greater single Marsh Marigold.* It has a Root which is composed of several long strings, which run down deep into the Mire. From this Root rise up several great, broad, round, deep, green, shining Leaves, a little dented or waved about the Edges; each one, on a long, thick,

81112

Great Marsh Marigold, Common, Single.

Single Great Marsh Marigold.

thick, round, fleshy Stalk by it self; among which rise up, fat, thick Stalks, almost a yard high, with some Leaves thereon: and at the tops several fair, great, gold-yellow Flowers, like unto *Crow-foot* Flowers, but much larger, and shining. We have here exhibited to you two Figures of this same Plant for information like.

IV. The second, or Lesser single Marsh Marigold. It has a like Root with the former, from whence rise many round Leaves spread abroad, of a dark green color, among which rise up

Small Marsh MARIGOLD.

divers Branches, charged with the like Leaves. The Flowers grow at the tops of the Branches, of a most shining yellow color. This *Parkinson* will have to be one and the same with the former, being only lesser or greater in one place than in another.

V. The third, or Double Marsh Marigold. It has Roots which are composed of many thick, long and round, whitish Strings, which run down deep into the Ground, and there are fastened very strongly. From this Root come forth many broad and round green Leaves, a little indented or waved about the edges, like unto the single Kind, but not altogether so large, especially in a Garden where it stands not a little Moist. The Stalks are weak, round, hollow and green, divided into three or four Branches at the top, with Leaves at the several Joints, on which stand very double Flowers, of a gold yellow color, the five outward Leaves being larger than any of the rest which are encompassed by them which fall away after they have stood blown a considerable time (for it continues in Flower a month or more, especially if it grows in a shady place) without bearing any Seed.

VI. The Places. The two first grow only in Waters and watery Ditches, and by their Bank-sides, as also in Marshy and Watery Meadows. The third grows naturally in Marshes and Moist Grounds, (in some places more double than in others) but with us it has been for a Long time Nurled up in our Gardens.

VII. The

VII. *The Times.* The two first Flower in the Spring, when the Crow-foot do, and often times in Summer, The Leaves keeping their greenness all the Winter. The double, Flowers in April, or May, as the Year proves earlier or later, and its Leaves do in a manner perish in Winter, and spring afresh in the end of February, or thereabouts.

VIII. *The Qualities.* The Root hereof is sharp and Hot in the fourth Degree, coming near the Qualities and Properties of Crow-foot: but for any of its Medical Virtues, nothing yet has been observed by Experience: but I am apt to believe, from its hot, sharp and burning Nature, it may perform all the same things which the Crow-foot will do.

which come here and there small white Flowers, and after them small reddish Seed.

Garden sweet MARJEROM.

C H A P. CCCCLXXIV.

of MARJEROM.

I. *THE Names.* It is called in Greek, *ῥάβδον ὀρίαν*; in Latine, *Samp-
sacum*, *Amaracum* & *Marjorana*: in English,
Marjerom: of the Arabians it is called *Mer-
senius* & *Morsangus*.

II. *The Kinds.* There are several Species of this Plant, as 1. *Majorana aestiva vulgaris*, Our Common Garden sweet Marjerom. 2. *Majorana tenuifolia*, Marjerom gentle. 3. *Majorana odorata perennis*, Winter sweet Marjerom. 4. *Majorana latifolia*, *Majorana Anglica*, Winter Marjerom, or Pot Marjerom. 5. *Majorana latifolia aurea*, yellow broad Leaved Marjerom. 6. *Majorana Sylvestris*, *Canila bubula* Plinij & *Dioscoridis*: Wild or Field Marjerom.

The Descriptions.

III. *The first, or Our Common Garden Sweet Marjerom.* It has a Root which is composed of several small Fibres or Strings, which perish with the whole Plant every year. This Herb is commonly Sown Annually in our Gardens of Foreign Seed, and is a small low Plant, little above a foot high, full of Branches and small Whitish and soft roundish Leaves on them, smelling very sweet. At the tops of the Branches grow several small long and round scaly Heads or Knots (and therefore by some called *Knotted Marjerom*) of a whitish green color, out of

IV. *The second, or Marjerom Gentle.* Its Root is like the other, from whence grow up several small Stalks and Branches, not exceeding the former in height, but it has finer and smaller Leaves, hoary and soft, and much sweeter than the former; the Heads are like unto that, and so are the Flowers and Seed, the whole Plant being more tender than the the first Common sweet Marjerom, and abiding but a Summer in like manner.

V. *The third, or Winter sweet Marjerom.* This is an excellent Plant, and abides green all the Winter, if it is not so violent, growing in the same manner and form which the first does, and its Leaves are a little smaller and greener than it, but with the like Heads and Knots. Yet some take this to be but the Common Summer sweet Marjerom, which by Transplanting, is made more strong, and able to abide the Winter.

VI. *The fourth, or Winter or Pot Marjerom.* It has a Root which is white and thready, not perishing in Winter, but abiding many years, and is increased rather by Slipping and Sets, than by Sowing the Seed. It is a small low bushy Herb, not growing much higher than any of the others, but spreading its Branches wider, on which grow broader and greener Leaves, set by couples, or pairs, with some smaller Leaves also, at the several Joins, all along the Branches: at the Tops whereof grow a number of small, purplish, white Flowers, set together in a Tuft, which turn into small and round Seed, larger than the Seed of the Common sweet Marjerom. The whole Plant is of a sweet smell, but much less and inferior to the other, being also nothing so bitter as is the Common sweet Marjerom, and therefore the more fit for a Pot-Herb.

VII. *The*

VII. *The fifth, or yellow broad Leav'd sweet Marjerom.* This is of the same sort with the Pot-Marjerom, differing only in the color of the Leaves, which are in Summer wholly yellow, in some Plants, or but a little green, or parted with yellow and green, more or less, as Nature is pleased to play her part; the smell being small like that of the Pot-Marjerom last described: there is also another of this Species consisting of party colors; white and green.

VIII. *The sixth, or Wild or Field Marjerom.* Its Root creeps under Ground, and encreases much, abiding from year to year. It sends forth several brownish hard square Stalks, with many small, dark, green Leaves set by pairs on them, very like to those of the Sweet Marjerom, but harder, and a little broader. At the top of the Stalks grow Tufts of dark or deep purplish red Flowers, which turn into small Seed, like that of the Garden Marjerom, but blacker: The whole Plant smells sweet, but very strong.

IX. *The Places.* The first five grow Wild on the Mountains in Spain, and in other places, but with us they are all Nurfed up in Gardens. The sixth grows Wild in the borders of Corn-Fields, and Pastures, and in some Common Ground, and near the High Ways, in several places in England.

X. *The Times.* They are Sown in April or May, and bring forth their scaly or chaffy Husk in August. They are to be Watered in the middle of the day, when the Sun shines hottest, (as Basil ought also to be) and not in the Evenings or Mornings.

XI. *The Qualities.* Sweet Marjerom is hot and dry in the second Degree. It digests, attenuates, opens and corroborates: is Cephalick, Neurotick, Stomatick Hystrick and Alexipharmick.

XII. *The Specification.* It is peculiar against the Lethargy, Palsie, Convulsions of the Nerves, Obstructions of the Viscera, and cold and moist Diseases of the Head, Nerves Stomach and Womb: provokes the Terms, and gives ease in the Colick.

XIII. *The Preparations.* You may prepare from Sweet Marjerom, &c. 1. A Liquid Juice. 2. An Essence. 3. An Infusion or Decoction in Wine. 4. A Powder of the Herb. 5. An Infused or Decolled Oil. 6. A Distilled Water. 7. A Spirit. 8. A Chemical Oil. 9. A Spirituous Tincture. 10. An Oily Tincture. 11. A Cataplasm.

The Virtues

XIV. *The Liquid Juice.* It is good against all Diseases of the Thorax, which cause shortness of Breath, or difficulty of breathing, opens the obstructions of Liver, Spleen, Reins and Womb, clearing them of those Tartarous Humours, which stuff them, and strengthens and confirms the Viscera. It expels Wind, gives ease in the Colick, provokes the Terms in Women, brings down the Loches, and causes a due cleansing to Women in Child-bed. It is also very profitable for such as have the Strangury, or cannot easily make their Water, being taken Morning and Evening from one Spoonfull to three in good white Port, or white

Lisbon Wine: Dropt into the Ears, it ease their Pain.

XV. *The Essence.* It has all the Virtues of the Liquid Juice, but is more powerful to all the intentions and purposes aforementioned, being given from one Spoonful to two Morning and Night, in any fit Vehicle.

XVI. *The Infusion or Decoction in Wine.* It has all the Virtues of the Juice, and strengthens the Nerves, Head and Brain: If it is made with the addition of a sixth part of Pellitory of Spain, Long Pepper and Acorus, it prevails against the Paralysis of the Tongue, and loss of Speech: and the Power of cold Poysons, which have been inwardly taken. It is thin, and of a digesting quality; and being drank from 4 to 8 Ounces, it is good for such as are beginning to fall into a Dropsy: mixt with an equal quantity of the Juice, and dropt into the Ears, it eases the ringing noise of them.

XVII. *The Powder of the Herb.* Being used as an Errhine, by being blown, or stuffed up the Nostrils, it provokes Sneezing; and thereby purges the Brain of cold, moist, watery, and Pituitous Humors: The Herb made into a very gross Powder, (or the green Herb it self) being long chewed in the Mouth, draws forth much Phlegm, and other cold and moist Humours afflicting the Teeth, Gums, Throat, Almonds, and other parts adjacent, and thereby eases pains caused therefrom.

XVIII. *The Infused or Decolled Oil.* It is thus made. Take of the Herb a little bruised 4 Ounces; Generous White Wine 6 Ounces; old Oil 12 Ounces; them together and Infuse, or Digest in an equal Sand heat: press out strongly; and repeat it thrice more with the same quantity of fresh Herbs; and then boil in Balneo to the consumption of the Wine. It is a good Cephalick, eases Pains of the Head, and helps all cold Diseases thereof; as also cold Distempers of the Stomach, Liver, Spleen, Womb, Nerves and Joints, noise in the Ears, bitings of Venomous Beasts, Strengthens the Ventricle, helps indigestion, warms, comforts, digests, and discusses Wind, &c.

XIX. *Oleum Majorane Compositum.* The Compound Oil of Sweet Marjerom. Take Sweet Marjerom 4 Handfuls; Mother of Time 2 Handfuls; Myrtle Leaves or Berries 1 Handful; Water Mint, Southernwood, of each half a Handful; Cassia Lignea 2 Ounces: Cut bruise and put them into a Glass in the Sun, or in a Bath, affusing thereon Oil Ompnacine 3 Pounds; after 8 days press them out: to the expressed Oil, add fresh Simples, or Ingredients, which repeat the third time exactly in the same manner, and then perfect the Oil according to Art. It is a very good Anodyn, and eases Pains of the Head, Stomach, Bowels, Hypochonders, Joints, and other parts; it comforts the Brain and Nerves, and is prevalent against the Palsie, Dead Palsie, Tremblings, Numbness, Cramps, Convulsions, Gouts, Sciatica, and pains of the Ears, Jaws, and Back, by anointing it on the parts affected. It is good against the bitings of Venomous Beasts: and Clysterwise, it expels Wind, and gives ease in the Colick.

XX. *The Distilled Water.* It has the Virtues of the Juice and Essence, but much weaker, and may be given to 6 Ounces, or more, sweetened with white Sugar, or mixed with an equal quantity of Generous Wine: it may also, being dulcified, be used as a Vehicle, to convey some of the other Preparations in, down into the Body. It is good against Inflammations and weakness of the Eyes, and is mixed with other sweet Waters, to make a sweet Wash of:

XXI. The

XXI. *The Spirit.* It is very Cordial, Neurotick, Cephalick, and Stomack, expels Wind, gives present ease in the Cholick, is good against the Apoplexy, Lethargy, Palsy, Convulsions, pain in the Stomach, want of Appetite, Indigestion, and loathing of Food; it comforts the Heart, cheers the Spirits, and prevails against Fainting and Swooning Fits, and other like Distempers of the Head and Thorax. Dose (being first dulcified with double refined Sugar) is from 2 Drams to 4, either alone, or mixed with a Glass of Generous Wine.

XXII. *The Chymical Oil.* It is a Specifick against the Colick, Palfie, Lethargy, Convulsions, Cramps, Hysterick Fits, and the Poyson of Serpents. Dose from 3 or 4 drops to 10 or 12, in white Sugar, or Syrup of Clove Gilliflowers, mixing the Oil very well therewith, and then with a Glass of some Generous Wine, or Sack Whey, and so to drink it off, Morning and Night.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the Juice, Essence, Spirit, and Chymical Oil; but not so powerful as the last: it gives ease in the Cholick almost in a moment: Dose from 1 Dram to 3 Drams, in a Glass of Generous Canary Morning Fasting, and at Night going to Bed.

XXIV. *The Oily Tincture.* Given from 10 Drops to 20, 30, 40, or a Dram in any convenient Vehicle, it gives present relief in the most vehement Colick, cleanses the Reins, Ureters, and Bladder, of Sand, Gravel, or small Stones, provoking Urine powerfully, and expelling the recrements of those Parts, which stop the Urine and cause pain: Anointed well on the Back Bone, as also on the parts affected, it many times cures the Palfie, Numbness, and Trembling of the Limbs, beyond most other Medicaments, and has had a good effect in those cases when all other things have failed.

XXV. *The Cataplasme.* Made either of the Powder of the Herb, or of the Green Leaves, beaten up to a Consistency with Honey, and applied, it takes away the black and blew marks of Blows, Bruises, Pinchings and the like: If it is made up of the Green Herb beaten with Salt and Vinegar, and Powder of Ginger, and Long Pepper, and so brought to a Consistency and applied, it is good against the Poyson of the Scorpions Sting, as also the Bitings of Mad Dogs, Vipers, Rattle-Snakes, &c. being immediately applied after the Hurt done.

XXVI. *The Pessary.* Made of the Green Herb beaten, and brought to a Consistency with Powder of the Roots of Pellitory of Spain, a little Salt, and Vinegar, and Bees Wax, and then reduced into Form, and put up the Womb, and so contained there for some time, it is said to produce effectually the Terms in Women.

C H A P. CCCCLXXV.

Of MARJEROM Goats.

I. *THE Names.* It is called in Greek, Τετραγύανος: in Latin, *Tragoriganum*: and in English, Goats Marjerom.

II. *The Kinds.* There are four especial Kinds which Authors take notice of, viz.

1. *Tragoriganum Creticum*, *Tragoriganum Cretense apud Venetos Lobelij & Pene*; *Tragoriganum Clusij*; *Tragoriganum tertium Hispanicum Casp. Bauhini*, Goats Marjerom of Candy.
2. *Tragoriganum latifolium*, five, *Marum Corioli Matthioli*, *Tragoriganum alterum Gesneri & Lobelij*; *Tragoriganum latifolium Bauhini*, Broad Leav'd Goats Marjerom: this second is that *Marum* which *Covius* sent unto *Matthiolus*, for *Thymum Creticum*; and by the Name of *Marum*, it is called by *Durantes*, and *Lugdunensis*: and *Lobel* says, that among all the Plants which are called *Tragoriganum*, he could find none which came nearer to those of *Dioscorides*, than these two first Kinds we have here Named.
3. *Tragoriganum Hispanicum*, *Tragoriganum secundum Clusij*, *Dodonei*, *Camarij*, *Lugdunensis* & *Tabernemontani*, Spanish Goats Marjerom.
4. *Tragoriganum Matthioli*, *Lugdunensis*, & *Tabernemontani*, *Tragoriganum serpillifolium*, *Matthioli* his Goats Marjerom, or Goats Marjerom with Wild Time Leaves.

The Descriptions.

III. *The first*, or Goats Marjerom of Candia. The Root spreads it self with many small Fibres, and the Plant abides green all the Winter, if care-

Goats M A R J E R O M.

fully

fully preserved and look'd to, but left without Defence, it for the most part perishes. It is a low Plant, and has several small low Branches, not above a Foot high, something Woody, on which are set at several Joins, two Leaves, and some times more, which are somewhat broader, rougher, and harder than the Leaves of *Thymum Creticum*, and something like unto *Summer Savory*, but of a sadder green color; the small, hooded, gaping Flowers, stand at the tops of the Branches, in several distances about the Stalks, of a purplish red color. The whole Plant, and every part thereof, tastes very hot and sharp, and smells very sweet, with a very strong sweetness, and very quick and piercing.

IV. *The second, or Broad Leav'd Goats Marjeron.* It has for its Root, a blackish Bush of many fibres, set together like those of Marjeron. This Herb grows up to be a fine small bushy Plant, little above half a foot high, whose Stalks are not so woody, but tenderer like *Marjeron*, with many small, smooth, gentle Leaves, two for the most part set together at a joint; something broader than our *Mustick-Thyme*, of so strong, hot, and quick a smell, that being a little bruised, and smelt unto, it pierces the Senses more than the former; and comes somewhat near unto the smell of *Calamint* or *Penny-royal*. The Flowers are small, and purple, growing up to the tops of the Branches, from between the Joins. This abides green all *Winter* as the former, but requires as much care in preserving it in the *Winter*, as that does.

V. *The third, or Spanish Goats Marjeron.* The Root of this is more woody, and less bushy than the former. And this Plant rises up somewhat higher than the last, with whiter and harder Stalks: the Leaves are whiter also, smaller, narrower, and longer than they, and more store of them usually at every Joint, smelling something Sweet, but nothing so strong or quick, nor tasting so hot as they. The Flowers are white, and grow at several distances, towards the tops of the Stalks, but larger and more gaping, standing in brownish green Husks. This also abides green in the *Winter*, but is preserved with more difficulty than either of the former.

VI. *The fourth, or Matthiolus his Goats Marjeron, or Goats Marjeron with Wild Thyme Leaves.* This Plant Matthiolus first set forth, and called it *Tragoriganum*. It has a bushy Fibrous Root, from whence spring up several hard Stalks and small Leaves growing upon them, at several distances, which are like unto the ordinary Wild Thyme. The Flowers are purple, standing in roundles at the tops of the Branches; and the whole Plant smells not much unlike to *Penny-Royal*.

VII. *The Places.* The first grows in *Crete* and in *Spain* also. The second is unknown. The third in *Valentia* in *Spain*. The fourth in the Province of *Feropolium*, and several parts of *Italy*: but all of them grow with us in *Gardens*.

VIII. *The Times.* They all Flower with us very late in the year, *Gerard* says in *August*; others say that we scarcely see any Flowers till *September*, or *October*, and sometimes scarcely see any at all.

IX. *The Qualities.* They are (especially the two first) hot and dry in the third Degree: and much more Strong, piercing and effectual, in all their other Properties, than either *Sweet Marjeron*, or *Origanum*, of which we have and shall speak in their proper places.

X. *The Specification, Preparations and Virtues,* are also the same with those of *Sweet Marjeron*,

of which we have largely discoursed in the former Chapter: saying that as these the two first especially, are more strong and potent, than any of the *Marjeroms*; so all the Preparations of these are much more effectual, to all the intentions and purposes there specified.

C H A P. CCCCLXXVI.

OF MASTR--WORT.

I. **T**HE Names. It has no *Greek* Name, as being unknown to the *Greeks*: but is called in *Latine*, *Imperatoria*, & *Asfrantia*: in *English*, *Master-wort*.

II. *The Kinds.* Authors make but two Species hereof, viz. 1. *Imperatoris*, five *Asfrantia vulgaris*, *Laferpitium Germanicum Eulichij*; *simpernium bortenense* *Tragi*, & *Osteritium*; but the generality of Authors call it by the two first Names. In *English*, our Common *Master-wort*. 2. *Imperatoria Alpina*, vel *Asfrantia Alpina Camerarij*, Mountain *Master-wort*.

The Descriptions.

III. *The first, or Our Common Master-wort.* It has a Root which is something great, and rather grows side wise, than deep into the Ground, shooting forth several Heads, which taste sharp and biting on the Tongue, and is the hottest and sharpest part of any of the rest of the Plant, (to which the Seed in heat comes next) this Root is blackish on the out side, with several Fibres or strings adjoining to it, and smells very well. From this Root spring up several Stalks of winged Leaves, divided into divers parts, three for the most part standing together, at a small foot Stalk, on both sides of the greater, and three likewise at the end of the Stalk, each of which Leaves are somewhat broad, and cur in on the edges into three or more divisions, and all of them dented about the brims, of a dark green color, somewhat resembling *Angelica* Leaves at first sight, till they be better viewed, as that these grow lower to the Ground, and upon lesser

MASTER-WORT.

lesser Stalks; from among which Leaves rise up two or three Stalks, which are short in comparison of *Angelica*, being about two feet high, and slender, with such like Leaves at their Joints, as grow from the Root below; but lesser, and with fewer divisions, bearing Umbles of white Flowers: and after them small, thin, flat, blackish Seed, something larger than *Dill* Seed.

IV. *The second, or Mountain Master-wort.* The Root grows in like manner as the former, and is black on the out side, but is more hot, sharp and biting upon the Tongue, than the Root of the first or Common Kind. This Plant grows also in form much like to the first, but lesser in every part, having nine Leaves standing on each Stalk by three and three, but they are smaller and narrower, and have fewer Incisions in them, but finely dented about the edges: The Flowers and Seed of this are also very like to the first, without any material difference, unless it be in the magnitude, these being something the lesser.

V. *The Places.* The first grows Wild on the Hills in Italy and Germany, in Woods also and Deserts: The second was found growing on the Alps in Switzerland: With us they only grow, and are Nurst up in Gardens.

VI. *The Times.* They are said to Flower from the beginning of June to the beginning of August, but if the Season is cold, and very moist, they Flower and Seed late with us, as not untill the end of August.

VII. *The Qualities.* They are hot and dry in the fourth Degree, being hotter than Pepper, and of very subtil parts. It is Attractive, Aperitive, Carnivative, Digestive, Discurfive, and Diuretick; Cephalick, Neurotick, Stomatick, Cordial, Nephritic, and Hyfterick; Præmick, Emmenagogick, Sudorific and Alexipharmick.

VIII. *The Specification.* It is said to cure the Cholick, expel Sand, Gravel, and small Stones;

provoke the Terms, resist Catarrhs, and is profitable against the Falling-sickness, Hyfterick fits, the Gout from a cold cause; expels all sorts of cold Poysons, and heals wounds made by Poysoned Weapons.

IX. *The Preparations.* The Root is chiefly used, and then the Seed for want of it, the Leaves very seldom, you may have therefore from the Root, 1. A Liquid Juice. 2. An Essence. 3. A Decoction, or Infusion in Wine. 4. A Powder of the Root. 5. An Infusion, or Decoction of the Seed in Wine. 6. A Powder of the Seed. 7. A Distilled Water of the Herb, Root, or Seed. 8. A Spirituous Tincture of the Root or Seed. 9. An Acid Tincture of the Root or Seed. 10. An Oily Tincture of the same. 11. A Lobeck. 12. A Cataplasm.

The Virtues.

X. *The Liquid Juice.* It is good against all cold Griets and Diseases both of the Stomach, and other Bowels, expels Wind powerfully both upwards and downwards: it provokes Urine, and helps to break the Stone, and expell it from the Reins; Ureters and Bladder, and powerfully brings down the Couries in Women, and forces away both Dead Child and After-birth: It is profitable against Vapors and Hyfterick Fits: and being mixed with White Wine, and used as a Gargarism, it attracts Flegm, Rheum, and cold and watery Humours out of the Jaws, Gums, Throat, Almonds, Head, Brain, and other parts adjacent. Being put into old Ulcers, and putrid running Sores, or Tears, or Pledgets dipt therein, and applied to the same, as also into Green Wounds, it soon recovers, cleanses and heals them, yea tho' a Gangrene, seems impending: And applied to the Gout from a cold Cause, it gives ease in the pain. Dose from half a Spoonful, to a Spoonful, or more, in any proper Vehicle.

XI. *The Essence.* It has all the Virtues of the Juice, and may be given in the same Dose and Vehicle, Morning and Evening; besides which it stops Vomiting, wonderfully strengthens the Stomach, causes a good Appetite, and a strong Digestion, dissolves Wind, and gives present ease in the Cholick; and is profitable against the Dropfie, Jaundice, Epilepsie, Lethargy, Drowsiness and Sleepiness, and other cold and moist Diseases of the Head and Brain: it has also a singular Virtue and Power against all sorts of cold Poysons, as also against any malign Disease, and the Plague it self: it provokes Sweat, and defends the Heart against any Venom, Malignity or Infection.

XII. *The Infusion, or Decoction in Wine.* It has all the Virtues of the Juice and Essence, but not altogether so powerful, and may be given from 2 to 4 Ounces, or more, Morning and Night, or as need requires, being dulcified with Syrup of Clovegill-flowers, or Syrup of Violets; and used as a Wash to any putrid or rotten Ulcer, it stops the Putrefaction, cleanses it, and induces the healing. *Tragus* says that the Decoction of the Root in Wine, being drunk, does restore the Ability of Generation in such as are Impotent, or where it is almost extinct, and this he speaks as a certain Truth.

XIII. *The Powder of the Root:* It has the Virtues of Juice and Essence, and may be given inwardly from 15 Grains to a Dram, mixt with a little Honey:

T t t t

Honey: It is good against Quartans, and expels the *Fetus* and After birth: used as an Errhine, it Purges the Head and Brain of Cold Humors, and is profitable against Apoplexies, Convulsions, Cramps, Epilepsies, Lethargies, Vertigo's, Megrim's, and other like distempers of those parts. And inwardly taken, it excites also the Generative Faculty, and powerfully corrects the cold and moist habit of the Stomach and Bowels: And being strewed upon old running Sores, and putrid Ulcers, it corrects the Putridity, cleanses them of the Corruption, and induces the healing.

XIV. *The Infusion or Decolion of the Seed in Wine.* It has all the Virtues of the *Infusion or Decolion of the Root*, and may be given in the same manner and the same Dose. It is a singular Prophylactick against pestilential Airs, and against the very Infection of the Plague it self. Taken in the Morning Fasting, it comforts the Stomach, helps Digestion, creates an Appetite, and expels Ventosities out of the Viscera.

XV. *The Powder of the Seed.* It has all the Virtues of the *Powder of the Root*, and may be given to a Dram, before the coming of the Fit of a Quartan Ague (so also the *Powder of the Root*) for the Cure of the same; it takes away the extrem rigor of the cold, provokes Sweat, and prevails against the Dropfie: it may also be used as an Errhine, as well as the *Powder of the Root*.

XVI. *The Distilled Water of Root, Herb, and Seed.* It has the Virtues of the *Juice*, but much weaker, and may be given from 1 Ounce to 6 Ounces, it may also serve as a Vehicle to convey the other Preparations in, which are to be given inwardly. It may also be mixed with the *Juice* for a Gargarism, or for a Lotion to wash old Sores, Ulcers, &c. for it notably cleanses and dries them.

XVII. *The Spirituous Tincture of the Root or Seed.* Tho' it has all the Virtues of *Juice*, *Essence*, *Infusion*, *Powder*, &c. yet in an especial manner, it rectifies the cold and moist habit of the Stomach, taking away all Pains and Aches there, and almost in a moment cures the Cholick. And it is profitable for such as have inward Bruises, occasioned by falls, blows, or other accidents, dissolving the concreted Blood, and so giving relief to the Patient. Dose from 1 Dram to 2 Drams, in any proper Vehicle, Morning Fasting, and last at Night going to Bed.

XVIII. *The Acid Tincture of the Root or Seed.* It is a potent thing against the Plague, and all sorts of Pestilential or Malign Fevers, used either as a prophylactick, or as a Curative: it prevails against Poysons of all sorts, and the Bitings of poysonous and venomous Creatures, as of Mad-Dogs, Vipers, Rattle-Snakes, and other Serpents: it causes Appetite and helps Digestion: is powerful in breaking the Stone, and expelling Gravel, both from the Reins and Bladder: it is good also against cold Catarrhs, or distillations of Rheum upon the Thorax or Lungs, gives ease in vehement Coughs, and helps such as are troubled with Hoarseness, Wheezing, shortness of Breath, difficulty of Breathing. It is to be taken in all that the Patient drinks, whether at Meals, or otherwise, so many Drops at a time as to give the Ale, Beer, or Wine, a pleasing Acidity.

XIX. *The Oily Tincture of the Root or Seed.* It has the Virtues of the *Juice*, *Essence*, *Decolion*, *Powder*, and *Tinctures*; but in particular it is good against Palsies, Tremblings, Numbness, Cramps, Convulsions, Lethargies, Colicks, Gours of all sorts, and the Stone and Gravel, whether in Reins

or Bladder; provoking Urine, and giving ease in the Strangury, beyond many other Medicines, being outwardly anointed on the Back-bone, and other parts affected; and inwardly taken from 10 drops to 60, according to Age and strength, in any proper Vehicle. It provokes the Terms, facilitates the Birth, brings away the Dead Child; and After-birth, cause a good cleansing, and gives present ease in After-pains, &c.

XX. *The Lobeck.* It is made of the *Liquid Juice*, mixt with a half part of Honey, first purified with whites of Eggs, and then by the heat of a Bath brought to a Consistency. It gives ease in Coughs, Colds, Asthma's, and most other Distempers of the Brest and Lungs, proceeding from Cold, and a Viscous Flegm.

XXI. *The Cataplasme.* It is made of the Roots and Leaves, beaten in a Mortar, and brought to the Form of a Pulstife. Being applied, it is said to cure Pestilential Carbuncles and Botches, and other like Apoftems, Bubo's and Tumors: it cures Contusions, dissolves congealed Blood; and is an absolute Remedy for the biting of a Mad-Dog, Viper or other Serpent, or venomous Creature, by strongly attracting or drawing forth the Poyson, &c. but this is to be understood, of such an Application as is made, when the Biting is newly done: applied also to poysoned Wounds, or putrid Ulcers, it draws forth the Poyson, and destroys the Putridity.

MATCH-WOOD, see Touch-Wood, Chap.

MATFELLON, see Knapweed, Chap. 414.

C H A P. CCCCLXXVII.

of M A T -- W E E D ;

OR,

M A T -- R U S H E S.

I. **T**HE Names. It has no Greek Name, but called in Latine, *Spartum Herba*; and in English, *Mat-Weed*.

II. *The Kinds.* Authors have many species of this Plant; we shall content our selves with these following, 1. *Spartum Marinum nostras*, *Spartum Herba terria Maritimum Clusij*, Our English Mat-weed, or Matram. 2. *Spartum marinum nostras alterum Lobelij & Bauhini*, *Gramen Spartium Spicatum latifolium*, Our other Sea Mat weed. 3. *Spartum parvum Batavicum & Anglicum*, *Spartum nostras parvum Lobelij*, *Spartum Herba Anglica*, *Gramen Spartium Juncifolium*, small Mat-weed. 4. *Spartum minimum Anglicum*, Our smallest English Mat-weed. 5. *Spartum Herba Plinij*, *Juncus Hispanicus*, *Gramen Spartium primum pannicula Comosa Bauhini*, Spanish Mat-weed or Rushes, or Frail-

Frail-weed. 6. *Spartum Herba alterum mollius Plinij, Spartum Herba Plinij alterum, Gramen Spartum secundum pannicula brevis folliculo inclusa Baubini, The lesser Spanish Rush, or Mat-weed.*

The Descriptions.

III. *The first, or Our English Mat-weed. Its Roots creep in the Ground, and fasten themselves strongly therein: It has divers long, hard, and very sharp pointed Rushes, piercing their Legs who go among them that are not Booted. The Stalks have soft spiked long Heads, like unto the Ears of Rye, and Blooming like it also.*

IV. *The second, or Our other Sea Mat-weed. Its Roots creep likewise under the Ground, and are strongly fastened to the Earth, as the others are: and this Mat-weed is in the growing like the former, but that the Rushes are broader and shorter, and so also the Heads or spikes.*

V. *The third, or Small Mat-weed. The Roots of this are likewise long, hard, and somewhat tough, fit to be wrought into little Baskets or the like. It has shorter, smaller, and harder Rushes: the Stalks are about a foot and a half high, having small, thin, long Spikes, and harder at the tops than the former.*

VI. *The fourth, or Our smallest English Mat-weed. The Roots are long and yellow, like the former small English Kind. From which rise up many small, slender, round Rushes, like Threads, almost 4 or 5 Inches long, growing thick together; among which, the Stalks which are very small, have smaller Heads, and fingle; that is consisting but of one or two small Rows.*

VII. *The fifth, or Spanish Mat-weed or Frail-weed. The Roots spread in the Ground into many Tufts, matting therein, that in some places they take up two feet square of Ground or more: From which rise up a number of round Rushes, a foot and a half long, each of which is parted a little above the Ground, into 3 or 4, or more, slender, long, tough, and green Rushes, something broader at the first, being whitish in the middle, which soon after have both their edges fo drawn together, that it makes them seem round, so that the Partition is scarcely discerned, and then grow harder and whitish, when they are dry (as we see them in Raifon Frails, &c. and in the round Matts, with which the Floors of Chambers are Matted, as they are wrought there, and brought over here to us) from among which rise up several Stalks, something higher than the Leaves, bearing at the top a small long Head of many sharp pointed Husks; after which come small long Seed, like unto some other Grasses.*

VIII. *The sixth, or Lesser Spanish Rush or Mat-weed. The Roots of this do matt like the other, but grow in moister places. From whence rise up the Rushes or Frails in the very same manner and order as the other Spanish kind do; These Rushes are more fine and slender, softer also, and bear a shorter Tuft at the Top, breaking out of a shining Husk or Hufe.*

IX. *The Places. The first, second, third, and fourth, grow very well with us in England; very plentifully on the Coasts of Norfolk, and Suffolk, and in many other places on the Sea Shore. And the first of them has been found growing also in the Isle of Tenet, near the Sea side, between also Marget and Sandwich, the two last grow in Spain,*

the Canaries, Madera's, and other warm Climates.

X. *The Times. They beat or bring forth their Heads in the middle, and towards the latter end of Summer.*

The Virtues and Uses.

XI. *These Plants are all useless in Physick, as having no known Medical Virtue, and also hurtful to Cattel, but serve to make Matts and Frails withall.*

C H A P. CCCCLXXXVIII.

Of MAUDLIN.

I. *THE Names. It is called in Greek, Ἀγέρον; in Latine, Ageratum: (quasi non Senescens, vel Senectutum non Sentiens; because the Flowers thereof gathered in a fit time, will not wax old or decay by Age:) and in English, Maudlin.*

II. *The Kinds. Authors make about five several species hereof, viz. 1. Ageratum Diofcoridis Camerarij, Castoris, Durantis, Gesneri, Lugdunensis, Matthioli, Tabernamontani; Eupatorium Mesues; Balsamita samina, & minor, Dodonæi, Costus Hortensis minor Gesneri; Mentha Corymbifera minor Cordi, Campborata Cesalpini; Herba Julia Anguillare & Gesneri; & Eupatorium mesues, Gesneri, Loniceri, Matthioli & Tragi; and in short, this is that Plant, which most of the best and latter Writers, or Authors affirm to be the true Ageratum Diofcoridis, and the true Eupatorium Mesues, and is our Ageratum Vulgare or Common Maudlin. 2. Ageratum Flore albo, Ageratum secundum Lugdunensis, & Matthioli; Ageratum Floribus Candidis Lobelij; Camerarij, & Tabernamontani, our white Flowered Maudlin. 3. Ageratum minus Lobelij, Camerarij, & Tabernamontani; Ageratum foliis non serratis Baubini; Small Maudlin. 4. Ageratum purpureum Lugdunensis; Ageratum ferratum Alpinum Baubini: Moschatella cerulea Germanorum (but it is not the Moschatella Cordi) Purple Sweet Maudlin. 5. Ageratum serulaceum Lugdunensis; Chrysanthemum Alpinum foliis Abrotani Multifidis, Fennel Leav'd Maudlin. This sort Baubinus refers to the Achillea Montana Artemisia tenuifolia facie Lobelij, and to the Achillea Montana Lugdunensis & Tabernamontani.*

The Descriptions.

III. *The first, or Our Common Maudlin. It has many Roots with Fibres adjoined, which are long, lasting, or abiding all Winter for some years. It is somewhat like to Costmary, (of which*

T t t t 2 it

it is said to be a Kind,) and has somewhat long and narrow Leaves, sharp about the edges, The Stalks are about 2 feet high, bearing at the tops many yellow Flowers set round together, and all in Umbles. of an equal height, much like to *Tansie*, after which follows small whitish Seed, almost as large as *Worm-Seed*, the whole Herb, is Sweet

scented and of a bitter taste, and is increased as well by slipping, as by sowing. *Gerard* says it is something like to *Costmary* in color, smell, taste, and in the golden Flowers set upon the tops of the Stalks in round Clusters, or Tufts.

IV. The second, or Our white Flowered Maudlin. The Root is small and Fibrous or stringy, like the other. It has woody Stalks, and many small Leaves set thereon like the other, but something smaller, and lesser dented in on the edges.

Maudlin
the
Greater

MAUDLIN.

White MAUDLIN.

At the tops of the Stalks grow many Flowers, as it were in an Umble or Tuft together, like to the former *Common Maudlin*, but in a manner wholly white, except a little shew of yellow in the middle. The smell of the whole Plant is not so strong as the other, yet very sweet and pleasant.

V. The third, or Small Maudlin. The Root is small and white, with many Fibres adjoined to it. It is but a small Plant, and has several hoary Stalks, not rising much above a foot high, beset as thick with Leaves, or thicker than the former, upon all sides of the Stalk, or rather round the Stalk, which are smaller, longer, narrower, and whiter than the other, and not dented at all about the edges, but something like unto the Leaves of yellow or golden *Cassilony* or *Gold-Locks*, in Chap. 322. Sect. 2. Fig. 1. foregoing. At the tops of the Stalks stand many yellow Flowers thrust thick together in an Umble or Tuft, very well resembling the first or *Common Garden Maudlin*, of a very good and Quick smell, which convert into Down, and is carried away with the Wind. The flowers of this and the first Kind, are very Beautiful, and will not lose their glory in growing, till they are very old, from whence came the Name *ἀγέρον* or *αγέρον*, non senescens, and are like in the Tuft to *Eliobryson* *Theophrasti*, which some will have to be the *Gold-Locks* aforementioned, others the *Aurelia*, *Coma aurea*, or *Golden Meth-wort*.

VI. The

VI. *The fourth, or Purple Sweet Maudlin.* The Root is yellow, small and short, bushing forth many small Fibres, by which it takes fast hold of the Ground. This rare and delicate Plant, has many small Leaves lying upon the Ground, round about the top of the Root, something like to the Leaves of the first Maudlin, above described, dented in on the edges, towards their points, and not backwards or towards the foot Stalk, or sticking on to the Stalk: it is bitterish in Taste, but not so bitter as the first or common. From among the Leaves rise up many small Stalks, beset with such like Leaves as grow below, but something smaller, unto the very tops, where many Flowers stand, one above another, every one upon a short foot Stalk, consisting of five small green Leaves, of an admirable Violet like purple color, coming forth of small green Husks, of so excellent and desirable sweet smell, that it much exceeds the Violet, and may be compared with Musk it self. After the Flowers are past, several small Seed Vessels rise up, containing in them small Seed.

VII. *The fifth, or Fennel Leav'd Maudlin.* Its Root is something long, black, and woody, rugged, and a little Writhed, with several Fibres growing to it. It has many Fennel like Leaves, lying upon the Ground round about the Root, which shoot forth several crested or cornered Stalks half a Yard high, on which do grow at certain distances, on each side one above another, such like Leaves encompassing the Stalk at the feet of them, as those of Fennel do. At the tops of the Stalks stand large Umbles of Flowers, some of the Stalks not rising so high as the others, yet all making a round compacted Tuft of yellow Flowers, very like to those of Groundsel for the Form, but of a more excellent Gold yellow Color, which being gathered before they be grown to full Maturity, will abide a long time in their perfect Beauty: and this is that which has chiefly caused this Plant to be joined to the Maudlins for that the Flowers decay not being gathered, for a very considerable Season.

VIII. *The Places.* The two first grow Wild in rough and untill'd places in Italy and France; The third on dry Grounds, and out of old Mud and Stone Walls. The fourth upon Rocks and Chifts, where there is sometimes but little Earth upon the Root, it growing or running many times into the Chinks, and moistned only by the Vapors of some Waters passing near it, or Dews falling on it. The last grows in dry and hungry Wood Lands: but with us they are all Nurst up in Gardens.

IX. *The Times.* They bring forth their Tuffs of yellow Flowers in the Summer Months, viz. June and July, in most Gardens where they are Planted and prosper.

X. *The Qualities, Specification, Preparations, and Virtues of Maudlin,* are the same with those of Costmary, which we have at large declared in in Chap. 156. Sect. 6. ad 25. foregoing of this Book, so that we need say little more of it in this place.

XI. *Nota.* A Compound Balsam of Maudlin is thus made. Take fresh gathered Maudlin, Adders-tongue, of each 12 Handfuls: Oil Olive 2 Quarts: White Wine a Pint: Boil to a Crispness, and press out; this repeat twice more, straining out at last with very gentle pressure: to this add Turpentine 12 Ounces: Bees-wax 8 Ounces: Resin in fine Powder 4 Ounces: mix and in a Bath make a Balsam, Boiling till the moisture is evaporated. It is an Excellent Balsam for Burnings and Scaldings; as also for cleansing, incarnating and healing old

and running Sores, and rotten Ulcers, and to raise and bring up the Flesh from a deep and hollow Wound, which things have been proved by a long Series or Number of Experiments.

C H A P. CCCCLXXIX.

of MAY-WEED.

O R,

Stinking C A M O M I L.

I. *THE Names.* It is called in Greek, *Kynobolus*, & *Kynoceros*, *Cynanthemis* & *Cynobotane*, i. e. *Camomilla Canina* & *Canina Herba*: in Latine, *Cotula*: and in English, *May-weed*.

II. *The Kinds.* There are three Kinds hereof, viz. 1. *Cotula fetida*, Stinking or strong May-weed. 2. *Cotula non fetida*, May-weed not stinking, or with out smell. 3. *Cotula Multiplex vel flore pleno*: double Flowered May-weed.

The Descriptions.

III. *The first, or Stinking or strong Scented May-weed.* It has a Root which is Woody, and perishes when

when the Seed is perfected. From whence shoot forth round Stalks, green, brittle, and full of Juice, divided into many Branches, much thicker and higher than those of our Common Garden Camomil; the Leaves in like manner are broader, and of a blackish green color; the Flowers are like in form and color to those of Camomil, but commonly larger, and of a rank smell; the whole Plant giving also a rank or stinking smell. This grows more upright than either the Common Garden Kind, or the non-fatida which follows, and its Leaves are longer and greater than it, as also are the Flowers, by the smell of which alone this sort is distinguished from the others.

IV. The second, or May-weed not stinking or without smell. The Root of this is like the former, and its manner and form of growing also: but it grows not altogether so high, yet creeps not or runs on the Ground, nor takes Root at the Joints or Branches, as the Garden sort does; but the Leaves hereof are longer and greater than those of that, yet very like, but of a paler green color, having no smell at all: the Flowers are also very like to the former, and to those of the Garden Kind, but larger, both in the white row or border of Leaves, and in the yellow middle Thrum: by which this sort is discerned from that of the Garden.

V. The third, or Double Flowred May-weed. This is very like to the first Kind here described, and differs nothing at all from it, but in the Flowers, which are commonly very double, and almost as large as double Camomil Flowers.

VI. The Places. They grow plentifully Wild, in most Counties of England, in Corn-Fields, and in, or near unto Furrows in Plowed-Lands, and by Path-ways in the borders of Fields. The double Kind has been often found in several parts of England, growing Wild, as the Single Kinds do.

VII. The Times. They Flower in the Summer Months, sometimes in June, also in July and August; sometimes earlier, and sometimes later, according as the season of the year is kindly.

The Virtues.

VIII. These Plants as they are never used for Food, nor yet scarcely for Medicine, so their Medical Qualities and Properties are for the most part unknown. Yet,

IX. The Juice or Essence of the first, or stinking Kind, is Commended as Gerard says, against Diseases of the Womb, and Hysterick Fits, and therefore may be profitable against Vapours, and other fainting Fits and Diseases of like Kind. Dose a Spoonful or two in a Glass of fair Water, or in Angelica Water, or in some other fit Vehicle.

X. The Ointment and Cataplasin made of the Herb. They are said to be good to dissolve Tumors or Swellings; to disperse Wind; and to ease Pains and Aches in the Joints; especially being made of the Stinking Kind, and applied Morning and Night to the parts affected.

MAY-BLOSSOM, see Lilly Convally, Chap. 444.
MEDICK-FITCH, see Cocks-head, Chap. 141.
MEDICK-FODDER, see Snail Claver, Chap. 135.
MEDOW-PARSNIP, see Parsnep-Cow, Chap.

C H A P. CCCCLXXX.

Of MEDE -- SWEET:

OR,

QUEEN of the Meddows.

I. THE Names. It is thought to be unknown to any Ancient Greek or Latine Authors: but later Writers call it *Ulmaria*, a *foliorum Ulmi similitudine*, from its likeness to Elme Leaves; in English, *Mede-sweet*, *Meddow-sweet*, and *Queen of the Meddows*.

II. The Kinds. There are two Species hereof, viz. 1. *Ulmaria Vulgaris*, *Regina Prati Dodonæi*, *Barba*, vel *Barbula Capra*, or *Barba Caprina Tragi*, *Barba Capri Fuchsij*, *Barbi Capra Lobelij*, *Medesufium Cordi*, our Common Mede-sweet, or Meddow-sweet: some have thought it to be *Rodora Plinij*, but that cannot be positively affirmed: *Tragus* thought it might be *Piconomon Dioscoridis*, as did also, *Gesner in hortis* & *Lonicera*. 2. *Ulmaria major*, five altera, *Potentilla major prima Anguillare*, *Argentina major Thalij*, The Greater Mede-sweet, or Meddow-sweet. *Lugdunensis* says, some took it to be *Melandrum Plinij*; and some call it *Dryasopogon*. *Camerarius* says the Germans call the first *Wormkraut*, Worm-wort, because says he, the Root is often found, as if it were eaten by Worms: but it is more likely, from its curing Horfes of the Botts and Worms, for which purpose the Country people used it.

The Descriptions.

III. The first, or Our Common Mede-sweet. It has a Root which is somewhat Woody and blackish on the out side, and brownish within, with several greater Stringers, and lesser Fibres adjoining; of a strong smell, but nothing so pleasant as the Flowers or Leaves; it perishes not in Winter, but abides many Years, shooting forth a new every Spring. Its Stalks are reddish and easy to break, rising to he 3 Feet high, and sometimes to 4 or 5; having at the Joints thereof, large winged Leaves, standing one above another at Distances; which are made of many somewhat broad Leaves set on each side of a middle Rib, being hard, rough, or rugged, and Crumpled much like to Elme Leaves, from whence it took its Name; but having also some smaller Leaves with them, like as *Agrimony* has,

has, something deeply dented about the edges, of a fid green color, on the upper side, and greyish underneath; of a prey sharp finell and taste, very like unto *Burnet*, and will no less give a fine relish to a Glas of Wine, if a few Leaves thereof be put therein. At the tops of the Stalks and Branches, stand many Tufts of finall white

MEDE--SWEET.

Flowers, thrust thick together, which smell much sweeter than the Leaves, which being fallen, in their places come crooked and cornered Seed, crookedly turning or winding one with another, and so making a fine little Head.

IV. *The second, or Greater Mede-sweet, or Meddow-sweet.* The Root of this is more Woody than the former, with many blackish strings, which smell strong, and taste somewhat barshly. This Plant grows higher than the former, with longer winged Leaves, set one above another upon the Crested brownish Stalks, having long foot Stalks supporting them; each being usually divided into three parts, the two lowest one against another, and every part also consisting of three or five smaller Leaves than the other, separate each from the other, being hard, crumpled and finely dented about the edges, at the tops of the Stalks grow the Flowers in longer Spikes, more sparsely and not so thick thrust together, turning down their Heads, which are white like the former, and smelling very sweet also, more nearly resembling a *Goats Beard*, (which Name some Authors have given to it) than the first kind here described. *Gerard* says, it has Leaves of the higness of *Wild Angelica*, and grows somewhat after the manner of *Wild Angelica*; that the Stalks are crested and divided into several Branches, which carry long bending Spikes or Ears of white Flowers or Seeds, each single

Flower and Seed being something like the former.

V. *The Places.* The first grows in moist Meadows which ly much wet, or near Watercourses, as the sides of Rivers, and watery Ditches, almost every where. The second grows in Woods, Copies, and shady places in Germany and other Countries, but here in England, only in Gardens.

VI. *The Times.* They are found in Flower through all the three Summer Months, viz. June, July, and August, and their Seed is ripe in some short time after.

VII. *The Qualities.* Mede-sweet is temperate in respect to heat or cold, but dry in the first Degree. Absterfive, Astringent, and Traumatick, or Vulnerary; Cephalick, Neurotick, Stomatick and Hysterick.

VIII. *The Specification.* It stops Bleeding, and cures Fluxes of the Bowels of all sorts, stops the Whites and Terms in Women, and gives ease in the Colick and Gripings of the Guts. And heals Wounds and old Ulcers.

IX. *The Preparations.* You may make from either Flowers, Leaves, or Root, or from all of them, 1. A Liquid Juice. 2. An Essence. 3. A Decolion or Infusion in Wine. 4. A Powder. 5. An Oil. 6. An Ointment or Balsam. 7. A Cataplasme. 8. A Distilled Water. 9. A Spirituous Tincture. 10. An Acid Tincture.

The Virtues.

X. *The Liquid Juice.* It stops all sorts of Fluxes, Bleedings, and Vomitings, as also the overflowings of the Terms in Women, and the Whites. It is said to alter and take away the fits of Quartane Agues, eases the Gripings of the Guts and moves the Belly downwards. Outwardly applied it heals old Ulcers, which are cancerous or eating, and fills up fistulous or hollow Ulcers with Flesh, and cures Sores in the Mouth and secret parts. Dose from 2 to 6 Spoonfuls Morning and Night, or osmer in any Convenient Vehicle.

XI. *The Essence.* It has the Virtues of the Juice, and is more powerful to all the Intentions before specified, and is only to be given from 1 to 3 or 4 Spoonfuls in any proper Liquor, Morning and Night. It is Cordial and very much Cheers the Heart.

XII. *The Decolion or Infusion in Wine.* They have the Virtues of the Juice and Essence, but may be given from 2 to 6 or 8 Ounces, sweetned a little with white Sugar: It is very Stomatick, strengthens the Bowels, and causes a good Appetite.

XIII. *The Powder.* It has the Virtues of the former Preparations, taken from half a Dram to a Dram in any proper Vehicle: if mixt with Honey and taken, it is good against Coughs, Catarrhs, Colds, Wheezings, Hoarseness, Shortness of Breath, and difficulty of breathing. Strewed plentifully upon old, moist and running Sores and Ulcers, it drys them, and induces a speedy healing: it is also said to kill Worms in Children.

XIV. *The Oil by Insolation or Boiling.* It eases Pains being applyed, and strengthens weak Joints, which have been lately Set, or where the Bones have been Broken.

XV. The

XV. *The Ointment or Balsom.* It digests, cleanses, and induces the healing of old running Sores, putrid Ulcers, Fistula's and the like, and breeds Flesh where it is wanting. Apply'd to parts or joints pained with the Gout, it eases them.

XVI. *The Cataplasm.* Made of the green Herb, and laid upon the Skin, it will in a small time (as *Tragus* says) raise Blisters thereon. Apply'd immediately to the Biting of a mad Dog, or Stinging of a Scorpion, Hornet, &c. it draws out the Poyson and gives ease.

XVII. *The Distilled Water.* It has the Virtues of the Juice, but nothing near so powerfull: and being drop't often into the Eyes, it eases their pain, and allays their Heat and Inflammation. It may also serve as a Vehicle to take some of the other Preparations in.

XVIII. *The Spirituous Tincture.* It is Cordial, strengthens the Stomach and other Bowels, stops Fluxes of all kinds, causes an Appetite and good Digestion, and is profitable against inward Bruises: and gives present ease in the Colick.

XIX. *The Acid Tincture.* It mightily strengthens the Stomach, and causes a good Appetite; and stops Vomiting tho' of long continuance. It may be taken in all the Patient Drinks, whether Ale, Beer, or Wine; so much at a time as to give the Liquor a pleasing sharpness; and that as well at Meals, as between Meals.

II. *The Kinds.* Authors have given us fourteen or fifteen several sorts of this Plant, but the most of them being unknown and not growing in England, nor in our English Plantations beyond Sea, we shall only describe the four following Species, viz. 1. *Melilotus Vulgaris*, *Melilotus major* *Vulgaris* *Tragi*, *Melilotus Germanica* *Camerarii*; & *Polonci*; & *Lobelii*; *Trifolium Odoratum* *Thelij* & *Dodonci*; *Lotus urbana* & *sativa* *Matthioli*, & *Lagduensis*; *Saxifraga Lutea* *altiera*, *Euchsi* & *Loniceri*: but *Serta* and *Sertula Campana*, the old Latine Name, is now quite out of use: Common Melilote, 2. *Melilotus flore albo*; *Melilotus major candida* *Tragi*; *Lotus Sylvestris flore albo* *Dalechampij*; white Flowered Melilote. 3. *Melilotus Italica* *Camerarii*; *Melilotus Italica folliculis Sabrotundis* *Bauhini*, Italian Melilote. 4. *Melilotus Syriaca*, *Meliloti vulgaris Species tercia* *Tragi*; *Melilotus Italica* *Dodonci*, *Euchsi*, *Gesneri*, & *Matthioli*; *Melilotus Syriaca odora* *Lobelii*, (because it came from Aleppo, as he says, but is used in Italy for the true Melilot, and therefore called by other Authors, as aforesaid, *Melilotus Italica*; and this *Tragus* thinks to be the Melilote of Serapio.) Assyrian Melilote.

The Descriptoins.

III. *The first, or Common Melilote.* It has a Root which is long, white, and tough, or plant, with several Fibres or strings adjoining thereto, which dies not every Year: From this Root rises up several weak green Stalks, about two or three feet high; on which grow longish Leaves, set round about at the Joints, three always set together like a Trefoil, of a fresh green color, and somewhat sweet smelling, being unevenly dented or snipt about the

C H A P. CCCCLXXXI.

of MELILOTE:

O R,

KINGS -- CLAVER.

I. *THE Names.* It is called in Arabick, *Alchilemelick*: in Greek, *Melilotos*; quasi *Mellea lotus*, from *Lotus*, which smells sweet like Honey; in Latine, *Melilotus*: and in English, *Melilote*. This Plant was anciently called in Latine, *Sertula Campana*, from its growing in Campania, where they used to put it in Garlands; also *Corona Regia*, because the yellow Flowers Crown the Tops of the Stalks: and *Trifolium Odoratum*, from its pleasant sweetnes, but improperly, because the *Trifolium Odoratum*, truly so called, is Our Garden Trefoil, of which we shall speak hereafter in its proper place. It is also called *Trifolium Equinum*, & *Caballinum*, because Horses delight to eat it, and thrive well with it: and so in many places of England it is called *Hart-Claver* (from Deer and Stags greedily feeding on it;) and in some places *Hart-wort*; but it is generally called with us *Kings-Claver* (as being the Noblest and chieft of all the Trefoils or three Leaved Grasses;) and *Melilote*, from the Latine and Greek, as being the Name now most used, and indeed best understood.

M E L I L O T E.

edges.

edges, and oftentimes eaten about the same. Out of the bosome of the Leaves come small slender Stalks about a handfull long, set thick on their tops with little yellow Flowers, hanging down and turning up again; each Flower being composed of two little yellow Leaves, of which the uppermost turns up again; and the undermost seems to be parted into three: they are made much like other *Trefoils*, but small and standing in long Spikes, one above another for an hand breadth or better: which being past away, turn afterwards into long crooked Cods, in which is contained the Seed, which is brown and something flat.

IV. *The second, or white Flowered Melilote.* Its Root is tough, white and slender, with many strings or threads adjoining, perishing commonly after it has given Seed, but springs up again of its own Sowing, Flowering the next year after its springing, or after the Seeding. This *Melilote* is very like the former, but has more Woody Stalks, rising up higher, greater, and with smaller green Leaves, smelling much like the former, but weaker. The Flowers grow also in long Spikes and more in Number, of a white color, and lesser also, which turn into small round Heads, and not crooked like the other.

V. *The third, or Italian Melilote.* Its Root is small long and Woody, perishing every year, and seldom rises again of its shed Seed, but must be new sown every Spring. It has seldom more than one Stalk rising from its Root, which quickly grows whitish and a little Woody, set here and there with three Leaves at a Joint, which are much larger than the former, and the end Leaf larger than the other two; something unevenly waved or cut in on the edges, of a smell almost as strong as the first, but somewhat more pleasant. At the tops of the Stalks grow many Flowers, spike fashion, but of a more deep yellow color, and something larger also than the first, which turn into round whitish Heads, greater than the last, which usually contain but one Seed or grain apiece.

VI. *The fourth, or Assyrian Melilot.* Its Root is Woody, and perishes every year, after it has given Seed. It rises up with several Stalks about two feet high, set with Joints: at every one of which grow three Leaves, something larger than those of the first, but not so large as those of the last or third described, and a little dented about the Edges. The Stalks spread themselves forth in Branches towards their tops, on which grow many pale yellow Flowers, set in order one above another, as in the former, which turn into small, long, and somewhat flat Cods, a little crooked or bending at the end like an Hawks Bill, in which is contained the Seed. The whole Plant, as well Flowers as Leaves and Seed, did smell very sweet at their first bringing out of *Afia*, or *Syria*, into *Europe*; but gradually, it grew every year weaker and weaker, so that as it seems, it has not now near half so good a smell as it had formerly. This Kind *Pena* says, is used in *Italy* instead of the true *Melilot* (which is the first described in this Chapter) for that there is great store of it growing in that Country.

VII. *The Places.* The first grows plentifully in *Germany*, and also is very common in most parts of *England*, as in the edge of *Suffolk*, and in *Essex* in divers places, also in *Huntington-shire*, *Cambridge-shire*, and the *Ile of Ely*; but most usually in *Corn-Fields*, in the corners of *Meadows*, and on plowed Lands ends, and in the *Furrows* of *Corn-Fields*, and sometime among the *Corn* it self: and certain it is, that it grows not more plentifully in

any part of the World, than in *England*, especially in the Counties aforementioned. It grows between *Sudbury* in *Suffolk*, and *Clare* in *Essex*, and from *Clare* to *Henningham*, and from thence to *Ovendon*, *Pulmare* and *Pedmarsh*, where many Acres of Ground are overgrown with the same, inasmuch, as that it becomes almost an annoyance both to the Land and *Corn*, generally overspreading that part of the Shire. The second grows not Wild with us, but is Nurled up in *Gardens*; in *Germany* it grows plentifully as the other does. The third grows in *Italy*. And the fourth in *Syria* about *Aleppo*, from whence it was brought to *Venice*, and these two last grow here also in *Gardens*, as the second does.

VIII. *The Times.* They all Flower in the Summer Months, in *June*, *July*, and *August*, and their Seed is ripe quickly after.

IX. *The Qualities.* It is hot and dry in the first Degree; Afringent, and Maturative; and yet withall Discussive, where Suppuration cannot be expected, also Traumatick or Vulnerary, Diuretick, Nephritick and Lithonriptick.

X. *The Specification.* It discusses Tumors, heals Wounds and Ulcers, provokes Urine, expels Stone and Gravel, and cleanses the Reins, Ureters and Bladder of Pituitous Humors and Tartarous Matter.

XI. *The Preparations.* You may have herefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decolion in Wine or Water. 4. A Vinegar. 5. An Insolated Oil. 6. An Emplaster simple. 7. An Emplaster Compound. 8. A Balsam. 9. A Cataplasm. 10. A Distilled Water.

The Virtues

XII. *The Liquid Juice.* It comforts the Stomach and Bowels, and is good to stop Fluxes of the Bowels. Dropt into the Eyes it is singular good against Pains and Inflammations there, and to take away Clouds, Films or Pannicles growing upon the Sight, and to strengthen the Eyes. And it is effectual to be given to those who are in fear of an Apoplexy, or have suddenly lost their Senses by a Paroxysm, to strengthen the Head and Brain, and restore the Memory, the Head being also externally bathed with the same. Dose 2 or 4 Spoonfuls in a Glass of Wine Morning and Night.

XIII. *The Essence.* It has all the Virtues of the Juice, and may be given from one to three Spoonfuls in some proper Vehicle. Dropt into the Ears it eases their Pains, and dropt into fore and running Eyes, it stops the Flux of Rheum. Applied to hard Tumors or Swellings, it discusses and softens them; and is profitably applied to simple Contusions.

XIV. *The Decolion in Wine or Water.* Bathed upon the Head it gives ease in the Head-ach: spreading Ulcers being washed therewith it cleanses and dries them. The Decolion of the Flowers with Camomil in Mutton Broth, and used Clyster-wise, expels Wind, and eases pains of the Belly. Made with Wine and Drank, it is good to strengthen the Memory.

XV. *The Vinegar.* It is admirably discussive, eases Pain and dissolves Tumours by bathing the part affected therewith: and so used, it comforts the Head, Brain, and Nerves: It dissolves Hardness, discusses Wind, and Tumors of the Spleen, Liver, Belly,

Belly, and Hypochonders, mightily easing the Pains of those Parts.

* XVI. *The Insolated Oil.* It mollifies hard Tumors and Inflammations, dissolves Swellings in the privy parts of Man, or Woman; it is a most Sovereign thing both for green Wounds, and old Sores, for Tumors, Cramps, Convulsions, Pains and Aches in any part of the Body, whatsoever, whether in the Muscular or Fleishy parts, or among the Nerves, Tendons, Veins, Arteries, &c. It is made of the Flowers and Herb with Oil Olive, *Insolated, or boiled in Balneo*, and then strained forth, repeating this with fresh Herbs and Flowers three times.

XVII. *The simple Emplaster.* It is thus made, Take green Melilot cut small 5 Pounds; pure Resin 8 Pounds; yellow Wax 4 Pounds; Sheeps suet 2 Pounds; Turpentine 1 Pound; mix, boil, strain out, and make an Emplaster according to Art. It ripens Tumors, breaks and cures them, draws, cleanses and heals Wounds admirably in any part of the Body; only be cautious of applying it to Wounds of the Legs, or other depending parts, for fear it should cause a flux of Humors, not easily to be diverted.

XVIII. *The Compound Emplaster.* Take Flowers of Melilot 6 Ounces: Camomil Flowers, Fenugreek Seed, Bay Berries, husked, Althæa Roots, Tops of Wormwood and Marjerom, of each 3 Drams: Seeds of Purshy, Bishops-weed and Carduus, Roots of Orrice, Cyperus and Spicknard, Cassia lignea, of each a Dram and half: Ammoniacum 10 Drams: Storax Calamita, Bdellium, of each 5 Drams: Turpentine an Ounce and half: Pulp of fat Figs, N° xij: Goats Suet, Resin, of each 2 Ounces and half: Wax 6 Ounces: Oils of Sweet Marjerom and Spicknard, of each 3 Ounces: Beat those things which are to be beaten; Extract those things which are to be extracted, as the Pulp of Figs, Althæa Roots, and Fenugreek, &c. Dissolve the Ammoniacum and Bdellium in Vinegar, &c. Then mix and make the Emplaster according to Art, adding the Oils of Sweet Marjerom and Spicknard, towards the end of the Operation. It is Maturative, Emollient and Anodyne, draws, cleanses and heals, strengthens the Stomach, Liver, Spleen, and Bowels, dissolves Wind and Tumors, helps Hypochondriack Melancholy, Vomiting, Indigestion, Rickets, &c.

XIX. *The Balsam.* It is made by boiling the green Herb bruised 2 Pounds, in Oil Olive 3 Pounds, to Crispness, then straining out, and renewing this Work three times: at length to every Pound of the strained Liquor add Bees Wax half a Pound: Chio Turpentine, Balsam Capivi, Gum Elemi Extracted, Balsam of Peru, of each 4 Ounces: mix and complete the Balsam. It heals green Wounds commonly at the first intention, and many times at one dressing: It digests eating Ulcers, cleanses putrid running Sores, incarnates, dries and heals; eases Pains in any parts, chiefly of the Nerves and Tendons, and cures the Gout, being fitly applied.

XX. *The Cataplasm.* It is made of the Flowers and Leaves boiled in Wine, and brought to a Consistency with Meals of Fenugreek and Lin Seed, or Barly Flower, or Poppy Seed beaten soft and small, or Yolks of Eggs boiled hard. It softens all hard Tumors and Inflammations in the Eyes, Nerves, Tendons, Muscles, &c. in any part of the Body, Fundament, Testicles, or private parts of Man or Woman; ripens and breaks Apotterns, stops the course of eating and spreading Ulcers, resists the putridity, digests and eases the Pain, &c.

XXI. *The Distilled Water.* It is made of the Herb and Flowers, by an Alembick with a naked

Fire, or in Balneo. Some use it as a Perfume: but mixt with an equal quantity of common Spirit of Wine, it makes a *Collyrium*, which dropt into the Eyes, cools, takes away Inflammations, and hot Rheums, clears the Sight, eases the Pain, and strengthens the part, thereby preventing any new or future Fluxion of Humors to the same.

C H A P. CCCCLXXXII.

Of MELON Garden:

OR,

P O M P I O N Garden.

I. *THE Names.* It is called in Greek, *Μέλον*; in Latine, *Pepo*; and in English, *Melon*, *Million*, and *Pompion*.

II. *The Kinds.* There are four principal sorts of this Plant, viz. 1. *Pepo Hortensis*, the Garden Melon or Pompion, of which in this Chapter. 2. *Pepo Sylvestris*, the Wild Melon, or Pompion, of which in Chap. 483. 3. *Melopepo*, *Melo moschatus*, the Musk Melon, of which in Chap. 484. 4. *Melo vel Pepo aquaticus*, *Citrullus*, the Citrull or Water Melon, of which in Chap. 485. following.

III. *The Kinds of the Garden Melon or Pompion.* There are these following Species, viz. 1. *Pepo maximus oblongus*, the great long Melon or Pompion. 2. *Pepo maximus rotundus*, the great round Melon or Pompion. 3. *Pepo maximus compressus*, the great flat bottomed Melon or Pompion. 4. *Pepo maximus clypeatus*, the great Buckler-like Melon or Pompion. 5. *Pepo minor*, five *Virginianus*, the smaller or Virginian Melon or Pompion, called also *Virginian Macock*.

The Descriptions.

IV. *The first, or Great long Melon or Pompion.* Its Root is of the bigness of a Mans Thumb, or larger, dispersed under Ground, with many small Fibres thereto adjoined. From this Root come forth thick and rough prickly Stalks or Branches, which creep upon the Ground, if nothing is near it to take hold of, otherwise with its clasping Tendrels, it climbs upon such things as are near to it, as Poles, Arbors, Pales, Hedges, Shrubs, &c. upon which great, ribbed, rough Branches, grow very large, rough Leaves, cut in on the edges with deep gashes, and dented also round about like a Saw, with many Claspers, which winde about every thing they meet withall. The Flowers are

are great and large, hollow and yellow, like unto a Bell Cup, divided in the brim into five parts or points standing out like Teeth. At the bottom of which, (as is in all the rest) grows up the Fruit, which is very great, thick, round, and long, or of an Oval form, sometimes of the bigness of an ordinary Mans Body, set round with bunched Ribs in some, and more plain and flat in others. The Rinde is either of a green, or grey, or yellow color, or whitish, or partly colored, as Nature is pleased to vary it, and of a mean hardness. The harder pulp of the Fruit is yellowish, or of a whitish yellow, and of a flatulent taste: but the thinner pulp within that, lying in the middle, is of a Slimy, Fibrous, and Watery Substance, in which the Seed is contained, which is white, large, broad, flat, thin, and almost Oval, but somewhat narrower pointed at one end, and of a sweet or Milky, Nut-like taste.

V. *The second, or Great round Melon or Pompon.* This is like unto the former, in its Root, Stalks, Branches, Leaves, and Clasping Tendrils; but the gashes in the Leaves are not so deep, and the Stalks are tenderer. The Flowers are in like

M C L O N Great Round.

manner yellow, gaping, cornered or pointed at the top, as those of the former; but the Fruit is something rounder, sometimes greater, and sometimes lesser, and often times of a green color, with an harder Bark, and sometimes now and then softer and whiter. The harder pulp within is like the other, and the Seeds have also the same form, with very little difference in their magnitude.

VI. *The third, or Great flat bottomed Melon or Pompon.* This differs not much from the other two in its Root, rough Stalks, or Branches, and in its gashed or dented Leaves. The Flower is also great and yellow, like those of the others; but the Fruit (which is of a great bigness) is com-

pressed or flat bottom'd, and its Rinde is full of little, hilly Whelks, not much unlike to those of the *Citron* Rinde or Peel, which when it is ripe, is in like manner, yellow.

VII. *The fourth, or Great Buckler-like Melon, or Pompon.* This very much differs from the others in form: the Roots, Stalks, Leaves, and Flowers, are much like the others; but the Fruit is not long nor globular, but altogether broad, and in a manner flat, like unto a Shield or Buckler, thicker in the middle, but thinner in the circumference, and curled, hilled, or bunched, up and down about the edges, like the rugged or uneven Peel of the *Citron*: and this Rinde is very soft, thin and white. The solid pulp within, is hard and durable, and the Seed in form, color, and taste, like the former Kinds, but somewhat less.

VIII. *The fifth, or Smaller or Virginian Melon or Pompon.* Its Root consists of many whitish Branches, creeping far abroad in the Earth, which perish at the first approach of Winter. From whence spring up rough cornered or straked Branches, trailing upon the Ground; 8 or 9 feet long or longer, which spread themselves and run upon the surface of the Earth, and are again divided into other Branches of a blackish green color, covering and taking up a great deal of room, sending forth broad, cornered rough Leaves, on great, gross, long, rough, hairy foot Stalks; like and full as large as the Leaves of the first or common *Melon* or *Pompon*; with clasping tendrils, and great, broad, shriveled, yellow Flowers, like to those of the common *Pompon*. After them comes the Fruit, upon the Stalks, not commonly so near the Root, but towards the tops or ends of the Branches; something round, and not extending in length, but flat like a Bowle, and not so big as an ordinary Bowle, being seldom above 3 Inches in thickness or length, and 4 Inches in breadth; of a blackish green color when it is ripe. The eatable pulp is of a whitish yellow color, containing within that, a great deal of a thinner, soft, slimy, fibrous Substance, in which the Seed lyes in certain rows, like that of the first or common *Pompon*, but much smaller.

IX. *The Places.* These are all planted in Gardens in England, and other Countries, and delight in a rich and fruitful Soil, and even in our Country, they come to great perfection.

X. *The Times.* They are planted in the latter end of March, or the beginning of April: Flower in the latter end of July, and August, and their Fruit is ripe in September and October.

XI. *The Qualities.* The Fruit (which is that which is chiefly made use of) is cold and moist in the second Degree; Absterfive, Anodyn, Diuretick, Lenitive, Nephritick, and Lithontriptick.

XII. *The Preparations.* You may have herefrom. 1. A Liquid Juice of the Fruit. 2. The Pulp of the Fruit. 3. An Emulsion of the Seed. 4. A Cataplasm of the Pulp. 5. A Distilled Water of the Fruit.

The Virtues.

XIII. *The Liquid Juice.* Given from a Spoonful to two, in the Distilled Water, and sweetned with Syrup of Clove-Gilliflowers, it quenches Thirst, abates the violent heat of Burning Fevers, allays the heat and inflammation of the Stomach and other

U u u u 2

Bowels,

Bowels, prevails against the Scurvy in a hot habit of Body, provokes Urine, and gives ease in the Stone and Strangury, being taken Morning and Night. It is also good against Vapors, and a *Platus*, proceeding from the Spleen or Distemper of the Hypochonders.

XIV. *The Pulp of the Fruit.* It is never eaten raw but boiled, for so it more easily descends, and by its lenitive property, makes the Belly Soluble. It has all the Virtues of the *Liquid Juice*, and being drest with Butter, Pepper, Salt, and Vinegar, it may be eaten in quantity, according to pleasure: it nourishes not much, but being boild in Milk, and eaten as aforesaid, it makes a good and wholesome Food, cooling and grateful to a hot Stomach, and inward parts which are inflamed. The same Pulp sliced, and fried in a Pan with Butter, is also good and wholesome: but Baked in an Oven with Apples, it is very flatulent or windy; unless it be so often Baked, or in such a violent hot Oven, that the Pulp becomes red, then it looses its windy property, and becomes very wholesome, with an Emollient and cooling property.

XV. *The Emulsion of the Seed.* It has the Virtues of the *Liquid Juice of the Fruit*, but cleanses the Reins and Bladder much more, and more powerfully provokes Urine, being very good for such as are troubled with the Stone in the Reins: It is an excellent thing against the Strangury, takes away the heat and scalding of the Urine, and cures the pissing of Blood.

XVI. *The Cataplasim of the Pulp.* Applied to pained Joints, and parts affected with the Gout it gives ease, and discusses the Humor, abating the heat. It is good against Inflammations, and discusses simple contusions being immediately applied to them. It also gives ease in the vehement pain of the Head, proceeding from heat and Inflammation, and takes away the Inflammation and Blood-heat of the Eyes.

XVII. *The Distilled Water.* It is good against an Erysipelas by bathing the parts affected often therewith, and applying Linnen Cloths four or six times double thereupon, wet in the same. Taken inwardly, it has the Virtues of the *Liquid Juice of the Fruit*, and *Emulsion of the Seed*, and may serve as a Vehicle, for conveying other Medicaments in, appropriated to the Reins and Bladder: mixed in equal quantities, with a Spirit drawn from Sugar, it makes an incomparable Eye water, to ease the pain of the Eyes, stop Rheums and Defluxions, take away Inflammations and Blood-heat, to heal Ulcers and Sores therein, clear the Sight, and strengthen the part against any future Defluxions.

C H A P. CCCCLXXXIII.

of MELON -- WILD.

O R,

POMPION -- WILD.

I. **T**HE Names. It is called in *Greek*, *Πίπυρος ἄγριος*; in *Latine*, *Melo vel Pepo Sylvestris*: and in *English*, *Wild Melon or Pom-pion*.

II. *The Kinds.* There are two sorts of this Plant, viz. *Melo vel Pepo Sylvestris major*, The Greater Wild Melon or Pom-pion. 2. *Melo vel Pepo Sylvestris minor*, The Lesser Wild Melon or Pom-pion.

The Descriptions.

III. *The first, or Greater Wild Melon or Pom-pion.* It has a Root which is thick, round, and sharp pointed, having several Fibres adjoining to it. From which come forth rough, uneven Stalks, set with sharp, thorny Prickles: The Leaves are also rough, and jagged or much cut in on the edges, of an unpleasant green color, and the Flowers are of a yellow color, much like those of the Garden Kind. The Fruit is thick, round, and long, almost of an Oval fashion, sharp pointed, and having a hard green Rind, whose first Pulp or Meat is hard like the others: but the middle Pulp soft and slimy, in which is contained the Seed, which is like that of the Garden Pom-pion, but the whole very bitter in taste.

IV. *The second, or Lesser Wild Melon or Pom-pion.* This in its Root, Stalks, Branches, Leaves, Flowers, Fruit, Seed, and manner of growing, is very like the former but now described, and differs from it only in its Magnitude, this being every ways much less than it.

V. *The Places.* These Plants grow Wild in *Barbary*, and most parts of the *West-Indies*, but with us in *England*, they only grow (being Sown) in Gardens.

VI. *The Times.* They spring up, and Flower in the same Seasons, with those of the Garden Kinds.

VII. *The Qualities.* These Melons are hot and dry in the third Degree, and are very bitter: they are also Absterive, Hysterick, and Cathartick.

VIII. *The Specification.* They are peculiar for the curing of Dropsies and the Kings Evil: and to provoke the Terms in Women.

IX. *The Preparations and Virtues.* of these Wild Melons or Pom-pions, are the same with those of the Wild Cucumber, in Chap. 479. & Sect. 9, ad 27. where you may have abundant satisfaction.

X. *Nota,*

X. *Nota.* If into the Shell or Rind (after the Pulp or Substance of the Seed is taken forth) you put in White Port or Lisbon Wine, and it let remain therein so long, till it becomes bitter, it admirably purge the Belly, and will educe Pituitous, Cholerick, and Watery Humors, and carry off the the Morbifick cause of the *Dropsy Sarcites*, or *Anasarca*, as also of the Kings Evil and the Gout.

XI. *The Inspissate Juice of the Fruit.* It has the same Operation with that of *Elaterium*, or *Inspissate Juice*, or *fecula* of the *Wild Cucumber*; and may be very well used in place thereof, for all those Diseases to which the *Elaterium* is applied; but I am apt to believe it must be given in a larger Dose, *viz.* in full the Double quantity.

CHAP. CCCCLXXXIV.

OF MELON -- MUSK.

I. **T**HE Names. It is called in Greek, *Μήλον*; (which signifies an Apple; and therefore some Authors have called it) *Μηλομήλον*, *Melopeon*: (or *Pepon* smelling like an Apple;) in Latine, *Melo*, *Melopepo*, *Melo moschatum*, and *Melo Muscatellinum*: in English, *Musk Melon*.

II. *The Kinds.* Authors make four Species of this Plant, to which we shall add a fifth, growing in America, *viz.* 1. *Melo*, vel *Melopepo vulgaris*, Our Common Musk-Melon. 2. *Melo Hispanicum*, the Spanish Musk-Melon. 3. *Melo Pyramiformis*, the Pear-fashon'd Musk-Melon. 4. *Melo Saccharinum*, the Sugar Musk-Melon. 5. *Melo Americanum*, vel *Floridianum*, *Melo Carolinianum*, vel *Virginianum*, the American or Carolinian Musk-Melon.

The Descriptions.

III. *The first, or Our Common Musk Melon.* It has a long Root with many Fibres at it, running not very deep into the Earth, but in a great measure under the upper crust of the Ground. From this Root shoot forth Stalks, Branches and Leaves, much resembling those of the *Cucumber*, both in the manner of growing, and in its trailing Branches, which are rough, with rough uneven Leaves, with yellow Flowers: after which come the Fruit, which is rounder, thicker, bigger, and rugged, than any *Cucumber*; and spotted on the out side, of a russet color, and green underneath, which when it comes to be full ripe, will change a little yellowish, being deep furrowed and ribbed, and sometimes without Ribs, and having many times chaps and rifts in some places of the Rind. The inward hard Pulp, is yellow, and of a pretty fast or solid Substance, and is only eaten: The Pulp

MUSK - MELON.

within that, is very soft, slimy, and watery, and of a pretty deep yellow color, in which is contained the Seed, which is something larger and yellower than that of the *Cucumber*. The Fruit coming to be of a strong sweet smell, and changing its color, either to yellowness, or a green yellow, shews its coming to ripeness: but it requires much watering in the hot time of the day, to induce its sooner ripening.

IV. *Gerard* has this Description of it. It is like to the Common *Cucumber* in its Stalks, lying flat upon the Ground, long, Branched and rough. The Leaves are much alike, but lesser, rounder, and not so cornered. The Flowers in like manner are yellow. The Fruit is bigger (than the *Cucumber*;) at first something hairy, something long, and somewhat round, often times greater, and many times lesser. The Bark or Rind is of an over-grown russet green color, ribbed and furrowed very deeply, having chaps or Chinks, and a confused roughness. The Pulp which is to be eaten is of a faint yellow color, the middle part of which is of a slimy moisture, in which is contained the Seed, much like to that of the *Cucumber*, and of a browner color.

V. *The second, or Spanish Musk-Melon.* It has from its Root which is like the former, long trailing Branches, on which grow broad Leaves, slightly indented about the edges, not divided at all as are all the rest of the Melons. The Fruit is large for the most part, and grow near unto the Stalk, like unto the Common Garden Melon or *Pompion*, very long, not crested or furrowed at all, but spotted with very many such marks or spots as are on the back side of the *Harts-tongue* Leaf. The Pulps (both the firmer and the softer) as also the Seed, are much like the former.

VI. *The third, or Pear fashioned Musk-Melon.* It has many long Viney Branches, upon which grow cornered Leaves, like those of the Vine; as also great

great store of long Tendrels, clasping and climbing, and taking hold almost of any thing they touch. The Fruit grows upon slender foot Stalks, and is fashioned something like a Pear, and of the largeness of a very great Quince.

VII. *The fourth, or Sugar Musk-Melon.* It has long trailing Stalks or Branches, lying upon the Ground, on which grow small clasping Tendrels, like those of the Vine; and also Leaves like unto the Common Cucumber, but of a greener color: the Fruit comes forth among those Leaves, growing upon slender foot Stalks, and round as a *Colequintida Apple*, and of the same bigness, being of a most pleasant taste like Sugar, from whence it took its Epithite or Sir-Name.

VIII. *The fifth, or American, or Carolinian Musk-Melon.* It differs but very little from the first described in this Chapter, neither in its Root, Stalks, Branches, Leaves, nor Flowers, nor in its form or manner of growing, saving that the Plant is in all its parts much bigger. The Fruit is big, round ribbed; and very large, sometimes as large as *Our Great Common Garden Pumpions*, and almost of the same shape, both of the first long Kind, and of the second round Kind, saving in the ribbing hereof, and when it is ripe, it is in its Kind of a whitish yellow color, and of the thickness of *Our Common Pompon*. The more solid Pulp, as also the soft slimy, and the Seeds contained therein are like for substance and color, to the first here described, and very pleasant in taste: but the Seed is larger.

IX. *The Places.* They delight to grow in hot Countries, as *Spain, Italy, Africa*, the Coasts of *Barbary and Egypt*, in several parts of *Asia*, and the *East and West Indies*, yet they thrive and come to perfection here in *England*, being husbanded with Care: and the last grows plentifully in *Carolina*, an *English Settlement in America*, and in other parts of that Continent.

X. *The Times.* They are sown in the latter end of *March*, and in *April*; and their Fruit is ripe in *August*, from the beginning of the Month to the end thereof.

XI. *The Qualities.* The Fruit and Seed are cold and moist in the second Degree; cleansing, and very grateful and refreshing to the Stomach and other Bowels.

XII. *The Specification.* The Fruit and Seed cool in Fevers, and admirably represse Lust.

XIII. *The Preparations.* You may have therefrom, 1. *The more solid Pulp.* 2. *A Liquid Juice of the Fruit.* 3. *An Emulsion of the Seed.* 4. *A Distilled Water of the Fruit.*

The Virtues.

XIV. *The Liquid Juice of the Fruit.* Given from one Spoonful to two mixt with some of the *Distilled Water*, and sweetned with *Syrup of Clove-Gilliflowers*, or of *Violets*; it cools and takes away the heat of Burning Fevers, and by repeating it at due distances of time cures it: it also much abates Lust, and takes away the Potency of Generation.

XV. *The more solid Pulp of the Fruit.* It is used to be eaten as a Saller, the outward Rind being first pared off pretty thick, and also being freed from the inward soft slimy matter: It is then sliced and eaten raw with Pepper and Salt, and by some with Sugar only; by which way, it very much cools and refreshes the Stomach, more especially if a Glass of Wine be drank after it.

XVI. *The Emulsion of the Seed.* It cures the hot burning fits of Fevers, quenches Thirst, cools the Stomach and Bowels; loosens the Belly, clears the Reins, Ureters and Bladder, provokes Urine, eases the Strangury, takes away the heat and scalding of Urine, helps such as make bloody Water, and represse Lust, (being long used) after a singular manner.

XVII. *The Distilled Water.* It has all the Virtues of the *Liquid Juice of the Fruit*, and of the *Emulsion of the Seed*: and may be taken from four to six or eight Ounces sweetned with some proper Syrup. Used as a Topick, it cools Inflammations, helps blood-shot and sore Rheumatick Eyes; and clears, softens, and whitens the Skin, removing Scabs, Itching, Scurf, Morpew, black and blew Spots, Tanning, Sunburning, and other defecations thereof: and this more especially if a little Juice of Limons, or very sharp white Wine Vinegar, be mixed with it, (but is not then to be used to the Eyes.)

C H A P. CCCCLXXXV.

Of MELON--WATER:

O R,

C I T R U L.

I. *THE Names.* It is called in *Arabick*, *Batec*, & *Batecha*: of the *Aegyptians*, *Chate*, *Abdolawi*, *Chajar*, and is thought to be the *Dalbaba Serapionis*: in *Greek* by *Aëtius* (who first Named it in that Language) *Ἀγγέων*, or *Ἀγγέια*, (which with the *Greeks* did sometimes signifie a Cucumber.) In *Latine*, *Anguria*, *Citrulus*, & *Citrullus*, a *Citreo colore* & forma: also by some *Cucumis Citrullus*, to distinguish it from the *Cucumber*: in *English*, *Water Melon*, and *Citrul*, or *Turky Melon*.

II. *The Kinds.* There are several sorts of this Plant, but the three following are chief, viz. 1. *Anguria sive Citrullus vulgarior*, The Common Citrul, Water Melon, or Turkey Melon. 2. *Anguria Americana*, *Citrullus Floridianus*, *Citrullum Carolinianum*, The American or Carolinian Water Melon, or Citrul. 3. *Anguria Aegyptiaca*, the Egyptian Citrul or Water Melon.

The Descriptions.

III. *The first, or Common Citrul, Water Melon, or Turkey Melon.* The Root spreads under the Ground, with several Ramifications and Fibres or Threads adjoining to them, and dies every year as the rest do. In its form and manner of growing, it is like other Melons and Cucumbers, trailing and lying upon the Earth, with its Vine-like Branches: the

the Leaves of which are hairy, longer, and narrower than in any other, and more divided into several parts, having small Claspers and yellow Flowers: but the Fruit is greater than a *Musk-Melon*, and something near the fashion of a *Pompon*, with a smooth greenish Bark or Rind, which will grow yellowish in

Turkey Water Melons: or, Citruls.

time, having some ribs thereon. The Pulp or inward Substance is watrish, in some sweet, in others a little tart, or acid, but in the whole very pleasant and delectable to the Taste. The Seed is contained therein, and is smaller, rounder, blacker, and harder Shell'd, than that of the Ground.

IV. *The second, or American, or Carolinian Water-Melon or Citrul.* Its Root is like the former, and the whole Plant varies but little from it in its Stalks, Branches, Leaves, Flowers, and manner of Growing: But the chiefest difference is in the Fruit, which is as great as a middle siz'd Melon or Pompon, some of which are a Foot or sixteen Inches long, and thick in proportion to that length, having a discolored Rind, variably spotted and striped with white spots upon the green; the inner Pulp of which in some is white, in some reddish, and in some almost a purplish color, very watrish, and of a most pleasant and delectable Taste; but tho' it is watrish, yet it is of firmer Substance than the former, and will keep after it is ripe for some small time. The Seed within this is like the other, but longer, greater, redder or browner, and more smooth or shining.

Citruls: or, Water-Melons American.

V. *The third, or Egyptian Citrul or Water-Melon.* This in its Roots, Stalks, Branches, Leaves, and Flowers, differs but little from the former, but its Fruit is much larger than those. For some of these are so great, as *Bellonius* says, that about six of them will load a Camel, and one or two of them a Man: the outward Rind is yellow, the inner Meat or Substance very little and almost empty, filled in the middle with much Water which is very sweet, and much distilled and drank by the People of the places where this Fruit grows; with which some mix *Damask Rose Water*, others *Musk* and *Ambergrise* to perfume it, and offer it as a great thing, for the Entertaining of their Friends: The Seed is not in great quantity, but smaller than the Seed of the former, in other things there is but little difference.

VI. *The Places.* The first grows throughout Turkey, and in all Italy, as also in Spain, the West-Indies, and other hot Countries. The second grows peculiarly in America or the West-Indies; and in a very great plenty in Carolina, both North and South. And in Virginia, and other places of the Floridian Continent. The third is a Native of Egypt, as *Prosper Alpinus* says in his Book of Egyptian Plants, and *Bellonius* in his Observations, Lib. 2. Chap. 75.

VII. *The Times.* They all are Planted of the Seed in the Spring time, viz. in March and April, and Flower in June and July, and the Fruit is ripe in August, or about the same time in which the others are ripe.

VIII. *The Qualities.* The Fruit and Seed, are cold and moist in the second Degree: The Seeds being reckoned one of the four cold Seeds. They are Absterfive, Diuretick, Nephritick and Antisebricitick, even beyond all the other sorts of Melons.

IX. *The*

IX. *The Specification.* They abate the heat of Fevers, strengthen the Stomach, refresh the whole Body, and help the Strangury, sharpness, heat and scalding of the Urine, &c.

X. *The Preparations.* You may have therefrom, 1. *The Pulp, or Sallet.* 2. *The Liquid Juice.* 3. *An Emulsion of the Seed.* 4. *A Distilled Water from the Fruit.*

The Virtues.

XI. *The Pulp of the Fruit, or Sallet.* It is usually eaten raw, being pared from the Rind and cut into slices, or pieces. It cools and refrigerates admirably, quenches thirst, refreshes the Spirits, abates the heat of the most burning and malign Fevers, cleanses the Bowels, provokes Urine, takes away the heat and scalding thereof, and gives ease in the Strangury. People in the *West-Indies*, eat of this Fruit very liberally, and tho' even without measure, (because of its pleasantness) yet it has never been known once to Surfeit: it is good for hot, dry, and wasted Bodies, and such as are grown feeble and weak by long Sickness, and the intense heat of Fevers.

XII. *The Juice of the Fruit.* It may be drank plentifully, and has all the Virtues of the *Pulp* afore enumerated; it prevails wonderfully against the hot intemperature of the Stomach, Liver, Spleen, Reins, Womb, and Blood, quenches thirst, and takes away the dryness and roughness of the Throat and Tongue.

XIII. *The Emulsion of the Seed.* It takes away the Febrile Dittemper of the Blood: it gives ease in the Strangury, abates the heat and scalding of the Urine, and cures Pissing of Blood: and represses Lust, (being used for some time) in an admirable manner. It has been given also with good success in a Virulent *Gonorrhoea*, for it cleanses the Ulcer, eases the pain, and induces the healing.

XIV. *The Distilled Water from the Fruit.* It is used as a Colmetick, and so it is in an especial manner, being mixed with *Juice of Lemons*, or choice *Vinegar*: and Inwardly taken, it abates the heat of all sorts of Fevers, and has the Virtues of the *Juice of the Fruit*, but in a weaker Degree: mixt with *Spirit of Wine* in an equal proportion, it is an excellent thing for Cloudy, Dim, Weak, Sore, and Rheumatick Eyes, it strengthens the part, removes the matter afflicting, and stops the defluxion.

C H A P. CCCCLXXXVI.

OF MERCURY Herb English:

O R,

GOOD -- HENRY.

1. **T**HE Names. It has no Greek Name that I know of, but it is called in *Latine*, *Bonus Henricus*, and in *English*, *Good Henry*, also *Herb-Mercury*: which to distinguish from other *Herb-Mercuries*, we call it *English Herb-Mercury*.

II. *The Kinds.* Of *Herb-Mercuries* there are three especial sorts, viz. 1. *Mercurialis Anglica*, *English Herb-Mercury*: of which in this Chapter. 2. *Mercurialis Gallica*, *French Herb-Mercury*, of which in Chap. 487. 3. *Mercurialis Sylvestris*, *Wild Herb-Mercury*, of which in Chap. 488. following.

III. *The Kinds of English Herb-Mercury.* It is a Plant of a Singular Species, and not at all referable to the *Mercuries*, tho' it has obtained that *English Name*, some Authors account it a Species of the *Wild Arches*: others a Species of the *Lapatha* or *Docks*: I am of a contrary opinion to both those, and think it a singular Plant of its own Kind. But from those Opinions and conceptions of what Kind it may be, it has obtained several Conformable Names; as, *Rumex undulosus Tragi*; *Rumicis genus Euehsij*; *Lapatha Sylvestris secundum genus Dalechampij*; *Atriplicis species Gesneri*; *Atriplex canina Sylvestris Loniceri*; *Lapathum undulosum Bauhini*; *Tota bona Dodonaei & Lobelij*; & *Bonus Henricus Matthioli*, *Brunfelsij*, *Tragi* & aliorum: with us in *England*, *English Herb-Mercury*, and *Good Henry*.

The Descriptions.

IV. It has a great, thick, and long Root, spreading out into many parts or divisions, and of a yellow color within like the sharp pointed Dock. From this Root spring forth several thick, flat, broad, and long, dark green Leaves, upon long foot Stalks, pointed at the ends, and double pointed at the bottoms, in shape something like to *Aron*, or *Wake Robin*, or to the Leaves of *Meadow Sorrel*, but very much larger. From among these Leaves spring forth several thick, flat, green Stalks about two feet high, full or thick set with Leaves like the former, but growing less as they approach towards the tops. On the Branches, and their several Tops or Heads grow as many spiked Heads of Flowers of a greenish color, growing in clusters, and thick set together: in which is contained the Seed, which is flat, and much like that of the *Arch*. The whole Plant is soft in feeling, and often times overspread with

English Herb Mercury.

with a greyish or whitish green Dust, as if it was covered with a fine Meal, like unto *Arach.* for which reason, it is, as I suppose, that some have accounted it a Species or Kind of that Plant.

V. *The Places.* It is commonly found growing in untill'd Land, by Hedge sides in *Orchards* and *Gardens*, and Ditch sides in some *Pasture Grounds*, and among Rubbish, near common Ways, old Walls, Pales, and other like places, in most Counties of *England*.

VI. *The Times.* It Flowers in *June* and *July*, and the Seed is ripe in *July* and *August*, or some little time after.

VII. *The Qualities.* It is Temperate in respect of heat or coldness, dryness or moisture; Absterfve or Cleansing, and Emollient or Loosening, by reason of its Earthen and slippery-ness.

VIII. *The Specification.* It heals Green Wounds, and cleanses and cures old and putrid Ulcers.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice of the Herb or Root. 2. A Cataplasim of the Herb or Root. 3. An Ointment or Balsam. 4. A Sallet.

The Virtues.

X. *The Liquid Juice.* Mixed 3 or 4 Spoonfuls of it with as much, or half as much *Hony*, and given inwardly, it loosens the Belly and Purges away Cold, glassy and slimy Humors; it

opens obstructions of the Lungs, and is good against Coughs, Colds, Wheezing, shortness of Breath, difficulty of Breathing, and Ulcers of the Lungs: but then the *Hony* ought to be clarified, and mixt in equal quantities with it: and so applyed to Green Wounds it heals them: and digests, cleanses, incarnates, and dries up old and rotten Ulcers.

XI. *The Cataplasim.* Applyed to Green Wounds or simple Contusions it quickly cures them: and applyed to old and running Sores, it resists the Putridity, cleanses them, and afterwards wonderfully consolidates and heals them.

XII. *The Ointment or Balsam.* It is a singular good Vulnerary, healing simple Green Wounds at a few times Dressing: and if they are Compos'd or Complicate, it causes Digestion in a very short time, then cleanses, incarnates and heals them. It heals also old Ulcers and Fistula's, Kited Heels, and other Distempers of like Kind: and applyed to the Gout from what cause soever, whether hot or cold, it eases the Pain and cures it.

XIII. *The Sallet.* It is made of the Herb, being Boiled in Water, or in Broth, made of Fat Pork, or Bacon, or Fat Beef, or Veal, being dress'd up with Butter, Vinegar and Pepper, and so eaten, it makes the Belly soluble, and cleanses the Pituitous Humors.

C H A P. CCCCLXXXVII.

Of MERCURY Herb French.

I. *THE Names.* It is called in Greek, *Λινωσσίς*, *Linossitis*, & *Ἑρμῆς ὅτιον*, & *Ἑρμῆς ὅτιον*, *Mercurij Herba*: also *Παρθενιον*, *Parthenion*, (but not truly:) in *Latine*, *Mercurialis*: and in *English*, *Herb-Mercury*, and *French Herb-Mercury*.

II. *The Kinds.* There are two principal Kinds hereof, viz. I. *Mercurialis vulgaris*, vel *Hortensis*, The Common or Garden French Mercury, which is twofold, viz. 1. *Mercurialis vulgaris Mas*, The Common Male French Mercury. 2. *Mercurialis vulgaris Femina*, The Common Female French Mercury. II. *Φυλλόν*, *Phyllum*, & *Ἐλαίφυλλον*, *Elæophyllum*, quasi *Olæosolum*: in *Latine*, *Phyllum*, and in *English*, *Childs Mercury*; and this is twofold, viz. 3. *Φυλλόν ὁρθόγονον*, *Phyllum thelygonon*, Diosc. lib. 3. *Phyllum feminificum*, vel *feminiparum*, *Phyllum Spicatum Bauhini*, Female Childs Mercury. 4. *Φυλλόν ἑσπερίογονον*, *Phyllum Arrhenogonon*, *Phyllum Testicularium Bauhini*, *Phyllum Marificum*, & *Mariparum*, The Male Childs Mercury. Of all which in order.

The Descriptions.

III. *The first, or Common Male French Mercury.* It has a long slender Root, very well furnished with a Bush, as it were, of long and small Fibres: Which sends up a square green Stalk full of Joints, about two feet high more or less, with two Leaves at every Joint, and Branching likewise from both sides of the Stalks, set

HERCVRY Male.

with fresh green Leaves, something broad and long, like unto the Leaves of *Pellitory of the Wall*, but lesser, and much about the bigness of the Leaves of *Basil*, finely dented about the edges. Towards the tops of the Stalks and Branches at every Joint come forth, (in this *Male Kind*) two small, round, green Heads, standing together upon a short foot Stalk, which growing ripe are the Seed, not having any Flower that ever we could see.

IV. *The second, or Common Female French Mercury.* This in its Roots, Stalks, Branches, Leaves, and manner of growing is so like the former, that it is not to be distinguished from it, but by its Flower and Seed. All Authors agree, that this Plant as well as that before Described, both rise from the Seed of one and the same Plant, as the several sorts of *Hemp* do; and they both are so like one to another, that if it was not for the Flowers and Seed which shew the difference, they could not be distinguished one from another. In this *Female* the foot Stalk of the Seed is longer, Spike fashion, and set round about

with small green Husks, which are the Flowers, and are made up in form, like small Branches of *Grapes*, which give no Seed that ever we could finde, but abide in that manner a great while upon the Stalks without thedding. The

HERCVRY Female.

Roots both of the Male and Female perish every Year at the first approach of *Winter*, and spring up again of their own Sowing. Where once they are suffered to Sow their Seed, the Ground will never want them afterwards, even of both sorts, so admirably they encrease.

V. *The third, or Female Childs Mercury.* Its Root is white, hard, and Woody, of the bigness and length of ones Finger, perishing every Year, and rising again from its own Seed, or the Seed of the Male Kind, in the Natural places. From this Root rises up a branched square Stalk, full of Joints and Branches, but weaker than those of the Male following, and more full of Leaves, higher also, and more bushy; at the Joints always stand two soft woolly Leaves, somewhat longer, and narrower, than in the former Common Kinds, and not dented (or but very seldom) about the edges, of an Acid and Salty taste: at the Joints of this Female come forth long foot Stalks, of Seeds and Flowers, which are longer than those of the Male Kind following. These Flowers which are in a cluster as it were, are small, pale, and Mossy; rarely bearing any Seed, but when they do, it is contained in little round Heads, and is small, and round like the Male Kind, sometimes two, and sometimes three or more, growing in a Cluster together. This and the Male has a stronger smell and taste, than any of the other *Mercuries*.

VI. The

Childrens M R C O R Y.

VI. *The fourth, or Male Childs Mercury.* This in its Roots, Stalks, Branches, Leaves, and manner of Growing, is so like the Female just now described, that it is difficult to distinguish them asunder, but by their Flowers and Seeds. At the Joins of this Male Kind come forth short foot Stalks, bearing at their tops two small round Seeds, like to those of the first Common Male Mercury, and without giving any Flowers like that also; which Seeds are of an Ash color, before they be perfectly ripe: but when they come to ripeness, they become of a blewish aspect, and not much unlike to Spurge Seed, growing as they do, two and two together: the Leaves are not much unlike the Leaves of the Olive Tree, covered over with a soft Down or Wool, and of a gray color. Some Authors will have that these Childrens Mercuries Male and Female, are the same with the first Common French Mercuries Male and Female, only differing as they grow in a differing Climate: but if they do but consider only the forms of the Leaves of each, and compare them (not taking notice of the Seed) they may be easily convinced in their own understandings of the contrary.

VII. *The Places.* The two first Kinds are found growing Wild in France, as also in several parts of England, as very plentifully by a Village called Brookland in Romney Marsh in Kent: it grows also in Vineyards, Orchards, and other shady places, Gerard found it under the dropping of the Bishops House at Rochester; and are generally Sown with us in Kitchen Gardens among Pot-Herbs. The two last grow about Montpellier in France, as also in Spain and Italy, but with us only in Gardens.

VIII. *The Times.* They all Flower in hot Countries in June, July, and August; and give

their Seed in some little time after: But the two latter Flower so late here in our Country, that they scarcely bear ripe Seed.

IX. *The Qualities.* Herb Mercury is hot and dry in the second Degree: Absterfive, Digestive, Hysterick, and a little Cathartick.

X. *The Specification.* Matthiolus makes it a Specifick against the Yellow Jaundice. It Provokes the Terms, eases the Strangury, and prevails against Scabs, Tettars, Ringworms, and other like Deformities.

XI. *The Preparations.* You may have herefrom, 1. A Liquid Juice of the Leaves. 2. A Decoction of the same. 3. A Powder of the Seed. 4. A Lotion. 5. A Cataplasim. 6. A Clyster. 7. A Distilled Water of the Herb.

The Virtues.

XII. *The Liquid Juice.* Taken to 4. or 5 Ounces in Broth or Drink, sweetned with a little Sugar, it purges Cholerick and Waterish Humors. Hippocrates commends it wonderfully for Womens Diseases; and he applied it to the Womb, to ease the Pains of the Mother: and he gave it to provoke the Couries in Women, and to expel the After-birth. He dropt the Juice into Sore and Watering Eyes, and applied it for Deafness and Pains in the Ears. It is good against Agues, and cleanses the Breast and Lungs of Flegm, but with some little Offence to the Stomach. Snuffed up the Nostrials, it purges the Head, Brain, and Eyes of cold, sharp, and salt Rheums afflicting them, and is very good against Catarrhs which fall upon the Lungs. Bathed upon Warts, it is said to take them away.

XIII. *The Decoction in Water, or Mutton or Veal Broth.* It has all the Virtues of the Juice afore declared, but much weaker, and therefore may be given to 8 Ounces or more: If it is made with Myrrh, and Pepper, it is good against the Strangury, and other Diseases of the Reins and Bladder. It purges also the Stomach and Bowels, of gross Humors, but more weakly than the Juice. And used as an Errhine, it purges the Head, Brain, Eyes, &c.

XIV. *The Powder of the Seed.* It may be given to a Dram, or a Dram and a half, either in the Decoction, or Distilled Water, and so it helps the Yellow Jaundice. The Seed of both Male and Female, boiled in Water or Wine with Wormwood, and the Decoction drank, is said to cure the Jaundice perfectly, in a most admirable manner, and that in a very little time.

XV. *The Lotion.* It is made of the Liquid Juice mixt with Vinegar. Being applied to Scabs, Itch, Tettars, Ringworms, and other like breakings out in the Skin, it cures them.

XVI. *The Cataplasim of the Leaves.* Applied to Warts it takes them away, as also other Defecations of the Cutis. It is Digestive, being applied to Tumors or Swellings in any part; it is also Discussive, (where the Swelling will not come to suppuration) and will spend the Humor which is the cause of the Tumor, and allay the Inflammation, by cooling and easing the Pain.

XVII. *The Clyster.* It is made of the Liquid Juice, and of the Decoction of the Leaves in Mutton Broth, of each equal parts. Exhibited

X x x x 2 warm,

warm, it evacuates from the Belly all sorts of cold, sharp, acid, Salt, or other evil Humors, which are apt to offend the Bowels, and cause Belly aches, and other vehement and sick Pains; and works as well in this manner, as if a sufficient quantity of *Sena* had been infused in the Decoction. But if to the Clyster, 4 Ounces of brown Sugar be added, it will work so much the better, and the more powerfully.

XVIII. The Distilled Water of the Herb. It has the Virtues of both Juice and Decoction, but acts in a much weaker manner. But if white Sugar Candy is dissolved in it, it will make a good Collyrium for weak, sore, and running Eyes. And if a few Grains of Scammony in fine Powder be dissolved in it, and used as an Errhine, it will notably purge the Head and Brain, of thick, gross, clammy, salt, sharp, and acid Humors, and therefore may be profitable against Colds, Catarrhs, Apoplexies, Epilepsies, Palsies, Vertigo's, Mergims, Head-aches, Lerhargies, and other like Difficulties of those parts. If sweetened with white Sugar and taken to 6 or 8 Ounces in a Morning fasting, it opens the Body and purges off gross, Viscous, and Melancholy Humors: And Authors say, if it is mixt with *Manna*, and *May Dew*, taken off *Rose Bushes* (for which reason some Writers call it *Rhodomanna*) it will purge Cholera also.

CHAP. CCCCLXXXVIII.

Of MERCURY Herb Wild:

O R,

DOGS--MERCURY.

I. **THE Names.** It is called in Greek, *Koria* & *Korogefun*, *Gynē* & *Cynocrambe*, which is *Canina Brassica*, but for what reason is hard to determine, for that it has no agreement with, nor is any thing akin to *Cabbage*, or *Cole-worts*: it might properly enough have been called *Mercurialis Canina*, (*propter ignobilitatem*:) but some Authors have rather called it *Mercurialis Sylvestris*, as *Cordus*, *Lonicerus*, *Thalius*, & *Trogus*: it is the *Cynocrambe*, *Camerarij*, *Dodonæi*, *Kuchsj*, *Lobelij*, & *Matthioli*: *Mercurialis Canina Columnæ*, & *Mercurialis Montana Bauhini*, (these two last thinking *Cynocrambe*, to be wholly improper:) in English, *Wild Herb Mercury*, and *Dogs-Mercury*.

II. **The Kinds.** The Principal of the Wild sorts of *Herb Mercury*, are these four following, viz. 1. *Mercurialis Sylvestris vulgaris*, *Cynocrambe dicta aliquibus*, *Mercurialis Montana testiculati Bauhini*, *Mercurialis Sylvestris vulgaris Mas*, The Common Male Wild Mercury. 2. *Mercurialis Sylvestris vulgaris Fœmina*, *Mercurialis Montana Spicata Bauhini*, The Common Female Wild Mercury. 3. *Cynocrambe Legitima Dioscori-*

dis Bauhini, *Cynocrambe vera Belli*, *Alfines facie Bauhinus*. 4. *Mercurialis Sylvestris siliquosa*, *Perficaria siliquosa Camerarij*, *Thaliij*, *Lobelij*, & *Lugdunensis*, *Mercurialis Sylvestris altera Tragi*, *Tibymalus Sylvestris Loniceri*, *milius Copreorum Gesneri*, *Impatiens Herba Dodonæi*, *Catenance altera Cesalpini*, *Balsamita altera Columnæ*, *Chrysea Lugdunensis*, *Balsamita lutea Bauhini*, & *Noti me tangere Bauhini*, *Camerarij*, *Gesneri*, *Lobelij* & *Tabernemontani*, Coddred Wild Mercury, by some, Coddred Arismart, Quick-Seed, Impatience, and Touch me not.

The Descriptions.

III. **The first, or Common Male Wild Mercury.** It has a manifold Root, full of small Fibres, which run under Ground and in time mat themselves very much, not perishing Annually as the former Mercuries do, but abiding the Winter, shoot forth new Stalks and Branches every Year, the old ones dying away and Perishing. From this Root spring up

HERB Wild, Common, Male and Female.

several Stalks, slenderer and lower than the Common Mercury, and with no Branches at all upon them. This Male Kind is set with two Leaves at every Joint, something greater than the Leaves of the next following Female, more pointed and full of Veins, and somewhat harder also in handling, of a darker green color, and lesser snipt or dented about the edges: at the Joints with the Leaves come forth longer Stalks than in the former, with two hairy, round Seeds upon them, twice as large as those of the first Common Male French Mercury: the taste hereof is Herby, and the smell something strong and heady.

IV. The

IV. *The second, or Common Female Wild Mercury.* Its Root, Stalks, and manner of growing is much like the former: Its Leaves are lesser, not so sharp pointed, have fewer Veins, and softer in feeling, and standing upon longer foot Stalks. From the joints come forth such like long Stalks, having long spikes of greenish Flowers, and which are longer than the Spikes of the former *Common Female French Mercury*, with many small Threads in them, which yield no more Seed than the Spikes and Flowers of that other *Female Mercury* does.

V. *The third, or True Dogs Mercury of Bauhinus.* It has a white, long, and fibrous Root, spreading it self round about in the Earth. The Plant it self is tender, small, and fussy, and Springs up like unto the first *Common French Mercury*, with a round, green, crested Stalk, about a Foot or more high, set with many joints, and branching forth from every joint, from whence come forth, at the first, two small Leaves, and somewhat round like unto *Chick-weed*; after which, spring forth two others, from the same joint, which are much larger and broader: and from the same place also come afterwards several other Leaves, smaller than the first two: and this proportion it holds, not at one joint alone, but at every joint through out the whole Plant, from the lowest joint almost of the Stalk and Branches, up to the top. From whence come forth three or four small, whitish green Flowers, with many Threads in the middle of them, which turn into small, hard, round Seed, like unto those of the *Common Male French Mercury*, but something lesser; which are green at the first, but of a blackish ash color when they are ripe.

VI. *The fourth, or Codded Wild Mercury, &c.* Its Root is blackish and thready, perishing every year: which sends up a round jointed Stalk, about two Feet high sometimes, branching it self, from thence in many places, whereat continually grows but one Leaf, upon a very slender rough foot Stalk, most like unto those of the *French Common Mercury*, but longer pointed, and something smaller at the Stalk; not so finely, but as it were grossly indented about the edges, being thinner, softer, and of a blewish green color. From every joint with the Leaf, from the middle upwards, and at the tops of the Branches also, comes forth one long brown foot Stalk, as small and fine almost as a Horse Hair, bearing one Flower thereon, and sometimes two or three, somewhat close together, hanging downwards, and composed of six Leaves apiece, some thing like to those of *Hollow Root* or *Cavious Fumitory*, but greater, of a fair Gold-yellow color, which are sometimes also as *Bauhinus* says, found of a paler color: two of them which stand like Wings at the sides, are larger than the other two which stand under them, which are small and round; the lowest is longer than the other two small ones, and broad at the end; the uppermost ends in a short crooked Horn or Heel, like a Spur, behind; the bottom on the inside is whiter than the rest, which have sometimes red spots in them. After these Flowers are past, small, long pointed Pods come up in their places, which hang downwards, and are striped as it were all the length of them, in which is contained small, long, and somewhat flat Seed of a dusky color, which is very difficult to be gathered, for that even before it is through ripe, if it be but very lightly handled, or but just touched, the Pods will break, and twine and twist themselves a little, as the Husk or Pods of some certain

Pulses will do, and the Seed will leap forth of its own accord, with such a kind of violence, that it is not to be caught; yea for the most part, the very shaking of the Branches by the wind, will cause the Pods to break open, and shed their Seed on the Ground, where the ripest may best be gathered or pickt up, if lookt after in Time. The taste of this Herb is poot and waterish while green, as *Colonna* says, and much the same when dried; yet *Lobel* says, it is Venombus; but whether there be any danger in taking of it inwardly, is uncertain, we knowing nothing of it by experience, but what vulgar hear-say has delivered to us.

VII. *The Places.* The first and second of these are found growing Wild in several places in *Kent* and elsewhere, but the *Female Kind* is more seldom found than the *Male*: *Gerard* says, he found it in many places about *Green-hills*, *Swainscombe Village*, *Gravesend* and *Southfleet* in *Kent*, also in *Hampsted Wood* four Miles from *London*, and in all the Villages thereabouts. The third is not found Wild with us, as it is in *Spain* and *Italy*, but is only Nurst up in *Gardens*. The last grows in the shady Woods of *France*, *Germany*, and *Italy*; it has also been found by the shady Woods side of the Mountains and Vallies in *Wales*, by one Mr. *George Bowles*, but is also Nurst up in our *Gardens*, for its rarity, where in shady places, it grows and flourishes very well.

VIII. *The Times.* The first three Flower in the Summer Months, as *June*, *July* and *August*; all the Summer long says *Gerard*, until extrem Frost comes and nips them. The fourth or last Flowers about the middle and end of *August* in the Fields, but in our *Gardens* in *June* and *July*, and presently after its Flowering it yields its Seed, which cannot be gathered from the Plant, without very much care.

IX. *The Qualities, Specification, Preparations, and Virtues* of the three first of these, are said to be the same with those of the *French Mercury* in the former Chapter, so that we shall say no more of them here.

X. As to the *Codded Mercury*, or *Noli me tangere*, Authors say it has a stronger Purging Quality, but it is by Vomit, and therefore it is thought that *Lonicerus* and *Tragus*, did rank it among the *Tithymales*, giving it such a Name, as nearest partaking of their Natures and Qualities; and for this reason I suppose it may be that *Lobel* and *Pena*, accounted it *Deleterious* or *Deadly*; tho' at the same time they say, it wants not its praise, as to its other Virtues: And *Camerius in hortis*, says that the *Distilled Water of the Herb*, is applied by some, to places pained with the Gout with good Success.

C H A P. CCCCLXXXIX.

Of MILK--WORT Common:

O R,

CROSS--FLOWER.

THE Names. It is called in Greek, Πολύγαλα & Πολύγαλον; in Latine, Polygala, Polygala recentiorum Lobelij, Amarella Gesneri & Flos crucis: in English, Milk-Wort and Cross-Flower.

II. The Kinds. There is 1. The Land or Field Milk-wort, of which in this Chapter. 2. The Sea Milk-wort, of which in Chap. 490. following. Of The Land or Field sort, we shall give you the five Descriptions ensuing, viz. 1. Polygalamajor; Polygala vulgaris major Clusij, Our Common greater Milk-wort. 2. Polygala minor, Polygala vulgaris minor Clusij. Our Common smaller Milk-wort. 3. Polygala Repens Lobelij, & aliorum, Creeping Milk-wort. 4. Polygala Monspeliciaca, Polygala foliis acutioribus Bauhini, Onobrichis tertia purpurea Lugdunensis Bauhini, French Milk-wort. 5. Polygala affinis Bauhini, Chamæmyrsine quorundam Lugdunensis, Bastard Milk-wort.

The Descriptions.

III. The first, or Common Milk-wort. It has a Root which is hard and Woody, with several Fibres adjoining to it, endures all Winter, and abides

M I L K = W O R T Greater.

long. From this Root Spring forth five or six hard, slender, and flexible Stalks, about a Foot or more high; thick set with somewhat long and narrow Leaves like those of Myers-weed, or small Hyssop; the flowers grow at the tops, in long Spikes, thick set together, something like to those of Fumitory, but larger, and of a fine diluted reddish purple color, and shining withall; Gerard says, they are fashioned like a little Bird, with Wings, Tail, and a Body easie to be discerned by such as will observe the same: which being past away, small, flat Pouches succeed, like those of Bursa Pastoris, but lesser, having usually two Seeds in them, which are long, blackish, and hairy.

IV. The second, or Our Common smaller Milk-wort. This in its Root, Stalks, Leaves, Flowers, Form and manner of Growing, is like to the former, yet somewhat hard or Woody, and not so many Stalks rising up from the Root, which have also fewer, and smaller Leaves on them. The Flowers are also alike, but smaller, and vary as much, or rather more in their

M I L K = W O R T Lesser.

color; being some of a blewish purple; others purple and white, some all white, others reddish, or of a wan color, or over-worn red, &c. There is also another sort hereof, whose lower Leaves which spread on the Ground, are many, and rounder than in any of the former, but those which grow on the Stalks are long like the rest; the Flowers of which are only blew, without mixture or variation.

V. The third, or Creeping Milk-wort. This small Plant has a number of Stalks, full of Branches, creeping, or lying and spreading on the Ground, not above a span long, set thick by couples

AC I L K W O R T Creeping.

couples with very small Leaves, like those of *Hermaria* or *Rupture-wort*. The Flowers are of a whitish color, standing among the Leaves, at the tops in wharles, encompassing the Stalk, one above another.

VI. *The fourth, or French Milk-wort.* It has a Root which is much like the first and second Kinds, being small, long, and white, from whence spring up several upright Stalks, a four or more high, having several longer and narrower Leaves on them, than those of the two first sorts, and set without order. The Flowers grow one above another, in longer Spikes, than in the second smaller Kind, and not fully like them, but of a reddish color. The Seed which follows is small, and contained in long cornered Husks.

VII. *The fifth, or Bastard Milk-wort.* Its Root consists of small, long, and white Fibres. This small Plant spreads it self much, with many weak, slender, round Stalks, upon the Ground, a span long or more, set with several small Leaves without order, in fashion something like unto *Myrtle* Leaves, but not so much pointed. The Flowers are very Beautiful, standing in a small Spike, one above another, with Leaves among them, consisting of six Leaves apiece, of a fine bright shining purple color; after which comes small Seed contained in small Husks.

VIII. *The Places.* Gerard says, that these Plants or *Milk-worts* grow commonly in every Wood, or Fertile Pasture, and that he had found them, where ever he had Travelled. The first grows also in *Germany*, and *Austria*, and parts thereabouts. The second is more frequent with us, and is found in Barren and Unrilled places, Heaths and the like, as well as in Fertile and

Pasture Grounds. The other three in *France*, *Germany*, and several other places.

IX. *The Times.* They all Flower from the beginning or middle of *May*, and continue Flowering a Month or more, Gerard says, till *August*, and perfect their Seed not long after.

X. *The Qualities.* They are all hot and dry in the second Degree, highly Absterfiv, and with all Cathartick. 'Tis more than probable, that these *Milk-worts*, not any of them, can be the *Polygonum Dioscorides*, because that, as *Dioscorides* says, breeds Milk in Womens Breasts; whereas these do rather the contrary, diminish the same, which is manifest from its Cathartick or Purgive faculty, for as much as all purging things are inimical to that intention.

The Virtues.

XI. *The Infusion in Wine.* Gesner who calls it *Amarella*, because of its bitterness, says, that a Handful hereof steeped all Night in Wine, and drank in the Morning fasting, will purge Choler effectually by Stool, without any danger; and this he had made tryal of upon himself.

CHAP. CCCCXC.

Of MILK--WORT Sea:

OR,

GLAUX.

I. **T**HE Names. It is called in *Greek*, γλαύξ, (from γάλαξ or γάλα, which is Milk:) in *Latine*, *Glauz*, from the *Greek* Name, and not a *Glauco Colore* as some would have it: and in *English*, *Sea Milk-wort*, and *Glauz*, also *Black Salt-wort*.

II. *The Kinds.* Authors have several sorts hereof, but the following three are chief, viz. 1. *Glauz Maritima Major*, *Glauz latiore folio Thuringiaca Baubini*, Ταλακτιν Plinij; The Greater Sea Milk-wort. 2. *Glauz Maritima Minor*, *Glauz exigua Maritima Camerarij*, *Dondei*, *Lobelij*, *Lugdunensis*, & *Tabernemontani*, The Lesser Sea Milk-wort. 3. *Glauz Maritima Veneta Alpina*, *Glauz in Maritimis*, *Dorychnio congener Clusij Baubini*, The Venetian Sea Milk-Wort of *Alpinus*: but *Baubinus* would have this last, to be of the Family of the *Trefoils* or *Lotus*, because they are in some things alike; yet with *Alpinus* we think them to be differing Plants, and that this comes as near, or more nearly to the *Glauz Dioscoridis*, than any other.

The

The Descriptions.

III. The first, or Greater Sea Milk-wort. It has a small Root which shoots forth down right with several Branches or Arms, and some Fibres adjoining to them: from this Root shoots up several weak Stalks, which spread themselves upon the Ground, and raise their Heads upwards, beset with several Lentil like Leaves,

M I L K = W O R T Sea Greater.

yet a little larger, and of a grayish green color on the upper side, and more grayish underneath. The Flowers are set with the Leaves at the Joints of a purple color; after which come small Buttons, with Seed in them. The Branches as they spread and lean upon the Ground take Root again, by which the Plant very much increaseth. Bauhinus says, that there is a great Variety observed in this Plant, it sometimes having much larger Leaves, and sometimes Leaves much narrower.

IV. The second, or Lesser Sea Milk-wort. This lesser sort, in its Roots, Stalks, Branches, Leaves, Flowers, and manner of growing, differs little from the former, but in the smallness of the Stalks and Leaves; some of the Stalks creep on the Ground, some stand upright, being tender, and small, and beset with many little flat Leaves, like *Tribulus Sylvestris*, or *Hernaria*, growing along the Stalks by couples, between which grow the small purple Flowers, which being past, little Bullets or Seed Vessels succeed; and its Root is small and Fibrous, taking hold of the upper Face of the Earth, as well as running

M I L K = W O R T Sea Lesser.

much down right, and by its Fibres spreading abroad it much encreaseth. Bauhinus says, that this lesser sort, has its Stalks thicker stord with Leaves, than the former greater sort, especially upwards, the lower being fallen away, leaving the Stalks bare as if they had great Joints.

V. The third, or Venetian Sea Milk-wort of Alpinus. The Root is long, slender, woody, and divided into several Branches. From which spring up four or five slender Stalks a Cubit or more high, set at equal distances, with several somewhat long and narrow Leaves, green on the upper side, and hoary white underneath; and at the Tops four or five Flowers standing together as it were in an Umbel for form and bigness, being very like unto the *Bastard Scorpion*, like *Podded Sena of Candia*, but of a whitish bluish color, which are succeeded by small, short round Podds, having small, round Seed within them, tasting a little sweetish.

VI. The Places. The first grows in many places in Germany, as also in Scotland, from which last place Bauhinus says he had it; but with us in Gardens. The second grows very plentifully in moist places and Salt Marshes near the Sea, from whence it has been taken and Planted in Gardens: and is found in many places upon the Essex and Kentish Shores: Gerard found it between Whitstable and the Isle of Thanet in Kent, and by Gravesend in the same County; by Tilbury Black-heuse in Essex, and in the Isle of Sheppy going from Kings-Ferry to Shoreland-Heuse. Bauhinus says, that this lesser sort is found growing near the Sea and Salt Lakes; but that the former greater Kind, is found growing on Hills as well as near the Sea. The third Kind grows as Alpinus says, in the Salt Marshes near to Cledio, a City of the Venetians.

VII. The

VII. *The Times.* They flower in *May* and *June*, and the Seed is ripe in the Months following, or towards the end of *Summer*.

VIII. *As to the Qualities, Specification, Preparations, and Virtues* of these Plants, Authors have said as good as nothing, at most, have been very sparing concerning the same: but they have been generally eaten as a Boiled Sallet, being boiled with Beef, Mutton, or Pork, and then dressed up with Oil, or Butter, Pepper, Salt, and Vinegar: This Sallet has been a common Food for Nurses, because it not only increased, but also bred Milk in Nurses Breasts; and for which purpose it is now so dressed, and eaten at this Day.

Common *HE I L L E T*.

C H A P. CCCCXCI.

Of M I L L E T.

I. *THE Names.* It is called in *Arabic*, *Hareomen*, *Geguers*, and *Givers*: in *Greek*, *Κίχρυς*, *Πασμάλι*, & *πασμάλιος*; *Galen*: in *Latine*, *Milium* (& *Miliaria Summa derivatum* ait *Festus*: *Meline*, as *Varro* thinks; but both *Dioscorides* and *Galen* make *Meline*, to be *Panicum*: also *Paspilos*, & *Paspile*: in *English*, *Millet*.

II. *The Kinds.* Authors make three several Species hereof, viz. 1. *Milium vulgare album*, Common white Millet. 2. *Milium vulgare nigrum*, Common black Millet. 3. *Milium Indicum Matthioli*; *Milium Turcicum*; *Milium Sarosenicum Euflij*; *Melica Dodonei*; *Sorgho*, & *Sorghum Italarum Lobelij*; *Panicum Indicum Gesneri*; *Panicum Dioscoridis* & *Plinij Trago*: *Indian* or *Turkey* Millet.

The Descriptions.

III. *The first, or Common white Millet.* It has a bushy Root which spreads & self round in the Earth, and perishes every Year after Seed times, as the Roots of other Grain do. From this Root rise up several hard jointed tall Stalks, full of a white Pith, yet soft, and a little Hairy or Downy on the outside, with long and large Reed like Leaves at them, encompassing one another: at the tops of the Stalks are a great number of whitish yellow long Spriggs like Feathers, bowing down their Heads; set all along with white Seed, inclosed in a whitish Husk, which being taken out, are of a shining, pale, yellowish or whitish color, something hard, and a little larger than the Seed of *Klewort*.

IV. *The second, or Common black Millet.* This in its Roots, Stalks, Leaves, Head, and manner of growing, differs very little from the former: saving that it is somewhat less with us, and that the Juba or Tuft is brownish, and the whole Plume or Head more loose and large, the Seed or Grain is also somewhat bigger, and of a blackish shining color.

V. *The third, or Indian, or Turkey Millet.* The Root of this bushes out more than the others, and perishes every Year after Seeding as the others do. This Plant is in all its parts

Indian. Millet.

Y y y

larger,

larger, or greater, and higher than the former, rising to be five or six Feet in height, or more. The Stalks are full of Joints with long large Leaves at them. The Juba or Tuft stands upright, not bowing down its Head as the other, on which grows the Seed, which is as big, but not as flat as *Lentills*; something round, either whitish, yellow, red, or blackish colored, hard and shining.

VI. *The Places.* All these Grains came first to us out of the Eastern and Southern Countries, as Turkey, Barbary, Syria, the East-Indies, Spain, Italy, &c. and now they grow plentifully through all the West-Indies, and in most of our English Plantations. They delight to grow in a light and loose Mould, provided it is fat and well watered, for they soon impoverish the Ground, and they thrive best in a moist and Rainy Season. They grow as *Columella* says, in great plenty in *Campania* in Italy.

VII. *The Times.* They are to be Sown in April or May, and not before, for they cannot endure the Cold: and in the hotter or more Southern Climates, the Grain will be ripe in August or September.

VIII. *The Qualities.* The Grain is temperate in respect to heat or coldness, and is drying in the second Degree. It has a tenuity of parts, Absterfitive, Altringent, Diuretick, and Antifebrictick.

IX. *The Specification.* It restores in Consumptions and abates the heat of Fevers: Stops Fluxes of the Bowels and of the Womb.

X. *The Preparations.* You may have herefrom, 1. *The Grain, and its Meal.* 2. *The parched Grain.* 3. *A Decoction or Syrup, called Syrupus Ambrosij.* 4. *An Emplaster.* 5. *A Distilled Water.* 6. *Ashes of the Stalks.* 7. *A Powder of the Flowers.*

The Virtues.

XI. *The Grain, and its Meal.* Made into Bread or Cakes, or Puddings, and eaten, it restores in Consumptions, and Strengthens the Stomach and Belly: Milk thickned with its Flower and given daily, stops Diarrhas and other Fluxes of the Bowels: Broth made of choice Beef, and thickned with the fine Flower hereof restores the Tone of the Stomach and Intraills admirably.

XII. *The parched Grain:* eaten alone, it stops Vomiting: being applied in Linnen Bags as hot as it can be endured, and applied to the Stomach and Belly, it gives ease in the Belly-ach and Cholick, and helps the Gripping of the Guts, Stitches, Pleurifies, and other Illnesses of like Kind.

XIII. *The Decoction, or Syrup of Ambrose:* Take Millet a Pound, Boil it in Water 2 Quarts, till it breaks, and then strain out by pressing: to 4. or 5 Ounces hereof add White Port or Lisbon Wine 2 Ounces: mix them. Let it be given to the Patient as hot as it can be endured: it prevails against Fevers and Agues, chiefly Tertians; is Diuretick, and yet strongly provokes Sweating, and quenches Thirst, the Sick being well covered down in a Bed; but it ought to be given in the declination of the Fit.

XIV. *The Emplaster.* It is made of a mixture of the Flower and Tar, to a just consistence. Being applied to the Bitings of any Venemous

Beast, it draws forth the Poyson, and secures the Life of the Patient.

XV. *The Distilled Water from the green Plant, robilest in Flower.* Being taken to 4 or 6 Ounces at a time, it is a singular preservative against the Stone, Sand, Gravel, and Tattatous Mucilage in the Reins, Ureters, and Bladder.

XVI. *The Ashes of the Stalks.* Being drank, or rather the *Lixivium* of them, they are good against Kernels under the Ears, and in the Throat, and to abate Strumous or Scrophulous Swellings. The Ashes mixed with an equal quantity of the Ashes of a red Sponge, and with an eighth part of Pepper in fine Powder, and made up with Wheat Paste into a Cake, and Baked under hot Embers, and eaten, two or three Ounces at a time, is an excellent thing against the Kings Evil, especially being taken in the Wane of the Moon.

XVII. *The Powder of the Flowers.* The red Flowers in Powder, given to a Dram in red Sceptick Wine Cures the Reds in Women, so also the Powder of the white Flowers given in the same Dose and Vehicle Cures the Whites, and they both of them, or either of them, cure all sorts of Fluxes of the Belly.

MILLEFOLLE, see Yarrow, Chap.

MIL-MOUNTAIN, see Flax Wild, Chap. 268.

MILT-WASTE, see Spleen-Wort, Chap.

C H A P. CCCCXCII.

Of M I N T Garden.

I. **T**HE Names. It is called in *Arabic*, *Nabanaba*; in *Greek*, by the Ancient *Grecians*, *Mint*; but by the latter *Greeks*, *Μέντα* (from *ἡδύς*, *Suavis vel jucundus*; and *ῥιζή*, *odor, suell*) because it has a sweet or pleasing Scent: in *Latine*, *Mentha*; and in *English*, *Mint*.

II. *The Kinds.* There are several principal Kinds of this Plant, as 1. *Mentha Hortensis*, Garden Mint, of which in this Chapter. 2. *Mentha Sylvestris*, Wild Mint, of which in Chap. 493. 3. *Mentha Aquatica*, Water Mint, of which in Chap. 494. 4. *Mentha Montana*, Mountain Mint, or Calamint, of which we have already Treated, Chap. 104. and 105. 5. *Mentha Cataria vel Felina*, Cats Mint, or Nep, of which we shall tread (God willing) in the Chapter of Nep, following.

III. *The Species of the Garden Kind.* Authors have given us many of the Garden Production, but these following are chief, viz. 1. *Mentha Romana Angustifolia*, five Cardiac, *Mentha Hortensis*, Our Common Spear Mint, called also Heart Mint. 2. *Mentha fusca*, *Mentha rubra vulgaris*, Our Common Red Garden Mint. 3. *Mentha Crucata*, & rotundifolia altera Flore Spicata, Cross Mint. 4. *Mentha Crispa*, *Balsamita Camerarij*, *Sisymbrium hortens*.

bortense Matthioli, *Mentha Crispa verticillata* Bauhini, *Mentha vulgaris Serpens retundorefolia*, *Pulegij Flore* Lobelij, Bawm Mint, or Orange Mint.
5. *Mentha Crispa Germanica Speciosa*, Great Curled Mint of Germany.

The Descriptions.

IV. The first, or Our Common Spear Mint. It has a stringy Root, with many Fibres adjoining, spreading far abroad under Ground, as all the rest do. From this Root spring forth several round Stalks, having longer and narrower Leaves dented

Spear Mint.

on the edges set thereon, than those of the next sort, growing also something lower and smaller, of a pleasing green color. The Flowers stand in spiked Heads, at the tops of the Branches, being of a pale bluish color, the smell is strong but very pleasant and grateful to the Sense.

V. The second, or Our Common red Garden Mint. The Root is much like the former and spreads like it, running and creeping under the Ground, so that when it has gotten place, it is difficult to be extirpated or rooted out. From this Root rises up several square brownish Stalks, with somewhat long and round pointed Leaves, dented (as the former) about the edges, of a dark green, and sometimes of a reddish color, standing by couples at the joints, and of a very sweet and pleasing smell. The Flowers are reddish, and stand by Spaces about the tops of the Stalks.

VI. The third, or Cross Mint. This has a Root very like the others also, which sends forth square Stalks a little hoary, as are also the Leaves, which are rougher, broader, and rounder than the second Kind, which stand on all sides the Stalks, one against another, two at a joint, and then cross against them at the next joint, so that they Represent a Cross, from whence

G R O S S . . M I N T .

came the Name. The Flowers stand in spiky Heads, of a purplish color, somewhat deeper than the first.

VII. The fourth, or Bawm Mint, or Orange Mint. This in its Root, Stalks, and manner of growing, is much like the second Kind above described, the chief difference between this and that

B A W M . . M I N T .

Y y y 2

is,

is, first in the Leaves, which are almost as round as those, but more rough or crumpled: then, in the Flowers, which are of a purplish color, standing in Bundles about the tops of the Stalks, and lastly in the smell thereof, this being full as sweet as any of them, but smelling more like unto *Broom*, or rather coming near to the smell of an *Orange*, for which reason, some People gave it the Name of *Orange Mint*.

VIII. *The fifth, or Great Cutled Mint of Germany.* This excellent Plant creeps with its Roots, as the other Mints do, from whence spring forth several high Stalks, which spread themselves out into Branches, with two Leaves at every Joint, something broad and large, but more deeply cut in on the edges, and as it were curled or crumpled together, more especially the lower Leaves: for those which rise up with the Stalk, are not so much torn or cut in on the edges, but are a little deeper dented than the former. The Flowers stand rounder, and in somewhat larger spiky Heads than others, and are of a pale purplish color. The smell hereof is sweet and pleasant, but not so quick or hot as some of the former Kinds.

IX. *The Places.* All these sorts of Mints grow in Gardens, in moist places throughout the Kingdom, and delight in the Sun, and in a rich and fat Soil; yet will grow also in shady Places.

X. *The Times.* They all Flower about the beginning of August for the most part, but seldom give any good Seed; but make a recompence another way, by the encrease of the Root; which as it lives all Winter, so it continues long, and advances its Stock so plentifully, that being once Planted in a Garden, it will be difficult to get rid of it again, every small bit of it being left in the Ground, springing up afresh in a small time after.

XI. *The Qualities.* Mint is hot and dry in the third Degree, Aperitive, Absterfivè, Afringent, Anodyn, Catminative, Digestive, Discussive, Diuretick, Cephalick, Neurotick, Stomackick, Cordial, Sudorifick, Alexipharmick, and Spermatogenetick.

XII. *The Specification.* It cures Vomiting, Green Wounds, Punctures of the Nerves and Tendons, Convulsions, Palsie, Lethargy, provokes the Terms, and facilitates the Birth, of Women in Labor, helps the Headach, provokes Urine, and gives ease in the Stone, Gravel, Strangury, and other Diseases of the Reins and Bladder.

XIII. *The Preparations.* You may have thencefrom, 1. A Juice of the whole Plant. 2. An Essence of the same. 3. A Syrup. 4. A Decoction or Infusion. 5. A Powder of the Leaves and Heads when in Flower. 6. A Decoiled or Insolated Oil. 7. An Ointment. 8. A Balsum. 9. A Cataplasim. 10. A Distilled Water from the whole Plant when in Flower. 11. A Spirit. 12. An Oil Distilled. 13. A Balsum Chymical. 14. A Spirituous Tincture. 15. An Acid Tincture. 16. An Oily Tincture. 17. A Saline Tincture. 18. Potestates or Powers. 19. An Elixir. 20. A Salt by Incineration. 21. A Mixture. 22. A Sauce or Sallet. 23. Observations.

The Virtues.

XIV. *The Liquid Juice.* Dioscorides says, that if it is mixt with Vinegar and taken, it will stop Bleeding; and I have found by Observation that so taken it, will stop Vomiting, tho' never so extream: mixt with a Syrup of Mint, and a few Grains of Long Pepper, it is not only extreamly Stomachical, but also provokes Venery or Bodily Lust exceedingly, and to

kill long, round Worms in the Stomach and Guts. Mixt with the Juice of Sower Pongranats, it stops the Hiccough, Vomiting, and Fainting, and allays the heat and violence of Cholet. Some Authors say that it stops the Courses in Women: but I have found by great Experience, that it on the contrary powerfully provokes them, facilitates the Birth, and brings away the After-Birth, as also the Dead Child. Dose from an Ounce to 4 Ounces, either alone, or mixt with a Glass of Wine, or with its proper Syrup: as an Errhine, it Putges the Head.

XV. *The Essence.* It has all the Virtues of the Juice, besides which, being Dulcified with its proper Syrup, or mixt with a Glass of Canary (from one Ounce to three) it prevails against all cold and moist Distempers of the Brest and Lungs, as Loathing, Sicknes at Heart, Pain of the Stomach, want of Appetite, Indigestion, Coughs, Colds, Rheums, shortness of Breath, difficulty of Breathing, Hoarseness, Wheezing, &c. Bathed upon the Forehead and Temples, it eases their Pains: and is good to wash the Heads of Young Children, to take away all manner of breakings out thenceon, as Scutt, Morpew, Pimples, Sores, Scabs, &c. Taken with 30 or 40 Drops of Our Stomach Tincture, or with 2 or 3 Drops the Chymical Oil of Mint, it is good against the Poyson of Venomous Creatures. Taken to 2 or 4 Ounces, it stops Bleeding at Nose, and provokes Venery admirably: Dropt into the Ears, it eases their Pains.

XVI. *The Syrup.* It is Stomackick, and Pectoral, good against Coughs, Colds, Hoarseness, Wheezing, Asthma's, and other Distempers of the Brest and Lungs. Dose 2 or 3 Spoonfuls in a Glass of White Port or Lisbon Wine Morning and Night: so taken it opens Obstructions of the Reins, Ureters, and Bladder, gives ease in the Strangury, and expels Sand, Gravel, Stones and Tartarous Matter; and is much more powerful for these Intentions, being taken mixt with an equal part or more of the Juice or Essence.

XVII. *The Decoction or Infusion.* They have both of them the Virtues of the Liquid Juice, Essence and Syrup, and may be taken from 4 to 8 Ounces or more, Morning, Noon or Night, sweetened with Syrup of Mint: the Infusion is the Stronger of the two (because by its Decoction it looses many of its Volatile parts) and it ought to be made in some Genetous sort of Wine, as White Port or Lisbon, in Alicant, Barcelona, or Canary, &c.

XVIII. *The Powder of the Leaves and Heads.* It is very Stomackick, and may be given from half a Dram to a Dram. It stirs up Lust, and taken with Oxycerate it stops Vomiting of Blood. It is good against Pain and Gnawing at the Stomach, and provokes Appetite: taken after Eating, it helps Digestion, expels Wind, and is good for such as are troubled with the Spleen.

XIX. *The Decoiled or Insolated Oil.* It is good against Pains and Aches in any part, proceeding from Cold: and taken inwardly a Spoonful or two at a time, it is good against Coughs, Colds, Wheezings, Asthma's, &c. and open all Obstructions of the Lungs; and if given in time is prevalent against Stitches in the side, Pleurifies, &c.

XX. *The Ointment.* It cures Wounds and Ulcers, old and running Sores, and is good to Anoint any old Pain or Ach in any part of the Body: it is an Excellent thing to Anoint with in the Hemorrhoids or Piles, as also against *Ficus in Ano*: and put up the Fundament (being melted) in a Clyster, it is good against a *Tenasmus*, and the Weakness of the *Intestinum Rectum*.

XXI. *The*

XXI. The Balsam. It is a thing singular for Wounds and Ulcers, and not inferior to the *Balsams* made of any other Wound Herb, except only *Angelica*, which I take (by my own Experience) to be one of the greatest of all Vegetable Vulneraries. This *Balsam* cures simple Green Wounds at once or twice dressing, and Contused Wounds, it causes to Digest immediately, suppurates Apoptems, cleanses, incarnates, dries and heals them in a very short time: It is profitable also against old running Sores and Ulcers, it digests and cleanses them, and strengthens the part, resists the Deluxion of Humors, and induces their speedy healing: Injected scalding hot into Fistula's, it softens the Calous, and in time dissolves it, resists the fluxion, dries, incarnates and heals them to admiration.

XXII. The Cataplasim. The green Herb beaten, and made into a *Cataplasim* with *Barly Flower*, and applied to Tumors not yet brought to Suppuration, discusses them: it represses Milk in Womens Breasts when Swollen therewith, and is good for such as have swollen, great or flagging Breasts. If Salt be added to it, it is good against the Biting of Mad Dogs, and of other Venomous Creatures. Applied to the Fore-Head or Temples, it eases the Head-ach. The Green Herb made into a *Cataplasim* with Honey and white Bread, and applied to blear'd Eyes, it is said to Cure them. Made into a *Cataplasim* with the Pouders of *Ant-seeds*, *Caraway's*, and *Coriander-seeds*, and applied to a simple Contusion, it Cures it, it also gives ease in the pains of the Joints, and the Gout. Applied warm to Kernels in the Throat and Neck, and recent Tumors of the Kings Evil, it discusses them. Applied to places affected with the Leprosie (mixt with Vinegar) it is said to Cure it, more especially if the *Juice* and *Essence* be also taken inwardly.

XXIII. The Distilled Water from the whole Plant when in Flower. It is an admirable Stomack, and stays Vomiting, having all the Virtues of the *Juice*, *Essence*, *Syrup*, and *Infusion*, but is to be taken in much greater quantity, as from 4 to 8 Ounces sweetned with *Syrup of Juice of Mint*. It causes Milk in Womens breasts, and hinders it from curdling: and taken as aforesaid, it is good against the Strangury, Stone, and Gravel.

XXIV. The Spirit. It is a singular Stomack and Cordial, good against Nauseousness, Vomiting, Indigestion, want of Appetite, Fainting, Swooning, Palpitation, and Sickness at Heart, and is a most excellent thing to be given to Children against Convulsion Fits, the Falling Sickness and other Distempers of the Head, Stomach, Heart, and other Bowels. Dose from 2 Drams to 4 to Elder People, mixt with *Syrup of Mint*, but from a Scruple to a Dram, being given to Children.

XXV. The Distilled Oil. It is a powerful Medicament against Stone, Gravel and Tartarous Matter in the Reins, Ureters and Bladder, gives present ease in the Strangury, strengthens the Stomach to a Miracle, stops Vomiting, causes a good Appetite and Digestion, restores in Consumptions, stops Coughs, and Distillations of Rheum, takes away Hoarseness, Wheezings, and obstructions of the Lungs, cures Asthma's, and is a potent thing against Fainting and Swooning Fits, Palpitation, and Sickness at Heart, Apoplexies, Convulsions, Palsies, Lethargies, Carus, and other cold and moist Diseases of Head, Brain and Nerves: It cures Punctures and other Wounds of the Nerves and Tendons, gives ease in the Gout, Sciatica, Cramps, and other like Pains of the Muscles and Joints. It provokes the Terms in Women, facilitates the Birth, brings away the After-Birth, and Dead

Child, and is a potent thing against the Cholick Vapors and Hysterick Fits, causes Fruitfulness, powerfully provokes Lust, helps forward Conception: and in a word, is one of the greatest Vegetable Productions that ever Nature produced. Dose from 3 to 12 or 20 Drops in any fit Vehicle.

XXVI. The Chymical Balsam. This is a peculiar thing, and is thus made, Take choice Oil of *Mace* by Expression, 2 Ounces, *Balsam of Peru*, and of *Tola*, of each 1 Ounce, *Chymical Oil of Mint*, 1 Ounce; Melt and mix them well together in *Balneo*, or in a Sand Heat, and keep it for use. It has all the Virtues of the *Chymical Oil* beforegoing, besides which it is an excellent thing for the Lungs, as also for the Reins and Bladder, to provoke Urine, ease the Strangury, expel Stone and Gravel, and to heal Ulcers in the Reins and Bladder. If prudently given, it is an excellent thing against a Virulent Gonorrhoea. Dose from a Scruple to half a Dram, in any proper Vehicle Morning and Night.

XXVII. The Spirituous Tincture. It stops Vomiting, eases the Pain of the Stomach upon the spot, and cures the Cholick, after a singular manner. It has all the Virtues of the *Juice*, *Essence*, *Infusion*, and *Chymical Oil*, being a most admirable Cordial, and prevails against Convulsions upon the spot. Dose from 1 Dram to 2 or 3, mixt with a Spoonful or two of the *Syrup*.

XXVIII. The Acid Tincture. It is more Stomack than the former, stops Vomiting, creates a good Appetite and a strong Digestion. It is a potent thing against the Plague, or Pestilence, Spotted and Purple or Scarlet Fever, and against all sorts of Burning and Malign Fevers whatsoever, taking away the Fever in less than an Hours time. It may be thus used. Take *Mint Water* a Quart, of this *Acid Tincture* almost an Ounce, Double Refined Sugar, enough to make it very pleasant and drinkable, and of this the Sick may drink at pleasure.

XXIX. The Oily Tincture. It is profitable against the Stone, Gravel, and Tartarous Matter in the Reins and Bladder, provokes Urine, and gives ease in the Strangury, and Anointed along upon the *Spina Dorsi*, and other parts affected with the Palsie, it cures it. It facilitates the Birth, provokes the Terms, and brings away the After-Birth, and Dead Child. Dose from 10 Drops to 20 or 30, in some convenient Vehicle.

XXX. The Saline Tincture. It has the Vertus of the *Juice*, *Essence*, *Decoction*, and *Oily Tincture*, in all respects, but not so Stomack, by reason of the *Menstruum* with which it is Drawn. Dose from 20 to 60 Drops, or more, in *Parssy Water*, or in white *Lisbon*, or in *Canary*, or *Canary* mixt with *Parssy Water*. Outwardly it is good against Scurf, Morpew, Itch, Scabs, and other Defections of the Skin.

XXXI. The Potestates or Powers. They have all the Virtues of the *Juice*, *Essence*, *Decoction*, *Spirit*, and *Chymical Oil* in perfection, and may be given from 40 to 80 Drops, yea to an 100, in a Glass of Wine 2 or 3 times a Day.

XXXII. The Elixiri. It has all the Virtues of *Juice*, *Essence*, *Tincture*, *Spirit*, *Chymical Oil*, and *Powers*, with this preference, that it is more Excellent than the last, and operates in somewhat a less Dose, being one of the greatest Stomackicks in the World; Dose from 30 to 60 Drops in a Glass of White *Lisbon* or *Canary*, or other fit Vehicle, as the Physician shall advise, and as oft as need shall require.

XXXIII. The Salt by Incineration. It admirably strengthens the Stomach and other Bowels, by absorbing

aborbing the preternatural Acid which afflicts them: is good against Surfeits, Gluttony and Drunkenness, and gives ease in the Strangury, cleansing the Reins, Ureters, and Bladder of Stones, Gravel, Sand, or Tartarous Mucilage, which may any ways obstruct them. Dose from 10 Grains to 20 or 30 in a Glass of *Possy Water*. It carries off the Recrements of the Blood and Humors, and the causes of many Diseases by Urine, for which reason it is of extraordinary Use in Fevers.

XXXIV. *The Mixture.* Take *Powers or Elixir of Mint* 6 Drams; *Powers of Cloves* 2 Drams; *Acid Tincture of Caraways* 1 Dram; mix them. Dose from 60 to 80 Drops in any proper Vehicle against the Cholick, obstructions of the Terms in Women, Hysterick Fits, Vomiting, and weakness of the Stomach. It is profitable also against Convulsions, Fainting and Swooning Fits, Sickness at Heart, and a Consumptive habit of Body.

XXXV. *The Sauce or Sallet.* It is made of the green Herb shred small, and made grateful with the best White Wine Vinegar, a little Salt, and a sufficient quantity of double Refined Sugar. It is acute and grateful to the Stomach, causes an Appetite, and is used as Sauce for Lamb, when in Season, and some other Meats.

XXXVI. *Observations.* In ancient times, the use of *Mint* was forbidden to Soldiers, not for any hurt it did them, but because, it did too much incline to Venery, and thereby took away, or abated their Courage and Valor. It is also farther observed, that a *Lotion* made of the Juice, Essence, or Decoction, by mixing with them a little of the *Acid Tincture, and Honey of Roses*, that it cures the Scurvy in the Gums and a Sore Mouth and Throat. And a *Gargarism* made with the Essence, Juice, Decoction, Powers or Elixir, by mixing with either of them, the Spirituous or Acid Tincture of Coriander Seed and Rue, or by infusing those two things in them, is an admirable remedy against a Stinking Breath, by gargling the Mouth and Throat therewith, and also oftentimes holding it in the Mouth: and it causes the *Uvula* or *Palate* of the Mouth when down, to return to its place and strength again. And an *Errhine* made with the Juice or Essence, two parts mixt with the Distilled Water one part, and the Acid Tincture half a part, is an Excellent thing against the Megrims, Head-ach, Vertigo, Lethargy, &c. by purging the Head of cold gross Humors. Being Snuffed up the Nostrils, and held in the Mouth, it is good against a Stinking Breath, which proceeds from rotten or corrupted Teeth.

Mentastrium: in English, *Wild Mint* and *Horle Mint*.

II. *The Kinds.* There are several sorts of this *Wild Mint*, as, 1. *Mentastrium Hortense*, *Mentha Sylvestris Hortensis*, *Sylvestria Mentha agrestis Lobelij*, Our Garden or Manured Wild-Mint. 2. *Mentastrium niveum Anglicum*, Our white or partly colored Wild Mint, or Horle Mint. 3. *Mentastrium folio Longiore*, *Mentastrium aliud Lobelij*, *Mentastrium Campanse Lugdunensis*, *Sisymbrium Sylvestre Martioli*, Long Leav'd Wild Mint, or Horle Mint. 4. *Mentastrium Montanum*, *Mentastrium Pannonicum Clusij*, Mountain or Hungarian Wild or Horle Mint. 5. *Mentastrium Tuberosum Clusij*, *Mentastrium Radice Tuberosa*, Tuberoe or Knobbed Wild or Horle Mint. 6. *Mentha geniculata Radice*, Wild or Horle Mint with Knead or Jointed Roots. 7. *Mentastrium hirsutum*, *Mentastrium minus Spicatum Lugdunensis*, *Mentastrium aliud hirsutum Camerarii*, *Mentastriifolia aquatica hirsuta*, & *Calamintha tertia Dioscoridis Lobelio*, *Mentha palustris folio oblongo Bauhini*, Hairy Wild or Horle Mint. 8. *Mentastrium rotundifolium minus*, & *Mentha rotundifolia Palustris Minor Bauhini*, Small round Leav'd Wild or Horle Mint.

The Descriptions.

III. *The first, or Our Garden or Manured Wild Mint.* Its Root is creeping, and much like to that of the Garden Kind. From whence spring up square Stalks, which are hoary and a little hairy also, on which grow larger and rounder Leaves than those of the Garden Kind, of an hoary white color, and covered as it were with down. The Flowers stand at the tops of the Branches in spiked Heads of a pale purplish color, the smell of which is heady and stronger than those of the Garden Kind.

Wild MINT.

C H A P. CCCCXCIII.

Of MINT Wild;

O R,

Horle MINT.

I. *THE Names.* It is called in Greek, *ἡδίστος ἀγρὸς*, & *Μένθα* vel *μάνθινος*, & *ἀγρὸς*; in Latine, *Mentha Sylvestris*, *Mentha agrestis*,

IV. The

IV. *The second, or Our white or party colored Wild Mint. This is much less, and better smelling than the former: Its Leaves are partly green and partly Milk white; and sometimes its Leaves are some of them wholly white: but more commonly all green: the Roots, Stalks, Flowers and other parts, are like those of the former but lesser. This is also Nurst up, and found growing in many of our English Gardens. It is the Menthastrum alterum Dodonai.*

V. *The third, or Long Leav'd Wild Mint, or Horse Mint. This has square brownish Stalks, and somewhat broad, but longer Leaves growing on them than the last, nothing at all hoary, but rather of a dull green color. The Flowers stand at the tops of the Branches, in rounder Tufts, of a pale purplish color: and the smell of the Leaves and Branches, is something more pleasant than the other.*

VI. *The fourth, or Mountain or Hungarian Wild or Horse Mint. It has a pretty hard, thick, long Root, with many Fibres springing forth from it, more like to Nep than Mint. From which spring up several square Stalks, on which grow by couples at every Joint, somewhat large Leaves, like as on the others, which are more green than the last, and dented also about the edges. The Flowers are whiter than the former, standing about the Stalks, at several spaces, and ending in small long Spikes. The whole Plant much resembling Common Spear-Mint, and is of a hot and sharp taste, smelling very like to the other Wild Mints.*

VII. *The fifth, or Tuberous or Knobbed Wild or Horse Mint. Its Root is something reddish within, and brownish on the out side, having several tuberous Heads joined thereto, which being separated will grow into Plants. From this Root spring up square hairy green Stalks, full of Joints, with two Leaves set at every Joint, which are long and rough, dented about the edges, somewhat hoary, of a whitish green color, and of a strong smell. The tops of the Branches do end in Spikes of hoary Leaves, among which, at certain distances, the Flowers stand, with two Leaves at a space of, a whitish color: after which follows small black Seed.*

VIII. *The sixth, or Wild or Horse Mint with Jointed or Kneed Roots. Its Root is something thick, and set with Joints or Knees, at certain spaces, shooting forth Fibres at the same. The Stalk rises not above a Foot high, being something hard, rough, and square, on which grow at the Joints, two long dark green Leaves, being soft in handling, but a little wrinkled and dented about the edges. The Flowers stand at the tops of the Branches in short Tufts or Spikes, like unto Nep, of a pale purplish color, after which come small, round, sweet smelling Seed, like in scent to the whole Plant.*

IX. *The seventh, or Hairy Wild or Horse Mint. This has square hairy Stalks, spread forth into many Branches, higher and greater than the Common sort of Wild Mint, on which grow hairy long Leaves at the Joints thereof, and many purplish Flowers at their several tops.*

X. *The eighth, or small round Leav'd Wild or Horse Mint. The Stalk is square, hairy, and reddish, much about a Foot high, having two Leaves at a Joint, somewhat long and round, soft, hairy, and dented about the edges, of*

a sad green on the upper side, and hoary underneath; from the Joints spring forth some Branches, set with the like Leaves, and round Heads of Flowers at the tops, of a purplish color; the smell of the Plant is heady, and of a strong sweetness.

XI. *The Places.* These are all of them Wild by Nature, and grow in moist and watery Places, as in Meadows near unto Ditches which have Water in them, and in Grounds many times overflowed with Water, as in Fenny Grounds, &c. but the two first are Nurst up in our Gardens, and so are also the others in many Places.

XII. *The Times.* These Flower when the Garden Mints do, viz. about the latter end of July, or beginning of August; and spring up again the next year from their old Roots, by which they also very much encrease.

XIII. *The Qualities, Specification, Preparations, and Virtues* are exactly the same (if not more Powerful) with those of the Garden Kinds declared in the former Chapter, to which I refer you.

C H A P. CCCCXCIV.

of MINT Water.

I. **T**HE Names. It is called in Greek, *Σισυμβριον*; in Latine, *Sisymbrium*, *Mentha aquatica*: and in English, *Water Mint*.

II. *The Kinds.* Of this there are two sorts, viz. 1. *Mentha aquatica rubra*, *Sisymbrium majus*; *Sisymbria Mentha Lobelij*: Beyond-Sea Apothecaries call it as *Tragus* says, *Balsamina*, as also *Balsamita*, as *Besler* in *horto Eystetensi* says, *Aquatica sive Sisymbria Mentha folio rubro Lobelij*, *Sisymbrium agreste aquaticum Gesneri*, *Sisymbrium Sylvestre Lugdunensis*, *Red Water Mint*, or *Water Mint the Greater*. 2. *Mentha Aquatica sive palustris minor*, *Mentha rotundifolia palustris minor Baubini*, *Sisymbrium minus*, The lesser *Water Mint*.

The Descriptions.

III. *The first, or Red Water Mint. It has a creeping Root, running and spreading in Muddy and Watery Places; From whence spring forth many square brownish Stalks, Branched forth almost from every Joint, with a Couple of somewhat broad, but pointed and dented Leaves, of a brownish or reddish color, and of a strong sweet Mint like smell. The Flowers are small and of a purplish color, standing at the tops of the Stalks or Branches, in loose round Tufts, one above another.*

IV. *The*

M F N T Water red Leav'd.

IV. The second, or Lesser Water Mint. It has a Root like the former, which sends forth a square reddish hairy Stalk, and sometimes a little hairy, of about a Foot in height; on which grow soft, hairy, round and somewhat long Leaves, two always at a Joint, dented about the edges, on the upper side of a dark green color, and grayish or hoary underneath. From the Joints with the Leaves come forth long Branched Stalks, with purplish Flowers at their tops, standing in round Heads. The whole Plant is of a strong sweet Mint like smell.

V. The Places. They both grow by Ditches and Water sides, and in wet and plathy places, as also in Fen Grounds, where they very much delight.

VI. The Times. They Flower late in the Summer, viz. about the beginning of August.

VII. The Qualities, Specification, Preparations, and Virtues, are the same with those of Our Garden Mint, declared in Chap. 492. And probably may exceed them in many respects.

C H A P. CCCCXCV.

of M O L Y:

O R,

O N I O N -- G A R L I C K.

I. THE Names. It is called in Greek, *Μόλυδα* Psellio, vel *μολύδα* Hipp. i. e. *Allium habens caput simplex, neque in stylis nucle-*

as division, as Galen interprets it. Or *Moly* Plinii, *μοῦλον* vel *μοῦλον* τὰς ῥίζας, & *mitigandis sedandisque morbis*: vel *ἀπὸ τοῦ* i. e. *ἀπὸ τοῦ*, quod *Veneficā* debeat: in *Lotione*, *Allium*, *Cepum*: in *Englibis*, *Moly*, *Onion*, *Garlick*, and *Soccers* *Garlick*.

II. The Kinds. There are many sorts of this Plant, as, 1. *Moly Theophrasti*, vel *Moly Homerici*, *Theophrastus* or *Homer's* great *Moly*. 2. *Moly Indicum* *Labellij*, *Clusij*, *alterumque*, *cavesson*; The *Indian Moly*. 3. *Moly Montanum Pannonicum bulbiferum primum*, The first bulbed *Hungarian Moly*. 4. *Moly Montanum bulbiferum secundum*, The second bulbed *Hungarian Moly*. 5. *Moly Serpentinum*, *Serpents Moly*. 6. *Moly Caule & folijs triangularibus*, The *Cornered Moly*. 7. *Moly folijs Naviculinis*, *Daffodil Leav'd Moly*. 8. *Moly Montanum latifolium Flore Luteo*, *Yellow broad Leav'd Moly*. 9. *Moly Pyreneum purpureum*, *Purple Mountain Moly*. 10. *Moly Montanum latifolium purpureum Hispanicum*, *Purple broad Leav'd Spanish Moly*. 11. *Moly purpureum Neapolitanum*, *Purple Naples Moly*. 12. *Moly Pyxidatum argenteum Hispanicum*, *Silver Cupp'd Spanish Moly*. 13. *Moly Serotinum confertum*, The late ripe *Pine Apple Moly*. 14. *Moly Dioscorideum*, *Dioscorides his Moly*. 15. *Moly Dioscorideum Hispanicum*, *Spanish Moly of Dioscorides*. 16. *Moly Masebatinum*, *Moly Zibettinum Mompelienfe*, *Sweet smelling Moly of Mompelien*. 17. *Moly Pannonicum latifolium Primum Clusij*, The first broad Leav'd *Hungarian Moly of Clusius*. 18. *Moly Pannonicum Flore odorata*, *Sweet smelling Hungarian Moly*. 19. *Moly Montanum Capite rotundo purpureo*, *Purple round Headed Mountain Moly*. 20. *Moly Africum umbella purpurascente*, *Purplish Headed African Moly*. 21. *Moly Italicum album Caule Triangulo*, *Italian white Moly with a triangular Stalk*.

The Descriptions.

III. The first, or Theophrastus and Homer's great *Moly*. Its Root grows very great, sometimes greater than any Man's fist doubled or closed, which is one great Bulb, and not divided into Cloves as *Garlick* is, but smells strong like *Garlick*, being whitish on the out side, and green at the top, if it be but a while bare from the Earth about it. It rises up most commonly with two, but sometimes with three great, thick, long, and hollow guttered Leaves, of a whitish green color, very near to the color of a *Tulip Leaf*: having sometimes at the end of some of the Leaves, and sometimes a part by it self, a small whitish round Button, like unto a small Bulb, the like of which also, but greater, does grow between the bottom of the Leaves and the Stalk, near the Ground, which being planted when it is ripe, will grow into a Root of the same Kind. Among these Leaves rise up a round, strong, and tall Stalk, a Yard or more high, bare or naked unto the top, where it bears a great Tuft or Umbel of pale, purplish Flowers, all of them almost, standing upon equal foot Stalks, or not one much higher than another, consisting of five Leaves apiece, striped down the Back with a small pale Line, having a round Umbone or Head with some Threads about it in the midst. These Flowers abide a great while blown, before they fade, but smell not strong like those of *Onions* or *Garlick*, but have a faint scent. When they are past, the Seed comes, which is black, and enclosed in white close Husks.

IV. The

IV. *The second, or Indian Moly. Its Root is white and great, covered with a dark Coat or Skin, which encreases but little under Ground. It has such like Leaves as the former, but shorter and broader. In the middle of which rises up a short weak Stalk almost flat, not having any Flowers upon it, but a Cluster or Head of greenish, scaly Bulbs, inclosed at the first in a large thin Skin, which being open, every Bulb shews it self, standing close one unto another upon its foot Stalk, of the bigness of an Acorn, which being planted will be a Plant of the same Kind: but besides that Head, it bears small Bulbs above the Ground, at the bottom of the Leaves, next the Stalk, like unto the former.*

V. *The third, or First Bulbed Hungarian Moly. Its Root is not great, but white on the out side, very like unto the Root of Serpents Moly, described at Sect. VII. following, increasing much under Ground, and smelling strong. It has three or four broad and long, green Leaves, folded together at the first, which after open themselves, and are carried up with the Stalk, standing thereon, one above another, which is not above a Foot high. At the top of which does grow a few sad reddish Bulbs, and between them long foot Stalks, bearing Flowers of a pale purplish color. After which Flowers, black Seed ensue inclosed in roundish Heads.*

VI. *The fourth, or Second Bulbed Hungarian Moly. Its Root is like the former, and covered with a blackish purple Coat or Skin. It has narrower green Leaves than the former: the Stalk is about the same height, at the top a great Cluster of small green Bulbs, which after turn of a darker color: from among which come forth long foot Stalks, on which grow purplish Flowers.*

VII. *The fifth, or Serpents Moly. Its Root is small, round, and whitish, encreasing into a number of small Roots, no bigger than Pease, round about the greater Root. This Plant is of the Species of the Bulbed Moly, but of greater Beauty and Delight; because the Bulbs on the Heads of the small Stalks, are redder, and more pleasant to behold. The Stalk is lower, and its grassie winding Leaves, which twine themselves like Serpents (whence came its Name) are smaller, and of a whiter green color. It bears among its Bulbs purplish Flowers also, but more Beautiful, whose smell is nothing so strong as some others.*

VIII. *The sixth, or Three cornered Moly. Its Root is white on the out side, and very like the yellow Moly. It has four or five long, and something broad, pale, green Leaves, flat on the upper side, and with a ridge down the back of the Leaf, which makes it seem three square or cornered. The Stalk rises up a Foot and half high or better, and is triangular or three cornered also, bearing at the top, out of a shining Husk, several white Flowers something large and long, almost Bell fashion, with stripes of green down the middle of every Leaf, and a few Chives tipt with yellow in the middle about the Head, wherein, when it is ripe, is inclosed small black Seed. Both Root, Leaf, and Flower have a Garlick smell, but not very strong.*

IX. *The seventh, or Daffodil Leav'd Moly. Its Root is sometimes knobbed, but more often bulbed, having in the Knobs some marks of the old Stalks to be seen in them, and of a Garlick smell, by which the Plant may be known. It has many long, narrow, and flat, green Leaves, very like unto the Leaves of a Daffodil (from whence came its Name) or rather of the early greater *Leucoium Bulbosum*, or *Bulbed Violet*. From among which rise up two or three Stalks sometimes, each of them about*

a Foot and half high, bearing each at top (as all the *Molys* do) a number of small, purplish Flowers, inclosed in a shining Husk, which abide not long, but quickly fade; after which comes black Seed, like as in the others.

X. *The eighth, or Yellow broad Leav'd Moly. Its Root is whitish, two for the most part joined together, which quickly encreases and smells with a strong Garlick like scent, as both Flowers and Leaves also do. It has but one long, and broad Leaf, when it bears no Flowers; but when it bears Flowers, it has two long, broad Leaves, yet one always longer, and broader than the other, which are both of the same color, and near of the bigness of a Tulip Leaf. Between those Leaves grows a slender Stalk, bearing at the top a Tuft or Umbel of yellow Flowers out of a skinny Husk, which parts three ways, made of six Leaves apiece, laid open like a Star, with a greenish back, or out side, and with some yellow Threads in the middle, after which follows black Seed, like as in the others.*

XI. *The ninth, or Purple Mountain Moly. It has a Root which is whitish, of a strong Garlick smell, but quickly perishes with the extremity of our cold Winters, which it will not endure without defence. It has two or three Leaves, a little like the former *Yellow Moly*, but not so broad, nor so white. The Stalk has not so many Flowers thereon, but more sparingly, and of dull purple color.*

XII. *The tenth, or Purple, broad Leav'd Spanish Moly. Its Root is small, and bulbous or round, with many Fibres adjoining, from which other small Bulbs shoot. It has two broad, and very long, green Leaves, like unto the *Yellow Moly*, at Sect. X. above; but in this they encompass one another at their bottoms; between which rises up a strong round Stalk, two Feet or more high, bearing at the top out of a thin Husk, a great many fair, large Flowers, upon long foot Stalks, consisting of six Leaves apiece, spread open like a Star, of a fine diluted purple or bluish color, with several Threads of the same color, tipt with yellow, standing about the middle Head: between the Stalk and the bottom of the Leaves, some small Bulbs grow, which being planted, will soon spring and encrease. Neither the Root, Leaf, nor Flower, have any Garlick like smell in them.*

XIII. *The eleventh, or Purple Naples Moly. Its Root is white, round, and bulbous, quickly encreasing as the other *Molys* do; and has a more Garlick like smell than the other parts of the Plant. It has three or four small green Leaves, growing upon the Stalk, after its springing up, which bears a round Head of fine purple Flowers, made of six Leaves apiece, but so closing together at the edge, that they seem like unto small Cups, never laying themselves open as the others do.*

XIV. *The twelfth, or Silver Cup'd Spanish Moly. Its Root is small and round, white, and in a manner transparent, at least so shining as if it were so; and increases nothing so much as many of the other sorts. It has two or three very long Rush like Leaves, which rise up with the Stalk, or rather dye away when the Stalk is risen up, to be about three Feet or more high, bearing a great Head of Flowers, standing close at the first, but afterwards spreading much one from another, every Flower standing upon a long foot Stalk, being of a white Silver color, with stripes or lines on every side, and shaped small and hollow like a Box or Cup. The Seed has scarcely been observed with us, because it Flowers so late, that the Winter hinders it for the most part, from coming to perfection.*

Z z z z

This

This Plant has no ill smell at all, but rather pleasant, and not to be refused.

XV. *The thirteenth, or Late ripe Pine Apple Moly.* Its Root is small and round, and shining like the last; and very tender, not being able to endure our cold Winters, which commonly causes it to perish. It rises up with one long green Leaf, hollow and round unto the end, towards which, on the one side, breaks out a Head of Flowers, enclosed in a thin skin, which after it has stood for a good while, (the Leaf in the mean time rising higher, and growing harder, becomes the Stalk) breaks, and shews a great Head, or Bush of Buds for Flowers, which are thick thrust or crowded together, shaped very like to the form of a Pine Apple (from whence came the Name) of the bigness of a Wall-Nut. After this Head has stood in this manner a Month, or thereabouts, the Flowers show themselves, which are of a fine diluted or whitish purple color, with several stripes in every one of them, and of the same Cup fashion with the former, but not opening so plainly, so that they can't be discerned to be open, without good observation. It Flowers so late in Autumn, that the early Frosts do quickly spoil its Beauty, and soon cause it to rot.

XVI. *The fourteenth, or Dioscorides his Moly.* The Root of this Small Moly, is transparent within, and covered with a thick yellow Skin, of the largeness of a Helle-Nut, or somewhat bigger,

MOLY.

which sends forth three or four long, narrow, grassy Leaves which are Hollow, and a little bending downwards, of a whitish green color; among which rise up a slender weak Stalk a Foot and half high, bearing at top out of a thin skin, a Tuft of Milk white Flowers, very like unto those of Ramsons, which continue a pretty while in their Beauty, and then pass away, for the most part without yielding any Seed: the Plant nor its Root, smell little or nothing of Garlic.

XVII. *The fifteenth, or Spanish Moly of Dioscorides.* This in its Root, Leaves, Stalks, Flowers,

and manner of Growing is altogether like unto that last described, saving that this is fairer, larger, and of much more Beauty, as having its Flowers twice as big as those of the former. But it seems not to be pleased with the cold of our Winters here in England, nor can it at all endure them, unless very great care be taken of its timely Housing, for otherwise it quickly perishes.

XVIII. *The sixteenth, or Sweet smelling Moly of Mompeller.* This is the smallest and finest of all the rest, having four or five small green Leaves, almost as fine as Horse-Hairs, or like the Leaves of the Fether-Grass. The Stalk is about a Foot high, bearing about five or six or more small white Flowers, laid open like Stars, made of six Leaves apiece, of an excellent sweeter smell, resembling Musk. It Flowers late in the Year, so that if the preceding Summer is over moist, or the Autumn be early cold, it looses much of that very sweet smell, which it will have, if those Seasons be hot and dry: besides it must be carefully looked after, and timely housed in a warm place; otherwise, it will not endure with us in the Winter time.

XIX. *The seventeenth, or First broad Leav'd Hungarian Moly of Clusius.* Its Root is white and bulbous or round, having several small Bulbs growing thereto. It is several long, and somewhat broad Leaves rise from the former Root. Its Stalk rises up, to about two or three Feet high, with those Leaves thereon, but naked or bare from the middle to the top, where it bears a round Tuft of purplish Flowers, after which comes blackish Seed in three cornered Husks.

XX. *The eighteenth, or Sweet smelling Hungarian Moly.* Its Root is white and bulbous, or round like the former, with some little Bulbs growing thereto. It has a very sweet smell, and in its form and manner of growing, very like to the last, but with lesser Leaves and Flower Stalks, which bear at their tops, a Tuft of pale colored Flowers upon longer foot Stalks, hanging down their Heads, of a pretty, fine, fresh, pleasing, sweet smell, which abides not long, but quickly Vanishes. The triangular Heads that follow, bring forth blackish Seed, something like to that of Pinks or Gillsflowers.

XXI. *The nineteenth, or Purple round Headed Mountain Moly.* Its Root is white and bulbous or round also, with some small Bulbs adjoining to it. It has a few long, narrow, green Leaves set on the Stalk like unto the other; and at its top, a large Tuft of delicate purple Flowers, which grow on short foot Stalks, never fully opening themselves, and having a strong Garlic like smell.

XXII. *The twentieth, or Purplish Headed African Moly.* Its Root is bulbous or round, from whence spring up but one Stalk sometimes (and sometimes two or three) of about three Feet in height, with a few somewhat broad and long Leaves, pointed at the ends, and a little hairy about the edges. The Tuft at top of the Stalk consists of purplish Flowers each of five Leaves which grow upon long foot Stalks.

XXIII. *The twenty first, or Italian white Moly* with a triangular Stalk. Its Root is small and bulbous or round, of a shining purplish color, smelling like Garlic. This small Plant has but one or two long, hollow Leaves, but somewhat broad, and ending in a point. The Stalk is triangular or three cornered, growing to be about six or seven Inches high, with several small, white Flowers at the top.

XXIV. *The Places.* These Mols are peculiar to several Countries of the Earth, as, England, France, Germany, Hungary, Italy, Spain, Turkey, &c. but

but they all or most of them grow with us in our Gardens, being Nurst up, and carefully lookt after, but the most of them are hardly enough to endure the coldest of our Winters.

XXV. *The Times.* They Flower for the most part in the Summer time, viz. in June, and July; and their Seed is ripe in some little time after.

XXVI. *As to their Qualities, Specification, Preparations, and Virtues,* they are altogether the same with those of the Garden Garlick (tho' I think not full out so powerful) which we have declared in Chap. 307. Sect. 8. ad 22. aforegoing of this Book, so that no more need to be said of them in this place.

C H A P. CCCCXCVI.

Of M O N E Y - W O R T.

O R,

Herb T W O - P E N C E.

I. *THE Names.* It was unknown to the Ancient Greek and Latine Writers; Modern Latine Authors call it *Numularia*; from the form of its Leaf, being round like unto Mony; also *Centummarbium*, *Centummarbia*, and of *Gesner*, *Centimorbia*, from its wonderful effects in curing many Diseases: and of *Brumfelsius* and others *Serpentaria*, either because Serpents haunt it, and ly under it, or for their being hurt or wounded, they heal and cure themselves therewith by eating it: in English, *Money-wort*, *Herb Two-Pence*, or *Two Penny Grass*.

II. *The Kinds.* There are three sorts of this Plant, viz. 1. *Numularia vulgaris*, *Numularia Major*, Common Money-wort, or the Greater Money-wort. 2. *Numularia Minor*, The Lesser Money-wort. 3. *Numularia Flore purpurascente*, *Numularia Minor Flore purpurascente*, *Numularia Minima*, The smallest Money-wort, or Money-wort with purplish Flowers.

The Descriptions.

III. *The first, or Common or greater Money-wort.* It has a small, tender, and thready Root, which spreads and disperses it self far about under the Ground. From which Root spring forth several long, weak, and slender Branches, lying and running upon the Ground, two or three Feet long, or more; set on both sides with Leaves, two at a Joint, one against another, at equal distances, which are almost round but pointed at the ends, smooth, and of a good green color. At the Joints with the Leaves from the middle forward, come forth at every Joint sometimes two yellow Flowers, and sometimes but one, standing each on a small foot Stalk, and consisting of five narrow, sharp pointed Leaves, with some yellow Threads in the middle, which being past, small, round, Heads of Seed follow in their places.

M O N E Y - W O R T Small.

IV. *The second, or Lesser Money-wort.* This in its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of Growing, is so like the former greater Kind, that it needs no other Description; and differs only from it in this, that it is every ways and in all respects much lesser than it.

V. *The third, or Smallest Money-wort, or Money-wort with purplish Flowers.* The Root of this is like to those before Described, but much lesser. From which rise up, very many small, slender, creeping Branches, spreading and running on the Ground, in the same manner that the other do, which here and there put forth Fibres, and take Root again. The Leaves are small, and round, standing by couples one against another, at several Joints, and a little pointed at the ends. And out of their Bosoms as the said Joints, spring forth slender foot Stalks, bearing at their tops pretty little Flowers, much smaller than any of the former, of a whitish purple, and sometimes of a purplish red color, consisting of five little Leaves, standing together in the manner of a little Bell Flower: after which come small, round Heads, (smaller much than any of the former) in which is contained small Seed.

VI. *The Places.* The two first grow in moist Grounds, and by Hedge-sides, near to Ditches and Streams, and other watery Places, and sometimes in moist Woods, in many places of England; the first is more plentiful and common, almost every where. Gerard says, he found it on the Thames-Bank, on the side opposite to White-Hall, and almost in every Country where he had Travelled. The third, Gerard says, he found in the Bishoprick of Durham, and in two or three places in Yorkshire: It grows also on the Bogs upon the Heath near Burnt-wood in Essex.

VII. *The Times.* They all of them Flower from May, thro' June and July; and the third in August also; and their Seed is ripe not long after,

Z z z z ?

VIII. The

VIII. *The Qualities.* Money-wort is cold in the first Degree, and dry in the second. It is Astringent, Vulnerary, and Pectoral.

IX. *The Specification.* It stops all sorts of Fluxes of the Bowels and Womb, heals Wounds and Ulcers, and prevails against Consumptions of the Lungs.

X. *The Preparations.* You may make therefrom, 1. A Liquid Juice. 2. An Essence 3. An Infusion or Decoction in Water or Wine. 4. A Syrup or Lobeck. 5. A Powder of the Herb or Seed. 6. An Ointment or Balsam. 7. A Cataplasin.

The Virtues.

XI. *The Liquid Juice.* It is very Astringent, binding, and drying; and is good to stop all Fluxes of Blood in Man or Woman, whether it be a Diarrhea, Dysentery, Lienteria, Hepatick Flux, or the overflowing of the Courtes in Women; it stops also all sorts of Bleedings, whether outward, or inward, as Spitting, Vomiting, or Pissing of Blood; rectifies the Weakness of the Stomach, strengthens it, and stops Vomiting; healing all excoriations or Ulcers thereof, as also of the Lungs, and of other inward parts. Dose 3 or 4 Spoonfuls at a time either mixt with Honey, or in a Glas of red Port, or red Florence Wine, Morning and Night.

XII. *The Essence.* It has all the Virtues of the Liquid Juice, and may be given in the same manner, from 2 to 4 Spoonfuls: besides which, it is an excellent thing to heal all simple green Wounds; and to digest, cleanse, incarnate, dry, and heal all sorts of old Ulcers, not yet become cacoethick, stopping the Fluxion of sharp and moist Humors which attends them, causing them either to spread, or to be long in curing.

XIII. *The Infusion or Decoction in Water or Wine.* These have the Virtues of the Juice and Essence, but nothing near so powerful, and therefore may be taken Morning and Night, from 4 to 6 Ounces, sweetned with a little of the Syrup.

XIV. *The Syrup or Lobeck.* These are made of the Juice, the first of them with fine Sugar; the latter with Clarified Honey. They have all the Virtues of the Liquid Juice and Essence, besides which, they are excellent against Coughs, Colds, Hoarseness, Wheezings, shortness of Breath, difficulty of Breathing, Excoriations and Ulcers of the Lungs, spitting of Blood, &c. Dose from an Ounce to two Ounces, every Morning Fastings, an Hour before Dinner, and last at night going to Bed.

XV. *The Powder of Herb or Seed.* Drunk in Water in which red hot Iron has been quenched, it stops Fluxes of the Bowels: and any old Sore or running Ulcer washed therewith, it cleanses, dries and heals it in a short time: so also the dry Powder bestrewed upon the same pretty thick every time it is dress'd.

XVI. *The Ointment or Balsam.* They cleanse running Sores and old putrid Ulcers, it incarnates, dries, and heals the same: and are of especial use for Green Wounds in any part of the Body: Applied to the Gout it eases the Pain in a short time, and so strengthens the parts afflicted, as to prevent a new flux of Humors to the same.

XVII. *The Cataplasin.* The Flowers and Leaves stamped and laid upon Wounds and Ulcers, cure them: but it is much more effectual being stamped

and boiled in Oil Olive, with an addition of Rosin, Wax, and Turpentine. Authors say, that there is not a better Wound Herb than this, no not Tobacco itself, nor any other Herb whatsoever.

CHAP. CCCCXCVII. of MOON--WORT.

I. *THE Names.* This Plant was not known to the Ancient Greek or Latine Writers, though some would have it to be the *Cerastia Plinij*: some to be *Tragium secundum Dioscoridis*, which growing on the Mountains, has the Leaf of *Scolopendrium*, or *Spleen-wort*, but I think erroneously. All our Modern Authors call it *Lunaria minor* (*À foliis Lune*, *Crescentis modo falcatis*:) Gesner calls it *Lunaria petrea* & *Taura*: it is the *Ruta Lunaria* vel *jecoraria Tabernemontani*: and is called in English, Moon-wort.

II. *The Kinds.* Authors make several kinds of this Herb, as, *Lunaria minor*, the Lesser Moon-wort, of which in this Chapter, and it is thought by some to be *Hemionitis altera*, & *Selenitis*, because they make, *Lunaria major*, to be *Hemionitis*, or, Mules Fern, in Chap. 342. Also, *Viola Lunaria*, *Bulbonack*, or *Satin Flower*, which see in its order. 3. *Lunaria minor ramosa Clusij*, small Branched Moon-wort; but this latter being totally a Stranger in England, and Native of *Silesia*, we shall say no more of it in this Place.

The Descriptions.

III. *The first, or small Moon-wort, has a small and Fibrous Root, from which Springs up usually but, but one dark, green, thick, and fat Leaf, standing*

Small Moon wort

upon

upon a short foot Stalk, not above two or three fingers breadth; but when it comes to Flowering, it then bears a small, slender Stalk, or about 4 or 5 Inches high, having but one Leaf growing from it in the middle thereof, which is much divided on both sides, sometimes into 5 or 7 parts, or more on a side, each of which parts is small next the middle Rib, but broad forwards, and round pointed, resembling therein an half Moon, (from whence came the Name) the uppermost parts or divisions being less than the lower. The Stalk rises above this Leaf 2 or 3 Inches, bearing many Branches of small, long Spikes or Tongues, every one of them almost like to the spiky Head of *Adders-Tongue*, of a brownish color, which whether they are to be called Flowers or Seed, is scarcely determinable. These Spikes after they have continued a while, resolve into a mealy dust. Sometimes this Plant is found with several such like Leaves, as the Leaf above described, with so many Branches or Tops arising from one Stalk, each divided from the other.

IV. *The Places.* It grows on Hills and Heaths, yet where there is much Grass, for therein it delights to grow. *Gerard* says he found it growing about *Bath* in *Somersetshire* in many places, especially at a place called *Carey*, two miles from *Bruton*, in the next Close to the Church Yard: on *Cocks-Heath*, between *Lowse* and *Linton*, three miles from *Maidstone* in *Kent*; as also in some Grounds by *Colchester*, in the Ground of the then *Mr. George Sayer* called *Miles-end*: it grows likewise on the side of *Black-Heath*, near the Stile leading to *Elibam House*, about an hundred Paces from the Stile: and in *Lancashire* near to a Wood called *Fairest* by *Latham*: in *Nottinghamshire* by the *West-wood* by *Gringley*, and at *Weston* in the *Layfield* by the West side of the Town: in *Bishopscleeve* at *York*: near unto *Wakefield*, in the Close where formerly *Sir George Savil's* House stood, called *Heath Hall*, and in many other places.

V. *The Times.* It is to be found only in *April* and *May*, for in *June* and the following Months, when the hot Wether comes, it for the most part withers and dyes away.

VI. *The Qualities.* It is cold in the first Degree, and drying in the second; Absterfive, Astringent, and Vulnerary.

VII. *The Specification.* It stops fluxes of Blood of all sorts, whether inward or outward, Vomiting, and other fluxes of the Bowels, fluxes of the Womb, and heals all sorts of simple Wounds, whether inward or outward, Ruptures, Fractures, &c.

VIII. *The Preparations.* You may have therefrom, 1. A Juice or Essence. 2. A Decoction or Infusion in Wine. 3. A Balsam or Ointment. 4. An Oil. 5. A Cataplasm.

The Virtues.

IX. *The Juice or Essence.* They are most excellent things for all Wounds whether inward or outward, they stop the Whites in Women, as also the overflowing of the Terms, and all sorts of Fluxes, of the Bowels as Diarrhæa, Dysenteria, and Lien-teria, as also the Hepatick Flux, and all other fluxes of Blood, whether, by Spitting, Vomiting, or by Urine, as also inward Fluxes of Blood, made by Wounds. They stop Vomiting, strengthen the Stomack, and other Viscera, and restore the Tone of the Bowels being hurt. Dose from 2 Ounces to 4. in any fit Vehicle.

X. *The Infusion or Decoction in Wine.* They

have all the Virtues of the Liquid Juice or Essence, and may be given Morning, Noon, and Night, from 4 to 6 or 8 Ounces, sweetened with Syrup of *Red Roses*, or of *Covegiliflowers*.

XI. *The Balsam or Ointment.* They are excellent for healing of Green Wounds, digesting, cleansing, incarnating, and drying, or healing of old, rotten, putrid, and running Sores and Ulcers, bringing them to a speedy Cure: They are good also to consolidate Ruptures, Fractures, and Dislocations, being duly outwardly applied, the Juice or Essence being also taken at the same time.

XII. *The Oil by Infusion.* It is an excellent thing against Burnings and Scaldings however made, and being timely applied, presently takes out the Fire, eases the Pain, and in a short time after cures the same.

XIII. *The Cataplasm.* It is good against Ruptures, Gaultings in any part, Inflammations, and consolidates Fractures and Dislocations. And timely applied, it dissolves simple Contusions wherefore, prevents Inflammation and Apostematation, and speedily restores the part.

MONKS-HOOD, see *Helmet Flower*, Chap. 354.

C H A P. CCCCXCVIII.

Of MOSS Ground, or Land.

I. *THE Names.* Moss is called in *Greek*, *Βρύον* & *σπαραγγιον*; in *Latine*, *Muscus*, which is *Byron Plinij*: in *English*, *Moss*.

II. *The Kinds.* There are three Generick Species of this Plant, viz. 1. *Βρύον χλωρον*, *Muscus Terrestris*, Ground or Land Moss, of which in this Chapter. 2. *Βρύον δασυκλον*, & *Τρυον*, & *σπαραγγιον*, *Muscus Arboreus*, Tree Moss, of which in Chap. 499. 3. *Βρύον θαλασσιον* & *καλαμιν*, *Muscus Marinus*, Sea Moss, of which in Chap. 500, following.

III. *The Species of the Land or Ground Moss.*

1. *Muscus Terrestris vulgarissimus, vel Terrestris Lobelij* & *Dodonæi*; *Muscus Hortensis Tragi* *Bauhini*, Our common Ground Moss. 2. *Muscus Terrestris vulgaris alter Gerardi*, *Muscus denticulatus similis Bauhini*, *Muscus montanus Tabernemontani*, Our other ordinary or common Ground Moss. 3. *Muscus Terrestris scoparius*, *Muscus scoparius Lobelij*, *Selago tercia Thalij*, Beesom Moss. 4. *Muscus Clavatus, sive Lycopodium, Lobelij* & *Dodonæi*; *Muscus Terrestris, Matthioli* & *Tragi*; *Seluginis Species altera Thalij*; *Muscus Ursinus Gesneri*, Club Moss, or Wolfs Claw Moss, greater and lesser. 5. *Muscus denticulatus major* & *minor*; *Muscus Terrestris aliorum*; *Muscus Lusitanicus Clusij*, Toothed or Dented Moss, greater and lesser. 6. *Muscus Pennatus major* & *minor*, Winged Moss greater and lesser. 7. *Muscatus spicatus repens*, Creep-

Creeping Mofs with spiked Heads. 8. *Muscus crellus Ranosus major & minor Bauhini*, Branched Mofs greater and lesser. 9. *Muscus parvus stellaris Bauhini*, *Muscus in Ericetis proveniens Lobelij*, Heath Mofs. 10. *Muscus Stellatus Roseus Bauhini*, Rose or Star-like Mofs. 11. *Muscus Pyxidatus Lobelij*, of which *Bauhinus* makes two sorts, viz. *Muscus Pyxiodes Terrestris*, & *Pyxiodes Saxatilis*, Cup Mofs, or, Cup-like Mofs. 12. *Muscus Corniculatus, Gerardi & Tabernemontani*, *Muscus Cernoides major & minor Bauhini*, Horned Mofs. 13. *Muscus minimus Terrestris Tragi*, the smallest Ground Mofs. 14. *Muscus Abietis facie Bauhini*, Fir-like Mofs. 15. *Muscus Filiceus major & minor, Gerardi & Tabernemontani*, minor *Bauhini*, Fern-like Mofs. 16. *Muscus Polytrichoides Bauhini*, *Muscus Capillaris, five Adiantum aureum majus & minus Gerardi*, Milden-hair Mofs, or Golden Maiden-hair greater and lesser, as *Gerard* calls it. 17. *Muscus Saxatilis Ericoides Bauhini*, Stone Heath Mofs. 18. *Muscus Terrestris Coralloides Baubini*, Hoary Coral-like Mofs. 19. *Muscus Terrestris Coralloides rufescentibus Cornibus Bauhini*, Coral like Mofs, with reddish Horns. 20. *Muscus Corallinus Montanus, Muscus Corallinus, five Corallina Montana Tabernemontani*, Mountain Coralline-like Mofs. 21. *Muscus Coralloides Saxatilis*, Rocky Coral-like Mofs: this *Columna* calls *Lithobryon Coralloides*. 22. *Muscus Clavatus Cupressi formis, Sabina Sylvestris, Gesneri & Tragi*, *Selaginis Pliniane prima Species Thalij*, *Chamaecyparissus Gerardi, Tabernemontani & Turneri*, Mofs Cypress, or Heath Cypress, called also Cypress Mofs, of which we have already Treated at large in Chap. 188. foregoing.

with many small single Stalks, about a Foot in height sometimes, and very oftentimes not half that height, with a great number of soft Leaves like Hairs, growing thick and close together, the tops of which, in the hottest time in Summer will be somewhat round and whitish; the whole Tussock is often found differing in color, being either green or reddish, or of a whitish yellow color.

V. The second, or Our other ordinary or common Ground Mofs. Its Roots are like the former, and it grows up with many branched Stalks, of long winged, but short green Leaves, almost like Heath, smooth and soft, not hard like Heath. It spreads much in the Ground, and rises not above half a Foot high: this Plant is more common in Germany, and other Foreign Countries than with us.

VI. The third, or Beesom-Mofs. It has a long bushy fibrous Root, and takes its Name from the manner of its growing, which is from a small Head below, sending up several shining, blackish, purple Stalks, of winged green, Thread-like Leaves, about twelve Inches high, which spread themselves out broadest in the middle, at the top of which breaks forth sometimes small yellowish Heads, which quickly fall away, without any Seed following them.

VII. The fourth, or Club-Mofs, or Wolfs-Claw-Mofs, greater and lesser. These run upon the surface of the Earth to a great length, breaking into other long, round Branches, shooting forth fibres into the Ground as they creep

CLUBB: MOSS greater.

The Descriptions.

IV. The first, or Our common Ground Mofs. Its Roots are very short, which are fastened in the Earth, from which the Herb springs up very thick, together

along, being made of many short yellowish, green, hairy Leaves: at the Joints of the Branches, grow in several places, two or three small, round, long, yellowish, scaly Heads, like

6 L V B :: M O S S lesser.

like the Catkins or Bloomings of the Hallel-Tree, which as in all the other Mosses come to nothing.

VIII. The fifth, or Toothed or Dented Moss greater and lesser. Both these sorts of Mosses grow one like the other, but one larger than another, and each of them somewhat like the last, Rooting in

M O S S :: T O O T H E D.

divers places, as they run on the Ground. The Stalks are almost as small as Hairs, upon which grow small Leaves thick set together, as if they were Scales, laid close one to another; the ends of them, sticking out like Teeth.

IX. The sixth, or Winged Moss greater and lesser. Both these Mosses need also but one Description, not differing but in the largeness and multitude of their Branches one from another: they creep on the Ground, and Root as they run: whose Stalks and short Branches are thick set with fine yellowish, green Leaves like Wings on both sides, from whence it took its Name. They grow in Woods, as also upon the Rocks and Stones.

X. The seventh, or Creeping Moss with Spiked Heads. This grows near to, and under Trees, creeping far abroad, with thick and long Branches, which send forth many fine Leaves, set close together, in manner of long Spiked Heads, one sort being green, and another white.

XI. The eighth, or Branched Moss greater and lesser. The greater Branched Moss grows thick and close together like a Turf, or Hassock of high Grass, whose Stalks are 4 or 5 Inches long; spreading into Branches of 2 or 3 Inches a piece, and those into others again; all which are covered with very fine Hair like Leaves, among which shoot forth small naked Stalks of an Inch long, with small yellow round Heads like Wheat Corns. The lesser sort hereof has its Stalks shorter, and its Leaves are so small that are they scarcely to be discerned.

XII. The ninth, or Heath Moss. It grows much on dry heathy Grounds, and being a small sort of Moss, it rises up with several

Heath
Moss

hard Stalks of small short Leaves, and at the top, many others set thick and round like a Turf.

XIII. The

XIII. The tenth, or Rose or Star like Moss. It is a small Moss which grows upon Rocks and Stones, and scarcely rises above an Inch in height, having many small, pale, green, sharp pointed Leaves, set at the tops of their small Stalks, in manner of a Rose, spreading forth like a little Star.

XIV. The Eleventh, or Cup Moss, or Cup like Moss. The Leaves of this Moss ly like Liver-wort, creeping upon the Ground, and are of a whitish yellow color, as are the small hollow Leaves like Cups,

609 :: 11033.

which rise from them. There is another Kind hereof, growing not on the Ground as the former, but on Rocks and Stones, whose Cups are smaller, more in number, and not so white.

XV. The twelfth, or Horned Moss. This grows on those Rocky Barren Hills, and Stoney or Rocky Grounds, where almost nothing will grow. It rises out of the Ground with several slender, weak, and somewhat broad Stalks, three or four inches high, naked and without Leaves, from the bottom to the top, but parted into smaller Branches, and they again into lesser, which are forked at the ends like unto Horns, of a dusky white color.

XVI. The thirteenth, or smallest Ground Moss. This small Kind of Moss usually grows with us, not only upon those Grounds, which are not stirred or turned up for two or three years together, but also in Flower Pots of Earth in Gardens many times, which have not been lately stirred. It is nothing else but a number of short green Hairs, matting upon the Ground, which in the heat of Summer, and sometimes sooner, will send forth small short Stalks an Inch high, with small yellowish or greenish Heads on them. This tho' best known to many, has been little regarded by most, and not mentioned by any before, except Tragus, and them which have followed him.

XVII. The fourteenth, or Firr like Moss. It grows close upon the Ground, creeping thereon with several long Branched Stalks, with fine, short, hairy,

green Leaves, set on both sides of the middle thereof, resembling a Firr-Tree Branch, from whence it took its Name.

XVIII. The fifteenth, or Fern-like Moss. There are several Kinds of this Moss, some bigger, and some lesser than others, all of them rising up with several Stalks, some blackish, some reddish, and fine Leaves on them, much like to Fern Leaves, but in some more finely cut or jagged into several parts, than in others; on the tops of the Branches of the lesser sort, hang small, round, pointed, crooked Heads.

XIX. The sixteenth, or Maidenhair Moss, or Golden Maidenhair greater and lesser, as Gerard calls it. There are three Kinds of this Moss, 1. One that has many short Stalks thick covered with short, but somewhat hard, rough, Hair-like Leaves, growing in wet Grounds. 2. Another which is less in each part, and the Leaves not rough or hard at all. 3. Another which is the least sort, and the Leaves smoothest: These two last grow upon old Walls. Gerard says, that the first of these Kinds has Stalks about an handful high, covered with short Hairs standing very thick together, of an obscure yellow green color, out of which Stalks spring up sometimes very fine naked Stems, and somewhat black, upon the tops of which hang as it were little Grains like Wheat Corns: Its Roots are also very slender and extremely fine. 2. The second differs only in magnitude from the former, and has many hairy Threads upon its Branches. 3. The third which is the very least of all (and possibly the least of Plants which grow) has only three or four of those hairy Threads close to the Root.

XX. The seventeenth, or Hoary Coral-like Moss. This small Moss has many small Hair-like Leaves, next the Ground, like unto the Common Ground Moss, among which rise up, rough Stalks, three or four Inches high, in some places bare of Leaves, and covered in the rest, with many such like Leaves, as are growing on the Erica Cornis folio, but without order, on the tops of each whereof stands a small Head.

XXI. The eighteenth, or Hoary Coral-like Moss. This is all of a hoary white, growing about a Foot high, whose upright Branches are thick, solid, and not hollow, divided into many Ramifications, each whereof is like unto a Stags-Horn, and sharp or small at the end.

XXII. The nineteenth, or Coral-like Moss with reddish Horns. This Moss grows among the ordinary, or common Ground Moss. And is a delicate sight to behold, the pale, green, ordinary Moss to grow on the ground, and this Moss being all white, to grow out from among it, parted like Coral into many Branches, hard or rough in handling; but the ends or tops of them are all of yellowish or reddish color, like small, hard, or rough Horns.

XXIII. The twentieth, or Mountain Coraline-like Moss. This is a small low, whitish, dry Herb, with small hollow Stalks, not stony or hard at all, but finely cut and divided into many parts, much resembling the true Coraline: this is oftentimes found upon dry heathy Grounds.

XXIV. The twenty first, or Rocky Coral-like Moss. This grows on Rocky Hills among other Mosses in Naples, as Columna says, whose Branches are many, and each ending in a two forked like Horn, something like the double forked Horn of a Stag, being hollow and white within, and green without: but of an ill earthy smell.

XXV. The Places. They most of them grow upon barren, heathy, dry and rocky, or stoney Grounds, according as is exprest in their several Descriptions. But the *Majus Capillaris*, viz. the sixteenth

sixteenth Species, is seldom found but in wet woody Grounds, upon Bogs and Moorish places, yet sometimes it has been met with in shadowy dry Ditches where the Sun does not come. Gerard says, he found it in great abundance in a shadowy Ditch upon the left hand near unto a Gate which leads from *Hampsted-Heath* towards *High-Gate*.

XXVI. *The Times.* They all flourish chiefly in the *Summer Months*.

XXVII. *The Qualities.* They are cold in the first Degree, and dry in the second; Astringent, Repulsive, Vulnerary, Diuretick, Stomack and Nephritick; and of them all, the first, fourth, and eleventh, viz. the *Common-Moss*, the *Club-Moss*, and the *Cup-Moss*, are said to be the most singular and effectual.

XXVIII. *The Specification.* The first and fourth are good against the Strangury, to provoke Urine, and break and expel the Stone. The *Cup-Moss* effectually helps the Chin-Cough in Children. The *Club-Moss* is said to recover Loaf or Prickt Wine. They all of them are good to heal Wounds and old Ulcers, to stop all sorts of Fluxes of the Bowels, as also Fluxes of Blood.

XXIX. *The Preparations.* You may have therefrom, 1. *A Decolion in Wine.* 2. *A Powder.* 3. *A Cataplasm.*

The Virtues.

XXX. *The Decolion of the Common or Club-Moss in Wine.* Being drank for some time is said to be drying and Astringent, to stop Fluxes and Bleedings of all sorts, and is a singular good thing to break Friable Stones in the Reins or Bladder, and to expel the fame, as also Sand, Gravel, or Tartarous Matter affecting those parts: it opens their obstructions, provokes Urine, and gives ease in the Strangury. *The Decolion of the Cup-Moss in Water or Whey,* effectually cures the Chin-Cough in Children; being taken for several days together.

XXXI. *The Powder.* Made of any of the Mosses and given to a Dram, it has all the former Virtues, and outwardly applied it stops Bleeding upon the spot, and dries up old Sores and putrid running Ulcers. The *Powder of the Cup Moss* given to Children for several days together, Morning, Noon, and Night, it certainly cures them of the Chin-Cough; more especially if it is given in the *Decolion*.

XXXII. *The Cataplasm.* Moss bruised and boiled in Water, and applied to any Inflammation, or pains arising from a hot cause, allays the heat, and eases them; and therefore it is applied by many to places affected with the Gout, and that as it is said with good success.

XXXIII. *An Observation.* *Club-Moss* being hung in a Vessel of Wine, that has lost its Vigor, and is become flat or prickt (so much as is convenient for the bigness of the Vessel) is said in short time to recover it again: for which reason *Brunfelsius* called it *Weinkraut*, or the *Wine Herb*.

C H A P. CCCCXCIX.

of MOSS Tree.

I. **T**HE Names. It is called in *Arabicke*, *Aruck*, and *Usne*: in *Greek*, *Βύσσων*, *Βύσσων*; in *Latine*, *Muscus Arboreus*, & *Muscus Quernus*, (because it is mostly to be found growing upon Oak Trees:) By the Apothecaries it is called *Usnea*, (which is a Name also given to the Moss growing upon Humane Sculis:) and in *English* it is called, *Tree-Moss*; and if it grows upon Oak Trees, then *Oak-Moss*.

II. *The Kinds.* There are several Species of this Moss, viz. 1. *Muscus Arboreus vulgaris*, *Muscus Quercinus vulgaris*, Our common Tree-Moss, or Oak-Moss. 2. *Muscus Arboreus Nodulosus sive Gemiculatus*, Knobbed or Knead Tree-Moss. 3. *Muscus Quercinus Fenniculatus*, Fennel-like Oak-Moss. 4. *Muscus Quernus, vel Quercinus fruticosus capitatus cavis*, Tree or Oak-Moss with hollow Heads. 5. *Muscus quernus vel quercinus alter latifolius Coralloides*, Oak Moss with broad horned Leaves. 6. *Muscus aridus crustatus*, Crusty dry Moss or dry Liver-wort or Lung-wort. 7. *Muscus Pulmonarius*, Lichen Arborum, Moss Lung-wort, or Tree Lung-wort, or Oak-Lungs, of which we have already discoursed at large in Chap. 458. foregoing.

The Descriptions.

III. *The first, or Common Tree-Moss, or Oak-Moss.* This generally grows on all Trees, and is nothing else but a number of Hairs or small Threads, proceeding from the Bodies and Branches of them, in

Oak or Tree Moss.

ERRATUM.

Page 728. *Sect. XX. line 35. for, Hoary Coral-like Moss; read, Stone Heath Moss.*

some shorter, in others longer; all for the most part hoary, or of a whitish gray color, which have neither Root, nor Stalk, nor flower, nor Seed. Some-
s A

times this Moss is of a reddish color, and sometimes blackish, which is the worst of all.

OAK MOSS.

IV. The second, or Knotted or Kneed Tree-Moss. This is of a grayish color, hanging from the Trees, with a large spread Brush of Hairs, a Foot in length, and sometimes half a Yard long, with several small knotted Joints like Beads, growing upon them towards the lower end, which are hollow, and grove so as if they were strung together, some being lower, and others shorter than the rest.

V. The third, or Fennel-like Oak-Moss, This usually grows upright on the Bodies, and the older Arms and Branches of old Oaks, and sometimes on

OAK--MOSS Fennel-like.

O R,

OAK-MOSS Branched Flowering.

Beeches also, fastned by a small brackish Root into their Bark, and from thence sends forth several slender, blackish, branched Stalks about two Inches or more high, with a number of most fine grayish Fennel like Leaves, which smell something sweet: at the tops whereof stand small, round, hollow Vessels, a little rough or hairy about the Brims, which quickly fall away, without any Seed following them.

VI. Johnson upon Gerard thus Describes this third sort. There is oftentimes found upon old Oaks and Beeches and such like over grown Trees, a Kind of Fennel like Oak-Moss, (called also Oak-Moss Branched Flowering) having many slender Branches, which divide themselves into other lesser Branches, on which are placed confusedly, very many small Threads of a greenish ash color: upon the ends of whose tender Branches sometimes there comes forth a Flower, in shape like unto a little Buckler, or hollow Mushroom, of a whitish color tending to yellowness, and garnished with the like Leaves of those upon the lower Branches.

VII. The fourth, or Tree or Oak-Moss with hollow Heads. This has hollow Stalks, with broad flat Leaves, somewhat hairy on the edges. The Heads are also hollow with a blackish Stile or Pestle in the midst of them, and sometimes encompassed about with a dented Verge. This has several short Branches spread divers ways, and is wholly of a grayish ash color.

VIII. The fifth, or Oak Moss with broad homed Leaves. This is of a whiter ash color, branching it self into many thick and broad parts, like unto the Horns of a Stag, bearing at the tops of them, certain small Vessels, of the bigness of Cicets or Chich Pease at biggest. This Moss does sometimes grow Luxurious swelling greater from the bottom to the top.

IX. The sixth, or Crusty dry Moss, or Dry Liverwort or Lung-wort. This does not much differ in form and color from the Moss or Tree Lung-wort, of which we have already treated in Chap. 458. but in its being dryer, or more crusty or hard: It grows as well on Trees as on the cleft Poles and Shingles made of Oak, as also sometimes upon Stones and Rocks on the Ground, and sometimes upon the very Common Moss it self, as it has been found sometimes growing in Windfor Park.

X. The Places. The first has been found growing upon Trees in many Forrests and Woods throughout all England, as also through the whole Continent of Florida, where it grows very large upon Oaks to admiration, so that in Carolina, they have to my knowledge made it the Winter Provision for their Cattel. It grows mostly upon Oaks and that in vast plenty. It grows also upon other Trees. It grows on the Arms and Bows of the Ilex, or Ever-green-Oak, as also upon the Larch Tree which is very white and sweet: that is an incomparable good Kind which grows on the Poplar Tree: but that which grows upon the Cedar is said to be the best of all others, it being very white and sweet: and Matthioli declares that to be the best, which is the whitest and sweetest. Yet some others think that to be as good which is found upon the Firr, Pine, and Pitch Trees. The second grows also frequently in England and other places. The third which grows many times upon old Beeches as well as upon Oaks, as also the fourth, fifth and sixth, are found frequently in the Woods or Wildernesses through the vast Continent of Florida, and in many other places of the West-Indies. The sixth and seventh are found frequently growing upon Oak Boards, Planks, Shingles, and Timber, throughout all the Brittish Isles.

XI. The

XI. *The Times.* They grow and flourish all the year, and are in a kind of Vigor, even in *Winter* time, in the middle of Frost and Snow.

XII. *The Qualities.* They are temperate in respect to heat or cold, of a Drying and Digestive quality withall, as *Galen* says, especially that which grows upon the great *Cedar*.

XIII. *The Specification.* The Virtues which the Ancients attributed unto *Moss*, are wholly to be understood concerning those which grow upon Trees: and each *Moss* does much partake of the Nature of the Tree on which it grew, or from whence it was taken. As that of the *Oak* is more binding, and better against Fluxes of the Bowels, Catarrhs, &c. than those of the *Cedar*, *Larch*, *Beech*, *Poplar*, *Fir*, or *Pine Trees*; and is more powerful than any of those against Vomitings, and Fluxes of Blood in any part.

XIV. *The Preparations.* You may have therefrom, 1. An Infusion or Decoction in Wine. 2. A Powder made of the substance of the Moss. 3. The Oil or Ointment.

The Virtues.

XV. *The Infusion or Decoction in Wine.* Being drunk it is good against Reachings and Vomiting, settles a troubled Stomach, and allays the Hiccough, comforts the Heart, as *Avicenna* says, and causes deep Sleep as *Serapion* affirms. It stops all Fluxes of the Bowels, and all internal Fluxes of Blood, whether of the Lungs, Reins or Guts: and stops the overflowing of Womens Courses being taken inwardly, and outwardly used as an Injection up the Womb with a proper Womb Syringe.

XVI. *The Powder.* It has all the Virtues of the Infusion or Decoction afore declared, and may be given from a Scruple to a Dram, made up into a Bolus with a little Mithridate or Venice Treacle, or given in any other proper Vehicle. It stops all inward Bleedings being given as aforesaid, or in any Scurvy red Wine: And it stops any outward Bleeding of Wounds, &c. being outwardly applied dry, either alone, or mixed with fine Bole, in fine Powder. And is said to be available against the Dropfie being taken in strong Drink or Wine for some time together.

XVII. *The Decocted Oil or Ointment.* The first is made by boiling in Oil Olive, &c. The second by Boiling in Hogs Lard. Being applied to the Temples or Forehead, it wonderfully eases the pain thereof which comes from a hot Cause: and stops the defluxion of hot sharp Rheums and Humors flowing thence to the Eyes and other Parts. The Ancients much used these Tree Moss's in their Ointments, against Lassitudes, to strengthen the Nerves, and comfort Joints and Parts which have been weakened by hurts, blows, and affluxes of Humors.

XVIII. *The Qualities, Specification, Preparations, and Virtues* of the seventh Species, viz. of the Moss or Tree Lung-wort, called by some Oak-Lung, you may see at large in the afore cited Chap. 458. from Sect. 7. ad 12. inclusive. Physicians use it against the most inveterate Consumptions, and that with good success, and indeed against most Diseases of the Lungs, as Colds, Coughs, Stuffings, Wheezings, Hoarseness, shortness of Breath, difficulty of Breathing, as also against all sorts of Fluxes of the Bowels. And Shepherds give it to their Cattel for the same purposes, mixt with a little Salt, and that with good Success. It is probable also, to be put into Lotions, to stop a defluxion of Humors

upon old Ulcers and running Sores in any part of the Body, as also Ulcers in the several parts of Man or Woman, the same being wash'd therewith two or three times a day.

CHAP. D.

Of MOSS Sea.

I. *THE Names.* It is called in *Arabick*, *Thahaleh* & *Tbaleh*: in *Greek*, *Βρύα θαλάσσιον*: in *Latine*, *Muscus Marinus*: and in *English*, *Sea Moss*.

II. *The Kinds.* There are several Species of *Sea-Moss*, as, 1. *Muscus Marinus virens Feniculatus*, *Muscus Marinus Herbaceus mollior Cesalpini*, short Fennel-like *Sea-Moss*. 2. *Muscus Marinus Ferulaceus*, *Fucus Ferulaceus Lobelij*, long Fennel-like *Sea-Moss*. 3. *Muscus Marinus Abrotanoides*, *Fucus Marinus foliis Abrotani Maris Lobelij*, *Muscus Marinus foliis Abrotani Lugdunensis*, Southernwood-like *Sea-Moss*. 4. *Muscus Marinus Neapolitanus*, *Muscus Marinus Clusij*, *Palmula Marina Imperati*, Neapolitan *Sea-Moss*. 5. *Muscus Marinus Venetus*, *Costi Indici radices effigie Pona*, The Venetian *Costus*-like *Moss*. 6. *Muscus Marinus Capellaceus Dioseoridis*, *Muscus Marinus Dioseoridis*, *Fucus Capellaceo folio Theophrasti* (as *Lugdunensis* thinks) The soft *Sea-Moss*. 7. *Muscus Maritimus Tintorius*, *Alga Tintoria Lugdunensis*, *Fucus sive Alga Tintoria*, red *Sea-Moss*, or red Dying *Sea-Moss*. 8. *Muscus Marinus Argentens Plumiformis Donati*, Silver Feather-like *Sea-Moss*. 9. *Muscus Marinus Aureus*, *Penna Marina Aurea Donati*, Golden Feather-like *Sea-Moss*.

The Descriptions.

III. *The first*, or short Fennel-like *Sea-Moss*. It grows up from blackish, round, and Fibrous Roots, with many fine short Leaves like Fennel, of an herby green color, among which comes forth, an herby Stalk, with such like Leaves on it, and having several swollen Eminences thereon.

IV. *The second*, or long Fennel-like *Sea-Moss*. The Leaves of this *Sea-Moss* are long and fine, like unto those of the Ferula, or Fennel Giant, growing from Stalks of almost a Foot long, and is divided into many Branches. It springs from Stones, Rocks and the like.

V. *The third*, or Southernwood-like *Sea Moss*. This springs up also from Rocks with thick Stalks and Branches, having thereon fine cut Leaves, something like unto Southernwood, but much bigger, and of a brownish red color.

VI. *The fourth*, or Neapolitan *Sea Moss*. This likewise grows from some Stone or Rock, and rises up with a Stalk of about 4 Inches or more high, with several Branches on them on both sides, and they again divided into lesser, all of them plentifully stored with very fine Leaves, as small as Camomil Leaves, or finer than they, if any of the two be finer, soft in handling at first, easy to be bended, green below at the lower part, and purplish above, and withall Transparent, if they be interposed to the light. This is not so brittle as Coralline when it

is dried, and grows more rough by the dryness: it has a very Salt taste, and being soaked a while in Water, grows pliant and soft again.

VII. The fifth, or Venetian Cottus-like Sea-Moss. This grows on Rocks in the Sea, which by the often agitation of the Water, is broken from it, and carried to the Shore, not having any Root, but being made as if it were a Tust of small Sticks set together, which being dry, much resembles the Root of Cottus Indicus, but whiter: and being moistened again, opens it self into form, being full of Salt, much like to small Sand.

VIII. The sixth, or Soft Sea-Moss. This is like unto those Mosses which grow upon the Ground or on Trees without any Roots, and grows only upon Rocks, or Shells of several Shell-Fishes, being a soft Herb, composed wholly of woolly white Hairs without any Branch or Stalk, and is oftener found white than reddish or gray, but seldom or never green. There is also another small sort hereof, found growing on the Stones by the Sea side, as also sometimes on Wood, and is likewise sometimes cast up by the Sea on the Shore among the Alga, or Sea Wrack, of several sorts growing something like to the former or Ground Moss, but that it is white, and a little saltish and binding.

IX. The seventh, or Red Sea-Moss, or Red Dying Sea-Moss. This is a small sort of Moss, and much like to the fourth Species, or Neapolitan Sea-Moss, it is furnished with a greater store of soft Stalks, but fewer Branches, and with as fine small Leaves on them like unto Fennel, of a reddish color, but with some whiteness mixed together. This is used by several Dyers to stain and strike a deep crimfon color, or a reddish purple, which will last long.

X. The eighth, or Silver Feather like Sea-Moss. This most beautiful Moss grows on Rocks in the Sea, upon the dry Shells of Fishes, and is oftentimes found wrapped among the Alga, or Sea-Wrack, or Sea-Weeds, when cast upon the Shore, growing up with many Stalks, and spreading it self out into many particular Branches, made as it were all of Hairs like other Mosses, but very much representing several sprigs of Feathers, of so pure a white Silver-like color, that it is to be wondered at, that ever any thing should become so white by Nature, or be made so white by Art.

XI. The ninth, or Golden Feather-like Sea-Moss. This is a Moss also of excellent form and beauty, Branching it self out into several Sprigs, resembling the Natural form of small long Feathers. The Branches are filled with Leaves on both sides fine like Hairs: and both Stalks and Leaves are of a most shining Gold color, beautiful to behold, and have a great resemblance of the Spartum Austriacum, Clusij, which we call Feather-Grass.

XII. The Places. The Descriptions shew that most of them grow upon Rocks, Stones, and Shells in the Sea, and on the Shore: scarcely any of them growing out of the Ground except the first: some of them are found in the Seas and on the Shores of other Countrys; and some or most of them on our own Coasts.

XIII. The Times. They grow and flourish all the year long, and live Summer and Winter very much alike.

XIV. The Qualities. They are cold and dry in the first Degree, are Astringent, Anodyn, Vulnerary, and Nephritick.

XV. The Specification. They cool Inflammations, gives ease in the Gout, kill Worms in the Body, stop fluxes, stay Vomiting, resist Fluxions of the Eyes or other parts, Stop fluxes of the Belly, prevail against Sand and Gravel in Reins, and Bladder, and cleanse, dry and heal old running Sores, and foul putrid Ulcers.

XVI. The Preparations. You have therefrom only, 1. A Decollion in Wine. 2. A Powder of the whole Body of the Moss. 3. A Cataplasim.

The Virtues.

XVII. The Decollion of the fourth and sixth Species in Wine. Injected into the Bladder or Urethra with a Syringe, it absterges very much, wastes Carnosities or Caruncles in those parts which stop the Urine, and heals Ulcers in the Bladder and Urethra; it said to have cured one who was troubled with that Disease in a very short time. And for this reason it is very probable, that it may be very effectual in healing a Virulent Gonorrhoea in Man or Woman, universals being first premised.

XVIII. The Powder. Given from a Scruple to a Dram in some fit Vehicle, it is said to kill Worms in Children, but it ought to be made of the fourth and sixth Kinds. The Powder of the fourth Kind is said to be very effectual for Watering Red Eyes, if mixt with Kennel Water, and put into them. And the same Powder taken with Vinegar stops Vomiting and strengthens the Stomach. The Powder of the fifth Kind, or Venetian Sea-Moss, is good to cleanse foul Ulcers of all sorts, whether inward or outward, and being given to a Dram in Wine, it expels Sand and Gravel from the Reins, and gives ease in the Strangury.

XIX. The Cataplasim. It is made of any of the Mosses being green and fresh, by beating a little in a Mortar. Being applied to Inflammations, it cools them, and eases their Pains: And in a hor Gout, it gives present ease, because it dries, thickens and cools: and withal it resists the Fluxion, and admirably strengthens the part afflicted.

XX. The Virtues of the eighth Species, or Silver Feather-like Sea-Moss. Applied Pulvis-wise with Vinegar, it eases the Pains of the Spleen, it also dissolves stumous Swellings or kernels in the Neck and Throat, or other Parts. The Decollion in Wine, given to fix or eight Ounces at a time, or the Powder given to a Dram at a time in White Port or Lisbon Wine, abundantly provokes Urine, and are profitable against the Dropsy: they cleanse the Reins, Ureters, and Bladder, from small Stones, Gravel, Sand, and other Tartarous Matter. The Powder may be given in Wine as aforesaid, or in Distilled Water of Erysimum, or Hedge-Mustard, or of Sea Holly, or of Parsly, or of Hydropiper, mixt with an equal proportion of Juice of Limons.

CHAP. DI.

of MOTH - WORT.

OR,

Golden CUD W E E D.

I. **THE** Names. It is called in Greek, *Εαιχερα*: in Latin, *Melichrysium*, *Eliochrysium*, & *Tincaria*, also *Coma aurea*, *Gerardi*, & *Aurelio Gaze*: in English, *Mothwort*, *Golden Moth-wort*, *Golden Cudweed*, and *Gold-Flower*.

II. The

II. *The Kinds.* It is supposed to be a Species of the *Cudweeds*, but seems to me, to be a singular Plant of its own Kind, and is the *Helichrysum* of *Dioscorides*. But *Parkinson* gives us three other sorts of it also.

The Descriptions.

III. This Plant has a long Root, of a considerable thickness, and furnished with several Fibres or Strings, springing from the sides thereof round about, from which spring forth slender stalks something hard and woody, divided into several small Branches, upon which do grow Leaves somewhat rough, of a white color, and much jagged, not much unlike to those of *Southernwood*. The Flowers stand on the tops of the Stalks, joined together, of a yellow color glittering like Gold, in form resembling the scaly Flowers of *Tansie*, or the middle bottom of the *Camomil Flower*, which being gathered before they be ripe or withered, remain beautiful for a long time after. For which cause of long lasting, the Carved Images of *Heavenly Gods* or *Idols* were wont to wear Garlands thereof. For which reason *Ptolomy King of Egypt*, did much observe it as *Pliny* says. Thus *Gerard*.

IV. *Parkinson* thus describes it. *Helichrysum* or *Golden Flower of Life*, has a Root which is small and Woolly, spreading under the upper crust of the Earth, living long in its own Natural place, but very hardly endures the cold of our Winters, unless they be mild, or well defended. From this Root rise up many hard, round, white Stalks, a Foot and half high, on which at certain distances stand many fine cut Leaves, or rather one Leaf cut into many fine and small parts, almost as small as *Fennel*, but of a greyish color, like unto the *Cudweeds* or *Cottonweeds*, (whereof certainly this is a special Kind.) At the tops of the Stalks stand many round Flowers, of a pale gold color, in an Umbel close together, yet every Flower upon its own Stalk, and all of an even height, which will keep the color (being gathered and kept dry) for a long time after, and are of an hot quick smell.

To this *Parkinson* gives us also the Descriptions of three other Plants, (which he will have to be Species of the same Kind,) and which we here deliver you, as follows.

V. *Helichrysum Creticum*, *Candy Gold-locks*, or *Golden Flower*. It has two or three small, slender Branches, which are white, and set here and there very scatteringly, with small, long, and narrow hoary Leaves, having yellow Heads of Flowers at the tops, made into Umbels or Tufts, not so round and even as the former, but long-wise, one above another, the Heads being made as it were of Scales, loose and not so closely set together, as in the next following: which when they are full ripe do pass into Down, and are blown away with the Wind, having a small reddish Seed at the end: but will abide a long time, as the others in its beauty, being gathered in its due season.

VI. *Helichrysum Orientale*, *Oriental Gold-Locks*, or *Golden Flower*. Its Root dies not every Year, but lives long, especially in the Southern and Eastern Countries, which have no cold Frosts; but with us, in our cold Climates, it requires much care and diligence to keep and preserve it. It is a beautiful Plant, and much like to the former *Cretick Kind* last described, but grows up higher, with many more Branches, and more hoary, white and woolly, having also long and narrow white Leaves, but somewhat broader, and thicker set on the

Branches. The Tuft of Flowers or Umbels do likewise consist of longer and larger Heads, more scaly and closer compact together, of an excellent pale yellow color, and shining, with some yellow threads or thrums in the middle.

VII. *Helichrysum Citrina*, *Chrysocome*, *Stachas Citrina*, *Gold Tufts*, *Gold Cassidony*. Its Root is small and Black, and the Plant is somewhat like to the *Candy Gold-locks*, at Sect. 5. above, having hoary Stalks, and Leaves standing confusedly on them, being long and narrower than those of *Creet* or *Candy*. The Tops of the Stalks are divided into many parts, each bearing a small, long, yellow Head or Flower at the top, with some yellow Thrums in them, which Heads being many, are diffusedly set together, like a loose or sparfed Umbel, keeping their color long long before they wither; and when they are ripe, have thin, small, reddish Seed, like *Marjoram Seed*, but lesser. The whole Plant (as well Leaves, and Flowers, as Roots, is of a strong, and sharp, but pleasant smell.

VIII. *The Places.* They all grow in Hot Countries, as in *Barbary*, *Candy*, *Italy*, *Provence* in *France*, and in *Spain*: where they grow in uncultivated Grounds, and in *Barren Meadows*, as also about the Banks of Rivers. With us they only grow in Gardens, and are very carefully to be looked after in Winter.

IX. *The Times.* Possibly in their Native Countries they may Flower in the latter end of the Spring or Summer Months, as *Theophrastus* and *Pliny* say; but with us, they all Flower in the end of August, or rather in September, to the time called *Michaelmas*.

X. *The Qualities.* They are hot and dry in the second Degree, incise, attenuate, and are Diuretick.

XI. *The Specification.* They are (chiefly the first and last) peculiar against the Strangury, Congelation of the Blood, and Bitings of Serpents and other poisonous Creatures.

XII. *The Preparations.* You may have herefrom, 1. An Infusion or Decoction in Wine. 2. A Powder of the Herb and Flowers. 3. A Spirituous Tincture of the same. 4. An Acid Tincture.

The Virtues.

XIII. *The Infusion or Decoction in Wine.* It heats and dries, and is profitable against Catarrhs, provokes Urine powerfully, and gives ease in the Strangury: comforts a cold Stomach, and helps Digestion. It is good also against the Bitings of Serpents and other Venomous Creatures, and being drank dissolves congealed Blood.

XIV. *The Powder of Leaves and Tops or Flowers.* It has all the Virtues of the Infusion or Decoction; and may be given Morning and Night, from half a Dram to a Dram, in a Glass of Generous Wine. *Dioscorides* says, that the tops thereof being drank in Wine, are good for such as can hardly make Water, against Bitings of Serpents, and Pains of the Huckle Bones, by which I suppose is meant the Sciatica: and being taken in sweet Wine it Dissolves congealed Blood.

XV. *The Spirituous Tincture.* It is good against weakness of the Stomach and Bowels, expels Wind, and prevails against the Colick and Gripping of the Guts: strengthens the Head, Brain, and Nerves, comforts the Bowels and Womb, and admirably provokes Urine. Dose from one Dram to three Morning and Night, in a Glass of Wine, or some other proper Vehicle.

XVI. *The*

XVI. *The Acid Tincture.* It Stops Vomiting, strengthens the Stomach, creates an Appetite, and causes a good Digestion. It opens obstructions of the Reins, Ureters and Bladder, and expels the Morbifick cause of Fevers by Urine. It opens also obstructions of the Lungs, and causes free Breathing. Dose so many Drops in Ale, Beer, or Wine, as to make it gratefully Acid; and to be repeated as often as the Sick drinks, till the Disaffection is removed.

XVII. *Nota.* Any of these Herbs, (but chiefly the first of them) being laid in Chests among Cloaths it keeps them from Moths; and from thence came the Name of *Moth-wort*.

MOTHER of TIME, see Time Wild, Chap.

CHAP. DII.

of MOTHER--WORT.

I. *THE Names.* I do not find that this Plant was known to the Ancient Greeks, or Latines: Our Moderns call it *Cardiaca* (from comforting and strengthening the Heart) and might very well be called *Matricis Herba* and *Matricaria altera* (from its curing of Diseases of the Womb:) The prime *Matricaria*, being that which we call *Parthenium*, or *Featherfew*. And in English we call it *Mother-wort*, from its curing Fits of the Mother.

II. *The Kinds.* Most of our Botanists have made but one Species hereof, and a singular Plant of its Kind: But Mr. Ray has added many more, but they being all Strangers to us, and not possible to be met withall here, we shall wholly pass them by. That which we shall here Describe is *Cardiaca vulgaris*, or *Matricaria altera*, Our Common Mother-wort. These, viz. 1. *Cardiaca Crispa*, Curled or Crisped Mother-wort. 2. *Cardiaca Americana annua* *Nepeta folio*, Annual American Mother-wort with Nep or Cat-mint Leaves. 3. *Cardiaca Americana minor Nepeta foliis*, The lesser American Mother-wort with Nep or Cat-mint Leaves. These I say, are the chief of those which he has added, besides which he has enumerated about seven other Kinds, all which being Foreign (as the Plants themselves are) to our design, we shall pass them all over.

The Descriptions.

III. Our Common Mother-wort has a slender Root which sends forth and is compassed of a great Number of small Fibres or long slender Strings, which are of a dark yellowish or brownish color, taking strong hold in the Ground, and perishes not, but well abides the coldness of the Winter. From whence rises up a hard square brownish, rough, strong Stalk, rising to be sometimes three or four Feet high, and spreading into many Branches, on which grow Leaves on each side upon long foot Stalks, two at every Joint, which are something broad and long, and as it were rough, or crumpled, with many great Veins which shew themselves therein, of a

HOOTER..WORT.

sad green color, and deeply dented in about the edges, and almost torn or divided. From the middle of the Branches up to the tops of them, which are very long and small, grow the flowers round about them at distances, in sharp pointed, rough, hard Husks, which are more purple or red, than in any of the Bawm's, or in any Hore-hound; but in the same manner, form, and roughness as those of the Hore-hound are; after which come small, round, blackish Seed in great plenty.

IV. Gerard has another kind of Description of this Plant, which something better pleases me, and it is this. Its Root is compassed of many small Strings, which sends forth a Stalk four square, thick, hard, and about two Cubits high, of an obscure, or over-worn red color. The Leaves are somewhat black like those of Nettles, but greater and broader than the Leaves of Hore-hound, deeply indented, or cut in on the edges. The Husks are hard and prickling, which do encompass the Stalks like Wharke, or little Coronets, out of which grow purplish flowers, not unlike to those of Dead-Nettles, but lesser. The whole Plant has a bitter Taste and rank Smell.

V. *The Places.* It grows among Rubbish and by the sides of Walls, and Hedges, and Banks of Ditches, in many places beyond Sea. And Parkinson says, he never knew or heard that it grew with us any where but in Gardens where it had been once Sown or Planted. But Gerard says, that it joys only in Rubbish, Stony, and other Barren places, and has been found in some places about Oxford: I myself in Travelling about England, have sometimes found it growing Wild, in several places.

VI. *The Times.* It Flourishes, Flowers, and Seeds from June to September, yielding a plentiful quantity of Seed. The Root endures all Winter, though the Leaves and Stalks dye away and perish.

VII. *The Qualities.* It is hot and dry in the second Degree, Astringent, Astringent, Diuretick, Vulnerary, Cardiack, and Hysterick.

VIII. *The Specification.* It prevails against Faintings and Swoonings, as also Hysterick Fits, Convulsions

vulsions, Cramps, and Palsies, opens Obstructions eases the Strangury, provokes Urine and the Terms, and facilitates the Birth, in Women in Labor.

IX. *The Preparations.* You may make therefrom, 1. *A Liquid Juice or Essence of the Herb.* 2. *An Infusion or Decoction of the same.* 3. *A Powder thereof.* 4. *A Spirituous Tincture.* 5. *A Distilled Water.*

The Virtues.

X. *The Liquid Juice or Essence.* It may be given from one Spoonful to three in a Glass of Canary, or other Generous Wine, against Faintings, Swoonings, sickness at Heart, Convulsions, Palsies, Lerhargies, &c. Given in *Pennyroyal-Water*, or in its own *Distilled Water*, it is good against Vapors and Hysterick Fits. Given in white Port or Lisbon Wine, it facilitates the Birth of Women in Labor, induces the Terms, provokes Urine, and gives ease in the Strangury.

XI. *The Infusion or Decoction in Wine.* It has all the Virtues of the *Liquid Juice or Essence*, but much weaker, and may be given Morning and Night, from four to six or eight Ounces, according to the condition of the Patient.

XII. *The Powder.* The Powder has all the former Virtues, and may be given from half a Dram to a Dram, or Dram and half in a Glass of Generous Wine, Morning and Night: It cleanses the Breast and Lungs of cold Flegm, and causes it to be easily expectorated; and kills Worms in the Stomach and Belly.

XIII. *The Spirituous Tincture.* This is much more Cordial than any of the former Preparations, and therefore more effectual against Diseases of the Nerves, Heart, and Stomach; it warms and dries up cold Humors, disperses and digests them in what part of the Body soever, and gives present relief in Cramps and Convulsions.

XIV. *The Distilled Water.* It has the Virtues of the former Preparations, but in a weak Degree, and is chiefly used as a Vehicle, to convey the former, or other Preparations in relating to the same Diseases.

fella altera erecta, The second or other upright Mouse Ear. 4. *Pilosella minima*, The smallest Mouse Ear. 5. *Auricula Maris tertia Tragi*, *Myosotis Scorpioides hirsuta*, *Alfine Myosotis Lobelij*, (referring it to the kinds of *Chick-weed*) Blew Mouse Ear with a turning top. 6. *Myosotis Scorpioides repens*, *Helitropium minus alterum Cespitum*, Small creeping blew Mouse Ear. 7. *Pilosella Americana*, *Pilosella Americana odorata*, *Pilosella Indica odorata*, Sweet Indian or American Mouse Ear. 8. *Pilosella minor*, *Pilosella Montanum*, *Pilosella minor Montanum Flore albo & Flore purpureo*, *Gnaphalium Montanum Flore albo & purpureo*, The lesser Mouse Ear, or Mountain Mouse Ear, with white and purple Flowers, or Cats-Foot, of Mountain Cudweed with white and purple Flowers. 9. *Pilosella Rosea*, *Gnaphalium Roseum*, The Rose Mouse Ear, Rose Cudweed, or Cotton Rose.

The Descriptions.

III. *The first*, or Our common small creeping Mouse Ear. Its Roots are small with some fibrous strings, whence shoots forth a low creeping Herb, running upon the Ground, and Rooting with small strings from several Joins, almost after the manner of the Strawberry Plant: at or from which grow upon the Ground many small and somewhat short Leaves set in a round form together, hollowish in the middle,

Creeping Mouse Ear.

where they are broadest, of a hoary color all over, as well above as below, and very hairy; which being broken do yield a white Milk, or milky Juice. From among these Leaves spring up two or three small hoary Stalks, about a Span high, with a few smaller Leaves thereon. At the top of which stand usually but one Flower, consisting of many pale yellow Leaves, broad at the points, and a little dented in, set in 3 or 4 rows, the greater outermost, and the smaller inwards,

CHAP. DIII.

of MOUSE EAR.

I. *THE Names.* This Plant is called in *Greek*, *Μυοσωτά*; in *Latine*, *Pilosella*, *Myosotis*, & *Auricula Maris*; in *English*, *Mouse Ear*. They are called *Pilosella* from the hairiness of their Leaves and Stalks.

II. *The Kinds.* They are manifold, as, 1. *Pilosella minor vulgaris repens*, *Pilosella major repens* (so called in respect to the eighth Kind,) *Holostium Lacune*; Our common small creeping Mouse Ear. 2. *Pilosella media vulgaris erecta*, *Pilosella major quorundam* (so called in respect to the eighth Kind, as aforesaid;) *Lactucella Sylvestris repens Camerarij* in *horto*, Our common upright Mouse Ear. 3. *Pilo-*

inwards, very like a Dandelion Flower, and a little reddish underneath about the edges, especially if it grows in a dry and not moist Ground, which after they have stood long in Flower, do turn into Down, which with the Seed is carried away with the Wind.

IV. The second, or Our common upright Mouse Ear. This is very like the former: the chief difference between them consisting in this, that the Leaves are longer and greener on the upper side, and somewhat hoary underneath, softer in handling, and not so much hairy; the Stalks of Flowers standing more upright and higher: this Plant, if its Stalk or Leaf be broken, does give a white or Milk-like Juice as the former.

V. The third, or second, or other upright Mouse Ear, which Gerard calls Pilosella major, or great Mouse Ear. It has a small, tough, and fibrous Root, whence shoot forth a few hoary and hairy broad and long Leaves, lying upon the Ground; among which rises up a slender hairy Stalk, bearing long and narrow Leaves thereon; and at the top two or three small, pale, yellow Flowers, like in fashion to the former, which turn into Down as those do.

VI. Gerard has this Description of it. Its Roots are hard, woody, and full of Strings. It has great and large Leaves greater than the common (creeping) Pilosella, or Mouse Ear, thick and full of Substance. The Stalks and Leaves are hoary and white, with a silken Mossiness in handling, and feel soft as Silk, Pleasant and fair in View. It bears three or four square Stalks somewhat knotty, and about a Foot in height. The Flowers come forth at the tops of the Stalks, like unto the small Dandelion or Pissabed Flowers, of a bright yellow color.

VII. The fourth, or smallest Mouse Ear. This is in all things like unto the second Kind, or Our common upright Mouse Ear, before described at Sect. IV. and is smaller by half than the first common Kind, both in Leaf and Flower, but creeps not by strings as that does.
